INDEX OF CONTENTS.

JULY TO DECEMBER, 1885.

A

ABERDEEN show, the, 369
Abies grandis, 563; *A. magnifica*, 725;
A. Morinda as a hedge plant, 274;
A. nobilis, 652; *A. n. var. robusta*,
 725; *A. Pissapo*, 468; *nobilis*, 652
 Abnormal form of *Puccinia betonicæ*, 180
 Abutilons, hybrid, 374
 Acacia, at Masonic funerals, 566; at
 Worthing, 552
 Achilleas, 204
 Adiantum *cydoniifolium*, 531
 Adirondack, forests of the, 531
 Adoxa, disease of, 21
Adiantum betula, 108
Acanthus Leonis, 80, 142
Acorus odoratum var. *D. midovi*, 585;
A. Vandrum, 628; *Leonis*, 783
 Afghan Delimitation Commission, the,
 77
Agaveus rubescens, 450
 Agaves, flowering in Holland, 142
 Agricultural returns of Great Britain,
 summary of, the, 243, 590
 Agri-Horticultural Society of India, 498;
 Society of Madras, 107
 Aila in Algeria, 118
Aloe insignis × 40
 Allotment question, the, 792
 Alpine flora, protection of the, 83
 Alpine Hutchinsia, the, 262
 Alpine plants, 47, 78, 203, 524, 684; and
 alpine gardens, 234; on the Gemmi,
 170; seed sowing, 524
Alstromerias, 244
Amaryllis, the, 39, 270
Amasonia punicea, 693
 Annual *Chrysanthemums*, 500
Anthericum liliumstr., 47
 Antoine, *Bromeliads*, 690 [144
 Antwerp Botanical Congress, 17, 112,
 Antwerp Exhibition, 176, 461
 Apiary, the, 21, 179, 235, 304, 367, 430,
 555, 623, 684, 759, 811
 Apocynon, 780
 Apogoneton fenestralis, 434 [625, 753
 Apple and Pear Congress, Scotch, 306
 Apple crop, American, 210; in Nova
 Scotia, 295; Glossy Reinette, 118
 Apples for planting, culinary varieties,
 407; Golden Noble and Waltham
 Seedling, 436, 626; to plant, 463;
 Nova Scotian, at Edinburgh, 658
 Apricot, St. Andreis, 500
Aranea exelsa, 113; *A. imbricata*,
 gumming, 220
Arboretum Segrezianum, 561
 Arboretum, Sir C. Bunbury's, 250
Arbutus Unedo, 401
 Architecture and landscape gardening,
 140, 203, 267
Arctotis acaulis, 38; *A. aspera*, 38; *A.*
aspera var. *arborescens*, 14; *A. aureola*,
 14; *A. cineraria*, 38; *A. cuprea*, 38;
A. decumbens, 38; *A. decurrens*, 38;
A. fastosa, 38; *A. glaucopicta*, 38;
A. grandiflora, 38; *A. Leichliniana*,
 38; *A. leptorhiza*, 38; *A. leucan-*
themoides, 38; *A. maculata*, 38; *A.*

reptans, 38; *A. revoluta*, 39; *A. rosea*,
 39; *A. speciosa*, 39; *A. squarrosa*, 39;
A. tricolor, 39; *A. undulata*, 39
Arctotis, the genus, 14, 38
Ariseemas, 179
Aristolochia elegans, 301, 339
Armenia ophioides, 78
 Arran, *Asceas* in, 594; *Cordylines* in,
 694; Tree Ferns in, 694; vegetation in,
 694
Artie of Gardening, the, 434
 Artichokes, Globe, to pickle, for winter
 use, 123
 Artificially coloured Potatoes, 759, 792
Arum crinitum, 375; fertilisation of, 439
Asa Gray, Dr., 722
Asarum Thunbergii, 600 [435
Asclepiads and *Hoyns*, fertilisation of,
 Ashridge Park, 551
 Ashton Court, Bristol, 295
Aster Engelwii, 135; *A. Thomsoni*, 105;
A. Washingtoni, 693
Astrantia helioborifolia, 135; major, 113
Astragalus laxifolia, 584; coning of, 660;
A. cupressoides, 270
Auricularis, double, 71
Atlas, *Popular*, Letts', 621
Auricularia, the, 23
Australian Orchids, 688
 Australia valley, an, 90
 Autumn flower, 400
 Automatic irrigation, 210
Asyapan, 140
Azalea, the, 270; *A. mollis*, hybrids of,
 210

B

BALATA industry in British Guiana, 212
 Balfour, *Plants of the Bible*, 754
 Balfour's terra-cotta, 146
 Balsam *Paranara*, 813
 Bamboo, 116; seedling, 730
 Banbury show, 309
 Banyan in a bowl, 713
Barkeria elegans, 142
 Barr's grounds, Tooting, 15
Bartholina Ethelae, 134; *pectinata*, 136
 Bast mats, Canadian, 18
 Battle Abbey, 423
 Baylfordbury, 220,
 Beans, French, 211
 Bean weevil, 436
 Bed, a charming, 23
 Beech-leaf miner, 159
 Beech-mast, meaning of word, 156
 Bedding plants, propagation of, 436
 Bees and bee-keeping, 531
 Begonia, John Heale, 593; *B. Princess*
Scarface, 300; Reading Snowflake, 660
 Begonias at Reading, 243; tuberous, at
 Swanley, 307
 Belon, Pierre, 305
 Belladonna, 178; *Lilies*, vars. of, 598
Bertham porriti, the, 16, 369
Berthamia frigida, 112
Bertham Wallichiana, 350
 Berlin, Horticultural Exhibition at, 17
 Bermuda Lily, 113 [815
 Berry-bearing plants, 679, 717, 747, 777,
Beuré Chlirgac, 688; Rome Gaujard,
 665
 Big Vine of Kinnell, the, 181
Bignonia purpurea, 273
Bilbergia Bracteata × 114 [752
 Billing Road Nurs'ry, notes from, 782
Blechnum, *Wolsey*, Surrey, 22
 Bobart, Jacob, 208
 Boiler, Waterspooon's tubular, 338;
 Wood's patent, 336

Boissier, M. Edouard, 434, 455
 Bokhara, fruit trees in, 14
 BOOKS, NOTICES OF.—*Arboretum Segre-*
zianum, 561; Atlas of Plant Diseases
 (Zimmerman), 720; Australian Orchids,
 688; Bible Flowers and Flower Lore
 (Anonymous), 754; British Moss Flora,

 Bunbury's, Sir C., arboretum, 250
 Burford Lodge, 165
 Burmese Dendrobis, 13; Lacquer, 20

C

CABBAGES, Early Etampes, 150
 Cacti, hardy, 151
Cacao Planter's Manual, 107
 Cactuses, culture of, 231; hardy, 679;
 hedges, 179; tender, 679; uses of
 spines in, 265
 Caister lifeboat relief fund, the, 369
Calanthe natalensis, 78; *C. Veitchii*, 690;
C. vestita oculata gigantea, 683
Calanthes, 126, 366, 808; at Oldfield
 Hall, 584; their culture, 12
 Caley, George, 263
 Calceolaria, 82
Calochortus venustus, 52
Callaranda bush, the, 262
Callispyche aurantiaca, 530
Campelia, 72, 167
campulana, 137
Campanula Hendersonii, 182; *C. lecti-*
folia, 135; *C. pyramidalis*, 557; *C. pi-*
pulla, 203; *C. Zeyssii*, 267
 Camphor in China, 306
 Canada, 219
 Canadian bast mats, 18
Canadian Record of Science, 176
 Candytuft, Empress, 24
 Cannell & Sons, Swanley Nursery, 753
 Cape Town Botanic Garden, 813
 Carnation and Fuchsia Society, National
 (Southern Section), 85
 Carnation, Clove, Chiswick Red, 242;
 layers, treatment of, 627
 Carnations and Ficoetes, 72, 171
 Carnations at Oxford, 264
 Carnations, winter blooming, 53, 811
 Caryopteris Mastacanthis, 531
Casimiroa edulis, 146
Castanea pumila, 686; *C. vulgaris* var.
pendula, 561
Castilleja indivisa, 242
 Cat plants, 400 [300
Catalpa Bignonioides, 330; *C. Purgul-*
ifera, 330
 Catechism and insects, 104; *C. macro-*
carpum, 78
 Catrillars, 202; destruct on of, 215, 747

Cattleya, 686
 Cattleya Aclandiae, 10; C. amethystoglossa, 10; C. bicolor, 11; C. Bowringiana (autumnalis), 593; C. chocoensis, 10; C. crispa, 248; flowers, honey glands on the sepals of, 20; C. Forbesii, 10; C. guttata, 10; C. g. Leopoldi, 10; C. g. Williams, 715; C. car. Leopoldi, 712; C. granulosa (white var.), 12; C. nobilior Hugueneyi, 142; C. sulphurea, 10
 Cedrela odorata, 398
 Centaurea glastifolia, 135; C. macrocephala, 135
 Cerastium caput 561; C. Herinquiniana, 561; C. Pseudo-Cerastium, 561
 Ceratandra, 136; C. bicolor, 136; C. chloroleuca, 136; C. grandiflora, 136; C. Hareyana, 136
 Cereals, cross-breeding of, 234
 Cereus, an extraordinary, 247
 Cicada, the periodical, 82
 Cider and perry, 211
 Cinchona bark, 691
 Cistus bedding-out, 218
 Cistus, 147; C. formosus, 5
 Citrus tripartita, 691
 Chamaedorea metallica, 730
 Chamaedorea Arebergiana, 530
 Chamaecyparissus, 142; C. Fortunei, 341; C. Fortunei and Eucalyptus, flowering of, 216
 Chard Nurseries, 135
 Charming bed, a, 23
 Chelsea Botanic Garden at, 232, 562
 Chepstow, public improvement in, 274
 Cherkley Court, tropical fruits at, 206; conservatory at, 624
 Cherries in Kent, 17; in pots, 205, 238; Morillo, 23; under glass, 281, 333
 Children, 205
 Children's exhibition, 85; gardens, 53
 Chinese Primula, double flowering, 269
 Chiswick, trial of Peas at, 106
 Christmas plants, 775; Rose, 818
 Christmas tree, 596; annual, 499; at the Exeter Nursery, 664; at B. S. Williams' nursery, 626; at Finsbury Park, 563; at W. Cutbush & Sons's, 626; at Messrs. J. Veitch & Sons's, 626; at Swanmore, 662; bud variations in, 590; diseased, 120; in October, 551; shoots eaten by insects, 731; shows, 459
 Chrysanthemum latifolium, 13; C. Leucanthemum, 150; C. Maximum, 135; C. Wermig, 500
 Chrysothamn virginianum, 267
 Chrysothymum canaliculatum, 691
 Cineraria, the, 761
 Cirriophorum Wallichii, 813
 Cistobolus micropetalum, 520
 Cistobolus dendricum, 664
 Cladotrichum passiflorae, 721
 Clandon Park, 711
 Clay soils, Pears for, 523
 Cleistogamous flowers of Hoya, 434
 Clematis Davidiana, 530; C. Jackmanni, 339; the wild, 33; late-flowering, 660
 Cliaanthus Dampieri, 409
 Cliban & Son's, notes from Messrs., 627
 Climbing plants for the conservatory, 247
 Clip or holder, patent, 309
 Cocca, 117, 283
 Cocain, 461
 Cockscob, Glasgow Dwarf Crimson, MacLachlan's, 182
 Colonial notes, 107, 141
 Common edible Mushroom, a, 460
 Commons and roadside slips of land, 746
 Composita macropetala, 365
 Com. ad della Flora Italiana, 178
 Com. ad in ramulis, 177
 Cones, 301; of Abies brachyloba, 151
 Conifer grafting, 203; propagation of, 637; unusual free growth of season, 430
 Coning of *Athanasia laxifolia*, 660; of *Peziza Pissapo*, 686
 Congrès International de Botanique et d'Horticulture d'Avvers, 17, 112, 144; de St. Petersburg, 722
 Corn midew, 245
 Corns and insect fertilisers, 103
 Conservatory at Bletchley Park, 233
 Cottage garden, a novel way of planting a, 216
 Cotton seed in America, uses of, 409
 Cotton wool for packing, 628
 Country growers and town salesmen, 408, 439
 Covent Garden, 609; v. Asiatic Cholera, 212; market and Christmas supplies, 784; prices, 500; new flower market, 72
 Cow-keeping by labourers, 718
 Cracking of Apples and Pears, 691
 Crioum augustiss, 310
 Crocus speciosus, 440
 Crocus, early autumn, at Kew, 469
 Cryptogamic Society of Scotland, 213, 465
 Cryta-th' Alice, the, 561

Cuba, T. abaco and cigar trade in, 350
 Cucumber, bisexual, 17; leaves, spotted, 791; Telegraph, 375
 Cucurbit in the Water Lily-house at Kew, 70
 Cudrania triloba, 410
 Cuscuta reflexa, 692
 Cyananthus lobatus, 203, 212
 Cycads in flower at Kew, 665
 Cyclamen, a double, 400
 Cyclamen and Yucca, germination of, 216
 Cyclamen at Hanwell, 660; at Messrs. Clarke & Co. at Messrs. Page's, 787; at Mr. Walker's, 787
 Cyprinoides Druryi, 142; C. Parshii, 110; C. Schroderi, 142; C. spectabile, 53; C. tessellatum var. porphyrophyllum, 71
 Cypridiums, 783
 Cyrtopodium punctatum, 334

D

DAFFODIL notes, 817
 Daifodil, White Hoop-Petticoat, the, 721
 Daifodils, Leeds and Herbert, 724
 Dahlia exhibition for the North, 340
 Dahlia show, the Grand National, 144

 Disease and decay in fruit, 51, 268, 564; of Adoxa, 21; of bulbs, 149; of Geniana, 372
 Diseased Chrysanthemums, 120; Tomatoes, 23
 Diseases of fruit, &c., 755; of plants, 108; of Potatoes and Vioes, 246
 Disinfectants, 108
 Dodder, 248, 303, 627
 Downington pulchella, 17
 Draecena Draco, propagation of, 175; D. intermedia, 175
 Draecena, propagation of, 174
 Dresden International Exhibition at, 656
 Dryas octopetala, 204
 Drought and vegetation, 176, 242

E

EALING, fruit growing at, 521
 Ealing, Hanwell, and Acton Society, 146
 Early Etampes Cabbage, 150
 Earthing-up, 715, 757
 East Anglia, mildness of the season in, 758
 Echeveria Peacockii, 661
 Echeveria, wintering, 659
 Economy and seed Potatoes, 407
 Eremocarpus scaber, 340
 Edge Hill, Malpas, plants in flower at, 104
 Edible Mushroom, a common, 460
 Edinburgh Apple and Pear Congress, 658, 735; proposed fruit show at, 339
 Ederaianthus dalmaticus, 203
 Ederaianthus, 203
 Eight days in the Garden of England, 406, 428, 459, 556, 618, 665, 683, 714
 Electric tree of New Guinea, 731
 Embolithium coccineum, 82
 Emulsi, of Mithridates, Hildebrandti, 431
 Enslave of Mithrey leaves, 298
 Epiandrium paniculatum, 142; E. prismatocarpum, 334, 462; seed vessels of species of, 332
 Epilobium Fleischerii, 267
 Epipactis latifolia, 247; and its vars., 660
 Erigeron caucasicus, 203
 Eritrichium barbergium, 716
 Erucastrum inodorum, 275
 Erythrina Crista-Galli, 310; E. suberosa, 270

Esparto in Tunis, 651
 Eucalypts, 617
 Eucalyptus, 607; and Chamerops Fortunei, flowering of, 216; in Arran, 694
 Eucalypti, transplanting, 569
 Eucalyptus globulus, 23; E. globulus in Scotland, in flower, 114
 Eucharis americana, 493; E. Mastersii, 210, 722
 Eucharis mite, 534
 Eucharis, seedling, a, 731
 Euryangium Sumbul, 50
 Exotic plants, 527
 Exhibiting Chrysanthemum blooms, 693
 Exhibits, bond free, 815
 Extinction of species, 235

F
 FABIANA imbricata and Ceanothus Veitchii, 23
 Fairy rings, 22
 Familiar Trees (Boulger's), 146
 Farm gardening, 117
 Fence, ornamental and shelter, 587
 Fenn, Mr., at home, 225
 Fern, a proliferous, 244
 Fern culture, 789
 Ferneries, 777
 Ferns, the Bridge of Allan, 619
 Ferns at Kew, 405, 724; hardy, 440; proliferation in, 371, 394, 473, 595, 788
 Fertilisation of Figs, 310; of the Passion-flower, 150
 Fiches, American, 173; Cocoa-nut, 808
 Ficus repens, 339; F. barbata in Scotland, 813
 Figs, 271; fertilisation of, 247
 Filbert bushes, how raised, 569; extraordinary crop of, 275
 Filmy Ferns of Jamaica, 102
 Flavour in Pears, 533
 Floral evolution, 370; illustrations, 145; novelties, 716; pyramids, 685, 726
 Flora of British India, the, 272; of Iceland, the, 173
 Floriculture in the City, 273
 Florida, the Italy of America, 154
 Florists' and fruiterer's Christmas supplies, 792
 Florists' flowers, 115, 148, 171, 246, 270, 335, 365, 398, 491, 526, 551, 621, 719, 781, 800
 Flower garden, management of the, 47, 111, 175, 239, 303, 367, 431, 495, 559, 623, 687, 719, 750, 783; in a cold spot, 143; Jewish, 627
 Flowering of Eucalyptus globulus in Scotland, 114
 Flower marketing, 58
 Flower Market, Covent Garden, rew, 72, 713
 Flower show, 370 (see under Societies)
 Flower show cities, 177
 Flowers, heat in, 592; fashion in, 658
 Flowers in season, 113, 594

S. SPOOSMERN, and FLORISTS, Haarlem, Holland, The
Wholesale Catalogue (No. 377A) of Dutch Flower Roots and
Miscellaneous Bulbous and Tuberos-rooted Plants of 1885-86, is
now ready, and may be had free on prepaid application by Nursery-
men, Seedsmen, and Florists. The Catalogue, although giving
only an extract of the collections, forms a pamphlet of 43 pages
8vo, in two columns, and is doubtless one of the most complete
sent out of this speciality. The prices of Tulips in general
are considerably lower than before. Prices of Tulips and other
Bulbs, too, are in many instances inferior to former quotations.
German and French editions as well as a separate English
edition for America, are published.

HILL AND SMITH'S BLACK VARNISH, Oil Paint no Longer Necessary. for Preserving Ironwork, Wood, or Stone. (Register Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufacturers, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
 "Pierrefield Park, June 24, 1876.—Sir, I have this day forwarded from Chepstow to your address a black varnish cask, which I filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. A dress Varnish to Pierrefield Park, Chepstow.—I am, Sir, yours respectfully, Wm. Cox"

CATTOW.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. S. & S. Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing Hedges, Field and Entrance Gates, &c., sent free on application to **HILL AND SMITH,** Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 195, St. Vincent Street, Glasgow.

DANIELS'

DEFIANCE CABBAGE.
GIANT EARLY MARROW.

The Best Early Cabbage for General Use.

1s. per Packet, POST-FREE;

7s. 6d. per pound; 4s. per half-pound.

Testimonial from Mr. J. M. CLEMENS, East End, New Quay.—"We have grown your 'Defiance' Cabbage for EIGHT YEARS with various other sorts, as a test, and always find your 'Defiance' beats all, being earlier, heavier, and of better shape and flavour."

ONIONS FOR AUTUMN SOWING.

DANIELS' GOLDEN ROCCA, per packet, 1s. 6d.
DANIELS' GIANT ROCCA, 1s. per ounce, 6s. per pound.

Priced Descriptive LIST of all kinds of Seeds for present sowing, gratis and post-free to all applicants.

DANIELS BROS.,

SEED GROWERS AND MERCHANTS,
NORWICH.

Clapton Nursery, London. E.
Bush Hill Park Nursery, Enfield, N.

At the above-named Nurseries are cultivated, in unusually large quantities, Azaleas, Houvardias, Camellias, Climbing Plants, Cyclamens, Epacis, Ericas, Ferns, Ficus, Flowering and Decorative Plants in variety; Fruit Trees, Gardenias, Genistas, Grape Vines, Greenhouse Plants in variety: Palms, Pelargoniums, Rhododendrons, Roses, Shiraz, Stone Plants in variety, &c.

ORCHIDS A SPECIALTY.—The stock at the Clapton Nursery is of such magnitude that without seeing it, it is not easy to form an adequate conception of its unprecedented extent. The glass structures cover an area of upwards of 236,000 superficial feet.

HUGH LOW & CO.

THE

Gardeners' Chronicle.

SATURDAY, JULY 4, 1885.

ST. ALBAN'S.

NOT that town dominated by the lofty square tower of a Norman Abbey, and across which the long nave seems to stretch like a retaining wall, nobody knows exactly how far—not that town which Mr. Sander has rendered famous among Orchid lovers, indeed not a town at all, not even a village, is the spot which has supplied a text for this note. St. Alban's Court is an estate belonging to W. O. Hammond, Esq., in East Kent, somewhere about midway between Canterbury and Dover. The downs hereabouts are bleak and barren, the soil a mere skin above the chalk. Good Barley soil it looks; Wheat, the farmers seem to sow thickly, as if they thought the haulms were so strong enough to hold themselves up and so required reciprocal support! Sainfoin, with its pretty pink flowers, is quite at home in the district, and the incarnate Trefoil causes a field here and there to glow with a depth of crimson that even Poppies cannot rival.

Here and there, too, are Hop gardens, though this immediate neighbourhood is not specially a Hop district—the soil is too poor. Not far off, however, some of the best in England are grown. The bines have now got to the top of the poles, they are trailing along the strings stretched from pole to pole like a child's cat's-cradle, or climbing along poles inclined like "fixed bayonets, prepared to receive cavalry," which some growers are now adopting. In Kent the talk is of Hops, very hoppy, and so even here, where Hops are few, we were shown how the bines were brown at the bottom, and a gardener knows what that means as well as a farmer. The Barley looked well, as such a "free and happy" cereal ought to do, the Wheat just in flower and so not requiring rain at present, though to our eyes it looked as if it had been rather stinted in the matter of drink during growth. But from now onward but little rain is wanted for the Wheat, a little drop just to swell the grain, perhaps, and then hot sweltering sun to ripen the golden corn and impart quality to please the factors in Canterbury Market. Roots—well, we did not see any, except some old ones from the pit that the lambs were eating to supplement the too scanty herbage. Clover-hay was lying about in the fields; meadow-hay is a rare commodity hereabouts, but white Clover, closely cropped but full of bloom, was scenting the air with its rich perfume. Peas and Potatoes, too, looked promising, as they always ought to do if only to preserve the alliteration. Cherry orchards are not so common hereabouts as higher up the country between Faversham and Sittingbourne, but still the baskets at Adisham Station and the casual conversation of the farmers as overheard on the journey betokened that this part of Kent, if not so richly endowed as some others with the national—of course we mean carnal glories—Hops and Cherries, is at least not entirely destitute of them, while as for the pretty women, which constitute

the third and crowning glory of the county, far, indeed, be it from us as born natives to dispute the fact of their existence. If on our journey by Barham Downs we did not happen to see any, that was, of course, our misfortune. Neither did we meet any of Dick Barham's acquaintances, though we were not far from the heart of the Ingoldsby country, a district as well defined as that which that prince of topographers, Walter Scott, has marked out in the northern half of the county.

Though the general impression is one of bleakness and want of shelter, yet there are rounded masses of green foliage darkening into black as we saw it on one of the latter days of June, and in the distance are parks and woods where we know we should find the Butterfly Orchis, perhaps *Orchis fusca*; the wild Lily of the Valley, and, earlier in the season, the Daffodil. They used to be there in boyhood's days; they must surely be there now; but inexorable fate forbids the happiness of going to look. Down in the hollows, too, are trees and rambling old farmhouses, thatched barns, delightfully pictorial; pigs lying sunning themselves in the yards; young chicks running to see if the visitor has not something for them to eat, and, turning away with a disappointed, not to say disgusted, air, when they find the said visitor to be for the nonce merely a loafer. Too close to the homestead are the horse-ponds; indeed, sanitary reform does not seem to have made much progress in these parts. Is it not the country?—and are there not sunlight and oxygen enough on Adisham Downs to burn away all impurities, and bid defiance to bacteria—bad bacteria, we mean, not the beneficent creatures, who, by turning the insoluble into the soluble, convert the inert matter of the soil into the rich food which plumps out the ears of corn. These good friends to the farmer work while he sleeps, but, as a rule, we question whether he is more conscious by day of the services rendered to him by these, his least but his best friends. Down in the "bottoms" hard by we may chance to pass one of those mysterious bourns—rivulets which disappear in some seasons and reappear in others. Littlebourne, Patricbourne, Bekesbourne, and other villages close at hand derive their names from these intermittent streams.

But what has all this got to do with St. Alban's? This much, that unless the reader can form some idea of the surrounding conditions, and of what Herbert Spencer calls the "environment," he cannot adequately appreciate a garden. With it he can understand why certain things are not to be found, while others thrive; with it he can sympathise with the efforts of the gardener, admire his success in fighting adverse conditions no less than his skill in availing himself of those that are favourable.

The principal attraction for the gardener at St. Alban's Court is the rock garden. Were a competent jury empanelled they would, we are sure, without hesitation give it a First-class Certificate *mem. con.* They would not stop to consider how it was that blocks of Hastings Sand, in defiance of geological propriety and sequence, crop out above the chalk. At present people see no incongruity in such an arrangement, but as knowledge increases, and Girtton and Newnham send out learned ladies to regulate the destiny of gardens, we may be sure that anachronisms of this sort will in time be as much subjects of ridicule as was the painter handed down as a subject for perpetual laughter by Horace. It is really worth consideration whether we do not err in attempting to imitate Nature closely rather than appropriately. A rockery which would be appropriate at Groombridge or Penhurst, is certainly not in keeping with the "environment" in this part of East Kent. The chalk downs of Kent with their swooping combs, the landslips with their terraces and

plateaux, the pell-mell confusion of the fallen masses by the sea, all furnish hints for the general construction of a rockery in such a district. But after all a rockery is but an artificial device for a certain purpose, and as such, it should, to our thinking, be suggestive rather than directly imitative. In this particular rock-garden—looked at from a cultural point of view—the first thing that struck us was the absence of "pockets" and niches. The rocks at St. Alban's have escarpments jutting out from the vertical plane, and covered with luxuriant Saxifrages now in full bloom; but as a rule, they do not project above the surface—some do so of course—but, for the most part, the plants seem to be growing on the flat, hence at first an impression is given that there can be but little depth of soil for the plants to root in, and that consequently they must be burnt up in summer. In truth, we believe the rocks are tilted downwards at a considerable angle, so that provision is made for depth of soil, while the porous nature of the sandstone ensures a supply of moisture which the dry chalk soil would not afford.

The rock garden at St. Alban's occupies a dell, which looks as if it might have been a disused chalk pit. It is somewhat oval in outline, shaded on the north by trees (including a fine *Picea Menziesii*). The south wall is of rocks, between which are sinuous paths, appropriately enough leading nowhere in particular, obstructed here and there by a boulder, but allowing convenient access to the plants, and, at one end, running up into a little *colours* lined with Ferns, among which *Adiantum pedatum* proves hardy. At the base of this is a little bog, with *Irises*, *Butomus*, *Pinguiculas*, and such like. At the time of our visit the most prominent plants were the Saxifrages—fine masses of *S. longifolia* and pyramidalis jutting out from the rocks in all directions; *S. lantoscana* stretched its prostrate pyramid of flowers over the borders. Glorious patches of *Sempervivum arachnoideum* and *Laggeri* revelled in the chinks, reminding one of Zermatt. More surprising than this is the profusion of *Ramondia pyrenaica*, a plant which thrives here better than we have seen it elsewhere. The Edelweiss is all over the place, much of it raised from home-grown seed. The curious *Aphyllanthes monspeliaca*, with its Rush-like leaves and blue flowers, was in full bloom—one of the plants which the Floral Committee would pass over, while the Scientific Committee might properly grant it a Botanical Certificate. Carpets of white *Tymnus corsicus*, blue *Veronicas*, and creamy *Dryas*, tufts of *Cypripedium spectabile*, clumps of *Lilies* (partly out), screens of *Sibthorpia* clinging lovingly to the rocks, masses of *Campanulas* such as *pulla*, *trubinata*—let these be taken as samples of what may be seen in this very beautiful and refined rock-garden. On endeavouring to analyse in what its beauty consists, we must yield the first point to its construction (forgetting geological anachronisms for the moment). It is striking without obtrusiveness, well balanced, pleasing to the eye. The next point is the care and judgment that have been exercised in the selection of the plants. Although there is great variety there is no confused medley. There is no straining after effect, by the insertion of bold *Yuccas* here or *Retinosporas* there, none of those devices which a less refined taste would undoubtedly have had resort to. The garden is devoted to alpine and low-growing herbaceous plants. Other things would be intruders, and of the plants that are admitted, although all seem at home and growing freely, there are few signs of that desperate conflict for existence that one often sees in other rock-gardens, where the strong overpower the weak, and the delicate and frail have to give place to the obtrusive and rapacious. To some extent this is no doubt a matter of careful planting and diligent supervision, but while attaching due weight

to these requisites we incline to think that the success at St. Alban's is due to the great care exercised in selecting the right sort of plant. A meadow, even an alpine meadow, is one thing, a natural rock-garden, such as one sees above the level of the alpine meadow, is another. Doubtless there is competition between plant and plant at the higher as at the lower level, but it is less intense. Some plants are not unfairly handicapped, but all seem on more equal terms, and consequently there is less visible predominance of one over another. Every one who has botanised on the Alps will see our meaning, and if they have the good fortune to visit St. Alban's they will, we think, see what has, consciously or unconsciously, been the guiding principle in its construction. Another point. The rockery at St. Alban's appears to us to be a summer rockery—all rockeries are so in a sense—we mean that there seemed a deficiency of autumn-flowering plants to take the place of those now fast passing their prime. But this is a mere impression, perhaps not well founded.

Elsewhere is an avenue of standard shrubs, including some one is delighted to see, so great is the neglect of such things now-a-days. Then there is—wonderful to relate—a ribbon border; the cold season has checked its radiance so far, doubtless it will be resplendent by-and-by. (On the lawn below the mansion (a handsome modern edifice in the Tudor style) is a large geometric flower-bed, not out of place where it is, and doubtless very effective from the windows. Then, as if to show how well such formal geometric gardens ally themselves to architectural lines, there is a short "Nesfield" border running along the base of a long narrow old building with a turret at one end—a charming piece of architectural effect with which the geometric border is, to our thinking, as much in place as it would be out of place in the rock garden. The Rose garden is also formal; it, too, is encircled by mediæval buildings of stone and red brick, and in it are two or three small stoves, containing a small collection of Orchids; but after all, the charm of St. Alban's resides in its rock-garden, and that is unique.

New Garden Plants.

CATASETUM MEDIUM, n. sp.*

A SMALL-FLOWERED *Catasetum*, with a blackish-red peduncle and numerous flowers. Bracts yellowish, ligulate, acute. Sepals and tepals greenish-yellow, with brown transverse bars. Lip yellowish, with red side lacinia. Column yellowish, with purple spots at the base. It is highly remarkable, as by the singular callus under the column it approaches "Myanthus" spinosus, as well as in its fringed lip, its total appearance is that of *Catasetum bicolor*, color. I had it from Mr. W. Bull. *H. G. Rehb. f.*

LÆLIA CANHAMIANA, n. hyl. art.

This looks like an improved *Lælia purpurata*. It might be mistaken for it inadvertently, had it not the rhomboid petals of *Cattleya Mossiae* and the broad undulate anterior part of the lip of the same, and those well known diverging rows of oblique brown stripes on the orange ground at the superior part of the lip. The anterior wavy part of the lip is tinted with such fine dark velvet-purple that you may scarcely find finer in the vegetable kingdom. The margin of the upper part of the lip is white. Sepals and petals lightest rose, as in the old *Lælia purpurata aurea*. Column white with light green on the sides and under the fovea. Pollinia unequal, four being much smaller, as would appear to be characteristic in all males between *Lælia* and *Cattleya*. This *Lælia* is a cross between *Lælia purpurata* and *Cattleya Mossiae*. The plant is thirteen (13) years old, which I cannot find very encouraging for going in for hybridisation. "Flowering bulb 8 inches long, leaf 12 inches long by 2½ wide, flower-sheath 5 inches long and 1½ wide, whereas

* *Catasetum medium*, n. sp.—Affine *Cataseto bicolori*; labello parvo conico saccato retrorso limbo trifido, lacinia laterali sub anticorico triangulari fimbriata, lacinia mediana lineari triangulari medio uterique ligulis filiformis quatuor; callo sub columnæ biansata trifido; lamina mediana ancipiti triangulari; lacinia laterali subquadrata superiore serrata. *H. G. Rehb. f.*

average length of sheath of *Lælia purpurata* is with us 6½ inches, and of *Mossie* 2½ inches." Those are the remarks of Mr. Harry Veitch, who wants the plant named in honour of Mr. Canham, a very ardent and assiduous Orchid grower of the Royal Exotic Nursery. *H. G. Rehb. f.*

DENDROBIUM ARACHNITES, *Rehb.*

This lovely gem has waited a long time from our first knowledge of it up to its flowering in England. It came first from my oldest English correspondent, Mr. Stuart Low, who presented me with a giant dried flower that exceeds in size either of the seven other flowers at hand. It was sent by Mr. Boxall in 1875 to Mr. W. Bull, who sent me a flower and an extract from his correspondent's letter, which said the plant was very rare. Lastly, Mr. F. Sander appeared very pleased with Mr. E. Rimann, a very ardent collector and connoisseur of Dendrobia, for sending living plants, dried flowers, and sketches. The bulbs are rather yellowish honey coloured, neatly stalked, perhaps not so always, as Mr. Rimann's sketch does not represent it. The flowers have broad, linear, blunt equal sepals and petals, and a much broader lip of different shape, sometimes simply ligulate, with basilar angles, sometimes with a very attenuate anterior part. It is convolute. The whole flower is of a very bright cinnamon-red, the veins of the lip being partly covered with a peculiar hue. The average flowers exceed 1 inch in length. Mr. Low's flower is like the father, exceeding the present ones by a half length. Mr. E. Rimann speaks in the highest terms of it, and such a pyramid of cinnamon flowers as he sketched them must be striking. Of the leaves I know nothing. I was lately most agreeably surprised to obtain a fine fresh bulb, and a very good flower from our Orchid Cæsus, Mr. W. Lee. *H. G. Rehb. f.*

TRICHOMANES (HEMIPHILEBIUM) LABIATUM, *Jenman, n. sp.*

Rootstock finely thread-like, dark, dirty-tomentose; fronds scattered, variable in shape, suborbicular and cordate at one or both ends, or subovate and narrowed from the middle each way, 1½–2 lines long, the broader ones as much wide, nearly or quite sessile; margins even and clothed with tufts of stellate hairs; texture membranous, dark green, pellucid, veins fanlike, forked, a distinct midrib only in the fertile fronds; sori confined to the apex, usually 1, rarely 2–4; involucre tubular, free or very shortly sunk; tufts of hair on the margined sides; lips large, expanded and rounded. Herb. Kew. British Guiana, rare on trees at Butrica Grove. The broader fronds have the solitary sori in the sinus at the top, as in Motley, the narrower taper from the middle into it, as in setiferum. Barren ones are in all cases rounded at the top. The marginal tufts of hairs are strong and plentiful in young fronds.

ASPLENUM (DIPLAZIUM) CAMPBELLII, *Jenman, n. sp.*

Rootstocks small, erect, with a few, minute, pale brown, reticulated scales in the centre, which clothe the base of the stipes, the latter caspitate, erect, dark, rather strong, 4–6 inches long, fronds erect, composed of one to two pair of contiguous lateral spreading pinnae and a similar usually slightly larger terminal one, which are lanceolate-acuminate, 3–5 inches long, 1½ inch broad, more rounded than cuneate at the constricted base, and shortly decurrent on the rachis, margins serrated throughout with blunt teeth, texture thin but chartaceous, copiously pellucid, dotted, colour a pale yellowish-green, veins spreading at a wide angle, once forked at the base, and usually again near the margins, sori copious, straight, linear, just short of both midrib and margins, all single or few or several double, involucre very narrow, even-edged. Herb. Kew. British and Dutch Guiana, terrestrial, but growing against the base of saplings in the front. In young plants the fronds are simple, but in all conditions they are fully fertile. Dedicated to the late W. H. Campbell, of Demerara.

STRAWBERRY "THE CAPTAIN."—This, one of Mr. Laxton's raising, has been lately sent to us for an opinion as to its merits. It is a large bluntly conical, good-looking fruit, having moderately prominent yellow seeds. Colour crimson, interiorly pink, and the flesh not solid at the centre. The acidity reminds one of the Elton, but is not so marked as in that variety.

INJURIOUS INSECTS.

MISS E. A. ORMEROD'S eighth annual Report of Observations of Injurious Insects and Common Farm Pests has recently been issued. As in former years, the report treats of injuries to farm and garden crops of all kinds, chiefly from insect agency, though, however, the depredations from the common sparrow come in for a full share of consideration. On this subject, which is one of considerable importance, and one upon which much misunderstanding has arisen, Miss Ormerod is careful to point out, in advocating a wise and careful diminution of the number of birds, the house-sparrow only is intended, and the subject should not in any way be mixed up with the consideration of other small birds. "Nobody," the writer says, "wishes to destroy the small birds broadcast." We should suffer severely if their presence generally was lessened; for instance, there appears to be good reason for considering that the insect presence in 1879 was more than usual, owing in part to the destruction of birds by the cold of the preceding winter, and the cold and wet spring affecting nesting and hatching. On this subject Miss Ormerod quotes the following note from a member of the Committee of Agriculture of the Royal Agricultural and Horticultural Society of South Australia. He says:—"I have been writing lately on the sparrow question, and also to the injury to Australian cultivators done by imported pests. The sparrows here have driven off nearly all our insectivorous birds, which, of course, are small, and have generally soft bills and a timid nature; but the sparrow will eat nothing but seeds while seeds are available; when there are no seeds they will eat fruit; when there are no seeds or fruit they will descend to kitchen vegetables (or zonal Pelargoniums); but if none of the foregoing are to be had, and the dog, the pig, and the cows cannot be robbed, the sparrow will stay his haunter with aphides, or soft grubs, and caterpillars." Miss Ormerod says she has not received from any of her correspondents a single trustworthy observation of sparrows feeding regularly on insects—such indeed is quite exceptional. Mr. Reginald Christie, of Boynton Hall, near Chelmsford, says:—"All other remedies having failed, I am obliged to poison them [the sparrows]. I have examined the contents of a great many at different times, and have invariably found corn and no insects." Another correspondent, writing from Kingsnorth, Kent, says: "As soon as the grains of corn begin to swell and become milky, the sparrows flock to the fields and commit such havoc as alone is enough to make the farmer demand their extermination. It is not what they eat so much as what they destroy that is so annoying."

Lieut.-Colonel Russell, of Stubbers, near Romford, who has paid considerable attention to the habits of the sparrow, says, that of fifty birds of all ages killed one summer, the food in their crops consisted of corn, milky, green, and ripe, and sometimes green Peas; but only two small insects were found in the whole number.

Of the Tipula oleracea, or Daddy Longlegs, Miss Ormerod says, that 1884 has been marked by severe attacks from these grubs. The large number of the flies which had been noticeable in many localities in the previous autumn gave signs of what was to be expected, and the steady course in which the attack came on is worth notice, as this is one of the kinds of attack in which (unless measures are taken to obviate it) the presence of the injurious insect may be pretty surely foretold. Miss Ormerod reports a case which occurred at Stroud in Gloucestershire, where the larvae of a large kind of Tipula was found in the drinking water, and absolutely poured out with the water from the tea-kettle. All the inhabitants of the house had suffered from illness. Besides the presence of the grubs, the water itself was in a very foul state. On investigation it appeared that the water supply had originally been conveyed by pipes from a tank at some distance, and at some time unknown a drinking place had been made for cattle by forming a pool across the course of the pipes, taking up a portion of them so that the water ran into the pool on one side pure and clean, and out at the other dirty and defiled. The pool was noted as being full of duckweed and green slime, and was open to

defilement by cattle standing in it, and the water was reported by the sanitary officer as injurious to the health of those drinking it. A list of the various water-insects which had been carried through the pipes, and which came with the drinking water on turning the tap, was sent to Miss Ormerod. They included dragonfly grubs, as well as grubs of some of the large water beetles. On this case Miss Ormerod makes the following remarks:—"The above observation is of service in turning attention to the need of looking when unaccountable illness occurs as to what may have happened where supply pipes are open, even to possibility of being tampered with, and likewise to note that though marsh Daddy Longlegs grubs and others may do no harm beyond being exceedingly disgusting when appearing from a tea-kettle, yet that the foul mud that suits them, and the dirty weedy water that suits other larvae, are some parents of illness, and the presence of the grubs is a sure sign of something amiss that should be looked to without loss of time."

The entire report is full of interesting matter. It indicates Miss Ormerod's power for work, and her assiduity in carrying out what she puts her hand to.

THE JUNE GARDEN.

"One hour with thee, when burning June Waves her red flag at pitch of noon."

JUNE is the most beautiful month in all the year. There is nothing like it. After years of wavering choice between autumn and the spring,—which might be best,—the decision is made, and the question, in my own mind at least, at rest for ever, on this green June morning. There is nothing else on earth that ever can compare with beautiful, flowery, wonderful June. The colour of the leaves is exquisite, and as perfect is the colour of the shade they cast. After June is past it will be different, since the leaves will no longer then be thinly half-transparent; but now on this glorious 1st of June the sun shines down upon the trees from the front of cloudless blue, and there is no shade; it is all green sunshine under the trees. The green, when many-tinted summer is new, if not so brilliant as autumnal gold and red, is yet sufficiently various to satisfy the eye. The olive-green of young Oak, and Poplar, and Ash, contrasts with the fresher greens of Elm and Lime. I remember an old Somersetshire woman who used to say the woods in June were like a piece of "ladies embroidery work." To-day the hedgerow Elms and lines of distant wood are lustrous. No other word could give so well this wonderful glow of June upon the leaves, and only a poet could have found the word! And then when the sun is down, and the glowing trees are by contrast dim and solemn, and the soft "turr, turring" of the turtle-doves in the Thoro tree in the field is hushed, I know that I shall find the white Irises more shining in their polished whiteness than during all the day, filling the air with perfume. In the garden we have gold as rich as October ever gave; and we have silver which is June's alone. Laburnums rain gold above the golden Broom, and intermix with silvern heaps of White Thorn and silvery Broom. And when did ever autumnal-mellowed Beech, light up the yellow groves with velvet firs so softly red as the young shoots of Copper Beech, which scatter now their spray of rubies and clear jacinth, dropping down between us and the sun? And when did autumn ever burn with such crimson as glow in these scarlet double Thorns, or in the piled-up splendours of Rhododendron, which now illuminate the woods?

The Vews and Yewen hedges have put on a new face, and conceal all trace of gloom beneath young leaves of russet-gold. Yet there is regret and grief this beautiful June morning! I find myself quoting Wordsworth, saying to myself, "There is a change, and I am poor;" for the whole garden is all jubilant with song, but the song that is best is not heard. There is no nightingale this year. We listen and watch in vain. Sometimes some thrush singing notes of unwonted fire and sweetness will for a moment deceive the ear; this has happened once or twice. But when indeed, the nightingale sings, he is never mistaken for a thrush. What, alas! is the mysterious cause of our loss? We are fain to hope it may be the cold winds of May and April, because there are no glowworms, or because there is so little Oak about the place (Oak scrub must this autumn be planted somewhere). Anything is better to believe than the

ugly reason of bird-stealers. Whatever the reason be—

“Such change, and at the very door
Of my fond heart, hath made me poor.”

Of a winter garden it is easy enough to write. But in June—the garden in midsummer! Out of the fulness of it how is choice to be made of one sweet flower for praise more than another? It is a world of surpassing beauty. This morning, in the still shade of a south window, one small petal dropped upon the window-sill from a flowery branch of *Cotoneaster* (Good Neighbour). One is seldom present just at the very moment when a petal falls. The flower may wither or be shaken in the wind, or fall at a touch, and the leaves be scattered. But when both shape and colour are unchanged, and yet the petals drop quietly one by one in some profound calm of a summer dawn or evening twilight, there is pathos in it. The flower is not dead, but her time has come. The flowers of the *Cistus* family, which are now delighting us, quite literally have their day. In the morning there is a mass of bloom; at evening not a single flower remains. The sole trace left is a pick or white or yellow mosaic, where the falling petals have showered down upon the grass or gravel. The difficulty is, to find room enough for *Cistus*. They require some bank or lengths of rock garden to be given up entirely to them. Then there might be a blaze of colour through all the summer, in favourable weather, for they do not like too much rain. In proportion to the brief individual existence of the *Cistus* flowers are their innumerable buds; and they are as costless as they are lovely. A few packets of seed will stock a garden! Once we had the pink Riviera *Cistus* of the large grey-green leaves and exquisite flowers which light up the hills and dusty roadsides like rose coloured lamps alive in broad daylight! Our plants perished in some unusually severe frost. The white *Cistus*, with narrower, more polished, aromatic foliage, is hardier, and seems quite happy here in a south aspect. We have but one old Gum *Cistus*, as fragile, and more wondrously beautiful than all the rest. How the folds and crumples in the satin of her ample petal do but enhance its beauty! It grows on the lawn at the foot of a *Noisette* Rose that now envelops the bare stem of a dead Weeping Ash. The Rose climbed up to the top of the tree and falls over in a great luxuriance of flower and leaf and thorn. Within the thorniest heart of this thorny Rose-thicket a thrush has her nest. I think, in her wisdom, she this time made it just a little too safe. The young thrushes sit full fledged in the nest; I think they dare not tempt the thorns.

As we pass through the south porch the martin from her mad hat over the door skims out into the sunshine. When she begins to sit there will be little time for these wide sweeps of flight, or to idle upon the Rose arches, twittering and preening those long, blue-black wings of hers! On either side the porch there grows a *Lavender* bush and a *Rosemary*. The *Lavender* is failing, as it did last summer. The bud-stalks look quite firm and healthy up to a certain point, and then each head hangs down, and in a little while they look withered and black—as if they were strangled. “Some failure at the root,” is the gardener’s verdict for this and many another unpleasantness in the garden. Is it not mostly “failure at the root” in many of our mistakes outside the garden?—None of the other *Lavender* plants seem affected in the same way, fortunately. Ferns and a fine root of *Turnep* Lily grow at the back of the *Lavender*, and up the porch wall is a young *Banksia* Rose climbing apace, and flowering for the first time. It might to have been yellow, but it has come white. Under the *Rosemary* is a great old conch shell, kept filled with fresh water for the birds. The narrow border that runs along under the Oak-room window is my trouble and my dear delight. I hope nothing will ever lead me to call it a “herbaceous border!” It has become so much the fashion to call everything herbaceous which is not “bedding out,” that the meaning of the word is usually lost sight of, and all kinds of woody perennials are, so it seems to me, included in the “herbaceous border.” The phrase also seems to leave out all the poetry of the garden. Not, I think, more than a dozen or fifteen years old, it dates from the first rage for yellow *Calcæolarias* and *Pyrethrums* and the carpetings, when “herbaceous” things were admitted only somewhere out of the way by surference. May this be the first and last time I have to write “Herba-

ceous.” Under the window a *Cotoneaster* bears good promise of its pink liliupitan Apple crop for the blackbirds in October. And then there is a little wilderness of wood Strawberries. They want to have it all their own way here, and mean to get it. They smother the *Hepaticas*, and choke the *Iris*s, and over-reach the turf verge, and then ground-Ivy stretches along and over the Strawberries, and has to be quickly made an end of. Red wood-Strawberries are ripening for the children, mixed with a few of the yellow-flowered *Fragaria indica*, which berry is very handsome, but so acid as to stay safe enough on its stalk. Neither child nor bird would taste a second time. Italians, with their characteristic gentle fun call it “*Ioganna Donne*.” Vine and Pomegranate and white French *Honeysuckle*, *Clematis* and *Eucrocarpus*, grow up in more or less of wild luxuriance around the window. The Pomegranate never yet has flowered, though her sister plant (since dead) in another part of the garden used to flame with blossom. Were it possible to decide which to like best of all these, one or two at least might attain perfection. It ought perhaps to be the Pomegranate, and a clear place should be made for it. But none of the others can be sacrificed; and indeed I wish for a *Pyraeantha* and a *Ceanothus* (for its blue

pillar. The seed-holders on the four branches support leaves of another shape in ordered pairs, and each pair guards a poisonous-looking flower or seed. First to last there is not a shade of indecision in the mind of any one of these three tall *Euphorbias* [Caper Spruce].

The “*Roman Walk*” in the morning, when shadows fall, is almost picturesque. There are some large clumps of *Sisyrinchium striatum* in profuse bloom; the flower-spikes and Iris-like leaves are most “showy,” contrasting well with the rocks and rounded masses of leaf and flower near them. The little pale yellow flowers, taken singly, may seem rather insignificant, yet there is something moving almost, in their religious attention to the hour which unwritten laws have determined; for even when gathered and kept in water in the house, at a distance from the windows, they shut up just the same, punctual to a minute. Lovely little purple *Licaria reticulata* (aureo-purpurea) scatters itself, self-sown, about the ledges, with the sweet, sad-coloured Night Stock; and I am afraid we tread heavier than need be upon the *Camomile*, spread flatly on the stony walk,—to make it give out all its aroma. The small *Campanula pulsa*’s deep purple bells, and in crevices near *Edelweiss* clothed in grey cottony bloom. It is curious to see the horror which an English dweller in Switzerland feels for this throned queen of alpine flowers! That *Edelweiss*, a name we pronounce almost with reverence, should ever be called “a cockney flower,” seems almost past belief. Yet so it is, and I am sorry, for there had been a certain pride when I thought our plants were finer on the height of the rock-garden than in its lower ranges! There is *Mesembryanthemum* and painted *Portulaca*, a coral *Schizostylis*, a yellow *Sisyrinchium*, and the *Stoncrocus* are coming into bloom. The *Artichoke* rears itself grandly, almost like some grey-leaved giant Fern, on the top ridge of rock, casting a great shadow across the stones.

A broad border—screened from a stray bit of kitchen garden by a battlemented *Arbor vitæ* hedge—has been divided into large squares of favourite plants. There is a square of *Ranunculus*, and this is a disappointment. I believe the flower resents its removal from the old place under the south wall. Our *Ranunculus* used to be small fire-balls of vermilion and gold. Then there is a square of yellow Sweet Sultan, and with it a lovely Lily with sea green silvery leaves. *Pancratium maritimum* is the right name, I believe, but I prefer to call it a Star Lily. There are *Catanans*, and then most delicately beautiful Spanish *Iris*; a large variety. The last square in the border is a blue mass of *Anchusa italica*. The air just there is perfumed with Musk. We let the Musk wander at will all over this *Lorder*. We give it neither care nor culture, and it gives back to us, for nothing, the treasure of its sweetness. With the parterre which lies up the lawn before the dining-room windows, I have little to do. The gardener plans the colours and arrangement of it, and I feel it is in good hands; two centre beds this season appear to me especially happy. They are White Bride *Gladiolus*, mixed with deep red Tuscan Rose, pure white and crimson.

The other long-shaded, narrow parterre we have tried to pattern out like one I saw last summer on a sunny Somersetshire terrace. It was in vandykes of many-coloured *Verbena*; ours is chiefly variegated and scarlet *Pelargonium*, blue *LOBELIAS*, both bronze-leaved and green dwarf *Ageratum*—*Tagetes* for yellow, and *Cerastium tomentosum*, known sometimes as *Summer Snow*. This *Snow* looks very brilliant from a distance, seen through openings in the dark Yew hedge. White is perhaps too much neglected in the ordering of coloured plots; yet in all the best art of old times, in stained glass or Eastern embroideries, it is the white parts that give brilliance to the whole. In the garden, yellow is the trouble. *Calcæolarias* I will not have; I seek vainly some low-growing yellow, the same tone as the little double yellow Rose that is teasing me by blooming high up out of reach by the garden gate. It should have the same effect, only in yellow, as pink *Silene*.

A short time since this *Silene* was used at Cliveden in a way that, once seen, cannot be forgotten. An immense circle of pink lay like a Magic Ring upon the grass. There is a set of jewel-shaped beds on a grand scale, leading up to it on either side. Between the ring and the lofty terrace and the house, there simply lies unrolled about a quarter of a mile of green

FIG. 1.—EFFECT OF SAND-BLAST ON TREE TRUNK. (SEE P. 9.)

&c., to be added; then there come the *Belladonna* Lilies, which will never flower, and a line of stately white Lilies which always bloom well, and just now brilliant *Roses* upon unpruned trees, in gadding wreaths of beauty, stray above the Strawberry leaves, with a sullen glow of yellow and purple *Iris* (*Darius*) between the wreaths. These tall *Iris* defied the over-mastering luxuriance about their roots, while the beautiful “*Versailles*” was discouraged. There is aromatic *Santolina* and *Woodruff* and *Japan Anemone*, all mixed up, and entangled with the wood Strawberries, and the border ends at a pink wall—pink with great hanging bunches of the old China Rose. Right in front, indifferent alike to Strawberries and all the world, are three *Euphorbias*. Of their own good will and choice they grow up here. It would be cruel to uproot them, they stand so firm and grand in their placid self-assertion. I do not love them, but they compel my regard. It has been remarked of them that they are beautiful, from the decision of character they display. From the seed they know how they intend to grow, and they complete their plan. There is the smooth firm stem, straight as a line, in colour emerald washed with amethyst, and the narrow leaves, exactly matched in size, placed with perfect symmetry up the stem till they reach the four-branched seed-holders, proceeding like a branching capital from the top of the green tall

velvet. Beyond the pink ring, dip down in sweetly wooded lines, steep cliffs and banks to level meads and windings of the silver Thames.

June 24.—On this midsummer morn St. John's Wort, under the Elms, is not yet in bloom. Yet I thought as I went over the garden there could not be a more ideal 24th of June.

White and purple Foxglove throng together in stately beauty in the Boccage and Fantaisie, with heads bent in the mid-day sun; but where one slender spike—milk-white or red—rises alone in some shady spot, peering through green Drake Fern, that is better still! I wonder what like was the "lesser dusky Foxglove," observed by Gerard in John Tradescant's garden. Also his "Digitalis ferruginea, with flower the colour of iron." A fine plant of the yellow Swiss Foxglove lives saug and solitary, under a Currant bush in the kitchen garden. It is certainly handsome, but I never know whether to admire it much or not. There is always an uncertainty about the name of Foxglove. In old French it is *Gante nostre dame*; in high Dutch, as in German, Finger-hut. And Roses!—It is Roses, Roses everywhere. A very Pasque della Rose. Never do I remember the garden to be so much of a real Rose garden; and the sweetest Rose of all is that which decks the Sweet Brier hedge. Paul Neron, with all his seven inches across and no scent, is nothing to that little deep-pink Brier Rose! The damask Roses overspreading a corner of the south

deep planting?—seeing that such a system, if followed by young beginners and would-be Melon growers, would in all probability lead to disastrous results. It was simply with a view to preventing disappointment of this kind from occurring that my previous, like these, notes were penned, and not from any desire to disprove the conclusions arrived at by your correspondent, "C. H.," who has failed in his endeavour to show grounds in support of his previously formed conclusions respecting the cause of canker in the stems of Melon plants.

I thought from the tone of "C. H.'s" observations at p. 671 that he had no experience of either Melon canker or of the plants having been set on mounds, but at p. 770 I find that his mind carries him back to an instance of both which occurred twelve years since, and which he cites as much with a view to weakening my case as strengthening his own, but how far he has succeeded in doing either your readers can decide for themselves. "C. H.," in trying to justify his opinion as to Melon canker being the result of a sudden fall of the temperature in the house or at the roots through cold water having been applied thereto or other cause, says that in his experience "canker usually occurs where the stems come in contact with the soil, and not the buried portion, consequently the temperature of the house would affect it;" adding, "and as the sudden fall in the atmosphere would in most cases

healthy when the last crop was cut as they were when the first one (the end of April) was. Your correspondent refers to the effect that too much water at the roots of Calceolaria and Cineraria plants would produce, but says nothing about the like results that potting the said plants too deeply in shifting them out of small pots into larger ones would bring about, though less quickly. In conclusion, I beg to assure "C. H." that I did not for a moment question his ability as a first-rate Melon-grower; indeed, on the contrary, if "C. H." truly represents his name, I believe him to be a good all-round practical gardener, and that it was simply the soundness of his views on the subject under notice, and the conclusions at which he arrived in connection therewith, that I did, and do still, question. H. W. Ward.

PINUS ALBICAULIS, ENGLM.

In volume ix. of this work, pp. 12, 13 (January 5, 1878), an account was given of the effects of the sand-blast (wind-driven sand) in eroding, scoring, and furrowing the hard wood of some of the Conifers that inhabit great elevations in the Sierra Nevada of California; and the account was accompanied by woodcuts that are veritable *fac similes* of the eroded surfaces of two species collected by myself in the autumn of 1877. These were a Juniper and the *Pinus albicaulis*, and fig. 2 is a reproduction of the appearance of the plant of the latter which afforded one of the illustrations, that with the very fine striae.* The tree in question was denuded of the bark for a great extent of the trunk, the scored naked wood being fully exposed. It grew out of a crest of rock, on the bleak stony side of Shasta Butte in Northern California, at an elevation of about 9000 feet, where it was exposed to the force of a wind thickly charged with coarse sand and even with gravel in violent gales. In its ordinary condition *P. albicaulis* forms a small alpine tree 20 to 40 feet high, with the trunk very short and stout, and rather bushy straggling branches. I have seen it only in scattered individuals, never forming forests, and it appears to delight in great elevations, where it becomes dwarfed in height whilst retaining its stoutness of trunk and limbs. The latter in these situations are often gnarled and prostrate, covered with a whitish bark and exceedingly compact wood, the rings of which are difficult to count. The wood is described by Professor Sargent as light, soft, not strong, brittle, close grained, compact, with obscure medullary rays, the colour of the heart-wood is light brown, and of the sap-wood white.

P. albicaulis has a wide range and latitude, from the coast ranges and interior of British Columbia to Southern California, at elevations of 8000 to 10,000 feet, it also extends eastward to the Montana, territory. I found it on Shasta only about and above 9000 feet elevation, and on the Sierra Nevada, always as scattered isolated trees. The rude sketch here given was made on Shasta. Engelmann has latterly reduced it to a variety of *P. flexilis*, which is a Rocky Mountain species, inhabiting lower elevations, and forming small forests, and which does not grow in the mountain ranges where *P. albicaulis* occurs. *J. D. Hooker*. [To render Sir Joseph Hooker's account more complete we reproduce at fig. 1 the illustration of the effect of sand-blast on this tree. ED.]

SEED SOWING, &C., AT SWANLEY.

It may be safely said that in no department of gardening has there been a more real advance than that which has been effected of late years with some of the popular kinds of flowers usually grown annually from seed, such as Chinese Primulas, Cinerarias, Calceolarias, Cyclamens, and Gloxinias. Primulas have always occupied so important a position for winter flowering that almost every one possessed of a greenhouse grew them, yet time was when there were few things caused more vexatious disappointment. A packet of what professed to be good seed would furnish a quantity of plants; but for one decent form grown growing there would be a dozen that produced flowers little if any better than a common Primrose by the hedge side. The result of this, was that to get a sufficient number with presentable flowers, ten

* By inadvertence in the account of these woods, given at vol. ix., p. 13, all three (A, B, C), were attributed to the Juniper, but the central one, B, belongs to *P. albicaulis*.

FIG. 2 — PINUS ALBICAULIS.

wall are an ideal of Rose loveliness. It is worth while to make a good south place for this old Rose; it will soon repay you a hundredfold in delicious beauty. Once more, after nigh two score years, I have the pleasure of smelling a York and Lancaster Rose. Her perfume is divine. And we have a real Black Rose (Empereur de Maroque?), if gathered before the sun has time to burn it, most beautiful, haunting the memory with that old foolish rhyme—

"Rosy in the parlour, Rosy in the hall:
Rosy was a black Rose, better than them all."

As for our old blush Rose age does but increase its charm. E. V. B.

MELON CANKER.

(Continued from p. 770, vol. xxiii.)

PERMIT me to inform "C. H." that I am perfectly well aware that the stems of Melon plants, if carefully planted and subsequently landed-up without being injured in doing so, may be buried a couple of inches in the soil without much fear of their becoming a prey to canker providing that the drainage and after-treatment be good, and that in the application of water to the roots care be taken not to water close to the stems of the plants. Indeed, before I had recourse to setting the plants on mounds, I used to draw a little soil up round about the stems of the individual plants, and made the same firm without pressing the stems, to prevent the lodgment of water thereto. But what advantage does "C. H." claim as resulting from

be accompanied also by a similar fall in the bottom-heat through the heat from the hot-water pipes not affording enough heat, the entire plant would feel the check." I beg to remind "C. H." that because canker in the stems of Melon plants is first visible at the point of contact with the soil it does not follow that the buried portion was not first affected, and that the canker did not afterwards ascend in the stems so far as the latter were surrounded by damp soil. However, assuming for the sake of demonstrating the advisability of planting on mounds, that canker only occurs at the point of contact with the soil, then, I ask, why not set the plants in the manner indicated at p. 703, so that the stems do not come in contact with the soil, and thereby avoid canker? "C. H." is wrong in his conclusions regarding the corresponding fall in the temperature of the house and the soil at the roots, because it does not follow that when the temperature of the house has fallen from 90° at 4 P.M. to 65° or 60° between then and the following mornings, as is frequently the case during the summer months, where no fire-heat is employed for supplying bottom-heat, that the temperature at the roots has consequently fluctuated more than 5°, if so much, during the interval. As a case in point, I may say that, from plants thus grown, but having one 4-inch hot-water-pipe running round the pit for supplying top-heat, I cut five crops of Melons from the same plants in one year (1877, and which fact was recorded in your numbers for August 14 and September 8 of that year), and the plants were quite as vigorous and

times the quantity that were needed had to be grown on to blooming condition. Of the other kinds of plants mentioned, so little dependence could be placed on seedlings that they were mostly propagated from named kinds that possibly stood in the proportion of not more than one in a hundred of the seedlings that were raised. Judicious crossing and careful selection have so far changed all this, that now the strains of the plants instanced are so much improved, that where good seed is obtained a worthless plant is an exception. Messrs. Cannell have taken a prominent part in the advance made in this direction. A sight of the houses when the immense stock of plants grown for seed purposes are in bloom is both interesting and instructive, disclosing the care and labour bestowed to insure the different forms of each kind of plant yielding seed that will come true. Of Primulas there are here a number of forms, sufficiently distinct in the colour and general character of the flowers to make them well worth growing. Amongst red varieties that have recently taken such a prominent position Swanley Red keeps improving year by year, and is remarkable for its vivid ruby colour, with distinct yellow eye, fine habit, profuse blooming disposition, and the increased size of its flowers: many of the plants come with a distinct shade of rose and violet. Swanley Purple is a large-sized flower of an intensely deep shade of purple, the foliage stout and bold. Swanley White, a very fine kind, of excellent habit, producing immense trusses of large pure white flowers. Another white, named The Queen, is a larger grower than the last, of splendid habit, the leaves drooping so as to almost cover the pots. The flowers are the largest I have seen, beautifully frimbriated, with an orange-yellow eye. Princess of Wales, bluish white, a distinct and lovely kind, of excellent habit. Delicata, a Fern-leaved variety, with bluish-coloured flowers. Lilacina, a very distinct Primula, of a clear lilac shade, sometimes striped with red, like a Carnation. Mammoth, an enormous crimson-purple flower. Some of the individual flowers of this kind that I measured were 2½ inches across. Queen of the Stripes, a large-flowered kind, ground colour white, flaked and striped with purple, and sometimes flushed with crimson. In the long houses occupied by Primulas each form is kept in a distinct group by itself. Fertilisation by hand is regularly carried out. The distinct kinds that have been raised here have not, as might be supposed, originated by accident, but are the result of crossing varieties dissimilar in colour and general character. Precautions are taken to prevent accidental crossing; the doors and every opening by which air is admitted are guarded by close netting, so that flies and bees cannot get through.

CINERARIAS

are in immense quantities, dwarf and robust in habit, and bear big compact heads of bloom in innumerable shades of colour, the individual flowers being of enormous size, many running from 2½ to 2½ inches across. These, like the Primulas, are each variety kept in groups by themselves. Exceptionally fine varieties that from time to time make their appearance—such, for instance, as Victory, March Past, and others—are propagated in quantity from suckers or grown on for producing seed. Like care is here taken to exclude everything in the form of a winged insect that could carry pollen from one plant to the other.

CALCEOLARIAS.

With these selection and rejection have been carried out until the stock appears to have a fixed uniformly dwarf robust habit, every plant being in this respect a counterpart of its neighbour. They fill one of the long houses. The plants are grown in larger pots than usually employed with plants for seed: 9 or 10 inches are used; this, with liberal feeding admits of their getting a large size, showing their true character. Self-coloured varieties, from yellow, through the various shades of red, to the deepest crimson, receive equal attention with the spotted flowers.

CYCLAMENS.

Of these a very large stock is grown for seed. The seed is sown in July for blooming in the spring but one afterwards. Here again each colour is kept separate. The strain collectively is unexceptionable, the plants having stout foliage, and producing a profusion of full-sized flowers in all shades from pure white to blackish-purple. Hand fertilisation is with these plants also carried out daily when there is sufficient sun to dry the atmosphere, the flowers on each

plant receiving a good shaking with a thin pliable stick.

Those who have seen the wonderful plants of double Primula exhibited by Messrs. Cannell, will not require to be told of the extraordinary cultivation brought to bear on them. The old white and frimbriated white still stand unequalled for their general usefulness, especially for cutting. A very large number of these are grown in all sizes, from small trade plants up to the largest specimens. Gilbert's seedlings are also grown in quantity; here, as elsewhere, they sport in all directions: Marchioness of Exeter and Earl of Beaconsfield appear to be the best.

BEGONIAS.

Amongst flowering plants grown here that keep on blooming continuously through the winter and spring, the following were conspicuous:—Of Begonias, which are a feature at Swanley, may be named the old *B. midda*, with its spikes of silver-blush flowers, still one of the best; *B. semperlorens alba*, one of the finest of all white flowering kinds; *B. semperlorens gigantea*, one of Lemoine's seedlings, flowers carmine; *B. semperlorens rubra*, flowers white, edged with red; *B. Digswelliana*, a compact habit kind yielding an abundance of flowers of a soft pink colour; *B. Saundersi* and *B. Ingrami*, the last the largest flower, both bright crimson. The old *B. fuchsoides*, when well managed, is not only one of the finest bloomers, but its bright coloured flowers and neat foliage give it a highly decorative appearance in spring. Of newer kinds, *B. Carrieri* is one of the most desirable that has ever been introduced, it is a hybrid between *B. semperlorens* and *B. Schmidtii*; the flowers, pure white, a little inferior in size to *B. semperlorens*, are borne in quantities.

WINTER FLOWERING CARNATIONS.

Amongst these, now so deservedly popular, the undermentioned were the most attractive:—The Moor, dark crimson; Marie Nague, pure white, lightly tipped with scarlet; Mrs. George Hawtree, a fine yellow; Andalusia, yellow petals, fringed; Avalanche, flowers large, white, edged with purple; Petunia, base of petals pale flesh, rose-purple at the extremities; Alegateira, still one of the best reds; Miss Jolliffe, another old variety, unsurpassed in its colour. Another good old winter ad spring blooming plant, now very seldom seen, is *Browallia Jamesoni*; it is grown in the form of small standards; its uncommon-looking orange-red flowers are produced freely from every bit of growth it makes. *T. B.*

ORCHIDS FOR AMATEURS.

(Continued from p. 820, vol. xliii.)

THE second type of *Cattleya* consists of a single species, *C. chocoensis*. The general appearance of this plant is like those of the *Labiata* section, but the flowers are not so open and have a campanulate form. The petals have more substance than in the *Labiata* type, and are often pure white; some varieties have a delicate rose tint, sometimes rayed with carmine. The labellum is either white, or more usually more or less coloured with rose or violet on the limb, with a citron-yellow spot in the form of an anchor in the throat. It flowers in the winter, and is a native of New Grenada.

The third group of *Cattleyas* is very distinct from the *Labiata* section; the pseudobulbs are long and cylindrical, and surmounted by two or three coriaceous leaves. The flowers are thick and fleshy, and form large racemes. The petals and sepals are of a rich orange-green or brown, marked with chocolate or crimson spots; the labellum is three-lobed, and entirely encloses the column. They form the

CATTLEYA FORBESII SECTION.

Cattleya Forbesii.—This plant has been made the type of the section, but it is less beautiful than the nearly allied form, *Cattleya granulosa*, which it resembles very closely. It is a native of Brazil. The flowers are yellowish-green with a yellow or white labellum, rayed and spotted with crimson on its middle lobe.

C. granulosa.—A native of the hottest parts of Bahia and Guatemala. It has long, narrow, upright pseudobulbs, about 1 foot to 15 inches long, knotted and channeled, partially covered with white glistening membranous sheaths, with two horizontal coriaceous leaves at their summit. The flowers are faintly fragrant, 2 to 3 inches in diameter, and six or eight on each spike. The sepals and petals are of an olive-green, with a few blood-red spots scattered over them; the labellum is fleshy, three-lobed; the lateral lobes, folded upwards over the column, are pure

white; the middle lobe is deeply cleft and dilated into two round lobes with toothed borders; these lobes are folded fanwise, and speckled with dots of bright crimson. The interior of the lip is yellow. It flowers in autumn and winter.

C. guttata is merely a variety of *C. granulosa*, with the middle lobe of the labellum of a uniform purple tint. It is remarkable for the number of flowers on each spike.

C. guttata Leopoldi, sometimes called *C. Leopoldi*, is a large variety of *guttata* with rich brownish-green flowers marked with spots of deep magenta and having a metallic lustre. It is very floriferous and fragrant.

C. anethystoglossa is also a mere variety of *granulosa*, with a deep carmine lip and pale rose-coloured sepals and petals spotted with small crimson spots arranged in rows. It is a very variable plant like all those included in the section, some have comparatively poor flowers.

C. Intola or sulphurea is a small variety of *granulosa*, probably a cross between it and some single-leaved species. It usually has only one leaf to each bulb. The flowers are small, and of a pale citron-yellow colour. It flowers in winter, and is a native of Brazil.

A distinct species, with numerous varieties closely allied to the preceding, but of smaller size than any except the last, is called *C. Loddigii*. It has lilac flowers with a yellow throat to the labellum.

C. Harrisoniana appears to be a maritime variety of *C. Loddigii* with rose coloured flowers; a violet variety is also known.

C. intermedia is another variety of Loddigii, but differs in having violet in the throat of the labellum instead of yellow; it is not considered nearly as good as the last.

All the plants included in this section come from the hottest regions of South America, grow in the full glare of the tropical sun, and pass through a very severe resting period, which is described by Humboldt in the following graphic terms:—"Then beneath the vertical rays of the bright and cloudless sun of the tropics, the parched soil cracks and bursts as if rent asunder by a mighty earthquake; and if at such a time two opposite and conflicting currents of air, moving in rapid gyrations, come into contact with the earth, a singular spectacle presents itself: funnel-shaped clouds of sand rise from the earth, sweeping on like the rushing waterspout which strikes such terror into the heart of the mariner. A dim sallow light gleams from the lowering sky over the dreary plain. The hot and dusty earth forms a cloudy veil which shrouds the heavens and increases the stifling oppression of the atmosphere. (In the middle of the sand cloud the thermometer stood for several minutes together at 111° Fahr. The dry sand in the village of San Fernando de Apure had a temperature of 126° Fahr.) The trees all lose their leaves, and every particle of vegetation is dried up, the pseudobulbs and leaves of the Orchids are shrivelled and desiccated. The first rains, however, bring about a total transformation; vegetation everywhere bursts forth, and in a few days the blossom buds of the *Cattleyas* break from their sheaths.

Experience tells us, however, that in cultivation such severe desiccation is undesirable—at least, that is the opinion of most growers, although severe and forced rest is absolutely necessary, or new shoots will appear after the formation of the flower-sheaths, and no flowers will reward the cultivator.

The maritime varieties are subject to less severe drought, but they are often found almost within the reach of the salt spray. I have found that a pinch of salt in a gallon of water agrees well with *C. Harrisoniana*, and I believe its natural habitat indicates such treatment. I hope to recur to this subject on a future occasion, when a longer experience in its use has enabled me to compare the condition of plants which have been so treated with those in which no salt has been given, and also when I have been able to note the effect of an increased quantity upon my plants.

C. guttata certainly needs a considerable supply of nitrogenous material, and flourishes well if guano water, of the strength already noted, is freely supplied. It is known to be a plant which feeds greedily by its roots. My own belief is that all the *Cattleyas* with cylindrical pseudobulbs require much sun and air to bring them to perfection. A close moist atmosphere does not agree with them, and the period of rest needs to be more severe than in those with ovoid bulbs.

CATTLEYA ALCANDIE SECTION.

The form of the labellum in this group is remarkable, the lateral lobes are very large and not folded over the column as in *Cattleya Forbesii*, but are flattened out. The terminal lobe is deeply cleft and very broad.

Cattleya Alcandii is the type form; the pseudobulbs are clavate, dilated towards their summits, with two or three short almost round leaves. The flowers are usually solitary, more rarely in pairs, nearly 3 inches in diameter, of a pale green, strongly

marked with intense chocolate-brown, inclining to purple, with a more or less metallic lustre. The lateral lobes of the labelium are white. The terminal lobe is white, veined with rose, and marked with median and longitudinal striae of a violet-purple colour, not unlike that of *Lesliea purpurata*. The column is very large and flattened. It is certainly one of the most beautiful and remarkable flowers in the genus *Cattleya*. The perfume is aromatic, and has been compared with the odour of pepper. A variety deliciously perfumed, with gigantic flowers, is known as *C. Aclandia grandiflora*. It grows near the sea, and is a native of Bahia.

Cattleya bicolor.—This plant also belongs to the *C. Accladioid* group; it has long slender pseudobulbs, often 2 feet in length, which bear a scape of eight or ten flowers. The sepals and petals are pale green, with bistre-coloured spots, and the labelium is of a rich purple colour. It is a native of Brazil; it appears also to be essentially a maritime plant. *B. T. L.*

(To be continued.)

ASCENT OF MOUNT TORLESSE.

MOUNT Torlesse being the nearest or, at any rate, the easiest attainable mountain to Christchurch, offers to the botanist or geologist a most interesting ground for collecting specimens. Hence to me it has always been a tempting goal for the holidays. Although not by any means to be considered a first-class ascent in a mountainous country like New Zealand, Mount Torlesse is nevertheless 6400 feet high, or twice the height of the principal peak in England—Scawfell—which I several times ascended when a boy. The mountain forms a gigantic mass of schistose rock, extending from the Waimakariri Gorge to Porter's Pass, and has two peaks reaching the height above-mentioned. Leaving the train at Springfield one windy day in January, I walked from that pleasant township to the top of Porter's Pass, 3160 feet above the sea, and the highest point on the West Coast road. Being provided with a small tent and the necessary kit, I camped for the night in a gully some 500 feet higher up the mountain.

On the following morning I commenced the ascent at five o'clock, the early hour being selected from an impression that a nor'-wester was brewing, and, unfortunately, my prognostications proved correct, and my investigations were much interfered with by the wind, of which those who have only experienced the half-tamed nor'-wester felt in the streets of the city can have but a faint idea. In ascending the mountain, one is struck by the apparently barren nature of the surface, which consists of large areas of rolling, ever-moving *débri*s, alternating with narrow strips of low shrubs interspersed with beautiful herbaceous plants.

The shrubs are principally species of *Veronica*, *Snowberries*, two alpine kinds of *Tutu*, one or two small mountain *Conifers*, and several kinds of *Neineis* (*Dracophyllum*). In an angle of the mountain a few trees of *Fagus solandri*, the *White Beech* of the settlers, have found a home, and formed a miniature hanging forest crowded with the usual shrubby sub-alpine vegetation, the ground and rocks being clothed with *Filmy Ferns*. The grassy strips and moister parts of the mountain are clothed with immense numbers of the larger kinds of mountain *Daisies* or *Cotton plants* (*Celmisia*), which at the time of my visit were in full bloom and covered the ground with their pure white *Chrysanthemum*-like flowers. No fewer than ten species of these fine plants were collected, one of them (*C. Haastii*) being very rare, and not previously obtained on Mount Torlesse. Altogether about 150 sorts of plants were obtained on the grassy slopes, and about fifty more on the rocks and shingle slips. To give the names of these would only weary the unscientific reader, but a few of the more interesting will be mentioned. Although the shingle slips look so barren to the eye at first, a close examination reveals the existence of many plants peculiarly adapted for living in such places. Many partake of the fleshy habit of succulents, although belonging to genera quite distinct from the succulent plants of other countries; thus there is a fleshy *Trobia*, numerous fleshy-leaved plants of the *Carrot* tribe, a fleshy-leaved *Buttercup* (*Ranunculus Haastii*), and many others.

Climbing these masses of loose *débri*s, which rest on a bed of rock at a very acute angle, and cover the greater part of the mountain, is rather fatiguing work, as the feet often slip back a foot or so at every step. But the botanist is repaid by the harvest of plants found only on such places in this colony, and in no

other country in the world. The vegetation of the New Zealand Alps is quite unique, almost every plant being confined to the colony. Thus a rich harvest was reaped by Dr. Haast and Dr. Sinclair on their first explorations of these mountains, and Dr. Haast tells us that on his first visit to Mount Torlesse, now twenty years ago, he collected over thirty plants new to science. Of course now-a-days the case is different, scarcely anything new is to be found, but there is plenty of work to be done in working out the relationships of certain plants of doubtful position, and in determining the altitudinal range of the species.

My object on the present occasion was to study the native grasses in their wild state, and to obtain fresh specimens of what are called by the curious name of *Vegetable Sheep*, in order to determine their botanical relationships more definitely than has been done hitherto. In both these objects I was perfectly successful, obtaining an excellent series of rare alpine grasses and excellent specimens of both kinds of *Vegetable Sheep* in perfect condition. These are most singular plants, belonging to the *Cudweed* tribe, and which have hitherto been placed in the genus *Raoulia*. They grow on loose *débri*s at 4500 feet to 6000 feet altitude, and form round or kidney-shaped patches like immense cushions, some of them as much as 8 feet across and 3 feet high. In one species the cushion is snow-white, in the other silvery-grey, and in both is formed of a dense mass of leafy branches, so closely packed together that a chisel can be thrust into the mass only with considerable difficulty. The flowers are so very small that their parts cannot be distinctly seen without a microscope, but in one species they exhale a delicious perfume. Owing to the peculiar shape and appearance of these plants they were, in the early days of settlement, sometimes mistaken for sheep by the shepherds, and hence the name.

After hours of hard climbing, scrambling over rocks and up shingle slips, enlivened at short intervals by the discovery of some rare or beautiful plant, which of course was duly transferred to the vasculum or tin box slung over my shoulder, I reached the top at noon, and, owing to the clearness of the atmosphere, a fine panorama met my view. The whole Canterbury Plain was spread out at my feet, with the Port Hills and Lake Ellesmere in the east, whilst westwards Mounts Kollerton and Franklin shut out the view of the sea. Southwards the greater part of the Upper Rakaia Valley was visible, with the angular mass of Mount Cook in the extreme distance. The scene well repaid the trouble of climbing, and the pure mountain air was a most acceptable change from the close atmosphere of the lower plains.

The descent of the mountain is very easy, though a trifle dangerous. In order to get down quickly it is only necessary to sit down on a shingle slip, set your heels moving, and away you go at a pace far exceeding at times the average speed of a New Zealand express train. It is necessary to see that you are not going in the direction of a precipice, and to keep a good look-out for the small boulders which sometimes follow in your wake, and that is all the danger, unless, indeed, you attempt to stop too suddenly, in which case your nervous system is apt to receive a shock not forgotten in a hurry. In this kind of mountaineering the alpenstock, or some good substitute, is very useful. By the aid of a few of these shingle slides the bottom is reached in an hour and a half, or sometimes less.

One striking feature of the mountain is the paucity of animal life. *Wekas* are fairly numerous still, and as mischievous as ever. A few stone chats were to be seen on the lower slopes, and these were all the birds observed except a pair of rock wrens (*Neenicus Giiiventris*), which were hopping about on some boulders far up the mountain. This bird has peculiar large feet, evidently adapted to life among loose rocks. When frightened, it does not fly away, but hides among the rocks. The pair I saw were singularly tame for their kind, and performed some amusing antics apparently for each other's amusement. On the way down I found large quantities of the rare mountain shield fern, *Polystichum cystogostegium*, which grows in snow runnels, and forms compact green masses of soft-textured fronds with curious bladderly fruit. A lovely yellow flowered species of *Forget-me-not* also rewarded my search; it is probably the finest of the family, and will no doubt become a great favourite in gardens. It is strange that Mount Torlesse is not more visited by tourists, as the view

from the top is so fine, and the exercise of climbing very healthful.

Lake Lyndon, a fine sheet of water, and the highest lake in the province, lies at the western foot of Porter's Pass, and affords some shooting and fishing, with capital camping ground on its banks. The whole can be easily reached the first day from Christchurch, and may some day become a popular resort. "*Littleton Times*," *New Zealand*.

RHODODENDRONS IN DRY SOILS.

THE present race of hardy *Rhododendrons* hold undisputed possession of the first place amongst outdoor flowering shrubs. The endless variety in the colours, shades, and markings of the flowers of the numbers of fine varieties now existent, combined with their profuse blooming disposition, leave little to be desired. Even when not in flower their handsome dense glossy foliage renders them second to none of the evergreens in cultivation for their leaves alone. Consequently it is no wonder that all who are located where the character of the soil is naturally such as suited to them or admits of being made suitable, give them the first position in their planting arrangements. As to the nature of the soil *Rhododendrons* like best it goes without saying that peat is the material before all others which they prefer. It used to be thought that they would not succeed without it, and on the strength of such supposition, where soil of this nature is scarce, much trouble and expense has often been incurred in procuring it. One thing, about which there can be no question, is that these shrubs cannot thrive where there is a deficiency of moisture within reach of their roots. The moisture-holding property of peat has a good deal to do with the liking these plants show for it, independent of the natural food elements suited to their wants which it contains. A cool bottom is what they like, such as is present where the subsoil is composed of clay, which as a matter of course does not admit of the water passing except slowly through it. Where such is present, and where in addition the upper soil within reach of their roots is alike of a nature that admits of its holding moisture, there *Rhododendrons* are to be seen in their best form. Where the opposite of this exists both as regards the top and under stratum—that is, where in addition to the surface being of a light nature it rests on gravel or sand—something requires to be added if *Rhododendrons* are expected to succeed. Those who have had anything much to do with the plants under notice are no doubt aware that where peat is scarce clay can be made to do duty in the place of peat. Yet this is evidently not so generally known as it might be, and in many cases where clay is used the way it is applied is such as to preclude the possibility of its being of much benefit to the plants. Clay when fresh dug, and in its crude raw condition, is totally unsuited to the roots of any plant, being too adhesive for them to enter it; whenever used, it should, before being dug in, be allowed to lie on the surface until it is pulverised—a state to which it is soon reduced either in winter or summer; in the former by the action of frost, in the latter by the drying influence of the sun, followed by rain; either way it crumbles down so as to admit of its being evenly incorporated with the soil, and helping it to hold moisture, and in this condition the particles of the clay are in a state to invite the roots to enter them, which they do freely. In light dry soil, where a selection of good *Rhododendrons* was to be planted, I have worked in as much as 8 or 10 inches of clay. The ground was prepared during summer for planting in autumn; half the quantity was laid on first; as soon as fit it was dug in, and a second application followed. Where so much as this is given, if put on at once it is difficult to get in condition. In place of letting the clay have time to thus become fully disintegrated, it is not unfrequently dug in at once, simply chopping it in pieces with the spade, in which state it is little capable of holding moisture, besides being impervious to the roots. I have seen ground where raw clay without stint had been added for *Rhododendrons*, and which, after lying several years, was little altered in condition; the square lumps as left by the spade had kept intact, the roots refusing to enter them.

In parts of the kingdom where the rainfall is light and the subsoil is such as not capable of retaining enough moisture, however liberal the addition of

clay or peat may be, it often becomes necessary to water freely in dry spells during the growing season.

Where large breadths of *Rhododendrons* are grown, the labour involved often precludes the possibility of this being done unless special provision in the shape of hydrants and hose-pipes is made. But where the natural soil is of a character to require additions, such as instance, it is better to keep the quantity grown within limits that will admit of their receiving the attention they need. There are no plants existent that better deserve to have all they require than *Rhododendrons*; but, the young shoots flagging day after day, as may often be seen in dry summer weather, is the certain forerunner of a thin crop of flowers the year following, and a sickly condition of the plants. One of the most common mistakes made in preparing the beds for these, and other things, in dry districts, is rounding them up in the middle in place of making them flat. By this means half the rain that falls runs off to the sides instead of soaking equally in over the whole surface. The advantage of picking the flower-heads off as soon as faded, before seed formation takes place, is sufficiently known, but far from being generally acted upon. *T. B.*

PROFITABLE FRUIT CULTURE.

MR. WATKINS, a practical fruit grower, in a paper read before the members of the Herefordshire Chamber of Agriculture, cited two successful cases of Apple growing last season that came under his own notice. In one case a small orchard of about three acres was recently planted with standard Apple trees of good sorts for table and kitchen use. The trees were properly cared for and managed, and as some sorts were found to be growing too freely they were root-pruned. The result was a magnificent crop of fruit last season, which realised about £16 per acre after paying all expenses.

In the other case an orchard was placed in Mr. Watkins' hands. The trees were a mixture of culinary, dessert, and cider Apples, a few of the sorts being inferior; but care was taken in picking and selection, and there was a profit of £15 an acre. In both cases grass was grown in the orchards, and paid the rent. On the other hand, he said, there were hundreds of acres of orchards in the county that barely paid the rent, but only because the trees were mostly of inferior sorts, not fit for cider or any other purpose.

Many more than the 188,000 acres of land under fruit in the United Kingdom might be similarly employed if tenants had proper security for their capital, and if varieties suitable to the climate and soil of the district were selected. All sorts of small Apples must be discarded by those who grow for profit—such sorts as Court of Wick, Golden Harvey, Old Golden Russet, Downton Pippin, Pearson's Plate, Sam Young, and many others.

The following are a few of the varieties which succeed in most soils, and should be extensively planted:—Yorkshire Beauty, Keswick Codlin, and Echlville Seedling for early culinary Apples; Beauty of Kent, Warner's King, Mère de Ménage, Hambleton Deux Ans, Blenheim Orange, and Dumelow's Seedling for mid-season and late culinary supply; Devonshire Quarrenden, Duchess of Oldenburg, and Worcester Pearmain for early dessert Apples; King of the Pippins (also called Prince's Pippin), Seek-no-Further, Cox's Orange Pippin, Duke of Devonshire, and Devonshire Pearmain for mid-season and late dessert Apples; and Cherry Pearmain, Cowarne Red, Forest Styrre, and Kingston Black for cider.

In an exposed situation plant rather thickly, say 18 feet to 20 feet apart; but if you have a sheltered situation, with a good deep and generous soil, give the trees plenty of room—30 feet or more. Apple or Pear trees may be planted alternately with Plums; the Plum tree is a much shorter-lived tree than the Apple or Pear, and comes into bearing sooner, thus bringing in a return till the other trees get fairly grown. A strong grower and a small grower may be placed alternately each way. Yet another plan is to plant them in hexagonal form instead of square; that is, instead of the trees being exactly opposite each other in adjoining rows, they are midway, thus giving more room to each individual tree without increasing the distance between or in the rows.

In filling up old orchards never plant in the old holes; it is better to get the trees planted irregularly

than to do this. Deep digging is essential in planting; but the trees should not be put in too deeply.

The want of care in picking and packing the fruit is a frequent cause of loss. Mr. Watkins prefers autumn planting, except in cold wet soils, where he would plant in spring, not later than March.

POLEMONIUM CONFERTUM.

THIS is probably the most beautiful species of the genus. It is a native of the Rocky Mountains of Colorado, and of the Californian Sierras. It is of dwarf habit, more or less densely covered with Musk-scented glandular pubescence, with linear pinnated leaves, the pinnæ very numerous, and overlapping, roundish-oval to linear-oblong. The flowers are clustered on the ends of the stalks, rich blue, funnel-shaped, about half an inch across, and have three ovules in each cell of the ovary. The specimen

FIG. 3.—POLEMONIUM CONFERTUM.

from which our figure (fig. 3) was taken was grown in the garden of E. G. Loder, Esq., of Floore, Weedon.

Orchid Notes and Growings.

CATLEYA MOSSIE (WHITE VARIETY).

A SUPERB form of this is now in flower with H. M. Pollett, Esq., at Fernside, Bickley, who seems to have a happy knack of acquiring good things and growing them to perfection. The variety in question has soft white sepals and petals of fine substance. The labellum is of great beauty, the throat being veined with mauve, merging into dark orange, showing the white veins, which also run into the pale mauve tint which fronts the orange, the whole of the lip being edged with a handsome pure white fringe, half an inch in width. It is one of the very best of white Mossies, and some idea of the massive appearance of its flowers may be formed when we consider that actual measurement proves each petal to be

4 inches in length and 3 in width, every point of the flower coming into a perfect circle. *Phalaenopsis Mariei* and several phenomenal *Odontoglossums* have just flowered with Mr. Pollett, whose collection always has an extraordinary proportion of fine things in bloom. *J. O'R.*

ODONTOGLOSSUM CRISPUM.

Baron Schroder has most kindly sent me, as my share of the Conference Exhibition, three varieties of this protean plant. I think if any varieties deserved to be picked out, at least two of these have the greatest claim. As to my private taste, I admire, as much I can admire a plant, the one I have called *elegantissima*, for the chaste nobility of its colours. As is the general rule with Baron Schroder's consignments, these came fresh and richly represented, and unusually well packed—the flowers in the thinnest paper, then in cotton—so that they did not come out of the box woolly as lambs.

1a. *Sanderiana*.—This has both sepals and side petals very broad. Sepals nearly covered by the finest mauve-purple, with very narrow white borders, and one or two small white included areas. Lip with some large spots of the same colour. Column yellow, with purple below the top. Wings of column exceedingly variable. I gladly adopt the name, which would appear to have been given at the Orchid Conference in honour of Mr. F. Sander. It is the highest development of *crispum fastuosum* I ever saw.

2b. *Ballantyni*.—This has the sepals nearly covered with a grand bluish of a very fine colour. I nearly imitated it by adding sepia-brown to cinnamon. Petals nearly high and angled, with one or several similar spots, but showing far more white, producing a very good contrast. There were some similar but smaller spots on the lip and apex of the column. It is light yellow at the base of the column and at the base and anterior part of the disc of the lip, and at last place exceedingly light.

No. 3 is *elegantissima*, a *crispum Alexandræ guttatum*, with an unusually broad lip and some mauve at the apex and base. *H. G. Rehb. f.*

CALANTHES AND THEIR CULTURE.

Such varieties as *C. Veitchii*, *C. superba*, &c., when in bloom, are very generally acknowledged to be exceedingly decorative, and for early winter blooming they have few to equal them for usefulness. The bloom-spikes reach in perfection a long time when used in the living-room, as pot plants in vases, &c., and the flowers are equally good as cut bloom, for which they are very suitable if kept in the warmest part of the conservatory, and kept free from draughts of cold air, and given but little water; they are, therefore, most convenient plants for the decorative gardener to have on that account. I grow about seven pots in three sizes, viz., 6-inch, 7-inch, and 8-inch pots, three bulbs in each pot. I select the largest bulbs for the largest pots, and with the following treatment they bloom about the middle of October, bearing spikes of flowers 2½ to 3 feet in length, and at that season, when good flowers are usually very scarce, they are very effective. I keep up the supply of them till January, and they can be kept much longer if required.

About the middle of March I pot them into the three sized pots as above-mentioned. The compost to be used may consist of half good fibrous loam, one-fourth turfy peat, and one-fourth of dry cowdung, well mixed, with a little broken charcoal. The cowdung should be thoroughly dried either in the sun or on the hot-water pipes till it is quite hard, when it should be broken into pieces about the size of Walnuts, and mixed up with the other materials. The pots should be well drained, and the soil should be firmly pressed round each bulb when potted. The most suitable place for them to stand is on shelves in the front of the fruiting Pine stove, where they are kept till the flower-spikes are seen, about the middle of October; and as they come into flower they are removed into the plant-stove and drawing-rooms and conservatory. Many of my plants have now leaves on them 18 inches and 2 feet long, which require very great care and attention to keep them on through the flowering season. The temperature most suitable for them is 75° to 80° by day, and 70° by night, and placed on a light, airy shelf, shaded from the sun, during the daytime. I syringe them daily in April, May, and June, but not after that time, but keep the leaves dry. They have air every day.

As soon as the plants have done blooming I take them back to the Pine stove, and pack the pots away under the shelf, putting the pots on their sides. They can remain there till potting-time comes again, when the bulbs will have begun to throw out young shoots at the sides, indicating that it is time to recommence operations. I shake all the old soil from the bulbs at repotting, and sink the bulbs to half their length in the soil.

Propagation is very easily accomplished, as the bulbs or pseudobulbs, when they are dry and ripe, shed the top of the bulbs, which will strike freely, and make new plants if potted in the same soil as recommended for the older bulbs. *Wm. Smythe, The Gardens, Basing Park, Alton.*

BURMESE DENDROBES.

In the new edition of Mason's *Enuma* we find the following notes from the Rev. C. Paris concerning *D. Dalhousieanum*, *D. calceolaria*, *D. moschatum*, and *D. fimbriatum*.—"Of the four species here described, *D. Dalhousieanum* and *D. calceolaria* have creamy-white flowers tinged with rose. *D. moschatum* and *D. fimbriatum* have yellow flowers. *D. Dalhousieanum* may always be infallibly distinguished by the purple lines on the first season's stems, whereas those of *D. calceolaria* are stippled and not striped. As the stems of *D. moschatum*, however, are also stippled, I know no mark whereby to distinguish this species from *D. calceolaria* when out of flower. When in flower the colour alone (yellow) is sufficient mark. *D. fimbriatum* may at all times be distinguished from the other three, both by the absence of all special marking, and by the circumstance that its stems (according to my experience) invariably taper at both ends, being stoutest in the middle. All four are beautiful Orchids, but *D. Dalhousieanum* bears the palm. I may add, that *D. moschatum* and *D. calceolaria* smell strongly of Rhubarb, the other two do not. They are all abundant in the ten Asserim Provinces, except *D. calceolaria*, which I never found but once."

BUCHAN HILL, CRAWLEY.

Our illustration (fig. 4) represents a group of garden erections which have recently been built by Messrs. H. Ormsom & Co., of Chelsea, horticultural builders, for P. Saillard, Esq. These houses form a rectangular parallelogram at the northern side of the kitchen garden, from which they are separated by a fence or espalier of fruit trees. The conical-roofed structure in the left-hand corner is a reservoir for water, the tank being overhead, so as to obtain sufficient force to carry the water to any point in the houses and gardens. The building in the opposite corner is a plant-house, near it being the stove-hole and boiler-house, containing the two Trentham boilers with which the houses are heated.

The northernmost range consists of a span-roofed greenhouse in the centre, flanked on one side by two vineries, an early and a Muscat-house, and on the other by a late vinery, the end divisions of the range being Peach-houses. The central path divides a span-roofed plant stove from a greenhouse of the same external construction. The span house to the right of the group is intended for a late vinery, and that to the left for the culture of Roses. These four span-roofed houses measure each 60 feet in length by 20 feet in breadth. The smaller erections lying between these are pits, to be used for a variety of useful purposes, as propagating, Melon and Cucumber growing, for Pine-apples fruiting and succession, Gardenias, &c. Each is 30 feet long and 14 feet wide.

The long rows of pits on the south side of the block comprise two warm ones and two cold ones, 88 feet long by 6 feet 6 inches wide—capital adjuncts for vegetable forcing. The whole is surrounded by a brick wall, on which it is intended to grow fruit trees. In the construction, the best Pitch Pine has been employed, and every useful modern appliance in venting has been adopted.

TREE LUPINES.—These are plants common enough in gardens some twenty years ago, but now rarely seen. At Mr. Barr's nursery at Tooting great bushes of them are to be found 7 feet in height, perfectly loaded with their short spikes of primrose, light blue, and white. They are well adapted for shrubby borders and the like places.

FIG. 4.—NEW HOUSES AT BUCHAN HILL, CRAWLEY.

FRUIT TREES IN BOKHARA.

THE first thing that struck me, says the Rev. Dr. Lonsdell in his recently published work on Central Asia, was the enormous size of the Apricot trees, standing like avenues of old English Pear trees, from 30 to 40 feet high, whilst in circumference the first I measured was 3 feet 10 inches, and the next 5 feet 3 inches, the latter being about four years old.

The wood is good for fuel only, but the Bek of Shahr had told me they often grow so many Apricots that they do not trouble to gather them. They have three sorts in Bokhara, the earliest being ripe towards the middle of June. A second kind, white, is obtained by grafting, one peculiarity in the process being that the scion is first dipped into a bowl of fresh cow's milk. Of a third and reddish kind, the stones are largely prepared as food. The dried Apricots, called "Mirak," of which I had read so much, were to me disappointing, and, till cooked, unattractive.

The Cherry and Peach trees did not strike me as so remarkable. Both are usually grown from the stone. The fruit of the Cherry, being acid, is very little used. Peaches are of three varieties, distinguished as red, white, and green. When sown the seed is put in the earth two fingers deep, before the frosts set in; water is then let in and allowed to freeze. After that earth is put over it and left till the following spring, when the young shoots are transplanted at intervals of four paces. The best Peaches are said to come from Samarkand.

The Vines in the Bek's garden were in some cases allowed to trail, and in others were trained to form colonnades, under which one might walk. In Bokhara are cultivated thirteen different kinds, and of these we tasted several. A small round, greenish variety, called "Kishmish," was thought much of, but there were larger kinds, the berries of which measured from 1 inch to 1½ inch in length. The mode of cultivation, however, was to me more curious than their flavour. In grafting, the stem being cut, they raise the bark all round for half an inch, though without removing it from its point; they then peel the graft for an equal distance and fix it on the stem, binding it all round with the bark. The two soon unite, and next year the Vine yields fruit. In autumn a trench is made, and the tops of the Vine buried beneath the soil for the winter. The soil chosen for the Vine is half clay and half sand, enriched with from 1 to 2 tons of manure to the acre. The ground is usually watered twice before budding time, and once towards the end of May, when the earth is completely inundated for 24 or 36 hours. A good crop averages from 40 to 50 tons to the acre.

Towards the end of the summer the bunches are enclosed in bags, and cut off later on to be suspended from the ceiling, and so preserved through the winter as food, but not pressed for wine. On the manufacture of this I neither heard nor saw anything in Bokhara, unless it were to some insignificant extent among the Jews. The Bokhariots use the Grape for making syrup and vinegar and for raisins. The last is done by exposing the picked fruit to the sun on the house-tops for three or four days, whilst the syrup is made by treating Grapes in a cylinder lined with plaster, refining the juice with pounded clay, and then boiling it to the solidity required.

We saw likewise in our garden many dwarf Pomegranate and Fig trees, planted in what appeared like sunken beds, the muddy-looking soil at the bottom showing that it was so done for purposes of irrigation. The Pomegranate requires a more sandy soil than the Vine, and that it be under water the whole of every tenth day. A tree springing from seed can yield fruit in the fourth year. Bokhara Pomegranates are excelled by those of Shari-saby, where also is a peculiar kind, with small seeds, called *bidone*, or seedless. The Bokhariot gardeners think the crop improved by the tree being dwarfed.

The Fig tree requires no peculiar soil, and the only two fingers' depth of manure; but as the fruit advances towards maturity the roots have to be covered with water three days in the week. The crop is usually from 70 to 140 lb. from one tree.

They have two kinds of Plums—yellow and black. Of course, by October 11 we were late for fresh fruit, but I observed some of the *stiah*, or black Plums, on a branch suspended in a shop, which having told Yakob to purchase, I found particularly well flavoured. From 150 to 200 lb. usually grow on one tree. There were in our garden Apple trees, but none of the *suwama* fruit. These last are brought

from Hazarasp, but I cannot say much for the flavour of any I tasted in Central Asia, as compared with good sorts in England. Of Quince trees we had noticed abundance at Khokand and elsewhere. They grow on almost any soil, and need little water. The fruit is not eaten raw in Bokhara, but minced meat is mixed with them; the seeds are administered in medicine, the pulp is used in soups, and, once more, boiled Quinces are prescribed as good against humours.

The various sunken beds, to which I have referred, in the Bek's garden, were connected by runnels with the quadrangular pool near the women's apartments, and near this pond were shady trees and two or three flower-beds; but of flowers there were only three or four varieties, and those of the commonest in England. The Bokhariots cultivate flowers only to a very limited extent—the Rose, however, among them—and then not for ornament in the house, but simply to be carried.

THE GENUS ARCTOTIS.

THIS is one of the finest of the interesting and beautiful Cape genera which have been neglected for a long series of years. In some measure this neglect is due to the modern taste for indoor decoration, which necessitates the devotion of considerable resources and attention to a class of plants suitable for the purpose. Be this as it may, we are assured that popular favour may be revived, by the late satisfactory appreciation of alpine and herbaceous plants which formerly suffered the same neglect, and those who do appreciate the beautiful Cape Heaths and choice greenhouse plants in general, can scarcely do too much to show forth their claims for a much larger share of attention.

Of the four cultivated species of this genus two at least must be regarded as valuable greenhouse plants, and another, the one annual kind we have, is ornamental in pots or on the border out-of-doors. They are as follows:—

A. aureola.—This very fine species has long been an inhabitant of our gardens; it was introduced in 1710, was figured in the *Botanical Register* in 1815, and during later years it has been known as a rarity in several choice collections. For a long time it was known erroneously as *A. grandiflora*, but when the correct name was applied about three years ago, Mr. Harpur-Crew remembered that it was the name he originally used. Quite wrongly, I think, judging from cultivated specimens, it is placed by De Candolle and Harvey as a variety of *A. aspera*—a mistake, I believe, because it is in no degree bipid or scabrous, but always soft and cottony, and because it appears specifically distinct from the undoubted variety we cultivate as *arborescens*. The figure in the *Botanical Register*, t. 32, evidently represents our plant, though the colour was made or has become too dark. A coloured plate, drawn from Cambridge specimens which had been verified at Kew, was published in the *Garden*, October 14, 1852. Mr. Gumbleton, in a letter to me shortly before, pointed out that it could not be *A. grandiflora*, but that it was rather *A. aureola*. He also said in the same communication—"Mr. Crew writes me that when first he got the plant from the late King of Sicily, Augustus Smith, it was named *A. aureola*, and he so called it for several years, till he found every one else who had it, called it *grandiflora*. In habit it forms a small stiff erect shrub; the stems are covered with silky tomentum, as also are the leaves, which have a silvery appearance; they are pinnatifid, with long, spreading and undulated lobes. The flower-heads are 4–4½ inches across, and the rays are of fine orange colour, without dark basal blotches, in the absence of which it differs conspicuously from *A. grandiflora*.

The cultivation of this species is not perfectly easy, for although it does not often die, it is liable to become yellowish if it is not happy at the root. I have, however, I think, found a means of growing it well without trouble, and that is by grafting it upon *A. arborescens*, which is always robust and strong. A specimen so grafted last spring is now strong and healthy; it has made free growth, and is the best I have. It has had, I think, five flower-heads open at once on the same branch, and each about 4½ inches across. The grafts appear to take no more easily than the cuttings root, but the after success is evidently worth the trouble of grafting. Cuttings are most easily rooted in July and August, and they must have hard wood for insertion in the soil, as

soft tissue is sure to rot. The cuttings should stand on a greenhouse shelf with but slight shade, and a bell-glass should not be used, as it appears by enclosing moisture to do more harm than good. I think, however, when a sufficient amount of care can be assured in watering, that a bell-glass may be of service. Gardeners who succeed well in striking *Centaurea ragusina* will succeed with this, as it requires similar treatment, being of a somewhat like nature, though it is of more delicate vitality. In potting it is important not to use unnecessarily large pots, because a large body of soil with few roots is liable to remain too long wet. The drainage must be good, and the soil should consist of good loam with enough grit or sand to permit free percolation of water. In winter the plants grow, following, as many kinds do, the time of their activity in a wild state, and therefore, though growth should not be encouraged, it must be allowed, and water should be given to keep the soil in only just appreciably moist condition. The object is to have as much growth as possible in the longer days of spring, when the flowers are much the finest, though they are produced also at other times of the year, often freely in summer, but principally after Christmas. I have never known good seeds to be saved from this, or the two other frutescent species, and I have failed to cross it with *A. aspera* var. *arborescens*. I have tried *A. aureola* in the open ground, out-of-doors in summer, where *A. aspera arborescens* does so well, but it did not flower, and the general result was not so good as by pot cultivation, though Mr. Harpur-Crew has found it effective as a summer-bedding plant, and therefore it will have to be tried again. In Scilly it is perfectly hardy.

A. aspera var. *arborescens*.—I found this plant when I came to the Cambridge Botanic Garden, and I have not been able to discover that it was cultivated anywhere else at that time. I find in the University Herbarium a specimen named *A. aspera* dated 1826, so that probably it has been cultivated from or before that year to the present. In the *Botanical Magazine* Sir Joseph Hooker says "It was cultivated in England before 1710, and in Holland much earlier, for it is described in John Commelyn's *Hortus Medicus Amstelolamensis*, published in 1697, as "Anemolospemmas Africana, foliis Cardui Benedicti, florum radiis intus sulphureis." There is a figure of it in Jacquin's *Hortus Schönbrunnensis*, published in 1797, and the next after is the beautiful one in the *Botanical Magazine*, 1850, t. 6528. This is the *A. arborescens* of De Candolle, that of Willdenow being the *A. maculata* of the *Botanical Register*, t. 130, and of Jacquin, *Hortus Schönbrunnensis*, ii., 171, which is *A. aspera* var. *scabra* of De Candolle's *Prodrum* and Harvey and Sander's *Flora Capensis*. Our plant differs from it in the colour of the flower, and in having softer foliage. Willdenow's *A. arborescens* has white ray-florets tipped with orange, and orange-coloured beneath, whilst the rays of this plant are creamy-white, yellow at the base, and tinted below with rosy-pink. It is described by De Candolle, but omitted by Harvey. Besides the figure in the *Botanical Magazine*, from Cambridge specimens, there is an illustration in the *Gardeners' Chronicle* from the same source February 3, 1853, p. 145. It is certainly a valuable species, and, unlike *A. aureola*, it is grown and propagated with the greatest facility. It is shrubby in habit, but the stems are weak and require some support in pots; out-of-doors in beds this decumbent habit is advantageous, as the plant spreads instead of becoming unduly tall, and no sticks are necessary. The leaves are extremely elegant, oblong, or oval, and pinnatifid with lanceolate lobes, angularly toothed, and undulated. The flower-heads are from 2½ to 3 inches across, and coloured as before described.

For cultivation in the greenhouse it is one of the most charming of Composites, and the flowers are chiefly produced during late winter and spring. The cut flowers are very lovely in vases, and they remain open at night, though on the plant they close. The buds are pretty because of the flush of pink beneath the ray, and they expand well in water. As a flowering bed plant I have found it extremely attractive, though it does not flower until some considerable growth has been made; it forms an excellent undergrowth for such large-leaved plants as *Kichinus*, and the creamy flowers and light green foliage contrast well with the red-leaved kinds. Its cultivation is so easy that little need be said; it should have a position always in full light, and in striking cuttings it is better to give too little than too much water. R. I. Lynch.

(To be continued.)

Florists' Flowers.

THE CALCEOLARIA.

It will now be quite time to sow seeds of the choice florists' strain. These showy flowers are almost indispensable ornaments to our greenhouses and conservatories during the summer months; they make a splendid display during April and May. Those of us who have been watching the progress made in the way of improvement during the past thirty years feel confident that it has been much greater in the past decade than it was in the twenty years preceding it. The newer brilliant colours, such as orange-scarlet, crimson, crimson-scarlet, crimson tinted magenta, &c., are not only valuable acquisitions as regards colour, but the flowers themselves are of full size and good form, thickly placed on dwarf plants, or at least dwarf in comparison with the named varieties of the old florists, which were borne on stems 2 feet high or more. The best or, indeed, the only way of propagating these Calceolarias is by sowing the seeds as soon as they are ready in fine sandy soil, placing the pots or pans in frames or hand-glasses in a shady place. A frame facing north or a handlight behind a low wall is as good a position as can be found for the young plants when they vegetate. The tiny seeds must necessarily be covered with the finest soil or sand. It is necessary to shade from the sun until the plants are well up; indeed, at no period of their growth should they be exposed to the scorching rays of the summer's sun. If this should happen during the process of the vegetation of the seeds the embryo plants would all be killed. Prick off the little seedlings as soon as it is possible to handle them, if the plants vegetate thickly in the seed-pans—they soon die off from overcrowding if not speedily separated.

AZALEAS.

It is safe to say that few hard-wooded plants are more easily grown than the Azaleas if they are kept clean, and one or two essential points in their culture carefully considered. At present they are, or ought to be, making or completing their growth in the hot-house. At that time they luxuriate in a moist cucumber-house or Pine-house temperature, being shaded from the direct rays of the sun. They ought also to be well supplied with water at the roots and overhead. Those not reported ought to be surfaced with some artificial manure. I have always used a small quantity of guano—a teaspoonful to a pot 10 inches in diameter. I mix with it a good handful of sandy peat, and spread the mixture thinly over the surface. The small rootlets soon form a perfect network in the dressing: another may be applied in two weeks. This causes a very vigorous growth, and the leaves become of a darker green. On some plants the flower-buds set too thickly; in that case it is best to thin them out. When the buds are set, give more air, less shade and heat, the plants to be ultimately placed out-of-doors; but do not be in too great a hurry to place them outside. Azaleas do best out-of-doors in the late autumn, when the leaves are laden with dew from dusk to daybreak. *J. Douglas.*

MESSRS. BARR'S GROUNDS, Tooting.

HERBACEOUS PEONIES are just at present attracting special attention at Mr. Barr's hands, and we found the finest collection of these showy plants which it is perhaps possible to meet with anywhere in this country. In making the collection much difficulty has been met with, owing to the confusion existing in the various sub-sections of the genus, different authorities holding a variety of views as to which are the distinguishing points of *P. mollis*, *P. edulis*, *P. officinalis*, *P. decorata*, *P. paradoxa*, &c., and even if any order may eventually be arrived at in the modified chaotic condition of the genus there will yet remain the parentage of the various hybrids to clear up.

The quantity of plants that have arrived at a flowering age, and which have been collected at no small expense from home and Continental sources, permits of a botanist identifying, by means of the excellent living material, many of the species with a maximum of certainty. And should that desirable object be attained, much benefit ought to accrue to

the public generally, as it would then know with reasonable certainty, when making purchases, that the plants were what they were said to be. Mr. Barr is especially to be commended for his useful endeavours in the way of clearing up the many disputed and doubtful facts in connection with Peonies.

IRISES.

Of the germanica, squalens, and variegata species, the flowers were mostly over, and the best of the remaining ones were being cut for an impending show. That a wonderfully complete collection has been here got together admits of no doubt, and the success that is seen in their culture proves that the soil suits them generally to perfection. It was a great treat to see great beds of *Iris virginiana*, sheets of blue and white, the flower-stalks tall and slender, and the newly opened flowers unrivalled in their colours. These plants always look best in colonies, as in isolated small patches the delicate blues, purples, broozes, browns, and other colours not easily described, are not noticeable in the same degree.

Plants and their Culture.

DIVERSE FERNS.

THERE are several species of exotic Ferns which deserve more recognition than they generally receive in most gardens. Notably so is this the case with *Asplenium cicutarium*, than which it is hardly possible to select a more light and elegant Fern when well grown in large 60's, or even in smaller pots than these. It has a special adaptability for cultivation in small pots, and in such we have used it effectively in groups at exhibitions, and likewise in dinner-table decorations, placing the pot in a finger basin and filling in the intervening space between the pot and glass with fresh green moss. This Fern is not one of the easiest to propagate, but if a well established plant can be obtained, seedlings can be secured, and a stock gradually worked up. The tinted *Adiantum*, *A. tiectum*, and *A. rubellum*, are also very pretty in a small size, being distinct and striking in the beautiful tints of their younger fronds. *Cheilanthes hirta Ellisiiana* is one of the most effective of its genus, of stronger growth than *C. elegans*, and of a deeper green shade. This, like the *Asplenium* just named, is most useful when of a medium size, and is very readily propagated from spores. When growing this genus it is well to allow them an abundant supply of water at the roots, and a rather dry atmospheric condition if possible. *Hypolepis distans*, of semi-scandent growth, is a rarely seen Fern which thrives well in a cool moist house, and can be increased both by division and from seed. *Onychium japonicum* can be increased in a similar manner, being an excellent and durable Fern for conservatory decoration, where *Pteris tremula* can likewise be turned to a good account, particularly during the summer months. *James Hudson, Gunnersbury House Gardens, Acton.*

FRUITS UNDER GLASS.

THE VINERY.

In early started vineries the Grapes will, ere now, be cleared off the Vines entirely. This will allow the ordinary course of syringing them twice a day now to proceed uninterrupted. On sunny days, however, the surface of the borders should also be thoroughly well moistened, in order to keep the atmosphere cool and salubrious—a condition much needed about early started Vines at this season for the preservation of their foliage and for the perfecting of the wood. As the season advances and the foliage on these Vines matures and becomes thin the surface or mulching materials on outside borders will naturally, by the powerful effects of sunshine, be liable to become dry much sooner than before; as this material is undoubtedly permeated by the young roots, which should be carefully preserved, it will, under those conditions, be advisable to add a little more to the mulching material for this purpose, and thus encourage these rootlets to grow and take up the nourishment which is applied for the benefit of the Vines, which at this season need much support;

therefore whenever necessary give diluted manure-water at the roots abundantly, and see also that the outside borders do not lack for this element.

In those houses where the Grapes are ripe, and these are required to hang on the Vines for some time to come, it will be necessary to keep the house cool and moderately moist, giving them air at all times, and an abundance of it during the prevalence of hot dry weather. Although these conditions are indispensable to keep them fresh and plump, these should however be exposed by degrees, so that the temperature accorded to the Vines during the ripening process is not brought down low too suddenly. In houses in which Grapes are now colouring, the temperature, both by night and by day, should be kept as uniformly as possible at about 70° and 80° respectively; for this purpose a little fire-heat will at times be required, so that their at the apex of the use may be admitted constantly, thereby ensuring a circulation of a warm and genial nature. When sunshine abounds, freely ventilate and also maintain a moderate degree of moisture by sprinkling available places within the house. *G. T. Miles, Wycombe Abbey Gardens.*

The Hardy Fruit Garden.

WALL TREES.

PEACH, Nectarine, and Apricot trees on walls should by this time have all superfluous shoots thinned out to the proper distance apart. Nothing is ever gained by having the shoots crowded; from 9 to 12 inches apart is a good distance, but it is better to err on the side of having the shoots too thin, than crowded thickly on the walls. When any gross shoots appear they should be cut back to one or two eyes, as to encourage a side growth to take the place of the gross shoot—for these last seldom bear any fruit and as a rule only rob the tree if allowed to grow unchecked. Pears, Plums, and Apples, on walls, should have all side shoots stopped, and well thinned out. Where there is little fruit on the trees, it will be found that such tree will make strong growth instead of forming fruit-buds. These shoots are better thinned out by breaking a number of them right off the stems. This is to be preferred to cutting back to one or two eyes, as by cutting, a thicket of young growth ensues instead of fruit-buds forming. Bush and other trees may be treated in the same manner. Cherries and Plums may be budded at any time during the month. Strawberry runners not required for forcing or forming new plantations may be removed every week, should time permit. If not convenient to layer in pots, they may be lifted, and pricked out thickly in a frame, where, if kept shaded and well watered, they soon form plants fit for potting up, or for making new plantations. *J. Smith, Mentmore, Bucks.*

The Kitchen Garden.

SEED SOWING.

ANY spare ground at the foot of sunny walls should now be sown with French Beans, and dwarf early Peas, placing the seed at about 1 foot distant from the wall, as in Potato planting. Both these will continue bearing in the autumn much longer than plants in the open border, they are also easily protected. Should the soil be dry, water the drills just previous to sowing, and as soon as large enough they should be well mulched. A frame of each should also be sown; not placing the lights over them until the nights get cool in the autumn. The following varieties of Peas are suitable for sowing in frames in the middle of July:—American Wonder, Chelsea Gem, and McLan's Little Gem.

A good sowing of Cos Lettuces should take place in the first or second week in July; these will be full grown before frost sets in, and if lifted and placed in frames or houses, will keep up the supply for a month or so later. Hick's Hardy is the best green Cos for this purpose. Unless with the idea of lifting them partly grown, to place in frames, the above should be the last sowing of white and green Cos. About the middle of July sow a good bed of hardy Brown Cos and several good winter varieties of Cabbage Lettuce, such as Hammersmith Hardy Green, Stanstead Park, and Hardy Dutch. The last outdoor sowing of Cabbage varieties should be made the beginning of August; these will come in for planting under walls and in sheltered positions, or planting in frames. Endive sowing may now commence. *G. H. Richards, Somerley, Ringwood, Hants.*

APPOINTMENTS FOR THE ENSUING WEEK.

		National Rose Society's Show, at the Royal Horticultural Society's Gardens, South Kensington.
TUESDAY,	July 7	Exhibition of Acacia and Tanwell Show, in Gunnersbury Park (two days).
		Sale of Imported Orchids, at Frotheroe & Morris's Rooms.
WEDNESDAY,	July 8	Lee, Blackheath, and Lewisham Horticultural Society's Show (two days).
		National Rose Society's Rose Show, at Sutton, Surrey.
		Royal Caledonian Horticultural Society's Show (two days).
		Sale of Plants, at Park Gates, Wanstead, by Frotheroe & Morris.
THURSDAY,	July 9	Hereford and West of England Rose Society's Show, at Hereford.
		Sale of Importation of Rare Orchids from Mr. F. Sanders, at Strevens Rooms, Chisleton, Chester, Rose Show.
FRIDAY,	July 10	Sale of Imported Orchids, at Frotheroe & Morris's Rooms.
SATURDAY,	July 11	Royal Botanic, Manchester: National Rose Society's Show, at Manchester.
		Sidcup Show.

IT is now a matter of certainty that the visitors at our various floral exhibitions are most numerous, and linger the longest over the bank devoted to the Orchids. This is not at all surprising, for there is much in such groups to arrest and fix the attention of those who know little and of those who have an intimate acquaintance with the numerous forms and varieties that are then displayed; here opportunities are offered for comparing forms that may have been seldom seen, or inspecting varieties that are quite new, whether natural hybrids or those that are the product of the skilful and patient hybridist; or, again, to gaze upon old favourites which, under the hand of a clever grower and equally clever exhibitor, are displayed in such a manner that the older forms often seem to be the best; and a determination is formed to endeavour at home to encourage growth and vigour in those under culture, so that the best results may be obtained in growth and flower. All this comes to the mind of those already possessing a knowledge, and having a collection at home to work upon; and then, too, to the many who have but vague ideas respecting this class of plants, those who simply gaze, and wonder, who express astonishment and surprise at every turn, whether in the inspection of the bulbs, roots, or singular flowers. Numerous examples of each class are always to be found around the Orchid groups, and doubtless for many years to come it will still be the same; and yet one cannot help thinking that even in this interesting class of plants, as we have hitherto seen them, there is room for improvement—that changes may be introduced which would certainly be beneficial, to the plants, to the exhibitor, and to the general public. For some time past a laudable attempt has been made, and if this is followed up more assiduously and determinedly it will, as certainly as anything can be predicted, be of service to the plants. We allude to the offering of prizes for *bond fide* specimens. No doubt, in the original offer of prizes at our different exhibitions, *bond fide* specimens were intended to be shown; but gradually, a lax and tolerant spirit creeping in, many specimens were admitted that by no attempt of reasoning or sophistry could be looked upon as single plants, until at the present time the chances are, that at most of our shows made-up plants are as numerous as those that are single specimens.

All have transgressed more or less in this matter; but though adopting the method nice out of every ten disapprove of the practice, and would much rather show their plants just as they are grown. Now to show sixteen Orchids there are often fifty, sometimes sixty, and it may have happened a larger number even than that have been used, shaken out, worked in, so that an effective group may be set up. Now instead of thus jeopardising, risking, and too often sacrificing a large number of plants, why not make classes for larger numbers of plants—say a class for fifty plants, admitting three of a sort? This would bring greater variety into collections, and would be equally certain to bring the best

grower to the front. Another class for thirty—these should be mixed groups; and then again a class for twelve Cattleyas and Lælias, two of a kind; the same for Cypripediums, and also Odontoglossums, with a clear understanding that they are *bond fide* specimens, not made-up or plucked for showing purposes. Each group should have worked in with it a stipulated number of *Adiantum cuneatum*, in 5 or 6-inch pots, so arranged that the light fronds of the Fern may help to throw up the beauty of the flower, as well, also, to hide in some degree the harshness of the flower-pot, or the angularity of the baskets, or the rusticity of the blocks upon which some may be growing. This method would be beneficial to the plants, it would also be an advantage to the grower, for how often after a show where made-up plants have been admitted has one to look along the stage in the Orchid-houses and note at a glance, by shrivelled bulbs and sickly leaves of such and such an one that was used on an important occasion, and is now suffering on account of the ruthless manner in which it was then treated? Such sickly subjects are the cause of considerable annoyance to master and man. And then to the public—first those who understand and know what Orchids should be—is there any pleasure to them in seeing thirty spikes of *Odontoglossum Alexandræ* all huddled together in a pan a yard across?—in a score of plants of *Masdevallias* placed with geometric precision in a square deal tray?—or a heap of *Oncidium concolor* fixed round an immense block?—or a company of *Cypripedium barbatum* and its varieties worked in so exactly that the flowers face all to the front? It is a pity that plants should be subjected to such treatment; and then the general public—those who having a few plants at home, are ever comparing their little plants with the elephants at the show, imagining, through imperfect knowledge, that the plants, as staged, are the standard by which their own should be judged; and thus a painstaking and careful man at home is placed at a disadvantage because he cannot produce anything like the plants at the show. And again, those who have no knowledge whatever of the culture and practices of Orchid growing and exhibiting—these often receive wrong and false impressions when such unnatural masses are placed before them; but if the plants were staged in the manner suggested, a great advantage would be obtained, and the groups at our shows would be much more effective and pleasing than the two or three rows of plants that are now mostly staged, with but little idea or attempt at beauty of arrangement or effective display.

IN many respects, so far as the year his gone, THE SEASON has been a pleasant one. The flowering of the spring shrubs has been exceptionally fine, whilst the leafing of the greater trees has been everything that could be desired. A rather severe attack of caterpillar now on Oak trees in some districts, on Thorns in others, is, however, much to be regretted. Grass, cereals, and Pulse for the most part look healthy and promising. But doubtless there will be local complaints amongst the fruit crops. In Warwickshire, which is not an Apricot district, there, we learn, more than for many years. Plums are thin. Cherries, especially Morellos, are plentiful. Peaches and Nectarines have not bloomed nor set well out-of-doors. Apples are good in many places, elsewhere disappointing. A correspondent in the Midland Counties has been at great pains in establishing a small orchard of Apples and Plums. The bloom on the Apples was exceedingly plentiful and strong, and equally so on transplanted and non-transplanted trees; but it is all gone! This is a lesson which teaches us to be careful, and in nothing more than in anticipations

of fruit crops. As regards these, there are two old English proverbs which ought ever to be borne in mind. The one is, "Not to count our chickens before they are hatched," the other, "Not to halloo before we are out of the wood." Gardeners may grow fruit trees through all stages, from the graft to the blossom, but then, at the very moment when success seemed possible, and, lest one should feel too proud, Nature steps in and the old Adam of Apple proclivities leaves us nothing much for our pains but barren trees. Almost as soon as the new year sets in some writers, who ought to know better, are busily at work peering into the very womb, and making calculations of the probable amount of Nature's fruitfulness for the ensuing year. It is so like a child at breakfast-time asking its mother what kind of a pudding they are to have that day at dinner-time. Pears are not much better on standards or pyramids, but on walls, and especially where they have the advantage of a flued wall, they are very satisfactory.

Small fruits, such as red and black Currants, will scarcely be quite an average. Gooseberries are good, but thin on the bushes, but it is a comfort to be able to say they are generally, but not entirely, free from caterpillar this year. Strawberries are plentiful but will require plenty of water to carry them on, and nets to protect them from birds, which latter, owing to the last few mild winters, have increased in extraordinary numbers. Hazel nuts and Walnuts seem promising.

In an early number we shall be in a position to lay before our readers an estimate of the condition of the fruit crops throughout the length and breadth of the land.

—THE GLASSHOUSES AT LAEKEN.—Some time since we published large views of the exterior and interior of the giant conservatory at Laeken, erected for His Majesty the King of the BELGIANS. In our present issue we give—thanks to the courtesy of the *Compagnie Continentale*—a view of the new houses erected under their auspices (fig. 5). They are devoted especially to the culture of Orchids, Azaleas, and other decorative plants; for the great conservatory, like others of its class, is ill-suited to grow plants, however well adapted to display them when grown.

—THE BENTHAM PORTRAIT.—It was felt by many that some memorial to the late Mr. BENTHAM should be placed in the Royal Gardens, Kew, to commemorate the services of the eminent botanist in the locality where so much of his life-long work was accomplished, especially in connection with the *Genera Plantarum*. With this view some friends of Mr. BENTHAM subscribed funds for a copy of the portrait in the Linnean Society's rooms. This has now been executed by Miss MERRICK, and was exhibited on Wednesday evening at the *conversazione* of the Linnean Society prior to its removal to Kew.

—GREAT HORTICULTURAL EXHIBITION, BERLIN.—A general exhibition of horticultural productions is announced to take place in Berlin during the month of September next, lasting from the 5th to the 15th, inclusive, it being held in the formerly Hygienic Exhibition building near the Lehrter Railway Station. A prize list is already issued, in which are to be found a great number of medals—gold, silver, gilt and bronze—and objects of art. Mr. SPÄTH, Kopnickstr. 154, Berlin, has the management of the Exhibition.

—ANTWERP BOTANICAL AND HORTICULTURAL CONGRESS.—We have before us the first part of the preliminary reports on various subjects of the programme, previously published. This circulation beforehand of the papers to be read and discussed is an excellent plan, which was adopted in London in 1866, but has been improved upon by our Antwerp friends. We shall in a future number call attention to the papers just issued, and may again remind our readers that the Exhibition and Congress will be held from August 1 to August 10.

—HALESIA HISPIDA.—Mr. DARTNALL sends us from the Tundridge Wells Nursery sprays of this beautiful plant. The leaves are like those of a Phila-

delphus. The flowers, which are like those of a *Deutzia*, are produced freely on the young wood in long pyramidal racemes. We do not know if any one has tried it as a forced plant in spring, but it seems as if it would be a suitable plant for the purpose. A large figure was given in our columns, 1884, August 9, p. 177.

— *LISSOCHILUS SAUNDERSONII*.—About thirty species of this genus are known to science, inhabiting tropical and South Africa. According to the translation of the generic name the above species would be a *Eulophia*, for a well-developed crest of elevated plates or ridges are present on the labellum. The classification, or rather the delimitation, of the two genera, according to the *Genera Plantarum*, rests on the dissimilarity of the sepals and petals both as to size and colour. In the present instance the sepals are comparatively small and greenish, while the petals are

usually low in Cardiganshire since June 10, both day and night. On the 10th the thermometer fell to 34°; on the 12th, 37°; 21st, 42°; 26th, 34½°; 27th, 34°; 28th, 40°; with strong, cold north winds which continue till the 30th. On the 26th, in the meadows at 5 A.M., there was ice on the grass. Outdoor Strawberries are not ripe yet, and everything is correspondingly late. What Apples and Pears there are will be small and scrubby unless warmer weather succeeds this wintry description.

— *NANODES MEDUSE*.—On a superficial examination this beautiful and extremely curious Orchid bears little or no resemblance to the general run of the vast genus *Epidendrum*, with which, however, it is so closely connected as to be included there by the more recent authorities. The leading distinctive features, however, lie in the aggregated condition of the succulent foliage clothing the pendent stems, the

hanging crop." "I am glad," said the other, "for the buyer in my case is a skinflint, and beat me down, and now the grass is covered with Cherries." It is the practice to Kent to grow Cherries over grass, and in some cases to sell the crop on the trees!

— *BISEXUAL CUCUMBERS*.—The interest attaching to flowers of this description is chiefly morphological. For practical purposes there is no advantage in a Cucumber flower having both stamens and pistils, nor from a physiological point either, but to those who are curious to know about the construction of the flower, and how the singular conformation of these flowers has come about, from what stock it probably descended, and what are the possibilities of its future development, they are full of interest, as affording just the sort of clue that a detective policeman likes to get hold of when he gets a good case. We owe the opportunity of examining such a flower

FIG. 5.—PLANT-HOUSES IN THE ROYAL GARDENS AT LAEKEN. (SEE P. 16.)

large and pure white. The large labellum has the lower part and lateral lobes greenish, striped with purple, while the terminal lobe is clear, pale purple. A magnificent specimen is now flowering for the first time in the Palm-house at Kew, where it was sent about six years ago from Natal. The flowering stem, when fully developed, will be over 6 feet high, and the great lanceolate plaited leaves are 3 to 4 feet long. The species of *Lissochilus* are terrestrial in habit, and the plant under notice is planted out in one of the beds in a mixture of peat and loam.

— *EXTRAORDINARY LOW TEMPERATURE AT THE END OF JUNE*.—Mr. WOODS, of Osberton Gardens, Worksop, writes that "on the night of the 25th ult. the thermometer at 10 P.M. stood at 39°, on the morning of the 26th at 4 A.M. it fell to 32°." To show the effect of the frost I send you the tops of a root of Potatoes taken from a piece of ground at the end of the park here where there is about 2 acres planted, the tops having all been caught in the same way.—The temperature has been un-

germinate sessile flowers closely hugging the apex of the stem, and thirdly in the pollinia being adnate to a scale breaking away from the rostellum. From a garden standpoint the value of this Orchid is determined by the large and showy labellum. It is almost orbicular in outline, deeply concave, and torn at the margin into a series of long entire or forked fringes. The colour is a deep amethyst-purple, but the shade is greatly determined by the direction in which the light falls on it. The sepals and petals are pale greenish, suffused or margined with purple, and dwindle into insignificance in presence of the labellum. The species is figured in the *Botanical Magazine*, t. 5723, and a flowering specimen may be seen in the Orchid-house at Kew.

— *CHERRIES IN KENT*.—Some parts of Kent are specially renowned for Cherries. Till recently the crop promised to be a good one, but lately many have fallen. "I am sorry for the buyer," said one farmer to another, in our hearing, lately, "for he is 'a good sort,' and offered me a good price for the

to Mr. THOMAS BUNYARD, of Ashford, who kindly sends us a flower in which the sepals are inordinately developed and leafy, the petals distinct, also leafy at the base, and surrounding five perigynous and sinuous anthers. The style is thick and columnar, dividing above into three wedge-shaped fleshy lobulate stigmas. The ovary presented nothing abnormal. Botanists familiar with the volumes of controversy as to the nature of the stamens in Cucurbits will note the significance of this flower.

— *DOWNINGIA PULCHELLA*.—Probably few will recognise under this name the *Clintonias* of gardens, but by virtue of this priority the above is the name this genus of pretty Lobeliaceous plants must bear. The species of *Clintonia*, on the other hand, are members of the Lily family. Considering the time the above-named plant has been in cultivation, it is altogether surprising how comparatively seldom it is seen in gardens. Compared with *Lobelia erinus* and its garden varieties this plant is, to say the least, a neglected one. Furthermore the flowers are twice

the size of the popular garden Lobelia, of an intense blue colour, with a large white eye beautifully set off with two large yellow blotches and three small almost black ones alternating with and at the base of the latter. In a sunny position it forms a sheet of the most dazzling blue, while the other three colours individualise it in a most characteristic manner. The habit is more compact and superior in every way to the above-mentioned Lobelia, except in the more select garden varieties. It requires the same treatment as its ally, and would certainly reward anyone's trouble to give it a trial. Its congeners, *D. elegans*, though inferior, is a select and pretty annual. There is a figure of *D. pulchella* in the *Botanical Register*, 1909, and it has been flowering for a long time in the herbaceous collection at Kew.

— THE ANTWERP ROSE SHOW.—This opened on Sunday last, and was visited by the King and Queen of the BELGIANS. We have not yet heard of any English exhibitors, but among the *jeux* we note the name of Mr. SHIRLEY HIBBERD, MM. SOUFRET and NOTTING, of Luxemburg, obtained the Queen's Prize.

— FUTURE SHOWS.—The month will open with the great show of Roses at the Crystal Palace, Sydenham, where a special exhibition of the flower by Messrs. W. PAUL & SONS will form a principal attraction. The great Rose Show at South Kensington follows on the 9th. Louth will hold a Rose and flower show on July 7 and 8, at which some good things are likely to be seen. The Lee, Blackheath, and Lewisham Horticultural Society will hold its summer show at the "Cedars," Lee, on July 8 and 9. The Royal Botanical and Horticultural Society of Manchester will hold a Rose show under the auspices of the National Rose Society on July 11. Bedford and Bedfordshire Horticultural Society's Show is fixed for July 15; Roses at this gathering come in for a good share of recognition. The show at Saffron Walden is to be on the same day as the last named, followed by that of the Winchester Horticultural Society on July 16. Newcastle-on-Tyne Summer Flower Show takes place on July 22, lasting three days. The Veitch Memorial Medal will be there given for six plants dissimilar in bloom, amateurs or professional gardeners competing. The great show of the Nottinghamshire Horticultural Society will be held at Nottingham on July 23, 24, and 25; that of Calne on July 28.

— THE ROSE SHOW AND FIRE BRIGADE ANNUAL INSPECTION AND COMPETITION.—On the 11th inst. the above will take place in the private grounds of Headington Hill Hall, by kind permission of the High Sheriff and Mrs. MORRELL, who have also arranged with the Rose Society's committee to throw the grounds and exhibitions open free to the public, at 3 o'clock. Members and friends holding tickets of admission will be admitted at the lower lodge, from 1 to 3 o'clock (an hour earlier than usual). The Oxon Bee-keepers' Association bee tent will be erected, where lectures and illustrations will be given by an expert; and it is hoped that cottagers will avail themselves of the opportunity so generously placed within their reach. In order to compensate the Society Mr. and Mrs. MORRELL will present to it a cheque for the largest amount ever received by the Society for the sale of tickets at their annual shows. By this generous offer the citizens will have the opportunity of seeing the beautiful private grounds, for which Headington Hill Hall is justly celebrated, while at the same time the Society will suffer no loss.

— CANADIAN BAST MATS.—Bast matting, so much used, is mostly made from the inner bark of the Lime tree (*Tilia europæa*). The bark of the American Linden has been used for this purpose, and the matting made from it is said to be quite as good as the Russian bast matting. The matting is obtained from young trees, which are stripped whenever they peel freely; it is thrown into water, and after a few days' steeping the layers of the bark readily separate when they are pulled apart and hung up to dry. As an incentive to the promotion of bast mat industry in Canada, the Americans point to the fact that 14,000,000 bast mats are annually imported into England alone, chiefly from Russia.

— GARDENING APPOINTMENTS.—Mr. J. CLARK, Gardener to C. PEEL, Esq., Manor House, Congleton, has been appointed Gardener to Mrs. BIRCHILL, Ribblesdale Hall, Preston.—Mr. A. FENTON as Head Gardener at Hopetoun House, Linlithgow, N.B.—Mr. JAMES LEE, from Dalkeith Gardens, as Head Gardener to Captain GRANT, Glen Grant, Morayshire.

Notices of Books.

Mason's Burma.

The first edition of this work was published in 1860, and now we have before us a second edition, in two very thick quarto volumes. It is the second volume which specially concerns us, but although it bears date 1883, it is only recently that we have met with it. The present volume contains nearly 800 pages, and is exclusively devoted to the botany of the country. The editor, Mr. Theobald, has added a very large amount of valuable information, but he has hardly been sufficiently careful in all cases to accentuate those portions which are the work of the original author. No direct charge can be laid to the editor in this respect but this, that he might have remembered that many readers are lazy and others overburdened with work. The requirements of both demand recognition at the hands of an editor. Again, it is open to question whether some of the additions made unmistakably and a wordily by the editor might not have been omitted with advantage. They increase the size of the volume, already too bulky, and though often interesting and suggestive, might better have been published separately. The introduction also of long quotations from such easily accessible books as the *Treasury of Botany*, itself a compilation, might surely have been dispensed with to advantage.

The work opens with an account of the Burmese forests, based on that given by the late Sulpiz Kurz, in his *Forest Flora*. Then comes a catalogue of the plants, in which the editor acknowledges the assistance he received from Kurz and the Rev. C. Parish. The lower Cryptogams, even, are not omitted—in fact, they are given twice over—though naturally the lists in this department are more incomplete than in the case of other plants.

The account of the Orchids has been furnished by the Rev. C. Parish, who, in accordance with the plan of the work, introduces his subject by some remarks intended for the general reader, and devised to serve as a pleasant "vehicle," as the doctors say, for the administration of drier details.

Of Burmese Orchids Mr. Parish catalogues over 350, but considering how large an area remains to be explored, he considers that Burma alone is capable in the future of showing a list of 500 species. Mr. Parish's list, with authorities and references, is so useful that we could have wished it had been issued separately, for the benefit of Orchid cultivators, but as it must be incorporated in the *Flora of British India* we must be content to await the completion of that work.

Numerous appendices, indices of vernacular names, botanical terms, of genera and species, of synonyms, as well as a general index of subjects, attest the care and labour bestowed on these volumes by the Editor. A final illustration suffices to show this clearly. Under the index of species all the entries of any particular adjective are referred to thus:—In the index under "alata" we find ten entries, referring to so many species of different genera thus named, besides one "alatus," and so on throughout. Take as an illustration the following note *à propos* of epiphytes and parasites:—

"There grew, when I first went to Moulmain, in 1852, just inside 'Tiger's Gap' (as the entrance to the cantonments on the Nyabusec side was then called) in the centre of the three, cross-way—*trivium junctis* vix—a fine *Vitex arborea* some 40 feet high. There stood in the same place when I left in 1876 a 'Peepal' or 'Ficus' tree of even larger size, the *Vitex* having entirely disappeared; yet no one removed the one, or planted the other. It was a simple, natural operation, the silent work of some twenty years.

"A ripe Fig seed obtained a lodgment in some crevice of the unhappy *Vitex*, germinated, and became a small and apparently innocent epiphyte. Being there comfortably entertained, it turned parasite (though not in the strict botanical sense), and took an unhandsome advantage of its position to turn its roots downwards till they touched the earth, and its branches laterally over those of its supporter.

"In the meek garb of modest worth disguised, The eye averted, and the smile chastised, With sly approach it spreads its dangerous charms, And round its victim wounds its wiry arms." Darwin.

"For some years it did no very evident harm, but in course of time, slowly and insidiously, the roots and the branches united into a solid mass, till all that could be

seen of the miserable victim was an arm here and there, as it were, imploringly stretched out and struggling towards the light, vainly trying to escape from the treacherous embrace of its tormentor. At last my poor friend the *Vitex* totally disappeared, enveloped in a winding sheet of inextinguishable folds, and strangled to death in the embrace of its inexorable foe—a vegetable Loo-lagoon.

"Round sire and sons the scaly monsters rolled,
Ring above ring, in many a tangled fold,
Close and more close their writhing limbs surround
And fix with foamy teeth the venomous wound."
Darwin, "Leaves of the Plants," canto iii., 331.

Few who now pass by and see the placid *Ficus* (for I doubt not it stands there yet) would suppose that such a foul deed had been done by it, and that it still holds the murdered body of its victim hidden within that smiling exterior. Many a giant *Ficus* in the forests breathes its former life by its perfectly hollow trunk, from which the very bones of a too confiding friend, similarly treated, have, by the process of inevitable decay, fallen out."

Wild Flowers Worth Notice.

Mrs. Lankester has recently published a new edition of this little popular manual, which is accompanied by coloured plates, the execution of which we cannot commend. Messrs. Allen & Co. are the publishers.

FARM GARDENING.

THE PROMOTION by noblemen and gentlemen of unquestioned honour of a national company for the purchase of land in divers parts of the kingdom specially for resale or letting on favourable terms to labourers and others wishing to become small landowners or occupiers, is one of the signs of the times. The large farm system, buoyed up as it was only by means of capital and a vast outlay, has practically collapsed under pressure of adverse seasons and low prices for farm produce; rents have fallen enormously, and agriculture, under existing conditions, has become an unfortunate business. Naturally, landowners have experienced the force of this depression as well as farmers, and they have now begun to realise that in throwing several small farms into one vast one, destroying homesteads, and otherwise abridging the demand for labour on the land, that they have been depopulating the rural districts, crowding the labourers into the towns, to linger and to suffer, whilst the once highly cultivated and profitable country is in danger of becoming deserted and a desert. With every desire to credit landowners with some return to common sense and kindly feeling towards their rural dependents, it is none the less too obvious that such a movement as is above indicated, has within it no inconsiderable substratum of selfishness, for now it is seen that the only, or almost only, hope of a revival of prosperity for agriculture and the land lies in the formation of myriads of small farms and freeholds! Landowners may well, for their own sakes, desire to promote a company, the which may prove, if practically worked, a marvellous power of good, and for profit presently. The old couplet respecting the destruction of our bold peasantry has been in danger of realisation, and it is well we have passed ere the rubicon is passed, and the country's pride laid low beyond reinstatement. It may be feared that the promotion of such a company as that to which reference has been made may be regarded as chimerical and incapable of successful realisation. On the other hand we see ample encouragement for such a proposal in the fact that companies have in and around our great towns—London especially—purchased large plots of land, and have either resold such land in small plots for building purposes to persons of small means, or else have built houses and let or sold them to working men, and have found in the transaction much profit. A large amount of sentiment will naturally enter into the business incidental to the purchase and resale or letting in small plots of rural land, because so much that is moral and social enters into the suggestion. Still the basis is that business, if it may be so tautologically put, must still be business, and without that basis, it cannot hope to be profitable. The reinstatement of our bold peasantry is a work that may well call forth the hearty sympathy of all who love their country, and if that sympathy will tend to promote financial success so much the better. It may be asked—What has all this to do with gardening? Well, the answer is simple enough—the very basis of any system of small

holdings in land must be found in garden practice. The creation of a vast number of small holdings, farms, and freeholds, will alone avail nothing. All good resulting will then be contingent upon the manner in which the land is cultivated. Lord Carington said the other day that by subdividing land into small allotments, which were all practically gardens, the produce of the land per acre was more than quadrupled, as compared with land under ordinary farm culture. Small holdings of a few acres must practically become farm gardens, and it will be found—although some of the noblemen promoting the new land company thought differently—that the chief elements or means of cultivation must be the spade and fork. We have had too much ploughing; we want more digging. The labour and cultivation which in gardens proves so profitable and so productive, must be carried into any system of small holdings if the holders of these small farms are to live. In how many rural districts is there not found a dearth of those garden crops, which are found almost too abundantly in large towns. With absolutely miles of land in cultivation at their very doors, yet residents in rural villages are often unable to purchase if they need them—and they often do—ordinary garden produce, milk, eggs, butter, and similar products, because under our present farming system garden crops find no place for sale, and the other produce is sent off in bulk to the towns. The association of cows, pigs, poultry, and bees, with gardening, is in such direction as projected indispensable, not only for the production of manure, but also for the provision of labour. No man could hope to find full development for his energies on a 3 or even 6-acre plot, if his cultivation is to be performed with ploughs and similar implements. Nay, it is doubtful whether the small holding system can ever prosper on such a basis of cultivation, because the small man cannot hope to extract with the same system of culture better crops from the soil than the large farmer does now; and in such case he cannot hope for a prosperous livelihood. Ploughs are all very well, but they cannot equal the spade and the fork, especially when every year those tools in the hands of industrious men turn over to the depth of 2 feet a portion of the small holding. There is not much present prospect of heating our words into ploughshares, but we may with good reason turn ploughshares into spades and forks, and in their use find employment for those myriads of labourers who just now seem so badly in want of it. After all land is not meant to be the delight of the few, but the means of living to the many, and in no way is it possible to create upon it more labour, or extract from it more wealth and happiness, than through the vocation of gardening. We have been sending myriads of our best labourers across the sea to remote lands, where they have found land in abundance, have raised corn cheaply, and revenge themselves on the farmers and landowners at home, who found them no work, by sending their produce here almost to the ruin of home agriculture. We are awaking from our dream of prosperity, and now realising that we should have done wiser had we found land and houses here for those whom we have made aliens.

The Herbaceous Border.

VERBASCUM OLYMPICUM.

FLOWERING in my nursery at Ashford (Kent) I have some six plants of this grand biennial, and knowing it to be new and rare I have ventured to send you a few particulars for publication. The flower-spike rises from 5 to 6 feet high, from a rosette of woolly, acuminate lanceolate leaves, each of these being from 24 to 30 inches long. At about 2 feet from the ground the spike throws out from thirty-five to forty candelabra-like branches, with, on an average, forty to fifty flowers on each. These flowers are of a bright and rich golden-yellow, from 1 to 1½ inch in diameter, and, of an evening, agreeably fragrant. Round each flower are clusters of buds, which continue to expand in succession, so that the plants have been flowering for a fortnight, and still maintain their original beauty. Bees seem very partial to the flower, and I think every one must acknowledge that, associated with the blue Delphiniums, or any of the varieties of Digitalis, or planted in the shrubbery, this biennial is unrivalled. *Thomas Bunyard.*

FRUIT NOTES.

PEAR CLAPP'S FAVOURITE.—We are trying this variety in pots this season for the first time, and so far as the short experience enables us to form an opinion of its merits for this purpose, we are justified in thinking highly of it. Growing in a house with Pitomasson Duchesse, Souvenir du Congrès, Beurré de l'Assomption, and other kinds known for their good quality as well as suitability for pot-culture, it has set its fruit as well, and is as satisfactory in growth, as either. I think it was Mr. Bunyard who exhibited this, to me, new Pear in good form at South Kensington last autumn, and if he, or some other cultivator who has grown it, would give its date of ripening compared with Jargonelle or Bon Chrétien, and also state the length of time it keeps in good condition after it is gathered, I should deem it a favour, and the information might be of service to other readers of the *Gardeners' Chronicle*. I observe it is catalogued as an early sort. The drawback to the majority of early Pears is the short time they keep after gaining maturity. I hope this may be an exception. *Thomas Coulter, Hendre Gardens.*

FRUIT GROWING.

One of the best crops of Peaches and Nectarines I have met with this season is at Sir Henry Davies', Creedy Park, Crediton. The orchard-house there is about 150 feet in length, and divided into three compartments, for early, succession, and late fruits. This range is just 6 feet wide, a dwarf wall in front, and is a lean-to building, the back wall being about 12 feet high. There are no trees grown in the front, all that is aimed after is the developing of the growths on the back wall, and these are carefully chosen and splendidly trained. In the early house there are three dwarf-trained trees, which completely cover the wall from the bottom. One is the Royal George Peach, carrying about 200 fruits; the middle tree has just 150, and is the Lord Napier Nectarine; the other has rather more than 230, and is also a Nectarine, named Oldenburg, an old and excellent kind. The fruits are large, and beautifully coloured next the sun, and are now ripening. The head gardener, Mr. Seward, is a clever cultivator, and quite a master in the orchard-house. *W. N., June 23.*

FRUIT CROPS IN WALES.

Our crops of Pears and Apples here are a failure, more especially the latter, compared to their average production. This is the more disappointing because all the conditions seemed favourable to a splendid crop, and the blossom was most promising. It becomes, therefore, an interesting question what the cause or causes of the failure may be. It cannot be due to imperfect ripening of the wood last summer, because we had the hottest and driest August known for very many years, probably since 1868. Neither was it caused by spring frosts, because in the first place the lowest temperature registered after April 18 was 35° (on a verified thermometer in a Stevenson case), and in the second place because the only Pear trees which have borne even a tolerable crop are in the part of the garden most exposed to frost and east wind. These and nearly all the other Pear trees were in full flower on May 7, as noted at the time; we must, therefore, look elsewhere for the causes of failure, and it seems to me to be due to one of two causes, viz., the excessive drought in the spring of 1884, lasting till June 28, or the somewhat heavy rain (4.43 inches) of July. Were the Pears alone a failure I should incline to ascribe it to the latter cause, as they make their growth early, and do best the year following a hot dry July, but this would not account for the failure of the Apples, which do best after a hot August. I must, therefore, conclude that it has been caused by the drought so weakening the trees that they were unable to set their fruit this spring. And this is borne out by the position of the Pear trees mentioned above as having a tolerable crop. My garden is on a sharp slope facing south-east, and the greater part of the Pear trees are simply planted on the slope, which is so steep that heavy rain has little chance of soaking in, especially as the soil, though dry and stony, bakes hard on the surface. But in 1882 I terraced a part of the garden, and the trees mentioned above were transplanted there. The ground in which they were planted, being level, would retain any rain falling on it, so that if drought were the cause of failure these trees would have a considerable advantage over those standing on the slope.

This, I think, goes a long way towards settling the question. It should be stated that the drought here was the worst I ever knew so early in the year. By June 15 (1884) the lawn in my garden and the drier pastures were as brown as a turnipke road. The total rainfall from April 1 to June 28 was only 3.06 inches, and from June 1 to 28 only 0.37 inch with very hot weather. We have had no plague of insects here to account for the damage. The larva of the Currant moth (*Abraxas grossulariata*) is very common on the hedges, but, curiously enough, I have not seen one in my garden, and the crop of Gooseberries is, as usual, very good. There is more than an average crop of Apricots, and a fair crop of Peaches, but Plums are almost entirely a failure on walls, and quite so on pyramids. It is clear from the above that the causes affecting our fruit crops are even more complicated than is generally supposed, and the chances against the cultivator heavier. I omitted to say that Pear trees on espaliers are quite as bad as pyramids, and those on walls little better. *Alfred O. Walker, Nant-y-Glyn.*

PEAR BEURRÉ WAMBERCHIES.

A late Pear, not in season till May, or even June 4. The tree is very fertile, but flowers early, and is thereby exposed to the chances of an inclement spring. The fruit varies in shape—that figured in a recent number of the *Bulletin d'Arboriculture* is of medium size, roundish, with a short stalk, moderately depressed eye, a yellowish-brown skin freckled with russet brown spots. The flesh, though firm, is melting, without grit and sometimes without seed, full of sugary juice slightly perfumed, and with a peculiar flavour. This Pear was raised by Mr. J. Wamberghies, of Reissaix, near Binche, and is described as suitable for espalier or standard.

LORD NAPIER NECTARINE.

This fine Nectarine is now to be seen to the best advantage in one of the houses at Gunnersbury House. One tree nearly covers the whole of the interior of a house; the dimensions of the tree are 19 feet by 10 feet, it had originally about 380 fruits, reduced to 330 or thereabouts by thinning. The tree is in the very perfection of health, and the fruits are rapidly ripening, and becoming very fine in colour. One needs to look on the body of fruit, through the glass to estimate the value of the crop. By placing a wooden label under 50 many of the fruits as have a tendency to hang down under the leaves, they are elevated, and have the full benefit of the light. *R. Dean.*

NEGRO LARGO FIG.

This fine Fig can now be seen in the best condition at Shipley Hall, near Derby, where Mr. Elphinstone has it planted out in the front of a narrow lean-to Fig-house. But it is subjected to a kind of rough-and-ready treatment which drives it into a free fruiting state, and producing fine fruit too. Twice a year the spade is driven down deeply into the soil, a foot to 18 inches from the plant all round, with the result, that instead of the plant producing growths, it yields abundant fruits. One thing appears to be quite certain, that if this Fig is planted out its roots must be restrained. This is why it is Mr. Roberts grows it entirely in pots at Gunnersbury Park, and takes admirable crops of fruit from his plants.

THE TRADE IN SAFFLOWER.

WITH the exception of Madder there is no vegetable dye that has been so largely interfered with as Safflower, by the introduction of the artificial dyes prepared by the chemist. It is chiefly a product of the East, and there it still retains some value among the natives. From 1851 to 1855 the official value of the Safflower imported into this country ranged from £71,000 to £134,000. Sixteen years ago we received over 32,000 cwt. Last year our imports fell below 1400 cwt., valued at £13500. In contrast to this our imports of aniline dyes from abroad (exclusive of those made at home) exceeded in value £710,000. *Carthamus tinctorius* (a Composite plant) is grown extensively all over India, mostly as a subordinate crop. That grown in Dacca is the best in India, and ranks next to that of China. It is an annual, growing to 1 to 2 feet in height.

The plants begin to flower in February, when

about 2½ feet high; from then till May the flower are picked off each day as they appear, leaving the flower-heads on the stalk. All that is detached is the fragile-looking corolla, which issues from the summit of the prickly Teazle-like flower-head. When these are picked off, their subsequent treatment depends on whether they are to be made up into the Safflower of commerce or whether they are merely to be prepared for dyeing purposes in the country. If the former is intended the florets are damped with water and pressed into lumps. A rough strainer is made by stretching a mat on a wooden frame; on this the lumps of florets are laid, and water is slowly poured over them, while a man treads them out with his feet, supporting himself on two sticks, used as crutches. In this way the yellow colouring is eliminated from the flowers, the presence of which would detract from the beauty of the crimson tint, for which they are chiefly prized. When the water (which at first is coloured yellow) comes clear through the strainer the process is complete. The flowers are then made up by hand into round flat cakes, the water squeezed off, and they are dried in the sun. In this form they are known as the Safflower of commerce.

Safflower intended for local use in India is not washed in the method above described at the time they are picked. The flowers are simply dried, in which state they are sold by cultivators.

There are thus two pigment principles in Safflower—Safflower yellow, which is extracted by pounding and washing, and Safflower red (or carthamin), which is the dye of commerce. The carthamin is a resinoid substance, giving to cloth a beautiful crimson colour, which, however, oxidises yellow in light. It is one of the chief ingredients in rouge. It is soluble in an alkali, which is used to extract it from the cakes of florets; an acid precipitates it. The colours, however, obtained from this vegetable dye are not very fast.

The following shows the exports of Safflower from India in the years ending March 31:—

	Cwt.	Value.
1877	7662	£30,467
1878	3698	14,800
1879	4977	18,671
1880	2411	18,145
1881	6675	35,175
1882	2293	9,475
1883	3068	9,203
1884	2333	6,449

The shipments are principally to the United Kingdom, the rest goes to China and the Straits Settlements. There can be no doubt that the competition of chemical dyes has ousted this beautiful and once favourite colour from the home markets, and it is very unlikely that it will ever regain the position it once held. *P. L. S.*

BURMESE LACQUER.

THE lacquer manufactures of India, Burma, and Japan, are, as is well known, important industries. By far the best known in Europe is the lacquer-ware of the Japanese, the production of which has been so well described of late in a report by the British Consul at Hakodate. Specimens of Indian lacquer-ware are also seen in this country, but are not so common as the last, while the Burmese work is much more rarely seen than either. These three kinds of manufactures are very distinct in their character, in their mode of preparation, and in the material used to give the well known polished surface. Thus, while the Japanese lacquer is obtained from the juice drawn from the trunks of *Rhus vernicifera*, the Indian lacquer is prepared from lac, which is produced by the puncture of an insect on species of *Ficus*; and the Burmese lacquer is the juice obtained from *Melanorrhoea usitata*, Wall. Though this lacquer, or varnish, is largely used in Burma, but comparatively little has been written on its preparation and uses; the following notes from a recently issued report on the subject will therefore probably be interesting:—

The Varnish-tree, as it is called, is a large deciduous tree of Munnipour, Burma, and Tenasserim. The lacquer-ware used in Burma is described as of two kinds—that in which the article is made of basket-work lacquered over, and that in which the article is made of wood. All the lacquer-ware of the basket-work-form comes from Upper Burma, where it constitutes a very important trade. In British Burmah the trade is confined to the production of wooden articles lacquered over, such as the large round platter with a raised edge in which the family dinner is served, round and square boxes, and bowls. And the Burmese artists produce richly gilt boxes used in the monasteries for holding Palm-leaf manuscripts, the bowls

with a pagoda-shaped cover employed for carrying food to monasteries, and pagodas and shrines on which to place images of Gotama. The coffers referred to appear as if covered with pictures drawn in black on a gold ground, and the effect is so good that a small demand for tables, panels, bowls, &c., of the same work has sprung up. If a black-coloured lacquer is required, the sap of the tree is used alone, but a deep red lacquer is much used, and is prepared by mixing the sap of the Lacquer-tree with vermilion in the proportion of 12½ parts to 10.

The wooden bowls, platters, &c., are scraped down with fine steel scrapers, to make the surface as smooth as possible before laying on the lacquer. All cracks, holes, and chipped edges are filled and built up, as it were, with a putty made of the lacquer itself mixed with Teakwood sawdust. The articles are then put away until the putty is dry and quite hard.

The raw lacquer is next rubbed all over the article with the bare hand, so that the least particle of sand or stone may be detected, and the article put in a cool and airy place to dry—not, however, in the sun, which would cause it to crack or blister. The articles are sufficiently dry in three or four days to receive a thick even coating of "thayo," made of "thisti" (the sap), rice-water, and Paddy-husk ashes. The article is again put away to dry and harden, when it is smoothed down with water and Paddy-husk ashes and stone polishers of graduated fineness from sandstone to a smooth rebble. This process removes all gloss or polish, and the last coating of either black or red is given to the article as a polish. The grounding is invariably black, and only the last coating red, if red-coloured ware is required. The black enamel used is made of two parts lead, one part silver, and one part copper, melted in a fierce fire, and sulphur added at discretion.

HONEY GLANDS ON THE SEPALS OF CATTLEYA FLOWERS.

SOME little time ago I was surprised to see little drops of a pure saccharine or honeyed secretion of the

FIG. 6.—HONEY GLANDS ON THE SEPALS OF CATTLEYA FLOWERS.

buds of *Cattleya Mendelii*, and I now wish to record the simple fact, leaving to others with more leisure the pleasant task of accounting for the sweet secretion and its possible uses in the plant's economy. The accompanying diagram (fig. 6) shows the position of these hairy or papillose honey-secreting glands on a full-grown flower-bud, but they exist also on the bracts on the peduncles or flower-stalks. Of course the above simple fact may not be new, but I never observed these honey glands until this year. *F. II. Burbidge.*

HYBRID GEUMS.

SOME plants appear to produce pollen so strong as to be liable to form a cross with any of the same genus flowering in a garden together with them. This seems to be the case with *Aquilegia canadensis* amongst Columbinæ, and with *Geum urbanum* amongst its kindred species. I say "kindred" because the plant which *G. urbanum* most frequently selects to cross with, and to cause to degenerate in my garden, is classed in *Nymæa's Conspexus*, not as *Geum*, but as *Sieversia*. It is, however, more commonly known as *Geum montanum*. Plants of this have several times been sent to me from the Alps. They at first flower with large flowers on short one-flowered stalks, rising very little from the ground, but after a year or two the same plants produce divided stalks fully a foot high, with three or four flowers on each stalk.

I have never attempted to make any artificial cross with them, but have observed that both the seedlings which come up round them, and those which I have raised by saving the seed almost always depart more or less from the type of the seed-parent, and degenerate by assuming a tall straggling habit, and a much smaller flower, apparently approaching the

form of *Geum urbanum*. A second generation of seedlings, self-sown, produced plants which I could not distinguish either by leaf or flower or stature from typical *Geum urbanum*. *G. urbanum* is not a very prevalent weed here; until introduced in this way I never saw a plant of it in my garden, though it is found in the neighbouring lanes and hedges; but I suppose it is more probable that the pollen of it is brought by insects, and produces this change, than that *G. montanum* passes of itself in two generations from seed into *G. urbanum*. The intermediate forms of which I have spoken are so strong and increase so readily that I can obtain any number of plants by division, and will willingly send a plant of them to any botanist to grow and test by seedlings.

The genus *Geum* is not in great request for garden decoration. Of three native species recorded in catalogues it is generally acknowledged that one, *G. intermedium*, is a hybrid between the other two, *G. urbanum* and *G. rivale*. This is said to be a fertile hybrid, but I have a very fine form of it in my garden, on which I have never seen any good seed, though I have never made a careful examination: but had the seed been good the plant could hardly have grown where it is for ten years without seedlings coming up round it, which I am certain they have never done. I have also had in my garden for several years, and have distributed to many other gardens, two hybrid *Geums*—one raised by Mr. R. Parker, of Tooting, and sold as *G. miniatum*, the other raised by Mr. Clibran, of Altrincham, and sold as *G. hybridum*. The flowers are large, of an orange-red colour, clearer and brighter in the Altrincham variety, but in all other respects the two are alike. They continue to flower from April to July, and become at last fully 3 feet high, and very straggling. I believe these to be seedlings from *G. chilense*, fertilised with the pollen of *G. urbanum*, either artificially or accidentally. The foreman of Mr. Smith's nursery at Worcester showed me five years ago several such hybrids, and told me their true parentage, which was as mentioned above. I have looked for good seed on these hybrids in my own garden, but have never found any. Both the Altrincham and the Tooting plant are of remarkably vigorous constitution. Observing this I have, by way of experiment, cut up a plant consisting apparently of a single crown, into eight or ten pieces, and in two or three months each piece has grown into a strong flowering plant. Of five hybrid *Geums* of unrecorded parentage, now in flower in my garden, each develops a seed-head, after flowering, quite distinct from the others, and from those of their supposed parents. The soft upright plume of the seed of genuine *G. montanum* is absent from them all, though two are certainly from that plant as the seed parent. That the pollen parent is *G. urbanum* has not been ascertained by any careful experiment of mine, but I have inferred it from the evident tendency of the seedlings, as well as from the statement of Mr. Smith's foreman. I repeat, that I am willing to send plants or seed-heads of all my varieties to any one willing to take a botanical interest in them, *C. Wolley Dod, Edge Hall, Malpas.*

FORESTRY.

WORK FOR JULY.

LOOK frequently over young plantations, to see that all is going on satisfactorily—that the plants are not being choked with Furze, Brambles, Ferns, or rough-growing grasses, all of which ought to be cut down before they are likely to interfere with the general health of the plants. Of course this advice refers directly to plantations that have been formed within the past two seasons. Wind-swaying should also be paid attention to immediately it is noticed, few things being more injurious to newly-planted trees or shrubs than allowing them to rock to and fro with the action of the wind. Ornamental trees of large size that were planted out during the past season will require particular attention in this way, to see that all the ties, stakes, or other supports are in good order, and not cutting or chafing the bark.

NURSERY.

In the nursery great attention should be given to the keeping down of weeds, which, with the present mild, damp weather, are unusually plentiful and vigorous in growth. Hand-weeding of seed-beds

is best performed in damp, dripping weather, failing which a good watering through a fine rose will to a great extent prevent injury to the remaining plants. Keep a sharp look-out for beetles and caterpillars preying on the young shoots and leaves of coniferous and other trees, and take all available means to stop their ravages, as the injury inflicted even in a few days is by no means easily overcome. This battle with insect pests should be extended to newly-formed plantations, as well as to the nursery borders. Landed proprietors are fast finding out that, in proportion as they keep their plantations free from decaying brushwood and timber, so in proportion are they freed from insect pests and the many evils attending their presence in a wood. Budding, layering, and planting cuttings may still be engaged in, indeed for layering we consider the present one of the best seasons in the year. Prune all kinds of nursery hedges—Yew, Box, Laurustinus, Privet, Barberry, or Cypress—and keep the ground for a couple of feet on each side free from weeds and to a partially loose condition for a few inches in depth. The rot-heap will now require attention, more especially where the Holly, Hawthorn, and Mountain Ash have been stored. Turn heaps of rotting weeds and decaying vegetable matter, and by adding a small quantity of lime, the vitality of seeds, which even fermentation has but little effect upon, will be destroyed.

THINNING AND PRUNING.

The thinning of young plantations, more especially where this is for the first time, may now begin with safety, and be continued for at least two months. In doing so keep the outer line or lines of trees rather thick, so as to prevent too sudden a change of temperature throughout the wood. Pruning forest trees generally should now be engaged in, as at perhaps no other season can this operation be performed with better success. Ornamental trees may be pinched back or otherwise pruned into shape.

Branches that are encroaching on the sides of drives or walks should also receive attention, and either be cut wholly off or terminally shortened. Heavy timber growing contiguous to drives or walks, and that it is intended to thin out during the coming season, may now be marked, as the change in the landscape occasioned by such removals is now more clearly seen than when the trees are leafless in winter. Prune off dead branches, or such as have become twisted or broken by the wind, and paint the scars over with tar or other composition specially prepared for the purpose.

FENCING.

Continue to erect new and repair existing fences of wire, wood, or stones. At no period of the year is more constant care required to prevent the inroads of cattle and sheep to plantations than the present. Ground intended for planting during the coming season should, when a temporary lull ensues, be fenced out, as, in most cases at least, this work is more readily performed during the summer months than in autumn, when required. The cartage of material is also less at present, more especially in hilly high-lying grounds. Tar fences during warm weather, but previous to this have all heritage cut closely on along the line of fence. A. D. Webster, Penryn, Banor.

