The collection which is to furnish the main part of these notes would be considered a large one, and contained trees trained in most of the usual ways. Walls facing east, west, and south were entirely devoted to Pears; the fruit came finest from the east and south walls, a fact which shows Mr. Wildsmith's dictum *re* west walls not to be universally true. The south wall was chiefly devoted to what are generally considered tender Pears, which for the most part were on the Pear stock. Varieties that were utter failures owing to inferior quality were Tyson, Monchallard, Beurés Six, Millet, and de Bolwiller, Beuré de l'Assomption (trained as a cordon), Octave Luchambre, Mary Guise, and Walter Scott. The following six late Pears were decidedly good, and ought to be far more widely grown:—*Iris Grégoire*, *Olivier de Serres*, *Prince Napoleon*, *Duchesse de Bordeaux*, *Nouvelle Fulvie*, and *Mariette de Millepieux*. Both Messrs. Rivers and Bunyard praise *Nouvelle Fulvie*, but have no mention of the last-named. Unlike *Bezi Mai* and others, it is a melting, very late Pear of large size and good outward favour, shrivelling but very little, if gathered late. The tree is very feeble, but bears freely enough, and would need, as it deserves, a south wall. Other rare varieties, among them *Madame André Leroy* and *Catherine Lambre*, failed to produce fruit during the six years I had cognisance of this collection.

Turning to the west walls. The following were set down as of little or no value with their then environment:—*Madame Lorie* de Barny, *Général de Lourmel*, *Beurés Berkmans*, de *Jonghe*, *Ballet père*, and *St. Michel Archange*. The last four were free bearers, but the quality of the fruit was very inferior. Failures as standards were *Souvenir d'Esperen*, *General Todleben*, *Comte de Paris*, *White Doyenné*, and *Naquette*. The latter is strongly recommended in the *Orchardist*, but if Mr. Scott supplied the right article it was a miserable little green thing, all rottenness within when scarcely turned colour. As a market Pear it was belauded. Poor consumers! Good Pears in this regard are *Fertility*, the old *Croft Castle*, and that luscious *Pear Suffolk Thorn*, which is quite equal to *Comte de Lamy*, and a prodigious bearer. Very good Pears, which are not as yet household words, were *Doyenné Robin*, *Princess Mary*, *Nouveau Poiteau*, *Burré Auguste Benoist*, *Fondante de Cuerne*, *Brockworth Park*, *Triomphe de Vienne*, *Madame Treve*, and *Clapp's Favourite*.

No 1 is a rounded medium-sized Pear, of most delicious flavour, affording a succession of fruit throughout October and November; it forms a prolific standard on the Pear stock. Nos. 3 and 4 were on Quince stocks, and were trained to a south wall. *Nouveau Poiteau* is a large fruit, which, like *Beurré Diel*, soon has its day. The same criticism applies to No. 5, but both are such good fruits as to deserve cultivation. *Marie Benoist* I have always found of poor quality, although it is most highly spoken of

FIG. 125.—TORREYA CALIFORNICA
(From a sketch by Sir Joseph Hooker.)

strong, very close grained, compact, susceptible of a fine polish, and very durable in contact with the soil. It had all the appearance of a slow growing tree, and this is its character in cultivation at Kew. The genus is one of the most interesting amongst Conifers, on account of the rarity and remarkable distribution of the few species it is known to contain. There are, besides the Californian, the *T. taxifolia*, Arnott (Savin or Stinking Cedar of Florida), confined to swamps in the neighbourhood of Bristol in Western Florida, and very rare there; *T. grandis*, Fortune, of North China; and *T. nucifera*, Siebold and Zuccarini, of Japan. *J. D. Hooker.*

MIDDLE TEMPLE CHRYSANTHEMUMS. — This year London will be poorer by one attraction, and this at a season when such a loss is most felt, by the discontinuance of the pleasant exhibition of the Chrysanthemums in the Middle Temple Gardens. These plants have always been well grown, and have afforded considerable enjoyment to many lovers of the flowers in London pent. The prohibition is only temporary probably, the well assorted collection remaining still under the charge of Mr. Wright, the gardener.

by many growers. Brockworth Park is described in Mr. Rivers' list as ripening in November. The Brockworth Park usually grown ripens with *Beurré d'Amoalis*, and comes to great perfection on an east wall, as also do *Bonné Louise*, *Fondante d'Automne*, *Williams' Bon Chrétien*, *Doyenné Boussoch*, *Marie Louise*, *Beurré Diel*, *Beurré Giffard*, and *Beurré Clairgeau*. Excellent varieties for bush or pyramidal growth on the Quince are *Emile d'Heyst*, *Délices d'Hardepoint*, *Mitaston Duches*, and *André Desportes*. C. A. M. C.

Florists' Flowers.

THE CHRYSANTHEMUM.

THESE plants have now been placed inside, and the attention they require up to the time the flowers open is merely to keep them sufficiently supplied with manure-water at the roots, but it must not be too strong, and should be given at each alternate watering only. The first traces of mildew should be destroyed with flowers of sulphur dusted over it. I find the best way is to dust the plants well before they are taken indoors, and when this is done the mildew does not attack them. The specimen plants intended for exhibition must have the flowers supported with sticks. Exhibitors caw on the side of over anxiety to get their plants dwarf, forgetting that an unnatural dwarfness is as objectionable to tasteful people as drawn up plants with a yard of stems at the base devoid of leaves. Plants grown in the form of dwarf bushes, with the least possible twisting of the stems, and at the same time furnished with healthy green leaves, are the most likely to hold a high position at exhibitions. The individual flowers should be of large size, and stand out boldly above the foliage. The pompon varieties require very little in the way of sticks; the main stems should be tied out, and a few stoutish sticks should be inserted in the pots, to hold them in their place. Most of the tying and training should be done before the flowers open; if this is left too late the plants show the effect of the training. Large blooms have a considerable tendency to damp off, single petals decay, and others speedily follow; unless these are removed as soon as perceived the whole flower will go to pieces. Care must be taken to keep the atmosphere of the house as dry as possible, and this is done by avoiding spilling any water about the paths when applying water to the roots of the plants; a very common error is to fill the pots too full when watering them, so that the water runs over and evaporates from the outside of the pots and from the sashes.

THE HYACINTH.

It will now be time to pot the main collection of bulbs. I pot each bulb separately in a 5 or 6 inch pot, using a rich open compost. In potting leave the crown of the bulbs only above the surface of the soil. Place a little white sand under the bulbs, and a small portion over the crowns. When they are potted plunge them out-of-doors in an open place. I stand the pots on a bottom of ashes trodden hard, and cover the pots with cocoa-nut fibre refuse. This material is the cheapest and best for the purpose; it is quite dry, and maintains an equable temperature round the bulbs. From the large number of new varieties introduced during the last few years I continue to select some that are improvements. Instead of only growing one straw or yellow coloured variety, as I did for several years, two more of this colour have been added to our collection—*Bird of Paradise* and *King of Yellows*. They are distinct from each other, and from *Ira*, the old variety alluded to. The bulbs of *King of Yellows* are not very large, but when it is in full vigour it is the best yellow. *Bird of Paradise* is a distinct and very fine variety, it has a long spike and well formed bells, but a few of those at the top of the spikes are greenish, which does not add to its beauty. *Souvenir de J. H. Veen* I have added again this year, it is the best dark purple-blue variety. *Princess Mary* of Cambridge greatly improves the pale blue section, and *Grand Maître* is also very distinct, forming a handsome spike. Amongst red varieties we have tried several new kinds; *King of the Reds* promised well, but after trying it last year I left it out, and went back to *Vuurbaak* for the best dark red or crimson; this variety, *Gairibaldi*, *Litaneus*, and *Albert Victor* are

the best dark red varieties. *Fabiola* and *Von Schiller* are the best pale pink kinds. *Gigantea* forms an immense spike in this colour, but the bells are too small to be effective. The double varieties seem to be at a discount, except *Koh-i-noor*, which has semi-double bells; no others are grown for exhibition. I always grow a few of the very best, such as *Lord Wellington*, *Blocksberg*, *Garrick*, *Laurens Koster*, and *Van Speyk*.

EARLY FLOWERING TULIPS.

These receive very much the same treatment as *Hyacinths*, except that three bulbs are planted in one pot. The potting soil is the same. Those who exhibit have to be careful to grow a goodly number of the very best sorts only, and after many years' careful selection recommend the following as the best to grow in pots:—*Fabiola*, *Joost van Vondel*, *Joost van Vondel* (white), *Keizer Kroon*, the best single Tulip; *Oghir d'Or*, *Pottebakker*, white; *Proserpine*, *Queen of the Violets*, *Van der Vee*, *Vermilion Brilliant*, and *Rose Alplatic*.

EARLY FLOWERING GLADIOLUS.

I have grown a number of these in pots this year, and found them very useful, both as cut flowers and for decorative purposes. The first of the group is *G. Corvillus albus*. It is a hardy free flowering variety of the species, which can be grown to flower from April to the end of June. The varieties of *G. ramosus* are also very beautiful. They do not require much pot-room. Half-a-dozen bulbs may be potted in a 6-inch pot. As they have been at rest for some time they may be potted now, but those I flowered this year were not potted until January. Some few late varieties were also grown in pots, such as *Gloire de Versailles* and the distinct and handsome species, *G. Sanderii*. The pots containing the bulbs should be placed in a cold frame, and be plunged in cocoa-nut fibre refuse. They are placed under the glass lights to protect them from too much rain. They would not be injured by a little frost, that is, the plunging material might be frozen, but the frost ought not to penetrate to the bulbs.

THE HOLLYHOCK.

Last season I determined to leave the plants out-of-doors in the same position in which they flowered. The winter was so mild that they passed through it without any injury whatever. It would not be quite safe to adopt this plan unless plants of the same varieties were grown in pots from cuttings struck during the spring and autumn. Those plants that have been propagated in that way, and are now in small pots, probably pot-bound, should now be repotted into 4 inch pots, which we call small 48's. They may be placed in a cold frame, and will require no further attention except to be moderately supplied with water, and be repotted again in March to be planted out in April or early in May. The old plants must also be taken up now from the open ground and be repotted in as small pots as the roots can be nicely got into. Light and not over-rich soil should be used to pot with. It is too late now to put in cuttings taken from the old plants. They may produce roots if managed with great care, but it is better to allow them to remain on the plants until the month of January, when they form roots very freely in a propagating house. Any eyes or cuttings that were put in late in the season, and have not yet formed roots, may be aided by a little heat, either by placing them in a gentle hotbed or a forcing-house where the heat is not very great. Seedlings produced from seeds sown as soon as ripe in September may be pricked out in boxes, and if covered with hand-lights, or frame-lights, to keep them growing during the winter, they may be planted out in the spring, and will flower strongly in September following. I prefer to keep the seed until the end of May. The plants get quite strong by the end of the season, if planted out in July where they are to flower.

THE DAHLIA.

The plants were sadly injured by frost towards the end of September, and no good flowers have been produced since. The ground is now saturated with rain, and we will be glad if it is drier before frosts come sufficient to blacken them completely. Pot-roots may now be stored under the greenhouse stage, or in a viney from which the Grapes have been cut. The object is to keep them dry—or, at least, comparatively dry—at the roots until the leaves become

yellow, when the stems may be cut through an inch or two above the ground. A sure sign of a revival of the interest in Dahlia culture is the fact that several growers are taking to saving seeds to raise new and improved varieties. The best way to obtain a stock of single varieties is to sow a packet of seeds early in the year. The produce will give a plentiful supply of flowering plants the same season. The ordinary show and fancy kinds may be treated in the same way. The seed-pods are now ready to be cut from the plants; cut them with a portion of stem attached, and hang them up in a dry place; when the seed turns brown pull the pods to pieces, and spread the seeds out on paper to dry thoroughly. When the old plants have been quite killed by the frost they should be cut over, and the tubers carefully dug up. Stand them with the crowns downward for a day, to allow the moisture to thoroughly drain out of the hollow stems. They may then be stored away in a dry place for the winter.

TULIPS.

The ground ought now to be in preparation to plant out these; if it was not dug or trenched before the wet weather set in it will not answer to interfere with the ground before it is quite dry. The planting out may be done any time during November; cut bulbs were not planted out last season until well into December, and we had a good and early display. Few growers will take the pains to provide a bed for Tulips as if a permanent Vine border was intended. They do well in any rich garden soil, and in planting them draw a deep drill, as for Peas. Press the bulbs in firmly with the fingers; place a pinch of dry white sand over each bulb; level in the drill, and the operation of planting is complete. It must be done in fine weather. When will the Tulip come in for its fair share of popular favour? It is rather amusing to read sometimes of the praise of flaming scarlet Poppies, while the late flowering Tulips with the colours and delicate markings are ignored.

OCTOBER FLOWERING CHRYSANTHEMUMS.

A box of blooms cut from this important section has been forwarded to us by a correspondent. They comprise Japanese and pompon varieties, some of which begin to flower early in September, and with a few that flower later carry the blooming period on to the time when the ordinary kinds are in their full blaze of beauty. These early flowering kinds are quite as deserving of attention as the best of the late varieties. *Madame C. Desgrange* is one of the most valuable of the Japanese kinds. A bed of it in the Kew garden, near the Water Lily house, was a very prominent feature in September. With a bloom of this variety there is also one of *G. Wermig*, said to be a yellow sport from it, and as it doubtless possesses the same good qualities of free blooming and good habit, will be as valuable for planting out in beds, though not so valuable for cutting. *Mandarin* is the most promising early Japanese variety; it has narrow slightly twisted petals, creamy-white in colour, shaded with pale rose; flowers large and full. *Isadore Feral*, rosy-lilac, yellowish centre. *Colibri*, a distinct full flower of a rich crimson colour. The pompon section is well represented:—*Frederick Pelé*, reddish-crimson; *Madeline Davis*, yellow; *Pélicotie*, bright yellow, the best of its colour; *Madame Piccol*, rosy-purple, a pleasing variety; *Illustration*, pretty pale pink. Of the smaller pompon varieties, *La Petite Marie*, a charming variety with full pure white flowers, is one of the best; *Pomponium*, yellow, with a suffusion of reddish-brown, a fall flower; *Petite Mignon*, a pretty white variety, the outer petals tinged rose; *Surprise*, rose, white centre, a compact flower, with the petals slightly frimbriated. The small flowered varieties are very useful as cut flowers; they ought to be grown out-of-doors freely, and a number of them should be cultivated in pots. Our greenhouses and conservatories are not too well supplied with flowering plants during the autumn months. They must be cultivated in the same way as the later flowering kinds, and are best grown in the form of bushes, to be freely supplied with manure-water after the buds are set. J. Douglas.

A NEW BRITISH BUTTERFLY. — The Rev. O. Piccard, Cambridge, has lately recorded the capture of a "Blue-tail" (*Lysena argiades*), in Dorsetshire. This is a common South European species, but has not before been noticed in this country.

THE PEAR.

THE Pear has been cultivated from the remotest ages, and has always been a favourite fruit, and when we consider that by a judicious selection and careful cultivation a daily supply of ripe fruit can be had at the table for seven months in succession, surely it deserves our special attention.

The Pear prefers a good loam, that inclined to be stiff rather than otherwise, and a good depth of soil; should the subsoil be clay drainage is indispensably necessary. In the South of England and in favourable localities in the Midland Counties, fruit for the months of August, September, and October may and ought to be grown in orchards, either as standards, pyramids, or dwarf trees; this gives the walls for the growth of the best winter kinds, which require greater warmth to ripen them. Seeing that the Pear when ripe keeps but a short time, those who are provided with a good many kinds are the most likely to keep up a daily supply without intermission, and to do this (unless the establishment is large) small trees are preferable to large ones, and to enable one to do so nurserymen keep a supply of trees grafted on the Quince stock. If the soil is suitable nothing can possibly do better than trees so worked; the Quince being a slow grower restricts the growth of the scion, and the tree is thus immediately thrown into bearing, and his is also especially recommended in exposed situations where lolly trees would be exposed to high winds, when the autumn gales would shake the crop from the boughs and bruise the fruit, rendering it worthless. Where the situation is sheltered and the soil light, we prefer the free stock, but in this case root-pruning will always have to be resorted to, to keep the tree from growing too rampant — root-pruning one side one year and the opposite side the year following. Great injury is very often caused to the trees by annually digging with spades and cutting off the surface roots, and thus encouraging the lower ones to take the lead and find their way into the sub-soil. We have found it better to give a coating of half-densayed leaves, or anything to encourage surface roots, and to leave the ground undug; in the case of fruit tree borders one is obliged to dig and crop, but then it can, and ought to be done with forks, which will not cut the roots. Large Pears should never be planted in orchards; the sway of the branches by the wind breaks off the fruit before they are ripe; large kinds, such as *Beurré Diel*, *Brookworth Park*, *General Todleben*, *Gambel's Bergamo*, *Doyenné du Comice*, *Beurré Clairgeau*, *Doyenné Boussoch*, *Pitaston Duchess*, should be planted on west walls; the last mentioned Pear is a chance seedling, raised at Pitaston, and certainly one of our best autumn kinds. Therefore plant orchards with small sorts; in favourable springs more fruit will set than is desirable, so that thinning is necessary; and it often happens that in the case of a very heavy crop the tree will need every encouragement to mature its fruit. In a case of this kind carefully remove the surface soil, and give the tree a thorough soaking of semi-liquid manure soon after midsummer, and return the soil, well mulching the surface. This will enable the tree to carry its crop to perfect maturity, and is a better way than the indiscriminate application of manure in winter, which, in the case of a light crop following, will cause the trees to grow vigorously—a most undesirable thing—which will take years to correct. The Pear is usually trained horizontally on walls, and one oftentimes sees several kinds grafted on one tree. I do not recommend this plan, because a strong growing kind will take the lead at the expense of its fellows. On all our piers on the garden walls here we plant upright double cordons, and nothing can possibly do better, as every year they yield a quantity of fruit, and great variety to the dessert.

GATHERING THE FRUIT.

The season of gathering commences with the month of August, and during that and the two following months hardly a day passes—certainly not a week—without some kind or kinds being gathered, and every one of which ought to be got before they are quite ripe; place the hand under the fruit, and raise it up to a right angle, and it will, if getting towards maturity, part from the shoot; but even then the finest ought only to be gathered; a few days afterwards the remainder may be gathered and kept, placing them apart in the fruit-room. This prolongs the season; but at last the time comes for the general gathering of the winter kinds; the last half of October will be

early enough, and sometimes, according to the weather, the first week of November. As a rule, late Pears are gathered too soon, and weeks afterwards one finds a stray fruit on the tree, missed at gathering time, quite plump, while those in the fruit-room are either ripe or shrivelling.

THE FRUIT ROOM.

And this leads me to speak of that building. It should have a north aspect, should be built with hollow walls, a double ceiling, ventilators on the roof, and shutters to keep the light out, and a regular temperature, which will possibly stand at 50° at first, but will gradually fall to 40°. On no account carry any diseased fruit into the store-house, nor suffer any that are decaying to remain there. In the dull winter months, when the various kinds approach maturity, by removing them into a place having a warmer temperature the flavour will be improved; but if it was necessary to be careful in gathering the fruit, it is especially so in the fruit-room, as the least thing will bruise them; therefore handle them most carefully. One can easily tell when the fruit is ripe by pressing it at the base of the stalk. If the flesh gives way under the pressure it is ready.

SORTS.

This article will not be complete without a list of the approved kinds; I therefore give one, and confine myself to those which we grow successfully here, remarking that the garden is 400 feet above the sea-level, rather exposed, the soil stiff loam resting on marl; and I shall, as near as I can, place them in the order of their ripening. Your readers will remark that several well-known names are left out: I have done so purposely, because we have had to discard them here.

A list of fifty Pears arranged in the order of their ripening:—*Deacon*, *Doyenné d'Été*, *St. Swithin*, *Citron des Carmes*, *Beurré Giffard*, *Clapp's Favourite*, *Jargonelle*, *Souvenir du Congrès*, *Williams' Bon Chrétien*, *Beurré d'Amansis*, *Flemish Beauty*, *Doyenné Boussoch*, *Louise Bonne of Jersey*, *Seckle*, *Forelle*, *Marie Louise*, *Pitaston Duchess*, *Beurré Hardy*, *Comte de Lamy*, *Beurré Boss*, *Belle Julie*, *Thompson's Beurré Diel*, *Beurré Superfin*, *Zepherin Grégoire*, *Van Mons' Léon le Clerc*, *British Queen*, *Napoleon*, *Passé Colmar*, *Doyenné du Comice*, *Kaigh's Monarch*, *Berri St. Anast*, *Winter Nelsis*, *Glou Morgeau*, *Chaumontel*, *L'Inconnue*, *Marie Benoist*, *Bergamotte d'Espèren*, *Joséphine de Malines*, *Jean de Witte*, *Olivier des Serres*, *Passé Crassane*, *Berri Mai*, *Duchesse de Bordeaux*, *Ne Plus Meuris*, *Beurré de Jonghe*, *Madame Millet*, *Van de Weyer Bates*, *Doyenné d'Alençon*, and *Directeur Alphonse*. The last twenty we grow on a south wall; they ripen better and keep longer, and right well will repay any one for the extra attention and best situation. *J. Rust, Eridge Castle, Sussex.*

REVERSIBLE FRAMES.

In my first article on the apiary I mentioned the fact that lately some people, principally Americans, had been reversing their frames, and in some instances their hives, in order to encourage the bees to go into the supers. I have given the matter a great deal of attention this summer. I always keep two or three hives on purpose to try experiments, and though this causes a little loss to the pocket I am always pleased with the knowledge thus gained. It is universally known amongst bee-keepers that occasionally bees will not enter the supers, and will hang idly about or swarm rather than do so, and as this is very vexing when there is plenty of honey about various ways of overcoming the difficulty have been tried. A 'cute man—but I am sure I do not know who the first 'cute man was—thought that as bees in a state of Nature or in a straw hive store honey at the top of the comb and brood at the bottom, that if the hive or the frames were reversed at the proper time the bees would carry the honey up above the brood and into the supers. Experiments have proved that this is the case. It has also another advantage. It has often been found that in extracting honey the comb breaks because it is not fastened at the bottom, but if the comb is reversed the bees fasten it all the way round,

and the frame and the comb form a firm slab, and is not at all likely to break. Hitherto, reversible frames have been rather expensive. I do not say that is the fault of the hive-makers. If you want anything good you must give a little more for it. But to the bees. I could draw a plan here of a frame I have devised, which consists of four pieces of wood only, and which does equally well whichever way up, but I am afraid the Editor cannot spare me the room for it. It will fit into any hive made the orthodox size, that is 14½ by 8½ inches. The frame does not hang on the sides, but rests on a little ledge ½ inch high. This ledge is fastened to each side of the hive on the floor, and allows the bees to pass under. I have no time to make these frames in numbers or supply them, but if any one wishes to possess and make them for himself I have no objection to send a single sample for *gd.* to cover postage and production. The best time to reverse frames is when hives are ready for supering, but care and judgment must be exercised. *Agnes.*

NOTES FROM THE PEAR-GROWING DISTRICTS.

(Continued from p. 534.)

HERTS.—In reply to your inquiry, we believe the annexed to be the best sorts of Pears for this district. The situation is low, the soil is heavy and moist:—

TWENTY BEST PEARS FOR GROWING ON THE QUINCE STOCK.

Beurré Diel	Beurré de Sterckmans
Bon Chrétien (Williams)	Baronne de Mello
Doyenné Blanc	Beurré Superfin
Glou Morgeau	Bergamotte d'Espèren
Passé Colmar	Conseiller de la Cour
Louise Bonne of Jersey	Doyenné du Comice
Beurré de Capimontou	Beurré d'Anjou
Fondante d'Automne	„ Bachelier
Beurré d'Amansis	General Todleben
Doyenné Boussoch	Winter Nels

TWELVE BEST PEARS FOR GROWING ON THE PEAR STOCK.

Gratioli	Flemish Beauty
Belleune d'Hiver (stewing)	Thompson's
Marie Louise	Beurré d'Amansis
Hacon's Incomparable	„ Hardy
Catillac (stewing)	Joséphine de Malines
Beurré Kace	Grégoire Bourdillon

W. Paul & Son, Waltham Cross.

WORCESTERSHIRE.—We find the following Pears succeed in our district on either Quince or Pear stock:—

Doyenné d'Été	Louise Bonne of Jersey
Jargonelle	Maichal de la Cour
Souvenir du Congrès	Doyenné du Comice
Williams' Bon Chrétien	Bergamotte d'Espèren
Albertaine	Soldat d'Espèren
Automne Bergamot	Winter Nels
Beurré d'Amansis	Zepherin Grégoire
„ Clairgeau	Marie Louise
„ Diel	Olivier des Serres
Duchesse d'Angoulême	Catillac

ON PEAR STOCK.

Gratioli of Jersey	Pitaston Duchess d'Angoulême
Beurré d'Arenberg	Swan's Egg
Husle	Joséphine de Malines
Marie Louise	Uvedale's St. Germain
Passé Colmar	

Richard Smith & Co., Worcester.

YORKSHIRE.—The undermentioned varieties are indicated by Messrs. Backhouse & Sons, York, as being those which are most suited to the climate of that part of the country:—

SUITABLE TO BE PLANTED AS STANDARDS FOR ORCHARDS	GREEN CHIEF
Autumn Bergamot	Jargonelle
Beurré d'Amansis	Réd Doyenné
„ de Capimontou	Wear of Winkfield
Doyenné d'Été	Bon Chrétien (Williams)
Beurré (Backhouse's)	Winter Windsor
Husle	

The following may also be planted as standards on warm soils:—*Beurré Diel*, *Marie Louise*, *Clapp's Favourite*, *Louise Bonne of Jersey*, *Hacon's Incomparable*, *Gratioli of Jersey*.

PEARS FOR ESPALIERS OR PYRAMIDS ON PEAR OR QUINCE STOCKS.

Baronne de Mello	Glou Morgeau
Bergamotte d'Espèren	Jargonelle
Beurré (Backhouse's)	Gratioli of Jersey
„ d'Arenberg	Jules d'Auroles
Colmar d'Été	Louise Bonne of Jersey
Clapp's Favourite	Comte d'Automne
Doyenné Boussoch	Madame Freyre
„ du Comice	Marie Louise d'Uvedale
Dursendun	Pitaston Duchess
Hacon's Incomparable	Winter Nelsis
General Todleben	

The following are suitable for espaliers or pyramids on the Pear stock, but do not succeed on the

Quince :—Bourré Superfin, B. Bachelier, B. Easter, Marie Louise, Seckle, Triomphe de Jodoigne. All the foregoing are suitable for dessert : the following are stewing Pears :—Bellissime d'hiver, Catillac, Uvedal's St. Germain, Vicar of Witkfield, Winter France Real.

The Rosey.

MARÉCHAL NIEL ROSE.

In the *Gardeners' Chronicle* of September 26 I saw a notice of this splendid Rose being in bloom for the third time this year ! Will the gentleman who so well manages this more-than-once-difficult-to-bloom-Rose, give us less fortunate growers his system of management ? By so doing, I am sure all lovers of this charming Rose will thank him. The season seems favourable for the production of good-tipe Rose seed. Will some kind raiser of seedlings publish in the *Gardeners' Chronicle* the best way of preserving and sowing the seed, and raising seedlings ? I sow a large quantity in the open ground, generally in the month of March, but I seldom get more than two or three to germinate. *John Hopper.*

NEW SEEDLING PEDIGREE ROSES.

Recently in the *Gardeners' Chronicle* your excellent correspondent, "Wild Rose," whose contributions are always so interesting, lamented the paucity of new Roses. Since then I have been on a holiday trip, and visited among the rest the spiritedly conducted nurseries of Alexander Dickson & Sons, at Newtownards, Co. Down. I am sure you and he will be pleased to hear that one of Mr. Dickson's sons has taken to raising seedling Roses, and proceeds, in doing so, on the principle of Mr. Bennett in hybridising "pedigree" varieties. He has been fairly successful, for out of one thousand seedlings at least six promise to be well deserving of being sent out and put in commerce. Appended is a description of this remarkable half dozen :—

H.P., Earl of Dufferin.—Rich velvety fiery crimson ; base of petals beautifully shaded with maroon ; flowers large and of great substance ; growth very vigorous, and a profuse flowerer. This is most highly perfumed.

H.P., Marquis of Londonderry.—Colour rich brilliant velvety crimson, shaded with dark maroon ; petals large and very smooth ; flowers large, full, and most perfect ; growth vigorous, with very distinct dark green foliage.

Lady Helen Stewart.—Colour brilliant carmine ; petals large and very thick ; growth vigorous, and flowering in great abundance.

Tea Miss Ethel Brownlow.—This is a thoroughly distinct Rose, not the least characteristic feature being its great lasting properties. The flowers are produced on stiff footstalks, which show them to great perfection ; the colour is difficult to describe, being a crushed Strawberry colour. The form resembles a Catherine Mermet.

Tea Lady Castlereagh.—Flower of great substance ; colour silvery-pink, shaded with salmon ; growth vigorous and very prolificous.

Tea Mrs. Hamilton Gell.—Colour white, faintly edged with pink ; petals smooth and beautiful ; very pretty.

First-class Certificates have been awarded to Earl Dufferin and Miss Ethel Brownlow at Dublin, Glasgow, and Edinburgh. *M.*

PRUNING ROSES.

The following observations have been contributed by a French grower of Roses, and are drawn from facts of which he has taken notice :—1. If in the spring some Rose bushes are pruned, and, on the contrary, some others are allowed to remain without any suppression of the branches at all, the latter will come into bloom about a fortnight before the others ; their flowers will be more numerous, and at the same time less beautiful. 2. If some Rose bushes are completely pruned, and upon some others are left only some twigs, these latter will have the same advance in the time of bloom. 3. If two Rose bushes are pruned alike, one at the end of September and the other in February, the one pruned in autumn will flower first. 4. If, towards the middle of September, the branches of a Rose bush are laid down horizontally, and those of another bush to exactly the same condition are left in the natural position, and in the spring both be pruned alike, the one with the branches laid down will bloom first. 5. In pruning Rose bushes before vegetation starts, that is to say, in February, bloom on them will be obtained in advance of that which will appear on bushes pruned later. 6. Pinching the young shoots, as they start on bushes

after pruning, retards blooming very much. In this case the pinching should be done before the flower-buds appear, or when the young shoots have only three or four leaves. *The Farm.*

PEARS AND JUNIPERS.

AN HEREDITARY legislator in his place in the House of Peers on an occasion of ceremony, and the same individual stalking stags in the Highlands, though one and the same, is very different in appearance, in "habit" and in "habits." A Guardsman in a London drawing-room at one time, and at another in the thick of the fight in the Soudan or elsewhere, presents similar diversity. A stag-beetle was at one time a grub, and so we might pile up illustration upon illustration if it were necessary. Our only object now is to show that the condition named "heterocismal"—a fearful word, for which we should be glad of a short Saxon equivalent—is not so very isolated and peculiar a phenomenon as at first sight

Berberry was duly produced. Others have done the same thing since, and however great may be the uncertainty in particular cases, there is now no doubt whatever of the fact that "heterocism" does occur. The same plant growing parasitically under different conditions assumes a different form and appearance, according to the particular plant upon which it grows, something as the ermine-robed peer in Westminster evolves into a tweed-hedded sportsman in the Highlands. Of course the analogy is not complete, but if it serve to make matters comprehensible it will answer the purpose.

A good deal has been written in our own columns upon this subject by Mr. Plowright and others (see *Gardeners' Chronicle*, October 28, 1882, p. 553), and our special object in alluding to the matter now is to point out that a relationship and course of development similar to that of the Wheat mildew and Berberry fungus above-mentioned takes place in the case of the Pear ; perhaps we shall be safer to say it is alleged to take place, for we have not ourselves proved it, though we are pretty well convinced of the fact by the authority of others. The allegation is that the yellow slimy fungus on the Juniper (*Podisoma juniperi*) (fig. 126), becomes, when its spores are transplanted on to the Pear or Hawthorn, the fungus known as *Restelia lacera*, (fig. 127). At the place above cited Mr. Plowright gives an account of the successful results of his experiments, which, however, are questioned by others. We give illustrations of both fungi, that our readers may note the great difference in their appearance. Similarly the dark orange fungus on the Savine (*Podisoma Sabini*) is said to produce the fungus known as *Restelia cancellata* which grows on Pear leaves ; while *Gymnosporangium juniperi* is said to produce the form known as *Restelia cornuta*.

We do not care to enter further into detail on the point just now. Some part of the history has been proved, other portions are still the subject of dispute, and while some have succeeded, others, among whom may be mentioned Professor Farrow, have been less fortunate, though the experiments of the latter observer, if not conclusive, at least afford strong presumptive evidence. It will be enough for us now simply to say to those who intend to plant Pears—keep them away from Juniper bushes !

EIGHT DAYS IN THE GARDEN OF ENGLAND.

(Continued from p. 459.)

ACROSS DARTMOOR IN THE RAIN.—Unfortunately time did not permit our visiting the gardens of Sir B. Wrey, at Holne Chase, where there are fine Araucarias and other trees, and equally unfortunately for us the morning of the day destined for our longest tramp was more than threatening. From distant Blacktor, a hill to the north of South Brent, we saw shower after shower come dashing up the Dart valley over Ashburton ; but, with a too optimistic faith in the doctrine that "when things are at the worst they will mend," we burnt our boats—*i.e.*, we sent our baggage on by rail to Tavistock, and starting in a lucid interval we crossed the rubicon—*i.e.*, the Dart—at Holne Bridge, so that though it then began to pour, retreat was not to be thought of, and we had the prospect of a good twenty-mile tramp over Dartmoor in characteristically "local" weather. And here I may say a word as to Devonshire distances. Measured along the road as laid down on the most accurate of Ordnance maps a distance is one thing, whilst, were it measured on a relief-map it would be quite another. As most Devonshire roads, and all those on Dartmoor, are either up-hill or downhill, it is not a fair representation of distance upon them to state the distance between the tops of any two hills as if it were a straight line ; for, as Euclid says, "Any two sides of a triangle are greater than the third side." Hence, despite any taunts as to the effects of saturated garments in heightening one's ideas of distance, I am free to maintain, guide-books notwithstanding, that the main road from Ashburton to Tavistock is considerably over 20 miles. At Holne Bridge, five pointed arches crossed a stream, now so diminished as not to fill the central channel ; but the well rounded "pot-holes," hollowed by pebbles worked by its eddies, in the slate rock at either side, far from the present water-level, pointed to the far greater volume of the stream in winter. On the previous afternoon we had measured the stream as 14 feet wide and 5 feet deep, and its velocity at one-third of a mile per hour, whilst abundant evidence proved it to be sometimes 8 feet deeper, and three times as wide. It is by overlooking

FIG. 126.—*PODISOMA JUNIPERI*, YELLOW FLESHY FUNGUS ON JUNIPER.

A, General appearance of the fungus (slightly enlarged) ; B, In process of growth ; C, Shows two spores ; D, Basidium with two fertile spines and one undeveloped ; E, Sporia in course of germination, magnified 460 diameters ; F, Sporia, after 24 hours in *Ann. Sc. Nat.*, 1834, p. 193.

it appears to be, and that at any rate the strangeness of the thing ought by no means to prejudice us. When a country bumpkin, or even a practical farmer, tells us that there is a connection between Berberry bushes and corn mildew it is not unnatural either that little heed should be paid to the remark, or that it should be met with ridicule—very wrong, no doubt, but inevitable so long as observations are not recorded in a form likely to command attention. But when a botanist not only asserts a thing but actually demonstrates it, as it were, before our eyes, then, indeed, his assertions demand and receive much more respectful consideration. De Bary, twenty years ago, set this particular matter at rest. He sowed, with all due precautions, to avoid error and fallacy, the spores (called teleospores) of the corn mildew, *Puccinia graminis*, on the leaves of the Berberry, and after a short time the *Æcidium* or cluster-cup of the

proofs of such a winter volume that summer tourists are unable to realise the power of such streams as those of South Devon to move the boulders that often lie, far from their parent rock, in the lower reaches of the river. Whilst watching the trout darting through the amber stream as it flowed between its dark grey rocky banks, and the eels moving slowly over the stones, we had also been able to note the formation of stalactites under the limestone bridge and the rootcaps on the many fibres that the Alders sent out into the water, but now the long walk before us and the driving rain prevented our noting much of Nature or of landscape. We did not, therefore, verify the statement that *Osmunda* grows wild near New Bridge, nor could we stop long to enjoy this part of the Dart with the last view of Buckland and Iolne Chase. Leaving what is perhaps the oldest, but certainly not the most interesting of bridges over the Dart, and passing some painfully inharmonious modern architecture, some stiff "collar-work" brought us past that most unpretending roadside beer-house, the "Tavistock Arms," and on to the bleakest

occur, and we thought we saw herons' nests at Dartsmeet, and though in several sheltered nooks, as at the same spot, there are trees, mostly Firs, Dartmoor having a mean elevation of 1500 feet enjoys too bleak a climate for Oats even to ripen with regularity. Being, however, mostly in enclosures for cattle pasturage much of the moor is bleak without appearing wild, whilst its "tors" never have the true mountainous character of the peaks of the Lake district. As we descended a steep gradient to the point where the East Dart comes tumbling down into the West Dart, past a clump of Firs, we traced on the slopes of Yartor several "hut-circles," those circular mounds with rows of transported stones of doubtful purpose and of still more doubtful age. It is easy to talk of Druids, but if they worshipped in woods the 130,000 acres of the "royal forest of Dartmoor" would apparently have afforded them but little shelter, and in this land of granite any age of rude civilisation would naturally be a "stone age."

Disappointed of an inn after an eight-mile walk, after a wet *al fresco* luncheon—for we were not with-

Our pleasure in the distant sight of the Princetown Convict Prison, telling of the near approach of our journey's end, was tempered by the long stretch of road reaching to a distant horizon that apparently lay between us and the "Saracen's Head," a halfway house which, according to our calculations, we ought already to have reached. That hospitable hostelry, however, renders itself doubly acceptable by being hidden at the foot of so steep a descent that even its chimney-smoke is not visible to the way-worn traveller until he is all but at its door. After a most welcome rest and meal, and a glance through one of the most amusing of the many amusing visitors' books of the district, our way lay for more than a mile through the fields tilled by the labour of the Princetown convicts. Considering what this labour has effected between stone walls, and how granite weathers on the hills-tops and Firs grow in the valleys, I could not help thinking that it might be an experiment worth trying to see if this "royal forest" might not be made a forest indeed. True it is that the weird "Wistman's Wood," which we had not time to visit, has remained for ages a grove of Oaks so gauged, stunted, and lichen grown as to be thought "uncanny;" true also, no doubt, that even in a coniferous plantation the keen winds would kill an outer belt of trees; but even then the remainder might well prove remunerative not only as timber but as shelter both for cattle and for arable land.

Passing out of sight of the unromantic, warehouse-like pile of buildings that constitutes Her Majesty's prison, and descending towards the hamlet of Merryvale Bridge, we caught sight of what may literally be termed the keystone of a most interesting assemblage of megalithic remains, viz., a "long-stone," or slab of granite placed on end, standing fully 12 feet above the ground. It is some 300 yards from the road and double that distance from the point where the Princetown road curls into sight towards the extensive granite quarries of Hessay Tor. On approaching it one cannot fail to notice near at hand a circle, some 60 feet across, formed by more than a dozen small stones inclined inwards, and from this the eye soon falls upon a smaller circle or cairn, in the centre of which is a hole for a missing long-stone. These circles are nearer to the road than is the long-stone, but do not seem definitely placed with reference to it or to the very perfect stone avenue close by. This last consists of two double rows of stones, 2 feet apart, with about 50 feet between them, extending for about a quarter of a mile, and ending in small stone circles, near one of which is a fallen cromlech. There can be little doubt that these megalithic memorials were monumental rather than sacrificial or ritualistic, and that, with Stonehenge and Avebury, Wayland Smith's Forge, and Kit's Coty-house, they are the work of that ingenious Mongolian race, using polished stone implements, that preceded the Kelt with his Druidical Nature-worship; but, standing by this long avenue and these stone circles, I could not help thinking that Mr. Roach Smith and that school of antiquarians who turn for an explanation of anything to the pages of Vitruvius or Pliny, might make out a good case in support of a theory that this was nothing but a Roman arena where perchance "Brutus of Troy" held chariot races like those his great-grandfather established, *feste* Virgil, in honour of Anchises. Admit the theory, and the *spina, meta* and stand for the editor *spectaculi* could easily be identified.

(To be continued.)

The Herbaceous Border.

CAMPANULA PYRAMIDALIS.

THE merits of this well-known ornamental flower can certainly never be overrated, for whether as a hardy, profuse bloomer that requires but a small amount of attention, or for beauty of individual flowers, it is well worthy of being placed in the first rank. At no time, however, is it so effective as during the autumn months when covered with its truly blue or white flowers, and which offer such a rich contrast to the then prevailing yellow of so many of our late flowering subjects. The white variety is, perhaps, not generally so tall as the type, with lighter green, smaller-sized leaves. These Campanulas delight in a rich, deep loam, and abundant,

FIG. 127.—CESTELIA LACERATA ON HAWTHORN. (SEE P. 395.)

part of the moor, where not even a wall protected us from the fury of the gale, and our only source of comfort was in the good quality of the road. The Devil's-bit Scabious and the Eyebright occurred by the roadside, from which, on either hand, the ground was covered mainly by the dwarf Fuzze (*Ulex nanus*) in full blossom, there being a striking scarcity of Erica. Hill after hill of no great steepness of slope, but each crowned with a curious artificial-looking heap of bare grey masses of granite, their slopes strewn with similar masses among the Ling, or divided by a monotonous network of stone wall, the whole overhung by a cold and cloudy sky, gave the moor a sameness that soon palled upon the senses. A geologist could gather some consolation in the fine specimens of granites in the walls, in which, when wetted, the large crystals of felspar are so far better seen than when they are dry; *Wahlenbergia*, rejoicing in the wet by the side of each streamlet that ran off the moor, might somewhat cheer the botanist, and the archaeologist had to keep his eyes open for hut-circles or other "prehistorics;" but it cannot be denied that in wind and rain a smaller sample of Dartmoor would content most people. Birds we saw none, though snipe do

out "pocket pistols"—as we ascended the hill above Dartsmeet we noticed *Cuscuta epithymum* for the first time, parasitical upon Calluna; and here, too, we first encountered evidence of that remarkable process of "weathering" of granite to which the tors of the moor and much of the fertile soil of the valleys alike owe their origin. In a roadside cutting, apparently in solid granite, in which each crystal was separately distinguishable, we found that the hammer could readily dig deeply into what was, in fact, a mere compact gravel, extending from 6 to 8 feet from the surface. In other similar pits this disintegrated granite formed regular cup-shaped "pipes," cutting through the jointing of the harder rock precisely as do the clay pipes through the bedding of the chalk or ragstone of south-east England.

The excess of moisture that occasioned us so much discomfort was pleasing to the large black slugs (*Arion ater*) that were not uncommon on the moor, and happening upon our first patch of Sphagnum we found upon it the lovely little pink cups of the bog Pimpercol (*Anagallis tenella*), a plant which, with its congener, *A. arvensis*, has been accidentally omitted from the list of Devonshire plants by Mr. Britten in White's *Directory*.

though not stagnant moisture, and are readily increased from seed or by division.

ANEMONE HONORINE JOUBERT

is very effective, the large white flowers, fully 2 inches across, being borne in the richest profusion on stout stems that often reach 4 feet in height. This is one of the very best autumn-flowering plants known, for from August till November, cut as you will, there is a succession of the pure white and highly attractive blooms. It is one of those plants that should be in every collection, large or small; but it is well to remember that in proportion as the soil in which the plants are growing is fertile or otherwise, so will be the size and production of the flowers. From this it must not, however, be inferred that the plant is dainty as regards choice of soil, for it certainly is not; any good loam suiting it well, but all the better if well enriched by an annual coating of thoroughly decomposed vegetable or animal refuse. The fine deep rose flowers of the true *A. japonica* contrast well with the snowy-white of the latter form.

HARPALIUM RIGIDUM

is a really good, handsome, and distinct Sunflower-like plant that from early August till the November frosts has, perhaps, no equal in the herbaceous border. Bold, well grown specimens crowned with their glistening golden-yellow flowers—the individual flowers often measuring as much as 5 inches across—are indeed a treat which even the most observant cannot but appreciate. It is of the easiest culture, any fairly rich garden soil meeting its requirements, more particularly where the plants are well exposed to sunshine, and where they never suffer from want of nor excess of moisture. Not only as an ornamental border plant but for cutting purposes this is one of the most useful occupants of our autumn borders.

HELIANTHUS MULTIFLORUS and H. MULTIFLORUS FL.-PL.

are just now at their best, and although introduced to this country at a very early date, 1507 I think, yet public favour has never waned in appreciation of their value, and certainly the most select collection of herbaceous plants would be rendered all the more select for their extension. The single flowered form is perhaps the most uncommon, and by not a few persons preferred to the double, being, perhaps, more floriferous and usually of taller stature. The double one is, however, a most effective plant, and one that we can recommend for general culture, being easily managed, a profuse bloomer, and of great value as a lasting cut flower in boxes and vases. Good cultivation is amply repaid by these Sunflowers, for in size, beauty of foliage, and form of flowers there is a vast difference between well fed, and half starved specimens.

Other desirable species are *H. californicus*, with a stiff, majestic habit and bright yellow flowers with conspicuous black centres; *H. argyrophyllus*, an annual species of merit; and *H. rigidus*, a rough leaved species, with fine, deep golden flowers, with a rich dark centre. For cutting purposes this latter deserves extensive culture.

THE MICHAELMAS DAISIES.

Of these there are many fine and worthy forms, but, on the other hand, just as many worthless and insignificant flowered species that are not worth growing as garden plants. As being more or less distinct from each other, showy in flowers, and therefore most suitable for the general cultivator, we would specially recommend the following:—*Aster tuberosus*, with large mauve flowers; *A. bessarabicus*, a very fine form of the well-known *A. amellus*, but with larger and brighter flowers; this is a very desirable plant; *A. taenactifolius*, which, although of only biennial duration, is distinct in several points from all other Michaelmas Daisies: it is of dwarf habit, with deeply divided Pansy-like foliage, and an abundance of delicate mauve-lilac flowers; *A. ibericus*, with pleasing purplish-blue flowers, and of remarkably compact growth; and *A. Curtisii*, a new but very bright and attractive species, with bright purple flowers. They are easily grown in any good rich loam with partial shade, and may, in most cases, be readily enough propagated by division of the roots after the flowering season. *A. D. Webster.*

SAXIFRAGA STRACHEYI.

M. Mathieu, of Charlottenburg, has, says the

Garten Zeitung, succeeded in raising several crossed seedlings from this species, hybridised with *S. thyanoides ciliaris*, *cordifolia*, &c.

PEARS IN WILTS.

In view of the Pear Conference which is now being held at Chiswick, a few remarks on the varieties which are found to yield the best and in every way most satisfactory results, will not only be opportune but may be of use to planters who are readers of the *Gardeners' Chronicle*. The varieties which do best here are—taking them in the order in which the fruit is fit for table—Doyenné d'Été, small, handsome, and excellent fruit, ripening towards the end of July; Citron des Carmes, fruit small, juicy, and well flavoured, ripe in August; Jargonelle, one of the best August Pears, fruit large and of excellent flavour, a good cropper, but owing to its want of keeping properties one tree of it is sufficient in most gardens—two, one on a south and the other on a west wall, may be useful in large gardens; Bauré d'Amans, a first-rate September Pear, fruit large, melting, and richly flavoured; the tree is also a good grower and cropper. The same remark applies to Bauré de l'Assomption and that well-known variety, Williams' Bon Chrétien. Succeeding these in October and November are Louise Bonne de Jersey, a good old variety, which succeeds well in most places if grafted on the Quince; the fruits are handsomely shaped, and of flavour much liked. Bauré d'Capiaumont, a good bearer of medium-sized finely coloured fruits and pleasant flavour, but being a bad keeper one tree of it is quite sufficient for a private grower. Marie Louise is one of the best Pears known, being large, handsome, and richly flavoured. The tree does well here, either as a pyramid, or trained against a south and west wall, and is an excellent cropper. Pitmaston Duchess is another large, handsome, and well flavoured fruit: as also are Bauré Diez, Van Mons' Léon le Clerc, and Passe Colmar, the latter being a prodigious bearer, of medium size, and highly flavoured. There are some good specimens of this variety here, trained umbrella and fan-shaped; both methods of training yielding alike satisfactory results. The following varieties come into use in December and four following months somewhat in the order in which the names appear, viz.:—Althorpe Crassane, medium size, fruit buttery and rich in flavour; the tree is also a good grower and free bearer; the same may be said of Bauré d'Arenberg. Crassane is a fine old Pear, the fruit being large and full of flavour. Glou Morgeau and Chamaumont are indispensable varieties. They should be grown against a wall, the fruit, in point of size, flavour, and appearance, being in both cases all that could be desired. Knight's Monarch is a good hardy Pear, and it does well at Longford, either as a standard or pyramid, and seldom fails to bear well, the fruit being richly flavoured, and which requires to be gathered somewhat earlier (when grown as tall standards, at any rate) than other mid-winter varieties, otherwise, owing to the fruit parting so readily from the stem, a little wind would cause them to drop off. Easter Bauré and Ne Plus Meuris, trained umbrella fashion, have been thickly studded with clean medium-sized fruit this season, as also have been trees of Josephine de Malines on walls, fruit medium size, handsome, full of juice, and of delicious flavour. Seeing that this excellent variety is a good grower, and bears freely on south and west walls every year, the wonder is that it is not oftener met with in gardens, as its merits unquestionably entitle it to be included in every collection of Pears worth growing. And the same may be said of Bauré Rance, one of our very best late Pears, as when well ripened and carefully stored away in a suitable fruit-room they keep well, and come into use from the end of January to May. The fruits, too, are large, melting, full of juice and highly flavoured. Catillac and Uvedale's St. Germain, are two excellent stewing varieties; the fruits are very large, and keep well till May. We have one tree of each on walls, but the Catillac on the inner side of a semi-circular wall having a north-western aspect bears good crops every year, while its companions on the opposite side of the same wall yields but half a crop. Chamaumont, Glou Morgeau, Van Mons' Léon le

Clerc, and many other large dessert varieties, are also very acceptable for culinary uses whenever they can be had. Those of your readers who may be making preparations for planting a new garden with fruit trees, but whose space at command may not admit of all the varieties enumerated above being grown, can, without much fear of erring in doing so, reduce the number to suit their own convenience by selecting every second or third variety from the list given, observing, however, the remarks respecting the individual varieties in making the said selection. I may remark that many of our trees are old, consequently they do not produce such fine fruit as younger trees.

CULTURAL REMARKS ON PEARS.

Having determined the distance at which the trees should be planted from each other against the walls—which for horizontally trained trees should range from 20 to 24 feet apart, and a few feet less for sun-for fan-trained trees, planting maiden trees for transplanting subsequently between them in the meantime—an order for the necessary number of healthy, kindly-grown, and rightly named trees should be despatched forthwith to any of the large nurseries having a reputation for supplying trees of this description; meanwhile, having first marked the central position of each tree on the wall with a piece of chalk or charcoal, excavate holes extending 2½ feet on either side the mark on the wall, 5 feet therefrom, and 4 feet deep, the outline of the hole forming a half circle. Into the bottom of this hole put 9 inches thick of bricks, stones, or clinkers, and over these a sufficient thickness of coarse gravel should be laid to fill in the chinks, and following this a layer of turf, grass side down, to ensure good drainage; but should water at any time be likely to rise nearer to the surface than 4 feet it will, of course, be necessary to reduce the depth of the hole to such an extent as will prevent the possibility of the roots of the trees being at any time submerged—a circumstance which would be injurious to their well-being. The holes having been made ready for the reception of the soil, the latter—assuming that the character of the natural soil is not such as is calculated to promote and afterwards sustain satisfactory growth in the trees—consisting of three parts good calcareous loam and one of old lime rubble and wood-ashes, well mixed, should be got into the holes in a moderately dry state, so that it may not adhere to the feet in treading on it. In planting the trees make due allowance for the soil subsiding 5 or 6 inches within as many weeks from the time of planting. Having placed the tree in position, spread the roots out in every direction, with a slight inclination downwards, shortening back at the same time any straggling roots, and cutting clean away with a sharp knife any portion of the same that may have sustained injury in the process of lifting; and with a view to encourage an emission of young feeders make a series of incisions along the principle roots previous to covering the latter with 6 inches thick of the compost indicated above, and before treading the latter gently over take hold of the tree by the stem and give it a few good shakes in an upward direction, so as to let the soil mix well among the roots. This done, lay on 3 or 4 inches thick of rotten dung as a mulching, which will maintain the roots in a more equable condition than could otherwise be secured. Trees thus planted should, as a matter of course, be temporarily secured to the wall with nails and long shreds, to allow of them sinking with the soil. Trees so planted, providing the after-treatment be good, cannot fail to yield satisfactory results during ordinary seasons.

TRAINING OF YOUNG TREES.

In training young Pear trees I make it a point the first spring after planting, when the sap begins to rise, to bend the shoots which are left their full length towards the ground, and securing them to the wall in that position, the bend starting from the point whence the first of the young shoots is desired to proceed. The check thus given to the flow of sap causes a sufficient number of wood-buds to push from each shoot to form a good sized "fan-shaped" tree the first year after planting. Of course, as soon as the buds nearest the base of the individual shoots so treated have pushed into growth, the nails should be drawn, the shoots (main shoots) spread out on the wall, after the manner of a hand and distended fingers, and secured thereto, leaving sufficient room in the latter for the develop-

ment of the branch; the young shoots indicated above being trained at proper distances over the intervening space, and a judicious course of pinching of the after-growth is pursued during the summer and autumn months with the obvious object of plumping wood-buds, forming spurs, and promoting a balance of growth in the individual trees. To conclusion, I may remark that a large percentage of the trees here are trained "umbrella fashion." The trees, which are, for the most part, growing on the borders on either side the central walk; leading north and south from the principal range of glasshouses, are 10 feet apart, 7½ feet high, nearly 6 feet through, and furnished with healthy fruit-bearing branches to within 9 inches of the ground, at which point the lower set of branches and those higher up are tied to each other and to a stout circular wire secured to small O.k. stakes, about 2 inches in diameter, driven well into the ground. These trees are admired very much, not only on account of their ornamental character and general productiveness, but more particularly on account of the great area of fruit-bearing surface which is secured from trees thus trained in comparison with the small extent of ground (a circular space of 6 feet in diameter) which each tree covers. *H. W. Ward, Longford Castle.*

The Flower Garden.

THE BEDS.

It will be advisable at once to clear away all plants that will not stand the winter, and refill the beds with shrubs and other hardy plants for winter effect, or with bulbs and hardy annuals for spring display. If neither of these plans is adopted, though one or the other should be, at least let the beds be dug and made tidy.

ROOTS.

Dahlias should now be taken up and dried before storing them. Cannas should be taken up and wintered in sand in any place free from frost and damp. Gladioli winter best in light warm soil. When left in the ground undisturbed they always flower better than when planted annually, but where stiff cold clay and wet subsoil exist they should be taken up and carefully dried before being packed away. *Salvia patens* and perennial *Lobelia*s should be packed closely together in shallow boxes and kept from frost till spring, then they can be potted or planted outside, and are easily increased by division if kept in a frame till established. Bedding plants of all kinds should now be in their winter quarters, and in open weather should be fully exposed to the air, and have all the light possible, to keep them stocky. In order to winter them well, *Chrysanthemum*s that are planted out in open borders or beds or against walls, and which are now coming into flower, should be at once protected from frost or the flowers will be destroyed. Any light material, such as tiffany, gauze, or scrim canvas, or old frame lights will save them from injury, and where cut flowers are required, they will prove a great acquisition.

Amongst our best border flowers at this season of the year I may mention *Schizostylis coccinea*, very pretty, and flowers well in a warm situation; and for light soil *Michaëlas Daisies*, *Aster amellus*, *A. ericoides*, *A. grandiflorus*. These plants should be grown much more than they are, as they come into flower after the summer flowers are over and before the *Chrysanthemum*s. They are most valuable for cut flowers. I also find the small dwarf and early flowering varieties of *Chrysanthemum* useful, as they commence to flower in August, and flower till the end of October. They are not much more than a foot high, and are covered with their beautiful little red and white, yellow and crimson flowers, most useful for cut flowers, and they are very easily transplanted to fill up vacant places in beds or borders when plants have gone off.

ROSES.

Roses may now be planted, and if done early a good bloom may be anticipated next season. Any that are not growing satisfactorily should be taken up and the beds or borders well manured and trenched before replanting. Bulbs of various kinds, and

Pansies and *Violas*, may be introduced amongst the *Roses* with good effect, without being detrimental to the *Roses*. Briers for standards should be planted as early as possible for budding next season, so that they may get established before spring. Tea-scented *Roses* require protection in winter. When they are in open beds or borders it would be advisable to take them up at once and pot them, keeping them in cold pits, from which take care to have the lights taken off in fine mild weather; they may be planted out again at the end of March or April, according to the season. The best soil to plant them in is one that is rich, light, and the beds should be well drained. *Noisette* *Roses*, if not grown against a south or west wall, will require protecting in severe weather; if grown as standards or pyramids or dwarfs, they should have some Fern, *Furze*, or *Heath*, or any other similar material tied about the stems, and mats fastened round the whole plants. Standards should have some similar material fastened round the stems where the bud is inserted, and among the branches.

The preservation of neatness will, for some time to come, be a most difficult matter till the leaves are all down—it will require daily attention to maintain neatness. All grass lawns should be mown for the last time this season. Beds, borders, walks, should be all treated alike; the continuous rains having made it impossible to use the hoe, the only means left, hand-weeding, to get rid of the weeds, is by far the best. *Wm. Smythe, The Gardens, Basing Park, Allon.*

Plants and their Culture.

HOUSING PLANTS FOR THE WINTER.

It will happen, even in the best appointed establishments, that some portion of the greenhouse and other plants which require protection from frost, will, through pressure of work, be left out until a sharp frost or two gives us warning that no further delay must be tolerated. At such times the plants may be placed together somewhat indiscriminately to save time; do not, however, allow them so to remain a day longer than can be avoided. Take the first opportunity that presents itself to have all the paint, glass, walls, &c., cleansed before arranging the plants in their winter quarters. To this advice one exception might be made—viz., where there is a wall that is permanently damp, consequently green and unsightly at all times; in such places contrive by the best available means to induce Ferns to grow, such as *Adiantum Capillus-Veneris*, *Peris longifolia*, and *P. serrulata*, with *Nephridium molle*, and other tolerably hardy kinds; to attain this there is not much difficulty, for those named will generally thrive well. To the Ferns should be added *Ficus repens* and its diminutive form, *F. minima*; if this material will be found of great service for cutting, and instead of having to expend labour in cleaning such spots some attention to watering only will be needed, whereas in the former case the labour expended would yield no lasting result.

Attend to the repairing of putty and broken glass at such a favourable opportunity; drip, occasioned by the heavy rains, will be very injurious to most greenhouse plants, a comparatively dry condition of the atmosphere being best suited to their requirements on the whole. When arranging the plants, bring those moderately close to the glass that are most likely to become drawn, or in the case of specimens that are more valued, see that they have sufficient space between them for the free circulation of air and admission of light. The intervening spaces can be filled in with those subjects that are not likely to come to any harm by reason of their comparatively dormant state for the next few months. By exercising forethought and by judicious contrivances it is surprising what a number of plants can be got into a structure without harm accruing to the plants. I am in favour of having swing shelves fixed wherever possible without injury to the other occupants of the house; where convenient we prefer them over the pathway, then any drip occasioned by watering will not so materially matter. These shelves will be found very useful for *Pelargonium*s and any other soft-wooded plants that it is essential to keep in a dwarf state. When the arrangements are completed see that an abundant circulation of air is maintained

on all favourable occasions; do not use fire-heat when the temperature can be kept a few degrees above the freezing point unless it be to dispel damp when in excess; for this purpose select the early morning hours so as to allow the pipes to cool down before nightfall. *James Hudson, Gunnersbury House Gardens, W.*

FRUITS UNDER GLASS.

THE CHERRY-HOUSE.

If from natural decay, or from any other cause, the removal of any of the trees in this department has become necessary, it should be done at this season of the year, and in the case where a tree has occupied the place for several years, and where the soil has become somewhat stale, if not altogether unsuitable for a fresh tree which may be expected to last a considerable number of years, it should be taken away entirely, and fresh stuff substituted, which should consist of the top spit of good yellow loam half decomposed, and if its nature is not at all gritty, it should be made so by adding a sixth part of road-scrappings. After this material has been put into the border and allowed time to subside, the trees should be planted at about 12 inches beneath the general level of the border; in this operation spread out the roots regularly over the surface, and shorten back those devoid of rootlets, moisten and cover them with 2 inches of soil, which should be trodden down firmly. After filling up the border mulch it with 3 inches of decayed manure, and well water all the new material.

The most suitable kind of trees for the purpose in question are those which have had about two years' growth on a wall out-of-doors; trees of this character if carefully lifted, planted, and treated well afterwards will speedily recover from the shift and come into bearing quickly afterwards.

Cherry trees when established and protected from the effects of frost, bear so abundantly every year, that the crop of fruit does, as a rule, check and subdue over-exuberance, so that root-pruning or partial lifting is seldom if ever necessary.

The customary cleaning of the house and trees should be done so that the pruning and the training of the trees can be proceeded with and finished before the beginning of December. *G. T. Miles, Wycombe Abbey.*

THE ORCHARD-HOUSE.

Assuming that the house is in two divisions, and that one division is allowed to start in its own way without any forcing, the earliest division must be managed to come in six or perhaps eight weeks earlier, and to do so it must be started with a gentle heat early in the year, say the first week in January. An opportunity must be taken between now and that time to clean the wood and glasswork of the house; for this purpose warm rain-water should be used with a very little soap in it. Strong soapy water acts injuriously in two ways—it causes the glass to become slightly opaque, and takes the paint from the wood. Our pot trees have all been turned out-of-doors and plunged in cocoa-nut fibre refuse. There is no injurious effect upon the trees through being turned out, but in cold wet districts it is better to leave the trees inside; in that case it is necessary to look carefully over them to destroy scale or any other insect pests that may be upon them. Remove the scale with a piece of wood, and afterwards wash it with a sponge and warm soapy water. It is a good plan to wash the trees all over with a mixture of soapy water and flowers of sulphur. This is a safe mixture, and does not cause the buds to drop. On one occasion I used *Gishurst Compound*; it happened to be too strong, and the result was that nearly all the buds dropped off. Soft-soap may be made too strong. Four ounces in a gallon of water is sufficient, and 8 oz. of flowers of sulphur; a little soot may be added to it.

The trees have now all been top-dressed, with a compost of about equal parts loam and decayed stable manure. Before doing this the top soil was removed to as great a depth as possible without materially injuring the roots, all the small fibrous roots being removed with the soil, and the fresh compost firmly rammed in. It is now a good time to purchase trees for potting.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Nov. 2	Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Dutch Bulbs, at Frothero & Morris' Rooms. Sale of Fruit Trees, Roses, &c., at Gibson's Nursery, Cubbery, by Frothero & Morris. Southampton Royal Horticultural Society's Christmas Bazaar (two days). Sale of Nursery Stock at Water's Nursery, Tottenham, by Frothero & Morris.
TUESDAY, Nov. 3	Clearance sale of Nursery Stock at the Barley Mow Nursery, Bethwinst, by Frothero & Morris. Sale of Dutch Bulbs, at Stevens' Rooms. Sale of 2,000 Fruit Trees, at the Osborne Nursery, Hampton, by Frothero & Morris. Sale of Plants, Roses, and Bulbs, at Frothero & Morris' Rooms (two days). Autumn Show, Horticultural Society, Surrey (two days).
WEDNESDAY, Nov. 4	Sale of several thousand Lilium auratum Bulbs, from Japan, &c., at Stevens' Rooms. Sale of Dutch Bulbs, &c., at Frothero & Morris' Rooms. Clearance sale of Nursery Stock, at the Nursery, Bromley, Kent (two days). Crystal Palace Great Christmas Bazaar. Show (two days).
FRIDAY, Nov. 6	Sale of Imported Orchids, at Frothero & Morris' Rooms. Sale of Dutch Bulbs, at Stevens' Rooms.
SATURDAY, Nov. 7	Sale of Dutch Bulbs, at Frothero & Morris' Rooms.

TO be or not to be? That is the question which the horticulturists of this country have to solve. There are those who think that the question whether there should, or should not, be an INTERNATIONAL HORTICULTURAL EXHIBITION on a large scale in 1887 should be solved by the Council of the Royal Horticultural Society or by the "Commissioners." The latter is a rather vague expression, but may be taken to mean the powers that be at South Kensington directly concerned with those Exhibitions, of which the "Inventions" is now drawing to a close, and to which the Indian and Colonial Exhibition of next year (1886) is to be the lineal successor. We venture to think, however, that the solution primarily depends upon the answer which the horticulturists of the country are prepared to give to the inquiry addressed to them by the Council of the Royal Horticultural Society, and which it is hoped they will give with no uncertain sound at the meeting to which they are all collectively and individually invited on November 10. Before any definite conclusion can be arrived at, there are various and most important considerations to be discussed. First, is it desirable? On that point in the abstract, so far as we can gather, there is no hesitation. It is desirable. The doubts arise when we come to the questions, how and by whom it is to be carried out. The answer to the question How? is really soon settled. It must be on a scale commensurate—that is, relatively commensurate—with the Exhibitions that have recently been held, viz., the Fisheries, the Healtberies, and the Inventions. We should be false to our calling; we should ignore our sense of the magnitude and importance of horticulture considered in its widest phase, if we did not avow our belief that the horticulturists—and those more or less directly connected with them—can, if they choose, produce within necessary limitations (but those of the widest character), as important an Exhibition, and maintain it as effectively for a period of many months as those who have hitherto succeeded in drawing so many thousands of people—millions we may say—to South Kensington. Will they so choose? Details may be settled hereafter, and difficulties may be surmounted or evaded as they arise. Will they so choose? They have a glorious opportunity of showing that horticulture, in its widest sense, is not a mere luxury—not a mere affair of æstheticism, not an affair for the wealthy and the cultured only, but a necessity for every inhabitant of this country—for all mankind. We are all concerned in the results of the cultivation of plants. We are all absolutely dependent—every one of us—on the vegetable kingdom, and on the due appreciation and application of what knowledge concerning it may be forthcoming. Food, fuel, health, clothing, our dwellings, our very tables and chairs, to say nothing

of the amenities of life, all depend essentially on horticulture in the wide sense in which we have a right to construe the term. There is, therefore, not the slightest hesitation in saying that an Exhibition of surpassing interest may be got together. There is no lack of material, and even if we bear in mind the necessary limitations, if we remember that part of the proposed Exhibition, and that the most generally attractive, must be of a temporary and intermittent character, there still remains a vast residue of permanent material for an Exhibition. If for the moment we consider only what we have called the temporary and intermittent exhibits—horticulturists, after the brilliant series of fortnightly shows which have been held for the last three years, cannot refuse to admit that the thing can be done; while even from the point of view of permanence surely the magnificent efforts of Mr. WARE, and of those nurserymen who have contributed throughout all the season to maintain an interesting and varied display, afford sufficient proof that zeal and co-operation can effect in the future as much, and a vast deal more, than has been done in the past.

So far, then, as material is concerned, whether permanent or intermittent, there is no doubt whatever that the thing can be done. Horticulturists must not tie themselves down too rigidly to the precedent of 1866. Circumstances are altogether different now. We cannot, perhaps, reproduce such an exhibition as that. Let us assume that we cannot. What then? We can do better. Not, perhaps, in certain particulars, but on the whole it would be absurd to suppose that we cannot, if we choose, surpass the efforts of 1866. But still, even after showing that the material exists in the country in abundance, still the cry rings in our ears, How?

Well, how have the three great Exhibitions been carried out? In each year we believe there has been a surplus, at any rate the expenses have been more than covered. Is it not fair to suppose, that with a good Exhibition and a similar organisation, success will ensue? We know we can if we choose make a good Exhibition, and the organisation is at hand also, if we choose to avail ourselves of it. That at least is the view we take of it. We believe that the same organisation, supplemented by the technical aid which horticulturists alone can render, would secure a success. The "how" rings in our ears again. What about the funds? where is the money to come from? The Royal Horticultural Society certainly has none to spare. Well, where did the funds come from to establish and maintain the present series of Exhibitions? What the Fisheries, the Healtberies, the Inventions, did in this matter, we ought to be able to do. They did not start with money in hand, it was advanced on sufficient security, and we do not doubt that the money would be forthcoming on similar terms. But then horticulture, even in the wide sense in which we here use the term, would probably not attract the millions of shillings that would be required. We should certainly have to make use of the same adjuncts of music, art, electric lights, fountains, and other attractions which the managers of the other Exhibitions have found to be necessary, with as many novelties of a cognate character as we could press into the service. We should have also to consider, in a very particular manner, the Clerk of the Weather, and as he is a very capricious personage, we should have to provide accordingly.

At any rate we think we may assert that if the horticulturists choose they may find the materials and experience no greater difficulty as to funds than the managers of preceding Exhibitions have done.

Then comes the question, By whom

shall all this be done, if at all? Obviously the Council of the Royal Horticultural Society would not be justified in committing themselves financially, they have not the money to spare, but they can give guidance, direction, aid of all kinds except money. It must be remembered that to a large extent their very existence, at least at South Kensington, depends upon their lending all the aid in their power to the Exhibition Commissioners. The Royal Horticultural Society now has no footing at all at South Kensington, except by the grace of the Commissioners. Cease to co-operate with them, and the Society would be turned out tomorrow. We may regret this, but it is of no use wallowing over spilt milk—we must look facts in the face. What chance is there of obtaining a chair to sit down upon in the future (there are not many now!) if the Royal Horticultural Society does not now work with the Commissioners? It is in evidence, then, that the Royal Horticultural Society by itself cannot carry out such an exhibition, but with the co-operation and support of the Commissioners (we use the word in a general sense, so as not to burden our argument with details that are for our present purpose unnecessary), it is assuredly possible. Once more, then, we ask the horticulturists of Great Britain, Shall this be, or shall it not? The definite answer to this question should assuredly be given at the meeting on the 10th proximo. In the meantime we shall gladly give insertion to such discussions and arguments, *pro* and *con*, as our limited space and other considerations permit; and we most earnestly press on the Council the necessity of presenting themselves to that meeting with full explanations and something like a programme, or scheme of action, to be adopted, modified, or rejected, according to circumstances.

— THE PROPOSED INTERNATIONAL EXHIBITION.—We understand that the Royal Horticultural Society has addressed a letter of invitation to the leading horticultural societies of the kingdom, requesting them to take part in the meeting at South Kensington, on November 10, for the purpose of discussing the practicability of holding an International Exhibition of Horticulture in 1887, the jubilee year of the reign of Her MAJESTY. As it would be impracticable to issue separate invitations to individuals, the Society has published an advertisement requesting the presence of all in any way interested in horticulture on the day in question. It may be hoped, therefore, that a thoroughly representative meeting of provincial, as well as metropolitan, horticulturists may be obtained. Those unable to be present can at least communicate their views to the President.

VEITCH MEMORIAL PRIZES FOR 1886.—We learn that the trustees of the VEITCH Memorial Prize Fund have decided to offer next year the following prizes, the dates for which and other necessary particulars will shortly be announced:—

At Stoke-on-Trent, a Veitch Memorial Medal and prize of £5, for a Group of Orchids, with Ferns intermixed.

At Stoke-on-Trent, a Veitch Memorial Medal and £5, for a Group of Miscellaneous Flowering and Foliage Plants.

At Exeter, a Veitch Memorial Medal and £5 (subject not determined).

At Royal Botanic Society, Regent's Park, a Veitch Memorial Medal and £5, for twelve Amaryllids.

At Royal Horticultural Society, South Kensington, a Veitch Memorial Medal and £5, for a Collection of Forced Salad Plants.

— LINNEAN SOCIETY OF LONDON will meet on Thursday, November 5, at 8 P.M., when papers will be read on the following subjects:—1. "Flora of the Peruvian Andes, and its History and Origin." By JOHN BELL. 2. "Monograph of Recent Braehiopoda." Part 1. By the late Dr. THOMAS DAVIDSON.

— "THE BRITISH MOSS FLORA."—Dr. BRATHWAITE has lately issued the ninth part of this work, in which both text and letterpress are as carefully executed as in former numbers; which is saying not a little. The book is quite indispensable to

all students of Mosses, and should be added to every botanical library. It is published by the author at 303, Clapham Road, S.W.

— "ARBORETUM SEGREZIANUM."—We have to record the publication of the sixth part of this important work. It will renew the feelings of regret at the loss of so ardent a student, it will excite afresh our sympathies with the French horticulturists so suddenly and unexpectedly deprived of their chief. Five parts had been published before M. LAVALLÉE'S

pendulous leaves, which character, however, is not shown in the plate; *Cerasus capuli*, t. 34, a Mexican species with Peach-like leaves and long erect racemes of white flowers like those of *Cerasus Padus*. *Cerasus Herincquiniana*, t. 35: this is the *C. Sieboldi pendula* flore roseo of the nurseries, but which, it appears has not been described in any botanical work. The branches are bent downwards as in *Sophora pendula*, the leaves are lanceolate, produced after the flowers, which latter are a white or pale flesh colour, and arranged in umbels. *Cerasus Pseudo-Cerasus*, t. 36: this is

garden management employ to make the central part attractive to the public. The electric arc lamps in the centre are masked, so to speak, by Chinese lamps encircling them, the object being to add picturesqueness to the general scene, and to prevent the milder lights from being overpowered by the electric light.

— OVUM IN OVO.—Dr. BARNES alludes in a recent number of the *British Medical Journal*, to a hen which at various intervals laid double eggs. The

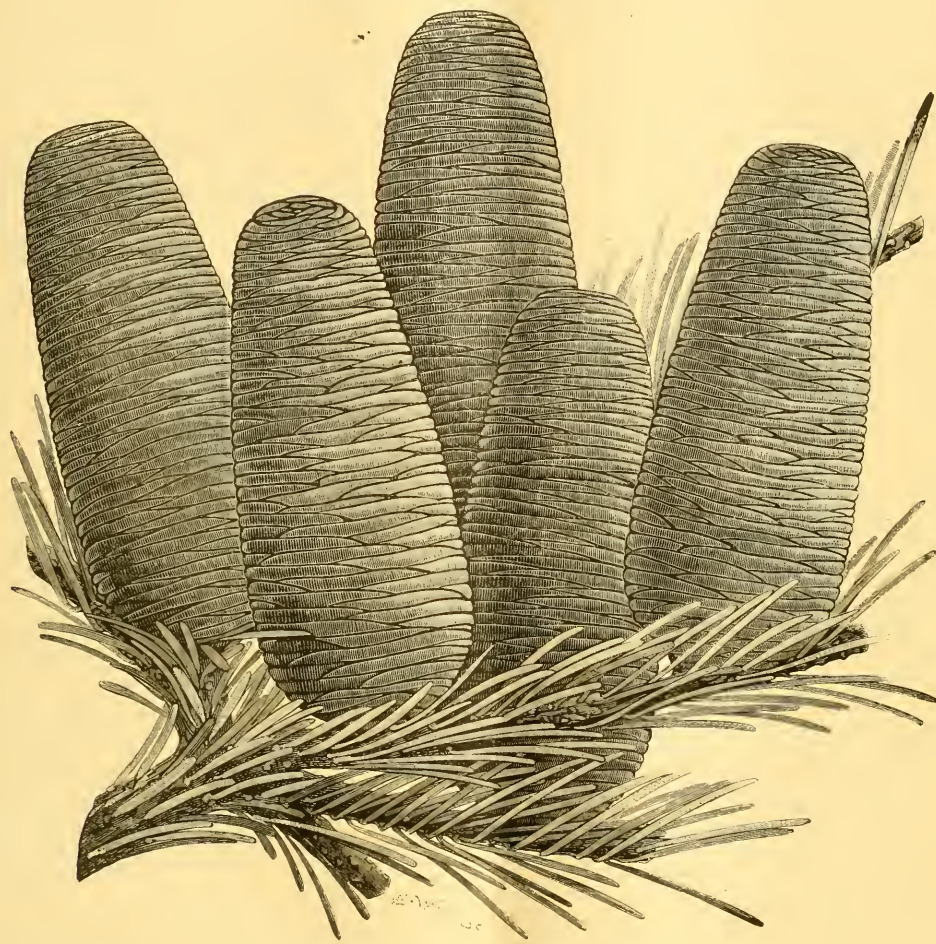

FIG. 128.—*ABIES GRANDIS*: BRITISH-GROWN CONES. (SEE P. 563.)

death; the sixth, which contains titlepage, preface, and index, closes the work. It has been issued by Madame LAVALLÉE, with the aid of M. HERINGO, and while it forms a fitting close to this particular work hopes are held out that, at some future time, the numerous plates which had been prepared before M. LAVALLÉE'S decease, but for which the text had not been completed, will be issued. The present part contains figures and descriptions of *Ribes multiflorum*, t. 31, a Hungarian species; *Pinus Bungeana*, t. 32, a Chinese Pine of marked aspect, the bark of which peels off in flakes, like that of the Plane; *Castanea vulgaris* var. *pendulifolia*, an elegant variety, remarkable for its long

the double Japanese Cherry or *Cerasus Sieboldi* of English nurseries, and of which *C. Watereri* is the form with single flowers. It is a native of Japan, and the Japanese gardeners have availed themselves of the beauty of the tree and its pliability to evolve numerous varieties.

— THE CRYSTAL PALACE.—Electric, and other supplementary lighting at this place of amusement bring out capitably the statuary and horticultural decorations, as the fine Ferns on the water basin, which look particularly robust this year, the groups of autumn flowering Chrysanthemums, Fuchsias, Pelargoniums, and the thousand and one items the

shell of the included egg was always of a red tint; the shell of the including egg was always of a dull chalky-white. The hen was a half-breed between a Cochins and a Dorking. The Cochins egg was in nine ascertained instances inside the Dorking egg. To find two yolks in one shell is common enough, but it is certainly rare to find two perfect eggs, one contained within the other.

— TWO CROPS OF PEACHES IN ONE SEASON.—A correspondent lately forwarded us a Peach of the size of a small Walnut produced under glass on the shoot of the year, which after having been stopped formed a bud which developed flowers, two of which

were set. Unfortunately the two fruits were accidentally knocked off, but it is hardly likely that they would have continued to swell after the fall of the leaf.

— **APOTHECARIES' BOTANIC GARDEN, CHELSEA.**—We have on several occasions lately made allusion to this old-established institution, whose primary objects, as it has been for the last 200 years, the teaching of botany to medical students, and latterly also to young women and to ladies in training for governesses in public schools. We now learn that during the present year the number of visitors, mostly students, has been 2784, of whom some 1200 were males and the remainder females. The Society gives a gold and also a silver medal in both classes of students to those who pass the most credible examinations.

— **ACACIAS AT WORTHING.**—One of the things that strike the botanical observer most forcibly as he steps out from his hotel at Nice into the public squares is the profusion of tall trees of Australian Acacias, such as he is accustomed to see in England only as small greenhouse plants, or at best in the temperate-house at Kew. There are favoured spots, however, in these islands where Acacias can be grown to advantage, in illustration of which Mr. BATEMAN brought to the Horticultural Society on Tuesday last some branches of *A. retinodes* in flower, and which were taken from a plant that has stood without protection other than that afforded by a wall in the garden of Mr. BATEMAN at Worthing.

— **THE BOTANIC GARDEN, GLASGOW.**—The Town Council held a meeting with regard to this garden, and have decided to allow the Society—and the directors have consented—to continue in the possession of the grounds until March 31, 1887, and any deficit then remaining is to be made up by the sale of plants and other moveable property of the Society.

— **THE MOVEMENTS OF PLANTS.**—This was the subject of an interesting lecture delivered by the Rev. G. HENSLOW, on the 10th inst., on the opening of the winter session of the Ealing Natural History and Microscopical Society. He commenced by stating that it was once thought that movement constituted a main distinction between animals and plants, but is no longer held to be so. A tree cannot move in the sense in which a lion can; but every plant has an actual movement of its own. An acorn was first taken as an illustration. The radicle goes down and moves in irregular ellipses and circles. The plant has an attraction for moisture, and will seek it. If the leading root is cut off it will cease to go down, but branch out horizontally. There is also a motion of rejection. If the radicle comes into contact with an obstacle it turns away and seeks another direction. This was illustrated by means of a coloured illustration of a Radish which had tied itself into a knot and was sketched by Mr. W. G. SMITH in 1866—an apt illustration of circumnutation. The roots of plants have been known to pass under roadways to reach a ditch, stimulated thereto by the moisture contained in it. The upward shoot is not always sent up straight from the radicle; it has to find its way through the soil, and twists and turns in doing so; but when out of the soil the tendency is to grow erect. The Strawberry and *Potentilla* both produce runners; a stem is thrown out which produces a tuft which makes a plant, and this in its turn forms another tuft. The case of climbing plants was instanced, moving by way of their slender stems. Some plants turn to the left, others to the right. This movement is done by circumnutation, but regular and symmetrical, describing circles. Other plants climb in a very different way. The Traveller's Joy (*Clematis vitalba*) climbs by means of its leaves, the prickles of the leaves furnishing the means; the Pea climbs by means of its tendrils, and so fastens itself to an object. This movement on the part of climbers was further illustrated by means of the Vine and a Virginian Creeper. Then there is rapid motion and slow motion. The Telegraph Plant, as it is termed, proceeds by jerking processes. It is one of some plants that are said to go to sleep. The Sensitive Plant is an illustration of quick motion. This also may be said to go to sleep, and so does the garden Lupin. The lecturer then proceeded to speak of veneration, or the various ways in which the leaves are arranged and fill up the bud. This was illus-

trated in various ways. The case of the *Mesembryanthemum* was mentioned, the flowers of which close when the sun ceases to shine. The case of *Trifolium subterraneum* was mentioned as an illustration of a plant that buries its seeds in the soil, and the *Cyclamen* also.

— **"VE ORIGINAL LITTLE BOOKE ON DAFFODILS."**—A prettily illustrated catalogue of the Daffodil, by W. BAYLOR HARTLAND, of Temple Hill, Cork, has reached us. The numerous illustrations seem very correctly done, one of the best being a plate of the cernuus varieties, from photographs, and exhibited on a black ground. The text is historical and controversial, and authorities are freely quoted, so that it is really something more ambitious than a trade list.

— **FLOWERING PLANTS AND FERNS OF THE RIVIERA.**—Messrs. TRÜBNER & CO. have published a series of eighty coloured plates of the plants of the Riviera, with accompanying text by Mr. C. BICKNELL, and on which it will be our duty to remark at greater length on a subsequent occasion.

— **THE INNER TEMPLE CHRYSANTHEMUM SHOW.**—The usual display of the Chrysanthemum flowers in reflexed and hybrid Japanese varieties is now to be witnessed in the small greenhouse near the Embankment entrance to the Gardens. The plants are as well grown as we now have got accustomed to see them; and besides the older favourites, there are some excellent new varieties in *Mulle Lacroix*, a sulphur-white; *Madlle. Antoinette Brunel*, pale rose suffused with white, the florets being tubular; and *Val d'Andorre*, *Mad. de Seoni*, *Jossy Ling*, *M. de Mossillac*, mentioned in our Royal Horticultural Society's show report. *Galatée* and *Colibri* are not in good form here this year.

— **DISA CORNUTA AND SATYRIUM CARNEUM.**—Through the kindness of Mr. P. BAER we have been enabled to examine flowers of these plants grown in the nursery at Tooting. The *Disa*, which is rare, has a flower-spike of 2½ inches in length, with six blossoms open; its radicle is pale blue, the lip pure white, having in the centre of the throat a small spot of blackish-purple. The spike of *Satyrium* measures 6 inches in length and 3 in diameter, the flowers being pink and white, and densely packed together.

— **HOT-WATER THROTTLE VALVES.**—A valve has been brought out by Messrs. BECK & CO., Great Suffolk Street, Southwark, which seems to fulfil admirably the conditions of a secure valve for hot-water pipes. We know how readily, with hard water used, the valves, of whatever metal they may be made, become encrusted with sediment, and also corrode, owing to the salts in such water; it therefore tends to greater efficiency when the valves can readily be taken out and cleaned, as in those before us.

— **TESTIMONIAL TO MR. W. INGRAM.**—We learn from W. L. EMMERSON, Hon. Secretary, Waltham-on-Wolds, Melton Mowbray, that it is proposed to recognise, by a suitable testimonial, the services of Mr. W. INGRAM, which have been devoted to the science and practice of horticulture, at Belvoir, for the last thirty years. All who are interested in gardening, and have enjoyed the privilege of seeing the charming spring gardens at Belvoir Castle, will readily acquiesce in the propriety of a proposal that an acknowledgment at least is due to the author of a style of gardening that has tended so much to the increased cultivation of our most cherished hardy flowers. The following gentlemen have consented to act as a committee to carry out the above object:—Rev. Canon SWELLS, Rev. Canon HOLE, Hon. and Rev. Canon FOSTER, Major NEWTON, Rev. Professor BLAKE, and H. SMITH, Esq.

— **THE ESSEX FIELD CLUB.**—The sixty-second ordinary meeting of the Club will be held in the Loughton Public Hall, Loughton, Essex, on Saturday, October 31, at half-past 6 o'clock. The following paper will be read:—"Mosses and their Allies, with special reference to those of Essex;" by Professor BOULGER, F.L.S., F.G.S., &c., Vice-President E.F.C.

— **SILOS AND ENSILAGE.**—A most valuable parliamentary paper has been issued relating to these

subjects, containing the replies to various questions addressed to farmers and landowners in Great Britain, with a view of eliciting facts and of obtaining the results of their experiments. Reports have been received from 1183 individuals, 963 of the silos being in England, 59 in Wales, and 161 in Scotland, the number being about double what it was in the preceding year. In almost all cases an improvement in the quantity and quality of both milk and butter is reported from the use of ensilage, so that there can now be scarcely any doubt as to the "importance of ensilage as an auxiliary to other food for animals whether for dairy, store, or young stock, among cattle as well as other kinds of stock. . . . [and] it appears probable . . . that farmers will be by its adoption in considerable measure compensated for the loss which they sustain in bad seasons for haymaking, while the importance of the statement to the effect that a larger number of stock can be kept on land where the method of ensiling crops, even of an otherwise unpromising kind, is practised will hardly fail to receive attention."

— **THE SURVEYORS' INSTITUTION.**—The first ordinary general meeting of the session will be held on Monday, November 9, at 12, Great George Street, Westminster, S.W., when the President, Mr. E. P'ANSON, will open the session with an address. The chair to be taken at 8 o'clock. Those proposing to enter their names for the students' preliminary examination, to be held on January 19 and 20, 1886, must intimate their intention to the Secretary before the last day of November. Students eligible for the proficiency examination, to be held in April, 1886, must give notice of the subdivision (table A of rules) in which they elect to be examined, not later than the last day of November. Examinations qualifying for the classes of professional Associates and Fellows will also be held in the month of April next. Names of applicants for these later examinations to be sent in before January 9 next. All particulars as to days, subjects, and course of examination will be forwarded on application to the Secretary.

— **HIPPOPHAE RHAMNOIDES.**—The silvery grey foliage of this rare native shrub is pleasing on its own account, and when planted amongst other shrubs or in the front of trees is conspicuous enough to warrant its being more extensively cultivated. The short lateral branches terminate in a strong spine, and from the fact of its being a maritime plant, and naturally adapted to resist the sea breezes, it is generally known as the Sea Buckthorn. There is no difficulty, however, in cultivating it inland, nor in fruiting it as successfully as, or even better than the *Elaeagnus*, to which it is closely allied. One thing with regard to this must be observed, namely, that the plant is dioecious, and requires male and female plants in the vicinity in order to ensure the fertilisation of the flowers. When this happens, the orange coloured berry-like fruit is produced in great abundance, and persisting on the plant for a long time after maturity, constitutes it a valuable subject for autumnal effects. The berry-like fruit is simply a fleshy calyx-tube, and shows what resources are at Nature's command for the dispersion or dissemination of the seed. The plant is figured in *English Botany*, 6425, and many other works of note. A group of healthy, young, fruitful specimens may be seen by the pond in front of Museum No. 1, at Kew.

— **ABRIDGES LEONIAL.**—A species discovered in Birmah by M. ALLAN COSS. According to the October number of the *Orchidophile*, wherein a coloured figure is given, it is a vigorous plant, with roots more than a yard long, while the rich green foliage does not spot as that of *A. Larpentæ* does. The flowers are in loose racemes, each about 1½ inch in diameter, whitish, with deep violet tips, and with a delicate perfume. The flowers, produced in June and July, last in perfection for three weeks. M. GODFREY cultivates it in a basket in a moist stove.

— **PUBLICATIONS RECEIVED.**—*Reports of the Botanical Exchange Club of the British Isles for 1883 and 1884.*—*Canadian Record of Science.* (Montreal.)

— **GARDENING APPOINTMENTS.**—Mr. J. WYKE, who has, until recently, been Gardener to Mrs. DUNN, Henley Grove, Westbury-on-Trym, Bristol, has taken charge of Mrs. DUNN's gardens at Eccleshall Castle, Eccleshall, Staffordshire.—Mr. E. JONES, Lindley Hall Gardens, Nuneaton, has been appointed Gardener at Stevenston Manor Gardens, Micheldever, Hants.

Orchid Notes and Cleanings.

VANDA CŒRULEA.

WHEN I read at page 437 that "the difficulty attached to the growing of this species is doubtless the greatest obstacle that prevents its becoming common," I felt that the writer had not sufficient knowledge of the subject about which he was writing, and a second letter at page 522 confirms that impression. First as to culture; I maintain *Vanda cœrulea* is easily grown. That it was considered difficult to manage twenty years ago is no reason why it should be stated to be difficult now; shutting one's eyes to the fact, that it is to be seen well grown in a score of public and private gardens near London. My own experience with it is this. I bought seven plants of its some eighteen months ago; they were the lowest priced ones, costing £3 for the lot, hence they are small. One of the smallest plants has a spike with twenty flowers; a larger plant has twospikes with thirty-one flowers. Two of the others have two spikes each, the remainder one spike each. The plants are grown at the lightest part of the Cattleya-house, where they get the greatest heat by day, and the coolest temperature at night. They are close to, indeed almost touching, the glass, at the south end, the part that catches most sun; but it is the end furthest from the boiler. "F," has now defined "a handsome flowering specimen" to be a plant 7 inches high, with one raceme having eleven flowers on it. I quite agree with "F." that the flowers are more handsome than those of *Vanda cœrulescens*, but they are not nearly so pretty. Is it a mere fancy of "F.," or is it a well ascertained fact, that the yellow spot, and the three longitudinal plates on the labellum of *V. cœrulea* "serve as guides to the fertilizing insects?" If the colours of the flowers were a guide to insects, what a confusion there would be amongst them in a house of Carnations in flower, but there is none.

ORCHIDS AT SILVERDALE LODGE, SYDENHAM.

The owner of this choice collection of Orchids, Walter Cobb, Esq., is an enthusiastic cultivator, and, with the aid of his gardener has succeeded in producing some wonderful specimens of good cultivation. The plants are kept in capital order, and to all the surroundings scrupulously clean. I would like to say here that cleanliness has much to do with the successful culture of orchidaceous plants, and especially so in the neighbourhood of London. The wood and glass work of the houses become ingrained both outside and inside with dirt of a nature that sticks fast, and requires a good deal of rubbing to remove it. The leaves of the plants also become thickly spotted with "blacks," requiring washing with soapy water and a soft sponge several times a year. White scale, thrips, greenfly, and other troublesome pests must all be kept from the plants, else no success will be achieved worthy of the name. There is not much to be seen in flower in any collection at present, although there is always something in flower even in late autumn; but we generally begin the Orchid season with the Indian Crocuses and Pleione. They are followed, or perhaps coeval with the white *Masdevallias*, and other choice winter flowering kinds. In Mr. Cobb's collection *Vanda Sanderiana* is in flower; one fine plant has three spikes with nineteen flowers on them. The longest spike has ten flowers open on it. This splendid acquisition has now proved itself to be winter-flowering, and when established does not seem to be of difficult culture; it requires to be grown, of course, in the warmest house. I had not previously seen the new *Angraecum Leonis* in flower; two small specimens were in flower, and very beautiful they were. When well established this species will be the most popular in the genus. *A. Ellisi* was producing a moderate-sized spike. Mr. Cobb is the owner of some very rare forms of *Cattleyas* and *Lælias*. There is in flower a species which we thought to be quite new; it may be a form of *C. speciosissima*, but it has flowers as large as a moderate-sized *C. gigas*, and not unlike that species in form, although the colours are more of *C. speciosissima*. The growths are very small and quite distinct. Two flowers have been produced on one spike. The petals are of a clear pale rosy-lilac colour, 2½ inches wide. The fringed lip is prettily marbled with purplish-crimson, the throat whitish. There is a pretty

form of *Lælia elegans*, with white sepals and petals, but the purplish lip is distinct from that of the original *L. elegans alba*. *Zygopetalum Gautieri* was exceedingly pretty, the sepals and petals, of a green colour, were nearly covered with brown blotches, the lip rich blue. *Lælia Dayana* is a bright little species at this season of the year; a few plants suspended from the roof were very attractive. The sepals and petals rich rosy-purple, and the lip rich crimson-purple, are the characteristics of this species. F. D.

ABIES GRANDIS.

THIS confusion in the nomenclature of our coniferous trees has arisen from imperfect information to begin with, from accidental misplacement of labels, from

FIG. 129.—BRACTS OF ABIES GRANDIS, TO SHOW THEIR VARIABILITY.

the separation in herbaria of branches from the cones, and other causes into which it is not necessary to enter. Suffice it to say, that each year, as the cones ripen and the trees come to maturity, we have the opportunity of clearing up some of the confusion that has arisen. It is for this reason that we now publish

FIG. 130.—SECTION OF LEAF, MAGNIFIED. †

an illustration (fig. 128, p. 561) of the cones of *A. grandis*, produced at Penthy Castle.

A. grandis forms in our plantations a particularly elegant tree of pyramidal habit with slender branches arranged in tiers, and with a long leading shoot, which gives a particular character to the tree. The bark of

FIG. 131.—BRACT, SIDE, AND SEED.

the tree in cultivation is brown, with a few longitudinal sinuous cracks, glabrous, or at first thinly covered with short reddish-brown hairs. The buds are ovoid, but more elongate than those of the nearly allied *A. Lowiana*, and the bud-scales are pushed off in the form of a small cap. The side buds of the crown of buds at the end of the shoot start into growth earlier than the central bud does. The leaves on the lateral shoots of the year form apparently two ranks, but are probably arranged on the three-eighth part. They are dark olive-green, the innermost or uppermost being shorter than the lower, and they are so arranged as to leave a bare space or parting in the centre. On the leader shoots there is not so much difference in the relative length of the leaves, and the inner or upper ones are somewhat appressed to the stem. The leaf in all cases is linear ligulate, blunt, notched at the apex, and channelled in the middle of the upper surface. The margins are rolled round on to the under surface, and between them and the midrib are two silvery bands marking the position of the stomata or breathing pores. The young shoots with

the leaves are upturned, flat beneath and concave on the upper surface. For further details relating to the botany of the species we may refer to our article in these columns, February 5, 1881, where we had occasion to figure a native grown cone, and then add a description of the tree as grown here.

The form known as *Gordoniانا*, from Vancouver's Island, is scarcely worth keeping up as distinct as the tree has an extensive geographical range, and, no doubt, varies considerably. The Gordon variety is perhaps handsomer, denser in habit, and of deeper colour than most of the specimens. We add the following extract from Sargent's *Forest Trees of North America*, and with it close our remarks on this species, the confusion concerning which is now well-nigh dispelled, though as much cannot be said of some of its near allies. Professor Sargent tells us that the tree is known as the White Fir, and that its distribution is from—

"Vancouver's Island, south to Mendocino County, California, near the coast; interior valleys of Western Washington Territory and Oregon, south to the Unmpqua River, Cascade Mountains below 4000 feet elevation, through the Blue Mountains of Oregon (Cusick) to the eastern slope of the Cœur d'Alène Mountains (Cooper), the Bitter Root Mountains, Idaho (Watson), and the western slopes of the Rocky Mountains of Northern Montana (Flathead region, Canby and Sargent).

"A large tree, 64 to 92 metres in height, with trunk 0.90 to 1.20 metre in diameter, most common and reaching its greatest development in the bottom lands of Western Washington Territory and Oregon, in rich moist soil or moist mountain slopes, then much smaller, rarely exceeding 30 metres in height.

"Wood very light, soft, not strong, coarse-grained, compact; bands of small summer cells broader than in other American species, dark coloured, resinous, conspicuous; medullary rays numerous, obscure, colour light brown, the sapwood rather lighter; specific gravity, 0.3545; ash, 0.40; in Western Oregon manufactured into lumber and used for interior finish, packing-cases, cooperage, &c."

CHRYSANTHEMUMS AT FINSBURY PARK.

THIS recently laid out park has since its commencement been very favourably esteemed by the inhabitants of the district during the summer months in consequence of its cleanly aspect and the high-class "bedding-out" with which it has been beautified. But at present there is the usual charm of the Chrysanthemum exhibition. This year we have no hesitation in stating that through the efforts of Mr. Madlin, the head gardener, the Chrysanthemums are in as fine a state as heretofore. Over 1600 are grown, and it certainly says a great deal, when we state that few plants in the whole collection can be said to be of inferior quality. They are all or nearly so in 8-inch pots, dwarf, compact, and have that peculiar dull green leathery-looking foliage that denotes vigorous health and strong perfect blooms. Some of the blooms are certainly "out of the common," and although many persons may think that the neighbourhood of Finsbury Park is more favoured, on account of its high elevation, than other situations in and around the "smoke," we certainly think that the neighbourhood has its due share of drawbacks in various ways, best known to the dwellers in the district.

The old favourites are nearly all represented, and include good examples of the following:—Lady Selborne, one of the favourites with everybody; Refulgence, some grand examples of Elaine, 9 inches across, with an unusual quantity of petals of fine substance; Mrs. Heale, some splendid blooms of Conte de Germiny, Etoile Toulouseane, the lively coloured Tendresse, some fine showy plants of Flamme de Funch, Tisiphone, striking from its delicately formed petals and pleasing colour; fine examples of Emily Dale; Chang still holds its position as a telling variety, and ought to be in every collection; L'Or du Rhin, very pretty yellow; and Aurea Multiflora, another grand yellow; Moosier Tarm, a very good pink; Mrs. Gordon Rundle, with good blooms; also Hivre Fleur, Red Dragon, Prince of Wales, George Jeny, Queen of England, Soleil Levant, a grand old yellow or deep canary; King of Crimson, a good old reflexed; Jane Salter, Margot, La Nympha, very refreshing in a group; Lord Wolsely, Lord Derby, Criticism, Laciniatum, a very pretty little old variety, little grown now, but well deserving of a place in every collection; Princess of Wales, St. Patrick, Mr. Bann, very good; Miss

Hope, rather a disappointing variety as a rule, is this year very good here. Amongst the newer varieties which have stood the test the best are Monsieur Boyer, a very lively salmon-pink bloom, though rather small; Monsieur Mousillac, a grand thing, very showy, of a deep rich crimson; Mastic, very choice canary, early; and Monsieur Henri Jacotot, another very brilliant crimson.

Of this year's novelties the finest were L'Or de France, a small showy orange-yellow; Colibri, a dull crimson, reverse of petals lighter; Monsieur Raux, after Colibri, but lighter; Fabian de Mediana, pretty tasselled bloom, light centre, ends of petals pink; M. Cochet, a neat light pink; Fernand Feral, a very good bright pink; Joseph Mahood, a grand yellow; Madame de Sevin, a very pretty bright crimson; Frijon, brilliant yellow; Rose du Main, a pretty reflexed pink; Sœur Dorothée Saville, a very choice Japanese Anemone, Souvenir du Japon, light crimson, with curiously twisted narrow petals; and Emblem, a very good orange-yellow. The collection, being very tastefully arranged, presents on the whole a charming effect, and will bear comparison with most of the collections round London.

DISEASE AND DECAY IN FRUIT.—III.*

ASPERGILLUS GLAUCUS, LINK, AND EUROTIUM HERBARIORUM, LINK.

EQUALLY common with the blue mould fungus, *Penicillium crustaceum*, Fries, of fruit, preserves, &c., already described, is *Aspergillus glaucus*, Lk., and its second condition, *Eurotium herbariorum*, Lk. Like *Penicillium crustaceum*, Fr., *Aspergillus* spreads over various decaying substances, it causes one form of "mouldiness," and is extremely common on fruit, preserves, dry bread, cheese, lard, &c.

Aspergillus is the name of the brush used for sprinkling holy water in the Roman Church, and the name has been applied to the fungus before us from a fanciful resemblance between the two. *Aspergillus* resembles a mop in form rather than a brush; *glaucus* refers to the greyish-blue or sea-green colour of the spores. The general resemblance, as seen by the unaided eye, of *Aspergillus* to *Mucor*—a fungus which causes "mouldiness," and to be next described—is shown by its synonyms, viz., *Mucor glaucus*, L., *M. Aspergillus*, Bulliard, and *Monilia glauca*, Persoon. Its superficial resemblance to *Penicillium* is shown in the specific name of *Penicillium glaucum*, Grev.

A peculiar resting condition of *Aspergillus glaucus*, Lk., was for many years described as a distinct species of fungus, under the name of *Eurotium herbariorum*, Lk. At the present time *Aspergillus* and *Eurotium* are known to be merely different conditions of the same mould. The *Eurotium* grows on the same substances as the *Aspergillus*, and the former plant is the resting condition of the latter.

The name *Eurotium* is derived from a Greek word, and means mouldiness; *herbariorum* has been given to the perfect condition of the fungus because its perfect state is commonly best seen on damp plants, often in dried plants in herbaria. The resting form is also common on fruits, preserves, and other decaying bodies. The superficial resemblance of this condition of the fungus to *Mucor* is shown by one of its synonyms, viz., *M. herbariorum*, Pers.; another synonym is *Farinaria sulphurea*, Sow.; the specific name bears reference to the mycelium, which is often sulphury-yellow in colour.

Aspergillus bears the same relation to *Eurotium* as *Oidium* does to *Erysiphe*, the *Aspergillus* being (like *Oidium*) the conidium-bearing, or imperfect, simple, naked-spore-bearing state.

It is usual in botanical descriptions to give the imperfect or conidoid condition of a fungus first, I will therefore first describe the *Aspergillus*. *Aspergillus* chiefly grows on fruits, preserves, and decaying vegetable substances, often in company with *Penicillium*, already described, and *Mucor*, to be described next. It is one of the blue moulds of cheese, to which it gives one of the peculiar flavours agreeable to some, so disagreeable to other persons. The "mouldy" odour from the spores, however, when they are produced in too great an abundance, is generally considered offensive. The mycelium, as seen by the unaided eye, partakes of various shades of white, yellow, verdigris-green, or glaucous blue. The mycelium, when

seen on decaying fruits, preserves, &c., may all belong to *Aspergillus glaucus*, Lk., or possibly to this and some four or five other closely allied species or varieties, and to other fungi, as *Penicillium* and *Mucor*.

When a fragment of *Aspergillus* is placed under the microscope and magnified 200 diameters, it will be seen as at fig. 132. The mycelium is very sparingly and obscurely septate, and distinctly twisted in a screw-like manner, as shown at A, A. From the mycelium numerous slender shafts arise, as at B, B, B, each shaft being more or less twisted like a screw. Nothing is more common than twisting or circumtortion in fungi. Mr. W. B. Grove, B.A., has recently described and illustrated in the *Journal of Botany*, vol. xxiii., p. 165, an *Aspergillus*, extremely close to the one we are now examining, which he has named, on account of its twisting habit, *Aspergillus spiralis*, Grove. Each shaft of *Aspergillus glaucus*, Lk., is surmounted by a globose head, from which spring multitudes of spores or conidia, as shown at C, C, C. The heads which surmount the fertile filaments vary

conidia is shown, enlarged to 1000 diameters, at D, attached to one of the numerous minute supports belonging to the spherical head; part of this head is shown at E, each conidium is attached to its fellow by an extremely narrow septate neck, as at F. The conidia are constantly produced from the globose head, and each new conidium pushes the older conidia further away from the supporting spicule; the consequence is, the conidia furthest away from the globose head are the first produced and the oldest. The conidia, of course, separate from each other at the septa or joints; they, however, do not separate very readily like *Penicillium*, but remain in the chain condition for a considerable time. The conidia germinate very readily by opening, generally at the side, and producing a germ-tube from which other minute shafts of *Aspergillus* quickly arise.

In Professor De Bary's often quoted essay on *Eurotium*, in the *Beiträge zur Morphologie und Physiologie der Pilze*, 1864, he illustrates an example of *Aspergillus* (as the type) with an unusually small head, about one half the diameter of the one I have given as a type; he also illustrates the conidia as globose or slightly oval in shape, and he omits the narrow septate neck between the conidia, and describes and illustrates the extremely minute supporting spicules as comparatively large and "peg-shaped" bodies, as large, or larger, than the conidia themselves. I have not seen the conidia and spicules as Professor De Bary has illustrated them, and I consider his spicules (*sterigmata*) to be really the first series of young conidia seated upon the minute true spicules, which he has overlooked.

It is necessary to point out these facts, as Professor De Bary's illustrations have been copied and recopied so many times that they are now to be found in every text-book of Europe. If new illustrations had been prepared from Nature, and new observations made, any possible inaccuracies of the plates I have mentioned would have been noticed and rectified, but, as I shall show further on, not only have inaccuracies been exaggerated by the copyists, but the copies have been published in such a manner that none but misleading representations of the fungus before us have been placed before students.

During the growth of the conidia certain other prolongations of the mycelial threads extend themselves in a screwlike manner, as shown at G. In these latter growths the twist or circumtortion of the threads is more marked than in the mycelium or the conidium bearing threads. As the apex of the club is reached the spiral turns grow closer and closer together, till the extreme end resembles a short hollow screw. The terminal growth of the thread is more clearly shown in fig. 133, A and B, p. 565, enlarged 400 diameters. It must be noted that the spirally twisted thread becomes more jointed or septate as the apex is reached, as shown. From the lower portions of the spiral slender branches now grow upwards, as at C, D, E, and become closely adpressed to the coil. Professor De Bary says the coil is a female organ (*ascogonium*), embraced by a male organ (*pollinodium*). Fusion no doubt sometimes takes place. Professor De Bary terms this fusion "conjugation," and says the protoplasmic contents of the spiral and the investing filaments, C, D, E, commingle. Sometimes filaments apparently identical with the investing threads grow low down on the spiral, as at H, J, fig. 132, and never reach the terminal cells. After this "conjugation" new filaments continue to envelop the spiral, till at last the spiral termination is quite covered, and it at length takes a globose form, somewhat similar with the analogous growth belonging to *Penicillium crustaceum*, Fr., as already described. This globose termination of certain filaments belonging to *Aspergillus* was at one time considered to be a distinct fungus, and was known as *Eurotium herbariorum*, Lk. A spiral termination enveloped by lateral threads, and so taking the *Eurotium* or globose form, is shown, enlarged 200 diameters, at K, fig. 133, p. 565.

When the infant *Eurotium* ball is once formed it quickly increases in size by the formation of new cells by the cell division of the outer cells inwards. This cell growth goes on until a minute ball the size of F (fig. 134) is formed, here shown in section and enlarged 400 diameters. The original investing cells are shown by somewhat thicker lines in the outer stratum at G, H, the newer cells are within, and the septate spiral coil is seen in the centre. Sprouting from the emeshed coil at J, K, L, and

FIG. 132.—DISEASES OF FRUIT: *ASPERGILLUS GLAUCUS* AND *EUROTIUM REPENS*.

in size according to the age of the filaments, as illustrated. These shafts or fertile threads, with their conidia, represent the growth, which is said to resemble the Romish sprinkling brush.

It should here be noticed that *Aspergillus* grows to about four times the height of *Penicillium crustaceum*, Fr., which is enlarged in fig. 56 and fig. 59, pp. 268, 269, to twice the scale of *Aspergillus*, viz., 400 diameters.

In *Mucor* the spores or conidia are all borne within the head or sporangium; in *Aspergillus* they are all borne in chains outside. The chains of conidia somewhat resemble those of *Penicillium*, but in the latter fungus the chains are continuations of branches from the main stem, whilst in *Aspergillus* the chains all radiate from the outside of the globose head.

In the illustration of the largest fruiting head of this fungus, all the chains of spores from the hemisphere facing the spectator have been removed, to show the form of the globose head with its obscurely reticulated surface, and the numerous little supports or spicules which bear the chains of conidia. The conidia are at first colourless, and as they approach maturity they vary in tint from a milky blue to that of verdigris-green. A fragment of a chain of

* See pages 51 and 268.

are flask-like outgrowths; these are bags or asci, each containing eight spores or sporidia. As the production of the asci goes on the ball or perithecium increases in size, and the loose inner cells of the perithecium collapse and disappear. The asci within are nourished by and grow at the expense of the inner cells of the perithecium, exactly as in Penicillium and germinating Ergot. The asci also dissolve, till at length, when maturity is reached, the Erotium ball consists only of its firm outer layer of brownish cells, and the free spores from the asci, exactly as in the sclerotium of Penicillium. This body belonging to Eurotium has as much right to be termed a Truffel as has the sclerotium of Penicillium. There is, however, no real resemblance to a Truffel: in either case.

Three asci, each containing eight colourless spores, sporidia, ascospores, or seeds, taken out of the Eurotium growth, are shown, enlarged 400 diameters, at N, fig. 133. The asci in Eurotium are four times the size of the similar bodies in Penicillium, and the spores of the former are from two to three times the size of the spores of the latter. The spores themselves are at first globular, as shown at O, but when ripe they take the form of biconvex lenses, as at P, enlarged 1000 diameters, fig. 133. At germination the spore splits, as shown at Q, and a germinal filament is protruded, as at R, also enlarged 1000 diameters. The ascospores of Eurotium and Penicillium are remarkably alike in form.

Further growth of the ascospore is shown at S, enlarged 200 diameters; the mycelium rapidly spreads over any dry and decaying vegetable substance, soon begins to circumnate or grow spirally, and throws up Aspergillus shafts as at T, exactly like the growths we commenced with, and so the life cycle is completed. No sooner is the Aspergillus produced, than a tendency to the screw-like growths of the infant Eurotium also begins to show itself, as at U.

Dr. Montagne was possibly the first to detect the asci of Eurotium. Dr. H. Reiss some years afterwards in *Botanische Zeitung*, August, 1853, appears to have (perhaps unwittingly) published Dr. Montagne's discovery as his own.

Dr. Montagne's protest against the requisition made by Dr. H. Reiss is so characteristic, that his words are here reproduced from the *Journal of the Royal Horticultural Society of London*, 1855, p. 121:—

"Eurotium lateritium, found in the garrison bread by Dr. Rayer, in the peridia of which I have detected asci containing spores, though this genus was previously considered as producing only naked spores. A German botanist (*Bot. Zeit.*, 1853, p. 134), who has either not read, or forgotten my observation, has, after a lapse of four years, published this fact as new, though professedly passing in review all the writers who have spoken of Eurotium. The *Annales des Sciences Naturelles* is not, however, a publication of such obscurity as may justify a writer who has not consulted it. Some, doubtless, would have taken occasion to propose a new genus. We may, therefore, at least be thankful to him for his reserve."

The Dr. Rayer mentioned by Dr. Montagne is the keen observer who first detected the bodies in Potatoes now known to be resting-spores of the fungus of the Potato disease.

Botanists differ considerably in their estimate of Professor De Bary's interpretations of the phenomena connected with the so-called "conjugation" of the spiral "female" thread termination and the "male" embracing filaments. M. Ph. Van Tieghem, in criticising these views in the *Bulletin de la Société Botanique de France*, 1877, vol. xiv., writes:—

"Things happen as M. De Bary describes, but I have seen nothing at any period to authorise me to admit any fecundation—i. e., by supposed sexes. Further he writes:—"With regard to the supposed sexuality observed by De Bary between the summit of the carpogone (spiral) and the extremity of one of the branches issuing from the base, one knows that anastomosis, perfectly indifferent elsewhere, and without apparent result, take place frequently between the mycelial filaments of these plants. There is nothing astonishing, therefore, that a like occurrence should take place, and also be of indifferent result between certain branches which compose the young fruit. One would only be compelled to recognise the union as sexual if by the intrinsic characters or by remarkable or constant consequences it differed from ordinary anastomosis of the vegetable apparatus. This demonstration De Bary has not given."

Van Tieghem goes still further, and says that the mere fusion does not always take place, and if by

accident the cells of the spiral termination and the cells of the investing threads become by "accident" fused, the fusion "is injurious, and determines the arrest of the development of the fruit." When fusion really takes place, Van Tieghem writes, "from that very moment an arrest of development" occurs.

Mr. W. B. Grove, B.A., in his *Synopsis of the Bacteria and Yeast Fungi*, says in reference to the nature of the so-called sexual growths of *Aspergillus* and *Penicillium* (p. 77), "But later investigators, e.g., Van Tieghem, throw grave doubts upon the accuracy of even De Bary's observations, and he himself (*Beiträge*, iv., 1) seems to admit that he was mistaken."

The conidia in *Aspergillus* also frequently fuse in the style of the fusion of the secondary spores in Protomyces. The simple fusion of Protomyces is termed "conjugation" by Professor De Bary.

Van Tieghem, in short, considers the Eurotium ball to be a mere common Sclerotium, such as I have described under *Penicillium*; and with Van Tieghem's view I am inclined to agree, for I can see nothing in Eurotium but an ascus-bearing sclerotium, but little differing from the ascus-bearing sclerotium of Ergot, of a large number of *Penizae* and of *Penicillium*. An immature Ergot before the asci are protruded is com-

versed; that is certainly of no great consequence, but they are taken from different plates, and some of the illustrations are enlarged to more than three times the scale of the others. The conidiophore is shown, according to the letterpress, without conidia, but with spicules only, but this is a mistake: the first, or two first rows of conidia are really illustrated, and the spicules overlooked. An ascus is engraved at the bottom of the plate in such an extremely awkward place—that it looks exactly as if it belonged to the mycelium of another figure closely adjoining which is only engraved as 190 is to 600. Now when other copies have been made from this already bad copy they have, in every instance known to me—and the instances are many—been reversed, as in Sachs's, and the same odd ends have been jumbled together with the conidiophore, said to be without conidia, and the ascus in the same unfortunate position, close to the mycelium, three times less than itself in scale, though drawn of identical diameter. To make confusion worse confounded sometimes Sachs's plate has been photographically reduced to suit pages of various sizes, so that the different scales, misleading at first, have become still more confused. Copyism in such a style, although said to be sometimes "good," is by no means creditable to the copyists; it causes general disrespect to be shown towards the work of all English botanists, and it does an obvious and great injustice to Professor De Bary's work. There is no need to copy over and over again plates of such common fungi as Eurotium, *Aspergillus*, *Mucor*, and *Penicillium*, for these plants occur in all places at nearly every season of the year, and can always be easily procured.

As in *Penicillium*, already described, the conidia and spores of *Aspergillus* and Eurotium are at nearly all times so extremely abundant in the air that it is most difficult to preserve fruits and provisions from their attacks. The remarks made regarding the spores of *Oidium* on p. 54, and *Penicillium*, p. 263, generally apply to *Aspergillus* and Eurotium. Some further and concluding remarks on the spores of the whole series will be given in the fourth paper descriptive of *Mucor*. *Worthington G. Smith, Dunstable.*

HOME CORRESPONDENCE.

The Gourcock Collection of Hybrid Gladioli.

—The collection of Gladioli shown by Mr. A. E. Campbell, of Cove Gardens, Gourcock, N.E., at South Kensington, on October 13, was remarkable for the extent of the exhibit, comprising, as it did, 165 spikes, and also from the fact that the spikes had been cut late on the Saturday night previous, and packed in flat wooden boxes, twelve or thirteen spikes in a box, and the stems covered with damp moss. The spikes are cut within about a week of being fully matured, and this allows for travelling and exhibition for a few days. Mr. Campbell stated it was the first time he had sent spikes of Gladioli so far without being placed in water. How beautifully fresh they looked when staged was clearly apparent, and no one scarcely would have imagined they had been brought a distance of over 400 miles. Gourcock is about two miles from Greenock, and when east winds prevail the smoke from this busy centre is blown on to the Cove Gardens. The latter are within 200 yards of the sea shore, and the soil is light and sandy on a gravel subsoil. The bulbs are planted out in March, and when the flower-spikes ascend they are tied out to stakes to prevent their being blown about by the wind. Not only were the spikes fine, but the individual flowers were large and handsomely coloured. Some of the varieties shown were raised by Messrs. Kelway & Sons, others by Mr. S. Dobree, another Somersetshire raiser; but the chief of them by M. Souchet. A selection of the best varieties comprises *Adolphe Brongniart*, *Africaine*, one of the darkest, *Ambrose Verschaffel*, *Archduchesse Maria-Christina*, *Atlas*, *Bicolor*, *Bremontier*, *Cameleon*, *Cyprie*, *Carnation*, *Celtimene*, *Colbert*, *Columbus*, *Crépuscule*, *Dalliah*, *Delicatissima*, *De Mirbel*, *Eclair*, *Felicien David*, *Flamboyant*, *Gigantes*, *Hercules*, *Hesperide*, *Horace Vernet*, *Jeannette*, *Lacpede*, *Laoder*, *Leviathan*, *L'Unique*, *Violet*, *Mabel*, *Marquis of Lothian*, *Meyerbeer*, *Minut Etua*, *Ondine*, *Orpheus*, *Psyche*, *Rosa Bonheur*, *Rosa Perfecta*, *Schiller*, *Shakespeare*, *Sylvia*, and *Titania*. This makes a very fine collection of just over forty

FIG. 133.—DISEASES OF FRUIT: ASPERGILLUS CLAUCCUS AND EUROTIIUM REPENS.

parable with Eurotium, and if we acknowledge a sexual process in the latter it must be extended to Ergot and many other sclerotia. It may be objected to this view that all sclerotia are (or rather should be) hard growths, as indicated by the name, but some sclerotia are soft and very loosely built up, and do not even require a period of rest, as the sclerotium of *Mucor subtilissimus*, B.

The statements found in our text-books under *Penicillium*, *Aspergillus*, and Eurotium must be received with great reserve; no printed descriptions but the originals are indeed worthy of notice, for they are mere copies to which no verification, criticism, or even thought, has been applied.

In the same way as *Penicillium* has unwisely been placed with the Tubercerae, or Truffels—a set of fungi to which it is entirely foreign—so Eurotium has been as hastily grouped with the Erysiphæe, another group of fungi possessing entirely different characters from Eurotium. *Erysiphe*, a genus of fungi which causes the mildew of the Vine, the Hop, and other plants, will shortly be described and illustrated in the *Gardeners' Chronicle*.

In reference to the manner in which copies have been made of the original illustrations as published by Professor De Bary, we may instance Sachs's *Handbook* (English edit.), p. 257. Here a number of odds and ends are jumbled together, with no clue to the scales of the different representations. The figures are

varieties, and a few of them are in all probability twenty and twenty-five years old, thus showing how some of the old varieties hold their own still. It may be added further, as a cultural suggestion, that Mr. Campbell lifts his bulbs at the beginning of December when there is a probability of severe frost, but when the weather is fine and drying the roots are lifted with a little soil adhering to them; they are put away in a cool and dry place, and when dry the bulbs are cleaned over for storing away for the winter. R. D.

A Hint to Gardeners.—Six weeks ago a man giving the name of Chas. Smith called upon me saying that he was destitute, that he had slept under the cover of boats on Brighton beach, and had tasted no food for two days; he had walked miles, but could get no employment. He said that if any one would only find him work, no matter what kind, he would feel thankful during the remainder of his days. Well, here is his idea of gratitude, after obtaining what many worthy men fail to obtain. I advanced him money to meet his pressing wants, gave him food and work, which he might have continued in until the completion of the new grounds here. Instead of which he quietly went away after receiving his week's wages in full, having requested me not to deduct money advanced, as he wanted to buy a coat. Since he left I have received numerous complaints from people who could ill afford to lose a few shillings. A man cannot prevent misfortune, but he might remain honest, and not a disgrace to the profession to which I am sure he belongs. J. McDonald, Foreman to R. Usher, Esq., Landscape Gardener, Worth Park.

Gardeners' Education.—As I have frequently seen the necessity of a better professional education for English gardeners urged in your valuable paper I have thought that it possibly might be of interest for some of your readers to see how horticultural knowledge is promoted in other countries. I will, therefore, give a short account of the course of instruction as carried out in the Royal High School of Agriculture in Copenhagen, an institution where I dearsay gardening is treated more scientifically than is the case anywhere else. The aforesaid institution is a combined school for veterinary surgery, agriculture, horticulture, forestry, and surveying. Where it is necessary to do as much as possible with limited means this combination has great advantages. Several subjects are naturally common to different classes of students, such as geology and chemistry for agriculturists and horticulturists. In those cases the same teachers will do for the various classes, and yet be able to render the lectures more instructive than the case would be were there small independent professional schools. Attached to the school is a botanical, a fruit, and a vegetable garden, together with a horticultural museum; besides these there are collections illustrating the sciences taught, as a mineralogical collection, &c. It is expected that the student at this entrance has sufficient knowledge to be able to follow the instruction, that is, has frequented a middle-class or grammar school; besides, scarcely any student of horticulture will enter without having had some years of practical experience. It is necessary to prove that degree of education only when he intends to apply for aid to enable him to carry out his studies. The subjects are physics, chemistry, geology, botany, zoology, surveying and levelling, drawing, plant pathology, and horticulture—the course lasting about a year and two thirds. In the class in physics are taught the general principles of statics and mechanics, the theories of heat, electricity and magnetism, optics and meteorology, frequently illustrated by experiments. Chemistry is treated both theoretically and practically. In the department of inorganic chemistry are taught all the elements of any consequence, their qualities, symbols, equivalents, and their most common compounds, and instruction in the use of the chemical numbers for finding out at the proportions of the elements in compounds, and the more prominent theories are also noticed. The lectures on organic chemistry comprehend the organic compounds generally found in plants and animals, and the most common products obtained from organic sources. The analytical chemistry treats of the tests for, and the methods of analysis of the principal substances. All lectures on chemistry are amply illustrated by experiments and specimens of the substances in question. In the practical course the student has to go through the

different operations necessary in a laboratory, examine the various tests, and at last practise the analysis of inorganic and organic substances. When the course of instruction is finished, and has been properly attended, the student is able to analyse every substance common in daily life, or necessary to him in his profession, such as artificial manure, &c. In geology a general view is given over the earth crust structure and genesis with a more special mentioning of the minerals that form the arable soils in Denmark. Special attention is paid to the physical and chemical qualities of the soils and subsoils, and their suitability for different crops. In botany, anatomy, morphology, physiology, and plant geography are taught. To the explanation of the natural and the Linnean systems are attached exercises in describing and defining of plants. There is given an account of the more prominent plants, which are useful, of service in human economy. In the botany of forestry, a description is given of nearly all the trees and shrubs hardy in Denmark. The instruction is illustrated by living and dried specimens, the instruction being assisted from the beginning of May by weekly excursions into the country. In zoology special attention is paid to animals injurious to plants. The course of surveying and levelling is chiefly practical. Surveying is taught in the field, and the construction of plans from the paper calculations and dividing of areas; levelling is practised so far that the student is enabled to construct profiles and equidistant horizontal curves after his own work in the field. In drawing the pupil practises projectional drawing, drawing of garden tools and implements, and of the signatures necessary for garden plans. In plant pathology instruction is given on the more common plant diseases, especially those caused by parasitical fungi, and such as are caused by external agents, as frost, insects, unfavourable situations, &c., with the rational preventives. The introductory instruction in horticulture comprehends the principal outlines of plant physiology, the qualities of soil and manure, the choice of situations for gardens, and the means to improve unfavourable situations by lee planting, &c., the fencing in, and the propagating and cultivation of plants in general. The history and development of horticulture in Denmark, together with a description of the present state of gardening at home and abroad, are also afforded. In special horticulture the plants of the fruit and vegetable garden are described singly, with respect to their geographical extension, varieties, propagation, cultivation, and application. The instruction is aided by exercises in describing plants and fruits, by excursions, practical demonstrations, and exhibitions in the horticultural museum. At the end of each course an examination, comprehending all the subjects treated, except geology, takes place. This examination is verbal and public, with the exception of horticulture, which is conducted at three *vised* *examinations*, and two in writing and chemistry, of which there is one practical test; and drawing and surveying, which are practical. The practical test in chemistry is to analyse a solid or liquid which may contain organic as well as inorganic substances. The result of the analysis is to be accompanied by a written account of the method of procedure. The practical test of surveying comprehends the levelling of an area of about 5 acres, a construction of a plan over the area with 1 foot equidistant curves, and a profile of the outlines, a calculation over the earth-work by the same areas, levelling and afterwards dividing it into given proportions. In drawing are required a projectional drawing, a drawing of a tool or implement, and a copy of a garden plan containing all the necessary signatures. C. V. Larsen.

The Acacia used at Masonic Funerals.—In reply to your correspondent "A. N.," respecting the Acacia used at masonic funerals, the following information may be of service. The true symbolic Acacia used by the Freemasons in their funeral service is *A. nilotica*, the Mimosa nilotica of Linnaeus, but in place of this generally unobtainable species, Robinia Pseud-Acacia has to do duty in Britain; a very opposite purpose to that for which it is used in America, where the young lover breaks off a branch of the Robinia with its beautiful blossoms and presents it to his sweetheart to declare his first passion. If your correspondent would like to know the origin of the custom, viz., the use of the Acacia at masonic funerals and you would care to print it, I shall be happy to

send you the same. [Please do so. Ed.] W. E. Dixon, P.M., 294.

Tritomas.—On p. 534 "A. D. W." writes of Kniphofia Sandersi as having a dwarf habit, which assertion is incorrect, for evidently "A. D. W." writes of a plant not true to name. Kniphofia Sandersi has been distributed from my garden, and is a plant quite as stately as *T. nobilis*; the flower-spikes are more cylindrical, over a foot long, and of a nearly uniform brick-red colour. The beauty of these plants will be appreciated still more when the newer forms which I have raised become better known; among these some have rich yellow flower-spikes, others blood-red protruding anthers; one is very dwarf and floriferous, another is the most giant form ever seen in Europe. Max Leichtlin, Baden-Baden.

Reports of Societies.

ROYAL HORTICULTURAL: October 27, 1885.

An excellent show of Potatoes, and vegetables, and fruit was found at this meeting, and flowers were in sufficient numbers to brighten up the conservatory with their presence. Where we might have reasonably expected only mediocre general excellence was found, for seldom have finer culinary vegetables been staged at an autumn show, and so extensive was the competition that many were delirious from taking prizes for first-class stuff for lack of prizes in the Royal Horticultural Society's schedule. The warmth of the soil, when aided by the welcome rains of September and this month, have done wonders for Potatoes and vegetation generally.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. J. Douglas, W. Bealby, J. Laing, J. Child, H. Herbst, J. James, T. Baines, J. Denny, H. M. Pollett, E. Hill, H. Cannell, H. Bullantine, H. Turner, J. O'Brien, H. Williams, A. Perry, Shirley Hibbeid, and Dr. Masters.

CERTIFICATED PLANTS.

Some pretty hybrid Calanthes were brought by N. C. Cookson, Esq., Oakwood, Wylm-on-Tyne, viz., C. Alexandrii × C. Veitchii and C. oculata—the colour was rosy-crimson; the other was C. Cooksonii × C. Veitchii and luteo-oculata, a light coloured flower, displaying, as did all of those shown, the conspicuous lip of C. Veitchii. These are useful additions to this late blooming genus. Messrs. J. Veitch & Sons, Chelsea, showed Cattleya autumnalis, with a tall spike of five dark purple blossoms. Mr. B. S. Williams, Paradise Nurseries, Upper Holloway, exhibited Sarracenia Buchananii, having a dwarf habit and dark rich crimson petals veined with lines of a deeper colour; Nepenthes Excebor, a robust growing variety, bearing dark chocolate-brown and green pitchers, equal to holding half-a-pint of liquid; and the charming lemon-coloured Cymbidium elegans—the flower-stalks in this species are partially pendulous and the blooms tubular; the plant bore the usual spikes which spring from the base. Mr. A. Wright, gr. in the Middle Temple, Gardens, showed Chrysanthemum val d'Andore, a Japanese variety, with red and gold thread-like petals.

A Botanical Certificate was granted to Mr. Billantine, The Dell, Egham, for Peristene elegans, an ivory-white bloom, covered with minute reddish spots, the flower, urn-like, pushes out through the material surrounding the roots, and is found in numbers, from three, as in this specimen, to nine on a flower-spike.

GENERAL FLORAL EXHIBITS.

Messrs. J. Veitch & Sons showed the following novelties in Chrysanthemums.—Lakme, Melanie Fabre, as plants in bloom; and of C. Lady Rosebery three cut blooms, a good-looking blue-colored Japanese variety raised by Mr. S. Siler. *Amazonia puricea* was again shown by them, and likewise some pans full of small plants of the best varieties of Bourdais, as General Garfield, Maiden's Blush, Alfred Neener, Leiantha, Vreclandii, Priory Beauty, Umbelata Alba, some specimens of its purple berries.

Mr. B. S. Williams showed the fine Bromeliad *Echmea imperialis*, a strong-growing species, with much mellowness on the stout, channelled leaves, the flower-stalk and bracts are vivid rosy-crimson, and the inflorescence green; Sarracenia Francaeusii, patacina and S. varioltris, the pitchers crimson and green, and quite dwarf.

J. Bateman, Esq., Worthing, showed *Acacia retinodes*, from the open air, as a proof that, at least amongst Antarctic species, there are some which can stand our climate in the south of the country. The shoots were still bearing a few flowers.

The New Plant and Bulb Company, Colchester, showed *Nerine venusta* in bloom, the orange-scarlet flowers making a vivid autumn plant.

Mr. W. E. Boyce, Verby Road, Upper Holloway,

showed the rich orange-brown pompon *Chrysanthemum Pomponius*, very free, one of the best of its class.

Mr. R. Owen, nurseryman, Royal Hill, Maidenhead, showed cut blooms of Japanese *Chrysanthemums*, mostly novelties, viz.—Margot, Japanese, rose-pink; Harman Payne, Gloire Japonaise, Souvenir de Carre, rich brown, the reverse of the petals golden; Empress of China, pale yellow, broad fluted; La Sirene, scedding, negonias, and Dahlia came also from this exhibitor, but judging from these late specimens, there was nothing of particular merit. A Vote of Thanks was accorded.

Messrs. H. Cannell showed *Chrysanthemums* and 2031 *Polygoniums*.

Mr. Forbes, gr., Dover House, Roehampton, had four new Japanese varieties of *Chrysanthemums*, good things mostly: 1. M. Leon Brunel, dead gold, tipped centre; and Mr. John Laing, red-brown, with a gold coloured centre; and the Violet-scented *Chrysanthemum des Jardins*, were handsome flowers, but the last named boasted of but little Violet scent, as was stated. Besides the Calanthes certificated Mr. Cookson sent C. Normani x C. rubro oculata and C. Veitchii, with a broad lip of white, and rosy-pink spot in the throat. Most of his Calanthe flowers were injured by frost, and the specimen from Newcastle, consequently was not seen at their best.

Messrs. E. G. Henderson & Co., Pine-apple Nursery, Maidva Vale, showed a collection of *Nerines*, the most N. carinata and N. elegans corolla, the remainder having shiny tints, not altogether pleasing. Crispina, Henderson's variety, had excellent tubular flowers, came from the same nursery.

A boxful of Tea Roses in excellent condition was sent by Mr. J. Ridout, gr. to T. B. Haywood, Esq., Woodhatch Lodge, Reigate.

Messrs. Hooper & Co., Covent Garden, were awarded a Bronze Medal for a collection of perpetual flowering Carnations, stocky plants, fairly furnished with blooms; nine scarlets were F. Raspail, Algaetiere, Zouave, White Madame Carle, Chevalier, yellow, striped rose; Crimson Dr. Raymond, Gourdault, a saty-red. Some of the seedlings named, and the Tea Rose were shown by the same firm, in good bloom for the season.

COMPETING GROUPS.

There were but three of Japanese *Chrysanthemums*, the one by Mr. Stevens, nurseryman, Ravenna Road, Putney, being 1st. The group was composed of a few white, and a few yellow, and was placed on a landing at the foot of the stairs in the conservatory, occupying, therefore, a capital position for displaying it, 2d, Mr. A. Luff, gr. to R. K. Hyatt, Esq., Hetherst, Streatham, whose group contained more variety, but fewer specimens; 3d, Mr. Quartermain, gr. to C. E. Smith, Esq., Silvermere, Cobham.

CUT BLOOMS.

For the best twenty-four cut blooms, single specimens, twelve Japanese and twelve incurved, the 1st prize fell to Mr. Kidout, whose stand contained fairly good blooms of rubro-striatum, Madame Reuditer, Augustine Gautier, Dr. Macoy, Margot, incomparable, Madame Sevin, Chang, Madame Indiguer, H. Desperandum, White Venus, Lady Hardinge, Prince of Wales, Jeanne d'Arc, and Nil Desperandum; 2d, Mr. J. Lowry, gr. to J. McAndrew, Esq., Belmont, Mill Hill, whose Ivy, Jacotot, Madame Reuditer, Monsieur Mousille, L'Arlinoise, Monsieur Deschamps, and Dalmia were first blooms; 3d, Mr. C. Goadge, gr. to G. G. Stone, Esq., Eastcote, Redhill, Surrey, all of whose flowers were of the Japanese section. The other exhibitors of cut blooms were Messrs. Owen, Skerrat, G. Stevens, and Davis.

LIST OF CERTIFICATES.

- To N. C. Cookson, Esq., for Calanthe Alexandrii x.
- To N. C. Cookson, Esq., for Calanthe Cooksoni x.
- To Messrs. J. Veitch & Sons, for Cattleya autumnalis.
- To Mr. B. S. Williams, for Cymbidium elegans.
- To Mr. B. S. Williams, for Nepenthes Excelsior.
- To Mr. E. S. Williams, for Sarracea Buchananii x.
- To Mr. Wright, for Chrysanthemum Val d'Andore.

Fruit Committee.

Present: H. Veitch, Esq., in the chair; and Messrs. W. Paul, S. Ford, C. Ross, T. B. Hayward, J. Roberts, G. Bunyard, R. Hogg, J. Burnett.

Several seedling Apples were shown, but nothing was deemed to be of sufficient merit to obtain a Certificate. An Apple named St. Christopher, shown by Mr. Pritchard, Queen Street, Sittingbourne, a very long keeled, conical fruit of medium size, was thought so well of that the committee expressed a wish to see it again later. A small dessert kind, with the marks of good parentage, came from Mr. Cummings, The Grange, Wallington. Mr. C. Townsend, Fordham, Soham, sent six varieties of seedling Apples, which exhibited considerable similarity to the seedlings came from Mr. Lancaster, gr. Holkham, Norfolk, five dishes of very high coloured fruits. Mr. W. Earley showed seedling Apple, very late keeper, coming in clusters, but varying greatly in size and colour. The fruits are commonly destitute of seeds, and it is a sort which will keep from August to June.

Messrs. Peed & Son, nurserymen, Roupell Park, Norwood, showed a red Plum, keeping in good order till late in the autumn; it is small, prolific, and fairly good in flavour.

Mr. W. Dance, gr. to Colonel Lowe, Halestead Place, Essex, showed a collection of fifty kinds of Apples and thirty of Pears, well grown and well coloured fruits. A Silver Banksian Medal was awarded.

The Vegetables.

Not only was the average quality of those shown high, but in most cases the competitors were remarkably keen. Thus in the class for eight kinds of vegetables there were not less than sixteen lots staged—an unwonted number, and leaving but too many disappointed competitors, most of whose exhibits would at any ordinary show have obtained prizes. Here one of the leading exhibitors of vegetables, Mr. Miles, of Wycombe Abbey Gardens, was a good 1st, his entire collection being admirably arranged and faultless in quality. He had admirably fine Cauliflowers, Sutton's New Intermediate Carrots, Veitch's Exhibition Brussels Sprouts, Walker's Exhibition Onions, Dean's Chancellor Potatos, Sion Leeks, Stamford Tomatos, and good red Celery. Mr. Phillips, The Gardens, Cedars, Meopham, came 2d, having comparable White Celery, Sion Leeks, Meopham Parsnips, Aigburth Brussels Sprouts, Perfection Tomatos, Reading Onions, &c. Mr. Haines, Colleshill Castle Gardens, Wilts, was 3d. Several first-class cultivators, had collections unplaced.

Turning to the single dish classes we found no less than twenty lots of Celery, in sixes, generally very fine and clean. Here Mr. Richards, of Somerley Park Gardens, Kingwood, was 1st, with a superb clean solid sample of Wright's White, as good as could be desired. Mr. G. Neal, gr. to P. Southey, Esq., Bampton, came 2d, with excellent stick culm; 3d, Mr. W. Smith, gr. to Lady Fletcher, Yalding, Kent, came 3d, with a solid, though less handsome, sample of Luckhurst Giant White. Sutton's Dwarf White Gem, neat but small, and Major Clarke's Red, were well shown by other exhibitors.

Parsnips are a remarkable show, not less than twenty-two half-dozen being set up. These varied considerably, from stout, handsome, fleshy samples, which the judges favoured, to long, tapering rods, some 3 to 4 feet in length, and nearly all tall. Here Mr. Richards was again 1st, with superb samples of Elmout's Selection, whilst Mr. Haines had, apparently, the 2d prize lot the same kind under the name of Improved Sutton, the same kind coming 3d.

Very handsome in form, and clean and pleasing in colour, were the eighteen half-dozen of Carrots, amongst which Messrs. Sutton and Co. had an intermediate figured prominently. Mr. R. Lye, gr. to W. H. Kingsley, Newbury, was 1st, with very handsome samples of that kind; Mr. W. Pope, Highclere Castle Gardens, coming 2d with the same kind; and Mr. W. Stuke, gr. to the Earl of Elingham, Brockley, followed with even prettier, if not so fine as the same kind.

Turpins made the smallest show, having suffered from drought far more than other garden products. Mr. Richards had pretty white Snowball; Mr. Bolas, gr. to H. C. T. Bell, Esq., Derby, had the same kind; and Mr. Willis, Edgework Park, Banbury, was 3d with neat Sisewick's.

No less than twenty-five lots of Onions, in sixes, greeted the judges, and gave them a very difficult task to select the best from. Eventually the honours fell to Mr. Neal, who had fine Anglo White Spanish, about the best such in the class, and in woodstock; Mr. Witt came 2d with the same kind; and Mr. Aggis, gr. to the Earl of Elingham, Oxford, was 3d. Many of the bulbs shown, though fine, lacked that perfect contour found in the best lots. Rousham Park Hero, Pinefield, and White Spanish were well represented.

Carrots though very numerous, the class was that for Brussels Sprouts, in plants, four of each, of which nine lots were shown; the best, a very erect, well furnished, and medium-sized sprouted sample, being simply a selected strain, from Mr. Lye, to Captain Le Blanc, Banbury, the best in capital, and far before the other high sprung forms commonly grown. Mr. Miles had the 2d best lot in the Edgework, rather squat in height; and Mr. A. Miller, gr. to W. H. Long, Esq., M.P., Townbridge, was 3d, with taller plants of the Aigburth strain. Then there were twenty-two dishes of Brussels Sprouts, Mr. Lye having the best in solid clean moderate-sized samples of the Reading Exhibition; Mr. Lye having 2d place with Aigburth, also good; and Mr. R. Smith came 3d, with the same kind.

Endive in six heads, three each of curled and broad-leaved, did not make a striking show, as much better have been seen. The best came from Mr. Neighbour, Beckley Park Gardens.

On the other hand the show of Beet was excellent, no less than twenty-one lots being set up. Here Keynell's Exhibition, shown in perfect form by Mr. May, was 1st; and Mr. Lye coming 2d, with very fine curled and broad-leaved. The 2d best lot in the Edgework, rather squat in height; and Mr. A. Miller, gr. to W. H. Long, Esq., M.P., Townbridge, was 3d, with taller plants of the Aigburth strain. Then there were twenty-two dishes of Brussels Sprouts, Mr. Lye having the best in solid clean moderate-sized samples of the Reading Exhibition; Mr. Lye having 2d place with Aigburth, also good; and Mr. R. Smith came 3d, with the same kind.

There were twenty lots of three heads of Cauliflowers, many very large, but the 1st prize three, from Mr. Haines, were medium-sized, solid, and white; Mr. Miller following with rather larger samples, though first-rate; and Mr. Ellington, Middenhall, Suffolk, 3d, with still bigger heads. Nearly all those exhibited were of the well known Autumn Giant variety.

Then came nineteen lots of Leeks, mostly huge white stems, the best being the one from Mr. Haines, Mr. Miles coming 2d, and Mr. Richards 3d, with wonderful samples.

Then there ten lots of Cabbages, the best coming from Mr. Osman of the District Schools, Sutton, with fine heads of Sutton's Allheart. Mr. Osman was also 1st, and Mr. Lye having the best in solid clean moderate-sized samples of the Reading Exhibition; Mr. Lye having 2d place with Aigburth, also good; and Mr. R. Smith came 3d, with the same kind.

Red Cabbages were capital samples, not too large, and very solid and highly coloured. Of these there were ten lots, the best again coming from Mr. Osman, whose specimens were of the same kind, whilst Mr. Ellington and Mr. R. Smith were 2d and 3d.

Then came fifteen dishes of Tomatos, the best being Trophy, which took for Mr. Phillips 1st place. These

were fine, handsome, and rich in colour. Hackwood Park and Excelsior were also well shown.

Some little interest attached to the show of Gourds, because of their great variety. Mr. Osman had the best collection of twenty-five kinds, including the Pear-shaped, bottle-shaped, warted, Giant, and other forms; Mr. Glen, gr. to the Hon. Mrs. Montehore, Crawley, Sussex, was 2d, and Mr. J. Sharpe, gr. to F. Hatchett, Esq., Grove Park, Kent, came 3d, with a smaller lot. From the Chiswick Gardens came a very fine collection of many interesting varieties, including the Giant Gourd, White Italian, Red Etampas, and many other large forms.

POTATOS.

South Kensington had an unwonted feature in the competition in the various classes being close, and the samples large, and excellent. There were five collections of thirty dishes. Mr. Hughes, gr. to Colonel Cartwright, Byfield, Notts, was 1st with a superb collection, and included such popular kinds as The Dean, Vicar of Laleham, Edgework Purple, Cardinal, Reading Russet, Rufus, Purple Perfection, of coloured kinds; and Chancellor, Captain, Colonel, Snowdrop, Fidler's Prolific, Cosmopolitan, London Hero, Schoolmaster, and M. P., whites. Mr. Willis was 2d, with a fine lot, and Mr. W. Kerr, of Dargave, Dunfriess, 3d, with smaller, but very clean, fresh samples.

There were ten collections of twelve kinds, in which class Mr. Ellington, Middenhall, was 1st, with good samples of Lee's Defence, Grampian, Edgework Purple, Lifeguard, coloured; and Snowdrop, Magnum Bonum, The Doctor, Chancellor, &c., white kinds. Mr. Willis was again 2d, and Mr. Hughes 3d.

In the class for six kinds there were fourteen lots, the best coming from Mr. Robins, gr. to E. D. Lee, Esq., Aylesbury, who had Schoolmaster, International, Reading Hero, Stodcock Beauty, Magnum Bonum, and Vicar of Laleham. Here Mr. Willis was again 2d, and Mr. Ellington 3d.

Messrs. Sutton & Sons, of Reading, offered special prizes for their Reading Ruby and Early Eclipse, but only four lots competed, the samples, with the exception of those from Mr. Donaldson, Keith Hall, Inverary, being small. This same exhibitor was 1st in the class for five named kinds, and was the most prominent firm. There were twelve collections. Mr. Donaldson had capital Lady Truscott, Favourite, Woodstock Kidney, Reading Hero, First and Best, Liffyfold, &c.; Mr. Haines came 2d, Mr. Howard, Canterbury, 3d, and Mr. Lye, Banbury, 4th. Two good collections were disqualified because in each case one dish was not according to name.

Mr. C. Fidler, of Reading, gave prizes for four named kinds—Success, Prolific, Enterprise, and Reading Russet, eight lots competing. Mr. Hughes having the best samples, with Mr. Willis, Mr. Osman, and Mr. Ellington following.

The only foreign representative collection of Potatos came from the well-known Paris firm of Vilmoren & Co., who had a hundred dishes, inclusive of the curious and unguinely French varieties, and many popular English ones, the samples generally very fine, and some of the English grown tubers are a long way ahead of Continental samples.

Of trade collections Messrs. Sutton & Sons had a fine one, including 14 pairs of Magnum Bonum, Reading Russet, Reading Hero, &c., with a large number of selected seedlings, many of our promising appearances; also good dishes of standard kinds and seventeen of their own sending out.

Some very fine new Intermediate Carrots, Leeks, &c., were also shown. Mr. Fidler, of Reading, put up some 20 kinds of Potatos, mostly very fine samples, including White Elephant, Beauty of Hebron, Reading Giant, General Gordon, Vicar of Laleham, &c., and Mr. W. Kerr put up a very clean neat lot of 10 dishes that were highly meritorious.

The special prizes for Onions of four kinds, viz., Major, Rousham Park Hero, Anglo White Spanish, and the Wroxton, offered by Mr. Deverill, of Banbury, brought some thirty lots. The three first-named kinds bear close family resemblance to the White Spanish, but the best examples were remarkably fine. The Wroxton is well shown by Mr. Osman, and Mr. Deverill, of Banbury, but very fine and handsome as shown. The best came from Banbury district in all cases. It would be interesting to learn what very special culture, as differing from ordinary culture, is applied to the production of these fine prize samples.

EXETER APPLE AND PEAR EXHIBITION.

The second Apple and Pear Exhibition at Exeter was held on Thursday and Friday, the 2nd and 3rd inst., in the Large Market, Fore Street. It was formally opened at noon by the Mayor of Exeter (W. Brown, Esq.), attended by the Sheriff and Town Council. The exhibition itself was a perfect success. The quality of the Apples was remarkably good, considering the unfavourable season for the production of fine fruit. There were ninety-five exhibitors as against eighty last year. On the occasion of the first show the number of dishes was fifty-three as against thirty-eight, and the entries 734 as against 622. The number of dishes of Apples staged for competition was 1708, representing 10,248 fruits. Pears were not so well shown as last year, the number being 100 in Devonshire are Pear crops reported good. The number of dishes shown was 328, or 1640 fruits. Besides the home county fruit was exhibited from Hereford, Kent, Somerset, and Oxford; and, as shown by the prize lists, the same county headed the prize list of every class, with the exception of a few single dishes where Messrs. G. Bunyard & Co. showed fruit grown

under glass. The trade-growers' as well as the amateur classes were strongly contended, and in every case capital collections were put up.—Mr. C. Scater, Devon Nurseries, Heavitt Bridge, Exeter; and Mr. H. Berwick, Sidmouth Nursery, sharing the 10 prizes in the classes. The show of Apples, taken as a whole, was far superior to the one held in London by the Royal Horticultural Society, October 13 and 14; but the Pears fell much short. The arrangements for the exhibition were perfect in every way. The only drawback was the inclement weather prevailing on Friday, the day on which the committee expected their largest number of visitors; it poured with rain the whole day through.

Messrs. Veitch & Sons, nurserymen, Exeter, exhibited about 120 dishes of fruit, grown in their nurseries, to name a few, and included all the best varieties in cultivation. They also contributed largely by loans of plants for decorating the tables—their Acers with their coloured foliage so suitable for intermixing with Apples.

Messrs. Lacombe, Pince & Co., staged some 300 dishes of Apples and Pears. This firm also contributed largely Ferns, Palms, &c., for the decoration of the tables.

APPLES.—CLASSES FOR TRADE GROWERS.

Twenty-four dishes, distinct varieties (eight competitors).—1st, Mr. H. Berwick, Sidmouth Nursery, very fine dish, but including Nelson's Glory and Warner's King, which are synonymous, was decidedly the best, but on account of the two varieties named being synonymous should have been disqualified; his other varieties were Buff Coat, Green Tiffing, Caroline, Dredge's Fame, new Hawthornden (very fine fruit); Dutch Codlin, Mère de Mère, Lord Suffolk, Cellini, Alexandra Russet, very fine and handsome; Emperor Alexander, good; Glory of the West, Hoary Morning, Brabant Bellefleur, good; Beauty of Kent, Hambleton Deux Ans, Blenheim Orange, very fine and well coloured; Reinctate du Canada, Royal Russet, good; Waltham Abbey Seedling, good; Lane's Prince Albert, very fine; and Dumelow's Seedling, also fine samples. Mr. C. Scater, Devon Nurseries, Heavitt Bridge, Exeter, was a good 2d. Included in his collection were very fine fruit of Beauty of Wils, Stirling Castle, and Seedling of Glamis. Dr. H. Cox's Pomona, beautiful colour; Annie Elizabeth, Cat's-head, Warner's King, Lady Henniker, Lady Waldron, Yorkshire Beauty, Red Ribbed Greening, very deep crimson, streaked, &c., 3d, Messrs. G. Bunyard & Co., Maidstone, Kent; extra, Messrs. J. Scott & Co., Marlborough.

Twelve dishes, dessert.—1st, Mr. Scater, with a fine lot of fruit, all of good size and well coloured. His collection comprised Apricot, Red Ribbed Greening, a fine coloured Apple; Winter Warden (Aromatic), beautiful, Cornish Gillyflower, Devonshire Queen, beautiful deep red; Ribston Pippin, Blenheim Orange, well coloured; Court Pendu-plat, very fine dish; Ross Nonpareil, Cox's Orange Pippin, King of the Pippins, 2d, Messrs. Bunyard & Co.; 3d, J. J. Scott & Co.

Twelve dishes, culinary (six competitors).—Again Mr. Scater led the way with a very capital lot, including Annie Elizabeth, fine, and well coloured; Alfriston, Cat's-head, Pondford (or Flanders Pippin), Gravenstein, Lady Waldron, Warner's King, Lady Henniker, very good; Emperor Alexander, Dumelow, very fine; Cox's Pomona, splendid colour; and Old Hawthornden, 2d, Mr. H. Berwick, followed very closely; his Stirling Castle and New Hawthornden were remarkably fine; 3d, Messrs. Bunyard & Co.

TENANT FARMERS.

Nine dishes (ten competitors).—1st, Mr. A. S. Loram, Alpbington, whose collection was almost equal in any respect to the best. He had a very capital lot, including Dredge's Fame, Brabant Bellefleur, Blenheim Orange, Royal Russet, best dish in the show; Royal Somerset, and a very large conical Apple called Loram's Seedling, of very fine size, and the colour of a perfect Mère de Mère, quite distinct to anything seen at any of the fruit shows this season; 2d, Mr. Scater, who followed very closely; 3d, Mr. J. Ham, Broadstait.

Six dishes, Cider Apples (ten competitors).—A fine lot of clean and handsome fruit, 1st, Mr. B. Griffin, Broadstait; 2d, Mr. W. Palmer; 3d, Mr. J. Ham.

PRIVATE GROWERS WITH GARDENER.

Eighteen dishes, distinct (twelve competitors).—1st, Mr. Garland, gr. to Sir T. D. Acland, Kilterton, who staged a very fine lot of fruit, his principal dishes being Mère de Mère, splendid fruit and well coloured, and Alexandra Russet, a fine handsome conical fruit; 2d, Mr. D. C. Fowler, gr. to the Earl of Devon, Powderham Castle; 3d, Mr. Butler.

Nine dishes, dessert (twelve competitors).—1st, Mr. H. Dowell, gr. to C. Carver, Esq., Bridgewater; 2d, Mr. A. C. Williams, gr. to W. C. Sim, Esq., Cyst St. George; 3d, Mr. Garland.

Nine dishes, culinary (eight competitors).—1st, Mr. Williams; 2d, Mr. Rowe; 3d, Mr. Garland.

PRIVATE GROWERS WITHOUT GARDENER.

Three dishes, dessert (fourteen competitors).—1st, Mr. A. Truman, Countess Weir, who had fine fruit of Blenheim Orange, Cornish Gillyflower, and Cox's Orange Pippin; 2d, Mr. H. L. Brewer, Wrentham, Exeter; 3d, Mrs. Manley.

Three dishes, culinary (twenty competitors).—1st, Mr. G. Ward, Wroxton, Banbury, with Peasgood's Non-such, Warner's King, and Lady Henniker, all very fine; 2d, Mr. A. Truman; 3d, Mr. J. Blythe.

Five dishes, by Devonshire cottagers.—1st, J. Hitchcot; 2d, W. J. Gibbins; 3d, C. Dipilate.

OPEN COMPETITION.

Eighteen dishes, distinct (ten competitors).—1st, Mr. Powell, with a clean lot of fruit, including a fine dish of Peasgood's Non-such, well coloured; Lord Derby, Lodington, Warner's King, Ecklinville, Annie Elizabeth, Mère de Mère, Reinctate du Canada, Blenheim Orange, Le Haricot, Royal Russet, Cox's Pomona, Galloway Pippin, Dumelow's Seedling, beautiful colour; Dredge's Fame, Old Hawthornden, Alfriston, Bedfordshire Foundling, 2d, Mr. C. Scater, also with a capital collection; 3d, Mr. H. Berwick.

Twelve dishes, culinary and six dessert (fourteen competitors).—1st, Mr. H. Berwick; 2d, Mr. Garland; 3d, Mr. W. Scott.

Best flavour, single dish.—1st, Mr. Bunyard, with Cox's Orange Pippin; 2d, Mr. H. Berwick, with Ribston Pippin.

Heaviest six fruits (twenty-three competitors).—1st, Mr. W. Blackmore; 2d, Mr. R. Dennis, both with Warner's King, 6 lb. being the heaviest.

Single dish.—Alfriston (to competitors), 1st, Mr. A. C. Williams, very fine; Blenheim (37), 1st, Mr. W. Blackmore, very fine, and well coloured; Golden Noble (13), 1st, Mr. A. C. Williams; Lord Suffolk (17), 1st, Messrs. Bunyard & Co.; Norfolk Beefing (6), 1st, Messrs. Bunyard & Co.; Warner's King (16), 1st, Mr. H. Dowell; Dumelow's Seedling (22), 1st, Mr. J. Mingo, gr. to C. E. Wares, Esq., Cobham; any other fruit (38), 1st, Mr. W. Mortimore, gr. to Colonel White Thompson, Bromford Manor, with very fine New Hawthornden; Cornish Gillyflower (20), 1st, Mr. C. Scater, very fine; Court Pendu-plat (14), 1st, Mr. C. Scater, extra fine; Cox's Orange Pippin (15), 1st, Messrs. Bunyard & Co., very fine fine handsome, grown under glass; Gravenstein (10), 1st, Mr. C. Scater; King of the Pippins (22), 1st, Messrs. Bunyard & Co.; Margil (8), 1st, Mr. Powell; Ribston Pippin (56), 1st, Mr. W. C. Lewin; Winter Warden (7), 1st, Mr. J. Stevens; any other sort dessert (46), 1st, Mr. J. Stenner, with Adams' Pearmain, good.

PEARS.—TRADE GROWERS.

Six dishes, distinct (eight competitors).—1st, Messrs. Bunyard & Co., who had fine Beurré Clairgeau, Beurré die, Doyenné du Comice, Calabasse, Émie d'Orst, Winter Nelis, Sir Germain; 2d, Mr. H. Berwick; 3d, Messrs. J. Scott & Co.

PRIVATE GROWERS.

Six dishes, distinct (nine competitors).—1st, Mr. Garvey, who did not show in his usual style, but had some very fine fruit of Pomaton Duchesse. He also had Beurré Die, Van Mons' Léon le Clerc, Doyenné du Comice, Winter Nelis, and Marie Louise. 2d, Mr. Powell; 3d, Mr. H. Dowell.

Three dishes, dessert (twenty-two competitors).—1st, Mr. Powell, with fine Marie Louise and Louise Bonne of Jersey, and handsome coloured Beurré Clairgeau; 2d, Mr. Garland; 3d, Mr. James, gr. to Sir J. Waldron.

Three dishes, culinary (ten competitors).—1st, Mr. Gibson, gr. to Sir B. Samuelson, Brixham, who had splendid fruit of Cattilac, Black Worcester, and Bellissime d'Hyver.

OPEN CLASSES.

Single dish.—Cattilac (11 competitors). 1st, Mr. Gibson, very fine; Uvedale's St. Germain (4), 1st, Mr. E. Prothero, Exeter; any other sort, culinary (11), 1st, Mr. E. Gibson, Black Worcester; Beurré Die (14), 1st, Messrs. G. Bunyard and Co.; Chamontel (8), 1st, Mr. J. Ham, fine colour; Doyenné du Comice (5), 1st, Mr. W. J. Batchesill; Éster Beurré (6), 1st, Messrs. G. Bunyard & Co.; Glou Morceau (7), 1st, Mr. W. J. Sweetland; Josephine de Malines (5), 1st, Mr. W. C. Lewin; Louise Bonne of Jersey (12), 1st, Mr. W. Sanders; Marie Louise (12), 1st, Mr. D. C. Powell, very fine dish; Pomaton Duchesse (5), 1st, Mr. W. J. Batchesill; Winter Nelis (7), 1st, Rev. T. Lewis; any other sort, dessert, (20), 1st, Mr. W. J. Batchesill, with a fine dish of Marie Benoit.

Six Quinces.—1st, Mr. C. Scater. Twelve Tomatos.—1st, Mr. D. C. Powell, with a fine and good collection of Hathaway's Excelsior, grown in the open air.

Twelve Medlars.—1st, Rev. W. B. Wrey (Dutch variety).

NATIONAL CHRYSANTEMUM SOCIETY.

At a meeting of the Floral Committee, held at the Royal Aquarium, Westminster, on Wednesday, October 28, Mr. E. Sanderson, President, in the chair, and the following members being present—Messrs. Ballantine, R. Dean, G. Gordon, G. Stevens, R. Davis, Lewry, J. C. C. G. Bevan, Butcher, Springbett, Mardlin, Berry, and W. Holmes, secretary, the following awards were made:—To W. Child, Esq., for large-flowered Anemone Chrysanthemum, Nouvelle Alvéole, a finely-formed and distinct pale purple variety of very promising character; to Mr. Wright, Temple Gardens, promising character; to Mr. Wright, Temple Gardens, for Japanese Monsieur Freeman, and to Japanese Val d'Andorre, gold and orange-brown; and to Mr. Forbes, Roehampton, for Monsieur Mollane. The following were commended—Madame Melanie de Savre, lively pale pink, very much reduced in size; a distinct variety of Mr. Forbes's Temple Gardens; an unnamed seedling reflexed Chrysanthemum, of a pale purple colour and distinct character, from Mr. Springbett, of Cheshunt; and Japanese Fleur des Bois, deep bright red, small, but very fine in colour, from Mr. Forbes, Roehampton. The committee requested to Mr. Wright, Temple Gardens, to send a specimen of the following again—Large flowering Anemone Grande Alvéole, bluish or delicate pink, from Mr. Child; Japanese Monsieur Garnier, deep orange-cinnamon, the reverse golden-buff, very

pretty indeed, from Mr. W. Holmes, Frampton Park Nursery, Hackney; Japanese Madame J. Laing, delicate flesh, with golden centre, large and full, quite distinct, the basal petals reflexed, the centre slightly incurved, from Mr. Wright, Temple Gardens; Anemone-flowered Japanese Bacchus, dark magenta, grand petals, the centre buff and crimson; Japanese Monsieur Harman Payne, deep reddish cinnamon, the centre pale gold, very promising, from Mr. N. Davis, nurseryman, Camberwell.

Votes of Thanks were passed to Messrs. H. Cannell & Sons, nurserymen, Swanley, for cut blooms of Dahlias, Begonias, and very fine zonal Pelargoniums; to Mr. W. Boyes, nurseryman, Ilington, for cut flowers of Chrysanthemums; and to Mr. R. Owen, nurseryman, Maidenhead, for the same. This was a very interesting meeting, and the appointment of a Floral Committee appears to be highly esteemed by the Chrysanthemum growers.

The Weather.

- Oct. 22.—Fine day night, very fine night.
- 23.—Rain all day.
- 24.—Heavy rain in early morning, dull day, very fine night.
- 25.—Fine day, very fine night; lunar halo.
- 26.—Rain in early morning, short intervals of sunshine during the day, very fine night.
- 27.—Fine day; very fine night.
- 28.—Fine day, overcast at times.

LONDON: Atmospheric Pressure.—During the week ending October 24, the reading from the barometer at the level of the sea increased from 30.12 inches at the beginning of the week to 30.17 inches by 9 A.M. on the 18th, decreased to 29.75 inches by 1 P.M. on the 21st, increased to 29.77 inches by 5 P.M. on the same day, decreased to 29.21 inches by 9 A.M. on the 24th, and was 29.31 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.75 inches, being 0.06 inch lower than last week, and 0.14 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 52°, on the 21st, on the 24th the highest was 46° 5'. The mean of the seven high day temperatures was 49° 2'.

The lowest temperature was 39° 0, on the 20th and 22d, on the 18th the lowest temperature was 42°. The mean of the seven low night temperatures was 40° 1'.

The greatest range of temperature in one day was 12° 4, on the 21st; the smallest, on the 24th, was 6° 5'. The mean of the seven daily ranges was 9° 1'.

The mean temperatures were—on the 18th, 45° 4; on the 19th, 44° 7; on the 20th, 43° 7; on the 21st, 41° 8; on the 22d, 44° 2; on the 23d, 44° 6, and on the 24th, 43° 3; and these were all below their averages by 4° 3, 4° 8, 5° 6, 4° 2, 4° 5, 3° 7, and 4° 6 respectively.

The mean temperature of the week was 44° 4, being 0° 4 lower than last week, and 4° 5 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 79°, on the 19th. The mean of the seven readings was 64° 4'.

The lowest reading of a minimum thermometer

placed on grass was 32°, on the 23d. The mean of the seven readings was 35°.

Rain.—Rain fell on four days, to the amount of 0.92 inch.

ENGLAND: Temperature.—During the week ending October 24 the highest temperatures were 59° 5 at Wolverhampton 59° at Truro, 58° at Plymouth and B-ighton; the highest at Bolton was 48°, at Sheffield 49°, and at Liverpool, 49°.2. The general mean was 53°.4.

The lowest temperatures were 33°.9 at Wolverhampton, 35° at Truro, 35°.2 at Bristol; the lowest at Nottingham and Leeds was 40°, and at Blackheath, Sheffield, Bradford and Preston 39°. The general mean was 37°.4.

The greatest ranges were 25°.6 at Wolverhampton, 24° at Truro 21° at Plymouth; the least ranges were 10° at Sheffield 11° at Leeds, 11°.1 at Liverpool. The general mean was 16°.

The mean of the seven high day temperatures was highest at Truro and Plymouth, 54°.3, at Liverpool, 51°.5; and was lowest at Bolton, 45°.1, at Liverpool and Sunderland 46°.4. The general mean was 48°.9.

The mean of the seven low night temperatures was highest at Brighton, 42°.3, at Leeds 41°.4, at Truro, 41°.1; and was lowest at Wolverhampton, 37°.8, at Bolton 38°.5, at Sunderland 58°.8. The general mean was 40°.1.

The mean daily range was greatest at Plymouth, 13°.4, at Truro 13°.3, at Wolverhampton 11°.5; and was least at Liverpool, 5°.9, at Bolton 6°.6, at Leeds 6°.8. The general mean was 8°.8.

The mean temperature was highest at Truro, 46°.9, at Plymouth 46°.7, at Brighton 46°.1; and was lowest at Bolton, 40°.9, at Sunderland, 41°.7, at Wolverhampton, 42°.5. The general mean was 43°.7.

Rain.—The largest falls were 2.57 inches at Hull, 2.52 inches at Sheffield 2.03 inch at Nottingham; the smallest falls were 0.66 inch at Preston, 0.75 inch at Bristol, 0.79 inch at Bolton. The general mean fall was 1.46 inch.

SCOTLAND: Temperature.—During the week ending October 24, the highest temperature was 50°.5, at Paisley; at Edinburgh the highest temperature was 48°. The general mean was 48°.9.

The lowest temperature in the week was 21°, at Perth; at Leith the lowest temperature was 37°. The general mean was 31°.3.

The mean temperature was highest at Leith 42°.5; and lowest at Perth, 38°.6. The general mean was 41°.

Rain.—The largest fall was 0.48 inch, at Edinburgh; the smallest fall was 0.02 inch, at Greenock. The general mean fall was 0.20 inch. No rain fell at Glasgow.

JAMES GLAISHER, F.R.S.

Enquiries.

"He that questioneth much shall learn much"—Bacon.

LIST OF EVERGREEN OR DECIDUOUS TREES AND SHRUBS.—Can any of your readers give a short list of evergreen or deciduous trees and shrubs suitable for New South Wales, in the district between the Murray and Lachland rivers, and in the vicinity of the townships of Oxley and Blairnaird? W. S.

Answers to Correspondents.

* * OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that in pursuance of the new telegraphic regulations our Registered Telegraphic Address is "GARDCHRON, LONDON." GARDCHRON being written as one word. Telegrams thus addressed will reach the Editor or the Publisher without other address being needed than "GARDCHRON, LONDON."

BEE: Y. R. Get Bee-keeping, by Alfred Rusbridge. E. W. Allen, 4, Ave Maria Lane, London, E.C., 11, 6d.

ERRATUM.—Messrs. J. R. Pearson & Sons have entirely given up Pear culture in pots, finding it very unprofitable. All their exhibits at the Pear Conference were gathered from open air trees, and not from pot-trees, as was stated in our report.

FILBERT BUSHES.—IS IT NECESSARY TO GRAFT THEM, AND WHEN DO THEY BEAR? W. W. It is not necessary to graft Filberts or Cob Nuts, as they are raised on their own roots. When planted early, they carry a few small Nuts the first year, but must be

cut back hard the next season, when they commence bearing again in the third year, if grown on the Kent system as basin-shaped bushes.

GOOSEBERRIES FOR MARKET: Alpha. For picking green the best sorts are Early White, Snowball, and Whitesmith. The number required per acre, at 8 feet apart, is 681.

INSECTS: C. S. & Co. We can find neither insects nor any traces on burrows of insects on the Larch shoots which are so much cankered, and we fear are not planted in a congenial soil. L. O. W.

LARGE AMERICAN BLACKBERRIES: J. L. Messrs. Cheal & Sons, Crawley, Sussex, are growers of these fruit.

LOBELIAS: C. Gilbert. See article on the Flower Garden this week.

MARK ON APPLE: S. A. S. Probably from some injury in the young state.

MR. WARNER: A. W. Broomfield, Chelmsford.

NAMES OF FRUITS: Old Subscriber. Apple: Old Nonpareil. Pears: 1, General Toddleben; 2, Huyshe's Victoria; 3, not recognised; 4, Passe Colmar; 5, Chaumontelle. — F. H. 1, Flower of Kent; 2, Dutch Fullwood; 3, Hambleton Duxians; 4, Vicar of Wakefield; 5, Droyed Gen; 6, Winter Windsor; 7, L. F. J. 3, Catillac; 7, Paradis d'Autonne; 10, Forelle; 11, Vicar of Winkfield; 14, Beurre Charneux; — W. F. 1, Carlisle Codlin; 2, Cellini; 5, Emperor Alexander; 6, Devonshire Quarrenden; 8, not recognised; — H. C. 1, Knight's Monarch; 2, Chaumontelle. — T. G. 1, King Edward; 2, Beurre Diel; 3, Knight's Monarch; 4, Josephine de Malines; 5, Beurre Rance; 6, Brown Beurre; — H. Kelsall. 1, Uvedale's St. Germain; 2, 6, Beurre Diel; 3, Louise Bonne of Jersey; 4, Marie Louise; 5, Napoleon; 7, Round Winter Nonsuch; 8, Gloria Mundi; 9, Ocellini; 10, Golden Knob; 12, Gange's Pearmain; — G. G. 1, King of the Pippins; 2, Dutch Mignonne; 3, Lord Derby; 4, 7, Dumelow's Seedling; 5, Royal Somerset; 6, Claygate Pearmain; — Pear: 5, Beurre d'Amannais; — E. P. 1, Dunsinbill; 2, King of the Pippins; 5, Blenheim Orange. Pear: Uvedale's St. Germain; others not recognised. — C. & J. T. 1, Sopsin-Wine; 2, Kerry Pippin; 3, not known—worthless; 4, Beurre Bachelier; 5, Bergamotte d'Esperen; 6, Grandmère; 7, Louise Bonne of Jersey; 8, Clark's Jersey Gratioli; 3, Beurre Diel; 4, Beurre Capiaumont; — H. J. P. 1, Adams' Pearmain; 2, King of the Pippins; 3, Pearson's Plate; 5, Northern Greening; 6, Beurre Hardy; — G. Gascoigne. 1, Louise Bonne of Jersey; 2, Beurre Rance; 3, Anax out-landish var.; others not recognised. — F. & A. Dickson. Your Apple is not Pear's Pippin—may probably be Kirk's Schone Rambour; — G. J. 1, Cider Apple, not known; 2, Verte Longue Panache; 3, not known. — F. M. You have sent us over thirty sorts of fruit to name, although we repeatedly state in our columns that we will not undertake to name more than six at a time. We oblige you so far as we can this time; but by careless packing several of the numbers had become detached, so that we cannot identify them. 1, 13, Beurre Diel; 5, Vicar of Winkfield; 6, Duchesse d'Angoulême; 7, Beurre Rance; 8, Louise Bonne of Jersey; 9, Clark's d'Anjou; 14, Van Mons' Léon le Clerc; 15, Pit-sman Duches; 18, 207, Maréchal de la Cour; 23, Bergamotte d'Esperen; 24, Napoleon; 25, Beurre d'Aremberg; 29, Cox's Orange Pippin; 30, Dutch Mignonne; 33, 34, King of the Pippins. — Sutton & Sons. Pear: Ermle d'Heyst.

NAMES OF PLANTS: Alex. Cocher. Nos. 1 and 3 appear to be started growths of Asplenium Adiantum nigrum Serpentina; 2, 4, are the ordinary form of Asplenium Adiantum-nigrum; 5, Asplenium marianum. — R. Y. Maxillaria elongata. — G. W. 1, Cratogeomys cordata (Washington Thorn); 2, C. nigra; 3, C. aronia; 4, C. Celsiana; 5, C. pucata; 6, C. oxyacantha var. eriocarpa; 7, C. Lays; 8, C. pyriformis. — L. Maurul. Cypridium Fraseri and C. Arthuriana are unknown to us; Odontoglossum Alexandræ are known locally as "Blanco's." — H. S. Ross. Can the vestita ignea oculata. — C. H. Maxillaria picta; F. E. Cymbidium giganteum; — J. Payne. 1, Maranta Bicolor; 2, M. picta; Rhus Cotinus. We do not name Crotons. — A. D. W. Loniceræ Xylosteum. The Fungi next week. — A. Henderson. Zygopetalum crinitum, Cymbidium giganteum, Cypridium insignis, var. perhaps Malili. Old Subscriber. Apples: 1, numerales; 2, Crotkham; 3, Retinodorus decurans; 2, Cupressus Lawsoniana; 3, Sabot-sporra squarrosa; 4, Chamacyparia spheroides aurea; 5, Cotoneaster sp.; 6, Retinospora plumosa aurea; 7, Cryptomeria elegans.

NEW BOUARDIA SPORT FROM DAZZLE: R. B. A nice variety, but not so good nor so floriferous as Flower of Beauty, which is the best pink Bouardia grown.

SEEDLING APPLE AND PEAR: T. D. Both of very inferior quality for this season of the year.

TRANSPLANTING EUCALYPTI: A. N. It is too late by two or three months to transplant these to other spots out of doors. If you wish to take them up to keep in pots during the winter, to be finally set out in April or May, you may do so, keeping them in a temperate-house till somewhat rooted. Take them up with as much earth as will cling to the roots, a large ball of earth not being necessary to their well-being.

WALNUTS: T. F. The varieties will come up fairly true, but with a little variation. Grafting or budding is not at all successful. The Nuts should be planted

where you intend them to remain, as they do not bear transplanting very well.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

DIED, at Darlaston Hall, Stone, Staffordshire, on October 25, JOSEPH DEVILLE, for many years Gardener to Lady Edwards, Wootton Hall, and also at Wyaoston Lees, Monmouth; and the last three years at the above place. Mr. Deville was one of the old school of thorough practical gardeners, a most successful fine grower, having taken many prizes at local and Regent's Park shows. He was very highly respected for his kind and genial manner by a large number of Staffordshire gardeners, who mourn his loss.

We also regret to hear of the death of Mr. W. H. LASCELLES, at his residence at Cropton, on Sunday last. He was a very successful horticultural hatter, and an enthusiastic horticulturist. For many years he was the proprietor of the well-known business at 121, Bunhill Row, but retired from it several years ago to obtain much-needed rest.

Markets.

COVENT GARDEN, October 29.

SEEDS.

LONDON : Oct. 28.—There was a meagre attendance of buyers on the market to-day, and the business doing was in very narrow compass. For red Clover seed a somewhat firmer feeling showed itself. The United States and Canada will apparently have no spare seed for export this next season. A fair quantity of yearling American red has been reshipped from European ports to New York. For bird seeds the sale is slow. There is no change in blue Peas or Haricot Beans. Winter Tares are neglected. Feeding Linseed keeps steady. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

FRUIT, ROOTS, AND VEGETABLES.

COLUMBIA (East London) : Oct. 27.—Moderate supplies, with fair demand for vegetables. Prices:—Apples, 2s. to 5s. and Pears, 3s. to 6s. per bushel; Onions, 4s. to 4s. 3d. per cwt.; Parsnips, 9d. to 1s. 2d. per sieve; bunch Beetroot, 2s. 6d. to 3s. per dozen bunches; Brussels Sprouts, 1s. 6d. to 2s. per half sieve, 3s. to 3s. 6d. per sieve; bunch Celery, 7s. to 8s. per dozen; bunch Parsley, 1s. to 1s. 6d. per dozen; bunch Carrots, 2s. to 2s. 6d. per dozen; bunch greens, 2s. 6d. to 3s. 6d. per dozen; Savoys, 2s. 6d. to 3s. 6d. per tally; Cabbages, 2s. 6d. to 4s. per tally; bunch Turnips, 2s. to 3s. per dozen; Carrots in sacks, 30s. to 50s. per ton; white Turnips, 50s. to 60s. per ton; Mangels, 22s. 6d. to 25s. per ton.

STRATFORD : Oct. 27.—Supplies have been good during the past week, as also the attendance of buyers, consequently a fair trade has been done at the following quotations:—Cabbages, 5s. to 7s.; Savoys, 4s. 6d. to 8s.; cut Collards, 3s. 6d. to 5s. 6d.; and Cauliflowers, 5s. 6d. to 9s. per tally; greens, bunch, 1s. 6d. to 2s.; and Swedes, 2s. to 3s. 6d. per ton; Carrots for cattle, 30s. to 32s. 6d. per ton; ditto, household, 35s. to 45s. per ton; Onions, 70s. to 100s. per ton.

POTATOS.

BOROUGH AND SPITALFIELDS : Oct. 27.—The trade continues dull, and only best samples are in demand. Even for these the demand was not large. Regents, 60s. to 80s.; Magnum Bonums, 60s. to 80s.; Early Roses, 70s. to 80s.; German Snowflakes, 45s. per ton.

COLUMBIA (East London) : Oct. 27.—Beauty of Hebrons, 65s. to 70s.; Reading Heros, 60s. to 70s.; Early Roses, 60s.; Champions, 45s. to 60s.; Victorias, 55s. to 70s.; Regents, 50s. to 60s.; and Magnums, 50s. to 70s. per ton.

STRATFORD : Oct. 28.—Magnums, 47s. 6d. to 75s.; Regents, 50s. to 65s.; and Champions, 55s. per ton.

Imports.—The imports into London last week consisted of 2885 bags from Hamburg, 3s. from Bremen, 3s. from Rotterdam, 1 from Ostend, 2,400 from Stettin, 5 from Amsterdam, 7 from Jamaica, and 702 packages from Ghent.

HAY.

WHITEHAVEN : Oct. 27.—Trade exceedingly dull, especially for Clover, at a further reduction of 2s. in the top price. Clover prime, 80s. to 105s.; inferior, 60s. to 80s. Hay, prime, 65s. to 92s.; inferior straw, 28s. to 30s. per load.

Oct. 29.—There was a large supply on sale. The trade was dull at Monday's rates.

STRATFORD : Oct. 28.—Clover, 75s. to 110s.; meadow hay, 60s. to 90s.; and straw 29s. to 36s. per load.

COALS.

The following are the prices current at market during the week:—East Wym, 5s. 6d.; Wall, End—Tyne (white crend), 11s. 3d.; Hetton, 18s. 6d.; Hetton Lyons, 16s. 6d.; Lambton, 18s.; Wear, 16s. 6d.; Tees, 18s. 6d.

N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

Oil Paint no Longer Necessary.
HILL and SMITH'S BLACK VARNISH,
for Preserving Ironwork, Wood, or Stone.
(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, with it is only two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.
Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufacturers' or of 12. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
"Piercelle Park, June 21, 1876.—Sirs, I have this day forwarded from Clapton your black varnish cask, to be filled and returned with as good varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Piercelle Park, Chestow.—I am, Sirs, yours respectfully, W. COX."
CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constant and increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, and is perfectly genuine.
Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to
HILL AND SMITH, Brierley Hill Works, Staffordshire
110, Queen Victoria Street, London, E.C.; and 75, Elmbank Street, Glasgow.

So confident is Mr. Jury of the excellence of his Whiskeys that he will pay the carriage upon a 50ml. bottle (Irish or Scotch), to any part of the United Kingdom on receipt of remittance. W. J. JURY, Belfast.

This Day is Published, Ninth Edition.

BOOK ABOUT ROSES.

By S. REYNOLDS HOLE. New and Cheaper Edition, 1885, 3s. 6d. 'His work may now be considered the most complete guide to this interesting branch of floricultural art.' - Saturday Review.

As once charming and instructive. . . The practical questions of positions, soil, manure, and selection are carefully and exhaustively treated. . . 'It is the production of a man who boasts of thirty 'all England' cups, who the Rosers are always looked for anxiously at flower shows, who took the lion's share in originating the first Rose show for the assistance of a judge, or amicus curie is always courted at such exhibitions. Such a man ought to have something to say worth heeding to those who love the Rose, and he has said it.' - Gardeners' Chronicle. WILLIAM BLACKWOOD AND SONS, Edinburgh and London.

ZADKIEL'S ALMANAC for 1886, the Year of Change. - Circulation over 140,000. Contains Voice of the Stars, Weather Predictions, Hierarchy, Zidkiele forecast of Russian Advance in Afghanistan, the Sudan Expedition, &c. London: COUSINS AND CO., 3, York Street, Covent Garden, W.C. Price, 6d.

WANTED, for a Nobleman's establishment, a soler and industrious young GARDENER, willing to make the Culture of Roses specialty. To a pushing man anxious to succeed, this is an exceptionally favourable opportunity. Apply by letter only, stating experience, &c., to J. James Vetch & Sons, Royal Electric Nursery, King's Road, Chelsea, S.W.

WANTED, a good SINGLE-HANDED GARDENER. Wages 27s. per week - C. J. T., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, a thoroughly trained, SINGLE-HANDED GARDENER. Will have to look after one Horse and Carriage, and Drive occasionally. Must be very quick, active and industrious. Wages for the first year £30, with board and lodging in House. - Mrs. Y., Westfield, Little Shelford, Cambridge.

WANTED, a steady young Man, about 28 years of age, as IMPROVER. State wages and previous experience to GARDENER, Sugaal Hall, Eccleshall, Staffs.

WANTED, a TRAVELLER. - One required who has a thorough knowledge of, and value of Nursery Stock, both Out and Indoors. - Address in own handwriting to Messrs. THOS. CRIPPS AND SON, Trimbridge Wells Nurseries, Kent.

WANTED, CLERK and TOWN TRAVELLER, for small Nursery. Will be required to look after the Books, and Solicit Orders in London for Pms, Ferns, and Decorative Plants. One with a London connection preferred. - Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, a JUNIOR CLERK. - Must be a soler and industrious man. - State age, experience, and wages expected to THOMAS S. WARE, Hale Farm Nurseries, Tottenham, London.

WANTED, an intelligent YOUTH, who has had some experience in a Florist's and Seedsman's. Must be active and willing to make himself generally useful. A good opportunity for improvement. - Address, with full particulars, &c., to Messrs. MORLE AND CO., 1, and 2, Finchurch Street, E.C.

WANT PLACES.

POSTAL ORDERS. - To Advertisers, Subscribers, and Others. - It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is given, and it has been made payable of a particular office, and to a particular person, it is impossible to procure any person into whose hands it may fall from negotiating it. N.B. - The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

SCOTCH GARDENERS.

John Downie, Seedsman, 144, Princes Street, Edinburgh has at present on his List a number of SCOTCH GARDENERS, willing to re-engage. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

Gardeners, Farm Bailiffs, and Foresters.

JAMES DICKSON AND SONS, "Newton" Nurseries, choosing at all times in a position to RECOMMEND MEN of the highest respectability and thoroughly practical at their business. - Full particulars, with names of previous employers, &c., on application.

TO LANDED PROPRIETORS, &c. - A. MCINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Remodelling existing Gardens. Plans prepared. 115, Listra Park, Stamford Hill, N.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c. - St. John's Nurseries, Worcester.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, with the best selections for the different capacities will be made. - Holloway, N.

GARDENER (HEAD), where three or more are kept. - A GENTLEMAN desires to recommend a Head Gardener, &c., requiring a practical and reliable man. - A. A. D., 41, Wellington Street, Strand, W.C.

GARDENER (HEAD). - Thoroughly practical; good experience in all branches, including Orchids. Excellent testimonials. For full particulars apply to Mr. MCKAY, Maristow Gardens, Rorborough, South Devon.

GARDENER (HEAD). - The Viscountess Down, Dingley Park, Market Harborough, wishes strongly to recommend her late Head Gardener to any Lady or Gentleman requiring the service of a thorough practical, trustworthy, and energetic man, in all branches of the profession.

GARDENER (HEAD). - Mr. BENNETT, Vineyard, Potters Bar, can with confidence recommend a thorough practical man of twenty years' experience in first-class places, to any Nobleman or Gentleman requiring the services of a Gardener fully competent to take the Management of a good establishment.

GARDENER (HEAD WORKING). - Age 27; married when suited; total abstarer. Thirteen years' good practical experience in all branches. First-class references. - W. L. H., Redleaf Gardens, Peshurst, Kent.

GARDENER (HEAD WORKING). - Middle-aged, married; great experience in all branches. Manager to the late Mr. Solomon. Understands disposal of surplus Fruit, Flowers, &c., Land and Sites, and the general routine of an establishment. - J. HAIGH, The Glen, Kipley, Surrey.

GARDENER (HEAD WORKING, or good SINGLE-HANDED). Age 23, single; thoroughly experienced in all branches. First-class references. - D., 2, Bridge Street, Bridgworth.

GARDENER (HEAD WORKING), or GARDENER and BAILIFF. - Age 46, married, no eccentricities; successful Grower of Grapes, Peaches, Melons, and Greenhouses; all kinds of Early and Late Forcing; a good Kitchen and Flower Gardener. Good character from his employer, and excellent testimonials. - E. W., 22, Gloucester Place, Cheltenham.

GARDENER and BAILIFF. - Age 37, married, no eccentricities; thoroughly experienced in every branch. Flowers, Plants, Laying-out Grounds, &c., also Management of Home Farm, all kinds of Stock, and Dairy. Twelve years in present situation. Can be highly recommended. - A. OFFER, Felcote, East Gristead.

Seed Trade.

A MANAGER of great experience, has had the superintendance for many years of the most successful Houses in the Trade, will shortly desire a re-engagement. America or the Colonies not objected to. - G. H., 65, Trafalgar Road, Old Kent Road, London, S.E.

DEPARTMENT FOREMAN, or NURSEY MANAGER; age 28. - Employment wanted by a well-informed, energetic man. Absolutely first-class character and references. Has last two years been in charge of leading nurseries in Denmark, Germany, England, and America. Leaves present situation. - Suffolk Seed Department to London, to do the market nursery - on own account. - W. SKARUP, Hoddeston, Herts.

FOREMAN, in a good establishment. - Age 25; can be well recommended by present and previous employers. Two years' Foreman in present situation. - E. J. SMITH, Caldecote Gardens, Nunetun.

FOREMAN, or entire charge of quantity of Glass, Market or Private. - Age 20, single, practical Plantsman, first-class at Fruit and Orchids. Fourteen years' experience. - W. H. S., The Gardens, Brookmans Park, Hatfield, Herts.

JOURNEYMAN. - J. MCNAIR, The Gardens, Ham Hall, Ashbourne, will be glad to secure for a pushing young man, a situation as above. - Address as above.

JOURNEYMAN. - Age 19; six years' experience Inside and Out. Excellent references, total abstarer. - W. SILLIS, 10, Fickett's Street, Blithem, S.W.

JOURNEYMAN; age 22. - Mr. E. SANDFORD, of The Gardens, Dale Park, Arundel, will be pleased to recommend George Watts, who has been with him for the last three years. - Address as above.

HANDY MAN. - A GENTLEMAN can recommend a handy man as Painter, Plasterer, and rough Carpenter, to any Gentleman. T. WOOD, Rudgeasy House, Eastville, Bristol.

TO FLORISTS. - A young Lady (Florist's daughter) desires re-engagement as ASSISTANT. - Able to keep Books if required. Highest references. - M. W., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

DR. LOCOCOCK'S PULMONIC WAFFERS. - Many cures of Asthma, Bronchitis, Coughs, Colic, &c., have come under my notice. No other medicine cures so quickly, safely, or pleasantly. In all disorders of the Throat and Lungs, Rheumatism, and all Hysterical and Nervous Complaints, they give instant relief, a rapid cure, and taste pleasantly. Sold by all Druggists at 1s. 1/2d. and 2s. 6d. per box.

HOLLOWAYS' OINTMENT and PILLS. - Rheumatism and Gout. - These purifying and soothing remedies demand the earnest attention of all persons liable to Gout, Sciatica, or other painful affections of the nerves, or joints. The Ointment should be applied after the affected parts have been patiently fomented with warm water, when the ungula-t should be gently rubbed upon the adjacent skin, unless the friction should cause pain. Holloway's Pills should be simultaneously taken, to reduce inflammation and to purify the blood. This treatment abates the violence, and lessens the frequency of Gout, Rheumatism, and all spasmodic diseases, which spring from hereditary predisposition, or from any accidental weakness of constitution. This Ointment checks the local mischief. The Pills restore the vital powers.

APPEAL TO THE BENEVOLENT

On behalf of Two Sisters, aged respectively 70 and 72 (the younger has been an invalid for many years) who have lived together all their lives. The leases of their property having fallen into the hands of the Ecclesiastical Commissioners some six years ago, they have vainly struggled since then to obtain a living by letting apartments, but the little money they had saved being now quite exhausted, and owing over a year's rent, make this Appeal, hoping to save their home from being broken up, and parting with everything they possess. Will any kind Friends help them in their deepest distress? The following Gentlemen have kindly allowed a reference to be made to them, and will give every information respecting the genuineness of this Appeal:—

- Dr. MAXWELL T. MASTERS, F.R.S., 41, Wellington Street, Strand, W.C.
- Mr. THOS. VERNON, Weekly Dispatch Office.
- Mr. J. FULLER, 4, Weymouth Street, Finsbury Place W.
- Mr. W. H. PERCY, Weekly Dispatch Office.
- Mr. J. KEASLEY, 62, Salton Road, Brixton, S.W.
- Mr. W. RICHARDS, 41, Wellington Street, Strand, W.C.

Contributions will be gratefully received and thankfully acknowledged by Mr. W. RICHARDS, "Gardeners' Chronicle" Office, 41, Wellington Street, Strand, W.C.

TURNER MEMORIAL PRIZES

AT A MEETING held in the Conservatory of the ROYAL HORTICULTURAL SOCIETY, South Kensington, August 17, 1885, SIR WYLLIE HERRICK, Bart., in the Chair, a resolution, moved by the Chairman and seconded by Dr. MACRAE, F.R.S., was unanimously adopted to the following effect:—

"This Meeting is of opinion that the eminent services to Floriculture of the late Mr. CHARLES TURNER, of Slough, should be commemorated by means of Special Prizes for Florists' Flowers, Fruits, &c.; and hereby resolves to promote the raising of a Fund, the interest of which shall be applied to carry into effect the said prizes, which shall be entitled TURNER MEMORIAL PRIZES; the Fund, and all its incomes and outgoings, to be administered by a body of trustees or governors to be hereafter appointed.

It was further resolved that H. M. POLLETT, Esq., of Farnside, Eickley, Kent; J. H. JACKSON, Esq., of Mr. JAMES WATKINS, The Gardens, Great Gearys, Lifford, Honorary Secretary.

The importance of the present movement will be fully felt and understood by Horticulturists of all grades and tastes, for in CHARLES TURNER has been held in honour, both because of the high character and gentle manners of the man, and his earnest work in the subject of horticulture during a successful career of over fifty years. It is no part of the business now in hand to propose any eulogy, the object of this circular is to make a direct appeal to the generosity of the public for the establishing of the proposed TURNER FUND. The promoters feel that the cause carries with it all the persuasions of utility, the need of the moment, and the sympathy with its needful to success, and they urge upon all sympathizers with it, and forwarding them to the Honorary Treasurer without delay. Copies of this circular will be supplied wherever needed, and Gardeners are requested to bring to the notice of their employers, the object being to make a formal and impressive public record of appreciative and affectionate regard for the memory of the most distinguished Horticulturist and Florist of the nineteenth century.

THE SUBSCRIPTION LIST will CLOSE at the END OF DECEMBER, any person wishing to contribute will kindly forward the amount to the Treasurer, Mr. J. H. JACKSON, Head and Under Gardeners are earnestly solicited to subscribe.

The Fruits of the Future.

The following Fruits are destined to completely revolutionise the whole question of "Fruit Culture for the Future," being STARKLING, NOVEL, and DELICIOUS, and having long been wanted as "Changes" from the Dessert and Culinary Fruits now in vogue:—

BLACK RASPBERRY. This we consider the most exquisite and palatable fruit yet introduced. It has been produced by crossing a Raspberry with "THE GLENFIELD," a Blackberry. The result is, we have here a MAGNIFICENT and ENORMOUSLY PRODUCTIVE RASPBERRY PARTAKING OF THE SHAPE, FLAVOUR, and HABIT OF THE WELL-KNOWN RED VARIETIES, BUT THE COLOUR IS GLOSSY BLACK. We should add, that there is just a perceptible taste of the Blackberry parent which renders the fruit even more delightful than either the Blackberry or Raspberry.

When we sent out the Wilson Junior Blackberry, we then strongly advised our patrons to bestow their IMMEDIATE attention upon that magnificent novelty, as we knew that when its true merits became known it would be immensely popular. As we foretold, our sanguine expectations are being verified by facts, and Wilson Junior is now rightly looked upon as one of the most popular acquisitions of the day. We therefore advise, even more strongly than we did in the case of the Wilson Junior Blackberry, those patrons who desire to possess a magnificent and wonderful new fruit, whether for their own dessert table or for market purposes, to give this striking novelty their immediate attention. Illustrated Circular gratis and post-free.

One-year-old Plants, 12. 3d. each, 72s. per dozen, and 85s. per 100. All orders carriage paid.

OUT-DOOR BLACK GRAPE. This is a splendid outdoor variety, special adapted for open-air culture; perfectly hardy, strong grower, very prolific, colour perfect, good-sized berries, flavoured delicious.

"THE LEICESTER" When we say that in its appearance and flavour it very closely resembles the Black Hambrogh, we think we have said enough to enable this grand acquisition to receive that attention which it rightly deserves, especially when we consider that we offer this variety at the reduced price as given below. As per our Circulars of September 5 and 12, we must again warn our purchasers to be careful to see that they obtain the true variety. Large Circular, illustrating a branch in full bearing, gratis and post-free.
Two-year-old plants, 3s. 6d. and 5s. each; 36s. and 46s. per dozen. All orders delivered free.

AMERICAN BLACKBERRY—"Wilson Junior." Owing to further concessions from the raiser we are enabled now to offer this variety at the reduced price as given below. As per our Circulars of September 5 and 12, we must again warn our purchasers to be careful to see that they obtain the true variety. Large Circular, illustrating a branch in full bearing, gratis and post-free.
Reduced price, 1s. each; 9s. 6d. dozen; 79s. 100.

Wilson's Early, Early Harvest, Pursley-leaved, Ancient Briton, Western Triumph, &c., at 8d. each; 7s. 6d. per dozen; 45s. per 100. Carriage free.

Now Ready,

THE GARDEN ANNUAL

Almanac and Address Book for 1886.

PRICE 1s.; POST-FREE, 1s. 3d.

THIS is a most complete and accurate Yearly Reference Book for the use of all interested in Gardens yet published. The Alphabetical Lists of all Branches of the Horticultural Trade have been corrected up to the END OF OCTOBER. The Lists of Gardens and Country Seats have been very carefully and extensively revised, and now form the most Complete List ever published. The GARDEN ANNUAL may be ordered through all Booksellers, Nurserymen, and Seedsmen.

It contains, among many other matters, the following, viz:—

ALMANAC for the Year 1886.

CONCISE CALENDAR of GARDENING OPERATIONS for each Month.

FLOWERS, FRUITS and VEGETABLES procurable each Month.

A carefully compiled ALPHABETICAL LIST of NURSERYMEN and SEEDSMEN, FLORISTS, HORTICULTURAL BUILDERS, ENGINEERS, and of the HORTICULTURAL TRADE generally.

THE PRINCIPAL GARDENS, COUNTRY SEATS and HORTICULTURAL TRADE in Great Britain and Ireland, arranged in the order of the Counties, extended and corrected to end of OCTOBER.

ALPHABETICAL LIST of COUNTRY SEATS and GARDENS in the United Kingdom, with Names of their OWNERS very much extended and corrected to date.

ALPHABETICAL LIST of HEAD GARDENERS in the Principal Gardens of the United Kingdom, with nearest Post Towns added.

This LIST has been greatly AUGMENTED.

Lists of New Plants, Fruits, and Vegetables Certificated during the Year.

- „ PICIFERA AUREA (true), 3 to 6 feet.
- „ FLUMOSA AUREA, 3 to 5 feet.
- THUOPSIS BOREALIS, 4 to 6 feet, hundreds.
- „ DOLOBRATA, 3, 4, and 6 feet, hundreds.
- THUJA LOBBII, 4 to 5 feet, hundreds.
- „ OCCIDENTALIS LUTEA, 3 to 5 feet.
- „ SEMPER AUREA, 2½ to 3 feet, hundreds.
- YEWs, Common, 3, 4, and 5 feet, thousands.
- „ Common, 6 to 10 feet, hundreds.
- „ Golden, of all sizes up to 10 feet.
- „ We have many thousands as Pyramids, Globes, and Standards, in point of variety and size unequalled.
- „ Golden Seedlings, 3, 4, 5 to 8 feet.
- „ Irish, 5 to 10 feet, hundreds.
- „ Irish, Golden, Seedling, 3, 4, and 5 feet.
- AZALEAS, Common, the finest varieties known, 2, 3, 4, and 5 feet, thousands.
- RHODODENDRONS, 3, 4, 5, 6, 8 to 10 feet, thousands of finer plants than can be found in any other Nursery.
- „ The fine Standard and other Rhododendrons annually planted in Rotten Row, Hyde Park, are supplied by ANTHONY WATERER.
- KALMIA LATIFOLIA, healthy and well furnished plants, 18 to 24 inches, showing from twelve to thirty trusses of bloom.
- AUCUBA JAPONICA, 2½ to 3 feet, hundreds.
- PAMPUSA METAKE, fine clumps, 5 to 8 feet high, transplanted spring, 1875, hundreds.
- BOX, Green and Variegated, 3, 4, 5, 6 to 7 feet, thousands.
- HOLLIES, Common Green, 3, 4, 5 up to 10 feet, thousands.
- „ ALTA CLARENSE, 3, 4, 5 up to 10 feet, many thousands.
- „ HODGINS, 3, 4, 5 up to 10 feet, many thousands.
- „ LAURIFOLIA, 3, 4, 5 up to 10 feet, many thousands.
- „ MYRTIFOLIA, 3, 4, 5 up to 10 feet, many thousands.
- „ SCOTICA, 3, 4, 5 up to 10 feet, many thousands.
- „ Yellow-barked and other sorts.
- „ Variegated, of sorts, 3, 4, 5 up to 10 feet, thousands.
- „ Golden Queen, 3, 4, 5, 6, 7, 8 to 10 feet, hundreds of beautiful specimens.
- „ Silver Queen, 4 to 10 feet, splendid specimens.
- „ Weeping, Perry's, on straight stems, with heads of ten to fifteen years' growth, hundreds.
- „ Weeping, New Golden, a large quantity of beautiful plants.
- The following trees have stout, straight stems, fine heads, and splendid roots, and have all been transplanted within two years:—
- ACACIA BESSONIANA, 6 to 10 feet.
- ACER DASYCARPUM, 13 to 15 feet.
- „ NEGUNDO VARIEGATA, Standards, 8 to 10 feet.
- „ REITENBACHII, 8 to 10 feet.
- „ SCHWEDLERI, 12 to 14, and 14 to 16 feet.
- „ WORLEYI, Standards, 12 to 14 feet.
- BEECH, Common, 10 to 12 feet.
- „ Purple, Pyramids, 9, 12, and 12 to 14 feet.
- BIRCH, Silver, 12 to 14 feet.
- „ Purple, 14 feet.
- CHESTNUT, Horse, 14 to 16 feet.
- „ Horse, Scarlet, 12 to 14 feet.
- „ Double, 10 to 12 feet.
- ELM, English, 10 to 12 feet.
- „ Guernsey, 10 to 12 feet.
- „ Silver-leaved, 12 to 14 feet.
- LIMES, 10 to 12 feet, 12 to 14 feet, and 14 to 16 feet.
- „ Silver-leaved, 12 to 14 feet.
- LIGULIDAMBAR, 6 to 8 feet.
- ASH, Mountain, 10 to 12 feet.
- MAPLE, Norway, 14 to 16 feet.
- GASK, American, 12 to 14 feet.
- „ English, 10 to 12 feet.
- PLANES, 14 feet and upwards.
- POPLAR CANADENSIS NOVA, 12 to 15 feet.
- „ BOLLEANA, 8 to 10 feet.
- SYCAMORE, Common, 14 to 15 feet.
- „ Purple, 15 to 16 feet.
- „ Variegated, Standards, 10 to 12 feet.

Weeping Trees.

- BEECH, Weeping, Pyramids and Standards, 10 to 12 feet.
- „ Weeping, Purple (true), Standards, 8 to 10 feet.
- BIRCH, Young's Weeping, Pyramids, 10 to 12 feet.
- „ Young's Weeping, Standards, 14 feet.
- ELMS, Weeping, Standards, 10 feet stems.
- HAZEL, Weeping, Standards, 8 to 10 feet.
- LARCH, Weeping, 6 to 10 feet.
- POPLAR, Weeping, Standards.
- SOPHORA JAPONICA PENDULA, Standards, 8 to 9 feet.

Intending planters are invited to inspect the Plants growing; no one interested in such matters will regret the trouble. Catalogues convey but a very inadequate idea of such a Stock.

THE Gardeners' Chronicle.

SATURDAY, NOVEMBER 7, 1885.

THE "HEREFORDSHIRE POMONA,"

"PART VII., completing the work." The significance of such words as these creates always, and under any circumstances, a mixed impression. Whatever the work be, and however satisfactory, there is a tinge of melancholy about them. They represent the cessation of effort, and when, as in this case, the effort has been worthy, and the result such as to win the admiration of all concerned, still the feeling of regret intermingles with the gratifying sense of something attempted, something—in this case much—done.

We cannot tell, we can but hope, that the last hours of Dr. Henry Bull, of Hereford, were solaced by this sense of having accomplished good work—something that should, apart from higher considerations, into which it would be presumptuous here to enter, prove to have promoted the welfare of his fellows. Be this as it may, it is something startling to have laid on our table at one and the same time, the last part of the *Herefordshire Pomona* and the announcement of the death of its author. In that part we find the following recognition of the services of Dr. Bull, signed by the successive annual Presidents of the Woolhope Naturalists' Field Club during the preparation and completion of the *Herefordshire Pomona*, and which was ordered to be inserted in the work immediately after the general introduction:—

"The members of the Woolhope Club desire to offer their special and grateful thanks to Dr. Bull for the ability and perseverance with which he has carried out the publication of the *Herefordshire Pomona*. In addition to his own valuable papers, he has edited and superintended the work from beginning to end. He originated it, and without the untiring diligence and zeal he has displayed for so many years it could not have been so successfully completed.

- " J. Griffith Morris, 1877
- " A. D. Phillot, 1878
- " Arthur Armitage, 1879
- " I. H. Knight, 1880
- " Augustin Ley, 1881
- Thomas Blashill, 1882
- George H. Piper, 1883
- Charles Burrough, 1884
- C. G. Martin, 1885
- Theophilus Las, Sec."

This is no more than a just recognition of the untiring labours of Dr. Bull. In carrying out the work Dr. Bull received the cordial assistance and co-operation of Dr. Hogg, but that gentleman will be the first to acknowledge that, alike in its inception and its conduct from beginning to end, the greater share of the work connected with the *Herefordshire Pomona* has fallen to Dr. Bull. Dr. Bull, moreover, raised the standard of the Woolhope Club at Rouen. What other local field club, we wonder, has essayed so daring a feat? And it was successful. Our courteous neighbours at once recognised the value of the effort, and honoured the Club, as well as Dr. Bull and Dr. Hogg, with substantial marks of their appreciation. Nor was this all a matter of friendly recognition, compliment and hospitality. The Woolhope Club—that is to say, principally, Dr. Bull—not only made a display of Hereford products, which won the sufferages of the Norman pomologists,

37, SOUTHAMPTON STREET, COVENT GARDEN, LONDON, W.C.