DISEASE OF ADOXA : PUCINIA SAXIFRAGARUM, SCHL.

No botanist who knows anything of the diseases of plants can look on a large bed of Adoxa moschatellina without thinking of the disease or diseases to which the plant is liable. Few observers would expect to see parasitic fungi growing in luxuriance in the winter or very early spring, and during a hard frost. On March 15 last I saw an immense spread of Adoxa on Dunstable Downs, and my thoughts immediately drifted to a fungus named *Æcidium albescens*, Grev., which sometimes grows upon Adoxa in April. Nearly four months have now passed, but no trace of the *Æcidium* of spring has been seen.

Wishing to examine the underground stems and runners of Adoxa last March I dug up a number of examples and washed them carefully in water. When the subterranean parts were perfectly clean I noticed that many of the underground stems (and those growths only) were infested with a Puccinia—a parasite which is generally considered not to be due till

the summer or even autumn. In no single instance was there a Puccinia pustule above-ground.

As fig. 7, I have engraved a flowering stem and radical leaf of a very young example of Adoxa as gathered in March last. At A B the underground stems are swollen with disease and marked with Puccinia spots, C D is the ground line; similar spots were on some of the runners and bud-scales. At a fragment of one of the swollen disease patches is enlarged to ten diameters, and at F G H the Puccinia spores are illustrated enlarged 400 diameters. The spore, F, is of one cell, on the style of Uredo, &c.; G and three others are two-celled, like Puccinia; and H is three-celled, like Triphragmium. Out of all the spores examined no one resembled another, some were long and narrow, others broad and flat, some angular, others round. With such materials to work with, an imaginative person might "prove" (to his own satisfaction) anything, and make out even new genera as well as new species.

By April 15 the leaves were invaded with the Puccinia, and on May 9 the floral organs and young berries were infested.

The explanation of the attack being first made on the subterranean parts of Adoxa appears to be this. The plants of last year were no doubt badly affected, and the resting-spores (Puccinia spores) fell to the ground in the summer: they hibernated in the

FIG. 7.—DISEASE OF ADOXA: PUCINIA SAXIFRAGARUM.

ground, close to the Adoxa plants through the winter, and germinated exactly at the time when the Adoxa began to show activity for the new year. The Puccinia spores being in the ground, the subterranean parts of Adoxa were necessarily the first parts affected.

Every species of Puccinia affords some evidence, either for or against the supposition that Corn Mildew, Puccinia graminis, can pass part of its life as an *Æcidium* on Barberry bushes. The following shows how the case stands with the Puccinia of Adoxa. In Cooke's *Handbook* P. saxifragarum, Schl., is said to grow "on Adoxa, &c.;" this Puccinia Mr. Plowright says exists only in the Puccinia state: it has, he says, no *Æcidium*. But other authorities say that the Puccinia on Adoxa is different from the Puccinia of Saxifrages, and the latter gentlemen have distinguished it by the name of P. Adoxæ, DC. Now Mr. Plowright, who assents to this difference, says that P. Adoxæ has both Uredo and *Æcidio*-spores. Dr. Winter says that there is no difference, but that both Puccinias are the same. The question is, Does the Puccinia spread from Saxifrages to Adoxa, and has it an *Æcidium*, or has it not? What has been "proved?" One half of the best authorities say "yes," the other half "no," to both questions. I have carefully examined authentic examples of both so-called species of Puccinia, and I cannot see the slightest difference between one and the other. To me they are perfectly identical, and my notes

show that no *Æcidium* is necessary, as the Puccinia was in perfect condition underground from three to five months before it was due above-ground—long before the *Æcidium* could possibly grow, and that up till now (July) has not grown at all.

In calling attention to another instance of Puccinia attacking the fruit and seeds, I may say that I have proof that not only does fugous mycelium often hybernate within the membranes of seeds, but resting-spores are sometimes produced within the seed-membranes, and these resting-spores germinate with the germinating seeds. In other words, many diseases of plants, as Corn mildew, Puccinia graminis, are hereditary, i.e., the diseases of the parent plants are transmitted direct to the seedlings by infected seeds. W. G. Smith.

The Apiary.

OBSERVATIONS ON BEES.

ONCE upon a time the people of England who kept bees attended to them about twice a year—viz., at swarming time and in the autumn. At swarming time the swarm was taken, put into a skep, and then left alone till the autumn. They were only disturbed between these times if a death occurred in the family, when the chief of the house went to each hive, and after tapping it, announced the demise of the person in question. This was considered necessary to the prosperity of the bees. In the autumn those stocks which were supposed not to have been able to gather enough for winter were "taken up," and then placed over burning sulphur. The effect on the bees and the honey is so well known that it is now unnecessary to go into it.

There has of late years arisen a more excellent way. Wooden hives have taken the place of straw, and the bees have been induced to hang their combs on pieces of wood, and store it in little boxes, &c. These combs can be taken out, and examined at any time, which is very convenient, but which has given rise to many evils. A gentleman residing less than 50 miles from here, examines and overhauls his bees about four times a day. He never allows one drone cell, and the thought occurs so frequently about the uselessness of the said drones, that he would cut out these cells four times a day (i.e., if he could find any). He makes—or has made—most elaborate chaff cushions, which are placed at the front and back of the bees just before winter, and quilts, counterpanes, and cushions, are laid on top. Cork dust is put all round the hive, and winter passages are cut for the bees through the combs. The legs of the hive must project at an exact angle to enlarge the base, and lest the cover should happen to blow off in a storm it is secured with ropes and tent pegs. These things, or most of them, are utter "bosh," and as they disgust me so much, you will excuse the short word of four letters just used.

Bees can be kept and wintered in four stout pieces of wood nailed together, with a low cover over, or without a cover at all, or packing, in a way presently to be explained. Another fashion has also arisen lately, which has received much attention from certain hive-makers—of course gain to that honourable craft has nothing to do with it. This fashion consists in having reversible combs, which at certain seasons are reversed, and the bees being turned upside down, and finding their honey, contrary to Nature, at the bottom, quickly remove it into the supers. The principle may be good, but the practice is very expensive.

Now for my plan. Take four pieces of wood, 1 inch or 1½ inch thick, and cut them of such lengths that the inside dimensions shall be 12 by 14½ inches, and 9 inches deep. This box is to have no bottom, but a top of some thickness can be screwed on, and all painted outside two coats. Then fix some foundation comb in the roof of the box radiating from the centre—a mode of arranging which I got from an American.

Put your swarm in this box. If it is a fair summer it will fill the box. Leave it alone for winter. It will require no cork-dust, cushions, quilts, nor dry sugar-feeder—price half a guinea. If it has been properly made and painted it will require no cover, and, therefore, no rope and tent-pegs. The above method of

arranging the combs does away with the ridiculous winter passages, as the bees can enlarge or contract with the greatest ease, and, when necessary, eat, drink, and be merry. In the spring, when my lords show signs of swarming, turn them upside down—if you like that fashion—and place another box on top, with no top or bottom, but same internal dimensions. In this you can hang eight frames or put boxes, and then, of course, a cover would be required. If you do not believe in the inverting system have a round hole in the top of the stock hive, and it can be supered without inverting, only in that case a cover would always be required, but no packing. So much could be said in favour of the time-honoured skep that it is quite certain it will never go out of fashion. Those persons who do not want to examine their hives four times a-day would do well to examine the catalogue of Mr. W. P. Meadows, of Syston, near Leicester. He has two hives, one of which is called The Gem, and the other The Favourite. Both consist of well-made skeps stood on a wooden stand. The Gem is covered with painted zinc, while The Favourite is covered with wood. Crates of sections can be put on each, and when partly filled others can be placed under. This can be done till there are three tiers of sections, one above the other. I have tried many hives, and have seen, I believe, the catalogues of every tradesman, but I do not think I have yet seen anything of the sort to equal these, and can thoroughly recommend them to those who keep bees for honey. I may give a little more of my experience at a future date. *Agnes.*

BLETCHINGLY, SURREY.

In countries subject to close cultivation there is always a tendency to limit or almost eradicate the primitive or indigenous vegetation. What remains is generally confined to the most determined weeds, or those that inhabit places unamenable to cultivation. Some, although of a weedy character, are amongst the most conspicuous ornaments of the cornfield, and not infrequently the sign of a lazy husbandman. Next to cultivation the plant collector must come in for his share of opprobrium for the despoliation of the choicer flora. Notwithstanding these evils, isolated spots or localities occur replete with many of the finer forms of our native flora in tolerable plenty or great abundance.

The North Downs, in the neighbourhood of Bletchingly, are in many places a paradise of wild flowers, and together with the corn, hay, or pasture fields that skirt the base of the hills or follow their sinuous windings, exhibit a rich and varied vegetation. The spotted *Orchis maculata* occupies both dry and damp situations, but in the latter it luxuriates with such freedom as to give its own tone of colour to the meadow. White varieties are not uncommon, and *Listera ovata*, together with the fragrant *Habenaria bifolia*, are partial to the same conditions as to moisture. *Gymnadenia conopsea*, another highly fragrant species, abounds in various situations, but chiefly those of a drier or chalky nature. No plant lower could fail to be interested in such British species as *Ophrys spheerica* and *O. muscivora*. The latter affects, or at least grows freely in shady situations, and is extremely interesting on account of the resemblance of the petals to antennae and the labellum to the body of a fly. The larger-flowered *O. spheerica*, however, will always be regarded as an object of great beauty. The greatest attraction lies in the rosy petals and the brownish-purple labellum, marked with traces of golden-yellow. Notwithstanding its beauty and high development, there is visible evidence in almost every fully expanded flower of the power and the process of self-fertilisation. The species delights in dry exposed places in the full blaze of the sun, where the chalky material in which it grows is dust dry. Rather uncommon Borageworts are *Cynoglossum officinale*, with purple flowers; and *Echium vulgare*, of a brilliant hue. The latter is so abundant in places as to give a most decided hue to the existing vegetation. The stems grow from 1 to 3 feet high, bearing scorpionid racemes (not cymes, as they are used to be considered), densely arranged over great part of their length, and are highly conspicuous and effective. *Orobancha minor*, with its dingy brownish-purple flowers, is by no means a fastidious parasite, but seems to affect a host of plants of widely different affinities. Here it occurs on the tuberous root-stock of *Arrhenatherum elatius bulbosum*. In the

deep shade of trees, where few of the above-mentioned subjects would maintain an existence, the curious Liliaceous plant, *Paris quadrifolia*, enjoys a cool retreat, although not altogether unmolested home. The leaves vary from four to seven, and the flowers, although far from attractive, are interesting, as the plant is rare or local.

Notable amongst the flowers of the cornfield are *Specularia perfoliata* and *Papaver Argemone*. The latter is the smallest of British Poppies, and is rendered conspicuous by its bright scarlet flowers with black spots at the base of the petals and finely-divided foliage.

In spite of the broiling sun and the steep ascent, one is impelled to climb or scramble up the best way practicable, through a rampant and tangled vegetation, whether pathless or otherwise. Scattered about in the most careless and natural manner are the Bee Orchis, Wild Thyme, *Erodium cicutarium*, and broad patches of *Hippocrepis comosa*, and a host of other choice subjects too numerous to mention. Later in the season *Chlora perfoliata*, *Erythraea centaurium*, and *Epipactis latifolia* will keep up the floral display. *Daphne laureola* having flowered early is now bearing its clusters of black berries. *Lathyrus sylvestris* covers a wide range in this neighbourhood, extending for some miles at least along the lower slopes of the hills, and later on will make a bold and lasting display.

Once the summit is gained the eye ranges over a wide tract of pasture-lands and cultivated fields variously defined by brooks, pathways, and hedge-rows, forming endless and fantastic outlines. Farther off, Redhill, Nutfield, and Bletchingly appear to nestle embosomed and sheltered amidst verdant clumps of trees. In another direction the vision extends uninterrupted to the familiar and characteristic towers of the Crystal Palace at Sydenham. *F.*

HOME CORRESPONDENCE.

Fairy Rings.—I measured the diameter of an enormous fairy ring to day on the chalk downs on the west side of Dunstable. It was exactly 60 feet in diameter, and was dark brownish-green in colour. This dark brownish hue was not owing to the presence of rank growing grasses but was almost entirely due to one broad and continuous growth of wild Thyme (*Thymus Serpyllum*). Dotted amongst this wild Thyme were numerous plants of the common Rockist, *Helianthemum vulgare*. Both these plants are diffused over the downs, but they both show a most distinct and special liking for the fairy rings. The common *Hippocrepis comosa* is also frequent on the downs, but it is curious that this plant appears to avoid the rings. It is seldom to be seen on them. The *Helianthemum* of the rings is of a more sulphureo-yellow colour than the *Hippocrepis*. The light sulphureo-yellow tint of the *Helianthemum*, on the circles of dark Thyme, with its purple flowers, looks very curious and pretty, and the contrast with the darker *Hippocrepis* can be readily seen. *W. G. S.*

Certifying Plants at the Royal Horticultural Society's Show.—I see this week another peculiarity of the system of certifying plants by the committee of the Royal Horticultural Society. It is that they gave a First-class Certificate to *Angoulea Ruckerii*, sent up by Sir Trevor Lawrence; but they did not give one to the plant sent up by Mr. Iogran on May 26, which had seven flowers, nor did they to one I sent up last year with the variety *sanguinea* (to which they did give one). Again, the plant of *Cattleya delicatissima*, sent up by the New Plant and Bulb Co., which I believe is a pure white-lipped, rosy-spalled and petalled form of *C. Mendelii*, was denied one. I also sent this variety up to the Conference, and that day my plant was denied a

certificate. Surely a form of *C. Mendelii* named *leucoglossa*, which has a white lip without any blotch, and has rosy (though faint) sepals and petals, is worthy of certificate. There is growing dissatisfaction as to the manner in which certificates are given or withheld; and it behooves the committee to give them as they should be given. It may be there are too many on the committee who know so little about Orchids that they vote in a manner that is divergent with the voting of the orchidists, and thereby cancel the vote that should be given. If it is so there should be an Orchid committee alone, and as there are plenty of people who know enough of Orchids who would act it should be considered by the Council for future years. There are scores of good plant-growers who know no more about an Orchid than it knows of them: if there are such on the committee they have no business there. *De B. Craushay.*

Libson Parks and Gardens.—Will you kindly allow me to make a correction in the note on the above heading in your issue of last Saturday (p. 826). "Portico" ought to be "patio." For the benefit of those who may not know the term, I may say that it is the Portuguese name for the quadrangular parcel of ground so often seen in the centre of houses in that climate. When this space is used as a garden it is still so termed, in contradistinction to "quinta," which would correspond nearest to our kitchen garden. The walls of the house round the "patio" are generally more or less furnished with balconies, which afford a delicious cool resort during the burden and heat of the day. Some of these "patios" are merely stone or tile pavements set around a fountain, with perhaps *Camellias*, *Loquats*, *Neriums*, or something else in each corner, according to the discretion of present or past owners. Others again have mixed beds of flowering and foliage plants, and a balcony overrun by climbers; such an one had I in my remembrance when writing the sentence. *C. A. M. Carmichael.*

Red-Spider on Vines.—Having had to force rather sharply, I found red-spider attacking the Vines, and after trying the usual remedy of sulphuring the pipes and running the temperature up quickly for the heat to drive off the fumes, without meeting with the immediate success I desired, I resolved on other measures and set to work with the garden engine, charged with clear soft water, with which we quickly washed the insects off, and instead of the Grapes (which are fast colouring) looking any the worse for the sousing it has improved their appearance, and they give every promise of finishing up with a very fine bloom. The way we managed was to get well under the Vines, so as to catch the leaves right, when the water was driven at them in a continuous rushing spray, which at once broke the webs of the spider, without harming the foliage. The time we set to work was about 3 o'clock in the afternoon, when we set the house wide open and had a good fire under the boiler that the Vines and Grapes might dry quickly, and to hasten this we now and then gave them a knock or gentle shake, to bring the big hanging drops down, and they fell in showers. I once tried the same experiment when the Grapes were about the size of Peas; they got a little damaged then, the skins being too tender to stand the dashing of the water, and the knocking or chafing together of the berries it caused. At a later stage, like the above referred to, no one who has red-spider need hesitate to do as we have, and wash them off, but care must be exercised not to break or make holes in the leaves, which is soon done if the force of the water is not regulated to what they will bear. *J. Sheppard.*

Tacnias Dying.—It is difficult, without seeing "H. K.'s" plant, to say what is the cause of the shoots dying in the manner indicated at p. 769 of our last volume. But have known shoots of *T. Van Volxemii*, when infested with white scale, to die in that way, and the cause, owing to the shoots being a good distance from the floor line, was not at first sight obvious. It is, therefore, just possible that the shoots of "H. K.'s" plant may be similarly affected. Or it may be that they are, or have been, tied too lightly to the trellis, or are in contact with unpainted galvanised wire. I would, therefore, advise your correspondent, if he has not already done so, to thoroughly examine his plants, cut clean away the decayed shoots, wash the individual plants and shoots with a sponge and soft-soapy water if necessary, train the same thinly

and loosely underneath the roof of his conservatory, and then give the plants a good watering at the roots, which, seeing that "H. K. 3" border is about the same size as the one here, and well-drained, should be repeated at least three times a fortnight during the summer and autumn months, with occasional applications of liquid manure, and whenever the flowers do not open, it is in a border made like your correspondents', and presumably full of roots, an indication of dryness at the roots. Shoots should not be stopped, but simply thinned out to prevent them from becoming crowded. Thus treated, and with proper ventilation, satisfactory results may be looked for. *H. W. Ward, Longford Castle.*

Flowering Shrubs in Suffolk.—Is not this year exceptionally a flowering year? The Hollies have been white with blossom, and even the flowering of forest trees—Oaks, Sycamores, &c.—has been unusually profuse. The Ban'sian Roses have been masses of bloom, and the Pomegranate blossoms just expanding promise us wreaths of their lovely scarlet flowers. Lilacs, Laburnums, Rhododendrons, and double May trees have made the garden one glorious nosegay; and the orchard, so gay a few weeks since, promises a splendid crop. *Myrtle.*

Eucalyptus globulus.—Mention having been made in your columns recently respecting the Australian Gum trees, and of the difficulty experienced in getting the seed to germinate, allow me to say that I have found the seed of *E. globulus* to germinate most freely. In the spring of 1879 I purchased seed of this species of Mr. Treseder, of Sydney, which had been obtained from Tasmania, and which was at least a year old. It was brought to England without any special precaution to protect it from the sea air (being merely wrapped tightly in a fold or two of paper), and sown in the autumn of the same year; in about fourteen days nearly every seed grew. The three strongest were selected, and are now grown to strong young trees 15 feet high, the largest being 9 inches in circumference at 3 feet from the ground. Unfortunately, from being in an exposed situation they have suffered much from the cold winds, the result being that the largest has lost nearly all its leaves and the extremities of the branches are dead or dying, but strange to say it is budding out all the way up the trunk from the ground. It has twice had the top broken off by the wind. Having lived through these mishaps, it is easy to conceive what the tree would have become had it been planted in a position favourable for its development. One of them has developed foliage quite different to the others, and is evidently harder, having retained its leaves. Of several seedlings raised each has exhibited some slight peculiarity of leaf; they have at first been opposite and ovate or ovate-lanceolate, ultimately becoming alternate and lanceolate; the young stem and branches being tetragonal; but in the exception mentioned the leaves have been not only different in shape but different in texture, being coriaceous and more like the common Australian Gums; the bark of the young stem is also different, being smooth, round and red. (I enclose a few leaves of this one for your inspection). The roots of this tree were a good deal meddled with at the time of planting, and had a quantity of manure applied to them. Whether the change in the foliage, &c., was the result of one or both of these causes, or whether it was from a seed of a different species, it is impossible to say. The leaves, at first, showed no perceptible marked difference from the others. I believe, myself, that all the seed was true *E. globulus*; if so, it shows to what an extraordinary extent the foliage and habit of the *Eucalypti* may vary, and gives some indication of the difficulties overcome by those who first undertook the differentiation of the species of this difficult genus. Last spring I sowed some more of the same seed when it was at least seven years old, and at the end of about four weeks nearly every seed germinated as before, the only difference being that the seed was longer in germinating and the young plants did not grow quite so fast as those of the first sowing. I have given the young plants away to different persons, but few seem to comprehend that such small plants can belong to a class of trees, individuals of which have been known to reach the enormous height of over 400 feet, and evidently regard the statement as somewhat over the left, consequently the plants are kept too long in the pots instead of being at once planted out where they are to remain. I believe the best way would be to put the plants

where they are to remain when they are about 12 or 18 inches high, as the pots soon become choked with roots: this would give the tap-root a chance of descending perpendicularly, which is essential to the well-being of the trees. If this were done, and some protection afforded during the first two or three winters, this species would do well in the warmer parts of England (and indeed Scotland, as is evident from the communication of your correspondent, the Rev. D. Landsborough), provided suitable sites be selected for planting; these would be on the warm slopes of sheltered valleys, where the trees would not be exposed to the winds, and where the bed-rock is some depth from the surface. When the seedlings are only an inch or so high they have roots 4 or 5 inches deep, so that the necessity of providing depth of soil is apparent. Whilst on this subject I cannot help expressing regret that the magnificent timber trees of Australia should have been so ruthlessly destroyed—all along the coast from Melbourne to Sydney the scenery is marred by thousands of dead trees which have been killed by the process of ring-barking, so say the squatters, for the sake of the grass. Whether the end justified or was attained by the means is open to question; there cannot be much doubt that the climate has been prejudicially affected in consequence, and some of the colonists are waking up to the fact now it is all but too late. *Frank Canning, Bristol, June 4.*

Pollen Pellets.—Probably those masses of pollen sent by Dr. Wallace to the Scientific Committee were deposited by *Osmia rufa*, one of our commonest wild bees. The bee found what seemed a convenient place for nidification, and then some human monster (I hope the lady will forgive me) opened the window and spoilt everything. *Entomophile.*

The Auricula.—Will you allow me to state that of the four types mentioned in your last article on the origin of the garden Auricula two are, according to Professor Kerner, hybrids, viz., *venusta*, Hort., *Auricula* × *carolinica*, and *pubescens*, Jacq., *Superauricula* × *hirtata*. *P. venusta* is only found in *Carniola*, not on *Monte Baldo*, as formerly was believed. *O. Forster, Lelenhof, Austria.*

Tying Plants.—How often one sees plants tied, twisted, and contorted out of all natural shape, to the great detriment of the luckless specimen so operated upon in more ways than one. While admitting that some plants lend themselves more readily to this style of treatment than others, I do not for a moment think that any plant looks so well when it is tied down, or up, as the case may be, without a twig out of place, as it would were it allowed to have a little of its own sweet will, and exhibit some of its natural habit. I allude to both plants in pots and planted out against pillars. How often one's feelings are outraged at the sight of a large climber trained up a pillar in a stiff-looking conservatory, tied in to its supports as tightly and closely almost as a Birch "besom." Now would the plant not look much happier if allowed a little more freedom, and will any one deny for a moment the improved appearance to the house were the longer shoots allowed to hang loosely? They might not just give an effect at once, but the shoots, leaves, &c., will soon adapt themselves to circumstances, and look very pretty. I remember once seeing a fine plant of *Clianthus puniceus* in fine flower, but it was tied in to the pillar of that conservatory, and a more "badly used" looking object you could not well imagine, whereas if it had but been left to throw its fine graceful shoots out from the pillar a little, it would have been a thing to admire, and would have afforded a relief from the painfully exact routine of the house. To go back again to plants in pots, I will take *Azaleas* as an instance, and I know I am treading on rather dangerous ground here, but assure all that I have no wish to hurt any one's feelings by writing against their particular hobby, but those that are so much in favour of those established ideas that *Azaleas*, to look well, &c., should be an exact pyramid and have the flowers regularly distributed over its surface, &c. I would simply ask them to see a large plant of the old *A. indica alba* or others allowed to grow in freedom, and see the pleasing effect produced by its introduction amongst Palms, Ferns, &c. Of course I do not advocate letting it grow where and how it likes; keep it within reasonable bounds by all means, but do not adopt the fearfully exact shape so much in vogue. I believe the chief

argument in favour of close tying is economy in space: this we all know is a perplexing problem to all gardeners, who, no matter how much glass they have, invariably require more, but against this may be reckoned the time taken up with the operation, also in case of an accident, such as anything falling up against it, or getting a knock in transit, the specimen that is tied will take more harm than one not. And will any one imagine that plants can be as effectively arranged with others when tied into a "bunch" as they can when growing gracefully and free? *F.*

Diseased Tomatos.—Can you kindly explain the cause and give a remedy for the spots on the Tomato leaves herewith enclosed? The plant when so attacked is generally enfeebled, and the fruit, if set, will not develop. It is prevalent in a district where Tomatos are extensively grown under glass for the market, *W. A. & Co.* [The orange or pinkish spots infesting the Tomato foliage are caused by a fungus named *Dactylium lycopersici*, by Mr. C. B. Plowright. A description and illustration of the fungus is to be found in the *Gardeners' Chronicle* for November 12, 1881, p. 621. If possible the diseased leaves should be gathered and burnt. *W. C. S.]*

Fabiana imbricata and **Ceanothus Veitchii**, &c.—Amongst the many plants in the nurseries at Monifeith, Messrs. Laird & Sinclair's, is a grand plant of the above, about 5 feet high, trained against a wall. Covered with its pure white *Erica*-like flowers, what a grand plant as seen here; a great pity not more generally grown and known. Another telling plant close by is *Ceanothus Veitchii*, trained in the same way, covered with its bright azure-blue flowers, fine branching spikes, contrasting well with the former. Some specimen *Deutzia gracilis* also, 3 to 4 feet high and as much through, are laden with flowers also. These nurseries contain an extensive and varied collection of ornamental trees and shrubs and a superb collection of herbaceous and alpine plants, which are now to be seen in flower in the well arranged beds and borders, contrasting nicely with the ornamental plants. *A. O.*

A Charming Bed.—It is one designed by Mr. J. Hudson, of Gunnersbury House. It is a circular bed of medium size, on the grass plat, and is planted in this way:—In the centre is the Persian yellow Rose pegged down, round this is the Apricot-coloured Austrian Brier similarly treated, and as a margin to the whole a ring of the pretty blue *Nemophila insignis*; then from amid the Roses rise up plants of *Hycacinthus candicans*. This is at its rate an unusual bed, and with the Roses and *Nemophila* in bloom at the present moment, makes a very unusual one, and it is a great relief from the stereotyped flower beds one sees much too often. *R. D.*

Mealy-bug on Vines.—Thinking that a detail of my experience might prove useful in getting rid of the above pest, I will give you a short history of the case. About five or six years ago I introduced a fine plant of *Stephanotis* into a corner of my vineyard, where for the first year it appeared healthy, and flowered abundantly. The next it was infested with mealy-bug, on which I removed it from the house; for the next three years my Grapes were entirely ruined, and the Vines became unhealthy in spite of every application I could think of. I tried sulphur, Fir-tree oil, and the usual recipes for washing the rods, besides fresh soil, paint, and whitening, without effect; but thinking it probable that the eggs or larvae were deposited in the earth (the Vines being planted inside), I thought I would try the application of soot to the roots externally. This year I am happy to say no mealy-bug has manifested itself, and I have great hope that a cure has been effected. As in *Phylloxera* the mischief begins at the roots, the application of soot may be of service in that terrible pest. I wonder whether it has ever been tried. *James C. Earnham.*

Morello Cherries.—Whether it is the result of electricity or not, I was last year deprived of a very fine Morello tree in mid-season. It had set its crop of fruit, and, equally healthy with those near it, suddenly it withered and died. On taking it up in the autumn I could detect nothing in the roots or stock that would give me any reason to suspect the cause of it. I have had Pears, Roses, Clematises die in exactly the same manner, and have attributed it to

some composition in the soil peculiar to this locality. In the case of the Rose it was saturated with water several times, and ultimately recovered. This was one of about 400 dwarfs planted in one border. The cause was not dryness at the roots, because only the day before I had cut an exhibition bloom from it; the next day it was all withered up. *D. C. Powell.*

The Rosefield Vandas.—My Vandas bruised blooms are mentioned on p. 823. In justice to them and the packing, please insert that they first opened on April 19, and travelled nearly 200 miles to four shows, and of course were packed and unpacked eight times, making sixteen operations. *De B. Crawshaw.*

The Position of Certain Stems in Plants.—In reply to your query regarding the above (*Gardeners' Chronicle*, June 13) the plants to which I more particularly referred were various species of Iris, notably our native *I. pseudocarus*, and the two foreigners, *I. gigantea* and *I. cristata*. A somewhat similar sample may be found in the leaves of our common Beech tree, the position and arrangement of the chlorophyll cells in those exposed to strong light being quite the opposite of such as grow in the shade. *A. D. Webster.*

Kandy (Ceylon) Exhibition.—Messrs. James Carter & Co., London, seed growers and merchants, have obtained the highest prizes, consisting of four Silver and six Bronze Medals, for the produce of their seeds at the Agri-Horticultural Exhibition held at the above place. *V. G.*

Candytuft Empress.—It is not often that a plant receives from the Floral Committee of the Royal Horticultural Society a First-class Certificate of Merit twice, but if the records of the doings of this body are examined it will be found that this very plant, which on Tuesday, June 23, received a First-class Certificate of Merit as Candytuft Empress, was previously awarded the same distinction in August, or early in September, 1883. It was then shown by Messrs. Biddis & Co., of Loughborough, under the name of Giant White Rocket Candytuft, and the Floral Committee awarded it a First-class Certificate of Merit, bestowing upon it the name of Iberis Empress. It is now shown as Candytuft Empress, and similarly honoured. If it received twenty First-class Certificates of Merit they would be deserved, for it is a great and remarkable advance in white annual Candytufts. The credit of originating it belongs rightly to Mr. James Dobbie, of Renfrew, an enterprising florist, who has done good work in the way of selecting very fine types of flowers and vegetables. This Candytuft was first sent out as Dobbie's White Giant Rocket Candytuft. I think Mr. Dobbie was a little too anxious to get it into the market, and so introduced it before its fine character was thoroughly fixed. I have seen seedlings from it varying considerably in character, some comparatively small, others wonderfully fine; and it was this last type that was shown on June 23. It should be grown by all lovers of hardy annuals. But under whatever name it may be known let Mr. Dobbie have the credit of having originated it. *R. D.*

Rhubarb Stork's Monarch.—I beg to corroborate the remarks of Mr. Cullingford at p. 827 respecting this variety. Its being of a green colour and large size may perhaps not find it favour with the market gardener or salesman, but for private establishments it would be appreciated, its flavour surpassing any other variety I know. *D. C. Powell.*

Double Primula sinensis.—These are admirably done at Shipley Hall, near Derby, by Mr. W. Elphinstone. There appears to be something novel about his method of management, and it does appear to have a great deal to do with the production of such finely grown and flowered specimens, fully 2 feet through, representing specimens such as one seldom sees. Mr. Elphinstone grows on young plants every year, and propagation commences as soon as possible after the specimens have done flowering. The plants are dried off gradually, and some powdered charcoal is laid upon the surface. Then the side shoots are cut half through with a sharp knife on the upper side, so that the half divided shoots sink down without becoming severed from the plant, and the charcoal beneath reduces the risk of decomposition. Here they remain for a few days, when the plants are placed in a temperature of something like 55° to 60°,

where they put forth roots at the point of half severance, then they are taken off, potted, and plunged into a strong bottom-heat. They are then potted on as necessary and grown on coldly through the summer until the autumn, when they have a more generous treatment. Growing in this manner, it is not surprising that Mr. Elphinstone exhibits such splendid plants at the Manchester Chrysanthemum shows, and it is not with the ordinary double white that Mr. Elphinstone is so successful, but with Mr. Gilbert's fine varieties, such as Marchioness of Exeter, White Lady, and Earl of Beaconsfield, also with Miss Eva Fish and Empress. This appears to be a new departure in the matter of propagating double Primulas; it is quite certain that it is a very successful one. *D.*

Foreign Correspondence.

LISBON BOTANIC GARDEN.

THE Botanic Garden is a recent formation in Lisbon. It is situated on some high ground in the city, sheltered, but not close. The curator, Mons. Jules Daveau, a young botanist, with no mean future before him, and who has already done good work in his pamphlet on the *Euphorbiacées du Portugal*, has fulfilled his duties in such a way that the garden in every way exemplifies the climate. This is high praise, for Portugal, in addition to a very rich indigenous flora, is naturally adapted for the growth of, amongst others, nearly all the Australian trees and shrubs, and a goodly number of Palms and Brazilian and Mexican plants. Vegetation from Madeira, the Canaries, and even the more distant Cape of Good Hope, seems only transplanted to a second home. The Palms in the open air are most interesting. The collection is a good one, and the growth of the young trees extremely vigorous and rapid. In an avenue in the lower part of the garden, the Palms in which are eight years from seed and four planted, have been matured in this short space of time into imposing proportions. Being composed of different varieties, a reliable estimate can be formed of those best adapted for the country. In this regard Washingtonia (Pritchardia), *Brahea filamentosa* undoubtedly bears away the palm. To quote Mons. Daveau's words, it is "*le roi des Palmiers ici en Portugal par la force de son végétation.*" A specimen near the conservatory is the tallest in Portugal, and is perfectly proportioned. Others that may be set down as successes are *Cocos flexuosa*, *Livistonia chinensis* (the Lantana Palm), *Brahea Rozei*, *Howea* (Kentia) *Forsteriana*, *Phoenix reclinata* (20 feet high), *Livistona* (*Corypha*) *australis*, *Rhopalostylis* (*Areca*) *Baueri* and *spida*. The Cycads likewise flourish, and mention can be made in particular of *Encephalartos villosus*.

I will not attempt to enumerate more than a few of the noteworthy trees. Lisbon is not so far away, and Cintra is one of those places a man ought to see before he dies. The collection of the genus *Ficus* approaches completeness, and includes fine specimens of the taller growing species. Some of the Sterculiads have attained to considerable heights. *Chorisia speciosa*, from Brazil, is furnished with a trunk 10 to 12 inches in diameter, and is most formidably armed with spikes. *Brachychiton populneum*, a number of the leaves on which were trilobed, and acerifolium are likewise well represented: the latter variety is quite a sight when in flower. Of the Leguminosae, noticeable were the prickly Parkinsonia and the *Cesalpinias*. Other trees and shrubs that are among the features of the garden are *Janipha manihot*, *Jatropha cocinea*, *Fabricia levigata*, *Aralia capitata*, *Cassine Maurocenia*, *Eucalyptus*, *gomphecephala*, *Rhopala corcovadensis*, *Stadmannia africana*, *Draecena indivisa*, *Musa sapientum*, and *Astrapea Wallichii*. Besides the above there is probably the finest specimen of *Casuarina tenuissima* in Europe. A more interesting, and at the same time pretty tree it would be hard to pitch upon. *Strelitzia augusta* forms a dense mass of striking foliage.

The borders of flowering plants were well filled and carefully arranged. As is only natural, the *Cistuses* were in great number: I noticed particu-

larly *albidus*, *lanigerus*, *hirsutus*, and *salvifolius*. There was also a full collection of the indigenous Irises. Near the Irises were bulbs of *Gladiolus segetum* and *Colvillei*, *Muscari comosum*, *Babiana villosa*, and *Lixia maculata*, all being in flower in the beginning of April. M. Daveau has been very successful in growing *Orchides*. In flower at the same time were *Orchis fusca*, *Serapia cordigera*, *oculata*, and *lingua*; *Aceras antrophosphora*, and *Anacamptis pyramidalis*. A striking plant allied to the *Eschscholtzia* is *Hunneemannia fumarifolia*. It is a native of Mexico, and produces brilliant yellow flowers. This was in flower also, together with various *Echiums*, *Aloe alba cincta*, and *Agathaea amelloides*, one of the prettiest blue flowers in cultivation. It is extraordinary why it is so little seen. The flower is shaped like a Marguerite, but the ray-florets are a pure blue. The same remark applies to *Mesembryanthemum tricolor*, the eye of which is purple and the petals white, edged with carmine. It is an exceedingly beautiful annual, that flowers very freely under Mons. Daveau's care, as also does *crystallinum*. To end this list of outdoor plants there is an extraordinary example of *Scabroa cretica*, 5 feet high, and thick in proportion.

The glass accommodation is not very large. The best *Orchids* were *Arpophyllum giganteum*, *Zygotetralium crinitum*, and *Ada aurantiaca*. Among the Ferns prominent were *Asplenium nidus*, *Lomaria splendens*, and *Platycerium Willinkii*. *Caryota urens* was the most striking of the Palms. I have written a very imperfect account, but I hope I have said enough to show that these gardens ought not to be missed even by a visitor to Lisbon, who is only superficially bitten by horticultural taste. *C. A. M. C.*

Reports of Societies.

EDINBURGH BOTANICAL: June 11.

THE Society met in the class-room, Royal Botanic Garden, Professor Dickson in the chair.

The following communications were read:—

I. "On the Germination of *Ruscus*, *Myrsiphyllum*, and *Asparagus*." By Professor Alexander Dickson, M.D. With illustrative specimens.

Professor Dickson exhibited seedlings of *Ruscus*, *Myrsiphyllum*, and *Asparagus*, chiefly in illustration of the postscript to his paper on *R. androgynus*, recently published in the Society's *Transactions*. Since that date the seedlings of *R. racemosus* had each produced (as was anticipated) a well-developed foliage-leaf of somewhat similar character to those produced in *R. androgynus*. In neither *R. aculeatus*, nor *Myrsiphyllum*, nor *Asparagus*, was there any trace of foliage-leaves.

Professor Dickson also exhibited seedling plants of the remarkable South African *Rhoeo* *ovata*, which, where in the adult condition the leaves are all reduced to small scales, and the leaf function is performed by the green tendril-like branches. In the seedling condition, however, there are developed true foliage-leaves, elongated, linear, channelled on the upper surface, and semi-cylindrical on the lower. For detection of this case Professor Dickson said botanists were indebted to Mr. George Oliver, one of the foremen in the Royal Botanic Garden.

II. "Note on the Prairie Grasses of Manitoba, with exhibition of specimens." By Andrew Taylor.

III. "Report on the Progress of Vegetation at the Royal Botanic Garden." By Robert Lindsay, Curator.

The month of May was unusually cold and ungenial, much rain and frost occurred during the first three weeks, which retarded the vegetation considerably. In the last week of the month, when good progress was made, a change of temperature having taken place. The season being a late one no permanent damage has been done; the only plant seriously damaged was *Dielis* *pectinabalis*, which had its flowers destroyed. The thermometer was at or below the freezing point on five occasions, indicating collectively 13° of frost (this is the greatest amount of frost registered in May since 1876, when 26° occurred. Last year no frost was registered in May). The lowest readings were, on the 6th, 20°; 7th, 23°; 8th, 29°; 21st, 28°. The highest readings were, on the 10th, 59°; 26th, 59°; 27th, 58°; 28th, 63°; 30th, 57°; 31st, 60°. The highest day temperature was 71°, on the 28th, (and the lowest 45°, on the 3d). The foliage of the ordinary forest trees are well developed, flower-buds are numerous, but late in expanding. By May 31 we generally have the Horse Chestnut, *Pavia flava*, *Laburnum*, *Lilac*, *Hawthorn*, and varieties of *Sorbus* in flower. This year we have only had double *Cherry*, *Geno*, *Apple*, and varieties of *Maple* in bloom, but they have been very well flowered; *Magnolias* on walls are better set with flower-buds than they have been for several years back. *Narcissus*, *Tulips*, and hardy spring bulbous plants generally have flowered well, the earlier kinds are now forming seed freely. On the rock garden 139 species of hardy plants came into bloom as against 228 for the same month last year. Only forty-

two plants are of the same species as those recorded for May last year, the remainder having yet to bloom.
Among the finest which flowered were—

Andromeda fastigiata	Enkianthus himalaicus
Androsace chamaejasme	Linaria alpina
" villosa	" origanifolia
Anemone pulsatilla	Mertensia sibirica
Anemone narcissiflora	Myosotis antarctica
" alpina	Oleandra Gunniana
Androsace Menziesii	Penstemon Menziesii
Alyssum alpestre	Phlox amurensis
Coronilla Maritima	" stolonifera
Coronilla minima	Primula veris
Daphne cneorum	" ebronica
Dianthus gelidus	" sikkimensis
Dodecatheon integrifolium	Rhododendron lepidotum
Dracopis plumulosus	" " " " "
Erica australis rosea	" " " " "

IV. "Report on Temperature, Vegetation, &c., in the Garden of the Royal Botanic Institution, of Glasgow, for May, 1885."

During the first half of the month 25° of frost were registered, the lowest readings being 27° during the nights of the 4th and 5th respectively. The day temperatures during the early part of the month were also correspondingly low, cold east and north-east winds prevailed, and with an occasional shower of hail and sleet, was anything but May-like. The weather during the latter half has also been variable, and generally cold, the highest temperature recorded being 64° (made) on the 28th. Owing to the untoward weather vegetation has been considerably retarded; the leaves of some hardy trees such as the Horse Chestnut and Bird Cherry, have a blighted look. Late-leaving trees, as well as hardy herbaceous plants, are still in advance of last year. Late-sown seeds have germinated freely. Deciduous trees and shrubs of all kinds are blooming freely, and there is every prospect of a good fruit season.

V. Miscellaneous communications:—
1. Dr. Buchanan White sent the following note:—"I wish to exhibit, on behalf of Mr. James Brebner, of Dundee, and a Fellow of the Society, the accompanying specimens of a plant which Mr. Brebner gathered in the neighbourhood of Loch Tummel, Perthshire, in July last, and which I have recently identified as *Scheuchzeria ferruginea*, C., a species which has not hitherto been recorded as British.

"S. ferruginea can be readily distinguished from the allied *S. nigricans* by being smaller in all its parts, by the shorter and more erect lower bract, fewer spikelets (usually two but often only one), and a flatter smooth or almost smooth on the back. From its European distribution it was not unlikely to occur in Britain, and will probably occur elsewhere in Scotland if looked for."

2. Mr. C. C. Babington sent the following note to Mr. Taylor regarding an accidental error in the last fasciculus of the *Transactions*:—" *Viola stagnina*, new to Britain (p. 165, line 14).—What does Mr. Evans mean? It was given by me as a British plant in the *Manual*, ed. 3, p. 36, A.D. 1851. I gathered it in Botolph Claydon in 1826, but we then contended it was *Viola lactea*. On our present *Man. canina*, p. 165, line 14. Henslow published it under the name of *V. lactea* in his *Catalogue of British Plants*, ed. 2, 1835, 'as a native of Cambridgeshire.'"

Mr. Dunn, Dalkeith Palace Gardens, exhibited a bunch of *Encalyptus sibirica* with flower-buds, from a plant in the garden at Dalkeith Gardens.
Mr. Lindsay drew attention to a flower of *Phyllocactus angulatus*, which was sent to the meeting from the garden at Trinity Grove, and to a plant of *Iris ibérica* from Mr. Munro, Abercorn Nursery, Fiershill; and to several other plants in flower from the Botanic Garden, among which were the following:—

Androsace foliosa	Primula herbunda
Allium rotundifolium	" " " " "
Arisaema triphyllum	" " " " "
Dianthus glaucalis	Silene quadridentata
" hybridum neglectus	Myosotis alpestris
Delphinium Bronnianum	Saxifraga odontophylla
Polygonum affine var. Bru-	" " " " "
nonia	" " " " "
Primula prolifera	Linaris angustata, &c.

TORQUAY HORTICULTURAL.

The annual Rose show of this Society took place on Thursday, June 25. It was held in the private grounds of Apsley House, which were admirably adapted for the purpose of the exhibition, being sheltered from gales, which have on previous occasions caused great anxiety to the committee. It was more central, and therefore more easy of access than the site chosen on Torquay. Rose growers in the neighbourhood had to put up with showery weather on a day or two previous, just sufficient to damage their blooms, and of course could not stand very strongly against the Oxford growers, who had been favoured with the best of weather for Roses. One or two large growers backed out of their engagement. As it was, there was more competition than in many former years. Prizes for plants were greater than usual, and should have brought many outsiders, but competition was entirely confined to the neighbourhood. Fruit and vegetables were good, but not very numerously contested.

ROSES.

Cut blooms (open):—twelve new Roses of 1884 and 1885, one truss of each.—1st, Messrs. Curtis, Sandford & Co., Devon Roseries, Torquay. Their box contained Caroline Savales, very fine Rose; Madame B. Mackart, Joseph Mital, Mlle. M. Rodocanachi, Mrs. G. Dickson, very fine Rose, like Madame G. Luise, but with a satiny Rose; Alphonse Superb, Mdlle. Julie Gaulain, Madame Dole-

vaux, President Sinclair, Benoit Comte, dark crimson; 1st d. Madame Rambau, 2d, Messrs. Cooling & Son, Fath—Marguerite de Romaine being the best in this collection.

Six blooms of any new Rose of 1884.—1st, Messrs. Curtis, Sandford & Co., who had a splendid stand of Alphonse Superb; 2d, Messrs. Cooling & Son.

Twelve blooms of any one variety.—1st, Messrs. Curtis, Sandford & Co., with Ulrich Brunner, a very fine bold growth flower; 2d, Messrs. Cooling & Son, who had Lady Mary Fitzwilliam, a hybrid Tea in very good condition; 2d, Mr. Prince, Oxford.

Seventy-two distinct varieties (one truss of each).—1st, Messrs. Curtis, Sandford & Co., who staged an excellent lot of blooms of good substance and varied in colour, the principal varieties being Magna Charta, a variety showing this season; Madame Rougier, Mrs. Baker, Merveille de Lyon, a beautiful light Rose; A. K. Williams, Prince Arthur, Catherine Mermé, Violet Bowyer, Abel Carrière, Devoniensis, and Helen Pal; 2d, Mr. R. W. Bechey, Fluder Nurseries, Kingscliff, near Torquay; 3d, Messrs. Cooling.

Forty-eight varieties, distinct.—Messrs. Curtis, Sandford & Co., who had specially good Général Jacquemont, Constantine Treliakoff, Victor Verdier, Xavier Olibo, Duke of Edinburgh, Duchesse de Valombrosa, Mons. Nonan, and Madame Lacharmé; 2d, Mr. Bechey, who is coming well to the fore in these classes, staging excellent blooms in all classes he exhibits in.

Thirty-six blooms, distinct.—Here Mr. Prince obtained 1st, having nearly all Teas, in splendid condition, including Alphonse, Madame Lambert, Mons. Furtado, Alphonse Superb, Eticlé de L'oye, A. K. Williams, Niphetois, Lady M. Fitzwilliam, Comtesse de Nadia, Mrs. Catherine Mermé, Amazona, a beautiful sulphur-yellow; Rubens, Adam, Marie van Houste, Souvenir d'Elise Varden, and Anna Olivier; 2d, Messrs. Curtis, Sandford & Co., who staged principally H.P.'s in good form; 3d, Mr. Bechey. Thirty-four varieties (three trusses of each).—Messrs. Curtis & Sandford, carried off the 1st prize, with an excellent lot of blooms.

Twelve Teas and Noisettes, distinct (one truss of each).—1st, Mr. Prince; 2d, Miss Watson Taylor (gr., Mr. F. Gordon); 3d, Messrs. Cooling.

AMATEURS' CLASSES.

Forty-eight varieties, distinct (one truss of each).—1st, Mr. Gordon; 2d, Mr. M. Sparke.

Twelve varieties, distinct (three trusses of each).—1st, Mr. Gordon; 2d, Mr. Leach, gr. to J. Drew, Esq., Park Villa, Kent; 3d, Mr. M. Sparke.

Twenty-four varieties (one truss of each).—1st, Mr. Gordon; 2d, Mr. M. Sparke; 3d, Mr. Cole, gr. to W. B. Fortescue, Esq., Octon, Torquay.

Twelve varieties (one truss of each).—Good competition, and numerous entries in this class. 1st, Captain Christy, with a very nice lot of blooms; 2d, Mr. Gordon; 3d, Mr. W. Colville. Thirty-three varieties, distinct.—1st, Mr. Gordon; 2d, Mr. M. Sparke.

Twelve blooms, one variety.—1st, Mr. Gordon, with a fine box of blooms of Marché Niel; 2d, Captain Christy.

Teas and Noisettes and sk. H.P.'s, distinct.—1st, Mr. Gordon; 2d, Captain Christy; 3d, Mr. M. Sparke.

PLANTS.

Twelve plants stove or greenhouse.—1st, Mr. H. Velland, gr. to Col. Campbell, Torquay; he had a fine specimen of *melea* Hendersoni, *Crasula coccinea*, *Phoradendron insularis*, and a very large *Phoradendron Phorium tenax variegata*, 2d, Mr. F. Ferriss, gr. to J. Kimber, Esq.; 3d, Mr. Coles.

Six stove plants.—1st, Mr. H. Damerel, gr. to Lady Macgregor.

Six stove and greenhouse plants in pots, not exceeding 8 inches in diameter.—1st, Mr. Stoneman, gr. to Captain Fane Tucker; 2d, Mr. Cole. A special prize was offered for fifteen tuberous Begonias, Mr. Bechey securing it, with a well-grown lot of specimens, all of good variety; 2d, Mr. Stoneman—equal 2d, Mr. Ferris—both of whom were close on the heels of the 1st. This class was quite a great feature of the exhibition, the double and single blooms being of unusual size and fine colour.

FRUIT.

Three bunches of black Grapes.—1st, Mr. Coles, with good bunches of Black Hamburgh.

Six Peaches.—1st, H. B. Samuelson, Esq., a very fine bunch of Barrington; 2d, Mr. J. R. Fisher.

Six Nectarines.—1st, H. B. Samuelson, Esq.

The local nurserymen came out strong with collections of plants; these were supplemented with large collections from Veitch & Son and Messrs. Lucombe, Pince & Co., of Exeter, Messrs. Phillips & Co., Messrs. Horn & Co., and others.

RICHMOND HORTICULTURAL: June 24.

This large suburban Society held its annual summer show so early as Midsummer Day, and was singularly favoured by the weather, which was so warm that the gardeners would be surprised to see and the fullest enjoyment obtained from the music the two fine bands discoursed. Held as usual in the Old Deer Park (where we note with regret not a few fine Beech trees have died from want of moisture), the ample space at the disposal of the committee enabled that body to erect ample tent accommodation, indeed one tent, some 230 feet by 60 feet, was one of the finest we have seen, and could but regret that its enormous area was so indifferently occupied. The most pleasing features in this huge canvass erection were the competitive and non-competitive groups of plants, arranged with much effect. Of these the trade displayed,

not for competition, as under.—Messrs. J. Laing & Son, Forest Hill, some superb Begonias set in a frame of foliage plants, in which way these rich hued flowers displayed their beauties admirably. Mr. J. Vander Rees, Footing, had a most interesting group of hardy plants, Peonies, Pyrethrum, *Galium verum*, Liliums, Spiras, Arums, Funkias, Campanulas, &c., that secured much attention. Messrs. Jackson & Son, Kingston, had a charming group of stove and greenhouse plants inclusive of many capital Orchids, and prominent were plants of the pretty pink flowered *Fuchsia diosmifolia*, also many of the well flowered *Ericas*, &c. Mr. S. Drosch, of Kew Road Nursery, staged a huge centre group of Palms, interspersed with *Hydrangeas*, *Lilium lancifolium*, *Iris*, &c., that was more heavy than handsome.

The open decorative groups of 100 feet area were a charming feature. Messrs. Hooper & Co., Twickenham, taking 1st place with a very elegant arrangement; Messrs. Fromow & Sons, Turnham Green, coming 2d with another very pleasing group, though rather too thin at the base; Mr. H. James, Norwood, who was too strong in white *Hydrangeas* and *Marguerites*, was 3d; and Mr. W. Browning, Richmond, 4th. Other small groups formed a pretty feature, and were admirably arranged, the competitors being limited to gardeners.

STOVE AND GREENHOUSE PLANTS

were fairly well shown by Messrs. Jackson & Son and Mr. H. James. The best specimens of *Pineles mirabilis* and *diosmifolia*, *Clarendonum*, *Balfourianum*, *Francisca calycina*, *Ixora Williamsi*, and several good *Heaths*, &c. Mr. James' collection were fine plants of *Darwinia Hookeri*, *Ericas*, *Stephanotis floribunda*, and *Allamanda grandiflora*. These same exhibitors were chief in the lists for six Orchids, Mr. James taking 1st place with literally masses, finely bloomed, of *Cattleyas Mossiae* and *Mendelii*, *Epidendrum vitellinum majus*, *Cypripedium barbatum nigrum*, *Oncidium macrantha*, and *Laelia purpurata*. Messrs. Jackson had good *Oncoglossums*, *Alexandra* and *waxillarium*, *Cattleyas*, *Dendrobium*, &c. Mr. F. Hill, gr. to H. Little, Esq., Hillingdon, had the 3d prize lot, including a good plant of the beautiful white *Dendrobium Dearei*. In the small class for stove and greenhouse plants Mr. Bates, gr. to Mrs. Week, Pottuck Lodge, Twickenham, had capital *Benignilla glabra*, *Allamanda Hendersoni*, *Dipladenia hybrida*, *Sobralia macrantha*, and other good plants, taking 1st place with ease. Ferns, Palms, and ordinary foliage plants were in great force, forming a most uninteresting feature in most shows, and that is far too much is made. Classes for these things need to be abolished thoroughly.

Parlour-gonions, on the other hand, lend ever welcome colour to any summer show, and in this case were well set up by Mr. Little, who had six superb large flowered kinds in *Thebais*, *Ruth Little*, *Fornosa*, *Duchesse de Nemours*, *Comtesse de Choussay*, &c. Mr. Wiggins, gr. to W. Clay, Esq., Kingston, was equally strong in fancies, having really finely flowered plants of *Princess Teak*, *Roi des Fantaisies*, *Queen of the Heliennes*, and *Est. Lyon*.

A special prize for the best group of large-flowered Pelargonium was awarded to Mr. Wiggins, his fine lot of seedling plants including not a few really capital kinds, giving him an easy 1st. Mr. Brown, of St. Mary's Nursery, Richmond, came 2d, with a neat group of small plants; whilst Mr. Little's larger group of half specimens fell far short of wanting.

Some capital zonal Pelargoniums were also shown by Mr. Sallows, gr. to J. T. Flack, Esq., Twickenham, who had finely bloomed *Madame Bolet*, *Madame Thibaut*, *M. Gelein Louange*, and other good doubles. Mr. Waite, gr. to the Hon. Colonel Talbot, Esher, who was 2d, had a finely flowered plant of *Princess Teak*, which was Fuchsiast, usually so strong a feature at Richmond, and very quite unrepresented.

Begonias were fairly good, and some excellent *Gloxinias* were staged.

CUT FLOWERS

always form an important feature, but the open class for thirty-six Roses in trebles, which usually brings good competition, was a good thing for Messrs. Paul & Sons, Cheshunt, as also was the class for twenty-four trebles, this firm being the only exhibitors. Good examples of *Charles Brunner*, *Mlle. E. Verdier*, *Alfred Colomb*, *Xavier Olibo*, *Lady M. Fitzwilliam*, *Mons. E. Y. Teas*, *Henri Ledehaux*, *François Michelon*, A. K. Williams, Mr. Prosper Langier, and Maurice Bernard were noticeable.

Messrs. C. Lee & Sons, Hammanish, put up a very fine collection of *Reichenbachii* H.P.'s, not for competition, that elicited much attention.

In the open class for twelve Teas, for amateurs, the best lot came from Mr. Mitchell, Gerpins, Esher, who had good blooms of standard varieties. The same exhibitor was 1st in the class for twenty-four single blooms, any kind.

Mr. Bates had the best box of stove and greenhouse cut flowers, capital things, but too closely arranged; and Messrs. Hooper & Co. the best lot of cut hardy flowers, a charming collection will set up, consisting of *Poppies*, *Peonies*, *Pyrethrum*, *Galium verum*, and many other showy things, for which this firm has a wide reputation. Mr. Howell, gr. to Lady Parker, Richmond, had very fine *Peonies* in his collection.

TABLE DECORATIONS

were generally excellent, though in the arrangements of a dinner-table for ten persons some effects of a very dowdy kind were produced by local lady amateurs, that were the reverse of pleasing. The best arrangement, which included three simple dressed cent-stands with pretty decorated finger-glasses and six modern table dishes of fruit, was exhibited by Mr. Butcher, of Nor-

wood, the whole calling for the highest approval. Mr. J. R. Chad, Clapham Common, was a fine stand of fruit, rather too carefully dressed, light dymes of fruit, rather too carefully heaped, and white Nymphs simply placed in finger-glasses. Mr. Chad was 1st with three table-stands, elegantly dressed, although the prettiest effect no doubt was obtained by Miss Hassell, Gravesend, whose dressings were admirable, but somewhat marred by rather heavy stands. Mr. Chad had the most solid bouquet, and Mr. Butcher one that erred in being rather too loose, still much better than the general run of show bouquets.

FRUIT.

Mr. J. Munro, gr. to E. D. Paul, Esq., Cambridge House, had the best collection of six dishes of fruit. Mr. Bates coming next with also capital samples, and was 1st in the class for black Grapes, with good Alicantes. White Grapes generally were not ripe.

Mr. Waite had the best collection of twelve vegetables, a really first-class lot; Mr. J. Coombs, of Sheen House, came 2d. Mr. Filself, Cambridge Park, won Messrs. Sutton's prize price for a brace of Cucumbers, with handsome Royal Windsor.

TWICKENHAM HORTICULTURAL: June 30.

HELD in the admirable grounds attached to the Metropolitan Police Orphanage, in pleasant weather, the annual summer exhibition of this popular suburban society not only showed marked advance on preceding ones, but was very liberally patronised. Amongst striking features were seen a beautiful group of stove and greenhouse plants from Messrs. Jackson & Son, Kingston. A fresh and lovely group of pot roses, backed by Japanese Maples, and faced by good plants of *Eryia latifolia* variegata from Messrs. Veitch & Sons. A good group of decorative plants from Mr. R. Laing, of Twickenham, and a very display of Pelargoniums from Mr. Wiggins, gr. to W. Clay, Esq., Kingston, to some few of which Certificates of Merit were awarded.

Messrs. Hooper & Co., of Twickenham, were placed 1st for a beautiful decorative group of plants in the open class, the theories of which were by Mr. Bendishaw's skill in arrangement; Mr. H. James, of Norwood, coming 2d with one in which Orchids largely predominated, but it wanted finish.

The best collection of flowering plants came from Messrs. Jackson & Son, Kingston, in a fine Cleodendron Balaifurium and *Pimelea diosmarifolia*. Mr. James was 2d with large, but not well furnished plants; and Mr. Parsons, gr. to T. Twining, Esq., Twickenham, had in the 3d prize lot a first-rate *Eucharis amanoana*, and a capital piece of *Onocidium flexuosum*.

Foliage plants were about in fair of their kind, but dull and uninteresting. Mr. J. Follows, gr. to J. J. Flack, Esq., Twickenham, had six first-rate Begonias in Snowflake, Lothair, Mrs. Duke, Marquis of Bute, Stella, &c.; the same exhibitor had the best pair of Achimenes, of large masses from 20 to 30 inches through, and full of many hues and markings, and was exceedingly beautiful. Mr. W. Poupard staged a big group of market flowers—Paeonies, Roses, Carnations, Pinks, white and scarlet Sweet Peas, blue Corn-flowers, Cannunculus, &c., in great variety. The best twenty-four cut Roses in competition came from Mr. Warwick, gr. to J. P. Kitching, Esq., Hampton, and Mr. Moorman, Coombe Bank, Kingston, was 2d, both lots of blooms being excellent. In the competition for twelve blooms positions were reversed, and Mr. Moorman took 1st place. The class for cut blooms of flowers was exceedingly attractive, and Mr. Warwick, who from the first seems to have taken the lead, was again placed 1st with some lovely flowers. Dinner-table stands were in great force, and some amateur arrangements displayed unusual excellence. Mrs. Alfrey, and Mrs. Gardner, all showing stands that merited high approval.

The best collection of six dishes of fruit came from Mr. Munro, who had good black Grapes, Gros Mignonne Peaches, Erluge Nectarines, &c.; Mr. G. Trauser, gr. to E. D. Paul, Esq., Cambridge House, some fine Duke of Buccleuch and Frankenthal Grapes, &c. Mr. Waite, gr. to Colonel Talbot, Escher, had the best collection of ten kinds of vegetables. A first-class lot of Hackwood Park was the best Tomato in a good class, and Royal Windsor and Tender and True the best Cucumbers. Mr. Poupard also staged a grand collection of vegetables and hairy fruits.

HARPENDEN.

A WILD FLOWER SHOW.—The practice is now very general at country floral exhibitions of offering prizes for collections of wild flowers shown by children. The competitors, however, rarely seem to understand that more is expected than the mere jumbling together of some many different sorts. It does not occur to them that pleasing and tasteful arrangements to have any influence on the awards. This error is entirely obviated by the capital tuition of Mr. John Henshaw,

the energetic master of the British Schools, Harpenden, who on Thursday and Friday of last week held his sixth annual show of wild flowers and grasses.

To stir up in the rising generation, who are likely to spend most of their days in the country, a pleasure in botanical pursuits will doubtless be attended with many beneficial results, and Mr. Henshaw tries to cultivate in the young minds committed to his charge a love for the beautiful taste in arrangement, and an interest in the flora of the neighbourhood.

The exhibits were arranged in rows of bottles of various sizes, and labelled with the botanical order to which the plants belonged, also the scientific and common English names.

The wild flowers were backed up with some excellently grown exotic Ferns from the conservatories of Mr. H. T. Hodgson (gr. Mr. C. Sibley), and some elegant foliage plants from the greenhouses of Mr. C. R. Fenwick, High Firs (gr. Mr. G. Underwood); these were very attractive, and imparted a tropical-like aspect to the show.

Owing to the limited space at command, the competitors were necessarily confined to boys of the upper classes, and were divided into three sections—Class A., showing different species; Class B., showing three different species; and Class C., showing twenty different species. Besides the ordinary exhibits, a special feature was a prize of £5 offered by Mr. G. Dantford, Ayres' End, Harpenden, for twenty of the rarest wild flowers found on a radius of 5 miles from the school. This prize was taken by Frederic Deller with the following plants:—*Campanula glomerata* (clustered Bell-flower); *Spirea filipendula* (Dropwort); *Cotyledon umbilicus* (Hennywort); *Ophiolepis vulgatum* (Adder's-tongue Fern); *Lychnis diureticum* (Campion); *Alchemilla vulgaris* (Daisy); *Niebschad*; *Anthyllus vulnera* (Lady's Fingers); *Lychnis foli-cuculi* (Ragged Robin); *Epipactis grandiflora* (large Epipactis); *Hebenaia bifolia* (Butterfly orchis); *Hebenaia viridis* (green Heleboro); *Ophrys apifera* (Bee Orchis); *Ophrys nigrata* (Black Bog Orchis); *Orchis troglodytes* (Crog Orchis); *Salvia verbenaca* (wild Sage); *Vicia sepium* var. *alba* (white flowered bush Vetch); *Geranium phoxum* (Lusky Crane's Bill); *Adonis autumnalis* (Pheasant's Eye); *Calamintha officinalis* (Calamint); and *Conium maculatum* (Henlock). The books given for this prize were Margaretta's series, comprising *Rambles in Search of Wild Flowers, British Ferns, and British Grasses*. For fifty specimens, the 1st prize, two books, entitled *Wild Flowers, with 176 coloured plates*, by Anne Pratt, was awarded to Frederic Archer Willis; the 2d prize *Flowers of the Field*, by Mrs. R. G. Johnson; the 3d prize, *Flowers of the Field*, by Mrs. Deller, the winner of the prize for the twenty rarest. The 1st prize in division B., a book entitled *Rambles in Search of Wild Flowers*, by Margaret Plues, was won by George Underwood, High Firs; the 2d prize, *Wild Flowers Worth Noticing*, by Mrs. Lankester, was taken by Edwin Jones, New Farm; and the 3d prize, *Botany for Beginners*, by Dr. M. T. Masters, was awarded to Sidney Longland. In division C., for twenty specimens the 1st prize, *Flowers of the Field*, was taken by Walter Shore, Bowing Alley; the 2d prize, *Botany for Beginners*, being won by Samuel Whitehead, Redbourne; the 3d prize, *Rambles in Woodland*, was obtained by James Fishbourne; and the 4th prize, *Lane and Field*, being secured by William Pearce—the collections of J. Aldridge and Charles Harris, all of Harpenden, being highly commended.

Great credit was to be shown as in former years, by several magnificent collections of hardy herbaceous and alpine cut flowers, to which was appropriated the class-room of the school. These exhibits included a very commendable selection from the nurseries of Mr. J. W. Curtis, of Tottenham. Other further collections from gardens in the neighbourhood, the walls of the schools were adorned with an exceptionally good collection of mounted botanical specimens of British wild flowers, the workmanship of Mr. William Deller, an assistant teacher in the schools.

GARDEN ANNUALS. Balsams, Petunias, Phlox, Zinnias, and Asters were exhibited.

FERNS.

were extensively shown, and in some of the collections, especially Mr. Pate's and Mr. Joukals', were fine specimens of really good varieties.

FOLIAGE PLANTS.

Crotons were a nice lot, well-grown and highly-coloured, by Mrs. Pearce. *Draecenas* were good, sent by one of our most persevering horticulturists, Mr. W. H. Wright, Colombo. Several exhibits of *Caladiums*, *Marantas*, and *Coleus* were staged, and the honours going to the Hon. J. F. Dickson and Mr. A. Whyte.

VEGETABLES.

Two good collections, grown from Messrs. Carter's, R. B. Laird & Son's, and J. Dickson & Son's seeds. Disappointed at the small number of competitors in this class, when our climate is so suitable for their cultivation. Tomatoes were good, The Trophy taking the lead followed by Excelsior and President Garden, the latter very large.

FRUIT.

Small collection; still the Peaches and Plums sent by Mr. Cotton were very fine, and much admired.

NATIVE PRODUCTS.

Paddy, *Oryza sativa*, the most important in this class, was very extensively shown, and some lots contained as many as fifty varieties. Mr. Ingletton was still to be seen with good Potocco and excellent cigars; Tree Cotton (*Bombax nubicarum*), in good samples—an industry lately developed by the natives; fibres, ropes, and seeds fairly represented.

ESTATE PRODUCTS.

The island of Ceylon may well give this class the prim claim; for every one, from the Governor to the Tamil coolie, depends upon our planting enterprise. Collection of estate products poor competition, and not as I expected. Commercial Teas, numerous entries, but owing to some misunderstanding most of the exhibitors had wrongly classified their Teas. A son of the soil, Mr. J. H. Barber, carried off the Gold Medal with Tea grown and manufactured at 2000 feet elevation; he also secured a Bronze Medal for fancy Tea. The fancy Tea first award, also low grown, went to Mr. Maitland, Rakwane. For Coffee in parchment and cured the award went to the Laird of Logie estate, 4500 feet above sea level. Liberian Coffee was also well shown. Cocoa was keenly contested, and several splendid samples taken; the Gold and Silver Medals going to Dunbura Valley, near Kandy, Pallakelle, and Rajasale estates, well known marks in the London market. Cardamoms a fine display. Cinchona, one of the most important exhibits in the exhibition, brought forth some very fine collections and beautiful samples of bark. The Gold Medal, "Kirkles Estate"; Silver Medal, Mr. Q. M. Christie, St. Andrews. Cinnamon, a splendid exhibit from "Ekelle Estate." Other small products well shown.

A nice collection of plants, containing several new and rare, were forwarded by Mr. Nock from Hakgala. Considering that they travelled 10 miles by road and 80 miles by rail, arrived in perfect condition, reflecting great credit on his foreman for careful packing.

This proved one of the most successful exhibitions ever held in Ceylon, leaving the finances in a very healthy condition. The committee have every reason to feel proud of their labours. *J. A., June 4.*

26—	— Fine.						
27—	— Very fine day and night.						

KANDY AGRICULTURAL EXHIBITION.

The first show of this Society was opened in Kandy on May 27 by His Excellency the Hon. Sir Arthur Hamilton Gordon. His Excellency was received at the entrance by Mr. Dr. Trimen (the secretary), and several members of committee. The entrance was through the Buddhist temple grounds, and passing the band-stand on the left, descended into the building over a neat artistic Japanese design of a Bamboo bridge. The building was after the form of a Maltese cross, designed by Mr. Spooner, P.W.D., and erected by prison labour under charge of Mr. Wood, who was specially thanked by His Excellency. Dr. Trimen conducted His Excellency over the exhibition, and he appeared to take an interest in everything as he passed along. The building was entirely open to the air, and not a nail being used. The roof and tables were built of *Bambusa vulgaris*, *B. arundinacea*, and *Dendrocalamus giganteus*, supplied from Peradeniya gardens, and tied down by Cocoa-nut yarn, the roof covered over with "Cadius," plaited leaves of the Cocoa-nut Palm, *Cocos nucifera*. The interior was most tastefully decorated by the Sinhalese headmen with fruit and flowers of the different Palms, Plantains, Fine-apples, Stag's-horn moss, &c.

GARDEN PERENNIALS.

were not extensively shown. Roses poor. Some good Begonias and F. lroniums. The Owen's Gloxinias were fine and would have done credit to any display. The fine stand of bronzed-leaved Pelargoniums from Cannell & Sons' stock were much admired.

June 28.—Very fine day and night.
 29.—Dull morning, fine bright afternoon.
 30.—Very fine morning, occasionally cloudy in afternoon.
 July 1.—Fine, dull day, gleams of sunshine.

LONDON: Atmospheric Pressure.—During the week ending June 27, the reading of the barometer at the level of the sea increased from 29.56 inches at the beginning of the week to 30.16 inches by 9 A.M. on the 23d, decreased to 29.85 inches by 5 P.M. on the 24th, increased to 30.23 inches by 1 P.M. on the 26th, decreased to 30.20 inches by 5 P.M. on the same day, increased to 30.33 inches by 9 A.M. on the 27th, and was 30.24 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.09 inches, being 0.18 inch higher than last week, and 0.10 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 86°, on the 24th; on the 25th the highest was 57°.5. The mean of the seven high day temperatures was 69°.

The lowest temperature was 41°.2, on the 21st; on the 24th the lowest temperature was 55°. The mean of the seven low night temperatures was 48°.5.

The greatest range of temperature in one day was 31°, on the 24th; the smallest, on the 25th, was 11°.5. The mean of the seven daily ranges was 20°.5.

The mean temperatures were—on the 21st, 52°.3; on the 22d, 56°; on the 23d, 59°.3; on the 24th, 69°.5; on the 25th, 51°.2; on the 26th, 54°; on the 27th, 55°.7; and these were all below their averages (excepting the 24th, which was 8°.6 above) by 7°.8, 4°.4, 1°.4, 9°.9, 7°.2, and 5°.6 respectively.

The mean temperature of the week was 56°.9, being 1°.8 higher than last week, and 4° below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 143°, on the 24th. The mean of the seven readings was 116°.8.

The lowest reading of a minimum thermometer placed on grass was 37°.2, on the 27th. The mean of the seven readings was 44°.

Rain.—Rain fell on the 25th, to the amount of 0.12 inch.

ENGLAND: Temperature.—During the week ending June 27, the highest at Cambridge was 86°.3, at Blackheath 86°, at Brighton 75°.5; the highest at Bradford was 61°.9, at Leeds and Preston 65°. The general mean was 69°.8.

The lowest temperatures were 38°, at Wolverhampton and Sheffield, 39° at Hull; the lowest at Brighton was 47°.3, at Truro 47°, at Liverpool 45°.4. The general mean was 42°.3.

The greatest ranges were 46°.7, at Cambridge, 44°.8 at Blackheath, 30°.4 at Wolverhampton; the smallest ranges were 19°.7, at Liverpool, 20° at Preston, 20°.2 at Plymouth. The general mean was 27°.5.

The mean of the seven high day temperatures was highest at Blackheath, 69°, at Cambridge 68°.8, at Brighton 67°; and was lowest at Bradford, 59°.3, at Bolton 59°.6, at Preston and Newcastle 60°. The general mean was 62°.7.

The mean of the seven low night temperatures was highest at Plymouth and Brighton, 51°.7, at Truro 51°.3; and was lowest at Bolton, 45°.5, at Newcastle 46°, at Sheffield and Hull 47°. The general mean was 48°.6.

The mean daily range was greatest at Blackheath, 20°.5, at Cambridge 19°.2, Brighton 15°.3, and was least at Liverpool, 10°.5, at Plymouth 10°.7, at Preston 11°.9. The general mean was 14°.1.

The mean temperature was highest at Brighton, 57°.6, at Cambridge 57°.4, at Blackheath 56°.9; and was lowest at Bolton, 50°.7, at Bradford 51°.5, at Wolverhampton and Preston 52°.2. The general mean was 54°.2.

Rain.—The largest falls were 1.83 inch at Bolton, 1.32 inch at Truro and Hull; the smallest falls were 0.06 inch at Brighton, 0.12 inch at Blackheath, 0.14 inch at Cambridge. The general mean was 0.90 inch.

SCOTLAND: Temperature.—During the week ending June 27, the highest temperature was 74°.2, at Paisley; at Greenock the highest temperature was 66°.5. The general mean was 70°.5.

The lowest temperature in the week was 38°, at

Glasgow; at Leith the lowest temperature was 43°.8. The general mean was 41°.5.

The mean temperature was highest at Paisley, 55°.2; and lowest at Greenock, 53°.1. The general mean was 53°.9.

Rain.—The largest fall was 0.17 inch, at Edinburgh, 0.04 inch at Perth. The general mean fall was 0.10 inch.

JAMES GLAISHER F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, June 29, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W.—The weather was dull and rainy in most parts of the kingdom during the first day of two of the period, but subsequently became dry and very fine in the western and north-western districts, and dry, though generally cloudy or overcast at the southern and south-eastern stations. Severe thunderstorms were experienced over France, and on the 28th thunder was heard at Jersey also.

The temperature has been below the mean in all districts, the deficit varying from 1° in "England, S.," to 4° in the "Midland Counties," "England, N.W.," and to 5° in "England, N.E.," and "Ireland, N." The maxima, which were recorded on the 24th in the south-east of England and on the 28th elsewhere, ranged from 82° in "England, S.," and 81° in "England, E.," to 68° in "Scotland, N.," and the "Channel Islands." The minima, which were registered either on the 25th, 26th, or 27th, were very low for the season. In "Ireland, N.," the thermometer fell to 32°, and in most other districts to between 35° and 39°, but in "England, S.," 42° was the lowest reading, and in the "Channel Islands," 52°.

Bright sunshine shows a striking decrease at Jersey, but a decided increase in most other localities. The percentages of the possible duration varied from 56 in "Ireland, S.," to 24 in "England, N.E.," and to 12 in the "Channel Islands."

The rainfall has been a little more than the mean in "England, N.E.," the "Midland Counties," and "England, N.W.," and about equal to it in "Scotland, N.," and the "Channel Islands," but less elsewhere.

Depressions observed.—As the period commenced a rather extensive low-pressure system was shown far to the northward of our islands, while off the east coast of England, and also over the St. George's Channel, subsidiary depressions were observed, the barometer being highest over France. A gradual change in the distribution, however, now took place, the highest readings being transferred to our western and north-western coasts, while over the Bay of Biscay and France depressions appeared. The wind, which was at first south-westerly or westerly, consequently shifted to the northward or north-eastward, and in many parts of eastern England and over the Channel blew freshly and strongly.

Enquiries.

"He that questioneth much shall learn much."—BACON.

ANEMONE FULGENS DUPLEX.—Will you allow me to ask through your columns if there is a variety of *Anemone fulgens duplex* worth growing? If so, it seems scarce; at any rate, the variety usually grown as double *Anemone fulgens* is, to my mind, totally worthless. *Grover*.

PERENNIALS, HERBACEOUS PLANTS: *R.* will be glad if any one will give him the names of the best and rarest. Address, Catton Grove, Norwich.

CATERPILLAR: *A. D.* From *cates*, food; and *filler*, plunderer, old English.

CHRYSANTHEMUM LEUCANTHEMUM AS A SALAD PLANT: *J. C.* We never heard of its being used as a salad.

COLOUR OF FRUIT TREE WALLS: *T. T.* Neither white nor lead-colour, but dull red, with a roughened surface, is found to be best. Black is also conducive to wood and fruit ripening, but is an ugly tint for a wall, but might be tolerated on a wooden fence. Colour the wall when the trees have lost their foliage.

CUCUMBER DISEASE: *J. W.* We are sorry we cannot help you to a cure. It is best to clear out and start afresh. In what state are the roots?—*J. E. C.* See our reply to "J. W."

CYCLAMEN STARTING BADLY, &c.: *R.* The tubers, having bloomed once, required a longer period of rest than you have given them. The plant is, as you know, a hardy one, and although it bears well to a high temperature for an alpine plant in the stages previous to its first crop of bloom, yet, having once flowered, it ought to have been rested under cool moist conditions till the end of August, at the earliest, but September would be better. By applying greater heat now you will not cure the evils attendant on your faulty practice. Young stock in a growing condition would do you more service in November. *Pairogoniums*: disband for the last six weeks before you want them to bloom. *Eucharis amazonica*, if of flowering age, ought to have expanded blooms in a month, but longer time is required in the dull months.

DALE'S HYBRID AND ABERDEEN TUNINGS: *A. B.* It would be better to apply to an agricultural authority.

DICTIONARY OF PLANTS AND THEIR CULTIVATION, &c.: *T. C. Frothingham*. The *Illustrated Dictionary of Gardening*, now being issued by L. Upcott Gill, 170, Strand, London, W.C.

DIGITALIS: *G. S.* The cup-like flower at the end of the raceme is the result of the fusion of several flowers into one. It has been often figured in our columns.

DISEASED PEAR LEAVES: *F. R.* The appearances in question are due to the attacks of a mite, *Phytomyces Pyri*. We fear there is nothing to be done but to destroy the affected leaves as far as you can.

ELECTRIC LIGHTING, DR. SIEMENS'S EXPERIMENTS: *Subscriber*. See *Gardener's Chronicle* for 1881, vol. xii, pp. 404, 407, 435, and 1882, vol. xvii, p. 772, 835. The correspondence has not been published separately.

EMBOTHYRUM COCCINEUM: *F. G. Elliot*. Try some Devon nurseryman.

EUNYMUS WEAK AND DOING BADLY: *C. Marvin*. You can slightly prune back the tips of the roots now, and apply some weak manure-water. It is possibly growing in a shady place, and thus the wood does not get well ripened, which will partly account for the weak wood made. In early spring cut the shoots hard back, and when it has sprouted again a little, transplant it carefully into well-manured sandy soil, and cut back at pinch, while tender, the young shoots made during May and June. You will then get a bushy healthy plant instead of your straggly weak one that is laid by every shower.

FUNGUS: *J. J. W.* The Stinkhorn Fungus (*Phallus impudicus*). It might be killed by a solution of carbolic acid. Try, and let us know the result. In any case the nuisance will soon be over.

GRAPES, &c.: *Salopian*. The Vine roots must be in a very poor condition, the leaves seem being thin and small, and, moreover, burnt in places by sun-blast. If the border is as bad as you state, all your ill-spring from that cause. The Potato is slug eaten.

NAMES OF PLANTS: *H. W. H., Wilton*. *Phaleropon anthalis*.—*C. W.* *Lychnis chalcedonica*.—*A. O. Walker*. *Eunymus latifolius*, and *Cytisus candicans*.—*W. Scott*. *Leptospermum scoparium*.—*W. Hopkins*. Your flowers were too withered to be recognisable. They are varieties of the larger flowered Spanish Iris.—*A. C.* *Escallonia Philippiana* (figured in the *Gardener's Chronicle*, July 27, 1878, p. 109).—*Notes*. 1. *Vicia cracca*; 2. *Ceranium Robertianum*; 3. *Ajuga reptans*; 4. *Listera ovata*; 5. *Potentilla Hornemannii*.—*A. S.* *Abelia triflora*.—*F. B.* 1. *Lilium Flumibergianum*; 2. *Lilium Martagon*.—*J. B.* *Ornithogalum flavum*.—*H. H. W.* Next week. —*F. B.* 1. *Pinus austriaca*; 2. *P. Cembra*; 3. *P. Strobus*; 4. perhaps *P. austriaca*. But these are open to doubt; we cannot be sure of the species from the not exist in Wellington Street. —*W. R. W.* 1. *Orchis palustris*; 3. *Serapias lingua*; 4. *Chrysanthemum coronarium*; 5. *Achillea ageratium*; 6. *Helichrysum* sp.—*Campie*. *Dendrobium secundum*.—*Redwood*. *Muscari montastrum*.

NOTICE TO QUIT EMPLOYMENT: *A. P.* If the gardener employed has been engaged as a yearly servant, at so much salary per annum, unless he has misconducted himself, a month's notice can be demanded, or its equivalent in money. We do not suppose that taking the wage weekly would set that aside.

ORCHIS LATIFOLIA: *C. W. Strickland*. The bloom-spike was of a rich colour, and a very daisy-like throughout.

PANSY BLOOMS, FANCY AND SELF: *F. Roemer*. Smaller than they had been earlier in the season, but still of considerable size and substance; the markings of the fancy varieties being very good and distinct.

ROSES FROM EYES: *H. W. W.* Thanks for communication. Plant will be figured later.

RUBUS, &c.: *A. D. W.* All the plants you mention are shrubs, not herbs. ACROCLADON—*akro*, the point; *klados*, branch (Greek).

WEIGELAS AND ACOQUILIA HYBRIDS: *J. W.* None of the seedling *Weigelas* seem to be improvements on existing forms. The *Acoquila* is a pretty flower, the habit more erect than usual.

CATALOGUE RECEIVED.

W. AND J. BIRKENHEAD, Sale, Manchester—North American Ferns.

DIED.—Recently, Mr. MUIR, gardener to the Earl of Hopetoun, Hopetoun House, Linlithgow. Mr. Muir was a good gardener and a worthy man, and kept the gardens in first-rate order since he came there about three years ago.

Markets.

COVEY GARDEN, July 2.

SUPPLIES still continue heavy, and with a glut of Strawberries now reaching us, prices all round are much affected. Trade better. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit name and price. Includes Cherries, figs, gooseberries, grapes, lemons, melons, pineapples, pines, St. Michael, strawberries.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable name and price. Includes artichokes, asparagus, beans, beet, cabbage, carrots, cauliflower, celery, cucumbers, endive, garlic, herbs, potatoes, radishes, spinach, tomatoes, turnips.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant name and price. Includes Aralia, Arbovitae, Begonias, Bouvardia, Calceolarias, Carnations, Cyperus, Dracena, Erica, Ficus, Geraniums, Impatiens, Lilies, Pelargoniums, Pinks, Primula, Rhodanthe, Roses, Spirea, Stephanotis, Sweet-scented, Tropaeolum.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower name and price. Includes Anemone, Arum Lilies, Carnations, Cowslow, Eucharis, Gardenias, Iris, Lapageria, Lilium, Liliou longiflorum, Liliou candidum, Marguerites, Mignonette.

SEEDS.

LONDON: July 1.—Complete inactivity continues to mark the trade for farm seeds; values consequently remain unchanged all round. Higher prices are asked for French Trifolium, which English buyers do not care to give. Mustard and Rape seed moves off slowly on former terms. Rather more money is asked for Canary seed. Hemp seed continues abundant, and very moderate rates are demanded. Occasional orders for Tares still come to hand. Feeding Linseed is firm. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

POTATOS.

The Borough and Spitalfields Markets reports state that supplies of new Potatoes are shorter and prices hardening. English will come on the market towards the end of the week. The supply at market was chiefly of Chesham rounds, at £6 to £10, 105, and Jersey kidney at £9 to £10 per ton.—The imports into London last week comprised 3538 boxes 350 cases from Chesham, 192 baskets St. Nazaire, 2212 packages Jersey and Guernsey, and 480 cases from Barbicru.

Weeds. How to Destroy them.—Use SMITH'S Celebrated WEED KILLER, the cheapest and most effective preparation ever invented. For testimonials and prices address MARK SMITH, Manufacturing Chemist, Louth, Lincolnshire.

A GREAT SUCCESS. JEY'S "GARDENER'S FRIEND."

One Gallon of this Fluid, diluted with water according to directions, and applied with an ordinary watering-can, Effectually Removes all Weeds, Moss, Worms, and Insects on Gravel Walks, Lawns, &c. Price, 3s. 6d. per Gallon, including 2, 40-gallon Casks, £1 10s. Carriage paid. JEY'S SANITARY COMPOUNDS Co. (Limited), 43, Cannon Street, London, E.C.

BEESON'S MANURE

Is the best for all Horticultural Purposes. Sold in Tins at 1s. 2d. 6d., and 10s 6d each; also in Sealed Air-tight Bags, containing 1 cwt. 13s. The 10s. 6d. Tins serve as strong substantial receptacle to weigh from the 1 cwt. bags. Supplies can be obtained through all respectable Nurserymen, Seedsmen, and Florists in the Kingdom; or, in districts where no Agents reside—Carriage Paid for Cash with Order—direct from the MANUFACTURER, W. H. BEESON, Carbrook Bone Mills, Sheffield.

NORWEGIAN FISH-POTASH GUANOS.

Composed of Pure Flesh and Bone of Cod and Herring and Refined Potash. A Perfect Fertiliser for Garden and Greenhouse, Lawns and Tennis Courts, Vegetables, Flowers, Exotics and Fruit Trees.

Prices, carriage paid, on receipt of Post-office Order: 28 lb. 6s. 6d.; 56 lb. 10s. 6d.; 1 1/2 cwt, 20s; 2 cwt, 30s.; 5 cwt, 60s. Larger Quantities at Special Prices, for which, and for Analytical &c., apply to J. JENSEN & CO., 10, ST. HELEN'S PLACE, LONDON, E.C.

GARDEN REQUISITES.

Quality, THE BEST in the Market. (All sacks included) PEAT, best brown fibrous ... 4/6 per sack; 5 sacks for 20s. PEAT, best black fibrous ... 6/6 per sack; 5 sacks for 35s. LEAF, best yellow fibrous ... 1/2 per bush. (sacks included) PREPARED COMPOST, best LOAM MOULD, best only ... 1/2 per bush. (sacks included) PFAT MOULD, best only ... 1/2 per bush. THOMAS GREEN & SON
(LIMITED),
Smithfield Ironworks, Leeds,
And Surrey Works, Blackfriars Road, London, S.E.

Horticultural Engineers to Her Majesty the Queen,
PATENT
WROUGHT-IRON TUBULAR
HOT-WATER BOILERS,
And others with SHELVES, and Hot or Ordinary Cast-iron
SADDLE BOILERS,
With WATERWAY BACKS, and WELDED BOILERS,
which are Specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c.
They are the neatest, cheapest, most effective, and durable of any extant.

The Tubular ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention. This pattern
Had the First and Highest Prize. A Silver Medal,
Awarded to it at the Royal Horticultural Society's Exhibition, South Kensington, London, on 7 June 3, 1883.

The *Journal of Horticulture* of June 9 says:—
"HEATING APPARATUS.—A great number of boilers, valves, &c., were exhibited by eight competitors, and considerable interest was manifested in the verdict of the judges, and much discussion was brought to bear on the merits and shortcomings of the different boilers. The apparatus for which the Silver Medal was awarded was a wrought-iron saddle boiler, with a series of intersecting tubes, somewhat in the form of a letter X, but the tubes in each form in the crown of the boiler. Most gardeners who examined the boiler expressed a favourable opinion of it. It is no doubt a quick and powerful boiler without being complex, the latter condition having, no doubt, had weight with the judges."

The *Garden* of June 21 says:—
"The premier prize, a Silver Medal, was taken by Messrs. Green & Son for their new patent tubular saddle boiler. It is a modification of their original patent, the boiler being longer and not so high. It is found to be a powerful and efficient boiler, and heats a large quantity of water quickly with a small consumption of fuel."
Descriptive Illustrated Price List may be had free on application. Estimates given for all kinds of Heating Apparatus, and Hot-water Fittings of every variety supplied on the shortest notice.
Galvanised Iron Cisterns, from 4d. to 1s. 6d. per gallon.

WANTED, GRAPE THINNERS.—C. R. TURNER, Kabley Nursery, near South Mimms, Barnet.

WANTED, a MAN for the Warehouse. Must be active, industrious, and sober. Also JUNIOR COULTRERS HAND.—F. SANDER and CO., Seed Growers, St. Albans.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

Gardeners, Farm Bailiffs, and Foresters. JAMES DICKSON and SONS, "Newton" Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability and thoroughly practical at their business.—Full particulars, with names of previous employers, &c., on application.

TO FLORISTS.—Lame young (age 17), had some experience, wants situation at a good Florist's where he would have an opportunity to Learn the Trade, time given.—C. DAVIS, Bourne Farm, Bourne Hill, Southgate, N.

HOLLOWAY'S PILLS and OINTMENT.—Bilious and other ailments, and all complaints arising induced by atmospheric changes, or too liberal diet, should be checked at once or serious consequences may ensue. When any one finds his ideas less clear than usual, his eyesight dimmed, and his head dizzy, accompanied by a distension for all exertion, physical or mental, he may be quite sure that he is in immediate need of some alternative medicine. Let him once send for a box of Holloway's Pills, and he will find a medicine which will remove the symptoms, and speedily renew his usual healthy feeling. If the bowels be irritable, Holloway's Ointment should be rubbed over the stomach and liver every night and morning.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "crown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artistic design, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E. Agents for LOOKER'S PATENT "ACME" FRAMES, PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrate Price LISTS Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3s per square yard upwards. Pattern Sheet of Plain or more elaborate Design, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety. Slates, Gables, &c. F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Ports to any Railway Station. Sample of Sand free by post. FINISHES and RICK LURKS for Rockeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharf. A liberal Discount to the Trade.

SLUG TRAPS, 3s p. doz., 30s p. gross, free. Mr A. MORTON writes:—"Slug Traps success; recipe for bait good."—F. COLE, 53, Pear Tree Road, Derby.

BUY ONLY ENGLISH THREE-QUARTER PLATE WATCHES.

BENSON'S NEW PATENT (No. 4658) "LUDGATE" WATCH,

SILVER, £5 5s. GOLD, £12 12s.

Is a "Special Strength" Silver English Lever, my best London make, with Three-quarter Plate Movement. *Travel throughout.* Chronometer balance, with damp and dust proof Patent ring-band, and extended barrel, in *Minutest stopping water dome cases.* With crystal glass front. *Winds, set hands and opens at back.* The superiority in value, accuracy and durability of the "Ludgate" Watch over the Swiss and American Keyless and Non-Keyless Watches, made no limitation of and sold as English watch, and the ordinary Full-plate English Watch is continuous. The "Ludgate" Watch is compact, strong, handsome, and durable. Being Three-Quarter Plate, it is superior in value and appearance to any £10 Watch sold, and, being compassed, it escapes perfect injury fitted with crystal front, it combines the strength of the Hunter, and convenience of the open face. Of my best London make, it will last a lifetime, stand rough usage of all sorts, and be without damage, and, being made in three sizes, it is for the above reasons suited for Home, Indian, and Colonial use by

Gardeners, Workmen, and Gentlemen. The "Ludgate" Watch is far superior. To any Watch at the price yet made, and Will be sent free and safe at our risk. To all parts of the world for 4s 5s. Cash or P.O.O.; or in instalments, £6 6s. Price in 18-carat gold, crystal glass cases, Twelve guineas.

SPECIAL NOTE that J. W. BENSON is the only Maker of a Three-Quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. A Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on application to

J. W. BENSON, Watchmaker to Her Majesty the Queen, The Steam Factory, 62 and 64, Ludgate Hill, E.C. Illustrated Pamphlets of Watches from £10 to £500, Gold and Silver Jewellery, Clocks (House, Chime, and Turret), and Musical Boxes, free on application.

Eitham Park, Eitham, Kent. IMPORTANT UNRESERVED SALE of a valuable COLLECTION of STOVE and GREENHOUSE PLANTS, ORCHIDS, &c.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions from the Executors of the late Thomas Jackson, Esq., to SELL by AUCTION, on the premises, Eitham Park, Kent, on THURSDAY NEXT, July 16, at 12 o'Clock precisely, a valuable Collection of well-grown STOVE and GREENHOUSE PLANTS, including many fine specimens, consisting of several fine Camellias and Azaleas, Greenhouse Rhododendrons, splendid examples of Eucharis, Dracenas, Crotons, Cycas revoluta, Anthurium, Palms, Ferns, an assortment of ESTABLISHED ORCHIDS, amongst which are several large examples including Peristeria elata, Dendrochilus biflorus, Aerides, and Dendrobium in variety, Cattleya Skinneri and C. spectabilis, and a very fine variety of Cycas. May be viewed day prior to Sale. Catalogues may be had of Mr. WAKELIN, the Head Gardener, on the Premises, and of the Auctioneers and Estate Agents, 67 and 68, Cheapside, London, E.C.

Friday Next.—New Orchids

ANGRECUM LEONI, a magnificent novelty, for the Cattleya-house. ANGRECUM SCOTTIANUM, rare and striking. ANGRECUM FUSTULUM, long spikes, covered with flowers. ANGRECUM ROSTELLARE, Pogonia Barklyana, Eulophia megistophylla. EULOPHIA PULCHRA, LISSOCHILUS STYLOSUS, ANGRECUM LEONI.—This is a most wonderful novelty, and next to Vanda Soderstrana, we consider it the finest Orchid we have had the pleasure to offer. It was discovered and collected by Mr. Leon Humbert in the Comoro Islands, growing at an altitude of 5000 feet. It should be grown in the Cattleya or the Dendrobium house, and it will be a plant of very easy culture; the plants, although only just imported, are beginning to grow. ANGRECUM LEONI is a serious rival to A. sepioides, surpassing it, we consider, not only in its extraordinary and very beautiful form, but in its adaptability to the Cattleya-house, its cool habit, and great ferocity, some of the flowers actually showing up to fifteen flower-pikes, each bearing six to ten of the large pure white flowers. Our Woodcut gives the exact size of the plant. The leaves are fleshy, and are quite a remarkable feature, standing boldly sideways, and are so arranged as to form a perfect ball circle, in front of which the flower-spikes arrange themselves; altogether it is a remarkable and grand thing, and is very easily to be cultivated. Professor Dr. REICHENBACH says in his description:—"The flowers may be well compared to Agrostis, and resemble a very stately thing, taking little space, bearing great flowers. It is not sufficient to make heat a collector's heat with satisfaction!"

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. F. Sander to SELL the above and other very valuable ORCHIDS in variety, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, July 16, at half-past 12 o'Clock precisely, at the Central Sale Rooms, 67 and 68, Cheapside, E.C. On view morning of Sale, and Catalogues had.

Flowering Orchids.—Special Sale

MESSRS. PROTHEROE AND MORRIS beg to announce that their next SPECIAL SALE OF ORCHIDS, in Flower and in Bud, will take place on TUESDAY, July 28, for which they will be glad to receive Notice of Entries as early as possible.

Farnborough.—(Sale No. 6212) Five minutes from Aldershot (Gareway Railway Station).

TO BE SOLD, WITH POSSESSION, THE NORTH CAMP NURSERY, nearly 17 Acres, with Dwelling-house, Stable, Cart-shed, and Greenhouse standing thereon. May be carried on as a Nursery or a Market Garden; but the Estate having no other available acreage will ultimately be valuable for building. Price £2400. Apply to Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, E.C.

FOR SALE, A FLORIST'S BUSINESS. Good position. Buckingham Palace Road. Lease, 9½ years. Apply to Mr. THORPE, 179, Allington Street, S.W.

FOR SALE, A SEED BUSINESS. Small but old-established and compact. £200 for Stock, Fertilisers, and Goodwill. In country place. Would suit delicate man. Address, COMFORT, Gardeners' Chronicle Office, 41, Wellington Street, Strand, London, W.C.

Norwich. TO LET, with possession of the Michaelmas Orchard of about 5 Acres, on which are four long Glass-houses heated with Hot-water Apparatus on the west principle, 2400 sq. ft. of glass, with a Greenhouse, 12 Cow-houses, Pig-sties, Piggeries, and other Outbuildings. Excellent water supply. A good business now being carried on. Apply to the Messrs. PROTHEROE AND MORRIS, 67 and 68, Cheapside, Norwich.

To Landed Proprietors, &c. A. MCINTYRE (late of Victoria Park) is now at liberty to undertake the FORMATION and REMODELLING of NEW GARDEN and PARK GROUNDS and PLANTING existing GARDENS. Plans prepared. 215, Listra Park, Stamford Hill, N.

JOHN KENNARD'S HORTICULTURAL BONDRIES, 1, Broad Street, Berkshire Park Depot. Catalogue post-free of every Horticultural Requisite.—Swan Place, Old Kent Road, S.E. Established 1854.

"YE NARCISSEUS OR DAFFODIL," containing its History, Poetry, and Culture, with Notes on Hybridising, and Illustrations of the "Crown" variety. BARR AND SON, King Street, Covent Garden, W.C.

Ferns.—Ferns.—Ferns.

He will be pleased to receive the Wholesale Price LIST of his Commercial Firms, and will mail his free on demand.

By Special Warrant.

"Superb SEEDS for PRESENT and Later SOWING." DICKSON'S CHOICEST strains of PRIMULA CALCOLARIA, CINERARIA, CYCLAMEN, BERGONIA, and AURICULA, in packets, 1s. 6d., 2s. 6d., 3s. 6d., and 5s. each. Double German WALL-FLOWER, superb strain, 1s. per packet. Extra selected Single Dark Flowered WALL-FLOWER, 6s. and 1s. per packet. Also all other FLOWER SEEDS for "Spring Gardening," as well as VEGETABLE SEEDS for Present Sowing. Carriage Post free. Seeds and Plants of every description. Descriptive CATALOGUES Post-free.

JAMES DICKSON AND SONS, 108, EASTGATE STREET, CHESTER.

S. SHEPPERSON, Florist, Prospect House, Belper, Derbyshire, begs to offer the following, of which he makes a specialty:—PRIMULAS! PRIMULAS! PRIMULAS!!! Grand premium prize strain of the finest new colors, as White, Carmine, Rose, Salmon, Crimson, Naue, &c. Fine large trusses and beautifully fringed flowers. Strong plants, to bloom well, 1s. 6d. per dozen; extra strong, 2s. 6d., all free. CINERARIAS! CINERARIAS! CINERARIAS!!! Bull's celebrated prize strain, dwarf compact habit, and most brilliant colors; cannot possibly be excelled. Good plants, 1s. 6d. per dozen; extra strong, 2s. 6d., all free. CYCLAMEN! CYCLAMEN! CYCLAMEN! GIGANTEUM!!! Grand prize strain, warranted. All the finest new colors, 1s. 6d. per dozen; extra strong, 2s. 6d., all free. S. SHEPPERSON, Florist, Prospect House, Belper, Derbyshire.

To the Trade only. F. H. KRELAGE AND SON, NURSEYMAN, BRESMEYER, and FLORISTS, Haarlem, Holland. The Wholesale Catalogue (No. 375A) of Dutch Flower Roots and Miscellaneous Bulbous and Tuberos-rooted Plants for 1886, is now ready, and may be had free on prepaid application by Nurserymen, Seedsmen, and Florists. The Catalogue, although giving only an extract of the collections, forms a pamphlet of 68 pages, 8vo, in two columns, and is doubtless one of the most complete sent out of this specialty. The prices of Hyacinths in general are considerably lower than before. Prices of Tulips and other Bulbs, too, are in many instances inferior to former quotations. German and French editions as well as a separate English edition for America, are published.

ROSES.

The Largest Rose Nurseries in the World. A visit is respectfully invited. No description can convey the slightest idea of the magnificent stock now in flower. They will continue in their beauty until October.

Descriptive Catalogue sent post-free on application.

THE

Gardeners' Chronicle.

SATURDAY, JULY 11, 1885.

TRING PARK.

MR. DISRAELI was never tired of asserting—as he did most effectively in his famous chapter on the Jews, in the *Life of Lord George Bentinck*—the genius and influence of the chosen race, scattered though they be. It is interesting to reflect that Isaac Disraeli's place of residence and final rest was at Bradenham, and Lord Beaconsfield's after forty years' residence and ownership, at Hughenden, in the same county of Bucks where the chiefs of the house of Rothschild, after the two Disraelis, set up their roof-trees. All, in fact, of that great house who were resident in England, save the late Baron Lionel de Rothschild, of Gunnersbury, settled in or near the Vale of Aylesbury, and within or on the confines of Buckinghamshire. Faithful cohesion among kindred implies that they possess virtues of no common order and much considerate charity, and therefore it is pleasing to record that five members of a most united family, respected by all, reside in close proximity. It is sometimes said, in such cases, that neighbours may remain very good friends provided they see as little of each other as possible. But the "satirical knave" who said that was not describing the Rothschilds.

From the leads of Mentmore Towers, formerly the residence of the late Baron Meyer de Rothschild, now that of Lord Rosebery, the husband of his only child, most of the seats I have referred to are actually visible. They are Waddesdon (see *Gardeners' Chronicle*, 1885, xliii., p. 820), the princely place of Baron Ferdinand; Halton, where Mr. Alfred has laid out a mint of money in house and gardens; Ascott, near Leighton Buzzard, where Mr. Leopold resides, and keeps the staghounds and manages the racing stud which was formerly at Mentmore; Aston Clinton, owned by the late Sir Anthony, from whom Sir Nathaniel inherited his baronetcy, and still occupied by his widow; and, finally, Tring Park, the residence of the head of the family, Sir Nathaniel, whom we must now call Lord Rothschild. Tring Park is just within the borders of Herts, and it comes last, and is the least on this list of the country seats of the Rothschilds. The head of the firm and family has not yet cared to encumber himself with the greatest nuisance that any man has ever yet invented for his own discomfort—a tremendous house. He has lived for years in an unpretentious mansion, well situated for him in a delightful part, one hour from Euston Square, and of comparatively moderate size. There are signs, however, that Aladdin has rubbed his lamp and bid the genie enlarge his dwelling, for a new house is manifestly growing and the old one is being absorbed. Handsome new stables have been already built, and other improvements are in progress, especially in those departments which Mr. Hill, the head gardener, presides over with so much skill.

The Park and home woods, which are all "kept" and under Mr. Hill's control, contain 300 acres, beautiful undulating acres, close to

MR. WILLIAM BULL,

Establishment for New and Rare Plants,
536, KING'S ROAD, CHELSEA, LONDON, S.W.

the town of Tring. You turn out of the street by Tring by a very modest entrance, and follow a carriage-drive uphill and among trees, everything looking very snug, and very much in the style of a local banker, or of a brewer who has prospered, or even of a country squire, till presently you pass the stables, and arrive at the rear of a house.

"Good gracious!" you exclaim, "why, if a brewer lives here, he must own something better than public-houses—to wit, a mind of marked refinement. See what improvements are going on?" One would know merely by those fine-leaved Ivies covering a new wall, with Golden Queen auriferous among them, that some one out of the common order must be in residence here with appreciative landscape gardening eyes. A broad new carriage drive leads to where a grand entrance to the house is evidently meditated, and on the right of this approach is a bank of evergreens. It was planted only eighteen months since with large shrubs of Yew, Bay, Box, Aucuba japonica, and other things, which have been so well watered and managed that they have not wined.

Passing round the house you will find a lawn, much enlarged lately, and clipped about by a very unlevel park, beautifully planted with clumps of Limes, animated by deer and short-horns, and enclosed by masses of encircling Beech woods on the high ground which bounds the view.

Except on the north side, where the eye may range from the newly projected front-door, far over the country towards Mentmore Towers and the smooth turfed hills of Ivanhoe, this beautiful place is quite secluded. It is not overlooked by a single road, and its near neighbour, the town, might be a hundred miles distant. Among the proofs of outlay, as well as of excellent taste, are the numerous costly shrubs around the house, including the bushes of Golden Yews grown from cuttings, as well as the much rarer seedlings furnished with leaders, and growing into trees. I daresay thousands have been expended in shrubs lately, and they are all looking well, not omitting a number of Golden Yews planted only two months since. Numbers give only a mechanical idea of works of planting like those which Mr. Hill, with his men and long hose, has brought to such a successful issue; but it may please nurserymen, and make their mouths water, to repeat that 500 Golden Yews, costing a great sum, have been planted here lately, and 10,000 bulbs of Gladioli set in the shrubberies to enliven them. The owner loves to watch the progress of the shrubs, knows their names and qualities, and takes delight in that newly planted long broad clump which fringes the lawn, and already shows superb and glowing with gold from across the path. I can only say that it is filled with costly "things," and in standing before that largest Japanese specimen which is many times repeated in smaller sizes, one cannot help counting the cost. It is the beautiful *Retinospora obtusa nana aurea*, and is worth seven guineas. The double Spanish Gorse is used as an edging of this grand clump of shrubs, and I observed several specimens of weeping Yew on stems 1 foot or more high, and then spreading horizontally.

The kitchen gardens are on the roadside near or in the town, and will soon be entirely shut in by walls, and enlarged from 3 to 6 acres. The houses are numerous, and the management unsurpassed. Five houses are devoted to Orchids, which have been described by specialists from time to time in the *Gardeners' Chronicle*. They were generally out of bloom at the time of my visit, but not so the Carnations in two houses devoted entirely to that flower, one of them to the favourite "Malmaison." The foliage plants—Crotons, Caladiums, Alocasias,

Dracenas, and others—all gathered together in one house, were superb, and the varieties of Coleus and Begonia in another house looked charmingly bright. I believe that a London firm decorates the London house so far as plants in pots are concerned; but the cut flowers are sent from Tring, and two houses of *Adiantum cuneatum* are required for the growth of Fern foliage by the bushel. There are five vineries where Muscat of Alexandria Grapes, of five years' growth, are as good as can be, and the adjoining Black Hamburgs, too, having this year the largest berries yet produced here. In the Fig-house the first crop was just over, and the second coming in. The Orchard-house here might be imitated at lesser establishments with advantage, being simple and comparatively inexpensive.

It consists of 135 yards of wall, enclosed by glass, having hot-water pipes to keep the temperature above freezing, and making all the wall fruit—Apricots, Peaches, Pears, and Plums—perfectly secure. The width is sufficient for a stage in front, where several transformation scenes occur during the year. At present the stage is partly devoted to fruits in pots, and as soon as these have ripened the double pots containing them will be plunged in the open ground till next spring. They will be followed presently by pot Roses and Tomatoes, and later on autumn *Chrysanthemums* will appear upon the stage. In short, a practised gardener finds that the rotations he can introduce on a stage of this sort are endless, and most profitable. I suppose all sorts of half-hardy bedding plants may be included, as well as Strawberries.

I must not omit to mention "the cottage," not far from Mr. Hill's house, in the kitchen garden, where six unmarried gardeners are made comfortable; nor the orchard of pyramid Apples in front of it, in an unsuitable light soil 18 inches deep, with a subsoil of gravel. The trees are about 10 feet high, and they are pruned as the fruit swells, and not allowed to increase in height. Apples can be grown anywhere by culture, but the crops must be gained by manure on soils like this, and only small trees are adapted to them. *H. E.*

THE GENUS ARCTOTIS.

(Continued from p. 34.)

Arctotis leptorhiza.—In the *Gardeners' Chronicle* of September 1, 1883, this annual species was mentioned as one of the most striking Composites then in flower in the herbaceous department at Kew; at the same time I had beautiful pot specimens from seed which I had received as *A. breviscapa*, under which name it was offered by Mr. Thompson, of Ipswich, and other seedsmen. It is thus found to be valuable, both for the greenhouse and the open ground. De Candolle, whom Dr. Harvey has frequently followed apparently in this genus, distinguishes two varieties under *A. leptorhiza*, the *A. breviscapa* of Thunberg and his own *longiscapa*, the first as having scapes shorter than the leaves, and the latter as having scapes longer than the leaves. The plant I have belongs to the latter variety, *longiscapa*, and the name *breviscapa*, under which the seeds were received, is therefore wrong. The plants grown at Kew and Cambridge are, I believe, identical. There is no figure, and I am unable to compare with specimens, but Mr. Baker kindly confirms me in the name *longiscapa*. Seeds of another kind are offered with the name *A. grandiflora*, but I have never found them capable of germination.

ARCTOTIS LEICHTLINIANA, n. sp.*

The subjoined description applies to a plant received from Mr. Max Leichtlin, who obtained it from the Palermo Botanic Garden as *A. speciosa*—a name that belongs to a variety of *A. acaulis*. There

* Suffruticose and lax in habit, 3 feet high, not hispid. Stems elongate, furrowed, covered with thick white tomentum. Leaves 2 to 8 inches long, obovate, or oblanceolate, petioled, pinnatifid and toothed, not angled or decurrent, tomentose below, arched above; lobes oblong, slightly lobulate, with pointed or angular apices. Flower-heads $\frac{1}{2}$ inches in diameter, or when pressed $\frac{3}{4}$ inches; upper free part of outer involucre scales spreading in bud, but little recurving in full flower, less

was much interested in getting this supposed *A. speciosa*, seeds of which I tried without success; and as we are indebted to Mr. Max Leichtlin for distributing it, and finding it unadvertising, I name it in compliment to him. Professor Oliver kindly examined this plant for me, and said he thought it must be referred to the species I had forwarded before, which was *A. aureola*. From a garden point of view, at least, it must, I think, be regarded as a distinct species, differing entirely in habit, coloration, and relative proportion in size of the parts of the flower, and in constitution. It strikes freely from cuttings, and is an easily grown plant, while *A. aureola* can only with difficulty be grown from cuttings, and is cultivated less easily. The coloration of the flower might be regarded as a small matter, but these plants have not been "broken" or worked up for our instruction by the hybridist, and it is combined with other points of difference. It differs from *A. grandiflora*, Ait., which has a tricoloured ray, though to that also it is nearly allied. This plant has very pretty flowers, but its lax habit is not in favour of its becoming popular.

The following kinds have been cultivated, and all are worth reintroduction. The attention of friends at the Cape may here be drawn to them:—

A. acaulis, Bot. Reg., ii, 122.—A nearly stemless perennial with long petaloid radical leaves, which are lobed and green above, covered with rough pile which peels off. The flower-heads are large, with golden rays, orange below.

A. aspera, Bot. Reg., t. 34.—Half-shrubby, hispid, and scabrous, with deeply incised leaves; the lobes obtuse. The flower-heads are similar to those of the cultivated variety *arborescens*, but are apparently larger.

A. cineraria, Jacquin, Hort. Schœnbrun., ii, 174.—Stem half shrubby, branches tomentose, leaves small, pinnatifid. The flower-heads are yellow rayed with out a ring about the black disc.

A. cuprea, Jacquin, Hort. Schœnbrun., ii, 176.—Referred by Harvey as a variety of *A. aspera*. It is shrubby, the leaves are pinnatifid with long narrow spreading lobes, which are toothed and undulated; the flower-heads are large, with orange-coloured rays, coppery below.

A. decumbens, Jacquin, Hort. Schœnbrun., iii, 381.—Stem stout and decumbent; leaves elliptical, strongly three-nerved, dentated, not lotted; flower-heads large, with yellow ray, bronze beneath.

A. decurrens, Jacquin, Hort. Schœnbrun., ii, 165.—Stem diffuse or erect, leaves short, petioled, lanceolate or elliptic-oblong, with slight tendency to form lobes. The ray-florets are white, with purple at the base, forming a ring about the disc.

A. fastuosa, Jacquin, Hort. Schœnbrun., ii, 166.—Said to be annual; stem hollow, leaves elliptic-oblong, coarsely toothed or sinuous, pilose on both sides. The flower-heads are large, with orange ray-florets and a deep red ring around the disc. One of the handsomest.

A. glaucophylla, Jacquin, Hort. Schœnbrun., ii, 170.—Allied to *A. acaulis*; stem short, with leaves crowded, pinnately divided into many lobes. The flower-heads are ornamental, with a clear orange ray. *A. grandiflora*, Jacquin, Hort. Schœnbrun., iii, 378.—Stem suffruticose, leaves pinnatifid, with narrow lobes. The flower-heads are very large and handsome, the ray-florets of orange colour, each with a dark basal mark, forming a ring around the disc. Apparently near to *A. aureola*, but it differs in having the ring, and the lobes of the leaves are much narrower.

A. leucanthemoides, Jacquin, Hort. Schœnbrun., ii, 164.—Apparently annual. The branches are sparingly leafy, the leaves are obovate and toothed, the upper ones lanceolate and entire. The flower-heads have numerous white ray-florets, suffused with pink beneath.

A. maculata, Jacquin, Hort. Schœnbrun., iii, 379; Bot. Reg., ii, 130.—Suffruticose, very distinct in the colour of the ray-florets, which are white, tipped with orange, and orange below. The leaves are in form similar to those of *A. aspera*, but much softer.

A. reptans, Jacquin, Hort. Schœnbrun., iii, 382.

than half a line broad—involucre otherwise as *A. aureola*; ray-florets golden-yellow, with dark basal mark, below flaked with red, $\frac{1}{2}$ inch long, $\frac{3}{4}$ lines broad. Most nearly allied to *A. aureola*, which has short and stout stems, clothed with purplish tomentum; lobes of leaves always rounded at the apex; flower-heads $\frac{1}{2}$ to $\frac{3}{4}$ inches in diameter; outer scales of involucre recurving in bud, free portion one line broad; ray-florets orange coloured, without basal mark, 2 inches long, $\frac{3}{4}$ lines broad.

—Much branched and dwarfed; leaves obovate, obtusely lobed or toothed. The ray-florets are creamy-white, orange-coloured below, and a dark ring is formed by the basal marks around the disc.

A. revoluta, Jacquin, Hort. Schoenbrun., ii., 173.—Suffruticose, branches tomentose, the leaves with distant lobes. The flower-heads are large, with orange ray-florets, each with a dark basal mark.

A. rosea, Jacquin, Hort. Schoenbrun., ii., 162.—Stemless, apparently annual, compact, with a number of white sinuate-pinnatifid leaves, the lobes short and obtuse. Very pretty on account of the pink ray-florets.

A. speciosa, Jacquin, Hort. Schoenbrun., ii., 161; Bot. Mag., xvii., 2182.—A distinct form of *A. acaulis*, with many-lobed leaves, and handsome flower-heads with showy reddish ring.

A. squarrosa, Jacquin, Hort. Schoenbrun., ii., 177. Rather coarse-growing, but very pretty, having numerous flower-heads, with orange rays lined with darker colour. It is well marked by this coloration. It is placed with *A. grandiflora* by Harvey under *A. levis*.

A. tricolor, Jacquin, Hort. Schoenbrun., ii., 159; Bot. Reg., ii., 131.—This is allied to *A. acaulis*, to which Harvey refers it, but it is probably quite distinct. It differs in foliage, not having a dense rough pile. The flower-heads are large and showy, with white ray florets, purple beneath, and a dark ring surrounding the disc.

A. undulata, Jacquin, Hort. Schoenbrun., ii., 160.—This, no doubt, is a form of *acaulis*. It is a fine plant with rather coarse leaves, and large bright orange flowers.

These names I take as given with the figures referred to, because Harvey's arrangement in the *Cape Floras* does not give the distinctions necessary from a garden point of view, the good and bad being often reduced under one name. It is unfortunate that real differences, such as Harvey no doubt saw, should not have been pointed out, because it is apt to be inferred that the plants are identical. This aggregation of more or less distinct forms is a difficulty, I am told, in the use of some foreign Floras on the spot, because the segregates of a species are often found to be very different practically, and in need of some distinction. This difficulty, however, could only be fully remedied by the cultivation of all the plants, which is impossible, and probably the genus *Arctotis* can only be well understood by cultivation of the various forms. Allied, but really distinct plants, appear sometimes to mimic each other, just as those do that belong to different natural orders, and probably this mimicry is the more likely to occur on account of relationship. In Jacquin's *Hortus Schoenbrunensis*, omitting those now referred to other genera, no less than twenty-seven kinds are figured, and without doubt are all more or less distinct, though Harvey reduces many to other species without distinguishing them as varieties. Twenty-one kinds are recorded in the *Hortus Keenensis* of 1813, and thirty species are allowed in the *Genera Plantarum*.

The late Mr. Harpur-Crewe intended to have written notes upon this genus, but his illness prevented him from doing so, and before his death memoranda were forwarded to me which Mr. W. E. Gumbleton had made for him from the nearly complete series of *Arctotis* figures in his library. *R. Irwin Lynch*.

THE TWAY-BLADE (LISTERA OVATA.)

PERHAPS nowhere does this inconspicuous, but by no means uninteresting, Orchid grow so strong and stately as in rather damp shady woods, with a southern exposure. This was forcibly brought to my mind but the other day, when meeting with a large number of these plants growing most luxuriantly under the above conditions. Several of these specimens measured 30 inches in height, with large ovate leaves 7 inches by 6 inches, and strong erect spikes, on which I counted upwards of eighty flowers.

The flowers were remarkably viscid, and contained a large supply of nectar—no doubt for the purpose of enticing insects for cross-fertilisation, as I have repeatedly noticed that in several of our Orchidaceous plants a greater number of seed-bearing capsules are produced by plants growing in the open than those in a woodland. This seems strange, and has certainly puzzled me very much to account for, but it is nevertheless a fact. When examining the wonderful

structure and movements of the organs of fertilisation in this Orchid—which any one who is interested in this subject would do well to note—I was forcibly reminded of him who has done so much to enlighten us on this subject, whose statue was the other day unveiled in the Natural History Museum, and for whom none felt a more sincere regard than the true horticulturist. *A. D. W.*

New Garden Plants.

AGLEONEMA ACUTISPATHUM, *N. E. Brown, n. sp.*

STEM erect, $\frac{3}{4}$ inch thick, smooth, dark green. Petioles 3–4 inches long, vaginate for $\frac{1}{2}$ – $\frac{2}{3}$ their length, but only sheathing the stem at the base, green, the evaginate part terete, with a slight flattening on the face. Lamina 6–8 inches long, 2 $\frac{1}{2}$ –3 $\frac{1}{2}$ inches broad, elliptic-ovate acuminate, a little oblique, base rounded and slightly cuneate at the petiole, apex gradually attenuated into a fine point about an inch long, margins undulate, uniform dark green, paler beneath. Midrib and veins impressed above, prominent and rounded beneath; primary lateral veins 4–6 on each side of the midrib, ascending, curved. Scapae about as long as the petioles, compressed, smooth, dark green. Spathe $\frac{3}{4}$ inches long, $\frac{1}{4}$ inch broad, ovate-lanceolate acuminate, widely expanded (as in *A. commutatum*), a little decurrent but not at all convolute at the base (in bud it is terete, gradually tapering to a very fine point), light green. Spadix sessile, $\frac{1}{2}$ inch long, female part about $\frac{1}{2}$ inch long, the rest male.

This species is allied to *A. commutatum* and *A. modestum*, but distinct from either. Its native country is a little uncertain. It was presented to the Royal Gardens, Kew, by Mr. Knaggs, from whom I learn that it was brought in Hong Kong, and believed to come from the neighbourhood of Canton. Mr. Knaggs further writes that "they seem to be hardy, and some of them flowered at sea, on the voyage home, in water, and two of them continued to live in water in our back garden (in London) for some considerable time," *N. E. Brown*.

TENARIS ROSTRATA, *N. E. Brown, n. sp.*

Hitherto this Asclepiadaceous genus has consisted of but one species, a native of the eastern frontier of Cape Colony; now we have another from Usagara, in East Tropical Africa, near Zanzibar, the tuber of which was sent home by Mr. Last and has just flowered at Kew. It has quite the habit of the original species, but is at once distinguished when in flower by the lobes of the corolla being nearly acute, instead of truncate, and by the segments of the inner corona having their apices prolonged into subulate beaks. The following is a description of the plant:—Tuber depressed—globose, $\frac{1}{2}$ inch in diameter; stem 18 inches high, slender, about $\frac{1}{2}$ line thick, erect, green, with about four pairs of distant linear acute leaves, 2–3 inches long, $\frac{1}{4}$ inch broad, arched, spreading. Peduncles 1 (–2?) flowered, 3–5 lines long, solitary from the side of pairs of small bracts, arranged along the terminal part of the stem in a racemose manner. Pedicels 2 lines long; calyx $\frac{1}{2}$ inch in diameter, lobes lanceolate, acute. Corolla $\frac{1}{2}$ inch in diameter, rotate, lobes 4 lines long, $\frac{1}{4}$ line broad, linear-oblong, subacute, very spreading with revolute margins, whitish, densely covered towards the base of the lobes with minute purple dots, giving the flowers a pinkish hue. Outer corona of five small, concave, broadly ovate, bifid, yellowish lobes, with two minute teeth on their inner face; inner corona of five erect or slightly recurving, subulate, pinkish segments, slightly gibbous on the shoulder. *N. E. Brown*.

VANDA DENISONIANA (*Bentl., Rehb. f.*) VAR. *HEIRAICA, n. var.*

Mr. B. S. Williams kindly sends a flower of this fine variety. The sepals and petals are subulate, coloured on both sides, darker inside, where they are covered with numerous spots, transverse, short bars, and figures comparable partly to a Greek lamb (A). Spur orange inside. Anterior part of the blade of the light olive-green. I had never seen this alive, though I knew its existence from a sketch prepared by Mr. Ernest Rimmann, Mr. F. Sander's fortunate traveller. *H. G. Rehb. f.*

THE AMARYLLIS.

THE present season has marked a decided advance in the culture and position of the Amaryllis. Its history was carefully written, and its culture well understood by the Hon. and Rev. William Herbert so long ago as 1837. What a pity that some enthusiastic possessing Herbert's love for the flower, his ability and perseverance, was not ready to take his place, and carry on the work where the master left it. Such varieties as Herbert possessed were carefully cultivated in his own garden. Being a keen hybridist, he raised some distinct and good varieties by cross-breeding, most of them, if not all, being now lost to cultivation. The type of flower of which *Hippeastrum pardianum* is a representative species was unknown in the time of Herbert, but to that species and the more recently introduced *H. Leopoldi* we owe the beautiful hybrid forms recently seen at our exhibitions. The very handsome form, *Empress of India*, also introduced into English gardens by Messrs. Veitch, of Chelsea, has worked even a greater revolution in this genus than either of the above species. The taste of the flower-loving public is all for large handsome varieties of what may be termed the florist's type, and doubtless they form the most beautiful decorative objects for our greenhouses and plant stoves. There are other forms interesting to botanical science which might well be taken in hand by the hybridist. Some of the species are conspicuous for their long tubes, the flowers more elegant perhaps though not so showy as the modern garden varieties. The South American species, *A. solandrefolia*, for instance, is the most distinct of the long-tubed species. The flowers, 8 inches in length, are green and yellowish-white. A variety of this described by Herbert had flowers 10 $\frac{1}{2}$ inches long, faintly striped outside with red; tube purplish-red. Dean Herbert raised many hybrids in his garden at Spofth, the produce being distinguished by the names of both species, examples of which are *Alicia x vittata*, *stratifolia x vittata*, *solandrefolia x Johnsoni*. Several crosses from *A. reticulata* were produced by this zealous cultivator, such as *bulbosa reticulata*, *reticulata bulbulosa*, and *alicia reticulata*. At this early period *A. reticulata* was cultivated in two varieties, one with green leaves and the other with stripes, as grown in our gardens at present. The striped leaved variety of *reticulata* has been met with frequently in a wild state in Brazil, not so that with green leaves, which is also lost. It is necessary to trace the different varieties to their source before we can be sure of the best method of culture to be pursued. Some of the cultivated species are almost, if not quite, greenhouse plants, although they may require stove-heat to bring them up to the flowering stage. Those species originally introduced from the Cape of Good Hope, such as *A. vittata*, are representatives of this type. *A. reticulata* is quite an evergreen, and succeeds well in a Cucumber-house all the year round, and it ought not to be quite dried up at the roots. The cultural remarks in the "*Amaryllidaceae*" are evidently founded on a large and successful experience; and I am sure most successful cultivators would endorse the following as being good advice for the present time. Herbert says:—"The principal causes of the sickly state of *Hippeastrum* in cultivation are too tight a soil, want of water at the roots, when the leaves are pushing, and too much water after." His experience also confirmed him as to the value of small pots. "I have had," he says, "seedlings of crosses with *H. vittatum* which sent up two stems of blossoms from a pot scarcely twice the size of the bulb." Experiments were also made with various kinds of potting soil. Peat did not give good results, the best being obtained with good loam, of a holding nature which formed a compost that would not become powdery when dry. We have now a considerable advantage over the cultivators of fifty years ago; we have a better class of hothouses, with a more complete system of top and bottom heating. Some cultivators make a mistake, by either neglecting the plants when the flowering period is over, or by not taking into account the fact that the nature of the plant is to make a second growth at midsummer. The leaves come with the flowers, and if the plants are kept comparatively dry during May and June they will not make much growth, and may be dried off almost for the rest of the season if they are kept in a cool-house, but perhaps not 50 per cent. would flower next season; whereas if they are grown on freely during the summer and

autumn months, the proportion of flowering bulbs to flowerless ones would be as ten to one. Over-potting is also a great evil. Good large bulbs may be potted in 5-inch pots, and will not only flower, but grow better in such pots than they will in larger ones. We had some small bulbs planted in 6-inch pots in the season of 1884, which produced flowering bulbs of large size and of the best quality. Some growers have a belief that flowering bulbs cannot be produced unless they are grown in 5 and 6-inch pots. A very limited experience with two sizes smaller would dispel this delusion. We use a rich potting soil, of four parts good substantial loam, one of decayed manure, and one of fibrous peat. The past season was a very good one for a prolonged bloom. Usually the end of March and the early days of April are hot, with drying winds, and few flowers are left by the end of April.

A careful inspection of the varieties raised this season reveals the fact that improvements have been made in every direction; but one of the most important gains from a gardening point is the increased number of flowers of the very best form and substance produced on one scape. The South American species, *Hippeastrum pardinum* and *H. Leopoldi*, gave good form and substance to the flowers, but reduced the number. But by intercrossing with some of the finest Continental varieties, such as *Empress of India*, which produces six flowers on one scape, we have now well-formed flowers of good substance, six of them being produced on one scape, and as many as three stems from one bulb. For several years I have carefully noted the best flowers in Messrs. Veitch's nursery at Chelsea, and also at the London exhibitions. The best production of the present season is undoubtedly the variety named *Perfection*: two plants exactly alike flowered from the same seed-pod—at least, as nearly alike as it is possible for two distinct plants to be; the flowers are of fine form, petals slightly reflexed, the colour creamy-white, with a white centre; the segments being irregularly marked with bright scarlet.

Lady of the Lake is a very fine white variety, not quite pure, but nearly so; it is quite distinct; the flowers, of the largest size, are borne aloft on stout stems, and are very conspicuous in the collection.

Lady Macbeth is quite an artistic flower, of large size, the segments, slightly twisted, are marked with rosy-scarlet.

Kilworth has not been seen outside the Chelsea nursery; it is formed after the florist standard; the colour crimson with a greenish tip to each segment, and a green centre.

I may add here that the green centre is not much thought of, but it sometimes, as in *Lady of the Lake*, adds to the beauty of the flower.

Triumphans is a noble variety, with richly-coloured flowers, the petals nearly 4 inches across, the flowers of the best form, greenish centre.

Linda, creamy-white, dashed with crimson, had ten flowers on two scapes.

The Giant, certificated about three years ago, flowered well this year. It has produced more flowers from one bulb than any other; they are distinct in colour and very handsome.

Orestes, crimson, the centre of each petal being richer in colour, green centre.

Titan, very distinct salmon-red, with a conspicuous maroon-crimson centre; flowers 7 inches across.

Dona, greenish-white, marked with crimson lines, and mottled the same colour.

Ernita, rosy-blush ground, with a bright rose central band to each segment, the flowers being also suffused with rose, and marked with brighter lines.

Prince Albert Victor has flowers of the finest form, rosy-crimson, and white central band on each petal.

Fairy, primrose, with reddish lines.

Hehla, white, with crimson streaks on each side of a whitish central band.

Lady Lawrence, a very distinct and handsome variety, the colour a peculiar pale purplish-rose, the segments marked with a greenish-white band, the colour deepest on each side.

Countess of Rosebery, reddish-crimson, greenish-white star, the ground colour creamy-white.

Duchess of Edinburgh, purplish-rose, mottled creamy-white, greenish-white star.

Mirabel, one of the most distinct in the whole collection, the flowers are so well blended—scarlet, crimson, and magenta, on a creamy-white ground.

Janet, fine large creamy-white flowers, scarlet flakes.

Storr's Beauty, a distinct and charming variety, raised in the Rev. W. Stainforth's garden, rosy-scarlet, with whitish bands on each petal, the colour bright rose on each side.

Serapis, pale salmon-buff, suffused crimson.

Boadicea, very large broad petals, scarlet, greenish star.

Modesty, narrow reflexed petals, white and rose.

Endymion, very distinct, the centre of petals maroon, with creamy white margin.

Picolote, distinct whitish flowers, marked on the edge with a narrow line of a red colour.

Lady Howard de Walden, by far the best pure white variety. Four flowers on one scape.

Mrs. Whitbourne, deep vermilion, with a whitish margin.

The above notes on the most recent varieties will show the endless variety of colour now obtained, and most of them produced two scapes from each bulb, and from three to six flowers on each. The large number of flowers produced from each bulb with such a variety of form and colour, have put such good old species and varieties as *A. Ackermanii*, *pulcherrima*, *pardina*, *Chelsoni*, *Junius*, *Sultan* and *Leopoldi*, quite in the shade. The flowers, though well formed, only came two on a scape, and usually one stem only from each bulb.

The increasing popularity of the *Amaryllis* has increased the number of growers, and of course novel systems of culture are brought forward. It has been stated in a contemporary that Messrs. Kelway, of Langport, grow them in borders out-of-doors "with a little litter strewn on the surface," as a sufficient protection in winter. The drying off of the bulbs is also objected to as unnecessary and perhaps injurious. The gain by not drying off the bulbs in winter is, we are told, an increased number of flowers on a spike; we are not told how many flowers Messrs. Kelway obtain from one spike of *Hippeastrum* grown out-of-doors, but if they get more than six from one spike or sixteen from one bulb, it will be glorious news for hardy plant growers. Referring to the drying off system, Mr. Heale, who has had the management of Messrs. Veitch's entire collection for many years, writes to say, "that they have tried both drying off and keeping the roots moist in winter, but that the drying off system is best, and is the one adopted at Chelsea," as it is in our garden at Great Gearty. *Jas. Douglas*.

ALOE INSIGNIS × N. E. BROWN.

(NEW HYBRID ALOE.)

IN several respects this handsome Aloe is a very interesting one; not only is it a beautiful species in its class, but is perfectly distinct in appearance and character from every other Aloe known, and teaches us to what a wide range the genus possesses the capability of being hybridised, and what great probability there is that several of the wild species of Aloe owe their origin, not to variation, but to hybridisation. A few hybrid Aloes are already in our gardens, but so far as I am aware nothing in this genus has been raised from such widely dissimilar parents, and with such a very distinct result. The history of this interesting novelty is as follows:—In 1874 Mr. Cooper fertilised flowers of *Aloe drepanophylla* with the pollen of *Aloe echinata*, and the seeds were sown in 1875. In April of this year (1885) some of the plants commenced to flower for the first time, that is, at an age of ten years.

Now *Aloe drepanophylla* is a species described by Mr. Baker in the *Gardeners' Chronicle* some years since from this very plant that Mr. Cooper hybridised! It is one of the tree Aloes, that is, it has a stem several feet high (about 8 feet in Mr. Cooper's plant) which does not throw out suckers or side shoots like the dwarf species, but may branch at the top when sufficiently tall. Mr. Cooper's plant is now three-branched at the top. Mr. Cooper had grown the plant for several years before it flowered, and the plant was many years old when he first had it. It was in the second year of its flowering that Mr. Cooper hybridised it; the first year he did not hybridise it, and it set no seed-pods, nor has it done so since, although I have seen the plant flower every year since, so that it appears not to be capable of being fertilised with its own pollen, and Mr. Cooper has only tried to hybridise it on the one occasion mentioned. There are some plants of it at Kew which have been three many years, and I believe have never flowered.

From this it appears, first, that *A. drepanophylla* requires to attain an age of many years (probably twenty at the least) before it flowers; and, secondly, that it requires to be cross-fertilised to produce seeds. Furthermore this species belongs to the section *Pachydendron*, all of which are tall-growing species, characterised by having their stamens protruding beyond the perianth.

The male parent, *Aloe echinata*, on the other hand, is one of the smallest of the genus, being quite stemless, and, leaving the flower-stem out of the question, it does not exceed 4 inches in height, and produces suckers at its base. Compared with *A. drepanophylla* it soon reaches flowering maturity, for if raised from seed it will flower in a few years, about five or six I believe. This species belongs to a very distinct group of the section *Eualoe*, all of which are small stemless species, and have their stamens included in the perianth.

Thus we must class the male parent among the dwarfs, and the female parent among the giants of the genus, and few people, looking at the two plants side by side, would expect to obtain a hybrid between them. Turning to the hybrid itself, we find that it is interesting not only in partaking of the characters of both parents, but at the same time in being so perfectly different from either that were its parentage unknown no one would suspect it to be a hybrid, and least of all a hybrid between its real parents.

In the possession of a stem, and in the number of years it has taken for it to arrive at flowering maturity, it resembles the female parent, whilst in the tendency which some of the plants have to produce shoots upon their stems it resembles the male parent, which produces offsets at the base. The leaves in their erect or slightly incurved habit, and the presence of tubercles on the face and back, exhibit in a degree the characteristics of the male parent, since in the female parent the leaves are very spreading, quite smooth on the face and back, and strongly falcate (whence the name *drepanophylla*); some leaves of the hybrid are also somewhat falcate, showing perhaps a slight trace of the female element; in size the leaves of the hybrid are intermediate between those of the parents.

In the erect flower-stem more lax arrangement and droop of the flowers it partakes of the characters of the male parent (the female parent having spreading flower-stems with very numerous densely packed and more spreading flowers), whilst in the colour of the flower, and in having exerted stamens it resembles the female parent. The form of the flower is different from both parents. In shape the bracts are intermediate, but in the brown nerves they resemble the female parent. The whitish colour of the open flowers, which is a very rare colour in this genus, and effectively contrasts with the deep coral-red of the unexpanded buds, at once renders this an attractive and conspicuous plant among its fellows. My drawing of it (fig. 8) represents, *b*, the entire plant of the hybrid one-third its natural size, and a leaf, bract and flower of ditto, natural size. *A* represents the leaf, bract and flower of the seed-producing parent, *A. drepanophylla*, all natural size, and *c* the leaf, bract, and flower of the male parent, *A. echinata*, also all natural size. The following is a description of this fine hybrid, which is I think the most interesting yet recorded for the genus, although Mr. Cooper has another and far more interesting one botanically, of which I shall give an account on a future occasion.

Stem in the plants seen at this date about 3 inches high, and $\frac{1}{2}$ – $\frac{3}{4}$ inch thick, crowned with a rosette of about 30–40 ascending and often slightly incurved and slightly falcate glaucous-green leaves, 7–11 inches long, gradually tapering from a 1–1½ inch broad base to a rather fine point; flat on the face, or sometimes concave towards the apex from the margins being inrolled, with an excentric median row of small prickles or tubercular points, and sometimes a shorter row of smaller ones on each side of it, or now and then without prickles on the face. Convex on the back with several longitudinal rows of small tubercular points.

Towards the apex of the leaf, one or two of the rows often develop into decided prickles. Margins sometimes, but not always, incurved towards the apex of the leaf, armed with prickles about $\frac{3}{4}$ –1 line long, of a rather paler green than the rest of the leaf. Flower-stem 18–20 inches high, erect, clothed almost from the base, but not at all densely, with elliptic-oblong or elliptic-ovate, acuminate, membranous, whitish bracts, with brown nerves 6–9 lines long. Flowers racemose, numerous (forty to fifty), pedicels 8–12

FIG. 8.—*ALOE INSIGNIS* ×, N. E. BROWN.

B, Entire plant, one-third natural size, with leaf (to the left), bract, and flower, natural size; A, Leaf, bract, and flower of female parent, *Aloe drepanophylla*, natural size; C, Leaf, bract, and flower of male parent, *Aloe echinata*, natural size.

lines long, ascending, longer than the bracts, green when the flower is open. Buds at first erect, afterwards drooping, deep coral-red, changing on expansion to whitish, with three green dorsal lines towards the apex of the perianth segments. Perianth straight, 15—16 lines long, 4 lines in diameter at the middle, where it is very slightly inflated. Stamens exerted 3—4½ lines beyond the mouth of the perianth, filaments yellow, anthers burnt-sienna coloured. N. E. Brown, Herbarium, Kew.

Orchid Notes and gleanings.

ORCHID PRUNING.

IN continuation of my pruning experience I want to record the history of a *Laelia anceps*. In 1873 I obtained a plant consisting of three bulbs with a leaf to each. It grew and bloomed yearly, and as a matter of course the old back growths lost their foliage as time passed away. Although I was conscious that I had in *Laelia* a plant differing considerably, both in its growth and requirements, to either of the species already mentioned, yet I considered it right and proper to cut away these old leafless bulbs. Therefore, at potting time, when the operation could be better performed, I cut out the bulbs, rhizome and all, close up to the bulbs, which retained good healthy foliage. This has been my practice ever since at potting time. The plant broke away very freely, and produced strong spikes and fine bloom every year. And notwithstanding that I took off a large piece on one occasion to have a second plant, and small pieces often for friends, the plant was sufficiently attractive to the eye of Mr. Oatram, who made a bid for it on behalf of his firm; and our second plant was coming on. Moreover we were glad to thin out, so by the consent of Mrs. Haselroft (my employer) the plant was allowed to go to the Holloway nurseries for £6. It had eleven spikes, bearing a total of thirty-two blooms, only one leafless bulb, but quite a mass of fine healthy foliage. This was in February, 1884—a little over ten years after receiving it. The piece taken from it, and which we still possess, produced thirty-one blooms this present year. It was seen by many lovers of Orchids, and specially admired by Dr. Ward of Southampton, who is one of the greatest lovers of Orchids in this district, and whose opinion is valued all over the kingdom. This specimen contains at the present time two leafless bulbs, thirty-one with fine leaves, and is breaking very strongly nine new growths. This plant, like our first, has been pruned at potting-time, which takes place with me about every third year, and would be worth £5 at least to the trade at the present time. Here then we have obtained £11 value from the three bulbs of 1873, and have also a fine young No. 3 specimen coming on. Can it be said in the face of these facts that pruning weakens the plants?

If pruning out the old worn-out back-growth is ruinous, as has been stated by the objectors to the system, then the whole of our little collection should have been on the rubbish-heap long ago, for a large majority of them have been pruned. But I think sufficient has been shown to satisfy reasonable men that pruning, as I have it, is not injurious to the health and vigour of many species of Orchids; in fact, I have a very strong opinion that many of the species really grow stronger and look healthier, and they certainly require less pot-room, when pruned.

I have now to speak of *Cattleyas*, but cannot go back many years, as my knowledge of these has been more recently acquired, but for four years I have pruned *C. Harrisonie*, *C. intermedia*, *C. Mendelii*, *C. Mossie*, and others. All of them look healthy; they grow well, and bloom very freely. Moreover, their appearance is improved, and this counts something with most people. I have just started the practice with a plant of *Ansellia africana*. In March last, while the plant was resting, I took it in hand for repotting. It bloomed last year but made very weak growth—so weak that I did not expect it to bloom this year. I therefore determined to shake it out and start afresh. It had but one leaf, but seven growths, two with foliage and five quite bare. I cut four of the back ones out, repotted the plant, and it soon started into growth at two places, and is now rooting very freely and pushing up two

strong growths. I cannot believe that it would have started stronger if I had left the old growth still on.

I am quite satisfied with the results of pruning, so far as I have tried the system, and as I have given the matter some years of attention and practice I will close my present notes on the subject by giving three rules, which I think are very important to a perfect knowledge of the culture of Orchids. Since I have followed these my plan of procedure has been shaped accordingly.

The first is to bear in mind that Orchids are never quite stationary as to growth, like other plants, but are always moving onward. Every new growth throws out roots which require to be fed, and these growths soon become independent plants, and moreover the roots attached to any bulb do not live many years. In some cases they die annually. The second rule is to ascertain at what age the young growths will produce their bloom, and how many times or seasons will these continue to bloom; also in what manner they will produce new growth, and when they lose the power to break afresh. Rule three is to remember that, though Nature's law is slow in its operation to separate the dying from the living, it does not follow that this law must be rigidly adhered to when plants are brought under cultivation. Of course there are many other things to know, such as seasons of growing, of resting, watering, shading, temperature, and a hundred other things, but above all, the individuality of every species. But these things are generally known and written about. *N. Blandford.*

ORCHIDS AND PITCHER-PLANTS AT BOCKING PLACE.

The effect of these when arranged together is well exemplified in the well-grown collection belonging to Sydney Courtald, Esq., at Braitree, where the three principal Orchid-houses are very showy and interesting with rare and well-grown plants in flower. Suspended over the tank in the warmest house is a splendid collection of Nepenthes, including all the obtainable species in cultivation—some of the rarer ones, such as *N. Northiana*, bearing unusually fine pitchers; indeed, the whole collection shows the plants at their very best, and it is difficult to imagine anything more noble, showy, or curious than the large blood-red pitchers on Mr. Courtald's specimen of *N. sanguinea* and *N. Masteriana* ×, the horny, hirsute ones on *N. Veitchii*, or the richly mottled leaf appendages on *N. Rafflesiana* and its allies. About the house are arranged many fine Orchids in bloom, the pouches of the *Cypripediums* seeming much in keeping with the pitchers of the *Nepenthes* overhead. One fine plant of the best variety of *C. Stonei* has two spikes of eight flowers; *C. niveum* fifteen snowy blooms; *C. Veitchii* equally good, and many nice specimens of *C. barbatum superbum*, *C. Roezlii*, and *Phalenopsis grandiflora*. Also good in this house are many forms of *Odontoglossum Roezlii*, *Dendrobium Lowianum*, *Dendrobium filiforme* with many spikes, *Broughtonia sanguinea*, *Oncidium Papilio*, and some *Aëides* and *Scaccolabiums*, the whole being very effectively displayed with the *Nepenthes*.

The principal flowering plant-house is gay with many excellent examples of the many varieties of *Odontoglossum Alexandræ*, *O. Pescatorei* and other *Odontoglossums*, including some well bloomed masses of *O. vexillarium*, many handsome and high-coloured forms of *Masdevallia Harryana*, and a charming specimen of the lovely *M. rosea* with about 100 blooms; also good *M. Veitchii* and *M. Shuttleworthii*. Among the other plants are some well-flowered *Vanda lamellata*, *Lycaste Deppii*, *L. aromatica*, *Lælia xanthina*, many *Epidendrum vitellinum majus*, *E. nemorale*, *E. variegatum*, *Angreecum falcatum*, *Promenaea citrina*, with thirty blooms; *Oncidium macranthum*, with twenty flowers on a spike; *O. crispum*, *Sobralia macrantha nana*, *Utricularia Endresii*, *Cypripedium Dominionianum*, *C. Schlimii*, in very robust condition; *Odontoglossum citrosimum*, with thirty flowers on one spike; *O. Cærdisti*, *Epidendrum Wallisii*. The unique and healthy collection in the *Masdevallia*-house also contributed some rare things, both curious and beautiful, to add variety to the display in the show-house, and among those may be noted *Masdevallia leontoglossa*, very curious; *M. porcellifera*, like a smaller form of *M. leontoglossa*; *M. velifera*, *M. Bonplandii*, *M. coriacea*, *M. gemmata*, and *M. tridactylites* with numerous flowers like brown beetles; *M. Macrura*, *M. isochromis*, *M. Chelsoni*, *M. Wallisii discoides*, and several forms of

M. chimæra. It may be noted, too, that the rare and curious *Coryanthes macrantha*, and equally uncommon *Eriopsis biloba* have just bloomed here in great perfection. In the Cattleya-house a good show is still kept up with many varieties of *C. Mossie*, *C. Mendelii*, *C. gigas*, and *C. Warneri*, one form of the last-named with gigantic flowers, and another of Sander's form of *C. gigas* with highly-coloured flowers on a spike, being of remarkable beauty. It is a pleasure to note that the Bocking Orchids, under the management of Mr. Alfred Wright, are fast coming to the front rank for clean, healthy, well-grown and well-flowered plants in every department, the *Cattleyas* and *Lælias* especially, which used formerly to be difficult here, being now in grand vigour. *J. O'B.*

ODONTOGLOSSUM VEXILLARIUM AT PICKERING LODGE, TIMPERLEY.

This species affords a sight that should be seen by every one interested in these beautiful flowers. The centre stage of the house they occupy is simply solid, to the enormous number of about 10,000 blooms. This seems almost incredible, but here they are, and of such grand forms, some measuring across the lip $3\frac{1}{2}$ inches, and $4\frac{1}{2}$ inches deep, from almost white to the very darkest varieties, and in some cases beautifully spotted. I should say there is not such a sight to be seen in any other establishment like this just now, and the foliage is of such colour!—none of the rust, as sometimes seen upon them; they are more like well-grown *Leeks*. The plants are full of dark, vigorous growth. The forthcoming Rose show will afford visitors a good opportunity of visiting this establishment, and I would advise all to see them, and they can then form their own opinion of it. The *Eucharis* here are in grand form. I noticed one that I believe is not yet named; the leaves are slightly ribbed, but not so much as *Sanderii*, about 3 inches across; the flowers, if possible, purer in whiteness than *E. amazonica*. In one of the *Odontoglossum Alexandræ* houses I counted about seventy spikes of splendidly formed flowers, and of very superior quality. The *Phalenopsis*-house is also very fine, every plant being full of vigorous health. The huge giants of *Cattleya* and *Lælia* are in grand healthy condition. I noticed some fine forms of *Cattleya Sanderiana*, *Mendelii*, and numerous others, but the majority of these have done flowering, though the plants in themselves are sufficiently interesting to those practically acquainted with them. *Cypripedium niveum* are very beautiful, carrying quantities of their white flowers. *Masdevallias* are full of vigorous growth and fine colour. Mr. Hardy has recently rebuilt most of his glass, and must have spent a vast sum to bring this collection to its present magnitude. Two *Vinerias* rebuilt and planted in March last are promising to give good return for the expenditure; the Vines have run to the top of the houses with good canes, almost as thick as a walking-stick, with close-jointed wood. The whole establishment, is, in fact, one thorough practical work; whatever Mr. Hardy takes in hand he does not do by halves, but in right down earnest. Let me once more impress upon strangers visiting the Rose show not to miss the sight of the *vexillarium*, which alone will well repay all lovers of Orchids. *S. Johnson, Clarendon Nursery, Sale.*

HYBRID PASSION-FLOWER.

MR. GEESON, of The Gardens, Haldon, near Exeter, sends us flowers of a hybrid *Passion-flower* raised by him between *P. racemosa* (better known in gardens as *P. princeps*), as the seed parent, and the white form of *P. cerulea* known as *Constance Elliott*.

The cross is a very interesting one botanically, and may turn out important horticulturally, for if Mr. Geeson can succeed in combining the hardness of *P. cerulea* with the inflorescence and colour of *P. racemosa*, he will accomplish a feat which should entitle him to the thanks of all gardeners. The specimens sent comprise a leaf which has the form and yellowish-green colour of that of *P. racemosa*, and two flowers which have the internal conformation of those of *P. racemosa*, but which differ in colour, the sepals being of a dull lilac, and the petals also of lilac somewhat deeper and brighter. The flowers are borne, Mr. Geeson tells us, on the joints (axillary), not in bunches, as in *P. racemosa*—*i.e.*, in terminal racemose clusters.

Hence, omitting minute botanical detail for which

our readers might not thank us, it may suffice to say that in this plant we have the foliage of *P. racemosa*, the inflorescence of *P. cerulea*, the white. The internal conformation is more like that of *P. racemosa*, and the coloration of the sepals and petals intermediate between the two, that of the coronal threads, however, being in one of the two flowers like that of *Constance Elliott*.

It is very interesting to note that one of the earliest hybrid *Passion-flowers* raised was that known as *P. ceruleo × racemosa*, a hybrid between the same two species as that before us; but in *P. ceruleo × racemosa* the leaves are mostly five-lobed, not peltate, deep green, and intermediate between those of the parents, while in the cross before us the foliage is more distinctly like that of *P. racemosa*. The structure of the flower in our present hybrid is essentially the same as in *P. ceruleo × racemosa*, with the exception that in one flower the outermost coronal threads, as we have said, are ivory-white, as in *Constance Elliott*.

It is a very singular circumstance that the colour of Mr. Geeson's hybrid should be so exactly that of *P. ceruleo × racemosa*, for although *Constance Elliott* is a derivative from *P. cerulea*, her flowers are ivory-white, and in her descendants (crossed with *P. racemosa*) the dull purplish hue, caused by the admixture of the blue of one parent and the bright pink of the other, comes out. The hereditary tendency, latent in *Constance Elliott*, thus shows itself in her descendants. The original *P. ceruleo × racemosa* was raised by Milne at Fulham, in 1819, and as it appears the pollen parent was also *P. cerulea*. Sabine, in describing this, mentions that there was great variation in the products of this cross; and Gaertner, who crossed the two species reciprocally, also mentions the variations he obtained. For a summary of the history of these hybrids the reader may be referred to Dr. Focke's useful work, *Die Pflanzen Mischlinge*.

It is a well known fact, commented on by all recent writers on hybridism, that *Passion* flowers are often infertile with their own pollen (like the *Aloe* mentioned in the present number, p. 40, col. b), even when it is applied artificially; but this is not universal, for *P. cerulea* and the *Napa Valley Nurseries*, *Napa, California*, and fruited by Mr. Chapman for the first time in 1876. It is alleged to be the most valuable shipping and canning *Cherry* in the world. The fruit is larger than its parent, more oblate in form, and of a slightly higher colour. It is sweeter than *Napoleon*, and has a smaller seed, but its chief value lies in its firmness. [A sample forwarded to us, which was picked June 1, 1885, arrived in not quite so bad a condition as the length of time the fruits had been packed would warrant us to expect. *ED.*]

FRUIT NOTES.

THE "CENTENNIAL" *CHERRY* is a seedling from *Napoleon Bigarreau*, being raised in *Napa Valley* by Mr. Henry Chapman, and sent out by Coates & Tool, of the *Napa Valley Nurseries*, *Napa, California*, and fruited by Mr. Chapman for the first time in 1876. It is alleged to be the most valuable shipping and canning *Cherry* in the world. The fruit is larger than its parent, more oblate in form, and of a slightly higher colour. It is sweeter than *Napoleon*, and has a smaller seed, but its chief value lies in its firmness. [A sample forwarded to us, which was picked June 1, 1885, arrived in not quite so bad a condition as the length of time the fruits had been packed would warrant us to expect. *ED.*]

WHINHAM'S "INDUSTRY" GOOSEBERRY.

Among the many varieties of *Gooseberries*, none have deservedly gained so rapidly in public estimation as *Whinham's Industry*. This is not a very new variety, but one that well deserves a much more extensive cultivation. Where grown it is highly appreciated for its many excellent qualities. It is of very vigorous growth, a heavy cropper, and bearing a large berry. For gathering green, few are superior to it. When ripe it is a splendid red fruit. This is one of the few sorts that do well in America, not being troubled by mildew, and some excellent authorities in the States have expressed an opinion that it will revolutionise *Gooseberry* culture in America. A correspondent states that "Whinham's Industry surpasses any of the older varieties for growth, bearing, and, what is of great importance to market gardeners, its earliness, weight and size of berry. From a plantation of two and a half years, say three summers' growth, at the time of gathering my average crop was, from ten trees, one pot, local measure, or 84 lbs. berries. The growth is so vigorous that trees planted 6 feet by 5 feet are nearly, and in some cases touching each other."

We send you by some post a few branches taken at random from a quantity of trees in full crop, and we think you will agree with us that, bearing in mind the number of berries on the branches, this variety is capable of yielding an immense crop of large and excellent fruit. *Richard Smith & Co., St. John's Nurseries, Worcester.* [The sample sent amply confirmed our correspondents' statement. *ED.*]

The Flower Garden.

The flower garden, or that part of it occupied by the summer bedding plants, will now, or will shortly, be at its best, and the enjoyment of it will be greatly enhanced by keeping all its surroundings and occupants in trim condition. Walks should be frequently rolled, verges and edgings clipped, and the lawn be mown weekly. The plants forming the groundwork and pattern of the flower-beds should be kept in regular order by pegging or pinching, and the design preserved as trim as when first marked out. What is known as carpet bedding can only be successfully accomplished by strict and almost daily attention to these points of management. It will be well to make notes of the best arrangements, and also of desirable improvements, in order that, if thought well, they may be carried out next year, noting any kinds of plants that may be discarded as failing to give satisfaction. Low-growing Sedums and Saxifragas, Echeverias, Antennarias, and Cerastiums, and all plants of that type which are used for carpet bedding, should have their flowers kept picked off.

Mesembryanthemum cordifolium variegatum and Leucophyton Brownii and Alternantheras, all will require to be pegged until they have covered the ground, after which they should be kept pinched. The large growing Echeverias which are used as dot plants should have all their flowers picked off. Calceolarias, Verbenas, and Violas require liberal supplies of manure-water. The heat of the past week and the north-east wind that prevailed here have been very trying to all plants. All kinds of Alternantheras, Coleus and Iresines will be very much improved if sprinkled daily with clean water over their foliage; it will brighten their colours and much improve them during the hottest weather. Now that the Rhododendrons and Azaleas have done flowering let all the seed-pods be removed, as by so doing the plants will be much benefited.

ROSES.

These are now in full bloom, and I never saw them looking better, but they are quite ten days later than last year. The overblown flowers should be picked off and all straggling shoots shortened back so as to produce a later crop of flowers. Budding should have every attention as soon as the stocks and buds are ready. *W. Smythe, The Gardens, Basing Park, Alton.*

Plants and their Culture.

SEED SOWING.

Now will be a very good time to sow another pinch of Cineraria seed. The stock obtained therefrom will make better progress than from the earlier sown seed; the plants will not have time to reach the dimensions attained by those, but their growth will be of that size and habit of plant which, in a Cineraria, is, in our opinion, of essential service, viz., the plant of medium size, the habit dwarf and compact, the foliage of good substance and not too large. The large and flaccid foliage of early sown stock is often-times lost to the plant in its younger stages of development, at least before there is any indication of bloom, leaving a plant, when in full flower, without the embellishment of healthy foliage.

It often happens, also, that there is a lack of room in pits, frames, and cool-houses during the dull days of late autumn and early winter, when, with the usual prevailing atmospheric moisture any overcrowding must be prejudicial to all plants of rapid growth; if, therefore, by late sowing, we can modify these disadvantages and provide the Cineraria with more room after the Chrysanthemum season is over, we shall have better reason to be satisfied with the plants when in flower. Late sown seed will also produce a stock of plants that are not so liable to attacks of aphid as the early ones.

A late batch of Primula sinensis will be equally useful in this respect, but earlier grown examples of this popular greenhouse annual are far more needed than in the case of the Cineraria. The earliest of the

Primulas for autumn use should soon be in their flowering-pots, and the later batches shifted into smaller sizes, either from their seed-pans or those into which they have been pricked off, when large enough to handle. Slight shading only should be used for the genera on which I have just commented; this is, however, preferable to growing them in frames under the shade of a wall with a north aspect. In the latter position the growth may be more rapid, but, as before stated, not of an enduring character.

OTHER ANNUALS.

A little seed of the dwarf Ten-week Stock, if sown soon, will prove of much service in the autumn, when sweet-scented flowers are valued; Mignonette likewise should be sown now for the same period, and a few weeks later on for winter and spring work, bearing in mind with the culture of this annual to ram the soil very solidly into the pots before sowing the seed thereon. We have done this almost to the bursting of the pots, and had the best results thereby. If some old mortar rubbish is at hand it should be mixed with the soil, and a covering of fowls' dung laid over the drainage. The dwarf Scabious, Corn-flowers (Centauria cyanus minor), Rhodanthes, and Nemophila insignis, should also be sown at once for flowering in pots during the winter season. Of the last-named annual another sowing should be made in a month's time for spring blooming in the conservatory, for which purpose it is most floriferous and very distinct, being well adapted for the edgings of ornamental baskets or suspended from brackets. Towards the end of the month will be ample time for sowing herbaceous Calceolarias, taking the precaution to stand the seed-pan over a saucer containing water, in order to guard against slugs feeding upon the young plants. *James Hudson, Gunnersbury House, Acton.*

FRUITS UNDER GLASS.

GRAPE HOUSES.

In late houses which contain late kinds of keeping Grapes intended for bottling by-and-bye a free ventilation should be afforded. In this case very large bunches are not so desirable, because sometimes they are not found to keep good so long a time as moderately-sized bunches. These should be well thinned, and in the operation care should be taken to cut the foot-stalks of the berries removed, quite short, as otherwise the remnant often produces mould, which is inimical to sound keeping. Late Grapes unquestionably should be fully ripe by the end of September. If this is not likely to be the case, much can be done towards this end by means of utilising sun-heat to the full whenever possible. In late Muscat-houses with borders inside, see that the roots in them have ample supplies of tepid manure-water in a much diluted state, and keep the mulch constantly moist at this period, in order to counteract the evil consequences arising from the foliage scorching. Keep a little air on at the top ventilators constantly, and if possible avoid using shading materials. If scorching should take place, let the lateral growths which the Vines are making be allowed to fill up defective places, and afford that protection to the fruit which is absolutely indispensable, and, moreover, necessary to finish the fruit perfectly.

THE CHERRY HOUSE.

If this structure is furnished with movable sashes these should be taken off the trees altogether now, so that they can have the benefit of natural influences entirely. This course of treatment is a considerable advantage to Cherry trees that are forced, year after year consecutively, inasmuch as it tends to arrest the precocious development so apt to occur with such trees. Keep the foliage of these trees clean and healthy by washing them regularly every day when dry, with a forcible use of the syringe; let the roots also be well attended to as regards water.

TREES IN POTS.

These should be brought out-of-doors at once, stood on a bed of ashes to stop the worms getting into the pots, and in a sunny position. The pots should be surrounded with partly decomposed leaves or manure to prevent the scorching rays of the sun shining too fiercely on them. Syringe the trees overhead in dry weather, and attend to the watering

regularly, giving them weak manure-water once or twice a week if it be required. As the watering will now be the most important operation, see that it is done judiciously.

Plum trees in pots, from which the fruit is gathered should now be treated in the same way as recommended for Cherry trees in pots. *G. T. Miles, Weycomb Abbey.*

ALPINE PLANTS.

ONOSMA TAURICA.—This but little known plant, introduced from the Caucasus in 1801, has many recommendations in favour of its extended use in our gardens. The bright yellow, tubular flowers are of exceptional beauty, distinct in form, and deliciously fragrant; and, further, the plant is an almost perpetual bloomer from early June until molested by the winter frosts. A nobler or handsomer plant we have not got if well placed on the rock garden, or a finer and more desirable thing in both form and colour. It delights in a dry, sunny, and well exposed situation, therefore elevated rockwork will be found the best position, and where the pendent flowers can be seen to advantage. Although usually described as herbaceous this is hardly true of the plant, for it usually retains much of its fresh foliage throughout the winter. In the variety, or species, *O. stellata*, we have, so far as general appearance is concerned, a miniature of *O. taurica*, with less beautiful, less bright flowers.

SILENE ALPESTRIS.

The Alpine Catchfly (*Silene alpestris*) is certainly one of the prettiest and most interesting of rock plants, and possessing every qualification that renders an alpine plant worthy of our best care and attention. It is of neat, compact habit, thrives well under ordinary circumstances if left alone, and produces during June an abundance of pure white flowers, which the notched petals further improve, thrown well above the shining green masses of leaves. This plant, it should be remembered, is rather impatient of disturbance, and when once thoroughly established should be allowed to roam at will, and thus alone can perfect sheets of bloom be secured.

RANUNCULUS.

Amongst Ranunculaceae vegetation I would especially notice *Ranunculus* as being a distinct and showy border plant, with bright yellow blossoms as double and compact, though of perhaps less size than those of a Persian *Ranunculus*. Like the majority of its relatives this desirable plant is best at home in rather damp loam, or a mixture of the latter and peat; indeed, the finest clump here is thriving luxuriantly under similar circumstances to *Iris cristata*, *Cypripedium spectabile*, the *Parnassias*, and other damp-loving subjects. It is readily increased by division of the root, and being a plant of hardy constitution, is but little affected thereby.

ANTHERICUM LILIASTRUM.

St. Bruno's Lily (*Anthericum liliatum*) is at present very effective, the fragrant silvery-white, Lily-like flowers being borne in great profusion. It is a neat-growing, elegant plant, that one cannot have too much of, and which for effect during June has but few equals. The flowers, which are faintly tipped with green, are borne on stems averaging a foot or more in height and during fine weather remain good for a considerable time. The variety major, which grows to double the latter's height, is a valuable addition, the large fragrant flowers and grassy-like leaves being both distinct and effective. Good loam with a moderate supply of water is all it wants, and, perhaps, during severe winters it will be all the better of a slight covering of ashes as a safeguard against frost.

PRIMULA FARINOSA.

Than the Bird's-eye Primrose (*Primula farinosa*) there is no prettier plant of the early summer. Somehow it is seldom seen in a happy state, most people having not yet got the knack of growing it freely. Coddling in pots will not do, nothing suiting this pretty native better than a cool, boggy spot amongst rich vegetable soil. The slender powdery stems, half-a-foot in height, surmounted with graceful lilac-purple, pink, rose, or deep crimson flowers, are at present very effective, and a worthy occupant of even the more prominent portions of the rock garden. *Emergo.*

(To be continued.)

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	July 14	Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 1 P.M.; Sale of Imported and Established Orchids, at Frothero & Morris' Rooms.
WEDNESDAY,	July 15	Reford Rose Show; Sale of Orchids and Flowering Eucharis, Calanthes, Clematis, &c., at Stevens' Rooms.
THURSDAY,	July 16	Wickworth, Derby, Rose Show; Sale of Imported Orchids, Seeds, &c., at Stevens' Rooms; Sale of Stove and Greenhouse Plants and Orchids, at Elham Park, by Frothero & Morris.
FRIDAY,	July 17	Sale of Valuable Anemones and other Orchids, at Frothero & Morris' Rooms.
SATURDAY,	July 18	Writal Kose Show.

By a singular, or was it a designed, coincidence? the *Times* of a few days since published two letters, one relating to the British (see p. 51), the other to the Alpine Flora. With the main object of these letters we and all our readers will be in full sympathy. The botanist proper looks upon marauders such as are alluded to in the two communications we have referred in much the same light as the scholar would regard him who, having found one of the lost books of LIVY, proceeded to destroy it. In truth, the greatest ravages are usually the result of pure ignorance. Those who know and those who merely appreciate do not do these things. The botanist desires to accumulate information respecting the structure, affinities, life-history, relation to insects, to soil and climatal conditions of the plants in question. He takes the keenest pleasure in observing facts and in learning some at least of the lessons these loveliest of instructors convey, not only as to the present condition of the world in which he lives, but also as to the former states of its surface. The interest is with the past equally with the present. It is absolute, it is concrete, at the same time that it is relative and abstract. From whatever point of view the botanist proper may chance to observe the wild plants of this or any other country, his feeling of reverence necessarily forbids him from compassing their destruction. His tendencies are all the other way. Again, the botanist, if he be not more imbued than other people with the love of all that is beautiful, that is good, that is true in Nature, is at least as much so, and hence he is not to be feared as an uprooter of rare and beautiful specimens.

Then there is the amateur botanist or gardener. He, too, is scarcely to be pointed at as a Goth or a Vandal; he may have the collecting instinct strongly developed—too strongly in many cases—but he is generally wise enough to remember the adage which warns us not to kill geese that lay golden eggs.

As to the professional collector, whose interest is mainly a mercenary one. Well, we do dread some of these gentlemen. No one who sees, as we do from time to time, the rubbish heaps of dead Orchids that may be seen—we will not say where—but will dread the destructive agency of this class of plant-collectors. Men who do this sort of thing in Central America, Borneo, Burmah, or wherever it may be, must not be aggrieved if we class them with the wretched tramps who root up Ferns and wild plants to sell in our markets and streets, or on our railway platforms. We say advisedly some, for it has been our privilege to know many who, labouring diligently in their allotted vocation, are yet quickened and restrained by their botanical conscience.

Another class of marauders are merely thoughtless, and among these must be reckoned hundreds of alpine tourists who pluck, and by thoughtless purchase, encourage peasants and children to grab at plants simply because they are pretty. We do not believe that much real mischief is done by this latter class; they have no very potent mercenary motive, and for the most part they have not

enough knowledge to be able to compass much damage.

What is the remedy for these evils? Are Acts of Parliament or Cantonal Edicts of any use? We doubt it: may we rather fear that by drawing attention to the supposed value of the plants and the profit to be obtained from such enactments might tend to increase, rather than palliate the evil? Popular sympathy is apt to be on the side of the smuggler, and the creation by law of an offence—we speak with deference in the presence of Mr. Justice WILLS—is not sound law, nor does it commend itself to the conscience of the layman's mind. What, then, is to be done? What do we do in the case of marauding birds? Do we not often find it cheaper and more effectual to feed them and so save our fruit and our Peas than to maintain an army of watchers and visivectors for their destruction. If we can ensure effectual protection by means of nets or other means, well and good; but if our directly repressive measures must be, from the nature of the case, partial and ineffectual, as generally happens, then it were better to fall back on indirect means, and go round the mountain whose summit we cannot climb. It appears to us that this is the principle upon which the Society for the Protection of Alpine Plants at Geneva, for which Mr. Justice WILLS asks the suffrages of plant lovers, acts; and from what we have ourselves seen of Mr. CORREYON'S procedures, we are bound to say that we believe that, by their means, a much larger and less intermittent supply of alpine plants may be obtained than would ever be secured by other means; while at the same time no ruthless depopulation of the mountain-side would ensue, and specially the chance of extinction of rarities would be materially lessened. Plants which are rare in Nature are so because, from some or other cause, they are not in full harmony with the conditions under which they happen to be. It is the gardener's privilege to be able to rescue such plants from the fierce struggle of relentless competition, or the storms of adverse fate. Let him, therefore, be called to the rescue, and the requirements of all classes interested will thus be more fully consulted, and with less injury to the sentiment of the lover of Nature, than by any other means we can think of. We append Sir ALFRED WILLS' letter:—

"The number of English tourists who visit Switzerland is very large, and increases yearly. Not the least charm of that country is the rich flora which adorns the valleys, the margins of the glaciers, and the alpine slopes. The impoverishment or destruction of this flora must largely diminish this charm, and must be regarded with serious apprehension on this if on no higher ground. It is a lamentable truth that, so far as some of the loveliest Swiss plants are concerned, their destruction is already an accomplished fact, while the entire flora of the country has undoubtedly undergone a palpable and grievous impoverishment during the last few years.

"The chief causes of this evil are—first, the reckless gathering of plants by the crowds of visitors who pour into Switzerland every year; secondly, the wholesale uprooting of plants for sale to tourists by professional plant-hunters, who penetrate constantly into remote alpine regions in search of specimens, and even willfully destroy large numbers of plants in order to increase the rarity and so enhance the market value of some species.

"In either of these cases specimens are obtained under conditions wholly unfavourable to life, being gathered carelessly, often in the height of their flowering season, and subsequently either carried or sent by rail or post to heat and drought, as well as to all kinds of rough usage. It is believed by those who have most carefully studied the subject that not more than 10 per cent. of such plants survive.

"It should also be remembered that all annuals and biennials depend for the perpetuation of their kind upon the production of fresh generations from seed, and hence their extermination is effectually secured by the constant abstraction of their flowers alone. It may be assumed that every lover of Nature and every true botanist will welcome any means by which these acts of vandalism, whether deliberate or resulting from carelessness and ignorance, may be checked.

"A society has lately been formed in Geneva (Association pour la Protection des Plantes) the aim of which is to compass this desirable result. Its operations are mainly directed—first, to the education of public opinion on the subject; secondly, to the supply of all the rarest and most attractive alpine plants to the public at prices below those usually paid to the plant hawkers who vend their specimens in the market places of Geneva, Lausanne, Vevey, &c., and in the best possible condition instead of the very worst. With this view the Society has taken a large garden (Jardin Alpin d'Acclimatation, 2, Chemin Daudet, Plainpalais, Genève), which is laid out in rockwork, bog, &c., and devoted solely to the raising of innumerable Swiss plants from seed and to the sale of the well established in pots at low prices.

"Such plants are vastly more robust and independent of local and climatal conditions than any which have been transplanted from their native habitats, and can always be brought or sent home with the certainty that every species which is amenable to cultivation will have the best chance of living and thriving in its new home.

"The Society is already prepared to supply a large number of plants in vigorous health in pots at low rates, and it appeals to all English tourists to visit the Alpine Garden, to purchase from this establishment such plants as they desire to possess, and rigidly to abstain from encouraging, directly or indirectly, the misdeeds of the professional Swiss plant-hunter. To this appeal it is very earnestly to be hoped that all English travellers in Switzerland will cordially and loyally respond.

"Funds are much needed for extensive works still required for the full prosecution of this admirable scheme, and Dr. MAXWELL MASTERS, F.R.S., 41, Wellington Street, Covent Garden (*Gardener's Chronicle* office), has kindly consented to receive subscriptions for transmission to the Society. Lovers of Nature may also give valuable help by taking shares in the undertaking, which are issued at 100 £ each. These may be obtained from its enthusiastic director, M. H. CORREYON, at the Alpine Garden, Geneva, who is also desirous of entering into arrangements with the curators of botanic gardens, with nurserymen who devote themselves to the culture of hardy perennial and alpine plants, and with private growers for the supply of specimens or of seeds. He will also gladly forward the reports of the Society, which are extremely interesting, lists of plants on sale, and any other information, upon application, to any one who feels an interest in the effort which the Society is making to popularise the cultivation of a very charming class of plants without encouraging the systematic destruction of the mountain flora, which lends to the scenery of Switzerland one of its subtlest charms."

—RHODODENDRON MANGLESI. —Messrs. VEITCH & SONS recently favoured us with a truss of this magnificent hardy Rhododendron, raised by them, and with which they appropriately associate the name of the late Mr. MANGLES, whose premature decease our plant-lovers and gardeners so earnestly deplore. As to the beauty of this rose, the illustration (fig. 9) speaks for itself; suffice it to say that it was raised as a cross between the glorious Himalayan R. Aucklandiae and the garden hybrid R. album elegans. In its calyx it shows traces of R. Aucklandiae, as also in the bold white flowers. Our illustration was taken from a specimen which flowered in the open air at Coombe Wood, but experience is required in order to enable us to know whether it will prove hardy in other localities. In any case, no one would grudge the slight protection such a glorious object would require.

—THE FRUIT CROPS OF THE YEAR.—The materials which have come to hand in respect to the crops of the more important fruits of the United Kingdom help to support the belief of many persons capable of forming an opinion on the subject, that these would be found to be in only moderate abundance; and although the end of June, when the bulk of the returns reached us, is somewhat early in the year, we can yet see that the crop of Apples will be greater than that of last year, but less than that of 1883, and that Pears will afford an average crop, whilst the crop of Plums is a poor one outside of the Home Counties and the Severn valley. Strawberries, now becoming more generally grown round the large centres of population, are a more than average crop, whilst the useful Currant and Gooseberry crop is generally abundant, so that the great preserving industries will be enabled to get the ingredients used, including sugar, at reasonable (and, we may hope, for the sake of the growers) and satisfactory prices. The cold weather in May, which included several nights in the middle of the month when 8° to 10° of frost were experienced, did much harm in the Northern, Central, and Eastern parts of England, and but little in Scot-

FIG. 9.—RHODODENDRON MANGLESI; HARDY HYBRID; FLOWERS WHITE. (SEE P. 48.)

land, where blossoming had been retarded, and in the Southern Counties of England, where it fortunately happened that the air was unusually dry, and the trees were tolerably full of foliage. In the most favoured districts the persistent falling of the fruit points to organs in the bloom injured by cold, but the period has now been reached when the loss from this cause will cease. The fruits grown on garden walls, or similarly protected, in the Home Counties are fairly abundant, in the West of England above the average, and the same may be remarked generally concerning these in all counties south of a line drawn across the country from the Wash to Bangor. In Scotland we find the fruit growing district of the Cause of Gowrie, with its exceptional salubrity, still suffered materially by the late spring frost, more so than in localities in which vegetation is always later. In Ireland good crops are spoken of, but very late, and will require a long warm summer for their proper ripening.

— AN APPEAL.—A very painful case of distress has come before us, of which, we trust, the mere mention may be of some measure to alleviate. Some months ago Mr. ROWE, formerly Gardener to Viscountess CLIFFDEN, and of whom the record, as we learn, is such that any one might envy, died. It appears that, on leaving his situation, from no fault of his own, he went into business, and lost the savings of many years. At his death he left a widow and four children. About three weeks ago the widow also died suddenly, after having had a brief but painful struggle to provide for her children and herself. The four children are consequently left unprotected and unprovided for, and it is on their behalf that we insert this appeal. The Rev. F. S. THORNTON, of St. Sepulchre's, Northampton, has interested himself in the matter, and we shall be happy to forward to him any sums that we may receive for the purpose, and we trust that they may be many. The smallest contributions in such a case have a value of their own.

— SMOKING IN THE CONSERVATORY, ROYAL HORTICULTURAL SOCIETY.—We publish the following note, and strongly endorse our correspondent's complaint:—

"Heatherbank, Weybridge Heath, July 7.

"I think a note in your paper might lead the Exhibition authorities to instruct their policemen to stop people smoking in the conservatory while a flower show is going on. Today Tobacco-smoke mixed with the scent of the Roses. I asked several policemen if they had authority to stop smoking; they had not. As the conservatory forms part of the Exhibition, I believe neither the Royal Horticultural Society nor the Royal Albert Hall authorities have jurisdiction. "GEORGE F. WILSON."

— EURYANGIUM SAMBURI.—This interesting Turkestan plant is now flowering at Messrs. JAMES DICKSON & SONS, Newton Nurseries, Chester. As the plant was strong, the flower-stem is about 10 feet high, sparsely branched, presenting a unique appearance in the hardy flower-garden. It is a singularly handsome foliage plant, producing large, freely divided foliage, reminding one of some of the Marantias, and many readers of the *Gardeners' Chronicle* will know the use of its dried roots in pharmacy. Mr. WARE, of Tottenham, also has this notable plant in bloom in his nurseries. Although its medicinal virtues are not very highly esteemed, or indeed known, in this country, the Chinese attach the highest importance to it. It is mentioned by DR. LANDELLS in his recent work on Central Asia.

— ROSE PRUNING.—The following experiments are suggestive. Three vigorous bushes of Charles Lefebvre, Paul Néron, and NOBLE'S Queen of the Bedders respectively, were thus treated. All the branches on each were divided into three sets. One set of each on the same plant was hard pruned late in March, one set had the buds rubbed off as they appeared for several weeks in succession, and one set of branches was left alone to grow as it would. The result is at this date that the branches which were left alone have been bearing in profusion flowers of fair average quality for the last fortnight; those that were hard-pruned are only now expanding a comparatively few flowers no better than those which were left severely alone; while those in which the buds were rubbed off systematically till about the end of May are weak and sickly, with few or in some cases no flower-buds, and what there are very backward and small.

It should be stated that the growth in all cases in the garden where these experiments were conducted has been unusually vigorous this spring, with an almost complete absence of greenfly, maggot, or midew. In most seasons greenfly or maggot very seriously check and deform the first flowers, so that as far as they go these experiments would seem to indicate, that in an ordinary season moderate pruning by checking and retarding the first growth enables the Roses to escape the attacks of their enemies, but if these latter do not put in an appearance, unpruned Roses do best. Of course, we have not the exhibition-table in view.

— CISTUS FORMOSUS.—Mr. KETTLEWELL, Balrath Barry, sends us flowers of this bright yellow alpine plant—a beautiful carpet plant on sunny parts of a rock garden, or when planted in light ground in the perennial border, but where it should always have some flattish stones placed round it, to elevate the growths and to retain the warmth of the sun.

— PHYLLOXERA IN GREECE.—The following official communication has been forwarded to us for publication:—

"Considerable alarm is felt here about the possible spread to this country of the Phylloxera, which is said to have appeared in the neighbourhood of Constantinople. Stringent measures will be adopted to prevent its introduction, the importation of all trees, plants, fruit, grass, and hay from eastern countries, including Candia and Egypt, being prohibited under very severe penalties. Things are bad enough in Greece as it is, and the scourge, should it reach this country, would almost consummate its ruin from an economic and financial point of view. I have the honour, &c., (Signed) "HORACE RUMBOLD."

"The Earl GRANVILLE, K.G."

— "THE AGRICULTURAL GAZETTE."—Our old friend and former associate has lately appeared in a new guise, and in an enlarged form. The Editorship is still retained by that most estimable man and sound agriculturist, JOHN CHALMERS MORTON, which is warrantly enough for those who know him, and those who do not will do well to make his acquaintance, at least through the *Gazette*, as speedily as possible.

— THE "BOTANICAL MAGAZINE."—The July number contains figures of the following plants:—

Chrysophyllum imperiale, t. 6823.—This is the noble stoe foliage plant provisionally named *Theophrasta imperialis*, remarkable for its bold leaves, like those of the Sweet Chestnut in form, but larger, firmer, and deeper in colour. The plant having flowered, it has been determined to be a Sapotad, of the genus *Chrysophyllum*. Its native country is the province of Rio Janeiro. The specimen figured flowered in the Botanic Garden, Cork, where it was observed by DR. HARTOG.

Excavim affine, t. 6824.—A Socotran Gentianad, discovered by Professor BAYLEY BALFOUR, with ovate leaves and small lilac flowers, described in these columns, May 10, 1884, p. 604, fig. 116.

Narcissus pachyphyllos, t. 6825.—An Algerian species, very rarely seen in flower. It has very large bulbs, glaucous leaves, small white fragrant flowers, like those of the Paper-Narciss, in bunches. The specimen figured came from the garden of E. G. LODER, Esq.

Corydalis pallida, t. 6826.—A Chinese species, with very deeply cut leaves and elongated pyramidal loose racemes of yellow flowers.

Rhododendron niveum var. fulvum, t. 6827.—Only differs from the type in the rich tawny pubescence on the under-side of the leaves and the deeper coloured flowers.

— VANDA LOWII.—The fine specimen of this Orchid at Château de Ferrières, which last year bore eleven spikes of bloom, has this season seventeen. There is one leader, seven breaks, and 120 leaves, each 70 centimetres long. The total height of the plant, exclusive of the basket, is 1 metre 80 centimetres. The flower-spikes measure 2½ metres in length each, and bear 400 flowers.

— ROSE CATALOGUE.—In the *Gardeners' Magazine* of July 4 is published the first instalment of what bids fair to be a very useful list of garden Roses, arranged alphabetically, and with indications of the class to which each belongs, the name of the

raiser, the year of its introduction to this country, the colour, the size, and habit. None but those who undertake such a task know the labour involved, and that is one reason why people are so indifferent, not to say ungrateful, to the race of index makers.

— GARDENERS' ROYAL BENEVOLENT INSTITUTION.—On July 3 the forty-second anniversary festival of this Institution was held at the "Albion" Hotel, Aldersgate Street, E. TIDSWELL, Esq., of Chigwell, in the chair. A numerous and influential company assembled, including Mr. G. Lambert, Master of the Patten-makers' Company; Mr. G. Cutts, Senior Warden of the Fruiterers' Company; Mr. J. F. Aldridge, Major Grant, Colonel S. Clarke, Messrs. Nutting, Gibbs, Sherwood, Carter, Veitch, Dickson, Barr, Webber, Hopcraft, Shirley Hibberd, and others. The Chairman, in giving the toast of the evening—"Success to the Gardeners' Benevolent Institution"—said this Institution had now been doing useful service since the year 1853. Its first years of lingering existence have been succeeded by years of vigorous usefulness, and it had had 500 annuitants, receiving pensions of £12 and £16 per annum. It was gratifying to reflect that, as men engaged in commerce, they could yet feel they had contributed to smoothen the last days of many a poor sufferer. Owing to the generous donation of £500 by an anonymous donor, a legacy of £450, and the generosity of numerous contributors, these pensions were increased last Christmas from £16 to £20 per annum for men, and from £12 to £16 for women. At the present time 104 annuitants—fifty-four men and fifty women—were on the pension list of the Institution. One chief aim of the Society has been to endeavour to make gardeners feel the value of their life, because they believed that it was right for every one to assist those who had first tried to help themselves; hence the fundamental rule of this Society was that any gardener who subscribed his guinea a year for fifteen years, or who gave his 10 guineas in one donation, should take precedence over any others who might be elected. Another principle was to make their expenditure for all efficient work as small as possible; and he was glad to say that nearly the whole of the funds went to the annuitants. After alluding in fitting terms to the fine productions of fruit and flowers contributed by members of the Institution, the Chairman touched on the great help that had been given by their Secretary at all times, and especially in getting together the Augmentation Fund. "The committee believed that the benefits accruing to the Institution were mainly due to his great efforts, wonderful assiduity, and great gifts. Immediately after the realisation of the hopes they had lately been working for, it was at once suggested that a testimonial should be presented to Mr. CUTLER, and he now had great pleasure in offering him a valuable gold watch, and a cheque for £450. He was glad to say that 480 subscribers had contributed a sum of £505 up to that time, and if the sum should be swollen to £705 or £1005, no one would be more gratified than himself." Mr. CUTLER, who was enthusiastically received, expressed in a few appropriate sentences the pleasure he felt on the receipt of such a handsome present. Short speeches followed by Mr. SHIRLEY HIBBERD, the Master of the Fruiterers' Company, Mr. C. LAMBERT, Mr. J. R. BOURNE, Mr. SHERWOOD, Mr. B. S. WILLIAMS, and Mr. NUTTING. The Secretary announced at the close of the entertainment subscriptions amounting to £750.

— HIGH PRICED ORCHIDS.—The following prices were obtained on July 3 at Messrs. PROTHORP & MORRIS's sale rooms:—*Lælia elegans*, imported mass, 25 guineas; *Cattleya Reineckiana superbiissima*, one good plant, 33 guineas; *C. Arnoldiana*, one good plant, 29 guineas; *Odontoglossum species* in flower, 18½ guineas.

— GARDENING APPOINTMENTS.—Mr. TOWERS, late Gardener at Syston Park, Grantham, as Gardener and Bailiff to Mrs. KINCAID SMITH, Wood End, Chichester.—Mr. EDMUND WILLIAMS, Head Gardener at Peasmarsh Place, Sussex, has been appointed Head Gardener to JOHN PARSONS, Esq., Ashurst Place, Langdon, Tunbridge Wells.—Mr. THOS. OLDHAM, late Head Gardener to E. HOMAN, Esq., J.P., Friar Watch, Finchley, has been appointed Head Gardener to Miss ONSLOW, Upton House, Aylesford, Hants.

THE PRESERVATION OF THE NATIVE FLORA OF GREAT BRITAIN.

We (*Times*) have received from the Council of the Midland Union of Natural History Societies, including upwards of twenty natural history societies and field clubs in the Midland Counties, the following statement upon the subject of the preservation of the native flora of Great Britain :—

"The Mason College, Birmingham, June 30.

"It is a fact only too evident to the most superficial observer that many of our rarest and most beautiful native plants have already been, or are being, rapidly exterminated; and it may be assumed that this extermination will be viewed with regret—even with indignation—alike by the student and by the ordinary lover of natural beauty, and that both will be willing to assist in any measures which may afford the prospect of arresting its course.

"The Council of the Midland Union of Natural History Societies bestows serious attention to the following brief statement of the causes of the rapid destruction of British plants, and of what it ventures to suggest as the best means of mitigating the evil. These causes appear to be mainly as follow :—

"1. The ravages of professional plant-hunters, who offer to the tourist, or to the general public by advertisement, plants attractive by reason of their beauty or of their comparative or absolute rarity.

"The large dimensions which this traffic has assumed are indicated by the number of such advertisements which appear in some of the gardening periodicals offering Ferns from Cornwall, Devonshire, Somerset, the Wye Valley, &c., at from 4s. to 7s. 6d. per 100, in named varieties; *Hymenophyllum unbridged* and *H. unilaterale* at 2s. per square foot; various species of *Orchis*, *Saxifrage*, &c., at from 2s. to 5s. per 100; *Asphodel* at 2s. per dozen, &c.; or inviting tenders for *Daffodils* and *Primroses* at so much per 100,000.

"2. The operations of exchange clubs, the members of which are often asked to supply large numbers of the rare plants of their own districts in exchange for corresponding quantities of those of other neighbourhoods.

"3. The reckless gathering of plants, often taken with their roots attached or in seed, by botanists and their students in the course of their excursions.

"4. The careless gathering of large numbers of specimens by individual botanists.

"Recognising that restrictive legislation or police interference are neither applicable nor desirable, the Council believes that it is by the indirect influence of example and the promotion of healthy public opinion that the evil in question can alone be combated.

"They therefore strongly urge the following considerations upon botanists, members of field clubs, natural history and other scientific societies, upon all lovers of Nature, and upon the public generally :—1. That they should rigidly abstain from encouraging or countenancing the purchase from professional plant-hunters of any native plants, for the sake either of their rarity or of their decorative value. 2. That botanists should resort to the assistance of exchange clubs, if at all, only for the purpose of obtaining such single specimens as are necessary to fill up blanks in their herbaria, using such assistance with discrimination, and excluding from their operations plants of great rarity. 3. That all teachers should inculcate on their pupils by precept and example the lamentable consequences of the wholesale or indiscriminate gathering of plants, especially with their roots or when in seed. 4. That individual botanists should seriously reflect on these consequences, and abstain from taking more than the smallest number of specimens indispensable for the purpose of genuine study, and even from taking any where the extermination of a particular species from a restricted habitat is threatened. 5. That tourists and amateurs should be urged to refrain from collecting plants of any degree of scarcity, especially when in flower or seed, it being certain that not 10 per cent. of those gathered under such conditions can possibly live after removal."

STRIKING A LIGHT.

In the new edition of Mason's *Burma* we read that among other uses to which the Bamboo is applied, not the least useful is that of producing fire by friction. For this purpose a joint of thoroughly dry Bamboo is selected, about 14 or 2 inches in diameter, and this joint is then split in halves. A ball is now prepared by scraping off shavings from a perfectly dry Bamboo, and this ball being placed on some firm support, as a fallen log or piece of rock, one of the above halves is held by its ends firmly down on it, so that the ball of soft fibre is pressed with some force against its inner or concave surface. Another man now takes a piece of Bamboo a foot long

or less, and shaped with a blunt edge, something like a paper-knife, and commences sawing motion backwards and forwards across the horizontal piece of Bamboo, and just over the spot where the ball of soft fibre is held. The motion is slow at first, and by degrees a groove is formed, which soon deepens as the motion increases in quickness. Soon smoke arises, and by the time it is now made as rapid as possible, and by the time the Bamboo is cut through not only smoke but sparks are seen, which soon ignite the materials of which the ball beneath is composed. The first tinder spark is now carefully blown, and when well alight the ball is withdrawn, and leaves and other inflammable materials heaped over it, and a fire secured. This is the only method that I am aware of for procuring fire by friction in Burma, but on the hills and out-of-the-way parts, that philosophical toy, the "pyrophorus," is still in use. This consists of a short joint of a thick woody Bamboo, neatly cut, which forms a cylinder. At the bottom of this a bit of tinder is placed, and a tightly-fitting piston inserted composed of some hard wood. The tube being now held in one hand or firmly supported, the piston is driven violently down on the timber by a smart blow from the hand, with the result of igniting the tinder beneath.

Another method of obtaining fire by friction from Bamboos is thus described by Captain T. H. Lewin (*Hill Tracts of Chittagong, and the Dwellers Therein*: Calcutta, 1869, p. 83), as practised in the Chittagong Hills. The Tiporahs make use of an ingenious device to obtain fire; they take a piece of dry Bamboo, about a foot long, split it in half, and on its outer round surface cut a nick or notch, about an eighth of an inch broad, circling round the semi-circumference of the Bamboo, shallow towards the edges, but deepening in the centre until a minute slit of about a line in breadth pierces the inner surface of the Bamboo fire-stick. Then a flexible strip of Bamboo is taken, about 1½ foot long and an eighth of an inch in breadth, to fit the circling notch or groove in the fire-stick. This slip or band is rubbed with fine dry sand, and then passed round the fire-stick, on which the operator stands, a foot on either end. Then the slip, grasped firmly, an end in each hand, is pulled steadily back and forth, increasing gradually in pressure and velocity as the smoke comes. By the time the fire-band snaps with the friction there ought to appear through the slit in the fire-stick some incandescent dust, and this placed, smouldering as it is, in a nest of dry Bamboo shavings, can be gently blown into a flame.

DRAINING.

The advantages of thorough drainage are at all times visible in well-managed plantations, but where a superabundance of moisture is allowed to accumulate the evils have seldom been so marked as during the present season. Attend to open drains in the woodland, and see that no accumulations of leaves and twigs impede the progress of the water. This should receive particular attention in recently thinned Oak woods, and where, from the thinness of the trees, a rank undergrowth prevails. The mouths of culverts and closed drains should be regularly examined at least once each fortnight, and during wet stormy weather it may be found necessary to have them cleared even once or twice a week.

GENERAL WORK.

The season being comparatively late, barking operations should now be all but completed. Harvesting of the bark has been considerably retarded by the wet, unsettled weather that has generally been experienced during the latter half of June. No opportunity should now be lost in having any that may be yet unsecured placed beyond the reach of danger. Remove all timber, firewood, and branches at once, as later on considerable damage to the stools and young shoots is almost unavoidable. Repair plantation roads, and towards the end of the month

* It is also made of a solid cylinder of buffalo's horn, with a central hollow of ¾ on an inch in diameter and 3 inches deep burnt into it. The piston, which fits very tightly in it, is made of ironwood or some wood equally hard.

clear them of all bracken, bramble, or rough grasses, at the same time paying attention that no overhanging branches can interfere with the passer-by. New roads and walks may now be formed, and stones and gravel got ready for future repairs. Prune and trim hedges, and keep them free from weeds at their roots; and during dry, warm weather, finish up the tarring, painting, or varnishing of all outdoor erections. Carriage drives and walks should be cleaned and edged, surface inequalities put right, and grass mown for a couple of feet back along their seeds, to prevent seeding.

Tree growth looks remarkably well this season, which, to a great extent, may be attributed to the mild, rather damp nature of the past and present seasons. Coniferous trees are at present specially attractive, from the difference of tints in the old and young foliage. Cones we have seldom seen so abundant, many of the rarer Pines and Firs bearing for the first time an abundant and healthy crop. Where, more particularly in the case of rare and valuable Conifers, a few sound seeds are desired, we have often found it necessary to assist Nature in the operation of fertilisation. It may here be well to state that in the Abies and Picea groups young trees, although they may produce an abundant crop of cones, are rather tardy in bearing male flowers. (I have noted one exception to this rule.) Under these circumstances it is important, in order to procure good seed and economise the pollen, to assist Nature in the operation. The proper time for impregnating the cones is when the tree is in full flower, and the following is the system pursued :—When the pollen is ripe, which is ascertained by gently shaking a branch bearing some male flowers (which will cause the pollen to leave the flowers in a small cloud of yellow dust, like sulphur), it should be collected upon white paper, and applied to the cones with a camel's-hair pencil, beginning at the top, and brushing it in all round to the base; and, if possible, a dry, sunny day should be chosen for the operation. A. D. Webster.

DISEASE AND DECAY IN FRUIT.—I.

OIDIUM FRUCTIGENUM

EVERY person who has walked in a fruit garden or orchard where Apple trees are grown must have noticed fallen Apples diseased with *Oidium fructigenum*, Schrader. The fungus is often extremely destructive to stored Apples when kept in damp or unventilated store-rooms; the same pest destroys Pears, Plums, and other fruits.

The very familiar external appearance presented by an Apple diseased with *Oidium fructigenum*, is shown natural size in fig. 12, p. 53. The disease spots are generally arranged in concentric circles, like miniature Fairy-rings, one within the other, and each spot projects like a soft wart from the surface of the fruit. The warts are generally grey in colour, varying, however, in tint from cream to fawn colour, or different shades of grey.

The word "Oidium" is derived from the Greek, and means like an egg in reference to the shape of the conidia or spores; "fructigenum" is from the Latin, and means born on fruit.

Species of *Oidium* are very familiar to gardeners in the mildew of *Roses*, *O. leucocoonium*; of *Vines*, *O. Tuckeri*; the white mildew of corn, *O. monilioides*; of the *Pea*, *O. erysiphoides*; and many others. The fungi just mentioned are often termed spurious species of *Oidium*, because they have been proved to be the early and imperfect condition of other fungi, and because they differ in other ways from what are recognised as genuine species of *Oidium*. It is difficult to characterise the difference in words, the general appearance of all species of *Oidium* being more or less similar. Still, a person familiar with these fungi can tell the difference at a glance. The genuine species, like the one before us, often grow in tufts and patches, forming warts, whilst the spurious ones form a thin white or grey powdery stratum. Under the microscope the genuine species have a more solid, lustrous, translucent, and generally robust appearance, as compared with the thin watery-looking spurious species.

An illustration of a spurious species is given in the powdery *Oidium* of *Pea* mildew, enlarged 400 diameters, in fig. 10, p. 52. I am not aware of any previous illustration of this *Oidium* in an English book. The

club-like growth of the Pea Oidium, *O. erysiphoides*, Fr., is shown at fig. 10, A, B, and C; each club rises from a thread of mycelium, as at D, which has emerged as a germinal tube from an opening in the spore as at E. The germinating spore was originally borne by the perfect condition of the Pea midew. The perfect fungus, which originally bore the spore at E, is named *Erysiphe blattii*, Lk.

If we take an Apple diseased with *Oidium fructigenum*, in our hands we find the tufts of the fungus seated on a portion of the skin which covers a soft, brown, and internally rotten portion of the Apple; the fungus has, in some instances, the power of changing the skin of the Apple to a jet-black colour; if we cut or break the Apple we always find the parts underneath the fungus-growth brown, watery, collapsed, decayed, and very soft. Each individual grey fungus-tuft is somewhat compact, though soft and powdery.

If we examine with the microscope a very small portion of the rotten brown substance taken from the interior of an Apple diseased with *Oidium* we find it traversed in every direction by the spawn or mycelium of the fungus. In some Apples this mycelium causes a highly disagreeable and bitter taste. The abundant spawn of this fungus, by appropriating to its own use the elaborated juices of the Apple, sets up putrescence and death in the fruit. The mycelium seldom produces spores within the Apple; but it bursts through the skin from within outwards, and there produces the *Oidium* tufts.

A fragment of one of these tufts of *Oidium fructigenum*, is shown, enlarged to 400 diameters, in fig. 11, and the great difference in general appearance between this fungus and *O. erysiphoides*, Fr. (fig. 10), is now apparent. Neither of the plants, however, can be termed altogether typical, as the species vary amongst themselves greatly. I am not aware of an illustration of *Oidium fructigenum*, in an English book, so the present figure, engraved from Nature, may be useful. Neither am I aware of any full description of the fungus.

The fruiting threads, or clubs, arise from an involved stratum of septate mycelium, as shown at the base of the illustration (fig. 11). The clubs of conjoined, lustrous, and translucent spores, or conidia, grow in long upright chains as shown, and it is remarkable that these spores (analogues of seeds) are almost invariably in pairs; that is, each individual conidium is not cut off from its fellows by a septum, or joint, but one septum only occurs to two conidia. This mode of growth is shown in the illustration. Some imaginative botanists would call a phenomenon of this class "conjugation," not simple fusion. It is not described under *O. fructigenum*, Schrad., in any books to which I have access. Another remarkable habit belonging to this fungus is, that some of the conidia open at the side as shown, and there produce secondary chains of conjoined spores after the manner of yeast fungi. Two conjoined conidia are shown at A, and three conidia still more curiously conjoined are shown at B. It is by no means uncommon to see three spores or conidia conjoined by a narrow band, and it follows that (if true conjugation takes place) there must in some instances be either two fathers or two mothers. But this fact need cause no surprise, for it is common to see two or more males (antheridia) attach themselves to one female (oogonium) in the fungus of the Potato disease (*Peronospora infestans*, Mont.). The peculiar shape of the conidia is shown further enlarged to 1000 diameters at fig. 11, C; each conidium is marked with fine, almost invisible, diagonally curved lines, as shown. It requires good eyes to see these lines; if some person who reads these lines tries to see them and cannot, it does not prove that they do not exist. I can always see them.

Oidium fructigenum, Schrad., is highly infectious; if a few of the spores are placed upon a cut or broken surface of an Apple or Pear they immediately germinate, set up decay, and reproduce the *Oidium*. All Apples and Pears are not equally susceptible to infection, the *Oidium* grows with most rapidity and luxuriance on the exposed inner substance of soft ripe and juicy fruit.

In my experiments the fungus has never under any circumstances whatever pierced the skin of the Apple from the outside inwards; the skin of the fruit acts as impenetrable armour against the attacks of its foe. On the other hand, if the skin of the fruit is injured in the slightest degree, broken by a bruise, or pricked with the point of a fine needle, and the spores laid on the little injured place, germination immediately

takes place, and the germ tubes invade the interior of the fruit by the gate thus opened for them. When the spawn-threads are once inside the fruit they make use of the sweet juices, and increase with great rapidity. The spawn-threads spread in radiating lines from a central spot (like the spokes from the centre of a wheel), and having now acquired extra potency from the absorption of the juices of the invaded Apple, Plum, or other fruit, the spawn-threads pierce the skin of the fruit from within outwards, and the grey tufts of the *Oidium* appear outside. As the

FIG. 10.—OIDIUM OF THE PEA.

first tufts appear at the circumference of the imaginary wheel it follows that the growth outside the Apple resembles a series of miniature Fairy-rings. After a temporary rest of from a few hours to a day the mycelium makes a fresh start within, and enlarges the circumference of the disease patch; a second crop of *Oidia* are then protruded through the skin of the Apple at the margin of the new growth within. The circle of spawn within the Apple or Pear, Plum, or other fruit, goes on widening and producing other circles of grey *Oidia* outside till

FIG. 11.—FUNGUS WHICH CAUSES DISEASE IN APPLES, PEARS, PLUMS, ETC. (*OIDIUM FRUCTIGENUM*, SCHRAD.).

at last the whole fruit becomes a mass of infectious rottenness.

The spores or conidia borne outside the fruit are wafted away by the air to invade other fruits, but I have shown that the spores appear to be quite powerless over sound fruit. If, however, there is an orifice in the skin, however small, caused by a wasp, a scratch or a slight bruise, the spores, by their germinal threads, will quickly find an entrance to the interior of the fruit, and speedily complete its utter destruction.

From observations like the foregoing made on Potato tubers with the spores of *Peronospora infestans*,

I am led to the belief that when the tubers are not properly moulded up slight injuries are likely to accrue to the Potatos by the action of the sun, rain, hail, wind, insects, &c., and that these slightly injured and possibly microscopically small places are the open gates by which the spores of the fungus of the Potato disease often attack the tuber. When the Potatos are well covered with mould the skin remains intact, and will, in most instances, effectually repel attacks from the germinating spores of *Peronospora infestans*, Mont.

There is no difficulty in accounting for the way in which *Oidium fructigenum*, tides over the winter, for, unlike the fungus of the Potato disease, which is generally only seen for a few weeks, or sometimes days, the *Oidium* of fruit may be seen at all times of the year. It is common in orchards and gardens in the summer and autumn, and it grows during the winter and spring months amongst the stored Apples of fruit-rooms, especially in fruit-rooms that are damp and improperly ventilated, and amongst sweating and bruised fruit.

In the fruit-rooms the spores of the fungus are produced in millions, and they either rest on the fruits or on the floors, ceilings, or shelves of the house. They have a stronger hold of life than the spores of spurious species of *Oidium* (as the *Oidium* of Vines, &c.), and they are able to rest before germinating.

The ravages of this *Oidium* may be kept within bounds by keeping the fruit-room perfectly dry, airy, and clean by cleaning the room thoroughly every summer before the fruit is stored, and by burning a small piece of sulphur about once a week during the winter and spring on a hot iron. The sulphurous fumes, when dissipated in the air, are fatal to all germinating spores.

Sometimes Potato tubers are attacked by a fungus which in habit and general external appearance so closely resembles *Oidium fructigenum*, to the unaided eye, that it appears identical, and one is constantly mistaken for the other by gardeners. The Potato fungus, which grows in grey concentric tufts, is, however, a totally different plant, named *Spicaria Solani*, Harting. It is a mere case of fortuitous (not "protective") resemblance. *W. G. Smith.*

HOME CORRESPONDENCE.

Leaf-cutter Bees and Rose Foliage.—I enclose you samples of Rose leaves taken from a house. Probably all who saw these or similar samples would aver that the semicircular incisions in them had been made by caterpillars, as indeed it was my belief on first noticing leaves similarly treated. Watching, however, for the predators I was surprised to observe a somewhat large wild bee, one about the size of an ordinary drone, alight upon the edge of a leaf, and commence with the greatest rapidity and precision, using its mandibles as shears, to cut a piece of the leaf clean out, and carry it away. Further watching showed the same process continually repeated, curiously enough the bee adopting the tactics of the man who sawed off the portion of the limb of a tree to which he was clinging; kept light grip with its feet to the portion being cut out, and the moment it was fully severed flying off, being, in this respect, better provided against a fall than was the unfortunate biped. Further observation revealed the fact that there were two of these bees engaged in this work, and also that having found a hole in one of the rafters of the house where decay had set in, the insects would seem to have set up house and engaged in the furnishing it. Perhaps others may have found their Rose foliage similarly excoriated, and wondered how it was produced. Possibly the incident above related may help to solve the mystery. Of course I do not intend permitting these unwelcome visitants to continue their depredations, and should you like to see them I shall be pleased to secure and submit them for your inspection. *A. D., Bedford.*

Calochortus venustus.—This charming variety is now in good condition with us. We planted the bulbs in a cold frame with south aspect, last November; the soil was made up of rich loam, leaf-mould, and sand in equal proportions, to the depth of 18 inches, with good drainage. The lights were entirely removed the third week in April; we are rewarded now with a profusion of bloom, one spike showing twelve flowers. This variety varies a little in the colour of

its blooms, the chief part of ours have bright lemon petals, with chocolate blotch in centre and slightly spotted, the colour and markings in the others being much lighter. *W. Kettlewell, The Gardens, Balvath Burry.*

Seed Saving.—The paper on seed growing, &c., at Swanley (p. 9) is very interesting, in so far as it describes varieties and products of fertilisation of diverse kinds of florists' flowers. What would have been of more interest—something as to the seed products of high-class selection and breeding—is not referred to, but it is a matter of great importance both to seed growers and the general public. I fear it must be regarded as an unquestioned fact that the nearer we approach to perfection in florists' flowers the farther do we find ourselves from seed bearing. Constant interbreeding seems to be productive of infertility, which even the most patient manipulation does little to correct. A gardener told me the other day that he had sowed with every possible care the moment received a 5s. packet of choice *Primula* seed, obtained from one of our leading firms, and raised from it only two or three plants. No one questions the entire integrity of the house in question, or the superior form of their Chinese *Primula* strains; but the fact illustrates what is true—that much apparently good seed from high-class flowers is infertile. *Cinerarias*, *Calceolarias*, and other florists' flowers show the same characteristics—a lack of pollen, and consequent lack of good seed. Inferior strains of these things will produce seed in great abundance, even without any attempt at artificial fertilisation. Very high-class strains seed only most sparsely even if fertilised. Thus the discrepancy often seen in seed stocks as represented and seedling productions, and which creates so much disappointment. This decadence in fertility is a heavy price to pay for our floral improvements in flowers, the production of which depends upon seed; but it is the result of natural laws. A knowledge of this matter should reconcile some who complain of high prices for good seeds to the incidence of the charge. *D.*

Vegetables in the North.—All vegetables are thriving well, and so far, have not suffered so much as usual from insect attack. Indeed, vegetation in general is unusually vigorous and healthy, and growth and foliage fully developed. *M. Dunn.*

Children's Gardens.—At the Police Orphanage at Twickenham there may be seen some forty-two gardens worked by the orphan boys. These are about half a rod in extent, and are in the keeping of two boys, one of whom is head gardener. Prizes were given for the best gardens by the local horticultural society the other day, when its exhibition was held in the Orphanage grounds, and much interest was of course aroused on the part of the youthful competitors. The superintendent of the institution, who is a devoted gardener, not only specially encourages the lads in their work but also gives them frequent lessons in elementary botany, with special reference to familiar garden flowers. These gardens are literally prizes in themselves for good conduct, and are highly appreciated. *A. B.*

Cypripedium spectabile.—At the foot of the east end of one of our hills this variety is now in good condition, our rich maiden loam mixed with a little peat and leaf-mould seems to make it a home. This is the third season we have had it. In the first instance we planted a small crown. The first season we had one flower, the second three. This season the plant (clump) has twenty-seven breaks, ten flower-spikes, and eleven flowers. We tried several of the other varieties, but they perished in out wet climate, not being sufficiently strong to start. *W. K., Balvath Burry.*

Winter Blooming Carnations.—I read with much interest "T. B.'s" graphic notes on "Seed Growing at Swanley," last issue, until I came to this paragraph, about which there has been some discussion and some misunderstanding. For several years I raised a batch of seedlings, which are sowed in February, transplanted any time in June or July, to where they are to flower. Those, as a rule, commence to bloom that were twelve months in the open air. The Moor, Mrs. George Hawtry, Andalusia, Miss Joliffe, Alegatière, &c., will do the same, but they will not bloom beyond October

or November. Must it then be distinctly understood that to have those in bloom in winter or spring, they must be grown under glass? The word winter is misleading. *W. J. Murphy, Clonmel.*

Ixora salicifolia.—Good well grown flowering plants of *Ixoras* are very useful and showy, but how seldom we meet with them. Years ago I used to see this variety figuring occasionally at some of our exhibitions, which from its graceful habit and intense bright orange-scarlet flowers is very attractive. I was pleased to meet with a good plant at Woodbank, Dumfries (C. W. Scott, Esq.) the other day with over fifty trusses, many measuring 8 inches across. It is an object of great beauty as seen here. The plant in question is worked upon the old coccinea, which makes the best stock for it, so I was informed by Mr. George Cole, the gardener. *A. O.*

Rhododendrons for Market.—I have been much surprised to find that the sellers of cut flowers in London never keep *Rhododendron* flowers for sale. Why is this? If cut before being fully expanded, they will travel perfectly well. Every year I send many hampers of them to friends in London, and they arrive in excellent condition. Nor do they soon wither in water; if picked before they come to maturity they will last a week, a fortnight, or even longer in water. I have even seen an instance in which a truss of flowers lasted more than a month before it withered. I will say nothing as to the beauty of the flowers. No plant which I know will

FIG. 12.—DISEASE IN APPLES CAUSED BY GIBBERELLA FRUCTIGENUM, SCHIR. (SEE P. 51.)

furnish bouquets on a large scale with the variety of colour which the *Rhododendrons* will afford, and this is true not only of the named sorts, but of the hybrids. Among these last the loveliest shades of pink, lilac, &c., may be found. Few shrubs have the same power of holding their own in woods or other bits of land already preoccupied by wild shrubs and plants, and in suitable situations and soils they will produce innumerable seedlings. If there were a sale for the cut flowers in London, tens of thousands of trusses could easily be sent every season. *Sperterius.*

Late Broccoli.—I saw in quantity so recently as the 3d ult., both in the kitchen gardens at Heckfield Place and at Bearwood, remarkably fine examples of Sutton's Late Queen, which seems to be one of the finest of late Broccolis. But for the time of year it might have been easy to mistake this grand Broccoli for the Autumn Giant Cauliflower, so large, white, and massive were the heads. At Heckfield the soil is deeply trenched, but very light and porous; at Bearwood it is altogether so stiff and strong that when baked, as it was the other day, it might well have borne a traction engine. A deep drain cut in the latter garden showed 4 feet of solid clay beneath the soil. I mention these matters to show that this Broccoli thrives equally well in both kinds of soil, as doubtless it will do well anywhere. Veitch's Model, with its large skittle-pin shaped and well-protected heads, was also in fine form at Heckfield, and it is certainly a grand late variety for private gardens, though I think less useful for market work, because it does not display its heads. I should think it would pay any market grower whose soil does Broccoli well to invest largely in Late Queen if seed can be obtained at a reasonable price. From the middle of May

onward all kinds of field vegetables are scarce, and a good Broccoli should then prove a very profitable crop. Some market growers may object that such a late Broccoli is too long in the ground, and comes off too late to enable another summer crop to follow. Certainly the best succession would be found either in Celery, or, in the field, in white Turnips. *A. D.*

Garden Refuse Disposal.—Looking over the large kitchen garden attached to the Metropolitan Police Orphanage at Twickenham the other day, I was much interested to note the way in which Mr. Gardiner, the superintendent, disposes of his garden refuse, leaves, sweepings, &c. A piece of ground is always kept vacant, and a piece which trenching will improve. A trench 2 feet in width and depth is thrown out, and into this is placed all the refuse of the garden as collected. When full, and well trodden to, another trench is thrown out, and the soil covering the refuse in the first trench deeply, and of course raising the ground somewhat for a time. In the course of a year a large piece is thus treated and improved, and as the trenching and burying proceed perpetually, the soil in time becomes deeply worked and exceedingly fertile. *B. A.*

Notices of Books.

Madeira, its Climate and Scenery, &c. By James Yate Johnson. London: Dulau & Co.

This, though nominally a third edition, is in reality a new book, and, what is more, it is an excellent one. "The writer has endeavoured to give, in addition to the usual information of a guide-book, such an account of the island in its chief aspects, as an intelligent visitor would desire to see." The author has in our opinion amply succeeded in his endeavour. In the introduction ample details are given as to the means of reaching the island, and copious hints are supplied to the traveller and visitor. Chapters on the history of Madeira, its government, manners, and customs, agriculture and physical geography follow, and then come details of special excursions to various places of interest. The fauna, flora, geology, and climate all come in for a share of attention, and, so far as we can judge from those sections with which we are most familiar, excellent abstracts are given. So far as temperature is concerned, the highest point yet recorded was 90° in July, 1882, the lowest 45°.6 in March—the mean temperature of the coldest month is 60°.3, in February; that of the three coldest months, January to March, being only slightly higher. August and September are the hottest months, their mean temperature slightly exceeding 72°. Rainy days vary from thirty-nine to ninety-nine, the mean annual number at Funchal being seventy-eight, the summer months being comparatively rainless. The mean climatal characteristics are the high winter temperature, the moderate summer heat, and the general equability. As a brief compendium of what intelligent readers and intending visitors are most likely to require, some knowledge of this unpretending little volume may be thoroughly recommended, the more so as ample references are given to works of greater magnitude for those in search of details that would be out of place in this handbook.

Forests of Poland, Lithuania, &c. (Oliver & Boyd.)

Dr. Crombie Brown's untiring diligence receives fresh illustration in the publication of this little volume, the companion to many others from the same pen. The preliminary chapter is taken up with a graphic account of travelling in Russia, from the author's own experience, and from Mr. Mackenzie Wallace's well known book. The contrast between the author's earlier travelling experiences in Russia in 1856, and his more recent ones is indeed remarkable, as also the substitution of 2½d. as postage for a letter conveyed from London to St. Petersburg in four days for 13s. 6d. for a letter, the transmission of which occupied nearly three weeks. The little volume, in addition to statistical details relating to forestry, contains so much incidental matter that it may be taken up to read at odd times with pleasure, though it has little reference to forestry. In Poland we are told an endeavour has been made to introduce the most advanced forest management of the day—the block method, or *methode des compartiments* of the French, while in the Baltic provinces there are special regulations for forest management which are specified at the end of the volume.

Single White Prolific Moss, Maiden's Blush, Captain Ingram, Blush China, being amongst the prettier sorts; 3d, Messrs. G. Bunyard & Co., who had Crested Moss, Rugosa, Cannes de la Reine, Leda, and Paul Ricaut; 4d, Mr. W. Rumsey, Waltham Cross.

Messrs. Paul & Son, Cheshunt; the Cranston Nursery Co., Mr. G. Prince, and Messrs. Bunyard & Co., took the four prizes in the order of their names for twelve bunches of Moss Roses, in not less than eight varieties. For the button-hole Roses, twelve bunches in six varieties—1st, J. Mattock, Esq.; 2d, the Cranston Nursery Co.; 3d, Messrs. Bunyard & Co.

NEW ROSES.

For the best varieties of these not in commerce in England before 1883—1st, Messrs. Curtis, Sandford & Co., for Lord Bacon, Madame Rambaud, Melde d'Anno, and Mrs. St. Germain; 2d, Messrs. Curtis, Sandford & Co., for Directeur, Madame de Lellevaux, Mary Bennett, Admiral Seymour, Marguerite de Romane, Souvenir de Leon Gimberta, Baron de Rothschild; Messrs. Paul & Son, Cheshunt, were placed 2d, with Marshall P. Wilder, a crimson; Long-fellow, purple; Madame Françoise, red; purple; Sunset, yellow; Madame Norman Neruda, purple-rose; Eclair, crimson; Grace Darling, M. Benoit Comte, a full crimson.

For the best twelve blooms of any new Rose not in commerce in England previous to 1883—1st, Mr. B. R. Cant, with M. Watteville, a pretty variety; Messrs. Curtis, Sandford & Co., for the new variety, with Alphonse Souperet; Messrs. Cranston & Co. 3d, with Nerveille de Lyon.

For the best twelve yellow Roses, single trusses, Mr. G. Prince was placed 1st, for fine examples of Comtesse Nadaille, clear and well finished; the Cranston Co. were 2d, with the same kind, but smaller flowers; Mr. Turner was 3d, with Madame Margottin, fairly nice blooms.

For the best twelve white Roses, single trusses—1st, Messrs. Curtis, Sandford & Co., with very large and perfect Merveille de Lyon; 2d, Mr. F. Cant, with the same variety; 3d, Messrs. Paul & Son, Cheshunt, the same.

Messrs. G. Cooling & Son took 1st prize for the best twelve crimson Roses, with A. K. Williams; Messrs. Paul & Son, Cheshunt, were 2d, with Alfred Colomb; and Mr. G. Prince, with Ulrich Brunner.

For dark velvety-crimson Roses, twelve single trusses, Messrs. Curtis, Sandford & Co., took 1st prize with H. P. Jean Lillieure, a beautiful dark variety; 2d, Messrs. Paul & Son, Cheshunt, with Abel Carrière—exquisite in its velvety look; 3d, Miss W. Taylor, with Dr. Hogg.

For the best twelve single trusses of any Rose Mr. H. Bennett was an easy 1st, with the Rose of his raising, Her Majesty, splendid in colour and in growth; Messrs. Curtis, Sandford & Co.; 3d, Mr. B. R. Cant, with Souvenir d'Elise; 4th, Mr. F. Cant.

In new seedling Roses Mr. H. Bennett was the only exhibitor, taking the Gold Medal for Mrs. John Laing, a distinct Rose, light pink, with a silvery sheen on the petals, less in size than Her Majesty, and perhaps more generally available for decorative purposes, and with a delicious perfume.

Messrs. F. Woollard & Son, Rose growers and nurserymen, Cooksbridge, Lewes, had a nice collection of cut blooms of Roses, not for competition. Messrs. J. Vetch & Sons, Chelsea, showed six boxes of capital Rose blooms, consisting of old and new varieties.

Rosa lucida was likewise from the same firm; it is an excellent kind for bouquet work or buttonhole, the calyx being peculiarly long, as in the old Moss Rose, but its growth is not so good.

A striking display was made by a row of well-grown Souvenir de la Malmaison Canations (200 from Ascott, Mr. Leopold de Rothschild (gr., Mr. Jennings) having made himself famous by their cultivation. The plants were disposed in a slight line on the centre table, stretching at times to a distance of a whole length.

Mr. T. Ware, Messrs. Barr & Son, Messrs. Kewley & Sons, added to the attractiveness of the show by an exhibition of the choicest hardy perennial flowers.

THE CRYSTAL PALACE ROSE SHOW:

JULY 4.

FAVoured by splendid weather this, the first great meeting of the competitors in Rose growing in the neighbourhood of the metropolis, gave the cue to what might be witnessed at the National and other shows in the following week. As the day anticipated the flowers were not so fine as they should have been, the cold intermittent sort of weather we have been subject to having checked and crippled bloom, the fact as to this being equally visible in the winning stands as in those of the less lucky competitors, notwithstanding culture always fails. The flowers have not puffed well, the eye is too often a conspicuous mark, petals are uneven in growth, marking where the cold, and maybe frosty night arrested their growth; cross-eyed blooms were not rare even in winning stands; even a premier bloom, in a lot of four, put up in such a way, being the kind of Roses seen as yet this year, we can only conclude the feats of the contending exhibitors as exhibited on the show table.

Taking the open classes first, Mr. R. B. Cant, of Colchester, took the 1st prize for seventy-two distinct single blooms, with an even lot of flowers, and little superior to the next winning stand, rendering the decision of the judges a very near thing. Many old favourites figured in the collection, and were seldom absent from any of the bigger competing groups, viz., Catherine Mermet, Violette Bower, Marie Baumann, Souvenir d'Elise, Baron de Rothschild, and the new variety, Madame Gabriel Luize, Countess of Rosebery, Marquis de Castellane, A. K. Williams, Marie Ray, Caroline Kuster,

Niphotos, Innocente Pirola, and Alphonse Souperet. The 2d prize in this competition fell to Messrs. Paul & Son, Old Nurseries, Cheshunt. In this collection there were good Xantho, Glite, Carmel, Rembrandt, Marie Verdier, Captain Christy, Belle Lyonnaise, and Beauty of Waltham. The 3d prize was awarded to Mr. C. Turner, Royal Nurseries, Slough.

For forty-eight, three trusses of bloom each, distinct, Messrs. Paul & Son, Cheshunt, took 1st prize, where a Eugenie Verdier, very good being Abel Grand, Madame Eugenie Verdier, E. Y. Teas, Françoise Michelon, Madame H. Jamin, Mrs. G. Paul, and Centifolia roses, Louis van Houtte, Mons. Noman, and Prince Arthur; Mr. B. R. Cant was 2d, his Comtesse de Nadaille, Duke of Orleans, and the new variety, with Alphonse Souperet, extra fine examples; Mr. C. Turner was 3d—good blooms, that wanted a day or two more to develop them.

Mr. J. House, Peterborough, took the 1st prize for twenty-four varieties, three trusses each—Fisher Holmes, Exposition de Paris, Dr. Andry, Amille Bernardin, and Horatio Vernet being amongst the best flowers; Mr. W. Rumsey, Joyning's Nursery, Waltham Cross, was 2d—Ed. Morren, Elie Morel, and Ferdinand de Lesseps being the pick of the blooms in his stand; 3d, Mr. F. Cant, Colchester; and Messrs. Cooling & Son, Bath, received the extra prize for a meritorious stand of twenty-four trusses.

For twenty-four varieties, single blooms, distinct, Mr. J. House secured the 1st prize, the blooms of Marechal Niel, Alfred Colomb, Lord Macaulay, Niphotos, and Charles de Guebre, being his best; Mr. F. Cant was 2d, his Contending, Crested, and the new variety, with Abel Carrière, being nice blooms, and Catherine Mermet extra fine; the 3d prize fell to the Oxford grower, Mr. Prince.

For eighteen Tea-scented and Noisette Roses, Mr. Prince headed the list, his Madame Welch, Jean Ducher, Blooms of Paris, and the new variety, being the best; Mr. B. R. Cant was 2d—Catherine Mermet and Souvenir d'un Ami having extra quality; 3d, Mr. C. Turner.

For a collection of yellow Roses, Mr. G. Prince took the accustomed lead in this class, the blooms of Comtesse de Nadaille, Marquise de Sanna, Françoise Kruger, were among his best, the latter being better than any we have seen as yet of the kind; 2d, Messrs. Paul & Son, Cheshunt, whose Madame Falcot, Marie van Houtte, and Madame Berard, were of much good quality; the 3d prize fell to Messrs. J. Burrell & Co., Cambridge.

For a big Rose, in trusses of three—1st, Mr. B. R. Cant, good, big and fresh being all he showed, Violette Bower, Niphotos, and Merveille de Lyon especially so; 2d, Mr. W. Rumsey; and the 3d prize was withheld, a good Rose often classed and nearly always sold as a white one, viz., Madame Hippolyte Jamin, being introduced as a very nice lot, but it is pink Rose it caused the disqualification of the stand.

In collections of pink-coloured Roses Messrs. Paul & Son, Cheshunt, were 1st—Julie Touvars, Duchesse de Morny, and Claude Bernard being the best blooms; Mr. B. R. Cant was 2d—France, Jolin, Noman, and Madame G. Luize, were the finest flowers in this lot; 3d, Mr. J. Mattock, New Headington, Oxon—nice selection but of unequal merit.

The prizes for a collection of crimson Roses were 1st, Mr. B. R. Cant, with the new variety, with Alphonse Souperet, being the best; Mr. B. R. Cant was 2d—Catherine Mermet and Souvenir d'un Ami having extra quality; 3d, Mr. C. Turner.

The velvety-crimson Roses, Bunyard took the 1st prize, the blooms of Rosierette Kays, Chas. Darwin, Sultan of Zanzibar, and Prince Arthur being of good quality for Kent Roses this year; 2d, Mr. B. R. Cant, whose Louis van Houtte and Abel Carrière were extra good blooms; 3d, Mr. W. Rumsey.

For eighteen Teas and Noisette kinds Mr. F. Cant, Colchester, was placed 1st, with Souvenir d'Elise—fresh and not over-bloomed; 2d, Mr. B. R. Cant, with the same kind; 3d, Messrs. Paul & Son, Cheshunt, with the blooms of Jean Ducher, of medium size. An extra prize was awarded to Mr. C. Turner.

For eighteen trusses of Marie Baumann—1st, Mr. B. R. Cant; 2d, Messrs. Paul & Son, Cheshunt; 3d, Messrs. H. Low & Co., Bush Hill Park, Enfield.

The prizes for the new variety, Beauty of Prince Camille type fell to Messrs. Paul & Son and Messrs. H. Low & Co., respectively, the first-named showing the rich dark crimson Abel Carrière.

For eighteen Roses of Françoise Michelon, or similar, Messrs. G. Paul & Son took the 1st prize, with a superior lot, Ulrich Brunner, fresh and even as to size; the 2d and 3d falling to the Cranston Nursery Company, Hereford, and Mr. B. R. Cant.

For eighteen Roses of Lady M. Fitzwilliam, as by right, the 1st prize fell to the fortunate raiser, Mr. Bennett, Shepperton; 2d, Mr. S. P. Budd, Bath; and the 3d to Mr. B. R. Cant.

The prizes for eighteen Roses of A. K. Williams—1st, Messrs. G. Paul & Son, Cheshunt, for blooms of fairly even quality and size; 2d, Mr. G. Mount, St. Dunstan's, Canterbury; 3d, Mr. W. G. Grant, Hope End, Ledbury.

Mr. House took 1st prize for eighteen bunches of W. A. Richardson; Mr. F. Cant was 1st for Niphotos, eighteen trusses; and Mr. B. R. Cant, 2d, Mr. Prince, the 3d.

AMATEUR CLASSES.

For forty-eight varieties, distinct (single trusses), a great many stands were shown, the same kinds being repeated in almost every stand, the open classes, and in so far as the winning stands were concerned, the quality was equally as good as in those, 1st, Mr.

Ridou, gr. to T. B. Heywood, Esq., Woodhatch Lodge, Reigate—Magna Charta, Merveille de Lyon, Violette Bower, Madame G. Luize, Ed. Loren, and Charles Darwin being conspicuous as good examples; 2d, Rev. J. H. Pemberton, Havering, Romford—Will Warden, Marie Moatet, Marquis de Gibot being his best blooms; 3d, Mr. A. Slaughter, Jarvis Villa, Steyning.

For twenty-four varieties, H.P., distinct, Mr. Gray, gr. to the Earl of Stanhope, Chevening Park, was 1st, Madame C. Wood, Marguerite de St. Amand, and Marguerite Brassiac being amongst his best blooms; 2d, Mr. G. Christy, Buckhurst Lodge, Westham; 3d, Mr. R. E. West, Reigate.

For twenty-four varieties, in three trusses of each, Mr. T. W. Girdlestone, Sunningdale, took 1st prize—Madame Langier, climbing Captain Christy, Ulrich Brunner, Thos. Mills, Marie Finger being some of the most noticeable blooms; 2d, Mr. J. Browne, gr. to A. W. Jarrold, Esq., Great Doods, Reigate; 3d, Rev. J. H. Pemberton.

For twelve varieties, a class which included the best Roses seen at the show, Mr. E. B. Lindsell, Bearton, Hitchin, Hertford, was 1st; Mr. J. Browne, 2d, Mr. E. Wilkins, Lyndhurst, Sutton; 3d, an extra prize being awarded to Mr. E. B. Lindsell, Bearton.

For Tea-scented Roses Mr. A. Slaughter took the 1st place, Mr. Bethune the 2d, and Rev. H. A. Berners the third. Among the minor attractions may be named Messrs. Long & Co.'s specimens of which the names of the certificated varieties will be found below. Fifty flowers were offered from Messrs. Cannell & Son; Begonias from Messrs. H. Cappin & Sons, Shirley, Croydon; Liliun auratum from Mr. C. Turner, and a large show of Roses at the eastern side of the main transept, brought by W. Paul & Son, of Waltham Cross.

Prizes for Picotees were awarded to Mr. Douglas, Great Gearies, Hford, and Mr. C. Turner respectively—1st and 2d in the order of their names; and for Carnations, in which the order was reversed.

First-class Certificates were awarded to Messrs. John Laing & Co., Rose-growers, for Mrs. John Howe, a double rose-coloured flower; Little Beauty, also double, and pink-coloured; Anak, an immense single scarlet; and Princess Victoria, a double pink, having a white centre. Mr. Henry Bennett, Shepperton, received a First-class Certificate for his new Rose, Mrs. John Laing, a fine flower, full, and less gigantic than Her Majesty, and therefore likely to find more numerous admirers; the colour is light pink, with a silver sheen—very beautiful.

BATH ROSE SHOW: July 2.

THE annual Rose show, which as regards the number and excellence of the exhibits, as well as the financial success attending the efforts of the Bath Floral Fete and Band Committee to make the show a thoroughly representative one by providing such a liberal schedule of prizes, must be classed as one of the best of the season, was held in association with the National Rose Society in the Sydney Gardens, Bath, on Thursday last, under most auspicious circumstances as regards the weather. Mr. B. R. Cant, Messrs. Curtis, Sandford & Co., Messrs. Paul & Son, Messrs. Keyes, Williams & Co., and Messrs. George Cooling & Son, were well to the front in the nurserymen's and open classes. In the latter and amateur classes Messrs. T. W. Girdlestone, S. P. Budd, A. Evans, Captain Christy, Rev. C. Eddy, and Miss Watson Taylor, occupied prominent positions, as a glance at the following prize list will show.

NURSERYMEN.

The liberal prizes which the committee very wisely offered this year in a few of the leading classes brought out a good competition and a capital lot of blooms. In the class for seventy-two distinct varieties there were four considerable lots staged, and these took the judges some considerable time to adjudicate upon; finally, Mr. B. R. Cant, of Colchester, was awarded 1st honours. Messrs. Paul & Son, the Old Nurseries, Cheshunt, Herts, 2d; and Messrs. Keyes, Williams & Co., Salisbury, a good 3d; each exhibitor staging fairly large, even, and fresh blooms.

For thirty-five varieties (three trusses of each), Messrs. Paul & Son were awarded 1st position for a truly grand lot of blooms; 2d, Mr. B. R. Cant. There were four lots put up in this class also.

Out of three lots of eighteen varieties (three trusses of each), Messrs. Curtis, Sandford & Co., Tottenham, had the best; showing grand blooms of old and new favourites. Ulrich Brunner was awarded the National Rose Society's Silver Medal for the best hybrid perpetual Rose in the show; Messrs. George Cooling & Son, Bath, were a good 2d, showing Roses in grand condition.

Messrs. Curtis, Sandford & Co. were again 1st (out of four lots put up in capital form) for thirty-six varieties, single truss of each; Messrs. Cooling & Son being, as in the preceding class, a capital 2d; and Mr. George Mount 3d.

In the following class for eighteen Teas or Noisettes, distinct, there were only three contestants: Mr. B. R. Cant, Mr. J. Mattock, and the Cranston Nursery Co., secured the awards in the order in which their names appear.

AMATEURS.

In the class for thirty-six distinct varieties (single trusses), J. W. Girdlestone, Esq., Sunningdale, Berks, had the best among four lots put up. S. P. Budd, Esq. (gr. Mr. George Campbell), was a good 2d—his blooms were very good; Miss Watson Taylor was a good 3d. Out of eight stands of twenty-four's Captain Christy,

Sidmouth, secured 1st position, with a grand lot of blooms; the Rev. Charles Eddy, Andover, being 2d, and A. Evans, Esq., 3d.

In the class for twelve trebles, distinct, four lots were staged. J. W. Girdleston, Esq., scored another victory, P. Budd, Esq., being a good 2d, and Miss Watson Taylor a good 3d.

Out of six lots staged of six varieties, three trusses of each, the Rev. Charles Eddy was 1st, Captain Christy and J. Smith, Esq., Warminster, being respectively 2d and 3d.

Six lots of six singles, distinct, were staged, the prizes being awarded to Mr. Tanner, Mr. J. W. Wits, and the Rev. R. C. Lazard (gr. Mr. J. Weston), in that order.

In the class for twelve Teas or Noisettes, distinct, single trusses, seven lots of excellent blooms were put up, the 1st prize going to J. W. Girdleston, Esq., for a really good lot of blooms, amongst them a beautiful Niphotes, which secured for its very successful exhibitor the National Rose Society's Silver Medal for the best Tea or Noisette Rose in the exhibition. Miss Watson Taylor (gr. Mr. Gordon) was a good 2d, and W. J. Grant, Esq., was a good 3d.

In the following class for six Teas, distinct, single trusses, Mr. W. Garaway, Oxford, had the best out of six lots staged; Joseph Smith, Esq., was 2d; and Mr. G. Tanner, Clipperton, 3d.

OPEN CLASSES.

These were well contested. There were eleven lots of twelve single trusses of any Rose staged. Messrs. Paul & Son were 1st, Miss Watson Taylor being a good 2d, and Mr. B. R. Cant and the Cranston Nursery Co. equal 3d.

In the corresponding class for twelve trusses of any yellow Rose five lots were put up. A. Evans, Esq., Oxford, was 1st, with grand blooms of *Maréchal Niel*; the Cranston Nursery Co. 2d, with rather small—as compared with those in the 1st prize stand—blooms of the same variety; 3d, Miss Watson Taylor, with neat blooms of *Belle Lyonaise*.

For a like number of trusses of any crimson variety Mr. B. R. Cant's *Marie Baumann* secured 1st place, and Alfred Dumestiel 2d, for Messrs. Curtis, Sandford & Co.; and J. W. Wits, 3d, for the Cranston Nursery Co. Nine lots were shown in this class.

Mr. B. R. Cant was again to the front in the pink Rose class, with twelve large blooms of *Madame Gabriel Luizet*, followed closely by Messrs. Paul & Son, with La France and *Madame Gabriel Luizet*; and S. P. Budd, Esq., with La France. Seven lots were staged.

There were six lots staged in the class for six trusses of any new Rose of 1883–84. Alphonse Souper gained Messrs. Curtis, Sandford & Co. premier position, as did Merville de Lyon the Cranston Nursery Co. 2d; and Lady Mary Fitzwilliam secured Mr. J. Mattock the 3d.

In the class for a basket of Roses (with Rose foliage only) tastefully arranged, Messrs. Cooling & Son were a good 1st, with a good arrangement of well chosen varieties; Mr. Mattock was 2d, and Mr. Drummond, Bath, 3d.

LOCAL PRIZES: AMATEURS.

There was only one stand of twenty-four distinct varieties, single trusses, put up in competition for the National Rose Society's Gold Medal and two pounds presented by the committee. This, consisting of excellent blooms of the leading varieties, secured, as all admitted it deserved to do, for Samuel P. Budd, Esq., the veteran amateur grower of the district, the prizes indicated.

Six stands of twelve varieties, singles, were put up. Mr. P. Clark secured 1st place with a very neat, fresh, even lot of blooms; 2d, Rev. G. Gardener; and Mrs. Home, 3d.

There was only one award made in the class for nine Teas, distinct, one truss of each. This went to S. P. Budd, Esq.

BOUQUETS (OPEN).

In the class for twelve bouquets of Roses for the hand, the prizes went to Messrs. George Cooling & Son, Mr. Mattock, and Mr. W. E. Drummond in that order. Mr. 1st and 2d prizes, which were very close to each other in point of merit, were composed of suitable varieties.

With six bouquets of Roses Miss Watson Taylor was 1st; Mr. Charles Garder, gr. to Sir F. C. Bathurst, Bart., Clarendon Park, Salisbury, was a close 2d; and Mr. James Stucky, 3d.

The following is a list of some of those Roses that were best shown in all the show:—Dippy Jamin, Marie van Houtte, La France, Duke of Wellington, Homer, Lady Mary Fitzwilliam, Innocente Pirolo, Souvenir d'Elise, Général Jacqueminot, *Maréchal Niel*, Marie Finger, Devoniensis, Catherine Mermest, Souvenir d'Ami, Violet Bowyer, Marie Verdier, Captain Christy, A. K. Williams, Etienne Levet, Xavier Olibo, Duke of Teck, Duke of Edinburgh, Sultan of Zanzibar, Niphotes, Merville de Lyon, &c.

PLANTS.

Two lots of twelve ornamental foliage plants, in variety, and two lots of twenty-five exotic Ferns, in twelve varieties, were staged (one row) along the centre of the staging in the two large exhibition tents by Mr. S. T. Bryant and Mr. W. C. Drummond, to whom in each case the prizes were awarded in that order; and by way of affording variety, six plants of Orchids, in two varieties, viz., *Cattleya intermedia* and *Odontoglossum Alexandræ*, were contributed by Mr. R. F. C. Bathurst, which received the certificate of merit, a similar award being given to Messrs. Hooper, Bath, for a nice stand of seedling *Ceratons*.

STRAWBERRIES.

Although the neighbourhood of Bath is somewhat famed for the production of fine Strawberries, the thirty-eight bushes which came under the notice of the judges on the present occasion were but mediocre. For six dishes of thirty fruits there were three competitors, one being disqualified for showing two dishes of one variety under two names. The 1st and 2d prizes went to Mr. G. Garaway and Mr. W. Tyle, in the order in which their names appear. Mr. H. Scott was 1st for three varieties, and Mr. Beavis 2d. Mr. G. Garaway was 1st for a single dish, with President; Mr. Warden following closely with Sir J. Paxton, Mr. T. Evry securing 3d place.

NEW MELON, LONGLEAF PERFECTION.

Mr. Pratt, of Longleaf Gardens, Warminster, obtained a First-class Certificate for a large green-skinned melon, which came under the notice of the judges. It is the result of a cross between Meredith's Cashmere and Easton Castle.

TUNBRIDGE WELLS HORTICULTURAL: July 3.

The twenty-fourth annual summer show held by this society, like so many that have preceded it, was a decided success. In most of the various classes the competition was unusually close. Plants, both flowering and fine-leaved, were remarkable for their general excellence, not the least commendable feature attached to them being their fresh appearance—a condition not always present at this advanced period of the exhibition season, when many of the specimens forthcoming often show the effects of repeated packing and long travel.

STOVE AND GREENHOUSE PLANTS.

In the open class for eight in bloom there was a near run between Mr. Gibson, gr. to I. F. Bunbury Atkins, Esq., and Mr. Gilbert, Hastings, who were respectively 1st and 2d. Mr. Gibson's group contained profusely flowered examples of *Dipladenia amabilis* and *D. rosacea*, *Anthurium Scherzerianum*, with numerous large and highly coloured flowers; the seldom seen *Clerodendron fallax*, large and full of bloom; *Ixora Williamsii*, *Clerodendron Balfourianum* profusely flowered, *Stactis profusa*, and *Allamanda nobilis*; Mr. Gilbert had amongst others a very finely bloomed specimen of *Erica Cavendishii*, *E. Exquisite*, and *Dipladenia amabilis*; 3d, Mr. Rann, gr. to J. W. Temple, Esq.

Four stove and greenhouse plants (open).—With these likewise Mr. Gibson took 1st, showing *Ixora Fraseri*, *Allamanda Hendersoni*, *Dipladenia amabilis* bearing large and highly coloured flowers, and *Anthurium Scherzerianum*; Mr. Pope, gr. to J. J. Barron, Esq., Tunbridge Wells was a good 2d. Three stove and greenhouse plants (amateurs).—1st, Mr. Moorhouse, gr. to J. W. Temple, Esq., Groombridge, who, in a nicely grown well-flowered half-dozen, had *Kalanchoë coccinea*, *Anthurium Scherzerianum*, and the pretty white *Erica Shannoni*; Mr. Pope, 2d, having a well bloomed specimen of *Erica Antoniana* Turbulla and *Ixora javanica*.

Four stove and greenhouse plants (amateurs).—1st, Mr. Pope, with medium sized examples, full of flower.

FINE-FOLIAGE PLANTS.

With eight, in the open class, Mr. Rann had 1st honours for one of the finest groups he has staged, noticeable in it being *Phlox* tennis, some 15 feet across; *Thrinax elegans*, *Croton Evansianus*, a large leaved, highly-coloured variety; and a beautiful specimen of *Bonapartea striata*.

Six ornamental plants (amateurs).—Here Mr. Moorhouse was 1st, showing, amongst others, in a creditable collection, *Areca sapida*, *Chamærops humilis*, and *Araucaria excelsa*; 2d, Mr. Turner, gr. to J. A. Leacheur, Esq., Tunbridge Wells.

FERNS.

of immense size and in beautiful condition were shown in the open class for eight, Mr. Rann again taking the lead, this best examples being *Cyathea dealbata*, C. Smithii, both large and in fine order; dense specimens of *Gleichenia rupestris* and G. Mendelii, with the rare *Thyrsopteris elegans*. Mr. Pope, who was 2d, also had a very nice group containing *Dicksonia squarrosa*, D. antarctica, *Cyathea medullaris*, and C. dealbata.

FUCHSIAS.

These were staged in nice order by Mr. Shoebridge, gr. to W. Edwards, Esq., Tunbridge Wells, who had large bushy specimens, clothed with healthy foliage and plenty of flowers; the plants, as being over-trained had a free and natural appearance; 2d, Mr. Beily, gr. to W. H. Tindall, Esq.

FELARGONIUMS.

With six large flowered varieties Mr. Wilkins, gr. to S. Hall, Esq., took 1st; 2d, Mr. Shoebridge. Six fan-leaved.—1st, Mr. Allan, gr. to G. H. Field, Esq.; 2d, Mr. Wilkins.

Double zonals were well represented, Mr. Wilkins taking 1st for six, Mr. Allan 2d.

Single zonals.—1st, Mr. Beily; 2d, Mr. Allan.

GLOXINIAS AND BEGONIAS

were in first-rate condition, compact, and stout in foliage, the flowers large, numerous, and free from brass or speck. With six Mr. Read, gr. to Mrs. W. C. Cripps, was 1st; Mr. Beily, who was 2d, likewise exhibited good plants.

Tuberous Begonias.—With these Mr. Allan took the lead, having nicely-flowered medium-sized plants; 2d, Mr. Turner.

SELAGINÆS.

have rarely been seen so well grown. Mr. Aylward, gr. to Mrs. Foster, and Mr. H. Scammell, gr. to E. Beily, Esq., being 1st and 2d prizes, and both staging plants in faultless condition.

Groups of plants arranged for effect are generally well done in this part of the country, and the present occasion was no exception to the rule. A good sized tent was wholly filled with them. In a close run Mr. Fennell, Mr. R. Carter, Tonbridge, headed the competition with a beautiful group, in which colour and form in the plants used had been kept well in view; Mr. Wilkins, and Mr. A. Bashford, gr. to Mrs. Stoddart-Douglas, who were 2d and 3d in the order of their names, also had very effective exhibits.

An extra prize was awarded to Mr. Coleman, gr. to Mrs. Arthur Pott, for an attractive group of flowering and fine-leaved plants shown not for competition. Mr. F. Webber, nurseryman, Tonbridge, received a well merited commendation for a beautifully arranged group of Ferns, and was 2d, Mr. Wilkins, 3d.

CUT FLOWERS.

Roses were not shown in such large quantities as we have been accustomed to meet with at Tunbridge Wells, but the quality of those presented made up the deficiency in their numbers.

For forty-eight distinct varieties, single blooms, in the open class, Mr. Piper, nurseryman, Uckfield, staged a fine lot of flowers which were a long way ahead of the other exhibitors in the class, but, unfortunately, the mistake was made of putting two blooms of Duke of Edinburgh, by which, as a matter of course, the stand was disqualified. It was an unfortunate mistake, as both the flowers were labelled; Messrs. Bunyard & Co., Maidstone, was 2d; Messrs. Woollard, nurserymen, Cocksbridge, 3d.

With twenty-four, Mr. Alfred Slaughter, Steyning, took a decided lead, having a beautiful lot of full-sized, even flowers, prominent amongst which were *Général Jacqueminot*, *Marie Rady*, *Charles LeFebvre*, *Marie Baumann*, and *Louis van Houtte*; Messrs. Bunyard, 2d. In the amateur class, twenty-four, Mr. Slaughter was again 1st, with another grand lot of blooms; Mr. Kidout, gr. to T. B. Hayward, Esq., who was 2d, also showed well.

Twelve Roses.—Here also Mr. Slaughter had first honours, with a good dozen, all but too many of a colour, red, 2d, Mr. Kidout.

Twelve Tea or Noisette varieties.—With these, Mr. Slaughter was once more to the fore, showing a fine set of blooms, noticeable in them being *Alba rosea*, *Perle de Lyon*, *Belle Lyonaise*, and *Amazone*; 2d, Mr. Kidout. In the amateur class, twenty-four, Mr. Slaughter was the best single bloom of hybrid perpetual shown in the open classes of forty-eight and twenty-four, was won by Messrs. Bunyard with a fine flower of *Violette Bowyer*.

A similar medal, offered for the best bloom of hybrid perpetual in the amateurs' classes of twenty-four and twelve, was awarded to Mr. Kidout for A. K. Williams in its best form.

The Bronze Medal for the best single Tea Rose shown in the class for twelve Teas or Noisettes, was taken by Mr. H. Simmonds, gr. to the Rev. R. C. Hastings, who had formed highly coloured example of *Marquis de Sania*.

Collections of eighteen varieties of cut flowers made an imposing display, Mr. Moorhouse taking a long lead with a beautiful lot.

FRUIT.

Of this there was a large display. In the class for a collection, unlimited in number of varieties, Mr. Hogpod, gr. to Sir Julian Goldsmid, Tunbridge, was 1st, his best examples being three Pines, Black Hamburg and Muscat of Alexandria Grapes, Peaches, Nectarines, a couple of Melons, Figs, Strawberries, and Cherries; Mr. Fennell was a good 2d, with fruit in nice condition; 3d, Mr. Waterman, gr. to H. A. Brasseay, Esq., Aylesford.

If three bunches of Black Grapes there were several very good exhibits, the best being contributed by Mr. Moorhouse, who had bunches of even, highly finished berries; 2d, Mr. Hogpod, who also staged fine examples, perfectly coloured, but a little over-thinned; 3d, Mr. Morris, gr. to W. Edwards, Esq., St. Leonards. Three bunches of white Grapes.—With these Mr. Harvey, gr. to C. L. Higgins, Esq., Warrington, took the lead, having Muscat of Alexandria; 2d, Mr. J. Wilkins. Three bunches of Grapes, in three varieties, exclusive of Hamburgs and Muscats.—Here Mr. Allan was 1st, three bunches of seedling Buckland Sweetwater and Black Prince; 2d, Mr. Gore, gr. to Captain Taylor, Hastings.

Peaches were well shown by a number of exhibitors, the 1st prize going to Mr. Moorhouse, for a good dish of Grosse Mignonne; Mr. M. J. Bashford, gr. to J. Corlett, Esq., Sutton, taking 2d, with beautiful examples of Early York.

Dish of Nectarines.—1st, Mr. Allan, with *Violette Hâtive*; 2d, Mr. Moorhouse, who had Lord Napier, beautifully coloured.

Dish of Cherries.—1st, Mr. Hogpod, with Black Tartarian, in excellent condition; 2d, Mr. Waterman.

Green-flesh Melon.—1st, Mr. Moorhouse, who had a handsome fruit of William Tillery; 2d, Mr. Bishop, gr. to F. Peake, Esq., Croydon. Scarlet-flesh Melon.—With this also Mr. Moorhouse had 1st, showing *Blenheim Orange*.

Strawberries.—1st, Mr. Braybon, gr. to the Countess Ashburnham, France, with a beautiful dish of Sir J. Paxton; 2d, Mr. Staples, with the same variety.

SHEPPERTON HORTICULTURAL :

July 2.

THIS Society came into existence last year, when an exhibition confined to Roses only was held, which was so successful that it was decided to make it a permanent one, so as to make the competition representative of gardening in its various branches. The committee have every reason to be satisfied with the result, as the show was a success in every way. The exhibition was held at Simbury Court, Lane, near the beautiful place; the well kept garden and grounds of which, adorned with the grand examples of trees and shrubs, added no little to the general attractions of the show.

The leading feature was the group of plants arranged for effect, which alone filled a tent, two or three of the exhibitors running so close as to make the judging difficult. 1st honours were won by Mr. Sutton, gr. to J. S. Sassoon, Esq., who for flowering plants mostly depended on things of a simple character, but well calculated to give the requisite colour, which was placed so as to produce an elegant effect. In a bed of *Adiantums* and *Lycopodiums* he had *Palms*, *Lilies*, *Campanulas*, &c. Mr. West, gr. to Major Lendy, was 2d, likewise having an excellent group, but slightly deficient in the larger green foliage plants. Remarkable in this exhibit were two or three plants of *Cattleya gigas Sanderiana*, a good form of *Cattleya Mendellii*, a magnificent variety of the bright yellow *Oncidium Rogersii*, light and dark varieties of *Odontoglossum vexillarium*, *O. crispum*, and *Utricularia montana*.

ORCHIDS

In sixes were also very well shown by Mr. West and Messrs. Jackson, the former taking a decided lead, having a fine half-dozen large and well bloomed, including *Cattleya gigas Sanderiana*, bearing nineteen flowers on four spikes; *C. Mendellii*, a good variety; *Odontoglossum vexillarium*, *Lelia purpurata*, and *Dendrobium thyrsiflorum*; Messrs. Jackson, who were 2d, had, amongst others, fine plants of *Odontoglossum crispum*, *Dendrobium snavissimum*, and *Oncidium macranthum*.

STOVE AND GREENHOUSE PLANTS

were nicely shown by Mr. Reeves, gr. to W. Hewett, Esq., and Mr. Wakefield, gr. to E. Pettit, Esq., who were ist and 2d in the order of their names. Mr. Reeves' best plants were *Erica Cavendishii*, *Statice profusa*, and *Erica capitata*, the latter the most meritorious being *Stephanotis floribunda* and *Erica verticosa alba*.

FINE-FOLIAGE PLANTS.

With six, Mr. Wakefield had 1st, his collection including *Chamaerops excelsa*, *Lantana borbonica*, and *Araucaria caladonia*; 2d, Mr. Reeves, who also had a nice group.

SIX CALADIUMS.—With these Mr. Reeves took the lead, staging a very fine lot; 2d, Mr. West.

FERNS.

In the class for six stave and greenhouse varieties Mr. Wakefield was to the fore, his best plants being a fine *Polypodium grande* and *Davallia Mooreana*; 2d, Mr. Waite.

Six *Adiantums*.—These were very well shown, Mr. Pratt, gr. to Lieut.-Col. Harfield, being ist with a fine lot, the most noteworthy of which were *A. farleyense*, *A. macrophyllum*, and *A. trapeziforme*; 2d, Mr. Pratt, gr. to J. W. Wilson, Esq., who also had a meritorious collection.

FUCHSIAS.

These were better than often met with thus early in the season. In the class for four those exhibited by Mr. Plowman, gr. to C. Lavers-Smith, Esq., were shown as these plants stage a full lot of flowers and healthy foliage, with very little training except a support to the main stem. The formal chimney-pot style of plant that meets with so much favour at the present day is about as stiff and unnatural as it will come to be. 2d, Mr. Reeves, with nicely done pyramids.

GLOXINIAS

were well shown, both in twelves and sixes. With twelve Mr. Bowden, gr. to E. Barnett, Esq., took 1st, having a beautiful lot of erect and drooping sorts; 2d, Mr. West, who also had good plants. In the class for six, Mr. Batt, gr. to H. W. Cuthbert, Esq., was 1st, with remarkably well-grown plants of fine varieties.

CUT FLOWERS.

Of these there was an imposing display. In the class for twenty-four distinct varieties, Mr. West was easily 1st, with a beautiful lot, composed wholly of Orchids, amongst which may be mentioned *Cattleya Schofieldii*, *C. gigas Sanderiana*, *C. Regnellii*; *Cypripedium caudatum*, *Vanda tricolor*, and *Dendrobium Dalhousianum*. Roses were forthcoming in plenty, eight or ten exhibitors putting in an appearance. In the class of six distinct varieties, Mr. Pratt, gr. to J. W. Wilson, Esq., was 1st, with a fine lot of flowers, with very little training except a support to the main stem. The formal chimney-pot style of plant that meets with so much favour at the present day is about as stiff and unnatural as it will come to be. 2d, Mr. Reeves, with nicely done pyramids.

Twelve.—1st, Mr. Warwick, whose best flowers here were *Chamaerops excelsa*, *Yucca*, *Teas*, *François Michelon*, and *La France*; 2d, Mr. Davis. Six Roses.—1st, Mr. Goddard; 2d, Mr. Roper. Twelve Tea varieties.—1st, Mr. West, with nice bouquets.—1st, Miss E. Donnel; 2d, Mr. J. Reeves.

FRUIT.

Collections were nicely shown, Mr. Sutton being 1st for six dishes of Black Hamburg and Buckland Sweetwater Grapes, Peaches, Nectarines, Strawberries, and a Melon; 2d, Mr. Bowden. Black Grapes were present in first-rate condition, Mr. Osman, gr. to L. H. Baker, Esq., taking the lead with Black Hamburg, fine bunches, berries well swelled and coloured; 2d, Mr. Bowden. White Grapes also were well represented, Mr. Osman having 1st, with Buckland Sweetwater, fine bunches and berries, and only a few examples for so late in the season. Of Peaches half a dozen good dishes were staged, Mr. Wakefield being 1st; Mr. Burns, gr. to H. H. Rigg, Esq., 2d.

Nectarines.—1st, Mr. Bowden, with a good dish; 2d, Mr. Sutton. Strawberries were forthcoming in quantity and mostly fine condition, Mr. West having the best; 2d, Mr. Waite, gr. to the Hon. W. P. Talbot, who likewise had fine fruit.

Mr. Pratt received a commendation for a nicely arranged group of plants.

From Messrs. Jackson, Kingstom, came an effective display of miscellaneous flowering and fine-leaved plants.

Messrs. Charles Lee & Son, Hammersmith, contributed a collection of Roses. Mr. Bennett, Shepperton, exhibited a beautiful lot of Roses, including several of his own pedigree seedlings, amongst which were charming boxes of Lady Mary Fitzwilliam and Her Majesty. With these were twenty-four blooms of Mrs. John Laing, a recent addition to Mr. Bennett's seedlings. This is a grand Rose, whether looked at from an exhibition or a decorative point of view; the colour is a beautiful shade of pale pink. It is a full-sized, deep flower, unexceptionable in form, with plenty of stuff in it—one of those Roses that can be shown big enough in a morning without being too far open in the latter part of a hot day. By not a few the question was raised, if not the best Rose Mr. Bennett has yet brought out. It received a well merited First-class Certificate.

TEDDINGTON HORTICULTURAL :

July 1.

The exhibition, which was held on the above date in the grounds attached to Bushy Lodge, gave evidence of successful gardening in the several departments of plants, flowers, and fruits.

STOVE AND GREENHOUSE FLOWERING PLANTS.

With six Messrs. Jackson, Kingstom, took 1st, with well bloomed, medium-sized plants. Four stove and greenhouse plants.—1st, Mr. Sutton, gr. to J. S. Sassoon, Esq.

FINE-FOLIAGE PLANTS.

With six Mr. Sutton had 1st honours, staging a nice lot, the best of which were *Kentia Baueri* and *Euterpeadula*. Three foliage plants.—1st, Mr. Higginson, gr. to Major-General Vials; 2d, Mr. Hoare, gr. to J. W. Clarke, Esq.

Single foliage plant.—1st, Mr. Sutton, with *Lantana borbonica*.

Four *Caladiums*.—1st, Mr. Harkett, who had well done plants; 2d, Mr. Staples.

MISCELLANEOUS.

In the class for Ferns, six varieties, the 1st prize went to Mr. Lambert, gr. to W. Truesell, Esq., with a nice collection; 2d, Mr. Coombes, gr. to W. Furze, Esq.

Three Ferns.—1st, Mr. Sutton, whose best plant was a fine specimen of *Cyathea dealbata*.

For the best show and fancy *Pelargonium* varieties, six plants, Mr. Wiggins, gr. to W. Clay, Esq., had 1st, staging very good examples for so late in the season, the best being East Lynne, Princess Teck, Evelyn, and Modesty.

Gloxinias were very well shown, Mr. Coombes having 1st, with nine beautiful plants, finely flowered; 2d, Mr. Sallows, gr. to J. J. Enoch, Esq.

Tuberous Begonias were very good, Mr. Sallows taking the lead in the class for six.

GROUPS OF PLANTS ARRANGED FOR EFFECT

were remarkably well done, especially in the open competition, the Ferns and other green-leaved plants used as a setting for the taller things and flowering subjects to give colour, being employed in sufficient quantity to avoid the overdone appearance in the matter of colour that is too often an objectionable feature in competitions of this kind.

In the open class there was a very close run between Messrs. Hooper & Co., of Twickenham, who were 1st, and Messrs. Fromow & Sons, of Chiswick, who were 2d. In the corresponding class confined to gentlemen's gardeners, the competing groups were also very well done, the 1st prize going to Mr. Coombes, and Mr. Buckland, gr. to J. F. Atkins, Esq., and Mr. Filsell, gr. to T. R. Greaves, Esq., had each meritorious groups.

FRUIT.

collectively, was nicely shown. With six dishes, Mr. Bates, gr. to Meek, Esq., had 1st, staging black and white Grapes, Peaches, Nectarines, Strawberries, and a Queen Pine; 2d, Mr. Sutton. Black Grapes were well shown by several exhibitors, Mr. Smith, gr. to Howard, Esq., taking the lead, while Mr. Bates was 2d. The class for white Grapes brought out the best finished Muscat of Alexandria we have seen this year, Mr. Coombes being 1st; Mr. Smith who was 2d, had

Foster's Seedling in nice condition. Single Pine.—1st, Mr. Bates, with a nice Queen; 2d, Mr. Sutton, who also had the same variety.

Dish of Peaches.—1st, Mr. Lake, with Royal George; 2d, Mr. Sutton, who had the same variety, large, beautiful fruit, but not ripe.

Dish of Nectarines.—1st, Mr. Lake, Violette Hative, very well coloured; 2d, Mr. Sutton. Strawberries.—1st, Mr. Bates, not so fine this year as usual, not having ripened kindly in most places. Mr. Higginson, who was 1st, had a very good dish of James Veitch.

CUT FLOWERS.

With twenty-four Roses, Mr. Warwick, gr. to J. P. Kitchin, Esq., had 1st, putting up a good stand; 2d, Mr. Coombes, who also had a meritorious collection. Twelve bunches of Gladioli.—1st, Mr. Higginson. Twelve bunches of Gladioli.—1st, Mr. Warwick, who had splendid flowers of fine varieties; 2d, Mr. Coombes. Stand of cut flowers.—1st, Miss F. J. Walker, with a beautiful arrangement; 2d, Mr. Fletcher.

Dr. Whitney's special prize for the best collection of British flowering plants, dried and mounted, was won by Mr. J. M. Hellier, whose exhibit was exceedingly well done, the colours of both flowers and leaves being well preserved.

Messrs Jackson, Kingstom, exhibited, not for competition, an effective group of flowering and other plants. Messrs. Veitch, Charles Lee & Son, and Mr. Anderson contributed cut Roses.

IPSWICH AND EAST OF ENGLAND.

THIS Society held its summer meeting on July 1, in Christchurch Park, which is an extensive and highly picturesque piece of ground, and is well broken and diversified by hill and dale, and finely timbered with grand old trees.

The most attractive feature of the exhibition was the Roses, which were unusually fine, the premier prize for the best forty-eight distinct trusses going to the champion grower, Mr. R. Cant, of Colchester, and Mr. F. Cant, of the same place, coming in 2d.

In the class for amateurs the Rev. H. A. Berners, the Honorary Secretary, was 1st for thirty-six, and exhibited a superb lot of blooms.

For twenty-four the Rev. Page Roberts came in 1st, with a good even stand. The Rev. H. T. Frere was awarded 2d, and showed a fine fresh-looking lot.

In the amateurs' class for twelve the Rev. H. A. Berners was again to the fore, and the Rev. Page Roberts and Mr. T. H. Powell were placed equal 2d.

There was also an open class for twelve, and in this Mr. B. R. Cant out-distanced competition, but Miss Penrice showed strong and took 2d.

In the class for Teas the Rev. A. Foster Melliar was a good 1st, with highly finished blooms. Comtesse de Nadaille was awarded the Silver Medal for the finest Rose in the show. The Rev. Page Roberts came in 2d, and Mr. T. H. Powell 3d.

For sixes the Rev. Page Roberts was 1st, and Mr. T. H. Powell 2d.

Next to the Roses, the stands of herbaceous and other hardy flowers came in for the greatest share of attention, but the prizes for these were very disproportionate, for while £2 was offered for the best twelve Roses, the prize for twelve herbaceous cut flowers was 7s. 6d., and 10s. for twenty-four, in which latter class Messrs. Gilbert took the lead, with a very fine lot; and Mr. J. Sheppard, of Woolston, took twelve, and occupied the same place again in the sixes.

For the best six stove and greenhouse cut flowers, Mr. Munday, gr. to R. C. Ransome, Esq., was 1st; and the Messrs. Gilbert, of St. Margaret's Nursery, Ipswich, 2d. In the class for twelve, Mr. Ransome's taste was displayed, the Messrs. Gilbert taking 1st for their stand in the open class; and in that for lady amateurs the premier position fell to Miss Bruff.

In the plant department a great falling off was noticeable, some of the older and principal exhibitors having partly withdrawn.

For six stove and greenhouse, the Messrs. Gilbert took the lead; and Mr. Munday came in 2d.

In the class for the six best ornamental foliage plants, the Messrs. Gilbert were again 1st; and Mr. W. Sheppard, gr. to R. Packard, Esq., of Berfield, 2d. For six stove and greenhouse plants, Mr. Munday was 1st, and Mr. W. Sheppard 2d; the same positions being occupied for four ornamental.

What constituted a most useful class, and one deserving of more encouragement as a class, was that of the best group of plants arranged in a space of 12 feet by 5, in which Mr. Munday was a good 1st, with a very nice, well-grown lot of clean, healthy stuff; and Mr. Cheney, gr. to H. Booth, Esq., 2d, with a most useful collection.

For the best specimen in bloom, Mr. W. Sheppard was 1st; and Mr. Munday took 1st for the best Orchid, with a large and superbly flowered *Dendrobium* in which class Mr. W. Sheppard came 2d.

For the best specimen foliage plant, Mr. Munday was again 1st, and the same for six exotic Ferns.

Mr. Munday was also to the fore in the class for six tuberous-rooted Begonias, and again for six Gloxinias, his plants of these being remarkably fine. In the fruit tent, for the collection of eight dishes, the contest laid between Mr. W. Allan, gr. to Lord Harfield, of Stanton Park, and Mr. J. J. Berners, Esq., of Woolston, the prizes being awarded to the order named.

Mr. Allan was also 1st for the best three bunches of black Grapes, and the same for three of white; the 2d in the first-named class going to Mr. Cheney.

For six Peaches, Mr. Allan was 1st, with some fine well coloured fruit—the prize for the best six Nectarines falling to the lot of Mr. W. Sheppard, who had a fine half-dozen of Lord Napier.

Cherries were fine, Mr. J. Sheppard showing good dishes of Tartarian and Frogmore. Bigarons, however, and outdoor fruits were conspicuous by their absence, the season being so late that none, except Cherries, had ripened.

The vegetables were remarkably fine, Mr. Cresswell, gr. at Stoke Park, taking the coveted reward for the best collection of twelve sorts; and Mr. Blair 2d.

FLOWER MAKING.

CERTAINLY not artificial flowers, for these, wondrous as they are, and singularly like to real as many may be, yet do not come within the scope of garden work, and are not referred to in the present instance. The flower-making under immediate notice is that of real flowers, such as are in request in vast quantities in the flower market, and always command good sale. The term flower "making" may be objectionable in some respects, because it seems to convey an impression of manufacture rather than of actual cultivation. To those engaged in market flower production on a large scale the distinction seems to lie less in terms than in method. A visit to the market establishment of Messrs. Hawkins & Bennett, Twickenham, is always of interest, but specially so at this season of the year, for a very pleasing speciality of this firm is found in Lily of the Valley. Their splendid Victoria strain is admittedly the finest in cultivation, and of them they have immense quantities, all planted in beds 8 feet in width, and so arranged that lights used to protect the earlier beds may be shifted from one set of beds to later ones, and so on, so that the season of bloom is as prolonged as possible. How many hundred yard lengths of beds of this width are grown we cannot say, but on the evening of our recent visit we learned that several hundred dozens of blooms had been that day gathered for market. These are assorted and bunched with exceeding care, as prices vary according to quality. To those unaccustomed to the work the perfume found in the tying shed is as overpowering, as it is in a lesser degree most delicious. Beds stand several years just as they may produce good spikes of bloom or otherwise. As soon as these show lack of quality the roots are in the following autumn lifted, the crowns assorted or sized, and the old soil in the beds being removed, fresh is introduced with ample dressings of manure, and the roots are replanted. The beds are not as a rule considered worth protection until the third year, when they are strong, and if doing well they will continue to produce a fine crop of flowers for several seasons. The Victoria Lily of the Valley is a fine strain, but it owes some of its superior character also to the high-class cultivation bestowed upon it at Twickenham. But whilst these hardy flowers are occasional specialties here, the backbone of flower-making is found in white, scarlet, and pink Pelargoniums, of which many thousands in 45 sized pots are grown. It is always difficult to ascertain the exact numbers of plants found in any of these large market establishments, especially as we do not care always to submit a direct query. Perhaps it would be fair, however, to say that if every Pelargonium in pots in this establishment were stood close together an acre of ground would not hold them. How many 45-sized pots would stand on such an area we leave youthful arithmeticians to settle. Pelargoniums here are never out of bloom. No matter at what season of the year visitors may drop in upon Messrs. Hawkins & Bennett; even if it be the foggiest, dullest day of mid-winter, they will still see what for the time of the year may well be termed a blaze of colour. Those who have seen Mr. Cannell's winter displays of bedding Pelargoniums will not doubt this statement. What is seen in mid-winter is, however, not quite so brilliant a display as may be seen in the many long broad houses here now; and this brilliant show is all the more remarkable when it is remembered that the flowers are being gathered in quantity from day to day. Vesuvius is still the most largely grown of single scarlets, and wondrously floriferous it is. A house full of this, 20 feet wide and 200 feet long is, indeed, an untoward sight, all the plants being in blooming pots, making good growth, and not in the bedding 60, as may be imagined. The firm grow no bedding stuff—indeed, they send no plants to market early, but later, when furnishing makes demand for colour, some thousands will go, because plenty of others will be prepared to take their places. But if rather less free than is Vesuvius, certainly very much finer is that grand scarlet, De Lesseps. So perfect, so fine, and richly coloured is this kind, as bloomed here, that it would seem as if improvement upon it were impossible. Perhaps something is due to cultivation, but certainly De Lesseps at Twickenham is a grand variety; as one truss is of more value in the market than three of Vesuvius, no wonder it is highly thought of here.

Naturally those who work in market flower making,

must proceed slowly in the use of new materials lest they commit a serious trade error. Hence Vesuvius has held its own for a long time, because it is so certain and so amenable to cultivation. Other kinds must be well tried before they can displace it, and thus change in material proceeds slowly. A very fine scarlet, too, is Commander-in-Chief, but it pales its first merit in presence of De Lesseps, whilst Master Christine seems to be the most largely grown of single pinks. The sway held by old Madame Vaucher so long as a market white has at length been quite broken, indeed a real queen has been found in one of the most perfect of white kinds. We have ever seen, and named fully Queen of Whites. This is one of that market veteran, Mr. Ladd's raising, and should be in universal demand. Not only has the plant a sturdy compact habit, but it is wondrously free and its flowers are borne in good sized trusses, the pips being not only stout and of the fullest and most perfect form, but it is a pure standing white. Another extremely striking white is Niphetos, perhaps the purest white ever seen; the plants are robust growers, and the trusses, borne on tall stout stems, are large, but the flowers partake somewhat of the Hybrid Nosegay habit, and lack form. It is greatly to its credit that it never pinks or discolours, and for that reason is most valuable for its particular use here, especially in the winter. Arethusa is also largely grown as a white kind. All singles are gathered as trusses, and before going to market pass through the hands of experts, who place a drop of liquid gum into each flower, thus making the petals adhesive and enduring. Doubles, on the other hand, are chiefly gathered singly, the pips, when fully expanded, being placed in small tissue-paper bags in dozens or scores, and dropped into trays. To all ordinary observers these bags might be supposed to hold sweets or cakes, but their contents, though sweet and very beautiful, barely come under the appellation of sweets. The finest double here is the deep scarlet E. V. Raspail, which produces very fine pips. King of Doubles, colour orange-scarlet, is also a very striking kind; and Madame Thibaut is largely grown, its purplish-pink flowers standing out in bulk with fine effect. The double Ivy-leaved section of Pelargoniums is also well represented, such fine forms as Madame and Albert Crousse, Jean d'Arc, and Gloire d'Orleans, being largely grown. There are several others in the various sections than those named, and also a quantity of seedling large-flowered Pelargoniums, all blooming freely, and giving a wondrous display of colour.

A great speciality with the firm is found in Maidenhair Fern, the chief kind grown, because of its admirable habit and usefulness, being the common Adiantum canescens. This is seen in thousands of big plants, chiefly in large 24's, and some few specimens in large pots from 4 feet to 5 feet through, the which it is supposed to show shortly at South Kensington. All these Ferns are grown for the production of fronds, which are pulled and bunched, going to market in boxes with the flowers. To maintain the supply of fronds required, it is needful to have a big stock of plants, and these obtain the best cultivation. In the production of large specimens, a few of which are always on hand, seedling plants are preferred to divided ones, as in the former the fronds come up in a cluster, and do not run out. The firm have a Maidenhair, which, whilst possessing all the admirable qualities of canescens, is quite intermediate between that and the somewhat fragile gracillimum. How far it may be distinct from other kinds opportunity will doubtless presently offer for determination. The entire establishment is kept in good order, and whilst every yard of ground is fully utilised, yet all is as tidy as in a private garden. A. D.

GIANTIC TREES.—At Dartington Hall (the seat of A. Champenowde, Esq.), near Totnes, opposite to and within sight from the front of the mansion, are seven Spanish or Sweet Chestnut trees—great monsters.

No.	has a trunk 14 feet 6 inches in circumference.
1	20 16 6
2	15 10 3
3	13 10 3
4	14 10 5
5	16 10 5
6	10 10 8
7	10 10 8

The ground covered by these noble specimens is about 23 yards x 60 yards, and they are from 60 to 70 feet in height.

BRAINTREE AND BOCKING HORTICULTURAL.

THE annual summer show of this Society was held on July 2, in the grounds belonging to Sydney Courtauld, Esq. The day was a delightfully fine one, and as the two preceding shows had unfortunately fallen on pouring days, the large company which assembled this year was all the more in the mind to enjoy the weather, the numerous fine exhibits, and the good music, which a large and well trained band discoursed. Four large tents were provided for the different classes, one being allotted to the foliage and flowering plants, and another to the cut flowers and table decorations and fruit, a third to the cottagers' classes, and a fourth to the vegetables. Among the extraordinary plants may be noted a grand *Cycas revoluta* (not for competition), some 20 or 12 feet across, and coming to fruit, from George Courtauld, Esq., M.P.; *Cycas media*, *Coeco Weddelliana* in the group from Sydney Courtauld, Esq., the generally fine exhibits of Mr. Dauce, gr. to Colonel Lowe, who took 1st for foliage plants, and a magnificent *Cyathus Harkelii* in Miss Castown's collection. Mr. P. Smoothly had some grand *Coleus* and *Centurion*, *Metastachyum*, and *Roses* and *Tuberous Begonias*. The prize twenty-four cut *Roses*, of Mr. W. Brown, of Braintree, were superb. The Braintree show is becoming noted for table decorations, and some of those set up on Thursday were of first merit, notably those of Mr. S. Sedgwick, gr. at the land of Mr. J. Tuffnell. Both from a business and a pleasure point of view the show was a great success, and reflected great credit on all concerned, and particularly on Mr. H. Gibbs, the secretary, and the committee, who must have worked hard to arrange so many exhibits in such a short space of time. (A Correspondent.)

MASSACHUSETTS HORTICULTURAL: Boston, June 6.

THIS was prize day or Rhododendrons and hardy Azaleas, but on account of the lateness of the season the competition was not very close. Mrs. F. B. Hayes was the best person to compete, and took the 1st prize for the best twenty-four, twelve, six, three, and a single tender Rhododendron, and also the 1st prize for the best six hardy kinds. Among the tender kinds we noticed John Walter, W. E. Gladstone, Lady Grenville, Baron Schroder, Lady Rolle, Auguste van Gert, Jeanie Deans, Lady Dorothy, and Mrs. Thomas Longman.

Mr. H. H. Hunnewell filled a large stand with Azaleas and Rhododendrons; Mr. B. G. Smith took the 2d prize for a cluster of hardy Azaleas, Baron Geo. Pike.

Mr. R. T. Jackson exhibited a splendid little alpine plant, *Fritius alpinus*, which has probably never bloomed before in this country.

Mrs. P. D. Richards, West Medford, exhibited forty-eight species and two vars. of wild flowers, receiving the 1st prize.

Hon. Marshall P. Wilder exhibited a collection of Tree Showers. J. W. Woodford displayed Clematis in varieties, and from many other contributors came herbaceous plants, hardy flowering trees, cut flowers, and wild flowers.

The Secretary read a letter from the General Union for the Promotion of the Cultivation of Bulbs at Harlem, proposing to offer a Gold Medal, a Silver-gilt Medal, and a Silver Medal for the best, 2d best, and 3d best Hyacinths in pots at the next spring exhibition of the Society. The Society appointed a delegation to attend the next meeting of the American Pomological Society, to be held in the State of Michigan in September next.

BOSTON: June 13.—The Rhododendrons from Mrs. F. B. Hayes were very fine, and shown in large numbers, nearly filling a large table. Mrs. Hayes also exhibited a fine collection of Azaleas and Irises. H. H. Hunnewell filled another large table with Rhododendrons and Azaleas. E. Sheppard showed Rhododendrons, Azaleas, Delphiniums, and Irises. J. H. Woodford again made a good display of Clematises and two vars. of Lamarque Roses. W. C. Strong, Brighton, showed the new white *Angela candida*, which seems to be hardy in this country. From Miss S. W. Story came a collection of named herbaceous plants. Mrs. P. D. Richards exhibited a large collection of wild flowers.

BRICKS OF CORK.—The waste cuttings of cork are now being employed for making bricks, which can be used for walls, impervious alike to heat or damp. The cork cuttings are reduced to powder in a mortar, and mixed with lime or clay, and from this composition the bricks are made in the usual way. When dried, they are capable of resisting a crushing strain of 36 kilograms per square centimetre (51.08 lbs. per square inch). They are very light, having a specific gravity of 0.35. *Journal of the Society of Arts.*

The Weather.

- July 2.—Very fine morning, dull afternoon.
- 3.—Fine day, dull.
- 4.—Fine dull day.
- 5.—Dull morning, fine bright afternoon.
- 6.—Very fine day.
- 7.—Very fine day.
- 8.—Fine day, slight shower of rain at 1.30 P.M.

LONDON: Atmospheric Pressure.—During the week ending July 4, the reading of the barometer at the level of the sea decreased from 30.24 inches at the beginning of the week to 29.94 inches by 5 P.M. on the 29th, increased to 30.01 inches by 9 A.M. on the 30th, decreased to 30 inches by 1 P.M. on the same day, increased to 30.17 inches by 9 A.M., decreased to 30.13 inches by 5 P.M. on July 1, increased to 30.22 inches by 9 A.M. on the 2d, decreased to 30.11 inches by 5 P.M. on the 3d, and was 30.20 inches by the end of the week.

The mean reading of the barometer for the week was 30.10 inches, being 0.01 inch higher than last week, and 0.11 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 79° 3, on the 3d; on July 1 the highest was 68° 5. The mean of the seven high day temperatures was 73° 4.

The lowest temperature was 47° 5, on June 28; on the 3d the lowest temperature was 55° 5. The mean of the seven low night temperatures was 51° 4.

The greatest range of temperature in one day was 24° 6, on June 28; the least range was 16° 7, on the 29th. The mean of the seven daily ranges was 22°.

The mean temperatures were—on the 28th, 57° 2; on the 29th, 57° 5; on the 30th, 59°; on July 1st, 57° 7; on the 2d, 61° 3; on the 3d, 65° 8; and on the 4th, 65° 3; of these the first four were below their averages by 4° 1, 3° 8, 2° 2, and 3° 5, respectively, and the last three were above by 0° 2, 4° 6, and 4° 3, respectively.

The mean temperature of the week was 60° 5, being 3° 6 higher than last week, and 0° 7 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 157°, on June 28. The mean of the seven readings was 126° 4.

The lowest reading of a minimum thermometer placed on grass was 37° 1, on the 28th. The mean of the seven readings was 41° 8.

Rain.—No rain fell during the week.

ENGLAND: Temperature.—During the week ending July 4, the highest at Cambridge was 80° 5, at Blackheath 79° 3, at Plymouth 75° 3, the highest at Bradford was 69° 1, at Liverpool 70° 3, at Preston 71° 5. The general mean was 44° 1.

The lowest temperatures were 39° at Cambridge, 40° at Truro, 40° 5 at Bolton; the lowest at Liverpool was 49° 5, at Brighton 48°, at Blackheath 47° 5. The general mean was 44° 1.

The greatest ranges were 41° 5 at Cambridge, 32° 9 at Wolverhampton, 32° at Truro and Sunderland; the smallest ranges were 20° 8 at Liverpool, 23° 1 at Bradford, 24° 5 at Preston. The general mean was 22° 5.

The mean of the seven high day temperatures was highest at Blackheath and Cambridge, 73° 4, at Leeds 69° 5; and was lowest at Liverpool, 64° 3, at Sunderland 65° 4, at Hull 65° 9. The general mean was 68° 4.

The mean of the seven low night temperatures was highest at Preston, 53° 3, at Liverpool 53° 2, at Leeds 51° 7; and was lowest at Truro, 45° 4, at Wolverhampton 47° 6, at Cambridge and Hull 47° 7. The general mean was 49° 7.

The mean daily range was greatest at Cambridge, 25° 7, at Truro 23° 2, at Blackheath 22° 5, and was least at Liverpool, 11° 1, at Preston 14° 7, at Sunderland 16° 3. The general mean was 18° 7.

The mean temperature was highest at Blackheath, 60° 5, at Preston 58° 8, at Leeds 58° 7; and was lowest at Hull, 54° 9, at Truro 55° 1, at Sunderland 55° 3. The general mean was 57° 1.

Rain.—The largest fall was 0.07 inch at Wolverhampton; and the smallest fall was 0.01 inch at Sunderland. No rain fell at Truro, Plymouth, Brighton, Bristol, Blackheath, Nottingham, Sheffield, Liverpool, Bolton, Hull, Bradford, Leeds, or Preston. The general mean was 0.01 inch.

SCOTLAND: Temperature.—During the week ending July 4, the highest temperature was 79° 8, at Paisley; at Leith the highest was 71° 5. The general mean was 75° 2.

The lowest temperature in the week was 41° at Perth; at Leith the lowest temperature was 45° 1. The general mean was 43° 4.

The mean temperature was highest at Dundee, 59° 6; and lowest at Glasgow, 57° 3. The general mean was 58° 4.

Rain.—The largest fall was 0.59 inch, at Aberdeen, and 0.06 inch at Greenock. The general mean fall was 0.21 inch.

JAMES GLAISHER F.R.S.

Answers to Correspondents.

POPLAR GALL: T. P. W. This is the production of an aphid allied to the greenfly of the Rose. Sweep up the leaves, and burn them.

FIG. 13.—POPLAR GALL.

DISEASED PEAR LEAVES: S. S. The Pear leaves are infested with Phytomyza Fyfi. You can only cut off affected foliage and burn it.

GRAPES DISEASED: C. J. Wheeler, Houghton. As the examples forwarded are infested with the common Grape mildew, it is only reasonable to suppose that the injury is due to this parasite. In bad cases like yours the fungus inserts a large number of microscopically small suckers into the skin of the fruit, and the minute orifices thus formed are the beginning of the soft decayed spots. On to these spots often fungi speedily affix themselves, as in your case, and destruction of the fruit is soon complete. We think good ventilation, and the other precautions usually taken against mildew, would prevent a recurrence of the decay. W. G. S.

HULL SHOW: W. Green. November 19, two days. Mr. MacMahon, Botanic Garden.

NAMES OF PLANTS: C. M. O. Allium neapolitanum; Aconitum lycoctonum. The other specimens were unfortunately dried up beyond recognition.—W. S. 1, Spizaea anisiflora, 2, next week; 3, Sedum spurius var. album; 4, Sidalcea nevadensis.—H. H. W., Brighton. 1, Erigeron speciosus; 2, E. glabellus; 3, one of the numerous forms of Veronica spicata; 4,

Ornithogalum narbonense? 5, Lobelia erinus; 6, probably Helicichrysum stuebeli, but not sufficiently advanced.—A. C. 1, Thunia gigantea; 2, T. occidentalis? 3, Libocedrus decurrens; 4, Abies conchifolia? 5, Cunninghamia sinensis.—A. Reader, M.C. 1, Polystichum angulare proliferum; 2, P. aculeatum; 3, Lactaria Filix-mas cristata; 4, E. dilatata; 5, Scolopendrium vulgare; 6, Lactaria spinulosa.—Notts. 1, Potentilla tormentilla; 2, Lyoposis arvensis; 3, Galium Cruciata; 4, Fumaria officinalis; 5, Centaurea nigra; 6, Lychnis dioica.—P. 7, 1, perianth Hieracium umbellatum, but specimen insufficient, and converted into ensilage before it reached us; 2, Melica uniflora; 3, Sceleranthus annuus; 4, Pox rigida; 5, Potentilla tomentosa; 6, Lyoposis arvensis.—E. C. Trifolium pratense.—Barr & Sons. 1, Bromus commutatus; 2 and 6, Agrostis ebullosa; 3, Briza media, stained; 4, Anthoxanthum ovatum; 5, Bromus macrostachys; 7, Bromus briziformis; 8, Polygopus monspeliensis; 9, Festuca heterophylla (?), no leaves.—Alpha. 1, Lathyrus pratensis; 2, Lotus corniculatus major; 3, Trifolium procumbens; 4, Lotus corniculatus; 5, Hieracium pilosella; 6, Cherochrymum sylvestre.—Young Gardener. Epidendrum seligerum.—Q. F. We cannot name plants from incomplete specimens.

PEACH LEAVES: R. M. The holes in your Peach leaves are caused by the ravages of the cherophorant on drops of water, and turning them into burning-glasses. Probably some of your rays of glass are of bad quality.

POPLAR: C. M. The female catkins of the Poplar, with the silky seeds.

TUBERS ON HAULMS: R. P. It is clear you do not read your Gardeners' Chronicle very attentively, or you would know that the occurrence is not uncommon. It is said that the cause is some injury to the plant, which is very likely. They are adventitious buds, as you suppose, and they would develop, if planted like other sets, into edible tubers.

TULIPS: G. P. The formation of bulbs in the axil of the stem-leaves is uncommon, but occurs occasionally.

WIREWORM: A. Curtis. Slight dressings of agricultural salt strewn between the crop in showery weather. Give enough to be just visible as a thin coating.

YEW DISEASED: C. M. O. The black spots on the Yew leaves are caused by a fungus named Sphaeropsis latx, and quite different from the Sphaeropsis latx, recently described and illustrated in the Gardeners' Chronicle. The Sphaeropsis is not, we think, capable of causing serious injury to Yews. Your Yew appears to be infested with an unicellular alga and lichens. We should say it is in a bad situation for growth. W. G. S.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing cut flowers such as Abutilon, Arum Lilies, Bouvardias, Carnations, etc., with prices per bunch.

SEEDS.

LONDON: July 8.—There is but very little business passing on the seed market. Samples of new French Tritolium are now showing.

CORN.

At Mark Lane on Monday the increased granary stocks from recent large arrivals, combined with the estimated deficiency of 1,200,000 quarters in the American Wheat crop, and the reported almost entire loss of the crops on the large Wheat-growing districts of Southern Russia, had great weight with holders.

HAY.

Tuesday's Whitechapel Market report states that trade was dull, with short supplies, more especially of straw. Quotations:—Clover, prime, 80s. to 107s.; prime second cut, 85s. to 107s.; inferior, 60s. to 75s.; hay, prime, 70s. to 95s.; inferior, 40s. to 60s.; and straw, 26s. to 37s. per load.

POTATOS.

The latest quotations to hand are as follows:—Magnum Bonum, 50s. to 60s. per ton; new ditto, Jersey King, 85s. to 95s. 6d. per cwt.; ditto, flukes, 10s. per cwt.; ditto, rounds, 7s. 6d. per cwt.; ditto, St. Malo, 6s. 6d. to 7s. 6d. per cwt.; ditto, Cherbourg, 6s. to 7s. per cwt.; ditto, flukes, 9s. to 9s. 6d. per cwt.

COALS.

The following are the prices current at market during the week:—East West Ham, 15s. 6d.; Ravensworth West Hartley, 14s. 6d.; West West Hartley, 14s. 6d.; Walls End—Harton, 13s. 6d.; Lyons (unscreened), 11s. 3d.; Hetton, 15s.; Hetton Lyons, 13s. 6d.; Hawthorn, 13s. 6d.; Lambton, 14s. 6d.; Wear, 13s. 6d.; South Hetton, 15s.; East Hartlepool, 14s. 3d.; South Hartlepool, 13s. 9d.; Tees, 15s.; Lambton, 14s. 6d.; Chilton Tees, 13s. 9d.

Government Stock.—The closing prices of Consols for the Monday were 99 1/2 to 99 3/4 for delivery, and 99 1/2 to 99 3/4 for the account. Tuesday's figures were 99 1/2 to 99 3/4 for delivery, and 99 1/2 to 99 3/4 for the account.

HILL AND SMITH'S BLACK VARNISH,
for Preserving Ironwork, Wood, or Stone.
(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about two gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIALS.
"Piercedford Park, June 21, 1878.—We have this day forwarded from Chesham to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Piercedford Park, Chesham.—I am, Sirs, yours respectfully, Wm. Cox."

"CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised."
"H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamped it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine."
Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c. sent free on application to
HILL AND SMITH, Rizerley Hill Ironworks, Stratford-hive; 116, Queen Victoria Street, London, E.C. 2 and 156, St. Vincent Street, Glasgow.

"Gather Honey from Your Flow'ers."
NEIGHBOUR'S Celebrated BEEHIVES.
Silver and Bronze Medals awarded at the International Health Exhibition, 1884, to Geo. Neighbour & Sons.

NEIGHBOUR'S
IMPROVED
COTTAGE BEEHIVE,
as originally introduced by them, working three bell-glasses or airy of sectional supers, is neatly and strongly made of straw; it has three windows in the lower Hive.

This Hive will be found to possess many practical advantages, and is more easy of management than any other that has been introduced.

Price £1 15 0
Stand for ditto 0 10 6

NEIGHBOUR'S FIFTEEN SHILLING FRAME HIVE.
This Hive has been designed to supply a want long felt by those who desire a Hive at once tasteful in appearance and moderate in price. The walls are built of straw neatly bound with cane. Ample means for ventilation in summer, and sufficient warmth in winter are thus secured. Nine Frames, of the standard size, fitted with metal ends, and a dummy for reducing the Hive, are enclosed therein, and slide quit to place over the Frames, a case of American one-piece sections for supering, and a substantial

cover of wood, to protect from the weather, are also included. Price, complete, 15s.

Also **BAR-FRAME HIVES**, from 7s. 6d. to 42s. each.
"THE APIARY," by ALFRED NEIGHBOUR. Price 5s., post-free.

CATALOGUE of Improved Beehives and Appliances may be had on application to

GEO. NEIGHBOUR & SONS,
127, HIGH HOLBORN, LONDON, W.C.,
and 149, REGENT STREET, LONDON, W.

COVERED SHEDS FOR CATTLE.
THE GLOUCESTER WAGON CO.
(LIMITED)

Have attached to their extensive works a large Joinery Department with the latest and most improved Machinery, for the Manufacture of Covered Sheds or Yards for Cattle, Conservatories, Greenhouses, Garden Seats, &c., at extremely moderate prices.

Full particulars may be had on application to **ALFRED SLATER, General Manager, GLOUCESTER.**
Roshier's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "crown" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and of great variety of design.

F. ROSHER AND CO., Manufacturers, Upper Ground Street, Backricks, S.E.1; King's Road, Chelsea, S.W.2; Kingsland Road, E.
Agents for **LOOKER'S PATENT "ACME" FRAMES, PLANT COVERS, and PROPAGATING FOXES;** also for **FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.**
Illustrate Price LISTS Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES,
for Conservatories, Halls, Corridors, Balconies, &c., from 2s. per square yard upwards. Pattern Sheet of Paving or more elaborate Design, with Prices, sent for selection.

WIDE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great quantities. Slates, Cement, &c.

F. ROSHER AND CO., Brick and Tile Merchants.
See Addresses above.

SILVER SAND,
fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from PORT to any Railway Station. Samples of Sand free by post.

FLINTS and BRICK BURRED for Roadways or Pavements.
KENT FEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above.
N.B.—Orders promptly executed by Rail or to Wharf. A liberal Discount to the Trade.

HOLLOWAY'S OINTMENT and PILLS.—Old Wounds, Sores, and Ulcers.—Daily experience confirms the fact which has triumphed over all opposition for more than 40 years, viz., that no means are known equal to Holloway's remedies for curing all the primary diseases, as Wounds, Diseases of the Skin, Erysipelas, Abscesses, Burns, Scalds, and, in truth, all maladies where the skin is broken. To cure these ailments quickly, and to prevent any compulsory confinement indoors weakens the general health. The ready means of Cure are found in Holloway's Ointment and Pills, which Heals the sores and expel their cause. In the very worst cases the Ointment has succeeded in effecting a perfect Cure after every other means had failed in giving adequate relief.

SALES BY AUCTION.

IMPORTED ORCHIDS in a splendid condition, from Messrs. Shuttleworth, Carder & Co., comprising Lusila albida, enormous masses; L. nigris, the very dark form; L. autumnalis...

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 47, Abchurch Lane, E.C., on TUESDAY NEXT, July 21, at half-past 12 o'clock precisely.

CATTLEA MOSSEL, five masses; PESCATORIÆ CERINA, ONCIDIUM TRICUSPIDATUM, COMPARETTIA FALCATA, MARSEVALLIAS, DENDRODIUMS, Mexican ORCHIDS and others, and 600 Bulbs EUCARIS AMAZONICA.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. F. Sander to SELL the above by AUCTION, at their Central Sale Rooms, 47 and 48, Cheapside, E.C., on FRIDAY NEXT, July 24, at half-past 12 o'clock precisely.

MESSRS. PROTHEROE AND MORRIS beg to announce that their next SPECIAL SALE OF ORCHIDS in flower and buds will take place on TUESDAY, July 28, for which they will be glad to receive Notice of Entries as early as possible.

Whetstone, Middlesex—Preliminary Notice. The well-known FREEHOLD BREWERY and Distillery, situated as the Whetstone Nurseries, or New Lodge, Whetstone, carried on so successfully for upwards of thirty years by the present proprietors, comprising about 5 Acres of LAND, Thirteen four superiorly erected GREENHOUSES, with nearly 4 miles' run of HOT-WATER PIPING, with a substantially built Twelve-roomed DETACHED RESIDENCE, and several other BUILDINGS; also 13 Acres of valuable Freehold Building LAND adjoining, opposite Oakleigh Park, and 30 minutes' walk from Clottenage Station.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL by AUCTION, at the Mart, London, E.C., at an EARLY DATE, the above very VALUABLE PROPERTY, in three lots, by the order of Messrs. Dow & Son, in consequence of falling health of Mr. Davis, Junr.

Thursday Next—(Sole No. 6943) VALUABLE IMPORTED ORCHIDS. MR. J. C. STEVENS will SELL by AUCTION at his Great Rooms, 38, King Street, Covent Garden, W.C., by order of Mr. F. Sander on THURSDAY NEXT, July 23, at half-past 12 o'clock precisely, a fine importation of PERISTERIA ELATA, wonderful species; immense masses of CATELEA MOSSEL, DENDRODIUMS, and other valuable ORCHIDS.

WANTED, to RENT, at ONCE, about an Acre of LAND, or a Large GARDEN, with Class; also a COTTAGE, suitable for a Florist, about 12 miles from London.

FOR DISPOSAL, a GARDENER'S, FLORISTS, and CARPING BUSINESS. Genuine old-established concern, in rising high-class neighbourhood. Ill-health cause of sale, and going on till 1889, including stock, 6 Harves, Van, and 2 Tip Carts.

TO BE DISSOLVED, of a small NURSERY, consists of 3 Greenhouses, of about 2000 feet of Glass, large Garden of about an acre, and Good Shop in main thoroughfare. Held as a year tenant. Together with the business of a Seedsman, Fruiterer, and Greengrocer, to which might be added that of a Jobbing Gardener, in a rapidly rising neighbourhood, 8 miles north of Covent Garden, with Horse and Carts, and all appliances for carrying on the above. Advertiser removing to larger premises, the reason of his giving up the same.

Apply on the premises, to J. W. WOODHALL, Seedsman, Florist, and Fruiterer, High Wood, Whetstone. Nearest Railway Station, Woodside Park, High Barnet Lane.

TO BE DISPOSED OF, the Business, Greenhouses, Tools, &c., of a Jobbing Gardener. Death cause of lotting.

California. FOR SALE, several GRAIN and FRUIT FARMS, CATTLE, and SHEEP RANCHES, in the most desirable parts of California.

Capital Old-fashioned Garden. To BE LET, FAMILY RESIDENCE, a facing Clapham Common, having advantages of the above nature not to be found in connection with a modern builder's house, and with the benefit of an hour drive to the City and West End. Good accommodation for a family. House much improved and modernised of late years. Stabling, Cow-house, Four-houses, and other buildings. Range-house, and an Ariel Grounds. Worthy the attention of any one who can appreciate a good old garden.

Messrs. MILES and SONS, Clapham Common; and Messrs. DEBENHAM, TEWSON, FARMER, and BRIDGEWATER, 83, Cheapside, E.C.

TO LET (16 miles from London), a NURSERY of 4 Acres, with 3 Greenhouses, 8-roomed House, Stabling, and Shed accommodation. Rent £50. Price for stock, lease, &c., £2000.

Apply, K. L. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

M. AY, Gardener, Vine Cottage, Navarino Road, Hackney, E.

WHOLESALE BULB CATALOGUE. Contains List of all varieties of English, Dutch, and French grown Bulbs, including the following:— ANEMONS, all the latest, in all varieties. CYCLAMEN, good strain. CHIONODOXA LUCILLE, charming blue spring-flower. CROCUS, all named varieties, and mixed. GIGANTIA, beautiful white-scented flowers. HELLEBORUS NIGER, Christmas Rose. (Cape bulb.) HYACINTHS, all colours, named, for pot, glasses, or bedding. IRIS, all the best varieties. KIAS, handsome, new spring flowers. LILIES, all the leading named sorts. NARCISS, Polyanthus varieties. NARCISUS and DAFNODIUS, in forty varieties. SCILLAS and SNOWDROPS, including the newest varieties of Lilies, Double and Single, in great variety. Of the latter WINTER SCILLAS, bright yellow, the first bulb to bloom in the open ground.

May be had on application. Please compare our prices before sending your orders abroad.

WALKINS and SIMPSON, Seed and Bulb Merchants, 13, Exeter Street, Strand, W.C. SOMETHING WORTH HAVING. AQUELEGIA GLANDULOSA, Grigor's Glandular Columbine (true).

"Respecting our variety of Aquegia or Columbine, Dr. Lindley, in the Gardeners' Chronicle, said:—'The plant is perhaps the most handsome and the most cultivated of its stems rise about 2 feet high, and sometimes carry from 50 to 80 blossoms. We have a plant now before us which, after a journey from Scotland, has produced five flowers, each 2 1/2 inches in diameter, with broad, thin, delicate, spreading sepals of the deepest ultramarine-blue surrounding 5 short petals, the upper part of which is pure white, resting on an azure ground. The effect is beautiful in the extreme, and no description that we have formerly given of it has done justice to its exquisite appearance.'"

"Having sent a specimen of this Columbine to the Editor of the Gardeners' Magazine, he says (June 10, 1879):—'If we could favour our readers with a sight of a bunch of flowers of it we have now before us, a few of them would excite.' Proudly I am 'Glorious!'" and so forth. We are bound to be cautious in the employment of the language of eulogy, but we shall probably be quite safe in saying that there is not in cultivation a finer hardy herbaceous plant than Grigor's variety of A. glandulosa, the Glandular Columbine. The plant is robust, handsome, and leafy: the flowers are produced in great profusion; they average 3 1/2 inches in diameter; the sepals deep ultramarine-blue, the corolla pure white with blue spot at the base of each petal, remarkably elegant, distinct, and refined, at the same time showy almost to a fault. We advise all who are interested in first-class plants to secure this Forbes edition of an old favourite.

Now Ready. Price for Strong Flowering Plants, carriage paid, 6s. per dozen, or a dozen for 10s., likewise carriage paid.

JOHN GRIGOR & CO., THE NURSERIES, FOSSES. EARLY WHITE ROMAN HYACINTHS.

B. S. WILLIAMS Takes the opportunity of announcing that he has received his annual consignments of the above Bulbs, which are available for early forcing, and solicits Early Orders, which will have prompt and immediate attention.

The Bulbs are unexceptionally fine this year.

FRED. ROEMER, Seed Grower, Quedlinburg, Germany. To the Trade only. E. H. KRELAGE and SON, NURSERYMEN, and FLORISTS, Haarlem, Holland. The Wholesale Catalogue (No. 3794) of Dutch Flower Roots and Miscellaneous Bulbs, and other sorts of Plants for 1885, is now ready, and may be had free on prepaid application by Nurserymen, Seedmen, and Florists. The Catalogue, although giving only the extensive collections, forms a pamphlet of 46 pages, 8vo, in two columns, and is doubtless one of the most complete sent out of this speciality. The prices of Hyacinths in general are considerably below any other Catalogue. Plants for 1885, 10s. in many instances inferior to former quotations. German and French editions as well as a separate English edition for America, are published.

S. SHEPPERSON, FLORIST, Prospect House, Delper, Derbyshire, begs to offer the following choice and beautiful PRIMULAS:—PRIMULAS!!! Grand premier prize strain of the finest new colours, as White, Carmine, Rose, Salmon, Cinnamon, &c., fine large blossoms and beautifully fringed flowers. Strong plants, to bloom well, 12s. 6d. per dozen; extra strong, 15s. 6d. all free.

THOMAS GREEN & SON (LIMITED),

Smithfield Ironworks, Leeds, and Surrey Works, Blackfriars Road, London, S.E. Horticultural Engineers to Her Majesty the Queen, CALL SPECIAL ATTENTION TO THEIR

PATENT WROUGHT-IRON TUBULAR HOT-WATER BOILERS,

And others with SHELVES, and Hollow or Ordinary Cast-iron GRATE BARS; SADDLE BOILERS.

With WATERWAY BACKS, and WELDED BOILERS, which are Specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c.

They are the nearest, cheapest, most effective, and durable of any extent.

The Tubular ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention. This pattern

Had the First and Highest Prize, a Silver Medal, Awarded to it at the 29th International Society's Exhibition, South Kensington, London, on June 3, 1881.

The Journal of Horticulture of June 9 says:—"HEATING APPARATUS—A great number of boilers, valves, &c., were exhibited, and of considerable interest was manifested in the verdict of the judges, and much discussion was brought to bear on the merits and shortcomings of the different boiler systems, for which the Silver Medal was awarded was a wrought-iron saddle boiler, with a series of intersecting tubes, somewhat in the form of a letter X, but the tubes in one form, in the crown of the boiler. Most gardeners who examined the boiler expressed a favourable opinion of it. It is no doubt a quick and powerful boiler without being complex, the latter condition having, no doubt, had weight with the judges."

The Garden of June 11 says:—"The premier prize, a Silver Medal, was taken by Messrs. Green & Son for their new patent tubular saddle boiler. It is a modification of their original patent, the boiler being longer and not so high. It is found to be a powerful and efficient boiler, and heats a large quantity of water quickly with a small consumption of fuel."

Descriptive Illustrated Price List may be had free on application. Estimates given for all kinds of Heating Apparatus, and Hot-water Fittings of every variety supplied on the shortest notice. Galvanised Iron Cisterns, from 4d. to 12. 6d. per gallon.

Oil Paint no Longer Necessary. HILL and SMITH'S BLACK VARNISH,

for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

THIS VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and it is of the same good quality, notwithstanding the fact of its being imitated, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, and by the Admiralty, and has secured the numerous testimonials of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 20 gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIALS.—"Pierced Park, June 24, 1885.—Sir, I have this day forwarded from Chestnut to your address a black varnish cask, to be filled and returned with as good Varnish as the Sirs you had, which I candidly admit was the best we ever had. Address Varnish to Pierced Park, Chestnut.—I am, Sir, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade, and the numerous testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which it is genuine.

Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL and SMITH, Blackfriars Ironworks, Staffordshire; 115, Queen Victoria Street, London, E.C. and 136, St. Vincent Street, Glasgow.

the United Kingdom.

PRIMULAS—PRIMULAS—PRIMULAS.

PRINCESS LOUISE, fine fleshy white, of great substance, the finest white Primula extant. 20 Seeds, 2s. 6d.;
50 Seeds, 5s.

MARQUIS of LORNE, fine purple-crimson, immense size and substance. The finest Primula of this colour,
30 Seeds, 2s. 6d.

The above Primulas have been carefully selected, and much finer than when originally introduced.

CARTER'S BLUE, novel colour. 20 Seeds, 2s. 6d.

We have just harvested a fine lot of the above Primulas, the seed was selected and gathered by Mr. Rose, who
raised (during the time he was with the late Mr. Tomkins) Marquis of Lorne, Princess Louise, Emperor, and the
Queen, which may fairly claim to be the four best Primulas in cultivation.

One remarkable characteristic of these Primulas is that while most Primulas degenerate after the first few spikes
of bloom, the sorts raised by Mr. Rose invariably improve on 2-year or 3-year old plants, whilst the other kinds are
generally useless after the first year.

POPE & SONS,

KING'S NORTON; 120, 121, and 122, MARKET HALL, and 3, GREAT WESTERN
ARCADE, BIRMINGHAM.

PRINCE'S IMPROVED EARLY NONPAREIL CABBAGE.

6d. per Packet, or free by Post, 7 stamps.

Sow for earliest Spring Crops, from middle to end of July, and trans-
plant first week in October; also, sow again from March till June for
successions during Summer and Autumn.

This is generally admitted to be the quickest and best flavoured
kind; in its early formation dwarf and compact in habit; and, if left,
will form a large handsome Cabbage in June; at the same time it is a
variety less liable to run to seed than any other grown.

GEORGE PRINCE, Seedsman and Rose Grower,
14, Market Street, OXFORD.

To Orchid Amateurs, Herbarists, Collectors of Natural History Specimens, &c.

MR. F. C. LEHMANN, OF POPAYAN (CAUCA), U.S. OF COLOMBIA,

Who has travelled for over 9 years in Central and South America, has established himself in
the above place to continue his labours.

Gentlemen desirous to complete or enlarge their Collections from that part
of South America may direct their Letters to POPAYAN.

SPECIAL CULTURE OF FRUIT TREES AND ROSES.

THOMAS RIVERS & SON

THE

Gardeners' Chronicle.

SATURDAY, JULY 18, 1885.

BROUGHAM HALL.

HENRY BROUGHAM, owner of this ancient Hall, the home of his ancestors before the Conquest, died at Cannes in 1868, when the title he had won as Lord Chancellor of England, and earned by his services in politics and literature, passed to his brother, the present owner. According to Debrett's *Peerage* the venerable lord was born in 1795. The old house occupies a steep ledge, easy of access in the rear, precipitous and exceedingly picturesque in front. The Saxon Broughams chose this site for their manor-house hundreds of years before the building of Brougham Castle, whose ruins, a few fields distant, may remind us that Westmoreland now needs no fortresses, and the lord of the manor no embattled gateways nor deep ditches before his door.

The scenery is magnificent, embracing distant views of the Lake Country and its several heights, and the Valley of the Lowther, while the pretty village of Eamond lies immediately before the windows, and not far distant are the castle, town, and beacon of Penrith, and the British mound known as King Arthur's Round Table, which all tourists visit. The entrance to the park and grounds of Lowther Castle is on the high road, near the Brougham gates. Occupying, as the Hall does, high ground amongst trees, its occasional name of Bird's Nest would seem to be appropriate, even if the property had not been owned during two generations by a family named Bird.

The Hall is an extensive building surrounded by high walls, venerable from age and Ivy. Two courts are enclosed within these walls, the doors of the outer one opening on the approach road, which reaches the house by an avenue of fine Oaks. One-third of a mile from the door, across the path, the rapacious Vipont, the Norman, erected Brougham Castle, and here the ruins of that ambitious building are now seen. Under these circumstances the Hall doors were made of solid Oak, 6 inches thick. The original doors of the thirteenth century, studded with nails, still remain, and no one could pass them without observing their strength, the enormous armorial knocker in front, and the round arch of the embattled gateway which they close. Within is the outer court, with its range of buildings. The house itself has been in great part rebuilt and renovated, but it is still remarkable for Oak carvings, tapestry, stamped leather and ancient decorations, and for a fine collection of armour. Some years since the Crusader, Udard de Broham, resting in peace in the chancel of Brougham Church, cross-legged in the usual attitude of a Crusader, with his cross-handled sword, and the talisman which he had brought home from the Holy Land, by his side (*Archaeological Journal*, 1847), was disinterred, and the "prick spur" taken from his heel. It is now here in the armoury. The incident is mentioned as affording a glimpse of history such as adds to the interest of the place.

To have held an estate at the Conquest and

to own it still is an honourable distinction—the reward of much virtue and persistency. But the twenty-four Lords of Brougham—for that is the exact number according to Sir B. Burke—have done more than rule the roost at home, since they have served their country in war or peace, according to the needs of each passing century. Nor have they escaped the vicissitudes which are frequent in great families. After submitting to the Conqueror they held their land by the tenure of drengage, a military service. But King William gave Robert de Vipont, one of his barons, such oppressive rights of reigning over the manor of Brougham that Gilbert de Brougham, in the reign of John, relinquished one-third of his estate to Vipont on condition of holding the remainder free. The Castle was built by this great Westmoreland Lord Vipont, on land which he had thus acquired, the older family having long resided in the ancient manor-house now called Brougham Hall.

The Castle stands close to the Roman station of Brocavam, which can still be traced by its fosse, and which Agricola founded, A. D. 79, by the side of the military road to Carlisle. Here he fixed one of his camps, and here, after a thousand years, Vipont built his Castle, and here, five or six hundred years later, King James, on one of his journeys from Scotland to London, slept in the Castle, which had been at that time much improved; and here, in the adjoining Hall, in 1860, Lord Brougham wrote his *British Constitution*, and its sonorous dedication to the Queen. It is a book, he says, which "professes to record facts, institute comparisons, draw conclusions, and expound principles, often too little considered in this country by those who enjoy the inestimable blessings of our political system."

One of the lessons to be read in connection with the history of Brougham Hall is, that England has grown like her Oaks, slowly, and that social progress, like the growth of trees, is always comparatively slow. But, to complete the narrative, about the year 1659 the Castle fell into neglect till at length its materials were sold, including stone, timber, lead, and wainscoting. Reverting to the manor-house, it only just escaped permanent alienation, when, in 1607, Thomas Brougham sold it to a Mr. Bird. In 1680, however, John Brougham, of Scales Hall, Cumberland, repurchased the estate, and entailed it for his nephew, from whom it passed in direct succession to the great man for whose sake it has now become an object of interest to his country, much visited by tourists. H.

New Garden Plants.

GOVENIA SULPHUREA, n. sp.*

This is a curious Govenia. The bulbs appear to be of the shape of Onions, according to a sketch kindly sent me by Mr. Harry Veitch. Leaves unusually narrow, the narrowest in the genus as it would appear, since they scarcely attain 2 inches in breadth. The median rib is of the colour of the juice of the fruits of *Sambucus nigra*. Flowers rather large, equalling those of *Govenia Andreuxii*. Sepals light sulphur-coloured. Petals white on the disc, sulphur on the margin, with numerous transverse broken purple lines. The lip is white, with some dark brown spots at the apex. Column white, with numerous brown spots on the fovea. I had

* *Govenia sulphurea*, n. sp.—"Pseudobulbos phariformi;" foliis cuneatis lanceolatis acuminatis angustis duos pollicis latis; racemo plurifloro; bracteis amplis, ovaria pedicellata non sequantibus; sepalis impari cuneato lanceolato acuto; sepalis lateralibus paulo latioribus, decurvis; petals latoribus cuneato obtusis acutis, labello cordato oblongo obtuso acuto, basi biplicato; columna basi producta, trigona, curva, apice striatim antorum obtusangula; anthera mucrone subulato. H. G. Rehb. f.

this plant from Messrs. Veitch. It is believed to come from Paraguay, being one of Mr. Saint Leger's discoveries. H. G. Rehb. f.

ZYGOPETALUM LAMINATUM, n. sp.*

A small-flowered *Kelefersteinia*. Leaves rather narrow. Sepals and petals light yellow. Lip white, quite free in its affinity for its exceedingly large clearly totally free laminae at the base, white with numerous purple spots. Column very plump, three-lobed on each side, apiculate at the top, the last inferior lobe much angled in middle of the column, yellowish with green spots. I have, however, not much belief in the constancy of this lobing. I had this botanical curiosity last and this year from my excellent correspondent, Mr. J. Day, who informs me he saw it named as *Zygopetalum forscipatum* in a celebrated emporium. As to myself, I had this [latter?] plant only from Messrs. Shuttleworth & Carter, and it is widely distinct in its lip, column, and colour. H. G. Rehb. f.

ODONTOGLOSSUM MACROSIPHILUM, hybr. (?) nat.

This has a broad (triangular, cordate apiculate or acute denticulate lip with numerous lateral keels, a central one looking forward, the lateral ones terminating in one or several bisties. Sepals and petals cuneate, lanceolate-acute in the way of those of *Odontoglossum odoratum*, with deep blotches of dark cinnamon; light sulphur in the original from Mr. Vuytlatek's—white, with light mauve, in Mr. Day's plant, which we may call *O. abiduum*. The wings of the column are denticulate, entire or lacinate. I learn some Orchidists are of opinion that I regard all those doubtful plants as hybrids, but we know just nothing about it, and I quite agree with those who think them partly varieties. Here would be a fine area where the gardeners might really help science. Help us for thousands of seedlings. H. G. Rehb. f.

EPIDENDRUM PUNCTULATUM, n. sp.†

This is very near *Epidendrum amabile*, Rehb. f. It is distinct in the presence of a sessile ovate acute mid-lacinia, and in the side lacinia of the lip being square. This is a slender panicle with stellate flowers. Sepals and tepals lanceolate acute, brown, green outside. Lip trifid, sulphur-coloured, with minute brown point-like spots. Mid-nerves incrassate. Column brown and green; border of anther-bed white, with brown spots. Plant nearly as in *Epidendrum vitellinum*, Of Mexican origin, according to Messrs. J. Veitch & Sons, who kindly forwarded it. H. G. Rehb. f.

MILTONIA SPECTABILIS (Lindl.) VAR. ASPEREA, n. var.

A very interesting variety. Sepals and petals cream coloured, partly washed with white mauve-lilac. Keel of lip unusually developed, colour of lip light mauve-lilac. Wings of column lobed, and projecting in an angular way, which looks very uncommon.

I have deliberated in vain as to whether it could be conjectured a male. There is no species whose features it partly has.

Major Leady, Sunbury House, Sunbury-on-Thames, kindly sent me three flowers, all of which proved identical. H. G. Rehb. f.

THUNIA MARSHALLIANA IONOPHLEPIA, n. var.

Mr. W. Bull kindly sends me a variety with sulphur-coloured disc and crest of lip, and in crease veins to the apex, when the disc is more orange, and there are only such veins at base in the original plant. H. G. Rehb. f.

CYRIPEDIUM GODEFROYÆ (Goef. Leeb.) VAR. HEMIXANTHINA.

A curious variety with sulphur-ochroleucous sepals; kindly sent by J. Day. H. G. Rehb. f.

PINCE'S BLACK MUSCAT GRAPE.—Few gardeners grow and finish this rather difficult variety better than Mr. Foot, at Clowance, Camborne. Last year the bunches were high perfection, and this season the crop promises well. W. N.

* *Zygopetalum (Kelefersteinia) laminatum*, n. sp.—Folius lineari-lanceolatis; pedunculo unifloro; sepalis tepalibus ligulatis apiculatis; labello oblongo antico crispato denticulato; lamella basosae pro maxima parte liberis pro dimidio labelli apiculis, apiculis paulo medio fissis; columna medio obtusangula carina sub fovea obtusata. H. G. Rehb. f.

† *Epidendrum punctulatum*, n. sp.—Aff. *Epidendrum amabile*, Rehb. f. Labelli lacinia lateralibus quadratis, lacinia mediana sessile ovata acuta, venis mediantibus incrassatis; andropodii margine integro. Paniculae "Planta Epidendri vitellini." Mexico. H. G. Rehb. f.

CUCURBITS IN THE WATER-LILY HOUSE AT KEW.

LAST year, after the new arrangements for heating and other improvements were effected, convenience was made for an extensive collection of climbers all round the house. This was composed chiefly of members of the *Convolvulus* order, but this season the experiment has been made with Cucurbits on rather a different principle, that at present gives ample promise of success. This is the more encouraging, seeing that collections not merely of Gourds but of Cucurbits in general, the public at large have very little opportunity of seeing.

They are planted out on a bank of turves occupying the narrow shelf surrounding the house—a shelf too narrow in itself to allow of a proper arrangement of pot plants of any sort. This bank of soil is covered with a variety of trailing fine-foliage plants, and occasions no unsightliness. Prominent amongst these may be noticed *Pellionia Daviana*, *Zebina pendula*, and *Panicum variegatum*, dotted about with such plants as *Cuphea Comersoni*, *Impatiens episcopi*, *Hemigraphis colorata*, *Episcia chontalensis*, and *Chirita Moonii*, with its enormous pale violet flowers.

The Cucurbits themselves are trained up the side and along the roof, and afford endless variation for combinations to give effect, or for the purposes of study, not only in the size, shape, and colour of the fruit, but the size or conspicuousness of the flowers, together with the remarkable diversity in the leaves.

Prominent among those in fruit is an East Indian species, *Cucumis utillissimus*, seedlings of which have produced green and almost white fruits. These are cylindrical, and notwithstanding their similarity to those of *Cucumis sativus*, prove of immense interest to visitors, especially the white fruit, which is over 2 feet in length. *Lagenaria gigantea* is doubtless a variety of the common Bottle Gourd, *L. vulgaris*, a variable form, like other long-cultivated species. Fruit hangs in a prominent position over the pathway, measuring about 1 foot long and 9 inches across the bottom of the bottle, which corresponds to the apex of the fruit. The enormous size of the cordate leaves is another striking feature of this Gourd. Various species of the Snake Gourd are making rapid progress, and the slender twisted fruits are more or less variegated and striped with deep green and grey.

The finely fringed white flower is a character common to the thirty known species, but the value or economic importance of this common inheritance in the life history of the plant it would be difficult to conjecture. The lower leaves of *Trichosanthes palmata* are reniform, the upper also small, deep green, palmately five to seven lobed, and very effective for the variety. About five species are represented in the collection. Considering it as a mere variety of the common Cucumber, *Cucumis sativus sikkimensis* is a most remarkable and interesting form. The fruits are cylindrical, deep bronzy green, slightly tuberculated, and when mature become brownish-orange, most attractively reticulated with yellow. There is an excellent figure of it in the *Botanical Magazine*, t. 6026. A small, as yet unnamed Gourd from Natal is interesting on account of its small Ivy-like leaves. They are deep green and shallowly five-lobed or angled, constituting a remarkable counterfeiter for Ivy. The fruit is said to be small and beautifully coloured. Another unnamed Gourd now finely in fruit proves to be *Citrullus vulgaris*. The spherical fruits are deep green and most attractively blotched and scrolled in regular lines, with a pale green almost white colour. This highly attractive and ornamental Gourd is readily distinguishable from its congener, *C. colocynthis*, by the larger size both of its fruit and foliage. The former is edible, and the latter is extensively cultivated for medicinal purposes. Several species of *Luffa* are rapidly passing into fruit, and amongst these *L. cylindrica* is the most forward. The fruit is cylindrical, deep green, and variegated with small grey tubercles and short ridges in regular lines, corresponding to the midribs and lines of union of the carpels. They are known as Towel Gourds, from the fact that the vascular network of the fruits when removed from the pulp is of a spongy character and used for towels, for straining Palm wine and other economical purposes. *Luffa spherica* of Harvey and Sonder's *Flora Capensis*, vol. ii, 490, is a *Spherosicyos*. The authors had not seen the female plant at the publication of that volume.

On the other hand a plant under the name of *Spherosicyos* sp. from West Africa is evidently a

Luffa from the monoecious flowers, cylindrical fruit, strikingly striped with dark green along its whole length and variegated with oblong grey markings. Luffa velans is conspicuous for its large shallowly five-lobed leaves and the enormous size of its bright yellow flowers. An unnamed species alongside of it has equally large flowers and a long slender fruit. A species of *Sicana* with deep green five to nine lobed leaves is no doubt *S. odorifera*, a plant well meriting a place among the finer leaved sorts. The fruit will be anxiously waited for and noted. It is figured by Naudin in the *Annales des Sciences*, ser. 4, xvii., 180, t. 8. An unnamed Cucurbit from New Guinea is notable on account of its small shortly oblong greenish-white fruit, which changes on arriving at maturity to a golden yellow. Alongside of this is a large rambling plant of *Momordica involucriata*, a South African species with five-lobed leaves resembling a deeply cut Vine. The flowers are creamy-white, with a large central dark blotch, abundantly produced and forcibly reminding one of *Hibiscus trionum* or *Turnera trioniflora*. More interesting is *M. Charaotia*, an East Indian species with equally fine leaves and yellow flowers. The fruit is spindle-shaped, deep green, and densely covered with irregular sized projecting tubercles, that give it a highly curious and characteristic appearance. On arriving at maturity the green changes to an orange-yellow, and the fruit ultimately bursts into valves, exposing the seeds covered with a fleshy red aril. The small deeply five to seven lobed, almost digitate leaves of *Cephalandra palmata* are noteworthy. The plant is grown under the name of *Coccinia palmata*, also synonymous with *Momordica palmata*, and is a native of South Africa, near Port Natal. *Benincasa hispida*, figured in Rheede's *Hortus Malabaricus*, viii., t. 3, bears large hispidly hairy, edible fruit, but is not yet in flower. Several varieties of *Cucumis Melo* are making rapid progress, amongst which may be noticed *C. M. odoratissima* with ellipsoid pale green fruit, maculated with darker spots, and another form named *C. M. flexuosa*, the fruit of which is long, slender, twisted, and striate with wavy lines, rendering it extremely curious and interesting.

Probably the most remarkable Cucurbit in Kew is *Conditiosicyos horrida*. It is to be regretted that the conditions of its successful cultivation have not yet been exactly hit upon, so that it might be placed with the collection. The leaves are reduced to small bract-like organs, with two formidable looking spines at the base, one on each side. It is a native of the arid regions of Dammar Land and Angola, and is a fit companion for *Welwitschia mirabilis*. With this exception, all the above, besides some as yet unnamed species, are making rapid progress in the Lily-house interspersed with *Ipomoea paniculata*, *L. velutina*, *I. rubro-cœrulea*, *Argyrea Hookerii*, *Allamanda Schottii* var. *Heudersoni*, *Dipladenia amabilis*, and other twicers in full flower. *F.*

ORCHIDS AT HOME.

The natural order of Orchidaceæ, the handsome and grotesque flowers of which are so fascinating to the gardener and botanist, comprises over 4000 species, of which about two hundred are native to British Guiana.

They are found everywhere, except in the dense forests and on the coasts; a moderate amount of light, plenty of moisture, and protection from strong winds being necessary to their good condition, and free flowering. They vary in size, from the *Pleurothallis* of 1 inch to the climbing *Vanilla*, which mounts above the forest trees to open its flowers in the bright sunlight. The greater number are epiphytes. These epiphytes flourish on the banks of rivers and creeks, inside the fringe of bushes which usually lines them to the water's edge. The ordinary passenger sees but few, but the collector pushes his bateau through the bushes, often finding some tree covered with Orchids. *Zygopetalum rostratum* generally grows in such a position, its large white flowers opening freely in the diffused light.

About 15 miles up the Hobaboe creek is a fringe of trees, bordered on one side by the creek, and on the other by a park-like savannah, the bushes on either side being almost impenetrable. Here, in looking for a wounded parrot, I came upon quite a family of *Zygopetalum* in full flower, decorating the rather thin tree trunks very prettily. In the same creek, above the lock, when the savannah is covered

with water, and the people in the canals complain of floods, the trees are decorated with hundreds of *Brassavola angustata*, and *Epidendrum nocturnum*, their pretty flowers making up in numbers what they want in individual beauty. Below the lock grows the *Oncidium altissimum*, one of our largest epiphytes, perfuming the air with hundreds of flowers, which grow on long stems, often 12 feet high. A large plant is a magnificent object; 4 or 5 feet through, with leaves 1 yard long, and six or 5 feet through; stems: it can scarcely be equalled among Orchids. The savannahs are bordered with belts of *Eta Palmis*, and below the parasol of leaves, among the old leaf sheaths, is seen something waving in the wind like tassels of broad-leaved grass. If it is the wet season the bateau is brought as near as possible by poing, or the men get out and haul it through the dense razor-grass, at the risk of cutting their fingers and legs. Nearing the Palm you see that the grassy leaves belong to *Catasetum longifolium*, and the next business is to get it. One of the boatmen climbs up and attempts to pull out a plant, perhaps breaking a few bulbs; or coming down with a run, covered with ants; or frightened at a lizard or hairy spider. There is nothing left but to cut down the tree, which you must do standing in water up to your knees. Presently you hear a crack, and with splash, splash, you get out of the way of the falling giant, which comes down with a great crash, throwing the splashes in every direction. All round the Palms you see the water covered with ants; large brown fellows which oip pretty hard, and perhaps a dozen hairy spiders and a wood slave. After a good deal of trouble and a few bites you get the Orchid, and find a bunch of beautiful flowers, the colour almost unique, being a bright orange.

On the tree branches overhanging the Hyama creek the *Stanhopea eburnea* hangs its magnificent waxy flowers, together with *Brassia*, *Googoras*, and thousands of small species.

At the front of the sand hills, on the low bushes, may be seen plenty of *Epidendrum*, *Maxillarias*, and other inconspicuous Orchids, but two or three miles aback, where visitors rarely go, a very good collection may be made. One of the best is *Scuticaria Steellii*, with long pendulous, whip-like leaves and fine flowers richly perfumed. Near the ground, and sometimes on the sand, *Sobralia sessilis* opens its rosy flowers in the morning, but unfortunately they last but a few hours. Its stems, like small Bamboos, with leaves at the top, may cause it to be often overlooked. If fortunate, the collector may find *Paphinia cristata*, with crimson barred, pendulous flowers; and the little gem, *Burlingtonia candida*, with delicate white and yellow flowers perfumed like Violets. Here I have found what is perhaps the smallest native Orchid, a species of *Aeranthus*, without leaves, the whole plant consisting of a few aerial roots, and a spike of flowers 1 inch high.

In sand, or on rocks in the interior, various species come to perfection, in fact many epiphytes grow well either in situation, but *Cyrtopodium Andersoni*, our finest sand Orchid, appears never to grow on trees. It has very long bulbs lined with Palm-like leaves, and a large panicle of bright yellow flowers, on a flower-stem 6 feet high. Where charcoal has been burnt, the banks of the pits, which look like newly opened graves, are covered with *Catasetum discolor* flowers, like green or yellow Quaker bonnets.

Under a silk-cotton tree at Soesdyk grows a terrestrial species with white spots on the leaves (*Spiranthes*); its flowers are, however, not very conspicuous. Among the cake of decomposing leaves in the forest, among *Voyrias*, I have found the singular *Wulshlegelia aphylla*, a leafless root parasite with a few almost colourless flowers.

On the savannahs, where the razor-grass is not too thick, may be found the *Habenaria macroera* (something like the English butterfly Orchid), its whitish flowers having spurs 6 inches long. But the queen of ground Orchids is *Cleistes rosea*. It is about 3 feet high, with a leafy stem, and two or three rosy tipped flowers on the top. The park-like savannah in which they grow reminded me of an English meadow as the thin dry grass allowed myriads of *Utricularias*, *Sauvagesias*, *Droseras*, *Burmanias*, and other pretty low flowering plants to grow to perfection.

Some of the epiphytal Orchids are common on the Calabash trees surrounding the huts on the banks of rivers, and even the canals, near town. The crimson-flowered *Rodriguezia secunda*, *Notylia albidula* with pendulous spikes of, greenish-white flowers, and

Oroithocephalus gladiatus, a pretty fan-like plant, 2 or 3 inches high, with little bird-like white flowers, are found almost everywhere. Even the *Moca-Moca* (*Montrichardia arborescens*) has its especial epiphyte in the graceful *Ionopsis utricularioides*. *J. R., Demerara.*

DOUBLE AURICULAS.

WHEN with whom the earliest of our double-flowered Auriculas originated it would be perhaps difficult to say. For years past I have grown the old double black and the old double yellow, known also under the names of *Ohello* and *Yellow Prince* respectively, but I am unable to determine how long they have been in cultivation. Report states there are two double black varieties, which is not improbable, but I am acquainted with but one only. The old double black is not a robust-growing form, and it requires good culture, but when well done throwing up from its healthy leaves a strong flower-stem, and a good truss of flowers: it is very pretty. The old double yellow is of a much stronger constitution, and throws up (in the case of a good plant) several flower-stems. The most vigorous produce several flowers of a clear golden colour, and a white centre, but they are never so fully double as the double black form. It is very sweet and attractive, and well worth growing for cutting from. During the spring I received from the North of Ireland a double yellow of a different character, the flowers about the same size as the other, paler in colour, and with the petals rounded at the edges instead of being serrated, as in the case of the older type. I like it very much, and hope to bloom it well next spring.

Occasionally a double variety will come among the seedlings raised from the seed of ordinary alpine Auriculas. A few years ago Mr. Thomas Hewitt, then of Solihull, exhibited at one of the spring shows at Birmingham a seedling double dark, of fine colour and proportions, but I fear he lost it. A correspondent in Scotland was equally fortunate in raising a dark purple double variety of great beauty, which I hope has not suffered the same fate as Mr. Hewitt's flower.

My own collection of double Auriculas comprises some dozen and a half varieties. They have been collected in various parts of the Continent. They vary in character, colour and size of the flowers, but they are all of interest, and when in good condition, unusual, novel, and attractive, and find plenty of admirers. I do not for a moment presume to put them on a level with our finest green, grey, white-edged, and self varieties; but there is plenty of room in this world for them, and a large number of persons who see much that is beautiful in them. They are later in flowering than the ordinary show Auricula, and that is why I have been unable to produce any in good condition at our annual Auricula show in London. They are all in pots, but I find it necessary to give them a very generous soil; in all other respects they are treated just as the show Auriculas.

One that finds most favour is a large primrose-coloured variety, named *Delicata*; it is a strong grower, and produces fine large full flowers of great size, on strong flower-stems; it is the largest flowered sort I have. *Purpurea* is large, full, handsome, of a charming tint of pale purple, the flowers produced in fine trusses, and highly attractive. Both the foregoing have received First-class Certificates of Merit. *Violacea* I was able to show at the last Auricula meeting at South Kensington; it is of a very pleasing shade of violet, suffused with deeper tints. It is very pretty, and some one at South Kensington, as I thought, happily described it as representing a large double Violet. *Cleopatra* is a very distinct sort, the flowers maroon, dashed with purple, large, full, and very double; a strong grower, producing a fine truss. One named *Hercules* is the *beau ideal* of a double Auricula; the flowers are so full that it appears difficult to add another petal without spoiling their symmetry. It is difficult to describe it, for there is a mixture of purple, lilac, salmon, and buff in the blossom. It is a good grower, and I am very proud of it. *Hercules*, *purpurea*, and *delicata* have Balsamic-like flowers, so large and full are they. *Pandora* and *Juno* are smaller, fully double, and have flowers that are tinted with shades of brown and yellow. They are of close and compact growth, and very free.

The foregoing are all I have named. I have others that require another season's growth, and each season I raise a few from seed. I must mention the double white, which I obtained from the late M. Louis van

Houtte, of Ghent. It is a misnomer to term it double, for the flowers come with two or perhaps three rows of petals, but not more; the flowers are delicate creamy-white, very chaste and large. It is a good grower, and however strongly I may grow it I cannot get it of a more fully double character. But it is always admired.

There are doubtless other double Auriculas about the country; yet those who possess them make known the fact through the *Chronicle*. *R. Dean*.

Florists' Flowers.

CARNATIONS AND PICOTEES.

The question is frequently asked, "What are the best flowers for town gardens?" The florist would exclaim at once, and that truthfully, "The Carnation and Picotee." Those who would like to see this verified in a practical way would do well to visit the nurseries of Messrs. James Veitch & Son's, King's Road, Chelsea, where every class and section of these beautiful plants are now fully represented in bloom, planted out in beds in the open air, and treated as any other hardy plants—not in isolated specimens merely, or in clumps of a dozen or so, but large beds containing a hundred or more plants of one variety. All the best flasks and bizarres in Carnations, and the most refined delicate Picotees are cultivated to perfection, but the demand for these is not nearly so large as that for the selfs, border Carnations as they are sometimes termed; but why one class or section should be termed border kinds to the exclusion of others, it is difficult to say. Many varieties of Picotees are possessed of the most vigorous constitutions, and few things are more beautiful in the floral world than the glistening purity of the Picotee, and the rich purple or delicate rose edges. It would be tedious to enumerate even the best varieties of the florist's type, as they will be found in the reports of the exhibitions in subsequent numbers. I was careful to note the best varieties in the various colours, adapted for beds or to plant in groups in the borders. What can be more beautiful at this season than a group of a dozen or more Carnations of one variety—rose, pink, purple, scarlet, crimson, white, or yellow, planted in a herbaceous border? Pure white forms are now very numerous, and I question if any of them surpass The Bride (Hodges); the flowers are pure white, of good form, and last longer than any of the others, it has also a good pod which does not burst.

There is a very large bed of W. P. Milner, a well-known hardy and handsome variety. Virgo is a beautiful white, very pure, of medium size. Ossian bush-white, large fringed petals, very beautiful and distinct. Exquisite flowers later than any of the others, very free, and of good habit; the petals broad, forming symmetrical blooms. The best of the scarlet colour varieties are Magnum Bonum; this has the largest and most handsome flowers, with a dwarf habit. Vivid very bright. Field Marshal also a very bright, full scarlet. Delvinsia, a late blooming variety, dwarf, compact plant and bright scarlet.

Pink colours are very attractive, and this section is well represented by Celia, the best of the whole group, which forms a charming bed; the colour is rose-pink, the flowers large, full, and well formed, Clove-scented. Corsair, pale rose-pink, distinct and good. Gertrude Teiger, small or medium, flowers pale pink, excellent to cut for small bouquets. Ouida, bright crimson, dwarf, and abundant flowering habit.

Purple selfs were well represented by Improvement and Lady Manners. The old crimson Clove formed a very effective bed; the plants strong and vigorous although they were not planted out until March.

Yellow self, and yellow-edged Picotees form a large part, and also the most interesting part, of this fine collection. They were well described at p. 43 of vol. xxii. for last year, and still maintain their first promise of high-class quality, and the profusion of flowers produced is very remarkable. Lord Tenyson is one of the best yellow varieties this year. Duchess of Teck is a handsome yellow Picotee, well marked with crimson. Goldfinder is a vigorous and distinct yellow Picotee edged with rose. Janira grows with remarkable vigour out-of-doors and is very distinct. Emperor is very large bright yellow, with flowers freely produced.

Aurea floribunda, Miss Mary Anderson, and Knaptin are all high-class yellow varieties. Belle Halliday is a distinct and handsome yellow, the form of the flower reminding one of Hodges' Bride; this is a Scotch production. John Barnet must not be omitted from the bright pink varieties; it is one of the best of them.

The season has not been particularly favourable for healthy growth. Cold days and colder nights checked their development early in the year. It has also caused the bloom to be late, although nearly all the varieties have pushed rapidly into bloom during the last few warm days. In looking over Messrs. Veitch's collection it was interesting to notice that some varieties were even more vigorous and healthy this season than they were last, amongst them being the old Clove, The Bride, W. P. Milner, Exquisite, Florence, and a few others.

THE CAMELLIA.

At this season of the year these gorgeous plants are often exposed to neglect, owing to carelessness in watering, or, if the weather is hot, red-spider attacking the leaves. It is a good plan, if the plants are large, to place them out-of-doors, not in full exposure to sun and wind, but, on the other hand, they must not be over-shaded, else the growths will be weak. The plants would be greatly benefited by having a surface-dressing of turfy loam and peat, pressed firmly down upon the roots with the fingers—that is, if the larger roots are exposed on the surface. This is a good time, now the growth is formed and the buds set, to report, but a hint must be given about the careful treatment of the roots; the young fibres are very brittle, and a wholesale destruction of them means a serious check to the further development of leaf and bud. I may allude to some very old plants we are now potting in our own garden. They have been placed out-of-doors, and the pots they had been growing in have become choked in the drainage. The plants were turned out, the drainage removed, a little of the spent useless soil carefully picked from amongst the roots, and the plants replaced in the pots in which they were previously growing. If the ball of roots was thickly matted, and the roots perfectly healthy, larger pots would have been necessary. Do not water at the roots for a few days after repotting, but lightly syringe the leaves twice a day. *J. Douglas*.