KNAP HILL NURSERY, WOKING, SURREY.

but succeeded in introducing into Herefordshire, after careful scrutiny, no fewer than eight varieties of Apples of Norman growth, which met the requirements of Hereford growers, as to quality of juice, vigour, hardihood, and fertility, varying period of blooming, late maturity, and general good reputation. This is a good example of what a local field club may do, under proper guidance, for the general welfare. The fungus forays, the mycophagous festivals, these are familiar to our readers: the genial fun, the animal spirits, the solid benefit to science—these have found record in our pages from year to year, and here again the presiding spirit was Dr. Bull. It seems so strange to have to write that word—was when we have before us, not only the last part of the *Pomona*, but when it is but a few days since that we had a communication from him relating to the Pear Conference only just concluded at Chiswick. Pomology and Mycology were two of the recreations of this energetic man. He was a Justice of the Peace, and a physician in large practice. No longer ago than the 4th of last month he wrote to one of our correspondents—"I am particularly busy just now, three long journeys a-day [referring to one of his patients], but perhaps a death will set me free"—and it has set him free. Before the month was over all that was mortal of Henry Bull had ceased to be. In the agony of grief that this comparatively sudden termination of a happy and useful career must have occasioned may be the feeling that the expression "ceased to be" has only a limited significance afford true consolation to those that are left to mourn—and to hope.

Of the *Herefordshire Pomona* itself the concluding part of which lies open before us, we must speak on another occasion. Enough for the present to record the death of one of the brightest, most energetic, most sympathetic of men. Dr. Bull died of cancer, after a short illness, on October 31, in his sixty-eighth year.

New Garden Plants.

MASDEVALLIA HIEROGLYPHICA, *Rehb. f.*

At last I have fresh flowers at hand, kindly sent by Mr. W. Lee, who had the plant from Mr. F. Sander, who alone would appear to have imported it. It is lovely, much like *Masdevallia Arminii*, but quite distinct in its long tails and in the shape of its sepals, which are much less rounded, and more triangular. The tails are mauve on the upper half, the lower part being orange-coloured. Bodies of sepals light mauve, purple outside, white at the base. The dorsal sepal has three Indian-purple lines, and four manifold rows of small spots of same colour. All the remainder of the inside of the sepals is purple; there is, however, an Indian-purple line on the mid-veins of the lateral sepals. Petals whitish-sulphur. Lip with innumerable small purple spots on the disc, purple at the base, darker purple in front. The column is white, with numerous small Indian-purple spots under the fovea. Excepting that place it is dark Indian-purple. It is a delightful gem. *H. G. Rehb. f.*

DICKSONIA LATHAMI, *n. sp.*

Arborescent evergreen; fronds tripinnate, coriaceous, narrow oblong, 14–15 feet long, including stipes; dark green on the upper surface, paler beneath; pinne alternate, often unequally distant, sometimes nearly opposite, sessile, oblong-lanceolate, broadish at the base, acuminate, the middle ones 1½–2 feet long, 6–8 inches broad, divided into rather close-set pinnules, which are also sessile; pinnules linear-oblong, narrowed to a point at the apex, about ¾ inch, or in the basal ones 1 inch, broad, the upper portion decrescent and confluent; pinules distinct, rounded or oblong-obtuse, the lowest with a narrow attachment, the rest more or less adnate, the margin in the fertile contracted portions distinctly crenato-lobate, each crenature or lobe bearing a sorus; the sterile parts crenatifid, with falcate oblong-acute lobes, indistinctly toothed at the apex; sori six to eight on each pinnule, globose, the green outer valve (tip of lobe) somewhat larger than the

brown inner one, both entire; veins in the fertile parts simple, one to each lobe, from a stout costa, which is prominent on the lower surface, in the sterile parts more or less forked; stipes 4 or 5 feet in length, clothed abundantly in the younger stages with bright rufous hair-scales, and as well as the rachis very stout, pale brown, with a central furrow above, deeper umber-brown, and bluntly rounded behind, the surface minutely asperous, the main and secondary rachides tomentose, with fine crisp deciduous hair-scales, the secondary and tertiary ones comparatively thin, also asperous, with a few scattered hair-scales along the base of the pinnules.

This very noble Fern, which appears to be of hybrid origin, was raised by Mr. W. B. Latham, Curator of the Birmingham Botanic Garden, after whom we have named it. The plant has a very stout trunk, and a most distinct character of growth. At the present time the stem is 4 feet 4 inches in circumference at a foot from the ground surface, and a height of 3 feet clear of fronds, the crown of fronds rising above this 2 feet 6 inches, reaching the total height of 5 feet 6 inches. There are about sixty fronds on the plant, the largest of which, including the stipes, measures between 14 and 15 feet, the stipes being 5 feet 6 inches long, and the lamina of the frond from the lower pinna to the apex 9 feet 4 inches; the lowest pinna is 19 inches long, and the largest, about the centre of the frond, 23 inches in the specimen before us. There is, moreover, this peculiarity in its habit of growth, that though the stems resemble those of *Dicksonia antarctica*, the fronds forming the head or crown of the plant are produced successively, and not simultaneously, as they are in that species.

Mr. Latham sends the following particulars of its history:—"Some years ago I had under my care a plant of the very rare *Dicksonia arborescens*, an imported plant, with a clear stem of from ¾ to 4 feet in height, and having so completely the character of that figured in Hooker's *Species Filicum* (i., t. 22) that I have no doubt it was the true plant. I collected spores from this plant and sowed them in a 5-inch pot, at the same time sowing in another pot of similar size some spores of *D. antarctica*. These pots were placed side by side. In due time the prothallia came up very freely in the pot of *D. antarctica*, but not so in the case of *D. arborescens*. Amongst those in the pot of *D. antarctica* I noticed two very distinct from the rest, and these I carefully watched from day to day, and when at length the first little frond made its appearance I was delighted to see something different from *D. antarctica*, and what then appeared to me to be *D. arborescens*.

"For some years after, while the plant was in a young state, it was supposed to be the latter plant, but when it began to develop its stem and the fronds grew to their full size, I saw it was distinct, and had combined the characters of *D. antarctica* and *D. arborescens*, which I now believe to be its parents, the spores having in some way got mingled in the seed pot. In the texture of its fronds it is very much like *D. arborescens*, but the general character of the plant, taken as a whole, comes nearest to *D. antarctica*, the stem quite resembling that of the latter, only being stouter, while *D. arborescens* on the other hand has a thinner, more slender stem in the way of that of *D. squarrosa*. The habit of throwing up the young fronds one after the other and not all at one time to form at once a new crown of foliage, is also foreign to *D. antarctica*, and more nearly resembles the mode of development in *D. arborescens*."

We have examined fragments of this plant at different times during the last few years, and had been inclined to refer it to *D. chryso-tricha*, a species of the Eastern Archipelago, not having been till recently aware that it originated from spores, under Mr. Latham's own care and observation. The account of its origin above given, however, leaves little room, if any, for doubt that it is one of the "hybrid" forms which under cultivation now and then intrude themselves on our notice, and, as in this case, furnish us with new objects of admiration—for the plant, we remember, was some years since a specimen of unique and stately character, unlike any others then known to cultivators, and it must have been a noble and majestic ornament to the greenhouse conservatory in which it is growing.

It is a remarkable fact that this hybrid is a most vigorous grower. Of *D. arborescens*, which it resembles in many ways, Mr. J. Smith, in his *Ferns, British and Foreign* (1866), remarks:—"The most

fastidious Tree Fern to cultivate is *Dicksonia arborescens*, a native of St. Helena. It was first introduced to this country in 1786, and many times since, but refuses to become established either in a tropical or temperate house." The same may be said of it to-day. Where are any established plants of it to be found in our gardens?

This novelty is of so interesting a character that we hope shortly to be able to add a figure of it prepared by Mr. W. G. Smith, showing its chief peculiarities. *T. Moore, Chelsea.*

ATHROTAXIS LAXIFOLIA.*

A FEW weeks since (see p. 270) we had occasion to figure the cones of *A. cupressoides* as produced on a plant in Mr. Noble's nursery at Sunningdale. Up to that time the plant had been called *A. selaginoides*, not only in the Sunningdale nursery, but also in other establishments. The finest specimen of *A. cupressoides* at Sunningdale is about 8 feet high, columnar in outline, like some of the Junipers, with rather loose short divaricate branches and foliage, as represented at fig. 60, p. 273. Since that notice was published specimens have reached us from Mr. Ransleigh's at Menably, which we refer to one of the other species mentioned in that article, viz., *A. laxifolia*. If we are right in our determination the specimen is the more interesting because up to this time the cone of this species has not been known either in a wild or cultivated state. Its appearance, moreover, lessens if it does not quite remove a doubt that was felt whether *A. laxifolia* was really a distinct species. The only material hitherto available, whether in herbaria or in books, was hardly sufficient to establish a species upon. The notes of the collectors and of those who had seen this tree in a wild state in the mountains of Tasmania, however, are in favour of the distinctness of *A. laxifolia* from the others, and their view will, we think, be confirmed by the specimen now figured (fig. 134). It is not necessary with the figure and with what has been published at p. 270, to give further botanical details, but we may appropriately add the following particulars, kindly communicated by Mr. Bennett, the gardener to Mr. Ransleigh, at Menably:—"Athrotaxis laxifolia is 10 feet high and 5 feet in diameter; it is a perfect pyramid, feathered from the ground. All the fruit on this plant is on the part facing the east from the twigs touching the ground to about 4 feet above it. It is growing about 100 feet above the sea-level in a rather exposed situation on a slight mound composed of the following:—Peat, loam, leaf-mould, and sand." The Athrotaxis are not likely to take high rank in this country as ornamental trees, being rather singular than beautiful, nor are they likely to be valuable as timber trees, from their slow growth and moderate height, 25–30 feet. They are propagated with difficulty, and no suitable stock has yet been found for them.

Orchid Notes and gleanings.

CALANTHES AT OLDFIELD HALL, ALTRINCHAM.

The praises of this interesting genus of Orchids has so often been sung, their acceptability during the winter months for the brightening up of our Orchid-houses, and the use they may be put to when cut for indoor decoration is so well understood, that there is now little need of again enforcing the desirability of their culture. Little that now can be said respecting them at this time of the year can affect their number or the quality of their blossoms; they should now be in a thriving condition, pushing spikes and flowers. It may be wise even now, however, to advise those who have an inferior variety to resolve upon procuring the better forms whilst they may be seen in flower; a little more, perhaps, may have to be paid for them, but that is not much to those who are determined to get only the best. There are at least three distinct forms, differing in regard to the form of the bulbs as well as in the colour of

* *Athrotaxis laxifolia*, Hook. fil., *Icones Plant.*, t. 563, *Flores Tasmaniae*, p. 354; Parlatore in De Casadole, *Prodromus*, xvi., pars 2a (1868), p. 434. "Species in plantis visis melius illustranda"; Veitch, *Manual of the Coniferae* (1881), p. 223.

the flowers, and the density of them on the spike.

These distinctions may be, and often are, of a more or less marked character, according to the conditions under which they are grown. The long bulb variety, sharply pinched in at about half its length, is not by any means so good as the form which has bulbs of a lesser length, and that tapers

the back of a Melon and Cucumber-house here, with a liberal treatment as regards heat, light, and moisture. They come on well, so that many of the bulbs are 1 foot in length, and the spikes pushing strongly, so that it is certain that many will reach from 3 to 5 feet in length. Such a display as these will make during the winter months will be most welcome. *W. Swan, Fallowfield, Oct. 27.*

flowers are produced in May. They are best grown in the warm end of the Cattleya-house, in baskets or rafts, near the glass, and freely supplied with water in the growing season. At no time should the bulbs be allowed to shrivel. *Orchid Album, t. 205.*

ODONTOGLOSSUM VEXILLARIUM VAR. PURPUREUM.

This fine variety was introduced to the Linden establishment by Benedict Roezl, whose death we have lately had to record. The flowers are of a remarkably deep rose-pink colour. *O. vexillarium*, according to Roezl, requires a treatment intermediate between that suitable for *O. crispum* and for *O. Roezlii*. The plant grows on the trunk of trees, and requires, says Count du Buysson, ample exposure to light, but not to the direct sunlight, a cool and moist atmosphere in winter of about 50°, and in summer between 66° and 70°, with abundant ventilation, when the plant is not exposed to degrees of temperature above or below those cited. The variety is figured at t. xiii. (1885) of the *Lindenia*.

ONCIDIUM BRUNLEESIANUM.

This is a new and pretty species, introduced from La Plata, and has the advantage of taking up little space. The bulbs are somewhat conical, compressed, the leaves oblong acute. The numerous flowers are borne in loose branching panicles. The segments are pale yellow, barred with brown, and the lip orange-yellow with a conspicuous blotch of deep sepia-brown in front. It flowers in April. It thrives best in a small basket or pan in the Cattleya-house, near the glass. The figure in the *Orchid Album*, t. 206, gives a very good idea of the plant, but it does not supply a view of one flower separately.

ONCIDIUM LANCEANUM VAR. SUPERBUM.

This variety, which differs from the type principally in the richer colour of the flowers, is figured in a recent number of the *Lindenia*, t. xvi. It is a native of Dutch Guiana, and requires a hot temperature, with full exposure to light, and an ample supply of moisture during the growing period.

TRICHOGLOTTIS FASCIATA.

An Orchid with the habit of a *Renanthera*, bearing the flowers in racemes from the sides of the elongated stems opposite to the leaves. The flowers are about 2 inches across, with segments pale yellow barred with brown. The lip is shorter than the segments, 3-lobed, the two lateral lobes broad, erect, with acute angles, the front lobe flat, oblong-ovoid, with two bastiforme projections, one on each side in front of the lateral lobes. The specimen figured in the *Orchid Album*, t. 208, was flowered in the garden of G. Heriot, Esq., of Ilighgate. It requires abundant moisture and considerable heat.

AERIDES ODORATUM VAR. DEMIDOVII.

This differs from the type in the more numerous spots and deeper colouring of the lip. It is well figured in the *Lindenia*, t. xiv.

LELIA MEASURESIANA.

This is "a compact growing evergreen plant, with clavate stems, 15 inches high, and dark green bluntly oblong leaves, about 6 inches long and 2 inches broad. The racemes of flowers proceed from a sheath after the growth is completed. The sepals and petals are white, the lip of a bright rosy-purple beautifully fringed round the margin, the throat yellow with the upper portion bordered with pale rose." It flowers in May. The plant flowers in the Cattleya-house near the glass exposed to plenty of light, but protected by a blind from the burning sun, when necessary. *Orchid Album, t. 207.*

ORCHIDS AT HAWTHORNDANE, DIDSBUV.

Some fine specimens of *Dendrobium* are to be seen at this place; during the past summer they have done well, and now that the greater part have finished their growth and the bulbs are assuming that stout, plump, and shiny appearance all are glad to observe, each one indicates the full complement of bud and blossom stored therein, which by skill and care will be developed. Some nice pieces of *D. chrysotum* were on blocks and in pots, the last bulbs being superior to any previously formed, and though flower cannot be expected from the later bulbs, the older ones, being stout and plump, will certainly bring good spikes. *D. albo-sanguineum* also does very

FIG. 134.—ATHROTAXIS LAXIFOLIA. (SER. P. 584.)

from the base without any, or a very slight, contraction at about a third of its length from the apex. At Oldfield Hall, the seat of J. Allen, Esq., there is at the present time a magnificent lot. Mr. G. Kirton has fifty plants of *C. Veitchii* bearing six to eight flowering bulbs each, some plants having eight to ten spikes. These are now commencing to open their blooms, and Mr. Kirton anticipates that he will have plenty of bloom from now till the middle of March. The plants have been grown during the summer months on a shelf at

SCHOMBURGKIA TIBICINIS.

A species with long grooved pseudobulbs, and short, oblong, notched leaves. The numerous flowers are borne in a loose panicle on the end of a long flower-stalk. The individual flowers measure about 3 inches in diameter, the five segments are spreading, oblong obtuse, reddish-carmine in colour, paler at the base, marked with a green spot near the apex. Lip projecting, three-lobed, the lateral lobes incurved reddish-purple, the anterior lobe flattish rounded, notched, and marked with a yellow blotch. The

well—in fact, much better than it is usually seen. Another fine plant growing in a basket is *D. Parishii*; this is a mass imported some few years since, and which flowered this spring very freely, having over 260 blooms of good quality. This summer it has made fourteen leading shoots, measuring from 15 to 18 inches in length. Another good plant in a basket is *D. fimbriatum oculatum*, with growth 4 to 5 feet long; *D. Pierardi* var. *fatifolia* has new bulbs 3 feet in length. Some nice plump pieces of *D. formosum giganteum* were in flower. In this house *Lælia autumnalis* was doing well on a block, and showing strong spikes of flower. *Calanthe Veitchii* were also numerous and well grown. In a viney a number of *D. Wardianum* were placed. These were just commencing to show bud, and in a short time will be put in the warmer house so as to bring them into flower. A nice piece of *O. Forbesii* was in flower. This is on a block, and has made good bulbs. Now it is flowering with two spikes, having forty-one and forty-three flowers open altogether. *O. crispum* was also in flower, beside several plants of *O. Barkeri* (*grinum*). Several nice pieces of the sweetly scented *O. ornithobrychum* were just opening their flowers. In another division were some nice plants of *Collegyne cristata*, beside some *Cattleyas* and *Cypripediums*. Among the latter was a capital plant of the dark-foliated form of *C. Swainiana*. This Mr. Ward stated to be very fine in form and dark in colour of the flowers. I noticed the open pots as now supplied by the Liverpool Nursery Company were used for some of the Orchids, and others that need potting are being placed in them. Mr. Ward is disposed to think them very useful for this class of plants. *W. Swan, Fallowfield, Oct. 20.*

MASDEVALLIA ROEHLII, *Lindenia*, t. xv.

One of the Chimera type, differing from the species so named in the smooth sepals and in the lip. The prevailing colour is whitish, or cream colour, thickly beset with reddish spots and with three long purplish hairs. As in the case of most *Masdevallias* M. du Buysson recommends it to be grown in a cool house with abundant water during the period of growth, exposure to diffused light, and with free ventilation. Hot dry air is very prejudicial to them. In the resting state the quantity of water given should be less, but the plant should not be suffered to become dry.

THE DIRECT CAUSE OF PEAR BLIGHT.

The following communication was read before the American Association for the Advancement of Science, in August last:—

It has now been five years since Professor Burrill brought the subject of Pear blight before this Association and announced that it was due to Bacteria. Previous to that time no instance of Bacteria acting the rôle of vegetable parasites had been known, and the discovery was therefore a very important one, opening the way to a new and promising field of research.

The experiments of Professor Burrill showed that the disease alluded to was invariably accompanied by a specific form of Bacteria (since named *Micrococcus amylovorus*, Burrill), and that as the disease progressed a colourless or yellowish viscid substance was formed, apparently by the action of the Bacteria upon the starch and other substances of the plant. The disease results in the complete death of all those parts of the tree that are attacked.

Although from these and subsequent investigations the theory has been quite generally accepted, that the Bacteria are the cause of the disease, no rigid proof of it has yet been brought forward. It was with a view to either absolutely prove or disprove the theory that a course of experiments was begun last March, and continued to the present time.

It has been incontestibly shown that the disease may be readily transmitted to healthy tissues by introducing a drop of an infusion made by putting some thin slices of the diseased tissues in water,* or by simply transferring a minute portion of the exudation from the diseased to the healthy shoot.† The problem was consequently narrowed down to one of two alternatives, either the Bacteria were the cause

of the disease, or the juices which accompanied them were the cause of it.

The first attempt was to secure some inoculating material in which the Bacteria were entirely freed from the juices of the disease. This was done by means of a succession of artificial cultures in a sterilized infusion of corn (Maize) meal.

Two series were successfully carried through, extending over about four months, and an inoculation from the sixth culture of each introduced into the green fruit of a Bartlett Pear.

The accompanying tables will show the kind of culture vessels used, the amount of culture fluid they contained, and the date at which each one was started. The first culture of the series was inoculated with a very

other cultures of the series was successively made with a small drop of the one preceding. From the last culture a drop was transferred to a puncture in an unripe Bartlett Pear. In both cases the Pears were soon filled with the disease. They did not turn brown about the wound, as is the more usual way, but first indicated the presence of the disease by beginning to shrivel, which occurred in one case in nine days after inoculation, and in the other in ten days. Upon cutting the Pears open the softer tissues were found broken down and liquefied, and a milky viscid juice ran out, showing that the disease had taken thorough possession.

By this means of fractional culture the juices accompanying the Bacteria first introduced were so much diluted in the transfers to succeeding cultures that the final drop used to inoculate the Pear was practically free of them, and to the Bacteria only, supplied by continued growth and multiplication, can be ascribed the last result.

Having shown that the Bacteria when isolated from their juices are able to cause the disease, it still remains to show what action the juices would have when separated from the Bacteria. On July 18 a strong infusion of blighted Pear was filtered through a porous earthenware vessel, such as used for small electric batteries, and an unripe Bartlett Pear inoculated with the filtrate, and another Pear with the infusion used for filtering. In a week the latter was thoroughly blighted, while the former showed no signs of injury except the slight wound, which finally healed. On July 24 another strong infusion of Pear blight was filtered through a second battery cell. Both of these cells were new and had never before been used for any purpose. In this case two unripe Bartlett Pears were inoculated with the so-filtered infusion and two others on the same tree with the resulting filtrate. Both the former showed strong evidences of the disease within three days, while the latter soon healed up the small wounds made by the inoculation, and have continued their normal growth.

The evidence is thoroughly satisfactory and conclusive. The Bacteria accompanying the disease of trees known as Pear blight when fully isolated will produce the disease, while the juices in which they live will not. They are therefore the direct cause of the disease. *J. C. Arthur.*

GARDEN PALMS.

(Continued from p. 394.)

EUTERPE, *Gertén*.—Two of the eight species in this genus are well known in gardens as decorative Palms, though, probably owing to their requirements in regard to moisture being imperfectly understood, they do not always give satisfaction, turning brown and losing their foliage, even when grown along with other tropical Palms. The two species here referred to are *E. edulis* and *E. oleracea*, and these when wild are found only in moist wooded swamps, and along river banks, always where there is an abundant supply of moisture in the earth and in the atmosphere, and never on dry land. For their cultivation, therefore, it will be seen from this that they require more water at the root than the majority of Palms. When properly treated they assume a graceful feathery appearance, their bright green, arching pinnate leaves, borne on the summit of what looks like a stem but is really the folding bases of the leaf-stalks, being very ornamental and well adapted for table decoration. They do not stand rough usage as well as many other table Palms, and they should be kept wet at the root at all times. Wallace, writing of their appearance when large, says:—“These are very elegant Palms; their stems are lofty, smooth and faintly ringed. The leaves are terminal, pinnate, regular, and form a graceful feathery plume. The bases of the petioles are sheathing for a long distance down the stem, forming a thick column 3 or 4 feet long, of a green or reddish colour. The fruit is small, globose (like the fruit of the Sloe), at first green, then violet or black, and consists of a thin edible pulp covering the hard seed.” A favourite drink, known among the natives as *Assai*, is made from this pulp, and the undeveloped leaves in the centre of the stem are cut out and boiled as a vegetable, which resembles Artichoke or Parsnip, and is said to be very good and wholesome, whence the name Cabbage Palm, applied to several species of *Euterpe*. Quantities of good seed are imported from South America into this country, and these, if sown in a hot stove and kept moist, ought to yield handsome little plants in about two years. Seedling leaves bipartite.

The Palm figured in *Bot. Mag.*, t. 3874, under the name of *E. montana*, is now placed in the new genus, *Pretea*.

E. acuminata, Wendl. (*Enocarpus utilis*, Kl.; *Oreodoxa acuminata*, Willd.).—Venezuela.

E. edulis, “*Assai* Palm.”—Tropical America.

E. oleracea, Mart., “Mountain Cabbage Palm” (*Arecá oleracea*, Jacq.).—Tropical America. This species, according to Aiton’s *Hortus Kewensis*, was cultivated in England by Mr. J. Tradescant in 1656.

GAUSSIA, Wendl.

There is only one species of this as yet imperfectly known genus, which is a native of Cuba, where it forms a stout upright stem of medium height, and thickened out at the base as in the *Hyophorbes*, to which *Gaussia* is closely related, and which it resembles in all its parts, at least as far as can be made out from a comparison of the plants at Kew. In the thick, rather fleshy petioles of the *Gaussia* there is, however, a character by means of which it can be distinguished from *Hyophorba amariculalis*, the stoutest of the *Hyophorbes*. The Kew plant is about 6 feet high, and has a stem 9 inches in diameter, formed by the sheathing bases of the leaves, and of a pale brown colour. The petiole is 18 inches long and 1½ inch in diameter, smooth, round, pale green, the pinnæ from 1½ to 2 feet long, by 1½ inch broad, with a long pointed tip and a curious warty mass at the base, as if affixed to the rachis by means of a lump of white wax. The frond is 5 feet long. The whole plant has a soft succulent appearance, unlike most Palms. Seeds like black Currants, and the pulp covering brown, the seed itself smooth and horny. Seedling leaves not seen.

G. princeps, Wendl., Cuba.—Under this, we suppose, must be placed *G. Ghiesbreghtii*, Wendl., known in gardens (Rollison) as *Oreodoxa* and *Chamedorea ventricosa*.

GEONOMA, Willd.

No fewer than a hundred species are described under this genus, all natives of Tropical America. Fifteen of them are cultivated at Kew, and are exceedingly ornamental, several belonging to the few Palms which find favour in almost every garden. The cultivated kinds require a tropical temperature, a moist atmosphere, and shade from bright sunshine; they are,

* Arthur, *Bull. N. Y. Agric. Exper. Station*, xcii., p. 34

Ann. Rep. N. Y. Agric. Exper. Station, p. 358.

† Burrill, *Amer. Acad. Adv. Sci.*, xxix., p. 589; *Amer. Naturalist*, xv., 589; Arthur, *loc.*

therefore, suitable for planting in shady places in large stoves, as, for instance, at Kew, in the Palm-house, where they appear to enjoy the shade of the taller Palms, which to the majority of the plants of this order is often harmful. The *Geonomas* delight in plenty of root-room and a liberal supply of water. The species may be divided into several groups, according to the form of their leaves and the height of their stems; in some, such as *G. macrostachys* and *G. Pohliana*, the leaves are a broad blade divided only at the apex, or sometimes split up into several broad segments; in others, of which *G. Seemanni*, *G. princeps*, and *G. gracilis*, are examples, the foliage is gracefully pinnate and even plumose. There is also considerable variety in habit exhibited in the plants of this genus, some forming a tuft of short stems, as in *G. macrostachys*, others bearing leaves a long way down the stem, which again is short in some kinds and tall in others. It will be seen that, as garden plants, the *Geonomas* possess many points of interest and beauty, their dwarf, graceful, Bamboo-like stems, and feather-like, or large entire leaves, which when young are in some species of a rich red-brown colour, being useful characters for garden purposes. In *G. gracilis* we have a Palm which in grace and elegance rivals the popular *Cocos Weddelliana*, and is quite as useful for decorative work. *G. Seemanni* is another strikingly handsome Palm with leaves entire when young, pinnate on older plants, the petiole and rachis covered with a dark brown scale-like rust, and the blade a deep olive-green. There is another Palm known in gardens under this name, with pinnate leaves, the pinnae being long, narrow and bright green. A beautiful pinnate-leaved Palm, with dwarf stems springing up in tufts, and forming a mass of dark green graceful foliage, is known in gardens as *G. Martiana*, but according to the *Genera Plantarum* it belongs to the genus *Asterogyne*. *G. baculifera*, a native of British Guiana, is remarkable owing to the aerial roots sent out from the joints of the stem, even from the highest joints, and to the development of young shoots which occasionally start from the sides of the stem, but which, however, do not grow to any size.

The stems of some of the *Geonomas* are imported into Europe to be made into walking-sticks. All the species inhabit moist forests. Their seeds are small, varying from the size of Peppercorns (*G. vaga*) to that of a Hazel-nut (*G. Spixiana*), the pericarp is leathery when dry, and the seed horny. Seedling leaves split at the apex.

- G. baculifera*, Kunth?—British Guiana.
- G. Carderi*, Hort. Bull.—Hab.?
- G. chiriquiensis*, Hort. Lind.—Hab.?
- G. cuneata*, Wendl.—Costa Rica.
- G. gracilis*, Wendl.—Costa Rica.

- G. Schottiana*, Mart.—Brazil, Guiana.
- G. Seemanni*, Wendl.—Nicaragua.
- G. Spixiana*, Mart.—Rio Negro, Amazons.
- G. vaga*, Griseb. and Wendl.—Brazil and West Indies.

Glasiava elegantissima is now placed in the genus *Cocos*.

Guilielma speciosa, the well-known Peach Palm, is now known as *Bactris major*.

HEDESCEFE, *Wendl.*

An old garden plant, known as *Veitchia* or *Kenia canterburyana*, forms the only species of *Hedyscefe*. It is a stout Palm, even when very small, and is well known for its usefulness as a decorative plant, its robustness, the elegance of its pinnate leaves, and the amount of rough usage it will stand, being favourable to its employment in this way. It grows very rapidly, forming handsome plants, 2 feet high, in about two years from seed. There is a very fine specimen of it in the Palm-house at Kew, with a stem about 25 feet high, 1 foot in diameter, bright green, with light brown rings, and bearing a large spreading crown of noble leaves, the petioles of which are covered with a brown meanness. The fruit is ellipsoid, 1½ inch long, the pericarp hard when dry; seed with a linear hilum extending far up on one side. Seedling leaves two-lobed.

H. canterburyana, W. and D., "Umbrella Palm;"

Kenia canterburyana, F. Muell.; *Veitchia canterburyana*, Hort.).—Lord Howe's Island.

HETEROSPATHA, *Scheff.*

This is another monotypic genus, closely related to *Nephrosperma*. It was introduced into Europe from the Java Botanic Garden in 1879, since which time it has become well known in gardens, owing to the elegance of its pinnate foliage, its compact habit, and its assuming at an early age a graceful habit. The leaves on young plants have short thin petioles, and segments about 9 inches long by half an inch wide, bright green, and narrowed upwards into a long slender tapering point. It grows very tall, the stem smooth and unarmad, and the leaves very long and arching. The fruits are small, pea-shaped, the pericarp rather soft and fleshy when fresh. Seedling leaves not seen. Being a native of the island of Amboyna it thrives only when grown in a moist stove and kept well supplied with water at the root.

H. elata, Scheff. (*Metroxylon elatum*, Hort.).—Amboyna, H.

(To be continued.)

ORNAMENTAL AND SHELTER FENCES.

We have within the last twenty years planted upon this district of the Seafeld estates over 100 small plantations, groups, and belts, with the twofold object of affording shelter and imparting beauty to the landscape. Now that many of them are grown up, and fulfilling the purposes intended, it may be interesting and instructive to some to know the leading particulars relating to this department of forestry. The construction of ornamental and shelter plantations differs materially in several respects from that of ordinary planting for profit. Groups, belts, and strips of plantation generally varying from half an acre to 1½ acre, less or more, are scattered over the whole estate, mostly in close proximity to farmstead-houses and cottages. It is really wonderful the difference between a district thus studded with groups of trees and shelter belts in contrast with one bare and destitute of them. On this part of the property there have been planted within the last thirty years besides the above number of groups, nearly 3000 acres of common plantation, and as many of these, as well as the groups, are now grown up, they impart a beauty to the landscape such as would be difficult to find in any other country. The charms of the surroundings led a person in my hearing, whose opinion on such subjects is of value, to say that these are not farm-houses merely but homes in the true sense of the word. The Romans had no word by which to express home, for the simple reason that they knew nothing of what we understand by home comfort. To those who may be about to undertake such delightful and beneficent work the following directions and suggestions the writer trusts may be found useful. In the first place plant as far as practicable on the north side of the house or steading, or on that side opposite to the sun at noon, for although the prevailing winds in this country are from the south and west, yet it is not from these points we need shelter so much as from the north and east. Plant therefore on the opposite side from the sun, and let it be observed that no trees are planted so as to shut out the rays of the sun from the windows of the dwelling-house. Another thing to be observed is to plant sufficiently far from the house that no tree if blown down will reach it. It is a very uncomfortable feeling to live in a house during a gale when at any moment a tree might be blown down and crush you to death. When at any time it is found that trees are too close to human dwellings the top should either be sufficiently lightened as to obviate danger, or if that is impracticable, the tree should be cut down, thereby of the two evils making choice of the least.

Our practice is to plant most extensively near the dwellings such trees as bear free lopping or pruning with impunity and do not so much attain height, as spread and grow bushy. For this purpose the Mountain Ash is an old and deserving favourite, as all know and can testify who have ever seen it grown to perfection. The Pear is also well adapted for such planting and so also are the Crab, Apple, Hawthorn, Willow, Bird Cherry, and Elder. Such groups we have endeavoured to plant extensively with all

species known to be truly hardy, long-lived, and adapted to the soil, climate, and situation in which they are permanently to grow. We have, therefore, made use of one or other of almost all the hardiest trees and shrubs in cultivation for the varied situations, conditions, and circumstances for which they are required. Common Beech has been freely used, and few groups planted without some *Sycamore* trees being in them. The trembling Poplar is deservedly a great favourite in the small group, and well deserves more attention than it has hitherto received. A few Maples interspersed are also of great advantage for the landscape effect. The display of flowers in early spring, and the golden, scarlet, crimson, and orange tints of autumn speak eloquently in its praise. The Elder, especially some of the bright coloured new varieties, is also deserving of a place in the foreground of groups. The groups in general have been planted near new houses, and the cry invariably is, Plant large trees and fast growers, so that we may have immediate shelter and comfort afforded by them in our own day. It is here the home nursery is of immense advantage, and for that purpose more than anything else ours has been valuable. The size of trees to be recommended for this purpose is from 10 to 12 feet high, well branched and well rooted, and, in addition to those above-named, Lime, Horse Chestnut, Spanish Chestnut, *Sycamore*, *Poplars*, *Elm*, *Birch*, *Silver Firs*, *Abies pectinata*, *A. nobilis*, and *A. Nordmanniana* have been freely planted. Of shrubs the Sea Buckthorn and Elder stand first in order of hardiness, and next to these as evergreens the *Rhododendron*, *Laurel*, *Bay*, and *Box*, and the *Ivy*, *Honeysuckle*, and *Sweet Brier* also find a subordinate place. To very exposed places and in bad soils the very hardiest plants had to be chosen, while in sheltered places with genial soil more choice could be made and favourite plants selected. It has to be observed that fine and choice plants have not been thought of for such planting, because they are not usually fitted to bear the exposure, &c., and because they are too expensive.

The next thing to attend to after planting, and making good blanks where they occur, is to thin them out in the manner best suited to the circumstances. Every species and individual tree requires to be grown under such conditions as favour it for all the purposes for which it was originally planted. Park trees, or such as are grown singly and with full freedom for their development, attain to the greatest age and remain sound for the longest period. Thinning, then, is a work of vital importance, and which, if properly done, yields splendid results, but if neglected defeats in a great measure the whole undertaking. The primary object in view is shelter, and not timber of a remunerative character, therefore thinning should be so managed as to induce low bushy trees, with short stems and spreading roots, which point out in the first place the necessity of early thinning, in the second place the need for prolonging it beyond the period when it should cease in purely profitable tree culture. It should be borne in mind that drawn-up, slender trees afford but little shelter and are not what is required, but, on the contrary, low bushy spreading ones. Trees thus planted where a dwelling-house is built should survive at least as long as the original structure lasts, when both it and they have fulfilled their allotted purposes. *C. Y. Michie, Cullen House, Oct. 12.*

FELLING.

As the present month is a good time to fell timber, and also the most convenient and suitable one for the farmers to have them removed from their fields, all hedgerows and park trees may now be taken down and disposed of. Where single or scattered trees are to be removed grubbing had better be resorted to; but in the case of hedgerow trees this cannot well be done without, to some extent at least, damaging the existing fences, both by injury to the intruding roots, and the forming of unsightly gaps in the hedges. The most judicious mode of felling isolated park trees is by grubbing up, or taking the solid part of the root with the bole, for the expense of taking up the roots afterwards, when either planting or tillage demands it, will be found to far exceed that of taking up the root with the stem in the first instance. As the felling of timber is an operation which calls for the greatest care, skill, and judgment in the workmen, the following remarks upon it will at the present time not be out of place. The tools commonly in use for felling are the cross-cut saw, hand-pruning saw, axe, and hand-bill;

Having first fixed upon the position in which the tree is to be laid or felled, one of the workmen, who has been told off for the operation, should next compare the size of head with the space available for its fall, and lop off any branches likely to interfere with, or cause damage to the neighbouring trees. After this, or previous to it, as found convenient, the tree should be "laid in," that is, dressed round with an axe as near the surface of the ground as possible, all inequalities of the stem likely to impede the progress of the saw being removed. A triangular notch should then be cut out exactly at right angles with the line of fall, the saw being inserted on the opposite side and worked parallel with the notch until the tree is felled. Wedges to save the saw may be inserted and driven home as the work proceeds, but this is seldom necessary unless in the case of weighty timber. An expert hand at felling will usually lay a tree within a few feet of the line selected, more particularly during calm weather, but on a windy day, or when working in a very close plantation, the use of a guide rope is to be recommended. During dry or frosty weather have all timber dragged or otherwise conveyed from fields and parks, firewood and branches disposed of or made into faggots, and such ruts or surface inequalities as may have been occasioned by removal filled up and levelled over, so that a neat tidy appearance may at all times be maintained.

PLANTING.

The excessive wet of the past month has, in most districts, but more particularly on stiff retentive soils, considerably retarded the progress of planting. As soon, however, as a favourable change sets in all the available force should be concentrated on this important operation, and the work assiduously prosecuted until it is considered well in hand. The planting of wet plastic soils should be carefully guarded against, as it is productive of anything but good. Peat bog or cold stiff clays should in all cases be planted in spring—these being the only exceptions to our oft-recommended policy of autumn planting—but it is well to have the pits opened for some time previous, as the ameliorating influence of the winter frosts on the soil is of paramount importance. *A. D. Webster, Penrhyn Castle.*

THE GENUS ODONTOGLOSSUM.

(Continued from p. 239.)

ODONTOGLOSSUM CRISPUM (ALEXANDRÆ).—Although described years before from Hartweg's specimens, and the memory of it frequently refreshed from various sources, but little was known of the beauty of this lovely Orchid before the specimens sent by Weir and Blunt bloomed in this country. In 1865 Messrs. Hugh Low & Co. obtained a First-class Certificate for it under the name of *O. Alexandræ*, and from that time it has steadily increased in public favour until now it is of all Orchids the greatest favourite. Despite the right of priority for the name *crispum*, that given to it in honour of our charming Princess has steadily gained ground, and bids fair to take the place of the other, in gardens at least; here it will be sufficient to say that both names apply to the same plant.

Considering the extraordinary variability exhibited by the species in the size, shape, and colouring of the flowers, and bearing in mind the fact of cross-fertilisation by insect aid, it may not be waste of time to offer a few suggestions as to the part which the abundance or scarcity of the insect which affects *O. crispum* may play in inducing those extraordinary variations. It is now well known that everything depends on the locality from which this plant is gathered, and that while some localities give only poor and narrow petalled forms, others yield round, broad petalled varieties, among which the poor starry kinds never appear. When speaking with the late Mr. J. H. Chesterton, who was so successful in introducing the best shaped forms, he told me that the better the strain the more thickly distributed were the plants, and that the bad varieties were always to be found in certain localities in abundance; so correct did he consider this test that he expressed the opinion that if a collector came across *O. crispum* thickly distributed and easily obtainable, he had better have nothing to do with it, as the varieties were sure to be bad. This seems to indicate that they are reproduced from seeds freely in some localities, and sparsely in others in which the varieties are the best. We may therefore

infer that the insects are plentiful, and their fertilising influence great in the thickly populated colonies, and that the certainty of being fecundated in sufficient quantity, and the early stage of the barely matured flower in which it takes place act as steadily degenerating influences; while on the other hand, where the fertilising insect is, and has been from some cause or other, scarce for a long period the flowers to offer additional attraction steadily progress in the expansion of their floral segments, and exhibit tinting and marking not necessary to their humbler brethren (which we call bad varieties), whose position for themselves and posterity is secured. [Can it be that the bad varieties are close-fertilised and do not require insect aid? There is some evidence in support of this, at least occasionally. Ed.]

It does not seem difficult to imagine that plants debarrated from producing fruits and having plenty of room might easily improve in the size, form, and substance of their flowers, while those which had to bear fruits frequently and were in consequence densely crowded, would, from a gardener's point of view, be inferior in the quality of their inflorescence, and hence, perhaps, the fame of the *Odontoglossums* from certain districts and the rejection of them from others. Such and more wonderful things are continually

in advance of all the others. It will be hard to beat, and whoever flowers one as good may command a price in three figures for it. Its large broad-petalled flowers are thick in texture, white, wonderfully tinged with rose, and heavily blotched with purplish-crimson. Baron Schroeder has it among his Orchid treasures, and received a First-class Certificate for it at the Royal Horticultural Society, June, 1884.

O. C. GUTTATUM.—This was flowered in 1867 by Wilson Saunders, Esq., of Reigate. Its flowers are not very broad in the segments, clear white, blotched with reddish mauve. Sir Trevor Lawrence received a First-class Certificate for it at the Royal Horticultural Society, April, 1884.

O. C. GUTTATUM ROSEUM.—A very handsome form of the preceding, with sepals and petals clear white, blotched and washed with rosy-purple in a very curious manner. First-class Certificate, Royal Horticultural Society, to Messrs. F. Sander & Co., June, 1884. For our illustration (fig. 135) we are indebted to Mr. Pollett.

O. C. BLUNTI.—This was exhibited by Mr. Marshall in 1865, and received a First-class Certificate as a distinct species; it is now only considered a good ordinary crispum.

FIG. 135.—*ODONTOGLOSSUM GUTTATUM ROSEUM*.

going on in Nature; those among us who have lived a good part of a lifetime among plants see many wonderful effects, and it is never idle to speculate as to their causes, for by so doing we must needs gain knowledge in the main even if we often err.

With respect to the names given to the varieties of *O. crispum* it is now generally understood that whoever gets a remarkably fine and distinct variety names it himself in the same manner as a raiser of a florist's flower would do. This is the wisest course in a class so subject to variation, and in which fine forms are of such great value that a distinguishing name is necessary for the guidance of the owner as well as the public, and for the identification of the variety should it ever be figured. [The distinguishing name in such cases should be in English, or if in Latin then it should be constructed so as not to mislead the reader and make him suppose that a botanical variety, duly chronicled, registered, and described, is intended. A fancy name should be a fancy name. Ed.] For my part so distinct do I consider the named varieties that I rarely forget the features of one of them, or fail to recognise it when I see it again. Although they are so distinct to the eye their description is a very difficult task. The following list enumerates most of the fine named varieties:—

O. C. VEITCHIANUM.—This wonderful variety of Messrs. James Veitch & Sons is certainly a long way

from *O. C. BOWMANI*, named in 1867, has rather narrow segments, white, sparsely spotted with dark rose.

O. C. JOSEPHINE.—This is a very fine form with large flowers, which seem to have a trace of *O. Andersonianum* in them. The flowers are white distinctly spotted with brownish-crimson, sepals faintly marked with rose. K. H. Measures, Esq., of The Woodlands, Seaham, has it in his collection.

O. C. ROSEUM PUNCTATISSIMUM represents quite a new type with large perfectly formed flowers, suffused with purplish-rose and blotched on the labellum with crimson. The flowers are profusely dotted with mauve, and that constitutes the chief peculiarity, as no trace of such marking has been seen until lately. H. M. Pollett, Esq., of Fenside, Bickley, received a First-class Certificate for it at the Royal Horticultural Society, May, 1885.

O. C. LILACINUM is of the same novel strain as the last-named. Its rosy flowers are tinged with lilac and blotched with cinnamon-red. Mr. Pollett received a First-class Certificate for it at the Royal Horticultural Society, May, 1885.

O. C. BALLANTINEI.—A most beautiful variety, with flowers of medium size, the overlapping sepals and petals being white heavily blotched with chestnut-brown, in such a manner that the markings seem to run into each other. It was named in honour of Mr. Ballantine, who so ably presides over Baron

Schroeder's gardens, and received a First-class Certificate at the Royal Horticultural Society, May, 1884.

O. C. DELLENSE.—This is another of Baron Schroeder's fine varieties. Flowers white, prettily spotted with light brown, the blooms being very compactly set on the spikes. First-class Certificate, Royal Horticultural Society, May, 1884.

O. C. TRIANE is one of the old figured kinds sent by Dr. Triana, who says he got it to leagues from Bogota, at an elevation of 7000—8000 feet. It has large white flowers with pink tinged sepals, the main peculiarity being that each sepal has a cluster of spots running into each other and forming one large blotch on each.

O. C. VIRGINALE is one of the most chaste and rarest of the varieties. Its flowers are snow-white, the only colour being a slight pale yellow tinge on the lip. Messrs. Shuttleworth, Carder & Co. recently flowered a superb form of it. Mr. B. S. Williams was awarded a First-class Certificate for O. c. virginale at the Royal Horticultural Society, November, 1882.

O. C. GUTTATUS FASTUOSUS.—This beautiful thing approaches O. c. Veitchianum in some degree,

O. C. DUCHESS.—This is also one of Mr. Stevens' varieties. It has large beautifully crimped, white flowers. First-class Certificate, Royal Horticultural Society, November, 1882.

O. C. DORMANIUM is an excellent form with large white flowers beautifully crimped and fringed, and heavily blotched with chocolate-brown. Mr. Dorman of Sydenham received a First-class Certificate for it at the Royal Horticultural Society, November, 1882.

O. C. JOHNSON.—This is one of the most beautiful of Odontoglossos, with large bluish-coloured flowers of perfect form, heavily blotched with yellowish-brown, and forming an unusual contrast in colouring. Messrs. F. Sander & Co. were awarded a Botanical Certificate for it at the Royal Botanic Society, June, 1885.

O. C. ROSEO-PUNCTATUM is another of Mr. Sander's introduction. Its rose flowers are prettily fringed on the petals and dotted with brown. Botanical Certificate, Royal Botanic Society, June, 1885.

O. C. PHALENOPSIS reminds one of a Phalenopsis Schilleriana, so broad are its segments, and bright its pink tint. It has a few brown dots on the petals.

cultural Society in May, 1882, and to Mr. B. S. Williams at the Royal Botanic Society. G. Neville Wyatt, Esq., of Lake House, Cheltenham, exhibited a fine form of it at the Royal Botanic Show this summer. Sepals and petals pure white, very broad and flat.

O. C. GRANDIFLORUM is one of Mr. B. S. Williams' certificated varieties, with remarkably large white crimped petalled flowers. It was certificated to B. S. Williams at the Royal Botanic Society, April, 1883.

O. C. ROTHSCHILDIANUM.—This is a very handsome kind, flowered by Mr. Bradshaw, gardener to Baron F. de Rothschild, at Waddesdon. It has large, wavy-edged, mauve-tinted flowers, the sepals having each one large dark red blotch, and being heavily tinged with violet, especially at the back; lip bright yellow at the base. James O'Brien.

(To be continued.)

ABOUT PEAR RAISING.

If I am right in the assumption that seedling fruit trees, and particularly Apples and Pears, derive certain acquired tendencies and peculiarities from their native soils and climate, and consequently thrive and produce the best results when grown in the localities which gave them birth, or in others which afford the same congenial circumstances, it is surely a matter worth the attention of fruit growers of every degree to devote some attention to the subject of obtaining new fruits more suitable to their own particular district than those which originated in a warmer climate. It must be admitted that seedling Pears are provokingly long before they produce fruit, and scores may be raised without anything of very superior excellence being obtained; still, there is always a chance, and an Apple or Pear of acknowledged value is sure of a good price; and, besides, it is an enormous privilege to signalise one's horticultural career by raising a good fruit, be it Apple or Pear. The late Mr. Hulse was singularly fortunate in obtaining four good Pears from a small batch of seedlings. But these Pears illustrate my opening remark—they are infinitely better in the locality in which they were raised than in more northerly districts. My father's British Queen has, however, a range beyond Frogmore, which stamps its merit as a very superior Pear. There was another seedling also raised at Frogmore which I thought when I first tasted it as incomparably the most delicious fruit I had ever met with; it was named Golden Russet; but it greatly disappointed me since, proving only of local excellence. I grafted it on trained wall trees with every advantage of aspect, but, alas! it failed in its early promise, and in this north Midland district it has never approached the position of a second-class Pear.

The high quality of Winter Nelis, and its marked peculiarities of habit and distinct foliage, suggested to me the idea of originating a race of Pears which, while possessing its distinguishing features, might also offer greater vigour, and an extension of season. Pursuing this idea I raised many seedlings from this delicious Pear, but hitherto nothing better than the parent has appeared to reward my attempt at extending the list of English Pears. I have yet to find the right seed parent.

I hope my suggestions and instances of success and failure may induce fruit growers to try what yet can be done in raising new Pears. Some of our best Apples have been raised by amateurs. We have at present in cultivation several good Apples, the result of single seeds deposited in odd corners of small gardens by cottagers. Bess Poole Apple, so highly valued in this district, was thus raised by the lady whose name it bears. Betty Geeson sprang from a pip sown by a peasant woman; and Bramley Seedling is an inheritance of success in Apple raising by unprofessional people. I should like to suggest to any one who has an idea of conferring that benefit on his own particular district, if not on the country at large, by originating Pears superior to those we now possess in some degree, to select as parents those sorts which possess the great merit of keeping in perfection after attaining ripeness. As is well known, a large proportion of our high quality Pears are no sooner ripe than they change to sleepiness or rottenness; but such fine old sorts as Crassane, Knight's Monarch, Beurré Rance, remain after reaching the period of ripeness for some weeks. This may be due to the leathery skin which Pears having this peculiarity possess. To obtain a Marie Louise and Don Chérien which would keep for some time would be indeed a boon. It certainly seems to me that this is one of the points that should be sought for in raising new Pears. W. Ingram, Belvoir, Oct. 25.

FIG. 136.—ODONTOGLOSSUM VAR. STEVENSII.

its flowers being prettily tinged and flaked with rose, and blotched with purplish-crimson. Perhaps the best form of it yet flowered is that which F. C. Jacomb, Esq., bloomed this year out of Mr. Low's importation.

O. C. SANDERIANUM also approaches Veitchianum, and is a rich and lovely thing. Sepals and petals heavily mottled and blotched with reddish-mauve, crest yellow. Baron Schroeder exhibited it at the Orchid Conference, May, 1885, where it was awarded a First-class Certificate.

O. C. COOKSONI is a grand form, with pure white flowers profusely sprinkled with large spots of deep purple. N. C. Cookson, Esq., of Wylam-on-Tyne, received a First-class Certificate for it at the Orchid Conference, May, 1885.

O. C. SOUVENIR DU PRINCE LEOPOLD.—This is a gigantic form with pure white sepals and petals, and broad labellum richly spotted with chestnut-brown. Messrs. F. Sander & Co., got a First-class Certificate for it at the Royal Horticultural Society, June, 1884.

O. C. WILSONI has large broad-petalled flowers, bluish-white, with large blotches of chocolate-brown. Mr. Stevens, gardener to the Duke of Sutherland at Trentham, received a First-class Certificate for it at the Royal Horticultural Society, November, 1882.

Messrs. F. Sander & Co. received a Botanical Certificate for it at the Royal Botanic Society, June, 1885.

O. C. REGINE.—This is a noble form with very large flowers, clearly marked with reddish-brown—the bright yellow of the labellum, and the crimson tint of the column rendering it very effective. F. A. Philbrick, Esq., of Oldfield, Bickley, exhibited it at the Royal Horticultural Society, in April, 1881, when it was awarded a First-class Certificate.

O. C. ROSEUM.—This name is applied generally to all forms of a good rose tint, but some are much better than others. Messrs. W. Thomson & Son, of Tweed Vineyards, Clovenfords, have flowered several bright rose forms equal in form, size, and substance to the variety giganteum.

O. C. STEVENSII.—Sepals and petals very broad, pure white, with heavy transverse blotches of chocolate, labellum large and blotched with red. Mr. Stevens, of Trentham, received a First-class Certificate for it at the Royal Horticultural Society, March, 1882. For our illustration (fig. 136) we are indebted to Mr. Pollett.

O. C. GIANTEUM.—This has become rather a hackneyed name, although there are many to which it might well be applied, as well as to the original plants certificated to Mr. Warner at the Royal Horti-

AGRICULTURAL RETURNS OF GREAT BRITAIN.

The following are among the general results of the returns which have been obtained for Great Britain:—

The area reported in 1885 to be under all kinds of crops, bare fallow and grass, exclusive of heath and mountain land, and of woods and plantations, amounts to 32,544,000 acres, as compared with 32,465,000 acres in the previous year, showing an increase of about 79,000 acres. The respective additions in each division are nearly 35,000 acres for England, under 9000 acres for Wales, and about 34,000 for Scotland. Some small portion of the increase is doubtless due to the more accurate returns made by farmers, but the reports of the collectors state that the greater part is caused by the enclosure and reclamation of moor, or heath, and waste land in different parts of the country.

With regard to the details of particular crops in Great Britain, the most noticeable features as regards corn crops, apart from the decrease in the total, seem to be that there is a considerable diminution of the area under Wheat, and an increase in that under Barley and Oats. The total quantity of land returned under Wheat in the present year is 2,478,000 acres, or 198,000 acres (equal to 7.4 per cent.) less than in 1884, and a decrease of 134,800 acres (or 5.2 per cent.) as compared with 1883, when the breadth was less than had previously been recorded. The diminution of the area under Wheat in 1885 is almost unanimously stated by the collectors to have been caused by the low prices obtainable for this grain in the autumn and winter of 1884, as the seed-time was generally of a highly favourable character in most localities.

They observe, likewise, that the tendency among farmers to devote more land year after year to breeding and grazing stock, as offering prospects of better results, has again greatly influenced the more limited acreage of this cereal in all districts where the nature of the soil and climate do not generally promise the probability of large crops, and the returns in the aggregate confirm the correctness of their statements. In reference to one or two counties, it is added that, were it not for the imperative requirement of straw in which farmers still find an inducement to grow Wheat, its diminution would there have been greater even than it is.

As regards green crops in Great Britain in 1885, Potatoes were planted on 549,000 acres, a decrease of 16,000 acres, or 2.9 per cent. as compared with 1884. Some of the reports attribute the lessened acreage planted to the reasons given for the deficient acreage of Wheat, namely, the unremunerative prices caused by the large crops of last year. The variation, however, is only in ordinary course, as the acreage of 1885 has been but seldom exceeded.

Turnips and Swedes have declined, they were this year returned as grown on 2,015,000 against 2,027,000 acres in 1884.

Mangels have increased by 27,000 acres, and Vetches, Lucerne, and other green crops unenumerated, have increased by 35,000 acres. The total area of green crops thus amounts to 3,521,000 acres, an increase of nearly 34,000 over the figures of the preceding year.

The extended acreage of Sugar Beet, mentioned in last year's report as having been returned in Suffolk, does not appear to have been continued.

The following table shows the acreage devoted to different purposes in 1884 and 1885 as returned on June 4 each year:—

Total for	Orchards, &c.		Market Gardens.		Nursery Grounds.		Woods.
	1884.	1885.	1884.	1885.	1884.	1885.	
England	192,300	189,700	53,900	47,900	10,600	10,300	1,466,000
Scotland	1,800	1,700	4,800	4,300	1,600	1,700	620,400
Wales	3,300	3,000	600	700	262	205	162,700

The annexed table shows the quantities and values of fruits (raw), Nuts (edible), and vegetables (raw), imported into the United Kingdom in 1884:—

QUANTITIES.	
Fruit (raw).	
Apples	2,679,830 bushels.
Oranges and Lemons	4,944,553 "
Not otherwise described	2,381,960 "
Total	10,006,343 "

Nuts (edible).	
Almonds	81,205 cwt.
Principally used as fruit	(See values).
Vegetables (raw).	
Potatos	2,444,160 cwt.
Onions	8,637,405 bushels.
Unenumerated	(See values.)

VALUES.	
Fruit (raw).	
Apples	£766,415
Oranges and Lemons	1,779,057
Not otherwise described	3,165,537
Total	£3,098,999

Nuts (edible).	
Almonds	£799,150
Principally used as fruit	557,540
Total	£1,356,690

Vegetables (raw).	
Potatos	£824,205
Onions	532,007
Unenumerated	426,970
Total	£1,783,182

The value of the entire lot was £6,519,920.

FRUIT NOTES.

PEARS WHICH SUCCEEDED AT GOODWOOD PARK. —In reply to your inquiry as to Pears generally, I find they do very well here either on Quince or Pear stocks in medium heavy soil and gravelly subsoil: the following varieties do well here:—Ne Plus Meuris, Beurré Diel, Iacon's Incomparable, Williams' Bon Christian, Glou Morceau, Beurré Clairgeau, Beurré de Capiaumont, Winter Nelis, Louise Bonne of Jersey, Fasse Colmar, Duchesse d'Angoulême, Bergamotte d'Esperein, Jargonelle, Josephine de Malines, Marie Louise, Doyenné du Comice, Beurré Rance, Beurré d'Amansil, Uvedale's St. Germain. *F. Rutland.*

EARLY FRUITING OF PEARS.

Modern Pear growers, by the employment of Quince and other stocks that check exuberant growth, have completely falsified the old saying, that "He that plants Pears plants for his heirs." A very forcible illustration of this occurred in my own experience this year, and I mention it that it may encourage people who, with the old saying in memory, hesitate to plant. I planted a horizontally trained Pear against a wall with an east aspect in the spring of 1884, the kind Madame Millet. It came to me with others from Messrs. C. Lee & Son's nursery. I gathered from it yesterday forty-nine well grown Pears. It was perhaps hardly judicious to allow a young tree to bear so heavy a crop, but its strength and vigour seemed to permit it. *W. Ingram, Belvoir, Oct. 26.*

BEURRÉ DE L'ASSOMPTION.

I am pleased to see attention drawn to this noble fruit (see p. 436). It deserves all that Mr. Wildsmith says in its favour, being a superior early variety that should not be overlooked by planters of kinds that ripen in September who have a favourable position in which to place it. At p. 113 "C. A. M. C.," who kindly answered my query respecting Clapp's Favourite, remarks that Beurré de l'Assomption frequently cracks when planted in other than warm situations; but that it does not always succumb to this failing when so placed I can testify. Pears are, however, all more or less capricious and particular as to soil and situation, both of which have a remarkable and puzzling effect upon them. Glou Morceau, for instance, which is deservedly highly

deeply imbedded, as particular attention has been observed to keep them near to the surface. It may, however, I think, be correctly attributed to coldness of the soil, as that in which they are growing is tenacious, and rests on marl. In reference to Beurré de l'Assomption, I can recommend it for pot culture; under this treatment it may be produced at its best with regard to size as well as quality of flavour, and it is in every way well adapted for this purpose. *Thos. Coomber.*

I send you the last of my Beurré de l'Assomption, which is better than any I have grown until this year, because the Pears hitherto never failed to crack. You will agree with me that grand quality would be needed to atone for such defects in form. I have grown the sort for about eighteen years; I never saw it handsome, nor tasted it good. Also I have seen it exhibited by others, large and sound, but always rather rough, and of very ungainly build. Possibly on a south wall it might do better here, but upon a west wall (where Souvenir du Congrès is very fine to look at) Beurré de l'Assomption is ugly and shy. The habit of growth can scarcely be judged from cordon trees, which are subject to prostraneous discipline, and which I have long discarded. But I have failed (with average care) to make any but a scraggy and unsightly tree of this Beurré. I have it on the Quince, and I have it "double-worked," and I trust next spring it will be treble-worked. The notes upon Pears which I sent to Dr. Hogg, and which he inserted in his valuable work, were not meant for publication as they stood, otherwise I would have taken more care to warn readers that I pretend to no authority, but give, *quantum valent*, the results of merely local experience. Mine is a good Pear soil, and grows nearly every kind to its average beauty, and many far beyond it—I send you a Louise Bonne and Beurré Superfin to show this. I have grown Beurré de l'Assomption very large, but always lumpy, rough, and fissured. *R. D. Blackmore.* (The specimen sent by Mr. Blackmore was as inferior as that forwarded by Mr. Wildsmith was good. But even in Mr. Wildsmith's specimen the form was not elegant, and the flavour, to our taste, inferior to Williams'. *ED.*)

A BEURRÉ CLAIRGEAU PEAR.

I have been from home for the last few weeks and have had no chance of seeing the *Chronicle*, but observe in your issue of October 17 you have an engraving of my Beurré Clairgeau. As Pears and Pear growing are now to be under discussion, I thought a short account of the tree might be of interest. Your woodcut is from a photograph taken in 1875; that year it was allowed to bear thirty-five fruits, which weighed 56½ lb., Jersey weight (17½ oz. to the pound), and continued to bear very large Pears until two years ago, when signs of exhaustion were evident, and last year it was quite worn out and had to be removed. The tree was planted in 1867, and the second year after produced one fruit which weighed 1½ lb., and until two years ago never had anything on it under 1 lb.; when in its prime the usual crop was from thirty to thirty-five Pears. This tree was on the Quince, not double grafted, but simply worked in the usual way. Of course it was well looked after, well thinned, mulched, and the top soil removed after every other year. The soil is a deep rich loam with sandy clay bottom, the situation west. Perhaps from this example we may gauge the life of a fruitful tree on the Quince stock under the most favourable conditions to be about fifteen years. *Edward Pond, The Vineries, Jersey.*

Plants and their Culture.

THE CHRYSANTHEMUM FOR DECORATIVE PURPOSES.

THE autumnal flower will soon be in its full beauty, therefore for the next few weeks it should occupy the foremost place among flowering plants for the greenhouse and conservatory, as well as forming the staple supply of cut flowers. Where groups of the plants are arranged for effect (and this, in passing, we might say is the best way to display them) it is necessary to stand them somewhat closely together, so as to obtain the best results. When this is done, every care must be taken by careful ventilation to keep the atmosphere of the house free from excess of moisture; where this is not guarded against both the

valued in some places—and used, I remember, to attain to large dimensions at Rendlesham Hall when I was there under Mr. Mill, who is an enthusiastic cultivator—behaves in a most unsatisfactory manner here; the fruits upon old trees, together with those upon young ones, regularly crack and mildew to such an extent as to cause a great portion of them to become utterly worthless; and this evil does not, in our case, result as it sometimes does from the roots being

foliage and flowers must suffer to some extent. In the case of the foliage mildew will cause the greatest injury, combined with the want of light, which until the plants were housed they obtained to a greater extent. Every care should be taken to keep the foliage as healthy as possible, so as to aid the fullest development of the flowers. A free circulation of air will likewise benefit the incurved varieties greatly, in preventing the petals from becoming unduly attenuated. A few weeks later another evil will present itself much too prominently, if the excess of atmospheric moisture is not kept in check, in the premature and rapid decay of the flowers, being first apparent in the more delicate colours. When the flowers begin naturally to fade, then it will be advisable to gradually withhold the abundant supply of water that has been supplied to their roots.

When the plants are all housed and arranged it will not be advisable to employ in any form manures that are of an offensive character. The house wherein the Chrysanthemums are displayed will be sure to have frequent visitors, every pains should therefore be taken to keep it as clean and sweet as possible. For the better information of the admirers of this flower, it will be found a good plan to attach the names of the plants to a convenient spot where they can be easily read. The latest flowering kinds should be kept apart from the main collection and receive more room and as much of light as possible; such as can be kept back for a few weeks will be found valuable when the main bulk is over.

Propagation should be seen to without delay in the case of those varieties which are productive of early cuttings, before the young shoots become unduly drawn. Regard to this point is all the more requisite where the pots are grouped close together, thus causing the young growths to become tender and weakly if left till the plants are again removed. Tall plants, such as are grown on from the cutting without being stopped and thinned out at an early period, will generally push out some later flowers up the stems; many of these will be of service for cutting, being at the same time available without detracting from the general effect of the whole. *James Hudson, Gunnersbury House Gardens, Acton, W.*

FRUITS UNDER GLASS.

FIGS IN POTS.

AFTER much experience in forcing early Fig trees, I have arrived at the conclusion that no plan equals that of having trees well established in large pots, and for general use no variety, in my opinion, is so good as the Brown Turkey. If the trees be trained somewhat after the bush fashion, a span-house is most suitable for them, because the trees individually obtain a larger proportion of sunshine and light, which during the murky winter months is so much needed. If, however, the trees are to be trained on a trellis beneath the glass, then a lean-to structure will meet the requirements, and perhaps at even less cost in the way of fuel. In either case, the house should be capable of holding a bed of fermenting material adequate for the purpose of producing heat from 60° to 70°, and retaining this degree of heat for a lengthened time.

Before the bed is put in, brick piers 9 inches square should be erected to carry the pots, by merely putting up the bricks to the height required, and filling in the spaces between them with coal-ashes, to make them stand firmly. The bed should be of good Beech or Oak tree leaves, and, if practicable, should be put in at once and trodden firmly down; otherwise the leaves should be collected together in a heap, so that fermentation may proceed, and then the bed might be put into the house just prior to forcing being begun.

The arrangement of the trees should be made so as to bring them well up to the glass, and the beds should be made up to the rims of the pots. Trees when placed on piers do not sustain damage from the bed overheating, because the subsidence that takes place owing to fermentation leaves them standing out of all danger from that cause. With trees properly prepared and placed under conditions as advised, together with fair treatment, good crops of fruit may

certainly be assured by the middle of April. For this period forcing in a gradual way should be commenced about December 1, with a night temperature of 55° and 10° more in the daytime; as considerable moisture will arise from the newly introduced bed: syringing must be regulated accordingly, so as not to have the trees constantly wet.

ROOT PRUNING AND LIFTING FIGS.

In the succession house the trees will most be planted out in borders. Under these conditions the roots, if not sufficiently restrained, will, generally speaking, require lifting, a process of which I much approve, and annually practise in the case of all the Fig trees which are grown under glass here as being the best to restrict over-exuberance and render the trees more fruitful. We make an opening down to the drainage, and take the latter out if the roots have penetrated it at the outward limit of the border, and work off from it 1 to 2 feet of the inert stuff. Then cut the roots back, and replace the old with fresh material, which by-and-bye will be filled with fresh young roots ready to take up whatever may be given in the shape of manures to invigorate the trees just at the time they require it. Proceed with those means which are requisite to extirpate insect pests, and thoroughly cleanse the house.

PRUNING.

Prune the trees and wash them with soapy water, using caution so as not to damage the embryo fruits on the terminal shoots. I depend solely on these for the crop of fruit, and therefore aim to have a supply equally distributed over the whole area of the trellis, and only take away those which have reached the limit of the house, and others which are not required; as the branches increase so quickly in size, so that ample room is left in the tying up, otherwise half the tree will need retreating by-and-bye. After such matters are finished, take away 3 or 4 inches of soil off the top of the border, and replace it with an equal quantity of fresh compost; water the whole border thoroughly, and freely ventilate the house until the time arrives for starting it again.

LATER HOUSES.

Here let the ordinary work of cleaning be done on suitable occasions, and when all is completed treat the house identically with the former until the trees are required to start again. Late trees in pots should, if necessary, be shifted into larger pots, or otherwise have the balls of earth slightly reduced, and be repotted. Where Fig cultivation is carried on in pots it is advisable to have some surplus trees coming on, and in readiness for any emergency. *G. T. Miles, Wycombe Abbey.*

The Hardy Fruit Garden.

CLEANING TREES, &c.

THE autumn and winter months are the best time for thoroughly overhauling the fruit trees. Should moss appear on the branches it is a sign that something is wrong, either the trees or branches are too crowded or the ground is damp; should the former be the case, removing a few large branches would lessen the evil, or if the latter, the ground should be drained. Moss is best removed by scraping the stems with a piece of hoop-iron or wood, and then dusting the trees all over with hot lime when they are damp.

PRUNING.

In pruning, the habit and general character of the tree should be considered. One of the most important points is in so having the branches regulated that sun, light, and air, can act on them; without this good results cannot be expected. Often varieties are condemned when it is the fault of the grower. For producing good fruit and keeping the trees healthy there is nothing like being able to leave a certain portion of clean healthy well ripened young wood at pruning time; this applies to summer as well as winter pruning, for with dwarf growing trees summer pruning is the most important. This requires careful attention to the habits of the trees, and can never be attained by a hap-hazard cutting away of branches. Young trees can always be pruned, so as to bear abundance of young wood, but in old trees that have filled the space allotted to them

it is more difficult. My own plan with the latter trees is to cut off a few large branches every year, this makes room for young branches to be left, and so a constant renewing of the trees goes on year by year.

TREES ON WALLS

may be treated in this manner, the same as those growing in the open garden. In planting young trees of Apricots the ground should be light and firmly placed round the stems; too rich soil is a fertile source of canker, &c., in these trees. The most important point is to secure short, firm, well ripened wood, and it is impossible to thoroughly ripen the wood where the trees grow a yard or more every year. Moor Park, Breda, Ilmiskirk, Frogmore Early, and Large Red are all useful varieties. These may be planted on an east or west wall, but one fully exposed to the south is the most favourable for the production of really good fruit.

Morello Cherries on north walls should now be pruned and nailed up. Where the trees are getting old and have become crowded it is advisable to remove a few large branches, cutting them off at the bottom of the wall; this will allow space for laying-in young wood, which always produces the best fruit. The walls may be syringed with soapy water; this will kill any moss or insects on the trees.

The Kitchen Garden.

TRENCHING AND DRESSING.

THE advantage to be obtained from early trenching cannot be over-estimated, especially by those who wish to excel with roots and tubers. By trenching early much stronger dressings can be given with safety as the work proceeds than if the work is left until a later period. By dressings I mean those which are applied mainly to cleanse the soil from insects and to quicken the constituents in the humus, thereby adding greater fertility to it. Some garden soils which have been constantly manured with decayed vegetables and animal manure year after year would be greatly benefited by receiving a dressing of artificial manure; but of this it is rather too early to speak, as it would be better if applied about three weeks or a month before the seeds are sown, lightly forking it into the surface. Another advantage derived from this early commencing trenching is that the spit of soil which is brought from below to the surface gets well pulverised by the action of the weather during the winter, and which by seeding time in spring will be in the best possible condition. Old garden soil is much benefited by a dressing of lime, soot, and salt, especially if none of either have been applied for a number of years. As soils having a similar character and dressing suit the following root-crops, it is always desirable to get ready a plot or quarter large enough to accommodate them in proximity to each other:—Carrots, Parsnips, Beet Root, Salsify, Scorzonera, and Chicory. To obtain the very best results, choose the deepest light soil available, as free as possible from stones, and also soil that was well enriched with manure in the spring. It will not then require any further manuring unless it be still considered poor, when a little artificial manure may be picked into the surface three weeks before sowing the seed. For roots double digging is much better than ordinary digging one spit deep, and finally trenching is better than either. As to the depth to which trenching should be carried that will depend entirely on the depth of the natural soil and the absence of water. Should wireworm be prevalent, or clubbing have taken place in the quarter selected for those crops, the dressing of soot and salt at the time of trenching or double digging will be most beneficial. To 3 bushels of soot add one of salt. This should be applied as follows:— After throwing the top spit into the bottom of the trench, apply a good sprinkling of the mixture on the top of it and prick it in with a fork before throwing on the next spit, which should then be treated the same as the lower spit. This simple remedy tends to the production of clean roots, and to invigorate the crop. *G. L. Richards, Somerley, Ringwood.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Nov. 9	Chrysanthemum Show at Stoke Newington, Sale of First-class Bulbs from Holland, at Stevens' Rooms. Royal Horticultural Society: Meeting of the Fruit and Floral Committees, at 11 A.M. Scientific Committee at 1 P.M., at South Kensington. Meeting in the Music Room at the Inventions Exhibition, to consider the subject of an International Exhibition in 1857. Kingston and Surbiton Chrysanthemum Society's Show (two days). National Rose Society: General Committee Meeting, at 3 P.M. Bexley Heath Chrysanthemum Society's Show (two days). Dudley and District Chrysanthemum Society's Show (three days). Brighton Chrysanthemum Society's Show (two days). Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Sale of Valuable Nursery Stock at the Millford Nurseries, Godalming, by Protheroe & Morris (two days). National Chrysanthemum Society's Show, Royal Aquarium, Westminster (two days). Sale of First-class Bulbs from Holland, at Stevens' Rooms.
TUESDAY, Nov. 10	Sale of Roses, Lilies, &c., at Protheroe & Morris' Rooms. Sale of Nursery and Greenhouse Plants, at Foster's Nursery, Sunbury, by Protheroe & Morris (two days). Tunbridge Wells Chrysanthemum Society's Show (two days). Sale of Valuable Imported Orchids from Messrs. Sander & Co., at Stevens' Rooms.
WEDNESDAY, Nov. 11	Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Sale of Nursery Stock, at American Nursery, Leytostone, by Protheroe & Morris (two days). Huddersfield Chrysanthemum Society's Show (two days). National Chrysanthemum Society's Show. Sale of a Collection of Established Orchids, at Protheroe & Morris' Rooms. Sale of First-class Bulbs from Holland, at Stevens' Rooms.
THURSDAY, Nov. 12	Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY, Nov. 13	Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
ATURDAY, Nov. 14	Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

THE production of heat in flowers has often been observed and measured, and the general chemical explanation given of the phenomenon is no doubt true in the main. It depends upon oxidation or the union of oxygen gas with the tissues of plants or their contents, and to the "combustion" or destruction that goes on in consequence, accompanied by the emission of carbonic acid gas. In an earlier stage of the plant's life the process is just the reverse. The leaves and green portions of the plant when exposed to sunlight give out oxygen gas; the process is one of deoxidation, and with it occurs a process of evaporation of moist vapour from the surface, both cooling processes; so that while on the one hand during the flowering period and during the ripening of fruits and the germination of seed we may expect the temperature of the plant to rise: on the other, all the time assimilation of carbon is going on in tissues still green and exposed to light the temperature may be expected to be no higher than that of the surrounding air. Some recent experiments recorded by Dr. ORD are so interesting from this point of view that we believe our readers will be glad to see the following report of them, taken from the *British Medical Journal*—

"In fruits we have, as it seems to me," says Dr. ORD, "two processes of meaning exactly opposed to the other; the building up of the fruit, wherein we have the formation of cellulose, starch, &c.; and the ripening, wherein we have the breaking down and the production of sugar. I determined to investigate fruits of rapid growth, and test their temperature as compared with that of the surrounding air. Before doing this I consulted botanical books, and questioned great living botanists; but information was not forthcoming from either source. The kindness of a friend who has large hot-houses near London enabled me to make some experiments which, I venture to say, have some importance in vegetable physiology, as well as in their relation to the question of pyrexia.

"The Cucumber was the fruit which I chose for my observations. It is a fruit which grows very rapidly, and a fruit in which the signs of ripening can be readily seen. It is grown in houses at a fairly fixed temperature, and in an atmosphere of considerable moisture. Having chosen my growing Cucumbers at a stage free from any fear of ripening I had a glass bottle, with wide open mouth, filled with water, suspended by the side of each fruit, the bottle equalling the fruit as nearly as possible in size. After twenty-four hours or more I commenced observation; I used a delicate pointed thermometer, lent to me by that skilful constructor, Mr. HAWKESLEY. With this I took, first, the temperature of the air of the hot-house around the fruit; next, the temperature of

the water in the bottle; next, the temperature of the Cucumber at different points of its length. This was done by plunging the short end of the bulb containing the mercury to a fixed depth, marked by a line on the bulb. I took the temperature of the Cucumber at various points in its length for a definite reason. Cucumbers begin to grow at the base or stalk end, and further growth is beyond this at the tip or flower end. If any difference of temperature between the fruit and the air should be found, it might be argued to be due to evaporation if the difference were equal at all points; but, if the difference should vary at the several points tested, the influence of metabolism might be recognised.

"On July 23, 1854, a very young day, I examined a young growing Cucumber 13 inches long. The temperature of the house was 86° F., Fahr., the temperature of the water in the bottle was 85° F., Fahr. The Cucumber gave the following readings—At the stalk, 84°; 2 inches along, 85°; middle, 85°; 2 inches from tip, 84.5; tip, 82° F. The experiment was repeated with another Cucumber on the same day, and with similar Cucumbers on other days. All the observations were to the same effect. I note one or two other observations.

"On June 7, the weather being much cooler, and the air of the house being at 75° F., the water in the bottle was at 82° F. A ripe young Cucumber was found to be at 82° F. in the middle; a young Cucumber, pendulous, 74° F. in the middle; a young Cucumber, horizontal, 74° F. in the middle.

"On June 11, the weather being again warm, the water stood at 86° in a bottle on one side, at 66° 3 in a bottle on the opposite side. Two Cucumbers to be at 84° F. in the middle; a young Cucumber, pendulous, 84° F. in the middle; a young Cucumber, horizontal, 84° F. in the middle; a young Cucumber, at the tip, small, but evidently growing Cucumber, 83° F. in the middle; a nearly ripe Cucumber, cut the preceding day, and placed close to the others, 87° at all parts.

"I trust that you find these observations, as they stand, something of interest. They show, at least, that the traditional coolness of the Cucumber is not a mere creation of fancy; but that the growing fruit is actually cooler than the medium in which it is growing. So far as these observations are concerned a new fact has been established; but the observations are not numerous, and the inferences are not sure. I hope to extend the observations; to introduce more controlling experiments; and so go on for safer inference. Nevertheless, arguing upon what we have before us, and upon parallel experiments made upon Bananas, with which I will not now trouble you, we may acknowledge that the comparative coolness of the growing fruit may have been due to evaporation, and that the warmth of the separated fruit may have been due to the comparative cessation of evaporation. On the other hand, I may urge that the air of the hot-house was loaded with moisture—as is the case in properly managed houses of this kind—and that moisture was deposited in beads on the surface of the fruit. This, of course, is against the evaporation explanation; and so far I should urge that the difference in the temperature of the fruit at various points in its length is against evaporation. Further, it is in favour of the hypothesis of metamorphosis in metabolism, in that the temperature was most reduced where, according to all appearance, tissue formation should be most rapidly proceeding. If time serve me during the coming year, I hope to institute experiments which will clarify the evaporation difficulty, and to investigate other fruits; but, so far as I have gone, I think that I am entitled to argue that there is indication that the metabolisms leading to the formation of tissues from juices do actually use up heat."

—THE PROPOSED INTERNATIONAL EXHIBITION.—On Tuesday next, November 10, the adjourned meeting to discuss this matter will be held in the Music Room of the Inventions Exhibition, South Kensington, at 12 30 P.M. Invitations have, we understand, been sent to the principal horticultural societies of the country, while individuals have been invited by means of advertisements. We trust, therefore, that a thoroughly representative meeting will be held, and that some satisfactory conclusion may be arrived at. At present there is not much appearance of zeal among the horticulturists, though we believe the fire would burn freely enough if only the Council of the Society could offer adequate guarantees that the requisite funds would be forthcoming. It is absurd to suppose that the material is not sufficient for the purpose, hardly less so to imagine that the same machinery which has carried out the last three exhibitions to a successful issue should not be able with the aid of the horticulturists to carry out the former view—the Council has hitherto not been in a position to give sufficient assurances on the questions of finance and co-operation on the part of the "Commissioners." Those who remember the past history of the Society, the numerous vague promises or implied promises which the "Commissioners," or those who spoke in their name, laid before the Society, and who call to mind the results of it all, as seen in the present state of the Society, may be forgiven if they exercise some caution as to vague assurances from such a quarter. But from this

point of view it is necessary to point out that there are Commissioners and Commissioners, and that those who have the management of the present series of Exhibitions are not the same body of men as the "Commissioners" who, in former years, dangled metaphysical Carrots before our eyes, but never allowed us to get a mouthful.

—CMBRETUM MICROPETALUM.—In any garden where autumn flowering stove climbers are desired, *Cmbretum micropetalum* (fig. 137) is well deserving of a place. It is probably owing to its having obtained the worst reputation a plant can have, that of being a shy flowerer, that it is so seldom seen in cultivation; but if properly treated, according to Mr. F. MOORE, it does not deserve such a reputation. It is a strong growing climber with handsome bold foliage. When pruned only half the shoots should be removed, and the remainder kept close to the light. They flower in September, and after flowering should be removed to make room for the succeeding shoots. The flowers are very closely crowded on a main stalk about 8 inches long, the stalks being in pairs, and each shoot carrying four to eight of these pairs. The flowers owe their beauty to the long yellow stamens with red anthers, which impart a pleasant, soft, and feathery appearance to the inflorescence. *Cmbretum micropetalum* is a native of Brazil, and is cultivated at Glasnevin, whence our specimen was derived, in the large stove, in which the minimum night temperature is 55° Fahr. It is trained close to the roof, and flowers freely each year.

—THE PEAR CONGRESS.—The Executive Committee which so far has had charge of the arrangements of the Pear Congress held its final meeting at Chiswick on Wednesday last, the closing day of the show. It has been a matter for regret that quite one-half the days the show of Pears was open were wet ones, thus seriously affecting the attendance of the public; still further, it is evident that Pears have entirely failed to create the interest which attached to the Apples two years since—inasmuch, indeed, that the receipts for admission have been small, and when the accounts are presented to the Council of the Royal Horticultural Society a material balance on the wrong side will be shown. As the Council, however, received the balance which accrued from the holding of the Apple Congress, and also the profits arising from the sale of the Congress report, that body can hardly complain. The work done at the Conference, if peculiarly unsatisfactory, was at least most practical pomologically, as will be seen when the committee's report, carefully prepared by Mr. BARRON, is completed and published, assuming, of course, that the Council will undertake that important responsibility, and without which the Congress would prove a comparative failure. The committee, at its recent meeting, did not undertake the exceeding responsibility of compiling an *index expurgatorius* of indifferent kinds, the work would have been too great and too invidious. On the other hand, it has prepared a list of kinds which are either new or too little known, and which includes also some first-rate winter Pears, which it recommends for wider cultivation, and also some good kinds for market culture. The only *bona fide* seedling kind to which a First-class Certificate was granted was Mr. RIVERS' Conference, a long tapering kind, of delicious flavour and soft luscious flesh, somewhat tinted with pink, and ripe in November.

—TURNER MEMORIAL PRIZES.—We have already alluded to the establishment of a fund by means of which the great services to horticulture rendered by the late Mr. CHARLES TURNER may be commemorated. There are many to whom the personal character of the man will appeal, even more forcibly than abstract considerations. But in either case it is desirable to increase the amount of the fund and that quickly. Up to the present time about 120 gentlemen, comprising many of the leading men in the horticultural world and some of the rank and file, have responded to the appeal and have individually contributed sums varying from a few shillings to ten guineas. We are not at the moment empowered to mention names as the gentleman's proposals are not fully matured, but we may say that one of our boiler makers proposes to present the committee with a boiler, of the value of thirty guineas, to be competed for at some exhibition to be hereafter arranged.

Fig. 137.—*CONCRETUM MICROPTALUM*: FLOWERS YELLOW. (SEE P. 522.)

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are requested to remind our readers that it is very desirable that the collecting cards should be returned to the Secretary without loss of time. The amount collected so far is estimated at about £140. The legacy of £100 bequeathed by SUTHERLAND LAW, Esq., of Southgate, has been received, so that the Institution is in a sound financial condition. On the other hand we hear that the number of applicants for the benefits of the Institution is larger than on any previous occasion. We are further informed that this Institution has secured permanent offices at 50, Parliament Street, Westminster, S.W.

— FLOWERS IN SEASON.—Mr. HARTLAND sends us from Cork a handful of flowers to show how autumn still lingers on in south-west Ireland. Among them are *Gladiolus Villa de Versailles*, a flower with narrow lanceolate, white segments, the lower ones fringed and feathered with crimson stripes. Mr. HARTLAND mentions this variety as flowering even in the dark days of December. *Sternbergia lutea*, var. *angustifolia*, is rare in cultivation. It resembles the common form, but has much narrower leaves and flowers a month later. The white-flowered *Escallonia montevideana*, and a dark blue *Ceanothus*, both from a wall, are sent to attest the fact that summer weather still prevails in that nook of the Emerald Isle.

— SHOW FIXTURES FOR NOVEMBER.—The following are the chief exhibitions of Chrysanthemums, viz.:—Nov. 9, Chrysanthemum Show, Stoke Newington.—Nov. 10, Bexley Heath, Dudley and district, fruit, plants, and Chrysanthemums, three days; Kingston and Surbiton, Brighton, two days.—Nov. 11, National Chrysanthemum, at the Royal Aquarium, two days; together with a Floral Committee meeting, and also on Nov. 25.—Nov. 12, Tunbridge Wells Chrysanthemum show, two days; Shrewsbury Chrysanthemum, two days; Portsmouth Chrysanthemum, two days.—Nov. 13, Huddersfield Chrysanthemum, two days; Reading Chrysanthemum, two days.—Nov. 17, Royal Botanical and Horticultural of Manchester, show of Chrysanthemums; Yewville Chrysanthemum, Devizes Chrysanthemum, Lincoln Chrysanthemum, two days; Winchester Chrysanthemum, two days.—Nov. 18, Birmingham Chrysanthemum show, two days; Bristol Chrysanthemum show, two days.—Nov. 19, Hull and East Riding Chrysanthemum show, two days.—Nov. 20, Sheffield and West Riding Chrysanthemum show, two days.—Nov. 25 and 26, and following days, Royal Caledonian Apple and Pear Congress and new winter or Chrysanthemum show; and the York Ancient Society of Florists on the 25th only.

— MR. T. LANTON'S NEW FRUITS.—The Apple September Beauty has the Ribston flavour, and is highly coloured on all sides. As an early autumn fruit, to be consumed before the middle of October, it will be much appreciated, the flesh being soft and digestible to a higher degree than many kinds of richly-flavoured Apples. The Dartmouth Crab, of American origin, is a showy fruit, to hang on the tree as late as possible, and give colour to the autumn garden, the colour being deep crimson. We cannot say much as to its flavour, which, in the specimens sent to us, was not provocative of gusto.

— "MALESIA."—The last part of this publication, edited by Signor BECCARI, and devoted to the description and illustration of the plants collected by him in the islands of the Malay Archipelago, contains the continuation of the descriptions of the species of Hydnoophytum, Rubiaceae parasitic plants producing a large tuber, divided in the interior into numerous cavities constantly inhabited by ants, and the formation of which is described. The ants are formidable assailants to predatory animals, and thus repay the hospitality offered them by the plants, at the same time, according to BECCARI, who in this matter is opposed to TREUB, they may furnish nourishment to the plant.

— PEACH YELLOWS.—This disease, little known in this country, is made the subject of study by Mr. PENHALLOW in the Canadian *Record of Science*. He shows, from the researches of NOBBE and others, that while potato is essential to the formation of starch in plants chlorine is essential to its distri-

bution, so that if chlorine be withheld the starch accumulates where it is formed, and is not transported elsewhere. The microscopical appearances in the case of the diseased trees were consistent with these facts, and hence Mr. PENHALLOW, deeming the disease to be the result of imperfect nutrition, treated a number of trees with muriate of potash, and "after the lapse of a few years they lost all appearance of disease, and were restored to such a condition of health that up to the present time they have been most profitable in their production of fruit."

— THE STINGING NETTLE.—There may be some who may think a quarto treatise of 250 pages, with numerous illustrations, a waste of labour when they learn that it has been expended on the Stinging Nettle—*Urtica dioica*. But this opinion could only be based on ignorance and misapprehension. Any one interested in the microscopic anatomy of plants will, however, turn to M. GRAVIS' *Recherches Anatomiques sur les Organes Végétatif de l'Urtica dioica* at first with interest, and subsequently with admiration. The importance of a thorough study of the minute anatomy of the plant in every stage of its growth receives strong illustration in this publication. On it depends much of our knowledge of the physiology of the plant; with it we have a clue to the lineage and affinities of the plant, and an illustration of the manner in which its tissues are modified according to circumstances, and enabled to adapt themselves to varying conditions. It thus becomes a matter of great moment to cultivators. Our successors, taught by the anatomists, will have resources placed at their disposal which their predecessors could not have. M. GRAVIS' treatise is exhaustive. Criticism of its details would be out of place here, even if it were possible to follow the author in his minute examination, but we may heartily congratulate Belgian botany on this important and valuable contribution to science, one that will be constantly referred to by workers in the same field, all of whom will acknowledge the justice of the remark with which M. GRAVIS concludes his work, and which affirms the necessity in the present state of science of a thorough scrutiny of the anatomy of the whole plant in all stages of its growth. Nevertheless the prospect is sufficiently formidable. Life is short, but the knowledge to be gained from a Stinging Nettle, as M. GRAVIS' treatise shows, would demand for its full attention the devotion of a long life, and even then it may be presumed, the next generation with improved methods of observation and research would find as much work to do. Clearly the men of action cannot wait; they must do the best they can with existing knowledge, but they can at least sympathise with the men of research, and encourage them in their patient toil.

— RARE DEVELOPMENT OF LILIUM AURATUM.—We read in the *Aberdeen Daily Press* that a very fine specimen of this Lily was lately exhibited in the shop window of Messrs. W. SMITH & SON, seedsmen, Market Street. The flowers were borne on a single stem, and grew in a 10-inch flower-pot. Bulbs of this variety at their highest state of perfection seldom produce more than a dozen flowers, but this plant has produced no fewer than fifty-five, all fully developed and perfect. The plant was grown by Messrs. W. SMITH & SON at Kiatore.

— ROYAL BOTANICAL AND HORTICULTURAL SOCIETY OF MANCHESTER.—A great exhibition of Chrysanthemums and fruits will open in the St. James' Hall, Manchester, on the 17th inst. The Society's Gold and Silver Medals are offered for collections of Apples and Pears, and about £150 for Chrysanthemums. This is the first autumn exhibition the Society has held on a large scale.

— STROPHANTHUS DICHOTOMUS.—The flowers of this species of Dogbane are singular and interesting in several ways. The twisting of the corolla in bud is a character common to all of the species of the genus, as well as a great number of the order; but in this instance the extraordinary length of the free segments so exaggerates the character as to give rise to the generic name. The flowers when expanded are shortly funnel-shaped at the base, with linear segments about 2 inches long, yellow, and striped in the throat with pale red lines. They are generally produced in threes terminating the branches, but the middle one, curiously enough, is the last to

open, or may prove abortive. The plant is evergreen, with opposite leathery leaves, and requires stove temperature, as it comes from the East Indies—some books say China and India. At all events Miss NORTH painted it in Java, and the painting, No. 467, may be seen in the "North" Gallery at Kew. The singularly large fruit follicles are exhibited, two from each flower, oblong in shape, and diverging horizontally. These pod-like fruits are rarely if ever produced in this country, although it has been cultivated more or less since 1816 or 1818. This species was figured in LODDIGES' *Botanical Cabinet*, p. 759, and a flowering specimen may be seen in the Begonia-house at Kew, where in one or other of the houses it flowers annually.

— MILDEW.—The *Journal Officiel* publishes a report addressed to the Minister of Agriculture by M. PRILLIEUX, Inspector-General of Agricultural Instruction, as to the results obtained by the use of a mixture of lime and sulphate of copper in countering mildew. It has long been the custom in some parts of the Médoc to sprinkle the Vines bordering roads with lime-water, to which a salt of copper was added. At one time verdigris was used, but it was expensive, and so sulphate of copper was substituted. The purpose of using it was to prevent children and depredators from pulling the ripe Grapes which were within their reach. They were afraid to eat the sprinkled bunches. A belt five or six stocks wide was treated in this way along the sides of the thoroughfares. When mildew spread to a serious extent in the Médoc it was remarked that the Vines which had been sprinkled with the mixture suffered less from the disease than the others. The leaves attacked by the *Peronospora* withered and fell off prematurely everywhere except along the roads, where they remained green, and where the Grapes ripened. At Dauzac, the property of M. JOHNSTON, the stocks had been carefully sprinkled by M. MILLARDET, Professor of the Faculty of Sciences, and M. GAYON, Professor of Chemistry at Bordeaux. After studying the results in this and a large number of other places, it was discovered that the sprinkling of Vines with a liquid containing about 8 per cent. of sulphate of copper mixed with lime-water checked the progress of mildew, and enabled the Vine which had been attacked to ripen its fruit. The treatment is easily applied, and cheap. The earliest application gives the best result. The action of the mixture is not yet understood, but MM. MILLARDET and GAYON hope soon to be able to throw light on it. It seems to M. PRILLIEUX that this unexpected remedy may prove useful to Northern agriculturists. The *Peronospora* of the Vine is closely related to that of the Potato, and it seems not improbable that if it is an efficacious remedy in the one case it may be so in the other. The hypothesis has already been supported. At Château Langoa, belonging to Messrs. BARTON, Tomatos were attacked by a disease to all appearance due to the development of the *Peronospora* of the Potato, which is known to attack also the Tomato. M. JOUET, the steward on the estate, who is a scientific agriculturist, treated the Tomatos like the Vines, and succeeded in destroying the disease. Isolated as this fact is, M. PRILLIEUX thinks it should be made known, so that Potato growers may make in their fields, from the first appearance of the disease, attempts similar to those which have been carried out with such success this year as regards the Vine in the Médoc.

— HYACINTH HOLDER.—Mr. JAMES SOUTHERN, nurseryman, seedsmen, and florist, Heaton, writes:—"I have forwarded you a sample of my new Hyacinth holder, being an article that has been long wanted. You will observe that it clips the Hyacinth glass below the rim, thus holding it firm, and is so far a great improvement on all others brought out. The bottom clip can be pulled off, and the holder inserted in the soil, so that it can be applied either to glasses or pots; it is also a very simple construction, and can be easily put together." [Useful and ingenious, yet simple, and might find extended use if the price is very low. It is made of copper wire, and is not conspicuous. ED.]

— GARDENING APPOINTMENTS.—Mr. JAMES ROBERTS, four years' Foreman at Penrhyn Castle, has been appointed Fruit Grower to Herr NATHANIEL DE ROTHSCHILD, Villa Rothschild, Hohenwarte, Vienna, Austria.—Mr. A. WHEELER, formerly with Mr. JOHN BOWLER, Head Gardener, Caldecote Gardens, Nuneham, has been appointed Gardener to the Hon. H. A. ADDERLEY, Filongley Hall, Coventry.

PROLIFERATION IN FERNS.

(Continued from p. 437.)

We may now, having, in some degree at least, gained an insight into the agencies to which, under their natural operation proliferation in Ferns appears to be chiefly due, turn to the next in order of the aspects of the question, and consider for awhile its utility, inquiring what economic purpose, if any, the possession serves, and whether there exists in those species which manifest any conditions not shared by their non-proliferous analogues which may be regarded to constitute an evident necessity for it. The chief object which, in the great majority of the cases, the development serves is, to one wandering in their native haunts, conspicuously obvious. Here primarily the feature is observed to operate as an important reproductive agency—important at least in its generally prevalent and completely effective character. There is no doubt that it is a very considerable aid in the multiplication of many species. In fact, in all cases in which the environment and general surroundings are favourable to the juvenile life—which is the state that, as a rule, obtains, as cause invariably determines effect—the chances are that every bulbil, tuber, or bud, will attain to independent adult plant existence; for the conditions which are most favourable to their births and abundance are also the most favourable to their eventual survival and establishment; but extremes of meteorological conditions can interfere much with their success. Under protracted drought they may starve and die, or in storms or continued and unusually heavy rain they may be washed away, and so perish; but beyond the elements, which may either foster or destroy, they have few friends or foes to be aided or injured by.

Now as to the evidence of this reproductive agency. I have before mentioned the increase of those stoloniferous and radicate species which, by means of this prolific facility, greatly spread and multiply, day by day extending their bounds, and, so far as the conditions they require will allow, invading new territory. Instances of this form are the most numerous of all, the plants, not literally but in effect, travelling associated in communities as scattered shoots, after (or more correctly before, as a case in Nature existing no doubt before military or other art) the manner of invading armies. But the other forms that the feature presents, though from the different course which their evolution takes not so obviously aggressive, and successful also very largely in proportion to the degree of the development of the feature, multiply by this agency. Of these other forms Marattias, which by the way exhibit one of the few instances of proliferation outside the great sub-order Polyodiaceæ, are a conspicuous example. Here the buds are produced from the axils of the fleshy processes of the enlarged joint at the base of the petioles. These joints, which are from 1 to 2 inches square in the different species, eventually drop from the rootstock carrying the buds, which have then more or less vegetated, but are still connected with them, to the ground. The Marattias are forest, shade-loving plants, and where they abound, gregarious as they usually grow, these joints often thickly strew the surface of the ground. In such places, where I have carefully examined, the greater part of the young plants appeared to have grown from the adventitious buds. Of many this origin was incontestable, for the joints, though the growth of the plants had far advanced, still retained their connection. Though detached from the rootstock, the points aid the vitality of the sprouting buds, for they remain fresh and green for several weeks, possibly for months, eventually granulating and turning to a white mealy substance, which is edible, on drying hard. This, like the previously mentioned cases, is so conspicuously successful as to arrest notice. Other cases, though from the small or diminutive size of the buds liable to be perhaps passed unobserved among other vegetation, I have found when examined equally productive. Of some species with much divided fronds the individual buds are small, and though possibly plentiful are likely to be overlooked, especially on the ground, but when detected and the case examined carefully, the reproduction is discovered to be more or less prolific. Occasionally a frond, from some accident—wind or water, its weight, or a passing animal—is broken down, where it lies spread on the surface of the ground, with the buds vigorously springing up into growth, and pushing their young roots into the

moist soil beneath. In the aquatic form of *Aspidium macrophyllum*, which I have described, the buds or young plants grow to a considerable size on the parent fronds. They drop at length by their own weight, or the strain of the current or drifting objects borne along at a rushing rate when the river is in flood, and the plants are partially or wholly submerged, dislodge them. Then they too are carried on the stream till stranded on the banks, or in the debris among bushes, or caught in the cleft of some half-prostrate tree, or other such-like situations, where they remain and establish their future home. S. Jenman.

(To be continued.)

MANY-HOMED PLANTS.

Of late years, most mycologists who have paid any attention to the rust-fungi have had more or less to say about the connection of æcidial forms on the one hand, with teleutospore forms on the other; and cultures have been tried by experimenters of all grades of skill, with a view to connecting isolated forms of both sorts. As a result, the botanical literature of the last decade or two is filled with notices on the subject, ranging from speculations based on the simultaneous occurrence of two forms, to evidence accumulated in an experimental way by such men as De Bary, Cornu and Magnus.

Since Deslongchamps suggested, in 1862, that *Gymnosporangium fuscum* might be genetically connected with *Roestelia cancellata*, Oersted, Cornu, and Magnus have instituted cultures the published results of which show that species of these genera are in reality alternating generations complementary one to the other; yet it should be noted that in America, where they reach their largest numbers, cultures by Farlow have given only negative or contradictory results, while Rathay has had no better success in Europe.

The experiments of Scholer on *Æcidium berberidis*, in the early part of the century, and the later and better ones by De Bary, Cornu, Schroeter, and many others, have apparently proved that a number of species of *Puccinia* and *Uromyces* are connected with *Æcidia* (often scarcely distinguishable themselves) living on other host-plants, whose only connection with those bearing the teleutospores is cohabitation. Still the number of unconnected æcidial and teleutospore forms is now large—a fact especially true of America, where cultures have not been resorted to; and even in Europe it is doubtful whether anything is gained by attempts to classify the species with reference to their life-history.

One of the latest papers on heterocicism is by Rostrup (*Revue Mycologique*, October, 1884), and contains a number of statements which will interest American students. *Puccinia suaveolens*, the fragrant rust of the Canada Thistle, is joined to the heterocicmal species, although its alternating generations occur on different plants of the same host. *Puccinia phragmitis*, a rust common on the Reed, and morphologically easy of recognition, seems far from being one of the simplest, since Nielsen and Rostrup claim, as the result of cultures, that its *Æcidium* occurs on *Rumex* and *Rheum*, while Cornu produced an *Æcidium* on *Ranunculus repens* as the result of infection with its teleutospores; so that a strict application of the logic of heterocicism must necessitate the recognition of two species in place of one. Another curious thing about the Reed rusts is, that *Puccinia Magnusiana*, a species morphologically different from the last, also produces cluster-cups on *Rumex* and *Rheum*, which cannot be readily separated from those of *P. phragmitis*, when taken by themselves.

Cœoma, a genus usually placed with the isolated uredo and æcidial forms, is said by Rostrup to be, at least in part, the æcidial stage of *Melampsora*, which has heretofore been supposed to have no *Æcidium*, if we except the sub-genus *Calyptospora*. *C. eunymii*, *C. ribesii*, and *C. mercurialis* are respectively connected with *M. caprearum*, *M. Hartigii* (in part), and *M. tremulae*, as the results of experiments; while a species similar to, if not identical with, the last named, is said to cause the development of *Cœoma pinitorquum* when sown on Pines—a fact which, if true, renders intelligible the greater abundance of the

Cœoma in the vicinity of Aspens, as observed in Jul-land.

As now understood, the truly heterocicmal species are brought together in the following list:—

<i>Teleutospore Forms.</i>		<i>Æcidia.</i>
<i>Chrysomyxa ledi</i> , A. and S.	<i>Æcidium abietinum</i> , A. and S.	
<i>rhododendri</i>	<i>abietinum</i> , A. and S.	
<i>Colosporium smacdonii</i> , P.	<i>Peridermium pinii</i> , Willd.	
<i>Gymnosporangium clavariæ</i>	<i>Roestelia lacerata</i> , Sow.	
<i>borne</i> , Jacq.	<i>penicillata</i> , Sow.	
<i>juniperum</i> , L.	<i>periclymenæ</i> , Gmel.	
<i>Schumæ</i> , Dick.	<i>cancellata</i> , Kellm.	
<i>Melampsora caprearum</i> , DC.	<i>Cœoma eunymii</i>	
<i>caprearum</i> , Kuehn.	<i>Æcidium colomarum</i> , A. and S.	
<i>hartigii</i> , Thuem.	<i>Cœoma Ribesii</i> , Lk.	
<i>tremulae</i> , Tul.	<i>pinitorquum</i> , A. Br. (?)	
<i>Puccinia arundinis</i> , DC.	<i>mercurialis</i>	
	<i>Æcidium ranaunculacearum</i> , DC.	
	<i>arctiæ</i> , Schum.	
<i>arctiæ</i> , Schum.	<i>arctiæ</i> , Schum.	
<i>coronata</i> , Gila.	<i>rhombi</i> , Gmel.

Wm. Trelease, in the "Journal of Mycology," U.S.A.

GRAPES AT BEXLEY HEATH AND SWANLEY.

AGAIN this year the Vines in the monster houses at Bexley Heath are loaded with crops that present a sight such as those whose acquaintance with Grape growing is confined to houses of ordinary dimensions can form but a meagre idea of. The 300 feet house, containing the oldest Vines, Alicante and Lady Downe's, although they have now for some eight years been annually loaded with fruit to an extent that might have been expected to cause their throwing out signals of distress, do not show the least falling off either in the way they finish up the crop, or by the weaker condition of the wood they make. The bunches are remarkably even, the berries large, and as black as Grapes can be. The state of the Vines in this house, after the severe test they have been subjected to, is such as to afford an instructive lesson as to what the Vine is capable of doing when the conditions requisite to success are present, amongst which liberal feeding, water without stint to the roots, and the keeping the foliage free from insects, are the chief.

The 120 feet house of Black Alicante adjoining, in this season quite as heavily cropped as it has been each year since it came into full bearing, the bunches and berries perfect. The big house, filled wholly with Muscat of Alexandria, is again a wonderful sight, the fruit highly coloured, and the crop as heavy as that borne last year, when some who saw the immense weight predicted that it would ruin the Vines. Some of the bunches here are not set quite so evenly as they were last year. Nothing in the way of late Grapes could promise better than the two adjoining houses of Gros Colmar. When I saw them, the second week in September, they were colouring fast, with here and there a berry perfectly black and blue with bloom, giving reliable evidence of their finishing up well. Like nearly the whole of Mr. Ladd's Vines, these have each two rods, the crop running from twenty-four to twenty-eight bunches to a rod.

The three houses filled with younger Vines, all Black Alicante, each 300 feet long, and, like those already noticed, 24 feet wide, are quite equal in the crop they are carrying to the older examples. This is the second season of their bearing, having been fruited half their length last year. The bunches here hang thickly on the rods, and with the berries are as even as if they had been cast in a mould, and as intensely coloured as this useful winter Grape is capable of. The bunches have this year been a little more thinned than hitherto has been Mr. Ladd's practice with this and other late kinds.

At Dartford Heath, some 3 or 4 miles from Bexley, where up to this time Peaches, Strawberries, and Tomatos alone have been grown, last spring three span-roofed houses were built. They join each other side by side, and are each 325 feet long by 25 feet wide; these have been planted with Gros Colmar. The Vines when put in were small, but have made

satisfactory progress considering that as usual under Mr. Ladd's course of procedure the treatment they get the first season is such as to make them a secondary consideration to the crop of Tomatos with which the houses are filled. Figures that indicate the size of these monster houses are soon written, and as soon read, but it takes a little time to realise fully what they mean. The space that these three houses cover is considerably over half an acre, or to put it correctly 2700 yards. Taking into account the low prices which second-rate Grapes now sell at, when the number of large houses that Mr. Ladd's has come into full bearing, and those of others on hears, of who are going in for Grape culture on an extensive scale, and whose produce is confined to first-class fruit, there are doubts whether in a short time cultivators of inferior Grapes will not find themselves in a like position to that of the Apple and Plum growers in seasons of glut, with nothing left for themselves after the cost of carriage and sale are paid.

The four houses, each 135 feet, of Royal George Peaches this season bore a grand crop of highly finished fruit, ripe in June. The trees which now fill the space available are in fine condition. This spring five more of this block of twenty houses were planted with a hundred trees each—400 Madeleine Rouge, and 100 Royal George, all maidens; they have made fine growth, and promise to carry a good crop next year.

At Swanley the young Vines planted last spring twelvemonths in the block of twenty houses, each 200 feet by 17, have made good progress, although most of them were very small when put out, being struck from eyes in the winter, with no particular attention; they were planted out about April, when little thicker than a straw, and had to get along as best they could amongst the Tomatos, with which the houses were closely filled through the summer. Five of these houses at the eastern end of the block were planted on each side with the smallest examples of Black Hamburg, two with Black Alicante, and three with Gros Colmar, similar in size to the Hamburgs. They were cut-in moderately close and two rods taken up from each, which, before the end of summer, had reached right across up to the ridge and down the opposite side of the house. Five of the adjoining houses, similar in size, were planted at the same time with Black Hamburgs, stronger plants than those already mentioned. These made such progress as to induce Mr. Ladd's to take six or seven bunches each from them this season, the average weight from each being 8 to 10 lb., and the way the canes have thickened shows that no harm has been done. An almost incredible amount of stable manure was put into the borders, which consist of the natural soil simply trenched 4 feet deep. No artificial drainage is required.

Ideas once accepted are often all but immovable, yet if those who disbelieve in putting manure into Vine borders, except the orthodox broken bones, had seen these Vines this season, with the fruit they bore, coupled with the condition they are now in, the question might suggest itself as to whether the slow, long-waiting system of young Vine treatment was the right course to follow. For there is no disputing the fact that unless manure without stint and in a condition suitable for the roots to take their fill of had been present from the first the fruit these Vines have borne the year after planting would have settled them, whereas no evil effects are not perceptible. Every one who is at all acquainted with the subject knows the value of bones as a manure, but alone their action is too slow for such quick growing, gross feeding plants as the Vine. The Vines in the biggest house—680 feet—have done well, and will next summer be cropped half their length. Four more houses were here planted this spring with Gros Colmar.

Tomatos again this season have been the principal crop succeeding other things in the houses here, as well as at Dartford Heath and Bexley, and have borne an immense weight of fruit, although Mr. Ladd's says that they have not done so well as last year. But in September vast quantities were just beginning to colour, in fact, at that time a large number of the houses appeared to be only coming to their best.

The stock of pot Strawberries for forcing is this year again very large; the intention was to grow about 150,000, but it has been a difficult matter to get a sufficient quantity of runners on account of their being backward through the combined effects of a late season and the unusually dry state of the ground preventing the plants making growth. T. B.

Notices of Books.

How to Grow Roses. Samuel Ryder. (Ryder & Son, Sale, Manchester.)

We have here, for the price of 6d., a useful little manual of sixty-two pages on the most fascinating of horticultural subjects—Rose growing. As the author candidly states in the preface, it is totally void of those little digressions that make a book more readable and interesting; nevertheless, we do not find his matter treated in too dry a style, and we fail to observe those inaccuracies which often mar amateur workmanship. The instruction and directions given for forming a rosery, and for selecting, growing, and exhibiting the queen of flowers are just those we should expect from one who is thoroughly at home with his subject.

MONSTROUS PRIMULA.

A CORRESPONDENT sends blooms taken from two plants of *Primula alba magnifica*, all the flower-spikes coming up singly, as shown in fig. 138, the specimen being a mass of bloom. The malformation is

FIG. 138.—MONSTROUS PRIMULA.

not uncommon, and is not infrequently the result of extra vigour in the plant at some stage of growth.

UNCOMMON GROWTH OF PEACHES.

In gardening as in other matters, there are some things so generally accepted that they come to be looked upon as never failing facts, from which there is no exception. Such, for instance, as, that Peaches which happen to be on shoots that fail to make growth beyond the fruit never grow so as to attain their full size. Yet this is by no means always the case, as shown by the accompanying illustration (fig. 139), which represents the fruit of a Walburton's Admirable Peach, grown this season in one of the houses at The Node, Welwyn, where, on several trees there have been numbers of like instances, in which the Peaches borne on shoots that have not only failed to push beyond the fruit, but have died back right to it so as not to leave an atom of live wood beyond, have been quite equal in size to those borne on the same trees where shoot extension in the usual way has occurred. The trees were carried full crops, the largest of which were from 8 to 9 oz.; neither was there any perceptible difference in the flavour of the fruit borne by the shoots that had died back. The trees are in excellent condition. Mr. Fulger, the present gardener at The Node, is a believer in the necessity for a copious application of water overhead and to the roots of

Peaches, so as to keep the foliage clean and free from insects, and the roots in the active condition essential to a healthy state of the trees. Those who have had anything to do with Peach cultivation will not fail to have noticed that it is nothing unusual for shoots that make no growth to carry an odd fruit or so; but such fruit does not generally grow to more than half the size of those that are borne on shoots where the usual extension has taken place; and, moreover, the fruit produced with an absence of anything "to draw the sap" is usually so far wanting in flavour as to be worthless. It is in this that the case in question differs from the ordinary run, showing that there are exceptions in this as in most other matters.

LATHYRUS SATIVUS.

LAST year it is stated that considerable fatality occurred among horses in Glasgow from their being fed on the seeds of this Pea mixed with Oats. The Pea is stated to have caused paralysis and spasm of the muscles, especially of the wind-pipe and larynx, whence tracheotomy has been adopted with success. The Peas in question are said to fatten swine, but to cause paralysis of the limbs. This is a matter that requires to be cleared up. It is certain that the seeds of many Papilionaceae do contain not only much nitrogenous matter, legumin, but also a poisonous principle, e.g., Laburnum, Calabar Beans, &c.; but *Lathyrus sativus*, a well known annual with lanceolate leaves, bluish Pea-shaped flowers on long stalks, is extensively cultivated in Southern Europe for its seed, which, says the *Treasury of Botany*, is used for the same purposes as the Chick Pea, the pod is also eaten green, and the whole plant is used for forage, while the Peas are much given to poultry.

The discrepancies in these statements may be capable of reconciliation, but the first thing to do is to make sure that the incupated seeds are really what they are described to be. It is not unlikely that some other seeds may be the real culprits, although, as we have said, there is abundant evidence of the poisonous nature of the seeds of many plants closely allied to the *Lathyrus sativus*.

Lathyrus sativus is a very near relative of *L. odoratus*, the Sweet Pea, and of the Everlasting Peas of our gardens, and is only one degree less nearly related to the common garden Pea, *Pisum sativum*. It is the Gesse blanche of the French, and finds mention in Vilmorin's *Plantes Potagères* without a hint of its poisonous qualities. It might be said, perhaps, that the unripe seeds, conked and eaten like green Peas, might be rendered harmless by the process of boiling; but Vilmorin goes on to say that the ripe and dry seeds may be employed in soups. No hint of its poisonous properties is given in recent books such as Luerssen, Vesque, or Bailion. M. Alphonse de Candolle mention its culture from time immemorial as a forage plant, and also seeds. Roxburgh and Royle mention its use in India for similar purposes, the former specially mentioning the use of the dried seeds as diet by the natives.

The only trustworthy evidence of its poisonous properties that we have hitherto been able to find is contained in Dutchie and Fuller's *Field and Garden Crops of North-west India and Oudh* (1883). At p. 15 of the second part of this work, where a figure of the plant is given, together with full details as to its general use and method of cultivation, the following details are given as to the noxious effects of this pulse when eaten in excess:—

"The remarkable part connected with it is its undoubted tendency to produce paralysis, which has been ascribed to the nitrogenous constituents, in which it is exceptionally abundant. The widespread occurrence of paralysis in Sindh after a season of extensive inundations in which Kasari (*Lathyrus sativus*), was grown on an exceptionally large scale, attracted considerable observation, and the settlement officer of Azamgarh reports that similar effects are to be noticed in the Azamgarh district, cases of paralysis being far from uncommon in villages where Kasari forms an important item of diet. It may also be noticed that the occurrences of some cases of paralysis in the military station of Almora some few years ago was traced to the fraudulent admixture of Kasari with the grain supplied for the use of the troops. Colonel Sleeman writes as follows of the effect of the large consumption of Kasari in eastern villages of Oudh:—

"In 1820 the Wheat and other spring crops in this and the surrounding villages were destroyed by a severe hailstorm; in 1830 they were deficient from the want of seasonable rains, and in 1831 they were destroyed by

The Herbaceous Garden.

LILIUM AURATUM VAR. CRUENTUM.

THIS is a scarce and beautiful plant, that I had by mistake from Mr. Ware about five years ago. In this variety the centre of each petal is marked with a deep crimson band, but otherwise little difference between it and the normal form is recognisable, although I fancy that it is a more robust grower, and with larger and narrower leaves. Of late a great deal has been written regarding the difficulty of preserving for more than a couple of years this fine Japanese Lily, and even plants raised from home-saved seed have not come up to expectation, for these, in numerous instances, have disappeared in the

established in good bold masses. Certainly the most successful cultivation of this now deservedly popular plant that we have yet seen was brought under our notice a few days ago at Penrhyn Castle, where, interspersed with Rhododendros, a whole bed was devoted to their culture. Planted as single bulbs three years ago they have now trebled their number, many of the spikes measuring as much as 6 feet in height, and loaded with their large white funnel-shaped flowers. The bed in which they are so successfully grown was specially prepared of almost pure peat for the choicer Rhododendros, but the happy thought suggested itself at the time of utilising the waste space between the rows by planting the bulbs of this Hyacinth. That they have done well we need hardly repeat, the shelter of the Rhododendros, above whose heads the flower-stems just appear, and cool peaty soil, evidently suiting their wants to perfection.

SEA HOLLIES.

Amongst the Eryngiums perhaps none is finer or more attractive than *E. amethystinum*, with its ooble tufts of dark green foliage and conspicuous steel-blue flowers. *E. giganteum* is another species that should not be overlooked, being highly ornamental and of a remarkable pleasing appearance, the cone-shaped heads of effective blue flowers standing well above the foliage, and at once rivalling the attention of the passer-by. Light, well worked soil and an open sunny position suits them best. *Emerge*.

HOME CORRESPONDENCE.

Brunsvigia Josephinae.—This is rather an expensive bulb to buy, but is well worth the outlay. The genus *Brunsvigia* is closely allied to *Amaryllis*, and ought to share in its popularity. The bulb increases to a large size, and throws up a thick scape supporting an umbel of sometimes as many as sixty flowers, many of which will be 3 inches across. The colour is a clear crimson, a little lighter than the hue of the Jacobean Lily. The leaves follow, *Colchicum*-like, a good while after the flower-spike has withered away. It is an exquisite plant placed among Ferns, so as to rear its vivid scarlet from their bright greenery. *E. coranica* is cheaper to buy, but is much inferior to the giant *Josephine*. Both give no trouble to cultivate, and flower in pots as greenhouse plants; in this respect, indeed, beyond the powers of few villa gardeners. That lovely Irid, *Diets (Moræa) bicolor* was flowering splendidly in the month of September, in the Tresco Abbey gardens. The colour of the petals is a bright sulphur, with a black-brown velvety spot at the base of each. When folks have got tired of luying infinitesimally different *Pelargoniums*, *Dahlia*s, or even *Dafodils*—though far be it from me to sneer against anything, least of all *Dafodils*—there is some chance of such valuable and delightful bulbous flowers as the above having their due meed of admiration and loving care. *C. A. M. C.*

Edible English Fungi: Truffles.—Have any edible English fungi, except Mushrooms, been artificially cultivated? If so, what varieties and what method of culture has been adopted? Have Truffles been successfully cultivated in England? If so, how? What is known about the artificial cultivation of them abroad? The information given by Cooke and Berkeley (*Fungi: their Nature, Influence, and Uses*) appears fragmentary and unsatisfactory. Is nothing more known? *R. S.*

Ornamental Gourd.—Numerous varieties of these, such as *Lagenarias*, *Cucurbitas*, and *Cucumis*, have been seen at recent shows in London and elsewhere, amongst which many desirable forms were observed. We ought to grow the most interesting of these plants more commonly than is now the case, for many other things are grown, and with difficulty, that afford less satisfaction than these do, in the process of unfolding their curious shapes from the tiny beginning onwards. They are often recommended to grow in unsightly places, or to cover arid banks, but then it is only the rapidly growing leafage that it is desired to encourage, fruit being secondary. The plants form an admirable screen, when tied on a stout espalier fence of wood, and in small gardens would serve to enclose an unsightly summer framing ground, or the like. The fence should not be less than 6 feet high, and even then the vines will reach the top, and should

blight. During these three years the Kasari, which, though not sown of itself, is left carelessly to grow among the Wheat and other grain, and given in the green and dry state to cattle, remained uninjured, and thrived with great luxuriance. In 1831 they reaped a rich crop of it from the blighted Wheat fields, and subsisted upon its grain during that and the following year, giving the stalks and leaves only to their cattle. In 1833 the sad effects of this food began to manifest themselves. The younger part of the population of this and the surrounding villages, from the age of thirty downwards, began to be deprived of the use of their limbs below the waist by paralytic strokes—in all cases sudden, but in some more severe than in others. About half the youth of this village of both sexes became affected during the years 1833 and 1834, and many of them have lost the use of their lower limbs entirely, and are unable to move. The youth in the surrounding villages in which Kasari from the same causes formed the chief article of food during the years 1831 and 1832, have suffered in an equal

FIG. 139.—UNUSUAL GROWTH OF PEACHES. (SEE P. 596.)

degree. Since the year 1834 no new case has occurred, but no person once attacked had been found to recover the use of the limbs affected, and my tent was surrounded by great numbers of the youth in different stages of the disease, imploring my advice and assistance under this dreadful visitation. Some of them were very fine looking young men, of good caste and respectable families, and all stated that their pains and infirmities were confined entirely to the joints below the waist. They described the attack as coming on suddenly, often while the person was asleep, and without any warning symptoms whatever, and stated that a greater portion of the young men were attacked than of the young women. It is the prevailing opinion of the natives throughout the country, that both horses and bullocks which have been much fed upon Kasari are liable to lose the use of their limbs; but if the poisonous qualities abound more in the grain than in the stalk or the leaves, man, who eats nothing but the grain, must be more liable to suffer from the use of this food than beasts, which eat it merely as they eat grass and hay."

same miraculous manner, so that cultivators are almost deterred from further attempts. In my own case by far the best results have been got by planting the bulbs in pure leaf-mould with or without sand, and in a rather dry, sheltered border. Under such treatment they not only flower well from year to year, but increase in stature and number of stems as well—sure proof that they are at home. The specimen of cruentum planted five years ago has now two flowering stems, one 6 feet in height, and bearing ten flowers of immense proportions; the other having four flowers on a stem 4 feet high. Other examples of successful cultivation in leaf-mould might also be adduced, whilst at the same time bulbs planted in ordinary loam have gradually declined, and ultimately died out altogether.

HYACINTHUS CANDICANS.

Groups of these plants, where rightly placed in a garden—that is, where their tall spikes of pure white blooms are backed up with some of the darker foliaged shrubs—have a fine effect, single specimens giving but a poor idea of what the plants appear when

PUBLICATIONS RECEIVED.—*A Treatise on the Drying of Fruit, Nuts, &c.* (Waynesboro).—*The Horticultural Directory for 1886* (Office of *Journal of Horticulture*, 171, Fleet Street).

be encouraged to descend the other side of the fence. If the site is a sunny one, and the plants, which should be raised on a slight hotbed in March or April, are planted on a barrowful each of stable manure fresh enough to give off a trifling heat, progress will be rapid, and ripened specimens of any of the smaller varieties may be looked for in September and October. It may be mentioned that all species bearing white flowers are recognised as being unfit for food, but those with yellow blooms as wholesome. *Melospiza*.

Fruiting of *Yucca filamentosa*.—There is now in my nurseries a plant of *Yucca filamentosa* carrying a seed-pod which will soon be ripe. Now, as I have never heard of any *Yucca* seedling in this country I should like to know if it is really an unusual occurrence, and if so, I should feel obliged if you would kindly notice it in your esteemed paper. *Edwin Morse, Epsom*.

Varieties of Belladonna Lilies.—I send you flower-stems of two varieties of Guernsey Lilies. The green stem is that of an early-flowering variety, coming into bloom early in September; and the red stem that of a much later variety, now in full bloom (October 30). I should be glad to know if they are known and recognised as different forms? They differ also most markedly in height, the early green-stemmed form being almost twice as high growing a plant as that which produces red flower-stems. *J. T. Peir, Riverston*.

The Proposed International Horticultural Exhibition.—Probably the chief difficulty to be surmounted in reference to the proposed International Horticultural Exhibition is the maintenance of it in a truly practical and representative form with living products over a long season. Hitherto no such proposition has been made, and the possibility of working out the suggestion has no precedent for guidance. We cannot have a show worthy of the name that does not include all kinds of plants, and for these we must be indebted chiefly to the horticultural trade. But the members of this body, whilst most anxious to further the interests of horticulture, and even to promote a fitting corollary in 1887 of the magnificent show of 1866, would of necessity shrink from subjecting their valuable plants to such an exposure as would endanger them, certainly materially injure them, and cause the owners irreparable loss. Private owners of plants could hardly be expected to be more disinterested; indeed, no exhibition, however representative and grand, could be esteemed satisfactory if the result, as far as many of the most interesting subjects of the show were concerned, was to produce injury and perhaps death. All our great shows of horticultural products so far have been but tentative in character because of the obvious difficulties which the nature of their component parts present; hence, whilst fulfil, yet they have never proved fully representative of horticulture. The special objects of a portion of a season no more represent the horticultural products of a year than do a dish of Apples or Potatoes in their seasons represent all the products of gardens in fruits and vegetables for the whole year. Without doubt something to remedy that defect in ordinary shows has been done at South Kensington during the past two or three years, and the visitors to the Exhibitions at the fortnightly meetings have been enabled to observe that British gardening, even as there represented, is not a thing of to-day or to-morrow, but of one endless continuity. If it be desirable to exhibit in 1887 a genuine show of what horticulture is all the world over, certainly there may be found certain elements, especially in the matter of hardy trees and shrubs, in which living objects may be utilised effectively for an entire season, whilst to these enduring features may be added dried specimens, models, and myriads of garden or horticultural appliances. But the really attractive features of the continual show must certainly be looked for in a series of intermittent displays of produce in season—in fact, a very considerable expansion of the present system of shows as adopted by the Council and the Commissioners conjointly. To carry out such an extended and costly arrangement by the aid of prizes a schedule extending over six months would need the aid of several thousands of pounds to produce the needful competitions and gather together the desired objects. Assuming some such arrangement to be carried out

it is obvious that it could only be done by the joint action of the Commissioners, the Council of the Royal Horticultural Society, and horticulturists generally, and the arrangements should be in the hands of a joint committee, in which each body should be adequately represented. Without doubt, the lack of foresight on the part of the Commissioners has led to means of access to the exhibition buildings and the gardens being terribly cramped, and probably there is no place of show so difficult to reach at the present moment as is the conservatory of the Royal Horticultural Gardens. No scheme for the carrying out of a great international exhibition, which would render the frequent removal of the objects absolutely needful, could be conducted unless provision were made for some more convenient means of access than at present exist. But the question after all is open to debate whether, assuming an international show in 1887 is determined upon, it is needful to make it continuous, and to hold it at South Kensington. Why may not a great show be promoted in London on an independent basis, and by an independent though eminent representative committee like that of 1866? It seems really doubtful whether it is in the power of the Royal Horticultural Society, with all its *prestige* to secure the patronage of royalty now [?], and certainly that would be a most important element in any such undertaking. *D*.

—As the *Gardeners' Chronicle* shows so praiseworthy a desire to have the suggestion of an International Horticultural Exhibition for 1887 thoroughly ventilated, and as the Council of the Royal Horticultural Society invite all interested in such an exhibition to meet the Chairman, in the music room of the Inventions Exhibition, on Tuesday next, I embrace the opportunity offered, to say a few words. My excuse for writing is that I was associated with the last exhibition of the kind, held in 1866. It might be considered a truism to say that any International Horticultural Exhibition, to be thoroughly successful, must first of all be thoroughly national. Such was the International Exhibition of 1866. The idea, having originated from similar exhibitions held in Brussels and Amsterdam, in the years 1864 and 1865, was suggested by a few leading horticulturists, and as spontaneously taken up by British horticulturists. A list of names, from Her Majesty downwards, was readily forthcoming as patrons, guarantors, or donors, and all worked smoothly to the end. What is the position at this time? The Royal Horticultural Society is moving in the matter. Does it possess the *prestige*, or the power, to make of this scheme a national movement? It is the only society within the precincts of the metropolis. Admittedly, it has no grounds at South Kensington, and is wanting in funds. It has the will, and much working powers; but these are not enough. I hold its monthly shows, just past, have not added really to its *prestige*. They have been too numerous. Tens of thousands of visitors to the "Inventories" have viewed them, expecting to see much more at the Society's exhibitions. They have contrasted them with local provincial shows, and are not likely to make special efforts to see another in a similar place or manner, however large or grand it is represented to be or really is. The Society cannot be blamed for this. Those minor shows were all exceptionally good, the merits of the exhibits being of a very high standard indeed. That horticulture has been advanced by them is undeniable, but from the point of view I have explained I fear the Society may have suffered. My impression is, if the Royal Horticultural can but make a start in this matter, if they can but induce the Commissioners to enter into the scheme and aid them by giving the ground, assisting as donors or guarantors, or both, and then, having done this work, step back and permit the Society to assume its legitimate proportions, with the hearty co-operation of every individual horticulturist, and the equally needed indirect aid of Horticulture's innumerable sympathisers, the scheme will command success. It must not be forgotten, however, that funds in no meagre proportion must be forthcoming to bridge over the doubt existing between the prepared display and assured reimbursement, and to secure which need I reassert how extremely desirable it is to make the scheme truly general? Even the Royal Horticultural Society must lay aside what to four-fifths of practical gardeners is known as its exclusive tendencies, else there will remain a danger that such a result may accrue as will make it better

that the project had never been entered upon. In view of securing funds could not a scheme be propounded by which donations (above a certain sum) should be repaid provided a success were assured. *William Earley, Ilford*.

Curious Position for Pears.—On a spur on the main stem of a Pear tree in the gardens here there were three Pears (Beurré Clairgeau) fully above average size produced this season. The spur is 18 inches from the ground, and 18 inches below the lowest branches, where they unite with the tree. The spur is two years of age and about 6 inches long. Those were the only Pears the tree produced this season. The tree was planted about thirty years ago, but the variety not being cared for, the branches were cut down, and another variety (Prince of Wales) grafted on the tree about sixteen years ago. The above-mentioned spur is the old or original variety. *J. E. P.*

Spruce and Larch Hedge.—These forest trees make capital hedges if planted at about a foot apart, in trenched ground. The trees may be allowed to grow to 6 or 8 feet in height, and then be topped, and the side cut in so as to make the thickness at the bottom about 2 feet, and allow the foliage to extend outwards at the top to 9 inches. With a stout fence wire, or Ash poles run through it at 2½ feet from the ground and again at 5 feet, a fence strong enough to resist cattle is made when grown strong. Both kinds of trees bear the shears well, which may be used in August; and sometimes spring clipping is done, but it is rarely required, unless the weather has been mild all through, since the late summer operation. As wind-breaks in exposed gardens and nurseries, such hedges are much sooner available than those made of deciduous material, and on account of their height and impermeability the space enclosed acquires a relatively high degree of warmth. *Thuja Wareana sibirica* is also a good hedge plant where a compact, ornamental fence is required—not combined with defence against animals. *W. W.*

Vanda cœrulea.—Quite recently in the pages of the *Gardeners' Chronicle* this lovely Orchid has been mentioned; several correspondents have given the size of the plants of which they have charge, none of which can compare with a specimen now flowering in the collection at Lake House, Cheltenham. There is a specimen worthy the name, and one of which the owner, G. Neville Wyatt, Esq., is justly proud. This plant is about 2 feet 6 inches from the top of the pot, has seven breaks, and eight racemes of flowers, the total of the latter being about ninety, or slightly over the average of eleven flowers on each raceme; this is probably one of the finest specimens in cultivation. It is now at its best; that is, the earliest-developed flowers are well coloured, and the characteristic reticulation prominent. These net-like veins appear to be developed just prior to maturity being reached, and were distinctly visible when I saw the plant on October 30. Some small plants are at Lake House which exhibit much health and vigour, and I doubt not the gardener, Mr. Simcoe, would give publicly to his mode of culture, by doing which he would confer a benefit on a large number of the admirers of this pretty Orchid. *E. Jenkins*.

Old Pot Pears.—After your flattering notice of our orchard-house Pear trees, p. 493, perhaps, in justice to old Mr. Rivers' hobby, I ought to say that after being more than twenty-eight years in pots they continue to bear very well and fine fruit. They can have no more shifts of pots, the size of these is limited to what a man and stout lad (the extent of our cottage garden establishment) can carry. Some seasons one Pear has finest flavour, in others another. This year Beurré d'Anjou has finer flavour than I ever before remember it to have had, *George F. Wilson*.

Exhibition Onions.—The enormous Onions shown at the last exhibition of the Royal Horticultural Society, are perhaps worthy of an award as exhibition enormities, but should scarcely be held up to gardeners as being objects to imitate in the ordinary kitchen garden. In but few places is the demand for these over-large productions at all excessive, as they are fitted only for roasting or serving whole. When Onion seed is sown moderately thick, a very trifling

thinning-out of the crop is necessary. The bulbs resulting from the crop so treated will be of all sizes, from 1½ inch to 4 inches in diameter, and consequently, sufficiently varied to meet without waste all the different requirements of the kitchen. The abnormally large Onions take special treatment and considerable space to grow them, keeping, moreover, badly, be the sort brought under such treatment that it may. The largest varieties shown seemed to be hybrid forms of the white Spanish, an early ripening mid-season Onion. *M.*

Sulphide of Potassium.—In your article on the Chrysanthemum, of the 31st ult., you say "the first traces of mildew should be destroyed with flowers of sulphur dusted over it." Why flowers of sulphur, when there is a remedy so far superior available? Sulphur in that form is unsightly, inconvenient to apply, and, being insoluble, very imperfect in its effects. Some time ago I directed attention in your columns to a very soluble sulphur compound, sulphide of potassium, which, when applied in solution, say half an ounce to the gallon, leaves no unsightly effects, is easily distributed over the plant by the syringe, spray dispenser, or by immersion, and which, so far from being in any way injurious, actually benefits the plant, even when applied to its roots, killing fungus in the soil and driving out worms. The solution kills all fungoid growth with which it comes in contact, but it is not sufficient in some cases to syringe only, as I have met with some forms of mildew which throw off the solution as a duck's back repels water; in such cases contact must be ensured by the sponge or other means. An efficient, cheap, and easily applied remedy cannot be too widely made known if consideration be given to the infinite mischief done to the Vine, Cucumber, Hop, Pea, Rose, Hollyhock, Chrysanthemum, &c. (the list is too long to be enumerated in full detail), by various forms of fungoid disease. I intend another year to try its effect on the Pear, soon after the fruit is set, as some of the best varieties in my garden are rendered worthless by forms of fungus peculiar to that fruit; for this and other purposes it is desirable that a spray dispenser on a large scale should be contrived. No one who has ever tried sulphide of potassium would ever again have recourse to flowers of sulphur. Mr. Coleman, of Easton Castle Gardens, writes:—"I have given the small bottle of sulphide of potassium a fair trial, and the excellent effect it has produced is more than satisfactory—it is marvellous;" a gardener of his eminence would not have committed himself to terms so strong unless he had thoroughly proved its efficiency. Sulphide of potassium is equally fatal to low forms of animal and vegetable life in animals, as in plants; consequently it is a specific for the diseases caused by them; I can testify, after an extended experience of more than thirty years, in the words of Mr. Coleman, to the excellent, and, indeed, marvellous cures effected by it, often when skilled physicians had failed in various forms of skin diseases, poisoned wounds, whitlows, &c., in man, mange in various animals, grease in horses, gaps in pigeons, poultry, &c. It is very rarely used by the medical profession; they do not try it because it is not considered an elegant preparation, and as it has an odour often associated with sewers may be supposed in these days of sanitary socialism to be injurious to health. *Edmund Tenker, Knowle, Nov. 1.*

Vanda cœrulea.—I feel much obliged to "J. D." for the information he advances at p. 563, concerning his treatment of ad success in the cultivation of this fine Orchid. Notwithstanding his statement as to the number of gardens near London in which its cultivation is thoroughly understood, I still maintain that it might be more common considering its cheapness as stated by him, and its exceptional beauty. He too virtually recognises the truth of my statement as to its handsomeness. After such a confession I should have expected that "J. D." would be satisfied. Instead of which he goes back to the original article and cites another passage, upon which he desires elucidation. The existence of the yellow spot and ridges or plates on the labellum is undeniable, and unless he considers their presence a useless possession to the plant (which I do not), it would be interesting to know what purpose they serve in the economy of the plant in a state of Nature, if not as pathfinders to that insect or those insects that habitually fertilise it. Out of twenty-four genera belonging to the Vandee group examined by Darwin he concluded that not a single

plant would set a seed without the aid of insects. There are probably hundreds of cases where similar spots and lines exist, did time and space allow me to enumerate them, and they all point to the nectary. These occur generally, if not exclusively, in highly specialised flowers, adapted for fertilisation by the higher classes of insects such as Lepidoptera and Apida. A great number of the species of *Dianthus* are most legitimately fertilised by diurnal Lepidoptera, which alone have a proboscis long enough to reach the honey. Flies and other short-tipped insects often visit them for their pollen. In perfectly double flowers little or no pollen exists. I am much interested in the subject, and perhaps "J. D." would furnish the information as to what class of insects he has observed "in a house of Carnations in flower," and what they were collecting. *F.*

Reports of Societies.

EALING, ACTON, and HANWELL:

November 3 and 4.

THE annual autumn show of this Society was held in the Lyric Hall, Ealing, on the above days, this ranking with the very earliest exhibitions of Chrysanthemums held this year. The result, however, in spite of the fact that Chrysanthemums are rather late, was far from disappointing, as, although trained plants were backward, the cutflowers were first-rate, and the competitions exceedingly good, although this year limited to the radius of the Society.

Amongst plant exhibits, very beautiful was a grand group of Chrysanthemums in pots from Messrs. C. Lee & Sons, grown by their able Ealing manager, Mr. Cannon. This huge group, or rather twin groups, comprised most of the best kinds in cultivation, including Japanese, Anemone, &c.; the flowers fine, the plants well foliaged, and all in most creditable form.

From Mr. Roberts, Gunnersbury Park Gardens, came a very beautiful lot of nine plants, very effectively employed to decorate the stage fronting into the Hall, and which included scarlet Plumagoes, Nerines, scarlet and white Bouvardias, Scabious (dwarf and well flowered), with good Crotons, &c., all faced with Maidenhair Ferns, and Panum variegatum.

Messrs. Hooper & Co., 7, Covent Garden, sent from their Twickenham nursery a basket of some of their fine Tree Carnations, and in addition to High Commendation received a First-class Certificate for Chevalier, pale yellow, flecked with rose.

Of other plant groups Mr. Fountain, jr., to Miss Wood, Hanger Hill, for a delightfully fresh and elegant lot of Ferns; Mr. G. Pufford, for J. Boosey, Esq., Ealing; and Mr. King, jr., to A. Gibbons, Esq., Clonsilla, both of which, as well as other groups of Chrysanthemums, received equal 1st prizes in the miscellaneous class.

Mr. H. B. Smith, of Ealing Den, sent a large collection of his fine strain of Cyclamen, of the most meritorious kind; and Mrs. Smith, who stands in the front rank of horticulturists, a couple of superb bouquets, one of crimson and golden Chrysanthemums, and the other of white Camellias, Eucharis, and double white Primulas for base, with buds of Madame Falcot Tea Rose and Neapolitan Violets projecting. Also a beautiful floral fan, the frame being covered with white lace, and upon this ground, arranged on coloured Bramble leaves, five radiating sprays of white flowers and Maidenhair Fern; on the obverse side were sprays of Ivy; this was novel and most beautiful, and worthy the acceptance of a queen.

The trained plants of Chrysanthemum may be passed over as late though full of promise. On the other hand the show of cut flowers was a surprise, the class for twelve incurved blooms bringing eight exhibits, the best coming from Mr. Beesley, jr., to A. Fraser, Esq., Ealing, with 1st prize; and the Empress of India, Golden Empress, Queen of England, Lord Alcester, Lord Wolsley, Emily Dale, Midshipman, Prince Alfred, Mr. Bunn, Refugees, Jeanne d'Arc, and Baron Beust; Mr. H. Davis, jr., to H. G. Lske, Esq., Chiswick, was 2d, with good compact flowers; and Mr. Collyer, jr., to Mrs. Murrell, Ealing, was 3d.

For twelve Japanese Mr. Davis was 1st, having moderate-sized but capital blooms, including good M. C. Andiguer, Margot, Jeanne Delaux, Hivre Fleur, Madame Lacroix, &c. Mr. Collyer and Mr. Beesley took other prizes.

In the class for nine incurved, Mr. Long, jr., to E. B. Rider, Esq., Ealing, was well 1st, with fine flowers; Mr. Baird, jr., to C. A. Daw, Esq., Castle Hill, 2d; and Mr. Chadwick, jr., to E. M. Nelson, Esq., Hanger Hill House, was 3d. In this class Mr. Hudson, jr., to H. J. Atkinson, Esq., M.P., Gunnersbury House, had an extra prize, for blooms set up with their own foliage—a very desirable arrangement, a single stout wire supporting each flower. This method of setting up blooms elicited great praise from the judges.

In the miscellaneous class, which found in the pompon section, for these flowers are always well done at Ealing, Mr. E. Smith, jr., to T. Nye, Esq., was 1st, with clusters

of three blooms, each in twelve kinds, having capital flowers of Suzar Melaine, Rose d'Amour, 'Thais, Bob, Madame Montrose, Rose Trevena, Prince Victor, Regulus, Adèle Prevetto, and Mrs. McColi. Mr. Beesley, who had good blooms of Marabout, Elise, &c., and Layellor, Fanny, Miss Nightingale, Atre de God, &c.

In the class for six pompons Mr. Collyer was 1st, with fine blooms. A very fine bloom of Lord Alcester, shown by Mr. Beesley, was the best single incurved; and the best single Japanese was M. C. Andiguer, from the same exhibitor.

The competition in other classes for cut blooms was large, the flowers being chiefly of the kinds previously named.

Some fine bouquets of this flower were also shown, the best one, of white kinds, coming from Mr. Chadwick.

A very fine lot of some fifty blooms, chiefly Japanese, was staged by Mr. Harman, gr. to F. C. Capps, Esq., who did not show for competition. F. A. Davis, La Fraise, Soleil Levant, Comte de Gerniny, Margot, Madame Lacroix, Incomparable, and La Parée, were first-prize specimens. Some good incurved flowers were also included. The judges awarded three Certificates of Merit to good kinds of recent introduction in this collection.

Fruit was largely shown, the best three bunches of Grapes coming from Mr. Hudson, who had superb Black Alicante, Alnwick Seedling, and Muscat of Alexandria; whilst Mr. Baird, who came 2d, had good Black Alicante only; Mr. Milson, gr. to W. Lindell, Esq., Ealing, having fine Lady Downe's, wanting more colour.

Mr. Chadwick had the best three dishes of Pears in Beurré Bosc, Marie Louise, and Deuré Diel; Mr. Milson coming 2d with fine Pitmaston Duchess, Beurré Diel, and Beurré Superfin.

Mr. Hudson was 1st with three dishes of dessert Apples, having Lord Blenheim, Ribston, and King Pippins. He was also 1st in the corresponding class for kitchen Apples with Blenheim Pippin, Golden Noble, richly coloured; and Dunelm's Seedling.

Messrs. Lee & Sons showed a fine collection of fifty kinds of Apples, including the best.

Mr. Chadwick staged as many of Pears and Apples, receiving a 1st prize in the miscellaneous class, and Mr. Garlandroy showed twenty dishes of good kinds, obtaining a 2d prize.

Some twelve lots of four dishes of Potatoes were shown in a class for prizes offered by the Messrs. Sutton & Sons, Reading; a cottager, Mr. John Fardon, coming 1st with Vicar of Laleham, Magnum Bonum, International, and Schoolmaster.

There were capital collections of six kinds of vegetables shown, Mr. Wright having the best, and Mr. Slater the finest Celery in Fulham, 1st prize.

In all the cottagers and other classes the competitions were large, and those for boiled Potatoes provoked much interest, the cooking as a rule being first-rate.

LAMBETH AMATEUR CHRYSANTHEMUM: NOVEMBER 3.

THIS Society has been formed for the purpose of advancing the culture of this favourite flower in, we may safely venture to say, one of the most unfavourable districts, viz., a radius of 1½ mile from the Elephant and Castle, in the City of London.

The number of members has been estimated by a visit to their annual exhibition, of which the one held in Hawkstone Hall, Westminster Bridge Road, S.E., was the eleventh. The exhibits taken all round were really remarkable, all things considered; in fact, some of them were quite new to many seen at the principal show. The specimen plants were fine, and the various groups very attractive. The arrangement of a Chrysanthemum show does not admit of much departure from the ordinary routine of tables for blooms with plants "down the middle," and the groups and specimen plants on the floor to hide the walls, but the Executive in this instance had certainly imparted a slight though very effective change by arranging a pyramidal group of decorative plants midway of the tables. The whole appearance of the show was such as to give pleasure to all visitors, whether from the vicinity or not.

The prizes were awarded as follows:—

POT PLANTS.

For six standard Chrysanthemums.—1st, Mr. W. L. Tracy, with good examples of Colonel George Gieny, Mr. Handley, Golden Christine, and Argenia; 2d, Mr. F. R. Williams, his best being Christine, Ariadne, and Golden Christine. For three ditto, the same gentlemen were placed as before.

Best group, not less than twenty varieties, to be arranged in 16 square feet, general effect and quality to be the leading features.—1st, Mr. H. Ellis, with a tastefully arranged group of well-bloomed plants of medium height, with very robust though "sooty-looking" foliage; his finest examples were Madame de Levin, Golden Evelyn, M.M. Tozier, Margot, Triomphe de Chatelet, Fabian de Mediana, &c.; 2d, this prize was rather difficult to decide, on account of the even nature of the other groups, but we think the judges were correct in awarding it to Mr. J. Hole, whose collection, though small, was of fine quality. 3d, Mr. W. Clarke. A very creditable group was given by Mr. Hall.

For six untrained bush pompons.—1st, Mr. W. L. Tracy, with good plants, only exhibited about a week too soon, as the blooms were not fully expanded.

For six dwarf pompons the same gentleman was 1st, with neat little plants, all in a star-shaped trellis.

For six standard pompons Mr. Tracy was 1st; Mr. T. F. Davison was 1st for three ditto.

CUT FLOWERS.

For twelve Chrysanthemums, incurved, Mr. J. A. Ball was decidedly 1st, with fine blooms of Mr. Brunles, Golden Beverley, a grand bloom of Prince of Wales Mr. Bun, White Globe, Mrs. Shipman, Colonel George Glenny, Nil Desperandum, Nonpareil, Mrs. Halliburton, Golden Eagle, and George Glenny; 2d, Mr. W. Tracy, with good examples of Bella Donna, Lady Shade, White Beverley, Refulgence, and George Glenny; 3d, Mr. T. Hadden. Mr. A. Ball was 1st also for six ditto; 2d, Mr. Brown; 3d, Mr. T. F. Davison.

For six blooms of Anemone—1st, Mr. Brown, with Colonel George Glenny; 2d, Mr. F. R. Wilson, with George Glenny.

For twelve Anemone-flowered... 1st, Mr. W. Clarke, with some good blooms of Minnie Chat, Lady Margaret, Prince of Anemones, Bijou, Empress, Gluck, Madame Goderan, Marguerite d'Anjou, and Acquisition; 2d, Mr. H. Ellis, his best being Lady Margaret, Georges Sands, and Acquisition.

For six Japanese, Anemone-flowered, Mr. R. Ellis was 1st, with Sœur Dorothee, Souille, Madame Bertier, Pigny, Fabian de Medina, Madame Thérèse Clos.

For twelve reflexed Chrysanthemums—1st, Mr. A. Ball, with Emperor of China, King of the Crimson, Chevalier Domage, Pink Christine, Jewess, and Ariadne; 2d, Mr. F. R. Williams, 3d, Mr. T. Hadden. For six ditto, Mr. A. Ball was again 1st, Mr. W. L. Tracy, 2d, Mr. F. R. Williams, 3d.

For twelve Japanese Chrysanthemums, Mr. C. J. Fill was 1st, with good examples of Feraud Fern, Etiole Toulouseine, Mr. J. Lang, Mons. Tarin, Cry Kang, Japon Fleur, Madame B. Rendell, Ed. Gaumet, James Sater, Lady Alice, Merveilles, and Rosa Superba; 2d, Mr. T. Child, with Conte de Germiny, Madame la Croix, Garnet, Flamme de Pouch; 3d, Mr. W. L. Tracy. For six ditto, the same gentlemen held their respective places.

For six ditto, with fine examples of Monsieur Tarin; Mr. T. F. Davison, 2d, with James Sater.

For twelve Anemone pompons... 1st, Mr. H. Ellis; 2d, Mr. T. F. Davison. For six ditto, Mr. J. Hole.

For bouquet of pompon blooms, Mr. C. J. Fill was 1st; Mr. T. F. Davison, 2d.

For twelve Japanese Chrysanthemum blooms, Mr. C. J. Fill was also 1st, with a splendid vase; 2d, Mr. F. R. Williams.

NON-COMPETING CLASSES.

In the class for honorary members Mr. J. J. Hillier was the only exhibitor, but his stands made up for the absence of others. The exhibition of Mr. T. Child exhibited, not for competition, six splendid blooms of Golden and White Queen of England. Mr. T. S. Ware, Tottenham, also staged a small stand of Chrysanthemum blooms. The Athenæum Pottery Glass Company were Highly Commended for a neat display of aquaria, fern cases, live fish, &c. Silver Cups were awarded for the best group, twelve incurved and twelve Japanese, and special prizes as seconds, with the exception of the "group."

AMERICAN FORESTRY CONGRESS.

The fourth annual meeting of the American Forestry Congress was recently held in the Horticultural Hall, Boston.

President Higley, in opening the proceedings, said that the subject which had brought the members together was one of great importance. Legislative action will soon be secured in various States, but legislative action cannot be expected until the majority of the people are awakened to their importance. The recent absence of flood waters has turned out early in April, now it is much later; Peach trees which formerly gave abundant crops are now dead. But in the spring the warm rain melts the snow, and sudden floods carry away bridges, dams, houses, and other property. The Mississippi and other rivers are frequently difficult of navigation in summer, the Connecticut and Hudson rivers are lower in summer than formerly, and the Schuylkill is so much affected by the destruction of forests near its head that the water supply of Philadelphia is seriously threatened. The climatic influences of forests are of the greatest importance, and seriously affect the horticultural interests of the country. People are disposed to get the greatest possible benefits from their property, and are not disposed to neglect the cutting of timber and draining of swamps, even when they know seriously to endanger the surrounding country. But timber land is not a dead waste; it can be utilised and made profitable. In Kansas the settlers early learned the importance of trees in that country, and took measures to preserve the natural forests and to cultivate new groves. As a source of profit in Nebraska, this cultivation of trees ranks next to the raising of stock. Forestry has proved remunerative in Europe, where for 153 years it has been under Government patronage. The book-keeping is accurate, and the balance-sheet is undisputed. In the United States, in Schoeny, forests, there is a profit of 7,000,000 dol.; in Schoeny, the profit is 4,500,000 dol.; and in Bavaria, with 3,000,000 acres, the profit is 4,500,000 dol. In Alsace during the past ten years the annual income has been 1,786,948 dol., the expenditure 596,684 dol., leaving

an annual net profit of 1,190,264 dol. It is estimated that the profits of the forests in the country amount to 800,000,000 dol. per year. There is a large destruction by fire, and the annual loss from this source is estimated at 1,500,000,000 dol. The amount of timber used for railroad ties is enormous, and estimating that thirty years are required for the growth of trees for this purpose, it would be necessary to have 17,000,000 acres constantly growing as a railroad reserve. "Arbor Day" has done much good in the interests of forestry. It has never, however, done so much for the country, you must put into the public schools. The school children take great interest in "Arbor Day." Forestry schools should be established, the public lands should be preserved, there should be a more general observance of "Arbor Day," and attention should be paid to the relations between commerce and forestry.

Vice-President N. H. Egleston, Chief of the Forestry Division of the Department of Agriculture, exhibited a large coloured chart, showing the proportion of forests and waste and cultivated land in the various States. He pointed out that we are destroying our forests at the rate of a section of country equal to the State of Rhode Island, every five days, or to the State of Massachusetts every thirty days. In closing he said—We may well inquire how long the forests can endure this drain, how long the country can bear this rapid destruction of the most important element of its wealth. It is a question we may well inquire, and ask the country to inquire with us most earnestly, what can be done to lessen this destruction or avoid its threatening consequences. More than one-fifth of this annual destruction—that occasioned by forest fires—is preventable, and ought to be stopped. The growth of new forests demands every reasonable encouragement. The destruction of the forests is our destruction. Our prosperity, our existence, depend upon their preservation.

Mr. William Little, a lumberman of Canada, expressed his conviction, based on an experience of fifty years, that the forests are devastated by fire rather than by fire. Nature restores the forests by growth more quickly than the fires can destroy them. The second day's morning session opened at 10.30 o'clock, President Higley in the chair, the Hon. Marshall P. Wilder occupying the honorary seat at his right.

The President in a complimentary speech, introduced Colonel Wilder to the Congress, congratulating him on celebrating his eighty-seventh birthday on the previous day.

Mr. Wilder said he should never be so old as not to appreciate the object of this Association. He selected its members to their first meeting in New England. He recalled the successful work of the Massachusetts Horticultural Society, the first of its kind in America. He closed by urging the Congress to continue in its great work.

Professor N. H. Egleston of Washington, read a paper on the "State of Forest Legislation in the United States." By far the most legislation seeks the protection rather than the extension of forests. He alluded to provincial laws in the earliest days providing heavy penalties for the cutting of the forests, and trees were valuable—Oak and Mulberry, for instance, that were sought to be preserved for shipping and silk culture. The continuance of this course by the United States Government had been confined to the protection of the live oak for naval purposes, but in other respects Congress had been negligent. The timber used in the construction of the Mexican Central Railroad, Professor Egleston said, was stolen from the Government forests of New Mexico and Arizona. The difficulty of proof in the case of forest fires was noted as showing how laws of the several States are rendered futile. But little has been accomplished in the way of extending forests, except by private efforts in but a few instances. In the West the interest is growing.

"Forest Economy in Canada" was the subject of Hon. J. J. Joly's paper. He said that in that matter, he said, for Canada to limit the cutting of lumber to Crown lands unfit for settlement, and these are let out to the cutters on lease, or during good behaviour under the law. In 1883 the province of Quebec enacted a law of this purport. He gave an illustration of the disastrous results of the cutting of trees for poor timber, and originally covering it being first destroyed. He urged the Congress to work on for posterity in the face of all obstacles, and closed by describing the stringent legislation covering locomotives, their owners and drivers, to prevent forest fires.

Professor P. H. Dudley, of the New York Central Railroad, exhibited a series of photo-micrographs, showing the structure, tissues, and cells of various woods, and gave brief descriptions of them and their uses for railway purposes.

Mr. S. W. Powell, of Brooklyn, read a paper on "What are the Requisites of an effective Forest Fire Legislation?" He said that legislation should not be too much in advance of public sentiment, for fear of reaction, and should be followed by steady enforcement to insure efficiency. Discrimination should be made between direct and indirect damage, and special officers should be appointed so as to be beyond partial influences. The danger from visitors in such regions as the Adirondacks was pointed out, and proprietors and guides urged as the proper persons to fill the present official positions. In the timber districts the forest must restrain the landless.

The Weather. STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, NOVEMBER 4, 1885.

Table with columns: MONTH AND DAY, BAROMETER (Mean Barometric Pressure, etc.), TEMPERATURE OF THE AIR (Range, Mean, etc.), HYGROMETRY (Dew Point, etc.), WIND (Average Direction, etc.), RAINFALL.

Oct. 29.—Fine morning, dull afternoon, fine night. 30.—Fog in early morning, dull day. 31.—Rain from early morning till about noon, darkness from 1 P.M. to 2 P.M., very dull after 2 P.M. Nov. 1.—Fine day, fog in evening. 2.—Dull in early morning, very fine day. 3.—Drizzling rain from early morning throughout the day. 4.—Drizzling rain from early morning till evening, fine night.

LONDON: Atmospheric Pressure.—During the week ending October 31, the reading of the barometer at the level of the sea increased from 29.31 inches at the beginning of the week to 29.67 inches by 9 A.M. on the 25th, decreased to 29.10 inches by 11 A.M. on the 26th, increased to 29.52 inches by 9 P.M. on the 28th, decreased to 29.49 inches by 1 P.M. on the same day, increased to 29.05 inches by 9 A.M. on the 30th, decreased to 29.33 inches by 1 P.M. on the 31st, and was 29.34 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.55 inches, being 0.20 inch lower than last week, and 0.36 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 56° 5, on the 26th, on the 31st the highest temperature was 45° 8. The mean of the seven high day temperatures was 48° 7.

The lowest temperature was 32°, on the 30th, on the 27th the lowest temperature was 43° 5. The mean of the seven low night temperatures was 38°.

The greatest range of temperature in one day was 20° 5, on the 26th; the smallest, on the 31st, was 3° 8. The mean of the seven daily ranges was 10° 7.

The mean temperature were on the 25th, 40°; on the 26th, 47° 4; on the 27th, 45°; on the 28th, 41° 3; on the 29th, 44° 1; on the 30th, 39° 5, and on the 31st, 43°; and these were all below their averages (excepting the 26th, which was 0.2 above) by 7° 5, 1° 9, 5° 4, 2° 5, 6°, and 3° 4 respectively.

The mean temperature of the week was 42° 9, being 1° 5 lower than last week, and 3° 8 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 73° on the 26th. The mean of the seven readings was 65° 8.

The lowest reading of a minimum thermometer placed on grass was 25° on the 30th. The mean of the seven readings was 31° 5.

Rain.—Rain fell on two days, to the amount of 0.67 inch.

ENGLAND: Temperature.—During the week ending October 31, the highest temperatures were 58° 4 at Cambridge, 58° 2 at Bristol, 57° at Truro and Plymouth; the highest at Bolton and Newcastle was 50°, at Sheffield and Preston 51°. The general mean was 54°.

The lowest temperatures were 28° 8 at Wolverhampton, 30° at Cambridge, 30° 8 at Bolton; the lowest at Brighton was 36° 5, at Truro, Liverpool, and Newcastle 36°. The general mean was 33° 2.

The greatest ranges were 28°.4 at Cambridge, 26°.2 at Wolverhampton, 25° at Bristol; the least ranges were 14° at Newcastle, 15°.4 at Liverpool, 17°.3 at Bradford. The general mean was 20°.8.

The mean of the seven high day temperatures was highest at Truro, 54°, at Plymouth 52°.8, at Bristol 51°.1; and was lowest at Bolton, 46°.2, at Sheffield 46°.5, at Liverpool 47°.2. The general mean was 49°.

The mean of the seven low night temperatures was highest at Truro, 42°.4, at Plymouth 39°.9, at Liverpool 39°.5; and was lowest at Wolverhampton, 34°.1, at Bolton 35°, at Sheffield 36°.7. The general mean was 38°.

The mean daily range was greatest at Wolverhampton, 14°.4, at Bristol 13°.6, at Cambridge 13°; and was least at Liverpool, 7°.7, at Newcastle 8°.3, at Brighton and Bradford 9°.6. The general mean was 11°.

The mean temperature was highest at Truro, 47°.4, at Plymouth 45°.6, at Bristol 43°.5; and was lowest at Bolton, 39°.8, at Wolverhampton 40°.5, at Sheffield 40°.8. The general mean was 42°.7.

Rain.—The largest falls were 3.04 inches at Bolton, 3.03 inches at Truro, 2.09 inches at Sheffield; the smallest falls were 0.55 inch at Bristol, 0.67 inch at Blackheath, 0.89 inch at Newcastle. The general mean was 1.45 inch.

SCOTLAND: Temperature.—During the week ending October 31, the highest temperature was 50°, at Paisley and Perth; at Dundee the highest temperature was 48°.7. The general mean was 49°.3.

The lowest temperature in the week was 21°, at Perth; at Leith the lowest temperature was 29°. The general mean was 25°.0.

The mean temperature was highest at Leith, 41°.8; and lowest at Perth, 39°.9. The general mean was 40°.9.

Rain.—The largest fall was 2.03 inches, at Greenock; the smallest fall was 0.46 inch, at Edinburgh. The general mean was 1.01 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, November 2, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W. 1.—The weather has been cloudy or dull very generally, with a considerable amount of rain.

The temperature has about equalled the mean in "Scotland, E.," but elsewhere it has continued below, the deficit varying between 1° and 3°. The daily maxima were generally low, but on November 2 they ranged from 54° in the north and west of Scotland to 58° in "Ireland, S.," and 59° in "Scotland, E." The minima, which were recorded either on October 30 or 31, varied between 26° in "England, N.W.," 29° in the "Midland Counties," and 33° in "Scotland, W.," and "Ireland, S." In the "Channel Islands" the minimum was 43°.

The rainfall has been rather less than the mean in "Scotland, E.," and about equal to it in "England, S.," and "Ireland, S.," but more in all other districts. Over central and north-western England the excess was large.

Bright sunshine shows a decrease in Scotland, but an increase over England and Ireland. The percentages of the possible duration ranged from 11 in "England, N.E.," to 37 in the "Midland Counties," and 41 in the "Channel Islands."

Depressions observed.—The distribution of barometric pressure has been subject to considerable changes, and the movements of the depressions somewhat erratic. The disturbances which most affected the wind and weather in our islands were the following:—1, a haud or "trough" of low pressure, having two distinct minima, which stretched from Scotland to the south of Sweden on the 28th, and subsequently moved south-eastwards; and, 2, a small but rather deep depression which moved quickly up the Channel during the night of the 30th—31st, and afterwards disappeared to the south-eastward. At the end of the period the barometer was again falling in the west, and further depressions were approaching us from the Atlantic. Strong westerly winds or gales were prevalent till late on the 28th, when fresh north-westerly or northerly breezes became general for a time. By the 30th, however, the wind was blowing

strongly from the southward in the west, and moderately from east in the south-east, but as the depression referred to above passed the Channel strong winds or gales from between east and north were experienced. At the close of the period moderate to strong south-westerly breezes were reported.

Law Notes.

PUNISHMENT FOR PETTY PILFERING AT THE ROYAL DUBLIN SOCIETY'S SHOW.—A Dublin correspondent states:—At the Southern Divisional Police Court here on Saturday, October 17, before Mr. Woodcock, a respectably-dressed man, Arthur Murphy, of 32, Haddington Road, no business, was charged with having stolen pipe Potatos, value 1s., the property of Mr. Seymour Mowbray, from the premises of the Royal Dublin Society, Ball's Bridge.

Constable 93 E stated that his attention was attracted to the prisoner by the manner in which the latter was observing him. Witness followed the accused, and the latter, seeing that he was being looked after, entered the premises of the Royal Dublin Society, and went into the refreshment saloon. When he came out, he (the witness) asked him what was the bulk he had in his pocket. The prisoner said they were a few Potatos he had got inside, but he did not know who gave them to him. Witness then charged him with the unlawful possession of the Potatos, when he admitted that he had taken one off each plate.

The Prisoner: I got them on the floor, and thought it was no harm to take them.

The Constable: He afterwards made a further statement that he got one off the plate, and the others on the floor.

The Prisoner: I had no notion it was any harm to take them, as the exhibitors had all gone away.

Mr. P. S. Barrington stated that the Royal Dublin Society was anxious to press the charge in the interests of exhibitors, who were really not safe if such a course were allowed to be pursued. The Potatos stolen were portion of a collection for which a prize of £3 had been awarded. Another exhibitor had taken a £23 prize. Some of the exhibitors had actually to put their Potatos in rabbit nets to protect them from being stolen.

Mr. Woodcock: Is this a thing that has been often done?

Mr. Barrington: No, it is not. Exhibitors have confidence in the Society, because there is always a very careful look-out kept.

The prisoner said he was very sorry for it, but as the exhibitors had all cleared away, finding the Potatos lying on the ground here and there, he thought it no harm to take them.

Mr. Barrington: The Potatos on the tables were not cleared away.

The prisoner was fined 40s., or one month's imprisonment.

Obituary.

M. C. J. M. JONGKIND-CONINCK.—From the *Bulletin d'Arboriculture* we hear of the death of this well-known writer on agriculture and horticulture. He was the director of the Agricultural Institute at Wageningen, and took a large part in promoting horticultural and agricultural education in the Netherlands. He died on August 15, in the fifty-second year of his age.

—EDWARD OTTO.—We also regret to learn of the death of this gentleman, on the 11th ult. For many years he was editor of the *Hamburger Garten und Blumen Zeitung*, a publication which was not a mere popular *rechauffé* of other people's work, but contained a large proportion of the results of original research.

—MR. WILLIAM HOLMAN.—It is with much regret that we have to record the death, on October 17, of Mr. William Holman, in his eighty-second year. For sixty years he occupied the post of head gardener to the Earl of Chichester, at Stammer Park, near Brighton, Sussex. For many years he was a

most successful exhibitor at the Brighton and other horticultural shows, producing both plants, flowers, and fruit of the highest merit. In these days of frequent changes it is a pleasure to note such a long period of service as the above. That the same was valued by his noble employer it is almost needless to mention, for the Earl always took a lively interest in his garden, visiting his aged and faithful servant but a few hours only before his decease. F. H.

Enquiries.

"He that questioneth much shall learn much."—BACON.

SADDLE-BACK BOILERS used in limekilns, for heating hot-houses, &c.? Where can one be seen, or can any one give information on the subject?

Answers to Correspondents.

* OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that in pursuance of the new telegraph regulations our Registered Telegraphic Address is "GARDCHRON, LONDON," GARDCHRON being written as one word. Telegrams (but not letters) thus addressed will reach the Editor or the Publisher without other address being needed than "GARDCHRON, LONDON."

CARNATIONS DISEASED: Friday. The Carnations are affected by a disease caused by microscopic or thread-worms. The subject is described and illustrated in the *Gardener's Chronicle* for December 3, 1881. Where possible, and in bad cases, the affected leaves should be removed and burnt. The worms come from the soil or the water.

ERRATA: ONIONS.—In our report of the vegetable section of the last show at South Kensington, read, in the competition of Onions, "slices" instead of "sides." Mr. Deverill also showed nearly 500 bulbs of the kinds Anglo White Spanish, Rousham Park Hero, Main Crop, and the Wroxton, for which a Silver Bankian Medal was awarded. Also, Mr. R. Farrance took the 1st prize for twelve Tomatos, and Mr. Phillips the 2d.

FUNGI: F. Steele. 1, *Agaricus longipes*, var. 1, 2, *A. granulatus*; 3, *A. fimpatis*; 4, *Hypophorus virginicus*; 5, two small perished species belonging to *Mycena* and *Nolanea*, material insufficient for naming.—*A. D. W., Bangor.* 1, black, on Oak, *Bulgaria iniquans*; 2, yellow, amongst grass, *Clavaria cinnabarina*; 3, salmon colour, on *Sycamore*, *Nectria cinnabarina*. W. G. S.

Allen.* 1, *Doyenné d'Esperen*; 2, 4, *Beurré Diel*; 3, *Bergamote d'Esperen*; 5, *Vicar of Winkfield*; 6, *Beurré Clairgeau*; 7, *Beurré Bachelier*.—*Pomologist.* A Bullace of some sort.—*F. Robson.* *Pear.* *Laure de Glynnes*.—*A. M.* 1, *Claygate Pearmain*; 2, *Golden Noble*.—*L. F. J.* 1, *Warner's King*; 16, *Gansel's Bergamote*; 17, small *Passe Colmar*; 18, *Duchesse d'Angoulême*; 19, *Thompson's*; 20, *Beurré Hardy*; 21, *Beurré Diel*.—*Constant Reader.* *Irish Peach.* *T. R.* 1, *Beurré d'Annalis*; 2, *Joséphine de Malines*; 3, *Glou Morceau*; 4, *Nonsuch*; 5, *King of the Pippins*; 6, not known.

NAMES OF PLANTS: Cocher & Co. *Maxillaria picta*.—*Cooper.* 1, *Pteris cretacea*; 2, *Pelargonium capitatum*; 3, *Coccoloba platycladon*; 4, *Pelargonium sp.*; 5, *Eupatorium Wernmannianum*; 6, *Pelargonium glaberrimum*.—*W. Y. D.* *Cucumber* (next week); not the tinusom.—*W. Y. D.* *Oncidium Wentworthianum*; *Sooly Deca*.—*F. W.* 1, *Oncidium Wentworthianum*; 2, *Diplaz. glutinosa*.—*W. Scott.* 1, *Aster amellus*; 2, *A. vinica* var. *horizontalis*; 3, *A. Novi-Belgii*; 4, *Veronica incana*.—*G. Fleming.* *Hemimantus albidiflos*.—*Woodside.* *Pleione ligularia*; *Bouvardia* species, quite undistinguishable on arrival.—*H. J. Ross.* *Pleione maculata*; *Cymbidium* species next week.—*Constant Reader.* *Cineraria maritima*.

ORCHIDS: S. R. Payson, Belmont, Mass., U.S.A. The *Cattleya* bloom was partially decaying on arrival, as were the leaves of *Phalaenopsis*, so that we cannot name the first nor indicate the nature of the disease on the last.

SEEDLING GRAPE: Strebor. Your white seedling from *Gros Colmar* is a juicy well-flavored seedling with skin thinner than is the case with the seed-parent. If it

should prove, on further trial, as good as that kind, it will be a welcome addition to late-keeping Grapes. The specimens sent were not in good condition for forming a just decision.

SUNFLOWERS: *W. Evans*, 1. About 4 to 5 lb. per acre, according to soil, &c. The seed should be drilled into the ground in rows 18 inches apart, and the plants thinned out to 20 inches from plant to plant, so there would be about 11,000 plants per acre, or a less distance could be used, 2 and 3. Get seed from South Russia, where it is extensively grown, &c. Usually four 5. The produce per acre in South Russia is about 10 cwt. 3/4, and oil per acre 275 lb. Each flower produces about 1000 seeds. 6. It all depends on the condition of the soil. A light rich soil, and quite open, is the best. In Russia a seed sown in September yields seed in February. Sowing about 1 inch deep, and when it has grown 1 foot high, earth up, 7. No 9, and unless you remove too many, there would be no effect whatever, but too many would ruin the crop. 8. Depends on circumstances. The above are from *Tropical Agriculture*.

TERM OF NOTICE TO LEAVE SERVICE: *Enquirer*. Young men in gardens, whether foremen or not, are not nearly servants, and being usually paid at weekly intervals, can claim only a week's notice, or its equivalent in money and rent if there is a lodging found.

WHANGEE CANE: *J. Bryon*. The name given to some Eastern canes, species of *Phyllostachys*.

Markets.

COVENT GARDEN, November 5.

TRADE heavy; prices generally lower. *James Webber, Wholesale Apple Market.*

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit name and price. Includes Apples, Grapes, Kent Cobs, Lemons, Melons.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable name and price. Includes Artichokes, Beans, Broccoli, Cabbages, Carrots, Cauliflowers, Celery, Celeriac, Coleworts, Cucumbers, Endive, Fennel, Garlic, Leeks, Lettuce, Potatoes.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant name and price. Includes Aralia Sieboldi, Begonia, Bouvardia, Chrysanthemum, Dracena terminalis, Evergreens, Ferns, Foliage Plants, Hyacinths, Myrtles, Palms, Pelargonium, Poinsettia.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower name and price. Includes Abutilon, Arum Lilies, Azalea, Bouvardia, Camellias, Carnations, Chrysanthemum, Eucharis, Geraniums, Hyacinths, Lappageria, Lil longiflora, Marguerites, Mimosa, Nigella, Pinks, Roses, Tulips, Violets, Zinnia.

SEEDS.

LONDON: Nov. 4.—The attendance on the seed market to-day, as might be expected, was very thin, and the business doing exceedingly small. Of speculative demand there is scarcely any just now showing itself, whilst no variety seems actually needed for present sowing. Red Clover seed, however, is held with increasing firmness, higher prices being confidently anticipated later on. Winter Tares, owing to the continued sodden condition of the land, are quite a dear article. Hemp seed is lower than it has been for many years past. The new Turkish Canary seed is also extremely cheap. There is more enquiry for blue Peas and Haricot Beans. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

MARK LANE: Nov. 2.—For English Wheat prices ruled in many cases 6d. to 1s. lower to sell in quantity. Foreign Warrants were adversely influenced by this reduction, and the more difficult to sell, except at reduced rates. Country flour compared 6d. under the rates of this day week. Prime malted Barley was firm, and fully as dear as last noted. Second qualities were very dull, and grinding descriptions barely supported late. Round Maize met a dull sale, and were 6d. lower. Round White Maize met a quiet demand, and were 3d. to 5d. above the rates current on this day's night.

Nov. 4.—The trade for Wheat and flour continues very quiet here, and no quotable change has occurred in prices. Barley, Beans and Peas sold in retail at about previous rates. There was more doing in Oats at slightly better prices.

Average prices of corn for the week ending Oct. 31:—Wheat, 31s. 4d.; Barley, 30s. 2d.; Oats, 19s. 2d. For the corresponding period last year:—Wheat, 32s. 4d.; Barley, 32s.; Oats, 19s. 2d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): Nov. 3 and 4.—Fair supply of fruit and vegetables. Prices moderate, demand good. Quotations:—Peas, 3s. to 6s., and Apples, 2s. to 5s. per bushel; Cabbages, 2s. 6d. to 4s., Savoys, 3s. to 4s. 6d., and Cauliflowers, 5s. to 7s. 6d. per tally; bunch greens, 2s. 6d. to 4s., ditto Parsley, 1s. to 1s. 6d., and Beetroot, 2s. 6d. to 3s. 6d. per dozen; Brussels Sprouts, 2s. to 2s. 6d. per half sieve; Celery, 7s. to 12s. per 12; ditto, Onions, 3s. to 4s. per cwt.; picking ditto, 4s. to 4s. 6d. per cwt.; Carrots, 3s. to 5s.; white Turnips, 4s. to 6s., Swede ditto, 3s. to 3s. 6d., and loose Mangels, 22s. 6d. to 25s. per ton.

STRATFORD: Nov. 3.—Supplies have been good during the past week, as also the attendance of buyers, consequently a fair trade has been done at the following quotations:—Cabbages, 5s. to 8s., Savoys, 5s. to 9s., and Cauliflowers, 5s. to 6s. per tally; greens, bunch, 3s. 6d. to 5s.; and Cauliflowers, 1s. to 2s. per dozen; Mangels, 17s. to 21s., Onions, 6s. to 6s., Carrots, cattle feeding, 3s. to 3s. 6d. household, 4s. to 5s., Turnips, 6s., per ton; ditto bunch, 3s. to 4s. per dozen; and Swedes, 3s. to 4s. per ton; Apples, 8s. to 11s. per cwt., 1/4, 9d. to 6s.; Early Rose, 5s. to 9d. per dozen; Tomatoes, 3s. 6d. per dozen pound.

POTATOS.

BOROUGH AND SPITALFIELDS: Nov. 3.—Supplies rather more than sufficient for the demand, which was, however, rather better. Best samples upheld their value, inferior sorts were dull and irregular. Quotations:—Regents, 60s. to 80s.; Magnum Bonum, 60s. to 80s.; Early Russet, 70s. to 80s.; Hebrons, 80s. to 100s.; German, 45s. per ton.

COLUMBIA (East London): Nov. 3.—Trade firm for good samples. Magnum Bonum, 50s. to 75s.; Champions, 45s. to 55s.; Victoria, 50s. to 60s.; Regents, 60s. to 65s.; Early Rose, 5s. to 9d. per dozen. Quotations:—Regents, 60s. to 80s.; Magnum Bonum, 60s. to 80s.; Early Russet, 70s. to 80s.; Hebrons, 80s. to 100s.; German, 45s. per ton.

Nov. 4.—Good demand for better classes. Beauty of Hebrons, 65s. to 80s.; Reading Hero, 60s. to 70s.; Early Rose, 50s. to 60s.; Champions, 45s. to 55s.; Victoria, 50s. to 60s.; Regents, 60s. to 65s. per ton.

STRATFORD: Nov. 3.—Magnum Bonum, 50s. to 75s.; Regents, 60s. to 70s.; and Champions, 52s. per ton.

Imports.—The imports into London last week consisted of 2768 bags 2 casks from Hamburg, 600 packages from Ghent, 1196 bags from Stettin, 41 sacks from Boulogne, 4 bags from Terzeuse, 60 from Bremen, 204 sacks from Dantzig, and 2 baskets from Rotterdam.

Planting Season.

JOHN PERKINS and SON offer the following in large quantity, at very low prices. All goods well-transplanted stuff:—ASH, 1 to 3 to 4 feet; PINE, Austrian, 1 1/2 to 4 and to 3 1/2 feet. BIRCH, 1 1/2 to 2, and to 3 feet. FERN, 1 1/2 to 2, and to 3 feet. OAK, English, 1 to 3, and to 4 feet. SPRUCE FIRS, 1 1/2 to 2, and to 3 feet. PINE, 2 to 3, and to 4 feet. HAZEL, 2 to 3, and to 4 feet. PRUNUS MYROBALANA, 1 1/2 to 2, and to 3 feet. BLACKTHORN, 1 to 2 feet. HOLLY, 1 1/2 to 2, and to 3 feet. HORNBONE, 2 to 3, and to 4 feet. LAURELS, Common, 1 1/2 to 2, and to 3, and to 4 feet. FERN, Evergreen, 1 1/2 to 2, and to 3 feet. YEW, English, 1 1/2 to 2, and to 3, and to 4 feet. THORN QUICK, fine transplanted. Special offers on application. Billing Road Nurseries, Northampton.

ROSES—ROSES—ROSES—Splendid Plants of the following and other rose varieties, in rich pots, 24s., 30s., 36s., and 42s. per dozen:—Marschal Niel, Gloire de Dijon, Cinnamon Hybrid, Devoenians, Duke of Connaught, Home, Madame Lamard, Madame Lambert, Madame Willmroz, Nephets, Etrole de Lyon, Perle des Jardins, Safrano, &c. Our Roses are well known to be the best and healthiest in the country. Complete LISTS of varieties in standard and bush forms. THE LIVERPOOL HORTICULTURAL CO. (John Cow), Limited, The Vine and Nurseries, Garston, near Liverpool. Telegraphic address:—COWAN, LIVERPOOL.

FRUIT TREES. Fine healthy stock of Acacia, various kinds, Horizontal Apples, PEACHES, PLUMS, and NECTARINES; Standard and Pyramidal PEACHES and PLUMS. Fruiting trees, in pots, of APRICOTS, PEACHES, NECTARINES, and FIGS. Prices on application. D. S. THOMSON and SONS, The Nurseries, Wimbledon.

PALMS.—A few hundreds of splendid young healthy *Phoenix elegans*, *Latania borbonica*, *Corytha australis*, *Spathis reclinata*, *Areca lutescens*, and *Euterpe edulis*, &c. in dozen, 25s. per box; same sorts, 20 inches high, 12s. per dozen, less quantity, 14s. per dozen. PALMS.—Strong, healthy, and handsome *Lomaria Gibba*, *Adiantum cucullatum* (Maidenhair), *Pteris tremula*, *Pteris serrulata*, *Pteris caerulea cristata*, *Pteris cretica alba lineata*, *Pteris argentea*, &c. in dozen, 25s. per box. GARDENIA INTERMEDIA (rose), 6s. per dozen. Packages and parcels post-free. GARDENER, Holly Lodge, Stamford Hill, London, N.

Royal Nurseries, Ascot. MESSRS. JOHN STANDISH and CO. beg to announce to their Friends and the Public that they have an unusual quantity of well-grown NURSERY STOCK, consisting of a choice collection of CONIFERS, RHODODENDRONS, Standard and Bush ROSES, Evergreen and Deciduous FERNS on every description, FRUIT TREES of all kinds, IVIES, CLEMATIS, and all other varieties of CLIMBING PLANTS. Also fine stocks of GARDENIA, AZALEAS, GARDENIA, and flowering HEATHS, BOUVDARIAS, Maidenhair FERNS, PALMS, and every beautiful Plant that can be named, which are prepared to offer upon most favourable terms for Cash. Special quotations on application.

PONTEY'S SUPERFINE LATE WHITE BROCCOLI.—This is one of the finest stocks of Late White Broccoli ever offered, producing large heads of a creamy white colour, and coming in for use as late as June. See following extract from the *Gardener's Chronicle and Agricultural Gazette*, London:—"MONSTER BROCCOLI.—A few days since, Mr. C. G. of Tottenham, has been growing a variety of well-grown Broccoli for upwards of half a century, and was one of the first to get the Early Broccoli of Cornwall into the London and Northern Markets, cut this monster Broccoli, which together weighed 50 lb. They were the only Broccoli sent to the White Walkers. The huge stalks at the smelting-house had to be called into requisition to ascertain the weight of the plants." Retail price, 6s. per cwt. on every description. Special quotations to the Trade. Apply to E. WILSON SERPELL, 21, Cornwall Street, Plymouth.

To Nurseriesmen, Seedsmen, and Florists. DUTCH BULBS.—Season 1885. WHY pay Freight from Holland to London BULBS on Dutch Bulbs? You can buy at a cheaper rate, the same quality, and get them brought over free by ordering from LEWIS ISAACS, WHOLESALE IMPORTER OF DUTCH BULBS, at Victoria Warehouse, Mansell Street, Aldgate, E.C.7. Established since 1845. Wholesale Catalogue sent free on application. An immense stock of all kinds of Bulbs is kept at the above address from August up to end of Dec. in each year.

100 Herbaceous and Alpine Plants for 26s. RICHARD SMITH and CO.'S selection as above consists of 100 of the most interesting and valuable assortment of beautiful and Hardy Plants for 26s. fine work, which produce flowers and render the garden attractive all through the year. New List of sixty-four pages free. RICHARD SMITH and CO., Nurserymen and Seed Merchants, Worcester.

SPECIAL CHEAP OFFER.—PINES, Austrian, from 2 to 6 feet; LARCH, from 2 to 4 feet; FIR, Scotch, 12 to 24 inches; ELM, 3 to 4 feet, 4 to 8 feet; ASH, Common, 2 to 3 feet, 3 to 4 feet, 4 to 5 feet; BIRCH, 1 1/2 to 2 feet, 2 to 3 feet, 3 to 4 feet; OAK, English, 1 to 2 feet; HORNBONE, 2 to 3 feet, 3 to 4 feet, 4 to 5 feet, 5 to 6 feet; MAPLE, 4 to 5 feet; OAK, English, from 1 to 2 feet; YEW, English, 1 to 2 feet, 2 to 3 feet, 3 to 4 feet, 4 to 5 feet, 5 to 6 feet; PRIVET, Evergreen, 2 to 3 feet, 3 to 4 feet, 4 to 5 feet; HOLLY, 1 1/2 to 2 feet, 2 to 3 feet, 3 to 4 feet; THORN, 4, 5, and 6 yr., 1 yr.; SYCAMORE, 3 to 4 feet, 4 to 5 feet, 5 to 6 feet; ACACIAS, 3 to 4 feet; PINE, 1 to 2 feet, 2 to 3 feet, 3 to 4 feet; OAK, English, 1 to 2 feet, 2 to 3 feet, 3 to 4 feet; ELDER, 4, 5, and 6 yr., 1 yr.; SYCAMORE, 3 to 4 feet, 4 to 5 feet, 5 to 6 feet; JUNEPINES, flowering; HOLMIES, in great variety; IVIES, in sorts; JUNEPINES, LABURNUM, LAURELS, assorted; RHODODENDRONS, several kinds in thousands; PINK, 1000; and other beautiful stuff; RETINOSPORA, YEW, Common and Irish. For Price List, &c., apply to ISAAC NATHAN and SONS, The Nurseries, Melton, Stoke-Neu.

Rosser's Garden Edging Tiles.

THE ABOVE and many other PATTERNS
 are made in materials of great durability. The
 planer sorts are especially
 suited for KITCHEN
 GARDENS, as they har-
 bour no Slugs or Insects,
 take up little room, and
 once put down incur no
 further labour or expense,
 as do "grown" Edgings, consequently being much cheaper.
GARDEN VASES, FOUNTAINS, &c. in Artificial Stone,
 very durable and of superior finish, and in great variety of design,

 A liberal Discount to the Trade.

Oil Paint no Longer Necessary.
HILL and CO.'S BLACK VARNISH,
 for Preserving Ironwork, or Stone.
 (Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on
 all outdoor work, while it is fully two-thirds cheaper. It was
 introduced upwards of thirty years ago by the Advertisers, and
 its genuine good quality, notwithstanding a host of unprincipled
 imitators, is fully attested by its constantly increasing sale.
 It may be applied by an ordinary labourer, requiring no mixing
 or thinning, and is well sold. It is used in the grounds at
 Windsor Castle, Kew Gardens, and at the seats of many
 hundreds of the Nobility and Gentry, from whom the most
 flattering testimonials have been received.
 Sold in Casks of about 20 gallons each, at 5s. 6d. per gallon,
 at the Manufactory, or 1s. 8d. per gallon carriage paid to any
 Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
 "Pierrefield Park, June 29, 1876—511s. I have this day
 forwarded from Chepstow to your address a black varnish cask,
 to be filled and returned with as good Varnish as the last we
 had, which I candidly admit was the best we ever had. Address
 Varnish to Pierrefield Park, Chepstow, W. or 2s, 9s, would
 specifically, Wm. Cox."
CAUTION.—HILL & SMITH would particularly warn their
 Customers against the various cheap Varnishes now so much
 advertised.
H. K. S.'s Varnish has been an article of common use on most
 of the large estates in the Kingdom upwards of thirty years,
 and its constantly increasing trade in it, and the numerous
 testimonials they receive stamp it as a truly genuine article.
 If the cask is returned with their name and Registered
 Trade Mark as above, without which none is genuine.

 Covered Sheds or Yards for Cattle, Conservatories,
 Greenhouses, Garden Seats, &c.,
 at extremely moderate prices.

Full particulars may be had on application to
ALFRED SLATER, General Manager, GLOUCESTER.

THE LOUGHBOROUGH GREENHOUSE
HOT-WATER APPARATUS.

Price, as engraving, with Boiler, open feed syphon, 12 feet of
 4-inch hot-water pipe, and patent joints complete, £4 4s.
 Delivered free to any station. Discount for cash.
 This is the simplest, cheapest, and most powerful apparatus
 made. It requires no brick setting, no stokehole, and no hot-
 water filter for fixing. The Boiler stands in the Greenhouse,
 the front only being outside and flank with the outer wall, so
 that the whole of the heat from the boiler itself is utilised.
 It burns over 12 hours without attention, at a nominal cost.
 "Loughborough" Boilers to heat up to 650 feet of 4-inch
 pipe, with hot-water pipe, joints, &c., always in stock.
 Cost of Apparatus COMPLETE for Greenhouses as below:—
 10 by 6 ft., £4 14 0 | 15 by 9 ft., £5 10 8 | 25 by 12 ft., £6 16 8
 12 by 8 ft., £ 4 10 20 | 20 by 16 ft., £ 6 0 14 | 16 ft., 12 12 4
 Proportionate prices for other sizes. Estimates on application.
 The measurement of Greenhouses being given, every apparatus
 is delivered with pipes cut and fitted ready for fixing.
 Illustrated List, with full particulars, post free.

GREENHOUSE Warming STOVE.

The only perfect Oil Stove made.
 Awarded the highest premium over
 all competitors wherever exhibited.
 The cheapest and most effective
 means known for warming small
 Greenhouses, and keeping out frost
 and damp. They burn absolutely
 without smoke or smell, require no
 pipes or fittings, give off no injurious
 vapour to either vegetable or animal
 life, will burn twelve to twenty hours
 without attention, are so portable
 they can be moved from one place
 to another while burning, and for
 efficiency and economy can be highly
 recommended. Prices from a few
 shillings. Sold by all Ironmongers
 and Lamp Dealers. See the name
 upon the stove before you purchase.

SUPERIOR VARNISH.

This Varnish is the cheapest and best
 covering which can be used for all outdoor
 purposes, and has many advantages over
 oil paint. It is applied cold, and may be
 laid on by any farm labourer or other un-
 skilled person. It dries quickly, giving a
 hard, brilliant polish, and looks equally as
 well as oil paint, yet at one-fourth the cost.
PRICE in Casks, containing not less than
 9 gallons, delivered free at most Railway
 Stations:—Best prepared Jet or Black
 1s. 6d. per gallon.

PUBLISHING OFFICE AND OFFICE FOR ADVERTISEMENTS, 41, Wellington Street, Strand, London, W.C.

BUY ONLY ENGLISH WATCHES.

BENSON'S NEW PATENT (No. 4658) "LUDGATE" WATCH, has obtained the Highest Award of a Gold Medal at the Inventions Exhibition, 1885

SILVER, GOLD, £5 5s. £12 12s.

The "Ludgate Watch" is a SILVER ENGLISH Lever, of my best London make, with "Special Strength" Three-quarter Plate Movement. Jewelled throughout in rubies—true Chronometer balance—adjusted for extreme north-south and dust-proof patent ring-band and extended barrel—massive sterling silver dome case with crystal glass front, which combines the strength of the Hunter with the convenience of the Open Face Watch.

The immense superiority in Value, Accuracy, and Durability of the "Ludgate" Watch to SWISS and AMERICAN (made in imitation of and sold as English) and to the OLD Full-plate English Lever (still sold by other makers), from the great defects of which the "Ludgate" is exempt—is proved by the Award of a GOLD MEDAL—the only one—to the English Watch. The "Ludgate" is of better quality and value than any Levo watch hitherto made. The "Ludgate" is my best London make—strong, handsome, and reliable—will stand the hardest wear and toughest work, and is therefore the best watch for Home, Inland and Colonial wear by Gardeners (No. 1, large size), Workmen, and Artisans (No. 2, as sketch), Gentlemen, Officers and Men in His Majesty's Land and Sea (No. 3, small), will be sent, free and safe at my risk, to all parts of the world, for £5 5s., or in 18-carat gold, crystal glass cases, Twelve Guineas (No. 2, as sketch). A remittance by P.O. Draft, or Cash, must accompany Order. SPECIALLY NOTE that J. W. BENSON is the only Maker of a Three-quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any other Watchmaker in the Kingdom. Any infringement of the Patent Rights will be prosecuted against the offender. An Illustrated and Priced Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on application to

J. W. BENSON, Watchmaker to Her Majesty the Queen, The Steam Factory, 62 and 64, Ludgate Hill, E.C. And 29, Old Broad Street, W. London. Consequently upon the award of the GOLD MEDAL, the demand, always great, has so increased as to necessitate more extensive Machinery, which now enables us to execute all orders for the "Ludgate" Watch without delay. Illustrated Pamphlets of Watches from £2 to £500, Gold and Silver Jewellery, Clocks, Hones, Chimes, and Lurets, Electro-plate and Musical Boxes, free on application.

The Ladies' Gazette of Fashion for Sept., 1885, says:—"For neatness, durability, and appearance, we can most strongly recommend them. . . . They combine every feature of excellence." For the Autumn and Winter. Warm and Durable.

DEVONSHIRE SERGE SAILOR SUITS: viz., Blouse, Knackerhockers, Single Collar, Gaiter, Lav 3rd, and Whistle, strong quality, from 7s., Carriage Paid. Fit and satisfaction guaranteed, or money returned. Girls' Naval Costumes same price as Boys'. Also Gaiters and Jersey Suits and Costumes, Ladies' Dress Serges, Cashmeres, Velveteens, and Underclothing, direct from our factories at astonishing low price. Write for Illustrated Lists.

Patterns and Measurement Forms post-free, from The Midland Manufacturing Company, Dudley, Please mention this paper.

105,000 Accidents.

For which Two Millions have been paid as Compensation by the RAILWAY PASSENGERS' ASSURANCE Co. Company, 64, Cornhill. Accidents of all kinds. Paid-up and Invested Funds, £260,000; Premium Income, £235,000. Chairman, HARVEY M. FARQUHAR, Esq. Apply to the Clerks at the Railway Stations, the Local Agents, or West-end Office, 8, Grand Hotel Buildings, Charing Cross; or at the Head Office, 64, Cornhill, London, E.C.

WILLIAM J. VIAN, Secretary.

THE LIVERPOOL HORTICULTURAL CO. (John Cowan) Limited, The Vineyard and Nurseries, GARST, REQUITE for one of their Liverpool Florist Establishments, a young LADY of good business ability. Must be a competent hand at making bouquets, wreaths, &c.—Apply, giving reference, stating salary expected, to the MANAGER.

WANTED, for the Cut Flower Trade, an experienced young LADY to assist in Conservatory. Must know Plants, and be a good hand at making up Wreaths, Bouquets, &c.—Apply, stating salary, to the MANAGER. In or Out-of-doors, to W. H., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable of a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

R. B. LAIRD AND SONS (Successors to the late Firm of DOWNIE & LAIRD) can at present recommend with every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended upon, either for large Establishments or Single-handed Situations; also FOREMEN, UNDER GARDENERS, and FARM BAILIFFS.—177, Frederick Street, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter.—Enquiries should be made to 237 and 235, High Holborn, W.C.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

TO LANDED PROPRIETORS, &c.—A. McINTYRE (late of Victoria Park) is now at liberty to undertake the management of all kinds of Gardens, and Residing or Renting Gardens. Plans prepared. 175, Listeria Park, Stamford Hill, N.

Gardeners, Farm Bailiffs, and Foresters. JAMES DICKSON AND SONS, "Newton" Nurseries, Chester, are always in a position to RECOMMEND MEN of the highest respectability and thoroughly practical in their habits. Full particulars, with names of previous employers, &c., on application.

SCOTCH GARDENERS. S.—JOHN DOWNIE, Seedsmen, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to Noblemen or Gentlemen requiring a trustworthy and competent Gardener.

GARDENER (HEAD).—Thoroughly practical; good experience in all branches, including Orchids. Excellent testimonials. For further particulars apply to Mr. McKAY, Maristow Gardens, Roroborough, South Devon.

GARDENER (HEAD).—A GENTLEMAN wishes to recommend his Head Gardener, who has had good experience in general culture.—C. A., Clarence Lodge, Dutch Road, Heme Hill, S.E.

GARDENER (HEAD), where three or more are kept.—A GENTLEMAN desires to recommend a Head Gardener to any one requiring a practical and reliable man.—A. A. D., 41, Wellington Street, Strand, W.C.

GARDENER (HEAD).—Age 30, single at present; experienced in the Forcing of Flowers, Fruit, and Vegetables, and General Routine of well-kept place. Good references.—W. L. H., Broad Moor Cottage, near Weston, Bath.

GARDENER (HEAD), where four or more are kept.—First-class excellent personal character, trustworthy, and economical.—Apply to the Manager, TYN WHITT DRAKE, 39, Elm Park Gardens, S.W. James Thomas, widower, one daughter.

GARDENER (HEAD).—The Viscountess DOWNE, Dingley Park, Market Harborough, wishes strongly to recommend her late Head Gardener to any Lady or Gentleman requiring the services of a thorough practical, trustworthy, and energetic man, in all branches of the profession.

GARDENER (HEAD).—Mr. BENNETT, Vineyard, Potters Bar, can with confidence recommend a thorough practical man of twenty years' experience in first class places, to any Nobleman or Gentleman requiring the services of a Gardener fully competent to take the Management of a good establishment.

GARDENER (HEAD); age 35, married, one child.—Colonel LANE (wishes to recommend his late Head Gardener, who has been with him six years, as a thoroughly practical and capable of taking the Management of a large Garden, with Houses, Vineries, &c.—Apply, stating particulars, to H. SWINNETON, Kings Bromley Manor, Lichfield.

GARDENER (HEAD); married.—W. SWAN, for the past twelve and a half years at Oakley, Fallowfield, and three years previously at Manley Hall, Macclesfield, seeking a re-engagement. Thorough knowledge of Orchard Culture, Stove, and Greenhouse Plants, and the general practice of good Gardening. Total abstainer. Excellent character and references.—34, Portland Grove, Fallowfield, Manchester.

GARDENER (HEAD); age 20.—Mr. WESTCOTT, Gardener to his Grace the Duke of Cleveland, Raby Castle, Darlington, would be a much pleasure in recommending his Foreman as Head Gardener to any Nobleman or Gentleman requiring a thorough practical, steady and respectful man, who has been in general charge of these gardens upwards of four years, and given me every satisfaction.

GARDENER (HEAD).—Age 34, single at present; thoroughly competent and trustworthy, total abstainer; has had a thorough practical experience in all things connected with In and Outdoor Gardening, and has also had long experience in Orchard Gardening. Good man, who has been in general charge of these gardens upwards of four years, and given me every satisfaction.

GARDENER (HEAD WORKING).—Age 27, married when suited; total abstainer. Thirteen years' good practical experience in all branches. First-class references.—W. L. H., Redleaf Gardens, Penshurst, Kent.

GARDENER (HEAD WORKING).—Age 35, married.—The Advertiser is now open to engage with any Gentleman requiring the services of a thorough practical Gardener; also has a good practical knowledge of Land and Surveying, and is a thoroughly reliable character.—W. R. KAYNE-HILL, 23, Chaucer Road, Acton, W.

GARDENER (HEAD WORKING).—Age 46, Scotch, no objection to being engaged in every branch of the profession—Orchids, Stove and Greenhouse Plants, Flower and Kitchen Gardening. Total abstainer. Well recommended. Well. Dairy and Poultry.—W. ROSS, Tildown, Dursley, Gloucestershire.

GARDENER (HEAD WORKING).—Under Greenhouse Land and Stock, good Orchard Grower, Stove and Kitchen Gardener, Flower and Kitchen Gardener. Good character and references. Twenty-two years' practical experience in large gardens.—J. CHILD, Garbaid Hall, Ewell, Surrey.

GARDENER (HEAD WORKING).—Age 40, married, no family; very good indoors and out, forcing all kinds of Fruits, Flowers, and Vegetables. Understands Planting Forest Trees and Laying-out Grounds, Land, and Stock. Wife first-class Laundress or Poultry. Well recommended.—Crown Cottages, Masbur, Road North, Westminster, W.C.

GARDENER (HEAD WORKING), or GARDENER and BAILIFF.—Age 45, married, no occupation; successful Grower of Grapes, Peaches, Melons, and Mushrooms; all kinds of Early and Late Forcing; a good Kitchen and Flower Gardener. Good character. First-class employer, and excellent testimonials.—E. W., 22, Gloucester Place, Cheltenham.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Age 25, single; experienced in all branches. Good character.—F. SELLWOOD, Stubbings Cottages, Maidenhead, Berks.

GARDENER (HEAD or good SINGLE-HANDED).—Well experienced in all branches of the profession. Good references.—Total abstainer.—A. B., 9, Churchill Road, Dartmouth Park, London, N.W.

GARDENER.—where a man with a practical knowledge of Gardeners in all branches is required, with a strong Lad.—GARDENER. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

GARDENER.—Age 23, single; understands Greenhouses, Nursery Work, Landscape Gardening, Drawing, and Painting. Can speak several languages.—WILLIAM LACHE, Ecole Polytechnique, near Caudebec en Caux, Seine Inférieure, France.

GARDENER, thorough (SINGLE-HANDED), whose assistance is wanted, age 33, married.—A GENTLEMAN desires to recommend a sober, steady man, as above. Invaluable to one requiring a reliable servant who understands his duties.—W. H., Inchiffe House, Ealing, W.

GARDENER (SINGLE-HANDED, or otherwise).—Age 20, single; fourteen years' experience in 10 and Out-of-doors, three years and eleven months of good character from last employer.—State previous.—S. BROWN, Clare Cottages, Barnes, S.W.

GARDENER (SECOND), where several are kept.—Age 25; nine years' experience both inside and out. Eighteen months' good reference.—J. WILDEN, The Gardens, Hayes Place, Beckenham, Kent.

FOREMAN, or MANAGER of a small Nursery.—Age 36, married; first-class Grower of Tomatoes, Cucumbers, Strawberries, &c.—Twelve years' experience in London Nurseries.—W. M., Shardrow, near Derby.

Cut Flower Trade. FOREMAN.—J. H. POUNCE, who is relinquishing business, can thoroughly recommend his Foreman, J. Merritt, to fill a similar position as a steady, experienced, persevering man.—Pounce's Nursery, Hendon, S.W.

FOREMAN; age 24. GEORGE STANTON, Park Place Gardens, Henley-on-Thames, can safely recommend a young man as above. Good knowledge of Plant and Fruit Culture, and a good Orchard Grower. Nine years' experience. Moral character excellent.—Address as above.

FOREMAN, in a good establishment.—Age 26; ten years' experience in first-class establishments. Well up in all branches.—Twelve years as Foreman. Strong and active. Good references.—FOREMAN 35, Melroby Terrace, Chorley Old Road, Bolton.

FOREMAN, in a good establishment.—Age 25; experienced in all branches. Two years' Foreman in present situation. Can be well recommended by present and previous employers.—Messrs. SMITH, Gaidcote Hall Gardens, Nuneton, Warwickshire.

To Nurserymen. PROPAGATOR and FOREMAN.—Well known in the Propagation of Rhododendrons, Camellias, Clematis, and Roses, all Hardy Plants, &c.—W. B., Bagshot, Surrey.

PROPAGATOR and GROWER.—Age 26; has had twelve years' experience in the London Nurseries Trade. Good reference.—E. W., Abbey Nursery, West End Lane, Kilburn, N.W.

To Nurserymen. PROPAGATOR and GROWER.—Well up in the Cultivation of Stove and Greenhouse Plants in general. Sixteen years' experience. Good references.—R. W., Longlands Nursery, Sidenup, Kent.

To Nurserymen. PROPAGATOR or GROWER (INDOORS).—Age 23; over seven years' experience. Good references.—JOHN WINNER, Plummers Plant, Horsham.

JOURNEYMAN.—S. JENKS, The Gardens, Blambletree, East Grinstead, would be glad to recommend a thorough industrious young man, as above.

JOURNEYMAN (OUTSIDE or INSIDE).—Age 23; six years' experience. Son of a Scotch Gardener. Good reference. Abstainer.—GARDENER, Str. Heine's, Broxtown, Dublin.

IMPROVER, in the Houses.—Age 19; has had some experience. Good references.—H. T., Rhine Hill, Stratford-Avon.

TO NURSERYMEN. An expert hand wants a situation. Nine years' character from Paul & Son (Mr. W. Park, Waltham House, Waltham Cross).—J. R. Rev. C. G. Chittoeden, The Grange, Hoddesdon, Herts.

MANAGER, &c.—ADVERTISER wishes place in the Trade. Considerable experience in every branch—Home and abroad; or would Manage Business.—W. A., Geer & Son, 53, Preston Terrace, Strand, W.C.

To Nurserymen and Florists. MANAGER (ASSISTANT), SALESMAN, or CORRESPONDENT.—A young man (age 27); desires situation in a Nursery as above. Is well educated, thoroughly acquainted with all kinds of Office Work, and has a fair knowledge of General Nursery Work and Stocks, especially in Herbaceous and Florist Flower Departments. First-class references. Can begin at once.—C. H., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (HEAD), or MANAGER.—Age 40; twenty years' experience in Retail Seed Trade, general in first-class Nurseries. Good Book-keeper, and efficient Correspondent. Moderate salary.—F. S., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (HEAD).—Age 27; fourteen years' practical experience in Wholesale and Retail Trade. First-class references.—F. S., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

TO THE SEED TRADE.—Situation wanted by a young man (age 30) with good references and eleven years' experience. Could enter upon engagement at once.—S. M., Hurst & Son, 152, Houndsditch, London, E.C.

TO THE SEED TRADE.—A young man (age 23, requires a situation in the Seed Trade. Four years' experience in first-class firms. Has been twelve months in the Seed Trade. Good references.—J. R. Romain, 9, Lower Winchester Road, Catford, London, S.E.