NEW FLOWER MARKET, COVENT GARDEN.

ANY one acquainted with the London flower trade of twenty years ago will recognise the enormous increase that has taken place within that comparatively short period. This is not exclusively to be attributed to the increase in the number of the buyers, but is the result of the aggregation which has taken place in the ranks of the cultivators for the markets in London itself and other large towns. The supply of flowers in greater abundance, their variety, and the cheapness of their production, aided by the great skill shown by the growers in preparing plants and cut blooms for the public supply, have helped to create a trade in these beautiful productions of the garden, which it may confidently be said would have been unattainable under the old conditions of the trade. That being so the Duke of Bedford's agent saw that Covent Garden Market, at least, must be so enlarged that the accommodation afforded there should be proportionate to the trade done or likely to be done. It will doubtless supply the long-felt want for a short time, but London is far too vast a place to get nearly all its supply of plants and cut flowers from one market, be that market never so centrally placed.

The congestion of traffic, with all its attendant evils, must eventually, when broader views are entertained on this subject, give way to tyrannical necessity; and although Covent Garden will remain the head market, whence the choicest articles will be obtainable, district markets of convenient size will have to be built in many other districts of London. By that means the grower in the country will be brought into contact with the actual consumers, who will be enabled, to a greater extent than now, to do their own marketing, as in Continental towns, instead of being heavily mulcted by every species of middlemen; and the former will obtain better prices for his productions.

The handsome addition to the existing Flower

Market, with its chief entrance in Wellington Street—views of which we give in this issue (figs. 14, 15, 16), is built on the site of houses formerly standing on the north side of Tavistock Street. The buildings are most substantially built with red brick, of excellent quality, with quoins, arches, and copings of white stone; and while being mainly constructed of strong materials, have a sufficiency of light admitted by lantern roofs, and windows of a large size at the sides. A main pathway divides the building longitudinally into two main divisions, these being again subdivided by paths of lesser width. Alongside these stand the wrought-iron staging, in three tiers, on which the growers display their wares, and that are indicated on the ground plan of the building, fig. 15.

Underneath the market is ample cellars for the storing of fruit, &c., which is approached by means of an inclined path, by the side of the building on the Tavistock Street front, and by stairs in Wellington Street, and in the general market. Further westwards an open flower market will be held on a considerable piece of ground that will be specially reserved for that purpose. Altogether this additional accommodation in Covent Garden Market will prove a great boon to the frequenters, be they buyers or sellers, and the new structure will rank amongst the most handsome of our public markets.

We understand that the Duke proposes to effect other improvements in the market, so as to increase the facilities for business in all branches of the trade.

The works are being carried out by Messrs. Cubitt & Co., under the direction of Mr. John R. Bourne, the Duke's steward; and for the plans whence our figures were taken we are indebted to the courtesy of Mr. Rogers, the architect.

REMARKS ON THE FRUIT CROP, 1885.

[For Tabular Summary, see p. 43.]

SCOTLAND.

ABERDEEN.—Fruit trees and bushes of all sorts had an extra abundant blossom, but owing to the cold weather in the end of April and beginning of May Plums, Pears, and Cherries set very thinly, and are, with one or two exceptions, a poor crop. Apples are in general a very abundant crop, but very late; small fruits also suffered from the cold weather: in low-lying places they are a very poor crop, while in others they are a good crop. Strawberries promise to be a heavy crop. *John Forrest, Haddo*.

BANFF.—All kinds of hardy fruit, with the exception of Plums, bear an abundant crop here. On walls Plums are the lightest crop we have had for a number of years. Standards are better, still numbers of them have gone back since setting. Apricots and Peaches are both good. Fruit clean. Trees healthy and vigorous. Cherries are plentiful and clear of insects. All kinds of bush fruit are in great abundance, especially Currants. *J. Webster, Gordon Castle*.

FORFAR.—At the present time (July 1) the fruit prospects in the Carse are not so great as at one time anticipated. On account of the late severe and continued frosts and hailstorms a good deal of the early bloom of all kinds has been blasted. Apricots, Peaches, and Nectarines, outside, suffered severely, as well as early Pears and Cherries, but the later kinds of Pears give better promise, and Morello Cherries will be a fair crop. The earlier kinds of Gooseberries have also suffered severely, especially those in exposed situations, but later kinds are not so bad, and what they want in numbers will be partly made up by increase of size. Most of the red and black Currants we have examined give promise of an abundant crop, and what with a few refreshing showers, the first instalment of which we have had, Strawberries will be good. We think Apples will be the most prolific crop of the fruit kind this season in the Carse. We have been privileged to examine a number of the best orchards, and in most cases find them well laden with young Apples. We have also examined a number of good gardens, which give equally good promise. Through the kindness of A. Lacaille, Esq., Gourdiehill—whose orchard is the largest in the Carse, if not in Scotland—we have had opportunities of examining for ourselves, and from what we have seen feel sure that Apples will be abundant if the summer be warm, and good ripening weather occur in the autumn. Mr. Lacaille has been making great improvements in his orchard since he came into possession of it—an

improvement which was greatly needed, as it had been allowed to run almost to waste for several years before. What with draining, planting, pruning, and manuring, he has had his hands full of it, but now Nature promises to recompense him for all his labour in her behalf. In addition to his extensive orchard of over 40 acres he has lately planted about 12 acres more, partly of small fruit, such as Gooseberries, red and black Currants, Strawberries, Raspberries, and a large number of the newer kinds of Apples not formerly grown on the estate, such as Eclinville Seedling, Lord Suffield, and the like. Of Lord Suffield he has planted 700, all looking well; and 200 Victoria Plums, which were in full bloom about the first and second week of May, when we had such heavy hailstorms, and which, nevertheless, are setting well. This Plum seems to be the best for outdoor cultivation in our northern climate, as it stands the cold well, is a free setter, and great bearer. We wish the Laird of Gourdiehill every success in his most laudable enterprise—an enterprise which greatly beautifies the world, for what is finer in spring than the Apple bloom? and which adds greatly to the food

down at 32°, and blackened the Potatoes a good deal near the seaside, up here they were not so far advanced, and being mostly dry weather the frost did not trouble us much although it was down at 36° on the 25th in the garden. *J. Mitchell, Carnoustie.*

MIDLOTHIAN.—The season is a fortnight later than the average at this date, but crops are making good progress, and if the remainder of the season prove favourable the fruit crop promises to be the heaviest and finest we have had for the last ten years at least. Fruit trees are generally in fine health, and free from insects. All the best sorts of Apples are bearing abundantly, and there is scarcely any sort but has a fair crop upon it. Pears are a heavy crop on some trees, and light on others of the same kind, but fully an average on the whole. Plums and Cherries are similar to the Pears. Apricots have not been so fine for many years, both for crop and quality. Peaches and Nectarines are also fully an average crop, and fine clean fruit. Strawberries and all small fruits are abundant, and very fine, if the next month will only be favourable to ripen them. *M. Dunn, Dalkeith.*

ENGLAND.—NORTHERN COUNTIES.

DURHAM.—Fruit crops gave indications of being heavy. Pear trees were covered with clean and healthy blooms, but the repeated late frosts caused most to drop, so there is only a scanty crop left. Apple trees fared better by being later in blooming, and have set a good crop. Gooseberries, black and red Currants all suffered, and although a fair crop remains, a great many dropped. *J. Hunter, Lambton Castle Fence Houses.*

WESTMORELAND.—A very promising show of bloom was completely ruined by cold weather in May. From May 7 to 19 an aggregate of 29° of frost was registered, 8° on the 8th being most. Gooseberries are a failure; Currants lost the top berries on s'rings; Apples seem to have been frosted when in bud. *W. A. Miller, Underley, Kirby-Lonsdale.*

YORKSHIRE.—Apricots are very good in some places, in other places they were partly destroyed by frost; on the whole they are good. Plums, too, suffered very much from the same cause. Currants suffered very much from frost when in bloom, but there will be a fair crop. Apples and Pears will be

FIG. 14.—NEW FLOWER MARKET, COVENT GARDEN: ELEVATION NEXT TAVISTOCK STREET.

supplies of our country. We are glad, however, to be able to say that others in the Carse are "going in" heartily for the same sort of work, notably Mr. Jackson, farmer, Port Allen, and lessee of the orchard there, who has been pruning on a very extensive scale, and has had one of the most scientific men in the horticultural profession assisting him. We learn with pleasure he is likely to be rewarded for his labour, as the orchard this year is looking uncommonly well. There are others in the district who are "going in" for orchard improving, some on a larger and some on a small scale, and all are hopeful of being amply rewarded for their labour notwithstanding the fearful rebodings of some unsuccessful pomologists, who foolishly declare that fruit will not now pay the grower unless the prices are raised by legislative protection—a dream which is not likely to be realised. *A Correspondent in the Carse of Govrie.*

Apples have set a most abundant crop. Pears planted in or about 1855 did not recover from the effects of 1880-81, a few young trees we have now set well, but all late. Currants of all sorts are most abundant. Rasp only in flower and not set yet, but will be good. The same may be said of Strawberries. We had frost every now and again up to June 8. when it was

Apricots are really a good crop, and if the season is in their favour there will be a good return. Plums, none, through rough weather when in bloom; ditto Cherries; rough weather made them set thinly. Peaches and Nectarines none outside. Apples seem to have set splendidly, but I am afraid they are very late. Pears a meagre crop. Small fruits and Strawberries seem about the usual weight. Nuts, none. *C. Johnstone, Dalhousie Castle Gardens, Lasswade.*

WIGTON.—Plums flowered abundantly but set irregularly, and on the whole the crop will be light. Cherries are a full crop. Peaches and Nectarines are not much grown out-of-doors, but where grown the leaves are much blistered; a fair amount of fruit has set. Of Apples I do not remember ever to have seen a more abundant set than there is this year. The foliage is unusually fine. Pears flowered freely. The crop is irregular, in some places moderate, but generally thinly set. Small fruits, generally a large crop. Gooseberries in some places indifferent, in others loaded with fruit. The fine summer and autumn of last year ripened the wood of all sorts of fruit trees thoroughly, consequently the fine bloom. *A. Fowler, Castle Kennedy, Stranraer.*

a large crop; the trees are in fine foliage, and the fruit look healthy. *W. Culterwell, Thorpe Perrow.*

With the exception of the Currant bushes all the fruit trees here are remarkably clean. Peaches, Nectarines, and Apricots are promising well for a good crop of fine fruit. Plums and Gooseberries are the worst crops; both suffered by the 7° of frost we had on May 7. *Thomas Jones, Ribston Hall, Wetherby.*

LANCASHIRE.—We had an extraordinary promise of fruit in the spring, bloom was abundant and good. The protracted cold and sharp frost, however, proved too much for the Pears and Plums, only a sprinkling escaping. Black Currants and early Strawberries were much injured also. I expected an extraordinary crop of Apples, but so many have dropped after apparently setting that I do not now anticipate anything over an average crop. The trees were attacked with Aphid during the dry weather of last month, which undoubtedly caused much injury. *W. B. Upjohn, Worsley Hall, Manchester.*

On the whole this is a fruitful year, but things are backward. It was the 26th of this month before I could see colour in a single Strawberry on a south border. There are not many Apricots grown,

but I have seen more fruit of these and Plums than for four years. Damsons none. Peaches and Nectarines set well, and where timely attention has been given to arrest the progress of the fly there are good crops. In a neighbouring garden I have seen several varieties of Pears on south wall so well furnished with fruit that a dozen could be covered with the hand. Many of our large orchard trees are almost destitute of fruit, a circumstance we attribute to the north-west wind which blew with force and bitterness during nearly the whole of May. At present there is a good crop of Apples on all trees, but many are poor. Small fruits, excepting perhaps black Currants, are as good crops as any one could wish. Gooseberries in these gardens have a tremendous crop. *W. Roberts, Cnerden Hall, Preston.*

MIDLAND COUNTIES.

BUCKS.—Peaches and Nectarines look remarkably well, very clean and healthy. Pears are a very fine crop, trees look well; and we have thinned once and shall have to thin again. Apples bloomed beautifully, but set badly, and a good many have dropped off. Strawberries are a wonderful crop. Morello Cherries are very fine and much cleaner than usual. In orchards about here a good crop generally of sweet Cherries. *T. Bailey, Shardloes, Amersham.*

—This is a very fruitful season hereabouts. Apricots, Peaches, Nectarines, and Plums are very plentiful and good; Apples, Pears, and Cherries very abundant; Raspberries and Strawberries likewise. The Gooseberry, black Currant, and Walnut crops in certain places sustained considerable damage by frost, are therefore less abundant. I fear insect pests will be very troublesome, they are already very abundant, and will, under the influence of real summer weather, such as we are now having, so rapidly increase and spread that it will take up much time to keep the number within reasonable bounds. *G. T. Miles, Wycombe Abbey.*

HERTFORDSHIRE.—The fruit crops in this and surrounding neighbourhood are generally good, Apples being the exception; owing to the severe frosts from May 8 to 12, much of the Apple blossom was killed, consequently the crop is a very partial one, and trees most infested with aphid and American blight. Pears and Cherries are generally good crops, also Plums and Damsons; Green Gages thin, except in sheltered situations; Gooseberries, Currants, and Raspberries abundant crops, and good; Filberts appear very plentiful everywhere. *R. Kuffelt, Panshanger.*

BERKS.—Our fruit crops on the whole are very good. Some of the Apple trees are very much blistered, with very little young wood on them, which, no doubt, is owing to the spring frosts and cold east winds. I may add, we still have most unfavourable weather for both trees and fruit, as the temperature for some nights past has been down to 37° and 38°, with a very cold north-east wind. *T. Jones, Frogmore.*

WILTS.—Although the Apricot and Plum crops are light the fruit crop of 1885, taking it altogether, may be pronounced a plentiful one. The Apple crop is an abundant one, though some of the trees in our orchard, which are exposed to the north and east winds, have suffered from the effects of May frosts. Trees of the following varieties of Pears are bearing heavy crops, viz.—Marie Louise, Glou Morceau, Chaumontel, Josephine de Malines, Beurré Ranc, Ne Plus Meuris, Louise Bonne de Jersey, Passe Colmar, Van Mons Leon le Clerc, Athorp Crasanne, Bon Chrétien, Fondante, Duchesse de Mars, Easter Beurré, Jargonelle. Plums of the following varieties are fairly well cropped:—Magnum Bonum, Mitchelson's Orleans, Denyer's Victoria, Pond's Seedling, Kirke's, and a sprinkling of Green Gages. Cherries:—May Duke, Bigarreaux, Cleveland, Empress Eugénie, and Governor Wood, are bearing well. *H. W. Ward, Longford Castle, Salisbury.*

STAFFORD.—I never saw the Apple trees so full of bloom as they were this season; however, some varieties have not set well, and are only a thin crop. The most prolific here are Cellini, Lord Suffolk, Keswick, Small's Admirable, and Hawthornden. Pears were very full of bloom, but are only just an average crop. With a fine autumn they should be good in quality. Gooseberries, Raspberries, Strawberries, and black and red Currants I never saw so full of fruit as they are this season. *J. Wallis, Keele Hall Gardens, Newcastle-under-Lyne.*

NOTTS.—Apples, Plums, and Pears flowered in the greatest profusion. Pears generally were very

conspicuous by the unusual size of the flowers, and, had the weather been favourable, fruit would have been plentiful instead of, as it now is, only partial. *Richard Carr, Welbeck Gardens, Worksop.*

LEICESTERSHIRE.—A profuse display of blossom on fruit trees generally was followed by an abundant setting of fruit. Although the weather was cold in April and May no frost of sufficient severity occurred in this district to affect the fruit crops. Owing to the deficient rainfall of the preceding seventeen months, the subsoil is very dry, and it has been necessary to apply copious waterings to Apricots and Peach trees on outer walls. Morello Cherries have suffered from black-fly. *W. Ingram, Belvoir.*

EASTERN COUNTIES.

SUFFOLK.—The show of blossom and the set of fruit on nearly all trees gave promise of a more than usually heavy crop, but the effects of the frosts in May are now showing themselves, as the ground is quite covered with Apples, Pears, and Cherries, more than half of which have fallen; but as regards the two first-named this is rather an advantage, as there would have been much labour and time taken up in thinning. Plums are almost a total failure, and the trees are much affected with aphid. Bush fruit is abundant; but Strawberries are deformed through the cold when the plants were in bloom. *J. Sheppard, Ipswich.*

—Never were prospects more brilliant, but the produce will prove disappointing. Plums, Apples, and Pears, will be thin, while Peaches, Nectarines, Apricots, and Cherries, will be fairly plentiful, Gooseberries and Currants, unless where frost-bitten and bird-picked in bud, will be plentiful. Raspberries very fine, Strawberries also full crop. The Apple fruits are not only falling fast, but the trees are considerably blighted and midewed. *D. T. Fish, Hardwicke, Bury St. Edmunds.*

NORFOLK.—Crops in general very backward. Apples a wonderful show of bloom, but crops apparently thin. Strawberries, good show, but many blind; at present time a few only changing colour. The late spring frosts spoiled the crops of Currants and Gooseberries, except in a few districts; also Plums and Pears got well set before the late frosts, but a good crop left after a severe thinning. Nuts only beginning to form—apparently a good crop. Raspberries a heavy crop. *J. Forder, Hillington Hall, King's Lynn.*

LINCOLNSHIRE.—The fruit crops in this neighbourhood, as a whole, are very promising, Plums and Cherries excepted; Morello Cherries a good crop. I have never witnessed such a show of blossom on fruit trees of all kinds as we have had this spring. Apple and Pear trees were quite pictures to look upon, and in most cases have set fairly well, and we anticipate a better fruit season than we have had for several years back. *D. Lunsden, Blaxham Hall, Sleaford.*

WESTERN COUNTIES.

CHEESHIRE.—Apricots, there is an average crop in this district. Plums are under; scarcely any Damsons. Cherries are good; Morellos plentiful. Peaches and Nectarines are bad, scarcely worth the growing. Apples will be, I think, about an average crop, but like all other fruits are very late. Pears will be a poor crop. Of small fruits, except Raspberries, there is scarcely any; Strawberries promise a fine crop, but are very late. *J. Grant, Withington Hall, Crewe.*

WORCESTERSHIRE.—The garden crops generally are more satisfactory than for the past two seasons. Pears on the walls are clean, and uniformly well-coloured, even at this early date. In the case of Apples, although such a profusion of blossom, in many places only a part of the crop remains, so many have fallen, due in a great measure to the excessive heat and drought of last summer. Gooseberries are an exceedingly heavy crop, and the berries of very large size, in fact all bush fruits are a heavy and excellent crop. *W. Child.*

—The Apple crop is not so abundant as was expected—so many fruit have dropped off, probably from weakness, resulting from an extra profusion of blossom. Pears are growing kindly, and good generally. Apricots fairly good crops, accompanied by the usual tantalizing dying off of branches. Peaches and Nectarines a thin crop; much blistering of leaves, but trees are now growing out of it. Plums an

indifferent crop, Pershore, Victoria, and the Shropshire Damson excepted. Cherries are a good crop; trees of both Cherries and Plums affected with aphid. Strawberry crops are enormous, consequently small in size. Bush fruits very good, although in places birds have reduced the crops by their mischievous attacks upon the buds in winter. Walnuts in abundance. *W. Crump, Madresfield Court.*

HEREFORD.—The fruit crop in this district is partial, light-lying gardens having suffered from the effects of the sharp frosts in May. Peaches and Nectarines are abundant and fine, and the trees are in fine condition. Some kinds of Pears will require much thinning, while many trees growing under similar conditions are fruitless or carrying very thin crops. Apricots in some places are abundant, in others the trees lost nearly all their flower-buds when the size of swan-shot. Cherries of all kinds are plentiful on walls. Orchard trees are generally thin, and the fruit is still dropping. Apples, our sheet-anchor, do not quite realise many people's expectations, and although there will, no doubt, be a good harvest, many trees being laden, there is not the all-round crop of the choicer kinds which the abundant blossom led us to anticipate. Heavy crops last year, a premature check during the intense heat last August, followed by a tardy, sluggish spring, may account for a partial set of fruit. Frost cannot be the cause, as we have not had any since the first flowers opened. Grub, as might be expected after a mild winter, is rather troublesome in some orchards. Black Currants are badly blighted. All other bush fruits, also Strawberries, are clean, plentiful, and fine. *W. Coleman, Eastnor Castle.*

SOMERSETSHIRE.—Abundance of bloom on all kinds of fruit trees, but where exposed to cold winds the greater portion of the apparently well-set fruit failed to swell. Apples and Pears over plentiful on some trees, and very thin on others, a good deal evidently depending upon the time of blooming of the respective sorts. Peach trees blistered badly, but they are recovering rapidly. Strawberries suffered both from cold winds and drought, and the fruits are unusually small in consequence. Raspberries very promising. *W. Isgulden, Marston House, Frome.*

DEVONSHIRE.—There is every prospect of a good fruit season. We have had scarcely any rain for a long time to get down to the roots of fruit trees, and unless it comes very soon the drought will seriously affect the crop. Strawberries are suffering much now on our light soil, I looked through the Apple orchards to-day; both table and cider fruit are full crops. In market gardens in the neighbourhood early Plums (Rivers' Early, which is extensively grown) are very prolific and good. *D. C. Powell, Powderham Castle Gardens, Kinton.*

—Apple and all other fruit trees were remarkable for the density and quantity of bloom on young and old trees alike, and also for the generally healthy vigorous growth they have since made. The Apple crop now promises abundantly, but Pears and Plums are decidedly deficient in fruit bearing, though they still retain their vigour of growth. Apricots, Peaches and Nectarines, too, are remarkable for vigorous, clean, healthy growth, and the fruit upon them decidedly beyond average, more especially Apricots. Other fruits are a fair crop, but likely to suffer from the dry state of the ground, the rainfall being much below average during the winter months, and up to this time. *J. Estone, Wear, Exeter.*

WALES.

PEMBROKE.—The Apple trees bloomed wonderfully well this season; but wet and stormy weather prevailing at the time, all but destroyed the crop. The varieties which withstood the weather best, and of which we have fair crops, are Royal Russet, Hawthornden, Keswick Codlin, Hauewell Souring, Rymer, Edciville, King of Pippins, Wyken Pippin, Perry Pippin, Red Autumn Calville, Reioette du Canada, and sheltered trees of other sorts are fair, especially Cox's Orange and Blenheim Pippins. The trees on the walls are also good. Pears are bad with the exception of Josephine de Malines, which is very good. *Geo. Griffin, Slebeck Park.*

CHANNEL ISLANDS.

JERSEY.—Fruit trees, as a rule, are looking healthy and well, making vigorous growth. The bloom of Apricots, Nectarines, Peaches, and Plums, suffered much during the hot weather in May, much of the

setting fruit falling off. Morello Cherries promised to be an abundant crop, but quantities of the fruit turned yellow and fell off. Strawberries are a low average, but Currants and Raspberries will be abundant. Nuts are not grown here. Medlars and Quinces will be a full crop. *C. B. Sanders, St. Saviour's.*

SOUTHERN COUNTIES.

MIDDLESEX.—The Pear crop is especially good, nearly every variety and nearly every tree bearing a full crop. The trees are healthy and the fruit swelling freely. By far the finest crop that has been noted for many years. Apples, especially on young dwarf trees, are very abundant and good. Plums, a few leading varieties such as Victoria, Wood's Seedling, Goliath are very abundant; others a complete failure. *A. F. Barron, Royal Horticultural Society's Garden, Chiswick.*

Generally throughout this market orchard district the fruit prospects give the greatest satisfaction; still, there can be no doubt but that in many cases the superb bloom prospects have not been fully borne out. This is especially the case with Cherries, which, though marked in the tabulated return from here as "average," must not be assumed to be good. Really, an average Cherry crop is a very moderate one, and that is the state of the crop this year. In some gardens Gooseberries are thin, having fallen in swelling; but in many other gardens the crop is an abundant one. Currants are moderate, the bloom bunches having been thinned by frost; but no doubt the fruit sample will be good. On the whole it may be said that the present season's fruit crop will prove to be one of the best known for several years in this locality. *A. D., Bedford.*

SURREY.—The spring of 1885 will be looked upon as the most promising one for fruit crops for many years. Owing, I think, to the late hot summer, which ripened the wood so well, every variety of fruit, and nearly every plant or bush was clothed with blooming buds and crowns, and to a great extent our hopes and prospects are realised. The frosty nights which we had the second week in May did little or no damage to the bulk of fruit trees. Gooseberries were clothed with foliage; Apples were not forward enough; Pears and Cherries were in full bloom, but, being dry, they did not suffer to the extent that was expected; but in the third week we were visited by heavy and continuous hailstorms, which cut off the Pears from the tops and exposed sides, and the leaves were riddled with the stones. The varieties that carry the best crops are, of Pears, Jersey Gratioli, Louise Bonne of Jersey, Bergamo, d'Esperen, Williams' Bon Chrétien, Huyshe's Prince of Wales, Winter Nelis, Seckle, Ne Plus Meuris, Dr. Trouseau, and Swan's Egg. Apples are good all round: the first on my list of heavy bearers are:—Duchess of Oldenburg, Lord Suffield, Dumelow's Seedling, Forge Apple, King of the Pippins, Bleenheim Orange, and Yorkshire Greening. Strawberries are excellent, but quite three weeks late. Gooseberries and Currants, red and black, are even crops. Plums are scarce, except on walls, where they are plentiful and clean. Peaches, Nectarines, and Apricots are good crops, clean and free from blister. Cherries also are above the average. *A. Evans, Lythe Hill, Haslemere.*

KENT.—Our whole crop in this district, with hardly a single exception, is most abundant; a few varieties of Apples, Pears, and Plums, which bore heavily last year, are thin; other varieties are carrying immense crops, and strenuous endeavours are made to secure the yield, but in my opinion, half must be left unpicked or otherwise spoiled. The foliage of everything is remarkably clear of insects and blight, particularly the Apples, which have for some years past been infested with caterpillar. *H. Cannell.*

The blossoming was the most abundant seen for many years, but the low temperature prevented a perfect set, and the frost in many places entirely destroyed the crop of black Currants and Plums; but, generally speaking, the crops may be described as good, and that of Pears as the most abundant for many years. The Kent Damsons are very partial, but Cob Nuts are unusually abundant. *G. Bunyard, Maidstone.*

SUSSEX.—Apple crops excellent. Apricots, Peaches, Nectarines abundant, all looking well. Pears good on the walls but thin on standards. All kinds of Currants plentiful. Gooseberries thin, principally owing to birds destroying the buds, which is becoming very general about this locality. Filberts are the

heaviest crop I have seen for years. *F. Rutland, Goodwood, Sussex.*

PLANTS.—Until May 8 fruit trees of all kinds looked unusually promising for abundant crops of fruit; Pears and Plums setting freely, but the 8th of frost on May 7 and 8 caused the fruit to drop, and Cherries are very much blighted and much affected with black-fly, and a poor crop with the exception of Morellos, which are good. Peaches and Nectarines where protected are carrying a good crop and trees look well. Apples a good crop but many kinds much blighted. Small fruits a good and abundant crop. *W. Smythe, Basing Park, Alton.*

—With the exception of Plums, all fruit crops in this district are much above the average. Plums flowered profusely, but when in full blossom we had from 4° to 8° of frost every morning for a fortnight, and though they did at first seem to set well they dropped as soon as warmer weather set in. Pears have an extra heavy crop. Peaches, Nectarines, and Apricots the same, and the trees are clean and vigorous. Apples, like Plums, suffered from frost, but still there is a good crop and the trees are clean. *W. Wildsmith, Heckfield.*

MARKET GARDENING.

(Continued from p. 75, vol. xxvii.)

I HAVE referred more than once in past remarks to "thick cropping;" indeed, the very fact that "foot crops" exist in market gardens by the hundreds of acres is proof of their desirability. Such crops besides are as often short of the mark as up to or over it; thus, not infrequently, stiff, stocky seedlings are planted at 10 inches apart. Practical tests have shown me that wide planting has little in itself to recommend it.

Autumn-planted Cabbage plants at 7 inches apart heaved up in the following spring splendidly, fitting tightly together, so that a dense row of hearts was the result. Cabbages, as all know, are not needed to be very large, as good medium-sized, well-hearted heads are preferred. I wish to show how economically the ground can be employed. Plants protect each other, when thickly planted, during winter, and, above all, the great advantages accruing to the ground being covered, both as regards the retention of moisture in it during dry weather, and the prevention of growth. These considerations are important, but that of thick cropping, so as to retain moisture, is during the late spring and early autumn months all-important. Besides these advantages, the practice lessens the work of hoeing immensely. Nor should it be at variance with the best system of culture, for surely to cover the ground with a green garb should be the aim of good gardening, not to permit bare places between rows like "drives" in a wood. The adage "Whoever can make two ears of corn or two blades of grass grow upon a spot of ground where only one grew before, deserves well of mankind," has more in it than appears in confirmation of my statement, supported as it is by market garden farm practices around.

As regards Cabbages, reasonably thick cropping means earlier maturity and more weight from a given piece of ground. Whilst upon this subject a contrast may well be drawn between open-air in the fields, and the more confined limits of most gardens. Full free air means "stocky" plants, early maturity, and excellence.

Here I may turn aside to refer to the ground-line conformation of kitchen gardens generally. In a far too common way "quarters" are much lower between paths and the bush or espalier fruit, which all but invariably surround them, than is needful. When forming gardens of this kind there can be no reason why walks may not be lowered for the benefit of the crops upon the quarters—the soil removed being applied to raising the latter, and levelled down at the sides of the walks whereon such fruits are grown so as to, in a word, elevate the actual vegetable ground. Again, the old system of forming alleys between crops has a similar advantage, giving crops by elevation a far more favourable aspect. Moreover it is beneficial to root-crops, such as Beet, Carrots, &c., so to grow them, as even during dry weather they benefit by being forced to push their tap-roots downward in search of moisture.

If, however, one kind of vegetable more than another will succeed well thickly planted, or upon what I may call mound-beds, it is the Cabbage. The plants like exposure and firm foothold. To the

latter I can testify from a fact which has come to my knowledge of a perfect Cabbage having been grown near the apex of a wall, in precisely the same manner as Wallflowers often grow. After all the mound-shaped bed is but an imitation of beds formed in the process of ploughing upon all plough-cultivated lands. It is the usual intention of growers to have as abundant a crop of each as is possible from a given space of ground. I maintain emphatically that the old rule of thumb practice, of setting out Cabbage plants wide apart, letting them struggle on upon a bare surrounding throughout the winter, only to give an ordinary heart and superabundance of gross useless outer leaves, and when cut to still continue the stumps for the purpose of a meagre supply of off-shoots, is not one likely to satisfy such wishes—this, even apart from the incidental work of hoeing ground, impoverishment, &c., before referred to.

Clubbing is as great, or greater, an enemy to the market garden grower's crops than to those of private growers. Many expedients are tried for its cure, but with little result. Gas-lime seems to have greatest value. Large quantities are annually carted from gas companies' works for this purpose. Slight surfacings are given before ploughing up the ground, and some growers even give surfacings immediately before planting. Artificial manures are often applied to these particular crops with great advantage. Fish manures in any form give marked results, and are known to give more lasting effect than any others. Soot is used very generally. It is applied just at the time the plants are in active growth; and whilst it may have the power of limiting injury by clubbing, it certainly invariably gives the crop when applied a filip in the matter of growth, and causes it to become of a deep green colour. This is a kind of manure easily obtainable and applied, and one likely to prove beneficial to all enclosed gardens, and should be generally used, more especially where only a limited supply of farmyard manures is obtainable. When it is considered how much good this simple aid does to the soil, even within the limits of what may be called the soot showers upon land around the metropolis, is it not reasonable to say that its influence is likely to be far more marked or beneficial in country districts, far removed from smoky atmospheres? *William Early, Hford.*

(To be continued.)

WATER RAM.

I THINK it will be some time before the experiences of the drought of last summer and autumn are forgotten by any of us. In common with many other places we suffered the inconvenience of a short supply of water; horses and water-carts were daily at work to keep up the supply, but in vain—for the tanks got empty, and all this with a cloudless sky, and for weeks and weeks the temperature at 80° or 90° in the shade. It became quite serious, for what is a garden without water? At last Mr. Blake, the well-known hydraulic engineer, was consulted. "Nothing simpler," said he; "you have a plentiful supply of water a quarter of a mile distant. I can supply a ram which will give you a supply of 6000 gallons per day easily." Leave was granted, and in a wonderfully short time it was at work, and the aspect of everything was changed, for on the topmost tower of the Castle there was water, in the garden, stables, laundry, mechanics' yard, and the farm, upwards of a mile distant there was, as Coleridge said, "Water, water everywhere."

When our Ram was first set to work the sound travelled up the naked pipe in a remarkable manner. "I'll see," said a visitor to me one morning, "that that fine ram of yours is stopped at night, for I do believe I heard it all night," but this noise ceased directly the pipes were covered. A new difficulty arose, for the chemical properties of the water corroded the iron valves, as barnacles do an uncoppered ship. These were soon replaced with valves made of gun-metal, and now all goes as "merry as a marriage bell"—every tank is brimful of soft-water, and already its temperature is 65°, and I doubt not in a month it will have risen to 70°, and this from an open lake of 20 acres. "But why all this yarn about your water supply?" asks some one. Why just this: that our case represents thousands throughout the country, and although I am "neither a prophet nor a prophet's son," yet may I do predict another dry season, and for the encouragement of those who contemplate supplying their estates with plenty of water I have written

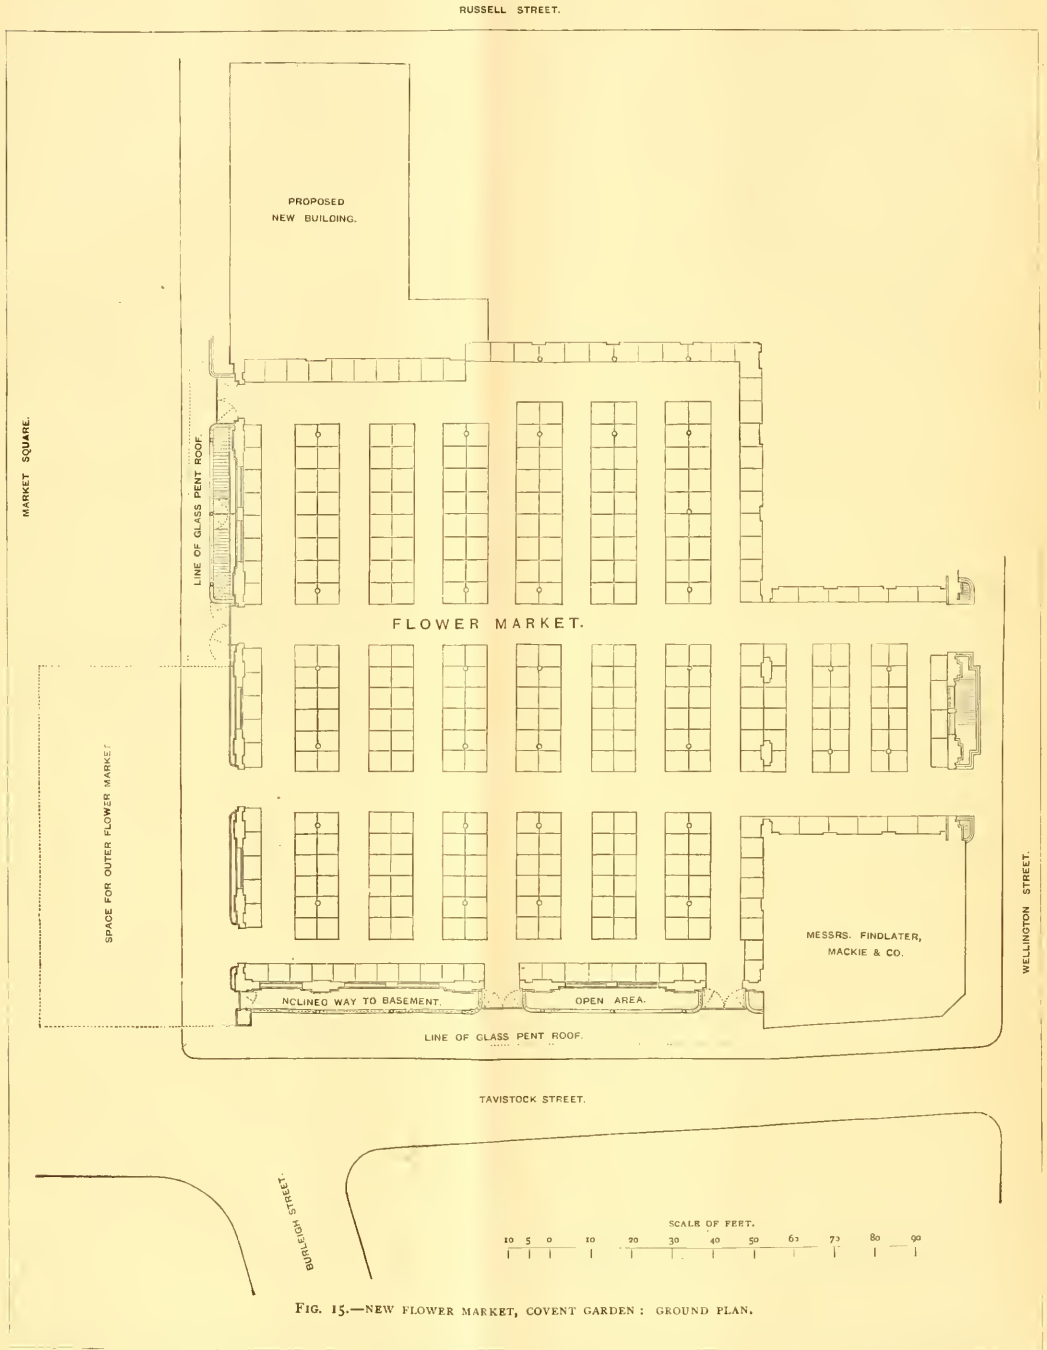

FIG. 15.—NEW FLOWER MARKET, COVENT GARDEN: GROUND PLAN.

this, for nearly everywhere it is practicable and nowhere expensive, compared with the comfort.

Before I leave this subject I would also ask a question. Why is it that from Land's End to John o' Groat's one sees every brook and river polluted by

the drainage of dwellings being turned into them? On the sea coast and in our very large cities there is some excuse, but surely in the open country, where millions of acres are starving for want of something to encourage vegetation, surely the case is otherwise.

So fashionable has this become that it behoves those of us who live in the country at all times to raise our voices against this twofold folly. Why poison the stream when the land all around is crying, "Give, give, give?" J. Rust, *Erville Castle, Sussex.*

THE AFGHAN DELIMITATION COMMISSION.

We (*Nature*) are indebted to the courtesy of the Kew authorities for the opportunity of publishing the accompanying letter from Surgeon-Major Aitchison, C.I.E., F.R.S., which gives the most recent account of his work as naturalist to the expedition:—

"Camp Tir-Phul, Northern Afghanistan, 6 miles from Khusan.

"Dear Sir Joseph Hooker,—

"I am now able to write to you with some pleasure, as I have been able to put together this year some 300 species in all. The last 100 I obtained on a ten days' trip that I made from this camp. I left this on April 25 under very bad auspices, as it had blown all night and was blowing a terrible gale with every chance of a heavy fall of rain from the north. But I started and got as far as Khusan, in the vicinity of which, beside the ruins of an old 'serai,' I halted. I picked up a few odds and ends, the chief attraction was the *Rosa Margarita* (if a new sp.) *mihl*. It covers the whole country in localised patches, and being very dwarf in habit, not above 2 feet, the flowers are seen to perfection; they open out expanding almost flat, when the brilliant eyes, formed by the claret colour of the bases of the petals, gives it quite a character. Amongst my *Rose hips* sent to you last year

of any sort: these are only to be found in the river bed—viz., *Populus euphratica*, and two species of *Tamarisk*, and a *Lycium*. At Tomán-ághá, in the bed of the river, was a woody *Salsolacens* shrub, which I do not know. I got good specimens of the wood and flowering branches.

"I left Tomán-ághá on the 28th, passing the remains of some old ruins 2 miles from my encampment, and turned east by north towards 'Galicha' (a carpet). As we marched along, fancy crossing the markings of two pairs of carriage wheels! These had been made some months ago by the carriage of a Persian prince who had come to our camp at Gulran to be doctored. The route lay now across towards the base of the Paropamisus range over a most extensive plain on which the attraction was a miniature forest of a species of *Umbelliferae*, excessively like, but not the *Assaefida*. This was in full bloom, the stem and flowers being at first all of a light orange-yellow; as the fruit ripens the whole colour changes to a russet-brown. Each flowering stem is from 3 to 5 feet high, and there are usually fifty plants to 100 yards square, the interspaces being altogether filled up by grass of a foot in height. On the 29th, left Galicha for the Kambao Pass to enable me to cross through the range. Our march lay over a plain the continuation of that of yesterday, and which from its extent is lost to the sight. This is celebrated as the plain of the wild donkey, and here I counted sixteen herds of at least 10,000 in each. The nearest was a mile off, and their presence was

an *Elæagnus*, of which I sent you the fruit last year; one *Pistachia* bush, a large number of *Astragal*, which I feel sure will puzzle Baker; a curious *Rubiaceous* shrub, a fine *Orbanche*, only five grasses, and a most lovely *Everlasting Pea*, like the ordinary English cultivated one, only dwarf. I believe everything here is dwarfed by exposure to the winds. You cannot understand the difficulty I have with it in collecting. To save my plants at all I have to put them at once into paper. It takes three of us to do this, and not allow paper or plants to blow away. I must say it does not improve one's temper.

"I got one or two species of a very nice *Gentian* like *Gentiana Kurroo* of Royle, the altitude of Hari-ród River, 2000 feet; *Kambao Pass*, west side, 2900 feet; pass itself, 3550 feet; *Kambao* on north-east, 3250 feet. Not a Fern of any sort, not even *Ophioglossum*, which I looked upon as a certain find. I spent my second day—viz., May 2—at the camp on the north-east side of pass; here there is a fine *Hawthorn*, from which I collected flowers in bud on the 1st. Along the whole of this range, well within it, where the water is sweet and the air cool, the *Hawthorn*, a common *Plum*, and *Amygdalus eburnea*, are more or less plentiful. I picked up an *Oxygraphis*, and a very pretty *Geranium* with a most curious *Potato-like* root, only the tubers are heaped up on each other when there is more than one to a plant. You know they made me naturalist, so, in addition to collecting plants, I have to shoot poor little

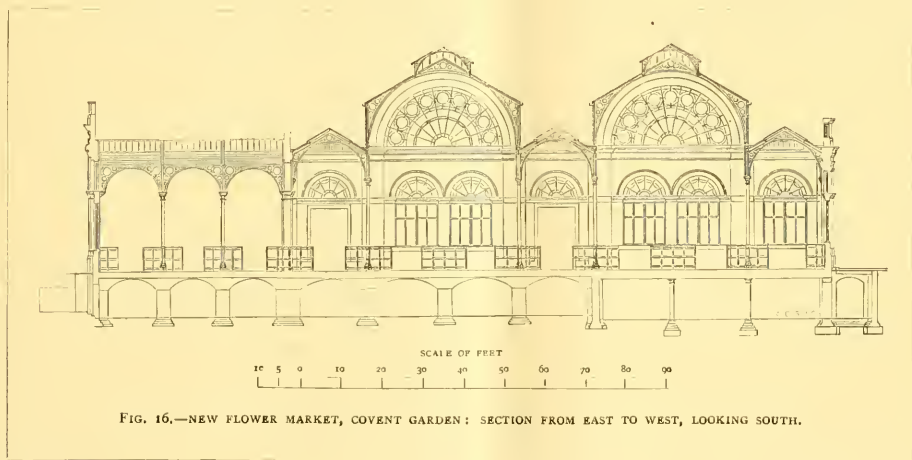

FIG. 16.—NEW FLOWER MARKET, COVENT GARDEN: SECTION FROM EAST TO WEST, LOOKING SOUTH.

this was one of the species. I hope to be able to supply you with a lot more of it. It would make a lovely flower border.

"I marched next to a plain on the right bank of the Hari-ród River opposite to Tomán-ághá, 15 miles. Our route lay over a plain that had once been the bed of a river where the river had made a great bend; the river, after silting up this bend, had left it. The most characteristic plant here was a *Rhubarb*, usually with three root leaves of immense proportion for the size of the flowering stem; these leaves are so pressed flat to the ground that it reminds one more of the *Victoria regia* leaves (without the margin), and this is the habit of the plant. The plant was fruiting, having large winged fruit of the most brilliant scarlet; it will make a grand thing in gardens. The beautiful colour of the fruit is much helped out by the splendid green of the leaf background. There are, one may almost say, no leaves on the flowering stem—one or two most minute. I measured one of the largest on the ground; it was 4 feet from the base to apex and 5 feet across; the other two with this one were a little smaller; the three together gave it a very curious look. I hope soon to get the seeds home. I have collected a good deal of the root; it is called 'Fool's *Rhubarb*' owing to its purgative qualities, and curiously enough the fruit is employed in preference to the root as a purgative, given as a decoction. With the exception of an occasional woody shrub that may rise to 5 feet, the place was covered with a species of *Artemisia* (probably several) about 2 feet high, and occasional *Umbelliferae*. There were no trees

recognised by a cloud of dust rising in a swirl on their galloping—like the smoke from the chimney of a steamer. It was a most extraordinary sight, watching these clumps moving from place to place. They are occasionally shot and eaten. I forgot to tell you that, except my own party, there was probably not a human being within 30 miles of us. The country has no inhabitants, and until the nomads turn up with their flocks from the lower regions it is a desolation. The last part of our march was for 6 miles within the ridges of the base of the hills, and here in the stream-beds *Tamarisk* was the only (woody) shrub. I halted some 5 miles to the west of the pass, hoping to make a great haul on the goth. From the moment of entering these valleys they seem a mass of colour—one from *Buttercups* (one species only), another from a *Poppy*; the bed of the stream purple with a tall *Onion*, and the interstices green with one grass. I had previously got most of the things so promising here, but saw signs of getting into a very fine new lot. On the morning of the 30th a regular hurricane of wind blew from the north, so that I thought the best plan would be to move my camp across the pass, and get a better and more sheltered locality. I just managed to get to the north-east side, when it did come down—such a torrent! but as all preparations had been made we were comfortable; and I remained on we must have been swept out of our old camp.

"May 1 proved a most superb morning, so I was up and out at 6 A.M., went straight back to my old encampment on the west side, and from there collected back. I got some thirty-five species—a second *Arum*, a *Prunus*,

birds, and I hate it. I got two bee-eaters, the one more lovely than the other, and a nightingale.

"On the 3d I marched to a place 8 miles nearer our first Gulran encampment. I had picked up most of the cream, and there was not much, except additions in the way of fruiting species, to be made. This I did, and got a venomous snake which may be a cobra—all but walked on to him—5 feet long and 6 inches at his thickest, fangs three-quarters of an inch; a most unpleasant fellow to meet. I shot him, and after fancying I had killed him, cut off his head and neck to keep (I could not keep his whole body), when lo! his body, minus his head, walked off searching for escape, the head trying to fang its own neck.

"On the 4th I moved still east by north some 12 miles to our first encampment at Gulran. I got some nice things *en route*, and had just ticketed and arranged them preparatory to great work for the morrow, when in came a letter from Sir Peter Lumsden telling me to return at once. Alas for my great expectations! I packed up, and we moved camp at 2 A.M. on the 5th, marched up the valley, passing our second Gulran encampment, and Pass. I had no time to halt and collect. I passed a *Gladiolus* and an immense number of things. On the pass I collected the '*Siach-cho*,' which is to me in all probability *Cotoneaster nummularia*. I had collected its fruit and sent it to you from these very bushes. I got it in this pass last year. It is from this shrub that '*Shir-Khist*,' the manna of these parts, is collected. I have sent you a bottle of it packed amongst some other things.

They have two other kinds—one from a Tamarisk and the other from Alhagi. I myself collected it from a Salsola. I got across the pass by 2 P.M.; halted until 8 P.M. and got into Tir-Phil at 8 A.M.; the camels at 10 A.M. of the 6th; did 60 miles in thirty-four hours—good going for camels, and men more or less on foot.

"I am glad I am in, because my plants had to be looked to. I got, as I said before, 100 species in this tour, not less than 1200 specimens. It is much harder work than Kurran; the fact is, I am not younger, and my back wants a good deal of oiling.

"J. E. T. MITCHISON."

Orchid Notes and gleanings.

ORCHIDS AT BRETTARGH HOLT, MILNTHORPE.

AMONGST the many grand examples of cultivation at this garden the following are well worth noting:—*Cattleya Sanderiana*, a superb specimen, with four dozen of its fine gigantic flowers expanded, a good variety, is well worth seeing. *Oncidium macranthum*, several flowering well, one specimen alone five spikes, in all over 150 flowers, is very attractive. There are also several fine *Vandas* in flower—suavis and tricolor—a plant of the former had a dozen spikes. *Odontoglossum vexillarium*, several fine forms; also others. A sight worth going to see is the Masdevallia-house, which is about 24 feet long, span-roofed staging round the sides full of grand varieties now in perfection. There are between 2000 and 3000 expanded flowers of all the best varieties in cultivation. Mr. Walker has for some time past been selecting these when in flower, and of all I have seen have never yet met with its equal. Gigantic forms of *Yeitchii*, *igneæ* *Harryana*, *Lindeni*, *Denisoni*, *Chelsoni* in many varieties, are here to be seen growing like weeds, and flowering magnificently under the care of Mr. Macgrigor, his intelligent gardener. *A. O.*

CALANTHE NATALENSIS, Rehb. f.*

This exceedingly handsome species is now flowering at Kew, and probably for the first time in Europe. It is a native of Natal, and the district of King William's Town, and doubtless occurs in the region between; the Kew plant was received from King William's Town, and is probably from the same locality (viz., Perie Bush, near King William's Town), as plants of it have been cultivated in the Cape Botanic Gardens. It is the only South African species of *Calanthe*; and according to the species on dried specimens only grows in swampy places in woods and forests; a local stating that it is "found only in very wet places in bush"—"bush" being the term for forest. The following is a brief description of the plant:—

Leaves elliptic, lanceolate acute, growing up to a foot in length, and 2½—4 inches broad, plaited, and a little crisped at the edges, bright green, with a slight tendency to variegation. Flower-stem, present with the leaves, 12—18 inches high, green, pubescent in the upper part. Bracts lanceolate acute, ¾ inch long, spreading. Flowers numerous, about an inch in diameter; sepals and petals oblong-elliptic acute, bright lilac on the outside and edges, the inner surface whitish-lilac; lips flatish, 3 lobed, at first bright lilac, afterwards changing to salmon colour; lateral lobes triangular oblong, spreading; middle lobe somewhat truncately orbiculate, with an apiculus in the notch, and three contiguous rows of small roundish calli towards the base, the middle row longest. Spur ¾ inch long, curved, whitish-lilac. *N. E. Brown.*

ORCHIDS IN BRITISH GUIANA.

A correspondent of the *Demerara Argus* is publishing in that journal a series of articles on the Orchids of that colony, and the most appropriate methods of cultivation in that country. The following extract will show the practical nature of the advice given. We shall watch the continuance of this series of articles with much interest:—

"In the cultivation of epiphytall Orchids it is necessary to take into consideration that they live on gases and moisture derived from the air; comparative stillness

is requisite, and strong winds very injurious. The east and north winds which prevail at certain seasons, if allowed free access to the plants, dry and ultimately kill them. When the air is still, and the garden below well watered, a current of moist air is continually ascending from the earth, creating a genial atmosphere in which to grow epiphytall on low trees. Some species require very little shade if well protected by a leafy screen to windward; others must have a canopy above, which only allows broken sunlight to penetrate.

"Two of the hardiest and best (*Oncidium Lanceanum* and *Cattleya superba*) are rather common in Georgetown, and often represent the survival of a number of species. These flourish in a drier atmosphere than many others, and do not flower if too much shaded.

"A well grown Orchid has plump bulbs, and firm, stiff leaves. If too much shaded the leaves are limp, and hang over; and if too dry they shrivel and fall off. Epiphytall should be fastened on the under parts of a branch, or on the trunk below a fork, to get some moisture from dew and rain trickling down the small channels in the bark. Until they have roots they should be fastened with wire, but when they are established the wire should be removed, being no longer necessary, but a hindrance to the growth.

"Several kinds of pots and baskets are used in growing epiphytall. Nothing stagnant or sour must remain near the roots. Rotten wood is a poison. Hardy plants will do well on blocks or shingles, but open baskets made of wood bars are better for the majority. Many grow best in pots, especially in the glass-house. Pots and baskets must be filled with some material which is porous and retentive of moisture. Crocks, burnt earth, and charcoal are suitable for outdoors, but in the greenhouse fibrous peat and sphagnum moss are best. All mounted plants should be dipped in water occasionally, to drive out woodlice and cockroaches.

"Watering will depend so much on weather, position, &c., that no general rule can be given, except that during the flowering season less is required. In an airy situation it is scarcely possible to water too much, but in close damp places much water causes rotting."

CATASETUM MACROCARPUM.

A species with elliptical pseudobulbs, deciduous lanceolate leaves, and few flowered racemes of flowers proceeding from the base of the pseudobulbs. The individual flowers measure 5 inches across. The sepals and petals lanceolate-acuminate with purplish spots on a green ground. The two side petals are directed vertically upwards behind the column parallel to it and to the dorsal sepal; the lip is an inch across, funnel-shaped, yellow, with a 3-lobed reflected border, column erect with three awns. *Orchid Album*, t. 189.

LELIA ANCEPS WILLIAMSII.

A lovely variety with star-like flowers, with five white spreading segments, the three-lobed lip projecting, the side lobes erect, yellow, with red veins, the central lobe flatish, tongue-shaped, with a yellow blotch at the base. It is figured in the *Orchid Album*, t. 190.

ALPINE PLANTS.

VERONICA LYALLI has proved itself perfectly hardy, having withstood our past four winters without the shadow of harm. It is a neat little plant, dense and compact, the stems closely furnished with small leaves, and at present suffused with tiny mauve-coloured blossoms. Hailing from New Zealand this pretty Veronica was at first branded with the reputation of tenderness, but, like many another of these-called tender foreigners, it has proved itself not only well suited for our climate, but a valuable addition as a neat, free-flowering rock or border plant. As regards soil it is by no means particular, light or stiff, dry or damp coming alike. It is readily propagated from cuttings inserted in the open towards the end of summer.

MERTENSIA SIBIRICA,

although similar in growth to the old Virginian Lungwort (*M. virginica*), is yet distinct in both foliage and flowers, and, in my opinion, a more desirable plant in every way. The leaves are large, of a beautiful glaucous blue, not unlike those of *Eucalyptus globulus*, and, being freely produced, give to the plant a decided characteristic of its own. This elegant plant is very attractive, the drooping panicles of sky-blue bell-shaped flowers still further enhancing its beauty, and at once rivetting the attention of the passer-by. As a genus *Mertensia* is distinguished from *Pulmonaria*, which is the old name of the plant, by the stamens

exceeding the corolla tube, and also by the nuts being fleshy when in a young state. A white-flowered variety of *Sibirica* has crept into circulation, but it is still somewhat rare, and a worthy companion to the normal form. Peaty loam suits this genus best.

Amongst the Cinquefoils, of which we have many worthless and troublesome forms, few can perhaps equal either for richness of bloom or for ornamental foliage, the Cashmerian variety *Potentilla dubia*. The flowers, which are bright yellow, and the size of a shilling, rise but a short distance from the intense green and remarkably dwarf foliage. In rather damp ground it succeeds well, and during early June and July the foliage is almost hidden with the innumerable bright yellow flowers. This is a fitting ornament for borders or rockwork, and easily increased by division.

LEONTOPODIUM ALPINUM.

The Edelweiss, or Bridal Everlasting, is now grandly in flower, and evidently as much at home in the lowland garden as on the great Continental mountains ranges. The white dwarf flowers we need not describe, for who has not seen these as dried specimens brought in quantity from its Swiss home year by year until the plant is now threatened with total extinction? The Bohemian Government are, however, trying to acclimatise it on their mountains, and should the experiment succeed, the flora of Northern Bohemia will have received a valuable addition. In this country it is a perfectly hardy perennial, but methinks I see in home-raised plants a step onwards in the way of acclimatization. As a rock plant it is very ornamental, but should be planted in rather poor, stony soil, that of a heavy strong nature causing too luxuriant growth, and doing away, to a great extent, with the white colour of the flower, which is so marked a characteristic of Continental over-home-grown specimens. Seeds are easily procured and as easily raised, so there is no excuse for this distinct and beautiful everlasting being any longer a stranger in our gardens. *Emergo.*

LINUM CAMPANULATUM.

Can any reader of the *Gardeners' Chronicle* tell me whether this plant is in cultivation in England? It is in many catalogues, but the plant sent for it is either *L. flavum* or a blue Flax of the class of *L. perenne*. *L. campanulatum* is a native of the South of France and North of Spain, and is figured in *Loddiges' Cabinet*, tab. 1254. It is, I think, much earlier in flower than *L. flavum*, a native of Austria, which is correctly figured and described in the *Botanical Magazine*, tab. 312, and more herbaceous and prostrate than *L. arboreum*, a native of Crete, figured in tab. 234 of the same work. All three species have yellow flowers, bearing much resemblance to one another; but I cannot meet with *L. campanulatum* true, though I have long had abundance of the other two species, which are often confused with it and with one another. *C. Wolley Dod.*

ARMERIA CEPHALOTES.

This variety is now a thing of great beauty on our rockery. It is one of the best perennials we have. Its pink flower-heads, 2½ feet high, are very effective. It is a variety that should be in every collection, and certainly no selection of perennials should be made without it. It is easily raised from seed; we have had no success by division. *W. Kettlewell, The Garden, Balrath Erry.*

Plants and their Culture.

PLANTING OUT IN THE OPEN BORDER.

THIS system I have consistently recommended in many previous Calendars as being more congenial to the wellbeing of the subjects under notice as well as a material saving in labour with the water-pot during the summer months. It will be well to look over the stock of winter and spring blooming plants once more, and see if there are any remaining in pots that can be so treated for the remainder of the summer and early autumn. We are just preparing a piece of ground that will be well suited to the old forms of the Cyclamen, which will at once be planted therein fresh root-action will then soon commence, although no leaf develop-

* *C. natalensis*, Rehb. f., in *Bouplandii*, 1856, p. 322.

ment will be apparent for some time to come. We have worked both soot and lime into the soil, and also added some leaf-mould that was rotted down in the forcing-pits. The soot and lime will prevent the wireworm and slugs (as troubling us) for some time to come. My latest batch of Spines (*Hoteia*) japonica are only just being removed from the conservatory—a proof of the great value of this plant for late as well as early work. This late lot of plants were stood in the open as soon as any danger of spring frosts was over, and taken to the conservatory when expanding their flower-spikes. Retarding their too rapid advancement was effected by a shading (somewhat heavy) during the day-time; this also accomplished another end that must not be lost sight of, viz., in causing the flower-spikes to be of a purer white than when the plants are fully exposed to the light, as under the latter condition they are disposed to assume a creamy tint. This late lot of plants will be turned out at once on a border where they can remain for one season, and be liberally supplied with water when needed. *Dielstra spectabilis* is another subject that succeeds when treated in a similar manner as regards planting out. If a few vacant spaces exist in the herbaceous border advantage could be taken of the same to plant the *Dielstras* therein, and in such a case, leave them, if possible, for two seasons.

EARLY FORCED POT ROSES.

These should receive attention in regard to retopping and other minor details as soon as possible. It may seem rather early to reduce the balls and place them into fresh soil, but they will soon make up for what little check they receive by rooting freely into the same, thoroughly establishing themselves before the late autumn rains come on. Pot Eupatoriums and keep them pinched to obtain dwarf bushy plants; exception must be taken, however, to the latter operation being performed in the case of the autumn-flowering variety. *James Hudson, Gunnersbury House, Acton.*

The Hardy Fruit Garden.

WALL TREES.

FRUIT TREES on walls and in the garden borders will require much attention during the present month. The weather being very hot and dry, watering and syringing will be required daily. Young growths will require nailing-in and some cutting-out, or pinching back as the case requires. All weakly growths are best cut out as much as possible, for it is impossible to expect good results from small unhealthy shoots; therefore it is most essential to obtain as far as possible a strong healthy well matured growth on all kinds of fruit trees, whether on walls, the open garden, or orchard.

ORCHARD.

Pear and Apple trees growing vigorously, but not bearing fruit freely, should now be marked for root-pruning early in the autumn. Varieties that are most fruitful in certain districts should also be noted with the object of increasing the stock at the proper season, either by grafting old-established trees with the most prolific varieties, or planting young ones. Cherries and Plums may still be budded, much in the same manner as Roses, or by inserting buds on any healthy shoots of established trees. Peaches and Nectarines may be treated in the same manner, with every prospect of success. Mildew and green-fly must be kept under, the former, by using sulphur freely whenever it appears, the latter, by a free use of tobacco-powder.

FIGS AND VINES.

Figs and Vines on walls will require constant watering and the syringe to be used freely, or the fruit of both will be small. One of the best varieties of Fig for the open wall is Brown Turkey, which is very hardy and prolific. Old trees are apt to produce a thicket of young shoots, which should be timely removed and the strong shoots left stopped five or six joints above the fruit. A good variety of Vine for the open wall, if not the best, is Royal Muscadine, which rarely fails to ripen its fruit, and if well thinned and not over-cropped will be of good size and average quality.

RASPBERRIES.

Raspberry canes should be gone over again, and all shoots not required for next year's fruiting pulled up

or cut away. Any one looking out for a good-fruiting vigorous growing variety with fine large fruit, will not be disappointed by ordering Bamforth's Seedling. *J. Smith, Mountmore, Bucks.*

THE ORCHID HOUSE.

SUMMER WORK.

JULY, August, and September, are the months during which we expect the largest proportion of the plants to make their growth, and if they are neglected at this season the results are sure to be unsatisfactory. In our own collection we make a point of getting a good growth on everything at this season, and to that end we give each genus as far as possible the treatment best suited to it. Take, for instance, the *Dendrobiums*, the advocates of the pruning system say that the growth must be made in a high temperature, and that this is necessary to make up in part for the lack of nourishment obtained from the back bulbs; but what is good for pruned *Dendrobiums* is equally good for those that have not been so treated. We have placed most of the *Dendrobiums* into the warmest house we have, where they have a temperature when the house is shut up in the afternoon ranging to 90° and 100°, the night temperature not falling below 70° or 75°, and with plenty of moisture in the atmosphere the growth is sure to be satisfactory. Those that luxuriate in this high temperature and moist atmosphere are *D. noble*, *D. Farmeri*, *E. thysiflorum*, *D. Dalhousieanum*, *D. Paxtoni*, *D. crysoctoxum*, &c. In three months the growths are made and matured, and when the winter season arrives they are prepared to pass through it in a low temperature and rather dry atmosphere. While growth is being made plentiful supplies of rain-water, at least as warm as the atmosphere of the house, is necessary.

In the warmest house *Odontoglossum Roezlii* is also making good growth at this season. We report these and *O. vexillarium* once in two years. They also like plenty of moisture, and to be freely watered at the roots. *Angraecum sesquipedale* is also pushing from the stem above the mosses thick succulent roots. Has any one noticed that when the moss in which the plants are growing is fresh, green, and healthy, the roots descend close to the stem, so as to reach it as speedily as possible, but when the potting material is in bad condition they grow out in a horizontal position, and thus avoid it? The attraction which suitable soil or potting compost of any kind has for the roots of different plants is worthy of investigation, not only to the scientific man but to every one having to deal with practical gardening. I ought to state that *Vanda* trees should be placed in the highest part of the warm house, the growths trained close to the glass roof, and very lightly shaded from the sun's rays during the warmest part of the day. We treat *V. Hookeri* in the same way, but cannot get anything like such strong growth upon it as we do on the other species. In the warm house the temperature will range from 65° as a minimum to 100° when the house is shut up in the afternoon.

The treatment given to the occupants of the Cattleya-house is very similar to that of the warmest department. All the plants not repotted during the last six months have had some fresh material placed on the surface, and this has caused the roots to grow freely from the base of the last formed pseudobulbs, or from those in course of formation. They are doing this in any garden where the plants are cared for; but in some gardens, either from want of knowledge or some other cause, Cattleyas do not get the right treatment. I visited a garden during the present week, and found a number of plants of *Cattleya Mossiae*, but not one of them was making roots on the surface; the moss, which ought to have been in a living state, was dead, and the peat powdery and not in a condition to form a healthy field for the roots to run into. Slugs and wood-lice are very fond of the fresh young roots, and if they eat them off the plants are sure to suffer. The destruction of these pests should constantly be going on, late at night and early in the morning. *Laelia purpurata*, *L. elegans*, and others of this type, are also rooting freely; they like a warmer temperature than some of the Cattleyas, hence it is better to place these with the Cattleyas that require most heat in the warmest end of the house; or at the cool end of the warm-house. *Odontoglossum citrosum* is also growing freely with the Cattleyas and *Laelias* on the sunniest side of the house. They have recently been potted, and are now rooting freely into the fresh sphagnum and turfy peat. On the shady side of the house, all the *Cypripediums* requiring an intermediate temperature are growing freely; most of them have passed out of flower and are making their growth. They are all the better to

be syringed overhead on the afternoon of hot days. Nearly the whole of them were potted in May. I fancy all the Ladies' Slippers succeed best when repotted in summer; the young roots can be seen in a week or ten days after pushing freely near the surface, and the plants speedily recover. Most of the exhibitors of *Cypripediums* grow the plants in 5 and 6-inch pots, and a day or two before the exhibition they are turned out of the pots and placed together in a large mass. From ten to thirty pots may be required to make up one plant. When the exhibitors are over they are repotted again in the small pots, and the operation does no material injury to them. *Vandas* and *Acridies* Fieldingi we place on the shady side, during the summer months at least. It is best to repot them if they require it early in the year. The Fox-brush *Acridies* are yet in flower, and are rooting freely into the potting material, which is live sphagnum intermixed with some drainage and charcoal. They are making leaf-growth, and will continue to do this for some time. The *Vandas* are a puzzle to me. I have been trying for many years to grow them, and at the same time save the lower leaves, but somehow they will die off. If a plant flowers well, and the spikes are allowed to remain on the plants for six weeks or thereabouts, one or two pairs of leaves will become yellow and die off. Some growers have plenty of bloom on their *Vandas*, and save all the leaves from the base upwards, but I must confess this is a feat we cannot accomplish. The plants are in an intermediate temperature, they have been placed in every position in the house, they have been watered freely at times, and at other times sparingly, but we do not yet master their culture. The *Cymbidium*ids have received numerous and important additions during the last few years; *C. Lowianum* is a noble plant, producing long spikes of flowers which remain in good condition for three or four months; it is one of the very best plants for exhibition owing to the character of the flowers, which do not readily suffer injury during packing or transit. *C. Lowianum*, though not included and described by Lindley in the *Gardener's Chronicle* more than forty years ago, is yet a very rare and beautiful species. The flowers are very distinct in their yellowish-green sepals and petals marked with lines of brown spots, the lip is red with two large spots or blotches of maroon-purple. Most of the *Cypripediums* seem to be ditch plants, and require loam in their potting soil; they also require a good supply of water during the period of growth—that is, when they are rooting freely, as they are doing at present. They do not require so much potting soil as is sometimes given to them. The healthiest plants and the most vigorous are those that have the pots packed full of roots; and as long as they continue to do well it is not necessary to repot them. The most useful of Orchids is the brilliant orange-scarlet *Epidendrum vitellinum* majes. Not many years ago ordinary plants of it were eagerly purchased at the Orchid sales for as many pounds as they now cost shillings, but a plant is none the less valuable which is like this in cheap. There is no need now to pay high prices in order to have a goodly display of magnificent Orchids. *J. Douglas.*

The Kitchen Garden.

SEED SOWING, PLANTING, &c.

The end of July is a good time to make sowings of Queen and Early Naples Onions, selecting a piece of ground where sufficient space will remain to make the main sowing (autumn) the second or third week in August. Amongst later varieties for the last-mentioned sowing, should size be a consideration, White Elephant (Daniels') and Giant Rocca should be sown in conjunction with the ordinary white and red Tripoli. In the beginning of August a sowing of Early New Carrot should be made on a well drained piece of ground. Short-horn Carrots of various sizes are always esteemed at table.

CABBAGE.

The last week in the month Ellam's Early Dwarf should be sown for early spring cutting, and a fortnight later then an autumn sowing should be made. To save labour of transplanting the seedlings into nursery beds, a sufficiently large bed should be sown, not only to provide plants enough for the autumn planting, but also to leave some hundreds in the seed beds to fill up probable blanks, and to make a similar plantation in the following spring if necessary. As soon as suitable weather occurs, the Savoy and Kale, and late sown Broccoli should be got out into permanent quarters. Tomatos on walls, &c., will now require constant attention in pinching and nailing, or tying to stakes. Of herbs a selection of the various kinds should now be cut and dried for winter use. They are best dried in a shed where there is a good current of air. *G. H. Richards, Somerley Gardens, Kingswood, Hants.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	July 21	Sale of Imported Orchids, at Protheroe & Morris Rooms West of Scotland Fancy Society's Show, Glasgow Newcastle-on-Tyne Flower Show (three days.)
WEDNESDAY,	July 22	
THURSDAY,	July 23	Peterborough Flower Show Salterhebble and District Rose Society's Annual Rose Show. Sale of Valuable Imported Orchids, in variety, from Messrs F. Sander & Co., at Stevens' Rooms
FRIDAY,	July 24	Sale of Imported Orchids, at Protheroe & Morris Rooms New Brighton Rose Show.
SATURDAY,	July 25	
		Darlington Rose Show.

THE question as to the origin of the cultivated Potato is not fully settled, even after the elaborate researches of Mr. BAKER, on which we commented at the time of their publication. Practical men, so called, are inclined to undervalue such researches, because they do not appreciate their importance. They do not, say they, help them to cultivate better or to secure larger crops, and so all this hair-splitting about wild species and the localities where they grow, is in their eyes but trifling. This sort of feeling was more common once than it is now. The progress of scientific discoveries has been so vast, and the practical results so obvious, that scientific research meets with much more respectful attention now-a-days than once it did. But, curiously enough, the same feeling crops up now in a somewhat different form, and in a quarter where it was least looked for, and where there is the least excuse for it. The physiological side of botany, up till within a few years, was sadly neglected in this country—the country, nevertheless, of GREW, of HALES, of ROBERT BROWN. From the time of BROWN to that of DARWIN there was, roughly speaking—disregarding exceptions—a period when structural and systematic botany was taught and pursued in this country to the almost entire exclusion of vegetable physiology. In former years we had repeatedly to lament in these columns this one-sided tendency as a serious impediment in the way of horticultural progress.

The pendulum has swayed in the opposite direction, and now we have to regret the relatively little attention paid to structural and systematic botany on the part of the coming generation. We have frequent opportunities of observing this, and examiners are making it a subject of complaint. The modern system of selecting a few types as illustrations of the whole plant-world is in its way excellent, still more so is the practical teaching occasionally associated with the didactic instruction of the lecturer. Practical teaching, such as may be had in a few, still a very few, of our institutions, is an admirable preparation for an introduction to further research; but, limited in scope as it is, the results are not much more satisfactory than they were on the old system, and students are found profoundly versed in the structure and physiology of Chara or Torula, but unable to recognise the difference between a Poppy and a Buttercup. Not only is this the case, but the professors of the new *regime*, especially in Germany, are apt to ridicule and make light of the work of the morphologist and systematic botanist, and to treat the departments of science to which they are addicted much in the same way as the old-fashioned self-styled practical men did science of any description.

One remedy for this state of things is to be found in the demonstration of the practical utility of such studies. Such a demonstration is the only telling one with a practical man; but that such a method should be needed for the enlightenment of those whose boast it is to follow knowledge for knowledge's sake is passing strange. When it is pointed out, for instance, that a knowledge of the distinctions between various species of Solanum, and of the conditions under which they grow naturally, is likely to be productive of good results in the way of

preventing or evading the Potato disease, the practical man is ready to pay attention. When it is shown that the same sort of information affords valuable evidence as to the formation of tubers, the origin and history of the Potato, and the action of the forces which have made it what it is, then perhaps the physiologists and the histologists of the present day may come to see that morphology and systematic botany are not the mere pastimes they consider them to be.

We have been led to make these remarks by a request we have recently received for information as to the form of the calyx-lobes in various Potato blooms. In most cases the lobes of the calyx or sepals are lance-shaped or acutely pointed. Whether this is universal, or whether there are varieties with blunt sepals, is the point it is wished to clear up. The work of the cultivator has been principally directed to the improvement of the tuber, and so we find an

long, sword-like, sickle-shaped leaves being uncleft, except at the point of juncture with the stems from which they gracefully curve on each side of the stem. The flowers, which are profusely produced on stout spikes, are white, the dark green leaves forming an effective background; the spur, which ranges from 5–7 inches in length, is curved in a most curious manner, as will be seen by reference to our illustration (fig. 17). The lip occupies its original or normal position, for the customary position of the lip on the lower half of the flower is due only to the twisting of the ovary after the first formation of the flower. The seed-vessels, or fruits, too, which vary in form in the different specimens, are interesting in structure. *Aëranthus* (*Angræcum*) *Leonis* was discovered and collected by M. LEON HUMBLOT in the Comoro Islands, growing at a height of 5000 feet, and it is therefore said to be an intermediate, if not a cool-house plant—a statement which its whole aspect fully bears out, the leathery texture of its leaves, and the wiry nature of its roots seeming to assert that the plant is anything but delicate. It will, no doubt, succeed admirably in the

FIG. 17.—FLOWER AND FRUIT OF *AËRANTHUS LEONIS*.

amount of variation in the tuber much greater than in the flower. Potatoes have never been grown for their flowers exclusively, and hence if we find variations in them the evidence so afforded will be the more valuable in that it is, so to speak, less artificial, and consequently more useful in affording a clue as to the real origin of the cultivated plant. The matter may seem trifling, but as it is one which has a direct bearing on the history of the Potato, and indirectly on the prevention or circumvention of the disease, we venture to ask those of our readers who may have the opportunity, to tell us the names of any variety in which the calyx-lobes are blunt or rounded at the tips.

—*AËRANTHUS LEONIS*.—This singular and beautiful Orchid (figs. 17 and 18), which was described by Professor REICHENBACH in our columns at p. 726, vol. xiii., and which was mentioned by us in a recent issue when calling attention to the peculiar arrangement of its spur, may be regarded as one of the most interesting of recent introductions. In habit of growth it is unlike any other Orchid, its thick flat 4–8 inches

Cattleya-house, either in baskets or pots, in sphagnum moss, if kept tolerably moist when at rest, and copiously watered when growing. None need fear to acquire this lovely stranger, for it is one of those plants which take kindly to a new home, and it will, under cultivation, even surpass in beauty the flowers gathered when the plants were collected. The question arises, What can be the moth which ensures the fertilisation of such a plant? The proboscis must needs be long and flexible to penetrate the curiously curved nectary of such a plant.

—*AFROPOS OF THE ANTWERP EXHIBITION*.—A new express day service between London and Antwerp will commence on the 25th inst., when the Great Eastern Railway Company will run a special Continental train from Liverpool Street Station at 9 A.M. In connection with this train their fast steel paddle steamer *Adelaide* will leave Harwich (Parkeston Quay) at 11 A.M., arriving at Antwerp the same evening. The service will be run every Wednesday and Saturday, and there will be a corresponding morning service from Antwerp on Tuesdays and Fridays, reaching London the same night. The ordinary week-day service leaving Liverpool Street Station at 8 P.M. every evening, reaching Antwerp

and Rotterdam early the following morning, will be run in addition to the new day service.

— **BRODIEAS.**—By accident we happen to have three so-called species of this genus before us, in the form of specimens kindly forwarded by the Rev. H. EWANK and Mr. WARE. In the *Genera Plantarum* Mr. BENTHAM combines some of the Millas, the Tritelesias, and the Calliproras into one genus, Brodiaea; and although we would not presume to question the propriety of so doing on purely botanical grounds, yet the structural differences are so great, and general appearances are so different, that it is a question whether for purely garden purposes it would not be well to retain the original appellations. In the case of Brodiaea coccinea the form of the perianth is so different that it seems better to retain the original name, Brevortia.

Brodiaea flavia.—The funnel-shaped flowers of this species are borne on long spreading slender stalks, arranged in simple umbels; each flower is about three-quarters of an inch long, tubular below, the limb divided into six oblong segments, coloured brownish-red outside, clear yellow within. The six stamens are of equal length, inseparate from the tube of the perianth. Each filament is two-lobed at the apex, the lobes membranous, oblong, with the anther sessile between them. The ovary is stalked. This is the Calliprora flavia of some.

Brodiaea laxa.—On the top of a long wiry stalk is placed a simple umbel of erect or spreading very slender flower-stalks, each supporting a funnel-shaped flower about $\frac{1}{2}$ inch long, of a purplish-lilac colour, with six oblong segments and as many perfect stamens inseparate from the tube of the flower. The pistil is raised upon a long stalk like that of a Passion-flower—an unusual circumstance in Liliacæ. The variety Murrayana is every way superior as a garden plant—its larger much more richly coloured deep violet flowers give it a special claim. Mr. BENTHAM who originally described the plant, called it Tritelesia laxa; KUNTH called it Seubertia laxa; BAKER ranged it under *Milla laxa*; and finally Mr. BENTHAM in the *Genera Plantarum* reduces it to Brodiaea. In Tritelesia in addition to the characters mentioned by BAKER and BENTHAM, the flowers are distinctly articulate at the top of the flower-stalk.

Brevortia coccinea.—From the apex of a tall stalk hang in clusters long cylindrical bells of deep crimson colour, the segments turned back like the cuff of a coat, and of a pale green colour. Within the six segments stands up a white frill of three oblong segments which on cutting the flower open are found to be abortive stamens alternating with the perfect ones. Mr. BAKER refers this to Brodiaea, but the tubular form of the perianth distinguishes it from that genus.

— **SCHOOL CHILDREN AT A FLOWER SHOW.**—The Council of the Caledonian Horticultural Society have followed out the course originated at the spring show this year of inviting the school children to see their exhibition in the Waverley Market. On the morning of the 9th inst. 711 of the boys and girls attending New Street School, and belonging to the poorest district of the city; 205 boys from the Original Ragged School, Ramsay Lane, and a similar number of girls from the corresponding institution in Leith Walk, with between 300 and 400 from the United Industrial School, Blackfriars Street, assembled in the Market, and under the guidance of their teachers were shown the various exhibits. The teachers proposed that the children be kept in sections in order that there might be no danger of the flowers being injured, but the officials of the Society gave them liberty to walk about freely, and it is satisfactory to learn that no injury was done to any of the flowers. Mr. MIDDLEMAS, of the Edinburgh Hotel, very generously provided each of the children with a bun and sweetmeats, which they seemed thoroughly to enjoy, and a similar present was made by the same gentleman to the children at the Institution who were unable to attend. The show was visited on the second day by 5000 persons, exclusive of the children. The Ramsay Lane boys had their band and pipers, and played selections of music while the children sang at intervals.

— **ONCIDIUM LEUCOCHEILUM.**—The majority of the species of Oncidium are of some shade of yellow, blotched with brown—a fact which greatly enhances the value of those that depart from the type. We have an instance of this in *O. incurvum*, with violet

and white flowers, a plant that sometimes passes muster for *Odotoglossum albo-violaceum*. The flowers of the plant under notice present another happy combination of colours. The flowers are of medium size, and produced on lateral racemes along nearly the whole length of a branched peduncle some 5 or 6 feet high. The sepals and petals are pale yellow, heavily blotched with chocolate-brown. The labellum is white, suffused with clear purple about the distinct and conspicuous crest. The column is white, with large clear purple wings, a yellow callus in front, and a maroon anther-cap. This attractive combination constitutes the plant a valuable one for ordinary cultivation, and although the flower-stem is tall, the leaves and pseudobulbs are compact, occupying little space, and well deserving of more extended cultivation. A vigorous well-flowered specimen may be seen in the Orchid-house at Kew, and this species forms the first plate in Bateman's *Orchids of Mexico*.

— **CALOCHORTUS.**—Mr. WARE sends us a handful of several varieties of these most exquisite flowers. Of *Calochortus venustus* he sends us several varieties of surpassing loveliness, but which it would be vain to attempt to pourtray in words. To those who are seeking some mark by which to recognise them we draw attention to the fringe of hairs placed below the blotch of colour above the base of the petals, on their inner side; sometimes this is a tuft of short dense tawny hairs, occupying the centre only of the petals—at other times it stretches across from edge to edge in a crescentic or horse-shoe form, as in a form called *purpureus*.

Calochortus citrinus has smaller flowers than some of its congeners, measuring about 2 inches in diameter. The petals are brilliant canary-yellow, with a half-moon-shaped fringe of short, thickset orange hairs above the base.

Calochortus splendens.—A not very appropriate name for a flower which owes its chief beauty to the lavender-grey colour of its flowers—just one of those colours which Quaker ladies used to affect before their taste had become vulgarised. The inside of the petals is lined with long hairs, and just above the base is a small patch of much denser, shorter hairs, looking like a mass of white powdered sugar. The anthers discharge their pollen before the stigmas are ripe, and sometimes the anthers, which are placed in front of the sepals, open before those which are placed opposite the petals. The structure, therefore, as in the allied genus, *Cyclobothra*, is clearly in relation to cross-fertilisation by insect agency. What insects can they be that require the allurements of such special beauty as these flowers present?

— **ROSE SHOW, ANTWERP.**—We are informed that Messrs. LAMBERT & REITER, Rose growers at Trier, Rhineland Prussia, were awarded the 1st and highest prize at the Antwerp Exhibition for a collection of cut Roses in 200 varieties of all classes. For their collections of new Roses, sent out since 1880, 100 varieties; and for Tea and Noisettes, in fifty varieties, they gained as well the 1st prizes. Messrs. LAMBERT & REITER were the only German competitors.

— **EMBOTHRUM COCCINEUM.**—We understood that the specimen at Combe Royal, Kingsbridge, was the largest of this ornamental South American shrub, but we have just learned of another which is yet finer. This one is flourishing in Mr. BOLITHO's garden at Tweddin, Penzance, and has been a blaze of scarlet recently, even now its flowers may be counted by hundred. The trunk, at 3 feet from the ground, is 44 inches in girth, and its entire height is certainly not less than 25 feet; moreover it is a good all round plant, being quite 20 feet through.

— **LILIUM BROWNII.**—Mr. WARE sends us blooms of this sturdy-looking Lily, with its long, trumpet-like flowers speckled with purplish-brown on the outer side, white within. The anthers are orange, and open before the stigma is ripe. It was formerly known as *L. japonicum*.

Lilium pardalinum californicum, with six flowers on one stem, the segments recurved, orange-red spotted like the pard at the base. The peduncles spring from the axil of a leafy bract, and each bears at its base on one side a lesser bract or bracteole so close to the proper bract that there appear to be two leaves in juxtaposition; where the leaves become crowded by the non-development of the internodes, an appearance of a whorl is presented, but the con-

stituent leaves are not all of the same order or age as they would be in a true whorl.

Lilium pardalinum Bourgei is very similar, but has broader flower-segments of a deeper orange colour. *Lilium elegans.*—Various forms of this are sent us by Mr. WARE, some rich enough in their blood-red colour to be worth calling atrosanguineum. We quite subscribe, however, to Mr. ELVES' opinion, that it is not possible to frame sufficiently constant distinctions between these forms. It is worth mentioning that this is the Lily formerly but erroneously called *L. Thunbergii*. *L. philippinense* was also exhibited by Mr. WARE, in his wonderful collections, daily renewed, at the "Inventories."

— **THE PERIODICAL CICADA.**—Dr. RILEY obligingly sends us a report on this remarkable insect (*Cicada septendecim*), which after a period of something like hibernation lasting for seventeen or for thirteen years, suddenly assumes a winged state. The insects are very destructive to the roots of fruit trees in some parts of the United States. Dr. RILEY is enabled to predict the occurrence of broods of these insects almost each year from 1885 to 1901, the brood which appears in any one year being that hatched from the egg seventeen or thirteen years previously. The history of the insect is most remarkable, as may be judged from the following extract, with which Dr. RILEY commences his paper:—

"Few species can claim such a singular history as can our Periodical Cicada. We are moved to admiration in contemplating the fact that an insect, after living 17 nearly seventeen years in the bowels of the earth, should at last ascend from its earthly retreat, change its sluggish, creeping, and wingless form, and, endowed with the power of flight, become a denizen of the air, and enjoy the full glory of the sun. But our wonder increases when we reflect that this same insect has appeared in some part or other of the United States at regular intervals of seventeen years for centuries—39, for ages, in the past! Long ere Columbus trod American soil this lowly insect must have appeared regularly at its appointed time. It must have filled the woods with its rattling song, when none but wild beasts and savages were present to hear it. To me there is something pleasant in the idea that through its periodicity we are enabled with tolerable certainty to go back in thought, for centuries in the past, to a particular month of a particular year, or even to a given day, when the woods resounded with its song in the same manner as they did in 1868, or will the present year.

"It was my good fortune to discover that besides the 17-year broods—the appearance of one of which was recorded as long ago as 1633—there are also 13-year broods; and that, though both sometimes occur in the same State, yet in general terms the 17-year broods may be said to belong to the Northern, and the 13-year broods to the Southern States, the dividing line being about lat. 38°, though in some places the 13-year broods run up considerably beyond it.

"It so happened that one of the largest 17-year broods, together with one of the largest 13-year broods, appeared simultaneously in the summer of 1868. Such an event, so far as regards these two particular broods, had not taken place since the year 1647, nor will it take place again till the year 2069.

"There are absolutely no perceptible specific differences between the 17-year and the 13-year broods, other than in the time of maturing; but while the insects forming these two classes of broods are not specifically distinct, they are good and distinct races which do not cross, and I have, therefore, for convenience sake, named the 13-year broods *Cicada tredecim*."

— **HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY.**—If we may anticipate success for the autumn show of this Society from any data, it is that contained in its last-issued schedule, which has just reached us. The money prizes offered for cut bloom—in the premier classes say £25—is more than the corresponding class of any other Society, not even excepting the National; besides which, the 1st prize of £10 carries with it the Chairman's Silver Challenge Vase of still more value. The prizes in the second class for cut bloom is also large. A silver challenge cup of the value of 5 guineas is offered in the amateurs' classes, open to those residing within six miles of Hull.

— **MUSHROOMS DANGEROUS UNLESS FRESH.**—We learn from the *Farmer's Gazette* that, at the last meeting of the French Academy of Science the question of poisons in edible Mushrooms was discussed, and MM. ROUX and HOUBE presented a report upon some poisonous products which they had

obtained from Mushrooms purchased in the market. Half the Mushrooms were eaten fresh without any bad result, the other half was allowed to putrefy to a slight extent, and were then submitted to treatment with a view to extract the alkaloids. Four were separated, and then, when injected into the animal tissues of guinea-pigs, brought about death with symptoms of intoxication. Those rather numerous persons who prefer Mushrooms in an incipient stage of decomposition, on account of their stronger flavour in that state, should take warning.

— A FINE COLLECTION OF TULIPS.—Among the numerous fine collections of late Tulips cultivated once by amateurs at Lille, France, one of the best was that of Mons. TRIPIER. This collection lately became the property of Mons. JULES LENGART, son-in-law of M. TRIPIER, who united it with his own fine collection in 1851. M. LENGART is a passionate Tulip amateur, and has preserved his collection till now, adding to it everything fine and good to be found in his neighbourhood in France, or Belgium. While all the collections of some importance at Lille have been sold at public auction and dispersed, M. LENGART kept a standard collection of the best broken varieties, as well as a very splendid collection of bearers, among which are many of his own seedlings. The whole collection has been lately sold to Messrs. E. H. KREAG & SON, Haarlem, Holland, and arrived in good condition in their nursery. It will be exhibited next May separately in a flower-bed close to the two large parade beds which, formed this spring, already make a fine show in that nursery.

— PERILOSA GRECA.—It is close upon 300 years since this useful Aesculap was first introduced to British gardens, yet notwithstanding its hardness and other rare qualities, its occurrence in gardens is exceptional, especially where the modern system of flower and carpet-bedding is carried out to any great extent. This is to be regretted since it could be put to a variety of purposes, such as covering walls or trellis-work. For the latter purpose its rapidity of growth is a great recommendation, enabling it to cover large spaces in a short time. The leaves are a deep shining green, but deciduous, and the flowers, of a rich velvety purple, are produced in great profusion on extra-axillary stems. The segments of the corolla are bearded on the inner face, and together with the tail-like appendages of the corona, present on close examination a curious and complicated appearance. A good specimen has been flowering for weeks on the wall of the herbaceous ground at Kew, and is likely to do so for some time. This species is figured in the *Botanical Register*, t. 803, and in the *Flora Græca*, t. 249. We can speak well of it as a hardy climber in the smokiest of town gardens.

— SOUVENIR DE LA MALMAISON CARNATION.—The splendid lot of this Carnation from Mr. LEONOLD DE ROTHSCCHILD's garden at Ascot, Bucks., which appeared at the National Society's Rose Show at the Royal Horticultural Society's Garden on the 7th inst., and which for size and variety have never been excelled, have been, we are informed, awarded a Silver Banksian Medal by the latter Society.

— BROMELIADS.—Merr ANTOINE continues the publication of his magnificent series of plates of Bromeliads. The fifth part now before us contains descriptions and elephant folio illustrations of the following species:

Karatas Plumieri, t. 21, 22.—Leaves tufted, very long, strap-shaped, pointed, remotely spine-toothed at the margins. Inflorescence contracted; floral leaves and bracts minimum-red; corolla red.

Karatas humilis, t. 23.—Similar in habit to the foregoing but with narrower leaves (1 inch in width at the base). Bracts leaf-like, reddish; corolla lobes red at the tip.

Karatas fulgens, t. 24.—Leaves tufted, each a span long, 2–3 inches wide, linear-oblong, obtuse, finely spinous, dentate. Inflorescence contracted; bracts scarlet at the base. Calyx scarlet, less than half the length of the corolla, the lobes of which are purplish.

Karatas purpurea, t. 25.—Leaves tufted, oblong acute, finely spine-toothed. Inflorescence contracted; bracts purple at the base. Calyx-lobes reddish, oblong, acuminate, half the length of the scarlet corolla.

— PROTECTION OF THE ALPINE FLORA.—In consequence of the articles which have appeared in the *Times*, and in our own columns, on this subject, we have received a subscription of £2 2s. from Mr. Justice WILLS for the benefit of the "Association pour la Protection des Plantes." We have sundry publications, detailing the objects and procedures of the Society, which will be sent on application.

SARRACENIA DRUMMONDI.

THE RIGHT TIME TO POT.

THE varieties of *Sarracenia Drummondii*, when well managed, are alike remarkable for their singular formation and the beautiful colouring of their long horn-shaped pitchers. The light coloured variety, *S. Drummondii alba*, is the largest grower, and is a most desirable plant, but the markings on the upper part of the pitchers are not so distinct and clearly defined as they are in *S. Drummondii rubra*, in which the red spotting on the white ground is so decided as to give it a brighter appearance.

There is a miniature form of the red kind, like it in every way both in shape and colour, only that it does not grow to more than a fourth of the size that the larger form attains. Both the red and the white varieties of *S. Drummondii* have been long known to cultivators, but from the fact of their not producing their horn-shaped leaves so freely under the treatment usually given them as the other species and varieties do, they are often met with destitute of leaves that show the true character of the plants than otherwise. All the kinds of *Sarracenia*s produce one crop of pitchers a year, in spring, except the *Drummondii* varieties, which differ from the others that they come with two distinct crops each year—*in* spring, and again in autumn. The natural habit of the plants is that a portion of the leaves which rise from each crown should come plain, or strap-shaped, the remainder, the strongest—usually one or two to each crown—broad, and furnished with the lid appendage. But, as ordinarily treated, it usually happens that all the spring crop of leaves of the *Drummondii* varieties come strap-shaped, in which condition, it is needless to say, there is little beauty or interest attached to them. For a good many years after I began to grow *Sarracenia*s this was the way that the *Drummondii*s, both red and white, served me.

Being otherways successful in getting the various kinds unusually strong, I felt dissatisfied at the behaviour of the sorts particularly under notice; as, with their old autumn-formed pitchers in a dingy discoloured state through the summer, when the other sorts were in their best condition, in place of adding to the appearance of the collection, they detracted from it.

To grow *Sarracenia*s with any degree of certainty as to their doing as they ought, they require to be taken wholly out of the old potting soil once a year; for, however lasting in texture it may be, the saturated condition the plants like it to be kept in endangers its becoming sodden and pasty before the end of a second season, in which state the roots die; and it takes years to bring the plants round again.

My practice up to the time named had been to re-pot the whole stock early in the year, about the end of February. The *Drummondii* varieties begin to grow considerably earlier than the others. [They come from more southerly latitudes. Ed.] The roots of all the kinds are in active motion before top growth begins; consequently at the time I had hitherto potted them the *Drummondii*s were moving. It then occurred to me that the disturbance consequent on shaking out after the roots had commenced growing might be the cause of their failing to make leaves of the right character in spring. To prove whether this was so or not, I again shook out the *Drummondii*s the following summer, about July, when they were wholly at rest, both tops and roots. The result was that in the autumn they made their full complement of horn-shaped leaves, and in spring another crop, individually bigger than ever the autumn set had been. The largest produced by the white variety, which is a stronger grower than the red sort, were over a yard long, stout in proportion, with more than an ordinary amount of white ground colour and spotting. After this the *Drummondii* section were always potted in summer, and continued to give two crops of leaves of the desired shape each year.

Where *Sarracenia*s do well I know of no more interesting or desirable plants; their singular formation of leaf, and equally singular and beautifully shaped flowers, differing wholly, as they do, from all other things, never fail to make them attractive. In addition to the curious shape of the flowers, common to all the species and varieties, those of *S. purpurea*, and the seedling varieties that have sprung from it, are of a beautiful deep crimson colour, glossy and smooth in texture, whilst those of *S. rubra*, which are proportionately smaller than those of *S. purpurea*, besides their leaf colouring, are as sweet and bright

perfumed as Violets. Most of the other kinds produce pale yellow or sulphur-coloured flowers. Whilst *Sarracenia*s are small, and have not acquired enough strength, it is well to remove the flowers as soon as they appear, as this naturally helps to strengthen them. Little account has hitherto been taken of the bloom of *Sarracenia*s; but when the plants get strong the flowers are by no means the least attractive feature they present, as the fine series of illustrations in this journal some year or two since may testify.

The condition in which these plants are often met with is not such as is likely to induce those who have not seen them when fairly managed to commence to grow them. Many suppose their cultivation is difficult, but so is not the case. I cannot admit that any plant is difficult to grow that, like the *Sarracenia*s, requires nothing more than continuous routine treatment, with little more variation than the difference between the summer and the winter season necessitates.

There need be no hesitation about the degree of dryness the soil must be allowed to get to at different seasons of the year, such as requires to be studied with a good many plants. The soil wants to be kept sopping wet from the time the roots begin to stir until late in autumn; in the winter less moist, but never dry. To be re-potted in wholly new soil once a year at the times stated; the plants to be kept close to the glass, with no more shade than will keep the sun from burning the leaves. A temperature of 48° to 50° in the night in winter, about 60° at night during summer, and a proportionate rise in the day, according to the time of the year and state of the weather, and keeping perfectly free from aphides and thrips, is all they want. So treated they will go on increasing in size and vigour, with an absence of the uncertainty attached to many kinds of plants.

The fact of their only requiring to be kept in an intermediate temperature at all seasons commends *Sarracenia*s to many who have not command of heat enough to grow Nepenthes, to which they are little, if any inferior, when all their merits are taken into account. T. B.

MANURIAL USES OF TAN.

HAS spent tan any manurial value? Applied to grass land, either in a fresh or rotten state, it gives no good result at all—its presence seems, if anything, detrimental. Does it contain any essential plant food? and if so, do certain deleterious properties counteract any benefit that might otherwise accrue from that plant food? At many leather-tanning establishments throughout the country vast accumulations of spent tan exist, for which there seems to be difficulty in finding suitable use; yet I am impressed with the idea that it should have its uses in aiding fertility in the soil, or at least in awakening dormant fertility in close difficultly workable soils.

Poor land, whether of the light dry sandy or extremely stiff clayey order, is greatly benefited by admixture with humus, although the humus contain no plant food in its composition; for humus certainly tends to modify certain defects in both these kinds of land; it lends a retentiveness of moisture to the dry sandy, and tends to keep open and pervious to water the stiff close clays, by both mechanical and chemical action. That pure humus is not, and does not contain, a plant food, such as plants take in by means of their roots, has long since been demonstrated by Liebig. Usually, however, humus is by no means (chemically) pure, and it is considered that great benefit is derived from it by plants, when, on its decay, it yields up these impurities (probably valuable plant foods) in that soluble condition in which they (the plants) can make use of them. What we now want to know is—Is tan, when fully rotted, pure or impure humus? and, if the latter, are the impurities contained in such humus good plant food, or merely harmless, or really deleterious matters?

Till science has thrown more light on the subject, I hold that quite rotten tan is humus, and it is well known that many kinds of soil are, as before stated, much improved in condition and consequent productiveness, by having humus mixed into them, although that humus contains no plant food whatever.

I have had large heaps of tan placed close to a dead well, and whenever the latter has become full the contents have been pumped out on to the tan, the water subsequently draining away, while the virtue, or at least some of it, remained in the tan.

This saturated tan applied to grass land appears to give very good results so far. In the absence of scientifically conducted experiments, however, it is of

course impossible for me to judge whether all the goodness out of the dead-well stuff is retained by means of the tan, or even so much of it as would be retained by using in a similar manner charcoal, dried peat, or earth of some kind. I have also for some years used tan mixed with ordinary farmyard manure, rotted down together, as a mulching for Roses and fruit trees in hot dry soil, and the result has apparently been very beneficial. I imagine ground coprolites mixed intimately with tan by being thrown on a heap thereof, and at the same time turning the tan well over, would shortly have the phosphates rendered as soluble as in superphosphate, and in the above-named soils (especially where phosphoric acid is deficient) would then make a very valuable manure. Kainit and other potash manures would also have their solubility much increased, and so become much more valuable by being mixed with the tan some time before its application to land.

If any of your correspondents learned in scientific agri-horticulture would give us, through the medium of your columns, their opinions on this subject they would, I feel sure, interest a large class of your readers. *J. E. E.*

THE HAY CROP.

At the end of April of the present year it was confidently expected that we should gather in an exceedingly abundant hay crop, but the result once again proves how very much the cultivator of the soil is dependent upon the weather for his reward.

Although May gave, according to the Rothamsted rain-gauge, the heaviest rainfall that has occurred since the year 1879, yet the cold atmosphere which accompanied it counteracted to a great extent its beneficial effects upon the mixed herbage of our grasslands.

The month of June, while giving a more than average amount of rain, experienced exceedingly variable temperature, the night air being frequently not many degrees above the freezing-point of water. The variation in warmth between two succeeding days, the 24th and 25th, was 18° 6, the one registering 77° 8, and the other 59° 2.

These great extremes are very trying to vegetation, and accordingly we find from Sir J. B. Lawes' experimental hay at Rothamsted, which has just been secured in capital condition, that the general result of this year's crop is below the average of the past twenty years. Without manure the produce per acre was 19½ cwt. This is about 3 cwt. more than the same plot gave last year, but is 2 cwt. below the average return.

The portion of ground which this season gave the heaviest yield of hay per acre was manured with mixed mineral manure and 600 lb. of ammonium salts. The result of this heavy dressing of artificial manure was 56½ cwt. of hay, being 1½ cwt. less than the same quantity of manure gave last year, and is 5½ cwt. per acre below the average for this plot.

Between these two extremes there are twenty plots, each receiving a different manual application, and under each condition of manure the yield of hay is deficient, ranging from 1 cwt. to 9 cwt. per acre below the average record.

The leguminous plants—the Clovers, Vetchlings, and Bird's-foot Trefoil—have this season made extraordinary growth in the mixed herbage of our meadows, more particularly *Lathyrus pratensis* and *Lotus corniculatus*; so that while the bulk is somewhat small, the quality of the hay is generally excellent, and fully makes up for the deficient yield. *J. W., Harpenden, July 13.*

GALLS ON THE ROOTS OF ORCHIDS.

THERE will, I trust, be no need for apology for referring the readers of the *Gardeners' Chronicle* to an article which was published in that work, in 1869, p. 1230, on two kinds of insects found between the leaves of a bud of an exotic species of Orchis by Mr. Bateman, one of which was evidently the larva of some kind of weevil (*Curculio* sp.), and the others were immature specimens of a minute hymenopterous insect, to which I applied the name of *Isosoma Orchidearum*, belonging to a very numerous family, Chalcididae, of which the species had theretofore been observed only as parasites in the bodies of other insects, but which

seemed to me (on the authority of observations made by the eminent American entomologists, Harris, Riley, and Walsh) to be plant-feeders. This article was supplemented by me in a more extended memoir published in the *Transactions of the Entomological Society of London*, in which my opinion, as stated above, was maintained.

Several naturalists, including Mr. McLachlan, dissented from my view of the subject, considering that the *Isosomæ* agreed with other Eurytomidae (to which group the *Isosomæ* were structurally referrible) in being parasites on the beetles, or some other insects infesting the Orchids; and in an article which appeared in the *Gardening World* on May 16, 1885, Mr. McLachlan writes concerning *Isosoma orchidearum*, "There is some amount of mystery attached to it. The *Isosoma*

FIG. 19.—GALLS ON ROOT OF CATTLEYA, WITH DETAILS OF INSECT STRUCTURE.

belongs to a group of Hymenoptera, parasitic in the larve of other insects, but some maintain that in this case the habit is abandoned, and that the Hymenoptera [*Isosoma*] itself is the true cause of the damage. Since Professor Westwood's paper was published, I have myself bred, from swellings on the roots of Cattleya, both the *Isosoma* and minute midges of the dipterous family Cecidomyiidae; hence I think it highly probable that *Isosoma* is really parasitic on the midge, and that it is the latter that does the damage. What was the colour of the larva found within swollen buds of Cattleya in company with the *Isosomæ*? If reddish or orange they are pretty sure to be those of the midge." The Editor adds:—"The larva are not red, but pure white," which would imply that they are the larve of the *Isosomæ*.

FIG. 20.—GALLS ON ROOT OF DENDROBIUM.

Mr. McLachlan was good enough to give me specimens of the infested root of the Cattleya (fig. A in the accompanying woodcut, fig. 19), showing two galls in the upper part of the root. He also gave me a specimen of each sex of the very minute midge itself. Of the male I have here represented, in fig. B, one of the binodose joints of the antennæ, together with one of the wings (fig. C), in which the lower or posterior vein (*) becomes scarcely visible at about half of its ordinary distance from the base of the wing. These figures are sufficient to prove that these Cecidomyiæ were inhabitants of the root-galls of the Cattleya, although on opening the larger upper gall in fig. A, the interior was found to be solid, and untenanted by any isoset.

I had, however, long previously been able to make another observation on the inhabitant of a root-gall found at the end of the rootlets of a *Dendrobium*

imported in June, 1878, by Mr. G. E. Cox, of Leyton. These galls, represented in fig. 19, D, are about the size of grains of Wheat, and on opening one of them (X) a minute oval cell was found, tenanted by a small orange-yellow larva (E), one eighth of an inch long, and which was clearly referable—as proved by the structure of the head (F), exhibiting the little corneous, forked, refractile implement shown separately (G) within the underside of the front of the segment next to the head—to one of the little midges of the genus *Cecidomyia*. In this case, therefore, it is clear that the gall was the product of the gall-midge, and that the latter had not been supplanted by an *Isosoma*.

Since my memoir was published there have, however, appeared several further notices on the *Isosoma*, both in America and Russia, fully confirming the existence of *Isosomæ* where no true gall-flies, either midges or Cynipidæ, occurred. And in our own country I have the opinion of a very competent observer, Mr. Thomas Whitmarsh, of Wilton, near Salisbury, who has examined "thousands" of specimens of "joint worms" found in grass, and which the structure of the mouth-organs clearly proved that they were manipulated larve of *Isosomæ* and not those of a midge. *I. O. W., Oxford, May 26.*

HOME CORRESPONDENCE.

Raising Roses from Eyes.—As this mode of raising Roses has of late obtained some slight share of the attention it deserves, it is likely that a hint as to one point in the practice may be useful. About the year 1856 I first adopted the practice, and very soon acquired expertness in it, so that from a half-ripe rod I could obtain as many plants as the leaves on the rod, save the youngest at the extremity. By making a fair cutting of the top the whole of the rod was utilised, and the result was a batch of owo-root Roses with a vigour of life and general character approximating to seedlings. I explained by means of a diagram the right way to do it in the *Floral World* of July, 1860, and subsequently in my *Amateurs' Rose Book*, p. 52. The bud is cut in precisely the same as for budding, but a portion of the leaf is retained and the bud is not peeled; in other words, wood and bark remain intact, to form a disc from which roots will in due time be emitted. The newer practitioners of the art remove the leaf entirely. Now we know where to look for the proof of the pudding, and I shall leave all the newer practitioners to go their own way. But having propagated from eyes with leaves and eyes without leaves, I can say that the leaf hastens the rooting process. But with entire leaves it is impossible to pack the eyes closely in the cutting boxes, therefore I remove by a clip with scissors all but the two lowest leaflets, and if need be clip off the halves of them. When dibbed into sand just deep enough to hold them and placed on a gentle bottom-heat, the rooting is soon accomplished, and the bud rises in a beautiful healthy growth. It is the best of all modes of propagating Roses. *Shirley Hibberd.*

The late Mr. Rowe: an Appeal.—About three months since, I read in your paper an account of the death of Mr. Rowe, of Northampton, florist, late gardener to the Lady Clifden, and formerly of Rothampton, where he was well known and much respected as a gardener. At his death he left a widow and four children, who have since had a hard struggle for a living. A short time since, as you have already stated, the poor widow was taken suddenly ill from the effects of sunstroke and died in less than two hours, thus leaving the four children in a most destitute state, three of them quite unable to do anything for their support. The eldest, a girl, is apprenticed to the dressmaking, and is of course quite unable to help to support the other three. My object in writing to you is to ask aid for these poor orphans, by publishing this letter in order to enlist the sympathy of my fellow gardeners for these poor helpless children. From my own knowledge of gardeners generally, I believe this appeal will not be made in vain. I therefore trust, for humanity's sake, that every gardener on reading this letter will at once contribute any small sum they can spare to so laudable an object. I have great pleasure in adding that the children are now under the care of the Rev. F. S. Thornton, Vicar of St. Sepulchre's, Northampton, who will be pleased to receive any

small contributions sent to him on behalf of these poor children, and will see the same properly applied to their use. *H. Beasley, Gardener, Earls Barton, Northampton.* [We have already received from H. C. Griddle Esq., and from H. Maycock Esq., and shall be happy to forward any subscriptions we may receive to the Rev. J. S. Thornton, on behalf of these orphans. Ed.]

Mildness of Last Winter.—As evidence of the mildness of last winter, it may be interesting to mention that there are now freely blooming in the borders of my garden in Shropshire, and in an exposed situation, some dozens of *Calceolarias* and several Purple King *Verbenas* which have stood the winter without the least protection. *W. H. O. S.*

National Carnation and Picotee Society (Southern Section).—The ninth exhibition of the above Society will be held in the Conservatory of the Royal Horticultural Society on July 28. The Treasurer (Mr. H. A. Kolt, 170, Hatfield Road, New Wimbledon), will be glad to receive subscriptions or donations to make the exhibition a financial success. He requires £20 more than he has yet received. The prizes have to be paid immediately after the exhibition. A few friends came forward and generously subscribed the funds to make the *Auricula* exhibition a financial success. The committee hope that the more popular Carnation exhibition may receive at least equal support. A few old subscribers annually fall off, but if each member would obtain one new subscriber the success of the exhibition would be assured. Intending exhibitors will please to send their entries to Mr. Barron, Royal Horticultural Society, South Kensington, at least four clear days before the 28th. *J. Douglas, Hon. Sec., Great Gearys, Ilford.*

Propagation of Lettuce.—It may be an object with some to propagate Lettuces without waiting for their more tedious production by seed. Everybody knows that when a Lettuce is cut the stump sends up a parcel of shoots; but it may not be known to everyone that each of these shoots possesses its own peculiar root, and that by slipping it off, with a portion of the skin and stalk below it, a perfect Lettuce plant will be obtained. It is said Cabbages are thus propagated in India. A Lettuce, however, has much the advantage of a Cabbage in this matter; for it is much easier to slip off with the Lettuce shoot a small portion of the old root, which may probably assist the rootlets of the plant. We have frequently propagated Lettuces in this way, and the result has been most satisfactory. We proceed thus:—We take up the stump when the shoots are about an inch long; but we have often taken some even 3 or 4 inches long. We slice the stump for about an inch or so down, so as to form a small, triangular-shaped slice of old stem to each shoot, and tear this off so as to bring a small portion of the old root with it. We dibble them out on well manured ground, about twice as thick as we propose them to stand, lest there should be any failure; and as we can transplant the spare ones afterwards, we put them in pretty deep, so as to have the entire stem slice below the surface, and give them plenty of water. Of those so treated not one will fail. "*Farmers' Gazette.*"

Children's Exhibitions.—It is now a somewhat common practice to offer prizes at horticultural exhibitions for collections and bouquets of wild flowers gathered and made-up by children. This is something gained, but it is by no means all that should be sought, and a few days ago the Rev. George Henslow, when speaking at the luncheon in connection with the summer exhibition of the Ealing, Acton, and Hanwell Horticultural Society, in Gunnersbury Park, highly praised the bouquets made up by children, which he regarded as a very interesting collection, and one in which he felt a peculiar interest, for thirty years ago his father, in Suffolk, used to teach the children in the National School the elements of botany, so that they not only made bouquets of wild flowers, but they would tell the name of every plant and the structure of every flower in the bouquet. [The late Professor Henslow's letters on this subject were published in this journal at the time, and excited great attention. Ed.] This point he enforced as one of great practical importance. Some might say it was superfluous to teach children such things, and ask—What is the good? Practical good, however, had come of such teaching. When he had a curacy in the South of England he followed his father's

practice, and the children, instead of getting into mischief in the streets, were increasing their intelligence by going in search of wild flowers for prizes. If any one would teach the exhibitors of the wild flower bouquets the elements of botany a great deal of practical good would come of it. They might be taught the uses of plants, that *Aconite* was a deadly poison, and that any member of the *Wallflower* family of plants could be eaten without harm. This knowledge would be very useful, for he had known many children poisoned by eating the berries of *Belladonna*. One instance where such teaching had led to advancement in life could be given. Mr. Maries, who had been a collector of plants in Japan for Mr. Veitch, told him some time since that his interest in flowers dated from the time when he learned the elements of botany at his (the speaker's) school in Warwickshire, and that he had found the knowledge he there gained of the greatest use to him in gardening, and in his botanical journeyings. *R. D.*

Peaches at Port Elliot, Cornwall.—Mr. Knox, who has held for many years the position of gardener to the Earl of St. Germans at Port Elliot, Cornwall, is well known as a good fruit grower, and the Peach-house there is similar in style to the one at Creedy Park, recently described in this journal. The dimensions of the early house are about 40 feet by 8 feet, and on the back wall are trained Tea Roses, which supply abundance of flowers from early spring. There are three Peach trees in the house—two of Royal George, and one of *Violette Hative*; these are planted in the front of the border, and trained parallel to the lean-to roof, being 16 or 18 inches from the glass. The crop numbered about 350 large fruits, some of them measuring 9 and 10 inches round. *W. Napper.*

Exhibiting Orchids.—As a grower and also an exhibitor of Orchids I read with much interest the remarks at p. 16 on this subject. The writer is, like myself, against the system of making up Orchids on purpose to show them; but there are, it is needless to say, two sides to this question. The managers of flower shows cannot be expected to object to made-up specimens, as the larger they are so much the greater is the display. And if amateurs and the trade like to risk any probable injury to their plants it is no one's business but their own. As a practical illustration I might allude to the schedule issued by the managers of the Regent's Park exhibition. The exhibitors have a considerable degree of freedom; they are not required to show distinct species, or even varieties of species. In one class no allusion is made to specimens massed together, but exhibitors please themselves whether they will exhibit in that way or show single specimens, or a mixture of both. In another class *bona fide* specimens only are admitted. This arrangement I greatly approve of, and hope it will be continued in future. The suggestion to provide a class for fifty Orchids is one that I hope managers of flower shows will not adopt. Such a class would bring the best growers to the front it is said. This is very doubtful. Who could show such a large number? Very few indeed. It would be the means of bringing some very poor specimens to the front; in that case the Maidenhair Ferns would be useful to hide the blemishes. Some exhibitors of Orchids do not grow Maidenhair Ferns by the hundred. I do not; and protest against being required to exhibit Ferns or any other plants because I am required to show Orchids. *Masdevallias* may be exhibited in square deal trays; but such an infringement of good taste never occurred at any London show, and on this subject I may remark that *Masdevallias* are not injured by being turned out of the pots in which they are grown and used to make up a large specimen. *Cypripediums* may be used in the same way without being injured; so also may other species and varieties of Orchids. It must not be supposed, because I say this, that I advocate making up masses of Orchids. I do not approve of it, and rarely ever do it. The writer of the article in question is drawing upon his imagination, when he alludes to the annoyance caused to master and man by the ruthless manner in which their plants have been treated. It is also begging the question to write of "thirty spikes of *Odontoglossum Alexandræ* all muddled together in a pan a yard across," "a score of *Masdevallias* in a deal tray," or "a heap of *Oncidium concolor* fixed round an immense block." And further, I cannot understand how "a painstaking and careful man can be placed at any disadvantage because he cannot pro-

duce anything like the plants at the show." This is the old grievance trotted out once more. It is very unfair too to write of the present manner of exhibiting "as producing false impressions," and an insult to exhibitors to say that the Orchids are now "mostly staged with but little idea or attempt at beauty of arrangement or effective display." Those who have little or no experience of exhibiting themselves are always ready enough with their advice. The plan of exhibiting a large number of Orchids mixed with Ferns has been tried at the Crystal Palace, and the result has not been such as to recommend its adoption anywhere else. *Jas. Douglas, Great Gearys, Ilford.*

Dicksonia antarctica and **Phorium**.—Two fine specimens of the former enjoy sheltered positions in the gardens of Trewidell, Cornwall, and great masses of *Phorium tenax* are now sending up their tall flower-spikes. *W. N.* [The latter plant is in flower in the open at Kew. Ed.]

Platanus orientalis.—In the public park of Dada Pest, where a national exhibition is now being held, there are two beautiful trees (of I should suppose forty or fifty years old) of a variegated *Platanus orientalis*. Can you tell me where young plants can be bought? They are most beautiful. *W. H. M., July 11.* [Write to any leading nurseryman. Ed.]

Lasiandra macrantha floribunda on the Back Wall of a Vinery.—At Clowance, near Camborne, the home of the Rev. H. Molesworth St. Aubyn, on the back wall of the succession vinery is an exceptional specimen of the *Lasiandra macrantha floribunda*. All its growths are tied in, and the space covered is about 16 feet by 9 feet. The floriferous character of this beautiful plant when properly cultivated is not generally known among gardeners, and the plant under notice is no exception, there being at the time of my visit abundance of its flowers on the point of bursting; in fact, every shoot is set with bloom-buds. Mr. Foot, the gardener there, has experienced no difficulty whatever with this plant when grown in a vinery, and it does not, he says, interfere with the well-being of the Grapes. It supplies plenty of its lovely blooms from July until far into the winter, and they are much appreciated. *W. Napper.*

Reports of Societies.

ROYAL HORTICULTURAL: July 14.

This last meeting was the occasion of a very interesting display of fruit, flowers, and vegetables. The tables were, however, not so loaded with the productions of the garden as will be the case when autumn arrives with its abundance of mature fruits, roots, and other products of the kitchen garden, orchard, and forcing-house.

Plants for competition, because of the restriction imposed as to size of pots, were small, and it must be said, wanting in novelty; but the collections of hardy plants from well known growers, were of a varied and charming description, especially noticeable being Lilies and *Calochortus*.

Scientific Committee.

A. Grote, Esq., in the chair.

FUNGOID DISEASES IN FRUIT TREES.

A communication was received, through Sir J. D. Hooker, from Mr. T. Kirk, Wellington, New Zealand, asking for advice as to remedial measures. In some districts the fruit trees are being destroyed by the mycelium of a ground fungus—a small *Puffball*—though the author suspects that several Agarics affect them. When the ravages are most serious the reproductive state is but rarely developed. It first appears as a circular patch, in which all vegetation (as in fruit trees, Oaks, Walnuts, grass, Sorrel, Strawberries, &c.) is more or less "blighted," the plants exhibiting a withered appearance, the leaves becoming slightly curled, droop and fall long before their time, and the plant dies. The roots are more or less covered with mycelium. The effects extend in a most singular fashion, travelling half-way across a garden or orchard from one side only, at others extending in all directions. It is most fatal to fruit trees. It is almost exclusively confined to light soils, on which Fern (*Pteris aquilina*) has grown. Damp or dry soils have no attractions for it. It occurs abundantly in the decaying rhizomes of the Fern, transferring its attentions to fruit trees whenever the opportunity is afforded. The first parts on which the affection shows itself is the juncture of root and stem. The bark becomes absolutely rotten

when permeated by the mycelium, and emits a nauseous odour. Plum trees usually show but little mycelium as compared with Apples, but the trunk is more obviously affected, and exudes gum freely. Experiments are being carried out in the following directions:—(1) Soaking the soil with tar-water and dressing the affected parts with the same; (2) dressing the soil with soot; (3) with sulphur; (4) with mild brine washes, both for trees and soil. So far the water seemed the most effective, but the author was inclined to think that sulphur will have the most permanent effect.

PEACH BLIGHT.

The author adds, that in all parts of the country the Peach is dying wholesale, but the cause is most obscure. The trees appear to flower with their accustomed luxuriance, and the fruit to set as usual. If a sudden change of temperature, or a severe frost has been experienced during the flowering time, the fruit does not swell, the leaves make their appearance readily and fall quickly—minute orange coloured blotches are seen on the twigs. These become confluent and black, and then the buds decay. At this stage the plant may die, or if the season prove favourable, a weak autumn growth may be made, and new leaves developed, tassell-like, at the tips of the branches; but a renewed attack during the following spring proves fatal, and the plant dies. Plants one year from the seed are attacked as readily as the oldest. Occasionally a tree partially sheltered has suffered less than its neighbour or has escaped entirely; while two kinds appear to resist the disease more than others, viz., Cornet and Salway, but they are certainly not blight-proof by any means.

In the absence of material the members of the Scientific Committee did not feel competent to pass an opinion on the subject.

POPPIES, VARS.

Mr. Smee exhibited seedling Poppies of P. Rheas with wedge-shaped black patches and white borders at the base; they had originated from the common form.

AMORPHOPHALLUS (HYDROSME).

Mr. Ridley exhibited a seedling he had raised from a fruit from Gambia, West Africa.

PICEA POLITA.

Dr. Masters exhibited a spray of this Japanese Conifer with cones, received from Mr. Veitch.

ELMS DISEASED.

Dr. Masters mentioned the fact of an avenue of Elms fifteen years old, in Guernsey, of which some thirty or forty trees were rapidly dying without adequate cause being apparent. Diseased branches were referred to Mr. Murray for examination and report.

PLANTS EXHIBITED.

Mr. Lynch brought from the Botanic Garden, Cambridge, a fine flowering spike of *Yucca angustifolia*; the anthers appeared to be abortive, and it never set seed. A spray of *Pelargonium Endlicherianum*, from Australia; *Jasminum angulare* var. *glabratum*, a plant new to cultivated gardens, from the Cape; *Nelumbium luteolum*, from North America. Dr. Masters exhibited from Mr. Ware an umbel of *Eurygonium* (Ferula) *Sumbul*, remarkable for the acrid and musk-scented juice.

CLOVER, VIRESCENT.

Mr. Houston exhibited specimens of a new uncommon form, in which the ovules were particularly well developed in the form of leaves.

POTENTILLA REPTANS WITH UNI- TO SEPTIEM-FOLIATE LEAVES.

The Rev. G. Henslow exhibited specimens of *Cinquefoil*, showing transitional states from one-foliolate forms, through ternate and quinque-foliolate to seven-foliolate forms.

OX-EYE DAISY.

Mr. Smith sent specimens in which the ray-florets were tubular, like those of *Centauria*, and not ligulate, as usual.

PHEASANTS POISONED BY FUNGI.

The following communications were received from Mr. W. G. Smith:—"A week or two ago Mr. Henry Mills, of The Gardens, Enys, Penryn, Cornwall, sent me an example of a fungus which had poisoned pheasants; the gamekeeper had cut open the pheasants' crops, and found pieces of the fungi in them. The birds swell, and are soon dead. On asking Mr. Mills to secure other specimens of the fungi he could not find them, but, strange to say, the pheasants, with superior eyes for such things, found them easily, for other birds died, and pieces were again found in their crops. It is remarkable that sheep and lambs have died suddenly in the same field, as well as in an adjoining field. Whether the sheep have died from the effects of the fungi is uncertain, but sheep will, no doubt, sometimes eat fungi. I have seen sheep eat Mushrooms. I hope to be able to name the species of Agaricus [and

Champignons, Ed.] with certainty at the next meeting of the Scientific Committee, as I have just received fresh and better material. I am, however, able to point out the series to which it belongs. It is one of the *Hypothodii*, or pink-spored Agarics, a series limited in Britain to a comparatively small number of species. The Agaric is a small one, about 1 inch in diameter, with characteristic nodular spores. It is probable an *Entoloma*, close to *A. placenta*, *A. helodes*, and *A. repandum*. A close ally of these, viz., *A. strigosus*, once put me to considerable inconvenience and annoyance."

RESTING-SPORES OF PERONOSPORA PYGMÆA.

"A correspondent, Mr. George Brebner, of Aberdeen, has sent me a large supply of the oospores of this *Peronospora* detected by him in leaves of *Anemone nemorosa*. He has also forwarded a drawing and a microscopic slide showing the oospores *in situ*. In the slide the oospores can be distinctly seen attached to the same mycelial threads as the conidiophores. Mr. Brebner states that Professor Trail has recently lighted on the oospores of *Peronospora* in rubescens in the leaves of *Papaver Argemone*. It is a mistake to suppose that oospores of *Peronospora* are rare; they are easily found by competent observers; and when seen on the same threads as the conidiophores—as by myself in *Peronospora infestans*, and by Mr. Brebner in *P. pygmæa*—no unprejudiced person can doubt their true nature."

Floral Committee.

Present: Shirley Hibberd, Esq., in the chair; and Messrs. Henslow, Baines, Bennett, Bealby, Wilks, Kinghorne, J. James, Herbst, G. F. Wilson, Duffield, Noble, J. Fraser, Domioy, Pollett, J. O'Brien, Hill, Llewellyn, Douglas, Hudson, Walker.

COMPETITIVE GROUPS (OPEN).

For the best nine distinct *Dracenas*.—1st, Mr. J. Hudson, gr. to H. J. Atkinson, Esq., M.P., Gannery House, with plants stocky and well foliaged; the green and white Regina Leopoldi, bronze and crimson *Ananias Baptisti Mooreana*, a better plant and showier than some others; *Gulleyoid* being the best of them; 2d, Mr. H. James, Lower Wood, 2d, Mr. A. Luff, gr. to K. R. Hyatt, Esq., Leigham Court Road, Streatham. In the competition for nine distinct *Crotons* Mr. Hudson took the 1st prize, with *C. acuminatus*, light yellow and green, a distinct variety; *Disraeli*, *Andream*, &c.; 2d, Mr. Luff, in whose group were the singular-looking *Hookeri*, with foliage half yellow, half green. A few *Nepenthes* and *Sarracenia*s were shown by Mr. H. James and Mr. Luff, who were awarded respectively 1st and 2d prizes in the order of their names.

In the class for twelve fine-foliaged plants. Mr. H. James took the 1st and only prize, his specimens consisting of well-known species and varieties. We noticed *Pandanus utilis*, *Dicranbachia Jemmani*, *Maranta Veitchii*, *Areca rubra*, and *Cocos Weddelliana*. Mr. Hudson took 1st prize in the amateurs class for nine distinct fine-foliaged plants.—In the collection there being several small well furnished Palms, a good plant of *Asparagus plumosus* and *Croton Warneri*, a distinct and singular variety with twisted pendulous leaves; 2d, Mr. Luff, whose lot contained three varieties of *Asparagus*; 3d, Mr. Chadwick, gr. to E. M. Nelson, Esq., Hanger Hill, Ealing.

Coleus, six distinct, were shown by Mr. C. Waite, gr. to Colonel Talbot, Glenhurst, Essex, 1st; Mr. Luff 2d; *Sunset* and *Butterfly* in the lot shown by Mr. Waite being the prettiest varieties.

*Adiantum*s six distinct, were exhibited by Mr. Chadwick, 1st; and Mr. Luff 2d. The plants were in either instance nicely grown, small furnishing material, consisting of such varieties as *decorum*, *gracillimum*, *cinereum laum*, *pentadactylum*, *tenerrimum*, &c.

Mr. Ware, Tottenham, showed twelve cut spikes of *Pinus*, and obtained the 1st prize. There were some bright and distinct colours amongst them, viz., *Colonel Flatter*, purplish-rose; *Madame Marie Senon*, crimson; *Kinnaird*, a soft rose and white; *Miss Robertson*, a very fine white; and *Madame de Sial*, pink with crimson eye. Mr. Ware took 1st prize in the Lilium class, his specimens comprising Humboldt's, a splendid yellow with crimson spots; *Martagon dalmaticum*, canadense rubrum, small orange-coloured species with crimson spots, flowers pendulous; *Browni*, *Parryi*, and *testaceum*. Messrs. Paul & Son, Chiswick, were 2d; and Mr. Quaterman, gr. to Mrs. Smith, Esq., Silvermore, Cobham, 3d. Mr. Bateman, Twicken Road, N., took the prize in Messrs. Paul & Son's Special Class for the best collection of Roses raised at their nursery.

HARDY HERBACEOUS PERENNIALS.

Mr. Ware staged an immense quantity of these, occupying a table nearly half the length of the conservatory. The genus *Lilium* was in great numbers, and the spikes, being cut and put up in profusion, gave a fine idea of their decorative value in masses or clumps. *Eriophorum longiflorum*, *Sieboldi*, *candidum* specimens were shown, particularly the soft yellow *paludosum*, *philippense*, *Humboldtii* and *rubescens* were amongst the more striking kinds; *Iris Kempferi*, *Alstromeria*s, *Veronica*s, *Penstemon*s, *Hemerocallis*, *Funkias*, and *Papaver nudicaule*. Messrs. Paul & Son took 2d prize for herbaceous perennials, and Mr. J. Moore, Nurseries, Epsom, the 3d. Mr. J. Hill, gr. to G. Hardy, Esq., Fickering Lodge, Timperley, Cheshire, grouped a splendid lot of *Odon-*

toglossum vexillarium, consisting of between sixty and seventy specimens, eight of them being in 15-inch pots; all of them, large and small, profusely bloomed, and comprised flowers of several shades of colour, from faintly shaded white to deep rose; the size of flower corresponding to their high state of cultivation. The trifling recognition of a Silver-gilt Banksian Medal was awarded them.

A pretty collection of cut blooms of mixed Roses came from Messrs. Veitch & Sons, Chelsea, consisting of well opened kinds, a box of twenty-four blooms of *L. France* was greatly admired. A Silver Medal was awarded.

Messrs. Lee & Son had a similar award for a group of shrubs and Roses suitably placed on the terrace in the conservatory.

Messrs. Kelly received a Bronze Medal for hardy flowers in a cut state, such as *Gaillardias*, *Tea Roses*, *Delphiniums*, also for some *Petunias*, &c.

CERTIFICATED PLANTS.

Mr. Hill, Tring Park, showed some spikes of the striking *Renanthera coccinea* (Storey), the flowers of which are brilliant scarlet; the upper lobes being barred with yellow, faintly; the spikes, as in *Renantheras* generally, being of considerable length.

R. H. Measures, Esq., showed a variety of *Odontoglossum vexillarium*, named *Measuresii*, having bloom of a pure white, and crest bright yellow—a pretty variety from the same type.

Mr. R. Owen, Floral Nursery, Maidenhead, brought a new *Begonia*, named *General Gordon*, cherry-red in colour, semi-globular in form, and double petalled.

Mr. W. Bealby, The Laurels, Roehampton, had a white zonal *Pelargonium*, *Eltoni*, *Porfait*, pink white, nicely formed, regular pip, and possessing a few extra petals, inferior in size to the normal ones.

Messrs. Paul & Son showed a *Privet*, *Ligustrum sinense* var. *floribundum*, a plant nearly 6 feet high, literally smothered with its white flowers. They also showed the spotted *Rose*, *Pride of Reigate*, and *Rose Madame Norman Neruda*.

Messrs. Henderson & Son, nurserymen, Maida Vale, exhibited *Aloxia Hendersoni*, a plant with sagittate leaves, of dark metallic hue.

MISCELLANEOUS PLANTS.

The New Plant and Bulb Company, Colchester, showed some fine handsome varieties of *Calochortus*, now at their best; also *Lilium aurantiacum* variety, of a pure orange colour; and *L. elegans* "Benny."

From Mr. Turner, the Slough Nurseries, came a useful-looking white *Carnation*, *Rose Molynæus*, a fairly good flowering *Camellia*.

Messrs. Carter & Co., Holborn, London, showed *Sweet Peas* in many separate shades of colour, and a new *Silene pendula* compacta, much more compact and sturdy than the old *S. pendula* which was shown alongside for the purpose of comparison. *Rhodanthe Mangeshi* alba shown by this firm is a useful variety.

Messrs. Henderson & Son showed *Hemeranthus Katherine* with a corymb of cerise blossom, and a collection of *Celastrus* in small pots.

Mr. R. Dean, Ealing, showed New Giant Ten-week Stock grown from seed sown in April. The spikes were thick and stood in the same time compact. He showed likewise *Mauve Beauty* and *Belford* *Crimson Stocks*—good strains.

Mr. King, Rousham, Aylesbury, brought *Coleus Pride of the Market*, a prettily marked, compact growing kind.

Comte de Gerniny, Rouen, sent *Cattleya Warszewiczii* *Sanderiana*, a spike of seven very big flowers of bright purple.

Messrs. Sander & Co., St. Albans, had a new *Scecolabium* as yet unnamed, the flowers pure white, and like the lip, which is pale lilac, the flowers spike on the weak plant seen not being more than 4 inches long. Mr. Salter, Selborne, Streatham, sent blooms of *Sobralia macrantha splendens*, a trifle deeper in colour than *S. macrantha*. A nice white *Pelargonium* of the "Egmont" section, of good substance in form, came from Mr. T. Buryard, nurseryman, Ashford, Kent. From R. H. Measures, Esq., came *Lycaste Deppii* *viridis*, *Odontoglossum cristatellum*, the latter with small dark brown flowers, more curious than ornamental, on stout spikes of 1½ to 2 high; *Angulica Measuresii* of cream white with a few external spots, thickly, densely spotted with minute crimson interiorly. Messrs. Veitch & Sons showed their fine *Andromeda speciosa* var. *canadensis*, the short shoots densely covered with large white bell-shaped blossoms; *Clematis coccinea* and *C. flammula* rubra; *Argemone*s, *Watts*, Esq., Lake House, Cheltenham, was sent *Vanda Denisiana* *hebraica*, a singular looking dirty white blossom with a green lip; and *Brassia Lyallii*, a flower with green sepals and petals, the lip being yellow, spotted with dark brown. Mr. B. S. Williams showed the same species of *Brassia*.

Messrs. Heath & Son, Cheltenham, showed *Odontoglossum vexillarium giganteum*, bright and large as the name denotes; the centre being white. From W. Cobb, Esq., Silverdale Lodge, Sydenham, came *Odontoglossum Cobblanum*, having the upper petals of a pink colour, which is the white of the eye.

Mr. Munro, from far away Dingwall, sent seedlings of *Pansies* of excellent quality; the margined blooms being very fine.

FIRST-CLASS CERTIFICATES.

To R. H. Measures, Esq., for *Odontoglossum vexillarium Measuresii*.

To Messrs. Henderson & Son, for *Aloxia Hendersoni*.

To Messrs. Paul & Son, for *Rose Pride of Reigate* and *Rose Madame Norman Neruda*.

To Messrs. Paul & Son, for *Lygustrum sinense* floribundum.
To Mr. R. Owen, for *Begonia* General Gordon.
To the New Lawful and Bull Co., for *Lilium Parryi*.
To Mr. E. Hill, for *Renanthera coccinea*.
To Mr. W. Beadly, for *Pelargonium Blanc Parfait*.
To Mr. T. F. Rivers, for *Nectarine Gordoni*.

Fruit Committee.

Present: J. D. Godman, Esq., in the chair; and Messrs. Harrison Weir, T. F. Rivers, Lyon, G. Paul, H. Veitch, Ross, J. Lee, Rutland, Blackmore, Ford, Willard, G. Bunyard, Hayward, Burnett, W. Paul, Roberts, Woodbridge.

FRUIT.

The most prominent section under this heading was found in the GRAPES, which were generally admirably shown, the class for three bunches of Black Hamburgs bringing not fewer than eleven exhibits, and nearly all first class. The best were staged by Mr. Taverner, gr. to Sir A. K. Macdonald, Liphook, whose bunches, though of medium size, and fairly solid, had very fine berries, rich in colour, and highly finished; Mr. J. Loudon, gr. to Thomas Barnes, Esq., The Quinta, Chirk, had larger and tapering bunches, with good colour, but with less colour, and Mr. D. Roberts, Prestwood, Essex, came 3d, with good clusters, the berries black as Sloes, but somewhat too glossy. With three bunches of any other black kind Mr. Roberts, gr. to the Messrs. De Rothschild, Gunnersbury Park, had a good lot, with Madresfield Court; his bunches, though somewhat clustered, were grandly berried—indeed, about as finely so as could be—richly coloured. Mr. W. Allan, gr. to Lord Suffield, Ganton Park, had same kind, smaller, but more tapering bunches, berries good, but wanting more colour; and Mr. Nield, gr. to Lord Carrington, Wycombe Abbey, came next, with fine examples of Gros Maroc, which winning also a little more colour to make them perfect. There were seven lots in this class, and in that for Muscat of Alexandria less competition, only five sets of bunches being staged. The best three, large, solid, although fairly soft, yet not overripe, were by Mr. G. Bunyard, gr. to W. H. Sewell, Esq., Loughton, Essex; Mr. Loudon was 2d, with smaller but better coloured bunches, and Mr. Cakebread, gr. to Sir P. F. Rose, Bart., Penn, Bucks, who was 3d, had moderate bunches. The class was not a satisfactory one, but less than seventeen couple being staged in one class for any one variety, Mr. Loudon had some clean handsome Queens; Mr. Mundell, Moor Park Gardens, followed with good samples of same variety; and Mr. J. Hudson, gr. to H. J. Atkinson, Esq., M.P., Greenbury House, was 3d, with Queens also. Some fine fruits of the Smooth Cayenne were shown in the class, but wanting colour. There were nine fruits staged in the single specimen class, the best, a handsome clean Moscat Queen, coming from Mr. D. Roberts—Mr. R. Nicholas, Castle Hill Gardens, South London, following with a large and well coloured Smooth Cayenne; and Mr. Loudon was 3d, with a very good Queen.

PEACHES were represented by eleven dishes, the finest Barrington, a large, though not highly-coloured, sample, being staged by Mr. C. Barrett, Cheshill Hill Gardens, Essex. Mr. Coombe, Sheen House, Surrey, came next, with good pale Grosse Mignonne; and Mr. J. Bashford, gr. to G. Searlet, Esq., East Sutton, was 3d with well coloured Crimson Galande. *Violette Hâtive* and *Bellegrade* were very well represented.

APPLES were staged in three classes not fewer than sixteen dishes being staged. Of these the finest were Stanwick, rich in colour, from Mr. Bashford; Lord Napier, fairly good, from Mr. Wallis, Keele Hall Gardens; and *Violette Hâtive* from Mr. Allan. Scarcely any other kinds than those named were shown.

FIGS.—With dishes five fruits Mr. W. Widsmith, gr. to Viscount Eversley, Heckfield Place, was an easy 1st, his samples of Brown Turkey being specially good and bright. With the same kind Mr. Taverner was 2d; and Mr. W. Juggelen, Mazon House Gardens, 3d.

PLUMS were staged in two classes, the best staged. The best and a superbly flavoured kind, flesh soft, melting, and luscious, was found in Longleaf Cashmere, a product from Eastnor Castle. Hybrid Cashmere, staged by Mr. Pratt, gr. to the Marquis of Rath Longfeild, 1st. This variety, which was also staged, and which we record in our Catalogue Certificate from the Fruit Committee last week at Chiswick. Mr. P. Goddard and Mr. Widsmith came 2d and 3d, with Hero of Lockinge.

STRAWBERRIES were for the season very good, though samples were in some cases irregular in form. The best bunches of dishes, of which eleven lots were staged, came from Mr. D. Roberts, who had good Presidents and fair British Queens. Mr. Allan followed with finely coloured Crimson Queen and line James Veitch; Mr. J. Smith, Romford, coming 3d, with Dr. Hogg, rather pale, and fair British Queens. In the single dish class Sir Joseph Paxton won 1st place for Mr. T. Edgington, Woodthorpe Crane Gardens, Nottingham; Mr. J. Wate, gr. to Hon. Colonel Talbot, Essex, having good British Queen; and Mr. Allan was 3d, with Dr. Hogg, out of thirteen.

CHERRIES were good, the samples especially which came from Mr. Hudson being fine and richly coloured; these were Black Circassian and Bigarreau Napoleon. Mr. Ward, gr. to Earl Radnor, Longford Castle, was 2d, with May Duke and Cleveley Bigarreau; and Mr. D. Roberts, Eastnor Castle, 3d, with Governor Wood and Frogmore Early. We cannot quit the fruit without referring here to the truly grand lot of Cherries, some twenty dishes, sent by Mr. T. Rivers, of the Sawbridge-

worth Nurseries, from pot plants grown under glass, the samples in most cases being marvellous. Rivers' Early, Black Bigarreau, Bedford Prolific, Bigarreau de Sothenien, and Noir de Guben, were of the finest kinds; and of white cherries, Bigarreau Napoleon, Bigarreau Gros Coucure, Bigarreau Monstreuse de Mexel, and Empereur François, were superb. Mr. Rivers also staged twelve sample dishes of Peaches and Nectarines, having especially fine of the former, the American Conking, large, handsome and brilliantly coloured, from Dr. Hogg, rather overripe; and the latter, the Spenser Pine-apple, with handsome Goldoni Nectarines; and was awarded a Silver-gilt Medal for the collection.

MESSRS. WEBBER'S PEACH PACKING PRIZES.

In competition for the handsome prizes offered by Messrs. Webber & Co., Covent Garden, for the best packed box of twenty-four Peaches, eight were sent by rail and delivered as parcels. Of these when opened, three were packed with moss, one with bran, and four with wadding. The moss proved to be the best material, as dry, clean, and well packed, it is soft, cool, and elastic; whilst of the wadding packed fruit, nearly all were more or less bruised, and the wadding becomes damp and less elastic. Mr. J. Turton, gr. to John Hargreaves, Esq., Maiden Erleigh, Reading, and who was 1st last year, again won with his admirable packing in soft moss. The fruit being packed in soft tissue paper. Mr. T. Hare, of West Gardens, Wellington, Graham, was 2d with similarly packed fruit; and Mr. Waterman 3d, also using moss.

VEGETABLES.

The class for eight kinds of these being in a strong display in not less than fourteen lots staged. Very close indeed were the best collections—Mr. G. H. Richards, gr. to the Earl of Northampton, Souerley Park, coming a good 1st; and, as a young exhibitor, meriting very high praise in this best of all experienced exhibitors. His collection comprised good solid London Cauliflowers, White Elephant Onions of great size, Saunders' Marrow Peas, like to Telegraph; Sutton's Improved Intermediate Carrots, long, tapering, and very handsome; Carter's Perfection Tomatoes, Canadian Wax Beans, Green Beans, and early Lapstone Potatoes. Mr. G. T. Miles was within a point or two of Mr. Richards, but his London Cauliflowers were a trifle too large. He also had white Onions, only here called Naples; Culverwell's Giant Marrow Peas, fine Stamford Tomatoes, Snowdrop Potatoes, &c. Mr. Haines, Colehill Castle Gardens, came 3d with good exhibits, including Duke of Albany Peas; Penny-byrd round Marrows, small and pretty; fine Trophy Tomatoes, and Woodstock Kidney Potatoes. Mr. T. A. Beckett, Penn, Bucks, and Mr. Waite, both received extra prizes for their capital collections, the latter having in snow-drops, white kidney, the best dish of Potatoes in the show.

TOMATOES were good, the best coming from Mr. Farrance, who had large Trophy, well coloured; Mr. Thompson, gr. to Messrs. W. & E. Wells, Hounslow, coming next with same variety; and Mr. Phillips, The Doarers, Meopham, was 3d, with very handsome Carter's Perfection.

A dozen brace of CUCUMBERS were staged, but none specially good. Mr. Godacre, who had the best in Telegraph and Purple Park Hero, was 1st; and Mr. Ward and Mr. Richards, 2d and 3d. SPECIAL PRIZES were offered by Messrs. Webb & Sons, Wordsley, for their Wordsley Wonder, a scimitar-shaped kind, the best samples all coming from Boston—Mr. H. Marriott, Mr. Cooke, and Mr. H. Marriott, jun., taking the prizes, and, curiously enough, coming in the same order in the class for a dish of House's Perfect Marrow, much like British Queen, the prizes being given by Mr. J. House, Peterborough. There was very good competition in both classes. Mr. T. Laxton, Gritford, showed several new Peas, mostly very fine indeed, including Evolution and Walton Hero. Messrs. J. As. Carter & Co., seedsmen, High Holborn, put up sixty dishes of Peas, of varying size and quality, their own famous kinds coming out finest, and secured a Silver Medal for the collection. Some smaller collections of Peas came from Mr. J. C. Mundell and Mr. W. J. Wood, gr. to Messrs. J. Leighton & Sons, Mr. Beckett, to all of whom Votes of Thanks were awarded; the last-named grower receiving, in addition, a Bronze Medal.

Trials of Fruit and Vegetables at Chiswick.

At a meeting of the Fruit and Vegetable Committee held at Chiswick on July 2 (present: Mr. C. Silverlock, in the chair; Messrs. Goldsmith, Ross, Burnett, and Rivers) the collection of Peas growing in the garden was examined. Messrs. J. As. Carter & Co., seedsmen, put up the Amerer, the result of a cross between Laxton's No. 1 (wrinkled) and Little Gem (seedling), having the appearance of a well selected stock of William I, and coming into use about the same time.

CAULIFLOWERS.

The collection of Cauliflowers was next examined. The following were all considered selections of the Early Erfurt, more or less pure, and were highly commended, viz., Dear's Early Snowball (Dean), Snowball (Williams), Earliest Erfurt (Koster), Haage's Dwarf (Koster, Anderson), Erfurt, very dwarf (Benary), Erfurt, dwarf earliest, light musk (Benary), Early Erfurt (Carter), Carter's Defiance (Carter), New Dwarf (Kulley), Erfurt (Vilmorin), Sharpe's First Early (Sharpe & Co.).

STRAWBERRIES.

The following seedling Strawberries from Mr. Laxton were next examined, viz.,—King of the Earlies, Captain,

A. F. Barron, Admiral; a First-class Certificate being awarded to the variety named A. F. Barron, stated to be the result of a cross between Sir C. Napier and Sir J. P. Paxton, an extraordinary prolific Strawberry, bright in colour and of fine quality.

Some fine examples of The Earl Plum and Early Rivers Cherry were exhibited by Messrs. T. Rivers & Sons.

Mr. C. Ross, Welford Park, Newbury, submitted evidence of a new Grape raised from the Black Monukka. The berries were large, ovate, clear pale green. The committee requested to see it again when more ripe.

NATIONAL ROSE.

ROYAL BOTANIC GARDENS, OLD TRAFFORD, MANCHESTER: July 11.—The exhibition of Roses held at the above gardens on Saturday last must be considered a success in every sense of the word. It is not often such a display has been spread out as was the case on this occasion; the blooms, besides being very numerous, were perfect in form and very rich in colour. The exhibits were staged in the large exhibition house, and during the time the show was open a stream of visitors was passing and examining the splendid stands of the queen of flowers. In many classes the competition was very severe; nine, ten, and in one case no less than fourteen, entries were sent in. The weather was all that could be desired, the company very numerous, and we are glad to announce that we found this show at least to have been a financial success.

THE NURSEYMEN'S CLASS.

For seventy-two distinct blooms,—Paul & Sons, Chesnut, were placed 1st with blooms of grand substance, form, and colour. In the group we noticed Star of Waltham, Boieldieu, Les Francs, Captain Christy, Ulrich Brunner, A. K. Williams, very fine blooms; Madame Gabriel Lafuze, Madame Eugénie Verdier, Horace Vernet, Marguerite de St. Amand, large and full; Mrs. Baker, Madame Lacharme, Sultan of Zanibar, Theodora, Queen of Queens, and Zavier Olibo, Theodora, Queen of Cranston's Nursery, and Seed Co., Hereford, who also had a grand lot of blooms; 3d, B. R. Cant, Colchester; and 4th, F. Cant, Colchester.

For thirty-six distinct, three trusses of each.—Here Paul & Sons again secured six honours, having Edouard Morren, Paul Néron, Dr. Andry, Duke of Teck, Countess of Rosbery, La France, Marie Baumann, Duke of Edinburgh, Niphotos, Alford Colomb, grand trusses of Madame Lacharme, Souvenir d'Elise Varden, Madame Prosper Langier, Jean Duché, Sémaphore, Faïssé, Perle de Lyon, Marshall F. Wilder, Madame Norman Neruda, Marschal Niel, Pride of Waltham, and Star of Waltham. 2d, G. Prince, Oxford; in this stand were fine examples of Lady Mary Fitzwilliam, Madame Marie Finger, Marie van Houtte, Madame de Walleville, Princess of Wales, Innocente Pirola, Violette Boyer, and Françoise Kruger. 3d, B. R. Cant; in this collection Duke of Wellington and Hon. E. Gifford were very full and fine.

Eighteen Teas or Noisettes was awarded to G. Prince, who had as a formidable opponent Paul & Sons, who staged 2d and 3d, twelve Noisettes of each. The winning stand contained superb examples of Amazona, Souvenir de Madame Pernet, Mlle. Marie Amand, Souvenir d'Ami, Rubens, Catherine Mermet, Marie van Houtte, Alba rose, Madame Cusin, Comtesse de Nadailac, Caroline Kuster, Niphotos, Jean Duché, Harceline Niel, Innocente Pirola, and Souvenir d'Elise Varden.

For thirty-six distinct blooms, eighteen three trusses of each, and twelve Noisettes or Teas.—John House, Eastgate Nurseries, Peterborough, was successful in securing 1st prizes in the two former classes; Curtis, Sandford & Co., Torquay, being 2d; whilst for the twelve Teas J. Matlock, New Headington, Oxford, was placed 2d; J. Burrell & Co., and J. Jefferies & Sons, Cirencester, also competed in these classes.

THE AMATEURS' CLASSES.

For thirty-six distinct blooms the Rev. J. Pemberton, Romford, was 1st, with blooms of perfect form and grand colour.—Star of Waltham, La France, Exposition de Brie, Etienne Levé, Madame E. Verdier, Duke of Wellington, A. K. Williams, Countess of Oxford, Françoise Mouchon, Madame Lager-Rogge, Schwab, Norfolk, The Belle, Madame Vallonbrosa, Dr. Andry, Innocente Pirola, Ulrich Brunner, Madame E. Verdier, J. S. Mill, Horace Vernet, Jules Finger, Auguste Rigotard, Caroline Kuster, E. Y. Teas, Abel Carrière, Jean Duché, and Pride of Waltham, 2d; W. J. House, Esq., Hope End Farm, Leatherslip, 3d; B. Hall, Rock Ferry, 4th; T. W. Girlington, Esq., Sunningdale.

For twelve distinct, three trusses, W. J. Grant was 1st, T. B. Hall 2d, and Rev. J. Pemberton 3d.

For twelve Teas or Noisettes, single blooms, T. B. Hall was awarded 1st prize. In the class for twelve blooms of Madame Lambert, Innocente Pirola, Madame Cusin, Anna Olivier, Jean Duché, Alba rosea, Marie van Houtte, Souvenir d'Ami, Françoise Kruger, Madame Willemoz, Madame Margottin, and Comtesse Rita du Parc; 2d, Rev. E. Lager-Rogge, Schwab, Norfolk. The show was very fine stand, and contained, besides Comtesse de Nadailac, Caroline Kuster, Niphotos, Devoniensis, Marie van Houtte, &c., a grand bloom of Souvenir d'Elise Varden which was awarded the Silver Medal as the finest Tea or Noisette in the show. 3d, Rev. J. Pemberton.

Twenty-four distinct single blooms, 1st, Rev. J. Garnett, Christleton, Cheshire; 2d, A. Tate, Esq., Woolton. Eighteen distinct single blooms.—W. Boyes, Millford, Derby, was 1st.

For twelve blooms, Rev. E. L. Fellowes, Wimpole Rectory, Royston, was 1st, with a magnificent stand; J. Fisher, Esq., Brigg. In this collection the Silver Medal for the best hybrid perpetual was awarded to a bloom of Lady Mary Fitzwilliam; the 3d prize falling to W. E. Hall.

For nine Teas or Noisettes, Rev. L. Garnett, 1st; A. Tate, 2d; W. Hayes, 3d.

For twelve Teas or Noisettes (three trusses), the Rev. F. Page-Roberts was 1st, with a very fine stand; T. B. Hall, 2d; Rev. J. Pemberton, 3d.

For six new Roses, not in commerce in England previous to 1883, J. W. Girdlestone was 1st, with President Senelar, Lady of the Lake, Joseph Metral, Edith Gifford, Sunset, and Rev. J. Pemberton.

In the open classes for twelve new Roses, single blooms, not in commerce in England previous to 1883, Curtis, Sandford & Co., came in 1st, with a very fine stand, beating Paul & Sons, who, however, secured a 2d place; the 3d prize being taken by H. Trillingham, Boston, Notts. In the winning lot were fine examples of Alphonse Souperet, President Senelar, Madame J. Gautier, Souvenir de Leon Gambetta, Lord Bacon, Merveille de Lyon, Baron N. de Rothschild, Madame Deleuvre, Directeur Alphonse, Madame Rambaux, Mrs. George Dickson, and Francis Bowie.

For twelve single trusses of any yellow Rose, F. Cant was 1st, with Maréchal Niel; George Prince, 2d, with Comtesse de Nadailac; Paul & Sons, 3d, with Maréchal Niel.

Twelve blooms of any white.—Curtis, Sandford & Co., were 1st, with Merveille de Lyon; F. A. Dickson & Sons, Chester, being 2d, with the same variety; G. Prince coming 3d, with Innocente Pirola.

Twelve blooms of any crimson Rose.—Here Paul & Sons were well to the fore, winning with fine blooms of Alfred Colomb; Camille Nivolet, 2d, with splendid blooms of A. K. Williams; J. House being 3d, with the same form.

For twelve blooms of any dark velvety-crimson, Curtis, Sandford & Co., and Paul & Sons were respectively 1st and 2d, with Abel Carrriere; 3d falling to B. R. Cant, with Prince de Rohan.

For twelve blooms of any kind, F. Cant was 1st, with a grand lot of Souvenir d'Elise; the Rev. F. Page-Roberts being 2d, with Comtesse de Nadailac; B. R. Cant 3d, with large and fine blooms of Alfred Brunner. Messrs. R. O. K. Williams, 2d, with a fine lot of Canon, Dracenas, and Palms, running all down the centre of the tables, also a good lot of plants of Lilium lancifolium rubrum. S. Barlow, Esq., showed a number of varieties from Llandudno of sorts not usually provided for in schedules for Rose exhibitions.

The 1st prize was awarded to Mr. Williamson, gr. to G. B. Blair, Esq., Whalley, for a collection of fruit, among which were good examples of Pines, ten Melons, including Victory of Bath, Easton Castle, Davenham Early, and William Tillery. (A Correspondent.)

ROYAL CALEDONIAN HORTICULTURAL.

THE summer show of our greatest Northern horticultural society was held in Edinburgh on Wednesday evening, the 16th inst. The entries numbered 604, as compared with 559 in 1884, 521 in 1883, 375 in 1881, and 459 in 1880. In 1882, owing to the International, there was no summer show. Everything was shown in splendid condition, and the Waverley Market Hall, in which the show was held, had a fine lot of flowers on appearance. Everything passed off in a satisfactory way. The arrangements were excellent, the number of visitors large, and altogether the Caledonian officials, especially such hard-working men as Messrs. A. Macleod, Malcolm Dunn, D. Mitchell, D. Thomson, the Treasurer, P. Neill-Fraser, and the Asst.-Secretary, W. Young.

At this show Roses are generally the great feature—for some years past it has come to be called the Rose show. On this occasion, however, our Scotch growers were heavily handicapped in competing with such a formidable force as Hugh Dickson, of Belfast. In Scotland the season has been backward, the winds of June having been very cold. Roses are just beginning to come into condition, and exhibitors in consequence have not the same choice of blooms to select for the competition as those from another season, and this has made a great difference. At the same time, despite these disadvantages, the display of Roses was exceedingly creditable, and attracted great attention. Hugh Dickson, Belfast, carried everything before him. Certainly the Irish Roses showed no signs of any fault in the character. They were for the most part of large size, excellently grown, pure in colour, and with a soft, satiny bloom upon them which made them very charming to the eye to rest upon. Thomas Smith, Stranraer, was not so good a 2d as he generally is, solely on account of the state of the season. A few Roses on his stand were of good size, shape, and colour.

In the gardener class Mr. Farlane, Roslin, had an excellent show, and had no difficulty in carrying off the honours in the section in which he competed. In all respects his Roses showed signs of excellent cultivation. In the other section, where there was a very fair show of stove and greenhouse plants—of the Heaths especially, Erica Bothwelliana being in good condition, the Orchids were a brilliant show—several of the plants shown being of great beauty, conspicuous among these plants being the mentioned splendid Cayuga regalis, two examples of Oncidium macranthum, a Vanda suavis, and an Odontoglossum vexillarium.

The competition tables of plants were of average merit, though the 1st prize collection included some pretty Orchids and other choice things. There was also exhibited one of the best collections of British Ferns

which has been seen in any of the Caledonian shows for many a day.

Many varieties were well selected and the plants beautifully grown. Little can be said for the Fuchsias, the art of growing which seems not much attended to in this quarter; but of Pelargoniums there was a first-class display. A very taking show was made by the cut stove and greenhouse Caledonian, though common enough at the English shows. It is likely to grow in favour, as an effective display can be made in connection with it. Some excellent Tree Carnations were staged.

Of fruit there was for this very early of the season a very fair amount staged. Mr. Johnstone, of Glamis, sent for exhibition two really fine bunches of Black Hamburg Grapes, and there were excellent Nectarines, large in size and high in colour, from Oxenford Castle, and Peaches from New Battle. A special award was made for seven fine Pine-apples from Culzean Castle. The Black Hamburg Grapes entered for competition were of good quality, the Muscats were decidedly poor. Some very fine Strawberries were shown by Mr. Sinclair, East Linton. The quantity of vegetables staged was not large, but the quality was good. The show was indebted for some of its most attractive features. One firm only, however, entered the competition lists for the best table of plants, 40 feet by 10, arranged for effect, for which a prize of £50 was offered. This was the firm of Laird & Son, whose table did them every credit—the quality of the exhibits being good and the arrangement tasteful and artistic. The flowers were grouped so as to show masses of bloom, and in their setting of green were exceedingly effective; among other good things were a specimen of *Orchis maculata* superba, a double Ivy-leaved Pelargonium, *Hydrangea paniculata grandiflora* (the hardy variety we have found exceedingly useful for forcing); *Kalmia latifolia*, and the new and rare *Alcoxia Thibautiana*, with its large hard some white ribbon leaves. The table of Mrs. Methven and foliage plants being alternately grouped, while at regular intervals some outstanding plant was well displayed. They were strong as usual in their wide-famed decorative Pelargoniums, and they had also some very fine specimens of these were four magnificent Croton Mossie, C. triumphans, C. Victoria, and C. cronstedtii; a free-flowering dwarf *Lantana*, a good *Lavatera arborea* var., a *Dracoccephalum gracile*, and a fine example of *Nicotiana glauca*, Messrs. Ireland & Thompson had a very effective exhibition of some greenhouse plants, elegantly arranged, including beautiful Crotons, Orchids, and Liliams, and their competition box of cut flowers was exceedingly fine.

Dickson & Co., Waterloo Place, were particularly strong in cut flowers, which they showed an excellent variety. Among other things here worthy of notice was a new white *Lobelia*, Pilrig Park, and a new white *Pink*, Mrs. W. M. Welsh, which was awarded a First-class Certificate. They were also a good 2d for their cut greenhouse flowers.

Mr. Robert Muir exhibited a very nice lot of herbaceous and alpine plants in pots, some of the former showing what can be done in cultivating even the simplest materials, there being in particular an admirable plant of the common creeper, *Lysimachia clethroides*, which was also shown in the North American Evening Primrose, *Oenothera marginata*, with delicious perfume; the Iceland yellow Poppy, which has won the hearts of the ladies at present, and some fine new seedling Carnations.

Lamon & Son, The Glen Nurseries, Musselburgh, had a very pretty display of Spanish and English Irises (fifty varieties being shown) and sweet-scented Peony Roses, and they had also a new variegated Silver Ivy.

T. S. Ware, Hale Farm Nurseries, Tottenham, London, showed some exceedingly fine cut herbaceous flowers, and a new flowered white *Lobelia*, Miss Hope; James Dickson & Sons showed some new Conifers. The horticultural business present were Mackenzie & Moncur and Keith & Hawke. The former showed a very nice display of greenhouse, costing about £60, fitted up in an artistic style, and the latter a lantern-roofed conservatory, the peculiarity of which is, as the glass roof is all round, the plants are prevented from being "drawn." Tillie & Turner seed merchants, had a tasteful stand, conspicuous on which were their prize American lawn mowers, which combine lightness and power, and appear to have given much satisfaction.

EDINBURGH BOTANICAL: July 9.

The Society met this evening in the class-room, Royal Botanic Garden: Professor Dickson in the chair.

The following communications were read:—

I. "Notes on the Grasses of the Southern Punjab," by W. Coldstream, B.A., H. M. Bengal Civil Service.

IV. "On Temperature, and its Influence on the Physiological Functions of the Tissues of Plants," with illustrative microscopic preparations." by G. F. Scott-Elliott, B.A.

III. "Report on the Progress of Vegetation at the Royal Botanic Garden." By Robert Lindsay, Curator.

IV. "On Temperature, Vegetation, &c., in the Botanic Garden, Glasgow, for June." By Robert Bullen, Curator.

ABSTRACT OF MR. COLDSTREAM'S PAPER.

The tract of country described in the paper is that which, till the occurrence of recent administrative changes, constituted the Hissar division. It stretches

from near Delhi westward to the Sutlej River to the confines of Multan and Bahawalpur; there are large sandy areas in this tract, which, however, is in part watered by the Western Jumna Canal, and the stream of the Ghaggar. The soil is prolific in the rainy season, which is the time of growth of the principal crops. The country is very fertile, the whole very hot and sandy. Rainfall varies from 12 to 20 inches. Some of the principal trees are *Acacia arabica* (native name, Keekar), *A. leucophylla* (native name, Roni), *Tecoma undulata* (native name, Kohira), which has large showy orange-coloured blossoms, and grows wild even in the barren and sandy tracts; *Prosopis spiciifera* (Hband), *Capparis arbuta* (Karli), *Salvadora oleoides* (Jal), and on the banks of streams and canals the valuable *Dalbergia sissoo* (Sheesham wood), a congener of the Bombay Black-wood. The principal crops are Sorghum (lower jawar) and *Fenilicaria* (cattas (Bajra)). These form the staple food of the people. But Wheat, Gram (*Cicer arietinum*), and on the fertile spots Sugar-cane, are also grown in considerable quantities. The unripe Sorghum plant is said to be sometimes, in seasons of drought, poisonous to cattle. The crops sometimes grow on sandhills and wonderfully unpromising looking soil. The farmer often dreads too heavy a rainfall because it is apt to wash his crop out of the soft and sloping ground of the sandhill. The wild grasses are numerous, and as this is a pastoral region their nutritious qualities are of considerable value. A peculiarly valuable natural product. For months in the year the cattle are largely dependent on the produce of the uncultivated grass lands. The breed of cattle is famous. The region is very liable to scarcity and fodder famine, owing to failure, or partial failure, of the rains. The mitigation of distress at such times by attention to fodder supply, is one of the practical questions which are engaging the attention of the Agricultural Department of the Government of India. That this is an eminently practical question is proved by the fact that in the wild and uncultivated areas, such as the hills, including bullocks, cows, buffaloes, camels, sheep, and goats are estimated to have died. The questions of stacking, ensilage, arboriculture, the supply of arboreal fodder, have yet to be studied. Stacks of Sorghum and Millet keep well; but the natives do not stack well, although the officers at the Hissar cattle farm do, and it is found that the hay keeps well for five or six years, or even longer. Nor do the natives sow grass; all the grass fodder which is consumed is what grows wild in the uncultivated areas. Much might be done with the cattle and the natives do not stack well, although in large quantities. The recent remark of Sir Alfred Lyall, Lieut.-Governor of the North-West Provinces, holds good for this region, that "a large number of cattle die every year because their owners take no trouble to keep them alive."

Some of the most interesting grasses of the region are the following, the native names being given in parentheses:—

Cynodon dactylon (Dab).—Makes into good turf for lawns, and is much eaten by horses. The grass is stacked up for use as a nutrient for the horse.

Andropogon pertusus (Palwa).—Especially relished by buffaloes.

Sporobolus tenacissimus (Kheo).—Particularly good for horses.

Heteropogon contortus (Sarwala).

Panicum monolum (Sawak).—Its grain is collected and sold in the bazars for making bread.

Panicum helopus (Kuri).

Elyonurus hirsutus (Sin, or Sewan).

Elyonurus flagelliflorus (Ghntli).

These grasses are collected and sold in the bazars for making bread. One of the most nutritious grasses seen in seasons of scarcity.

Pennisetum cenchroides and *Cenchrus montanus* (both called Anjao and Dhāman).—These grasses are considered the most nutritious of all.

Andropogon Laniger (Būr, or Khāwi).—A nutritious and fragrant grass; imparts an aroma to the milk of cattle eating it.

Sorghum halepense (Barū).—The wild Sorghum or Jawar. When eaten in a season of drought before its grain is developed, is said to be sometimes fatal to cattle; but at other times a nutritious grass grain, much eaten by the poorer classes in Bikaner.

Andropogon muricatus (Pantli).—The principal thatching grass of the Punjab. Its root forms the scented Khas-khas used for lattices or damp screens.

Elyonurus hirsutus (Sin or Shū).—Collected and eaten by the poorer classes in Bikaner. It is the grass along with a few others whose grazing qualities give the grazing grounds of Bikaner their high character. Called Cusa in Hindu mythology.

(Bhurat).—A grass very common in the Bikaner territory and elsewhere; seeds eaten mixed with Esjira flour.

The first eight are said to stack well. If thoroughly protected from rain, stacked grass will last in the climate of Hissar for a very long period—some species for ten, twelve, and even twenty years; it seems, in the open properly dried and protected, to be nearly imperishable.

PROGRESS OF VEGETATION AT THE ROYAL BOTANIC GARDEN, JUNE, 1885.

The month of June was mild and pleasant, though somewhat dry. On the whole it was favourable in advancing outdoor vegetation. The plants in foliage were with hardy trees and shrubs developed during the month has been matter of general observation. Most trees were late in coming into leaf, and thus escaped injury from late frosts. This, combined with autumn, is the season of the year produced the best last

of foliage now seen. Amongst those which flowered well were various species and varieties of *Catagoga*, *Æsculus*,

Pyrus, Sorbus, Sambucus, Rhododendron, Azalea, and Fraxinus Ornus. Variegated forms of *Taxus, Biota, Retinospora,* and other Conifers are remarkably well coloured, affording a pleasing contrast with the dark green foliage of the typical species. Late transplanted trees and shrubs have suffered severely from drought, and a great many plants and verges began to turn brown by the end of the month. Herbaceous plants, as a rule, have done well, notwithstanding the drought which prevailed. The lowest night temperature was 35° on the 15th of the month, rather low readings occurred—on the 14th, 37°; 13th, 38°; 23d, 39°; 26th, 37°. The lowest day temperature was 50° on the 8th, and the highest, 77°, on the 12th. There were twenty perfectly dry days, and slight showers only during the remaining ten days.