HOLLOWAY'S OINTMENT and PILLS.—Ever Useful.—The afflicted by illness should look their diseases fully in the face, and at once seek a remedy for them. A short search will convince the most sceptical that the noble medicaments have afforded ease, comfort, and sometimes complete recovery to the most tortured sufferers. The Ointment will cure all descriptions of Sores, Wounds, Bad Legs, Sprains, Erysipelas, Eruptions, Rheumatism, Gout, and Skin Affections. The Pills never fail in correcting and strengthening the Stomach, and in restoring a Deranged Liver to a wholesome action. They are in routine use for the purpose of increasing their secretion, and in re-establishing the natural healthy activity of the Bowels. Holloway's are the remedies for complaints of all classes of society.

Come and See
OUR CHRYSANTHEMUMS.

WE are determined (under this heading in particular, when so many are supposed to have the best) to keep our announcements accurate. Last year our show of our 100 best houses was described by The Press, and admitted to be an extraordinary exhibition and the best trade display ever seen. This year we have erected five houses, specially constructed, which present a continuous bank of the whole family from the original species to 950 named varieties, 1000 feet by 4 to 5 feet wide, of nearly 5000 plants, with vigorous dark green foliage, and as near perfection as can well be imagined, and the treat which awaits all lovers can readily be anticipated. Beyond this the collection is enriched with best varieties direct from Japan: also Messrs. Collingford, Tescdale, A. W. Latz, and our own seedlings. Consequently we feel quite justified in saying that nothing hitherto so interesting in the history of the Chrysanthemum ever approached it in our view at Swanley. Send for our CATALOGUE—the most complete and Descriptive of the best kept Collection in England. A Greatly Reduced PRICE LIST of Eighty New Varieties collected from all parts of the World also sent post-free.

APPEAL TO THE BENEVOLENT

On behalf of Two Sisters, aged respectively 70 and 72 (the younger has been an invalid for many years), who have lived together all their lives. The leases of their property having fallen into the hands of the Ecclesiastical Commissioners some six years ago, they have vainly struggled since then to obtain a living by letting apartments, but the little money they had saved being now quite exhausted, and owing over a year's rent, make this Appeal, hoping to save their home from being taken up, and parting with everything they possess. Will any kind friends help them in their deepest distress? The following Gentlemen have kindly allowed a reference to be made to them, and will give every information respecting the genuineness of this Appeal:—

- Dr. MAXWELL T. MASTERS, F.R.S., 41, Wellington Street, Strand, W.C.
 Mr. E. W. PERNON, *Weekly Dispatch* Office.
 Mr. J. P. FULLER, F. Weymouth Street, Portland Place, W.
 Mr. W. H. PERCY, *Weekly Dispatch* Office.
 Mr. J. KESLEY, 62, Salmons Road, Finsbury, S.W.
 Mr. W. RICHARDS, 41, Wellington Street, Strand, W.C.
- Contributions will be gratefully received and thankfully acknowledged by Mr. W. RICHARDS, "Gardens' Chronicle" Office, 41, Wellington Street, Strand, W.C.

GARDENERS' CHRONICLE OFFICE TELEGRAMS.

WILSON JUNIOR BLACKBERRY... GLENFIELD BLACK CRABAPPLE... VICARS CULYERS LEIGESTER

ANNECRES MANAGER... NURSERIES GLENFIELD BLACK CRABAPPLE

Anneced specimen testimonial regarding Wilson Junior Blackberry, speaks for itself:—"New Park, Leicester. I am very much pleased with the Amercan Blackberries that you sent me in the spring. The fruit is superb."

As per our circulars of September 5 and 12, we must strongly advise would-be purchasers to see that they obtain the true variety, otherwise they will only meet disappointment if they find that after all they only possess the inferior variety. "Wilson Early." To therefore avoid chagrin order only from us, or from those houses who have purchased their stock from us, or from those who have purchased their stock from us. We must urge the importance of autumn planting.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 14, 1885.

WOBURN ABBEY.

IN *Fraser's Magazine*, September, 1879, Mr. J. A. Froude gives the history of "Cheneys and the House of Russell." He went down to Cheneys and visited the tomb-house of the Russells, where they lie, about four score of them, from young Lord Amberley, son of "Lord John," the hero of the Reform Bill, back to Anne, Countess of Russell, who built the mortuary chapel at Cheneys, A.D. 1556, and who lies there with her husband, sculptured in alabaster, in a seeming trance—the earliest of the monuments, and one of the finest in Europe. The name of this great family appears on the roll of Battle Abbey, but the Lady Anne was the great ancestress of the earls and dukes, who have been since gathered to her side. Her mother was a Cheney; her father, Sir Guy Sapcote, of Huntingdonshire; and from her came the Cheneys estate and 18,000 acres of the richest land in the shire just named; but, judging from her stern and noble portrait, she bequeathed to her sons gifts more precious than their broad estates. Her husband, the first Earl of Bedford—who could say with Othello that he had "done the State some service," a prudent and a cautious man, who was certainly well rewarded for his pains—lies by her side.

A family who have enjoyed 350 years of earldom and dukedom can afford to disregard the previous period since the Conquest when they could claim no particular distinction, and Sir John, the first Earl, who gained his knighthood and lost an eye in a battle in early life, must be regarded as the founder of his family. I should like to have discovered in Mr. Froude's paper something more than the praises of successful politics, and of the virtues appertaining to high birth and running, as he says, in the blood of aristocrats. I should like to have found a record of the social services of the Russells, and of their attempts to make two blades of grass grow where only one grew before, as recorded in the *Hortus Granitæus Woburnensis*, of their noble patronage of agriculture, horticulture, and silviculture, and of their employment of Repton, who formed the roads in the park at Woburn, planted the distant slopes and ridges seen from the windows of the Abbey, and fashioned the lake.

To begin at the beginning, the Abbey of Woburn was founded in 1145 by Hugh de Bolebec. It was granted in 1547 by Edward VI. to Sir John, afterwards Lord Russell of Cheneys, where he lies in alabaster as aforesaid, awaiting the unknown with a thoughtful countenance, while his countess—for he became an earl, as already stated—seems to look up with awe, bearing a bold heart nevertheless. Two hundred years later, in 1747, the old Abbey house was replaced by a new one, which has since been altered and improved, and is now a magnificent quadrangular house, called Woburn Abbey. It stands amid 60 acres of pleasure-grounds, with palatial stables adjoining it, together with a tennis-court and a riding-school, having a sculpture gallery on

one wing, all connected with the house by a long colonnade, and standing on the site of the former Abbey cloisters. Enclosing the whole of these extensive buildings is a noble park, containing nearly 3000 acres, which is perfect as an English park, of varied contour, peopled by herds of red and fallow deer and highland cattle, having avenues of Elms 2 miles long, roads that lose themselves in the distant foliage, unnumbered timber trees, tall and large Oaks enough to form a fleet, Beech which would keep High Wycombe in stock for several years, Spanish Chestnuts that would roof in all the houses in Beds, English or Cornish Elms, as they are called here, sufficient for a million coffins, and Horse Chestnuts and large White-thorns, which were in full blossom during my visit. The distant views from the higher ground reach into Northamptonshire, or to the chalk downs of Ivanhoe and Tring. Along the lower ground between the house and the little town of Woburn a string of eight ponds, most of them stew-ponds in old times, vary the scene, and hold the duke's fishes, the golden carp and tench from Germany, in which the present duke delights. After drawing off a pond to inspect his favourites Mr. Frank Buckland became so enthusiastic over some of the duke's imported fishes that he jumped about and cheered like Lord Randolph Churchill on hearing the announcement of the late majority.

On the Abbot's Oak, the outside tree of a group before the windows by the water side, the last abbot was hanged for denying the king's supremacy. The London Road passes through the town and skirts the lake on the opposite bank, so that travellers can obtain, at the distance of a mile, a noble view of the park and of the west front of the Abbey. Standing on the terrace of Woburn Abbey you behold Nature in one of the best of her English aspects, clothed in timber and turf, and, in Shakespearean phrase, mended by the art of Repton. Some buildings of the "Home Farm," the very spot where Duke John's sheep shearings were attended by Arthur Young and all the great agriculturists of the period, are on the lower ground concealed by clumps of trees, and further off, beyond some wide-reaching shrubberies, the little town of Woburn discreetly hides, like modest Rachael—all but the old church, which too boldly perhaps lets itself be seen, as does the spire of the new one, which the duke himself erected at great cost, immediately without the park gates. In the foreground of this splendid scene, across the bold sweeps of grass, fallow deer come nibbling up towards the house unconsciously playing an appropriate part.

The gardens at Woburn Abbey were described in 1833 by the gardener of that time, Mr. James Forbes, in his *Hortus Woburnensis*, dedicated to the Duke of Bedford. Four remarkable books, now scarce and costly, two of them by the Duke himself, the others by his famous gardeners, Sinclair and Forbes, testify to the useful patronage which the owners of Woburn have long extended to the arts of agriculture, forestry, and botany. John, Duke of Bedford, the great patron of agriculture, was also famous as a planter. The park owes to him the "Evergreens," a plantation of 100 acres on the Woburn and Athmill Road, which he planted in 1743, and thinned at the proper time, in spite of his gardener, who, on receiving directions as to the thinning, replied, "Your grace must pardon me if I humbly remonstrate against your orders; but I cannot possibly do what you desire, since it would destroy the young plantation, and seriously injure my reputation as a planter." The Duke replied, "Do as I desire you, and I will take care of your reputation;" and as soon as the thinning had been effected, he had a board fixed by the roadside, on which the following notice was written:—"This plantation has been thinned by John,

Duke of Bedford, contrary to the advice and opinion of his gardener."

The next Duke John, the author of *Pinetum Woburnense*, and *Salicium Woburnense*, says in the former that his love for Conifers was a hereditary taste. It induced him to form a Pinetum in the pleasure grounds, which rivalled the collection at Dropmore. The ducal work is magnificently illustrated, and contains descriptions of most of the exotic Conifers which were introduced up to 1839.

In *Hortus Woburnensis* Mr. Forbes describes the gardens, which contained 6000 plants best adapted for culture in the greenhouse, stove, pleasure-ground, or flower-garden. Woburn owes much of its picturesque beauty to the skill of Repton in grouping the plantations, altering the form of the great sheet of water before the windows, and planting the slopes beyond. The pleasure grounds, however, were formed by one of the most remarkable and accomplished ladies of the family, a member of that noble race of Gordons whose statues and memorials remain in Strathspye, where the celebrated Duchess of Gordon raised her regiments at the period of George III.'s great wars. She was the duchess of the great agriculturist, John, Duke of Bedford, early in the century. A pleasing memorial exists in the double-flowering Thorn tree planted in her private garden, and formed by close clipping into an arbour, paved with pebbles, and having an arched entrance and arboral windows. At present some private rooms open into this retired retreat, which has not been altered, and could not, I think, be easily improved. Roses, Honeysuckles, Jasmynes, and Ivy are trained on ornamental trellises; simplicity and perfect elegance prevail; there are graceful curves and attractive corners, and the lawn is delightfully soft. It is a small garden, yet endless in appearance, through the concealment of the outer fence by evergreens and groups of trailers.

The parterres in front of the sculpture gallery come next in order as you pass from the south front along the colonnade to the pleasure grounds. They are laid out in the older, but not the oldest style, consisting of a lawn with gravel walks, and many beds edged with close clipped Box. Within the gallery are the "Three Graces," by Canova, a group which was executed for the Duke of Bedford at a cost of £15,000, standing on an antique pedestal, and placed in a secure recess which is appropriately paved with marble from the Duke's Devonshire estate. In the garden outside are Westminster's bronze statues, the Dying and the Fighting Gladiators, and Silenus nursing Bacchus.

The attractive beds of Heaths, mixed with a few plants of Pampas grass in the foreground of the pleasure garden, remind one of another of the Woburn Abbey series of horticultural works, the illustrated *Hortus Eric. Woburn.*, which was printed for private distribution in 1825, the work being illustrated with costly engravings of the Heaths in the adjoining Heath-house, an extensive building 100 feet long. The hardy Heath garden, designed by Mr. Sinclair, is kept up in perfection, and numerous as the hardy species of Erica, Calluna and Menziesia, as well as Empetrum and Hudsonia, are strangely overlooked as ornaments of gardens. I may here allude to them as a characteristic novelty always admirable, and especially in August and throughout the winter. An avenue of Araucarias, a quarter of a mile long, is notable in this part of the pleasure grounds. Many of the salient features of the period of Duke John, the great horticulturist, remain in the grounds immediately surrounding the Abbey; others have been swept away in recent years, including the "Grass Garden," which contained 400 species of grasses, each growing in a plot bordered with cast iron edgings. The Arboretum and

Pinetum, and the trial ground of the Willows, have also been dispensed with.

A conservatory, Camellia-house, and other greenhouses are easily accessible from this point, as well as the tennis-court, stable, and riding-house. Near the buildings, in a recessed part of an extensive lawn, is a pond with a cool and costly grotto near it, and a Chinese dairy on the margin, paved with marble, having old and valuable china and porcelain instead of the customary dairy utensils. *H. Evershed.*

(To be continued.)

New Garden Plants.

BRASSIA ELEGANTULA, n. sp.*

THIS small-flowered Brassia has exceedingly stiff glaucous, uneale ligulate acute leaves, and a glaucous, rather small bulb. Its inflorescence is a raceme of few (two to five) flowers. The bracts are very large, triangular, not equal to the stalked ovaries. The sepals are spreading, the lateral ones deflexed, all green with brown transverse bars. Lip oblong, apiculate, with two longitudinal keels at the base, hairy inside. The colour of the lip is white, with a few small, brown-purple dots in front of the calli. It is bent in the middle, the keels being found in the hollow under the stigma. The column is quite wingless, brown and green.

I had this first—a very fine plant—from Mr. F. Sander, who stated that it is of Mexican origin, which surprised me. As it is the habit of many modern packing employes not to pack flowers, but to throw them into an empty box, as if they were hail-shot, the flowers came broken and the bud did not expand. It was a most agreeable surprise to get from Herr Oberhofgärtner H. Wendland, at Herrenhausen, near Hanover, a very fine five-flowered inflorescence, packed neatly, first in paper then in sphagnum. This is also of Sanderson origin. Now I can describe the plant. The really elegant thing is near to Brassia chlorops, Rehb. f., which has a one-sided inflorescence, a very narrow green lip, and adventitious acute calli in front of the keels. This I have only received once, and then from Messrs. J. Veitch & Sons. *H. G. Rehb. f.*

HOYA LONGIFOLIA (WALL.)

VAR. SHEPHERDII, N. E. BR.

THIS is the beautiful Hoya figured in the *Bot. Mag.*, at t. 5260, under the name of H. Shepherdii, Hook., which is placed by Sir Joseph Hooker in the *Flora of British India*, vol. iv., p. 57, as a doubtful synonym of *H. longifolia*. The leaves are certainly much narrower and longer than those of *H. longifolia*; but there appears to me no difference in the flowers. It is true that no type specimen of *H. Shepherdii* is preserved in the Kew herbarium, nor have I seen flowers of the plant here figured; but on comparing our illustration (fig. 149) with the plate in the *Bot. Mag.*, it becomes quite evident that they represent the same species, and in the Kew herbarium are wild specimens, collected in Khasia and Sikkim, of what is certainly the same plant, and I am unable to distinguish the flowers of these in the dried state from those of *H. longifolia*, and therefore place this plant for the present as a variety of that species. The specimen from which fig. 149 was engraved was kindly communicated by Mr. G. W. Cummins, gardener to Mr. A. H. Smee, and to him I am also indebted for a specimen (unfortunately without flowers) for the purpose of description. It appears to be a rare plant in cultivation; not only is this attested by the fact that there are no cultivated specimens of it preserved in the Kew herbarium, but also by the statement of Mr. Cummins, who writes me as follows:—"It seems strange to me that although many gardeners, &c.,

* *Brassia elegantula*, n. sp.—Aff. *Brassia chloropis*, Endr. & Rehb. l.; racemo quaqueverso; bracteis spatulatis triangularibus; ovario pedicellato non squamibus; sepalis impari semilanceo sepalis lateribus aequalibus deflexis; tepalis subequalibus arcuatis brevioribus, latello oblongo apiculato nunc obscurissime lateribus lobato, antice reflexo, superiori parte cum carinis suis in ovularum partem excavatam infrastigmaticam impressis, carinis geminis in basi antice inflexis, inter se puberulo velutinis; Oncidium elegantum. Planta climatica. Folia a cili. mercatore Albanensi F. Sander. *H. G. Rehb. f.*

visit this garden, no one has remembered seeing it elsewhere. In my opinion it deserves quite as prominent a position in any collection as the beautiful little *Hoya bella*; it flowers from the axil of nearly every leaf." The following is a description of the plant:—

Stem climbing, glabrous, as are also the leaves, peduncles, and pedicels. Leaves pendulous, 5—7 inches long, $\frac{1}{2}$ inch broad, linear or narrow linear-oblongate, acute, tapering at the base, where they make an obtuse angle with the $\frac{1}{2}$ —1 inch long terete petioles, fleshy, channelled down the bright green face, obtusely keeled down the paler green under-surface, which is mottled with brownish patches. Peduncles rather short. Umbels many-flowered,

ORCHIDS IN FLOWER AT MR. BULL'S NURSERY.

We do not find any great number of Orchids belonging to different genera in bloom at this season of the year, so that we are the more gratified with the few that do enliven the houses. Foremost among these, especially when seen in clumps or large pots, when the mass is of various shades of pink, is *Oncidium ornithorychum*. These plants are in full bloom at this period and onward, and few things are more choice for occasional use in the dwelling as a dinner-table object. Several plants of *Barkeria Skinneri* and *B. elegans rosea* were also furnished with their cheerful spikes of flowers. Such easily managed winter bloomers ought

white flowers of waxlike consistency. A *Vanda Sanderiana* has eighteen fine large flowers, and a *Saccolabium Blumei* var. *pulchra*, the flower-spike of which, although only about 8 inches in length, indicates what a fine thing a large specimen in flower would be. It is almost white, the lilac tinge being of the faintest.

Of *Cattleyas* few are now in flower, but those in the large house, viz.:—*C. Trianae*, *C. Skinneri*, and *C. Meodelii*, are showing abundant sheaths. The very dwarf-growing *C. luteola*, with blooms yellow and green, was in flower, in a house where *Saracenia* were resting, where we likewise found *Ceoloyne cristata alba*, snow-white, a great acquisition where flowers of the kind are in request. The new *Angra-*

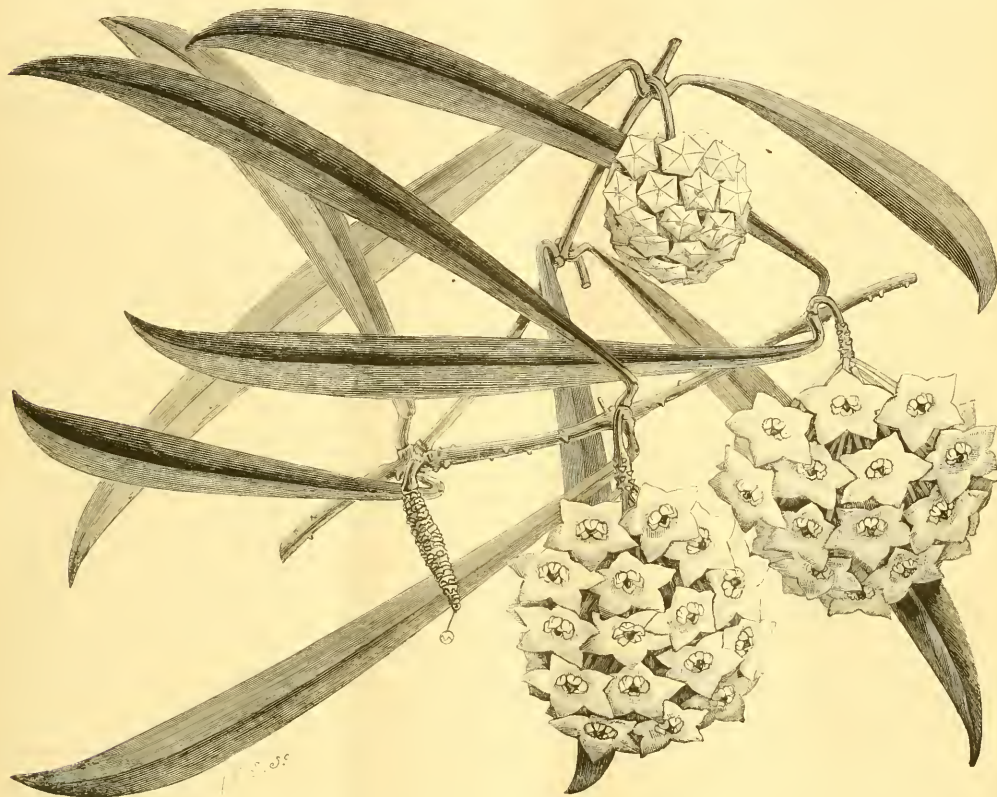

FIG. 140.—HOYA LONGIFOLIA, VAR. SHEPHERDII; FLOWERS PALE PINK.

pedicels $\frac{1}{2}$ —1 inch long. Calyx lobes small, ovate obtuse. Corolla rotate, $\frac{1}{4}$ inch in diameter, pale flesh-coloured, glabrous outside, puberulous inside on the broadly ovate lobes. *N. E. Brown.*

EUCALYPTS.—At the Linnean Society on November 5 there was shown for the Baron von Mueller a characteristic collection of skeleton leaves of species of *Eucalyptus* prepared by Mrs. Lewellin, of Melbourne. These confirm Baron von Mueller's observations as to definite layers and the relation of these to the skeletonising process. The leaves in decaying produce no bad odour. Mueller's observations do not support Mr. Riviere's statement that the Bamboo is as good as *Eucalypts* to subdue malaria; the former dry up, but do not exhale the volatile oil, as do the latter, and the *Eucalypts*, moreover, absorb moisture as quickly as Willows, Poplars, and Bamboos.

to be in every collection of plants. *Cymbidium giganteum* was in flower in several instances, as was *C. Mastersii*, with pure white blooms, desirable as being earlier than *C. eburneum*. Those charming *Pleione* *Birmaniana*, rose-coloured, and *P. maculata*, white, with crimson spots on the white ground of the lip, that is pouting and frilled elegantly, were grouped together in one of the houses. In close proximity were *Lycaste Deppelii*, showing a large mass of pale cream blooms on a comparatively small plant; and *Phaleopsis Dayana*, showing a bloom or two of pure white; another white flower was *Dendrobium infundibulum*.

The *Cypripediums* were beginning to show a few flowers here and there, such as *C. Sedeni*, *C. calurum*, good strains of *C. Lawrenceanum*, *C. Spicerianum*, *C. Asbartoixii*, a pretty form of *C. barbatum*, named *pulchrum*, quite distinct. The rare and beautiful *Aerides Lawrenceana*, a small plant, is carrying a small spike of its sweet-scented rose and

cum Leonis, a small plant, was carrying one fair-sized bloom: this is also of purest white.

In a house filled with plants of *Odontoglossum crispum* just a few spikes of flowers were visible, and plenty of promise for the future. A few *O. vexillarium rubellum* were flowering, and of *Masdevallia tovarensis* many, some few *M. trochilus*, *M. corniculata*, and *M. Shuttleworthii*. The fragrant *Trichopilia fragrans*, and *T. nobilis* were in bloom, emitting a most agreeable odour.

Odontoglossum grande, a fine old plant, was showing quantities of its big, bold, yellow and brown flowers; *O. leopardinum*, with dark brown sepals and petals barred with green, the crest orange; *O. Rossi majus*, *O. bipharcantum*, an astral form, with thin narrow petals and sepals brown spotted, pretty and useful as an early flowerer; the old *O. bictonense roseum*, and *O. b. album*, were both exhibiting some few blooms; as was *O. Forbesii*, so remarkable for the

richness of its tints; *O. madrense*, an Ecuador species, white with a purple stain. Of *Ocoidium*s, were *O. pratense* (a beauty in brown), *O. concolor*, and the minute *O. ceterophorum*. The graceful *Dendrochilum Cobbiacum* was prettily in bloom in various houses, and showed much difference of size. Many examples of *Lælia autumnalis atrovirens* were in bloom, forming a most welcome bit of lively colour amongst white flowers. *L. autumnalis* was stoced in proximity, to show the improvement in colour in the first named.

A plant of the deep golden-yellow flowered *Mormodendron pardiun* unicolor was in flower; the spike is large and massive, and deliciously scented.

THE MANURIAL VALUE OF FRESHLY FALLEN LEAVES.

OUR knowledge regarding the manurial value of fallen leaves has recently been added to by Professor Emmerling and others, in a communication contributed to the current number of the *Bied. Centr.*, 1885.

The results are given in the following tables:—

PERCENTAGE COMPOSITION.

	Grey Poplar (cassene).	White Willow (Salix alba).	Silver Poplar (L. genetica).	Silver Birch (Betula alba).	Sycamore (A. ulmo-laburnum).	Common Alder (Alnus glutinosa).	Oak (Quercus robur).	Beech (Fagus sylvatica).	Hornbeam (Carpinus betulus).
Water	20.88	20.27	18.34	15.73	17.74	17.06	17.73	15.35	17.02

PRINCIPAL CONSTITUENTS IN THE ASH—PER CENT.

Potash	14.79	21.60	20.31	12.73	14.30	7.87	12.02	10.55	10.95
Soda	7.93	7.61	4.74	4.43	2.56	2.47	3.85	5.41	3.57
Lime	24.69	27.10	26.57	31.75	30.86	45.03	27.18	22.12	23.84
Magnesia	9.39	6.38	7.39	24.38	6.95	10.70	8.85	6.24	10.65
Phosphoric acid	4.97	7.36	5.37	3.18	2.44	5.53	4.05	4.72	5.84
Sulphuric acid	5.07	13.37	8.46	3.81	3.10	5.76	3.43	3.85	4.31
Silica	23.95	5.49	21.34	3.37	32.05	10.93	22.97	32.58	13.76

A glance at these figures will show the immense variation in the constituents, and consequently in the manurial value, of different plant leaves, but it must be remembered that a few analyses of plants or their separate organs do not suffice to decide what kind and what amount of plant food a crop needs, and still less in what combination they produce the best effect; they simply tell what kind and amount the plant under examination contains at that particular moment. It is a well established fact that the same variety of plants, whether raised upon different kinds of soil or upon the same soils of a varying degree of richness, may contain a widely differing absolute amount of the same kind of organic "volatile" and inorganic "fixed" constituents.

It appears that about 3000 lb. of perfectly dry Pine timber are produced with a consumption of only 2½ lb. of potash and 1 lb. of phosphoric acid per acre per annum; with Beech trees the quantities required are rather larger. The growth of trees and shrubs, therefore, plainly less exhaustive to the soil than ordinary garden culture. The demand on the soil becomes, moreover, considerably greater if all the fallen leaves are removed. J. J. W.

THE AMERICAN POMOLOGICAL SOCIETY.—Colonel WILDER, now in his eighty-eighth year, has issued his annual address to the Society, in which he reviews the work of the year, and makes suggestions as to the future work of the Society, the reform of nomenclature, and the raising of new fruits. The address is in the old strain of enthusiastic eloquence, and we cannot doubt that the words of wisdom and encouragement he has uttered will bear fruit in the way the venerable President would wish, and tend towards the advance of pomology and the welfare of mankind.

EIGHT DAYS IN THE GARDEN OF ENGLAND.

(Continued from p. 557.)

THE daylight was fast waning as we passed the spink like pile of Vixen Tor, and the red Dartmoor cattle turned homeward towards Tavistock without the aid of a herdsman, separating themselves as they turned off to their respective homesteads, when a glimpse of Tavistock at the foot of the hill made us think ourselves happily near our destination. Alas! with Will-o'-the-wisp-like delusiveness Tavistock proved further and further off, and it was quite dark when we reached the Bedford Hotel, where we were informed that we had just missed the local flower show, and that the heavy rain we had experienced up on the moor had only been represented at Tavistock by a few slight showers.

TAVISTOCK.

Viewing our position by daylight, we found ourselves literally in the middle of a Benedictine abbey. The hotel stands on the site of the chapter-house; in front is the church with a fragment of the cloister in

Brent Tor. Arrived at Lydford Junction we walked about a mile to the house of Daniel Radford, Esq., in whose grounds this remarkable natural phenomenon is situated, and by whom we were most hospitably provided with luncheon. The house and garden are but newly established; but specimens of *Cypripus*, *C. macrocarpa*, *Escallonia rubra*, and other shrubs promise well in this favourable situation. Here, again, we found that bush fruit only had yielded anything like a crop this year; but Mr. Radford had a good show of Grapes, though grown from the old wood.

The attractive feature of the grounds, however, is the gorge—a narrow fissure in the live rock, from 15 to 40 feet or more in width above, and 30 to 40 feet in depth, at the bottom of which brawls the swift torrent of the Lyd, in places only 3 or 4 feet across, the sloping upper part of its sides planted with trees. It is in the main a perpendicular cleft in the dark greenish-grey and black slaty rocks, partially draped with Haat's-tongue and other Ferns, access having been made to its inmost recesses by a ledge of path and steps about a foot wide that has been cut for over a mile along one face of the ravine. At one point the high road crosses the cleft by a stone arch that, according to an apocryphal legend replaced a wooden one, the casual breaking down of which was the necessitating cause of one of the many Smuggler's Leaps of our south coast. What a smuggler was doing at a spot so far inland does not appear; but the leap, though a nervous one, would be by no means impossible. The water, leaping in a series of cascades into a circular basin nearly 20 feet across, whose arched roof speaks of the excavating power of its swirling motion, dashes along its narrow course in an amber stream, breaking into foam at the corners, where it is hollowing out pot-holes, until, beyond Mr. Radford's estate, it leaps over the 100-foot cascade that is said to be the finest in the South of England. After an exceptionally dry season, this sliding stream of white foam—for it is not strictly a fall—coming without any particular force over a bare ledge of reddish-grey rocks in the middle of a wooded valley, was disappointing. There are dozens of better falls in the Lake country; but comparisons are odious.

Without lingering to examine the scanty remains of Lydford Castle, or the church of the parish that, including Dartmoor, is the largest and the most thinly populated in the county, having less than 3000 souls to its 55,000 acres, we "made tracks" for Brent Tor. The three-mile walk from Lydford station to the volcano was not of particular interest. Lydford being about 660 feet above sea-level, and the summit of the Tor 1114, it involves an ascent of 450 feet, about half of which is included in the last quarter of a mile. Misled by guide books we were anatomising the vagaries of Devonshire arrangements that put inns five miles or more apart on Dartmoor, and placed the "Herring Arms" and the "Stag's Head" within a stone's-throw of one another below Brent Tor, when we discovered that the latter, where the key of the church is kept, is merely a house, quaintly so named, and no inn. Close by is a manganese mine that has had a chequered prosperity, the ore from the 30-fathom shaft of which seemed, however, to be of fine quality.

The climb up the absolutely treeless hill is a stiff one, but the view from the churchyard at the summit amply repays one for the trouble. The conical mass of basalt, pumice, and scoria, cannot, it seems, be truly considered as an entire volcano in miniature; but apparently the burnt appearance of its rocks gave it the name of Brent and suggested to the Normans that it might be well to curb any fiery evil spirits beneath by placing a church dedicated to St. Michael on the hill-top. This unpretentious edifice, the chief scene of Mr. Baring Gould's weird tale of "Margaret Gwithier," published in the *Cornhill Magazine* for 1884, is 40 feet long and 14 in width. One bell having fallen, the rest have been removed, and the belfry tower, which is separated by but one single stone from the precipitous scarp of the hill, has been boarded up. Service is, however, performed regularly in the white-washed interior and in the summer many people drive to it, whilst the sexton bore witness to various recent marriages, and the tombstones to recent burials, at this inconveniently "high" church. Wild Thyme grew on the ledges of the rock, and *Asplenium Adiantum-nigrum* in its crevices; to the east stretched a panorama of western Dartmoor; whilst in the distance, in other directions, rose Brown

LIDFORD AND BRENT TOR.

Our destination on this day was the strangely beautiful gorge of the river Lyd and the volcano of

Willy, and many another Cornish hill, surmounted by chimney-shaft after chimney-shaft.

After tea at the "Stag's Head" we walked to Mary Tavy Station, noting *Erica tetralix* and plenty of *Blechnum on route*, and also that the outermost of some Larch plantations had suffered much on their windward side; and, on our arrival once more at our Tavistock hotel, though days spent in the open air are conducive to drowsiness, we beguiled an hour or two with the local guide-book (by a lady), containing a list of the "Botanical Plants of Dartmoor," and at least one autograph pencil note by Douglas Jerrold. The lady describing how a shower of rain damped the ardour of a party of archeologists discussing the Roman or Grecian origin of some remains, Jerrold writes, "It washed all the grease out of us."

(To be continued.)

AMERICAN FLORICULTURE.

THESE are, it was stated by the President at the recent convention of the Society of American Florists, not fewer than 8000 florists engaged in the business, either growing plants or raising cut flowers for sale. Allowing 400 feet of glass-covered surface to each florist, gives us a total of 3,200,000 square feet; in other words, 630 acres. Calculating that half of the glass structures are used for growing plants, and that one-third of the space is actually covered with them, and averaging the size of pots used at 3 inches diameter, and allowing two crops each year, the number of plants would be about 10,000,000.

The remaining half of the glass structures are used for the purpose of growing cut flowers; the actual number produced is almost incredible. I can state, however, that during the past season—beginning with November and ending with April—nine large growers of Roses sent into the New York market close upon 4,000,000 of flowers, and when I state that this was not 50 per cent. of the Roses sent to New York alone, the magnitude of Rose growing will be imagined. The Roses grown around Boston, Philadelphia, Pittsburg, Cleveland, Chicago, Washington, and all other places, could not be less than twice as many as were produced for the New York market. This would bring up the number of cut Roses produced during the past season to 24,000,000. It would be very safe to multiply the number of Carnation flowers produced in the same time from all sources by at least five; this would give 125,000,000. Fabulous as this may seem, I feel that my calculations are rather under than over the actual number placed in the market. It would, moreover, be very safe to state that at least one-fourth as many Roses and Carnations are annually raised by gentlemen for their own enjoyment, which represents as much value as if thrown on the market and sold over the counter. Of various other flowers, though not in the same proportion, there are produced many millions.

THE bulb trade, the bulk of which is represented by importation, has grown to be a source of great value to the business, and as there is a duty of 20 per cent. on all bulbs imported, it is a source of revenue to the country also; and, while I have no actual data to make a close estimate of the value imported last season, it is safe to say that not less than 200,000 dollars' worth were actually imported in the last twelve months—the bulk of these being Hyacinths and Tulips, more than one-half being used to force cut flowers; this does not include more than 5,000,000 of Lilies of the Valley, which are not dutiable.

THUS far I have not said anything about a very important branch of the business, or those engaged in it. I refer to that branch known as the florists' supplies and requisites, which has grown to be a most important factor in the trade. The number engaged is estimated at 700. The most important articles are shapes for floral designs, such as ornamental baskets, vases in glass and porcelain, and other wares; wire work, holders for bouquets, tinfoil, wire for stemming, different papers for packing and wrapping flowers, and other articles used in the business. The actual amount of capital invested in this branch of our business is in the aggregate many hundreds of thousands of dollars, employing more labour in proportion than does the florist proper, paying in many cases enormous rents for their accommodation. Most of those engaged in this branch have other business relations, either as seedsmen or dealers in bulbs or cut-flowers. Then we have the army of cut-flower men, those who are not producers, but make a business entirely of

selling flowers, either made into shapes or loosely. This is a growing branch, and to-day there are not less than 2000 employed in it.

THE land occupied with flowering plants and bulbs of all kinds scattered over the country must aggregate at least 12,000 acres, in addition to several thousand acres used for growing flower-seeds. This is accounting only for land so occupied in America. It would not be too much to say that fully half as much land in Europe is also used in the same manner for the American trade. In addition to this there is nearly as much area of land, and as much glass, and more than half as much labour devoted to the cultivation of flowers by gentlemen who can make a pleasure of so doing; yet, with all this, the florists and gentlemen growers of America have been unrepresented by any organisation until the Society of American Florists was established. Just think of an industry of such magnitude without a voice or a word in its own interest!

TELPHERAGE.

ON THE 17th ult., the first line for the conveyance of goods by the electrical system invented by the late Professor Fleming Jenkin, and entitled "Telpherage," was formally opened at Glynde, near Lewes. The system was fully described in a paper read before the Society by the inventor on May 14, 1884, but the details have been somewhat modified since that date. The line is a double one, nearly a mile in length, and is composed of two sets of steel rods, three-quarters of an inch in diameter, supported on wooden posts of T-shape, and about 18 feet high. The wires are supported one on either end of the cross-piece of the T, which is 8 feet long. The carriers, or skips, as they are technically termed, are iron trough-shaped buckets, each holding about 2 cwt., and suspended from the line by a light iron frame, at the upper end of which is a pair of grooved wheels running on the line of rods. A train is made up of ten of these skips, which are in electrical connection with each other, and with an electrical motor which is placed in the middle of the train, having five skips in front of and five behind it. At a point about midway of the length of the line is the engine-house, in which is a steam-engine which drives the dynamo. From these latter the current is led to the line, and thus to the electrical motor which moves the train. The use to which the line is put is to carry clay from a pit to the Glynde railway siding, whence it is delivered into trucks, and transported by rail to the works of the Newhaven Cement Company. At the charging end of the telpher line the skips are loaded each with about 2 cwt. of clay, the train thus carrying 1 ton. A labourer, by touching a key, starts the train, which travels at a speed of from four to five miles an hour along the overhead line to the Glynde station. Arrived there another labourer upssets each skip as it passes over a railway truck, into which the clay is thus loaded. This upsetting, however, is eventually to be performed automatically by means of a lever on each skip, which will come in contact with a projecting arm as it passes over the truck. *Journal of the Society of Arts.*

FERNFIELD, BRIDGE OF ALLAN.

THIS small but marvellous collection of rare Orchids is well worth a long pilgrimage to see, even at this season, for if you arrive cold the Doctor will see to it that you are properly dispensed for. The following, although not a complete list of those in bloom, or coming into bloom, includes the more important species, the varieties of which have been selected with the greatest care. Dr. Paterson believes in cool treatment throughout; the three or four compartments into which his range of Orchid-houses is divided, Indian, Brazilian, Mexican, and numerous species from the South American Andes, are all throughout well grown in a temperature in which a weak-throated person can delight, and where the strong could take no harm. There are a few Indian species, such as *Phalenopsis grandiflora*, *P. amabilis*, &c., also various *Ascocolumbium*, *Aërides*, and many others which could be named that are found from experience not to succeed here. A list of such as are grown would be a valuable and safe guide to many amateurs and others, seeing that those only are grown which succeed:—

- Odontoglossum Uro-Skinnei, very large and deep in colour.
 - Pleione lageneria, flowers larger and higher coloured than usual.
 - .. Reichenbachiana.
 - .. maculata.
 - Oncidium tigrinum, labellum large.
 - Odontoglossum Rossi majus, a grand form of it.
 - .. grande.
 - .. madrense (maxill. r.).
 - .. various plants of crispum (Alexandre); on one strong spike we counted six lateral branches, on another twenty flowers.
 - Epidendrum vitellinum, a grand specimen.
 - Various *Mastelias*, M. Davisii and M. Veitchii being in fine form.
 - Cypripedium were also varied, the best being *C. marginatum* (*Speierianum magnificum*), and the true *C. Maulei*.
 - Cattleya marginata, a bright coloured form.
 - .. maxima, with two spikes.
 - Maxillaria lepidota.
 - Mitonia Moreliana var. atrovirens.
 - Stenia fimbriata.
 - Promeneia citrina.
 - Sarcanthus terebinthifolius?
 - A beautiful seedling Zygopetalum, with deeply coloured sepals, and a beautifully marked labellum, looks as if it might be intermediate between *Z. maxillaria* and *Z. Maclayi*.
 - Coleogyne ocellata var. maxima, showing four spikes.
 - .. barbata, five spikes.
 - Vanda tricolor, Dalketh variety.
 - .. corulea, Burford Lodge variety, enormous blooms.
 - .. Cathcartii, 5 feet high, showing three fine long spikes.
 - Cymbidium elegans, with five large partially pendulous spikes of lemon-coloured flowers, exceedingly fine.
- Robert Eullen.

THE GENUS ODONTOGLOSSUM.

(Continued from p. 589.)

ODONTOGLASSUM CRISPUM SCHROEDERIANUM.—I hardly know whether this grand and distinct *Odontoglossum* should be put with the crispums, as it shows so many strange features, the profusely maroon-spotted lip especially being so unlike any other. The sepals and petals are white, profusely blotched with purplish-crimson. This very lovely variety was awarded a First-class Certificate when Baron Schroeder sent it to the Royal Horticultural Society in January, 1885.

O. C. GOLDINGIANUM.—A superb variety, with finely-formed, broad-petalled flowers; sepals and petals snow-white, lip chestnut edged with white, column dark purple.—R. H. Measures, Esq., Streatham.

O. C. AUREUM.—This is a very charming plant, with all the characteristics of an ordinary crispum, except that its flowers are soft canary-yellow instead of white; the sepals are spotted with reddish-brown. F. A. Philbrick, Esq., was awarded a First-class Certificate for it at the Royal Horticultural Society in February, 1884.

O. C. AUREUM MAGNIFICUM flowered with Mr. Dorman. It has a white ground, edged with light yellow, and having reddish-brown spots. A very distinct plant, with a light trace of *O. Andersonianum* in it.

O. C. FLAVOLUM is another bright light yellow variety; it is unspotted, and can only be called a good yellow crispum. The best form I have seen is with George Hardy, Esq., at Timperley.

O. C. LEHMANNI is a curious and pretty small-flowered variety, intermediate in form between *O. crispum* and *O. Pescatorei*.

The following varieties seem nearer to *O. crispum* than to any other species:—

O. MEASURESIANUM.—This exquisite thing is as puzzling as it is beautiful. It is certainly one of the best marked *Odontoglossums*; in general appearance like *O. Pollettianum*, but by the column and crest much nearer to *crispum* than that variety. *O. Measuresianum* has flowers of medium size with the greater part of their surface blotched and spotted with a bright vinous crimson. The ground colour is white shaded with rose. When this handsome variety gets strong it will prove wonderfully beautiful and distinct. It flowered with R. H. Measures, Esq., of Streatham.

O. HOESMANNI.—This rare variety is very handsome; its flowers have a white ground changing to pale yellow, sepals and petals richly blotched with bright red. It was named after Mr. Fred. Hoersman, of Colchester, who collected it.

O. SHUTTLEWORTHII.—This is a superb kind, in form a decided pure white-grounded crispum, with the pretty brown markings which give it at first glance the appearance of Wilkecanum albens. Its column and crest differ slightly from crispum. Messrs. Shuttleworth, Carder & Co. were the lucky importers of it, and they received a First-class Certificate for it at the Royal Horticultural Society, April, 1884.

O. CHESTERTONI.—This plant, which was named after the late J. H. Chesterton, the botanical collector, was awarded a First-class Certificate at the Royal Horticultural Society in March, 1876. The true variety, such as that now at Baron Schroeder's, has medium sized, rather curled flowers, white, changing to pale yellow, and prettily marked with reddish-brown.

O. PRIONOPETALON.—This is one of the grandest of Odontoglossums, and it appears to bear traces of *O. triumphans* or a finely formed *O. crispum*. Flowers very large, cream-coloured on a primrose ground, heavily barred with bright chestnut. The peculiarity of the variety is the enlargement of the petals and their saw-like edges. Sir Trevor Lawrence first flowered it, and still has the very best variety.

O. SCOTTI is something like *O. prionopetalum*, having also jagged-edged petals, but more irregularly marked. The crest bears traces of *O. Hallii*. It is moreover a grand variety. It was exhibited by G. F. Wilson, Esq., of Heatherbank, Weybridge, and received a First-class Certificate at the Royal Horticultural Society, February, 1883.

O. EUGENES.—This grand Orchid should perhaps have been placed next to *O. excellens*, a glance at which at p. 241 will give a good idea of its loveliness. *O. eugenes* has pale yellow sepals and petals marked with bright reddish-brown, lip white, with yellow and crimson at the base. It is said to be a *Pescatorei* hybrid, but it might easily be out of crispum by the lip and column. Mr. Stevens, of Trentham, was awarded a First-class Certificate for it at the Royal Horticultural Society, July, 1883.

O. MACROSPILUM.—I think this is close on *O. crispum*, although it has a suspicion of *O. Andersonianum*. It has large flowers, with sepals and petals of a firm texture, creamy-white to light sulphur, spotted with dark cinnamon. It is very attractive. One of Mr. E. S. Williams' introductions. *James O'Brien*.

(To be continued.)

A COMMON EDIBLE MUSHROOM.

AGARICUS ODORUS, Bull.—At p. 460 a description and illustration are given of an edible Mushroom named *Agaricus rubescens*, P. The plant now before us, *Agaricus (Clitocybe) odorus*, B., is, in comparison with *A. rubescens*, P., very simple in structure. With a slight amount of observation it is impossible to mistake it for any other species.

Agaricus odorus, of Bulliard, grows in woods; it is common in Fir plantations amongst Fir needles (see base of stem). Unlike *A. rubescens*, P., *A. odorus*, Bull, has neither volva at the base, collar round the middle of the stem, or patches on the top. The gills are adaxial, or slightly decurrent, that is, the gills touch the stem, and run very slightly down it (see section). The stem is generally sub-bulbous. The top or pileus is not viscid; it is dull bluish-green, or dirty green in colour, the solid or stuffed stem and gills are whitish, pallid, or very pale dull green. *A. odorus* is highly fragrant; it smells strongly of almonds, Mellilot, Aniseed, new mown hay, or Meadow-sweet. The plant may often be detected by its odour some time before it is seen, and the pleasant fragrance remains with the fungus a long time after it has been dried. The spores are white, and when magnified 500 diameters, are seen as on the left of the illustration (fig. 141.)

In cooking *A. odorus* it is only necessary to remove any dirt and cut and fry in butter, or with meat, in the style of preparing the common Mushroom for the table. The flesh is very tender, with a taste slightly suggestive of its enticing odour. A taste may soon be acquired for the delicious and novel flavour of this *Agaric*.

There are several other bluish or dull green *Agarics*, as *A. virosus*, Fries—this has an offensive fetid odour; *A. eruginosus*, Curtis, this at first has a viscid, sometimes scaly top, the stem is hollow and has a collar, and the gills are deepish brown or purple-brown in colour. It has a disagreeable smell.

Allied to this are *A. Worthingtonii*, Fries, and *A. albo-cyanus*, Desm. *Agaricus nudus*, Bulliard, is a large species, and not ascended.

Some edible species of *Russula* are greenish, as *Russula virescens*, Fries, and *R. heterophylla*, Fr.; neither are fragrant.

The large subgenus to which *A. odorus* belongs—viz., *Clitocybe*—is an eminently safe one. It is probable that nearly all the species are either edible or non-poisonous. There is an edible ally in *Agaricus fragras*, Sow. It grows in woods, is much like *A. odorus* in its forms and parts, but is pallid white in colour. It is fragrant, but not to such a high degree as *A. odorus*, Bull. Several other species of *Clitocybe* are faintly scented and edible. *W. G. Smith*.

A GREAT ORCHID SALE.

THE disposal by auction of the superb collection of Orchids of the late Mrs. M. J. Morgan, of New York, and who had selected the very choicest varieties, has, says the *American Florist*, made one of the most important distributions in American floriculture. Many lots went for less than a quarter of their value, yet when we consider how much spirit was displayed in bidding and the very fair prices

Court, representing Veitch & Sons, London, England; and E. McKenzie, representing Sander & Sons, St. Albans, England.

The most important purchases made by Mr. Court were *Atrides expansum* Leonis, 70 dols.; *Atrides Veitchii*, 35 dols.; *Cattleya Skinneri* alba, the best plant in cultivation, 200 dols.; *Cattleya* sp., 80 dols.; *Cattleya Dominiana*, 55 dols.; *Cattleya labiata*, 90 dols.; *Cattleya Masteriana*, 90 dols.; two *Cattleya fausta* delicata, 145 dols.; *Cypripedium Mergaioianum*, a hybrid of Messrs. Veitch, and which was presented by them to Mrs. Morgan, 750 dols. This is the largest plant in cultivation, there being only a very few of any size. When this plant was offered a severe stillness pervaded the room. As was expected, a severe fight was made for it. Mr. Kimball started with 100 dols., he and Mr. Grey, Mr. Corning's gr., bidding by 50 dols. up to 500 dols.; Mr. Court and Mr. McKenzie then fought until the plant was sold to Mr. Court for 750 dols. Applause followed the purchase. The plant would have been purchased by Mr. Court even if the price had reached 1500 dols. The next important purchase by Mr. Court was *Cypripedium Stonei* platyneurum, 450 dols.; C. Fairrieanum, 100 dols.; and many other very rare plants.

Mr. McKenzie, for Messrs. Sander, purchased

FIG. 141.—AGARICUS ODORUS, BULLIARDI.

obtained, it goes to prove that the love for Orchids is much stronger than ever. We have to admit that the plants did not realise their full value, taking into account prices obtained for such like plants in Europe. The collection cost in the neighbourhood of 200,000 dols. The total amount of the sale was about 22,000 dols. This is, of course, a great sacrifice, and may be accounted for in various ways. Many of the plants were purchased when there was not more than a dozen of each to be had at any cost, since which time importations of large quantities has reduced the value; again, there are but very few trade collections of Orchids formed in America where such valuable plants could be stored, until in turn they would again find their way into private collections.

The sale was advertised for two days, but was continued over four days. The number of lots sold on the first day was 393; the second day, 420; the third day, 620; and the fourth day, 300. The principal buyers were Jay Gould, Irvington; Erasmus Corning, Albany; C. J. Osborn, New York; W. S. Kimball, Rochester; S. S. Bain, Montreal; De Witt S. Smith, Lee, Mass.; Seibrich & Wadley, New York; Wm. Matthews, Utica; George Such, New Jersey; F. L. Ames, Boston; H. G. Marquand, New Jersey; W. Barr, Orange, N. J.; Robert Garrett, Baltimore; L. Menard, Albany; John S. Dush, New York; H. Graves, New Jersey; F. Scholes, Brooklyn; J. Cockcroft, Connecticut; L. Pratt, New York; C. A. Dana, New York; W.

among other rare and scarce varieties of *Atrides*, Schroederii, 80 dols.; *Cattleya exoniensis*, 250 dols., and 80 dols.; *Cattleya labiata*, 160 dols., 66 dols., and 55 dols.; *Cattleya fausta*, 35 dols. and 95 dols.; *Cœlogyne cristata* alba, 210 dols.; three *Cattleya Louisiana*, 60 dols., 18 dols., and 16 dols.; and several others.

Mr. H. Seibrich, of Seibrich & Wadley, bought the first plant and the last, and the gem of the collection, *Vanda Sanderiana*; the final bid of 900 dols. was made by Mr. Seibrich, and amid cheers he lifted the plant carefully and carried it off. The plant cost originally 2000 dols., and except for the delay in transit of instructions from England it would have sold for more than the original cost to have retained it here. The plant has been resold to C. J. Osborn at a considerable advance. The next lot to this, *Vanda suavis*, was sold to Mr. Kimball for 400 dols.; Mr. Kimball bought many plants at high figures and good bargains, as did most other buyers. So it will be seen the plants are widely scattered, many of which will be as much appreciated as ever. The pulse of the sale is that never before in the history of Orchid culture with us has there been anything like the enthusiasm. It shows that America will soon have as good collections of Orchids as of other plants, and the time is not far distant when we can say, every city has one or more representative collections of Orchids. *American Florist*.

BOOK RECEIVED.—*Orchids, the Royal Family of Plants*, by Harriet Stewart Miner (John Stark, 12, Fluty Place, Camden, N.W.).

Florists' Flowers.

THE PELARGONIUM.

The large flowered varieties are easily managed during the winter months; and as they are now in the resting period, they must not be excited to grow freely. They have no period of complete rest, as large and small specimens will continue to grow a little all through the winter. Alluding to the large specimens first, especially those that have to be in full beauty about the end of May, these ought now to be in their flowering pots, and if they have not yet been reported this ought to be seen to without a moment's delay.

Let the plants be moist at the roots, but they ought on no account to be very wet; when repotted place them in a position where they can have as much light and air under and over them as possible without exposing them to high winds.

Give them no water at this season for a week or perhaps ten days after repotting them; even after

that all had been done that man could do. The florists thought the Editor was wrong, and pursued their work steadily. If the work of seedling raising is as steadily pursued during the next forty years, I doubt not that quite as much progress will be made. If any one can "sail on another tack," only good will result from it; I had a good try to produce seeds from intercrossing the Cape species, but failed to get any.

Our winter-flowering zonal Pelargoniums are just coming into bloom, and they promise well. The temperature of the house is kept up to 50° and 55°, with a rather dry atmosphere. The plants have well filled their pots with roots, and as they are in full growth they require a good supply of water; an occasional supply of liquid-manure adds richness to the colour of the leaves and flowers. Specimen plants or plants of any size wintered in a house from which frost is just excluded will require scarcely any water during winter; give none until the soil in the pots is almost dusty dry.

The fancy or small-flowered section requires the warmest position in the greenhouse, and the potting soil ought to be rather lighter; a larger proportion of

FIG. 142.—HELIUM AUTUMNALE, WITH STALKED FLORETS, ETC.

the roots have taken firm hold of the potting soil, water very sparingly. It is of considerable importance that the glass should be cleaned. Plants of all kinds under glass cannot get even enough light up to March. Tie a piece of tarred string under the rims of the pots, and tie the young growths down to it. This can be done with the greatest safety when the plants are dry at the roots. A word also about seedlings. They may also be shifted into their blooming pots now. Some leading men in the floricultural world have said, that the show Pelargoniums cannot be much further improved. My own opinion is that there is still great room for improvement, especially in the habit of the plants. It may be interesting to read what was stated in the *Gardeners' Chronicle* on this subject forty years ago, vol. vii., p. 763:—"Hybridising in the direction followed by the raisers of Pelargoniums has reached its limits; we have obtained all the results that are attainable. Therefore we say, gentlemen, you should now sail on another tack. Put your ship about; it is no use to cruise any longer in these seas; you have done all that men can do in this quarter, and if you are wise you will steer in another direction." The same advice has been repeatedly tendered to the florists during the period which has intervened since the learned Editor of the *Gardeners' Chronicle* thought

sand should be added to it, and some pouched charcoal. J. Douglas.

HELIUM AUTUMNALE.

The specimen here figured (fig. 142) was kindly forwarded to us some time since by the Rev. C. Wolley Dod. The outer or ray-florets were on long stalks, instead of being sessile, as usual; the corolla greenish, destitute of stamens, but with a more or less leafy pistil. In some cases within the outer corolla was a second petal-like tube, which, when cut open, revealed in the interior a small secondary flower-head raised on a short stalk, so that the general tendencies of the flower-head were to revert to the vegetative condition, as shown in the propensity to become green and to branch.

"LETTS' POPULAR ATLAS" should find a place in every garden library. The maps contain a large amount of information, are clearly printed, and issued at a low price. In one of the recent numbers is given a map of the Turkish empire, of special interest just now, and in another a good geological map of England.

The Rosery.

ON SOME TEA AND NOISETTE ROSES.

THERE is always danger that in the race for exhibition varieties of Roses, some kinds, that from one cause or another, especially from want of size or lack of petals, should be overlooked; and so it comes to pass that it is needful to remind lovers of a garden that there are amongst these classes, which, as I have already said, contains the best and most enduring of garden Roses, some of which are apt to be neglected; they cannot be called button-hole Roses—as some of them are too large for that, nor exactly garden Roses—as some are not quite vigorous enough for it, although there are many of them that might be classed under both these classes. They might perhaps be termed fragrant Roses; but I think that perhaps that which I have applied to them—ooo-exhibition Roses—will be more inclusive than any other; and under that title I shall notice them.

Ma Capucine.—This is another charming button-hole Rose, the most remarkable in colour of all the Tea Roses, a bright orange-copper. The plant is not vigorous, and the buds are very small, but it is a most attractive Rose, and is an instance of how a Rose may be overlooked. Some time ago, when I had noticed it elsewhere, and several persons had desired to obtain it, I had several letters to ask me why I recommended a Rose which no one seemed to have? Since then it has reappeared in several catalogues. It must be recollected that it is almost a single Rose, and very suggestive of the Austrian Copper; but at the same time catch it in the bud state, and I venture to say ladies especially will be delighted with it.

Madame Falot.—This is another very highly coloured flower, large, and more double than the preceding, but at the same time one on which no dependence can be placed for exhibition, neither has it vigour enough for a garden Rose. The colour is a deep apricot with a tinge of orange in it; it is very beautiful when in a half-open state, but woe to the exhibitor who, tempted by the beauty of its appearance, places it in a stand: he will inevitably find it staring at the judges, and wondering what they are looking at it for.

Bougère.—An old Rose, more than fifty years in cultivation. At one time it was considered quite fit for exhibition, but its day is past; it is, however, still a pleasing Rose, is very vigorous in growth, and deserves a place as a decorative Rose. It does best among a wall.

Homère comes near to being an exhibition Rose, and is quite deserving of a place in the garden; it is very vigorous, and when it is in proper condition an attractive flower; the colour is white, with a pink edge, the form cupped, and the edges crimped, which give it a very distinct appearance.

William Allen Richardson.—A Rose sometimes said to be of American origin, but which was, I believe, raised by the Widow Ducher at Lyons. It is of all others the most attractive as a button-hole or spray Rose, being fuller than *Ma Capucine*, and consequently lasting longer, while its colour is very taking; the lower half of the flower is of a deep brilliant orange, and the upper half white; sometimes the orange runs up the whole of the petals, but when in its real character the line is very distinct. Mr. House, of Peterborough, has brought it largely before the public, and the stands where it has been shown have always had a large number of persons standing round, captivated by its attractive colouring; it is very vigorous in habit, and free in blooming.

Madame Chedane Guinoisseau, or, as it is more briefly named in Pince's catalogue, *Madame Chedane*—a very bright and pretty Rose, of a bright yellow, small, and most suitable for a button-hole or spray Rose; it is not a strong grower, and cannot be called a garden Rose; but its place is unquestionably that of a button-hole Rose, for which it is admirably adapted.

The foregoing may all be fairly classed as Tea Roses, although the last-named variety comes very near to being a *Noisette*, but the following Roses must, I think, with the exception of the first, be classed amongst the *Noisettes*; I have included it with them because of its climbing character, which it shares with them, and which is one of their characteristics. There are only two *Noisette* Roses which are classed amongst exhibition flowers (*Caroline*

Kuster and Maréchal Niel) in the carefully prepared catalogue of the National Rose Society, and I know that some question whether they ought not rather to be classed with the Noisettes.

Gloire de Dijon.—It seems rather hard upon this, probably the most extensively grown of any Rose in cultivation, that it should be excluded from the list of exhibition Roses; for what a useful Rose it is!—vigorous in growth, enduring all kinds of treatment and all varieties of situations, forcing well, covering walls, climbing up pillars facing north, east, south, or west, it seems that old Glory of John can never be put out of countenance; it beams upon you from all quarters, and rewards its owner with abundance of blooms; it withstands the extremes of cold and heat, and is everybody's flower, and yet it came up as a chance seedling in the garden walk of the nursery of Jacotot at Dijon. Its parentage is unknown, but Mr. Girdlestone, who is no mean authority, suggests that it has a good deal of Bourbon blood in it, indeed it has been suggested that it was a cross between a Tea and a Bourbon; but, as I have said, its parentage is absolutely unknown. As a full-blown Rose it is rough, but about half of three-quarters open it is very pretty. It is a free seeder, and some of its seedlings are smoother and better than the parent, which, however, will long remain in its present position as the most popular and widely grown of yellow or quasi-yellow Roses. Its growth is straggling, and the shoots not well covered with foliage.

Céline Forestier.—This is a very abundant flowering and distinct looking Rose, so distinct that the merest tyro would hardly fail to recognise it; so good is it that a Portuguese Rose grower has, it is said, sent out a second edition of it, under the name of *Lusitana*. It originated with Frouillard, the foreman of M. André Leroy, at Angers; and I remember well when with the late Mr. Standish at that charming old French town, seeing it when he introduced it, and have a lively recollection of the complimentary tea (not Rose) with which we were treated, made with cold water. The Rose is very vigorous [But tender. Ed.], and continues in flower a long while.

Aimée Vibert.—A very old Noisette, pure white in colour, and very free flowering, and almost evergreen; one seldom sees it now, but it ought not to be neglected, for it is the purest white climbing Rose that we have.

Lamarque.—This somewhat tender Rose, does well in the Southern Counties, but is scarcely hardy enough for cold districts; colour white, shaded with yellow, blooming in clusters very abundantly.

Ophir, another Rose that is too much neglected as a climber, for it is one that blooms abundantly in the autumn, and the colour is bright, being a deep apricot. It has so much of the Tea blood in it that it blooms profusely in the autumn, and is altogether a very desirable Rose.

Rive d'Or.—This I regard, taking it all in all, as the best yellow climber that we have; it is said to have been raised in 1869, but I am inclined to think it was a year later, for it was one of a small parcel which came to me from Lyons during that terrible year, and was six weeks on the journey; it however, survived, and was planted against my house, of which, as I have said, it in a few years covered a large portion on an easterly aspect, and reached up to the very eaves. It has one great advantage over the Roses of the *Gloire de Dijon* type, that it is thoroughly covered with foliage up from the ground, and it is almost evergreen. In colour it approaches to Madame Falcot; the flower is not very full, and consequently it is best in a half or three-quarter open state. I have never yet seen a climbing yellow Rose that could compare with my plant previous to those two terrible winters of 1880 and 1881, when it was cut down to the ground; it has, however, recovered itself, and will, I hope, soon occupy the same space as before.

Salfatere.—An old climbing Rose, semi-double, yellow, and exceedingly free-flowering; the shoots are long and straggling, like *Gloire de Dijon*. A plant of it covers the south front of a house close to me, and is always early and profuse in flowering, and I adhere to my opinion that the best yellow climbing Rose is *Rive d'Or*. "What about Maréchal Niel?" some one will say. Well, I do not believe in it as an out-of-doors Rose; it will only grow in warm situations, and there is very subject to mildew, and its manner of drooping its flowers detracts considerably from its effect.

I would desire to thank your correspondent "M." for bringing under our notice the new Roses of my good friends the Dicksons of Newtonards. I had,

not heard of them before. The descriptions sound well, and they are honest folks, and, like St. Patrick, come of "decent people." *Will Rose*.

FRUIT NOTES.

ALPINE STRAWBERRY, QUATRE SAISONS.—Mr. Roberts is now fruiting a considerable quantity of this variety within the glass-covered Peach wall at Gurnersbury. It is very useful indeed, for furnishing a supply of Strawberries at this season of the year. The fruit are of good size for an alpine, and colour well, though they would probably take on a better colour in a higher temperature. They possess an agreeable fine flavour. It is also a free bearer. *R. D.*

BEURRÉ FOUQUERAY.

This is a newly introduced French Pear, of the first quality, ripening from the middle of October to the middle of November. The fruit measures 4½ inches in length by 4 in breadth, is pyriform, obtuse, with a short thick stalk set in a rather shallow basin. The skin is olive-green speckled with brown spots. The flesh is white, tender, melting, sweet and perfumed.

BEURRÉ DE L'ASSOMPTION.

Mr. Blackmore's description of this Pear as clumsy and ugly, with a bad habit of growth and worse texture, has always appeared to me not only happy but true. It is pleasant to hear from Mr. Wildsmith that it is not universally so. From bush trees on the Quince the majority of the fruit are irregularly shaped, not to say deformed. The flavour is sharply piquant, and there is quite enough grit at the core. In Suffolk I have seen it grown as a cordon on a south wall with very moderate results. It was a shy bearer, and the fruit not nearly so good as Williams' or even Clapp's Favourite. Tyson is another belauded early sort that falsifies its Yankee reputation in East Anglia, where also (I am speaking of the neighbourhood of Bury St. Edmund's) Monchallard, Beuré Six, Beuré de Bolwiller, Beuré Ballet père, Comte de Paris, Général de Lourmel, and others I could mention, only cumbered the ground and deserved none of the praise in the *Orchardist*. *C. A. M. C.*

GOLDEN NOBLE AND WALTHAM ABBEY SEEDLING APPLES.

The matter to which "P." drew attention in a former number, in reference to the coupling of these two very distinct kinds of Apples together in the Royal Horticultural Society's schedule, was commented upon last year, when it was explained that whilst no doubt existed as to the absolute dissimilarity of these kinds at headquarters, yet that having been sent out some years since somewhat mixed in nomenclature it was still held best so to class them in the schedule because of this difficulty. Probably the time has now arrived when former mistakes should be ignored, for no one who is the least familiar with Apples can be unaware which is which of the two kinds named. Certainly no two kinds can be more dissimilar in appearance of fruit and in style of tree. Both deserve to rank amongst our best kitchen kinds, for both are permanent croppers, produce good sized fruits, and both keep well. Of the two I think Waltham Abbey Seedling the most prolific and best for general culture, indeed it may be termed the cottager's Apple *par excellence*, for it never fails to fruit. The tree is compact habitied, and rather handsome as a standard. Apples of the kinds under consideration are most valuable when such big kinds as Warner's King, Lord Suffield, Peasgood's Nonsuch, and many others are rotten. I would like to add that of kinds not generally grown two have fruited here with me on free grown trees most abundantly this season, the fruit literally hanging like roped Onions. These are Norfolk Bearer, medium-sized, pretty well coloured fruits, either dessert or kitchen; and American Mother, a first-rate dessert kind. Still farther, both kinds nearly always fruit well. The former especially should make a popular market Apple, as the trees do not grow large and therefore occupy but limited space. Nelson Codlin, again, is another moderate growing but even fruiting kind, which deserves a place in any garden as a fine and valuable kitchen kind. *A. D. Bedford.*

—Permit me to inform "P." that the Royal Horticultural Society and Dr. Hogg are perfectly agreed as to the distinctive characters of these two Apples. It is notorious, however, that they are

often confused the one with the other. At the Apple Congress fully one half of the examples were wrongly named. In the schedule of the Royal Horticultural Society to which "P." refers, the two sorts are invited together, so as to prevent disqualification of either if exhibited wrongly. It should read, Apple Golden Noble or Apple Waltham Seedling, so as to have saved "P.'s" peace of mind. *B.*

BEURRÉ CLAIRGEAU.

Why is prominence given to this Pear? Such of your readers as are commencing the growth of Pears will be led astray, and believe that it ought to take the lead in their selection of varieties; but it is ever eaten by a Pear grower? It ripens at the height of the Pear season with a large number of really good Pears, such as Doyenné du Comice, Maréchal de la Cour, Marie Louise, Thompson's, Van Mons' Léon l'Clér, Comte de Flandres, Passe Colmar, &c., which are always good, while it is never tolerable. It is described in Hogg's *Manual* as of third quality in a list where hundreds are described as of first quality. A Pear of even second quality ought not to be grown now, when the best are as cheap and even more easily obtainable than the worst. The main object of a conference on Pears should be to weed out inferior varieties, not to give undue prominence to a variety absolutely worthless, and pander to a vulgar taste for size and colour, especially when the coarse appearance of the fruit is sufficient to enable a judge of Pears without tasting to form a correct opinion of its quality. In the selection of a well ordered dessert all other considerations should subserve flavour, even to the exclusion of a Pitmaston Duchess by a Marie Louise. *Edmund Tonks.*

SOLANUM MAGLIA.

In your observations on the experiments now being conducted at Reading by the Messrs. Sutton & Sons with a view to obtaining a race of disease-resisting Potatoes by crossing *Solanum Maglia* with some of the forms of *S. tuberosum*, you mention that at Kew the former species had been cultivated for some time, but without producing much result so far as tubers are concerned. Permit me to give you in brief the history of this Potato as far as regards its cultivation at Kew. As has already been stated by Mr. Baker in his paper on the tuber-bearing species of *Solanum*, the present stock of *S. Maglia* at Kew are the descendants from small tubers presented to the garden by Dr. Sclater in 1862. It is also stated by Mr. Baker that for the first two years no tubers were produced by the plants when grown in the sandy soil of the nursery garden, but evidently this must mean no large tubers, as some, however small, must have been produced to perpetuate the plant, no seeds having ever been borne by this species under cultivation in this country till Messrs. Sutton last year fertilised its flowers with pollen from a variety of *S. tuberosum*. From the year 1862 till the present this *Solanum* has, therefore, been preserved alive at Kew, though as the species was not supposed to possess any valuable tuber-producing qualities its preservation in the collection was all that was aimed at, and consequently no attempt to develop the size of its tubers was made. It seems only fair, therefore, that Kew should be credited with having preserved for nearly a quarter of a century an annual plant which did not produce seeds, and which had long since perished in all other collections to which it had at some time been introduced.

Last year *S. Maglia* suddenly sprang into prominence as a tuber-bearing Potato, mainly owing to the exertions of Earl Cathcart, who called to his aid Mr. Baker's botanical knowledge. On making a careful study of the several tuber-yielding species of *Solanum*, Mr. Baker perceived at once that "Darwin's Potato" was not *S. tuberosum*, but *S. Maglia*, and that some valuable results might therefore follow from experiments on the tuber-yielding capacity, &c., of this plant. To this end the plants at Kew were planted in prepared soil, but not till after the season was well advanced, so that the yield of tubers was not very encouraging, so far at least as regarded size. This year, however, an early start was made, and that the result has been good you will be able to judge from the specimens of the tubers forwarded to you a day or two ago.

In taking up the plants we noticed that the tubers were none of them at a less depth than 16 inches,

while a some of them were nearly 2 feet below the surface. In digging them out we found no Potatoes of any kind in the top "spit" of soil, but on throwing out a second spit we found a good crop of tubers; some of them resting directly on the gravelly subsoil 2 feet below the surface. The six tubers sent you weighed 18 ounces, the weight of the largest one being 4½ oz. You will observe that the roots on the plants sent along with the tubers are some of them 3 feet long, and that they gradually thicken towards their extremities instead of becoming attenuated, as in the cultivated Potato. These thick roots or "runners" grow in an oblique direction, and from them spring thinner roots, upon which the tubers are developed. This habit of sending its roots down to a much greater depth than is done by *S. tuberosum*, and, as it were, burying its tubers out of the reach of harm from excessive drought or the diseases which attack Potatoes, will probably be of importance in the cultivation of whatever forms may result from Messrs. Sutton's experiments; for on the assumption that the Jensen method for the prevention of the Potato disease is of value, a Potato which naturally buries its tubers a foot or so in the soil would be of importance in the amount of labour it would save, as well as in other ways. To conclusion I may note that I had a few tubers of Darwin's Potato cooked on the same day as they were taken out of the ground, and found them watery, rather "sticky," and with a very perceptible early taste. I did not consider them good eating. *W. Watson, Kew.*

lightly syringed; the practice of syringing the trees often and heavily before growth is excited I am strongly opposed to, as being somewhat detrimental in its effects; a proper state of salubrity had far better be maintained by moistening available surfaces about the house than by the other means. It is very essential that the roots of the trees should be thoroughly moist now, and if any doubts exist on this matter it should be ascertained practically. The foregoing treatment should be enforced until the close of the current year, by which time the trees will be fast unfolding their blossoms. *G. T. Miles, Wycombe Abbey.*

the tubers, which should be planted 4 inches deep. Nothing will be gained by crowding planting; the sets may be placed 1 foot apart, in rows, from 14 to 16 inches asunder.

In some establishments early forced Potatoes are appreciated quite as much as any kind of forced fruit, and where a heated frame cannot be devoted to them at least a limited supply may be obtained from pots grown in early vineries and Peach-houses, and the haulm of the Potato is not so subject as many other plants to the attack of injurious insects, which are at times so difficult to prevent from infesting the permanent occupants of the houses.

GENERAL WORK.

When frost threatens, the plots of early Broccoli should be looked over, and any with the hearts well formed, and likely to be injured, should be lifted with a good ball of earth, and placed under glass, or in some position where they can be effectually protected from injury.

Endive now out-of-doors three-parts grown should be lifted without further delay, and placed in frames or cool houses or boxes, from whence a few roots at a time should be placed in the Mushroom-house, or dark warm cellar, to blanch as required. Young plants of Endive are perfectly hardy, but when the hearts of the plants begin to develop they soon get browned by sharp frosts. Mustard-and-Cress should now be sown under glass at intervals as required.

Where young Onions are required for salad purposes through the winter, and the autumn-sown Tripolis are not thick enough to allow of much thinning out, some should now be sown in boxes in light fine soil in a brisk heat near the glass. By this method a supply, just the proper size, may be easily kept up, by sowing once a fortnight or three weeks until the spring Onions come in. The China Rose Radish is now coming in well out-of-doors; the beds should be protected with mats on the approach of sharp frosts.

Some Chicory (a few roots are sufficient at a time) should be lifted, and introduced into the Mushroom-house to blanch. It will now be advisable to lift the whole of the crop of roots, and relay them thickly together a little deeper in the soil in a well-drained part of the garden. *G. H. Richards, Somerley.*

The Hardy Fruit Garden.

PLUMS.

PLUMS are at all times a welcome addition to our dessert fruit, therefore I would advise every one to plant a number of these on a south wall, also some of the fine later varieties on east walls, and the latest varieties on a north aspect. I would recommend cordun trees of these being planted, as they come quickly into bearing, and occupy little space on the walls; they may be planted 18 inches apart. For a north wall I should advise such varieties as Wyedale, Belle de Septembre, Reine Claude de Bavay, and other late keeping sorts. For growing on a south wall, Green Gage, Oullin's Golden Gage.

Fruit stores should be looked over twice a week, and all decayed fruit at once removed; air may be admitted on fine warm days. All vacant spaces on the walls should be filled up at once with young trees; these cost little when bought small, and they can be trained in any form desired. *J. Smith, Mentmore, Bucks.*

The Flower Garden.

THE flower beds will have been put in order for the winter, and, where bulbs have been planted, will require a sharp look-out for rats and mice, or they will soon destroy them before it is noticed. I find by experience it is far best to put down mouse-traps as soon as the bulbs are planted, prevention being better than cure, for once they get a taste of the bulbs they are not so easily caught in traps. Any beds that are not intended to be furnished for the winter should be manured and dug or trenched, so that the soil may get the full benefit of the frost. All the turf should be levelled and re-turfing done where required; it should be rolled as often as time will permit, and if lime and wood ashes are strewn over it the turf will be greatly improved next season. This dressing will kill the moss and destroy grubs, and the grass will come finer, and keep a good colour. Leaf raking and sweeping occupy the greatest part of the time till the leaves are all down. The leaves should be taken care of for leaf-mould, as it is of great value. When the leaves are all down, the shrubby beds and borders should be dug or forked over. Sickly plants, if any, should be looked to, and fresh soil or manure added as the case may be. American shrubs thrive best in peat and leaf-mould mixed. *W. Smythe, Basing Park, Alton.*

The Kitchen Garden.

SEED POTATOS AND FORCING.

THE general stock of tubers should occasionally be examined, in order to ascertain that none of the early varieties are making injurious growth, through being stored too thickly, or through being in a too warm and close atmosphere. Tubers of early varieties which show signs of commencing growth, and which will soon be required for forcing in pots and frames, may now be placed in shallow boxes in light soil in order to make a little corresponding root-action. The boxes can either be placed in a light airy frost-proof house, or be put into a little warmer temperature to start into steady growth to supply the sets for pots or frames as soon as it is thought fit to start an early batch. Even where pot cultivation is relied on to produce the first supply, it is best to start the tubers in boxes in the same way as is usually done for frame-grown Potatoes, as by so doing the tubers with the strongest growth may be selected, and another important point can be attended to prior to potting, *i.e.*, the reduction of the growth on each tuber. Two growths are quite sufficient for a 10 inch pot, which should be only half filled with soil to commence with. The best guide to successful work with pot cultivation (the same as in frames), is to start gently, aiming at short sturdy growth, and keeping the pots as near the glass as possible.

When the growths are about 1 inch above the rims of the pots, they should be earthed-up, leaving half an inch for watering. It will grow one tuber with two shoots in a 10-inch pot will produce a dozen young ones of an equal size. If more than two growths are allowed, the young tubers may be more numerous, but not so profitable in the long run, neither will they be fit for use quite so early, which is a consideration in favour of restricting the amount of haulm.

The beginning of December is a good time to plant an early frame, which at that early date for planting should be heated by hot-water pipes. The sets for such a frame may be placed in boxes as before recommended, at once, and started in the early vinery. The materials to form the hotbed should be collected, and should consist of leaves and short litter, which must be returned several times before it enters the frame. After the hotbed has been made several days, place on it 1 foot of light soil a couple of days before planting

The Apiary.

WAX EXTRACTING.

In all apiaries, even in small ones, there will always be more or less of comb which is unfit to use again. Do not waste a bit of it, and do not lay it out, as it will only harbour the wax-moth. If you have a large apiary it is quite well worth the money to have a machine. The quality of the wax obtained from a machine is very superior, and a good price can always be got for it.

If a machine is used you cannot do better than have one of Geneva's, or one made after his pattern. This consists of a perforated tin basket standing on three pieces of metal in a metal dish, and about an inch from the bottom of it. All this is put into a cylinder not perforated, and there is a spout connected with the dish. When you want to melt some wax, take the perforated cylinder and fill it with wax, and insert it in the other cylinder, and put the cover on. Then place this over a vessel with water, and put it on a fire. The steam passes up from the water when it boils, and the heat of the steam penetrates the basket and the wax oozes through the basket, and runs down into the dish, and out at the spout mentioned before. Nothing can be purer than the wax which comes out, and all useless refuse is left in the basket.

If you have not enough wax for a machine, or do not wish to buy one, there are various other ways of getting the wax out, but there is none better than Mr. Hooker's. Take all the comb you want to melt, and put into the copper, and ram it down tight. Take a hot cloth that will fit into the copper, and fit a cheese-cloth over it. This must be kept down by some means or other, and is best done with sticks wedged against the ceiling. Then fill your copper with water and light the fire. When the water boils the wax will ooze through the cloth and rise to the surface. You must use a little judgment not to boil the water longer than sufficient to melt the wax. Let the fire go out, and when the water is cool a cake of beautiful wax will be found on the surface. This can be taken up and melted again in some vessel, and poured into moulds or basins. There will be nothing but refuse at the bottom of the copper. Throw this right away, some distance from the hives, as it might lead to robbing. This is a much better way than boiling the wax in bags, and it is done much quicker. *Agnes.*

Fruits Under Glass.

PEACHES AND NECTARINES: STARTING THE HOUSE.

If these fruits, which rank so high in the limited number of choice kinds for the dessert in the months of May and June, are to be ripe by that period, it will soon be time to encourage growth in the trees that are intended for the purpose. My custom is to close the early peachery about the middle of November, and during the first fortnight to use no fire-heat whatever, unless frost should demand it, which is not very often the case at this time of the year; on favourable occasions the house is freely aired, and the surfaces about the house, if they get dry, are moistened occasionally, and the trees on sunny days are sparingly syringed. About December 1 we begin with the usual course of forcing operations, and keep the house as near to 50° as possible at night, and 55° or 60° during the day by artificial means, if necessary; and if this is increased by solar aid we ventilate slightly at 65°, and let it range to 75°, and close up when it falls to 65° again. At this time the trees are

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Nov. 16	Sale of Plants and Bulbs from Holland, at Stevens' Rooms Sale of Dutch Bulbs, at Protheroe & Morris' Rooms Crysanthemum Show (two days)
TUESDAY, Nov. 17	Grand Show of the Royal Botanic and Horticultural Society, at Manchester. Yewell Crysanthemum Show Sale of Roses, Plants, Bulbs, &c., at the City Auction Rooms, by Protheroe & Morris Burlington-Trent Crysanthemum Show (two days) Bristol Crysanthemum and Fruit Show (two days)
WEDNESDAY, Nov. 18	Birmingham and Midland Counties Crysanthemum Show (two days) Sale of Plants and Bulbs from Holland, at Stevens' Rooms Colchester and East Essex Crysanthemum Show (two days) Hall and East Riding Crysanthemum Show (two days) Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms Sale of a Collection of Orchids in Flower, at Stevens' Rooms Chorley Crysanthemum Show (two days)
THURSDAY, Nov. 19	Shefford and West Riding Crysanthemum Show (two days) Sale of Imported Orchids, at Protheroe & Morris' Rooms Derby Crysanthemum Show, and 49d. Sale of Dutch Bulbs, at Protheroe & Morris' Rooms
FRIDAY, Nov. 20	Sale of Plants and Bulbs from Holland, at Stevens' Rooms
SATURDAY, Nov. 21	

THE adjourned meeting convened by the Council of the Royal Horticultural Society to consider the propriety of inaugurating an INTERNATIONAL EXHIBITION on a large scale in 1887 was held on Tuesday last under the most depressing conditions. Soil and atmosphere alike seemed muddy. Fog prevailed, light was not, drizzling rain fell without intermission. To add to these uncheering surroundings the place wore an appearance of general dismemberment and dilapidation. The "Inventions" Exhibitions was closed the night before, and already confusion seemed to reign supreme. Disjointed machinery, dismantled stalls, engines swathed in wrappers, old packing-cases, others new, some in process of construction, and *debris* of all kinds scumbered the ground. Rolling toiles, ceaseless hammers, grating saws, contributed their share to the general din, broken now and again by the discords elicited from some musical instrument thus audibly complaining of the indignities to which it was subjected. Amid such surroundings was the meeting held. In one sense it was cheering. The ideas of continuity and rejuvenescence suggested themselves amid the gloom and clatter, just as they did when the citizens of Chicago met amid the smoking ruins of their destroyed city to enact that it should rise from its ashes. It was hardly to be expected under such conditions that the meeting should be enthusiastic, but at any rate it was unanimous, and no voice was heard to deny the proposition that it was desirable to hold such an exhibition as proposed in 1887; no alternative proposition was offered, and no objection was raised to the plan of action proposed. The Council attended in full force, headed by its President, Sir TREVOR LAWRENCE. The meeting, if not large, was at least more representative than on the former occasion. Representatives of metropolitan and provincial societies were present. Men of leading in the provinces were there in considerable numbers, some of whom, as Mr. FINDLAY of Manchester, Mr. HARRISON of Leicester, Mr. WATTS, and Mr. CHEAL of Crawley, took part in the discussion, and, as we have said, though some did not vote at all, not a dissentient voice was raised. The metropolitan nurserymen, with few exceptions, held their peace and made no sign. We do not blame them for this. So much work and anxiety must necessarily fall on them, if the proposal is carried out, that we are not surprised that they should hesitate. But we do feel strongly that if any present entertained serious objections to the proposal, they should at once have given expression to their opinions. The meeting was called for that very purpose, and by their silence, by their abstention from active participation, they have lessened their power to

object to whatever may be done in future. An honest display of negative opinion would have been as valuable in its way for the purpose of the meeting as any manifestation of approval. Be this as it may, the general principle, that it is desirable to hold such an exhibition, may now be held to be established beyond dispute. The explanations given by Sir TREVOR LAWRENCE as to the negotiations with the Commissioners, and as to the relative position of the Council and the Commissioners, were clear and to the point. They did not pledge anybody to anything, but they showed that the interests of the Commissioners were bound up in the success of the scheme, and that both Commissioners and Council believe and are desirous that something should be done. The scope of the exhibition was defined in general terms in the same lines as those we had already sketched out in our previous articles on this subject, and the difficulties in the way of finance and organisation were shown not to be insuperable. After Sir TREVOR LAWRENCE's explanations the coast seemed clear for a public avowal that such an exhibition was desirable, and this accordingly was the text of the first resolution, proposed by Dr. MASTERS, seconded by Mr. WATTS, and carried without a dissentient voice, after some remarks by Mr. HARRISON, of Leicester, and others. The second resolution, proposed by Mr. SHIRLEY HIBBERD—to the effect that, provided the Commissioners gave adequate assurances of harmonious co-operation and support, the gardens at South Kensington were the most suitable locality for the purpose—was also carried unanimously. The second, however, Mr. BRUCE FINDLAY, after saying that he would promote the object to the best of his power in his own neighbourhood, very properly pointed out the risks attaching to a system of dual control—a warning which those who remember the misfortunes of the Society, in its relations to the Commissioners in past years, will do well to bear in mind. The existing Council as a Council is hardly aware of the fact that the present condition of the Society is really due to the ill-assorted union of the two bodies in past years. Still, as we have before said, circumstances are widely different now, and the Council, the strongest and best for many years, is not likely to be kept in the dark as to facts of past history, and the necessity for caution in the future.

The remaining resolutions, spoken for by Mr. W. PAUL, Mr. FRASER, Mr. ELWES, and others, with incidental suggestions as to the method of carrying out the proposal, were the necessary outcome of the adoption of the preceding resolutions; and before the resolution was adopted to adjourn the meeting, in order to allow of further negotiations between the Council and the Commissioners, was put to the meeting, the present state of the case was most lucidly put by Professor MICHAEL FOSTER, so that there might in future be no misunderstanding as to the feeling of the meeting and its knowledge of the bases of negotiation with the Commissioners. After Professor FOSTER's clear statement of the state of the case, there was ample opportunity for any objection to be raised, but as no dissentient note was sounded, it may be taken for certain, as we have stated, that the general body of horticulturists, as represented at the meeting, are pledged to the general principle, but in nowise tied to details; and that the Council, backed by the unanimous votes of the meeting are empowered to open up further negotiations with the Commissioners if assurances on either side are forthcoming.

Sir TREVOR LAWRENCE, in bringing the proceedings to a close, replied to a few objections that had been raised in the course of the debate, and pointed out the great advantages to the trade of the country that must ensue from

such an exhibition; and expressed his belief that if the horticultural body could now lay a foundation there would be no lack of guarantees as to finance. As to organisation, the last three exhibitions had been worked under a system of dual control without friction, and as the interests of all parties in this matter were identical and all were interested in its success, he did not apprehend any serious difficulties on that score. In point of fact, the difficulties and obstacles which look formidable at a distance seem no greater than Englishmen are accustomed to surmount, without much fuss, any month in the year. The meeting was ultimately adjourned to allow of further negotiations being entered upon with the Commissioners, no one being in the meantime pledged to anything more than the assertions that such and such things, under such and such conditions, are desirable.

— THE PROPOSED INTERNATIONAL EXHIBITION.—The following is the text of the resolutions carried at the meeting on the 10th inst. Dr. MASTERS, who had moved the adjournment of the last meeting, moved the first resolution, which was as follows:—

"That in view of the great and increasing importance of horticulture, and in order to preserve the high reputation in which British horticulture is held by other nations, it is desirable to hold at no distant date an International Show and Congress of Horticulture in the widest sense of that term; and that the year 1887 being the jubilee year of Her Most Gracious Majesty the QUEEN, would be the most fitting time for such an undertaking."

This was seconded by Mr. WATTS, of Wiltshire, and carried unanimously. The second resolution was proposed by Mr. SHIRLEY HIBBERD:—

"That should Her Majesty's Commissioners of 1851 be prepared to afford adequate facilities, such a show and Congress would be most advantageously held on some of the Commissioners' grounds at South Kensington, provided that any use which the Commissioners propose to make of the rest of the grounds during the year 1887 be found to be in harmony with the character of the projected show and Congress."

This was also carried unanimously. The third resolution was proposed by Mr. WM. PAUL, seconded by Mr. A. H. SNEE, and carried unanimously:—

"That this meeting requests the President and Council of the Royal Horticultural Society to take measures to ascertain the views of the Commissioners of 1851 on the matter, and assures the President and Council that should the proposals of the Commissioners be of such a nature as to afford reasonable hope that the show and Congress may be carried out in a manner worthy of British horticulture, no effort shall be wanting on the part of those present to secure the success of the undertaking."

The fourth resolution, moved by Mr. HARRISON of Leicester, and seconded by Mr. CHEAL of Crawley, was as follows:—

"That this meeting do now adjourn till such time as it shall be summoned by the President and Council of the Royal Horticultural Society, in order that the results of the negotiations with the Commissioners of 1851 may be laid before it."

— CONSERVATORY AT CHERKLEY COURT.—In our number for June 13 of this year, in which we gave a view at Cherkley Court, Leatherhead, the residence of ABRAHAM DIXON, Esq., and also one of the fine conservatory, we drew attention to the pleasing manner in which the walls on the one side were clothed with Ferns and foliage Begonias; we now avail ourselves of the opportunity to illustrate this rather difficult subject, as we are sure many of our readers will be able to find in their greenhouses and conservatories, walls and odd corners which they would fain change from their present blank state into as near an approach as possible to those lovely combinations of foliage the subject of our illustration (see supplement). The arrangements for producing such effect are not difficult to command—an open wire trellis fixed 2 or 3 inches away from the wall, and filled in with peat or other fibry soil into which the plants are to be planted. Maidenhairs of all kinds take well to such culture, and the foliage Begonias assume a much more beautiful aspect and exhibit their lovely metallic

THE PHOTO SPRAGUE & CO. LONDON

VIEWS IN THE CONSERVATORY AT CHERKLEY COURT, LEATHERHEAD.

colours much better when grown in this way than they do in pots; some of the oldest varieties, such as Rex, Marshall, and Queen Victoria, are still unsurpassed for massive foliage, but Louise Chrépion, Berthe Frontier, Fire King, and others of their section among the newer introductions, are very lovely. At the top of our illustration showing the models of Alhambra arches, the Bougainvillea glabra will be seen in flower; grown as it is at Cherkeley Court, it is one of the brightest and most lasting trailers we have.

— **SCLEROTHIA OF PENICILLUM.**—We are requested by Mr. W. G. SMITH to publish the following letter, the transmission to us of which has been accidentally delayed:—

"I am asked on p. 305 to describe with as much detail as possible how I obtained these structures. I have found them produced spontaneously, and I have three times produced them artificially. I have had no failures. I saw them first inside Gorgonzola cheese, and in this material it was easy to make sections. I afterwards twice saw them inside very old and dry Potatoes. I last saw them inside a dry capsule of *Papaver somniferum*. I obtained them artificially as follows (I think the plan is not the same as BREFFELD's, but I have not BREFFELD by me for reference):—I took six slices of coarse crummy bread for three experiments. These six slices I dried in an oven, with the idea of killing any spores that were not wanted, and that might possibly be in the cavities of the bread. When the slices of crummy bread were quite dry, I slightly dampened one surface only of each with distilled water, on the damp surface I placed (with a dry camel-hair brush) spores of *Penicillium*. I then placed the damp spore-infected surfaces together and made three *Penicillium* sandwiches, quite dry outside and slightly moistened inside. Each sandwich was wrapped in tissue paper tied with twine and then shut up for a week in a box in the dark. This was with the idea of getting rid of any superfluous moisture. After a week, and when the spores had germinated, I took six pieces of thick glass and squeezed each sandwich as tight as possible between two pieces of the glass in a carpenter's vice. I then glued paper over the ends of the glasses, so that the slices of bread looked like pictures in air-tight frames—a picture behind and a picture in front. The frames were then put in a dark box again and kept in a dry place. They were opened at the end of one, two, and three weeks, and the sclerotia were found abundantly in the bread cavities of the examples which had rested longest."

— **POTATOS.**—MR. THISELTON DYER exhibited at the Linnean Society, on November 5, specimens of DARWIN'S Potato (*Solanum Maglia*), grown at Kew, the weight of twelve tubers being 28 oz.; also the "Papa del oso," Bear's Potato (*S. tuberosum* var.), grown out-of-doors, from tubers received from Dr. ERNST, of Caracas, who obtained them from Merida, where they are found wild.

— "THE ASCLEPIAD" is a quarterly journal entirely written by Dr. B. W. RICHARDSON. It is devoted particularly to medicine and allied subjects. Dr. RICHARDSON'S biographical notices are well written. In the present number the life of LEEUWENHOEK is sketched. The Dutch physiologist was one of the first to use the microscope, and but little has been generally known of his career. From what Dr. RICHARDSON tells us he was Bedell or Town Sergeant of Delft, and occupied his leisure with those experiments and researches that have made his name famous.

— **KÜHLER'S "MEDICINALEN PFLANZEN."**—The last part of the reissue contains coloured figures of *Cochlearia officinalis*, *Malva silvestris*, *Lavandula vera*, *Plantanthera bifolia*, *Digitalis purpurea*, *Rhamnus cathartica*, *Matricaria Chamomilla*. The plates are so superior to any hitherto published in this country, and so much less expensive, that we call attention to them as very serviceable even to those not familiar with the language of the text.

— "POPULAR GARDENING" is the title of a new American publication issued at Buffalo every month at the cost of 6 cents (3/4) for each number. Its contents are varied and bright, and the paper looks as if it meant to succeed, and we have no doubt it will.

— "THE COVENT GARDEN GAZETTE."—This new venture, to be published at one penny weekly, is announced as a representative journal for agriculturists and fruit-growers, and for florists and market sales-

men. It is intended to give "actual practical information on current prices and supply and demand, so that he [the grower] may not be in the dark when sending consignments to market." As this information is much needed, but in our experience not easy to get, we shall rejoice if our new contemporary succeed in satisfying the natural requirements of growers and consumers in this matter. The French correspondent notes that "if trade in England, owing to Free Trade, is bad, in France, with Protection, it is a thousand times worse." In spite of the depression, our contemporary writes upon most topics in a cheerful frame of mind, and we can but wish that it may be maintained.

— **OUR ALMANAC FOR 1886.**—Secretaries of provincial and town horticultural societies are invited to send us, as soon as possible, the dates of their meetings and exhibitions during the ensuing year, so as to ensure their insertion.

— **APPLE AND PEAR CONGRESS, EDINBURGH.**—At a meeting of the Congress committee of the Royal Caledonian Horticultural Society, held on the 11th inst., it was announced that intimation had already been received from many contributors throughout the United Kingdom of their intention to exhibit at the Congress, and that the number of dishes already promised, amounted to upwards of 7000, although many of the largest contributors have not yet made their entries. These entries close on Monday, the 16th inst., and all those who intend to send contributions of Apples and Pears should forward the same without delay, so as to enable the committee to make proper arrangements for the display of the exhibits; which promise to be so numerous as to tax even the immense capacity of the Waverley Market.

— **GHEENT HORTICULTURAL SOCIETY.**—At a meeting held last Monday the following awards were made:—First-class Certificates to MM. Jacob-Makoy & Co., Liège, for *Bouvardia Hogarth* fl.-pl.; to MM. Vervae & Co., for *Cypripedium vexillarium* and *Odontoglossum vexillarium*; to M. Aug. Van Geert fils, for *Ptychosperma* Van Geerti. Cultural Certificate to M. Jules Heye-Leyse, for *Cypripedium Spicarium*. Commendations for novelty to M. L. Spae-Van der Meule, for *Encephalartos Kazeri*; to M. Ed. Fynaert, for *Anthurium Prochaskyianum*; to MM. Desbois & Co., for *Begonia Madame Henri Gache*. Cultural Commendations to M. Ad. d'Haene, for *Dracena Baptistii*; to M. Bernard Spae, for *Rackia Ellemetti*.

— **NEW SWEET PEA.**—In addition to the new varieties of Sweet Peas of Mr. H. ECKFORD'S raising which Mr. W. BULL will distribute, Mr. J. C. SCHMIDT, of Erfurt, announces one of his own raising, named *Vesuvius*. It is described as being quite distinct in character, the large upper petals are brilliant carmine-rose, shading to a deeper hue, till it ends in a glowing purple throat; the whole is sprinkled with dots of crimson. The lower petals are of a dark velvety violet, shading off into lilac towards the edge.

— **PHYLLOXERA LAWS.**—The following official document has been forwarded to us for publication:—

"Bucharest, October 15, 1885.
"My Lord,—I have the honour to report that a notice has been inserted in the *Official Monitor* to the effect that, in consequence of the appearance of *Phylloxera* in Roumania, the Hungarian Minister of Commerce has forbidden, until further notice, the importation into Austro-Hungary of Vines, Grapes, trees, shrubs, and other plants, and generally of all green or dried plants, fruits, vegetables, and other horticultural products of Roumania.—I have, &c.,
(Signed) PERCY SANDERSON.
"The Marquis of SALISBURY, K.G., &c."

— **INFLUENCE OF LIGHT ON TRANSPIRATION.**—On December 3 Rev. G. HENSLOW is expected to make a communication to the Linnean Society, on the influence of the different rays of the solar spectrum on the transpiration of plants, a subject on which he has been known to have been experimenting for several years.

— **PASSIFLORA KERMESINA.**—This is a charming subject just now in one of the plant-houses at Gunnersbury Park, Acton. It is trained along a bar in the apex of the span of the roof, and its bright and attractive blossoms are particularly attractive and numerous.

It is a lovely free growing slender kind, with trilobed dark green leaves; the flowers are abundantly produced. As an autumn and winter flowering type it can be highly commended.

— **LINNEAN SOCIETY OF LONDON.**—A meeting will be held on Thursday, November 19, at 8 P.M., when papers on the following subjects will be read:—1. "On the Perignathic Girdle of the Echinoida." Professor P. M. DUNCAN. 2. "Anatomy of *Sphaerotherium*." GEO. C. BROWNE. 3. "Immature Stages of *Tegeocraus capheiformis*." A. D. MICHAEL.

— **FLORA OF THE PERUVIAN ANDES.**—A paper on this subject by Mr. JOHN BALL was read at the Linnean Society, November 5. His statements referred chiefly to the western slope of the Cordilleras. From the collections made and other data so far as this region of Peru is concerned, it may confidently be answered that the limit of alpine vegetation has been placed by previous writers on the subject as far too low. In the present instance there can be no serious error as to heights, seeing these are based on those of the railway engineers. The explanation of this relatively high extension of the temperate flora depends on the peculiar climatical conditions. Rain occurs but sparingly, the nights are cool, but frost scarcely known; whereas in the plateau region eastward storms, heavy snow and frost are frequent. The vegetation of the region visited Mr. BALL divides into a subtropical dry zone from coast to 8000 feet, a temperate zone reaching to 12,500 feet, and an alpine zone upwards to 17,000 feet above the sea-level. As regards the proportion in which the natural families of plants are represented in the Andean flora, the Composite amount to nearly one-fourth of the whole species, next to these the grasses about one-eighth, the Scrophulariaceae supply 5 per cent., while Cruciferae, Caryophyllaceae and Leguminosae each are represented by about one-thirtieth of the whole. The Cyperaceae are conspicuous by their absence. A remarkable feature is the presence of four *Crusulaceae*. If the proportions of the endemic genera and species be taken as criteria, then, as far as materials admit, the Andean flora appears to be one of the most distinct existing in the world. Mr. BALL agrees with those who think it probable that the south polar lands constitute a great archipelago of islands. To the region in question he is inclined to refer the origin of the so-called Antarctic types of the South American flora.

— **ROYAL METEOROLOGICAL SOCIETY.**—At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 18th inst., at 7 P.M., the following papers will be read:—"The Helm Wind of August 19, 1885;" by WILLIAM MARRIOTT, F.R. Met. Soc. "The Typhoon Origin of the Weather over the British Isles during October 2, 1882;" by HENRY HARRIES. "Note on the Principle and Working of JORDAN'S Improved Sunshine Recorder;" by J. B. JORDAN and F. GASTER, F.R. Met. Soc. A committee has been appointed to take into consideration the question of the supposed diminution of water supply and the suggested increase of floods. The committee is desirous of obtaining as much information as possible, and will therefore be very glad to receive any data that may have any bearing upon the subject, and showing the past and present state of the water supply, either from gaugings of wells or springs; the height of flood marks in rivers, streams, and lakes; the records of low-water periods; or any historic data which may have been collected relating to the subject. Information relating to the period between 1825 and 1835 would be extremely valuable, in order to enable the committee to fill up a gap in the diagram accompanying the report in the *Quarterly Journal* for July, 1885. All communications should be addressed to the Assistant Secretary, Mr. W. MARRIOTT.

— "VORLESUNGEN ÜBER BACTERIEN."—Botanists and others interested in the study of Bacteria, whether as lowly organised fungi assuming various forms, according to the condition in which they grow, or in relation to the various diseases known or suspected to be connected with their presence, will be glad to hear Professor DR BARY'S views on the subject. His lectures are published separately, and may be had of WILLIAMS & NORWATE. Plant diseases attributable to these organisms occur in the Hyacinth (the yellow rot, described by WAKKER, see *Gardeners' Chronicle*,

vol. xxiii., p. 14); the Pear blight, described by BURRILL, *Gardeners' Chronicle*, November, 1885; the erosion of Wheat grains, observed by FILLIUS, and the "Naxos fault" of the Potato, described by REINKER and BERTHOLD; see *Gardeners' Chronicle*, p. 14, vol. xxiii.

— DR. CARPENTER.—The announcement of the death of this gentleman, under very painful circumstances, will be read with general regret. Dr. CARPENTER'S career is an instructive one. Educated as a physician he early in life renounced the practice of his profession for the pursuit of pure science. His works on the Physiology of Men and Animals and on the Microscope and its Teachings gained for him a high reputation, but little profit. Hard work of excellent quality brought but little remuneration, even although he became as well known to the general public as to the scientific few. After several years he obtained the office of Registrar to the University of London, a position which, while it afforded him an adequate income, brought him into contact with a large number of influential men, and most of the foremost of their time in matters intellectual. Easy circumstances by no means benumbed his faculties so far as scientific work was concerned, and Dr. CARPENTER continued to the end to work in his favourite departments of research, and took a leading part in the dissemination of scientific truths among the public. His services to the University in particular, and to science in general, were such as to ensure for him the respect due to high principle and honest, conscientious work.

— "HORTICULTURAL DIRECTORY" FOR 1886.—We notice with much satisfaction this useful publication for next year, published by Dr. HOGG, at the *Journal of Horticulture* Office, 171, Fleet Street, E.C. The book contains the usual information with regard to gardeners addresses, brought as far as possible up to date.

— ANEMONES.—Messrs. J. CARTER & CO. have sent us some flowers of the strain of Anemone "St. Bridget Crowe," cut from plants grown in the open ground from seed sown in March. The flowers were of bright colours and large size. Certainly it is pleasing to be able to have Anemones in flower at this season, especially with such a variety of colours as we noticed in these flowers. There were purple, crimson, and other shades of red, whilst one had petals of delicate pink finishing off in white, and another had this order of the colours reversed.

— ANGRICUM LEONIS.—Some uncertainty prevails as to the mode of spelling this word. We have seen it spelt LEON, Leonei, and Leonis. As the name was given in compliment to M. LEON HUMBERT, we imagine Leonis to be the more correct form.

— PASSIFLORA VIOLACEA.—This beautiful Brazilian Passion-flower is figured in the *Acme Horticult* for October 16. It has palmate, three-lobed leaves and very long peduncles bearing a large flower about 3 inches across, the petals lilac, the coronal threads as long as the petals, curved, blue at the base, white at the tips. The sepals are provided with long, leafy points. It is remarkable that so beautiful a species should not have been introduced previously. It will be distributed by M. BRUNANT, nurseryman, Poitiers.

— BULB CULTURE IN HOLLAND.—We quote the following details from the *Illustration Horticult*:—In thirty parishes in the neighbourhood of Haarlem alone, an area of upwards of 505 hectares is devoted to cultures of this kind, viz., Hyacinths, 231 hectares; Tulips 205, Crocus 74, Spirea, Hoteia, and Dientra collectively, 22 hectares; Narcissus, 9; and miscellaneous bulbs, 52 hectares. A hectare is about equal to 2½ acres.

— We hear that the whole of the stock of plants of the Cape Wax Climber, *Macroloma lineare*, has passed into the hands of Messrs. J. CARTER & Co. for distribution.

— CHESTER.—The new Mayor of this ancient city is Mr. GEORGE DICKSON, senior partner in the old firm of JAMES DICKSON & SONS, nurserymen.

— GARDENING APPOINTMENTS.—Mr. W. A. COOK has been appointed Gardener to W. WILLS, Esq., 110me Wood House, Peterborough.—Mr. R. H. HOLLOWAY, late Foreman at Headfort House, Kells, Co. Meath, has been appointed Gardener to Lord CASTLETON, Granston Manor, Abbey Leix, Queen's County.—Mr. HENRY REED, late Foreman to Mr. OLLERHEAD, Gardener at Wimbledon House Gardens, has been appointed Gardener to Mrs. MEINERKZHAZEN, Belmont, Wimbledon, Surrey.

CHRYSANTHEMUMS, ETC., AT MESSRS. VEITCH & SON'S, CHELSEA.

TITS display of Chrysanthemums at this nursery is very fine, and although the majority of the plants require a little more time to perfect their blooms, the collection will repay a visit from now till some time to come. Only the most approved varieties are grown, and of these the following were the best:—Collingfordii, the new crimson, orange-centred variety, was in fine order, and proved itself worthy of a place in the best of collections; Flambeau, somewhat similar, but hardly so large in the bloom; Mrs. J. Crossfield, a most attractive incurved pink-blush; La Charmeuse, a pretty light purple flower, with tips of petals forked; Francis Delaux, a grand dark crimson; Carpet, deep brick-red, bronze centre; Isidore Feral, bright pink—Japanese; Mons. Heeri Jacotot and Mons. Mousillac, Boule d'Argent, a pleasing pink variety; Beauté des Jardins, a good crimson; Mons. Roux, somewhat similar to F. Delaux; Brise du Matin, beautiful flesh-pink; F. A. Davis, the best dark; La Tendresse, orange-pink, small but distinct; William Robinson, bright orange; Bronze Jardin des Plantes, a grand old variety that ought to be in every collection; George Gordon, a good dark, Mons. Burnet, a large light pink flower; Mons. Burnet, a large light pink flower; J. Laing, a fine flower, brick-red, with orange; Perle des Beautés, a pretty little dark symmetrical variety; Criterion, fine large orange-yellow; some fine blooms of Dr. Sharpe.

Amongst the new Continental varieties the following were the best. The colours of new varieties are becoming so varied that one is quite at a loss to satisfactorily describe them. The best of these were Mlle. Melanie Fabre, deep lilac, good petals; M. Freeman, somewhat similar, but lighter; l'Aube Matinale, a fair sized flower, resembling no colour in our vocabulary, but corresponding to the "crushed Strawberry" of milliners, &c.; L. Laing, a good deep orange; l'Adorable, large, bronze; Souvenir de Haarlem, a most beautiful flower of a deep flesh-pink colour, finely curved petals, lying well together, and forming a compact bloom of great excellence; M. A. Vilmoren, a good flower, introducing a new shade amongst the "Buff's." While visiting the Chrysanthemums time should be found for a run round the houses devoted to Carnations, Bouvardias, &c., where the visitor will be amply repaid. In an intermediate-house was a large batch of those old attractive favourite plants *Lasiandra macrantha* and *L. macrantha floribunda*, the latter being the more prolific in bloom and dwarfier and of better habit, most of the plants being about 8 inches high with at least five fully developed buds on them. In the cool hard-wooded houses too was a fine lot of Crowea, a greenhouse plant of great value for the present season, its pretty pink star-like flowers and fine dwarf compact habit stamping it as a grand decorative plant. The greenhouse *Rhododendrons* were as usual in vigorous health with a fair sprinkling of bloom.

To describe the collection of Orchids would occupy too much space, many fine varieties being in bloom, and the Pitcher-houses were a sight worth travelling a long way to see.

W. CUTBUSH & SONS, HIGHGATE.

A remarkably fine collection, neatly arranged in an improvised canvas house, the soft light inside of which shows the colours of the blooms off to perfection. The plants for the most part are very dwarf, with abundance of robust dark green foliage, but we were rather too early to see them at perfection, the cold bracing air of Highgate Hill having delayed the progress of most of the varieties considerably. The display of bloom is, however, very good, though nothing to what it will be in a week or two. A glance at the following list of names will indicate better than words the choice character of the collection:—Margot, White Globe, Julia Lagravere, one of the best of the old darks when well done; J. Delaux, Nil Desperandum, Lady Margaret, Prince of Wales, Gloire de Toulouse, Orach, Peter the Great, James Salter, Geo. Gleany, Baronne de Prailly, Golden Rhine, a very pretty little yellow; grand examples of Elaine, Mons. Astorg, Triomphe du Nord, Mrs. Dixon, Lady Talford, Mrs. C. Rundle, Source d'Or, very fine in form and colour; Dr. Macary, a very pleasing variety, pink with white; Henry Jacotot, Golden Jardin des Plantes, a fine yellow; Duchess of Albany, La Charmeuse, Heloise,

L'Africaine, Golden Christine, Lord Beaconsfield, R. Ballantine, very fine. Fine blooms of Prince Alfred, Dr. Sharpe, General Bainbridge, a very fine, slightly incurved bronze, though rather flat; Madame B. Rendater, Flambeau, a grand dark; Striatum, Perfection, Marquis of Lorne, a distinct orange-bronze; Albert, fine bright brick-red coloured flowers; Japanese Venus, Meteor, Garnet, Helvetia, a very lively light crimson; Cherub, a good bronze-yellow; Bronze Dragon, good; Barbara, and Golden Queen of England. This collection will last for some time, as the major portion of the plants are yet to bloom, but are giving promise of a grand show by their numerous large, plump, rapidly unfolding buds. C. Z.

MR. B. S. WILLIAMS.

Here is a fine collection staged in the large conservatory, where they are shown off to advantage by the overhanging Palms, Ferns, &c. A praiseworthy feature is also introduced in a row of stands containing cut blooms along the staging, neatly covered with verdant moss, by which there is a good opportunity of comparing the qualities of the blooms for show or other purposes. Only varieties that are in demand or have some special quality to recommend them are grown, and the following were the most noticeable as suitable for decorative purposes:—Mrs. Dixon, Scur Melanie, a fine dwarf floriferous white; Chinaman, Comte de Germiny, Dr. Sharpe, in grand condition; Triomphe du Nord, a fine dark; Peter the Great, a lively yellow; Prince of Wales, Simon Delaux, L'Île des Plaisirs, Soleil Levant, Madame Deveril, a very distinct and pretty variety for grouping; also Red Dragon, Virgin Queen, a showy white; Gloire de Toulouse, Gluck, Thunberg, Lady Selbourne, still, and likely to be a great favourite; Bend Or, a grand yellow; Fulton, another good yellow; Princess Royal, a very pretty Anemone-scented variety; Beauté des Jardins, and J. Delaux.

Notices of Books.

The House Sparrow. (London: William Wesley & Son, Essex Street, Strand.)

This is an exhaustive little treatise, containing a paper on the house sparrow, *Passer domesticus*, by an ornithologist, J. H. Gurney, jun.; one by a friend of the farmers, Colonel C. Russell; and another entitled "The English Sparrow in America," by Dr. Elliott Coues.

"There's a special providence in the fall of a sparrow."
Hamlet.

Thus reads the motto on the title-page of this pretty book, bound delicately in green, and adorned with a golden sparrow. There is no separate memoir by a friend of the sparrows; indeed, the book is not at all from the sparrow's point of view, but is a very one-sided affair altogether. There is a full account of the life-history of the bird, his deeds, and his misdeeds, and we regret, but are not surprised, that the summing-up of his judges is dead against him. It appears that only in his very early stage of existence is he to be fed upon grubs and insects. No sooner can he fight for himself than he betakes himself to the farmers' fields, where he not only devours his grain, but spoils more than he devours. His domestic character is of the worst possible kind; he robs chickens, and chases from his neighbourhood birds of a more peaceful nature.

In America, where the sparrow has been introduced, it has become a perfect pest, and those who were at one time anxious to see it established there are now only too anxious to pay for its destruction.

The sparrow increases rapidly and we think there is no doubt whatever as to the advisability of diminishing its numbers in localities where it is superabundant. We are not, however, prepared to advocate its extermination, as some do, for in London and other large and grimy towns, it is almost the only wild (?) bird that will make itself at home, that it has chased away from the towns many wild birds has not yet been sufficiently proven—the cat has in this respect much to answer for also, we think. In spite of its sins (and in towns it offends mainly by robbing chickens and blocking up gutters with its nests), its tameness, the amazing

impudence and boldness of so small a creature (see it in the Tuileries gardens in Paris for instance) its liveliness and even its shrill chirp are of interest to many who never see a "bit" of the country from one year's end to another. As a remedy against the evil of too many sparrows Mr. Gurney suggests that "sparrow pie is a toothsome dish," also that the bird is very good "cooked and eaten in the same way as larks." Certainly where both birds are numerous let us save the larks, and devour the sparrows! We think, however, that the most humane way of lessening the numbers of this little pest where it is superabundant, is, as is suggested, to "destroy the eggs and nests whenever it is possible to do so."

NOTES FROM MESSRS. CLIBRAN & SON'S, ALTRINCHAM.

MICROLEPIA HIRTA CRISTATA.—This very beautiful Fern, when grown in a pot, is apt to lose a good deal of its distinct character unless stood on a stand above its surrounding fellows, so that its dense tassels may be seen to the greatest advantage. Calling at the Messrs. W. Clibran & Son's, Oldfield Nursery, Altrincham, a few days ago, I was pleased to find they were growing it with others of a somewhat pendulous habit in baskets suspended from the roof. Under these conditions the whole of the plant can be seen to advantage, and a well grown plant with dense tufts and tasselled pinnae hanging round the sides of the baskets gives a much better idea of worth and beauty than when grown with others on the stages or tables. This is one of those that require a little more hicc during the winter than some that will grow and succeed well with it during the summer. Its fronds, which are of a soft downy texture, are very liable to damp and rot if exposed to much cold and wet. It would seem to prefer a temperature where *Davallia Mooreana* does well—where, in fact, the thermometer does not often get below 55° during the winter months.

RHOODENDRONS.

For forcing *Rhododendrons* one of the best and earliest is Cunningham's White. It will soon be time to mark those that can be lifted from the borders for this purpose; where, however, they must be procured from the nurseries, this and Jenny Lind and *caucasicum roseum* are such as come on quickest, and can more confidently be reckoned upon. A splendid stock of these useful sorts are grown, and are now full of bud; potted up and gradually put into a little heat they may be had in bloom by the time the last of the *Chrysanthemums* are over, and so obviate that tiresome break that so often takes place during the latter part of January and beginning of February.

MARÉCHAL NIEL ROSE.

This grand Rose receives special care and treatment here. There is at the present time a fine stock of plants, with shoots from 12 to 15 feet long. These are now stood outside, to ripen and mature, and can confidently be expected to produce a fine lot of flowers in the coming spring. The plants are about twelve months old; grafts during the past summer have had every attention given them in one of the light structures here, kept free from filth and mildew, and now have shoots stout and strong, that will certainly harden and be sure to give satisfaction to all who may procure them. It is just one of those things that should be in every garden, not merely singly, but where space can be spared another should be planted out to take the place of the older one. *W. Swan.*

WHEN TO EAT FRUIT.—Fruits, to do their best work, should be eaten either on an empty stomach or simply with bread—never with vegetables. In the morning, before the fast of the night has been broken, they are not only exceedingly refreshing, but they serve as a natural stimulus to the digestive organs. And to produce their fullest, finest effect, they should be ripe, sound, and every way of good quality; moreover, they should be eaten raw. What is better than a bunch of luscious Grapes or a plate of berries or Cherries on a summer morning, the first thing on sitting down to breakfast? Or a fine ripe Apple, rich and juicy, eaten in the same way? In our climate Apples should constitute not the finishing, but the beginning of the meal, particularly the breakfast, for at least four months in the year; and fruits, raw or cooked, should make a part of the morning and evening meal (provided sugars are eaten) during the entire year. *Farm and Home.*

HOME CORRESPONDENCE.

Vanda cœrulea.—It is amusing to see practitioners in their long clothes talking about mastering the culture of *Vanda cœrulea* after eighteen months' experience. A writer at p. 563 says:—"I bought seven plants of it seven months ago," and then goes on to give a history of his cultural success. But, pray, what does that amount to? So far as these particular plants are concerned he is not out of the alphabet of cultivation. When he has grown the plants, say, ten years, and can produce them well clothed with leaves without speck or blemish, flowering periodically, then there will be room for a little "crowing." It is only misleading beginners to tell them that because one man or a dozen of them can grow say, *Epidendrum bicoloratum*, *E. nemorale*, *Cattleya superba*, *Ionopsis paniculata*, *Galeandra Devoniana*, *Oncidium Lanceanum* decently for eighteen months that the same cultural routine will hold good for ten years! Just let your ambitious correspondents who are wanting to take a first-class certificate for cultural skill have a try at these species, and if they are not very much superior in practical skill to those who have had a twenty and thirty years' try at them, they will break down with the most of them before half the decade has been run. I do not want to freeze the ardour of any collector or cultivator, but I like to see difficult subjects fairly assessed. In times gone by we had to be contented with "singles" of many of those species, now they are imported in such numbers that the price paid then, £3 for, say a single plant, is now sufficient to buy a score. Any one now-a-days can afford to have a variety of practice, and it would be a pity for horticulture if some cultural progress could not be recorded. But I want to ask any successful cultivator of *Vanda cœrulea*—I mean one who has grown and flowered the species for the past ten years—whether he has got over the conditions of atmosphere that creates that spot which so disgraces the leaves, which the writer and the Rev. M. J. Berkeley some eighteen years ago simultaneously detailed in the *Gardeners' Chronicle* of that time, and what these conditions are? I am sure it would greatly interest and educate more than *James Anderson, Meadow Bank.*

Single Dahlias and Marguerites.—The most effective ornaments of my garden for the past two months have been single Dahlias and the white Marguerites. The latter were struck from cuttings taken in March, a dozen in a small box; they were planted out in June, and have been till lately quite a conspicuous feature in an oval bed; hundreds of their showy discs of snow and gold might be gathered to-day. I moved a few plants to the greenhouse a fortnight ago, and they promise to furnish cut blooms up to Christmas. As for the single Dahlias they have been charming; they were raised from seed which I gathered from some of Ware's fine varieties last autumn. Most of the flowers are yellow, but there are also half-a-dozen whites. It would appear from this circumstance that the lighter coloured varieties ripen their seeds most perfectly. I do not know of any garden flower at the dull time of the year so elegant and effective for vases, &c. There are various shades of yellow among the seedlings, but one of them is a pure bright primrose. *T. W. Harrow.*

Hedychium flavescens.—This species, under similar conditions and grown freely, always exceeds the more universally grown *H. Gardnerianum* in stature, but has narrower, paler coloured leaves. The stems attain a height of 4 to 6 feet, and being less robust than those of the last named species, spread about rather loosely if unsupported. As a flowering plant, however, it excels the common species both in the relative size of the flowers and their delicious perfume; for while the odour of *H. Gardnerianum* is by no means inviting in the other case it is not only powerful, especially if the sun is shining and the temperature rather high, but is equally agreeable. In this respect it agrees with another closely allied congener, also flowering at Kew, namely, *H. coronarium*, whose flowers are pure white with a faint blotch of greenish-yellow on the broad deeply bifid lip. The flowers of *H. flavescens* have relatively longer petal-like stamodia than those of the last named species, and pale yellow fading to white at

their tips. The true petals or rather perianth-segments of this order of plants are usually if not always small, narrow, and insignificant or so inconspicuous as to deserve little attention for decorative purposes. *Hedychiums* as a rule delight in a liberal supply of water while making their growth, and *H. flavescens* is grown in a pot partly plunged in the tank of the Water Lily-house. A figure of it is given in *Loddiges' Botanical Cabinet*, 723, while another is given of *H. coronarium* at 507 of the same work. *J. F.*

Dianthus japonicus.—In general appearance this species may be said to resemble in a measure that of *D. barbatus*, but is botanically very distinct. The flowers are about the same size, and pink when first expanded, deepening to a uniform red, or reddish-purple, and the inflorescence is more decidedly cymosely paniced than *corymbosus*, as in *D. barbatus*. The leaves are ovate or oblong, of a dark green colour, and present a stout leathery appearance, quite unusual in the genus. It was originally introduced to British gardens in 1804, and is stated to be a half-hardy perennial, flowering in June. Thunberg, who figured it in his *Flora Japonica*, t. 23, says it grows in the neighbourhood of Nagasaki, Japan, and flowers in the month of August. A strong plant has been flowering for many weeks on the rockery at Kew, and in spite of the cold, foggy, and rainy weather continues to expand its flower-buds and make itself conspicuous when the great majority of herbaceous plants begin to look ragged, except the usual autumnal display of North American Composites and a few stragglers, such as *Lobelia* of the *L. splendens*, *cardinalis*, and *syphilitica* type. The plants in question were raised from seeds recently reintroduced, and which it is to be hoped will prove sufficiently hardy to resist ordinarily severe winters. *J. F.*

Narcissus viridiflorus.—This plant seems still to defy all attempts to cultivate it successfully in England, and indeed it is hardly worth the trouble taken with it, except as a curiosity. All to whom I sent it two years ago tell the same story: the bulbs continue sound, and occasionally throw up a leaf, but seem to have lost all reckoning of times and seasons. No doubt, bulbs, if dug up when dormant, may be persuaded to flower once, the flower germ having been formed in their home near Gibraltar. In this way I have at present two bulbs flowering in my greenhouse. About a dozen bulbs were sent to me in May, of which I distributed all but four, which I potted, and baked all summer, and in September removed into a hot-bed for a month, watering them well. The flowers are very fragrant, the scent resembling that of *Chimonanthus fragrans*. *C. Wolley Dod, Edge Hall, Oct. 30.*

Impatiens glandulifera not Eaten by Rabbits.—In planting some *Rhododendrons* last year (spring of 1884), in a wood very much infested with rabbits, a small plant of *Impatiens glandulifera* happened to be growing on the ball of earth attached to one of those shrubs. It grew and flowered, and remained throughout the season unmolested. This year a number of plants of this balsam were transplanted both in the wood and in open places in which rabbits were numerous and hungry, and I still find the plants untouched. *Impatiens glandulifera* is a free growing and flowering plant, and looks well in masses in woodland scenery, and when other plants cannot be grown, on account of rabbits, it may be introduced with advantage. It grows from 4 to 5 feet in height, and should be sown in the spring of the year. *W. Ingram, Belvoir.*

Treatment of Carnation Layers at Present.

From this forward is the time to remove rooted layers, and to get them ready for the winter, in private collections, and also for purchasing the splendid recently introduced new varieties for adding thereto. I am reminded of this by a large box of three dozen "pairs," in splendid condition, from a certain well known "Home of Flowers." I was brought to see yesterday, just received by a friend, how to treat them? This was a material point, and upon which I beg you to invite discussion. My friend does not exhibit, and grows all his flowers, as far as possible, in the open air. How to do this, and yet run no risk of losing any of the splendid collection of Carnations and Picotees he had been purchasing was the crux. At last we came to the conclusion to get ready a large frame and fill it with tan, which was easily accessible—to give a mild bottom-heat—and to

transplant the rooted layers in boxes, and put them therein. The 2^d or 3^d of heat generated by the tan and leaves will induce slight root action during November, but artificial heat is not at all necessary. A cold frame, kept dry rather than moist, answers admirably. If at all moist after the layers are put in, the dreaded "spot" makes its appearance on the leaves, and the collection will soon be seriously thinned out. Carnations and Picotees are like Pansies—once root-action has commenced they continue moving wherever the temperature is above the freezing point. To induce this root-action after the reception of the plants at this dull cold season, when the atmosphere is generally damp and foggy, is most material, and hence my recommendation to my friend. He believes in growing these useful and brilliant flowers in the open air, as I do, and he would not hear of potting them, as he wants them for beds next spring. That the very best varieties can be thus grown even in the heart of London smoke, has been proved by the bedding-out success Messrs. Veitch have had at Chelsea. No person, therefore, who has the smallest patch of town garden, and a cold frame to keep his plants (layers) during the alternate frosts and moisture of the winter and spring—dry cold they do not mind any more than the Anticula—may at once procure rooted layers of the choicest kinds and transplant them into a bed next February, with the certainty that he will be able to cut a bouquet of blooms from July to November during 1886; with my limited collection, which contains a few dozens of the perpetual kinds, especially the crimson selfs and yellow grounds, I can do so even to-day. But they must be fed, or the September and October blooms will not be worth cutting; however, this point another time. As I said, my friend did not want to put up seventy-two plants, and they could not be planted out, so we decided to get suitable boxes and put in the "pairs" of each variety across, and easily accessible, so as to be readily lifted out with the trowel and transplanted into the beds when the time came. I mention this plan in detail because it is not usually adopted, and because it has many things to recommend it to amateurs and suburban villa gardeners. The soil or compost is of some consequence; give, therefore, a preference to old pasture sods (loam), pulled asunder. If a field is near that was ploughed up last season, the sods will suit admirably, and, what is very important, the larvae of the click-beetle—the dreaded wireworm—is rarely found in those sods the second year, probably having assumed another form. In any case, the soil should be examined for it; if present it will find your Carnation root-stems, and make the centre its new home, until eaten through. Lime and brick rubbish, say an eighth part, will be useful to mix with the soil, and if sea shells are convenient pound some up and add a small portion. I do not give water if the soil around the roots of the new layer is at all moist, for the present, and during the winter your frameful of Carnations, Picotees, and the choicer Pinks will have more to dread from dampness than drought. *W. J. Murphy, Clonmel.*

Solanum Maglia.—We had Darwin's Potato yesterday to dinner—pure Maglia, untouched by hybridisation. Our vote was that it could not be called first-rate in its present phase of development, but that it would pass muster as a fair average eatable Potato, and that there was no trace of bitterness in its taste. After one year's cultivation in prepared soil at Kew a dozen tubers which I exhibited on behalf of Mr. Thistelton Dyer at the Linnean Society on Thursday night weighed 28 oz. *J. G. Baker.*

Fruiting of Yucca (p. 598).—Mr. Morse asks records of Yucca fruiting in England. In 1876 Y. recurva fruited here, and I sent fruit and seeds to Kew and to Dr. Engelmann. I believe it has fruited since, but I have no record of it. This year a few abortive fruit appeared, but soon fell off. I suppose any of the species might be artificially fertilised, but I have never tried the experiment. *H. E. Ellacombe.*

—These plants associate well with Tritomas, and impart quite a special feature to the border they occupy. For landscape gardening they have certainly few equals when well placed, the rigid leaves and large terminal panicles of white flowers giving so distinct an appearance to these noble plants. In Y. recurvifolia we have a most desirable plant, with gracefully recurved leaves and an abundant supply

of greenish-white flowers. The panicles are more branched than in the nearly allied Y. gloriosa, and the leaves differ considerably in being less concave and not nearly so sharp-pointed. Y. filamentosa is another very ornamental plant, with creamy-white flowers which are shown off to advantage by the well branched panicle and large stout scape. The leaves are broad and arranged in a dense rosette. There are several other species in cultivation, but for ordinary gardening purposes the above are about the most floriferous and easy of cultivation. *X. J.*

Galanthus nivalis var. **Octobrensis.**—Through the kindness of Mr. Barr I have received a living specimen sent to him by Mr. James Allen of this autumn-flowering Snowdrop. It does not agree with the description of the autumn-flowering Galanthus Olgae of Orphanides from Mount Taurus, and, indeed, presents no obvious botanical difference, so far as flower goes, from the typical spring-flowering Galanthus nivalis. The outer perianth segments are oblong-spathulate, about three-quarters of an inch long, the inner deeply emarginate, with rounded lobes, with a green line at the top on the outside, and abundant green longitudinal streaks inside. The stamens are half as long as the inner perianth segments, with short filaments and anthers lengthened out into a long point. *J. G. Baker.*

Peter Whitton.

Cotton Wool for Packing Peaches.—This has been unfavourably spoken of several times lately, for the above purpose; but however good dry moss may be, it is not every one that can obtain it in sufficient quantity, and the following facts will show that cotton wool may be used without danger if used carefully. On October 12 I packed in a small box in the usual way, a dish of fine Salwey Peaches, that were ripe enough for dessert, for exhibition at South Kensington Fruit Show. Owing to urgent matters I was not able to leave home; they were therefore sent enclosed in a large box with other things, and delivered by the railway company. I am told they were duly staged, but without any exhibitor's card attached, at any rate I did not expect they would be of any use after the show was over, but contrary to my expectation, they were repacked and returned, this time by luggage train, and reached me on the 19th. As we were very busy the box was not opened until the 21st, when I was very much surprised to find they were still fit for exhibition. *W. H. Divers, Kelton Hall.*

AËRIDES VANDARUM.

In the *Gardeners' Chronicle* of September 28, 1867, Professor H. G. Reichenbach says:—"It is astonishing how long an error may last. A single glance at the figures in the *Botanical Magazine*, and in Wright's *Icones*, vol. v., t. 1740, shows how different the plant above named is from A. cylindricum. A Vandarium has very pretty white flowers, reminding one of Vandara flowers by the reflexed petals and by the undulation of both sepals and petals." Kept up by the great resemblance of the plants in their habit of growth, and by the few opportunities there have hitherto been of seeing them in flower, the error is as widely spread now as ever, and we are therefore glad of the opportunity of illustrating both the plants, and thus affording an easy means of putting the matter right in the future (fig. 143). Aërides Vandarum and A. cylindricum have been called shy flowers, but their better culture in a few of our gardens of late years proves them to be free enough to produce their blooms if properly grown.

In Lord Rothschild's garden at Tring Park Mr. Hill grows all the terete-leaved Aërides and Vandara in perfection in a warm and rather sunny house. There—planted out in sphagnum moss, Vandara teres may be seen with hundreds of flowers open at one time; Y. Hookeri in pots and fastened to blocks blooming equally well but in less numbers, and both the Aërides we here notice flowering as well as could be desired. Mr. Hill thinks the nearer the tops of the plants are to the glass the better their chance of producing flowers, provided the temperature be kept regular and not allowed to get below 60° in winter. *J. O'B.*

Reports of Societies.

ROYAL HORTICULTURAL:

November 10.

THIS meeting, almost the last of the year now drawing to its close, was held in the conservatory of the Royal Horticultural Society's Gardens.

Some groups of Cyclamen, one of Bouvardias, a few cut blooms, and most of the specimens, chiefly new, or newish varieties, and some few Orchids and seedling Apples, comprised the main portion of the exhibits, the conservatory presenting rather a dreary look after the animated and crowded days of the past season.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. J. James, J. Hudson, W. Bealby, H. Herbst, J. Walker, J. Fraser, Shirley Hibberd, G. Duffield, H. Williams, J. Dorniny, J. O'Brien, H. Turner, E. Hill, Dr. M. T. Masters.

A pretty collection of *Barkerias* in bloom, including B. Lindleyana; *Odontoglossum Kramerii* var. alba, and the small-flowering *Oncidium retusum*, a yellowish-white flower of small beauty, came from Dr. Deeke, The Glen, Lewisisham (gr., Mr. Norfolk). The interesting lot received a Cultural Commendation.

Colonel T. Clarke, Daventry, showed *Pouretia flexilis*, a Bromeliad with recurved foliage, narrow, and serrated, the central portion of the heart-leaves being of an intense scarlet colour.

The New Plant and Bulb Company, Colchester, had again several varieties of *Nerine*, the best being N. Fothergillii, a brilliant scarlet, of much usefulness at this season; a new form of *Cypripedium igneum* named Wallacei, in which the dorsal sepal is spotted a dark brown, and margined with a distinct white band, the whole flower having the peculiar varnished look of this section of *Cypripedia*; a noteworthy plant.

Messrs. J. Veitch & Sons, Chelsea, sent a collection of *Cyclamen* in good bloom and of rare quality; another of *Bouvardias*, as noticed in our report of the last meeting; several *Chrysanthemums*, as M. Freeman, a rose-coloured, a rose-kind, La Japonaise (Delaux), orange-coloured; M. Vilmorin, a reddish-copper, fine in hue and form; M. Paul Fabre, red-brown; and a few others of Japanese incurved and three-petalled of lesser merit. A useful autumn flowering *Androsace*, from Chantreaux, of a pale pink of medium size and good form. A Silver-gift Bankers Medal was awarded for the various exhibits.

Mr. W. Bill, Chelsea, sent *Pancratium fragrans macrophyllum* in good bloom, *Dendrochilum Cobbanium* giganteum, the most robust variety, and showing the longest racemes of flowers, which are French-white and yellow. Other plants shown, as *Mormodes pardalinum* unicolor, *Barkeria*, *Vanda Sanderiana*, *V. cœrulea*, *Oncidium Forbesii*, *Trichostoma suavis*, *Cattleya aurea*, and *Leelia autumnalis atrovirata*, are specified in our notice of plants in bloom at this nursery, in another page. A fine piece of *Tillandsia Lindenii vera*, dwarf-habited, much more so than T. Lindenii, the bracts rose-coloured, and the flower of the loveliest shade of blue imaginable; *Alcoxia Sanderiana*, green digitate foliage, white margined and ribbed; and *Enchiridium Mastersii*, nicely flowered, a mass in a broad pan, the flowers thrown well above the leaves. A rose-coloured, tasselled and quilled *Chrysanthemum*, M. Ghys, was also shown by Mr. Bull.

Messrs. Page & Sons, Great Nursery, Teddington, received a Silver-gift Medal for an excellent collection of *Cyclamen*, showing great variety in colouring, and, for the season, unusual size and substance in the flowers.

A very fine *Mynogramma schizophylla superba*, in a ro-inch pot, came from Mr. Wright, or to J. A. Whitlard, Esq., Roydon Mount, Streatlam Hill, S.W. This Fern, seldom seen so large as this, should, with a complete of good treatment, make a fine show specimen. It was Culturally Commended.

Mr. Owen, Floral Nursery, Maidenhead, showed the unusual feature, at this period of the year, of a collection of fresh-looking single-flowered *Daisy*, presumably from plants in pots; a good white *Pelargonium*, *Duchesse de Cairs*; a yellow *Marguerite*, and a collection of Japanese *Chrysanthemums*, cut from plants struck in June this year.

Mr. Marün, Blefield, Henfield, Sussex, showed a yellow sport from the *Chrysanthemum White Globe*, a three-petalled incurved flower, the best point in it being the clear canary-yellow colour; and fine *Chrysanthemums* in pots came from the same exhibitor.

Mr. Stevens, nurseryman, Putney, showed a plant of *Chrysanthemum Maiden's Blush*, a large, almost white flower, broad petalled and of great substance, possibly an exhibition variety of merit.

CERTIFICATES.

To Messrs. J. Veitch & Sons, for *Chrysanthemum* M. A. Vilmorin; and for *Amaryllis* Autumn Charm.
 To Mr. Stevens, for *Chrysanthemum* Maiden's Blush.
 To the New Plant and Bulb Company, for *Cyrtopodium* Wallacei.

Fruit Committee.

Present: R. Gilbert, Esq., in the chair; and Messrs. J. Taylor, G. F. Pritchard, J. Noble, — Harrison, A. Miller, A. Lancaster, F. T. Rivers, B. S. Williams, and Rev. H. H. D'Ombrian.

Mr. B. S. Williams showed again his black Grape, Winter King, well coloured, but barely ripe. This should be a deserving sort under good treatment, but as shown it was acid to a disagreeable degree.

which the general effect, especially under the electric lighting, was very satisfactory.

In an average season this date is fully two weeks too early; it is therefore very pleasing to record the fact that the exhibition was an exceedingly good one, the entries being very numerous and quite up to the best standard of recent years in quality. In some of the classes the competing stands were very close to each other, and the judges did not arrive at a decision without a careful comparison of the individual blooms. The principal class was an open one for cut flowers.

Twenty-four incurved and as many Japanese, not less than eighteen varieties of each, nor more than two of one variety.—For the four prizes offered in this class there were eleven competitors, the 1st prize being awarded to Mr. E. Molyneux, gr. to W. H. Meyers, Esq., Swanmore Park, Bishops' Waltham. His flowers were much in advance of those exhibited by the other competitors: they were in fact wonderful examples of good cultivation.

similar varieties to those already named; Cherub, Sir Stafford Northcote, and Novelty, were additional. Mr. Berry, Roehampton House, S.W., was 2d; Jeanne d'Arc was fine in this stand, as it was throughout. Mr. J. Holmes, gr. to G. M. Storey, Esq., Nightingale Lane, Balham, was 3d, with smaller flowers.

TWELVE INCURVED.

Mr. J. Wyatt, gr. to J. Perry, Esq., Braddenhurst, Caterham Valley, was 1st; he had good blooms of John Salter, Empress of India, Prince Alfred, White Venus, &c. Mr. E. Smith, gr. to T. Nye, Esq., Oakville, Castle Bar Hill, Ealing, was 2d.

SIX ALFRED SALTER CLASS.

Mr. Molyneux was awarded the 1st prize for six splendid blooms of this kind. Mr. Thomas Sadler, gr. to C. Lambert, Esq., was disqualified, because one of his blooms of Prince Alfred had sported to another shade of colour. The 2d prize was withheld.

EIGHTEEN JAPANESE BLOOMS.

The class brought out an excellent competition. The 1st prize was awarded to Mr. John Ridout, gr. to T. E. Haywood, Esq., Woodhatch Lodge, Reigate. Amongst other fine blooms the best were Dr. Macary, pale rose; Japonaise, Jeanne Delaux, The Lutinio, and Madame de Sevin, rich rosy-purple; Mr. J. W. Springbett, Holly Nursery, Cheshunt, was a good 2d; he had Madame de Sevin and Mons. H. Jacotot, very fine. Mr. Jas. Brown, gr. to A. J. Waterlow, Esq., Great Doods, Reigate, had the best twelve Japanese blooms, and Mr. Molyneux the 2d best.

SIX JAPANESE BLOOMS OF ONE VARIETY.

This brought out a much better exhibition than the six incurved. Mr. Molyneux obtained the 1st place easily with six remarkably large and fine blooms of Madame C. Audiguier, large even for that variety; Mr. C. Orchard, gr. to J. Galsworthy, Esq., Combe Warren, Kingston-on-Thames, was 2d with fine blooms of Mons. Jacotot; Mr. Burnett, gr. to Mrs. Fenton, The Grange, Hillingdon, Uxbridge, was 3d, with only moderate blooms of Triomphe du Nord. Excellent blooms of Elaine were exhibited by Messrs. Berry & Sadler.

TWELVE BLOOMS OF REFLEXED VARIETIES.

In this class Mr. Molyneux was easily 1st with a splendid bloom of Cullingfordi, rich crimson-scarlet; Phidias, Félicité, white; Mlle. Madeline Teizer, &c.; Mr. Sadler was 2d; Mr. E. Chadwick, gr. to E. W. Nelson, Esq., Ealing, being a good 3d.

TWELVE LARGE-FLOWERED ANEMONES.

Mr. E. J. Cole, gr. to W. Pethick, Esq., J.P., Sneyd Park, Bristol, gained the 1st prize—Empress, Lady Margaret, and Glück, very old varieties, were the best of these. Japanese Anemones were not admitted, and Mr. Gibson was disqualified owing to two blooms being in his stand. Mr. J. T. Salter was 2d, and Mr. E. Chadwick 3d.

Mr. Molyneux gained the 1st prizes for twelve pompons, three blooms of each variety, and also for twelve Anemone pompons, exhibited in the same way. La Purité was very fine in the former, Antonius and Madame Montels in the latter class.

SIX JAPANESE ANEMONES.

This class was not well contested. Mr. E. S. Cole gained the 1st prize. He had Madame B. Pigny, very fine, rosy-purple; also Sœur Dorothee Souille and Madame Closs; Mr. Springbett was 2d.

NEW VARIETIES.

Messrs. Laing & Co., Stansted Park, Forest Hill, exhibited a considerable number of the best new Continental Japanese varieties, and many good seedling forms raised in their own nursery. First-class Certificates were awarded to John Laing, a large full flower, a rich reddish colour, tinged with gold, the centre petals inclined, showing the reverse of a golden colour, and Madame Laing, a large flower with broad petals of a straw colour, the centre petals tipped yellow. Alpha, a seedling raised by Messrs. Laing, is very promising, but the First-class Certificate which it will probably receive some day was withheld, owing to one bloom only being exhibited. The seedling plant, Bronze Queen of England, shown by Messrs. Carter & Co., was, as it well deserved to be, Commended.

GROUPS.

Plants in pots arranged for effect, not less than 100 square feet, of incurved varieties, were staged by Mr. G. Stevens, St. John's Nursery, Putney; Messrs. Laing & Co., Forest Hill; and Messrs. Carter & Co., High Holborn, who received the awards in the order of their names, old well known kinds forming the majority of those shown.

Groups of Japanese varieties of the same extent of superficial area were staged by Messrs. J. Laing & Co., 1st; Mr. Stevens, 2d; and Mr. G. Edwards, Balham Nurseries, 3d. In the winning group were nice specimens of Hy. Jacotot, rich brown; Alpha, pale lilac; La Reine Marie, deeper lilac; Dormilieu, the broad petalled white Madame Astorg, as well as many of the now well appreciated varieties of French origin.

GROUPS BY AMATEURS.

Groups of plants of similar extent to the foregoing were shown by Mr. C. Orchard, gr. to J. Galsworthy, Esq., Combe Warren, Kingston-on-Thames, whose plants were well assorted, conspicuous being the new variety

FIG. 143.—AERIDES VANDARUM. (SEE P. 628.)

Mr. Rivers showed a seedling from Gansel's Bergamotte Pear, called The Parrot—perhaps from its imitating the qualities of the parent in a minor degree.
 Mr. A. Miller, Rood Ashton Park Gardens, showed seedling Apples, large culinary, which, probably from want of variations from old kinds, received no recognition. Messrs. Harrison & Sons, nurserymen, Leicester, showed seedling Apples Lord Melbourne, a fruit resembling Blenheim Orange, and dishes of Apple Annie Elizabeth, one of their own raising. A few fruits came from Mr. Lancaster, Holkham; Mr. Noble, Fortis Green; Mr. Pritchard, Sittingbourne; and Mr. Taylor, Soham; but nothing of especial merit.

GRAND CHRYSANTHEMUM EXHIBITION AT THE CRYSTAL PALACE.

Nov. 6 and 7.—This excellent show was held in the central nave of the building, tables for cut bloom and dwarf plants occupying the centre of the eastern half, the various groups having been disposed at wide intervals in front of the bordering beds and statuary—a method of arrangement that admitted of close inspection, and of

The incurved flowers were, back row—Queen of England, Lord Alcester, Queen of England, Alfred Salter, Empress of India, Alfred Salter, Lord Alcester, Empress of India; second row—Jean d'Arc, Princess of Wales, Emily Dale, Lord Wolseley, Princess of Wales, Emily Dale, John Salter, Golden Empress; third row—Empress Eugénie, Jardin des Plantes, Prince Alfred, Princess Beatrice, Retulgence, Lady Hardinge, Mr. Bunn, Nil Desperandum, Japanese; back row—Madame C. Audiguier, Fair Maid of Guernsey, Belle Pauline, a curving variety; Val d'Andorre, Baron de Frailly, Val d'Andorre, Meg Merrilies, Madame C. Audiguier; second row—Septre, Toulouse, Jeanne Delaux, Criterion, very fine; Madame Deville, Meg Merrilies, Madame Bertie Rendtler, Belle Pauline, Criterion; third row—Yellow Dragon, Mlle. Lacroix, Margaret Marrouchi, Elaine, Duchess of Albany, Madame de Sevin, Soleil Levant, and M. Astorg; 2d, Mr. Gibson, gr. to J. Wormald, Morden Park, Mitcham; 3d, Messrs. Dover, florists, Fareham, Hants; 4th, Mr. F. Holmes, gr. to A. B. Hill, Esq., Clapham Park.

EIGHTEEN INCURVED.

In this class Mr. Molyneux was again 1st, with nearly

Cullingford and Sulphur Gem, both fine in their way; 2d, Mr. W. Webster, gr. to Mrs. Scott, Mavis Bank, Grand Road, Upper Norwood; 3d, Mr. C. S. Bowman, London Road, West Crayke.

Six trained incombuntheaters.—1st, Mr. Cherry, gr. to Mrs. Gabriel, Norfolk House, Streatham, S.W., for small plants, fairly bloomed; 2d, Mr. J. Weston, gr. to D. Martineau, Clapham Park.

Four trained incurved.—Mr. W. Clarke, gr. to T. Bass, Esq., 15, Christchurch Road, Streatham, S.W., 1st; Mr. J. Howe, gr. to Mrs. F. Bennett, Tulse Hill, 2d.

For six trained specimens of Japanese kinds there was no competition. Mr. C. Portway, gr. to B. H. Portal, Esq., Daventry House, Upper Tooting; Mr. C. Orchard, gr. to Mr. Luff, gr. to R. H. Esq., Longwood, Court Road, Southam, were respectively 1st, 2d, and 3d, all these exhibits being of medium size, and in the main well bloomed, but wanted more time to expand their blooms.

Six trained pompons.—Mr. E. Cherry was 1st, with pretty, medium sized specimens of such as Brilliant, La Vogue, St. Michael, and Perle; 2d, Mr. J. Weston 2d, having plants of 3 feet in diameter, full of bloom; Mr. C. Portway 3d.

THE NATIONAL CHRYSANTHEMUM

November 11 and 12.

The chief show of this Society was held at the Westminster Aquarium on the above given dates. Here, as elsewhere, the plants were not so large and fine as usual, owing to the inclement weather in early autumn; but the various plants of Chrysanthemums shown as pot-grown specimens left nothing to be wished for either in flower or foliage; so abundantly, indeed, had many of the new forms of Japanese hybrids flowered, and so marvellous was the variety of rich colours, that it was a surprise even to *habitats* of Chrysanthemum. Nothing seems to have given so much zest to Chrysanthemum growing as the ability to grow these gems of the genus; and there are many, doubtless, who are induced to commence their culture, easy as it is, by seeing, by word and picture, some of the varieties at these meetings. The various special manures now before the horticultural public may be credited with some of the general excellence of the exhibits, and a few growers were at this meeting so candid as to mention the sort of fertiliser employed, although of not much weight, the productions not being of superlative merit.

CUT BLOOMS.

Taking the best classes of cut blooms first (open), we have thirty-four in eight specimens, in less than the twenty-four varieties, Mr. Lowry, gr. to J. MacAndrew, Esq., Belmont, Mill Hill, was 1st, all the blooms being of great merit, and very much so were Madame de Sevyn, Boule d'Or, H. Jacotot, Mr. J. Laing, Elaine, Critérium, Japonaise, Val d'Andore, Soleil Levant, and Album plumeum, the chief weight being found in the new varieties mentioned, older ones being quite up to the mark likewise; 2d, Mr. Ridout, gr. to T. B. Hayward, Esq., Woodhatch Lodge, Keigate, who had put up an almost equally fine collection.

Twenty-four Japanese, distinct.—1st, Mr. T. Bettworth, gr. to E. Ewing, Esq., Chesnut, who had amongst other fine specimens of Japanese kinds, Oracle, Grand Monarch, Garnet, Triomphe du Nord, Red Gaudet, H. Jacotot, Soleil Levant, Elaine, Fulgore, M. Paris, and Duchesse de Matry; 2d, Mr. J. J. Shoemith, gr. to Mrs. H. P. Thorne, gr. to Mrs. J. J. one of the best yellows; Comtesse de Beauregard, M. Dalaux, and Japonaise; 3d, Mr. Downie, Ely, Camb.

Twelve Japanese, distinct.—Mr. Shoemith, gr. to Rev. Canon Hodgson, Saltwood Rectory, Hythe, was 1st, with very beautiful blooms, that would have been intended for some very important occasion, being Soleil Levant, Ferand Feral, Jeanne Delaux, Elaine, Mr. J. Laing, Agreement de la Nature, Meg Merrilies, and Madame Cléonance Andiguer; 2d, Mr. G. Wills, gr. to Mrs. Pearce, The Firs, Bassett, Southampton, fine blooms, but rather wind-torn and rough; 3d, Mr. Maxted, gr. to the Marquis of Ely, Kearsney Abbey, Dover.

Six Japanese, one variety only.—1st, Mr. J. R. Wildman, gr., The Oatlands, Clapham Park, whose full blooms of Elaine were even in size and well shown; 2d, Mr. H. Christy, gr. to Mrs. Anderson, Claverty Abbey, with beautiful blooms of Madame C. Andiguer; 3d, Mr. C. Herrin, gr., Chalfont Park, Bucks, with the same variety as the last named.

Six Japanese, distinct (those who have not taken a prize in cut blooms).—Mr. C. Langdon was 1st, Mr. G. Wills, with very nice blooms of Jeanne Delaux, Meg Merrilies, Madame C. Andiguer, Triomphe du Nord, Agreement de la Nature, and Ferand Feral; 2d, Mr. D. Phillips, gr. to R. H. Mann, Esq., Langley Broom, Slough, whose best were Thunberg, Triomphe de la République, Chatter, Mont Arden, and Mr. Browne, gr. to A. Waterlow, Esq., Great Doth, Reigate.

Twelve reflexed blooms in not less than six varieties.—1st, Mr. Bettworth with the following fine sorts—King of Crimsons, Golden Christine, Peach Christine, Pink Christine, White Christine, and Cloth of Gold, an even lot as regarded quality and choice; 2d, Mr. G. Wills, Bassett, with Dr. Sharpe, King of Crimsons, Peach and Pink Christines, and Cloth of Gold; 3d, Mr. C. Maxted.

Twelve large-flowered Anemone-flowered, distinct (Japanese Anemones being excluded).—1st, Mr. Sullivan, gr. to D. B. Chapman, Esq., Downshire House, Roehampton; beautiful flowers of this section were observed in this lot of the following—Lady Margaret, Empress, George Sands, Glück, Louis Bonamy, Queen Margaret, Acquisition, and Mrs. Pethers. E. Jukes, Esq., Hope

House, Winchmore Hill, was 3d, with a pretty lot of well developed blooms.

Six large-flowered Anemone blooms, one variety only.—Mr. Bettworth was 1st, with the fine white Lady Margaret; Mr. M. Sullivan with the same was 2d; and Mr. Berry, gr. to the Countess of Leven, Roehampton House, Roehampton, 3d, with Glück.

Six Japanese Anemone-blooms, in not less than three varieties.—1st, Mr. M. Sullivan, having the sorts Fabian de Madrazo, Scur Dorothy, Scurry, Scurry, Scurry, and Madame Cabrol; 2d, E. Jukes, Esq., with nearly similar kinds; 3d, Mr. G. Wills.

Twelve Anemone-pompon, distinct, three flowers of each in bunches with foliage.—In this minor class Mr. Butcher, gr. to C. Guery, Esq., was 1st.

Twelve pompons, distinct, shown in the same way.—1st, Mr. Butcher.

INCURRED FLOWERS.

Forty-eight blooms in not less than twenty-four varieties, and not more than three of any variety—No 1st was awarded; 2d, Mr. C. Penford, gr. to Sir F. Fitzgibbon, Leigh Park, Havant, his finest flowers being Pink Venus, Golden Empress, Alfred Salter, Jardin des Plantes, Mr. Howe, Madame Coby Barbara, Dr. Sharpe, Mabel Ward, Miss M. Morgan.

Thirty-six incurred blooms, in not less than eighteen varieties.—1st, Mr. Gibson, gr. to Mr. W. W. W. Morden Park, Surrey, who showed flowers of much substance, and generally were the perfection of form; extra were A. Salter, Empress of India, Lord Wolsley, Princess of Wales, Golden Empress, Prince Alfred, John Salter, Golden Eagle, Lord Alcester, Nil Desperandum, and Lady Lardale; 2d, Mr. Berry, whose best were Prince Alfred, Lord Wolsley, Jeanne d'Arc, Empress Eugénie, Emily Dale, and Queen of England; 3d, E. Jukes, Esq., with perfect blooms, much smaller.

Twenty-four incurred varieties, distinct.—1st, Mr. E. Sanderson, gr. to R. E. Smith, with a very superior even stand of perfect form, and to which a Silver Cup, in addition to the prize of money, was awarded. The best where all were fine were Golden and White Queens of England, Nil Desperandum, Empress Eugénie, Princess of Wales, and Lardale; 2d, Mr. M. Sullivan, Lord Alcester, Mr. Bunn, and Queen of England being very superior; 3d, Mr. Wildman.

Eighteen incurred varieties, distinct.—Here Mr. Berry was 1st, with Emily Dale, Keston, and Lord Wolsley, Jeanne d'Arc, Alfred Salter, Lord Alcester, and Golden Empress being the finest, the whole stand being good, few weak points being noticeable. 2d, Mr. Major, gr. to J. P. Redstone, Esq., Wynn Park, Potter's Bar. This stand was rather unequal as to quality, the best specimens being Queen of England, Lord Wolsley, Alfred Salter, and Empress of India; 3d, Mr. E. Sanderson, with flowers of excellent finish but small.

Twelve incurred varieties, distinct.—1st, Mr. Shoemith, with magnificent blooms of Queen of England, Golden Empress, Empress of India, Mrs. Heale, John Salter, and Princess of Wales; 2d, Mr. C. Broom, gr. to Nazing Park, Waltham Cross, with small but perfectly finished examples; 3d, Mr. E. Smith.

Six incurred varieties, for those who have not taken a prize for cut flowers of the Chrysanthemums in previous years.—Mr. Shoemith, with very fine blooms of Princesses of Wales, Mrs. Heale, J. Salter, and Empress of India; 2d, Mr. W. Payne, gr. to Grenville, Upper Clapton, with flowers much less large.

Six incurred blooms, one variety only.—1st, Mr. Burnett, gr. to Mrs. F. T. G. Green, Hillingdon—a capital lot of Golden Empress; 2d, Mr. C. Herrin, with Jeanne d'Arc, much smaller; 3d, Mr. Sullivan, with Queen of England.

AMATEURS.

Twelve incurred blooms, distinct.—1st, Mr. Hillier, 13, Priory Road, Woodsworth, with perfect blooms of Nil Desperandum, Mrs. Heale, Queen of England, John Salter, Princess of Teck, Golden Empress, Mrs. Brunel, Lord Alcester; 2d, Mr. Bingham, 22, Manor Road, Stoke Newington; 3d, Mr. Wildman.

Six incurred blooms, distinct.—1st, Mr. Wildman—Lord Alcester, Mrs. Bunn, Prince of Wales, Empress Eugénie, and Lord Wolsley being his finest blooms; 2d, Mr. Hillier.

Twelve Japanese, distinct.—1st, Mr. J. J. Hillier, Wandsworth; fine were T. Todman, Madame Candyrien, Flamme de Punch, M. Delaux, Fair Maid of Guernsey, Golden Dragon, and Val d'Andore; 2d, Mr. Walker, 12, Lingfield Road, Witleton—F. A. Ellis, C. Andiguer, Ferand Feral, and Mrs. C. Fry Kang, and Peter the Great being meritorious flowers.

Six Japanese, distinct.—1st, Mr. Hillier, with Critérium, Madame Marouche, M. Delaux, and Midle, Lacroix; 2d, Mr. H. Downie; 3d, Mr. G. Walker.

METROPOLITAN CLASSES.

Twenty-four incurred, in not less than eighteen varieties.—1st, Mr. G. Langdon, gr. to Messrs. Monroe & Adams, Brook House, Clapton—a fine stand of standard kinds, even in quality, and with few weak points; 2d, Mr. G. Wills, The Cazenoves, Upper Clapton, with a good stand; 3d, Mr. Nichols, gr. to J. Ogden, Esq., Verandah House, Clapton Common.

Twelve incurred varieties, distinct.—1st, Mr. G. Langdon, a first-class stand, the only weak ones being those which usually are undersized, and which therefore Mr. W. S. Inoué, gr. to Mr. Marsden, gr. to Mr. Matthews, Esq., The Cedar, Woodbury Down, a good stand of blooms; 2d, Mr. W. Payne.

Six incurred, distinct.—1st, Mr. Langdon, with excellent blooms of old favourites; 2d, Mr. W. Payne; 3d, Mr. Gilbey.

Twelve Japanese, distinct.—1st, Mr. Gilbey, with blooms of medium dimensions; 2d, Mr. Langdon; 3d, Mr. W. Martin.

Six Japanese, distinct.—Mr. W. Martin 1st, Mr. W. Payne 2d.

POT PLANTS.

A group of Japanese varieties only, 60 square feet.—1st, Mr. Stevens, Nursery, Putney, put up an attractive group of the newer kinds, well assorted and abundant in leaf; the plants had been grown in Crute's concave pot. 2d, Mr. Davis, Nursery, Camberwell, also a fine group, 2d, Mr. Davis, plants as large as the kinds the popular new ones.

Group of Chrysanthemums, excluding Japanese kinds.—Here again Mr. Stevens was 1st with an excellent lot, the blooms even in size and plenty of them, yellow predominating; 2d, Mr. Davis, plants as large as the foregoing, but with smaller blooms.

Nine trained specimens, large flowered.—1st, Mr. Monk, Forest House, Leytonstone, a capitally flowered group of plants, averaging 3 feet in diameter; 2d, Mr. C. Guery, gr. to Mrs. Gabriel, Norfolk House, Streatham, clean, vigorous, semi-globular plants; 3d, Mr. Clarke, gr. to J. Bass, Esq., Rouppel Park, Streatham, medium-sized plants.

Four trained specimens, large-flowered varieties.—1st, Mr. F. Moore, gr. to E. Hall, Bekele Heath; these were very fine specimens, globular in form, on 4 feet stems, and as full of bloom as it is possible to have them, the sorts being Chinoana, Roseum superbum, Curiosity, and Elaine; 2d, Mr. Gilbey, equally as well flowered; 3d, Mr. Monk.

Six trained Japanese varieties in pots, not larger than 12 inches.—1st, Mr. Monk, with nicely-flowered pyramids; 2d, Mr. Lovogrove, gr. to H. Spicer, Aberdeen Park, Highbury.

Four trained specimens, Japanese or pompons, in pots not exceeding 12 inches.—1st, Mr. Gilbey, with Bonquet Fat; 2d, Mr. Mearns, and Dr. Sharpe, splendid specimens, seldom if ever equalled for colour and floriferousness; 2d, Mr. F. Moore, but little less good, of Hiver Fleur, Elaine, and Bonquet Fat; 3d, Mr. W. Clarke.

Six trained pompons.—1st, Mr. E. Cherry, with pyramid bushes, warded specimens of the same; 2d, Mr. G. Langdon, with a single specimen Chrysanthemum, any variety, and in any form.—1st, Mr. Monk, with robust, massive plant of the deep copper-red George Gordon, well foliaged, and covered with blooms; 2d, Mr. Wills, with a plant of 12 inches in diameter, flowered profusely, La Nymphe; 3d, Mr. Gilbey, with a good specimen of the same. An extra prize was awarded to Mr. Howe, for a specimen of Scur Marie.

MISCELLANEOUS.

Mr. Robert Owen, nurseries, Maidenhead, showed boxes of single Dahlias and Chrysanthemums; as did also Messrs. Cannell & Sons, Swanley, making a fine show with nine boxes of Chrysanthemums of all sections, put up with their foliage in bunches of three or more blooms.

Mr. Springbett, nurseries, Chessnut, had likewise a great quantity of similar stuff, but for comparison. Mr. Crute, the inventor of the concave-bottomed flower-pot, had a large pyramid formed of these pots, in all the various sizes in which he makes them. His other exhibits were rustic upright boxes for balconies and windows, made to resemble wood, but which being of clay and very massive, are much to be preferred to cork wood, and the like; likewise an urn, of a rustic pattern, to hold plants which are used in rooms; the upper half is in two, and removable when the plant is required to be put into it. Various other designs in useful domestic garden pottery were to be seen.

Mr. T. Ware, Tottenham, exhibited a box of new single-flowered forms of Chrysanthemums.

Mr. Wright, gr., Middle Temple, showed a stand of well-finished blooms of the bright red-brown Chrysanthemum Cullingfordi, but which was not specially recognised by the committee. He was, nevertheless, awarded a Silver Medal for six new forms—Júpita, a red Japanese; Madame J. Laing, M. Freeman, M. Vivian Floral, a pale primrose; Belle Etiole, bronze; and Souvenir d'Haarlem, bright pink.

CERTIFICATES.

To Mr. Davis, Camberwell, for Dr. Burrell, a golden-rose; Madame Fabola, and for the same kinds as those for which Mr. Wright received the Silver Medal of the Society.

To Messrs. J. Carter & Co., High Holborn, for bronze sport from Queen of England.

To Mr. Stevens, Putney, for Maiden's Blush.

FRUIT.

Rarely at this show have Grapes been so admirably represented as on this occasion, for there were, to begin with, not less than eight collections each of twelve bunches, and the class in itself many in-class samples. Mr. P. W. Wright, gr. to the Marquis of Bath, Langley was 1st here, with four grand clusters of Black Alicante, four good bunches of Lady Downe's, and four superb Muscat of Alexandria. It was unfortunate in the interests of Mr. Wallis, Keele Hall Gardens, that the collection should have been interpreted to be met with three kinds only, although they were of superb quality. Mr. Wallis, holding that variety was required sent twelve kinds in twelve bunches, and a most meritorious and interesting lot they were. It comprised, of blacks, Burchard's Prince, Mrs. F. Pince's Black Muscat, Barbara, Black Alicante, Lady Downe's, Gen. Marcor, Gros Colmar, and Alwick Seedling; and of whites, Muscat of Alexandria, White Tokay, Mrs. Pearson, and Royal Vineyard. Mr. Osmar, Ottershaw Gardens, Chertsey, was 3d, having four kinds only.

In the class for white Grapes, three bunches, Muscat of Alexandria, were shown the best; very well finished samples coming from Mr. S. Castle, gr. to F. J. Cooke, Esq., West Lynn; Mr. Wallis coming 2d, and Mr. Perkins, gr. to the Right Hon. W. H. Smith, M.P., Hereford.

Eight lots of three bunches of black kinds were staged, the finest, huge massive clusters of Black Alicante, weighing 15½ lb., from Mr. Howe, gr. to H. Tate, Esq., Streatham Common, coming 1st; and some superbly finished, though medium sized bunches, of Gros Colmar, from Mr. Castle, being paired 2d; Mr. Osman coming 3d, with good Pince's Black Muscat. The other lots were chiefly Black Alicante.

Pears made a good show, as might have been expected, some eleven lots of six dishes being in competition. Of these the best came from Mr. Goldsmith, gr. to C. A. Hoare, Esq., Beckenham, who had good dishes of Beurré Clairgeau, Beurré Superfin, Duchesse d'Angoulême, Durandeu, Pimontau Duchesse, and Doyenné du Comice; Mr. G. Duncan, Warham Court Gardens, Horsham, was next, with good Doyenné du Comice, Flemish Beauty, Beurré Diep, and sorts named above; whilst Mr. Waterman, gr. to H. A. Erassey, Esq., Midsitone, had capital Chaumontel, Gloa Morceau, Triomphe de Jodoigne, Hacon's Incomparable, &c.

Desert Apples were a remarkable feature, as no less than eleven collections of six dishes, were staged, and generally the samples gave rich colour and good quality. Mr. Jacob, of Petworth, Sussex, came 1st, with good samples of Ribston, Cox's Orange, and King of the Pippins, Lewis's Incomparable, Nancy, and Winter Delicieux, the latter of which was a new variety. It much resembles the Ribston, Mr. F. Miller, of Margate, was 2d, with pretty Blenheim, King, Ribston, and Fern's Pippins, Scarlet Pearmain, full of colour, and Cornish Aromatic; Mr. C. Ross, gr. to C. Eyre, Esq., Welford Park, Newbury, was 3d. In the other collections were good Cox's Orange, Pearmain, and the new Aromatic Russet, Winter Pearmain, Welford Park Non-such, &c.

Kitchen Apples were represented by eleven collections of six dishes, Mr. Ross coming to the front with good-sized ones, and Mr. Howard, of Ridge, Canterbury, a veteran grower, who had of coloured kinds, Vines of Laleham, The Dean, Reading Russet, Beauty of Hebron, and Brownell's Best; and of white kinds, Snowflake, Ashtop Fluke, Radstock Kidney, and Schoolmaster, good; Mr. R. Dean, Ealing, came 2d, with very pretty Snowflake, The Dean, Rosbald, Edgemoor Purple, Cardinal, and Vicar of Laleham, coloured sorts; and of white kinds, Magnum Bonum, Chacellor, Prime Minister; Lily White, and Recorder.

Mr. C. Wiles, Edgemoor, Banbury, was 3d in the class of these distinctive varieties. The pears were taken in the same way by the same exhibitor, and those above named were chiefly shown. Mr. Howard had The Dean and Chancellor in fine form; and Cosmopolitan in the second lot was admirable.

SPECIAL PRIZES.

Thanks to the generosity of Messrs. Sutton & Sons, of Reading, who offered liberal prizes for a collection of six kinds of vegetables, there was a fine show of these, the quality being generally excellent.

Mr. Miller, gr. to W. H. Long, Esq., Road Ashton, was 1st, having handsome Koshan Park Onions, Autumn Giant Cauliflowers, Stamfordians Tomatos, Schoolmaster Potatos, Aigburth Brussels Sprouts, and excellent Carrots. Mr. Haines, Coleshill Gardens, Wilts, was 2d, having superb Roushan Park Onions, Autumn Giant Cauliflowers, Lyon Leeks, and Carrots, but his Tomatos were the least well shown. Mr. R. Dean, gr. to Captain Le Blanc, Barnet, was 3d; Mr. Waite, Glenhurst, Esher, 4th; and Mr. Waterman, who had dwarf Beans, good Asparagus, and Mushrooms, 5th.

Messrs. Webb & Sons, Worsley, offered prizes also for six kinds of vegetables, but the competition was limited to six collections. Here Mr. Miller was 1st, with Cauliflowers, Student Parsnips, Leeks, Anglo White Onions, Carrots, Potatos, &c.; Mr. May was 2d, having fine stems of his selected Brussels Sprouts, a perfect strain; and Mr. Waite was 3d.

Mr. Sutton & Sons exhibited a large and varied collection of Potatos; Messrs. C. Lee & Sons a very fine and interesting collection of Apples and Pears, some hundred dishes; Mr. T. Laxton had samples of new Apples and Potatos.

RICHMOND HORTICULTURAL:

November 5 and 6.

This popular Society held its fifth annual Chrysanthemum Show in the spacious rooms behind the "Castle" Hotel, Richmond, on the above dates, and was enabled to present a first-class display of autumn produce in plants, flowers, fruits, and vegetables to its patrons, Messrs. who were, the President, the Duke of Teck, and Mrs. who were, the Duchess of Teck, and their elder daughter, visited the show early on the 5th inst. A class for decorative groups of the usual mixed order

afforded Mr. Bruchehaus, manager to the Messrs. Hooper & Co., Twickenham, opportunity to display his admirable ability in the arrangements. The usual base of Ferns edged with Panicum variegatum, and topped with Palms, Crotons, Dracaenas, Caladiums, &c., was richly lit up with flowering plants, Tree Carnations, Gloxinias, Genesars, Cyclamens, &c., Mr. W. Brown was 2d in this class; and Mr. J. R. Chard, Clapham, had a very meritorious arrangement of Palms and Ferns, the former being elevated on mounds of moss, while Ferns were dotted and irregularly placed with much taste. The Palms were scarcely good for the purpose, and for the time of year some life was wanting in the group, but still the effort to attain some originality was of so meritorious a kind as to evoke high praise.

GROUPS.

The finest group of Chrysanthemums in pots came from Mr. W. Campion, gr. to Thomas Cave, Esq., Richmond. It was of the usual solid, massive character, the plants well grown and foliated, and the blooms of the finest quality, including considerable variety; Mr. J. Munro, gr. to E. H. Paul, Esq., Cambridge House, Twickenham, came 2d, with large tall plants, Japanese kinds preponderating. Mr. Brookes, gr. to J. E. Hilditch, Esq., Richmond, was 3d. The only six trained plants came from Mr. Sallows, gr. to J. J. Flack, Esq., Twickenham, and included some good specimens of Hiver Fleur, Little Bells, and the newly introduced, and highly recommended, Rundles. The three latter again appeared, *ad nauseam*, in the class for three trained standards, the best coming from Mr. H. Elliott, gr. to Mrs. Harrison, Richmond; Mr. Sallows coming 2d with the same kind. I hope the day is not far distant when only one of this trio will be admitted into any small collection.

TABLE PLANTS.

A fine line of some three dozen of table plants were staged, the best half-dozen coming from Mr. Chard, who had pretty and rich coloured Crotons, Dracaenas, and Palms. The best six Chinese Primulas, all single whites, came from Mr. Chard, gr. to J. M. Lindell, Esq., Twickenham; and the best six variegated plants for table decoration were from Mr. Newell, gr. to Mr. E. Saunders, Wimbledon, and were charmingly fruited, Prince of Wales, yellow, pendent fruited, and Sutton's Scarlet Tree Fuchsia, erect-fruited Capsicums. A pretty arranged basket of table plants was staged, and was 1st in that class from the Messrs. Hooper & Co.; Mr. A. Bates, gr. to Mrs. Meek, Poulett Lodge, Twickenham, coming 2d, with some admirably fruited plants. A noticeable feature among honorary groups was a fine line of plants, from Messrs. Page of Teddington, who now take high rank amongst market growers of these winter flowers.

CUT BLOOMS.

The chief attraction of the show was no doubt found in the classes for cut blooms of Chrysanthemums, which were 2d and well filled, and there were no less than five entries for the preponderance of forty-two in this class, half incurved and half Japanese, wherein Mr. Gibson, gr. to J. Wormald, Esq., Wimbledon, was 1st, with some good blooms, though not equal to what may be looked for at later shows. His Japanese included good J. de la Reine, Elaine de Blonay, Peter the Great, Flamme de Ponce, &c.; and of incurved were Lord Wolsley, Refalenge, Empress of India, Novely, Prince Alfred, Alfred Salter, and Midshipman; the 2d and a fine lot of blooms came from Mr. Sullivan, gr. to D. B. Chapman, Esq., Roehampton; and Mr. Elphick, gr. to J. Chetton, Esq., Richmond, was 3d.

With twenty-four incurved flowers, Mr. Sullivan was 1st, his stand including fine Prince Alfred, Alfred Salter, Lord Wolsley, Madame Madeline Teizer, John Salter, Princess Beatrice, &c.; Mr. J. Bennett, Wimbledon, was 2d.

A fine lot of blooms were shown in the class for twelve incurved flowers, the finest, from Mr. Coombs, being Queen of England, Empress of India, Golden and White, Lord Alester, A. Salter, Prince Alfred, Prince of Wales, J. Wolsley, Jeanne d'Arc, Mr. Bunn, and Mr. Beverley. Mr. Elliott was 2d in this class, and Mr. Woodgate, gr. to Lord Wolverton, Coombe Wood, 3d.

The class for twenty-four Japanese was a good one, the best lot coming from Mr. Bennett, who had in good form four or five specimens, viz., Mr. J. Jacot, Diana, Criticism, Middle Lacroix, Madame C. Audigier, &c.; Mr. Woodgate was 2d, with small but exceedingly fresh blooms; and Mr. Monro came 3d.

With twelve Japanese, Mr. Benson, gr. to W. H. Roots, Esq., Kingston, was 1st; Mr. Monro 2d, and Mr. Coombs, Teddington, 3d.

Mr. Benson had the best six Japanese blooms in Criticism, M. Lacroix, Soleil Levant, Val d'Andorre, Comite de Germany, &c.; Mr. Bennett was 2d.

Mr. H. B. and the Japanese of any one kind in Madame C. Audigier, and Mr. Brown the finest six incurved of one kind in grand blooms of Jeanne d'Arc; Messrs. Sullivan, Bennett, and Gibson having the best twelve Anemone flowers in the order placed.

BOUQUETS.

Bouquets were divided into two classes. In the one the best came from Messrs. M. A. King, of Kingston, and in the other from Mr. W. Brown, of Richmond. Both were chiefly composed of white flowers relieved by small ones of mauve, and Cattleyas, Pleioneis, &c., with Fern fronds. Some of the competing bouquets were too heavy and stiff, others too much overdone with variety in flower and foliage.

From Mrs. Skewes Cox, of Richmond, whose arrangements were perfect, each pair matching—white Tuberoses and Blue Violets in one case, and Safrano Roseuds and scarlet Bouvardias in another were charming. Miss H. B. Smith, Ealing Dean, showed here two superb bouquets, a floral fan, and several sprays for ladies, as described in our Ealing show report last week. These arrangements elicited much admiration.

TABLE STANDS.

were largely shown in several classes—one for Chrysanthemums and Ferns, of which Mr. Chard had the best; one for vases adorned with happy foliage and berries, the best coming from Mr. Tipping, of Richmond; and a class for three stands, the 1st prize going to Miss Ashby, Richmond, but rather overdone, the colour of the scarlet Anthurium spathes killing Poinsettias.

FRUITS.

A fine collection of twenty dishes was shown by Mr. Hudson, gr. to H. J. Atkinson, Esq., Gunnersbury House, who had superb Black Alicante, Gros Maroe, Muscat of Alexandria, and Alnwick Seedling Grapes, Pine, Apples, Pears, Medlars, &c.

The best six dishes of fruit in two separate classes came in each case from Mr. Bates, who had capital Muscat of Alexandria and Alicante Grapes, Pine, Apples, Pears, &c. Mr. Campion was 2d in one class, and Mr. Munro in the other.

Mr. Campion had the best two bunches of black Grapes in finely finished Gros Colmar, almost blue; Mr. Howe, gr. to H. Tate, Esq., Streatham, coming 2d, with fine Alicantes.

Mr. Bates had the best pair of bunches of white Grapes in superbly finished Muscat of Alexandria, Mr. Osman, Chertsey, coming 2d, and Mr. Campion 3d, with same kind.

There was a large competition in that for four dishes of Pears, Mr. W. Davis, Teddington, having the best in Louise Bonne, Flemish Beauty, Doyenné du Comice, and Beurré Bosc.

The best four dishes of Apples, two to be of dessert kinds, and two of kitchen kinds, came from Mr. Coombs, Sheen House Gardens, who had fine Ribston and King Pippins, Nelson's Glory, and Reineette du Canada. Mr. Chadwick, gr. to E. M. Nelson, Esq., Ealing, was next, with good Haxwell Souring, and Warner's King and some dessert kinds. There were fourteen lots in this competition.

The best Tomatos, Stamfordian, came from Mr. Waite, gr. to the Hon. Colonel Talbot, Esher, who also had the best collection of six kinds of vegetables in fine Richmond Park Onions, Brussels Sprouts, Giant Cauliflowers, Intermediate Carrots, and Tomatos—a first-class lot of vegetables.

There was a capital competition in the cottagers classes also. A. D.

KINGSTON AND SURBITON CHRYSANTHEMUM: November 10 and 11.

The ninth annual show of the above Society was held in the Drill Hall, Kingston, on Tuesday and Wednesday last, and, as is its wont, proved equal to the best display of the kind previously held during the season. An special interest attaches to this exhibition, owing to the fact that a Challenge Cup, value 25 guineas, is annually offered in open competition to the exhibitor who by the same exhibitor on two separate occasions it becomes his absolute property. The Kingston Drill Hall is especially adapted for show purposes; comprising a single span-roof of large extent, it admits of the growing of plants in every form around the walls. The several cross tables, and the number of comfortable plants of a small size; and ample room was allowed for the arrangement of cut blooms in classes, and for their examination by all. The present display, when compared with those held by this Society in past years, was fully equal to the best of them, one exception being a falling off in the matter of pot-grown pompons, —entirely due to the frosts experienced during the early autumn. Most of the groups arranged for effect were of a very high order of merit, giving the judges some trouble to adjudicate upon them.

CUT BLOOMS.

The forty-eight blooms, Japanese and incurved, the trial for the Challenge Vase, consisting of as many as six lots, found W. H. Myers, Esq. (gr. Mr. Molyneux), the winner, and a finer collection of forty-eight blooms, consisting of twenty-four Japanese varieties and twenty-four incurved, taken altogether, it is difficult to conceive. Mr. J. Wormald, Morden Park, was a good 2d, his Japanese varieties being equal to the best, but his rival had much the best incurved flowers; W. Furze, Esq., Teddington (gr. Mr. E. Coombes), was 3d; and C. S. W. W. Esq. (gr. Mr. E. Coombes), was 4th.

Twenty-four blooms, incurved, were also warmly contested, with the result that Mr. Molyneux was again winner of the 1st prize; Mr. G. Woodgate, gr. Warren House, Kingston, was 2d; W. Furze, Esq., 3d; and Mr. W. G. Dwyer, florist, Barnum, a good 4th.

Mr. Alderman and Sheriff Evans (gr. Mr. Carter) was 1st with twelve incurved blooms, staging a very neat stand; Mr. R. Few, Walsley Grange, Esher, 2d; and Captain Cundy (gr. Mr. J. Watson), a good 3d; Mrs. Dunnage, Sarbyton Hill (gr. J. Crossford), 4th.

Twenty-four Japanese varieties, an excellent class, and Mr. Molyneux again carried off 1st prize, with a uniformly fine lot, comprising varieties similar to those shown by him in the 48's; Mr. R. Few was 2d, and Mr. G. Woodgate 3d; Mr. J. Muoro, Cambridge House, staging the 4th.

Twelve Japanese varieties again found Mr. A. Carter

1st; Messrs W. & G. Drover, Farsham, 2d; and Mrs. C. Izod (gr. Mr. Holden), 3d.

Twelve Anemone-flowered varieties was not so formidable a competition as usual, nevertheless a neat display was made by Lady Bowater, Richmond (gr. Mr. C. Stadel), and Mr. J. Wormanid, the latter of whom won the 1st prize.

Twelve reflexed.—The blooms from Mr. Molyneux were at the head of the prize list, his Cullingford being very fine; Mr. Purze was 2d, and Lady Bowater 3d.

Six Japanese varieties.—Mr. Molyneux was also the winner of the greater size for blooms of one variety, staging Belle Pauline in grand style; to this bloom the judges subsequently awarded a First-class Certificate.

Six incurved.—As with the preceding so with this class, Mr. Molyneux was 1st; Mr. T. A. Benson 2d, with good blooms of *Jeune d'Arc*; Mr. Molyneux 3d.

Five Japanese Anemones.—The 1st prize was awarded to Mr. Molyneux, the variety *Fabias* de Maderana being the best shaped of his group.

Anemone pompons were a pretty display, the 1st prize being won by Mr. W. H. Roots, with Mr. Molyneux 2d.

Many minor classes were ably filled by amateur growers, and some promising seedlings staged by Messrs. Jackson & Son, Kingstons, two or three of which received certificates, but were unfortunately unnamed.

Flowering plants, not Chrysanthemums, were exceptionally good, a great show being given by Mr. J. R. Greaves (gr. Mr. T. Glover), consisting mainly of Ferns, Palms, and Orchids in flower; and another by Mr. J. R. Greaves (gr. Mr. G. Fissell), made up of Palms and flowering plants, of low stature, arranged on a groundwork of Maidenhair Ferns, proved 1st.

Many plants possessing very distinctive features, the judges awarded them equal 1st prizes.

The best group of Chrysanthemums arranged for effect, quality of bloom to be taken into consideration, was given by A. S. Price, Esq., Parkside House, Ewell (gr. Mr. J. E. Burt), the quality of the blooms, and in some instances the dwarfness of the plants, being all that could be desired; Mr. W. Ewell, Worcester Park, was an admirable 2d.

Other plants deserving of notice were three trained Japanese, Mr. Few showing the best, Fortrose stands 2d, Mr. H. Elliott, was 1st; J. Shand, Esq. (gr. Mr. H. Trussler), 2d; and with six trained incurved, Mr. Few was 1st and Mr. Shand 2d.

MISCELLANEOUS.

There was in addition a neat display of epergnes, bouquet-holders, &c., and collections of fruit, amongst the latter being a fine display comprising collections of Grapes and hardy fruits by Messrs. Jackson & Son, the former being sufficiently good to receive recommendation from the judges. Besides neat displays of table plants, Cyclamens, and *Primulas*, &c., in the classic set apart for them. Messrs. H., Page & Sons, Grove Nursery, Teddington, staged a large bank of Cyclamens, which were exceptionally fine in bloom for so early a date. W. E.

HIGHGATE, FINCHLEY, AND HORNSEY CHRYSANTHEMUM.

THE above Society inaugurated its first exhibition in Northfield Hall, Highgate, on Thursday and Friday, Nov. 5 and 6, and achieved a success sometimes not obtained by more important societies in a financial point of view, the hearty support received from the neighbouring gentlemen and their gardeners, providing one of the prettiest floral treats that has been seen in the locality. Although the exhibition was not large the exhibits were excellent, many of them being of a stamp that would place them far above the owners in the front rank of the Chrysanthemum shows. In the hall the vivid colours of the Chrysanthemum flowers were set off by the choice table plants, *Primulas*, &c., and further enhanced by two fine groups of plants from Messrs. B. S. Williams and W. Cutbush & Son. Amongst the groups Mr. James Brooker, gr. to W. Reynolds, Esq., The Grove, Highgate, whose exhibits generally were of the first order of merit, staged a group, not for competition, which received a Certificate of Merit of the National Chrysanthemum Society, which was well merited, and a large number of the blooms being up to standard form. Several baskets of plants were suspended from the roof.

There were also several collections of fruit, vegetables, &c., which afforded a welcome contrast to the other exhibits.

PLANTS.

The principal awards were:—For the best single specimen plant.—1st, Mr. J. Brooks, gr. to W. Reynolds, Esq., The Grove, Highgate, with a good plant of *Elaine*; 2d, J. Keller, Esq., Middle Lane, Hornsey; 3d, Mr. Hodges, gr. to Mrs. Crossley, Copple Dene, Highgate.

For the best group of Chrysanthemums.—1st, Mr. Theobald, gr. to Mr. W. E. Burt, Esq., who group almost painfully regular and exact, but composed of a number of good plants well bloomed; 2d, Mr. John Henry Wilby, Highgate New Town, with a group of well cultivated plants, dwarf, and fair as to blooms; 3d, Mr. Hodges, with what we considered the best group of the sort, as the formality which prevailed in the others gave way to freer arrangement, the whole group sloping more gradually, and was margined with pompon and Anemone varieties; the individual blooms were not so fine as the others, though the difference was not very marked.

The rest of the plant classes were not so good as those mentioned.

CUT BLOOMS.

For twenty-four incurved.—1st, Mr. J. Brooks, with

really fine blooms of Beethoven, White and Golden Empress of India, Golden Beverly, A. Salter, Lord Alcester, White and Golden Queen of England, Mr. Bunn, White Globe, Prince Alfred, Bronze Jardin des Plantes, John Salter, Mrs. Heale, Barbara, White Venus, Refugeuse, and Inmogene; 2d, Mr. B. Calvert, gr. to G. Kent, Esq., Highgate, with good 3/4 incurved Nugget, Princess of Wales, and White Globe; 3d, Mr. J. H. Wilby.

For twelve incurved, Mr. Hodges was 1st, with a clean lot; 2d, Mr. W. Theobald.

For twenty-four Japanese Mr. J. Brooks was also 1st, with a grand lot, for which he was awarded the National Chrysanthemum Society's Certificate of Merit. His stand contained the following:—Madame Audigier, Fair Maid of Guernsey, Elaine, Japan Fleuri, Bouquet Fait, Monsieur Astorg, George Gordon, Duchesse of Albany, Chinaman, Thunberg, L'Incomparable, James Salter, Peter the Great, J. Delaux, Mastie, &c.; 2d, Mr. J. H. Wilby, with a neat lot, but far behind the former; 3d, Mr. Theobald.

For twelve Japanese, Mr. Hodges was 1st, with a nice lot; 2d, Mr. J. Brittain, gr. to F. Rickett, Esq.; 3d, Mr. H. Neary, gr. to Rev. R. W. Powell, Hornsey.

For six incurved.—1st, Mr. Thomas Caryer, gr. to R. G. Meissner; 2d, Mr. H. Neary; 3d, Mr. H. Neary, gr. to H. R. Parkinson, Esq., Hampstead Heath.

For six Japanese.—1st, Mr. T. Caryer; 2d, Mr. H. Neary.

For twelve Anemone-flowered.—1st, Mr. Theobald; 2d, Mr. A. R. Rundell.

For twenty incurved.—1st, Mr. B. Calvert. For twelve ditto.—1st, Mr. Jas. Brooks; 2d, Mr. Thos. Taylor, gr. to J. Johnstone, Esq., Hampstead; 3d, Mr. B. Calvert.

For twelve Japanese.—1st, Mr. J. Brooks; 2d, Mr. J. Brittain; 3d, Mr. Thos. Taylor.

Several "half-dozen" of table plants were shown.

SPECIAL PRIZES, &c.

Mr. J. Brooks was 1st for three plants of Lady Selborne, Mr. J. Wright, of the Middle Temple, had a good stand of twenty-four, twelve each incurved and Japanese. Messrs. Dixon, of Hackney; T. S. Ware, Tottenham, and others, showed cut stands of bloom or plants.

STOKE NEWINGTON CHRYSANTHEMUM.

MUM: November 9 and 10.

THE above Society held its annual exhibition in the Assembly Rooms, Church Street, Stoke Newington. This is the place where the improved cultivation of the Chrysanthemum had its birth, and which has still one of the best shows in London, and visitors this year would not be disappointed in this respect, as the exhibits were quite up to previous good quality, if (?) they are a little deficient in quantity. Chrysanthemum shows, as a rule, are arranged so as to have a pleasing effect, and this one, under the able superintendence of Mr. Goldsmith and Mr. Hicks, is no exception to the rule. The space at disposal was just sufficient to show all the exhibits being seen to the best advantage, which is not the case where "crowding" has to be resorted to.

PLANTS.

Nine Chrysanthemums in pots.—Mr. W. Monk, gr. to W. Fowler, Esq., Forest House, Leytonstone, was 1st, his plants quite up to Mr. Monk's well known form. The varieties were Tokio, Mrs. G. Rundell, Triomphe du Nord, Mrs. Dixon, La Nympe, G. Glenny, Dr. Sharpe, John Salter, and Cedar Melange; 2d, Mr. G. Davey, gr. to C. Paine, Esq., Ceaf House, Stamford Hill, whose best were Lady of Derby, Venus, Mrs. G. Rundell, and Mr. Drain; 3d, Mr. H. Lovegrove, gr. to H. Spicer, Esq., 14, Aberdeen Park, N.

Four standard pompons in pots.—Mr. H. Lovegrove was 1st.

Three standards, large-flowering varieties.—1st, Mr. R. Esq., gr. to Mr. Sutton, Davis Lane, Leytonstone, with John Salter, Guernsey Nugget, and Prince of Wales; 2d, Mr. H. Lovegrove, for four ditto.—1st, Mr. S. Gilbey, gr. to B. Booth, Esq., The Cazenoos, Upper Clapton, with good examples of Bouquet Fait, Gloire de Toulouse, and Lady of Derby; 2d, Mr. W. Monk, with Madame B. Readtler, Mrs. Dixon, Mrs. G. Rundell, and Prince of Wales; 3d, Mr. H. Lovegrove.

Four plants, large-flowering varieties.—1st, Mr. S. Gilbey, with a grand exhibit of *L'ile des Plaisirs*, Dr. Macarty, Dr. Sharpe, and Bouquet Fait; 2d, Mr. W. Monk, with Madame B. Readtler, Venus, Prince of Wales, and M. C. Hubert; 3d, Mr. J. Harding, gr. to F. Wright, Esq., Rosslyn, Stamford Hill.

Six foliage plants.—Mr. E. Eassey, gr. to W. Vokings, Esq., 22, Aberdeen Park, N., was 1st; and for six plants suitable for table decoration, Mr. W. Challinor, gr. to W. Dare, Esq., Albion Lodge, Stoke Newington. These two last classes, which were well contested, generally helped the attractiveness of the exhibition.

CUT BLOOMS.

Twenty-four incurved (nurserymen and gardeners of Hackney and Finsbury only).—Mr. S. Gilbey was 1st; and for six plants suitable for table decoration, Mr. W. Challinor, gr. to W. Dare, Esq., Albion Lodge, Stoke Newington. These two last classes, which were well contested, generally helped the attractiveness of the exhibition.

sey Nugget. Twelve ditto.—1st, Mr. W. Payne; 2d, Mr. W. Martin, gr. to H. Matthews, Esq., The Cedars, Woodbury Down. Six ditto.—Mr. S. Gilbey, 1st; 2d, Mr. W. Payne; 3d, Mr. G. Whitehouse, gr. to Dr. Reynolds, Stamford Hill.

Twelve incurved (amateurs).—1st, Mr. F. Bingham, 2d, Manor Road, Stoke Newington, with a very creditable fresh-looking lot; 2d, Mr. W. Goldsmith, Grove Road, Stamford Hill; 3d, Mr. F. France, 82, Park Road, Ground End, Hornsey. Six ditto.—1st, Mr. F. Bingham; 2d, Mr. W. Holland, Grove Lane, Stamford Hill; 3d, Mr. F. France. Six Japanese ditto.—1st, Mr. W. Holland; 2d, Mr. F. France; 2d withheld.

Twenty-four incurved blooms, open.—1st, Mr. Monk, 1st, with good Mrs. Heale, Nil Desperandum, Golden Empress, Refugeuse, John Salter, Lord Alcester, Lady Harding, Empress Eugénie, Mr. Bunn, Baron Baust, and Geo. Glenny; 2d, Mr. Peers, gr. to F. C. Ater, Esq., Enfield Highway, with good Queen of England, Prince Alfred, *Jeune d'Arc*, Mr. Bunn, 18d, Mr. Calvert; 3d, Mr. G. Kent, Esq., Southwood, Highgate. Twelve ditto.—1st, Mr. Monk; 2d, Mr. Peers; 3d, Mr. Calvert.

Twelve blooms of Japanese, distinct.—1st, Mr. Monk, with good *Sarnia*, Val d'Andorre, Comte de Germiny, Fair Maid of Guernsey, Golden Dragon, Elaine, Madame E. Readtler, Peter the Great, Madame de Sevin, and Fulton; 2d, Mr. Peers, with good Comte de Germiny, Madame C. Audigier, Thunberg, Mons. Tarn, Hiver Fleuri, and Peter the Great; 3d, Mr. Calvert. Six blooms ditto.—1st, Mr. Calvert; 2d, Mr. Monk; 3d, Mr. Peers.

Thirty-six blooms, twelve Japanese, twelve incurved, and twelve large Anemone.—1st, Mr. Martin, whose best were Fair Maid of Guernsey, Sultan, J. Delaux, and Elaine; Emily Dale, Prince Alfred, John Salter, Lord Alcester, and Lord Woiseley; and Prince of Anemones, Chick, Lady Margaret, Minnie Chate, and Georges Sands; 2d, Mr. Harding.

The best vase of twelve Chrysanthemums.—Mr. Jones, gr. to E. C. Goble, Esq., Stoke Newington.

NOT FOR COMPETITION.

A magnificent stand of twenty-four distinct incurved sorts, shown by Mr. T. Cochrane, Superintendent of Finsbury Park, were very highly commended, and well deserved it. Mr. W. S. Smith, of 128, High Street, Stoke Newington, staged a very showy table of choice fruits and flowers, which could not fail to be much admired. C. D.

GUADALUPE ISLAND, LOWER CALIFORNIA.

TEN years ago "This sweet lone isle amid the sea"—I am not responsible for the application of this line—was first visited by a naturalist, in the person of Dr. Edward Palmer, well known from the important botanical collections he has made in Northern Mexico and in the southern territories of the United States. There is something like a charm attaching to the animal and vegetable life of the remote islands of the great oceans, for most of them support plants and birds and other organisms peculiar to themselves, often, however, associated with plants, at least, of almost world-wide littoral distribution; but the presence of the latter element is due to situation and the nature of the shores, concerning which I have something more to say later on. Guadalupe Island is about the size of the Isle of Wight, and is in 29° north latitude, about 100 miles from the western coast of Lower California, lying in the course of the great ocean current which flows southward from Alaska. It consists of a large tableland about 300 feet high, its volcanic rocky sides being in most places too precipitous for even a goat to climb, and almost wholly barren. The plateau is interrupted by a central ridge, some points of which rise 1000 feet higher; but the tableland portion of the island is pleasant, with a considerable breadth of open grassy plain, some miles of Cypress woods, and several springs of excellent water; although there are no streams that flow after the winter rains have ceased.

The climate of Guadalupe is described as colder than that of the coast regions of even the central part of California, a circumstance due to its position in the direct path of winds and currents that sweep down from the arctic regions. Fogs are heavy and prevalent, especially in the northern and in the higher parts of the island; yet the south is sunny and excessively hot and dry in the summer, so much so that all vegetation is in some seasons completely scorched up. As already mentioned, it is colder than the opposite coast, especially in the northern exposures; ice an inch in thickness has been observed in the middle of the island, and snow to the depth of 2 inches, followed by several days of cold rain. Yet in the northern extremity it keeps clear and warm, and it is warm in the lower cañons or ravines.

Dr. Palmer collected 110 species of flowering plants, which are communicated by Mr. Sereno Watson in the eleventh volume of the *Proceedings of the American*

Academy of Arts and Sciences. Omitting a species of *Heuchera*, the specimen of which was insufficient for determination, Watson classifies them in five groups, namely:—1, introduced species, twelve; 2, species ranging from the Atlantic to the Pacific States of North America, nine; 3, species found throughout California, or at least as far north as San Francisco, forty-nine; 4, species found in Southern California, below Los Angeles, or in Arizona, eighteen; and, 5, species peculiar to the island, twenty-one.

Last spring Mr. E. H. Greene visited the island, and he publishes the particulars of his week's sojourn there, together with the botanical results, in the *Bulletin of the Californian Academy of Science*, from which it appears that he collected fourteen species that were not in Dr. Palmer's collection. Of these seven are Californian, some of them having a wider distribution; four are common European weeds, and two are described as new species; whilst one, a seedling *Arctostaphylos*, is indeterminate.

Guadalupe has never been inhabited, according to Greene, except very temporarily, by shipwrecked or seal-hunting sailors, or fugitives from Mexico. But since the beginning of 1884 a small band of some forty Lower Californian soldiers has been stationed there by the Mexican Government, "to prevent the wholesale slaughter of the goats, of which there are many thousands still on the island, notwithstanding the fact that for some two or three years prior to 1884 many a cargo of goat skins and tallow had been taken to San Diego."

In this, as in so many other remote islands, goats were originally introduced for the purpose of supplying food to shipwrecked or passing mariners; and the effect in many instances has been the almost complete extirpation of the indigenous vegetation. How long ago goats were first introduced into Guadalupe is uncertain, though probably towards the end of the last century. Dr. Palmer mentions them among the agents affecting the vegetation, yet without any specific account of their having proved destructive. Greene, however, specially alludes to the favourable effect on the vegetation "in the very best part of the island" the small garrison has had, as the goats, in consequence of being constantly hunted, avoid the part where the soldiers encamp.

From the figures given above, and the relationships of the endemic species, it is evident that the flora of Guadalupe Island is essentially Californian, as distinguished from the Mexican flora, to which belongs the vegetation of the intervening peninsula of Lower California. Respecting the plants which by their abundance or prominence gave character to vegetation, Palmer says:—"The 'Sage-brush' and 'grease-woods' of the Basin [the 'Great Basin' of Artemisia] are represented by an *Artemisia* and an *Atriplex*, which share with a *Frazeria* in covering large tracts, and in protecting the soil and the smaller animals from the winds and sun. Trees are numerous over much of the island, chiefly confined to a Pine, a Juniper, and a Cypress, and a small Oak. To these is to be added the Palm, which is frequent in the southern cañons, growing to a height of 40 feet." Among introduced plants *Erodium cicutarium* was more abundant than any other plant in the island, being found everywhere. The herbaceous and shrubby endemic plants belong to genera represented in California, or exclusively Californian and eastward of it, and the species are most closely allied to those of the Californian region. The Pine is a two-leaved variety of *Pinus insignis*; the Cypress, Watson describes as a new species (*Cupressus guadalupensis*), but it is very closely allied to the beautiful Californian *C. macrocarpa*; and the Juniper is referred to *Juniperus californica*. The Oak (*Quercus tomentilla*, Engelman) is endemic, and allied to the common Californian *Q. chrysolepis*; and the endemic Palm (*Erythraea edulis*) is represented on the mainland by a second species recently discovered in the Tantilus Mountains, Lower California.

It is interesting to compare Mr. Greene's observations on the various elements of the vegetation ten years later than Dr. Palmer, especially in relation to the very rapid disappearance of some of the endemic species and other formerly prominent indigenous ones. Palmer found the Cedar in irregular groups in the middle of the island, apparently common enough; now it is already becoming rarer, and Greene says he cannot guess at the cause of its destruction. It would seem, however, that the existing trees have mostly reached the limit of their age, and the species is disappearing because the numerous goats prevent

seedlings from growing up and replacing the older generations. Formerly, Greene supposes, it must have occupied almost the entire plateau of the northern half of the island; but now upon the greater part of this tract only the fallen decaying trunks remain. It is a pity so noble a tree should die out. It has the conical-shaped head of *C. macrocarpa*, as it grows in this country, not as it grows in its home, where its habit is Cedar-like, and reaches a height of 50 feet, with a trunk sometimes as much as 25 feet in circumference.

The Juniper in Palmer's time was all over the middle of the island and occasional at the south end, in the ravines and valleys, forming groves about 15 feet high. Now, we are informed, it is on the verge of extinction—"in the middle of the island only three trees that were not quite dead; and on the three only a few tufts of green twigs gave the feeble sign of exhausted vitality. Only on a south-eastern cliff, hanging over the sea, did I find a tree vigorous enough to be bearing some well-formed fruit."

The Pine still exists in groves of considerable extent on the high narrow ridge forming the north-eastern extremity of the island; but the handsome Oak, a spreading tree 50 feet high, has dwindled down to about half-a-dozen individuals; whereas Palmer states that it was frequent at the north end and occasional in the cañons on both sides of the island. Concerning the Palm Greene is silent. On the ascent from the narrow beach to the plateau the most conspicuous plants at the time of his visit were *Senecio Palmeri*, a handsome shrub, 3 or 4 feet high; *Spharalcea sulphurea*, *Hosackia ornithopus*, and *Convolvulus macrostegius*, all endemic species, associated with the Californian *Brodiaea capitata*, which was also exceedingly common on the tableland itself.

The very widely spread littoral element alluded to at the beginning of this sketch is wanting in the shores of Guadalupe; whether this is wholly due to the nature of the coast, or partly due to the direction from which the oceanic currents come that touch the island, is not clear from the information available. In the *Botany of the "Challenger" Expedition* I have brought together all the trustworthy evidence I could find bearing upon the dispersal of seeds and plants by oceanic currents, &c., and I have there pointed out that many of the plants thus conveyed are not exclusively littoral, but actually grow and thrive equally well inland. More evidence is wanted on this subject, and that is my reason for mentioning it here; but there can be no doubt that the sea has played a most important part in covering the distant coral islands of the Pacific and Indian Oceans with vegetation, thereby rendering them inhabitable.

In conclusion, I may, perhaps, be permitted to repeat a curious fact concerning the *Coccoloba*, recorded in Mr. H. O. Forbes' book on the Malayan Islands. It is very well known how widely the *Coccoloba* Palm is dispersed on tropical sea-shores, both insular and continental; and the question has often been discussed how far oceanic currents have been instrumental in effecting this wide distribution. Some writers maintain that it is mainly, if not entirely, due to human agency; and one argument employed against oceanic agency was that the *Coccoloba* would not germinate unless buried. This is very likely correct, as to bare ground, at all events; but, as I have stated elsewhere, the waves often bury the objects they cast ashore; and Mr. Forbes observed that the burrowing crabs, so numerous in the Keeling and other islands, sometimes perform the operation when burrowing very near the surface. *W. Botting Hemsley.*

A METHOD OF WATERING PLANTS IN INDIA.—At a meeting of the committee of the Agricultural Society of Madras, Deputy-Surgeon-General John Short, concerning watering in India (on the Sherwaro Hills) said:—"I also resort to the *Gurrah* mode of watering plants, that is, the common water-pot styled *codrum* on the Madras side, having a small mouth. It has a small hole knocked into the bottom, and the pot is buried to a depth of one-third its size, as near to the stem of the plant as possible, and it is kept constantly filled with water, which very gradually oozes into the soil through the minute opening at the bottom, giving moisture to the roots of the plants without causing waste by spilling or evaporation. I find this method a great success."

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, NOVEMBER 11, 1885.

- Nov. 5.—Very dull day.
- 6.—Dull morning, fine afternoon.
- 7.—Dull day.
- 8.—Very dull day, little rain in afternoon.
- 9.—Dull day.
- 10.—Drizzling rain from early morning nearly all day.
- 11.—Drizzling rain throughout the day.

LONDON: Atmospheric Pressure.—During the week ending November 7, the reading of the barometer at the level of the sea increased from 29.34 inches at the beginning of the week to 30.15 inches by 9 A.M. on the 2d, decreased to 29.86 inches by 9 A.M. on the 3d, increased to 29.87 inches by 1 P.M. on the 4th, decreased to 29.58 inches by 1 P.M. on the 5th, increased to 30.36 inches by 9 A.M. on the 7th, and was 30.35 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.04 inches, being 0.49 inch higher than last week, and 0.08 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 53° 5, on the 2d; on the 6th the highest temperature was 42°. The mean of the seven high day temperatures was 49° 1.

The lowest temperature was 30° 3, on the 6th, on the 4th the lowest temperature was 48°. The mean of the seven low night temperatures was 38° 9.

The greatest range of temperature in one day was 18°, on the 2d; on the 4th the smallest was 4° 3. The mean of the seven daily ranges was 10° 2.

The mean temperatures were, on the 1st, 42° 7; on the 2d, 45° 5; on the 3d, 48° 8; on the 4th, 48°; on the 5th, 42° 9; on the 6th, 36° 6; and on the 7th, 44° 3; of these the 3d and 4th were above their averages by 3° and 2° 4 respectively, and the rest were below by 3° 5, 0° 5, 2° 5, 8° 5, and 0° 4 respectively.

The mean temperature of the week was 44° 1, being 1° 2 lower than last week, and 1° 4 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 83° 5, on the 2d. The mean of the seven readings was 62° 9.

The lowest reading of a minimum thermometer placed on grass was 23° 3, on the 6th. The mean of the seven readings was 29° 1.

Rain.—Rain fell on three days, to the amount of 0.56 inch.

ENGLAND: Temperature.—During the week ending November 7, the highest temperatures were 62° at Newcastle, 60° at Leeds, 59° 2 at Liverpool; the highest at Brighton was 53° 2, at Blackheath 53° 5, at Bristol 54°. The general mean was 56° 7.

The lowest temperatures were 29° at Hull, 29° 2 at Wolverhampton, 30° 3 at Blackheath; the lowest at Truro was 44°, at Plymouth and Liverpool 38° 2. The general mean was 34° 1.

The greatest ranges were 28° at Newcastle, 26.2° at Cambridge, 26° at Hull and Leeds; the least ranges were 13° at Truro, 16°.9 at Plymouth, 18° at Bristol. The general mean was 22.6°.

The mean of the seven high day temperatures was highest at Truro, 54°.4, at Leeds 53°.5, at Plymouth 52°.5; and was lowest at Bolton, 45°.3, at Wolverhampton 48°.8, at Preston 48°.9. The general mean was 50°.9.

The mean of the seven low night temperatures was highest at Truro, 45°.6, at Liverpool 43°, at Plymouth 42°.5; and was lowest at Wolverhampton, 35°.8, at Bolton 37°.7, at Brighton 38°. The general mean was 40°.3.

The mean daily range was greatest at Wolverhampton and Leeds, 13°, at Brighton, Hull, and Newcastle 12°.3; and was least at Truro, 8°.8, at Liverpool 8°.9, and at Bristol 9°.1. The general mean was 10°.6.

The mean temperature was highest at Truro, 49°.4, at Plymouth and Liverpool 46°.9; and was lowest at Wolverhampton, 41°.7, at Bolton 42°.4, at Brighton 43°.5. The general mean was 44°.9.

Rain.—The largest falls were 1.80 inch at Bolton, 1.67 inch at Preston, 1.32 inch at Truro; the smallest falls were 0.24 inch at Sunderland, 0.29 inch at Hull, 0.38 inch at Sheffield. The general mean fall was 0.89 inch.

SCOTLAND: Temperature.—During the week ending November 7, the highest temperature was 62°.1 at Leith; at Greenock the highest temperature was 56°.7. The general mean was 53°.8.

The lowest temperature in the week was 27°.5, at Aberdeen; at Paisley the lowest temperature was 35°.3. The general mean was 32°.7.

The mean temperature was highest at Leith, 48°.5; at Perth the lowest 44°.4. The general mean was 46°.2.

Rain.—The largest fall was 1.58 inch, at Greenock; the smallest fall was 0.14 inch, at Edinburgh and Leith. The general mean fall was 0.60 inch.

JAMES GLAISHER, F.R.S.

DURATION OF TEMPERATURE, RAINFALL, AND SURMOUNT OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, November 9, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W. —The weather has been very dull and damp over the whole kingdom, especially over the southern, south-western, and western districts. Rain (in most places hail) has fallen very generally, but in most localities the amount has been rather inconsiderable.

The temperature has been higher than of late in all parts of the country. In "England, E." and "England, S." the values for the week have again been slightly below the mean, while in the Channel Islands the mean has been equalled; but in all other districts the readings show an excess varying between 1° and 4°. The maxima were generally recorded on the 3d, when the thermometer rose to 63° in "Scotland, E.," 62° in "Ireland, S.," and to 60° in "Ireland, N.," whilst elsewhere they ranged from 53° to 59°. The minima, which were registered in most places on the 6th, ranged from 29° in "Scotland, E.," and 29° in "England, E.," to 35° in "Scotland, W.," and "Ireland, S.," and to 40° in the "Channel Islands."

The rainfall has been rather more than the mean in the case of England, but less or about equal to it elsewhere.

Bright sunshine shows a slight increase in "Scotland, E.," but a decided decrease in most other districts. The percentages of the possible duration ranged from 8 in "England, N.W.," and 9 in "England, N.E.," to 25 in "England, S.W.," and 30 in "Scotland, E."

Depressions observed.—During nearly the whole of this period depressions have skirted or passed over our extreme north-western and northern coasts, bringing moderate to strong south-westerly or southerly winds to all our stations. During the earlier part of the week some subsidiary disturbances, which passed more directly over us, caused the wind to vary somewhat in direction. At the close of the period, however, the conditions had become anticyclonic, and the winds on our southern coasts light from the eastward.

Enquiries.

"He that questioneth much shall learn much."—BACON.

DISEASES OF CONIFERS.—Can any of your readers tell me the name given by English foresters to the disease on Pinus sylvestris, P. Larix, and other Conifers, as well as on many of our deciduous trees, which is caused by Rhizomorpha, the sclerotoid condition of Agaricus mellesus? R. Hartig proved (1873) that this fungus is the cause of the "Harzkuze," "Harzibierfäule," or "Erdkrebs." I want the English equivalent of the disease so named. E. B.

GRAVELLING KITCHEN GARDEN WALKS.—Can any of your readers inform me with regard to the best means of setting Buxton gravel? Admirable as it is for the above purpose, it has the disadvantage of taking a long time to set. Watering and rolling is advocated for most gravels, but this can scarcely be called even a partial remedy in the case of Buxton gravel, on account of its being crushed rock, and consequently destitute of the binding properties which are more or less contained in most other gravels. The walks here have been previously washed with Buxton gravel, which I thought of turning and adding a surface dressing of the same sort, mixed with a little cement to make it set. If any of your readers have made any experiments in this direction I would be glad of their advice, particularly in what proportion the cement is to be used, and what thickness the layer would have to be put on in order to stand the ordinary wear and tear that is required in a kitchen garden. Any information on this subject would, I am sure, be of great advantage to others besides myself. R. L.

Answers to Correspondents.

* OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that our publications of the new telegraph regulations our Registered Telegraphic Address is "GARDCHRON, LONDON." GARDCHRON being written as one word. Telegrams (but not letters) thus addressed will reach the Editor or the Publishers without other address being needed than "GARDCHRON, LONDON."

BALLS FROM A SCOTCH LOCK.—H. O. H. The balls fished up from a Scotch lock are composed of the threads of a Conifera, Cladophora zygopodia. M. C. C.

BOOKS: R. Bullen. Tropical Agriculture is published by E. & F. N. Spon, 48, Charing Cross, London. The author is P. L. Simmonds, F.R.C.I.

CUCUMBER LEAF: J. B. The leaf seems to have suffered from scalding. The little insect which we discovered was red-spider, so be on your guard, or there will be no Cucumbers at Christmas.

DYING TREES: R. H. The only verdict we can give on the specimen sent is "found dead." It is impossible, without no other evidence, to say, in any way, from what you say, it seems most likely that the cause is in the soil. Can there be fungus mycelium in it?

FUNGUS: J. S., Edinburgh. 1, Nectria cinnabarina; 2, some Myxomycetous fungus reduced to the dust condition; 3, probably some small Agaric increased in growth by frost or some other cause.

FUNGUS ON RUBUS: Jamaica. Uredo ruborum. M. C. C.

NAMES OF FRUITS: T. Kennedy & Co. 1, Brownlee's Russet; 2, Cellini; 4, French Cox; 5, Court of Wicket; 6, Round Winter Nonsuch; 7, Winter Strawberry; 8, Ribston Pippin; 9, Cox's Orange Pippin; 10, Red Quarrenden; 12, Mannington's Pearmain; others unrecognised.—C. W. 1, Beuré Did; 2, Passe Colmar; 3, Beuré d'Amalins (bad); 4, Marie Louise; 5, Napoleon; 6, rotten.—A. Chalmers: 1, Cat's-head; 3, Emperor Alexander; 4, probably Northern Spy. These Northern Apples are so different in appearance that we cannot recognise them.—J. K. B. Apple: Rymen.—Sydenham. Very inferior specimen—may be Beuré Bachelier.—W. P. Pear: Comte de Lamé.—J. S. Apples: 1, New Hawthornden; 2, Cox's Pommant; 3, Grange's Pearmain; 4, Cat's-head; 5, Round Winter Nonsuch; 6, Reinette de Canada. Pears: 2, Bowood; 4, Knight's Monarch; 5, Comte de Lamé; 6, Fondante d'Automne; others unrecognised.—H. Knight. Pears: 1, Marechal de la Cour; 3, British Queen. Apples: 5, Northern Spy. Others unrecognised.

NAMES OF PLANTS: C. W. 1, Cotonaster Simonsi; 2, the seed-veils is Iris foetidissima.—E. H. C. 1, Ptilosporum conifolium; 2, Cornus mas; Schinus Moli.—L. Hartley. Pleurothallis sp.—P. Hiern. Cattleya Lodgdesii.—Bolton. 1, Eucharis Mastersii; 2, too far decayed to recognise; 3, a small rounded-pinnuled form of Adiantum cucullatum, very pretty, of course, but one which we should think scarcely distinct enough from that and other recent acquisitions to make it desirable that it should be introduced to cultivation under a distinctive name.—H. J. Ross. 1, Cymbidium ensifolium.

PRIMULAS DYING-OFF: J. C. The plants are rotting away at the root, probably from something in the soil. Have you used strong manures? Send more particulars.

SCIENCE OF HORTICULTURE: Scient. Read the chapters on the "Life History of Plants," in Cassell's Popular Gardening, which contain the most recent information on the subjects you name; also Burbidge

on the Propagation and Improvement of Cultivated Plants.

Markets.

COVENT GARDEN, November 12.

TRADE very quiet, with heavy supplies. A large consignment of St. Michael Pines to hand, but not in good condition. Kent Coxes lower. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Fruit name, Quantity, Price, and Unit. Includes Apples, Grapes, Kent Coxes, etc.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 4 columns: Vegetable name, Quantity, Price, and Unit. Includes Artichokes, Beans, Beet, Broccoli, etc.

POTATOES.—MAGNUM BONUM, bad trade, 9s. to 8s.; Regents, 6s. to 8s.; per 100; German Reds, 2s. 10 to 2s. 6d. per bag.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Plant name, Quantity, Price, and Unit. Includes Aralia Sieboldi, Arbo. vite, Begonia, etc.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Flower name, Quantity, Price, and Unit. Includes Abutilon, Arum lilies, Begonias, etc.

CORN.

MARK LANE: Nov. 9.—Damp samples of Wheat on the week are 6d. lower, but prime dry qualities are not quotably altered. For foreign W heats there was an apparent disposition to meet buyers on rather easier terms, but buyers were not forthcoming. Prices of flour compare 6d. lower with those of Monday last. Common English Barty was again rather easier, but foreign grinding stores were not quotably lower, though very dull. Beans and Peas supported late value. Maize prices continue to hinder. Oats were firm, and prices in the week advanced 6d. on American and Russian. Nov. 11.—Trade was dull for Wheat. Prices can hardly be quoted as altered. There was a very slow sale, and in favour of buyers. There was very little

passing in Barley, and foreign grinding qualities were barely so well supported. Maize teded against buyers. Oats were again dearer.

Average prices of corn for the week ending Nov. 7:—Wheat, 31s. 1d.; Barley, 30s. 3d.; Oats, 18s. 11d. For the corresponding period last year:—Wheat, 32s.; Barley, 31s. 10d.; Oats, 19s. 4d.

SEEDS.

LONDON: Nov. 11.—As might have been expected, there were but very few buyers on the Seed Market to-day, and the transactions were few and unimportant. Foreign seed continues to harden in value, the total recent advance having no assumed substantial proportions. White, Alsike, and Trefoil keep steady. Low quotations continue to prevail for both Hemp and Canary seed. Feeding Linseed is neglected. There is no change in Blue Peas and Haricot Beans. For Winter Tares the trade is markedly over. Mustard and Rape seed are without alteration. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

FRUITS AND VEGETABLES.

COLUMBIA (East London): Nov. 11.—Good supplies of fruit and vegetables. Trade moderate, fair demand. Quotations:—Apples, 2s. 6d. to 6s.; Peas, 2s. 6d. to 6s. per bushel; Cabbages, 2s. 6d. to 6s., and Savoys, 2s. 6d. to 5s. per hundred; Brussels Sprouts, 3s. 6d. to 4s. per sieve; Beetroot, 2s. 6d. to 3s. 6d.; Celery, 6s. to 10s.; greens, 3s. to 4s.; Turnips, 3s. to 4s.; and Carrots, 2s. to 3s. 6d. per dozen bundles; Parsley, 1s. to 1s. 6d. per dozen bunches; Onions, 4s. to 5s., and pickling ditto, 4s. to 4s. 6d. per cwt.; Carrots, in sacks, 30s. to 50s. per ton; white Fernpurs, 10s. to 60s. ditto; Swede ditto, 30s. to 32s. 6d. ditto; Mangels, 22s. 6d. to 25s. ditto.

STRATFORD: Nov. 10.—During the past week the market has been well supplied with all kinds of produce, and with a good attendance of buyers a fair trade was transacted at the undermentioned prices:—Cabbages, 9s. to 7s.; Drumheads, 6s.; Collars, 4s. to 5s.; Cauliflowers, 3s. 6d. to 10s., and Savoys, 4s. to 7s. 6d. per tally; greens, bunch, 3s. 6d. to 4s. 6d. per dozen; Sprouts, 3s. 6d. to 4s. 6d. ditto; Mangels, 17s. to 22s. per ton; Swedes, 24s. to 35s. ditto; Carrots, cask feeding, 28s. to 35s. ditto; household, ditto, 38s. to 50s. per ton; Turnips, 50s. to 65s. per ton; ditto bunch, 3s. to 4s. per dozen; Apples, 1s. 6d. to 3s. per bushel; Onions, 70s. per ton; ditto pickling, 2s. 6d. per sieve.

POTATOS.

BOROUGH AND SPITALFIELDS: Nov. 10.—Owing partly to the weather, the supplies were only moderate, and the late advance was well sustained. Quotations:—Regents, 70s. to 100s.; Early Roses, 70s. to 90s.; Champions, 60s. to 90s.; Belgian kidneys, 60s. to 80s.; German reds, 60s. to 70s.; ditto Snowflakes, 60s. per ton.

COLUMBIA (East London): Nov. 11.—Trade very good. Magnum Bonum, 55s. to 75s.; Regents, 50s. to 65s.; Victoria, 55s. to 70s.; Champions, 50s. to 58s.; Early Rose, 50s. to 60s.; Reading Hero, 60s. to 70s.; and Beauty of Hebron, 65s. to 80s. per ton.

STRATFORD: Nov. 10.—Magnums, 50s. to 75s.; Regents, 60s.; Champions, 50s. to 60s.; and Early Rose, 65s. to 70s. per ton.

Imports.—The imports into London last week consisted of 2314 bags from Hamburg, 2 from Bremen, 300 from Ghent, 5 from Amsterdam, 85 bags 34 casks from Rotterdam, and 3 casks from St. Nazaire.

CATTLE.

METROPOLITAN: Nov. 9.—Choice cattle were scarce, and our top quotation is rather advanced. Middling qualities sold as badly as before. No appreciable improvement occurred in the sheep trade, and sales closed slowly at previous rates. Calves were very dull of sale. Pig trade unchanged. Quotations:—Beasts, 3s. 6d. to 4s. 4d.; 4s. 8d. to 5s. 4d.; calves, 2s. 6d. to 4s. 8d.; sheep, 3s. 8d. to 4s. 6d., and 4s. 8d. to 5s. 6d.; pigs, 4s. to 4s. 6d.

Nov. 12.—Trade has been in a very lifeless condition. Both beasts and sheep have sold slowly at about late rates. Fine calves were steady; other kinds dull. Pigs flat.

HAY.

WHITECHAPEL: Nov. 10.—With smaller supplies, sales of meadow hay were more of a little more ready. Quotations:—Clover, prime, 60s. to 100s.; inferior, 60s. to 85s. Hay, prime, 70s. to 90s.; inferior 50s. to 67s. Straw, 25s. to 38s. per load.

Nov. 12.—A rather large supply was on sale, and there was a quiet trade at previous prices.

STRATFORD: Nov. 10.—Clover, 75s. to 110s.; meadow hay, 65s. to 90s.; and straw 30s. to 36s. per load.

Government Stock.—Consols closed on Monday at 100½ to 100¾ for both delivery and account. Tuesday's figures were 100½ to 100¾ for both transactions. The final quotations of Wednesday were the same as those recorded on Monday. Prices closed on Thursday at 100½ to 100¾ for delivery and 100½ to 100¾ for the account.

THE COLONIAL MANURE.

Unequaled for Excellence of Quality and Productive Powers.

Table with 3 columns: Supplied in Tins, Per in Bags, and Special Prices to the Trade on application. Values range from 1 0 each to 1 37 6.

The COLONIAL MANURE being powerful and lasting in its effects, very little need be used; consequently it will be found more economical than any other Chemical Manure.

The COLONIAL MANURE is to be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

Sole Proprietors and Manufacturers,

HAYMAN & BENJAMIN, 3, 4, 5, 6, CAMOMILE STREET, LONDON, E.C., who only supply the Wholesale Trade and Export Merchants.

GOLDEN EUONYMUS, for Sale.—Fine bushy plants, well coloured, 9, 12, and 18 inches high, 6s., 9s., and 12s. per dozen, £4, £3, and £4 per 100. Cash with order. Sample by post on receipt of P.O.O. for 2s. ALFRED BALL, Florist, Parkstone, Dorset.

DOUBLE AFRICAN TUBEROSES.—Extra fine, 10s. per 100, £4 per 1000; extras large, finest ever imported, 12s. 6d. per 100. AMERICAN PEARL, ditto, 12s. per 100, £5 per 1000. LILIUM AURATUM, cheapest for quality ever offered, 38s. and 25s. per 100. MORLE AND CO., 1, 2, and 16a, Fenchurch Street, E.C.

CHRYSANTHEMUMS at SWANLEY

WE EXTRACT a small portion of a Report given in the last issue of the Journal of Horticulture:—"As is well known, Chrysanthemum form a special department of the 'Home of Flowers,' and are in charge of an expert who devotes his whole thought and time to their propagation and culture. Every section is represented, all established varieties grown, and new ones added from American, French, Chinese, Japanese, and English raisers. The collection embraces 900 varieties, represented in about 5000 plants. These arranged in five new span-roofed structures, each 100 feet long, a walk passing down the centre, and the soil excavated on each side, so that the pots are 2 feet or so below the floor level, and the blooms are, consequently brought literally 'under the eyes' of spectators." Send for our Catalogue—the most complete and descriptive of the best-kept collection in England. A greatly reduced PRICE LIST of eighty-six new varieties, collected from all parts of the world, also sent post-free. MR ADAM FORSYTH, Kakahi, Oamaru, New Zealand, July 4, 1885.—"I received all the Chrysanthemums (but two) in fine condition; one happened to be the Hero of Stoke Newington (one of my children) so you can guess my vexation. Primulas and Cyclamen came especially; the former are immensely showy; such colours I never expected to see."

H. CANNELL & SONS,

Hooper's Seed and Ball's low prices. The Covent Garden Seed warehouse. Splendid in quality.

HYBRID RHODODENDRONS.—Fine

Plants, 1½ to 2½ feet, all colours, mixed, some in bud, 40s. per 100.—W. JACKSON, Blakedown, near Kidderminster.

FOR SALE, Nine large Specimens of STEPHANOIS, true Evasion variety; also grand Specimens ALLANAS, CROCODENDRONS, BOUGAINVILLEAS, &c., cheap. For size and price apply, W. JACKSON, Blakedown, near Kidderminster.

MILTRACK MUSHROOM SPAWN.—

The best and cheapest ever offered. Quality guaranteed, 4s. 6d. per bushel (10 casks), 3d. per bushel package; 2 casks as samples, free parcel post, 1s. 3d. Trade supplied very low.

MORLE AND CO., Manufacturers, Child's Hill Farm, N.W. and 1 and 3, Fenchurch Street, London, E.C.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are especially suitable for **FLINT AND BRICK GARDENS**, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper. **GARDEN VASES, FOUNTAINS, &c.**, in Artificial Stone, very durable and of superior finish, and in great variety of design. **F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.;** King's Road, Chelsea, S.W.; Kingsland Road, E. Agents for **LOOKER'S PATENT "ACME" FRAMES, FLINT COVERS, and PROPAGATING BOXES;** also for **FOXLEY'S PATENT BEADED GARDEN WALL BRICKS.**

Illustrated Price Lists Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., from 3p. per square yard upwards. Patterns, Sheet of Plain or more elaborate Designs, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Pavings of great durability. Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety. Slates, Cement, &c. **F. ROSHER AND CO.,** Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. **FLINTS and BRICK BURRS** for Kitchens or Ferneries. **KENT PEATS or LOAM** supplied at lowest rates in any quantities.

F. ROSHER AND CO., Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A Liberal Discount to the Trade.

Stock List and Prices on application. Quote Chronicle.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully proved by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at the Royal Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. "Pierrefield Park, June 24, 1896.—Sirs, I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Piercefield Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised. H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years, and their constantly increasing trade in it, and the numerous Testimonials they receive stamped it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which one is genuine. Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to **HILL and SMITH, Brierley Hill Ironworks, Staffordshire;** 181, Queen Victoria Street, London, E.C.; and 73, Elmbank Street, Glasgow.

FOR SALE, a PEACH RANGE, 90 feet by 12 feet 6 inches, and 11 feet high, with Fruit Trees and Piping, in three compartments. Apply to **L. F. EDWARDS,** Crosby Court, Northfleeton.

WRIGHT'S
Champion "Endless-Flame-Impact"
HOT-WATER BOILERS.

Medal at Philadelphia U.S. International Exhibition.
Medal at Christiania Exhibition, Norway.
Medal at Alexandria Palace International, London.
Highest Award at Carlsruhe International Exhibition, for

The Best Hot-water Apparatus.

Admitted by the entire Trade, after public and formal challenges, to be the MOST ECONOMICAL OF FUEL, the MOST POWERFUL, the SIMPLEST, and the CHEAPEST Hot-water Boiler in the Market.

Prices greatly reduced. Our new net Price List, giving full details, will be handed to all on application. Over 500 in use. **WRIGHT'S BOILER CO.,** Boiler Works, Airdrie, N.B.

THE "SPHINX"
CIRCULATING COPPER BOILER,

FOR HEATING CONSERVATORIES, GREENHOUSES, &c.

8-in. diam. to heat 30 ft. of 2-in pipe, £3 0 0
9-in. " to heat 100 ft. of 2-in pipe, £3 15 0
10-in. " to heat 150 ft. of 2-in pipe, £4 10 0
12-in. " to heat 250 ft. of 2-in pipe, £5 15 0

This is the most economical Boiler known for heating water by gas. The interior consists of corrugated discs, so arranged that in the smallest size there are nearly 800 inches of heating surface. It will maintain 200 degs. in 20 feet of 3-inch pipe, with 7 feet of gas per hour.

TESTIMONIAL—"I want another Sphinx Boiler, same as supplied last January. The Gentleman whose Conservatory I heated with it is so pleased he has recommended it to one of his neighbours."—H. FRANCE, *Adlington Road, Croydon.*

NUNS' VEILINGS, Plain and Figured, from 8s. 6d. to 10s. 6d. per yard.

SOLEIS, Plain and Figured, from 1s. 4d. to 3s. per yard.

THE LARGEST and CHEAPEST STOCK in England of HAND MADE home manufactured goods, held by the ACTUAL MANUFACTURERS. ANY QUANTITY CUT, at Wholesale Prices.

Unlike so-called Manufacturing Companies, who buy of good, bad, and indifferent MANUFACTURERS to sell again as their own, the goods of HENRY PEASE & CO.'S SUCCESSORS are of their own Manufacture. They are thus enabled to warrant the WEAR AND QUALITY of EVERY YARD, and to sell at prices which cannot be approached. Ladies are invited to send their addresses from any part of the World, when they will immediately receive a complete set of the above, POST FREE. Purchases of £1 and upwards, CARRIAGE PAID. Cheques and Post Office Orders to HENRY PEASE & CO.'S SUCCESSORS, Spinners and Manufacturers, DARLINGTON. Established 1752.

E P P S'S GRATEFUL-COMFORTING. C O C O A

Fruit Tree Foreman.

WANTED, an experienced and thoroughly practical MAN, to take charge of the Fruit Tree Department. Every encouragement given to a really good man—Apply in own handwriting, stating age, experience, where last employed, and wages required, to JAMES DICKSON AND SONS, Newton Nurseries, Chester.

WANTED, a thorough practical ROSE PROPAGATOR and GROWER for a London Market Nursery—Apply to TRADE, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, a steady young MAN, to take charge of Conservatory, Orchard-house, &c. 16s. per week, including bothy—State previous experience to Mr. B. HOPE, Middleton Park Gardens, Bicester, Oxon.

WANTED, a JUNIOR CLERK and SHOPMAN—Apply, stating experience and salary expected, A. B. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

Second Counter Hand at Seed Trade.

WANTED, a smart intelligent person, as SECOND COUNTER HAND. Exceptional references required as to character and capability. A provincial person preferred, where customers were seen daily; not a "moocher," as in the monster London warehouses.—W. BAYLOR HARTLAND, Seedsmen, Cork.

WANTED, a young MAN, in a Seedsman and Florist's, should be active, and willing to make himself useful. State age, experience, wages expected, &c., to MORLIE AND CO., 1 and 4, Fenchurch Street, E.C.

THE LIVERPOOL HORTICULTURAL CO. (John Cowan), Limited, The Vineyard and Nurseries, Garston, LEQUIRE for one of their Liverpool Florist Establishments, a young LADY of good business ability. Must be a competent hand at Making Bouquets, Wreaths, &c.—Apply, giving reference, stating salary expected, to the MANAGER.

WANTED, for the Cut Flower Trade, an experienced young LADY to assist in Conservatory. Must know Plants, and have a good hand at making up Wreaths, Bouquets, &c., and Trade Decorations.—Apply, stating wages in or out of doors, to W. R. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

SCOTCH GARDENERS.—JOHN DOWNIE, Seedsmen, 144, Piccadilly Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

TO LANDED PROPRIETORS, &c.—A. McIntyre (Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Remodelling existing Gardens. Plans prepared, 115, Listra Park, Stamford Hill, N.

RICHARD SMITH AND CO. wish to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and also his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BALLIFF, FOREMAN, or JOURNEYMAN Ladies or Gentlemen requiring any of the above will please send full particulars, which will be the best selections for the different capacities will be made.—Holloway, N.

GARDENER (HEAD).—Thoroughly practical; good experience in all branches, including Orchids. Excellent testimonials. For further particulars apply to Mr. MCKAY, Market Garden, Boborough, South Devon.

GARDENER (HEAD), where three or more are wanted.—A Gentleman is required as a Head Gardener to any one requiring a practical and reliable man.—A. A. D., 41, Wellington Street, Strand, W.C.

GARDENER (HEAD); age 40, married.—A GENTLEMAN is desirous of recommending his late Head Gardener in any Lady or Gentleman requiring a practical, trustworthy man of twenty years' experience.—F. H., 7, Beaconsfield Terrace, Perry Hill, Croydon.

GARDENER (HEAD), where two or more are kept.—Age 30; understands Gardening in all its branches. Seventeen years' experience in nurseries and private establishments. Wesleyan. Good references.—W. T. H., Broad Moor Cottage, Weston, near Bath.

GARDENER (HEAD); age 29.—Mr. WESTCOTT, Gardener in his Grace the Duke of Cleveland, Raby Castle, Yorkshire, who has much to recommend his former as Head Gardener to any Nobleman or Gentleman requiring a thorough practical, steady and respectful man, who has been in general charge of these gardens upwards of four years, and given me every satisfaction.

GARDENER (HEAD) to any Lady, Nobleman or Gentleman, requiring the services of a thoroughly practical trustworthy man. Can be very highly recommended by Nobleman and Gentlemen, as a first-class man of twenty years' experience in growing all kinds of Flowers, Fruit, and Vegetables; also the keeping of same in thorough good order. Highest testimonials.—R. P., Sharnbrook, Bedford.

GARDENER (HEAD WORKING).—Age 26; total abstainer. Twelve years' good practical experience in all branches. First-class references.—H. TULL, The Gardens, Eltham, Sandown, Isle of Wight.

GARDENER (HEAD WORKING); age 38, married.—A Gentleman is now open to engage with any Gentleman requiring the services of a thoroughly practical Gardener; also has a good practical knowledge of Land and Soil. Several years' thorough character.—W. R. RAVENHILL, 23, Abchurch Lane, London, E.C.

GARDENER (HEAD WORKING).—Great experience in all branches of the trade. Says in Conservatory Grounds, New Plantations, Erection of Horticultural Buildings, Land and Stock, and the general routine of a Gentleman's Establishment.—Excellent character.—BROWN, 6, Upper Park Road, Hampstead, N.W.

GARDENER (HEAD WORKING) or good SINGLE-HANDED. Age 25, single; ten years' good practical experience in all branches. Good character.—G. CORBETT, Station Road, Ashford, Surrey.

GARDENER (HEAD WORKING), where help is given, or good SINGLE-HANDED.—Age 38, married; has a thorough knowledge in all branches. Twenty years' experience. No objection to a cow. Excellent references. Leaving through Gentleman selling his estate.—R. O., The Gardens, Dribin House, Hanger Hill, Ealing, W.

GARDENER (GOOD WORKING).—Age 26; understands all kinds of Early and Late Forcing. Twelve years' experience in the Florists' business.—F. BISHOP, 20, Duppas Hill Lane, Croydon.

GARDENER (SINGLE-HANDED, or otherwise); age 23, married, no child.—A Gentleman wishes to recommend his Gardener. He is reluctantly obliged to part with him to reduce his expenses.—Mr. W. NEWTON, Gould's Grove, Bemson, Oxon.

GARDENER (SINGLE-HANDED or otherwise)—Married; thoroughly understands Glass, Flower and Kitchen Gardening. Five years' good character.—H. STONEHAM, Upon Fyne, near Exeter.

GARDENER (UNDER), Inside or Out.—Age 41; good character.—W. H. Kirtton Hill Farm, Preston Lane, North Shields, Newburnhead.

Cut Flower Trade.

FOREMAN.—J. H. PONCE, who is relinquishing business, can thoroughly recommend his Foreman, Mr. Merritt, to fill a similar position as a steady, experienced, persevering man.—Fountain's Nursery, Heaton, N.W.

FOREMAN (HERBACEOUS).—A thoroughly practical and experienced man. No objections to go abroad.—G. F. G., R. Simpson, Stationer, Cannonmills Bridge, Edinburgh.

FOREMAN (GENERAL, or FOREMAN in good establishment); age 29.—Thos. HOLEY, Gardener to Colonel Sowerby, Putney Park, Luton, Beds, can with confidence recommend his late Foreman, who has been with him in the same capacity five years, as a trustworthy and thorough practical man in all branches of Gardening.

PROPAGATOR (SECOND), or SECOND GARDENER.—Three years' good character.—W. BATCHELOR, High Street, Hampton Wick.

To Nurserymen.

PROPAGATOR and FOREMAN.—Well up in the Propagation of Rhododendrons, Conifers, Clematis and Roses, all Hardy Plants, &c.—W. S., Egberton, Surrey.

To Nurserymen.

PROPAGATOR and GROWER.—Well up in the Cultivation of Stove and Greenhouse Plants in general. Sixteen years' experience. Good references.—R. W. Longlands, Nursery, Croydon, Kent.

JOURNEYMAN, in the Houses.—Age 21; two years' present place. Good references.—D. CRACKNELL, Cannon Hill Gardens, Barnsley, Yorks.

IMPROVER, in a Gentleman's Garden.—Has been over three years in last place.—J. SHEA, Parsonstown, Slane, Co. Meath, Ireland.

IMPROVER; age 18.—W. L. BIRD, Gardener to A. Seymour, Esq., Norton Hall, Daventry, wishes to recommend a steady industrious youth as above.

To Gardeners.

IMPROVER.—Age 19; two years' experience. Good references.—Abstainer.—R. Mr. Broadacre, Bookeller, Salisbury.

IMPROVER.—Young's has had six years' experience in a first-class Plant Culture. Abstainer. Wages £1, and bothy. Fruit and Veg. to £1. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

CLERK, BOOKER, or SHOPMAN.—Fourteen years' experience in the Seed and Nursery Business.—JAMES SIMPSON, Peter Lawson & Son (Limited), Edinburgh.

SHOPMAN (HEAD), or MANAGER.—Age 40; twenty years' experience in the Retail Seed Trade, gained in first-class London and Kent Houses. Careful and efficient Correspondent. Moderate salary.—F. A. R., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (HEAD), or MANAGER.—Thorough practical knowledge of the Trade in all its branches, acquired during a twenty-five years' experience in London and Provincial London and Kent Houses. Careful and accurate in all matters of business detail.—J. GEORGE, 2, Kingston, Veovil.

SHOPMAN.—Age 27; fourteen years' practical experience in Wholesale and Retail Trade. First-class references.—F. S., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (SECOND).—Six years' experience in all the branches of the Trade; has also a fair knowledge of the Nursery Business.—E. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (ASSISTANT).—Age 19; five years' experience. Good character.—ALPHA, Brookland House, Porten Road, West Kensington Park, London, W.

To the Seed Trade.

SHOPMAN (ASSISTANT).—Age 24; eight years' experience. Thorough knowledge of the Trade. Unexceptional references.—A. B., 17, Lower Drumcondra Road Dublin.

TO NURSERYMEN.—Wanted, a situation in a Nursery, either In or Out-doors, or Office, by one who has been accustomed to Travel, and has a good connection. Highest references.—A. E., Mr. Luton, 2, King's Square, Bristol.

TO SEEDSMEN and Others.—Wanted, a situation by a Lad (age 16) Two years' experience. Good reference.—E. BALL, Wickham Road, Chichester.

TO FLORISTS, &c.—Situation wanted by a young Lady; thoroughly experienced, and able to take Management. Undeniable references.—T., 10, Saunders' Terrace, Kenal Green, W.

HOLLOWAY'S PILLS and OINTMENT are remedies which should invariably be taken by travellers in search of health, pleasure or business. Many dangerous influences are constantly at work in foreign climates, tending to deteriorate the health; these and the altered conditions of life will entail on those who travel the necessity of carefully attending to early symptoms of disease, and they will find the use of these remedies to be highly necessary, the action of the Pills being purifying and strengthening and of great service in cases of fever, ague, and all inflammatory diseases, whilst the Ointment is a sovereign cure in cases of piles, bad legs, bad bruisings, wounds and ulcers. Holloway's remedies do not deteriorate by change of climate.

CHRISTMAS ROSES.

HELLEBORUS NIGER ANGUSTIFOLIUS, "Brookhurst" variety, pure white, very free, good grower, grand for forcing and the best of all the Christmas Roses. Strong clumps, 1s. 6d. each, and 2s. 6d. each, 18s. 24, and 30s. per dozen. ...

Bermuda Easter Lily. LILIAM HARRISII.—This Lily, coming direct from Bermuda, must not be confounded with the variety generally sent from America under the above name, ...

LILIAM AURATUM.—Mr. WILLIAM BULL is now booking 40s. for good, plump, sound bulbs at 6s. 9d., 12s. 18s., and 24s. per dozen. All other good Lilies at equally low prices. Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

PINUS ARISTATA.—"A correspondent

who has tried the nursery tree in vain" for the above Pine, may surely find it in many nurseries, but nowhere so cheap and so good as with MORRISON BROTHERS, Aberdeen, who can give fine healthy plants, 6 to 9 inches, at 1s. 9d. to 2s. each, at 1s. 6d. and 3 to 4 feet, at 7s. 6d. each.

A LIST of all hardy Pinus sent free on application.

FRANCIS R. KINGHORN begs to offer, in

splendid stock at low prices, the following:—PLANES, 11 to 12 feet, straight stems and good heads; Caucasian and Round-leaf LAURELS, 3 to 4 feet, bushy; Oval-leaf PRIVET, 4 to 5 feet, bushy; Irish IVY, in pots, 5 to 6 feet, many shoots; SWEET BRIAR, in pots, 3 to 4 feet; Double GORSE, in pots, 2 feet, bushy; BERBERIS DARWINII, in pots, 2 to 3 feet, bushy; LILACs, 5 to 6 feet; RIBES, 4 feet. ...

ROSES.

20 Acres of grand plants in best varieties. BUSHES, H.P., 8s. per dozen, 60s. per 100.

STANIARDS, H.P., 15s. per dozen, 150s. for Cash with Order. CLEMATIS (80,000), 12s. to 24s. per dozen.

ROSES, in Pots (80,000), 15s. to 36s. per dozen. FRUIT TREES (7,125). IVIES (600), 3s. to 6s. 6d.

ORCHARD HOUSE TREES, "Fruiting," in Pots. STRAWBERRIES, 4s. per 100; Forcing, 15s. to 25s. per 100. ASPARAGUS, 2s. 6d. per 100; Forcing, 12s. 6d. per 100. SEAKALE, strong Forcing, 16s. per 100.

EVERGREENS, CONIFERS ORNAMENTAL TREES (50 Acres). FLOWERING SHRUBS, 8s. per dozen.

FOREST TREES, HEDGE PLANTS UNDERWOOD, & BULBS

Of Finest Quality.

Descriptive LISTS of above and SEEDS free.

CHRYSANTHEMUMS.

OUR EXHIBIT at the NATIONAL EXHIBITION, ROYAL AQUARIUM, fully confirms that nothing in the history of the CHRYSANTHEMUM ever approached the completeness and extent of our stock, or our display (not for competition) which extended nearly 50 feet, comprising 850 blooms; its beauty and exquisitely new arrangement was fully acknowledged and enjoyed by all the spectators, the whole body of Judges unanimously awarded us the Silver Medal in corroboration of above: side report in The Garden and Gardener's World. For further and full particulars, prices, &c., see our NEW CATALOGUE—now being made and ready to be sent them until a much higher and more attractive position than it ever before held. Our stock and facilities are such as enable us to supply well-established plants of the whole of Europe, and to supply in flower; these for containers and immediate propagation, could not be better.
Mr. CHERRYER, The Gardens, Lillenden, Hauxthorpe, Notts. I had from you last season 1 no. enclosed you another order."

H. CANNELL & SONS,

R. HALLIDAY & CO.,
HOTHOUSE BUILDERS AND HOT-WATER ENGINEERS,
ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.
 Vineries, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work, and that THE VERY BEST.
 Conservatories and Winter Gardens designed architecturally correct without the assistance of any one out of our firm, from the smallest to the largest Hot-water Heating Apparatus, with really reliable Boilers, erected, and success guaranteed in all cases. Melon Frames, Sashes, Hotbed Boxes, &c., always in stock.
 Plans, Estimates and Catalogues free. Customers waited on in any part of the Kingdom.
 Our Maxim is and always has been—
MODERATE CHARGES. FIRST-CLASS WORK. THE BEST MATERIALS.

THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

Price, as engraving, with Boiler, open feed syphon, 12 feet of 4-inch hot-water pipe, and patent joints complete, £4 4s. Delivered free to any station. Discount for cash.
 This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stokehole, and no hot-water fitter for fixing. The Boiler stands in the Greenhouse, the front only being outside and flush with the outer wall, so that the whole of the heat from the boiler itself is utilised.
 It burns over 12 hours without attention, at a nominal cost. "Loughborough" Boilers to heat up to 650 feet of 4-inch pipe, with hot-water pipe, joints, &c., always in stock.
 Cost of Apparatus COMPLETE for Greenhouses as below:—
 10 by 6 ft., £4 14 0 | 15 by 9 ft., £5 10 8 | 25 by 12 ft., £6 16 8
 12 by 8 ft., £5 1 0 | 20 by 10 ft., £5 0 0 | 43 by 16 ft., £8 12 4
 Proportionate prices for other sizes. Estimates on application.
 The measurement of Greenhouses being given, every apparatus is delivered with pipes cut and fitted ready for fixing.
 Illustrated List, with full particulars, post free.

Bedale, Yorkshire.

ANTHONY WATERER

Invites attention to the following List of well-
grown and properly rooted

NURSERY STOCK:—

- ABIES CANADENSIS, 4 to 8 feet, hundreds.
- .. DOUGLASSI, 3 to 6 feet, thousands.
- .. DOUGLASSI GLAUCOA, 3 to 5 feet, hundreds.
- .. HOOKERIANA or PATTONIANA, 3 to 5 feet.
- .. ORIENTALIS, 4, 5, 6 to 10 feet, hundreds
- .. PARRYANA GLAUCOA, 1½ to 3 feet, hundreds. All
from seed.
- CEDRUS ATLANTICA GLAUCOA, 3 to 6 feet.
- .. DEODARA, 6 to 9 feet, hundreds.
- .. LIBANI (cedar of Lebanon), 4 to 5 feet, hundreds.
- CUPRESSUS LAWSONIANA ERRECTA VIRIDIS, 3, 4,
4 to 8 feet, thousands.
- .. LUTEA, 3, 4 and 5 feet, hundreds.
- JUNIPER, Chinese, 5, 8 to 12 feet.
- PICEA CONCOLOR, 2 to 5 feet, hundreds:
- .. LASIOCARPA, 3 to 5 feet, hundreds.
- .. MAGNETICA, 2 to 3 feet, hundreds.
- .. NOBILIS, 3, 4, 5 feet, hundreds.
- .. NORDMANNIANA, 4, 5, 6 to 10 feet, hundreds.
- .. PINSAPO, 6 to 10 feet, hundreds.
- PINUS AUSTRIACA, 3 to 4½ and 4 feet, well furnished and
transplanted October, 1884, thousands.
- .. CEMBRA, 3, 6 to 8 feet, hundreds.
- RETINOSPORA OBTUSA AUREA, 3 to 6 feet.
- .. PESTERA ALBA (true), 3 to 6 feet.
- .. PLUMOSA AUREA, 3 to 5 feet.
- .. THUIOPSIS BOREALIS, 4 to 6 feet, hundreds.
- .. DOUGLASSI, 3, 4, 5 feet, hundreds.
- .. THUIA LOBBII, 4 to 6 feet, hundreds.
- .. OCCIDENTALIS LUTEA, 3 to 6 feet
- .. SEMPER AUREA, 2½ to 3 feet, hundreds.
- YEWs, Common, 3, 4, and 5 feet, thousands.
- .. Common, 6 to 10 feet, hundreds.
- .. Golden, of all sizes up to 10 feet.

- We have many thousands at Pyramids, Globes, and
Standards, in point of variety and size unequalled.
- .. Golden, Seedlings, 3, 4, 5, to 8 feet.
- .. Irish, 2 to 10 feet, hundreds.
- .. Irish, Golden, Seedling, 3, 4, and 5 feet.
- AZALEAs, Hardy, the finest varieties known, 2, 3, 4, and 5
feet, thousands.
- RHODODENDRONS, 3, 4, 5, 6, 8 to 10 feet, thousands of
finer plants than can be found in any other Nursery.
- THE fine Standard and other Rhododendrons annually
planted at Kotten Row, Hyde Park, are supplied by ANTHONY
WATERER
- KALMIA LATIFOLIA, healthy and well furnished plants,
15 to 24 inches, showing from twelve to thirty trusses
of bloom.
- AUCUBA JAPONICA, 2½ to 3 feet, hundreds.
- BAMBUS METAKE, fine clumps, 4 to 8 feet high, trans-
planted spring, 1875, hundreds.
- BOX, Green and Variegated, 3, 4, 5, 6 to 7 feet, thousands.
- HOLLIES, Common Green, 3, 4, 5 up to 10 feet, thousands.
- .. ALFACLAENSE, }
.. HODGINS, } 3, 4, 5 up to 10 feet, many
.. LAURIPOLIA, } thousands.
- .. MYRTIFOLIA, }
.. SCOTICHA, }
.. Yellow-berried and other sorts.
- .. Variegated, of sorts, 3, 4, 5 up to 10 feet, thousands.
- .. Golden Queen, 2, 3, 4, 5, 6 to 10 feet, hundreds of beau-
tiful specimen.
- .. Silver Queen, 4 to 10 feet, splendid specimens.
- .. Weeping, Portia, on straight stems, with heads of ten to
fifteen years growth, hundreds.
- .. Weeping, New Golden, a large quantity of beautiful
plants.

The following trees have stout, straight stems, fine heads,
and splendid roots, and have all been transplanted within two
years:—

- ACACIA BESSONIANA, 6 to 10 feet.
- .. ACER DASYCARPUM, 10 to 15 feet.
- .. NEGUNDO VARIEGATA, Standards, 8 to 10 feet.
- .. RETINDENBACHII, 8 to 10 feet.
- .. SCHWEDLERI, 10 to 12 feet, 14 to 16 feet.
- .. WORLEVII, Standards, 12 to 14 feet.
- BEECH, Common, 10 to 12 feet.
- .. Purple, Pyramids, 9 to 12, and 12 to 14 feet.
- BIRCH, Silver, 12 to 14 feet.
- .. Purple, 14 feet.
- CHESTNUT, Horse, 14 to 16 feet.
- .. Horse, Scudler, 12 to 12 feet.
- .. Double, 10 to 12 feet.
- ELMS, English, 10 to 12 feet.
- .. Guiney, 10 to 12 feet.
- LINES, 10 to 12 feet, 12 to 14 feet, and 14 to 16 feet.
- .. Silver-leaved, 12 to 14 feet.
- .. LIQUIDAMBAR, 6 to 8 to 10 feet.
- .. LINDLEYI, 10 to 12 feet.
- ASH, Mountain, 10 to 12 feet.
- MAPLE, Norway, 14 to 16 feet.
- OAKS, American, 12 to 14 feet.
- .. English, 10 to 12 feet.
- PLANES, 14 feet and upwards.
- POPLAR CANADENSIS NOVA, 12 to 15 feet.
- .. BOLLEANA, 8 to 10 feet.
- SYCAMORE, Common, 14 to 15 feet.
- .. Purple, 15 to 16 feet.
- .. Variegated, Standards, 10 to 12 feet.

Weeping Trees.

- BEECH, Weeping, Pyramids and Standards, 10 to 12 feet.
- .. Weeping, Purple (true), Standards, 8 to 10 feet.
- BIRCH, Young's Weeping, Pyramids, 10 to 12 feet.
- .. Young's Weeping, Standards, 14 to 14 feet.
- ELMS, Weeping, Standards, 10 feet stems.
- HAZEL, Weeping, Standards, 8 to 10 feet.
- LARCH, Weeping, 6 to 10 feet.
- POPLAR, Weeping, Standards, 10 to 12 feet.
- SOPHORA JAPONICA PENDULA, Standards, 8 to 9 feet.

Intending planters are invited to inspect the Plants growing in
no one interested in such matters will regret the trouble.
Catalogues convey but a very inadequate idea of such a Stock.

KNAP HILL NURSERY, WOKING, SURREY.

THE Gardeners' Chronicle.

SATURDAY, NOVEMBER 21, 1885.

SUNNINGDALE.

THE undulating moorlands, partly in Surrey,
partly in Berkshire, are at all times inter-
esting, at most times beautiful. Their interest
lies in their geological conformation, in the
speculations and researches into the reason
why of these great deposits of sand and
ironstone, in the inquiry what has fashioned
this hill, levelled this plain, scooped out
this valley?—why are sand and heather
in one place, rich loam and gravel here,
moorland and peat there? We may
make a guess why the handsome Gentiana
pneumonanthe is here—we are not surprised
to hear of Droseras; and Narthecium, and
Cotton-grass. But it is not the season to look
for these, and our errand is not with them.
Willows with clear yellow leaves, Birches
with foliage of gold, bronzed Oaks mirror gloriously
with blue Pines, whose dark heads act as a
foil to the lovely orange-pink hue of their
bark. These are what we see on a
November morning, and, dull as the day is,
the earth seems full of colour. But it
is no fit day for botanising on the open moor.
The day, however, must be bad indeed, if one
cannot botanise in a well-stocked nursery. No
the trees and shrubs of our own country,
beautiful as they are, not the lowly wildings
which are never displaced in our affection by
the glories of the florist, or by any new importations
from far-off lands, can vie with the
manifold interest of a collection from all avail-
able parts of the world, manifesting every
variety of form, and colour, and adaptation.
The two categories are different—one appeals to
the sentiments, the other to the intellect. Japan
and China, California, the Atlantic States, the
Himalayas, the Chilian Andes—the temperate
zone throughout the world—offer in a nursery,
for comparison, their richest treasures in the
way of trees and shrubs. Apart from the fascina-
tions offered by their physical beauty, and the
attractions furnished by their adaptation to
the material and aesthetic requirements of the
time, such plants furnish a quarry for intel-
lectual enjoyment that is perfectly inexhaustible.
In such a frame of mind you might enter any
nursery, even the humblest, and find matter for
research or speculation. If this be so with the
humblest establishment, what must it be in the
case of such a nursery as that we are about to
visit?

The Sunningdale Nursery is an offshoot—a
divergence from the famous establishment of
Standish & Noble. What was done by that
firm in the way of new introductions, hybridisa-
tion, and selection, it is not necessary for us now
to do more than mention. Mention at least is
necessary, for the old firm of Standish & Noble
was the precursor whence the Sunningdale
Nursery was evolved, and hence, in spite of the
divergence in detail, the principle of continuity
prevails, and the same knowledge, interest and
care, which made the one establishment famous,
have had a like effect here. A nurseryman has
to grow what his clients require; it does not pay
him to indulge personal tastes at the expense of
business exigences. For all that some there

are who are so happily constituted that, while they are far from being slothful in business they yet manage to conduct their operations in the spirit of an intellectual pursuit as well as of a commercial enterprise. Sunningdale Nursery is such a place. Any man might get together rows of Laurels, quarters of Gooseberry bushes, "breaks" of common Rhododendrons, but the development, selection, and growth of choicer, more beautiful, more interesting sorts demand not only business tact, but a feeling and love for plants such as the mere man of business never attains to. You have but to walk a few paces in the Sunningdale Nursery to feel this. All that you see is so much "stock," good, plentiful, and well selected, but it gives evidence of something more than mere commercial value, it gives unmistakable evidence of critical knowledge and cultivated taste. Your severe business man might attach little value to the latter, but that would not be the feeling of the purchaser. The nurseryman may act as a public instructor, he may educate the public taste to his own level and thus create a demand for his stock in quarters where the ordinary commercial inducements would fail in producing any effect. The grand avenue of *Abies Nordmanniana*, the noble isolated specimens of *Abies grandis*, *A. lasiocarpa* (hort.), *A. nobilis*, *A. magnifica*, *A. Albertiana*, the Douglas Fir, the *Libocedrus*, *Taxodium sempervirens*, must strike the most heedless. Grand specimens as these are they are not readily movable. In the eyes of some people they would be deemed to lumber the ground, but if looked at only as advertisements and show cards their use in facilitating the dispersal of the smaller specimens duly prepared for removal by frequent lifting must be great. The lease of part of the ground having expired, the stock has been cleared, leaving these noble specimens available for those fortunate enough to create villa residences in this neighbourhood. Much has been cleared, as just mentioned, but much more remains to be removed, if some one be not found with sufficient enterprise to carry on an established business, for it is unfortunately an open secret that from ill-health Mr. Noble has deemed it prudent to diminish his anxieties and lighten his labours by disposing as best he can of his nursery and its contents. The attractions of the locality, its easy distance from town, the soil, scenery, and last, not least, the glorious specimen trees that might be available in future pleasure grounds carved out of the estate, should render the disposal of the whole or part of the nursery no difficult matter.

Among the smaller specimens of Conifers are the wiry-looking *Athrotaxis cupressoides*, bearing numerous cones, as figured in our columns a short time since; purple and golden *Retinosporas*, bronzy *Chamaecyparis*, elegant *Prumnopitys*, massive *Thuopsis dolabrata*, silvery *Junipers* (*virginiana glauca*), towering Douglas Firs, among them the very beautiful glaucous variety; and scores more which it would be wearisome to name. It is not the season for Rhododendrons, but one cannot help admiring the regiments of well-formed standards of the best varieties, nor avoid speculating on the changes and chances the tiny seedlings we see by the tens of thousands in a sheltering wood not far off, undergo in their varied career from the seed-bed to the nursery rows. Hollies, in bush and as standards, are almost equally numerous and varied, and if we mention one in particular it is because while, in most places, it is apt to be shabby or inconspicuous, here it forms really handsome bushes—we allude to the small-leaved *Ilex crenata*. It is worth while mentioning this shrub as one well adapted for planting in smoky localities; even the smokiest, as we have proved by personal experience. *Acubas* and *Yuccas*, invaluable also in towns, and scarcely less useful in the country, are

found here in vast numbers and endless variety. Roses, of course, no nursery can be without, and here they were still showing flower, as if loth to leave the stage, or as if challenging the rampant and glowing *Tropæolum speciosum*, which is quite at home here, and the remaining Dahlias, Tritomas, and Gladioli in a test of endurance against the common enemy, frost; the whole making, with the Pampas-grass, a respectable floral display at a time when most of the deciduous trees were already bare or decked in the flaunting colours which, in

persons not studying the collections in our national arboretum at Kew, or even in the great tree nurseries, with sufficient care at the right season. Now that the leaves have well-nigh fallen, and only the more tenacious remain (though among these are the most gorgeous) we can only mention a few, and prominent among them the old *Rhus cotinus*. There are few more striking shrubs than this when in flower, when its great fuzzy panicles of palest lilac excite astonishment and admiration alike; and there are few which are more resplendent

FIG. 144.—SECTION OF *A. PRO CERUS*. (SEE P. 649.)

this case, are the heralds of approaching dissolution.

Naturally at this time of the year our attention was more turned to the evergreen shrubs, but Mr. Noble has much too wide knowledge and too good taste to participate any further than he can help in the prevailing neglect of deciduous trees and shrubs. On the contrary, there is a fine selection here of all the best sorts, whether for silvicultural or ornamental purposes. The neglect of our planters, even of professional landscape gardeners and foresters, of the resources at their disposal is one of the regrettable features of the time. In great measure we believe it arises from such

in purple and gold and scarlet than this is in the autumn. *Ptelea trifoliata* and *Spiræa opulifolia aurea* are all ablaze with golden foliage, *S. prunifolia* is almost equally gay in red attire; *Liquidambers* in glowing crimson, and *Rhus Pissardi* purple all the summer, and retaining its bravery to the last; *Comptonia asplenifolia*, so like a Fern, but now with a peculiar pale coppery hue unlike anything else. And here we get a wrinkle from our intelligent guide—if you want the plant to grow well and colour well, cut it back every year. This, too, is the secret in the case of the Golden Elder, which, if not cut back in this way, is apt to revert to the green condition. *Spiræa Lind-*

leyana is another shrub of surpassing elegance, which does best under similar treatment. *Rhodotypos kerrioides* is still in flower, but except as a curiosity we should not recommend it for general use. *Exochorda grandiflora*, on the other hand, is a shrub every one should have if they can get it; but it is, we learn, difficult to propagate. *Clerodendrum trichotomum* is showy in flower, and bold as to foliage; it flowers late, but—smell it not! The new American *Catalpa speciosa* seems likely not to be of much use here, and seems even more tender

A COMMON EDIBLE FUNGUS.

AGARICUS (LEPIOTA) PROCERUS, *Scopoli*.—*Agaricus procerus* is one of the commonest, and one of the most delicious, if not the most delicious, of all edible fungi. It also possesses the great advantage of being very easily recognised. With the assistance of the following notes it should be impossible for any moderately observant person to mistake any other fungus for the grand *procerus*.

As far as I know, no one has ever said a word of disparagement about the fungus before us. Every one

among our side dishes at table." Dr. H. Wharton, M.A., who is certainly no enthusiast for fungi as food, is obliged to write, "procerus is indeed delicious, soft, savory. Its close ally *rachodes*, I have found quite as dainty." We often find our poor relations "quite as dainty" as ourselves, sometimes more so. Fries writes, "Edulis sed lentus." Roques writes:—

"Il est peu de Champignons, aussi légères, aussi délicates, aussi faciles à digérer. Il a peu de chair, mais il est très savoureux, d'une odeur douce et fine. Son usage est très répandu. Plus d'un ménage champêtre en fait presque sa nourriture pendant plusieurs semaines."

Add Paulet says:—

"Elle est d'une saveur très agréable et d'une chair tendre, très délicate et très bonne à manger. Les amateurs la préfèrent même au Champignon de couche comme ayant une chair plus fine et étant beaucoup plus légère sur l'estomac."

After these notes of introduction and admiration *Agaricus procerus* may be briefly described. The illustration (fig. 145), engraved from Nature, shows a group of three examples growing in an open place amongst low-growing flowering plants. To make out the botanical characters of *A. procerus* it is necessary to get a good fresh example and cut it in two across the top and down the stem, as was done with *A. rubescens*, p. 460. The accompanying outline (fig. 144) shows the section of a large example of *A. procerus*. The salient characters given below are printed in italics. *A. procerus* grows in pastures, orchards, lowlands, on banks, and in open places, amongst bracken, &c. It does not grow in woods. Observe that the cap is fleshy, as shown by the thickness at A; that it is umbonate—i.e., it has a boss or swelling in the middle, like the boss of a Greek shield, at B; that the scales, C, at length separate from the flesh, as at D, E, F (in *A. rubescens* they are adherent). The stem is piped or hollow, G and H; and it is bulbous, J. There is a ring or collar round the stem, K; it is not permanently fixed to the stem (as in *A. rubescens*), but is loose, L; and when the fungus is mature the ring may be easily pushed up and down the stem with the fingers. Sometimes the ring breaks and falls away from the fungus to the ground. The gills do not touch the stem, but are remote from it, M, N. In this species the cap is very readily detached from the stem; the stem may be readily pulled away without breaking the cap, and a depression is then left under the umbo or boss of the cap on the dotted line, N.

This section is a good example of the line of the *hymenophorum* (hymen, or fruit-bearer), O being distinct from the line of the stem, P; a most important character, but in some examples unfortunately more potential than definite. The spores or seeds are white; a group of four, enlarged 500 diameters, is shown at Q.

The fungus may be popularly described as follows:—The cap (pileus) is dry, fleshy, and soft, 3 to 7 inches or more in diameter; in young unexpanded examples the cap is ovate (see illustration), then expanded and umbonate; at first brown in colour. Toward the margin into broad, brown (at length evanescent and separating) scales or flakes. Margin and outer surface beneath the scales rough, white, pale buff or pinkish in colour. Gills and spores white. Stem hollow, tall, 6 to 10 or more inches high, half an inch or more thick at top, variegated with small close-pressed brown scales (like the skin of a snake), bulbous at the base. Ring at length loose on the stem. Gills remote or unconnected with the stem. Taste and odour when raw pleasant.

The sub-genus of *Agaricus* to which *A. procerus* belongs is named *Lepiota*, from *λεπιτα* = a scale, in reference to the scaly top; *procerus* simply means tall, a somewhat indefinite specific name, as many fungi are tall, and many others are considered by some as scaly things.

Agaricus procerus is really a very close relation of the common pasture Mushroom, although it is (artificially) far removed from it in our Floras. The chief distinguishing characters are the white gills and white spores of the former, and the purple-brown gills and spores of the latter. There are many species of *Lepiota*, allied to the plant before us, and I should be inclined to trust several of the larger species as edible. The first four species of Fries, viz., *A. procerus*, *A. rachodes*, *A. excoriatus*, and *A. gracilentus*, I believe, are the same thing. They all gradually

FIG. 145.—AGARICUS PROCERUS, THE TALL OR PARASOL AGARIC.

than the common sort; *Viburnum plicatum*, the Japanese Guedres Rose, is fine in its bold plicated foliage, and in the summer noteworthy for its compact heads of snow-white flowers. But it is time to draw our notes to a close, not for lack of matter forthwith, for there are the forest trees and fruit trees unvisited, but simply that we may not weary the reader, and thus fail in our object of inducing him to go and see for himself.

ROYAL HORTICULTURAL SOCIETY. — Captain E. S. Bax (late 84th Regiment) has been appointed Assistant-Secretary to the Royal Horticultural Society, in place of Mr. Henry R. Newport.

who has written about it, or tasted it, has had good words for it. It is esteemed by many as better than the pasture Mushroom itself, for *Agaricus procerus*, whilst possessing all the good qualities of the latter, is much more delicate in flavour. Mrs. Hussey says it is the "King of Mushrooms," but to some people, including the writer, this would be but a dubious compliment. The Rev. M. J. Berkeley, who has always been reticent in recommending fungi as food, has been "conquered" by *procerus*, for he says it is "a most excellent Mushroom, of a delicate flavour," and "it must be considered a most useful species." Dr. Badham writes, "Were its excellent qualities better known here, they could not fail to secure it a general reception into our best kitchens, and a frequent place

run into each other and it is often impossible for the most acute observer to distinguish one from the other. *A. rachodes* has sometimes been termed unwholesome, and *A. exoriatus* (perhaps from some misunderstanding of the meaning of the somewhat threatening specific name) has been called poisonous; but all four are very good for the table, *A. procerus* being the chief dainty. Some of the larger species, beginning with *A. acutesquamosus*, are perhaps best avoided. One small species, *A. cristatus*, is known by its disgusting odour. Several grow in greenhouses, and are no doubt of exotic origin, as Sowerby's *A. cepesipes* and my *Georginae*. Dr. Cooke, in the new edition of his *Handbook*, now in course of publication, says the latter species was named by me "in honour of Mrs. Worthington G. Smith." This unfortunate mistake of the Doctor's might have led (in some quarters) to a domestic alteration: *Georgina* is some one else!

The proof of procerus is in the catag. Like all other Mushrooms, it requires to be well and skilfully cooked, and served quite hot. Sound examples only must be prepared for the table.

The late Dr. Bull, of Hereford, carefully wrote out, from experience, the best modes of cooking *A. procerus*, and for the following methods fungologists are chiefly indebted to him. The modes are approved by the writer and are adopted by the Woolhope and other clubs:—

MODES OF COOKING AGARICUS PRO CERUS.

It may be cooked in any way, and is excellent in all.

Broiled.—Remove the scales and stalks from the Agarics, and broil lightly over a clear fire on both sides for a few minutes; arrange them in a dish over fresh made, well-divided toast; sprinkle with pepper and salt, and put a small piece of butter on each; set before a brisk fire to melt the butter, and serve up quickly.

If the cottager would toast his bacon over the broiled Mushrooms the butter would be saved.

Baked.—Remove the scales and stalks from the Agarics, and place them in layers in a dish; put a little butter on each, and season with pepper and salt. Cover lightly, and bake for twenty minutes or half-an-hour, according to number placed in the dish. Put them on hot toast in a hot dish. Pour the hot sauce on them and serve up quickly.

Steamed.—Remove the scales and stalks from the freshly gathered Agarics and stew them for twenty minutes in milk and water, which will be improved by a little good gravy; then season with pepper and salt, and add a blade of mace if desired. Thicken the same with a spoonful of flour, a little cream, or the yolk of an egg. Boil for a few minutes, and serve up quickly in a hot, well-covered dish.

Delicately Steamed.—Remove the stalks and scales from the young half-grown Agarics, and throw each one as you do so into a basin of fresh water slightly acidulated with the juice of a lemon, or a little good vinegar. When all are prepared, remove them from the water, and put them into a stewpan with a very small piece of fresh butter. Sprinkle with white pepper and salt, and add a little lemon juice. Cover up closely and stew for half an hour. Then add a spoonful of flour, with sufficient cream, or cream and milk, until the whole has the thickness of cream. Season to taste, and stew again gently until the Agarics are perfectly tender. Remove all the butter from the surface, and serve in a hot dish, garnished with slices of lemon.

A little mace, nutmeg, or ketchup may be added; but there are those who think the spice spoils the Mushroom flavour.

Procerus Sauce.—Chop up about half a pint of young Agarics, pepper and salt, and add an ounce of butter rolled in flour. Put in a stew-pan over a slow fire for a few minutes; add half a pint of milk, or, better still, cream, and boil gently, stirring all the time until it is sufficiently thick and smooth. Pour round boiled fowls or rabbits, or any light *fricadee*.

Beef or veal stock may be used when a brown sauce is required; and some will think a little mace or nutmeg, or a few drops of Indian soy, or a little Harvey Sauce, a good addition. The brown sauce is excellent for steaks, cutlets, game, or any kind of *steaks*.

Scalloped Procerus.—Mince young fresh Agarics, season with pepper, salt, and a little lemon juice, add a little butter, and stew in a warm oven for ten minutes, then put them in a scallop tin, layer by layer, with fresh bread crumbs, moistened with milk,

cream, or good gravy; bake for five minutes, and brown well before a quick fire.

Cottager's Procerus Pie.—Cut fresh Agarics in small pieces, and cover the bottom of a pie-dish. Pepper, salt, and place on them small shreds of fresh bacon, then put a layer of mashed Potatoes, and so fill the dish layer by layer, with a cover of mashed Potatoes for the crust. Bake well for half an hour, and brown before a quick fire.

Procerus Omelette.—Mince some young fresh Agarics; season with pepper and salt; add butter, and set them in the oven whilst you whisk well the whites and yolks of half a dozen eggs; then put 2 oz. of butter into the frying-pan, and heat until it begins to brown; having again well whisked up the eggs with three table-spoonsful of the prepared Agarics and a little milk, pour it lightly into the boiling butter; stir one way, and fry on one side only for five or six minutes; drain it from the fat; roll it up and serve quickly on a hot, well covered dish.

Potted Procerus.—Remove the scales and stalks from young fresh Agarics; sprinkle with pepper and salt, and set aside for three or four hours; then place them in the stewpan with the liquor that they have exuded and stew until dry; next fry in butter for a few minutes; put them into small jars, and when cold pour in as much butter, melted, as will just cover them; when again cold, pour on a little melted snet, and tie down with bladder.

When required for use, soak them for two or three hours in a little warm milk and water, and stew with milk or cream, or stock, and use it in any way that may be required.

Essence of Procerus.—Sprinkle young but full-grown Agarics with salt, and let them stand for six hours. Then beat them well up, and the next day strain off the liquor, and boil very slowly until it is reduced to one half the quantity.

This essence will not keep long, but is much preferable to ketchup, where the delicate flavour of the Agaric is overpowered by spice. Add to it one-third part of good French brandy, or half its quantity of any wine, bottle carefully, and it will keep for any reasonable time.

Procerus Ketchup.—Place the Agarics of as large a size as you can procure, but which are not worm-eaten, layer by layer in a deep pan, sprinkling each layer as it is put in with a little salt. The next day stir them well up several times so as to mash and dip the ends in juice. On the third day strain off the abstract their juice, and boil for two minutes, and then to every pint of the liquor add half an ounce of black pepper, a quarter of an ounce of bruised ginger root, a blade of mace, a clove or two, and a teaspoonful of mustard seed. Boil again for half-an-hour, put in two or three Bay leaves, and set aside till quite cold. Pass through a strainer, and bottle; cork well, and dip the ends in resin. A very little Chili vinegar is an improvement, and some add a glass of port wine or strong ale to every bottle. The next day it should be taken that the spice is not added so abundantly as to overpower the true flavour of the Agaric. A careful cook will keep back a little of the simple boiled liquor to guard against this danger; a good one will always avoid it. "Doctors weigh their things," said a capital cook, "but I go by taste." But then, like poets, good cooks of this order must be born so, they are not to be made. (Dr. Bull.)

Procerus.—In the *Procerus*.—Steep for two hours in oil, with some salt, pepper, and a little garlic; then toss up in a small stew-pan over a brisk fire, with Parsley chopped, and a little lemon-juice. (Dr. Badham.)

"Comme il est très léger et très délicat, il faut le faire sauter dans l'huile fine après l'avoir assaisonné d'un point d'ail, de poivre, et de sel; en quelques instants, il est cuit. On le mange aussi en fricadee de poulet, cuit sur le grill, ou dans le tourtière avec de beurre, de fines herbes, de poivre, de sel, et de la chapelure de pain; ou ne mange point le tige, elle est d'une texture coriacé." (Roques). *Worthington G. Smith, Dunstable.*

FRUIT CULTURE IN LOS ANGELES.—In the Northern and Eastern States of Los Angeles a great variety of semi-tropical fruits, such as the Orange, Lemon, Lime, Pomegranate, and Fig, are cultivated. Every year the average of fruit culture is increased very largely. Peaches of the finest quality are raised at the orchards for one halfpenny per pound. Even at this low price a good Peach orchard will pay £60 per annum per acre. Grapes sell at from £3 to £5 per ton. The products of the orchards are either sold green, evaporated, canned, preserved, crystallised, or sold green. The crystallisation of fruits as practised in the South of France has recently been commenced, and is meeting with much success.

New Garden Plants.

ÆRIDES BERNHARDIANUM, n. sp.*

MR. HARRY VEITCH has kindly sent me this surprising novelty with this note:—"The *Ærides* was sent to us by Mr. Curtis from Borneo; we know nothing like this." Neither do I. The position of the lacinioe of the lip, the side lacinia overlapping one another, and the front ones covering both in front side, are great peculiarities, and I cannot remember to have seen anything like it except in *Ærides* Leeanum. There is a strong, thick, abrupt, emarginate callus in the base of the mid-lacinia, under it a small triangular one, and lower down on the sides of the mouth of the spur two rounded, swollen lines. The appearance of the raceme is almost that of *Ærides* quiquevenerum. The leaf is narrow, strap-shaped, and unequally bilobed.

It is a great satisfaction to me to dedicate this fine novelty, with hearty gratitude and best wishes, to Mr. Theodor Bernhardi, now of Erfurt, late Curator of the Leipzig Botanic Gardens, who was surpassed by no one in skill and zeal and love for plants during the time he held his difficult position. *H. G. Rehb. f.*

ONCIDIUM HÜBSCHII, n. sp.*

A new *Oncidium* of the pyramidal group. It has an exceedingly branched pyramidal panicle, flowering like others of the same group. The bipartite orange coloured wings of the column give the best character. The lip is narrower in front than at the base, and wears a very peculiar system of calli. Colour sulphur-coloured with some brown tint. It was imported by Mr. F. Sander, and sent to the eminent orchidist, Baron Hrabý, of Petschkau, who kindly forwarded me the first inflorescence, laden with very numerous flowers. The Baron informs me it was sent him, in 1833, by Mr. Hübsch, from Ecuador. He is one of the numerous Sanderian collectors. I feel very happy to dedicate the species to its persevering discoverer. *H. G. Rehb. f.*

THREE NEW ANTHURUMS.

To Mr. W. Bull I am indebted for the following three new members of this already unwieldy genus. Of these the hybrid, *A. chelstensis*, is much the finest for horticultural purposes, although *A. Veitchii* var. *acuminatum*, will, when fully developed, probably be as bold and ornamental a plant as the typical form. *A. flavidum* is allied to *A. Andreamum*, but the sinus of the leaf is much more open, the leaf is punctate dotted beneath, and the ultimate areolation larger in *A. flavidum*; it appears to be one of the tall-growing or climbing species, and will make a good foliage plant.

Anthurium chelstensis, n. hybr. N. E. Brown.—A fine handsome hybrid between *A. Veitchii* and *A. Andreamum*, with leaves resembling those of *A. Veitchii*, which I suspect to be the seed-bearing parent; they are, however, more ovate, and the veins rather fewer and less arching backwards, at least in some of the leaves, and the midrib is acutely keeled beneath, instead of being flat with merely a raised line, as in *A. Veitchii*. The petioles and scapes are terete. The spathe is broadly cordate, cuspidate at the apex, $3\frac{1}{2}$ —5 inches long, $2\frac{1}{2}$ —3 $\frac{1}{2}$ inches broad, spreading, of a rich crimson colour, quite smooth and somewhat glossy, but not so much so as *A. Andreamum*. Spadix 3 inches long, about $\frac{1}{2}$ inch thick (in fruit $\frac{3}{4}$ inch thick), slightly tapering, basal part white, apical part yellowish at first; styles protruding about $\frac{1}{2}$ line beyond the sepals. The spathe is more tapering, and the styles appear to me rather more protruding than in *A. Veitchii*. It is to my mind a more handsome plant than *A. Ferriense*, and about equal to another new hybrid derived from *A. Andreamum*, raised by the Compagnie Con-

* *Ærides Bernhartianum*, n. sp.—Folius linearifolius ligulatis apice oblique bilobis; racemo plurifloro *Ærides* quinquevenerum, Lindl.; sepalis tepalibus affinis; labelli laciniis lateralibus subquadratis imbricatis, lacini mediana hinculata acuta intersegmentis illis legente, calicem antrosum verso conico breviusculo callo emarginato magno in fascia laciniæ anticæ, callo parvo triangulo appposito, lineis geminis incrassatis infra carinæ ostium inferius, rotello brevi. E. Bomes, introd. c. more, Lond. *Ærides Bernhardi*, per longum tempus curatori (horti botanici Lipsiensis), vero merissimum gradum animo dicitur. *H. G. Rehb. f.*

* *Oncidium Hübschii*, n. sp.—Aff. *Oncidium pyramidalis*, Lindl.; callis basi latiori cordato, ab istis brevi acetulo orbato; callis in basi, 2 angulatis, aquam styliformibus, medianis terminis styliformibus antepositis; alis. Columnæ hieracibus, linearibus extus, retusis, dentatis. Ex Ecuador, miss. coll. Hübsch, cui dicitur. *H. G. Rehb. f.*

tinente d'Horticulture, which will be published in an early number of *L'illustration Horticole*—the two are, however, quite distinct in foliage and in the colour of their spikes.

Anthurium Veitchii var. *acuminatum*, N. E. Brown.—The typical *A. Veitchii*, now so well known, has an elongate-oblong leaf, with nearly parallel sides for about three-fourths of its length, and a very narrow sinus, the basal lobes often overlapping more or less. In this new variety the leaf is ovate-lanceolate, gradually tapering in a slightly curved line to an acuminate point, the sinus is open and triangular, the veins, especially the basal ones, are less arched backwards, and there are rather fewer of them, though as I only examined a few leaves of one plant this may not be the case with all. The inflorescence is the same as in the ordinary *A. Veitchii*. It has been introduced from Columbia by Mr. Bull.

Anthurium flavium, n. sp., N. E. Br.—Stem elongating. Petioles terete, 12–18 inches long, 2½–3 lines thick, light green. Lamina 10–14 inches long, light shining green, cordate-ovate, apex acuminate, base cordate with rounded basal lobes, and a very broad rounded sinus 3–4 inches across, and 1–2 inches deep between them; primary lateral veins 12–14 on each side the midrib, nearly straight or slightly curving, all ascending, the basal lobes 3-veined, the veins uniting about ¼ inch from their origin from the base of the midrib, and denuded in the sinus, intramarginal vein continuous, 1–3 lines distant from the margin; all the veins and midrib acutely prominent on both sides, but on the upper side of the leaf they are at the same time depressed in channels below the general surface; under-surface paler than the upper, and minutely punctate-dotted. Scape 5–6 inches long, sub-terete, 1½–2 lines thick, pale green. Spathe spreading, yellowish or pale yellowish-green, oblong, abruptly cuspidate, 2–2½ inches long, ¼–1 inch broad, cusp 4 lines long. Spadix 1½–3 inches long, 3–4 lines thick, terete, obtuse, scarcely tapering, sessile, pale violet-pink. A native of Columbia, whence it has been imported by Mr. Bull. It appears to be a tall-growing species, and although not so gay as some others of the genus, is still sufficiently ornamental to recommend itself to lovers of this class of plants. Its position in the genus is next to *A. indecoram*, Schott. *N. E. Brown.*

SEEDLING FRUIT TREES.

MR. W. INGRAM'S remarks upon this subject at p. 559 tend to confirm an idea that I have long entertained, viz., that seedling Apples, Pears, and possibly other fruits, may under the conditions of the soil and climate, &c., of the districts in which they have originated be found to be possessed of qualities which they will not retain when transferred to other localities where similar conditions do not exist; while on the other hand, varieties may have been discarded on being found of little value in the locality where they originated, but which might, under the influences of other soil and climate, be found to be possessed of desirable qualities.

Many years ago I found that such varieties of the Pear as the Grey Achan, Moorfowl Egg, &c., which in the cool moist climate of the South of Scotland are found to be of excellent quality as dessert Pears, were worthless when produced in the comparatively arid atmosphere and drier soil of some parts of the Eastern Counties of England, where even such varieties of the Apple as Bess Poole and Betty Gesson, &c., which are deservedly esteemed in the Midland Counties, are found to be of little value. Many years ago a child sowed a few Pear pips in a pot of earth, and in the course of time some of the plants produced by the seeds thus sown produced fruit. The seedlings were all very distinct from each other in foliage as well as in fruit, and so far as was known were distinct from existing varieties—the fruit of one variety at least proving to be of such excellent quality that it was considered worthy of being shown before the Fruit Committee of the Royal Horticultural Society at its meeting of October 23 1874, when a First-class Certificate was awarded to it, and an illustration of it appeared in the April number of the *Florist and Pomologist* for 1875; and the Editor (Mr. T. Moore), in alluding to this fruit, writes as follows:—"If we cannot claim for Old England the parentage of many of our favourite Pears, we may at least assign to her some of the very best quality, and among these must rank the subject of our present illustration—Pear Lucy Grieve. As will be seen from our figure, this variety is remarkable for its long, narrow, Willow-like leaves, which gives the tree a peculiar appearance. The fruit is full medium size, oblong pyriform, broadish just above the middle, its average weight

exceeding 7 oz. The colour is clear deep lemon-yellow, thinly marked with russet dots, and having a small russet patch about the eye and the stalk. The flesh is moderately firm, fine grained, tender, and melting, very juicy, with a rich, luscious flavour, and a slight and agreeable dash of acidity, such as is occasionally met with in the Glou. Morceau. The odour of the fruit is penetrating and agreeable, and its appearance something like that of an elongated Glou. Morceau."

Dr. Hogg, in the fourth edition of the *Fruit Manual*, 1875, gives a lengthened and equally favourable description of this Pear, ending as follows:—"Flesh white, very tender and melting, very juicy, and richly flavoured. This is a delicious Pear, and has the texture of flesh of Marie Louise; it is ripe in October." Dr. Hogg further says:—"I named the Pear Lucy Grieve as a memorial of the raiser." Under this name it was distributed by the Messrs. E. G. Henderon & Son, then of the Wellington Road, St. John's Wood. The original tree still exists upon a low wall, facing south, in Culford Gardeau, near Bury St. Edmund's. This season the tree only produced a few fruits, part of which were kindly sent to me, and these were examined and tested by several good judges of fruit, who agreed in considering it well worthy of all that had been said in its favour; yet, strange to say, it has not in any instance, so far as I know, been exhibited at the Pear Congress just closed, and this circumstance leads me to think that this variety may possibly be one of those whose good qualities are only retained in the soil and locality which gave them birth. As has been said, the foliage, &c., of this variety are peculiar, and it can hardly have been confounded with other varieties; and should this communication chance to meet the eye of any reader who may have succeeded in fruiting it, they may possibly be inclined to favour your readers, as well as the writer, with their opinions respecting it. *P. Grieve, Bury St. Edmund's.*

Foreign Correspondence.

VEGETABLE PRODUCTS OF DALMATIA.—Reporting on the agriculture of Ragusa, the British Consul says the country is now adapted to the rearing of the silkworm and the cultivation of the Mulberry. The secret of the production of silk by means of the silkworm was, it is said, long jealously guarded by the Chinese, but was at length disclosed to the Emperor Justinian through the treacherous proceedings of a princess of China who, on leaving China to marry the Khan of Khotan, managed by the aid of her bridal robes to deceive the vigilance of the guards on the frontier, and for the first time carried the eggs of the silkworm out of the country, and so gave her husband a surprising nuptial gift. About the year 552, by means of missionary monks in Central Asia, Justinian managed to procure a supply of eggs, and in the reign of his son the manufacture of silk in Europe became established.

Under the protection of the Byzantine Emperors Dalmatia was one of the first countries in which the culture of silk became general, and there can be little doubt that the sacerdotal garment, called the Dalmatic, owes its name to its having been originally fabricated in silk. The cultivation of the silkworm has, however, been gradually diminishing in Dalmatia, and is still diminishing.

One of the chief articles of export of Ragusa in ancient times was dried Figs to Venice, and the Fig tree is still much cultivated, and the dried Fig of Dalmatia is of a very fine quality. The cultivation of the Fig has, however, much fallen off since the flourishing period of the provinces.

The same may be said of the Almond, which also flourishes well. The most esteemed kinds have a tender shell, which can be broken easily with the fingers, and large quantities are exported to other parts of Austria. Both Oranges and Lemons thrive in the southern parts of Dalmatia, but their cultivation is much neglected. The Carob tree is also abundant, and grows wild.

Little or no attention is given to the cultivation of garden produce; all vegetables grow pretty much as they will. Asparagus grows wild in abundance in the mountains, but none is grown in the gardens. Lettuce also grows abundantly, but is of inferior quality, for a supply of which Ragusa, with a superior climate, is sometimes dependent on Trieste. The

national vegetable is the "Kupus," a species of Cabbage, which only requires planting once in three years, and requires no attention.

The reputation of the flowers of the *Chrysanthemum cinerariaefolium* as an insecticide has suffered on account of defective kinds, and the adulterations of it, which have found their way into the market; however, when well selected and prepared there is no doubt of its efficacy, and it is especially valuable for the protection it affords to costly furs and stuffs against the attacks of moth. The best quality comes from the island of Tesina; the plant is said to thrive better in some localities than in others, and to lose its insecticidal powers out of Dalmatia, where it is indigenous. Another plant which thrives particularly well in Dalmatia is the Sumac, which is much used in tanning leather.

ESPARTO IN TUNIS.—Reports from Tunis state that the Esparto grass trade is now carried on there on a large scale, and large tracts of Esparto-producing fields have been bought by speculators. The Anglo-French Esparto Fibre Company are developing their trade at Abouhedma, and a tramway is now being laid down by the same to carry the Esparto fibre to the coast. But export duty is very heavy on this article, and competition by Tripoli and Algeria, where Esparto pays no export duty, is telling much on the trade. This trade is said to be amongst the very foremost resources of the Lousa district. "Through good and bad, dry or rainy years, there is always a crop of it. The Arabs fall back on it chiefly in times of scarcity, when successive years have brought them deficient crops. But the duty on this article, especially at Lousa, is so heavy as to deter the Arabs from pulling and bringing it to the market, except when they feel the pinch of poverty."

VANDA CERULEA AT PETSCHIKAU.—I have read several times about this beautiful and distinct Orchid in the *Gardeners' Chronicle*. Mr. E. Jenkins writes on p. 593 about a fine specimen, which surely must be a very healthy plant and a magnificent sight. After this I think it may still be interesting to some of your readers to be informed that we have two strong single-headed plants of *V. cerulea*, each carrying one spike, one with twenty-one, and the other with eighteen flowers and buds. Just now the lowest flowers are fading, and a few top buds are not yet opened, but there are twelve to fourteen well expanded and well coloured flowers on each. The variety is a very good one (both the same, coming from one original plant), measuring over 9 cm. (over 3½ inches) across the petals.

I keep the plants in summer in a span-roofed house, with thinly whitened glass, leaving the ventilators open day and night in favourable weather, say during three months (stormy nights excepted), where the temperature on the hottest days attains 100°–110° Fahr., and gets down to 65° and 55° Fahr. at night sometimes. In October I take them to the coolest end of the intermediate-house, which is well aired in favourable weather, even in winter, and kept at this end of the house, where the temperature stands at 55°–60° Fahr. at night. Those flowering and those that have not yet flowered are all established in pots, with cricks and charcoal, with some sphagnum on the top. At the present time they get just enough water to keep the sphagnum and cricks damp, till February or March, at which time the potting, if required, is done, and they begin to get more water. When I place them in the above-mentioned house in May they are syringed daily at night when the days are sunny and warm. *V. Faus, Petschikau, near Köln, Bohemia.*

DAHNE RUPESTRIS.—Any one who has once seen this gem of the Alps in its native habitat (South Tyrol), when it sends its woody roots far back into the very narrowest crevices possible, and then carpets the face of the limestone crags with its dense prostrate twiggly shoots and dark green, leathery, blunt leaves—in some instances forming compact masses nearly half a yard across—would hardly expect to see it brought down from its home, 5000 to 6000 feet elevation, to the level of man's habitations, and there grown as a standard; such a feat, however, is accomplished by Mr. Maly, of Vienna, who is an old and ardent lover of alpine plants, as may be seen when viewing his most interesting alpine garden, where many fine examples of these plants are growing.

SILENE ACAULIS.—This was as fine, if not finer, than I ever remember seeing it, either cultivated, or

wild. The same remarks equally apply to many other rarities. However, what interested me most was that which Mr. Maly showed us last—this little gem, *Daphne rupestris*. It had been grafted on stems 6 to 9 inches high, surmounted with an umbrella-like tuft of dark glossy leaves, perhaps 4 to 6 inches in diameter; the stems are about the thickness of an ordinary lead-pencil. They are extremely quaint, and highly interesting, and when in flower must be very pretty. The blossoms are large, of a soft rosy pink, waxy in texture, and in the highest degree fragrant. These results are not the work of a year, but have required fourteen years of loving and watchful care, which I am sure they have had, they are so clean and thoroughly healthy. *R. P.*

ABIES NOBILIS.

EVERY one interested in Conifers is familiar with this tree; which is one of the most valuable of Douglas' introductions. Its history has been given again and again, and its characters are pretty well known alike to the amateur and to the professional arborist. It is not, therefore, desirable to repeat details that may be got from any text-book; it will suffice to give one or two extracts from the latest and most trustworthy sources. Engelman thus describes—

"*Abies nobilis* of Lindley.—A magnificent tree, 200 feet high, with thick cinnamon-brown bark (red inside), leaves rigid, curved upward, covering the upper side of the branchlets, glaucous and stomateous, and keeled both on the upper and under side, acute or obtuse, about 1 inch long, only on the youngest trees or lowest branches longer (1½ inch), flatter, slightly grooved and somewhat two-ranked; cones cylindrical-oblong, thick, 6–9 inches long by 2½ or 3 inches broad, obtuse, almost covered by the erect reflexed cuneate cuspidate bracts; scales comparatively narrow (1½ inch wide by 1 inch long or more); seeds slender, with a cuneate-triangular somewhat retuse wing; embryo with seven or eight cotyledons.—*Penny Cyclopaedia*, i., 30; Nuttall, *l. c.*, p. 117; Engelman, *l. c.*, 601. Pinus nobilis, Douglas; Parlatore, *Picea nobilis*, Loud., *l. c.*, 2342, fig.; Newbery, *l. c.*, 49, fig. 17. [Veitch, *Manual*, p. 101.] The 'Red Fir of Northern California, forming large forests about the base of Mount Shasta at 6000–8000 feet altitude, and extending through the Cascade Mountains to the Columbia River. The timber is said to be better than that of other Firs. Forms are found with almost enclosed bracts, often accompanying the others, which may connect with the following species" [*magnifica*].—Engelman, *Botany of California*, ii. (1880), p. 119.

Sargent, in the *Forest Trees of North America*, says of it:—

"*Abies nobilis*, Red Fir.—Oregon, Cascade Mountains from the Columbia River south to the valley of the Upper Rogue River, and along the summits of the coast range from the Columbia to the Nestucca River (Collier).

"A large tree, 61 to 92 metres in height, with a trunk 2.40 to 3 metres in diameter, forming, with *A. amabilis*, extensive forests along the slopes of the Cascade range between 3000 and 4000 feet elevation; less multiplied in the coast ranges, here reaching its greatest individual development.

"Wood light, hard, strong, rather close grained, compact; bands of small summer cells broad, resinous, dark coloured, conspicuous; medullary rays thin, hardly distinguishable; colour light brown, streaked with red, the sap-wood a little darker; specific gravity, 0.4561; ash, 0.34."

It is, however, its relations to *Abies magnifica* to which we propose specially to allude. There are in nurseries plants known as *Abies nobilis*, *A. nobilis robusta*, and *A. magnifica* (so called), the latter name, however, being generally employed as synonymous with *nobilis robusta*. Whether the true *Abies magnifica* is in cultivation or not is a matter of doubt, which can be settled only when the trees produce cones. We may at once say that the characters of foliage, buds, the minute structure of the leaves, the general habit and other supposed marks of distinction melt away, and become less and less distinct the greater the number of specimens examined. There is no difficulty in recognising the more northern *A. nobilis* (true), at least when a cone-bearing specimen is at hand. The illustration at fig. 146, for which we are indebted to Messrs. Veitch, will sufficiently show how distinct and handsome the typical *A. nobilis* is.

A. magnifica, typical, fig. 145, p. 661, the more southern in its habitat, is equally easily recognised in native specimens provided with cones. We have not,

hitherto, seen cones produced in this country, for, as we shall presently show, what is sometimes called *magnifica* is not the tree rightly so named, but probably a form of *nobilis*. To make the matter clearer we cite the characters of the true *magnifica* as given by Engelman, and insert an illustration of the cone from the previous volume (fig. 148, p. 661) i.—

"*A. magnifica*, Murray.—Similar to the last (*nobilis*), even more than 200 feet high, and 8 to 10 feet in diameter, with the same kind of thick red-brown bark, and with similar very rigid foliage, but the leaves never grooved nor notched even on the young trees, on older branches shorter and thicker, so that they are mostly only a fourth wider than thick or even perfectly square, and often only 6 to 9 lines long; cones 6 to 8 inches long, 2½ to 3½ inches thick, purplish-brown; bracts lanceolate, acuminate, shorter than the very wide scales, which are 1½ to 1¼ inch broad, by scarcely 1 inch high; seeds slender, the wing broader, very obliquely obovate-cuneate; cotyledons 8 to 10.—*Proc. Hort. Soc.*, iii., p. 318; *Engelm.*, *l. c.*, p. 601. *Abies amabilis* of Californian botanists. [Veitch, *Manual*, p. 99.]

"The 'Red Fir' of the higher Sierras is not rare at an elevation of 7000 to 10,000 feet, but forms no forests by itself. Easily distinguished from the last by the enclosed bracts. Forms, however, are said to occur (Mount Siliman, Brewer), with exsert bracts, and it remains to be seen whether the slight differences in the leaves, scales, and seeds will suffice to keep the species separate." Engelman, *Botany of California*, ii., p. 119.

To this we add an extract from Sargent's *Forest Trees of North America*, p. 214:—

"*Abies magnifica*, Red Fir.—California, Mount Shasta, south along the western slope of the Sierra Nevada to Kern County. A large tree, 61 to 76 metres in height, with a trunk 2.40 to 3 metres in diameter, forming about the base of Mount Shasta extensive forests between 4000 and 8000 feet elevation; farther south less common, and reaching an extreme elevation of 10,000 feet. Wood light, soft, not strong, rather close-grained, compact, sunny, durable in contact with the soil, liable to twist and warp in seasoning; bands of small summer cells broad, resinous, dark coloured, conspicuous; medullary rays numerous, thin; colour light red, the sap-wood somewhat darker; specific gravity, 0.4701; ash, 0.30; largely used for fuel, and occasionally manufactured into coarse lumber."

Turning now to the *magnifica* of gardens our difficulties begin. In the first place we may cite the following letter from an obliging correspondent in Devonshire:—

"But to return to the *P. magnifica*, v. *P. nobilis*. I will here repeat the distinctive characteristics (other than shown in the sections of the leaves), which I find in my specimens.

"*P. magnifica* [= *nobilis robusta*].—Twenty-five years planted, needless, more rigid, less spreading, and branches more formally arranged, lower branches annually dying back up to at least one-third of the height of the tree, though the upper two-thirds appear healthy and vigorous.

"*P. nobilis*.—Cones early and abundant, branches feathering to the ground, and more graceful and sweeping, and of irregular length. Cones for the last few years brown and showing none of the beautiful purple colour they bore formerly—a character always mentioned in botanical descriptions. I cannot understand this change of character in the same specimen."

The habit of the first-mentioned tree as described by our correspondent, the form of the leaf-section and its structure, as observed by us, are quite those of the tree generally grown as *magnifica* (= *nobilis robusta*), but at the very base of some of the leaves there is an indication of a groove as in *nobilis*, while the true *magnifica* is destitute of any appearance of a groove.

In September last Mr. Heale, the manager of the Cranston Nursery Company, was so obliging as to send the magnificent cones figured at fig. 147, p. 657. These were sent under the name *Abies magnifica*, with two shoots, one from a sterile branch, the other from the cone-bearing tree. The tree is stated to be about 16 feet in height. Here was a revelation. To what species does these superb cones belong? Certainly not to typical *nobilis*, equally certainly not to typical *magnifica*. The leaves of the Cranston *magnifica* were all more or less four-sided, and while those on the cone-bearing branch were not grooved at all those on the sterile branches were grooved at the base. Thus, so far as leaf-characters go, the specimen combined the characters of both *Abies nobilis* and of *Abies magnifica*.

On looking to the olive-brown cones the first thing to attract attention was the projecting bracts of a

superb golden-brown colour not bent downwards, as they always are in *nobilis*, but projecting horizontally. Then again the general shape, thick, ovate-oblong, blunt, broadest near the base, is different from the more slender cylindrical-conic cone of *nobilis*, and but for the projecting bract, much more like that of *magnifica* (true).

Now after several weeks that the cone has lain on our study-table for us to feast our eyes on its beauty and endeavour to come to some conclusion as to its identity, we see that the bracts on one side of the cone—that on which the cone has rested on the table—have become bent downwards as in *nobilis*, while on the other side of the cone they still mostly project at right angles, (though some show a tendency to reflex) as in *magnifica*, the bracts are larger, broader, and more deeply notched at the edges than in ordinary *nobilis*. In spite of their greater breadth, the bracts are farther apart, so that they leave uncovered spiral spaces, while in *nobilis* the scales are generally, but not always, completely concealed. It must be remembered also that Mr. Syme described and figured scales of what he considered to be *magnifica*, also from the Cranston Nursery, but in which the bracts were longer than the scale, as in *nobilis*, but inflexed, not reflex, as in *magnifica* (see fig. 148, details). We conclude, then, from the evidence before us, that the Cranston *magnifica* is a form of *nobilis*, that it is probably the same as that grown in most nurseries as *magnifica*, and in some as *nobilis robusta*.

The true *magnifica* is likely enough to exist in English gardens, but so far, we have no positive evidence that it does. It may be that the *magnifica* of gardens and of the Cranston Company is a variety of *magnifica*, or it may be an intermediate link between *nobilis* and *magnifica*, in which cases of course, there would be two species, and which, according to botanical usage, should bear the oldest name, i. e., *nobilis*; or, again, it may be that there are two species, *magnifica* and *nobilis*, and that this is a hybrid between them, but that is a point we cannot determine. In any case, we may fairly congratulate the Cranston Company on being the certain possessors of a form which, if not entitled formally to bear the name *magnifica*, at least deserves to. We are, however, of opinion, that if it be a form of *nobilis*, and probably the form called *nobilis robusta* in gardens—as also by Carrière, whose description we append:—

"*Abies nobilis robusta*, Veitch; *Abies amabilis*, Hort. non Forbes; *Picea amabilis magnifica*, Hort.; *Picea amabilis*, Hort. Angl.; *Picea magnifica*, Hort.; *Picea amabilis robusta*, Hort. Belg.; *Abies magnifica*, Hort. Belg.—This form, which is found at present in commerce under the name of *Abies amabilis*, has the following characteristics:—Branches verticillate, crowded, very spreading. Branches and branchlets (two to two rows), leaves very numerous and turning upwards, nearly completely hiding the upper surface of the branch, narrow, sometimes subtriangular or rhomboid, usually flat, slightly twisted, and raised at the tips. When the trees grow older the leaves become wider and more regularly arranged, and the trees thus much resemble *A. nobilis*. These plants seem to be very variable, so that from the same seeds several very distinct varieties may easily be picked out. These perhaps soon lose their exceptional characters. Nevertheless, *A. nobilis robusta* is much more easy to raise than *A. nobilis*, is much preferable to the latter, and is likely to replace it."

The following points of distinction may be of service:—

Abies nobilis (fig. 146).—Buds, as compared with those of *nobilis robusta*, early to start in spring; leaves 1½–2 inch long; flat, stoutish, curved upwards, usually flat and grooved on their upper surface for nearly their whole length, flat and lozenge-shaped at the apex on the lower side, on older branches more four-sided and grooved at the base only; cones cylindrical conic, tapering to the point, bracts projecting, usually deflexed, concealing the scales.—Cascade Mountains, Oregon, Douglas type 1; Engelman and Sargent 1; Gardiner 1.

Var. robusta (fig. 147).—Branches formally verticillate, uniform, young bark purplish-brown. Buds not developed till late in spring, leaves on the leader-shoot slightly appressed, those on the lateral shoots upturned, ascending, straighter than in *nobilis* proper; leaves on the sterile branches slender, straight or curved, more or less four-sided in section, grooved at the base only on the upper surface; leaves on the fertile branches stouter, shorter, all upturned, four-sided, ribbed on both surfaces, and not at all grooved. Cones ovate, oblong-ovate. Bracts at first projecting horizontally (afterwards deflexed).

A. nobilis robusta, Carrière et Hort.; *A. magnifica*, Hort. (query, of Murray and Engelman).

A. magnifica (fig. 148).—Leaves slender, curved at the base only, straight elsewhere, four-sided, not grooved at all on older branches thicker, more curved. Cones thick, oblong-ovate. Bracts usually, but not always, concealed.—California, Sierra Nevada, Lobb, 441, type 1; Jeffrey, Oregon, 1480 1; Roez 1 *M. T. M.*

SEED, SCALES, AND BRACTS.

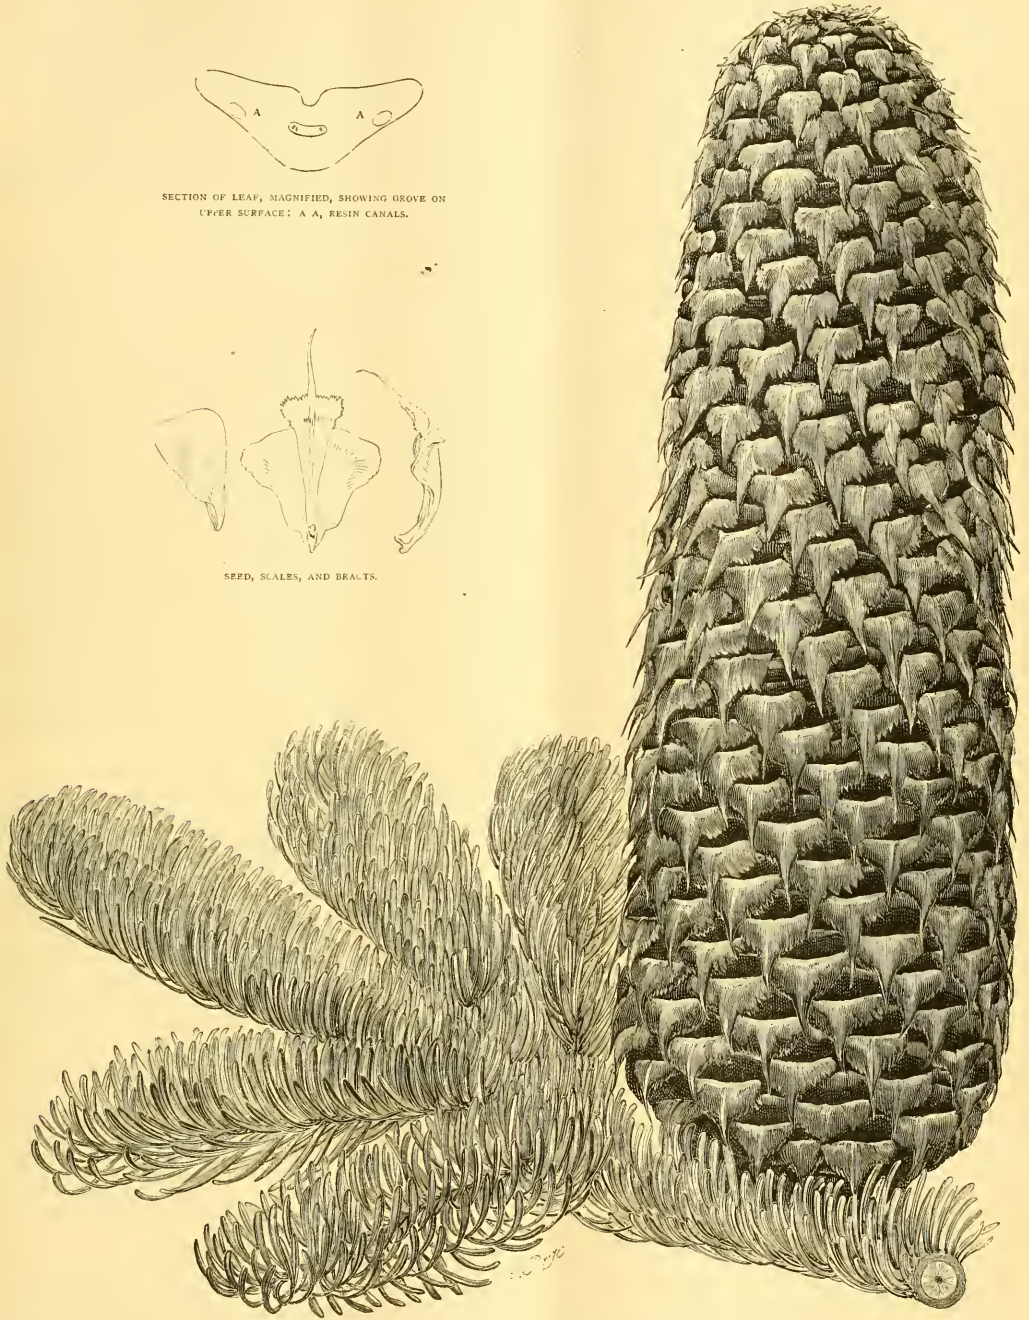

FIG. 146.—*ABIES NOBILIS*. (SEE P. 652.)

WOBURN ABBEY.

(Concluded from p. 616.)

I DO not know any gardens and pleasure grounds more easily reached from the house and more retired and delightful than those which I have thus en-

deavoured partially to describe. I reached this earthly paradise on a lovely day in June, and felt myself, within them, nearer Heaven than I had ever been before, and very grateful to the Dukes of Bedford, past and present, and especially to John the Second. A history of Bedfordshire has not yet

been published, so I have no reading made easy at hand to assist me in this sketch; and if I dip into this great tome and that, other places which await reporting may wither and turn brown in the waning summer before I can reach them, John the First having been the sheep-shearer, John the Second, as I have called

him, was the author and plant collector, who died in 1839. Having weak health he kept much at home, but occupied himself worthily, as his own works and those of Forbes and Sinclair suggest.

I have omitted to mention an Oak tree of great beauty standing at a corner where you can enter the grounds from the park—a stately sentinel, drooping its branches to the ground. The trunk is 21 feet in girth at 4 feet high, and lofty, as are all the trees of Woburn, owing to the depth of the soil, which is a good clay on sand. The branches are slender, so that all the timber is in the trunk, and the leaves are long-stalked, the species being *Quercus sessiliflora*, the best of the English Oaks, as are all those on the estate. Near this tree is a variegated Oak, which no tree lover would pass without notice; and on walking on along the outer pathway furthest from the house, which was as yet buried among the trees, we reached a small ornamental temple, from which extends a wide avenue of Deodar Cedars, with a row of plants of the Pampas-grass in front of each row of Cedars. At the end of this avenue is seen the cupola of the riding-school. Few plants for shrubberies are more graceful than the Laburnum, which abounds here. I observed one particularly beautiful clump of shrubs and trees, including Laburnums, the flowering Ash, Lilacs, a cut-leaved Weeping Birch, *Weigela rosea*, some evergreens, and a great Oak, with Ivy trailing about the butt. As an object of curiosity, a Paper Birch, yielding many layers of thin bark, attracts notice; and for its large measurement of timber a Cedar of Lebanon, opposite the south front of the house, with a trunk 14 feet 9 inches in girth at 5 feet from the ground, and towering upwards to the crown with very little diminution of size to a height of 60 feet. The head of branches sars another 60 feet, and for years a pair of ravens had their nest at the top, and a man somehow reached it sometimes by ladder and rope, though an iceberg would be climbed as easily as that great smooth trunk up to the crown. The tree stands in the park near the highest of the string of ponds. A Cedar of Lebanon graces the lawn, too, with a surprising quantity of timber in the vast bole, which measures 14 feet at 5 feet from the ground, and runs up an almost undiminished trunk. A Silver Fir, planted in 1745 to commemorate the battle of Culloden, has a portion of its butt remaining 10 feet in circumference, the tree having formerly been 130 feet high till the wind snapped it.

The lawn, extending from the library, or south front of the house, is separated from the park by a sunk fence and balustrade, and from the house itself by a broad flag pavement, which forms at all seasons a dry and clean promenade. The bedding system, which custom established here for a time, has now been replaced by a less gorgeous and more enduring method of ornamentation, by means of smooth grass, a few raised beds covered with Ivy, and many marble and bronze vases.

Mr. Forbes' account of the kitchen garden includes plates of the various hot-houses in the forcing department of what was then a very extensive establishment, the methods of cultivating the various fruits or vegetables, from the Pine, "the king of fruits," to the Melon and the Mushroom. The houses are admirably constructed with iron doors, and lights well glazed with iron frames and copper bars. At the age of more than half a century they look as good as new. There are three Peach-houses in the kitchen garden, with iron framework on the back wall, and in front covered with trained Peach trees, seven vineries, and five plant-houses, with forcing-pits. After November Asparagus never fails to appear at table, nor cut flowers in that unreasonable profusion which modern fashion, for I will not call it taste, requires. During the past seven or eight years the word has gone forth from drawing-rooms and dinner-tables, "We mean to be immoderate in regard to cut flowers;" and, of course, with gardeners, to hear is to obey: so they must needs go on growing and mowing by the acre till a natural taste for living specimens shall have replaced the prevailing rage. Meanwhile Mr. McKay, the head gardener at Woburn Abbey, has been relieved from the excessive forcing of fruits. The growing of Pines has been abandoned, wisely, I think, on the principle of sound trade, since the article in question can be grown more advantageously in Bermuda, at St. Michael's, Antigua, and at the Azores, and *omniscuris* have failed to distinguish between the best imported Pines and those of home growth.

In the centre of the range of houses a visitor will be interested to enter a dessert-room where the guests at the Abbey, including statesmen of both parties, have come down on summer evenings to enjoy fresh fruit without politics. The room is plainly furnished in the style of fifty years ago, and it looks out upon the central walk of the kitchen garden, and a more perfect kitchen garden could not be imagined. Four acres are enclosed within the walls, and on either side of the walls are rows of pyramids and bushes of various fruits. Outside the walls is the park, where the ground fronting the dessert-room rises rather abruptly, forming a slope in which Oaks, Beeches, and Spanish Chestnuts are beautifully grouped, and as the land is good the trees are large, tall in trunk and great in girth. A Spanish Chestnut in the strip of garden outside the wall measures 18 feet 10 inches in circumference at 5 feet from the ground, and a great Apple tree near it, a Hambleton Deux-ans, is probably the largest in the county. Its girth is 7 feet 4 inches at 5 feet high, and the three leading branches which spring from the crown, spread grandly over a space 48 feet in diameter, the tree forming a great dome like the roof of the Albert Hall, perfectly well proportioned. It yields a crop of 40 bushels in good seasons.

These details show that the kitchen garden is a sheltered nook. It is a place of retirement, made doubly interesting by scientific horticulture and the special industry of those experts and intelligent men whom you may find and converse with, either in the garden or among the *Wew-fenced* forcing-pits outside. The Duke has his private entrance to the kitchen garden, and here both Mr. Gladstone and Lord Beaconsfield have found the pleasure that warriors must experience at some cool spring when resting from the combat. Mr. Gladstone brought his axe, and I saw a tree, serene and dead, and stretched at length, and evidently a relic. It was a *Cedrus Deodara*, 26 inches across the severed butt, with grain so tough that the chips the illustrious woodman made were but small: yet he overturned it in twenty-five minutes.

The excellent gardener's house—and the adjective describes both the house and the man—was built by the Duke John who quitted this paradise in 1839. In one of the rooms is Mr. McKay's "Gladstone Corner," where the frame of the statesman's portrait is ornamented by polished Elm chips from Hawarden. Another frame, similarly ornamented, contains the following testimonial:—"In great admiration of the fruit and flowers, especially of some of the finest, if not the very finest, Grapes I ever saw. *W. E. Gladstone, Oct. 24, 1878.*"

One could not help lingering in such a corner, where I was allowed to open a small casket of Oak crusted with chips from Mr. Gladstone's outdoor workshop, and within the precious depository I found a copy of the "Homer" which Mr. Gladstone prepared for one of the series of *Literature Primers*, edited by Mr. J. R. Green, with a proof on the title-page of how a statesman may esteem a gardener. It is in the author's own handwriting, and is as follows:—"Mr. A. McKay, with the author's best wishes. Jan. 1883." These are pleasing records; they remind one of a sentiment in the speech of Fortia, when she played the lawyer in the "Merchant of Venice." "Mercy," she says, "is twice blessed; it blesses him that gives and him that takes." *H. E.*

Orchid Notes and gleanings.

ORCHIDS IN ENGLAND.

M. GODEFROY-LEBEUF makes some observations in the last number of the *Orchidophile* which are worth attention. He is comparing Orchids in France and in England, and while giving the palm to the latter in the matter of cultivation, he claims for his own countrymen a wider and more catholic choice of subjects. No doubt we here run too much on Cattleyas and *Odontoglossums*, as if there were no other Orchids worth growing; but as a fashion in these things, and some day the turn of the Stanhopeas and other now neglected genera will come. Phalaenopsis are, says M. Godefroy, better cultivated in France than here.

ORCHIDS AT LAKE HOUSE, CHELTENHAM.

There is just now a splendid specimen of this Orchid in bloom in the collection of G. Neville

Wyatt, Esq., Lake House, Cheltenham. The plant has ninety blooms expanded, and, having clean foliage and abundance of healthy roots, is really a beautiful sight, worth making a journey to see. There is a grand plant also of the rare *Cymbidium affine* with six beautiful spikes of sweet-scented blooms; the *Bolles* and *Pescatoreas* are still in rude health, and nearly always in bloom. *J. Cypher.*

ORCHIDS IN BLOOM.

In Mr. J. Cypher's nursery, Cheltenham, there is a fine plant of *Aërides Lawrenceanum* with a spike bearing twenty-four fine flowers; *Vanda Sandariana*, with a spike of ten blooms; and a fine lot of *Cypripedium Spicerianum*.

VITALITY OF ORCHIDS.

"While there is life there is hope" is an adage specially applicable to Orchids, and more particularly imported ones. It is astonishing how shrivelled and apparently dried up plants, such as *Odontoglossums* and *Dendrobiums*, recover and push into vigorous growth under favourable treatment. "Certainly," some one says; "but the rub is in those two last words, for we are often at a loss to know what that treatment is which is favourable." A few months ago we had a number of Orchids sent to us from Moulmein, and among them were several stems of *Aërides maculosum*, which were leafless, dried quite brown, all the roots shrivelled and dead, no sign of life being present anywhere except in the heart of the stem. As an experiment, but with little hope of success, we hung these stems up in a tropical moist stove—a propagating-pit, really—and left them to grow or die, as they chose. To our surprise the stems plumped out, in a few weeks they pushed forth buds, which rapidly developed into quite strong flower racemes, and opened most satisfactorily. After the flowers were over the leaves grew from several points in the stem, and now these stems, which last midsummer were merely dried-up sticks, are healthy well-furnished little specimens, and look as if they had been in good health for years. To those who have not had much experience with imported Orchids this note will have special value. I know that these dried-up plants, when newly imported, often give more satisfaction than well established ones. *W.*

ORCHIDS ON WALLS.

Those old-fashioned lean-to houses with tall back walls are still in existence in some gardens, though the houses we build now-a-days are simply enormous glass cases—glass at the sides from the ground upwards almost, as well as at the top. But there are a good many Orchids, as well as other plants, which delight to have their roots fixed in the moist cool crevices of old stone walls, in preference to being attached to bits of wood, or fixed in baskets, and hung up in such a manner as to have light and heat about their roots exactly as about their tops. It must be evident to any one who is acquainted with the conditions under which many epiphytal Orchids grow when wild, that the latter treatment is a poor imitation of the natural condition as regards a base for the roots; whilst, on the other hand, an old wall—or a new one, for that matter—would afford a good substitute for the moist cool trunk of a tree. I saw, a few days ago, a beautiful specimen of the rare *Vanda Cathartii* growing upon such a wall. The plant was about 8 feet high, freely branched, and showed signs of being very soon rich in flowers, the racemes pushing out from the stems in the most gratifying way. There are many Orchids to which such a position as this would be particularly well adapted—*Renanthera coccinea*, *Vanda cœrulea*, *V. Denisiana*, some of the *Phalaenopsis* and *Aërides*, being a few of them. *W.*

SACCOLABIUM BLUMEI.

This Orchid appears to be very abundant in its native haunts, judging by the large quantities of it imported annually, and sold at a very moderate rate in the auction rooms. And perhaps it is fortunate that this species is plentiful, as otherwise we should most probably find it rare in English collections. Of all East Indian Orchids it is perhaps the worst to prevent from suffering from that terrible outward and visible sign of an internal sickness or weakness—I mean, of course, spot; and when once the plants show signs of this it is almost impossible to keep them from gradually weakening and dying, or becoming unfit to look at. Such, at any rate, is my experience with this Orchid, and so far as I can learn

it is the same with others who admire this beautiful plant; for it is beautiful, its long fox-brush-like pendant spikes of sweetly-scented rose and white flowers being equal in grace and beauty to any other Saccobolium. A high temperature is sure to bring on spot in a few months; and, on the other hand, a low or intermediate and rather airy house prevents spot for a year or two. But the end comes much too soon, even when the plants are kept moderately cool. It is, of course, possible that my experience, and also that of my friends, is exceptional with regard to this Saccobolium, and there may be those who succeed in keeping it healthy year after year without any trouble. If it be so I need hardly say that I and my fellows in failure shall be glad to know in what that success consists. W.

DENDROBIUM FORMOSUM GIGANTEUM.

I have here in flower a *Dendrobium formosum* giganteum in a 32-pot. It has two pseudobulbs, carrying respectively five and six flowers, which have been in bloom for upwards of a month, the bulbs themselves being about to inches long. I understand this variety is seldom found flowering satisfactorily. J. A.

FORESTRY.

HEDGING AND THE FORMATION OF NEW HEDGES

SHOULD now be well in hand, and brought to a close as early in the present month as circumstances permit. The ground intended for the reception of Quicks should be well prepared by deep digging or trenching, previous to which it is at all times advisable to add a good coating of thoroughly decayed farmyard manure. From 3 to 4 feet in width, and about 2 feet in depth, will be sufficient dimensions to trench or dig in preparing the ground. When trenching, form the soil into a small ridge rising above the level of the surrounding ground, as it is found that Quicks succeed better on slightly elevated than in hollow situations. In planting the Thorns stretch a garden line along the prepared surface, and take out a notch of sufficient size to contain the roots of the plants without doubling up or cramping them. The plants should then be inserted in the trench made for their reception at 6 inches apart, the roots being spread out to their full extent and covered with soil. Should a double row of Quick be desired shift the line and proceed as before, keeping the plants at the same distance apart and the rows at from 6 to 9 inches from each other as may from the plants' size be found practicable. Little attention save a bi-annual cleaning and hoeing will be required for the first three or four years, after which a slight pruning of the long and straggling shoots will induce even growth. When the fence has attained the full size intended, annual trimming with the shears or switching knife should be attended to, as well as an occasional cleaning of the adjoining soil, thus inducing healthy free growth, and preserving the shape and appearance of the fence.

ROADS, &c.

Where roads and drives require repairing no time should be lost in having such completed; walks gravelled and rolled, and all intruding tree branches cut back and removed. Stones should, if possible, be put on during the present month, as they are more likely to bind and consolidate than if put on later in the season. A slight coating of gravel, or screenings, and heavy rolling after rain will materially assist the stones in setting, and so form a permanent and smooth road in the shortest time. In repairing roads, or forming new ones, too little attention is usually given to their drainage, but when it is remembered that on this, to a great extent at least, depends their usefulness and durability, it will be seen that thorough drainage is a necessity to a well-made road. Loose, rolling stones are neither safe nor pleasant on roadways, so have all such either broken and well levelled down, or collected and removed.

THE NURSERY.

In the nursery continue to trench and lay all vacant ground in ridges, exposing as much of the surface of the soil as can be well done. Those who have home nurseries should never lift more plants in one day than can be planted in one or two days—quick removals ensuring greater success in planting than

where the trees are allowed to remain "sheughed" for some time previous to their final despatch. Tree seeds may still be collected during dry weather, those of the coniferous section being invariably late in ripening this season. This is a good time to secure a collection of leaves for rotting; to improve lawns by a heavy top-dressing of compost, to dig shrubberies, and to trim and clear neglected fences. Open drains and culverts will require constant attention during the winter months, as they will, in many cases, be apt to get choked with accumulations of leaves, branches, and other debris. A. D. Webster, *Fairlyn Castle, North Wales.*

Plants and their Culture.

STOVES.

THESE structures will no doubt be arranged prior to this for the first part of the winter season. If not seen to do not let any further delay occur in the removal to safe quarters of all plants that are susceptible to injury from a sudden fall of the temperature. Many stove plants are often fatally injured or partially crippled by allowing them to remain in too low a temperature for a few weeks. The *Clorodendrons* are most susceptible to injury from this cause, as are also the *Caladiums*. The complaint often made in the spring-time, that the stock of *Caladiums* is affected with the dry rot, causing a serious lessening of the store, can usually be traced to the above cause. *Gloxinias* also suffer, but not so quickly as *Caladiums*; *Allamandas* and *Bougainvilleas* must not be trifled with either. A heated pit is a capital place for all of these, and kindred subjects that for the time being are not of any ornament. A pit in which the minimum temperature is not above 60° will suit such stock as this. As to their other treatment it is necessary to observe that a too severe withholding of water from the roots will have an injurious effect on the vitality of the plants. *Allamandas* and other plants that make much sappy growth, should have the shoots severely reduced prior to being stored for the winter. In order to facilitate matters in the way of getting more room, any specimen plants may be taken from off their trellises when such means of training have been employed; this will considerably increase the room, and give an opportunity to have the wirework or stakes cleaned and painted.

CLIMBING PLANTS

in the stove that are turned out of pots or trained up the rafters should, in the case of summer flowering kinds, be considerably thinned out (this advice will embrace the major portion of the stock), by which means more light will reach the plants beneath them, and to attain this object we have recently been compelled for the sake of the plants to wash from the outside of the glass of our houses all the accumulations of soot and dirt which are always found in the proximity of large towns. In the stove at this season spare time should be utilised in cleansing plants, particularly the fan-leaf section. Where mealy-bug is found, this will be a good time to use every endeavour to get rid of the pest. It is not so much a question of this or that insecticide, but rather the lack of perseverance and determination to exterminate, at all cost for the time being, this enemy of the stove house, that accounts for their presence in some gardens. *James Hudson, Gunnersbury House, Acton, W.*

The Hardy Fruit Garden.

RECENTLY planted trees in orchards should be carefully watched where hares or rabbits abound, as they are sure to find up any fresh trees that may have been planted to fill up gaps where trees have died, and in a single night may destroy a number of them by eating off the bark all round the stems. The plan I adopt to prevent this is to mix up a large pailful of lime and cow-dung to the thickness of paint, and to apply this mixture to the stems of trees with a whitewash brush. An active man will dress a great number of trees in a day; should heavy rains in time wash it off, it costs very little to have it repeated, and I fancy the trees are all the healthier for the dressing.

Where permanent trees are to be planted it is most important that the ground should be thoroughly free from weeds, as no amount of after-management will make up for this if neglected at planting time, it being impossible to clean the ground thoroughly after the trees are planted. I have seen the evil effects of this neglect many times, and have an orchard of Currants and Gooseberries in view that has been planted five or six years, and the owner thought of clearing the ground after they were planted, but who now finds out the mistake he made, and all the bushes will have to be removed before it is possible to clear the ground. Success cannot be expected until this is done. About 10 acres of ground were recently added to this estate, which it is proposed to plant with fruit trees such as Victoria Plums and Prune Damsons. The first thing we are doing is to thoroughly drain it, and as it is very full of weeds, it will be ploughed up in spring by the steam-plough, and allowed to remain fallow during the summer, taking care to have it thoroughly cleaned during the dry weather, so as to kill all perennial weeds.

Early in the autumn the trees will be planted, and the following spring a crop of Oats sown, to be later in spring sown down with the seeds of permanent grass. In the meantime the trees are purchased and planted out in nursery rows, so that they can be removed with plenty of fibry roots. *J. Smith, Mentmore.*

The Kitchen Garden.

MUSHROOM-HOUSE.

EARLY beds will now be in full bearing, and where houses are heated by hot-water pipes a temperature ranging from 55° to 60° should be maintained. If the maximum temperature here given be much exceeded, early exhaustion of the beds will surely follow. The atmospheric conditions of a house as regards moisture must be regulated according to its position. Many houses heated by hot water, which is brought into constant use at this time of year, are kept much too dry in this respect. It is better to keep the atmosphere well charged with moisture than to apply much water directly to the beds; however, when watering the latter, sufficient should only be used to permeate the soil casing the beds. Heavy waterings are injurious. In houses where beds are formed to prevent the surface drying quickly, a slight covering should be given to them in the shape of broken straw, such as market growers cover their outside beds with.

OUTSIDE BEDS.

The greatest difficulty experienced by many in the management of these is to keep slugs and woodlice from destroying the young Mushrooms immediately they peep through the soil. To obviate this great care must be bestowed on the selection of the soil to be used for casing the beds. Good loam, and not ordinary garden soil, should be used, which ought to have been in stack for some months prior to use. Several weeks before the soil is required for casing, it should be chopped up, and receive a dressing of common agricultural salt, after which the heap should be turned over several times, and protected from heavy rains. This will stop the ravages of slugs to a great extent, and also act as a stimulant to the Mushrooms. Woodlice breed with great rapidity in stable litter, but not so much so when the long straw used for covering the beds is subjected to a heating process before being used, similar to that which is selected to form the beds with. When shaking out the droppings and short broken straw to be prepared for making up beds, the long stuff should be thrown up into a compact heap by itself, and if it is too dry to commence fermenting, a little water should be applied, but only just enough to start it. By the time the short material and droppings which were extracted from it become purified, made into a bed, spawned and cased, this long straw will supply the best possible covering material. After a bed is spawned and cased, care must be exercised in accordance with the weather, in placing on the requisite amount of straw covering, in order that the internal heat of the bed may not be raised or allowed to fall too rapidly, thereby injuring the running spawn. As the heat must be tested frequently by feeling the test-sticks inserted in the bed, it will be easy to determine when a little more outside covering is necessary. From 14 to 16 inches of outside covering will be required after the beds have been cased two or three weeks, and still more must be added should the weather be severe. A row of old mats or thatched wood, placed so as to throw off rain or snow, would be of great advantage. *G. H. Richards, Somerley.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Nov. 23	Sale of Bulbs and Plants, at Stevens' Room. Sale of Dutch Bulbs, at Frothero & Morris' Rooms. Liverpool Chrysanthemum Show. Sale of 2000 Lithum auratum, Seeds, &c., at Stevens' Rooms.
TUESDAY, Nov. 24	Sale of Roses, Fruit Trees, Conifers, &c., at the City Auction Rooms, by Frothero & Morris. York Ancient Society of Florists' Show.
WEDNESDAY, Nov. 25	Sale of Bulbs and Plants, at Stevens' Rooms. Sale of Plants, Roses, and Lilies, at Frothero & Morris' Rooms. Sale of Imported Orchids from Mr. F. Sawyer, at Stevens' Rooms.
THURSDAY, Nov. 26	Great Sale of Dutch Bulbs, at Frothero & Morris' Rooms. Sale of Flowering, Imported, and Established Orchids, at Frothero & Morris' Rooms.
FRIDAY, Nov. 27	Royal Horticultural Society of London, General Meeting. Sale of Bulbs and Plants, at Stevens' Rooms.
SATURDAY, Nov. 28	Sale of Dutch Bulbs, at Frothero & Morris' Rooms.

IN one sense it is matter for hearty gratulation that the EXPERIMENTS carried out at CHISWICK for the purpose of testing the value of the JENSEN system of MOULDING as a preventative of the POTATO DISEASE, have again failed in their main objects. The experiments were carefully performed, under the supervision of a committee nominated by the Royal Horticultural Society, and in the same manner as last year. The tubers were duly overhauled before planting, their growth was watched, and the results noted from time to time. When the crop was lifted, it was keenly scrutinised and all doubtful specimens referred to Mr. GEORGE MURRAY. That gentleman reports that only one of the tubers forwarded to him developed the Potato fungus when submitted to the appropriate experimental cultivation in the laboratory. So far, then, it would seem that there was in all probability a very much smaller proportion of diseased tubers in the crop than in the sets when planted. In any case the amount of disease observed during growth, and at the final scrutiny, was, again, so small as to afford no evidence at all as to the value of the Jensenian system. However satisfactory this may be on general grounds, it is disappointing as an experiment, and it tends to discourage those gentlemen who, with much personal disinterestedness have, during two seasons, given their time and their labour to the planning and the supervision of the experiments and, lastly, to the task of summarising the results. We shall not anticipate the formal statement of results which will in due course be laid before the Scientific Committee. We violate no confidence, however, in thus stating that, for the second time, the experiments were null and void as regards their main object.

It must not, however, be supposed that there is no instruction to be got out of them. It would be impossible for any experiment, so carefully conducted and keenly scrutinised, to be absolutely without value, directly or indirectly. One point in particular has struck those who conducted the experiment—and, if it is of a speculative character, the speculation is fraught with practical possibilities—and that is the effect produced by cultural methods on plants, as compared with Nature's way of doing things, when left to herself. It may be stated that the essence of the experiment consisted in earthing-up the plants for definite periods, longer or shorter as the case might be, and in the comparison of the results, in the plants so treated, with others in which no earthing-up at all was practised, but in which the plants grew, if not exactly at their own sweet will, at least without interference on the part of the cultivator.

Now, we are not going to forestall the official report by going into statistics, but we may allude to one or two matters which are prominently brought into view, and which are of much interest for the thoughtful cultivator. In general terms, when the Potatoes were moulded up, even for a short time, the resulting crop

was, from a practical point of view, more even and uniform, that is to say, better than when the plants were left to themselves, and generally the more uniform the longer the period of moulding. This is, of course, in accordance with general experience. If it were not so, why take the trouble? That matter has been settled by the experience of generations. But we doubt if the average cultivator has given much attention to the results of the let-alone policy as carried out in the "control rows," and yet it is a subject eminently worthy of his attention. It brings into prominent relief the difference between growth for artificial needs and requirements under correspondingly artificial treatment, and growth under more natural conditions. If we might, for the moment, assume voluntary effort on the part of the noble tuber, we might say that its object in life is not to provide food for mankind, but to secure its own advantage, and ensure the continuity and perpetuation of the race after the individual had perished. But in Nature, as under artificial conditions, no one, no tuber we mean, lives for itself, or can live for itself independently of other considerations. It is acted on by external agencies—heat, light, moisture, and the like—and moreover, whether it will or no, it is forced by circumstances to live not only for itself but for others. The primary object of the tubers we may safely assume to be the perpetuation of the race, but there are such things as wireworms, slugs, predatory animals of all kinds, which, under artificial conditions, much more under natural surroundings, have to be provided for. In the great scheme of Providence these creatures have to be provided for as well as the wingless, two-legged race, who are too apt to presume upon their superior advantages, and to imagine that the world was created and is in process of modification solely for their benefit only. In point of fact one of the most remarkable things about the plants in the control rows was their extraordinary variability—big tubers, little tubers, some even tubers, others misshapen, tubers on the surface, tubers beneath it, tubers green as the haulms, tubers of the earth, earthy as to their exterior, but within filled with richness—that is to say, starch. Now, what does all this mean? Why all this variation? The conditions of growth were, as we have shown, as equal as they could be made, and yet the results were most diverse. All confusion and muddle some may think. That is not our view. To our thinking the plant has all sorts of conditions and requirements to fulfil, some for its own benefit, some for the advantage of others. Some of these variations are useful for one purpose, some for another. Given the principle of variability which, as we know, all plants possess, then come in those other principles of adaptation and selection of which we hear so much now-a-days. Certain variations enable the plant to live under certain conditions, others fit it for life under different circumstances. Those different circumstances may, or may not, make their appearance; if they do, plant and circumstances are at one—the right tuber, so to speak, is in the right place. If they do not the variation is not perpetuated, but dies out; and if no good results occur, at least no harm accrues. At any rate an opportunity is offered for man with his requirements, and especially with his intelligence, to observe these variations and to turn them to account. He can select and intensify those that he wants, he can neglect and pass over those he does not require. At any rate, with that mixed lot before him, he must surely miss his opportunity if he fail to see that not one, but many chances are offered to him if he will but avail himself of them. As things go he is too much engaged with one particular object, and he overlooks and neglects other opportunities. For instance, a good deal has been said about the possibility of raising disease-

proof Potatoes. Some ridicule the idea, but these are the people who stand still and do not try. It may not be possible in the way or ways suggested, but it may be in others. Is there no lesson to be learnt from that motley heap of even and of misshapen tubers from the control rows? Surely there is. Some of those tubers manifestly are in the right condition to be an easy prey to internal disease, some to predatory animals, others would obviously offer a stout resistance to disease, and would, as it would seem, be decidedly unpalatable to marauders, however hungry. It is a matter, therefore, for serious consideration, whether what we may call natural variation may not furnish us with as strong and varied an armoury against disease as hybridisation, cross-breeding, or the introduction of new varieties from beyond the seas. At any rate, variation and adaptation, as here faintly suggested, are at least as promising as the other agencies, and more easily and quickly put to the test.

INTERNATIONAL EXHIBITION IN DRESDEN.

—There will be held in this town, in May, 1887, a flower show and exhibition of an international character. The committee elected by the united horticultural societies has obtained the King's permission to hold the exhibition in the royal park and gardens, and plans for grounds and building are already completed. M. J. F. SEIDEL, of Dresden, is appointed president of the committee.

NEW BOOK BY THE EDITOR OF THE

"GARDENERS' MAGAZINE."—Mr. SHIRLEY HIBBERD is preparing for publication a volume of prose and verse for young people. It will contain a few of the drolleries that have appeared in Christmas numbers of the *Gardeners' Magazine*, with other papers written for the purpose. It will be entitled *The Golden Gate with Silver Steps*.

OUR ALMANAC FOR 1886.—Secretaries of

provincial and metropolitan horticultural societies are invited to send us, as soon as possible, the dates of their meetings and exhibitions during the ensuing year, so as to ensure their insertion.

THE LATE M. BOISSIER.—The following

extract is taken from an obituary notice written by M. DE CANDOLLE:—

"Once he discovered, on the mountain of Tuchet, which belonged to his father, a stony and shady nook, which he made into a kind of botanic garden, where he planted the rarest of the local species. Singular and first trial of alpine plant culture, which he followed afterwards with such zeal at Valleyes for so many years! The traveller of the future, who afterwards traversed the East, Algeria, and Spain, showed his bent more plainly later on, when M. VALETTE (his tutor) had left. EDMOND obtained leave from his father to visit the Great Saint Bernard, which he had heard spoken of as a spot highly regarded by botanists. He left, accompanied by a trustworthy gardener, and furnished with the little sum necessary for a day or two's excursion. Arrived at the Saint Bernard, so near Italy, he was seized with a desire to go as far as Turin. There the two travellers went on foot, economising their means. They visited the town, then crossed Mont Cenis, still on foot. In Savoy hunger obliged them to enter a cabaret. There they were offered fried Potatoes. 'We are too poor,' they said; 'give us some bread.' In this way they arrived at Geneva with a franc only at the bottom of the purse."

GALANTHUS NIVALIS CORCYRENSIS.—Mr.

EWBANK kindly forwards us a specimen of this early-flowering variety of the Snowdrop. The small flower offers so special peculiarity beyond its season of flowering. It is noteworthy, however, that the pollen is shed very freely while the stigma is still immature. How far this "protandrous" condition is characteristic is more than we can say, but it suggests an interesting subject for inquiry.

GHENT HORTICULTURAL SOCIETY.—We

learn that the Government of Belgium, in order to show its appreciation of the services rendered to horticulture by three of the members of the Society, has made MM. AD. D'HAENE, L. SPAE-VANDER MEULEN, and A. PRETERS, Chevaliers de l'Ordre de Léopold. A complimentary banquet in honour of

FIG. 147.—*ALIES NOBILIS*, VAR. *ROBUSTA* = *MAGNIFICA*, HORT. (SEE P. 624.)

the event will take place on Thursday, November 26, at the Hôtel de la Post, Ghent.

— "TRESPASSERS BEWARE." — "Botanists," says the *Pharmaceutical Journal*, "who are in the habit of taking their holiday among the Scotch mountains, will be glad to learn that the Scottish Right of Way Society has already begun its work in the Braemar district, and that a guide-post has been erected at the foot of Glen Dole, Clova, indicating that the path marked by the proprietor as a private entrance is a 'public path to Braemar,' and that it is now only necessary to assert the right in order to gain access to this beautiful and botanically interesting spot." We are delighted to hear of this attempt to break down illegal barriers. Legal ones are bad enough to the wandering botanist, but dogs, illegal ones, are intolerable. We hear that the botanical excursions planned by the members of the Botanical Section of the British Association at Aberdeen had to be abandoned because certain church proprietors of deer-forests refused to grant the requisite permission; but that botanists are a law-abiding, charitable set of folk, we might be inclined to say something disrespectful of the proprietors aforesaid.

— NOVA SCOTIAN APPLES AT THE EDINBURGH APPLE AND PEAR CONGRESS.—Professor G. LAWSON, Halifax, Nova Scotia, has informed the committee of the above Congress that he has been instructed by the Government of Nova Scotia to form a collection of the fruits of the colony, and to forward them by steamer on the 7th inst., so that it may be in good time for the Congress. Several other collections are expected from abroad, and it is likely to be a very comprehensive exhibition of Apples and Pears.

— CYPRIPIEDUM MORGANÆ. — The *Revue de l'Horticulture Belge* for October contains a good coloured figure of this beautiful hybrid, raised by a cross from *Cypripedium Stouei* of C. superbiens. The dorsal sepal is large, ovate, white, traversed by purple veins, the two very long pendulous curved petals are of a green colour, spotted with purplish-brown, and the large oblong, smooth, basket-shaped lip is of a purplish-brown colour.

— FASHION IN FLOWERS.—It is useless to protest against the fashion that proclaims Orchids to be almost the only flowers worth consideration, and of Orchids that only a few genera are entitled to recognition. The magnificent new *Bomarea*s which we figured in these columns a few years back have, we are sorry to learn, not found admirers. This can only be because the flowers have not been seen, for otherwise it is impossible to imagine any lack of admiration, so gorgeous are they, while their culture offers no difficulties and demands less care and expense than most Orchids.

— TROWBRIDGE HORTICULTURAL SOCIETY.—At a meeting of the committee of this Society, held a few days ago, a report was presented, showing that it is in a very flourishing condition, having a balance of £208 in hand. Like many other societies, it has had to pass through times of depression, invariably caused by losses through bad weather on the show day; but the tide has turned in a highly satisfactory direction. At this meeting it was resolved that the gratuitous services of Mr. JAMES HUNTLEY as Honorary Secretary during the past twenty-two years should be recognised in some fitting manner, and a committee was appointed to carry out this purpose.

— GISHURSTINE.—We have received some boxes of this excellent preparation from Price's Candle Company. It is used for the boots, making them proof against wet, besides rendering the leather soft, and so is very serviceable to gardeners and others who have outdoor work to do during the winter.

— GRAFTING OF SEEDLINGS.—Messrs. SOUTEKT & NOTING, according to the *Revue Horticole*, practise grafting seedlings on the Brier stock. As soon as the first young leaf appears the seedling plant is grafted by notch-grafting on to the Brier, the grafts being kept under a bell-glass in a propagating frame at a temperature of 30° C. They are kept under the bell-glass for twelve days. In this manner the Rose, Princess Wilhelmine des Pays Bas, originated in March, 1884, by the fertilisation of Mignon-

nette by the pollen of Madame Damaizin (Tea). The seeds produced by this cross were sown on November 3. The seedlings were grafted in December, and flowers were produced in February, 1885, one year after fertilisation.

— PORTSMOUTH CHRYSANTHEMUM SHOW, NOV. 12 AND 13.—The *Portsmouth Times* says that over 5000 persons visited the Chrysanthemum show in the new drill shed of the 3rd Volunteer Battalion Hampshire Regiment after 5 o'clock on the 13th. The total receipts were as follows:—First day, £50; second day at 6d., £7 7s. 9d.; at 3d., £23 17s. 10d.; at 1d., £22 10s.; total, £103 15s. 7d. Among the special exhibits were some cut blooms of Japanese Chrysanthemums sent by Mr. LANCASTER, J.P., one of which was 36 inches in circumference.

— "BOTANICAL MAGAZINE."—The plants illustrated in the November number are the following:—

Nymphaea stellata var. *zanzibariensis*, t. 6843.—This magnificent Water-Lily has large flowers, 6–8 inches in diameter, of a violet-blue colour. The flowers, which are deliciously fragrant, open at noon and close at night, and remain sometimes a fortnight before being submerged for the ripening of the seed. The plant is a native of Zanzibar, and is allied to *N. stellata* and *N. corulea*.

Calanthe natalensis, t. 6844.—A terrestrial Orchid, native of Natal, with tufted, stalked, plicated, broadly-lanceolate leaves, and erect pyramidal many-flowered racemes. The flowers are 1–1½ inch in diameter, pale lilac, deeper at the points, and with lip orange-red. The perianth segments are spreading, ovate-acute, nearly equal; the lip with two small lateral lobes, and one larger, one broad ovate, 2-lobed, with a long curved spur.

Boronia heterophylla var. *brevisipes*, t. 6845.—A Swan River species, with the habit of *B. megastigma*, and flowers of a similar colour.

Anemone trifoliata, t. 6846.—A European plant with tall slender stems, bearing a tuft of stalked-roundish 3-foliate leaves, leaflets oblong acuminate serrate. Flowers on long stalks, solitary, resembling those of the British Wood Anemone.

Polygonum sphaerostachyum, t. 6847.—A Himalayan species with simple erect stems, lanceolate leaves, and short thick cylindrical densely crowded spikes of crimson flowers. It is of a very ornamental character, and is suitable for a rockery.

— THE SURVEYORS' INSTITUTE.—The next meeting will be held on Monday, November 23, when a paper will be read by Mr. EDWARD SMYTH (Professional Associate), entitled, "The Copyhold Emancipation Bill, 1884-5." The chair to be taken at 8 o'clock.

— PRIMULA SINENSIS.—Messrs. SUTTON have introduced a strain with leaves of a cordate ovate-acute form, with serrated edges, quite unlike any other form of leaf in this species that we are acquainted with.

— RHUS COTINUS VAR. PENDULA.—M. BURVENICH describes in the *Revue de l'Horticulture Belge* a variety of this curious shrub with pendulous branches, which must be very effective. This is a shrub far too little appreciated, and yet when the feathery inflorescence is expanded it excites the attention of the most unobservant, while the leaves in autumn turn of the most glowing bronze and scarlet.

— HORTICULTURAL CLUB.—The monthly dinner and *conversations* took place on Tuesday, November 10, at the Club-room, 1, Henrietta Street, Covent Garden, when there was a large attendance of members, including the Hon. and Rev. J. T. BOSCAWEN, the Rev. H. GALL, Messrs. Wheatstone, Wood, Ingram, Collings, Loder, Balderson, &c. The subject for discussion was Grape-growing, opened by the latter gentleman, who detailed his method of growing ten varieties of Grapes in one house, and showed his success by exhibiting good well finished bunches of Mrs. Pince, Madresfield Court, Muscat of Alexandria, Foster's Seedling, Duchess of Buccleuch, Golden Champion, Black Hamburg, &c., which were (especially Mrs. Pince) pronounced to be excellent. The Secretary gave some account of the Castle Coch vineyards of the Marquis of Bute, near Cardiff, and by the courtesy of Mr. Pettigrew, his lordship's able

gardener, the members were enabled to taste the produce of the vineyard, a bottle of the vintage of 1881 having been sent by him for that purpose; it was pronounced excellent, and bore a likeness to good still champagne. The discussion was continued by Mr. BOSCAWEN and others, and the thanks of the members were given to Mr. Balderson for his interesting paper, and to Mr. Pettigrew for his courtesy.

— "BOTANIKER KALENDER, 1886."—This, which may be Englished as the *Botanists' Pocket Book*, contains, in addition to the usual almanac and general information, articles on the collection and preparation of plants, lists of botanical authors, technical abbreviations, lists of local flora, of medicinal plants, of the floral regions of the globe, of the various modes of inflorescence, of the German species of Bramble, Rose, Charax and Sphagnum, of the principal reagents and staining substances used in microscopic work. A second part or supplement, issued separately, contains a full list of German botanists, with their addresses; obituary notices, lists of the Professors at the several Universities, and of the subjects of their lectures; a catalogue of scientific societies and their officers, an enumeration of the German agricultural experimental stations, botanic gardens, forest schools, natural history museums, and much other information of a similar character. The book is specially intended for Germans, but English botanists and gardeners will find it convenient for reference, though it should cause them some humiliation to have the evidence of the vast inferiority of their own country in such matters thus brought home to them. The publisher is JULIUS SPRINGER, of Berlin.

— APPLE AND PEAR CONGRESS, EDINBURGH.—At a meeting of the Apple and Pear Congress Committee held on November 18 it was announced that the entries of fruit amounted to upwards of 11,000 dishes, with still a number of promised contributions to be added. The exhibits are contributed by growers in almost every county in the United Kingdom, as well as from the Continent of Europe and from America. The Royal Horticultural Society contributes, through Mr. BARRON, a large and interesting collection of Apples and Pears from their celebrated collections at Chiswick, and many of the leading trade and private growers throughout England contribute largely to the aggregate display. Almost every private grower of note in Scotland will be represented by a more or less numerous collection—the total dishes entered from Scottish growers alone being upwards of 6000 dishes; so that the exhibits in this section of the Congress will be thoroughly representative and exhaustive of the produce of Scotland. The collections from Ireland, although not quite so numerous as those from the sister countries, will still be a highly interesting display, as they comprise contributions from the north, west, south, and east, and are likely to contain many specimens never before seen on this side of the Irish Channel. The display from the Channel Islands, France, and other parts of Europe, and especially the collection sent by the Government of Nova Scotia, and from the State of Massachusetts, both famous for the Apples they produce, will add greatly to the attractions of the Congress, and draw many visitors from distant parts to view the display. The jurors begin their duties early on Wednesday, the 25th inst., and the exhibition remains open to the public till 10 o'clock on the evening of Saturday, the 28th. The new winter or Chrysanthemum show of the Society is to be held at the same time, the capacious Waverley Market affording excellent room for both. The show also promises to be a success, the entries having considerably exceeded expectations.

— NEW PUBLICATIONS.—*Atlas Manuel de Botanique*. Two hundred plates. Illustrations of natural orders, with text. J. DEMKER. Paris: BAILLIÈRE.—*Die Botanische Ergebnisse der Polakischen Expedition nach Persien*. Von Dr. OTTO STAFF. ("Botanical Results of the Polak Expedition to Persia.") Vienna: GEROLDT.—*Untersuchungen über die Morphologie des Dicotyledonen Endosperms*. ("Structure of the Endosperm.") Von Dr. HEGELMAIER. Halle.—*James Naumyth; an Autobiography*. Edited by S. SMILES (JOHN MURRAY: London).—*A Short History of the Chrysanthemum*. By C. HERMAN PAYNE (*Journal of Horticulture*, 171, Fleet Street, E.C.)—*Convention Phylloxérique Internationale et Mesures d'Exécution en Belgique* (Chambre Syndicale des Horticulteurs).

TREES, SHRUBS, AND HARDY FLOWERS FOR SMOKY TOWNS.

"What shall I plant in my garden? I have tried all sorts of things and nothing seems to do." Such is the exclamation that is sometimes heard from the lips of householders in the suburbs of manufacturing industry, those in coal and iron districts especially, and to the latter my remarks will apply more particularly. From long experience in the vicinity of a large town, as noted for its smoke as for the excellence of its manufactures, and from a personal knowledge of the Potteries and the "Black Country" (North and South Staffordshire), and experience in the suburbs of London, Liverpool, and Manchester, I believe I shall be able to offer a few suggestions worthy the attention and consideration of those who find themselves in such difficulties as the town gardeners and proprietors, who often make use of the expression at the head of this article.

There are very few gardens indeed where "nothing" will grow, even though the garden boundary wall on one side is that of some huge ironworks; but these notes are intended to have a wider and more comprehensive scope, and are addressed to the greater public but the notes will apply to the small gardens always found near towns.

Assuming that the dwelling-house is already built, and the general plan of the grounds decided upon, the question arises—What shall we plant? We have not to deal with a salubrious atmosphere in which we may venture to plant almost anything, which only require a little shelter from the south-west gales or the cutting east winds, in order to allow them to "grow like weeds;" but we have to contend with one laden with sulphurous and carbonic vapours, as well as dense volumes of smoke, consequently what is planted will have a hard struggle for existence and undergo a veritable battle of the "survival of the fittest." The conditions for plant life being so deleterious, it is very desirable that the roots of the trees, &c., should be in congenial soil; but here again conditions are, more frequently than not, unfavourable; the surface of the soil for several inches in depth is charged to a greater or less degree with acids that have been precipitated on it for years, and the sub-soil may be either clay or rock, as is the case here, but in some places it may be something better than either. In any case the ground should be well prepared by being broken up to a depth of at least 2 feet, 30 inches would be better, and in the case of a clay subsoil it should be well drained. If the trenching is objected to on the score of expense, then holes should be made several feet larger and deeper for the plants than would otherwise be necessary. If possible let the holes be excavated several weeks before they are required, so that the whole body of soil may become aerated; and in the process of excavation let the best soil be placed on one side and the worst on the other side the hole, then when the trees are planted the best soil can be placed about the roots—immediately above and below—and the worst at the top, where the roots will not reach it. Any large stones, brick-bats, or tree-roots and stumps that may be met with in preparing the ground ought to be taken care of, as such-like rubbish will be useful in forming banks and mounds for "blocking out" undesirable views, and for purposes of shelter for dwarf-growing and tenderer plants; the banks and mounds to be furnished with Ivy or other plants to be hereafter mentioned.

Having prepared the ground for the trees to be planted in the direction from which shelter is most required from smoke, as also from prevailing winds, the varieties and species to be selected for planting will depend upon the area to be planted and protected; if less than a quarter of an acre in extent tall forest trees are undesirable, and recourse must be had to trees and shrubs growing from 10 to 20 feet high; if upwards of a quarter of an acre then forest trees may be admissible in numbers according to the area.

In a general way smooth-leaved and fast-growing trees are more capable of withstanding a smoky and poisonous atmosphere than are those that are rough-leaved and slow-growing, and the Canadian Poplar (*P. canadensis*, or *P. levigata*) I find to be one of the best of tall-growing trees for such a purpose, and this I place in the front rank opposite the enemy; two ranks will be better than one. Next in order is the Black Italian Poplar, and to this I would add the

Balsam Poplar (*P. balsamifera*). If the height to which they will grow naturally is an objection, they may be cut down to any height required. The Sycamore (*Acer Pseudo-Platanus*) will do well behind the Poplars, and whether planted in lines, groups, or as single specimens, it has a noble appearance. The common Lime (*Tilia europæa*) withstands the smoke fairly well if sheltered by the preceding; but, like the Sycamore, it is apt to lose its leaves rather early, and at the time I write (October 29) the Limes, Elms, and Sycamores, are quite denuded of their foliage. The beautiful and graceful Birch (*Betula alba*) also thrives here in positions sheltered from the south-west gales, suffering but little from the smoke. And who would be without "the lady of the forest" in her dress of silvery grey? And then, by way of contrast, what can be richer and deeper in colour than a nice specimen of the Purple Beech (*Fagus purpurea*, which thrives under similar conditions? And to the foregoing may be added the common Ash (*Fraxinus excelsior*); the London Plane (*Platanus occidentalis*, although it does not grow here with the same freedom as in London; the Scotch or Wych Elm (*Ulmus montana*); and last, but not of least importance for the purpose, the Apple, the Pear, and the Mulberry. Small plantations, or "belts" of the above-mentioned trees, planted in the order named more or less, will give satisfaction, and form efficient shelter for smaller and less sturdy subjects.

As an undergrowth to the forest trees, and to make an efficient screen from the ground upward to a height of 10 to 15 feet, and for the formation of shrubberies, groups, &c., as well as for screens and shelter where tall trees are not admissible, the common Thorn in varieties of white, pink, and crimson—both single and double—will be found invaluable; so will the Holly, Shepherd's variety in particular; it is robust in constitution, free in growth, and bears large smooth leaves, which are easily washed by the rain; but all the Hollies are better for partial shelter from strong gales. The Laburnum grows well, and gives us a wealth of golden blossoms; and the common Lilac, pink and white, are suitable companions for the Laburnum. The flowering Currant gives variety, as also does Broom, and the double Gorse should be planted wherever there is space for it, the more there is the better the effect when in flower—Aucuba japonica, the common Laurel, and common Potted Rhododendrons, it is scarcely necessary to mention, being essentially town shrubs. To these I would add Berberis Darwini and *B. aquifolium*, the common Privet, Veronica Andersoni, *V. decussata*, and *V. Hendersoni*; and last, but by no means of least value as a suitable plant for smoky towns, the common Elder and its varieties; it will grow anywhere, and will produce its large umbels of white flowers in great profusion. Large specimens of the common variety when in flower at the beginning of summer, make a feature in any English landscape, and few shrubs are more effective at that time; most people are aware of the economic uses of the fruit in autumn and winter. I shall refrain from recommending any of the Conifers, because there are very few, if any, that are likely to do well in such places as I have in view.

Amongst suitable climbers and creepers for covering walls and buildings, the most valuable are the varieties of Ivy, and next in point of value is the Virginian Creeper, both the common and Veitch's variety; another is *Aristolochia Siph*, a plant rarely seen; *Clematis lanuginosa* does fairly well, so do *Jasminum nudiflorum* and *J. officinale*. Several varieties of the Vine grow well, but, of course, do not bring their fruit to perfection, the foliage alone is of sufficient value; *Cotoneaster microphylla* and *C. Simmonsi* are very useful, and *Cydonia japonica* does well, but requires a little shelter from harsh winds.

In forming the shrubbery borders for the reception of small shrubs, herbaceous plants, &c., let the soil be trenched to a depth of 18 inches at least, break and pulverise it well, adding manure, decayed leaves, or burnt garden rubbish as the work proceeds, to enrich the soil and provide food for that which will be planted. If the soil has not been broken up before, or has become hard and impervious in its nature from being trampled on, it should be forked over carefully as many times as possible at intervals of a week or a fortnight if time will permit. When the soil has become sweet and friable planting may commence, and one of the plants I would recommend to be planted at the back portion of the border is the giant

Cow Parsnip (*Heracleum giganteum*), if the borders are at all extensive. In recommending this plant I know that I am laying myself open to criticism and ridicule, but it is noble in aspect, tropical in appearance, artistic in outline and detail, showy if not gorgeous in inflorescence, eminently suitable for a bad climate, and it grows without any further trouble after being once planted; it is singularly effective as single specimens or in groups, especially with dark background. In similar positions I would plant *Tritoma uvaria*, *Michaelmas Daisies*, *Chrysanthemums*, *Poppies* (*Papaver orientale*), *Phlox*, double *Pyrethrums*, and *Dahlias*. Nearer to the front would come the common Iris, herbaceous *Anemones*, *Wallflowers*, *Sweet Williams*, *Carnations*, *Forget-me-Nots* (*Myosotis*), *Primroses*, *Polyanthus*, *Alpine Auriculas*, *Daffodils*, *Violas* and *Pansies*, *Antirrhinums*, *Delphiniums*, &c.; and at the front of the borders we have masses of *Iberis*, *Arabis*, *Abutilum*, *Alyssum*, *Saxifraga umbrosa* (London Pride), *Crocus*, *Scillas*, *Vinca*, *Sedums*, *Sempervivum*, *Lysimachia nummularia*, *Thrift* (*Armeria*), &c., besides hardy annuals of various kinds. In shady corners the more vigorous growing British Ferns, such as *Lastreas*, *Athyriums*, *Scopolopendriums*, *Blechnum spicatum*, and *Polypodiums* may find a place. It will thus be seen that there is no lack of material with which to shelter and furnish a town garden satisfactorily, and the amount of success attending the undertaking will depend on the measure of intelligent care and attention bestowed. When such things as have been mentioned become established it will be an easy matter to find nooks and corners wherein plants of a more tender nature may be tried, my object having been to show how easily an apparently barren and desolate waste may be made beautiful by a selection of suitable plants and the proper preparation of the soil, rather than to give a full list of such plants that might possibly be cultivated after the first and greatest difficulties were overcome. *J. Udale, Shirecliffe Hall, Sheffield.*

HOME CORRESPONDENCE.

Wintering Echeveria.—It is evident that most people have their own particular way of preserving this plant through the winter months; various ways have been tried here with more or less success. The plan we tried about twenty years ago succeeds admirably. A border was made outside the stove on the north side, 70 feet long and 2 feet wide, sloping from the wall and slightly higher than the surrounding ground. The first row of plants were laid down, not planted, near the pathway; and the second row was laid on the roots of the first row, and so on until the wall was reached; they were placed close together, and when the bed is finished they form one mass. No watering is required. They will stand 8" or 10" of frost with impunity, as the sun will not reach them. When sharper weather sets in a few Yew branches are laid over them, and in severe frost a few inches of long litter is laid on the branches; the latter allows of a little circulation of air amongst the plants. I have known the plants to be covered up for weeks in hard frosts. When the weather has changed they must be uncovered very gradually, a little each day is the best. Under the above treatment we never lose a single plant out of thousands. I may mention that the stove is built with hollow brickwork, which, of course, gives out more heat than a solid wall; but I believe they would winter against the latter, and should not be afraid to try them. Echeverias are like shrubby *Calceolarias*, they do not like to be coddled. When preserved as above described they are much stronger, and may be planted out sooner in the spring than when wintered under glass. *John Perkins, Thornham Hall, Suffolk.*

Paronychia argentea.—This is one of the Knot-wards, or *Illecebrææ*, of which *Illecebrum verticillatum* is indigenous to England, and is a hardy perennial. It is much used in the flower garden of Killerton House by Mr. Garland. The centre beds are enclosed by stonework, and raised 18 to 20 inches above the grass level. The *Paronychia* is planted next the masonry, and hangs down over it. The drooping habit is graceful, and the hue of inflorescence and foliage silvery, somewhat akin, for example, to the colouring of that popular bedding plant, *Leucophorum Brownii*. These two properties combined render this tutted herb peculiarly adapted for the place it fills, as also for hanging down from

vases, or indeed from anything. The plant is common in the South of Europe and Algiers. Independent of its beauty and utility, the plant would be cherished at Killerton from the fact of the original stock having been brought home by Sir Robert Inglis from Nazareth, where it is one of the commonest weeds. *C. A. M. C.*

Begonia Reading Snowflake.—The value of this hybrid as a perpetual flowering form is scarcely so much appreciated as it deserves to be. It flowers all the year round, and as freely at midwinter as in summer; the flowers are pure white, and double the size of *B. semperflorens*, one of its parents. The habit is excellent. It makes a good pot plant, and is of great value for decorative purposes. *R. D.*

The Leeds Daffodils.—The following is an extract from a letter I have just received from a well-known gardener, who has not given me leave to mention his name:—"I was well acquainted with Mr. Leeds and his collection; he always said he had his original collection from Dean Herbert, but I think that referred to species; he continued to hybridise and raise seedlings so long as I knew him, and that was until he parted with them to Messrs. Barr & Sugden and the Rev. Mr. Nelson, of Aldborough." *C. Wolley Dod, Edge Hall, Nov. 12.*

Late Flowering Clematis.—Plants that flower late in autumn are not over-plentiful, and on that account, a part from their individual good properties, are always acceptable. Not the least of the merits of some of the newer varieties of Clematis is that they bloom so late in the autumn. A good many of the hybrids of the lanuginosa, and also the viticella and the Jackmanni types, have shown a disposition to keep on blooming through September and until well on into October, but the late flowers are often so few, and have such an appearance about them, as to remind one of the "last Rose of summer." An unnamed seedling that I noticed in the Sunningdale Nursery was, in October, in a condition such as to deserve the character of being a profuse autumn bloomer, covered with flowers and buds that would keep on opening until cut off by frost. It is a comparatively small five-petaled flower, about the size of *C. Jackmanni*, but with petals nearly as broad as they are long. The colour is deep lavender-blue. Madame Grange, another late bloomer, was as full of flowers as *C. Jackmanni* is usually seen in the summer. The colour is light mulberry. Mrs. Cholmondeley—a full-sized lavender-coloured sort—was also nicely in bloom. Daniel Deronda is another of the late flowers; colour purple. *C. Jackmanni alba*, the original plant of which now covers a pillar 11 feet high, so as to form a dense mass 4 feet through, was covered with a sheet of bloom from the beginning of August, and had still quantities to come on. Some of the shoots had half a dozen pairs of buds yet to open. It is evidently one of the freest and most robust growing varieties that has ever appeared, and an equally free flowerer. The late blooming varieties of Clematis when grown on buildings, as these plants often are, will generally get enough shelter to prevent their flowers being injured by the early frosts. In such positions their late flowering habit is seen to the best advantage. *T. B.*

Orchid Houses.—It is now absolutely essential that the greatest advantage be taken of the light now at command, so that backward growths may obtain all the assistance that can be rendered from this source, and that bulbs almost finished up may become plump and sound with all possible dispatch. There is now a much better appreciation among growers than formerly used to be the case, that to have bulbs plump and thoroughly ripened, to be followed by a certain definite period of rest, is one of the most necessary conditions for the full and perfect development of the flowers, and for a free and satisfactory growth afterwards. Simple truths need repeating even now, for there will ever be new beginners—those who are starting in the culture of Orchids; and since remarks of this nature are intended for such, rather than those who are advanced in the culture and have gained experience, the very rudimentary suggestions and advice will doubtless be acceptable to many. If not done already, let every bit of fixed shading, such as canvas tacked on at odd ends and corners, be at once removed. These out-of-the-way pieces are so often disregarded and permitted to remain on, to the exclusion of light, that not a day

should be lost ere they are removed. So, too, where portions of the roof have been smeared over with whitewash, &c.—this must be washed away at once; and if the district is one where, through the smoky condition of the atmosphere, the outside of the houses become quickly covered over with a sooty deposit, let the glass be washed all over, not only washing the glass but the rafters and woodwork, for the better removal of all filth. There is nothing better than a little soft-soap in the water used with the brush, and then plenty of clean water poured on with hose-pipe or water-can will speedily effect a change for the better. In some localities this process will need to be repeated once or twice during the winter, for immediately after a thick heavy fog in the neighbourhood of the large manufacturing towns of the North there will be observed on all objects outside walks, roofs, leaves of shrubs, &c., a filthy and black deposit, injurious to all vegetation, and one that materially lessens the entrance of light into our houses. With roofs clean inside and out the cool *Odontoglossum*s and *Mastodermis* will now be pushing well away, the former in the majority of cases with growth about half or three parts formed, the leaves of which should stand well up, and, being moderately broad and of medium length, will indicate that the condition in which they are placed is of the best, and one that must be carefully followed and persistently continued. The flower-spikes on the most forward growths will soon be pushing up from the base of the yet immature bulbs, and as the spikes come quickly up the bulbs continue swelling, until having reached their due size the spikes come away more rapidly, and buds will be formed of a stout and plump character, which in due time will develop into flowers of good size and substance. It is mostly to be observed that the finer forms of *O. crispum* flower in early spring, and up till May and June, whilst the majority of the more stately varieties flower later or at more irregular periods. *W. Swan.*

Coning of Athrotaxis laxifolia.—I have to-day read in the *Gardeners' Chronicle* your notice of the *Athrotaxis laxifolia*. I believe you are wrong in saying the cone has not been known before. The tree flourishes in the gardens of Robert Loder, Esq., Whittlebury, Towcester, where I gathered quantities of the cones in the year 1875. A. [We should be glad to see cones of this or last year. Ed.]

Cyclamen at Hanwell.—A magnificent lot of these popular plants is now to be seen at the nurseries of the St. George's Nursery Company at Hanwell. At this nursery there are twelve long low span-roofed houses that are particularly well adapted for the growth of plants, and Cyclamens at present are to be seen in every one of them. They can be seen in all degrees of development, from seedlings just putting their first leaves through the soil, to plants three, four, five, and six years old, representing the fine specimens Mr. Smith, the manager, is in the habit of staging for exhibition in spring at South Kensington and at the Regent's Park. Seeds are sown about the end of August or early in September. The usual practice has been to sow some thirty seeds or so in shallow pans 9 inches in diameter. These are stood on an ash bed in one of the houses, and in about six weeks the first leaves begin to appear above the soil, but some seeds appear to germinate more quickly than others. It may not be generally known that seeds of *Cyclamen persicum* will retain their vitality for six or seven years, though a longer time is required for them to germinate, and a certain proportion will fail altogether. The best way to preserve seeds of Cyclamen is to put them in bottles and keep them perfectly airtight. This season Mr. Smith has adopted the practice of sowing the seeds singly in thumb-pots. Several thousands were treated in this way, and the majority of them have put forth two and three seed leaves. This method has been adopted in order to obviate the check which the tiny plants receive when they are pricked off from the seed pans into pots, and from these to thumb-pots. By sowing in tiny pots they can be shifted into 60-sized pots without injuring the ball of roots, and not the slightest check is thereby caused. It is true that the sowing of the seeds singly causes a greater expenditure of time, but it is at the season of the year when labour is more available, and the time required to prick off the seedlings in early winter or spring, when work is more pressing, is avoided.

There is a very fine lot of specimens of two years old and upwards. They comprise the very cream of the seedlings, and are consequently of the highest quality. In addition there are almost numberless plants of seedlings raised fourteen months ago, many of which are already in flower and others coming on to succeed them. Thrips is one of the most tiresome pests the cultivator has to contend with. One of these will fasten upon a bud just as it is showing colour, and preying upon it disfigure it by piercing the petals, leaving a mark on each. Therefore it is that the plants are well fumigated down to the time that they show for bloom. *R. D.*

Epipactis latifolia and its Varieties.—Botanists have been somewhat puzzled where to draw the line of distinction between the various species and varieties of this highly interesting genus of plants. This is, however, not to be wondered at, more especially in those who have not had the chance of examining the plants growing under various circumstances in their native wilds, as the forms of one species alone, *E. latifolia*, are certainly many and perplexing. I can also readily understand how any person on being sent either of the extreme types of this plant would hesitatingly pronounce them as species; but let the same person examine carefully a wood in which the normal form occurs plentifully, and he will find that all gradations of colour occur, from almost a pure white to a deep purplish-pink, and which latter is the plant that has been elevated by not a few of our botanists to a distinct species under the name of *E. purpurea* or *rubiginosa*. Did no gradations occur between this purple form and the typical species (putting aside any differences in the structure of the flowers, which certainly does not exist) some leniency might be granted to those who still feel inclined to uphold the erroneous appellation of *E. purpurea*. On finding the white-flowered form some years ago I own I was somewhat puzzled, although at the time I labelled it *E. latifolia alba*, but since then I have found it on various occasions, but always in company with the normal form; and after a careful examination of several hundred specimens and taking into account the variability of colour in the flowers of *E. latifolia*, I cannot think otherwise than that it is but a well-marked form that, save in colour of flowers, differs in no way from the normal species. The purple form is, as regards colour of flowers, as extreme in an opposite direction to the white; and during the past season I could in one wood alone have shown all gradations of colour from almost pure white through the normal green to the deep pinky-purple of the so called *E. purpurea*. *A. D. Webster.*

Tropæolum tricolorum.—When well grown and nicely in flower this is a beautiful object. Formerly it was to be found in most collections of plants; of late years its culture seems to have fallen off, and it is only rarely to be seen. It is a plant of easy culture when it is understood, but to the uninitiated its culture is not so easy. The tubers when dormant should be kept in boxes of very dry sand and be placed on shelves in a cold house where mice cannot get to them. This is a matter that should be attended to, otherwise they will eat the whole of the tubers. When the tubers break into growth, which will be in general some time in August, they should at once be potted into the pots they are intended to flower in. Pots of 8 or 10 inches in diameter will do for all the larger-sized tubers; smaller tubers should be put into smaller pots. The pots should be well drained and a layer of decayed manure should be placed over the drainage. They will do well in a compost of loam, peat, and sand. The soil should be well pressed into the pots and made level with the rims. The tubers should then be put into the soil in the centre of the pots, planting them only a little below the surface of the soil. The smaller tubers should be planted in small pots and the larger tubers into larger ones. The young shoots are very liable to be broken off when in a young state, especially if they have not been exposed to the light. This should be carefully guarded against by securing them neatly to stakes, so that the shoots do not snap off if the plants should get shaken. They may be trained to any form of trellis, but they look as well on balloon-shaped trellises as on any other form. The best place to grow them in is a house having a temperature of about 45° by night and 50° by day; this will suit them well during the autumn and winter months, but the temperature should not be allowed to fall lower. They should be

placed on a stage and kept near the light. They should be looked over nearly daily, and the young shoots kept neatly tied in to the trellis. They will not require much watering until they begin to root freely into the soil, when they will require watering more freely. In March and April, when the plants begin to cover the trellis they will require liberal supplies of water. During the autumn and winter months they must be kept growing steadily; the plants will now begin to cover the trellises, and towards the end of April and during May they will begin to flower freely, and for two or three months are beautiful objects, especially during

will soon vegetate. When the young plants are a few inches in length they should be carefully potted off, the best of them singly into small pots, and the smaller plants three or four in a pot. The whole, when potted, should be put into a gentle heat. When they get nicely into growth they should be placed near the light, and have plenty of air given to them. Toward the beginning or middle of August the whole of the seedlings will require a shift into larger pots. After they are potted they should be kept near the light, and in a nice gentle heat. Towards the spring the plants will begin to flower, and will continue to do

heat at, say, 65°; in about a fortnight they will have started into growth. The heads are then taken off with a sharp knife, sufficiently low to allow of stripping a dozen or so leaves from the base of the severed head. These leaves are then laid upon pans of sandy compost, and a good percentage of them will make plants in time to be used the same season, the heads being pressed into pans of similar compost sufficiently low to hold them in position until rooted, which in the temperature mentioned will be in about a month. The old stools are carefully stowed away, and these produce a good supply of offshoots. Although in the winter season this *Echeveria* cannot bear artificial

FIG. 148.—*ABIES MAGNIFICA*: CONE, LEAVES, LEAF SECTION. A, RESIN CANALS; SCALES AND BRACT FROM THE BACK, FRONT, AND SIDE. BRACTS IN THE TYPE SHORTER THAN THE SCALE, IN SOME VARIETIES LONGER, BUT INCURVED.

May and June. They should be taken to the conservatory or to a cool house, where they will continue to flower for two or three months. About the end of June and during July the flowers will begin to decay, the plant should then be removed to a warm house to perfect and ripen the seed. When the seed is ripe it should be gathered and kept in sand until the end of July or August, and then sown thickly in pots. The old tubers should be taken out of the soil and placed in some boxes of sand, and put where the mice cannot get to them until the season for starting comes round again. The seed will vegetate quicker and better if steeped in cold water ten or twelve hours. When this is done the outside covering is easily removed, and the seeds grow sooner. After the seed is sown it should be put into a nice heat: it

so for some time. When the stems have died back the tubers should be taken out of the soil and put into boxes of dry sand, and stored as before stated. By attention to the foregoing details there is no difficulty in growing to perfection this beautiful greenhouse climber. *M. Saul, Holgate, York.*

Echeveria Peacocki.—Among modern introductions to our gardens this *Echeveria* is destined to take a high place. I well remember three years ago seeing it for the first time out-of-doors at Hampton Court. To those who grow it for bedding purposes, but who may not be successful in propagating it in large quantities, the following is the *modus operandi* which we find to be the best. About the middle of February select the largest plants and place them in a warm

heat, its greatest enemy is damp. There is a weevil which is very fond of it, but if the soil is carefully prepared this can in great measure be guarded against. This variety does not produce offshoots in the way many of the commoner kinds do, but it is capable of being grown to large size, and is then invaluable either as dot plants in beds or as decorative plants for indoor work. *H. L., Leamington.*

Scottish Annual Hiring System.—To day was the Martinmas Term (Nov. 11) in Scotland, the time when it is the practice among young gardeners to change their situations, the majority of them coming to Edinburgh, to try to get a situation through the medium of the nurserymen. This Term fully the average number of men have turned up, and, as a

class, they appear to be a decided improvement on the men of a few years ago—clean, smart, and intelligent-looking young fellows; but the bad times make it very difficult for even the pick of them to find good berths, and many good men must seek other employment for the winter. The system of yearly changing of places, which has so long been in vogue in Scotland, is not one that can be recommended, and it is becoming evident that it is not at all suited to the advanced times in which we live. It is objected to by all parties—employers, gardeners, nurserymen, and the young men themselves; but it is difficult to eradicate the long-established custom. It is a matter that chiefly concerns gardeners; and if they were at all unanimous in putting a stop to the useless practice, there would soon be an end to it. Let us hope the day will soon come, and that the "drones" of young gardeners infesting the streets of Edinburgh at Term-time will ere long be a thing of the past. N. B.

Gladioli Ripening-off.—Some of these are very late in flowering this season, and as it is sometimes necessary to clear the beds as early as possible in order to get them dressed during the winter, it is well to lift the bulbs, with some soil adhering to them, cutting away the flower-stems previously, and then plant them out under a south wall, placing some fine potting-bench soil about the roots. If this practice, which is a good deal followed by growers having small gardens, be carried out with care, the ripening process will be hastened without doing any injury to the bulbs. They can then be lifted at the proper time—that is, when ready—as stored away in the usual manner. This early lifting will be required only in the case of late seasons like the present. R. D.

Wax Climber.—I have already published the fact that the *Microrola lineare* is in flower with me at present; and I would like to know through your columns whether any one else has yet flowered it in Britain. *James Wilson, jun., Florist, &c., Greenside Gardens, St. Andrew, N.B.*

Reports of Societies.

EDINBURGH BOTANICAL: Nov. 12.

The first meeting of the fifth session of this Society was held at 5, St. Andrew's, Professor Dickson, President, in the chair. The office-bearers for the ensuing session were duly elected:—

President: Professor Dickson, M.D., LL.D., F.R.S.E., Vice-Presidents: W. B. Boyd, of Faldonside; T. A. G. Balfour, A.M., F.R.C.S.E.; Alexander Robertson, M.D., F.R.S.E.; Hugh Cleghorn, M.D., F.R.S.E.

Councillors: Rev. John Macmurtrei, M.A.; Robert Lindsay, Patrick Geddes, F.R.S.L.E.; Symington Grieve, Andrew Taylor, F.C.S.; William Sanderson, Rev. I. M. Robertson, M.A.; William Watson, M.D.; Robert Gray, F.R.S.E.; William Craig, M.D., F.R.C.S.E., F.R.S.E., Honorary Secretary: Professor Douglas MacLagan, M.D., F.R.S.E.

Honorary Curator: The Professor of Botany. Foreign Secretary: Andrew P. Aitken, M.A., Sc.D., F.R.S.E.

Treasurer: Patrick Neill Fraser. Assistant Secretary: John M. MacFarlane, D.Sc., F.R.S.E.

The second part of volume xv. of the *Transactions*, concluding Dr. Smeaton's work "On the Hepaticæ of the Anthon and Andes," was laid on the table.

The following communications were read:—

1. "On the Fertilisation of *Epipactis latifolia*." By A. D. Webster, Llandegai, Penryn.

"Having during the past few years, and more particularly the summer of 1885, devoted considerable attention to the above interesting subject, I have thought the following observations not unworthy of record, more particularly as contributing a note towards a subject which, although it has already received some attention, may still be considered as in its infancy. In the woodlands of this county (Carnarvonshire), where the above plant grows in unusual quantity, exceptional opportunities have been afforded me of studying it under various circumstances as regards soil, altitude, and situation.

"All, or nearly all, my observations certainly tend to point out (1) that *Epipactis latifolia* is very imperfectly fertilised; (2) that, although visited by insects, cross-fertilisation seldom takes place; and (3), that self-fertilisation by the pollen falling spontaneously on the stigma is not uncommon."

We give only the proof of the first two propositions:—

"1. That the plant is only very imperfectly fertilised is only too evident from the small quantity of seed produced. On examining nearly one hundred of these plants when the seeds were ripe in October, I was perfectly surprised at the small number of capsules pro-

duced. (The ovules of unfertilised flowers drop from off the plant at an early date, thus affording an unerring guide as to the difference between barren and well-filled capsules.)

"I examined nineteen plants that were growing in consecutive order in one wood, and out of a possible of 492 capsules only thirty-eight produced seed. Thinking that perhaps the density of foliage or maritime situation could be made to account for this unusually small production of seed, I examined the plant in quantity in two other warm, shady woodlands, but with almost similar results. Sixteen plants growing within a short distance of each other produced from 516 flowers only thirty-two capsules, while in another wood similarly situated twenty-six were produced out of a total of 175. This small production of seed, more particularly in an unusually fine season like that of 1885, clearly points out that *Epipactis latifolia* is most imperfectly fertilised, and as will be seen hereafter, that cross-fertilisation by insect agency seldom takes place. The conclusions are naturally arrived at, that this Orchid is more frequently self than cross-fertilised, but when the small production of seed is taken into account, very imperfectly by either method.

"2. That although visited by insects cross-fertilisation seldom takes place is proved out by the following observations:—Amongst the insects which visit the flowers of the pollinia that I have seen visiting the flowers of this *Epipactis*, I may particularly mention the red-tailed humble-bee and our common wasp, the latter, however, but very rarely. On the other hand the red-tailed bumble-bee, which is the most common insect visiting the pollinia by its peculiar method of sipping up the nectar without really entering the flower, never removes the pollinia. On August 21, 1885, being in a wood where beds of this plant were in full flower, I saw the above bee enter several flowers on two different plants that were growing side by side without in any case removing the pollinia. On the 24th of the same month and in the same wood I saw a red-tailed humble-bee visit successively no less than sixteen flowers on a spike of this *Epipactis* without removing any of the pollinia. In this case the spike of flowers was so dense that the bee simply crawled from one to the other in a spiral fashion from bottom to top without once bringing its head or proboscis in contact with the viscid disc at the base of the pollinia. After sucking the nectar from the last flower it flew off for a few yards, but immediately returned to the same flower, and in the same flower, but this time in a sort of half-dilapidated fashion as if striving to improve on work that had been already well done. Again on the 26th of the same month I saw several of the same bees visit the flowers of this plant, one visiting most of the flowers on a spike (in succession) without removing the pollen, although, being close to, I noticed them visit numerous flowers that contained the pollen masses. The bees hung on the distal portion of the labellum and inserted their long proboscis without the bead coming in contact with the viscid disc. The 26th, when the above was the case, I spent fully an hour watching the plants, but during all that time, although wasps were flying about in number not one visited a flower. (This certainly was quite the opposite of what I expected, as several naturalists are under the impression that the red-tailed bumble-bee, fertilised by this insect, one indeed, going so far as to say that if wasps were becoming extinct in any locality, so, in all probability, would *Epipactis latifolia*.) On other occasions, however, I did see the common wasp visit several flowers, but the visits were short, and I may use the expression, he was a lovely evening, but he did little therefrom. Owing to their long narrow shape and short proboscis wasps remove the pollen masses with ease, for I have caught them immediately after coming out of the flower with the pollinia attached to their head, and I have seen them do so, but I have never observed by this way is certainly a rare occurrence. In numerous instances, also, the pollen masses will be found glued to the upper sepal of the flower, which is done as follows:—

"The wasp on entering, more particularly a newly-opened flower, gets the pollinia attached to its head when sucking the nectar, but immediately on entering another flower the upper sepal is so situated that the sharp stiff edge comes in contact with the viscid substance, and, together with the pollinia, is left attached to it. This, I may say, I have never seen take place, and I have seen the wasp get the nectar out of the flower, and also readily illustrated with a pencil. In various other parts of the plant it is not at all uncommon to find the pollen masses attached as if the discs were not sufficiently viscid to retain their hold on the insect's head, and on more than one occasion I have found them left underneath, or in their entirety, on the stigmatic surface. Small insects also visit the flowers in numbers, as I have watched them creeping about within the labellum and other parts of it; but in numerous instances many of them, which come in contact with the viscid stigma are unable to do so, and so perish. The same may be said of an insect that has been killed in this way was $\frac{1}{2}$ of an inch in length. When the plants begin to wither, or immediately after fertilisation takes place, the distal portion of the labellum curves upwards, and effectually closes the entrance to the basal portion of the nectary, but for what good end I am totally at a loss to know."

(To be continued.)

SOUTHAMPTON HORTICULTURAL:

November 3 and 4.

The autumn exhibition of Chrysanthemums and fruit was held in the Victoria Skating Rink, a place specially adapted to the purpose. The lateness of the season for the queen of autumn flowers, and the early date chosen for the show, are causes which prevented the display being as good as usual, still there was an excellent show,

Evidently the Chrysanthemum is gaining popularity in this neighbourhood, judging from the number of new exhibitors who put in their appearance. Plants at this season were not so numerous, and, indeed it, indeed it would be difficult to name a place where they were better. Cut blooms of Chrysanthemums also were staged in considerable number, and of good quality on the average. Apples, Peas, and Grapes are extensively grown, and were also most successfully shown, and the latter formed an important item in this exhibition. Everything runs smoothly under the able guidance of the small but very energetic Mr. C. S. Fudge, the Secretary, backed up as he was by an excellent committee, of whom Captain Gibbs, who has the best interests of horticulture at heart, is chairman.

GROUPS.

For the best arranged group of Chrysanthemums, occupying a space of 40 feet, there were but two competitors; but the group from Mr. J. Eiland, gr. to J. Bailey, Esq., Elmfield Hill, Southampton, was excellent in plants and arrangement; Mr. N. Blandford, gr. to Mrs. Hatfield, Moorhill, West End, was 2d.

For six plants, incurved or reflexed, Mr. J. Allen was 1st, with plants fully bloomed, and not too stiffly trained; 2d, Mr. W. Joy, nurseryman, Shilley, with large plants, but not so freely bloomed.

For six Japanese varieties, Mr. J. Allen was 1st, with plants 5 feet in diameter, and carrying 150 flowers on each. The same exhibitor was 1st in the class for nurserymen, with plants somewhat similar in character.

Mr. E. Willis, gr. to Mrs. Pearce, The Firs, Bassett had the best single specimen—a plant of Dr. Sharpe, whose colour was rich in the extreme and bearing 150 fine flowers; 2d, Mr. J. Allen; 3d, Mr. W. Joy.

CUT BLOOMS.

For twenty-four incurved varieties, distinct, Messrs W. & G. Drover, were 1st, with flowers rich in substance, colour, and finish; 2d, Mr. C. Denford, gr. to Sir F. Fitzwygram, East, M.P., Leigh Park, Havant, whose blooms were larger, but not so well staged as the premier collection; 3d, Mr. J. Allen.

For twenty-four Japanese varieties, distinct, Mr. Penford was 1st, staging grand blooms, large in size and well coloured, the following being a few of the best:—Solari Levant, Oracle, Eclaircissement, and J. Delaux; Mr. W. Neville, gr. to W. High, Esq., 2d, Messrs. Twyford, Winchester, was 2d, with a neat good stand well staged, the best being Margaret Marrouh, M. Delaux, and Mille Lacroix. The same exhibitor had the best twenty-four blooms in eighteen varieties. Mr. W. H. Ward, gr. to W. High, Esq., 3d, Nettle Castle, Salisbury, was 2d, this being his first attempt at Chrysanthemum growing, and right well did he stage; 3d, Mr. J. Allen; 4th, Mr. C. Warden, gr. to Sir F. Eubhurst, Clarendon Park, Wilts, who in his arrangement departed quite from the orthodox style of setting up blooms. He in this case staged the plants, with foliage, and resting upon green moss, a margin of *Isolespis gracilis* putting a finish to the boxes.

For twelve incurved, Messrs. Drover were 1st; Mr. I. Selden, gr. to Mrs. Brooks Firman, St. Thomas', East, Gosport, was 2d, with neat examples; Mr. Willis was 3d.

For twelve Japanese, Mr. Renford had the 1st place, with very fine produce; 2d, Mr. W. Widsmith, gr. to Lord Eversley, Heckfield Place, Winchester, who ran the first-named exhibitor very hard for 1st place, so good were his blooms.

Mr. Penford had the best twelve Anemone, and same number of reflexed kinds, being followed by Messrs. Drover and Mr. Widsmith, all showing well.

For twelve blooms, shown as grown, with foliage, Messrs. Allen, Neville, Warde, and Renford won in the order named.

Pompons were well shown by Mr. Molyneux, gr. to W. H. Myers, Esq., Swanmore, and at Bishop's Waltham, and by Mr. Willis.

For twelve blooms, not less than eight varieties, Mr. J. Reynolds, gr. to the Right Hon. H. Crichton, Nettle Castle. The best arranged stand of Chrysanthemums and other flowers was one from Miss Flight, which was an elegant combination of colours.

MISCELLANEOUS.

Mr. Blandford had the best group of Orchids, amongst them being very fine spikes of *Cyclopis Veitchii* and *C. civesita* rural. Mr. Willis had best table plants and small palms grown in 6-inch pots. Amateurs' groups of Chrysanthemums, a new feature at this show, were of good quality, and should encourage future efforts; this is considered a serious matter.

For three bunches, distinct varieties, of Grapes, Mr. Ward was 1st, having Mrs. Pince, fine; Muscat of Alexandria, beautifully coloured; and Barbarossa, small in bunch but splendidly coloured, the berries being of large size. Mr. Bland, gr. to G. Dilgely, Esq., 2d, Mrs. H. Rous, gr. to Mr. H. Bunches of Muscat of Alexandria and Alicante being perfect; Mr. Hall, gr. to Captain Davison, Stone Southam House, was 3d, showing splendid bunches of Alicante.

For three bunches black, Mr. Molyneux was 1st with bunches of Black, gr. to G. Veitch, in the aggregate 16 lbs., fine in berry and colour; 2d, Mr. Hall, with Alicante, handsome in shape, and having a dense bloom; 3d, Mr. T. Grant, gr. to Major Murray, Osenley Manor, Christchurch, with Black Alicante, extra large berries.

For two bunches of white Mr. W. Saunders, gr. to J. East, Esq., Longstock House, Stockbridge, was 1st with faultless examples of Muscat of Alexandria; Mr. Ward and Mr. Budd were respectively 2d and 3d.

For two bunches of black and same number of white Mr. Penford was 1st. The heaviest bunch was one of

Barbrossa, from Mr. Ward, weighing 10 lb.; Mr. Hall followed with Alicante. Mr. Wildsmith had the best Pine-apple.

Dishes of Apples and Pears were shown, some fine samples coming from Mr. Wildsmith, Mr. J. Busby, Mr. Saunders, E. H. Goodwin, Esq., and other growers in the county.

Twenty exhibitors of eight varieties of vegetables combined, making a grand display, the quality in most instances being excellent. 1st, Mr. J. Cox, gr. to R. K. Wyndham, Esq., Corsham House, Bishop's Cleeve, his best being Long Lyons Leek, Rousham Park. 2d, Mr. W. Coley, and Improved Magnum Bonum Potatoes; 2d, Mr. W. Pope, gr. to the Earl of Carnarvon, Highclere Castle, Newbury, whose dishes of Intermediate Carrots, Tomatos, and autumn Cauliflowers were particularly fine; 3d, Mr. Saunders; 4th, Mr. E. Mellor. Mr. Badd had the best collection of salads. Messrs. Lumboe, Pince & Co., Exeter, staged 18 dishes of Apples and fifty dishes of Pears of excellent quality, the colouring being particularly rich. These and six fine Pine-apples by Mr. Wildsmith were amongst the items not for competition. *E. M. S.*

WEST KENT CHRYSANTHEMUM SHOW :

November 10 and 11.

THIS Society has been in existence some eight years, and keeps on increasing in the quantity and quality of plants and flowers competing in the various classes. The exhibition was held in the Public Hall, Bexley Heath.

The Silver Cup offered in the open class for forty-Japanese varieties, twenty-four incurred and twenty-four original, brought out six competitors, all showing good collections. In a close run Mr. J. Martin, gr. to C. N. Kidd, Esq., Dartford, took 1st, with full-sized even flowers, his Japanese varieties especially were large and in beautiful condition; Mr. Whitte, gr. to C. H. Gagen, Esq., Arlington, who was 2d, had a good lot of incurved flowers, but a few of his Japanese kinds were not quite up to the mark; Mr. Sharpe, gr. to Hatchett, Esq., Lee, took 3d, some of the flowers in this stand not being sufficiently open.

PLANTS IN POTS, OFFEN.

Six bush-shaped, large-flowered Chrysanthemums.—1st, Mr. Mitchell, staged moderately sized specimens, evenly flowered; 2d, Mr. Burgess, who had taller plants less closely trained. Six standards.—These were very well done; in a close run Mr. Burgess scored 1st, Mr. Mitchell 2d. Single specimen trained Chrysanthemum.—1st, Mr. Mitchell; 2d, Mr. Burgess.

BATH CHRYSANTHEMUM SHOW :

November 11 and 12.

THE committee of management and the energetic Secretary the Bath Floral and Band Committee, are to be congratulated upon the success of the show of Chrysanthemums, fruits, and vegetables, which was held in the Assembly Rooms on the above dates, and which was larger than any previous show of the kind. The trained plants, which were neat without being stiff, and cut blooms of chrysanthemums were, on the whole, of a high order of merit, as also were the Grapes, Pears, Apples, and vegetables, ornamental foliage and flowering plants, Primulas, &c.

PLANTS.

In the class for six large flowered distinct varieties, Mr. E. Silcox, gr. to Mr. W. Vowles, secured chief honours with dwarf, well-trained, and grandly-flowered plants, inclusive of one of Mrs. Dixon, to which the National Chrysanthemum Society's Silver Medal for the best plant in the show was awarded. Mr. R. B. Cator, Bath, was a good 2d; and Mr. G. Tucker, gr. to Major Clarke, Froxbridge, was 3d.

Mr. F. J. Walters had the best four plants, showing good specimens; Mr. H. Scott had the 2d best, and Mr. A. A. Walters the 3d best lot, all showing creditably grown plants.

Mr. W. J. Brown had the best six plants, distinct varieties, of Japanese; Mr. S. P. Budd the 2d best, and Mr. G. Tucker the 3d best, and 1st in the next class for a like number of pompons.

Mr. J. E. Morris, gr. to R. B. Cator, Esq., was 1st for specimen plant (pyramidally trained) with Peter the Great, 7 feet high and nearly 5 feet through at the base; Mr. Southard, gr. to J. Brown, Esq., was 2d, with the same variety; and Mr. Silcox 3d, and 1st for a similarly-trained plant of pompon; Mr. Jolly being 2d.

Mr. James Lee, gr. to T. M. Miller, Esq., was 1st in class 8 with Mrs. G. Rundle (which also received the 2 guinea prize which was offered for the best plant in the show grown by amateurs); equal 2d, Mr. Morris and Mr. A. A. Walters showing Peter the Great and Mrs. Dixon respectively.

In the class for three incurved and three Japanese, combining best foliage and bloom with most natural growth, there was only one lot put up by Mr. W. J. Brown, who was awarded 1st place.

Primulas were shown largely and well in the class for twenty plants (one in each pot), six dark and six light, single—1st, Mrs. Walker; 2d, Mr. H. Lord; and Mrs. Home was 3d, all showing large, well-flowered plants of a very good strain.

Five plants, any colour, single, Mr. T. M. Miller was 1st; Mr. Jeron Murch 2d, and Mr. H. Bennett 3d.

Mrs. Home was 1st for four plants of double-flowered Primulas; and Mr. T. Jolly, 2d.

For six ornamental foliage plants, distinct varieties, Mr. W. C. Drummond was 1st; Mr. J. W. Mould, gr. to E. E. Bryant, Esq.; 2d; and Mr. H. Mardon was 3d, all showing well; and in the class for four plants of a like description, Mr. M. Miller was 1st, Mr. J. Murch 2d, and Mr. R. B. Cator 3d.

Mr. Hawkins, gr. to Thomas Jolly, Esq., had the best single specimen stove or greenhouse plant in a fully well flowered plant of *Eichans amanzica*; Mr. Mould had the 2d best showing *Lapageria rosea*, trained ball-ooon-shape, and Mr. G. Tucker, the 3d best, with *Rondeletia speciosa*.

In the class for three standard Chrysanthemums, distinct—1st, Mr. S. P. Budd; 2d, Mr. W. J. Brown; 3d, Mr. T. Jolly.

Mr. Cator had the best six plants, dissimilar varieties, for conservatory decoration; 2d, Mr. E. Silcox; 3d, Mr. Jolly, all showing well.

The class for the best group of Chrysanthemums brought out a capital competition, the plants, foliage, and flowers, being alike fresh and good. 1st, Mr. Gay, gr. to L. Daubeny, Esq.; Mr. Cator being a capital 2d, and Mr. Budd a good 3d—a Certificate of Merit being awarded to Mr. A. A. Walters group.

The three prizes for six plants of Poinsettias, brought out dwarf creditably grown plants—1st, Mr. S. Tredwell; 2d, Mr. F. Tagart; 3d, Mr. J. Baily.

For a collection of plants arranged for effect on a space not less than 10 feet by 4 feet, Messrs. George Cooling & Son, Bath were 1st, with a neatly arranged collection of choice plants, including Orchids, Bouvardias, Crotons, Drecaenas, Ferns, &c. Mr. Drummond was a capital 2d, and Mr. Miller a good 3d.

The two prizes which were offered for the best twelve plants of Cyclamen brought out some nice plants. 1st, Mr. A. A. Walters; 2d, Mr. G. Garaway; and a Certificate of Merit being awarded to Mr. W. S. Ashman. There were three 2d, and six 3d plants each of Bouvardias staged. 1st, Mr. G. Garaway, with nice bushy plants of Alfred Neuner, B. Hogarth, B. jasminiflora, B. The Bride, &c.; 2d, Mr. Miller—all showing capital plants, well flowered. The last-named exhibitor had the best six plants for table decoration.

CUT FLOWERS.

In the class for twenty-four blooms of large-flowered Chrysanthemums, exclusive of Anemone and Japanese, not less than twelve distinct varieties, Mr. W. Cook, gr. to J. Taylor, Esq., was placed 1st, with a very good stand; 2d, Mr. F. Tagart, and Mr. W. Iggulden, gr. to the Earl of Cork, Marlton House, Frome, was a good 3d. In the class for 12 plants in this stand was awarded the National Chrysanthemum Society's Silver Medal for the best bloom in the show. A Certificate of Merit was awarded to Mr. J. Marshall for his stand.

Mr. L. Daubeny had the best stand of twelve distinct varieties, and Mr. R. Richards the 2d best, only two lots being staged.

Mr. H. Waite was 1st for six varieties, Messrs J. Baily and Budd being 2d and 3d in that order, all showing well.

Messrs. F. Hooper, G. Hooper, and Jolly were 1st, 2d, and 3d in the order in which their names appear, for twelve bunches of pompons.

In the class for twelve blooms, Anemone-flowered, in not less than six varieties, Mr. E. Cole, gr. to W. Pettick, Esq., was 1st; Mr. Tagart and Mr. H. Derham being 2d and 3d respectively. In the class for twelve incurved plants of Japanese Mr. Iggulden was a good 1st, Mr. F. Tagart and Mr. J. Marshall being 2d and 3d. Eight lots were staged in this class. In the following class for twelve incurved blooms, in four distinct colours, Messrs. James Taylor, J. Marshall, and H. Derham, secured the prizes in that order.

DRESSED VASES AND BOUQUETS.

These were admirably shown, being composed of tastefully arranged choice flowers. For the best-dressed vase or epergne for table decoration, Mr. E. T. Hill took 1st prize with a light, graceful stand. Mr. G. Garaway had 2d, and Mr. Nash, gr. to the Duke of Devon, H. Mould the 3d best, and Mr. E. Cole the 3d best, all with good arrangements.

FRUIT.

The show of fruit, as regards both quantity and quality, an excellent one.

Grapes.—For four bunches of Grapes, not less than two varieties, Mr. Nash, gr. to the Duke of Beaufort, Badminton House, Chippenham, was 1st, showing good, well-finished bunches of Black Alicante and Muscat of Alexandria; Mr. W. Taylor, gr. to James Chiffin, Esq., Bath, was a good 2d; and Mr. H. Carpenter, Bath, was 3d. In the class for four bunches of fruit, one medium-sized compact bunches of Black Alicante, Mr. W. Taylor being 2d, with smaller and less compact, though better coloured, bunches; 3d, Mr. B. Chedze, gr. to W. Duck, Esq., for larger but badly-finished examples of the same variety. Eight lots were staged. Mr. J. Elliott, gr. to H. W. Tagwell, Esq., had the best three bunches of white Grapes, showing nice bunches of Muscat of Alexandria; Mr. H. W. Shelton, gr. to W. K. Waite, Esq., and Mr. H. Carpenter being 2d and 3d with the same variety.

Apples.—For four collections of six varieties of dessert fruit (Pine excluded) staged. Here Mr. Nash was once more to the front, showing three bunches of Alicante, and a like number of Muscat of Alexandria, both being good in bunch, berry, and finish; Golden Gem Melon, and Apple Honeycrisp were commendable. Pear, and a good dish of Meclars, Mr. Iggulden was a good 2d,

and Mr. Baister, gr. to H. S. Vincent Ames, Esq., was 3d. Four collections were put up.

Apples were well represented, as also were Pears. In the class for six varieties of the former (dessert), six fruits of each, there were eleven lots put up, the 1st prize going to Mr. George Hall for good even dishes; Mr. G. Garaway was a good 2d, and Mr. E. Hall 3d. Out of fourteen lots of four dishes each Mr. W. Ery had the best.

Mr. A. J. Biss was 1st for eight fruits of one variety (ripe); Mr. F. Ford was 2d, and Colonel Grant 3d, fourteen dishes being shown.

In the class for six varieties, culinary, six fruit of each, there were ten lots put up, the 1st prize falling to Mr. W. Webber, Messrs. Smith and Hallett being 2d and 3d; and in the corresponding class for six fruits of one variety Mr. Bass, gr. to Mrs. Hall, was 1st. Thirty-two dishes were shown.

There were three classes devoted to Pears. In the 1st class, for six varieties, four fruits of each, Mr. W. John Smith was 1st, for ripe, clean, even fruit; 2d, Mr. E. Smith, whose best dish was *Beurre Diet*; 3d, Mr. E. Hall. Eleven lots were staged.

In the next class, for four varieties, four fruits of each, Mr. H. Lord was 1st, Mr. A. T. Hall 2d.

VEGETABLES.

Three good collections of nine varieties were put up by Messrs. G. Garaway, T. Ery, and W. Tyler, who took the prizes in that order. The 1st prize collection contained some extra good Telegraph Cucumbers, Tomatos, and Carrots.

MAIDENHEAD CHRYSANTHEMUM :

November 11 and 12.

THE annual exhibition of this local Society took place on the above dates. Although the third occasion on which a show has been held this is the first time that any prizes have been awarded to the exhibitors. Having met with every encouragement in the previous attempt, to establish a Chrysanthemum show the committee and secretary felt emboldened by their efforts, and in their schedule several substantial prizes were offered for this season. This is a most commendable system to adopt, and is preferable to launching forth with a flourish of trumpets and high prizes in the first instance, often resulting in a balance on the wrong side. The committee have every reason to be satisfied with their labours so far, their mode of procedure being worthy of imitation.

For groups of plants, quality and effect combined, Mr. Owen, Boyne Hill Nurseries, Maidenhead, staged an admirable collection, chiefly consisting of Japanese kinds. The notable features of this group were the fine blooms, the varied colours, and the remarkably dwarf and sturdy character of the plants; Mr. Elliott, gr. to J. Herbert, Esq., coming 2d, with an effective group which would have been improved had a little more thinning of the blooms been practised.

Mr. Hopkins, gr. to J. W. Barrows, Esq., took all three of the premier awards for specimen plants (incurved, reflexed, and Japanese).

Cut bloom classes.—Mr. Elliott was the strongest competitor, taking 1st for twelve incurved kinds with a very even set. For twelve Japanese the same grower stood 1st with fine blooms, likewise with incurved varieties. In each case Mr. Sharrett, gr. to Miss Harrison, Maidenhead Thicket, was a very close competitor with fine flowers.

The amateur exhibitors are to be congratulated on the fine blooms that were staged by a few of the best growers, they being evidently well-up in Chrysanthemum culture. Mr. Hance and Mr. Arrowsmith were the most successful.

A class devoted to the ladies, for the best-arranged basket, with the option of using other foliage in combination therewith, produced some lively competition, Miss Temple, of Braywick Lodge, taking the 1st prize, with a very pleasing arrangement, some tinted Yucca leaves being worked in with good effect.

The Black Grape class brought out two grand bunches, splendidly ordered, of Gros Colmar, from Mr. Lockie, gr. to Lord Fitzgerald, Oakley Court, to which the 1st prize was awarded. Mr. Furham, gr. to H. J. Smoaks, Esq., Reading, being 2d, and Mrs. H. Hopkins, gr. to Mrs. Dowse, of two good bunches of Lady Downe's, from Mr. Hopkins.

Other fruits were shown in considerable numbers, consisting of the various Apples, Pears, &c., now in season. *J. H.*

READING CHRYSANTHEMUM :

November 13.

IT should be noted that this is a distinct exhibition from those held by the Reading Horticultural Society. It is carried out by an independent committee, Mr. R. D. Catchpool being the Hon. Secretary and Manager. This is the second show, and took place in the two halls of the new Municipal buildings. It was a very large show, plants, flowers, and fruit alike being of a high order of merit, and there was a keen competition in all the leading classes.

PLANTS—GROUPS.

The best collection of Chrysanthemums occupying a space of 50 feet, brought as many as seven competitors, the best coming from Mr. Baskett, gr. to W. J. Palmer, showing Reading, Mr. Furham, gr. to H. J. Smoaks, Esq., Reading, being 2d, two others being placed equal 3d, and two equal 4th, so good were they. The plants were well grown, and the quality of the flowers decidedly high.

Specimen plants.—The best six, excluding Japanese, came from Mr. Fawcay, gr. to C. Stephens, Esq., Wood-

ley; Mr. Booker, gr. to R. Tomkins, Esq., being 2d; they were generally well grown and flowered, and consisted of varieties usually grown as specimens. Mr. Powell, gr. to W. G. Gilligan, Esq., had the best three plants; J. Franklin, gr. to F. A. Lucas, Esq., Sonning being 2d. Mr. Booker had the best good plants of Japanese varieties, Mr. Hermon, gr. to F. Skurray, Esq., being 2d. Mr. Evey had the best three, Mr. Surman being 2d, both with well grown and flowered specimens. Mr. Booker also had the best three and the best specimen standard varieties, Messrs. Surman and Neighbour taking 2d prizes. Mr. Booker was the only exhibitor of three specimens; Mr. Powell being 1st with three, and Mr. Evey with a single specimen.

CUT BLOOMS.

These were numerous and very fine, the best stands coming very close to each other in point of merit. The best eighteen incurred blooms came from Mr. Neville, gr. to F. W. Flight, Esq., Twyford; 2d, Mr. W. Wildemore, The Gardens, Heckfield Place, Winchfield, with an admirable lot of flowers, almost equal with Mr. Neville's in point of merit; 3d, Mr. Pope, gr. to the Earl of Carnarvon, Highclere.

The best twelve blooms were from Mr. Strong, Wellington College, gr. to H. E. Venet, 1st; 2d, Mr. Holdaway, gr. to Major May, Basingstoke; 3d, Mr. Baskett. Mr. Kendall, Reehampton, had the best six, which comprised very fine blooms; 2d, Mr. Jennings, Farnborough; 3d, Mr. Farham.

The reflexed varieties were finely shown by Messrs. Neville and Wildsmith, the 1st prize going to the first-named. Mr. Wildsmith had an excellent lot of blooms also. In the class for six blooms they were so indifferently shown that the two leading prizes were withheld.

Wildemore-flowered Chrysanthemums were in excellent form also. Mr. Wildsmith had the best six. Mr. Kendall being 2d, and Mr. Elliott, Maidenhead, 3d.

Mr. Kendall had the best six bunches of pompons, shown in trusses; J. Mr. Wildsmith being 2d, and Mr. Jennings the best six. Mr. Neighbour being 2d.

Japanese Chrysanthemums were finely shown, as was most numerous. Four of the stands of twelve varieties came very close together. Mr. Holdaway was 1st; 2d, Mr. Neville; equal 3d, Messrs. Wildsmith and Baskett; while two extra prizes were also awarded. Mr. Jennings had the best six. Mr. Neighbour being 2d.

The best bouquet of Chrysanthemums was shown by Mr. Phippen, Horist, Reading; 1st, Mr. Balchio, gr. to B. Simonds, Esq., Reading, being 2d; and Mr. Elliott 3d. Mr. Balchio was the only exhibitor of a vase of Chrysanthemums, which was awarded a 1st prize.

Messrs. Phillips of Reading had the best stand of cut flowers, and also that of flowers and foliage. Mr. Neville had the best six Roses, Mr. Trauter coming in 2d.

Miscellaneous plants included Chinese Primroses, Violets, Cyclamens, table plants, Bougainvillae, Poinsettias, bearded plants, &c., all of which helped the general effect.

CHESHUNT CHRYSANTHEMUMS:

November 13 and 14.

ONE of the youngest amongst Chrysanthemum societies, and one of which much is hoped, is that started at Cheshunt last year, and that held its second exhibition at St. Mary's Hall, Cheshunt, on the above dates. This hopeful agency is assisted by the fact that, whereas last year at the opening display trade help was deemed a necessity, this year such help has been entirely dispensed with, nevertheless a very full and meritorious exhibition was secured. Groups of plants arranged for effect occupied the vantage ground of a stage erected at the extreme end of the hall—other specimens being arranged at the corners and around, the cut blooms, collections of fruit, vegetables, &c., occupying three long tables throughout the entire length of the building.