In the rock garden 350 species of herbaceous and alpine plants came into flower during the month, making a total of 818 for the season as compared with 798 at corresponding date last year. The following were amongst the most conspicuous which flowered, viz.:

- Aciphylia squarrosa* (5)
- Ajuga reptans*
- Androsace rotundifolia macrocalyx*
- Allium cernuolum*
- Anagallis tenella*
- Arenaria montana*
- Asperula*
- A. albus*
- Callitriche glandulosa*
- Calochortus cernuus*
- Calcicolaria Kelyana*
- Colinus spectabilis*
- Chrysosolanum Hookeri*
- Clinonia Andrewsiana*
- Coronilla filicris*
- Crocus pinnatifidus*
- Dianthus alpinus*
- D. eximus* (hybrid)
- D. stri*
- D. neglectus*
- D. fidei*
- Diapensia superba*
- Diapensia alba*
- Echium rubrum*
- Erigeron aurantiacum*
- E. purpureum*
- Erica puncticaulis albus*
- Eriophorum alpinum*
- Gaultheria maxima*
- Geotaria alba*
- Geranium intricatum*
- Gaultheria carnea*
- Haplocardia Leitchiana*
- Hebe*
- Houstonia cernua*
- Hyssopus erectus*
- Jussiaea grandiflora*
- Maldegium alpinum*
- Lewisia rediviva*
- Linum alpinum*
- Linaria glandulosa*
- Lycchnis pyronum*
- " viscaria splendens,*
- Ononis rotundifolia*
- Osmunda taurica*
- Oxytropis Hilleri*
- Panacemum Lewisii*
- Potentilla eriocarpa*
- Pratia angulata*
- Ranunculus*
- Sedum Oreogalum*
- Trilium alpinum*
- Valeriana montana*
- Vella spicata*
- Vincetoxicum Haastii*
- " carolinica*
- " Chathamica*
- " Hulkeniana*
- Vancouveria hexana*
- Vaccinium olgynicum*
- Vallisneria spiralis*
- Wahlenbergia saxicola*, &c.

ON TEMPERATURE, VEGETATION, &c., IN THE BOTANIC GARDEN, GLASGOW, FOR JUNE, 1885.

The temperature has been low, 36° having been registered several times in the latter as well as in the early part of the month, and frequently the temperature did not exceed 40°. The lowest day reading was 59°, the highest 78°. The weather has been very dry; bright sunny days have been general; the few slight showers which have fallen have been of little benefit to vegetation, and most garden and farm crops are suffering. Spring-roses, particularly those of the late kind, promised well but being kept alive by artificial watering have made little progress; indeed, all half-hardy plants have a stunted look. Hardy trees and shrubs of all kinds have been profuse of bloom, but owing to the occasional cold nights and dry days the foliage is not so healthy as usual. Hardy herbaceous plants are mostly early in bloom.

EALING, ACTON, AND HANWELL HORTICULTURAL: July 7 and 8.

In celebrating this year the attainment of the twenty-first anniversary of its existence, this Society held in the park attached to the mansion of Lord de Rothschild and brothers at Gunnersbury on the above days, an extensive exhibition, which it was also resolved should on this occasion extend over two days that the population inhabiting the suburbs around Gunnersbury might have opportunity to inspect the park so kindly placed at the Society's disposal. In addition to this kindness, which was largely helped by the courtesy shown by Mr. Roberts, the Messrs. Rothschild placed at the committee's disposal the sum of 50 s., which was offered in various special prizes, and aided materially the production of a fine horticultural display. On Wednesday Lady de Rothschild presented the numerous prizes won by the cottager section of competitors to them, thus adding personal interest to tangible assistance. The show formed four large tents, one being entirely devoted to cut flowers, table decorations, bouquets, &c., and fruit, and was one of the best displays we have seen for a long time. The cottagers' contributions, comprising several hundred entries, occupied a large area of table; whilst the plant tents were well filled. The trade recognised the importance of this year's show, and sent many collections, prominent amongst which was a grand group of some 200 ferns in pots, all fresh and finely flowered, from Messrs. Jas. Veitch & Sons, and including most of the best kinds. Backed with Japanese Acers, and fenced with dwarf Ferns and ornamental foliage plants, it attracted attention. Messrs. C. Lee & Sons sent a group of their ornamental foliaged trees and shrubs. Messrs. B. S. and G. Jamieson sent a collection of cut stems and greenhouse plants, inclusive of some Orchids proving an attractive feature. Messrs. John Laing & Co. had a group of their Begonias that startled visitors by the huge size of their blooms and rich colours, and were widely noticed in the midst of decorative plants. Mr. R. Deaa showed fine examples of the new Rocket Candytuft, Empress.

DECORATIVE COMPETITIVE GROUPS.

These, always an interesting feature, were specially so here, three separate classes being set apart for them. In the large groups Messrs. Fromow & Sons, Turbham Green, again met their powerful rivals in decorative art, Messrs. Hooper & Co., Twickenham, both having groups of much beauty. The former had rather the best position, and perhaps more bloom; the latter had the most elegant arrangements. Eventually bloom, which was strong in *Lilium auratum* and *L. longifolium*, some good Orchids, &c., gave Messrs. Fromow the premier place. Still, opinions varied, and many thought Messrs. Hooper's collection, which was the most pleasing. Mr. Ravenhill, gr. to Mrs. Treadaway, came 3d, having many gay *Pelargoniums* in his group. In another group class Mr. Chadwick, gr. to E. M. Nelson, Esq., Ealing, came 1st with a pleasing arrangement of white *Paucratius*, *Amaryllis*, *Eriacas*, &c. Mr. G. Fulford, gr. to J. Bossey, Esq., Acton, came 2d, the competition being large. There was also a class for yet smaller groups. Of honorary groups shown by gardeners, special mention must be made of the very elegant and beautiful one put up by Mr. Hudson, gr. to H. J. Atkinson, Esq., M.F. Gunnersbury Park, which was also entered in the plant competitions. This group included as a central figure a huge and grandly done piece of *Asparagus plumosus*, some 17 feet high, and 4 feet through; also handsome *Palms*, *Ferns*, *Crotons*, *Dracenas*, &c., it up with fine *Gloxinias*. To this special class, as also to a fine lot of the Souvenir de la Malmaison and *Amethyst Glove Carnation*, in pots, faced by others of the crimson *Napoleon mule Pink* and *Maidenhair Fern*, staged by Mr. Roberts from the gardens.

SPECIMEN PLANTS.

These were prominent amongst the foliage classes. *Ferns*, *Palms*, *Caladiums*, red *Begonias*, *Coloseus*, &c., were in fine form and great variety. Flowering stove and greenhouse plants were less strong, which is to be deplored in the interest of next exhibition. Mr. Davis, gr. to Lake Esq., Chiswick, had the best of these in *Pentas*, carnation, *Allamanda Hendersoni*, *Bougainvillea glabra*, and a capital *Vinea rosea*. Mr. Chadwick came next with a good *Stative profusa*, *Clerodendron Kalfourii*, &c. Mr. Smith, gr. to F. Nye, Esq., Ealing, had a gigantic *Conoclinium*, which in his collection was the most striking feature. The best four *Fuchsias* came from Mr. Wright, gr. to G. P. Greenfield, Esq., Hanwell, who had large, though rather thin, pyramids of *Arabella Improved*, *Cannel's Gem*, *Mrs. Rundell*, and *Brigade Mr. Davis* had smaller but denser plants in *Symmetry and Red Enigma*, red; and *Emily Lyell* and *Arabella white*. The four best large-fringed *Pelargoniums*, full of bloom and singularly fresh for the time of year, came from Mr. Ravenhill; and Mr. Davis had in *Laura Straun*, red; *reddish-salmon*; *Mrs. Levers*, *rosy pink*; *Sarah Bernhard*, white; and *Quida*, rich *rosy-cerise*; some splendid grown and flowered plants. The only collection of six Orchids came from Messrs. Fromow & Sons, and included *Cattleyas Gaskelliana* and *Rozeili*, *Odontoglossum Alexandrae* and *cinrasum*, *Aceris odoratum*, and *Dendrobium suavisissimum*. *Petunias*, *Begonias*, and *Gloxinias* in flowered plants were largely shown, and proved most attractive.

CUT FLOWERS.

Foremost amongst these was a fine lot of cut *Roses*, sent by Messrs. Lee & Sons from their Ealing nursery. The collection comprised twelve boxes, and many of the simplest, yet prettiest, when taken as they were from Mr. Cannon, only ordinary culture had been bestowed. Messrs. James Veitch & Sons also put up a fine collection of choice kinds, Messrs. Lee & Sons and Messrs. Hooper & Co., each staged very interesting and representative selections of the flowers of Sweet Williams, *Antirrhinums*, *Gloxinias*, and mixed cut flowers were in great force; specially charming were the boxes of cut *Petunias*, fine double and single, striped and fringed flowers, creating rich and striking effects. Zonal *Pelargoniums* were also in great force in this section.

TABLE DECORATIONS, BOUQUETS, &c.,

were remarkably attractive and beautiful. Mrs. Hudson had the best dressed table for ten persons, her stand being elegantly dressed and fruit of the best quality; Mr. Butler, of Narwood, had the 2d best table, also charmingly decorated, the fruit wanting freshness. These tables were greatly admired. The three finest bouquets in competition, one for bride and two for bridesmaids, came from Mr. Phippen, of Reading, and were of more than usual excellence, although perhaps not large. Mr. J. A. Morris, Acton, had the good bouquets also, and Mr. Chadwick had the best single bridal bouquet; also was 1st with bouquet of *Roses*. A capital class and including some fine arrangements. Miss P. Nelson, Hanger Hill, had the prettiest yet simplest button-hole bouquets, and was also 1st in the class for sprays for ladies' hair, using chiefly white *Gardenias*, *Stephanotis*, *Gladiolus*, *pink* and white *Pelargoniums*, &c. Vases and stands of *Roses* and *Ferns* were beautiful, Mr. Hanger Hill being 1st in place, and being also 1st with a basket of flowers for drawing-room table, with a simple but pleasing arrangement. Mrs. H. B. Smith, Ealing, exhibited two Court bouquets, and Mr. Smith for head decoration, mounted on velvet stands. FRUIT. Mr. J. Gough, Harefield Grove Gardens, sent (not for competition) some fine *Highcross Hybrid* and *Victory* plants of *Red Melons*, handsome *Queen Pines*, *Tomatoes*, &c.

In the open class for eight dishes, Mr. J. Hudson was invincible with *Madrefield Court* and *Foster's Seedling Grapes*, *Queen Pine*, fine and wonderfully coloured *Lardier Nectarines*, *President Strawberries*, *Black Circassian* and *Napoleon Bigarreau Cherries*, and a *Melon*. Mr. Baird, gr. to C. A. Diw, Esq., Castle Hill, had the best six dishes of fruit, including *Duke of Buccleuch* and *Black Hamburgh Grapes*, *Peaches*, *Cherries*, all good. Mr. Milson had the best black *Grapes* in two superb bunches of *Black Hamburgh*, finely coloured and finished. Mr. Baird coming 2d with same kind, but was a good 1st in the class for whites with some huge *Duke of Buccleuch*; Mr. Ravenhill coming next with rich coloured *Buckland* and *Red Strawberries* were very fine; some splendid samples of *J. Veitch*, *British Queen*, *Dr. Hogg*, and *Sir J. Paxton*, being staged.

Vegetables were shown in large quantities by gardeners, amateurs, and cottagers, and of high quality; and some 150 bunches of wild radish and fifty of garden flowers were staged by children for numerous prizes.

BEXLEY HEATH HORTICULTURAL: July 8.

In no part of the kingdom is there so much to be seen in gardening matters that excites surprise in those who have been for some years absent as in the extent to which the cultivation of fruit and vegetables has been extended in such parts of the county as are best adapted for the purpose. The displays presented at the exhibitions held by the horticultural societies in these parts give evidence that the standard of cultivation has kept pace with the extension that has occurred. The Society under notice held their annual summer show at the Grove, Bexley, on the above date. Plants, both flowering and leaf-leaved, were very well shown.

Six stove and greenhouse varieties, in bloom.—Mr. Mitchell, gr. to Mrs. Arbutnot, Bridgen Place, trunk 1st, with a well-grown half-dozen, which included *Allamanda grandiflora*, *A. Hendersoni*, *Anthurium Scherzerianum*, bearing some forty highly coloured flowers; *Aceris odoratum*, with twenty spikes; *Dipladenia profusa*, and *Vinea oculata*, full of flower.

Single specimen plant in flower.—1st, Mr. Moore, gr. to W. Pickersley, Esq., Blendon Hall, with a very fine specimen of *Anthurium*, and a pair of single-ripe very large flowers. It is an unusually good variety of this variable plant, in that there appears to be many that are inferior to the few that produce large, well-developed flowers; Mr. Mitchell 2d, with *Allamanda Hendersoni*.

BEGONIAS.

1st, Mr. Moore; 2d, Mr. Mitchell, both showing nicely flowered plants.

FINE-FOLIAGE PLANTS.

In the class for six Mr. Mitchell was easily 1st, staging, amongst others, a beautiful specimen of *Craton Queen Victoria*, finely coloured; *C. Johnsonii*, and *Asparagus plumosus* in the form of a feathery well-fringed bush. Mr. Moore 2d, his best examples being *Scaevola elegans*, *Alceosa Veitchii*, and *Anthurium crystallinum*.

COLEUS.

were well shown. For six, Mr. Burgess, gr. to G. J. Mitchell, Esq., had 1st; Mr. Tonlin, gr. to S. White, Esq., being 2d.

Six table plants.—1st, Mr. Burgess; 2d, Mr. Moore.

FERNS.

Here again Mr. Mitchell took the lead with six, staging a nice group of medium-growing kinds, the best being *Adiantum laryeum*, *Gymnogramma chrysophylla* and *G. Wettinalliana*; 2d, Mr. Moore.

GROUPS OF PLANTS

arranged for effect, as now at most exhibitions, excited much attention. On this occasion Mr. Mitchell and Mr. Moore were placed equal 1st; the former had very tasteful arrangement, with as there ever should be in combinations of this character, an absence of too much colour through there not being too many flowering plants, nor such as are massive in appearance, in place of those of light elegant habit as more preferable. Mr. Moore amongst the selections of *Adiantum Scherzerianum*, *Odontoglossum tessellatum* and *Anthurium Scherzerianum*; 3d, Mr. Tonlin, gr. to S. White, Esq., Oakwood.

FRUIT

was shown in good condition. For three bunches of *Black Grapes*, Mr. Moore was easily 1st, with nicely finished examples of *Black Hamburgh*; 2d, Mr. Mitchell.

With three bunches of white *Grapes* the order was reversed, Mr. Mitchell taking the lead with *Foster's Seedling*, nice bunches well coloured; Mr. Moore had larger bunches of the same useful variety, but not so well up in colour.

Dish of *Peaches*.—1st, Mr. Moore, with *Royal George*, full sized fruit in beautiful condition; Mr. King, gr. to Mrs. T. Burton, who was 2d, had *Hale's Early*, also well shown.

Dish of *Nectarines*.—1st, Mr. Moore, with *Newington*, handsome fruit, finely coloured.

CUT FLOWERS.

With twenty-four *Roses* Mrs. Fuller, Bexley, took the lead, having a fine stand; 2d, Messrs. Buryard & Co., Maidstone.

Twelve *Roses*.—1st, Mr. Marshall; 2d, Mr. Burgess. A beautiful stand of twelve varieties of *Teas*, three blooms of each, was shown by Mrs. Fuller, not for competition.

There was a sufficient number of exhibits of table decorations, centre-pieces, bouquets, &c., to fill a good sized tent. Mrs. Rogers took 1st, for a nicely arranged table; Mr. Eyles 2d, for a very nice arrangement.

With a table arranged with wild flowers alone Miss A. Jenkins had 1st.

Bouquets were well shown, Mr. Mitchell taking the lead with a very nice example; 2d, Mrs. Mitchell.

THE CRAY VALLEY AND SIDCUP HORTICULTURAL: July 11.

The National Rose Society has been the means of calling into being so many Rose shows that it is not matter for wonder one was started in that pleasant district of Kent known as the Cray Valley. It was the first exhibition of this newly formed Society, and took place in the grounds of Sidcup Place, the residence of the Rev. R. M. Berens. It was more particularly a Rose exhibition, though there were classes for plants, flowers, fruits, and vegetables.

ROSES.

The classes open to all comers brought an excellent display. The best forty-eight varieties, single trusses, came from Mr. B. R. Cant, St. John's Nursery, Colchester, who had nice, fresh, bright blooms; 2d, Messrs. Paul & Son, Old Nurseries, Cheshunt, who had the blooms in good form.

Messrs. Geo. Bunyard & Son had the best twenty-four varieties, single trusses, staging charming blooms; 2d, Mr. B. R. Cant.

The class for twelve varieties of Teas and Noisettes brought a good competition also. The best came from Messrs. Bunyard & Co., who had nice fresh blooms; 2d, Mr. B. R. Cant, with a stand containing some very fine blooms.

In the class for six trusses of Roses of one variety, Mr. B. R. Cant was 1st, with A. K. Williams; 2d, Messrs. Bunyard & Co., with Marie Baumann.

In the classes for amateurs residing within 30 miles of Sidcup, Mrs. Fuller, Beckley, was 1st, with twenty-four varieties; 2d, G. H. Ongley, Esq., Eltham; 3d, A. Harris, Esq., Eltham.

The Silver Medal of the National Rose Society was also awarded to Mrs. Fuller's stand in this class.

Mrs. Fuller was also 1st, with twelve varieties.

With six varieties of Teas Mrs. Fuller was again to the fore, having good blooms.

The Bronze Medal of the National Rose Society was awarded to the Rev. J. N. Rowsell for the best specimen Rose, having a capital bloom of Etiole de Lyon.

Honorary contributions of a valuable character, not for competition, were sent by Messrs. George Bunyard & Co., who had a collection of old-fashioned Roses, and a very interesting collection of Moss Roses; J. H. Bath, Esq., North Cray (W. Parsons, gr.), who had a charming collection of Orchids; Mr. R. Sim, nurseryman, Fords Cray, who had a fine collection of hardy Ferns; Messrs. H. Cannell & Sons, who had a collection of cut flowers, including Pergamonums, Begonias, &c.; Messrs. J. Laing & Co., Stanstead Park Nurseries, Forest Hill, who had a collection of choice plants, including some pretty Begonias; Mr. R. C. Ravenscroft, Granville Nursery, Lewisham, who had a collection of flowering plants; and Messrs. James Carter & Co., Crystal Palace Nursery, who had a group of Empress Penulias.

Variorum.

THE PASTORAL DISTRICTS OF NEW SOUTH WALES.—There are many who entertain an impression that the far inland districts of New South Wales partake much of the character of the African desert, consisting of broad arid plains, wholly destitute of animal and vegetable life. It is true that during prolonged periods of drought they possess a dried up appearance, and are insufficient to feed the millions of sheep scattered over their surface, but a few showers of rain suffice to change the scene to one of luxuriant abundance. A recent visitor to the western portion of New South Wales, a region devoted chiefly to pastoral purposes, describing his arrival at the township of Narrandera, says it is in the heart of a fertile agricultural country, which only lacks a regular rainfall to make it all that the selector could desire. For the last three years it has been suffering, in common with the whole of the western districts, with continued drought; but the soil is good, the land comparatively cheap, and the construction of the railway has already transformed a part of it from wild uncultivated bush to productive land, and is destined to transform the rest at no very distant date. For miles and miles the line passes through tall forests of Gum trees, thickly scattered, to be sure, and not costing much to remove; broken here and there with level tracts of cultivated ground, and relieved at intervals by small townships and stations, or more frequently a siding erected by the Government for the conveyance of the produce from fertile districts. Half way between Narrandera and Hay the scene changes. The Gums are left behind, except where they serve to mark the course of the river to the left, and only a few stragglers remain here and there to break the

monotony of the immense pastoral plains which stretch out on either side for many a weary mile. A few weeks ago the whole of this country was absolutely bare. Not a blade of grass covered the face of the earth, nor had one been seen for months past; and vast flocks of sheep, with numbers considerably thinned by the drought, were huddled together in small paddocks strewn with hay, stored for the purpose in long wooden sheds, erected near the sidings in order to be as near as possible to the rail by which the food was brought down from town at ruinous expense. But now the whole face of the country was changed. The downpour of rain in January had fallen upon a soil which was so parched for want of it that it almost despaired of ever being able to quench its thirst again, and which was only too ready to show its gratitude to Heaven for the long-delayed blessing when at length it was vouchsafed. The long stretch of level land was covered with a carpet of the tender green; the ditch which at intervals fringes the side of the line is adorned with velvet as pleasing to the eye as it must surely be to the touch; while from above the waters rise mounds of grass as verdant as any that ever waved by the banks of the Hooghly, or adorned the American plains. The sheds are deserted, and feeding on the tender shoots which have sprung up with such marvellous rapidity under their feet are thousands of sheep, which bask in the glow of the evening sun, or browse on the sweet young grass, as their fancy directs.

AN AUSTRALIAN VALLEY.—About 46 miles from Sydney, on the Blue Mountain Railway, is a place which, if situated in Europe, would annually attract thousands of tourists and pleasure-seekers. It is known as "The Valley," and is a lovely vale of grassy undulating land, lightly timbered and well watered, presenting quite an English park-like appearance; but instead of huge gnarled Oaks, Beeches, and Elms, we have here colossal Eucalyptus, and other majestic indigenous timber, while the rocks with which the gullies are faced are everywhere clothed with a wealth of Ferns in immense variety; Gleichenias, Adiantums, Dicksonias, Pteris, and a host of other forms valued by collectors, may be gathered here in waggon-loads. If the fortunate owner of an acre of this country could but transport its vegetation unimpaired to London or Paris, he would quickly find himself a moderately wealthy man. Gleichenias, and other rare varieties which abound here, are frequently sold in London at from 3 to 10 guineas per plant. In the spring, and during the early summer months, some of the most beautiful members of the mountain flora are in full bloom. The Varatath (Telopia speciosissima), Eriostemon, Boronias, Correas, Indigoferas, Heaths, Dilwynias, and many others, are radiant with blossom, while the Selaginellas and mosses everywhere abound, giving life and incident to the

"Zigzag paths and juts of pointed rocks,"

to the beauties of which only a Kendall could do full justice. *Sydney Paper.*

- July 9.—Dull day, sun shining at times.
- 10.—Very fine day.
- 11.—Very fine day.
- 12.—Rain in early morning, faint gleams of sunshine at intervals. Dull day.
- 13.—Dull day, fine and bright occasionally, thunder-storm between 9 and 10 P.M.
- 14.—Fine and bright mostly.
- 15.—Very fine day.

LONDON: Atmospheric Pressure.—During the week ending July 11, the reading of the barometer increased from 30.20 inches at the beginning of the week to 30.27 inches by 9 A.M. on the 6th, decreased to 30.09 inches by 9 A.M. on the 8th, increased to 30.22 inches by 9 A.M. on the 9th, decreased to 30.17 inches by 1 P.M. on the 9th, increased to 30.20 inches by 9 A.M. on the 10th, and was 29.96 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.16 inches, being 0.06 inch higher than last week, and 0.18 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 85° 3, on the 11th; on the 8th the highest was 72°. The mean of the seven high day temperatures was 79° 1.

The lowest temperature was 47° 5, on the 9th; on the 5th the lowest temperature was 57° 2. The mean of the seven low night temperatures was 53° 5.

The greatest range of temperature in one day was 34° 4, on the 10th; the smallest was 15° 5 on the 8th. The mean of the seven daily ranges was 25° 6.

The mean temperatures were—on the 5th, 66° 9; on the 6th, 68° 3; on the 7th, 62° 7; on the 8th, 61° 3; on the 9th, 59° 6; on the 10th, 66° 5; and on the 11th, 68° 6; of these the 5th, 6th, 7th, 10th, and 11th, were above their averages by 5° 4, 6° 7, 0° 9, 4° 3, and 6° 3 respectively; and the 8th and 9th were below their averages by 0° 7 and 2° 5 respectively.

The mean temperature of the week was 65°, being 4° 5 higher than last week, and 2° 9 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 142°, on the 10th. The mean of the seven readings was 134° 1.

The lowest reading of a minimum thermometer placed on grass was 34° 5, on the 9th. The mean of the seven readings was 41° 9.

Rain.—0° 02 inch fell on the 8th.

ENGLAND: Temperature.—During the week ending July 11, the highest at Blackheath was 85° 3, at Cambridge 83° 8, at Sheffield 80°; the highest at Bolton was 70° 8, at Preston 71°, at Liverpool 71° 3. The general mean was 76° 1.

The lowest temperatures were 38° at Truro, 40° 5 at Wolverhampton, 44° 2 at Bolton; the lowest at Newcastle was 52°, at Preston 51°, at Brighton 49° 5. The general mean was 46° 6.

The greatest ranges were 38° at Cambridge, 37° 8 at Blackheath, 36° at Wolverhampton; the smallest ranges were 20° at Preston, 22° 4 at Liverpool, 24° at Newcastle. The general mean was 29° 5.

The mean of the seven high day temperatures was highest at Cambridge, 80° 5, at Blackheath 79° 1, at Leeds 74° 3; and was lowest at Bolton, 66° 2, at Liverpool 66° 7, at Preston 67° 6. The general mean was 71° 7.

The mean of the seven low night temperatures was highest at Newcastle, 54° 6, at Leeds 53° 9, at Brighton 53° 8; and was lowest at Bolton, 47° 6, at Wolverhampton 47° 7, at Truro 49° 3. The general mean was 51° 5.

The mean daily range was greatest at Cambridge, 29° 7, at Blackheath 25° 6, at Sheffield 25°; and was least at Liverpool, 13° 8, at Preston 14°, at Plymouth 16°. The general mean was 20° 2.

The mean temperature was highest at Blackheath, 65°, at Cambridge 63° 2, at Leeds 62° 1; and was lowest at Bolton, 55°, at Truro 57°, at Wolverhampton 57° 8. The general mean was 59° 7.

Rain.—The largest falls were 1.01 inch at Liverpool, 0.79 inch at Bolton, 0.49 inch at Newcastle; the smallest falls were 0.01 inch at Cambridge and Bradford, and 0.02 inch at Blackheath. The general mean was 0.26 inch.

SCOTLAND: Temperature.—During the week ending July 11, the highest temperature was 74° 7, at Dundee; at Greenock the highest temperature was 68°. The general mean was 71° 9.

BAYLISS, JONES & BAYLISS,
 VICTORIA WORKS, WOLVERHAMPTON,
 And 130 and 141, Cannon Street, London, E.C.

BUY ONLY ENGLISH THREE-QUARTER PLATE
WATCHES.

BENSON'S NEW PATENT (No. 4058)
 "LUDGATE" WATCH,

SILVER, GOLD,
£5 5s. £12 12s.

Is a "Special Strength" Silver English Lever, my best London make, with Three-quarter Plate Movement.
Revolves throughout.
Chronometer balance, with damp and dust-proof
Patent ring-rod, and expanded barrel, in
Massive sterling silver dome cases
With crystal glass front.
Winds, set hands and opens at back.

The superiority in value, accuracy, and durability of the "Ludgate" Watch over the Swiss and American Keyless and Non-Keyless Watches, made in imitation and sold as English work, and the ordinary Full-plate English Watch is enormous. The "Ludgate" Watch is compact, strong, handsome, and durable. Being Three-Quarter Plate, it is superior in work and appearance to any £10 Watch sold, and, being compensated, it keeps perfect time; fitted with crystal front, it combines the strength of the Hunter and convenience of the open face. Of my best LONDON make, it will last a lifetime, stand rough usage of all and every kind without damage, and, in being made in three sizes, it is for the above reasons suited for Home, Indian, and Colonial use by

Gardeners, Workmen, and Gentlemen.
The "Ludgate" Watch is far superior
to any Watch at the price yet made, and
will be sent free and safe at our risk
To all parts of the world for £5 5s.
Cash or P.O.D., or in hunting cases, £6 6s.
Price in 18-CARAT GOLD, crystal glass cases,
Twelve Guineas.

SPECIALTY NOTE that J. W. BENSON is the only Maker of a Three-Quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any Watchmaker in the Kingdom, any infringement of the Patent Rights will be proceeded against. A Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on the application to

WANTED, a young or middle-aged man, with a good general knowledge of Trees and Plants, to act as a **SALES-MAN** and **ORDER-BOOKER**, and possibly to occasionally take a journey.—Applicants will please furnish particulars as to age, experience, &c., in their own handwriting, to **RICHARD SMITH AND CO., St. John's Nurseries, Worcester.**

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at **DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.**
N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent Men, several of whom are personally well known to Messrs. CARTER.—Enquiries should be made to 237 and 238, High Holborn, W.C.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—**St. John's Nurseries, Worcester.**

TO LANDED PROPRIETORS, &c.—**A McILVERIE** (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Ground and Park Grounds, and Remodelling existing Gardens. Plans prepared. 125, Little Stanstead, London, E.C.

TO NOBLEMEN, GENTLEMEN, &c.—To receive and attend to the orders of the **STEWARDS, GARDENERS, &c.**—We have on hand Applications from several Men of tested ability, and shall be pleased to Assist any Nobleman, &c., in obtaining Men specially suitable for their requirements.—**VICARS COLLYER AND CO., Leicester; A. W. CREWS, Manager.**

GARDENER (HEAD)—Age 27; thorough practical experience with Orchids, Plants, Fruit, Flower, and Kitchen Gardening. Excellent character.—**H. FAYNE, 4, North's Terrace, Blackhorse Lane, Walthamstow.**

HANDY MAN, on a Gentleman's Estate.—Well experienced in Plumbing, Gas Fitting, &c. Willing to make good references.—A. L., 1, Beversbrook Road, Upper Holloway, N.

HOLLOWAY'S PILLS.—Nervous Debility.—No part of the human machine requires more watching than the nervous system—upon it hangs health and life itself. These Pills are the best regulators and strengtheners of the nerves, and the safest general purgatives. Nausea, Headache, Giddiness, Numbness, and Mental Apathy yield to them. They attack in a sudden manner those distressing Dyspeptic symptoms in a young man, such as Flatulency, Belching, Stomach Pain, Fullness of the Stomach, Abnormal Distension, and overcome both Capricious Appetites and confined Bowels—the accompanying signs of defective or deranged nervous power. Holloway's Pills are particularly recommended to persons of studious and sedentary habits, who gradually sink into a nervous and debilitated state, unless some such restorative be occasionally taken.

Cucumber Frames.

R. HALLIDAY AND CO. desire to draw special attention to their Cucumber Frames, of which they always have a large stock, ready glazed and painted. They are made of the best materials, and can be put together and taken apart in a few minutes by any one.

To Nurserymen and Others

THE DIRECTORS of the ASTON GROUNDS CO. (Limited), Aston Lower Grounds, Birmingham, are willing TO LET, on advantageous terms, the magnificent GREENHOUSE, with all the apparatus, consisting of eight to number, heated by Steam Pipes, and including Stove and Propagating House, to a responsible firm. The Houses measure from 60 to 100 feet in length, and are at present fully stocked; they are well fitted with strong staging, and are general in a state of perfect repair. The Greenhouses themselves are situated in an enclosure about 50 yards square, which contains about 300 feet of Harding-off Frames, and also contains about 300 feet of Harding-off Frames, and Tool Stove and Potting Shed; also two Dwelling Cottages. The Aston Lower Grounds are the most important pleasure gardens in the Kingdom. The Grounds are visited annually by a million of people coming from all parts of the Kingdom. This is an offer, which is not an entreprising firm would afford an opportunity of acquiring a business of this nature at such a price, and at the same time a profitable business. Every facility would be given in the grounds for the Sale of Flowers and Plants. The Houses can be viewed at any time on application at the Offices, and full particulars may be obtained from C. KEENE'S LIMITED, Jun., General Manager, Aston Grounds Co. (Limited), Birmingham.

Southampton (Exec).

About a mile from this important Town. TO BE LET, on LEASE, 25 Acres of LAND, in a high state of Cultivation, from September next. Terms, on application to Messrs. PROTHEROE AND MORRIS, 67 and 68, Chesham, E.C.

SOMETHING WORTH HAVING.

AQUILEGIA Glandulosa.

Grigor's Glandular Columbine (true). Respecting our variety of Aquilegia or Columbine, Dr. Lindley, in the Gardeners' Chronicle, said: "The plant is perhaps the handsomest hardy perennial in cultivation; its stems are about 2 feet high, sometimes carry from 50 to 80 blossoms. We have a plant now before us which, after a journey from Scotland, has 25 expanded flowers, each 3/4 inch in diameter, with broad, thin, delicate, spreading petals, of the deepest ultramarine-blue streaking 5 short petals, the upper part of which is pure white, resting on an azure ground. The effect is beautiful in the extreme, and no description that we have formerly given of it has done justice to its exquisite appearance." Having sent a specimen of this Columbine to the Editor of the Gardeners' Chronicle, he writes in 1870: "If we could favour our readers with as little of a bunch of flowers we have now before us, a few of them would exclaim, 'Prodigious! Wonderful!' 'Glorious!' and so forth." We are therefore extremely cautious in the employment of the language of eulogy, but we shall probably be quite safe in saying that there is not in cultivation a finer hardy herbaceous plant than Grigor's variety of a glandulosa, the Glandular Columbine. The plant is robust, handsome, and leafy; the flowers are produced in great profusion; they average 3/4 inches in diameter; the sepals deep ultramarine-blue, the corolla pure white with blue spots at the base of each petal, remarkably elegant, distinct, and refined, at the same time showy almost to a fault. We advise all who appreciate first-class hardy plants to secure this Forbes edition of an old-fashioned flower. Now Ready. Price for Strong Flowering Plants, carriage paid, 6s. per dozen, or 2 dozen for 10s., likewise carriage paid.

JOHN GRIGOR & CO., THE NURSERY, FORRES.

R. O S E S IN POTS; all the best New and Old English and Foreign sorts, from 18s. to 36s. per doz. Descriptive LIST free on application.

Worms			

FIR TREE OIL destroys Lice and Flies on Animals; it will cure Ringworm and all Skin Diseases produced by Parasites, and is perfectly harmless to the Hairs & Skin. Sold by Stationers and Chemists, 1s., 2s., and 4s. a Bottle. Per post 3d. extra. Per gallon 12s., or less in larger quantities. A Treatise on **FIR TREE OIL**, as an **INSECTICIDE**, its application to Plants and Animals, sent Post Free, on receipt of address, by the Manufacturer.

E. GRIFFITHS HUGHES, Manchester, Wholesale.—HOOPER & CO.; CURRY, SOFER, FOWLER AND CO.; C. E. OSMAN & CO.; and from all the London Seed Merchants and Wholesale Patent Medicine Houses. New York.—BOLKER & SONS.

COCAO-NUT FIBRE REFUSE.—Best and fresh only, 1s. per bag; 15 bags, 12s.; 30 bags, 22s. sent to all parts; trucks, 22s. free to Rail. PEAT and LOAM.—A. FOULON, 32, St. Mary Axe, London, E.C.

12-oz. Sample Packets, free by post, 12 Stamps.

FIBROUS PEAT FOR ORCHIDS, &c.—BROWN FIBROUS PEAT, best quality for Orchids, Stove Plants, &c., 2s. 6d. per Truck. BLACK FIBROUS PEAT, for Rhododendrons, Azaleas, Heaths, American Plant Beds, 15s. per ton per Truck. Sample Bag, 5s.; 5 Bags, 22s. 6d.; 10 Bags, 42s. Bags included. Fresh SPHAGNUM, 10s. 6d. per Bag. SILVER SAND, Coarse or Fine, 22s. per Truck of 4 Tons. WALKER AND CO., Farnborough Station, Hants.

GISHURST COMPOUND, used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Blight. 1 to 2 ounces to the gallon of soft water, 4 to 16 ounces as winter dressing for Vines and Orchard-house Trees; and in lather from the cake against American Blight. Has obtained many preparations intended to supersede it. Boxes, 2s., 3s., and 12s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 1d. and 2s. from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

FOR SALE, CHEAP, 100 Loads of good GARDEN MOULD, and 200 Loads of BALLAST. Apply to the FOREMAN of the WORKS, 84, South Lambeth Road, Vauxhall, S.W.

Carriage free on receipt of Post office Order.

DANIELS BROS., TOWN CLOSE NURSERIES, NORWICH.

PRINCE'S IMPROVED EARLY NONPAREIL CABBAGE.

6d. per Packet, or free by Post, 7 stamps.

Sow, for earliest Spring Crops, from middle to end of July, and transplant first week in October; also, sow again from March till June for successions during Summer and Autumn.

This is generally admitted to be the quickest and best flavoured kind; in its early formation dwarf and compact in habit; and, if left, will form a large handsome Cabbage in June; at the same time it is a variety less liable to run to seed than any other grown.

GEORGE PRINCE, Seedsman and Rose Grower, 14, Market Street, OXFORD.

SPECIAL CULTURE OF FRUIT TREES AND ROSES.

THOMAS RIVERS & SON

INVITE those interested in the above to visit their establishment. The Fruit Houses for the growth of PEACHES, NECTARINES, GRAPES, CHERRIES, FIGS, ORANGES, &c. are now full of Fruit in various stages, and will continue to be of great interest until the end of September.

Many thousands of PYRAMID, BUSH, and CORDON TREES are Grown and Fruited out-of-doors. A large stock of the best ROSES will be in flower. Full information will be given of our various methods of cultivation.

The Nurseries are situated between the Harlow and Sawbridgeworth Stations, Great Eastern Railway, each 1 mile distant, and conveyances may be secured.

Gardeners' Chronicle.

SATURDAY, JULY 25, 1885.

ISLAND FLORAS.*

IT will be within the remembrance of our readers that a scientific expedition, under the command of Captain Nares, was despatched a few years ago, mainly with the object of investigating the depth and nature of the seabottom in various parts of the globe, and of studying the physical and natural history of the ocean, and of such lands as might be touched at. It was hoped that many problems in the phenomena connected with the peopling of various lands, and the filiation and dispersion of living creatures might thus be solved, and help to throw light on the past history of the plants and animals which now occupy the globe. How this was accomplished is sufficiently known to the general reader. The collections made were naturally very large, and have occupied the attention of numerous naturalists, some of whom have already published the results of their labours; and as regards generalities, Mr. Moseley has already communicated to the Linnean Society some notes on the general aspect of the vegetation of many places visited.

The botany of continents was naturally but little attended to, but special attention was given to the vegetation of oceanic islands. What are the constituents of the vegetation of such islands? Whence, and in what manner has it been derived?

In the case of islands near the mainland with only a shallow channel between, it is easily understood that the flora of the mainland and of the island are one and the same. Where the distance between the mainland and the island is greater, and the depth of the intervening channel more profound, it is natural to suppose that there are greater variations in the vegetable population, and to infer that the separation has taken place at a period remote in proportion to the degree of diversity of the flora from that of the nearest land. But in the case of most oceanic islets, their recent origin, volcanic or coralline, precludes the idea of their ever having been attached to any continent, and their great distance from any other land lends great interest to the problem of the origin of the vegetation which clothes their surface. The set of the currents, the direction of the prevalent winds, the migrations of birds and other creatures, all have to be taken into consideration, while, of course, the study of the endemic or aboriginal vegetation (where such exists, and has survived the ravages of goats and other destructive agencies), is of surpassing interest to the botanist. These points were ably treated of in Sir Joseph Hooker's lecture on "Insular Floras," published in our columns in 1866, and they form the subject of Mr. Alfred Wallace's instructive book entitled *Island Life*.

But now we have in the bulky volume before us, for the first time, a more complete account of the vegetation of these oceanic islets. The col-

* Report on the Scientific Results of the Voyage of H. M. S. Challenger, during the years 1873-76, &c.—Botany. Vol. 1, 1885, quarto.

lections made during the voyage of the *Challenger* have been studied by Mr. Hemsley, who in reporting on them has availed himself of what has been previously collected by other travellers, and of what has been published by other writers. When Mr. Hemsley began his task, he tells us, he was inclined to speculate, fascinated no doubt, as so many of us have been, by the writings of Darwin, of Hooker, of Wallace, and of others on this subject, but as materials accumulated Mr. Hemsley found that he would be doing better service by arranging and co-ordinating facts than by framing theories. In the introductory notes on the vegetation of the various islands are given tables showing the numbers and distribution of the genera and species, together with observations on the composition and affinities of the different floras, the agencies operating in the dispersal of plants, and the part played by oceanic currents, drifts, and migratory birds.

The general characters of remote oceanic insular floras are stated by Mr. Hemsley to consist in the large relative proportion of orders and genera to species, in the number of endemic species, the woody habit of a large number of the species, the prevalence of plants with small narrow leaves [perhaps due to the prevalence of wind-storms], and the relative rarity of brightly-coloured flowers [perhaps correlated with a corresponding deficiency of insects].

The islands themselves admit of being roughly grouped into three divisions—those in which there is a large aboriginal endemic element especially in the case of genera, those in which there is a less marked endemic element, and that more especially marked in the case of species; and thirdly, islands in which there is no special endemic element.

In the first group may be placed St. Helena, Juan Fernandez, the Sandwich, Galapagos, and Seychelle groups. In the second category are the Azores, Bermudas, Ascension, the Admiralty Islands, &c. The third group consists of recent coral islands in the Indian and Pacific Oceans. The generalities relating to the floras of these several islands are described by Mr. Hemsley in the introduction, as well as certain special features pertaining to them, such as the relatively large proportion of shrubby Composites, the relatively small proportion of Leguminosæ, Coniferae, Cyadaceae, Orchidaceae, and petaloid monocotyledons generally. The species of *Carex* (Sedge), are found in a large number of islands, both temperate and tropical, some of the islands having species peculiar to themselves, and hence they are made the subjects of special investigation. Several of the species common in the northern hemisphere are found also in New Zealand, but nowhere else in the southern hemisphere—a circumstance rather of explanation. Other phenomena of distribution such as the very limited range of certain orders, genera, and even species, are discussed with a view to show that restricted distribution is not confined to islands; thus *Campanula isophylla* is peculiar to a small strip of coast near Noli, on the Genoese Riviera; *Saxifraga florulenta* is found on the Alps in the vicinity of the Col de Tenda, and nowhere else; *Dionea muscipula* is confined to North and South Carolina; and so forth. Lists are also given of plants known, or surmised, to be distributed by currents, birds, &c. The origin of the antarctic flora is discussed, and then some general remarks on the floras of each one of the islands specially treated of in the present volume are supplied. After these generalities the author proceeds to give a detailed list of the plants of each island or group of islands visited by the *Challenger*, beginning with Bermuda, where one of the most interesting plants is the *Juniperus bermudiana*, already commented on and figured by Mr. Hemsley in our columns. The Bermuda Lily, *L. Harrisii*, appears to be known only in cultivation, and is not alluded to by

Mr. Hemsley, but how thoroughly it is suited to the climate may be judged from the illustration we gave of a Bermuda Lily ground some time since. The botany of St. Paul's Rocks may be summed up by saying there is none, at least there are but seventeen plants known, and these are sea-weeds. Fernando Noronha seems to have a flora like that of Tropical America, with no specially numerous endemic elements, but the discourtesy of the Governor prevented a full investigation of this little known island. Ascension is next mentioned, concerning the extremely scanty vegetation of which Mrs. Gill has a few incidental memoranda in her charming *Six Months in Ascension*—a book, by the way, not included in Mr. Hemsley's biographical list. Some notes concerning this island may also be found in earlier volumes of this journal, Dr. Lindley having been called on by Government to report on the capabilities of the island. The flora of St. Helena is richer and better known, but the botanist will be glad to have so compendious a summary as that given by Mr. Hemsley. South Trinidad has been visited only by Sir Joseph Hooker and Dr. Copeland. The latter gentleman found enormous numbers of dead trees, but not one living one. A Tree Fern, *Cyathea Copelandii*, has been discovered here, but up to the present only thirteen species are known from this island. The vegetation of Tristan d'Acunha is fairly well known. The Crozets, Kerguelen, and Heard Islands have a substantially identical flora. In Amsterdam and St. Paul's Islands the Phanerogams and Cryptogams occur in equal numbers, though only thirty-eight species are at present known (excluding cellular Cryptogams).

The third part of the volume is devoted to the botany of Juan Fernandez, the south eastern Moluccas, and the Admiralty Isles. Juan Fernandez is decidedly Chilean in its vegetation, with a strong endemic element. The south-eastern Moluccas have a rich luxuriant vegetation, the constituents of which, unfortunately, are only imperfectly known, and the same may be said of the Admiralty Isles. The work is completed by a chapter on the various seed-vessels, seeds, and other parts of plants collected, as drifts. Moseley even mentions in Little Ki Island a mass of epiphytic pseudobulbs of some Orchid which had been washed up in a storm, but which was still in vigorous vitality.

The work consists of three separate parts, each with separate pagination, and with its own index and plates. Happily the latter are numbered consecutively, so that we are spared the annoyance of three sets of plates in one volume. A general index for the whole volume is a desideratum, and a separate list of the new species and genera described by the author himself would have been an improvement.

Mr. Hemsley has completed, with great ability, what most occasionally have been, from its necessarily fragmentary and discontinuous character, a very perplexing task. Botanists and geographers will be grateful to him for the work he has accomplished, the suggestions he has made, and the references to other literature, that he has supplied. The plates, sixty-five in number, have been executed, very satisfactorily on the whole, by Miss Smith.

Considering the scanty material Mr. Hemsley too often had to deal with, his work compares favourably with that hitherto published in connection with this famous expedition.

— CYDONIA JAPONICA.—It is the habit of some Pearls to flower twice in the season, the second bloom being formed, not on the spur of last season's growth, but on the new shoot of the year, as in a Rose. This year we noticed in the Chiswick Garden that *Cydonia japonica* is doing the same thing—a pretty clear proof that, great as the difference appears to be physiologically, it is of no "specific" importance.

New Garden Plants.

LISSOCHILUS KREBSII VAR. PURPURATA.*

THIS is a far finer plant than the original form, and is really a most beautiful plant. It has coiled pseudobulbs, about 3 inches in length, with very stout roots, and broad, thin, plicate, lanceolate acute leaves, the longest of which are a little over a foot long and 2 inches across. The scape is 3½ feet in height, and terminated by a raceme of twenty flowers, four of which only open at a time. The flowers measure sometimes nearly 2 inches across. The sepals are dark green at the back and deep maroon-purple in front, the margins being revolute. The petals are ovate, bright yellow above, and paler cream, faintly veined with red, beneath. The lip dull orange-yellow with the lateral lobes chocolate-purple, streaked with darker lines. The spur tipped with pink. The column is white. The plant, which has been recently introduced by Mr. E. A. Heath, from Southern Africa, is now flowering in the Botanic Gardens, Regent's Park. It does not seem to present any great difficulties in cultivation, and is certainly well worth the attention of Orchid Growers. *H. N. Ridley.*

THE FILMY FERNS OF JAMAICA.

A PERIOD of ten years' residence in the island opened in botanical and horticultural pursuits has afforded many opportunities for becoming acquainted with these beautiful members of the cryptogamic flora. A few remarks on their homes, and the climate and situations in which they are found, may therefore be of some interest to your readers, especially to those who have of late years initiated the cool system of treatment for these beautiful plants. Some 450 species, with sixty-five varieties, of Ferns indigenous to the island are now known to exist. The most of which have either been seen by, or specimens are in possession of your correspondent. Of this number some forty-seven species belong to the genera *Hydrocotyllum* and *Trichomanes*. Their principal home is among the gullies adjacent to, and on the ridges and peaks of the highest range of mountains in the island in situations for the most part nearly inaccessible, and not available for cultivation on account of the steep and precipitous nature of the mountain-side, which often closely approaches the perpendicular, and is seldom of an easier slope than an angle of 45°. In many places the sides of the main ridge is broken into subsidiary ridges by large gullies or ravines through which, during the rainy season, the mountain torrent foams and roars on its way to the sea, bringing down in its course huge boulders of rocks from the heights above. The hills and gullies are clothed throughout with a vegetation wild and varied in its character, in which the Phanogamous flora, though well represented, is eclipsed in point of number and variety by the cryptogamic Ferns, Lichens, mosses, Hepaticums, and fungi, in one form or another, are to be seen on every branch and twig, living or dead; while on the ground they form a carpet, including numberless forms of varying colour and of exquisite beauty. In the few puddles and pools, and on wet rocks among the mosses, many members of the lowest forms of vegetable life find a congenial home. The older and well known forms of *Algae*, *Desmidiaceae* and *Diatomaceae* being met with in fair proportion, while some few, new to science, have lately been discovered. Among the trees composing the forest, lofty specimens of the "Bloodwood," *Laplacea hematoxyloides*, Camb., prominently abound, covering the ground below them during their period of flowering with a snowy carpet of their white deciduous blossoms. *Podocarpus coriaceus*, Rich., the "Yacca" of the natives, is also abundant in places, but its habitat is usually so inaccessible and remote from seaports that its wood, in common with many others indigenous to

Lissochilus Krebsii var. *purpurata*, n. var.—Florus speciosus; sepalis dorso viridibus antice atropurpureis s. marginibus, revolutis; petalis dorso splendide flavis, antice pallidioribus, venis pallide rubris; labelli lobo medio luteo, costis purpureo tinctis, lobis lateralibus brunneo-purpureis; calcaris brevis apice roseo. Africa meridionalis. Introd. E. A. Heath. *H. N. Ridley.*

Jamaica, though of good value for cabinet use, will not pay the cost of transit to the seaside for export purposes, especially when placed in competition with woods of a similar character more readily obtained from other countries.

Cyrtia antillana, Mich.; *Lyonia jamaicensis*, Don; *Clethra tinifolia*, Sw.; *Vaccinium meridionale*, Sw.; *Fadyenia Hookeri*, Endl; two species of *Dipholis*, several *Eugenia* (*Myrtus*), and the smooth-leaved members of the *Hibiscus* stud the ridges most exposed to the wind, and by their weatherbeaten appearance bear evidence of the humours of wild Boreas. The Composites are represented by *Critonia*s and the arboreal *Senecio*s, and are found in sheltered spots in common with the arboreal species of *Solanum*, *Hedera*, and *Sciadophyllum*, with two or three representatives of the *Euphorbiaceæ*. Climbing Bamboo (*Chusquea abietifolia*, Gr.) and several species of *Gleichenia*, form almost impassable barriers on the more exposed or infertile spots where the arboreal vegetation is somewhat scanty. Types of *Melastomaceæ* and *Rubiaceæ* are met with at every turn, while *Leguminosæ* trees are rendered conspicuous by their total absence. It is in traversing the ravines, gullies, and ridges of the mountains covered with such a variety of vegetation as I have attempted to describe, that the Filmy Ferns are met with in all their native beauty. The great majority of them are found at high elevations, for the most part in well shaded and sheltered spots, secure from exposure to sun, wind, and storm, and in situations where even at mid-day the atmosphere is nearly saturated with moisture almost every day, even during dry seasons. The mountains are enveloped in cloud and mist, though at times dissolved by the sun, they are again covered, as by a mantle, at the approach of evening. The temperature in these regions may be approximately ascertained, by allowing a reduction of 3° Fahr. for each 1000 feet above sea level, the mean annual temperature of which stands, for Jamaica, at 80° Fahr.

As most of the *Filices* are inhabitants of regions between 3000 and 6000 feet, it follows that the temperature most suitable is a range from 62° to 71°, mean annual, which has been proved by experiment to be that which actually exists. The range of daily temperature at 5000 feet is from 19° to 20°. The maximum temperature seldom being above 75°, or the minimum below 55° in the warmest months; while in the cooler months a difference of 5° in both maximum and minimum may usually be observed. To those of your readers who have these gems in cultivation these facts may be of interest, but there are other points relating to their habits and mode of growth which must be attended to as well as humidity and temperature to ensure success with artificial cultivation; but as these points vary with the different species, I would mention them for convenience in connection with each species, in the order in which they are placed in Jenman's *Hand-List of Jamaica Ferns*—a mere list in itself, but soon, I trust, to be followed by a more important descriptive work from the same pen. As the elevation is given at which each species flourish, the temperature it requires can be easily ascertained by noting the foregoing remarks.

LIST OF SPECIES OF HYMENOPHYLLUM AND TRICHOMANES INDIGENOUS TO JAMAICA.

(The figures between parentheses denote the height above sea level.)

- Trichomanes spicatum* (500—1500).—One of the few species found at low elevations, on rocks, in gullies, or by river sides.
- T. reptans* (3000—5000).—In gullies, on wet rocks, and among the shorter growing *Sphagna* and *Hepaticæ*.
- T. punctatum* (2000—4000).—On trees, in shady woods and ravines.
- T. membranaceum* (3000—4000).—Grows on wet rocks, beside waterfalls, where it is constantly bedewed with spray, but able to stand some degree of drought.
- T. seiferum* (4000—5000).—The smallest of the Jamaica Ferns, scarcely ever exceeding three-quarters of an inch in length. Grows on wet rocks in deep shade.
- T. apodum*.—Not seen growing.
- T. muscoides* (3000—4000).—Grows side by side with *T. membranaceum*.
- T. pusillum* (4000—5000).—On rocks and among mosses on shaded and moist banks.
- T. sinuosum*.—Not seen growing.
- T. Bancroftii* (3000—4000).—Grows on damp rocks in shaded gullies, living apparently on the decayed remains of *Algae* and mosses.
- T. crispum* (5000—6000).—Finds a congenial home in forests covering the peaks and ridges of the highest

mountains. It grows on moss-covered ground on peaty beds; will stand water overhead in quantity.

T. Kaulfussii (500—6000).—Usually found growing under shade of decayed tree stumps. Doubtfully distinct from the last. Its habitat may account for the laxness of habit and thinness of texture, which, together with its reduced basal plane, form the best marks of distinction.

T. crinitum (4000—5000).—A very pretty species; evidently does not like a wet jacket. In common with all the villose species, always found hidden on the underside of a rotten tree stump or Tree Fern root.

T. alatum (4000—6000).—Usually grows among mosses at the base of Tree Ferns in shaded situations.

T. Kraussii (500—1000).—On naked stems of trees near river courses under thick shade.

T. pyxidiferum (4000—5000).—On the ground among decaying vegetable matter, and on rotten tree stems in dense woods.

T. radicans (3000—6000).—In ravines, climbing on rocks and tree stems, and in shady woods by river sides.

T. lucens (5000).—One of the rarest and handsomest of all the indigenous *Trichomanes*; usually found on the underside of rotten and overhanging tree stumps. It has a pendulous habit of growth and evidently does not like overhead moisture.

T. rigidum (3000—6000).—Invariably found on the ground, under shade. Fronds often covered with *Algae* and *Jungermannia*; grows in stiff clayey soil.

T. scandens (3000—6000).—On the ground and on rotten tree stumps, among mosses and decaying vegetable matter.

T. tenerum (3000).—In very dense woods, on damp dark banks, in clayey soil.

T. tricholeidum (4000—6000).—This Fern covers the stems of Tree Ferns, especially *Cyathea pubescens*, to a height of 10 or 12 feet forming a thick mossy mass in positions where it must receive the drip from surrounding trees.

Hymenophyllum asplenoides (3000—6000).—Covers stems of trees, on which it hangs in a pendulous manner, fairly exposed to light, but not to direct sunshine.

H. abruptum, *H. rufum*, *H. L'Hermieri* (4000—6000).—Among mosses on rotten logs on the ground in shady woods.

H. polyanthum (4000—6000).—The most common species; grows in almost every conceivable position, on the variety of which depends the size and substance of the fronds; will stand water freely overhead.

H. sphaerocarpum (5000).—On shaded and overhanging damp, clayey banks, among roots, &c.

H. undulatum.—Not as yet noticed *in situ*.

H. axillare (4000—6000).—A soft, flaccid species, growing in large masses on overhanging trees, in such a position as to freely shed any water that falls upon it.

H. crispum (4000—6000).—In similar positions as the last.

Unbridgenia (4000—6000).—Though answering fairly to the description of the British plant I have reason to think our species is merely a depauperated form of the next.

H. lucoides (4000—6000).—On tree stems and mossy trunks in shady woods.

H. lanatum, *H. hirsutum*, *H. lineare*, *H. sericeum* (4000—6000).—Are all of similar texture, hirsute, pendulous, and impatient of stagnant moisture. Any of them will soon succumb if subjected to the same treatment that *H. polyanthum* requires. Though impatient of drought they should have a free play of air around them, tempered with humidity. They are found clinging to the shady side of upright or leaning rotten stumps in shady woods.

H. Catherinei, *H. ciliatum* (4000—6000).—Both found in precisely similar places, among moss, on decayed logs, and on peaty, moss-covered soil on the ground.

H. elegitissimum (5000).—A most beautifully delicate and fragile species, growing in deep shade in moist situations, on banks, or at the base of Tree Ferns.

H. micellum, *H. microcarpum* (4000—6000).—On the ground or dead logs among mosses and *Hepaticæ* in shady woods.

For all the species one of the first desiderata in attempting cultivation is to secure abundant drainage. The other essentials are a humid but not stagnant atmosphere, and a temperature in accordance with elevation at which they are found. The most suitable potting medium for the generality of species is a mixture of fibrous peat, sharp sand, and a small quantity of thoroughly decomposed leaf-mould, with the addition of a small quantity of well broken porous brick or charcoal which has been well exposed to rain and air to remove its otherwise somewhat caustic properties. *J. H. Hart, Superintendent, Government Cinchona Plantations, Jamaica.*

TRADE MEMORANDUM.

C. STEINPOCK, Scheibmühl-Traisen, Lower Austria.

GUIANA ORCHIDS.

THEIR INSECT FRIENDS AND FOES.—When I saw *Coryanthes speciosa* flourishing luxuriantly with its oval mass of roots, a nest for myriads of stinging ants, the questions naturally occurred to me:—"What is the connection between the insect and the plant?" "Is there any benefit or injury from the association?" "Did the Orchids grow on the ants' nest, or the insects make their home in the root of the plant?"

These questions can be answered, thanks to Darwin, Lubbock, and other naturalists who have investigated the connection between ants and Orchids; and confirmed by my own observations in some cases. The Orchid being pendent from small branches, or creeping plants, it affords a secure asylum for the insects, in the same way that the mocking-birds' nest is hung from the outer branches of tall trees to preserve the brood from their enemies. It is certain that the Orchid suffers no injury from its tenants, but on the contrary, flourishes in perfection under such circumstances. That the plant does not originate upon the ants' nest is proved by the fact that young specimens are often found uninhabited, but with bunches of roots similar to the older ones. "Ants plants" derive benefits from their tenants from the fact that these are carnivorous, preying upon such pests as naked caterpillars, cockroaches, and plant mites. It is a common and interesting sight to watch a small regiment of ants carrying a cockroach up a wall, or attacking a live caterpillar; but when an army of yakman or hunter ants make a raid, hundreds of plant-eaters may be seen running, jumping, and crawling, to rid themselves of their tormentors, which hold on in spite of the big jumps of grasshoppers, or the rolling of caterpillars.

In growing these plants near the coast (their tenants having been evicted by the collectors), some difficulty is experienced to keep them free from cockroaches, which gnaw at the roots, and often kill the Orchids in a little time. In collecting them, the supporting branches are cut away quickly, and the whole plant dropped into the water, then pushed under with a long pole until the ants come to the surface. As may be supposed, the collector is almost certain to get well bitten, even with most careful management.

Although the *Coryanthes* is benefited by its freedom from cockroaches, &c., there is one insect which (being essential to the propagation of the species) it is necessary to attract. The contrivances by which the insect is attracted are among the most wonderful in Nature. Below the bulb hangs a flower-stem about 2 feet long, near the tip of which five to ten flowers are ranged. The texture of these flowers is fleshy, and probably attractive to cockroaches, but these vermin are kept away by the ants. It is rather difficult to describe the flower in popular language, but the general shape is like a cock, the place of the body being a cup, into which a liquid drips from the horn-like process above. When the flowers open a number of brilliant green flies are seen swimming in the liquid at the bottom. They have been attracted by the smell, which is something like stale meat, and flying at that part which stands above, they fall into the cup, wetting their wings so that they cannot fly out. The sides of the cup being steep and slimy, and the fly smeared over with the liquid, it cannot climb, but moves round and round, like a cockroach in a tea-cup, sometimes being drowned instead of finding the way out. It generally, however, finds its way to the only place of exit, where the column which contains the essential organs of fertilisation comes near to a gap in the cup. Some force is necessary, as the cup is like a spring door, and in pushing through the fly passes the stigma (female organ), ruptures the box containing the pollen (male organ), which, being glutinous, sticks to its back, and is carried off. The wings being smeared it cannot fly, but crawls from one flower to another, and in going through the same process again carries the pollen and rubs it on the stigma, thus fertilising the seeds. Insect fertilisation of Orchids is by no means so certain as that of most other flowers. Seed-vessels are rather rare, even on common species, not one flower in a hundred producing perfect seeds; but as one pod will have 20,000, or more, it is not so necessary for each to be fertilised, as in some other plants. I have often watched the flies doing what is here described, and even caught them with the pollen masses adhering to their backs. [Figures of *Coryanthes* illustrative of these phenomena were given in vol. xvii., t882, p. 593. Ed.]

The three species of *Coryanthes* show the best types of dependence on insect friends, but most of the species of *Orchids* are fertilised by, and many others provide homes for, them. *Epidendrum bicornutum* has hollow bulbs with small holes at the base, where the ants have their doorway. These bulbs are the perfection of ants' nests, their inhabitants being perfectly sheltered from rain or enemies. This *Orchid* is difficult to cultivate, even in England, probably from want of its insect protectors.

CATASETUM.

The *Catasetums* usually have hood-like flowers, and below the hood the pollen masses are contained in little spring-boxes. From the anthers or pollen-boxes two antenna-like appendages project inside the hood, one nearly straight and the other bent like a fish-hook. When the flowers open a great buzzing is heard, and a pretty yellow and black bumble-bee is seen hovering round them. Watching carefully you see the insect fly into the flower, and in a moment come out with something sticking to its head. It has tickled the sensitive antenna of the flower, the spring box is opened, and out jumps the pollen mass like a skip-jack, adhering by means of a disc covered with a gum like birdlime. Into another flower goes the bumble-bee, and pushing its head against the stigma fertilises the flower. The pollen masses spring out with considerable force, and when touched with a needle will jump 6 feet, adhering closely to whatever comes in the way.

Many of our *Orchids* do not get fertilised in Georgetown, probably because the particular insect required does not live near the coast. The white flowered species are generally fecundated by nocturnal moths, and are usually highly scented at night; it is obviously more difficult to see the process in their cases. Once only (in the early morning) I saw a hawk moth, with its long proboscis inserted within the flower of *Burlingtonia candida*.

The scale insects (cocc) are great pests to *Orchids*. A small black ant is always found with the coccus, apparently living on some exudation from it. I have thought that the ants have something to do with bringing them, acting as nurses, but I have not been able to prove it. Possibly they may carry the eggs from one plant to another, as I have seen some of the dead cocc perforated on the back as if an ant had been getting inside. *J. R., "Demerara Argosy."*

A MALAYAN FOREST.

TROPICAL forest would be a better term than jungle, and less likely to be misunderstood; for it is a forest of noble trees, mingled with saplings, tall and slender, growing as close as may be. When one tries to analyse the constituents of the mass, the eye soon loses itself in the confusion of stems, vines, branches, and foliage. There are, however, three kinds of tree conspicuous, that is, tall saplings, shorter trees as tall and straight, a foot or so in diameter, with a green or grey smooth bark; and finally the large brown heavy stems with rugged scaly bark (*Dipterocarpus* and *Dammur* Pines). From the latter hang loose swinging vines of every size, from the thickness of twine to stout hawsers, sometimes leafy, sometimes like loose cordage, or the tangled rigging of a ship. Then the leaves are of every shape—minute or immense, opening like huge umbrellas, or spreading in feathery sprays like a mist over the water.

These leaves are of every colour. The glorious autumn tints of a European forest are surely outdone by a Malayan jungle. Looking down from any elevation the trees form a mosaic pattern. While I write I see around me crimson and light green, yellow, grey with brown, and even blue tints, like so many gems, for they always glisten with the moisture of the woods.

The stems of the large trees are seldom without festoons of *Dracaenas*, Ferns, and climbing plants. At the branching, or just below where the branches spread out, there is usually a crown of the well-known Bird's-nest Fern (*Asplenium nidus*), or more rarely a species of *Platyterium*, or Stag's-horn Fern. A stout *Polypodium* *Iseracolum* often makes a full round the stems, with fronds 8 and to feet long, a perfect giant of its kind. But the most graceful as well as the most common Fern is *Aspidium exaltatum*, which hangs down its long feather-like fronds for 6 feet and more from the stems of trees. I once measured a frond drooping from the limestone rocks in Salongore, which was 10 feet 7 inches long, and in no part wider than 4 inches.

We have hitherto been looking above us in this

view of the jungle. As we lower our gaze the eyes rest upon the close growth of Bananas and Palms. Below these are the ground Ferns, the *Lycopods*, *Selaginellas*, the fallen timber (in great abundance), the fungi (many luminous at night), and many small flowers of *Gesneraceae*, *Begonias*, and *Acanthaceae*.

The evergreens, which twine in garlands around the stems of trees, are endless, such as *Peppers*, *Dioscoreas*, and the pretty head-like *Dischidia*. The latter plant is with difficulty distinguished from a Fern named *Drymoglossum carnosum*, which spreads its slender brown rhizomes over the stems of nearly every old tree in the peninsula. The barren fronds are nearly round and somewhat about half an inch across, while the fertile ones are like long leaves with the fructification halfway between the midrib and margin. Near the ground most of the trees have long fringes of moss (*Jungermannia*) with transparent Ferns of the genera *Hymenophyllum* and *Trichomanes*.

I need scarcely say that this is the country for *Orchids*; they abound in every tree and rock, which, I am sorry to add, they do not in general adorn. Few of them have conspicuous flowers, the general aspect of their fleshy stems forcibly reminds one of half-withered Cabbage stumps. Yet, as they will grow anywhere, there is a great taste for hanging them everywhere by amateur gardeners in the Straits Settlements. Thus verandahs become places in which you can scarcely walk with safety. These plants are perfect ants' nests, with an occasional centipede ready to invade the bedrooms as soon as the rainy season sets in.

There is a curious phenomenon connected with the undergrowth of the jungle for which I cannot account. Mosses, Ferns, and small plants, such as *Selaginella*, Ferns, and *Melastomads* (*Sonerilla* especially) are clothed in certain areas with a beautiful metallic lustre of the clearest blue, like the blue of steel. It affects all the plants in the locality.

I have not mentioned yet the extraordinary brilliancy of the variegations of leaves among certain shrubs, notably *Maranta*, *Begonia*, *Caladium*, *Anacardium*, and *Sonerilla*. They all grow here in the greatest profusion close to the ground; a small *Sonerilla*, with dark-green heart-shaped leaves, regularly dotted with brilliant white, sometimes covers acres of ground. I would say more about the *Begonias*, but every horticulturist knows what they are better than I can describe. This country is one of their homes. It will be news to many perhaps to hear that the Malays use the succulent leaf-stalks precisely as we do *Rhubarb*.

It need not be said that such a vegetation gives a shade which the sun can scarcely penetrate. Just at the place I am describing the forest was opened to the sky by the stream, whose banks were fringed by many an ornamental shrub and flower. *Crinum*, *Pandanus*, and *Caladiums* grew in the water; *Ixora coccinea* was also common, so that every few yards the colour was varied by its thick clusters of star-like scarlet blossom. Another glory of the jungle is *Æschynanthus*, a beautiful crimson creeper often seen on trees.

I might particularise many other flowers, but it must be admitted that the Malayan jungle derives its beauty more from its graceful masses of vegetation than from flowers, and thus, with all its luxuriance and magnificence, there is a certain sameness everywhere—lovely, if you will, but which pall somewhat when you get nothing else.

I must not omit to mention, however, that several of the fruits are very ornamental. The crimson *Modecca* is just like a large *Capsicum*; the fruit of a *Dyosoxylon* like an *Orange*, while the open seed-pods of some *Pithecolobiums* equalled any flower in brilliancy. The Malays brought us in wild fruits such as *Mangosteens*, *Lunsats*, and some wild *Grapes*, but none very savoury; indeed, some of the party suffered much from a burning throat and tongue after eating the *Grapes*.

For vegetables we had *Yams* (*Dioscorea*) and the white inner leaves of a *Cabbage Palm*, which was very agreeable when cooked, besides the stalks of the *Begonia* leaves already referred to. All the shrubs are juicy and succulent, as one might expect in a country where rain, rain, rain is the usual weather.

Gutta trees of the genera *Icosandra*, *Bassia*, and *Willughbeia* were common. A small incision into the latter, which bears a large edible fruit, exudes a thick viscid white juice, which one can wind off in round balls. In a few minutes it becomes elastic,

like indiarubber. There are many trees here with milky juices, but only a few harden into a good gutta. The Malays of Kedah, however, have a method of hardening some of these sufficiently to make them useful in adulterating the valuable kinds of rubber. My men showed me how this was done. They collected about a pint of juice and mixed it with common salt, which caused it to curdle. The compressed curds from this juice made a hard white ball about 1½ inch in diameter. It was not elastic, but broke into pieces like enamel, yet not without a hard blow. The substance wants all the elastic qualities of good gutta, but still might be turned to many useful purposes. The tree from which the juice was obtained was conspicuous for its enormous leaves, shaped like a Fig leaf, and often 2 feet in diameter. It is a species of *Pterospermum* (*acerrifolium*?), and is common throughout the Malay peninsula and China. I also noticed it as one of the most common trees in North Borneo.

It was rather amusing to notice one way in which the Malays made use of the true gutta juice. When their thin calico clothes were torn—the lacerations, I need hardly say, being frequent and considerable—they used to mend them by bringing the edges together and plastering the rent with gutta juice. This made a permanent and strong joint, with the additional advantage of being waterproof. *J. Tenison Woods.*

SAXIFRAGA PALLIDA, WALL.

LEAVES green, very spreading, forming a flat rosette, 1–2 inches in diameter, with a flat petiole and an elliptic or roundish limb, more or less toothed on the margin, ½–¾ inch long, ¼–½ inch broad, sparsely covered, as well as the peduncles, pedicels and bracts, with short-jointed colourless hairs (scarcely glandular). Peduncles 1–4, 1–4 flowered, 1–4 inches high, including the ½–2 inches long pedicels. Flowers ½–¾ inch in diameter; basal part of the calyx obconic, calyx-lobes broadly ovate, subacute, at first suberect or a little spreading, but during the ripening of the fruit becoming more or less reflexed, dull green, or reddish tinted, glabrous, 1½–3 lines long, 1–½ line broad. Petals but slightly spreading, persistent and erect in fruit, elliptical, ovate, 2–4 lines long, 1½–3 lines broad, shortly clawed, white, with or without red tips and dorsal median line. Stamens shorter than the petals, filaments white, anthers small, red. Ovary half superior, dull purplish-red, styles very short, scarcely any. Capsule large, seeds ellipsoidal acutish at both ends, and covered with beautifully crenulated longitudinal ridges, as viewed under a lens.—*S. pallida*, Wall., in *Sternb., Saxifrag. Suppl.*, t. 23; Hook., *Fl. Brit. Ind.*, ii, p. 394.

A neat little alpine *Saxifraga*, native of Sikkim Himalaya, at elevations of between 13,000 and 17,000 feet. Plants of it flowered at Kew this spring, raised from Himalayan seed. It is remarkable for the persistence of the petals during the ripening of the seed, and of the great variation in the size of the flowers. *N. E. Brown.*

ORCHIDS FOR AMATEURS.

(Continued from p. 80, vol. xxiii.)

The last group of *Cattleyas* contains only a single species—

Cattleya citrina.—It is a native of the lofty mountains of Mexico and Oaxaca. It grows from the under-side of the branches of Oaks, so that the whole plant is inverted. The pseudobulbs are about 1 to 2 inches in diameter, egg-shaped, and covered with loose white membranous scales, with two strap-shaped leaves, which are glaucous or mealy. The flower-stalk bears two large waxy yellow flowers, which are bell-shaped and have the perfume of the *Jonquil*.

The attempt to grow this plant in its natural inverted position does not appear to have been very successful, but splendid specimens have lately been sold grown in baskets, with the leaves and bulbs turned upwards instead of hanging down. It should be placed in the *Odontoglossum*-house, and needs abundant supplies of air. I believe that a close atmosphere is its greatest enemy, as water resting upon its leaves or amongst its roots is very destructive to it, but like most *Orchids* it is easily starved, when it produces miserable bulbs and flowers. I do not think it is a plant which ever does well in large cities

or in their vicinity, but I am not sure that even under such conditions it might not be grown with success. Heat and dry air are sure to kill it, and a cold stagnant wet atmosphere is equally fatal to it. *B. T. L.* (To be continued.)

VANDA DENISONIANA.

THIS is one of Col. Benson's discoveries in the Arracan Mountains. It was originally described in our columns May 15, 1869, p. 528, when the flowers were described as milk-white, but in the variety hebraica exhibited by Mr. B. S. Williams and by Mr. Neville Wyatt, at the last meeting of the Royal Horticultural Society, the flowers were of a greenish-yellow colour. As the plant was fully described in our columns at the time of its first introduction, and has been figured in the *Botanical Magazine*, t. 5311, we need now only refer our readers to the illustra-

to remote places, and it becomes a matter of moment to pack them safely, so that they become in no way disfigured.

To gather fruit fully matured, pack it, and enable it to journey safely and soundly over a long distance by rail or other means, and when unpacked to be secure that it shall be as fresh and as delicious eating as if just gathered ripe from the tree, is a problem which it has been the Messrs. Webber's desire to see solved, and satisfactorily. Of course this firm of fruit salesmen are not greatly concerned as to the results of packing Peaches for private use only. They have business transactions with many private gardeners, who in their employers' interests send to Covent Garden large quantities of surplus fruit for sale, and which, if arriving damaged through defective packing, proves unsatisfactory equally to salesman and sender. Old hands at this sort of thing and trade growers as a rule, do their packing well. Private gardeners, whatever their assumed knowledge and ordinary practice, seldom

that with simple means and ordinary care Peaches that are well matured though not soft ripe, can be sent some distance per rail as ordinary parcels with complete safety. A flat deal box from 3 to 4 inches in depth inside according to the size of the fruit to be packed, a little soft tissue-paper, and some clean sweet, dry moss are the materials needed, and not only experience extending over many years, but even the limited competition the other day, showed that the moss is far before wadding, or any other packing material. Moss is soft, cool, and elastic. It leaves fruit at the end of the journey just as when packed, and though so elastic as to offer no pressure on any one part of the fruit yet it grips effectively. Wadding, on the other hand, is comparatively non-elastic, and offers but little resistance to pressure. A box with bottom covered with wadding yields nothing to the touch, but a moss bottom is soft and yielding. The same result is found when wrapping—wadding only parts one soft fruit from another, and equally bad results

FIG. 21.—VANDA DENISONIANA: FLOWERS IVORY-WHITE.

tion at fig. 21, taken from a plant in the collection of Sir Trevor Lawrence.

PACKING PEACHES FOR TRANSIT.

THE competition which through the liberality of Messrs. Webber & Co., of Covent Garden, took place at South Kensington last week in Peach packing for transit, without doubt created more interest amongst the gardeners present than did other exhibits. We know pretty well all that can be learnt about Peach culture, and are not less familiar with fine fruit; indeed, the show tables show us from time to time that in the matter of Peach growing, both on walls and under glass, our growers can hold their own against the world, always, of course, subject to climatal conditions, which it is to our home growers' credit that they can successfully overcome. But Peaches, whilst very beautiful when hanging on trees, when gathered have often to be sent

do so to the satisfaction of the salesmen, hence the establishment of these competitions. In previous years we have seen these packing competitions limited to one occasion, and comprising Strawberries, Peaches, and Grapes. That such combination limited competition there can be no doubt, and with a view to make that competition wider, the one class has this year been broken up into three; the first, that for a box of Strawberries, having come off in May; and that for a box of Peaches, of not fewer than twenty-four fruit, last week. The competition for the Grape packing fifty stands over till the Grape show in September. The first competition for the year, that for a box of Strawberries, brought poor competition, and should the prizes be offered another year it is to be hoped that gardeners will show towards them more public spirit. The Peach competition of last week was very satisfactory, as no fewer than eight boxes were sent, although Mr. Webber lamented that none of the older and more experienced packers entered, if but to show younger men how good packing should be done. Still the competition sufficed to establish the fact

are reached when thin coatings of wadding divide the fruits, and thick pieces are pushed into the interstices where they cannot touch. Then wadding is absorbent of the juices of the fruit. On opening the boxes the other day the judges were surprised to find how dry and cool was the moss, and damp the wadding, indeed it felt quite moist. It is true that wadding contains a good deal of animal oil, which may promote this sweating, and impart its flavour to the fruit, but it is certain that the chief portion came from the Peaches, and was abstracted from them. How such dampness in the packing material would act disastrously on the fruit in a long journey can be well understood. In the estimation of experienced salesmen wadding is about as bad a packing material as can be found for choice fruit. Of course in packing ripe Peaches in moss careful handling and manipulation are needful: a wrapping first in soft paper, and little of that—indeed, only enough to keep the fruit clean. That should be done with cool hands. Then having placed a neat even layer of moss in the bottom of the box the packer will commence by

placing a wad of moss in one corner, and hollowing it slightly to suit the form of the fruit; and then another wad followed by another fruit, the hollowing process being repeated until the box is full, and each fruit is set in a soft nest. A layer is then laid over the top, the lid is carefully screwed down, and all is secure. For Peach packing purposes moss should not only be collected in the spring, but be kept dry and clean in crates or hampers for this special use. Bran was employed in one of the boxes seen at South Kensington last week, and although simple enough yet is such an uncertain quantity that its capacity to remain firm cannot be trusted. In this one instance it was escaped upon opening the box that either some had escaped during the transit or else that shaking had settled it down unduly. In any case a considerable vacuum was found, which it would have taken a quart more of bran to fill. Oat hulls were also in one case employed with wadding, but the fine points of the hulls penetrated both wadding and fruit, and, in addition, settled down unduly, as did the bran. Absolutely the best packing material is moss, and gardeners will do well to take note of the fact. *A. Dean.*

PLANTS IN FLOWER AT EDGE HALL.

ROMNEYA COULTERI.—This beautiful Californian Poppy is, without doubt, a difficult plant for cold soils and cloudy climates; but it ought not to be despair of without a trial, and it is worth the trouble it gives. Good seed is not easy to obtain, as I find that the seed of all Poppies germinates badly in proportion to the length of time it has been kept. A Californian collector of seeds lately complained to me that good things were not appreciated in England, as two years ago he offered seed of *Romneya Coulteri* in England at a dollar an ounce, and only sold two or three ounces at that price. Some of this seed probably remains on the market. In the spring of last year I obtained a packet of seed from Mr. W. Thompson, of Ipswich, from which I raised more than twenty plants, the seed germinating in a cold frame in three or four weeks. In the spring of this year I obtained seed from three different sources, but did not raise a single plant. Of those I raised last year I distributed the larger part amongst friends having warm gardens, reserving only three. One of these I planted in July last year under a south wall, and though it did not flower it was 4 feet high at the end of autumn. At the beginning of winter it was surrounded with bricks, on which a hand-light was set, and removed in April. Last year's shoots still remain green, but have made no flower-buds. It is the young wood, thrown up each year from the ground, which alone seem to produce the flowers of the year. Of these there are three or four now 7 feet high, with several branches, each bearing a terminal bud or flower. The flowers do not always open well. The sepals become so hardened as to resemble the husk of a Spanish Chestnut, and from many flowers I have had to pick them off, in order to liberate the petals and allow them to expand. The other two plants which I reserved, were kept through winter in a frame in 7-inch pots, and planted out in May. This treatment stunted their growth, and they do not seem likely to flower this year. *Romneya Coulteri* is worth a trial in all warm gardens. I saw fine plants of it in flower last summer in the gardens of Sir W. Bowman, near Dorking, and of Miss Jekyll at Munstead. I heard that no seed was ripened in either of these gardens. I have not heard of any way of propagating the plant except from seed.

MECONOPSIS WALLICHI.

The first difficulty with this plant is to obtain good seed. My friends kindly send me seed from many quarters, but only twice have any plants been produced here, once from seed sent by Colonel Stuart Wortley, opened near Regent's Park, and once from seed of the brown variety produced in Mr. Wilson's garden at Wisley. From the former I raised about 100 plants in the spring of 1883, many of which are now flowering in different parts of the country. At Edge about a dozen are in flower, the average height being about 6 feet. The colour of the flowers varies from reddish-brown to good light blue, but their behaviour is not quite satisfactory. They open few at a time, twelve or fourteen at once on each plant being a full average. Sun or rain soon causes them to wither, and the flowers often have not enough vigour to

throw off the sepals which adhere at the points, and finally fall, carrying the unexpanded petals with them. The best situation I find to be under a south wall, shaded from all sun after 10 in the morning by trees; but at the best I have never produced or seen anything like the picture in Miss North's collection at Kew, and conclude that M. Wallichi, like many other Himalayan plants, will always flower better in its mountain home than in English gardens.

LINUM NARBONENSE.

This is by far the finest blue perennial Flax I have seen. I was surprised last week to find in several good gardens in the South, *L. perenne* growing under this name. The plants had been obtained from nurseries, and this accounts for a statement I have seen in some garden paper that *L. narbonense* is no better than *L. perenne*. I first obtained the true plant from a garden at Colwyn Bay, and though tender it has survived the last three winters at Edge. The form of the flower is very different from that of *L. perenne*. Besides being twice the size and substance the long sepals do not expand, so as to allow the flower to open flat, but form a funnel, giving the flower a campanulate or turbinate form. The petals of *L. perenne* are about $\frac{3}{4}$ of an inch long, whilst those of *L. narbonense* are fully $1\frac{1}{2}$ inch. The plant forms a spreading bush, branching at the ground line from a single root-stock, and requires to be increased by cuttings. It dies back in winter nearly to the ground, and is worth being preserved by a *clouche*, but in mild winters requires no protection.

INULA GLANDULOSA.

This very showy plant is always at its best in the month of June, though its flowering season is not long. Some of the flowers, which are bright orange-yellow, are nearly 6 inches across. It increases fast, does well in any position, and requires no attention except a rich dressing in early spring, which greatly improves the flowers. With this treatment more than one of my plants have this year produced double flowers on the same roots with single, imitating in this the habit of *Helianthus multiflorus*.

ASTER THOMSONI.

This rare and showy Aster from Eastern Asia, comes into flower at the beginning of July, and continues till late autumn. It came to me from a nursery, I think Mr. Ware's, as *Callimeris incisa*, but Mr. Baker of Kew gave me its true name, adding that miao was the first he had ever seen alive. It grows about 2 feet high, producing flowers abundantly about 2 inches across, of a good lavender colour. It forms a spreading bush, branching at the ground line from a single root-stock, and cannot therefore be divided. It produces abundance of seeds, which germinate sparingly. The leaves are sessile, deeply serrated, more than 2 inches wide near the base, and tapering to an acute point. These leaf characters serve to distinguish *Aster Thomsoni* from *Callimeris incisa*, a plant of far less merit for garden decoration, having narrow lanceolate leaves, and flowers with thinner and more straggling rays. *C. Wolley Dod, Edge Hall, Cheshire, July 18.*

TRIAL-PEAS AT CHISWICK.

In the same way that the drought has discounted the produce of the ordinary garden crops round London just so has it materially affected the growth and precocity of the Peas which have this year been grown for trial in the Royal Horticultural Gardens, at Chiswick. Still the trial has not been an unsatisfactory one, especially as far as the earlier kinds are concerned, because all the sorts were sown early and the soil, though not holding, is rich and deeply worked. In spite of the drought there is, however, no mildew, the chief injury resulting being found in the check to that full and complete development of growth and podding without which it is not always possible to find out the true character of the various kinds under trial. Peas, as is well known, need moisture and deep holding soil, but get these requirements almost exclusively when grown under exceptional conditions, unless the season be unusually favourable. When such is the case then the growth and production seen at Chiswick is as good as may be seen anywhere. For that reason we may accept the present season's results as fairly correct, and probably as good as would have been obtained in most other places. Space at Chiswick is at present

so limited that an extensive trial of old kinds of Peas, conjointly with new ones, cannot be well carried out, but of course full and complete descriptions of the kinds grown in previous trials may always be referred to if desirable.

In the present case some few old kinds are found with the new sorts, and one result seems to afford proof that in the matter of first early kinds there has been no great advance for several years, indeed it seems doubtful whether we can hope to induce any fair cropping and generally useful kinds to turn in earlier than does Earliest of All; which seems to have the start of all others by two or three days. It is a small podded kind, and valuable only because of its facility of yielding a gathering ere William I. and Best of All are available. Indeed here First and Best seems to be the very next earliest. This kind has been grown from both English and American seed. A test trial has been made in several cases for the purpose of discerning how far home growth differed from that raised in the United States, the result may be generally stated to be thus:—The American seed came through a couple of days or so earlier, but at blooming and podding time not the least difference could be discerned. The American Royal New Yorker appeared to be the same as First and Best, whilst Alaska not only bore a close resemblance to Earliest of All, but was just about as early to pod.

It is thus seen that, taking these American Earliest with American Wonder as examples of the Transatlantic varieties, that our American cousins are not a whit ahead of us in the matter of precocious Peas. It was instructive to find growing, just for this season, sent by a seed firm, such old kinds as Harrison's Glory, Blue Imperial, and Dwarf Long-pod, the latter perhaps thought to be a fine Pea in its day, but all are poor enough now and hardly worth cultivation, except the former, which is fairly hardy and is thus favoured for field culture. Apart from Telephone, which here as elsewhere seems to be one of the finest croppers and podders amongst tall kinds and one of the earliest, the best kinds are to be found chiefly in selections from stocks sent by Messrs. Jas. Veitch & Sons, and Mr. Eckford.

Before noticing these, however, we must refer to a very fine kind, Sharpe's Early Paragon, a 6-foot kind producing large, well-filled pods; a really first-rate marrow and early. This kind received a First-class Certificate last year.

From Mr. Eckford, who has dropped upon a fine strain of marrows, the best of which, amongst dwarf kinds, seems to be the Shropshire Hero, 2½ feet high, and which has been honoured with a First-class Certificate. This is a capital cropper and robust grower. Its pods are somewhat curved, fine, and well filled. It should make a first-rate main crop kind. Emperor is a 6-foot Pea, having pods of a somewhat British Queen type, but a trifle more pointed, fills well, and is a very fine cropper for the mid-season. British Trump, by the same raiser, is also a tall, free cropper, has large handsome pods; Peas sweet and of excellent quality. A very fine kind is Quality; it has green pods of Ne Plus Ultra form, but finer, and is a grand cropper, and of the finest quality—has been certificated. The Baroness, another tall and grand Pea, has fine pods and is a heavy cropper. And last, Eckford's Duke of Connaught, 6 feet high, a grand mid-season Pea; pods long, straight, and full—has been previously certificated.

Messrs. Jas. Veitch & Sons have amongst others, Prodigy, a tall kind, heavy cropper, carries a huge pod, full of heavy seeds, high quality. It is a good mid-season marrow, and has a First-class Certificate. Gladiator, from the same firm, is a capital late kind, 3 feet in height, fine cropper, and with large stout pods. Autocrat, growth from 3 to 4 feet in height, is a dwarf Ne Plus Ultra, pods green and full, and Peas sweet and excellent—a capital late kind. Universal is also from Veitch & Sons, rather dwarf habit, has semi-curved pods, well-filled, and is a fine cropper.

Messrs. Webb & Son's Wordsley Wonder, height 3 feet, pods freely, but the pods are uneven in size, perhaps owing to the season. Its pods are very scimitar-shaped, and the small ones resemble those of the old Auvergne. Chancellor, from the same firm, seems to be a superior kind, has fairly long pods, crops freely, and is a good late variety. Amongst old kinds Champion of England and Fortyfold, growing side by side, seem to be identical. Ne Plus Ultra is also close by, and shows a fairly good crop. The dwarf Stratagem and Pride of the Market, though generally so good, do not seem to

thrive so well here as the taller Telegraph and Telephone.

Of Mr. Laxton's novelties Seedling No. 15, which has had a First-class Certificate, and is 6 feet in height, is a very fine podded kind, in the best sample, but is not quite true generally, seems to be the best. Ameer, just certificated, is but a reproduction of William 1., with pods a trifle finer.

Bliss' Abundance, First-class Certificate last year, is a good Pea, but their D. A. No. 2, 3 feet high, looks better.

It would very much facilitate the work of testing these novelties if raisers would, in sending seed, mention probable height, season, and kind on which any may be thought an improvement.

COLONIAL NOTES.

MADRAS FORESTS.—The annual Administration Report of the Forest Department, Madras Presidency, for 1883-84 has reached us. It is full of statistical detail, relating to the forest products of such places as Thirumaladevarakonda and Molamidakamboladina! The most important part of this formidable publication for home readers is the list of trees and shrubs of the Northern Circars, compiled from personal observation by Mr. J. S. Gamble. The conservator also points out the necessity of felling trees flush with the ground, so that there may be good coppice-shoots, capable of forming good trees, instead of pollard shoots, which cause the centre of the old stool to rot.

BOTANIC GARDEN, CAPE TOWN.

The Director's report for 1884 shows that the great reproach to the colony in the management of the garden still continues and paralyses the legitimate work of the garden.

Finding that the inquiry for Cape bulbous plants is rapidly increasing, these plants have been actively collected and grown from seed. The garden bulb stock housed this year for export has never been equalled in extent. A considerable number of species of terrestrial Orchids has been added, in the hope that the Cape may be represented in European Orchid collections by something more than the old favourite *Disa grandiflora*, L.

During the temporary relaxation of the original Phylloxera proclamation an endeavour was made to get in a stock of the newest sorts of Roses, Fuchsias, and Pelargoniums. As, however, they did not arrive till after the passing of a resolution in Parliament restoring the prohibition, the stock was given up and destroyed on landing. There is no doubt that while it may be advisable to prevent the importation of rooted plants, whether open or in Ward's cases, the prohibition of dry bulbs and tubers is a refinement of precaution which might as reasonably be extended to the straw packing of bottled wine from phylloxerised districts, to compressed hay, Hops, or even cocoa itself.

AGRI-HORTICULTURAL SOCIETY OF MADRAS.

This Society has throughout the year earnestly continued its work with a view to compassing the objects for which it was founded very nearly fifty years ago, namely, the promotion of horticulture and the encouragement of improvements in agriculture, and its labours have not been unrewarded, though the season on the whole cannot be called a good one. In the office letter books will be found 1623 letters, many of them of much importance, written and entered during the year, which of course do not include numerous notes written by the officers of the Society, of which it was unnecessary or inconvenient to keep a record. The correspondence of the Society, which is to a great extent a rough gauge of the amount of work it is doing, has very nearly doubled during the last ten years, and trebled since 1869. The principal work of the Society consists in the introduction and diffusion of economic plants, and in the supply of information on such matters. The annual flower show was not so successful as usual, owing to excessive rainfall of the season, and to a cyclone on Nov. 21, 1881.

ROYAL BOTANIC GARDENS, PERADENIA.

Dr. Trimen's report for 1884 summarises as usual the principal work of the year in the gardens under his charge. A summer-house or kiosk is to be erected in the garden in the native Kandyan style of architecture, in memory of Dr. Thwaites. Tea planting is

rapidly superseding that of Coffee, the cultivation of which is rendered futile by the fungus (*Hemiteia*). Cinchona has also been exported in very large quantities, with the beneficial result of lowering the price of quinine. Cocoa planting is also on the increase.

THE "CACAO PLANTERS' MANUAL"

This little book has been translated from the Dutch, and is published by Kirkland, Cope & Co., Northumberland Street, Strand. The English version is in places peculiar, but not so much so as seriously interfere with the utility of the book, which we commend to our colonial readers as one worthy their attention. Pruning to a single or to a small number of stems is found most advantageous.

SOUTH AUSTRALIA.

In Dr. Schomburgk's report on the Botanic Garden of Adelaide it is stated that only 18.7 inches of rain fell within the year, the hottest shade temperature being 102° Fahr. The report contains information about a South African tanning plant (*Elephantorrhiza Burchellii*)—the root is the valuable part; *Withania coagulans*, used as a vegetable rennet to curdle milk; *Ipomoea chrysothiza*, the Kumara root, figured in our columns; the Tree Tomato, *Cyphomandra betacea*, Sumach, &c. In an appendix Dr. Schomburgk gives a long list of plants suitable for cultivation in conjunction with Wheat, the culture of which is not so remunerative as once it was.

AGRICULTURAL AFFAIRS IN NOVA SCOTIA,

hitherto managed by a special Central Board of Agriculture, have, by virtue of an Act of the Legislature, been assumed by the Government. Professor Lawson has been gazetted as "Secretary for Agriculture." He will be provided with such assistance in the performance of the duties of this office that his academic and laboratory work in the University will not be interfered with. It is intended to adopt a system of training of agricultural teachers, specially fitted for giving instruction in schools, in which Tanner's *Agricultural Chemistry*, with Introduction by Professor Lawson is already in use. A veterinary surgeon will periodically visit the counties. A lecturer on agricultural chemistry is to be appointed to teach in the normal school, and supervise the agricultural teaching in the schools. The Legislature votes annually £1,300 sterling to aid agricultural societies, £800 towards a provincial exhibition, and other sums for importation of cattle, horses, sheep, field seeds, &c.

KHIVAN MELONS.

CONCERNING things botanical, I had expected much in Khivan fruits, especially the Melons. They are a most lucrative crop. With good management, Koztenko says, an acre will yield from 10,000 to 14,000 Melons, and these, at 1½d. each, will bring from £50 to £70. M. Brodovski says that about Samarkand an acre yields 10,000 Melons. The natives hang them in cool characters to the ceilings, where certain sorts will keep from the time when they are ripe till the following May. Maturad gave us the price of Melons from 12s. to 20s. per 100. There are, of course, several varieties. I heard of one sort, small as an Apple, but pronounced very good; some are 1½ foot long. On their winter Melons Maturad did not appear to set much store, but said that two varieties, ripe at harvest, were sweet as sugar, though they would not keep. My host gave me seeds of five kinds, which, as did Colonel Bursaby, I brought to England, hoping that I might be more fortunate than he in raising them. I must say that, after eating Central Asian Melons, I have tasted none in England that are by comparison worthy of mention. Those I ate in Constantinople came nearest, and hence, believing that I had real treasures to give, I distributed the seeds to such of my friends and acquaintances as had convenience for growing them. The five kinds were called—1, Katsai (or Chinese); 2, Zamcha; (3) Kutcha, all sown in Khiva in April, and ripen in about two months, or say the beginning of June; whilst the remaining two (4) Sherin-pitchek, and (5) Alikeh, are ready in a week or two later. Mr. J. D. Alford sent me the first fruit in 1883, less than a foot long, somewhat Pear-shaped, of green flesh, but tasteless, and not juicy—I fear not quite ripe. Earl Stanhope kindly tried some seeds the same season, at Chevening. Mr. Gray, the head gardener, informs

me that one plant was raised of such rampant growth that it ran on a trellis over a space of nearly 200 square feet, covering half the roof of the glasshouse, and then would have spread further if permitted. It was planted early in March in an ordinary loam and leaf soil with bottom-heat. For a long time the blossoms, with one exception, did not set, and that one produced a large ovate Melon of 10 lb. weight. Subsequently other blossoms set, and were growing fruit weighing 3 or 4 lb. each, when unfortunately the plant gave way through rot at the collar, and died. The plant took quite five months to grow. The large Melon was cut a little too early, and was lacking in the juicy qualities it probably would have acquired had it been left longer on the plant; but the gardener considered it a good Melon. Next year three sorts were tried by Mr. A. F. Barron, of the Royal Horticultural Society's Gardens at Chiswick, but he did not report very satisfactorily upon them. Of those he tried one did not fruit, a second produced two long ovate Melons, and the third round fruit; these ripened, the flesh being tender, very juicy, even water, but by no means rich. Mr. Barron adds, "They were rather rampant in growth, and did not fruit readily, but the foliage was somewhat destroyed by the hot sun, and this, no doubt, affected the fruit." Mr. Wildsmith, of Heckfield Gardens, near Winchfield (Viscount Eversley's) spoke of the Alikeh as best of the three kinds he raised, and not so rampant in growth as the other two, but, though speaking of the Zamcha as excellent, thought them no better in quality than English Melons. The Zamcha was tried also at Burchley Gardens (the Marquis of Exeter's) by Mr. Gilbert, who is famous, I am told, for growing Melons, and he exhibited from my seed a fruit weighing 11½ lb. at the Royal Horticultural Society's Show on September 9 last. Another fruit from the same plant, weighing 9½ lb., was of green deep flesh, and though not of very rich or aromatic flavour, was liked for its great juiciness. The appearance of the Kita Melon, as reported on from Burchley Gardens, was not flattering, being "precisely like a large Vegetable Marrow, and of a dark green colour." I sent seeds to my friend Dr. Haughton, to be tried in the botanic gardens of Trinity College, Dublin. He committed them to Mr. Burbidge, who distributed some seeds to a few English gardeners who made Melons a specialty. From the correspondence that ensued, I learn that Mr. O'Donovan, who penetrated to Merv, thought the introduction of Central Asian Melons to Europe so desirable, that he carried some of the seed in his saddle-bags 4000 or 5000 miles, and spoke of them as of marvellous excellence. Mr. Simpson, of Wortley, grew some of Mr. O'Donovan's Melons, but they proved insipid and flavourless, or, at best, just passable. He also tried some of my seeds, of which only one, the Sherin-pitchek grew, and this he pronounces as the same type as O'Donovan's. Mr. Simpson says, "I gave it a light air to itself, but it was rather straggling and weak from the first, and could not endure the bright sunshine. It lost its foliage, and the single fruit it bore never ripened properly." It was sent, however, to Dr. Haughton, and thought highly of. Dr. Haughton received, too, a Zamcha Melon, grown at Lord Eversley's, weighing 4 lb., of which he subsequently told me that, though familiar with America as well as British Melons, he never in his life ate any as fine as this from Khiva. Previously to receiving this information I was becoming dispirited, and thinking that my seeds would turn out no better than those of Colonel Bursaby or Mr. O'Donovan. Another trial, however, has been made of the "Alikeh" at Chevening, where the gardener, taught by experience how much space was necessary, planted the Melon under a frame with five lights, expecting it to cover the entire area. I saw the plant thus growing on September 5. It was not so strong, I was told, as that of the previous year, but it had three half-grown fruits of fair size. One of these was sent to me, not quite ripe, on October 13, which, upon eating ten days later, I was delighted to be able to pronounce quite equal to those I had eaten in Khiva, and far more delicious than anything I had ever tasted in England. This opinion was shared by others with me at the table. This ovate fruit measured 8 inches long, and was green-fleshed, juicy, sweet, and eatable to the skin. This I consider that Mr. Gray and Mr. Wildsmith have demonstrated that two kinds, at all events, of the Khivan Melons can be grown in England. The former considers the Alikeh Melons require plenty of

heat, and a long season, since English Melons planted simultaneously with them ripened six weeks before those from Khiva. This, however, will make the latter valuable for late eating, especially as they have such good keeping properties. I hope, therefore, that English gardeners will learn how to grow these fruits. The great size and robustness of the plants may prevent their having fair play in English houses, but I have given seeds also for outdoor growth in Florida, whence the fruit could easily be sent to the London market, so that if, after all, I do not succeed in getting them on English tables it will not be for lack of endeavour. *Henry Lansdell, D.D., "Russian Central Asia."*

DISEASES OF PLANTS.

ON THE ÆCIDIOSPORE OF PUCICINA VINCE.—The Puccinia and its accompanying uredospore upon *Vinca* major have long been familiar to us as parasitic upon the large Periwinkle. My friend, the Rev. Canon Du Port, last year sent specimens of this from the eastern part of Norfolk. Being anxious to verify the statement which has been made, that the uredospores are accompanied by spermogonia, Mr. Du Port kindly, this year, sent me, from Oby Rectory, some very fine specimens, which were covered by spermogonia. No uredospores at this time had made their appearance. I noticed, however, that the leaves affected with the spermogonia exhibited a very distinct, although not a powerful, odour—an odour which recalled the perfume of some flower. This in itself is an interesting observation confirming as it does Rathay's statement that the spermogonia of the Uredines are attractive to insects, either by their perfume or by their showy appearance. I was fortunate enough to find this fungus near home, namely, in the Rev. A. Groom's gardens at Ashwicken, from which place sufficient material has been derived to further study the life-history of the fungus. The first point which strikes one is that the plants bearing spermogonia are different in habit and growth from healthy ones. The shoots are taller and more erect, the leaves paler in colour, and more elongated than in those of healthy plants; in fact the affected plants look as if they had been "drawn up" by want of sufficient light. More closely observed, a number of dark brown, almost black spots were discovered upon some of the younger shoots. These spots were firm in structure, hard in texture, and looked very like some *Dothidea*. The leaves bearing them were dwarfed in size, thicker and usually more or less convex. They appeared as if stunted in their early growth. On further examination it became apparent that these blight spots varied in size and colour, being at first almost black and very small, but as they increased in diameter they became paler in colour, gradually assuming a brown tint, but the oldest specimens were surmounted by a delicate film of white dust. The spots themselves were solid cushion-shaped bodies, about a millimetre or two across. Under the microscope a thin section of one showed it to consist of an aggregation of hyphæ, continuous below with the mycelium [which pervaded the whole plant, placed parallel to one another and perpendicular to the surface of the leaf. The free summits of these hyphæ were surmounted by colourless globose spores, 10—12 μ in diameter.

Placed in water these spores in ten or twelve hours germinated by protruding a germ tube, three or four μ in diameter, into the end of which the almost colourless contents of the spore were passed. The spores themselves were as nearly spherical as possible, and none of them showed any remains of the adherent hyphæ which characterises the uredospore. They appear to be slightly granular from the protoplasm which they enclosed. Colourless æcidiospores are very uncommon, the vast majority being orange or yellow; a few are brown (Roestelz.) The spores of *Æcidium ramicis* are, however, colourless. So unlike any other *Æcidie* were these solid pulvini, that it was only after repeated and careful examination that I could bring myself to regard them in their true morphological significance. When, however, their spore germination was observed their affinities became obvious. It is curious that the structure and functions of these bodies should have hitherto been overlooked, considering the number of observers who have devoted so much time and energy to the elucidation of the Uredines abroad. The two forms of uredospores mentioned by Dr. Winter in Rabenhorst's *Kryptogamen-*

flora, p. 188, have both of them brown spores more than double the size of the *Æcidiospore* above described, viz., 20—40 μ long, by 17—26 μ wide.

The life-history of *Puccinia Vince* thus appears to consist of (1) a perennial mycelium pervading all parts of the affected plant, which every spring produced spermogonia and æcidiospores; (2) uredo and teleospores, which arise from the æcidiospores, and, judging from other Uredines, have localised, mycelia of limited duration—e.g., *Puccinia tragopogonis*, *menthae*, *epilobii*. *Charles B. Plowright.*

ÆCIDIUM BETÆ.

The æcidiospores of *Uromyces Betæ* are comparatively rarely seen; they have not been, I think, exhibited to the Scientific Committee. Having hitherto been unsuccessful in finding this *Æcidium* I determined to cultivate it from the *Uromyces Betæ*,

FIG. 22.—PUCICINA VINCE.

A, Plant with Spermogonia; a, c, D, Æcidia of same.

which occurs so abundantly every year upon Mangels. I succeeded some time since in producing upon the foliage of two Mangel plants three or four clusters of the *Æcidium* in question, but an accident happened to the culture, so that I am unable to exhibit them. Lately, however, I met with the *Æcidium* upon *Beta maritima*, on the banks of the river Ouse, at West Lynn. The specimen is sent herewith. *Charles B. Plowright, King's Lynn.*

DISINFECTANTS.—A great deal of disappointment may be experienced if people do not realise that deodorising substances, and even antiseptics like green vitriol, are not true disinfectants. They have their advantage in removing evil odour, or checking putrefaction, but they do not necessarily kill the germs on whose life and activity many epidemic diseases depend. Destruction by fire of infected material, and, where that is not practicable, chloride of lime, is the best germicide for general use.

Notices of Books.

Russian Central Asia, including Kuldja, Bokhara, Khiva, and Merv. By Henry Lansdell, D.D. Two volumes, maps and illustrations. Sampson Low & Co.

Many of our readers will remember the remarkable journey undertaken by Dr. Lansdell, and described by him in his work *Through Siberia*. In the present pages we have the record of a journey yet more remarkable, as the title suffices to show. As in the previous journey, so in this, the primary object of Dr. Lansdell was to circulate the Scriptures among the inmates of prisons and among the inhabitants generally. Geography, ethnology and natural history were by no means neglected; indeed, the wonder is that Dr. Lansdell contrived to accomplish so much, for not only does he make no pretence to be a man of science, but he was perpetually travelling for 179 days, during a large portion of which period he knew not the comfort of a bed. The actual distance travelled is estimated at 12,000 miles. Dr. Lansdell clearly is not only a man of great tenacity of purpose and energy, but is blessed with keen powers of observation and an appreciation of matters of interest of whatever nature they may be. Personal observation on the spot gave him the means to fill his note-book with details of what he saw, while a previously organised system of cross-examination enabled him to elicit information from the natives in a less haphazard fashion than is sometimes the case. Official statistics and the writings of others duly digested have been pressed into the service to supplement and annotate the author's personal observations, and thus it happens that in these two handsome volumes we have a fuller and more accessible account of Central Asia and Turkistan than has ever been laid before the public. But few Englishmen have been enabled to penetrate into Turkistan, and over a part of the route traversed Dr. Lansdell claims to have been the first English traveller.

The requirements of three classes of readers have been kept in view—the classes of readers being defined by Dr. Lansdell as general, students, and specialists. We are bound to say the author has most diligently sought to supply the demands of these three classes of readers. For our own part, having read the book from cover to cover, with scarcely a page skipped, we are in a position to judge in some measure of the manner in which the author has supplied the needs of each of the three classes of readers. So far as the general reader is concerned, Dr. Lansdell would, we think, have done well to have condensed the more important matters. For this class of readers, Dr. Lansdell is too generous, he gives them more than they will thank him for. The numerous biblical illustrations will, however, be found of extreme interest, and the writer's entry into Bokhara and his intercourse with the natives will be found instructive and entertaining. Political matters the author wisely avoids for the most part, though it is clear he sympathises with the Russians and gives them credit for the good they have effected, and are effecting, in introducing civilisation and settled government in place of barbarism and anarchy. Religious discussions of a sectarian character are also strictly avoided; an earnest religious principle and a high sense of duty pervade the volumes.

The second and third classes of readers are allied by so many bonds that they can hardly be definitely divided, but we think the author has succeeded admirably in giving such a general idea of the country traversed, the manners of its inhabitants, the climate and natural productions, as is required by the student; while for the specialists the appendices relating to the fauna, flora, and literature of the subject, and in some of which the author has had the assistance of various men of science, will of themselves cause the name of Lansdell to be held of grateful memory for many a long year. A copious index, numerous illustrations, and one or two maps serve to render this one of the most complete works of its kind—works that we are accustomed to expect as the outcome of long years of research on the part of specialists, but which in this case has been accomplished almost as speedily as the journey itself. We should willingly, did space permit, make some extracts of a general character; but limited as

we are, we must confine ourselves to a few extracts relating to the vegetation of Turkistan. Readers of this journal will be more or less familiar with the harvest of novelties collected by Dr. Albert Regel, the son of our excellent friend and colleague, the Director of the St. Petersburg Botanic Garden. Many of these have been described and figured in the *Garten Zeitung*, whence we have from time to time made extracts. Dr. Regel the elder has also published numerous papers on the flora of Turkistan, in illustration of the plants collected by Fedchenko and many others; but these papers are scattered through numerous publications, which are not to be met with in general libraries, and not even in all botanical collections. We have, then, to thank Dr. Lansdell for bringing together in one of his appendices a summary of what is known of the flora of Russian Turkistan—a summary in which the several botanical collectors, from Sievers and Ledebour to Regel and Capus, are duly alluded to; and the list given by E. Regel and F. von Herder of Semenov's plants printed in full. We must not, add do not, complain, but we should have been glad if this list had been extended by the inclusion of the published lists of other botanists and travellers. A relatively small amount of labour would have sufficed to frame a general list of names which would have been of the utmost service to those who desire to know what has been published, and invaluable to the scientific botanist whose duty it will presently be to found a proper catalogue. It is time, however, to let Dr. Lansdell speak for himself, and this we may most appropriately do by quoting at some length what he has to say as to the vegetation of Turkistan.

"The surface of Russian Turkistan, viewed with reference to vegetation generally, may be conveniently divided into the mountain country, oases, steppes, and deserts; and of these last I shall speak when they come in my path. I have already touched upon the arborescent vegetation of the mountains in Semirechia, quoting such authorities as Semenov, Osten-Sacken, Regel, Severtsoff, and others. To those travellers in the eastern portion of the Thian-Shan must be added Dr. Capus, who travelled in the western portion, preceding me by one year only, and to some of whose papers, since published, I am indebted for information.

"Taking first the upper and lower limits of the growth of trees they run," says Dr. Capus, "parallel to the line of perpetual snow, which varies in the western Thian-Shan, according to M.M. Kaulbars and Osten-Sacken, from 8800 to 9800 feet."

"At Issik-Kul the Juniper (*Juniperus pseudo-sabina*) is found, according to Dr. Regel, up to 14,000 feet. Dr. Capus found its lower limit in the Bokhariot mountains of Baisoune to be 4000, and in the Karaf-Shan Valley about 3800 feet. In the Alexandroff range, the farther to the west, the larger is the tree. In the Kirghese Ala-Tau at Urianda the trunks are about 14 feet high. The 21 feet stems in the Badam heights are from 14 to 18 inches thick. The high-stemmed Junipers seen by Severtsoff had generally a bare trunk for half their height, the sparse branches measuring about one-fourth of the altitude of the tree, the top of which is generally broken. Above a certain height this tree becomes stunted, and becomes almost horizontal, with the branches only jutting upwards. Towards the south, where the woods decrease, the Juniper grows higher, but it is replaced on the mountains by Firs and Birchies. The limits of the Birch tree (*Betula*, sp. not European) are from 3200 to 8800 feet. Its lower limit depends upon the nature of the valley in which it grows, and the specimens are small, crooked, and with broken tops, probably from the snowfall. In the Kirghese Ala-tau the inferior limit of the Birch nearly coincides with that of the Fir, whilst in the Kara-Bura mountains at the sources of the Chatkal, the superior limit of the Birch and the tall-stemmed Junipers coincides with that of the Sorb Apple. The Willow, of which there are upwards of nineteen varieties, is found in the valley of the Talas and in the Kara-Bura at heights varying from 2000 to 9900 feet, whilst the *Picea Schrenkiana*, one of the rare Conifers of the Thian-Shan, descends in the Alexandroff range to 5300 feet, and ascends in the Ala-Tau to 8000 feet. Of five kinds of Poplars, that which the Russian Aspen is found in the woods along the Talas; and on the river Kara-Bura are two thickets of similar large old trees, but of an intermediate form between the Black Poplar and the Aspen. The Turanata Poplar (*Populus diversifolia*) is found in the woods on the Arys. To these trees may be added two species of Ash in the gorges along the Boroldai and its affluents.

"Among the Turkistan shrubs are found two species of Hawthorn in the valley of the Talas. In some places it grows to the dimensions of a tree with a straight trunk 18 feet high and 18 inches thick. About the sources of the Tchaian it attains to 20 feet in height. In Semi-

rechla M. Semenov found two species of Buckthorn, the Spindle tree, and three varieties of Cherry, the Cotoneaster and Mountain Ash. The Tamarisk, too, is there represented by six varieties.

"To the foregoing may be added the rare shrub called Boialysh (*Atraphaxis*), found in the dry sandy clay lands at the mouth of the Boroldai; also the insignificant Ephedra, or Jointed Fir, in the grey parched soil of the steppe between the canals of the river Asa. In the valley of the Kitch-Knie Kara-Bura are several small prickly shrubs, like those near the Syr-daria, and with the same reddish flowers. They grow principally at an altitude of between 4000 and 5000 feet. I was surprised not to find in the gardens of Turkistan either Gooseberry or Currant bushes. Black Currants, however, are said to grow wild at the source of the Chatkal, and in Semirechia there are red Currants, and four others of the Ribes tribe. Dr. Capus mentions also in Kohistan the Honeysuckle, Barberry, Medlar, and Sea Buckthorn, growing in great abundance at a height of about 8000 feet; whilst in the Chirchik Mountains the wild Plum, Pistachio nuts (*Pistacia vera*), and wild Almonds are found 4000 feet lower. In Abtaonne the same explorer found the superior limit of the

FIG. 23.—PUCCINIA VINCAE. (See p. 108.)

E, *Puccinia Vincae*, enlarged; F, section, enlarged; G, *Ecdiospores*; H, *Spermatogonia* germinating; J—M, *Ecdiospores* germinating.

Nut and the wild Apple to be about 4500 feet, with the Ash (*Fraxinus Sogdiana*), and a species of Maple. In the same valley wild Apricot trees grew up to 4000 feet, and on the shores of the Iskander-kul even to 7000 feet. Lastly, I must not omit to mention one shrub which grows abundantly in the valleys of the Syr-daria, because on its thorns there collects a sugary material called vantak-shakar, or taran-jobin; but it is remarkable that the same shrub, when growing on the mountains, yields no saccharine matter. It resembles *vis-a-lig*, is acid in taste, and liked by the camels. From this plant, after rain, taran-jobin or manna is collected, of which, with the Pistachio, are made ruckta and other well-known Bokhariot confections. Concerning this manna the Bokhariots have a story that beyond the Syr steppe is covered with dust of a grey-yellowish colour, called taran-jobin. This dust is supposed to fall early every morning during the three summer months, specially near the holy city of Turkistan, along the left bank of the Syr-daria, where it is collected by the natives up to sunrise, but with the first rays of the sun it becomes mixed with the soil and sinks.

"Turniog from forest trees to those of the gardens, one meets in Central Asia with a kind of Elm called Karagatch, frequently planted, I observed, for the shade

It affords, near pools of water. Its trunks yield timber, often to be met with as carved pillars in native mansions. There is also a species of Plane (*Platanus orientalis*) called Chinars, and a wild Olive called Jida (*Elaeagnus hortensis* et *E. angustifolia*). We often saw the latter, with its yellow-reddish Olive-like fruit, hanging over the garden walls. I recalled having met with it in the Trans-Caucasus, near Echniadjin, where I did not care for the taste sufficiently to eat it. When growing wild in thickets the Jida has smaller fruit, which, when ripe, is of a greenish-grey hue. The wild Mulberry (*Morus alba*) is one of the commonest trees in Turkistan, and is cultivated along the first river we crossed—the Chirchik—chiefly for the sake of its timber. It attains to a height of 35 feet, and to 14 inches in diameter. North of Tashkend the tree is less common, and is particularly small at Anlie-Ata. Dr. Schnyler mentions four distinct varieties—the Hassak, or wild Mulberry tree; the Shabat, brought originally from Persia; the Balkhi, introduced from Balkh, the largest and most beautiful variety of all; and the Khorasmi, from Kharezin or Khiva. Of some species the fruit is so little esteemed that the natives in Bokhara told me they did not take the trouble to gather it; but they use for food the large white berries, both fresh and dried, as well as made into a flour and mixed with water for a beverage, or with wheat flour for a paste, called tut-halab. The chief use of the Mulberry tree, however, is for feeding silkworms, for which purpose not the twigs merely, but all the branches are cut off, and the tree reduced thereby to a pollard.

"In the gardens of Kurama grow, in addition to the forementioned, Peaches, Apricots (which form the staple of Khokand gardens), Pomegranates, Apples, Pears, Quinces, Plums, Almonds, more than a dozen varieties of Grapes, and Figs. Some of these last, of a whitish colour, and smaller than the green Fig commonly seen in England, were offered us in the Tashkend bazaar. Cucurbitaceous plants abound in Turkistan, among which the Melons are of exquisite flavour. Gourds (*Cucurbita lagenaria*) are grown in large numbers, and serve the various purposes of tobacco-boxes, pipes, and water cruses. Among umbelliferous plants Coriander is used as seasoning for food, and as a carminative. For seasoning or against flatulence Shabit, or Fennel (*Anethum feniculum dulcis*) is used, which does not grow wild in Turkistan, but is cultivated in kitchen gardens, as is also another kind of Fennel (*Nigella Romana*). The grain is green and oily. To these should be added certain plants for dyeing, such as Khana, giving a green powder, containing an essential oil. On blotting paper it gives a stain that evaporates, whilst cold water infusion easily extracts from it a pigment of a reddish colour. The colouring matter of Spariak (or Ispariak, a recent addition to the Larkspur family), is dissolved in boiling water, and produces a yellow mixture with a peculiar smell and bitter taste. It is procured from the dried flowers of a species of Larkspur (*Delphinium ochroleucum*, Mey.), growing wild in the neighbourhood of the Turkistan mountains, and also throughout Turan. Like the English species it grows about 2 feet high. Byzzunj is also a vegetable dye, used for making substances black, and is obtained apparently from galls of the Pistachio tree. Madder (*Rubia tinctorum*) is sown in submerged places, and Saffron (*Carthamus tinctorius*) grows in the fields.

"I have said that the district of Kurama is the granary of Tashkend. Now land under culture in Central Asia is of two kinds—that which lies near the mountains and receives the rain is called 'hailni', and that which is watered by irrigation 'abi'. Comparing an average Barley harvest on rain-land with one on irrigated land, the result, according to the Turkistan calendar, appears to be the same, but whilst a batman of Wheat sown on 3 acres of rain-land yields from 17 to 20 cwt., it gives on irrigated land in the same locality 17 to 23 cwt.

"Turkistan Wheat (*Budias*) is of two kinds—red and white, or winter and spring. Maize is cultivated, but in small quantities. Oats will not grow, it is said, in Central Asia; they, and Barley also, to a considerable extent, are replaced by Figs (*Holcus* sp.), a kind of sugary Sorghum, or Indian Millet, the grain of which is used for gravel, and the old stems for fuel, whilst the young stems and leaves, which are not very sweet, make good fodder for cattle. One species of Oat-grass, being considered less heating than Barley, is cultivated principally for horse fodder, as also is Knaak, which resembles Fox-tail grass. The tablelands of the Boroldai and Katuran are said to be the true native land of Rye. Here it grows luxuriantly, and, with full ears, flowers in May and ripens in June; but the crop does not appear to have been cultivated before the advent of the Russians, who raise a little for their own use. Rice is sown on land where water abounds, and also Millet, of which there are three varieties. Millet ripens early, and is therefore used for the second crop after winter Wheat. Flax and Rape are cultivated, but chiefly for the sake of the oil they yield. In Kohistan, both Flax and Wheat were met with by Dr. Capus at an altitude of 10,000 feet. The

cultivation of Hemp has been introduced into certain suburbs by lovers of the intoxicating hashish.

"There are yet one or two seed plants to be noticed, such as Anjir, or Anise, which grows wild." The seed, when candied, is called Candiala khili, and constitutes an article of exportation. *Sesamum* also is cultivated. *Santalina* seed, an antheimetic, is obtained from a wild plant from 10 to 14 inches high, found in abundance both in the plains and in the mountains of Central Asia. The Tashkendians employ the Kuramas and the Kirghese to cut and harvest the green stems, at the extremity of which is a sort of purse, or little bag, about 4 inches in length, and a finger thick, containing the seed. These native gatherers, to facilitate their work, often pull up the plant by the roots, and thereby lessen the abundance of future collections, but in a fruitful year there is exported from the district between Tashkend and Turkistan from 2500 to 3000 camel-loads, or from 570 to 720 tons.

"Among the varieties of steppe vegetation that serve for fodder is a poor one called *Idelek* (*Ceratocarpus* sp.), on which the Kirghese, in winter, feed their herds; also in other places of limited extent are met with *Kyjak* (*Polygonum latifolium*), and *Jusan* (*Absinth*), both of which serve as fodder for sheep and goats. A more nourishing fodder, found on the Myn-buiah, is called *Kipets*, and another, not so good, is *Kamys-chob*, or reed-grass. This latter grows so abundantly on the swampy banks and islands of the Turkistan rivers that it chokes other similar grasses. It is used as food for cows and horses, but it is so tasteless and little nourishing that the cattle eat it very unwillingly, and animals unaccustomed to it, especially Russian horses, are often made sick thereby." This Reed serves as a common article for fuel, and a similar plant, called *Shye*, furnishes material for the double matting with which the Kirghese cover their kibitkas. There is yet another class of fodder grasses, known by more than a dozen different native names, that grow with abundance in unwatered localities in Turkistan. In taste they are sour and salt, though somewhat succulent. The majority of them have prickles and thorns, and of domesticated animals the camel alone eats them. One is called *Jantah* or *Camel's-tail* (*Alhagi camelorum*). The roots of another, *Kuk-pak*, are collected in large quantities for fuel in winter, as also are a species of *Lily* called *Sura* and *Albanya* or *Goose-foot*. *Jungurcha* or *Clover* is cultivated, but there is also a kind called *Jan-shikah* (*Medicago* sp.), that grows wild along the canals of some of the rivers. Another allied species is the *Dlany-shikhe*, possibly the same as the Chinese *Mu-sue*."

The Dairy of the Farm. By James Long and J. C. Morton. (Bradbury, Agnew & Co.)

This is one of the Handbooks of the Farm series, which has won so high a place in public estimation. As Mr. Morton has long been known as an authority on such matters, the public will be interested in obtaining here, in a condensed form, the results of his experience, and the history of that change which has "lifted what used to be the homeliest and most stagnant of all departments of our agriculture into the very foremost rank of all, so far as energy, activity, and all the other evidences of life are concerned." Mr. James Long contributes to the present volume much information on foreign dairying. The work is written for the dairyman rather than for the farmer, whose requirements have been considered in other volumes of this series. As so many of our readers are interested in the cow and her produce we shall be doing them a service by recommending this work to their perusal. We cannot pretend in this place to give a critical analysis of its contents, it must suffice to say that the chapters give statistics as to the quantity of food, the yield of butter, cheese, and milk, the management of the cow, and of the dairy, and the manufacture of dairy products.

The Woods of the United States: with an Account of their Structure, Qualities, and Uses; and Geographical and Other Notes upon the Trees which produce them. By C. S. Sargent. New York: Appleton.

This is a detailed catalogue of the collection of woods of the United States, got together in the first instance, at the instigation of Mr. Morris K. Jesup. Mr. Jesup's collection in the American Museum of Natural History, is the outgrowth of an investigation into the forest wealth of the United States commenced by Mr. Sargent five years ago, and the results of which are published in the ninth volume of the *Reports of the Tenth Census*, recently reviewed by us. We need only refer to our notice of that magisterial publication to remind the readers of the magnitude and importance of that publication and its accompanying maps.

The trees of the United States are represented in the Museum by large and characteristic trunk specimens arranged in the sequence of their botanical relationship, the sections being made in different directions, polished and unpolished, with and without the bark. The catalogue now before us is condensed from that fuller list which is given in the Census Report, and as it contains sufficient information for most purposes, it will be available where the larger and more costly volume would be unattainable or inconvenient. A carefully compiled index shows that nothing has been omitted to make both the collection and the catalogue as serviceable to students as possible.

Orchid Notes and gleanings.

ORCHIDS AT OLDFIELD, BICKLEY.

The collection belonging to F. A. Philbrick, Esq., has always been noted for the excellent manner in which the *Phalenopsis* have been grown. Visitors who used to admire their vigorous growth and profusion of flower when they were in their old quarters near Regent's Park used to say that there was something in the house in which they were grown which was particularly suitable to the plants, but the fact of their doing equally well at Bickley, in a house of a totally different kind, proves that to the general treatment of the plants may be attributed their success, and not to any peculiarity in the structure in which they are grown. Mr. Philbrick's house of *Phalenopsis* is a pleasant thing to look at in these days when so many unhealthy lots are to be found in collections, and it will be well to note a few of the conditions under which they are grown so as to form large plants bearing many great fleshy leaves on which trace of spot or disease has never been seen. The house in which the plants are kept is a span-roofed one with a walk down the middle; on either hand the beds are raised to the height of the staging in plant-houses generally, are planted with *Cyrtoidera fulgida*, *C. chontalensis*, *Fittouais* and *Pilea*; and these, growing naturally together, form a pretty and desirable carpeting which is no doubt of great service in keeping up a healthy and unvarying atmospheric moisture around the plants. The *Phalenopsis*, which are grown in baskets, are suspended about 2 feet from the glass, and just midway between it and the carpeting of *Gesneraceous* and other plants beneath. The plants are kept tolerably cool in winter, at which season they are carefully watered but never allowed to get very dry. In spring and summer the house in which they are kept warm moist and shady, and the plants when watered are thoroughly soaked by being dipped; but this is never done until they are becoming dry, so that they are never in danger of having stagnate moisture about them, which is often so fatal to *Phalenopsis*. The plants are never syringed overhead, but the syringe is used occasionally to moisten the baskets and roots protruding through them, the sides of the house, and the plants planted out in the beds. So managed the Oldfield culture of *Phalenopsis* leaves nothing to be desired in that direction, and Mr. Heims, who so well carries it out, says that there is nothing more simple when it is properly done. *P. Schroderiana*, *P. violacea*, and *P. Sandertiana* are well in bloom now in the house.

The *Cattleyas*, which are grown in a large span-roofed house, having a tank for rain-water the whole length of the central stage, are in excellent condition, clean, vigorous, and remarkably well rooted; with them, too, the plan of having living vegetation on the staging, which is so extensively carried out at Oldfield, is adhered to, the shell gravel on the close staging being completely covered with *Selaginella*, and the plants raised over it by being placed on bricks or inverted flower-pots; so arranged, they seem to exhibit a great liking for the living moss growing beneath by sending out a great quantity of roots over the sides of the pots. This certainly indicates that the right course is being adopted, as a healthy and plentiful supply of sound roots is one of the surest

signs of the present good condition of the plants, and the best guarantee for their future health. Some few of the fine specimens of *Lelia purpurata* yet have blooms on them; and the grand masses of the varieties of *C. gigas* have some exceptionally fine flowers. A good mass of a very richly coloured *C. Leopoldi*, and a huge specimen of a superb form of *Sobralia macrantha splendens* are grown, and *Odontoglossum hastilabium*, *O. roseum*, *Epidendrum Wallisi*, *Trichopilia hymenantha* (with four flowers on a spike), *Cypripedium Dominionianum*, and various other odd novelties are in bloom.

The East India house has *Palms*, *Pitcher plants*, and *Orchids* arranged together, and the *Cypripediums* especially, by their great vigour, seem to say that they like the arrangement; those of them, too, which are in flower exhibit marked excellence in the quality of their bloom. In particular may be noted *C. Veitchii*, and Messrs. Veitch's hybrid improvement on it, *C. superciliale*, which has very large and handsome flowers; *C. selligerum majus*, *C. Ashburtoni*, *C. marmorophyllum*, *C. Lawrenceanum*, *C. Stonei*, *C. vexillarium*, and *C. Loweii*, all of which are well bloomed. Some few *Vandas*, *Aerides* and *Saccolabium* are also in flower. The cool-house *Orchids* are in as good condition as formerly. Some *Odontoglossums*, *Masdevallia ephippium*, *M. rosea*, *M. Veitchii*, and the many forms of *M. Harryana*, and *M. ignea*, being in flower in this department, and the whole of the varied collection bears evidence that neither Mr. Philbrick nor his gardener have lost their love for the *Orchids* nor their skill in growing them.

ODONTOGLOSSUM VEXILLARIUM AT BLENDON HALL.

When one meets with a well grown and flowered lot of *Odonoglossum vexillarium* the fact is worth recording. It is a pity we are so often used to see failures, even in the hands of experienced men, in growing this beautiful *Orchid*. I lately saw a fine batch at Blendon Hall, Besley. Mr. Moore told me he bought them very small imported stuff two years ago, they are now in 6-inch pots, beautiful plants with fine strong bristling growths and without a spot on them. I noticed each plant carried seven to eight at least six flowers, giving forty-two flowers to each plant—good results in so short a time. Mr. Moore keeps these in a moderately warm house during the winter months, taking care to use water of the same temperature at the roots, and that very sparingly, also carefully avoiding the least drop on the leaves. As the season advances they are gradually transferred to cooler quarters, with more air and water. Any extra care bestowed on them is now well repaid by their present highly satisfactory state. *A. I.*

CYPRIPEDIUM PARISHII

is not usually rated as a first-class species, but it is to be seen in capital form in Messrs. Veitch's nursery at present. One plant has two spikes, with six flowers on each. They are quaint in appearance, and quite distinct. *Cattleya Gaskelliana* in the same nursery has been and still is beautifully in flower, some large specimens being furnished with more than a score of flowers. It is a distinct species allied to *C. Mossii*, but quite different in habit of plants, and flowers in June and July.

J. D.

DENDROBIUM MACCARTHEE.

The large drooping flowers of this fine species bear, on superficial examination, a striking resemblance to a *Barkeria*, but as a matter of course the construction is altogether different. It is rather difficult to treat successfully under cultivation, but its bold striking appearance renders it a fitting subject to have in any well-ordered collection of *Orchids*. The pseudobulbs are slender, and bear the flowers in short lateral racemes. The spreading sepals and petals are of a pale rosy-purple colour, while the long scoop-shaped lip is characterised by a large deep purple blotch in the throat, with numerous spots and stripes of the same colour lower down. It is furthermore just such a sort as a grower would desire to possess; but its individual likings constitute it an exceptional species, very unlikely, on that account, ever to become common. There is a figure of the species in the *Botanical Magazine*, t. 4886, and a flowering specimen may be seen in the *Orchid-house* at Kew.

SACCOLABIUM AMPULLACIUM.

A small species with oblong leaves, truncate and bilobed at the apex; flowers numerous in dense cylindrical racemes, magenta-rose, with a white centre, each about $\frac{3}{4}$ -inch across, segments oblong spreading,

lip with a linear blade and a blunt spur. *Orchid Album*, t. 191.

BULBOPHYLLUM LOEBH.

This, together with a few more, such as *B. siamense* and *B. Dearei*, form a sectional group of the genus, and are, from a horticultural point of view, the most important and ornamental of the genus. The species under notice belongs to the *Sarcopodium* of Lindley, not the *Sarcopodium* of the *Genera Plantarum*, which comprises a group or section of the genus *Dendrobium*, under which it is sometimes placed. The flowers are yellow, more or less spotted externally with purple. They are produced singly on peduncles at the side of the pseudobulbs, and are distinguished from any section of *Dendrobium* by the lip being articulated with the foot of the column, and movable, while the petals are shorter and narrower than the sepals, which are also unequal. The above-mentioned species are frequently included in large collections of *Orchids*, and the one under notice flowered lately at Kew. There is a figure of it in the *Botanical Magazine*, t. 4532.

ONCIDIUM VARIOSUM.

One of the free flowering species with long loose racemes of yellow flowers with a relatively large suborbicular two-lobed lip, the small sepals and petals are pale green veined with brown. *Orchid Album*, t. 192.

The Flower Garden.

THE summer bedders are growing splendidly. Alternantheras have coloured beautifully, as have the different kinds of tricoloured Pelargonium, and the flowering kinds are just now in perfection. Calceolarias will require great care in watering and mulching to keep them in perfection during the warm dry weather, and the beds of them are likely to become patchy if not shaded during the heat of the day. In light soils liquid-manure is found to be of great benefit; but I find from experience the safest and best plan is to remove the old soil from the beds for a depth of 14 inches every two or three years, and replace it with good rich mould, mixed with half its bulk of good dung.

Continue to peg down and trim into form all plants requiring such manipulation to make the patterns and designs as effective as possible. Ageratum, Petunias, Verbenas, Heliotropes, and similarly habited plants require going over at least once a week to keep all in perfect order.

HERBACEOUS BORDER.

This will require attention; all tall growing plants should be tied up, and all old flowers and dead leaves removed, so as to give all a clean and neat appearance. They should be well supplied with water, to encourage and prolong the blooming season. The spring bedding plants which were removed to the reserve garden should now receive attention; all bloom should be removed from them, and propagation either by cutting or division of the roots of many of the subjects should be done at once. A north border is the best and the most convenient place for this kind of work at the present time. Most border plants will strike root at this season of the year if watered and shaded for a week or two. Cuttings and layers of Carnations and Pink and Picotees should now be made, as by striking them thus early good strong plants fit to stand the winter will be obtained. Now is a good time to sow in pans East Lothian, Intermediate, and Brompton Stocks, as well as the various hardy biennial and perennial plants required for next year's display. The tenderest varieties should be sown in pans, and placed in cold frames, but the hardier ones will do better sown in the open.

ROSES.

Roses should now be propagated by budding and by cuttings; for budding, care should be taken to operate when the sap of the stock flows freely, so as to enable the bark to be easily separated from the wood. If deferred too long the bark adheres firmly to the wood, the operation cannot then be properly executed, and many failures occur in consequence. Another frequent failure is caused by the fermenta-

tion arising after the bud is inserted, owing to the operation having been performed in wet weather; dry dull weather should if possible be taken advantage of, and if bright hot weather should occur a few extra strands of worsted over the buds will be found advantageous in preventing too great evaporation of moisture therefrom. In propagating by cuttings, care should be taken to select sound, well-ripened shoots of moderate strength; such as have a point or keel at the base should be selected. Cut close to this with a sharp knife, and plant the cuttings in a frame, or under a handlight in rich sandy soil, under a north wall and shaded from the bright sun so as to retain the foliage on them as long as possible. Remove shading and glass lights in the evening, so as to expose them fully to the night air and refreshing dews. They should be sprinkled every morning with a fine rose-water-pot. The soil must be sandy, and made very firm round the cutting, or failure will be the result. Most kinds of Roses can be easily propagated as above directed. *Wm. Smythe, The Gardens, Basing Park, Alton.*

Plants and their Culture.

SUCCESSION OF FLOWERS FOR THE CONSERVATORY.

THIS is a matter that, in order to maintain the desired supply, must not be allowed to escape our notice. Annuals of the tender type are invaluable for the conservatory during the summer, when shading has to be employed to protect the permanent plants. At this season plants that are farthest from the glass, and that are oftentimes overshadowed by dense foliage, causing them to become drawn and consequently soon fit only for removal, are not at all satisfactory. When this has to be contended against such plants as can be thrown away when past their best will be found an advantage. A good stock of Balsams, Globe Amaranthus (*Gomphrena purpurea*), Celosias in variety, Petunias and other quick growing plants will be then of much service. *Humex elegans* and *Campanula pyramidalis* are also most useful during the summer. Seed of both of these biennials should be sown at once for next season.

STOVE AND INTERMEDIATE-HOUSE PLANTS FOR AUTUMN AND WINTER DECORATION.

The earliest struck stock of most of these indispensable subjects should now be making good progress. Do not let any of them become pot-bound until they are put into their last shift. This is particularly to be avoided with such as *Poinsettias* that have been propagated singly in thumb-pots; these will shift well into 4-inch pots, thence into 6-inch ones if required, and in most cases it will be so, for some stronger plants, even if tall in the stem, are still desirable. Selection of the strongest and most promising should be made for these purposes, but beyond a 6-inch pot it is hardly advisable to venture with plants of this season's propagation. Feeding them with stimulants will be a better plan. This resource will be found ample, bearing in mind that all the soil in which they are growing is, or should be, fresh and full of the elements necessary to sustain plant life, with the aid of a stimulant at the finish. Grow the *Poinsettias* by all possible means in the full sunshine, and as near the glass as possible. During warm evenings and nights give a little ventilation, except when dewy potted, then for a few nights they may be closed up with a more humid atmosphere till fresh root-action commences. Our early stock will now soon be placed in a Melon pit that has been cleared out. The old stools have kept much better than usual this year, and will yield quantities of cuttings for dwarf plants, some of which will be struck as late as September for the very dwarfest. We have not touched upon old plants, these, however, are very valuable for large conservatories or lofty stoves, and when furnished with half a dozen or more well-developed bracts they are a fine sight. Such as these should ere this be making good breaks after having been cut down. We have grown these in the open air when in a more favourable locality for several weeks of our warmest summer weather. They succeed well under this treatment, and the plants are retained in a much dwarfier state.

EUPHORBIA JACQUINEFLORA.

This companion of the *Poinsettia* will thrive well in the same pits or houses as the latter, but if a

slightly warmer temperature can be granted them, so much the better for obtaining a vigorous growth that will eventually become well ripened and productive of extra fine racemes of bloom. Given a sunny corner of a warm house and the convenience suitable for turning out a few plants, we advise a trial to be made of this method; the extra return will remunerate any such trouble taken. The best grown *Euphorbias* I ever remember seeing were in a Pine-stove of three-quarter span; these plants were placed on shelves, and partly overhanging the back path, making a most vigorous growth, and were productive of the best results.

BEGONIA INSIGNIS, B. KNOWLESIANA,

and other winter-flowering varieties, should soon be in their blooming pots, and when established the resin be kept freely ventilated by night as well as by day, until the chilly evenings of autumn are found to reduce the temperature somewhat lower than is desirable, thereby endangering the plants by excess of humidity in the atmosphere when at its lowest point.

THYRSACANTHUS RUTILANS.

Our stock of these are mostly 4 and 5 feet high, and are at present tied to the back trellis of the earliest vinery, which is well aired. They are doing very well in that position at present, but later we shall have to find a place more exposed to the sunlight.

ERANTHEMUM FULCHELLUM.

This species, unsurpassed in its colour at its season of the year, may still be struck, and will be found to yield a stock of serviceable dwarf plants; the earlier stock of plants will probably need another shift yet, 6-inch pots will be large enough in any case to secure a good display. *James Hudson, Gunnersbury House, Acton, W.*

FRUITS UNDER GLASS.

THE STOCK OF YOUNG PLANTS.

EXCEPTING under exceptional circumstances our climatic influences at this season of the year are so propitious that if properly used they will alone afford the necessary warmth for the cultivation of this section of the Pine stock. Assuming therefore the plants are placed in modern sized houses or pits—the best kind of structures for this purpose, at this season—within a moderate distance from the glass, and the pots plunged in a fermenting bed, having a genial heat of about 80° at the base of them, they will with ordinary good treatment speedily grow into sturdy plants and be far preferable for fruiting the subsequent season than those of larger size. In the ordinary course of management the plants intended for fruiting next May and June should be in their fruiting pots before the end of the current month, and every inducement should be afforded them to mature and develop; it properly before the middle of October; therefore utilise to the fullest extent solar heat by closing the place at 05° in the afternoon, and at this time lightly syringe the plants overhead and other available places about the house; this will produce a general state and secure sufficient warmth in the place throughout the night, for the plants at their present state. Ventilate the place at 80° and open it freely in sunny weather until closing time in the afternoon arrives. Whenever necessary water the plants with weak guano-water in a tepid state, not indiscriminately but judiciously, as herein lies the chief source of success.

THE FRUITING DEPARTMENT.

The growth and development of the fruit will also derive benefit from the same kind of treatment, although in the case of these artificial heat at certain times must not be dispensed with. Pine-apples swell off very freely in a somewhat low and moist temperature at this period and onwards for a considerable time yet; still, these conditions are not the best to employ for the purpose, because the lack of heat tends to impair the quality of the fruit, which often, when cut, reveals a discoloration that reduces its value and renders it next to worthless, a defect that is seldom found in fruits that have been ripened in a higher and drier temperature. For these reasons I recommend the temperatures in this division to be well sustained, by artificial means if necessary, rather than that they should be constantly low at night—75° night should now rule, and 80° in the daytime, with an increase of 15° during sunny days, with plenty of air in the house. Keep the plants free from useless suckers, by screwing them out as soon as they can be handled, leaving one on each plant to increase the stock. Discontinue the syringing of the plants when they are in flower, and at all times use the purest water possible wherewith to wet the fruit. Attend to moistening the pathways and other surfaces in the house in the morning and at closing up time each day. *Geo. Thos. Miles, Wycombe Abbey.*

APPOINTMENTS FOR THE ENSUING WEEK.

		Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Scientific Committee, at 2 P.M.
TUESDAY,	July 28	National Acclimatization and National Carnation and Floriculture Society (Southern section), Show of Carnations, Florists, &c., at the Royal Horticultural Society's Gardens. Sale of Orchids in Flower, at Froehner & Morris Rooms.
WEDNESDAY,	July 29	Aberdeen Horticultural Show (three days)
FRIDAY,	July 31	Sale of Imported Orchids, at Froehner & Morris Rooms
SATURDAY,	Aug. 1	Southampton Horticultural Show (1st and 2d)
		Liverpool Horticultural Show (1st and 3d).

THE APPLE CROP IN NOVA SCOTIA is a matter of so much concern to British consumers and British merchants that we hasten to lay before them the following communication from our correspondent in Nova Scotia, and in which the prospects of the Apple crop are spoken of very favourably:—

"The spring season was a very favourable one for cultivators of the soil this year; the heavy covering of snow last winter prevented the frost going very deep, and in April we had the unusual phenomenon of the frost being out of the ground (as it is commonly expressed) before the covering of snow had left us. All crops started early; we had fine weather for seed-time. Our Apple orchards profited by the genial weather. Blossoming was abundant, and the early growth strong, but we had a long course of unmitigated dry weather in June. This seemed to shrivel up some of the newly formed fruit.

"The most reliable reports I have received from the several counties in which fruit is raised correspond very well with a very explicit statement made to me by Colonel W. E. STARRATT, of Paradise, Annapolis County, who is himself owner of one of the finest orchards in the Annapolis Valley. He says that there will be an ample, if not unusually abundant, crop of fall (autumn) and early winter Apples, and that the clean, healthy appearance of the trees gives every indication of good quality of fruit. We shall thus be able, it is hoped, to hold our own in the English market as regards quality and beauty of sample in early winter Apples; and as regards quantity the number of barrels will certainly not be less than heretofore, as new orchards are coming into bearing every successive year. As regards late winter or spring fruit we cannot say as much. There is a decided deficiency in quantity, and what the quality will be remains to be seen. Nonpareils are in many orchards a complete failure. (The Yellow Bellefeur, or "Bishop's Pippin," as it is commonly called in Nova Scotia, has of late years become so spotted and small in size that its vocation as one of our leading market Apples is well nigh gone.)

"Our small fruits had a hard time during the June drought, but we have had abundant warm showers so far during the present month (July) which has brought about a great change on all our crops in field and garden. We are now in the midst of our Strawberry season. The Sharpless appears to be the most showy one offering on market. Strawberries are now selling at from 10 to 15 cents a box (supposed to contain a quart), say from 5d. to 7½d. per quart."

The following letter, relating to the INDIAN and COLONIAL EXHIBITION of next year, has been addressed to us for publication:—

"I am desired by the Council of the Royal Horticultural Society to ask you to allow them to make known through the medium of your columns that they are prepared, at the request of, and in concert with, the Royal Commissioners of the Indian and Colonial Exhibition of 1886, to offer their co-operation and assistance to such of the colonies as may desire to avail themselves of it. Some of the colonies have already expressed a desire to have as a feature of their courts illustrations of the indigenous flora in vesicules or plant-houses. In addition to these the Council believe that collections of ornamental and economic plants in a growing state and of fruits would be of much interest and value. The Royal Horticultural Society will be ready to give advice and practical assistance in preparing, arranging, and carrying out such illustrations to any of the colonies who may apply to them. But they desire to point out that it is essential for even a very limited display of growing plants that not a day should be lost. I shall be glad to answer any inquiries. The Assistant-Secretary and the Superintendent of the Society's gardens will be ready to meet and consult with the Colonial Commissioners, and to take forthwith the necessary steps in conjunction with them. "F. MASON, Secretary,

"Royal Horticultural Society,
"South Kensington, S.W.

— BENTHAMIA FRAGIFERA.—If the memory of the late GEORGE BENTHAM depended for its perpetuation on its association with any particular plant it would be a real misfortune that the plant which in gardens bears his name should by botanical law be hereafter called a *Cornus*. A *Cornus*, however, it is; but we suspect in gardens it will remain *Benthamia*. It is a shrub with large lanceolate leaves, of a grey colour, like those of the Olive, but much larger, and its flowers, surrounded by large white bracts, are succeeded by a red fleshy fruit, not unlike in superficial appearance to a Strawberry. In the Northern Counties it is a tree of doubtful hardihood, but in the milder climate of the South-west it forms a large tree. Our present illustration (fig. 25) is taken from some trees in the gardens of R. G. LAKES, Esq., Trevarick, St. Austell, Cornwall, and believed to be the largest in the country. They exceed 35 feet in height, and the trunk of one is 5 feet in circumference at 3 feet from the ground. They are now in flower, and will shortly be covered with their Strawberry-like fruit.

— CHARLES MORREN.—We object to unnecessary alterations in the names of streets almost as much

long since established a similar tribunal, which we believe works well, and now we are informed Amsterdam follows suit. As the Royal Horticultural Society was the parent of most of the similar societies, so its committees seem destined to be the propositors of like institutions elsewhere.

— ANTWERP BOTANICAL CONGRESS.—The opening meeting will be held on Sunday, August 2, in the hall of the "Cercle Artistique, Littéraire et Scientifique." On the same day the Horticultural Exhibition will be opened. At 3 p.m. a visit will be made to the Musée Plantin. At 8 p.m. a concert will be given in the gardens of the Exhibition in honour of the members of the Congress.

On Monday, August 3, there will be meetings of the Congress, and at 8.30 p.m. an official reception by the Burgomaster in the Town Hall.

On Tuesday, August 4, the Congress meetings will be resumed, and in the evening there will be a banquet at the Cercle Artistique Littéraire et Scientifique.

Wednesday, August 5.—Excursion to Ghent:—1, Visit to the Botanic Garden; 2, Reception at the Town Hall; 3, Visit to the Winter Garden of the Countess Kerchov de Denterghem; 4, Lunch at

FIG. 24.—FLOWER OF BENTHAMIA FRAGIFERA.

as to similar changes in the nomenclature of plants, but the fact that the Municipality of Liège has decided that one of the streets leading to the Botanic Garden of that city shall henceforth be called Rue CHARLES MORREN, is noteworthy as a mark of appreciation on the part of the burghers.

— "GREENHOUSE AND STOVE PLANTS, &c."—

This is the title of a work on the cultivation of these plants, which demands, and will receive, the consideration which the well-earned reputation of the author (Mr. T. BAINES) necessitates. After a few generalities the author proceeds to give in alphabetical order an account of the several genera selected by him. We must reserve a further notice of the work till we have been enabled to examine it more thoroughly; meanwhile, as a book on the cultivation of plants, we have no hesitation in at once recommending it to the notice of our readers—the more so, as a considerable portion of the practical matter was originally published in our columns. The work is published by MURRAY.

— THE FLORAL COMMITTEE.—Pretty frequently we hear complaints of the doings of this body, but we do not hear so much of the good work that its members do gratuitously, and at a great sacrifice of time and labour. That the work is not done so badly is shown by the fact that Ghent not

the Casino; 5, Visit to the principal horticultural establishments; 6, Concert in the Zoological Garden in honour of the members of the Congress.

Thursday, August 6.—Botanising excursion in the Campine.

Friday, August 7.—Excursion to Brussels:—1, Visit to the Botanic Garden—*déjeuner* given to the members of the Congress by the Société Royale de Belgique; 2, Visit to the Royal Winter Garden at Laeken; 3, Reception at the Town Hall.

The second part of the preliminary reports sent in answer to the questions proposed on numerous points of horticultural and botanical interest has been published, and will form the object of comment on a future occasion. Nothing seems to have been left undone so far to secure the success of the Exhibition and Congress.

— PHACELIA CAMPANULARIA.—We have frequently had occasion to mention this Californian annual, but its merits are so great, while as yet its reputation is so limited, that we do good service by calling attention to the plant, whose rich blue, bell-shaped flowers, often with a metallic sheen upon them, render it one of the very best annuals that can be grown. In habit it is like a *Nemophila*, and requires the same treatment. It was introduced by Mr. THOMPSON, seed merchant, of Ipswich.

— THE ROWE ORPHAN FUND.—In addition to the sums mentioned in our previous issue we have received the following amounts:—G. MONRO, £1 1s.; A Gardener, Poole, Dorset, 10s.; J. YOUNG, 5s.

— FLOWERS IN SEASON.—Miss OWEN, of Knockmullen, Goree, sends flowers of *Antirrhinum bellidifolium*, a curiosity hardly worth a place in any other than a botanist's garden. *Carmichaelia australis* is even more curious, and would attract attention even from lovers of gay gardens, from its singular structure, the leaves being conspicuous by their absence or minute size, the branches being flattened and leaf-like to compensate for the deficiency of true

leaves. The flowers are small, yellowish, and papilionaceous. *Meconopsis Wallichii*, with its tawny hairs and purple flowers appeals to a larger circle of admirers; and *Tropaeolum speciosum* is sure to obtain universal suffrage. Miss OWEN sends it to show that growers should not be disheartened by one or two failures, but continue to try it in various positions. Miss OWEN, after several failures, has succeeded in growing it on the rockery almost equally well in sunshine and in shade; but thinks that it flowers best in the sunshine, and so we have found it in Wales and Scotland.

— THE BERMUDA LILY.—Some time since we gave an illustration showing how freely this beautiful variety of *L. longiflorum* grew under cultivation in the Bermudas. *Lilium Harrisii* (so called in gardens)

has made its way to favour both in this country and in the United States, but it is clear that there is considerable variation in it. Mr. BULL showed some fine examples at the recent meeting at Kensington, and Mr. KENDALL has now favoured us with specimens which are the finest of the kind we have seen.

— ASTRANTIA MAJOR.—All lovers of herbaceous plants know this old plant, and many must have gathered it in Germany and Switzerland, and admired its frill of white bracts picked out with green. Theoretically, each flower in the umbel should have its bract, and a specimen sent by Miss OWEN goes far to realise the theoretical structure, inasmuch as, in

the primary one is very rare in *Araucarias*, and indeed in some other Conifers. Others again, like *Picea Menziesii* and *ajamensis*, frequently produce them.

— SOUTHWARK PARK.—This park, which forms an "oasis" in the desert of Rotherhithe, and which, although quite unknown to the majority of Londoners, is fully appreciated by the many thousands who dwell within a stone's-throw of its boundaries, has recently been made still more attractive by the addition of an ornamental lake. For many years the want of water has been felt, and as long ago as September, 1883, the Vestry of Rotherhithe, in which

FIG. 25.—*BENTHAMIA FRAGIFERA* AT TREVARRICK. (SEE P. 112.)

addition to the outer frill or involucre, there is a second inside the first, and separated from it by several rows of flowers. By patient selection, no doubt, a "race" might be procured which would be very effective and which gardeners would surely offend the botanists by calling double.

— PAPAVER UMBROSUM.—Poppies have a tendency—why, we cannot say—to turn their stamens into pistils. Cases of the kind have been figured in this journal, and now Miss OWEN sends us illustrations of the same kind in *Papaver umbrosum*.

— *ARAUCARIA EXCELSA*.—M. CARRIÈRE describes in the *Revue Horticole* an instance wherein a lateral branch has assumed an erect direction like a leader shoot. The production of leader-shoots other

parish the park is situated, memorialised the Metropolitan Board of Works on the subject, praying that a lake might be formed in the park, and it was not until last December that they unanimously agreed to recommend the Board to construct the lake. This result was, we believe, brought about mainly through the exertions of Mr. JOHN TOLHURST, the member for Rotherhithe. Designs and working drawings were then prepared by Mr. GEORGE VULLIAMY, the architect of the Board, and submitted to and approved by the Board. Tenders for the work were advertised for and opened on February 25 last, when out of the tenders (the highest being £4855) that of Mr. GEORGE BELL, of Tottenham, which was the lowest, was accepted, for the sum of £2665. The work has since been carried out by Mr. BELL, under the superintendence of Mr. J. J. SEXBY, the Surveyor of Parks

and Open Spaces. The lake consists of a concrete basin, well puddled with clay as a foundation, and neatly finished around the margin with a coping of blue rounded bricks. The outline both of the mainland and the islands, which are three in number, consists of a succession of graceful curves, so arranged as to give the appearance of continuity, and we could find no point of view from which the whole extent of the lake could be seen. The advantage of this is apparent, as although the total area, including banks and islands, is, we understand, only about 2½ acres, the indefiniteness of the view would lead an observer to suppose it might be very much greater. Planting has been executed by the Board's own labouring staff, under the supervision of Mr. COFFIN, the Superintendent of the park. The islands have been thickly planted with suitable trees and shrubs.

— **EUCALYPTUS GLOBULUS** IN FLOWER IN SCOTLAND.—Mr. DUNN, of the Dalkeith Gardens, kindly forwards a branch of this in flower, with the following note:—

"The plant, or tree, was raised from seed I received from Melbourne, Australia, in 1879, and sown in the early spring of 1880, and grown under glass for two years. In 1882, when about 5 or 6 feet high, it was planted out, in the month of June, in the middle of a Rose bed in a sheltered spot in the grounds, where it has grown freely and uninjured since. It began to show its adult leaves last season, and on the branches on which they were borne the flower-buds appeared in May this year. The first flowers opened on the 16th inst., and they are now opening freely, and present rather a striking appearance on the young tree. The tree is about 18 feet high, and the flowers are produced on the branches from the middle upwards. I am not aware that it has flowered out-of-doors in Scotland previously."

— **THE PROMENADE AND BOULEVARD ASSOCIATION.**—This useful body has just added another open space in a populous part of the metropolis available for the recreation of the people. Wilmington Square, Clerkenwell, is a comparatively quiet, retired area, lying a hundred yards to the westward of the highway from Mount Pleasant to the "Angel" Inn at Islington. The houses of well-to-do folks surround the square; but beyond these are the closely packed dwellings of the more needy. The area of Clerkenwell is redolent of rural names, to wit, Sadler's Wells, London Spa, Clerkenwell Green, and Mount Pleasant, and many names of streets and lanes suggestive of a time when all that is now covered with dwellings was outside the boundaries of London, and was resorted to by her citizens with about the same consumption of time as required to get to Tunbridge Wells at the present day. The garden, which has been nicely laid out with broad well-made walks, turf spaces, flower and shrubby beds, a fountain, and many seats for those who are weary, or whose playtime is gone by, was opened by Her Grace the Duchess of SUTHERLAND, on Saturday last, July 18. Lady ALEXANDRA GOWER, Lady MARGARET SANDHURST, Lord BRABAZON, Lord COMPTON, the Bishop of BRISBANE, and many of the clergy and friends of the Association were present.

— **MR. G. S. JENMAN, F.L.S.**—This gentleman, who spent some years in Jamaica, is now the energetic Government Botanist in the colony of British Guiana, at present in England on leave of absence.

— **LABISIA POTHOINA.**—An undershrub with erect stem about a foot high, with alternate stalked leaves, lance-shaped in form, finely notched at the edges, and traversed by a prominent deep red midrib. The small whitish flowers are borne in long densely-set axillary clusters. The plant is so like some of the Aroids in the shape of the leaves that it was at first sight taken to belong to that order. The venation and the sheathing base of the leaf-stalks give rise to the illusion, speedily dissipated by the examination of the flowers, which are like those of an Ardisia. The plant is a native of the Malayan Islands, and is figured in the *Illustration Horticole*, t. 561.

— **HÆMANTHUS CINNABARINUS.**—Several of these Amaryllids might with propriety be included in select collections of bulbs, and it is desirable that the reaction which has set in lately with regard to bulbs may continue; for although their season is, as a rule, comparatively short compared with the continuous blooming of some popular garden subjects, there is a

freshness and a charm about them that is always attractive. *H. cinnabarinus* will compare favourably with most of the species in cultivation as regards flowers, but in foliage is inferior to *H. sanguineus*. Another property, however, which must not be forgotten is the presence of leaves with the flowers, a circumstance which brings it on a level with such excellent species as *H. Kalbreyeri*, *natalensis*, and *Katherine*. The flowers are produced in dense sub-globose heads, and tube and segments of the perianth, together with the stamens, are of a brilliant vermilion fading to a pale purplish-red colour. The perianth segments are broader, and the stamens stouter, than those of *Kalbreyeri*, tipped with short golden-yellow anthers. A flowering specimen may be seen in the Palm-house at Kew, and a figure in the *Botanical Magazine*, t. 5314.

— **TREES IN KENSINGTON GARDENS.**—The course followed a few years back in the removal of the numerous old half dead trees that stood in the north-west end of Kensington Gardens, the necessity for which was at the time urged in the pages of the *Gardeners' Chronicle*, already gives a forecast of the advantages gained. The young trees, which have been judiciously planted in groups of limited numbers, with sufficient open spaces intervening, are thriving well, and thus early convey an idea of the marked improvement in effect that results from this kind of arrangement in contrast with the continuous wood-like aspect which existed before with the whole surface occupied. In the original planting in this part of the grounds, in place of the trees from the first being allowed enough room to admit of their assuming their natural spreading habit, the mistake had been committed of putting them in thickly in the way usual when the object is to produce timber. This was further aggravated by the evident absence of any attempt at thinning out afterwards; the result of the overcrowding being that the whole were reduced to a state of decay through starvation. In the planting of the young trees this has been guarded against by giving them room enough from the first. This is a wise course, as in such places the reluctance to thin out usually outweighs better judgment. It is gratifying to see that in the selection of the young trees there has been some departure from the Elms of the past, and the never-ending Planes of the present generation of London tree planters. Yet still more variety might with advantage have been introduced, and in place of Horse Chestnuts we would have used more Sycamores. This fine old British tree is not enough planted about the metropolis and other towns. It thrives almost anywhere where the London Plane will succeed and in a good many places where the latter will not. It is quite equal to the best of the Planes in appearance, and nothing in the shape of insects affects its leaves in a way to cause their early falling. The way that the young leaves of the Horse Chestnut suffer in spring with the stunted appearance of the established trees in Hyde Park, and most other places near London, are sufficient cause for steering clear of it. The North American Fawias seem to generally thrive better near London than the Horse Chestnuts.

— **HOMALOMENA INSIGNIS.**—Please note, gentle reader, that this should not be written "Homalomena" as most writers seem instinctively to do. *H. insignis* is a Bornean Aroid with tufted leaves, scarlet leaf-stalks, supporting a broadly lanceolate deep green blade, the ribs of which are prominent on the under-surface, and of a deep red colour. It comes from the section *Curmeria*, and is a stove plant of value for decorative purposes. It is figured in the *Illustration Horticole*, t. 560.

— **SAWRIDGEWORTH FRUITS.**—A most interesting group of these was staged by Messrs. THOMAS RIVERS & SON, of the Sawbridgeworth Nurseries, at the Saffron Walden Flower Show on the 15th inst. There were a dozen or so plants of various kinds of fruits, all admirably grown and fruited, the following being well represented:—Peach Albatross, a very fine-looking fruit; Sea Eagle, and Nectarine Peach. Nectarines Gordoni, extra fine in appearance, and an admirable exhibition variety; Orange, and Pine-apple. Plums, Kirke's, Early Transparent, and Jefferson, all bearing good crops of excellent fruit; and Bigarreau Gros Creux Cherries. In addition there was a collection of gathered fruits, consisting of fine examples of Dr. Hogg and Conkling Peaches, Prince Albert, Gordoni, Humboldt, and Byron Nec-

tarines; large red Bigarreau and Early Rivers' Cherries, the latter represented by fine fruit of the highest quality. The highest commendation was awarded to this interesting collection.

— **GREAT YORK GALA AND HORTICULTURAL FÊTE.**—The balance-sheet of the exhibition in June last has been published, and shows the year's income to have been £1794, and the expenditure £1577 18s., which includes £535 for prizes, &c. The greater portion of the balance of £217 will be handed to the charities of York. The Gala was favoured with fine weather and was in every way a success, and the speedy winding-up of affairs and issue of a balance-sheet is highly creditable to the committee, and to the Secretary, Mr. JOHN WILSON. The accompanying figures convey a tolerably correct idea of the interest which is taken in the annual exhibition at this fine old city:—First day's attendance, 4351; second day, 25,635; third day, 10,924; making a total of 40,910; and this notwithstanding that it threatened rain on the third day. This result is well deserved by the committee, and their indefatigable Secretary, Mr. WILSON, who during the twenty-seven years this great horticultural gathering has taken place have worked together with a will and fidelity of purpose that has alike gained the confidence of exhibitors and the appreciation of the public.

— **THE SUN.**—Professor LANGLEY, who recently gave an account at the Royal Institution of his ascent of Mount Whitney in Southern California, for the purpose of making investigations as to the nature of sunlight and the earth's atmosphere, concludes that the sun is blue. The apparent yellow colour is due to the fact that the atmosphere through which the light passes has absorbed or sifted out the other colours to a greater extent than the yellow. The solar heat is calculated to be capable of melting a shell of ice 60 yards thick annually over the whole earth. The total loss by absorption from the atmosphere is nearly double what has been heretofore supposed, and the human race owes its existence and preservation to the heat-storing of the atmosphere even more than has been believed, for if the planet were allowed to radiate freely into space without any protecting atmospheric veil, its sulcit surface would probably fall, even in the Tropics, below the temperature of freezing mercury. The apparently limpid aerial sea above our heads and about us is carrying on a wonderfully intricate work on the sunbeam and on the heat returned from the soil, picking and sorting out selected parts in hundreds of places, and as one result changing the sunbeam on its way down to us in the manner indicated.

— **BILBERGIA BREAUTIANA** x. —The *Revue Horticole* of July 1 gives a coloured figure of this beautiful hybrid between *B. pallescens* and *B. vittata*. The plant is tufted with numerous oblong obtuse leaves, provided with fine red spines at the margins. Inflorescence peduncular, shorter than the leaves, with numerous rose-pink oblong bracts and clusters of numerous flowers, each about 2 inches long, with red calyxes and violet petals twice the length of the sepals. M. ANDRÉ, by whose gardener, M. BRÉAUTE, the plant was raised, speaks very highly of it for decorative purposes, and recommends it to amateurs and market-growers by reason of its easy culture and abundant bloom.

— **PITTIOSPORUM UNDLATUM.**—Some handsome plants of this Australian evergreen shrub are now growing freely on a south border by the side of Hanger Hill House, Ealing, and are very striking and elegant objects. The seeds of this, and of several species of Gum trees, were received from New Zealand by Mr. E. M. NELSON, and the plants raised from them were planted out, during 1884, in a warm recess on the high ground on which the mansion stands. They came through last winter, without taking harm, but as it was a very mild one—it scarcely furnished a sufficient test of the comparative hardihood of the Pittiosporum in the open ground near London. At present there is no appearance of the plants blooming, but they have made a free growth, and their elegant habit and undulated silvery leaves are in striking contrast to other types of vegetation surrounding them. The position the plants occupy is one eminently favourable to their coming through the winter with safety, but should it prove severe some

protection will no doubt be afforded to these interesting subjects. At present they appear to be doing as well as the most fastidious could desire.

— MARKET GARDENING.—M. GILLEKENS, the Director of the National School of Horticulture at Vilvorde, has published a lecture given by him on the subject, and which will well repay perusal. M. GILLEKENS' object is to show how by developing market gardening among the small peasant proprietary a profitable industry may be developed, to compensate for the loss on agricultural operations proper. M. GILLEKENS gives details as to the culture of vegetables, and statistical estimates of the cost of so doing, but in the latter estimate he does not, so far as we see, include the cost of getting the products to market—a cost which must, in proportion, be heavier for the small grower than for the large.

— THE HARTZ MOUNTAINS.—Those who are contemplating a holiday should purchase No. 3 of the *Holiday Handbook* (125, Fleet Street), and those who are not should expend a penny for the same purpose. In neither case are they likely to be disappointed, for the guide is both pleasantly written and contains a large amount of miscellaneous information useful alike to the traveller and to the sedentary reader.

— HEMLOCK BARK EXTRACT.—The manufacture of the extract from the bark of the Hemlock Spruce (*Tsuga canadensis*) is assuming very large proportions in America. It is chiefly carried on in the eastern townships of the province of Quebec, where the tree abounds. It is, however, found over a very extensive area in North America, and grows to a height of from 70 to 80 feet. It is said to be found far better to manufacture the bark into a merchantable article of current value at the place of growth than to send it bulky, as it is in the rough, to foreign markets. The custom returns of America show a very marked increase in the export of hemlock bark extract during the past four years. To manufacture the extract the bark is put through a process of "leaching," and thus the principal watery portion is evaporated, so that a concentrated solution of tannin is the result. The wholesale destruction of hemlock trees for the manufacture of extract threatens to seriously diminish the future supply of this wood, which will become more and more useful as Pine disappears. In a report of a committee of the Canadian Parliament so far back as 1863 it was estimated that an extent of 10,000 acres of the best hemlock land was stripped every year for supplying bark to the extract factories, the timber being left to rot on the ground.

— GENTIANA TRIFLORA *Pall.*, tab. 1189.—This plant belongs to the handsomest of this widespread genus, and has the particular advantage of blooming in September and October, when almost all other perennials have ceased flowering. The large, handsome flowers resemble those of *G. pneumonanthe*, but it is to be preferred to that species in that the small, tender foliage permits the bloom to be better seen. The cultivation of this Gentian is exceedingly easy, as it requires merely loamy soil enriched with humus, and a sunny open site. It can be propagated by cuttings, divisions, and by seed.

— GARDENING APPOINTMENTS.—Mr. W. A. COVE, Gardener to J. ALLEN, Esq., Stowford Lodge, Ivybridge, Devon, for the last five years, has been appointed Head Gardener to Colonel S. CORYTON, Pentlic Castle, Saltash, Cornwall.—Mr. S. LYON, for the last six years Gardener to Lady Scott, Sundridge Park, Bromley, has been engaged as Head Gardener to Viscount Lord BRIDFORD, Cricket St. Thomas, Chard, Somerset.

TREVARRICK, ST. AUSTELL, CORNWALL.