The two prizes offered for the best managed group of plants, quality of specimens, and the most complete and warmly contested, were to be taken into effect, were so indifferently shown that the two leading prizes were withheld.

The best group of miscellaneous plants, the 1st prize for which was won by W. G. Rowlett, Esq., was a deservedly popular one, the winner by his mixture of Roman Hyacinths, Ferns, Cypripis, Uræceæ, and other flowering plants, having made a very pretty display.

For six distinct varieties, large flowered, Robert Ewing, Esq., received 1st prize; W. G. Rowlett, Esq., 2d.

Messrs. Crocker and Horner won 1st and 2d prizes for Primulas, in the order here given, the plants of the latter being of fine growth and finish, yet wanting in variety.

An extremely fine plant of Adiantum, grown in an Orchid-pot, shown by W. G. Rowlett, Esq., received an extra prize.

The class for twenty-four cut blooms, twelve incurred severe competition. Robert Ewing Esq. (gr. J. Billesworth), was awarded 1st prize, showing splendid blooms; J. Pringle, Esq., Pousborne, was 2d.

In the succeeding class, six reflexed and six Anemone, large-flowered, the former two exhibitors won, maintaining each his former position. Mr. Ewing being 1st, and J. Pringle, Mr. Ewing taking 2d prize.

Six large-flowered Anemone found Messrs. E. Horner and J. Warren equal 1st, the latter exhibitor winning 1st prize for six bunches of pompons.

Mr. S. Not, Albany House, was 1st for twelve Japanese, showing very good blooms; Mr. E. Horner and Mr.

Powlett being respectively 1st and 2d with six blooms incurred; the same exhibitors being similarly bracketed for six Japanese, distinct.

For four incurred, four Japanese and four Anemone, Mr. R. Ewing, Barton Grange, was an excellent 1st, the latter also staged a large collection of seventy fine blooms, which were highly commended; and those from E. Caldecott, Esq., Ingaestone, consisting of six Japanese and six incurred, were also highly commended.

For a vase a good display. Very fine Grapes and Apples from Mr. Warren secured for him 1st prizes, and Mr. Ewing won also 1st prize for Pears.

The display of vegetables by cottagers deserves a word of praise. W. E.

ASCOT, SUNNINGHILL, and DISTRICT HORTICULTURAL: November 11.

THIS was the second exhibition of Chrysanthemums held by the Society, and it took place in one of the large dining-rooms in the rear of the grand stand at Ascot. It was a charming show, flowers and plants being very good indeed, while the fruit classes were well filled. We can only say that a few of the leading features, but it must be admitted the exhibition did great credit to the Chrysanthemum growers of the district.

In the class for a group of Chrysanthemums in pots, shown in the form of bays, there was a very good and keen competition. The 1st prize going to Mr. Lane, gr. to Miss T. D. Smith, King's Ride, Ascot, with an admirable lot of plants well grouped; Mr. Savage, gr. to Baron Huddleston, Ascot, coming 2d, and Mr. G. Read, gr. to A. Magniac, Esq., Ascot, being 3d. There were, in seven groups, and prizes were awarded to six of them. There were several other classes for plants in pots, but while creditable to the district, they did not rank so high in value as the cut blooms, to which a little more attention is given.

A class for the best group of miscellaneous plants, staged and greenhouse arranged for effect, brought a superb group from Mr. Bant, gr. to J. C. Bowring, Esq., Sunningdale, far away the best of its kind shown, and worthy of the highest commendation.

The best eighteen cut blooms of incurred Chrysanthemums came from Mr. Page, gr. to A. Southard, King's Ruckle, who had excellent examples of both old and new kinds; 2d, Mr. Saunders, gr. to the Hon. A. Ponsonby, Ascot, with a lot only just inferior to the foregoing.

Mr. Lane had the best twelve blooms, showing remarkably fine blooms. In the class for six varieties there was a good competition and excellent flowers. Mr. Lane had the best six flowers of one variety, staging very fine examples of Lord Alester, and one of these was selected as the best flower in the room. Next in point of merit was staging capital flowers.

In the classes for twelve and six blooms of Japanese there was a large competition; the best twelve came from Mr. Page, Mr. Saunders being 2d. The flowers were large and finely developed.

A fine collection of Chrysanthemums in pots, margined with Bouvardias, Ferns, &c., was staged by Messrs. J. Standish & Co., Royal Nurseries, Ascot, and highly commended, as also was a fine lot of cut blooms of Chrysanthemums shown by Colonel Mallock, of Bagshot.

FRUIT.

The best two bunches of black Grapes were Cooper's Black, shown by Mr. Wells, gr. to R. Ravenhill, Esq., Bracknell; Mr. Sinclair, gr. to Colonel Campbell, Windsor Park, being 2d with good examples of Black Hamburgh. Mr. Sinclair had the best white Grapes, showing well finished examples of Muscat of Alexandria. Mr. Wells had the best four dishes of Pears, amongst them Osage Beurré, a good-looking American kind; and Mr. Hughes, gr. to H. F. de Paravicini, Esq., Ascot, was 3d.

The best four dishes of Apples came from Mr. H. Gough, gr. to H. C. Rothey, Esq., Ribston, Wincoburn, who had excellent fruits; 2d, Mr. Sinclair; and Mr. Wells was 3d.

Messrs. Sutton & Sons, Reading, offered prizes for the best six dishes of vegetables, the leading prize going to Mr. Hughes, for a very fine lot.

Huddersfield Chrysanthemum.

THE second annual exhibition was held in the Town Hall, Huddersfield, on Friday and Saturday, November 14 and 15, and was in every way thorough and successful. Though this Society is but of very recent formation, the committee of management have every reason to be pleased with their present venture, and are encouraged to hope for even better things, for when once an interest in horticulture is created, it is surprising how the possibility of establishing a good society and show in this town, are constrained to become subscribers, and in a very short time will enter the lists as competitors.

With a very liberal schedule, there being 10 classes for 1st, 2d, 3d, 4th, 5th, and 6th prizes, and a 7th value, it will be seen there was something to induce strenuous efforts being made.

In the open class for forty-eight varieties, distinct, twenty-four Japanese and twenty-four incurred, Mr. W. Cox was 1st, Mr. W. H. Walker, Esq., Liverpool, was the only exhibitor, his stands were of a splendid order, just such as we look for from gardeners in that district. Mr. Cox was 1st with twenty-four varieties, distinct,

twelve Japanese and twelve incurred; Mr. F. Stokes, gr. to Mrs. C. Crossland, was 2d.

In the class for twenty-four, confined to local growers, Mr. W. Daniels, gr. to Mrs. Hague Cook, was well to the front. This exhibitor was most successful, taking 1st prizes in most cases. The 2d fell to Mr. Chambers, gr. to J. Vickerman, Esq., whose stand was very meritorious; 3d was taken by Mr. H. Walker. With twelve blooms Mr. Daniels was 1st, equal 2d being awarded to Mr. J. Nettleton and Mr. W. Chambers, the 3d to Mr. J. Smith.

In the class for twelve incurred blooms two stands were disqualified, the judges considering that the blooms under the name of Empress of India and White Globe were the same thing, viz., Empress of India.

With six incurred Mr. Daniels was 1st, Mr. A. E. Stott coming 2d, while six Japanese, and six reflexed and six pompons, the 1st prizes in each case fell to Mr. Daniels.

Three fine groups of plants in flower were arranged in three half circles in a space containing 54 square feet; these were just in front of the orchestra, were very creditable and much admired. The 1st prize group, to which a beautiful impiece was awarded, was staged by Mr. J. Hatch, gr. to J. F. Brigg, Esq. Here every plant was in the best of health and condition, foliage good, well developed, and fine coloured and well averaged. The 2d was staged by Mr. T. Carter, gr. to A. Hurst, Esq.; the 3d by Mr. H. Walker, gr. to Mrs. G. Crowther. These two latter ones were good, but a long way inferior to the 1st prize group.

For three specimen plants, incurred, Mr. Hatch was 1st, with Lord Alecster, Empress of India, and Golden Empress; Mr. Chambers being 2d. The latter exhibitor was 1st with three Japanese, showing James Salter, Lady Selborne, and Margot, in very fine form; Mr. Green was 3d.

With three pompons Mr. Green came in 1st, Mr. Chambers 2d.

Some good plants of Bouvardias, 2 feet high and well covered with bloom, were shown by Mr. Chambers, and were placed 1st, the falling to Mr. W. Bulb. Mr. Chambers was also placed 1st with good plants of Poinsettias, and also for three pots of Roman Hyacinths; Mr. Bubb and Mr. Daniels coming in 2d and 3d in this latter class.

There were many plants of Chinese Primulas, for the most part well done. The 1st prize was taken by Mr. Denham; 2d, by Mr. T. Carter; and 3d by Mr. H. Walker.

Mr. Bubb was the only exhibitor with three pots of Calanthes, and was awarded 1st.

There were good stands of twelve trusses of stove and greenhouse cut flowers. Mr. Chambers was placed 1st, Mr. Stevenson 2d, and Mr. Tindle 3d. Capital trusses of bright greenhouse Rhododendrons, Lagereria rosea and L. alba, Eucharis, Amaryllis, Abutilons, &c., were present in these collections.

Mr. F. Stokes was 1st with three Ferns, among which was a fine plant of Cibotium Baromet; Mr. Daniels was 2d, and Mr. H. Walker 3d.

Some very good bouquets were shown. Mr. Lamprey being 1st, Mr. J. F. Sharp 2d, and Mr. J. Bubb 3d. The Mignonette and good plants of Eucharis amazonica were also shown, whilst Epiphyllums were staged by several exhibitors, Mr. W. Daniels coming in 1st.

A small quantity of fruit was shown, which was not of a very high quality.

There was a good display of table plants, neat, light, and useful, suitable for the purpose. Mr. W. Daniels was 1st, with six; Mr. Chambers 2d, and Mr. J. Stokes 3d.

The committee and Honorary Secretary, Mr. John Bell, have much cause to be gratified with their success and the establishing of their position. W. S.

CHRYSANTHEMUMS AT THE EXETER NURSERY.

MESSRS. LUCOMBE, PINCE & CO.'s annual show of spring flowers in March is always one of considerable interest to the horticultural public, as is testified by the multitude of admirers who flock thither, and it seems that their autumn show of Chrysanthemums is destined for similar honour. Devonshire is often characterised as "the garden of England," and Devonians are most essentially a garden-loving people; perhaps this trait of character is particularly distinguishable in the neighbourhood of Exeter—a fact supported by the many well-kept gardens and greenhouses to be met with there. *Propos* Messrs. Lucombe, Pince & Co. are fortunate in this respect, for it is highly encouraging to promoters of horticulture, as well as other shows, to be freely patronised by visitors. Albeit their Chrysanthemum shows of former years have been very good, yet this season's display eclipses any previous one—not so much in point of number as in quality and improved varieties. About 500 specimens are to be seen, and these are arranged in a beautifully coloured bank, the front row being composed principally of the dwarf pompon flowered sorts, and the unbroken mass of flowers and foliage rising gradually to 7 and 8 feet in the back row. W. N.

CYCADS IN FLOWER AT KEW.

THE magnificent collection of Cycads at Kew is second only in importance and nobleness of form to the rich collection of Palms cultivated in those gardens, chiefly in the Palm-house. Popularly these two orders—Palms and Cycads—are considered to be closely related; indeed, many people call the commoner garden Cycads Palms, but there is a very wide botanical difference between the two, much wider than between Palms and Pandanus. In early days even botanists were puzzled as to the proper relationship of Cycads, some classing them along with the Palms, whilst others, relying upon the habit and form of their foliage, ranked them with Tree Ferns! If, however, we glance at the character of the inflorescence of the Cycads we see at once that they must be affixed to Conifera, and in the structure of the stem they are evidently Dicotyledons. So near is the relationship between Cycads and Conifers that they can only be distinguished from each other by their habit and leaf characters. In the Kew collection there are now a good number of Cycads bearing their cone-like inflorescences, and to any one interested in these strange yet noble foliage plants these flowering specimens will be specially attractive. As in some genera of Conifera, viz., Ginkgo, Araucaria, &c., the Cycads have their male and female flowers on separate plants, and there is often a wide difference between the form and size of the cones of the two sexes—a difference which often extends to the habit of the whole plant. The kinds now in flower, that is, bearing cones, at Kew, are *Encephalartos villosus*, a beautiful, arching-leaved plant, with rather large shining pinnae, the leaves all springing from a short stout stem (see fig., p. 181, vol. xiii., 1880). The cone is on the top of the stem, and is erect, 1½ foot long by 6 inches wide at the base, gradually narrowing to a pointed top, and composed of a great many closely set fleshy scales, on the undersides of which are the large nut-like fruits. As the cone ripens it turns from green to bright yellow, the scales open out, and reveal the deep orange seeds. The ornamental character of these cones when ripe is very attractive. It is remarkable that although the female flowers are not fertilised, yet the seeds grow to full size and maturity; they are, however, devoid of embryo, and, of course, are, therefore, useless for propagation. *Zamia mexicana* is represented by a large specimen bearing two male cones, and a magnificent plant with a very fine female cone. Nothing can surpass this female plant in the nobleness and grace of its great, feather-like leaves, which are 10 feet long, beautifully arched and twisted, the pinnae being long and pointed, smooth, shining green, and arranged regularly all along the midrib. It bears a cone 15 inches long by about 6 inches in diameter, which is made up of thick, closely set, fleshy scales, arranged exactly one over the other, not in a spiral, as in the *Encephalartos* and *Macrozamia*; each scale is hexagonal in front, with a ridge across the middle, upon which are two spiny horns. Small plants of *Zamia muricata*, *Z. Skinneri*, and *Z. Miqueliana* are also in flower, the cones in these being small and pale brown, except in the last-mentioned, which has the face of the scales broad, two-horned, and coloured olive-green, mottled with brown. A splendid plant of *Encephalartos Altensteinii*, the most striking perhaps in the whole collection, is now bearing two very fine cones, each nearly 2 feet in length, by 6 inches wide at the base, upright, or nearly so, and composed of hundreds of rather narrow, pointed scales, which have separated, and allowed the dust-like waxy pollen to fall out and cover the whole of the heart of the plant. It is impossible to give by mere words a satisfactory description of this noble specimen (see fig., p. 392, vol. vi., 1876); it stands 8 feet high, the leaves springing from a stemless trunk, each leaf over 6 feet long, the spread of the foliage being about 12 feet through. Two large plants of *E. caffer* are bearing cones, which are 18 inches long by 7 inches wide, and pale brown in colour. An interesting plant, now coming for the first time we believe at Kew, is a female specimen of *E. horridus*. It has glaucous rigid spine-clothed leaves, and the cone is about a foot long and 6 inches wide, the scales being broad faced, grey, and arranged in a spiral.

A large plant of *Cycas Rumphii*, with a thick stem 6 feet high, bears a stout cone 1 foot in length and 4 inches wide, its colour being yellowish-brown. There appears to be little difference between this specimen and plants labelled *C. cirinalis*. It is only

in very large stoves where room can be afforded these plants to grow into large specimens that their noble character is properly developed. The appearance of the Palm-house at Kew would fall a long way short of its present beauty were the Cycads removed. On a shelf in the same house is a rich collection of the smaller species of this order. It is only in botanical collections that the numerous kinds of Cycads could reasonably be found room for, as for garden purposes many of them are very similar to each other. There are, however, a good many species among such genera as *Cycas*, *Zamia*, and *Macrozamia*, which are well worthy the attention of gardeners, as they are very graceful in form, often dwarf, and of useful size for decorative purposes, and they are at least as well able to withstand rough usage as are many of the Palms. With very few exceptions all the Cycads are easily grown; they require the temperature of a stove or a warm greenhouse, and whilst some of them, such as the *Zamias* and *Cycases*, thrive best when kept moist and shaded from bright sunshine, others, such as *Encephalartos*, are perfectly at home in a dry atmosphere and full sunlight. H.

FRUIT NOTES.

WALL FRUIT ON A WOODEN FENCE.—From the fact that the choicer kinds of wall fruit are seldom grown on a board fence it would appear that there is some doubt as to their success. In the southern parts of the country even the choicer Peaches and Nectarines may thus be grown. A half-inch deal weather-board tarred fence forms the boundary of my garden. It is 6 feet 6 inches high, with strong oaken posts 8 feet apart. On this I have grown during the past summer some fine highly-coloured Nectarines, Victoria and Fine-apple, and there is plenty of well-ripened shoots showing prominent double and triple buds as a promise for next year. In addition to the Nectarines there were some remarkably fine Plums—Pond's Seedling, Goliath, and Coe's Golden Drop. Between the trees Tomatos bore a great crop. Low wooden fences of the kind described would be serviceable in many ways and especially for the finer kinds of Pears, such as Pitaston Duchess, Glou Morceau, Marie Louise, and Easter Beurré. For Pears and Plums, however, the wooden walls might be double and stand east and west. For these match-boarding might be used nailed to the front of 4-inch posts, and the hollow space filled in with sawdust. It would be easy to protect the blooms from spring frosts by a movable projecting coping. T. W., Harrow.

BEURRÉ ROME GAUJARD.

This is a seedling from Beurré de Jonghe, raised by M. Gaujard, jun., and by him dedicated to his father. It is figured and described in the *Bulletin d'Arboriculture* for August, from which we take the following particulars:—"The fruit is of medium size, pyriform, skin brownish-green, passing into rust-coloured, and ultimately yellow. The flesh is white, firm, melting, and slightly perfumed. Season, January and February."

PRINCESS AND MARY PEARS.

By an error these two Pears were written as one on p. 553, under the name of Princess Mary. Both are good Pears, but Princess is the harder and at the same time the better variety. Both also produce handsome brightly coloured fruit, abundantly freckled. For a small bush on the Quince, or a cordon, few Pears will be found better than Durandean. A more prolific Pear, trained in these ways, I do not know. As a bush on the same stock Autumn Nelis and Beurré d'Arcemberg are full-flavoured and good yielders. A large very hardy sort for an cast wall may be mentioned in Doyenne Boussoch. It was omitted in the first list because the quality was very so-so—at least, in the soil in which we had it growing. C. A. M. C.

GROS COLMAR GRAPE.

Two remarkably fine bunches of this kind were shown by Mr. Lockie from Lord Fitzgerald's garden at the annual exhibition of the Maidenhead Chrysanthemum Society last week. They were coloured as black as Sloes, with berries of an extra size even for this big-berried kind. The bunches, too, were of large dimensions, therefore in keeping with size of berries. It would be interesting to growers of this

Grape who do not succeed in its culture if Mr. Lockie would record his mode of procedure to attain such satisfactory results. J. Hudson.

BEURRÉ CLAIRGEAU PEAR.

The quality of this Beurré deserves all Mr. Tonks' strictures, albeit I have heard good words spoken of it by Devonshire growers. It, however, has its great and special value; for if any conclusion can be generally valid in Pear culture, it is one of the best varieties extant on which to graft others. C. A. M. C.

—May I say that I think Mr. Edmund Tonks is a great deal too hard upon this Pear in your last impression? It is a favourite of favourites with me in its own line. I grant that Dr. Hogg only gives it third-class honours in point of quality, by which I suppose flavour is meant. But it comes so nearly to a second-class even in this respect, that with others it very often takes a higher grade than he has accorded to it. It, moreover, should be noted that Beurré Clairgeau is most variable in its performances, and I do not think Mr. Tonks would have much to complain of if he had a good specimen brought to him. But, surely, something more than flavour may be considered. I care as much for the gratification of my eyes as for that of my palate in everything which comes out of a garden—and if you want to have a most glorious sight in the autumn months, I commend to you a large pyramid tree laden from top to bottom with Beurré Clairgeau Pears, and whose branches are quite bent down to the ground by the weight they have to carry. The colour of this Pear is to my eyes splendid in the extreme—a sort of pale yellow, with russet-brown, over which there come patches of the most gorgeous vermilion—and is most attractive to look at. The tree quite glows in the sun on a bright October day; and if the fruit had only the flavour of a Potato I would grow it still for the beauty of the picture which it presents. It may be added, that these trees bear so well with me—far better than others I have—that I am sure the produce of a single tree would be worth ten shillings at one of the fruiterers in Hyde, if I cared to dispose of it. Taking their average flavour, extreme beauty of the tree itself, unbounded fertility, into consideration, I think Beurré Clairgeau should never be put out of court, but should be met with more frequently than it is. I append two opinions, which may count for something about this matter. André le Roy says, in his *Dictionnaire de Pomologie*, "This Pear is a great bearer. The fruit has a white flesh, which is melting, juicy, and not very gritty, the aroma being agreeable and delicate. It is very variable, however, as regards both shape and quality; although sometimes second-rate, it is generally first-class." In Scott's *Orchardist* I find the following statements:—"It forms a handsome pyramid either on the Pear or Quince stock, and bears so much, that its limits as a grower are circumscribed by its fertility. This is a very variable Pear in size, quality, form, and time of maturity. The fruit sometimes weigh 1½ lb., or more." He speaks of the flavour as second-rate, though sometimes of high excellence. H. Evbank, Ryde.

EIGHT DAYS IN THE GARDEN OF ENGLAND.

(Continued from p. 619.)

IVYBRIDGE AND THE SOUTH HAMS.—The following morning found us *en route* for Ivybridge by rail. The line runs through a lovely district of wooded valleys, verdant slopes by winding upland streams, rocks red and grey, mines worked by water and so but little disfiguring the landscape, and distant views of the moorland. Passing the picturesque confluence of the Walkham with the Tavy, the beauties of this class of scenery culminate about Horrabridge and Bickleigh. At the latter point the mass of granite known as Wigford Down, projecting like a peninsula into the Devonian slates, over which it towers in the crag known as the Dewerstone, and altering their mineral condition along the well-marked line of junction at Shaugh Hill, recalled the tradition of the ghostly pack of "swish" hounds that erst swept over the hills in their nightly hunt—thoughts soon dispelled by the sight of the outlying modern earthworks to the north of Plymouth. Milky streams, flowing between broad tilted wastes of chalk-like sediment, telling of the "kaolin," or porcelain-clay, that results from the weathering of the moorland granite, are not delightful, and we were glad, on

leaving Mutley, an uninviting suburb of the great port, to climb the steep incline that soon brought us into the picturesque valley of the Erme. This we had an opportunity of examining by stopping for an hour or two at Ivybridge, where the railway crosses the river-valley by a lofty wooden viaduct rising from stone piers. Here the river, tumbling over huge boulders through a wooded glen, would have been perfectly charming, but for the thriving paper-mill on one side and the unattractive town on the other; and, even with these drawbacks, the single arch with its leafy covering to which the place owes its name, is decidedly picturesque. Below it is a weir, mainly natural, formed of huge ledges of live rock, dipping at high angles northwards, &c., up stream. The slate in this neighbourhood has been altered by the intrusive granite into a "spotted," or "chistoille" schist. Just south of the railway station is a very fine specimen of *Cupressus macrocarpa*, the stem of which is nearly 18 inches through. Finding but little beauty in the dismantled but modern church, its yet more modern substitute, or the town generally, after a comfortable meal at the London Hotel, where there is a very respectable garden, we left for Kingsbridge Road. Getting a good view of the south side of the moor, and crossing several fine viaducts over the streams that flow from it, we reached that uninteresting station, from which, in order to reach the south coast, one has to take a coach-drive of 10 miles. Ten miles, up and down hill, through deep lanes, with banks hung with Hart's-tongue, and hedgerows laden with Nuts, traversing clean, well-cultivated arable land, ignorant of frost—for miles, moreover, behind a good team, and for the very moderate fare of 2s., is far from disagreeable. Near the somewhat dismal village of Laddiswell we caught glimpses of the bold promontory of Bolt Head, and of the channel to the south-west of it, where the fine tower of the mother-church of Kingsbridge at Churchstowe stands well up on the horizon. Passing the historic gardens of Combe Royal, which we decided on visiting on the morrow, we rattled into the neat little town of Kingsbridge. Piazzas, like those of Totnes, with a queer octagonal clock above the town-hall, and steep streets down to the quay at the head of the beautiful Salcombe estuary, give the place a quaint interest of its own. The fine parish church possesses two of the finest "squints" or "hagioscopes" I have seen, reminding me of those at Sere in Surrey, and besides a good old octagonal granite font, holy-water stoup, and piscina, boasts of a magnificent wooden screen and a marble bas-relief by Flaxman. The comfortable hostelry opposite, the "King's Arms," the starting point of coaches to Dartmouth, as well as to Kingsbridge Road, has a large garden, with extensive vineries and orangeries; but here, as elsewhere, we noticed that under glass the Orange tribe suffer from a disease, apparently fungal, producing black smuttness upon the leaves. On our way to the quay our attention was attracted by a fine Magnolia, well loaded with bloom, this season having seemingly been very favourable to them, and not here only, for we have since seen one at Starch Green, Hammersmith, in equally good condition. *G. S. Douglas.*

(To be continued.)

The Rosery.

CLIMBING OR WEEPING ROSES AS STANDARDS.

STANDARD ROSES have not been received with great favour during recent years. The reason of this is perhaps not far to seek. In the first place they have not had justice done them, even when received in good condition, but they are not always received in good condition, especially those that are purchased at sales—they are kept too long out of the ground, and even when they are planted they are placed in such a position that the chances of their producing, even a few good flowers, is very problematical. It is safe to say that the largest proportion of standard roses for sale in the nurseries are hybrid perpetuals, but then a very large proportion of them are not at all adapted for this system of culture; they do not form good heads, even with the most skillful management, and after three or four years they do not even produce good flowers. In a great many instances the culture is at fault. Even if the plants have good

roots, with healthy fibres, they are placed in circumstances where they have to struggle for their food under the most adverse circumstances. It seems to be the right thing to plant a double row of standards from the front gate to the front row of hundreds of villa residences in the neighbourhood of London. In some cases the work of planting is well done, in other it is performed in the most perfunctory manner. A hole is dug out in the hard, unworked, natural soil of the place, scarcely large enough to hold the roots, the earth is thrown back upon them, and the turf is replaced close up to the stem of the unfortunate Rose. I do not recommend planting standards of hybrid perpetual roses at all, but if they are to be planted, some arrangement must be made to give the roots a chance to grow freely, and some suitable compost must be provided if the ground is not naturally adapted to the growth of roses. Although I have nothing to say in favour of growing some classes of roses as standards, there are some roses that may be grown in that way with the most pleasing results. Thirty or forty years ago standard roses were frequently to be seen with tall stems from 5 to 6 feet high; indeed, I have a vivid recollection of a towering specimen of the crimson Boursault Amadis with a stem 8 or 9 feet high, in the nursery where I was an apprentice. Some of these gigantic specimens would form a compact head 20 feet or more in circumference. Such specimens form objects of great beauty on a lawn. They are striking features in the landscape, and can well be admired in detail, while a profusion of beautiful roses can be selected from them as cut flowers. The late Mr. Thos. Rivers, of Sawbridgeworth, wrote the first article in the first volume of *The Florist*, on climbing standard roses. His words on this subject are well worth quoting:—"Some six years since, having some rose stocks 5 or 6 feet high, and stout as broom-handles, I was induced to try what effect some of the beautiful varieties of *Rosa sempervirens* would have if budded on them, as I had some latent idea that they would form very graceful pedunculous trees; I accordingly selected from that family a few of its most interesting varieties. These trees are, in the blooming season, pictures; not a shoot has ever been touched with the pruning knife, there is consequently no formality. Their beauty consists in their gracefulness and rusticity, which is quite refreshing in contrast to the closely pruned heads of the finer varieties of standard roses." The varieties cultivated by Mr. Rivers were Banksiaeflora, very double pure white flowers, with straw-coloured centres; Donna Marie, very double, pure white; Félicité Perpetuelle, creamy white, tinted pink on the outside: "I really is perfect enjoyment to see this Rose, in a balmy morning in June, covered with its flowery gems, more numerous than its leaves." Myrianthes, pink, flowers abundantly; Princess Louise, pale pink; Princess Marie. Most of these are white and pink varieties, but the crimson Boursault flowers early, and is dark in colour; so also is Boursault inermis. Mr. W. Paul, of Paul's nurseries, Waltham Cross, recommends Virginia Rambler, Ruge, Flora, Félicité Perpetuelle, Gracilis, Reine Marie Henriette, Maréchal Niel, and Réve d'Or, for tall standards, such as I have described. One thing ought to be borne in mind—they do not require much pruning. Mr. Rivers remarked of the plants described by him, "not a shoot has ever been touched by a pruning knife." They certainly do not require more in the way of pruning than to cut out any useless wood when the trees are too much crowded with branches. I like also to see the trees well balanced, and in order to have them in this form it may be necessary to lay the foundation for it in the first and second year of the tree's growth. If this is not done the head might all hang to one side instead of growing equally all round. The cultural requirements are simple enough. The Brier Rose grows almost anywhere, and in all kinds of soil, but with the greatest luxuriance and stability in clayey loam. Many gardens do not possess this inestimable boon to Rose growers. A light shallow and gravelly soil is the very worst kind for roses, and to obtain the very best results when a garden is composed of this material a round hole should be dug out, 2 feet wide and 2 feet deep, and be filled up 3 or 4 inches above the surface with some good clayey loam which has been enriched with a fourth part of decayed stable manure. If the roses can be obtained they ought to be planted in November, but many persons in the country can obtain such stout, tall Brier stems better

than the nurserymen can; and in most old gardens these beautiful climbing roses can be found rambling in wild luxuriance over old walls, or trained loosely to the walls, or over the porches of the dwelling-houses. Many of these roses are quite as vigorous as the common Bramble, and might be usefully employed in taking the place of Nettles and other noxious weeds in out-of-the-way corners. When once established on their own roots they can take care of themselves. I alluded to obtaining the Briers from hedgerows and wild places. In that case they ought to be planted where they are intended permanently to remain, and planted too with as much care as if they were rose trees. Budding standards is a much more pleasant occupation than stooping down and performing the same operation on dwarfs. Jigs is the best month in which to bud roses. *J. Douglas.*

Nov. 12.—Very dull day.
13.—Very dull day.
14.—Very dull day; rain in afternoon.
15.—Very fine day and night.
16.—Very fine day and night.
17.—Very fine day and night.
18.—Very fine day and night; lunar halo.

LONDON: Atmospheric Pressure.—During the week ending November 14, the reading of the barometer at the level of the sea decreased from 30.35 inches at the beginning of the week to 30.28 inches by 1 P.M. on the 8th, increased to 30.32 inches by 5 P.M. on the same day, decreased to 30.30 inches by 1 P.M. on the 9th, increased to 30.32 inches by 9 A.M., decreased to 30.31 inches by 1 P.M., increased to 30.32 inches by 5 P.M. on the 10th, decreased to 29.67 inches by 1 P.M. on the 14th, and was 29.70 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.16 inches, being 0.12 inch higher than last week, and 0.19 inch higher than the average of the week.

Temperature.—The highest temperature in the shade in the week was 48°.2, on the 13th; on the 11th the highest temperature was 44°.2. The mean of the seven high day temperatures was 46°.

The lowest temperature was 31°.9, on the 8th, on the 14th the lowest temperature was 43°. The mean of the seven low night temperatures was 40°.1.

The greatest range of temperature in one day was 13°.1, on the 8th; the smallest, on the 9th and 12th, was 3°.5. The mean of the seven daily ranges was 5°.9.

The mean temperatures were, on the 8th, 32°.4; on the 9th, 43°; on the 10th, 44°.4; on the 11th, 42°; on the 12th, 42°; on the 13th, 44°.5; and on the 14th, 44°.3; of these the 10th, 13th and 14th were above their averages by 1°, 1°.8 and 1°.8 respectively, the rest were below by 4°.9, 0°.9, 1°.2, and 0°.9 respectively.

The mean temperature of the week was 42°.8, being 1°.3 lower than last week, and 0°.5 below the average of the week.

The highest reading of a thermometer with black-

ened bulb in vacuo placed in the full rays of the sun, was 51°.5, on the 13th. The mean of the seven readings was 47°.4.

The lowest reading of a minimum thermometer placed on grass was 23°.8, on the 8th. The mean of the seven readings was 38°.

Rain.—Rain fell on four days, to the amount of 0.29 inch.

ENGLAND: Temperature.—During the week ending November 14, the highest temperatures were 55° at Plymouth, 54° at Truro and Leeds; the highest at Cambridge was 45°.8, at Bristol 47°.8, at Bolton, 47°.9. The general mean was 50°.7.

The lowest temperatures were 29° at Cambridge, 30°.6 at Liverpool, 31°.9 at Blackheath; the lowest at Plymouth was 41°.8, at Truro and Leeds 40°. The general mean was 36°.3.

The greatest ranges were 18°.5 at Liverpool, 17° at Sheffield, 16°.8 at Cambridge; the least ranges were 8°.6 at Bristol, 11°.3 at Nottingham, 12° at Sunderland. The general mean was 14°.4.

The mean of the seven high day temperatures was highest at Truro, 52°.4, at Plymouth 51°.3, at Leeds, 48°.5, and was lowest at Bolton, 44°, at Cambridge, 44°.8, at Wolverhampton 45°.6. The general mean was 46°.9.

The mean of the seven low night temperatures was highest at Truro, 45°.4, at Plymouth 44°.3, at Leeds 42°.4; and was lowest at Wolverhampton, 38°.4, at Bolton 38°.5, at Sheffield 38°.8. The general mean was 40°.9.

The mean daily range was greatest at Hull, 8°.4, at Wolverhampton 7°.2, at Truro and Plymouth 7°, and was least at Bristol and Sunderland, 4°.6, at Nottingham 5°. The general mean was 6°.

The mean temperature was highest at Truro, 48°.5, at Plymouth 47°.4, at Leeds 45°, and was lowest at Bolton, 40°.7, at Cambridge 41°.4, at Wolverhampton 41°.5. The general mean was 43°.4.

Rain.—The largest falls were 0.49 inch at Sunderland, 0.29 inch at Blackheath, 0.28 inch at Cambridge; the smallest falls were 0.01 inch at Leeds, 0.04 inch at Bradford, and 0.05 inch at Bristol and Preston. The general mean fall was 0.15 inch.

SCOTLAND: Temperature.—During the week ending November 14, the highest temperature was 57°.6 at Edinburgh; at Dundee the highest temperature was 50°.9. The general mean was 54°.1.

The lowest temperature in the week was 30°.5, at Glasgow; the lowest temperature at Greenock was 39°. The general mean was 34°.3.

The mean temperature was highest at Greenock, 44°.7; and lowest at Dundee, 42°.5. The general mean was 43°.7.

Rain.—The largest fall was 0.17 inch, at Paisley; the smallest fall was 0.07 inch, at Aberdeen. The general mean fall was 0.13 inch.

JAMES GLAISHER. F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, November 16, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W. 1.—The weather was unusually gloomy during the greater part of the period, with a good deal of mist or fog, and in some places drizzling rain. Towards the end of the week, however, the conditions had undergone a change, and, after a general fall of rain, fine bright weather had become prevalent.

The temperature has been about equal to the mean in "England, S.," but below in all other districts, the deficit varying from 1° to 2° in most parts of the kingdom to 3° in "England, N.W.," and 4° in "Scotland, E." The maxima, which were generally registered on the 13th, varied between 45° and 54°. The minima were recorded on the 16th, when the thermometer fell to 20° in "Scotland, E.," "England, N.W.," and "Ireland, N.," and to between 22° and 30° in all other districts except the "Channel Islands," where the lowest reading was 37°. During the earlier part of the week the diurnal range was extremely small, that at Oxford on the 12th being only half a degree.

Rainfall has been considerably less than the mean in all districts. Bright sunshine was altogether absent in most parts of the kingdom till the period drew towards its close, when a rather high percentage

was recorded. The percentage of the possible duration for the week ranged from 9 in "Scotland, N.," and "England, N.E." to 25 in Ireland, and 34 in the Channel Islands.

Depressions observed.—The general distribution of pressure during this period was anticyclonic, and the only depression which appeared in our neighbourhood was a rather large one which travelled east-north-eastwards over the northern part of our area during the 13th. Until the approach of this disturbance light easterly airs were experienced in the south and east, and moderate southerly breezes in the west and north, but under its influence the wind over our islands became south-westerly to westerly, and subsequently moderate from the northward. Owing to the rapid recovery of pressure which took place in the rear of the depression the distribution at the close of the period was again anticyclonic, and on our extreme south-west coasts a moderate to strong easterly gale prevailed.

Obituary.

ALEXANDER FORSYTH.—Last week we briefly recorded the decease of Mr. Alexander Forsyth, who had reached a good old age, having exceeded the allotted three score and ten years. For some time past he had been in failing health. Thus has passed away another of the practical gardeners of the old school; one, moreover, who had been a very successful practitioner in his day, having occupied with credit some prominent positions in the gardening world, as well as gained for himself an honourable name in connection with the literature of horticulture. His gardening fame carries us back some few decades, for between forty and fifty years ago he was appointed to the charge of the gardens at Alderley Park, Cheshire, the seat of Lord Stanley of Alderley. Subsequently he became gardener to the Earl of Shrewsbury, at his princely establishment—Alton Towers, Staffordshire. Besides filling these and other situations of importance, Mr. Forsyth had been a constant and frequent contributor to the pages of this journal from its commencement up to a very recent period, and his name is appended to many a cultural essay both in *London's Gardeners' Magazine* and in the later volumes of the *Florist and Pomologist*. Among other topics of interest contributed to our pages we may mention his persistent advocacy of Holly-leaf tea, and his strong recommendation of the compact undeveloped inflorescence of the Rhuibar plant as an excellent, "the pouches of unopened flowers," he argued, "bearing the same relation to the leaves of Rhuibar that Cauliflowers do to Cabbage leaves." For this purpose the Rhuibar was directed to be grown in rich ground, so to get large masses of tender flower-buds, the removal of which would, of course, be beneficial to plants grown also for a supply of the leaf-stalks. Mr. Forsyth died on the 8th inst., in his seventy-sixth year. Of late years Mr. Forsyth resided at Salford, near Manchester, where we believe he held some official position.

MR. SAMUEL WALTERS.—The death of this gentleman, an old inhabitant of Hilperton, Wiltshire, occurred on Wednesday, the 11th inst. He was for many years an ardent lover of flowers, and when quite young abandoned the trade in which he had been brought up, and devoted himself entirely to the pursuits of a florist. Tulips, Ranunculuses, Auriculas, Polyanthuses, Dahlias, and other flowers, were grown by him with great success, the Dahlia remaining to the last one of his prime favourites. He will be remembered as the raiser of Dahlia Beauty of Hilperton, some twenty-five or thirty years ago. He established at Hilperton a florist's business as far back as 1830, in connection with a seed business carried on there since 1810. For about half a century he was one of the most successful exhibitors in the West of England, and for a good portion of time in London also. Owing to his sight becoming greatly impaired he gave up exhibiting some ten years ago, yet to the end he continued to derive the greatest pleasure from the cultivation of flowers. He was a remarkable illustration of a man diligent in business, and from his unvarying uprightiness he gained the esteem of all who had dealings with him. In May last he experienced a great bereavement in the loss of his wife, and he was frequently heard to say he should not long survive her. He died at a good age, after a short illness.

Answers to Correspondents.

* * OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that in pursuance of the new telegraph regulations our Registered Telegraphic Address is "GARDCHRON, LONDON," GARDCHRON being written as one word. Telegrams (but not letters) thus addressed will reach the Editor or the Publisher without other address being needed than "GARDCHRON, LONDON."

APPENDIX: NATIONAL CHRYSANTHEMUM SOCIETY, November 11 and 12. The following Certificates were awarded:—To Messrs. J. Veitch & Sons, for Japanese variety L'Adorable, a bronze-carmine variety of fine quality; to Mr. Davis, Camberwell, for the same kind and Jupiter; to Mr. Mardlin, for incured Yellow Globe, and for a hybrid pompon, Mr. Mardlin, large full flower of a pleasing colour; to Messrs. Cannell & Sons, for Japanese L'Ebouriffe; to Messrs. J. Laing, for Laing's Anemone; and to Mr. Sullivan, for Japanese Pietro Diaz.

ADDRESS: W. C. 89, Long Acre, London, W. C.

BOOK: T. Baines' Greenhouse and Stove Plants. J. Murray, 59A, Albemarle Street, Piccadilly, S.W. We do not know what is the cost of the book.

BUXTON GRAVEL.—I should recommend R. L. to spread Malmesbury gravel over his Buxton ground. It will set quite hard, would be far cheaper than cement, and would look a great deal better, the gravel being of a bright yellow colour, and free from earthy matter, it being entirely composed of grit, and it does not wash up after a thaw or heavy rain. I can recommend this gravel with confidence, and I am sure Mr. Fraser, nurseryman, Malmesbury, would be pleased to send him a sample. *Argus.*

CELINE FORESTIER: H. T. C. We spoke from our own personal experience. We have it against a west wall on a cold soil. It has been nearly killed outright in severe winters, and only in hot summers does it give any bloom worth speaking of. *Ed.*

CORRECTION: ROYAL HORTICULTURAL SOCIETY.—In our report of the last meeting the names of the exhibitors of fruits were, by an inadvertency, given instead of those of the members of the Fruit Committee.

INSECTS: A. D. W. As you have cut off the tops of the shoots of your Corsican Pines which contained the insects which have injured them, we cannot determine whether they have been attacked by the Pine weevil (*Hylurgus piniperda*) or by one of the Pine moth (*Tortrix Turtonana* or *resinana*). The only remedy is to cut off and burn the affected parts which contain the insects. *I. O. W.*

NAMES OF FRUITS: W. E. G., Junior Carlton Club. Pears, small: 1, decayed; larger: 2, Beurré Clairgeau. Apples, larger red: 1, Mère de Ménage; smaller green: 2, striped Beaufort—*Apr.* 1, Vicar of Winkfield; 2, Comte de Flandre; 3, *Ed.* 1, unrecognised—very pretty; 3, Autumn Pearmain; 4, Blenheim Orange; 5, Beauty of Kent; 6, Scorpion.—*T. W. R.* 1, Durandean; 2, Doyenné Gris; 4, Belle-sime d'Hiver; 6, Passe Colmar; 7, Hacoa's Incomparable; 9, Colmar d'Arenberg; 10, Duchesse d'Angoulême; 11, Cédille; 12, Brown Beurré; 13, Marie Louise; 15, Glou Morceau—*7. U.* 1, Empereur Alexander; 2, Golden Noble; 3, Cat's-head; 4, York-shire Greening; 5, Downton Popple; *T. Hewitt & Co.* 1, unrecognised; 2, Wadhurst Pippin; 3, Fearn's Pippin—*W. H.* 1, Colmar; 2, Flandre; 3, Ménage; 4, Rymer; 6, Alfriston.—*J. C. B.* 1, Maréchal de la Cour; 2, Passe Crassane; 3, Beurré Bosc; 4, Duchesse d'Angoulême; 5, Passe Colmar; 7, Beurré Rance; 8, Glou Morceau; Doyenné Boussouch and Beurré Superfin—numbers to these missing.—*A. L. F.* 1, Wyken; 7, Fearn's Pippin; 9, Court of Wick; 10 and 12, French Crab.—*A. M. M. Apple:* Manx Codlin. Pears: 1, Althorp Crassane; 2, Gansell's Bergamot; 3, Beurré Bachelier; 4, Passe Colmar; 5, Knight's Monarch.—*D. A.* 1, Chantonnelle; 2, Winter Crassane; 3, Beurré d'Arenberg; 4, Marie Louise.—*F. B. S.* 1, Flemish Beauty; 2, Old Crassane; 3, Tibbet's Pearmain.

NAMES OF PLANTS: Whiteberry. 1, Ligustrum ovalifolium; 2, Lathospermum officinale. The name refers to the stony seed: it is not a gall.—*Barr & Son.* Silene Schafta.—*Old Subscriber.* Specimens too incomplete. Asters can't be named with any certainty. Little pieces cut off the top: 1, probably diffusum; 2, Novae-Angliae; 4, Novi-Belgii; 8, dumosus. The other three we dare not venture upon.—*W. H.* 1, Eria alba; 2, Eria flaccida; 3, Brassia brachiata; 4, Cataeum Wallesi.

NEW PEAR: V. C. & Co. There can be no doubt as to the cropping qualities of the variety in America, but we cannot say anything in favour of its texture, which is of the coarsest, or of its flavour, which is much inferior to that of several of our autumn kinds. We have already far too many inferior kinds.

ORCHID BLOOM: Wootton. Please send a better bloom and a leaf next week.

PHYSALIS ALKIKENGI: W. Northfield. It is a hardy perennial, which may be sown in the open ground at the end of March, or not under glass somewhat earlier, and when big enough transplanted into the open border. It seeds freely, and when once obtained is rarely lost, self-sown seeds germinating every spring. It flowers from early sown plants the first season. The botanical name of the Sweet Yam is *Batatas edulis*. It is not a Solanum.

SOOLY QUA: W. Y. D. Your specimen may be true to name. It is a species of Luffia, the fibrous tissue of which is sometimes used, instead of spooqe, for baths.

THE GARDENER'S ASSISTANT: W. B. No scale is given.

WOODLICE: G. G. Trap them with little pots filled lightly with hay, turning them out into hot water every morning at daylight. Keep roads about the garden.

Markets.

COVENT GARDEN, November 19.

OUR market for best goods is very depressed, owing in a large manner to the coming elections; Grapes especially being affected. Prices all round subject to offers. James Webber, Wholesale Apple Market.

FRUIT—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit name and price per unit. Includes Apples, Kent Cobs, Lemons, Melons, Pears, Pine-apples, Raspberries, Strawberries, Currants, and Grapes.

VEGETABLES—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable name and price per unit. Includes Artichokes, Beans, Beet, Broccoli, Cabbages, Capsicums, Carrots, Cauliflowers, Celery, Coleworts, Cucumbers, Celeris, Herbs, Leeks, Lettuce, Potatoes, Mushrooms, Mustard, Onions, Parsley, Parsnips, Potatoes, Radishes, Salsify, Scorzonera, Seakale, Shallots, Spinach, Sprouts, Tomatoes, Turnips, and various other vegetables.

PLANTS IN POTS—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant name and price per dozen. Includes Aralia Sieboldii, Azalea, Begonia, Bouvardia, Cineraria, Chrysanth, Cyperus, Dracena terminalis, Geranium, Hebe, Hyacinthus, Ilex, Lili longiflora, and various other potted plants.

CUT FLOWERS—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower name and price per bunch. Includes Abutilon, Arum Lilies, Azalea, Bouvardia, Camellia, Carnations, Chrysanth, Eucharis, Geraniums, Hyacinthus, Lapageria, Ranunculus, and Lili longiflora.

SEEDS.

LONDON: Nov. 18.—All descriptions of Clover seed exhibit great firmness, but the demand is small. No supply of red seed can be expected this season, either from the United States or from Canada. Trefoil seed is now obtainable at extremely low rates. For Canary seed more money is asked, but Hemp seed continues unusually cheap. The colder weather, as might have been expected, has somewhat hardened the values of boiling Peas and Haricot Beans. Feeding Linseed is

steady. In other articles there is no quotable change. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

MARK LANE: Nov. 16.—Rather a firmer tone was evidenced in the Wheat market, and buyers showed a little more disposition to operate at previous rates, but not at any advance. Flour moved more slowly than Wheat, but maintained steady value. Maltng Barley was without notable change, but grinding sorts were the turn dealer. Beans and Peas moved off steadily at unaltered rates. Maize was 6d. higher on the week. Oats were quite 6d. above the rates of Monday last.

Nov. 18.—Business generally opened with a stronger tone, especially as to feeding stuffs, but the want of demand was still unrelieved, and the result of the day's business was disappointing, the few small sales leaving prices all round without quotable improvement.

Average prices of corn for the week ending Nov. 14:—Wheat, 31s.; Barley, 30s. 4d.; Oats, 19s. For the corresponding period last year:—Wheat, 31s. 6d.; Barley, 31s. 10d.; Oats, 19s. 1d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): Nov. 18.—Good supply of all kinds, prices moderate, demand fair. Quotations:—Peas, 3s. to 6s.; and Apples, 2s. 6d. to 5s. per bushel; Cabbages, 2s. 6d. to 4s.; and Savoys, 2s. to 4s. per tally; Carrots, 7s. to 10s. per dozen bundles; Brussels Sprouts, 4s. to 5s. per bushel; bunch greens, 4s. to 5s. per dozen bunches; Turnips, 3s. to 4s. 6d.; Carrots, 2s. 6d. to 3s. 6d.; Parsley, 1s. to 1s. 6d. 6d.; and Beetroot, 2s. 6d. to 3s. per dozen; Onions, 4s. to 5s. per cwt.; Carrots, in sacks, 2s. to 5s. per ton; white Turnips, 15s. to 60s. 6d.; Swede, 6s. to 2s. 6d. 6d.; and Mangels, 22s. 6d. to 25s. 6d.

STRAFORD: Nov. 17.—There was a good supply, and a fair trade was transacted at the following prices:—Cabbages, 3s. to 6s., per tally; Savoys, 4s. to 10s. 6d.; Cauliflowers, 8s. to 10s. 6d.; greens, bunch, 3s. to 4s. 6d.; Sprouts, 4s. to 6s. per bushel; Mangels, 22s. to 24s. per ton; Swede, 5s. to 27s. 6d.; Onions, 7s. to 10s. 6d.; Turnips, 5s. to 6s. per ton; do., bunch, 3s. to 4s. per dozen; Apples, best, 2s. to 5s. per bushel; do., common, 4s. to 5s. per cwt.; Carrots, 3s. to 4s. 6d.; Swede, 6s. to 10s., household, 4s. to 4s. 6d.

POTATOS.

BOROUGH AND SPITALFIELDS: Nov. 17.—Fair supplies and slow trade. Prices.—Regents, 70s. to 100s.; Magnum Bonums, 50s. to 85s.; Champions, 60s. to 80s.; Early Roses, 60s. to 85s.; Belgian kidneys, 70s. to 90s.; German Reds, 60s. to 70s.; Snowflakes, 50s. to 60s. per ton.

COLUMBIA (East London): Nov. 18.—Demand fair. Prices:—Regents, 60s. to 70s.; Virgians, 60s. to 65s.; Heroes, 70s. to 80s.; and Eagle of Hebrov, 70s. to 80s. per ton.

STRAFORD: Nov. 17.—Good supply and fair trade. Magnums, 50s. to 75s.; Regents, 65s. to 70s.; Champions, 50s. to 60s.; and Reading Hero, 70s. to 80s. per ton.

Imports.—The imports into London last week consisted of 325 bags 71s sacks in Stettin, 2825 bags 5 sacks from Hamburg, 2 bags from Bremen, 81 bags from Rotterdam, 2 bags from Antwerp, and 1170 bags from Ghent.

HAY.

WHITECHAPEL: Nov. 17.—Trade dull, with good supplies, and a decidedly drooping tendency in the price of Clover. The tone for hay was firm for best qualities. A more liberal supply of straw, and the top quotation barely supported. Quotations.—Clover, prime, 90s. to 100s.; inferior, 60s. to 80s. Hay, prime, 70s. to 90s.; inferior, 50s. to 67s.; and straw, 25s. to 38s. per load.

CUMBERLAND (Regent's Park): Nov. 17.—A large supply, with better demand. Prices.—Clover, best, 95s. to 102s. 6d.; second, 60s. to 90s. Hay, best, 75s. to 87s. 6d.; second, 50s. to 70s.; and straw, 30s. to 36s. per load.

CATTLE.

METROPOLITAN: Nov. 16.—Prime cattle were short this morning, and cleared more readily at rates against buyers, though hardly apparent in quotations. Middling qualities did not improve. Sheep sold more freely at late rates for wetters, and occasionally slightly better prices for ewes. No change transpired in the calf and pig trade. Quotations.—Beasts, 3s. 6d. to 4s. 6d., and 4s. 8d. to 5s. 4d.; calves, 2s. 8d. to 4s. 10d.; sheep, 3s. 10d. to 4s. 4d., and 4s. 8d. to 5s. 6d.; pigs, 4s. to 4s. 6d.

Nov. 19.—Quietness was characteristic of the trade. Beasts were a slow sale at barely Monday's prices, except for fine qualities, which were scarce. Prime sheep were fairly steady, other kinds weak. Calves were steady, and pigs dull.

COALS.

The following are the prices current at market during the week.—East Wylam, 15s. 6d.; Walls End—Hetton, 17s. 6d.; Hutton Lyons, 15s. 6d.; Tunstall, 15s. 6d.; Lambton, 17s.; Wear, 15s. 6d.

GREENHOUSE GLASS, 1 1/2d. per foot, in boxes. Suitable for Frames, Conservatories, &c. PATENT NON-POISONOUS PAINT for Greenhouses, 6d. per lb. or 42s. per cwt.—B. LAMB AND CO., Glass, Lead, Paint, and Varnish Merchants, Builders, and Decorators, Sundrymen, 8, Bucknall Street, London, W.C.

PRUNING MADE SAFE AND EASY.

Advertisement for 'THE STANDARD TREE PRUNER'. Includes an illustration of the tool and text describing its benefits for pruning trees and shrubs safely and easily.

Rhubarb and Seakale Forcing. STRONG WELL-MADE POTS for the above. Hyacinths in Pots. PATENT EXPRESSLY FOR HYACINTHS. J. MATTHEWS, of the Royal Weston-super-Mare. PRICE LIST FREE. Roshers's Garden Edging Tiles.

THE ABOVE and many other PATTERNS

are made in materials of great durability. The planter sorts are especially suited for KITCHEN GARDENS, as they have no sides or corners. Take up little room, and once put down, incur no further labour or expense.

Agents for LOOKER'S PATENT 'ACME' FRAMES, PLANT COVERS, and PROPAGATING BOXES: also for FOXLEY'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price Lists Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES,

for Conservatories, Halls, Corridors, Balconies, &c., from 3s. per square yard upwards. In extra Street of Plain or more elaborate Design, with Prices, sent for selection. WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchens, Ranges, Baths, &c. Grooves, or Italian Pavings of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles of great variety, Slates, Cement, &c. F. ROSHER and Co., Brick and Tile Merchants. See Addresses above.

SILVER SAND,

fine and coarse grades desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and BRICK BURS for Rockeries or Forests. KENT PEATS or LOAM supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above. N.B.—Orders preferred by mail to Mr. Wharves. A liberal Discount to the Trade.

JURY'S VERY OLD WHISKEYS

(IRISH and SCOTCH). "Jury" Whiskey, 5 years old, 3s. 6d. bottle; 42s. dozen. "Special Jury" Whiskey, 7 years old, 4s. bottle; 48s. dozen. "Grand Jury" Whiskey, 20 years old, 6s. bottle; 72s. dozen. So confident is Mr. Jury of the excellence of his Whiskeys that he will pay the carriage upon all orders from Great Britain to any part of the United Kingdom upon receipt of remittance.

THE VERY BEST DRESS GOODS direct from our **OWN MILLS** at **WHOLESALE PRICES**, thus avoiding **any intermediate profits whatever.**

At the BRADFORD TECHNICAL EXHIBITION, opened by H.R.H. the Princess of Wales, and in FACE of the KEENEST LOCAL and UNIVERSAL COMPETITION, HENRY PEASE AND CO.'S SUCCESSORS obtained THE ONLY GOLD MEDAL awarded by THE CLOTHWORKERS' COMPANY, London, which was the HIGHEST HONOUR any Manufacturer could obtain.

Unlike so-called MANUFACTURING COMPANIES, who buy of good, bad, and indifferent Manufacturers to sell again as their own, and at ordinary retail prices, the goods of HENRY PEASE AND CO.'S SUCCESSORS are of their own manufacture, direct from the sheep's back to that of the wearer, and every process is completed within their own factories.

HENRY PEASE AND CO.'S SUCCESSORS are thus enabled to warrant the WEAR and QUALITY of every yard, and to Sell at Prices which cannot be approached by any firm offering goods under what is often fallaciously termed "direct from the producer to the purchaser."

DARLINGTON

OUR MANUFACTURES have had 133 years' reputation, have GAINED SIX PRIZE MEDALS, and are made from the SAME YARN as goods supplied to H.R.H. the PRINCESS OF WALES. They are the best made. 3500 people are engaged in their production.

WARRANTED TO WEAR AND ALWAYS LOOK WELL

Ladies are invited to send for Patterns (and Illustrated Circular) from any part of the World, who they will immediately receive a complete set POST-FREE. Purchases of £1 and upwards, Carriage Paid. Address:—

PUBLISHING OFFICE AND OFFICE FOR ADVERTISEMENTS, 41, Wellington Street, Strand, London, W.C.

Oil Paint no Longer Necessary. HILL and SMITH'S BLACK VARNISH, for Painting Wood, or Stone. (Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or in 2d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 21, 1876.—Sirs, I have this day forwarded from Chestnut to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chestnut—1 am, Sirs, yours respectfully, WM. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years, and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL and SMITH, Brickley Hill Works, Staffordshire; 125, Queen Victoria Street, London, E.C.; and 73, Elmbank Street, Glasgow.

BUY ONLY ENGLISH WATCHES.

BENSON'S NEW PATENT (No. 4658) "MID-AIR" WATCH, has obtained the Highest Award of Gold Medal at the Inventions Exhibition, 1885

SILVER, £5 5s. GOLD, £12 12s.

The "Ludgate Watch" is a Silver ENGLISH Lever, of my best London make, with "Special Strength" Three-quarter Plate Movement.

These do not fluctuate in radius—true Chronometer balance—adjusted for extremes with damp and dust-proof patent ring-band and extended barrel—massive sterling silver case case with crystal glass front, which combines the strength of the Hunter with the convenience of the Open Face Watch—Winds, set hands and opens at back.

The immense superiority in Value, Accuracy, and Durability of the "Ludgate" Watch to Swiss and American (made in imitation of and sold as English) and to the Old Full-plate English Lever (still sold by other makers), from the great defects of which the "Ludgate" is exempt—is proved by the Award of a GOLD MEDAL—the only one adjudged to English Watches.

The "Ludgate" is of better quality and value than any £5 watch hitherto made. The "Ludgate" is my best London make—strong, handsome, and reliable—will stand the hardest wear and roughest usage, and is therefore the best watch for Home, Indian, and Colonial wear by Gardeners (No. 1, large size), Woodmen, and Strangers (No. 2, as sketch), Gentlemen, Officers, and Men in H.M. services, Yachts and Boats' (No. 3, small), will be sent, free and safe at my risk, to all parts of the world, for £5 5s. or in 18-carat Gold, crystal glass case, Two Guineas (No. 3 size).

A remittance by P.O. Draft, or Cash, must accompany Order. SPECIALLY NOTED that J. W. BENSON is the only Maker of Three-quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through any other Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. An Illustrated and Priced Book explaining the advantages of the Watch and the Full-plate English Watches sold by all other makers, will be sent Post-free on application to

J. W. BENSON, Watchmaker to Her Majesty the Queen, The Steam Factory, 62 and 64, Ludgate Hill, E.C.

And 25, Old Bond Street, W. London. Consequently upon the award of the GOLD MEDAL, the demand, always great, has so increased as to necessitate more extensive Machinery, which now enables us to execute all orders for the "Ludgate" Watch without delay. Illustrated Catalogues of Watches, from £5 to £500, Gold and Silver Jewellery, Clocks (House, Chamber, and Table), Electroplate and Musical Boxes, free on application.

Nurserymen to Working Foremen with £200.

PARTNERSHIP Management in a going concern.—PROVINCIAL, Mr. Newton, 39, Mark Lane, London, E.C.

WANTED, a young man, as UNDER GARDENER and COWMAN, and to look after Poultry. Apply to F. B. BAKER, Esq., later. — D. N. DRUCE, 29, Upper Thames Street, London, E.C.

Fruit Tree Foreman

WANTED, an experienced and thoroughly practical MAN, to take charge of the Fruit Tree Department. Every encouragement given to a really good man in any branch of the trade. — JAMES DICKSON and SONS, Newton Nurseries, Chester.

WANTED, a young man, as PROPAGATOR, under General Foreman. Would be engaged principally amongst Climbing Plants. Experience in these, especially Clematis, indispensable. Must be steady, obliging, and industrious. To such a man the situation in question would be a permanent, progressive, and comfortable one.—Apply, stating age, experience, where acquired, and wages expected, to T. T. GARDENERS' Chronicle Office, 41, Wellington Street, Strand, W.C.

WANTED, ORCHID HAND, in a large establishment, where Orchids are very extensively grown.—a young man as No. 2. One in the trade preferred.—J. R. W. BARWELL, Potter, & Co., 10, Abchurch Lane, London, E.C.

WANTED, a young MAN, about 25, to work in the Houses and Outbuildings, as well as in the Rose Culture. State wages; lodging found.—A. BROWN, The Gardens, Easing Park, Godalming.

WANTED, a respectable young man, as SECOND ASSISTANT in a Show Conservatory. Must be well up in Cut Flower, Bouquet, and Wreath Work, and have a knowledge of Plants, Bulbs, Seeds, &c.—Apply stating age, experience, and wages expected, to R. J. WOOD, The Nurseries, Haverstock Hill, N.W.

THE LIVERPOOL HORTICULTURAL CO. (John Cowan, Limited, The Vineyard and Nurseries, Garston, R. QUIRK for one of their Liverpool Florist Establishments, a young LADY of good business ability. Must be a competent hand at Making Bouquets, Wreaths, &c.—Apply, giving reference, stating salary expected, to the MANAGER.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS or GARDENERS. JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

RICHARD SMITH and CO. beg to announce that they are constantly receiving Applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

TO LANDED PROPRIETORS, &c.—A. McNEVRY (late of Victoria Park) is now at liberty to undertake the formation and design of New Gardens and Park Grounds, and Resting existing Gardens. Plans prepared. 115, Listeria Park, Stamford Hill, N.

SCOTCH GARDENERS.—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

GARDENER (HEAD), where three or more are kept.—A GENTLEMAN desires to recommend a Head Gardener to any one requiring a practical and reliable man.—A. A. D., 41, Wellington Street, Strand, W.C.

GARDENER (HEAD), where four or more are kept.—First-class excellent personal character, trustworthy and economical.—Apply to the Misses TYRRELL, 12, Elm Park Gardens, S.W. (James Thomas, widower, one daughter).

GARDENER (HEAD).—GEORGE SMITH, for fifteen years Head Gardener to John Rylands, Esq., Longford Hall, Stretford, near Manchester, is open to treat with any Nobleman or Gentleman who may be requiring the services of a qualified Gardener. First-class references.—Address as above.

GARDENER (HEAD) to any Lady, Nobleman, or Gentleman, requiring the services of a thoroughly practical trustworthy man. Can be very highly recommended by Nobleman and Gentleman, as a first-class man of twenty years' experience in Growing all kinds of Flowers, Fruit, and Vegetables; also the keeping of same in thorough good order. Highest testimonials.—R. P., Sharnbrook, Bedford.

GARDENER (HEAD WORKING).—Age 26; total abstainer. Twelve years' good practical experience in all branches. First-class references.—H. TULL, The Gardens, Killydrays, Sandown, Isle of Wight.

GARDENER (HEAD WORKING), where several are kept.—Age 42, married, no family; thoroughly understands his duties; good character.—B., 81, Junction Road, London, S.

Orchid Grower.

GARDENER (HEAD or SINGLE-HANDED).—Skillful Grape, Fine Peach, and Orchard Grower. Living-out Pleasure Grounds. Eighteen years' character.—WILLIAM HENDERSON, 94, Jamaica Street, Bristol.

GARDENER (SINGLE-HANDED, or otherwise).—Age 29; used to Houses, Lawn and Kitchen Garden. Good character.—J. A., 16, Mableton Place, Euston Road, London, N.W.

GARDENER (SINGLE-HANDED), or otherwise).—Age 33, married, one child.—A GENTLEMAN wishes to hire his services, as he is relatively well qualified to part with him to reduce his expenses.—Mr. W. NEWTON, Gould's Grove, Benson, Oxon.

GARDENER (UNDER), Inside or Out.—Age 30, married; good references.—T. S., 77, Tower Hamlets Road, Forest Gate, Essex, E.

FOREMAN; age 29.—Mr. THOS. HEDLEY, Gardener to Colonel Sowerby, Putteridge Park, Luton, Beds., can confidently recommend his late Foreman, who has been with him in the capacity five years, as a trustworthy and thoroughly competent man in all branches of gardening. Accommodated to Table Decorations, Bouquets, &c.

FOREMAN, in a good establishment.—Age 25; experienced in all branches. Two years' Foreman in present situation. Can be well recommended by present and previous employers.—E. J. SMITH, The Gardens, Goldcliff Hall, Nonesuch, Warwickshire!

FOREMAN (WORKING).—Thoroughly understands the Cultivation of Draecenas, Eucharis, Ferns, Palms, Ficus, and other Exotic Plants in quantity, Bouquets, Solanums, Cinerarias, and Primulas. Good references.—R. W., Longland's Nursery, Sidcup.

NURSEY FOREMAN, PROPAGATOR, or FLORAL DECORATOR.—Nine years in last situation as above. Excellent testimonials.—G. W., 45, Bute Street, Kemp Town, Brighton.

FOREMAN PROPAGATOR, or MANAGER of a Small Nursery.—Twenty-three years' experience in Stone and Greenhouse Plants in quantity, Bouquets, Wreaths, Crosses, &c.—T. S., Broom Edge, Norton, Staffordshire.

To Nurserymen.

PROPAGATOR or GROWER (INDOOR).—Age 23; over seven years' experience. Good references.—JOHN WINSER, Post-office, Plummers' Place, Holborn, S.W.

PROPAGATOR (SECOND), or SECOND GARDENER.—Thirteen years' good character.—W. BATCHELER, High Street, Hampton Wick.

JOURNEYMAN, Outside or Inside.—Age 22; six years' experience. Son of a Scotch Gardener. Good reference. Abstainer.—GARDENER, St. Helena's, Booterstown, Dublin.

JOURNEYMAN, Inside or Out.—Age 23; seven years' experience under Glass. Good character.—A. W. G., Mex Eggham, near Staines.

JOURNEYMAN, Inside or Out.—Age 21; good character. Six years' experience.—F. J. ADAMS, Kitton Hill Farm, Preston Lane, North Shields, Northumberland.

TO GARDENERS, &c.—Wanted by a youth (age 18) a situation as Third or Fourth in a Nobleman's or Gentleman's Garden. Has had two years' experience in two Outdoors.—T. BELCHER, Highgate, London, W. Wanted.

TO GARDENERS.—A youth (age 18) wants a situation in a Nobleman's Garden. Over three years' experience in Gardening. Well recommended.—G. F., 54, Pembroke Road, Kensington, W.

TO MARKET NURSEYMEN.—An active young man is in search of a situation in a Market Nursery. Quick at Fitting, Tying, and Watering. Excellent references for eleven years' experience.—J. S., 18, Barrow Hill Road, St. John's Wood, N.W.

TO NURSEYMEN, SEEDSMEN, and FLORISTS.—A young man (age 27) desires permanent situation in a Nursery, Seed, or Florist's Establishment in place of trust. Six and a half years' practical experience in all branches of the business.—AMES SIMPSON, Peter Lawson & Son (Limited), Edinburgh.

TRAVELLER, MANAGER, or HEAD SHOPMAN.—Many years' experience, and thoroughly up in every department of the Seed Trade. Fair knowledge of Plants.—ALPHA, 99, Craven Street, Birkenhead.

SEED TRADE.—Advertiser is open for re-engagement, either as MANAGER, SHOPMAN, or any other good position. Best references.—C. B., Gardeners' Chronicle Office, 41, Wellington Street, Strand, London, W.C.

TO THE SEED TRADE.—Situation wanted by a young man (age 26) with good references and eleven years' experience. Could enter upon engagement at once.—S. M., Highgate Hill, N.W., Houndsditch, London, E.

SHOPMAN (HEAD), or MANAGER.—Thorough practical knowledge of the Trade in all its branches, acquired during a twenty years' experience in London and Provincial Wholesale and Retail Houses. Careful and accurate in all matters of business detail.—J. GEORGE, Messrs. Scott & Co., Yeovil.

S H P M A N (HEAD).—Age 36; in the eighteen years' experience in Retail Seed Trade, with partial knowledge of Nursery Business in general. Good Correspondent.—F. B., 10, Child's Street, East's Court, Kensington, S.W.

SHOPMAN.—Twelve years' experience.—First-class references.—H. K., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN.—Fourteen years' experience; thorough knowledge of the Trade; could take Management of Business. First-class references.—S. A., Hurst & Son, 159, Houndsditch, E.

HOLLOWAY'S OINTMENT and PILLS.—Coughs, Influenza.—The soothing properties of these medicaments render them well worthy of trial in all diseases of the respiratory organs. In common Colds and Influenza, the Pills, taken internally, and the Ointment rubbed over the chest and throat, are exceedingly efficacious. When Influenza is endemic, this treatment is especially beneficial. The Pills purify the blood, remove all obstacles to its free circulation through the lungs, relieve the over-gorged air vessels, and render the patient fit to receive the action of the strength, irritating the nerves, or depressing the spirits; such are the ready means of escaping from suffering when afflicted with Colds, Coughs, Bronchitis, and other Chest Complaints, by which the health of so many is seriously and permanently injured in most countries.

HOT-WATER VALVE
MANUFACTURERS, &c.

GOLD MEDAL, HEALTH EXHIBITION.

WHEATLEYS PATENT.

The above is an illustration of our NEW PATENT THROTTLE VALVE, the advantages of which are shown in sections below.

BEST AND MOST COMPACT THROTTLE VALVE in the MARKET.

Prices:—2-inch. 3-inch. 4-inch.
8s. 3d. 10s. 12s. 6d.

Should this Valve be left unworked for a lengthened period and be found tightly wedged, by simply unscrewing the Lower Nut, or Spindle, the wing will be released and can then be readily turned at pleasure and the Nut reightened.

No violence is therefore needed, and the Valve should never be broken.

For renewal or cleaning the Wing and Cover can be removed, as shown above.

Beck's Patent Horizontal Screw-down Hot-water Valves

Are Manufactured at the above Address only, and the Name of the Firm is Cast on each.

NEW APPLES.

SEPTEMBER BEAUTY.

First-class Certificates from the Royal Horticultural Society and at the Crystal Palace, 1885.

This is one of the handsomest, richest-flavoured, and most digestible mid-season dessert Apples, having the full Ribston flavor, but precedes that delicious Apple, and is bairdier and more fertile.

6s. and 7s. 6d. each.

THE DARTMOUTH CRAB.

The largest, best, and most distinct of all the Crabs, and one of the handsomest fruits in cultivation, being of a beautiful crimson-scarlet colour, coated with a rich bloom, and carried on a long stalk. The fruit resembles an enlarged Victoria Plum, and the tree laden with fruit is most attractive.

This Crab, which ripens early, is not acid, but if eaten at the ripening point is equal to a first-rate summer Apple.

3s. 6d. and 5s. each.

PURPLE CATALPA.

Now offered for the first time.
 RAISER'S DESCRIPTION.—The purple-leaved Catalpa is constant in this:—The tree grows constantly from early Spring to October frosts. There are four pairs of the young leaves (terminal), are always an intensely metallic purple. The older leaves are of dark-purple to deep green. The original tree is about 18 feet high; every branch has a terminal crown of dark-purple leaves all the time from April to October. The mature leaves are 20 to 28 inches diameter either way. Small Plants, 1 to 2 feet high, 10s. 6d.; larger, 2 to 3 feet, 4s. 12.
 H. WATERER, Importer and Exporter of Plants and Bulbs, 56 N., 38th Street, Philadelphia, U.S.A.

FOREST TREES

One of the largest stocks in Europe; quality unsurpassed; prices favourable to buyers; trees hardy; roots abundant.

Catalogues and all information on application.

LITTLE & BALLANTYNE,
 BY SPECIAL WARRANT
 Nurserymen and Seedsmen to the Queen, and Wood Foresters to the Crown,
CARLISLE.

SPECIAL OFFER OF WELL-GROWN STOCK.

- 6,000 FRUIT TREES, mostly Pyramids and Standards, consisting of best sorts, APPLES, PEARS, PLUMS, and CHERRIES.
- 15,000 GOSEBERRIES, mostly Warrington; also some Red and Black CURRANTS.
- 60,000 ASPARAGUS and SEAKALE; the forcing Seakale is fine.
- 10,000 LAURELS, including rotundifolia and caucasicum.
- 20,000 IVIES, mostly small leaved.
- 5,000 TREE BOX.
- 5,000 POPLARS, LIMES, THORNS, CHESTNUTS.

And for Special Quotations, &c., apply to
HARRISON & SONS,
 NURSERYMEN and SEED GROWERS,
 LEICESTER.

ROSES.

- 20 Acres of grand plants in best varieties.
- BUSHES, H.P., 8s. per dozen, 60s. } Packing and Carriage
 100. } FREE
 STANDARDS, H.P., 15s. per dozen, } for Cash with Order.
 30s. per 100.
- CLEMATIS (80,000), 12s. to 25s. per dozen.
- ROSES, in Pots (80,000), 15s. to 35s. per dozen.
- FRUIT TREES (74 Acres).
- VINES (6000), 3s. 6d. to 10s. 6d.
- ORCHARD HOUSE TREES, "Fruiting," in Pots.
- STRAWBERRIES, 4s. per 100; Forcing, 15s. to 25s. per 100.
- ASPARAGUS, 5s. 6d. per 100; Forcing, 12s. 6d. per 100.
- SEAKALE, strong Forcing, 16s. per 100.
- EYEGREENS, CONIFERS ORNAMENTAL TREES (12 Acres).
- FLOWERING SHRUBS, 6s. per dozen.
- FOREST TREES, HEDGE PLANTS UNDERWOOD, &c.

BULBS
 Of Finest Quality.

RICHARD SMITH & CO.,
 WORCESTER,

THE
Gardeners' Chronicle.

SATURDAY, NOVEMBER 28, 1885.

THE RAISING OF HARDY FRUITS.

I HAVE read with much pleasure Mr. Ingram's interesting article (p. 589) on raising new varieties of Pears and Apples from seed, and am delighted to see that one occupying his distinguished position as a horticulturist and a writer has leisure to devote his talents to such a praiseworthy and interesting pursuit.

The floral favourites of this generation will probably be all but forgotten in the next, but the raiser of really good Apples may reasonably hope that his productions may, like the Ribston and Golden Pippins, and the old Pearmain, survive and occupy positions of honour among Apples centuries hence. I know that many gardeners view the introduction of new fruits with mistrust and aversion, on the ground that too many varieties exist already.

I readily admit that far too many kinds of Apples are grown, and would gladly see a liberal weeding out of inferior varieties, but at the same time I would be sorry to think that our British Apples were capable of no further improvement, for even the best of them fail to meet the requirements of the times, and in many of our markets are practically excluded by American varieties. Some maintain that this is as it should be; that ours is not a fruit-growing country; and that it is hopeless for fruit growers here to try to compete with the large, fine, and highly-coloured fruit, which is supplied in such large quantities from America. I do not take this view of the matter. Though a genuine free-trader, and glad to see a plentiful supply of good fruit, from whatever source obtained, brought within reach of the people; still, I think that we should not resignedly accept the present state of matters as inevitable, but should endeavour by every means in our power to improve our home-grown fruits, not only by careful selection of existing varieties and proper modes of cultivation, but by endeavouring to raise new and improved kinds. Further, I see no reason to doubt but that persistent, earnest, and well-directed efforts on the part of British fruit raisers may result in a race of Apples suited to our climate, and in no respect inferior to the best American fruit.

We have sorts that attain the largest size, we have varieties that excel the best American Apples in flavour, we have sorts of handsome and regular outline; many of our varieties cannot be surpassed as bearers, while there are not a few that put on the richest colour even far north in Scotland. Now, in the hands of enthusiastic and skilful cultivators is there not a possibility, by means of raising seedlings from selected fruit, or, perhaps still better, by systematic crossing, of combining all these qualifications in the same variety? The ideal might never exactly be reached, but the efforts to attain it could not fail to produce many valuable acquisitions. Thus, a Stirling Castle with greater vigour of growth, an Ecklinville of more attractive colour, and a Blenheim Orange that would come sooner into bearing,

would all be decided improvements, and probably easy of attainment.

That increased attention has lately been directed to this subject is evident from the number of really good new varieties of hardy fruits that have been introduced and certificated within the last few years, while at almost every monthly meeting of the Royal Horticultural Society new claimants for honours are submitted, and though most of them are relegated to obscurity, still the sign is a healthy and a hopeful one.

The writer has for a number of years devoted a considerable amount of attention to the raising of new varieties of hardy fruits. Special attention has been given to the Apple as likely to give the best results in Scotland, but numerous seedlings have also been raised of red, white, and black Currants, Raspberries, &c. Among the seedlings that have fruited few, so far, have been thought worthy of special distinction; but the pursuit has been interesting and instructive, and many promising looking seedlings have yet to disclose their qualities; and among them something may be found worthy of being handed down to posterity. In raising seedling Apples those varieties only should be used as parents which succeed well in the district in which the raiser resides. American and Continental sorts, however fine (except the few that have proved to do well in this country), should be avoided as not likely to produce offspring suitable for cultivation in our climate.

This, at any rate, was the experience of Van Mons in regard to seedlings of French *versus* Dutch Pears, and no doubt the same thing holds good in regard to other fruits and other countries. I would also recommend that those varieties chiefly should be selected as seed parents which are large, smooth, round, and finely coloured, while on the contrary fruits of awkward outline, angular, knobbed, or ridged, with deeply sunk eyes and stalks or unattractive in colour, should be avoided.

Peasgood's Nonsuch, Stirling Castle, and new Northern Greening, may be cited as examples of Apples of pleasing outline; while Devonshire Quarrenden and Worcester Pearman exhibit the perfection of colouring. A preference should also be given to late flowering sorts, as likely to produce varieties calculated to escape the late spring frosts, which so often play havoc with our fruit crops, though I have seen the Oslin Pippin escape by reason of its extreme earliness, the set fruit evidently withstanding the frost better than the expanded blossoms of later flowering varieties.

The method I have generally followed in raising seedling Apples is to save the seed from choice fruit as opportunity offers, and to sow in pots in a greenhouse or frame early in spring. Each variety is kept separate, and a record kept of the parentage. By autumn they are nice plants, 9 to 18 inches high, and they are then planted out and carefully labelled. In the spring one or two scions are taken from each of the strongest seedlings, and grafted on Paradise stocks in the nursery lines. After a season's growth they are planted out in the experimental ground, 3 feet apart each way, and kept within moderate compass by means of pinching, and, if necessary, root-pruning, and in a few years they show flower and fruit.

It is very interesting to watch the characteristics of the different seedlings as they develop. Some sorts seem to reproduce themselves with little variation, as far as foliage, wood, and habit of growth are concerned. Thus in numerous seedlings from King of Pippins (or the variety generally grown by that name) almost every one has the upright habit of the parent; and the progeny of Potts' Seedling nearly all exhibit the peculiar knob or thickening of the shoot below each leaf-bud so distinctive of that variety. On the other hand, some of the seed-

lings have nothing in their appearance which would give a clue to their parentage; thus a number of seedlings from Warner's King are small and twiggy in their growth, poor in foliage, and do not raise any lively expectations as to their future. Among seedlings from Stirling Castle are several of evidently greater vigour than their parent, while one is so beautifully pendulous as to promise to be an acquisition as an ornamental tree. Seed from very free bearing Apples often seems deficient in vitality, a result probably of overcropping. Thus the seed of Lord Suffield often fails to germinate, and of those that come up many are weak and are carried off by mildew the first year. In the case of such free bearing sorts the seeds should be taken from fruit on young trees, bearing a thin crop. Seedlings which have thin twiggy growths and small leaves are scarcely worth the trouble of grafting, for though there may be a few exceptions, nearly every good Apple recommends itself to the experienced eye by its foliage, wood, and style of growth.

It may be interesting to record that among a considerable number of seedlings of white Currants which have fruited, none so far have produced red fruit. Seedling Raspberries exhibit a great variety of growth, though they preserve a general resemblance to the parent. In my latest lot of seedling Raspberries I observe several which have canes entirely free from spines.

Afraid that I have already encroached too much on your valuable space, I will reserve some further observations for a future occasion, if thought desirable. *James Grieve, Pitrig Park, Edinburgh.*

New Garden Plants.

ALOCASIA SINUATA, N. E. Br., n. sp.

THIS is a very striking and distinct novelty, recently introduced by Mr. W. Bull from the Malay Archipelago. It is a handsome plant, very different from anything else at present in cultivation, so far as known to me, and remarkable for the unusual number of leaves produced by each crown, which, taken in conjunction with their fine dark colour and the strongly sinuate margin of the blade, make it a very ornamental and highly effective foliage plant, and one of the most striking Aroids that I have seen for some time. The specimen from which the description given below was made, was a flowering plant, and I am informed by Mr. Bull was very much below the average size, and that according to the statements of the collector a full grown plant would be about 4 or 5 feet in diameter; a grand and noble Aroid. From this it will be understood that the dimensions given below are introduced to show the proportions of the various parts. The boat-shaped limb of the bracts is a remarkable character, and well illustrates the transition from the blade of a leaf to a spathe, and indeed it is very similar to the limb of the actual spathe. I have not noticed it in any other species. This plant is also interesting as forming a connecting link between *Alocasia* and *Schizocasia*, and I am now, after examining this species inclined to adopt Engler's former view, that the two genera should be united.

Leaves numerous (for an *Alocasia*). Petiole 6 inches long, flattened on the face, rounded on the back, sheathing at the base, dull green. Lamina sagittate, with strongly marked sinuous margins, 9 inches long, 4 inches broad (growing to a very much larger size), the front lobe oblong, very obtuse, with a short triangular point, the basal lobes about half as long as the front lobe, triangular, obtuse, with straight inner margins, and separated by an acute triangular sinus. Primary lateral veins about seven or eight on each side of the midrib, spreading, straight or variously curved, the four lower ones stout and rather distant; those near the apex much more slender and closer together. The postical branches of the midrib

which run into the posterior lobes, give off two distant lateral veins from their upper edge; intramarginal vein about $\frac{3}{4}$ -line distant from the margin. All the veins are strongly impressed above and prominent beneath, making the surface somewhat bullate. The upper surface of young leaves is of a very dark green along the principal veins, and of a lighter chequer green between them; but in old leaves the lighter green deepens and becomes less distinguishable, although the contrast is still evident. Under-surface whitish-green, with the principal veins darker. Scapes several, from the centre of the rosette of leaves, each with two sheathing bracts, the outer furnished with a stalked, lanceolate, acute, boat-shaped, green lamina; the inner membranous, lanceolate, acute, concealed within the sheath of the outer bract. Scape 8 inches long, $\frac{1}{2}$ inch thick, slightly compressed, terete, light green. Spathe about 3 inches long (tube 7 — 8 lines long, lamina 2 $\frac{1}{2}$ inches long), entirely light green inside and out; tube a little compressed, ellipsoidal, nearly as broad as long, lamina erect, narrow boat-shaped, about $\frac{1}{2}$ inch broad, convolute-acuminate at apex. Spadix 2 $\frac{1}{2}$ — 2 $\frac{1}{2}$ inches long (female part 4 lines, neuter part between ovaries and stamens 5 lines, male part $\frac{1}{2}$ inch, and the cylindrical-connoidal appendix 1 — 1 $\frac{1}{2}$ inch long), ovaries rather few, in two or three whorls, globose, green, with a large 3 — 4 lobed whitish stigma; the rest of the spadix milk-white. Malay Archipelago. *N. E. Brown, Herbarium, Kew.*

*BARBERIA VANNERIANA, n. sp. (hyb. nat. ?).**

This is a very fine plant, nearly intermediate between *Epidendrum Skinneri* and *Barberia Lindleyana*. Its flowers are equal to those of the last named, fine rose-purple in colour, with a small whitish disc on the lip. The column is quite *Barberoid*, but the rounded acute lip is far more like that of *Epidendrum Skinneri*. Is it a hybrid? I had it from Mr. F. Sander, who obtained it from my excellent correspondent, Mr. H. Vanner, of Camden Wood, Chislehurst, to whom it is dedicated with pleasure. It would, however, be unfair not to state at once that I have known the plant since December, 1883, when Mr. W. Bull sent me just the same thing under No. 823. When I asked him for more material, it had, I believe, been disposed of, and thus the plant was left in my herbarium and kept unpublished. There is still another very curious undescribed *Barberia* from Mr. Bull in my herbarium. *H. G. Rehb. f.*

CATLEYA WARSCEWICZII, Rehb. f.

I lately had a gorgeous flower of this little-known grand *Catleya* from Messrs. A. Spae's successors, E. Vervae & Co., Mont St. Amant-lez-Gand. Not to speak of the uncommonly delicate colours, I may say that the dried flower (of course smaller than the fresh one) before me measures 1 inch from the base of the dorsal sepal to the tip of the lip, and the line between the tips of the petals is of the same length. I learn that the plant had three such flowers, one of which was forwarded to Sir Trevor Lawrence, another to M. Massange de Louvrex. *H. G. Rehb. f.*

[The plant, which had twenty bulbs, is now the property of Sir Trevor Lawrence, Bart., M.P. *E. Vervae & Co.*]

ANGRÆCUM GLOMERATUM, n. sp.†

At a recent meeting of the Horticultural Society there was shown by Major Leody a curious *Angræcum*, with a request for its name. I have been unable to recognise it as a described species, and herewith offer a description of it under the name of *Angræcum glomeratum*. It has the narrow bilobed leaves and short stem of *A. pertusum*, and bears a single lateral compact head of forty small white sweet-scented flowers. The bases of the heads are covered with ovate brown membranous bracts. The structure of the flowers is like that of *A. clandestinum*, Lindl., but the lip is less open, the spur quite straight, parallel to the smooth white ovary.

* *Barberia Vanneriana*. — Vultu *Barbericæ* Lindleyana: labello oblongo acuto nec antice retusosculo, callis depressis ligulatis acutis in basi geminis, limbo carinato elevatis, ungue apicem termitis; columna depressa. Speciosa planta eq. *H. Vanner* dicaturo. *Epidendrum Vannerianum*, Rehb. f. *H. G. Rehb. f.*

† *Angræcum glomeratum*, n. sp. — Folia ligulata biloba; membranaceis bracteis, margibus scariosis, tecto. Flores parvi albi odori. Petala et sepala ovata obtusa. Labellum infundibuliforme integrum. Calceus ovario equivo rectus. Ovaria stipite divaricata. Columna longiuscula, marginalibus incurvis rostellis elongato acuta. Anthera truncata. Caudicula *A. distylo* duo, discus elongatus oblongus integrus. Sierra Leone. *H. Ridley.*

and clubbed at the end. Major Lendy tells me he purchased it from F. Sander in 1834. It was introduced for Messrs. Sander by the late Mr. S. Schröder from Sierra Leone. H. Ridley.

CALANTHE LANGEI.

Leaves elongate-lanceolar, gradually acuminate, narrowed into a channelled stalk, several tufts of leaves from one rhizome: flower-stalks basal, much surpassed in length by the leaves, beset by several large green clasping bracts; flowers numerous, pendent, crowded into a dense glabrous raceme; floral bracts membranous, linear, gradually much pointed, reaching to the summit of the calyces, early deciduous; stalklets short; calyx-tube about half as long as the lobes; the latter deep yellow, not spreading; upper one ovate and somewhat acute; lateral lobes lanceolar, blunt at the base; inner lobes nearly as long, ovate, acute; labial lobe slightly shorter, adnate up to the summit of the gynoestemum, thence spatulate-obovate, apiculate, at the base of the free portion lobulated by two minute almost deltoid teeth, towards the base gradually raised into two slight longitudinal elevations; spur hardly half as long as the calyx-lobes, turgid, ovate-cylindric, blunt; rostellum not elongated.

In New Caledonia, from whence it was transmitted by Consul E. L. Layard, C.M.G., to Fr. Lange, Esq., of Melbourne, in whose splendid garden it bore flowers in August, 1885.

Leaves attaining a length of about 2 feet, and towards the middle a width of 2½ inches. Racemes 3-4 inches long. Flowers not perceptibly odorous, almost vitellineous in colour. Calyx-lobes about ½ inch long, or not much longer; saccate basal portion of the labellum about as long as the ovary at the time of flowering, filled with nectar liquid; free portion of the labellum somewhat bastate.

This handsome and evidently rare plant is closely allied to *Calanthe curculigoides*, from which it differs in the flowers being more bent downwards, in the smaller lateral lobules of the labellum, in the shorter, much thicker, and straight spur, and also in the not long-pointed rostellum. From *C. speciosa* it is distinct in having smaller flowers, the inner calyx-lobes or petals not rhombiform, and the labellum not cristate but somewhat turgid from callisities towards the base. From *C. ventralabra* in the outer calyx-lobes not being acuminate, and in the labellum not being provided with five radiating elevations.

This is the third *Calanthe* made known from New Caledonia, where the widely distributed *C. veratrifolia* occurs as well as the endemic *C. angrecifolia* (H. G. Reichenbach, in *Garcke's Linnaea*, xli, 75); but *Limodorum unguiculatum* (Labillardiere, *Sertum*, no. 19, d. 25), placed by Bentham (B. and H. *Gen. iii.*, 521), also generally under *Calanthe*, belongs to *Spathoglottis*, as shown already by H. G. Reichenbach, in Seemann's *Flora Vitensis*, 300. *Baron von Mueller*, in "Wing's Southern Science Record," vol. i. (new series), 1855.

BERRY-BEARING PLANTS.

DURING the dull winter season, when flowers are scarce, berry-bearing shrubs are of great service, their brilliant colours coming in well either for Christmas decoration or brightening up the dull corners of our gardens and shrubberies.

CRATEGUS PYRACANTHA.

Foremost amongst these we feel inclined to place *Crategus pyracantha*, which, with its agreeable dark glossy foliage and dense clusters of orange-scarlet berries, is certainly one of the most effective of wall plants during the winter season. Complaints are, however, by no means few as to the berries being produced only on the upper branches of this Thorn, but this is simply the result of insufficient knowledge regarding its treatment. To induce free blooming and an even distribution of berries an annual pruning back of the lower branches is all that is required, and which will also have the effect of greatly improving the general appearance of the plant. As regards soil it is by no means fastidious, although the deeper and richer this is, so in proportion will be the vigour of the plant. A northern aspect seems to suit it best.

C. COCCINEA,

the scarlet-fruited Thorn, is another highly interesting and desirable shrub for winter decoration, the

clusters of large coral-red fruits being both attractive and ornamental in no small degree. For growing singly as a lawn or garden plant this is invaluable, the bold vigorous growth, large shining deep green leaves which in autumn assume a yellowish-scarlet tint, and profusion of berries being all recommendations of the highest order.

EUONYMUS EUROPEUS,

the Spindle tree, is at all times deservedly popular in ornamental plantations and grounds, but more particularly during late autumn and winter, when the pale scarlet fruit is open and revealing the orange coloured aril of the seeds, thus producing a strikingly beautiful effect. Like the Privet, this native plant is almost an evergreen, the hardiest of the genus, and invaluable for planting in maritime districts. As a standard it always looks best, and, as it bears pruning with impunity, it can always be kept within bounds, and of a trim, tidy appearance. There are several desirable varieties, the most interesting of which is the white-fruited kind, which, however, differs in no way from the species save in the colour of the capsules. Then there is the dwarf form—*nanus*—an acquisition for rockwork, and a variety with scarlet leaves, which, when well placed, offers a rich contrast to the normal species.

COTONEASTERS.

Amongst these *C. frigidia* is just now one of the most effective of all our berry-bearing trees, and certainly constitutes an important element in the garden landscape at this season. To see it when well covered, as it usually is, with its coral clusters of fruit, as they stand out against a dark background, is truly a pretty sight, and makes one wonder why this handsome and distinct shrub, or rather small tree, is not oftener seen in our gardens. It is perfectly hardy, a rapid grower, and of the easiest culture. Another distinct and beautiful species is *C. Simonsii*, the bright vermilion-coloured berries borne all along the slender shoots giving to a well-covered bush quite a glow of red. *C. microphylla* may well be added to the list; its pretty and numerous white flowers, its dark, shining foliage, and, above all, its never-failing crop of dull red berries, rendering it a general favourite for walls, or covering bare rocky patches of the garden borders. It bears pruning with impunity; in fact, the more it is cut the denser it grows, and it is by no means uncommon to see it so thickly studded with its beautiful berries that the wall against which it is trained is a glow of red.

HOLLY.

The common Holly is by most persons considered king of the berry-bearing shrubs—a title it, no doubt, well deserves, for when laden with its bright scarlet berries—which, by the-by, are well set off by the dark, shining green foliage—it has indeed few equals amongst our hardy evergreen trees. It has, however, one fault—if fault it can be called—that, unlike most berry-bearing plants, it rarely bears fruit for two years in succession. As an ornamental evergreen the Holly is of particular value, possessing as it does the great merit of growing and thriving luxuriantly under the shade and drip of other trees. In the formation of hedges it has few equals; but its slow growth and seeming difficulty to transplant, has doubtless much to do with the infrequency of its use in this way. For planting in elevated positions it is also invaluable, the closeness of its foliage causing it to furnish a large amount of shelter in proportion to the space it occupies.

HIPPOPHAE RHAMNOIDES,

or the Sea Buckthorn, when laden with its bright orange-coloured berries, is certainly not to be despised, and there is no reason why it should not be planted in our shrubberies, for there are few plants whose berries are so attractive, or of such an unusual colour, at the present season. To see this plant as it is at present in some gardens along the sea coast, where the numerous long twiggy branches are covered for about a foot of their length with crowded clusters of the brightest orange berries, is simply grand, and would scarcely be credited by those who have not had the good fortune to see it in its most luxuriant form. Although usually considered a seaside plant, yet it is by no means exclusively so, for in many inland counties of England it blooms and fruits freely enough. Like the *Acubia* this shrub is dioecious, so that to have a production of berries male and female plants should be placed in close contiguity. Good strong loam suits

it well, although in this respect it is by no means fastidious, thriving well on that of very opposite characters.

ARBUTUS UNEDO,

the Strawberry tree, is now not only gay with its greenish-white flowers, which hang amongst its dark evergreen foliage like so many waxen bells, but also abundance of Strawberry-like and highly-coloured fruits. Two years are required for the fruit to ripen, therefore the production of flowers and fruit goes on at the same time. (When favourably placed and well developed the *Arbutus* is massive and pleasing in outline, but this perfection is rarely attained unless the plant is grown on light porous subsoil, or where shingly rock crops out at the surface. Here both shape and beauty are brought out, the shrubby habit is left off, and the proportions of a fair-sized evergreen tree taken instead, while its floriferous and berry-bearing nature is likewise enhanced in due proportion. Cold, damp soils are unsuitable for its growth, which may also be said of high-lying exposed situations. A. D. Webster.

(To be continued.)

CACTUSES.

HARDY CACTUSES.—Apart from *Opuntia missouriensis*, *O. Rafinesquii*, and *O. vulgaris* and their varieties, we have very few hardy Cactuses. I have succeeded in wintering safely *O. pescovii* and some others, but with uncertainty. I have found *Echinocactus Simpsoni* very uncertain; it would live through one winter all right, and rot off during the next one. *Echinococcus phœnicus* and a form of *Mamillaria vivipara* I have known to survive several winters, but not in my garden; and Mr. Menand showed me in a neighbour's garden at Albany a bunch of what he called *Echinococcus Krausei*, which had been growing there out-of-doors for several years. As a garden plant I have found *Opuntia missouriensis* the hardiest and most accommodating of all Cactuses, and I never knew it to miss flowering; with me it always blossomed copiously. In the case of hardy Cactuses I have found they must be grown where water does not lodge in winter, as for instance on raised ground, and if they can be covered over by some leaves, hutch, or, better still, snow, in the winter, they come through with less injury in spring. My old neighbour, Mr. John C. Hovey, an ardent admirer and grower of Cactuses, gave me the following list of *Opuntias* which he found to be hardy in his garden, ordinary level clayey soil—*Opuntia vulgaris*, *O. Rafinesquii*, *O. R. grandiflora*, *O. cymochila*, *O. stenochila*, *O. hystericina*, *O. missouriensis*, *O. m. macrosperma*, *O. m. altipinna*, *O. fragilis*, *O. tusiformis*, and *O. pescovii*. Among those mentioned by Mr. Siler I have tried *Cereus Englemanni*, *Echinocactus cylindricus*, *Opuntia rotula*, and *Mamillaria chlorantha*, also *Agave utahensis* as hardy plants, but all died. I would say here that I have grown some fifty distinct species and varieties of *Agave*, and have found *A. utahensis* the most difficult of all to grow. Dr. Edward Palmer, the eminent botanical collector, sent me plants from their native places, and I have raised it from seeds and coaxed it in many ways, but without avail; the plants appeared unhappy. And this is the only species of *Agave* I have failed with.

TENDER CACTUSES.

I regard all Cactuses not absolutely hardy as being tender, and treat them accordingly. While a few degrees of frost may not hurt some of them, still it does not do them any good. Epiphyllums, Phyllocactuses, Rhipsalises, Melocactuses, and the more tropical *Cereuses*, as *C. grandiflorus*, *C. Jamacaru*, *C. nycticalis*, and *C. cœrulescens* like warmish winter quarters. The general run of "Cusibon" Cactuses, *Opuntias*, and the like, if kept in dry airy places and inactive, may be wintered safely in a moderately low temperature, but under 40° is unsafe. All Cactuses delight in being set out-of-doors in summer. *Cereuses*, *Echinopsis*, and *Opuntias* enjoy being set out in open sunny places; but *Mamillarias*, while they like being planted out, very much dislike moist foggy weather, heavy rains, warm weather immediately succeeding wet weather, and cold or heavy night dews; all of these cause "rust," and "rust" is incurable. I have always grown *Mamillarias* and all other delicate, weakly, new, rare and valuable Cactuses in cold frames in summer, and covered them over with sashes as a preventative against the above

evil conditions. In propitious weather they were fully exposed.

I prefer planting out even in frames in summer to keeping them in pots, because I thereby have a good opportunity to see that my plants are thoroughly cleaned twice a year—at planting out and lifting time—and the plants grow much better and bigger, and bloom more copiously, when planted out than when kept along in pots. If [growers] had much to do with *Opuntia exuviana*, I should not wonder if [they said] something naughty; but, that species excepted, what in earth is there in other Cactuses to incite an evil word? There is a knack in handling Cactuses. For a good many years I handled the fullest collection of cactaceous plants in the country, and twice a year every plant passed through my own hands. I myself planted them out in May, and lifted or repotted them in September, and all because I was afraid if I trusted any of the workmen with the job they would be more careful of themselves than of the Cactuses. And I can assure you no orchidist ever watched the progress of *Vanda Sanderiana* or *Phalenopsis Stuartii* with more anxious pride than I did my *Cereus Thurberei*, *C. Palmeri*, *C. Greggii*, *Echinocactus myriostigma*, *E. phyllanthus*, and other pets. And how disgusted I [was] when to some visitor I would point approvingly to *Cereus giganteus*, 20 inches high and ten years old, to be informed, "Oh, that's nothing; you should have seen it at the Centennial." And so I did, and elsewhere, too; but such another life-long garden-grown plant as that is I never came across east of the Mississippi.

I have found that each and every kind of Cactus that I have grown will do well in a gritty turfy loam. Drain the pots well and pack the soil firmly. Lime rubbish, pounded bricks or rotten stone added to the soil has no visible beneficial effect whatever; the drainage will not clog nor the soil get sour if you don't over-water your plants. *W. Falconer, Glen Cove, Long Island, New York, in the "Gardeners' Monthly and Horticulturist."*

THE GENUS ODONTOGLOSSUM.

(Continued from p. 589.)

THE ANDERSONIANUM section and others allied, conjuncture hath it, are the result of crosses between the many varieties of *O. crispum* and the very variable forms of *O. odoratum*, which run from the small-flowered kind originally figured in various grades up to that called *gloriosum* (fig. 149). Gardeners generally, who are, perhaps, the best judges of Orchid physiognomy, think the case pretty clearly made out, the features of each being merged in the progeny, as will be seen by reference to our illustrations, and a comparison of them with those of *O. crispum* vars., illustrated in our issue for November 7. The following are the best-known varieties; most of them have branching flower-spikes and numerous flowers:—

O. ANDERSONIANUM (fig. 150) was first described in the *Gardeners' Chronicle*, June 6, 1868, from the plant which flowered in the Meadowbank collection. Its flowers, which are harder in texture than those of *O. crispum*, are pale yellow or cream colour, blotched with various shades of brown.

O. A. FLAVOLUM.—A very fine form with large branching spike of bright yellow flowers marked with red. Mr. Ballantine received a First-class Certificate for it at the Royal Horticultural Society, December 9, 1884, when he exhibited it for Baron Schroeder.

O. A. OBTUSATUM has flowers rather smaller than the type, and with a shorter labellum, but similar in other respects.

O. A. LOBEATUM (fig. 151) is a very elegant form, with nearly white flowers, marked with brownish-crimson. Its labellum is curiously elongated, and recurves when mature, as seen in the illustration.

O. A. PICTUM is a very handsome variety, certificated at the Royal Horticultural Society this year. The flowers are yellow, prettily marked with bright blood-red. Sir Trevor Lawrence has it in his collection.

O. HEBRAICUM.—This is very close to *O. Andersonianum*, it having little but the disposition of the marking to distinguish it. *O. hebraicum* has flowers with pale yellow ground colour marked with reddish-brown, the peculiarity being that the marking is not continued the whole length of the two petals, but confined to the lower half next the column, and arranged

in irregular radial lines supposed to call to remembrance Hebrew characters. Sir Trevor Lawrence has a very fine form, which is amply distinct from *O. Andersonianum* (*Gard. Chron.*, 1881, xvi., 173).

O. II. LINEOLIGERUM.—In this variety, which flowered with Mr. James Cypher, of Queen's Road Nursery, Cheltenham, the irregular markings on the petals of the type are in this departed from, the marks being in lines.

FIG. 149.—ODONTOGLOSSUM GLORIOSUM.

O. BAPHICANTHUM in form resembles *O. Andersonianum*, indeed it may be said to be an unspotted pale yellow form of that variety.

O. DELTAGLOSSUM.—This also is very close on the preceding, and both of them give a very tangible link between *Andersonianum* and *crispum* by the nearness to which they approach it to the varieties of *O. C. aureum* and *O. C. flavolum*.

FIG. 150.—ODONTOGLOSSUM ANDERSONIANUM.

O. JENNINGSIANUM comes near to *O. Andersonianum* and bears also traces of some of the narrower petalled forms of *O. c. guttatum*. Its flowers are white or cream colour blotched with dull crimson.

O. J. PARCIGUTTATUM is a form of the preceding with very few reddish-brown blotches on the petals.

O. J. LIMBATUM.—This is a very pretty variety, approaching *O. Ruckerianum*. Flowers white, spotted with crimson, petals edged with yellow.

O. POLLETTIANUM (fig. 152, p. 681).—This may fairly be put at the top of the *Ruckerianum* varieties as being by far the best. Its flowers resemble those of a

good large *Ruckerianum* marked with the bright crimson tints of the *O. crispum guttatum*. Spikes upright, much branched, flowers large, white, tinged with rose, and heavily marked with crimson. *O. Pollettianum* is one of the finest varieties of its class, and H. M. Pollett, of Fernside, Bickley, was awarded a First-class Certificate for it at the Royal Horticultural Society, February 12, 1884. *James O'Brien.*

(To be continued.)

NOTES FROM A BUCKINGHAMSHIRE GARDEN.

Sunday, September 13.—Autumn or spring! "I know not which is sweetest, no not I!"—the deep mellow calm of an evening such as this, in the middle of September, or the green brilliance of the spring. The colour is rich, like an old Venetian master; and how sad I with the strange sweet sadness of all last things—last days, last hours. The air is filled with a golden warmth, and all tremulous with the sound of bells. The chimes of four churches make music together, within a half circle of four miles. Save for the dazzling glow of tall crimson Phloxes, or where the leaf of some Virginia vine, impatient of the lingering summer breaks into sudden scarlet, or where great *Sunflowers* burn in fair majesty serene, the tones of colouring are subdued and solemn; the young moon alone shines coldly through this saffron clouds that pass across the far azure of the southern sky, while in the west a pink flush, deepening into orange fires, reflects back rosy-gold upon the lulled earth beneath. Across the *Fetunias* and many-coloured *Zinnias* bend fruitful branches of *Apple* and *Pear*. There is a sense of settled calm and peace, of home, and of all that may be most pleasurable and most secure, in these plenteous boughs weighed down by the load of their good great *Apples* and gently swelling *Pears*, and the mellow round of each ripening fruit glows as if illumined from within. And now a great silence steals on upon the air. The bells have ceased, their last vibrations lost along the far-spaced fields. The sharp "tzit, tzit," of a robla, or a beetle's drone in passing flight, seem but to intensify the stillness. In this beautiful hour, as twilight deepens down upon the flowers, they seem to open their hearts to you and speak. The half-cold, with-drawn look of common day has vanished from each lovely face, and as you pass by, voiceless, they tell you sweet nothings without words.

It is more strange than perhaps at first sight appears, the illumination of flowers and bright coloured objects after sundown, while the green of surrounding grass and foliage is lit only with a sombre radiance. I may be pardoned for giving a suggested theory in explanation thus. The colour of all objects depends upon the kind of illumination they receive. A completely yellow light thrown upon a nosegay will kill all colour excepting in the yellow flowers. Newton discovered that sunshine and all white lights have the power of pouring every conceivable shade of colour upon all objects, and these again have the power of extinguishing all shades except the few which suit their own substances and textures. "A blue *Salvia* extinguishes all the red, yellow, green, and possibly the violet rays, while a red *Poppay* absorbs all the violet, blue green, and possibly yellow. We therefore see the latter brilliantly red, and the former purely blue." When mellowed fruits and yellow and red flowers shine at evening it is because the sunset light comes to them through more and more of the air that envelopes the earth, and which, though invisible, quenches almost entirely the violet, blue, and green. All objects disposed towards yellow and red are then illumined as with a pure light of these two colours, and they gleam out triumphantly, because all other green, blue, and violet objects are more or less deprived of their favourite rays. Nothing of this, however, quite explains why white and yellow flowers often appear so bright at night, or why some other flowers—(notably some kinds of crimson *Snag-dragon* (*Antirrhinum*))—do often shine, so as to attract the eye from a distance on some very dull grey days. These (as, indeed, all flowers in some degree) doubtless have a self luminous power, which we call phosphorescence, whatever that may be.

We have already had large store of delicious, well-sunned wall fruit—*Peaches*, *Figs*, and *Plums*. I can believe that, had we means to build and keep up long ranges of houses—*Peach-houses*, and *Nectarine* and *Fig-houses*—they would be built, and we should draw

from their rich produce the same enjoyment that others do who possess glass. But I do not believe that these houses would ever give me the same delight as does the little basketful of fruit and flowers that is brought in to me every morning on these late summer days. I do not believe that the finest fruit ripened under glass could compare at all with the beautiful red sun-ripened Peaches picked from the old brick walls! My basketful holds sometimes one such perfect Peach, two or three purple Figs, yellow Plums

and China Roses too, all fresh and dewy. The quantity of immense bunches that are gathered out of our one small house, lasting up to nearly Christmas, never fails to be a surprise to me, although it is always the same every year.

October 19.—My best yellow autumn window curtains are up! No other curtains could ever please me so much as these. But to make it understood how perfect in their way they are, the windows also must be described. They are almost the only windows in the

summer, and in autumn golden yellow. The pair is odd, for there must be nothing commonplace about the room; so the one is Magnolia, the other chiefly Vine. On the right is a bold intricate pattern of glossy leaves with here and there a great white creamy blossom—a chalice of so rich a scent—set here or there upon the branches, with blue sky between. The left is all Vine, made admirably to suit the seasons. In winter the curtain is drawn back, as it were; for a few interlacing barren lines keep out no light. The thin delicate arabesque of spring gives place to summer, when the green comes full and cool and shades the noonday sunlight. And now in autumn, my left-hand curtain is all yellow gold, reflecting back gold sunshine of its own. There should be dispersed amid the gold, bunches of ripe green Grapes, like clustered berylls. That part of the needlework has not been well done this year, and the Grapes are mostly shrunk and mildewed. To repair the loss of them, slender Jasmine twigs set round with dark green leaves, hold out little silver stars, peering round the corners, stretching round the window-sills, while across them comes a dash of red Virginian climber. The one fault I find, is that my curtains do not endure. Come a sharp frost, or strong gust of wind, they are gone in a moment. The failure of the Grapes is this year a serious disappointment to the birds, who count upon their vantage at the windows; yet the shutters opening in the morning discover them some times at work. There is a blackbird, with full black chest, swallowing the Grapes as fast as his golden bill can manage it; or a thrush sits in the Vine taking breath between his mouthfuls, while the sun shines sidelong on his spotted breast; or a robin shows his red waistcoat for a moment. He is not, I fear, my robin that has till now been so constant to the window for twelve months past—he has hardly missed a day. Bold and familiar in the winter, silent and hurried at nesting time. Not a feather in his tail, and very shy when moulting. Gay and insouciant in his new suit, looking as big again, and trilling half a bar at a time short and full, but “always regular to his meals” at the saucer of sopped biscuit. Dear little, tame robin! I shall grieve if he is dead; but I think he will come back in the winter, when birds are hungry. They say that robins go to the seaside in October; and another saying would have the young birds kill the old ones at this season. Even this is better than the way my friends the swallows behave. Up to the time when they all left England—about the 13th—they seem to have been still occupied with late broods of young. It was indeed without my consent that they thus foolishly employed themselves here in the north porch. If they could but have understood, I should have persuaded them to stay a little longer, to give their young a chance. On the 16th only one swallow was seen, and three days after a tragedy happened in the porch! Late in the afternoon a poor little full-fledged swallow lay dead on the cold ground. The forsaken nestling may have fallen in its hungry efforts for food, or have attempted in its weakness to follow the strong-winged parents, whose cruel desertion it is hard to forgive. Strange and inexplicable is the migratory instinct with birds. It is then more powerful with them than even mother's love! and yet love is said to be stronger than death. The habits of the swallows who make themselves at home in our entrances, north and south, are full of interest. The red-throated chimney swallows like best the north. On the south side are martins. Both kinds agree in departing from ancestral laws in their way of house building. The typical swallow's nest used formerly to be neatly built up—usually under the eaves—with a hole for them to fly in and out. Our swallows of to-day make flat hasty nests on projecting ledges inside the porch. One nest (re-filled three times last summer) is made up of ugly black clay, bearded with long straws of hay hanging down. Is it not a new thing for swallows to build with hay? We have only one really well-rounded, neatly-finished nest, and this is a martin's. The chimney swallows seem to be the most hurried and careless. One of our families makes no nest at all, there is simply a layer of mud laid on the ledge. Along the rim the five newly feathered young ones sit in a row to be fed, like five old owls in miniature. There is one thing that a swallow never forgets or forgives, and that is destroying the old nests. The place remains empty to this day where once we cleared away two overcrowded nests. They love overcrowing. I watched the old birds, on their return the following May,

FIG. 151.—ODONTOGLOSSUM ANDERSONIANUM VAR. LOBATUM. (SEE P. 680.)

FIG. 152.—ODONTOGLOSSUM POLLETTIANUM. (SEE P. 680.)

bursting with sugared juice, a golden Pear, a few Muscat or Madresfield Court Grapes, lovely in their exquisite bloom of misty gold or green, while single flowers of richly-scented Tuberose and dainty pink Begonias lie intermixed with the green Vine leaves and the fruits. Our sole pride of glass fruit culture is in the vinery. Season after season our Grapes excel in size and in flavour. The Muscats remind me of the Grapes of Italy. Travelling along the Corniche in days before railroads, Grapes, large and golden-green as these are the peasant people would bring to us and pour into our laps, with green Figs

house that are not old-fashioned casements. At that period, in the beginning of the century, when in most old houses the picturesque and small-paned casements were made into sash-windows, the windows of what is now my room were enlarged and modernised. Here then, are two very large sash windows, almost due south, with the large frames and dull bald character usual to such windows. Ugly as they are, they were never altered, for the sake of the fine wide opening when the sash is thrown up. Covering the entire space of the upper half, and enframing the whole, hang my curtains: green for

inspect the place, flying in and out and round about it; but either they forsook altogether, or nested elsewhere about the house.

Flowers still are blooming everywhere in the garden. There are still beautiful red Roses, smelling as sweet as June. *Rosa rugosa* has only just ceased to flower. A great clump of pale bluish *Anemone japonica* at the south end of the broad walk has flowered grandly for some time past. A clump of white ones from the kitchen garden is to be planted there also, since it is plain that they look best in large masses. Had we room I should like to plant blue *Salvia* next to the white *Anemones*. The fine blue of this old *Salvia* enriches now the whole garden in almost every part. The colour is said by some to be in a false key, and as such to be out of tune with the more natural greens and blues around, contrasting ill with the lovely tones of *Nemophila* or of the blue *Daisy*—or even with the firmament itself. I know not how this may be, but to me it is nevertheless a magnificent blue—nearest, perhaps, in tone to the deep blue of the alpine *Gentian*, and losing beside the *Gentian* only because it lacks its depth of black heart. Pure ultramarine must be used in the painting of either flower. Our old walls are all well furnished with the vivid orange-scarlet glow of *Tropeolum*. It gives promise, too, of lasting on as long as winter frosts delay. I cannot give the name of this special variety of *Tropeolum*; its leaf is bluish and round, and the plant seems to be always in flower, from August until far into November. In the entrance court the old useless Green Gages and Golden Drop Plum trees against the walls are dressed out in these gay flowers, climbing, streaming, creeping, clustering about all over them—branch and stem. The vivid colouring is splendid as it comes out a few days after it is mixed in many places with the purple of jackman's *Clematis*. At this moment the blossoms intermingle here and there with tall yellow *Helianthus*. The aged fruit trees are doomed, and flowering climbers are to cover the walls in their place. The standard *Cherry* tree between the pyramid *Yews* is to be cut down, and a broader flower border to be made. It is hard to sentence the *Cherry* tree. In spring it is so like a great round nosegay of loveliest blossom, and when the *Cherries* begin to redden a thrush so loves to build its nest in it, and at evening to perch on the top and sing the lingering day away. Yet the *Cherry* tree must go. These kind of changes which at intervals have to be made throughout the garden cause me a thousand regrets. When the young trees and shrubs thrive and grow all round as Nature intended, the very success and growth of them overturns all our plans, and changes are inevitable. "The Fantaisie" has changed its character, and is not the same in any way as it was when first laid out. Then flowers and evergreen shrubs grew together on either side of the turf walk, and each enhanced the other's charm. Twelve or thirteen years later the *Cryptomerias* and *Aucubas* and *Berberis* have grown so large that nearly all the flowers are crowded out, and a new aspect takes possession of the whole. The law of change which thus rules the garden has lately forced us to remove a large English *Yew* from the spot which it has occupied for many years. It was pushing its dark growth right into the beautiful grey foliage of an *Abies amabilis*. So last month the grand move had to be arranged. To watch the transplanting of a tree is one of my best amusements of autumn in the garden. The work begins early in the morning. Two, three, four hours or more, according to the size of the tree, is taken up with digging round and throwing out the earth. The roots and rootlets have to be carefully separated: not cut or severed more than is necessary. The tree is tied close with strong cords: all its lower branches bound up together. The head gardener watches and gives his orders quietly, jumps down into the trench, and lends a hand himself with spade or pick; walking round, returning again and again. Silently, cheerfully, the men work. A wholesome fragrance of new earth spreads upwards in the air. The labour is severe, but at last the tree stands free, with a great ball of earth round his roots. The bell goes for the men's dinner; powdered all over with brown mould they scramble up and shake themselves, throw an old mat over the roots, and depart for their hour of rest. The men return refreshed, and set to work again with a will; and now three tall stout poles, the ends meeting at top in a triangle, are set up and fixed, with ropes and pulleys fastened to them. It may take long to adjust all right, but at last the tree swings high in the air, dangling from the summit of the triangle. The excitement of the moment grows intense. Two or three men in the end below steady and guide the swinging mass; four or five pull the ropes with might and main. The tree swings fair above the centre of a trolley, wheeled up to the edge ready to receive it. The gardener holds on to the strong shaft or bundle of the trolley, his eye fixed anxiously on

the swaying tree, encouraging the men, directing every movement. The ropes are tight; the tree is well up. "Now let go." Slacken the ropes!—vently—so!" Gently the tree is lowered down upon the platform of the trolley, and the ball of earth once more is wrapt in mats. Now begins the dragging, and pushing, and pulling; there's a shove and a tug all together, and the tree is fairly off on its journey. Toiling along the gravel-walks, the triumphal car rolls slowly on. The progress may be short or long; somewhere it ends, at the edge of a big hole prepared in the special spot designated to receive the tree. Soon the slides safely down into the bed ready made in the hole. There is a merry shovelling in and stamping of the earth, leaving a little ditch all round to hold the great watering which is the ending of the work; and there the tree is left, looking as if he had been there all his life. Unmoved the neighbouring trees and shrubs stand round, and not a green leaf flutters welcome to the new-comer; it is henceforth as if the transplanted tree had never been anywhere else. Should the tree have to move to be larger than usual, it may take to do it twenty-six working hours or more.

Men of old time planted trees for posterity. With far-seeing wisdom they planned many a stately avenue, which still remain the ornament and pride of our fine old country houses. We do not in these days seem always to look so far beyond the present. When a few years ago I planted a row of young *Limes* (in old books they are "lines") as a continuation of the Lime avenue, with *Arbor-vitæ* between each tree, and parallel to these a double row of *Larch*, and a *Beech* hedge along the walk between the *Limes* and the *Larch*, I did not foresee the dilemma that has ensued. A decision must before long be made between the selfish enjoyment of the present, extending perhaps to a few uncertain years, or the future and lasting improvement of the place, which I shall not see. While we hesitate the trees grow on. The stems of the *Limes* grow thick and smooth, and their branches spread; the beautiful green *Arbor-vitæ* flourishes, and are rapidly making handsome trees; my favourite *Larch* send up strong tall shoots every season, threatening to overtop everything; while the *Beech* hedge is so luxuriant that I am tempted to sacrifice all to it. Which is it to be? *E. V. B.*

ORCHIDS IN FLOWER AT MR.

B. S. WILLIAMS' NURSERY.

HERE, at this place, as elsewhere, flowering Orchids are very rare at the present time, but what there are deserve a passing note. We found *Piluma fragrans* small but fragrant, perfuming the air in the *Vanda*-house. The odour of *Hawthorn* pervading these flowers reminds one of spring hedgerows, but is certainly unpleasant when inhaled at very close quarters. The New Guinean *Dendrobium superbum* was in flower—its light purple and white blossoms, airy disposed on slender spikes of great height, render it desirable for associating with *Ferns* and mosses. *Lelia Dayana*, a pretty purplish flower, the plant of very low habit, was flowering in baskets. Many *Calanthes* were blooming, including *C. vestita oculata*, the white variety with a purple-crimson eye. Of *Cypripedium* there were *Chantini*, otherwise punctatum, a handsome form of *C. insigne*, the dorsal petal being abnormally large, mainly of a white colour, sparsely spotted with brown; *C. Harisianum*, a flower of generally reddish-copper colour as to lip, and dark petals and sepals; *C. (Selenipedium) Roezlii*, a long-tailed green flower, and a pretty continuous bloomer, was likewise showing spikes that were almost over for this season. This is one of the late *Benedict Roezlii*'s earliest introductions to this country, and is deserving of a place in collections for its singular appearance.

Vanda Cathcarti showed two bloom-spikes not yet open, and a pale form of *V. Sanderiana* was in flower. This is much paler than the better known variety, and is less handsome. As yet but little variation from the type has been observed, but some may be looked for amongst the importations now coming to this country. Some few *Odonotoglossum Alexandre* and *O. Pescatorei* were showing flowers, the latter getting now past its prime. The display of pitchers of *Nepenthes* was very rich, the major part of the species being fully provided with them.

In Palms of recent introduction, and which are well suited to do service in the dwelling, may be mentioned *Calamus ciliaris*, a very graceful pinnate-leaved species, reminding the observer of a miniature *Cycas revoluta*, the foliage, as indicated by the specific name, being soft and hairy to the touch, but not to the sight. *Rhaphis humilis*, a rare species,

slow growing, with more graceful foliage than *R. flabelliformis*, and increasing in the same way by rhizomes; and *R. f. variegata*, a handsome Palm with pale yellow-stripped foliage—an acquisition if it should prove constant.

Amongst *Bromeliads* were *Massangeana tigrina*, an enduring hard-foliaged plant which ought to be much grown by those having indoors decorations to carry out—its handsome, barred, dark bronzy leaves, which are coated with white mealliness, are very striking. On the Continent this plant is making much headway, as does any other plant of this or allied genera.

THE BOTANICAL GARDENS IN JAVA.

DURING the last few years so many useful and important improvements have been made in the botanical gardens at Buitenzorg and Tsi-Bodas that it might not be amiss if the attention of the readers of *Nature* were again drawn to these valuable seats of systematic and philosophical research.

On entering the gardens at Buitenzorg the stranger is at once struck with the wealth and luxuriance of the vegetation he sees, the great height of the trees whose trunks and branches are in many cases covered with heavy creepers, the dense copses of the different species of Bamboo, the eccentric-looking Screw Pines, and the handsome Palm trees; but the scientific observer is also struck with the care that has been taken to arrange all these many varieties of tropical plant life in, as far as possible, their systematic order, and that each specimen has its scientific, and in many cases its Malay name also, clearly and distinctly printed on a little board by its side.

It is not difficult for any one to find his way about the garden, and in a very short time he can discover the particular family or group of plants which he may desire to study. Many families have probably more representatives in these gardens than in any in the world. The Sapataceæ, for instance, so rarely seen in Europe, are here represented by a great variety of genera and species, and the Palmaraceæ, the Rubiaceæ, the Burseraceæ, the Orchidaceæ, and other families, have now a large number of rare and interesting representatives.

The herbarium, which is attached to the garden, contains a large collection of dried plants and seeds collected together from the many expeditions into the little or unknown parts of the Archipelago, and from other sources. Attached to the herbarium there is a comfortable and convenient little library, which contains most of the important botanical books and journals.

The laboratory, which, thanks to the energy of Dr. Treub, the director, is now completed, is a large, lofty, and, for these climates, particularly cool room, and is well fitted out with reagents and apparatus for carrying on botanical research. The generous invitation which Dr. Treub has issued to naturalists, and to which the attention of the readers of *Nature* has already been directed, has attracted several scientific men of different nationalities, and some excellent research has already been made in this laboratory.

When I arrived in Buitenzorg Dr. Treub was at Tsi-Bodas; so, after spending a few days in study in the gardens, I made the journey across the mountains to pay him a visit. The road from Buitenzorg to Tsi-Bodas crosses the Poenohuk Pass, and is full of interest and beauty. On the way the traveller passes quite close to the Talaga Werner, the crater of an extinct volcano which is now filled with water, and forms a most beautiful little lake hidden in the dense foliage of the mountain slopes. The path from the road to the lake is through a dense wood of fine forest trees, and amongst the undergrowth are found many fine shrubs and plants which are not found in the low-lying country beneath.

The gardens at Tsi-Bodas are situated on the slopes of the Gedeh Mountains, at an altitude of 5000 feet, and here I found Dr. Treub at work in the comfortable little house which is attached to the gardens.

From this spot a very wide range of vegetation may be studied, from the rich and varied vegetation of the plains to the interesting vegetation of the Gedeh and Pangeranso peaks, at an elevation of 10,000 feet. In the gardens themselves a very fine collection of *Conifere* from America, China, Australia, and other parts of the world, has been got together, and spaces have been cleared for the growth of the various species of *Eucalyptus*, *Cinchona*, and

other plants. Year by year the surrounding forest is being encroached upon by these gardens to make room for new importations. I was extremely sorry that I could not prolong my stay at Tsi-Bodas, but I had to return to Batavia to catch the Molucca boat. I saw, however, enough to convince me of the great importance of these gardens for the advancement of our botanical knowledge, and the great opportunities they afford for research into all branches of the science.

I need hardly say that the climate in this region is extremely pleasant and invigorating, and the neighbouring village of Sindanlaya is much resorted to by Europeans and others whose health has suffered on the coasts or low-lying districts of the Archipelago. At Buitenzorg the climate is by no means unpleasant or unhealthy, but as it lies a few thousand feet lower than Tsi-Bodas, it is naturally a good deal warmer; but I am assured that several Europeans have worked there for several years without feeling their health the least bit affected.

It is hardly necessary to add that every one who has come over to Java to work in these gardens has been amply repaid for the time spent in the long journey over the sea, for the insight which can be gained here into what tropical botany really is one which can be gained nowhere else in the world so well, and leaves an impression which is not likely to be forgotten in a lifetime. *Sydney T. Hickson, Batavia, July, in "Nature."*

EIGHT DAYS IN THE GARDEN OF ENGLAND.

(Continued from p. 665.)

SALCOMBE AND ITS ESTUARY.—"Time and tide wait for no man," so to our chagrin we found that, it being spring-tide, we should only reach the much-vaunted Salcombe by night-fall; and in order to be in Exeter, as we were obliged, on the following night, that we must leave at 9.30 next morning—and this, when we had been rejoicing in the spring-tide as affording us an opportunity of finding the British coral-polype in one of its few localities on our south coast! The evening journey by steamer down the beautiful estuary was, however, very pleasant in itself. Undulating hills of ripe cornfields on all sides, with well-timbered hedgerows and copses of Oak coming down to the water's-edge, owing to the winding course of the shallow inlet, gave it all the appearance of a lake. The transparently clear water was scarcely ruffled by a single ripple, and as the lading sunlight tinted it with pink and gold, while the green of the trees on shore gradually became black, the scene reminded one forcibly of Windermere. Real mountains and wooded islets were, however, absent, so that the resemblance was not complete. As we neared Salcombe the outline of the church tower was just visible, but the terraced grouping of the little town was rendered apparent by the already numerous lights; and on landing our exploration of a place where Myrtles, Bays, and Oranges were reported to flourish in the open was performed under the difficulty of almost total darkness. Touch and taste, however, told of the whereabouts of many fine evergreens, and this evening ramble was supplemented by one in the early morning, after a comfortable night at the homely Victoria Inn, the best apartment in the town. The water is certainly beautifully transparent. Bolt Head and the rocks that lie off the mouth of the estuary, introduce the element of grandeur into the scenery. Many of the villas are pretty; but, it must be confessed, our general impression of Salcombe itself was one of disappointment. The farmers in the neighbourhood used also to engage in ship-building, turning out many handsome schooners for the fruit trade of the Mediterranean, and we saw a little ship-building in progress on the estuary; but the screw steamers have ruined the trade. The old town is as dirty as that of Folkestone, which is saying a great deal, and the rest is new, painfully so. Still, everything thrives as a matter of course; for here in the South Hams, as this district (once all known as Totnes) is called, frost is unknown, the mean annual temperature being 47° F.

COMBE ROYAL.

Having steamed back to Kingsbridge, watching the cormorants and Kittiwakes now flying and now swimming over the estuary, we walked up the lane to Combe Royal, noting by the way the occurrence of *Geranium striatum*, doubtless originally an escape,

though not now cultivated hereabouts. Entering the lodge gate we found the drive sweep along the east side of the long and narrow combe, about midway up its slope.

On our left an underwood of *Euonymus japonicus*, with a foreground of *Hypericum calycinum*, was arched over by larger trees, whilst on the right was a grassy slope down to the American garden, a group of fine Elms and Planes and a small pond, on which a black swan was disporting itself, and beyond, the other slope of the combe was well timbered with Sycamore, Copper Beech, and other sheltering trees. Near the lawn gate rose a magnificent Plane, beneath which a large clump of Hydrangeas were in full flower. They are all blue-tinted here. Noting the two well-lodged Fig trees near the stables while we waited for Mr. Horsman, the gardener; when he arrived we were most courteously conducted over the whole of the extensive gardens, the management of which is entirely carried out by himself and three under-gardeners. The viney, where a good crop of Madresfield Court on young wood looked as if it would be all the better for thinning, seemed to tell of an insufficient staff, whilst in the small stove there were some good Crotons, Gloxinias, and Adiantums, besides a Bougainvillea and a Banana that fruits every year, and has even borne twice in one year; but, probably owing to deficient moisture, Mr. Horsman has not been successful with *Adiantum farleyense*. In the kitchen garden Raspberries were a good crop in spite of the too numerous blackbirds from the nearness of the sheltering woods, and there was a good promise of wall-fruits, the walls all having projecting stone eaves, from which red-mats are hung in winter. The conservatory, with small old-fashioned panes, was most rich in such climbing plants as require comparatively little oversight—*Lapageria rosea*, *Allamanda*, *Tacsonias*, *Bignonia*, *Datura sanguinea*, and *Begonia fuchsoides*—all of which looked well. Mr. Horsman next took us past two fine old Palms on the front lawn, which are entirely unprotected in winter, to the orangery, one of his main attractions. It is simply a gravel terrace, with a high wall facing the south-west, in which are nine or ten shallow recesses, each accommodating one large tree of a species of Citrus. There was one tree, a Seville Orange (*C. communis*), if memory does not deceive, 250 years old; and another, planted by Mr. Horsman's grandfather a hundred years ago! The common Orange (*C. aurantium*) and its Maltese variety, the Lemon (*C. limonum*) and the Sweet Lime (*C. limetta*), the Citron (*C. medica*), and the Shaddock (*C. decumana*), each had its niche, and was flourishing and fruiting freely in the open air, without any of the smut-like appearance seen on those under glass at Kingsbridge. The trees are kept severely pruned back, are protected by mats in winter, and are thoroughly manured yearly with soot and guano, the gravel being turned back from their roots for the purpose.

On the slope above this terrace were many interesting trees; Camellias, the Loquat (*Eriobotrya japonica*), Embotrium, a fine *Aracaria*, and a large *Eucalyptus*, with clumps of Bamboo (*B. metake* and *B. glaucescens*), and bushes of *Lycocateria formosa* and a *Hypericum*, which I believe to be *H. patulum*. There is an interesting series of this genus in the pleasure-garden at Kew just now; but I failed to recognise this species among the pretty branched shrubby kinds. Walking along a wood-side path I was much struck by the beauty of *Flex latifolium*, forming a large bushy tree, and by the numerous fine Cyresses, whilst *Euonymus* seemed to more than replace Holly as an evergreen under trees. Crossing the meadow towards the American garden, I first realised the great distinctness of habit in the Cornish Elm. Not sending out horizontal limbs, it has a Pearlike, almost pyramidal outline, with dark, glabrous, markedly oblique leaves, of a medium size. It does not usually fruit, but does not seem either to give off many suckers.

Luxuriating in perfectly undressed natural soil, a clayey loam, which is, I presume, mainly kaolin from the granite and slate of the interior, the American garden exceeds even the rest of the grounds in its wonderful luxuriance. We entered between walls of every kind of Rhododendron, the Himalayan species and many hybrids rivaling ponticum in size and general habit. Unfortunately none of the plants are named. *Gunnera scabra* was not placed so as to show to advantage, as it does on Sir George Mackay's lawn at Pendell; but a large tree of the rare *Halesia hispida*,

whose large pendulous racemes of white flowers were now over, a fine Chinese Juniper, and a gigantic *Cupressus macrocarpa* formed a most effective group. The latter tree, one of the earliest introduced, had a stem fully 2 feet in diameter, and more resembled a bushy young Lebanon Cedar than a Cypress. Winter's Bark (*Drimys Winteri*) in flower, *Magnolia Yulan*, the interestingly ternate-leaved Orange (*Choisya ternata*), and a variety of flourishing *Eucalypti*, were also among the collection. The latter, received as small plants from Kew, have now no names, but the Blue Gum, *E. globulus*, is not among them, as even here a winter is occasionally too much for it. Some of the trees rivalled in rapidity of growth those exhibited from the south of France at the Edinburgh Forestry Exhibition, giving a diameter of 4 inches for seven years' growth. An artificial streamlet filled with a luxuriant growth of *Richardia æthiopica* was the last feature we noticed before, having thanked Mr. Horsman for showing us a garden that reflects so much credit on his industry, we set off to catch the coach for Dartmouth. *G. S. Boulger.*

(To be continued.)

Orchid Notes and Cleanings.

CATLEYA BOWRINGIANA (AUTUMNALIS).

This very lovely new introduction is in bloom in several examples with Messrs. James Veitch & Son, who are the importers and holders of the stock. At first sight it might be taken for an autumn-flowering *C. Skinneri*, but examination reveals peculiarities which render it totally distinct from that species, or, indeed, from any *Catleya* in cultivation. The chief peculiarity consists in each of the pseudobulbs having an enlarged and flattened base, so that each of them seems to spring from a formation something like a pseudobulb of *Broughtonia sanguinea* or *Lælioopsis*. The pseudobulbs, too, are clad with sheaths of a very peculiar structure, and the leaves have a glaucous tint, which makes them resemble a tall form of *Epidendrum ciliare* or *E. cinnabarinum* more than a *Catleya Skinneri*. The flowers are in neat bunches, the sepals and petals being mauve-tinted rose, and the labellum dark crimson, with yellow stain in the throat. Flowering, as it does, in the very duldest season, *C. Bowringiana* will be a great acquisition, and more demands will be made for it no doubt than the limited stock will meet. *J. O'B.*

VANDA CÆRULEA.

There was lately at Lake House, Cheltenham, in the collection of G. Neville-Wyatt, Esq., a plant carrying the unusual quantity of ninety blossoms. *J. Cypher.*

CALANTHE VESTITA OCLATA GIGANTEA [Oh.]

possesses a remarkably showy character, and blossoms after some of its allies, thus affording a continuity of bloom. The foliage, moreover, remains green during the time of its flowering. It has long arching spikes, 3-4 feet in length, producing numerous flowers, which are large, and of a soft creamy-white colour, with a white lip, the base of the lip and underside being of a dazzling fiery red, which feature is the most striking characteristic of the variety. It blooms in March and April, and continues flowering for two months or more. *Condensed from the "Orchid Album," t. 211.*

ODONTOGLOSSUM RAMOSISSIMUM.

M. Linden, who discovered this brilliant species in the dense forests near Merida in Venezuela, at a height above the sea of more than 2000 metres, has described it by saying, "A magnificent species, with oval compressed pseudobulbs, flower-stem 2-3 feet long, covered with innumerable flowers of the purest white, petals rosy-purple at the base, lip purple." M. Roez adds that it grows also between the rivers Canca and Magdalena at a height of 4500 metres, exposed to slight frost at night and where a thick icy fog prevails almost constantly. *Lindenia*, t. 17.

ALPINE PLANTS.

LINARIAS.—The genus *Linaria* comprises about fifteen species, suitable to decorate our walls and rockeries. Some belong to the section of *Cymbalaria*, creeping over and hanging from the rocks, and are good for furnishing old walls. Their flowers are placed on long slender stems, which spread out on all sides or form long spikes. Others are erect, and show themselves in the form of a little bush, whose stems, more or less long and stiff, terminate in a bunch of flowers usually as compact as those of *Linaria vulgaris*. Lastly, a third section includes the species which, although creeping or trailing, bear their flowers on a terminal spike, as in *L. alpina*. None of these plants are difficult to cultivate, and if each has its special requirements it is easy to supply them. In the first section we find:—

Linaria cymbalaria, Linnæus.—So common as to need neither description nor particulars of cultivation. *L. hepaticifolia*, Duby, is a charming species, much more graceful than the preceding, and which when placed in good conditions is covered with flowers during all the season to such an extent that its leaves cannot be seen. It was covered with flowers until lately on our rockeries, where it has been flowering since the early spring. Much less inclined to run over the ground than *L. cymbalaria*, this elegant species, a native of the Corsican mountains, however, very rapidly covers the rockeries and the ground on which it is placed. It also suits walls very well. It succeeds everywhere, in the shade as well as in the sun; but if many flowers are wanted, it must be placed in the sun in a hole with little soil.

L. pilosa, De Candolle, a native of the Apennines, is a plant which approaches *L. cymbalaria*, but never develops itself so much and which even is rather difficult to propagate. The leaves are smaller and rounder than in *L. cymbalaria* and covered with hairs. The flowers are of a reddish-violet. It does best when fully exposed to the sun.

L. pallida, Tenore, of the Apennines, is the most beautiful of all the *Linarias*. Its flowers are very large, of a violet-blue, and decorated with a pretty spot of orange-yellow as in *L. alpina*, but much more apparent. It is sweet-scented. The large greyish leaves are like those of *L. cymbalaria*. This is one of the most decorative of rock plants. It likes a vertical position on the stones and the old walls, which it rapidly spreads over. It must be exposed to the sun and be planted in a strong soil. It is easily multiplied by parting the roots.

L. origanifolia, DC.—A native of the south of Europe, differs from the preceding in its foliage, which is near the other *Linarias*, and by its flowers which are less violet-blue.

L. macrostachya, Boissier and Reuter, is near to *L. origanifolia*. It is very graceful, with flowers on a longer peduncle and of a pale lilac colour. It comes from the lower zone of the Sierra Nevada, and requires exposure to the sun.

The second section includes:—

L. genistifolia, DC.—Southern Europe. This is the largest species which is cultivated on rockeries. The stem is 0.15 to 0.20 centimetres (6–8 inches), and bears broad and glaucous leaves. Flowers large, yellowish-white, and arranged in loose spikes. It requires a good and fertile soil, and is multiplied by seeds.

L. linifolia, Willdenow.—Tauria, Podolia. A smaller species, more compact, with small flowers of a bright yellow. It flowers all the summer.

L. striata, DC.—This is a charming little lilac flower, striped with lines of a deeper colour. It flowers all the summer.

L. tristis, Miller, is a species rarely cultivated. This plant, a native of Spain, is short, and has broad dark green leaves. The flowers, to the number of five or six, are placed in very short terminal bunches, and are marked by a blackish-brown spot on the upper lip. This spot is rather large and of a rather dark brown, so that the name *tristis* is quite appropriate to this species. *L. tristis* succeeds in a sandy, gravelly, and light soil exposed to the sun. It is reproduced by means of seeds and by the division of its tufts.

L. pyrenaica, DC., from the French Pyrenees, is a small compact species, very slender, and inconspicuous. It forms tufts, whose flowers, of a golden-yellow, are very decorative. It hardly attains the height of more than 5 or 6 centimetres (2–2½ inches), and assumes the appearance on the rocks of a golden

button, the outer stems lying on the ground as if to sustain the upper ones.

L. melanantha, Boiss.—Sierra de Guadarrama. A very pretty species, with delicate foliage, flowers of a brownish-yellow, fairly large and glandular. It likes dryness and exposure to the sun.

The third section furnishes:—

L. alpina, Miller, of the Alps of Europe, is one of the most pleasing species of the genus. Its glaucous leaves spread on the soil, and form little rosettes, which are pretty objects alone. I do not know what to say of the nice flowers on slender spikes rising from the centre of the pretty tuft. The corolla is of a fine lilac, with an orange spot on the upper side. *L. alpina* is generally supposed to be an annual or biennial species; but I have, however, grown some specimens which have lasted five or six years, which proves to me that it is a perennial. Its cultivation is easy. It wants a sandy soil, granitic or slaty, if possible, and very porous. When shown where it is desired to remain it succeeds better than when it is transplanted; however, if care is taken to transplant it in the autumn it will be sure to succeed. I brought some back from an excursion made on March 2 with my friend, Mr. Scott Wilson, and I notice with pleasure that they have made many roots in the pots into which they were put. They are in a very good condition, and to me appear to be prospering very well. Nevertheless I have observed that the plants raised from seed always become stronger and more floriferous than the others.

L. petraea, Jordan, seems to me to be nothing else than a variety of *L. alpina*. It is peculiar to the chain of the Jura, where the true type, *L. alpina*, is never met with. *L. petraea* is stronger and more vigorous than *L. alpina*. The stems, instead of lying on the ground are erect, or raise themselves at the extremity of their branches, the base of which creeps on the ground. The flowers are smaller, more numerous, and often deprived of the pure orange-yellow spot which characterises the species *alpina*. It was been flowering until lately on our rockeries.

L. anticaria, Boissier and Reuter, of the Spanish mountains (Trocal des Antequera).—*L. anticaria* is one of the best of the rock plants introduced from Spain. This species differs entirely from those described previously. Somewhat resembling *L. alpina*, it possesses a great likeness to *L. tristis*. Its foliage is glaucous and very elegant. Its stems are erect as in *L. petraea*, but much stronger. Its flowers are large and in compact bunches of a very pale lilac, nearly white, with dark spots on the upper lip. It is multiplied by seeds. *H. Corrodon, Geneva.*

The Apiary.

MOVING BEES.

THERE is no better time than the months of November and December for moving hives of bees. Many mistakes are made by novices on this point. If the habits of bees are studied these mistakes will not occur. When bees are provided with "seats and a station," as Virgil says, they immediately mark the spot, and when loaded with honey or pollen rise up into the air and fly in a straight line to their much-loved home. Now, if on a summer evening you move your hive only a dozen yards, you will have the following result:—The bees will rush out the next morning and will fly away to their work, not knowing their hive has been moved. When loaded they will fly straight to the old spot, and, not finding their home, some will fly wildly about the old spot till they sink exhausted; while others, perhaps, will endeavour to enter other hives, with almost the certain result of being slain. Even if their home is within a dozen yards they would never find it. If it is necessary to move hives in the summer move them a yard or less a day, but even that is better avoided; and from experience I would earnestly give the advice sometimes given to those about to get married, viz., "Don't."

But this time of the year, as bees are not flying, hives may be moved with impunity. I moved all my hives the first week in November, and I have not lost a bee. The reason is obvious. The bees are not flying at the present time. If a warm day came they would only play about their hives and go in again. During the winter some (very often many) old bees die, and others are born. In fact, a good part of the

population by April will be new, and when the bees, whether young or old, take their first spring flight, they will mark the spot and return.

There is no better way of arranging beehives than that called quincunx, or arranging them in fives. To make this clear, just mark off a perfect square on a plot of ground, put one hive at each corner of the square, and one in the middle, *i.e.*, where the diagonals would cross each other. This arrangement was so unintelligent to the ancients, who were by no means so unintelligent as some imagine. Cicero recommended planting trees in this order, and Cæsar applied it in the formation of his army. The advantages are these. The hives are equally distant from each other. Space is economised, because the quincunx system allows the greatest possible number of hives on a given area, and at the same time allows them to be the greatest distance apart. Even the bees teach us the quincunx system, for they make their cells on each side of the honeycomb with a very thin floor or septum between them. But the cells are not opposite each other, thus they do not have a common base, but the centres of the bases are arranged in fives, thus giving, at the same time, the greatest strength and the greatest space.

Once more, you may at this season of the year move your hives any distance, great or small, and if the bees, according to the ancient legend, come out on Christmas Eve and sing a carol, be very sure they will go in again when it is sung. *Agnes.*

FLORAL PYRAMIDS.

THOSE who have only seen Ivy-leaf Pelargoniums in an ordinary pot or bedding plant form can have no idea of the wondrous beauty got out of some of the free-growing kinds when treated to that end, and there can be no doubt that, as shown in the illustration (fig. 153), Mr. Proft, gardener to B. W. Currie, Esq., at that gentleman's truly lovely place at Coombe Warren, Surrey, has succeeded in displaying the highly decorative features of these plants in a very beautiful fashion. As basket plants, or even as ordinary pot plants, these Ivy-leaf forms have proved most serviceable. Generally, as bedding plants, with some few exceptions, they have proved too free of growth and shy of bloom, whilst for trellis, wall, or pillar training they have proved invaluable, though for those purposes they are too little used.

Few men have done more for the Ivy-leaf Pelargonium than has Mr. George, of Putney, and he will no doubt be specially interested to learn that the kinds which Mr. Proft finds so amenable for the production of those marvellous pyramids at Coombe Warren are of his raising. They are single forms, free growers, and profuse bloomers, not named at the time they came into Mr. Proft's hands, but the colours of the flowers are chiefly rosy-cerise, deep rosy-red, and rosy-lilac. There is no considerable admixture of colours in the sorts employed, not more than two being found in any one pyramid, as a too liberal employment of floral hues might materially detract from the undoubted beauty produced now. These pyramids, and there are many, composed both of these Pelargoniums and of *Heliotropes*, stand at the outer edge of the upper lawn terrace immediately fronting the quaint yet charming house, and range from 8 to 9 feet in height, with bases from 6 to 7 feet broad. They are not in tubs and composed of single or even of a few plants, for they are planted out, and the secret of the wondrous beauty found in the pyramid lies in the fact that Mr. Proft prepares his plants beforehand, having them of graduated heights, the tallest and those of full height being in the centre, and others worked in when the pyramid is tied out to fill the apex, and thus at the time of planting in May the whole of the trellis is neatly furnished. It does not do to prepare the plants for this sort of decorative work in the preceding year only. Really a large number are propagated every autumn and grown on through the following year in pots, tied close to small sticks, and thus in case of failure of old plants there is always an ample stock to fall back upon at planting-out time. The plants forming the pyramids are all lifted and potted in the autumn. In doing so the leaves are largely removed to enable the wood to be gathered up closely, and thus they occupy but a small space. A little warmth induces root-action and just enough is kept to prevent absolute stagnation until as the spring advances new growth is induced and the greater portion of these old ones live through the winter to go out again, the ample stock of succes-

sional plants on hand helping to fill vacancies. The trellises are composed of iron supports fixed in round the margins of the pyramids and brought together in the form of a cone; over which are secured stout wire and iron hoops, so that there is ample support to tie to. In every instance, not only were the pyramids perfectly furnished with short-jointed growth and luxuriant leafage, but they were almost masses of bloom. Of course, *Heliotropes* are less gay, but they prove admirable foils to the more glossy *Pelargoniums*. The method of producing plants is just the same, and the course of treatment throughout identical. At Coombe Warren the true pyramidal form is carefully ensured, but that is not an

ness of bloom, striking foliage, and admirable habit, how ever effective *Fuchsias* may be made in the flower-garden. At Coombe Warren one meets with a series of surprises, for its arrangements are diverse and unique, thus in another small enclosed garden may be found a wall covered with panels of *Heliotrope*, some 4 feet in width, alternated with half-pyramids of scarlet zonal and Ivy-leaf *Pelargoniums*. These so arranged prove to be a singularly attractive feature, whilst *Ampelopsis Veitchii* is being introduced to give a green background to the heads of the half-pyramids another year. Large quantities of standard and sharp-pointed pyramid *Laurustinus*, *Bays*, *Euonymus*, *Eurys*, and other suitable and striking shrubs

are projected, and doubtless will be carried out. In a large house were to be seen a lot of old standard Orange trees in big tubs: these had been beheaded in the summer, and then stood here with a quantity of stable manure about them to promote bottom-heat, and had broken remarkably well. Being retubed next spring, they would another year certainly develop grand heads. X.

MESSRS. VEITCH'S NURSERY.

THE large house built for the Cattleyas at this nursery contains, at the present time, but little in the way of bloom to delight the senses if we except a group of *Cattleya autumnalis* at the northern end, the cheerful tints of this most attractive species making the plants conspicuous a long way off. Nothing can exceed the healthy appearance of the other inmates of this house, the bulbs bigger and foliage stouter and fuller developed than we remember ever seeing in Cattleyas. With fine growth it is only natural to expect fine flowers, and the promise of these, as seen in the thousands of sheaths on the plants, is remarkable.

In the *Cypripedium* houses about twenty varieties and species were giving evidence of the blooming season having commenced, if, indeed, it ever comes to an end now. Seden's improved variety, named *Schroederii* is worthy of especial mention, as being a distinct and pretty flower—the tints more decided and brighter than in the original, and the inner surface of the lip is prettily spotted. The long tail-like side petals are very distinctive appendages of the variety. *C. Leeanum* is another hybrid which was found in bloom. It is a hybrid between *C. insignis* var. *Maulei* and the beautiful *C. Spicerianum*. The colour of the lip is brighter than in any other *insignis* variety, and the white colour is disposed as a margin to the dorsal petals, instead of being spread over the greater portion. It is a distinct variety, and worth attention. *C. Harrisianum superbum* is another handsome flower, the dorsal sepal in this variety being marked with very dark brownish-purple stripes, arranged vertically. Others were *C. Ashburtoniae*, *C. porphyrophyllum*, *C. Spicerianum*, *C. Sedeni*, *C. barbatum* varieties, *C. Arthurianum*, and *C. vexillatum*.

A strong piece of *Vanda Sanderiana*, with a fine mass of bloom on it, had been in flower some few weeks; the long-enduring blooms were showing just here and there slight signs of decay. Few *Orchids* last so long in bloom as this, or are of easier culture.

The curious *Angreæum* recently mentioned in these pages was observed in a small specimen carrying two blooms, the plant being accommodated in a teak-wood basket.

A few *Oncidium*s were blooming, notably *O. Jonesianum* and *O. Kramerianum*; a few also of *Phalenopsis*, as *violacea fragrans* and *P. Sanderiana*, but the bulk of the species were exhibiting only many long and strong spikes, yet to open in their proper season. *P. Esmeralda* was just past.

In *Odontoglossum*s there were in flower *O. Rossi*, a winter-blooming Mexican species, with white and purple flowers, always grateful at that season. There were a good many shades of colour noticed amongst these winter gems of the *Orchid*-house.

Pleiones, that associate well with the last-named, were likewise observed to be still in bloom. Of forms of *Odontoglossum crispum*, there was seen much variety in the numerous lovely spikes that were open in the house set apart for these plants. In the same were *Oncidium O'Brieni*, a diminutive flower of brown and gold, a useful thing in personal decoration, but not much of a decorative object in a pot—*O. varicosum* and *O. incurvum* lighting up with their bright hues of white, and brown, and pink.

Trichosme suavis and *Calanthe veratifolia*, the first conspicuous by the scent of its minute blooms, and the other by its pure white flower-spike, were in flower in the *Odontoglossum* house.

In other houses *Ipomœa Horsfalliæ* alba was showing many flowers, trained under a rafter; the late flowering *Amaryllis aulica platypetala*, a Brazilian species of some beauty at this time when the showing hybrids are at rest; and the *A. Eschyanthus splendens*, a plant every one with a stove ought to have, were showing bloom. As a greenhouse winter flowering plant, *Babingtonia camphorosma* is worthy of mention; it is not showy in any stage, but it is neat, elegant, and useful, either in the cut state or on

FIG. 153.—PYRAMIDAL IVY-LEAF PELARGONIUM. (SEE P. 684.)

absolute necessity, for if the plants having once filled the trellis were permitted somewhat free growth, they might develop into gigantic mounds or bushes. In the former case the plants are secure from injury by storms; in the latter they may suffer, although only in exposed positions. Certainly there are few gardeners who have seen or may see these beautiful pyramids but would wish to imitate them. On a wall backing a pretty parterre flower garden, Ivy-leaf *Pelargoniums*, with a few plants of the variegated *Abutilon* here and there, have been employed with striking effect to cover it, and there are growing in this garden a large number of dwarf standard plants of the *Fuchsia Wave of Life*, each some 2 feet in height, and with perfect umbrella-shaped heads, 30 inches over, that are at once singular and beautiful. These show, by their profuse-

are grown here and line the terrace walks, or dot the lawns. Not a few of these pyramids are 10 feet in height, and are most striking. All the features about the grounds are uncommon; as, for instance, a grass bank exposed to the sun planted with large quantities of *Heaths* in great variety; and in a few years—so well do the plants thrive in the soil—this lot of *Heaths* will have grown into a perfect mass. The variable features of the house are well matched by the interesting varieties met with in the grounds. Certainly the 30 acres enclosed within the fence, and which forms the pretty estate of Coombe Warren, are now nearly all converted from wild wood and Heather into delightful glades and beautiful smooth lawns, charming terrace garden, or other pleasing features of garden formation; but even yet other alterations and improve-

the plant, and blooming at this time is an additional merit. The colour is white, the flowers being single, silver-like, and disposed in erect spikes. *M.*

GREENHOUSE RHODODENDRONS.

The collection of greenhouse Rhododendrons to be seen at the present time is one full of interest to the visitor, for they are not only very attractive, but they afford an illustration of how rapidly an improvement of a marked character can be made with a flower when subjected to the operations of an intelligent cross-breeder.

The first of the race—Rhododendron javanicum—was introduced from Java in 1846, and in 1849 *R. jasminiflora*, a beautiful species with pure white flowers, having a pink eye, came from Malacca. This is a plant of an intermediate character, between a stove and a greenhouse subject, and should be grown in an intermediate-house. In 1860 *R. Lobbi* was introduced from Penang, and all three were grown at the Exeter Nurseries, by Mr. Taylor. This came from Mr. Lobb, and proved of great service by giving salmon and buff colours; and to all appearance gave other tints also of a desirable character. The first cross made by Mr. Taylor was at Exeter, between javanicum and jasminiflora, and from this came Princess Royal, with long funnel-shaped tubular flowers of a bright rose-colour; and Princess Alexandra, with flowers of the same shape, pure white in colour with pink stamens. There is no doubt but that the long-tubed character of the flowers was derived from *R. jasminiflorum*.

The main business of the firm having been removed from Exeter to Chelsea, Mr. Taylor went thither with his Rhododendrons, and resumed operations in the way of crossing. *Lobbi*, javanicum, and jasminiflorum were crossed in various ways. From this came Duchess of Connaught, bright vermilion-red; Duchess of Edinburgh, bright orange-scarlet; Taylori, bright pink; Maiden's Blush, white, suffused with the most delicate rose; and Princess Fredrica, soft pale buff, becomingly tinged with rose. Duchess of Edinburgh appeared in 1874; Maiden's Blush and Princess Fredrica in 1876; Taylori in 1877; Duchess of Teck, bright buff-yellow, dashed with orange-scarlet, and Prince Leopold, salmon-buff, in 1879; Duchess of Connaught in 1881, and Queen Victoria, light buff-yellow, suffused with rose, in 1882. These were all the results of Mr. Taylor's work, and all of the varieties were awarded First-class Certificates of Merit by the Royal Horticultural Society.

At this point Mr. H. al took up the work, and crossed several of Mr. Taylor's hybrids, and any fine seedlings that were available for the purpose, with the result that all the new varieties raised during the past three or four years are great improvements upon those which preceded them. Monarch, Sir Garnet Wolseley, Excelsior, Favourite, Sir B. Seymour, and Aurora appeared in 1882; Baron Henri Schroeder, Princess Christian, Thomas Moore, Scarlet Crown, Diadem, and Brilliant, in 1883; Princess Beatrice, President, Empress, and Conqueror, in 1884. During the past summer the following have been named:—Militaire, Cardinale, Incarnatum floribundum, Indian Yellow, Pearl, Mincerva, and Apollo. Nearly all of the foregoing have received Certificates of Merit from the Royal Horticultural Society, and all are single-flowered types.

There are something like three double-flowered varieties, and they originated in this way. Some seed was sown in 1876, and among the progeny Mr. Heal noticed one flower with a tendency to develop other petals in the centre; all the flowers but this were removed from the truss, and it was fertilised with its own pollen; from this cross came Balsaminiflora, rose; Balsaminiflora alba, white; and Balsaminiflora aurea, yellow.

The seed of the hybrid Rhododendrons is sown as soon as ripe in a gentle heat, and it germinates in three weeks or a month, but some more quickly than others. In twelve months they are in the thumb-pots, and then grow on, and bloom in 48-sized pots; but none of them flower under five years. But little culture is necessary for seedlings, except that the plants are kept in a fitting temperature, kept clean, and not allowed to suffer for want of water. The soil used is two-thirds peat, one-third loam, and a little sand.

These Rhododendrons are increased both by cuttings and by grafting. Cuttings may be put in at any time of the year; a shoot is taken off at a joint, put into a thumb-pot of peaty soil with some sand on the top;

generally the cutting is at the side of the pot, and the pots placed in a gentle bottom-heat. In autumn two months will expire before they take root; but in spring they root much more quickly.

Grafting is the more rapid process by which stock is increased. The best stocks are Princess Royal and Princess Alexandra. If a graft be taken with a good well-formed bud it will flower, and it is in this way the tiny flowering plants sometimes seen at South Kensington are produced.

The double varieties are very persistent in the duration of their blooms, and will last six and seven weeks in flower. They produce no pollen, and any additions to the group can be obtained only by the self-fertilisation of flowers producing superabundant petals. *R. D.*

TREES AND SHRUBS.

TAXUS BACCATA FASTIGIATA (THE IRISH YEW).—Unique examples of this very distinct variety of a dark green fastigate form are more or less common in many of the more important gardens of the West of England. In the geometrical garden at Montacute House, in Somersetshire, are very handsome specimens, and Messrs. Lacombe, Pierce & Co., Exeter Nursery, have some of the largest and finest I am familiar with (I say familiar advisedly, for I have known these intimately from my childhood), and they are flourishing in their prettily designed Italian garden. For contrast, there are some admirable dwarf rounded masses of *Abies clabrarliensis* and hemispherical Golden Yews, and pyramidal variegated Hollies, among which some handsome vases are interspersed, the whole producing an excellent effect. Altogether there are seventy-two of these grand formal-looking Irish Yews in this Italian garden.

SOPHORA VIOLACEA.

From its dwarf and compact, early flowering habit, this plant would seem to merit cultivation as a stove flowering subject. The leaves are long, narrow, and pinnate, with ovate and oblong obtuse leaflets. The inflorescence consists of terminal and lateral many-flowered racemes of blue or violet coloured flowers, the individuals of which are rather small. The upper petal or standard is much the larger, and serves to give character to the whole flower. The flowers are abundantly produced in the wild state, and a plant flowering lately in the stove at Kew was only 1 foot high. It is a native of Ceylon, and is found near the seashore on the south-west of the island, about, or not far from, Matura. The long jointed seed-pods produce seeds but sparingly, and these, being comparatively large in this as well as other species, give the fruit a knotted appearance, reminding one very forcibly of jointed Charlock. This species has recently been introduced to this country, and does not seem to have been figured anywhere. *J. F.*

PICEA PINSAPD CONING.

In the *Gardeners' Chronicle* of October 10 there appears an illustration of *Abies Pinsapo*, or more commonly called *Picea Pinsapo* (*fig. 99, p. 465*), also on p. 468 an account is given of the above tree bearing cones at Penrhyn Castle. Here, at Chesterford Park, one tree is loaded with cones—over 200; another with 100, and one with fifty. They do not grow singly on the branch as represented in the illustration, but in groups of various numbers. *Henry Eldridge.*

CASTANEA PUMILA.

is to be recommended for its dwarf habit (3 to 4 feet), hardness, and profuse production of catkins of white flowers, which contrast well with the dark green leaves. M. Goeschke, in the *Garten Zeitung*, recommends that the tree or bush be cut down occasionally, so as to induce the formation of new shoots, on which the flowering spikes are produced. It is a native of the Southern United States.

DESFONTAINEA SPINOSA.

I notice that during November and December of 1877 there was much interesting correspondence concerning this charming Peruvian evergreen flowering shrub in the *Gardeners' Chronicle*, and at p. 787, vol. viii., Mr. G. Dodd, of Woodstock Park, Kilkenny, promised to plant a bank of rockwork with ten dozen plants at 600 feet above sea-level. He also speaks of a specimen, 3 feet 9 inches by 4 feet,

having flowered well with him that season, and that its longest annual growth was 9 inches. Now after a lapse of eight years it would, I am sure, be useful information to many (presuming that the said plantation was made) to know how this bank of 120 *Desfontainas* succeeded, and their condition and appearance at the present time. There is something so quaint about its shining, spiny, Holly-like foliage, and its singular Fuchsia-like flowers, in Cornwall it is quite at home, and perfectly hardy; and I remember comparatively a common shrub there, and I remember seeing huge specimens in flower not long since in the highly ornamental grounds of Scorrier House, near Truro, but I have only met with a few small plants in Devonshire, excepting at Chaddlewood, Plympton, where are some of the finest specimens I know. The *Desfontainas* has never come under my notice in the adjoining counties. *W. Napper.*

THE ORCHID HOUSE.

SEASONABLE NOTES: CATTLEYS.

THE weather during the first half of November has been more than usually trying to Orchids of all sections; but there is, I fancy, most danger of the occupants of the intermediate-house being injured during a long spell of dull weather. The right thing to do under the present trying conditions is to avoid unduly exciting the plants into growth. Take the Cattleys, for instance. We have in our house two descriptions of plants—those that made their growth very early, and those that made late growths, or have not yet completed them. With large specimens such Cattleys as *C. Mossie*, *C. Mendilli*, *C. Trianae*, &c., there is no difficulty; they make their growths steadily after the flowering period is over, and steadily rest until it is time to develop. On the other hand, recently imported plants that are not flowered—or, perhaps, have done so once only—are with difficulty restrained; they made strong flowering growths in the summer, and unless most skillfully controlled they will again start into growth at most uncertain periods during the autumn and early winter months.

How is this unreasonable and useless growth to be prevented? It cannot be prevented entirely, but it may be held in check by close attention to the habit and vigour of the plants. When a very vigorous young plant has made its growth it ought to be kept rather dry at the roots, and in a cooler, more airy place. This is all that can be attempted at present. We have many plants of recently imported Cattleys and *Lælias* which are yet in all stages of development and formation of their pseudobulbs. We have placed such in the lightest and warmest part of the house, where they will continue slowly to develop their growths through the winter months.

Some of the *Pleiones* have gone out of bloom, others yet continue to develop their delicate beauty and tracery of colouring in the gloom of this murky month. They should be potted once in two years, and as soon as they go out of bloom. The young rootlets are already pushing out from the point where next season's flowering bulb is starting, and the sooner they are potted the less probability there is of injury. Some people grow them in shallow Orchid-pans; I fancy they grow stronger in ordinary flower-pots. The pots during the season become full of roots; a sure sign that they require more space than shallow pans can possibly afford them.

Enough has been said about *Vanda crerulea*, but these are now in full beauty here, arranged in a group with Ferns and other plants. They remain a long time in flower at this season, if the atmosphere is kept rather dry, and the temperature not more than 50° to 55° at night. The roots are not very active at present, and the plants do not require much water. *Cymbidiums* are now growing freely; indeed, this is a good time to repot any of them that may require it, especially such as *C. Lowianum*. The flower-spikes of this species are now pushing from the base of the last formed pseudobulbs; when this takes place they may be repotted. Some persons use peat only; others loam and peat mixed; while they have been found to do well in soil used for bedding plants.

The ordinary daily management of the houses consists in keeping up a night temperature of about 55°;

falling to 50° in cold weather. The amount of evaporation must be regulated by the weather. In close damp weather use water sparingly, and more freely when the pipes have been well heated to keep out sharp frosts. The atmosphere may be too dry, but it is more likely to be too moist, and it is better to err on the dry side.

ODONTOGLOSSUM CIRROSUM AND OTHER ORCHIDS.

I grow this species in the Cattleya-house during the winter months, and in the cool-house in summer. When they were grown in another cool-house, well exposed to the sun in winter, they did not require removal to the Cattleya-house. Our cool-house is now a lean-to, with a north aspect, and plants that succeeded well in the old house will not do in this during winter. The *O. cirrosus* is an illustration; the plants would all have been dead by this time if they had not been removed to the intermediate-house in winter; this was proved by keeping some of the plants in the cool-house. We grow the *O. Rossi majus* and *O. Cervantesii* in the cool-house; they are there now, and are doing well—just as well as the *O. cirrosus* are doing in the Cattleya-house. *Cœlogyne cristata*, *Lælia anceps*, and *Lycastes* we grow in the Cattleya-house. Referring for a moment to *Lycaste Skinneri*, we had two plants in the cool-house which made no progress. I moved one of them into the Cattleya-house, with the result that this plant very speedily grew away with much greater vigour than the other still in the cool-house; that plant was ultimately removed into the warmer house, where they are both doing well. I will remember the magnificent specimens of *Lycaste Skinneri* grown by Mr. Ward at The Poppars, Leyton, in a cool-house not any warmer than our own; we have treated them the same, but cannot command a like success; I am, therefore, quite prepared to admit that it is not easy to lay down a general rule as to the treatment of Orchids, but cannot admit that it is impossible to do so. It is quite possible, if all the cultural details are given, and the conditions under which the plants are grown. I believe success is attained in every branch of horticulture and floriculture by attention to the most minute details of the work, and have constantly urged the desirability of this. The position in which the plants are placed in the house is of very great importance also. The plants of *Odontoglossum Rossi majus* and *O. Cervantesii* are suspended close to the glass in baskets in our cool-house; perhaps they would not succeed so well as they do if they were placed on the stage.

Lælia autumnalis and *L. majalis* require rather different treatment; we are trying about a dozen plants of each placed quite close to the glass, and well exposed to the sun, in a warm greenhouse temperature, 40° to 45° in winter, with ample ventilation, keeping the plants very dry at the roots, but not altogether without water. I have been successful in growing and flowering *L. autumnalis* year after year, but cannot boast of a like success with *L. majalis*.
J. Douglas,

The Flower Garden.

THE next two months is the most trying time for bedding-out plants which, by being kept too closely shut up, damp and mildew will attack them. Air should be given freely on fine days, and keep the plants carefully looked over, and all decayed matter should be removed. See that all pits and frames are well protected at night; all tender plants, such as *Coleus* and *Alternanthera*, should have a minimum temperature of 60°—they do not winter well in a lower temperature, but most of the other flower garden plants will winter and be all the better in a temperature of 40° to 50° if they are kept dry both as to soil and atmosphere. Always water on fine days, and give plenty of air to dry the plants off.

TRANSPLANTING.

As the weather keeps mild this work should be pressed forward with all possible speed, so as to complete it before a change takes place. When frost and snow set in there will be but little chance of delicate shrubs succeeding, as the temperature of the soil decreases so rapidly at this season, and the atmo-

spheric conditions are also most unfavourable to growth. The operation of transplanting should not be delayed a day longer than is necessary. This work should be performed skilfully and quickly with great care not to expose the tender roots to the effect of the cold cutting winds, which is the cause of so many failures, and cannot be too strongly condemned. To obviate this mats should be in readiness. As soon as the tree or shrub is taken up the roots should be covered till it is replanted. Before commencing to plant either trees or shrubs the object and use for which they are ultimately intended should be duly considered, and only select such trees and shrubs whose habits and characters are found more suitable for the purpose intended. Due care should be taken to plant such kinds only as will succeed in the soil and situation to be planted. Inattention to these matters is too frequently the cause of failure and disappointment. Great care and attention should be paid to digging large holes, and where the soil is bad good fresh soil should be provided to plant the trees and shrubs in. As the operation proceeds every plant should be watered and mulched with litter, which protects them from frost and also from the cutting north-east wind in spring. The soil should be made firm round the stem and roots, and the stem firmly secured against wind and storms. *W. Smythe, The Gardens, Basing Park, Alton.*

THE PROPAGATOR.

THE PROPAGATION OF CONIFERS.

(Continued from p. 577.)

THE Thuiopsis varieties are excellent for ornamental purposes. In small pots they will last a considerable time in heavy condition, and are, therefore, very useful for the decoration of cool conservatories and winter gardens. A general batch of the cuttings should be taken at this time of the year.

Thuiopsis dolabrata—For the cuttings ripe and well developed pieces of the side growths, from 2 to 3 inches in length, should be selected. The bottoms of the stems should be levelled with a sharp knife, and any small leaves for an inch up the stems should be trimmed off. Twelve pieces can be dibbled round the edge of a 48-pot, and four in the middle. Each piece should be pressed in firmly, and the holes caused by dibbling should be filled up with dry sand. After having been watered the cutting-pots should be placed on a cold bottom in a shallow case or frame. While in the frame they must not be watered overhead, but with a fine spout-pot, and this must be done carefully to prevent the soil being washed up. Air must be given for an hour in the morning and for half-an-hour in the afternoon, and on sunny days they must be shaded. As soon as the cuttings are well rooted, the lights of the frame should be raised an inch, and left so day and night, and as the plants gain strength the lights should be raised higher and higher, until at length they are strong enough to be stood out upon the open platform of the house. They should be kept out upon the open platform for about ten days, and then be potted off into small 60-pots. After having been watered they should be placed on a coal-shaft bottom on a front platform. The house, by the way, should be heated just enough to keep out the frost.

When the plants have rooted through small 60's they should be potted into small 48's, watered, and replaced on the platform. They can be potted again when they are strong enough. They should be carefully watered during the winter months, and not allowed to become dry. As soon as the plants are well developed they can be taken to a cold house or frame, to be taken from thence and used for decorative purposes as required.

The cuttings of *T. dolabrata variegata*, *T. borealis*, *T. b. variegata*, and most of the *Cupressus*, can be treated in a similar way after they have been potted, but, unlike *T. dolabrata*, it is better to pot these cuttings into long thumb-pots.

The soil for the cuttings should be made up of half good yellow loam, quarter peat, and quarter sand and additional small quantities of charcoal and peatbuds, both finely broken up. The soil should be well mixed together and sifted and rubbed through a quarter-inch sieve. 48-sized pots or deep pans should be used for the cuttings of *T. dolabrata*. The pots should be well drained and filled with the soil above-mentioned, pressed in level with the rim of the pot. The soil should be watered before the cuttings are dibbled in.

When the plants are potted into 60's and afterwards, the soil used should be composed of half good yellow loam, quarter leaf-mould, and quarter river-sand, and small quantities of charcoal and ballast. *T. O'B,*

FRUITS UNDER GLASS.

PEACHES AND NECTARINES.

In the second division all ordinary work, as cleansing the house, &c., should be done off-hand. Prune the trees, and wash them with weak soapy water and a soft brush, and after cleansing the trellis, regulate and tie the trees to it again. Take about 3 inches of the old stuff off the surface of the border, and replace it with fresh material of a similar nature, and afterwards mulch and well saturate the border with water, and all will be ready for starting the trees at the time appointed.

LATE PEACHERIES.

These of late years have wonderfully increased in numbers by reason of many of the old Peach walls being now covered with glass constructions. This move undoubtedly is in the right direction, particularly when the variability of our climate, and its detrimental effects on these subjects when fully exposed to the elements, is duly considered. The reasonable cost of appliances now-a-days also has materially conduced towards the same end, so that with structures, and the means in them to exclude frost, with proper attention, the crops may safely be depended on under any external conditions whatever. As Peach and Nectarine trees can be transplanted and moved so readily when they have been properly planted beforehand without much damage to them being apprehended, no hesitation need exist in the mind of growers of limited experience about loss accruing to the subsequent crop through the operation. It more often happens that this is made even more satisfactory in every way. Trees of a reasonable size, or others can with safety be moved at any time when not frosty in the interval between November and March. Although it is computed by some that great advantages result from early planting of these subjects, I have as yet failed to discover any, and prefer, under whatever conditions the trees are placed, to let the wood of the current year's growth be as well matured as possible, before doing so. In the process of planting the chief matter to see to at the time, is to have the roots moist and to embed them firmly in the soil, and keep them moist subsequently. Any trees in an unsatisfactory state should have the roots seen to now, and those that are over-exuberant should be partially lifted, the roots shortened, and replanted. *G. T. Miles, Wycombe Abbey.*

The Kitchen Garden.

ROOTS.

It would be advisable to lift from the open quarters at once such roots as the following—*Asparagus*, *Parsnips*, *Jerusalem Artichokes*, and *Horseradish*—just sufficient for a few weeks' supply in case sudden sharp frosts should harden the ground and stop the lifting from open quarters. These should be laid in close together where protection will prevent the soil freezing much, so that a few things may be drawn out for use at any time, no matter how severe the weather may be. The bulk of the main lot of *Parsnips* and late sown *Carrots* will be best left in the ground and dug up as required.

The main sowing of *Carrots* which have completed their growth should now be lifted, trimmed and stored in a cool cellar, or in a clamp out-of-doors, similar to *Potatoes*. When storing, reject all damaged and split roots from the bulk.

Seakale roots which are intended to be removed from the open ground and forced under cover, should be lifted at once. Until required for forcing they should be laid in thickly in well drained soil, and the crowns protected from frost with leaves and litter. When lifting the plants save all the largest thongs for making cuttings for next spring's planting.

The cutting may be made at once, or the roots selected for this purpose may be placed in damp soil in a shed, or out-of-doors under protection. The cuttings can then be made at convenience when the weather is unfavourable for other work. Permanent plantations of *Seakale* and *Rhubarb* should have some leaves and litter placed over the crowns, and on the approach of severe weather some *Rhubarb* roots should be lifted for forcing. *G. H. Richards, Somerley,*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Nov. 30	Sale of Dutch Bulbs, Roses, Fruit Trees, &c., at Stevens' Rooms. Sale of Roses, Bulbs, &c., at Protheroe & Morris' Rooms.
TUESDAY, Dec. 1	
WEDNESDAY, Dec. 2	Sale of Dutch Bulbs, Roses, Fruit Trees, &c., at Stevens' Rooms. Sale of Plants, Roses, &c., at Protheroe & Morris' Rooms. Annual General Meeting of the National Rose Society. Sale of Imported and Established Orchids, and good Lignum auratum, &c., at Stevens' Rooms.
THURSDAY, Dec. 3	
FRIDAY, Dec. 4	Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Sale of Imported Orchids, at Protheroe & Morris' Rooms. Sale of Bulbs, Roses, Fruit Trees, &c., at Stevens' Rooms.
SATURDAY, Dec. 5	

THE announcement that at the end of this month KEW GARDENS will be without a HOOKER at their head will be read not only with regret, but with something approaching consternation. Kew and HOOKER, HOOKER and Kew, were, as it seemed, so inseparably combined that no severance could take place. If a HOOKER did not plant the seed he transferred it from the seed-bed and nursed it till it became a goodly tree, while another HOOKER still further developed the tree till it bore abundantly of flower and fruit and seed. In painer terms, Sir WILLIAM HOOKER found the garden at its lowest ebb. Shortly before his accession to the office of Director, to such a state of stagnation had the garden arrived that it was seriously proposed to hand over the collections to the Horticultural Society. In consequence of the report and recommendation of the former Editor of this journal, Sir WILLIAM (then Dr.) HOOKER removed from Glasgow, where he had already done wonders in establishing and maintaining a botanical correspondence and interchange of plants with all parts of the world, and assumed the post of Director of the Royal Gardens, Kew. Those who remember the old state of things, speak of HOOKER'S transforming touch as something magical. By his clear-headedness, his untrifling diligence and zeal, his extensive knowledge, his stately courtesy, and the encouragement he extended to all occupied in horticulture and botany, he raised Kew in a very short time from its low estate, and with the assistance of the ex-Curator, who still survives, made it the botanic garden of Europe. Actually dying in harness, at a ripe old age, just twenty years ago, Sir WILLIAM succeeded in the directorate by Dr. (now Sir JOSEPH) HOOKER. The career of the son is well known, at least its main features, to every botanist, and to most gardeners. His early travels in the antarctic regions with Sir JAMES ROSS, his adventurous wanderings in Sikkim Himalaya, whence he introduced so many of the glorious Rhododendrons, gave him fame, if not fortune, and on his return from India he occupied himself with the determination and distribution of the immense collections made by himself and Dr. THOMSON, and shortly after became Assistant-Director of the Gardens under his father, so that on the decease of Sir WILLIAM in 1865 it was universally felt that he, and he alone, was a fit successor.

During the twenty years that have elapsed, the record of Kew is one that the proud administrator might envy; the area has been greatly extended, the succulent-house, the T-range, have been erected, old houses have been removed, the herbaceous ground remodelled, the fruticetum and rock garden constructed, the arboretum vastly extended, the museums (three in number) greatly enlarged and improved, the new herbarium built, the "North" gallery installed, the Laboratory erected. The two latter establishments testify to the confidence reposed in the Director. Such munificent gifts would never have been

made to the public had there not been a general admiration of the administrative ability and competence of the Director. While all this new work has been undertaken and carried to a successful issue the maintenance and improvement of the old have been such as to elicit admiration; and herein the chief has been well seconded by the Assistant-Director, Mr. DYER, Mr. JOHN SMITH (who occupies the same position that his namesake did under the directorate of Sir WILLIAM), and the other officers of the establishment.

So far we have alluded to results which all can see for themselves, but all the time that this work of extension, supervision, and maintenance has been going on, a vast amount of work has been thrown upon Sir JOSEPH, or rather he has himself developed it in connection with India and our colonies. The father, Sir WILLIAM, early endeavoured to make Kew the great botanical centre of the English-speaking world, and the idea has been fully developed by the son. Kew is now the head centre of a series of botanic gardens and similar establishments throughout the empire. The diffusion of information, the interchange of plants has been most beneficial, but it has entailed on the directorate at Kew a vast amount of correspondence on all matters connected not only with scientific botany but with practical or economic botany, and with methods of cultivation. In this way Kew has taken a large share in the collection and dispersal of the Cinchonas in India and elsewhere, which is of untold and ever-increasing value. A similar statement may be made with reference to Tea, to Gutta-percha, and Caoutchouc yielding trees, and to very many more useful plants distributed mainly through the agency of Kew. This is, indeed, a vast work, but one of which but few of the hundreds of thousands of annual visitors to Kew know anything. While all these labours have been carried out unintermittently Sir JOSEPH has found time to undertake and carry through an amount of purely scientific work which if he had done nothing else would have of itself been considered remarkable. We have not space to do more than mention his many classical papers, on systematic Botany and Botanical Geography, his Floras of the antarctic regions, of New Zealand, of Tasmania, and his co-operation with the late Mr. BENTHAM in the elaboration of the *Genera Plantarum*. When one calls to mind the amount of detail and drudgery which must have been encountered to bring such works to a conclusion it becomes a matter of astonishment how in the midst of the official duties of administration so much can have been achieved. But this is not all. While all this was in progress Sir JOSEPH, abandoning the traditions of his early education, warmly adopted the now generally accepted Darwinian views of evolution, took his share in the government of the Linnean, the Geographical, the Geological, the Royal, and of other Societies. For a few years he filled the chair of NEWTON at the Royal Society; he has presided over the British Association, and taken much active interest in the Royal Horticultural Society, over the Scientific Committee of which he has presided for some years.

It is no matter for wonder that Sir JOSEPH should, after twenty years' such labour, varied by travel in Western America, and in Syria, and in the far less accessible Morocco, desire to be relieved from the strain and responsibility of official duties, but his reasons are characteristic. The *Flora of British India* has occupied several years to bring it to its present state, with the assistance of several collaborators; at least a third remains to be accomplished. Apart from his pre-eminent capabilities as a botanist Sir JOSEPH has a knowledge of local and special matters relating to Indian botany

that no one else possesses, or is likely to possess. To obtain leisure to complete the *Flora of India* is, then, one of the main reasons which have induced Sir JOSEPH to tender his resignation. It is some satisfaction to know that the completion of this work will necessitate his frequent presence at Kew (though in an unofficial capacity). There, in the noble herbarium originally formed by his father, so largely extended by himself, and in which so much of his own life and work has been spent, Sir JOSEPH will, it is to be hoped, find leisure to complete those works which heretofore must have been sadly hampered by administrative duties.

In any case we respectfully offer to Sir JOSEPH, on his retirement, the expression of our admiration and gratitude for his botanical services, and for the proud consciousness that, much as we may be behind some nations in certain branches of science, in no country in the world is there an establishment of like nature which can take rank with Kew.

—APPLE AND PEAR CONGRESS, EDINBURGH.—We have obtained through our reporter a skeleton report of the fruits of Scotland, Ireland, and Canada. That for England, which was represented by sixteen counties, and Wales by one, will appear, together with more detailed information, in our next issue. The exhibits noticed are stated to be the most important of the show.

—"HOLLY LEAVES"—The Christmas Number of the *Illustrated Sporting and Dramatic News* has been published, and will be found varied and attractive. The woodcuts are numerous and good, and the coloured plate alone worth the money.

—LINNEAN SOCIETY OF LONDON.—A meeting will be held on Thursday, December 3, at 8 P.M., when the following papers will be read:—1. "On Castilleja elastica and some allied plants," Sir J. D. HOOKER. 2. "Effects of the Solar Spectrum on the Transpiration in Plants," Rev. G. HENSLOW. 3. "Parasites collected by the late CHARLES DARWIN," Professor COBOLD. 4. "Variations of the Cirri in Comatulæ," F. H. CARPENTER.

—BEURRÉ CLAIRGEAU.—Mr. EWENK writes that, not having the record at hand when he wrote previously, he under-estimated the produce of this tree. We now learn that from one tree the gardener plucked *manu propria* 300 large Pears. At least another hundred were gathered early to obviate damage by the wind, or were blown off. These windfalls were all utilised in one way or another.

—"JOURNAL OF THE SCOTTISH METEOROLOGICAL SOCIETY.—This valuable publication contains the third of Mr. BUCHAN'S papers on the climate of the British Isles, and which is devoted to the consideration of the rainfall. Mr. BUCHAN here has made use of the very extensive series of records got together by Mr. SYMONS. The heaviest rainfall—80 inches and upwards—occurs in Skye, the Lake district, and the mountain districts of Wales. Dartmoor is nearly as wet, as also is Galway. In the Lake district, at Syte, the rainfall amounts to as much as 185.9 inches, at Beddgelert, in Wales, to 116.9 inches. The smallest rainfall, from 22—25 inches, occurs in the south-eastern districts. Everywhere it is seen that the key to the distribution of the rainfall is the direction of the rain-bringing winds, to the physical configuration of the surface. Tables are given showing the mean annual rainfall for 547 places in Scotland, 1080 in England and Wales, and 213 in Ireland. Papers follow on the meteorology of Ben Nevis, of Culloden in Inverness-shire, of Dundee, Central Uruguay, Sao Antonio (Buenos Ayres), of the several northern light-houses, as well as tabular results of very numerous stations in Scotland, the whole forming a most valuable mass of statistical information for future use.

—"AUSTRALIAN ORCHIDS."—The last part of this valuable publication, embodying the observations of Mr. FITZGERALD, and with full-sized illustrations and copious analytical details, is before us. The species figured and described are *Eriochilus autumnalis* and scaber, *Caladenia reticulata* and *leptochila*, *Bobophyllum mautesissimum*, *Galeola Ledgeri*, *Chiloglottis trilobris*, *diphylla*, *Gunnii* and *Muelleri*;

Cryptostylis longifolia, *C. ovata*, *Pterostylis recurva* and *turfosa*, *Cleistesoma Beckleri*, *C. Keffordii*, *Thelymitra crinita* and *T. mucida*. Very few of these would find favour with those who grow Orchids only

mentioned in our columns as the tiniest of Orchids. It looks more like a *Jungermannia* at first glance than an Orchid. It grows on rocks in wet situations exposed to the sun at Ballina, on the Richmond

is *Galcolia Ledgeri*, the subject of the next plate. This is the largest Orchid in Australia, and is found in the same locality as the preceding. It is worthy a place in the collection for its showy appearance. It is an epiphyte growing on trees, with no true leaves, but leaf-like bracts at the base of the main branches of the inflorescence. From the nodes opposite to these bracts, and also from the ordinary nodes, proceed long roots [?] which dilate at the distal end into flat sometimes lobed and digitate expansions, by means of which it adheres to the trees. These are very curious, and their development and structure should be studied by those who have the chance. The yellow flowers are numerous, in loose branching panicles, sometimes 6 feet in length, by 3 feet in breadth. Each flower measures 1½ inch and upwards across. The five segments are oblong acute, waxy, dull yellow, the lip projecting, trowel-shaped, rosy-pink in colour, and covered with numerous irregular fleshy lobe-like processes. *Chiloglottis trilabra* has all three petals lip-like, as happens in cases of *peloria*, but the lip still differs from the other petals in being jointed, and therefore adapted to insect fertilisation, the lip acting as a spring and pressing the insect visitor with its load of pollen against the column. The species of *Thelymitra* have nearly regular flowers (as in regular *peloria*), but nevertheless, according to Mr. FITZGERALD, they are fertilised by insects, or rather "fertilisation passes in *Thelymitra* from total dependence on insects to constant self-fertilisation, according to the cohesive or crumbling character of the pollen."

— *DICKSONIA LATHAMI*.—We are now enabled to give a figure (fig. 154) showing a portion of the frond, and some botanical details of the noble and remarkable Fern described by our old colleague, Mr. THOMAS MOORE, at p. 584. The interest attaching to it is enhanced by the probability of its hybrid character.

— A HYBRID PALM.—Some years ago M. NAUDIN mentioned in our columns the fact that the flowers of *Chamærops humilis*, fertilised by the pollen of *Phoenix dactylifera*, had produced fruits and seedlings. Some of the latter have since flowered, and M. CARRIÈRE gives, in a recent number of the *Revue Horticole*, an account of a second cross effected by fertilising the flowers of the hybrid with pollen from *Chamærops excelsa*. The original hybrid received the name of *Microphœnix decipiens* ×; M. CARRIÈRE now proposes the name *MICROPHENIX SAHUTI* × for the new hybrid raised by M. SAHUT, of Montpellier. From the description given it appears that the new hybrid is quite intermediate between its parents, resembling the pollen-parent in the fruit and the purple colour of the base of the leaf-stalk, and partaking of the habit, mode of growth, and foliage of the seed-parent.

— *LILIUM POLYPHYLLUM*.—The *Illustration Horticole*, t. 565, gives a coloured figure of this handsome Afghan Lily, which has lanceolate leaves, drooping funnel-shaped flowers, about 4 inches long, with recurved segments, yellowish, sprinkled with reddish-purple spots of about the same length as the narrow flower tube.

— PLANT LICE.—Those who read French will be glad to possess M. LICHTENSTEIN'S *Les Pucerons*, for Mr. BUCKTON'S splendid work on *British Aphides* is, unfortunately, not likely to be available for the majority. The part before us contains a list of the works consulted by the author, a complete list of species and genera, and, what is of great service to botanists and cultivators, an alphabetical list of all genera of the plants known to be affected by particular aphides, with the names of the latter. Thus, species of *Rosa* find sustenance for ten different species of aphids, species of *Salix* to twenty-three; *Fuchsias* have but one species, and *Aconitum* is also only credited with one, but as the latter plant is as poisonous (to man) as the *Fuchsia* is harmless, it would seem that one which is a man's poison may be an insect's food. To these lists follow chapters on the anatomy and life history of the insects, which are of the greatest importance to cultivators, as in the case of the *Phylloxera*, but which we cannot here enter into, partly by reason of their complexity, partly because some of the most important matters connected with it are still matters of controversy. Three coloured plates, illustrative of various galls on the leaf-stalks of *Poplars*, accompany this useful

FIG. 154.—*DICKSONIA LATHAMI*.

as pretty flowers, but to real Orchid lovers and students many of them are of very great interest, and by them Mr. FITZGERALD'S notes and illustrations will be very highly valued, as indeed they deserve to be. *Bolbophyllum minutissimum* has already been

River, and was first found in 1849 on the site where now the city of Sydney stands. It is one of those species likely soon to disappear. Mr. FITZGERALD shows that it is distinct either from *Dendrobium* or *Bolbophyllum*. Contrasting strongly with this

tractise, which may be had of WILLIAMS & NOR-GATE, or other foreign booksellers.

— **BROMELIADS.**—The sixth part of M. F. ANTOINE'S magnificent publication, *Phyto Iconographie des Bromeliacées*, has lately been issued. It consists of large folio lithographic plates, partly coloured and showing the habit and details of the species. The species illustrated are Karatas Innocenti, t. 26, sometimes referred to Nidularium, the innermost or floral leaves of the nest-like tuft being of a red colour. The leaves are oblong, strap-shaped, acute, recurved, finely toothed at the edges. The flowers are greenish. Karatas Scheremidewii—a name few Englishmen could hope to pronounce or spell—has a similar habit, but the leaves are narrower, more acute, and the flowers bluish at the tips. Karatas Laurentii has oblong leaves, obtuse, with a strong curved mucro, and more or less blotched and spotted. Karatas acanthocheater is a noble species, with very broad, oblong, obtuse leaves, terminated by a stout mucro. K. coriacea is similar but smaller, and with the leaves entire, not toothed at the margin.

— **THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—The funds of this institution appear to be in a more satisfactory condition than heretofore, thanks to the great exertions that have been put forth by the committee of management, greatly assisted by their energetic Secretary, Mr. CUTLER. Such being the case, we are requested by the committee to announce that, owing to the unusual number of vacancies, the whole of the candidates for pensions, numbering twenty-six, will be put on the list of pensioners without election. The committee, by deciding so to act, have strained a point, and candidates will this time have the satisfaction of being saved the trouble, expense, and disappointment in some cases, consequent on a personal canvass. We regret to hear that Mr. SPARY, formerly of The Graperies, Brighton, is obliged to claim the aid of the Institution, owing to reverses in business. He is eighty-two years old. The annual meeting is fixed for Friday, January 15, for the transaction of the customary business. The committee have decided that the card collection shall finally close on December 1, and they will be greatly aided in their work by collectors sending in their cards by that date.

— **ORCHID EXPORTATION FROM BRAZIL.**—We confess to a certain feeling of satisfaction at reading the following extract from a letter written by one of the collectors of the Compagnie Continentale:—"The Municipal Council (of the island of St. Catherine) has also imposed a tax of 500,000 reis (= 2500 francs), on each individual leaving the island with plants, and an additional tax of 5 per cent. provincial dues; and all this because a collector last year boasted to have taken from the island more than 100,000 francs worth of Orchids, saying that the Brazilians were simpletons who did not know the value of their weeds, as they call the Orchids. I force the time when, all the countries acting in the same way, Orchids will become very rare in Europe, and where it will not be easy in future to introduce them in large masses. It is alleged that certain districts formerly rich in Orchids are no longer so now. The great fault does not, however, depend on an excessive quantity of Orchids sent to Europe; but on collectors, who after having obtained the desired numbers, set the forests on fire and thus destroy the plants and prevent them from being collected by others." If this be true, hanging is too good for such murderers.

— **LEPTOSPERMUM LANIGERUM.**—This beautiful greenhouse myrtaceous shrub is a native of Tasmania and New South Wales, with tomentose branches, linear leaves, and numerous circular, flat, white flowers, each about three-quarters of an inch wide. It is well suited for the greenhouse and conservatory, requiring but little water during the resting period. It is well figured in the *Illustration Horticole*, t. 570.

— **HONOURS TO HORTICULTURE.**—The following distinctions have been accorded to Belgian horticulturists:—MM. Philippe Jansens of Brussels, and M. Edward Morren of Liège, have been made Officers of the Order of Leopold; MM. Ignatius de Beucker, Louis Delrué-Schrevens, Adolphe d'Haene Madame Caroline Le Grelle d'Hanis, M. Dieudonné Masange de Louvrex of Bailionville, M. Joseph Moens,

M. Auguste Peeters, M. Spré-Vander Meulen, and M. Charles Eeckhaut, received decorations. How strange it would seem in this country if Mr. Ware of Tottenham, Mr. Barr, Messrs. Paul, Mr. Maurice Young, or others who contributed to the success of the late Inventions Exhibition, or the members of the Scientific Committee, were named members of the Order of Victoria.

— **A QUESTIONABLE EXHIBIT.**—At a Californian fair a large Squash, painted green, was exhibited as an "Irish Water Melon."

— **BUD-VARIATION IN CHRYSANTHEMUM.**—Mr. MAWLEY kindly forwards us a sport from Madame B. Rendatler, a Japanese variety, with orange-pink florets of irregular, often lobed, form. The sport shows itself in the form of a proliferation of the inflorescence, exactly as in the Hen-and-Chicken Daisy, the number of adventitious side-buds being very large, and, what is interesting, all the flowers on the sport are pale yellow, and show little or no trace of the irregularity of the type. We do not know the original of Madame Rendatler, but this sport points to the probability that it was a yellow-flowered variety. Indeed, so far as variations in colour go, though the superficial appearances may differ greatly, the change is really of the slightest, a very little more or less colouring matter making all the difference.

— **CALANTHE VEITCHII.**—Cultivators of Orchids will be acquainted with that peculiarity of Calanthe Veitchii, of producing flowers of varying degrees of colour, which may vary from bright cerise to colour so pale as to be almost white. Mr. H. WILLIAMS points out that the deepest tinted blooms are invariably the produce of those pseudobulbs which have a "waist" made as if a ligature had been tied round the bulb before it had arrived at full size, causing thereby a contraction at that point. There is no indication of ill-health in bulbs so formed, the foliage and flower-spikes growing to their normal size, but so fixed has the peculiarity become that bulbs of this species are selected for their colour in their resting period by the shape of the bulb alone. Analogous peculiarities will occur to cultivators amongst other species of plants grown in gardens, and would seem to indicate both want of vigour and poverty of the colouring matter of the flowers, but usually the former.

— **ASARUM THUNDERGII.**—Authors seem much divided about the naming of this plant, judging from its synonymy. It is accordingly variously known as *Asarum japonicum* and *Heterotropa asaroides*, besides the above name. *Heterotropa* is dropped in the *Genera Plantarum*, where the characters are considered too trivial or too inconstant to warrant the division of the genus into sections even. The lurid purple perianth is contracted at the orifice, which is surrounded by numerous whitish appendages, and far exceeds in size those of *A. europæum*, often cultivated in the open border, with a small wide open perianth. The flowers, notwithstanding, can only be regarded as curious. The large cordate, subsagittate leaves, on the other hand, are leathery and deep green, with a broad grey band carried round the upper surface, resembling in a measure those of a Cyclamen. On this account alone it deserves a place in the greenhouse. Some plants of this species in flower may be seen in the Cape-house at Kew. It is figured in the *Botanical Magazine*, t. 4933, and in *REGEL'S Gartenflora*, 928.

— **INDIARUBBER IN NICARAGUA.**—Reports from Nicaragua on the rubber trade continue to refer to the falling off in the supply. The rubber trees, it is stated, along the banks of the river San Juan and the neighbourhood of Greytown have been almost entirely destroyed by the short-sighted policy of the rubber cutters, and the entire want of efficient police supervision. The men who formerly worked in these forests, who bought their provisions and sold their Indiarubber in Greytown, are now dispersed along the Mosquitoo coast.

— **TILLANDSIA LINDENI VERA.**—Amongst Bromeliads this is undoubtedly a gem, which recommends itself to the cultivator in various ways. It is easily cultivated, requires small space for its development, and lasts a long time in beauty. The slender leaves are numerous, and gracefully arch on all sides,

From amongst these the peduncle emerges a short way, supporting an ensiform or elliptic inflorescence about 4 inches long. The bracts are clear rose-carmine, much compressed laterally, and densely imbricated in two ranks, just allowing the petals to be protruded at the apex. These are large and bright blue, constituting a fine contrast to the bracts, and being developed successively, prolong its flowering season. There is a plant of this fine form of the species flowering in the stove at Kew. It is a variable plant in a state of Nature, and much confusion prevailed about the naming of it as the different varieties came into flower. A history of the species is given in the *Gardener's Chronicle*, 1879, xii., p. 461, where three varieties are distinctly defined, with a figure of the variety T. L. Regelliana, differing in its longer peduncle and green bracts. The variety under notice is figured in the *Illustration Horticole*, 1869, p. 610.

— **JUDGES AT THE PENNSYLVANIA STATE FAIR FLOWER EXHIBITION.**—The Philadelphians pride themselves on the way they exhibited cut flowers at the State Fair. "One amusing incident in connection with the show of funeral designs to which my attention was drawn" (says a writer in the *American Florist*) "was the appointment of judges. At the request of one of the exhibitors, three undertakers (or to be more accurate, three funeral directors) formed the majority of the judges; two florists were appointed to act with the funeral directors. It was a curious fact, that when it came to a vote on who should have first premium, the undertakers voted one way, and the florists the other, and yet the florists signed the report. Would it not have been better for them to have presented a minority report? Just for satisfaction many men would have done so, and would have given their reasons why they had done so, in intelligent writing. What do funeral directors know of cut flower work?"

— **VRIESIA HIROGLYPHICA.**—This magnificent Bromeliad is figured in the *Belysque Horticole*, 1885, t. 10. The leaves are 70—80 cm. long (nearly 3 feet), 12 cm. (or 5 inches) wide, oblong strap-shaped, bright green, marked transversely with broad irregular black markings. The flower-spike is 1 m. 20—1 m. 20 cm. in height, bearing above a branching panicle of numerous yellow flowers, each about 2 inches long. The plant is a native of Brazil.

— **COVENT GARDEN.**—The articles now in season are rather few as regards number, and will doubtless remain so till the Christmas goods arrive. Nevertheless, there is a good all-round supply of fruit, which is chiefly foreign. Apples from Canada, seemingly in good condition, are there in large quantities, and of Pines and Bananas from the West and East Indies respectively large consignments arrive. Grapes are to be seen in large quantities, both British and Spanish, varying from 6s. to 4s. per pound. The vegetable supply is of Celery, Leeks, Sprouts, &c., and salads in a very young state are to be had as well as Asparagus in a like condition. Lemons, Oranges, and Limes have now begun to come in in quantity, and of all qualities and sizes, some being almost too small for use. Spain sends Melons and Onions chiefly, besides other fruits; the Onions are rather small, but fine and clean. Custard Apples from Madeira, Seakale, Celeric, and, of course, Medlars, are now in the market. In the plants in pots Tulips and Ferns may be mentioned as having just come in, as also have Poinsettias, Christmas Roses, Carnations, Ericas, Cyclamen, and Epiphyllums, are the chief of the flowering plants to be seen now. Among cut flowers of course Chrysanthemums are predominant; but a good supply of cut Orchids and Pelargoniums, Eucharis, and Roman Hyacinths give relief. A lot of Ivy leaves, and a small display of Holly are among the quieter-looking decorative material.

— **FORTEA KERMESINA.**—There is a good figure of this plant in the *Revue Horticole*, 1870, p. 230, where, however, the writer says its characters do not differ from those of *Bilbergia*. The base of the perianth is prolonged beyond the top of the ovary into a deep cup, narrow and thick walled at the base, much wider, with thinner striate walls upwards, from the mouth of which the sepals are free. The sepals of *Bilbergia*, on the other hand, are free from the top of the ovary. The leaves, of a deep bronzy-red on both surfaces, are arranged in a close vaseiform rosette,

attaining a length of 2-2½ feet, and arching towards their tip. The inflorescence is as conspicuous and ornamental as the foliage, forming a stout club-shaped head, consisting of large concave bracts of a clear rose-red colour, enclosing numerous clusters of flowers. The deep blue petals are exerted about 1 inch beyond the sepals, which are pale pink or flesh coloured. The former resemble those of a *Bilbergia* externally, but the latter are tipped with a bristle and developed on one side into an appendage larger than themselves. For garden decorative purposes the plant is distinct both in colour of the leaves and attractiveness or conspicuousness of the inflorescence. A large plant has been flowering for some time in the Victoria-house at Kew.

— **CINCHONA BARK.**—The *Pharmaceutical Journal* states that "During the twelve months ending September 30 last the total quantity of Cinchona bark exported from Ceylon amounted to 11,678,360 lb. (1,143,140 lb. of branch bark and 10,535,220 lb. of trunk bark), being 185,143 lb. in excess of the total quantity exported during the previous twelve months."

— **CHRYSOPHYLLUM CAINITO.**—The "Star Apple," a tropical American fruit, is well figured in the *Illustration Horticole*, t. 567. It is a globular fruit, of the size of the largest Apple, purplish red on the outside, with 5-10 cavities in the interior, each with a single seed. The tree belongs to the Sapota family.

— **THE TREES ON THE EMBANKMENT.**—On Saturday last workmen commenced the taking up and cleansing of the perforated iron gratings, and the loosening of the soil about the roots of the double row of Plane trees throughout the length of the Victoria Embankment, and in the adjacent avenues. These young trees, numbering altogether about 800, stand the smoke of London well, and are found for the most part to be flourishing. Their healthy condition, however, depends much upon the access of rain-water to the roots through the iron gratings let into the pavement, the holes in which become after a time entirely choked up by the mud and dust. Not the faintest smell of gas-leakage—that mortal foe of London trees—could be detected on Saturday in the loosened mould, a result due, no doubt, in some measure to the copious percolation of water through the soil.

— **LÆLIA PERRINI AND VARS.**—An Orchid which flowers in the last three months of the year is considered specially valuable, and we, therefore, find autumn-flowering *Odontoglossum*, such as *O. vexillarium* var., or the autumn-blooming *Cattleya labiata*, are of much greater value in the market than the spring or summer flowering forms. The above *Lælia* belongs to the few late-blooming species, and as it is both large and beautiful in its flowers it is a most desirable plant. At present it is somewhat rare, although it is not difficult to keep in health and induce to flower. Plants of it are now in flower at Kew, where, in addition to the pink-flowered type, there is also a variety with the petals and sepals pure white, the lip being pale yellow on the disc and light purple at the apex. Another beautiful variety is that known as *irrorata*, in which the petals and sepals are of the lightest rose colour, and the lip marked as in the last-mentioned. Both these varieties, as well as the type, thrive under the same treatment as suits *Cattleya Skinneri* and *C. Mossie*. The pseudobulbs are long, rather thin at the base, and compressed upwards, and the leaf is stiff, 8 inches long, and dark green. The flowers are produced two or three together upon a short stalk, which develops on the apex of the matured growth of the current year. After flowering the plants should be rested for a few weeks by keeping them cool and rather dry.

— **ANACARDIUM OCCIDENTALE.**—The *Illustration Horticole* gives at plate 573 an excellent illustration of the Acorn of Cashew nut, *Anacardium occidentale*, the flower-stalk of which swells into a pulpy Pear-shaped "fruit" of a brilliant red colour externally. The true fruit is a kidney-shaped nut placed on the end of the stalk. The flavour of the fruit stalk is pleasant acid, and much in favour in tropical countries.

— **GARDENING APPOINTMENT.**—EDWARD TAYLOR, late Gardener at Spinfield Hall, Marlow, has been appointed Gardener to Mrs. CHAMBERLAIN, Cranberry Park, Winchester, Hants.

CRACKING OF APPLES AND PEARS CAUSED BY CLADOSPORIUM DENDRITICUM.

THE worst form of cracking in Apples and Pears is caused by a fungus named *Cladosporium dendriticum*, Wallroth. It not only attacks the fruit, and causes

FIG. 155.—APPLE ATTACKED WITH THE FUNGUS WHICH CAUSES CRACKING, CLADOSPORIUM DENDRITICUM.

serious cracking, but in the spring it grows upon the leaves, and forms black, dendritic, arborescent spots, that is, spots a quarter of an inch or more across, which branch in all directions like a miniature black tree. The fungus also attacks the petals, anthers, and pistils of the flowers, and in bad cases causes abortion of the fruit. The name *Cladosporium*—from *klados*, a branch, and *spora*, a spore or seed, refers to

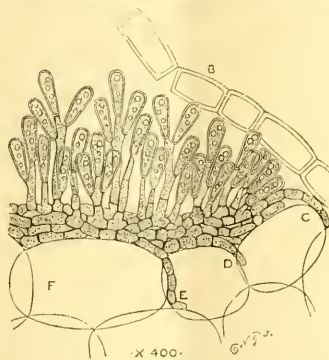

FIG. 156.—CLADOSPORIUM DENDRITICUM.

Upper figure magnified 5 times; lower figure shows a section magnified 400 diameters.

the arborescent habit of the fungus; dendriticum refers to the form of the spots.

Sometimes the spots take dendritic shapes on the fruit, especially in mild cases, and in the earlier growth of the fungus, but as the disease advances the spots become sub-rotund, black, and depressed, with a thin white margin, as shown in the accompanying illustration, fig. 155.

If the spots are examined with a lens they will be seen, if magnified five diameters, as shown in the

upper part of fig. 156. The white margin of each spot is now seen to be the burst and lacerated transparent membrane of the Apple or Pear, as the case may be; and the black portion is a compact mass of brown spores or seeds which have grown, and are still growing, underneath the membrane. As the fungus grows it constantly tears open the membrane of the fruit, and the mycelium or spawn of the *Cladosporium*, which lives upon the juices of the fruit, burrows into the flesh, and causes cracks. The cracks are at first slight, and these at length become confluent, and in bad cases, as every gardener knows, very deep fissures are presented, which expose the inner substance of the fruit, and make it unsightly, unmarketable, and ultimately cause it to rot. If a vertical section be made through the margin of one of the small spots, and enlarged 400 diameters (the scale so often used in the *Gardeners' Chronicle* for illustrations of this class) it will be seen, if the section is well made, something like the lower part of fig. 157. At *n* the epidermis of the leaf, composed of transparent cells, is shown pushed away from the pulp of the fruit, *C*, *D*, *E*, and *F*, by the fungus. The fungus itself consists of brown profusely jointed mycelium, or spawn, which sends up short slightly branched shafts, which carry long egg-shaped conidio-spores analogous to seeds; each spore has numerous colourless spots. The spawn threads at *C*, *D*, and *E* are seen pushing themselves between the cells of the fruit, and so setting up the early condition of cracking.

Cladosporium dendriticum is often referred to in horticultural and botanical books as *Helminthosporium pyriforme*; it is also known as *Fusicladium dendriticum*. The form which attacks Pears has been distinguished as *Fusicladium pyriforme*; another that injures Cherries as *F. cerasi*; a species or variety also grows on a Garden Hawthorn, *Crataegus pyracantha*. The late Mr. Alfred Snee, who was badly plagued by these fungi in his gardens at Hackbridge, expressed the opinion that the fungus on his Siberian Crabs was also distinct from the pest which invaded his Pears. Peyl has boldly cut the Gordian knot belonging to the names of several species or varieties of this fungus by terming a group of forms *Cladosporium polymorphum*—that is, the *Cladosporium* of many forms.

The variety of Pears most injured in Mr. Snee's garden were the *Louise Bonne* and *Easter Beurré*. Mr. Snee has said that the *Cladosporium* always first appeared with him when cold south-west winds were blowing in early summer, and he writes, "We have found the best remedy is to lift the trees and give them some good top spit loam." This remedy was applied to trees, seen by the writer, which had the foliage of summer reduced to tinder by the attacks of the fungus. The injury to the foliage, of course, dwarfs the fruit, and the dwarfed fruit becomes cracked and rotten by the ravages of the loquus, which in the early summer spotted and scorched the leaves.

Allied species attack *Asparagus*, others grow on *Alder*, *Angelica*, *Fumaria*, &c.

It is extremely difficult to suggest any means either for the prevention of cracking, or its cure, for the spores of the fungus seem in some seasons to infest the air, and wherever they fall they invade either the foliage, blossoms, or fruit. It is very probable that fruits with a thin membrane suffer most, and that coarser fruits, like the coarser Potatoes, are armour-proof against the attacks of the *Cladosporium*. I need hardly say that all cracks in fruits are not necessarily caused by the fungus here described.

For an illustrated account of a fungus extremely destructive to Apples and Pears, *Oidium fructigenum*, Schr., see present volume of *Gardeners' Chronicle*, p. 51. *W. G. Smith, Dunstable.*

CITRUS TRIFLORA.—The want of appreciation shown of really valuable and interesting plants, often of easy culture, is a feature which plant lovers and journalists not only have daily reason to deplore, but which they do their best to remedy, though with little effect, in the teeth of those enemies to progress—fashion and heedlessness. Our French contemporary, the *Revue Horticole*, in giving a coloured plate of it, protests with justice against the neglect of this plant, a hardy Orange—hardy, that is, at Kew, to our knowledge—with rigid spiny green branches, 3-foliate leaves, studded with translucent oil-glands, like a *Myrtle*, and with Orange blossoms for flowers. In this country, we believe, it has not borne fruit in the open air, but our contemporary suggests that by cross-breeding it might be possible to obtain an Orange which should, even in these Northern climes, ripen its fruit in the open air, or at least against a wall.

HOME CORRESPONDENCE.

Vanda cœrulea.—Some further remarks on this plant are found at p. 627. Mr. Anderson introducing at the same time other Orchids. My object when writing on this subject at first, was to show that *Vanda cœrulea* was not a difficult subject to deal with. I say it is as easily managed as any other *Vanda*. Does Mr. Anderson say it is not? It was also stated by me that this was a cheap plant now, and could be obtained by the cultivator of humble means. That statement, I presume, is not denied. I have not had an opportunity of growing *V. cœrulea* for twenty years, but I have seen it under the care of a gardener, flowering splendidly after twenty-five years. I have only tried my hand with two of the species mentioned by Mr. Anderson—viz., *Cattleya superba* and *Oncidium Lancœnum*. The last-named I purchased in 1865—a small plant, which increased in size rapidly and flowered well, being in splendid health up to two years ago, when, owing to an accident, it is not now in good health, but will I hope recover. It was in splendid health at the end of eighteen years' culture, and flowered well. The treatment it received was to grow it in a teak basket in the warmest house. It was suspended from the rafters with the leaves close to the glass from the 1st of November until the end of February; during the remainder of the time it was placed on the stage with other plants. Of *Cattleya superba* I had several plants which were grown and flowered quite ten years in succession. I tried to grow it in pots with the same treatment that the usual run of *Cattleyas* receive, but totally failed. My next attempt was to attach the plants to a stump of Tree Fern, and suspend them close up to the glass. There *C. superba* succeeded perfectly and flowered freely in the warmest house for many years. Mr. Anderson has not quoted me correctly. I did not say "seven," but eighteen months. I fancy the Editor knows what experience I have had with Orchids. I grew them fairly well before Mr. Anderson commenced their culture at Meadowbank, nor do I see how "crowing" applies to me. One may surely mention one's own experience. There are two classes of teachers:—1st. Those who are daily working amongst their plants, putting every one of them with their own hands, watching the development of leaf and bud, carefully considering the position each plant has to occupy, and moving it nearer to the glass at one time, and again selecting for it a more retired position on the stage as the sun gains more power. That has been my work for nearly twenty-five years, and I have ventured to recommend to others any details of the work that may have been interesting, or that has tended to success. 2d. We have the theoretical man, useful, no doubt, in suggesting new systems of culture, or inventing new baskets, or material in which to grow the plants, or he may have charge of a large collection of Orchids, but is too dignified or too busy with other matters to be able to find time to give his plants much personal attention. We have, 3dly, the gardener or amateur in "long clothes," who has not had much experience, but who is anxious to learn, and who ought to be encouraged, instead of snuffed-out by those who have had so much experience as Mr. Anderson and myself. J. D.

Cuscuta reflexa.—The "Nepal Dodder," grown here on Ivy as a foster-parent, is now very pretty, its wiry growths covered with small bell-shaped *Erica*-like flowers. At a little distance in the greenhouse these exhale a pleasant perfume, but the odour is not so pleasant at close quarters. Outside it grows rampant on Willow, or Forsythia, but it shows best on the dark Ivy leaves; 5" of frost kill it down entirely. As you will observe the specimen sent has strayed from its foster-parent, the Ivy, to the young leaves of *Agave americana variegata*. *F. W. Eurbidge*. [A pretty plant in bloom, with its snow-white oval bells, but a dangerous introduction to the plant-houses unless carefully controlled. Ed.]

Gros Colmar Grape.—In compliance with the wish of your correspondent, Mr. Hudson (p. 664), to have some information respecting the treatment of the above-named Grape, as shown by me at the Maidenhead Chrysanthemum exhibition recently, I give the following particulars of my

treatment of the Vine:—It is grown in a house planted with late varieties, and has no special treatment whatever. The Vines have been planted about six years, and occupy a narrow inside border, which consists of the usual materials; but the roots are allowed free access to an outside border in the ordinary soil, and which was simply trenched, getting at the same time a liberal dressing of half-inch bones, some soot and lime rubbish well worked in. It receives annually a dressing of short stable manure. The Vines in question are allowed to break naturally, and are then assisted with a little fire-heat when required. I find it is a great advantage to allow the Vine to make plenty of foliage, and not to stop so hard as is usually done, and a young rod or two is taken up yearly in order to keep up healthy root-action, and to afford shade to the bunches. By the above treatment I have been enabled to produce Grapes equal to those in question for several years past. The crop averages about fifteen bunches to a rod. *T. Lockie, Oakley Court, Windsor*.

Rosemary.—The sweet-smelling old favourite is scarcely so tender as some of the readers of gardening papers seem to suppose, although it is seldom seen growing with any vigour. There is one thing that militates against its well-doing, and that is removal. It likes to be let alone, and that may be one reason that it is not often met with in small gardens. The cottager seldom "moves" anything, partly because he has doubts as to his ability to do so with success, but more from association and innate disinclination. Twenty years ago—and it may be it is there now, for *Rosemary* is very long-lived—there grew on the sunny side of a cottage at Loughton in Essex a bush of *Rosemary*, that was at that period as high as the window-sill (4 feet), and which was at least 6 feet in breadth, the unusual difference between breadth and height having been brought about by annual cutting-back of the young growths on the upper part, which would unrestricted have obscured the outlook from the window. This plant's stem, so far as I can recollect, stood about 18 inches from the wall, the depth of the plant from front to back being about 3 feet. The situation was high, and doubtless well drained, which, combined with the warm position, were conditions that favoured its growth, and prevented damage from frost. *W.*

New Dahlias.—What is a fair estimate of the new Dahlias sent out in 1885? is a fitting question to put just now, at the time when cultivators are taking stock of the variety they have grown, and are determining what to retain and what to reject. That it proved a very trying season to cultivators must be generally admitted. The dry weather set in almost before the plants were established in their blooming quarters; and it continued right up to the end of August, or early in September. Then the black thrips was abundant, and with it other vermin that prey upon the flowers; and it was only by dint of constant watering that the plants were kept growing so as to produce flowers up to show mark. How persistently this must have been done was seen at the Crystal Palace exhibition, where flowers were staged of remarkable quality, the season considered—large, symmetrical, well-coloured, and clean; and the delicately tinted flowers were particularly good; that fine variety *Mrs. Gladstone* being in the very best form, and the fact that this sort was selected for premier honours in the show division testifies to its excellence. I had an opportunity of seeing the new varieties in flower in Messrs. Keyes, Williams & Co.'s nursery at Salisbury. Their *Dahlia*, suffered much from the drought, and therefore in estimating the qualities of any particular variety, some allowance must be made on the score of weather, and the trying circumstances under which they were grown. The three new varieties sent out by Messrs. Keyes, Williams & Co., were as follows:—*Falcon*, light lawn colour, very constant, free, of fine form, a charming and very pleasing flower; *James Huntley*, a good purple self, early flowering, constant, very fine and striking; and *Mrs. Langtry*, cream colour, beautifully edged with crimson, a flower of a lovely type, constant, and good habit: three good useful varieties. Mr. C. Turner had a batch of nine show varieties, one of which, *Dugleman* (Fellows), dark maroon, shaded with bright crimson, I did not see in flower; *Harry Turner* is a dark self of a velvety-blackness, and with the slightest crimson tip, good build, fine petal, and

a good useful flower; *Mrs. Douglas* is a bright scarlet self in the way of *James Backhouse*, and likely to be very useful to the exhibitor: it has a good outline and petal, and is very bright in colour; *Mrs. Glasscock* is a white self, something in the way of *Miss Henshaw*, but poor as seen, probably the season had not proved favourable to its wellbeing. *Mrs. Kendall*, white ground, heavily tipped with purple, is of a very pretty colour, but rough as seen, yet likely to be good in a more favourable season; *T. J. Saltmarsh*, yellow, deeply edged with red, is a very constant and useful large back-row flower that is likely to be found in many exhibition stands: *William Dodds*, orange, or orange-buff, is a very promising variety, but requires a moister summer to bring it to perfection—it will make a useful show variety. All these, with the exception of *Dugleman*, were raised by Messrs. Rawlings Bros., of Romford, who appear to have hit upon a very fine strain of seedlings. *Pandora* (Fellows), a delicate lilac self, has a good habit of growth, but it was very rough as seen growing—it needs another season's trial; *Sybil* is of a reddish-buff colour, in the way of the old *Cherub*—a promising and good useful flower. Of the new fancy varieties I take the *Salisbury* batch first:—*General Gordon* fully deserves all the praise bestowed upon it last season: it has a very peculiar but desirable habit, blooming freely from the very base of the plant—the yellow ground petals are tipped with bright scarlet: it will occasionally come as a bright scarlet self, and then it is very rich in colour: finally, it is very constant; *Neptune* is bright orange, striped with crimson, a very pretty bright fancy, useful, and fully constant; *Romeo*, buff, striped with maroon, is a bright good fancy, but it is reflexed in shape. The Slough batch of fancies consisted of six varieties, two of which were raised by the Rev. C. Fellows, as follows:—*Adventure*, pale ground, striped and marked with red, but very rough as seen, the season being against it; and *Mrs. Friseton*, crimson-purple, tipped with white, apparently a late variety, not to be had until late in the season. The following three were raised by Messrs. Rawlings Bros.:—*Charles Turner*, light buff ground, striped with maroon: somewhat dull looking, but a good useful fancy; *Henry Eckford*, yellow, or light buff, striped with scarlet, marked like *Hercules*: a good useful variety of dwarf habit; and *Mrs. Carter*, crimson-purple tipped with white, good shaped, but at *Salisbury* nearly every flower had come as a crimson self. Lastly, *W. G. Head* (Turner), a dark flower slightly striped with crimson, but mainly self-coloured, and then very like *William Rawlings*. One noticeable fact in these new varieties was their general dwarf growth. The large majority of them average 3 feet, and not exceeding 4 feet; and many of them possess the character necessary to a good useful decorative *Dahlia*, that of throwing up the flowers erect, and not drooping, as many of the old varieties used to. Tall growing exhibition *Dahlias* are now the exception, whereas they were formerly the rule. Some are found saying that in the new *Dahlias* of the present time they can see little or no improvement over the flowers of ten or twelve years ago. To this it is certain that raisers and cultivators for exhibition will take exception. There is a perceptible improvement, but it is of necessity much less marked than it was a score of years ago. But in the habit of growth there has been a marked improvement; and old *Dahlia* growers are found saying that constitution in the plants and constancy in the flowers have so developed of late years that flowers are much easier to get than they were in times past. These are among the gains made by *Dahlia* raisers. *R. D.*

The Champion Chrysanthemums at Home.—Many hundreds of people have lately seen, admired, and wondered at the perfection of the *Chrysanthemum* flowers that have been exhibited from Swanmore Park, but I venture to say that had they been so fortunate as the writer has been to have seen them at home, their wonder would have been turned into amazement. First, in respect of the large number of plants; second, the myriads of flowers, and scarcely a second-rate one amongst them; thirdly, the luxuriant foliage and sturdy growth of the plants; and fourthly, the arrangement of them in the various houses in such a manner that every flower of every plant is visible at the first sight—a task of no mean order, when it is considered that the plants range from 3 to 12 feet in height. A description of the arrangement is an im-

possibility, and I will not attempt it, further than to say that the whole forms one of those sights that those who wish to keep themselves free from the Chrysanthemum craze should not witness, as it would, if they were at all hesitating, completely convert them. As showing Mr. Molyneux's passion for this flower, there is a south wall covered with plants on which have been bestowed as much pains as the exhibition plants have received; and well have they repaid the labour by the number and fine quality of their flowers, many being nearly equal to those on the indoor plants. So much for Chrysanthemums at Swanmore, and lest any one should think that other departments are neglected, I have simply to say, go and see some of the finest Grapes in the kingdom, the same of Peaches, and other fruits, greenhouse and stove plants, hardy shrubs, herbaceous plants, and flowering plants generally. W. H. Myers, Esq., has just cause to be proud of his garden as I know his gardener is of serving such a generous and appreciative employer. W. W.

most monotonous, and seems somehow soon to provoke satiety on the part of show visitors. On the other hand, whilst it really affords the best method of staging for the benefit of judging, just as Roses, Dahlias, and similar flowers are, the plan is most advantageous to exhibitors, because it enables them to carry their blooms to exhibitions over long distances in the most convenient and desirable fashion. Any system of staging flowers, for instance, which threw the blooms up materially above the present level would render it needful to have deeper or larger travelling boxes or cases, in addition to which it is difficult to see what would be gained if any such plan were universally adopted, because it would be about the same as now exists, and no more. If it be desired to obtain some more pleasing or decorative method of exhibiting Chrysanthemums, apart from that which ordinarily exists, and for other than competitive purposes, then stands or boxes may be ignored altogether, and vases or epergnes employed. If even in such arrangements the quality of blooms is to be a feature

ing for the production of effect no doubt the Japanese blooms would prove the most useful and pleasing. Very likely in any such effect we should see the majority of decorators tempted to introduce too many colours, but that would be a mistake, as some two or three striking yet harmonious hues would be far more pleasing and acceptable. The National Chrysanthemum Society may not be deterred by the ill success of its previous well-intentioned efforts from trying yet farther what original methods of showing flowers can be displayed, but it will do well to make it clear whether the special objects of these efforts is to find a more pleasing method than now exists of exhibiting show flowers, or whether it simply wishes to ascertain what decorative effects can be evolved out of, say, a dozen ordinary Chrysanthemum blooms of any kind and in any way. With respect to Mr. Cannell's remarkable show of cut flowers, and all so originally and for his purpose so effectively arranged, it is but fair to say that no one has ever attempted previously to present the public with such a novel and attractive display of Chrysanthemum blooms. A. D.

Amasonia punicea.—This beautiful flowering stove shrub remains in bloom for a long time, which adds greatly to its decorative value. A plant that came into flower on August 8 was as gaily bloomed at the end of October as at any time. Every little piece appears to produce blossoms, and cuttings only two months' struck were seen showing for flower. Its striking distinctness of character is self-evident. R. D.

Second Leafing and Flowering of a Lime Tree.—There is a Lime tree on the estate at Bank Grove, Kingston-on-Thames, which presents a remarkable appearance at the present time. About the middle of August it lost all its foliage through the dryness of the season, a few days after it commenced to grow again, and about the end of September it was in full leaf and in flower the second time and it has looked beautiful and green since up to the beginning of last week, when the frost commenced, which has made it look rather brown in some parts. C. Atwell.

Chrysanthemums at the Royal Nursery, Slough.—A thoroughly representative collection of these flowers has made, and still continues to make, a grand display at the above nursery. One large structure that formerly accommodated the famous Slough Azaleas is filled with a most select and varied assortment of the Japanese varieties, whilst in another long house are grouped on either side of the path a mixed collection, which, viewed from either end, forms a most attractive vista. In another house, of somewhat lofty dimensions, are arranged the cream of the incurved varieties, among which are many flowers that would hold their own in any exhibition stand. Other houses are filled with later varieties that will extend the season well on to Christmas. The entire collection forms an exhibition in itself, and if it were possible to arrange them all under one roof the effect would be something unique in its character and instructive in its results if only for comparison. J. H.

Begonia, John Heal.—This new hybrid is remarkable for the length of time its flowers will remain fresh in a cut state. Some flowers were taken from a plant on October 14, and on October 23 they were to all appearance as fresh as when cut. The blossoms do not drop quickly as in the case of the ordinary tuberous-rooted types, and the flowers are all male. At present there does not appear to be any possibility of obtaining seed from it. R. D.

FIG. 157.—ASTER WASHINGTON NEEDLE.

Aster Washington Needle.—This, a new variety of Aster, partakes of the characteristics of the thread-petalled varieties of Japanese hybrid Chrysanthemums, now become so much admired. It is of pyramidal growth, with needle-shaped flowers of 4 to 5 inches in diameter; it is the largest Aster having needle-formed petals, and is one of the novelties of 1886 to be sent out by Messrs. Haage & Schmidt, Erfurt. (See fig. 157.)

Exhibiting Chrysanthemum Blooms.—The well meant efforts of the National Chrysanthemum Society to promote some other than the present stereotyped method of staging flowers, seems so far to have failed that the various new methods exhibited at the Royal Aquarium the other day obtained no commendation. It is just possible that exhibitors felt their hands tied by the stipulation that the flowers should be "staged," as this term has a well understood and a limited application. It is well known that staging show flowers signifies placing them so that they may be most fully displayed for the inspection of the judges, and no method has yet excelled that so universally in vogue. The system is horribly flat and

then all blooms must be faced to the front, and that would materially detract from any charm attached to novel or effective arrangement. Thus the style adopted with material success by Mr. Cannell at the Aquarium show of exhibiting his fine collection of flowers in conical bunches, after the now prevailing fashion of exhibiting single Dahlias, whilst permitting the flowers to be fronted to the observer yet gave some air of stiffness and formality to the grouping just because it was obviously impossible that flowers could remain in such positions except by employing some adventitious aid. Show blooms of Chrysanthemums are so large that they group badly in any sort of way, and therefore if arranged loosely or naturally more than usual skill is needed to avoid lumpiness and formality, which seems otherwise almost inevitable. Perhaps some interesting effects might be obtained by showing dozens of blooms in round flat baskets filled with moss, especially in distinct colours, or a deeper basket holding some half-dozen tall Hyacinth glasses covered with moss into each of which were dipped some three or four blooms on stems of diverse length, thus varying the height of the flowers. In all these methods of group-

Reports of Societies.

EDINBURGH BOTANICAL: Nov. 12.

(Concluded from p. 652.)

II. "Report of Half-Hardy Plants growing on the East Coast of Arran." By the Rev. E. Landborough, Kilmorock. (The other specimens mentioned, the girths are taken 5 feet from the ground.)

"In my report this year I will confine myself almost exclusively to Gum trees, Tree Ferns, Tree Lilies, and Watties."

THE EUCALYPTUS IN ARRAN.

"No tree so fully represents the beautiful saying of Scripture, 'The leaves of the fig tree were for the healing of the nations,' as the Gum Trees of Australia. They heal the land by drying the poisonous marsh. They heal the air by emitting quantities of ozone to purify it, by removing injurious organic matter. They heal man himself by preventing the spread of diseases by arresting the entrance of fever; by allaying the irritation of cough, and by giving sleep to the sleepless."

"We rejoice to be able to report that many species of this tree grow in Arran. They are as follows:—

"1. The Blue Gum (*Eucalyptus globulus*).—This is the best known, and most extensively planted of all the Gums. It germinates freely, grows rapidly, and attains a great height—as high as 330 feet. When young its leaves are soft, and covered with a blue bloom, and diffuse abundantly a camphoroid odour, also in that oil which has been found to be beneficial as a medicine. Like most of the Gums, its appearance in the earlier years of its growth is very different from what it becomes when the tree is more advanced. Then the leaves acquire a scimitar shape, become leathery, diffuse less perfume, and the tree is altogether much less attractive. In this country it has also the disadvantage of being delicate—no tree in Scotland, growing in the open air, having survived the severe winter of 1866—61, except the one at Captain Brown's, Craighay, Lanish. It is now about 30 feet in height, and has 10 to 12 inches in girth; and the plant grows at Strabane, Brodick. The species is named from the form of the leaves when the plant is young. It has not yet bloomed in Arran, nor any of the others.

"2. The Twiggy or Manna Gum (*E. viminalis*).—This may be called the Weeping Gum, for its flexible drooping from the Blue Gum in the leaves being round and leathery, and in the branches being very slender, the leaves much resemble the Blue Gum in perfume, bloom, and also in hue, though this is somewhat more of a plum colour. This species is very hardy. A large tree is found at Whittinghame, near Letham. One has been planted this year at Lanish. It is named *E. viminalis*, from the slenderness of its branches.—Manna Gum from manna being obtained from it.

"3. The Almond-leaved Gum (*E. amygdalina*).—This and *Eucalyptus colera* are the tallest trees in the world, growing, in some instances, to the height of nearly 600 feet. A tree of this species has grown at Cromla, Corrie, for about fourteen years. It is somewhat slow in growth, being only about 23 feet in height and 10 inches in girth. This Gum is more hardy than the Blue Gum, but not so hardy as some other species. It is named from the leaves resembling those of the Almond tree. It and the Blue Gum are the species from which the oil of commerce is principally obtained.

"4. The White Gum (*E. pauciflora* syn. *coriacea*).—In 1874 I received a specimen of this Gum from Mr. Bailey, Government Botanist, Queensland; it had been gathered on the Blue Mountains, New South Wales. I sowed it at once. The following year (1875) it was planted at Craighay, Lanish. It is already 133 feet in height, and 74 inches in girth, and probably will one day be the tallest tree of any kind in Scotland, and probably in Britain. It is so hardy that not even a leaf was browned in the severe winter of 1880—81. Its leaves are very large, approaching the size of those of the Blue Gum. They are covered with a white bloom. It is the White Gum because of the whiteness of the trunk after the annual shedding of the bark. It is a native of Tasmania, and its white trunk gives a peculiar character to the forests of that great island. Plants of it grow also at Brodick and Corrie.

"5. The Alpine Gum (*E. alpina*).—This tree is a very interesting and important addition to the forestry of Arran, as it is altogether diverse in habit from any of the Gums formerly introduced. Its leaf is large, thick, and remarkably broad, 9 inches by 11. It is specially illustrative of that class of plants which Australia only enables them to expose themselves edgewise, instead of horizontally, to the sun, for the development of one side of the leaf is almost twice that of the other, and thus the superior weight of the one side causes it to hang down. To make the one side white and erect, the other side of the tree also corresponds to the shape of the leaf, being broad and close. This tree also illustrates the well-known fact that some alpine plants grow well in the vicinity of the sea. This tree, which, as its name denotes, is a native of the high mountains of Australia, is at Corrie Hotel, Arran, growing in fullest luxuriance within 24 yards of the sea, at high water. It was planted last year, and is now 33 feet in height. I send a leaf.

"6. The Cider Gum or Mountain White Gum (*E. gummiata*).—This tree is small, of a light green colour, and are highly odoriferous. It is very hardy, and grows in the open air in Kew. A plant 6 feet 5 inches in height grows at Craighay, Lanish; a smaller one at the Free Church Manse, Whittinghame. It receives the name of Cider Gum from the liquid that flows from it when the bark is pierced.

"7. The Umb-bearing Gum (*E. urigera*).—The leaves of this species are of medium size and of a dark green colour. It grows at Strabane, Brodick, and is very hardy. It receives its name from the shape of the vessel containing its seed.

"8. The Iron-bearing Gum (*E. coccifera*).—This differs from most of the Gums in the leaves being leathery, even when the plant is very young. They are small and of a dark bluish colour, and look as if covered with bloom. This species is very hardy. A tree of it is found at Powdermill Castle, Kenton, Devonshire, more than 60 feet in height and more than a foot in diameter. A tree of what I consider this species, though the authorities at Kew have pronounced it to be *E. amygdalina*, grows at Castle Kennedy, Wigtonshire. It grows at several places in Arran.

"In addition to the above mentioned Gums already in Arran, through the kindness of friends allowing me to plant them in their gardens, I may mention that I have specimens of the Fig-leaved Gum (*E. ficifolia*), from Broken Inlet, Western Australia. It grows of which, as its name denotes, resembles those of a species of Fig. It is also remarkable for flowering when comparatively young, and from the flowers being of a crimson colour; I have also a plant of the crimson-flowered Iron-Bark (*E. leucocoxylon* var. *coccinea*), whose flowers are magenta-coloured. Its leaves are small and narrow, and the stem is slender, so that it quite resembles a Babylinian Willow. Its wood is said to excel that of all other trees in hardness. I have also the red Iron-Bark (*E. siderophylla*), the bark of which, as its name tells, is almost iron-like in hardness. Its leaves are small, and the veins of which are red, on account of which it is named the red Iron-Bark.

"This summer I have further, through William Stewart, Esq., been favoured by receiving from Sir F. Mueller, Government Botanist, Victoria, several of the *Coniferae*—these have just germinated; also of *E. pauciflora*, the White Gum already mentioned, as growing so well in Arran. I have also received a similar favour from Mr. Bailey, Government Botanist, Queensland, who has sent the seeds of a rare and most valuable Lemon-scented Iron-Bark (*E. australiana*) from the Palmer kind car- of my friend Mr. Gray, gardener, Newfield.

"I only add that plants of several of the most hardy Gums, such as *E. pauciflora*, *E. Gunnii*, *E. urigera*, and *E. coccifera*, are now growing at the Palmer coast at Strabane, Brodick, Knockdolon and Acheuane, near Balnrae; at the Established Manse, Rosneath; and at Ballinakil, Cauntye.

TREE FERNS.

"At one time I imagined that Tree Ferns were remarkably slow in growth, and that no one could hope to raise them from seed, and see them worthy of the name of Tree Ferns. All such ideas have been dissipated by my experience in growing them in the open air in Arran, as the following notes show:—

"The great Bush Tree Fern (*Dicksonia antarctica*).—This plant was probably sown in 1825, as it was very young when planted at Cromla, Corrie, in 1867. It took about eight years to acquire its full girth of stem. The stem then began to ascend at the rate of about 3 inches yearly, while during this period the plant formed, both in spring and autumn, heads of fresh fronds. About the year 1870 the leaves began to lengthen, and since then it has grown annually only about 2 inches, and it has also sent out yearly only one crown, developed in spring, and consisting of eighteen or more fronds, each of them about 6 feet in length and 2 feet in breadth. Its stem is now 2 feet 3 inches high, and 2 feet 33 inches in girth, and it is a magnificent plant.

"*Dicksonia squarrosa*.—This plant was brought from Canterbury, New Zealand, and was given me by Mr. Gray, Newfield. It is now in perfect health. The fronds are 3 feet 33 inches in length, and 14 inches in breadth.

CORDYLINES.

"These plants receive in Australia the name of 'the Victorian Palms,' or 'the Cabbage Palms.' At Cromla, Corrie, where three species grow, they are worthy of the name Palm, as the largest, a plant of *Cordylina indivisa*, sown by me in 1873, and planted in 1875 is now (including leaves) 14 feet in height, and probably will be 33 inches in girth. It may be expected soon to bloom.

ACACIAS.

"The most graceful and beautiful of all evergreen shrubs are the pinnatifid varieties of this family. That they are so considered in Australia, from which most of them come, appears from the name there given them—'Feather-leaved Acacia.' It is very difficult to report most favourably of them in Arran. The Black Feather-leaf (*Acacia decurrens*), one of the most beautiful, and also one of the most delicate in appearance, is now growing at Craighay, Lanish. It is, like the other species, a standard, its feet 10 inches in height, and it grows to a great luxuriance. It grows also at Lanish Cemetery. Another variety, specially named the Feather-like Feather-leaf (*Acacia penniformis*), of a blue-green shade, which does not close its pinnules at night, and in dull weather, as does the other, also grows at Craighay, Lanish. A third variety (*A. longifolia*) grows at Strabane, Brodick. The Broad-leaved *Acacia* (*A. pycnantha*) grows at Craighay.

"Miscellaneous Plants.—The broad-leaved Chinese Fir (*Cunninghamia sinensis*), the Australian Bramble (*Rubus cuneifolius*), the Australian acacia, whose flower is so fragrant; and the Oak or Beef Wood (*Casuarina equisetifera*), all grow in the Castle Garden, Brodick. *Camellias*, *Myrtles*, and *Desfontainia spinosa* (7 feet 8 inches high), all bloom freely at Cromla, Corrie. *Agalynia tomentosa* has just been planted at Craighay,

Lanish. I have also plants of the Botle Tree of Australia (*Brachychiton diversifolium*), the Grass Tree of Australia (*Xanthorrhoea arborea*), of Liberia grandiflora, and of a *Casuarina* from Mexico, which I hope ere long to transfer to Arran."

III. "Exhibition of rare British plants, from Mr. A. Bennett, Croydon."

"Specimens of rare Scottish plants were exhibited from Mr. A. Bennett, Croydon, including *Carex elongata*, collected by Mr. J. McAndrew, from Kemare, Holm; *Kirkcubright*; *Carex salina* var. *katteganensis*, and *Calamagrostis strigos*, both collected by Mr. J. Grant, Wick, from that neighbourhood."

IV. "Progress of Vegetation at the Royal Botanic Garden, Edinburgh, from July till October." By Robert Lindsay, Curator.

"All outdoor vegetation suffered severely from the excessive drought which prevailed during the month of July. Many trees and shrubs had their growth arrested. Herbaceous plants were dwarfed, but continued to flower freely. Grass lawns were very brown, and required little or no cutting. Aphis were very abundant. *Bosch. Elm*, and *Lime* trees were specially infested by them, much injury being done to their foliage in consequence. There were twenty dry days, and only slight showers of rain during the remainder. The lowest night temperature was 41° on the 1st of the month, and the highest 75° on the 23th. The highest day temperature was 84° on the 23d, and the lowest 53° on the 26th. On the rock garden 230 species and varieties of plants came into flower during July, amongst which were the following:—

<i>Astragalus purpureus</i>	<i>Geniana septemfida</i> var. <i>cordifolia</i>
<i>Anemone rivularis</i>	<i>Lupinus Kramerii</i>
<i>Cactaceae</i> <i>Leucanthemum</i>	<i>Meconopsis Wallichii</i>
<i>Campanula elegans</i>	<i>Leontopodium alpinum</i>
<i>Campanula</i> <i>alpestris</i>	<i>Saxifraga aizoides</i>
<i>Calliptra flava</i>	<i>Odontophylla</i>
<i>Cistus borealis</i>	<i>Silene Elizabethae</i>
<i>Cistus rupestris</i>	<i>Sium hircinum</i>
<i>Erythraea diffusa</i>	<i>Oranthe rubra</i> , &c.
<i>Geranium Lambertii</i>	

"August was also an exceedingly dry month, there being nineteen days when no rain fell. Several low night temperatures were registered for this month; the lowest readings were on the 14th, 15th, 16th, 17th, 19th, 23rd, 30th, 31st, 33rd. The highest morning readings were, on the 10th, 66°; 18th, 62°; 19th, 65°; 22d, 64°; 24th, 66°. East and north-east winds were prevalent. Autumn tints began to show early this season; *Sugar Maple*, *Fern*, and *Amelanchier* *Veitchii* were well coloured by the end of the month. Seventy-six species of plants came into flower on the rock garden, amongst the most conspicuous were:—

<i>Calochortus pulchellus</i>	<i>Origanum Tournefortii</i>
<i>Calluna vulgaris</i> , fl. pl.	<i>Polygonum capitatum</i>
<i>Clematis integriflora</i>	<i>Lychnis viscaria</i>
<i>Cyclamen hederifolium</i>	<i>Pterocarpus Parassii</i>
<i>Colchicum speciosum</i> rubrum	<i>Saxifraga speciosa</i>
<i>Delphinium cardinale</i>	<i>Saxifraga flagellaris</i>
<i>Delphinium</i> <i>ornatum</i>	<i>Saxifraga</i> <i>alpestris</i>
<i>Urtica</i> <i>tuberosa</i>	<i>Saxibola speciosa</i>
<i>Hypericum patulum</i>	<i>Veronica longifolia</i> var. <i>subulnifolia</i> , &c.
<i>Urtica</i> <i>terrestris</i> , &c.	

"Frost set in early this season. On September 2 the thermometer stood at 31°, or 1° of frost, but in several districts in Scotland 10° of frost were registered at the same date. Last year the first frost registered here occurred on October 11, when 3° of frost were registered. Other low readings occurred on the 17th, 33°; 24th, 35°; 27th, 26°. The highest morning readings were, on the 4th, 66°; 6th, 60°; 17th, 61°; 22d, 55°. Westerly winds were prevalent, and a good supply of rain fell, there being only ten perfectly dry days throughout the month. Dahlias and other tender plants were cut down by 6° of frost which occurred on the 27th. Owing to the continued drought throughout the summer months many shrubs have had a second growth, and a few have flowered prematurely.

"The season has been very favourable for ripening seed of both fruit and annual plants; thirty specimens came into bloom on the rock garden during the month, amongst which were—

<i>Allium glaucum</i>	<i>Lilium tigrinum</i>
<i>Grass</i> <i>austriflorum</i>	<i>Lobelia lutea</i>
<i>Grass</i> <i>austriflorum</i>	<i>Mouretia crocosmiflora</i>
<i>Geniana asclepiadea</i> alba	<i>Saxifraga</i> <i>Newmaniana</i>
<i>Gladiolus Saundersii</i>	<i>Schizostylis coccinea</i>
	<i>Veronica glauco-cerulea</i> , &c.

"During October the thermometer was at or below the freezing point on four nights, registering the following 20° of frost. The lowest readings occurred on the 11th, 25°; 12th, 27°; 24d, 22°; 25th, 23°; 30th, 31°. The highest morning readings were on the 2d, 51°; 3d, 49°; 7th, 50°; 16th, 48°. The lowest day temperature was 42°, on the 22d; and the highest, 58°, on the 2d of the month. There were ten days when no rain fell, and although there was more or less rain during the remaining twenty-one days, plants, such as *Rhododendrons*, which were growing underneath trees in various parts of the garden, were suffering from drought until the last week of the month. Autumn tints were very fine, but of short duration on various trees and shrubs; the brightest and best coloured of all were the different forms of hardy *Azaleas*, some of their leaves showing rich crimson shades, others brown and yellow. *Maples*, *Oaks*, *Beech*, *Pyrus*, *Berberis*, *Liquidambar*, and *Tulip* tree have also had finely coloured leaves. The brown leaves of the *Yew* were also very bright. This season of the year have been most conspicuous on *Thua* area and *elegantissima*. *Fruit* is abundant on *Holly*, *Cotoneaster*, *Thorn*, *Yew*, *Eunonymus*, and *Gaultheria*. Late-flowering herbaceous plants have been very well flowered, and many are in good condition, amongst the best being *Tritomas*, *Asters*,

Chrysanthemums, Helibon albus, and autumn-flowering species of Crocus.

"On the rock garden the following species came into bloom during the month, viz., *Crocus byzantinus*, *C. medius*, *Eranthis acutis*, *Mutisia decurrens*, *Pinguicula chrysantha purpurea*, *Hepatica triloba* alba. From January 1 till the end of October 1168 species of hardy plants, including well marked varieties, have flowered on the rock garden. At the same date last year 1122 had flowered."

Mr. Lindsay exhibited from the garden flowers of *Mutisia decurrens*, and small braches, covered with fruit, of *Gaultheria carnea*, both from the open air. Seedling plants of *Eucalyptus pauciflora* and *coccifera*, natives of Tasmania, were shown. He also mentioned that he had succeeded in raising seedlings from the large *Eucalyptus* which had grown in the open air at Whitehatch, East Lothian, since 1846. The seeds were ripened this summer. This tree, which had been supposed to be *Eucalyptus viminalis*, had been determined by Sir Joseph Hooker to be *E. Gunnii*, a native of Tasmania.

V. "On the Temperature and Vegetation at the Glasgow Botanic Institute for September." By R. Bullen, Curator.

"The thermometer has been below the freezing-point three times during the month, the lowest record being 6° during the night of the 10th. The highest temperature was 70° on the 6th, the next highest was 64° on the 31 and 4th, and 60° on the 16th, all other days having varied from 51° to 59°. The nights have also been comparatively cold, showery days have been frequent, often heavy, and on other occasions very dry. The sudden and severe frosts experienced on the morning of the 27th proved disastrous to all half-hardy plants, not only in the garden; field crops, especially Potatoes, have suffered severely in many places, where the temperature fell much below that recorded here. The cold wave which has passed over the country has indeed been felt so severely so early in the season. All hope of saving seeds of many tender plants has vanished. Although we have had a very dry and bright summer, we have had a constant succession of cold nights, which have had a very bad effect on the maturation of seeds, but on the backward state of late-blooming plants, such as Dahlias; these were just coming into bloom. Chrysanthemums are also in a very backward state, particularly the late-blooming kinds.

"The temperature for October, has been at or below the freezing-point eleven times. During the month, with a total of 29° 12' of which were registered during the night of the 24th. This is the lowest temperature recorded here for many years for the same month; 15° and 16° were recorded in several places not many miles distant. The day temperatures have been below the average, as well as the nights. The greater part of the month, the weather was all that could be desired, and afforded every facility for outdoor gardening operation. It is seldom that late leafing trees have been so entirely denuded of their foliage so early to autumn, but the young wood of most trees seems to be well ripened."

VI. Miscellaneous communications:—

Mr. Nell Fraser intimated having gathered in September, 1884, on a mountain in the neighbourhood of Pitlochry, Perthshire, *Astragalus alpinus*, and also a variety which has been named by two stations in Scotland (*Clova* and Braemar), and *Oxytropis campestris*, only found hitherto at one station. Neither was in flower. It is possible, when further specimens are obtained, that the *Oxytropis* may turn out to be *Halleri*, also a very rare alpine plant; but Mr. Fraser believes it to be *campestris* that he discovered.

EDINBURGH APPLE AND PEAR CONGRESS.

(FROM OUR OWN CORRESPONDENT.)

Edinburgh, November 26.—From a pomological point of view this is undoubtedly a great event, and so far as the plans and arrangements of the Council of the Royal Caledonian Horticultural Society are concerned in initiating and conducting it to the present stage—that (if an exhibition—it is an unequalled success. The four tables, stretching about 100 yards each along the north side of the great Waverley Market, with three aisles extending across the width of the western end, are laden with Apples and Pears from nearly every latitude and various altitudes in the United Kingdom, from Germany, and from Nova Scotia, showing qualities as various as the different sorts of Apples and Pears. The interest, in so far as the British Islands are concerned, meet here in the collection from Kent and that from Orkney; and it is interesting to note the gradations in quality from either extreme as exhibited on these tables.

It is impossible to particularise in detail in the limited space at our disposal, and much that is of general as well as particular interest must unavoidably be omitted at present. The importance and practical value of the Congress in respect of the advantages that may accrue from it can only be barely alluded to, but the ample materials so generally brought together by so many willing coadjutors on this occasion offer the best opportunity that has ever occurred in the metropolis of the northern kingdom for correcting the nomenclature and assessing the relative values of the different sorts of Apples and Pears, and the adaptability of different kinds to different conditions of soil and climate.

The arrangement of the collections from the different countries adopted by the committee of management is alphabetical, which has the merit of simplicity at least, and following we now proceed to note briefly the leading characteristics of each.

Aberdeenshire is represented by six collections of Apples and one of Pears from private gardens, and two of Apples and one of Pears from nurseries.

Mr. Donaldson, The Gardens, Keith Hall, Inverurie, sends fifty varieties of Apples and twelve varieties of Pears, which, considering the cold bleak climate in which they were grown, are very good. Generally most noteworthy are good samples of Apples—*Red Astrachan*, *Devonshire Quarrenden*, *Fearn's Pippin*, and *Ann Elizabeth*; and of Pears—*Hæmon's Incomparable*, *Marie Louise*, *Beurré d'Arenberg*, *Beurré Napoleon*, and *Grégoire Diel*.

Mr. Forrest, The Gardens, Haddo House, Aberdeen, sends twenty-four varieties of Apples of fair merit. The collection sent by Messrs. James Coe & Sons, nurserymen, Aberdeen, comprises 225 varieties collected from various parts of the county, this exhibiting very fine varieties of Apples and Pears, and also very fair samples of *Knights' Mowrah* and *Duchesse d'Angoulême* Pears from walls over in the collection, and of Apples good samples of the rare and choicer *Osain*, *Warner's King*, and *Tower of Glamis*, were conspicuous.

The contribution of Messrs. Smith & Son, nurserymen, Aberdeen, comprises 150 varieties, but these are not representative of the county, samples appearing from Nairn, Dingwall, and Morayshire, which somewhat confuses the alphabetical arrangement of the Congress, as well as the general character of the collection, which is of moderate merit, and comprise varieties similar to those represented in the other collections from Aberdeenshire.

Ayrshire.—There are five collections, all from private gardens, more remarkable for fine colour than size. The largest collection is from Mr. Bogie, Auchan Gardens, comprising 150 varieties of Apples and twenty varieties of Pears, and who is the only exhibitor of Pears from this county.

Mr. G. Gibrist, Cairnhill, Hurlford, sends a collection of thirty varieties of Apples, well coloured, but deficient in size and ripeness, with average Scotch samples.

Mr. Wilson, Auchanerri, Ayr, sends also thirty-two varieties, Apples and Pears—the latter, from walls, very good—*Beurré Diel*, *Marie Louise*, and *Duchesse d'Angoulême*, being noteworthy.

Argyleshire.—This county sends but one representative, Mr. Griestock, Toxtick Gardens, Tobermory, Isle of Mull, with twenty-four varieties of Apples, and four varieties of Pears, which, considering the natural conditions under which they have been grown, are very respectable fruit.

Berwickshire.—The most conspicuous collection from this county is that from Paxton House, Mr. McIntosh gr., comprising 100 varieties of Apples, which are fair in size and quality.

Caithness.—This northern county sends one representative—Mr. Munro, Keir's Castle, Wick, who has twenty-five varieties of Apples and five varieties of Pears. Culinary Apples comparatively good. Amongst the Pears *Black Achan* and *Moorfowl Egg* were good, *Marie Louise* small but clean.

Dumfriesshire is fairly represented by a collection of a hundred varieties of Apples from Messrs. Kennedy & Co. Dumfries, which show fair average merit for Scotland.

East Lothian is strongly represented by nine large collections, all conspicuous for fair size and good colouring.

Mr. James Hamilton, Gilnerton Gardens, Drem, sends 123 varieties of Apples and thirty varieties of Pears, remarkable for size and excellence of colour.

Mr. James Morrison, Archerfield Gardens, sends 120 varieties of Apples, and thirty varieties of Pears, all good for the district; notices of the latter are Flemish *Bonnet* and *Conseiller de la Cour*, very good.

Mr. Brotherton, Tynningham Gardens, sends a hundred varieties of Apples and twenty varieties of Pears, comprising evidently an excellent selection for the district, as all are good.

Mr. Garrett, Whittingham Gardens, Prestonkir, sends sixty varieties of Apples and twenty varieties of Pears, very good.

Mr. Daw, Newby, Prestonkir, sends sixty varieties of Apples and Pears, a very superior lot.

Mr. McKelvie, Pitconny, Dunbar, forwarded thirty-six varieties of Apples from espaliers, all fine.

Fifehire.—Very moderately represented. The Apple samples put up in the four collections sent in are fairly good, but the Pears are poor with the exception of the following—*Urbaniste*, *Marie Louise*, *Duchesse d'Angoulême*, *Beurré d'Arenberg*, and *Grégoire Diel*, grown on wall trees, are above average for Scotland.

Forfarshire is strongly represented in point of numbers. The quality is above average for Scotland. Messrs. Laird & Sinclair, Dundee, send 300 varieties of Apples, and fifty varieties of Pears, collected from various parts of the county, the collection on the whole being very good. Mr. Johnston, Glamis, has a very excellent collection of thirty varieties of Apples, being clean, of good size, and well coloured.

Lawershire.—This county exhibits strongly in point of numbers, but the samples are not remarkable for size, and of average colour is good.

Morayshire.—Mr. Morrison, nurseryman, Elgin, contributes 120 varieties of Apples, and a few varieties of Pears, the former of ordinary merit, the latter poor.

Middlethian comes up in great strength in point of numbers of collections, and also as regards the excellence of the Apples grown. The samples of Pears collected from the county are of the same standard. There are sixteen collections tabled from the county, the largest being from Mr. Malcolm Dunn, Dalkeith Gardens, comprising 250 varieties of Apples and eighty varieties of Pears, among which are many noteworthy sorts.

North Ayrshire & **Northern Ayrshire**, come next in point of numbers with a collection comprising 150 varieties of Apples of average merit.

Messrs. Ireland & Thomson, nurserymen, Edinburgh, send forty varieties of Apples, some of which were remarkable as regards size and quality.

Orkney sends one exhibitor, Mr. McDonald, Balfour Castle, Gardus, with twenty-one varieties of Apples, among which *Edinburgh*, *Edinburgh Nonpareil* and *Boston Russet* were comparatively good.

Perthshire.—Only two exhibits came from this county. Mr. Borthwick, Stobo Castle Gardens, sends twenty varieties of Apples, and four varieties of Pears, of fair quality.

Mr. McIntyre, The Glen, sends ten varieties of Apples, above average quality for Scotland.

Perthshire.—Eight exhibits are tabled from this county. The Apples are above average for Scotland as regards size and colour, but Pears are generally inferior in quality.

Renfrewshire.—Only two exhibits come from this county. The Apples are above average for Scotland, and among the most noticeable Pears are *Beurré Bosc* and *Marie Louise*, from Mr. Lindsay, Cathcart Gardens, which are good.

Ross-shire sends also only two exhibitors, who show only moderate quality, although one or two samples of Pears are fair for Scotland. They are *Beurré Diel* and *Marie Louise*.

South Ayrshire.—Messrs. Laing & Mather, nurserymen, Kelloe, put up eighty varieties of Apples and twenty varieties of Pears of fair quality.

Mr. Galloway, Minto Gardens, Hawick, sends a hundred varieties of Apples, very good.

Mr. Fowler, Merton Gardens, St. Boswell's, puts up fifty varieties of Apples and twenty varieties of Pears, the latter particularly good.

D. Melville, Elliston Gardens, St. Boswell's, exhibits forty varieties of Apples and forty varieties of Pears. A remarkable collection. Many varieties of Pears and Apples grown in cold-houses are very superior.

Messrs. Ormiston & Renwick, nurserymen, Melrose, table 200 varieties of Apples, a very good collection.

Sutherlandshire.—From Mr. Melville, Dunrobin Gardens, come twenty varieties of Apples, poor quality.

Strathgryth.—Four collections are sent in from this county. Messrs. Drummond & Sons, nurserymen, exhibit 220 varieties of Apples and seventy varieties of Pears, which are of fair average quality for Scotland.

Mr. Sowza, Touch Gardens, Stirling, sends seventy varieties of Apples and forty varieties of Pears—very good lot.

Mr. Crossie, Buchanan Gardens, Drymen, sends fifty varieties of Apples and twenty-four varieties of Pears—above average merit.

Wigtownshire sends two exhibits, both above average quality for Scotland.

IRELAND.

Co. Antrim.—Mr. Warwick, Shane's Castle, forwarded seventy-two varieties of Apples; very good.

Co. Down.—Messrs. Roger McClelland & Co., Newry, send thirty varieties of Apples and ten Pears; very nice collection.

Co. Dublin.—Mr. Blackburn, Abbotstown Gardens, Castleknock, sends fifty varieties of Apples; excellent.

Co. Galway.—Mr. Cobban, Garbally Gardens, Ballinacree, contributes forty Apples and twenty Pears; very good collection.

Co. Mayo.—Mr. Farrally, The Castle Gardens, Westport, sends thirty varieties of Apples, of superior quality.

Co. Wexford.—Mr. Turner, Courton Gardens, Gorey, sends fifty varieties of Apples and twenty varieties of Pears; very fine.

CANADA.

Nova Scotia.—Professor Lawson, Nova Scotia Fruit Growers' Association, sends 118 varieties—a remarkably good collection. Conspicuous among the Apples were fine samples of *Bienheim Orange*, *Gloria Mundi*, *Gravenstein*, *Golden Russet*, *Mammuth Russet*, *Fox Pippin*, and *Northern Spy*.

The labours of the jury were not completed when our report left.

TWICKENHAM HORTICULTURAL SHOW.

November 17.

This meeting was held in the Town Hall, Twickenham, under far more pleasant weather auspices than greeted shows during the preceding week, and the plant made if showing a little falling off in the plant section was admirable in the cut flower classes, as well as in the fruit and vegetable sections. A very beautiful group of Cyclamens in pots pleasingly fronted with *Maidenhair Fern*, was sent by Mr. Walker, of Milton; Mr. W. Poupard, of Twickenham, put up a remarkably interesting collection of Apples and Pears grown for market, some fifty dishes of the former and twenty of the latter being shown; also several good samples of Potatos. A fine band of the red market *Golden Wonder* attracted much attention. Mr. W. Mann, of the same place, exhibited a fine lot of vegetables, inclusive of huge Cauliflowers, Savoy and other Cabbages, &c., and some good dishes of Apples.

Groups of Chrysanthemum plants were limited in number and of about the average quality, the best coming from Mr. Parsons, gr. to T. Twining, Esq., and the 2d best from Mr. Sallovs, gr. to J. T. Fish, Esq., both of Twickenham. Mr. Sallovs had the best six trained plants.

There were some good table plants, scarlet *Pelargoniums*, the best being *Henry Lacey*, from Mr. Parsons; Chinese *Primulas*, the best from Mr. Garrod, gr. to J. R. Tweddell, Esq., Twickenham, all single white;

Cyclamens, &c. Of floral decorations a beautiful cross of white flowers came from Messrs. Hooper & Co., of Twickenham, backed by good winter blooming Carnations.

A special competition by ladies for single stand or epergne for a Challenge vase, brought three that were admirably dressed, but the one from Mrs. Ferris was so beautiful and refined in its arrangement, that it won readily.

In another class for stand dressed with hardy leaves and berries, the best came from Mrs. Chapman, of Twickenham, and a very pleasing arrangement it was from such materials.

The best collection of twelve incurved and twelve Japanese blooms came from Mr. Coombs, gr. to W. Furse, Esq., Teddington, the former being very good. The best prize lot were better Japanese, but the incurved flowers were weaker; this came from Mr. Monro, gr. to E. D. Paul, Esq., Twickenham.

Mr. Coombs had the best twelve incurved, good blooms, and Mr. Monro the best twelve Japanese in the former class. Mr. Worrell was 2d, and in the latter Mr. Coombs was in the same position, whilst in the class for twelve Anemone blooms the latter was a good 1st, with fine flowers.

The best twelve pompon blooms came from Mr. Green, gr. to S. Grant, Esq., & Parsons having the 2d, the best lot. Mr. W. Bates, Foullet Lodge, showed some capital flowers, not for competition.

Mr. Parsons had the only collection of fruit in very fair Alicante and Gros Colmar Grapes, Beurré Bosc Pears, and Court Pendu-plat Apples.

The best four dishes of Peas came from Mr. Garrod, who had Duchesse d'Angoulême, Beurré Diel, white Doyenné, and Marie Louise. Mr. Monro was 2d. Mr. Worrell, gr. to Colonel Murray, Whitton Park, had the best four dishes of Apples in King and Ribston Pippins, Wellington, and Election Orange. Mr. S. St. John, of the Police Orphanage, was 2d.

Collections of vegetables were excellent, and there was good competition in the Potato class excellent samples being shown.

DEVIZES CHRYSANTHEMUM SHOW:

November 17.

As is usual, this took place in the Corn Exchange, Devizes, in conjunction with a bazaar in aid of the Benevolent Society. There was a pretty and very good exhibition of plants and cut flowers, though the competition was somewhat restricted. But the usual quality of the show was maintained, and, as heretofore, the whole was arranged with excellent judgment by Mr. Thomas King, gr., Devizes Castle, who also furnished some fine specimen Palms and Tree Ferns, which greatly helped the general effect.

PLANTS.

The best six specimens of large flowering Chrysanthemums came from Mr. H. Clack, gr. to C. E. Colston, Esq., Roundway Park, Devizes, who had admirably grown and flowered trained specimens, one of which (Prince Alfred) was a fine example of thorough good cultivation, which was awarded a special prize as the best plant in the show; 2d, Mr. W. Hale, gr. to C. N. May, Esq., The Elms, Devizes.

The only exhibitor of four plants was Mr. G. Tucker, gr. to Major Clarke, Wyke House, Trowbridge, who had four examples of some of the best varieties.

In the class for six varieties of pompon Chrysanthemums, Messrs. Clack and Hale had admirable specimens, the one only just inferior to the other. Mr. Clack was placed 1st; Mr. Hale came in 2d with finely-grown and flowered Lavender.

Mr. Tucker was also only exhibitor of four specimens, having smaller but creditable plants.

In the class for six specimen Japanese Chrysanthemums those shown by Messrs. Clack and Hale were so evenly balanced and so thoroughly good that they were awarded equal 1st prizes, the specimen Salteri being a capital one.

In the class for four plants the 1st prize was withheld, and a 2d awarded to Mr. G. Tucker.

In the class for three specimen plants, to consist of Mr. Rundle, of Salisbury, Mr. Dixon, Mr. Clack was 1st, with very fine and well grown specimens, averaging fifty flowers each; Mr. Hale coming 2d, also with good plants, smaller, but carrying less flowers, though of a fine character.

CUT FLOWERS.

Mr. Clack had the best twelve incurved blooms in four varieties, showing in good form Princess of Wales, Barbara—one of the blooms of this variety was selected as the premier flower in the show; Mrs. Heale, and Lord Wolsley; Mr. Hale was 2d; 3d, Dr. Hitchcock, and Howard Lavington.

Mr. Hale had the best twelve blooms of incurved varieties; 2d, Mr. Clack; 3d, Dr. Hitchcock.

Mr. Hale also had the best twelve blooms shown with 12 inches of foliage, an admirable way of showing off the flowers to the best advantage; 2d, Mr. Clack; 3d, Dr. Hitchcock.

The best twelve Japanese varieties came from Mr. Clack, who put up some finely developed flowers; 2d, Mr. Hale; 3d, Dr. Hitchcock.

The best twelve blooms of Anemone-flowered varieties came from Mr. Clack. Mr. Hale was 2d, and Dr. Hitchcock 3d. Noteworthy flowers all of them.

Among the miscellaneous exhibits were baskets of wild flowers and foliage, &c., and some pretty epergnes, shown for table decorations.

A First-class Certificate of Merit was awarded to Mr. James Lye, Clyffe Hall, Market Lavington, for red

Kidney Potato, Lye's Freedom, a large form of Bountiful, a heavy cropper, and of excellent table quality.

A fine-looking Onion, the result of a cross between Yellow Zittan and the White Spanish, was Highly Commended. This was raised by Mr. Lye.

WINCHESTER: November 17 and 18.

THIS, the third exhibition of Chrysanthemums and fruit, was held in the Guildhall, the show in question being remarkable for the excellence of the cut blooms of Chrysanthemums, which being staged in large numbers rendered it one of the best Chrysanthemum shows of the season. Such an impetus has been given of late to the cultivation of the flowers in this neighbourhood, that it was not surprising to see so many a display. Messrs. Porter and Colson, the hon. secretaries, assisted as they were by an equally able committee, deserved much credit for their arduous endeavours in bringing so good a show together.

It was a pleasure to observe the advancement made by the local growers since the last show, this being most marked in the class for six plants, open to residents within 5 miles of Winchester, the plants which took 1st prize in this class belonging to Miss Butler, St. Thomas Street (gr., Mr. A. Frouling).

The results of the miscellaneous plants and Chrysanthemums were a marked improvement on the show in 1884, whilst the specimen plants of Mr. W. Joy, Shirley, Southampton, have not been excelled this year anywhere, so large, healthy, and profusely bloomed were they.

Vegetables were staged in large quantities, and were of first-rate quality; while the arrangements of flowers, &c., confined chiefly to ladies, were to be much commended, as they usually are at this Society's exhibitions.

GROUPS AND PLANTS.

For the best collection of Chrysanthemums occupying a space 3 feet by 2 feet there were seven excellent competitors, the best being that of F. W. Pugh, Esq. (gr. Mr. W. Neville), Twyford, Winchester, whose plants were profusely bloomed, and flowers of a large size, tastefully arranged without overcrowding; 2d, Miss Butler, St. Thomas Street (gr., Mr. A. Frouling), whose group was a great advance on last year, and was well arranged; 3d, Mrs. Warner, Northlands, Winchester (gr., Mr. T. Hunt).

For six plants,—1st, Mr. W. Joy, nurseryman, Southampton, the only competitor, who staged magnificent specimen plants in display.

For six Japanese varieties, Mr. Joy was again 1st. This was the only collection staged, but the plants were so remarkably good that they formed quite an exhibition in themselves. Mr. Joy was also 1st for single specimens, incurved, with a grand plant of Mrs. G. Kutek, and a magnificent one of the Earl of Guernsey he was awarded 1st prize for best Japanese plant.

For six plants, open to members residing within five miles of Winchester, Miss Butler was 1st; 2d, Lady M. de St. Maur, 3rd, Mr. T. Phillpott, and Mr. A. Stridge, 3d, W. B. Simmonds, Esq., Abbots Barton, Winchester (gr., Mr. A. Stridge).

For a miscellaneous group of plants, arranged for effect, C. M. Shipley, Esq. (gr., Mr. C. Axford), Twyford, Winchester, was 1st with an excellent collection, followed by Mrs. Brown (gr., Mr. T. Phillpott), and Mr. A. Stridge, Solanms, Primulas, Cyclamens, table plants, and Pinsetias were well shown by Mr. A. Stridge, Mrs. Warner, Mr. Hunt, and Mr. Phillpott.

CUT BLOOMS.

These were staged in great numbers. Mr. Molyneux, gr. to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, here completed a successful season, by taking five out of the six 1st class prizes, his blooms being remarkable for their large size, solidity, and perfect finish.

For twenty-four distinct, sixteen incurved or reflexed, and eight to be Japanese, Mr. Molyneux was an easy 1st, his competitors being Mrs. C. Audignier, Belle Pauline, Boule d'Or, and Meg Merrilies being the best among the 'O' or, and the incurved section was represented by beautiful large blooms of Lord Alcester, Golden Empress, Queen of England, Hero of Stoke Newington, Lady Carey, &c.; 2d, Mr. Neville, whose incurved and Japanese were fine, the best being 'd'Arc, Mrs. Shipman, and Mr. Brunles; 3d, Mr. W. Pope, gr. to the Earl of Carnarvon, Highclere Castle, Newbury; 4th, Mr. C. W. Warder, gr. to Sir F. Bathurst, Clarendon Park, Salisbury.

For twelve incurved blooms, not less than eighteen varieties, Mr. Molyneux was again 1st, with blooms similar to the former class; Mr. Neville was 2d, and Mr. Pope 3d. Mr. Molyneux repeated his former successes by taking 1st for twelve incurved blooms, distinguished competitors being Mr. A. Bridger, gr. to Colonel Martin, Fleetlands, Farnham, was 2d.

For twelve Japanese and same number of reflexed kinds the prizes went to Mr. Molyneux, Mr. Neville, Mr. W. Warder, and Mr. Bridger, all staging produce of good quality.

For twelve blooms, not less than eight varieties, Mr. Trinder, gr. to Sir Henry Mildmay, Dogmersfield Park, Winchester, was 1st, with a clean, even, fresh collection; 2d, Mr. L. Jennings, gr. to J. Freeman, Esq., Fording Lodge, Farnborough; 3d, Mr. A. Bridger, all staging produce of good quality.

For twelve pompons Mr. Neville was 1st, closely followed by Mr. Molyneux, Mrs. Rensbury, Twyford; Mr. E. Flight, Winchester; and Lady Wodehouse staged the best blooms—a creditable lot—in the amateurs' classes.

FRUIT AND VEGETABLES.

For three bunches of Grapes, distinct varieties, Mr. Molyneux was 1st, with Alicante, Gros Guillaume, and Trebbiano, all in fine condition; 2d, Mr. C. W. Warder, whose best bunch was a fine one of Gros Colmar; 3d, Mr. Neville.

Mr. J. Mildon, gr. to Mrs. Turner, King's Worthy, had the best two bunches of black Grapes, fine specimens of Alicante; 2d, Mr. C. W. Warder; 3d, Mr. Neville.

For two bunches white Grapes, Mr. James Chalk, Westwood, Wilton, Salisbury, was 1st, with Muscat of Alexandria in fine condition, the heaviest bunch, one of Gros Guillaume, in good condition, followed by Mr. L. Jennings.

For three dishes of Peas, six fruits of each,—1st, Mr. S. Jennings; 2d, Mr. Trinder; 3d, Mr. A. C. Smith, Havant.

The best three dishes of kitchen Apples were staged by Mr. J. T. Phillpott; 2d, Mr. A. Stridge.

Vegetables were of more than good quality. Mr. R. Lye, gr. to W. A. Kingsmill, Esq., Snydmoor Court, Newbury, was awarded 1st prize for a collection of eight kinds, followed closely by Mr. Pope, whose best dish was a grand one of Reading Perfection Tomato; 3d, Mr. W. Ashton, gr. to the Very Rev. the Dean of Winchester.

The best arranged stand of Chrysanthemums and foliage suitable for table decoration was that put up by Mr. B. Flight.

Mr. E. Hillier, nurseryman, Winchester, contributed a collection of plants which added much to the decoration of the room where the hardy fruits were staged.

MANCHESTER BOTANICAL AND HORTICULTURAL: November 17, 18, and 19.

The annual exhibition of this Society took place on the above dates, at St. James' Hall, Oxford Street. This immense building, now used by the Society for the first time, is admirably adapted for the purpose, being generally situated east of access from the high road, with sufficient light for the inspection of the various exhibits. Hitherto the show has been held in the Town Hall, but this year the Society attempted greater things, offering better prizes, with Gold and Silver Medals for collections of fruit, the result being that the most magnificent display was got together of plants, cut blooms, fruit, &c.

The centre of the hall was taken up by a very large group of plants from the Botanical Gardens, comprising tall Palms, Ferns, and other foliage plants, which twined up the walls, and were admirably adapted for the purpose, the groups being edged with small plants of Coniferae. Near by was a capital group from Mr. J. Allen, Altrincham, whose Chrysanthemums throughout the show were excellent.

At the other end of the hall was a nice lot from Mr. E. Hardwick, Ashton-on-Mersey. Messrs. Fisher, Son & Sibry had a fine display of greenhouse Rhododendrons; large plants, full of bright showy flowers. Among the sorts we observed Duchess of Connaught, Duchess of Edinburgh, Prince Leopold, Princess Royal, Princess Alexandra, &c. The plants were in fine condition. There were nice plants of Clivia nobilis and flowering Orchids, as Oncidium Forbesii, Cheilophorum, Masdevallia tovarensis, &c.

PLANTS.

In the class for twelve large-flowered Chrysanthemums Mr. T. Statter, Prestwich, was awarded the 1st, having good examples averaging 4 feet high, among them being Prince of Wales, Cassandra, Mr. Bunn, White Venus, Golden Beverley, and Prince Alfred; Mr. S. Bless was 2d, Mr. J. Allen 3d.

For six incurved plants the 1st went to a nice lot shown by J. P. Bolland, Esq., who had Queen of England, Prince of Wales, Empress of India, Alfred Salter, and Golden Empress in excellent form; Mr. J. Allen was 2d; Mr. S. Bless being 3d. Mr. T. Statter, Mr. S. Bless, and J. P. Bolland, Esq., showed three plants, and were placed 1st, 2d, and 3d.

For six Japanese in pots there was strong competition, the prizes ultimately falling to Mr. S. Bless, 1st, with good examples of Alexander Dufour, La Nymphe, L'Isle des Fleurs, Triomphe de la Rue de Chaudron, Blanche Fontaine, &c.; 2d, Thos. Statter was 2d, having Margot, Hiver Fleur, Bouquet Fat, Elaine, and Peter the Great in good form; Mr. John Heywood was 3d; Mr. J. Allen 4th.

The pompons were not open, and so were rather disappointing. In the class for eight, only two competitors entered, Mr. S. Bless being 1st, and S. Hazopolo 2d.

For three pompons, which were rather better as regards bloom, Mr. T. J. Bolland was 1st, and Mr. S. Bless 2d.

CUT BLOOMS.

Passing on to these, of which there was a fine display, and of a really of excellent quality, we noticed that the neighbourhood of Liverpool still asserts itself as a grand centre for high-class blooms.

For thirty-five varieties, eighteen incurved and eighteen Japanese, Lieutenant-Colonel Pilkington Prescott was well to the front. In the section for 12 in splendid form, and every bloom perfect. A few of the more noticeable were Empress of India, John Salter, Golden Empress, Prince Alfred, Queen of England, Guernsey Nugget, Jeanne d'Arc, Mrs. Heale, Lord Alcester, Lord Wolsley, and Emily Dale; the Japanese being Meg Merrilies, Gante de Germany, Mrs. F. Audignier, Flambeau, Soleil Levant, Jean Delaux, Bouquet Fat, Mrs. Marsham, Criterion, Triomphe du Nord, Mr. J. Allen was 2d, in whose stand were grand blooms of Beauty, Mrs. Brunles, Prince Alfred, Nil Desperandum, Mons. Lemaine, Boule d'Or, Mdlle. La Croix, Comte Beaugard; Mr.

E. G. Wrigley was 3d, and equal 4th was awarded to J. E. Platt, Esq., and H. S. Woodcock.

In the class for twenty-four, and eighteen incurved, Mr. J. Allen was the only competitor, but his blooms were so uniformly good that he was placed 1st with both lots.

With twelve incurved, A. Tate, Esq., Woolton, Liverpool, was placed 1st, having Mrs. Howe, Inner Temple, Jardin des Plantes, and Jeanne d'Arc, in good form; Mr. J. Allen was 2d, and Mrs. Shaw 3d.

With six incurved, J. King, Esq., and W. Lees, were 1st and 2d.

The stands of Japanese were much admired, there being an attractiveness about these that leads many to stop and admire who pass by other forms. Mr. J. Allen was 1st with twenty-four distinct blooms, each one being of a size and colour fit to compare with any—Mrs. Townsend, Thurberg, Baronne de Frailly, Madame de Sevin, Sultana, Orang, Chang, being among his best; E. G. Wrigley, Esq., was 2d, with a splendid collection; the 3d falling to the Corporation of Stockport.

With twelve Japanese A. Tate, Esq., was 1st, Mrs. Shaw 2d, and Mrs. Monk 3d.

The class for twenty-four miscellaneous cut blooms was taken by Mr. J. Allen over several competitors; the Corporation of Stockport 2d, and equal 3d to H. S. Woodcock and W. Lees.

With very fine lot of cut blooms were staged by Mr. W. Cibran & Sons, not for competition; whilst from Mr. J. W. Springbett, Cheshunt, Herts, a capital lot of Japanese, incurved, Anemone, and reflexed blooms were also shown. In this collection Val d'Andorre and Cullingfordi were some of the best blooms in the show.

FRUIT, &c.

The fruit shown was of excellent quality, the Apples and Pears being such as have been seldom seen in Lancashire. The best were Messrs. Bunyard, Maidstone, were splendid examples. Messrs. Bunyard showed a hundred sorts of Apples, and were awarded the Gold Medal; the Silver Medal being taken by Mr. J. Watkins, Hereford, who had 180 dishes, showing many sorts useful for cider making. Messrs. Bunyard also secured a Gold Medal for sixty dishes of Pears—Mr. C. W. Neumann showing about the same number, but which were much less in size; these, however, were awarded a Silver Medal.

In the class for ten dishes of fruit Mrs. Ackers, Congleton, was 1st, with Gros Colmar and Muscat Grapes, a Pine, Melon, Golden Drop Plum, Worcester Pearmain and King of the Pippins Apples, and Glou Garners and Pear, &c.; 2d, the Earl of Ellesmere, with Golden Queen, Black Alicante Raisin de Calabre, and Gros Colmar Grapes, Melon, Pines, &c.

Mr. G. T. Miles, Wycombe Abbey, was the only competitor, with two Pines; he also secured 1st honours with one Pine-apple, Major Dixon and Mrs. Ackers being 2d and 3d.

The black Grapes were in capital condition, the Earl of Ellesmere being 1st, with Gros Colmar; D. Adamson, Esq., 2d, with the same sort; Mr. J. Heywood, 3d.

White Grapes were shown by Mrs. Ackers, whose Muscats were excellent; Mr. H. S. Woodcock was 2d, Mr. J. Wallis, Keele Hall, 3d. The last-named exhibited a fine collection of Grapes, including Gros Maroc, Alwick Seedling, Gros Colmar, Mrs. Pearson, White Tokay, Black Alicante, Barrossa, Mrs. Fince, Black Muscat, Burchardt's Prince, Royal Vineyard, and Muscat of Alexandria, and was awarded an extra prize.

MISCELLANEOUS.

Some excellent bouquets came from A. Heine, Esq., who was 1st for three; Mr. J. Mason being 2d. For one bouquet Mr. J. Mason was, however, 1st; Mr. J. Heywood 2d, and Mrs. Lord 3d. Mr. A. Heine was also 1st with a splendid vase for table decoration, bearing D. Adamson, Esq., who came 2d; and Mr. W. Irvine 3d.

From Mr. S. Schloss came spikes of the scarce Bourguillies lateritia (speciosa) and from Mr. Scatter there came a plant in flower of the new and rare Onidium Joesonianum.

H. Cannell & Sons had a capital stand of double and single zonal Pelargonium blooms, the white Queen of the West being the principal order.

Mr. B. S. Williams, of Holloway, occupied a long table with winter-flowering Heaths, Cyclamen, &c. Messrs. Dickson, Brown & Tait also had a fine lot of Roman Hyacinths, capital in foliage, the bloom standing well without needing any stakes. The Cyclamen in this stand were large flowering forms and highly coloured.

Mr. W. G. Caldwell & Sons showed a collection of foliage and flowering plants, a capital group of small Conifers.

Messrs. Dickson & Robison occupied a large table with a varied assortment, among which were capital Heaths and Solanums.

Messrs. J. & W. Birkenhead made a fine display with Ferns.

On the opposite side Mr. W. Cibran had a large group of Chrysanthemums in splendid condition, 3 to 4 feet high, nicely edged with smaller flowering plants, Ferns, &c.

From Messrs. Smith, of Worcester, came about sixty dishes of Apples, and a fine lot also from F. & A. Dickson, of Chester.

Stands of blooms of Chrysanthemums were shown by Mr. J. Robson, Altrincham; wreaths and crosses by Mr. J. Mason, and Messrs. J. Leech & Son, of Smithfield Market, exhibiting a large collection of fruit and flowers, roses, &c., not for competition. A collection of fruit came also from the Royal Horticultural Society's Gardens, Chiswick.

Messrs. Webb & Sons had about eighty dishes of Potatos, all of excellent quality, some being quite new,

The weather was somewhat against the show, in that it was very cold, sharp frost and cutting wind prevailing much of the time.

BIRMINGHAM SHOW.

The Midland Counties Fruit and Flower Show was held in the Towo Hall on Nov. 18 and 19, being its twenty-fifth annual exhibition. This Society has made rapid progress, and is now the principal show of this description in the Midland Counties. The entries were very numerous, but there was a considerable falling off in the quality of the cut flowers shown, although the quantity was far greater than usual. The weather on the 18th was not very encouraging to exhibitors of choice exotic plants. Primulas formed a good attraction, over 300 fine well grown plants being staged. They are exceedingly well grown in the neighbourhood of Birmingham. Another interesting feature of the show was a collection of Orchids—about two dozen sorts—from the Right Hon. J. Chamberlain, Highbury, containing some novelties, nicely shown. Mr. Cooper, gr. to it, was commended upon his fine display, which was much admired.

GROUPS.

The groups were poor after what we have lately seen, the 1st going to Mr. Patterson's specimens. The 1st for nine and six went to Mr. Dyer, gr. to Mrs. Marigold, whose plants were a long way ahead of the others; the 1st for pompons was awarded to Mr. W. White. Standards—no entries.

CUT BLOOMS OF CHRYSANTHEMUMS.

These were shown in great quantity, but they were not what one expected to see for such liberal prizes as £10, £7, £4, and £2. The 1st for forty-eight flowers, twenty-four incurved and twenty-four incurved. Chrysanthemums, went to Mr. P. Southey; the 1st for twenty-four blooms, twelve of each, to Mr. G. A. Everett. The 1st for eighteen incurved to Mr. H. Lovatt; and the other 1st falling to the same exhibitor. For local growers, Messrs. Evert and Madeley were the winners.

OPEN CLASSES.

These were very fine: Messrs. Pope & Sons taking all the honours with good examples of cultivation. The 1st for Cyclamens and Epiphyllus was awarded to the Right Hon. J. Chamberlain (Mr. Cooper, gr.).

GARDENERS AND AMATEURS.

Nine stove and greenhouse plants.—1st, Mr. F. A. Watco, for a decent lot; 1st for six, Mr. Dyer, gr. to Mrs. Marigold, for a good neat collection.

Primulas here, as in the open classes, were very good—the 1st prize going to Messrs. Martineau, Matthews, and Taunton.

Poinsettias.—1st, Mrs. Marigold, for fair plants. Three grand plants of Mignonette from Mr. Martineau were 1st.

Zonals from the Right Hon. J. Chamberlain (Mr. Cooper, gr.) were awarded the premier prize.

BOUQUETS.

These were well done, both by nurserymen and gardeners. The 1st prize in the former competition was awarded to Messrs. J. B. Thompson; and 1st for amateurs to Mr. C. E. Matthews. The 1st for bouquets to Mr. C. E. Matthews; while 1st for button-holes went to Mr. Fayton.

FRUIT, &c.

Grapes were good, being well coloured and nicely finished, the Rev. E. W. Stanners, Mr. Corbett, and Mr. Evert taking the premier prize.

Apples and Pears, fine clean well-coloured fruit, were extensively shown, the competition being very keen for the 1st prize for dessert Apples and Pears. Sir H. Vernon was 1st for Apples, and Mr. Thornley for Pears. For culinary Apples, to Mr. Higgins; and Pears, Mr. Corbett.

Cucumbers and Mushrooms were well shown; of the former a nice brace from Lady Edwards obtained 1st; while a good dish of Mushrooms from Mr. Mitchison, Perry Hall Gardens, was 1st.

MISCELLANEOUS EXHIBITS.

The various groups shown by the local nurserymen did them great credit; the corners of the large hall were allotted to them. From Haas Niemand, Edgbaston (Mr. Spinks manager), came a fine collection of beautifully arranged stove and greenhouse plants, ornamental flowering and foliage plants, and some well grown Cyclamens of a good strain.

Messrs. Thompson occupied the opposite corner with a group of similar plants; a fine cross and wreath of gigantic size was also shown by this firm.

On the galleries Messrs. Cooper and the corners were filled with collections of plants from Mr. R. H. Veretagus, Chad Valley, and Messrs. Pope & Sons. The former had some good Roman Hyacinths, Primulas, Cyclamen, Poinsettias, &c. Messrs. Pope showed some fine single and double Pelargoniums, well grown and flowered. They also showed some rustic-work.

From Messrs. Cannell, Swanley, came some cut flowers of zonal Pelargoniums and single Chrysanthemums, including the new Cullingfordi, which were greatly admired.

On the galleries Messrs. Smith & Co., Worcester, showed a collection of Japanese plants, also Pears and Apples. The Rev. A. Williams, Stratford-on-Avon, exhibited a collection of Apples.

Messrs. Perkins & Sons, Coventry, displayed cut

Roses, wreaths and cross, beautifully made up. A new Fern, in the way of Gymnogramma schizophylla, was exhibited by Messrs. Pope & Sons. It is a fine Fern, of graceful habit; its entire stock was purchased by Mr. Outram for Mr. B. S. Williams.

It is very gratifying to state the decision of the judges gave great satisfaction; everything passed off very satisfactorily. A. O.

BURTON-ON-TRENT: November 18 and 19.

The first Chrysanthemum exhibition under the auspices of the Burton Floral and Horticultural Society was held in St. Paul's Institute, a building at once handsome, spacious, lofty, well lighted, and comfortable—of wood and the room heated by means of hot water. At one end is an orchestra, and a beautiful organ, upon which recitals were given each day. The exhibition florally was a complete success, and would vie in quality of produce with others longer established and of greater renown.

The specimen Chrysanthemums, incurved and Japanese, exhibited by Mr. Prince, gr. to the Misses Gretton, Bladon House, Burton, were thoroughly well grown and flowered, and highly creditable to the cultivator.

The Mayor of Burton (Alderman Lowe) exhibited a very beautiful specimen standard Chrysanthemum (Mrs. Rundle), with an immense head, and bearing a great profusion of good flowers; the flowering shoots were not staked, and therefore the upper part was devoid of the stiffness usually seen in standards.

The groups of Chrysanthemums arranged for effect down one side of the hall presented a large bank of good and brightly coloured flowers to the eye. The 1st prize in this class was deservedly awarded to Mr. Warren, gr. to T. Robinson, Esq., who had a most effective group of healthy, well-flowered plants.

Cut blooms were well represented and of good quality, the 1st prize for twenty-four incurved and twenty-four Japanese being awarded to Mr. J. Udale, gr. to H. E. Watson, Esq., Sheffield; Mr. Howe, of Nottingham, being a good 2d.

Sir Henry Allopp, Hindlip Hall, Worcester (gr., Mr. Barker), sent some fine samples of cut blooms of Chrysanthemums, not for competition.

Fruit was shown of excellent quality by Mr. Brunt, gr. to the Earl of Carnarvon, Bretby Hall, and by Mr. Maynard, gr. to Sir G. Beaumont, Coleorton Hall.

Groups of miscellaneous plants arranged for effect (Chrysanthemums excluded) brought strong competition, Messrs. Meaking, Brunt, and Johnson taking honours in the order named with tastefully arranged groups.

Mr. W. Fisher, of the Horninglow Cross Nursery, who has rendered considerable assistance in forming and bringing to a successful issue the first exhibition, contributed considerably to its floral success by sending a beautiful group of plants, not for competition, which consisted principally of a background of Palms and other foliage plants, with an elegant bordering of Ferns, interspersed with Poinsettias, Eucharis, Roman Hyacinths, Primulas, Azaleas, Chrysanthemums, &c. The same gentleman also exhibited an exquisitely made cross and wreath.

Mr. Barratt, the Secretary, and his colleagues, Messrs. Rudd, Fisher, Cooper, Leach, &c., are to be congratulated on the success of their combined efforts.

HAMSTEAD CHRYSANTHEMUM:

November 18 and 19.

THIS Society held its fifth annual exhibition in the Vestry Hall, Haverstock Hill, on the above dates. Most of the classes were well represented, these for specimen plants especially so. The most was made of the various exhibits as regards effect in arrangement, a fine group of decorative plants from Messrs. Cutbush & Son and the splendid groups of Chrysanthemums being the most striking features in the show, but on close inspection of the flower stands, amongst a good lot of blooms, a judge or lover of these favourite flowers could not help singling out at least two flowers as exceptionally fine. One of these blooms, a Boule d'Or, shown by Mr. Tribe, gr. to H. M. Matheson, Esq., Highlands, Hampstead, was pronounced by all who saw it as the finest bloom they had seen this year. The other, a Meg Merrilies, was shown by Mr. Williams, gr. to Mrs. Inman, Froggnal Rise, Hampstead.

GROUPS OF PLANTS.

For the best group Mr. Tribe was deservedly 1st, with a very neat group of well grown plants; 2d, Mr. Relland, gr. to — Baylis, Esq., St. Cuthbert's, West Heath; 3d, Mr. Banks, gr. to E. Gotto, Esq. The Logs, Hampstead. The specimen plants, besides being numerous, were very fine in quality.

For six incurved Mr. Tribe was 1st; 2d, Mr. H. Gibbs, gr. to Miss Carter, Sandfield Lodge, West Heath.

For six Japanese Mr. Tribe was also 1st, with grand examples; 2d, Mr. H. Gibbs. For six pompons Mr. H. Gibbs was 1st with a nice lot. For a single specimen incurved Mr. Relland was 1st with a fine dwarf plant of Mrs. Dixon; 2d, Mr. Tribe, with Queen of England.

For a single specimen Japanese Mr. Tribe was 1st with a well grown Golden Dragon; 2d, Mr. Relland, with Maid of Orleans.

For the best specimen reflexed—1st, Mr. Tribe, with Julia Lagrave; 2d, Mr. Hawkins, gr. to H. Field, Esq., The Proyors, Hampstead, with Golden Christine.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, NOVEMBER 25, 1885.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, WIND, and RAINFALL. Includes data for Nov 19-25 and a summary for Nov 19-25.

LONDON: Atmospheric Pressure.—During the week ending November 21, the reading of the barometer at the level of the sea increased from 29.79 inches at the beginning of the week to 30.43 inches by 1 P.M. on the 16th, decreased to 29.82 inches by 1 P.M. on the 18th, increased by 9 A.M., decreased to 29.23 inches by 1 P.M. on the 19th, increased to 29.99 inches by 9 A.M. on the 20th, and was 29.56 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.03 inches, being 0.13 inch lower than last week, and 0.13 inch higher than the average of the week.

Temperature.—The highest temperature in the shade in the week was 45° 3, on the 19th; on the 17th the highest was 40° 1. The mean of the seven high day temperatures was 42° 5.

The lowest temperature was 27° 5, on the 16th, on the 20th the lowest temperature was 40°. The mean of the seven low night temperatures was 31° 6.

The greatest range of temperature in one day was 14° 5, on the 16th; the smallest was 4° 5, on the 20th. The mean of the seven daily ranges was 10° 9.

The mean temperatures were, on the 15th, 36° 4; on the 16th, 34° 9; on the 17th, 33° 8; on the 18th, 33° 9; on the 19th, 39° 3; on the 20th, 41° 9; and on the 21st, 37° 5; and these were all below their averages (excepting the 20th, which was 0° 2 above) by 5° 9, 7° 3, 8° 2, 8° 2, 2° 5, and 4° 2, respectively.

The mean temperature of the week was 36° 8, being 6° lower than last week, and 5° 1 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 74° 5, on the 16th. The mean of the seven readings was 63° 1.

The lowest reading of a minimum thermometer placed on grass was 19° 5, on the 16th. The mean of the seven readings was 26° 6.

Rain.—No rain fell during the week.

ENGLAND: Temperature.—During the week ending November 21, the highest temperatures were 54° at Truro, 52° at Plymouth, 50° at Newcastle; the highest at Bolton was 42° 7; at Bradford 43° 2, at Liverpool 43° 8. The general mean was 46° 4.

The lowest temperatures were 22° 5 at Cambridge, 23° at Wolverhampton and Sheffield; the lowest at Plymouth was 34° 5, at Truro, and Brighton 31°. The general mean was 27° 3.

The greatest ranges were 23° at Truro and Newcastle, 22° 4 at Cambridge; the least ranges were 13° 8 at Liverpool, 15° 8 at Preston, 15° 2 at Bolton. The general mean was 19° 1.

CUT BLOOMS. For twelve incurved, distinct, Mr. H. Gibbs was 1st, with a good lot; 2d, Mr. J. Powley, gr. to Mrs. White, Ivy House, North End; 3d, Mr. Tribe. For twelve reflexed Mr. Relland was 1st. For twelve Japanese Mr. J. Powley and Mr. Tribe were equal 1st; 2d, Mr. J. Willmott. For twelve bunches (three in a bunch), pompons, Mr. J. Powley was 1st; 2d, Mr. Relland. There were also various other classes for amateurs and cottagers, which, as a rule, were well contested, but the quality of which does not call for special mention. Various specialties were awarded by patrons of the Society, and brought forth a lively competition. For six plants, Japanese, Mr. Relland was 1st; 2d, Mr. Tribe. For six incurved Mr. Tribe was 1st with similar plants to his others; 2d, Mr. Relland. For twelve cut blooms, large flowering, Mr. H. Gibbs was 1st; for twelve Japanese, Mr. H. Tribe, C. J.

HULL CHRYSANTHEMUM: November 19 and 20.

On Thursday last week there opened in the Artillery Barracks, Park Street, the annual show of the Hull and East Riding Chrysanthemum Society, and in point of entries and merit of exhibits it was far ahead of the very excellent show of last year. The large drill hall was occupied on each side by groups of Chrysanthemums in pots, while the tables in the centre of the room were devoted mainly to the exhibition of cut blooms. The gun-room was also devoted to the purposes of the exhibition, there being in this room an excellent show of plants in pots, principally by local amateurs.

In the north hall there was a tasteful exhibition open to ladies only. In the centre of this room was a dessert table competition, the floral decoration of which was limited to Chrysanthemums, in combination with other foliage. In addition there were in the ladies' department many tasteful arrangements of cut blooms of Chrysanthemums.

In front of the orchestra there was a most varied and attractive group of Chrysanthemum and other blooms by Mr. E. P. Dixon, who had also tastefully decorated the orchestra, but Mr. Dixon's exhibits were not for competition. Mr. W. E. Martin had a most attractive exhibition, not for competition, at the west end of the room, consisting of bulbs of various kinds, grasses, seeds, &c. Altogether there were sixty-one exhibitors for competition, and many of them exhibited in nearly every class.

Classes 1 to 9 were open to all England, and 10 to 13 to exhibitors in the East Riding of Yorkshire, or in Lincolnshire within 20 miles of Hull. In class 1 a Silver Challenge Vase of the value of 15 guineas was offered by Mr. G. Bohn, the Chairman of the Society, in addition to the 1st prize of £10. The conditions with regard to the Challenge Vase were, that if an exhibitor should win it three times, or twice consecutively, it shall become his property. There were four prizes in the first class; the 2d being £3, 3d £5, 4th £3. Class 2 consisted of forty-eight blooms, to be exhibited in not less than eighteen varieties, and twenty-four Japanese in not less than eighteen varieties. This was without doubt the most attractive portion of the exhibition, not even excluding the massive and well-arranged groups. There were eight competitors in this class, and the second class was a most excellent one, and the prizes substantial.

In the amateur class a Silver Challenge Cup was offered by the Hull Amateur Floral and Horticultural Society for the best tray in classes 21 and 22, in each of which there were twelve blooms of Chrysanthemums, those in class 22 being Japanese. In the open classes for plants in pots the 1st prize in class 27 was £5, and with it was presented an oil painting by Mr. J. F. Norton, artist, Hull.

CUT BLOOMS. Forty-eight blooms.—Challenge Vase and 1st prize, Sir T. Edwards Moss, Bart., Otterspool, near Liverpool (gr., Mr. D. Lindsay); 2d, C. W. Newmann, Esq., Wyncote, Allerton, near Liverpool (gr., Mr. W. Menase); 3d, J. Woolbright, Esq., Mosely Hill, near Liverpool (gr., Mr. Green); 4th, Mr. T. B. Morton, Mowden Bridge Nurseries, Darlington.

Twenty-four blooms.—1st, Sir T. E. Moss, Bart.; 2d, Mr. C. W. Newmann; 3d, Mr. J. Woolbright. Twelve blooms incurved.—1st, Mr. C. W. Newmann; 2d, Mr. J. Woolbright; 3d, C. H. Johnson, Esq., Thornghubald Hall (gr., Mr. G. Usher). Twelve blooms Japanese.—1st, Sir T. E. Moss, Bart.; 2d, Mr. C. W. Newmann; 3d, Mr. J. Woolbright.

Twelve blooms Anemones.—1st, Mr. T. B. Morton; 2d, D. Wilson, Esq., Cottingham (gr., H. Pulmer); 3d, W. J. Warner, Esq., Bracebridge (gr., W. Mitchell). Twelve blooms, ditto, reflexed.—1st, Mr. T. B. Morton; 2d, W. Ashley, Esq., Limefield House, Lincoln (gr., J. Bunge); 3d, Miss Johnson.

Six blooms, one variety.—1st, Mr. C. W. Newmann; 2d, Mr. W. J. Warner; 3d, Mr. J. Howe, Peas Hill Road, Nottingham. Best incurved cut bloom in the show.—Mr. J. Woolbright.

Best Japanese cut bloom.—Mr. C. W. Newmann. Twelve blooms incurved, and twelve Japanese.—1st, Mr. F. W. Jameson, Eastella, Hull; 2d, Mr. D. Wilson; 3d, A. Wilson, Esq., Tranby Croft (gr., Mr. J. P. Leadbeater).

Twelve blooms incurved, not less than six varieties.—1st, Mr. E. Harland, Cottingham; 2d, Mr. C. H. Johnson; 3d, Mr. F. W. Jameson.

Twelve blooms, six varieties.—1st, Mr. David Wilson;

2d, Mr. F. W. Jameson; 3d, Mr. J. Browsho, Beverley. Six incurved and six Japanese.—1st, Mr. W. J. Tall, Harland Rise, Cottingham; 2d, Mr. D. Wilson; 3d, Mr. F. W. Jameson.

AMATEUR CLASSES.

Six incurved and six Japanese.—1st, Mr. W. Roper, Hull; 2d, Mr. A. W. Stanley, Hull. Three incurved and three Japanese.—1st, Mr. W. Roper; 2d, Mr. A. W. Stanley; 3d, Mr. R. L'Anson, Hull.

Six blooms, reflexed.—1st, Mr. A. W. Stanley; 2d, Mr. W. Roper; 3d, Mr. E. Goddard, Hull. Six blooms, Anemones.—1st, Mr. W. Roper; 2d, Mr. E. Goddard; 3d, Mr. A. W. Stanley. Best incurved cut bloom in amateur classes.—Mr. Goddard.

Best Japanese cut bloom.—Mr. A. W. Stanley. Twelve blooms incurved.—Challenge Cup and 1st, Mr. E. Goddard; 2d, Mr. A. W. Stanley; 3d, Mr. S. Garbutt.

Twelve Japanese.—1st, Mr. E. Goddard; 2d, Mr. A. W. Stanley. Twelve blooms, any variety.—1st, Mr. G. Kidson, Hull; 2d, Mr. A. W. Stanley; 3d, Mr. T. Mapplebeck, Hull.

One bloom, incurved.—1st, Mr. G. Kidson; 2d, Mr. A. W. Stanley; 3d, Mr. J. Melbourne. Six Japanese blooms.—1st, Mr. E. Goddard; 2d, Mr. A. W. Stanley; 3d, Mr. S. F. Smith, Newtoning, Hull.

Six blooms, varieties.—1st, Mr. G. Kidson; 2d, Mr. E. Goddard; 3d, Mr. A. W. Stanley.

PLANTS IN POTS.

Group interspersed with foliage, arranged for effect in a space of 100 feet.—Oil painting, value 5 guineas, and 1st, D. Wilson, Esq.—(Mr. G. Lawson, gr.); 2d, Mr. J. S. Graham; 3d, Mr. G. Cottam, Jun., Cottingham; 4th, Lieut.-Colonel Saner (gr., Mr. L. Howell). Three distinct varieties, bush grown, but on a single stem.—1st, Mr. D. Wilson; 2d, Mr. J. H. Wood; 3d, Mrs. Ross, Houghton (gr., Mr. W. Wilkinson). Three trained specimens, any variety.—1st, Mr. D. Wilson; 2d, T. L. Read, Esq., Newtoning, Hull (gr., Mr. W. Merritt); 3d, Lieut.-Colonel Broosbott, Kirkella (gr., Mr. W. Mason).

Three distinct varieties, bush grown.—1st, Mr. W. J. Tall; 2d, Mrs. Ross; 3d, Mr. J. H. Wood. One trained specimen.—1st, Mr. R. Stamper, Thornghubald; 2d, Lieut.-Colonel Broosbott; 3d, Mrs. Ross.

Three dwarf, distinct varieties, for window or table decoration.—Mrs. Ross.

AMATEUR CLASSES FOR PLANTS.

Twelve plants, six incurved and six Japanese.—1st, Mr. H. J. Bethell, Hull; 2d, Mr. G. Kidson. Three plants, any variety.—1st, Mr. A. W. Stanley; 2d, Mr. H. J. Bethell; 3d, Mr. C. D. Foster, Hull.

Twelve plants, any variety.—1st, Mr. J. Raby, Hull; 2d, Mr. J. Inavy, Hull; 3d, Mr. W. Stanley. Six plants, any variety.—1st, Mr. G. W. Oakley, Newland; 2d, R. Petch, Hull; 3d, Mr. D. C. Foster. Three plants, any variety.—1st, Mr. G. Kidson, 2d, Mr. D. C. Foster; 3d, Mr. S. Davey.

One plant, any variety.—1st, Mr. J. Browsho; 2d, Mr. G. W. Oakley; 3d, Mr. R. Petch.

LADIES' CLASSES.

Desert-tablet for six persons.—1st, Miss M. K. Reckitt, Swanland Manor; 2d, Mrs. Thomas Bailey, Norfolk House, Goslee; 3d, Miss Gertrude A. Dixon, Steppay Lodge, Hull.

Hand bouquet of Chrysanthemums.—1st, Mrs. G. Cottam, Cottingham; 2d, Miss Jameson, Eastella; 3d, Miss Swanson, Barton-on-Humber.

Best-arranged stand or vase for table decoration.—1st, Mrs. L. C. Cook, Hessele; 2d, Miss Ethel Jameson, Eastella; 3d, Mrs. D. Joy, Welton Garth.

Arrangement of cut blooms.—1st, Miss Ethel Jameson; 2d, Mrs. H. J. Bethell; 3d, Mrs. W. Logan, Hull.

Messrs. J. Dickson & Sons, Chester, and Messrs. Richard Smith & Co., Worcester, had stands of fruit; and Messrs. Cannell & Sons, Swanley, Kent, had Pelargoniums and single-flowered Chrysanthemums, not for competition. Hull News.

THE VEGETABLE PRODUCTS OF RUSSIA.—There are few countries where the adaptation of cultivated fruits and vegetables to climate is more perfect than in central Russia. The fruit trees are dwarfed, with leaves remarkably close-celled and firm, so as to resist the aridity and severity of climate. The close texture of most of the central Russian plants adapts them admirably to their surroundings. Fruits and vegetables which are usually associated with warmer climates are grown in abundance. Russia is noted for its Water Melons and Musk Melons. The best of their Musk Melons is an anomalous vegetable, being scarcely like our Musk Melon. It possesses little musky flavour. It keeps until Christmas. Plums and Cherries are grown at high latitudes, and the native varieties are hardy. German sorts are grown far north also, but they usually need protection, and are uncertain. Even the Reine Claude Plum is grown in Russia, but the trees are planted in a leaning condition, making an angle of 45°, or less, with the surface, and are bent to the ground before the snow falls. The Farmers' Gazette.

The mean of the seven high day temperatures was highest at Truro, 49°·4, at Plymouth 47°·4, at Hull and Newcastle 44°·1, and was lowest at Wolverhampton 40°·7, at Bolton 41°·2, at Liverpool 41°·3. The general mean was 43°·2.

The mean of the seven low night temperatures was highest at Truro, 40°·4, at Plymouth 38°·3, at Brighton 34°·1; and was lowest at Wolverhampton, 27°·5, at Cambridge 27°·6, at Bristol 29°·3. The general mean was 32°·6.

The mean daily range was greatest at Cambridge, 15°·2, at Wolverhampton 13°·2, at Bristol 12°·3; and was least at Liverpool, 7°·5, at Truro and Brighton 9°.

The general mean was 10°·6. The mean temperature was highest at Truro, 44°·6, at Plymouth 42°·6, at Newcastle 38°·4; and was lowest at Wolverhampton, 33°·8, at Cambridge 34°·9, at Bristol 35°·1. The general mean was 37°·5.

Rain.—The largest falls were 0·52 inch at Truro, 0·16 inch at Bristol, 0·15 inch at Leeds; the smallest falls were 0·01 inch at Liverpool, Bolton, and Hull. No rain fell at Brighton, Blackheath, or Sheffield. The general mean fall was 0·09 inch.

SCOTLAND: Temperature.—During the week ending November 21, the highest temperature was 46°·7 at Aberdeen; at Perth the highest temperature was 42°·5. The general mean was 44°·2. The lowest temperature in the week was 13°·1, at Perth; at Leith the lowest temperature was 22°·5. The general mean was 18°·5.

The mean temperature was highest at Leith, 34°·5; and lowest at Perth, 30°. The general mean was 33°·0.

Rain.—The largest fall was 0·21 inch, at Aberdeen; the smallest fall was 0·03 inch, at Paisley. The general mean was 0·07 inch. No rain fell at Greenock during the week.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

* OUR ALMANAC for 1886.—Secretaries of Provincial and Metropolitan Horticultural Societies are invited to send us, as soon as possible, the dates of their meetings and exhibitions during the ensuing year, so as to ensure their insertion.

APPLES: G. Donaldson. We do not think your package came to hand.

BOOKS: A Young Gardener. Thompson's Gardeners' Almanac is the best you can get; it is published by Messrs. Blackie & Son, Paternoster Buildings, London, E.C.; its price, now, is 3s. 6d.—A Manual of the Coniferae, published by J. Veitch & Sons, 544, King's Road, Chelsea, S.W., is the book you mean on Conifers, and would suit you very well.

DOUBLE LAGERBERIA BLOOM: J. M. The habit is not likely to prove constant. The foliage is very fine indeed, showing that the plant is in excellent health, to which fact the doubling of the flower may be due. We frequently have flowers of Lagerberia sent which show doubling of parts to a much greater extent than these.

EMIGRATION: T. Adams. For all information on such a subject you had better apply to the New South Wales Government Emigration Office, 5, Westminster Chambers, S.W.; the South Australian Government Offices, 8, Victoria Chambers, Victoria Street, S.W.; or some other of the emigration agents.

EUCHARIAS BULBS: A. Dunlop. Your bulbs are slightly infested with the mite. There is no known cure, so that your only method of extirpation, to prevent its further increase, is to burn the bulbs, but be careful that appear affected in the slightest degree, or which have grown in pots with infected bulbs.

FUNGUS: A. D. H. The spores of the Juniper fungus transferred to the Pear produce the Rostelia. There are many such cases recorded, but some of them are open to doubt.

HARVEY'S LIFE: R. W. A., Natal. Bell & Daldy, York Street, Covent Garden, W.C. A letter will follow.

JAPANESE ANEMONE VAR. IN A STAND OF JAPANESE CHRYSANTHEMUMS: K. G. No, it should not disqualify.

LABELS IN 1884: E. Jones. We have no record of the name of the person who was awarded a prize by the Society of Arts. You might apply to the Secretary of the Society.

NAMES OF FRUIT.—S. B. Apple: Pomeroy. F. O'B. 1, Pear: Triomphe de Jodoigne; 2, Apple: London Pippin; 5 and 6, Flower of Kent; 7, Northern Greening; 8, 9, 10, 11, and 12, all recorded, very fine; 3, New Hawthornden; 4, Lord Derby; 5, Pitmans Russel Nonpareil; 6, Peasgood's Nonsuch.—M. Y. T. Apples: 1, Round Winter Nonsuch; 2, Fearn's Pippin; Pears: 1, Marie Louise; 2, Winter Nells.—Yates Smith, A fine-looking Apple, greatly resembling Flinders Pippin.—George Wall, Pear: Beurré

Diel.—Alfred N. Jones, 3, Forelle; 7, Josephine de Malines; 9, Marie Louise; 12, Beurré Rance; and others so much bruised and out of character that they cannot be recognised.—Albert Butler, 1, not known; 2, Thornby Seedling; 3, Hambleton Deux Ans.—A. H. 1, variety of Crab; 2, Pear: Knight's Monarch.—J. Y. Poller, 2, Doyenné Gris; 2, Flemish Beauty; 3, Passe Colmar; 5, Beurré Diel; 6, Doyenné Boussouch.—T. Jackson, Pears: 1, Gansell's Bergamot; 4, Doyenné Gris; 5, Napoleon; Apples: 2, decayed; 6, Blenheim Orange; 7, Bedfordshire Foundling; 8, Franklin's Golden Pippin; 9, Margil; 10, Clavate Pearmain.—J. B. 1, Brown Beurré; 2, Beurré d'Arenberg; 3, Old Crassane; 4, Duchesse d'Angoulême; 5, Beurré de Capriaumont; 7, Doyenné Boussouch.

NAMES OF PLANTS: J. E. Oncidium diodon. Please send the two Ferns again.—Southampton. Dr. Wm. W. H. Stevens. Epidendrum cochlearum var.—B. W. Odontoglossum Inseleyi splendens. Several plants of it have flowered in collections this year.—E. C. Calceyge Gardeneria.—H. J. Ross. Filumna huxa.

PEAR LEAVES WITH MICROSCOPIC THREAD-WORMS.—A correspondent has forwarded Pear leaves spotted with pallid patches. On a microscopical examination the spots are seen to be infested with minute nematoid worms allied to the worms which cause the rotting of Carnations. Similar examples were forwarded last year.—W. G. S.

SOUTH AFRICAN PLANTS: J. R. Twidden. In reply to your enquiry we are unable to say if Mr. Sanderson is still alive; but a good set of the plants he collected, together with some of his original notes and copies of other of his drawings are preserved in the Kew herbarium. The first set of Cooper's plants, and nearly complete sets of those collected by Gerrard and Krauss, are also in the Kew herbarium. N. E. Brown, Herbarium, Kew.

TESTIMONIAL TO MR. INGRAM: C. W. D. Hon. Secretary, W. L. Emmerson, Waltham-on-the-Wolds, Melton Mowbray.

VINE ROOTS: X. Brunfelsia americana.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

COMMUNICATIONS RECEIVED.—A. Natal.—P. W. St. Petersburg.—J. S.—H. E.—A. D. W.—D. R. Watt, Calcutta.—Wild Rose.—R. W. B. H.—E. T. F. Sander & Co.—F. W. B.—R. W. Adlam.—J. H.—H. T. G.—W. S.—W. Smythe.—H. E.—J. D.

Markets.

COVENT GARDEN, November 26.

MARKET very quiet and heavy, with large supplies of Grapes. Large importation of Canadian and Nova Scotia Apples at low prices. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit and Price. Includes Apples (per 1/2 sieve, 1 0-3 0), Canadian (barril, 10 0-20 0), Grapes (per lb., 0 6-2 6), Kent Cobs (200 lb., 22 6-25 0), Lemons (per case, 115 0-30 0).

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable and Price. Includes Artichokes (per doz., 1 0-1 0), Beans (Kidney, 1 lb., 1 0-1 0), Beet (red, per dozen, 1 0-2 0), Broccoli (bundle, 0 6-1 0), Cabbages (per dozen, 1 6-2 0), Capsicums (per doz., 1 6-2 0), Carrots (per bunch, 0 6-1 0), Cauliflowers (per doz., 2 0-3 0), Celeries (per root, 0 3-1 0), Endives (per doz., 2 0-4 0), Coleworts (doz. bunch, 2 0-4 0), Cucumbers (each, 0 6-1 0), Enives (per dozen, 2 0-4 0), Herbs (per bunch, 0 2-4 0), Leeks (per bunch, 0 3-4 0), Lettuce (per dozen, 1 0-2 6).

POTATOES.—Magnum Bonums, bad trade, 30s to 80s; Regents, 60s to 80s. per ton; German Reds, 2s to 2s. 6d. per bag.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant and Price. Includes Aralia Sieboldi (doz., 0 18-0 8), Erica (per dozen, 0 6-1 0), Ferns (per dozen, 0 6-1 0), Begonias (per dozen, 6 12-0 12), Bouvardia (doz., 12 18-0 18), Chineria (per doz., 10 12-0 12), Chrysanthemum (per doz., 9 12-0 12), Cyclamen (12 pots, 112 18-0 18), Cyperus (per dozen, 4 0-12 0), Dracena (per dozen, 10 0-12 0), Ficus elastica (each, 1 6-7 0), Ferns (in variety, per doz., 4 0-18 0), Foliate Plants (various, 0 18-0 10), Hyacinths (Roman, per pot, 1 0-1 10), Marguerite Daisy (per dozen, 8 12-0 12), Myrtles (per dozen, 6 0-12 0), Firms in var. (each, 6 2-10 0), Pelargonium (each, per dozen, 6 0-9 0), Poinsettia (per dozen, 12 18-0 18), Primulas (single, 12 0-18 0), Frits (each, 4 0-6 0), Tulips (12 pots, 8 0-12 0).

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower and Price. Includes Anethum (12 bunches, 2 0-4 0), Arum Lilies (12 blms., 6 0-8 0), Carnations (per bunch, 0 6-1 0), Bouvardia (per bunch, 0 6-1 0), Camellias (12 blms., 3 0-6 0), Chrysanthemum (12 blms., 1 0-2 0), Cyclamen (doz. blms., 0 6-0 8), Euphyllium (dozen, 0 6-1 0), Eucharis (per dozen, 4 0-6 0), Fuchsias (12 blooms, 4 0-6 0), Hyacinths (Rom, 12 sprays, 1 0-2 0), Lappagers (white, 12 blooms, 2 0-3 0), Red, 12 blooms, 1 0-2 0.

SEEDS.

LONDON: Nov. 25.—On account of the Elections, and for other reasons, the business now doing in farm seeds is, as might be expected, on a very small scale. Clover seeds generally continue steady all round. The total recent shipments of Red seed from European ports to America have now assumed important proportions, one estimate placing them at over 5000 bags. Trefoil, by reason of its remarkable cheapness, has lately met with more attention. There is no change this week in Haricot Beans or Blue Peas. The late advance in Canary seed is well maintained. Hemp seed continues exceedingly cheap. Feeding Linseed is firm. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

FRUITS AND VEGETABLES.

COLUMBIA (East London): Nov. 25.—Good supplies of fruit and vegetables. Trade good. Prices moderate. Quotations.—Pears, 2s. 6d. to 7s., and Apples, 2s. 6d. to 6s. per bushel; Cabbages, 2s. 6d. to 6s. per tally; and Savoys, 4s. to 8s. doz.; Brussels Sprouts, 4s. to 4s. 6d. per sieve; bunch greens, 2s. 6d. to 4s. per dozen bunches; bunch Turnips, 2s. 6d. to 3s. 6d. doz.; bunch Carrots, 2s. to 2s. 6d. doz.; bunch Parsnips, 1s. to 1s. 6d. doz.; bunch Leeks, 1s. to 2s. doz.; Celery, 5s. to 6s. per dozen bunches; Beetroots, 2s. to 4s. doz.; Onions, 4s. to 5s. per cwt.; Carrots, in sacks, 30s. to 50s. per ton; Turnips, white, 50s. to 60s. doz.; Swede do., 30s. to 32s. 6d. doz.; and Mangels, 22s. 6d. to 25s. doz.

STRATFORD: Nov. 24.—The supplies have been good during the past week, as also the attendance of buyers, consequently a fair trade was done at the following prices.—Red Cabbages, 12 doz. to 6s. per tally; Savoys, 4s. to 7s. 6d. per tally; Cauliflowers, small, 2s. doz.; greens, bunch, 1s. 6d. to 4s. per dozen; Mangels, 17s. to 22s. per ton; Swedes, 20s. to 40s. doz.; Turnips, 50s. to 60s. doz.; Brussels Sprouts, 3s. 3d. to 4s. per sieve; Apples, best, 2s. 6d. to 5s. 6d. per bushel; do., common, 10s. to 14s. per cwt.; Onions, 70s. to 80s. per ton; Carrots, cattle feeding, 30s. to 32s. per ton; do., household, 40s. to 50s. doz.; do., white, 30s. to 35s. doz.

POTATOES.

COLUMBIA (East London): Nov. 25.—Magnums, 50s. to 80s.; Regents, 60s. to 70s.; Victorias, 60s. to 65s.; Chempions, 50s. to 60s.; Early Roses, 60s. to 70s.; Reading Heros, 60s. to 70s.; and Beauty of Hebron, 70s. to 85s. per ton.

STRATFORD: Nov. 24.—Magnums, 56s. to 75s.; Regents, 60s. to 75s.; Roses, 80s.; and Chempions, 50s. to 60s. per ton.

Imports.—The imports into London last week consisted of 8850 bags from Hamburg, 10 from Harlingen, 200 from Antwerp, 723 from Ghent, 100 from Montreal, 100 from Boulogne, 14 bags to sacks from Rotterdam, 47 packages from St. Michaels.

HAY.

WHITECHAPEL: Nov. 24.—Large supplies and very dull trade, in consequence of the wet weather. Quotations.—Clover, prime, 90s. to 105s.; inferior, 70s. to 85s. Hay, prime, 75s. to 90s.; inferior 65s. to 70s. Straw, 28s. to 37s. per load.

Nov. 26.—A moderate supply was on sale. The trade was dull at Tuesday's prices.

CUMBERLAND (Regent's Park): Nov. 24.—The weather has influenced a bad trade, with prices lower to effect a clearance. Clover, best, 90s. to 100s.; seconds, 70s. to 90s. Hay, best, 72s. to 85s.; second, 60s. to 70s. Straw, 30s. to 35s. per load.

STRATFORD: Nov. 24.—Clover, 80s. to 100s.; hay, 75s. to 85s.; and straw, 30s. to 35s. per load.

COALS.

The following are the prices current at market during the week.—Ravensworth West Hartley, 14s. 6d.; Holywell West Hartley, 15s. 6d.; West End Type (not screened), 11s. 3d.; Hetton, 17s. 6d.; Hetton South, 15s. 6d.; Hulan, 15s. 6d.; East Hartlepool, 16s.; Lynn Hartlepool, 15s. 6d.; Tees, 17s. 6d.; Lambton, 17s. Wear, 15s. 6d.; Caradoc, 17s. 6d.

Government Stock.—Consols closed on Monday at 100½ to 100½ for delivery, and 100½ to 100½ for the account. Tuesday's and Wednesday's final record was 100 to 101 for both transactions; and the same return was made at the close on Thursday.

BOULTON & PAUL, Norwich,
HORTICULTURAL BUILDERS and HEATING ENGINEERS,

Awarded the **GOLD** and **SILVER MEDALS** by the Royal Horticultural Society, for the General Excellence of their Exhibits—1881.

 Work, Manures, &c. Cheapest prices of
WATSON AND SCULL, 90, Lower Thames St., London, E.C.

THE BEST DRESS GOODS are the CHEAPEST,—PEASE'S (Estab. 1752) SUCCESSORS' are the VERY BEST MADE.

LADIES, in any part of the World, are invited to send for Patterns to the ACTUAL SPINNERS and MANUFACTURERS, who will IMMEDIATELY forward Samples and Illustrated Circular, POST-FREE, of the VARIOUS descriptions of their DRESS FABRICS.

ANY QUANTITY CUT, from all the New and Seasonable Makes and Colours, at Wholesale Prices.
 THE LARGEST and CHOICEST STOCK in England of BONA FIDE Home Manufactured Goods held by the Actual Manufacturers.
 At the Bradford Technical Exhibition, opened by H.R.H. the Princess of Wales, and in face of the keenest local and universal competition, we obtained the only Gold Medal for Cashmeres awarded by the Clothworkers' Company, London, which was the highest honour any manufacturer could obtain.

OUR GOLD MEDAL CASHMERES,
 From 1s. 11d. to 3s. per yard.

MERINOES,
 From 2s. to 3s. 6d. per yard.

OTTOMANS,
 From 1s. to 3s. per yard.

COSTUME CLOTHS,
 From 2s. to 4s. per yard.

CORDS,
 From 6d. to 1s. 6d. per yard.

All the above are PLAIN and COLOURED.

By ordering direct from us, all intermediate profits are saved.

Unlike so-called Manufacturing Companies, who buy of good, bad, and indifferent manufacturers to sell again as their own, and at ordinary retail prices, the goods of HENRY PEASE and CO.'S SUCCESSORS are of their own manufacture. They are thus enabled to warrant the wear and quality of every yard, and to sell at prices which cannot be approached.

Ladies are invited to send for Patterns from any part of the World, when they will immediately receive a complete set with Illustrated Circular, POST-FREE.

DARLINGTON

(Practically untearable either way of the cloth)

CROSS-WARP

TO THE SEED TRADE.—A young man (age 23) requires a situation in the Seed Trade. Four years' experience in first-class firms. Has been twelve months in England, at John Lane & Co., with whom he is at present. Good references.—C. ROMAIN, a Lower Winchester Road, Catford, London, S.E.

TO THE SEED TRADE.—Situation wanted by a young man (age 26) with good references and eleven years' experience. Could enter upon engagement at once.—S. M., Hurst & Son, 159, Houndsditch, London, E.

HOLLOWAY'S PILLS.—One of the most efficient

remedies for the cure of the most efficient causes of dangerous diseases, and the most prolific source of those melancholy forebodings which are worse than death itself. A few doses of these potent Pills act magically in dispelling low spirits and relieving the nervous system, and the nerves by excessive heat, impure atmosphere, over-indulgence, or exhausting excitement. The most shattered constitution may be restored to its former firmness, and the Pills will regulate disordered action, brace the nerves, increase the energy of the intellectual faculties, and revive the falling memory. By attentively studying the instructions for taking these Pills and explicitly putting them in practice, the most desponding will soon feel confident of a perfect recovery.

TO SEEDSMEN AND MARKET GROWERS.

HARRISONS' EARLY ECLIPSE PEA.

The Earliest Variety in Cultivation.

The haulm is of a peculiar light colour, only 2 feet in height, the pods of a lively green and well filled, and is the heaviest cropper for an early variety we have ever seen. The seed is blue, and similar in appearance to the "Kentish Invicta," but it is harder and earlier than that excellent variety.

This variety was selected by us from *Harbinger*, which was intro-

The Earliest in the Market, and made the Highest Price last season.

Price on application.

duced by Mr. Laxton some years ago, and it has again proved its superiority as an early Pea over all other kinds. We published last season a long list of testimonials from nearly every county, and this year we have a far greater number, too many for publication. We, however, shall be glad to give any intending purchaser the address of some one in their locality to whom they may refer.

HARRISONS' "EXHIBITION" MARROW PEA, OR IMPROVED NE PLUS ULTRA.

In order to introduce this selection we are compelled to give it a distinct name to prevent it being classed with the many worn-out stocks of the old and famous *Ne plus Ultra*. We do not wish it to be considered a new variety, but a well and carefully selected stock of the original one. It possesses all the quality, prolificness, and general usefulness of its parent, but we believe has a better constitution and improved

character; its height is about 6 feet in ordinary seasons, and very robust. The pods are deep green colour and filled very tightly with Peas of unusual size and of the finest flavour possible. It is undoubtedly a Pea that should be grown upon sticks, as being so long in the haulm, and not all coming in together, many gatherings may be made from the crop during the season.

Price on application.

THE SMITHFIELD CLUB CATTLE SHOW.

Our STAND No. 71, at this Show, will be in the usual position in the Galleries, where we shall have samples of the leading kinds of Peas, Beans, and other Seeds, of which we invite an inspection.

HARRISONS' "LIST of NOVELTIES and IMPROVED VEGETABLE SEEDS." Post-free on application.

Hooper's Splendid Seeds and Bulbs at low prices The Covent Garden Seed warehouse Catalogue free to Nurseries

LILIU AURATUM (Large Home-grown).

We are now taking up in fine condition the Bulbs of Lilium auratum, which produced the magnificent flowers which we exhibited at the Great Conservatory, South Kensington, all through August and September, and which obtained universal admiration. Prices, 125, 245, and 365, per dozen; very large bulbs, 55 each; selected best forms, 25, 6d., 35, 6d., and 55, each. Our importations of Indian LILIES, POLYPHYLLUM, WALLICHANUM, NIELGHERRENSE, are now on their way. For prices, see our List No. 77, pages 15, 19. NEW PLANT and BULB COMPANY, Colchester.

GREAT SALE OF NURSERY STOCK.

Part of our Kingston Hill Ground having to be cleared by Christmas, we intend selling at the KINGSTON HILL NURSERY, All kinds of DECIDUOUS and EVERGREEN SHRUBS, FOREST TREES, ROSES, and FRUIT TREES, AT GREATLY REDUCED PRICES. The Trade and Private Buyers will find this an excellent opportunity for Stocking.

T. JACKSON and SON, NURSERIES, KINGSTON-ON-THAMES.

NEW APPLES.

SEPTEMBER BEAUTY.

First-class Certificates from the Royal Horticultural Society and at the Crystal Palace, 1885.

This is one of the handsomest, richest-flavoured, and most digestible mid-season dessert Apples, having the full Ribston flavour, but precedes that delicious Apple, and is harder and more fertile.

5s. and 7s. 6d. each.

THE DARTMOUTH CRAB.

The largest, best, and most distinct of all the Crabs, and one of the handsomest fruits in cultivation, being of a beautiful crimson-scarlet colour, coated with a rich bloom, and carried on a long stalk. The fruit resembles an enlarged Victoria Plum, and the tree laden with fruit is most attractive. This Crab, which ripens early, is not acid, but if eaten at the ripening point is equal to a first-rate summer Apple.

3s. 6d. and 5s. each.

Further particulars on application to

THOMAS LAXTON, SEED and NOVELTY GROWER, BEDFORD.

SPECIAL OFFER OF WELL-GROWN STOCK.

MESSRS. JAMES VEITCH & SONS
 CAN NOW OFFER
NEW MINIATURE ROSE, "ROSE BUTTON."

THIS is a most attractive addition to our list of Miniature Roses, among which it takes the first rank. It is a double-flowered form of *Rosa lucida*, an American species well distinguished by its bright shining foliage and neat compact habit. The flowers are produced in terminal clusters of 10 to 15; the central flower is the largest and expands first, and being surrounded with buds forms a most beautiful object. The flowers are rose colour, with a deeper centre, and are delightfully fragrant. A First-class Certificate was awarded to this Rose by the Royal Horticultural Society, July 22, 1884.
 "A very pretty double Balsam-flowered variety that will be valuable for border cultivation."—*Gardener's Chronicle*.
 "A most charming little Rose, quite distinct from any other, being a double-flowered variety of a species seldom seen in gardens. It is extremely floriferous."—*The Gardener*.
 "A charming little Rose, producing its flowers freely in good clusters, perfectly double, and in form very similar to a first-class Balsam."—*The Gardener*.
 "It will be found one of the most valuable of the small-flowered Roses for supplying cut flowers."—*Gardener's Magazine*.
 Plants, 5s. each, 48s. per dozen. The usual Discount to the Trade.

GREAT SPECIALTY—FRUIT TREES, carefully trained, very strong, in full bearing. 1867, Prix d'Honneur, et Objet d'Art, Expositions Universelles, 1878, Two Grand Prix, Croix de la Légion d'Honneur. CATALOGUES on application.

NEW PEARS, "BACKHOUSE'S BEURRE,"

Figured in Gardener's Chronicle, November 3, 1883. This is a hybrid between the Jargonelle and Beurré Diel, and is one of the latter, but with the melting sweet juiciness of the Jargonelle. In season it is also between the two, and bears well as a Standard in Yorkshire. From its large size, excellent quality, great productiveness and hardiness, we have confidence in recommending it for general cultivation, alike for choicest collections where Pears are grown for dessert or exhibition, and for gardens where a profitable market return is all-important. Strongly recommended for delivery. Maiden Plants, 3s. 6d. each. Standards or Dwarfs, 5s. each. Dwarfed trees for walk or espaliers, 7s. 6d. each. General CATALOGUE of Fruit Trees sent on application. Also of Roses, Forest and Ornamental Trees, &c. JAMES BACKHOUSE AND SONS, York Nurseries.

SPECIAL OFFER.

COMPANY'S SUCCESSORS, The Mills, DARLINGTON.

CHARLES SHARPE & CO., SLEAFORD.

SPECIALTIES FOR 1885-6.

SHARPE'S SIR F. A. MILBANK PEA.

This, the latest of Mr. Culverwell's many excellent introductions, is a Blue Wrinkled Marrow much of the Paragon type in habit and growth, but earlier, and differing in being of a beautiful dark grass-green colour, and even more prolific than that celebrated variety; the pods are produced in abundance, are large, square, and closely filled with the extra large dark green Peas, so closely packed that it would appear when opened as if the pods could scarcely have contained them. The flavour is all that could be desired by the most fastidious connoisseur, and in every respect it is a variety that we can with the greatest confidence recommend, either for exhibition or table purposes. It is robust and hardy in constitution, and may be sown early; for Market Garden purposes it cannot fail to prove a great acquisition.

Price 2s. per Quarter Pint sealed packet.

SHARPE'S TRIUMPH PEA.

Triumph is one of the very best of the many fine varieties Mr. Culverwell has given to the public. It is a Blue Wrinkled Marrow Pea of exquisite flavour; the pods are large, very much curved, and are well filled with large Peas closely packed in the pod. The habit is good, being dense and bushy, attaining a height of 2 to 3 feet. The plant is covered with pods from ground to the extreme top of the haulm. On one plant no less than sixty-nine pods have been counted, containing from nine to eleven Peas in a pod. The pods are of a bright green, in clusters of two or three; and are not easily affected by drought, remaining green for a long time. In constitution it is robust and hardy; and, without hesitation, we can say that it is the perfection of Peas for either the Market Gardener or the Private Grower—for exhibition, or for ordinary use.

Price 2s. per Half-pint sealed packet.

SHARPE'S EARLY PARAGON PEA.

FIRST CLASS CERTIFICATE. ROYAL HORTICULTURAL SOCIETY, 1884
Chiswick Report, 1884, accompanied with First-class Certificate:—"PARAGON—A very fine Second Early Variety, and of good quality. Pods large, and well filled."

Price 2s. per Pint Packet, 1s. per Half-pint Packet.

PARAGON, one of Mr. Culverwell's recent introductions, shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkled Marrow of fine flavour; bright from 4 to 5 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick-backed, containing from twelve to fourteen large Peas.

PARAGON is the earliest of the large Wrinkled Marrows, being ready before Prizetaker; in fact the Gardens at Trobach Ferrow it was gathered at the same time as William the First; it is very hardy and will stand out for sowing than any Pea of its class. It is most valuable for a succession crop as it is not liable to rot in law, and a constant supply of Peas for four months can be obtained from this one variety.

SHARPE'S WHITE PROLIFIC MARROW.

Price 2s. per Quart.

A magnificent White Wrinkled Marrow, height 2 to 2½ feet; pods in pairs, long, straight, and well filled. Flavour excellent. As a Second Early Wrinkled Pea there is nothing to equal this, either for quality or production. It is a few days later than the Prince of Wales, but is a much heavier cropper than that variety, and for Market Garden purposes very far superior to it.

THE EARLIEST OF ALL POTATOS.

SHARPE'S VICTOR.

Sharpe's Victor is a seedling raised from the Alms Kidney and the old early short-top round Potato. It is earlier than any present variety, and having a very short top, it is especially suitable for frame cultivation; its precocity is such that it can be had fit for the table in eight weeks from the time of planting, and there is no difficulty in securing new Potatos for the table every day in the year. Victor is a flattened roundish oval in shape, with a beautiful clear skin, and extremely shallow eyes, being one of the handsomest as well as the heaviest croppers of any variety adapted for Frame work, or for a first early crop outdoors. It is dry and mealy when cooked, and the flavour and the quality of the flesh are superior to nearly every other variety at present in use. Another season's trial has fully confirmed all that has been said in favour of the Victor Potato. It is proved to be the earliest, most prolific, and best flavoured of all the early Potatos; and for Pot Culture it is unrivalled.

VICTOR—CHARLES SHARPE & Co. have now a fine stock of sprouted Sets fit for immediate Planting in Pots or Frames—for use end of December and January. Early orders solicited.

Price 8d. per Poina.

CUCUMBER—SHARPE'S EPICUREAN.

CUCUMBERS ALL THE YEAR ROUND.

This, the perfection of Frame Cucumbers, is a cross between Telegraph and Tender and True; in form it has a resemblance to Telegraph, but is of a darker green and much longer—fruits 31 inches in length having been cut from it. It is crisp and juicy, and in flavour it is superior to Tender and True, but its chief recommendation is its marvellous productiveness, in which it exceeds everything that has come under our notice, as many as 300 and 400 fruit having been cut from twelve plants, in a 3-light pit, 3 quarter span. For succession it is unequalled bearing abundantly at Christmas and Midsummer—and in addition to its handsome form and lovely colour, it is a variety that seldom produces seed, not one in a hundred containing a trace.

Price 2s. 6d. per Packet.

SHARPE'S NEW TOMATO, "ECLIPSE."

The Eclipse is a seedling raised from the celebrated Nisbet's Victoria Tomato. The fruit, which is produced in large bunches of ten or twelve, is more than three times the size of the Victoria. The bunches are produced at every joint, as in the parent type, and the plant requires very little stopping. The fruit is oval in form, of a rich cherry-red colour, and the flavour is as exquisite as that of the Victoria. Eclipse is, without hesitation, the most prolific Tomato in cultivation. The immense bunches of richly-colored fruit, when seen traoped to a south wall and well grown, present a sight such as no other Tomato can equal.

Price, Packets, 1s. 6d. each.

THE POMEGRANATE TOMATO.

This is one of the greatest acquisitions in the Tomato ever submitted to the Trade. The fruit is a depressed globe, perfectly smooth; of a deep pink suffused with violet, the beautiful shade of colour being almost impossible to describe; the flesh is firm, of an exquisite flavour, with very little seed, and of a deep rich crimson, very closely resembling the interior of a ripe Pomegranate. It is very prolific, the fruit being produced in bunches at every joint, and it is equally adapted for Outdoor or Frame cultivation. We have no hesitation in recommending it as a great advance upon any of the large kinds of Tomato.

Price, 1s. per Packet.

- Varietated, Standards, 10 to 12 feet.

Weeping Trees.

- BEECH, Weeping, Pyramids and Standards, 10 to 12 feet.
- Weeping, Purple (true), Standards, 8 to 10 feet.
- BIRCH, Young's Weeping, Pyramids, 10 to 12 feet.
- Young's Weeping, Standards, 14 feet.
- ELMS, Weeping, Standard, 10 feet stems.
- HAZEL, Weeping, Standard, 8 to 10 feet.
- LARCH, Weeping, 6 to 10 feet.
- POPLAR, Weeping, Standards.
- SOPHORA JAPONICA PENDULA, Standards, 8 to 9 feet.

Intending planters are invited to inspect the Plants growing; no one interested in such matters will regret the trouble. Catalogues convey but a very inadequate idea of such a Stock.

**KNAP HILL NURSERY,
WOKING, SURREY.**

THE Gardeners' Chronicle.

SATURDAY, DECEMBER 5, 1885.

CLANDON PARK.

AN outing even in November is sometimes necessary to country-bred folk whose occupations call them to town occasionally for longer residence than they desire. Much to my satisfaction the new railway from Leatherhead to Guildford carried me through some Surrey villages known of old and now very gladly revisited. Having spent some hours at East Horsley, till the sun went down—for there was a sun that day though not a glimpse to pierce through the mist of the day before, or the day after—I arrived at Guildford. The next morning I had two great gardens to visit. Wet or dry I meant to see Clandon Park that day, and to cross the hill and call at Albury.

Strange to run by rail through little woods and copses well known in former days, and to see the smart cock pheasants not so much as skulking in the brushwood at the novelty of the train. Strange to alight at Clandon at a new red station outside the Earl of Onslow's little village, where, in spite of the democracy, you are not likely to find any land on the market for some time to come. Here we are at the Park gates in the village street, not the chief entrance, which is on the Guildford side of the Park. There is the church a little further on, and in its rear, not far removed from the main road, is Lord Onslow's great house, one of the largest in Surrey. With all respect for those architects of the last century who deserved any, and a great many of them did not, what a blunder it was to ignore the best prospects as well as the sun in selecting a site!

A shooting party left the house at the time of my approach, and before night many braces of pheasants and hares, like Falstaff's "ragamuffins" had been "well peppered." My mission was to Mr. Court, the gardener, and fortunately a public path through the park to Merrow and Guildford passes the kitchen-garden. So I committed no trespass, which must upon occasion be done in passing through the country, or you will miss something you ought to have seen. The garden is a good one, 3 acres in extent, and walled, with several "houses," as gardeners call them, fairy palaces if we consider, formed of an exquisite, transparent fabric, which admits the sunlight, and is marvellously cheap. This department has been made attractive by flowers and grass paths, a conservatory, and a very pretty Rose-garden, surrounded by Yew hedges.

In one of the houses Mr. Court pointed out a Sutton's Chiswick Red Tomato in a 10-inch pot, having a bunch containing ten Tomatos, and a crop of a hundred altogether—a wonderful plant!

The gardening is all accomplished by four men with their head, so the working-man cannot have degenerated, though it is the fashion to say that he has done so. Close to the gardens are the house of the estate agent, clothed with Ivy, the stables and the timber yard. A short walk across the park brought us to the mansion, an oblong building of red brick, sobered by as many years as have shed their storms upon it since it was built in 1731. I

New Garden Plants.

ERIA (HYMENERLE AFF.) RIMANNI, n. sp.*

stands in the midst of a lawn of six acres, three storeys high, oblong in shape, colossal, and embellished by an English, a French, and an Italian front—a strange fancy of the poorest century for taste in building that this country has ever known. It seems ungracious to indulge in criticism, and I will only add in regard to the site, what a pity! The views towards the North Downs, whose ridge crosses the country half a mile south of the house, lie on the sunny side and are singularly pleasing, but they are out of sight. The northern landscape, seen from the windows and still better from higher ground near the church, comprises the park, and occasional groups of deer, with the high lying country beyond, the conspicuous tower of Knap Hill, and Frimley and Chobham Ridges, where the poorest sands of Surrey refuse to produce even the characteristic growth of such wastes as those of Woking and Bagshot. A pretty pond in the foreground of this pleasing landscape sparkles from the windows having the brightest of water well stocked with red spotted trout of the true Surrey breed.

The park slopes gently northwards away from the house, an arrangement which the architect should have altered by fixing the site where, in looking from the windows, you might imagine the landscape leaning towards you instead of shunning your gaze.

Clandon Park belonged originally to the family of Weston, of Sutton Place, Send, near Guildford, whose representative, Sir Richard Sutton, introduced red Clover into England, and encouraged the growth of field Turnips. The park was formed by an earlier Sir Richard with leave and licence of Henry VIII. In 1642 it was sold to Sir Richard Onslow, of Knole, Cranley, Surrey, or Cranleigh, as the word is now spelt to prevent confusing this Cranley with another somewhere else. A grandson of the above removed here early in the last century. Mr. Speaker Onslow became the first peer.

Over the hill to Albury, by Newlands Corner, and past the great Yews of the Pilgrim's Way, was for me a walk of deepest interest. I have known the Yews from a child, and turned aside to examine them. They have scarcely grown older in appearance. One ancient veteran, in whose hollow trunk a rufian lighted a fire thirty years since, has become younger by a well-known process of healing and over-barking, one may call it rejuvenescence. The hills, too, are unaltered so far as I could see them lying still and solemn in the mist, with the leaves of the trees that cover most of them yellow and sere, and ready to fall. A friend of old times, a little worn like others by many years passing over him, welcomed me, and, after a short repast, we walked together to call on Mr. Kemp at Albury Park. In the company of a first-rate gardener, happy apparently in showing us the gardens and grounds he has managed for thirty years, the time slipped fast away like the rapid Tillingbourne that waters this beautiful place. There was constantly another specimen we must see, and another; day departed, and we stood before a dark thing—a tree, a Douglas Fir, I was told—twenty-three years planted, and eighty-two feet high; beautiful if we could only have seen it. We hope to do so some other time. *H. E.*

SWOLLEN MOUTH AFTER EATING PINE-APPLE.—A correspondent of the *British Medical Journal* states that "A gentleman about forty years of age received a Pine-apple as a present. The fruit had an unusually dark rind [Black Jamaica]. He ate several slices after dinner, carefully cutting off the rind, none of which touched his mouth. Within a few hours his lips began to swell. The swelling did not disappear for twenty-four hours. The tongue was not affected. The gentleman had no other uneasiness or pain." [We had a similar experience in some Pine-apples raised from suckers that came ashore from the *Tyne* Mail steamer, which came ashore off St. Albans Head in 1858. Ed.]

This *Eria* would be a genuine *Hymeneria*, were it not for its very coriaceous leaves and the inflorescence, which has a slight covering of short reddish hairs on the rachis, bracts, stalked ovaries and sepals. The bulb is pyriform, or like a fresh Fig, covered in the mature state with a very characteristic, rather shining brown or grey wrinkled skin (comparable to that of *Eria myrsiciformis*, of Sir William Hooker), reaching nearly 3 inches in height and almost as much in circumference at the widest part. The leaves are cuneate, oblong, acute, very leathery, light green, much lighter underneath, with the eleven nerves of a dark green colour. I received only a single fresh leaf, the three bulbs having none, but there were scars of 3–4 at the top. The nodding inflorescence is very dense. The flowers may be compared to those of *Eria pachystachya*, Lindley, if the widely distinct lip be not considered. They are pellicid, of the lightest sulphur, and have a long blunt mentum. Lip sulphur coloured, with the front lobe of a fine golden-yellow, and two small purple spots over it, and a small tumour at the very base, covered with purple dots.

It was discovered by Mr. Ernest Kimann, in Burmah, when travelling for Mr. F. Sander, at whose establishment it is now in flower. It is a pleasure to name it after this ardent and successful collector. *H. G. Rehb. f.*

ODONTOGLOSSUM CONSTRICTUM (Lindl.) CASTANEDUM, n. var.

I think I have seen hundreds of inflorescences of this well-known old plant, but this is quite distinct in its colours, and rather nice. The sepals and petals are cinnamon-colored, with one or two greenish-white lines at the base. It was kindly sent by Mr. F. Sander. *H. G. Rehb. f.*

NEW SPECIES OF PRIMULA FROM THE MOUNTAINS OF YUNNAN, WESTERN CHINA.

THE genus *Primula* is now in the ascendant, and the number and diversity of the species in certain regions, especially in the mountains of Asia, seems almost inexhaustible. When that part of Sir Joseph Hooker's *Flora of British India*, containing the *Primulaceae*, appeared some three years ago, it afforded a great surprise in the large number of new species of *Primula* described, chiefly from the Himalaya Mountains. After the reduction of a large number of forms that had previously been described as independent species to *P. obtusifolia*, P. Stuartii, P. petiolaris, and others, there still remained, including one in the addenda, forty-four admitted species. And every fresh district visited since has yielded something new, so that the publication of additional new species from the Himalayan region may be expected at any time.

It is noteworthy that no species of *Primula* has hitherto been detected, either on the mountains of the western peninsula of India, or on those of Ceylon. One very fine and distinct species, *P. imperialis*, inhabits the mountains of Java, and the familiar *P. prænitenis* (siensis) and *P. japonica* are the most conspicuous of the few species inhabiting the extreme east of Asia. But lying between Eastern India and Western China is a vast tract of country, the interior of China, concerning the vegetation of which comparatively little is known. Various French missionaries, notably David and Delavay, have, however, made considerable collections in the western provinces of China, and M. A. Franchet has described a great many of their novelties in various publications.

* *Eria (Hymenerle aff.) Rimanni*, n. sp.—Pseudobulbis pyriformibus, junioribus usque quadrifloris; foliis corticis cuneato-oblongis acutis; racemo densissimo cæcuis; rhachi rufo-pubescente; bracteis ligulatis obtusis rufo pilosis ovaria rufa-pilosa pedicellata dimidio aequantibus; sepalis acuta brevissimo rufo-pilosis, sepalo impari triangulari; sepalis lateralibus triangularibus in mentum obtusum descendentibus; tepalibus oblongis obtusis, labello cuneato antice trilobis lobis lateralibus semi-oblongis, laciniis anticæ transversa oblongis emarginata cum lobulo tertio medio triangulo insidente, callo tumido in lobis. Flores pellicidi hyalini sulphurei. Labello lobus antice læte circureo. Puncta duo purpurea lobo hinc superposita. Punctula purpurea, nomolla in callo humili in unguis basi. *H. G. Rehb. f.*

His latest contribution* to Chinese botany is a synopsis of the species of *Primula* collected in the mountains of Yunnan by Delavay. The collection comprises twenty species, nearly all found around Lake Tali; and of these twenty species, sixteen are, according to Franchet, absolutely new; three are referred to Himalayan species, and one is treated as a remarkable variety of *P. auriculata*, a native of the Caucasus and Siberia. The greater number of the *Primulas* of the lofty mountains of Yunnan, Franchet says, are singularly remarkable for the beauty of their flowers, surpassing even the Himalayan species in brilliancy of colouring. The new species described are:—

1. *Primula (Primulastrum) septemloba*, Franchet.—This has purple flowers, and is nearly related to *P. mollis*, Hook. (*Bot. Mag.*, t. 4798), and *P. geraniifolia*, Hook., differing from the former in its less abundant pubescence, in the shape of the calyx, and in the mode of cutting of the leaves; and from the latter in the fewer, very obtuse lobes of its leaves, and from both in the absence of a ring at the mouth of the tube of the corolla. P. Kaufmanniana, Regel, has leaves more numerous lobed, and glabrous pedicels. Finally, Franchet adds, these four species are very closely allied to each other, scarcely differing, except in the shape of their leaves. Collected in woods at the foot of the glacier of Likiang.

2. *Primula (Aleuritia) bullata*, Franchet.—A handsome species, covered in nearly all its parts with a very enduring golden powder. Its bullate, strictly lanceolate leaves and thick rhizomes constitute it a well-characterised type, which, with the next, may be placed near *P. petiolaris*. Flowers golden-yellow, very numerous, and borne in loose umbels. Found on limestone rocks on Mount Heechanmen.

3. *Primula (Aleuritia) bracteata*, Franchet.—Flowers yellow, corolla scarcely exceeding the calyx. Differs from *P. bullata* in the absence of flowery powder, and in the short, partly glandular pubescence which covers the whole plant. Both differ from *P. petiolaris* in having rugose leaves, and almost woody rhizomes. It inhabits shaded clefts in the limestone rocks of Lankong.

4. *Primula (Aleuritia) soucheifolia*, Franchet.—Flowers violet. Near *P. obtusifolia*, Royle, though quite distinct in its almost runcinate leaves, recalling those of *Sonchus asper*. Collected on the summit of Mount Tsangchan at an elevation of 11,000 to 13,000 feet.

5. *Primula (Aleuritia) serratifolia*, Franchet.—This is also near *P. obtusifolia*, differing in its triangular acuminate calyx lobes, in its acutely toothed leaves of thinner texture, and in its yellow flowers. From the elevated humid pastures of Tsangchan, above Tali.

6. *Primula (Aleuritia) secundiflora*, Franchet.—Readily distinguished by the unequal arrangement of its fine violet flowers. It may be associated with *P. sikkimensis*, Hook. The very deep colour of its flowers renders this one of the handsomest species of the genus. Found near springs on the glacier of Likiang, at an altitude of 11,000 to 13,000 feet.

7. *Primula (Aleuritia) calliantha*, Franchet.—Related to the last, from which, however, it is readily distinguished by its more coriaceous leaves, covered with a golden dust beneath, and finely crenulate instead of serrulate, by its large calyx and short thick pedicels, and by the denticulate lobes of the corolla. Flowers showy, of an intense purple-violet. Collected in very shady places under Fir trees on Mount Tsangchan, near Tali.

8. *Primula (Aleuritia) amethystina*, Franchet.—Amethystine flowers, borne in umbels of three to six. Leaves resembling those of the Daisy, with flowers of P. Kingii. Found in humid pastures at an elevation of about 13,000 feet on Mount Tsangchan.

9. *Primula (Aleuritia) bella*, Franchet.—Habit of *P. uniflora*, but very different in the narrow, deep lobes of the leaves, in the shape of the calyx, and in the corolla, which has bifid lobes, and the throat of the tube closed with whitish hairs. Flowers large and showy, of a deep purple-violet. Collected on the summit of Tsangchan.

10. *Primula (Aleuritia) yunnanensis*, Franchet.—This very elegant species is also rather closely related to *P. uniflora*, from which it is distinguished by its leaves being more attenuated at the base, with a glabrous petiole, by the lanceolate acute calyx lobes, by the bifid, not quadrifid, lobes of the corolla,

* *Bulletin de la Société Botanique de France* (1883), xxxii, p. 764.

and by the pedicellate flowers, with the pedicels proceeding from different heights. Flowers violet-purple, with a slender corolla-tube. Growing in clefts of limestone rocks at the foot of the Likiang glacier.

11. *Primula (Aleuritia) spicata*, Franchet.—Remarkable in having unilateral spicate flowers, a kind of inflorescence previously unknown among *Primulas*. The leaves recall those of *P. Wattii*, but they are less attenuated at the base, and doubly crenate, and the violet flowers closely resemble those of *P. uniflora*. Collected in the elevated pastures of Tsangchan, above Tali, after the melting of the snows.

12. *Primula (Aleuritia) glacialis*, Franchet.—A pretty species, readily distinguished by its long calyx, divided four-fifths of its length into very narrow lobes, and by its corolla, which has relatively narrow, quite entire divisions. It is nearest *P. nivalis* and

pinnatifida, and this should be classified with *P. capitata*, Hook. (*Bot. Mag.*, t. 4550), and *P. erosa*, Wall., from which they both differ, in their flowers being strictly sessile, as well as in the shape of their leaves and in their calyx. From the chalky alpine pastures of Heegnichan, above Hokin, north of Tali.

16. *Primula (Omphalogramma) Delavayi*, Franchet.—A very interesting species constituting a new subgenus, characterised by having large laterally compressed seed, with a thickened appendage on the ventral side, and by the flowers appearing before the leaves, borne singly on bractless peduncles. Flowers large, deep purple, slightly hairy; peduncles ultimately as much as a foot high. Collected on the Tsangchan in cold, rather damp situations, in clayey soil, at an altitude of more than 16,000 feet, which is nearly as great as the greatest at which *Primula*s have been found in the Himalayan Mountains.

AN OLD BANYAN IN A BOWL

THE curiosity in trained plants seen in fig. 158 was brought home by Lady Brassey, after making a voyage round the world in 1876-77, in the yacht *Sunbeam*. It is stated to be a hundred years old. The plant and vase stand 3½ feet in height, and the plant is kept to that height by cutting-back and tying. The hole from the ground to the foliage is 1 foot high, and 2 feet 9 inches in circumference, and has been used for a birdcage, the roots being tied to wires for that purpose, but now the wires are decayed with age it is no longer used for such a purpose. The plant is very healthy. We have to thank Mr. Allan, head gardener to Sir Thomas Brassey, Normanhurst Court, for the above-mentioned particulars. The particular species of *Ficus* is not quite evident from the foliage merely, but it is thought to be *F. vasculosa*, Wall. (*F. Champsoni*, B. h.). There is no specimen like it from Japan in the herbarium at Kew.

COVENT GARDEN AND THE NEW FLOWER MARKET.

THE handsome new flower market (illustrated in our columns, 1872, p. 176, and July 18, 1885, pp. 73, 76, and 77), which the Duke of Bedford has added to his market at Covent Garden is now approaching completion, so the following account of an interview which Mr. Bourne, the Duke of Bedford's agent, was kind enough to accord to one of the staff of the *Tall Mail Gazette* will no doubt be of general interest:—

"The Duke," said Mr. Bourne, "saw the need of a flower market years ago. A number of years ago the trade was but small, and space was allotted to the vendors in the general market, who afterwards shifted under the piazza by the Floral Hall, where they were found to be an inconvenience. He then determined to begin the buildings at present in use, though we were told that a flower market would never repay the outlay. It happened that the ground facing Wellington Street was available, and what is called the Wellington Street annex was built. The experiment proved even more successful than had been anticipated, for the flower business enlarged rapidly, until two or three years ago the new buildings were planned and begun, and as the leases of adjacent houses fell in the space was utilised for the erection of the present buildings, which are not yet completed, though used, of course, for the market. To show the extent of the business, I may tell you that we have let the whole of the 370 stands, and I have now fifty applicants whom I have to deny. The market is wholesale, and in summer the hours are from 5 A.M. to 9 A.M., when the market is swept and shut up. In winter it is opened three mornings a week, in summer every morning."

A REVOLUTION IN THE FLOWER TRADE.

"The increased railway facilities have revolutionised the flower trade. Now foreign flower growers are endeavouring to force their way into the market, and it is possible to sell flowers from the South of France which three days before were uncut. Our own growers grumble terribly at the competition, for they say: 'It is all very well to have flowers from Nice, but then, you see, when the salesman finds he cannot dispose of his stock, he almost gives it away, and forces our prices down at once.' In the ordinary run of things the English vendor takes the stock left over back to his nursery, and puts it under glass to wait for another day. I say in reply that if people want flowers from Nice they must have them, for I see no objection to foreign flowers." "How do you account for this increased demand for flowers?" "I fancy much of it is due to the æsthetic movement of the last few years, but I think myself that the Princess of Wales brought the taste from Denmark, and on Russian dinner-tables you cannot see the food for the flowers. To give you a proof that Covent Garden has become a great wholesale centre, not only for the general trade, but for the flower trade, I may tell you that the flower-buyers who attend the wholesale market supply the northern markets of the great provincial towns. I have been compelled to stop the activity of some of them, who used to get hold of the vendors before the market was opened, and, buying what they wanted, have it put into waggons waiting for the purpose, and taken down into the country by the 5.45, or newspaper train. This was, of course,

FIG. 158.—BANYAN TRAINED: BROUGHT HOME BY LADY BRASSEY.

P. Fedtschenkoii, differing in its larger, more deeply lobed calyx, and peduncle shorter than the leaves. Flowers violet, three to five in an umbel. Found in clefts of rocks on the glacier of Likiang near the permanent snows.

13. *Primula (Aleuritia) dryadifolia*, Franchet.—This *Primula* has the habit of *Dryas octopetala*, and is well characterised by its leaves and the shape of its bracts. It belongs to the same group as *P. uniflora*. Flowers violet. Found on the glacier of Likiang, four days' journey north of Tali, at an elevation of about 13,500 feet, near the everlasting snows.

14. *Primula (Aleuritia) pinnatifida*, Franchet.—Near *P. Wattii*, King, differing in its leaves, being distinctly pinnatifid, not merely toothed, and by its corollas being only half as large, with entire lobes. The flowers recall those of *Erinus alpinus*, though they are larger. From the glacier of Likiang, at an altitude of 10,000 to 11,000 feet.

15. *Primula (Aleuritia) cernua*, Franchet.—*P.*

With regard to the prospect of seeing these new Chinese *Primulas* in cultivation, M. Franchet says there is every reason for hoping that seeds will be sent with the bulk of Delavay's collections, which had not reached Paris at the time he wrote; a small consignment by post being the only portion received. There were four cases of dried plants on the way to Paris, and there is no doubt, from the sample to hand, that the entire collection will prove a most valuable contribution to botanical knowledge. The only Yunnan plants in the Kew herbarium are a small collection made by Dr. J. Anderson on Major Sladen's expedition in 1868. *W. B. H.*

TEA IN THE CAUCASUS.—One of our Russian correspondents informs us that under the auspices of a society the cultivation of Tea in the Caucasus is likely to be successful. Experience has shown that the shrub thrives at Souchoom-Kalé, Batúm, and various other places near the eastern shores of the Black Sea,

unfair to the other salesmen, and I resisted the innovation; for the more competition the better the market."

THE GENTLEMAN FLOWER GROWER.

"The fashion has created another business, for the professional florist is often a cultivated gentleman. I remember some time ago a young friend of mine was halting in his choice of a profession. He had to choose between the Church and the Law. He had no vocation for the Church, and there are lawyers enough already. Why not be a florist? I suggested. He took my advice, and was articulated to Mr. Veitch for a couple of years. Then he proceeded to some great gardens, where he perfected himself by further practical experience, and subsequently started a small place of his own, built hot-houses, and laid out grounds, and is now, I believe, a successful grower of flowers for the market. Ner is that the only instance." "By the way, Mr. Bourne, do you think it right that the streets leading to and from Covent Garden should be blocked morning after morning? If a cab once gets into that whirling maelstrom it is all up." "A cab has no business to enter the maelstrom. The public, remember, must for the time be subordinated to the market. Now in carrying out these new improvements we have widened the adjoining streets by 15 feet, thus lessening the present congestion. The ground-rents are correspondingly lessened, but no doubt the improvement will pay for itself by increased facilities of locomotion, and of movement to and from the market. It may, by the way, surprise you to hear that in my time two of the gates which it was customary in old times to shut during the holding of the market, in Burleigh Street and Southampton Street, have been removed, and, although I can find no record, I believe other gates existed for the same purpose."

THE CONVENT GARDEN AND THE FIRST EARL OF BEDFORD.

Mr. Bourne then gave me a history of this famous market. He told me how the land had been granted by Henry VII. to the Earl of Bedford, and showed me a Bartolozzi print of this gentleman which had just been presented to him by an antiquarian friend. "It was part of the old Convent Garden, when the monastery to which it was attached was one of the few houses in what is now called the Strand, and when all about us were fields and pasture land. In course of time the immigrants from the provinces and elsewhere had settled themselves about to the district, and as the people increased, and houses sprang up, the beginning of a market was formed, and Charles I. granted a charter to enable the Earl of Bedford to hold a market in Covent Garden fields, in front of St. Paul's, which, by the way, had been built and endowed by a Bedford. I may say that the portico of this same church is one of the most beautiful in London, and we have at one time or another expended £20,000 in its restoration and the rehabilitation of the churchyard. Well, without detailing the intermediate changes, let us go on to the year 1810, when the population had of course greatly increased. In 1810 an Act of Parliament was passed, called 'The First Management Act,' which did not interfere with the original charter, but enabled the Duke to frame laws for the better government of the market, which had by this time acquired large dimensions. It was then an open-air market but for the few wooden shanties which had been erected. In 1828 the then Duke determined to put an end to these rude methods, and the present buildings were erected."

HOW THE TOLLS ARE COLLECTED.

Mr. Bourne has been kind enough to explain in what manner the business of the market is carried on. "In old days the toll levied used to be charged for a head-load. There is no such measure now. Another measure of those times is called a mound, which we now make the equivalent for a bushel. Under the common law which regulates market tolls (or those peculiar to chartered markets) the money was payable by the buyer, which was one of the inconveniences removed by the Act of 1810, when they were made payable by the vendor. The same system holds good now, except that it is perfected and administered in the most careful, efficient, and economical manner. It may seem strange to you, contemplating the never-ending file of waggons which make their way in the early hours of the morning to the market, that this apparent chaos can be reduced to anything like order.

Our corps for conducting these operations consists of one superintendent and six collectors, assisted by subordinates. We have also erected six offices, one for each of the railway companies, to allow us an inspection of the way-bills of all goods that come over their lines. Toll is charged on the load and bushel. There are two classes of people who frequent the market; in the early morning the waggons come, and upon these the toll is levied—not on the goods, but upon the waggons. The trader often agrees to pay an annual rental for the right of entry of one, two, or three waggons, as the case may be. He comes in the morning and sells his stuff from the tail of the wagon, by this means escaping the inconvenience of repacking; but these traders are compelled to clear off by 12 o'clock. They are followed by the new race of traders which the railways have created—that is, the salesmen—who are really the consignees of the great growers in all parts of the country, and even the Continent. These salesmen are generally capitalists, whose dealings are on a large scale. Take, for instance, the American Apple trade, where one of them would think nothing of running across to America and buying up the Apple crop of a whole district.

"I remember one of these gentlemen coming to me in a great state of alarm. He said, 'I have just had a telegram saying that there are 80,000 barrels of American Apples coming up to me by the next train, and I have no place to store them.' I gave him a place in the new market, and before the day was over they had all been sold under the hammer. These salesmen are auctioneers, and their business begins after twelve, so that you see business is really going on at Covent Garden during the whole twenty-four hours. Subordinate to the salesman is a middleman, who acts, not as a consignee, but as a speculator, buying likely lots which he sells again at a margin of profit. In fact, the market does not so much supply local wants as it serves as a great centre of distribution." *Pall Mall Gazette, Nov. 23.*

EIGHT DAYS IN THE GARDEN OF ENGLAND.

(Continued from p. 693.)

TO DARTMOUTH BY COACH.—Our drive was uneventful. Up and down hill, over an arm of the estuary by the pretty bridge at Balcombe, and past one or two villages gay with Fuchsias, Escallooias, Veronicas, and Euconymus—shrubs that rejoice in the neighbourhood of the sea, we only noticed the paucity of the Apple crop, and that the reaping machines were hard at work, before we reached, near Stokenham, the long strip of marsh known as Slatton Sea. Filled with reeds—a valuable crop for that—and white Water Lily, this pool stretches behind a sand-bank, copiously sprinkled with yellow-hooped Poppy, Thrift, and Sea Holly, extending about 2 miles along the coast from the little fishing village of Tor Cross. The coach, after passing along these sands by the calm blue waters of the Channel, climbs a steep ascent, and after dipping down once or twice, as at the beautiful little inlet of Blackpool, descends rapidly into the narrow streets of Dartmouth. The Weymouth Pine and Iris feicidissima luxuriate along this coast, as at Sandgate and Folkestone, and but for the old three-decker training ships and the numerous boats of all kinds, the view up the Dart as seen from the steam ferry and the railroad is very similar to that obtained a few miles higher up stream from the castle at Totnes, whilst Dartmouth itself, with its narrow lanes running in terraces on a steep slope, is not unlike Salcombe. Night was closing in as we caught a glimpse or two of Torbay, and we reached Exeter too late for any exploration that evening.

EXETER.

A cathedral city with a Norman castle and nine or ten parish churches proved too attractive to our archaeological instincts to allow us much time for horticulture, so, to our great regret, we were unable to visit the well-known nurseries of Messrs. Lucombe, Pince & Co., or of Messrs. Veitch. The study of the fine work in colour, so conscientiously restored by Sir Gilbert Scott, the Norman towers, the 13th century clock, the elaborate bi-hop's throne, erected in 1326, and the richly decorated west front, by Bishop Brantingham (1394), did, however, allow us to peep at many an interesting little courtyard scene in the close, or in the

numerous quaint almshouses of the city, to admire the fountain in the garden of Bedford Circus, and just to glance at various small orchards and gardens occupying the slopes of what was apparently once the town ditch. Having admired the old houses and quaint churches of High Street and Fore Street, and the ivy-mantled gateway and well-timbered terrace lawn of the castle at Rougemont, we did just find time to climb the hill overlooking the city above the reservoir, so as to get a bird's-eye view to the Haldon Hills, where the tower of Belvedere rises among the trees, and to notice the beds of shale near the railway-station before our inexorable "return excursion" bore us off on our journey home, impressed by the fact that in Devonshire gardens Nature does more than Art. *G. S. Boulger.*

Orchid Notes and gleanings.

TRICHOCENTRUM MACULATUM, *Linl., Orch. Lindeni*, p. 24.

THIS plant was originally discovered by Mr. J. Linden in New Grenada. There are also numerous specimens at hand from Messrs. Schlim, Wagener, Warszewicz, Smith, Patin. Notwithstanding its having been published as early as 1846, I never knew of its having flowered in Europe, till I had quite lately a leaf and a peduncle from Mr. F. Sander. The oblong acute, very leathery leaf is light green, spotted with purple above, and almost totally sordid purple beneath. The flower is totally in accordance with the indications given by Mr. J. Linden to Dr. Lindley. They have a certain white colour with a slight indication of the lightest sulphur hue, purple spots on the dorsal sepals and petals. The cuneate oblong, almost retuse or bilobed lip, has two orange keels at the base. The column is striped with purple at the back, and has lobed and toothed wings, which are green and purple. The spur is filiform, wider at its mouth, light green. Another quite generic, with numerous acute papillae, looking like a hedgehog. Sepals evidently keeled on the mid-line outside. *H. G. Rehb. f.*

GOVENIA DELICIOSA.

This "is a very pretty and distinct Orchid, with the habit of a *Plelia*. It has an underground tuberous rootstock from which proceeds an erect stem, about 1 foot or 18 inches in height, furnished with a pair of bold plicate leaves. The flower-spike is borne at the top of the stem, and consists of from 6—8 flowers, of which the sepals are white, and the lip yellow at the base, the front half being white covered with purple spots." It should be grown in a cool-house or frame, and should be potted in a compost of warm leaf-mould and sand with good drainage. When the growth is completed the plant should be allowed to have a good season of rest, water being withheld until the tuber again shows signs of starting into growth. *Orchid Album*, t. 211.

CYPRIPEDIUM TESSELLATUM VAR. PORPHYROPHYLLUM.

This is a hybrid from *C. barbatum*, fertilised by the pollen of *C. concolor*. In the shape of its leaves it resembles the male parent, while the marbling of the lip is that of the seed parent. The form porphyrophyllum was raised from the same cross (from the same seedpod) as the one called tessellatum, but is distinguished from it by its vigorous growth, its broader leaves, more thickly spotted, and by the flowers of a fine purplish-brown colour. *Lindenia*, t. 18.

CATTELEYA GUTTATA VAR. LEOPOLDI.

A magnificent variety with stiff many-flowered spikes; flowers nearly 4 inches across, segments roundish, oblong, yellow with purplish spots, lip projecting, three-lobed, lateral lobes roundish erect, concave, anterior lobe obovate, purple. *Lindenia*, t. 19.

ONCIDIUM LIMMINGHEI.

This is a strange plant, with leaves like those of a *Sophronis* banded with brown stripes and springing from glaucous bulbs arranged in two rows on either side of a creeping stock. *O. Limminghei* is a pretty miniature of *O. Papilio*, and one of the most elegant species of the genus. It should be cultivated on a cylindrical block. In order to produce numerous branches Count de Buisson recommends that when

the plant is once established the rhizome is cut through below the second bulb from the top at the time when the plant is beginning to grow. A shoot is then formed at the section which will form a branch. The operation is repeated when the branches have four bulbs, and thus in a few years the block is completely covered with flowers. The plant should be hung near the glass in the Cattleya-house.

CATLEYA GUTTATA WILLIAMSIANA

is an evergreen plant like the typical form in its manner of growth, but more compact. It has stems 1½ foot high, with two leaves of a dark green colour, one on each side. The flower-spike proceeds from the top after the growth is completed. The sepals and petals are of a dull purple colour faintly striped towards the margin, or in some cases spotted with deep purple; the lip is pale rose-lilac with a very dark rose-purple front lobe. It blooms in June and July, and lasts for some time in beauty. This plant requires the same treatment as the species itself, that is, it should be kept in the Cattleya-house, under pot culture, with good drainage, in a compost of peat, sphagnum and moss. This class of Cattleyas requires to be well grown, and never allowed to shrivel, either in the stem or foliage, for if either of those parts should fall a victim to neglect in this respect the possibility is that they will fail to get over it. They must never be disturbed excepting when they require fresh potting, or need fresh material about the roots, for they cannot endure to have bad sour material about them; it must always be sweet and fresh. The plants should never be cut unless they are in vigorous health. If it is required to increase them, care should be taken in performing this operation, to leave two or three old bulbs as well as the new growth. We find it better to cut them partly through, and when they begin to make growth the rhizomes may be cut asunder, but even then it will be better to leave the plant intact until the next season, and then to separate the parts just as they are beginning to make their growth, but with much caution, so that the roots may not be injured. After this pot them, but do not put them into large pots, as they do not need it. Over-potting is dangerous in the case of these plants, for they do not require more material about them than just enough to keep them firm in the pot. Some lumps of charcoal intermixed with the peat will be beneficial to them, as it serves to keep the material open, and, moreover, the roots will be benefited by it. *Orchid Album.*

ODONTOGLOSSUM CRISPUM.

In reading the remarks of your correspondent, Mr. O'Brien, on the variability of *Odontoglossum crispum*, I observe that he places a great deal of importance on insect fertilisation. While admitting that this factor is not to be overlooked, I think we might with advantage enquire after the companions the so-called good and bad varieties keep. We should endeavour to find out the so-called species of *Odontoglossum* that grow in company with the varieties of *O. crispum*. It is very possible that the character of the neighbouring species may account to a great extent for one locality being stocked with poor, or small-flowered and strong growing varieties, while another locality has large-flowered and strong growing varieties.

Considering the abundance of plants and bad varieties as in one locality, it would not be out of place to suggest that *O. crispum* has for companions some species that readily cross-fertilise, and that the seeds when matured proved very fertile. In all possibility *O. odoratum* or *O. gloriosum* is the male parent of many of the narrow reflexed petalled *crispum*. On the other hand, the fact of finer flowered and stronger growing varieties being located by themselves, and thinly distributed, may be accounted for by species growing in company with *O. crispum* not crossing so freely, and, consequently, fewer fully developed seeds being produced, hence fewer plants of the finer varieties are found in their native habitat. Many of the finer varieties of *O. crispum* have a strong resemblance to the *O. luteo-purpureum* section in some of their parts. Believing that both good and bad varieties are more or less dependent upon insect fertilisation for the reproduction of matured seeds, if plants were overcrowded in their native habitat so as to starve them in their growth that would account for the poor inflorescence at first, and likewise the thinly grown plants would produce the fine flowers seen by

the collectors, and for a time after being imported. But how would the two sections compare with each other after being cultivated at home for some years side by side? *T. H. A.*

DENDROBIUM SPECIOSUM.

I have a plant of this very shy blooming *Dendrobium* with eleven spikes, fully developed, and averaging 1 foot long. I learn from my gardener that the plant has not flowered for four years. I succeeded in getting vigorous growths in the early season. In June it was studded on a brick wall (due south), and the hot summer we had nearly baked it. During September it was placed in an earlyinery which was at rest. Nothing more was thought of it among the generality of resting cool plants that happened to be placed there. Happening one morning to look at it I found it pushing vigorous flower-spikes, which I allowed to grow on in the same house, and am now rewarded with a grand display of this fragrant species. The plant is now in a night temperature of 55°. I have other plants of this variety which I hope to succeed with, as they are showing well, and promise a nice display in due course. *Thomas Garnett, Cavendish Gardens, S. W.*

EARTHING-UP.

The ridge, consisting of earth heaped round the base of the plant, exercises very diverse actions; often useful, it is sometimes without sensible action—occasionally the effect is even hurtful.

The practice considerably modifies the physical constitution of the soil; it, moreover, exercises a very important influence on the manner of growth of plants.

The temperature in the raised mound, as compared to the temperature of the level ground, has been found greater by 1° to 2½° C. at mid-day at a depth of 10 centimetres during the day from June to August; this fact has been proved in various soils. At night, on the contrary, the temperature has been found to be 1° lower in the ridges. During winter it is generally the raised soil which is coldest.

Generally, when the sun is shining, the ridge aids the heating of the soil; when the sun has set, the ridge produces a cooling effect. These results are easy to explain: the ridged soil offers a greater surface to the sun, it receives the rays less obliquely, the soil there is very dry, and it takes a less quantity of heat to warm it; thus it is natural that it should be warmer during the day; during the night, on the contrary, the radiating surface is greater on the ridge, it is more mellow, more easily penetrated by the cold air; if there has been rain, the surface of evaporation is more extended the temperature necessarily falls lower there than in the level soil.

This increase in the temperature of the soil reacts on the plants by aiding the development of roots, by favouring the absorption of water, and generally by hastening their development. Experiments have shown that the more carbonic acid there is in the soil the colder it is; now the presence of carbonic acid proves the existence of inferior organisms whose work it is to elaborate the organic matter which forms the nourishment of plants; it is thus in the ridges that the plants find most food. But, it must not be forgotten that these inferior organisms only work when the soil contains exactly the proper amount of water which is indispensable to them; if the soil is too dry their work stops.

If by earthing up we dry the soil too much we lessen or even destroy its fertility, and this explains to us why this practice may even become injurious. During one season the quantity of water existing in different sorts of soil, both in ridges and on the flat, was determined. One hundred parts of soil contained of water—

	Clay.	Sand & limestone.	Sand & flint.	Peat.
On ridges	66.35	10.33	1.22	43.99
On the flat	17.48	12.23	2.52	51.64

This table clearly shows that the soil of the ridge is always the drier; but it is in the siliceous sand that

it loses the greatest proportion of water, so that it is in this kind of soil that the disadvantageous results are chiefly manifested.

To sum up, the ridge will be useful on compact soils, rich in humus, holding water, and situate in moist climates; while in dry regions cultivation should be carried on on the flat.

We have said that the ridge exercises a very important action on the manner of development of plants. On many species of plants, in addition to favouring the development of true roots, it promotes the development of adventitious or secondary roots; this may be seen in kidney Beans, broad Beans, and in Turnips. Some species have not the power of making adventitious roots. Grasses, for example, as Wheat, Rye, Barley, Oats, Millet, Buckwheat, do not form new roots. [?] Such plants do not require the earth to be heaped up round their stem. There are even plants which are enfeebled by this treatment, because it causes an unnecessary lengthening of their stem, as in those plants in which the stem terminates at the surface of the soil in a rosette of leaves. If you put earth on such a stem you induce it to elongate so as to produce its leaves on the surface to a length equal to the depth of the soil over it, and this lengthening is effected at the expense of the materials which were destined to develop the other organs of the plant. Some very interesting comparisons have been made between Beetroots grown under identical conditions, with the exception that one lot was grown on ridges and the other was not. The average for one Beetroot is found to be:—

	Ridge.	Flat.
Weight of the leaves	359	391.6
„ „ radicles	9.2	27.5
„ „ root	507.6	525
„ „ whole plant	875.8	934.1

The ridge produces a diminution in the numbers of the leaves and in the development of radicles; it promotes lengthening above the ground, and with this lengthening of the stem there is a corresponding diminution of the underground and useful part of the plant. Evidently the ridge had lessened the total weight of the plant and the weight of the underground and utilisable parts.

In the case of Turnips, it may be noticed that the ridge prevents the crown from becoming green, so that it remains tender and preserves the texture of the root; this latter is a great advantage in a plant used for food for cattle.

The ridge is greatly used in the culture of Potatoes; it produces such marked results that the tuber is planted almost on the surface; but if the Potatoes are planted deep the ridge is of no use, and is even often hurtful to the plant. In those kinds of soil where ridges produce bad results, because they draw from the soil the humidity which is indispensable, the tubers must be planted deeply, and allowed to develop in level ground. Let us remark here that the culture on the flat will slightly favour the growth of weeds, on account of the maintenance of too great an amount of moisture in the soil; but these can easily be got rid of with the hoe.

With the greater number of plants for which the ridge is useful, it is important to hoe the weeds as soon as possible; if we wait too long we risk touching and injuring the plants. In growing old they have partly lost their faculty of forming adventitious roots, and they profit much more from the work of new roots than from those which were formed earlier. With Potatoes the tubers which are developed on the new stolons have more time to ripen.

We have seen that the soil is drier in ridged land than in the plain ground, it would therefore be useful to sow, in certain lands, plants on the ridges, although these plants do not derive any direct advantage from it, for example, Beetroots. The ridges running north and south have a much more uniform temperature than those going from east to west; the south side is always drier than the north side. The ridges directed from north to south exhibit great uniformity in the evaporation of water from both their surfaces; it is evident that these are conditions favorable for the development of plants. Some Beetroots from ridges running north and south were ripe in September, those from ridges running east and west were only ripe in

October, the former contained 12.25 per cent. of sugar, the latter 10.62 per cent. *Dr. Wolley in Annales Agronomiques.*

NOTES ON SHRUBS.

A VAGABOND'S notes on this head, chiefly suggested by walks about Exeter, may be pardoned if regarded as a well intended effort to gather moss. Those who have seen Algerian or Levantine gardens—or, indeed, any garden by the side of the sunny Mediterranean—will probably have kindly reminiscences of large Rosemary bushes—

"There's Rosemary,—that's for remembrance!"

'Tis a pity that we cannot have in "our tight little island," on account of Jack Frost's envious scythe—the Nemesis of flourishing tender plants—thick shrub-like growth of the Rosemary. A tolerable makeshift, as far as foliage is concerned, is supplied in *Salix rosmarinifolia*, which, owing to the silvery reverse of the leaves, is an uncommon pretty thing, whether worked as a, standard or as a bush. The fact that it is so seldom seen in shrubberies in the precincts of houses is painfully suggestive of ignorance of our native shrubs. [A doubtful native this. ED.] Under a south wall, if possible in the east corner, few South Coast horticulturists need hesitate about planting out that old favourite, *Erythrina crista-galli*. Flowers are not so common out-of-doors in September that we can dispense with one so floriferous. The chief *raison d'être* of an Orchid maniac is the strangeness and beauty of the flowers, since the bilious hue of the leaves can delight nobody. Even so the nurseryman ought to try and spread for their own benefit the open-air cultivation of the *Erythrina*, and not be so constant in the recommendation of small Conifers. The sight of *Cupressus erecta viridis* standing on a grass-plot too small for tennis, like a stuffed sentinel, will soon become distasteful even to the jobbing gardener.

Two other shrubs I saw out in Exeter were *Berberidopsis corallina* and *Eurya latifolia variegata*. The latter never attains the same splendid colouring as in heat, and I would far rather risk in sheltered positions *Clethra arborea*, named popularly the "Lily-of-the-Valley Tree," and which is truly a gladdening thing of beauty.

BITTON.

As distances are considered in England it is a good way from Exeter to Canon Ellacombe's garden at Bitton. But even there, as a goodly number of your readers will know to their pleasure, there is a wealth of shrubs uncommon on account of supposed tenderness, or neglect only explainable from the narrow groove in which the minds of many professional gardeners are wont to move. This contentedness with a bygone and at one time almost stereotyped form of shrubbery planting, principally consisting of Yews and Laurels, is rapidly fleeting by, and side by side with the great and indubitable progress in fruit culture can often be found a greater enlistment of beautiful shrubs and plants into shrubberies, and greater care taken to get them established and kept *perpetue*. Suitable subjects for shrubbery planting, which may, one and all, be called neglected of the many, and which occur to me without reference to notes, may be mentioned in *Clerodendron trichotomum*, *Chamerops excelsa*, *Eleagnus macrophylla*, *Aralia japonica*, *Crataegus Lelandi*, *Cotoneasters Hookeri* and *frigida*, and *Cercis siliquastrum*.

Canon Ellacombe will perhaps tell you, if you are fortunate enough to have him as guide over his small parcel of ground, "You must expect to see weeds and shrubs." A giant *Equisetum* was the first weed that obtruded itself into notice. A bright and graceful cynosure it was, and one which the Canon himself, despite its great and troublesome reproductive faculty, would be loth to lose from the side of *Colchicum speciosum rubrum*, grandest of its tribe. The two formed a combination capable of adding a fresh beauty to any border, be it never so select. Such combinations form the particular charm of this garden. The beautiful undergrowth of *Cyclamen* in the beds on the grass lawn has been there for sixty years. The trouble of naturalisation was no doubt immense, but now there is the minimum of labour and a result as exquisite as can well be cherished. Why should not more take the same trouble, instead of spending money on the protection of perishable *Pelargoniums*? *C. A. M. C.*

NOVELTIES FOR 1886.

THE plants figured on this page, from blocks kindly lent by Messrs. Haage & Schmidt, Erfurt, will be found useful subjects in the hands of the cultivator who has an eye for the beautiful amongst

FIG. 159.—PHACELIA PARRYI.

plants not included amongst florists' flowers *par excel-lence*. We append the descriptions of the plants found in the catalogue of the before-mentioned firm:—

Phacelia Parryi, Torr. (fig. 159).—A truly magnifi-

FIG. 160.—ERITRICHIMUM BARBERGII.

cent new annual from California, of branching habit, and 1 to 1½ foot in height; leaves ovate, irregularly doubly-toothed or lacinate; hirsute, bright green; racemes loose, elongated; flowers circular, ½ inch in diameter, of a lovely purplish-violet colour, with five

FIG. 161.—HUMULUS JAPONICUS.

pure white spots at their base, similar to the *P. campanulata* introduced last year, but surpassing the latter by its greater abundance of bloom.

Eritrichium Barbergium, Gray (fig. 160).—A pretty and extremely free flowering hardy annual of dwarf spreading habit with pure white Forget-me-not like flowers and linear-oblong, hirsute leaves. The

flowers of this Borage-wort appear in racemes on an elongating spikes like those of the *Phacelia*; the bushy plants keeping up a constant succession of bloom throughout the season, present with their white flowers a charming aspect.

Humulus japonicus, Sieb. et Zucc. (fig. 161).—A new annual Hop from Japan, which has proved in our hands to be a very ornamental and extremely fast growing climbing plant. The foliage resembles in shape that of the common Hop (*H. lupulus*), but having more incisions, is very dense and of a lively green; stems and leaves are somewhat rough and hairy. The principal and most valuable feature of this new climbing plant is that it can be sown in the open ground in spring, and that it attains enormous dimensions in a very short time. Undoubtedly one of the best climbers for covering verandahs, trellis, &c., never suffering from the heat or being injured by insects like so many other climbing plants, but retaining its fresh and lively green colour until late in the autumn.

A COMMON EDIBLE FUNGUS.

AGARICUS (CLITOCYBE) INFUNDIBULIFORMIS, Schaffer. — (This is an extremely common fungus, white or pallid in all its parts. It grows amongst grass, &c., by paths and open places in woods.

The accompanying illustration (fig. 162) shows a mature and full grown example natural size, with a section at the base. The cap or pileus is thin, but somewhat fleshy, as shown by the section; it is soft, not harsh or brittle, the outer surface is clothed with minute silky down. At first the cap is convex and umbonate (*i.e.*, with a central boss or projection), but it soon becomes funnel shaped and flaccid, as here illustrated. The stem is thin, soft, and stuffed—*i.e.*, neither hollow nor decidedly solid, and generally slightly thickened towards the base. The gills are moderately distant, and strongly decurrent—*i.e.*, they run down the stem. Spores white. The odour is pleasant and fungoid. Fries says "Odor gratius."

The sub-generic name, *Clitocybe*, is derived from *κλίτος*, a declivity, and *κύβη*, the head, in reference to the outer surface of the funnel-shaped cap; *infundibuliformis* has a similar meaning, *viz.*, funnel-shaped. *Agaricus infundibuliformis*, is a close ally to *A. odoratus*, described on p. 620. With common care the fungus before us cannot be mistaken for any other species; it is perfectly safe eating and very delicate and tender. It may be cooked in the same way as *Agaricus procerus*, (see p. 650). A very curious variety of *A. infundibuliformis*, first detected as British by myself, and named *A. membranaceus*, Fries, is sometimes found in Pine woods. Original coloured drawings of both type and variety may be consulted in the department of botany—British Museum, South Kensington. *W. G. Smith, Dunstable.*

FORESTRY.

WORK FOR DECEMBER.

FEW things in connection with an estate are so useful as a plentiful supply of well-seasoned, home-grown timber, and as the present season is just the time for providing it, every opportunity should be taken during stormy weather, when planting operations are suspended, for laying by a stock, more especially on such estates as are provided with that invaluable adjunct, a saw-mill. It is well to remember that the lasting quality of timber and its consequent value is much enhanced when the trees are cut up a season before being used, as by this means it has time to get well seasoned, and when regularly tarred or painted it lasts much longer than when converted in a green state, its lasting qualities in that stage being considerably deteriorated, and consequently unfairly represented. Fencing materials of all kinds—posts, rails, boarding, stags; also wood for gate-making, for repairing tool and other sheds, drain-soles, &c.—should be cut up and stored away in a cool, airy building, until wanted for use.

SEASONING.

As the seasoning of timber both before and after conversion by the saw is of the greatest importance, and well deserving of our most serious attention, we would strongly urge on those who have the charge of such work to see that it is done in a way in which the preservation of the timber is most efficacious. Both a natural and artificial method of timber-seasoning is now in use, natural by allowing the sap to evaporate

of its own accord, and artificial by the extracting of the sap by an air-pump and by the application of heat. As the former method is that generally adopted on estates, and perhaps the best, certainly the cheapest, we will briefly direct attention to one or two ways which have been found practicable on various estates, and which may, therefore, be judiciously extended wherever home-grown wood is in request. Fell the timber at any time between the end of September and the beginning of April, and leave it fully exposed to light and air for at least eighteen months or two years, after which it may be sawn into boards, planks, or fencing material, and stored away in a dry, airy shed, great care being taken not to allow the planks to lie too close, but to have a free passage of air circulating amongst them. After six or eight months they will be ready for use. Another, and perhaps simpler method, and one that is very generally adopted, is to cut the timber as soon as felled into logs, which are stored in a dry, airy shed for a year or two before being sawn into boarding. Larch fencing posts may also be cut up when in a green state and stacked for a year or so before use; when thus treated they are exceedingly durable and capable of resisting the

inured to their breezy high-lying situation than those of larger size. Where the soil is of average quality the kinds of plants best adapted for hillside planting are the Corsican, Austrian, and Scotch Pines; while amongst hardwoods, the Sycamore, Birch, and Mountain Ash are invaluable. Larch should also form the major portion of the crop.

THE CORSICAN PINE.

Last week I examined a 30 acre plantation at 700 feet altitude on the Snowdon range that was formed six years ago, and was certainly pleased to find how well the Corsican Pine, which was planted as standards at 16 feet apart all through, had thriven—better far than either the Scotch or Austrian. Even on the most exposed sites and where fully exposed to our much-dreaded south-west gales this Pine is quite at home, rising with clear, straight stems and not a branch shrinking or bending from the blast. Altogether this is a most valuable tree for general forest planting, and one which, from our rather wide experience of it, can be thoroughly recommended as a first-class introduction in the formation of new woods. As it is rabbit-proof, or almost so, its value as a forest tree in game-infested districts is enhanced. Where slit or

Buckthorn, Tamarisk, various kinds of Euonymus, Cotoneasters, Arbutus, Laurustinus, Portugal Laurel, Escallonia, the Myrica Horroly, and Aucubas all do well, and may be planted without the least reluctance or fear of harm.

TIMBER PRICES.

The timber trade is just now exceptionally dull, indeed we cannot remember prices at so low an ebb, and unless for Sycamore, Oak, and Larch there is little or no demand. Boat building along the coast here enhances, however, to some extent the prices of such timber as is used for that purpose—notably Oak, Elm, and Larch—but for general forest timber and merchant. Clog-making, being carried on in most Welsh towns the price of Birch and Alder tends to keep steady, although even these have considerably declined of late years. Propwood on an average of 6 yards to each pole, and sawn to 3 inches in diameter in the small end, realises at present exactly one-half the price per yard that it did five years ago; while Scotch Fir, Spruce, and the smaller hardwoods can hardly be disposed of at any price. The following is a list of prices, such as are realised at present for timber of average quality, Oak, Elm, and Larch being, as before stated, considerably affected by local demand:—

Per cubic foot—s. d.	Per cubic foot—s. d.
Sycamore 8	Hornbeam 7
Oak (English) 6	Poplar 8
Oak (Turkish) 10	Willow 8
Elm (Scotch) 1	Gum tree 3
Elm (English) 6	Larch 10
Ash 6	Spruce 6
Birch 10	Scotch Fir 6
Alder 9	Silver Fir 6
Beech 7	Corsican Pine 7
Chestnut (Spanish) 16	Austrian 6
Chestnut (Horse) 7	

Propwood sawn to 3 inches diameter in small end, 11d. per lineal yard; firewood, 5s. per cartload; faggots, small, 8s. per 100; faggots, large, 10s. per 100. A. D. Webster, Penrhyn.

FIG. 162.—EDIBLE FUNGUS, CLITOCYBE INFUNDIBULIFORMIS. (SEE F 716.)

encroaches of damp and its attending consequences for a long period. Ringing or girdling is another method of seasoning timber, which consists of removing the bark from around the bole for, say, 2 inches in width previous to felling. This is usually performed in September, and the following winter the trees may be cut down and sawn up at once. Being somewhat unsightly, more particularly in park or road-side woods, this girdling method is not very generally adopted.

PLANTING.

With the exception of a few nights' frost towards the middle of the month, followed by heavy rain, the weather during November has on the whole been very favourable for conducting planting operations, which work should now be well advanced, and, where only on a limited scale, finished as early as possible in December. Where, however, there is a large extent of planting on hand it will be necessary to press it forward during open and favourable weather, but on no account attempt planting in frosty weather, during keen, cold winds, nor in wet portions of the ground.

The nature of the ground, the quality of soil, the elevation, and exposure, will, in a great measure, dictate the size and kinds of trees to be used. For rocky elevated ground plants of one or two years' growth will be found most suitable, and they are more readily

notch planting is adopted be careful to thoroughly close the opening after the plant's insertion, neglect of which has led to irreparable loss in mountain planting.

Holing or pitting, although more expensive, is decidedly the best preparation of the ground previous to planting, but only in low-lying districts, where large plants are to be used is it to be generally recommended. The size of the pits will, of course, vary with the size of plants to be used, but circular pits of, say, 2 feet in diameter and about 18 inches in depth, will be sufficiently large for the general run of plants. These, it may be well to state, should always be opened and the soil left loosely exposed for some time previous to planting, as by this means it will become thoroughly pulverised, work kindly, and be in the best possible condition for placing around the tender rootlets of the plants. In some cases, such as when planting rather damp, retentive soils, the process of planting may immediately succeed that of pitting, as the holes are apt to fill with water; but this seldom happens where thorough drainage has been attended to.

SEA-SIDE PLANTING.

For resisting the effects of the sea blast, we find the following trees of great value—Pinus Finaster, P. Laricio, P. austriaca, P. insignis, P. sylvestris, Quercus ilex, the Sycamore, Huntingdon Willow, Beech, Ash, and Cupressus macrocarpa. Amongst shrubs the Sea

BERRY-BEARING PLANTS.

(Continued from p. 675.)

BERBERRIES.—Some of the Berberries, notably *Herberis vulgaris*, *B. aquifolia*, and *B. stenophylla*, are second to none in the brightness and profusion of their fruits. Our native species, *B. vulgaris*, although surpassed in beauty of flower by several of the evergreen forms, is, especially when laden with its orange-scarlet fruit, a plant not to be despised for well chosen portions of the shrubbery. The purple-leaved variety of this plant is both distinct and beautiful, the foliage of this, in spring, is of a deep wine-colour, passing gradually into a pleasant purplish-green as the season advances. *B. stenophylla*, a hybrid between *B. empetrifolia* and *B. Darwinii*, is, when in the shape of large bushes, remarkably effective, the profusion of dark purple berries preceded by the pretty yellow flowers rendering this plant well adapted for a front place in our grounds. It is also perfectly hardy—more so, indeed, than the favourite *B. Darwinii*—a circumstance which makes it specially valuable. Several other species are well worthy of being largely grown for both fruit and flowers, such as *B. aquifolia* or *Mahonia aquifolia*, a well-known and valuable evergreen species, with large ovate-lanceolate leaves and terminal racemes of deliciously scented yellow flowers; *B. Darwinii*, perhaps the handsomest in cultivation, with dark glossy leaves, and orange-yellow flowers, succeeded by a wealth of deep purplish berries; and *B. dulcis*, with coriaceous oblong leaves, slender peduncles of yellow flowers, and bluish-black berries.

SYMPHORICARPUS.

The Snowberry, *Symphoricarpos racemosus*, with its conspicuous and familiar white berries, is distinct, and offers a fine contrast to other berry-bearing shrubs—indeed, it stands almost alone as the representative of the white-fruited section. It is a common bush in English gardens, and deservedly so, for, from its throwing up suckers in profusion it quickly forms a dense, twiggy mass, with small oval entire leaves, and racemes of rather insignificant pinky flowers, which, in their turn, are succeeded by the large white berries, that are persistent during a greater part of the winter. *S. vulgaris*, the Coral Berry, is of less stature than the former, usually more compact, and with small dark red berries. The Wolf Berry, *S. occidentalis*, resembles *S. racemosus*, but has larger flowers and smaller fruit. A variegated form, in which the margins of the leaves have a faint yellow tinge, is also in commerce.

BENTHAMIA FRAGIFERA,

with its large scarlet Strawberry-like fruit, is another valuable addition to our berry-bearing shrubs. Unfortunately, this handsome and desirable plant is not generally hardy, and, unless in the southern and western English counties, will not survive our severer winters. In the South of Ireland it withstood uninjured the severe winter of 1879-80, which induces us to believe that there are many, especially maritime, situations where, with a little care in the selection of suitable sites, it would be quite at home. The fruits, about the size of large Walnuts, are of a dark red colour, and being distasteful to birds, not unfrequently remain on the tree till spring. It is a native of Nepal.

COLUTEA ARBORESCENS,

the Bladder Senna, a native of Southern Europe, has long been known in English gardens as a species of rapid growth, the easiest culture, and a desirable acquisition whether in flower or fruit. From mid-summer onwards—indeed, until frosts set in—the yellow pea-shaped flowers are produced in abundance, these being succeeded by large red bladder-like pods, which impart an interesting and by no means common aspect to the plant. It is of the easiest culture, any soil seeming to suit it well if not overcharged with moisture. [It does well in the smokiest localities. Ed.]

PYRUS.

In the genus *Pyrus* are several highly ornamental berry-bearing shrubs or small trees, of which the White Beam tree, *P. aria*, *P. domestica*, *P. malus*, *P. prunifolia*, *P. torminalis*, and our well-known Rowan Tree, or Mountain Ash, *P. aucuparia*, may be considered the most desirable. When loaded with its abundance of scarlet berries in autumn the latter is highly attractive, and forms a most conspicuous object in the landscape; indeed, in this respect its merits are not half appreciated, for it is more frequently found in out-of-the-way places than gracing with its distinct foliage, and large, dense corymbs of white flowers, well chosen spots in our gardens and parks. The White Beam tree, although closely resembling the Mountain Ash, is nevertheless perfectly distinct, the leaves being light green above and downy underneath, which latter gives to the tree a peculiar and distinct appearance when agitated by the wind. When covered with its red or scarlet fruit this tree is very ornamental, but unfortunately these are so relished by birds that they rarely, unless in extremely mild seasons, remain for any length of time after becoming ripe. The rich yellow, rosy-checked fruits of *Pyrus* or *Cydonia* *Maulei* renders it a very attractive autumn plant, whether used, as it frequently is, for hedges, or standing singly in sheltered portions of the garden.

OSTRYA CARPINIFOLIA.

The Hop Hornbeam, with its Hop-like catkins, has a very singular and pretty appearance, and is decidedly an ornamental tree that is well worthy of extended cultivation in this country. Hop Hornbeam, the popular name, is given by reason of the singular resemblance that exists between the female catkins and those of the Hop, and between the ovate-cordate leaves and those of the Hornbeam (*Carpinus*).

As regards soil this pretty and distinct tree—for under favourable circumstances it attains the height of our common Hornbeam—is by no means difficult to please, and will be found to succeed well in most situations where not too exposed. *O. virginica*, from North America, is of similar appearance to the latter, but does not attain to so large a size, and being somewhat tender in most parts of England is rarely seen in good form. *A. D. Webster.*

(To be continued.)

COW-KEEPING BY FARM LABOURERS.

A CERTAIN sympathy naturally exists between the gardening community and farm labourers because of the well-known attachment of the latter to their gardens, and we are pleased to learn from a pamphlet before us that on some estates in pastoral districts farm labourers are able, not only to hold ground around their great pleasure and advantage, but also plots of pasture sufficient for the maintenance of one cow for each family. A pamphlet prepared at the request of the Royal Agricultural Society must needs differ widely from some other discourses which have recently been published on cows and farm labourers. It is the result of inquiries pursued on the estates where cow-keeping has been

most successfully carried out, and it expressly states that success can only be assured on grass land where the cow can crop her own provisions, and her rations have not to be expensively produced by spade labour. The author does not mix up this business of cow-keeping with the vexed question of small holdings. He simply reports that he has discovered no examples of successful cow-keeping by labourers on arable land, while in the case of pastures they abound, the essential elements of success being grass land, and a knowledge of dairying among the female members of the labourers' families. The best examples of the system are in Cheshire, while in the dry eastern counties there are few. Lord Toller-mache's estate in Cheshire boasts of 260 rustic labourers, each keeping a cow, which, by his providence, has now become a hereditary virtue; he purchases, sometimes with money partly borrowed, and insures in admirably managed cow-clubs. The whole system, as organised on this and some other estates, together with its admirable influence on the labourers, and the increased comforts they enjoy, are described in detail. But it must not be imagined that every labourer can keep a cow. Lord Toller-mache owns an estate of 7000 acres in Suffolk, and there is not a cow plot on it! The land does not take to grass kindly, and the labourers' wives know nothing about cows. Cow-keeping by labourers, however, is capable of great extension in many districts where it might be introduced, especially now that the breadth of pasture land is rapidly increasing. We recommend this shilling pamphlet to those who are interested in its subject, and in increasing the attractions of village life.

ORCHIDS AT KNEBWORTH.

NOT a little of the insight that has tended to make the wants of these singularly beautiful plants better understood is learnt from the success of those who grow them under conditions that were looked upon as such as to make even their existence impossible. Especially has this been the case with the kinds that it used to be considered not possible to grow without the aid of a hot, close atmosphere through the season of growth, with a temperature, even when at rest, equal to that of the hottest parts of the tropics. A case of this kind recently came under my notice at Knebworth, Lord Lytton's beautiful place, near Stevenage, where, amongst a number of other species grown in vineries, are some *Saccolabium*, *Vandas*, and *Aerides*, such as one might travel the kingdom through without finding their peers. Of these the most remarkable is *Saccolabium guttatum* and *S. guttatum giganteum*. The former has twenty-four leaves to the principal growth, fresh and green, with numerous roots from the stem above the lower leaves. The plant has five strong breaks. *S. guttatum giganteum*, in the same basket with it, is equally strong, but has not retained its bottom leaves quite so well. Three specimens of *Vanda Roxburghii*, with five and six growths in each basket, unusually large and strong, and apparently retaining every leaf they have made since they came into the country. *Aerides odoratum purpuratum*, as strong and vigorous as it could be, *Vanda creata* is represented by a specimen with five leads, filling the large basket in which it is grown. The strongest growth bears twenty-two leaves, the others a few less; the plant was bearing five spikes of bloom, carrying nine, ten, eleven, twelve, and sixteen flowers respectively. This, like the others, is one of the best examples I have met with. The leaves are in perfect condition, in which they are seldom seen, as those acquainted with Orchids will endorse. The fact of the two *Vandas* named succeeding under the treatment is a matter to cause less surprise than the *Saccolabium*, which are usually considered to require as much heat as any Orchids in cultivation, and which have hitherto been looked on as incapable of bearing the low temperature to which they are necessarily here subjected from the time the last house of Grapes is ripe at the end of September, until the end of December, when the early house has been started so as to admit of their being transferred to it.

To make the conditions understood under which the plants have been grown during the six years that have elapsed since Lord Lytton sent them home from India it will be necessary to say a word about the vineries in which they are located. These are three in number, ordinary lean-to, standing under the full influence of the sun, with nothing to lessen its force. The houses are worked so as to come in in success-

ion; the first is started early in December, the second to give a supply of fruit during the intervening time between the earliest being over and the last, which consists of Muscats and late black varieties for winter use, ripe about the end of September. It may be well to state that the Vines are in good bearing condition—not merely Vines in name, that are subjected to the treatment the Orchids require, but simply the reverse, the Orchids having to put up with what the Vines need. The late house was carrying a very good crop, the Muscats especially were well done, bearing well-coloured good bunches. As to the details of the treatment pursued, it will be best to let Mr. Kipling, the gardener, speak. This I am enabled to do from what he was so kind as to write in answer to a few questions I asked him respecting them, which my hurried visit to Knebworth did not give me an opportunity of ascertaining verbally.

After the Grapes are ripe the Orchids in question remain in the late vinery, where, as a matter of course, the regular use of fire-heat is discontinued from the time the crop is ripe, but the lowest point that the temperature is intentionally allowed to fall to is 50°. Occasionally the glass in the morning has gone down to 45°, but this was after a very cold night, and I have taken every care not to have it repeated, for I have taken every care not to have it repeated, for I have taken this lowering to 45° was what the *Saccolabium* did not like, but singularly enough neither the *Vandas*, nor the *Aerides*, appeared to suffer from it. The maintenance of a temperature from 50° to 55° is aimed at, and to this they have been subjected for the last six years during the resting months, and they are what you saw them. They stay in this house till about the last week in December, by which time we have started our early vinery some two or three weeks; and the night temperature here will be about 50° to 55°. Into this house the *Vandas*, *Saccolabium*, *Aerides*, *Celogynas*, and some of the *Dendrobiums* are moved. Here they are kept until the mid-season-house affords conditions to allow of their being transferred to it, and in this they remain till the late vinery, in which are grown Muscats and late black kinds is started, when they are put in it, and kept hung up, with their heads as much exposed to the light as the foliage of the Vines will permit of, through the summer, of course, subject to the conditions of heat, air, and moisture given to the Vines.

During the time I have grown these plants in the vineries it has been a question with me whether what are considered to be the hottest of the East India Orchids could not be induced to grow and flourish in houses and temperatures which have hitherto been generally supposed not suitable for them. In the vineries (with us at least) they are subjected to a drier and more airy atmosphere than they receive in Orchid-houses proper, and in this, I think, partly lies the elements of success. Another, and very important point, and one I think which should not be lost sight of, has, I believe, a bearing on their well-doing, namely, all through January, February, and March, they are subjected to a long period of direct sunlight—feeble sunlight, no doubt—yet very bright at times during March. In April the Vine leaves are sufficiently developed to cover the roof glass, and give the necessary shade. During the exposure to the sun the leaves get quite browned, and this exposure, I believe, helps to consolidate the tissue and fibre of the leaves, and gives them that stiff and rigid feel in the hands which they always have with it. The exposure, I think, has a great deal to do with their free flowering.

The other cultural details are as follows:—About March or April the baskets are cleared out without disturbing the plants. Every bit of moss, &c., is carefully removed from amongst the roots, the baskets are then thoroughly washed in a tank of tepid water, every bit of decaying matter being removed from the roots. After this the baskets are re-filled with live sphagnum, crocks and charcoal, nothing else being used.

A number of *Dendrobiums* of various kinds, and other species of Orchids, are also growing thrifflily, the appearance of the growth showing at a glance that they are sure to flower well. These Orchids afford another instance in confirmation of that which I have long urged, that no one need hesitate growing many kinds of Orchids in houses with other kinds of plants. Some of the best examples of hot and intermediate kinds I have seen were grown along with a collection of the usual stove plants; but it is something altogether new to find that the *Saccolabium* named can be so well grown in vineries in the way described. *T. E.*

Florists' Flowers.

THE AMARYLLIS.

"No better time than the present to prepare for the future. Nature sets us the example; in this time of rest is the renewal of strength." This is the time of rest for the Ilippeastrum family, but it is also a time in which the mind of the cultivator must be occupied with his plants. There are some who require to be constantly reminded of their duties in this respect—they begin to take an interest in their plants when it is long past the time that they should have received some little, but absolutely necessary attention. The small seedling plants raised from seeds sown in August should not be dried off, but they should not be grown in a very high temperature in bottom-heat. The pots may be plunged or not, and in either case but little water is required with a temperature of from 50° to 55° at night. Air may be admitted freely by day when the weather is fine. The two-year-old plants, if they have been plunged in the tan beds so that the rims of the pots are below the surface, will require no water during the months of October, November, December, and January. They will not lose their leaves quite so much as the old plants, but all the outer ones must be removed; a few of the centre ones will remain on until the time of repotting in January. The old flowering bulbs of the seedlings, or named varieties, are now rapidly losing their leaves, indeed, they will all be removed during the next week or ten days. These old bulbs require quite a greenhouse temperature with plenty of air, and no artificial heat, except enough to keep out the frost. No water whatever should be applied to them. Our potting soil has been prepared, ready to repot the plants early in January. I fancy that it is in a better state for potting when it has been mixed together for two or three months before it is used; the manure becomes incorporated with the soil, and in that state is preferable for potting purposes. The best potting soil is one of three parts loam, one of peat, one of leaf-mould, and one of decayed manure. Some sand should also be added to the compost. When the time comes for repotting, shake the old potting soil from the roots, and pot carefully, as the roots are easily injured. The bulbs should stand up half out of the soil when the potting is finished. Plunge the pots to the rims when the bulbs are all potted, and do not give any water to the roots until it is seen that they have started to make their growth. The bottom-heat should be gentle at first and the temperature of the atmosphere about 45° to 50° at night. *J. Douglas.*

The Flower Garden.

At this season of the year every attention must be paid to neatness and order, and now that all the leaves are down from the trees, the beds should be picked over, and leaves and rubbish removed, and the beds picked over lightly, levelled, and the soil made firm round the plants, and a thin layer of leaf-mould or cocoa-nut fibre placed all over the bed; about 2 inches thick will be sufficient for the purpose of protecting the plant from frost; and all bulbs should be treated in the same way.

Spring-flowering plants have now established themselves, and most of the beds are well covered.

Shrubberies should have attention, and such work done as digging them over, thinning, and transplanting any shrubs or trees where required, pruning the shrubs and trees when getting too large, or crowding others; and cutting out all dead wood. Hedges should be clipped, climbers pruned, tied, and trained, protecting any plants about which there is doubt as to their hardiness, such as *Chamerops humilis* and *C. Fortunei*, Bamboos, *Phormium*s, and *Aralia Sieboldii*.

Cannas, if left in the ground, and bulbs of *Gladiolus*, should be protected with mounds of leaf-mould; a little bracken or cocoa-nut fibre, 12 to 16 inches thick, placed above and around them; the *Chamærops* should have their leaves tied close together, and *Fir* boughs stuck and tied round them, will most effectually protect them from injury by frost.

Rockeries should be put in order, and the half-hardy Ferns protected by placing round each leaf-mould with bracken over, but by no means should the dead fronds of the Ferns be cut off or leaves removed till spring, as these afford great protection. *W. Smythe, Basing Park, Alton.*

Plants and their Culture.

STOVES—TEMPERATURES.

At this quiet season the temperatures by night and day can be lowered; where the usual collection of stove plants are grown, from 63° to 65° may be taken as a suitable night temperature, a lower grade than this should only be adopted during very cold or windy weather, then it will be an advantage to the plants in general by preventing exhaustion by too much evaporation by the overheating of the pipes, and at the same time save fuel. A lower temperature than 63°—65° would in mild weather be found insufficient to dispel moisture which, if allowed to remain on the plants would soon cause the foliage or flowers (as the case may be) to suffer; this is the case of a low temperature would be discerned the first thing in the morning, the plants being as it were bathed in moisture. According to the state of the weather the temperature for the day may rise 5°, 10°, or 15°, admitting fresh air when a rise has been obtained but closing early at all times. Damping down or syringing must be done with discretion—during dull or rainy weather but little will be necessary, a slight bedewing with the syringe being sufficient, besides sprinkling the floors. If it is found necessary to syringe heavily for any special purpose, such as the dislodgement of thrips or fly, then take advantage of a bright day and have a little extra heat in the pipes so that the moisture may soon be got rid of.