MR. LAKES, the genial owner of this rich estate, is a well-known patron of horticulture, as were his fathers before him. There are very few places that can vie with Trevarrick for remarkable specimens of exotic trees and plants. The two trees of *Benthamia fragifera* there are said to be the largest specimens in Britain. They exceed 35 feet in height, and the one I measured has a trunk 5 feet in circumference at 3 feet from the ground (see fig. 24). Towards the end of summer they are clustered with the large red Strawberry like fruit, and just now they present a very striking appearance, being literally covered with thousands of heads of white flowers. Directly in front of the mansion is a *Camellia* which has produced upwards of 16,000 blooms during the past spring. It is in the open ground, and is 84 feet around, and is dense, from the bottom rising in a cone to a height of some 10 or 12 feet. Not far from this huge specimen is an original plant of *Cupressus Lawsoniana*, 50 feet high, and 65 feet around, of which the beauty: *Fabiana imbricata* is treated as a shrub here, 7 to 8 feet high; its Ericale-like flowers are just now at their best: alongside is the *Ozothamnus rosmarinifolius*, of similar dimensions, and a sheet of white. *Taxodium sempervirens*, as well as the deciduous kind, *T. distichum* (the deciduous Cypress), tower to a height of 70 feet, the trunk of the former being 8 feet 7 inches in circumference at 3 feet from the ground, and 40 paces around. *Pinus palustris* (very scarce) is 25 feet high; *Cryptomeria elegans* is 30 feet and 53 feet around; and the *Lucombe Oak* at the entrance gates is finer than that grand original specimen at Messrs. Lucombe, Pince & Co.'s nurseries at Exeter. Mr. Lake's tree is about 100 paces around, and the trunk at 3 feet from the ground is 12 feet in circumference. The rock garden is well furnished with rarities, and it almost took my breath away when I saw here the *Mitrasira coccinea* quite 14 feet across and covering a small hillock. This plant is usually found in the greenhouse, but at Trevarrick it luxuriates outdoors, and its brilliant flowers are now coming in. *W. Napier*, June 27.

HARDY TREES AND SHRUBS.

CLEMATIS CORDULEA ODORATA.—Messrs. Veitch send us flowers of this fine old hardy Clematis with its deep violet-purple flowers and yellow anthers. The flowers measure about 1½ inch across, and have a rich perfume of prussic acid.

SPIRÆA PALMATA ALBA.

The rich crimson flowers of the Japanese *Spiræa palmata* are known to most gardeners, but the white variety is much less frequent. Messrs. Veitch send us fine sprays of it, which show that the ordinary variety is all as ornamental as the ordinary variety.

SPIRÆA LINDLEYANA.

A loose-growing shrub, with elegant pinnate leaves and large triangular panicles of white flowers, is very lovely just now. Those who have plenty of room should certainly grow it, but its rampant habit does not commend it for small gardens. Moreover it is somewhat tender, and large branches are apt to die and look unsightly. Nevertheless, the shrub is so lovely when it blooms, and its foliage so graceful, that we should be sorry to discard it.

CASSINIA FULVIDA

is a plant no lover of hardy shrubs should be without. Its slender thicket branches are covered with tawny scales, the minute leaves are dark green above and tawny beneath, the flower-heads small, white, clustered in dense masses at the ends of the branches. Some recognise it under the name *Diploupappus*, but under whatever name no one will do wrong to grow it. Messrs. Veitch send us a fine spray of it from Combe Wood.

LIGUSTRUM SINENSE.

A hardy shrub of graceful habit and most profuse flowering tendency. The leaves are yellowish-green,

borne on long slender arching shoots, and the numerous white flowers fill the air with a fragrance which to some folk is objectionable.

LARGE CONIFERS.

At Flete (Mr. H. B. Mildmay's home), near Ivy Bridge, where Mr. Salway is the gardener, there is a fine example of the weeping English Yew (*Taxus baccata* *Davostoni*). Its trunk is 9 feet in circumference at 3 feet from the ground, and its entire height is at least 40 feet. It is about 50 paces around, and it is remarkable for its symmetry and gracefulness. Close at hand stands a noble tree of the *Pinus insignis*, quite 100 feet high, whose trunk is 11 feet 6 inches in girth, and the spread of its dense branches, which sweep the ground, is some 50 feet across. *W. N.*

BUDDLEIA GLOSOBA.

It is perhaps noticeable that although this plant has been in this country for more than a century, it appears to have been sparingly planted. It is not often met with in gardens, but it is just now a noteworthy object in the gardens of Gunnersbury House, Acton, where Mr. Hudson has it growing in a shrubbery border under the friendly protection of some tall trees, and where it is flowering very freely, throwing out its flowers in bright yellow globular heads, brilliant and fragrant, and decidedly striking. Hard frost will sometimes cut back this showy plant to the very ground, but that the root is not killed, and that it springs up again luxuriantly. [We lost ours in 1880-81]. The position given to it at Gunnersbury House is no doubt favourable to its preservation, and another purpose is served, for the plant has a straggling habit of growth which is not noticed where it can spread its branches among other shrubs. It is said that it will hardly stand the ordinary English winter north of the Trent, and when planted beyond this line should have the assistance of a wall, and be further protected during winter.

CERCIS SILIQUASTRUM.

The finest *Judas Tree*, or Love Tree (*Cercis siliquastrum*) I have ever met with is at Saltram-Plympton, Lord Morley's seat. It stands apart from the other trees in the park, within a gunshot of the mansion, and on the occasion of my visit, a short time since, was clustered over with its purplish-coloured flowers, and its leaves of singular form were just appearing. The trunk, at 3 feet from the ground, measures 5 feet 4 inches in circumference, above which it soon forks out into a well-branched head, the circumference of which is about 30 paces. Its height is about 35 feet. *W. N.*

THE POTATO CROP OF 1885.

(Continued from p. 75.)

SCOTLAND.

ABERDEEN.—The Potato crop looks very promising but this season everything is about from ten to fifteen days later than usual. All those above-ground before May 10 were cut off by the frost of that morning (10°). There is no appearance of disease. I find that Sharpe's Victor, as an early Potato, still holds its ground out of about sixty sorts I have on trial. *V. Farquhar*, *Evrie Castle*.

— Potatoes in general came up well, and are looking well, but are very late. Early sorts, such as Ash-leaf Kidney, &c., will not be ready for use for at least two weeks yet, unless such as have been forced and carefully protected. *J. Forrest*, *Hadde*.

BANFF.—Potatoes are everywhere looking healthy in this district, but owing to the long track of ungenial weather are backward in growth for the period, especially amongst the late sorts. *J. Webster*, *Gordon Castle*.

EAST LOTHIAN.—Potatoes look well and promising, both in field and garden. Early kinds are smaller than usual owing to the long drought. *L. Dow*, *Prestonkir*.

FIFE.—The Potato crops are very healthy at present, and no doubt with fine weather they will give satisfaction to the grower. *John Proctor*, *The Gardens, Donbristie*.

FORFAR.—All looking well in this quarter, gentle showers now and again and brilliant sunshine bring them on very fast, and I hear no complaints about them at all. *J. Mitchell*, *Carnoustie*.

MIDLOTHIAN.—Potatoes do not look nearly as well as last season; they are very late, especially garden

varieties. The Potatoes here were all frosted on their appearance above-ground. Field varieties seem healthy but late, with warm weather they will make rapid progress. *C. Johnstone, Dalhouie Castle Gardens, Bonnyrigg.*

— It is too early to give a safe guess at what the Potato crops may be, but the earliest garden Potatoes are turning out well, and the field crops are looking exceedingly promising. Of course there is no disease yet. *M. Dunn, Dalkeith.*

SUTHERLAND.—Potatoes, particularly kidney varieties, come up very irregularly. Owing to the cold, wet spring, a good many sets rotted to the ground, otherwise they look promising since warm weather set in, but will be later than usual. *D. McVie.*

WIGTON.—The Potato crops are generally looking well in this district, but ten days later than average years. The breadth planted is less than in most former years, owing to the low prices of last year's crop. *A. Fowler, Castle Kennedy, Stranraer.*

ENGLAND.—NORTHERN COUNTIES.

CUMBERLAND.—Potatoes are looking well in the fields, and those that we have been taking up in the gardens are a fair crop, and of average quality, and free from disease. *J. Hammond, Braxton, Carlisle.*

WESTMORELAND.—Both early and late sorts look healthy, none being out of the ground when the frosts visited us; but both are later than usual. *W. A. Miller, Underley Gardens.*

DURHAM.—Potatoes look well, and free from blast or disease up to the present. Early crops were cut down on three different nights, and to all appearance the crop is damaged, the tops being of a weak nature, and the tubers small. Field crops, although late, are clean, and likely to turn out well. *J. Hunter, Lambton Castle.*

YORKSHIRE.—The early Potato crops will be very light, they were cut off so much with the frosts, which make them quite a fortnight later for the markets. The late field Potatoes look very well, and if fine dry weather should continue we shall have good crops again. *J. Skew, Nunappleton.*

— Potatoes look very well, and have made wonderful progress since we had the 1.92 inch of rain on June 24 and 25. Schoolmaster is a great favourite here; we are still using that sort, and find them most excellent. *T. Jones, Wetherby Hall.*

LANCASHIRE.—With the exception of a few plots of Magoum Bonums, Potatoes in this locality are looking well and growing rapidly. The above-named sort is a patchy and irregular crop, owing—as I believe—entirely to the sets having been planted without due preparation. *F. Harrison, Knowley Garden.*

— Potatoes are about two weeks later than usual, came up irregularly, but are now improving, and with a continuance of fine genial weather will, I fancy, turn out well. *A. Jamieson, Haigh Hall Garden, Wigan.*

— The Potato crops are looking extremely well. Early sorts were nipped by frost, are now looking in good order, but will be late. All crops in this locality are a fortnight later this year than last. *H. Lindsay, Huntrayde Gardens.*

MIDLAND COUNTIES.

STAFFORD.—Potatoes are turning out well, but early are quite a fortnight later than last year. Field crops are in fine time—there is every likelihood of a big turn-out. Sutton's Early Regent seems to me to be one of the most promising of the newer sorts. *J. Landon, The Quinta, Chrk.*

— It is rather early to say much about the Potato crop; they are looking wonderfully well in this district, I never saw them looking better. Having had a good supply in frames, I have only lifted a few outside, and they promise well. *J. Wallis, Keele Hall Gardens.*

SALOP.—We commenced lifting Veitch's Ashleaf Kidney here on June 15, which are very good both in quality and crop, and I think I may venture to say I never saw the Potato crop more promising, both in field and garden, than it does at the present time. *K. Milner, Sundorn Castle.*

NOTTS.—Potatoes are looking well, but are late. No disease to be seen amongst early ones in the gardens, those in the fields very strong and healthy, but on Saturday morning we had 2° of frost. At a small village 2 miles from here had Potatoes cut down. *A. Henderson, Alerton.*

BUCKS.—Very promising in every respect. Began digging Early Bird outdoors on south border on June 8. This Potato was sent out by the late Mr. Turner, and is a first-class early variety. None have been injured by frost. Later varieties are looking healthy and strong. Schoolmaster is one of our main crop varieties. No appearance of disease at present. *J. Smith, Mentmore.*

OXFORD.—Early Potatoes are a very light crop, but of good quality. With very cold nights and a light rainfall the growth has never been free. Late sorts look promising at present, but want rain very much. *J. Watson, Nuneham Park.*

HERTS.—I grow between twenty and thirty varieties, all growing remarkably well. The earliest now lifting are very clean, and of fine quality. At present this promise to be a good Potato year. *J. C. Muddell, Moor Park.*

EASTERN COUNTIES.

LINCOLN.—Potato crops look very promising, no disease as yet; first earliest are turning out fairly well, but not many are lifted yet. Earliest crops were cut down by 8° of frost on May 12, which they have never got over. *D. Lumsden, Blaxholm Hall.*

NORFOLK.—Potatoes at present looking remarkably well, though being cut back with the late frosts, but now no sign of the check. Not many at present have been lifted, but the early ones, though small, lifted by myself, are very good, showing no sign of any disease. *J. Forder, Hillington Hall, Kings Lynn.*

ESSEX.—Owing to the long drought we are having in this district, early Potatoes are small, but good in quality. Up to this time I have not heard of or seen any disease. The late crops look promising at this date, but are waiting rain. *J. Mill, Woodbridge.*

— Our first crop, Beauty of Hebron, was very good both in size and quality. We are now using the varieties of Ashleaf, which are not so large, but clean, and of good quality. Other sorts of the later kinds look favourable, and we have not seen any disease amongst them. *D. Donald, The Green, Leyton.*

SOUTHERN COUNTIES.

BERKS.—Potatoes crops are most promising; our early kinds are very good, late sorts strong and very vigorous. I found Potato disease on early kinds on June 24. The dry weather setting in will have an effect on its spreading. *J. Teag, Bearwood, Wokingham.*

MIDDLESEX.—The Potatoes look very well up to the present time, and the early ones turn out well. The later ones, I hope, will be as good. *W. Bates, Point Lodge, Twickenham.*

— Potatoes are looking very well indeed, and hundreds of acres of ground are covered with them in this locality; though planted earlier than usual, owing to the dry, open nature of the weather in March, yet the germination seemed to have been unusually retarded, and in many cases there are breaks in the rows, not so common where the sets were put in much later. Still growth now is robust, rapid, and healthy with all kinds, and they are legion. Plants are producing bloom early and abundantly, and its free appearance may be taken to indicate health and early tuberage. No doubt in consequence the season will be prolific in seed, and in future years of seedling kinds. The value of these, however, must be largely dependent upon the nature of the crosses made. Something marvellously good is now required to constitute a new first-class Potato. *A. D., Bedford.*

— Potatoes are very promising in appearance, but want rain very badly; unless we get a plentiful downfall at once there is every prospect of super-tuberage, should much rain occur later on. *T. Baines.*

KENT.—Promise well and are of fairly even appearance. Very early growths were cut back by late frosts. *Correspondent, Bedgebury.*

— The Potato crop is very promising at present, a good rain would still much improve it; the land is getting very dry, especially where there is free drainage. There is no sign of the blight, which makes its appearance later on as a rule. *A. Waterman, Preston Hall, Aylesford.*

SUSSEX.—Potatoes, up to this time, I have not seen looking better in any past season. They are in a splendid promising state. I have not seen any blight as yet. *S. Ford, Leonardlee.*

WILTS.—The Potato crop is very satisfactory in every way. Early varieties in this neighbourhood

are an excellent crop, of good quality, and perfectly free from disease. Late sorts with us are promising well—I think better than last year. *W. Phipps, Bowood.*

— Potato crops are looking remarkably well—rather late in this neighbourhood, owing to the cold weather in May, with continual frost at night. Should we be favoured with warm growing weather I am in hopes we shall have an abundant crop. *T. Beck, Crichel House, Wimborne.*

WESTERN COUNTIES.

HEREFORD.—At the present time early Potatoes are looking remarkably clean and healthy, with no sign of disease. Late Potatoes in the field are also looking well, and, with fine weather, we may expect a grand crop. *J. C., Dawnton Gardens.*

— A fine dry time for getting in the sets and tolerable freedom from frost have favoured a bold healthy growth of haulm. The ground being fairly covered, the fine rains we have lately had must tell in favour of full crops of good tubers. So far there is no sign of cut or the dreaded disease, and the plant being forward for the season, vigorous and healthy, the prospect is better than it has been for some years past. We grow only those which do well on our soil—Mona's Pride, Veitch's and Myatt's, as being our earliest; Lady Paget, a fine cropper and fairly free from disease. Tubers of last year, although a second early, are still sound. *W. Coleman, Eastnor Castle.*

— The Potato crops are well advanced and are very healthy and promising. A few of the early sorts have been dug and have turned out very satisfactorily. Given an immunity from disease, an abundant crop can be anticipated. *K. McKenzie, Alenmore Court.*

WORCESTER.—We are lifting Myatt's Ashleaf for use, of very good quality, but rather smaller than usual. Mid-season and late varieties look wonderfully clean and healthy; I never remember them looking so well, and should not the disease make its appearance the yield will, I imagine, be enormous. *W. Child, Croome Court.*

CORNWALL.—On the whole Potatoes are looking fairly well, early ones are of good quality, but the crop is not enormous. Second earlys are looking well, so also are the field crops. No disease has appeared yet, should that keep off another month, we hope to lift an average crop. *C. Lee, Bocomo.*

— Early Potatoes are a very good crop, late ones look very promising, but sorry to see disease in White Elephants and Champions, "imported seed." *Corinthian, Tehidy Park, Camborne.*

DEVON.—Potatoes are looking remarkably well at present. We have been taking up Myatt's Ashleaf and Beauty of Hebron for the past fortnight; very good crops of each. Disease has not appeared very much for these two years past. It is rather too early to expect its appearance yet. *D. C. Powell, Powderham Castle Gardens, Kenton.*

WALES.

PEMBROKESHIRE.—The early crops turned out fairly good, and were a little later than usual. The second earlys are very good, and the late crops look remarkably well. The disease appeared in this district on the 15th. Some early Ashleafs were observed on that day, on a dry, warm south border, to be badly affected. Previous to its appearance we had had a few days of hot, muggy weather. The disease had never been observed in the border before. Wood ashes have been used as manure, and the seeds were healthy, so under the above conditions the early outbreak is rather unaccountable, unless it be the weather. *G. Griffin, Slebach Park.*

GLAMORGAN.—We have been digging early kidneys in the open since the latter part of May, and they are very abundant, of fair size, and very good quality. We had no late spring frosts to injure them, but owing to the weather being very backward in the fore part of May general crops are later than usual. There is no indication of disease, and the crops in the whole district promise well. *J. Muir, Margam Park.*

CHANNEL ISLANDS.

JERSEY.—The early Potato crop has been a comparative failure here this season owing to the cold weather in May; when the growth was stayed over a period of three weeks; many pieces of ground have not produced more than double the quantity planted for seed. The second early and later crops have a better appearance, and are producing a fair crop as

they are being taken up; and should fair weather continue, the late crops will help to counterbalance the growers' losses in their early crops. *C. B. Saunders, St. Saviour's.*

IRELAND.

FERMANAGH.—Potatoes are looking fairly well. Rain is very much needed at present. With a favourable season will be plentiful. *W. Magee, Gardens, Florence Court, Enniskillen.*

Numerous other reports from Ireland are of a similar character.

COCA.

ACCORDING to a report quoted in the *Pharmaceutical Journal*, Coca (Erythroxylco Coca), the leaves of which are used as a stimulant, and also for their anæsthetic effects on mucous membranes, is produced along the whole length of the Andes, from Ecuador to the Argentine Republic, forming a valuable source of revenue.

The general method of cultivation seems to be common to Peru and Bolivia. The best Coca is said to be produced on hill sides which are from 3000 to 6000 feet above the sea-level, and it is grown upon terraces of various widths on the sides of deep narrow valleys called "yungas." The seed is sown during August in beds, or boxes filled with earth, and by the following June, when the plants are 8 or 10 inches high, they are transplanted on the terraces about 3 feet apart, in a soil kept free from shade and from any other growths. By November the first or lower leaves are of the deep olive-green colour, which marks maturity. A rich soil is needed, but fertilisers are not used, and, however good the soil, it is said to be rather rapidly exhausted by the plants, so that a succession of fresh plantings is kept up. The shrub grows to the height of from 2 to 6 feet, but the largest plants do not yield the best leaves. Each bush yields, as a rule, three crops a year, or in exceptional localities four crops. The first is called the March crop, the gathering commencing in January. The second is the St. John crop, beginning in May, and the third is All Saints, collected in October, and then the shrub is completely stripped of leaves. Most seasons produce the most delicate leaves of finest quality, and droughts are very destructive to the crops; but as droughts in these mountains do not extend over very large districts, the total crop is not often seriously varied from this cause.

The crops are gathered leaf by leaf, chiefly by Indian women and children, who stoop in front of each bush, and collect only the leaves which are mature in their aprons. Minister Gibbs' authority tells him that the women are careful not to touch the top of the bush, for, if this is touched by man or animal, "it withers and dries up." Men visit the women from time to time, and take the gathered leaves in large sacks to an enclosed yard, which is paved with smooth flat stones or slates, laid with very close joints and kept very clean. These pavements are so situated as to get the full force of the sunshine, and the first gathering of leaves is not brought to them until they are very hot from the sun's rays. The leaves are then spread thinly over the hot pavements, and being loosely raked and turned from time to time, are dry in from three to four hours in favourable weather. Sometimes, however, they have to be left overnight, and are then liable to be damaged by dew. No gathering is done in very cloudy or damp weather, and damage only occurs from changes during the day after the collection has begun.

When dry, the leaves are packed at once by means of a rude wooden press in square bales of coarse cloth, of a cista, or about 25 lb., each. Two of such bales are put together, under another envelope, generally made from the bark of the Banana tree, and such a package, of about 50 lb., is called a tambor, or drum, and measures about 11 x 15 x 17 inches. When these parcels have to be sent across the coast range of mountains for exportation three are put together in a tarpaulin-covered package of 150 lb., and two of such packages make a load for a mule, or other pack animal, for this transportation of several hundred miles through mountain passes.

Coca is very easily damaged by the combined effect of heat and moisture, and is therefore always stored in cool, dry warehouses, and rarely handled or transported in damp weather, or during the rainy season. This rainy season is from January to April, and there-

fore that stored on the west side of the coast range is alone available for export during the rainy season. When exported it is said that it usually starts in very good condition, and will reach its destination in the same condition if carried in a cool dry place. The only absolute security for it in transit is therefore to have it soldered up in tin or zinc.

SUMBUL.

MR. WARE has been good enough to send us a flowering shoot of *Perula Sumbul*, an umbelliferous plant growing to a height of 10 feet, with very large deltoid thrice pinnately cut leaves. The flowers are small, polygamous, yellowish in colour, borne in compound umbels destitute of involucre and of involucre. The fruits are sub-globose and smooth. Like all the taller Umbellifers this is a handsome decorative plant, but its chief interest consists in the abundance of milky juice it contains and the powerful aromatic bitter and musky principle by which it is pervaded. A plant with so potent juices would naturally be expected to possess medicinal virtues. Accordingly we find that it has been recommended in cholera, and with better reason as a stimulant and antispasmodic like its near allies *Asafoetida* and *Galbanum*. Theodour of the present plant, however, though powerfully musky, is far more agreeable than that of the plants just named. The Sumbul was jealously protected for a time by the natives of Turkestan, who were very unwilling that the Russians should gain information concerning it. Dr. Lansdell, in his recent work on Russian Central Asia, mentions that M. Boshthoff was authorised to promise twenty half-imperials for a

FIG. 26.—PERULA SUMBUL.

specimen, but the reward was for some time unclaimed. By close questioning, however, he ascertained that it grows in mountain valleys watered by overflowing rivers, such as the upper courses of the Chir-chik and Syrdaria. Fedchenko obtained a portion of the plant and planted it in the Botanic Garden at Moscow, where it blossomed, thus rendering possible a detailed investigation of the plant, and rejoicing the heart of the explorer, who said that if the Bek of Maghian (the potentate who had tried to prevent the Russians from discovering the whereabouts of the plant) "chose to go to Moscow, he might see there in perfection the plant he had tried to keep so exclusively in his own mountains." Dr. Lansdell speaks of the plant as producing a bulb, but that of course is a technical error. It was found by Fedchenko near Maghian in the mountains south-east of Samarkand, at a height of 3000—4000 feet. It has been described by Kauffmann in the *Nouveaux Mémoires* of the Imperial Society of Natural Sciences at Moscow (1871), t. 24, 25; by Sir Joseph Hooker in the *Botanical Magazine*, t. 6196, and by others. The history of the plant from a pharmaceutical point of view is given in Flüchiger and Hanbury's *Pharmacographia* (1874), p. 279. The large size of the "witte" or cauls containing the milky juice in the seed-vessels, is very remarkable.

SCARBOROUGH FLORAL AND HORTICULTURAL SHOW.—The forthcoming meeting of this Society will be held in the grounds attached to St. Nicholas House, Scarborough, on August 5 and 6. The funds are not in a prosperous condition, so that the results of a good attendance would be greatly appreciated.

METROPOLITAN PARKS AND OPEN SPACES.

THE parks, commons and open spaces now under the control of the Metropolitan Board of Works are, according to the annual report for 1884, as follows:—

	Acres.
Finsbury Park	115
Southwark Park	63
Gardens on the Victoria, Albert, and Chelsea Embankments, and in Leicester Square	24
Blackheath	267
Hampstead Heath	240
Shepherd's Bush Common	8
London Fields	27
Hackney Downs	50
Well Street Common	30
North Mill Field	29
South Mill Field	28
Clayton Common	25
Stoke Newington Common	874
Waste Land at Dalston Lane, &c.	1
Tooting-Beck Common	144
Tooting-Gravensay Common	63
Clapham Common	220
Eastall Heath	55
Plumstead Common	110
Shedder of Matton Green	4
Wormwood Scrubs	194
Eel Brook Common	12
Parson's Green	2
Brook Green	6
Peckham Rye	64
Goose Green	654
Nunhead Green	154
Streatham Common	66
Total	1835½

FINSBURY PARK.

This park, which is on the northern outskirts of the metropolis, in the parish of Hornsey, and which derives its name from the circumstance that it was intended mainly for the benefit of the inhabitants of the parliamentary division of Finsbury, was opened to the public in August, 1869. It has year by year been growing in attractiveness and popular favour, and the Board has neglected nothing which could contribute to make it a place of healthful recreation and intelligent enjoyment for all classes. Its value for these purposes continually increases, for, whereas, when it was first laid out, there was open ground on every side of it, the town has of late years so extended that the park is now nearly surrounded with streets and houses.

The Board has for about three years past allowed music in the park on Sundays during the summer months, and as the performances appear to give satisfaction to the public, and there has been no complaint of misconduct or disturbance of any kind, there has been no reason for altering the arrangement. Last summer the Board also allowed music to be played in the park on one other evening in each week. A stand has been erected for the musicians, and the space around it tar-paved.

SOUTHWARK PARK.

This park, which when originally planned and laid out was to a great extent surrounded by open ground used for market gardening, is now in the midst of a large population, and is a much valued place of resort. The same care is bestowed upon it as upon Finsbury Park, although, owing to less favourable conditions and surroundings, it may not present quite so attractive an appearance. One feature which has hitherto been wanting, that is, a sheet of ornamental water, is about to be supplied, the Board having given directions for the formation of a lake at a cost of about £2500. (See p. 113.)

THAMES EMBANKMENT GARDENS.

These are plots of ornamental ground of various size, situated at intervals adjacent to the public thoroughfares along the Victoria, Albert, and Chelsea Embankments. They are kept up with great care, are abundantly supplied with flowers and plants at the proper seasons, and most agreeably diversify the urban surroundings.

Some open ground adjoining the northern abutment of the Chelsea Suspension Bridge has this year been ornamentally laid out, planted, and enclosed with wrought-iron railings, at a cost of about £1400.

HACKNEY COMMONS.

As has been stated in previous reports, the Board has been much impeded in its efforts to keep these commons in good condition by the existence of various rights, the assertion of which prevented the Board from exercising complete control over the

commons. It has accordingly been necessary to obtain special statutory powers to purchase and extinguish these rights.

The plots of waste ground in Dalston Lane and Lauriston Road (formerly Grove Street), which were placed under the Board's control by the Act confirming the scheme relating to the Hackney Commons, have been ornamentally laid out and enclosed at a cost of about £400, and handed over to the Hackney District Board of Works, which has accepted the charge of them.

With a view to avoiding any future question with respect to public meetings on the commons and open spaces under the Board's control, the Board has recently decided that upon a certain defined part of every common large enough for the purpose, orderly public meetings may be held without the necessity of applying for the consent of the Board.

GLASNEVIN.

THE following extracts are taken from the report of Mr. F. Moore, Curator of the Royal Botanic Garden, Glasnevin, Dublin, for the year 1884:—

NUMBER OF VISITORS.

It is very satisfactory considering the condition much of the garden was in, owing to new works and changes in progress during 1884, to be able to report a small increase in the number of visitors.

1884.		
Total number of visitors	356,914
Sunday visitors	256,074
Weekday visitors	78,559
Highest monthly attendance, June	56,056
.. weekly	.. week ending June 7	57,249
.. Sunday	.. June 15	9,000
.. weekday	.. June 2, Whit Monday	7,649

CONSERVATORIES.

In the indoor department the past has been a year of much anxiety and extra work, owing to the large number of plants that had to be moved about to make room for workmen. All the conservatories have been numbered as follows:—No. 1, Tree Fern-house; 2, house for aquatic plants; 3, cool end, 4, central compartment, 5, stove end, curvilinear range; 6, Orchard-house; 7, large Palm-house; 8, Camellia-house.

Having been informed that the new Palm-house would be commenced early in spring, I lost no time in removing the rockwork in order to leave space for the excavation of the foundations, &c., and had a new rocky erected in a picturesque situation with the excavated material, as well as extra stones and materials supplied by the Board of Works, and collected from various places in the garden.

Messrs. Boyd (the contractors for the work) commenced operations on March 19, and the house was sufficiently completed for the reception of the plants by October 1.

The house is a handsome structure, 100 feet long by 80 broad; it is heated by ten rows of hot-water pipes round the sides, and four round the central portion; there is also a hot-water pipe round the springing of the upper roof, which is of the highest importance, as it prevents condensation.

Light iron galleries run round both on the inside and outside of the house. The shelves are constructed of slate with iron uprights. The principal portion of the house is of iron; the lower upright sashes are, however, of teak wood.

I am happy to say that, notwithstanding the delicate nature of the plants, they have by various expedients been practically saved from injury. About thirty large specimens, weighing from 1 to 5 tons, were successfully removed to the new house from the other houses, and about twenty-six, including all the largest plants in the garden, were retubed.

LIBRARY AND HERBARIUM.

This department is now in a fairly satisfactory condition, but more space is required. The front room was taken from the ladies' waiting-rooms, and a new entrance to the latter was made in a less conspicuous position. The Board of Works partially furnished this room, and enough herbarium cases were purchased to hold the present collections, which were then removed from the unsuitable presses in which they had been stored away. By this means space was also found for many books which had been stored away unbound, and the library was rearranged.

Dr. McNab re-arranged the collection of dried

plants in the new cases, and they are now easily available for reference purposes. He also had all these specimens remounted. Some modern works are urgently required for the library, and also some good bookcases; however, these cannot be purchased out of the ordinary funds of the gardens.

OUTDOOR DEPARTMENT.

Owing to the erection of the new Palm-house much additional work was created, and therefore several contemplated changes were abandoned.

By the end of May the new rockwork before alluded to was completed. In planting it, only the choicest plants from the old rockwork being used; these, with about 2000 plants from the alpine yard, and the British Ferns which were removed from an unsuitable position and planted on its north side, leave but few vacancies to be filled up.

PURCHASE OF PLANTS.

The amount expended on purchase of plants and seeds was £200 3s. 10d., considerably less than last year's expenditure under this head, the reason being that several exceptional items caused by the new works in the gardens had to be provided for out of this year's vote for incidentals.

1884.—Number of plants purchased, 556.

Indoor Ferns, Orchids, &c.	£157 11 8
Seeds, bulbs, bedding plants, &c.	31 15 9
Hardy plants, trees and shrubs	10 16 5
Total	£200 3 10

EXCHANGE OF PLANTS AND SEEDS.

Some exchanges having been made in the hardy plant arrangements at the Glasgow Botanic Garden the Curator applied for some plants from Glasnevin. He sent his foreman here in March, and he packed and forwarded to Glasgow over 1200 plants.

Owing to this the number of plants given from Glasnevin this year is exceptionally large. A valuable donation of plants was received from the Director of Kew Gardens, and many of the leading English plant merchants were exceedingly generous in giving contributions of plants to the various collections. Messrs. Veitch, Backhouse, and Low gave specially valuable donations of indoor plants, and Mr. Bull reduced to one half the catalogue price the prices of many rare plants which would otherwise have been too expensive to purchase. Messrs. Ware and Barr & Son gave many valuable hardy plants. Herr Max Leichlin gave many rare plants and seeds, as did the directors of the following botanical gardens:—Kew, Edinburgh, Cambridge, St. Petersburg, and Leiden.

The number of donations was 149, from 102 donors, residing in the following countries:—Ireland, 39; England, 29; Scotland, 6; Germany, 11; Italy, 3; Holland, 3; India, 2; America, 2; Australia, 2; Switzerland, 1; Denmark, 1; Spain, 1; Ceylon, 1; Russia, 1.

1884.—Number of donations, 149; number of donors, 120. Plants received, 1129; plants distributed, 2666. Seeds received, 1925 packets; seeds distributed, 1467 packets.

FRUIT NOTES.

CLAPP'S FAVOURITE PEAR.—In reference to Mr. Coomber's remarks on p. 19, while I fully endorse the good opinion he entertains of Clapp's Favourite Pear, it has not, as far as I know, been shown from here. It has not suited several times, and is very handsome, in the style of the old Windsor, and it comes in between Beurré Giffard and Jargonelle, and as it is also a first-rate grower we consider it one of the best. The Pear Mr. Coomber refers to was probably Triomphe de Vienne, which we have grown very large, and it is a most delicious variety, but owing to the date of the Kensington meetings being a month apart in September, it was not in condition. It is a most beautiful grower, and the fruit is very large and handsome, and the tree is fertile, while the quality leaves nothing to be desired. It is season here is after Beurré d'Amanlis, and before Doyenné Boussoch and Madame Freyre. When it first bore fruit we considered it the best Pear of that season, which was a cold one. Our fruit was from a pyramid tree, upon a cordon or wall. It would probably weigh over a pound. *George Emyard, Nurseries, Maidstone.*

I have no experience of Clapp's Favourite Pear under pot culture. Our-of-doors, on the Quince, it was a strong grower, but a very

meagre bearer. It is a nice quality fruit, but is not nearly so tasteful as the Bon Chrétien. It ripens almost simultaneously with Williams', and keeps in condition about as long. Of early Pears Beurré d'Assomption, and Souvenir du Congrès, except in warm situations, too frequently crack, and the latter is not a good flavoured Pear. Among the most prolific of the early sorts are Jargonelle, double worked on the Quince, and Beurré d'Amanlis, Madame Freyre, and André Desportes. One of the nicest Pears grown, but which must be eaten at the nick of time—for in a day or so after yellowing it is mealy and decayed as to the core—is Nouveau Poiteau. It is a mid-season variety, large, and very prolific as an espalier or west wall tree. *C. A. M. C.*

APPLE GLOSSY REINETTE.

There is not anything known with certainty regarding the origin of this Apple, which is otherwise called Bordsdorfer Reinette, except that it comes from the Austrian Tyrol. The form is regular, smooth, globular, and sometimes pyramidal, the greatest diameter being about the middle, or towards the eye. It is of middling size. The eye is half-open, or closed; the eye (sepals) long, pointed, and slender; the stalk of medium length, lignaceous, thin, woolly, lying in a deep russet cavity. The rind is fine, smooth, but slightly yielding, very shining, straw-yellow on the sunny side, marked sometimes with faint carmine. Flesh white, fine in grain, rather firm, juicy, and with a pleasant flavour. The core-axis is hollow, sometimes open; seed well developed, long, egg-shaped, and dark brown. The fruit is ripe in November, and continues good till spring without shrivelling. The fruit is to be recommended for culinary uses. The tree is to a moderate grower, but obtains to a large size, and is easily distinguished by its long, slender fruiting shoots. *Garten u. Blumen Zeitung.*

ALFA IN ALGERIA.

THE following is an abstract of an interesting account of the growth of Alfa (*Macrochloa tenacissima*) in Algeria. The plant is described as being found in calcareous soil or siliceous clay, but not in compact clay or pure sand, unless at a short depth below them siliceous clay is found, or soil impregnated with sea salt. The thin, circular and shallow roots of the plant require air and a little moisture; thus the Alfa is never found in the white sand near the *chotts*, nor in the depressions of compact soil scattered about the high plateau.

The tuft of Alfa presents at its base the appearance of a central axis, around which, at a short distance, proceed horizontal ramifications; these then spring up vertically, and produce bunches of flowers, sheathed in narrow falling leaves, measuring about 2½ feet at maturity. After the first year's growth each ramification sends out from its base a shoot which descends into the ground, producing a small root; then other ramifications are produced at the base of previous ones, and become rooted in their turn. The tuft thus increases from the centre to the circumference, each addition being united to the central mass, but forming gradually its own roots, so as to be able to live when the central part dies and disappears. It is only in the third year from the sprouting of the ramification that the flower seems to be developed.

If the plant is allowed to grow unchecked its flowers and leaves vegetate during the spring, they ripen in summer, and they commence to decompose from the point downwards under the action of the autumnal rains, fading progressively during the winter. In proportion as the sap of spring develops new leaves those of the previous year fall over inert and partly dried up without becoming detached from the stem, on which they continue to decompose during the following years. After several years the dead leaves form a thick central mass impenetrable to the shoots at their base; all around the new leaves pierce this plume-like form, and the little roots continue to develop outside the circle. If the tuft is burnt such of the central shoots as have been preserved from the action of the fire, being no longer smothered by dead leaves, speedily produce new ones.

Alfa grows abundantly in Algeria, and a large population, both of Spaniards and Arabs, is engaged in collecting it. The workman generally twists round his hand, or round a small stick, the upper part

the leaves, which he tears out by a sudden jerk and puts under his left arm; this he continues to do till he has made a small sheaf, which he ties up. A number of these small sheaves are made into a larger one, and these are placed upright to dry.

To preserve this plant as much as possible an ordinance of the Governor-General was published on March 13, 1883, prohibiting the collection of it during a close period of about four months every year, varying according to the climatic conditions of the district where it occurs. The best part of this *Alfa* is exported to Spain, where it is mixed with the *Esparto-grass* of that country; the ordinary quality is almost all sent to England, for the manufacture of paper. Of late the exportation has greatly diminished, owing partly to the competition in Spain, Morocco, and Tunis, but partly to its excessive price and the introduction of wood-pulp in the paper trade.

The extent over which *Alfa* is found in Algeria is about 1,797,952 hectares, and it is calculated that upwards of 8,000,000 quintals were collected during the year 1883. *R. J.*

PLANT-GROWING AT BRIDGEN PLACE.

This place, the residence of Mrs. Arbutnot, is nicely situated on elevated ground overlooking one of those pretty slopes of which much of the fertile county of Kent is composed. It lies southwards from, and about a mile distant from Bexley Heath—one amongst the ever-increasing number of growing suburbs that keep stretching out from London in every direction. Gardening is successfully carried out here in each department, plants especially being well managed. A pretty conservatory attached to the mansion has the roof completely clothed with *Tacsonias*, the shoots of which are allowed a good deal of freedom, so as to form a graceful hanging canopy over the whole. An arrangement of this kind has a charming effect, but as a natural consequence most of the plants required to keep up a display of flowers except shade loving things like *Camellias*, have to be grown elsewhere, on account of the limited amount of light which the roof climbers admit to the body of the structure. Throughout the various other houses devoted to fruit and other things soft and hardwooded plants nicely grown, in considerable quantities were coming on to keep up a succession. *Achimenes*, so useful for summer display, were well in bloom, the plants stout, short in the stems, and not too much crowded in the pots, as one often sees them, and through which their flowering is of shorter duration than where they are allowed enough room. Of tuberous *Begonias* there were a number in fine flower. Represented as this continuous blooming and useful class of plants now is by all but endless variety in forms and colours, they commend themselves to all who have to keep up a display of blooms. *Lilium auratum* in various stages was coming on, some in flower, with others to follow. This species, and others of the now numerous family of *Lilies*, have the merit of not only producing beautiful flowers of the most varied character both in form and colour, but beyond this there is the advantage attending their cultivation, that even with a large stock they require comparatively little room under glass for much of the growing season, and they can be kept in winter in places where many things of less decorative value would not succeed.

In a span-roofed house filled with stock of various kinds were some *Tuberous* just about opening their flowers. These favourite plants are as desirable for cutting, as they are for general decorative use. Where used in association with dwarf, more compact-growing things, their tall, erect stems go to relieve the often otherwise too even surface. A roomy span-roofed stove contained, along with a general assortment of flowering and fine-leaved plants, a number of large and well-managed specimens, trained in the usual way, beautifully in flower. These Mr. Mitchell, the gardener, here grows well; they included *Allamanda lloendersoni*, of which there were several examples bearing larger flowers than usual, and the yellow colour deeper than it is often seen; *A. grandiflora*, equally well flowered. This distinct-looking species is not easily matched when, as here, in good condition. *Dipladenia protusa* was full of flower. This is one of the hybrid varieties in the way of *D. amabilis*; it is a free bloomer and equally free grower. A large and well-managed plant of

Anthurium Scherzerianum bore from thirty to forty flowers. Of *Ixoras*, including the fine old *I. coccinea*, there were several varieties coming into bloom. Amongst ornamental foliaged plants were a large, densely-clothed specimen of *Croton Queen Victoria*, the leaves beautifully coloured; *C. Johannis*, one of the best of the narrow-leaved section, a nice companion plant to the first-named; a large example of *Pandanus Viticili*, *Arca Bueri*, conspicuous for its fine arched leaves; and a healthy thriving example of *Cycas revoluta*. Of *Ferns* there is a nice assortment, well grown. They comprise several of the best kinds of *Adiantum* and others that can be confined within moderate space, and which it must be confessed are more generally useful than the large tree species, which, noble in appearance as they are, require much space to accommodate them. In another house, amongst a variety of plants, was one of the best grown examples of *Asparagus plumosus* I have met with. It was trained bush fashion round a few sticks.

A moderate sized house is occupied by a nice little collection of *Orchids*, which collectively are doing well, having that strong robust appearance in their leaves and bulbs that denotes their liking the treatment they get. Several examples of *Dendrobium Wardianum* have produced bulbs 4 feet long and unusually thick; *D. crassinode*, comparatively little inferior; as also *D. thyrsiflorum* and *D. densiflorum*. Several plants of *Vanda tricolor* and *V. suavis*, with stems 4 feet high furnished with leaves down to the bottom. Some of these were in flower. *Phalaenopsis grandiflora*, and *P. Schilleriana* were growing freely. In *Aerides* there are a number of examples of *A. crispum* in excellent condition, with every leaf perfect down to the surface of the pots; a large specimen, in beautiful condition, of *A. odoratum* was carrying some twenty spikes of bloom. *Cattleyas* and *Laelias* thrive equally well in company with the warm species named *Loelia purpurata*, *L. crispata*, *Cattleya Trianae*, *C. Mendelii*, *C. speciosissima*, *C. Mossiae*, and others, several of which were in flower, are growing in a way that leaves nothing to be desired, as also numerous representatives of other genera including *Cypripedium villosum* and *C. Stonei*, very strong.

A large number of *Chrysanthemums* were coming on, which from their vigorous appearance promise to do good service in the conservatory when their time of flowering comes round.

Of fruit, the first crop of *Grapes* was about over; second house, mostly consisting of *Black Hamburgh*, bearing a heavy crop of medium-sized bunches, was just in, with others later to follow. In two *Peach*-houses, filled with good trees in free bearing condition, there were heavy crops of fine fruit. *Outside*, *Apples* and *Pears* were about an average. Mr. Mitchell speaks highly of the new *Raspberry*, *Baumforth's Seedling*: the fruit is good in quality, it comes in early, and is a profuse bearer. *T. E.*

HOME CORRESPONDENCE.

Large Vegetables.—There are some who delight to "run down" certain flowers and vegetables because of their large size. A short time since I noticed in your columns that some one was running down *Stot's Monarch Rhubarb*, not because of any deficiency in its quality or productiveness—for on both these points it is unassailable—but because of the immense size of its stalks and their greenish colour. Now, I think the following is incontestable, certainly as regards *Rhubarb*, if it does not hold good with all other vegetables; viz., that where quality is satisfactory, large size can be no drawback, rather indeed the reverse, and colour should be no drawback. It is said with regard to horses, that a good horse cannot be a bad colour; in other words, if a horse is good, peculiarities of colour in no way detract from his real value. The same writer who ran down the *Rhubarb* a week or two later while praising *Champion Scarlet Runners* because of their superiority in size over the old kinds, had no good word to say for *Laxton's Girford Giant Scarlet Runners*, because this kind produces pods very much surpassing in size the *Champion*. Now, if the *Champion* is the better for being bigger, why are not the *Girford Giants* the best for being the biggest? Something further was also said about the *Girford Giants*, however, and this was, that they do not set their fruit freely, many

of their blossoms producing no fruit. If this should be confirmed by further experience of this new kind it is, of course, a serious defect. Quite possibly, however, the best method of growing this kind has not yet been found. If, on further trial, it is found that, with suitable treatment, it is capable of setting as many pods as the old common kind, and these pods are on an average from two to three times as large as the old kind, and of equal quality, the correct inference to draw will be that this sort is two to three times as good as the old kind, less any extra expense of cultivation that it may be necessary to incur, to bring about the best results. Let it be taken as a general rule that plants (as well as other things) with a great predominance of good qualities over bad, are good, and likewise that other plants, equal in all other respects to these, but larger in size, are better. In a *Rose*, for instance, size of bloom, combined with fragrance, good form, fine shape, substance of petal, and hardness of constitution, is a merit; and a *Rose* with similar good qualities, but with even larger-sized blooms, is even more meritorious. There may, of course, be exceptions to this rule, but that it is a rule few persons with a reputation for common sense will be disposed to deny. Let us by all means in our power endeavour to improve all good "strains" of flowers, fruits, vegetables, &c., in all their good points, by no means neglecting size. *J. E. E., Hants.*

Pelargonium Growing at Foxhill, Westwood, Leeds.—There used to be a commendable sort of pride which gardeners took in excelling in the cultivation of plants that required much skill and attention to grow them up to the best condition, and which there is reason for supposing is not now so prevalent as it once was. Amongst the plants that were looked on as a test of the cultivator's ability were the large flowered and the fancy kinds of *Pelargoniums*. At the time when the *Chiswick* and the *Regent's Park* shows came into existence considerable progress had been made in the raising of new varieties of the show and fancy kinds of these plants. Several growers who took an interest in this sort of work set about in earnest to make still further advance upon what had already been done. *Pelargoniums* then became one of the leading features of the London exhibitions. Exhibitors were encouraged by the offer of liberal prizes to aim at a higher standard of cultivation than had up to the time prevailed. With these, as with most other things subject to pot cultivation, the old course of culture had often than otherwise done little more than keep the plants alive in a neglected, miserable-looking state, consisting, as they usually did, of a few tall, straggling shoots, the result of their being crowded together as close almost as the pots would stand in dark, unsuitable houses, their condition still further affected by being kept much too far from the glass. A study of the habits and requirements of the various kinds of plants taken in hand with close attention to their wants soon resulted in the production of specimens that attained a size and vigour, combined with a disposition to flower profusely, such as had not before been looked on as possible, equalling, or in many cases exceeding that which the plants attained in their native countries. The increased vigour of growth and extraordinary development in the size of the flowers with their matchless combination of colours made these hybrid *Pelargoniums* favourites with plant growers and with the public, the outcome of which was the all but unequalled banks of soft and brilliant colours which an assemblage of these plants when well managed present. *Gaines*, *Parker*, *Staines*, *Cock*, *Foster*, *Nye*, *Fraser*, *Dobson*, *Wiggins*, *James*, and *Ward* were the chief growers, the last named when gardener to Mr. *Wilkins* of *Leyton*, for some years exhibited plants which for size and excellence of cultivation were quite equal to the magnificent examples shown by Messrs. *Turner* and *Bailey*, when at their best. The cultivation of *Pelargoniums* in the way that they used annually to be brought to the London exhibitions by the growers named, appears to have moved northwards, especially to *Lancashire* and *Yorkshire*; in the former county, *Kylance*, of *Ormskirck*, near *Liverpool*, for a long series of years has shown quantities of large, finely grown plants. In *Yorkshire*, *May*, of *Bedale*, *Edwards*, *Steward*, and *Lazenby*, of *York*, and last, but not least, Mr. *Eastwood*, gardener to the late *F. W. Tetly*, Esq., at *Westwood*, still at the same place with *Mrs. Tetley*, took up the cultivation of these splendid flowering

plants which have gradually been on the wane in the metropolitan district until those now forthcoming do little more than serve as reminders of times past to old frequenters of the London shows who still attend these gatherings. The effect produced in the tents devoted to Pelargoniums at the York and the Leeds shows is well known by those who have been in the habit of attending the exhibitions at these places. The immense number of these plants that are yearly brought into competition at the above-named shows differ in no way from those that used to be present at the metropolitan displays, except that the specimens are not usually quite so large as the largest that used to be shown in London. Mr. Eastwood's exhibiting has been confined to the York and Leeds shows; during the twenty-five years he has competed he has held the prominent position of leading prize-taker, frequently scoring 1st in nearly the whole of the numerous classes devoted to Pelargoniums, both open and those confined to amateurs, and this, moreover, with the competition of the keenest description. During the last twenty years he has taken 130 1st, seventy 2d, and thirty 3d prizes for Pelargoniums. With pot Roses Mr. Eastwood has also been very successful, having won with them fifty 1st, thirty 2d, and twenty-five 3d prizes. It often happens that those who see the various plants shown by the leading exhibitors of the present day, and still more so of the past, but who have no further acquaintance with them, are under the impression that those who grow them have every convenience in the shape of houses especially constructed for their cultivation, than which frequently nothing could be further from the fact. The Westwood Pelargoniums and Roses are a case in point. There is not a single house on the place devoted to plants. The whole of the Roses and the large collection of Pelargoniums are grown in vinerias and Peach-houses, of which there are six of the former and four of the latter. They are all span-roofed structures, not very wide, with steep pitched roofs. For the greater part of the year the Pelargoniums occupy a wide shelf under the ridge immediately over the central path that runs the entire length of the houses. It is sometimes supposed that if gardeners are allowed to exhibit the plants or whatever they show will absorb attention to an extent that will cause other things to be neglected. Where the gardener is made of the right material there is no danger of this occurring, as he will naturally exert himself to the utmost, and in a way that would not be likely to occur were he not allowed the privilege of showing. The garden at Fox Hill collectively, both inside and out, gives evidence of this view being correct; everything in addition to the exhibition plants being well managed, with an air of order and cleanliness about the place that shows there are no shortcomings. *T. B.*

Lilium Kramerii.—When this beautiful Japanese Lily was first introduced and for some time afterwards, it was single flowered. I ventured to predict that it would grow into having several flowers. We have bloomed it with five flowers to the stem, and I lately saw at my friend, Mr. McIntosh's, at Oatlands, a magnificent specimen growing in a Rhododendron bed. It was more than 6 feet high, and had eight fine flowers. I fancy this Lily does not like cold situations. A friend, a first-rate grower of many Lilies, tells me it will not thrive in his cold garden. With us at Oakwood, it grows well in several soils and situations, but I think it prefers shade and shelter. *L. californicum*, which grows in an orchard-house, was for many years a single-flowered Lily, is now blooming in the wood garden with as many flowers as the ordinary *L. pardalinum*. *George F. Wilson.*

Passion-flowers.—Noticing Dr. Masters' remarks on the infertility of Passion-flowers with their own pollen in a recent number, I am able to state, on the contrary, that hundreds of plants have been raised by Messrs. Lacombe, Pince & Co.'s propagator recently from seeds saved from a plant which covers the side of an old cottage in their neighbourhood. There is no other plant to my knowledge in the locality, and this one I planted, when quite small, some seven or eight years ago, but it has grown wonderfully, and was blooming finely when I passed that way a short time since. *W. Napper, Alphington Cross.* [This is a very interesting exception to the rule laid down by Darwin and others. Are the flowers fertilised by their own pollen, or by that of some other flower on the same plant? Ed.]

Tomato Ne Plus Ultra.—I was recommended to try this kind by Mr. Garnett, of Bystock Gardens, Exmouth. I did so, and found it to merit all the good qualities attributed to it. It is rather a strong grower, yet short jointed, and of a free-bearing habit. The fruit, which hangs in long clusters, is large and smooth, and of the best flavour. *T. G., Cavendish Gardens, S.W., July 20.*

How to Preserve Rose Blooms.—Your correspondent, W. Comfort, (p. 91) will be able to make a very good *pot pourri* if he will proceed according to the directions given below, and the scent will last for three or four years. Mix $\frac{3}{4}$ lb. of common salt, a $\frac{1}{4}$ lb. of saltpetre, $\frac{1}{2}$ oz. of storax, six cloves, a handful of well dried heads of Lavender flowers and a handful of dried Bay leaves. Then add a considerable quantity of Rose leaves which have been gathered on a dry day, and partially dried on newspapers in the sun. Stir all up well occasionally, and add, if you like, the petals of other fragrant flowers. Some put a few Sandal-wood chips and Cinnamon, others like Orris root and Musk, but I think the last spoils all the rest. *Helen Winton, Wimbledon.*

Diseased Chrysanthemums.—The pieces of Chrysanthemum which I send you are infested with some disease, and I should be greatly obliged if, in the pages of the *Gardeners' Chronicle*, you could tell me what disease it is. I have lost two dozen plants by this disease, some of them being attacked close to the ground, and others about 2 feet above it. Small, black, globular bodies roll out of the stems as you will see, some of them being found in the centre of the stems, whilst others appear just under the bark. It is a disease which I have never seen before in Chrysanthemums. *E. E. Perry.* [The examples of diseased Chrysanthemums sent by "E. E. P." are identified with the diseased Potato stems described by me in the *Gardeners' Chronicle* for August 20, 1880. Readers interested in the subject can refer to that article. The Chrysanthemum stems sent are reduced to a state of tinder. On cutting, or pulling them in two longitudinally, they are found to be infested with fungus spawn, or mycelium mixed with dust, the remains of the perished pith. In the centre of each stem numerous black bodies are enclosed: their bodies look exactly like the dung of mice: some of them are embedded in the bark. The black growths are the sclerotia of botanists, compacted masses of fungus spawn in a hard resting condition. These black bodies will rest in a living state in the old Chrysanthemum material till next spring; they will then germinate, and probably produce a fungus named either *Peziza chlorioides*, *P. postuma*, *P. sclerotica*, or *P. sclerotium*. These fungi are probably all mere forms of one species, any slight differences being merely in the imagination of the describers. The fungus before us seems to be the same with the sclerotium which causes the so-called *Peziza* disease of Potatoes—a disease which of late has wrought such destruction, year after year, in Ireland. The only way to lessen its ravages is to at once destroy with fire all infested material, for every black body which falls to the ground now will produce two or three millions of spores next spring, and each spore, under favourable circumstances, will be able to invade next season's Chrysanthemum plants. *W. G. S.*]

Variations in Potato Bloom.—I have carefully examined all the bloom on diverse kinds of Potatoes here, and have failed to find one showing any diversity or variation from the normal form of the sheath or calyx, and in every case the pointed lobes are prominent. The particular kind which shows rounded or obtuse lobes must, I think, be from some distinct species to that commonly grown in gardens. Whilst in the common varieties of the Potato we see little diversity in form or size of bloom, there is prominent distinction often found in colour and expansion as in the latter case some corollas almost reflex, in others they are half closed. Looking over the illustrations of species of *Solanum* found in Mr. J. G. Baker's interesting review of tuber-bearing species, as read before the Linnean Society in January, 1884, I find, curiously enough, that the calyx segments of the flowers of *S. tuberosum* are far more rounded or obtuse than are those of any other species, whilst those on flowers of *S. Jamesii* are the narrowest, or most pointed. As the calyx segments of almost if not all flowers borne by garden varieties of Potatoes are found to be long,

lance-shaped, or pointed, it is worth consideration whether *S. Jamesii*, or perhaps the species which has the next most pointed calyx segments, *S. Maglia*, may have some parental connection of perhaps ancient date with our present edible kinds. The subject opens up an interesting field of inquiry for the botanist. *A. D., Belfast.*

The Pruning of Orchids.—No one seems to contradict Mr. N. Blandford's notes on Orchid pruning with regard to *Lælia* aneeps, on p. 41 of July 11 issue. I do not wish to do so either, but I want to lay before your readers a question arising out of the note mentioned, and more especially to ask Mr. Blandford himself, as follows:—Is cutting away old, worn out, leafless bulbs of a *Cattleya* or *Lælia* pruning as used and performed on *Dendrobiums* by some growers? To my mind, Mr. Blandford's pruning is merely taking away an old bulb which has lost its leaf. The leaf probably died naturally, the bulb would follow, and when discoloured any one would take it away. To use his own words, "as a matter of course the old back growths lost their foliage as time passed away," in other words, they lost their natural functions, for years had exhausted their system—they died, and he removed them. I think Mr. Blandford cannot claim these facts to establish the superiority of pruning, for really it is not pruning, but only the ordinary work of cultivation. He says lower down (in the second paragraph) "pruning as I have it is not injurious," and thereby hardly ranges himself under the hard pruners, though he considers he is a pruner. *De B. Craunshay, July 21.*

Choice Zonal Pelargoniums.—One of the features of the Manchester Whitson show was a stand of Chilwell-raised zonal Pelargoniums produced by Messrs. J. R. Pearson & Son. There were several boxes of bunches of massive flowers, remarkable alike for their size, substance, form, and rich and varied colours. Not long since an inquiry was made—Which are the best of Pearson's zonal Pelargoniums? A selection of flowers made at Manchester, and for their obviously excellent character, enables one to answer this question. As a matter of course, the flowers had been produced under glass, but they were so fine as to suggest the admirable material at the command of gardeners for making their greenhouses, say, during the spring and early summer months, while it is a great advantage to have—the Messrs. Pearson have, and as Mr. Cannell has—houses well adapted for the purpose of growing zonal Pelargoniums in the best character, yet a command of heat enables gardeners to do a great deal more than some of them appear to be able to perform in the way of producing zonal Pelargoniums in good character early in the season. The selection of Pearson's varieties consists of *Mary Caswell*, white, flushed with pink; *Lady Chesterfield*, salmon, suffused with orange, very fine; *Lord Chesterfield*, bright magenta; *Plutarch*, bright scarlet, with bold white eye; *Ajax*, rich vermilion; *Caroline*, glowing crimson-scarlet, with white eye; *Cælia*, rose, shaded with magenta; *C. H. Swinestead*, vermilion; *Dr. Orton*, dark crimson, old, but still very good; *Eurydice*, lilac-pink, white eye, very pretty; *Hermionius*, scarlet, shaded with purple; *James Douglas*, rich dark crimson; *Lucy Mason*, salmon, suffused with orange; *Miranda*, scarlet and magenta; *Mr. Holland*, salmon; *Mrs. Miller*, dark crimson; *Nelly Thomas*, crimson; *Nerissa*, salmon-scarlet; *Orhelle*, dark scarlet, white eye; *Raphael*, scarlet, shaded with rose and magenta; *Ruby*, rosy-scarlet, white eye; *Tristram*, crimson-scarlet, white eye; *Viola*, magenta, with dashes of red, white eye; and *Zeno*, scarlet, shaded with magenta. Add to these *Queen of the Belgians*, white, and there is as perfect a selection as one can well desire to have. *R. D.*

Peaches Eightpence Each.—I would like to ask any reader of the *Gardeners' Chronicle* if he ever remembers an almost useless Peach to sell for 8d., when the price in the market was from 2s. to 8s. per dozen. On July 15 I sent thirty Peaches to Covent Garden Market, the consignment arriving there on the next day. The salesman was so kind as to inform my employer by letter that the Peaches arrived in an almost useless condition, and that he would sell them at only 8s. per dozen, mentioning that had they arrived in good condition they would doubtless have made double that price. Of course I do not know what may be the opinion of the readers of the *Gardeners' Chronicle*, but I should say that a man who

gave 1s. 4d. each for Peaches in the middle of July would have more money than wit. *Fair Play.*

Phormium tenax variegata.—A plant of *Phormium tenax variegatum* was bloomed in the garden of Robert F. Wilkins, Esq., Brookhill, Kingswear, South Devon, in the spring of 1881. It has grown to a fine mass, and this year for the first time is flowering three spikes upwards of 12 feet high. Is it usual for it to flower outdoors? [It is in flower out-of-doors at Kew.] This plant has had no protection. *Phormium tenax* also flowers with us this year. *H. Allen.*

Exhibiting Orchids.—I would like to offer a few supplementary remarks to Mr. Douglas's letter on p. 85, July 18. He says it is doubtful if a class for fifty Orchids would bring the best growers to the front. I think it is certain it would not, for the class for twenty-five at the Royal Horticultural Society's Orchid Show only brought one competitor. Surely no greater confirmation is wanted that the class for fifty Orchids as mentioned on p. 16 (in reply to which leading article Mr. Douglas writes) would be useless. While heron, I would state that the Council of the Royal Botanic Society this year made an error in offering prizes of a higher value to made-up plants than to *bona fide* specimens. The object of a society (especially should it be a "Botanic" one), is to further and reward good culture. This was overlooked this year, and the massing of small plants in a big pot for the occasion was bid for, though, strange to say, the 1st prize made-up lot was not an all made-up lot, as Mr. Douglas can tell. If the man who grows a small plant into a big one is to be paid more than he who buys a lot and pots them up together for a year (or a week perhaps), I maintain that Society is overlooking its main object and had better not do so for its own as well as the exhibitors' interests. *De B. Crawshaw.*

Texture of Soils.—Everyday experience points to the fact that in the matter of soils successful cultivation depends not alone on the land containing the requisite food elements to supply the wants of the plants grown thereon, but also to the texture of the soil being such as to favour the production of roots, and admit of their penetrating freely through it in search of the elements therein present. It is generally found that the progress made by a plant is regulated by the greater or less quantity of roots it possesses, particularly the small feeding fibres with their absorbing extremities, which where the conditions of the soil are favourable will usually be found ramifying in all directions, acting the part of forgers to supply the army of shoots and leaves above-ground with the water requisite to keep up a healthy existence. Nature does not work in vain, and few, if any, of her children make greater efforts to adapt themselves to circumstances than do plants, and where the texture of the soil happens to be too close to admit of the feeding rootlets entering in their wonted fashion, their ramification is correspondingly reduced, the result of which is, that the progress made by the plants to which they belong is so much slower. In the case of some plants, such, for instance, as are of an enduring nature requiring a long period to reach maturity, the slower growth may be no disadvantage, possibly the reverse; but with most things, particularly those that are of an annual duration, like the majority of kitchen garden crops, slow impeded growth, such as instanced, is much loss—loss from a twofold point of view, in quality as well as in quantity, for it goes without saying that vegetables in any way checked or retarded in growth, are never equal to such as have been grown under conditions favourable to their quick and free development. Cultivation, by which the land is periodically stirred to a depth commensurate with that to which the roots of the plants to be grown naturally descend, aided by the drying influences of sun and air, and the disintegrating action of frost, effect a good deal in the way of pulverising and breaking up close adhesive soils, still, where there is naturally an absence, or all but absence, of sand in the soil, the effects of digging and trenching, helped by the weather influences, do not effect the permanent loosening of the soil in a way that befits it for the full production and extension of roots, as even in the short space of a few months the naturally adhesive nature of the land is such that in garden phraseology it goes together again to an extent that seriously impedes root progress. Additions in the shape of manure or vegetable matter dug in have an influence for a time in keeping

heavy soils of a clay-like nature more open, but as this kind of matter decays it leaves little impression of a lasting character on the close compact mass with which it has been incorporated. Nothing short of the addition of some matter that will mix with the soil, but that will not decompose, will suffice, otherwise no more than a temporary influence will be effected. Sand, the material that where naturally present in the soil keeps it permanently in a condition suited to the free action of roots, is the commodity that would present itself as the most suitable for adding to heavy retentive soils, such as many kitchen gardens are composed of, and to these my remarks mostly apply; but unfortunately in localities where the land is of the most stubborn clay nature there often happens to be a total absence of this material within a distance that admits of its being used in quantities sufficient to fully remedy the evil, and, beyond this, it is generally found that where sand is applied with this object to land that is annually dug it gradually gets washed low down so as to get below the point where most wanted. But there is another and a lasting remedy whereby land of the description under notice can be brought to a right condition, and which moreover in most cases offers the advantage of the material being on the spot in the shape of clay, which simply needs burning to bring it to a state that will correct the evil in a way that nothing else will, as from the time it is dug into the land no perceptible disintegration takes place, and through the fact of its being lighter than the soil with which it is incorporated, it does not descend. In gardens where the land is of a heavy clay nature, the soil is usually insufficient in depth, and here another advantage presents itself by bringing up 8 or 10 inches of that which lies next below that which the spade has hitherto stirred, burning, and then working it in with that which has previously been at the top. The staple is so much deepened, and the whole brought to a condition that befits it for the free unchecked extension of the roots of the different crops to be grown on it, with the further gain that the temperature of the soil is increased by the quicker passage of superfluous water from it consequent on its more open condition. Clay, or, as it is more generally termed, ballast-burning is often looked upon as a formidable operation by those who reside in localities where little or none of such work is carried out; yet it is neither difficult nor expensive, even in places where fuel may be dear. Work such as here described can be done at little if any more cost per acre than the market gardeners often spend on a single application of manure, with this difference, that where the land is too adhesive in nature for the roots of plants to act in it as they should, one may go on indefinitely applying manure to it, which, under the conditions will never be more than half effective from any point of view, whereas the ballast remedy will be complete and lasting in its influence. It is no exaggeration to say that the cost of the work will in future years be quite covered by the saving in labour effected through the much greater ease with which digging, hoeing, and other operations will be carried out through the freer condition of the soil, with the additional advantage that it will admit of being worked in weather that would preclude the possibility of its being stirred if in its original state. The winter season, when the crops in kitchen gardens are cleared off, affords an opportunity for this kind of work being done that does not occur at other times. To those who have not had any experience with this material it may be well to state that the finer condition to which it is reduced before being dug in the more effective it will be. The nature of the clay has much to do with the state of the material after it has undergone the process of burning as to its being fine. Coal-ashes, against the use of which intermixed with the soil there is often a prejudice, is fairly effective in its lightening influences on heavy land; but it is only in the neighbourhood of large towns that it is obtainable in any considerable quantity, and it is not so good as the burnt clay. *T. B.*

Dendrobium nobile var. Cooksonianum.—At a meeting of the Floral Committee at South Kensington on March 10 I showed a plant under the name of *Dendrobium nobilissimum*, and about the same time I sent a flower to Professor Reichenbach telling him the name I had shown it under, and its history, as far as I knew, but not mentioning the source from which I obtained it. I have since been

informed, and believe to be correct, that naming it *Dendrobium nobilissimum* was incorrect, inasmuch as the generic [specific] name should have been retained. The Professor sent back a notice, naming it *Dendrobium nobile Cooksonianum*, and this notice appeared in your issue of May 30 last. My stock of plants originated from two I obtained in exchange from Mr. T. Lange, of Heathfield Lodge, Gateshead-on-Tyne in April, 1883. The original plant having appeared about five years previously in his garden, which has been under the charge of Mr. Andrew Methven for ten years, and it is by his care and attention that it has been increased, till both he, Dr. Wallace, and I have plants of this grand variety. It was only quite lately (some time after sending up my plant to South Kensington) that I heard that the plants in Mr. Methven's charge have for years been called *Dendrobium nobile Heathfieldianum* (they certainly were never so spoken of to me either by Mr. Lange or Mr. Methven), but I am now satisfied such is the fact, and I wish to give the entire credit of raising the variety to Mr. Andrew Methven. As my reason for not mentioning Mr. Methven's name at an earlier date may not be apparent, I may state that I was endeavouring to buy up the entire stock of the variety, and did not wish to provide competitors against myself, which such a course would have entailed. *Norman C. Cookson, Oakwood, July 14.* [This is an outcome of unauthorised nomenclature. There is nothing to prevent a grower or proprietor from naming any plant in the manner he pleases; but as a matter of convenience it would be far better, either that he should not name the plant at all, or, if he does so, that he should follow the canon law. The case is one of "regularity," such as we see more or less perfect specimens of frequently in the course of the year; and are glad to see that growers (not raisers in this case) have succeeded in perpetuating the sport. Ed.]

Schedules Again.—As an exhibitor in a class for "Four pots of annuals or herbaceous plants grown in pots, in flower, and distinct," at the late Wimbledon Show, I exhibited two Achimenes and two tuberous Begonias, all distinct, for which I was disqualified. I should feel much obliged if you could give me any reason for my disqualification. *Joseph Law.* [In default of precise instructions in the schedule the judges would fall back on general custom. Now it is not the general custom to include in schedules the Achimenes or tuberous Begonias as annuals or herbaceous plants. Botanically speaking, the judges were wrong, but they were not judging from a purely botanical point of view, but from that of exhibition custom, and in so far they were right. The blame rests with the schedule framers. Ed.]

Galls on Orchid Roots.—I see another note on "Galls on Orchid roots" in last week's issue at p. 85, but as far as I can see the paper is a discussion of what sort the insect is—that does not help growers. We want to know, if we should happen to get them, are they injurious to the plants? [Obviously.] How are we to kill them except by cutting off the affected root or puncturing it to kill the larva? and how are we to stop them breeding if they increase after the roots are cut off? *De B. Crawshaw.*

Reports of Societies.

THE BIRMINGHAM ROSE SHOW, July 15 and 16,

at the Botanic Gardens, Edgbaston, was a decided success, an excellent display of flowers being staged in the new large glass corridor, and was well set-off by various plants belonging to the gardens. In the nurserymen's classes the following exhibited:—

For thirty-six trusses.—1st, The Cranston Nursery Co.; 2d, Messrs. Perkins & Son, Coventry; 3d, Messrs. Paul & Son, Cheshunt, equal 3d, Mr. Charles Turner, Slough.

For thirty-six singles.—1st, Messrs. Paul & Son; 2d, The Cranston Nursery Co.; 3d, Mr. C. Turner.

For twenty-four trusses.—1st, The Cranston Nursery Co.; 2d, Messrs. Perkins & Son.

For twenty-four singles.—1st, The Cranston Nursery Co.; 2d, Messrs. Paul & Son; 3d, Mr. H. Frettingham, Nottingham.

For twelve Teas and Noisettes.—1st, Messrs. Paul & Son; 2d, The Cranston Nursery Co.; 3d, Mr. C. Turner.

To the amateurs' class for twenty-four singles.—A. H. Griffiths, Esq., Harborne, was 1st; W. G. Mayhew, Esq., 2d; Mr. Brown, Shadon Hall, 3d.

For twelve trusses.—1st, R. Ramsden, Esq.; 2d, A. H. Griffiths, Esq.; 3d, Rev. H. W. Watson.

For twelve singles.—1st, A. H. Griffiths, Esq.; 2d, Rev. J. A. Williams; 3d, J. Richards, Esq.

Fortwelve Teas.—Rev. J. A. Williams, with a very fine lot 1st; 2d, R. Ramsden, Esq.; 3d, Rev. H. W. Watson.

Some excellent blooms were staged, and in Messrs. Cranston's exhibits were fine blooms of Deborah, Duchesse de Morry, A. K. Williams, Marquis de Casablanca, Merveille de Lyon, E. Y. Teas, Madame Caroline Kuster, Comtesse de Nadaille, Prince Arthur, Madame Willermor, Antoine Ducher, Lady Sheffield, Horace Vernet, Lady Mary Fitzwilliam, Reynolds Hole, Madame Ferdinand Jamin, very fine; Duke of Edinburgh, Mrs. Van Houtte, Madame Thérèse Levet, Innocent Fiolra, and Jean Ducher.

In Messrs. Paul's stands were very fine blooms of A. K. Williams, Marshall P. Wilder, Madame Alphonse Lavallée, Queen of Queens, Lady Sheffield, Duke of Teck, Star of Waltham, Comtesse of Rosebery, E. Y. Teas, Merveille de Lyon, Souvenir d'Elise, Marie Bauman, and Jean Ducher.

In Mr. Turner's stands were excellent blooms of Marguerite D'Ombrai, Merveille de Lyon, Comtesse de Nadaille, very fine; A. K. Williams, King of Bedders, Caroline Kuster, Française Levet, Marie Verdier, and Madame de Lyon.

In Messrs. Perkins' stands were also good blooms of Duc de Rohan, Mrs. Laxton, Charles Darwin, Souvenir de Thérèse Levet, very fine; Louis van Heutte, E. Y. Teas, Alba rosea, Etienne Levet, Merveille de Lyon. Messrs. Paul & Sons' stand of Teas, which took the 1st prize, were a superb lot, consisting of Niphotes, Catherine Mernet, Souvenir d'Elise Vardon, Souvenir d'un Ami, Perle des Jardins, Marchéail Néil, in superb colour; Innocent Fiolra, La Boule d'Or, Caroline Kuster, and others.

Mr. J. Williams had in his stand of Teas a remarkably fine Madame Lambard, Marie van Houtte, Etoile de Lyon, Jean Ducher, Souvenir de Paul Vernet, Anna Olivier, Ferle des Jardins, Caroline Kuster, Madame Hippolyte Jamin, Souvenir d'Elise Vardon, Catherine Mernet, and Marie de Fartado.

Mr. Davidson, nurseryman, Hereford, staged a very fine twelve blooms of Merveille de Lyon.

Mr. Hans Niemand set up a beautifully arranged group of plants, for which a special Certificate was awarded, also special Certificates for *Caladium candidum* and the new double-flowered *Akloria*. Messrs. M. Vertegans received a Certificate for a fine collection of alpine and herbaceous plants, and Mr. F. Perkins, Leanington, a Certificate for two handsome bouquets of Roses and Rose sprays. Mr. Perkins also sent examples of the white *Pelargonium*, *Volonté Nationale*.

SHEFFIELD BOTANICAL AND HORTICULTURAL: July 17 and 18.

The second annual show of the above Society was opened on July 17, in the Botanical Gardens, with every prospect of being, in all respects, a much more successful exhibition than that held last year. The committee had done well in taking the advice given them in engaging a gentleman well versed in arranging exhibitions of this description, as everything this year was carried out in a thorough practical manner. Unfortunately financially the show is a failure, owing to the inclemency of the weather, and last year the show suffered equally or even worse than this year.

PLANTS IN POTS.

One of the principal features of the exhibition was the groups of plants arranged for effect. These classes called for some special attention, but in most cases the groups were far too crowded with plants; however, they produced a good effect looked at as a whole.

The competition with table plants was very keen, the entries numerous, and many good plants adapted for the purpose were staged, both in the nurserymen's and amateurs' classes.

Florists' flowers in pots were poor in numbers, as in quality. Foliage plants were snail, but nice and clean, as were also exotic and hardy Ferns.

ORCHIDS.

The entries were small, both by nurserymen and amateurs. Messrs. Fisher, Son & Sibray were 1st in the former; in the latter some very strong comments respecting the awarding were made: the person placed 2d, who afterwards was made equal 1st, in my opinion, as well as that of others, was a very easy 1st.

All flowers, especially Roses, were very good. Messrs. Cranston & Co. Hereford, easily securing the highest honours by staging some fine clean fresh blooms. Amateurs also showed both numerously and well, the leading prize going to a Liverpool grower.

BOUQUETS, &c.

Bouquets were well shown, the leading prizes going to Messrs. Perkins & Sons, of Coventry, in the nurserymen's class; also for button hole bouquets. These were very pretty, and good examples of skill, not being so crowded with blooms as such productions so often are.

FRUIT

was shown in quantities, but the quality was much below the average of former years, except for Grapes, Peaches, and Pines, and the prize for the best collection of eight dishes went to Mr. Wood, Redding's House, Alfreton, for a good clean collection.

MISCELLANEOUS.

Cottagers came well to the fore, some very good examples of cultivation being shown in their respective classes.

Messrs. Fisher, Son & Sibray, Handsworth, showed a very extensive collection of hardy trees and shrubs, stone, greenhouse, foliage, and flowering plants, &c., which occupied the whole of a large tent. These were a great attraction in themselves, and were well arranged.

Mr. B. S. Williams, Holloway, sent a good collection of miscellaneous flowering and foliage plants, including some good Orchids, Nepenthes, &c., which were beautifully arranged at one end of the pavilion, forming a feature much admired, especially the novelties.

Mr. Ewing, the enthusiastic Curator, has brought the Botanical Gardens here, by his assiduous endeavours, into a grand condition, considering the fickle nature of the climate of this part. The bedding was very well managed, in fact it was one of the finest displays of the kind that I have seen for some time; he evidently having by long experience succeeded in learning the plants best adapted for the climate, and uses them with great skill and artistic feeling. The various departments in the houses are also well managed, and present a fine display of foliage and flowering plants. (*A Correspondent*.)

CHISWICK HORTICULTURAL: July 16.

SOME of the glories that clustered round the old Chiswick exhibitions of thirty years ago centred about the garden of the abbot, when for the fifth annual exhibition of this Society took place. Some features of the old shows have ceased to be repeated at modern exhibitions, some features of this particular exhibition would not have characterised the shows of a former day—such as the groups arranged for effect; the very fine tuberosous rooted Begonias, the newer forms of *Coleus*, and the magnificent erect *Gloxinias*.

A long tent set up on the grass plot, south of the Council chamber, accommodated the leading plants, groups, cut flowers, table decorations, &c.; a supplementary tent, for the foliage plants, &c., in fruit and vegetables, unusually numerous, found a place in the great variety.

GROUPS OF PLANTS.

In the class for the largest groups, Messrs. Hooper & Co., Twickenham and Covent Garden, were placed 1st, with a most charming arrangement; Messrs. J. F. Fromow & Co., Tottenham, were 2d; Messrs. J. Hudson Green, being a good 3d; E. H. Watts, Esq., Devonshurst (Mr. Wright, gr.).

The best of the smaller groups came from F. R. Geaves, Esq., Cambridge Park, Twickenham (J. W. Howell, gr.), took the first very hand by E. M. Nelson, Esq., 2d; H. J. Salmons, Esq., 3d; H. G. Lake, Esq., Fairlawn House, Acton (Mr. H. Davis, gr.), being 3d.

STOVE AND GREENHOUSE PLANTS.

The best group of six, a nice lot, came from Mrs. Meek, Foullet Lodge, Twickenham (Mr. W. Bates, gr.), who had *Cleome dendron* (Balfourianum, Eugeniavillea), Almand & Hieronymus, Stephanitis Boriniana, *Draecophyllum gracile*, and *Diplandena hybrida*; E. H. Watts, Esq.; 3d, E. M. Nelson, Esq.

The best three *Fuchsias* came from E. H. Watts, Esq., good bushy well grown plants; H. G. Lake, Esq., coming 2d.

Several *Pelargoniums* were shown in groups of six and three, and being nicely grown and flowered formed attractive patches of colour.

Tuberosous rooted Begonias are always well done at Chiswick, and the best six came from J. F. Flack, Esq., Twickenham (Mr. J. Salmons, gr.); J. K. Starling, Esq. The Chestnuts, Gunnersbury, coming in a good 2d. Cockscombs were pretty good, and *Gloxinias* were numerous and fine; the best twelve plants of the latter came from G. P. Greenfield, Esq., The Spring, Hanwell (Mr. W. Wright, gr.); J. F. Flack, Esq., 2d. Mr. Flack had six admirable plants of *Achimenes*.

FOLIAGE PLANTS.

The best six came from Mr. E. M. Nelson, who had fine specimens of *Croton variegatus*, *C. angustifolius*, *Latania borbonica*, *Alocasia Lowii*, *Dracena Youngii*, and *Areca lutescens*; 2d, H. G. Lake, Esq. Mr. Nelson also had the best six exotic Ferns, consisting of fresh well grown specimens of *Gymnomorpha Laucheara*, *Davallia Mooreana*, *Dicksonia antarctica*, *Adiantum Santa Catherinei*, *A. cucullatum*, and *Lygodium scandens*; 3d, E. H. Watts, Esq., with a good lot also. No *Caladiums* were shown, but *Coleus* were abundant, Mr. J. F. Flack having the best, closely followed by E. H. Watts, Esq. *Lycopods* were superbly done by Mr. J. K. Starling, large well-grown specimens in the finest character, the sorts *Mertensii*, *Kraussii variegata*, *Kraussii aurea*, *Mertensii variegata*, *stolonifera*, and *uncinata*; E. M. Nelson, Esq., was 2d. Plants for table decoration were largely and well shown.

CUT FLOWERS, ROSES.

Of these there was a good display, some excellent blooms being shown. The best twenty-four came from Mr. W. Ramsey, Waltham Cross; T. W. Girdlestone, Esq., Sunningdale, being 2d, having some fine *Teascent* varieties in his box. Mr. G. P. Greenfield had the best six: *Wm. Lindell*, Esq., *Elling*, Mr. Wilson, gr., being 2d; H. J. Atkinson, Esq., M.P., Gunnersbury House (Mr. J. Hudson, gr.), was 1st with twelve bunches of cut flowers, an admirable lot of stove and greenhouse subjects; W. Lindell, Esq., being 2d, with twelve bunches of well grown roses, and in the class for twenty-four blooms of *Gloxinias*, in pairs, in hanging baskets, Mr. Hudson was 1st with a very good

lot, Mr. Nelson coming in 2d. Bunches of zonal *Pelargoniums* were numerous and very good.

TABLE DECORATIONS, BOUQUETS, &c.

The best three stands or vases for table decoration came from Mrs. Hudson, Gunnersbury House Gardens, arranged in the excellent style characteristic of this able decorator; Mr. J. R. Chard, floral decorator, Clapham, was 2d; and Mr. J. Frewett, Hammersmith, 3d—both very good. Miss S. A. Fromow had the best single piece; Miss Prevett being 2d. Miss Barron, Sutton Court Road, had the best vase of wild flowers—a very pretty and tasteful arrangement; Mr. D. Bullen, Little Sutton, being 2d. In the class for three bouquets, one bride's and two bridesmaids', Mr. W. Gardiner, Bayswater, was 1st; Mr. J. Frewett being 2d; and Mr. G. Phippen, Reading, 3d. Buttonhole bouquets were both numerously and well shown.

FRUIT.

Mr. Hudson had the best two bunches of black Grapes, showing very fine Madresfield Court; Mr. Nelson being a near 2d, with well finished Black Hamburgs; and Mr. Baird 3d, with the same. The best two bunches of white Grapes were from Mr. Baird, who had excellent Duke of Buccleuch, which he admirably finishes in a mixed house. Mr. J. Coombes, Sheen House, Richmond, was 2d, with Muscat of Alexandria. Foster's Seedling was also shown. Strawberries, Cherries, Raspberries, Currants, and Gooseberries were also well shown.

VEGETABLES.

These were extensively shown, and in good condition. Mr. C. J. Waite, Glenhurst, Esher, was invincible in this department, as he was 1st, with nine dishes of vegetables; also in the classes for six dishes, in which special prizes were offered by Messrs. Carter & Co. and Messrs. Sutton & Sons; and also for three dishes of Potatoes, Peas, Tomatoes, Cucumbers, &c., were very good.

One special class at this exhibition is always of a very interesting character, namely for the best hand-painted china or terra-cotta vase, tile or plate, handsome special prizes being offered by Mr. J. K. Starling and the Chiswick School of Art. The 1st prize went to Miss A. E. Heritage, South Kensington; 2d, Miss E. Ray, Hammersmith; 3d, Miss A. Fitch, Wimbledon.

Miscellaneous contributions comprised a wonderful collection of hardy ornamental and variegated plants from Messrs. C. Lee & Sons' arboretum at Isleworth; and cut Roses from their Ealing nurseries; cut Roses from Messrs. Veitch and Mr. C. Turner; and a large group of plants from Chiswick House, furnished by Mr. May, which was highly Commended.

- July 16.—Dull morning. Fine and bright at times in the afternoon.
- 17.—Dull day, finer about 3 P.M. Clear night.
- 18.—Dull but fine throughout.
- 19.—Dull day, occasional sunshine.
- 20.—Dull day, occasional sunshine.
- 21.—Dull day, alternately clear and cloudy.
- 22.—Very fine day and night.

LONDON: Atmospheric Pressure.—During the week ending July 18, the reading of the barometer at the level of the sea increased from 29.96 inches at the beginning of the week to 30.07 inches by 9 A.M. on the 12th, decreased to 30.01 inches by 5 P.M. on

the 13th, increased to 30.24 inches by 9 A.M. on the 15th, decreased to 29.98 inches by 5 P.M. on the 16th, increased to 30.08 inches by 9 A.M. on the 17th, and was 29.91 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.07 inches, being 0.09 inch lower than last week, and 0.08 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 77°, on the 15th; on the 12th the highest was 68°. The mean of the seven high day temperatures was 72°.9.

The lowest temperature was 49°, on the 14th; on the 12th the lowest temperature was 57°.8. The mean of the seven low night temperatures was 53°.5.

The greatest range of temperature was 26°.2, on the 15th; the smallest, on the 12th, was 10°.2. The mean of the seven daily ranges was 19°.4.

The mean temperatures were—on the 12th, 60°.6; on the 13th, 61°.5; on the 14th, 58°.7; on the 15th, 62°.9; on the 16th, 62°; on the 17th, 60°.6; and on the 18th, 61°.3; and these were all below their averages (excepting the 15th, which was 0°.2 above) by 1°.8, 1°, 3°.9, 0°.7, 2°.1, and 1°.3 respectively.

The mean temperature of the week was 61°.1, being 3°.9 lower than last week, and 1°.5 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 135°, on the 15th and 16th. The mean of the seven readings was 117°.2.

The lowest reading of a minimum thermometer placed on grass was 38°.5, on the 14th. The mean of the seven readings was 42°.7.

Rain.—Rain fell on three days during the week to the amount of 0°.44 inch, of which 0°.41 fell on the 12th.

ENGLAND: Temperature.—During the week ending July 18, the highest temperatures were 78° at Cambridge, 77° at Blackheath and Leeds; the highest at Bolton, 62°, at Newcastle 64°, at Liverpool 65°.1. The general mean was 70°.8.

The lowest temperatures were 39° at Truro, 40°.1 at Bolton, 40°.4 at Wolverhampton; the lowest at Brighton was 50°, at Blackheath 94°, at Newcastle 43°. The general mean was 45°.2.

The greatest ranges were 35°.5 at Wolverhampton, 32° at Leeds, 31°.1 at Cambridge; the smallest ranges were 16° at Newcastle, 17°.3 at Liverpool, 20° at Sunderland. The general mean was 25°.6.

The mean of the seven high day temperatures was highest at Blackheath, 72°.9, at Cambridge 72°.4, at Brighton 70°.3; and was lowest at Bolton 59°.4, at Newcastle 61°.3, at Sunderland 61°.8. The general mean was 66°.3.

The mean of the seven low night temperatures was highest at Blackheath 53°.5, at Brighton 53°.3, at Plymouth 53°.1; and was lowest at Bolton 46°.1, at Wolverhampton 47°.2, at Sunderland 48°.7. The general mean was 50°.8.

The mean daily range was greatest at Cambridge, 20°.9, at Blackheath 19°.4, at Wolverhampton 19°.2; and was least at Liverpool, 9°.8, at Newcastle 10°.8, at Preston 12°.9. The general mean was 15°.5.

The mean temperature was highest at Blackheath, 61°.1, at Brighton and Cambridge 60°, and was lowest at Bolton, 50°.8, at Sunderland 53°.3, at Newcastle 54°. The general mean was 56°.6.

Rain.—The largest falls were 0.89 inch at Bolton, 0.84 inch at Preston, 0.72 inch at Sunderland; the smallest falls were 0.07 inch at Nottingham, 0.05 inch at Wolverhampton, and 0.07 inch at Brighton. The general mean fall was 0.33 inch.

SCOTLAND: Temperature.—During the week ending July 18, the highest temperature was 69°.1, at Aberdeen; at Greenock the highest temperature was 61°.2. The general mean was 65°.9.

The lowest temperature in the week was 41°, at Glasgow; at Aberdeen the lowest temperature was 48°. The general mean was 44°.7.

The mean temperature was highest at Aberdeen, 57°.9; and lowest at Greenock, 53°.8. The general mean was 55°.4.

Rain.—The largest fall was 1.27 inch, at Greenock, and the smallest fall was 0.27 inch at Edinburgh. The general mean fall was 0.64 inch.

JAMES GLAISHER F.R.S.

Kingdom, for agricultural and sanitary purposes, for the week ending Monday, July 20, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W.—The weather has been fair generally over England, but showery at the west and north stations; a good deal of fog has prevailed over our south-western districts.

The temperature has been below its mean value everywhere. Over England the deficit has amounted to only 1° or 2°, but in Scotland it is 3° or 4°, and in Ireland it varies from 3° to 5°. The maxima (which exceeded 70° at the English stations only) were recorded on various dates, according to the locality of the station, and were, of course, much higher at the inland stations than on the coasts. The minima occurred as a rule on Tuesday (14th), and were very low in some cases, especially over the northern and central parts of Ireland, where they ranged from 34° to 30°.

The rainfall was from four to five-tenths of an inch less than the mean for the week at the English stations, while it was about its mean value in Scotland, slightly in excess over "Ireland, S." and "England, S.W.," and largely in excess over "Ireland, N." and "England, N.W." The number of rainy days varied from two in "England, S.," to five in "Scotland, N.," "Scotland, W.," and "England, N.W.," and to six in "Ireland, N."

Bright sunshine shows a decided decrease from the values recorded last week. In the south of Ireland only one-seventh of the possible duration was recorded, and in the northern parts of Scotland and Ireland, the quantities recorded show rather less than one-fifth of the possible duration, while over our Midland and Eastern Counties there was only one-fourth, and even in the Channel Islands less than half.

Depressions observed.—These were comparatively unimportant; and, until the 19th, were confined to the north and north-western parts of the kingdom. The distribution of pressure then became very complex, and some shallow disturbances passed across Ireland and England, producing little wind, but in some places much rain.

Answers to Correspondents.

LEAF-MINER ON HOLLY: W. M. The work of Phytomyza ilicis. Pick off and sweep up the leaves, and

FIG. 27.—LEAF-MINER ON HOLLY.

burn. There is no other remedy on a large scale. The Beech leaves will be reported on next week.

ANTS IN SOIL NEAR A ROSE-BUSH: A Fifteen Years' Subscriber. Pour into the ant-hill a small portion of carbonic acid and water, or gas-tar, in small quantities. The ants might prove of service in keeping your Roses free from aphides.

CANADA: A. H. For one who is acquainted with gardening generally, and willing to work, the best places are those that have been longest settled, as Montreal, Quebec, and Hamilton, where employment might be found. Later, when better acquainted with the climate and methods of work, a start could be made in business.

CHAMPIGNON: W. G. S. The interpolation was misplaced. We have seen sheep eat Champignons.

FERN SEEDLING: C. Kershaw. The fern sent is a very pretty form of Adiantum cuneatum, and one which seems to deserve a name and separate recognition. Mr. Moore proposes to send us a few descriptive notes of it under the name of Adiantum cuneatum elegans.

FERNS: No name. 1, Athyrium Filix-femina; 6, Blechnum boreale; 8, Lastrea thelypteris; 10, Aspidium aculeatum; 11, Polypodium vulgare. The other numbers we do not find.

JAMAICA FERNS—AN ERROR: F. H. writes to correct a misstatement that occurred in the report of the Jamaica Botanic Garden cited by us some time since, and in which it is stated that the Jamaica Ferns are ten times as numerous as those of the United States. The approximate numbers, however, are 450 for Jamaica, and 150 for the United States.

LARGEST STRAWBERRY GROUNDS IN KENT: T. H. You had better ask Mr. Cannell, of Swanley, for information.

MELONS IN JAMAICA DYING OFF: L. C. G. The thin-skinned weakly constituted English varieties, which we cultivate most artificially, seldom succeed out-of-doors in any climate, the foliage falling a prey to diseases, and the fruit bursting before it is fully grown, from an excess of moisture. Cashmere, Cabool, President, and the numerous kinds of Cantaloupe Melons, are the best for out-of-doors work in warm countries. English kinds can be made to succeed in low frames of glass without sides, in which they must be slightly shaded in the hottest part of the day, and the vines allowed to run at will beyond the limits of the frame. Under this way of growing the watering is quite under the control of the gardener.

NAMES OF PLANTS: J. H. We cannot name from such miserable scraps. S. v. M. Inula glandulosa.—C. Y. M. A Willow; probably a form of S. repens, but the specimen is insufficient.—P. J. Rubus odoratus.—E. U. Russell. 1, Cupressus macrocarpa; 2, Thuja pisifera.—F. Cocker & Sons. 1, Celtis occidentalis; 2, Inula Hookeri; 3, Thalictrum aquilegifolium; 4, T. majus.—C. W. Dod. Inula Hookeri.—W. Scott. 1, Centaurea macrocephala; 2, C. dealbata; 3, Cimicifuga racemosa; 4, Isotoma axillaris;—H. Centaurea; too scrappy to name, send better specimen.

PELAGARGONUM BLOOM WITHERING: A. M. It would seem as if the fumigation had been too much for these and the Roses. But you did not say if the withering of the flowers took place before or after the smoking.

PICKLING GLOBE ARTICHOKE FOR WINTER USE: G. W. After shortening the stalks, place them in strong brine of the same strength as is used for meat. The vessel used should be of wood, and must be furnished with a lid that will slide up or down the interior. When the Artichokes are put into the pickle the lid is placed on them and weighted with a piece of stone to keep them under the surface of the water. Scum will arise from the Artichokes, which must be wiped off the lid, on which it lodges, with a clean cloth that should be kept for the purpose. Green French Beans, Runner Beans, Peas, and Cucumbers, can be just as readily kept for winter consumption in the same way. The chief points to observe are wiping away of the scum, and keeping them under the pickle. With this amount of attention the articles will keep good for several months.

PLANTS ATTACKED BY INSECTS: J. B. M. The buds of your neighbour's Conifers have been attacked by the caterpillars of a very pretty small moth—Tortrix (Retinia) Tutionnana, figured in the Gardeners' Chronicle, 1850. Pick off and burn the infested buds, which can easily be distinguished, although we fear the moths have already escaped. A. O. W.—F. Fraser. Your Vine leaves arrive in too dry a state to enable us accurately to determine the cause of the numerous blotches and galls upon them, which are most probably produced by the gall-mite (Phylloxera vitis), although the numerous filamentous matters within the galls have not the appearance, under a Zeuss microscope, of animal matter.—O. J.

ROSE AND IRIS: A. J. We cannot undertake to name florists' varieties.

THREE-FLOWERED MARGUERITE: G. W. Such abnormal blooms are very common.

* All communications intended for publication should be addressed to the "Editor," and not to the Publisher, or to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

COMMUNICATIONS RECEIVED.—G. T. D. (an engraver's hand).

L. Locker & Sons.—W. Scott.—S. G.—C. G.—Professor Martens, Louvain (next week)—B. W.—J. M.—Jas. Veitch & Sons.—A. W.—F. W. B.—C. W. (please send another specimen, the others have gone).—M. O. (many thanks).—E. W. S., Gardeners' Magazine Office, Ave Maria Lane, F. C.—E. V. B.—R. D.—C. W. S.—H. G. (no, thank you).—C. Joly (with many thanks).—Prof. Bendor.—H. Buser.—F. S. & Co.—W. G. S.—N. E. Brown.—W. Dod.—H. E. G. Bunyard.

Enquiries.

"He that questioneth much shall learn much."—BACON.

GARDENS.—Is anything known of the two gardens mentioned by Dr. Kaye in the following passage? "De Hooze, gladden fert, ut quercus, Iugina. Utriusque ferens unam vidimus in Britannia, marem in horto pyrisino in ripa transthemina, formidiana horto regio Westmonasterii." Johannes Caii Britanniae de rariorum animalium et stirpium historia, 1570, p. 29. Henry N. Elliscombe, Bolton Vicarage.

VARIETATED ORIENTAL PLANE.—W. H. M. wishes to know where this can be obtained. Please note it is the Oriental Plane that is asked for.

Markets.

COVENT GARDEN, July 23.

VERY heavy supplies this week, and prices have been firm at a reduction. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Cherries, Apples, Figs, Grapes) and their prices per unit.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with columns for vegetable types (Artichokes, Asparagus, Beans, Beet, Cabbages, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Garlic, Herbs) and their prices.

POTATOS.—English, new, 8s. to 9s.; Jersey, 8s. to 9s. per cwt.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Aralia Sieboldi, Arbor-vitae, Begonias, Bouvardia, Calceolarias, Carnations, Cyperus, Dracena terminalis, Eucalyptus, Euonymus, Evergreens, Ficus elastica, Geraniums, Foliage Plants) and their prices.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Abutilon, Arum Lilies, Bouvardias, Carnations, Chrysanthemums, Cosmos, Eschscholus, Eucharis, Gardenias, Larkspur, Lilies, Lisianthus, Marguerites, Mignonette) and their prices.

SEEDS.

LONDON: July 22.—There was but little business transacted on the Seed Market to-day. New English Trifolium is now coming to hand, and opens at moderate prices—the quality also is very satisfactory. French Trifolium continues too dear for English buyers. New Rape seed is obtainable at rather low rates. Mustard seed there is an improved sale. Feeding Linseed is firmer. The bird seed trade is dull and neglected. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

HAY.

Tuesday's Whitechapel Market report states that trade was quiet, with small supplies.—Quotations:—Clover, prime, 80s. to 105s.; prime second cut, 85s. to 107s.; inferior, 60s. to 75s.; hay, prime, 70s. to 98s.; inferior, 20s. to 60s.; and straw, 28s. to 38s. per load.—On Thursday there was a fair supply on sale. The trade was dull, especially for Clover, but prices were without alteration.

POTATOS.

The Borough and Spitalfields Markets reports state that supplies come to hand moderately, and the trade is slow, but prices upheld. Quotations:—Essex Shaws, 120s. to 130s.; Early Roses, 90s. to 100s.; Jersey Kidneys, 150s. to 160s.; ditto rounds, 100s. to 120s.; Cherbourg rounds, 120s. to 120s. per ton.—The imports into London last week consisted of 2371 boxes from Cherbourg, and 2157 boxes 478 cases from Barfleur.

COALS.

The following are the prices current at market during the week:—East Wylam, 15s. 6d.; Holywell West Hartley, 14s. 6d.; Ravensworth West Hartley, 14s. 9d.; Walls End—Tyne (unscreened), 11s. 3d.; Henon, 12s. 6d.; Hutton Lyons, 12s. 6d.; Lambton, 15s. 6d.; Wear, 14s.; East Hartlepool, 14s. 6d.; Tees, 15s. 6d.

WANTED, a young WOMAN, in a First-class Business. Must have had 30 years' experience in the business.—Apply by letter to Mr. EDWARDS, 35, Devonshire Road, Forest Hill, Kent.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BALIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send particulars, when the best selections for the different capacities will be made.—Holloway, N.

TO NOBLEMEN, GENTLEMEN, &c., requiring smart, sound, and thoroughly competent STEWARDS, GARDENERS, &c.—We have on hand Applications from several Men of talents, and all are pleased to Assist any Nobleman, &c., in Obtaining Men specially suitable for their requirements.—VICCARS COLLYER and CO., Leicester: A. W. CROMWELL, Manager.

TO ANTED PROPRIETORS, &c.—A. McNEILSON (late of Victoria Park) is now at liberty to undertake Farming and Planting of New Garden and Park Grounds, and Remodelling existing Gardens. Plans prepared. 25, Ladbroke Park, Stamford Hill, N.

RICHARDS SMITH and CO. beg to announce that they continue to receive applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars. &c.—St. John's Nurseries, Worcester.

GARDEN, or GARDEN and ESTATE MANAGERS.—Age 43; has had over thirty years' experience. Understands Laying-out New Grounds, Roads, Walks, &c. Can prepare Sketches and Plans for the Erection of Glass Houses. Would undertake the Laying-out of a New House, or the Remodelling of an old one, and wish to be permanent Head Gardener, or not, as any Lady, Nobleman, or Gentleman may desire. Has had 40 hands under him in present situation, where he has been twenty years. F. USUKA, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

PAINTER, &c.—By Hour or Contract, or constant Work on Estate. Good reference.—EMAUS, 71, Romany Road, Lower Norwood, S.E.

HOLLOWAYS' OINTMENT and PILLS.

—A frequent cause of gout and rheumatism is the inflammatory state of the blood, attended with bad digestion and general debility. The removal of this state of the system is an effectual preventive against gout and rheumatism. Any one who has an attack of either should use Holloway's Ointment also, the powerful action of which combined with the Ointment, the Pills, must infallibly effect a cure. These Pills act directly on the blood, which they purify and improve. Having once subdued the severity of these diseases, perseverance with the Ointment, after fomenting the affected joints with warm brine, will specially relax all stiffness and prevent any permanent contraction.

GREENHOUSES OF EVERY KIND DESIGNED, ERECTED, AND HEATED.

Constructed so as to obtain, with the least obstruction to light and sun, the greatest strength and rigidity, at prices which, owing to unusual facilities, defy competition.

Gentlemen will do well to obtain an Estimate from us, for which no charge is made, before placing their orders elsewhere.

Illustrated Catalogues free. Richly Illustrated Catalogue, containing over 60 Plates of Winter Gardens, Conservatories, Vinerics, Plant Houses, Forcing Houses, &c., recently erected by M. & Co., for 2s. stamps.

Come and See,

5000 LILIUM AURATUM in Bloom.
Many Spikes with 15 to 20 large open flowers.
A MAGNIFICENT SPECTACLE.
Spikes cut and sent to order, packing free.
8s. to 12s. per dozen.

NEW PLANT and BULB COMPANY, Colchester.

OUR AUTUMN TRADE LISTS, Nos. 75, 76, are now published. Traders not having received a copy are requested to apply for one.

CLEMATIS

JACKMANNI ALBA (Noble).

"The hardy flowering plant of the season." "Certificated unanimously."

See *Gardeners' Chronicle*, July 29, 1883.

Now being sent out at 7s. 6d. and 10s. 6d. each. Cash or reference.

CHARLES NOBLE, BAGSHOT.

SEEDLING PLANTS OF CHOICE FLORISTS' FLOWERS.

We have much pleasure in offering strong healthy transplanted seedlings from our superb strains of the following:—

Calceolarias, from choicest flowers only ..	Doz.	100.
Beautifully variegated and spotted ..	d. s. d.	1 6 10 6
Carnations and Picotees, from stage flowers. Will produce 50 per cent. of fine double blooms ..	1 6 10 6	2 6
choicest yellow, very fine ..	2 6	..
Cheritias, from a grand strain of beards ..	1 6 10 6	..
ful flowers ..	2 6	..
New, dwarf, large flowered, splendid ..	3 6	..
Primula, Crimson King, magnificent ..	3 6	..
alba magnifica, large, pure white, with beautifully fringed flowers ..	2 6	..
Daniels' choicest red, very fine ..	1 6 10 6	..
" " white, very fine ..	1 6 10 6	..
" " mixed, very fine ..	1 6 10 6	..
" " extra strong plants ..	2 6 10 6	..
Feroclawed, very choicest, mixed ..	1 6 10 6	..

Carrriage Free on receipt of Post office Order.

DANIELS BROS., TOWN CLOSE NURSERIES, NORWICH.

EARLY WHITE ROMAN HYACINTHS. DOUBLE ROMAN and PAPER-WHITE NARCISSUS.

MESSRS. JAMES VEITCH & SONS

REG TO ANNOUNCE THEY HAVE RECEIVED THEIR USUAL CONSIGNMENTS OF

THE ABOVE VALUABLE BULBS FOR EARLY FORCING,

And will be pleased to receive Orders for immediate delivery.

ROYAL EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON, S.W.

PRINCE'S

IMPROVED EARLY NONPAREIL CABBAGE.

6d. per Packet, or free by Post, 7 stamps.

Sow, for earliest Spring Crops, from middle to end of July, and transplant first week in October; also, sow again from March till June for successions during Summer and Autumn.

This is generally admitted to be the quickest and best flavoured kind; in its early formation dwarf and compact in habit; and, if left, will form a large handsome Cabbage in June; at the same time it is a variety less liable to run to seed than any other grown.

GEORGE PRINCE, Seedsman and Rose Grower, 14, Market Street, OXFORD.

SPECIAL CULTURE OF FRUIT TREES AND ROSES.

THOMAS RIVERS & SON

INVITE those interested in the above to visit their establishment. The Fruit Houses for the growth of PEACHES, NECTARINES, GRAPES, CHERRIES, FIGS, ORANGES, &c., are now full of Fruit in various stages, and will continue to be of great interest until the end of September.

Many thousands of PYRAMID, BUSH, and CORDON TREES are Grown and Fruited out-of-doors. A large stock of the best ROSES will be in flower. Full information will be given of our various methods of cultivation.

The Nurseries are situate between the Harlow and Sawbridge worth Stations, Great Eastern Railway, each 1 mile distant, and conveyances may be secured.

SAWBRIDGEWORTH, HERTS.

LÆLIA HARPOPHYLLA.

(Sale No. 6944.)

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, August 6 at half-past 12 o'Clock precisely, by order of Mr. F. SANDER, a very grand importation of

LÆLIA HARPOPHYLLA,

just received per steamer *Elbe*, and in extra condition. Fine masses, and very healthy sound plants make this lot the best yet offered. Also a splendid lot of

CATTLEYA SCHILLERIANA,

also in fine condition.

On view the morning of Sale, and Catalogues has.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

The Livepool Horticultural Co. (John Cowan), Limited.

GRAPE VINES. Have this season a stock of GIGKEY VINES which never been surpassed, if indeed equalled. Are intending purchasers are requested to come and see them during the growing season. The Black Hamburgs for fruiting in Pots are especially fine, and the entire stock are from eyes this season. Planting Canes, 5s. and 7s. 6d. each; Fruiting Canes, 10s. 6d. and 12s. 6d. each.

TEA ROSES. The Company have a very large stock of TEA and NOISETTIE ROSES, comprising all the leading varieties. The plants are healthy and in good condition for sending out. 12s., 18s., and 24s. per dozen.

MANURE. COWAN'S VINE and PLANT MANURE. This is too well known to need recommendation. 15s. per cwt.

ORCHIDS. The Company have a large stock of established and imported ORCHIDS, all in fine condition, and they are constantly receiving fresh importations from various parts of the world.

CIRCULARS WITH FULL PARTICULARS ON APPLICATION. Special Prices to the Trade.

THE VINEYARD and NURSERIES, GARSTON, LIVERPOOL.

ROSES

IN POTS; all the best New and Old English and Foreign sorts, from 18s. to 36s. per doz.

Descriptive LIST free on application.

FERN NURSERY, SALE, MANCHESTER.

Clapton Nursery, London, E.
Bush Hill Park Nursery, Enfield, N.

At the above-named Nurseries are cultivated, in unusually large quantities, Azaleas, Bourdianas, Camellias, Chamaelirium, Cyclamen, Episcias, Ericas, Ferns, Ficus, Flowering and Decorative Plants in variety; Fruit Trees, Gardenias, Geraniums, Grape Vines, Greenhouse Plants in variety; Palms, Pelargoniums, Rhododendrons, Roses, Shrubs, Stove Plants in variety, &c.

ORCHIDS A SPECIALTY.—The stock at the Clapton Nursery is of such magnitude that without seeing it, it is not easy to form an adequate conception of its unprecedented extent. The glass structures cover an area of upwards of 237,000 feet superficial.

HUGH LOW & CO.
cordially invite Gentlemen interested in Horticulture to inspect the Nurseries.

CUTBUSH'S MILL-TRACK MUSHROOM SPAWN.—Too well known to require description. Price 6s. per bushel (1s. extra per bushel for package), or 6d. per cake; free by Parcel Post, 1s.

None genuine unless in sealed packages and printed circular directions enclosed, with our signature attached. **WM. CUTBUSH AND SON** (Limited), Nurserymen and Seed Merchants, Highgate Nurseries, N.

WHOLESALE BULB CATALOGUE.

Contains List of all varieties of English, Dutch, and French grown Bulbs, including the following:—

- ANEMONES**, all the best varieties.
 - CHIONODOXA LUCIDIFLORA**, including the newest variety.
 - CROCUS**, all named varieties, and mixed.
 - FREESIA REFRACTA ALBA**, beautiful white sweet-scented.
 - HELLEBORUS NIGER**, Christmas Rose. [Cape bulb.]
 - HYACINTHS**, all colours, named, for pot, glasses, or bedding.
 - IRIS**, all the best varieties.
 - IXIAS**, handsome showy spring flowers.
 - LILIES**, all the leading named sorts.
 - NARCISSUS**, Polyanthus varieties.
 - NARCISSUS** and **DAFFODILS**, in forty varieties.
 - SCILLAS** and **SNOWDROPS**, including the newest varieties.
 - TULIPS**, Double and Single, in great variety. [of the latter.]
 - WINTER ACANTHUS**, bright yellow, the first bulb to bloom after Christmas.
- May be had on application. Please compare our prices before sending your orders abroad.—**WATKINS AND SIMPSON**, Seed and Bulb Merchants, 13, Exeter Street, Strand, W.C.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 1, 1885.

HARTWELL.

THE ancient seat in Bucks known from an early period in history by the pleasing name of Hartwell, came into the possession of the present owners by the marriage of their ancestor, Sir Thomas Lee, with the heiress of Hartwell, who was a Hampden, one of the family who owned Great Hampden before the Conquest, the Lees being as old, since they belonged to the ancient family of Leighs, of Legh and Lyme in Cheshire. Sir Thomas built the old house on the site of an older one in 1570, and since the time of his successor—the first baronet, the Sir Thomas Lee who died in 1699, and was a country gentleman of mark, father of a Lord Chief Justice of England—the gardens have afforded examples of the several styles that have been in vogue, from the formal Dutch to the modern English.

The house has been much altered by the improvements of successive generations, while the 70 acres of ground around it have changed too, by the substitution of fine timber and flowerbeds for the clipped and architectural Yews and the artificial parterres and terraces which first came into fashion two centuries ago, and have now been swept away by the broom of improvement as ruthlessly as leaves are brushed from a lawn. The specimens of Oaks and Elms and Planes, Cedars of Lebanon, Limes, and Abies are exceedingly handsome, and render the place as pleasing as any site in this butter-making fall of the Vale of Aylesbury can be.

A very interesting event in the history of Hartwell occurred when it became the refuge of King Louis XVIII. and his court. It was during several years crowded by members of the royal family of France, and of the highest nobility, who were packed away at Hartwell in exceedingly close quarters, including the King, the Queen (who died here), the Comte d'Artois, the Duc and Duchesse d'Angoulême, Duc de Berri, Duc de Grammont, and other dukes and duchesses, besides counts, barons, chevaliers, abbesses, physicians, and their domestics, numbering, all told, 140 as the usual family, and sometimes 200 when company arrived: only the ingenuity of the French could have accomplished such a squeeze. But for six years Hartwell remained a happy as well as overflowing household. Most of the rooms and closets were subdivided, while the adjacent cottages were also occupied by those who had hitherto been accustomed to the best salons of Paris. A French gentleman, however, is a cheerful personage, easily amused, "tickled with a straw," and until another Revolution brings to Hartwell another such a company from Paris, such merriment as enlivened that rather dreary neighbourhood will hardly be repeated there. We sometimes say of the residences of farmers in England, *manoir odor*, and the same may be said of the mirth, music, and dancing at Hartwell during the residence of the French. The example of the King was admirable, for the "royal sage of Hartwell"

was not merely a scholar and philosopher, but a gentleman noted for his *savoir vivre* and wit.

During the ownership of the late Dr. Lee, to whom I was introduced many years ago, and whom I showed my museum and observatory, his friend Admiral Smyth, an antiquarian and archaeologist, prepared a learned volume entitled *Edes Hartwelliana*, which I have read and, I fear, forgotten. Another and more popular account of Hartwell and of a visit to the French King, by the well known author of the *Greville Memoirs* (vol. ii., p. 345), by Mr. Greville himself as a youth of eighteen, with his father, is as follows:—"About ten years ago my father and I went to Hartwell by invitation of the King. We dressed at Aylesbury and proceeded to Hartwell in the afternoon. We had previously taken a walk in the environs of the town, and had met the Duchesse d'Angoulême on horseback accompanied by a Madame Choise. At five o'clock we set out for Hartwell. The house is large, but in a dreary, disagreeable situation. The King had completely altered the interior, having subdivided almost all the apartments in order to lodge a greater number of people. There were numerous out-houses, in some of which small shops had been established by the servants, interspersed with gardens, so that the place resembled a little town."

They were conducted by the Duc de Grammont into a small private apartment hardly larger than a closet, where the exiled King received them most graciously and shook hands. Pictures of the late King and Queen, Madame Elizabeth, and the Dauphin, Louis XVII., hung on the walls. The King continued rather oddly during the audience, swaying his body backwards and forwards—a habit which, in so small a cabin, caused in the elder visitor sensations resembling sea-sickness. After the interview the whole party assembled in the *salon*, a large room, which, at that time, had a billiard-table at one end, and here the visitors were presented to the Duc and Duchesse d'Angoulême, the Duc de Berri, the Prince and Princess de Condé, and a number of other Ducs and notabilities, including the Duchesse de Siron, a little old *dame d'honneur*; to Madame d'Angoulême, and the Archbishop of Reims, an infirm old prelate, a martyr to the *tic douloureux*. Soon after six dinner was announced, and the party passed into the adjoining room, the King walking out first. The dinner consisted of a few dishes only, and two sorts of wine—port and sherry, the native vintages of France not being represented. But the King himself did the honours, and the repast, though plain, was agreeable, being seasoned by the civility of a monarch.

Mr. Greville gives an interesting account of the habits of the illustrious exiles and their friends. After dinner, which lasted but a short time, the ladies and gentlemen all got up together. Each lady folded up her napkin, tied it round with a bit of ribbon, and carried it away, and all present, Ducs as well as Duchesses, returned to the drawing-room and drank coffee. After a quarter of an hour's conversation the King retired to his closet, and the rest of the party followed his example, and sought their private apartments—but not for bed! The Grevilles were taken to the Duc de Grammont's apartments, where they drank tea, and in about three-quarters of an hour they went to the apartment of Madame d'Angoulême, where most of the party were assembled, and where they remained about a quarter of an hour. All then descended to the drawing-room, where several card-tables were laid out, and the King played whist with the Prince and Princess de Condé and Mr. Greville, the King settling the points of the game at *le quart d'aix shilling*. The rest of the party played billiards and ombre. A very gracious invitation from his Majesty to remain the night instead of returning to the inn at Aylesbury induced them

to sleep at Hartwell, after due warning as to the slender accommodation. "I fear you will be *très mal logés*," said the king, "but one offers what one can."

They retired at 11 o'clock, and *très mal logés* they were! Among their endless experiences some of the family had adopted roof gardening—that is, they had carried up some earth, and had planted some little gardens, and in the morning, just as Mr. Greville, the elder, had arisen from his couch, an old woman on the roof rove in view upon the leads just outside his window, where she remained—an elderly Eve, tending her plants—while he dived hastily beneath the clothes again.

At ten they breakfasted, and at eleven took leave of the King, who then went to mass, according to his custom, while they went to town. And so time slid at Hartwell. In 1811 Gustavus IV., the dethroned King of Sweden, visited the King, two crownless monarchs together! Our "royal sage" remained expectant, and the drama on the Continent proceeded. At the birth of the King of Rome he observed in one of his clever and animated letters, "So then we have a babe in the Napoleon family!—all the babes in the world will not prevent the overthrow of iniquity."

The prediction came true. The Allies entered Paris, and Louis all at once became *Le Désiré*. The family were at prayers at Hartwell on the morning of Lady Day, 1814, when the rumbling of wheels approaching rapidly disturbed them, and two post-chaises and four, followed soon by other carriages, containing deputies from Paris and Bordeaux, bearing the white flag of the Bourbons, dashed up to the door. Louis received his visitors in the library, signed a declaration which Talleyrand had suggested, and presently became king.

Modern gardening on a costly scale is not carried out at Hartwell now, but the beauty of pleasure grounds depends quite as much on shrubs and trees and permanent subjects as on that kind of gardening which is fugitive in its effects; and those owners are fortunate whose predecessors were not unmindful of posterity.

H. E.

New Garden Plants.

ADIANTUM CUNEATUM ELEGANS, n. var.

FRONDS triangularly cordate as in the type; pinnales (ultimate) very narrowly cuneate, for the most part slightly oblique or incurved, the upper margin undivided or more usually bilobed, occasionally trilobed; sori one, two, or three, on each pinnalet, according to the absence or presence of apical lobes, each surrounding the base of an apical notch, roundish reniform; indusium pallid, of the same form, entire.

This is an elegant variety of the old favourite evergreen Fern, *Adiantum cuneatum*. Its fronds are about the normal size, the specimens before us having a dark glossy tips of about 6 inches long, and a triangular frond or lamina measuring about 9 inches in length and as much across the base. The pinnales, which are ovate, triangular, have a distinct stalk, and the whole frond has a light and open appearance owing to the pinnales being rather widely set on the hair-like divisions of the fronds. The pinnales are quite small, the larger ones not exceeding one-fourth of an inch in length, and one-eighth of an inch across the widest part at the tip, while many are not half this size; their form is narrowly wedge-shaped and usually they are slightly oblique or laterally curved, being curved inwards towards the rachis. The smaller ones are undivided and have a solitary sorus, with its roundish reniform, pale-coloured, entire indusium; the medium-sized ones are usually parted into two lobes, each lobe bearing a sorus; and the larger ones are parted into three lobes, all fertile.

The three fronds before us are quite uniform in character, so that the variety may be considered as a fixed one; and the light airy appearance which its small

and wide-set pinnales give to it, give it a perfect claim to the title of elegance which we propose to apply to it. Less dense than the typical form and less gossamer-like than the variety gracillimum, it is about intermediate between the two, perfectly distinct and equally effective as a decorative plant. It was raised by Mr. C. Kershaw, of Slead-Syke Nurseries, near Bighouse, who will probably in due time be prepared to distribute it. *T. Moore*.

SEDUM FORMOSANUM (N. E. Br.), n. sp.

This is an exceedingly pretty and rather graceful species, which is now making a fine show in the Succulent-house at Kew. It is a native of Formosa, where it was collected in June, 1884, by Mr. C. Ford, and sent to Kew. It is an annual species, and likely to be useful for outdoor effect. The only species known to me with which it is likely to be confused is the Chinese *S. Alfredi*, Hance, but it is easily distinguished from that plant by its erect carapels, since in *S. Alfredi* they are widely divergent.

Annual, quite glabrous, growing to about 6 inches high; stem repeatedly branched from near the base in a trichotomous or dichotomous manner, with divergent branches, the ultimate branches recurving, very indistinctly tetragonal, with a groove down two of the faces, very pale green tinged with red. Leaves 1—3 in whorls at the branchings of the stem, with occasionally 1—3 on the long internode between the points of branching, 1—1½ inch long, ½ inch broad, flat, spatulate, obtuse, recurving towards the apex, softly succulent, bright green above, paler beneath, midrib distinctly impressed. Flowers sessile (except those in the primary forkings of the stem, which are sometimes pedicellate), bracteate, bracts like the leaves, but smaller; calyx green, sepals unequal, 1—2 lines long, fleshy, spatulate, obtuse, spreading; corolla bright yellow, petals lanceolate acuminate, channelled down the face, very spreading; stamens shorter than the petals, filaments yellow, anthers at first red, afterwards black; hypogynous scales minute, sub-retangular, pallid; carapels erect in flower and in fruit, with short subulate slightly recurving styles. Formosa; Oldham, 255 (112 Kew distribution)!; Wilford, 523! *N. E. Brown*.

ÆRIDES LOBBI, Hort. Veitch (Mr. Cypher's variety).

I have seen enough of *Ærides Lobbi*. It has flat leaves, a panicle inflorescence, and spotted flowers. It is in remarkably great perfection at Hamburg in the very fine collection of Herr H. von Ohlenhoff, under the care of Mr. Blythe, an excellent Orchid grower, once of the establishment of Messrs. J. Veitch & Sons. Mr. J. Cypher, Cheltenham, Queen's Road Nursery, sends a very curious specimen. The leaf is rather narrow for *A. Lobbi*—of course, flat. The inflorescence is not a panicle, but a very long raceme with large flowers, covered with remarkably dark purple spots and stripes. The lip is so covered with rows of spots that it appears at a distance to be self-coloured purple, with the exception of the white narrow margin. It would be very interesting to learn whether there are many such plants, and whether they will keep constant in future as to the simple, not panicle raceme. *H. G. Rehb. f.*

MORMODES LUXATUM PUNCTATUM, n. var.

A variety, whose whitish flowers have numerous small reddish spots on the inner side of the sepals and petals. It was kindly sent me by Mr. F. Sander. *H. G. Rehb. f.*

LELIA ELEGANS PLATYCHILA, n. var.

Near *Lelia elegans* praesita; sepals and petals narrow, and without any green paint. Lip remarkably broad, and nearly confluent, I had it from Mr. F. Sander, who tells me it was grown by John F. Riley, Esq., of Burnley. *H. G. Rehb. f.*

LILIUM BROWNII (Mulle) VAR. VIRIDULUM, Baker.

This appears to be a well-marked variety of this species, which is the plant I formerly (*Journ. Linn. Soc.*, vol. xiv., p. 230) supposed to be the *Lilium japonicum* of Thunberg, but which the authentic specimen in Thunberg's herbarium shows to be really what has of late years been called *L. Krameri*. From the typical *L. Brownii*, as figured in the *Flore des Serres*, t. 47, the present differs in the creamy-white colour of its flowers, which are tinged on the outside with yellowish-green, with only a faint dash of claret-brown. The leaves are much broader and shorter than in the type, those of the upper part of the stem being only two or three inches long by an inch broad, oblong-lanceolate instead of lanceolate. It has been imported from Japan by Mr. T. S. Ware. *J. G. Baker*.

HARDY FLOWERS IN JULY.

The hot sun has made the succession of flowers very rapid, but, with the help of the water-pot, the garden has continued gay through July. I mention a few plants in flower on July 25, selecting some which are not in universal cultivation:—

ASTRANTIA HELLEBORIFOLIA.

The only one of the genus, as far as I have seen, of which the flowers have a decided colour, and in the species they are good pink. It is a native of the mountainous regions between the Black and Caspian Seas. The leaves are divided in the centre into three equal ovate acute lobes. The flowers are as large as those of *A. major*, but less freely produced. It runs fast underground.

GERANIUM ARMENUM.

A very handsome plant in a sunny season like this. Several plants here, 4 feet high and 6 feet across, make a great display. The flowers are larger than those of any other Geranium, and are produced in abundance. It does best on a dry raised bed, and where it has room to spread to the ground all round the centre. It may be cut up in autumn, and pieces grow rapidly. It ripens seed in good seasons, fertile seed being easily distinguished. The seedlings flower the second year.

GERANIUM WALLICHIANUM.

A good Himalayan plant, doing well in a dry and well-drained soil like that of Kew, where it occupies a large share of the Geranium bed in the herbaceous garden. It is a prostrate, wide-spreading plant, doing well on the edge of a bank. The flowers are large and prettily marked with conspicuous black veins. They vary in different plants from dark blue to pink. The kind is increased best by seed.

HYPOCHERIS MACULATA.

A rare native plant, and a very effective subject for a sunny border, where the soil is deep and dry. It has large handsome spotted leaves, the shape of those of the common Cat's-ear. The stalk is stiff, and about 2 feet high in cultivation, branching into three or four large flower-heads of bright golden-yellow. It continues long in flower, bearing all weathers well, and is universally admired, though seldom seen in gardens. It is perennial, but should be grown from seed.

OBONTOSPERMUM MARITIMUM.

Though not quite hardy this beautiful plant, from Southern Europe, is a most desirable addition to the summer garden. Cuttings may be taken in September and wintered in a cold frame, and the plants put in deep sandy soil in a hot sunny part of the garden in May. The habit of the plant is compact and excellent, and the flowers continue to be produced so abundantly until the end of summer as to overlap one another. They are of remarkable regularity, and bright clear yellow.

SENECIO LEUCOPHYLLUS.

A species from the Pyrenees, with much crimped, very silvery leaves, rising not more than 3 inches from the ground. The chief merit lies in the foliage, the flower being like that of a small Ragwort.

SENECIO MACROPHYLLUS.

This plant is often called Ligularia, and is a fine conspicuous subject for a back row. The leaves are large and glaucous, shaped like those of Horse Radish. The flower-stalk is 6 feet high, bearing a tuft of yellow flowers, like a magnified Golden Rod, 2 feet long and 1 foot through. I recollect, when there was a long walk of flowers at Hale Farm Nursery, thinking these the most effective plants in the row. The Caucasus is the native country.

SENECIO JAPONICUS,

called also *Frythochæte palmatifida*, or red-haired, with palmate-cleft leaves, a name which describes the orange-yellow of the flowers, as well as the broad characteristic leaves with five deeply cut lacinated segments. It flowers best in sheltered and sunny situations. Like nearly all Japanese plants it is liable to be injured in bud by cold spring winds. It flowers in umbels like a gigantic Ragweed, each flower being quite 4 inches across. The plant grows about 4 or 5 feet high.

CENTAUREA GLASTIFOLIA.

Two fine plants, with large Thistle-like flowers, compete with one another for merit as decorative; both are 5 feet high, and branch from the ground to 3 or 4 feet across; both came to me from Western Asia. One I obtained some years ago at Hale Farm Nursery by the name of *Centaurea aurea*; but it is not the plant of that name figured in *Bot. Mag.*, tab. 421, but the *Centaurea glastifolia* of *Bot. Mag.*, tab. 62, described by Boissier in his *Flora Orientalis* under the generic name of *Charitolepis*. It has a more slender growth than the following, and the flowering season is longer, but the flowers are smaller. It ripens no seed at Edge, but is easily divided.

CENTAUREA MACROCEPHALA.

figured in *Bot. Mag.* 1248, is a stouter and larger plant, having many flower-stalks, each surmounted by one flower; but fifty flowers out at a time make a great display, and plants of three or four years old have as many as that. It ripens seed in abundance, and the seedlings flower the second year. The flowers last about for a fortnight.

OX-EYE DAISIES.

This is the time for the large white Daisies of the "Ox-eye" class—*Leucanthemum*—now made a sub-species to *Chrysanthemum*—has usually been their generic name. Several are enumerated which approach so near to one another, and to our wild Ox-eye (*C. vulgare*), that botanists have been tempted to class them all as varieties of one. Two of these are prominent as the best, and I highly recommend them. Their characters are easily recognised, though they may truly say "by many names men call us." I follow the names adopted at Kew. The best and earliest of the two is

CHRYSANthemum MAXIMUM.

A native of the Pyrenees. The flower of this in cultivation is often nearly 5 inches across. The plant spreads widely from a small base; the stalks are of uneven height, varying when the plant is in flower from 2 feet outside the clump, to 3 feet, or even 4 feet, in my garden in the centre. The rays of the flower are unequal in length, giving it the appearance of a decorative star. The leaves are lanceolate near the base of the stalk, 4 inches long and 1 inch wide, and acute, generally serrated at the edges, but sometimes smooth. These become short and narrow as the flower is approached, until the highest are awl-shaped, 1 inch or less long. The plant is much improved by being pulled to pieces in autumn and replanted in good soil. This plant came to me some years ago as *C. atiatum*, a name it often bears. The true *C. atiatum* is still rarer, *C. vulgare*, and I do not know it in cultivation. *C. tripteris* is another of the names, but of no authority, by which *C. maximum* figures in gardens.

C. LATIFOLIUM.

comes into flower nearly a month later and is a larger and coarser plant, though the flowers are smaller. It is more commonly called *C. lacustris*, but its Kew name rightly describes it, as it has leaves fully 2 inches across and obtuse, becoming shorter, but not narrower as the top of the stalk is approached. The stalk is very stout and swells beneath the flower-bud. It is found wild only in Portugal. A botanical friend who lives there tells me that it is by no means common; he found a bed early this summer growing fully 10 feet high, from which he sent me seed. It germinated at once, and I now have a thick crop 6 inches high. The flowering season lasts into September. The ordinary height in my garden is 6 feet.

CAMPANULA LACTIFLORA,

a native of the mountains of Asia Minor and Armenia, is one of the finest garden plants in cultivation, if properly treated. One of them now attracts attention first of all the plants in a flower bed here. It is 6 feet high, three years old, and has about thirty flowering stalks; each of these has a dense bunch of flowers 2 feet long and 9 inches through. The colour is clear pale blue, and the whole mass makes a very effective display when properly disposed by staking and tying. Nothing can be more simple than its cultivation. Seedlings which come up here spontaneously, flower the first year at a foot high. Select the colour you like best, as they vary from blue to white, and plant them in any situation in rich soil, giving plenty of room. The root-stock soon becomes large and hard and chokes the plant, which ought not to be expected to do well for more than three or four years.

HELIUM BOLANDERI AND H. AUTUMNALE, VAR. PUMILUM.

are both excellent plants. The latter is well known and only requires management to keep it vigorous, and to prevent it running too much. The former has been distributed under the wrong name of *grandiflorum*, which, according to Asa Gray, is a synonym of the large forms of *H. autumnale*. Our plant is the earliest of its class to flower; it has a weak stalk a foot or 18 inches high, a black disc, and is certainly the *H. Bolanderi* of Asa Gray.

ASTER BIGEVOII.

was figured in *Bot. Mag.*, tab. 6430, as *A. Townsendii*, but Asa Gray, whose authority is absolute for the names of North American Composites, says that it is to be *A. Bigevoii*. It is only biennial, but well worth growing. In cold soils it is not very hardy, belonging, as it does, to the South-Western States. I find it best to sow in summer, and keep the pans in a frame through winter, planting out in May. The plants then flower all July and August. The flowers are 2½ inches across, and have dark purple rays, with a rich golden disc. The habit is branching, and the flower-stalks produce flowers early from the ground, growing 4 feet high. It is handsome and distinct.

ENOTHERA MARGINATA.

figured in *Bot. Mag.*, tab. 1593, as *E. cespitosa*, is by far the finest of its class, but many gardeners seem to lose it. I find it not difficult to keep by constant transplanting in light moist soil and an open situation. Each flower lasts only from 6 in the evening to the next noon, but the flowers are abundantly produced, and perfume the night air, showing conspicuously in the twilight. The flowering season is continued for long, the underground runners of spring becoming the flowering plants of autumn, but it must have and deserves to have ample room to develop these. *C. Wolley Dog, Edge Hall, Malpas, July 25.*

TERRESTRIAL ORCHIDS OF SOUTH AFRICA.

WHILST epiphytal Orchids are diligently sought after and carefully cultivated, the terrestrial species have been very much neglected, although among them are many that are equally beautiful as a number of the epiphytal species, which are so highly prized and high priced. The reason of this may possibly be because it has generally been found that, after flowering, the plants fail to appear again in the succeeding season; but how far this is due to natural causes, not understood, and how far to ignorance of the proper method of treatment, remains to be discovered. Probably both causes have operated, for it is well known that some species will appear, and flower in abundance during one or two seasons in their native habitats, and then be seen no more for several years; I have observed our English Orchis ustulata do this in the neighbourhood of Reigate. But most species appear regularly every year in their native localities, and with these it is difficult to assign any other reason for failure under cultivation than that they have not been properly treated. The terrestrial Orchids are chiefly natives of the extra-tropical regions, and as some of them grow in dry situations, others in marshy ground, some at low and some at high elevations, some near the sea coast and others inland, they no doubt require different methods of treatment under cultivation to meet their several requirements; but so long as the cultivator has no knowledge of the soil, situation, climate, &c., in which the plants he has to cultivate thrive, especially—as seems to be the case with terrestrial Orchids—if they are not such as can easily adapt themselves to different conditions, he may be a long while experimenting before he succeeds in cultivating them easily. With a view of giving some information upon a few of these points that may perhaps be found of practical utility, I propose to enumerate some of the finest of the South African Orchids (nearly all of which are terrestrial), giving brief descriptions, and what particulars I possess as to the conditions under which they grow, and the locality in which they are found in their wild state; adding at the end some observations as to what may possibly be the best mode of treating them under cultivation. I have chosen the South African species for these notes in preference to those of other regions, because I am better acquainted with them in the first place, and, secondly, because I learn that during the last year or two some importations of them have taken place, but I believe with not very successful results hitherto.

There are, however, in Europe, Australia, New Zealand, and Chili, numerous other terrestrial Orchids of as much interest and beauty as the South African ones. Mr. Elwes has recently drawn attention to some of them in these columns, dealing more especially with the European species, and if desirable I may on a future occasion give some account of those from other regions in the same way as I here deal with the South African species.

For notes relating to the soil, situation, altitude, &c., of many of the Cape peninsula species I am greatly indebted to Mr. H. Bolus, of Cape Town, and the sentences placed between inverted commas are copied from his notes. Mr. Bolus is making a special study of the Cape Orchids, and his information may therefore be taken as about the best that can be obtained.

In South Africa there are about thirty genera of Orchids, out of which only about half a dozen contain epiphytous species, the rest being terrestrial. Of the epiphytous there is a Megacelinium, an Ansellia, a few small-flowered species of Angreæum, Mystacidium, and Polystachya, and a Cymbidium, some of which are worthy of cultivation, and a few have already been introduced. Of the genus Cymbidium there are also terrestrial species. In the following enumeration the brief generic characters are chiefly taken from Harvey's *Genera of South African Plants*; and I have arranged both genera and species alphabetically for convenience of reference. As most of the genera belong to the tribe Ophrydæ (which has granular pollen), the pollen masses are only described in those genera belonging to the other tribes. Besides the species mentioned there are numerous others more or less worthy of cultivation, and likely to be introduced.

BARTHOLINA.

Sepals and petals erect, narrow. Labellum spurred at the base, very deeply cut into numerous thread-like segments. This curious genus contains only the two following species. The leaf is solitary, and the stem bears but one flower:—

B. Ethelæ, Bolus.—Remembers the following species in general appearance, but the petals are pale bluish, and the lip pallid, with greenish-brown flumens ending in a white knob. Found in similar places to the following, but rarer: flowering in December.

B. pectinata, R. Br. (*Bot. Rec.*, t. 1633).—A curious and interesting plant, which, grouped in a pot, would be very striking. It has but one roundish cordate, glabrous, dilated leaf, spreading on the ground, and a hairy stem 4–6 inches high, bearing one flower $1\frac{1}{2}$ inch in expanse. All three sepals are erect and green; the petals and pectinate part of the lip are light violet, the middle part of the lip being green. This grows "among shrubs, most copiously close to the sea, in well drained light soil" on the Cape peninsula and elsewhere, flowering in September.

CALANTHE.

Sepals and petals subequal, free spreading. Labellum spurred, rarely spurless, three-lobed, and with the middle lobe notched, lamellate or tubercled on the disc. Pollen masses 8, waxy, much narrowed at the base, adhering in fours to a two-partite gland. Only one species (*C. natalensis*, Rchb. f.) in South Africa, confined to Natal and the South-eastern districts. It is a very handsome plant, with broad plaited acute leaves, which are produced at the time of flowering, and a flower-stem, 12–18 inches high, bearing numerous bright lilac-coloured flowers about an inch in expanse; the inner face of the sepals and petals are whitish, and the labellum, after two or three days, changes to salmon-colour. It grows in swamps in forests, and, therefore, requires shade and plenty of moisture. This species is now in cultivation: see *Gardeners' Chronicle*, p. 78 of the present volume.

CERATANTRA.

Old sepals and petals united into a hood, which is usually in front of the flower, and pendulous; lateral sepals free, spreading. Labellum clawed, reniform or lunate, adnate to the column, with or without a fleshy appendage. Column horse-shoe-shaped. A small genus, natives of the western districts of Cape Colony. The roots are fasciated and fleshy; the whole of the stem is clothed with very narrow leaves, and the curious flowers are more or less yellow in colour. All of the species are probably worthy of cultivation, but the following appear to be the finest:—

C. bicolor, Sond.—About 6 inches high; leaves

fewer than in most of the species, linear or linear-lanceolate, lax. Flowers 1–8 in a lax spike, about $\frac{3}{4}$ inch in expanse; dull yellow, the sepals yellowish-green; labellum reniform, with a quadrate greenish fleshy appendage on the disc. Moist grassy places, in sandy soil, on Table Mountain, &c., at about 2000 feet elevation. It flowers in December.

C. chloroleuca, Eekl.—A fine species, 6–12 inches high, stem well clothed with linear-lanceolate leaves. Flower-spikes 3–6 inches long, dense. Flowers $\frac{3}{4}$ inch in expanse, yellow. Labellum with a purple quadrate appendage on the cordate-lunate expanded part. To judge from dried specimens this ought to be an ornamental plant in cultivation. It grows in moist sandy soil on Table Mountain, at 2400 feet elevation, and elsewhere, and flowers in November and December.

C. grandiflora, Lindl.—In general appearance this resembles *C. chloroleuca*, but the spike is shorter and broader, and the flowers larger. The reniform expanded part of the lip has no fleshy appendage upon it. It grows at low elevations on sandy plains in the vicinity of Algoa Bay, &c.

C. Harveyana, Lindl.—This resembles *C. bicolor* in general appearance, but differs in its small triangular-lunate acute lip, which is also provided with a fleshy appendage. The sepals are green, and the rest of the flower yellow. Moist grassy places on Table Mountain, at about 2000 feet elevation, flowering in December. (N. E. Brown.)

(To be continued.)

CHARD NURSERIES.

CHARD, horticulturally, was almost unknown until a few years since, when Mr. Jarman came there and started a nursery business. The seed business was carried on by the late Mr. Jarman and his son, the present proprietor, for upwards of sixty years, but the gradual increase of business rendered the management very onerous, so that it became a necessity for the successful prosecution of the affair to start a nursery. The first tree was planted by Mr. Jarman's eldest son on March 28, 1884, on a piece of land near the town, which has been named Springclose Nursery.

I was not a little surprised recently, on being shown round the nursery by the manager, Mr. Lenge, to see the stock of useful stuff already got together, and ready for sale. A collection of choice Conifers looked very healthy, and, to judge from the quantity of Rose stocks prepared for working this summer, the Rose trade is intended to be made a great consideration; over 250 varieties of the best sorts are already in stock, and about 10,000 stocks will be worked this year. Perennial Phloxes and Pæonies are planted largely; a large space is allotted to Kibuhar—New Queen, Early Albert, Lioness, and Victoria being the sorts planted. Better soil could scarcely be found for a nursery, being a fibrous loam of great depth and good quality.

I was much struck with the lowness of the roofs of the houses, which from outside seemed to be rather flat; but was informed that the angle adopted was considered quite sufficient to throw off rain and avoid drip. The buildings have been carried out by a builder of the locality from plans furnished by Mr. Jarman, whose great object was to erect houses that would ensure good sturdy growth; and I think this idea will be fully realised. The houses being somewhat scattered three boilers are used for heating, having more than 4000 feet of 4-inch piping connected to them, and are arranged so that each house can be heated separately if necessary. One is a span-roof house, 27 by 10 feet, chiefly filled with *Ericas*. Another is a span 35 by 16 feet, used for propagating purposes. It contained a fine stock of *Ixoras*, *Crotons*, *Coleus*, *Eucharis*, *Ferns*, and a large batch of seedling *Gloxinias*, and tuberous *Begonias*, from which some fine flowers are expected. Near this house is a long range of pits and frames filled with various kinds of plants. One span-house, 35 by 16 feet, is used for growing pot *Roses*, *Tree Ferns*, *Bouvardias*, *Azaleas*, and *Camellias*. *Pelargoniums* are cultivated in another large span-roof house, *Adiantums* are grown in quantity, and *Stephanotis*; and in a lean-to was a useful lot of plants for decoration—amongst them fine specimens of *Adiantum gracillimum*. A lean-to, 25 by 30 feet, was filled with zonal, tricolor, and other *Pelargoniums*, with *Tea Roses* in pots. Another span-roof, 30 by 20 feet,

is to be used for seedling *Calceolarias*, *Cinerarias*, and *Primulas*.

I hope Mr. Jarman will receive the well deserved support of all in the locality; his energy in starting such a business in such a sleepy place as Chard being most commendable. The good folk of the town and neighbourhood can now buy pot plants, &c., since Mr. Jarman has opened his nursery, but before they could only purchase such things on the weekly market days. To meet the demands of a very fast increasing trade a more central position in the heart of the town has been purchased to erect a commodious seed shop and stores. *R. Andrews*.

HETEROTOMA LOBELIODES.

THIS is at once remarkable for its showy flowers and for their singular structure. It is a Mexican plant, herbaceous or woody at the base, with alternate stalked lanceolate leaves, and numerous flowers in loose terminal racemes. Each flower is about 2 inches in length, raised on a slender stalk, and of an orange-crimson colour, the tips of the corolla being light yellow or greenish. The extraordinary shape of the flower arises from the great inequality of the receptacular tube. The flower-stalk expands at the summit into a flat bowl-shaped dilatation, at one end of which are three small calyx-teeth, while at the other are two smaller ones. The corolla is tubular, split down the back, and ligulate, as in *Lobelia*, prolonged at the base into a long spur, adherent to the anterior or prolonged part of the receptacular tube. Four of the five stamens originate from the throat of the corolla tube, the fifth is prolonged into the long spur of the corolla. The anthers are coherent, two of them provided with a fringe of hairs at the top, three naked. The anthers open by pairs at the top behind the fringe of hairs, and liberate the pollen prior to the ripening of the stigma. The ovary is two-celled with numerous ovules, as in *Lobelia*. The singularity of the flower is thus brought about by the disproportionate growth of the receptacular tube on one side, which then drags with it two of the sepals and one of the petals—the latter in the form of a spur. The plant makes a very handsome greenhouse plant, though it is not often met with. Mr. Moore, of the Chelsea Botanic Garden cultivates it every year with a degree of success satisfactory to the gardener, but perhaps not so much to the taste of the botanical pupil, to whom the peculiarities of the flower must prove somewhat formidable. It is not mentioned in Mr. Baines' recent work on stove and greenhouse plants, though amply worth including in any choice collection. Seeds may be raised on a hotbed, and the plant grown in a compost of peat and loam. (Fig. 28.)

Notices of Books.

Dictionnaire des Roses, ou Guide Général du Rosériste (*Dictionary of Roses, or General Guide for the Rosarian.*) Par Max Singer. Tournai: Max Singer.

In two thick volumes M. Max Singer, a Rose grower of Tournai, has laid before the reader a descriptive catalogue of 6000 Roses. To each Rose has been appended, so far as possible, the name of the raiser, the date of introduction into the trade, the section to which it belongs, a description of the bush, the nature of the foliage, the colour of the flower, &c. The author recognises that his book is not perfect, and submits it to the judgment of the critics. "I shall listen," says he, "to the observations of proficients, I shall follow the advice of competent counsellors, and I shall laugh at those who will find fault and scold for the pleasure of fault-finding and scolding." Thus warned we proceed to cut open the pages of the book, but with a feeling of frank independence as great as that of the author we declare our opinion that the critic who troubled his head about whether the author listened to his criticisms, heeded them, concerned himself with M. Max Singer's hilarity, or cared for anything but the book before him, would be unworthy of his office.

To the book, then. The first fifty-five pages, devoted to what the author calls *raees et espèces anciennes*, are probably the worst in the book. The author makes use of the terms species, races, varieties, sub-varieties, in the vaguest fashion. If we were

to say that the town of Tournai was a continent, that the province of Hainault was a village, the kingdom of Belgium a parish, the continent of Europe a commune, we should use geographical terms in the same vague fashion that the author applies botanical terms. It is true that such carelessness is by no means peculiar to the author, but is general to books written by and for horticulturalists. By way of illustration we may mention that *Rosa rugosa* is given as a variety of *Rosa ferax*, and a native of Japan, from which country it has never emerged (*sortie*)! In like manner *Rosa involucrata*, *Lyellii*, *microphylla* are referred to *Rosa ferax* "third species, 1 race," and other species are similarly treated. The author is of course entitled to his own opinion, and he may laugh as long as he likes at those who differ in opinion from him. For our

Veitch, Curtis, Prince, and other great rosarians seem not to have been seen, or, if so, they are not alluded to in the list of *ouvrages consultés*.

Glancing down the list of names we find "Madames" occupy seventy-six pages—a proof that rosarians prefer expanded blooms to Rose-buds, for "Mademoiselles" only occupy twenty-one pages, while "Monsieurs" only seven. But then the "Mistresses" and "Misses" and "Misters" are given separately. Still, in any case, the complimentary dedications to the wives are far more numerous than to the husbands or their daughters; doubtless this is done "with an eye to business." There is one "Grand Papa" and one "Grand Maman." Seven pages are devoted to "Generals," almost all French, one or two English, one American, one German. A page suffices for the

Here and there we find illustrations of the same name having been applied to two Roses of the same class, thus there is a H.P. Alfred Colomb, sent out by Lacharme in 1863, and another H.P. of the same name sent out by Ducher in 1852. The latter name of course ought to have priority, but in the topsyturvy nomenclature of gardens the rules of priority have been honoured in the breach. English names are mutilated in the usual manner, perhaps not more so than foreign names are with us, *e.g.*, Paul Neyron, which we usually but erroneously write P. Neron, or Charles Lefebvre, in which the b is too often omitted. But in a Rose catalogue of this pretension we do not expect to find Reverend H. Dambrain, or Reynolds-Holle, Khuston Radclyffe, Standisch, Docteur Hoog, Docteur Hoocker, Duke of Edenburgh (p. 260), Duc

FIG. 28.—*HETEROTOMA LOBELIOIDES*: FLOWERS SCARLET AND YELLOW. (SEE P. 136.)

parts it is a pleasure to get away from these fifty-five pages and enter upon the more substantial and useful part of the book. This consists of more than 800 pages of valuable information, by the side of which the fifty-five preliminary ones are as nothing. We have, in fact, in alphabetical order, a descriptive list of an enormous number of Roses with indications of the class to which they belong—a brief description of their characters, and frequently the name of the raiser, and of the nurseryman by whom it was first introduced to commerce. The catalogue is very full; but it is remarkable, that of our rich rosarian literature, the author seems only to have seen one English catalogue, and the name of that is misspelt. M. Max Singer ignores *in toto* the excellent catalogues of the National Rose Society; the works of W. Paul, Rivers, Shirley Hibberd, Reynolds Hole; the catalogues of our Pauls, Cranstons, Rivers, Turner,

"Captains;" "Admirals" occupy but little more space, which would seem to indicate that the navy is not very popular in France; "Counts" take up four or five pages, "Countesses" ten or eleven, "Rois" two, not forgetting that Roi d'Yvetot so much better known out of history than in it; "Dukes" six, "Duchesses" eight, "Emperors" one, while of "Empresses" only two are mentioned; but there are some fifteen "Impératrices." Six or seven pages are attributed to "Princesses" and "Docteurs" respectively, while there are thirteen mournful entries in the shape of "Denils" and eighteen pages of "Souvenirs"—one called *Souvenir du Centenaire de Lord Brougham*. Happily for label writers there is only one "Fiançailles"—*Fiançailles de la Princesse Stephanie et de l'Archiduc Rodolphe*.

These figures, apart from any intrinsic interest they may have, will exemplify the scope of the book.

of Edinburgh (p. 272), or Georges Backer. James Veitch is lucky, but his son "John Veitch" has not escaped the usual fate among those who use the French language.

The following extract, relating to a Rose which has been shown in fine condition this season, will show the author's plan:—

H.P. MERVILLE DE LYON, Pernet, Sen., 1882.—Growth vigorous, wood with stout straight prickles, foliage fine bright green, thick-set; flower very large, full, cup-shaped, colouring pure white, petals large, rounded, flushed in the centre with satiny-rose, always solitary; a seedling from Baron Rothschild, of fine appearance. The flower sometimes exceeds 4 inches in diameter."

The woodcut illustrations are coarsely executed, badly printed, and apparently not original, though the source whence derived is not given. We have felt it

our duty to make some comments on this dictionary in accordance with the invitation in the preface, but we should be conveying a wrong impression if we did not give the author full credit for his diligence. In a book of such scope and magnitude errors are inevitable. We cordially say "Yes" to the author's last question in the preface, and say that he has rendered such service to rosarians by the publication of these volumes that no rosarian can afford to do without them.

The Science of Agriculture. By F. J. Lloyd, F.C.S., Longmans.

This volume, we are told, consists mainly of a reproduction of some lectures given at King's College, London. The author begins at the beginning, and gives his readers some notion as to the nature and constitution of the earth and the air, proceeding then to manures, vegetable physiology, the management of farm crops and dairies, and terminating with a chapter on climate.

The chapter on physiology is disappointing and not altogether trustworthy. We do not think any physiologist would be satisfied with the definition of the nucleus as that given by Mr. Lloyd, "an small spot of dark matter." Again, though the author probably did not intend it so, his account of protoplasm reads as if that substance were confined to single cells, and that when cells are aggregated together, they either contain no protoplasm, or it is subjected to modification. Seeds are said to "possess two distinct parts—an embryo and a perisperm, enclosed in a coat or covering called the integument." But in the paragraph immediately after the one cited we read of the Bean, which certainly has no perisperm. In another place we are told that the vascular bundles of long cells and vessels run "the whole length of the stem and branches, open up a network of passages, and form a communication between the various parts of the plant, as our veins and arteries do throughout the various parts of our body." The account of stomata is equally curious, as well as the statement that "certain diseases of a fungoid nature invariably commence at the stomata of the leaves." The account of the diseases of plants is meagre in the extreme; and the selection and improvement of cultivated plants is not treated of at all. We opened this book in the hope and expectation that we might find a handy manual of chemical and botanical science, as applied to agriculture, but we must say that our expectations have not been realised.

How to Make the Land Pay? Longman's.

In the preface to the interesting book which lies before us, bearing the above title, and published by Messrs. Longmans, Green & Co., the author, the Rev. H. P. Dunster, M.A., of Woodbastwick Vicarage, tells his readers that his sole object has been to do good. Such a declaration was hardly needed in this case, because it is evident to even the most cursory reader that the reverend gentleman realises to the full the somewhat depressed condition of agriculture, and indeed of nearly all that relates to the land, and he offers many suggestions, more or less practical, in the book in the hope that they may lead farmers and landlords to think, to break away from the beaten track of ordinary culture and cropping, and finally, by adopting some new and distinctive course, seek for that prosperity which seems for the time to have withdrawn its countenance from the landed interest. In entering upon such an undertaking it is obvious that no writer could offer practical information, the product only of his own experience. Very much which is submitted to the judgment of readers is of a theoretical nature, or is not absolutely so, has been practised only by experts, or those trained specially to market and flower gardening. On the other hand the author is not without considerable knowledge of land cropping and cultivation, and still further he has largely laid under tribute not a few others who have discussed views in relation to the land analogous to his own; hence his book becomes, not merely an instructive essay, it is largely a digest of what is already known, or has been written, on the subject. Its interest and usefulness, possibly also its practical value, are therefore by no means inconsiderable.

Our author boldly declares in favour of what may be not inaptly termed farm gardening, and it seems obvious that in advising the production of many articles hitherto esteemed outside the range of farming he favours the increase of smaller holdings, so that

actual personal labour, interest and control may be brought into play. There is a certain useful opportuneness about the issue of the book just now, because it seems to accord largely with the objects of the Small Farm and Holding Association recently promoted, and not long since referred to in these columns. Indeed, if it be proposed to diffuse amongst labourers and others anxious to purchase or rent small breadths of land, information of a useful kind to support and encourage them in such pursuit, we can strongly recommend that numerous copies of Mr. Dunster's book should be circulated, as it probably contains more information of the useful kind than any other compilation. The author is not at all charmed with the ordinary routine of land cropping as practised by farmers, for whilst he points out that many ordinary farm crops will not pay, the range of plants is of so limited a nature that much of the land is corn sick. Hence, if it is to be resuscitated and made once more productively profitable, it must be better cultivated and recropped with absolutely diverse subjects. Of these we find great stress laid upon hardy fruits, which it is thought opens up a profitable field for investment. Naturally those whose attention is being constantly attracted to the uncertainties which attend upon hardy fruit culture, look with some doubt upon the proposals thus made. The chief want in the securing of success in outdoor fruit culture is found in certain and safe seasons—conditions which nothing man can do can ensure. It is one thing to plant and to cultivate, but diverse climatal conditions may, and indeed often do, withhold the increase. On the other hand we are met by the singular fact that market growers of fruit, in spite of their many difficulties and disappointments, are yet constantly extending the radius of their fruit land; and if men who have market experience beyond that of all others are doing this, we may rest assured that others may go and do likewise. Perhaps, too, new supplies may open out new markets, especially if growers can be brought into immediate contact with consumers. In dealing with this question of "How to make the land pay" we are morally certain the solution lies as much in the direction thus pointed out as in any other. For the reason thus given we cannot but sympathise with the author in his warm advocacy of the wider cultivation of orchard fruit—bush fruit, always certain to crop well, and almost always profitable; Strawberry culture, on holding and suitable soils, especially of late sorts for sale after the usual glut is passed. There is very much that is interesting found under the head of Filbert growing meaning thereby all kinds of small nuts of course, and with respect to which much useful information is given. Of course good Filberts cannot be grown if left to take their chance in woods and amongst squirrels. We import enormous quantities of Spanish grown nuts, but should save the money expended by purchasing of our home growth, but we have too few, although it is found that good prices for our home Filberts can be obtained in the United States—a fact which should encourage many land owners to plant Filberts and Cobs extensively and place their plantations under the charge of experienced cultivators. We have plenty of land, plenty of labour, and plenty of capital; our chief want, then, is such a revision of our present land system as shall encourage enterprise. A chapter devoted to bulb growing somewhat urgently advises us to grow our own bulbs rather than encourage the Dutch growers. The author asserts that much of our own land is as good for the purpose as is that of Holland, and largely enters into methods of cultivation adopted there, to which success in bulb culture is perhaps as largely due as to soil and climate. Perhaps we have not the knowledge essential to success in this form of enterprise—perhaps we lack courage to embark in it. In any case it would not absorb any very extensive area were it entered into here. We know of one case where it was tried in suitable soil by a good cultivator, but as the produce could not be truthfully called "Dutch bulbs," the trade would not buy. On the other hand vegetable gardening opens up for the cultivator a wide range of enterprise, and very much is said under this heading which, if not new, yet is worth rereading. Naturally, in vegetable culture we find the nearest approach to ordinary farming, but to rear good marketable crops such more manure, labour, and deep cultivation are needed. To the vegetable gardener, almost more than any other, it is essential that he should have good markets within easy distance. These secured there can be little doubt but that there is an

illimitable future open to this form of market farming. Persons of restricted ideas on land cultivation will be surprised at the range of subjects which Mr. Dunster thinks well of for the purpose of making the land to pay. Thus he devotes interesting chapters to Mushroom, Sugar Beet, Osier, and even Watercress culture; and of allied garden subjects, considerable stress is laid upon bee-keeping, poultry, and rabbit farming, &c., and, not least, the production of milk, butter, cheese, bacon, and similar products, all of which are associated with farming, but chiefly with those small holdings which it seems to be the earnest desire of both philanthropists and social economists once again largely to establish in our midst. Specially in vegetable farming is there found a large quantity of vegetable refuse, which cannot be more profitably employed than in feeding cows, pigs, and poultry, and creating manure.

Perhaps the chapters which will secure the closest attention from gardeners are those which deal with flower culture for the production of cut blooms for sale, and also for the purpose of distillation and medicinal uses. In these chapters also may perhaps be found the most debatable matter. Mr. Dunster's selections of market flowers are hardly such as commend themselves to our mind, and he seems in making these selections hardly to have studied the subject practically. Flowers are classified under colours, but with little regard to fitness. Who would embark in the cultivation of Escalonia, Verónica, Laburnum, Pyrus japonica, and similar shrubs, or grow Hepaticas, Mimulus, Gentian, and similar unsuitable things for the production of market bloom? Many things which are notoriously popular for market purposes are omitted, and many things named which would be valueless. Of course these defective selections need not detract from the advice given with respect to market flower culture generally, and the author is correct in assuming that there is room for much wider extension of what is even now a considerable industry. On these points the reader is referred to an article on "root-growing" in the present issue. The cultivation of various herbs, medicinal and otherwise, merits attention, especially those available for purposes of distillation. We should like to see that industry largely extended. Taken altogether the book before us is full, not only of suggestion and advice, but of practical instruction. Mr. Dunster stands out somewhat prominently amongst his fellow vicars as a clergyman of broad views and of high aspirations, evidently most anxious to do whatsoever lies in his power to promote prosperity in our rural life, and add to the happiness and welfare of the people.

Traité de Botanique, Agricole et Industrielle. Par J. Vesque. Paris: Baillière.

M. Vesque commences his book with the reflection that very few agriculturists know the plants that grow in their meadows or can distinguish between those that are useful and those that are injurious. Liebig's assertion, that agricultural students neither know the seeds of grasses, nor the plants that produce them, is quoted with approval, and unfortunately with too much reason. Hence M. Vesque, primarily for the use of his own pupils, and next for the general benefit of those concerned, has compiled a succinct account of the genera and species of economic plants, including under that term those useful in agriculture, medicine, or industry. The classification adopted is partly that of Endlicher, and partly that of Bentham and Hooker, while the grasses are arranged according to the method of Jessen. A description of the genera is given, as well as an account of the respective species, and of the uses to which they are put.

Cours de Botanique Fossile. Par M. B. Renault. Paris: Masson, 1885.

The preface to this volume is occupied with an account of the anatomy of Sphenophyllum, on which point the author is at variance with M. Van Tieghem, the latter author considering the structure to indicate a close relationship to Lycopods, while M. Renault is of opinion that Sphenophyllum belongs to a separate type of vegetation, now extinct. The chief interest, however, in this volume lies in the account of the Conifers. M. Renault begins with the Ginkgo, describing first the morphology and anatomy of the G. biloba or Salsburia of China, well known in

gardens, and then passing on to the description of no fewer than seventeen fossil species, which show that the genus was well represented in the northern hemisphere in the Miocene of Greenland and North America, in the Oolite of Europe, the Wealden of Germany, and in the Lower Oolite of Australia. Several genera allied to Ginkgo, now wholly extinct, are also described, as well as numerous representatives of the other groups of Conifers. The genus *Vequia* is intermediate between the Yews and the Torrejas and Cephalotaxus. In the Triassic, Liassic, and some portions of the Oolitic periods Conifers seem to have predominated almost to the exclusion of other forms of vegetation. In the coal measures representatives of Yews, Araucarias, Cypresses already existed—a fact which leads M. Renault to consider it impossible in the present state of our knowledge to refer all existing Conifers to one common stock. On the contrary, from the existence at the early period mentioned of well marked groups, and from the absence of intermediate types, M. Renault is led to conclude that our existing Conifers are the descendants, not from one, but from several stocks. The work is copiously illustrated, and is provided with an excellent index.

ROOT GROWING FOR MARKET.

MESSE'S. W. & H. HEATH, CHEQUERS GREEN, SOUTHGATE.—“What is root growing?” some one asks. “All plants have roots, have they not?” Quite true. [No!] But, in Covent Garden Market the term roots applies to a limited number of plants, mostly of a hardy description, that are favourites with the British public. Which said public, be it observed, has a fixed liking for pretty old-fashioned flowers—such, for instance, as Disraeli describes Lady Corsande's garden to be, full of bright looking, sweet-scented old favourites, that the ever-appearing novelties of the day are never able to supplant in the estimation of the multitude who are fond of a garden, but who know and care little for high-priced rarities. With them such things as Wallflowers, Sweet Williams, Pinks, Pansies, Carnations, Daisies, Lavender, Southernwood, and others of like description, have been known from childhood, and will ever have the preference which their merits, and a life-long acquaintance entitle them to.

There are thousands of homes within the outer circle of the huge metropolis that have small gardens attached to them, and the occupants of these homes derive much pleasure from their gardens. Although cultivation under the attendant circumstances is uphill work so far, that every succeeding spring brings with it the necessity for beginning anew with a fresh lot of plants, through the fact that winter and want of knowledge, with or without the help of the jobbing gardener, have done their work in killing most of the previous years' supply. Thus it is that as each year comes round the root grower is in requisition and never fails being ready with an abundance of the plants required, and which, by the way, are marvels of cheapness, such as nothing but lengthened experience, persistent labour, and undivided attention to a few kinds of plants has made possible. Any variety of the particular kinds of plants that the root growers cultivate, however fine or attractive the individual flowers may be, is useless unless it is naturally a free vigorous grower, and a free bloomer. Every plant that is propagated from cuttings, needs to possess this property, and in the case of such as are grown from seed the strain requires to be alike reliable. With this view Messrs. Heath keep on yearly selecting from amongst their immense stock anything that shows improvement in the quality and quantity of the flowers, combined with freedom of growth. This particularly applies to such things as Pansies, Sweet Williams, Canterbury Bells, Hollyhocks, Wallflowers, Stocks, and Polyanthus, of which, by continual selection of the best to produce seed, a continued improvement in the stock is effected, in addition to which foreign seed of several things to infuse fresh blood is constantly being used.

Messrs. Heath have now 20 acres devoted to the cultivation of the description of plants under notice. It is a moderately free loam, of good quality and sufficient depth, bounded on one side by the Edmonton Brook, which at all times, even in the driest seasons, affords an abundant supply of water, which is indispensable for the successful cultivation of the class of plants in question. For, needless to say, with them

time is everything; if anything grown is not ready exactly when wanted, half its value is lost, and unless planting is carried out at the right time the crop will not be ready when required. Consequently, there must be no waiting for rain; if moisture does not come from the clouds horse and hand labour have to supply the deficiency until a crop gets hold, after which it can usually take care of itself, as the quantity of manure used, combined with the naturally good quality of the soil, enables it to do this. A dressing of manure such as would surprise many people is applied before every crop is put in. Long-tined steel forks and the plough are the implements by which the ground is dug and turned over, the operation in this respect being varied according to the time of the year, the condition of the land, and the nature of the crop it is to carry. Of the different things grown some are for sale in the shape of plants alone, others for the production of cut flowers, as well as plants, and others again for cutting alone, such as the summer flowering Chrysanthemums, Dahlias, Sweet Peas, Mignonette, &c. The following are the principal things that are grown in quantity.

CARNATIONS.

Of these such varieties as the old Crimson Clove, also a scarlet Clove-scented sort, a free flowerer, with full sized, bright coloured flowers. One of the merits of this kind is that the pods do not split. The large white flowered variety, Gloire de Nancy, is likewise a great favourite. It is a good grower and a free bloomer, the flowers are Clove-scented and about two-thirds the size of *Souvenir de la Malmaison*. Other free-growing sorts are grown, but only self-colours, no flaked or edged varieties. Pinks are also in quantity; of these Mrs. Sinkins a full-sized white kind, the best forms of the pheasant-eyed varieties, with a selection of the best of the mule Pinks. From 2 or 3 acres of these are grown for plants as well as cutting.

PANSIES,

are obtained from cuttings. The latter are from seeds as well as from cuttings. The latter are obtained from the many beautiful varieties that have appeared here in past years. The strain has much in the way of bright colours and size of flowers that the Belgian varieties possess, with the substance and form of the English show sorts, combined with a vigour of growth which most of the exhibition varieties are, so deficient in. Of these 1 to 1½ acre are grown.

WALLFLOWERS

of the best dark market variety occupy about half an acre. They are transplanted from the seed-bed before they get crowded, so that when ready for sale they are close and compact.

SWEET WILLIAMS.

Of these the green-leaved, as well as the dark leaved form, which is so much in favour in the market, cover about half an acre. The strain is so good that scarcely an inferior flower is to be met with in the long beds they occupy.

CANTERBURY BELLS

are remarkable for their profuse disposition to bloom, as well as the size and varied colour of the flowers. A quarter of an acre of these is the usual complement.

VERONICAS.

Only one form of these plants is grown. It is a dwarf grower, with small leaves, that keeps on blooming from the beginning of July up to the end of the year, as a few degrees of frost do not stop it. The flowers are deep purple. It is struck from cuttings in winter, lifted and potted as required. The stock occupies from one-fourth to half an acre.

SUMMER-FLOWERING CHRYSANTHEMUMS.

These are grown in quantity, representing the different coloured varieties that commence to flower soon after midsummer, and keep on until the general representatives of the family begin to bloom.

DAHLIAS

occupy an acre or more. They are confined to such kinds as are distinct in the appearance of their flowers, and can be induced to come in bloom early in July. The sorts that are found to possess these properties are Peacock, maroon, tipped with white; John Bennett, yellow, edged with red; Duke of Edinburgh, yellow; Princess, white; Guiding Star, white pompon; Risioig Sun, scarlet; Dr. Webb, scarlet.

SWEET PEAS.

Of these the red and the white varieties alone are grown, to the extent of a quarter of an acre.

DOUBLE FEVERFEW.

This in considerably quantity is also grown, for the flowers alone.

ASTERS,

in such varieties as the Victoria, and the Chrysanthemum flowered, are sown at intervals that will keep up a regular supply in bloom from the end of July up to as far in autumn as the weather will permit. A large portion of these are transferred to pots when in bloom, and others are sold in a cut state. Quite an acre are grown, and in keeping with other things their cultivation is such as to bring them out in the best possible condition.

TEN-WEEK STOCKS

of an excellent strain take the place of some of the earliest cleared crops, so as to keep up a succession until frost comes. The flowers of the earliest are cleared off before the last hatch are planted out from the seed beds.

HOLLYHOCKS.

A quarter of an acre of these are raised annually from seedlings. As regards the seedlings most dependence is placed on home sown seed as with the careful selection practised good double flowers can be relied on.

PHLOXES.

White, purple, and red varieties, raised annually from cuttings, are grown to a similar extent to the Hollyhocks.

POLYANTHUS

from seed and *Delphiniums* have half an acre between them.

THRIFT, LUPINS, LYCHNIS, AND DAISIES, red and white, collectively cover about half an acre.

CREeping JENNY.

which is so much in favour for edging window-boxes and vases, as well as for growing by itself in pots, is grown in immense quantities. It is propagated from small cuttings, and has 1½ acre to itself.

MIGNONETTE,

of which Messrs. Heath have one of the best varieties I have ever met with, is remarkably well done. A large breadth of this is cultivated to give flowers from as early as it can be had in the season up to the time when frost puts an end to outdoor flowers.

Southernwood, Lavender, Herbs, &c.

both struck from cuttings put in in cold frames early in spring, and planted out in summer, to be grown on for the season following, conjointly occupy half an acre.