Cratoons would be found an exception to the above rules, as they do not suffer from an excess of atmospheric moisture, provided the temperatures we have quoted are maintained, on the other hand it appears to be suited to their requirements. With a little management, these and kindred subjects that require a trifle more attention in this direction, can easily be accommodated.

Gardenias for flowering at this season of the year are better managed if a heated pit can be set aside for them, where the warmth and moisture necessary to the production of flowers can be given them. We have some large bushes that have stood the whole of the autumn in a Peach-house; these have been transferred to the stove, where they will produce occasional blooms that will provide us with variety in coat flowers. *J. Hulson, Ginnnersbury House, Acton.*

The Hardy Fruit Garden.

Now is a good time for cleaning any trees that may be infested with scale or mealy-bug. The following mixture may be used:—2 oz. of flowers of sulphur, 2 oz. of soda, ½ oz. of shag tobacco, and a small quantity of lime, put in a saucapan and boiled in a gallon of water for a quarter of an hour. Allow it to settle, pour off the clear liquid, and therewith syringe the trees well once or twice during the winter. It will keep good for any length of time. I have also used paraffin mixed with water, say a wineglassful to a gallon of water. This will clean the trees if repeated while growth is at rest. Another plan that I have found to answer, is to syringe the trees four or five times with strong manure water as collected in a tank from the cow-shed.

BUSH FRUIT.

Gooseberries and Currant bushes may now be pruned, and instead of cutting off all the young shoots and only leaving a few eyes, I would advise plenty of young, well ripened shoots to be left. To prevent bushes getting crowded, a few large branches should

be cut clean away from the bottom every year. This would in a certain measure renew the bushes year by year. Since we adopted the plan of dusting the bushes over with soot and lime three or four times during the winter, and annually dress the ground under the bushes with rotten dung, we had hardly any of that destructive pest the Gooseberry moth or caterpillar.

RENOVATING OLD PEAR TREES.

In old kitchen gardens there is often seen fine old established Pear trees trained in the most faultless manner, and a good deal of labour expended on them every year, but as a rule they only produce an annual crop of young shoots and leaves. I once had charge of such a Pear wall; it faced the east, and the soil was a deep rich loam, resting on clay. Young pyramidal trees in the gardens bore excellent crops as a rule, but the trees that cost most labour and attention hardly ever produced any fruit. Most of the trees were good varieties, so I determined to retain them; had they been worthless varieties I should have preferred grafting them. The plan I adopted was as follows:—Early in the autumn a trench was opened 3 feet from the main stem of each tree, and all the roots extending outside of this were cut clean away, with the exception of those extending along the wall; these were preserved as far as possible, and a trench was cut under each tree right up to the wall, so as to make sure no tap roots were left. Before the soil was filled in each tree was slightly moved away from the wall, to allow fresh soil being placed between the roots and the wall. The first season few of them made much growth, and one or two hardly any leaves, but the second season most of them were covered with blossom, so much so that I had some of it thinned out to prevent the trees being exhausted. During the summer the trees were kept well mulched, watered, and syringed three and four times a week when the weather was hot and dry. Now is a good time to perform such operations, and to any one in charge of unfruitful trees I can only recommend them to try the above plan, and if carried out with ordinary care success is sure to follow. Plums, Apples, and Cherries may be treated in the same manner. Another simple plan to adopt with unfruitful Pear trees is to cut about 6 inches of the bark off half way round the stems just below the ground. I have known this plan adopted with success.

WALL TREES.

Cherries, Plums, and Pears should all be nailed on walls; Peaches and Apricots are better left at present. Old trees in orchards should be gone over and all useless branches thinned out to allow sun and air to act on the fruit. Established orchards should also be looked over, and see that the roots are not choking any of the drains. If the water is allowed to stand for any time about the trees it will kill all the young roots, and so render the trees unhealthy and the fruit small and almost worthless. *J. Smith, Mentmore, Bucks.*

The Kitchen Garden.

The roots, such as *Salsify* and *Scorzenera*, should be treated the same as *Chicory* roots, i.e., laid in thickly together in well-drained soil, and covered with leaves and litter when necessary. White Turnips, large enough for use, should be collected, and placed out of reach of much frost.

Celery which has made much growth since the last earthing-up should again have more soil placed around it. Stable litter may be used to prevent the ridges becoming frozen through, but it should not be allowed over the foliage; dry bracken or clean straw is best for this purpose. However, such protection (over the foliage) will not be required unless the thermometer should register more than 10° or 12° of frost.

SEEDS.

The remnants in the seed-drawers should now be looked over, and any seeds of last year's purchasing (of which sufficient remains to repay the trouble) may now be tested in order to ascertain their respective germinating powers. Fifty seeds of each should be sown in 60 pots, or larger, in a gentle heat, and when grown high enough the seedlings counted, the results entered down for guidance and reference when ordering next year's supply. Probably many will be good enough for next spring sowing. *G. H. Richards, Somerley.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Dec 7	Sale of 5000 Lilium auratum, Tigridias, &c. at Stevens' Rooms. Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Royal Horticultural Society: Meeting of the Fruit and Floral Committees, at 11 A.M., Scientific Committee at 4 P.M., at South Kensington.
TUESDAY, Dec 8	Sale of 4000 Lilium auratum, Plants, Roses, &c. at Protheroe & Morris' Rooms. Sale of Roses, Fruit Trees, Shrubs, Border Plants, and Dutch Bulbs, at Stevens' Rooms.
WEDNESDAY, Dec 9	Sale of Valuable and Imported Orchids, from Mr. E. Sander, St. Alban's, at Stevens' Rooms. Great Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY, Dec 10	Clearance Sale of Glass Erections, Plants, &c. at the Park Nurseries, Finchbury Park, by F. and E. de Morris.
FRIDAY, Dec 11	Sale of Imp tied and Established Orchids, at Protheroe & Morris' Rooms. Sale of Roses, Fruit Trees, Shrubs, Border Plants, and Dutch Bulbs, at Stevens' Rooms.
SATURDAY, Dec 12	Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

IN our last issue we had occasion to comment upon the retirement of Sir JOSEPH HOOKER from official duties, and we took the opportunity to allude to the great value of his services to botanical and horticultural science, and to the establishment at Kew in particular. It is in some way significant that Sir JOSEPH HOOKER'S retirement occurs at the same period that Professor HUXLEY finds it incumbent on him also to seek relief from the pressure of official duties.

The public career of these two eminent leaders in Science extends in general terms over the last half century, and in framing a retrospect over that period Professor HUXLEY, in vacating the Presidency of the Royal Society, took occasion to review the progress in intellectual and material welfare that has been made during that period. He had no difficulty in showing that the vast improvement in almost all departments of knowledge, and in their application to the wants of mankind had been made as a direct consequence of the increase in what is termed scientific knowledge. We will not do more than point out that scientific knowledge is essentially not different from any other form of intellectual development, but it is allowable to point out that the pursuit of truth, which is the aim of all honest seekers after knowledge, has been far more advanced by scientific methods familiarised to us by the labours and generalisations of FARADAY, of GROVE, of JOULE, of HOOKER, of HUXLEY, to say nothing of DARWIN, than by the haphazard guesses of party politicians, inclined as they must be in all cases by interested considerations whether of party or person. The facts are absolutely indisputable. No one who lives in this present year of grace and who compares the resources, the necessities, the comforts at his command, with those which were at the disposal of his forefathers, can for a moment doubt that they have been secured to him as a direct consequence of the progress of science. No one will dispute the advantage of literary culture, but any one may see for himself that those advantages might have been secured in the past, and might be secured in the future, far more speedily and efficaciously by the application of scientific methods. Take, for instance, the question of practical politics, which are disturbing the country at the present moment. There are principles at stake; there are facts to be weighed and considered. How do our politicians set about the task before them? Do they not in the main either ignore great principles, or does not each party claim them as its own special inheritance, and assume, nay, unblushingly assert, that they are not the property of the other?—and if they condescend to consider the facts at all, do they not distort them, now in this direction, now in that, solely for the sake of personal or party advantage? Is this our boasted science? Is this the result of the education of our public schools and universities? To a large extent it is. We cannot, especially

in the throes of a General Election, eliminate the purely selfish element—man is but man in such matters; but when calmer times come and intellect is allowed free play apart from prejudice and passion, shall we not have reason to deplore this potentiality of active ignorance? Shall we not ask ourselves whether such exhibitions of mental distortion as we are now witnessing on one side and on the other are not a disgrace to our system of education? The crudest theories and the wildest hypotheses are put forward on this side and on that for the acceptance of the multitude, as if they were established facts and well grounded generalisations. Would any man of business—would any practical gardener—carry on his daily work in such a way? What must be the result if he did? Men of science are no more free from human infirmity than their fellows. They share the common instincts of self-preservation with their fellows—they are swayed by the same passions, the same sympathies, the same antipathies as their fellows; but in their own special pursuits they know to a greater or less degree how to eliminate such "accidents" from the general results. Those who do so to the greatest extent are the leaders of Science, those who do so to the least are unworthy labourers indeed.

Admitting, then, that while men remain men, the selfish personal element must always, to some extent, mar and soil the purer pursuit of truth, we may ask whether this evil is to remain as it is, or to become a diminishing quantity. Too obviously the heretofore prevalent systems of education have not sufficed to lessen the mischief. Is there any hope that the more scientific training of our youth, whether it be in literary culture, in art, or in technical industry will in the future prevent or lessen the evil? It is too much, perhaps, to expect that it will prevent it, but we may surely indulge in well-grounded hopes that it will mitigate and lessen it. What has been the secret in these later years of the rapid advance in our material benefits? What has been the secret of the rise of this nation—the decadence of that? Clearly in both cases the increase of knowledge, the most ignorant have had to go to the wall.

The philosophers and schoolmen of the middle ages went round and round without adding much to the stores of mankind, either mentally or physically, because their science was an affair of mental gymnastics, not a solid advance based upon conscientious investigation of facts and phenomena. It was not a steady progress from the known to the unknown, but a kaleidoscopic shifting of particles already less or more well known. Now is not this pretty much the character of practical horticulture at the present day? Our forefathers have gathered for us a large amount of cumulated experience. We add to it by our own personal observation, but there we stick. If we open a horticultural book of the year 1885 shall we not find in all matters outside common routine and daily practice the same theories—save the mark!—the same baseless figments, the same wild hypotheses as are to be found in the writers of a century ago? We make no aspersions on those writers. They were up to the mark in their day, but they are of necessity far behind the requirements of the present.

The rank and file of British horticulturists and agriculturists, however, might, with few exceptions, just as well be living in 1775 as in 1885. The reason for this is to be found in the utterly inefficient system of education doled out alike to masters and men in their degree. Ask any successful horticulturist what he owes to his education, and what he owes to his own observation and the pressure of circumstances? How much labour might have been saved him, how much his perceptions might have clarified

and widened had he had the advantage of a training in habits of accurate scientific observation and correct induction. Books are valuable—most valuable—but of what use is the information obtained from them as compared with that which is gained by the earnest student as the result of practical work rightly directed and carried out with scientific method. It is one thing to learn in books and from the mouths of teachers that plants feed by their roots and their leaves, it is vastly different to find out and prove the fact for one's self. In the one case the talent is laid out to compound interest, in the other it is at best an investment of dead capital—a coin subject to rust and deterioration.

Of HUXLEY'S work as a master or as a teacher in science, whether to experts or to beginners, it is not needful for us to speak here. Of his exertions to secure a higher type of practical education—practical in the best sense of the word—we would wish to speak with all honour and respect. No matter who may succeed him in the tenure of NEWTON'S Chair at the Royal Society, the verdict of posterity will assuredly be, that no one of his predecessors has occupied it more thoroughly to the advantage of his fellow men—no one with a more disinterested search after truth than he who on Monday last vacated the chair in favour of the eminent mathematician, Professor STOKES. And to the advocates of literary culture as the one thing needful we may ask, Who among modern writers is a more perfect master of literary style than THOMAS HUXLEY?

—TAXED *versus* UNTAXED TRADING.—We publish the following communication received from our old correspondent, Mr. JAMES ANDERSON, of Meadowbank, Lanarkshire, as it touches on matters in which all political parties must feel an interest. He says:—

"I asked each of the candidates for the North-east division of Lanarkshire the following question—'Would the candidate be prepared to support any well considered scheme for rating and taxing such landlords as sold their spare produce in or about their gardens on the same footing as those tenants who pay rent, rates, and taxes, and have to compete with them in the open market?'"

"Mr. CUNNINGHAM, of Craginels, replied that 'landlords were taxed on their incomes, and be presumed they would pay accordingly, but that be scarcely considered the question a national one.' Mr. DONALD CRAUFORD replied that 'he was not aware of the irregularity referred to, but if it exists (and you ought to know) I should be in favour of removing it.'"

"I did not ask the question from any querulous disposition, but with the view of calling attention to, and if possible correcting, the anomaly. None of us in the trade have any right to call in question what our fellow-men may do with what belongs to him, be he a duke or be he a peasant; but I don't see why there should not be some measure framed whereby such a seller should not only pay as a landlord, but as a tenant as well. If he chooses to sell his goods and compete with the legitimate trader, who puts up his sign and advertises his goods, surely in common fairness, not only should he pay the State the direct taxation on what he sells, but he should be rated on the sum for local burdens as well. I don't say it is the fault of the parties; no doubt many or most of them would willingly pay if the taxes were imposed. I join issue with Mr. CUNNINGHAM in asserting that it is not a 'national' question. I think it is; and it is becoming more and more so every day, and I look to the *Gardener's Chronicle*, as the leading paper of its kind, to open its columns to such contributions as will eventually end in justice being meted out and the grievance swept away."

—ATLAS OF PLANT DISEASES.—Dr. O. E. ZIMMERMANN is publishing under the title of *Atlas der Pflanzenkrankheiten*, a series of photographic illustrations representing the microscopic appearances of the fungi affecting plants. An explanatory text accompanies the plates. The photographs are direct from the microscope, and are mostly very clear. It would be a convenience if the divisions of the micrometer scale were in future photographed with the objects. The work may be had of Messrs. WILLIAMS & NORGATE.

FIG. 163.—EUCCHARIS MASTERSII: SECTION OF THE FLOWER AND POLLEN GRAINS. (SEE P. 722.)

— "VENETIAN" HOUSES.—We are informed that Messrs. SKINNER & BOARD, horticultural builders, Bristol, have received an order from New York for a range of their "Venetian" flower and fruit houses, the clever contrivance of whose ventilation was noticed in the *Gardeners' Chronicle* some months since.

— THE SURVEYORS' INSTITUTION.—The next meeting will be held on Monday, December 7, when a paper will be read by Mr. A. D. WELLS (Associate), entitled "The Cost of Production and the Value received for our various Farm Crops." The chair to be taken at 8 o'clock.

— NATIONAL AURICULA SOCIETY.—NATIONAL CARNATION AND PICOTEÉ SOCIETY.—The annual general meeting of the above Societies will be held, by permission of the Council of the Royal Horticultural Society, in the Conservatory, South Kensington, as soon after 12 o'clock as possible, on Tuesday, December 8. The business of the meeting will be, the election of officers and committee, the receipt of the Secretary's and Treasurer's report, the election of judges for the ensuing year, and any other necessary business as may pertain to the annual general meeting.

— "BULLETIN DU CONGRÈS INTERNATIONAL DE ST. PETERSBOURG."—In this volume we have the proceedings of the Botanical Congress of St. Petersburg in May, 1884, and the full text of several of the memoirs presented to it. These latter are varied in substance as they are in form, being concerned with many points of physiological and systematic botany, and written in French, Russian, German, Spanish, and English. We think the plan adopted in 1866, and partially followed also on this occasion, of requesting each author to give an abstract of his communication, might well be adopted on all similar occasions, and, moreover, that the abstract should be written in Latin or in French, as the languages most likely to be understood by scientific men of all nationalities. If this were done there would be less objection to the publication of papers in the language of the authors. In the present volume there is a paper in Spanish, which is not known to many, and there are several in Russian, which is even more incomprehensible. Among the papers of special interest to horticulturists in the present volume are Mr. ELVES' paper on Lilies, Mr. LYNCH's communications on the culture of bog plants, Professor WITTMACK's historical sketch of the genus *Begonia*, M. NIEFRASCHK on the cultivation of large Palms in winter gardens, and M. PYNAERT's note on the influence of light. On some of these points we may have occasions to comment on a future opportunity.

— DR. ASA GRAY.—A Cambridge [U.S.] correspondent writes that on November 18, Dr. GRAY was the recipient of a very handsome silver vase, the gift of 180 North American botanists, who availed themselves of the seventy-fifth anniversary of Dr. GRAY's birth, to testify their gratitude and esteem. The vase is in *repoussé* work, the decoration including representations of such plants as *Grayia*, *Solidago*, *Asters*, *Shortia*, *Lilium Grayi*, and others, with which the Doctor has been specially associated. The presentation was managed by some young botanists, and was an entire surprise to the recipient. Nearly all those who participated in the memorial gave personal expression of their love and gratitude to the master at once so genial and so profound, and as much esteemed on this, as on the other side of the Atlantic.

— UNSEASONABLE FOLIATION.—An instance of the influence of the recent weather upon trees may be cited in the case of some Lime trees coming into leaf on Friday, November 27. Doubtless the warm damp autumn which followed upon the exceedingly dry summer was the cause of this. The first sharp frost will kill these unfriendly shoots. It is necessary to remark that not one Lime tree was thus in leaf, but quite a dozen.

— "HISTOIRE DES PLANTES."—The last of M. BAILLON's series of monographs contains the Campanulaceæ, Cucurbitaceæ, Loasaceæ, Passifloraceæ, and Bignoniaceæ, profusely illustrated, as usual, with accurate and beautifully executed woodcuts. In associating the Passifloraceæ with the Cucurbitaceæ, in spite of the different relative position of the parts

of the flower and the presence of albumen in one case and its deficiency in the other, not to mention other matters, M. BAILLON does but follow the example of most of his predecessors. The collocation of these two orders, however, next to Campanulaceæ, will be received with great astonishment. Of course, so expert a botanist can produce plenty of reasons for this approximation, but he can hardly expect that his readers will attach the same degree of validity to those reasons that he does.

— NATIONAL DAHLIA EXHIBITION (NORTHERN SECTION).—This enterprise, which would have been carried out by the committee of the Grand Yorkshire Gala, under the management of Mr. JOHN WILSON, the Secretary, had an adequate response been received to the circular issued by that gentleman, is, it is feared, doomed to failure. The committee asked for donations and subscriptions to a guarantee fund, and a sum of not less than £400 was named. A circular was prepared and issued to those likely to take an interest in the proposal, but the responses have proved so insignificant that there is no prospect of carrying it out. No assistance has been rendered by any one interested in the project. Mr. WILSON deserves high praise for his exertions in the matter. That he does feel some disappointment there can be no doubt; but if the cultivators, exhibitors, and admirers of the Dahlia are slow to support, there is no help for it but to abandon the proposal. More's the pity, for the management of the proposed show would have been in hands trained by long experience to make such things conspicuous successes.

— DR. TRIMEN.—From the *Indian Agriculturist* we learn that Dr. TRIMEN has had a very interesting botanical trip through portions of the North Central, Eastern and Central provinces of Ceylon, working more especially along the sides and within the triangle formed by the roads from Dambulla to Anaradhapura, thence to Trincomalee, and from Trincomalee back to Dambulla. Dr. Trimen visited Pullonaruwa and Minneriya lake, which he thought most interesting; and altogether this trip has more than ever impressed him with the great variety of country, scenery and resources possessed by the island. Scarcity of water at some of the stopping-places was the chief drawback to comfort encountered, and no one can form a true idea of the many ways in which water is indispensable to the convenience as well as comfort of living, until they find absolutely none to be got for miles around their habitation! What struck the travellers was the absence of "wells": where such existed the villages are comparatively independent; and as wells are much easier made than tanks, we may ask why are wells not found at every village, and indeed every possible stopping-place on the roads referred to? In India the authorities apparently pay a good deal more attention to well-digging than is the case in Ceylon, so far as we can judge.

— DIFFICULTY OF BREATHING CAUSED BY PELARGONIUMS.—The *British Medical Journal* for November 28 contains a note on difficulty of breathing produced by *Pelargonium grossularioides*, by Mr. G. BIDIE, Deputy Surgeon-General, Madras. Mr. BIDIE says that the odour which the plant gives out after rain, &c., is agreeable to most people, but that in the case of a lady who came under his observation it immediately produced dyspnoea. As the plant was in flower it was thought the pollen grains caused the trouble, as in hay fever, but on experiment it was found to be due to the effluvia of the leaves. Whenever plants were brought near the lady she was affected by them; and when out driving or walking she would announce the presence of the enemy when the plant could not be seen by the eye, and whilst other people could notice no smell until their attention was directed to it. This is, therefore, a new example of an "idiosyncrasy of olfaction."

— USEFUL WOODS IN AMERICA.—In a report on the trade and commerce of Astoria, North America, it is stated that the chief forest trees of the district are Hemlock, Spruce, Fir, and Cedar. The former has been used only to a very small extent for its bark for tanning purposes. Spruce is used where lightness is wanted, but it must be kept from the wet. Salmon cases are made from it. Fir is the most generally used of all the different kinds of wood; its strength, durability, and care with which it is manufactured, brings it into use for all the general

purposes of house building, boat building, planking of roads and bridges, and piling for the support of bridges and buildings over water, ships' spars and deck planking, some thousands of feet of selected timber being sent to New York for trial for this purpose. Cedar wood is used in finishing where lightness and ease of working are wanted. It is a very durable wood, lasting for years as fence posts, house sills, window jambs, &c.; it is also much used as finishing in river steamer cabins, being light; it is, however, very brittle.

— BOOKS AND PUBLICATIONS RECEIVED.—*Life on the Farm: An Animal Life*. By Professor BROWN (BRADBURY, AGNEW & CO.).—*Indigenous Flowers of the Hawaiian Islands*. By Mrs. FRANCIS SINCLAIR, JUN. (SAMSON, LOW & CO.).—*Report of the Smithsonian Institution* (Washington: U.S.A. Government Printing Office).—*Live Stock Journal and Agricultural Gazette Almanac*, 1886 (VINTON & CO., 30, Hampstead Road, London).—*Grevillea* (WILLIAMS & NORGAATE).—*La Belgique Horticole* (*Annales de Botanique et d'Horticulture* (Agents: DULAU & CO., 87, Soho Square, London).—*Third Annual Report of the Board of Control of the New York Agricultural Experiment Station for 1884* (Albany, New York: WELD, PARSONS & CO.).—*The Carnation and Picotee*. By Mr. E. S. DODWELL.

— GARDENING APPOINTMENTS.—Mr. JAMES ARNOLD has been appointed Gardener to W. G. CRUM, Esq., Mere Old Hall, Kantsford, Cheshire.—Mr. EDWARD MENZIES, of Chatsworth Gardens, has been appointed to succeed Mr. LEANEY, as Head Gardener to THOMAS CHISTY, Esq., F.L.S., Malvern House, Sydenham.

EUCHARIS MASTERSII.

This new species of *Eucharis* has been shown several times during the past season at the meetings of the Royal Horticultural Society at South Kensington, Mr. Bull showing it twice, October 13 and 14, and November 10—on the last occasion a beautiful mass of well grown plants in a large pan having been brought from the Chelsea Nursery. On the first occasion that Mr. Bull showed it a First-class Certificate was awarded, the plant appearing to be a valuable addition to the genus as a decorative subject.

We take the following from the *Botanical Magazine* for August, 1885, relating to this plant:—"This new *Eucharis*, which at the request of Messrs. F. Sander & Co., of St. Albans, has been named after Dr. Masters, F.R.S., is intermediate between the two finest species already known, *E. grandiflora*, Planchon et Lindley (plate 4971); *E. amazonica*, Hort.; and *E. Sanderi*, Baker (plate 6676). It has entirely the same habit and leaf, and the same large pure white perianth-limb, but is different from both of them in the staminal cup, of which the free portion of the present plant forms a narrow but united collar-like rim to the perianth-tube, with two deltoid teeth between the base of each filament. The bulb is globose, 1½ inch in diameter. Leaves distinctly petioled, oblong, acute, just like those of *E. grandiflora* and *Sanderi* in shape and texture, 8 or 10 inches long, 4 or 5 inches broad, bright green on the upper surface, pale green beneath, with fifteen or sixteen curved veins on each side between the midrib and the margin. Scape slender, glaucous, terete, under a foot long. Umbel two-flowered in the specimen drawn [but see our figure, p. 721]. Pedicels very short, valves of the spathe small, green, imbecillate. Ovary green, oblong, trigonous. Perianth-tube 2 or 2½ inches long, cylindrical in the lower two-thirds, infundibuliform in the upper third, with a throat 1½ inch in diameter. Limb pure white, 3 inches in diameter. Segments ovate, much imbricated. Staminal cup striped with green, adnate to the tube of the perianth, except a narrow collar-like rim which has a couple of deltoid teeth between each filament. Style reaching nearly to the tip of the perianth segments, thickened and obtusely three-lobed at the stigmatous apex."

This is the technical description drawn up by Mr. Baker, to which we may add, that for practical purposes its smaller flowers will render it specially useful for bouquet and other decorative work. The culture will probably prove to be the same as for the better known *grandiflora*. (See fig. 163, p. 721.)

HOW NOT TO DO IT.

The grand display of designs in immortelle work exhibited by Eugenie Weiss, at the flower exhibit at the Pennsylvania State Fair, is worthy of special mention. Nothing like it was ever seen in this or perhaps any other country. A *fac simile* of the design made by this enterprising young florist for the Grant obsequies, and presented by the Mead Post, of Philadelphia, occupied a prominent place in the display. In the contest for the best wedding canopy of natural flowers Hugh Graham was decidedly first. Selaginella densa was the ground-work, with the monogram "H. G." in the centre; a "true lover's knot" and a four-leaved Clover on either side were cleverly wrought, and the whole was bordered with double rows of maroon Dahlias and a chain of pink Balsams. The canopy proper was made of Smilax, and from the extreme edges were suspended seven bells (why did he not make an octave?) on which were the words "love, happiness, joy, health, wealth, long life, and peace," in purple immortelles. This, it must be confessed, detracted somewhat from the general effect, the purple immortelles giving it an unmistakably funeral appearance; pink or red lettering would have answered the purpose much better. The ropes were made of *Hydraea paniculata*, and were draped in festoons and run through a loop at the back. For the best three floral designs the contest was between Craig & Bro. and Hugh Graham & Co. The first premium was awarded to the latter firm, but it called forth some comment. Graham's were a trifle poorer in conception, but were no more appropriate, nor so well executed as Craig's.

For the original floral design there were several competitors. Among the best were an hour-glass, "the broken pitcher at the well," and the life-boat "safe in the haven." The latter was from Hugh Graham & Co., and was given first premium. The "well and the broken pitcher" came from Jos. Kilt & Son, and it received second premium; it was beautifully worked out and attracted a great deal of attention, albeit the idea was somewhat fatigued as a funeral design; but there is no mistaking the fact that it was a neat piece of work. For second place in the competition for dinner-table decoration, Chas. Fox had a very pretty design. The centre was a miniature lake, in which were live fish, sporting in real water, and fussy ducklings moved to and fro on the surface; at each end of the table were two cornucopias made of *Hermosa* Roses, from which were emptied in bounteous profusion fine *Perle* Roses; every favour was different—a slipper, a fan, &c. Faust & Crawford came in third, with three large plateaus. The centre one was made after the style of two four-leaved Clovers, each leaflet being made in solid colours, resting beds of *Adiantums* and other choice Ferns. Hugh Graham & Co., fourth premium, one of the most elaborate designs ever seen at any exhibition, but it was rather too stiff and formal for the purpose for which it was intended. It occupied the whole length of the table in an unbroken line except a few inches of the edge—barely leaving sufficient room for plates. No space was left for candelabra, or other paraphernalia necessary to complete a dinner or luncheon table. Although it was faulty in some respects, it was acknowledged on all sides to be a very fine piece of work, and reflected great credit on its designers. Selaginella densa formed the basis of operations, through which was delicately traced the stem of a compound leaf, presumably a Rose leaf; the leaflets were made of white *Careations*, with *Carnation* Crimson King to define the veins, at one end of the table, while *Violets* were used at the other end; all were veiled with the misty froods of *Adiantum gracillimum*. The blossoms were composed of four petals, worked out in solid colours. In the centre was a square plateau of delicate *Adiantums* and fancy foliage plants. The whole was edged in ribbon border style with fine *Rosebuds*. Each of the other three designs contained *Orchids*, but this one had none, otherwise the flowers in general were good, and the *Roses* especially were very fine.

Adiantums and other good Ferns played a very important part in all the best work throughout the entire exhibition, and are certainly destined to become used more and more each year until they shall occupy that position to which they are entitled. There was a pendant design sent by Joseph Kilt & Son, and a piano by W. A. Wyatt, which was nicely made. There were also windmills and other incongruities,

made of a few flowers and a great deal of woodwork, but the least said about these the better. *The American Florist*. [Surely there is work cut out for our contemporary to improve the public taste. Ed.]

Notices of Books.

Year-Book of the Scientific and Learned Societies of Great Britain and Ireland, 1885. Charles Griffin & Co., 1885.

This Year-Book purports to give an account of scientific work done during the year 1884, a record of progress, and a convenient handbook of reference. It contains a list of the several scientific and literary societies' metropolitan and provincial, with their officers, and an indication of the papers and memoirs published during the year. The utility of such a publication is unquestionable, and every effort should be made to secure completeness and accuracy.

An index of authors and of subjects might advantageously be given. The primary object of the majority who use this book is not to ascertain what has been done at or in a particular society, but what has been published concerning a particular subject.

The Royal Horticultural Society is represented here only by the list of some of the principal officers, while the very numerous communications made to its Scientific Committee, and the records of trials and experiments made at Chiswick, are entirely omitted. This omission can hardly be charged to the Editors of the present volume, neither can it be attributed to the fact, that the Society's published records are of a sadly intermittent character, for the very next paragraph is devoted to the Bedford Park Natural History and Gardening Society, in which we find twelve entries of papers read, but no indication of any official publication.

Fruit and Fruit Trees, &c. By Leo H. Grindon. Manchester: Palmer & Howe.

"This volume claims to be no more than an amateur's contribution to the literature of the very large and varied subject of fruits and fruiting plants." This introductory statement is further limited by the restriction of the subject-matter to those fruits "which are either produced in Great Britain, or which are imported from foreign countries as established articles of commerce." Mr. Grindon treats his subject as an amateur, that is, not as a practical fruit grower, but, unlike some so-called amateurs, he takes pains to be accurate in his statements, and does not merely confine himself to the task of writing a pleasant book. The latest accessible information is pressed into the service, as an instance of which we may mention that the main results of the Apple Congress are duly noted, though, oddly enough, the official record drawn up by Mr. Barron, and which will form the text-book of Apple information for years to come, is not specifically mentioned. Of course, the corresponding results of the Pear Congress are too recent to have been inserted in this volume, but in any future edition the outcome of the Pear Congress must also be alluded to. Reference, moreover, should be made to the beautiful *Herefordshire Pomona*, so recently brought to a close, and which Mr. Grindon might have worked as a rich quarry of information on the subject on which he treats. Mr. Grindon lightens his pages with scraps of literary gossip and philological lore, and in doing so his literary skill is apparent, for while they serve his purpose they are strictly pertinent to the subject in hand, and are not dragged in to show the extent of the author's reading, or the capacity of his notes-books.

The source of "Jordan" Almonds might naturally be inferred from the name applied to the nut, but erroneously so, for Mr. Grindon tells us the name is the result of a misunderstanding of the name given "in the *Promptorium Parvulum*, the celebrated old English-Latin Dictionary, compiled in 1449, by Geoffrey, the grammarian, viz., 'Jardyne almaunde, amigdulum jardiunum,' literally a cultivated or garden Almond."

Under the heading of the Grapes we are reminded that England raises Grapes for export. "It is not generally known, but none the less one of the curiosities of modern commerce, that Copenhagen and St. Petersburg are largely supplied with Grapes from Yorkshire, Grapes grown in the great vicinities at

Govrick Hall, near Goole." This we suppose is an instance of trading acceptable to fair and free traders alike. Mr. Grindon's book is like ripe fruit, seasonable; and those who are deliberating as to the choice of a Christmas present to the intelligent schoolboy of the upper forms, may have their embarrassment satisfactorily ended by the purchase of this book.

NOTES FROM NURSERIES.

MESSES. H. CANNEL & SONS, SWANLEY.—Supposing it to be possible for one not knowing the season of the year to be dropped at the present time into the middle of Messrs. Cannell's Pelargonium and other houses he would assuredly think it the height of summer here, and not "drear November." There are some thirty-two houses devoted to the culture of Pelargoniums, singles, doubles, and Ivies, presenting a brilliant display of colour, ranging from pure white and through all shades to the deepest crimson; Begonias, Chrysanthemums, Cyclamens, Primulas, Bouvardias, Carnations, &c., the whole forming a floral display that must be seen to be realised. Before entering into brief details concerning these subjects it may be of interest to note a wrinkle or two in the heating of the houses adopted by Messrs. Cannell, who are nothing if not original and practical. The houses are heated with Canonell's "Circulator," an efficient boiler. The pipes are so arranged that what is usually in ordinary practice the "flow" is here made the "return" pipe, and *vice versa*—quite an upsetting of the old notion, and probably a nut for the hot-water engineers to crack. That it answers, and admirably so, is seen in the splendid condition of the plants.

In some of the houses the usual 4-inch cast-iron pipes are supplemented by wrought-iron pipes 1 inch in diameter. These, viz., the wrought pipes, are fixed directly under the glass and near the lower end of the sash-bars, three pipes being on each side of the roof, the lower one being about 8 or 9 inches from the wall plate, and the others 9 and 13 inches above it. It is claimed—and apparently with justice—for this system of roof-heating that it gives a more equal distribution of heat and a drier atmosphere (important essentials in the cultivation of such plants as are here to be seen), than is secured by the common method of arranging the pipes.

Out of such a host of Pelargoniums, some 600 varieties being grown, it is necessarily only possible to enumerate a few of the best. Queen of the Belgians, a splendid variety, one of the purest whites, a fine single-flowered zonal; Le Cygne, double-flowered zonal of the same character as the preceding, and a valuable addition to the double-flowered whites. Swanley Gem, bright rosy-salmon, of a most distinct, pleasing, and attractive shade, large white centre; extra large, fine-shaped flowers of great substance, a fine bold truss, and a striking variety. Kentish Fire—in this we have a decided advance in the crimson-scarlet varieties, flowers of fine form and substance, good overlapping petals, thus possessing the good qualities of a first-class zonal Pelargonium. Of colour which are good, yet this variety was found of a rich shade of scarlet, with enormous flowers and trusses. Mrs. W. E. Carden (double), soft rosy-cerise of pleasing tint, the flowers full and of good form, a fine variety for winter flowering; habit good, free, and effective. Emile Lemoine—double-flowered Ivy-leaved; in this we have a new edition to this increasingly popular section; colour quite distinct to anything yet seen in this class of Pelargoniums, of a rich orange-scarlet shade, the pips large and semi-double; an acquisition of much merit.

Some five houses, containing 8000 plants, were filled with Chrysanthemums of all kinds, including the newest varieties. The plants are sunk in the ground—viz., not placed on stages, so that the visitor has a better opportunity of observing them, as they may be looked down upon instead of their being above the line of sight, as is too often the case.

November is an unusual season in which to see Begonias in quantity in flower, but we saw here a house about 700 feet long of this showy flower in fine trim, that brought back visions of hot July (the month *par excellence* for the Begonia) to our mind.

Cyclamens, a grand batch, were just beginning to "peep," as if to give us a foretaste of what the plants would be at a later period. Primulas, as is well known, are made a specialty of at Swanley; of the

useful old alba-plena for cut flowers a large stock is grown. Swanley Blue Primula, having a distinct shade of blue in its symmetrical flowers, is a good thing, and is probably the best of the colour yet out. Of that sweet useful winter flower the Bouvardia an immense stock is grown, and comprising all the best varieties, specially noticeable being Humboldtii corymbiflora, of free growth, fine large flowers, and of pleasant aromatic scent, snow-white; this is a very fine variety. A good commercial plant is the now well known Carnation, Pride of Penhurst; some thousands of it are grown at Swanley.

One of the most desirable plants in cultivation is Salvia Picheri, a very beautiful herbaceous plant, with branching stems 2 to 3 feet in height; colour azure-blue, producing a quantity of flowers during the autumn months.

We have spoken thus far very inadequately of plants producing flowers, just one note of a house devoted to foliage plants. These are mainly foliaged Begonias, very beautiful, interspersed with variegated Aspidistras, small Palms, Dracænas, and elegant Ferns; the beautiful Panicum variegatum, relieved by green moss, gracefully draping the walls below the stage on each side of the house. Standing at the entrance to this house, and looking down its long vista, the effect is very striking. *B.*

HEMLOCK SPRUCE BARK EXTRACT.

THIS substance, which is now much used for tanning, is obtained from the bark of the Hemlock Spruce (*Tsuga canadensis*, Carrière = *Abies canadensis*, Linæus), a tree 70 to 80 feet high, found over a very extensive area in North America, extending from Nova Scotia, Hudson's Bay, and New Brunswick, through Canada and the United States, as far south as North Carolina. The tree yields Canada pitch, used for similar purposes as Burgundy pitch in Europe. Oil of Spruce, or oil of Hemlock, is also distilled from the leaves, and used in medicine. The bark contains nearly 14 per cent. of tannin. In the southern parts of the United States the stripping of the bark commences in the spring, and continues during April and May. In New York, Michigan, and Wisconsin, the bark is collected in June and July, and further north it is still later; that obtained furthest south is said to be of the best quality. In consequence of the demand for Hemlock bark, the forests are said to be fast disappearing. The extract, which has superseded the export of the crude bark, contains from 18 to 25 per cent. of a deep red tannin, which gives considerable weight and firmness to leather. The following is given as the mode of preparing the extract:—"The bark, in pieces $\frac{1}{2}$ to 1 inch thick, and several inches long, is soaked for about 15 minutes in water at 95° Cent. (200° Fahr.); it is then fed into a hopper, which conducts it to a 3-roller machine, something like a sugar-cane mill, through which it passes. Coming out lacerated and compressed, it next falls into a vat of hot water, where it is agitated by a wheel, that the tannin from the crushed cells may be dissolved in the water; hence it is raised by a series of buckets on an endless chain somewhat in the manner of a grain elevator, to another hopper, whence it is fed to another 3-roller mill; here it receives its final compression, and comes out in flakes or sheets like coarse paper, and almost free from tannin. The buckets are made of coarse wire that the water may dip through during the elevation. In order to avoid the blackening action of iron whenever this metal is brought into contact with the solutions, it is thickly coated with zinc. The solution is evaporated to a solid consistency generally by vacuum-pans. About 2 tons of bark are represented by one bar (of less than 500 lb.) of extract." The total production of extract is probably over 10,000 tons annually, ranging in value between £17 and £23 per ton.

No returns are available as to the quantity and value of the extract imported into Britain, as it is included under barks and extracts used by dyers and tanners. Neither is there any record of the cost of extraction; the profits, however, must be sufficient to maintain a large plant and a considerable number of hands. From the general use of the extract, it would seem that it is applicable to most, if not to all, kinds of leather. It also has a medicinal value, in consequence of its having similar properties and effects to extract of Khatany (*Krameria triandra*), and consequently applicable as a medicine where that drug is applied. *John R. Jackson, Museum, Kew.*

HOME CORRESPONDENCE.

Daffodils: Leeds and Herbert.—It will be a great pity if the Rev. Wolley Dod's informant does not give us his own account of his conversations with the late Mr. Leeds. I have myself seen a good many of Herbert's letters written during the comparative short period of his life when he really studied the Narcissi, and in these letters he frequently requests aid from his contemporaries, but very rarely offers any on his own part. I note that it was "species only" that Leeds is supposed to have received from him, so that the credit of Leeds' own labours is secure. That Leeds was fully alive to the value of Dean Herbert's literary labours and hybridising experiments is proved by his own reference to them in the *Gardeners' Magazine of Botany* at the time his own seedling Narcissi were being illustrated therein, in the year 1851. I hope Mr. W. Dod's informant will kindly and of his own generosity tell us all the remembers of the late Mr. Leeds and of his work. *F. W. Burbidge.*

Cladotrichum passifloræ, n. sp.—I venture to propose the above name for a very curious black mould which occurred, but very sparingly, on leaves of *Passiflora quadrangularis* here this spring, and which, by a slight expansion of Corda's genus, *Cladotrichum*, may be included in it. It consists of somewhat branched

FIG. 164.—CLADOTRICHUM PASSIFLORÆ.

septate mycelium of a darkish brown colour; from this arises a slender hypha or thread slightly swollen at the tip, 1-2 septate, which produce a single branch much swollen and very black, bearing at its extremity a simple hyaline spore. It would thus accord with Corda's genus in every respect, except in having simple and not septate spores. The form is a somewhat obscure one, and it is not easy to determine whether the dark bulbous swelling is the spore with a hyaline appendage, or whether the said appendage is the real spore; a portion is sometimes left adherent to the end, and on the other hand these bodies are often free. The very small amount of material obtained—a few specks on a single dead leaf—rendered all attempts at germination impracticable. The spores are about .0003 inch x .0003 inch; the swollen portion .0007 inch x .0004 inch. In fig. 164 A represents a group on the epidermis of the leaf, and B a single detached specimen; c, spores (?). *Greenwood Pim, M.A., F.L.S., Monkstown, Dublin.*

Ten-week Stocks for Market.—A market gardener in a large way in West Middlesex grows these largely for marketing in early summer, but he sows the seeds early in November instead of in early spring. The seeds are sown in pans and shallow boxes, in suitable soil, stood on raised sloping beds in cold frames, raised up near the glass, and where the sun can fall freely upon them. During the winter air is given on all favourable occasions, and when severe weather sets in they are kept covered up from frost. By the spring they have formed fine young plants, they are then pricked off into cold frames for a time, and finally planted out in good soil in the

open ground, with good balls of earth attaching to the roots. This is done as soon as convenient, and it is found that they grow freely and robustly, and produce many spikes of flower that are bunched and sent to market. Three colours are grown—the purple, crimson, and white, the latter rather more largely, and the purple less than the other two. These come in well to follow the autumnal and Queen Stocks, and they in turn are followed by the Ten-week Stocks raised from seed in spring. *R. D.*

Summer Hill, Pendleton, the seat of W. Agnew, Esq., M.P., is just now a most interesting spot to visit. I have had the pleasure of calling here on several occasions, but I think I was never so pleased as when I had a look through the houses a few days ago. Mr. Agnew is a great lover of Orchids, as may be gathered from some of the prices paid for plants at the Manley Hall sale thirteen years ago, but it was not so much the Orchids that took me there as the ordinary winter blooming plants now making the houses gay and attractive. Mr. Bradley, the gardener, has ever to have at hand a good supply for cutting purposes, and so one part of his *Chrysanthemums* are permitted to bring three or more flowers on a stem; for vases and basket, &c., such medium flowers are very serviceable. A second lot of plants are disbudded to a single bloom, and at the present time this batch is very gay. The flowers are of large size and good form, the Japanese, of which there are many sorts, are especially fine. A third batch is also grown, which will carry on the blooming period till Christmas and the new year. In the house next this is a fine batch of Primulas, well grown and flowered, capital plants, with trusses well up above the leaves. The division adjoining this one is deserving of special mention, as the subjects, though well-known and usually well done, are not often blended together in the manner in which we saw them here. On the side stages (for a path runs through the centre of the house) are a large number of well-grown *Poinsettias*, with large and showy bracts and flowers. These have kept their leaves fresh and green, so that the bare naked appearance these often present is not here noticeable. Arranged amongst these all through the house are many plants of the different forms of *Calanthe*, viz., *Veitchi*, *vestita rosea* and *lutea*; the spikes of those latter just elevated and slightly curving over the *Poinsettias* produce a happy combination, and one that is very striking on a first inspection. A row of *Poinsettias* at the back of both stages will shortly be opening their bright orange-scarlet flowers, then the effect will be even more attractive. Good *Cœlogynes*, *Dendrobis*, *Vandas*, &c., with *Phalaenopsis Luddemanniana*, a mass having eighteen plants growing together, with a nice lot of *Ondotoglossums*, are a sample of the Orchids to be seen. The specimen *Camellias*, too, in a very short time will be covered with their useful flowers. Mr. Bradley finds his *Calanthes* succeed best grown in baskets and hung up in the stoves; certainly nothing could be much finer than the bulbs and spikes now produced, the result of a very careful and liberal supply of heat, air, and water. *W. Swan, Fallisfield.*

Hardy Ferns at Kew.—In the *Gardeners' Chronicle* for July 17, 1875, p. 78, I find a paragraph relating to a number of greenhouse Ferns that were planted out for trial among the hardy Fern collection at Kew. We should be glad to learn from the Kew authorities whether these have continued to stand out up to the present date. They are as follows:—*Adiantum hispidulum*, *Cyrtomium falcatum* var. *castoides*, *Asplenium obtusatum*, *A. umbrosum*, *Laytonia decomposita*, *Doodia aspera*, *D. caudata*, *D. media*, *Lomaria procerca*, *Onychium japonicum*, *Polypodium Billardieri*, *P. plebeium*, *Pteris cretica*, *Wandwardia orientalis*, and *W. radicans*. Should these have done well in the open air we shall be induced to try several other cool-house species which we are inclined to think are quite as hardy as the above. *H. C.*

Pears.—I hope that the Pear Congress which has been held at Chiswick will be the means of drawing attention to the great number of worthless varieties of this useful fruit with which our gardens are encumbered. In the gardens of which I have charge there are scores of Pear trees, the fruit of which is absolutely worthless—small, hard, round ones, and some conical, that never will soften or ripen, no matter how long they are stored. A friend of mine, who had a con-

tribution of over three dozen samples of varieties grown in this district to the Congress, showed them to me before sending them off, and I can candidly affirm that there were about only eight sorts amongst them which I could honestly recommend to any one about to make a new orchard. Of all that I am acquainted with in this district the following sorts are those of which I approve, viz.:—Jargonelle, Williams' Bon Chrétien, Souvenir du Congrès, Autumn Bergamot, Baron de Mello, Beurré Clair-gau, Brown Beurré, Beurré Diel, Easter Beurré, Marie Louise, Glou Morceau, Napoleon, Louis, Bonne, Passe Colmar, and Bishop's Thumb. The rest I should not give place in a garden, and would urge our nurserymen to propagate none of them, and only grow such as will be found to be good by a concurrence of opinion. *A. Macdonald, Cheddle, Manchester.*

Grevillea robusta.—This well known New Holland evergreen greenhouse shrub is much more grown as an ornamental rather than a flowering plant, because of its elegant Fern-like foliage. And what a useful plant it is, for it is one of the best things to use in rooms, as it will stand gas, drought, dirt, sun, &c., as well, if not better than any other subject. It is not, therefore, to be wondered at that it is largely in demand for indoor purposes. At Messrs. Sutton & Son's nursery at Reading in the summer just past could be seen a number of handsome young plants that had been raised from seeds. The seeds were sown early in January, and raised in a temperature of 70° to 80°. They germinate very irregularly; those that grow at once are raised in about six weeks. The pans are kept indoors for six months, and then they are placed out-of-doors to take the chance of any further plants putting in appearance. *R. D.*

Tomato Roots Diseased.—Can you tell me what is the malady affecting the two pieces of roots of some Tomato plants which I send you? I have made other inquiries before troubling you, but should be thankful for the benefit of your practical opinion through the medium of the *Gardeners' Chronicle*. The specimen sent you is one of the worst, but there are some others as bad. The attack of the present season has not been the first I have had, but it has been much worse than in former years, and the attack was visible at a much younger stage of the growth (both in Tomatoes and Cucumbers) than formerly. *J. J. Rolfe*. [The answer is given in the "Notices to Correspondents" in this issue. *Ed.*]

Diseased Orchids.—The following letter was received by us from Mr. Hugh Low, Clapton, to whom it had been sent by a correspondent:—"Your traveller, Mr. Casey, called upon me lately and I showed him the leaves of my *Odontoglossum* made in 1884, also leaves on my *Dendrobium thysiflorum*, both diseased, and it came on them in April, and now again it is going worse. Casey told me if I sent you some leaves you would kindly send them to the *Gardeners' Chronicle*. The lot marked No. 2 are *Odontoglossum* in various stages of decay. Lot 3 a single leaf, on which at the under side near the tip (the extreme tip I cut off to examine), with the aid of a pocket lens, you can see groups of small lumps or dots raised on the surface. These I want him to particularly notice. No. 1, *Dendrobium* leaves all spotted or blotched with what I believe to be fungi. If you can help me to what it is that causes this disease on my plants and the best way to quit it I shall esteem it a great favour. *R. P. Percival*." [Mr. Worthington Smith's reply to the above will be found this week in "Answers to Correspondents." *Ed.*]

Magnolia grandiflora.—Here in Devonshire it is usual to meet with fine specimens of this lovely fragrant white-flowered evergreen, sometimes as a bush or tree, but more frequently growing against a wall. As an instance it would not be untrue to describe the lawn at Sea Grove, Dawlish (J. L. Lea, Esq., M.P.), as "a plantation of *Magnolia* trees." I have not yet had the pleasure of inspecting this remarkable collection when in full bloom, but judging from the description sent by the gardener, Mr. Coleman, the sight must be a fine one. Last September I was, however, fortunate in seeing in flower at Wimborne, Dorset, the best wall of *Magnolias* I have yet seen, and through the courtesy of Lord Wimborne's gardener, Mr. Williams, who took me over the highly ornamental park and gardens of Canford Manor. The wall in question is not far from, and

(so far as I can remember) in a line with the front of the mansion, and is 25 feet in height and about 150 feet in length. All this is entirely covered from end to end in a very effective manner, with eight magnificent *Magnolias*, planted equidistant, seven being the free-flowering variety (*Magnolia grandiflora exoniensis*). *W. Napier*.

Mecopopsis nepalensis.—I do not think *Mecopopsis nepalensis* is enough grown in gardens for its foliage; at this season beautiful objects in gardens get scarce, the *Mecopopsis*, which is grown in many places in our experimental garden, at Wisley, constantly pulls me up to admire it in passing. The soft grey-green blanket-like leaves, with rain or dewdrops on them, are really beautiful, and seem not to care for frost. The plant is very easy of cultivation, it likes good loamy soil, not too dry, and though only a biennial, sows itself about, and so keeps up the supply. *G. F. Wilson*.

Lycaste cruenta.—In the seed-vessel of this plant (fig. 165) we have a different form to most of those we have already figured. It is club-shaped, with its broadest diameter near the top, where may be seen remains of the thick fleshy column. The very stout prominent

FIG. 165.—LYCASTE CRUENTA.

ribs are also noteworthy. The varied forms of these organs are clearly due to disproportionate rate and intensity of growth in some parts as compared with others, but it is not easy to assign any reason for the disproportion except hereditary tendency, and we are more in the dark as to why the progenitors of our *Lycaste* produced seed-vessels of this form (as they probably did), than to account for the like phenomenon in their descendants. *M. T. M.*

Abies nobilis, var. robusta.—I am glad this particular case has been further investigated, and a conclusion arrived at. When I first saw this plant at the Cranston Company's, I took it to be *Abies magnifica*; it had the remnants of a cone left on it, so I sent it to Mr. Syme, who described and figured it. I cannot find my remarks relating to the cones of the following year, viz., 1878; but by your illustration the bracts seem to have become elongated, but they were at that time decidedly inflexed, the cones were not so long as they are in *A. nobilis*, and were more obtuse at the apex. It will be interesting to note if it still further changes its characters, viz., if the cones become longer, and more pointed, and if the bracts, which are now at right angles to the cone, become reflexed; if so, I think it will be the most conclusive evidence that it is simply a variety or sport of *A. nobilis*. *Wm. Partridge, Fenham Nurseries, Newcastle-on-Tyne*. [There is no doubt that the plant we figured at p. 657 is a form of *A. nobilis*,

The scales have now all turned down, as in ordinary *nobilis*. If it be really true that the cones with inflexed scales, sent by Mr. Syme, figured on the left-hand side of fig. 148, came from the same tree as that which produced the cones figured at p. 657, the interest is even greater, but we should like to be sure on this point. *Ed.*]

Honours to Horticulture.—I observe in the *Gardeners' Chronicle* of last week an account of the distinctions awarded to horticulturists in Belgium, supplemented with the remark "How strange it would seem in this country if Messrs. So-and-so and others, who contributed to the success of the late Inventions Exhibition were named members of the Order of Victoria." Why strange? Because there are no precedents for it? True. But wise men make precedents. These distinctions are admittedly given in recognition of services rendered to the State, and as a stimulus to further exertion. Who shall say that horticulturists have not a fair claim to recognition on these grounds? And if they had received it in the past they would have had a readier will and more power to inaugurate and push on the movement for an International Horticultural Exhibition now projected. Look at the importance of horticulture, which I regard as synonymous with cultivation in dealing with the raw material of food, clothing, and the many vegetable productions put to various economical uses, as well as the beautiful objects constantly brought forward to decorate our hearths and homes. Who will say that an art—or a science and art, for it is both—that has eight weekly journals as its chroniclers and exponents is of small interest or importance in the eyes of the community? The horticulturist is literally the man who makes two blades of grass grow where but one grew before his interposition. But I do not think this State recognition is due simply for services rendered at the late Inventions Exhibition, however great they may have been, but rather for a summing-up of services over a lengthened period in the past. But our quiet and plodding horticulturist has been so used to be treated by the great as a mere hewer of wood and drawer of water, probably because he is seldom a diplomatist, that the enterprise which is unquestionably in him has never been nurtured and developed. It would surely be a patriotic and popular movement if you, Mr. Editor, would place his claims to this recognition fully and fairly before the powers that be, to be dealt with according to their deserts. If found to be fairly recognisable, I venture to predict that it would give a great impetus to a most useful, ornamental, and order-promoting art. And it would be a gracious act on the part of Her Majesty's Commissioners of the Exhibition of 1884, who have succeeded to the garden at South Kensington which the Royal Horticultural Society made, but couldn't hold, if they were to lend a helping hand in the work. *F.R.H.S.* [We shall have something to say on this subject on another occasion. In the meantime we should be glad to hear of the opinions of others of our correspondents. *Ed.*]

Primula floribunda.—I think it is impossible to over-praise this beautiful and useful species, because of its simple elegance and its marvellous prolificacy of bloom. Seedling plants raised at the end of last summer and grown on into size are now flowering profusely, and have been blooming without intermission since June last. Having by the end of April filled some small 60-sized pots with roots, they were then shifted into 48's, well drained, leaf-mould, grit, and loam forming the compost, and some pieces of charcoal mingled with it. The plants were potted a little deeply, the soil being within an inch of the top of the rim, and on the surface some stones were laid, supporting the plant all round. This has operated to keep the surface of the soil cool and moist—a condition of things the plants appeared to like. All the summer the pots have occupied a shelf in the greenhouse, where but little sun falls upon them; and this position appears to be favourable to their wellbeing. They make an admirable fringe to other plants on a shelf, and the stems bearing their many whorls of blossoms gradually become pendent, and hang down over the sides of the pots. This species appears to grow much more freely in the cool autumn weather than during the hot days of summer: this is so in my case, but it may not always be so. I notice that all my plants—about a dozen—have flowers in which the pistil or pin is very prominent, but as I have reason to believe they all

came from one parent, this may be explained. But has any one noticed thrum-eyed flowers in this species? And is it capable of being improved—that is, in the size and form of the flowers? Also, is it reasonable to expect that other shades of colour might be forthcoming? Would P. obconica and P. floribunda cross with each other? They are both such persistent bloomers that could a cross be accomplished something interesting might result. I think P. obconica less hardy than P. floribunda; at any rate, I can manage the latter more successfully in a cold house. P. obconica appears to do better in a warmer and drier atmosphere, as it is to all appearance susceptible of damp, and appears to die when the soil about the roots is over-moist. It evidently requires to be well drained. But it is such a marvellous flowerer, blooming in a gentle heat nearly or quite all the year round, that it will always be a great favourite with those who can grow and flower it. Do seedlings from this show any variation in colour? R. D.

Floral Pyramids.—I can quite believe in the remarks of your correspondent "X," in reporting the beauties of the floral pyramids of Ivy-leaved Pelargoniums as grown at Coombe Warren by Mr. Profit. To my thinking, nothing adds to the grandeur of the flower garden, and more especially the formal terrace, where a certain amount of stonework or sculpture takes a prominent position. I am aware that some consider the stonework of the terrace bad taste and rather hard lines, and would only admit of the mansion being connected with the shrubbery or the forest with natural groups of beds or bushes, undulating lawns, bold curving walks, and natural-looking lakes, with beds of Dogwood and other shrubs blazing away in the distance. Such is the fancy of some modern landscape gardeners, and may be termed the cheap extreme. The flights of steps, balustrades, and expensive stonework is all artificial grandeur, which may be called the expensive extreme. But where such are found, nothing sets the artificial terrace off so much as pyramids of any sort, whether Orange trees in tubs or hardy shrubs planted out and cut pyramidal fashion. When tender things are taken indoors for protection, the hardy formal established shrubs take away the bareness of the terrace for the winter, and in addition to the ordinary flat beds of Pelargoniums, &c., nothing adds so much to the splendour of the scene as floral pyramids, even of the most common Pelargonium and Fuchsia. Fancy the old Riccarton Fuchsia, in the West of Scotland, attaining the height of an ordinary haystacks, which our inland situation will not admit; and to make the best of our floral display, the storing of our fancy and tender plants for nearly seven months in the year is our greatest difficulty, more especially as some of them require, to get them up a decent height, several years' attention, and to be pinched, as it was last September, when in full flower. It is a question whether they are worth all the trouble, at all events unless more comfortable quarters are provided for them after being lifted, any attempt to go into the pyramidal life will become a failure. Some years ago Mr. Hugh, of Fulham Palace, used to grow the old Kentish Scarlet Pelargonium, 12 feet high; Mr. Tillyard of Brocklesby, when at Bentley Priory, used to adorn the terrace with grand imposing pyramids, with such things as Pelargoniums, Heliotropes, and Calceolaria alexandricana. At the time of my visit, if my memory fail me not, some of them were upwards of 6 feet high. And now, when we have such vigorous and strong growing varieties of the Ivy-leaved Pelargonium, nothing could be more suitable for the purpose, particularly as they are so very floriferous, and they make large and handsome specimens in pots, while almost perpetual in flowering. Many of my friends will remember the fine effect the old pink Nougay Pelargonium had in the shape of pyramids 9 feet in height and 5 feet at the bottom, not only as single specimens, but by the dozen, upon the terrace at Workshop Manor and Clumber. John Miller, Ruxley Lodge, Esher.

Commons and Roadside Slips of Land.—It may appear the height of audacity to question the words of such an eminent man as Lord Bramwell, but judges are not infallible—their judgments are frequently set aside. I think that his Lordship's opinion as to roadside slips of land in his letter in the *Times* of November 12 last is calculated to give a wrong impression. In what instance, I would ask his Lord-

ship, do roadside slips of land not practically belong to the public, though in theory the soil of the highway may belong to the adjacent landowner? We have just issued a paper on the "Law relating to Footpaths and Encroachments." The following paragraph appears in it:—

"2. AS TO ENCROACHMENTS ON HIGHWAYS.

"It is now clearly established by decided cases that no one has any right to enclose any part of the original highway between the fences even although he may still leave the road 30 feet wide. Any land which has once formed part of a highway must remain open for ever for public use, and no lapse of time can give a good title to an encroachment. This is a most important fact, which has been lost sight of by many public bodies in England. The misapprehension of the law on this point no doubt arose from a misconstruction of the 6th section of the Highway Act, 1835, which merely provided a summary remedy in the case of encroachments within 15 feet of the centre of the highway, without in any way altering the existing law so far as other encroachments were concerned. (See cases of Regina v. Edwards, 11 J. P. 602; Regina v. U. K. Telegraph Co. L. J. 31, M.C. 196; and Turner v. Ringwood, L.R. 9 Eq. 418)."

This has passed through the hands of several lawyers, and has also been settled by Mr. William Cunningham Glen—I think one of the first authorities on the law relating to highways. *Henry Allout, Secretary to the National Footpath Preservation Society, 42, Essex Street, Strand, London, Nov. 30.*

Reports of Societies.

THE EDINBURGH APPLE AND PEAR CONGRESS.

(Continued from p. 625)

This great show, on which we have already reported, was brought to a close on Saturday, the 8th ult. As a show it has already been said to be a great success. The Managing Committee deserve unstinted praise for the thoroughly energetic manner in which they carried through the task of arranging and giving effect to every detail. They, unfortunately, have not the satisfaction of having accomplished a financial along with the practical accomplishment of their purpose in getting up the Congress. The election fever and the weather were both adverse to the general public being disposed to give their attention to Apples and Pears, and the consequence will be a heavy loss to the Royal Caledonian Horticultural Society, which, however, it is fortunately able to bear without being hampered thereby.

The jurors did not finish their work till near midnight on Saturday, so much naming and comparing having to be done, and the difficulties of recognition in some cases among the Scotch productions being so great as to require extreme care on the part of the jurors to avoid error in their endeavours to eliminate it wherever they existed. Their votes and deliberations are now in the hands of the committee, and will doubtless appear in compact form in due time as a practical reference of high value to all interested in pomology.

The jurors were—Messrs. Barron, Chiswick; Bunyard; Reintgen; Burnett; The Nelsons; Woodbridge; Sion House; Webster; Garden Castle; Thomson; Drumlanrig; Thomson; Viewfield; Dalkeith; Crosby; Buchanan House; Smith; Menmore; Fowler; Castle Kennedy; Coleman, Eastnor; Castle; Dr. Robertson; Errol; J. Lint, Ardgowan.

ENGLAND.

As was to be anticipated, the various collections brought up from England were conspicuous for their preference of colour, superior size, and every mark of high quality. The country was well represented from the West and the Midlands were conspicuous by their absence. Taking the collections as they were placed in alphabetical order by the counties—

Buckingham sent a grand collection of over 200 varieties, including Smith, the Garden Remembrance. Conspicuous among the Apples were splendid samples of Galway Pippin, Lindula Pippin, a very pretty seedling of medium size and reputed good quality, raised in a cottage garden at Leighton Buzzard; Scarlet Nonsuch, Dumelow's Seedling, Best of Fosse, Fearns Pippin, and Reintgen's Count. The Nelsons' Glory and many others; and among Pears were some very fine samples of Glou Morceau, Josephine de Malines, Crassane, Prince Albert, Beurré Diel, and Bergamotte d'Espéran. Mr. Miles, The Gardens, Wycombe Abbey, also sent a collection of fifty varieties of Apples, notable for their good size and very fine colour.

Cumberland and Westmorland.—These two counties were represented by a remarkable collection, brought together from various districts within the limits of the counties, by Messrs. Little & Ballantyne, nurserymen, Carlisle. It was the largest in point of number of an single exhibit on the tables, comprising as it did about 600 dishes of Apples and Pears, many of which were quite equal in size to the average of English fruit of the same sorts, although deficient in colour to the collections

from more southern counties. Altogether it was generally considered one of the most instructive exhibitions ever containing as it did, the largest number of varieties of any. More conspicuous among the Apples were fine samples of Cat's-head, Hollandbury, Cellini, Lord Suffolk, Emperor Alexander, Scotch Codlin, Warner's King, and Ecklinville; and among the Pears fine examples of Haecon's Incomparable, Beurré Diel, and Marie Louise.

Derbyshire sent but one collection, contributed by Mr. Hutton, Whittington Hill, Chesterfield. It comprised twenty varieties of Apples and the same number of Pears—all very good, and, considering the district, about an average quality.

Devon was represented by one exhibitor only—Mr. Hunter, Lambton Castle Farm Houses, whose collection, being chiefly from orchard-house trees, were of very superior quality, and very clean.

Hampshire exhibited two collections—Mr. Wildsmith, of Heckfield, sending fifty varieties of Apples and Pears of more than average quality; and Mr. Bell, The Gardens, Strathfieldsaye, twenty-five varieties of Apples, also good.

Herefordshire was represented by one exhibitor only, but the exhibition in point of numbers and quality was regarded as quite a representative one. It was from Mr. Watkins, of the Herods, Hereford, and comprised over 200 varieties of Apples of very superior culinary and dessert kinds, and an interesting collection of cider Apples—the only exhibit of this kind set out. The rich colours of the cider Apples gave this collection a most attractive appearance, which was very highly appreciated by the general public.

Kent.—This county was worthily represented by Messrs. Bunyard & Co., Maidstone, who tabled 300 varieties of Apples and Pears of surpassing excellence. The whole collection was remarkable, not one unsatisfactory sample appearing in the whole. The colour was superb, and the size, cleanness, and perfection of form all that could be desired. Conspicuous among the Apples were Blenheim Orange, only surpassed by one other sample in the show, that from Nova Scotia, which, though larger than that from Kent, had the colour and finish of the latter. Warner's King, Golden Noble, Gascoyne's Scarlet, very attractive in colour; Cox's Orange, Reineette du Canada, Peasgood's Nonsuch, Annie Elizabeth, Lord Derby, Gloria Mundi, King of the Pippins, Wellington, and New Hawthornden. Of Pears, the following were worthy of notice—King Edward, Constance de La Cour, Beurré Rance, Triomphe de Jodoigne, Daycne du Comice, Calabrese Grosse, Beurré Diel, Emile d'Heyst, Beurré Bachelier. There were also two collections put up by private growers from Kent, viz., forty varieties of Apples from Mr. Young, Sittingbourne, all remarkably fine, with specially notable samples of Warner's King, King of the Pippins, Worcester Pearmain, and Blenheim Orange. The other private collection comprising forty sorts was from Mr. McLean, Vinters Park, and contained remarkable samples of Ludington Pearmain, Warner's King, and Blenheim Orange.

Lincolnshire.—From Mr. Ingram, The Gardens, Belvoir Castle, came a very excellent and correctly named collection, comprising fifty varieties of Apples and thirty varieties of Pears. The fruit were not so remarkable for size as for superior colouring and cleanness of form.

Middlesex.—From this county came two of the most remarkable collections in the whole exhibition, viz., that of the Royal Horticultural Society of London, and that of Messrs. James & Co., Sons, Chelsea. The former comprised upwards of 250 varieties of Apples and Pears of the highest excellence, all correctly named, thus forming a valuable means of reference in cases of doubt, which arose in other collections. The more noteworthy varieties of Apples were Braddick's Nonsuch, Sweeney King, Court Paradise, Cox's Orange Pippin, Cellini, Blenheim Orange, Bumba's Red Winter Reineette, Emperor Alexander, Lane's Prolific, Mrs. Barron, Lane's Prince Albert, and Swedish Reineette. Among the more remarkable Pears were Marchal Vallant, Passe Crassane, Doyenne du Commerce, Marchal de la Cour, and Reintgen's Count. Along with this grand collection was also exhibited an interesting collection of fifty varieties of perry Pears, which were the only samples of the kind exhibited.

Messrs. Veitch's collection was superb, every sample perfect, the nomenclature was correct, and the selection was comprehensive of all the best of each class. Among the Apples perhaps the most remarkable was Bismark, an orchard-house sample of extraordinary size and hand-some appearance. There were also splendid samples of Royal Albert Pippin, King of the Pippins, Winter Hawthornden, Lady Henrick, Wyken Pippin, Winter Hawthornden, Barker's Seedling, Gloria Mundi, Reineette du Canada, Dumelow's Seedling. Among the Pears were grand samples of Duchesse d'Angoulême, Beurré Diel, Beurré Bachelier, Camushe, Prince Consort, Reintgen's Count, Easter Bell, Beurré Clairgeat, Haecon's Incomparable, Beurré Batur, and Clear of Wickfield.

Norfolk.—From this county only one representative appeared, Mr. Stephen Castle, West Lynn, with a collection of thirty varieties of Apples and fifteen varieties of Pears of only ordinary merit.

Northumberland.—Mr. English, Howick Hall Gardens, sent a remarkably clean, well-grown collection of 110 varieties of Apples and twenty varieties of Pears, among the most noteworthy Apple varieties being Golden Wonder, Grand Leader, Lord Derby, Northern Dumping, and Lord Suffolk; and among the Pears, Gansel's Bergamotte, Louise Bonne of Jersey, Beurré Bosc, and Beurré Diel.

Mr. Adam, of Haggerston Castle, sent fifty-six varieties of Apples and twelve of Pears of average merit.

Mr. Harris, Alnwick Castle, put up a nicely grown collection, comprising 108 varieties of Apples and twenty-eight varieties of Pears. Among the more notable Apples were Cellini, Cox's Orange Pippin, Warner's King, Kentish Filbasket, and Ecklinville; and among the Pears, Beurré Die, Marie Louise, Hacon's Incomparable, Souvenir du Congrès, and Duchesse d'Angoulême.

Shropshire was represented by two fairly good collections—one from Mr. Sherwood, Chetwynd Park, Newport, and the other from Mr. Leslie, Aquilata Hall, Newport, the former comprising sixty-five varieties of Apples, and the latter forty-nine varieties of Apples and sixteen varieties of Pears.

Staffordshire.—Mr. Banerman, gr. to Lord Bagot, Blithfield, put up a very nice collection of Apples and Pears, which were above average merit. The more notable among the Apples were Alford, Paigod, Nonsuch, and Lord Suffield; and among the Pears Glon Morgeau and Duchesse d'Angoulême were very superior. **Surrey**.—Mr. Burnett, The Gardens, Deepdene, sent up fifty varieties of Apples of superior merit, and thirty-eight varieties of Pears, also good.

Very good ones were also sent up by Mr. Ritchie, Earliest Gardens, who set up a very excellent collection comprising 100 varieties of Apples and fifty varieties of Pears. They were a very highly coloured and generally well grown lot, the samples of King of the Pippins Apple and Pitmaston Duchess Pear being the finest in show.

Yorkshire sent two private collections, one from Mr. Tindall, Sprotborough Hall Gardens, Doncaster, comprising sixty varieties of Apples and thirty varieties of Pears—a very fine collection, in which were some excellent samples of Empress of France and Ten Shillings Apples; and Beurré Bachelier, Bergamotte d'Espéren, Beurré Die, and Winter Nels Pears—the last-named very fine. The other collection from this county was from Mr. McIndoe, Hutton Hall, Guisborough, comprising twenty-four varieties, among which were some excellent samples of Doyenne du Commerce Pear, Beurré Die Pear, and Blenheim Orange, Warner's King, Stirling Castle, and Ecklinville Apples.

WALES.

Only one collection was sent up from Wales, but it was a very worthy one. It was put up by Mr. Lowden, The Quinta, Chirk, and a very superior collection it was, rivaling in size and merit the great collections from more favoured quarters. It comprised a hundred varieties, amongst which were most notable Warner's King, Mère de Ménage, Gloria Mundi, Emperor Alexander, Lord Suffield, Peasgood's Nonsuch, and Adam's Pearmain Apples.

The Chrysanthemum Show.

This show was held in the Waverley Market, Edinburgh, on November 25 and 26, in conjunction with the Apple and Pear Congress. The exhibits of cut flowers were a great advance on anything of the kind previously seen in Edinburgh, but the plants were behind what may be done with this indispensable winter flower. There were very good plants of many kinds, and keen competition in Apples and Pears, and some grand vegetables. From our Own Correspondent.

LIVERPOOL HORTICULTURAL CHRY-SANTHEMUM ASSOCIATION.

November 24 and 25.

The annual autumn exhibition was held in St. George's Hall, which was completely filled with flowering and non-flowering plants, cut blooms, and fruit, most of the exhibits being of a high order. In many instances the entries were far in excess of the number of prizes offered, so that when the collections came to be staged there were brought together one of the most complete exhibitions that has ever been held in Lancashire. The trained plants, both large varieties and pompons, were splendid, the cut blooms, for which this district is famous, were of the finest, whilst the fruits were meritorious.

The class that was most admired was doubtless that for thirty-six cut blooms, eighteen incurred and the rest of the number of prizes, and from Mr. W. H. Gossage, Silver Vase, given by J. Williams & Co., Liverpool, was awarded to F. H. Gossage, Esq., Woolton (gr., J. Jellicoe), whose blooms were of very fine size and colour, and were inclusive of the best of the old and newest kinds. W. D. Holt, Esq., West Derby (Mr. F. Roberts, gr.), also showed well, and was awarded 2d. Many of the sorts seen in the first collection were represented in this one. R. N. Dale, Esq. (Mr. T. Leadbetter, gr.), was 3d.

In the class for twenty-four incurred varieties two competitors entered the lists, the first being to Mr. F. H. Gossage. Mr. R. N. Dale was awarded the 2d prize with a very good lot also.

The class for eighteen incurred was well contested, Messrs. W. G. Bateson, Allerton (Mr. J. Martin, gr.), securing the 1st prize; W. H. Watts, Esq. (Mr. A. R. Cox, gr., 2d); and W. H. Jones Esq. (Mr. E. Broadley, gr.), 3d.

Two classes for twelve blooms were provided, the exhibitors in one being unable to compete in the other, and as a consequence many good stands were put up. J. E. Reynolds, Esq., Wotton (Mr. J. Wilson, gr.), R. N. Dale, Esq., and W. H. Watts, Esq., securing honours in one class, and W. S. Taylor, Esq. (Mr. C. Osborne, gr.), W. D. Holt, Esq., and W. Brockbank, Esq. (Mr. C. Gittins, gr.), winning in the order in which their names appear in the other.

For six incurred blooms W. W. Sandbrook, Esq. (Mr. H. Riding, gr.), was 1st, and Mr. F. Tobin 2d.

The class for twenty-four Japanese was a splendid one, the blooms of special brightness and colour. W. H. Cox, Esq., was placed 1st; Mrs. W. G. Bateson came in 2d, and W. D. Holt, Esq., 3d.

J. E. Reynolds, Esq., secured the 1st position with eighteen Japanese; F. H. Gossage, Esq., 2d; and H. Cunningham, Esq., 3d. W. G. Bateson, gr., 4th.

Twelve Japanese were shown by W. S. Taylor, Esq., W. H. Jones, Esq., and E. Menocck, Esq., and stood in the prize list in the order in which their names appear.

Cunningham, Esq., was successful with six Anemones, and also with 1st relieved; while for twelve pompons, cut blooms, W. B. Bowring, Esq. (Mr. J. Hurst, gr.), was 1st.

R. L. Greenfields, Esq. (Mr. S. Bell, gr.), was successful with six incurred and six Japanese; R. Cam, Esq., 2d; and H. J. Kollan, 3d. This class was specially for those who had not won a prize for cut blooms at the Society's exhibitions.

For six large flowered plants, H. McIver, Esq., Allerton (Mr. J. Hughes, gr.), was awarded 1st, having double-trained plants, with from thirty to forty flowers a piece, of Jardin de Plante, Garden of India, Mrs. G. Glenn, Mrs. Shipman, John Saiter, and Lady Hardinge, Mr. C. Finnigan, Winter Garden, New Brighton, was 2d, with good plants of Empress of India, Mrs. G. Ruddle, Prince Alfred, Guernsey Nugget; Mr. J. Lewis, Allerton, 3d, and Astray, 4th.

With three plants, Mr. W. C. Clarke, Mr. G. Pilkington, and Mr. C. Finnigan were the successful competitors.

The pompons all through were good. Mr. C. Finnigan was 1st for six plants; Mr. H. McIver showed fine specimens also, but only obtained 2d; J. Lewis, Esq., 3d.

With three pompons Mr. C. Finnigan was again the front; Major Pemberton (Mr. T. Blackmore, gr.) 2d, and Mr. H. McIver 3d.

J. W. Mossley Hill (Mr. E. Green, gr.) was 1st with one standard, also with one pyramid Chrysanthemum.

STOVE AND GREENHOUSE PLANTS.

The various groups of stove and greenhouse plants, Ferns, Palms, &c., were arranged along the outer side of the hall, and contained many plants of good culture. Mr. W. H. Watts was 1st in the former class, showing large plants of Croton Queen Victoria, Dicksonia, antarctica, Erica hymenalis, a plant 4 feet by 4, full of bloom; Latania borbonica, a well-bloomed Epacris, and an Ikora; Mr. F. Gossage was 2d, and had a large lot of plants, a Croton Hawk, a fine piece of Rhododendron Princess Royal full of flower, and a good specimen of Calanthe Veitchii, with a dozen spikes, as his best plants; Mr. R. C. Coltart 3d.

With four stove and greenhouse plants, Mr. H. Watts came 1st, having Isora Diakina, Cyrtopodium insigne, Croton Dielsii (in splendid condition), and Calceolarias; A. A. Johnson (Mr. R. Cubbon, gr.) was 2d, and Mr. Hall 3d.

Mrs. A. Johnson was 1st with four Ferns, having good plants of Microlepia hirta cristata, 5 feet through; Dicksonia antarctica, Davallia Gahana, and a Kenia Cactaeo-peziforme; Mr. J. Cunningham was 2d.

For specimen Free Fern, Mrs. A. A. Johnson and J. S. Parker, Esq. (Mr. J. Lowndes, gr.), were respectively 1st and 2d.

Three Palms were staged by Mrs. A. A. Johnson, who was 1st with large plants of Cycas revoluta, Areca lutescens, and Seafarbia elegans; Mr. R. C. Coltart and Mr. B. C. Finnigan were placed 2d and 3d.

ORCHIDS.

Some very nice Orchids were shown; the best three coming from E. Harvey, Esq. (Mr. T. Worth, gr.), including Cyrtopodium Spicerianum with twenty-four good blooms; Odontoglossum Rossi majus in a basket, and O. grande. W. Holland, Esq. (Mr. W. Moss, gr.), was 2d, with a fine form of Odontoglossum Andersonianum, Cymbidium Mastersii, and Zingulionia venusta. Mr. J. Woolwright, who was 3d, had a splendid form of Oncidium Fendleri, O. Kosterianum, Odontoglossum Alexanderi.

With one Orchid, E. Harvey, Esq., was again 1st, having fine plant of Lælia elegans picta; Mr. W. Holland 2d, with Cyrtopodium Sedeni, having eight good spikes; and Mr. W. H. Watts 3d, with Oncidium Rogersii. Mr. W. Holland was 1st with one Cyrtopodium, showing insignis with thirty flowers. The same exhibitor was 1st with two Calanthes, having C. Veitchii with twenty spikes, and C. vestita lutea with the same number; also with one Calanthe, showing C. Veitchii, very well done.

MISCELLANEOUS.

Bonquets were not very numerous; 1st prize in both classes being taken by Hall, Esq. (Mr. A. Crossbie), equal 2d falling to Mr. W. Bateson and Miss A. Corke. With a vase for table decoration, Mr. J. Lewis and Mr. T. S. Rogerson were successful.

The Roman Hyacinths and Primulas were very good, and made a capital display. In the former class Mr. R. Singlehurst was placed 1st over eight competitors; Mr. T. S. Rogerson 2d, and Mr. H. Liversidge 3d.

Mr. J. Branker's Primulas were full of foliage and flowers, and were placed 1st; Mrs. Watts (Mr. T. Agnew, gr.) 2d; and Mr. J. Woolwright 3d. In the latter class twelve plants were shown, but several exhibitors put up plants more too heavy for ornamental use. The 1st prize was awarded to a light half-dozen shown by Mrs. Watts, T. F. Harrison, Esq. (Mr. T. Fleetwood, gr.) being 2d.

Mr. J. Cunningham had six beautiful plants of zonal Pelargonium, being single and three double; he was awarded 1st prize.

Standard Mignonette, Poinsettias and Epiphyllums were shown in capital condition.

From Messrs. R. P. Kerr & Sons came about 100 Cyclamens in different shades, the pure whites for size, substance, and general excellence being among the best ever seen in the district. This collection was honoured with a First-class Certificate. The same distinction fell to the Liverpool Horticultural Company for a very beautiful group of small plants, including Callas, Crotons, Dracaenas, Heaths, Palms, Primulas, and a capital lot of Dute Van Thul Pippin in flower, the whole nicely edged with Primulas and Ferns.

FRUIT.

Messrs. F. & A. Dickson & Sons showed a collection of Apples and Pears of good colour and size; Messrs. R. Smith & Co. of Worcester staged sixty dishes; Messrs. J. Dickson & Sons, of Chester, and Mr. C. Ryland, Ashton, also showed fine collections of these fruits. Each was awarded a Certificate of Merit. The fruit staged for competition was entirely of good quality. Such Grapes are rarely seen except at a first-class exhibition, and this show should now be considered one of the finest of the season.

With twelve bunches of fruit the Earl of Harrington (Mr. J. H. Goddard, gr.) came in 1st, having fine bunches of Black Alicante, Gros Colmar, Muscats, and Mrs. Pearson; Queen Pine, Hero of Lockinge Melon, Pears and Apples; the Hon. C. H. Wynn (Mr. J. Bennett, gr.), was 2d, with a grand lot of Gros Colmar, Hannagan, gr., 3d. The Earl of Harrington was also 1st with six dishes, having capital Gros Colmar, Muscat, and Beurré Die Pear; Mr. R. C. Naylor 2d, and Mr. W. B. Bowring, 3d. The Hon. C. H. Wynn was successful with two, and also with one Pine-apple.

In the classes of two bunches of black Grapes there was strong competition all through, and some truly wonderful bunches were placed before the judges. In one class fifteen stands were put up, and in all others there were but slight difference in the various exhibits.

With black Grapes, Macclesfield, J. F. Campbell, Esq., Uttoxeter (Mr. J. Hollingsworth, gr.) secured the coveted position with Mrs. Pine's Black Muscat; Alderman Raynes (Mr. J. Barker, gr.) 2d, the Earl of Harrington 3d, W. H. Watts, Esq., 4th.

Two bunches black Grapes fell to L. Smith, Esq. (Mr. A. Coltart, gr.), and a grand lot of Gros Colmar; Mr. J. F. Campbell 2d, with equally fine Barbarossa; the Earl of Harrington 3d, with Gros Colmar, grand in colour and berry; an extra prize was awarded to Mr. W. Watson, also Mr. W. H. Watts, so good were their respective bunches.

The Earl of Harrington, Alderman Raynes, and Mr. F. H. Harrison were successful with Black Hamburg, taking prizes in the order in which their names appear.

The white Grapes were also remarkably fine. Two bunches of Muscat was secured by R. Pilkington, Esq.; the 2d going to G. Jones, Esq.; and the 3d to A. R. Gladstone, Esq. (Mr. T. Elsworth, gr.).

Two bunches of any other white variety was taken by Mr. J. F. Campbell, the Rev. W. Sneyd (Mr. J. Wallis, gr.) 2d, and the Earl of Harrington, 3d.

Mr. J. F. Campbell was 1st, with four bunches, showing Black Alicante, Golden Queen, and Mrs. Pine's Black Muscat; Mr. A. R. Gladstone showed Alicante, Muscats, Golden Queen, and Alwick Seeded, and came 2d; the Earl of Harrington securing 3d.

There were eight competitors in this class. Pears and Apples were grandly and well contested, splendid Pitmaston Duchess and Beurré Die appearing in many collections, the Rev. L. Garnet securing 1st honours with eight dishes of Pears.

Numerous stands of useful and ornamental articles were shown, including a nice lot of Orchid rafts, baskets, poles, &c., from Mr. W. Bateson, of Liverpool. In spite of a steady downpour of rain on the first day and the stir and excitement of an election on the second, the exhibition was well supported, and at times the flowers could only be seen after a considerable amount of exertion and patience. S.

SWANSEA CHRYSANTHEMUM SHOW.

This show opened at the Prince of Wales' Hall on Wednesday, the 25th ult., and was continued over the following days, but, owing to the most unpropitious, as the rain fell continuously all the first day, and being also in the midst of the local election fever interfered materially with the attendance of the general public. The committee, however, may be congratulated on having provided good treat for those who attended their first chrysanthemum show in Swansea.

The hall affords an excellent opportunity for effective arrangement, and this had been well taken advantage of by the committee. No less than seven prizes were offered in the class for a group of plants in which the exhibitors were to show the best of the cuttings, and they availed themselves of the opportunity of introducing many other plants, that greatly enhanced the effect of the display of Chrysanthemums, while using, at the same time, a large proportion of the latter. These in many of the groups were shown in good form, and with many fine blooms upon them, rivaling individual blooms grown expressly for exhibition.

The competition for twelve trained plants, and for the like number of standards, did not bring forward much competition; the 1st prize lots in each class were good examples of ordinary cultivation, but had not been sufficiently prepared for exhibition purposes; the varieties were good and well flowered, but lacking in training. Classes were also provided for six plants, and for a single specimen, with corresponding classes for amateurs and cottagers.

The smaller hall was devoted to the cut blooms,

bouquets, &c., and to the collections of fruit and vegetables.

The cut blooms the competition was extremely close, and many fine stands were exhibited; the effect would have been even better if a uniform height and width of box had been stated in the rules. Most of the blooms were exhibited as grown, very few flowers having been at all dressed.

Some very good fruit and vegetables were shown, especially in the collections from Singleton, which obtained 1st in both classes.

In the open class for twelve specimen Chrysanthemums, Mr. Reynolds, Sketty, carried off the 1st prize; and a like position was taken for two standards by Mrs. Vivian, Singleton (gr., Mr. Harris).

For six plants and for a specimen ditto, the premier positions were obtained by Mr. Reynolds and Mr. Speck, Llanelly.

Classes for amateurs and cottagers were well filled, and the specimens exhibited were highly creditable.

In the open class for cut blooms, F. W. Aylwin, Esq., was 1st for twenty-four fine flowers, undressed, of the leading varieties of incurved and Japanese types; and Sir H. H. Vivian, Bart., of Park West, Swansea, was 2d, with an admirably good lot.

D. Llewellyn, Esq., Neath, obtained 1st place in the twelve with a nice even stand of fresh-looking flowers; 2d place going to Sir H. H. Vivian.

For a bouquet of Chrysanthemums and for a hand bouquet, the 1st prizes fell to Mrs. Vivian, Singleton. The hall was full of bloom in the other sections of the exhibition were well contented.

For a collection of fruit Mrs. Vivian, Singleton (gr., Mr. Harris), was placed 1st, with good Salway Peaches, black and white Grapes, well finished Black Jamies, and other Fines, fine fish dishes of Pears, Apples, Melons, &c.; T. T. Lewis, Esq., Bridgend (gr., Mr. W. Richardson), 2d.

For a collection of hardy fruits, Sir H. H. Vivian secured 1st honours; and for that of vegetables, Mrs. Vivian, Singleton, was like Williams, &c. The hall was full of interesting collection of entomological subjects, lent by J. T. D. Llewellyn, Esq., Penleare, who also lent some nice groups of well-bloomed greenhouse plants, among which we noted particularly good plants of *Fuchsia coccinea*. A large number of the larger hall was devoted to groups of plants as above noted, and the arrangement and general effect were particularly good.

The 1st prize went to the group from Singleton, in which Chrysanthemums fully predominated, crowned by a lofty Tree Fern, and a well finished Adiantum fern, together with *Polka-dot*, &c., and bordered with *Calanthes*, *Cypripedium*, &c.; T. Cary, Esq., Sketty (gr., Mr. J. Lodge), 2d, with a more general arrangement of Palms, Cycads, Ferns, Crotons, *Dracenas*, *Marantas*, &c.; 3d, Richard Hughes, Esq., Nvinstaw (gr., Mr. Williams). In a group nicely relieved by large Seville Oranges well laden with fruit. Seven prizes were offered in this class, and they were all competed for and obtained by fairly good groups, which were very effective for the embellishment of the hall, but which contained no subjects requiring special notice. In only remains to congratulate Captain Colquhoun, the Chairman of committee, and the Hon. Secs. Messrs. Manaton and Williams, on their indefatigable perseverance in securing so good an exhibition. *A Correspondent.*

YORK ANCIENT SOCIETY OF FLORISTS: CHRYSANTHEMUM EXHIBITION.

November 25, 26, and 27.

WELL done, York Florists! It is the verdict that must be passed upon this exhibition. In the spacious exhibition building of Fine Arts which is near to the Minster, and affording ample space for the purpose, was this exhibition arranged by Mr. J. Lezenty, the secretary, and his assistants; and regard being had to the lateness of the season, in one of the most backward districts of England, it was an admirable show, thoroughly representative and characterised by high quality. The specimen plants, of which there were a large number, were arranged on the ground on the gallery, where there is abundance of light on a clear day, but a lack of it when it is a dull one. A line of tables running down the centre of the building accommodated the cut flowers, table plants, &c.; another line of tables running parallel with the platform was laden with fruit, and in the galleries on both sides were to be found the vegetables, collections of Pears, Apples, &c. The spacious lobby leading to the main building accommodated the groups of plants arranged for effect, and the specimen Palms, Ferns, &c.; while the groups of Chrysanthemums arranged for effect were placed in circles in the main building, between the line of tables and the specimen plants. Chrysanthemums always show up well by gas-light, and at night, there being a superabundance of colour, the effect was considerably heightened.

CHRYSANTHEMUM PLANTS.

The best group of Chrysanthemums arranged for effect, competing for the Silver Cup given by the Lord Mayor of York, came from Dr. Baker, Friends' Retreat, York; Mr. Alderman Close, Dringhouses, was 2d; and Mrs. Gutch, Holgate House, York, was 3d. As these prizes were arranged for effect, in the corridor, difficulty was experienced in making them face well all round, and it would be better in the future, and more satisfactory to the exhibitors, if these groups were backed against a wall, as in the case of the miscellaneous groups of plants, also arranged for effect, in the corridor.

There were six collections of nine specimen Chrysanthemums, incurved and reflexed, Dr. Baker was 1st with well-

flowered plants of Christine, George Glenny, Mrs. R. Rundle, Mrs. Dixon, Prince Alford, Baron Beust, Guernesey Nugget, Miss M. Morgan, and King of Crimons—an even, well-balanced lot; 2d, Mr. Alderman Close; 3d, Dr. Baker.

With six plants Dr. Baker was 1st with excellent specimens of John Salter, Mrs. Dixon, Mrs. Sharpe, Christine, Guernesey Nugget, and Mrs. Forsyth; 2d, Mrs. Gutch; 3d, Mr. J. T. Hingston, Clifton.

Dr. Baker had the best plants of King of Crimons, Guernesey Nugget, and Julia Lagravere; Mr. C. B. Lamb was 2d; 3d, Miss Stewart. Dr. Baker had the best specimen, staging an excellent John Salter; Mrs. Gutch being 2d with George Glenny. Dr. Baker had the best nine plants of Japanese Chrysanthemums, staging well-merged and blended examples of Diamond, James Salter, Delicata, Peter the Great, Flambeau, Elaine, Etoile du Midi, Fo Kio, and Hiver Fleur. The 2d prize was withheld. Dr. Baker had the best six, having capital specimens of Elaine, James Salter, Peter the Great, Hiver Fleur, Dr. Wray, and Dr. Masters; 2d, Mr. J. T. Hingston; 3d, Miss Stewart. Dr. Baker also had the best three, staging James Salter, Elaine, and Dr. Masters; Mr. Alderman Close was 2d, and Miss Stewart 3d. Dr. Baker had the best specimen, and Mrs. Gutch was 2d.

Dr. Baker won the 1st prizes for the best nine, six, and three single specimen pompons; indeed, his gardener, Mr. T. Dave, was invincible on this occasion. His nine plants consisted of Mr. Astie, Mdle. Marthe, White Cedo Nulli, Model of Perfection, Golden Circle, and Bijou d'Horticulture; his six plants consisted of King of Crimons, Golden ditto, White ditto, Lizzie Holmes, and Bijou d'Horticulture. His three, Golden Cedo Nulli, Lila ditto, and Mdle. Marthe. His single specimen, White Cedo Nulli. Mr. Hingston was 2d with nine plants, Miss Stewart with six, and also with three; and Mrs. Gutch 2d with the single specimen.

Dr. Baker was the only exhibitor of three plants of large Anemone-flowered Chrysanthemums, and he had the best specimen also, staging a good plant of Gluck; and also the best specimen pompon Anemone, staging Mr. Astie.

MISCELLANEOUS PLANTS.

Some charming groups, arranged for effect, were staged, and they consisted of coloured foliaged plants mainly, with a few flowering subjects dotted among them. The best came from Messrs. A. Simpson & Son, Haworth Nurseries, York, a collection grouped with great taste and skill; Mr. J. F. Hingston was 2d; and Mr. R. W. Taylor, 3d.

Mr. T. Hutchinson, Egglestone, had the best six plants of Chinese Primroses; Mr. E. Bell being 2d, and Mrs. Gutch, 3d. Mr. Bell was the only exhibitor of double varieties, getting 1st with six small, but good plants. *Cycas* and *Persicum* were poorly shown.

Plants for diorama-decoration were both numerous and good; Mr. R. Wyse, Auburn Hall, Malton, was 1st, Messrs. Simpson & Son being 2d, and Mr. T. S. Brogden 3d.

Mr. T. Brogden had the best six exotic Ferns, and Miss Stewart 2d; these formed effective groups in the entrance corridor.

Messrs. Simpson & Son had the best specimen Palm, and Mr. Hingston the best specimen *Dracena*, D. Veitchi being the type mostly shown.

Some fairly good plants of Chrysanthemums were shown by the amateur division; Mr. R. Hudson, Acomb, having the best three and the best single specimen.

CUT FLOWERS.

Owing, probably, to the dull weather, some exhibitors who had entered failed to show, but there was a good display of blooms. The best thirty-six, composed of eighteen incurved and reflexed and eighteen Japanese, came from Mr. R. F. Jameson, who had good examples of the best of either section; 2d, Mr. D. Wilson, Cottingham, who had also good blooms; 3d, Mrs. M. Firth, Oakbrook, Shelfield.

The best twelve incurved and reflexed, came from Mr. Alderman Richardson; 2d, Mr. R. F. Jameson; 3d, Mr. M. Firth.

The best six came from Mr. Alderman Richardson, Miss Moore being 2d.

Japanese Chrysanthemums were highly effective; Mr. Alderman Richardson was 1st with twelve blooms; 2d, Mr. D. Wilson.

Mr. R. F. Jameson had the best six, staging admirable examples; 2d, Mr. Alderman Richardson.

Pompon Chrysanthemums in a cut state were scarcely shown, and these in indifferent form. Mr. D. Wilson had the best twelve large flowering Anemone type; 2d, Mr. Alderman Richardson.

The Silver Medal of the National Chrysanthemum Society was awarded to the premier plant in the show—a fine specimen of John Salter, shown by Mrs. Gutch. The premier bloom was Lord Wolsey, shown by Mr. D. Wilson.

MISCELLANEOUS CUT FLOWERS.

Boxes of twelve bunches were finely shown. The best came from Mr. J. H. Smith, Leeds, who had grand examples of *Calanthe Veitchii*, *Eucharis amazonica*, *Zygopetalum Mackayi*, *Cypripedium insigne*, C. Roszli, white and red *Lapagerias*, *Rondeletia speciosa* major, *Isonia*, *Phlox*, *Phlox*, and two others; 2d, Mr. A. Pease, Dallington, with a very good lot indeed; 3d, Mr. R. Bell.

Camellias, hand bouquets, or Chrysanthemums, and also of other flowers, button-hole bouquets, and an excellent lot of cut flowers were also shown.

A very fine lot of cut blooms of Chrysanthemums, not for competition, came from Mr. T. B. Morten, Mowden

Bridge Nursery, Darlington, thoroughly representative and highly interesting. These were not for competition.

FRUIT.

The best six bunches of Grapes, in three varieties, came from Mr. H. J. Clayton, The Gardens, Grimston Park, Tadcaster, who had well finished and very fine examples of Muscat of Alexandria, Alnwick Seeding, and Gros Colmar; 2d, Mr. Cochrane, Aldin Green, Durham, with very fine Gros Colmar and Alicante, but weak Muscat of Alexandria; 3d, Mr. G. B. C. Yarrowborough, Campmount, Doncaster, with Black Hamburgh, Gros Colmar, and Alicante.

Prizes offered by Messrs. Backhouse & Son, nurserymen, York, for collections of Apples grown north of the Tweed, brought nine lots, including fifty to sixty varieties each. The best came from Mr. J. T. Hingston, Mr. A. Pease being 2d, and Mr. D. Wilson 3d.

Similar prizes were offered for the best assortment of Pears grown north of the Tweed, three collections being staged. Mr. A. Pease was 1st, Mr. T. M. Weddell 2d, and Mr. R. Bell 3d. The following were in good form, the season considered.—Brookborough Park, Knight's Monarch, Durandé, Van Mons' Lion le Clerc, Nouveau Poiteau, Beurré Die, B. Baltet, Passe Colmar, Soldat d'Espèren, Josephine de Malines, Marie Louise, Gour d'Ingrève, Louise Bonne de Jersey, Easter Beurré, Beurré d'Annis, and Beurré de la Reine.

Mr. Weddell had the best six culinary Apples, staging a large variety named Tim Shilling; Mr. A. Pease being 2d, with Peasgood's Nonsuch; and Mr. J. D. Hutchinson 3d, with Warner's King.

Mr. J. Stoutart staged a dish of dessert Apples, staging good Cox's Orange Pippin; Mr. Oglesby, Micklegate, York, being 2d.

Mr. A. Pease had the best six dishes of Apples, having very good examples of Potts' Seeding, Lord Derby, Empress Alexander, Peasgood's Nonsuch, Blenheim Orange, and Pippin; Mr. R. Wyse was 2d.

Mr. T. M. Weddell had the best six dishes of Pears, staging capital fruit of Durandé, Clapp's Favourite, Marie Louise, Beurré Die, Brookborough Park, and Louise Bonne de Jersey; 2d, Mr. A. Pease, very fine.

Mr. Pease had the best single dish of very excellent fruit of Marie Louise, and this variety was also 2d and 3d.

VEGETABLES.

Vegetables were largely shown. We briefly refer to them first of all, to praise their high-class quality throughout; and second, to mention a few of the leading prize winners.

Mr. R. Wyse had the best eight dishes; Mr. S. Taylor being 2d.

Mr. R. Wyse was 1st with six dishes; Mr. J. Kirk being 2d.

The best six dishes of Potatoes came from Mr. C. Hammond, who had handsome samples of Porter's Excelsior, Magnum Bonum, Lapstone, Schnolmaster, Alpha, and Woodstock Kidney; 2d, Mr. J. D. Hutchinson.

Messrs. Backhouse & Son exhibited, not for competition, a collection of ninety-two dishes of Apples, and the leading variety was formed by the committee as representing the best sorts for growth north of the Tweed. They were Ribston Pippin, Tower of Glamis, Pott's Seeding, Peasgood's Nonsuch, Nancy Jackson, Marie de Monage, D. T. Fish, Ferns' Pippin, Golden Reinette, Chapin's Pippin, Annie Elizabeth, Golden Wonder, and Hawththorn, King of Pippins, Kymer, and Royal Russet.

Mr. Henry Deverill, of the Seed Stores, Banbury, had a wonderful display of Onions, staging several hundreds of extraordinary bulbs, among them Rousham Park, and the variety known as the "Wreath." Several stems models, averaging 1 lb. in weight, were perfect, and also shown, and it is difficult to imagine a better. This collection attracted a good deal of attention, and it was awarded a Special Prize and First-class Certificate.

CLONMEL CHRYSANTHEMUM AND FRUIT SHOW.

On Thursday, November 26, was inaugurated in this town what we hope will in future be an annual event of no mean importance. With so many circumstances to demand attention, it required no ordinary courage for the gentlemen who formed the committee to start a Chrysanthemum and fruit show, and then, as if to throw a further "damper" on their exertions, the weather was most unpropitious. Despite these discouragements on all grounds, the show was pronounced an unqualified success, while the number of visitors, at least in the early-entrances, exceeded expectation. The arrangements in the ballroom of the courthouse were simply perfect—which can seldom be said for most shows—and reflected much credit on the managing committee.

On entering the large room the visitors at once had reason to admire not alone the admirable way in which the flowers and fruits were arranged, but also the tasteful way in which the room itself was decorated. The festooning of the windows, walls, &c., in crimson and white, had an exceedingly pleasing effect, and harmonised well with the dark green foliage and rich colouring of the mass of exotic plants and other plants which filled the hall of tables and different stands around the room. As to the exhibition, we may mention, before passing to a more detailed description, that it was one of which Clonmel and its vicinity may well feel proud. Indeed, the Clonmel Gardeners' Chrysanthemum shows at the Clonmel Gardeners in London freely stated that our local show, though by no means equal in extent, was fully up to the merits of its great London contemporary in point of merit.

The schedule was much more modest than it need be, for some of the exhibitors could readily have staged forty-eight varieties instead of twelve, but competition was invited, and the large and small growers had almost similar opportunities. Six classes were provided, and, short as the notice was, the number of competitors in each does credit to the floral resources of the surrounding district. Taking them *seriatim*:—

First Class.—In pots.—1st prize went to Mr. F. Clibborn, Anner House (gr., Mr. P. Crowley); 2d, George Gough, Esq., Birchhill (gr., Mr. T. Bulfin). Other very creditable and floriferous groups were shown by Messrs. Boyd and Phelan, but none were either trained or grown as specimens, though suiting admirably for conservatory decoration. Many of the blooms were exhibition size. The next five classes comprised the cut bloom section, and formed the *pièce de resistance* of the show.

Two-joined.—Mr. T. Phelan—already named (gr., Mr. P. Halpin), was a good stand, with twelve distinct varieties. As this exhibit would stand a fair chance at any show in the kingdom, and as the varieties are typical, we give the names in the order "set up":—Empress of India, Golden Queen of England, Lord Wolsley, Mr. and Mrs. Lady Garding, Jeanne d'Arc, Nil Desperandum, Princess of Wales, Bronze Jardin des Plantes, Golden Empress, and Alfred Salter. The 2d stand was very creditable, but in size a few "points" behind, the prize going to Mrs. Malcomson, Minella (gr., Mr. John Crehan). The blooms in both were, in many instances, similar varieties. Empress of India was, particularly good, Mr. Phelan's being 16 inches in circumference, and 4½ inches deep. Besides the blooms already named Mr. Crehan had British Queen of England, White Venus, and the three members of the Kundle family—all well done and very finished. If size alone were the test, nothing could have taken a prize from Mr. F. Clibborn, but his immense blooms were too far gone. There were three other very creditable stands with many blooms of superior merit.

Twelve Japanese.—The 1st prize went easily to Mr. Phelan; the 2d prize went to H. S. Boyd, Esq. (gr., Mr. J. Keating), being hand pressed by Mr. Clibborn and Mrs. Malcomson, already named, winning by only a few "points." As Mr. Boyd's were in most instances new varieties of last year's introduction, we mention the most notable British Marquise in the show. As Mr. Mame Sevin, Beauté des Jardins, and Mons. Léon Brunel.

Reflexed and Anemone-flowered.—Mr. Boyd here came 1st and Mr. Phelan 2d, both staging some capital blooms of Marginaum, Fleur de Marie, &c., the former stand having some of the fine varieties recently introduced.

Twelve pompons (in bunches).—For this there were three entries, and the prizes were as in last section. Mr. Boyd had three gems of the fibriata class, "perfect little cushions of beauty," as one lady described them.

Twelve blooms, any variety.—We regard this as a most important class, intended for amateurs who have no gardeners, and which would have been well filled but for the short notice. Mrs. Jellioce, Cahir, got 1st prize, with a creditable stand. We would suggest that next year this class be subdivided for those who grow under glass and in the open air.

Lastly, in this department came the disposition of the large Silver Medal so kindly placed at the disposal of the committee by Messrs. Saunders, the spirited proprietors of the Friars' Walk Nurseries, Cork, for the best collection of Chrysanthemums in the show. As Mr. Phelan had already won 1st prizes in the principal classes, incurred and Japanese, his right to this additional trophy was unquestioned.

Before passing from the floral to the fruit sections we must not omit noticing the extra exhibits, which would hardly have made an independent flower show. As Mr. Phelan had two stands of eighteen varieties, Japanese and incurred, many of them new varieties, which with those competing made a total of forty-eight distinct varieties, all of exhibition form, size, and substance, well illustrating the great resources of spring gardens.

In the same way from Anner House Mr. Clibborn contributed thirty-six distinct varieties, all splendidly finished, one of his stands of twelve having six new Japanese and six incurred, well deserving the notice and prizes received. In new varieties, large as were the exhibits of the gentleman named, they were behind Mr. Boyd, who had many gems that even experts had seen for the first time. His contributions of plants to the general display, too, were admirable, especially a large collection of plants in a large flower show. As Mr. Phelan from Minella. Here must be specially noticed the contributions of George Gough, Esq., Birchhill, among the rest several rare Orchids, such as the *Odontoglossum Alexandræ magnificum*, *Lælia*, &c., *Poinsettias*, *Cactuses*, *Dracænas*, two immense *Adiantum*, *Ceraleys*, &c.; while a general collection of *Adiantum*, gold and other Ferns came from Anner House. *Cordylines*, *Bamboos*, and many brilliant foliage plants were interspersed with the best effect, while vacant spaces were filled with a collection of *Cypripediums* from Anner House.

THE FRUIT COLLECTIONS.

The second section of the show was devoted to fruit collection. Remembering the time of the year, and that no previous preparation had been made for this exhibition, the display was a credit to our locality. No less than five collections were staged, and these filled one side of the ball-room completely. The 1st prize was well won by Mrs. Malcomson, Minella (gr., Mr. John Crehan), who had five Melons, two fine bunches of two varieties of Grapes, and a superb collection of Pears and Apples. Of the Pears may be named Doyenné Boussoch, Duchesse d'Angoulême, Beauté Did, Hampden's Bergamot, Beauté Rance, &c., all splendid specimens. Mr. Crehan

had also two dozen varieties of Apples of fine size and highly coloured—baking, or kitchen, and dessert. Of unusual size were Hawthornden, Mère de Ménage, and Afriston, very beautiful Esau's Fippin, Maxx Codlin, and the now too seldom seen Jolly Beggar. The 2d prize, for the most select and varied collection, went to Captain Bagwell, D.L., Marfield (gr., Mr. Wm. Cleary). It included several dishes of Pears, Nuts, Medlars, kitchen and dessert Apples in variety—a rich and most creditable display.

If there was a prize for Apples alone it would have been hard to beat Mr. Boyd's two dozen varieties, some of them of immense size and rich colour.

Equally creditable were Mr. Phelan's twenty dishes of more than a dozen distinct varieties.

Special mention must be made of the two large baskets, not for competition, sent from her beautiful garden at Coolgreany, by Mrs. Crean. Many varieties were of immense size and of the most brilliant colours. *Climmel Chronicle, Tipperary and Waterford Chronicle.*

The Rosery.

THE ROSE GARDEN IN WINTER.

NEITHER pleasant to eyes or nose is the aspect of what was in the month of June a scene refreshing and gladdening to both, for the Rose requires such treatment in winter as militates sadly against the appearance of the garden, and this is one of the reasons why it is so desirable that instead of being mixed up with other flowers, it should have a place to itself.

In preparing the beds for winter, two things have to be guarded against—the rough action of high winds, and the destructive action of frost. With regard to the former, where long shoots have been kept the wind is apt to get hold of them and so to keep loosening the plant that a hole is made by the crown and thus water gets in it and rots the roots, while the continued moving about by the wind loosens the roots and they do not do their work well. To remedy this it will be necessary in the first place to shorten the shoots about 1 foot or 18 inches; this will give the wind less play and will not be sufficient to cause them to break out too early, which has been urged as an objection by some against the simple process; in fact, one excellent authority and large grower advocates the complete pruning of Roses before Christmas; this I cannot agree with, for if anything of a severe frost sets in the wood must be injured, and should it be a mild winter I think that the Roses would start much sooner into leaf and so expose themselves to the spring frosts of May which generally do so much injury. It will also be well to tie these long shoots to a stake and so to secure the plants; where plants are bushy this may be done also, and in exposed positions this autumn staking is quite a necessity.

But frost is, after all, the real enemy with which we have to contend. When standards were more grown than they are now, it was a much more serious matter; thus after the terribly severe winter of 1881 millions of standards were killed in the Rose growing districts of Brie Comte Robert, and indeed the locality has never yet recovered its rosy character; but now few Rose growers care for standards, and especially for the reason that they are so liable to be injured by frost, whereas if care is given to dwarfs, whether on the Manetti or Drier, the evil effects of frost may, to a certain and considerable extent, be warded off. I have found it to be a good plan first of all to draw some of the earth round the collar of the plant, and then carefully to mulch all the bed with manure. Where manure is scarce (as it is not with me) it may be sufficient to place it round each plant, but where plentiful the whole bed had better be covered. The manure best suited for this purpose is pig-dung. This is very strong, and the Rose is a very gourmand, a gross feeder, and the stronger it is the better it likes it. Moreover, it is not so liable to create fungus as horse-manure. I lay it evenly over the beds, and have continually to watch the blackbirds and thrushes who are very fond of scratching amongst it for grubs

and worms, which, however, it does not contain in the same quantity as other kinds of manure. The autumn and winter rains will wash down into the soil the fertilising salts and other matter, and in the spring the long straw may be raked off, and the short manure which remains be gently forked into the beds. I found last year that the raking off my roses made a very respectable heap, on which I planted Vegetable Marrows, which gave me a most bounteous supply. This process of mulching is at first a very unpleasant one to those whose olfactories are susceptible, and once I very nearly drove a relative away whose sense of smell was very acute by indulging in this proceeding when she was with us; but after a little while this goes off when rains have come, and you have the satisfaction of knowing that your favourites are benefiting by it. Where it is dangerous to plant Tea Roses in the autumn, or where, as is sometimes the case, they are considered to require more protection than hybrid perpetuals, it will be well to lay them in, so that they can be covered over completely in severe weather, and planted out in the spring. I have found that Tea Roses so heeled make very good growth if carefully attended to; and I have seen some splendid boxes of blooms shown by Mr. Prince, of Oxford, fine plants, which had only been planted in May.

When Teas and Noisettes are grown upon walls, and especially when they are used as climbing Roses, it will be necessary to be watchful, and to be ready to protect them in case of frost; it will not do to cover them up too soon, as they are thereby induced to start early, and to get cut with the spring frost—this is especially the case when the wall faces the east. I feel now that if I had so protected my finest plant of Rive d'Or, I should not have had to have deplored the cutting of it down to the ground; it will not be needful to cover with thick material. There is nothing better for the purpose than what is known as scrim, or papering canvas, it is tougher than tiffany and not so easily torn, while it is quite sufficient to sift the frost and cold cutting winds, and will not encourage premature growth.

The weather has, up to this date (November 25), been so open, that where these precautions have not been already taken, they may be done now, and, like sailors before a gale, having battened down the hatches and made all preparation, they may have the satisfaction of looking forward with some degree of confidence, as they say "All taut." *Wild Rose.*

COLONIAL NOTES.

EXPERIMENTS AT TIPLING.—Mr. J. Aitken Middleton, of Tio-kong, reports as follows to the Agricultural Society of India:—

Vanilla.—I think I told you that I had planted this in virgin jungle with only the undergrowth cut down. It came on splendidly, but I regret to say that the squirrels took a liking to it, and ate off the shoots as they came out. I have removed it to a more open space, and have planted artificial shade over it, and I am glad to say it is now doing very well. Of course this transplanting has checked growth considerably, and will, I fear, cause delay in blossoming and fruiting, but I have little fear for it now.

Ceara Rubber.—The last lot has germinated fairly well; after it is germinated it seems to have only one enemy, namely, the mole-cricket. This fellow destroys them when they are 3 to 4 inches high. I had forty plants destroyed in one night. The only tree that came to any size here (Tin-kong) out of the very first lot of seed you sent me, has begun to flower. I regret to tell you, however, that during a thunderstorm some two nights ago the flowering branch was broken off. This branch I have cut in pieces and planted to see if they will grow. In March one of the trees planted at Tipling was blown down in a gale; I had it cut in pieces and planted at once, and am glad to say that all the cuttings are doing well. I should now be obliged by your giving me some information as to when, where, and how the trees ought to be tapped.

Divi-Divi.—As I told you some time ago, the tree grows very freely here. Nearly every seed you sent me has germinated. The few trees I have here have not grown much in length lately, but have thickened about the roots, and have spread out on top. They seem to like the sun, as all are turned towards the south and south-west. Two are specially noticeable in that way, being spread out like trained Plum trees facing south-west, not a leaf on the other sides. There is no shade anywhere near them, so I cannot account for this way of growing.

JAMAICA: FORMATION OF A HORTICULTURAL SOCIETY.

Kingston, Jamaica.—For some five years annual flower shows have been held at Kingston, largely assisted and supported in the way of plants for ornamental purposes by the botanical establishment of the island. Recently a movement has been organised for the furtherance of horticultural matters of a permanent character under the title of the Kingston Horticultural Society. In this the promoters of the flower show movement have heartily joined, and a sum of £53 has been handed over to the new Society.

At the inaugural meeting held on October 6 rules were passed and officers appointed for the ensuing year as follows:—President, the Hon. H. J. Kemble Vice-President, D. Morris, M.A., F.L.S.; Treasurers, P. E. Auvray and W. Bailey; Hon. Secretary, J. J. Bowrey, F.I.C., F.C.S. The Society starts with 120 members, and meetings are to be held monthly for the reading of papers and discussions bearing on such practical aspects of horticulture as obtain at Kingston and the neighbourhood. Since the inauguration of the annual flower shows a marked improvement has been effected in the cultivation of flowers, fruits and vegetables, in the area affected by them. The new Horticultural Society, which is the natural outcome of this increased activity, has therefore a useful career before it. The next meeting of the Society is fixed for November 3, when Mr. D. Morris, the Director of the Botanical Department, will read a paper on "Tropical Gardening." At the close of each meeting members will bring specimens of flowers, fruits, and vegetables for exhibition and to be named; and in this manner the meetings will be rendered of great practical value, and at the same time be the means of diffusing useful and accurate information on horticultural matters amongst members and the community at large.

DROUGHTS IN JAMAICA.

Mr. Morris, who seems never to leave a stone unturned in his desire to promote the welfare of the island in which he fulfils the office of Colonial Botanist, has published a lecture on the occurrence of droughts in Jamaica, their probable causes, and the means to be taken to remedy them. The highest annual rainfall (50.1 inches) is in the Government Cinchona plantations, at an elevation of 4850 feet, while the lowest is more than 8.9 inches, at the Palisados plantation, 6 feet above sea-level. Mr. Morris discusses the meteorological and physical conditions of the island, the influence of forests on rainfall as observed in various countries, the effects of improvident destruction of woods, principally by fire—to which he attributes much of the evils complained of in Jamaica; and concludes by making certain practical suggestions for the preservation of springs, rain-water, and humidity.

THE POTATO ROT, &c.

Minnesing, Ontario.—After an unprecedented wet season it need not be a matter of surprise that some Potatoes in low situations should be affected with rot, but we regret to state that both in high and low situations on sand and clay, a large proportion of our Potatoes is lost. Some fields have all been bad. Such a calamity has not befallen us before. Our fall Wheat crop has been a fair one; the spring Wheat poor, and in many cases a failure. Barley and Peas might be described as an average. Apples have been various, some remarkably abundant and others deficient. Common Plums were plentiful, but finer kinds scanty, and many trees killed by frost, and this to an extent previously unknown. *M. Morren.*

BAMBOOS SEEDING.

Some Bamboos of the "Katang" variety (*Bambusa arundinacea*, Retz.) having flowered in Gzaburo, North-Western Provinces, Mr. Nichols, C.S., had the seed collected for distribution. Mr. Nichols advises sowing in shallow pans, or in seed-beds under shelter. Transplant to a nursery bed when the seedlings are about 2 inches high. Again transplant when about 7 inches high, and keep till finally located in a place where they can be frequently watered. The Katang likes a rather sandy alluvial soil, though it will do well on "Regur," or black cotton soil. At Jabalpure, where planted mostly for ornament, the plan which seems to have succeeded best of all was to plant in a circle. So far as I can see, there

will probably be no chance of getting more seed for some forty years. This variety is believed to have a life period of about fifty-five years. It often attains the height of 60 feet under favourable circumstances. In 1836 Captain Steeman recorded in this Society's Journal (*Transactions*, vol. iii.) the flowering and death of all the Bamboos in Dehra Doon, and states that it is a characteristic of the Bamboo that all the produce of the same seed will run to seed and die in the same season, without reference to the season in which they may have been transplanted from original stock. Dr. Brandis seems to confirm this in his *Forest Flora*, and says isolated clumps may be met occasionally, "but, as a rule, all clumps in one district come into flower simultaneously, a few clumps flowering in the previous and some in the succeeding years." So it is probable that there will be a widespread flowering next season. *Journal of the Agr. Horticultural Society.*

Obituary.

MR. DANIEL HIGFORD DAVALL BURR, of Aldermaston Court, near Reading, died on Sunday last at his own residence in Eaton Place, London. The deceased gentleman was the eldest son of the late Lieutenant-General Daniel Burr, by his marriage with Mary, daughter and heiress of Mr. James Davis, of Chestow, Monmouthshire, and was born in 1811. He was educated at Eton and at Christ Church, Oxford. He was for a time a member of the Council of the Royal Horticultural Society. About the year 1850 he purchased the estate of the Congreves, at Aldermaston, where he pulled down the old court and erected a magnificent new mansion in the antique style.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, DECEMBER 2, 1885.

- Nov. 26.—Rain from early morning.
- 27.—Rain in early morning; fine day.
- 28.—Very dull day; fine clear night.
- 29.—Very dull throughout.
- 30.—Rain falling nearly all day.
- Dec. 1.—Very fine day.
- 2.—Very fine day.

LONDON: Atmospheric Pressure.—During the week ending November 28, the reading of the barometer at the level of the sea decreased from 29.50 inches at the beginning of the week to 29.45 inches by 5 P.M. on the 22d, increased from 29.63 inches by 9 A.M. on the 23d, decreased to 29.48 inches by 1 P.M. on the same day, increased to 29.70 inches by 9 A.M. on the 24th, decreased to 29.35 inches by 1 P.M. on the 25th, increased to 29.45 inches by 9 A.M. on the 27th, decreased to 29.27 inches by 5 P.M. on the 26th, increased to 29.66 inches by 5 P.M. on the 27th, decreased to 29.29 inches by 9 A.M. on the 28th, and was 29.40 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.46 inches, being 0.57 inch lower than last week, and 0.41 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 57°.2, on the 28th; on the 24th the highest temperature was 39.5°. The mean of the seven high day temperatures was 48°.

The lowest temperature was 34°.8, on the 22d, on the 28th the lowest temperature was 47°.5. The mean of the seven low night temperatures was 40°.8.

The greatest range of temperature in one day was 12°.2, on the 22d; the smallest on the 24th was 3°.5. The mean of the seven daily ranges was 7°.2.

The mean temperatures were, on the 22d, 41°.4; on the 23d, 40°.3; on the 24th, 38°.2; on the 25th, 44°.1; on the 26th, 47°.2; on the 27th, 48°.4; and on the 28th, 52°.6; of these the first three were below their averages by 0°.1, 1°.4, and 3°.4 respectively, and the last four were above by 2.5, 5.6, 6°.8, and 1°.1 respectively.

The mean temperature of the week was 44°.6, being 7°.8 higher than last week, and 3° below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 77°.5, on the 27th. The mean of the seven readings was 55°.5.

The lowest reading of a minimum thermometer placed on grass was 30°.0 on the 23d. The mean of the seven readings was 37°.

Rain.—Rain fell on five days to the amount of 1.37 inch.

ENGLAND: Temperature.—During the week ending November 28, the highest temperatures were 59° at Cambridge, 57°.2 at Blackheath, 57° at Truro; the highest at Sunderland 49°, at Bolton, Preston, and Newcastle 52°. The general mean was 54°.3.

The lowest temperatures were 33°.1 at Bolton, 34° at Wolverhampton and Preston; the lowest at Plymouth was 43°, at Truro 49°, at Brighton 39°.5. The general mean was 36°.9.

The greatest ranges were 23°.5 at Cambridge, 22°.4 at Blackheath, 21° at Hull; the least ranges were 12°.8 at Plymouth, 13° at Sunderland and Newcastle. The general mean was 17°.4.

The mean of the seven high day temperatures was highest at Truro, 55°.3, at Plymouth 53°.3, at Brighton 49°.9, and was low at Wolverhampton, 44°.5, at Bradford 44°.6, at Preston 45°.3. The general mean was 47°.8.

The mean of the seven low night temperatures was highest at Truro, 46°.4, at Plymouth 45°.3, at Brighton 42°.7; and was lowest at Wolverhampton, 37°.0, at Bolton 37°.2, at Bradford 38°.9. The general mean was 40°.6.

The mean daily range was greatest at Truro 8°.9, at Hull 8°.4, at Bolton 8°.3; and was least at Nottingham 5°.4, at Bradford 5°.7, at Leeds 6°.1. The general mean was 7°.2.

The mean temperature was highest at Truro, 50°.7, at Plymouth 49°.1, at Brighton 46°.1; and was lowest at Wolverhampton, 40°.4, at Bolton 41°.1, at Bradford 41°.6. The general mean was 44°.

Rain.—The largest falls were 2.3 inches at Truro, 2.65 inches at Plymouth, 2.49 inches at Brighton; the smallest falls were 1.16 inch at Cambridge, 1.20 inch at Prestrey, 1.26 inch at Newcastle. The general mean fall was 1.71 inch.

SCOTLAND: Temperature.—During the week ending November 28, the highest temperature was 50° at Glasgow; at Paisley the highest temperature was 47°.2. The general mean was 48°.7.

The lowest temperature in the week was 32° at Perth; at Paisley the lowest temperature was 36°.9. The general mean was 35°.

The mean temperature was highest at Leith, 41°.8; and lowest at Dundee, 40°.1. The general mean was 41°.

Rain.—The largest fall was 1.87 inch, at Greenock; the smallest fall was 0.78 inch, at Leith. The general mean fall was 1.23 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, November 30, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W. —The weather has been dull, with

frequent and heavy rain in England and the S. of Ireland, but somewhat finer in Scotland and the N. of Ireland.

The temperature has been about equal to the mean in "Scotland, N.," but above it elsewhere; in eastern, central, southern, and south-western England the excess has been as much as 6° or 7°. The maxima, which were generally registered on the 29th, ranged from 49° to 53° in Scotland, from 56° to 59° in Ireland, and from 54° to 59° over England. The minima, which were recorded on different days in the various districts, ranged from 30° in "England, N.W.," to 36° in "England, S." and "Scotland, W.," and to 45° in the "Channel Islands."

Rainfall has been less than the mean in "Scotland, N.," but more in all other parts of the kingdom. In most of the English districts, in the S. of Ireland, and over the English Channel, the excess has been very large.

Bright sunshine has been very deficient in nearly all places, the percentages of the possible duration varying between 3 and 12 in most districts to 19 in "Ireland, N.," and 29 in "Scotland, N."

Depressions Observed.—Three depressions appeared within our area during this period. The first was shown off the south of Ireland on the 24th, but it remained almost stationary until the night of the 25th—26th, when, having grown deeper, it travelled northwards outside our western coasts. The second moved quickly in a north-easterly direction over our islands on the 28th, disappearing over the south of Scandinavia on the following day. The third moved with rather unusual rapidly north-north-easterly outside our western and north-western coasts on the 29th, and disappeared to the northward of Norway. Very strong gales from between east and south-east were experienced on our northern coasts on the 26th and 27th, and strong winds or gales, at first from east, and afterwards from the south-westward, in most other parts of the kingdom. During the remainder of the period the wind was generally south-westerly to westerly, and at times increased to a strong breeze or gale.

manure and sand added. After repotting, stove treatment must be adopted for two months, after which the plants may be placed in the greenhouse. When they are sufficiently hardened off they may be stood in warm, partially shaded spots, out-of-doors. When in sufficient numbers, the pots may be sunk to the rim in the cold borders, where the foliage and delicately-scented flowers are very effective. The plants, when the pots have become filled with roots, require plenty of water, and occasionally applications of weak manure-water are of benefit. Before frosts occur, such plants must be removed indoors, and gradually forced to rest by withholding water; and when the growth is partly decayed, it may be cut to within 4 inches of the soil.—S. Ray. The wretched scrap was withered beyond recognition. We guess it may have been a fragment of the common jasmine, the other is one of the hybrid shrubby Veronicas.—H. S. Var. of *Lycaste macrophylla*.—M. S. Cooke. Var. of *Lycaste macrophylla*.—S. C. As near as we can tell, your *Viola* are—1, *Helix canariensis grandiflora variegata*; 2, *H. algeriensis*; 3, *H. conglomerata*; 4, *H. canewoodsiana*; 5, *H. aurea variegata*; 6, *H. marginata grandis*; 7, *Epidendrum cilense*.—S. F. Ross. Two pretty and distinct forms of *Calanthe vestita* oculata lutea, one white and the other pale sulphur.

INSECTS: T. W. The caterpillars which have injured the roots of so many of your different kinds of plants are those of the common small brown Swift moth (*Hepialus fuscus*). They are now nearly full grown. They are proving especially injurious at the present time by gnawing off the heads of the young underground shoots of my *Chrysanthemum*, I. O. W.—C. A. G. The soil in which your *Viola* were grown is infested with mites, woodlice, myriapod centipedes, and various worms and other abominations. Turn it all out and get some fresh soil.

ORCHID LEAVES DISEASED: R. P. P. 1, *Dendrobium* leaves. This is the black spot of gardeners, caused, it is supposed, by a fungus named *Protomyces concomitans*. 2, *Odontoglossum*. This is a remarkable case. The underneath side of each leaf is dotted all over with minute dark projecting spots or pustules, the edges of the leaf being burnt over each spot. Each spot looks like a familiar *Puccinia* or *Uredo*-pustule, as caused by fungi. On removing one or more for examination with the microscope each pustule is found to be closely packed with Nematoid worms and their eggs. The Nematodes have been identified before as deraying pseudobuds of Orchids. For an account of "Diseases of Orchids" see *Gardener's Chronicle*, May 30, 1885. Remove and burn affected leaves, and look to the source of infection from the soil or water. W. G. S.

PELAGONUM: T. F. Particoloured flowers, such as you send, are not uncommon. Your flower would not find favour with the ladies.

RED BERRIES: A. C. They appear to be those of *Hippocrepis rhamnoides*.

SEEDLING EUCHARIS: W. Stevens. The bloom is handsome, and formed with much regularity of outline. It seems to be midway in size between *E. amazonica* and *E. Sanderei*. If it should prove of a free flowering habit it will be worth keeping.

THE ELECTRIC TREE OF NEW GUINEA: B. The so-called *Elaeagnus electrica* belongs to the Bost or Fudge family. It has many synonyms, such as *Feleites aptodes*, *Melicium inudans*, *Fallicia fagosa*, not to mention vernacular names.

TOMATO ROOTS DISEASED: J. F. R. The Tomato roots sent present an extraordinary appearance. They look like small, rough, brown Cauliflowers full of nodosities, the latter varying from the size of a Pea to that of a Hazel-nut. The roots swarm in every part with nematoid or microscopic thread-worms and their eggs. These are not to be distinguished after a cursory examination from the similar objects so well known in Cucumbers. These worms attack the plants from the soil—they are often in the water supplied. There is no doubt, the Nematodes could easily be destroyed without injury to the plants, and opportunities for experiments have not been forthcoming. The decaying parts of the plants are full of eggs. The best plan is to destroy all the diseased plants by burning. I always fancy I can detect Nematodes by an odor, so that if any of your tomatoes, may, of course, belong to the plants affected. W. G. S.

INTELLIGENT READERS, PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

DIED, on Monday last, aged seventy-five, Mr. GEORGE LANE, senior partner in the firm of Messrs. G. & J. Lane, of the Cockmanning Nursery, St. Mary Cray, Kent. Mr. Lane was visited by a paralytic fit about six months ago, and a more severe attack entirely prostrated him in October last; since then he had been gradually sinking. He had been connected with the firm all his life, and was known as a successful Apple grower.

Markets.

COVENT GARDEN, December 3.

[The subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding, the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. Ed.]

TRADE dull in most of our goods, Pines and Grapes especially suffering. Heavy consignments of Canadian and Nova Scotia Apples still reaching us, as also St. Michael Pines. James Webber, Wholesale Apple Market.

Table with 2 columns: Fruit and Price. Includes Apples, Currants, Peas, and Lemons.

Table with 2 columns: Vegetables and Price. Includes Artichokes, Kidney Beans, Broccoli, Cabbages, Potatoes, Carrots, Cauliflowers, Celeries, Cucumbers, Endives, Herbs, Leeks, and Lettuces.

POTATOES.—Magnum Bonum, lad trade, 5s. to 8s.; Regents, 6s. to 8s. per 100; German Reds, 2s. to 2s. 6d. per bag.

Table with 2 columns: Plants in Pots and Price. Includes Arenia Sieboldii, Arbo vitæ, Begonia, Bouvardia, Brunia, Chrysanth., Cyclamen, Cyperus, Dracena terminalis, Eucalyptus, Eustoma, and Ferns.

Table with 2 columns: Cut Flowers and Price. Includes Albulon, Acaacia, Arum Lilies, Arum Lilia, Azalea, Bignonia, Camellia, Carnations, Chrysanth., Cyclamen, Euphyllidum, Eranthis, Eucharis, Gardenia, Hyacinth., Lappageria, and Lilium.

SEEDS.

LONDON: Dec. 2.—Owing to the Elections, and also to the near approach of Christmas, there were but very few transactions passing 10-day in field seeds. Some few shipments of red Clover seed have been made to America. New Trefoil, under the influence of speculative inquiry, has advanced 1s. per cwt. More attention is also given to white Clover seed. Canary seed keeps exceedingly firm. Hemp seed is still extremely cheap. In Rape seed the tendency is upward. There is no change in blue Peas or Haricot Beans. White Runners are selling at very moderate prices. Peeding Linseed is dull. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

OUR ALMANAC FOR 1886.—Secretaries of Provincial and Metropolitan Horticultural Societies are particularly invited to send us, as soon as possible, the Dates of their Meetings and Exhibitions during the ensuing year, so as to ensure their insertion.

APPLE SEEDLING GRAFTED: R. Ross. The seedlings are grafted to get them to bear fruit earlier than they would on their own roots, and are grafted as possible, in the case of Apples, to get them to have the property of causing early fruitfulness. Without so grafting seedlings, the raisers might have to wait many years before fruits were produced.

BOOKS: G. A. Natal. Harvey's Life. Messrs. G. Bell & Son inform us that they have still the work on sale.—A Beginner. The letterpress will no doubt tell you, if you read it. We cannot say the scale system, without seeing it. But we suppose the decimal system of metres and centimetres is used throughout.

ERRATUM: EDINBURGH APPLE AND PEAR CONGRESS.—In the report of exhibits from Renfrewshire the two Pears, Beurré Bosc and Marie Louise, were wrongly stated as from Mr. Lindsay, they having been sent by Mr. Henry Maxwell, Ralston Gardens, Paisley.

EUCCHARIS: J. Lynn. Swarming with mites.

HEMLOCK SPRUCE BARK EXTRACT: T. Kirk, Wellington, New Zealand. Our correspondent is referred to a paragraph on this subject at p. 724 of our present issue.

INSECTS ON ORCHIDS: Camjje. You have bought more than you bargained for. The plants are covered with scale-cocci. They are so badly infested that we recommend you to burn them.

NAMES OF FRUITS.—J. F. Pear: not recognised.—Arthur Lee, Apples: 2, Dumelow's Seedling; 3, Beauty of Kent; Pears: 4, Maréchal de la Cour; 5, Triomphe de Jodoigne; 6, Beurré Diel.—V. G. 1, Pear's Pippin; 2, W. Masson; 3, Colonel Vaughan; 4, not known; 5, Cox's Pomona.—J. F. A., not recognised; B, Bedfordshire Foundling; C, Lord Derby; D, Haawell Sowing.

NAMES OF PLANTS: H. V. Hedychium Gardnerianum. Greenhouse treatment will suit the plant during winter, when it must be kept dry in the manner of Cactuses. In April the roots may be wholly or partially shaken out, and be repotted in a compost of three-quarters loam and one-quarter peat, with a little

CORN.

MARK LANE : Nov. 30.—There was very little inquiry in any department. English Wheat sold at 6d. to 1s. lower from want of condition. Foreign Wheats, whilst dull, were not as a rule quoted ably. Flour, though hanging on hand, was not quoted ably in value. With liberal arrivals Peas declined 1s. per qr. Oats from the same cause were not so much affected as previous rates. Maize was steady in value, and in Barley there was hardly sufficient doing to test quotations.

Dec. 2.—There was no appreciable change in the Wheat or flour trades, both remaining very quiet at nearly nominal rates. Oats were firmer, but without sufficient doing to establish better prices.

Average prices of corn for the week ending Nov. 28 :—Wheat, 30s. 9d.; Barley, 29s. 5d.; Oats, 18s. 7d. For the corresponding period last year :—Wheat, 30s. 5d.; Barley, 31s. 3d.; Oats, 19s. 4d.

FRUITS AND VEGETABLES.

COLUMBIA (East London) : Dec. 2.—Average supplies of fruit, vegetables, and Potatoes, with a fair demand. Quotations :—Apples, 2s. 6d. to 3s. and Pears, 2s. to 6s. per bushel; Cabbages, 2s. 6d. to 4s. per tally; Savoy, 3s. 6d. to 8s. do.; bunch greens, 3s. to 4s. per dozen bunches; Carrots, 2s. to 2s. 6d. do.; Turnips, 3s. to 3s. 6d. do.; Parsley, 1s. to 1s. 6d. do.; Celery, 6s. to 10s. per dozen bundles; Beetroots, 3s. to 3s. 6d. per dozen; Cauliflowers, 2s. 6d. to 3s. do.; Brussels Sprouts, 2s. to 2s. 6d. per half sieve; Onions, 4s. to 5s. per cwt.; Carrots, in sacks, 30s. to 35s. per ton; white Turnips, 40s. to 60s. do.; Swede do., 2s. to 3s. do.

STRATFORD : Dec. 1.—During the past week the market has been well supplied with all kinds of produce, and with a good attendance of buyers, trade was transacted at the following prices :—Lobegans, 2s. 6d. to 3s. per tally; Savoy, 3s. to 3s. 6d. per dozen; Carrots, 2s. to 2s. 6d. per sieve; Mangels, 17s. to 21s. per ton; Swedes, 20s. to 30s. do.; Turnips, 40s. to 70s. do.; Carrots, cattle feeding, 38s. to 40s. do.; do., household, 40s. to 50s. do.; Onions, 70s. to 100s. do.; do., picking, 70s. do.; Parsnips, 10d. to 1s. per score; Apples, 1s. 9d. to 1s. 6d. per bushel; Celery, 9s. to 12s. per dozen; Horse Radish, 10s. to 1s. per bundle; Spinach, 2s. per sieve.

POTATOS.

BOROUGH AND SPITALFIELDS : Dec. 1.—Supplies were moderate, and best samples firm. Quotations :—Regents, 90s. to 105s.; Magnum Bonum, 70s. to 90s.; Early Roser, 70s. to 90s.; German, 60s. to 70s. per ton.

COLUMBIA (East London) : Dec. 2.—Magnum, 50s. to 75s.; Regents, 60s. to 70s.; Victoria, 55s. to 65s.; Champions, 50s. to 60s.; Reading Heros, 60s. to 70s.; and Beauty of Helston, 70s. to 80s. per ton.

STRATFORD : Dec. 1.—Magnum, 50s. to 95s.; Champions, 50s. to 60s.; Regents, 50s. to 80s. per ton.

Imports.—The imports into London last week consisted of 6847 bags from Hamburg, 2871 from Ghent, 15 from Harlingen, 847 from Stettin, 28 from Rotterdam.

CATTLE.

METROPOLITAN : Nov. 30.—Supplies were in some degree larger, but not the proportion of really prime qualities, which were short. About 2½ per 8 lb. 1d. lot was rather general on both beasts and sheep, excepting for quite top quality. English calves were unaltered; 1 sh most unobtainable. No improvement in the pig trade. Quotations :—Beasts, 3s. 8d. to 4s. 6d., and 4s. 10d. to 5s. 4d.; calves, 2s. to 4s. 6d.; sheep, 4s. to 4s. 4d., and 4s. 8d. to 5s. 6d.; pigs, 3s. 8d. to 4s.

Dec. 3.—Trade was quiet and featureless. The weather was again adverse to the seller. Supplies were not large, but were sufficient. Both beasts and sheep sold slowly, at barely Monday's prices. Calves and pigs were dull.

HAY.

WHITECHAPEL : Dec. 1.—Supplies were short, in consequence of the wet weather yesterday. Trade was dull, without change in prices. The closing quotations on prime, 90s. to 105s.; inferior, 70s. to 85s. Hay, prime, 73s. to 88s.; inferior 63s. to 67s. Straw, 28s. to 37s. per load.

Dec. 3.—A moderate supply was on sale. There was not much more doing, but no improvement in prices.

STRATFORD : Dec. 1.—Hay, 60s. to 90s.; Clover, 75s. to 110s.; straw, 28s. to 30s. per load.

COALS.

The following are the prices current at market for the past week :—Rawnorth West, Hartley, 14s. 9d.; Walls End—Harton, 15s. 6d., and 14s. 6d.; Tyne (unscreener), 11s. 3d.; Eastington, 15s. 6d.; Hetton, 17s. 6d., and 15s. 6d.; Hetton Lyons, 15s. 6d.; Tunstall, 15s. 6d.; East Hartlepool, 16s.; South Hartlepool, 15s. 6d.; Tees, 16s. 6d.; Lambton, 16s.; Wear, 14s. 6d.

Government Stock.—Consols closed on Monday at 100½ to 100½ for both delivery and the account. Tuesday's figures were 99½ to 99½ xd. for delivery, and 99½ to 99½ xd. for the account. The closing quotations on Wednesday were, as on the previous day, for delivery, and 99½ to 99½ xd. for the account.—Thursday's final figures were 99½ to 99½ xd. for delivery, and 99½ to 99½ xd. for the account.

HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertiser, and its genuine good quality, notwithstanding a host of unscrupulous imitators, is fully attested by its constantly increasing sale.

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years, and their constant increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article.

Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 73, Elmbank Street, Glasgow.

West, Belfast.

BUY ONLY ENGLISH WATCHES. BENSON'S NEW PATENT (No. 4658)

"LUDGATE" WATCH has been awarded the Highest Award of a Gold Medal at the Invention Exhibition, 1885

SILVER, £5 5s. GOLD, £12 12s.

The "Ludgate Watch" is a Silver ENGLISH Lever, of my best London make, with "Special Strength" Three-quarter Plate Movement. Rewound throughout in rubber-true Chronometer balance—adjusted for extremes with damp and dust-proof patent ring-band and extended barrel—massive sterling silver case covers with crystal glass front, which combines the strength of the Hunter with the convenience of the Open Face Watch—Winds, sets hands and opens at back.

The IMMENSE superiority in Value, Accuracy, and Durability of the "Ludgate" Watch to Swiss and American (made in imitation of and sold as English) and to the Old Full-plate English Lever (still sold by other makers), from the great defects of which the "Ludgate" is exempt—is proved by the Award of a GOLD MEDAL—the only one adjudged to English Watches.

The "Ludgate" is of better quality and value than any 50 watch hitherto made. The "Ludgate" is my best London make—strong, handsome, and reliable—will stand the hardest wear and roughest usage, and is therefore the best watch for Home, Yachts and Colonial wear by Gentlemen (No. 1, large size), Workmen, and Artisans (No. 2, as sketch), Gentlemen, Officers and Men in H.M. services, Youths and Boys (No. 3, small), will be free and safe at any risk, in all parts of the world, for £5 5s. or 18-carat gold, crystal glass case, Twelve Guineas (No. 3 size).

A remittance in P.O.O., Draft, or Cash, must accompany Order. Specially Note that J. W. BENSON is the only Maker of a Three-quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or by any other Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. An Illustrated and Priced Book explaining the advantages of the Watch, and the various English Watches sold by all other makers, will be sent Post-free on application to

J. W. BENSON, Watchmaker to Her Majesty the Queen, the Steam Factory, 62 and 64, Ludgate Hill, E.C. and 25, Old Bond Street, W. London. Consents upon the award of the GOLD MEDAL, the demand, always great, has so increased as to necessitate more extensive Machinery, which now enables us to execute all orders for the "Ludgate" Watch without delay. Illustrated Pamphlets of Watches from £5 to £500, and Silver Jewellery, Clocks (House, Chime, and Turret), Electro-plate and Musical Boxes, free on application.

IRON GARDEN WHEELBARROWS

With TUBULAR FRAME and HANDLES. Every Gardener should use the "Easy Tip." No. 14, Japanned, 18s.; with Galvanised Body, 21s.; Galvanised all over, 26s. Barrows forwarded, Carriage Paid, to any part of England on receipt of Cheque or Postal Order, payable to BIERLEY & SON, BIRMINGHAM.

THE LOUGHBOROUGH GREENHOUSE HOT-WATER APPARATUS.

Price, as engraving, with Boiler, open feed syphon, 12 feet of 4-inch hot-water pipe, and patent joints complete, £4 4t. Delivered free to any station. Discounts for cash. This is the simplest, cheapest, and most powerful apparatus made. It requires no brick setting, no stokehole, and no hot-water filter for fraying. The Boiler stands in the Greenhouse, the front only being outside and flush with the outer wall, so that the whole of the heat from the boiler itself is utilised. It burns over 12 hours without attention, at a nominal cost.

"Loughborough" Boilers to heat up to 650 feet of 4-inch pipe, with hot-water pipe joints, &c., always in stock. Cost of Apparatus CO. METE for Greenhouses as below:—10 by 6 ft., £4 10 0; 15 by 6 ft., £5 10 0; 20 by 6 ft., £6 8 12 by 8 ft., 5 2 0; 20 by 8 ft., 6 0 0; 4 by 16 ft., 12 2 4 Proportionate prices for other sizes. Estimates on application. The measurement of Greenhouse being given, every apparatus is delivered with pipes cut and fitted ready for fixing. Illustrated List, with full particulars, post free.

DEANE & CO., Horticultural Builders and Hot-water Engineers, 46, King William Street, LONDON BRIDGE.

GREENHOUSE Warming STOVE.

The only perfect Oil Stove made. Awarded the highest premium over all competitors at the Royal Exhibition. The cheapest and most effective means known for warming small Greenhouses, and keeping out frost and damp. They burn absolutely without smoke or smell, require no pipes or fittings, give off no injurious vapour to either vegetable or animal life, will burn twelve to twenty hours without attention, are so portable they can be moved from one place to another while burning, and for efficiency and economy can be highly recommended. Prices from a few shillings. Sold by all Ironmongers and Lamp Dealers. See the name on the stove before you purchase. Full Illustrated LIST and name and address of nearest agent forwarded free on application to the sole manufacturers.

THE ALBION LAMP COMPANY, ASTON ROAD, BIRMINGHAM.

STOVES.

WANTED, a young MAN, to serve in a Seed and Florist Business.—Apply, stating full particulars as wages required, to FRANK HILLIER, 6, Market Street, Cambridge.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

R. B. LAIRD and SONS (Successors to the late Firm of Downie & Laird) can at present recommend with every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended upon, either for Large Establishments or for small Situations; also FOREMEN, UNDER GARDENERS, and FARM BAILIFFS.—17, Frederick Street, Edinburgh.

JOURNEYMAN.—Married, with family. Has had fifteen years' experience in Budding and Grafting Roses, Clematis, Conifers, Fruits, and other Trees; Packing and general Nursery Work. Honest, sober, and industrious.—E. P. G., Messrs. Ewing & Co., Sea View Nurseries, Havant, Hants.

JOURNEYMAN, or IMPROVER, in a Gentleman's Garden.—Age 18; five years' experience. Would not object to pay a small Premium.—C. W., 22, Gloucester Place, Cheltenham.

TO THE SEED TRADE.—A young man (age 23) requires a situation in the Seed Trade. Four years' experience in first-class firms. Has been twelve months in England, at John Lister & Co.'s, with whom he is at present. Good references.—E. ROMAN, 9, Lower Winchester Road, Catford, London, S.E.

MANAGER, or SHOPMAN.—Married; 16 years' practical experience in the Wholesale and Retail Trade. First-class references.—B. C. Gardner's Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (HEAD), or MANAGER.—Twenty-six years' experience in first-class houses, accustomed to a brisk Country Trade, familiar with every detail of business routine, efficient Correspondent, conversant with Plants. Can be well recommended by former employers.—H. 10, Lambeth Road, London, S.E.

SHOPMAN.—14 years' experience in Wholesale and Retail Trade. First-class references.—S. A. Hurst & Son, 152, Houndsditch, E.

SHOPMAN.—Age 27; good knowledge of the Trade in all its branches. Understands Book-keeping. First-class references.—L. S. Gardner's Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN (ASSISTANT).—Advertiser is open for engagement. Has had eight years' practical experience in all branches of the Trade; principally Retail. Unexceptional references.—N. S. Gardner's Chronicle Office, 41, Wellington Street, Strand, W.C.

Cure of Cough and Inflamed Throat by DR. LOCOCK'S PULMONIC WAFERS.—Extract of letter from Mr. LEITH, Harbour Master, Strathairn, Thurso:—"The two fat loaves I got gave me immediate and great relief. I have had a cough for over two years, brought on by repeated attacks of inflammation of the lungs." They instantly relieved and rapidly cure Asthma, Consumption, Bronchitis, Coughs, Colds, Shortness of Breath, Pleurisy, Pains in the Chest, Rheumatism, and taste pleasantly. Sold at 1s. 1/2d. and 2s. 9d. per Box, of all Druggists.

HOLLOWAY'S OINTMENT and PILLS.—These remedies are unequalled throughout the World for Bad Legs, Wounds, Foul Sores, Bad Breasts, and Ulcers. Used according to directions given with them there is no Wound, Bad Leg, or Ulcerous Sore, however obstinate or long standing, but will yield to their healing and curative properties. Many poor sufferers who have been treated by the most eminent hospitals under the care of eminent surgeons, and have derived little or no benefit from their treatment, have been thoroughly cured by Holloway's Ointment and Pills. For General Swellings, Tumours, Piles, and Diseases of the Skin, there is nothing that can be used with so much benefit. In fact, in the most dangerous forms of disease, and in the most delicate of the blood, these Medicines, used conjointly, are irresistible.

J. WEEKS AND CO. Manufacture the very best description of Hothouses and Conservatories. Their Patent Double Upright Boilers supersede every other kind of Hot-water Boiler in the Kingdom. Ten years guarantee (subject to printed conditions) given with every Double Upright Boiler. Orders of 5000 Sold. Catalogues free.

PONTEY'S SUPERFINE LATE WHITE BROCCOLI.—This is one of the finest sorts of Late White Broccoli ever offered, producing large heads of a creamy white color and coming in for use as late as June. See following extract:—

From the Gardeners' Chronicle and Agricultural Gazette, London, &c. 1885, p. 1045, says, since Mr. Kessel, of the Coombe, Penzance, who has been a Broccoli grower for upwards of half a century, and was one of the first to introduce the Early Broccoli into London and Northern Markets, cut two monster Broccoli, which together weighed 50 lbs. They were the sort known as Pontey's Late White Broccoli. The huge scales at the smelting-house had to be sent into requisition to contain the weight of the plants. Retail Price, 2s. 6d. per dozen. Special quotations to the Trade. Apply to E. WILCOX SEPPELL, 21, Cornwall Street, Plymouth.

Home-grown Vegetable and Field Seeds. H. AND F. SHARPE will be pleased to forward on application their Wholesale Special Priced Lists of Home-grown VEGETABLE and FIELD SEEDS of 1885 growth, all raised from the best selected stocks, and having in addition the reputation of being the weight of the plants. See Growing Establishment, Wisbech.

TELEGRAPHIC ADDRESS.—'GILBERT, STAMFORD.' The gem of the season—Gilbert's Late White BROCCOLI, Victoria—in open competition beats all the Models, all the Gemots, and all the Queens, besides seven dishes of Capital merit. Awarded a First-class Certificate at the Royal Horticultural Society. This Broccoli is without doubt pre-eminently the London in commerce. Not thimbleful, but in 1/2 oz. packets, 2s. 6d. each.

A. F. BARRON MELON, Green H-sh, First-class Certificate at the TELEGRAPH CUCUMBERS, 1 dozen seeds, per packet, 1s. 2d.

CHOU DE BURGHELY, a pure stock, and Universal SAVOY, in 1/2 oz. packets, 1s. 2d.

FRIMROSE SEEDS, chosen with Harbinger, from a very fine collection, 1s. 6d. per packet.

BORDER CARNATIONS, all colours, a very hardy and good stock, 5/6 per packet.

Apply to G. GILBERT, High Park Gardens, Stamford.

EARLY PEAS FOR SEED. PRIZETAKERS. WILLIAM THE FIRST. KENTISH INVICTA.

All harvesters of the above, in 1/2 oz. packets, for 1s. Price 10s. per Bushel. Special quotations for 40 Bushels and upwards. Apply, C. RANDELL, Chadbury, near Evesham.

SPECIAL OFFER. GOOSEBERRIES, 20,000 1 yr. cuttings, 8s. varietes. CURRANTS, various, 10,000 1 yr. cuttings.

CURRANT BUSHES, various, 10,000 1 yr. cuttings. ASPARAGUS, 20,000 1 yr. cuttings.

COTONEASTER SIMONS, 10,000 1 yr. cuttings. VINES, English, 10,000 1 yr. cuttings.

FILBERTS and NURS, various, 2000. NUT and FILBERT Layers, 500.

CHEERY PLUM (Prunus mischobolana), for fencing, 5,000. 100 WALNUTS, Standards.

The whole of the above is offered at very low Trade prices. The ROYAL NORFOLK NURSERIES (late King's), Eaton, near Norwich.

'BACKHOUSE'S BEURRE' A R. Figured in Gardeners' Chronicle, November 3, 1883. This is a hybrid between the Jargosse and Beurre Diez, with the form and size of the latter, but with the melting sweet quality of the former. It so soon becomes a standard, and bears well as a Standard in Yorkshire. From its large size, excellent quality, great productiveness and hardiness, we have confidence in recommending it to all who desire to possess choice collections where Pears are grown for dessert or exhibition, and for gardens where a profitable market return is all-important. Strong trees now ready for delivery—Standard Plants, 3s. 6d. each. Standards or Dwarfs, 5s. each.

Dwarfed trained for walls or espaliers, 7s. 6d. each. General GARDENERS' and Fruit Trees sent on application. All of Roses, Forest and Ornamental Trees, &c. JAMES BACKHOUSE AND SONS, York Nurseries.

FOUR HUNDRED THOUSAND PACKETS of Choice FLOWER SEEDS for 1886. Advertiser is now ready to send on any order without prepayment, if the genuineness of this Advertisement is doubted, a PARCEL, which is probably the most extraordinary shilling's worth of any commodity ever offered, containing not less than 80 separate named packets of 100 and choice varieties for outdoor cultivation; and if not acknowledged by the most critical recipient to be worth at least three times the money asked for it, no payment will be accepted.

Clearing off old seeds, but a fresh, choice, and genuine parcel. It will be sent post-free for 1s. 3d., two for 2s. 3d., or one dozen packed (containing 100 packets) for 10s. Those who remit with order must kindly enclose a professional reference, to prevent Advertiser being duped by the unscrupulous. Agents at various places, and numerous sales and exchanges, village in the three Kingdoms.—Address, LLOYD BOOTH, 6, Royal Seed Merchant, Loudwater, near High Wycombe.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION,

THE COMMITTEE beg to GIVE NOTICE that they have secured permanent Offices at

No. 50, PARLIAMENT STREET, WESTMINSTER, S.W.,

and it is respectfully requested that all communications may be addressed there.

By Order,

EDWD. R. CUTLER, Sec.

November 3, 1885.

R. & A. MORRISON, THE NURSERIES, ELGIN.

NEW APPLES.

SEPTEMBER BEAUTY.

First-class Certificates from the Royal Horticultural Society and at the Crystal Palace, 1885. This is one of the handsomest, richest-flavoured, and most digestible mid-season dessert Apples, having the full Ribston flavour, but precedes that delicious Apple, and is harder and more fertile. 5s. and 7s. 6d. each.

THE DARTMOUTH CRAB.

The largest, best, and most distinct of all the Crabs, and one of our handsomest fruit cultivations, being of a beautiful crimson-scarlet colour, coated with a rich bloom, and cured on a long stalk. The fruit resembles an enlarged Victoria Plum, and the tree laden with fruit is most attractive. This Crab, which ripens early, is not acid, but if eaten at the ripening point is equal to a first-rate summer Apple. 3s. 6d. and 6s. each.

Further particulars on application to

THOMAS LAXTON, SEED and NOVELTY GROWER, BEDFORD.

CHRYSANTHEMUMS.

OUR PLANTS are mostly cut down and placed under the glass, as our houses are expressly built to produce the best possible strong, clean, healthy, country-grown Cuttings, so that they can be taken from them into good plants. All the best varieties in cultivation are now posted to any quantity in tin boxes all over Europe by thoroughly experienced men, therefore all are warranted true to name. For prices, and a vast amount of valuable information, see CATALOGUE, sent free. Our Selection—CUTTINGS, 12 6d. per dozen, 1 cutting each of our 900 best CUTTINGS, 5s. per dozen, 35s. per 100; the 900 for £14. Plants of the 86 New Varieties for £4; Cuttings, £2. 30 of the above for £1; Cuttings, 10s.

FRIDAY NEXT.

WHITE LÆLIA ANCEPS.

LÆLIA ANCEPS SCHRODERIANA, STELLA, and SANDERIANA, in splendid masses.

MESSERS. PROTHEROE AND MORRIS are instructed by

Mr. F. Sander to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, December 18, at half-past 12 o'Clock precisely, a very fine importation of the above WHITE LÆLIA, in splendid condition. All were separately packed in cases and sent home from the West Coast of Africa, via San Francisco and New York, by passenger train, the intention being to bring them into the market in bloom, but the spikes have faded. The Bulbs are plump and in fine order, and the masses very large, some having two and three hundred bulbs each. Also a wonderful importation of ONCIDIUM MARSHALLIANUM.

On view morning of Sale, and Catalogues had.

JUST PUBLISHED, SIXTH EDITION, ENLARGED AND REVISED.

THE ORCHID-GROWERS' MANUAL.

By BENJAMIN SAMUEL WILLIAMS, F.L.S., F.R.H.S.

Post 8vo, Cloth, Price 15s.; Free by Parcels Post, 15s. 6d.

Profusely Illustrated with a large number of Fine and Double-page Engravings on Wood, together with Blocks illustrative of types of the various genera.

THIS Popular Work has been entirely remodelled and revised up to the present time, and has been enlarged to 650 pages. It contains descriptions of upwards of 1470 species and varieties of Orchidaceous plants, together with 478 synonyms; also authorities for the names, the families to which the various genera belong, the flowering period, native country, and references to figures. Making in all the most complete work on Orchids ever published.

Oil Paint no Longer Necessary.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark)

THIS VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 20 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Pierrefield Park, June 24, 1876.—SIR, I have this day forwarded from Chepstow to your address a black waxed cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chepstow.—I am, Sir, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates &c., sent free on application to **HILL and SMITH**, Brierley Hill Ironworks, Staffordshire; 119, Queen Victoria Street, London, E.C.; and 73, Embank Street, Glasgow.

CHARLES SHARPE & CO., SLEAFORD.

SPECIALTIES FOR 1885-6.

SHARPE'S SIR F. A. MILBANK PEA.

This, the latest of Mr. Culverwell's many excellent introductions, is a Blue Wrinkle'd Marrow much of the Paragon type in habit and growth, but earlier, and differing in being of a beautiful dark grass-green colour, and even more prolific than that celebrated variety; the pods are produced in abundance, are large, square, and closely filled with the extra large dark green Peas, so closely packed that it would appear when opened as if the pods could scarcely have contained them. The flavour is all that could be desired by the most fastidious connoisseur, and in every respect it is a variety that we can with the greatest confidence recommend, either for exhibition or table purposes. It is robust and hardy in constitution, and may be sown early; for Market Garden purposes it cannot fail to prove a great acquisition.

Price 2s. per Quarter Pint sealed packet.

SHARPE'S TRIUMPH PEA.

Triumph is one of the very best of the many fine varieties Mr. Culverwell has given to the public. It is a Blue Wrinkle'd Marrow PEA of exquisite flavour; the pods are large, very much curved, and are well filled with large Peas closely packed in the pod. The habit is good, being dense and bushy, attaining a height of 2 to 3 feet. The plant is covered with pods from the ground to the extreme top of the haulm. On one plant no less than sixty-pine pods have been counted, containing from nine to eleven Peas in a pod. The pods are of a bright green, in clusters of two or three; and are not easily affected by drought, remaining green for a long time. In constitution it is robust and hardy, and, without hesitation, we can say that it is the perfection of Peas for either the Market Gardener or the Private Grower—for exhibition, or for ordinary use.

Price 2s. per Half-pint sealed packet.

SHARPE'S EARLY PARAGON PEA.

FIRST CLASS CERTIFICATE, ROYAL HORTICULTURAL SOCIETY, 1884. Chiswick Report, 1884, accompanied with First-class Certificate.—"PARAGON"—A very fine Second Early Variety, and of good quality. Pods large, and well filled.

Price 2s. per Pint Packet, 1s. per Half-pint Packet.

PARAGON, one of Mr. Culverwell's recent introductions, shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkle'd Marrow of fine flavour; height from 4 to 5 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick-backed, containing from twelve to fourteen large Peas.

PARAGON is the earliest of the large Wrinkle'd Marrows, being ready before Fizz-taker; in fact in the Garden at Thorpe Perrow it was gathered at the same time as William the First; it is very hardy, and will stand earlier sowing than any PEA of its class. It is most valuable for succession crops as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

SHARPE'S WHITE PROLIFIC MARROW.

Price 2s. 6d. per Quart.

A magnificent White Wrinkle'd Marrow height 2 to 2½ feet; pods in pairs, long, straight, and well filled, flavour excellent. As a Second Early Wrinkle'd Marrow there is nothing to equal this either for quality or productiveness. It is a few days later than the Prince of Wales, but is a much heavier cropper than that variety, and for Market Garden purposes very far superior to it.

THE EARLIEST OF ALL POTATOS.

SHARPE'S VICTOR.

Sharpe's Victor is a seedling raised from the Alma Kidney and the old early short-top round Potato. It is earlier than any present variety, and having a very short top, it is especially suitable for frame cultivation; its precocity is such that it can be had fit for the table in eight weeks from the time of planting, and there is no difficulty in securing new Potatos for the table every day in the year. Victor is a flattened roundish oval in shape, with a beautiful clear skin, and extremely shallow eyes, being one of the handsomest as well as the heaviest croppers of any variety adapted for Frame work, or for a first early crop outdoors. It is dry and mealy when cooked, and the flavour and the quality of the flesh are superior to nearly every other variety at present in use. Another season's trial has fully confirmed all that has been said in favour of the Victor Potato. It is proved to be the earliest, most prolific, and best flavoured of all the early Potatos; and for Pot. Culture it is unrivalled.

VICTOR.—CHARLES SHARPE & Co. have now a fine stock of sprouted Sets fit for immediate Planting in Pots or Frames—for use end of December and January. Early orders solicited.

Price 8d. per Pound.

CUCUMBER—SHARPE'S EPICUREAN.

CUCUMBERS ALL THE YEAR ROUND.

This, the perfection of Frame Cucumbers, is a cross between Telegraph and Tender and True; in form it has a resemblance to Telegraph, but is of a darker green and much longer—fruits 32 inches in length having been cut from it. It is crisp and juicy, and in flavour it is superior to Tender and True, but its chief recommendation is its marvellous productiveness, in which it excels everything that has come under our notice, as many as 300 and 400 fruits having been cut from twelve plants, in a 3-light pit, 3 quarter span. For succession it is unequalled bearing as abundantly at Christmas as Midsummer—and in addition to its handsome form and lovely colour, it is a variety that seldom produces seed, no one in a hundred containing a trace.

Price 2s. 6d. per Packet.

SHARPE'S NEW TOMATO, "ECLIPSE."

The Eclipse is a seedling raised from the celebrated Nibbel's Victoria Tomato. The fruit, which is produced in large bunches of ten or twelve, is more than three times the size of the Victoria. The bunches are produced at every joint, as in the parent type, and the plant requires very little stopping. The fruit is oval in form, of a rich cherry-red colour, and the flavour is as exquisite as that of the Victoria. Eclipse is, without hesitation, the most prolific Tomato in cultivation. The immense bunches of richly-colored fruit, when seen trained to a south wall and well grown, present a sight such as no other Tomato can equal.

Price, Packets, 1s. 6d. each.

THE POMEGRANATE TOMATO.

This is one of the greatest acquisitions in the Tomato ever submitted to the Trade. The fruit is a depressed globe, perfectly smooth; of a deep pink suffused with violet, the beautiful shade of colour being almost impossible to describe; the flesh is firm, of an exquisite flavor, with very little seed, and of a deep rich crimson, very closely resembling the interior of a ripe Pomegranate. It is very prolific, the fruit being produced in bunches at every joint, and it is equally adapted for Outdoor or Frame cultivation. We have no hesitation in recommending it as a great advance upon any of the large kinds of Tomato.

Price, 1s. per Packet.

TRADE PRICE AND SPECIAL LIST of NOVELTIES for 1885 and 1886,

ROSES. ROSES.

See our New Catalogue. The finest H.P. varieties, 6s. per dozen, 40s. per 100. Tea-scented and Noisettes, 15s. per dozen; 100s. per 100. Beautiful Mosses, 6s. per dozen. Climbing varieties, for Rockeries, Arbours, &c., 6s. per doz. The above are all our own growing, and will grow and flower much better than Roses grown in a good climate and rich soil.

FOREST TREES,

ORNAMENTAL and DECIDUOUS SHRUBS, RHODODENDRONS and AMERICAN PLANTS. Fine quality, low prices. See New Catalogue.

OUTDOOR FLOWERS IN SPRING.

DAISIES, Red, White, Rose, &c.; in POLY-ANTHUS, Single PRIMROSES, in variety of colours; WALLFLOWERS, CANTERBURY BELLS, 9s. per dozen, 4s. and 5s. per 100. PANSIES and VIOLAS (colours separate), ARABIS, ALYSSUM, SILENE COMPACTA, AUBRETTIAS, MYOSOTIS, 2s. 6d. per dozen, 8s. 6s. per 100; or, 500 assorted Spring-flowering Plants for 17s. 6d.; 100 for 31s. 6d. HEPATICAS, Blue and Red; Double PRIMROSES, Sulphur, 3s. 6d. per dozen. WM. CLIBRAN and SON, Oldfield Nursery, Altrincham.

BEAUTIFUL FLOWERS for GARDENS. POTENTILLAS, PYRETHRUMS, DELPHINIUMS.—Lovely hardy flowers for cutting or garden bloom, named, 5s. per dozen.

SPLENDID PHLOXES, PENTSTEMONS, PINKS, PANSIES, in the finest varieties, 3s. 6d. per dozen. HARDY HERBACEOUS PLANTS.—The most showy sorts, 2s. per dozen, 21s. per 100. CARNATIONS and PICOTEES.—Good exhibition sorts, 6s. per dozen plants; fine Clove and Border Self varieties, 4s. per dozen—all from layers. LILIES.—Candidum, Orange, and Tiger Lilies, 3s. per doz. WM. CLIBRAN and SON, Oldfield Nursery, Altrincham.

A GAY CONSERVATORY.

CINERARIAS and HERBACEOUS CALCCEOLARIAS, 1s. 6d. per dozen, from stores, our own fine strains. BOUVARDIAS, TREE CARNATIONS, DEUTZIA GRACILIS.—In pots for early blooming, 6s., 9s., and 12s. per dozen. SPIREA JAPONICA, DELYTRA SPECTABILIS.—Fine clumps, 5s. per dozen. AZALEAS.—Ghent, mollis, pontica, or ideoica, all with buds, for forcing, 18s., 24s., and 30s. per dozen. WM. CLIBRAN and SON, Oldfield Nursery, Altrincham.

SEE our NEW CATALOGUE for this Autumn for Moderate Prices of all BULBS, PLANTS, or TREES you want for In or Outdoor Gardening; also for CUT FLOWERS, WREATHS, CROSSES, BOUTQUETS, &c. Safe and fresh by post or rail.

WM. CLIBRAN & SON, OLDFIELD NURSERY, ALTRINCHAM; 12, MARKET STREET, MANCHESTER.

KENT; the GARDEN of ENGLAND.

GEORGE BUNYARD & CO.'S

CELEBRATED FRUIT TREE NURSERIES, MAIDSTONE,

Offer to Purchasers the advantage of a choice from a Stock of 400,000 well-grown, fully ripened, and carefully and scientifically trained trees, which lift with such remarkable roots that they are suitable for all soils and positions.

Considered by competent judges the finest general stock in Britain.

FRUIT TREES

IN ALL FORMS,

For the Orchard, Market Plantation, Walled or Villa Garden, Prepared for Standards, Rider Trained, Dwarf Fan, Espalier or Horizontal Trained, Pyramidal, Double or Single Cordons.

All Trees on the most congenial Stock.

Thousands of Fruit-bearing Trees.

Also Orchard-house Stuff in pots, Figs, Vines, &c.

Large Exhibitors and Prizetakers at the Crystal Palace, Exeter, and London Shows, the great Apple Congress, and the Pear Conference. Winners of the Champion Prize for Apples at the "Inventories."

- APPLE, LADY SUDELEY, First-class Certificate, Royal Horticultural Society and Royal Society of Horticulture. HIGH CANONS, First-class Certificate, Royal Horticultural Society. GOSPATRIC (fine at the Congress). Circulars, with Testimonials, post-free. The above New and First-class Apples will be sent out by G. B. & Co. this November, for the first time.

ACRES OF ROSES, SHRUBS, CONIFERS and PARK TREES.

CATALOGUES GRATIS.

Frequent trains on the Chatham and Dover (Victoria), or South-Eastern (Cannon Street) Railways. An Inspection is solicited from all Lovers of Horticulture.

Gardeners' Chronicle.

SATURDAY, DECEMBER 12, 1885.

LONGLEAT.

THIS beautiful place, the seat of the Marquis of Bath, is situated on the confines of Wiltshire and Somerset; a considerable portion of the grounds are within the latter county, whilst the house stands in Wiltshire. The principal entrance lays southwards, from which direction the road leads through the pretty village of Horningsham, after leaving which it enters the park, where there is a lodge about a mile distant from the mansion, to which, from this point the drive is in a straight line through an avenue of majestic old Elms, part of which in different places a long time ago were unhappily removed; more recently these gaps have been filled up with young trees that are thriving satisfactorily, but, needless to say, the requisite uniformity of growth and size so essential in the trees composing an avenue is wanting. Avenues sometimes exist where their absence would have been preferable, either through their being out of keeping with the surroundings, or by mistakes in the planting; but here the avenue is not only quite in character with the place, but the judgment has been correct in allowing enough greensward between the road and the trees proportionate to the extent and importance of the place. It would be interesting to know when, and by whom the Longleat avenue was originally planted. Be this as it may, this old avenue forms a fitting approach to the palatial mansion to which it leads. A sight of the building as it is approached conveys the idea that whoever chose the site had an eye to the comfort a sheltered position affords, to which none appear to have been more alive than the religious communities of old, who seldom made any mistake in the positions which they selected for their habitations. Seen from the different roads by which it is reached the house has the appearance of standing in a land-locked valley, yet the space immediately surrounding it is sufficient in extent, before the ascent in each direction begins, to prevent a feeling of too much confinement. A priory of Augustinians, founded about 1270, occupied the spot where the mansion now stands; after an existence of some 250 years it was dissolved, and in 1540 was bought by Sir John Thynne.

From an interesting account of Longleat by the Rev. J. E. Jackson, rector of Leigh Delamere, it appears that the present building was begun by Sir John Thynne in 1568; operations were continued for about ten years; he died in 1586, at which time it would seem most of the external work was completed, but only part of the interior, which was finished by his successors. It is a noble structure, partaking mostly of the Italian style, as will be seen by the accompanying illustration, and is in excellent preservation, having well withstood the long wear of the 300 years that have elapsed since its substantial walls were raised. The dimensions are 220 feet long by 180 deep—a large building, but by no means too large to accommodate the numbers that on several occasions have been gathered under its roof. Soon after it was built Queen Elizabeth visited the place;

Hooper's and The Covent Garden Seed Warehouse. Splendid Seeds at Low Prices. Catalogues free by post.

Charles II. was there—each, no doubt, following the fashion of the times, would have a host of retainers. George III., accompanied by several of his family, came to Longleat in 1789, at which time it is said that 125 people slept there; on the two days of his stay an extraordinary amount of feasting went on. In 1881 the Prince and Princess of Wales and suite spent the greater part of a week here, during which a ball was given in the great hall, at which 600 guests assembled. In 1883 there were three weeks' rejoicings at Longleat to commemorate the coming of age of Viscount Weymouth, eldest son of the Marquis of Bath. These were brought to a close by a day of amusements in the park, with a luncheon of which over 1100 friends of the family and tenants on the estate partook. In the evening huge bonfires on the hills in the surrounding neighbourhood and fireworks in the grounds brought to a conclusion a series of festivities on a scale such as is seldom carried out.

The grounds are in keeping with the style and extent of the mansion. The whole extent enclosed is some 16 miles round; this includes about 5000 acres of woods, which mostly occupy the high surrounding land, more especially on the eastern side. Within the grounds there are 16 miles of private roads. The great extent of surface occupied by the woods might lead any one who has not seen the place to suppose that there was a deficiency of open space, but this is far from being so—long, broad, irregular expanses of grass meet the eye at every turn, the groves and groups of fine old trees that have reached maturity, and also those of less age, have been well placed with a view to effect. As might be expected in an old place of this character, Elm, Oak, Ash, Beech, Lime, and Sweet Chestnut, predominate in the positions of most importance, and from the proportions they attain evidently like the soil; but most of the hardy deciduous, as well as evergreen trees, do well.

One of the features of the place are the extensive sheets of water, five in number, succeeding each other in irregular line; these have been formed by damming at intervals the stream which follows the course of the valley from south to north on the eastern side at some distance from the mansion; the largest of these—that which is opposite the building—is some half mile in length. On this side the lawn, which occupies the intervening space between the house and the water, descends considerably; there is here a large flower garden very effectively planted with the usual kinds of summer bedding plants; in addition to this there are a number of large beds dispersed over this part of the grounds similarly filled, which, combined with the flower garden, have a gay appearance. By the side of a long walk running northwards from the east front of the house there is a border bright with blooming plants.

On the north front there is a space of grass, interspersed with shrubs, and beyond this a large garden arranged in the old Dutch fashion, filled with evergreens in rows, consisting principally of Yew, Box, Berberis Darwinii, Holly, Cotoneaster, and the like, with narrow gravel paths between and grass verges. The shrubs are kept closely clipped to about a foot in height, and the whole is as angular and formal as this terribly unnatural style of gardening demands. At all events it serves as a living illustration of the fashion prevalent 200 years ago, about which time this garden seems to have been made. Northwards from this stands the Orangery, now principally filled with Camellias. Near here is a lawn-tennis ground; the spot for this is well chosen, as here there is an absence of the disquiet that a dead level space in a conspicuous position on a lawn often produces. Further in this direction a walk follows the side of the water, wherein is an

island occupied by tall trees, in which a colony of herons build. Retraversing this walk, one cannot fail to notice the beauty of the rising slope on the opposite side of the water, stretching for a long distance past the mansion, with its broad expanse of grass relieved here and there by groups of trees, and backed by the dense woods that clothe the summit of the ridge, giving shelter from the eastern blast—an essential that it behoves the planter not to lose sight of.

To the right of the entrance front of the building, at a short distance away, a walk commences that leads through the pleasure-grounds, which run in a southern direction; here, associated with deciduous kinds of trees, are numbers of the best Conifers, that have attained a goodly size. Amongst these may be named *Cupressus macrocarpa*, nearly 50 feet high; *Taxodium sempervirens*, 60 feet; *T. distichum*, over 60 feet; *Abies Menziesii*, 60 feet; *Salisburia adiantifolia*, 65 feet; *Dacrydium Franklini*, 30 feet. In the high woods adjoining, westwards, there are numbers of Silver Firs that run from 115 to 125 feet high, magnificent trees with massive trunks and still in a thriving condition. In many parts of the grounds there are trees of unusual size, noticeable amongst which are *Liriodendron tulipiferum* (the Tulip tree), the largest of which are nearly 100 feet in height; Oak, girthing 24 feet at 4 feet from the ground; Elm, 120 feet high, girth 26 feet at 4 feet from the ground; and many others only a little less than those named are in a healthy thriving state, and to all appearance are likely to keep on growing for an indefinite time.

The natural formation of the land, with its undulating surface, has done no little in making the work of the planter so successful here; this is not alone perceptible in the grounds in immediate proximity to the dwelling, but also in the more outlying parts, which are equally deserving of notice. Especially is this so in the eastward direction, which is reached by the road that leads from the entrance lodge already mentioned, through the village of Horningsham, which, by the way, demands a few words. It is somewhat extensive, the houses being picturesquely scattered on each side of the road for about a mile. Some of the roofs are thatched. The whole present a neat appearance, such as is rarely met with. This in no little degree is owing to the way that they are covered with climbing plants, consisting of Ivy, *Escallonia macrantha*, *Cotoneasters*, *Roses*, *Clematis*, *Honeysuckle*, and the like, which clothe the walls so as scarcely to leave a bit visible. The uniformly beautiful condition these present is in no little owing to the interest which the Marquis takes in their appearance, and who provides the labour to keep the plants in order.

After passing the village the road bears to the left northwards, traversing the wooded ridge in the direction of Warminster; the trees are not, as usually seen, in an unbroken line flanking the road, but in many places are sufficiently far away to leave room for flowering plants such as *Cotoneaster Simonsii*, *Deutzia crenata*, *Spiræas* of sorts, and similar things planted in masses, each kind separately, with masses of red *Dogwood* and *Pampas*-grass introduced amongst them. At some distance in this direction there is one of the many divergent roads that leads to the various points of interest within the grounds: that to the west from this point leads to Heaven's Gate, where the finest view of the place, as well as the country westwards, presents itself. Here, from an open space in the wood, high up as from the vantage point of an amphitheatre, the panorama of Longleat at once breaks on the eye, whilst in the far distance may be seen the tower on the Mendip Hill and Amerdown Park the seat of Lord Hyllon.

Returning to the Warminster Road, the drive

is flanked right and left by dense masses of *Rhododendrons* and other flowering shrubs, with quantities of the best kinds of Conifers, young trees, growing freely. Again, reaching the main road, there is another that leads from it at right angles to Sherwater. Here the descent is rapid, through immense breadths of old woods on each side, principally Oak and Beech.

Further on, entering the valley, which here runs eastwards, the character of the planting is quite different; broad stretches of Silver Firs and old Scotch Firs occupy the higher portions of the slopes, whilst quantities of the newer kinds of Conifers are on the lower ground. These consist of *Cedrus Deodora*, *Cryptomeria japonica*, *Thuopsis borealis*, *Wellingtonias*, &c. These are growing like Willows in the bottom of the valley, where soil and shelter alike suit them. Still further in this direction is Sherwater, a piece of water some 40 acres in extent, which has been formed by constructing a dam across the valley through which runs a stream, the water of which is thus held. It is a favourite place with tourists, who, by permission, are allowed the use of the boats kept on this miniature lake. Near at hand is the village of Crockerton, passing through which and turning to the left the way leads back westwards through an extensive tract of woodland, until it again joins the Warminster Road, where, some distance further northwards there is another entrance to the park at about 2½ miles from the house. Entering at this point the road in places has a steep descent. Here again the views that keep on continually presenting themselves are alike beautiful and varied; wide open glades stretch out in different directions, with fine trees grouped in masses, such as their respective positions happen to require: the road thus continues until it reaches the mansion. Another road from Frome, which is some half dozen miles distant, enters the park on the western side, and continues until it joins the others near the house.

THE FRUIT HOUSES.

Few places can boast of such Grapes as are now grown at Longleat. The principal range of vineries is span-roofed, in three divisions; the first of these, commencing at the northern end, is between 50 and 60 feet long, by 30 feet wide; it is filled with Black Hamburgs carried this season an immense crop of fruit, beautifully finished, the bunches collectively very much larger than usually borne by Vines of their age. (They, like those in the two other compartments, have been planted sixteen years.) Many of the bunches would run from 6 to 7 lb. The central portion, nearly 90 feet long, contains four Muscats, each Vine here as in the rest of the range, occupying much more space than is generally given, were also bearing a magnificent crop fast coming to maturity, and promising to colour well; the bunches were very large, not a few would reach half-a-dozen pounds each. The remaining division was filled with five Vines, two Black Alicante, two Lady Downe's, and one Mrs. Pince; the crop they were carrying was similar to that in the first and second divisions, and quite equal to them for the size and beautiful finish of the fruit. The bunches of Lady Downe's were larger than one often meets with, and so even as to show that there had been an absence of scalding to which this favourite late variety is so liable. The Alicantes were as large and handsome in the bunch as this handsome Grape is when well managed; whilst the crop of Mrs. Pince was unusually well finished, the berries large, black, and even. Mr. Pratt may be complimented on having in this range a crop of Grapes such as is not often seen.

In a range of old-fashioned hip-roofed houses, in several divisions, the first is filled with Peaches, the earliest forced. Next to this is

the earliest vinery, the crop of which had been cleared some time. The adjoining house was filled with Melons; this, like the rest of the range, is about 40 feet long, yet three plants occupied the house. Mr. Pratt gives all his Melons much more room than many growers think necessary; each plant is in a brick pit, from 3 to 4 feet square; in this way they keep on bearing all through the season. When I saw them about the middle of August they were carrying a beautiful lot of fruit. The sort principally grown is one of Mr. Pratt's raising, and bears the name of Longleaf Perfection; it is a cross between Eastnor Castle and Meredith's Hybrid Cashmere, and is a fine kind in every way, a free bearer, the fruit good-looking, and highly

their endurance in a cut state being not the least merit they possess.

The walls are extensive and covered with the usual kinds of fruit trees, Pears especially were carrying good crops. In the principal division of the kitchen garden there is a very useful contrivance for preserving bush fruits from the birds. A border against a north wall, some 80 yards long, and 4 wide, is planted with Currants and Gooseberries; the former are standards, there are three rows of them, and three of Gooseberries, mostly Red Warrington; on the wall are Morello Cherries. The whole is enclosed with a wooden framework consisting of light rafters resting on posts about 4 feet high in front, and on the wall at back: over this

STYRAX JAPONICUM.

THIS is a hardy deciduous shrub, whose appearance should be a passport to public favour, and yet it is very little known even in nurseries. We have spoken of it as hardy in ordinary winters, how it would be affected by such phenomenal winters as ushered in the present decade we have no information. The bell-shaped white flowers, loosely arranged in panicles, give the shrub a very elegant appearance, more so than in the case of the European species, *S. officinale*, also almost banished from our gardens. The nearly allied *Halesias* fare no better. It is the exception rather than the rule, to meet with them in spite of their hardiness and their beauty. *Styrax officinale* formerly supplied a fragrant resin used in perfumery, but this is now replaced by a similar substance procured from

FIG. 166.—STYRAX JAPONICUM: HARDY SHRUB; FLOWERS WHITE.

flavoured. After these comes the second Peach-house. Another house is devoted to Figs.

Several houses are filled with flowering and fine-leaved plants, the latter consisting of large quantities of *Caladium argyrites*, *Dracenas*, *Crotons*, *Pandanus*, *Palms*, *Ferns*, and the like, mostly small stock, best suited for hall and table decoration. One house, 60 feet long, is occupied by *Gardenias*, planted out, and *Eucharis amazonica*, of which there is a fine stock of strong, vigorous plants.

The useful *Dendrobium nobile* is grown in quantity, and so are the red and the yellow-eyed varieties of *Calanthe vestita* and *C. Veitchii*. These *Calanthes* with the *Dendrobiums* to follow, give through the late autumn and winter a succession of flowers, than which there are few more beautiful or generally useful,

strong galvanised iron wire netting, about 1/2-inch mesh, is permanently fixed, with doors and ends of the same material. In this way a very large quantity of fruit is secured without the trouble entailed by the use of the ordinary twine nets, which, to cover a space such as this, would give a considerable amount of labour annually, and which, in addition to the wear and tear of nets, would no doubt in the end be more expensive than a durable wire enclosure.

The kitchen-garden is about 9 acres in extent. Hardy fruit and vegetables, like the several other departments of gardening, are well managed, collectively giving evidence of the skill and attention brought to bear on their cultivation. *T. B.*

[For an illustration of the mansion at Longleaf, see separate Supplement.]

Liquidambar orientale, and called by the same name. For the specimen from which our figure (fig. 166) was taken we are indebted to Messrs. Veitch.

A PROLIFEROUS NARCISSUS.

IN that curious old book, *Horti Farnesiani*, by Tobias Aldinus, published at Rome, 1625, and which contains engravings and descriptions of certain of the rarer plants which were growing in the Farnese Gardens at Rome, is an excellent engraving (p. 98) of *Narcissus chalconicus* proliferus. It is very similar to pl. xxxiv. in Burbidge's *Narcissus*, a double *Tazetta* or *Polyanthus Narcissus*, with the very curious peculiarity of each flower having a satellite flower projecting from its calyx, as is the Hen and Chickens Daisy (only that each hen has but one chicken). This is a form of double double flowering

which I have never met with in my experience, and so far as I can learn it has not been noted by any writer of recent years. It will be interesting to learn if some of the large Dutch Narcissus growers have ever noticed it.

The Latin description, freely translated, states:—"We know of certain plants producing profliferous flowers, such as *Bellis profliferum*, *Chantia* (?), *Ranunculus*, *Anemone*, &c. My present intention is to give a plate of *Narcissus calcedonicus*, profliferous to the extent of one flower only. I could also have shown profliferous flowers of the section purple-lilac-Scabellus, which I sowed with us three years ago, but as I did not have them drawn, it must suffice to note it. But a flower of *Narcissus calcedonicus*, a picture of which we give, does not vary from the others, except that it produces another little flower from the inside of the leaves (sepals). The leaves and the bulbs are of the same kind as the others, amongst which, by chance, we found it, and as the flower is rare, we wished to give the drawing to the curious." *Wm. Brockbank, Brockhurst, Distbury.*

New Garden Plants.

SACCOLABUM GIGANTEUM (Lindl.) PETOTIANUM.

The large, very rigid flowers are of the purest white. I have never seen anything like it. It comes from Cochín China, and is now in flower with Mons. Godefroy-Lebeuf, of Argentail. It is inscribed to Mons. Petot, one of the most enthusiastic French Orchidists of our day. *H. G. Rehb. f.*

NEPENTHES.

HIGHLY specialised plants, or those with peculiar adaptations, fitting them for unusual conditions of life, command the attention of naturalists of all ages, and people in general, in proportion to the amount of their singularity, and the extent to which their life histories are known as well as their special physiology. We are so accustomed to seeing adaptations in the animal world, that it ceases to arrest our attention, and we are apt to attribute such phenomena to animals alone. As science progresses and knowledge gets disseminated, so are we able to obtain correct views of Nature.

The genus *Nepenthes*, containing over thirty well marked species, offers a specially interesting case, and is pre-eminently adapted for observation, for various reasons. In addition to the curiosity attaching to them must be added their showiness and suitability for garden decorative purposes as well as their amenability to cultivation. Their value as subjects for cultivation depends principally upon the pitchers; for although the flowers are more or less showy, the size necessary to attain a flowering condition militates against their being grown to such dimensions, except by the curious or those with plenty of space at command, or who are desirous of obtaining seed. Therefore it will be evident, that variety must be sought in the habit of the plant as a whole, but more especially in the form and colour of the pitchers. Amongst distinct species in cultivation there is no lack of diversity of form, but an examination of a considerable number of garden or hybrid varieties reveals a paucity of innovation, inasmuch as the progeny in most cases is traceable to a few original species, such as *N. Raflesiana*, *N. distillatoria*, and *N. phyllamphora*. The first-named, and undoubtedly the most popular, is extremely variable in a state of Nature, and together with its well marked variety *N. Hookeri*, has given rise by hybridisation to *Chelsoni*, *Dominii*, *intermedia*, *Outaniana*, *Lawrenceana*, *Williami*, *robusta*, and several others, the parentage of which is traceable by the general outline assumed by the sorts in question.

In all the above-mentioned hybrids, excepting *N. robusta*, the form most assuredly resembles *N. Raflesiana* figured in the *Botanical Magazine*, t. 4285, and the *Gardeners' Chronicle*, vol. ix., n. s., p. 177. This form it will be observed in all the pitchers of the lower part of the plant, is pouch-shaped, and tapers gradually from a wide bottom to the orifice without any contraction in the middle above a bulging base, observable in *N. distillatoria*, *N. Khasiana*, and *N. phyllamphora*, frequently employed by hybridists. The shape of both types specified will be found on examination to bear a definite relation to the space occupied by the secreting glands in the interior of the pitcher. In *N. Raflesiana*, and all those above described as conforming to it in shape, these glands occupy the whole of the interior with the exception of the space immediately beneath the

"peristome," or rim, and that part behind the pitcher which is more or less elongated supporting the operculum or lid. The sudden contraction observable about the middle, or below that in the *N. distillatoria* group, is present here at the termination of the glandular surface, and close to the orifice as already indicated. This part interiorly is glassy smooth and glaucous, and known as the conducting surface. *N. Veitchii*, *N. ampullaria*, *N. bicalcarata*, and *N. Khasia* are species agreeing with this type, and although they differ considerably in their proportionate lengths, they all agree in the extent of surface occupied by the glands in the conducting surface being reduced to a minimum, and in the contraction at the termination of the glands occurring close to the peristome. The other type, much used by the hybridist, and represented by *N. distillatoria*, has pitchers more or less amplified or swollen in the lower part, and then suddenly contracted somewhere near the middle. The termination of the glandular surface corresponds exactly to this contraction, so abruptly differentiated is it from the non-glandular conducting surface which is also denoted by a different colour. Besides those already given, *N. sanguinea*, *N. Mastersiana* × *N. gracilis*, *N. Reinwardiana*, *N. Edwardsiana*, *N. Kennedii*, *Hookeri* × *N. Morganae* × *N. superba*, and numerous others, both species and hybrid sorts agree in the distribution of the glands. For garden purposes this distinction is obvious, and serves to give variety as much as colour does.

In connection with both these types, two forms of pitchers are often produced on the same plant. Near the base, broad-bottomed pitchers are developed, and these would, in a state of Nature, rest on the ground, but as the plants climb up, and the pitchers are swung in mid-air, a long, curved base is developed, giving them a trumpet appearance. This may be seen in the figures already referred to, and also in the case of *N. Northiana*, figured in the *Gardeners' Chronicle*, December 3, 1881. It is evidently designed to strengthen the connection between the pitcher and its slender stalk, which would otherwise be liable to be broken away by the weight of liquid contained in the pitchers, by animals drowned in it, and by others seeking the spoil. Owing to the custom of keeping the plants low by pruning this trumpet form of pitcher is less noticeable than the other. It seems to be a constant character, however, in *N. phyllamphora* and some others to have a greatly curved tapering base. The distribution of the secreting glands is not affected by it. In *N. ampullaria*, where the stalk supporting the pitcher is very short, it is less material whether this tapered elongation of the base occurs or not. Judging from dried specimens of *N. Pervillei*, a species from the Seychelles apparently not yet in cultivation, the pitchers are remarkably funnel-shaped, dilating gradually from a narrow base to a wide open mouth, and 3 to 7 inches long with a width of 1½ to 2½ inches at the orifice in a dried state.

The wings serve as another important feature in giving character to various forms of pitchers. They are, however, variable in different species and at different ages of the plant in the same species. When plants are allowed to run up, the wings of pitchers borne on the upper part have a tendency to become much reduced in width or altogether obsolete. This is the case in several already mentioned, together with that fine, but rare species, *N. sanguinea*, figured as early as 1849 in the *Gardeners' Chronicle*, p. 580, and again in vol. ii., n. s., p. 13, besides other works. By reference to the figure of *N. Northiana*, there seems to be no reduction of the wing in the trumpet-shaped pitchers with tapering hooked bases.

In seeking to secure variety the cultivator should attend to all these leading characteristic features, but more especially the hybridist who desires to infuse fresh attractions or striking novelty into his seedlings. The degree of hairiness is sometimes of importance, as exhibited by *N. Veitchii*, *N. villosa*, and *N. Raflesiana* var. *nivea*. The latter would seem a desirable variety to introduce, on account of its being filled with white hairs. Under the microscope the hairs of ordinary sorts present some remarkable and curious forms. They are usually much branched, and resemble brown star-fishes in some cases, and miniature plants in others, having a central axis furnished with gracefully arching or spreading leaves.

The rim is sometimes elaborately developed, and becomes a feature of prime importance as far as conspicuousness and variety of form is concerned. It adds materially to the distinctness and value for garden purposes of *N. Veitchii*, and the same, no doubt, will apply to *N. Northiana*, and in a measure to *N. Khasia*, when good-sized pitchers are obtained in a state of cultivation. The latter is figured in the *Gardeners' Chronicle* for October 15, 1881, from a native specimen, and also from a seedling raised in this country. Two species not yet introduced to cultivation would furnish a novel feature amongst their numerous curious congeners already inhabiting our stoves. The pitchers of *N. Edwardsiana* often exceed a foot in length, and the orifice is surrounded by a complicated spiral-looking rim resembling a large

screw. The pitchers of *N. echinostoma* are 8-10 inches long, while the peristome is developed into a dense array linear acute processes about half an inch long.

The two spurs of *N. bicalcarata* already in cultivation are developments of the rim, and the same thing may be observed in other species, though in a more incipient degree. *Z. F.*

BOMAREAS AT KEW.

OVER fifty species of *Bomarea* are known to science, of which a few only are in cultivation—a neglect they by no means deserve considering the showy character of the flowers of many species, their long-lasting properties and the little difficulty attending their cultivation. They closely resemble their near allies, the *Alstroemerias*, but are readily distinguishable by their generally taller, climbing, or more properly twining habit, regular flowers, and tuber-bearing roots, although it is yet undetermined whether or not this last character is prevalent throughout the genus. A few species have been described under the name of *Collasia*, but they do not differ from the type except in the shorter, more erect stems.

A greenhouse temperature is sufficient to grow and flower them to perfection. Many of them will also fruit under these conditions, and some are not only conspicuous and interesting in that state, but are highly ornamental. A good friable loam with an admixture of peat, or, what is better, well decayed leaf-mould, with sufficient sand to keep the whole porous and open, is all that these noble *Amaryllids* require in the shape of soil. They may be grown in pots while young or insufficiently rooted, but will give most satisfaction if planted out in a well-drained bed or border.

A number of species are so planted at Kew on a raised and brick-built border that also does duty for side-staging in the succulent-house. Prominent amongst these is *B. Carderi*, seldom seen without either fruit or flowers, and frequently bearing both. This is one of the more robust species, and has a very telling effect when the huge branching umbels hang down from the roof, displaying its large waxy tubular or funnel-shaped flowers. The outer segments are rose-coloured, while the inner are slightly longer and paler, but more profusely spotted with purplish brown. The fruit is hexagonal, attaining a large size, and assuming a yellow colour as it approaches maturity. An inflorescence is figured in the *Gardeners' Chronicle*, 1876, vol. v., p. 793, and fruit in 1879, vol. xiv., p. 617.

B. Caldasiana occupies a similar position to the last, trained up the end of the house close to the glass. The stems attain a considerable length, bearing at their apex a simple umbel of highly coloured flowers. The outer segments are orange-scarlet, while the inner are much longer and bright yellow, attractively spotted with small red dots. It is not, however, so persistent a bloomer as *B. Carderi*. There is a figure of this species in the *Botanical Magazine*, t. 5442.

The inflorescence of *B. patococcensis* is also simple with numerous flowers of a nearly uniform rich crimson. Variety is secured in the colour, but this is of secondary importance when the periods of flowering in different species do not coincide. The most serious objection to this species, as well as *B. Caldasiana* and some others, is the length of stem, carrying the flowers so far above the eye of visitors. This evil might be remedied or modified to some extent by a timely arrangement of the upper end of the shoots previous to flowering; for, these, like all the rest, flower at the apex only. There is a figure of *B. patococcensis* in the *Gardeners' Chronicle*, xviii., p. 187, under the name of *B. conferta*.

The comparatively short slender stems of *B. oligantha*, coupled with its free flowering habit, as exhibited in the Kew plants, render this species a desirable one where space is limited. The name signifies few-flowered, and some descriptions say the umbels are one or two flowered, but from eight to twelve are most commonly produced. The outer segments are spatulate and orange-scarlet; and the inner ones somewhat longer, much broader, and bright yellow, spotted internally with small blood red spots.

Bomarea Shuttleworthii has a bold branching inflorescence of orange-scarlet or vermilion flowers. The outer segments are somewhat spotted, and nearly

equal to the inner segments, which are red and yellow, spotted near the tips with a dark colour. This handsome species would contrast well with *B. Cardeti*. The Kew plant is not sufficiently strong to flower, but a figure may be seen in the *Gardeners' Chronicle*, 1882, January 21, figs. 11 and 14, p. 77.

B. edulis was described by Herbert, and was amongst the earliest introductions of the genus. It is also known as *Alstroemeria oculata*. The flowers are more or less crimson tipped with green; and the plant is further recommended to the notice of cultivators by the showy character of the seed. When the capsule is mature it splits open along the truncate apical end, exposing the numerous round seeds, the testa of which becomes pulpy and bright scarlet. The fruits are in this condition at the present time, and render the plant noticeable in the dull winter season. The plant was originally introduced in 1806, and is figured in the *Botanical Magazine*, tab. 1613.

A small plant of *B. Williamsæ* has been flowering more or less for months. The flowers are about 2 inches long, and produced in a branching umbel, which is said to attain large dimensions in full-sized specimens. The perianth segments are rose-coloured, more or less spotted. The stem and leaves betoken a robust habit of growth, and the small plant its free flowering character.

B. frondea and the following species have tall leafy stems, and although not so free flowering as several of the above mentioned species, are distinct and more or less showy in their way. *B. frondea* has funnel-shaped flowers with deep yellow outer segments, while the pale yellow inner ones project half an inch beyond them, and are beautifully spotted. It is figured in the *Gardeners' Chronicle*, May 20, 1882, p. 669, fig. 102.

B. acutifolia is another old introduction, and seems to vary considerably in the colour of the flowers in a wild state. The outer segments vary with deep orange and some shade of yellow, while the inner ones are paler and more or less spotted. Several varieties have been figured from time to time in the *Botanical Magazine*. *J. F.*

THE GIANT BROMELIADS OF CHILI.

In a hasty notice (*ante*, p. 296) of the paintings of Chilean flowers and vegetation recently added to the Marianne North Gallery at Kew, I ventured to suggest that the gigantic yellow and blue-flowered *Puyas* might be merely varieties of the same species. I thought this might be so, partly because both Molina and Gay mention only one species, and partly because I failed to find any differential characters that seemed to be of specific value in the meagre herbarium specimens and the reduced figures in their *Journal*, the *Botanical Magazine*, and elsewhere; but I was in error. I had overlooked a life-size painting, placed in the porch of the gallery, of the inflorescence of one species; and Miss North subsequently pointed out to me easily recognised differences in the foliage by which the blue and yellow-flowered *Puyas* may be distinguished from each other. On consulting the literature of the subject, I see that there is great confusion in the synonymy of these two large Chilean species of *Puya*, in consequence of Molina's original name having been sometimes applied to one and sometimes to the other, and sometimes apparently to a combination of the two. By beginning with the earliest author, and comparing his description with later descriptions and figures, and Miss North's paintings, I am able to give what I believe to be the correct history and synonymy of the two species which exhibit the following distinctions:—Leaves straight, green on both sides; flowers yellow. *P. chilensis*, leaves recurved, glaucous beneath; flowers blue. *P. Whytei*, Molina (*The Geographical, Natural, and Civil History of Chili*, English edition, p. 130), gives a popular description of a plant bearing the vernacular name of *Puya*, which name he proposed to retain as the botanical appellation of the genus he there formally founded for the plant in question. On p. 288 of the same work, there is a very brief Latin description of the genus *Puya*, with which is coupled the specific name of *chilensis*. Although the description is meagre and imperfect, it is not difficult to understand that it applies to one of the noble Bromeliads with which later botanists have associated the name; and as he states that the flowers of his species were yellow, there can be no doubt which of the two now known should

bear the name *chilensis*. Then, as now, the trunk was used as cork throughout Chili, and Molina mentions that the inflorescence attained a height of 9 feet. Although Molina was the first to give the plant a botanical name according to the binomial method, he was not the first to publish an account of it, for Penille's described and adequately figured it in 1725 as *Renalemia ramosa lutea foliis spinosis*. In the second Spanish edition of his work Molina changed the specific name to *suberosa*. In 1795 Ruiz and Pavon (*Systema Vegetabilium Floræ Peruviana et Chilensis*, p. 81) reduced it to their genus *Pourettia*, with the specific name *coarctata*, whilst Gay (*Flora Chilena*, vi., p. 11) restores Molina's generic name, but retains Ruiz and Pavon's specific appellation of *coarctata*. All this synonymy, with the additional name of *Pitcairnia coarctata*, Persoon, is correctly given in the *Botanical Magazine*, plate 4715, which was drawn from a plant that flowered in a cool stove at Kew in 1853. Philippi (*Linnaea*, xxxiii., p. 246), describes a species of *Puya* with a stem 10 to 15 feet high, and having straight leaves, green on both sides, and yellow flowers, to which he gives the name *gigantea*. I have no doubt that this is the true *P. chilensis*, and also that Philippi's "emended description" of *P. coarctata* in the same place refers to *P. Whytei*, for he says, "foliis recurvis subtus argenteis, petalis pallide viridi-ceruleis."

The first publication of the species having blue flowers and recurved leaves, glaucous beneath, is, as far as I can discover, in the *Botanical Magazine*, plate 5732 (*P. Whytei*, Hooker), which was drawn from a plant imported from Chili by Messrs. Veitch through Mr. Mark Whyte. It is there suggested that the *Puya cerulea*, Miers (*Botanical Register*, 1849, plate 11) may be the same, but that, from specimens preserved in the Kew Herbarium, appears to be a *Pitcairnia*, which differs in habit as well as in the seed-vessel from *Puya*, which should be restricted to plants of the type of *P. chilensis* and *P. Whyte*.* See also *Gardeners' Chronicle*, October 1, 1881, xvi., p. 437, fig. 82.

The synonymy of these two species may follow here:—

1. *Puya chilensis*, Molina, syn. *P. suberosa*, Mol.; *P. coarctata*, Gay; *P. gigantea*, Philippi; *Pourettia coarctata*, Ruiz and Pavon.
2. *Puya Whytei*, Hooker, syn. *P. coarctata*, Philippi, not of Gay.

The Marianne North paintings include life-size representations of the inflorescence of both species, as well as the reduced plants in several landscapes, from which it is evident that they have never yet attained their full development under cultivation in this country.

Besides the foregoing there is one other Chilean Bromeliacea in the collection, which I think may be the *Puya rubricaulis*, mentioned in the *Botanical Register* in the text referring to *Puya cerulea*, and of which there is a dried specimen in the Kew Herbarium, though no description of the plant under that name has been published that I can find. It must also be near *Puya paniculata* Philippi (*Linnaea*, xxxiii., p. 247), but that is described as having bracts much shorter than the pedicels. *W. B. Hemslry*.

ORNAMENTAL BERRY-BEARING PLANTS.

(Continued from p. 718.)

HAVING in previous numbers directed attention to the larger growing trees and shrubs with ornamental fruits we will now conclude the subject by bringing under notice some of the dwarfier growing kinds that at the present season are almost invaluable for rockwork and border-decoration.

PERNETTYAS.

Amongst these the various *Pernettyas* are undoubtedly the most popular, and deservedly so, for whether in the embellishment of rockwork or for planting in the front lines of shrubberies, or narrow sunny beds, they certainly stand pre-eminent. The diversity of colour in the fruit is simply astonishing, ranging as they do from white to deep blackish-maroon, the intermediate tints of pink and deep crimson being especially effective. In all the varieties the berries are the size of large Peas, hang in massive

clusters all along the erect branches, and if left unmoisted remain in good form for a considerable time, even until the plants are producing their new buds in spring. Some of the most distinct varieties are as follows:—*Alba*, with white berries; *nigra major*, a distinct form with black berries; *purpurea macrocarpa*, purple, large-sized fruit; *rosea macrocarpa*, bright rose berries; *lilacina*, light lilac, effective and pretty; with hosts of others that space will not permit our mentioning. Whilst advocating the extensive use of these varieties we must not forget a word in favour of the normal form, *P. mucronata*, which as a neat evergreen bush that during the winter and spring months is literally smothered with purplish-red berries, has few equals amongst ornamental shrubs. Good sandy, well-drained loam, with or without the addition of peat, will meet the requirements of these plants well.

GAULTHERIA PROCBMENSIS.

A low-growing, almost prostrate plant when seen at its best, with the bright scarlet berries peeping from amongst the pleasing crisp foliage, which seem to concentrate nearly every conceivable tint between green and red, is indeed a desirable border or rockwork shrub that, unfortunately, one sees but far too seldom. Peaty soil suits it well, but in this respect it is certainly far from particular, the finest bed we have ever seen being in the grounds of the North Wales University College at Bangor, where the soil is loam of a very ordinary quality lying at no great depth on shaly rock. *G. nummularifolia* can scarcely be overpraised, for whether in flower or fruit, both of which are borne profusely even on young plants, it is a distinct and ornamental acquisition to any peaty bed or border.