A good breadth of herbs of different kinds is grown, and occasionally, when a piece of ground is cleared, and is not immediately wanted for roots, a crop of Potatoes or Peas is put in, which gives a change to the land. The course followed is never to let any part of the land lie idle. During the spring and summer it is a rare occurrence for a week to elapse between the clearance of one crop and another being put in. Cleanly cultivation is systematically carried out; as soon as the weeds vegetate the hoes are set going, so as to destroy them before they have time to get any size, or take much out of the soil. The situation is open, with nothing in the shape of trees to shade or lessen the free circulation of air amongst the various crops cultivated, which, combined with enough space being allowed to every plant that is grown, insures the stock being strong and robust—a condition that in these times of keen competition makes an appreciable difference in the prices realised.

Over an acre is covered with glass, which is mostly in the shape of low long span-roofed houses and pits, wherein are raised vast quantities of plants from seeds and cuttings. A number of houses are filled in winter with bedding plants, of which immense numbers are grown; as soon as they are cleared off the houses are occupied by Cucumbers—Rollisson's Telegraph is the sort principally grown.

Needless to say a large amount of labour is required all the year round to keep pace with the go-ahead rate of production that is followed. Without seeing the boxes that are got through in marketing the stock each year, it would be difficult to credit the

quantity. They are piled up in the yards and about the packing sheds like stacks of hay. One man is employed the whole year round in converting Orange and other packing cases into boxes of the different sizes used, and keeping them in the necessary repair.

T. B.

NATURALISATION OF ORCHIDS.

THE recent conference on Orchids, and the very extensive literature connected therewith presented to readers of the *Gardeners' Chronicle*, will, I believe, stimulate attention to this beautiful and interesting order of plants throughout the world. In the colonies we receive, after all, our impulse very much from home; and many a botanist engrossed with other studies will be tempted, by seeing and bearing so much of Orchids, to give them more attention than, possibly, they have lately received at his hands, to the manifest advantage of both himself and his collections.

In Jamaica we have not many Orchids of great beauty and value. We have *Broughtonia sanguinea*, *Oncidium pulchellum*, *O. tetrapetalum*, *O. variegatum*, *Bletia Shepherdi*, *Zygopetalum cochleare*, *Stenorhynchus orchidioides*, *Arphyllum spicatum*, *Lælia monophylla*, *Schomburgkia Lyonsii*, *Compæretia falcata*, *Ionopsis utricularioides*, *Epidendrum fragrans*, *E. variegatum*, *E. verrucosum*, *Brassia caudata*, *B. maculata*, and *Phaius grandifolius*, all of which are interesting and beautiful in their native haunts, or when cultivated in large quantities in the open air, on trees, in pots, or in hanging baskets. They do not, however, obtain much favour at home, as many are difficult to maintain under prolonged cultivation; and hence the more showy *Cattleyas*, *Lælias*, and *Odontoglossums* are in request, to the exclusion of their less attractive though by no means less interesting brethren.

There was one interesting point which, I believe, was not touched upon at the Orchid Conference, and that was the naturalisation of Orchids; under which head might be discussed the extent to which certain Orchids of temperate and tropical species have become practically wild in a country not their own.

Perhaps by bringing up the subject in your columns it may lead to an examination, and possibly to the preparation of a record of instances in which Orchids, both terrestrial and epiphytal, have broken the bounds of cultivation, and, following the example of numerous other exotics, have succeeded in establishing themselves amidst the environment of a new country.

The Orchid last named on the list given above (*Phaius grandifolius*) is an instance of an East Indian terrestrial Orchid which has become thoroughly naturalised in the West Indies; and it is now found growing freely in the bush and "reincante," and sometimes even in the forest on the hills of Jamaica at about 2000 feet to 4000 feet elevation. Gosse, I know, in *A Naturalist's Sojourn in Jamaica*, throws some doubt upon this plant being introduced, and mentions that "the lone humid forest, a very likely locality in which to find a large and beautiful flower escaped from a garden." Grisebach (*Flora Brit. West Ind.*, p. 622) solves any difficulty that may have arisen in his mind on the subject by giving the habitat of this plant as extending to Tropical America—practically, therefore, making it a native.

If we had nothing authentic and reliable as regards the introduction of this Orchid we might be compelled to give a verdict of "not proven." But in turning over the leaves of an old list called *Hortus Eastensis*, or a *Catalogue of Exotic Plants in the Garden of Hinton East, Esq.*, in the *Mountains of Liguana, in the Island of Jamaica*, by Arthur Broughton, M.D., published circa 1793, I find that "*Limodorum* (*Bletia*, R. Br.), *Tankervilleæ*, or Chinese *Limodorum*," is recorded as having been introduced to Jamaica by Hinton East in 1787. This is *Phaius grandifolius*, Lour., which was also introduced to England in 1778* (*Puydt, des Orchid.*, p. 15). Neither

Hans Sloane (1696—1752), Patrick Browne (1756), nor Swartz (1797—1806) mentions this plant; and these accurate observers could hardly have omitted so conspicuous and handsome a flower if it had been accepted as a member of the indigenous flora of the island in their time. Hence, therefore, *Phaius grandifolius* is undoubtedly an instance of a terrestrial Orchid, a native of the East Indies, which has become naturalised in the West Indies.

An incident came under my notice about three years ago which would point to the probability that *Schomburgkia tibicinis*, the "Cohorn" Orchid of British Honduras, often cultivated in gardens here, has also become naturalised in the island. A plant of this species in flower was brought to a friend of mine by a negro, who stated he had found it growing wild on a Calabash tree at the foot of the St. Andrew Hills. The locality indicated was not far removed from the site of Hinton East's old garden of 1793; and it is therefore quite possible, although the fact is by no means properly established, that it may have been an escape from thence. When we consider the quantity of seed produced by such plants as *Phaius* and *Schomburgkia*, and the favourable agencies of wind and birds which exist for their distribution, it is not at all surprising that, under conditions somewhat resembling or approaching those which obtain in their native country, Orchids, as well as other plants, should become established and flourish in places far removed from their original and recognised habitats.

This question of the naturalisation of Orchids is, I trust, sufficiently interesting to attract the attention of colonial and other botanists, and I would venture to suggest that it may very fittingly be pursued as one of a series of subjects naturally suggested by the papers and discussion at the late Orchid Conference. *D. Morris, Jamaica, July 6.*

ARCHITECTURE AND LANDSCAPE GARDENING.

IN the course of his lectures on the above subject (from which we gave some extracts in a previous number), Mr. G. Richards Julian, A.R.I.B.A., after describing the history and characteristics of the Romanesque style of architecture, and more especially the form of it which took root in our own soil, and is known as the Norman style, referred to the new Natural History Museum at South Kensington. He said of this building that it was, although freely treated, imbued with much of the spirit of the Norman style and ornamented with many of its details, and continued:—"I recommend all the details of this great building to your careful notice, but I have more especially alluded to it, because you will find on the staircase and in the arcades of the gallery in the great hall, which is, I believe, called the Index Museum, excellent suggestions for the appropriate treatment of balustrades and piers in harmony with Romanesque building. For further suggestions we must go to the ornamental wall arcades of Norman buildings."

After tracing the rise of the successive styles of Gothic architecture and their distinctive mouldings and ornaments, particularly the various English forms known as the Early English, the Decorated, and the Perpendicular, the lecturer devoted some time to a special notice of Domestic Gothic, and of the half-timbered houses of which examples are to be found, ranging from the fourteenth to the sixteenth centuries.

Passing to the consideration of garden architecture he said:—"We shall obtain the best suggestions for the proper treatment of terrace walls or balustrades to harmonise with Gothic buildings by a study of the parapets which we find on the old churches and cathedrals. For this purpose I have prepared a sheet of illustrations of such parapets of different periods."

"In all the periods of English Gothic work embattled or battlemented parapets are to be found, but such examples will evidently not suit our present purpose. Battlements appear absurd except when crowning a wall of considerable height, and although used in later Gothic work purely as ornaments, always suggest preparations to receive a warlike attack; another reason for avoiding the use of anything like a battlemented top to a terrace wall is, that, even if the coping is not intended to be leaned upon by those looking over it, no uncomfortable suggestion that it is not to be so

used should be apparent. There are, however, examples of ornamentally panelled parapets even in the Early English period when perfectly plain parapets with a plain unbroken coping were the rule; and of these, from Salisbury Cathedral, I have illustrated. Other early parapets are pierced with trefoils, quatrefoils, &c., and such forms may most appropriately be used to accompany any building the details of which are of early character. A series of small pointed and cusped arches carried on diminutive columns such as I have shown in the Gothic balcony from Venice, or similar small columns with either carved or moulded capitals (or both used alternately) and carrying the coping without any arches, as used by Mr. Street in the walls around the open areas of the New Law Courts, will harmonise with Gothic buildings, if the details of the mouldings and carving and the outlines of the arches are appropriate in style.

"In the Decorated period parapets were ornamented both by panellings and by piercings; trefoils, quatrefoils, and other geometrical forms being used. I have drawn an example of one from St. Mary's Church, Oxford, but of course many pleasing arrangements of geometrical forms can be made which would be appropriate. In the later part of this style the piercings of the parapets, like the window tracery, formed flowing lines, one very common form being that in which the leading line of stonework forms a continuous undulation.

"The parapets of the Perpendicular period are often extremely rich in detail, either when panelled or when pierced. In early examples quatrefoils were used as in the example from St. Peter's, Oxford, but it will be observed that a vertical line is introduced between the quatrefoils—forming small triangular panels in the four corners—and this is a distinctive mark of Perpendicular treatment. In later examples, such as those of the Tudor period, the decoration of parapets was similar to that of the panelling on the walls, reproducing the window tracery of the period in miniature.

"In most of the existing examples of terrace walls of medieval date the treatment is a perfectly plain wall with a saddle-backed coping, having a large roll on the top, but this is no reason why we should not make them as ornamental as the means at our command allow, provided that they be designed to harmonise with the building which they adjoin. A safe rule is, to make the window tracery of the period suggest the forms of arching and of piercings." [See Supplementary Sheet.]

THRINAX GRAMINIFOLIA.

THIS elegant Palm is recommended by the Compagnie Continentale of Ghent as eminently suitable for indoor use and table decoration, as indeed the figure for which we are indebted to the Compagnie, fully shows (fig. 29). The leaves are fan-shaped, divided into very narrow segments, and raised on long, slender, spineless stalks.

AYAPANA.

M. LOUIS BOUTON, in his *Medicinal Plants of Mauritius*, gives the history of this plant, which, in answer to a correspondent, we translate as follows:—

"Captain Augustus Baudin, brother of him who commanded the expedition round the world, brought this plant to Mauritius in 1797. Being at Rio Janeiro, and bearing the Ayapana spoken of as a panacea, he tried by all possible means to obtain cuttings, but could not succeed in purchasing any. He then resolved to carry away during the night a plant placed in the balcony of an inhabitant of this town; which he did skillfully by the aid of a sailor armed with a ladder, and, the ship having set sail immediately, he escaped with his treasure.

"This plant (*Eupatorium Ayapana*) was introduced from Brazil by Captain Baudin towards the end of the last century, bringing with it the highest reputation. It was thought that the universal panacea had just been discovered, and the sick flocked from every part of the island to Pamplonnesses Gardens, where the plant was deposited, thinking they had found a remedy for all their ailments.

"Its success lasted pretty long, but when the reaction came people jumped from one extreme to the other, as is generally the case when the first rupture is over. When once the plant had been experimented upon and analysed at Paris, people attempted to prove that it possessed no energetic virtue of any kind. 'Its smell is certainly aromatic, but to an inferior degree. It is the same with its bitterness. It possesses slight astringent properties, but all so slightly that it is difficult to believe that it can produce any effect upon the animal economy.'

fig.—China to Australia. This grand Orchid was introduced from China in 1793 by Dr. John Forster. Flowers white without and chocolate within, with some rose and yellow in the labellum. Hort. Kew."

* For synonymy I quote the following from the *Gardeners' Chronicle* of 1832, vol. xviii., p. 565:—"Phaius grandifolius, Læurois, Rehb. f., *Walp. Ann.*, vi., p. 459; *Bot. Rec.*, 1839, Misc., p. 40; Benth., *f. Austr.*, vi., p. 304; *Fl. des Serres*, vii., t. 733 (var. *superbus*). *Bletia Tankervilleæ*, R. Br., *Bot. Mag.*, t. 1942; Lodd., *Bot. Cab.*, t. 20. *Limodorum Tankervilleæ*, Ait., *Hort. Kew.*, ed. 1., pl., p. 300, t. 12; L'Herit., *Sert. Angl.*, t. 28; Andrews, *Bot. Rep.*, t. 426; Schneizl., *Fl.*, t. 5; Redouté, *Lilite*, t. 43; Pachyne spectabilis, Salisb., *Trans. Hort. Soc. Lond.*, 1., p. 209. *P. australis*, F. Leconte, and P. Carrovi, F. Muell., *Gard. Chron.*, 1873, p. 732.

"Nevertheless the Ayapana has continued to occupy a high rank in the list of our medicinal plants. It is daily used in the shape of tea in difficult digestion and derangement of the chest and bowels. The leaves, bruised and lacerated in honey and wine, form an excellent topical application for wounds, bruises, and sores, both for man and beast. We all know how extensively the plant was used during the cholera in 1854 and 1856. Dr. Gouly recommended it to restore the circulation and combat the coldness which supervenes in this dreadful malady; and Dr. Perrot relates that Ayapana enters into the composition of a remedy which has been used in cases of cholera previous to the blue stage."

COLONIAL NOTES.

RANUNCULUS LYALLI.—I give willingly the information requested by a correspondent, so far as in my power, as to the habit of this interesting New Zealand. Hooker's designation, in his *Flora*, of Water Lily, so far as has ever come under my extended

them would be about 800 feet. Of course the best time of discovering a bed of the *Lyalli* is during December and January when in full flower, as it then can be noticed at a considerable distance owing to its dazzling white. In a cultivated state I have seen it growing splendidly, almost at sea level, and close to the water of the bay at Port Chalmers, in rich loamy soil. At Dunedin it grows in sandy or gravelly soil in the low-lying gardens, and on the stiffish clay on the hills: it also flowers freely. In my own garden, which is rather peaty in character, I have grown it for several years, but did not succeed in getting it to flower; this may have arisen from the soil containing a good deal of salt, as it was in former days covered by the sea, and even now the water, a few feet down, is brackish in taste. In not one of our gardens where the plant is grown does it receive any extra attention or care; it is exposed to the bright glare of the sun, to the winds which sometimes blow rather strong, and to the sharp frosts which frequently occur.

We have amongst our flora several other Ranun-

on such a scale as to constantly suggest man's own littleness. Generally, the mountain-sides are clothed up to irregular heights with bush and trees of different varieties, displaying a gorgeousness of foliage perhaps nowhere else to be witnessed. These primeval forests are mostly composed of the *Fagus* family, here popularly called Birch. The timber of these trees is not much valued for any purpose. There are, however, a few representatives of *Conifere* to be seen here, and these embracing *Libocedrus*, *Podocarpus*, and *Dacrydium*. The *P. Totara* and *D. cupressina* now are most numerous, and very highly prized.

Among the smaller trees or bushes the more noticeable are *Plagianthus Lyalli*, which skirts the lower edge of the forest, and was at the time in truly magnificent bloom. It was indeed worth the fatigue to have a look down or up one of the glens and see the contrast between the varied hues of green, with here and there a dazzling scarlet-flowered *Metrosideros lucida*, commanding admiration, asserting its right to the tallest and most prominent position, and the base fringed with the more modest but not less beautiful *Plagianthus*, with a snowy wreath corresponding with bleak hoary-headed top.

One peculiarity I noticed among the smaller vegetation, namely, that the *Aciphylla Colensoi*, called with us Spear-grass, and which I saw illustrated in the *Gardeners' Chronicle* some time ago, does not extend, at least on this route, beyond the lake. It was common enough all the way up, but on the western slope was not to be seen. Its place was, however, taken by the *Matagourie* (*Dicaria*), another prickly shrub, of which horses are very wary. The common Thistle, too, has been introduced, and takes possession, growing to a height of 6 feet, and of it horses have a perfect dread; both in the bush and in the open it is a thorough nuisance. Many other plants might be alluded to if space permitted; suffice it for the present to name the *Veronica*, of which there is great profusion; *Astelias*, attractive and interesting; *Cordylines*, of which I came across a species not known on the eastern side, and known as *Gika*, the leaves of which when pulled will stretch like a piece of india-rubber, and its berries are much sought after by children for eating.

Among the *Filices* the varieties were great, the most conspicuous being, in addition to the *Cyatheas*, *Gleichenia Cunninghami*, standing to a height of about 2 feet, the fronds branched out, regularly covering a space of nearly an equal diameter, and justifying our popular name of Umbrella Fern; *Trichomanes reniforme*, growing profusely on rocks and tree trunks; *Lindseas*, *Cystopteris*, *Davallia*, and *Adiantums*; but on the whole my attention was most attracted by patches of *Gentiana* growing on the accessible mountain tops, known to us as our Snowdrop and Daisy. They are in their native habitat a sight to be seen and never forgotten. Then again the *Coriaria rusciifolia* with its curious shade of green leaf and its long clusters of berries inviting enough to be eaten and can be used with impunity, provided the seeds are not swallowed, as they are known and have often proved decidedly poisonous. *J. M'Indoe, Dunedin, New Zealand.*

IMPROVISED LAWN ROLLERS.

There are as enthusiastic lawn tennis players at hill stations in India and the West Indies as in any part of the world. But what is a lawn without a lawn roller? As many places where lawn tennis is played (and where good gardens are also kept) are connected only by bridle roads, and pack animals are the only means of transport, the usual iron lawn roller is a luxury to be wished for, but not always realised. A very simple and efficient lawn roller may, however, be made, as a friend of mine made one the other day, out of the section of a steam-engine chimney. This was a piece of tubing 14 inches in diameter, of sheet iron 4-inch thick, and about 3 feet long. An axle was first of all fixed in the centre and the whole well filled by a packing of concrete. A roller on the same lines, but without the outer sheeting of iron, was made here some time ago, and has proved most servicable. A mould was made of White Pine slats, 1½ inch wide, fixed in a frame so that the inner space was exactly the size of the roller required. A piece of well seasoned hardwood was squared and fixed carefully in the centre to serve as axle; and the mould was then filled with concrete and rammed so as to form a compacted solid mass. The concrete was made of one third Portland cement, one-third sharp sand, and one-third small angular stones the size of a pigeon's egg, called here "grouting." After trimming the

FIG. 29.—*THRINAX GRAMINIFOLIA*. (SEE P. 140.)

observation, is certainly misleading, as I have never seen it growing in water or even marshy places, nor have I ever heard it so called by any other having any acquaintance with the plant. In every place where I have seen it growing naturally the soil was dry and plentifully mixed with gravel and stones. On a journey which I made during February last overland to Jackson's Bay on the west coast I came on it pretty frequently. On Mount Roy, at the foot of Lake Wanaka, I could not find a single plant, but on the sides of the Minaret Peaks, a few miles higher up the lake, I found it frequently. On a little island in the centre of the lake I also obtained some. On the whole way up the Makarori Valley, which extends from the head of the lake, I did not see a single specimen, nor did they again appear till the Haast Pass was crossed and the bed of the Fisk River followed down for about 2 miles. Here they were growing freely in very little soil on a bed of shingle, and although they would certainly be covered during a flood, they were then a few feet above the level of the stream. The lowest altitude at which I found

culi, which are also well worthy of introduction and cultivation in British gardens, but none of them so excellent as *Lyalli*.

The journey from Lake Wanaka to Jackson's Bay is one of great interest, and at the time I made it of adventure. The distance is not great, about 90 miles, but the character of the country is grand in the extreme. There had been a track cut down to the Haast Mouth, but the native bush and Fern had grown up and quite obliterated it, so that it was somewhat difficult for man or horse to push through. Three to four miles an hour was a good record, and as there are no habitations, the traveller must conclude to rough it, and make his bed amongst the Ferns. To give an idea of the appearance of the country is not easy. It is an irregular confusion of mountains, piled up to varying heights, of every conceivable shape, intersected by dark and gloomy ravines, cascades and waterfalls tumbling over in all directions, and of wonderful shape; glaciers of immense size hanging over, and at any time ready to fall sheer down thousands of feet; rivers and streams foaming along in their rocky beds; and everything

projecting ends of the axle and fixing a frame and handle, we had for a few shillings a roller weighing about 6 cwt., as efficient as if it had cost as many pounds, *D. Morris, Jamaica, June 13.*

Foreign Correspondence.

FLOWERING AGAVES IN HOLLAND.

In the winter garden at the establishment of Messrs. E. H. Krelage & Son, Haarlem, Holland, there is at present a fine plant of *Agave filifera* about to flower. On July 7 the flower began to develop, and at present it is nearly 2 metres high, so that it makes in twenty-four hours a growth of 10 centimetres (4 inches). Of this *Agave*, two specimens are reported to have flowered in 1872 at the Veezicht Garden, near Zeist, and about the same time in the Botanical Gardens at Utrecht. An *Agave americana* is in flower in the gardens of Reelwig, at Viet, the property of Mrs. Slingsby van Hoven. It has a flower-stem of 3½ metres in height. In the summer of 1879 at the Mantoung Wassenaar, near the IJlague, the property of Mr. C. J. Vander Oedermeulen, there flowered two *Agaves*, viz., *A. filamentosa* or *longifolia*, and *A. xalapensis*. In 1875, in the Botanical Gardens at Groningen, there was in flower an *Agave americana* foliis luteo-hirsutis with a flower-stem of 7 metres, with 5000 blooms. The age of this plant was proved to be at least eighty years. In 1873, in the gardens of His Royal Highness the late Prince Henry at Soeldrig, there flowered an *Agave americana* with a flowering stem of 6 metres, with twenty-eight branches. In 1875 an *Agave xalapensis* flowered at Lommerlicst at Baarn, the property of Mr. C. A. A. Dudok de Wit, of Amsterdamm. It had a flower-stem of 3.25 metres.

In private collections in the Netherlands there are many fine and large plants of *Agaves*; so that in the years which follow fine summers, and which are favourable to the flowering of *Agaves*, flowering plants may be expected here and there.

Among all the Dutch collections of *Agaves* the best is, without doubt, that of the Zoological Gardens at Rotterdam. This collection was presented to the gardens by Mr. T. de Jonge van Ellemet, of Oostkapelle, near Middelburg, in 1874 and 1875, and consisted then of about 300 fine and large plants. Mr. de Jonge van Ellemet, who was a friend of the late Professor Dr. Karl Koch, at Berlin, and of General van Jacobi, had formed a collection of *Agaves*, one of the best in Europe, as it may be yet at this moment. In this collection there flowered in 1875 several fine specimens, viz., two plants of *A. chiapensis*, with stems of 1.60 and 2 metres; one plant of *A. uncinata* (Jacq.) or *densiflora* of Belgian gardens, with a stem of 1.20 metres; a plant of *A. Celsiana* (Hook.), with a stem of 80 centimetres; an *Agave Elmeletiana* (Jacobi et Koch), with a stem of 2.23 metres; and an *A. dealbata*, with a stem of 2.50 metres; besides plants of *A. schidigera* (Lem.), and *A. dasyliroides* (Gaert.). In many instances the growth of the flower-stems was about 10 centimetres in twenty-four hours. *J. H. Krelage, Haarlem, July 25.*

AN OLD-FASHIONED GARDEN.

THERE is a charm and fascination about an old-fashioned garden, a picturesque suggestiveness of bygone times, an old-world look of peace and plenty and stability about it that modern gardens seem to lack. Subtle odours, too, are afloat in and around it, Lavender and Ladslove are there, with Thyme and Marjoram, Cabbage Roses, Honeysuckle, and Musk, Cloves and Gillyflowers. Then the prim hedgerows of Privet and Yew form such effective background of sombre greens against which those stately obelisks of glowing colour, the Hollyhocks, stand out so grandly. There is such an old garden hard by, sheltered by the hill, on which stands the church, and on the north, east, and west, by belts of trees—Chestnuts, Elms, and Scotch Firs, which will ere long, perhaps, be a green oasis in a region where artificiality will be supreme. It consists of a couple of acres of garden, and three of pasture land. The lady whose property it is, has resided on the spot for upwards of half a century. She deserves the thanks of the neighbourhood for still holding it, inasmuch as land, at that time worth a hundred pounds an acre, would now sell readily for twice as

many thousands. I have just been walking round it with the head gardener, Mr. Gough, who seems to take as much interest as the good lady herself in its successful management. There is no stint of manure, but the enormous crops of fruit and vegetables grown are owing chiefly to the persistent application of well directed labour. Ten feet walls bound the principal kitchen garden on the east and south. On both of these there are large crops of Peaches and Nectarines, Apricots, Plums, Figs, and Pears. On the east wall both Peaches and Apricots do well, though they miss the sun entirely by 12 o'clock. A singular circumstance occurred with regard to a Buckland Sweetwater Grape on this wall. Year after year the crop was muddled badly and consequently worthless. It was found necessary, however, to make a doorway in this wall, and since (for two years) there have been heavy crops of fine fruit. In the same aspect, on the blackened boards of an old stable, Black Hamburgh Grapes have been grown sufficiently fine to compete with those grown under glass. There is always something to take note of in a good all-round garden, though the note may sound flat to a professional gardener. I could not help but compare my Telegraph Peas with those I saw here: had I put in a tenth of the seed actually planted, so much the better; it would not have been merely the saving of seed, but the weight and quality of the crop. The seeds in this case were planted zigzag, 4 inches apart; the haulms and foliage were remarkably strong and healthy. Reverting a moment to open-air Grapes, a white Muscadine was planted in front of an open, tiled shed, trained up a support; a branch by accident straggled under the tiles, and on this was one capital bunch of Grapes, the others were worthless; the branches are now every year drawn back into the shed, and ripen the fruit nicely. In planting new beds of Strawberries, three plants are invariably put together, and whenever there happens to be a barren one it is at once removed. Raspberries are grown trained to three strands of iron wire stretched between 6-inch Larch poles 4 feet high; by this means the canes are exposed to sun and air, and the fruit more conveniently gathered than when trained to stakes in the ordinary way. This is altogether a most interesting old garden, especially rich in herbaceous plants, among which we noticed some fine plants of *Pæonia moutan*. In the little conservatory adjoining the drawing-room I noticed some plants of *Vesuvius* grown in 14-inch pots to cover a black trellis; they were between 8 and 9 feet high and very effective. Though only, perhaps, 30 yards from a busy metropolitan station on one side, and bounded by high roads on the other two, the good lady has managed to preserve the birds. Wood pigeons build close to the house, and their young feed on the lawn, while blackbirds and thrushes all day, and nightingales all night long, keep up their chorus of sweet songs. The air for some weeks since was loaded with the fragrance of blossoming fruit trees, Wallflowers and Stocks; afterwards filled with the sweet odours of Lilac-tide. The only fruit that has suffered in this neighbourhood is the Plum. There is promise of enormous crops of Apples, Pears, and wall fruits, and there will be in all probability abundant supplies of small fruit. *T. W., Harrow.*

after the growth is completed from a sheath of the just matured stem, the flowers being produced during the winter and spring months, and continued in beauty for two or three weeks. This variety comes from Peru. *Orchid Album*, t. 193.

ODONTOGLOSSUM HEBRÆICUM.

An evergreen plant, the foliage and pseudobulbs being of a pleasing green colour. The flowers proceed from the base of the bulbs on scapes some foot or more in length, after the growth of the pseudobulbs has been completed, and are borne in panicles. The sepals and petals are a pale yellow, distinctly spotted in a curious hieroglyphical manner with chocolate-brown, and the lip is of the same colour, with three or four irregular blotches in the centre. It blooms in winter, and requires the same treatment as *O. crispum*. *Orchid Album*, t. 194.

BARKERIA ELEGANS.

A deciduous plant, with upright slender stems, with light green foliage; the flower-scapes proceed from the top of the stem. The sepals and petals are of a delicate bluish lilac, and the lip is white, with a large deep magenta blotch on the fore part. It blooms in early spring. *Orchid Album*, t. 6195.

CYPRIPEDIUM SCHRÖDERÆ.

A garden hybrid described in these columns, six, 432. It is an evergreen *Orchid*, with light green foliage. The flower-stem proceeds from the centre of the young growth. The dorsal sepal is of a pale yellow hue, tinged with dull red, the petals dull crimson, lighter towards the base, and the lip dull crimson, densely spotted in the interior. It blooms in December. *Orchid Album*, t. 196.

CATTLEYA NOBILIOR VAR. HUGUENEYI.

Leaves ovate acute, flowers flat stellate, sepals oblong acute, petals ovate, dull lilac, lip projecting, 3-lobed, lateral lobes rounded, erect, anterior lobe spreading, 2-lobed, yellow, with a broad lilac edge. *Lindleya*, t. 5.

CYPRIPEDIUM DRURYI.

Flowers solitary, sepals oblong, yellow with a central narrow band of reddish-purple, lip bag-shaped, yellow. Southern Mysore. *Lindleya*, t. 6.

EPIODENDRUM PANICULATUM.

A handsome species with sessile amplicaul oblong acute leaves; flowers lilac rose, numerous, in terminal erect pyramidal panicles. *Lindleya*, t. 7.

PHALENOPSIS STUARTIANA VAR. PUNCTULATA

differs from the type in the markings of the flower being more distinct, and the carmine-yellow colouration of the lip much brighter. The figure was taken from a plant which flowered in the establishment of the Compagnie Continentale, at Ghent. *Lindleya*, t. 8.

FORESTRY.

WORK FOR AUGUST.

As this month brings but little special work for the forester, every opportunity should be taken to forward all general woodland operations, and upon land intended for autumn planting, so that these may be well in hand before the busy planting season actually sets in.

Enclose such ground as is to be planted during the coming season, and have the same cleared of all Gorse, Brambles, and other herbage, drained and trenched where necessary, and the making of roads, planting, cartage of material, and all other necessities, well in hand as time and other circumstances will permit.

TRANSPLANTING.

The transplanting of evergreens may be commenced during the latter part of the month, choosing dull, damp weather for the operation. If properly attended to this will be found a successful month for the work, and greatly to be preferred to a later period. Preparations for layering should now be made, pegs cut, the ground loosened around such stools as are meant to be layered, and the work taken in hand towards the end of the month.

THE NURSERY.

In the nursery little can now be done, for the keeping of weeds in bounds will occupy most of the spare

Orchid Notes and gleanings.

ÆRANTHUS LEONIS.

REFERRING to the "curiously curved nectary" of this new species it is stated at p. 80 that the moth must have a very long and flexible proboscis that can reach the nectar at the lowest point. On referring to the plate, however, it will be observed that in every case the end of the nectary is higher than the curve, which would cause any viscid substance to drain to that point which is the lowest, and in that case the proboscis of any insect could easily reach it. *J. Douglas.* [Why didn't we see so obvious a fact? ED.]

CATTLEYA MAXIMA BACKHOUSII

is a dwarf compact evergreen plant, having pale green stems and foliage, in which peculiarities it is distinct from all others. The sepals and petals are of a light magenta, and the lip is of the same ground colour, but distinctly veined with deep magenta-purple. It blooms

time. Bud Hollies, Chestnuts, and Thorns, and pay attention to recently grafted and budded trees, so that the bandages may be loosened and all shoots rubbed from off the stocks where required. Cuttings of evergreens that are propagated in that way should be inserted towards the end of the month or beginning of next. Choose a loose soil of rather a peaty nature, and add a plentiful supply of clean sharp sand, which will induce free rooting and prevent damping off. Vacant ground should be kept well stirred; and also the spaces between lines of young plants. Clear drives and walks during dry, warm weather, and where weeds are extra abundant a sprinkling of salt or small quantity of carbolic acid will greatly assist in keeping these in bounds.

GENERAL WORK.

Mow grass and rubbish growing alongside drives and walks so that seeding may be prevented; and attend to all overhanging branches that are likely to interfere with the traffic. When time permits have all timber that is intended for home consumption carted and stacked near the saw-mill, while it can be removed without the grit and dirt which adhere to it in winter, and which, not unfrequently, does so much injury to the machinery used in its conversion.

Fences will still require attention, indeed the work of the fencer is much alike summer and winter. Tree guards should be frequently examined, as where young horses roam at will injury is of by no means unfrequent occurrence. The tarring of fences, gateposts, &c., may still be prosecuted, especially when the weather is warm and dry. In parks and other inclosures cut off such branches as the cattle have barked or are in any way likely to interfere with. Prune dead branches from park and lawn trees, remove rival leaders, and keep within bounds such shrubs as are likely to infringe on Conifers in their close environ. Draining, levelling, and road making may be taken in hand, while hedging, thinning, and charcoal-baking are now well advanced. *A. D. Webster, Fourhym Castle, North Wales.*

Plants and their Culture.

STOVE FINE-FOLIAGE PLANTS.

As soon as there is a spare corner in the propagating pit (or any substitute that is made use of instead of this useful adjunct) the opportunity should be taken to strike some well coloured shoots of Crotons, which ought now to be had without any difficulty. The advantage to be derived from propagation at this season is that young stock of sturdy growth, retaining their foliage even from below the level of the soil in which they are struck, can be obtained without difficulty and with but little or even no artificial heat. Straight shoots with the foliage well balanced should be chosen, and those of the brightest variegation always preferred. The pots known as long 60's are best for these cuttings, out of which, when well rooted, they can be shifted into 4 or 5-inch pots according to the size and vigour of the plant. After this shift, and when the plants are become well rooted, they will be fit for decorative uses; and, considering the rapidity with which this can be brought about, there is no subject can equal the Crotons when well grown. The selection of good cuttings is of great importance in the earlier stages of cultivation of any shrubby plant, but is perhaps more apparent in that of Crotons than in any other stove plant. After being established in their first shift, water may be applied to the roots almost without stint, and a free use of the syringe must be made to keep in check insect pests. Crotons are something like Willows, and delight in an abundance of moisture, they, however, require free exposure to the sunlight in order to intensify their beautiful, colorations and to retain a compact habit of growth. On no account must they be allowed to suffer for want of water, or the loss of the lower leaves will ensue; some liquid manure or artificial stimulant should frequently be used when the plant has become pot-bound. *J. Hudson, Gunnersbury House, Acton.*

FRUITS UNDER GLASS.

MELONS.

Ripe Melons can be obtained late in the autumn months by sowing seed of them about the 1st of August. We have on several occasions done this and secured merely a fair crop of ripe fruit, but this is owing to the waning sunshine, and kindred causes which tend to impair the size and reduce the quality of the fruit. We have abandoned the raising of this crop altogether as being scarcely worth the time and attention it involved, and for our latest we now, as a general rule, sow the seeds about midsummer-day. With the usual treatment, these plants are now, July 27, ready to put into fruiting pots or beds, as the case may be, and with ordinary management the crop of Melons on the plants will be ripe at the end of September, or thereabouts. It is expedient to employ for this crop a house which will enjoy every ray of sunshine, and further, possess a heating apparatus to maintain the necessary warmth, failing sun heat. The latter should be utilised to the utmost by closing the house in the afternoon with the thermometer at about 90°. Ventilate rather early in the morning, in order to rid the foliage of condensed moisture before the sun's rays become powerful enough to injure them—in the interim before closing time sunshine prevails, ventilate the house freely and fully whenever 95° inside can be assured. At closing up time for the day, if the plants be on trellises, syringe both the upper and under surfaces of the leaves. This is the best way to displace that prolific pest, the red-spider, should it abound, and also keep the leaves clean and healthy. As time proceeds, and growth likewise, and the fruits become heavy, they should be supported before ripening begins. Those which hang beneath trellises can easily be suspended by two broad pieces of matting attached to the trellis and crossed under the bottom of the fruit, whilst those on the surface of beds merely require a piece of slate underneath them, placed so as to let the water run off it quickly; the former way is much to be recommended for late crops as being infinitely the best method for late work. Another matter of moment is to ensure having a gentle warmth at the roots continuously and more especially at that period when the fruit is approaching maturity. Give the customary attention to crops of Melons advancing in frames; do not suffer the plants to run almost wild and then at once to divest them of half the shoots and foliage together, but rather afford a little time, about once or twice in each week, to attend to their requirements in the way of stopping and training. This will more than be compensated for in the size and superior condition of the fruit. If the sunshine and heat, as we have lately experienced, continues, Melons in frames ought, with fair attention, to do well. Open the frames a little way at the top on the mornings of bright days, give an abundance of air in hot, sunny weather, and shut up the place in the afternoon at about 90°. At this time sprinkle the foliage of the plants and the walls.

This course of treatment should be pursued so long as sunny weather endures. Under less favourable circumstances modify the treatment so as to maintain the heat in such places as equal as possible. As the fruit approaches maturity more care should be exercised, so as not to wet it so much, as the flesh of Melons becomes more tender and more liable to decay from a superabundance of moisture than from any other cause at this stage of development. *Geo. Thor, Miles, Wycombe Abbey.*

The Hardy Fruit Garden.

WALL TREES.

ALL such trees should have great attention for some time as regards watering, syringing, and keeping the foliage clean and free from insects. No after attention will compensate for neglect at this time of the year, as now is the time to build up the trees and fit them to bear satisfactory crops; for, no matter how skillfully the winter pruning, naillog, and cleansing may be, it will all be in vain if the trees do not receive proper treatment during the growing season.

Most kinds of wall trees will by this time have

almost completed their summer growth, and the chief aim should now be to thoroughly ripen the wood. This applies to Peaches, Nectarines, Plums, Pears, &c.—in fact, to all kinds of fruit-bearing trees and bushes; thinning out all weakly shoots, nailing in the young wood close to the walls, and, above everything, to avoid crowding the walls with young shoots. It is much safer and far more satisfactory to err on the side of having the shoots too wide apart than to have the walls crowded with half-ripened shoots, which cannot bring satisfactory results.

STRAWBERRIES, &c.

Strawberry beds will be finished bearing in most places, and all the young runners not wanted for potting up or forming new plantations should now be cleared away, and should the weather continue dry and hot a good watering would be of much advantage to the beds. Carefully avoid cutting off the old leaves; only remove such as are withered. I have seen all the leaves clean cut off, a practice which I must strongly condemn. Of sorts, Oxonian I find later than Elton Pine, so that growers would do well to make a note of this variety, and if not already grown, lose no time in planting it in a cool, shady position. Gooseberries, such as Warrington and Henson's Prolific, should now be netted over to keep off birds, much in the same way as advised for Strawberries in former Calendars. When Raspberries are done bearing, the shoots that have borne fruit should now be cut clean away, and the young shoots lightly tied up, so that they may have a chance to become thoroughly ripened. *J. Smith, Mentmore, Bucks, July 27.*

The Kitchen Garden.

SEED SOWING AND PLANTING OUT, &c.

IT is important to have a goodly number of Lettuce and Endive about three-fourths grown and fit for lifting and placing in frames just before the approach of injurious frosts. To secure this end attention as to the date of sowing is necessary. The dates for Lettuce sowing were given in a former Calendar. Endive for this purpose should be sown about the middle of August. Preparations must now be made for getting in the seed to supply the winter Turnips, and a couple of weeks later the winter Spinach. A piece of well drained and manured ground in a well exposed position is best for both crops. The ground should also receive a good dressing of fresh soot, to which a little lime may be added prior to spreading. This may be applied after the ground has been manured and dug. It should be then well worked in with the hand-harrow or wooden rake prior to drawing the drills, which may be 7 foot apart for Turnips, and 14 to 16 inches apart for Spinach. Where Leeks are required throughout the winter successional plantations may be made as the ground becomes vacant by the removal of Peas, Beans, or Potatoes. The same remarks apply to winter Greens, Kale, Savoy, and late Broccoli, many of which have been large enough to plant out long ago; had the weather not been so hot and the ground so dry.

Radish-sowing may begin again in August, as the ground gets cooler; they will be mild in flavour, similar to spring roots. Kidney Beans should have short stakes placed to them; receiving this attention keeps the plants from being broken when gathering the pods; the tops cut from Pea-stakes are suitable for this purpose.

WATERING.

Well watering overhead with a coarse rose keeps the hearts of the plants clean and free from fly and other insects, as well as keeping them healthy at the root. Late Peas, successful Kidney Beans, Scarlet Runners, newly-planted Asparagus beds, Celery, Cauliflower, &c., must be watered in the absence of rain—that is, if the best results are ultimately to be obtained, as the soil now, even where mulched on the surface, is dust-dry beneath. Peas especially, should receive special attention in this respect, or they will quickly be affected with mildew. Break the leaves over Cauliflowers to protect the flower from the sun. Tomatos should be looked over weekly and pinched, all superfluous shoots being removed.

During this favourable weather advantage should be taken to destroy all weeds between growing crops—in fact the above and watering, preparing of ground for winter crop will now be the staple work in this department until the much wanted rain comes to facilitate other operations. *G. H. Richards, Somerley Gardens, Kingwood.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Aug. 3—Horticultural Show, Northampton.
TUESDAY,	Aug. 6—Horticultural Show, Aberdeur.
WEDNESDAY,	Aug. 8—Horticultural Show, Malak.

WE have great pleasure in laying before our readers the following circular relating to the NATIONAL PEAR CONFERENCE proposed to be held in the Royal Horticultural Society's Gardens, Chiswick, in October next:—

"The crop of Pears this present season being generally abundant and good, an extremely favourable opportunity is presented for the examination of the numerous varieties cultivated throughout the country. The Council of the Royal Horticultural Society has therefore decided to hold a Conference on Pears (of a similar character to that so successfully adopted in regard to Apples in 1883), in the great Conservatory at Chiswick, commencing on October 21 next.

"This Conference will not assume the form of an ordinary exhibition—there will be no competition and no prizes—the objects being to disseminate useful knowledge on the varieties most suitable for cultivation, to compare their merits, and to correct their nomenclature, and generally to render the meeting instructive to fruit growers. The collection of Pears grown in the gardens, which contains many typical varieties, will be available for comparison.

"Growers of fruit will have in this exhibition an opportunity of correcting or verifying the nomenclature of their own fruits, by bringing specimens with them and making a personal examination. Every possible assistance will be given by members of the Committee to such enquirers.

"All fruit growers are invited to contribute, and the more widely the collections are procured, the greater will be the interest created. No limit will be placed on the number of varieties any one may see fit to send, and it is not necessary that they should be the products of his own grounds. The Council desires that an effort be made to procure representatives of all the varieties that are grown in the various districts, and that all should be distinctly labelled with the name or names under which they are grown in their respective localities.

"It is desirable that every collection should be accompanied with as much information as can be furnished, with regard to soil, stocks, exposure, and physical conditions of the districts from which they are gathered &c., to aid the Committee, if necessary, in drawing up their report. Cards and forms for this purpose will be supplied by the Secretary to all exhibitors on application.

"The specimens being strictly for examination, they must necessarily be at the disposal of the Committee where required.

"As the earlier varieties of Pears will be over before the time fixed for the Conference, it is desirable that specimens of these be sent to any of the meetings of the Fruit Committee preceding Conference. These should be addressed to the Secretary, Fruit Committee, Royal Horticultural Society, South Kensington.

"Exhibitors are requested to send not less than two or more than six fruits of a kind for the purposes of comparison.

"Notice of intention to exhibit must be given to the Secretary, MR. BARRON, not later than Wednesday, October 14, stating the number of varieties to be exhibited, and the amount of space that will be required. Consignments of fruit—to be staged by the Committee—should be addressed to the Secretary, for delivery on or before Monday, October 19. The carriage will be paid by the Society. Heavy packages to be sent per goods train.

"Exhibitors staging their own fruit may do so on Tuesday the 20th, or on the morning of the 21st, so as to be ready for the inspection of

the Committee at 1 o'clock P.M., when the exhibition will be opened.

"All exhibitors will be admitted to the gardens free, and will receive tickets in proportion to the extent of their exhibits for the admission of friends."

The following gentlemen have been appointed a committee to carry out the objects of the Conference in various parts of the country, those marked * forming the Executive.

Anderson, A., Oxenford Castle, Dalkeith.
 Bashford, —, Guernsey.
 Blackmore, R. D., Teddington.
 Breeze, G., Petworth Park, Petworth.
 Brotherton, R. P., Tynningham, Prestonkirk.
 Browne, Colville, The Paddocks, Swaffham, Norfolk.
 Bulmer, Rev. C. H., Credenhill Rectory, Hereford.
 Bull, Dr., Hereford.

 Wildsmith, W., The Gardens, Heckfield Place, Winchfield.
 Wynne, B., 17, Catherine Street, Strand, W.C.

— PRINCESS HENRY OF BATTENBERG.—The beautiful bouquet of choice white flowers which the Princess carried on the occasion of her marriage was presented to her by Mr. VEITCH. In the centre was a sprig of Myrtle from a tree at the Swiss Cottage at Osborn, which was struck from a similar sprig in a bouquet presented to the Crown Princess of GERMANY, on her marriage, June 25, 1858, also by Mr. VEITCH.

— DICTIONNAIRE DE BOTANIQUE.—M. BAILLON's important publication has reached its eighteenth number, which brings the Dictionary down to the word Francoa. Some important articles are included in the present number, such as Eucalyptus, Euphorbia, Fleur, Feuille, Fougère. A great feature of this publication consists in the woodcuts, excellent alike as faithful representations, and in execution.

— GRAND NATIONAL DAHLIA SHOW.—We are requested to announce that at a recent meeting of the subscribers to the prize fund for the show to be held in September next at the Crystal Palace, it was decided to offer a prize to be called the Turner Memorial Prize, as a memento of the late Mr. CHARLES TURNER, of Slough, who laboured so assiduously towards the establishment of these exhibitions. Several subscriptions, varying in amount from 2s. 6d. to 21s., have been received for this object. Those who desire to contribute either to this or the general fund, are requested to send their subscriptions within the next few days to the Hon. Treasurer, Mr. THOMAS MOORE, Botanic Garden, Chelsea, S.W., in order that the conditions of the prize may be settled at the next meeting of the committee, which will take place shortly.

— THE ANTWERP CONGRESS.—At the opening meeting on August 2, the question to be discussed will be:—

The flora of the Congo and the experiments to be undertaken in the cultivation and acclimatisation of plants in the Free State of Central Africa.

At the second meeting, August 3, questions relating to the best methods of extending the knowledge of theoretical and practical botany in relation to the cultivation of plants will be brought forward, as well as matters concerning the steps to be taken to secure the uniform adoption of the Centigrade thermometer scale; to combat the attacks of aphides; and to secure the modification and uniform application of the Phylloxera Convention of Berne.

In the Botanical section (August 5) the principal matters in the programme have reference to the establishment of botanical laboratories for purposes of research; to instruction in Cryptogamic botany and vegetable pathology. The question of the best kind of labels will also be discussed.

In the Horticultural section, which meets on August 4, the questions of artificial manures, and the use of sewage in plant cultivation will be brought forward, as well as the culture of Mushrooms, the remedies for Phylloxera, the establishment of provident societies for gardeners, and railway tariffs.

The Market-Garden section will deliberate upon the best varieties of fruit and vegetables for market purposes, and the best means of disposing of the produce in the markets. The subject of fruit-tree culture will also be considered.

— THE ROWE ORPHAN FUND.—In addition to the sums announced as having been received by us, we are pleased to say that additional sums have been received during the past week, through the kind instrumentality of Mr. GEORGE, nurseryman, of Putney:—

An Old Gardener, 103, High Street, Putney	..	£	0	2	6
G. Stevens, St. John's Nursery, Putney	0	6
H. Brown, The Cottage, Putney Heath	0	0
Paul & Sons, Chesnut	1	0
W. Rapley, Balham	0	5
J. Bennett, Feltham	0	0
E. Sanders, St. Mary's Road, Harlesden, N.W.	0	5
H. Veitch, Royal Exotic Nursery, King's Road, Chelsea	5	0
J. Roberts, Gunnedbury Park, Acton	1	0
Robert Veitch & Son, Exeter	0	5
W. Holmes, Frampton Road Nursery, Hackney	0	2

Also from John Gardner, Elsham Hall Gardens, Bigg, 5s.

— VANDA SANDERIANA. — A correspondent writes:—"Chester was certainly *en fête* during the days upon which the Musical Festival was held in the cathedral. The windows of the nursermen in the city were filled with beautiful flowers. Messrs. F. & A. DICKSON & SONS, the Queen's Seedsmen, showed a good collection of cut Roses, Lilies, and herbaceous plants, added to which they exhibited a beautiful specimen of *Vanda Sanderiana* from the collection of ARTHUR POTTS, Esq., Hoole Hall, a well known horticulturist and an enthusiastic lover of Orchids."

— FLORAL ILLUSTRATIONS. — We are tempted sometimes to inquire what is the object of a particular illustration? If the subject be treated merely from a decorative point of view, well and good; we can afford then to put up with the absence of correct detail, and with obscurity of outline, for the sake of delicate gradations of light and shade, or subtle contrasts of colour. A drawing or an engraving which, from a botanical point of view, is a mere Whistlerian

no one will say that in his work there is any lack of "effect" although he strove to be accurate in all he did. A portrait painter will not feel contented with the mere reproduction of a man's features, but he will endeavour to "catch the expression" of the sitter and give animation to what otherwise would be a mere diagram. In like manner the ideal botanical drawing will, without any sacrifice of essential matters, convert a plant into a picture which shall give details with accuracy, and yet produce an impression of life.

— MESEMERYANTHEMUM EDULE. — We are indebted to the Surveyor of the town of Torquay for a specimen of this robust species, which grows and flowers in profusion at Torquay, where it proves perfectly hardy. The plants are not protected in any way, but grow so near to the public road that strong shoots are frequently removed by passing carriages. The specimen sent, with its large awl-shaped, 3-sided leaves and broadly expanding yellowish flowers, makes one wish that it should be

system, and having studied the British woods since 1868, he was of opinion that if we had trained woodmen our woodlands might be made much more productive. Sylviculture was better understood in England than arboriculture. [So stated in the daily journals, but we suspect the reverse was intended. Ed.] There were many fine ornamental trees, but planting was not done on a sufficiently large scale. It was the general opinion of those acquainted with our woodlands that the establishment of a forest school would be of great advantage to this country. Various steps have been taken in that direction in Scotland by the establishment of an arboretum, museums, and libraries. Timber was imported into this country to the amount of £17,000,000 annually, which was brought up by resin, bark, turpentine, &c., to £31,000,000. All the foreign possessions of England were taking up the subject more or less. Supplies of timber from Canada were very considerably diminished. Prince Edward's Island, which was once covered with timber, was altogether denuded. There was no doubt of the

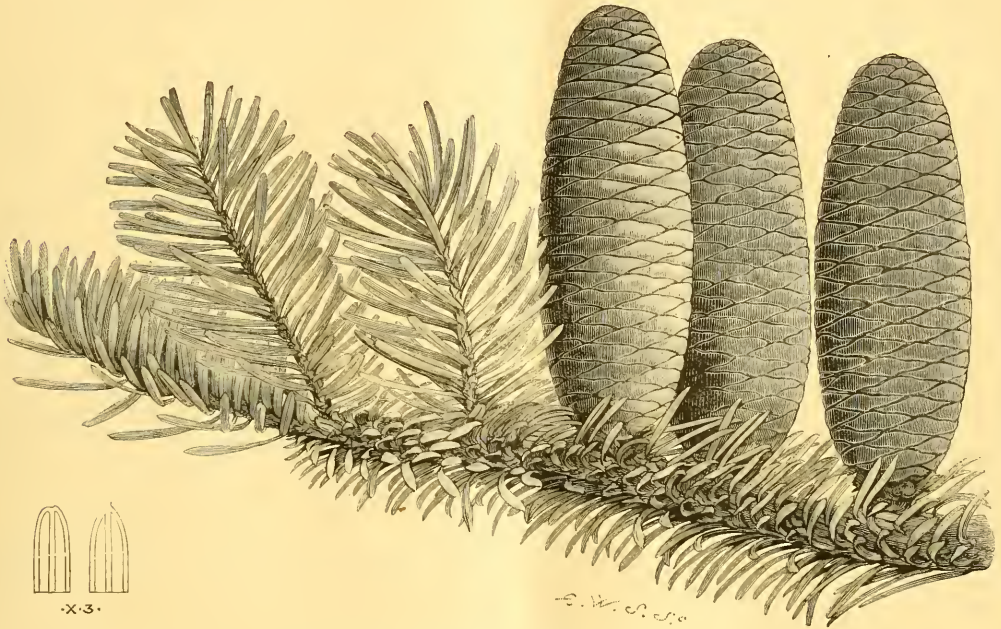

FIG. 30.—ARIES BRACHYPHYLLA: CONES PURPLE. (SEE P. 151.)

smudge, from the imaginative or poetic point of view of the artist, may be one which would justly find favour with lovers of TURNER or REMBRANDT; but for the purposes of the gardener or botanist something more definite is required. The object in this case is to present the spectator with a recognisable portrait,—correct in outline, faultless in detail. Many artists are thinking of something different, which they call effect—an effect which may or not be true to Nature—an effect which may be beautiful, but which is not what is required. The conventional artist sees one facet of the diamond of truth, the descriptive botanist another, the physiologist yet another. The artist loves to depict the curves and twists of the leaves, the varied position of flowers and their parts, and as these are dependent to a large extent on the conditions under which a plant grows, to depict them truthfully is to furnish a record of the plant's history. An artist seizes these points instinctively as the result of observation, and very often without a thought of the causes, physiological and physical, by which they are brought about. LEONARDA DA VINCI, to cite only one illustration, felt the necessity for trained observation, and

tried in other seaside places. Even on some parts of the Kentish coast, as near as Sandgate, it might be tried with advantage.

— "A FEAST OF CARNATIONS." — We are requested to state that the Provisional Committee of the Oxford Union Carnation and Picotee Society give notice that they will lay out a feast of Carnations in the gardens of Mr. DODWELL, The Cottage, Stanley Road, Ilfley Road, Oxford, on Tuesday next, August 4. Admission, from 2 P.M., free. Lovers of the flower are invited to partake.

— THE DUTCH HORTICULTURAL AND BOTANICAL SOCIETY OF ARNHEIM. — We learn that a deputation from this Society intends to visit the horticultural establishments near London in the middle of August. Arrangements have already been made with Messrs. CANNELL for this purpose.

— FORESTRY. — Dr. CLEGHORN gave evidence recently before Sir JOHN LUBBOCK'S Committee of the House of Commons on this subject. Having had experience in the establishment of the Indian forestal

importance of increasing the home growth of timber to provide against a possible timber famine. There were many tracts of land in England now comparatively idle which would grow timber on a large scale, and give employment to the people. — Colonel FEARSON, who had charge of the Forest School in India, was of opinion that the scientific training of students there had a great deal to do with the increased revenue from forests, and he had no doubt that something of the same kind might be done on a smaller scale in England. Scientific forest education might be given at King's and University Colleges, rather than at Oxford or Cambridge, and a forestal chair might be established at Edinburgh, but in each case it would be absolutely necessary that the students should be taken to the woods to acquire knowledge by actual observation. — Mr. THISTLETON DYER, of Kew, was of opinion that scientific knowledge essential to the successful cultivation of forests. If the general knowledge of skilled foresters was brought to bear on English woodlands immense advantage might be derived. Picked men had been sent from Kew Gardens to the colonies to give directions in forestry, and these had generally

been successful. Asked his opinion as to what steps should be taken with respect to England, he considered that India, where they had every advantage for the study of forestry, should be made the nucleus of forest education.

PETER LAWSON & SON (LIMITED).—The directors, in view of the approaching annual general meeting of the company, to be held in the registered office of the company, No. 1, George IV. Bridge, Edinburgh, on Thursday, August 6, at 3 o'clock P.M., has issued the following circular:—

"The directors have to report to the shareholders satisfactory results from the working of the company since they took over the seed business of the Lawson Seed and Nursery Company (Limited).

"After paying all the expenses incurred in the formation of the company, allowing for discounts, bad debts, depreciation, &c., the accounts show a clear surplus of £580 11s. 11d. Looking to the amount at their disposal, the directors, under ordinary circumstances, would have felt warranted in dividing a much larger amount, but in considering the short time the company has been in existence they think it more judicious to recommend that a dividend at the rate of 10 per cent. per annum, free of Income Tax, be declared upon the paid-up capital as from November 1st last, payable on the 15th proximo, and that the balance of £5233 0s. 3d. be carried forward.

"All the directors now retire in terms of the company's Articles of Association, but are eligible for re-election.

"The auditors may also be re-appointed.

"JAMES GLENN, Chairman.

"Edinburgh, July 25."

CASIMIROA EDULIS.—A Constantinople correspondent inquires—What is the most suitable stock for grafting this upon? We have no experience of our own to offer, but would suggest from the natural affinity of the plant that some of the hardier varieties of Orange (Citrus) might be tried. We may remind our readers, as the fruit of this tree is still but little known, that a specimen was figured in our columns, October 13, 1877, from the gardens of MITCHELL-HENRY, Esq., M.P., Kylesmore, Galway, when we were enabled to give cultural details, kindly supplied by Mr. GARNIER, the gardener who had the honour of first fruiting the tree in this country.

THE BOTANY OF SOUTH KENT.—The following letter from the late Rev. GERARD SMITH, the author of the *Plants of South Kent*, will be read with interest. The Plantago referred to was a remarkably fine specimen of the prolious variety of P. major, and the Primrose alluded to was extremely remarkable in its structure. Its history is this. Some quarter of a century ago the present writer was shown some water-colour sketches of Primulas executed by the Rev. G. SMITH five-and-twenty years previously. One of these sketches showed so extraordinary a structure that a tracing was made of it, but the appearances were so peculiar that some error of observation was suspected, and hence no mention was made of the case in *Vegetable Teratology*. A few years ago, however, in some specimens sent by Mrs. DOWSON, the self-same appearances were presented as had been noted in Mr. SMITH'S drawing so many years previously. A careful examination was then made, and the results communicated to the Linnean Society, and published, with illustrations, in its *Transactions*. With this necessary explanation we now subjoin Mr. SMITH'S letter:—

"Your letter has given me sincere pleasure, both because of the interest which you take in the remarkable variety of Plantago major of which Mr. COOLING sent you a specimen last autumn, and of the associations and recollections which you revive so forcibly and happily of old times and habits in South Kent. It was not a month since I was speaking with a friend of Sandgate and Selling, and my days spent there; and to give him an idea how greatly my zeal for botany exceeded the pastoral, I mentioned the visit of my vicar, upon his coming to Selling a month or two after my appointment to be his curate, at the house of a neighbouring farmer, and receiving for answer to his enquiry how he liked the new curate, 'Oh, there never was such a man! I'll go up to his waist in a bog for a rare plant!' The vicar was a clergyman of the good old sturdy school, well read in divinity, and a careful and intelligent preacher, whose ideas did not extend far beyond the duties of a public school and his well-filled library. When he returned from that visit he came to me in my room at the vicarage, and, looking round at the plant-press, bundles of plants, &c., mingled with books, and papers, and ter-

mons, he gravely related Mr. —'s remarks, and added, 'It will be a happy time, Mr. SMITH, when your recreation becomes your study, and your study your recreation!' Professionally he was right, and I felt it; but, for myself, I must say that when he left me as curate in a parish of smugglers and machine-breakers, without any experience, and as scanty a preparation for the ministry as was considered sufficient in those days, he had little reason to complain that a young man who had studied Nature from his childhood, and had been encouraged by his teachers, himself included, in the love of Nature, should often stand at the gate of the vicarage, doubtful whether to go among the people or to take to the hills, and decide at last for the hills, especially when *Orchis fucosa*, or *Pyrola rotundifolia* was in bloom!

"I thank you very sincerely for the copy of your paper upon the morphology of the Primulaceæ, which I had seen a few months since, and had greatly admired. One of your correspondents one day brought me your paper, with other documents—I forget for what reason. When I opened the paper at t. 39, I exclaimed at once, 'Why, here is the very self-same Primula with its style-bearing filaments that I found in a wood at Upnorden between forty and fifty years ago!' Behold, upon reference to the letterpress, I found that the figures were actually a reproduction of my own dissections!"

"Let me mention a circumstance connected with those abnormal-flowered Primulas which may add to the notice similar but hidden examples. There were several plants growing near together in the wood at Upnorden; and in the same wood I found that whenever the undergrowth was cut for bakers' bays, plenty of *Euphorbia lathyris* sprang up. All the plants of *Primula vulgaris* in the state above-mentioned had the corolla bent inwards over the tube, flaccid and paler than usual."

TERRA COTTA POTTERY.—At the stand of Messrs. BALFOUR & CO., in the Inventions Exhibition, there are some pretty things in garden flower-pots, Orchid pots and baskets, &c. The ware is of graceful proportions, well made, and of porous finely comminuted clay of a pale red colour. The articles on view there are those that would find favour with amateurs having a little greenhouse in which everything must look tasteful and neat. For the ordinary use of a garden the better class of ware is too costly, and is not necessary.

TEA FROM JAMAICA.—What a Colonial botanist can do to stimulate flagging industry and develop new resources is well exemplified by Mr. D. MORRIS, the Director of the Botanical Department, Jamaica. We have before us the broker's report on the first commercial sample of Jamaica-grown Tea, sent into the market mainly through the energy and forethought of Mr. MORRIS:—

"We have carefully examined the sample of Tea, and now beg to hand you our report on it. The leaf is very fairly made, though if intended for our market we think it would be well if the slight glazy appearance it possesses could be avoided. After infusion the leaf is bright, indicating good quality and careful preparation; while the liquor has fair strength and good flavour, combining to a great extent the peculiar characteristics of a fine China black leaf, and a Ceylon Pekoe Souchong. We consider the value of the Tea here to be from 1s. 6d. to 1s. 8d. per pound (in bond), and if you could send a fair sized parcel no doubt it would meet a good reception from London buyers. If at any time we can furnish you with information, or assist the development of the Tea industry in your island, in the meantime to be permitted to congratulate you upon the specimen of the manufactured article you have now sent us.

(Signed) "GEO. WHITE & Co."

"FAMILIAR TREES."—Messrs. CASELL have issued the first number of a periodical intended to be a companion to their *Familiar Garden Flowers*. It is to be devoted to British trees, and opens well with a well written account of the Oak. The coloured illustrations, if we may judge from those devoted to British Plants and Garden Flowers, while the name of Mr. BOULGER, as editor, is a guarantee that accuracy of treatment will be combined with an agreeable style. The subjoined extract may be given in illustration:—

"In a growing Oak notice will be taken of the outward spreading of the stem at its base; of the rugged bark; of the curiously tortuous branchlets, twisting in zig-zag fashion almost rectangularly towards every point of the compass, owing to the central shoots becoming abortive; and of the uniquely waving outline of the yellowish-green leaves. The leaves generally make their first appearance in the south of England towards the end of April, when the young shoots blush with a ruddiness

almost autumnal; and, if at all sheltered from the glare of July and August, from the time when the ash bark is first draped in foliage, a constant succession of the pink and bronze-tinted glories of the young leafage is kept up in our moist summers till late in autumn, when the first formed leaves are beginning to change. Then the green loses its olive-yellow tints for clear gold, mottled with clear grass-green, fading to the sober palid russet which lasts through the winter. This indescribable hue has none of the copper richness of the dead leaves of Beech, nor the warm amber of the Horse Chestnut; it is the grey ghost of a brown that has been. The catkins appear shortly after the leaves: the male ones pendulous, the female erect. The former are 2 or 3 inches long, bearing at intervals stalkless clusters of inconspicuous flowers, each consisting of a six or seven-lobed calyx and ten stamens. The female flowers, on the other hand, are solitary, each being surrounded by the numerous overlapping scales, or 'bracts,' which afterwards form the cup. The flower itself is but the ovary enclosed by the adherent calyx, divided internally into three chambers, and surmounted by a triple style—the miniature *fleur-de-lys* on the sceptre of the forest king. In each chamber there are two ovules, and it is a noteworthy fact that from these six only one is matured into the single seed that every acorn contains. A similar circumstance occurring in the case of Palms and of other trees, suggests the explanation that perennial plants, trees more especially, require to produce fewer seeds in order to ensure the permanence of the species than do annuals, whose individual existence is so many times shorter."

EALING, ACTON, AND HANWELL HORTICULTURAL SOCIETY.—The financial success which attended the anniversary exhibition of this Society held in Gunnersbury Park on July 7 and 8 completely surpassed the most sanguine expectations of its promoters. The sum of £95 was taken in payment at the gates; and a sum of over £89 taken by the sale of tickets on the preceding day; some £55 of this sum being for sixpenny admissions sold at fourpence each. A very large body of subscribers and their friends, as well as exhibitors and their assistants, were admitted by special tickets. Notwithstanding that such a large body of persons passed through the grounds, which were freely thrown open to the visitors, Mr. ROBERTS had not a single cause for complaint; and the behaviour of the multitude was most decorous. The income of this Society, which was last year just over £500, will this season amount to nearly £650.

GARDENING APPOINTMENTS.—THOMAS FEAST, Foreman at Oakley Court Gardens, Windsor, as Gardener to F. M. HUTH, Esq., Hennead House, Cuckfield, Sussex.—Mr. A. RYDER, Plant-Foreman, Kensington Palace Gardens, has been appointed Gardener to the Right Hon. Lord BATEMAN, Shobdon Court.

BAMBOO.—In Burma, as in most tropical countries, the Bamboo is in great demand, and to the mass of the people is invaluable. Of Bamboo alone a complete and comfortable house, absolutely proof against the tropical downpour of rain, can be erected in an incredibly short space of time. A roof made of large Bamboos split in half, and laid over and under, like tiles, is absolutely waterproof. The drawback, however, of Bamboo as a house material is that it lasts but a few years, and is, of course, simply swept away by fire; but to a native of a country abounding in Bamboos, from which in three days he can reconstruct his dwelling, this is a trifle. Other everyday uses are scaffolding, bridging, fencing, and decoration—carts, boats, a fittings, matting and domestic utensils, and a variety of industrial and economic purposes too numerous to detail. A fine mat of split Bamboo forms the basis of the exquisite Burma boxes, the one industrial speciality of Upper Burma. The young shoots of Bamboos are edible, and pickled by the Chinese, whilst the softer wooded species yield a highly promising material for the manufacture of paper. Silica is contained in large quantity in both the leaves and stem of Bamboos, and is held in solution in the fluid contained in the growing stems of many species. This fluid is often limpid, but as it dries up it becomes milky, and finally deposits a cake of gelatinous opaline silica at the bottom of the joint, known as "tabasheer," possessing curious optical properties. These little discs of "tabasheer" may often be picked up in a Bamboo forest after the Bamboo which yielded it has decayed; and when a Bamboo forest has been destroyed by fire these white calceolite discs form quite a feature of the ground. *Mason*.

The Herbaceous Border.

CAMPANULAS.

CAN any of your readers tell us the history of *C. abietina*? Every visitor we have admires it, and none seem to have seen it before. It grows in circular bosses of dense foliage, and sends up stems bearing a few flowers of exquisite shape, and of a rich reddish-purple. It is quite unlike any of our older garden Campanulas. For rockwork it is the best of all the Campanulas, as it continues in flower for two or three months, whereas *C. pulla*, *C. pumila*, and the other dwarf growers, have a very brief span for blooming. *C. Scotti* is another similar flower, but its scapes have more blooms, and its foliage is sparser. An odd seedling came to us amongst some plants from Herr Gusmus two years ago, and it is very like *C. Scotti*, although different. All three remind me most of our rare British *C. patula*, which appears to me to be a hybrid, probably from *C. rotundifolia* × *rapunculus*. I argue in the same way that *C. abietina* may be a hybrid or cross variety from alpine sorts. We are just now having similar hybrids raised by British gardeners, such as G. F. Wilson; and Haylo [ensis?], raised by the late Mr. I. Anderson-Henry, and C. Tymonsii, raised by our excellent friend the great Irish florist of Cloghan. There may be numbers more, and they will all be welcome. We have nearly a hundred varieties of the Campanula and its allies growing here, and I see many cross varieties in the grounds this year from chance seedlings, one plant of *latifolia* having its flowers striped blue and white. There are plants of *rapunculus* of greater stature, and thickly coated with hairs, like *lambata*, and several new and grand varieties of *persicifolia*—one with pelviform flowers, like that beautiful variety of *carpathica*, *C. pelviformis*.

I a recent note of the rock garden at St. Alban's Court in your columns, the writer remarked that it appeared to be a summer rockery, no provision being made for late blooming. The Campanulas and *Dianthus* fill up this space of gardening time very well, and furnish abundant bloom for a month or so. Our garden never looks so gay as when the Roses, Campanulas, and English Irises are in bloom. I am glad to see *C. Zoysii* in flower to-day. It is thus quite hardy, as it has been here now three years. *W. Brockbank, Brockhurst, Didsbury, July 25.*

GARDEN PESTS: HOW TO PREVENT THEM.

CATERPILLARS.—It is necessary in order to destroy these pests, whose kinds are legion, that every chrysalis found under the copings of garden walls and in the crevices on gates, windows, palings, doors, &c., be carefully picked off during the winter and spring months.

The best method of preventing trees, especially the Apricot (to which they are very partial) from being infested by the Lepidoptera (moths or butterflies) which lay their eggs on the bark, is to scrape the stems with a smooth piece of bone or wood, made in the form of a knife. Steel would hurt the bark and consequently injure the tree.

When the stems have been carefully gone over wash them with an equal quantity of soap-suds and liquid-manure. Should the trees be planted against a wall wash that over with the same mixture, for many moths and butterflies deposit their eggs on the walls to which those trees whose foliage their larva most affect are trained.

Directly winter has laid the trees bare insects vanish, but immediately foliage appears in spring, caterpillars, some of whom have but just emerged from the eggs laid by the perfect insect at an earlier period, and some who have passed through their winter in this state, are seen devouring on all sides every bit of green they can find, often leaving the tree quite naked; so in autumn, as soon as the leaves begin to fall, it is well to rake up and sweep away all litter into a refuse heap and immediately set fire to it.

Some people mix up decayed foliage with manure and save it for hot-beds; they say that this process destroys any eggs that may remain on the underside of the leaves, but I prefer burning them. Ova, chrysalids, &c., may survive the one, but cremation most certainly destroy all vitality. In washing the

stems some of the mixture falls on the beds underneath the trees, and that destroys the slugs. I allude now to the second washing, which should take place in the spring, before the buds begin to swell, for it will not do to wash or water with this mixture after the trees come into bloom.

When there are any caterpillars on the leaves it is easy to discover them by the curling up of the foliage; every curled leaf will be found to contain one or more specimens.

There are some gregarious sorts which make a sort of cobweb net or bag, fixing it on to a branch of a tree. The Procession caterpillar, so often found on the Oak, is one of this kind. It is the produce of the Bombyx processionis. It is very amusing to see these caterpillars come out of their nests of an evening in single file; they form one continuous string, the head of the second caterpillar just touching the tail of the first, and after the single file becomes about 2 feet long they double it, two march abreast: after a little while three, until in a short time perhaps as many as eight will come all in a row, and one can easily imagine the ravages they commit on the trees they feed upon with their sharp cutting mandibles.

It is said that each plant has its very own peculiar species of caterpillar, but I think that a great many of them show a considerable predilection for Cabbages, although there is, of course, the caterpillar of the Cabbage butterfly (Pieris Brassicae), which, fastening itself by means of thin threads to a leaf, transforms itself into a chrysalis.

Other caterpillars make slight cocoons by gathering two or three leaves into a ball in order to protect themselves from observation. Some strengthen their cocoons by adding earth and various substances, while some, so Reaumur relates, actually tear the hair with which they are covered off their bodies in order to construct their cocoon.

One might fill pages with the description of the various transformations and habits of the different caterpillars found even in our own country, but as this notice is more especially intended to point out the best way of destroying the insect pests of our gardens I shall not make any more entomological remarks. *Helena Watney.*

FRUIT CROPS OF NOVA SCOTIA.

HALIFAX.—Although a great extent of the province of Nova Scotia, including Cape Breton Island, is well adapted for the production of Apples, Pears, Plums, Cherries, and other hardy fruits, yet the principal orchards are found in the counties of King's and Annapolis, in the districts known as Cornwallis and the Annapolis valley. Fruit culture is slowly spreading to the other counties, and Cape Breton is already noted for its Plums, which find a ready market in the United States, where Plum culture is very precarious, owing to the prevalence of the Curculio. The Hon. George Whitman, of Roundhill, Annapolis, reports that in his district the late frost in June did much damage to fruit, especially to Plums and Pears, and that the continued dry weather in June has so injured the crops in light soils, that the yield of Apples will be far short of an average. Colonel W. E. Starratt reports from the town of Paradise (another fruit centre in Annapolis county) in similar terms, and says that the Apple crop this year will be much below an average one. The Nonpareil, "the King of Apples," as a long-keeper, will prove this year a failure. The reports from King's County are more hopeful. Mr. R. W. Starr, writing from Cornwallis, says that fruit, which is fast becoming the great staple in that district, will prove a full average crop. Pears are hardly up to the average, but Apples will give a fair crop for most sorts. Baldwins will be short, as it is not their bearing year (many varieties bear a full crop only in alternate years); but most of the other sorts are looking as well as could be expected after the heavy crops of last year. Mr. C. F. Eaton, on the other hand, writing from another part of the same district, says that there will probably not be an average crop of Apples, although some orchards look well. Pears and Plums are only medium, perhaps below an average in quantity; Cherries plentiful; Strawberries abundant and very fine, as they are all over the province, wherever cultivated. The wild Strawberries, which form an important article of commerce, being used extensively for preserving, were

a short crop this year in consequence of the great drought at their ripening season in the latter part of June. In Varnouth County, on the Atlantic seaboard, at the mouth of the Bay of Fundy, Mr. C. E. Browne reports that the fruit crop promises to be a large one, with favourable prospective conditions; it finds a home market. Small fruits are doing well, except Raspberries, the canes of which, in most instances, were winter-killed as to the buds, the canes remaining green; prolonged growth during mild weather, in the Fall, and consequent partially ripened buds, may explain this.

From the Fundy shore districts, where Cherries specially thrive, the crop is reported better than last year. The weather during the present month (July) has been as favourable as could be desired for all crops in this province; the hay crop, which is our most important one, has profited by the warm weather and frequent rains, and yet the weather is dry enough to promote the healthy growth of the Potato, Indian Corn, Squashes, and Cucumbers, Tomatoes, and other crops requiring heat. Garden crops are exceedingly luxuriant. Early Peas have come into use during the past week. The Halifax market is abundantly supplied with early Turnips, Spinach, salads, Carrots, and even Cauliflowers, and many other vegetables. The abundant supplies of fruit (*Vaccinium*) from the "Blueberry barrens" is nearly ready; the Huckleberry (*Gaylussacia*), which is even more abundant and cheaper in price, comes later in the season. *George Lawson, Secretary for Agriculture, Government of Nova Scotia Office.*

PORT WILLIAM.—On the whole we shall, I think, have a fair crop, perhaps under an average, but there are so many young orchards just beginning to fruit it is a difficult matter to judge by any previous season as these young orchards make up very largely for any deficiency in the older plantations. We propose making an exhibit of Apples at the Crystal Palace, London, on Nov. 6, when we hope our fruit will show to better advantage than last year, when much of it had to be picked a month too early. I note what you say about our fruit suffering from bad packing. *C. R. H. Starr, Sec., N. S. Fruit Growers' Association and International Show Society of Nova Scotia.*

CISTUS.

THREE mild winters in succession have enabled us to bring into cultivation here a considerable number of the genus *Cistus*, though hardly one of them can be called truly hardy in the soil and climate of this part of Cheshire. During a recent visit to Kew I was able to correct and verify the names of most of them—about which both in nurseries and in private gardens there is often much confusion. The best way to grow *Cistus* in a doubtful climate is to take cuttings every summer, which may be potted as soon as struck and kept in cold frames during winter. Some fast growing kinds flower pretty well the first year if planted out the following spring, but they do better if kept in pots through two winters and planted out the second spring. If this treatment is followed there is no fear of any kind being lost, as all strike easily and winter well in cold frames. They are natives of Southern Europe, Northern Africa, and the Levant, and the number of good species is stated in the *Genera Plantarum* to be about twenty. Sweet in his monograph of the *Cistaceae*, published in 1830, figures and enumerates thirty-four, but several of these are hybrids or varieties. Others are now referred to *Hellebenthemum*. The following are twelve of the best which we have in cultivation:—

Cistus ladaniferus, having large white flowers 4 inches across, spotted at the centre with purple, is the stronger grower and one of the hardiest. In warm gardens it grows into a large bush, living many years, but plants of three or four years old flower better. It is almost too coarse a plant for the pot treatment recommended above. There is a variety with pure white flowers.

C. laurifolius.—This is another coarse growing kind, bearing white flowers nearly 3 inches across, and is one of the hardiest. I lately saw it in the park at Dropmore in Buckinghamshire growing mixed up with Dog Rose and other wild shrubs to a height of 8 feet or more, but it looks better when a low, bushy habit is kept by pruning.

C. cupanius.—This is Sweet's name for one of the best of the white-flowered *Cistuses*, but the name

is unknown at Kew, though I saw cuttings of the plant labelled *C. cordifolius*. Cupanianus is given in Nyman's *Conspectus* as a synonym of *C. villosus*, a very different plant from this, having pink flowers. This plant is often seen in gardens wrongly named *C. florentinus*, from which it is easily distinguished by its heart-shaped and long-stalked leaves. It has a good dwarf, compact habit, and flowers abundantly in June.

C. hirsutus.—Another very good plant, of neat, bushy, almost procumbent habit, with white flowers similar to those of the last species. The leaves are narrow, long, almost sessile, and a good deal crimped at the side, and very rough.

C. florentinus is set down in Nyman's *Conspectus* as a variety or hybrid of *C. monspeliensis*. The true variety may be seen at Kew, whence I had it; it is there considered to be a variety of *C. hirsutus*. The plant is not so common in gardens as the name. It is more upright in growth than the type *C. hirsutus*, and has rather smaller flowers and narrower leaves. It comes very near in appearance to *C. monspeliensis*, a species with still narrower leaves, smaller flowers, and more slender and upright growth.

C. tauricus.—This I had from Kew, and identify it with Sweet's *C. oblongifolius*. I saw a plant of it grown in Mr. Loder's rock garden at Floore. It really a Tauric plant I am at a loss to know why it is omitted by Boissier from his *Flora Orientalis*, which includes all the plants of Asia Minor. It has white flowers, and rather coarse oblong leaves, and is said to be one of the hardiest.

C. purpureus.—A very showy kind, flowering freely the first year from cuttings; the flowers are very large, good pink-purple, with a dark spot at the base of each petal. Leaves rather large, narrow, oblong, nearly sessile, with an amplexical stalk; one of the best. Its natural history is obscure. Nyman does not enumerate it in European plants, and Boissier, though including it as Asiatic, says he does not know its habitat. De Candolle says it comes from the Levant; it is probably Cretan.

C. sativifolius, which ought to include, according to Boissier, Sweet's *obtusifolius*, either as a hybrid or a variety. Both are good free-flowering kinds, with white flowers, and both tolerably common in gardens, forming larger bushes than those with similar flowers mentioned above.

C. Cypricus.—There is some confusion in Sweet between this and *C. ladaniferus*. He says that the *C. ladaniferus* of *Bot. Mag.*, t. 112, is *C. Cypricus*, as three buds are there shown in a bunch, the flowers of *C. ladaniferus* being solitary. In other respects, however, the figure in the *Bot. Mag.* is nearer *ladaniferus*. In cultivation and real life the two plants are widely distinct. *C. Cypricus* being of very spreading, dense, and almost prostrate habit, flowering far more freely than a bush of *C. ladaniferus* of the same dimensions. The flowers of *C. Cypricus* are rather smaller, and open more flat, and the purple spot at the base of the petals is not so large as in *ladaniferus*. *Cypricus* is, for garden decoration, a very superior plant to the other. Of pink-flowered *Cistuses* three may be mentioned as common in cultivation.

C. crispus is the best, with flowers of clear bright pink, having by far the best colour of this class. The leaves are much crimped and glaucous. It grows into a well formed, much spreading bush about 2 feet high, and the flowering period continues for more than two months. It is a native of Portugal, and one of the hardiest.

C. albidus.—Distinguished easily from the last by its larger flowers of pale pink, its more glaucous and longer leaves, and its more straggling and upright growth, and from the next as easily by the colour of its leaves and its pointed buds. It is a fine variety where conditions are suitable, but it seems even more impatient of damp than most of the *Cistuses*, and is apt to become straggling and untidy.

C. villosus.—Leaves almost roundly ovate, rather blunt, nearly as broad as long. Sepals recurved at the tips before flowering, covered with conspicuous hairs, as are also the leaves and young stalks. A species common in cultivation, varying a good deal in the shade of colour of the flower.

There are two plants with handsome bright yellow flowers and a black spot near the base of each petal common in gardens, and very ornamental but tender. They are generally known as

C. formosus, with rather broad leaves and larger flowers. I lately saw this at Mr. Whitaker's nur-

ery, Breadsall, growing 9 feet high against a wall, and flowering profusely.

C. algarensis, with narrower leaves and smaller flowers.

Both require a warm sunny situation, and are liable to be lost in hard winters; but the plant at Breadsall is eight or ten years old, and has endured a temperature of nearly zero, with the protection of the wall. These two are now referred to the genus *Helianthemum*. *C. Witley Dod*, *Edge Hall*.

FUNGUS POISONOUS TO PHEASANTS.

DURING the past fortnight I have received better materials for the identification of the fungus fatally poisonous to pheasants from Mr. Mills, who also informs me that another case of poisoning has occurred, and that pieces of the fungus have been again found in the dead bird's crop. A similar case has also been reported from the Scilly Isles.

The accompanying illustration (fig. 31) of the fungus is engraved, natural size, from a living example forwarded direct from Enys by Mr. Mills. A section is seen on the right; a cystidium is enlarged 400 diameters, and the distinctly nodular brown spores are enlarged 800 diameters. The fungus is brown all over.

The Agaric bears a very strong resemblance to a small example of *Agaricus (Inocybe) rimosus*, Bull, and to this plant the fungus might be doubtfully referred. It, however, differs in having nodular spores, the spores in *A. rimosus*, Bull, being, according to my observations, oval and plain. It is, however,

FIG. 31.—FUNGUS POISONOUS TO PHEASANTS: *AGARICUS TRECHISPORUS*, BERR.

remarkable that some drawings made by Mrs. Russell, purporting to represent *A. rimosus*, Bull, in the Botanical Department of the British Museum, South Kensington, show *A. rimosus*, Bull, with nodular spores, exactly in the style of the illustration here given.

I consider the poisonous fungus to be an ally of the above, viz. the *Agaricus (Inocybe) trechisporus* of Berkeley, although the engraving does not exactly correspond with the original illustration published by Mr. Berkeley himself in the *Outlines of British Fungology*. A drawing of this latter species by Mrs. Russell in the British Museum, however, closely corresponds with the engraving. Fungologists will notice how close is the resemblance of our poisonous plant to *Agaricus (Inocybe) scaber*, Müll.

A highly poisonous ally of the plant before us has long been known in *Agaricus fastidiosus*, Fr.

In originally attempting to determine this plant from the remains found in the birds' crops I was led astray by the form of the spores and large cystidia in considering it to be an *Entoloma* instead of an *Inocybe*. There is no doubt whatever that the poisonous plant is a true *Inocybe*, and one of the very limited set with a longitudinally cracked pileus and nodular spores.

The fungus was found growing at Enys amongst the grass on the lawn; the lawn extends over thirty-five acres, and there are many and various trees upon it. *W. G. Smith*.

SHOW FIXTURES.—Northampton Horticultural Society, August 3; Matlock Horticultural, August 8; Sutton and Cheam Horticultural, August 12; Wells Horticultural, August 20; Shropshire Horticultural, August 19 and 20; Handsword and Sheffield Horticultural, August 26.

Floists' Flowers.

THE AURICULA.

ABOUT the end of July is an important period in the life of an Auricula. At that time they have passed through the summer's rest and are starting into active growth. The two seasons of rest are not noticed by all cultivators, and thus the plants do not get the treatment best suited to their needs. Midwinter is well known to be the season of rest before the plants awake into active and vigorous spring growth. Midsummer is also a period of rest, during which the plants must not receive much water, and be kept as cool as possible, freely exposed to the air by night and by day. It is by judicious management at this season that the plants are cultivated so as to make their growth without at the same time producing any flower trusses. Some growers are much more successful in this respect than others, and none more so than the Rev. F. D. Horner. He seldom has more than five per cent. of his plants running up to bloom in autumn, we seldom have less than twenty per cent. I know Mr. Horner's treatment very well, and have followed it closely, but not with the same results, and can only account for the difference in climate, ours being hotter and drier. Finish off all potted as speedily as possible, ours would have been done before this but for a pressure of other work. The potted time affords an excellent opportunity to remove all offsets having a portion of roots attached to them, they are now clustering thickly round the neck of the plants. They should be potted into very small thumb-pots, singly or two together. I find they form roots, and succeed better in these tiny pots than they do in small 6's. Pot on the seedlings as they require it, and also the offsets propagated in the spring.

THE CARNATION AND PICOTEE.

By the time this appears in print the plants ought to be layered. The details of this operation have been so often described, that no more need be said about them. Hybridising the flowers to obtain seeds should be continued all the time the plants are in flower. Those who have not had much experience in seedling raising—who have not perhaps traced the progress of the seed into a tiny plant, and watched it up to the flowering stage—may think perhaps that seeds from a scarlet bizarre, or from a rose-flake, ought to produce duplicates of their parents with but slight variations: they would open their eyes with astonishment at the medley of form and colour produced from even one seed-pod—selfs of various colours, flakes, bizarres, single, semi-double, and double in endless variety not one alike. The profusion of flowers produced and the vigour of the plants cannot fail to please those who admire sweetness, and an interminable variety of beautiful forms. I write this with a bed containing tens of thousands of beautiful flowers and buds before me. The seedlings intended to flower next year have not long been planted out; it is best to plant them where they are to flower early in June, the plants will then form good strong specimens which will produce an average of fifty flowers the following season. Some persons say the flowers ought to be opened on cards, and in the gardens of the genuine old florists each remarkable specimen has its background of white card-board. We never have a card on any of our flowers except when they are prepared for exhibition.

HOLLYHOCKS.

Although the season has been very favourable to the development of the troublesome fungus, [?] there is not yet any trace of it on our plants growing all over the garden. The plants are just now coming into bloom, and if we could supply them liberally with manure-water, the flowers would be of very large size. The whole of the plants have been out-of-doors all through the winter. It is now a good time to propagate plants from eyes. The side growths have usually two or three eyes near the base, these must be cut out in the same way as Vine eyes, the leaf cut off, leaving the stalk. They will soon produce roots in a frame; a very little bottom-heat stimulates root-action, but they will produce roots in cold frames, if the small pots are plunged in cocoa-nut fibre refuse. Remove the blooms as soon as they decay, and also the seed-pods, if seeds are not wanted.

THE PANSY.

This dry hot weather is very trying to the Pansy. The plants must be freely watered, and even then many of them will die off. Green-fly is also very abundant, which cripples the plants and prevents their blooming. A reddish species, small in size and peculiar to the Pansy, clusters thickly round the points of the young shoots and stops their development. The right thing to do, as soon as dry hot weather sets in, is to take cuttings from the whole of the plants, dip them in soft-soapy water, and plant them in a shady place, using light sandy loam. Many of the old plants will die off suddenly, and they would be lost but for this precaution of taking cuttings. It is now a good time to sow seeds, which will produce strong vigorous plants before the winter. A bed of seedling Pansies is a very beautiful object in any garden, and they stand the hot weather much better than the choice named varieties propagated by cuttings. The principal points in their culture are a rich deep soil to grow in, abundant supplies of water as soon as hot weather sets in, and keeping the leaves free from insect pests.

RANUNCULI AND TULIPS.

The roots of these have been taken up and stored for the season. Both of them flowered beautifully this year, and without any special preparation of the ground, except in the case of the Ranunculi, a few inches of fine peat (the siftings from the Orchid pottings) was laid on the surface, a little of the ordinary garden soil was stirred up with it, and so well have they grown, that the stock of roots is increased fourfold. If the ground intended to be planted with Tulips can be trenched and manured now, it would be well to do so; the exposure to heat and rain alternately brings the ground into capital condition for planting in November. *J. Douglas.*

DISEASE OF BULBS.

GUMMING OF ROMAN HYACINTHS.—Sometimes Roman Hyacinths, although imported to this country in an apparently sound and healthy condition, deteriorate and perish by gumming before the time of planting arrives. If the unsound examples are planted they perish in the ground, or if they are only slightly affected they do not flower. The diseased bulbs exhibit an exudation of gum, generally at the crown, or, more rarely, at the sides; in bad examples they swell and soften, gum bursts through the entire surface, and the bulbs at length putrefy. The external aspect of a slightly affected bulb is shown in fig. 32, and a section in fig. 33. The gum generally forms a kind of seal at the crown, through which the flowering shoot within (even if sound) cannot penetrate. As will be seen in the sectional drawing, the gum is produced in the heart and between the scales. On a microscopical examination of the soft thick gum it is found to be thickly traversed by the mycelium of one of the blue mould fungi, *Penicillium crustaceum*, Fr. The gum when removed from the bulbs and placed under favourable conditions for growth generally produces the fruiting condition of this fungus from the mycelium within. The *Penicillium*, it is supposed, cannot set up decay in perfectly sound substances, but it doubtless greatly accelerates decay when it once alights on any slightly bruised or unhealthy surface. It is also certain, as we have proved by experiment, that the gumming increases in the bulbs as the fungus extends in growth. It appears, then, probable that the *Penicillium* spores are imported with and inside the bulbs, and that if the bulbs receive any slight bruises or other injuries, in packing or transit, gumming is started; the gum is a pabulum exactly suited to the fungus, and the *Penicillium* spores germinate and grow in this material. The gum, with its contained growing fungus, by irritation increases the gumming. The gum, with its fungus, is probably capable of setting up gumming in other bulbs by contact. Every bulb, therefore, which shows the slightest trace of gumming should be removed and burnt, for it is probable that by the exuded gum the disease is extended from one bulb to another in collections.

Nurserymen and gardeners often complain of Lily bulbs, especially imported bulbs of *Lilium auratum*, becoming rotten. The damage is caused by slight injuries to the scales received in the process of packing in Japan, and perhaps sometimes from the

bulbs being lifted whilst immature and packed whilst in a damp state and before the bulbs have sufficiently parted, by drying, from their superabundant moisture. The *Penicillium*, which is present everywhere, cannot, in the first instance, cause disease, it lives on the juices of the bulbs which have been set free by breaking and bruising. The fungus, however, acquires greater potency over the bulbs when it has once fixed on the exuded juices, and then it has the power of rapidly extending in size the originally damaged parts. In examples of this class the outer fleshy scales of the bulbs are soft, and on a microscopic examination

FIG. 32.—GUMMING OF ROMAN HYACINTH: EXTERNAL ASPECT. NAT. SIZE.

they are found to be permeated by the mycelium of the fungus above mentioned, viz., *Penicillium crustaceum*, Fr. The fungus can almost invariably be traced to injured places or bruises.

In bad cases cure is hopeless, as the heart of the bulb is perished; in slight cases dryness and dry heat will have a tendency to stop the growth of the fungus and arrest the rot. The decayed parts should be carefully cut away with a sharp, clean knife, and the cut surfaces dusted with powdered charcoal, or powdered lime. In no cases should the bulbs be planted in humid soil till the cut places have completely healed. In slight cases immersion in a one

FIG. 33.—GUMMING OF ROMAN HYACINTH: SECTION THROUGH BULB, SHOWING GUMMING. NAT. SIZE.

per cent. solution of carbolic acid would probably destroy the fungus growths; the water containing the acid should be allowed to quickly drain away from the bulbs in a dry place. The bulbs should be quite dry at the time of planting, and the pots or beds in which the Lilies are grown should be thoroughly well drained.

In an early number of the *Gardeners' Chronicle* we shall fully illustrate and describe *Penicillium crustaceum*, Fr., together with *Aspergillus* and *Mucor*, fungi which play most important parts in the decay of fruit, &c.

Mr. Albert Michael reports that gumming in bulbs is in the first instance caused by the attack of an *Acarus* or mite named *Rhizoglyphus Robini* (gen. of *Tyroglyphidae*). This *Acarus* is supposed by some observers to be a parasite on a *Phylloxera*, but the

idea is not supported by Mr. Michael. The mite attacks bulbs between the scales, where it deposits its eggs. Such attacks would undoubtedly start gumming.

Sometimes the bulbs of Snowdrops and Tulips and the corms of *Crocus* exhibit small pale-coloured, but at length black flattened sclerotia in their outer coatings. A sclerotium is a little nodular mass of compacted mycelium (or fungus spawn) in a resting or hibernating state. These little masses are sometimes no larger than a pin's point, many are about the size of a mustard seed, or a little larger. The black sclerotia outwardly resemble *Sclerotium complanatum*, Tode, a compact mycelium very common on fallen leaves, especially of the Elm. When examined in section the bulb sclerotia are, however, seen to be different, as they exhibit the structure of the minute loosely compacted sclerotia which give rise to *Mucor subtilissimus*, Berk., in Onions. The germinating sclerotia of Onions are highly destructive to the bulbs, and there can be no doubt but the bulbs of Snowdrops and Tulips and the corms of *Crocus* are often destroyed by a fungus allied to the *Onion Mucor*. All bulbs which exhibit disease should be burnt or deeply buried, and on no account should bulbs be planted a second season where the little black sclerotia have been proved to exist. The sclerotia probably rest in the decaying vegetable material, or in the ground, during the winter months and germinate in the early spring. It is obvious, therefore, that if they germinate near plants as different as possible from the nurse plants, they will probably perish from want of a suitable host.

A brick-red fungus which sometimes forms dull red patches on Potatoes, *Acrostalagmus cinnabarinus*, Corda., frequently attacks bulbs of Lilies and corms of *Gladioli*. The *Gladioli* is also sometimes affected by a kind of Smut fungus named *Urocystis gladioli*, W. Sm. *W. G. Smith.*

HOME CORRESPONDENCE.

Planting Winter Stuff.—In this dry season it will be found of advantage, in light soils especially, to plant between the rows of Potatoes such sorts as Savoy, Kale and Broccoli. These in good garden soils will grow sufficiently large for home consumption without the use of manure put in for the crop itself, and will be found to withstand frost better than others forced into sappy growth by over-much manure. The bottom of the furrows between the rows of Potatoes contains some moisture in the warmest weather; it is also firm—another advantage; and will be better if not loosened with a fork, as this would make it less suitable for the plants, and would dissipate likewise much of the moisture present. *M.*

Royal Horticultural Society's Committee and Judges.—It appears desirable to direct attention to a small difficulty that accompanies the formal business at South Kensington at times when committees meet and exhibitions are in progress. The manager of an exhibition (whether Royal Horticultural or special) finds it convenient to select for judging members of committees, and it is at that point the difficulty begins. For example, I was at the table as member of Floral Committee at the usual hour on Tuesday last, but being appointed with my friend, Mr. John Fraser, to judge Carnations, I did not sign my name in the committee book. [Why not? The book was on the table. Ed.] At the end of the year, when the attendances are counted, my total will be diminished by as many occasions as I have been absent from the table, in order to operate in the larger field. For myself I am not speaking, being content to be usefully employed, and the final counting of signatures does not trouble me. But having set forth the facts, I wish to direct attention to their injurious tendency. If I ask a member of committee to assist in judging an exhibition that may happen to be in my charge, he will possibly decline to act, on the ground that the omission of his name from the committee book will diminish the total of his attendances. I have had to face this difficulty and lose the aid of good men who were otherwise willing. I see others, who are sufficiently burdened with cares of management, troubled in the like manner; and the question suggested by the facts is to find a way out of the difficulty. It appears to me a very easy matter, and I

submit, subject to approval by the Council, a simple plan of procedure. For every meeting of committee let there be assigned in the signature-book two pages facing each other. On the left-hand page the names of members actually sitting will be entered in the usual way, and on the opposite page those of members who are at the same time engaged in the business of the exhibition. This being done, we shall have less difficulty in obtaining judges, and we shall have a complete record of personal work. *Shirley Hibberd.*

Early Entants Cabbage.—Among early Cabbages getting a high character for excellence I fall to find the Early Entants among the best. We find it both to be the earliest and best. *L. L.*

Chrysanthemum Leucanthemum.—I send you by this post flowers of a very handsome Leucanthemum I have growing here. You will observe they are exceptionally large: the whole plant is of a much larger stature than the ordinary Chrysanthemum Leucanthemum, of which it appears to be a form. I collected it abroad about ten years ago, I think in the Western Alps, but I most unfortunately lost the record of its habitat. It is a very handsome herbaceous plant, growing nearly 4 feet high. Flowers after the ordinary C. Leucanthemum and long before C. maximum. It is just now a mass of the large white "Daisy" flowers, some of which are 3½ inches across. *Go. Mau.*

Phormium tenax and other Plants in Scotland.—The finest plant of New Zealand Flax in this district is growing in the garden of Mr. Wm. Walker, Strathkness. Some of the leaves are nearly 8 feet in length. At present there are two flower-stems, the tallest of which is 9 feet. This bears a dozen trusses of deep crimson flowers. (I know of one catalogue and one dictionary in which white is given as the colour.) Note was taken of the rate of growth, when at its quickest. This was found to be 2½ inches in 24 hours—1½ during the day, and 1 inch during the night. The soil is strong loam, and there is but little shelter. This plant, which has flowered twice before, is a seedling from seed ripened in the open air by Dr. Traill, Orkney. In the same plot is a fine example of *Veronica Traversii*, 4 feet in height, 5 feet across, and completely covered with bloom. In a small cool greenhouse, amongst luxuriant native and hardier exotic Ferns, is an *Adiantum pedatum*, with stems 20 inches in length, and leaves almost 2 feet from tip to tip. *F. W., St. Andrew's, N.B.* [The usual colour of *Phormium tenax* is orange. Ed.]

The Potato Crop in Middlesex.—The change which has come over the general aspect of the Potato crop since I penned the first remarks concerning its appearance and prospects in this district, which you inserted last week, is at once remarkable and distressing. Three weeks of autumn drought accompanied with great heat has told upon the plants with disastrous results, and the larger portion of the early kinds may be said to be dying off rather than ripening. The tubers are very small, though of course sound, and as a result the price in the market is advanced, although not sufficiently to counterbalance the loss in bulk incidental to the drought. Even if the growers found prices so advanced that the increase sufficed to recuperate the loss in bulk, the consuming public would, of necessity, be sufferers, and then we see how speedily a short crop at home acts upon the markets, and how terribly our vast population would suffer, were our food supplies restricted by import duties. With respect to the later kinds there is yet not a great deal to complain of, although it is certain that nothing less than a heavy ground rain of twenty-four hours' duration can save these either from early collapse or later superabundance. The remarkable drought of last year was, up to this time of the year, productive of far less disastrous results to the Potato crop than is seen this season. The plants are also much infested with the aphid. This drought has shortened the duration of the Pea crop, and smothered the plants with blight. The seed crop will probably be a limited one, though a well hardened sowing. Runner Beans are blooming freely but setting badly, and of all the winter Cabbage tribe enormous difficulties are found in planting out with soil so hard and dry. The drought is also telling upon the Apple, Pear, and Plum trees; fruit is falling fast, or is very small. After all, the brilliant prospects of the spring seem to be fading into remote distance as the summer and the drought go on. *A. D.*

Fertilisation of the Passion-Flower.—My experience tends to prove that no general law can be formulated as to the fertilisation of the *Passiflora* tribe. Darwin states that, according to the accounts he had received, "quadrangularis" never produced fruit with its own pollen (*Animals and Plants under Domestication*, vol. ii, p. 137), at the date of the publication of that book. I had for many years been growing the variety, and rarely if ever failed in fertilising it with its own pollen; but no flower ever produced fruit unless the pollen was artificially transferred to the stigma, clearly proving that the fertilisation was not due to other pollen. Afterwards I grew another strain of the same variety, but I never succeeded in fertilising a single flower with the pollen of the same plant, while I set as many as I wanted with the pollen of "kermesina." On the other hand "freida," remarkable for its beautiful mossy involucre, without assistance produces as many fruits as flowers. The fruit of this variety, described in *Curtis's Botanical Magazine*, as being "dry, inflated," is with me juicy, high flavoured, and liked by many. *Edmund Tenker, Knowle, July 25.* [Please send specimen for confirmation. Ed.]

A Firm Path.—Mr. Darwin, in his interesting book on the earth-worm, tells us something of the labours of that humble creature. There is abundant evidence of such labour in a road from Greenhill to Headstone. It was made some fifteen years ago, the road and path being covered from 6 to 9 inches deep with Harrow Weald gravel. On the path by the side there is now a firm, smooth sward, nearly 2 inches thick, entirely due to the labours of earth-worms. Probably in another fifteen years scarcely a vestige of the works of the human road-makers will remain to be seen, so effectually are these lowly workers levelling up. *T. W., Harrow.*

Sweet Peas from Boreatton Park.—A charming lot of new Sweet Peas has been forwarded by Mr. Henry Eckford, from Boreatton Park, Baschurch, the flowers of great size, brilliantly coloured, distinct, and very fine. The latter quality, no doubt, is partly owing to the increased size seen in the new varieties previously raised by Mr. Eckford, and partly to his method of culture. Instead of following the somewhat barbarous practice of sowing the seeds thickly in a line—too thickly, indeed, for the plants to have sufficient space in which to develop themselves, and there is such a drain upon the soil that when a time of severe drought comes like that through which we are now passing, the flowering time is very short, if the plants are allowed to set their seed-pods. If the old method is to be followed it would be much better to sow in a well manured trench like that used for Celery, so that a mulching could be given in hot weather, with plenty of water when necessary, and the earliest decaying flower-stems be cut away. Mr. Eckford grows his Sweet Peas either singly or in clumps of two or three plants in well manured soil; the result is that the individuals grow freely, branching profusely, and become perfect pictures of floral beauty, producing very fine blossoms. The following are the new varieties sent by Mr. Eckford:—*Charming*, magenta standards, with slight margin of purple, paling to pink towards the base, the wings and keel white, forming a wire edge of blue—very pretty indeed; *Purple King*, the standard bronzy-purple, with a distinct margin of clear purple, the wings bright purple—very fine, distinct, and showy; *Imperial Blue*, puce standard, shading off to mauve and violet, the wings and keel bright blue—very fine, pleasing, and distinct; *Duchess of Edinburgh*, pale bright orange-carmine standard, very rich in colour, and effective, the wings and keel delicate magenta, shaded with violet—very bright and glowing in colour, and extremely pleasing; *Rosalind*, pale bright rosy-pink standard, the wings and keel delicate mauve—bright, pleasing, and very fine; *Isa Eckford*, the standard delicate pink, the wings and keel white, very delicately flushed with soft pink—this is very sweet and pretty; in the case of the young flowers the standards are of a very pleasing shade of buff, which changes to pink with age; *Mrs. Eckford*, the standard delicate pinkish-mauve, shaded to a distinct margin of mauve, the wings and keel creamy-white, with a distinct wire edge of mauve—very fine indeed, and extremely pleasing. Lastly comes *Charmer*, the standard of a lovely shade of delicate mauve, the white wings slightly suffused with mauve—very pleasing and pretty. It is remarkable how

very few varieties of Sweet Peas put in appearance up to 1852, but now that Mr. Eckford is busy with crossing the best varieties, the results are numerous and striking. It would not now be difficult to enumerate twenty distinct varieties of Sweet Peas. The fragrant Peas are among the most valuable, as they are one of the commonest of hardy annuals. A garden, whether large or small, seems to be incomplete without some of these fragrant flowers. Mr. Eckford's new varieties appear to be very rich in perfume. When the box containing the bunches of flowers was unpacked the scent was delightfully acute. The bunches of flowers sent from Boreatton have been in water for a few days; their fragrance is still rich, and the blossoms retain it until they decay. *R. D.*

Onosma tauricum.—Although this fine Borage-wort has been in this country for some years it appears but little known, as it is seldom seen; and yet it is one of the most desirable of the hardy perennials, as it bears scorpioid cymes of rich citron-yellow coloured long tubular shaped flowers, that are very sweet-scented. The place which appears to suit this *Onosma* best is a somewhat elevated position where it can get good depth of soil and have free drainage, under which favourable conditions it is sure to do well. The way to propagate it by division, which should be effected in spring, just as the plants begin to grow, when they may be separated with safety; or seed may be sown. *O.* echinoides bears a close resemblance to the one mentioned above, but this variety is a biennial, and therefore of less value, as it is more apt to be lost. *J. S.*

Passion-Flowers.—Replying to the Editor's inquiry (*Gardeners' Chronicle*, vol. xxiv, 1855, p. 120), I am much inclined to believe that the flowers on the specimen referred to are fertilised from neighbouring blooms by insects or other agents, since there would be many expanded on this plant at the same time; but of course the question as to whether an individual bloom would develop a fruit producing perfect seeds when fertilised by its own pollen, could be easily demonstrated by removing all the flower-buds save one, which could then be fertilised with its own pollen, and I dare say, as this is a matter of some importance, some of your readers who possess an isolated Passion-flower will try the experiment, and enlighten us on the matter at some future period. *W. Napper.*

Fruit and Vegetable Farming.—In the various schemes which are now before the public for the bettering of the farmers of this country, none of them seem so untenable as those advocating fruit and vegetable farming in a wholesale way. If this should ever be adopted generally over the great areas now under grain and pulse crops, the system would have but short duration, simply from want of consumers. Our country people get now almost enough of vegetables as is good for them in this climate, and fruit can here be looked only on as an adjunct to a meal, not as a meal itself. Our people, even if they could be induced to take to vegetable diet, would do so reluctantly, and it would be impossible for them to do a fair day's work on one purely vegetable. The writer recollects some years ago a number of Flemish navvies being imported during a strike on a stretch of southern railway. Now these men ate fruit and bread, did not see any virtue in beer and beefsteaks like their English compeers, and went into the town to make their purchases in carpet shoes. The contractors for the line were soon glad to give their navvies, who had struck for an addition to their pay, the sum required, and ship the Flemings back again to the Fatherland, for they saw that one good Englishman could do three times as much work as they, with apparently less exertion. Beyond the reform of our land laws, which would bring more good land into cultivation, that is now laid down under grass, as parks, &c., is an increase of small farms, where the yeoman could grow hardy varieties of Wheat, not fine tender kinds like Talavera Red, and the like; Rye, which is the bread-stuff of millions in central and northern Europe; Oats, more Peas, Haricot Peas, and roots, such as Parsnips and Beets. Potatoes should be less grown than they are now, for not only are they an uncertain crop, but the feeding qualities of any of the varieties is very low, the Haricot Bean being greatly its superior, besides permitting of being cooked in more

different ways. Poultry, rabbits, cows for milk, and more stock, even if it were not of the finest breeds, could be kept in greater numbers under small farm management than under large. The chief want of the day in our country is not more jam, or fruit, or vegetables, but more meat, grain, and pulse for the growing children and hard-working men and women—not forgetting that almost indispensable food for the young, plenty of good milk. If we had cheap and abundant supplies of meat, should we spend so much money with the Chinese for their Tea? I believe we should not, for meats, soups, and broths would take its place in the dietary of those who were the workers, and certainly with advantage to themselves and to the country generally. Soups of Beans and Lentils, with a small addition of fat meats, are greatly superior to either Tea or Coffee for breakfast and supper; and oatmeal, in various ways, is to be preferred to either, as every Scotchman will aver. *Haricot*.

Everlasting Peas.—For growing in semi-wild places, or anywhere in a garden for the supply of cut flowers, nothing can be more useful than *Lathyrus latifolius*, which is one of the most hardy and enduring of plants, as it will grow and flourish almost anywhere, and send up its strong shoots, which ramble and scramble up amongst hedges or bushes, and bloom profusely during two or three months of the year. Although the coloured variety is very valuable, the white kind is even more so, but both should be in every garden, and if planted at the backs of borders, in the foreground of shrubs, they will make a fine show. The way to support them there is to have a strong, tall iron guard for them to climb up, or stout lanky sticks stuck round for them to cling to, when they will form a thick mass, and produce a striking effect. Like the annual varieties, *Lathyrus latifolius* comes freely from seed, which may be sown as soon as it is ripe, either in pots under glass, or where the plants are to grow, or they may be propagated by division of the crowns, which should be done in the spring. *J. S.*

Good Grape Growing.—One of the best examples in Grape growing I have had the pleasure of inspecting this season is at Portland House, Barnstable, which speaks well for the skill of the gardener, Mr. Westcott, whose employer is R. C. Rafarel, E-q. The vinery there is not a large one, being only about 25 x 15 feet. It is a hip-roofed building and is divided for early and succession crops. The sorts grown are Golden Queen, Lady Downe's, Muscat of Alexandria, Madresfield Court, Black Alicante, Alwick Seedling, Duke and Duchess of Buccleuch. The Madresfield Court, which does so badly with many, is simply perfection here, some of the bunches measuring 12 inches in length and 8 inches across the shoulders. Altogether there are about 140 bunches in this house, averaging 4 to 6 lb. each, and they are remarkable for their perfect shape and very fine berries. The Vines are planted in the house, and the border extends to the outside. *W. N.*

Lilium candidum.—In going along country roads in this part of the country one can hardly imagine that there is any difficulty in keeping and growing the fine old *Lilium candidum*, such as some are said to experience, as in almost every cottage garden quantities may be seen sending up spikes, 4 to 6 feet high, and bearing great heads of its lovely, pure white blooms, the scent from which quite pervades and fills the air with strong odour. The soil all about the district where these Lilies are so abundant is of a light, dry, sandy nature, which evidently suits the bulbs, as they increase freely, and become so thick, after a time, in the clumps as to push each other out of the ground. If it could only be made to do so well in pots, and would bear gentle forcing, so as to get it in early, what a fine thing it would be for greenhouse and conservatory decoration—a purpose for which it looks specially suited. *J. S.*

Hardy Cacti and Nymphaea alba var. rosea.—These interesting species and beautiful plants of such opposite habits have been flowering freely at Bayfordbury, in the rock garden, in a part of it appropriated to aquatics and bog plants—the Cacti consisting of *C. Opuntia*, *C. Rafinesquina*, *C. missouriensis*, and *C. arborescens*, of which the first and second produced about one hundred fine yellow flowers, and are now fruiting. *Mesembryanthemum*

uncinatum, which is spreading over the rocks, is still flowering, and more freely than I have hitherto seen it. All these have proved hardy for several years past, care only being taken to keep them dry in the winter, with plenty of air. With respect to the *Nymphaea* it has borne this year five flowers on one plant, of a beautiful rich rose colour. I have examined one of the flower-heads which first came out, and finding it to contain plenty of well formed and nearly ripe seed, I shall have every care taken of the rest, and should be glad of any hints as to the best way of rearing them. I propose sowing the seeds in pans to be sunk some inches below the surface of the water, and kept in a greenhouse during the winter, also I should like to know where this *Nymphaea* has flowered elsewhere than at Kew, where I have seen it myself. *W. R. Baker*. [An account of the germination of the Victoria Lily at Kew in *Gardener's Chronicle*, May 2, 1855, p. 568, would give you some useful hints on raising them. ED.]

Dolphinsium.—The perennial varieties of these are among the most striking of hardy border plants, sending up as they do very tall spikes of variously shaded rich blue flowers that make a grand show and last a long time in perfection. The situation most suitable for these *Larkspurs* is in the foreground of shrubs, which not only afford them the necessary shelter from strong winds, but back them up well. Although they will grow in almost any kind of soil, that which suits them best is a deep light loam, as in that they do not suffer from excess of moisture and can send their roots deep down, and find the food they require. If extra fine specimens are desired, it is a good plan to dig out a hole for each plant, and work in at the bottom some rotten manure by mixing it up with a fork, when, after filling in again, the plants may be planted. The best time to do this is in the spring, just as they begin to start, at which period they may be cut through the crowns, or dug up, pulled apart, and divided, when, if planted in positions prepared in the way mentioned above, they will soon make large clumps, and a magnificent show. *Dolphinsium* also come readily from seed, which most of the single kinds bear freely, and this may be sown as soon as it is ripe, or in spring, the first-named period being the most preferable, as plants raised during the summer will flower the following year. The way to get these up, if the seed be sown now, is to make use of a handlight, and to sow under it in sandy soil, but if left till March or April, a little heat is required to get the seed to germinate. *J. S.*

Reports of Societies.

ROYAL HORTICULTURAL: July 28.

The Carnation and Picotee show formed the main attraction to the public on this occasion, still there were many objects of interest in the exhibits of Messrs. Ware, J. Laing & Co., Hooper & Co., and Sutton & Sons, of Reading. The herbaceous plants of the first-named firm, the Begonias from the Stansfield Park Nurseries, and the beautiful varieties of *Gloxinia* from the two last, meeting with well-earned admiration. Of minor interest were the small collections of plants in pots, and the vegetables; with the exception of *Pisces*, but little fruit appearing on the tables.

Scientific Committee.

A. Grote, E-q., in the chair.

PHEASANTS POISONED BY FUNGI.

Mr. W. G. Smith made some further remarks on this subject. See p. 148.

ODONTOGLOSSUM NEBULOSUM WITH THREE LIPS.

Dr. Masters reported on the flower from Dr. Duke submitted to him at the last meeting. The segments of the perianth were normal, as also the single perfect stamen. Midway from either side of the column proceeded a lip-like petal wholly detached from the lip. There was no trace of the three inner stamens, nor of the stigma.

CONES OF ABIES BRACHYPHYLLA.

Dr. Masters showed cones of this comparatively new Japanese Conifer, grown by Messrs. Veitch, at their Combe Wood nurseries; they were of oblong form, and of a rich purple Plum-like colour, similar to those of *A. Webliana*, but smaller. The tree in question is one of the handsomest and hardiest of its

class, and grows rapidly. [The cone figured in *Gard. Chron.*, November 1, 1879, where the tree is described, was from a native specimen.]

BOOKS RECEIVED.

Various donations were acknowledged for the library.

The meetings of the committee were then adjourned till November 10.

Floral Committee.

Present: G. F. Wilson, E-q., in the chair; and Messrs. J. Laing, W. Wilks, H. Herbst, J. Child, J. Greas, J. O'Brien, Dr. Masters, H. Williams, H. Turner, R. Douglas, J. Duffield, J. Smith, H. B. Lantine, J. D. myn, W. M. Pollett, E. Hill, K. Kinghorne, W. Bealby, W. B. Kelleck, T. Baines, A. Perty, J. Walker, H. Cannell.

BEGONIAS.

A group, not exceeding fifty plants, shown by nurserymen, brought only one exhibitor—Messrs. Laing & Co., Stansfield Park Nursery, Forest Hill—who obtained the award of 1st prize for well-blended examples of a feet or more in height, double and single-flowered kinds. These showy and enduring plants, that are, if anything, better out-of-doors than indoors, are now running a close race with the zonal *Pelargonium* and *Balsam* in the estimation of the general growers.

For nine distinct tuberosus Begonias, open.—1st, Messrs. John Laing & Co.; 2d, Mr. W. Bealby, The Laurels, Roehampton Park, the latter showing novel varieties of a small size.

For six tuberosus Begonias, distinct, anateurs.—Mr. Choeseman (gr., Mr. Mordaunt, The Hall, near Dulwich, took 1st prize; with a nicely assorted lot, full of bloom; 2d, Mr. W. Bealby; 3d, Mr. Aphorpe, Albion Brewery, Cambridge.

For six tuberosus Begonias, double-flowered, distinct, open.—The veterans, Messrs. Laing & Co., were again the winners of the 1st prize, a few of the best being Mrs. Brissenden, rose; Goldsch, scarlet; Mr. Brissenden, same; and The Cz. r., same colour. Mr. Bealby took the 2d prize, he having *Blanche Penary*, a good scarlet; *Virginalis*, a white, and *Elanch Duval*.

Six Lilies, in not less than six varieties, open.—The prize in this competition went to Mr. Ware, Hale Farm, Tottenham, the sorts being *Chalcidonium maculatum*, a deep crimson; the creamy-white *Brownii*, *pardalium* *Michauxii*, an orange, with black spots—a showy kind; *auratum*, and *Humboldtii*.

Six Achimenes, in distinct kinds, anateurs, brought but few plants; a 2d prize being awarded Mr. A. Luff, gr. to R. R. Wyatt, Streatham, for well-blended, nicely assorted varieties, the 1st prize being withheld.

Eight *Gloxinia*s, distinct, anateurs, brought nothing that could be termed first-class, most of them being over-potted and deficient in bloom and leaf.—The 1st prize went to Mr. Waite, gr. to Colonel W. P. Talbot, Glenhurst, Essex; and the 2d to Mr. A. Luff.

In the collection of carnivorous plants, Mr. H. James came out strongly in *Sarracenia*, *Nepenthes*, *Dionaea muscipula*, *Drosera capensis*, and *Cephaelis follicularis*. He was awarded 1st prize, and Mr. A. Luff the 2d.—His latter grower showing a much smaller collection of plants of a diminutive size.

A contest with twenty-five miscellaneous plants in, in 8-inch pots (open), resulted in a few groups being staged; but the condition as to size of pot determined the size of the plants, consequently there was nothing shown that calls for special notice. Mr. James, Castle Nursery, took 1st prize, the best things he had being *Agapanthus umbellatus* albus, *Thunia* *Benzonia*, *Conium*, and yet other plants with large purple blooms; and *Thiandria splendens*. Mr. A. Luff was awarded the 2d prize.

CUT FLOWERS.

A class for cut flowers of herbaceous plants seemed in danger of falling through but for the entry of Mr. T. S. Ware's grand group, which was, if judged relative to the awards made in other classes, worth many times the sum given as a 1st prize. Whilst comprising specimens of size of pot determined the size of the plants, consequently there was nothing shown that calls for special notice. Mr. James, Castle Nursery, took 1st prize, the best things he had being *Agapanthus umbellatus* albus, *Thunia* *Benzonia*, *Conium*, and yet other plants with large purple blooms; and *Thiandria splendens*. Mr. A. Luff was awarded the 2d prize.

MISCELLANEOUS.

Messrs. Hooper & Co., Covent Garden, London, showed a large collection of French collected varieties of the *Gloxinia* associated with small Maidenhair Fern. The colouring of most of them was remarkable for prettiness, and had the plants not been so crowded whilst growing they would have been furnished with better foliage. A silver Banksian Medal was awarded. Messrs. Sutton & Sons, Reading, showed a still larger collection of robust habit, the colours being strong, well defined, and foliage all that could be desired. We were informed the plants are the produce of seeds sown in January last. A Silver-gilt Medal was awarded in this case.

Messrs. J. Laing & Co. received a similar award for a splendid assortment of cut blooms of Begonias, and Messrs. J. Veitch & Sons for Carnation blooms.

A capital strain of Balsam was shown by Messrs. F. Smith & Co., Dulwich, for which they received a Bronze Medal.

From Messrs. Veitch & Sons, Chelsea, there were Piper ornatum, a pretty variety, rather with green cordate leaves marked with white, very distinct, would contrast well with *Cissus polyphyllus*; *Tillandsia rhodocena*, a Bromeliad with a pink peduncle and bracts, the flowers being pale blue, and not conspicuous—a handsome plant; *Rhododendron Nemesi*, with flowers in a rather loosely formed, somewhat orange—showy plant, and seemingly a strong grower for a tender hybrid; *Cypripedium Sedeni* caudatum, a variation from the better known *C. Sedeni*—it has pink and white flowers, with a white bloom diffused over them; *Cypripedium* *marginatum*, a tall flowered species, the case of claret colour and wings of 3 inches in length, green, densely spotted with circular markings of brown. Some hardy hybrid Gladioli of curious and distinct colours were also exhibited from the Chelsea nurseries, as also a painful plant of the dense white-flowered *Gleichenia Hastata*. The Hon. R. Boscawen, Lamoran, Cornwall, showed a large specimen of *Lælia purpurata*, bearing five spikes of four flowers each, the individual flowers being large and well coloured. A Vote of Thanks was awarded him.

Messrs. J. Carter & Co., exhibited some dwarf varieties of Marigold, African and Orange.

Mr. W. Beatty showed zonal Pelargoniums, *Rosa Bonheur*, and another which received a Certificate. A deep crimson Dianthus, named Napoleon III., was sent by Mr. Dobson, Altrincham, which obtained a Vote of Thanks.

Mr. Pollett, Fernside, Bickley, showed a small plant of *Cattleya calummatia* much resembling in some respects *C. Aclandiae*, and an *Odontoglossum crispum* spotted in a distinct manner with brown. A Vote of Thanks was given to Mr. Pollett of Cienkowski Kirki was shown by Mr. B. S. Williams, Holloway Nurseries.

Mr. James showed a neat growing, pure white *Lobelia* named Florio White, which had been recognised by a First-class Certificate in 1883.

CERTIFICATED PLANTS.

Some fine border Carnations came from the Chelsea nursery of Messrs. J. Veitch & Sons. The blooms were large, full, and showed admirably what cultivation can do for this class of flowers in London itself.

Rhododendron incarnatum floribundum with corymbs of flowers of a rich blue, and the whole plant of floriferous character, in a young state, came from the same nurseries, as did also *R. Indian Yellow*. The colour of this hybrid was very pure, and was nicely contrasted with the red stem; the foliage was long and of much substance. *Begonia Thwaitesii*, a dwarf variety with lacy green foliage, covered with reddish bracts, and pink leaf-stalks, was remarked as being a distinct and useful thing.

Mr. Ware had a pretty plant in *Draacocephalum virginicum album*, the flower-spikes of *Pentstemon*-like blooms being of the purest white. *Campanula* *Hendersonii*, a dwarf pink flowered species, and *Helenium pumilum*, a flower with rays of a bright yellow colour and a greenish-yellow disc, were distinct plants.

Mr. W. Beatty showed Pelargonium Paul Charbonnier, a semi-double scarlet zonal of fine form and great substance. He likewise had an Ivy-leaf variety named Josephine von Hohenzollern.

Messrs. Cannell & Sons, Swanley, Kent, showed Carnation The Governor, a flower flesh-white in tint, with incurving petals of great substance and fairly double.

Messrs. J. Carter & Co.'s dwarf orange African Marigold met with the approval of the judges.

The Begonia with double flowers—*Marquis of Stafford*—shown by Messrs. Laing & Co., was a handsome double bloom of good substance; and Messrs. Sutton & Sons' Hybrid bedding Begonia Prince Henry is likely, as to its hardy character and flowering habit, to make a useful flower garden.

Mr. Cannell likewise showed a Begonia, thought to be of the same purpose, named *Marchioness of Lothian*; and E. Picotee, a plant having flowers with pointed petals, rose-scarlet tipped with white; it is distinct and pretty.

FIRST-CLASS CERTIFICATES.

To Messrs. J. Veitch & Sons, for border Carnations.

To Messrs. J. Veitch & Sons, for *Rhododendron incarnatum floribundum*.

To Messrs. J. Veitch & Sons, for Begonia Thwaitesii.

To Messrs. H. Cannell & Sons, for Carnation The Governor.

To Messrs. H. Cannell & Sons, for Begonia Marchioness of Lothian.

To Messrs. H. Cannell & Sons, for B. Picotee.

To Mr. W. Beatty, for zonal Pelargonium Paul Charbonnier.

To Mr. W. Beatty, for Pelargonium Josephine von Hohenzollern.

To Messrs. J. Laing & Co., for Begonia Marquis of Stafford.

To Mr. Ware, for *Campanula Hendersonii*.

To Mr. Ware, for *Helenium pumilum*.

To Messrs. J. Carter & Co., for Marigold African Orange.

To Messrs. Sutton & Sons, for Begonia Prince Henry.

FRUIT COMMITTEE.

Present: H. Veitch, Esq., in the chair; and Messrs. A. Sutton, J. Willard, S. Lyon, J. Burnett,

T. F. Rivers, C. Silverlock, J. Lee, G. Bunyard, R. D. Blackmore, T. B. Haywood, J. Ellam, H. Webb, G. T. Miles, Chas. Ross.

Messrs. Sutton & Sons, Reading, kindly offered valuable prizes for collections of eight kinds of vegetables, and on the night these were staged, the quality, however, hardly warranted that shown at the previous show. Mr. Richards, gr. to the Earl of Normanton, Somersley Park, Ringwood, was fortunate enough to be again placed 1st, as then having good examples of London Cauliflower, Duke of Albany Peas, Canadian Wonder Peas, Potatoes, Earl of Kador, Colshill, &c. Mr. Waite, gr. to the Hon. Col. Talbot, Esher, was a close 2d, indeed it was a near chance of his being 1st, his examples were so good; he had handsome Snowdrop Potatoes, fine Autumn Giant Cauliflowers, good Stamford Potatoes, John Bull Peas, &c. Haines, gr. to the Earl of Kador, Colshill, was 3d; Mr. T. A. Beckett, Penn, 4th; and Mr. Neighbour, Bickley Park, 5th—this last exhibitor had the best samples of Sutton's All Heart and Earliest of All Savoy Cabbages, very white and solid, and the next best were staged by Mr. Osman, the District Schools, Sutton, Surrey.

FRUIT.

A very fine exhibition of eighteen Smooth Cayenne Pine-apples, the best lot seen for many years at exhibition tables, was sent from the Castle Hill Gardens, South Molton, Devon (gr. W. Walsingham), which were very ripe and were quite soft, or approaching ripeness, and were free externally from all blemish, the weight averaging 6lb. each. A Silver Banksian Medal was bestowed.

Mr. Faulkner, Inkpen, Hungerford, showed Raspberry Lord Beconsfield; and Mr. Meryall, gr., Walsingham Park, Dover, a fine looking seedling Raspberry, crimson in colour, and conical in shape.

Seedling Melons were shown by Mr. Ross, gr., Welford Park, and by Mr. Worsley.

The National Carnation and Picotee Society (Southern Section).

The annual exhibition of Carnations and Picotees took place as usual in the conservatory, and notwithstanding that the weather had proved excessively hot and trying for the flowers, striking down many of them even before they could possibly become perfectly developed, yet the representation of the Carnation and Picotee was so good as to excite surprise: the Carnations shown were very fine, pure, rich in colour, full and massive. The bulk of the exhibition was smaller than usual, but those connected with the management of the exhibition had much reason to congratulate themselves on the success that attended their efforts, and the general public appear to be greatly interested in the flowers staged for competition.

CARNATIONS.

In the class for twenty-four blooms of Carnations, not less than twelve varieties, Mr. C. Turner, Royal Nursery, Slough, was 1st, with a superb lot of blooms, large in size, of fine quality, and brilliantly coloured. The varieties were—Scarlet bizzars: Robert Lord, Arthur Medhurst, and Fred; crimson bizzars: Master Ford, E. S. Dodwell, H. K. Mayor, William Hewitt, and John Harland; pink and purple bizzars: Sir Garnet Wolseley, Sarah Payne, James Ford, and William Rowan; C.B. bizzars: Samuel Moore's No. 8, Mrs. Barlow (Dodwell), Miss Gorton (Dodwell); P.F., F. Whitbourn, and James Douglas, and Florence Nightingale; S.F., Henry Cannell, Seedling (Douglas), and Matador; R.F., Sybil, 81, Stamford Road, Ipswich; 4th, Mr. F. Hooper, Hines Nursery, Wimbledon Hill, Bath; 5th, Mr. T. Garratt, South Mill, Bishops Stortford.

With twelve blooms, dissimilar, Mr. Joseph Lakin, Temple Cowley, Oxford, was 1st, with S.B., Robert Lord, J. Sawyer, John S. B., and Adm. Curzon; C.B., Thomas Moor, P.P.B., Captain Owen (Dodwell), and Thomas Austins (Dodwell); P.F., Dolly Varden (Dodwell); 2d, Mr. J. Douglas, with S.B., Adm. Curzon, Robert Lord, and Sarah Cross; 3d, J. S. B., William Skirving, Seedling, Mrs. Gorton, and Sarah Payne; P.F., Florence Nightingale and James Douglas; S.F., Matador; R.F., Seedling, 3d, Mr. J. Buxton, 27, Manor Street, Clapham, whose best flowers were S.B., John Hines, Edward Adams; P.F., James Ford; R.F., Sarah Payne; R.F., Sybil; 4th, Mr. John Hines; 5th, Mr. T. Garratt.

The best six blooms came from Mr. M. Rowan, 36, Manor Street, Clapham, with S.B., George; P.P.B., William Skirving and E. S. Dodwell; P.F., Florence Nightingale; S.F., Clipper; R.F., Jessica; 2d, Mr. Harrison Weir; P.P.B., Sarah Payne; P.F., Florence Nightingale; and S.F., Henry Cannell. 3d, Hudson Morris, Esq., The Nest, Hayes, Kent (G. Wynne, gr.), with very large full blooms of P.P.B., Sarah Payne; S.F., Sybil; R.F., R. F. Mayor of Wotton; and 4th, Earl of Wilton, and Florence Nightingale, 4th, A. Springle, Esq., The Nest, Blackheath; 5th, Mr. C. Glasscock, South Street, Bishop Stortford.

Then followed five prizes in each of the six divisions in which the Carnations are divided, and they were awarded as follows—S.B., 1st, Mr. J. Douglas with Arthur Medhurst, and 2d with the same; 3d and 4th,

Mr. C. Turner, with Robert Lord; 5th, Mr. J. Lakin, also with Robert Lord. C.B., 1st, Mr. C. Turner, with John Harland; 2d, Mr. J. Douglas, with a bright-coloured Seedling; 3d, Mr. J. Lakin, with Master Ford; 4th, Mr. J. Douglas, with the same; 5th, Mr. J. Lakin, with Thomas Austins; P.P.B., 1st, Mr. C. Turner, with Sarah Payne; 2d, Mr. J. Douglas, with William Skirving, and 3d with the same; 4th, Mr. C. Turner, with James Taylor; 5th, Mr. T. Austins, with R. F. Sybil; R.F., 1st, Mr. J. Douglas, with the same; 2d, with James Douglas; and Mr. Douglas was 3d and 4th with the same. A flower named Sporting Jack was 5th, but no exhibitor's name was attached to it. S.F., 1st, Mr. C. Turner, with Matador; 2d, Mr. J. Douglas, with Henry Cannell; and 3d, with Spotsman; 4th, Mr. J. Lakin, with Dan Godfrey was 5th, without an exhibitor's name. R.F., Mr. C. Turner was 1st and 2d, with Rob Roy. Mr. Douglas was 3d and 4th with the same; and Mr. J. Lakin 5th, with Sybil. The Premier Carnation was S.F. Rob Roy, a magnificent flower in Mr. Turner's 1st prize stand of twenty-four varieties.

PICOTEES.

Turning to the Picotees, Mr. Douglas was placed 1st, with a fine stand of twenty-four blooms, not less than twelve dissimilar varieties, remarkable for the purity of the blooms, and their finely formed petals, having red-edged, blue, white, and yellow, and also with Spotsman and Violet Douglas. Purple-edged, Baroness Burdett-Conts, Her Majesty, Jessie, Mrs. A. Chancellor, and Muriel. Rose-edged, Constance Heron, Mrs. Payne and Royal Visit; 2d, Mr. C. Turner, with very large and full-flowered, but lacking the refinement and in those forming Mr. Douglas's stand, his varieties being Juliette, Mrs. Bower, Her Majesty, Thomas William, a lovely light purple-edged, Baroness Burdett-Conts, Muriel, Dr. Erps, Robert Scott, Favourite, Lucy, Brunette, Dr. Abercrombie, Constance Heron, Mrs. F. Ricard, and seedlings; 3d, Mr. J. Douglas, with Mrs. Hines, Mrs. J. Hines, Mrs. Pennington, John Smith, Edith D'Ombrian, Mrs. Bower, Lady Louisa, Royal Visit, and Mrs. Horner, 4th, Mr. F. Hooper, Bath. Mr. Douglas had the best twelve varieties, also staging Brunette, Princess of Wales, Violet Douglas, Liddington favourite, Constance Heron, Miss Wood, Zerlina, and Mrs. Gorton. 2d, Mr. Joseph Lakin, with Premier, Constance Heron, Jessie, Brunette, Mrs. Payne, John Smith, Mrs. Rudd, Favourite, Clara Pennington, Mrs. A. Chancellor, Thomas William, and Mrs. J. Hines. 3d, Mr. J. Hines. 4th, Mr. J. Buxton; 5th, Mr. T. Garratt.

Mr. T. Austins, Brill, had the best six blooms, staging John Smith, Liddingtons Favourite, Purple Prince, Mary, Clara Pennington, and Mrs. Bower; 2d, Mr. M. Rowan, with Dr. Erps, Thomas William, 3d, Mr. C. Glasscock; 4th, Mr. H. Cattley, 16, Cavendish Buildings, Bath; 5th, Mr. H. Starrip, 3, Stanley Road, Bromley.

In the classes for single flowers in each division, the awards were—Heavy red edge: 1st, Mr. J. Douglas, with Brunette, and 2d with Princess of Wales; 2d, Mr. Sanders, with Dr. Erps; 4th, the same with J. B. Bryant; 5th, Mr. C. Turner, with Brunette. Light red edge: 1st and 2d, Mr. J. Douglas, with Thomas William; Mr. C. Turner, 3d, with the same; 4th, Mr. M. Rowan, with the same; 5th, Mr. J. Douglas, with Thomas William. Heavy white edge: 1st, Mr. J. Douglas, with Muriel; 2d and 3d, Mr. C. Turner, with the same; 4th, Mr. J. Douglas, with Chancellor; 5th, Mr. Sanders, with Zerlina. Light purple edge: 1st and 2d, Mr. J. Douglas, with Her Majesty; 3d and 4th, Mr. C. Turner, with Juliette; 5th, Mr. J. Douglas, with Violet Douglas; 6th, Mr. C. Turner, with Muriel; 7th, Mr. Hines, with Edith D'Ombrian; 2d, Mr. J. Douglas, with seedling; and 3d, with Mrs. Payne; 4th, Mr. J. Douglas, with Mrs. Payne; and 5th, with Constance Heron. Light rose edge: 1st, Mr. C. Turner, with Liddingtons Favourite; 2d, Mr. J. Douglas, with Liddingtons Favourite; 5th, Mr. J. Lakin, with Empress Eugénie. The premier Picotee was Liddingtons Favourite, light rose-edged, in Mr. J. Douglas' 1st prize stand of twelve varieties.

NEW CARNATIONS AND PICOTEES.

In the classes for seedlings in the C.B. division Mr. J. Douglas was 1st, with Rosamond, very bright, stout in texture, good petal, and full; and a First-class Certificate of Merit was also awarded to it. In the P.F. division Mr. Douglas was 1st, with a fine, bright, and beautiful variety of excellent quality; and a First-class Certificate of Merit was also awarded to it. In the rose flake division Mr. Douglas was 1st, with Margaret, a good addition to this class; and a First-class Certificate of Merit was also awarded; and he was 2d, with Thea; in the class for light red edged Picotees Mr. Douglas was also 1st, with Dr. Horner, a seedling of the Rev. F. D. Horner, a stout fine petalled variety, with a wire edge of bright rose; also awarded a First-class Certificate of Merit.

SELFS, FANCIES, AND YELLOW GROUPS.

What a brilliant and pleasing display these made; and the public gathered about the stands as if highly delighted with their gay and effective colours. Mr. Turner had the best twenty-four, not less than twelve dissimilar varieties, consisting of Mrs. Bower, Mrs. Pennington, Harry Matthews, Edith, Jupiter, Grandiflora, Colonel Ward, Princess of Battenberg, William Skirving, Lady Stamford, Rosa Bonheur, Cento d'Orion, Guardsman, Robert Lord, Polly Cheetham, Florence, Janira, Mrs. Logan, E. Adams, Mary Morn, and Chronos. The Fire King, John Keet, Florence, Princess of Battenberg, Sport, Edith, Rosy Morn, Negro, Juliet, and Faecy. The great variety seen in the character of the

flowers was most marked in these stands, and especially that from Slough. 3d, Mr. T. Hooper; 4th, Mr. H. Catley; 5th, Mr. G. Medick, florist, Bath. Mr. Lakin had a grand and twice staging some superb flowers, consisting of Sir Toby Belch, very fine, crimson flaked with black; Queen, John Soper, Mrs. A. Medhurst, Mrs. Mostyn, Dean Ward, Hudson Morris, Mrs. H. Morris, Ruby, May, and a seedling, 2d, Mr. Hudson Morris, Hayes; 3d, Mr. Thomas Angus, Hill; 4th, Mr. A. Sparking. This collection contained a very beautiful unnamed yellow seedling, 5th, Mr. W. Medick.

Mr. Turner had the best twelve blooms of yellow-gold Picoetes, the flowers large and very full, and of strong quality in the pots. Orange, Mrs. J. Colman, Ne Plus Ultra, Dove, Lady M. Lascelles, Princess Margaret, Mazini, and Princess Beatrice, 2d, Mr. J. Douglas, with fine blooms of Daphne, Clio, Euphrosyne, Janira, Lightning, Ne Plus Ultra, and Queen Margaret, 3d, Mr. H. Catley; 4th, Mr. F. Hooper.

PLANTS IN POTS.

The best nine of these came from Mr. C. Turner, who had well grown and flowered plants of Favourite, Miss Small, Matador, Juliana, King of Yellows, Jessica, Miss F. Ricardo, Jupiter, and Lady Stamford—a collection representative of small types of flowers. 2d, Mr. J. Douglas, with finely grown and flowered plants, he being the better exhibitor. We are pleased to state that the throttling horse-collars were dispensed with in this section.

There were several valuable horticultural contributions of cut blooms of Carnations, Picoetes, and Cloves. Foremost was that from Messrs. James Veitch & Sons, Carnation and Picoete Show in itself, and a very instructive one too. There were eight boxes of flowers, two each of Carnations and Picoetes, and four of Cloves. Among the former were fine blooms of S.B., Harry Turner, Admiral Curzon, True Briton, John Hines, G. Oberlin, Edith, John Hall, T. J. S. H. J. Nett, C. H. B. Graells, John Harland, A. D. Southgate, and Harrison Weir; P. and P.B., Princess Beatrice, Squire Llewellyn, and William Skirving; P.F., Ada, Ajax, Earl of Wilton, Purple Pirine, and Jano; S.F., Le Lion, Lyons, Flirt, John Hall, and Jupiter; R.F., Jessica, and Red Christmases, Rose, and Standard, and Sybil. Picoetes: Red edge; Dr. Epps, Ensign, Hilda, Lother, Mrs. Fuller, Mrs. Keynes, Picurata, and Queen of Summer. Purple edge: Alice, Baroness Burdet-Comts, Mary, Mrs. A. Chancellor, Mrs. H. Hooper, and Princess Dagny; Rose edged: Edith D'Ombrain, Lady Boston, Louisa, Miss Gibbs, Mr. Payne, Mrs. Rayner, Mr. Webb, and Royal Visit. The Clove and fancy flowers comprised a large representation of the best varieties. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, had stands of cut blooms, and also two boxes of bunches of Cloves and Picoetes, including some pretty varieties. This was a novel innovation, and should be more fully recognised by the Society in the future; Mr. H. Canell also had some cut blooms; and Mr. Toly, of 3, St. Mark's Grove, Chelsea, had a collection of Cloves, roses, and Picoetes. It would greatly assist the instructive value of this exhibition if, in the future, it were made compulsory that in naming the flowers the class, such as C.B. or S.F., &c., should be set forth, and also the division to which the Picoetes belong. Those whose business it is to report should would do well to make a list of the most valuable aid in preparing a rapid and accurate report.

NEWCASTLE HORTICULTURAL AND BOTANICAL: July 22—24.

THIS important exhibition was held at Leazes Park in the late morning, the usual form of these large spans, and usually used for the exhibits in former years. The show was perhaps the finest ever held in the North of England, and reflected the greatest credit upon the committee, who have been working heavily handicapped, but not having the support they deserved from the influential bodies of county Newcastle. They have, however, struggled well, and through offering good prizes have had the desired effect of greatly increasing the exhibits. The weather was all that could be desired, and the company numerous, so that the success was greatly promoted. The plants were secured from former exhibitions, and to place themselves in a solvent position.

For eight plants in bloom, dissimilar, the 1st prize was awarded to Henry Johnstone, gr., Polam Hall, Darlington, with grand examples of high cultivation, showing three plants of *Ixora*, one of which was a marvel of good culture, and was bloomed on every pot, but which is not yet at its best. His other plants consisted of *Clerodendrons*, *Allamandas*, *Ericas*, *Staticas*, *Bougainvilleas*, &c.; 2d, Mr. Cypher, with a fine, vigorous lot, but more in the usual form, of three large spans, and usually used for the exhibits in former years. The show was perhaps the finest ever held in the North of England, and reflected the greatest credit upon the committee, who have been working heavily handicapped, but not having the support they deserved from the influential bodies of county Newcastle. They have, however, struggled well, and through offering good prizes have had the desired effect of greatly increasing the exhibits. The weather was all that could be desired, and the company numerous, so that the success was greatly promoted. The plants were secured from former exhibitions, and to place themselves in a solvent position.

The weather was all that could be desired, and the company numerous, so that the success was greatly promoted. The plants were secured from former exhibitions, and to place themselves in a solvent position.

GROUPS OF MISCELLANEOUS PLANTS.

These were arranged for effect, not exceeding 20 feet

by 10 feet, placed on the ground. The 1st prize was gained by Mr. Hammond, whose group was so attractive as to compel attention at some distance. His Crotons were beautifully coloured, and stood along with the other plants, on a groundwork of Maidenhair Ferns edged with *Panicum virgatum*. Mr. McIntyre, gr., Hutton Hall, was 2d, his plants being remarkably good, but the design somewhat marred by his using too many plants, and by placing his flowering plants too thickly together, although the latter were preferable to the first lot. Clark & Brothers, of Carlisle, were 3d, with a fine lot of young plants, healthy and clean, but staged with but small effect.

Messrs. William Fell & Co., Hexham, occupied considerable space with their table of exhibits, being very tastefully arranged. Cut Roses were well represented, also cut herbaceous spikes; Conifers, in pots, in great variety, and also a good collection of stove and greenhouse plants. Altogether this collection was very attractive.

Six Orchids.—Mr. Cypher, Cheltenham, took 1st prize with a fine even lot, but there was no competition.

Six exotic Ferns.—1st, Mr. Johnstone; 2d, Mr. Hammond; 3d, J. Noble. All showed finely grown and adapted for the class, but the former especially gained the 1st place.

Three Crotons.—1st, Mr. McIntyre, of Darlington, his plants being Warren; 2d, Mr. Hammond, with smaller plants that were much brighter. One of his plants, a seedling called Hammondii, received a Certificate of Merit from the judges; it was very distinct kind, and although there are plenty of Crotons, this will not fail to take a front place on the exhibition table.

Three *Dracaenas*.—1st, Mr. Noble, with coloured plants; 2d, H. Johnstone.

Six tuberous-rooted Begonias.—1st, J. Noble; 2d, A. Meisen; 3d, J. Garret, with small plants, but finely bloomed.

Four *Ericas*.—1st, Mr. Cypher, who was a long way in advance of the other competitors; 2d, Mr. Methven; 3d, Mr. B. Thompson.

Twenty-paired bedding plants.—1st, Mr. Methven; 2d, Mr. McIntyre; 3d, Mr. J. Richardson.

For rock-plants and Sempervivus, Mr. J. Richardson was 1st for both; 2d, Mr. J. McIntyre; 3d, Mr. H. Johnstone.

In the division open to all, nurserymen excepted, Mr. Edmonds had the best plants in bloom, which took the Veitch Memorial Medal, and justly, as being the best in the show. His plants were the same as he exhibited at York—the *Anthurium Schzerianum* showed with a hundred spathe on it looking better than it did then. Mr. Letts was also placed 1st for foliage plants, which were grand examples of great vigour.

The exhibition of Roses was very large, and brought flowers from all parts of England. As Rose growers, Messrs. Harkness & Sons, of Bedale, took a leading position, although the competition was keen in all classes. They were placed 1st in the forty-eight and thirty-six varieties, in which Mr. Whitwell was placed 2d.

The superiority of the best stands was evident at the first glance, and mistakes were all but impossible on the part of the judges.

CUT FLOWERS.

These were not only numerous but very fine, and were freely commented on, as the like had not been seen in the North at any previous show.

FRUIT.

Eight dishes.—1st, Mr. J. Edmonds, Bestwood Lodge; his Black Hamburgs were fairly good, but were lacking in colour, as also were his Muscats, that were also a little under-ripe, but fine in bunch. For very good Peaches, a good Queen (fine), Melons, Figs, and Cherries, and very choice *Eragre* Nectarines, the 2d fell to Mr. M. Letts.

Four dishes.—The 1st prize fell to Mr. J. Edmonds, with Mr. Jenkins as a very near 2d.

Four bunches of Grapes.—1st, E. Douglas, Derwent Lodge, Cockermouth; and Mr. Thompson, Dumfries, was 2d with good fruit. The 1st prize for Muscats was also won by Mr. Douglas, and upon the whole he exhibited the finest Grapes in the show.

Grapes in pots, Pine-apples, Melons, and small fruit were exhibited in great profusion, the prizes mostly falling to growers in the locality of the town of Newcastle.

Hardy Ferns, *Fuchsias*, *Coleus*, *Carnations*, *Picoetes*, and *Pinks* formed a large section of the exhibits staged in the amateur classes. J. H.

NOTTS HORTICULTURAL AND BOTANICAL: July 23—25.

STARTING in comparatively recent years this Society has by leaps and bounds come to the front as a body which promotes to the fullest degree the art and science of gardening, and as one which promotes far and away the finest show which is to be seen in the midland counties. This year the exhibition was again held in the grounds of Mapperley Park, which Alderman Lambert had once more lent for the three days of its duration, but this year the weather was more favourable than was the case twelve months ago, when the thunder, lightning, and all sorts of weather made the venture anything but a financial success. The arrangements were somewhat altered from those of last year, and altered greatly for the better. The entrance was placed nearer to Nottingham than was then the case, and in other respects was greatly improved. The exhibits were staged in five large marquees, and all were shown to the best advantage. The progress which the Society has made is shown by the fact that there were 730 entries against

484 last year, while nearly 600 people subscribed instead of 300 at that time. Since the last show, on the other hand, a great loss has been sustained by the Society. Mr. Don, who for so long was one of the hon. secretaries, has died, and his place it has been hard to fill. Nevertheless, the arrangements were satisfactorily carried out by Mr. Steward, the present hon. secretary, to whom a large share of the success is due.

The principal feature of the exhibition of the groups staged for effect. To the groups staged on a 200 square feet base nearly the whole of one tent was devoted, and five wonderfully effective masses of bloom and foliage were the result. Each exhibit was very good, and as to the merits of some of them there may be some difference, but it is quite certain that Mr. Thacker's was the best. A magnificent *Sealthoria elegans*, which towered almost to the top of the tent, formed the centre-piece of his group. Ranged around were other graceful plants, and plants of *Lilium auratum*, *Crotons*, and *Dracaenas* helped to make up a group which it would be hard to equal. Mr. Edmonds, the gardener at Bestwood, was a very good 2d, with a display in which *Palms*, *Dracaenas*, *Crotons*, and *Eucharis amazonica* were prominent. The finest lot of stuff, no doubt, was that seen in the third group, that of Mr. Letts, and Mr. Letts' arrangement was somewhat heavy. The other two groups were exceedingly meritorious, as were all the exhibits in class 2, where a space of only 100 square feet was allowed. A tasteful arrangement, in which *Fitcheria* and *Lilium auratum* were the principal features in the background, showed great advantage was placed 1st, but Mr. Cutts' exhibit ran it very closely. A nice lot of plants sent by Colonel Seely were so put together as to look rather heavy.

ROSES.

Roses were only of middling quality throughout, the best being the thirty-six shown by Mr. H. Frettingham, in which a *La France*, a *Paul Neyron*, and a *Dr. André*, were the best blooms. Mr. Hallam and Mr. Howe were placed equal in the first class, with *four Roses*, and Mr. N. Radford had on exhibition the best two. Out of this last-named lot came the premier bloom of the show—a magnificent *Horace Vernet*. Among the most noticeable features in the classes for cut flowers were the bouquets. The best bridal bouquet was a very tasteful arrangement of *Staphanotis*, *Eucharis*, and *Staphanotis*, Tuberoses, *Pinks*, and *Carnations*, were the principal blossoms in the best hand-bouquet shown, that of Mr. Chad, and a wonderfully pretty nosegay of *Roses* and *Ferns* was composed of Maidenhair, *Marchioness Niel*, and *Niphetos Rose*. The principal bouquets for ladies' dresses, and buttonhole bouquets, were all put together with taste, and the remainder of the plants and flowers were all well worthy of attention. The fruit was creditable, the stands of Strawberries, Raspberries, Grapes, Peaches, and Melons, being among the best.

VEGETABLES.

These were not so fine as in former years, but the competition was very lively. A number of special prizes were given. Among them were those for the best potato table decoration, and for the best vegetable. It certainly did not go with that of the judges. The arrangement to which the 3d prize was awarded—a beautifully light one—was far better than that which was placed 1st—indeed, it was a question whether the 4th was not. The 2d was a nice bit of decoration, but was not improved upon either in the matter of the arrangement, or in the flowers, plants, and fruit brought out a number of groups, of which the best was a neat display arranged on a groundwork of moss and Ferns.

CUT STOVE AND GREENHOUSE FLOWERS.

Here Lady Ossington was again 1st, Colonel Seely, 2d. Herbaceous flowers were well shown. The 1st was easily taken by Messrs. Pearson & Son, Chilwell, for a grand lot. Some first-rate things were well arranged in this collection.

Orchids were poorly represented, as were also *Pelargoniums*, *Fuchsias*, *Petunias*, &c.

MISCELLANEOUS.

There were not many plants sent for exhibition, but what there were were very good. Some very fine Ferns, *Palms*, and exotic plants were shown by Mr. Edmonds, of London, and by Mr. Harvey, of the Blyth Street nurseries. The latter gentleman also had on view several wonderfully good pyramidal 8-foot Bays. Messrs. Pearson & Son, of Chilwell, also showed a miscellaneous collection of Ferns, stove and greenhouse plants, a beautiful cross and two wreaths, being designed for funeral work. There were also a number of exhibits of garden furniture, &c.

STAMFORD HORTICULTURAL.

An attempt was made last year to revive the once celebrated Stamford show, which was only partially successful, and barely cleared the expenses incurred owing to unfavourable weather, but still the committee resolved to try again, and this time with more success. The day opened very promisingly, but eventually cleared off fine, and brought a good attendance of visitors who appeared to enjoy the sight very much; and as the competition was quite in proportion to the prizes offered, we may reasonably hope ere long Stamford show will regain its former usefulness.

At the opening of the class the chief prize offered was for a group of plants arranged for effect, which brought four exhibitors. Mr. Wilson, gr. to the Earl of Lindsay, was awarded 1st prize; Messrs. W. & J. Brown, of Stamford, 2d for a very compact and closely packed clump; Mr.

Winn, gr. to J. R. Lowe, Esq., 3d; the other group was staged by Mr. Divers, gr. to J. S. Hopwood, Esq., Kett Hall, and although it was more natural in appearance was deficient in colour.

For six *Coleus*, Mr. Wilson also took 1st prize; Mr. Winn ad, with better green and richer coloured plants, but more flat in appearance.

For six table plants, Mr. Taylor was 1st, Mr. Wilson 2d, and good useful things were shown.

Six greenhouse or stove Ferns only brought two collections. Mr. Divers was an easy 1st; Mr. Winn ad; some nice little *Fuchsias* and *Pelargoniums* were shown.

For cut flowers, Messrs. Brown took no less than ten 1st prizes.

Mr. House, of Peterborough, obtained 1st prize for thirty-six *Roses*, without any opposition, and for twenty-four blooms Messrs. Brown, of Stamford, were 1st; Mr. Wilson, 2d. Considering the hot dry weather in this district the *Roses* were very good.

The chief prize for fruit was for a collection of eight varieties, which only brought one exhibitor, Mr. Divers, who showed Black Hamburg Grapes, Governor Wood and Early Rivers Cherries, Lord Suffield Apples, Elbert Nectarines, Charlotte Rothschild Pine, Early Albury Peaches, and Six Wax Strawberries. For Grapes, Mr. Gilbert had an easy victory, taking 1st for black with some good Hanburgs, and for white with Muscat of Alexandria. Some splendid Strawberries were shown notwithstanding the dry season—Mr. Wilson taking 1st prizes for one variety, and for 2d; the best in appearance were Oxonian from Buryleigh, which Mr. Wilson placed 2d, the 1st dish being Dr. Hogg. Mr. Wilson also took 1st prize for Nectarines. Mr. Gilbert was 1st for Peaches, and Mr. Divers 2d in both classes.

It might be anticipated Mr. Gilbert was easily 1st, with a collection of top varieties, but his produce, he showed a remarkably fresh and healthy looking lot.

One good feature of the schedule was the way in which the exhibitors were divided into classes so as to give all a chance as far as possible. In class B, for persons not employing more than one gardener, some good things were shown by Mr. Fradmore, gr. to Miss Thompson; Mr. Taylor, gr. to J. Richardson, Esq., and others. *Roses* in this class were very good. Mr. Duncomb, of Stamford, and Mr. Canner, of Empingham, being the chief exhibitors.

Vegetables were shown in the cottagers' tent, and to judge from the Tripoli Onions shown it must have been a very favourable season for them, the judges being unable to decide the 3d prize among eleven collections, awarded a prize to each. (A Correspondent).

WINCHESTER HORTICULTURAL:

July 16.

The second show of the above Society was held in Kingsley Park, and was a decided success from a horticultural point of view. The committee received the well-earned reward of their endeavours, having used great exertions to make the show one of the best in the South of England. Special inducements were offered this time in the larger plant classes, which had the most effect. Fruit, however, was not so much appreciated when such exhibitors as Messrs. Cypher, Mould, and James entered the lists, not forgetting a local grower (Mr. Wills), who ran, Mr. Cypher hard in one class for 1st honours. *Roses* were a strong feature of the show, and were well staged, a tractor prominently brought out in the amateurs' classes. Fruit was well represented in so far as regarded quality if not in very large quantity. Noticeable in this section of the show was a fine collection of nineteen dishes, not for competition, staged by Mr. W. Wildsmith, gr. to Lord Eversley, Heckfield Place, Winchfield, consisting of fine Black Hamburg and Muscat of Alexandria Grapes, the latter requiring a little more colour to make them quite perfect. Queen Pines, excellent Broad Turkey Figs, Hero of Lockinge Melon, and good Peaches, Nectarines, and Strawberries. A Certificate of Merit was awarded to the exhibitor.

Table decorations were, as they always are at Winchester, well done and much admired.

STOVE AND GREENHOUSE PLANTS.

For twelve distinct varieties, not less than six varieties in bloom—Mr. J. Cypher, nurseryman, Cheltenham, easily gained 1st honours, with a very fine collection staged in his well known form. He had *Cycas circinalis* in good health, *Lantana borbonica*, a magnificent plant; *Cycas revoluta*, *Kentia australis*, *Croton Johannis*, well coloured; *Dasylium acrotrichum*. The flowering plants consisted of a fine *Yucca Filigrina*, *Yucca regina*, with large trusses of flower; *Stephanotis floribunda*, freely flowered; *Erica ferruginea* and *E. major*, the latter very fresh; *Allamanda Hendersoni*, and *Anthurium Scherzerianum*, ad, Mr. F. J. Mould, nurseryman, Tewkesbury, was 2d, and had good plants of *Erica serotina*, *Erica Kingcoteana*, *Yucca colorata*, and *I. regina*. Mr. H. James, Castle Nursery, Lower Norwood, and Mr. E. Wills, gr. to Mrs. Pearce, The Firs, Bassett, Southampton; the former had *Erica ferruginea*, good, and well bloomed plant of *Kalosanthes*; the latter had *Lantana borbonica*, fine condition, *Clerodendron Balfourianum*, fresh, and a well bloomed plant of *Cypripedium barbatum majus*.

For six stove and greenhouse plants Mr. Cypher was again placed in the premier position with handsome plants of *Kentia Fosteriana*, *Croton Johannis*, *Erica Farnetiana*, the latter a very good example. Mr. Wills was a close ad, having a very healthy plant of *Cycas revoluta*, particularly good coloured and freely bloomed specimen of *Phenacoma prolifera Barnesii*, and *Erica Farnetiana* roses.

For six stove and greenhouse plants, amateurs, Mr.

Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, Bishopscote Waltham, was 1st, with handsome plants of *Alocasia macrorrhiza variegata*, *Croton Queen Victoria*, and a densely bloomed *Engelmannia glabra*.

MISCELLANEOUS GROUP OF PLANTS

arranged for effect, 12 feet by 10 feet.—Mr. Wills was an easy 1st, with plants well adapted for the purpose, lightly angled, the colour evenly balanced; 2d, Mr. E. Hillier, nurseryman, Winchester, with a bright group, slightly overcrowded. 3d, Mr. H. James with a pleasing group, except in one or two places where the pots were too plainly seen. For single specimen stove or greenhouse plant, in bloom, Mr. Hillier was 1st with *Erica Farnetiana*, the same exhibitor being 1st with *Kentia Canterburyana*. Mr. Wills followed with *Coccos Weddelliana*. *Coleus*, *Begonias*, *Fuchsias*, and table plants were well represented in their respective classes.

ROSES.

Forty-eight single trusses: 1st prize, a piece of plate.—This trophy was awarded to Messrs. Keynes & Son, Salisbury, for a bright and even stand of not large blooms. The following were some of the most noteworthy—Duke of Teck, Louis van Houtte, Niphetos, Alfred Noisette, and A. K. Williams, ad, Mr. Frank Cant, Colechester; 3d, Mr. Cant, Colechester.

For thirty-six blooms, distinct, single trusses, Messrs. Keynes & Son followed up their previous success by taking 1st prize with blooms similar to those in the 1st prize of forty-eight varieties; ad, Mr. Charles Turner, The Nurseries, Longchamps, B. Can, Colechester.

For twenty-four *Roses*, distinct, three trusses—1st, Messrs. Keynes & Son; 2d, Messrs. G. Cooling & Son, Broad Street, Bath; 3d, Mr. C. Turner.

For twelve Teas, distinct—1st, Mr. Frank Cant; 2d, Mr. E. Hillier; 3d, Messrs. G. Cooling.

For twelve single trusses, any variety hybrid perpetual, dark—1st, Mr. F. Cant, with A. K. Williams in grand condition; 2d, Messrs. Keynes.

For same number of light colour, Mr. B. Cant and Messrs. Cooling took the prizes in the order named. *Roses* in the classes devoted to amateurs were excellently shown by the Rev. J. H. Penberton, Harvington, Norfolk; Mr. Flight, Cornstables, Tawford, Winchester (gr. to Mr. Neville); Mr. P. B. Budd, 8, Gay Street, Bath; and Captain Ramsay, Fareham; the former took all the leading prizes, staging blooms of fine substance and colour.

For twelve bunches of cut flowers, hardy varieties, Mr. Molyneux was 1st; 2d, Mr. F. Thompson, gr. to W. Baring, Esq., Salisbury; 3d, Mr. Neville, with good stands.

FRUIT.

Six dishes, distinct.—Mr. J. Budd, gr. to F. G. Dalgety, Esq., Lockery Hall, Romsey, was placed 1st with good Black Hamburg and Muscat of Alexandria Grapes, fine in bunch and berry, only wanting little more in colour to make them perfect; a good Queen Pine, Melon, Peaches and Nectarines. 2d, Mr. Thompson, whose Grapes were not quite so well finished as those in the former collection.

Three bunches black Grapes—Mr. Molyneux was 1st with Hamburgs, fine in bunch and berry and finish. Mr. Thompson followed close with Madresfield Court, in good condition; 3d, Mr. E. Hillier, with Hamburgs, of very good quality, rather small in berry. Three of very good quality, rather small in berry. Three of very good quality Grapes—Mr. Thompson was 1st with rather green Muscats; 2d, Mr. Molyneux, with Buckland Sweetwater; 3d, Mr. Budd, with same variety.

Melons were exhibited few in number, and those of not first-rate quality. Mr. Wildsmith had best Hero of Lockinge, Mr. R. Baker, gr. to Mr. Moore, Belle Vue House, Winchester, had the best scarlet variety. Mr. Wildsmith staged the best Peaches—an excellent dish of Bellegrave. Mr. Thompson put up the best Nectarines, followed by Mr. J. Dauncey, gr. to J. Branstone Stano, Esq., Buckfield, Basingstoke, who staged the best dish of Strawberries—an excellent one of Sir C. Nadier.

VEGETABLES.

The competition was spirited, Mr. Molyneux leading, with very fine Levlathian Onions, Early Nantes Carrots, Midsummer Kidney Potato, Canadian Wonder Bean, and so on. 2d, Mr. J. Dauncey, with some fine Hackwood Park Tomato. 3d, Mr. J. Budd.

A SHOW AT NETLEY ABBEY.

THE Hound and St. Mary Extra Horticultural Society held its eighth annual show on Thursday, July 23, in the charming grounds adjacent to Netley Abbey. It would be difficult to find in the county of Hampshire a more attractive spot in which to hold a flower show on a warm July day than the old Abbey grounds; the ivy-clad ruins and mouldering walls and pillars lend special charms to the scene of the day.

This Society was started to encourage the cottagers of the locality to cultivate vegetables, fruit, and flowers in a better manner than has hitherto been the case. And very successful have the endeavours of the Society been, especially by the productions displayed on the occasion, judged by when regard is had to the long period of warm, dry weather experienced in this part of the country.

The Strawberries, Currants, and vegetables generally gave proof of much skill and persevering attention having been bestowed on them by the exhibitors. But the plants were also very fortunate in getting much sympathy and support from the wealthier classes in the neighbourhood, who supplemented their subscriptions by special prizes, and the loan of collections of plants to make the show more attractive than otherwise would have been the case. (A Correspondent.)

FLORIDA, THE ITALY OF AMERICA.

A SHORT account of this portion of the United States, which at present is occupying so much attention, and where American and British capital is being invested, may be interesting to your readers. It is only during the last few years that the State has been brought into prominent notice, formerly thought only fit for the Indians and negroes to live in. It is a land of flowers—the Italy of America. The climate is really very fine, and there is no winter, that season being fully better than the average English summer, whilst the summers are hot, 95° in the shade being an average; still, it is nothing in comparison to the heat experienced in the Northern States and Canada. Florida being a peninsula, having the Atlantic Ocean on the east, and the Gulf of Mexico on the west, has the breeze wafted from ocean to gulf. The evenings are, as a rule, pretty cool. Mosquitoes and gnats are in some parts troublesome, and in others unknown, and as the country fills up will almost entirely disappear. Snakes are to be found in the swampy portions of the State. Malaria, —i.e. chills and fever, ague, &c.—is prevalent in some parts, to prevent which, Eucalyptus globulus, or Blue Gum, is planted in large quantities; Orange County is, however, very healthy. The climate is very beneficial to persons afflicted with pulmonary diseases; diphtheria, quack, measles, &c., are unknown. Civilisation is being rapidly developed, more especially in Orange County, of which Orlando is the chief town, now within fifty hours' run from New York by a railway opened recently. Florida may be termed a Horticultural State, Oranges being at present the staple industry; the demand for the fruit far exceeds the supply, notwithstanding the thousands of acres planted with Orange trees. A twelve-year-old tree will bear as many as 1500 Oranges, and it will be difficult to conceive what the demand will be when the foreign trade is developed. The first shipment to London was by W. H. Sands, Esq., who sent several boxes this spring, the returns for which barely covered the cost; another gentleman shipped some later on, which paid him a better return. A direct line of steamers from Florida to the Old Country is what is wanted. The cost of an Orange grove depends on the quality of the land, and its locality; 10 acres being an ordinary sized grove, and fifty trees to an acre. There are two ways of raising your trees—from the seed and by budding seedling stocks with whatever variety you want. The latter will bear in four years. Attention is being turned to other tropical fruits—the Fig, Vine, Pine-apple, Banana or Bread-fruit, good and ripen their fruits without any protection whatever. Musa Cavendishii, lately introduced, is doing remarkably well. The Lemon, Lime, and Guava all do well. Strawberries are in fruit for about seven months. The winter is the harvest for vegetables, which bring large prices here, and in northern markets. Peas, Broad and French Beans, Cucumbers, Vegetable Marrow, all in full bearing in December and January; later on Mush and Water Melons are plentiful. The summers are, however, too hot for the successful cultivation of vegetables in the open unshaded fields in that season, however they can be raised in the Orange groves between the trees while coming into bearing. Magnolia grandiflora is seen here at its best, stately trees, about 80 feet high and 3 feet in diameter, loaded with their delicate white and fragrant blooms.

The following subjects are growing almost wild, viz., *Poinsettia pulcherrima*, *Clerodendron fragrans flore-pleno*, *Jasminum Sambac flore-pleno*, *Plumbago capensis*, *Hoya carnosa*, *Chorozeema Lawrenceana*, *Gardenia florida*, *Hibiscus* in many varieties, also the *Amayllis*, and *Valotta purpurea*, and others too numerous to mention. *Roses* do remarkably well, considering that the land here is composed entirely of a grey sand.

The State, although larger than England and Scotland combined, is very flat, covered with a fine growth of majestic Pine trees; Orange County in particular having a very large number of magnificent deep, clear fresh-water lakes dotting its surface, well stocked with fish, including trout, of various sorts. Round the margin is a dense growth of hard wood, such as the Gum, *Laurus nobilis*, Maple, Cedar, &c.; whilst the beautiful *Oreodoxa*, or Cabbage Palm, raises its head above. Round these lakes dwellings are being built, more especially in the vicinity of the settlements, which are rapidly formed. Orlando five years ago was a small collection of huts at a cross

road in a Pine forest, with only a Court-house; to-day it is an incorporated town, with a population of about 3000, and over one dozen hotels and boarding-houses. Many other industries have been started, and two railways now go through the town, while others are in contemplation. Land in the vicinity is worth about 500 dol. per acre, while town lots have been sold at the rate of 36,000 dol. Land all over the State is rising in value.

Owing to the slackness of trade and the severity of the northern winters, a great influx of families have settled in Florida, so that work is not over-plentiful, 1½ dol. (5s. 3d.) per day being the average pay for labourers; skilled workmen are better paid. Carpenters and gardeners especially are wanted. Wages for the latter run about 27 dols. per month, with board; without board, 37 dols. is about the highest price paid. There is a great demand for domestic servants; wages from 9 to 15 dols. a month, with board.

The hours of labour are longer than in the Old Country. The cost of living is much higher, many of the articles being double in price. Clothing is very dear, but of that not much is wanted, the houses are, of course, all of wood, and are furnished with verandahs. Rents are moderate, there is plenty of wood for fuel, which is only wanted for cooking purposes.

At present the best way of reaching Florida is *via* New York, thence by steamer to Savannah, then rail to Jacksonville (the City of Hotels), which stands on the banks of the St. John's River. There are a number of Scotchmen, there and they have a flourishing association; in fact, Scotchmen are found in all parts of the State, illustrating the old proverb "that a Scotchman is never at home except when abroad." From Jacksonville the traveller has a choice of two routes, one by steamer 160 miles up the river to Sandford, then rail to Orlando 30 miles further, passing through a succession of splendid Orange groves, or by the newly opened railway already referred to, *via* Taveras to Orlando, thence the journey can be continued to Tampa on the Gulf coast.

It is hardly necessary to state that, to any one coming to Florida, it is a great advantage to have capital to invest, but there are instances to be found of men coming here without any means, who to-day have become wealthy by their own industry and the increase of the value of their property. *B. Smith, Park House, Maitland, Orange County, Florida, U.S.*

Law Notes.

MIDDLESEX SESSIONS: July 25.—KAY, Appellant—THE PARISH OF FINCHLEY, Respondents.—In this case, which was of considerable interest to market gardeners, Mr. Philip Kay, of The Nurseries, Long Lane, Finchley, appealed against a general district rate of 1s. 2d. in the pound. Mr. Forest Fulton appeared for the appellant; Mr. Bartly Dennis for the respondents. It was stated that this was a friendly appeal, made in order to obtain a decision as to the interpretation of section 211 of the Public Health Act, 1875. A sub-section of that Act provided that all woodlands, market gardens, or nursery grounds should be assessed at only one-quarter of the annual value. The appellant owned about 2½ acres of ground, of which 2 acres were covered with glass-houses used for the purpose of forcing fruit and flowers for the early markets. For the appellant it was contended that such property came within the exemptions specified by the Act. In support of the appellant's case, Mr. Charles F. Jones, surveyor, and Mr. Morris, of the firm of Protheroe and Morris, horticultural auctioneers, were called, and both stated that, in their opinion, the glass erections in question were nurseries, and that the appellant's property could only be described as a market garden or nursery ground. For the respondents (the Parish of Finchley) it was contended that the Act was only meant to cover arable land or pasturage, or such gardens or grounds as were used to grow fruit and flowers by the agency of Nature unassisted. In the present case there were no "grounds," all the growing being done in what were no mistakably buildings—horticultural buildings. The appellant had admitted that these buildings had cost him £7000 to erect, and that he

annually sold many thousands of pounds of Grapes at from 2s. to 12s. a pound, besides flowers, the profit from which equalled that made on fruit. The appellant had, in fact, as much advantage from the expenditure of the rates as if his property was an ordinary manufactory, and he made his money by selling cloth instead of Grapes. The Bench decided to allow the appeal. In their opinion the appellant's property was within the exemptions mentioned in the sub-section of the Act. In answer to Mr. Dennis, however, Mr. Forsyth said the opinion of the Bench was that it was by no means a clear case, and that they would certainly grant a case for a Superior Court. Each side must pay its own costs.

Obituary.

WILLIAM CHATER, of Saffron Walden, whose name was so long and so successfully associated with the improvement and culture of the Hollyhock, died, full of years and honours, at the Grove Nurseries, in that town, on July 21, in the eighty-fourth year of his age. He was an able, modest, kindly, genial man, spending a quiet, useful life, and passing away amid many regrets.

William Chater was born on February 4, 1802, at Heliions, Dumpstead, Essex, his father being head gardener to Mr. Stevens, at Bower Hall. In those days, as in more remote times, village schools were few, and his father and mother instructed him in the elements of education, and possessing a love for study he was allowed the run of the library at the Hall. He worked in the garden with his father, where he imbibed a strong taste for gardening, and especially for florists' flowers, and shortly before attaining the age of twenty years he went to live with his brother, John Chater, a good florist, then in business as a nurseryman at Haverrhill.

At twenty-two years of age he started in business as a nurseryman and florist at Saffron Walden. At that time there was a circle of florists in the neighbourhood, and William Chater entered with ardour upon the cultivation of Carnations, Picotees, Ranunculus, Dahlias, Fancies, Tulips, and the Hollyhock. At this time Charles Barton, agavee florist, resided at Saffron Walden, a name that will long remain associated with the earlier improvement of the Hollyhock. Of these he had an excellent collection, also of Ranunculus, Fancies, &c. In August, 1847, William Chater entered into an arrangement with Charles Barton to cultivate and sell Hollyhocks, and the first list of Baron's seedlings, nineteen in number, was issued in that month, but none of them were named, only the colour given.

In October of the same year several collections were sent out at £5 per set. I have heard Mr. Chater say that he found little result from Baron's Hollyhocks until he secured a variety with some pretensions to a double character, which he obtained on the Continent. By crossing this with Baron's and some of his own seedlings decided advances were obtained, resulting in the early production of Comet, the seed parent of this being Baron's anemone-flora. This variety was held in poor esteem by Charles Baron, but William Chater, believing it likely to prove a useful parent, used it with striking success. It was the progenitor of Comet, Walden Gem, Walden King, the latter the best scarlet, and probably one of the most perfect flowers ever grown. Then followed Charles Baron, pinkish-salmon, and the parent of all the later salmon-coloured flowers. From Baron's Model of Perfection came all the white flowers having purple bases, while the purple varieties came from purplea elegans, &c. On August 6, 1850, Mr. Chater exhibited a collection of his new Hollyhocks at one of the meetings of the Royal Horticultural Society, and was awarded the Banksian Medal. In 1851, during the time of the Great Exhibition of Industry, he for several weeks exhibited spikes and cut blooms of Hollyhocks, for which he was awarded a Medal. An inflexible rule with William Chater was never to send out a seedling until it had been proved the second year.

William Chater was also a successful fruit grower, and was a great believer in the orchard-house system advocated by the late Thos. Rivers. He had the superintendence of the gardens of Short Grove Park, Newport, for upwards of thirty years, and produced fine crops of orchard-house fruit. As a landscape gardener he displayed great taste and first-rate ability. His last piece of work was laying-out the

grounds of Hutton Hall, Guisborough, for Sir J. W. Pease, Bart., M.P., which was accomplished during the years 1864—67. He was always very proud of this achievement. In February, 1866, he finished plans for the laying-out of the churchyard at Darlington after the restoration of the church; the plans were accepted, and carried out successfully. He also carried out extensive alterations in Short Grove Park, the seat of the late W. C. Smith, Esq., and it is now regarded as one of the most beautiful parks in the county, and well worthy a visit from all lovers of landscape gardening. The pretty gardens and grounds at Bridge End, Saffron Walden, the residence of the late Francis Gibson, Esq., were entirely designed and laid out by William Chater, and not a few other places in the county. He was awarded the first prize (open to all England) for the best plan for laying out the Walden Cemetery, which was subsequently carried out by him.

To him, last, so long as power to do so remained to him, he loved to talk of the flowers he cultivated with so much success. He died peacefully, closing a life full of usefulness and honour. *R. D.*

LONDON: Atmospheric Pressure.—During the week ending July 25, the reading of the barometer at the level of the sea decreased to 29.91 inches at the beginning of the week to 29.37 inches by 5 P.M. on the 19th, increased to 30.46 inches by 9 A.M. on the 22d, decreased to 30.29 inches by 5 P.M. on the 23d, increased to 30.31 inches by 9 A.M. on the 24th, decreased to 30.26 inches by 5 P.M. on the same day, increased to 30.34 inches by 9 A.M. on the 25th, and was 30.28 inches by the end of the week.

The mean reading of the barometer for the week was 30.21 inches, being 0.14 inch higher than last week, and 0.25 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 82°.8, on the 25th; on the 19th the highest was 73°.2. The mean of the seven high day temperatures was 76°.5.

The lowest temperature was 47°.5, on the 23d; on the 20th the lowest temperature was 59°.8. The mean of the seven low night temperatures was 54°.3.

The greatest range of temperature was 30°.8, on the 25th; the smallest, on the 19th, was 14°. The mean of the seven daily ranges was 22°.2.

The mean temperatures were—on the 19th, 63°.6; on the 20th, 65°.2; on the 21st, 62°.7; on the 22d, 63°.1; on the 23d, 60°.3; on the 24th, 62°.6; and on the 25th, 67°.5; and these were all above (excepting the 23d, which was 1°.9 below) by 1°.1, 2°.8, 0°.4, 0°.8, 0°.4, and 5°.3 respectively.

The mean temperature of the week was 63°.6.

GARDEN NETTING. S. A. SANDS

(SUCCESSOR TO J. W. HAYTHORN), Manufacturer of Hexagon and Chiswick GARDEN NETS. Warranted to Protect Bloom from Frost, Winds, Hail, and Fruit from Birds, Wasps, &c. Pattern and Prices Free per Post.

Address—S. A. SANDS, 20, CLUMBER STREET, NOTTINGHAM.

COVERED SHEDS FOR CATTLE. THE GLOUCESTER WAGON CO. (LIMITED)

Have attached to their extensive works a large Joinery Department with the latest and most improved Machinery, for the Manufacture of Covered Sheds or Yards for Cattle, Conservatories, Greenhouses, Garden Seats, &c., at extremely moderate prices.

Full particulars may be had on application to ALFRED SLATER, General Manager, GLOUCESTER.

Under the Patronage of the Queen. J. SMITH'S IMPERISHABLE STRATFORD LABELS.

The above Labels are made of a White Metal, with RAISED BLACK-PACED LETTERS. The Gardener's Magazine says:—"We must give these the palm before all other plain labels, as the very first in merit."

J. SMITH, The Royal Family Station, Stratford-on-Avon.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense.

As do "grown" Edgings, consequently being much cheaper. GARDEN VASES, FOUNTAINS, &c., in Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME" FRAMES, PLANT COVERS, and PROPAGATING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price LISTS Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 2s. per square yard upwards. Patterns sent of plain or more elaborate Design, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and Ribbed Paving of great durability, With Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c. F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits by any Railway Station. Samples of Sand free by post.

FLOTTING AND BRICK LISTS for Roadsters or Farmcarts. KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

DAVID LOWE & SONS, HORTICULTURAL BUILDERS

AND HOT-WATER ENGINEERS, GILMORE PARK, EDINBURGH; and CORNBROOK, CHESTER ROAD, MANCHESTER. Plans and Estimates on application for every description of Horticultural Buildings in Wood or Iron. Garden Frames and Sashes in Stock.

W. H. LASCELLES & CO., HORTICULTURAL BUILDERS, 121, BUNHILL ROW, LONDON, E.C.

W. H. LASCELLES AND CO. will give estimates for every description of HORTICULTURAL WORK, free of charge, and send competent assistants when necessary. LASCELLES' NEW ROCKWORK material in various colours. Samples can be seen and prices obtained at 121, Bunhill Row, and 55, Paultry, Cheapside, E.C. Illustrated Lists of Wooden Buildings, Greenhouses, and Conservatories, and Concrete Slabs for walls, paths, and stages, sent post-free on application.

GLASSHOUSES & HEATING. B. W. WARMURST, 31A, BEAUFORT STREET, CHELSEA, S.W.

BOULTON & PAUL, NORWICH.

SMALL, HANDY, LEAN TO FRAMES.

TWO-LIGHT FRAMES, 6 feet by 4 feet, painted three coats, and glazed with 21-c. English glass. Carriage paid, price £2 2s.

If with hinges, set-on, and prop, as shown, price £2 10s 6d. Packing 3s, allowed in full if returned.

THREE-LIGHT FRAME, largest size made, 9 feet by 4 feet, price £3.

If with hinges, set-on, and prop, as shown, price £3 10s. Packing 4s, allowed in full if returned.

Cucumber Frames.

R. HALLIDAY AND CO. desire to draw special attention to their Cucumber Frames, of which they always have a large stock, ready glazed and painted. They are made of the best materials, and can be put together and taken apart in a few minutes by any one. The frames are adapted to any station in England.—L. s. d. 2-light frame, 8 feet by 6 feet | Packing | 3 10 0 2-light frame, 12 feet by 6 feet | Cases free | 5 5 0 6-light frame, 24 feet by 6 feet | | 10 0 0 The glass is oiled and put in. Lights and framing for brick pits at proportionately low prices. R. HALLIDAY AND CO., Holborn Square, London, E.C. Royal Horticultural Works, Middleton, Manchester.

SEEDS.

LONDON: July 20.—The actual business doing in seeds continues small, the chief interest being centred in the new produce. Samples of this season's winter Tares, Rye, Trifolium, Italian Rye-grass, and Rape seed are coming to hand; and while prices in some cases are not yet fixed, the general range of values promises to be low. There is nothing yet doing in Clover seeds. Hemp seed is rather firmer; no change in Canary seed. In consequence of the bad reports of the new crops holders of blue Peas are asking more money for what little stock they have left over. Feeding Linseed is steady. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday the business done in Wheat was too small to affect quotations. Flour was dull, but held for late value. Barley, Beans, and Peas were unchanged, but the drought gives support to the market for all feeding stuffs, and Oats were 6d. dearer on the week.—On Wednesday nothing transpired to establish any quotable change in current values of Wheat. Apart from this flour remained dull. Maize ruled slow. Oats and other spring corn were quiet and unchanged.—Average prices of corn for week ending July 25:—Wheat, 37s. 11d.; Barley, 29s.; Oats, 21s. 8d. For the corresponding period last year:—Wheat, 37s. 1d.; Barley, 27s. 5d.; Oats, 23s. 4d.

CATTLE.

At Copenhagen Fields on Monday the trade showed increased depression. Sales of beasts, even at a decline of 2d. to 4d. per 8 lb. made but very slow progress. Sheep and lambs were dull of sale, and prices ruled lower by quite 2d. per 8 lb. Calves were most unsaleable and quotations nominal. Quotations:—Beasts, 3s. 10d. to 4s. 6d., and 4s. 10d. to 5s. 2d.; calves, 3s. to 4s. 8d.; sheep, 4s. 2d. to 4s. 10d., and 5s. 2d. to 5s. 8d.; lambs, 5s. 8d. to 6s. 4d.—On Thursdays of an unimproved charactered trade. Supplies of beasts were not large, but they satisfied the demand, which continued heavy. Sheep were in a fair supply, and were a firmer market, the best Downs and half-breds making 5s. 4d. to 5s. 6d. per 8 lb. Lambs were quoted at 5s. 8d. to 6s. 2d. per 8 lb. Calves and pigs were unaltered.

HAY.

Tuesday's Whitechapel Market report states that trade was very dull, with good supplies; and that inferior qualities of hay were almost unsaleable at the following quotations:—Clover, prime, 60s. to 70s.; prime second cut, 85s. to 107s.; inferior, 60s. to 75s.; hay, prime, 70s. to 98s.; inferior, 20s. to 60s.; and straw, 28s. to 38s. per load.—On Thursday there was a moderate supply on sale. The trade was very dull at Monday's rates.—Cumberland Market quotations:—Clover, best, 85s. to 105s.; inferior, 60s. to 110s.; best, 85s. to 97s. 6d.; second quality, 75s. to 84s.; inferior, 40s. to 70s.; and straw, 30s. to 36s. per load.

POTATOS.

The Borough Market quotations state that there were fair supplies and quiet trade. Quotations:—Regents, 115s.; 140s.; Shaw's, 100s. to 110s.; Early Roses, 85s. to 95s.; Kidneys, 130s. to 150s.; Jersey rounds, 95s. to 110s.; kidneys, 110s. to 140s. per ton. The imports into London last week consisted of 1073 boxes from Harflour, 40 packages Boulogne, 1415 cases Cherbourg, 12 sacks St. Brioux.

COALS.

The following are the prices current at market during the week:—East Wylam, 15s. 6d.; Hollowell West Harley, 14s. 6d.; Dowla's Merthy, 16s.; Wallys End—Tyne (unscreened), 11s. 3d.; Hetton, 15s. 6d.; Hetton Lyons, 13s. 6d.; Lambton, 15s. 6d.; Wear, 14s.; Caradoc, 15s. 6d.; East Hartlepool, 14s. 9d.; South Hartlepool, 13s. 9d.; Tees, 15s. 6d.

Government Stock.—Consols closed on Monday and Tuesday at 99½ to 99¼ for both delivery and the account. Wednesday's figures were 99¼ to 99½ for both transactions. The closing figures for Thursday were 99½ to 99¼, for both money and account.

THE GARDENERS' CHRONICLE.

SCALE OF CHARGES FOR ADVERTISING.

Table with columns for number of lines (4-14) and charges for different durations (1-13 lines). Includes a note: 'AND SIXPENCE FOR EVERY ADDITIONAL LINE.' and 'If set across columns, the lowest charge will be 3s.'

PUBLISHING OFFICE and OFFICE for ADVERTISEMENTS, 41, Wellington Street, Strand, London, W.C.

BUY ONLY ENGLISH THREE-QUARTER PLATE WATCHES.

BENSON'S NEW PATENT (No. 4658) "LUDGATE" WATCH,

SILVER. GOLD. £5 5s. £12 12s.

Is a "Special Strength" Silver English Lever, my best London make, with Three-quarter Plate Movement.

Chronometer balance, with damp and dust-proof Patent ring-band, and extended barrel, in massive sterling silver case cases With CRYSTAL GLASS FRONT. Winds, sets hands and opens at back.

The superiority in value, accuracy, and durability of the "Ludgate" Watch over the Swiss and American Key-wind and Non-Key-wind Watches, made in imitation of and sold as English work, and the ordinary Full-plate English Watch is enormous. The "Ludgate" watch is compact, strong, handsome, and durable. Being Three-quarter Plate, it is superior in value and appearance to any £10 Watch sold, and, being compensated, it keeps perfect time; fitted with crystal front, it combines the strength of the Hunter and convenience of the open face. Of my best London make, it will last a lifetime, stand rough usage of all and every kind without damage, and, being made in three streets, it is for the above reasons suited for Home, Indian, and Colonial use by

Gardeners, Workmen, and Gentlemen. The "Ludgate" Watch is far superior to any Watch at the price you must make, and will be sent free and safe of our cost. To all parts of the world for £5 5s. Cash or P.O.O., or in banking cases, £6 6s. Price in 18-carat gold, crystal glass case, Twelve Guineas.

SPECIAL NOTE that J. W. Benson is the only Maker of a Three-quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any Watchmaker in the Kingdom. Any infringement of our Patent Rights will be proceeded against. A Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent free on application to

J. W. BENSON, Watchmaker to Her Majesty the Queen, The Steam Factory, 62 and 64, Ludgate Hill, E.C. Illustrated Pamphlet sent free on application. Gold and Silver Jewellery, Clocks (Home, China, and Turin), and Musical Boxes, free on application.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by brush, or by dipping, squaring, no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs, I have this day forwarded from Chestport to your address a black varnish cask, to be filled and returned with as good varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chestport.—I am, Sir, yours respectfully, W. G. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S. Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which one is genuine.

Large Illustrated CATALOGUE of Fencing Hedges, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 73, Elmbank Street, Glasgow.

WANTED, a steady MAN to attend to the Fires. Good character indispensable. - Apply, stating references, to WELLS and SEGAR, Royal Exotic Nursery, South Kensington, London, W.

WANT PLACES.

POSTAL ORDERS. - To Advertisers, Subscribers, and Others. - It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B. - The best and safest means of Remitting is by POST-OFFICE ORDER. Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

R. B. LAIRD and SONS (Successors to the late Firm of DOWNER & LAIRD) can at present recommend every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended upon, either for large Establishments or Single-handed Situations; also FOREMEN, UNDER GARDENERS, and FARM BALIFFS. - 17, Frederick Street, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BALIFFS, or GARDENERS. JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. CARTER. Enquiries should be made to 237 and 238, High Holborn, W.C.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c. - St. John's Nurseries, Worcester.

TO LANDED PROPRIETORS, &c. - A McIntyre (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Gardens and Park Grounds, and Remodelling existing Gardens. Plans prepared. 115, Listeria Park, Stamford Hill, N.

TO NOBLEMEN, GENTLEMEN, &c., requiring smart, sound, and thoroughly competent STEWARDS, GARDENERS, &c. - We have on hand Applications from several who should be pleased to Assist any Nobleman, &c., in Obtaining Men specially suitable for their requirements. - VICARS COLLIER and CO., Leicester; A. W. CREWS, Manager.

TO MARKET GARDENERS and FRUIT GROWERS. - Advertiser (age 24) wishes to hear of a situation in the above, where he could learn the business. Would give his services for short time. - S. W. D., The Estate Agency, Rosedale Road, West Dulwich, London, S. E.

TO NURSERYMEN. - Advertiser wishes to enter a Nursery with the view of extending his knowledge of the business. Could take position of trust. Good address. - N. Gardner's Chronicle Office, 41, Wellington Street, Strand, W. C.

SHOPMAN. - Nine years' experience in all branches of the Nursery and Seed Trade. First-class references. - A. B. D., Messrs. Dickson, Brown, & Tait, Manchester.

To Nurserymen and Seedsmen. CLERK. - Age 24; considerable practical knowledge and experience (acquired in Scotland). Knows Plants. Can Test for Adulteration in Manures, and has made a special study of the Agronomy of Grasses, &c. - T. B., Gardner's Chronicle Office, 41, Wellington Street, Strand, W. C.

Seed Trade. ASSISTANT. - Wanted by a young man, a situation as above. Five years' good experience. Excellent references. - Mr. ALPHA, Post Office, Old Swan, Liverpool.

HOLLOWAY'S OINTMENT and PILLS. - Debilitated Constitutions. - When climate, age, or hardships have undermined the health, skin diseases are prone to arise and augment the existing weakness. Holloway's medicines daily prove most serviceable even under the most unfavorable circumstances. This well-known and highly-esteemed Ointment possesses the finest balsamic virtues, which soothe and heal without inflaming or irritating the most tender skin or most sensitive sore. Holloway's Ointment and Pills are infallible for Curing and Lessening the Pains, Swelled Ankles, Erysipelas, Scaly Skin, and every variety of Skin Disease. Over all these disorders Holloway's remedies exert a quick and favourable action, and, where cure is possible, gradually but certainly arrive at that consummation. They are invaluable in the cure of Scrofula and Scurvy.

Appointed by Royal Warrant Makers to Her Majesty the Queen and His Royal Highness the Prince of Wales.

OIL PAINT no Longer Necessary. HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork or Stone. (Registered Trade Mark).

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 4d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. "Fireproof Park, June 21, 1876.—SIR, I have this day forwarded from Chesham to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Fireproof Park, Chesham.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised. H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as being genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; and 115, Queen Victoria Street, London, E.C.; and 73, Elmbank Street, Glasgow.

Table with 2 columns: Size (e.g., 14x12, 16x10, 18x12, 20x12, 18x14, 20x14) and Quantity (e.g., 20x15, 16x10, 22x10, 24x16, 20x14, 22x18, 44x18).

21-oz. Foreign of the above sizes, in 100 and 200 feet boxes, 30s. and 60s. each, including cartage to any station. A large stock of similar current sizes of 15-oz. glass in 100 foot boxes.

Preserving and Cucumber Glasses, and all Miscellaneous Glass Articles, can be obtained from GEORGE FARMILOE & SONS, GLASS, LEAD, OIL and COLOUR MERCHANTS, 31, St. John's Street, West Smithfield, London, E.C.

Rosher's Garden Edging Tiles. Illustrated with various tile patterns.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they take no Slugs or Insects, but up little room, and, once laid, do not require any further labour or expense, as do "crown" Edgings, consequently being much cheaper.

GARDEN VASES, always in stock, in all sizes, of very durable and superior finish, and in great variety of design. F. ROSHER and CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.1, King's Road, Chelsea, S.W.; Agents for LOOKER'S PATENT "ACME" FRAMES, LANTERN COVERS, and PROTECTING BOXES; also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.

Illustrated Price Lists Free by Post. The Trade supplied. ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 2s. per square yard upwards. Sheet of Plain or more elaborate Design, with Prices, sent for selection. WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchens, and Bakers' Ovens; or Grooved and other Stable Paving of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles, in great variety. Slates, Cement, &c. F. ROSHER and CO., Brick and Tile Merchants. See Address above.

SILVER SAND, fine or coarse grain as desired. In bulk, 10 per Ton, or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and BRICK BIRRS for Baskets or Fences. KENT PATES or LOAM SUPPLIES, at lowest rates in any quantities. F. ROSHER and CO.—Addresses see above. N.B.—Orders promptly executed by F. ROSHER & CO. A liberal Discount to the Trade.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 8, 1885.

BURFORD LODGE.

SIR TREVOR LAWRENCE'S noble collection of Orchids, in spite of the hot, dry season, which has been very trying to most cool things, is making that good progress for which it is noted, and which, considering the extraordinary variety of the species cultivated, and the great age of many of the specimens, cannot fail to be a source of surprise to all who know how difficult it is to manage a large mixed collection, and how liable some of the plants are to decline in time unless managed with the greatest skill. So many of our Orchid-growers cultivate only the showy genera, and things which can be bought by the hundred, such as Cattleyas, Odontoglossums, and Masdevallias—things which can be treated in batches—that they know but little of the constant care and vigilance required in the Burford collection, which stands alone in the possession of specimens of the rarest things, both new and old, in many cases the specimens there being the only ones in cultivation. The interest of the Burford collection is also greatly enhanced by the many fine hybrids raised there, and of which every year brings forward new treasures, now that they have had time to grow to flowering size—hybrid Calanthes of great beauty, Zygopetalums of strange parentage, and Cypripediums, Cattleyas, and Dendrobis, some proven good, and others whose parentage give great promise. Among the Cypripediums raised at Burford may be noted that lovely plant C. Leeaunum, the result of a cross between C. niveum and C. insigne violaceo-punctatum, and which was also raised by Messrs. Veitch, of Chelsea. The nice batch of it at Burford Lodge proves it to be one of the freest growing, as it is one of the handsomest of Cypripediums. Also growing very strongly is a nice lot of an interesting cross between Dendrobium Findlayanum and D. heterocarpum; the plants are from crosses both ways, but in both cases they seem alike and just intermediate between the two parents.

Among the rare plants which every one likes to hear about we noted a fine specimen of Aërides illustre, a rare species in the way of A. Schroderii, the original plant of A. Lawrencei, furnished well with spikes; Saccolabium cœleste, that little beauty with spikes of pale blue flowers with dark blue labellums; Odontoglossum vexillarium Lawrenceana (superbum), the king of all "vexillariums"; O. Warscewiczii, very strong; Cattleya Wagnerii with twelve young growths—a grand mass; and the huge specimen of Renanthera coccinea, which was mentioned by Mr. J. O'Brien in his paper read at the Orchid Conference, as having been exhibited by A. Palmer, Esq., of Cheam, in 1846, with seven panicles of scarlet flowers, each bearing from 100 to 110 flowers. Of course the plant was an old one then, and the original label now in it at Burford dates back to 1816. The vigour of the plant, after so many years of cultivation, proves that Orchids need not die so prematurely as they often do, if they are well looked after. Among the other rare things are the new An-

WHOLESALE BULB CATALOGUE.

Contains List of all varieties of English, Dutch, and French grown Bulbs, including the following:—
ANEMONS, all the best varieties.
CERONDOXA LUCILLE, charming blue spring flower.
CRANUS, all named varieties, and mixed.
FRESIA REFRACTA ALBA, beautiful white sweet-scented.
HELLEBORUS NIGER, Christmas Rose. [Cape bulb.
HYACINTHS, all colours, named, for pot, glasses, or bedding.
IRIS, all the best varieties.
IXIAS, handsome showy spring flowers.
LILIES, all the leading named sorts.
NARCISSE, Polyanthus, varieties.
NARCISSE and DAFFODILS, in forty varieties.
SCILLAS and SNOWDROPS, including the best varieties.
TULIPS, Double and Single, in great variety. [Of the latter, WINTER ACONITES, bright yellow, the first bulb to bloom after Christmas.
May be had on application. Please compare our prices before sending your orders abroad.—WATKINS and SIMPSON, Seed and Bulb Merchants, 13, Exeter Street, Strand, W.C.

CUTBUSH'S MILL-TRACK MUSHROOM SPAWN.—Too well known to require description. Price 6s. per bushel (1s. extra per bushel for packages), or 6d. per cake; free by Parcel Post, 1s. None genuine unless in sealed packages and printed cultural directions enclosed, with our signature attached.

W. & J. BIRKENHEAD, FERN NURSERY, SALE, MANCHESTER.

OUR BEGONIAS, DAHLIAS, CARNATIONS, ZONAL PELARGONIUMS, FUCHSIAS, and numerous other Plants are now lovely, the former very much the finest and choicest ever seen. Send for a CATALOGUE. Now is the time for striking Cuttings of almost everything which we are supplying in any quantities.
Our SEEDLING CINEARIAS are just now in splendid condition for potting, 1s. 6d. per dozen, 10s. per 100 (by post). We need hardly say the strain is the best in Europe.

H. CANNELL & SONS,
SWANSEA, THE HOME FOR FLOWERS

græcum Leoni in bud, A. Scottianum, of the same importation, also well advanced for flower, and evidently true; and *Odontoglossum* excellens, which is one of the most beautiful of *Odontoglossums*. It was imported a few years ago by Messrs. Hugh Low & Co., and was evidently a natural cross between *O. Pescatorei* and *O. triumphans*; it is a very lovely thing, with lemon-yellow sepals, and petals blotched with reddish-brown, the large white labellum being also stained with yellow at the base, and marked with the same bright colour as the petals. The last new *Cattleya*, too, which every one is looking forward to seeing — C. Lawrenceana, from the Roraima — is sheathing up well, and will soon show what it is like.

The *Odontoglossum*-house is purposely kept short of bloom at this season, as the plants get through the hot weather better without having to support the flowers. A good plan of keeping the house cool in very hot weather is being tried at Burford, as it has been in many other places, viz., syringing the blinds from time to time during the heat of the day, and this is found to keep a good atmosphere in the house, and also to reduce the temperature 2°, which makes a great difference to highland and cold-logging Orchids.

The *Cattleyas* are in good order, the now favourite C. Gaskelliana and the varieties of C. Eldorado having to supply the greater part of the flower. Some good specimens of the former (one with ten large and perfectly formed flowers) are magnificent, being showy, delicately tinted, and delightfully fragrant; a well flowered plant of the white and orange C. Wallisii is also very handsome, and gives off a delicate odour of Honeysuckle.

The *Cypripedium*-house is the showiest just now, indeed, since the raising of so many fine hybrids its occupants seem never without a display, as one section follows the other, the perpetual flowering "Sedeni" section weaving them all together. Some of the best, of which there are large specimens at present in flower at Burford, are C. Ashburtonia and C. A. expansum, the latter being a much rounder and better thing in every respect than the former; C. cænanthum superbum, with large white and finely-marked dorsal sepal; C. tonsum, with immense flowers, shaped somewhat like C. Lawrenceanum, yellow, tinged with green, and sparsely marked on the petals with blackish blotches; C. Lawrenceanum, a noble plant of the best form, with fourteen flowers; C. ciliolare, C. Veitchii, and C. Parishii, with four spikes, and six flowers on a spike. In the same house is a grand specimen of the elegant *Dendrochilum filiforme*, with about one hundred flower-spikes, and beneath the stage are planted *Eucharis amazonica*, which seem to thrive well and give flowers freely.

In the other house—all of which are patterns of cleanliness, neatness, and order—many other interesting things are flowering, among which we noted *Dendrobium ciliatum*, a curious species with buff petals and a brown lip curiously ridged and fringed; D. Smillie, with habit of D. secundum and pinkish green-tipped flowers a little resembling those of *Veltheimia capensis*; D. Jamesianum, *Utricularia Endressii*, with sky-blue flowers, many specimens; *Bolbophyllum Dearei*, *Odontoglossum gracile*, with brown flowers, white recurved lip and purple tint over the whole plant—very curious; *Epidendrum stenopetalum*, with bright rose-coloured flowers exactly like *Barkeria* blooms, a very rare plant, although dried specimens have been sent from various parts many years ago among others from Merida, near St. Christoval, where it was found in the forests at 3000 feet elevation; *Epidendrum Cooperi*, a gigantic plant of *Sobralia macrantha splendens*, *Leclia callistoglossa*, L. elegans, *Calanthe plectrochoma*, *Cattleya Schilleriana*, and *Stanhopea eburnea*

are also in flower, and two fine specimens of the handsome white *Mormodes luxatum eburneum*, each with eighteen to twenty large flowers on a spike, are marvellously beautiful. The *Masdevallia*-house is spare of bloom, but the plants are perfect and many of the rare and curious things are in bud, notably a great panful of *Masdevallia racemosa* (Crossii) with many spikes, and the curious bell-flowered *M. Carderi*.

In speaking or writing of Sir Trevor Lawrence's pretty establishment the Orchids always come first, and naturally so, for they, the main feature there; but whatever other branches of gardening are gone into at Burford are equally well attended to, and equally successful; and the vineries, stove and greenhouse plants, and general outdoor garden, will compare favourably with the best. The large span-roofed cold house, devoted to greenhouse flowering plants at the present time, is charmingly arranged with tuberous *Begonias*, *Impatiens Sultani*, *Trichinum Manglesii*, and other flowering plants, the tall group fronting the door being a very effective display; it is composed of several large specimens of the orange *Monrebria Pottsi*, equally good; pure white *Agapanthus*, some fine plants of the tall shrubby *Gloxinia maculata*, with its spikes of wax-like blue flowers; some big bushes of *Impatiens Sultani*, and other flowers, and suitable foliage. In the stoves are some very fine *Pitcher-plants*, *Anthurium Veitchii*, A. Warocqueanum, and other fine-foliage plants. Here and there rise the tall curious scarlet spathes of *Anthurium ferriense*, A. Andreanum, and A. Scherzerianum, the best forms of the last-named being the brilliant spathed *Cypher's* variety, which often measures 6 inches by 4 and is borne on very tall and strong stalks; and A. S. Palmerii, with very long and narrow spathes of a very bright colour. The *Tydeas*, *Clerodendrons*, *Gardenias*, &c., are also very pretty in the arrangement. In the fernery varieties for cutting and for decoration are principally grown, and these are in good order. A great portion of the outdoor garden is devoted to herbaceous perennials and florists' flowers, which are handsome to look at and useful for cutting, and notwithstanding the long spell of dry weather there is a profusion of bloom. The *Alstromerias* have seemed to like the heat, and have bloomed profusely.

The large beds of *Gaillardias*, *Rudbeckias*, *Carnations*, *Phloxes*, and other showy things are very effective and useful; and the general collection of herbaceous plants give some interesting things in bloom, one of the best of the blue flowers being *Platycodon grandiflorum*, and one of the most elegant for mixing with other flowers, *Gypsophila paniculata*, with its large panicles of silvery little flowers. As an ornate and noble plant *Crimum Powelii*, which has been growing in the open ground at Burford Lodge for some years, is one of the finest. It is there now, furnished with many spikes of large bluish-coloured and fragrant flowers, which last a long time when cut, the buds opening in water as well as they do on the plant.

The whole of the gardens at Burford Lodge seem to improve every year, and the Orchids do not get neglected for the garden nor the garden for the Orchids, as sometimes happens.

WOMEN'S WORK. — A French woman writes to the *Vigne Americaine* to say that although, unlike some of her sex, she does not attend a school of grafting, yet she manages to graft 300 Vines a day in March and April, besides attending to her children and to her household duties. Her husband, less embarrassed by other work, grafts twice the number. Numbers of women and girls are now employed at the proper season in grafting the better kinds of French Vines on to American stocks, which are less injured by the attacks of the *Phylloxera*.

New Garden Plants.

ODONTOGLOSSUM LÆVE (Lindl.) AURATUM, n. var.

Is this a second *Odontoglossum læve*? I think so. Its character is a very narrow lip, little dilated at the apex and acute at the top. It would also appear to have simple racemes in lieu of panicles, but of this I am not quite sure. I had it first in October 1, 1851 from Director Moore, of Glasnevin; and then from Mr. F. Sander; finally from Messrs. J. Veitch & Sons, who obtained it from Major Leedy, of Sunbury House, Sunbury-on-Thames.

MALVASTRUM GILLIESII (Baker) = MALVA (MODIOLA) GERANIIOIDES (Gillies); Hook and Arn. in "Bot. Misc.," iii., 152, non Cham. and Schlecht. in "Linnaea," v., 226 = MALVA GILLIESII, Steud., "Nomenclature," edit. 2.

This is a fine plant, tolerably well known in gardens, but which is in want of a name. It belongs to the genus *Malvastrum*, and it was described long ago under the name of *Malva geranioides*, but we cannot call it *Malvastrum geranioides*, because that name is already preoccupied by a Mexican plant. Our only wild specimens in the Kew herbarium were gathered in Parana, by M. Gihert. It is closely allied to *Malva purpurata*, Lindl., *Bot. Reg.*, t. 1362, *Bot. Mag.*, t. 3514, which also is a species of *Malvastrum*. *Malvastrum* may be distinguished at a glance from *Malva* by its capitate stigma. It contains a great many fine plants, nearly all of which are natives of the Cape and the temperate regions of North and South America. It belongs to the same tribe as *Malva*, *Althæa*, and *Lavatera*, characterised by its solitary erect seeds. *Modiola* belongs to the tribe with more than one ovule in each cell. The present plant has been in full flower on the Kew rockery for the last month, and came to us from Mr. Joad.

A perennial, with habit and flower rather like *Geranium sanguineum*. Stems radiating in a circle from the root, about a foot long, slender, decumbent, pilose. Leaves alternate, with a long ascending petiole and two persistent green ovate free stipules; blade deltoid, deeply palmately quinquefid, or in the upper leaves trifid; segments deeply pinnatifid, with a few remote lanceolate lobes, the lower compound. Flowers solitary on long ascending slender pedicels from the axils of the upper leaves. Epicalyx of three ovate-lanceolate free persistent bracteoles. Calyx pilose, $\frac{1}{2}$ inch in diameter, with a short tube and five ovate-lanceolate segments. Corolla bright deep rose-red, $\frac{1}{2}$ inch in diameter; petals orbicular, unguiculate. Staminal column less than half as long as the petals; anthers peltate; filaments free and spreading in the upper third. Pistil shorter than stamens; stigma blackish, capitate. J. G. Baker.

ONCIDIUM CALOGLOSSUM, n. sp.†

A stately *Oncidium* from tropical America, introduced by and kindly sent to me by Mr. Bull, with the following remarks:—"It has a large branching inflorescence of about thirty flowers, with bulbs and leaves very much like those of *Oncidium Marshallianum*, the bulb perhaps smaller," the flowers equalling those of *Oncidium pectorale*. The sepals and petals are yellow, striped with sepia-brown, and those stripes remarkably confluent in the petals. The lip is of a brighter yellow, with brown blotches in front, the wings of the calli reddish with numerous brownish-red spots all around. Column of the lightest yellow colour, with a greenish hue on the back and on the sides, with a few brownish-red spots at the base, and purple spots on the rings. H. G. Robt. f.

* *Malvastrum Gilliesii*, Baker. — Perennis; calibus gracilibus decumbentibus pilosis; stipulis persistentibus ovatis, foliis longe petiolatis palmatis quinquefidis segmentis pinnatis ellipticis parvis lanceolatis remotis; floribus axillaribus longe pedunculatis; bracteis 3 liberis calicis brevioribus; calicis pilosis tubo brevi segmentis ovatis acutis; petalis orbicularibus magnis rubris, staminibus petalis triplo brevioribus. J. G. Baker.

† *Oncidium caloglossum*, n. sp. — Affine *Oncidium Marshallianum*, Rehb. f., et *pectorale*, Lindl. Labell. auriculis basilaribus ellipticis parvis, lacinia mediana cuneato dilatato antice biloba; callorum systematis quinque segmentis basilaria a basi aperta lacinia triangulari et papulis inter se liberis multatis, area extrorsa hypericæ et papulis utriusque, lacinellis plerumque divergentibus marginis papulis utriusque antice; columnæ albis papulis abruptis papulis undulatis. Ex Am. trop.; introd. cl. W. Bull. H. G. Robt. f.

ORCHIDS FOR AMATEURS.

(Continued from p. 105.)

The genus *Lælia* contains some of the most beautiful, if not the most beautiful, plants of the order. The grander forms of *Lælia purpurata* and elegans are unequalled in the vegetable kingdom, and every species, even the tiny *Lælia monophylla* of the mountains of Jamaica, has a chaste elegance and a brilliancy of colour which cannot fail to excite the enthusiasm of the lover of Nature.

The close relationship of *Cattleya* and *Lælia* has already been noted, but to my mind the flowers of *Lælia* excel those of the sister genus. The two, however, cross freely, and some species are referred to either genus with equal propriety, if we except the single character drawn from the number of pollen masses, and even this character is purely artificial, and in some cases the four extra pollen masses in *Lælia* are rudimentary. One of the grandest of the *Lælia* is exceedingly abundant; it is known as *Lælia purpurata*.

Lælia purpurata.—This plant is a native of Brazil, and it was introduced with the great majority of the genus in 1830. Perhaps no Orchid is more variable, but unfortunately many varieties fall very short in excellence when compared with such grand varieties as *L. purpurata* Williamsii and Brysiana. A "good" *L. purpurata* is a magnificent sight when in flower, but some are very disappointing. The flowers are from three to five in number, supported on a branching spike, surrounded by a green spathe, which is often spotted with violet. They are 6 inches in diameter, or even larger; the sepals and petals are narrow, white, or rose-coloured; the labellum is cornet-shaped, with a very broad lip, almost resembling that of *Cattleya labiata*. The lip is deep purple, with a yellow throat, and lines of purple extending back to the claw of the labellum. The points of excellence are the broadness and depth of colour in the lip, the definite lines extending into the throat, and the texture and flatness of the sepals and petals.

There is a strong tendency in the flowers of *L. purpurata* for the sepals and petals to roll up longitudinally, probably from poorness of texture. This is a great blemish. The margin of the lip is always paler than the rest, with a tendency to spread in the centre towards the throat; the extension of the pale area is also a blemish, and it sometimes destroys the dark purple of the lip, which is reduced to an irregular band or two spots. I believe these defects are the result of starvation. The yellow or orange in the throat of the type form is absent in *L. Schilleriana*, which appears to be a mere variety of *L. purpurata*.

Other varieties differ in having lilac or rose-coloured sepals and petals, and in the brighter colouration of the lip, which is crimson in *L. purpurata* Nelisii and Brysiana. The latter is perhaps a natural hybrid between *L. purpurata* and *L. crispata*.

L. purpurata Williamsii has a deep violet lip and pure white petals and sepals.

CULTURE.

The cultivation of *L. purpurata* is easy, although great differences of opinion prevail as to the best temperature for its growth. It is a very accommodating plant, and will grow without much heat. My own belief is that it requires a high temperature and plenty of moisture during the period of growth, say, 75° to 85° or 95° to 100° on sunny days, with a very decided fall at night, say, to 60°. In the winter during its rest 50° is amply sufficient.

Plants which have lost their main lead are a long time before they flower, and this is the case with the majority of newly imported plants. The first shoots are often feeble, then two or three years are necessary to get a flowering bulb, but if each succeeding bulb is better than that which preceded it success is certain. In a healthy state the pseudobulbs of *L. purpurata* are quite smooth. The imported bulbs are usually deeply channelled or grooved, but these either die, or become plump and smooth in a year or two.

After the year's growth is completed the plant requires a distinct and decided rest, and scarcely any water, except an occasional syringing or sponging. The flowers and young shoots are produced at the same time, the former from the bulb of the preceding summer. As soon as growth commences the plants require a gradually increasing temperature, and a corresponding increase of moisture. I remove my plants to a cool well-aired house—Mexican—as soon as the growth is completed, and return them to a moist

stove in spring. It is important to have the compost pretty dry before reducing the temperature in autumn.

L. elegans differs considerably in habit from the last species. Its cylindrical-jointed pseudobulbs, bearing one or two leaves, are very unlike the stout fusiform pseudobulbs of *L. purpurata*, although the flowers of the two species are closely related. The sepals and petals are white or rose-coloured; the labellum is edged with white, and marked with a deep purple band. The striae leading to the throat, and the yellow band within the purple are wanting; some varieties are very fragrant.

Its cultivation differs little from that of its congener, but the flowers are produced in the same year as the bulb which bears them, before it arrives at maturity. So that the period of rest does not precede the flowering. The epoch of flowering is variable and depends upon the time at which the flowering growth is started. It is a maritime plant, a native of Brazil, and comparatively rare.

L. Turneri is a variety of *L. elegans* with very dark flowers and a bright blue border to the lip of the labellum. *L. Wolstenholmie* is also a variety of *L. elegans*.

L. gigantea, Lindley, is a distinct species closely related to *L. elegans*, from the Andes. The sepals and petals are green, and the labellum is reddish-brown. The plant, figured and described by Warner under this name is quite distinct, and is perhaps a variety of *L. elegans*. It is a native of Brazil; the petals and sepals are rose coloured dotted over with bright purple spots. It should perhaps be called *L. elegans gigantea*.

L. superbiens.—This is a very distinct species with the habit of *L. purpurata*. It has upright, somewhat compressed pseudobulbs, 12 to 18 inches long, with one or two coriaceous leaves growing from the summit of each bulb. The flowers are smaller and more fleshy, and the labellum is raised into parallel fleshy ridges. The flowers are purple, and the throat of the labellum is orange-coloured both outside and inside. The flowers are eight to twelve or more in number on each spike, and the spikes are said in its native country to be 10 or 12 feet long with twenty or more flowers. Twenty years ago a magnificent plant of this species was growing at Chiswick. It frequently had five or six spikes of flowers open at the same time. It was growing upon a large block in a cool stove without either peat or moss. It grew exceedingly well, and increased every year. It is said to have measured 5 feet in diameter, and it was purchased by E. Farnie, Esq., of Liverpool. This plant is a native of Guatemala, and was discovered by Skinner in 1839. It requires plenty of air, and, according to the Count de Bysson, it grows well in a viney. He adds that it does best in a well-drained, dense compost, differing in this respect from all other *Lælias*, which flourish best in the most porous compost that can be afforded them. *B. T. L.*

(To be continued.)

EUCALYPTUS.

You publish from time to time in the *Gardeners' Chronicle* notes on *Eucalyptus*, which greatly interest me. I have not only studied the numerous species, but I also interest myself in propagating them wherever there is a chance of success. This explains the interest that I have in reading in your journal of the attempts that are made in England.

The greater part of the experimenters only work with *E. globulus*, which is not the one that succeeds best in Northern climes. There are species much more hardy, such as, for example, *E. viminalis*, *E. Gunnii*, *E. polyanthema*, *E. coriacea*, and *E. cocifera*. It is believed, moreover, that *E. globulus* is the quickest grower, and certainly it is classic under this head; but I possess another undetermined species which grows at least twice as quickly. My tree at the present time, five and a-half years old since the sowing of the seed, is over 12 metres (more than 37 feet) in height, and more than 1 m. in circumference at the base. It is a very handsome tree, and of regular pyramidal form. Moreover, it is about to flower, and probably will yield seeds; so that the species may be propagated.

I have reason to believe that this remarkable tree has not yet been described or recognised among other species of similar appearance, for here the confusion of species is easy and frequent when there has been no opportunity of examining the young plants. If it is really new—and

that is extremely probable—I will publish it under the name of *E. Muellieri* to commemorate the labours of the great Australian Eucalyptographer, who has contributed more than any one else to the propagation of *Eucalyptus* in the South of Europe and Algeria. The services which he has rendered us are inestimable, although the public is too prone to forget them. It is an injustice to be repaired.

The *Gardeners' Chronicle* has frequently noticed the *Eucalyptographia*, which contains a detailed description of a hundred species. To properly understand the difficulty of such a work it is necessary to be occupied specially with *Eucalyptus*, the incredible variability of which seems to defy the perspicacity of the most skilled botanists. Bentham himself, with the information supplied to him by F. Mueller, declared this difficulty "almost insuperable," and this assertion is not exaggerated. I have now hundreds of young *Eucalyptus* obtained from seeds, where individuals vary from germination to such an extent as not to be recognisable. It is said that the same species take different characters according to the locality whence the seeds are collected, and the question is presented, "Are there truly fixed species in the genus *Eucalyptus*?" *Acacia* and *Nelaleuca* seem to me every bit as difficult to unravel, but that is a matter I leave to others. *Ch. Naudin*.

CAMELLIAS.

NEXT to the Rose no flower is more beautiful or more useful than the Camellia. It may readily be so managed that its natural season of blooming shall be from October to March, thus coming in at a time when Roses can hardly be had without forcing. In every quality, with the single exception of scent, the Camellia may be pronounced the equal of the Rose. It can be used in all combinations or for all purposes for which Roses can be employed. In form and colour it is probably more perfect, and fully as brilliant. It is equally or more durable, either on the plant or as a cut flower. It is a little dearer to buy, and perhaps slightly more difficult to cultivate; but like most plants the Camellia has crucial periods in its life, when it needs special treatment. That given, it may be grown with the utmost ease; that withheld, its culture becomes precarious, or a failure. The Camellia is so hardy that it will live in the open air in many parts of Great Britain, and herein lies a danger to many cultivators. Because it is quite or almost hardy they keep it almost cool. This is all very well if the cool treatment be not carried to extremes, and persisted in all the year round. Camellias in a dormant state will live and thrive in any temperature above the freezing point, and will take little or no hurt if subjected to from 3°–4° below it, or a temperature of 27° Fahr.

They will also bloom freely in a temperature of 40°, though 45° suits them better. Hence, during the late summer and early autumn it is hardly possible to keep Camellias too cool either out-of-doors or in. They are also particularly sensitive to heat just before the flower-buds begin to swell in late autumn or winter; a sudden or sensible rise of temperature at that stage sends the flower-buds off in showers. This is what too often happens, in fact, to the Camellias of amateurs. No sooner do the buds begin to show than a natural impatience seizes the possessors of well-huddled Camellias to have the flowers opened. More warmth, a closer atmosphere is brought to bear upon them, and down fall the buds in showers on stage or floor—the chief cause of this slip between the buds and the open flowers being a rise of temperature. A close or arid atmosphere often leads to the same results. Camellias can hardly have too free a circulation of air, or too low a temperature. Another frequent cause of buds dropping arises from either too little or too much water at the roots. Either a paucity or excess of water at the roots should lead to identical results. Most amateurs over-water their Camellias during their flowering stages. Seeing so many buds expanding they naturally rush to the conclusion that a good deal of water must be used to fill them to bursting point. But the opening of Camellia buds is less a manufacture than a mere development, and the strain on the plant and drain on the roots is far less during this stage than many suppose. Of course the opposite extreme of over-dry roots must be provided against, else this would also cause the plants to cast off their buds.

But our object now is less to point out how buds are to be developed into fully expanded flowers

than to show how they were to be formed in plenty, and the plants preserved in robust health year after year. One of the simplest and surest modes of reaching this desirable end is to adopt a system of semi-tropical treatment for two months or so after flowering. The moment or even before the late blooms fade the plants should be pruned if necessary. Few plants bear the knife better than Camellias, though it is folly to cut them unless they are too tall or too large for their quarters or have grown out of form. As a rule healthy Camellias produce sufficient or even a redundancy of shoots without cutting back; but should they need pruning, after flowering is the best time to perform the operation.

During the breaking of the tender leaves and the growth of the young shoots in their first stages the plants should be shaded from direct sunshine, unless, indeed, they are a long way from the glass, when the diffusion and dispersion of the rays of light tone down or break their scorching force; few young leaves and shoots are more tender and easily burned than Camellia, and scorching not only disfigures the plants but also hinders the formation of fine growths and the development of flower-buds.

The atmosphere during the early season of growth may almost touch saturation. It must not fail to be genial, and this geniality of the air must be kept up by the surface-sprinkling of paths, floors, stages, walls, and the plant themselves at least twice a day.

With the pots or border well drained it is hardly possible to overwater the roots of Camellias during their period of wood-making. The temperature may range from 50° to 65° during most of the period. As the flower-buds form, and become more conspicuous, the tropical treatment may become less and less tropical, until the Camellias are subjected to the common treatment of greenhouse or conservatory plants in summer. Even at this early stage it is wise to attend to the thinning of the buds. Many varieties of Camellias—notably that most useful of all varieties, the double white—will often set and swell five or ten times more buds than it ought to be allowed to carry. Nothing is gained, but a good deal is lost, by allowing so many embryo flower-buds to be formed or partially developed. It is in fact far wiser to take off the majority of the excess at the earliest possible point, so as to concentrate the strength of the plant into those that remain.

As it is, however, often a point of great moment to have a succession of Camellia flowers for as long a period as possible on the same plants, buds of all sizes should be selected to remain. Fortunately, it is found in practice that the plants, unless over-weighted with blooms, do not cast off the smaller or later buds in their efforts to open their earlier and larger ones. With the setting, thinning and partial swelling of the flower-buds the semi-tropical treatment of Camellias must close; continued longer the result would be their blooming out of season, or more probably their not blooming at all.

The best place for Camellias from the time of setting their flower-buds to their blooming season is a vexed question, which can hardly be said to have been settled as yet. They may either be left in a cool greenhouse, or placed in a shaded, sheltered position in the open air. Some of the finest Camellias ever seen have been placed in the open air from June to October. These in some cases have been stood behind south, and in others behind west walls. Those facing the east in their summer quarters were, on the whole, the finest, many of them being truly magnificent plants, not a few of them having been imported direct from Florence at a time when Camellias were far less grown in England than now.

In all cases where Camellias are placed in the open air in summer care will be taken to place the pots on worm-proof bases, and to shield the tops from direct sunshine from 10 to 4 o'clock. If these two points are attended to, and also shelter from high winds, it matters little where they stand. In all cases it will be to place Camellias under glass shelter early in October, less for fear of cold than of saturating rains causing a sodden state of the soil in the pots.

While advertising, however, to the safety and usefulness of placing Camellias in the open air in summer, it must not be inferred that this is essential to the successful culture; it is, in fact, far otherwise, as the majority of the finest Camellias in the country are planted out in conservatories with immovable roofs. Many such houses are, however, treated to special semi-tropical treatment as has been described, and are kept as cool and open as possible after the

flower-buds are fairly set, so that the cultural and climatic conditions approximate as closely as possible to those here indicated.

Soil and seasons of potting may be described as vexed questions in Camellia culture. As to the first, some affect pure loam, others peat only, yet more a half-and-half of both, with a liberal proportion of gritty sand, or a little smashed charcoal or bruised bones as porous or feeding agents, or both. Most growers prefer the mixture, and as good Camellias are grown in each of its constituents it follows without saying that they may also be well grown in various proportions of both.

Under rather than over potting suits the plants best, and the best time is doubtless just before they are good to start into fresh growth, though many are good cultivators elect to shift their plants in the late summer or autumn, that is, soon after the growth is finishing, and the flower buds fairly and fully set for the next season. From all which it is obvious that the Camellia is not only among the most useful and showy, but likewise among the most accommodating of plants.

Under good cultivation it is also one of the cleanest, though when scab gets on it, it is difficult to get rid of it. Mealy-bugs also occasionally make a hurried visit to Camellias when making their growth, as well as aphides. But the leaves once formed and advanced to semi-maturity are too hard and leathery for such insects, while they will bear scale being rubbed off them with impunity. But really well grown Camellias, as a rule, are wholly free from insect pests, and their clean dark glossy leaves are only of secondary beauty to their brilliant exquisitely formed and many sized flowers. *D. T.*

CATTLEYA LAWRENCEANA.

So much interest has been expressed on this splendid new Orchid from Roraima, in British Guiana (see fig. on p. 375 of our number for March 21 of this year), introduced into England by the successful Orchid collector Mr. Siedel, on behalf of Mr. F. Sander, that no excuse is needed for adding some further particulars about this plant, especially of its native home, to those already published in the *Gardeners' Chronicle*; and, in the first place, let me present a sketch of the exact place where this plant occurs (fig. 34), which is not, as seems to have been supposed in England, actually in Roraima, but is along the bed of the Kookenaam River, where it flows along the base of the south side of the twin mountains of Roraima and Kookenaam, at a level of only about 3750 feet above that of the sea, and not of from 6000 to 8000 feet as would be the case did the plant come from Roraima itself. The mountain in the background of the sketch is Kookenaam—its southern end, seen from a point somewhat to the east of south. The stream in the sketch is the Kookenaam River, which here runs along the bottom of a deep channel which it has cut for itself through the surrounding bare savannah lands. In the shelter afforded by the high banks of this channel, among the countless blocks of stone, of all shapes and sizes, which here occupy the bed of the stream, grow many shrubs and stunted trees, and some few trees of greater height, most of which latter, at the time when I made the sketch—Christmas Day, 1884—had been blasted by the hot breath of some recent savannah fire, which, however, had left unscathed the lower plants down in the cool shelter of the deep channel. It is on the trunks and branches, often big and gnarled, of the shrubs and trees down in this gully that *Cattleya Lawrenceana* grows in abundant splendour. Even as I was making the sketch I saw on a tree close to me two most magnificent clumps of this Orchid, on a tree overhanging the bathing pool of the Arekooa village of Teroota, the better of the two having five spikes of flowers, of which one bore nine, each of the others eight blossoms, in all forty-one, of some of the largest and finest *Cattleya* flowers ever seen on a single small plant, the roots of which easily lay on my extended hand. Our Christmas decorations that day consisted of an enormous pile of these flowers. And these were gathered after the Indians employed by Mr. Siedel had, day after day for many weeks, collected from that immediate neighbourhood, two, three, or even six enormous baskets of this plant—each basket a strong man's load. These baskets, by the way, as many of the plants happened to be in full bloom, were strangely beautiful. The Indians asserted that the *Cattleya*, which they expressively called by a word which means "blossom of the wood" (trunk),

grows also along several of the other similar streamlets in the neighbourhood, though, they added, not always so large and fine in form.

Mr. Siedel had visited the place in the previous April, and had then detected the plant and collected considerable quantities of it; but that lot, being unfortunate in its journey to England, had perished. The same very diligent and patient collector was at the same spot again while we were there in December of last year, and was gathering a new lot, which, I am glad to hear, afterward appeared in fine condition in Mr. Stevens' sale room in London.

Lastly, while I cannot help paying a tribute of admiration to the patient toil and endurance of dull bardship of such commercial Orchid collecting as this, and cannot help congratulating both the collector and his employer and the Orchid-loving English public on the successful result of this collecting, neither can I help expressing regret at the probable extinction in their native homes of such plants as this by their wholesale collection for market. A splendid Orchid at home is a thing of beauty, to be admired by many; the same Orchid in its native home is a thing of yet far greater beauty, seen and therefore admired by but few; but then these few are generally wearied travellers, who deserve and want the refreshment of the beautiful picture.

The preceding paragraph was meant to be my last, but, like Dr. Baxter, I have "more last words," and these are simply, that I purpose, with the permission of the Editor, at some future time to offer the readers of the *Gardeners' Chronicle* a short series of articles on Guiana Orchids in their native homes, in the hope that this may increase the interest felt in these same plants when transferred to English hot-houses. [We accept the proposal on behalf of our readers with cordial thanks. Ed.] *Everard F. in Thurn, Pomeroon River, June 18.*

SCHOOLS OF HORTICULTURE.*

HORTICULTURE may be considered to bear the same relations to botany as manufacturing chemistry does to general chemistry. In fact, horticulture is merely the application of botany to practice, nearly all the daily occupations of the gardener being founded on a basis of scientific rules. It is therefore plain that the study of this science should occupy a prominent place in the programmes of schools of horticulture, but it is important to point out what the nature of the teaching should be, in order to be truly useful.

THEORETICAL INSTRUCTION.

This should be carefully adapted to the special requirements and capacity of the pupils. The requirements for the preliminary examinations in the Belgian schools are far from being difficult. They only require that the pupil should possess that slight amount of knowledge which may be acquired in a primary school. The regulations also allow the admission of pupils from the age of fifteen years. It usually happens that these lads have not had a sufficient education to understand anything more than an elementary course. The Professor should therefore endeavour to make his instructions as simple as possible, and employ all the means in his power to make himself understood. He will succeed the better in proportion as he makes his course more practical. To this end he should make use of fresh plants or dried specimens, museum specimens, diagrams, &c.; in short, of everything which appeals to the eye. Under these circumstances a junior pupil will understand and remember the explanations given. This theoretical course should be extended over two or three academic years, and should comprise general botany and special botany. In general botany the elements of anatomy should be studied, the forms of organs, and above all physiology. It is important that the gardener should have an idea at least of the structure of the different parts of plants and of their uses. He must know the details of the phenomena of the life of plants, in order to place plants under the most favourable conditions for their growth. To mention only a few examples chosen at hazard, how can he regulate the watering of plants if he is not acquainted with the mode of action of roots and leaves, with the phenomena of absorption and evaporation? How, if he ignores the peculiarities relating to sexual reproduction, will he proceed in any intelligent manner to effect artificial pollenisation and hybrid-

* A paper read at the Antwerp Horticultural Congress, by Professor Kicks.

isation? A very important chapter of the programme of general botany which must be taught to the horticultural pupil is the study of the influence of external agents—for example, light, heat, electricity, the soil, &c.—upon plants. The two first of these especially are concerned with a number of physiological phenomena which the gardener meets with in his daily work. He must understand the influence of temperature in order to manage the germination of seeds successfully, the ascent of the water of evaporation,

this as it may, however, in this report I may be excused from dilating on this subject, because it will receive special attention at the hands of the Congress.

Special botany should hold a still more important place in the programme. It is indispensable, in fact, that all who apply themselves to gardening should be acquainted with botanical terms and descriptions, so as to be able to understand the descriptions of the plants given in the Floras, and to be able on occasion to make a dissection of the flower. The gardener

possesses these facts will be less exposed than others to the risk of failure when he is called on to cultivate newly introduced plants. He will know, on the contrary, how to place them under conditions of existence analogous to those of their native country. The theoretical teaching to be easily understood by the pupils should, as is before said, be based as far as possible on practical instruction. What idea can a young man, having had little preparatory education, form of the cell, the seat of the principal functions of

FIG. 34.—THE HOME OF CATILEYA LAWRENCEANA. (SEE P. 168.)

the ripening of fruit, seeds, &c. He should know how to regulate in an intelligent manner the operation of heat and light in his flower and fruit houses. If gardeners had clearer notions of the part which rays of various-coloured light play in the functions of life, we should not have seen advanced a few years ago the absurd idea of covering greenhouses with blue or violet glass in order to hasten the maturity of Grapes.

The study of vegetable pathology, which in most schools forms part of a course of botany, is also of great interest to horticultural pupils. The subject might even form the object of a separate course. Be

should have as clear an idea as possible of classification. If they understood better what is meant by a natural group, family, genus, species, &c., they would not be so often seen trying to obtain a graft or a hybrid under impossible conditions, nor announce in their catalogues, as among new species, simple forms soon condemned to disappear by returning to the primitive type. It is equally a necessity that the pupils of a school of gardening should receive some information concerning the geographical distribution of plants, and the dispersal of different natural groups on the surface of the globe. The gardener who

plants if the Professor has not shown it to him under the microscope? This simple examination will ensure a better result than the longest explanations. It is certainly of little use for the future gardener to be instructed in the art of making microscopical preparations for himself; but it is desirable to allow him to see from time to time those made by the Professor. It is especially in special botany that practical work is of use. To this end the Professor should lay before his pupils well selected specimens from the principal natural groups, and proceed to examine them with his pupils. In Belgium the excellent manual by

M. Crépio is of great use in this respect, the pupils employing their botanical excursions successfully. These herborisations, in spite of all their advantages, have nevertheless a drawback; this is, they take up time which might be devoted to more useful garden work. When, as is the case at Ghent, a collection of plants exists, and in which the plants are labelled and classified after a natural method, the necessity for a number of excursions is in a great measure done away with. In a botanic garden instruction is made to bear on plants not represented in the native flora of a country, and which the gardener is perhaps specially interested in knowing. It is very important to teach the pupils to dry plants and to preserve them in herbaria. Each should be supplied with a label mentioning, not only the name of the species, but even the spot where it was gathered, the time of its blooming, and the name of the collector.

ALPINE PLANTS ON THE GENMI.

THESE notes were made on plants collected principally on the Gemmi Pass between June 12 and July 18, that is to say, I have crossed the Pass going up from Leukerbad, by one of the most wonderful zigzag paths in Switzerland, in June, thus passing into the Bernese Oberland; and in July we recrossed the Pass, this time, of course, descending to Leukerbad. In June the path, from the little hotel Wildstrubel at the top of the Pass to the inn of Schwärenbach, was only to be discovered by stakes driven in along the edge of the path itself, the ground on either side being covered with snow. The most noticeable plant was *Saxifraga oppositifolia*, forming large patches of pink, some of them nearly a foot in circumference, hanging down over the rocks on all sides; it was also in great abundance on the Torrenthorn, a mountain we ascended from Leukerbad in June, and we found it in flower there when we had left all other flowers far below; *Crocus vernus* and *Soldanella alpina* in great abundance on the Torrenthorn, the former struggling up through the snow as fast as the snow melted; *Anemone alpina* and *A. sulphurea*, the latter in one place only; on the Alp or lower pastures of the same mountain *Anemone vernalis* was also found. In the Pine forests above Leukerbad *Viola biflora* was very conspicuous with its small bright yellow flowers, also *Valeriana montana*. To return to the Gemmi—still in June—the rocks and ground (where the snow had already melted) on the left-hand side of the path, shortly before arriving at Schwärenbach, were a mass of colour—pink, yellow, purple, and white. *Primula farinosa*, *Ranunculus* (?) (yellow), *Viola alpina* (purple), *Pancy*, and *Ranunculus glacialis*, and *Primula Auricula* (yellow), and *Gentiana verna*, here and there, not in the same quantity as the first-named. I have never seen such a blaze of colour, except, perhaps, in Miss Jekyll's garden at Munstead. As we began to descend—that is, towards the valley of Kandersteg—we found the meadows full of flowers, *Anemone narcissiflora* being abundant. I was sorry not to be able to take either notes or specimens as we started late in the afternoon, and my guide said if that I stopped by the way we should not get to Kandersteg that night.

In July, when we recrossed the Gemmi, the flora was very much changed, all the species of *Anemone* being over, also *Primula farinosa*, and but few of either *Viola alpina* or *Ranunculus glacialis* remaining in flower; the two most showy flowers now were *Dryas octopetala*, which I think is "the beauty" above all the other alpine; and *Rhododendron hirsutum*, both in great abundance. *R. ferrugineum* we also found, but it is not common here; then *Edelweiss*, now (July 18) in flower, but still not fully out in many plants, though my guide managed to gather six fine bunches of the flowers. I give the names of a few other alpine I collected mostly on or about the Gemmi:—

<i>Globularia cordifolia</i>	<i>Gentiana acutis</i>
<i>Phaca astragalina</i>	" <i>lutea</i> (in the valley of
<i>Saxifraga aizoides</i>	Kandersteg, a very
" <i>rotundifolia</i>	showy plant, 2-3
<i>Achillea moschata</i>	feet high)
<i>Azalea procumbens</i> (in June	<i>Linaria alpina</i> (common, but
and July)	very pretty)
<i>Aster alpinus</i> (in July in	<i>Myosotis alpestris</i> (a lovely
flower)	blue)
<i>Eriogonum alpinum</i>	<i>Rosa alpina</i>
<i>Veronica saxatilis</i>	<i>Cerastium alpinum</i>
" <i>fruticosa</i>	<i>Alchemilla alpina</i>
" <i>latifolia</i>	<i>Beladissastrum Micheli</i>
<i>Gentiana bovarica</i>	

And, lastly, among Orchids, all the following species I found growing together in the Oeschinen-

thal, a stony valley with a stream running down the middle, the overflow of the beautiful Oeschinen See, a small lake at the top of the valley, overlooked by the glaciers of the Blumlisalp, Dolderhorn, &c.:—*Ochis maculata*, *O. conopsea*, *Ophrys aranifera*, *O. muscifera*, *Epipactis rubiginosa*, *Listera ovata*; and the same day, on the Gemmi, *Crocus alpina* and *Nigritella angustifolia*, the latter very sweet.

I must mention the Jardin d'Acclimatation at Geneva, of which my friend, M. Henry Corveon, is the able Director, and where all the rarer alpine plants are to be seen in perfection. Every one who goes to Geneva should pay the garden a visit and see for himself the good work he is doing in saving the rarer alpine plants from extermination, all the specimens being raised from seeds gathered on the mountains, and not by pulling up the plant. The letter of Mr. Justice Wills in your columns will, I hope, be of much service. *Scott Wilson, Geneva.*

MARKET GARDENING.

(Continued from p. 75.)

VEITCH'S AUTUMN GIANT CAULIFLOWER has been very extensively grown under field culture during the last few years, and here is seen an excellent illustration of the readiness with which growers keep pace with the requirements of the metropolitan markets. When, about six years ago, I first advised a neighbour to commence its culture it was unknown in this district—unknown, I mean, to market gardeners. The great success attending my friend's commencement, however, brought numerous competitors; so much so, that during the last two seasons large masses of these very superior "Whiteheads" became all but unmarketable at a fair remuneration. As regards its culture, very slight difference is made concerning the preparation of the ground and planting to that long in vogue with Savoys, &c. Certainly, an additional quantity of manure is generally applied immediately before the crop is planted, and more distance is given between plants as a matter of course. Again, a fact I have already endeavoured to emphasise, comes very prominently to the fore; viz., simply ploughing and rolling the ground produces by its inherent firmness, or clod consistency, as fine if not finer produce than highly manured and spade-wrought garden soils give. The field culture of this crop also affirms how very hardy this handsome variety is, as the seeds are sown broadcast across fields, at the same time and in precisely the same way as are those of Cabbages, hardy greens, &c. The seedling plants which result from them keep pace with all. One singular fact is always associated with the young plants, though the cause is difficult to explain—i.e., quite 15 per cent. of the young seedlings prove invariably blind and quite useless.

One of the most prominent crops in this way is that known as the PURPLE-SPROUTING BROCCOLI. Probably there does not exist in the whole of the long list of species and their innumerable varieties of the Brassica tribe a more hardy one than this, in all that concerns its growth from the germination of the seed to the planting and full growth, though, owing to its luxuriance, it occasionally succumbs to severe mid-winter frosts. The young seedling plants are transplanted at any time, age, or size, when suitable ground space can be prepared for them. Sometimes they are so large, or so long, as to be planted by simply laying them along a freshly-opened trench and plough-planted. Often long attenuated seedling-bed drawn plants, 18 inches or 2 feet in length, are thus treated, and they form, even in this recumbent position, huge heads in due season. This system of planting, though the soil is heaped over the roots more freely and more loosely than is the case in regard to dibble-planting, never succeeds so well as the latter, albeit the stalks are often buried more deeply—sometimes a desirable feature, but in extensive practice the reverse. It is well to observe, these purple Broccoli are not planted simply for the flower-heads. The huge growths made—so fine often that two or three of them occasionally fill a sieve—are cut and marketed long before any signs of flowers appear. They are always appreciated by the public, and constitute one of the most tender and delicate-flavoured greens grown. Gardeners, having extensive supplies to provide during the months of January and February, will find it very advantageous to grow a quantity of this variety, to be used in lieu of Cabbage greens, &c., which are often too much depended on, though they

have so little to commend them in point of tenderness or flavour.

DWARF FRENCH BEANS need no explanatory remarks: they are grown somewhat like garden crops, but the variety of Bean known more commonly as "Runners"—field-grown varieties of which comprise the Scarlet Runner and, though less frequently, the white Dutch—are cultivated around the metropolis in a way that would surprise many non-travelled country gardeners. Sown in hundreds of acres, across the fields, they are forced into early and very heavy cropping by a most persistent system of frequent stoppings: no sticks being ever used, except on very rare occasions, and then only to grow seeds of fine colour and quality, either for market or for a future season's planting. It is remarkable, also, how very early Runner Beans are field sown, sometimes even during the first of second week in the month of April, and always within this month where ground is ready to receive the seed. It is a fact, probably not too well known, that this plant when the first "spear" or shoot is cut down by an early frost will produce a second, and succeed in cropping well afterwards. As regards the stopping already alluded to: this is commenced as soon as the shoot forms, following the seed lobes or leaves. And this is followed up by close stopping whenever a young shoot shows above the leaves. By this means flowers are forced to form at once, and the result is early cropping. I gathered my first dish on a row so treated on July 20 last. Where the plant is permitted to run up sticks fruiting is of necessity later than this, and, as a rule, such abundant crops are not produced. As these plants have, moreover, the merit of continuing in vigour and uninterrupted fruitfulness until the frosts of early autumn cut them down, there is much to commend this simple system of culture, to say nothing of the saving made in regard to the outlay for sticks in places where they have to be purchased. *William Earley.*

BOTANY AND GARDENING.

NOT so long ago it was considered high praise by some to say of any one that he loved flowers for their beauty, and did not care to pull them to pieces and examine their structure. Probably the same idea is still in existence. As well might it be thought that the musician who had studied the science of music must therefore enjoy the less its beauty as an art; yet no one believes that musicians would have produced compositions of equal beauty in harmony and melody had they ignored the scientific side of musical culture, or that their works would be the better interpreted by an absence of all such knowledge on the part of the performers. The same assuredly holds good in regard to the culture of flowers. It is possible to thoroughly love both music and flowers—to express artistic feeling in the one, and to cultivate successfully the other—without the slightest scientific knowledge of either; but the gain in either case is great if "the reason why" be carefully looked into. A world of marvels is opened up to the botanist, increasing the interest of practical gardening; and although the number of botanic gardens through the country must necessarily be small, there need be no such limit to the number of botanical gardeners. It is just such an army of intelligent observers which is at present wanted. There is work enough for all, since Mr. Darwin has, as it were, made botany a new science, and taught us that every smallest marking in a flower, every minutest peculiarity in a plant, has its meaning and history. No garden is too small, and no careful and accurate observer too ignorant, to be of some use in this great work. But of all things accuracy is the most important. An inaccurate observation is not only useless, but positively mischievous, and can only serve to mislead others. A certain amount of knowledge as to what is, and what is not, worth recording amongst these observations, is of course of great use; and probably a mass of observations which would be of value to scientists, is lost by the want of such knowledge. This can only be remedied by some degree of careful botanical training becoming part of the education of every gardener worthy of the name, whether professional or amateur. The sooner the old popular idea that botany means "how to know the names of plants" is annihilated the better. Useful, indeed practically essential, as such knowledge is to the gardener, it is but a small item in the sort of knowledge required, if gardening is to be, as it certainly ought to be, a rich field of observation, to which

science workers may look for a supply of some of the facts they require. Such facts often throw a flood of light on some of the deepest botanical questions; and amongst these facts worth recording, are the abnormal growths which perpetually occur, many of which may be full of interest as links in the evolution of the plant, and in its relation to far distant branches of the great genealogical tree of plant life. Some knowledge of structure and function, of vegetable biology in fact, is the requisite guide as to what to observe; for nothing is more curious than the way in which even a trained eye fails to observe what comes directly "under its notice," but what in reality is often not noticed at all. Hisbert Spencer speaks of a fact which "has its significance observed by its extreme familiarity," and this is a danger which besets every gardener, and which cannot be too carefully guarded against. The very faculty of "wondering why" seems to be but too exceptional. Though it is by workers in the laboratory that some of the greatest botanical discoveries have been made, yet, from the very nature of their work—work often requiring a course of observation by night as well as by day—they cannot have the same kind of opportunities for observing the daily life of many a plant which gardeners necessarily have. And just as the work is different, so it may be of use. The gardener may not have time, or taste, or knowledge necessary for the patient microscopic observations and carefully thought-out conclusions of the scientist; but if the gardener be a botanist he will feel too deep a debt of gratitude for the results of such scientific work not to be ready to aid by accurate observation (however small in degree be the aid he can give) in the progress of scientific research.

By such means gardening becomes, not merely a useful and interesting occupation and a pleasant amusement, but an intellectual pursuit, with possibilities on every side for new observations which may sometimes lead to important discoveries; and at the same time the practical knowledge of plants which intelligent gardening involves adds in no small degree to the interest of botanical study, and to that of many books which open up fresh lines of thought with regard to plant-life—such hooks, for instance, as some of Darwin's, as Wallace's *Island Life*, Kerner's *Flowers and their Unhidden Guests*, &c., must be full of suggestiveness to the gardener, and make him realise that gardening and botany are in no degree antagonistic, but that to its work in connection with botanical science gardening must look for its highest development in both pleasure and interest. *C. M. Owen.*

ROOT STRUCTURE.

THE variation in the appearance of roots according as they grow below the surface, in the air, or in water, is well known. Lately M. Constantin has pushed the inquiry further, and has examined the internal structural modifications which accompany the more obvious external changes. M. Constantin examined the structure of the root in terrestrial and in epiphytal Orchids respectively, and also made comparative experiments by causing aerial roots to grow underground, and others exposed to light or immersed in water, and as follows. M. Constantin's general conclusions are so forth:—

The growth of roots in the air—1, diminishes the bark, and, on the contrary, increases the pith; 2, causes an increase in the fibrous system of the bark as well as of the centre; 3, causes an increase in the number of ligneous vessels; 4, renders the endodermic cells harder and more impermeable.

When, on the contrary, the root develops in water, the following results are apparent:—1, increase in the size of the spaces between the cells; 2, diminution of the pith; 3, reduction of the fibrous and vascular systems.

These observations show plainly that the roots adapt themselves in the same manner as do the stems when under different conditions.

Like the aerial stem, the aerial roots are characterised by the great development of the central cylinder, of the fibrous and vascular systems.

Like the rhizomes, the subterranean stems are distinguished by the great thickness of their rind, the reduction of the pith, and the small importance of their fibres and vessels.

Like aquatic stems, the roots produced under the water are similar in structure to subterranean organs, but differ in having intercellular spaces, and in the lesser development of the vascular elements.

The analogy remains even when blanched stems are compared with roots, which have grown in air and obscurity, the rind and ligneous system being of less importance than in subterranean organs. The root is therefore as liable to modification as the stem, and if its organisation seems very uniform it is because it is most often developed under the ground. It is to the influence of the medium, terrestrial or aquatic, that we must attribute the feeble development of the pith of roots. The absence of this tissue consequently does not serve to characterise the root anatomically. The most striking result of these experiments upon the root as well as on the stem, is that the woody matter is formed with relative difficulty under the ground, in water, and in darkness. A consequence of this is very important, as the functions of the fundamental tissue and of the endoderm, are thus found to be entirely altered.

GROUPING IN THE GREENHOUSE AT KEW.

IT is a notorious fact that no system, however well designed, or novel at the outset, is destined to give satisfaction for any lengthened period of time. In evidence of this may be mentioned the summer flower bedding, and lately carpet bedding, which brought about such a revolution in modern gardening. Both these systems, except in public parks and gardens, have fallen greatly into disrepute, a circumstance to be accounted for in various ways. Nor is it a matter of surprise, seeing how the times change.

For some years back, at least, it has been the custom in the greenhouse at Kew to arrange plants, of any sort whatever, almost entirely in a mixed manner. One might occasionally see a group of *Lachenalias* or other spring flowering bulbs, but this was exceptional. Lately, however, what must be considered in the light of an innovation, is the arrangement of plants in groups of a kind. This system has by no means been rigidly adhered to throughout the house but is most fully effected in the side-wings. The larger groups are made up of tuberous-rooted *Begonias*, *Pelargoniums*, and *Fuchsias*, and one group in particular was most effective lately; this consisted of Ivy-leaved *Pelargoniums*, both single and double, in full flowering condition, occupying a bench, backed up by a huge plant of *Bougainvillea glabra*, monopolising the whole end of the wing, and flowering most profusely as it does annually for many weeks at this season. An attempt has been made to break the monotony or uniform appearance of some of these groups, for instance, by inserting plants of *Cordylina*, *Cyperus*, *Grevillea*, as well as the taller, shrubby fine-foliaged *Begonias* amongst the tuberous-rooted sorts. This undoubtedly carries with it its own attractions, but becomes objectionable on the ground that it frustrates to some extent the original design, the motive of which was to gain effect by the massing of varieties of one class of plants. Moreover the innovation has been eliciting the attention of the more frequent visitors.

Conspicuous amongst other things are some groups of the deservedly popular *Scutellaria mocciniana*, whose somewhat rigid massive spikes of scarlet flowers contrast well with plants of a more graceful character. There are several groups of *Chrysanthemum carinatum*, a most effective hardy annual, with more finely divided foliage and far showier flower-heads than *C. coronarium*, growing alongside of it. The disc is maroon, and the rays yellow, pink, or white, according to the variety, with a golden-yellow base frequently surrounded by a crimson zone. Both single and double forms are represented.

Distributed about the house are smaller groups of *Datura suaveolens*, *Phlox Drummondii*, *Torenia Fournieri grandiflora*, and *Carnation Souvenir de la Malmaison*—the latter noticeable for its huge double pale-coloured flowers.

This may suffice to show the nature of the arrangement, and if the groups are occasionally removed and replaced by others in their season the design cannot fail to be instructive as well as attractive. The hinge of the novelty will rest on the variety and showiness of the groups introduced from time to time amongst the more permanent occupants of the house. Prominent amongst these in flower may be mentioned *Banksia compar*, *Phormium tenax*, *Swainsonia Osborni*, and *S. galegifolia*. The two latter are allied, but distinguishable species, of slender habit, and amenable for pot culture, or for planting out and

training as climbers, when they will flower freely for many weeks together. Profusely flowered plants of *Crassula coccinea*, *Trachelium cotuleum* with its white variety, and *Francoa appendiculata*, exhibit decided tones of colour distinct from those around them. The climbers, twiners, and other subjects trained to the pillars and rafters, are a special feature of the house, and some one or other of them is in flower at almost any season. The graceful habit and showy character of *Begonia fuchsoides* would never be dreamt of by those who cultivate it in pots only. A great number of climbers are flowering more or less profusely at the present time, but it must suffice to mention a few, such as *Passiflora coerulea-racemosa*, a hybrid with red sepals and pale violet petals, together with *Mandevilla suaveolens*, *Trachelospermum jasminoides*, and *Jasminum confusum*—the three latter of which have white flowers, and fill the house with their agreeable fragrance. *F.*

Florists' Flowers.

CARNATION AND PICOTEE.

FOR the last nine years I have sent a *resumé* of the new Carnations and Picotees exhibited at the exhibition of the National Carnation and Picotee Society. It is very interesting and instructive to look back through all these years, and contemplate the progress that has been made. My own experience is that seedling raising fluctuates very much. Some years a great many new and distinct varieties are produced, in other years they are few and far between; this is probably to be accounted for, by the greater difficulty in obtaining seeds when the season happens to be unfavourable to the proper fertilisation of the flowers. Hot and dry seasons are the best, and perhaps such a one as the present, which was very unfavourable to strong development of the plants at first, has been very favourable indeed, now that the plants are fully in flower. Some varieties are very unproductive of pollen, and unless very favourably placed will not produce seeds. The yellow ground kinds are most difficult to fertilise, and as far as my experience goes we are able to get one seed only for every two blooms. Perhaps better results will be obtained this year: we flowered the plants earlier, and the seed pods now formed promise well. I may allude first to a few of the old varieties, as it is of much importance to growers that they know how the best of those sent out in previous years yet maintain their early promise of goodness.

Beginning with the SCARLET BIZARRE class, it is marvellous to observe how well Admiral Cuzon holds the position it has so well kept for more than a quarter of a century. Arthur Midhurst and Robert Lord, raised by Mr. Dodwell, are worthy to be placed with it. Fred, which promised well at first, is not to be depended upon.

In CRIMSON BIZARRES, most of the new ones already show signs of weakness, or they do not maintain their character. Samuel Barlow, for instance, certificated by the National Society in 1883, and sent out subsequently, is not pure enough in the white, and is not good enough to put in a stand of twenty-four at an exhibition, although it was placed in our own at the last. Master Fred already shows signs of weakness in constitution, and William Skirving has much degenerated in quality. H. K. Mayor (Dodwell) is a good substantial variety shown well by Mr. Turner. Thomas Moore has improved in quality since it was first sent out.

THE PINK and PURPLE BIZARRES do not yet form an important section. The best we had this year was Miss Gorton (Dodwell); it is far superior in form to Sarah Payne, and was equal to it in colour this year. Mrs. Barlow was superb last year, this year it has lacked brightness, but it is one of the best.

Passing to the PURPLE FLAKES, Simonie's James Douglas certainly still heads the list, followed by Squire Whithorn (Dodwell), while for its distinct shade of purple, Florence Nightingale must form the last of the trios. In scarlet flakes, Henry Cannell (Dodwell) and Matador (Abercrombie) were about equal this year. The first named is very bright in colour, but the petals are too small, and in that respect Matador gains a point. John Bull (Dodwell) was well exhibited by Mr. Turner, but I cannot place it before that old and well-tried variety

Sportsman (Hedderley), as one of the three best. Rob Roy has come well to the front as by far the brightest and best rose flake. Tim Bobbin has gone back from its first promise of goodness, and is replaced by Jessica. John Keet must hold the next best place until some of the new ones not yet in commerce take its place.

The three best heavy red PICOTEES are Brunette, John Smith, and Princess of Wales. The best light red-edged varieties are Mrs. Gorton, Thomas William, and Violet Douglas. Heavy purple-edged varieties are best represented by Muriel, Mrs. Chancellor, and Zerlina, while in light shades Her Majesty, Jessie, and Baroness B. Coutts, hold the foremost place. Heavy rose edges have been much improved during the last few years. Constance Heron, Mrs. Payne, and Royal Visit have come well to the front, and are the best in commerce. In light rose edges, Liddington's Favourite, brought into prominence by Mr. T. Austin, of Brill, last year, and which gained "premium" in London this year, is easily

Thalia is a promising flower, which received the 2d prize as a rose flake.

I have only to remark in reference to the exhibition, that it was very pleasing to see the classes so well filled. In some of them there were as many as ten entries; and considering the season the quality of the blooms was all that could be desired. I would also offer a hint to some exhibitors who showed remarkably well grown blooms, but failed to obtain the place their culture deserved, owing to the lack of variety. It will not do to place three blooms from one class in a stand of six, nor six from one in a stand of twelve. The classes should all be represented, and this can be done without growing a very large number of varieties; it is for that reason I have named three varieties only in each of the six classes of Carnations and Picotees. They can be obtained at a cheap rate, and are the varieties which are best to be depended upon for exhibition.

It is a pity that the yellow ground Picotees are not more grown. Some new seedlings were exhibited,

HARDY SHRUBS.

SPIRÆA DOUGLASSII.—Amongst deciduous shrubs few are at present more attractive than the various species of *Spiræa*, and amongst these as a valuable flowering shrub none can surpass and few equal the above interesting and highly ornamental form. Planted in good bold masses as say from a dozen to 40 or 50 yards back from drives and walks, this *Spiræa* will create a feeling of both delight and surprise, as well by its ornamental appearance as by its profusion and continuity of bloom. The flowers, which are nearly sessile, and vary in colour from pink to nearly white, are arranged in a dense terminal of from 6 to 9 inches in length. Originating from North-west America, it is perfectly hardy, and well suited for our climate generally.

LEYCESTERIA FORMOSA

is a very distinct, interesting, and ornamental shrub, that is well suited for planting in similar situations to

FIG. 35.—PLAN OF SUBURBAN GARDEN.

1, House; 2, Carriage drive; 3, Lawn; 4, Servants' entrance; 5, Terrace; 6, Garden gate; 7, Summer-house; 8, Rockery; 9, Yard; 10, Flower beds; 11, Rhododendrons; 12, Grass; 13, 14, Seats.

first in the class. Estelle is second, and Ethel third.

I have selected the above, after long and patient comparison, as the best Carnations and Picotees now in commerce.

Amongst NEW VARIETIES there is not much room for difference of opinion, as so few were exhibited. Two new raisers of seedlings must be added to the list, viz. the Rev. F. D. Horner and myself. I have some rose flake Carnations from Mr. Horner, one of which, just flowered, promises well. He also raised the very beautiful red-edged Picotee, Dr. Horner, exhibited by me, and which was awarded 1st prize in its class and a First-class Certificate. Out of some 750 seedlings I have been able to select three or four that will probably hold a high position. Three of them received 1st prizes and First-class Certificates from the National Society, viz. Rosamond, crimson bizarre, a well-formed flower, with broad and regular flakes of rich red and purple; Grace, pink and purple bizarre, also a well-formed flower of a paler tint; Margaret, rose flake—it resembles Sybil in the broad regular marking, but the rose colour is paler.

one at least of them is a great advance on the old varieties; it has a distinct red edge, the yellow ground pure and clear, without spot or bar. One bloom only was exhibited, consequently no award was made, except that it received a 1st prize in its class. *J. Douglas.*

PLAN OF SUBURBAN GARDEN.

THIS is a design (fig. 35) which would be appropriate for small gardens in the suburbs of London and large towns. Straight walks and borders have been avoided, and specimen trees have been placed on the grass outside clumps, so as to produce an indefinite appearance. As the ground is very sloping, the banks are necessarily heavy, so as to make a good level for tennis. The circular beds between the clumps are placed so that they shall be well seen from the walks and house. This plan has been designed and laid out for Messrs. H. & E. Kelly, Fitzjohn's Avenue, Hampstead, by Mr. E. T. Chamberlain, landscape gardener, of 192, Haverstock Hill, London, N.W., and Harrow. The figures to the plan will supply what further details may be necessary.

the preceding but, unlike that plant, it is, we think, better suited for growing as single specimens than for clump planting. The highly interesting and by no means inconspicuous flowers are borne in verticils, and gradually diminish in size towards the tip of the raceme. Deep purple berries supported by deep purplish bracts succeed the flowers, thus rendering the plant, both in flower and fruit, a desirable acquisition to our shrubby borders. It is readily propagated by cuttings or division of the roots.

DEUTZIA CRENATA

—or as it is usually though incorrectly called scabra—is one of the most handsome or graceful flowering shrubs in cultivation. Planted in conspicuous positions on the lawn—a sheltered situation suits it best,—or within easy access of drives and walks, this lovely plant will at all times attract attention, indeed here the only fault we find with it is that the flowers are so enticing to the passer-by that unless well guarded, they are seldom allowed to remain intact for any length of time. It grows about 6 feet in height

with racemose or paniculate flowers, the stems being remarkably slender, which still further adds to the beauty of the plant when in flower. The tree *D. scabra* is seldom seen in cultivation.

TAMARISK.

For planting in maritime situations we find few shrubs, when ornament is combined with utility, to equal the various species of Tamarix. The light, feathery branchlets, almost resembling our garden Asparagus, when tipped with their rosy-white spikes of flowers, have a very graceful and ornamental appearance. It is invaluable for seaside planting, succeeding well on bleak exposed shores where comparatively few things will flourish. Well grown specimens frequently exceed 10 feet in height, and nearly as much through; and when, as at present, they are laden with their conspicuous and sweet scented flowers, have a particular fascination of their own. *T. gallica*, which is now naturalised on some parts of our coast, is perhaps the best species for general use, although *T. germanica*, a native of Central and Southern Europe, and which bears red flowers, is more floriferous.

DESFONTAINEA SPINOSA,

with its scarlet and yellow trumpet-shaped flowers, is just now very effective. Perhaps, as a wall plant it is seen to best advantage—at least, in such a position it succeeds best, as, being a native of Chili, it can only be classed as "rather tender." In most British stations it, however, grows and blooms freely. The prickly Holly-like foliage is of a deep green colour, and very ornamental, and the drooping, tubular flowers, red outside and yellow within, are borne in profusion. Having a good habit of growth, it would be difficult to imagine a more beautiful shrub either in or out of flower.

PERNETTYA MUCRONATA.

This spiny-leaved plant is of remarkably free growth, and a most ornamental subject when planted in rich peaty loam. Having a creeping rootstock, it soon covers a considerable surface of ground, the young suckers coming up in all directions, and is therefore invaluable for using either as game covert in the more ornamental woods, or for mass planting in conspicuous situations. The narrow coriaceous leaves, pink stems, and white pendulous flowers, are attractive features of the plant when well grown in deep sandy peat.

PHILADELPHUS.

Two or three varieties of Philadelphia, notably *P. thyrsiflorus*—which is certainly the finest of the whole group—*P. coronarius*, and *P. grandiflorus*, must rank among the most effective and beautiful of perfectly hardy deciduous flowering shrubs. North America is certainly the home of the Mock Orange, and our specimens being few, small-flowered, and, as regards nomenclature, in the most happy state of confusion, from the number of names being in excess of the number of forms. The common European species (*P. coronarius*), of which there are several varieties in cultivation, is perhaps the least showy, and cannot in point of beauty compare with *P. thyrsiflorus*, which is certainly the most distinct and by far the showiest of the whole tribe. The flowers approach in size those of *P. grandiflorus*, but are of a clearer and purer white.

KERRIA.

The variegated *Kerria* is really a charming shrub where it succeeds well in the open. Weaker in constitution than its parent, the old Japanese *Kerria*, this handsome plant is rarely seen in good form unless in dry, warm soils. During August it is invariably studded with golden-yellow flowers, which among the silvery-edged foliage produce an uncommon and pretty effect. *A. D. Webster.*

AMERICAN FIBRES.—The *American Eagle* says, that among other matters of special interest connected with the American Exhibition, London, 1886, may be mentioned that of American fibres. During the past ten years many valuable discoveries have been made of fibrous plants in America, suitable for the manufacture of paper, rope, twine, &c., and some of the results have been of the greatest value to the future commerce and manufactures of the United States. The importance to all the world of this question of fibres has led to the appointment of F. ALBER SMITH, Esq., of St. Louis, Missouri, as Special Commissioner for the collection and exhibition of American fibres to the forthcoming American Exhibition, London.

DAVID DOUGLAS.

It is well occasionally to recall the services of our great botanical collectors. It is not agreeable to have to write it, but the truth remains that the public is apt to ignore the services of some of their greatest benefactors. How many people know who introduced the common Aucuba or the Pontic Rhododendron? After a time such plants as these become so familiar that we almost look upon them as natives, and the coming generations do not trouble themselves to inquire into the history of what to them are such common plants. Already people begin to overlook the work that Fortune did, much more do they pass over the labours of Douglas. Yet of all the men who have enriched our gardens there is not one who ranks higher than David Douglas.

We owe the present opportunity of recalling his merits to the courtesy of Sir Joseph Hooker, who placed in our hands some time since the materials from which our illustration has been taken. The portrait is from a sketch taken about 1827, after his return from his first memorable journey. Those who would know to the full who Douglas was and what he did should consult the account given by the late Sir William Hooker in the *Companion to the Botanical Magazine*, 1836, vol. ii. There will be found a complete list of the plants introduced by this ardent col-

DAVID DOUGLAS.

lector. Douglas was born at Scone, in 1799. In boyhood he preferred bird-nesting to book learning, and was apt to play truant, but his master, Mr. Beattie, gr. to the Earl of Mansfield, afterwards said of him that "he preferred a devil to a dult," from which we may gather some indication of the energy and determination which characterised the future traveller. Messrs. R. & J. Brown, of the Perth Nurseries, were good botanists, and encouraged the lad in his botanical tendencies by lending him books and giving him information. It was natural that such a lad should find a place in a botanic garden, and a fortunate thing it was for science and gardening that Douglas came under the notice of the Professor, Dr., afterwards Sir William Hooker, at Glasgow. Here he gained the goodwill of the Professor, helped him with his lectures, and accompanied him on his excursions. When, in 1823, the Horticultural Society of London—it was not Royal to those days—determined to send out collectors Douglas was recommended by Hooker to the then Secretary, Joseph Sabine, and was sent to the United States, and afterwards to North-West America and California.

Now-a-days people go in Pulman cars and take their ease at their inn as they roll along the railway track, but it was very different in the days when Douglas first sighted the Fir which has since borne his name. In spite of the difficulties Douglas journeyed from the Pacific to the source of the Columbia River, and thence to the Atlantic. His plants were described in Hooker's *Flora Borcali-Americana*, and in the *Botanical Register*. The red-

flowering Currant, now so common, Clarkias, Calochortus, Pentstemons, Eschscholtzias, and hosts of other plants were discovered and introduced by him, together with the Douglas fir, *Abies nobilis* and *A. amabilis*, *Pinus Lambertiana*, and many other Conifers. He returned to London, and for a time was made much of in London society, but eventually he paid a second visit to California, sending home *Mimulus*, seeds of *Taxodums*, and Pines such as *ponderosa*, *Sabiniana*, till he writes to Dr. Hooker, "you will begin to think that I manufacture Pines at my pleasure." Hearing that his friend Sabine had resigned the secretaryship of the Horticultural Society, Douglas resigned as collector to the Society, but continued to collect nevertheless, receiving every encouragement from his constant friend, Dr. Hooker, not the least of whose good qualities was the constant support he afforded to botanical collectors. In 1833, Douglas left California, and proceeded to the Sandwich Islands. Here was another fine field for his energies, and he entered upon it with his customary zeal, but it was not to be for long; for, in July, 1834, news of his death reached the missionaries at Hawaii, and the later research revealed that he had met with a fearful death. Some pits were dug on the mountain side for the purpose of capturing wild cattle. In one of these pits the body of Douglas was found under circumstances which led to the inference that he had fallen into the pit and miserably ended the career of one of the ablest and most successful of that army of martyrs—botanical collectors.

THE FLORA OF ICELAND.

A PAMPHLET, written by Gronland, the well-known author of the *Icelandic Flora*, in his native tongue, deserves the attention of all students of comparative botany. The title, *Karakteristikk af Plantevæsten paa Island, Sammenlignet med Floraen i flere andre Lande*, "The characteristics of the Icelandic flora compared with that of several other countries," sufficiently explains its general character. The countries, however, in which the comparison is carried out most fully are the kingdoms of Denmark, and its dependencies Greenland and the Faro Isles, and Sweden and Norway, which for this purpose are considered as one country. It would have increased the interest of the work for English readers if Great Britain, or at least Scotland, had been included also.

Among other results of this comparison it is shown that the flora of Iceland corresponds very nearly with that of the higher regions of Norway, while there are found locally a certain number of plants which in Norway are met with almost exclusively in the deep valleys or in the warmer regions of the coast and islands. This circumstance is due in some slight degree to the influence of the hot springs, but far more frequently to the sheltered situations afforded by those drifts which frequently occur in the lava fields. Among plants of this kind we may mention the *Rubus saxatilis*, *Viola canina*, *Pyrola minor*, *Listera cordata*, *Paris quadrifolia*, *Poa nemoralis*, *Lactuca spinulosa*, *Aspidium lonchitis*, *Polypodium dryopteris* and *Polypodium leucopteris*, all of which occur, some of them chiefly in high situations, in various parts of Great Britain. Of the 340 flowering plants and twenty-five Ferns and Lycopodiums which occur in Iceland only five species and six varieties are not known to occur in Sweden and Norway. The former are *Chamerium* (*Epilobium*) *latifolium*, *Pleurogryne rotata*, *Platanthera hyperborea*, *Carex angustata*, *Carex capillipes*. Of these five two only—*Platanthera hyperborea* and *Carex angustata*—are otherwise confined to America, and one only—*C. capillipes*—is found only in Iceland. This is also the case with three of the varieties above referred to. On the other hand, only something over half of the species found in Iceland occur, as far as is known, in Greenland, and these are almost confined to such as are common to almost all arctic situations, including not only Siberia, Spitzbergen, but also the higher ranges of mountains throughout Europe. All this tends to prove an original continuity of continent between Iceland and Norway; but its further continuance to Greenland can hardly be considered established. This view has, however, been maintained by Axel Blytt, the well known Norwegian botanist, in his essay on the "Transmigration of Plants."

The rest of the pamphlet deals very ably with the question of the influences of the physical and geological conditions of Iceland upon the flora. The conclusions of the writer have been obtained by a

very careful comparison of the species found in different parts of the island. The conditions which are most calculated to affect the flora are—1, The high latitude of the island; 2, the volcanic character of its geological formation; 3, the warm and cold currents which touch the south-west and north-east corners of the island respectively; 4, the frequent occurrence of hot springs.

1. As a consequence of the first, we find the snow-line averaging only 3000 feet in the southern, and about 2500 feet in the northern half of the island. This accounts of course for the general arctic or subarctic character of the flora.

2. The volcanic character of the island affects the flora indirectly in many ways. The presence of large wastes of volcanic sand, constantly shifting with the wind, which prevail for many miles in extent over the central tableland, make vegetation impossible in those districts. Travellers between the north and the south have to rest for something like sixteen hours without being able to obtain fodder or water for their horses. Again, the lava streams, which occur pretty constantly in different parts of the island, especially in the more northerly and southerly districts, only very slowly become sufficiently disintegrated to admit of any considerable vegetation. The extent of the flora upon these lava streams or fields depends chiefly upon their age. The subject is one which perhaps can never be determined with perfect exactness; but a good deal of knowledge has been gained by a careful investigation of those lava fields whose date can be ascertained by historical records. Thus upon certain lava fields near Mjvatn, which were known to have existed between the years 1724—29, the flora is still very scanty. On the other hand, upon the lava field at Thing-bellir, which was in existence at the first settling of Iceland in the ninth century, there is a fairly luxuriant growth of grass and flowers.

Much depends upon the character of the lava fields. When the surface is rough the depression becomes filled with soil and moisture, and the growth of vegetation becomes more rapid. Again, as above mentioned, the rifts which frequently occur are chiefly in the older lava fields, and becoming filled with water or forming watercourses admit of often a very luxuriant vegetation. Again the fertility of a district may be at any time completely destroyed by a fresh eruption. The volcanic sand, when it falls into moist places, is specially favourable for the growth of some species of plants.

3. The ocean currents do not seem to affect the flora as much as it might be supposed they would. The general difference in the number of species found in the northern and southern halves of the island is quite inconsiderable, the chief difference being rather in the frequency with which certain species are met with. Thus some plants which are pretty frequent in the south occur only locally in specially favourable situations in the north.

4. The influence of the hot springs is also not so great as might be supposed. In some few places the neighbourhood of the springs is marked by a largely varied flora; but more frequently the difference is marked rather by the greater luxuriance of the species which occur. I remember observing myself, at the so-called Blass Well, the magnificent size of the fronds of the *Cystopteris fragilis*, which grew over the steaming waters. Again, the influence of the hot water is often more than counteracted by the sulphur which it contains. Thus, round the well known geysers very few plants occur except *Plantago major* and *Stellaria media*, and other coarse weeds of the kind, and the same is the case with the sulphur springs near Krisuvik, in the south-west.

The writer makes some interesting observations on the general character of specimens met with in the island. As a rule, the growth is stunted, and yet exceptions to this rule are by no means uncommon, especially when plants are found in sheltered situations. Thus, the blossoms of the *Geranium sylvaticum*, *Arabis petraea*, *Rhodiola rosea*, *Bartonia alpina*, *Veronica saxatilis*, are frequently quite as large as in other countries where they grow; and those of the *Chamaenerium* (*Epilobium*) *latifolium*, a plant little known to European botanists, are singularly large and beautiful; indeed, they far exceed those of the larger species of *Epilobium* with which Swiss botanists are familiar. Sometimes, too, plants attain a very considerable height. Thus, specimens of *Aegelia archangelica* have been found growing to the height of 6 to 8 feet. Again, very many plants which do not attain any considerable height, make up

for this deficiency by the luxuriant tufts which they form. This is especially the case with *Dryas octopetala*, *Salix herbacea*, *Sibbaldia* (*Potentilla*) *procumbens*, *Alchemilla alpina*, which sometimes cover patches of many feet square.

Perhaps I may be pardoned if I add a few remarks of my own, which are the result of the impressions made upon me by the flora of the country during a visit I paid to the island some years ago, and which this pamphlet has brought back vividly to my mind. The botanist who visits Iceland, expecting to find a rich flora either in point of the number of hitherto unknown species, or of beautiful flowers—supposing, of course, that he is already fairly acquainted with the flora of such mountains as the Alps or the Pyrenees—will probably be disappointed. He will here find certainly a large number of the plants which are to be met with on almost every Swiss mountain above a certain altitude; but he will miss many of those larger and more beautiful plants, such as the so-called alpine Rose or the Edelweiss, which add so much enjoyment to a tour in the Alps. At the same time he will find some new species, which in point of interest or beauty he will feel, if he is a genuine lover of flowers, will make up for the discomfort which a tour in Iceland more or less necessitates.

Two of these I will specially mention. One is the *Pleurogyne rotata*. It belongs to the Gentian family, and is very closely allied to the *Swertia perennis*, a plant which is not uncommon in some parts of Switzerland. It, however, differs from it in the one essential characteristic from which it derives its name. It has no styles, and the stigmas are decussate on the sides of the ovary, which is, as is *Swertia*, coloured blue, like the rest of the flower. This plant is rather local, but grows, I believe, in several parts of the island. I found it only at Akreyri, the chief seaport on the north. The other, called by Grönlund *Chamaenerium latifolium*, but given in an old Icelandic Flora as *Epilobium latifolium*, is by far the most beautiful flower I found in the island. It grows upon the gravel islands and banks of the large southern rivers much the same kind of way that the *Epilobium Fleischeri* grows on the glacier streams of Switzerland. The Icelanders themselves call it the *Eyraros*, or Gravel Rose, and do well to be proud of it. *Oxon.*

THE PROPAGATOR.

THE PROPAGATION AND CULTURE OF DRACÆNAS.

(Continued from p. 737, vol. xxiii.)

It must not be forgotten that greenhouse varieties must be propagated in a warm house; it could of course be done in a cold greenhouse, but it would be such a slow process that it would not pay for the trouble, nor produce such good results.

When the plants have been brought together in a warm house for propagation the first thing to be done is to examine them, and if any red-spider is detected they must all be sponged with a mixture of weak-tobacco water and soft soap; but should they be infested with thrips or green-fly, it will be necessary to lightly smoke the house three nights in succession. If after this has been done the weather is dull, no air need be given, but if the sun shines the house must be carefully ventilated. The floor of the house should be kept well watered. It will be found that if the house is lightly smoked for three nights in succession, it will do a great deal more good than one night of heavy smoking. The plants should not be syringed until after they have been smoked.

The plants should not be cut down for about ten days after they have been brought into the warm house, and during that time they should be well watered and syringed twice daily, except of course during the smoking time, giving them but little air, and shading them from the strong rays of the sun.

D. INTERMEDIA.

This garden variety is one of the best in cultivation for dwelling-house decoration. It keeps green for a great length of time, and always looks well. When used in the dwelling-house it should, of course, be watered as it becomes dry, but it should also frequently be taken into the garden to be syringed, so as to cleanse it from any impurities it may have. After this has been done the plant should be held with the head towards the ground for a few minutes, so that the water which had accumulated in the axils of the leaves may readily run off. The plant should not be

taken into the house until the foliage has become dry. If this simple plan was adopted with plants generally used in the dwelling-house, they would not require changing so frequently, and would thus be a great saving of expense to the owner. It comes between *D. congesta* and *D. rubra*.

1. *From Seed.*—This variety may be propagated from seed. When the plants are coming into flower they should be moved to a part of the house beyond the reach of the syringe, and as the flowers open they should be fertilised day by day until the flowers drop off. When as many flowers have been fertilised as it is thought the spike will be able to bear, the remaining unfertilised flowers should be picked off. They must now be well supplied with water. As soon as the seed is ripe it should be taken out of the pod and sown. For this purpose it will be necessary to prepare a well-drained pan, filling it to within a quarter of an inch from the top with soil, which should be firmly pressed in with the bottom of another pot and made level. The seeds should be thinly sown on the surface and covered with soil level with the rim of the pan. After well watering them with a fine-rose pot, place them in a cutting-case upon a gentle bottom-heat. Here they should be watered as they become dry, shaded from the sun's rays, and ventilated for an hour night and morning. When the seedlings have grown to the height of 1½ inch the pans should be placed outside the cutting frame for a few days, to strengthen them. At the end of that time they should be potted each into a small long thumb-pot, and after watering them replace upon the gentle bottom-heat. They must now be sprinkled with a fine-rose pot two or three times a day. They must also be shaded from the sun, but they should receive but little air until they get strong, then the quantity should be gradually increased. As soon as they have rooted through the soil they should be potted into large 6's, and a small stick should be placed to each one and tied in two places loosely. After watering them replace upon the gentle bottom-heat; they must now be kept well syringed, shaded from the sun and should be allowed a good supply of air. When the plants are strong enough they can be potted in large 4's and taken to a warm house and placed upon the cold ash bottom of a fruit platform. When the plants are established and well developed they can be removed to a greenhouse or wherever they may be required.

2. *From Cuttings.*—The plant must be cut down to 2 inches below the last leaf and cut up into pieces 1½ inch long; each piece should be divided down the centre into two pieces, leaving as far as possible an equal number of leaves on each piece. The top cutting, however, should have 2 inches of the main stem attached. After preparing the bottom of the cuttings with a sharp knife, they can be potted into long thumb-pots. The soil must be firmly pressed into the pot, and a small stick must be placed to each plant, the leaves being tied up loosely in an erect form. The cuttings must now be watered with a fine rose pot and placed in the cutting-frame upon a gentle bottom-heat. While in the case the cuttings must not be watered overhead but with a spout-pot. This should be done while they are standing outside the frame for air, for an hour night and morning. They must be shaded from the sun. When they have become well rooted in the thumb-pots they should be placed outside the frame for a few days and then potted into large 6's, to be returned to the case after they have been watered. As soon as the plants have gained strength enough they should be moved to a cold bottom and potted into larger pots as it becomes necessary. When the plants are well developed they can be taken into the greenhouse or conservatory.

3. *From Root Cuttings.*—The old plants which have been cut down for the cuttings should now be taken and the soil shaken from the roots. The long centre fleshy tap-roots should be taken off and cut up into pieces an inch long, and some of the very strong pieces can be divided down the centre into two pieces. A well-drained deep pan or 32-pot should be half filled with soil, which should be firmly pressed down; the pieces of root can be placed on the levelled surface upon their sides, but not so near each other as to touch. They should now be well sprinkled with river-sand, and the pots may be filled up with soil. They must be placed in a frame upon a gentle bottom-heat, and for a week they must not be watered, but at the end of that time they should be watered as they become dry. The case should also be ventilated for an hour night and morning. When the young

plants the roots send up have grown about 6 inches high they should be taken off as cuttings, and potted into long thumb-pots, and placed in the frame to receive the same treatment as those referred to above. If the pans containing the old roots are placed back in the cutting-frame they will bear several further lots of cuttings; should, however, only a few plants be required, the old roots and their shoots can be potted up together, instead of being separated for cuttings, and thus forming strong plants at once.

The following varieties can be propagated in a similar way, viz., D. congesta, D. rubra, D. lineata, D. Veitchii, D. australis, and all other varieties of the same sections.

D. DRACO.

The seed of this plant should not be watered for a few days after it has been sown, but at the end of that time they should be watered and placed upon the open bottom-heat to be watered as they become dry. As soon as the seedlings have grown 2 inches in height they should be potted off into long thumb-pots, and placed upon a gentle open bottom-heat. When they are strong enough they can be potted into 60's and placed upon a cold ash bottom at a cool end of the house. They can be further potted on as they increase in size and strength. To propagate this plant by cuttings the top growths must be cut out with about an inch of the old stem. After being firmly potted up and watered, they should be placed in a cutting frame; the case should be ventilated for an hour night and morning and shaded from the sun, and the plants should be watered with a spout-pot as they become dry.

When any of the cuttings have rooted they should be placed upon the open bottom-heat, and after a few days they can be potted into pots of suitable size, and placed upon a cold bottom in a warm house. They can be further potted on as required, and when they have become well established they can be removed to the greenhouse. The same mode of treatment can be applied to the following varieties:—D. Rumphii, D. spectabilis, and D. spectabilis variegata, excepting the last-named variety, which does not come true from seed.

The soil for the seeds and cutting should be composed of half peat, quarter loam, and quarter sand. The soil should be damped with a fine rose-pot as it is being mixed together. It should also be sifted and rubbed through a quarter inch sieve before it is used. For the old plants and rooted cuttings the following soil is the best, viz., one-half good turfy loam, the remaining half being made up with peat, leaf-mould, and river sand. T. O.

The Flower Garden.

THE flower garden is now in full beauty, and no pains should be spared to keep it so for the longest time possible. Never allow the beds or borders to get into a bad state for want of attention—such as a good supply of water. Attend to all weeding and the removal of decayed flowers and foliage, regulating the growth of the plants by pegging and pinching, for once they are allowed to get into a bad state it is most difficult to get them into a perfect state again. I never saw the flower beds looking better than they do at present: the carpet bedding is perfection, all the foliage plants are magnificent; I never saw the colours more brilliant than they are this season, the heat of July has brought colours out to the highest perfection. (Begonia boliviensis I beg to specially mention as one of the most beautiful plants for groups: of brilliant scarlet colour, compact habit, and good free grower, and most abundant blossoms, I think no garden should be without this beautiful plant. And I can also recommend Begonias for bedding; so many beautiful hybrids, either mixed or kept in groups, make a grand show, and last till very late in the season, till frost kills them.

The Begonia should be a great favourite as a garden plant, as they are easily managed and easily propagated either by seeds or cuttings, and their bulbs can be kept in any shed through the winter if kept moderately dry, and covered with sand, to keep rot from them.

PROPAGATION.

As the time for propagation will shortly have to begin, especially Pelargonium cuttings, they will

strike freely in pots or boxes—if put into light saudy soil, and the boxes or pots placed fully exposed to the sun—or they will strike freely if the cuttings are put in very light soil in the open borders. They do best if sprinkled every morning with clean water, if the days are hot and dry, but I find it much more convenient to have them struck in boxes, or pots, or pans, as they can be removed without fresh potting them till after Christmas, when we have more time and more room for them than at present; also provide a moderate hotbed for striking such subjects as require it. There will be no difficulty in obtaining the desired quantity of cuttings if care is taken to thin out the same without injuring the beds. Most kinds of succulents that are used for bedding are also best propagated at this season. Offsets of Echeveria secunda glauca, E. metallica, and E. glauca metallica, are best raised from seeds sown now in gentle heat, or offsets will root freely if planted firmly in light soil in single small pots, and exposed to the full sun.

As soon as we get rain no time should be lost before planting out seedlings of Wallflowers, Sweet Williams, Penstemons, Antirrhinums, Brompton Stocks, Pinks, Carnations, &c., and divide Pansies, Primroses, Polyanthus, and Daisies, well watering and mulching them, for the hot, parching weather that prevailed during the last two months has been a most trying time for most plants, and more so where a thorough system of mulching and watering has not been carried out. Lawns and walks are now in a very bad state for want of rain. We have not had any rain here since the 4th of June, and the grass is completely burnt up; and the walk gravel is in a very loose and dusty state; nothing can improve the grass or walk but a copious supply of water, which I am sorry to say we cannot afford in this part of the country. *Wm. Smythe, The Gardens, Basing Park, Alton, Hants.*

Plants and their Culture.

BULBS FOR EARLY FORCING.

THE white Roman Hyacinths are the most prominent of these, and the season has again arrived when they can be obtained. The sooner, therefore, that the desired quantity is ordered the better, as a rule, will it be for the purchaser; the first opportunity should be taken advantage of to put-up at least a portion of these. For our own part we prefer to pot them all at once, it being a very easy matter to retard some if advancing too rapidly. Three bulbs in a 48-sized pot will make a very good display for decorative purposes, and be far better than placing the bulbs thickly in a pan or box, and then transferring them to pots as they advance into bloom. This latter system is, we are well aware, largely adopted now; it has not, however, anything in it to recommend itself, but should rather be discouraged when the practical side of the question is looked at. When the bulbs are in flower we want them to last as long as possible in a fresh state; and disturbing the roots, and thus causing the loss of many of them at that important period, is not the way to obtain satisfactory results. If the bulbs are only wanted to supply cut blooms then we have nothing to say against the system; pans, boxes, or any other receptacle will then answer the purpose, and be a saving of labour.

Good mellow loam, with well decomposed manure, should be chosen, and some sharp sand or road-scrappings added; this will give a soil wherein they will thrive well. Rich soil is desirable for these and other bulbs that have to make a rapid root growth and develop their flowers in such a short space of time. After potting we still recommend the same practice as we have previously advised in other years, and this we will condense in a few words now. Choose a frame or cold pit with a sunny aspect, place the pots therein, and near the glass, then give a thorough watering, and cover with a layer of cocoanut fibre of about an inch in thickness, allowing the same material to settle among the pots as this operation is being performed. Damp the fibre as it becomes dry, and leave the lights off till the colder nights set in. If no space under glass is available, stand the stock close together in the open, and then later on a movable frame will perhaps be at command wherewith to cover them. If extra early flower is

desired, then close the frame or pit early in the afternoon, after the bulbs have been potted a few weeks.

Early Roman and Paper-White Narcissus, and the Duc Van Tol Tulips may be treated in like manner as just recommended for the Hyacinths. Of the latter, also, some of the most early flowering kinds of the Dutch section should be secured early; of whites, two the Vedette and Madame Vander Hoop are two of the best; of pink or red kinds choose L'Ami du Cœur and Homerus; and of blues, Grande Vedette and Argus; these kinds will be found to answer their purpose well, but bear in mind that when early flowering is expected a correspondingly early potting must be practised to obtain the best results. Failures at the blooming time are not so much the fault of the firms who grow and who supply the bulbs as we are at times disposed to attribute to them.

OTHER BULBS.

Of these the Belladonna and Guernsey Lilies should be chosen as soon as the first importations arrive; delays are dangerous with these subjects, the flower-spikes often being on the move ere the bulbs can be potted up; in such cases do not fully expose them to the light at once, but give the roots a little opportunity of making headway in the first instance, nor is it advisable to attempt to hasten them at any time. More failures occur, we think, from these omissions than from any other cause.

DRACÆNAS.

The reason previously given for now propagating Crotons also applies to this genus where struck from the tops, either by gradually severing them from the parent stock, or by taking them off straight away into small pots; and as soon as this work is performed, if any extra quantity be needed, it will be well to look after the stem and tap-root for this purpose. Before any DRACÆNAS are stood closely together whilst under the process of propagation, look sharply after any of the thrips that are peculiar to the plants, as these if present will quickly work much injury to the leaves, which no after-cultivation whatever can efface.

ACALYPIAS.

These are handsome plants in a small state when of characteristic growth; their diversified markings and bright colours cause them to light up well at night. Where any extra amount of autumn and winter decoration is anticipated, some dwarf plants should be secured without delay; they are distinct from anything else, and easily grown, but require a light place.

ANANASSA SATIVA VARIEGATA (THE VARIEGATED PINE-APPLE).

At this season of the year large plants of this form will probably be fruiting; fortunately, this variety with some cultivators has a disposition to emit several crowns of smaller size, rather than one large one, from the top of the fruit. These should be looked after, and propagated singly in small pots; the character of the growth from crowns is far more elegant than from suckers, and capital plants can be secured in 5-inch pots. If no better place is at hand, they can be suspended from the roof of the stove, but as near the glass as possible; they will thrive well in this position, and the foliage is not so liable to be injured. *James Hudson, Gunnersbury House Gardens.*

THE JERUSALEM ARTICHOKE.—The Sunflower Artichoke is being extensively cultivated in Belgium, as by a new process of distillation some 8 per cent. of alcohol can be obtained from its tubers. More than 3500 acres of poor, almost waste land, around Antwerp will this year be cropped with the plant. The residue after distillation is nutritious. France is thus also in the way of cultivating large stretches of her poor, thin, chalky, and schistose soils with this new crop. The cultivation of Jerusalem Artichoke is very much the same as that for Potatoes. February or March is the time to plant; the earlier, the better will be the yield. Indeed, if the soil be sufficiently friable, the planting may be made even in winter. Owing to the quantity of its foliage the Jerusalem Artichoke draws a great deal of its food from the atmosphere. Artichokes are now being cultivated alike in Iowa and Arizona as a material for fattening pork. In field culture they are not hard to eradicate, and must be replanted at least once in two years. An Iowa farmer finds one or two acres sufficient for quite a large herd of hogs. *Journal of Forestry.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Aug. 11	Royal Horticultural Society: Show of Plants, Flowers, and Vegetables, at 12 noon; Meeting of Fruit and Floral Committees, at 4 P.M.
WEDNESDAY, Aug. 12	Sale of the Collection of Orchids, &c. of the late J. S. Law, Esq. of South Lodge, Southgate, at Stevens' Rooms; Surrey and Chesham Horticultural Society, with County Show of the Surrey Beekeepers' Association; Ramsgate and St. Lawrence Horticultural Society's Show.
THURSDAY, Aug. 13	Taunton, Fene Horticultural Society's Floral Fete; Sale of Established and Flowering Orchids, Ferns, Caladiums, seeds, &c., at Stevens' Rooms; Slade's Cream Horticultural Society's Show.
FRIDAY, Aug. 14	Sale of Imported Orchids, at Protheroe & Keble's Association.
SATURDAY, Aug. 15	Sale of Consignment of Bulbs from Holland, at Stevens' Rooms.

for 160 years, not, alas! at any one place, but by careful calculation I have obtained values which are, I believe, very near the truth, for every year from 1726 to 1885. During the whole of this long period there is no instance of more than five consecutive years being wet until we come to recent years, and then we have the unprecedented fact of nine consecutive years (1875 to 1883), each wetter than the average; in short, the quantity in those nine years was as great as usually falls in ten years and a quarter. In 1884 (just as in 1834, 1844, 1854, 1864, and 1874) the fall was below the average, and complaints of drought and of deficient water supply immediately arose. I have not had time to thoroughly examine the records of the early months of 1885, but my impression is that up to the middle of June the fall did not differ materially from the average, but the latter half of June was very dry. I now come to July, which has been so remarkably dry that I am sure the facts will be examined with interest. I append them in the form of a table."

Rainfall in July, 1885.

— THE ANTWERP EXHIBITION.—We publish in another column a report of this important exhibition, which however does not equal the corresponding exhibition in Paris in the spring. As usual on such occasions, great confusion reigned at the beginning, and our reporters complain that the facilities afforded by the authorities were not what they might have been. We Britons are very apt to grumble and parade our shortcomings, though we are not so pleased to hear other people do so, but in this matter of flower show arrangements and of judging, we have certainly little to learn from our foreign friends. Indeed, we think they might learn a lesson in organisation and economic management of time by studying our system, especially that of judging. We do not admit that Continental judging is any better than our own, but it certainly requires three or four times the length of time that our judges find necessary.

— CRYPTOGLOSSUM CORONARIUM (fig. 37).—We cannot do better than quote with reference to this species what Mr. WILLIAMS, in the *Orchid Growers Manual*, says:—"A charming species, from South America. It grows 18 inches high, with short thick pseudobulbs, and dark green foliage; the spike, which rises upright from the side of the bulb, is about 18 inches in height, sepals and petals reddish-brown, edged with yellow, lip bright yellow. It does best in a pot in heat, and will continue a long time in perfection." The specimen figured is of moderate size as compared to that figured at p. 304 of our number for September 6, 1879, where will be found some comments on the art of flower drawing, which are not without interest at the present moment. The plants of it in Sir Trevor Lawrence's collection are perhaps the most vigorous in the country, and there they are grown in long narrow baskets adapted to the creeping habit of the plants. They are

placed in a cool, sheltered part of the Odontoglossum-house, where neither the direct rays of the sun nor varying currents of air can reach them. It is found to do best in fibry peat and living sphagnum moss, so placed about it as to allow of perfect drainage for the liberal supply of rain-water which the plant demands at all seasons. In several other places we have seen the plant doing well placed over the tank in the cold house.

— "THE CANADIAN RECORD OF SCIENCE."—This publication includes the proceedings of the Natural History Society of Montreal, and replaces the *Canadian Naturalist*. The part before us is chiefly occupied with geological matters.

— TURNER MEMORIAL.—We very willingly give insertion to the following:—"Some steps have been taken to raise a fund to provide a Memorial for the late Mr. CHARLES TURNER—the memorial to take the form of certain prizes offered at the Dahlia Show, but I think you will agree with me that something more should be done than this, to express the regret we feel for the loss of one who for nearly half a century held such a prominent position amongst us, and who was so universally respected. A meeting of horticulturists will be held at South Kensington on August 11, to consider the matter? J. DOUGLAS."

— THE JUBILEE YEAR OF QUEEN VICTORIA.—The auspicious date of the "Year of Jubilee" of Her Majesty Queen VICTORIA is on the 20th day of June, 1886. The half-century of her reign will be completed on the 20th of June, 1887, but the precedents are in favour of the "Jubilee" being held at the beginning and not the end of the fiftieth year. "The most direct (says the *Globe*) is that of 1809, upon the 25th of October, when rejoicings were held throughout the empire because of the entrance of GEORGE III. upon the Jubilee Year; and to this the original institution of the Jubilee itself was obviously followed. 'Thou shalt number,' says the Mosaic law, 'seven sabbaths of years; that is, seven times seven years; and the space of the seven sabbaths of years shall be unto thee forty and nine years. Then shalt thou cause the trumpet of the jubilee to sound . . . throughout all your land. And ye shall hallow the fiftieth year, and proclaim liberty throughout all the land unto all the inhabitants thereof; it shall be a jubilee unto you.' Only three sovereigns in the whole tale of English history have been suffered to see the opening of such a year—HENRY III., EDWARD III., and GEORGE III." It is another happy coincidence that the year 1886 should have been chosen by Americans for the holding of the American Exhibition in London. It will lend an additional *clat*, says the *American Eagle*, to HER MAJESTY'S Jubilee, complementing as it will the British Colonial and Indian Exhibition, and thus the whole of the English-speaking races will be represented in the British metropolis.

— CHAMEROPS EXCELSA.—Mr. SNOWDON HENRY of Bouchurch, has kindly favoured us, through Messrs. VEITCH, with a photograph of this Palm, which is flowering in the open ground, where it has been for the last four years without protection, which is not a common occurrence, though we remember to have seen it in bloom at Kew. We hope shortly to give an illustration of the inflorescence.

— MORMODES LUXATUM EBURNEUM.—The flowers of the type are a straw-coloured yellow, and in this variety, although not so white as the name would lead one to imagine, they are nearly so with a faint trace of green veins, and a blood-purple band on the lower half of the labellum. They are deliciously fragrant, and produced on a long, pendulous, many flowered peduncle with a bold striking appearance. M. luxatum was described by LINDLEY, but since his day science has brought more light to bear upon the limits of the genus, and this species must now be included amongst the *Catasetums*, although, in all probability, the older name will be retained amongst gardeners. There are three form (namely, male, female, and hermaphrodite) belonging to the same species, and M. luxatum is the female form, belonging to the section *Monanchanthus* of *Catasetum*. It is characterised by the absence of the bristle-like appendages of the column by which no doubt LINDLEY considered it to be a *Mormodes*, under which name it is figured in the *Botanical Register*, 1843, t. 33.

THE hot dry weather experienced lately in the South naturally leads to some apprehension as to what the effects of such a drought may be, where circumstances do not permit of sufficient artificial supplies being afforded. The gardener and the farmer are fully impressed with the necessity that growing plants experience for water, but they apparently do not think it worth while to do much in the way of providing storage, and they have comparatively little information as to the exact nature of the changes in the plant brought about by water, whether in excess or in deficiency. In discussing this matter recently, M. DUCHARTRE referred to some experiments of HELLRIEGEL, of which it may be serviceable to give the general results. Seeds of Wheat, Rye, and Oats were sown under identical conditions in all respects except as to the supply of water. As to the supply of this agent the experiment was divided into seven sets. In the first set water was supplied to the soil to the amount of 80 per cent. (full saturation being considered as 100). To the second set 60 per cent. of water was supplied; 40 per cent. to the third; 30 per cent. to the fourth; 20 per cent. to the fifth; 10 per cent. to the sixth; and 5 per cent. to the seventh. The dry matter of the crop remaining after the watery constituents had been driven off by heat, was in round numbers as follows:—No. 1, 19.6; No. 2, 22.7; No. 3, 21.7; No. 4, 17.1; No. 5, 14.6; No. 6, 6.3; No. 7, 0.1. So that the largest results as estimated by the amount of dry matter were obtained when the percentage of water supplied to the soil was 60. A rapidly progressive diminution occurred when the amount supplied was less than 40 per cent., and in absolutely dry soil no growth at all took place. Following up these experiments, M. DUCHARTRE took some Yam tubers (*Dioscorea*), and placed them in a dry room where they were exposed to diffused light, but where they received no water at all save such as might have been in the atmosphere. After a time the tubers began to sprout as Potatoes will do under like circumstances, the water in the tissues of the tuber being sufficient for a time. The shoots and leaves produced from the Yam under these circumstances presented precisely the same superficial appearances as do shoots that are produced in the dark; that is to say, they were much lengthened, very slender, and with small ill-developed leaves. The colour, however, was uninfected, and the internal changes were quite unlike those witnessed in the case of etiolated plants. In blanched plants the walls of the cells and vessels are relatively thin and flaccid, but in the Yam the shoots were extraordinarily rigid—a result due, not so much to any increased thickening of the cells and fibres which go to support and brace the plant, as to the great reduction of the more cellular portions; in other words, the woody framework was not much affected by the drought, but the portions devoted to the reception, assimilation, and digestion of food, were greatly reduced.

— THE DROUGHT.—Mr. G. J. SYMONS writes to the *Times* as follows:—"Rainfall observations have now been made uninterruptedly in this country

But the labellum is sessile and deeply concave, not clawed as a true *Mormodes* should be. What is even more peculiar, it is twisted on one side, so that one of its lateral edges, not the apex, faces the column. A strong flowering plant is now conspicuous amongst the Orchids at Kew. A large page illustration is given in our columns, July 29, 1882.

— FLOWER SHOW ETHICS.—A correspondent writes:—"At a recent show I sent some plants to compete for a cup. Through an oversight no entry was made, but the plants were accepted, shown, judged, and awarded 1st prize, which was stuck up, but afterwards taken down again, and the committee decided that no prize should be given. I have

members on the morning of August 6, at 8.30, previous to the excursion to Lowther. Mr. WATT invited several members of the English Society to meet their Scottish associates on this occasion. The meeting was a representative one of the arborists of Great Britain, and now that the subject of forestry is receiving great attention, it is likely to be productive of much good.

— IRIS LÆVIGATA.—It is highly gratifying to note how plentifully this noble Japan Iris is becoming disseminated in this country. When properly understood it is by no means difficult to cultivate, and if planted in a suitable position the trouble of attention as to watering is reduced to a minimum. Being sub-

this bears a strong resemblance to a white-flowered *Ramondia*, but the anther connectives are produced beyond the cells and united to form a cone round the style. The rotate corollas and prominent stamens also bear a strong superficial resemblance to the flowers of a *Solanum*; but as a matter of course it differs widely in the construction of the ovary and other particulars. The leaves are ovate, rugose, of a deep shining green, and lie pretty close to the ground. The flowers are produced in corymbose cymes on naked scapes about 3 to 6 inches high, and as a rock-garden plant may be considered neat and attractive. It is a native of the mountains of Japan, introduced to this country as late as 1879, and still a rare plant. There is a figure in the *Botanical Maga-*

FIG. 37.—ODONTOGLOSSUM CORONARIUM. (SEE P. 176.)

entered a protest, saying that the committee has no right to withdraw the cup after having allowed the plants to be shown and the judges to award them the 1st prize. Am I right or not?" [This is a difficult point to decide, as so many considerations are involved, and so many irregularities seem to have been committed. For our part, we think that the committee is in this case the final court of appeal. The committee was wrong in the first instance in allowing the competition to be made at all, because it was unfair to those who had complied with the rules; but this initial error does not, in our view, deprive the committee of its rights as supreme arbiter to revise its decision in the case. ED.]

— SCOTTISH ARBORICULTURAL SOCIETY.—This Society held its annual excursion in the Carlisle district, and Mr. WATT, of the firm of LITTLE & BALLANTYNE, offers hospitality to the

aquatic in habit, it enjoys a constant supply of moisture in the growing season, while in the absence of that the plants not only fail to give satisfaction, but merely dwindle, and ultimately perish. A most natural position would be the banks of a stream or pond, where the roots on descending would find an unlimited supply of moisture. Two fine clumps on the banks of the pond facing the Museum at Kew have been the admiration of visitors for some time back. The massive-looking flowers are 6 to 8 inches in diameter, and several varieties offer strange contrasting mixtures of purple, indigo, violet, white, and the never-failing yellow blotch in the throat. The species is figured in REGEL'S *Gartenflora*, 442, i., in the *Botanical Magazine*, t. 6132, and in *Gardeners' Chronicle*, July 11, 1874, and is best known in English gardens under the name of Iris Kämpferi.

— CONANDRON RAMONDIODES.—At first sight

zinc, t. 6484, and a flowering specimen on the new rockery at Kew. Hitherto its hardness has been doubted, but should it resist the severity of our winters as well as *Ramondia pyrenaica*, British gardens will have made an acquisition; otherwise, however, the cultivation of the one will suit that of the other.

— THE ROWE ORPHAN FUND.—We are sorry to have no further contributions to record this week—a circumstance attributable to the August holiday season probably, but the need for help is sore.

— DR. REICHARDT.—The *Times* correspondent telegraphs that Dr. HENRY WILLIAM REICHARDT, one of the Professors of Botany in the University of Vienna, committed suicide recently by hanging himself in a fit of temporary insanity. This sad event, which occurred at Moedling, deprives Austrian science of a man who, though he was but fifty years old

at the time of his death, had long ago made his mark among the botanists of Europe. Dr. REICHAARDT had many friends in England, and was an occasional contributor of articles on botany to English periodicals. Most of his writings, however, were published in the monthly journal of the Vienna Academy of Sciences. His last undertaking, which remains unfinished, was the compilation of a catalogue of the Imperial Botanical Cabinet, of which he was the keeper, and the arrangement of this valuable collection in the rooms allotted to it at the new Natural History Museum. REICHAARDT was born at Igau in 1835. He graduated as doctor in medicine at Vienna in 1860, became Assistant Professor of Botany in the same year, and in 1866 was named Deputy-Keeper of the Imperial Botanical Cabinet. In 1879, on the death of Dr. FENZL, he succeeded the latter in his Chair of Botany at the University, and also in his appointments as Chief Keeper of the Botanical Cabinet and Vice-President of the Vienna Horticultural Society. He had previously been Secretary of this Society.

— **BELLADONNA.**—The leaves of this plant, which is grown about Hitchen for medicinal purposes, should be collected at the flowering period, when it is found that they are richest in atropin. An article in the *Pharmaceutical Journal* states that GERRARD finds the leaf to be the part of the plant richest in alkaloid, the root, fruit, and stem, next in order. An examination of parts of wild and cultivated plants by GERRARD showed 100 parts each gave as follows:—

	Wild.	Cultivated.
Root450	.350
Stem110	.070
Leaf580	.400
Fruit320	.200

The leaves, without exception, have been found to yield the largest percentage of alkaloid.

— **THE AMERICAN EXHIBITION OF 1886.**—As already announced, a great Exhibition of American Products and Industry will be held next year at the same time as the Colonial Exhibition. The committee have secured 22 acres of ground, near Earl's Court, in direct communication with all the leading railways. The *American Eagle*, from which we take some of the following particulars, is a monthly journal published at 7, Poultry, London, E.C., and devoted to the interests of the Exhibition:—

"The industrial departments of the Exhibition, in all their varied branches, will invite and attract special attention to the wonderful progress made in the United States of America since the Centennial Exhibition of 1876. Comprising much that has not yet been seen in Europe, the great improvements made by Americans in all branches of labour-saving machinery, especially for the utilisation of wood and metals, the practical helps for household purposes, the advantages secured by new motors and the most recent completed appliances for using the telegraph and the telephone, will possess a deep interest for Europeans and visitors from the colonies.

"It is proposed to arrange the entrance hall so that the European visitor shall take leave of his native soil, and shall temporarily be in and commence his visit to North America from the harbour of New York, with the BARTHOLOMEW statue of Liberty, and the striking features of the eastern entry to the United States around him.

"On leaving 'New York harbour,' the visitor's first excursion will be through the various States across the continent to San Francisco—from the Atlantic to the Pacific seaboard. He will have the opportunity of inspecting collections illustrating the wealth and civilisation of the entire country from east to west, from north to south.

"The railway routes and the picturesquely diversified scenery of the agricultural, pastoral, forest, and mining States will be illustrated by paintings, plaques and products. The material resources and characteristic social conditions of the various parts of the vast territory extending from ocean to ocean and from the Lakes to the Gulf of Mexico, will thus be exposed to view, and offer exceptional facilities for comparison.

"The condition of the respective agricultural, grazing, mineral, and manufacturing localities will be particularly shown, and in a manner which will be intelligible and interesting to all; whilst the state of development and the undeveloped resources of the various sections will be brought under the visitor's notice in such a form as will enable him to establish a trustworthy basis for judgment as to their respective advantages.

"About 10,000,000 of people reside within one hour of the proposed American Exhibition Station, in addition to the 250,000 strangers who, it is estimated, enter the

city of London daily. For accessibility by railway the site at Earl's Court is probably not equalled by any other in the United Kingdom.

"The manufacturing department of the Exhibition will comprise the development in every branch of that inventive genius which in the United States has reached so high a point; and, so far as possible, it is proposed to present the various processes in working order by the aid of electricity, steam, gas, or hydraulic power.

"A separate hall (the Industrial Hall) will be devoted to the handicrafts pursued by white, Chinese, Indian, and negro men and girls. The labour-saving machinery, by which manual toil is reduced to a minimum, will be plentifully exhibited. The systems of working the great railways and canals, the oil wells, and the coal and silver mines will be shown, together with the machinery and organisation by which American manufactures are produced.

"The site selected will furnish 10 or 12 acres of grounds for these purposes, and afford ample space also for the display, in climatic sequence, of exclusively American Conifers, and other plants, shrubs, and flowers, including an avenue commencing with those found in the Northern and Eastern States, and ending with those of the Southern and Western States.

"The Exhibition will include a Californian wine-shop, Florida fruit stores, an Indian village, Indian canoe-makers and mat-weavers, ice-drink pavilions and bars. Restaurants, with the products of the Eastern and Pacific coasts, of the Northern and the Southern States characteristically prepared and served by white and coloured male and female cooks and waiters, will help to mark the peculiarities and variety of American social development. Arrangements are being made to include a press pavilion, an Atlantic cable office, an electrical elevated railway, and reproductions of the façades and interiors of remarkable hotels and public buildings.

"Proposals are on foot for the holding in England of the annual conventions for 1886 of American learned societies and other similar bodies. The corresponding British societies have already cordially offered hospitality and the use of their respective headquarters to their 'American cousins.'"

— **WESTON-SUPER-MARE.**—The annual flower show will be held on August 18.

— **"RAEHNHORST'S CRYPTOGAMIC FLORA."**—The fourth volume of this important publication commences with the Musci, described and illustrated by Herr K. GUSTAV LIMPRICHT. The illustrations are very clear.

— **"COMPENDIO DELLA FLORA ITALIANA."**—The last portion of the text of this publication is now issued. The plates contain carefully drawn illustrations of the several genera of the Italian flora, while the text contains concise descriptions, in Italian, of all the species. The work has been edited by Professors CRESATI, PASSERINI, and GIBELLI, and has been several years in execution.

— **GARDENING APPOINTMENTS.**—Mr. W. JARMAN, for upwards of thirteen years Head Gardener to the late S. LIEBERPATH, Esq., has left Westwood Lodge, Thanet, and been appointed Gardener to J. FARMER, Esq., Chapel Hill House, Margate.—Mr. WALLACE ADAMS, for the past four years Foreman at Stoneleigh Abbey, Kenilworth, has been appointed Gardener to W. J. LEIGH, Esq., M.P., Lyme Park, Stockport.

CACTUS HEDGES.—The Cactus makes an admirable hedge, and is easily propagated by cuttings. Snip off a piece and bury its end in the ground, and it will generally grow. Some nervous people, however, object to it for its supposed property of harbouring snakes or vermin, and the authorities, in some places, wage a war of extermination against this useful plant. A sort of Cacticide epidemic raged some years ago in Madras, and a native medical officer won both honourable mention and a tangible reward by divulging to the authorities his discovery that the "Coccus," or Cactus bug, was the natural and appointed destroyer of the Cactus tree, and should be therefore enlisted for its destruction! The suggestion was rapturously received. The labours of gangs of convicts employed in grubbing up and burning the plant were dispensed with, and in lieu thereof a departmental issue of Cactus bugs was at once ordered on the most profuse scale. For months the luckless postal runners groaned beneath the weight of parcels of the Cactus plant, with healthy "cocci" adhering, pieces of which infected plant were to be distributed in spots where the Cactus was plentiful, that the great battle of Coccus versus Cactus might be fairly fought out. It reads like a scheme disintegrated from the archives of the philosophers of Laputa, but was actually conceived and carried out in Madras, and is too curious an example of intellectual idiosyncrasy to be passed over in silence by the conscientious historian. *Nason's "Burmah.*

THE DATE PALM.

In the *Gardeners' Chronicle* for February 21, 1885, page 240, the following statements occur, quoted from *Nature*, under the heading of "The influence of direct sunlight on vegetation." Regarding the Phoenix dactylifera, L., it is stated that "it never forms dense forests;" that "the Date Palm is indigenous to the Great Desert (Sahara);" that "nowhere else does the plant vegetate so rapidly;" that "when cultivated with success, it is also in a desert climate, as, for instance, in that of Murcia in Spain;" that "the cause of its being without fruits in the Mediterranean is the dry summer, their being no subterranean wells, as is the case in the Sahara.

"I think these theories are erroneous, as I shall endeavour to show further on, but before doing so, I would call attention to an article in the *Garden* of February 28, 1885, page 165, on the "Palms at Bordighera," in the Mediterranean. It says, "But by far the most lucrative trade is in Palms. They are planted in every available spot, and most carefully cultivated; the soil is excellent and suits them well. As the plants attain a certain height they are swathed, or tied up in the same way that we treat Lettuces. Large quantities thus blanched are sent to Rome and other places for Palm Sunday, while a considerable number find their way in the month of August to different Jewish communities for the Feast of Tabernacles." [See also illustration in *Gardeners' Chronicle*, April 8, 1876.] Further on, it states that "Many old Palms have straws or orange-coloured Dates depending from the crowns, but these are never fit for food." The group of Palms selected for the illustration in the *Garden* certainly does not show careful cultivation. They are growing out of a hill-side, where they could get little water, either from rain or other sources.

I do not know whether the Date Palm is indigenous to the Sahara desert; but this I know, that it has been disseminated wherever the Arabs have gone. All along the North of Africa, up the Nile, into the Soudan, into Spain, whence it could have been easily introduced into Bordighera, on the Riviera, by "Dominican monks some centuries ago," as the *Garden* states. In Mooltan, Sindh, and adjacent countries the Date Palm grows in hundreds of thousands. There is a legend that the seeds were introduced by the Arab conquerors of Mooltan in the seventh century. It is largely grown on both coasts of the Persian Gulf, whence the best Dates found in the London shops come. The Date Palm is more likely, I think, to have been indigenous in Arabia (or wherever the Phoenix sylvestris has its home), and then to have found its way to the Sahara with the Arabs.

There is no doubt that most trees require direct sunlight to grow luxuriantly and strongly, provided they get moisture at their roots, and I should say the Date Palm is no exception to the rule. I know it grows badly under trees, but I would not be certain that this happens because of the absence of direct sunlight, and not because it is robbed of nourishment by the trees. The Phoenix dactylifera and the P. sylvestris are, I believe, botanically identical. At the foot of the Kalka Hill, in the Punjab, there is a dense forest of the latter. The Wild Date Palm is also to be seen all over India. It is one of the "Toddy" Palms in Mysore, the Deccan, North-western Provinces, and ever further north. In many parts of this district (Etawah) there are groups of the wild Date Palm, with numbers of young Palms growing at the foot of the old ones; and in the latter case their source of water can only be from the clouds, in the rains, as the subsoil water is too deep (often 60 or 70 feet) to suppose that their roots get down to it.

I think the Date Palm will vegetate rapidly wherever it gets water at its roots, at the same time that it has a suitable soil, and a sufficiently warm atmosphere.

In Bengal immense plantations are made of the Phoenix sylvestris. Date-sugar is made from its sap. In Jessore alone, in 1882-3, official reports state that there were 24,122 acres under Date cultivation, and that the value of moist and dry sugar in that year, came up to Rs. 48,46,241. In Bengal the subsoil water is near the surface, and the atmosphere is more or less damp throughout the year. This Palm is grown there only for its sap, and the Palms are so planted that their leaves touch, when full-grown.

As to the Phoenix dactylifera, the cultivated variety, I have studied it more closely. In the

Persian Gulf there is a great trade in Dates with Europe and America. From information obtained through the British political Resident, it appears that in the Gulf there are upwards of one hundred varieties of Dates, that some do not ripen their fruit beyond the red or yellow stage, which is crisp and astringent, or sweet, according to the amount of ripeness. These are called "Kharek," and those kinds which are exported to Europe in boxes, after passing through their "Kharek" stage, become soft and sweet, and acquire the well known amber-brown colour, and when allowed to become semi-dry on the trees are picked and packed for exportation. These are called "Khoodma."

Now everywhere in the Gulf the Date Palm is very carefully cultivated. Plantations are formed of female offsets only, the trees are irrigated from whatever source may be possible—rivers, wells, springs, rain torrents. Irrigation appears to be an important matter in Date cultivation. The trees are also well manured; in short, they are treated in every way as fruit trees are from which a first-class crop is expected. When in flower artificial fertilisation is practised, without which, they say, a crop cannot be relied on. Moreover, they say that "unfertilised Dates are stoneless and insipid, and only fit for goats." If the Palms are well cared for and in good soil, they begin to bear in five or six years from offsets.

All along the Gulf, at Busra, Bushire, Lar, Eudder-Abbas, Bahreïn, El Hssa, &c., the Date Palm has the influence of the sea; in the interior of Arabia it has not. Palgrave met with it throughout his journey, but always in oases, where it could be watered from some source or other. He says, "it is the staff of life and the staple of trade." In Muscat it has also the sea air. There the annual rainfall is only 6 inches.

On the other hand, in Mooltan, it grows from seed spontaneously. It is never cultivated. In Sindh, Bahawalpoore, Dehra Ghazi Khan, Dehra Ismail Khan, and as far as Baana, it is equally abundant. Mr. O'Brien, Deputy Commissioner of Mooltan, informs me that the *P. dactylifera* grows literally in hundreds of thousands, so that in the Mooltan district alone the Government revenue, at the nominal rate of one anna per female tree (four farthings) comes to Rs. 12,084. At this rate there cannot be less than 193,344 female trees. There are, however, many exemptions, and the male trees are not taxed. The annual rainfall in Mooltan is 7 inches, and there is no such thing as sea air. *E. Bonavia, M.D., Etawah.*

(To be continued.)

FORESTRY.

THE THINNING OF WOODS.

I NOW come to what I consider the most important part of a forester's responsibility. He has fenced, drained, and planted, and it will now devolve upon him to attend to the future welfare of the plantation. I do not expect that for the first ten years much thinning will be required, but side branches on Firs may be overreaching the hardwood; these should be cut back, and if any rival branch be appearing on the hardwood tree, it should be neatly cut off. This will give liberty for two or three years more, but after that time the cutting-out process must begin. It is now of the utmost importance to thin by carefully cutting out the worst trees, and allowing a free circulation of light and air to penetrate through the whole plantation. This should be continued with the same care, at stated intervals of four or five years, up till thirty years of age. Beyond that age thinning may not be required for six or eight years, and at intervals up till sixty years of age, when much more cannot be done until they are finally all cut down. I always class a certain number of acres of aged plantations with a given number of young to be thinned during the year, so that both classes of plantations may receive their due share of attention. Besides, the receipts and expenditure, on a yearly comparison, appear more evenly adjusted by adopting this plan of thinning. I manage to get over the whole every seven years. And in order to show that planting is not a losing investment, I herewith give the result of my twenty-eight years' management and experience, during which time I have planted 800 acres of old

and new land, yielding therefor little or no return as yet. The receipts properly have been derived from 2000 acres, making £1 10s. 11d. per acre, and the expenditure 12s. 4d. per acre. If I take the whole 2800 acres into consideration, the receipts are £1 2s. 10d., and the expenditure 8s. 5d. per acre, leaving a clear nett balance in the first case of 18s. 7d., and in the second case of 13s. 8d. per acre. Moreover, there is a crop of fine thriving trees left standing on the ground for futurity, worth from £40 to £60 per acre. "*Management of Plantations in Cumberland,*" by W. Bats.

ARISÆMAS.

THE interest attached to these singular-looking plants is of no ordinary kind. Few of them have been cultivated in this country for any considerable time, but their distribution in gardens is not so universal as the beauty of their foliage or the unique character of their inflorescence would warrant. Probably their want of popularity is due in a great measure to the absence generally of gay colouring—a feature of leading importance in the horticultural world. The cultural treatment is of the easiest, as the tuberous rootstock may be potted, grown, and rested exactly as in the case of deciduous bulbs. The species under notice are natives mostly of the Himalayas and cooler parts of Asia, and consequently succeed in a cool house provided the atmosphere be not saturated with moisture nor stagnant for any lengthened period, otherwise a deposit of water, resulting from condensation, collects in the spathe, causing the whole inflorescence to damp off prematurely. On the other hand, if subjected to too drying an atmosphere by ventilation necessary to regulate the temperature, the healthy green colour of the leaves is changed to that of a sere or sickly hue, or, in other words, the plants are hurried to maturity much sooner than is desirable. They will also succeed in an intermediate or cool stove temperature, but apparently a cool atmosphere is more appropriate to their well-being, and conducive to the proper development of the foliage, which in *Arisæma speciosum* and *A. galeatum* attain handsome dimensions. In either case the leaves are ternate, the leaflets elliptic and margined with dark brown or red. They are figured in the *Botanical Magazine*, t. 5964 and 6457 respectively. One leaf only is produced from a tuber contemporaneously with the inflorescence. The spathe of *A. speciosum* is unusually large, and of a deep blood-purple colour, while the enormously elongated and slender tall-like continuation of the spadix, together with other characters in both species, are broad and distinctive marks of affinity. These appendages doubtless serve as guides to creeping insects, there being no question about the necessity of the intervention of insect agency in the process of fertilisation. *A. ringens*, better known perhaps as *A. precox*, and synonymous with *A. Sieboldi*, differs from the above in having two leaves and in the absence of the attenuated appendages to the spadix. The large-hooded spathe is green, striped with white lines, and bears striking resemblance to a cobra in the attitude of striking. The deep brownish-purple aricles surrounding the lateral orifices form another conspicuous feature of this species. It is a native of Japan, and a figure is given in the *Botanical Magazine*, t. 5267. *A. curvatum*, figured in the *Botanical Magazine*, t. 5931, exhibits a striking departure from the above type. The enormously elongated leaf-sheaths clasp the flower-stalk and greatly simulate a true stem bearing two or three cauline leaves. The two lateral leaflets of each are branched in a helioid manner, doubtless giving rise to the synonymy, *A. heliobifolium*, by which the plant is frequently known. The sheaths are most beautifully marked with zig zag red blotches on an olive and pale green ground, presenting in different individuals a wide range of colour in ever-varying intensity. The flowers are monocious or mostly so, that is, the male and female flowers are found within the same spathe—a character of uncommon occurrence in the genus, as these organs are mostly always on different plants. The spadix ends in a curiously curved proboscis-looking structure. We have a third and very distinct type of leaf in *A. concinnum*, figured in the *Botanical Magazine*, t. 5914. It is cut up into a great number of linear leaflets that simulate the radii of a wheel. The spathe is green striped with white lines; and slender branching processes above the female flowers representing abortive

stamens is another marked character of this species. In *A. nepenthoïdes*, figured in the *Botanical Magazine*, t. 6416, the sides of the spathe above the tubular portion are drawn out into yellowish-brown aricles, thus mimicing in some degree a Pitcher-plant. Another species that surpasses *A. speciosum* for decorative effect is *A. Griffithii*, otherwise known as *A. Hookerianum*, and figured in the *Botanical Magazine*, t. 6491. The spathe is very large, hooded, and a curious mixture of brownish-violet striped or reticulated with green. The spadix is also drawn out into a long appendage. It is to be regretted this species is not more universally cultivated. *A. triphylla* has a green spathe, striped with broad bands of purplish-brown, and is interesting as the oldest introduction belonging to the genus. It is the *Arum triphyllum* of Linneus figured in the *Botanical Magazine*, t. 950.

Fifty species are known to science, but only a few comparatively have been introduced. A collection is annually flowered at Kew in some or other compartment of the T-range. A full-sized illustration of *A. speciosum* is given in our columns, vol. xii., 1879, p. 585, and at p. 689, November 29, 1884, a new and very remarkable species, *A. fimbriatum*, is described and figured. *J. F.*

The Apiary.

THE present year, 1885, has been a very good one for our little friends the bees. The early part of the season, especially during May, was very unfavourable to them, and many good stocks were lost throughout the country for want of a little attention and feeding. But those who fed their pets have been well rewarded since. It may be taken as an axiom, that if it does not pay to feed animals it certainly will not pay to starve them, and bees form no exception to the rule.

It is well known to experienced bee-keepers, that the great breeding month in England is May. While bees are breeding they require a great deal of food, and if they cannot get it out-of-doors they must be supplied with it artificially in the shape of sweet syrup, or they will get very weak, and much valuable time will be spent in recovering their strength, which might be spent in gathering honey.

It was not till June 1 that bees generally began to work hard, but ever since that date they have been working early and late. Honey has been stored at an amazing rate, and it has also been a great swarming year. I have great respect for good second swarms, and as a rule I always keep them, instead of returning them to the parent stock. All swarms after the second had better be returned from whence they came, to prevent the parent stock from becoming hopelessly weak. My reason for liking good second swarms is because they contain young queens, and it is of the utmost importance to have good, fertile, young queens in the Apiary. The natural time for a queen to exist is four or five years, but as a rule their laying powers begin to fail at the end of the third year, and it is then very desirable to destroy them and put in their places young queens. A very good time to do this is at the end of August, for no honey of any importance is collected after that. In my own Apiary this year I have several second swarms, which are doing more work than the firsts; and I attribute this to the age of the queens, as the first swarms are always headed by the old queen. When it is understood that a hive is only prosperous when it is well peopled, and that a young queen lays about 2000 or 3000 eggs a day, it will be seen that as soon as she begins to fall she must be superseded, if large quantities of honey are to be obtained. In my next paper I shall give very clear instructions how to take the honey, and double up weak stocks for winter. *Agnes.*

A PINE DESTROYING FUNGUS.

IN the list of awards of the International Forestry Exhibition at Edinburgh in the *Gardeners' Chronicle* for December 6, 1884, p. 726, it appears that in Section 12, "On the Destructive Influence on Wood of Fungi," no essay was received. We in this country have rather dropped behind our German confères in this matter. Much attention has been recently paid by them to the destructive influence which the larger fungi have upon living trees. It has taken us about twenty years to grasp the fact that some of the Uredines are heteræcismal in their life-

history (that is, they assume different shapes, according to the plant upon which they live), so that by the beginning of the next century we may come to recognise the fact that many *Agarics*, *Polypori*, *Pezize*, &c., are not confined to dead and rotting matters, but that they actually cause the death and decay of living trees.

Dr. P. Magnus has recently drawn attention to the fact that *Polyporus Schweinitzii* must now be regarded as a fungus capable of causing the death of certain species of the Pines. He recently communicated to the Botanical Society of the province of Brandenburg the following facts concerning the death and destruction of a fine tree of the Weymouth Fir (*Pinus Strobus*, L.), in the Berlin Botanic Garden. On October 9, 1881, during a severe gale, this tree was blown down, when it was discovered that the interior of the base of its trunk was rotten through the action of the mycelium of *Polyporus Schweinitzii*. Since 1874, possibly before, specimens of this fungus had been observed growing beneath the tree in question, they occurred annually more or less regularly in converging lines corresponding to the principal roots on one side of the tree.

In 1874 the fungi were found at a considerable distance from the stem; year by year they got nearer and nearer to the trunk, until at last they occurred upon it. Dr. Magnus pointed out that those specimens which grew at a distance from the tree where they had to push themselves through a layer of earth were of typical central stemmed form (*Mesopus*); when they were produced on the stem in the fork between two main roots they were provided with a lateral stem (*Pleuropus*) but when they grew from the stem itself they were stemless (*apodia*), and further, that when they occur upon a flat surface they are in the young state resupinate, constituting the *Polyporus coruscans* of Schuler v. Müggendorf. In the affected wood of the Berlin Fir tree the mycelium of the fungus formed the same kind of "mycelial nests" or "mycelial cushions" which Hartig describes with his *Trametes radiciperda** (*Polyporus annosus*, F.). The woody cells were perforated by the mycelial hyphæ, and in those parts in which the wood was quite soft and rotten the tissues were more or less absorbed. The fungus in question also attacks the roots and base of the stem of other Pines. This Dr. Magnus has observed with *Pinus sylvestris* at Königsdamm, near Berlin, and with *Larix europæa* in the Engadine, near Pontresina. Charles B. Plowright, 7, King Street, King's Lynn.

AN ABNORMAL FORM OF PUCCINIA BETONICÆ, DC.

A SHORT time ago I received from Mr. Downes, of Bristol, a *Puccinia* on the leaves of *Betonica officinalis*, which presented a very abnormal appearance. Very many of the spores, about one-eighth of the entire number as near as I could estimate, were three-celled. Many of these had the three cells placed one above the other so as to approach *Phragmidium*, but others had them arranged at various angles and in various relative positions so as exactly to resemble a *Triphragmium*. There were also a few meso-spores, or one-celled telento-spores. The great variety present will be seen from the accompanying drawing (fig. 38). The ordinary two-celled spores were the most numerous, and in other respects the fungus exactly agreed with the type of *P. betonicæ*. I have examined specimens from three other localities, but failed to find any but the ordinary spores.

There are at least two other species of *Puccinia* besides *P. variabilis* and (according to New, J. E. Vize) *P. conii*, with the same peculiarity—*P. tripartita*, Trelease, which is sometimes even 5-celled; and *P. triarticulata*, B. and C., both of which occur on gramineous plants. *Phragmidium triarticulatum*, B. and C., on *Potentilla* (which is only a form of *P. obtusum*); and *Triphragmium deglubens*, B. and C., on a leguminous plant, also have two horizontal septa; the latter, *var. parenthæsa*, appears to be a good *Phragmidium*. Thus the form of *P. betonicæ* here figured (fig. 38) is a connecting link between *Puccinia*, *Triphragmium* and *Phragmidium*, and if it were not for its smooth spores and the great preponderance of the two-celled forms it might be doubtful how it should be classed. Mr. Downes informs me that he has found it only in a single spot, on the downs near the Avon gorge, and the species is, I believe, hitherto unrecorded for the Bristol district. W. E. Grove, B.A., Birmingham.

COMMON GARDEN INSECTS.

In my last article on this subject I glanced at a few of the insects to be found haunting the ground, and concealed beneath stones and in crevices. I now change our place of observation, and look amongst the vegetation for other garden inhabitants. Here we shall find a much greater variety of insect life, and here also we shall have to look closely to find out the full extent of that small life. Most of these insects are of such colouring or form as to be easily mistaken for the surrounding objects the insect may happen to frequent—such as the leaf on which it feeds, or the timber in which it burrows. Thus it will often be found that the insects on green leaves are green, and of so similar a shade that it is but the motion of the insect that enables us at a glance to detect its presence;—thus to most minds will recur the instances of green caterpillars, green aphides, and green beetles. Some caterpillars are so exactly like bits of broken twigs that they often startle children who take hold of them, and feel the bits of twigs soft and alive. Many plant beetles are the imitation of buds, others are like seeds. Many other examples might be given, but these suffice to show that close observation is necessary in this interesting branch of natural history. It is astonishing how quietly and how unobservedly insects at times destroy

FIG. 38.—ABNORMAL FORM OF PUCCINIA BETONICÆ

vegetation; they do it in so subtle and sure a manner that often the first indication of their presence is the ruins of once-flourishing beds of plants, or the sudden withering of the foliage of hitherto healthy trees. This is often due to the similitude in appearance between a portion of the plant and its destroyers—or to the nocturnal habits of the depredators.

A more careful observation of the curious and of the complex habits and transformations of insects enables us to discern which are beneficial and which injurious, and how to encourage the one class and eradicate the other. Thus it is that we know aphides to belong to the latter and ladybirds to the former class.

The foliage and flowers of spring and early summer shelter countless minute caterpillars, and a variety of small variously coloured insects; later in the summer months it is observed that the majority of the caterpillars are of larger size, and there is an evident increase of brightly-coloured beetles, spiders and flies. The caterpillars are mostly hatched by the warm rays of sunshine from minute eggs which are dispersed in immense numbers on the leaves, stems and bark of trees, &c., where they had been deposited in the previous autumn. No better example of this class of garden denizen could be given than that of the common large garden white butterfly (*Pieris brassicæ*), the life history of which is illustrated in the lower half of fig. 39, p. 181.

THE CABBAGE BUTTERFLY.

A patch of eggs and the minute caterpillars or larvae nearly immersed from them are seen on the leaf. These tiny eggs are at first quite white or pale yellow, and form an object for the microscope

of remarkable beauty, which is worthy the examination of all who take an interest in the garden and its insect life. An egg magnified is drawn at the bottom left-hand corner of the woodcut. When the eggs are near the hatching point they darken in colour, and a magnifying glass reveals through the delicate transparent shell a sight which fills the observer with amazement; the embryo caterpillar is seen in gradual course of formation, and if patience and warmth have permitted it, the observer will witness slight movements within the life-case, and presently the shell will break and a black head with moving jaws will be thrust out; the little caterpillar unfolds and slowly crawls away from the egg-shell and inserts its jaws into the green leaf. It is curious to witness how judiciously the little creatures avoid crowding together, but strike out in different directions, and thus they make sure of a plentiful supply of food, and distribute the effects of their depredations. These caterpillars eat continually, and hence rapidly increase in size, until they present the appearance shown in our drawing in the centre of the illustration, which is a full-grown caterpillar.

It will be observed that this insect is composed of thirteen segments from head to tail, which is a distinctive characteristic of all insects both in the larval and perfect states; but in the case of this and most other caterpillars these segments are sharply defined and readily recognised. It will also be noticed that the three segments or "joints" nearest the head bear a pair of legs each; these are the real feet, or claspers, as they are sometimes termed, which develop into the feet of the future butterfly. There are four pairs of false feet or suckers, which adhere to the ground by suction, and which disappear in the butterfly. On the last or tail end is a fifth pair of suckers also, which can attach themselves to a surface with considerable force, as any one can attest who has noticed the wriggings of one of these caterpillars when feeling for new feeding ground.

The caterpillar now ceases to eat, and quietly betakes itself to a secluded corner, where in peace it spins a web around its body, and wrapt therein remains quiescent awaiting its change into the butterfly. Although so dormant outwardly, activity reigns inside; processes are going on within that chrysalis-case which are the amazement and the puzzle of all naturalists. In course of time the worm is changed into the beautiful winged butterfly, which breaks its case and emerges soft and wet; but it quickly dries and spreads its wings to commence its life in the air and sunshine. The chrysalis is represented in fig. 39 on the left. The butterfly, it will be recognised, is one of the common insects so familiar to all, with strongly veined white wings, bearing three black spots, two on the upper and one on the lower wing, and dark colouring on the corner of the upper wings. The antennæ, as with all butterflies, is clubbed at the extremity—unlike moth's, which are tapering—and the large black staring eyes are the optical apparatus, containing, we are told, thousands of lens, each a perfect, simple eye.

The wings derive their chief beauty and their colouring from the covering of scales which lie on like slates on a roof, and are attached in a similar manner. A small portion of the wing magnified is drawn in fig. 39, at the bottom right-hand corner, and detached scales more highly magnified next to it, exhibiting somewhat the form of batletocks.

THE PEACOCK BUTTERFLY.

Another well known insect is illustrated in fig. 39, upper portion—the Peacock butterfly (*Vanessa Io*). The curious spiked and spotted caterpillar feeds upon the common Nettle. This beautiful butterfly—common in most districts—is brilliantly coloured and figured in the upper side of the wings but only of a mottled brown on the under-surface, somewhat resembling a dried and brown leaf, so that it is no easy matter to detect the conspicuous brightly-decked insect when it alights from flight upon foliage and brings its wings to gather over its back after the manner of butterflies. At the left-hand corner is seen the head of the insect, magnified, showing the long spiral tongue.

This is a curious structure, and one that will repay the trouble of microscopic examination; in the figure the profile is seen, the large compound eye at the side and the long curved tongue, so elephantine-looking in form though of minute size, is seen unrolled as it is when about to be inserted into flowers to pump up the booney-juice. This little piece of insect apparatus is a mass of muscles and sensitive nerves comprising a machine of greater complexity and of no less precision in its action than the modern printing

* Hartig, "Lehrbuch der Baumkrankheiten," p. 77, t. 33.

machine. When not in use the tongue rolls into a spiral and disappears under the head. A butterfly's tongue may readily be unrolled by carefully inserting a pin within the first spiral and gently drawing it out.