SCIKIMIA JAPONICA.

not less valuable for its bright scarlet berries in autumn than for its terminal panicles of fragrant whitish flowers in spring, is a low growing evergreen with Laurel-like leaves and a good habit. Just now, when the stout short branches are literally covered with berries, the plant is very effective, and never fails to attract the attention of even the most unobtrusive. Loamy soil and a sheltered northern aspect are its chief requirements, at least these are the conditions under which it succeeds in our home nursery here, where, at present, a narrow border is quite a glow of red from the large production of fruit. Birds are particularly fond of the berries, indeed, more so than those of almost any other shrub, which is year after year found out on the weather becoming the least severe, when, in a few days, the bushes are quite stripped of their beauty.

THE MEZEREON (DAPHNE MEZEREUM).

with its beautiful coral-red berries, is perhaps never more effective than when grown in cool moist soil alongside a running stream, having then a very different appearance to what it presents, as usually seen in hot, dry borders, and in company with other shrubs. A clump or bed planted in this alone in some cool partially shaded position, is sure to form a most attractive feature, either from the sweet-scented blossoms, which are produced in quantity when few other shrubs are in flower, or the beautiful bright red berries that usually are produced in such rich profusion towards the end of the year. There is a white-flowered variety which is even prettier, certainly choicer, than the ordinary purple, and its berries are of a soft amber colour, thus offering a marked contrast to the coral-red of the normal plant. Well do I remember some years ago when seeing a veritable specimen of this yellow-berried form—4 feet in height by about the same in diameter—literally covered with fruit, of feeling the inclination to rank it as the most perfect, and certainly not the least beautiful I ever had the good fortune to behold.

MARGYRICARPUS SETOSUS.

the bristly Pearl-fruit shrub, a trailing habited Rosaceous plant with bright evergreen foliage and snow-white, pearl-like fruits, cannot but be a favourite with all who have seen it. For rockwork it is particularly well adapted, being of a compact, neat habit, with small shining leaves, nearly white stems, and an abundance of fruit, which are carried nearly throughout the year. It is a rare plant, being as yet only found in a few collections, but when better known, and the reputed tender nature of the shrub dislodged from our minds, it will no doubt be more extensively used.

* What the *Puya gigas*, André (*Revue Horticole*, 1882, p. 244, fig. 74), is, is very uncertain; the flowers being unknown. It has the foliage of an *Agave*, with a flower shaft from 20 to upwards of 30 feet high.

A light, rich, vegetable soil suits it well, and placed on the rockwork, where the trailing stems and bright berries rest on a dark-coloured boulder, this singular plant will be found as ornamental as it is uncommon. A native of Peru, and introduced in the year 1829. *A. D. Webster, Penrhyn Castle.*

THE GENUS ODONTOGLOSSUM.

(Continued from p. 680.)

O. RUCKERIANUM is a very variable kind, running from the original form, figured at p. 204 of this volume, which first flowered with the late Sigismund Rucker, up to much showier things, many of which are cherished in collections with distinguishing names (see fig. 167). The flowers are white or cream-coloured, often tinged with pink, and always more or less marked with brownish-red markings. F. A. Phibbrick, Esq., of Oldfield, Bickley, received a First-class Certificate for a very fine form of it at the Royal Horticultural Society, April 26, 1881.

O. ODORATUM.—This is so variable that the circumstance has given rise to a multiplicity of names for what can only be regarded as one species, all having freely branched spikes of Hawthorn-scented flowers. The originally figured form is of the smaller flowered Venezuelan kind, which comes, too, from the forests of the Sierra Nevada of Merida 5000—7000 feet altitude. The *O. nævium majus* of *Folia Orchidacea*, described as coming from New Granada at a height of 8000 feet, is certainly a form of *O. odoratum*, with perhaps the whitest ground to the flowers of any. Various other forms have been imported from different localities, some of the finest figuring as *O. gloriosum*. The most beautiful variety of all perhaps is that robust flowerer which Messrs. F. Sander & Co. imported from Santa Martha last year. The flowers of most of the varieties of *O. odoratum* are light yellow marked with reddish-brown.

The following, also, in form and odour, or in some other peculiarity, have, in different degrees, traces of *O. odoratum* either directly or by affinity to some of the other varieties here enumerated:—

O. SANDERIANUM.—This lovely *Odontoglossum* has not yet been estimated at its full value. Later on, when it is well grown and producing its large branched spikes of over a hundred flowers, as seen on the dried specimens, it will be much prized. Its sepals and petals are of the form of a fine *O. odoratum*, yellow, marked with red disc, brown lip, showy, approaching that of *O. nevadense*; white, with bright crimson blotches. It is delightfully fragrant. It comes from the Sierra Nevada, altitude 7000 feet.

O. SCHILLERIANUM.—This, one of the most beautiful of the *odoratum* section, was described many years ago in the famed Schiller collection, since that it seems to have been lost, but has been reintroduced by Messrs. F. Sander & Co. It has stately branched spikes of numerous showy flowers, yellow, prettily marked with chestnut-red, and very fragrant.

O. CINNAMOMUM.—A very rare plant, certificated to Sir Trevor Lawrence at the Royal Horticultural Society in April, 1884. Flowers showy, closely set on upright spike; light yellow, marked with reddish-brown, the lip having a peculiar velvety patch in the centre. A very striking and distinct variety.

O. LEANUM.—This in general appearance resembles the last-named; its flowers are, however, much yellower, and have a quaint likeness to those of *O. pardinum*. The lip generally bears a bright brownish-crimson blotch. It was one of Messrs. Veitch's introductions, and they were awarded a First-class Certificate for it at the Royal Horticultural Society, March 28, 1882.

O. CROCIDIPTERUM.—A neat variety, resembling a smaller and slender form of *O. odoratum*; flowers creamy-yellow, prettily dotted and striped in small lines with brown.

O. DORMANIUM.—This is a very charming and rare variety, a few plants of which were imported by Messrs. F. Sander & Co. last year from Ocaña, altitude 7000 feet. It bears a profusely branched spike of pretty flowers, which may be described as intermediate between *O. crocidipterum* and *O. blandum*. Flowers nearly white, spotted and lined with bright crimson, base of the lip yellow.

O. BLEPHARICANTHUM.—A very curious little variety, blending the features of *O. odoratum* with a trace of *O. blandum*.

O. BLANDUM.—A pretty and distinct kind, with

slender sprays of white flowers marked with dark crimson. The lip is showy for the size of the flower, white, dotted at the base with purple.

O. CONSTRICTUM.—This is one of the smallest flowers of the section, but that is made amends for by the profuse manner in which they are produced, so that a good specimen of it, with four or five of its slender arching spikes, is by no means an insignificant thing. Sepals and petals yellow marked with brown, lip white.

O. CRISTATUM bears distinct features of column and crest, but to a florist's eye it has something of the appearance of *O. constrictum*, and has flowers of similar size. Sepals and petals dull yellow, marked with brown, lip whitish. Flower-spikes slender and arching. Native of Peru.

O. WALLISII.—This is a very elegant kind, with slender drooping spikes of unbranched or sparsely branched flowers, in appearance something like those of *O. Lindleyanum*, but thinner in substance. The sepals and petals are bright yellow, with a few brownish lines, column prominent and white, lip white, with violet spots.

material known to science except the diamond. These *corundum* rollers are made of special form and bevelled off to suit the angle which experience has shown to be the best adapted for cutting. They grind equally well wet or dry, are marvellously lasting, and give the greatest safest satisfaction to all users. Should they become dirty in process of time, through grease or gummy matter, they are easily cleaned by the use of water, or soap and water. The maker is Mr. T. Barraclough, 8, King Street, Manchester.

GARDEN PALMS.

(Continued from p. 567.)

HOWEA, Beccari.—This genus is composed of two species (according to Hooker one) of Australian Kentias, so-called, viz., *K. Fosteriana* and *K. Belmoreana*. In gardens it is usual to distinguish these two Palms from each other by the colour of the petioles, the former being said to have dark green, the latter red-tipped leaf-stalks or "stems;" or again, the plants with broad leaf-segments are called *K. Fosteriana*, and those with narrow ones *K. Bel-*

FIG. 167.—*ODONTOGLOSSUM RUCKERIANUM INSIGNE*.

O. W. PURUM is a bright light-coloured variety of the previously named, having a white lip tinged with lemon-yellow. The varieties of *O. Wallisii* are really pretty and well worth growing. The plant is by no means common, as no regular importation of it has been got over. *James O'Brien.*

A GRINDING MACHINE.

This machine is the result of a series of experiments made in order to obtain a light but strong portable machine, of simple construction, easily worked, and capable of grinding quickly, in the field, the sections of the sickles and knives of reaping and mowing machines, with great ease, in a thoroughly efficient manner. (See fig. 169.)

Every user of reaping and mowing machines knows from experience how very much better and more easily all sickles and knives cut when kept thoroughly sharp, when the cutting bevels of all the sections are uniform, and the heels well ground; also how much more and better work is done in a given time when the sickles and knives are kept constantly in first-class condition. The machines weigh 23 lb. each, and are specially adapted for use in the field.

The grinding stones or rollers of the machines are of the very best quality of *corundum*, the hardest

moreover. But, however convenient these divisions may be in a garden sense, they do not run parallel with the characters by which botanists distinguish two species, for we have had all four of the above characters among seedlings raised from one batch of seeds imported as *K. Fosteriana*. A third name for these Palms is *K. australis*, and which has been given to the form called *K. Fosteriana*. With reference to the species above named the following note is taken from Bentham's *Flora Australiensis*:—"F. Muellier distinguishes two species, the *K. Belmoreana*, or 'Curly Palm,' with the segments of the leaves converging upwards, and *K. Fosteriana*, or 'Thatch Palm,' with the segments hanging. The specimens, as far as they go, show no difference, and the distinctness of the two, whether as varieties or species, remains to be ascertained." Wendland considers that "*Kentia australis* is perhaps a good species, but *Fosteriana* and *Belmoreana* are doubtfully distinct."

Full grown plants have a stem 35 feet high, smooth, annulated, and bearing a crown of shining green leaves which are 8 feet long, pinnate, the segments numerous and acuminate and gracefully arching, as also is the whole leaf. The fruit is oblong or ellipsoid, 1—1½ inch long, the pericarp, when dry, like the husk of a Cocoa-nut, enclosing a seed the size of a Damson. Seedling leaves bipartite, usually the third leaf becoming pinnate.

The beauty and usefulness of these Palms is abundantly recognised by their being keenly sought after by nurserymen and plant decorators. They form pretty little table plants in about two years from seeds, and when grown on they assume a most elegant character, which, whether in the stove or exhibition tent, is rarely equalled by any other Palm. They require the treatment of tropical stove plants.

ments, which are broad on small plants, dark green and shining. As an ornamental plant this is frequently cultivated in gardens. It requires a moist tropical stove, where, with liberal treatment as regards water and soil, it soon develops into a majestic Palm.

H. Wendlandiana, Wendl. and Dr. (Kentia Wendlandiana, F. M.).—Tropical Australia.

FIG. 168.—CHAMÆCLADON METALLICUM. (SEE P. 750.)

H. Fosteriana, Beccari.—“Flat or Thatch-leas Palm” (Kentia Fosteriana, F. Mueller; K. australis, Hort.; Grisebachia Fosteriana, W. and D.).—Lord Howe’s Island.

?*H. Belmoreana*, Beccari.—“Curly Palm” (Kentia Belmoreana, F. M.; Grisebachia Belmoreana, W. and D.).—Lord Howe’s Island.

HYDRIASTELE, Wendl. and Drude.

Under this name is placed the beautiful garden

HYOSPATHE, Martius.

There are three species included under this, all natives of Brazil. They are not yet introduced into gardens, the plant known to botanists and cultivated in some gardens as *H. pubigera* being now placed under *Prestœa*.

HYOPHORE, Gærtner.

The three species included here belong to the most useful of cultivated Palms, as they are clean, free

prominently veined, and bearing near the base whitish hair-like scales; the whole plant being uniformly dark green. The latter plant has numerous tufted Bamboo-like stems, smooth, shining, arching, rather short leaves, the petioles of which are yellowish, hence the name *lutescens*.

H. amaricaulis is a very robust Palm even when young, and is easily recognised by its brown-tinted leaf-stalks and dark green segments. Fully developed plants have stems 60 feet high, bottle shaped, 2 feet in diameter at the base, and strong leaf-stalks bearing a pinnate blade 3 feet wide by 8 feet in length.

H. Verschaffeltii has apparently a trigonous stem when young (really the sheathing bases of the petioles, the true stem being round), and a petiole marked with a yellow band extending along its whole length; the segments of the leaves are a dark shining green, with a prominent central nerve. When full grown it has a stem 25 feet high, with a curious bulge at the base, where it is about a foot wide. The seeds are small, from $\frac{1}{2}$ —1 inch long, narrow, rounded, and marked with a few irregular lines. Seedling leaves bipartite.

H. amaricaulis, Martius (Areca speciosa and *Hypspathe amaricaulis*, Hort.), *Illust. Hort.*, xiii., 462.—Mauritius.

H. indica, Gaertn. (*H. Commersoniana*, Martius; *Areca lutescens*, Bory, not of gardens).—Mauritius;

H. Verschaffeltii, Wendl. (*Areca Verschaffeltii*, Hort.), *Illust. Hort.*, xiii., 462.—Rodriguez.

HYPHÆNE, Gærtner.

Although the plants of this genus are interesting botanically, owing to their stems being frequently branched or dichotomous, a character very rare among Palms, and economically from the ginger-bread-like rind of the fruit, which is eaten by the natives of those parts of Africa where the species are found wild, yet none of the species appear to have ever become established in European collections, notwithstanding their having been frequently raised from seeds, both at Kew and elsewhere, during the last thirty or forty years. Young plants of the “Doum Palm,” *H. thebaica*, are in the Kew collection at the present time, but these show a very stubborn disposition as regards growth, though they are now healthy enough. According to Dr. Kirk, some of the species are common to the maritime region, as is the Cocoa-nut, whilst others are found only inland along river banks. *H. thebaica*, according to Sir Joseph Hooker, is a native of a wide area along the eastern coast of the African continent.

As far as can be made out this species grows in sandy regions, though probably where its long tap-roots are within reach of a constant supply of water. At Kew, recent experience with young plants of *H. thebaica* show that an unusual amount of root-room is required as soon as they germinate, any attempt to cramp the roots in small pots proving fatal. A plant placed with the lower part of the soil in water, kept at a temperature of about 80° is healthier and more promising than others not so treated. A Palm which grows only to a height of 30 feet, the stem many times divided at the top, and bearing large fan-shaped leaves, is botanically, at all events, deserving of a great deal of attention, with a view to getting it established in this country. The form of the stem varies with the species, some being ventricose, others cylindrical, others dichotomous. There are no spines either on the stem or the leaf-stalks. The fruit is Pear-shaped, oblong, or curiously bulged at the base, and the seed is egg-shaped, and about 2 inches long. A fine series of the fruits of this genus may be seen in one of the museums at Kew. Seedling leaves long, strap-shaped, acuminate, curling somewhat, and growing along the ground.

H. thebaica, Martius (“Doum Palm”).—Upper Egypt, Nubia, Abyssinia.

IRIARTEA, Ruiz and Pavon.

This genus is now reduced to five species, one only of which is known to be in cultivation with us. They are handsome and very distinct Palms, both when large and when in a small state, suitable for ordinary plant-houses. The leaves are pinnate, and gracefully arched even on young plants; the pinnae are broad and short, premorsely cut, and are similar to those of the *Caryotas* and *Arengas*, but shorter, and often rounded like a fan. Young plants with half-dozen leaves are very ornamental. The species are found in the moist woods of Tropical America, where they attain a height sometimes of a hundred feet, the stems annulated and unarmed, crowned with a head of long narrow leaves, and elevated

Palm known as *Kentia Wendlandiana*, and described under that name in Bentham’s *Flora Australensis* as follows:—“A tall Palm, leaves many feet long, the segments numerous, unequal, the longest $1\frac{1}{2}$ foot long, the upper ones confluent at the base, all or mostly jagged or toothed at the apex. Fruit ovoid or globular, when dry about 4 lines in diameter, and longitudinally striate, with prominent ribs, succulent when fresh, with a thin endocarp.” Young plants have the appearance of some of the *Ptychospermas*, both in habit and in the jagged apex to the leaf seg-

growers, very graceful when young, and form handsome specimens when large. Being natives of Mauritius and Rodriguez they require to be grown in a stove, though they may be frequently used for decorative purposes in houses without doing them much harm. There is in gardens some confusion with *H. indica* and the plant known as *Areca lutescens*, referred by Wendl. to *Chrysalidocarpus*. The former has a single stem, when full grown is 40 feet or more high, tapering, and about 6 inches in diameter; the leaves long, pinnate, the segments

FIG. 169.—GRINDING MACHINE: A, IN USE GRINDING REAPER-KNIFE; B, IN USE ON ORDINARY WORK. (SEE P. 748.)

upon a large cone-shaped cluster of thick roots which are developed from the base of the stem at an early stage, the lower part of the stem dying away, so that the stem has the appearance of having been forced up some feet from the ground by the pressure of the roots against the earth. The bark of these "aerial" roots is roughened like a grater, for which it is used as a substitute by the natives. The species are all reported to grow in wet places, so that under cultivation they require an abundant supply of water; they thrive only in a tropical temperature. The seeds are globose, about an inch long, the endocarp very thin, usually gelatinous (Spruce), forming a slightly oblong covering, and becoming almost black when old. Seedling leaves not seen.

I. deltoidea, K. and P. (*I. robusta*, Hort.).—Fera. Several garden Palms known as *Iriarates* are now referred to other genera, viz., *I. exorhiza* and *I. gigantea* to *Socratea*, *I. andicola* and *I. nivea* to *Ceroxylon*, *II.*

CHAMÆCLADON METALLICUM.

This is a handsome stove foliage plant of the Aroid family, introduced from Borneo by the Compagnie Continentale d'Horticulture, and figured in the *Illustration Horticole*, t. 59. It is a tufted plant, the leaf-stalks 2–3 inches long, purplish, and sheathing, the leaf-blades 3–5 inches long, 2–3 inches broad, elliptic-acute, bronzy olive green above, reddish beneath. The inflorescence is inconspicuous. For the use of the illustration (fig. 168) we are indebted to the Company.

The Apiary.

ON BEE LITERATURE.

THE winter evenings are now very long, and afford the very best time to purchase and read bee books. I am going to mention the names of the best English and American books, but before commencing allow me to say that every book mentioned in this article now lies before me, and as I have more than dipped into them your readers may rely on my statements.

One of the very best published in England, if not the best, is *The Apiary*, by Mr. Alfred Neighbour. This book has been through several editions, and the last edition has been almost entirely rewritten, and is thoroughly reliable and accurate. The *British Bee-keeper's Guide Book*, by Thomas William Cowan, Esq., is a very good little book indeed, and is written by one of our most successful bee-keepers. Other very good books are *Bee-keeping Plain and Practical* by Alfred Rusbridge, and the *Bee-keeper's Manual*, by the late Henry Taylor, and revised by Mr. Alfred Watts. Then we have the *British Bee Journal*, at present published fortnightly, but to be published weekly, commencing with January, 1886.

I have been greatly instructed by a splendid lot of books, published in the United States of America. It must not be forgotten that the Americans were first in the field with some of our most useful appliances, and the apiaries in America must be very extensive, and make one long to see them.

The Hive and Honey Bee, by the Rev. L. L. Langstroth is a very fine work on bees, and is indeed a classic. The only fault to find is that as it has not been revised since 1855 it is not quite up to the times, but Mr. Langstroth tells me he is bringing out another. He is very advanced in years. May he live to do it is our wish. *The Bee-keeper's Guide*, by Professor A. J. Cook, of Michigan State Agricultural College, is written by a scholar of the first order, and as the book sells so quickly fresh editions are constantly called for, and so the book contains everything required. A book that has highly pleased me is the *A. B. C. of Bee Culture*, by A. J. Root, Medina, Ohio. Mr. Root keeps the type always standing, and when he finds out anything fresh immediately puts it in type. *Bees and Honey*, by T. G. Newman, of Chicago, is an excellent book. It is rather smaller than the books before mentioned, but none the worse for that. Mr. Newman publishes the *American Bee Journal*, a weekly paper full of excellence. *Quinby's New Bee-keeping* is an excellent work. It has been revised by his son-in-law, L. C. Root. *The Bee-keeper's Text-Book*, by the Messrs. King, is a very nice little book, and sells well. The copyright has been purchased by King, Aspinwall &

Co., of New York; 55,000 copies have been sold. *Blessed Bees*, by John Allen, is a book well worth reading, and will make you open your eyes. My name was written in my copy by "John Allen" himself, who, by-the-by, is not John Allen, but a respected American clergyman. *The Bee-keeper's Handy-book*, by Henry Alley, is chiefly devoted to queen rearing, in which Mr. Alley has been very successful. In conclusion, the reader must not think the American books are arranged in the order of their merit. That would be very difficult to do. All these books can be purchased at Messrs. Neighbour's, in Regent Street and High Holborn. *Agnes*.

ORCHIDS FOR AMATEURS.

(Continued from p. 450.)

EPIDENDRUM.—4. THE BARKERIA SECTION (continued).

E. (Barkeria) spectabilis.—Stems, for they can scarcely be called pseudobulbs, quill-like, about 6 inches long, with two or three dark green leaves, alternating with each other. Peduncle surrounded at its base by a long sheathing scale-like bract. Flowers eight or ten in number, nearly 2 inches in diameter. Sepals spreading, all three directed upwards, lateral petals somewhat broader than the sepals directed downwards. Labellum broad and pointed. The whole flower is of a delicate lilac colour, with dark rose-purple spots on the labellum. It is a native of Guatemala, and flowers in summer.

E. (Barkeria) elegans.—Stems or pseudobulbs quill-like, 8 or 10 inches long, with four alternate sheathing leaves. Peduncle twice as long as the bulbs, green, blotched with purple, and sheathed with several scale-like bracts arising at intervals. Inflorescence a lax raceme of four or five flowers. Petals and sepals almost white within, and lilac-purple without, lip large, nearly square, with a long point. The disc of the lip has an oblong callus raised into three ridges. The limb of the labellum is nearly white, with a large purple blotch in its centre. The column is very broad, white, dotted with deep purple spots. Both the column and the base of the lip are stained with yellow. This plant is a native of Mexico, and it flowers in winter after the fall of its leaves.

E. (Barkeria) melanocaulon closely resembles *E. elegans* in its habit, but the stems are of a deep purple colour. The flower is rose-coloured to the callus at the base of the labellum, this and the column are pale green—the latter striated with deep purple. It is a native of Costa Rica, and flowers from June to September.

E. (Barkeria) cyclostella is intermediate between the two last-named species. The flowers resemble those of *E. elegans*, and the stems those of *E. melanocaulon*.

E. (Barkeria) Lindleyanum.—The whole plant resembles *E. elegans*, but the flowering stems are more slender. The flowers are of a delicate lilac colour, but the disc on the labellum is white and raised into a double keel. The column is clavate and narrowly winged, its apex is 3-lobed. It is a native of Costa Rica and Panama, and it flowers in September and October. A variety of this plant, *E. Lindleyanum Celsense*, from Panama, has the anterior half of the lip of a deep purple colour. It was named after Mrs. Cener, the wife of the Superintendent of the Panama Railway (*Gardener's Chronicle*, November 29, 1873, p. 1597).

E. (Barkeria) Skinneri.—A very floriferous species, the racemes often consisting of from twenty to thirty flowers. These are of a deep rose-colour. It is a native of Guatemala, and flowers in winter. A variety,

E. Skinneri superba, is described with larger and more brilliantly coloured flowers, in which the lip has a deeper colour, and yellow stripe at its base.

5. RADICANS SECTION.

The remainder of the Epidendrums have a very distinct habit, the stems are cane-like, and never assume the form of pseudobulbs. These are the most brilliant plants in the genus. They will do best with pot culture, and the greater number require a high temperature. In some the stems are semi-scandent, in others they are erect, and grow 3 or 4 feet high. In some a spathe surrounds the base of the flower-stem, the subgenus "Spathium" of Lindley, in others the spathe is absent. These form the

subgenera Amphiglottum and Euepidendrum of the same author. As the characters of these subgenera are somewhat recondite, and the characters seem to merge into each other, I have not attempted to separate them.

Epidendrum radicans (*E. rhizophorum* of Bateman, in *Botanical Register*, 1838).—This plant has long, climbing, jointed stems, rooting at intervals, with long white roots. The stems are leafless below, sheathed with scales, but bear numerous broad, subcordate, fleshy, sheathing leaves above. The inflorescence is terminal, and compressed into a globular head. The flowers are as much as 1½ inch across, and bright scarlet. Each head of flowers is from 3 to 4 inches in diameter, and as the plant flowers freely, it is one of the most magnificent in the genus. The lip has a yellow throat and it encloses the column, its limb is three-lobed, the lateral lobes sharply toothed, the middle lobe deeply notched (emarginate), and toothed.

This plant is a native of Guatemala, where it grows in the grass, it needs pot culture, and is most effective when trained over a wire-basket. The temperature of the East Indian-house is recommended, but it could hardly fail in the Cattleya-house.

E. Schomburgkii is closely allied to the last in habit and form of inflorescence. Its long reed-like stems are clothed with a double row of obtuse fleshy oblong leaves, often bordered with crimson. It emits no roots from the stems. The flowers are of a rich scarlet when they first open, but they ultimately become crimson. The sepals and petals are narrow and spreading, the lip is three-lobed, strongly keeled at its base and more or less lacinate in its limb. The form of the lip varies much, and it is often so deeply divided that it assumes the form of a circular disc surrounded by a deep fringe. It is a native of Demerara.

E. cinnabarinum is a third closely allied species, from Bahia. It only differs from the last in the wedge-shaped undivided central lobe of the labellum.

E. Wallisii resembles the three last in habit, but its tall stems, which are often 3 or 4 feet long, are clothed with leaves to the base. The stems are reed-like, and the leaves are thick and fleshy. The inflorescence is a compact raceme, and heads of flowers are not only produced at the extremities of the stems, but at intervals from the axils of the leaves. The flowers are 1½ inch in diameter, the sepals and lateral petals are of a deep golden-yellow, dotted with small distant crimson spots. The lip is fan-shaped, deeply cut into four divisions, white, and pencilled with leathery radiating lines of crimson. Mr. Williams recommends the Cattleya-house as the most suitable for this magnificent plant. It needs an abundant supply of water when growing, and, like the three last, may be most effectively displayed by training it over a wire basket. It is a native of New Granada, and the flowers are fragrant with a musky perfume.

E. ellipticum, also called *E. crassifolium*.—Stems long and reed-like, with scales below, and a double row of thick, fleshy, concave, oval leaves above. The flower-stem is terminal and covered with close sheathing bracts, and it bears a profusion of pale rose-coloured flowers in summer. This is by no means so handsome a plant as the majority in cultivation. It is from the Organ Mountains. A closely allied species, with narrower leaves and darker flowers,

E. elongatum, is a native of the West Indies. It is also sometimes cultivated.

E. svingothyrus.—This plant has reed-like stems, 3 or 4 feet high, with bright green distichous leaves, and a dense terminal panicle of deep purple flowers. The labellum is white. There are often as many as a hundred flowers on each stem. It is a native of Peru, and is found in damp places on the mountains at an elevation of from 7000 to 8000 feet. It, therefore, requires cool treatment, and it should be grown in the Odontoglossum-house. *Os. T. L.*

(To be continued.)

The Flower Garden.

HERBACEOUS BORDERS.

PLANTS may be divided and rearranged if required, and as most herbaceous plants flourish best in a deep and rich soil it should have some well decayed manure dug in between them, and if leaf-mould is put round the plants they will be protected from the frost.

SHRUBS AND PROPAGATING.

Now is a good time to put in cuttings of *Anacuba japonica*, *Eucynimus japonica* and its varieties; also *Laurustinus*, *Ivy*—green and variegated kinds,

Lonicera aurea reticulata, *Retinosporas* and *Thuia Lobbi*, *T. lutea*, *T. Hookeriaea*, *Thuopsis borealis*, *T. aurea variegata*, and *T. dolabrata*. I propagate the abovementioned plants in three different ways, first by layers, which make plants far quicker than by cuttings. In doing so clear round the bottom of each shrub, then place some light sandy mould on the surface round the plants to be operated upon, then take shoots a foot long and cut a notch or tongue, pegging them down firmly and cover with the light mould. In twelve months they will have made nice plants, and should be cut off from the stock plant and be planted in the beds. Cuttings root freely if put into frames, or under handlights placed under a north wall. Place at the bottom of the frame 3 inches of drainage, and on the top of that place 6 inches of light sandy mould, and 1 inch of sand on the top; all should be made quite firm. The cuttings, 6-7 inches long, should be of well ripened wood, avoiding strong pieces and that which is unripened.

After taking two or three leaves from the bottom of the stem, the end should be cut with a sharp knife, and the cuttings dibbled into the frame to the depth of 2 or 3 inches, about 3 inches apart, and all made quite firm, and should then be sprinkled overhead with a fine rose waterpot and afterwards when they require it; air on fine days. As soon as they are rooted the frame can be removed. I have succeeded well in striking the above mentioned plants by dibbling out under a northern aspect without the protection of frame or handlight, or by simply putting the cuttings into slight trenches about 3 inches deep, filling the trench with sand, and treading them firm at the finish. I find most of them grow under this treatment, and make nice little stuff fit for filling the flower-beds in winter, and when the plants get too large for that position they come in most useful for planting out into the pleasure grounds, &c. *Wm. Smythe, The Gardens, Basing Park, Alton.*

Plants and their Culture.

WATERING PLANTS.

This is a point in plant culture (in pots) that is frequently much neglected. I do not mean by this that an insufficient supply is given on the whole, nor that the other extreme is practised, but with an inexperienced man in charge, injury from the last-named source is far more likely to occur. With all beginners a proper knowledge of the requirements of cultivated plants should receive close attention, as much in regard to watering as in choosing the potting soil, and other necessities of plant life in pots. A study of the roots, their character, and mode of growth, their durability and relative numbers in proportion to the foliage of the plant, will all need to be considered; the character of the plant itself also requires to be looked into—rapid growth in any given genus as a rule denotes a proportionate supply of water to sustain its root-action, slower growth points to a more moderate supply, whilst in the case of plants of hard wiry growth (such as many of the New Holland plants or of greenhouse) the most careful attention is essential to maintain them in a healthy state, and with such, extremes must be avoided. One point in regard to the latter class of plants requires much attention, that is, any plant that has become pot-bound, if it has been well grown and good soil has been used, the ball will have become a compact mass of roots and soil, and most likely the roots will have taken firm hold of the surface soil. Now in such a case if there is not too much room left for the reception of water by reason of the plant being low in the pot, once or even twice filling the pot with water will not be sufficient to penetrate the entire ball; the result in such cases of omission to give water being a loss of those roots that have congregated around the drainage and lower portion of the ball of the plant. If this occurs with *Ericas*, or *Azaleas* for a few times, the issue by-and-by will be apparent in the development of puny diminutive flowers in the place of those of good size and strength. The slopping system of watering is bad with all plants, a little now and a little another time should not be tolerated in any case, and particularly so when dealing with plants of woody growth. Watering, too, is oftentimes hurried over in order to

get on with other work. Now when this occurs, the consequences will defeat the real object in view, viz., "ill-root" success. It is a bad plan to give a superficial attention at the watering, equally as much as it is to go to the other extreme and water plants against their needing any the next day. After a close observation of the requirements of each genus, the art of watering is simplified. The health of each individual plant will need to be studied, and its state at the root as to whether it has been potted lately or become pot-bound, must also be thought of. Plants that are usually grown in peat or in a compost in which this material is the chief component, will not as a rule bear to become so dry at the root during any season of the year as those that are grown chiefly in loam or manured soil. We have been induced to make these brief remarks now, knowing that all plants require a greater amount of attention in respect to watering (i.e., in a careful manner) at this season of the year, than at almost any other time. *J. Hudson, Gunnersbury House Gardens.*

FRUITS UNDER GLASS.

EARLY VINES.

THE time at which early Vines should be started into growth for the ensuing season will very much depend on the nature of the requirements. If a continuous supply of ripe Grapes is required all the year round the supply on hand must of necessity in the same degree rule the matter; if a sufficient supply of them on hand will meet the demands from now and onwards until the end of next April, there will be no necessity to start the first viney earlier than the first or second week in December, because those Vines will produce ripe fruit by May next, in readiness to continue the supply onwards. All those practically acquainted with forcing Vines very early know full well the trouble and expense it is, and the fatal consequences to which it speedily leads, and therefore it should be avoided as much as possible; neither is it absolutely necessary now-a-days, as it was formerly, before we possessed that excellent late kind of Grapes, namely, *Lady Downe's*; this variety, keeping, as it does, until May, has sensibly diminished the very early forcing of Vines, and plainly indicated the advantage of growing more late Grapes, which can be produced at much less cost in every way, and which answer the end for general purposes as well as tending to postpone forcing operations at least a month, and to a more reasonable period at which year after year consecutively Vines may be gently excited without being much impaired.

TREATMENT OF THE EARLY HOUSE.

Vines started now should be gently excited by keeping a regular temperature in the house of about 55° at night, and from 65° to 70° in the day time; in houses that will admit of a good heap or bed of fermenting materials being placed within it, this should be done, as by means of the vapour and genial condition produced, growth is more readily excited; under other circumstances it will be necessary to provide a genial state by means of sprinkling all available surfaces about the house occasionally when they become dry. Syringe the Vines early in the morning and at closing up time in the afternoon, on sunny days, freely ventilate, closing up the house at about 70°; fire-heat should only be used to keep up the heat at the points before mentioned.

POT VINES.

Where early pot Vines are cultivated they will at some places be considerably advanced in growth now; encourage it by giving the best attention to all matters in detail. Stop the shoots at the first or second leaf above the bunch and the lateral growths above the first leaf; keep the temperature at about 58° at night, and 70° in the daytime by fire-heat, and from 5° to 10° more by solar heat, when the house should be carefully ventilated so as to avoid a cold current of air. Diligent care in the moistening of heated surfaces should also be exercised, otherwise not only the leaves but the fruit when in a tender state may be irreparably damaged. At this advanced period it will be advisable to set the Grapes when they come into flower with a camel-hair pencil, especially any kinds which may be grown that are known to require it. If the pots are plunged in beds keep the heat regular at

70° to 80°. As soon as the roots become active encourage surface ones to the fullest extent: as soon as one layer of stuff is permeated by the roots add fresh material in a warm and lumpy state. This should be applied in a rough not compact form. Watering, which is the most important operation, must be done by well practised hands, or otherwise every care should be exercised in the matter. Tepid water slightly improved with guano or other manure, should be given whenever necessary, and of which a considerable quantity will be necessary when the plants are healthy and the drainage of the pots perfect. *G. T. Miles, Wycombe Abbey Gardens.*

The Kitchen Garden.

I HAVE not advised the sowing of Peas in autumn, having come to the conclusion that there is really no gain attached to this practice—in fact, generally speaking it ends in loss and disappointment. A south border should now be prepared (as soon as the soil is in condition for such work) in readiness to receive Peas to be turned out of small pots some two months hence. If the same south border has to be used successively for this crop a little fresh soil as well as manure should be added, such as old frame soil, or siftings from beneath the pitting bench, no fear need then be entertained but what as good results as formerly will follow.

DUNG-BED FRAMES.

The time is fast approaching when preparations for the production of early spring crops must be commenced herein. The first to claim attention will be Potatoes and Radishes, and these can be produced in succession on the same hotbed. Lasting hotbeds are of the greatest importance, and to assure these the heating material must be well managed. By the end of December or the beginning of the New Year the first hotbed should be ready to receive the Potato sets. When these are planted sow the bed broadcast with early forcing Turnip Radish seed or Wood's Frame. Probably the whole of the latter crop cannot be left long enough to come to maturity but a great many bunches may be gathered before it is necessary to remove what remains small and unfit to gather, in order to clear the ground, so that the soil between the rows becomes available for earthing-up the Potatoes. About the same date a smaller hotbed should be got in readiness and sown with Radishes alone. These should be pushed on, with early closing towards the afternoon; the crop on the Potato bed will form a succession to these.

THE CUCUMBER-HOUSE.

The ill effects produced on the plants by the past dull sunless weather, will be plainly visible in weaker growth and paler foliage, and the much slower development of the Cucumbers. If it is desired that the plants keep up an unbroken supply of fruit, the young shows must be well thinned out, and only just sufficient allowed to grow large enough for use to keep up the supply. The fruit should also be cut in a young state, and not allowed to hang on the plants a day after they are large enough to use—i.e., when they are from $\frac{1}{2}$ to 1 inch in diameter. If not already being practised, discontinue the stopping of lateral growths; should this cause a too thick canopy of foliage, some of them should be removed entirely. Watering the plants must now be done very carefully; this, and the management of the top and bottom heat, will play a very important part in the maintenance of healthy fruiting plants. The atmospheric condition of the house must also be strictly regulated in accordance with the weather and ventilation. Daring dull weather guard against a too free use of water, both for syringing and damping. When the weather is favourable for syringing let it be thoroughly done: the same remarks apply when giving water to the root.

On favourable mornings admit a little air early, and close in time to catch sufficient sun-heat to raise the thermometer 10° or 15° above the night temperature, which should now range from 65°-68°. On dull days the temperature should be raised 4° or 5° by the aid of extra fire-heat. At this time of year Cucumbers may be kept firm and good for quite a month after being cut from the plants. *G. H. Richards, Somerley.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Dec. 14	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
		Border Plantings, &c., at Stevens' Rooms.
WEDNESDAY,	Dec. 16	Sale of 3000 <i>Lilium auratum</i> , and 30000 <i>Cent. Aretha</i> , <i>Flants</i> , <i>Roses</i> , &c., at Frotheroe & Morris' Rooms.
		Sale of a Collection of Orchids in Flower, 3000 <i>Lilium auratum</i> , from Japan, &c., at Stevens' Rooms.
THURSDAY,	Dec. 17	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
		Sale of Repertories of White Læliis, and other Orchids, at Frotheroe & Morris' Rooms.
FRIDAY,	Dec. 18	Sale of Consignments of First-class Bulbs, Border Plantings, &c., at Stevens' Rooms.
SATURDAY,	Dec. 19	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.

NOW that the PLANTING SEASON is in full activity we may once again call the attention of landscape gardeners and proprietors to the neglected riches by which they are surrounded. What is the reason that people go on planting the same trees and shrubs to the exclusion of scores of others equally good or better? Of course the attachment to old favourites may be taken as a testimony to their value, and we shall not say a word in derogation of them. We simply plead for a wider, freer choice, and a judicious intermixture of the more interesting species with older and better known subjects. It may be urged that they are difficult to get and more expensive, but these obstacles, even if they exist, may easily be overcome. Many nurserymen, it is true, have discarded them as unprofitable occupants of the ground. Where the requisitions of the landlord, the title holder, the tax collector, and the labourer have to be met, there is obviously no room for unproductive land. Nevertheless, in many nurseries, and especially in those which are managed by proprietors of good taste having a liking for plants for their own sakes, irrespective of their commercial value, a few of the finer deciduous trees and shrubs are still kept more for the gratification of the proprietor than as a source of revenue. Nevertheless, if once a demand were to spring up there would be little or no difficulty in supplying it, for, disregarding exceptions few in number, the plants in question are quite hardy, easily cultivated, and propagated with nearly equal facility.

The truth is, the popular taste wants educating and improving. Look round the suburbs of our large towns and see the shocking manner in which too often the shrubberies and plantations are neglected. This, unfortunately, is quite as noticeable in cases where good things have been originally planted as where more ordinary material has been employed. It is perfectly cruel to see the manner in which the trees and shrubs around our "cottages of gentility" and suburban villas are allowed to indulge in civil war and fratricidal strife. Thinning and transplantation are rarely thought of; pruning—that is to say, ruthless hacking—is done without the slightest consideration of the habit of growth of the tree, and indeed without any consideration whatever beyond that of reducing inconvenient bulk, or the removal of an obstruction. Trees and shrubs are planted in too close proximity to the walls and windows of the residence. It may be that they are suitable enough all the time the trees or shrubs remain of small dimensions; but the residents seem to forget that in a few years the trees will have outgrown their present limits, and will be converted by the ignorant perversity of man from a thing of beauty to an eyesore, an obstruction and a nuisance. This of course arises, in some cases, from the fact that the tenants of such houses do not reckon on a long tenure, and the original planter may long since have changed his residence and repeated the same error. It is sad to write it, but there is a depth of ignorance and carelessness even greater than those we have alluded to. We have in view the cases where a house or a wall is actually built close

up to a fine specimen tree or to a row of such. In most cases it would be easy to transplant them beforehand, in any case it would be better far to destroy outright than spoil and mutilate such noble objects.

We do not altogether subscribe to the doctrine that it is the bounden duty of those that call attention to errors and omissions to propound a remedy for them, though it is true that those who feel the evil most acutely are the most likely to be in a position to suggest measures for its alleviation. The Press is nearly powerless against fashion in any department. Ridicule even does not kill it. Railing is useless, and, happily, unnecessary, because sooner or later the fashion changes. The fashion that has banished from our gardens such scores of flowering shrubs, has been of long duration; there is then all the more reason to hope that a change will speedily occur, and our gardens be made beautiful and interesting with *Cissus* and *Helianthemum*, *Pavias*, *Caryopteris*, *Cytisus*, *Ribes*, *Olearia*, *Deutzias*, *Eucryphia*, *Exochorda*, *Halesia*, *Weigela*, *Bignonia*, *Philadelphus* and *Buddleia*, *Rubus*, *Spiræas*, *Stautonia*, *Stuartias*, *Lonicæras* *Viburnums*, and dozens of others.

However powerless the Press may be against the caprices of fashion, it is not so impotent against that other obstacle to progress and improvement—we mean ignorance.

In the particular case we are speaking of the Press undoubtedly does render service by repeatedly publishing what to plant, and how to do it; and, although, year after year, the same lessons have to be set forth, yet there is good ground for the belief that some good is effected. It is, however, to the horticultural societies that we would especially commend the work of instructing the public in this particular manner. The actual display of the thing itself is a far more effectual means of imparting information than pages of printed description, or even illustrations. We would then urge upon the horticultural societies and the framers of schedules the desirability of offering a few prizes for cut specimens of deciduous trees and shrubs, in flower or otherwise, according to circumstances. The Floral Committee, too, might readily relax its rules, and award certificates more freely to plants that it is not convenient or possible to show except in the form of cut specimens. We have only to refer to the wonderful collections of cut herbaceous and bulbous plants exhibited throughout the entire duration of the Inventions Exhibition by Mr. WARE and others to illustrate the educational, and we may say the commercial, value of such exhibits as we propose. The Royal Gardens at Kew and the several botanic gardens of the country might greatly aid by sending up specimens for exhibition in due season. Already this is done to some extent, sufficient to make us wish it were a more frequent practice.

For the diminution of that other evil of which we spoke, the neglect of shrubberies and plantations, the local horticultural societies might do much. Too often such societies confine the whole of their energy to the establishment of a floral picnic once or twice a year. This is very nice, no doubt; but it should not be the only, nor even the main, object of a horticultural society. We have often lamented the opportunities which local horticultural societies allow to run to waste, and shall not now do more than suggest to them that in their schedules they should include prizes for the best kept shrubberies and gardens. By some such means as we have alluded to, and by others which will readily suggest themselves, we may hope to see a tide of fashion set in for the now neglected classes of trees and shrubs in general, and of flowering shrubs in particular.

— MR. WILLIAM ABRAHAM, of Fort Prospect, Limerick, elected as a Nationalist for the Western Division of that county, is engaged in business as a

nurseryman in that city, and was born about the year 1839. He was an active member of the Irish Land League. In 1884 he was elected Chairman of the Limerick Board of Guardians.

— NATIONAL CHRYSANTHEMUM SOCIETY.—The annual dinner of members ad friends of this Society will be held at the "Old Four Swans," 84, Bishopsgate Street Within, on Monday evening, December 14. The chair will be taken by the President, E. SANDERSON, Esq., at 6 o'clock precisely. The prizes awarded at the recent exhibition at the Royal Aquarium, Westminster, will be distributed on the occasion.

— DR. ASA GRAY.—A correspondent furnishes us with some interesting particulars supplementary to those we published last week concerning the testimonial to Dr. ASA GRAY:—

"We were at Cambridge on November 18, the seventy-fifth birthday of Professor ASA GRAY, and he was so gratified with the testimonial he had just received that I think you will be glad to hear about it. It was a beautiful silver vase, covered with plants in *vegetation* work, something like the Portland Vase, only larger, and more oval, with handles, presented by 180 American botanists, and all their cards came with it on a silver salver. The vase was executed most beautifully at Boston, and the plants on it, most tastefully arranged, are those named after him, or with which he has been much identified. The stems of the handles are ornamented with *Dionæa*. The handles themselves are Californian Ferns—*Notholaena Grayi*. The most conspicuous plants on the vase itself are, the Golden Rod—*Solidago*, an Aster, also *Centaurea americana*; the rest are *Grayia*, *Lilium Grayi*, *Shortia*, *Michelia repens*, *Jelferferia*, *Rudbeckia*, *Adulmia*, &c. Some one else sent seventy-five *Roses*, one for each of his years; and Mr. LOWELL sent the following lines:—

'Just fate prolong his life well spent,
Whose indetachable hours
Have been as gaily innocent
And fragrant as his flowers.

To A. G. on his seventy-fifth birthday."

— SOCIÉTÉ NATIONALE D'HORTICULTURE DE FRANCE.—We are informed that this Society proposes to organise, in connection with its general exhibition in Paris, from May 4–9 next, a Horticultural Congress. The object is to promote the progress of horticulture by the discussion of various points of interest.

— A CONTRIBUTION TO THE STUDY OF TRANSPARATION UNDER THE DIFFERENT RAYS OF THE SOLAR SPECTRUM.—A paper on the above subject, by Rev. GEORGE HENSLOW, was read at the Linnean Society on Thursday, December 3. The experiments described were undertaken to test the results of WIESNER, who found (contrary to the opinion of others, who thought that the brightest rays of the spectrum were the chief agents in effecting transpiration) that it was mainly due to the rays which are absorbed by chlorophyll. The spectrum of that substance reveals seven absorption bands, the most powerful of which are in the red, blue, and violet; and when plants were grown under coloured glasses Mr. HENSLOW found, just as WIESNER had done, that transpiration attains to a maximum under the monochromatic red glass, and under the blue and violet as well, while ordinary colourless glass gave another maximum. On the other hand, yellow and green gave a minimum. WIESNER'S interpretation is that light thus absorbed by chlorophyll is converted into, or manifests itself, as heat, and then it raises the temperature of the tissues, and so causes the formation of aqueous vapour. If this be true it would seem to account for DEHÉRAIN'S discovery, that plants can transpire in a saturated atmosphere, and as a corroboration WIESNER found that light which had been first transmitted through a solution of chlorophyll was almost powerless to cause transpiration. A fact which Mr. HENSLOW could not account for was that while the red glass which admitted no other rays gave a maximum, the yellow glass, which transmitted red and green rays besides yellow, gave a minimum. It would seem as if yellow had actually a retarding effect upon the other rays. The method adopted by Mr. HENSLOW was to grow small Lettuces and other plants in miniature pots, and by wrapping them up in a gutta-percha sheeting tied round the base of the stems all loss of moisture from the earth was prevented. Then he weighed the whole day by

LONGLEAT, THE SEAT OF THE MARQUIS OF BATH.

THE PHOTO. SPENCER & CO. LONDON.

day after its having been under each coloured glass for twenty-four hours in succession. He thus ascertained the percentages of the losses, the means of which gave the results mentioned above. Mr. HENSLAW also drew attention to the importance of distinguishing between transpiration and evaporation, the former being a vital action, the latter purely physical, which will take place from dead and living substances, but is modified or held in check to some extent by the latter. Thus if a leaf be cut in two, and one half suddenly killed by scalding, it will be found that this one rapidly dries up, while the other loses water much more slowly. Again, thick leaves and older ones absorb more heat than thin ones and younger ones respectively, yet the transpiration is greater from young leaves and deciduous, contrary to what one would expect if transpiration depended solely upon heat.

— ROYAL METEOROLOGICAL SOCIETY.—At the ordinary meeting of the Society, to be held by permission of the Council of the Institution of Civil Engineers, at 25, Great George Street, Westminster, on Wednesday, the 10th inst., at 7 P.M., the following papers will be read:—"The Influence of Forests upon Climate," by Dr. A. WOOKOFF, Hon. Mem. R.Met.Soc.; "Report on the Phenological Observations for 1885," by the Rev. T. A. PRESTON, M.A., F.R.Met.Soc.; "Études sur les Crépescules Rosées," by Prof. A. RICCO; "The Storm of October 15, 1885, at Fartenkirchen, Bavaria," by Colonel M. F. WARD, F.R.Met.Soc., & F.A.R.S.

— HERITIERA MACROPHYLLA.—Mr. BAXTER sends us from the Oxford Botanic Garden a specimen of this tree in flower. The tree is a native of tropical India, and belongs to the Sterculia family. Its chief interest consists in its bold foliage. The leaves are raised on long leaf-stalks thickened at each end, the oblong acuminate leaf-blades are dark green on the upper, silvery-white on the lower surface, whence the name Looking-glass tree. The young leaves are of pretty pink colour, provided on each side with a long linear lanceolate stipule. The inflorescence consists of much branched, paniced cymes, about half the length of the leaves, from whose axils they spring. The individual flowers are small, white, bell-shaped, not unlike in superficial appearance those of the Lily of the Valley, but rather smaller. The whole inflorescence, with its whitish brachies, and still whiter and very numerous flowers has a light and pretty appearance. The whole plant is more or less covered with small circular scales, some silvery in colour, others brownish. The silvery look of the under-side of the leaf arises from the very dense covering of these scales, as may be seen by the aid of a pocket lens of low power.

— THE APPLE AND PEAR CONGRESS AT EDINBURGH.—The Congress was a great success from the main point of view. As an effort to instruct the multitude about hardy fruit growing, and even as regards the finances, there is nothing to find fault with, as the Congress drew a good deal more than was expected, in the midst of the General Election, and which, added to the surplus on the previous shows of the year 1885, will leave little or no deficit. The accounts are not yet made up, but there is good reason to expect that the deficit will not be great, if anything, there being sufficient funds to meet it. The work was rather hurriedly done, but as it was imperative for the jury to get through the judging in the four days; the best was done under the circumstances.—The county of Sussex was accidentally omitted in our report of the contributions from England to the Congress. Its fame as a fruit growing county was worthily upheld by Mr. KUST, gardener to the Marquis of ABERGAVENNY, Eridge Castle Gardens, who set up a numerous and interesting collection of Apples and Pears—especially rich in fine dessert varieties. They were accompanied by a few large cards, giving the soil, rainfall, altitude (400 feet above the sea-level), and similar particulars of a very instructive nature, and were a fine, clear, evenly grown lot. Among the best Apples were Kerry Pippin, the finest sample in the exhibition; Beauty of Kent, Warner's King, Sturmer Pippin, extra fine; Small's Admirable, Paradise, Hall Down, extra; Lady Henniker, Tower of Glamis, Adam's Pearmain, Washington, Brabant Bellefleur, Mère de Ménége, Cambusnethan, and New Hawthornden.

Among the Pears, Doyenné du Comice, Beurré Bosc, Glou Morceau, Doyenné d'Alençon, Vicar of Winkfield, Van Mons' Léon le Clerc, Josephine de Malines, Beurré Sterckmans, and Triomphe de Joazeux were some of the largest and finest.

— SCOTTISH HORTICULTURAL ASSOCIATION.—This Association met in the Bible Society's Rooms, Edinburgh, on the evening of Tuesday, Dec. 1, Mr. ALEXANDER MILNE, Edinburgh, presided. Mr. LINDSAY, Curator of the Royal Botanic Gardens, Edinburgh, read a paper written by Mr. F. W. BURBIDGE, F.L.S., of the Trinity College Botanic Gardens, Dublin, on "Orchids, abroad and at home." The paper stated that the growing conditions abroad were principally intense light and drier moisture, the latter especially at night. The nearer these conditions could be imitated at home the better would be the results. Orchids had of late years attained to such popularity at home, and the rarest and most beautiful had realised such high prices, that Mr. BURBIDGE was irresistibly reminded of the Tulipomania which raged in Holland a century or two ago. Cattleyas, Dendrobies, and Vandas of the rarest quality realised to-day from £100 to £250 or more each, and our merchant princes paid these prices with the same alacrity and zest which must have possessed the Dutch burghers when they paid 1300 florins for a single bulb of Tulip. In conclusion, Mr. BURBIDGE pointed out that there was no royal road to Orchid culture, but only the long and certain one of observation and practical experience. A sketch map, showing the generic distribution of Orchids throughout the world was exhibited. A discussion followed the reading of the paper. It was also unanimously agreed that Mr. BURBIDGE'S paper be printed in full in the *Transactions* of the Association, to which Mr. BURBIDGE was also elected an Honorary Life Member. Mr. ALEXANDER McMILLAN, Edgely Hill, Dean, had on the table a specimen of *Chrysanthemum segetum*, a British wild plant, brought for the purpose of showing how well it could be flowered in a hothouse in winter. There was also exhibited a collection of Ferns gathered in Ireland by Mr. D. REDMOND, Antrim. Votes of thanks to these gentlemen, as well as to Mr. BURBIDGE and the Chairman, closed the meeting.

— TREPHO.—A substance said, by the maker, Mr. B. FIELD, Swan Place, Old Kent Road, London, S.E., to form a good material for growing Orchids in baskets and pots, &c., has been sent for our inspection. It is live sphagnum chemically treated, possibly with some substance that will aid in its preservation for a considerable period of time. It is pressed into blocks, when alive, by hydraulic pressure, and is specially prepared for Orchids. Mr. FIELD is the sole purveyor of this article. It has been tested for two years, and in the saturated atmosphere of an Orchid-house absorbs and continuously takes up all the gases and moisture. One dipping last three days.

— MR. W. SWAN.—Our well-known correspondent and excellent gardener and Orchid cultivator, who-e last situation was at Oakfield, Fallowfield, Manchester, and which he left owing to the sale of the place, has, we are glad to inform our readers, obtained another appointment at Preston. In consequence of this change of residence he has resigned the office of Secretary to the Manchester Horticultural Improvement Society, Mr. U. JOHN, of Worsley, having been appointed in his stead at the meeting of the Society held on December 3.

— THE INTRODUCTION OF THE POTATO INTO GERMANY.—A correspondent in an American paper writes:—"While travelling in the upper Rhine countries, we found ourselves obliged to pass the night and part of the day in the little village of Offenbourg, on the borders of the Black Forest. While looking about in search for the marvellous that is always to be found in some form in these border villages, we came upon a huge monument, upon the pedestal of which was the figure of a man in the dress of the Elizabethan courtiers. Our wonder increased as we saw loquently piled upon the broad, projecting base, quantities of Potatoes carved in stone. It was a monument to Sir FRANCIS DRAKE and the excellent tuber! The cavalier and discoverer holds extended in one hand a Potato plant, and upon the four sides of the pedestal are inscriptions expressing the gratitude of a great people for the blessing that the

Creator had been pleased to bestow upon them in time of famine."

— PEAT.—In some parts of England good peat, suitable for successful Orchid growing, is not easily obtained, and gardeners are compelled to send long distances for it. We have had sent us recently an excellent fibrous sample, sweet smelling, and fit for immediate use, from Messrs. GATERELL & SON, Ringwood. In the New Forest and neighbourhood there is much peaty soil, but except on the estates of the large landowners, who are naturally unwilling to sell their soil, there are not any great facilities for digging good peat in quantity.

— LINNEAN SOCIETY OF LONDON.—A meeting will be held on December 17, at 8 P.M., when the following papers will be read:—1. "Ceylon Entomotrachia;" Dr. C. S. BRADY. 2. "Madagascar Orchids;" H. N. RIDLEY. 3. "Recent Ephemeride," part 4; Rev. A. EATON. 4. "Colombian species of Diabrotica;" J. BALY.

— FORESTS AND MOISTURE.—At the Boston (U.S.A.) Society of Natural History meeting recently, the subject of "The Influence of Forests upon the Atmosphere" was presented by Dr. G. L. GOODALE. His conclusion, in brief, was that their influence is very slight. In regard to moisture their direct action in throwing off moisture is, he said, insignificant; but their indirect action in holding back the water which has saturated the soil in rainfall is very great. Droughts and excessively dry atmosphere are consequent upon an extensive cutting away of forest growths. In the debate which followed it was stated, without question or contradiction, that two broad conclusions have been drawn heretofore concerning the desert coasts of the south side of the Mediterranean Sea, and that other causes besides the cutting off of forests must be recognised as having effected, in part or wholly, the result now seen. One speaker thought it to be a matter of conjecture whether there ever were any forests there.

— THE STUDY OF BOTANY.—The *Pharmaceutical Journal* says that there is much that tends to reconcile students to the study of botany. It is the study of some of the most beautiful objects of Nature, which although in the ordinary scene mute, possess an eloquence of their own, and never fail to appeal to the hearts of those who are willing to hold converse with them. They are organised beings like ourselves, and of all created beings they are perhaps those which offer the greatest facilities for deep searching investigation into the mysterious development of special organisms springing either from an ingrafted type or from a minute spark of vitality which may have lain dormant for years in an apparently inactive seed. There are some hundreds of thousands of forms of vegetation proceeding from such obscure sources, each having distinct and definite characters of its own, which it is capable of further propagating, and thus maintaining a life everlasting. The root, the stem, the branches, the leaves, the flowers, the fruit, the seed! Consider the arrangements of all these parts; how extremely elaborate, and sometimes fantastic, they are. Such arrangements are apparently infinite, but they are all subject to a law of Nature, namely, that of symmetry, which is one of the elements of beauty. Among the inducements to pursue the examination and study of the elementary structure and arrangement of parts in the vegetable kingdom is this, that we have tangible objects to deal with here, which can be brought within the cognizance of our senses. We can dissect, divide and subdivide them, and when we have thus passed to the limit of observation by the unaided organs of vision, we can resort to the powers of the microscope, and thus open out extended fields for further investigation. The knowledge we thus acquire is of a definite and definable nature. There is nothing speculative about it. It partakes not of the abstract, but of the concrete character.

— GARDENING APPOINTMENT.—FREDERIC W. SEERS, late Gardener to J. O. COOPER, Esq., of Calcot Gardens, Reading, Berks, has been engaged as Gardener to FRED. J. MYERS, Esq., of Charlton Lodge, Banbury.—Mr. J. LEES, late Foreman at Burwaton Hall Gardens, Bridgeforth, has been appointed Gardener to Col. H. BAGOT LANE, King's Bromley Manor, Lichfield.

NEW PLANTS CERTIFICATED BY THE ROYAL HORTICULTURAL SOCIETY, JULY-DECEMBER, 1885.

* B.C., Botanical Certificate; F.C., First-class Certificate.

Table listing various plant species and their certifiers. Includes Aganisia corulea, Alouca Hendersonii, Anemone, Angraecum Leonis, Aristolochia elegans, Begonia Blanche Duval, Begonia Banaica, Caladium, Calanthe Alexandrii, Campanula Hendersonii, Carnation, Cateleya autumnalis, Chrysanthemum, Chysis Lycea superba, Cyrtopodium, Dahlia Bird of Passage, Eucharis, Galathea, Gasteromacha hybrida, Gladiolus, Grandis, Helianthus, Lilia, Liliopsis, Lycopodium, Marigold, Nasturtium, Odontoglossum, Pelargonium, Pea, Petalostemum, Phlox, Pinks, Primula, Ranunculus, Rhododendron, Salvia, Saxifraga, Scilla, Senecio, Solanum, Stachys, Tradescantia, Verbena, Viola, Zinnia.

Table listing specific plant varieties and their certifiers. Includes Pea, Shropshire Hero, The Amerer, Potato, Chancellor, Cole's Favourite, Suffolk Favourite.

Notices of Books.

Bible Flowers and Flower Lore. Anonymous. Hodder & Stoughton.

The Plants of the Bible. By [the late] John Hutton Balfour. New edition. T. Nelson & Sons.

One object of the first-named of these books is stated to be to remedy some of the inaccuracies which...

writer confounds with the Savin); the Juniper of The Plants of the Bible is a kind of Broom, Genista monesperma. The doves' dung of the Book of Kings is, according to the Edinburgh Professor, Ornithogalum unbellatum; while the anonymous author gives good reason for supposing it to be the Chick Pea...

Flowering Plants and Ferns of the Riviera and Neighbouring Mountains. Drawn and described by C. Dicknell. Triebner & Co.

This is a series of eighty-two coloured plates with descriptive text. The figures are accurate as far as they go, but they are rather the rough memoranda which the collector makes for his own use...

Nevertheless, from the point of view of the botanist and gardener Mr. Bicknell is a benefactor of his kind, for a series of generally faithful drawings, whatever their technical defects in points of detail, cannot fail to be of great service.

The Scriptural teachings are obviously not intended to convey botanical instruction, and the writers were not compiling a Flora. It is necessary to remember this, for, true as it is, writers—popular writers especially—still think it necessary to perplex themselves and their readers, by the endeavour to render definite what was never intended to be otherwise than suggestive.

Studies of Plant Life in Canada, &c. By Mrs. C. P. Traill. Ottawa: Woodburn.

This is a popular account of the flowers, Ferns, trees, and shrubs of Canada, by a lady who has passed the greater part of a long life among them, who remembers when forest or prairie occupied the site of noble cities replete with all the resources of civilisation.

Table listing vegetable varieties and their certifiers. Includes Apple, September Beauty, Nectarine, Pear, Strawberry, Waterloo, Chou de Gilbert, Pea, Autocrat, Prodigy, Quality, Sensation.

This agreement, however, does not extend very far. The Aloe, by one writer, is referred to Aloe perfoliata, while Dr. Balfour, with less eogeneity as it seems to us, argues for Aquilaria agallochum. The Juniper of Bible Flowers is the common Juniper (which the

which cannot be obtained from books alone. She has done well to introduce the word "life" into her title, for her observation has evidently been most exercised among living plants. Generally speaking it is hard to get up any sympathy for "popular" books. Their diffuse meanderings, their want of accuracy, their utter failure to secure their professed object, all make one look askance on popular books of the ordinary type. But the one before us is not of this character. It is popular in its arrangement of matter, it is popular in the pleasant style in which it is written, but it is something far better than popular in the fidelity and accuracy of the word portraits of Canadian flowers and the interesting details of their history.

The book is illustrated with several chromolithographs, in which the mechanist seems to have done his best to dim the image drawn by the artist and destroy her outlines. The tone and spirit in which the book is written are so healthy and cheery as to excite the sympathies of the reader with the octogenarian authoress. Her life has been in part one of toil, hardship, and isolation, but she has evidently met and mastered her trials and difficulties by the aid of that spirit of trust and hopefulness which the study of God's creation is so well calculated to engender.

The following extract serves to give a good idea of the author's style:—

"One of the loveliest and most graceful of our forest trees is a young Hemlock. As great a contrast does that elegant sapling, with its gay, tender green feathery sprays, bear in its beauty of form and colour to the parent tree, with its rugged, stiff, and unsightly trunk and ragged top, as the young child in its youthful grace and vigour bears to the old and wrinkled grand sire. The foliage of the young Hemlock in the months of June and July, when the spring shoots have been perfected, is especially beautiful; the tender vivid green of the young shoots, at the end of the flat, bending branches of the previous year, appears more lively and refreshing to the eye in contrast to the older, dark, glossy, more sombre foliage, which they serve to brighten and adorn.

"The Hemlock does not reach the lofty height of the White Pine, though in some situations it becomes a giant in size, with massive trunk, and thick bushy head; the bark is deeply rifted, dark on the outside, but of a deep brick-red within; the branches are flat, the small, oval, soft cones appear later in the summer on the ends of the shoots of the previous season. The timber of the Hemlock is very durable, tough, and somewhat stringy, loose-grained, but is said to resist wet; it is used for granary flooring, rail-ties, and some other purposes in outdoor work. The bark is used largely in tanning. The backwoods settlers stack the Hemlock bark while clearing the forest land and carry it in during the sleighing season to the tanneries, receiving a certain value per cord, in money or store goods. Formerly the payment was chiefly made in leather, when every man was his own shoemaker; but times have changed since those early, more primitive days, and the wives and children would now disdain to wear the home-made boots and shoes that were manufactured out of coarsely-dressed leather by the industrious father of the family, in the long winter evenings, as he worked by the light of the blazing log fire with his rude tools and wooden pegs.

"The old shanty life is a thing of the past; the carding and spinning, the rattle of the looms, even the knitting needles are not now so constantly seen in the hands of the wives and daughters as formerly. Railroads and steamboats, schools, and increase of population, have wrought great changes in the lives and habits of the people. Villages and towns now occupy the spots where only the dark forests of Pine and Hemlock, Maple and Beech once grew. The trees disappear indeed before the axe and fire, from the site where Nature had placed them, but they reappear now as ornaments, planted by the hand of taste in the gardens, and as shade-trees on the streets of the towns and cities; and this is good, it speaks of taste and culture. The Hemlock, however, is less frequently seen about our dwellings, beautiful as it is, for it is tardy in growth, and does not take kindly to cultivation. Its natural soil is dry, rocky or gravelly land.

"A remarkable hoof-like fungus, of a deep red colour, semicircular in outline, and elegantly scalloped at the edges with curved lines like some large sea shell, hard, dry, and varnished on the surface, is found occasionally growing on the rough bark, or big, scaly roots of decaying Hemlocks. These fungi (*Polyporus pinicola*) are found in clusters of larger and smaller growth on thick stems united at the base. I have seen a group of this singular parasite, the largest measuring more than a foot in diameter; it was greatly prized for its elegant form and rich colour. The under-side of the fungus is of a fine warm buff tint."

THE ORCHID HOUSE.

HOthouse ORCHIDS IN WINTER.

WRITING last week on the treatment the Mexican Orchids ought to receive, we had to deal with a continuous period of dull, depressing weather, with frequent fogs more or less dense. Now they have cleared off, and been succeeded by bright sunshine by day, with sharp frosts at night. A sooty deposit has been left on the glass by the fogs, but this has been washed off, as every ray of light we can obtain is valuable. We get the temperature in this house up to 75° by day, and by closing the house early the sun heat is retained well into the night, but it falls towards morning to 63° or 58°—a temperature sufficiently high for most Orchids requiring an East India temperature. Most of them should be kept in a state of rest, even although they may be making their growth. The Orchids we value most in this house are some handsome specimens of *Oloontoglossum Renzlii*; this species succeeds remarkably well with us, and from about eighteen plants we have never been without flowers for a period of twelve months. The main period for bloom on this species is during the months of April, May, and early in June, although the best of them are over before the last-named month comes in. They require a fair supply of water at theroots during winter, but ought not to be kept what one would term wet; on the other hand, if they are kept so dry that the sphagnum moss on the surface quite loses its green colour, that would be an error in culture, and which would tell upon the future well-being of the plants. We do not grow any other *Oloontoglossum* in this house.

During the last few years the genus *Angraecum* has been greatly improved by additions. There has been no species introduced to approach in stately appearance the wonderful *A. sesquipedale*; but *A. Ellisii* and an allied species, *A. articulatum*, have been introduced freely of late years, while *A. Scottianum*, from the Comoro Islands, is interesting and very pretty. The most recent introduction, *A. Leonis*, seems to be the easiest to introduce and establish of the whole family; and when it has been well established in our hothouses it will, I doubt not, be next in importance to *A. sesquipedale*. *A. citratum* is very charming, and flowering as it does at the dulllest period of the year with great freedom, and without in the least injuring the plants, is a great point in its favour. They do not really need such a high night temperature as some cultivators are disposed to provide for them.

Amoogs: bothose Orchids that require a high night temperature are the two or three species of *Cypripedium*, viz., *C. Lowii*, *C. Stonei*, and *C. niveum*. The first-named species has an unfortunate tendency to rot or damp off in a temperature which suits the *Angraecum* admirably.

Ociedium ampliatum majus, which has been introduced rather plentifully lately also requires the very warmest night temperature, 65°, falling on cold nights to 60°; anything lower than this minimum should be very exceptional indeed. To keep up the necessary temperature the pipes require to be heated very considerably on cold nights; this may have the effect of causing an over-dry atmosphere, which must be counteracted by judicious evaporation. We do not fill the evaporating troughs with water in winter, but rather by the slower process of sprinkling the paths and stages.

We have not alluded to the *Phalænopsisids*, which are doubtless the most highly esteemed of all the occupants of the East Indian-house. The treatment of these beautiful Orchids is now well known. During the winter months an excess of heat and moisture is likely to produce spot, but it must not be forgotten that these Orchids have not any pseudobulbs in which moisture may be stored, consequently it would not answer to allow them at any time to become quite dry at the roots. The atmosphere must also be moderately moist. Excessive moisture either at the roots or in the atmosphere might cause "spot," which was prevalent a quarter of a century ago, but which has been banished from all good collections, since Orchid culture has been more generally understood. I am free to say that during the twenty years I have grown Orchids I cannot recollect one single plant being affected by spot. It is a disease doubtless, but it is no doubt preventable by good

management, and may be induced by damp at the roots or in the atmosphere, or by a combination of both during the winter months.

COOL HOUSE.

It is a question frequently asked, How low can the winter temperature of the cool house be maintained, and yet the plants continue in vigorous health? My impression is that a continuous low night temperature during winter is not the best for the plants, and if persisted in during the whole of the winter months may be disastrous to some of them. So far the varieties of *Oloontoglossum crispum* seem to be best adapted for a low temperature. *Ociedium macranthum* and the new distinct species, *O. Edwardii*, is also one of the coolest species; but many of the most important subjects, including *Oloontoglossum Pescatorei* and nearly all the *Masdevallias*, succeed best with a night temperature ranging from 45° to 50°; the highest of the two figures ought to be the most frequent minimum. Not a few people have an idea that cool Orchids may be grown in an ordinary greenhouse; that they may live, and perhaps thrive in such a position during the summer months is possible, but during winter they will not do well, unless the treatment be such as would not be suitable for the run of greenhouse plants. The pretty delicate white *Masdevallia tovarensis* is now crowded with its pure blossoms. The flowers are much used for decorative purposes, and it is pretty well known that the old stems remain green from year to year, so that they produce from the top of the stems an annual crop of flowers. If the old stems are removed, a thicket of new ones will be produced, but if the old ones are not removed very few new ones will be produced. The knowledge of this may be useful, as the flowers cut with the stems are more valuable than the single blooms cut with scarcely any stem attached. *J. Douglas*.

DISEASES OF FRUIT, PROVISIONS, ETC.—IV.*

MUCOR STOLONIFER, AND MUCOR MUCEDO.

THE Mucors are amongst the commonest moulds or mildews of fruits and provisions. They cause flour, bread, and other substances to become musty. The spores of these fungi, together with the spores of *Penicillium* and *Aspergillus*, already described, are always in the air; they especially abound in warm damp cellars and store-rooms where provisions and fruits are kept. When the spores light on any suitable substance, as damp flour, bread, preserves, bruised or sweating fruit, stale Mushrooms, &c., they germinate, produce spawn or mycelium and fruiting threads. The growth of these fungi hastens putrefactive decomposition.

There are various species of *Mucor*, as there are of *Penicillium* and *Aspergillus*. I here describe two species only as types—*Mucor stolonifer*, Ehrh., and *M. mucedo*, L. The simpler of the two, sometimes very common on bruised or sweating Melons, I will take first. On fruits, these fungi subsist on the cell sap which has escaped from the cells to the surface or to the intercellular spaces.

The generic name is derived from the Greek *Mukēs*—a mould; whilst the specific name, *stolonifer*, refers to the stolon-like, or long trailing branch-like growth of the spawn or mycelium, in the style of a Strawberry runner, as shown between A and B (fig. 170), where a small patch of the fungus is shown enlarged 20 diameters.

The *Mucor* covers decaying fruits and other substances with a fine white, woolly, non-septate or very sparingly septate mycelium; the mycelium also grows in the substance of ripe and juicy fruits, and hastens decomposition. Rising from the fleecy surface of the mycelium numerous extremely short and slender threads arise, each thread being capped with a minute head, at first pallid, then black. The fruiting threads, which resemble, when magnified, pins, nails, or drumsticks (see fig. 170), may be seen with the unaided eye or with a common lens. The fruiting threads or filaments grow out at certain privileged points on the stamens, as at A and B, the shafts are shown at C, C, C, and the heads at D, D, D. The heads are really spore-cases, or sporangia, spherical growths enclosing spores or seeds. Each glassy-looking sporangium is at first filled with translucent protoplasm, and cut off from the supporting thread

* See pp. 51, 285, and 564.

or shaft by a septum or joint at the base; this basal septum, at first near the point F, ultimately grows up into the sporangium so as to form a kind of core within, as shown in the section at G, enlarged 400 diameters. At length the contained material of the sporangium becomes differentiated or arranged into a vast number of polyhedral black spores, as shown inside the sporangium near E. When the spores are quite ripe the extremely thin membrane of the sporangium bursts, doubtlessly aided by the growth of the inner core, and the minute spores are expelled into the air. The bursting of the sporangium generally takes place just above the base of the core (columnella—little column), leaving the remains of the membrane as a ragged collar surmounted by the core and dusted with spores. The membrane of the sporangium breaks up or dissolves, and the inflated columnella collapses over the top of the supporting thread, like a minute cap of Liberty on a pole.

Four spores, or sporidia, one germinating, are shown at H, enlarged 400 diameters. These spores germinate very quickly on decaying fruit or its juices, but not readily in water; if kept dry they will retain their vitality for several months. In the hot weather of the summer, from May to July, the stolons beneath the white felt form vesicular expansions, which come in contact as shown at J. When the expansions thus join a septum

set free an enormous number of the little black simple spores, and these are carried away by the wind. Such as fall on juicy fruits, decaying vegetables, preserves, &c., hasten putrefaction; any others that fall upon unsuitable substances perish.

Under favourable conditions a *Mucor can*, of course, propagate itself by the simple spores for an unlimited number of generations. Zygospores are indeed not very frequently formed on the mycelium. They are generally unnecessary within-doors where *Mucors* commonly grow. The *Mucors* are obviously protected from destruction by the zygospore, as this body is capable of living in a hibernating state on the ground in the winter for several months, when no fleshy fruits, household provisions, or other suitable substances are near. The infection to out-of-door fruits may come from the zygospores germinating on the surface of the ground.

Mucor stolonifer, Ehrh., is sometimes described as *Rhizopus nigricans*, Ehr.; or *Ascochloa Mucedo*, Tode.

MUCOR MUCEDO, L.

This is one of the most abundant of all the mildews; it is not only frequent upon juicy fruits, but it is common on paste, preserves, provisions, horse dung, &c. Its life history is more complex than the last. The mycelial filaments are without, or have very few,

especially on old mycelium, and these at length break up into a number of small globular cells, gemmules, buds, or "chlamydo-spores." Chlamydo-spores have been so called, I suppose, because they seem to be produced, as spores, in the interior of the spore-bearing shaft; the word is derived from *chlamys*, a coat. These latter bodies (filled with condensed protoplasm), not unlike extremely minute *Sclerotia*, are illustrated at D; each of the minute spherical cells there shown is capable of reproducing the *Mucor*. Under favourable conditions of growth the mycelium throws out minute vesicular expansions as illustrated at E, exactly in the style of *M. stolonifer*, Ehrh. These little swollen vesicles, especially when the fungus is excluded from free air, conjoin, a septum is soon formed at the base of each, and the two swollen ends or conjugating cells coalesce and form a zygospore. We therefore see that *Mucor Mucedo*, has five methods of reproduction:—1st, by the sporidia in the larger sporangia, B; 2d, by the sporidia in the sporangioles, A; 3d, by the conidia, C; 4th, by the small globular sclerotium-like cells, D; 5th, by the zygospores arising from the conjugating cells at E.

At A, fig. 172, I have engraved a section through a sporangium enlarged 100 diameters; the columnella, or core continuous with the stem, is shown at B. At C, D, the remains of a sporangium are seen after the

FIG. 170.—MUCOR STOLONIFER, EHRH., ENLARGED 20, 100, AND 400 DIAM.

FIG. 171.—MUCOR MUCEDO, L., ENLARGED 20 DIAM.

cuts off the more swollen end of each expansion from its supporting mycelium, as shown at K, where three septa instead of one are now seen. The two innermost cells at K are termed conjugating cells, and one is generally somewhat larger in size than the other, as shown; at length the central septum is absorbed, the protoplasm unites, and the two inner cells become fused into one body, termed a zygospore, yoke-spore, or resting-spore. The formation of the zygospore occupies about twenty-four hours, it then increases in size and becomes coated with a comparatively thick and warty membrane or skin. The interior is full of granular protoplasm and an oily fluid. A ripe zygospore is shown at L, enlarged 100 diameters. Its shape is spherical, with flattened places formed, as shown at M, by the two supporting cells or suspensors, which soon perish. Unlike the simple spores the zygospores do not germinate at once, but require a period of rest. They do not produce mycelium like the simple spores, but give rise at once to one or two filaments which bear little black sporangia similar to the ones at D, D, D, first described. These first sporangia are produced directly from the substance of the zygospore, and do not require the support of juicy fruits or any other external nourishment for their growth; their vital material has been stored up for them within the zygospore, in the same way as the first food of infant plants is stored in seeds. The first formed sporangia from the zygospores quickly burst and

These first sporangia are produced directly from the substance of the zygospore, and do not require the support of juicy fruits or any other external nourishment for their growth; their vital material has been stored up for them within the zygospore, in the same way as the first food of infant plants is stored in seeds. The first formed sporangia from the zygospores quickly burst and

supply of oxygen, long filaments are produced,

glassy-looking investing membrane has collapsed, the remains of this membrane are seen as a ragged collar at D, the dotted line shows its former position, and a few sporidia are seen near the base of the columnella. Sporidia enlarged 400 diameters are shown at E. The sporangia and sporidia, especially the former, are variable in size; the latter, when they fall upon a suitable matrix, as on sweating fruit, reproduce *Mucor Mucedo*, L. One of the tufts or frills from a conidium-bearer is shown at F, enlarged 100 diameters; each of the ultimate branchlets carries a very small sporangiole, containing each about four sporidia. A single sporangiole, containing four sporidia, is shown, enlarged 400 diameters, at G. Sporangia of every intermediate size, from the largest normal sporangium, to one of the smallest sporangioles, are frequently observed on the same growth. A conidium-bearer, with its branched apex and conidia, is shown enlarged 100 diameters at H; and the analogous long filaments of mycelium, which have broken up into chains of minute globular gemmules, sacs, sclerotia, or chlamydo-spores, are shown at J. The vesicular expansions upon the mycelium, as formed within the substance upon which the *Mucor* grows, are shown at K, the two bodies at L being the suspensors, and the two central cells at M are the sexual cells, often of different sizes, which combine to form one body termed the resting spore, or zygospore. After the fusing of the two central cells, and the consequent production of a resting-

spore, the latter body grows to a much larger size; the endospore within is warty, and the black exospore without, which represents the original membrane of the two conjugating cells, adapts itself to all the inequalities of the endospore within, as shown enlarged 100 diameters at N, the suspensors being shown at right and left. After a period of desiccation and rest, the zygospore if placed in moist air germinates as illustrated. The germinal thread always grows at right angles to the line of the suspensors as shown, and the protruded shaft is not a mycelial thread, but a true sporangiophore or sporangium-bearer, which may be either simple, bearing a single normal sporangium of *Mucor Mucedo*, L., or slightly branched. This sporangiophore is merely the interior utricle of the zygospore elongated into a tubular shaft. The sporangium thus produced is seen in elevation at O, and is in every way identical with the sporangium at A, with which we started, and so the life cycle is completed.

On juicy and decaying fruits it is by no means uncommon to find several *Mucors* or *Mucorine* fungi growing in company. One of these is the remarkable

A few words must be said as to alcoholic fermentation. *Oidium fructigenum*, Schr., first described, is not one of the fungi of alcoholic ferments. As regards *Penicillium crustaceum*, Fr., some authors have stated that the latter fungus is one form of the yeast of beer, *Saccharomyces cerevisie*, Meyen, but this statement seems to have been founded on erroneous observations. Hofmann thought he had seen *Penicillium* arise from an isolated yeast cell, and Berkeley considered Hofmann correct. Pasteur has experimented a great deal with *Penicillium*, and he says, "If we distil saccharine liquids on the surface or in the body of which we have grown *Penicillium*, and repeat the distillation in the manner that we have already described for the detection of the minutest quantities of alcohol, we shall readily find that those liquids frequently do contain a little ordinary alcohol." A submerged condition often excites a feeble production of alcohol. According to the observations of Pasteur, the "Vinegar plant" has no relationship with *Penicillium*. His experiments show that the "Vinegar plant" is *Mycoderma aceti*,

wherever they are used I have endeavoured to make their meaning clear. The fungi described are important and typical. They are cosmopolitan and of everyday occurrence. They grow in nearly all places. When they occur in ill ventilated store-rooms, where fruits are in a bruised or sweating condition, the fungi are highly infectious. All damaged fruit should therefore be carefully removed and destroyed, and perfect ventilation secured. The occasional burning of flowers of sulphur in a dry store-room will keep most of the mildew fungi in check.

There are many species closely allied to the fungus here described, which have been distinguished (as I consider) by characters which are often more or less uncertain. I suspect two-thirds of them to be worthless species. The habits of some species are sometimes peculiar, and do not lend themselves to immediate acceptance as characteristic; for instance, amongst other habitats we have "on an old chicken coop," "in the human ear," "on Pasteur's solution," &c. There is also great confusion in the names, more than once they occur in duplicate, so that it is often almost or quite impossible to know what species some authors have in view, especially when measurements, authors' names, and scales are not given, as is very often the case. Even Pasteur does not give the names, of the authors of the species he describes. Sometimes, as in the yeast fungus, there are at least six different generic names, and it is common to find a note of interrogation after a synonym, indicating that it is uncertain whether the two or more plants described, are the same or not. *Worthington G. Smith, Dunstable.*

FIG. 172.—MUCOR MUCEDO, L., ENLARGED 100 AND 400 DIAM. (SEE P. 756)

and much discussed fungus named by the Rev. M. J. Berkeley, *Botrytis Jonesii*, *Ann. Nat. Hist.*, 760, 1854; but now better known as *Chaetocladium Jonesii*. De Bary and Woronin have said that this *Botrytis* or *Chaetocladium* is a mere conidia or monosporangium-bearing form of *Mucor Mucedo*, L., but the general belief of botanists now is that *Chaetocladium Jonesii* is, as Mr. Berkeley originally said, decidedly a true species, bearing, not conidia, but sporangia, each sporangium containing a single sporidium. It is remarkable that some species of *Chaetocladium* at times fix themselves on to other *Mucorine* fungi, and so seem to live as parasites. Under such circumstances they have been observed to grow more vigorously than on the substratum which is supposed to be their normal one. Van Tieghem has termed this occasional ambiguous parasitism "facultative." Like *Mucor Chaetocladium* produces zygospores. Van Tieghem calls the fruit a sporangiophore. *Mucors* will not grow on dry, sound fruits, as there is, in these instances, no escaped sap or nourishing fluid; when, however, *Mucors* are artificially grown in fruit pulp and then inserted in, or sometimes on, sound fruit, the fungi will then rapidly penetrate the substance and cause decay.

the "Mother of Vinegar," and that the crop of *Penicillium* which so often arises from it is due to infection from the air, where the spores of *Penicillium*, *Aspergillus*, *Mucor*, &c., are almost invariably present. There is no reason, however, why all these fungi should not grow with the *Mycoderma* in the Vinegar plant, but Pasteur says he has proved the *Mycoderma* to be the cause of acetic fermentation. In the so-called Ginger-beer plant alcoholic fermentation is simply set up by the yeast fungus, *Saccharomyces cerevisie*, Meyen, but several other fungi can be easily detected in it.

Aspergillus, when submerged, so that the oxygen of the air does not reach it, is a weak alcoholic ferment; it then decomposes sugar, like yeast, and produces alcohol and carbonic acid gas.

Alcoholic fermentation belongs to *Mucor*; alcohol will arise from *M. Mucedo*, L., when it grows in saccharine fluids. The species named *Mucor racemosus* is the *Mucor* ferment of Pasteur. The latter fungus is almost identical with *Mucor Mucedo*, L.

In writing these notes on *Oidium*, *Penicillium*, *Aspergillus*, *Eurotium*, and *Mucor*, it may be complained that many of the technical terms are uncouth and difficult. These difficult words are none of mine;

HOME CORRESPONDENCE.

Earthing-up Potatos. — In the paper on "Earthing-up" at page 715, there is something fallacious in the reference to the usefulness or otherwise of earthing-up Potatos. The writer intimates that deeper planting of the seed tubers produces as good results as those from earthing-up, but it is not simply to protect the tubers that earthing is applied. The Potato stem is of a tender brittle nature, and needs support against rough winds, hence it is found advisable to give it the support and stay found in several inches of soil placed against it. Then a ridge of soil about the plants and over the roots tends to keep the latter fairly dry and protected from heavy rains, which are detrimental to the young tubers. On the other hand, the moisture so cast off from the tubers is thrown more immediately into contact with the actual roots of the Potato plants, which are found working more remote from the stem. But the chief fallacy which is complained of is that which holds that deep planted tubers of necessity produce their progeny of young tubers deep also. That is not an actual fact, as it is found that not only is the forcing of Potato shoots through some 6 inches of soil not only wasteful to the plant and needless, but also that these same stems throw out their roots or tuber stolons rather near to the surface than deep. Hence, whether planted deep or shallow, the earthing-up or ridging is equally desirable. Some 4 inches depth is not held to be excessive for the planting of tubers; and when the plants are well up and the stems stout, some 4 inches of soil added in the forming of a ridge is desirable. But even then it will be found, unless more than the usual space between the rows is given, the new tubers are far from being too deeply covered—indeed, ample room between the rows is an absolute essential to proper earthing. A. D.

Forsythia viridissima.—This, at other times uninteresting shrub, is at this season in its full glory of scarlet leaves, quite equalling some hothouse plants with coloured foliage. *Thiscombe*. [We have never observed any very brilliant colouring on the autumnal foliage of this plant. Ed.]

Some Useful Plants.—The culture of greenhouse *Rhododendrons* is deservedly gaining ground. Unlike the *Azaleas* they can be had in bloom in the autumn. Again, there is hardly any *Azalea* that has blooms equal in substance to Princess Alice *Rhododendron*, and none with its delicious fragrance. R. Duchess of Edinburgh and R. Duchess of Connaught, which flower just as they make their growth, have good claims to such an epithet as perpetual blooming. I was much interested while strolling through the glasshouses of Messrs. Veitch, of Exeter, in the

uncommonly successful cultivation of the variegated *Ophiopogon jaburan* and *Paulinia thalictrifolia*. The former is sometimes grown in the open border, but in such a position always wants the erect habit it attains in moderate heat. Mixed with other lowly growing plants or Ferns it is peculiarly effective, and, besides, makes an admirable decorative plant for rooms or dinner-tables in the autumn. The plant is well enough known, so, beyond trying to place it before the attention of those who may not have cultivated it largely, or at all, I will only allude to the beautiful soft purple colour of the Grape Hyacinth-like flower. The *Paulinia* has neat Fern-like foliage, and the infant leaves are crimson tinted. It is a climber, but if kept pinched forms a sturdy little plant also most suitable for decorative purposes. Mr. T. Moore, in the *Treatise of Botany*, has a most interesting note on the use of guaranine, which is prepared from the seeds of *P. sorbilis*; some further notes on the subject would, I am sure, be appreciated. Mr. Greenfield, of The Priory Gardens, Warwick, by placing his plants of the variegated Pine-apple (*Annona salvia variegata*) in saucers and then suspending them near the glass, has changed the white edging to a beautiful ruddy colour, and much increased the vigour. He also cultivates extensively two beautiful old plants in *Clerodendron fragrans* fl. pl., and *Eurycles Cunninghamii*. The flowers of both are most useful for buttonholes and bouquets, and the first-mentioned will keep an exceptionally long time in water. *C. A. M. Carmichael.*

Honours to Horticulture.—I think I shall not be alone in assuming that "F. R. H. S." is, in relation to the above subject, ambitious of wearing in his buttonhole the blue ribbon of the Royal Order of Horticulture, or some other absurd form of decoration, which serve to gratify the childish egotism and vanity of weak man, whilst they do but present food for amusement for the wise. Honours to horticulture, indeed!—what honour can earthly potentate or power give to our conscience that it does not already possess? On the other hand, if the degradation of ribbons and decorations be flung at horticulturists and there follows a general scramble amongst the vain and emulous ones for the glittering baubles, what a bitter flood of jealousy and ill-feeling will sweep over our present peaceful and happy profession. And if "honours" be given how are these to benefit horticulture? Will they bring more trade?—will they create more interesting gardening?—will they promote brotherly esteem and good feeling?—will they help to develop the natural taste for gardening, and deepen the hold which it already has upon the community? Certainly none of these things will follow. Ask the nurseryman whether he would prefer a paltry decoration, or "honour," to increased trade and more activity and growth in horticulture, and I am sure he would prefer the latter. One is surprised to find in the ranks of horticulture such craving for the contemptible as is evidenced in this demand for some special honours for its devotees. Why not for agriculture, for engineering, for manufactures in all branches, indeed why not for everything which adds to the nation's wealth and tends to the prosperity and happiness of the people? I trust the gardening community will show that it has a soul above these petty aspirations, and that our vocation needs no such meretricious aid for its progress and prosperity—

"For 'a' that, and 'a' that,
Their 'honours' cheap and 'a' that,
The path o' sense and pride o' worth
Are higher far than 'a' that."

X. [The question is not the glorification of individuals, but the advance of the profession in public estimation, Ed.]

Longford Hall, Stretford, has so long been under the able management of Mr. G. Smith, that to think of the one apart from the other requires at first some effort of the imagination, and yet, in a very short time, the severance will be an accomplished fact. As one of the best gardeners in this district, one of the most successful exhibitors, one whose skill in arranging for effect has again and again been commented on, and withal one of the most pleasant and cheerful neighbours, Mr. Smith has for a long time had a place in the esteem and admiration of gardeners round Manchester. Shortly we may lose him. We wish him every success in any new sphere he may

have the good fortune to occupy. The immense quantity of glass at this place has during the past season been put to the most practical of uses. The ranges of vinerias have brought tons of fruit; many houses are stripped, and already preparation is being made to commence shutting up the first house. Other vinerias have leaves and fruit of capital size and colour in abundance. The labour connected with the thinning of such a quantity of Vines, &c., in the early spring is truly great. Ranges of Peach-houses, 100 feet long, are now quite quiet. The early house is being taken in hand, and it too will be pruned and tied ready for shutting up. Stoves, corridors, green-houses, &c., are full of plants of their various sections, a capital planted out Fernery being not the least pleasing feature of the garden. I noticed good plants of *Adiantum ciliatum* in baskets, and pretty it looks when grown thus. Two other good *Adiantums* are *dolabriformis* and *palmatum*. This latter is the plant used so effectively in the group staged by Mr. Smith at the Whit-week show at Old Trafford. Passing through the greenhouses, specimen *Azaleas* are numerous, and in good order. Capital hard-wooded *Heaths* are vigorous, and of good colour. *Hedromas*, *Phenacomias*, *Acrophyllums*, &c., plants 4 and 5 by 5 feet, are to be met with. On the back wall of one of the corridors we noticed a large plant of *Luculia gratissima*, very healthy, just showing flower. Large numbers of *Camellias* of all sizes are grown for cutting purposes, and with the *Camellias* receiving greenhouse treatment is a large plant of *Gleichenia flabellata*, in capital order. Real trees of *Acacia affinis*, over 20 feet high, are in the conservatory, and during their flowering season are invaluable. Associated with these is a fine *Araucaria excelsa* 20 feet in height, with foliage to the bottom. In other houses there are fine batches of *Coleogyenes*, *Panacraums*, *Eucharis*, that capital winter plant *Thrysanthus rutifolius*, *Euphorbia jacinthiflora*, besides large plants of *Anturiums*, *Crocus*, *Ixoras*, *Palms*, *Yuccas*, &c. A large stock of *Calanthes* is also finely grown in this place. Here they have retained their foliage, which is now quite green, and the spikes are pushing up with great vigour, many will reach 5 feet in length, and last two or three months longer. *C. Veitchii* has bulbs 16 inches long, and stout at the base; the varieties of *C. vestita* are also strong, the bulbs clean, and covered with a white silky skin free from spot or disease of any description. Splendid bulbs of the new *C. Regnierii* had been grown this past summer, and were now pushing up spikes that would come in with the late forms, such as *C. nivalis* and *C. Turneri*. *W. Swan, Fallowfield.*

Mildness of the Season in East Anglia.—Driving to Saxmundham yesterday (December 3) I observed at Benhall a pyramid Pear tree about 8 feet high in full flower, and not a leaf on it. Such a contrast to the many green Hollies, heavily laden with their bright berries! I wonder what will be the future of that poor tree, and when one may expect the new crop of fruit? Certainly not next season. Is it likely that it is worked on the Quince stock, which may have had a good deal to do with its untimely flowering? I have not seen anything else showing signs of untoward growth here, excepting one Irish Peach Apple tree growing on the Paradise stock, which opened a few blooms in the autumn, and has now one or two others about to open. Having read so much lately about Pears and the Congress, I begin to ask myself if we are justified in planting largely trees worked on these stocks. *C. Sheppard, Glenham Gardens, Saxmundham, Suffolk.* [Untimely flowering is just as commonly observed on trees not so worked, and on other subjects not worked at all. Ed.]

Pruning and Planting Fruit Trees.—Before making a too free use of the knife and pruning-shears the operator should thoroughly weigh in his mind whether or not he is proceeding in the right direction to bring about the best results. If the same attention was paid to the welfare and condition of the roots of many trees as is yearly bestowed on the regulation of branch and shoot, how different and more satisfactory would be the crops of fruit. Unfortunately the knife, &c., is often brought into use when the spade would be found to be the proper corrective required. Unfruitful seasons have much to do with causing the production of over-vigorous

wood; but in many more instances where satisfactory results are not obtained it is the outcome of careless planting in the first onset, which includes shallow soil, bad drainage on retentive soil, and other evils which should have been rectified ere planting. Often yearly amputations of shoot and branch take place which only tend to aggravate the evil arising from over-production of strong wood, furnished with few flower-buds, resulting in little or no fruit of inferior quality. I am now alluding principally to trees in the open, such as pyramids, standards, &c. In a deep naturally rich well-drained soil and a favourable climate the combined influences are not such as every cultivator can command, as it frequently occurs that where the soil is rich and deep, the climate is unfavourable, or exactly *vice versa* may be the case. As to trees planted in good and deep well-drained soil and in favourable localities, very few remarks are necessary as to their ultimate management either in respect to pruning root or branch. Fibrous roots and firm wood well set with flower-buds will develop simultaneously, and only after several years of barrenness will it be necessary to sever a few of the strongest roots in order to restore the balance of root and branch. I am, of course, now speaking of trees which are allowed to grow somewhat naturally, with plenty of side and head room for development, and not of those which are compelled by circumstances to be dwarfed, in order to meet the requirements of position. How different is the case with trees planted in shallow soil, with large fibrous roots which have probably been years growing into a damp unfavourable subsoil. Growing under these conditions trees are in a hopeless state, and can never be expected to produce fine fruit unless the spade is brought into use, the gross tap roots removed, and the natural soil deepened; and if the trees are somewhat large when subjected to this treatment, a corresponding reduction of branch should take place. To those about to plant let them not study false economy, but lay the foundation of success in good deep soil and perfect drainages. What is a little extra expense when planting, in order to secure fine crops and healthy trees, compared with trees which would be quite the reverse if planted on the haphazard principle? It is to be regretted that so many trees have been planted so indiscriminately around the kitchen garden quarters in private gardens, many of which have been brought into an almost worthless state by constant digging too near the stems of the trees. This is most apparent in gardens where the soil is shallow; it deprives the trees of their best rooting medium wherein the roots should have been encouraged by the application of mulchings, under which hoeing, or slightly pricking over the surface, should never have been exceeded. In conclusion, let me advise clear quarters for vegetables, and others set apart exclusively for fruit trees, and the many evils arising from intermixing the two will be avoided. *G. H. Richards.*

Non-rated Trading.—The grievance to which Mr. Anderson refers at p. 720 is one which has often been remarked upon in these columns, and may be discussed with all the more ease that it is happily outside the region of mere party politics. It is a grievance which is peculiarly hard upon horticultural trading, because it is possible only with gardening, and it is one which appreciable exemptions from local and imperial taxes on the one hand, and the readiness of salesmen in our markets to help on the other hand, has materially fostered. In the latter case it is but natural that whilst gardeners have from their wealthy but often mean employers orders to assist in eking out the garden expenses by selling what they can of the garden produce for what it will fetch, salesmen should be only too ready to accept such produce for disposal, because they know that moderate returns will in such case be regarded as satisfactory. The owner has not to live and maintain his garden from the sale of his garden produce. A gardener knows that his wages and subsistence are not dependent upon the sale of the produce. Both hope that as much as possible may be returned in the shape of cash, and that is all. On the other hand the trade grower is absolutely dependent upon his returns for a livelihood, and he has very heavy pecuniary burthens to bear. How on earth, with this unnatural home competition, by which he is handicapped, he still exists, is a wonder, and can only be explained on the ground that his produce is of a more marketable kind, and worthily obtains a higher price. Of course

it may be not inaptly pleaded that this competition, if unjust, still benefits the consuming public, and it has no cause for complaint; but no such result can justify the injustice incidental to rating and taxing heavily, even to the uttermost farthing, the trade grower, whilst the rich amateur trader goes almost scot free. But Mr. Anderson probably knows that the grievance of which he complains might be remedied even now did local authorities and justices of the peace act with justice in the matter of rating. Buildings erected for the gratification of a taste for luxury and enjoyment should be fiscally dealt with at a much higher rate than buildings erected solely for the purposes of trade; but I believe it is a fact that the reverse is the case, and that the latter pay the heaviest imposts. If local authorities would reverse this system and place the heavier imposts upon the former class of property, the burden of the trader would be proportionately lightened. But then were such the case we might see the wealthy and influential house and land owner appealing against the assessment authorities—the only result of such an appeal would be easily discerned beforehand. Really, there can be no hope for remedy until some national system of local government throughout all the counties is established, and that upon a complete representative basis. Then and only then may we hope to see the grievance (with some others) complained of removed. All over the kingdom are to be seen fine houses lying empty, because whilst the rating is almost *nil* the owners have no pressure put upon them to let at reduced rentals. Ordinarily the assumption is that properties should be rated at their rental value. But that is not always a fair basis of assessment. Some properties have a fictitious rental value, others one far below their real worth. Rating should therefore be carried out on a fair and equitable basis, and that can only be found by creating a standard of worth or value, and assessing all property, no matter whether let or unlet, ornamental or trading, precisely alike. But there can be no satisfactory settlement of this vexed question until the incidence of taxation, and especially in its local operation, is dealt with. At present only real property as found in land and buildings pays local taxes. The farmer, market-gardener, nurseryman, or tenant of any buildings is locally taxed to the utmost because they occupy and exist upon tangible or real property. Hence the man who rents land only, and the buildings needful for its profitable employment, or he may perchance be the owner and occupier of the same, having expended upon them all his capital, is called upon to pay rates on all he possesses. But the investor in other directions, whether in shares, or in Consols, or various ways, occupies a house that pays but one-eighth the amount of rating a farmer may pay for his house and land, and yet the occupier of the house may be ten times the richer man. Still all his investments are beyond the reach of the local authorities. They are not to them found in a tangible shape, and thus they pay nothing to the local rates. Clearly that is unjust, because the local expenditure is of as much value to the owner of personal property as to the unfortunate owner or occupier of real property. The matter affords evidence of the need for an immense reform in the present incidence of fiscal burthens, which fall with special force upon one class, whilst others are materially exempted. The diverting of a portion of the income tax towards lightening local rates might be of some use, but a simple and more equitable system of local taxation would be the greater boon, provided that in the rearrangement we did not get out of the frying pan into the fire. A. D.

Artificially Coloured Potatoes.—At the Birmingham Cattle Show last week there was, as usual, a large display of Potatoes, but to my great surprise prizes were awarded to exhibits in several classes which contained specimens which were artificially coloured, principally the red varieties. I have for many years visited large and small shows of Potatoes, but never before have I seen such a flagrant or gross insult to Nature's colouring. I hope those gentlemen who were appointed to make the awards will be able to justify their action, and I trust the opinion of exhibitors generally will be freely expressed through your columns on the subject. *J. Harrison, Leicester.* [We have no information on the subject, but if our correspondent's statement can be substantiated, there is ample cause for remonstrance. Ed.]

Reports of Societies.

ROYAL HORTICULTURAL : December 8.

A very small gathering witnessed the close of the year of exhibitions at South Kensington on Tuesday last, so sorely have the numbers of productions and of the visitors dwindled since the greater exhibition of Inventions shut its doors in October. The three faithful committees were present, but with little wherewithal to occupy their time.

Scientific Committee.

The Hon. and Rev. J. T. Boscawen in the chair.

SCLEROTIA IN STEMS OF CHRYSANTHEMUMS.

Examples of these, described by Mr. W. G. Smith in the *Gardeners' Chronicle*, were forwarded by him, as also an abnormal form of *Leontium lepidium* (Agaricoid), closely resembling a branching *Clavaria*, from a coal-pit near Stoke-upon-Trent. It is often phosphorescent when in this state in mines.

PRODUCE OF LARGE PALMATE POTATO.

A Potato much resembling a hand in form was sent to the Scientific Committee in November, 1884. It weighed 15 oz. On being planted the produce in 1885 was 8 lb., or more than 800 per cent. Such a result would seem to corroborate those at Chiswick—namely, that whole sets usually give a much greater produce than those which have been cut, the former presumably supplying more nourishment, and therefore greater vigour on the commencement of growth.

RESULTS OF EXPERIMENTS ON EARTHING-UP POTATOS AT CHISWICK.

Dr. Masters brought a preliminary report, observing that through the absence of Peronospora, as in 1884, the main object of the experiment failed; but the general results of produce under the different methods of treatment corroborated those of last year. He summarised them as follows:—1. Earthing-up produces a crop of more uniform and of superior quality, even if less in quantity. 2. That bending the haulms occasions a diminished yield. 3. That a larger aggregate produce is derived from planting whole tubers than from the employment of cut sets. It was suggested that the sub-committee should continue the experiment next year, but with fewer rows, and confine the observations to testing the Jensenian method of moulding should the disease occur.

DELPHINIUM, FASCIATED.

Mr. Boulger exhibited specimens, about 5 feet long, which had occurred on the same plant for two or three years. Dr. Masters observed, on the authority of Mr. George Paul, that a Holly, var. *Dominionensis*, is particularly liable to fasciation, as also are the Hollies at Bearwood. Mr. Boulger was inclined to attribute it to poverty of soil. Hon. and Rev. Mr. Boscawen remarked that fasciated stems often occurred from the same root of *Asparagus*.

RESERVE MATERIALS OF PLANTS IN RELATION TO DISEASE.

Rev. C. Henslow called attention to a paper by Mr. D. P. Penhallow in the *Canadian Record of Science* (vol. ii. No. 4, October, 1883), in which the author fully corroborated a single result of a large series of experiments carried on at Loughran Farm in 1883; to ascertain (amongst other objects) a cure for Peach yellows. In only one instance was the Early York Peach very decidedly benefited by the special manures applied, and that was with muriate of potash. "Instead of small abnormal and coloured leaves in early July, the foliage developed into organs of good size and a fine healthy colour, while the growth was also fine (1883)." The cause of the disease he had found to be localisation of starch in the bark, &c., during the summer, instead of its being utilised for growth. In the author's latest communication he calls attention to the fact that in 1871, Nobbe and Schröder demonstrated by their experiments on Buckwheat the influence which may be exerted upon the distribution of reserve material by an abnormal food supply. Chlorine and potash were found to have important bearings upon the products of assimilation; potash being essential to the formation of reserve matters, while chlorine was found to bear a most important relation to their final distribution, and that by withholding chlorine, starch accumulated in the bark and leaves, particularly in young growth. Restoration of chlorine gradually effected the distribution of starch and restored the normal state of health. Acting on these results, and applying them to the

Peach yellows, Mr. Penhallow gives the following analyses to show the beneficial results of a similar application of chlorine:—

	Fruit of Crawford's Early.		Wood of Ditt.	
	Healthy.	Diseased.	Restored.	Diseased.
Ferric acid ..	0.58	0.46	0.52	1.45
Calcium oxide ..	2.64	4.68	54.53	64.23
Magnesium oxide ..	6.29	5.49	7.55	10.28
Phosphoric acid ..	16.02	18.07	11.37	8.37
Potassium oxide ..	74.46	71.30	266.01	156.67
	100.00	100.00	100.00	100.00

These analyses, before and after the application of the muriate of potash, made it at once clear that in the disease the ash contains more phosphoric acid and lime and less potash. Consequently a number of diseased trees were treated with muriate of potash. "After the lapse of a few years they lost all appearance of disease, and were restored to such a condition of health that up to the present time they have been most profitable in their production of fruit." . . . Hence, "So far as chemical data could determine the disease was caused by, or at least, associated with imperfect nutrition."

CRUCIFERES, DRIED SPECIMENS OF.

Colonel Clarke exhibited a series of twenty-five autumn flowering species, illustrating the various characters of the perianth and stamens, the latter organ being regarded as an important classificatory character.

THE CHAIRMAN.

As this was the last meeting a vote of thanks was proposed by Dr. Masters, and seconded by Colonel Clarke, to the Chairman of the Committee, Sir J. D. Hooker, and the hope was expressed that he would continue to hold the office in the ensuing year.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. E. Hill, H. Williams, H. M. Pollett, J. D. Dominy, H. Ballantine, J. Fraser, T. Baines, J. James, H. Herbst, W. Bealby, H. Bennett, J. Child, Shirley Hubbard, J. Douglas, H. Cannell, W. B. Kellock, H. Turner, J. Hudson, G. Duffield, F. R. Kinghorne, and Dr. M. T. Masters.

Of the few *Oreohis* brought out, there were some attractive forms of *Calanthes*, from Sir Trevor Lawrence's garden, Burford Lodge, viz. *C. casta*, white, with a yellow spot in the centre of the perianth, a bright magenta, a compact bloom, with a lip smaller than most of the species; *C. burfordiana*, was alike in colour, but with blooms of a much larger size; *C. aurantiaca*, of the *C. oculata* type, having an orange centre; *C. anabilis*, a pale pink form of flimsy texture. *C. Dorrnan*, Esq., The Firs, Currie Park, Sydney (gr. Mr. White), showed *Odontoglossum Humeanum*, a dwarf species, with a flower-stalk in this instance of 6 inches in length, bearing three blooms. The sepals being mottled brown, petals greenish-white, column white, rose tipped, the lip being about an inch in diameter, and of a pure white.

W. Vanner, Esq., Camden Wood, Chislehurst (gr. Mr. Robins), showed *Barkeria Vanneri*, a long and slender spike of purple-rose coloured blooms.

Messrs. J. Veitch & Sons showed *Chrysanthemum Domination*, a broad bred hybrid Japanese variety, pure white, and of value for its lateness of blooming chiefly.

Mr. Rallings showed also a sport from *Chrysanthemum Duchess of Albany*, a flower of some merit, of which something better may be made under good culture. Mr. L. James, Walsley, Farnham Park, showed *Primula Purity*, a well-made white variety, of substance and regular form, the foliage being of the neat-looking serrated kind.

Mr. R. Owen, nurseryman, Castle Hill, Maidenhead, brought a handsome full of a nice decorative *Chrysanthemum* with numerous white flowers—a variety of much usefulness at this late period of the *Chrysanthemum* season—a fact which received full attention from the committee.

Messrs. J. Carter & Co. showed the curious *Bous-singaultia* baselloides, a temperate-house climber, from Buenos Ayres, being a number of tubers on its branches. The leaves were of a lively green colour, and cordate.

From the Swanley nurseries came a pretty stand of bright blooms of *Pelargonium*, single zonals; conspicuous amongst them was *Swanley Gem*, of bright cerise; *Queen of the Belgians*, fine white, of good truss, and substance; *F. Kaufner*, a rich maroon, one of the best Mr. Cannell had brought; lastly, *Eurydice*, a purple-rose, a beautiful distinct variety.

A dozen blooms of the pretty Ivy-leaved *Pelargonium Madone* (Tibbald's) were on sale at this time of the year. The remaining exhibits from Messrs. Cannell & Sons were several show-boxes of various classes of *Chrysanthemums*, shown as cut blooms.

Messrs. H. Page & Son, Grove Nursery, Teddington, had a capital collection of *Cyclamen persicum* and other kinds; especially noticeable were some white specimens, quite true in strain, and finely grown and flowered. Almost without an exception the plants were the produc-

tion of seeds sown in September, 1884. A Silver-gilt Banksian Medal was awarded.

FIRST-CLASS CERTIFICATES.

To Sir Trevor Lawrence, for Calaupe porphyrea.
To Mr. Owen, for Chrysanthemum Bonle de Neige.
To Messrs. H. Cannell & Sons, for Chrysanthemum Queen of the Yellows.

Fruit Committee.

Present: H. Veitch, Esq., in the chair; and Messrs. J. Lee, J. Burnett, J. Willard, J. Woodbridge, G. T. Miles, G. Paul, F. Rutland, R. D. Blackmore, and G. Bunyard.

Mr. B. S. Williams showed again the handsome black Grape, Winter King, said to be a graft sport from Gros Colmar worked on Raisin de Calabre; but in the case of the fruit shown it was the produce of a Vine on its own roots, the characteristics being apparently as easily distinguished as in former samples exhibited before the committee. Some of the berries were very much like those of Gros Colmar, whilst others were distinctly oval; the bloom was very dense, and the keeping qualities undeniable. What is it?

A few seedling and other Apples were shown, but nothing that obtained a recognition of merit from the committee.

SMITHFIELD CLUB.

At the eighty-eighth annual show of this club, which opened on Monday, the 7th inst., a good display of roots, corn, &c., was to be seen, besides the cattle and sheep.

Messrs. Sutton & Sons, Reading, exhibited large quantities of various sorts of which, viz., Berks Prize and Golden Tankard, were particularly fine, which may also be said of the Champion Swede. A feature of this stand was a collection of grasses for agricultural purposes. A number of dishes of Potatoes were also exhibited, besides collections from members of the Royal Family.

Mr. J. K. King, Coggeshall, Essex, had a stand of various roots, which were of fair quality.

From Messrs. J. Carter & Co., Holborn, London, came a varied collection of roots, &c., and also some 20 glass jars of seeds from various people throughout the country. This firm also exhibited for Colonel Stockwell, Potatoes and Turnips, grown in the Island of Anticosti, River St. Lawrence; the Turnips from the Colonel were very large and clean, but the Potatoes were cracked, although of good size. Mangels, Swedes, Potatoes, &c., were shown in good condition, and some boxes in which Clover and different grasses were just sprouting, were also exhibited.

Messrs. Raybird & Co., Basingstoke, exhibited a varied collection of organic manures from the Anglo-American Guano Works, and chemical manures from the Lawes' Chemical Manure Company, besides of grasses and Wheat, Peas, Beans, Clover, &c., and hay from Hampshire Cow-Grass, which is said to yield 3 tons per acre.

Messrs. Webb & Sons, Stourbridge, exhibited a number of Swedes, among which was the Imperial Swede which took the prize at Birmingham this year. Messrs. Webb also exhibited a great many varieties of Potatoes, among which we noticed the new variety Kinver Hill, of good appearance; seeds of grasses and cereals of many kinds were planted.

An interesting exhibit consisted of 238 samples of ensilage shown in the name of Mr. Kains-Jackson. The samples at this stand were half-boxes of the prize lots brought from the exhibition at the Ensilage Society's rooms, Museum Street—Mr. Kains-Jackson being a member of the Council of the Society.

Messrs. Hooper, of Covent Garden, had a small exhibit of Potatoes and corn; their Potatoes were large and clean, especially Schoolmaster and White Elephant.

Messrs. Thos. Gibbs & Co., Down Street, Piccadilly, occupied a large space, exhibiting produce grown by their customers, which consisted chiefly of the usual agricultural roots, Swedes, Mangels, &c., varieties of Potatoes, and a sample of ensilage, cured in 1884, was shown from Luton Ho Park, Luton. Some very large cabbages of very fine substance, and Yellow Belgian Carrots of great length, were exhibited by this firm.

A collection entirely of seed corn was sent by Messrs. Oakshott & Co., Reading.

Messrs. Harrison & Sons, Leicester, and Messrs. Hall & Son, Westbury, Wilts, both exhibited collections of roots, comprising Swedes, Potatoes, Onions, and seeds of other agricultural plants, such as grasses, &c.

One of the most interesting exhibits of the show was that of the Canadian Pacific Railway. This was an exhibition of the produce of Manitoba and the Canadian North-West. The produce is all natural, without the aid of manures. The Potato is a Squash of enormous size, Onions, and Beauty of Hebron Potato might be seen here, the latter grown to about three times its usual size, as also are many other varieties. Tomatoes and various sorts of fruit were seen preserved in jars, the Tomatoes looking wonderfully fine. In a glass case was a sample of the soil, showing its texture for several feet in depth.

NATIONAL CHRYSANTHEMUM.

A MEETING of the Floral Committee took place at the Royal Aquarium on Wednesday last, when one of the best displays of bloom that has come before this body was seen, several very fine flowers being produced—indeed, surprisingly fine for the season of the year.

First-class Certificates of Merit were awarded to Japanese White Dragon, a pure white flower of the Dragon type with stout broad petals, and promising to make a very fine exhibition variety; to Japanese Bicolor, like the foregoing, an American production orange-red, the reverse orange, of the Dr. Hayes type of flower, large, full, and striking; and to Gloriosum, pale yellow, in the style of Agremens de la Nature, but with broader petals, and quite distinct in character. These came from Messrs. W. & G. Drower, nurserymen, Farnham. The same award was made to Felicia, a fine white variety in the way of Ceres, but without the bluish tinge found in the last named; it has fine broad petals, and appeared to be first-rate in every respect. This came from Messrs. James Veitch & Sons, who also had Domination, a small white flowered Japanese variety.

Mr. N. Davis, nurseryman, Camberwell, received First-Class Certificates for Japanese Duchess of Albany, orange or cerise-red circumference, with clear golden, fine and bold, the petals narrow and long; Japonaise, very finely shown, large full flowers of the incurved type, pale reddish on the surface, with a reddish-gold reverse;—very fine, and will make an excellent exhibition variety; also to Bonle d'Or, Golden Orange, a very large and fine variety, the flowers of great size; also to Ceres, very delicate blush, changing to white, broad flat petals—certificated as a Christmas Japanese, a fine late-flowering variety, the petals of the buds very large and full of blooms of other Japanese varieties, including Ville de Toulouse, pale lilac, with a dull reverse—very light and pleasing; Dormillion, pale bright magenta; Mons. Burnet, blush face, pale reverse—very large, and of a bold show variety; Roseum pictum, R. striatum, &c. A First-class Certificate of Merit was also given to Messrs. H. Cannell & Sons, for Aemone Catherine Wheel, a Japanese type, with long white quilled guard petals and sulphur centre—very pretty and distinct. Also to Mr. Owen, nurseryman, Maidenhead, for Bonle d'Or, a large-flowered, red and white variety—pure white, very free, and exceedingly late, and promising to be most useful.

Votes of thanks were passed to Messrs. H. Cannell & Sons and N. Davis, for contributions of cut flowers, the former showing forty bunches of different types.

MASSACHUSETTS HORTICULTURAL.

BOSTON: Nov. 12 and 13.—The annual Chrysanthemum show of the Society took place on the above dates, and certainly was more extensive than any previous one, both in the number of plants and in the number of exhibitors. All into one hall as in former years. There were many new seedlings shown, including some from New York and New Jersey. The finest seedling variety is a white one from President-Elect, Dr. H. P. Walcott, marked "C. to." It is probably the best white seedling ever originated in this country. The plants were displayed in the upper hall; in the centre were the specimen plants from Dr. H. P. Walcott, Cambridge, and Edwin Fekkes, Newton Highlands, Massachusetts; while on either side were arranged large collections of many varieties. Dr. Walcott was particularly successful in the display of specimen plants, including a large number of Chinese, and Edwin Fekkes 2d, with Mr. G. Gunny, Japanese—Dr. H. P. Walcott 1st, with Fernand Feral; Edwin Fekkes 2d, with Carmen. In Dr. H. P. Walcott's collection we also notice the seedlings George, six petals, bright pink; Colorado, yellow; Pres. Parkman, pink. He also exhibited the following varieties, including some of the finest plants in the hall, viz.:—Fair Maid of Gurnsey, Golden Golden, M. Boyer, Mrs. Shipman, Salamon, Mlle. Marthe, Alfred Satter, Crimson King, Mr. F. B. Child, Mrs. Child, and Mrs. Child. Also Mr. Brock, John Thorp (seedling of the quilled var. with yellow centre), and Beau Paul. Edwin Fekkes also exhibited Source d'Or, Flambeau, Mme. C. Andiguer, Margot, Golden Dragon, Oracion, B. Incomparable, John Satter, Felicia, White Ward, and Mr. Geo. Glenn. E. W. Wood was 1st in the class of forty named varieties, all classes, and Edwin Fekkes 2d, 3d, Patrick Melley. In the lower hall the cut blooms and fruit were arranged. Edwin Fekkes was 1st with twelve cut blooms of large flowered or Chinese, named; 2d, E. Sheppard & Sons, 1st; 3d, Edwin Fekkes 2d. Six cut blooms, large flowered or Chinese, named.—Edwin Fekkes, 1st; S. Neil, Dorchester, 2d. Six cut blooms, Japanese, named.—E. Sheppard, 1st; 2d, George W. Gray.

At one end of the upper hall the Orchids were arranged on a table running across the hall, backed up with tall Palms, &c. William Robinson, gr. to F. L. Ames, took 1st prize in the class for three plants, named varieties, in bloom, with Odontoglossum Alexandrie, Vanda, and Van der Veer, in bud. He also showed Cyripedium Chantini, C. Spicerianum, C. Harrisianum, C. marmorophyllum, Vanda cernula, Phalenopsis amabilis, Dendrobium formosum giganteum, Oncidium crispum Forbesii. He received a First-class Certificate for the first named variety, which is a new hybrid, also a new Seden hybrid, Cyripedium ressellatum porphyreum, also for Cyripedium Tonson. The above are the principal plants shown by them. E. W. Gilmore, Esq., North Easton, Mass., Thomas Greaves, gr. contributed a large collection, including a plant of Oncidium ornithoglyphum, with fifty flowers, and a new one, also Oncidium varicosum, with sixty flowers, and the following, viz., Calanthe Veitchii, C. vestita, pink eye; Dendrobium formosum giganteum, D. bigibulum, Lycaste Skinneri, Masdevallia tovarensis, Odontoglossum grande, Oncidium amabilis, and Oncidium majumajum.

From the Harvard Botanic Gardens (W. Mass.), we noticed an interesting group of plants, among which we noticed the curious Streitzia augusta, or Bird of

Paradise flower; Tagetes Lemonci, a native of the United States; Salvia leucantha, with purple and white flowers; and a species of Aristolochia, very curious to look at, but smelling like carrion. Mrs. F. B. Hayes contributed a collection of cut Chrysanthemums and Camellias, Edwin Sheppard Chrysanthemums, Geraniums, and Paneratum fragrans. J. Lewis Childs, of Floral, New York, had a large collection of seedlings and other varieties. The above includes most of the principal collections, but we cannot mention more for want of room. On the fruit table we noticed some very fine Pears, viz., Angouleme, Anjou, Langeliers, Lawrence, Vicars, and Winter Nelis, also some very fine Dana's Hovey. From Mrs. F. B. Hayes came a dish of Psidium (Guava). On the vegetable table were some very fine Cauliflowers, Brussels Sprouts, and Celery.

STOVE PLANTS IN WINTER.

THE time of rest for plants is now at hand, and even in the case of the large number of tender kinds grown under glass the majority require a period of either total or partial rest, according to their nature. Heat and moisture [and high] are the primary agents that excite growth in vegetation; in the absence of either of these in quantity sufficient to keep the vital force in an active state growth ceases, wholly or partially, in accordance with the extent of the reduction that takes place in any of the exciting forces. Plants that are indigenous to countries where there are extreme fluctuations from excessive moisture to excessive drought naturally are the kinds that submit to treatment of a comparatively like character at the hands of the cultivator. Yet the sight of a plant stove wherein are located an average collection of species, brought together from the eastern and western hemispheres, no two in all probability coming from places where the climate is alike, especially in the matter of moisture, but in other respects differing much, causes those who are acquainted with the widely different conditions under which the plants exist naturally to marvel that they can be induced to thrive in the same house, where, when all that is possible has been done in regulating the heat, the majority will get either more or less than they exactly require; for although in a good sized house something may be done to meet the requirements of the inmates, by putting those that want the most warmth at the warmest end, and such as require less at the coolest end, and by giving all the air that is admitted to the house at the latter, still this will fall far short of securing to each of the occupants the condition they are subject to in their native habitats. Thus it follows that the state of complete or partial rest required by each kind of plant, must in great measure, be regulated by the use of the water-pot. Those who have ever so little knowledge of what occurs in some parts of the world where the temperature from one end of the year to the other is always high, need not be told that were it not that the soil is so completely dried up for a time vegetable life would be continuously moving at high-pressure rate. There is ample proof that a like condition of rest can be brought about with some plants when under artificial cultivation by drying their roots, when otherwise the heat they are subject to is such that it would keep them on growing when it is needful for them to be at rest. The advantages attending this method of resting such plants as will bear without injury their roots being quite dry is, that when there is not the convenience of special houses wherein to place them whilst at rest, they can remain in the stove without the heat, as often practised, being reduced too low for those plants that require a comparatively high temperature even in the winter. I have often had such things as Allamandas, Eugouinivella glabra, Clerodendron Balfouri, C. Thompsonii, Aristolochias, Mussenda frondosa, Thunbergias, Dipladenias, and others of a like character, standing for eight or ten weeks quite dormant in a house that was kept at a temperature of 66° or 68° in the night. Needless to say the soil was quite dry, or the plants would have grown space with the amount of heat present, as shown by others of the same kinds which were located in the same house, and being required to flower earlier had the requisite amount of water to keep them growing.

Even plants like Stephanotis, Passiflora quadrangularis, the shrubby Clerodendrons, Medinillas, and others that are quite evergreen will, if the growth has been made under conditions that have given sufficient strength and substance to the wood and leaves, bear without injury the soil keeping dry enough for a time to prevent their growing perceptibly. But although the plants last spoken of will bear their roots keeping comparatively dry in the way described, and those

previously named do not suffer by their roots being in soil devoid of moisture, still it would not do to treat indiscriminately all the various subjects that come under the head of stove plants in this manner. Neither would a like course answer if the atmosphere of the house was too dry, for it naturally follows that a plant cannot bear standing in an atmosphere so dry as to extract any moisture from its foliage at a time when its roots have none within their reach to supply the loss. Instead of this the air of the house should be charged with as much moisture as the dull time of the year will permit of being used.

It may be well here to mention that, except with the intention of inducing them to flower later in the spring or summer than they otherwise would, there is no necessity for subjecting many kinds of plants to this drying up process that are usually looked on as requiring to be so treated to get them to flower sufficiently the ensuing year. There are many stove plants that through being annually subjected to a half-dried condition of the soil are so injured that they do not grow or flower as they should or otherwise would do. *Ixoras* in particular suffer by this mistaken practice. All the reduction in the matter of water that they require is that consequent on their making less growth, and the moisture not drying up so fast as in summer, proportionately less should be given. These and all other plants that do best when kept moving continually throughout the winter, and that bloom naturally from the current growth without a season of rest between the growth being made and its flowering, should never have the soil drier than is consistent with continuous root extension—a process that is always going on with them, only slower in winter than in summer.

Many stove plants that naturally make continuous root-growth are annually, as autumn comes round, put through the punishing process of having the soil kept much too dry, under the impression that unless the wood is in this way hardened up they will not flower. Anything in the shape of bloom that is got in this way will be of little account, as it may be taken for granted that unless the previous summer's growth has been made under conditions such as to give it the requisite strength and solidity no amount of drying off will set the matter right, but rather make worse the state of the plants so treated. I have already alluded to the widely different conditions under which an ordinary collection of stove plants exist, conditions that it will not do for the cultivator to lose sight of, especially in a matter of such importance as the extent to which root moisture should be withheld. In this more than in most things connected with their cultivation any approach to an all- alike course of treatment will not end satisfactorily. Whilst some plants will bear without injury their roots for a time in winter being kept perfectly dry and others partially so, there are many that suffer if there is any approach to such a condition of the soil. *T. B.*

Florists' Flowers.

THE CINERARIA.

THIS is certainly one of the most esteemed of greenhouse flowers during the first four months of the year. They immediately succeed the *Chrysanthemums*, and their rich, brilliant colours are fitting heralds of the coming spring. The plants suffer from damp at this season, unless they are placed in a heated house, with ample ventilation. It is no use to place them in frames or unheated pits at this late season of the year, as tender frosts may soon set in, and the plants are of too delicate a nature to resist cold. When the weather is at all favourable ample ventilation must be the rule, but high winds damage the large fleshy leaves. A sure sign of good cultivation is the preservation of the large leaves near the base; if these decay from any cause the plants cannot be of the highest merit. Everybody cannot afford a special house for their culture, but those who can will, or ought to have plants in all stages of growth, and as they come into flower they should be removed to the greenhouse; this gives those that remain a better chance to develop themselves. I need not say that plants intended for exhibition in the spring should have plenty of space, and must not be allowed to become pot-bound before they have been placed in their flowering pots. I only

stop the flowering growth once, and that is as soon as the flower-stem rises out of the centre of the plant. The importance of ample ventilation cannot be over-estimated. I like to have the plants in a house from which the lights can be removed, and I would take the trouble to remove them even in this late period of the year, if the weather was favourable. It is not well to be too free with manure-water; if this is applied at all it ought to be weak, and never unless the pots are well filled with roots. The plants are very easily injured by greenfly. They cling closely to the stems, and insinuate themselves close round the flower-buds, extracting all the substance out of them. I would fumigate with tobacco smoke if I saw a single greenfly in the house. By far the largest proportion of cultivators grow their plants from seeds, and the improvement within the last few years has been so great, that for all ordinary purposes seedlings are not only easier to manage, but are quite as showy as the best named varieties. For exhibition purposes, I would much rather grow named sorts or selected seedlings. They are very easily propagated during the months of May and June, and such plants will produce large handsome specimens which will fill an 8-inch pot, forming a very large head of bloom. The points most essential in their culture are cleanliness and the production of healthy growth by keeping the plants close to the glass, admitting air abundantly, but by no means exposing the plants to be injured by high winds. A few of the double varieties may be grown for variety, the best of them being very pretty; but taking them in the mass they are not nearly so elegant as the single forms. They require just the same treatment. *J. Douglas.*

MARKET GARDENING.

IN continuation of my remarks on vegetable growing, as practised in connection with metropolitan markets, it will be necessary to refer to several crops, or kinds of vegetables together, owing to the fact that as co-existing crops they occupy the same space of ground together. The principal or main crop is, however,

CELERY.

Owing to the extent of ground required in connection with this important crop, to insure that it be efficiently earthed up to properly blanch, &c., much more space has to be given it than is really required during the summer seasons. Market gardeners are therefore obliged to make the most of such space, and always grow other crops thereon which owing to their market value are desirable. Celery growing for the London markets is an industry which has become more or less, a monopoly in the hands of a limited number of old and efficient growers, whose produce and names are recognised in each market, though there is no necessity to give them here, their success being due to care in selecting soils and sites, and to experience in its culture only obtained by long practice. The soil preferred is a dark loam, and the sites generally such as have some minor tributary of a river or a brook flowing alongside, the water of which is brought either by artificial means, or by simple flushing, for the process of irrigation during the summer season.

It will be seen, therefore, that these conveniences outweigh usually those possessed by private growers. Besides which, as Celery is an indigenous marsh plant, made fit for food by improvement, it flourishes best in such-like sites.

Each year's culture may be said, for the purpose of these remarks, to date from a period in the winter, or very early spring, when the necessary trenches are dug out for the crop, which is done in the usual way, though they are not dug out so deep as many gardeners think it desirable to do. The trenches are subsequently manured with green, or once or twice turned stable manure, and not, as is generally the case in private gardens, with old decomposed dung from hotbeds. There seems to be no disposition to dig such manure in at once; the reason appears to be that a "catch crop" is taken before the time for planting out the young Celery plants arrives, one such crop being

EARLY RADISHES.

For this crop the mounds between the prepared trenches is utilised. During a mild period, early in the third month of the year, such mounds are neatly raked over, taking care not to force the loose soil

into the trenches, and a crop of Radish seed is sown. The variety most commonly used is the French Breakfast, an Olive-shaped form of Turnip Radish. Whether it be the soil, or the elevated beds they are grown upon, the success obtained by the simple system of growing them described is wonderful—though I am bound to say some part of the success is due, I believe, to sowing the seeds somewhat thinly compared to the way similar seeds are generally sown in private gardens, &c. In other words, the seeds are sown so thinly as to insure an ample crop, yet not so thickly as to impede each other's proper growth and bulbing. So admirable are the results that when examining these long beds I have pulled up bunches of the finest size and quality of Radishes, each time I put my hand down and pulled up as many as the hand could grasp.

The birds are a great hindrance to success in connection with the successful culture of Radishes in small gardens, and where thick sowing is all but invariably resorted to to neutralise their depredations amongst such seeds, which birds are particularly fond of. The fact remains, however, when the seedlings come up too thickly they cannot bulb, hence a great waste of ground, time, and seed is the result. Not only is this the case in connection with Radishes, but Turnips and all bulbous rooted plants show it in like degree. Turnips are usually thinned out, and this would in degree prove equally efficacious with too thickly sown Radish seed. I do not overlook the fact that seed-sowing in large breadths is a very different thing to patch sowings of more limited areas, and that birds cannot do the injury to large sowings they invariably do lesser ones, or that boy bird tenders are veritable additions to large market gardens; I desire only to point out that abundance of light and air, with ample distance between the seedling plants, are capable of giving the best results. The expanse of Radish beds sown requires no further attention until full grown, when bunching takes place, after which the beds and the whole space is again free for other crops. Other crops are occasionally grown in lieu of Radishes, or in succession to them, and an important one suitable for either is

LETTUCE.

Seedling plants, mainly of the Paris Cos type of Lettuce, are secured, either by autumn sowings under the protection of cold frames, or early spring sowings in a suitable temperature—such seedling plants being duly attended to so as to keep them stocky and robust by giving air abundantly, or transplanting them in the usual way. At a suitable season they are finally transplanted, three or four rows deep along the flat ridges between each Celery trench.

The Lettuces come in for market uses at a period of the year when there are no excessive supplies, sometimes securing high prices. Another and similarly treated crop is

EARLY CAULIFLOWERS.

Though not so generally grown as the two preceding crops, owing to earlier produce finding its way into market, and its uncertainty compared with the preceding, still occasionally a row or two of early Cauliflowers are planted along the ridges by way of change crop. These, however, only deserve passing notice. I return, therefore, to the main subject—the Celery crop.

SOWING CELERY SEED.

Market gardeners have evidently very fixed ideas as to what kind of seedling plants make in the long run the best produce. And though some of them commence digging good blanching examples somewhat early in the season, they do not appear to unduly force germination, or the after-growth of the young seedling plants.

Wooden frames are partly filled with rich soil, or, as is oftener the case, the ground is well prepared by enriching, breaking up, &c., and the frames placed thereon, such frames being of the modern type, handy, comparatively shallow, light, and convenient. The seeds are then sown and neatly covered, and the sashes shut down until germination is in progress, air, &c., being given as growth progresses. By this means very vigorous young seedling plants are secured.

As soon as large enough for pricking out, every possible advantage is taken of ground where protection can be afforded to transplant and forward the earliest batch of plants, so as to make them ready for

planting out at the earliest possible time. I have observed Celery growers even to use span-roofed houses for this purpose. Elevated beds are raised, and the young seedlings dibbled out thereon. This work is done by women employed on the premises for general work.

During the subsequent summer months the power to irrigate the trenches gives great impetus to growth, and it is not to be wondered the result gives such thick, sturdy sticks!

It may be observed, however, these are all important and requisite features, from a market point of view, and odd strange as it may appear, in regard to Celery more particularly.

The fact is, to make a profit it requires good uniformly well grown Celery, and a variable or inferior crop would consist of so much waste, even if good bundles could be made, so that the returns would be lessened one half and more.

Gardeners who grow for private tables need not wish to emulate the large compact market sticks. The tenderest and best Celery rarely grows fine show sticks. The fact is, high quality consists of tenderness, and the most tender, or crisp and best are, owing to their very crispness, prone to split in two at the outer leaves during growth. Thus such a crisp variety as Williams' Matchless would never succeed upon market vans nor exhibition boards, though for salads it may have no equal.

But I imagine private growers may profit from even these facts. It is needless to remark private growers, in their anxiety to have early, and, as they imagine, large and fine produce, are prone to sow seeds in heat at a somewhat early date; the result being, when pans or boxes of young seedlings are secured, they are placed on one side until greater convenience, either of time or space, permits of their being planted out. This fact in itself causes the plants to become stunted, and occasionally, later on, to bolt more or less.

But I maintain that still more permanent injury is done. It matters not how long, or how strong a plant drawn in a transplanted seedling form may be, if it is not possessed of a good base. And as regards nursed-up, overdrawn plants, even when they are planted out early, their whole vigour, if they possess any, is expended in forming such requisite base, the result being that ultimately the whole of those earlier leaves wither away, and even if rich soil and attention to watering cause subsequently a vigorous growth, this becomes drawn and out of character, so that the original want of a good robust young plant causes even the matured produce to be thin and devoid of heart. If private growers would emulate their market counterparts, and set aside a small frame on a sunny sheltered site, sowing the seeds therein at precisely the same date they habitually make those early sowings in heat, giving but slight attention to it subsequently, I am convinced better results would ensue.

As it is, too early forced, transplanted, and hence drawn-up plants do not come up with nearly such good fibrous roots, and being transplanted often during dry periods, subsist on meagre supplies of root moisture, as compared with the ample supply which efficient irrigation affords, applied as matured practice dictates.

In connection with Celery growing for market, the preparation of the plants following a summer's growth for earthing up is particularly well performed. Growers know the great injury that accrues to the stalks by permitting suckers to remain upon them. Great care is therefore taken to remove all such. The earthing up work is performed with nice regularity and care, so as not to unduly force the soil against any part unduly, and so check the upward growth of young leaves, or, what is worse in connection with the earlier stages, cause "sticks" to become "seated," or bent double. In view of this the soil, previous to the first and subsequent moldings, is broken down finely, so that it may lie evenly and settle down as evenly and firmly together as possible following rains. *William Earley, Ilford.*

Obituary.

We have to record the death, on December 5, of ALEXANDER AYSON, aged fifty-six, who for the last twenty-seven years fulfilled the duties of Head Gardener to the late General Studd and his eldest son and successor, E. F. Studd, Esq., Oxtou Hall, Kenton, Exeter. Mr. Ayson was a good all-round gardener. Orchids at one time were well cultivated, the collection comprising many grand specimens of the most popular varieties. Pansy culture was carried

out to a great extent, several hundred varieties of the best in cultivation being grown, his employer being especially fond of this modest flower. He was the raiser of that beautiful Regal Felargium, Beauty of Oxtou, sent out some years ago by Messrs. Cannell & Son, and which has found its way into every collection. The Coniferæ at Oxtou, of which there are many fine specimens, were raised from seed by Mr. Ayson, and he lived to see many of them as perfect specimens as are to be met with. Fruit culture, both indoors and out, together with all the other departments, showed signs of good cultivation.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, DECEMBER 9, 1885.

MONTH AND DAY	BAROMETER		TEMPERATURE OF THE AIR				HYGROMETRICAL DEDUCTIONS FROM GLAISHER'S TABLES 7th Edition	WIND	RAINFALL

Mean	29.73		-0.04	11.13	1.3	37.3	4	N.W.	0.53

Dec. 3.—Rain in morning; very dull day.

4.—Slight rain from early morning till 9 A.M.; very fine in afternoon; shower of rain about 4 P.M.

5.—Dull day; rain at night.

6.—Fine day; dull.

7.—Dull day; fine.

8.—Very fine day; very cold.

9.—Fine day; slight fall of snow at night.

LONDON: Atmospheric Pressure.—During the week ending December 5, the reading of the barometer increased from 29.40 inches at the beginning of the week to 29.65 inches by 9 A.M., and decreased to 29.61 inches by 1 P.M. on the 29th, increased to 30.32 inches by 9 A.M. on the 2d, decreased to 29.66 inches by 9 A.M. on the 4th, increased to 29.82 inches by 9 A.M. on the 5th, and was 29.65 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.91 inches, being 0.45 inch higher than last week, and 0.01 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 57°.5, on Nov. 30; on Dec. 5 the highest temperature was 41°.5. The mean of the seven high day temperatures was 49°.5.

The lowest temperature was 31°.2, on Dec. 2, on Nov. 30 the lowest temperature was 44°.8. The mean of the seven low night temperatures was 37°.6.

The greatest range of temperature in one day was 18°.8, on Nov. 29; the smallest on Dec. 5 was 8°.1. The mean of the seven daily ranges was 11°.9.

The mean temperatures were, on Nov. 29, 48°.4 on the 30th, 50°.5; on Dec. 1st, 42°.6; on the 2d, 39°; on the 3d, 45°.8; on the 4th, 44°.2; and on the 5th, 37°.9; and these were all above the averages (excepting Dec. 2 and 5, which were 2°.8 and 3°.8 below their averages), by 6°.7, 5°.8, 0°.9, 4°, and 2°.4 respectively.

The mean temperature of the week was 43°.6, being 1° lower than last week, and 2°.3 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 64°, on Dec. 2. The general mean was 58°.3.

The lowest reading of a minimum thermometer

placed on grass was 29°.4 on the 22d. The mean of the seven readings was 33°.3.

Rain.—Rain fell on six days to the amount of 0.98 inch.

ENGLAND: Temperature.—During the week ending December 5, the highest temperatures were 58°.5 at Cambridge, 58° at Truro, 57°.5 at Blackheath; the highest at Sunderland was 51°, at E. London, 51°.6, at Preston and Newcastle 52°. The general mean was 55°.

The lowest temperatures were 36° at Truro, 30°.4 at Wolverhampton, 31°.2 at Blackheath and Liverpool; at Preston lowest was 37°, at Bradford 36°.4, at Leeds and Sunderland 36°. The general mean was 33°.6.

The greatest ranges were 28° at Truro, 27°.5 at Cambridge, 26°.3 at Blackheath; the least ranges were 15 at Sunderland and Preston, 17° at Newcastle. The general mean was 21°.4.

The mean of the seven high day temperatures was highest at Truro 51°, at Plymouth 53°.6, at Leeds; 51°.5, and was lowest at Sunderland, 45°.7, at Bolton 46°.4, at Liverpool 48°.7. The general mean was 49°.6.

The mean of the seven low night temperatures was highest at Truro, 41°.4, at Plymouth 43°.8, at Bristol 39°.8; and was lowest at Wolverhampton, 33°.7, at Bolton 35°.4, at Hull 36°.4. The general mean was 38°.7.

The mean daily range was greatest at Wolverhampton, 15°.4, at Hull 13°.3, at Nottingham 12°.7; and was less at Sunderland, 7°.3, at Newcastle 9°, at Truro 9°.6. The general mean was 10°.9.

The mean temperature was highest at Truro, 49°.1, at Plymouth 48°.6, at Leeds 45°.2; and was least at Bolton, 40°.8, at Wolverhampton, 41°.3, at Sunderland 41°.9. The general mean was 44°.1.

Rain.—The largest falls were 1.88 inch at Bristol, 1.58 inch at Truro, 1.29 inch at Bolton. The smallest falls were 0.13 inch at Newcastle, 0.15 inch at Hull, and 0.18 inch at Sunderland. The general mean fall was 0.75 inch.

SCOTLAND: Temperature.—During the week ending December 5, the highest temperature was 53°, at Glasgow; at Dundee the highest temperature was 48°.1. The general mean was 50°.5.

The lowest temperature in the week was 27°, at Glasgow; at Perth the lowest temperature was 34°.9. The general mean was 31°.

The mean temperature was highest at Leith, 43°.3; and lowest at Dundee, 39°.7. The general mean was 41°.8.

Rain.—The largest fall was 2.06 inch, at Greenock; the smallest fall was 0.43 inch, at Leith. The general mean fall was 0.91 inch.

JAMES GLAISHER, F.R.S.

* OUR ALMANAC FOR 1886.—Secretaries of Provincial and Metropolitan Horticultural Societies are particularly invited to send us, as soon as possible, the Dates of their Meetings and Exhibitions during the ensuing year, so as to ensure their insertion.

ADDRESS: J. A. de Mar, Williams & Norgate, foreign booksellers, Henrietta Street, Covent Garden, London.

COWPEAKING BY FARM LABOURERS: F. B. The cost is 1s., and it can be obtained from Henry Everhed, Hurstmoor, Sussex.

DIARIES: Ed. Birchall. We know of no diary specially suited to a gardener.

ERRATA.—In our report of York Ancient Florists' meeting (p. 728), for "Apples and Pears north of the Tweed," read "Apples and Pears north of the Trent."—At p. 715, third line, in *Dendrobium speciosum*, read "my man" for "my gardener."—On p. 678, col. 6, in the article on *Cattleya Warszewiczii*, sixth line, read "I span" instead of "I inch."

FERNS: *Broomfield*. 1. Now more fully developed this proves to be *Adiantum Moritzianum*, a large and free-growing form of *A. Capillus-Veneris*, regarded by some as a distinct species, which is very doubtful. 2. Not in a very satisfactory state, but the smaller more fully fruited pieces seem to be the small pinnuled form of *A. Capillus-Veneris* said to have been introduced from the Crimea, and sometimes named *A. c-v.*, var. *Hookeri*.

ILLUSTRATIONS OF TREES: R. Coombs. There is no book of which we are aware that gives accurate drawings of each kind of tree so as to make it available for an artist. The persons who deal in artists' requirements may have sketches of common English trees.

INSECTS: J. W. The little motts seen as a species of Tinea, perhaps T. pallescentella. The little maggots seen in decaying vegetable mould are probably their larvae; but please say in what manner they have attacked your French Beans by a line addressed to Professor Westwood, Oxford.

KEW GARDENS: G. Parker.—You must apply to Mr. Smith, Curator, Kew, who would then put the applicant's name on the list. Vacancies are seldom.

MANURE FOR NEWLY LAID TURF: J. Van Hutbergh. At any time during the winter you can dress the grassland with sifted loam, wood ashes (one-fourth of the whole), and rotten cow or horse manure may be added, the soil being poor, otherwise the latter is better omitted. The compost should be well mixed before using it. A frosty day should be chosen, so that it can be wheeled on without causing injury to the turf, and be spread thinly—that is, just covering the ground, without hiding the blades of grass. The rains will wash it all in before growth takes place in the spring.

NAMES OF FRUITS: We regret to say that a package, containing several varieties, despatched to our fruit dealer, was tampered with, and we are consequently unable to give the names.

NAMES OF PLANTS: H. T. Hakea laurina.—J. Uryukhart, 1. A. H. Dilleni; 2. Adiantum excisum; 3. Acaacia arnata; 4. A. Riccardia; 5. Woodwardia orientale.

PRIMULA: W. J. H. Chinese Primrose and Primula sinensis and P. pratinensis are synonymous.

RIBSTON PIPPIN AND CORNISH GILLYFLOWER APPLES: H. G. You should get these sorts true to name from nurserymen in your county—as Messrs. Lacombe & Pince, and R. Veitch, of Exeter, or of Mr. Scott, Merriott Nurseries, Crewkerne.

SALIX ROSMARINIFOLIA: C. A. M. C. This plant has been found in Britain in a few places, but it is stated by most authorities to be North European. It is met with in Sweden.

THE RISE AND PROGRESS OF GARDENING: W. Scott. W. Garden, by A. Smees, published by G. Bell & Son, York Street, Covent Garden, W.C.; Johnson's Dictionary of British Gardening, now out of print.

* * All communications intended for publication should be addressed to the "Editor," and not to the Publisher, or to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspaper articles should be careful to mark the paragraphs they wish the Editor to see.

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

INTELLIGENT READERS, PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

CATALOGUES RECEIVED.

Enquiries.

"He that questioneth much shall learn much."—BACON.
POINSETTIAS NOT FLOWERING.—I shall be much obliged if some of your correspondents will tell me the cause of the leaves that form the bracts getting black and falling off when just unfolding from around the flower. I have planted quite a quantity this year, the plants ranging from 6 inches to 6 feet high; some of the stems are clothed to the top with healthy foliage, others have from three to eight healthy leaves, but not one plant has perfected a single bract. Would guano-water in a weak state cause it? for they were watered during summer and autumn with it. I shall be glad to get any

information as to the means to be adopted to prevent such an occurrence another year, as I am sure something must have gone wrong in the management. They never got dry, but had every attention. Toki.

Markets.

COVENT GARDEN, December 10.

[The following reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week, may not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. Eo.]

LARGE consignment of Grapes to hand with a free sale at low rates. English Flines flat, in face of heavy arrivals from St. Michael. Fine samples of Kent Cobs in demand. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. s. d. Apples, per 1/2 sieve 1 0-3 0; Beans, Kidney, lb. 0-8 0; Beet, red, per dozen 1 0-2 0; Broccoli, bundle 0 9-1 0; Cucumbers, per dozen 1 6-; Capsicums, per 100 1 6-0; Carrots, per bunch 0 6-; Cauliflowers, per doz. 2 0-3 0; Celery, per 100 0 2-3 0; Coleworts, doz. bunch 4 0-6 0; Cornish, lb. 0-6 11; Endive, per dozen 1 2-2 0; Herbs, per bunch 0 2-2 4; Lettuce, per bunch 0 3-4 0; Lemons, per case 11 3-0 30

VEGETABLES.—AVERAGE RETAIL PRICES.

SEEDS.

LONDON: Dec. 9.—Owing to the presence in London of a large number of agriculturists up for the Cattle Show, there was a larger attendance than usual on today's Seed Market. Business, however, continues exceedingly quiet; and, in fact, no great activity is expected until the New Year. Mentioning, in the all-round exhibit considerable steadiness. Rather higher prices are asked for Trefoil. In neither Clovers nor Alsikes is there any quotable change. There is more business now passing in blue Peas and Haricot Beans. Feeding Linseed is firmer. Hemp and Canary seed show no alteration. French Beans very weak, and that rates are supported is the best that can be said. The

CORN.

MARK LANE: Dec. 7.—Arrivals from abroad having been very moderate, has tended to give some support to prices, but the trade nevertheless was very slack, and that rates are supported is the best that can be said. The

flour trade was also quiet, and without change in prices. New Maize was easier. Barley was quiet, and Oats, with fair arrivals, were a slow sale, and in some cases the turn in buyers' favour.

Dec. 9.—Wheat and flour were quoted at late rates. Spring corn generally was supported, and Russian Oats were firmer. New Maize was dull. Average prices of corn for the week ending Dec. 5:—Wheat, 31s.; Barley, 30s. 10d.; Oats, 18s. 10d. For the corresponding period last year:—Wheat, 30s. 10d.; Barley, 31s. 2d.; Oats, 19s. 2d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): Dec. 9.—Good supplies of fruit and vegetables, with a good trade at undermentioned quotations.—Pears, 2s. 6d. to 5s., and Apples, 2s. 6d. to 5s. per bushel; Cabbages, 2s. 6d. to 2s. per tally; Savoy's, 3s. to 7s. do.; Spinach, 2s. 6d. to 3s. per sieve; Brussels Sprouts, 4s. to 4s. 6d. do.; Cauliflowers, 1s. to 2s. per dozen; Beetroot, 2s. 6d. to 3s. do.; Celery, 6s. to 10s. per dozen bunches; bunch greens, 2s. 6d. to 4s. per dozen bunches; ditto Turnips, 3s. to 3s. 6d. do.; ditto Carrots, 2s. 6d. to 3s. do.; ditto Parsley, 1s. to 1s. 6d. do.; Onions, 4s. 6d. to 5s. per cwt.; white Turnips, 40s. to 58s. per ton; Swede do., 25s. to 30s. do.; Carrots, 30s. to 30s. do.; Mangels, 22s. to 25s. do.

STRAFORD: Dec. 8.—There was a good supply of produce, and a fair trade was done at the following prices:—Cabbages, 3s. to 5s. per tally; Savoy's, 3s. to 7s. 6d. do.; red Cabbage, 3s. to 5s. do.; greens, 2s. 6d. to 4s. per dozen; Cauliflowers, 1s. 6d. to 2s. do.; Mangels, 17s. to 20s. per ton; Swedes, 20s. to 25s. do.; Turnips, 35s. to 60s. do.; Carrots, cattle feeding, 28s. to 45s. do.; do. household, 22s. 6d. to 50s. do.; Celery, 6s. to 12s. per dozen rolls; Apples, 2s. to 6s. per bushel; Spmach, 1s. 6d. to 2s. per sieve; Horse Radish, 9s. to 12s. per dozen bundles.

POTATOS.

BOROUGH AND SPITALFIELDS: Dec. 8.—Supplies good, and demand slow, at previous rates fully for best samples. Quotations.—Regents, 70s. to 105s.; Magnum Bonum, 50s. to 95s.; Champions, 50s. to 60s.; German, 50s. to 60s. per ton. COLUMBIA (East London): Dec. 9.—There was a good trade at the following quotations:—Reading Hero, 60s. to 70s.; Beauty of Hebron, 60s. to 75s.; Champions, 50s. to 60s.; Victorias, 50s. to 60s.; Regents, 55s. to 65s.; and Magnus, 50s. to 70s. per ton.

STRAFORD: Dec. 8.—Magnums, 50s. to 80s.; Regents, 60s. to 80s.; Champions, 45s. to 60s.; Reading Hero, 60s. to 65s. per ton.

Imports.—The imports into London last week consisted of 672 bags from Hamburg, 54 from Rotterdam, 13 from Ostend, 3 from St. Michael's, 95s from Ghent, and 32 cases from Antwerp.

HAY.

WHITECHAPEL: Dec. 8.—The finer weather improved demand, and there was rather more doing at steady prices. Quotations.—Clover, prime, 60s. to 102s.; inferior, 63s. to 85s.; Hay, prime, 75s. to 88s.; inferior, 63s. to 75s.; Straw, 28s. to 37s. per load.

Dec. 10.—A moderate supply was on sale. The trade was quiet except for best hay.

CUMBERLAND (Regent's Park): Dec. 8.—With favourable weather trade slightly improved at following rates:—Clover, best, 90s. to 100s.; second, 70s. to 92s.; Hay, best, 75s. to 85s.; second, 60s. to 70s.; Straw, 30s. to 36s. per load.

STRAFORD: Dec. 8.—Clover, 75s. to 110s.; meadow hay, 60s. to 90s.; and straw, 28s. to 36s. per load.

CATTLE.

METROPOLITAN: Dec. 7.—Prime qualities of cattle, which comprised but a very moderate proportion of the supply, cleared readily at steady value, whilst middling and large descriptions were an exceedingly difficult sale, and a plain part of the supply was left unsold. Sheep, of which the supply was light, advanced 2d. per 8 lb., and in some cases 4d. The calf trade was slow, but choice qualities nominally dear. Quotations:—Beasts, 3s. 8d. to 4s. 6d., and 4s. 10d. to 5s. 4d.; calves, 2s. to 4s. 10d.; sheep, 4s. 4d. to 4s. 6d., and 4s. 10d. to 5s. 8d.; pigs, 3s. 8d. to 4s. 2d.

Dec. 10.—Trade was on the whole, steady, but not active. Prime beasts were in fair demand, and were quiet as dear, but other sorts were weak. Sheep were dull, and previous prices were with difficulty maintained. Calves were quiet, and Pigs rather dear.

COALS.

The following are the prices current at market during the week:—East Wylan, 15s. 6d.; Ravensworth West Harley, 14s. 9d.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 17s. and 17s. 6d.; Hetton Lyons, 15s. and 15s. 6d.; Lambton, 16s. 6d. and 17s.; Wea, 15s. and 15s. 6d.; East Hartlepool, 15s. 3d.; West Hartlepool, 15s. 1s. and 17s. 6d.; Haswell, 17s. 6d.; Hulam, 15s. 6d.

Government Stock.—Consols closed on Monday, Tuesday, Wednesday, and Thursday, at 99½ to 99½ for delivery, and 99½ to 99½ for the account. These quotations are ex div.

THE GLOUCESTER WAGON CO.,
 (LIMITED)

Have attached to their extensive works a large Joinery Department with the latest and most improved Machinery, for the Manufacture of Covered Sheds or Yards for Cattle, Conservatories, Greenhouses, Garden Seats, &c., at extremely moderate prices.

Full particulars may be had on application to ALFRED SLATER, General Manager, GLOUCESTER.

DEANE & CO.'S RANGE OF HOUSES.

No. 9.—A very useful range of three quarter-span houses, divided into three parts, the centre part projecting a foot above the ends. It can be varied in form to almost any extent. Designs and estimates for ranges of Houses, including Co-servatory, Peach-houses, Vineries, &c., prepared and furnished free.

ESTIMATES.—The prices given are for ERRECTING COMPLETE, by our own men, within 15 miles of London Bridge, including building dwarf wall, 2 ft. high, 10 ft. 6 in. from front and end's, two divisions on 4 1/2 in. brickwork, and erecting, painting, and glazing in the best style.

HEATING APPARATUS.—No reliable price can be given for this off-hand, as the heat required in the different divisions varies so much, but estimates will be forwarded when information is obtained as to the purpose for which the various divisions are to be used.

Length.	Width.	Width of Centre Part.	Price.

WANTED, an ASSISTANT SHOPMAN. Must be quick at Counter Work.—Apply, stating age, experience, and salary, to JAMES CUTHBERT, Claydon Square, Liverpool.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable of a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

B. S. WILLIAMS begs to intimate that he acts at present in the Nursery and up his Regis, some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or GARDENER, and to give the best references of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

SCOTCH GARDENERS.—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

SITUATION REQUIRED by young man (age 26); eleven years' experience. First-class references.—R. M., Gardener's Chronicle Office, 41, Wellington Street, Strand, London, W.C.

HOLLOWAY'S OINTMENT AND PILLS.—Cold, Coughs, Shortness of Breath.—These maladies require early and a stimulating action, for if neglected they often end in Asthma, Bronchitis, or Consumption. The Ointment well rubbed upon the chest and back, penetrating the skin, &c., also, a moderate quantity of the Pills, which expels all impurities. All the blood in the body is perpetually passing through the lungs, and there all noxious particles tending to disease can be quickly, thoroughly and permanently neutralized, rendered harmless, or ejected from the system. Holloway's Ointment and Pills perfectly accomplish this purification; and through the blood thus cleansed, the influence of the powerful medicinal matters reaches the remotest part of the human body, and thus cures all diseased action, whether internal or external.

DESIG TO ANNOUNCE THAT THEIR

CATALOGUE of GARDEN and FLOWER SEEDS for 1886,

CONTAINING

LISTS of CHOICE VEGETABLE and FLORAL NOVELTIES,

HORTICULTURAL IMPLEMENTS, AND OTHER GARDEN REQUISITES,

Is now ready, and can be had, post-free on application.

ROYAL EXOTIC NURSERY, CHELSEA, LONDON, S.W.

HOOPER'S NEW SPOTTED GLOXINIAS.

This splendid strain of Gloxinias we are quite sure is not surpassed, and we do not believe is equalled. We have received numerous prizes and awards for them, and the highest compliments of growers and the trade; and we are able to say that many Continental strains, now being offered at high prices, are every way inferior.

We refrain from saying much about the unparalleled beauty of the colours of these flowers—their novel and exquisite spottings, and their grand substance and finish. They must be seen to be fully appreciated.

SEEDS,
2s. 6d. per Packet.

CHRISTMAS PLANTS.

THE use of certain evergreens in this country for Christmas decoration gives no general idea of the extent to which plants are associated with the great Christian festival. With us at the present time there seems to be no limit to the plants that may be used, and of late years almost anything and everything that happens to be green at this season of the year is pressed into the service for Christmas decoration. At one time, and this not so very long since, Holly, Ivy, and Mistletoe were the principal plants used, the first and the last of these being considered absolutely necessary; now, however, the Laurel, the Fir, the Yew, the Laurustinus, and others are equally used, and flowers of any kind that can be persuaded to blossom at this period of the year vie with the Christmas Rose (*Helieborus niger*), always in great demand at this season. Though some plants are more especially dedicated to Christmas than others in consequence of their more immediate association with Our Lord or with the Virgin Mary, the tradition that all plants rejoice at Christmas in commemoration of His birth affords some reason for an indiscriminate use of such as are in leaf, flower, or fruit out-of-doors at this season.

The Christmas Rose just referred to is one of those which so flowers during the winter and early spring months. Its connection with Christmas, however, seems to be due to the period of flowering rather than to any relation with the Christian festival, notwithstanding that the plant is sometimes known as Christ's Herb, and in France and Germany as the Rose de Noel, and Christwurz respectively.

The Rose of Jericho is a plant of a very different character and history from the Christian Rose. It is an annual plant, the Anastatica hiero-chuntica of botanists, and belongs to the natural order Cruciferae. It inhabits the deserts of Arabia and Egypt, and, after withering, the spreading branches roll themselves up into a ball, and the whole plant is detached from the sand in which it grows and blown about by the wind, the branches expanding again with the first rainfall. At times these plants are blown out of the loose sand in such quantities before the wind that it is with much difficulty a horse-man can proceed. The plant is sometimes called Rose of the Virgin or Mary's Flower, and it is said to have first expanded or blossomed at the birth of Our Lord; that it closed at the Crucifixion, opening again at Easter; in consequence of which it has been called Resurrection Flower.

Besides this, the capsular fruits of Mesembryanthemum trifolium, from South Africa, and the entire plant of Selaginella lepidophylla, are often called by the name of Rose of Jericho. In the case of the Mesembryanthemum the fruit, which is about three-quarters of an inch in diameter, opens in the form of a star when wet, closing again as it dries; and the Selaginella in its fresh state forms a flat rosette, which closes up in the form of a ball when dry.

Very few words need be said on the Holly, so well known is the plant in connection with Christ-

mas decorations. The common name Holly, or Holme, is derived from the Anglo-Saxon Holign, or, as some writers assert, from the old Norse Hulr. It has also been called Holly tree, in consequence of its use at this time of year—a name easily corrupted from Holly. The use of Holly is said to have been “derived from the Romans, who were in the habit of sending boughs to their friends during the festival of the Saturnalia, which occurred about the same period; and, the Oaks being then bare of leaves, the priests obliged the people to bring in boughs of Holly and evergreens.”

The practice of decorating houses with Holly seems to have been introduced by the early Roman Christians, and this practice became in course of time connected with the Christian faith. The prickly character of the Holly leaf is suggestive of its reputed power in driving away evil spirits, and in many parts of the Continent Holly branches are cut on Christmas Eve and hung up in houses and stables for this purpose. The prickles of the foliage, the blood-red colour of the berries, and the word “holy,” from Holly, are all suggestive of Christian associations, and consequently opposed to the witches or evil spirits.

In Germany the Holly is known as Christ-dorn, as it is supposed to have formed part of the crown of thorns used at the crucifixion of our Blessed Lord. Many curious superstitions are connected with the Holly both in this country and on the Continent, and it is valued according to the abundance or scarcity of the fruits or berries. The present season is an exceptional one for its very large crop, many of the finest trees and even the clipped hedges in the Royal Gardens, Kew, being thickly studded, and in some cases laden with dense clusters of bright scarlet berries. The Holly, besides being found naturally in copses and woods in this country, is found also in other parts of Europe, from Southern Norway to Turkey and the Caucasus, and also in Western Asia.

The Sainfoin (*Onobrychis sativa*), though a plant that could not at the best of times be used for decorative purposes, still less at this time of year, is to some extent associated with the feast of the Nativity, for we read that in early times it was called Holy Hay, and a French legend says that whilst the infant Saviour was lying in the manger a spray of rose-coloured Sainfoin was found among the dried grass and herbs upon which he laid, when the Sainfoin suddenly opened its flowers and formed a wreath around his head, greatly to the surprise of the Blessed Virgin.

The Apple is connected with Christmas in many ways besides that of furnishing a dessert fruit for the Christmas table. A few notes on this head will suffice to prove this. In the West of England an ancient custom still prevails of saluting the Apple trees on Christmas Eve. The ceremony varies somewhat in different districts; processions, however, are mostly made to one of the principal orchards, where a representative tree is selected and saluted, cider being sprinkled over it, and some lines sung breathing hope in the full bearing of the tree in the coming year. At the conclusion a dance is made around the tree, and the party finish up at the farmhouse with draughts of cider. In Sussex on Christmas Eve, or between that and Twelfth Day, the custom still exists of wassailing the Apple trees, which proceeding is somewhat similar to the above, except that most, if not all, the trees are visited in turn.

In Derbyshire it is believed that the sun shines through the Apple trees on Christmas Day an abundant crop of fruit is ensured:—“In a Roumanian legend, the infant Jesus, in the arms of the Blessed Virgin, becomes restless, will not go to sleep, and begins to cry. The Virgin, to calm the Holy Child, gives him two Apples. The infant throws one upwards, and it becomes the moon; he then throws the second, and it becomes the sun. After this exploit the Virgin Mary addresses him, and foretells that he will become the Lord of Heaven.”

The Cherry seems to have been specially dedicated to the Blessed Virgin, for tradition says that before the Saviour's birth she asked St. Joseph to gather for

her some fruits that hung in clusters on a tree, and being refused, the Cherry tree immediately bent its branches downwards to enable her to gather the fruits herself.

The tradition connected with the Glastonbury Thorn is so well known that it will be scarcely necessary to repeat the story in detail, it will suffice to say that, when St. Joseph of Arimathea arrived in this country, he selected Glastonbury as the site for a church, and while preaching there stuck his staff—a dried branch of Hawthorn—into the ground, whereupon it immediately grew, producing buds and flowers, and in course of time forming a large bush or small tree with a branching trunk which regularly flowered on Christmas Day, and thus commemorated the feast of the Nativity. The tree was mutilated by a Puritan in the time of Elizabeth, the man receiving as a reward for his bigotry an affliction of blindness in one eye, caused by some of the prickles thus striking him. A branch of the Glastonbury Thorn was often carried in procession at Christmas time, up to the reign of Charles I. The tree was, however, cut down during the civil war, but plants were raised from the branches.

Regarding the history of the Glastonbury Thorn since the middle of the last century, Folkard says:—“When the new style was introduced in 1752, the alteration, which consisted of omitting eleven days, seems to have been very generally disliked by the mass of the people, the use which was made of the Glastonbury Thorn to prove the impropriety of the change is not a little curious. The alteration in the Christmas Day, which was held that year and since on a day which would have been January 5, was particularly obnoxious, not only as disturbing old associations, but as making an arbitrary change from what was considered the true anniversary of the birth of Christ. In several places where real or supposed slips from the Glastonbury Thorn existed, the testimony of the plant against the change was anxiously sought on the first Christmas Day under the new style. As the special distinction of the Thorn arose from its supposed connection with the great event commemorated on that day, it was argued that it must indicate the true anniversary, and that its evidence would be conclusive on the subject. The event of one of the references (at Quainton, in Buckinghamshire) is thus recorded in the *Gentleman's Magazine* for 1753:—“Above 2000 people came here this night (December 24, 1752, N.S., being the first Christmas Eve under the new Calendar), with lanterns and candles, to view a Thorn tree which grows in this neighbourhood, and which was remembered (his year only) to be a slip from the Glastonbury Thorn, that it always budded on the 24th, was full blown next day, and went off at night. But the people finding no appearance of a bud, it was agreed that December 25, N.S., could not be the right Christmas Day, and accordingly they refused going to church or treating their friends as usual. At length the affair became so serious that the ministers of the neighbouring villages, in order to appease the people, thought it prudent to give notice that the old Christmas Day should be kept holy as usual. The slips of the Thorn seem to have been everywhere unanimous in this opposition to the new style.” Two trees that blossom during the winter months are said to still exist at Glastonbury Abbey.

A curious tradition is connected with the Juniper in relation to the infant Christ. The Virgin is said to have fled with the babe from Herod's soldiers, the rustling and crackling of the Chick Peas and Brooms during the flight betrayed them. A friendly Juniper tree extended its branches and gave shelter to the mother and child. A blessing was pronounced on the Juniper by the Virgin, while the Chick Peas and Brooms, being the objects of her displeasure have ever continued to rustle and crackle. In consequence of this blessing the Juniper is venerated in Italy, and branches of it are used on Christmas Day for the decoration chiefly of stables and cattle sheds.

Regarding the Star of Bethlehem (*Ornithogalum umbellatum*), though its common name would seem to associate it closely with the Nativity it would appear to derive its name from its pretty white star-like flowers, being likened to that star which announced the birth of the Saviour. It has been thought by some writers that the bulbous roots of this plant formed the dove's dung mentioned in the 6th chapter of the 21 book of Kings, the plant being abundant in Palestine, where, in spring, the white flowers are conspicuous on the hillsides. It is

certain that the bulbs were at one time used for food in Syria, and also in early times in Italy, being dried, ground into meal, and mixed with flour for making bread.

It is unnecessary to lengthen this paper with mere references to plants which, though connected with Our Lord or the blessed Virgin, are not closely associated with the Nativity; but in conclusion we might add to those already mentioned the *Galium verum*, popularly known as Our Lady's Bedstraw, from the tradition that it was this plant that filled the manger at Bethlehem in which the infant Saviour was laid. *John R. Jackson, Museum, Kew.*

New Garden Plants.

SCHISMATOGLOTTIS NEOGUINEENSIS, N. E.
Brown, n. sp.

This is the pretty foliage plant that was described and figured in *L'illustration Horticole*, 188, vol. xxvii., pl. 380, under the name of *Cotocasia neoguineensis*, Linden (to which genus it does not belong), and I find it cultivated at Kew under this name, as well as under that of *Schismatoglottis variegata* (which is a very different plant), so that it no doubt exists in other gardens under these names. Having examined the flowers I find it is a true *Schismatoglottis*, and although the name it will now have to bear is not an enticing one, yet from a gardener's point of view the plant itself is attractive. In habit it is not so closely tufted as some of the species, the rhizome being more creeping; the leaves are cordate ovate, and conspicuous by their cheerful bright green colour, handsomely blotched with pale yellowish-green. The following is a description of the plant:—

Glabrous. Rhizome creeping. Petioles 9—12 inches long, terete, sheathing at the base, light green, darker towards the base, with a very faint glaucous tinge. Blade of the leaf 8—9 inches long, 5—5½ inches broad, ovate acute, deeply cordate at the base with a rather narrow sinus gaping outwards in a recurved line; the basal lobes are slightly unequal, one being rather more triangular in outline than the other, both are obtusely rounded; upper surface bright green, marked in a very irregular manner with large pale yellowish-green blotches. Inflorescence solitary in the axils of the leaves, the scopes are 1½—3 inches long, enclosed in the sheaths of the spathe tube. Spathe pale greenish, with a narrowly elliptoidal obscurely trigonous tube 1 inch long, and an acuminate limb 1½ inch long. Spadix 1½ inch long; female part cylindrical, slightly tapering upwards, ½ inch long, ovaries pale greenish-white, oblong trigonous, one-celled, with 2—4 (usually 3) parietal placentas bearing several ovules, the upper ones much depressed, and passing into a few nectar organs at the constriction of the spathe tube, stigma sessile; the obconic style part and slightly tapering, obtuse, barren terminal portion, firmly together a stout milk-white clavate mass, ¾ inch long and 4—4½ lines thick at the middle; the barren portion is densely packed with smooth clavate nectar organs. A native of New Guinea, introduced into cultivation by Mr. Linden about the year 1879. *N. E. Brown.*

CYRANTHUS HYBRIDUS.

I learn from Mr. Ball that he has also raised this plant from a cross between the same parents, but that his plants are slightly different in colour from those raised by Sir Trevor Lawrence's gardener. It is interesting to find that a cross between the same two species, made in different places and by different persons, should have produced the same result. This is of course what one ought to expect, but I do not remember to have seen any similar case recorded beyond that of *Taesonina Andersoni* given by the Editor of this paper, in vol. xxiii., p. 736 (June 6, 1885), though possibly others could be added. The name, by the way, was by some mistake published as *Cyrtanthus hybrida* on p. 391 of the present volume of the *Gardeners' Chronicle*; it should be *C. hybridus*. *N. E. Brown.*

THE HOULLETIAS.

The species of *Houlletia*, although not requiring great heat, cannot be said to be cold-house plants in winter; it is therefore better to regard them as cool intermediate-house plants all the year round, and to select for them a moist shady corner of the Cattleya-house. The species are all showy and attractive when well-grown, the following being an enumeration of the species in cultivation:—

H. Brocklehurstiana.—This was the earliest introduced of the *Houlletias*, it having flowered with T. Brocklehurst, of Macclesfield, in 1842. It has the same habit as the variety here illustrated (fig. 173), but is a still stronger grower. Flowers yellow, barred and blotched with reddish-brown.

ceived this plant from Schomburgh, and it flowered with them in 1842. It resembles a smaller form of *H. Brocklehurstiana*. Yellow, streaked with deep chocolate.

H. Wallisii.—This, like *H. Lowii*, is unlike the rest of the species in appearance, as its flowers seem to partake of the cup-like form of the *Acinetas*. In colour they are yellowish-white, often dotted with red. *J. O'Brien*.

FERNERIES.

It is to be pitied that the houses used for growing Ferns are now filled with hardly any varieties except those adapted for cutting. In going through gardens you generally come across one house devoted to

would rather have a row of table decoration plants in preference. Let the *dilettanti* turn their affections to the decoration of their fireplaces, where there is ample scope for dainty devices and conceits, and cease to make Ferns and Palms flaccid in an odour of luxury which they cordially hate.

Little ferneries, intended primarily to supply cut fronds, can be rendered very attractive by growing Ferns of quite a different habit among the *Adiantums*, such, for instance, are *Osmunda palustris*, the young sprays of which are very graceful and of a delightful ruddy tint; *Woodsia polytrichoides*, *Goniophlebium appendiculatum*, and *Asplenium nobile* and *speciosum*. The *Goniophlebium* has the young fronds beautifully veined, and the two *Aspleniums* are worthy of culture both on the grounds of uncommon growth and natural beauty. The fronds and pinnæ of *speciosum* are covered thickly with short hairs, and nobile is much prettier than the Fennel Fern, which it resembles. Lovers of the curious ought by no means to be without the rare *Lomaria l'Herminieri*; this is the Fern that makes such a feeble attempt to imitate tree growth, and looks by the side of even such as *L. gibba* a puny dwarf. A plant twenty years old in the nursery of Messrs. Veitch, of Exeter, is only now about a foot high; the fronds, notwithstanding, are very beautiful, the young ones assuming a crimson hue, much deeper than that of *Osmunda palustris*.

It is regrettable that the subordinates in many gardens seem to think the same as their chiefs. Having remarked to one that his Ferns looked healthy, and asked why his master did not grow other kinds besides *Adiantum farleyense* and *cuneatum*, the reply was, "Not a bit of good to us; we only want those we can cut." But even if a gardener has an employer who is totally devoid of interest in his greenhouses, it is quite within his power to make his ferneries something above the average of what can often be seen in the houses of a working florist with little or no capital. *C. A. M. C.*

BERRY-BEARING PLANTS.

(Continued from p. 748.)

SEVERAL species of *Vaccinium* are sufficiently distinct and ornamental to justify their being recommended for admission to our gardens. Of these our native Red Whortle or Cowberry, *V. vitis-idaea*, with its bright glossy leaves, terminal racemes of pale red or pink flowers, which, under favourable circumstances, are produced very abundantly, and succession of dark red berries renders it one of our prettiest and most desirable of carpet or marginal plants. The berries, when undisturbed, remain on the plant for several months after becoming ripe, their deep red colour contrasting strongly with the glossy green box-like foliage. There is a variegated form in cultivation with pretty straw-coloured foliage, which is both a distinct and choice rock plant. *V. myrtillus*, the Whortleberry, or Bilberry; *V. uliginosum*, the Bog *Vaccinium*; and the Cranberry, *V. oxycoccos*, are all more or less ornamental native species, and whether in flower or fruit are worthy of a corner in the bog or American garden. The latter, with its slender, thread-like branches and conspicuous red fruit, when seen trailing over some damp rocky ledge is especially effective.

Shepherdia canadensis and *S. argentea*, the Buffalo Berry, are both ornamental-fruited shrubs, the latter in particular having such an intense silvery hue in its foliage as to be very striking, especially where associated with darker foliaged plants. The berries, which ripen in September, are in size about as large as our red Currant, of a deep scarlet, and produced in continued clusters along the branches and twigs of the plant. They are acid, but rich in taste, and are much relished in America, where they are known under the name of Buffalo Berries, Rabbit Berries, and, particularly by the Indians, Beef Suet. It should be remembered that, as the plant is dioecious, those of opposite sexes should be planted in close contiguity, or, better still, portions of the staminate engraved upon the pistillate plant, thereby insuring the production of berries. This shrub delights in moist cool situations, although in soil of average dryness it succeeds well, and is dwarfier in growth; and for the foreground of ornamental shrub groups the light silvery foliage and edible scarlet fruits render it at all times a desirable plant. In *S. canadensis* the leaves are not so ornamental, and the yellowish flowers are succeeded by small orange-red berries.

FIG. 173.—HOULLETIA ODORATISSIMA: FLOWER OF NATURAL SIZE, PLANT REDUCED.

H. chrysantha is also of the same habit as *H. odoratissima*. It is a beautiful species, with golden-yellow flowers, the sepals being yellow at the backs and blotched with brown on the insides; lip dark yellow.

H. Lowii.—This is very distinct, its flowers being very unlike the *H. Brocklehurstiana* section, and more resembling those of a *Peristeria*. They are white, and very wax-like in appearance. Flowered in October, 1874, by Messrs. Hugh Low & Co.

H. odoratissima (fig. 173).—The noble fragrant flowers of this species constitutes it one of the handsomest. They are often 3 inches across, sepals and petals yellow, veined with brownish-orange; lip white, tipped with yellow. Our illustration was taken from a plant in the gardens of Sir Trevor Lawrence.

H. picta.—This pretty species flowered with Bishop Sumner, at Farnham Castle, in 1876. Flowers yellow, barred with red; lip with two curved horns.

H. vittata.—Messrs. Loddiges, of Hackney, re-

nothing else but Maidenhair Ferns. It surely ought to be a principle that every plant-house should be more or less of a conservatory—I mean, have some eye-pleasing grouping, something beyond mere rows of pot plants on ascending staging. In the case of Ferns particularly is a such nurseryman's arrangement annoying and quite unnecessary. The excellent and pretty method of growing *Adiantums* in soil held to the wall of a house by wirework is not so commonly adopted as it should be. Where walls have been thus covered there is usually so ample a supply of fronds for cutting that space can be given to the cultivation of many exquisite gems of Ferndom, which to a large enough proportion of utilitarian professional gardeners are unknown quantities. I do not know what Mr. Letts, Lord Zetland's gardener at Aske, thinks, but I question if, in his whole collection of show plants, there is anything prettier than a large *Gleichenia rupestris glaucescens*. To repeat the opening sentence, an employer is to be pitied who

The different Roses are all handsome in a berry-bearing stage, perhaps the finest in this respect being *R. rugosa*, whose large orange-red hips, that are produced freely enough during the autumn months, contrast strongly with the bristly stems and bold rugose foliage. In *R. spinosissima* there is a marked difference to the latter in colour of fruit, these being very dark; in fact, almost black when fully ripe. *R. lucida* and *R. cinnamomea* bear showy crimson berries; while *R. villosa*, with its long prominent bracts, is usually well covered with bright red fruits.

Aucuba japonica when laden with its large and conspicuous scarlet berries is at once one of our most beautiful as well as attractive shrubs. Until late, in consequence of the absence of male plants the production of berries on the *Aucuba* was of rare occurrence, but now with care in placing plants of opposite sexes in contiguity heavy crops of fruit are produced year by year—indeed this regular production of berries is somewhat remarkable, its fruit-bearing propensity exceeding even that of the *Pyracantha*, and that is saying a good deal. The conspicuous mottled foliage also adds to the plant's beauty, and renders it a desirable acquisition for placing in good-sized clumps in front of Laurels or other dark foliage and larger growing shrubs.

Of the Butcher's Broom, *Ruscus*, several species are well worthy of cultivation as ornamental-fruited plants, and of these *R. hypoglossum*, a South European species, when grown in a cool, half shady shrubbery recess, is a distinct and effective plant. The large red Cherry-like fruit, produced on the upper side of the flattened branches (cladodes), and supported by the slender thread-like stem, gives to the plant an appearance as uncommon as it is pretty. For mass planting this dwarf evergreen shrub should be used extensively, but being somewhat tender the more sheltered corners of the shrubbery will suit it best. It also grows luxuriantly when used as a carpet for half standard *Rhododendrons*, the amount of shelter thus afforded seeming to produce perfect development of both fruit and flower. The Alexandrian Laurel, *R. racemosum*, from the extreme grace and beauty of its foliage—indeed, of the whole plant—is also worthy of select situations. In this species the flowers are in terminal racemes, but the berries are seldom produced in such quantity as to render them an attractive feature of the plant.

Eugenia Ugni, a dwarf, branching, Myrtle-like shrub, when covered, as it usually is when favourably situated, with its showy red berries, is sure to attract attention. As a wall plant we have found it to do best, the warmth and protection thus afforded causing it to flower and fruit well. A variety with yellow or creamy variegation, and small delicate Peach-like flowers, is also worthy the attention of those looking out for ornamental, foliaged small-growing shrubs. *A. D. Webster.*

FORESTRY.

WORK FOR DECEMBER.

(Concluded from p. 774.)

THINNING.—General forest thinning may now be pushed on, hedgerow trees removed, and dead branches pruned from conspicuous trees in the park and grounds. In thinning trees a well-grounded knowledge of the principles of vegetable physiology, and the general habits of trees, is very necessary for the successful execution of this important branch of arboriculture. Than a thorough knowledge of the art of thinning there is undoubtedly no branch of forest management of greater importance in the successful rearing of timber trees for profit. When conducted on rational principles, and carried on gradually, timber rearing, even with the present low prices of wood generally, is fairly remunerative—at least, much more so than where a hap-hazard system of management is adopted. In thinning remove first of all the inferior and unhealthy trees, and in young plantations look more to the future value of the timber than to such as is to be taken down. In mixed plantations it is also well to retain, as far as possible, such trees as are found to be doing best on the various soils and situations for the permanent crop. Avoid, more especially in exposed situations, opening up the woods too much at one time, serious damage often resulting from a sudden rush of air in newly thinned plantations, and to prevent which it is always advisable to leave the outer row or rows of

trees thicker than those in the interior. Judicious pruning may be said to be productive of similar results in our woodlands to that of timely thinning, and should in all cases go hand in hand. The removal of rival leaders and straggling side-branches which cause an undue preponderance of these on one side of the tree should therefore be corrected, dead or twisted branches removed, and unsightly wounds dressed over with tar or paint. As soon as felling is finished remove the timber to the sides of clearance roads, where it may be lotted for sale, each species of tree occupying a distinct lot, measured and valued, the particulars being recorded as a convenience at the time of sale. Firewood and branches should also be removed, the former lotted in about cartload size in each, and the latter converted into faggots for fire-lighting; or, should they prove worthless for such, burned on the ground, thus preventing the hibernation of injurious insects, and preserving a tidy appearance of the woodlands. When the plantation has been cleared of all these, broken walls and fences should be at once made right, ditches cleared of all fallen rubbish, and ruts and inequalities on clearance roads levelled down and sown with grass seeds in early spring.

NURSERY WORK.

Few duties in connection with nursery management seem more simple and easily performed than the lifting of plants, yet how often do we find this done in a slovenly careless manner!—roots broken and strained, as well as unduly exposed to the drying influences of the atmosphere. In well-managed nurseries all these should be carefully avoided, the plants being lifted, not pulled, from the ground, and immediately "sheathed" until wanted for use. By careful attention to lifting, and never allowing the roots to become dry, the plants receive little or no check by transplanting, but soon become established in their new abodes and make rapid progress; whereas, on the other hand, when carelessly lifted, and allowed to become dust-dry before planting, their chances of success are limited to a very small degree, loss and disappointment being the result.

GENERAL WORK.

Fencing, hedging, draining, and general ground improvements, may now, during suitable weather, be carried on, while the making and repairing of roads and walks will also require attention. Metalling that had been conveyed to suitable positions during summer may now be laid on, blinded over with a slight coating of gravel or screenings, and heavily rolled down after wet weather. Previous to putting on metalling it is in all cases advisable to have the surface of the road slightly loosened by picking, thus, as it were, forming a bed for the stones, and into which they soon become firmly pressed down and united by traffic and the timely application of a heavy roller. Pay attention to all tree-guards, as horses now become troublesome; and see that rabbit-proof nettings are serving the purpose for which they were intended, that vermin are not molesting specimen trees, or committing damage amongst the stock in newly formed plantations. Clear woodland drains and ditches, the shoals of flying leaves and broken twigs being apt to cause extra work during blusterous December. As faggots are made cart them home to the shed used for the reception of such; prepare firewood, and cart home all unsaleable wood for the manufacture of charcoal. *A. D. Webster, Penrhyn Castle, North Wales.*

WOOD SALES IN KENT.

The great underwood and plantation sales now being held in Kent are going off very badly. The depression in prices is most severe in the better class of woods from which hop-poles are mostly supplied. The fall in the price of hop-poles in consequence of the low value of Hops is quite unprecedented. For the best woods of Mid-Kent the biddings have been extremely slow, and fully 30 per cent. under last year's prices. *Journal of Forestry.*

THE PEAR CONFERENCE.

We have received from the Secretary of the Royal Horticultural Society the following abridged statement taken from the full report of the Pear Conference recently held at Chiswick, and which is not yet sufficiently advanced for publication. This extract will, however, serve the purpose of disseminating useful information to intending planters during the present season, and it is with this object that the Council have decided upon giving it the earliest possible publicity. The report has been prepared by Mr. A. F. Barron, and we shall look forward with interest to its publication.

The selection of the present season for the holding of a great Exhibition and Conference on Pears in succession to that on the Apples in 1883 proved to be

propitious, the crops of Pears throughout the country being in general very abundant and good. The cold, dry summer was not specially favourable for the growth and development of Pears, and in many instances the fruit was much smaller than usual, especially of the earlier varieties. The later varieties benefited greatly by the autumnal rains, and proved in general of a fair average character.

The response to the invitation issued by the Council proved of the most satisfactory character, the number of Pears sent in for exhibition far exceeding the most sanguine expectations of the committee, the exhibition being not only large in extent, but in all respects a truly representative exhibition of nearly all the varieties of Pears grown or cultivated in this country. The total number of exhibitors taking part in the Conference numbered 165, contributions being received from thirty-five of the English counties, also from Scotland, Ireland, Wales, and the Channel Islands, the total number of dishes or different lots of Pears staged numbering 6350. In addition several large and meritorious collections were received from France, which proved of great interest.

The total number of reputedly distinct varieties of Pears exhibited subsequent to the corrections made by the committee amounts to 650.

An audit taken of the whole of the varieties exhibited gives the following result as to the most favoured or popular varieties, *Beurré Diel*, although only a second-rate Pear, standing at the top of the list, having been exhibited 194 times; *Marie Louise* being placed second, 155 dishes being shown; and *Louise Bonne* of Jersey third (132 dishes).

In regard to nomenclature, each of the collections exhibited was carefully examined by the committee and corrections made where considered requisite. Errors of judgment may in some cases have occurred, due to the altered appearance the same fruits often assume under different conditions, &c. Some others may have been overlooked, or their proper labels have got misplaced. Every endeavour was, however, made to secure the most correct nomenclature possible. The corrections made by the committee have in all cases been sent direct to the exhibitors. A pleasing feature noted by the committee was the general correctness of the nomenclature.

On a general examination of the whole of the collections exhibited, and noting the more prominent varieties in each, the following list has been prepared, viz. :—

Styly of the most Prominent Varieties of Pears Exhibited at the Conference.

Table listing exhibitors and their respective pear varieties, such as Alexandre Lambré, Josephine de Malines, and others.

Of modern Pears or varieties, although not new, which are not yet in general cultivation, the committee made the following selection of Pears, which are highly recommended for good quality, both in flavour and bearing properties, viz. :—

Table listing recommended pear varieties and their seasons, including Beurré Giffard, Madame Teyssé, and others.

Of new varieties, the Conference Pear exhibited by Messrs. Rivers & Son (season, October) was awarded a First-class Certificate.

In the collections of varieties exhibited from France, and not yet proved in this country, the committee recommended the following as worthy of introduction :—

Table listing new pear varieties and their seasons, such as Beurré Dumont and Madame André Leroy.

No list of the worthless varieties has been prepared, it being deemed sufficient in this report to notify those that are worthy of cultivation.

Without entering into comparison of the merits of the different collections exhibited, it is important to notify this fact—that the cultivation of good Pears is not confined to any particular climate or district of the country. If we take the magnificent examples from M. Cornu, of Jersey, as the result of good and careful cultivation, we have their equals produced by Mr. Haycock and by Mr. Thomas, in Kent, and closely followed by Mr. Wildsmith, in Hampshire, and Mr. Breeze, in Sussex. Many other single examples throughout the exhibition were equally meritorious. No one failed to remark on the excellence of the examples from Lord Chesterfield, in Derbyshire, or those further north still from Mr. Dalrymple, St. Boswells, Scotland, which were probably the most meritorious of all. Nothing contributed so much to these successful results as good and careful cultivation. As a general rule, the best fruits are produced where the greatest care is bestowed. An important factor in the successful cultivation of the Pear is, as gathered from the returns, in the use of the Quince stock, which, from its close surface-rooting character, is more directly amenable to the attentions of the cultivator.

A general detailed report is in course of preparation, but which will necessarily take some time. This will contain the cultural and other notes supplied

by the various exhibitors, and the selections of varieties made by them; also a short descriptive catalogue of the whole of the varieties exhibited. A. F. Barron, Secretary to the Committee.

A SYNOPSIS OF THE SPECIES AND HYBRIDS OF NERINE.

There are many genera of garden plants of which cultivators know far more about the characters of the species and their range of variation and mutual relationships than has ever been placed on record in botanical books. Nerine is such a genus, and as I have lately been attempting to work out a classification and definition of its types for the projected bulb volume of the Flora Capensis I wish now to lay the result before your readers, and to ask them to supply any deficiencies which they find. The great puzzle in determining the garden forms arises from the fact that so many of them owe their origin to hybridisation, and that the parentage of these hybrids has not been placed on record. I have already questioned about the matter several of my most experienced horticultural correspondents, especially Messrs. Leichtin, Elwes, O'Brien, and E. G. Henderson & Son, and they have helped me very materially. What I wish to do is to define and classify in their proper position all the forms to which Latin names have been given, whether they are genuine species or of garden origin.

Key to the Species.

- Peduncle long, slender. Perianth-limb erect. Stamens and style nearly straight.
Leaves green, straight.
Leaves glaucous, curved.
Peduncle long, slender. Perianth-limb slightly irregular. Stamens and style declinate.
Umbel centrifugal.
Leaves 4-5, linear-lorate. Perianth-segments distinctly crisped.
Perianth-segments nearly straight.
Leaves 6-10, filiform.
Umbel centrifugal.
Perianth-segments about 1/2 inch long, much crisped.
Perianth-segments 1 1/2 inch long, less crisped.
Peduncle short, stout.
Leaves linear, contemporary with the flowers.
Leaves ligulate, produced after the flowers.

DESCRIPTIONS OF THE SPECIES.

- 1. N. SARNIENSIS, Herb. App. 19.—Bulb ovoid, 1 1/2-2 inches diameter; tunics pale brown. Leaves about six, bright green, suberect, not curved laterally, developed with or a little after the flowers, linear, finally about a foot long, 1-1 1/2 inch broad. Peduncle slender, rather compressed, 1-1 1/2 foot long. Umbel 10-20 flowered, centripetal; pedicels 1-1 1/2 inch long; spathe-lobes ovate-lanceolate, 1 1/2-2 inches long. Ovary green, globose-triangular, 1/2 inch diameter. Perianth suberect, 1 1/2-1 3/4 inch long, bright crimson; segments oblanceolate, 1/2 inch broad, equally falcate, little crisped. Filaments erect, bright red, little longer than the perianth-segments; anthers oblong, 1/2 inch long. Style straight, nearly 2 inches long.—Kunth, Enum., v. 617. Amyralis sarniensis, Linn., Sp., 421; Curt. Bot. Mag., t. 204; Red. Lil., t. 35; Jacq. Hort. Schœm., i., 34, t. 66. A. dubia, Houtt. Pflanz. Syst., xii., 121, t. 84, fig. 1. Hæmanthus sarniensis, Thunb. Prodr., 58; Fl. Cap., ed. 2, 298. A. Jacquinii, Tratt., Gartenfl., 43. Nerine Jacquinii, Roem. Amaryll., 105. Imhofia sarniensis, Salisb. Gen., 118.
Var. N. PLINII, Hort.—Differs from the type in the colour of the flower being a duller crimson, the segments more distinctly unguiculate and the peduncle longer.
Var. N. venusta, Herb., App., 19.—Leaves green. Flowers bright scarlet, produced earlier than in any of the other varieties. Ker, in Bot. Mag., t. 1090. Imhofia venusta, Salisb., Gen., 118. N. profusa, Hort.
Var. N. rosea, Herb., App., 19.—Leaves darker green than in the type. Flowers rose-red. Seeds oblong. Bot. Mag., t. 2124. Imhofia rosea, Salisb. Gen., 118.
Var. N. corusca, Herb., App., 19.—Bulb tunics not chaffy. Leaves broader than in the type, bright green with distinct cross-bars between the main veins. Flowers large, bright scarlet, resembling those of N. curvifolia, Herb. Amaryll., 283; Kunth, Enum., v. 617. Amyralis corusca, Gawl. in Bot. Mag., sub t. 1430. A. humilis, var. Gawl. in Bot. Mag., t. 1089. Imhofia corusca, Salisb., Gen., 118. N. Meadowbankii, Hort.
Hab., Southern Provinces, Thunberg, Burchell, 1816; Ecklon, Rev. Wm. Rogers. Commonly cultivated in European gardens under the name of the Guernsey Lily. N. insignis, Hort. Leichtin, is also a variety of this species.

2. N. CURVIFOLIA, Herb., App., 19.—Bulb ovoid, 1 1/2-2 inches in diameter; tunics pale brown. Leaves six, developed after the flowers, linear-lorate, curved laterally, thicker in texture than in N. sarniensis, glaucous, closely veined, a foot long, 1-1 1/2 inch broad. Peduncle slender, glaucous, 1-1 1/2 foot long. Umbel 8-12 flowered, centripetal; pedicels 1-1 1/2 inch long; spathe-lobes about as long as the pedicels. Ovary globose-triangular, 1/2 inch in diameter. Perianth erect, bright scarlet, 1 1/2-1 3/4 inch long; segments oblanceolate, 1/2 inch broad, equally falcate, but little crisped; stamens suberect, about as long as the perianth-segments. Style suberect, finally 2 inches long.—Herb. Amaryll., 283, t. 36, fig. 4, t. 45, fig. 3; Kunth, Enum., v. 616. Amyralis curvifolia, Jacq. Hort. Schœm., i., 33, t. 64; Gawl. in Bot. Mag., t. 725; Red. Lil., t. 274. Imhofia glauca, Salisb. Gen., 118.

Var. A. Fothergillii, Roem., Amaryll., 104.—More robust in all its parts than the type. Leaf broader. Flowers in an umbel, more numerous, between crimson and scarlet. Amyralis Fothergillii, Andr., Bot. Rep., t. 163. Hab., Southern Provinces. Common in European gardens, where it flowers from the middle to the end of September.

3. N. FLEXUOSA, Herb., App., 10.—Bulb subglobose, 1 1/2 inch diameter. Leaves 4-5, contemporary with the flowers, linear-lorate, acute, bright green, 1 1/2-2 inch broad, sometimes, but not always, rough, with pustules. Peduncle slender, suberect, slightly glaucous, flexuose, sometimes 2-3 feet long. Flowers 10-20 in a centripetal umbel; pedicels slender, 1-2 inches long; spathe-lobes lanceolate, as long as the pedicels. Ovary globose-triangular, 1/2 inch in diameter. Perianth-limb generally pale pink, 1-1 1/2 inch long, cut down very nearly to the ovary; segments oblanceolate, crisped, 1/2 inch broad. Stamens declinate, the three longer ones rather shorter than the perianth-limb; anthers oblong, claret-red, 1/2-1 inch long. Style declinate, as long as the stamens.—Herb., Amaryll., 283; Kunth, Enum., v. 619. Amyralis flexuosa, Jacq. Hort. Schœm., i., 35, t. 67; Willd. Sp. Plant., ii., 60; Ait., Hort. Kew., ed. 2, ii., 229; Ker in Bot. Mag., t. 172. N. excellens, Moore in Florist, 1832, 52, t. 567.

Var. N. Sandersonii, Baker.—Peduncle and pedicels more robust. Leaves an inch broad. Perianth 1 1/2 inch long; segments less crisped and more distinctly united in a cup at the base.

Var. N. pulchella, Herb., App., 19.—Leaves glaucous, firmer in texture than in the type. Peduncle not flexuose. Perianth-segments pale pink, with a rose-red keel. Stamens and style whitish.—Herb. in Bot. Mag., t. 2407 Kunth, Enum., v., 629.

Var. N. angustifolia, Baker.—Like the last, but leaves not above 4-5 inch broad, and pedicels pubescent. N. pulchella var. angustifolia, Baker in Ref. Bot., t. 329.

Hab., Southern Provinces, Burchell, 2089; mountains of Somerset coast, 4000-5000 feet, Dells, 2202; Natal, Wood, 157; Reimann, 7320; McKen. Var. Sandersonii, Traubw., Sanderson. Var. pulchella, Macowan, 1519. Var. angustifolia, Boeberg, 4000-5000 feet, Macowan, 1880; Orange Free State, Cooper, 3221.

J. G. Baker, Kew Herbarium. (To be continued.)

TREES AND SHRUBS.

TREES AND SHRUBS SUITABLE FOR THE SEASIDE.—In proceeding to consider the various trees and shrubs which experience has proved to be useful in resisting direct exposure to the sea blast, some of the principal difficulties with which the planter has to contend, and which occasionally frustrate his best attempts, may be briefly pointed out. The chief consideration in seaside planting is unquestionably shelter, for it may be noticed anywhere along our coast that wherever the direct force of the hurricane is broken these trees and shrubs are tallest and most luxuriant. Another, and perhaps the principal, evil with which one has to contend, is the injurious effect caused to trees, but more particularly evergreen shrubs, by the saline particles which are driven and deposited with such force on the leaves and branches as in many instances to give them the appearance of having been scorched or cut over when in full vigour by an untimely frost. Wind-shaking, although a minor evil, must also be carefully guarded against, so that at the outset it is well to have all trees, unless such as are of a dwarf size, securely staked and tied so as to obviate the dire results occasioned to the roots of newly-planted trees when the stems are allowed to rock to and fro with the wind. My object in the present paper is, however, not so much to point out the methods adopted for obtaining shelter, as to bring under notice such trees and shrubs as are well suited for seaside planting, and also to show that the monotonous repetition of some half-a-dozen kinds, which for centuries have been known as suitable, is

by no means necessary, there being numbers of plants equally well adapted for embellishing our seaside grounds and gardens—in fact that, with careful manipulation, there is scarcely a limit to the number of species that may be successfully cultivated. Before commencing planting operations on the seacoast (I am not here referring to drifting sands or large areas of ground, but principally to the smaller tenements that are so common along our shores), the preliminary step is to erect a barrier of some kind, which will intercept the violence of the wind and act as a screen or shelter to the young plants. For this purpose various kinds of erections are equally suitable, but that generally adopted, and which ultimately turns out the least unsightly, is a raised mound of turf and soil, of, say, 6 feet in height, and of sufficient width atop to allow of the planting of a double or treble line of Quicks. This is in most cases easily formed, costs but little, and if not equally efficacious, is certainly far more ornamental than a dead stone wall. Immediately behind this screen pits of not less than 2 feet in diameter, and about 18 inches in depth, may be opened, and all the better if so for a winter previous to being planted. The bottom and sides of each pit should be well loosened with a pick, and if the soil is found of inferior quality, or of an unkindly nature, it will be well, more especially where it can readily be obtained, to add a spadeful or two from some adjoining old hay-field.

March or April will be quite soon enough to commence planting operations, an early start at growth being much in favour of young trees that have but recently been transferred to the sea coast. The plants to be used should not exceed 3 feet in height, but should be of strong growth in proportion to their size, and supplied with an abundance of fibrous roots; lanky, ill-grown plants have but a poor chance of succeeding under such adverse circumstances. In planting keep the strongest roots seaward, and do not place the trees at a greater depth in the soil than they stood whilst in the nursery border, this latter being an oft-committed mistake, that is productive of anything but favourable results. A stout stake should then be driven close to the stem of each on the exposed side, and to which the plant is firmly united by strong matting or teased-out tar-rope, and in such a manner as to insure against chafing or rubbing.

In the first line or lines of pits next to the screen fence the trees best adapted for withstanding the first brunt of the sea breeze are the Elm, Sycamore, and Willow amongst hard-woods; while of Pines, the Pinaster and its smaller variety maritima, the Aleppo or Jerusalem Pine, insignis, Laricio, austriaca, and our native sylvestris, are decidedly superior to any others. Regarding the merits of the Pinaster for seaside planting it would be almost superfluous for me to speak, while the Elm and Sycamore send out their strong branches into the very teeth of the blast and are known as being particularly well adapted for such situations. On the Isle of St. Marguerite, opposite Cannes, the Aleppo Pine (*P. halepensis*) grows with its roots down even to the salt water, and there, without a shadow of harm, withstands the most terrific sea gales. Unfortunately, it is somewhat tender, but in many maritime situations along our coast line it would no doubt do well. *A. D. Webster, Penrhyn Castle.*

STYRAX JAPONICUM.

The genus *Styrax*, which gives its name to the order Styracaceae, contains about sixty species, and is widely dispersed throughout both hemispheres. It is nearly allied to *Halesia*, the "Snowdrop tree" or "Silver-bell tree" of the Eastern United States. The greater number of species occur in the warmer regions of Asia and America, and so far none have been found in Tropical or Southern Africa or in Australia. *S. officinale* is a shrub or small tree from South-eastern Europe and Asia Minor, but is thoroughly naturalised in many places in the Mediterranean region. It furnishes storax, a fragrant resin which was known to the ancients. This and the three North American species which are mentioned in Loudon's *Arboretum*, are now rarely met with in English gardens. This is no doubt due to the fact that they cannot be counted upon as hardy except in favoured spots in the Southern Counties. In all probability *S. japonicum* is harder than those just mentioned; at any rate it has grown for many years on a cold, gravelly, clayey bank in Messrs. Veitch's picturesque nursery at Coombe Wood. It also makes a fine object when grown in pots for cool conservatory

decoration. A glance at the illustration given in *Gardeners' Chronicle*, December 12, 1885, will show that a beautiful shrub it is. The long-stalked, scented, snowy flowers are, when in bud, not unlike those of the Orange, but instead of being borne, as in that plant, on rigid erect peduncles, they are quite pendulous. When fully expanded the golden-yellow anthers form a pleasing contrast with the pure white corollas. In Siebold and Zuccarini's *Flora Japonica* it is stated that the species now under notice is one of the most beautiful of Japanese shrubs, and that it is abundant in South Japan, where it thrives on hillsides and on the borders of woods—attaining a height of about 6 feet, and flowering in May—at an elevation of from 300 to 1200 feet above sea-level. In the pleasure gardens and around the temples, where it is largely planted, it grows more vigorously and to a greater size than in a wild state. The hard white wood is used for turnery and all sorts of carving purposes. *S. japonicum*, in the *Flora of British India*, is united by Mr. C. B. Clarke with Roxburgh's *S. serrulatum*, but it is a much handsomer plant, and for garden purposes abundantly distinct. *S. Obassia*, another Japanese species, recently introduced by Messrs. Veitch, is a vigorous growing large-leaved shrub with a racemose inflorescence; this will no doubt prove a great acquisition to British gardens. *G. Nicholson, Kew.*

APOSPORY.

FOLLOWING up Mr. Charles T. Drury's exhaustive pamphlet on *Apospory in Ferns*, read before the Bristol Naturalists' Society (reprinted from the Society's *Proceedings*, vol. iv., part 3, 1884—1885). I am induced from sundry jottings over a period of thirty years to give the public the benefit of my observations on certain abnormal growths of some of our British Fern varieties. This prothalloid growth, very aptly referred to "apospory," is one of the most wonderful in which Dame Nature shows off her vagaries.

As long ago as May 4, 1855 (extract from my diary), I observed on *Polypodium vulgare* var. *omni-lacuum*, Bennett, a very remarkable membranaceous or prothalloid growth from lash-like elongations on the apices of the serrate lobes, on the summits of which there were evident incipient germs in the form of discolourations of the tissue. In some of these I removed from the plant and layered in damp sandy soil under a bell-glass, but eventually no young Ferns were produced. On May 7 of the same year I communicated these facts to Mr. Thomas Moore, curator of the Botanic Gardens at Chelsea, and also to Mr. William Bennett, the finder of the Fern.

I mentioned this to show that the subject on which I am going to treat is not new to petriologists but that it has been allowed to fall into abeyance until the present time, when this and other kindred anomalies are exciting great interest in the botanical world.

The Fern, the subject of this paper, is named *Polystichum angulare* var. *pulcherrimum*, Padley, and was discovered in North Devon by the Rev. Charles Padley more than twenty years ago. A specimen of it was first exhibited when I read the opening address of the first Pteridological Congress at Darlington Hall, Co. Stafford, the seat of the late Swynfen Jervis, Esq., on August 23, 1865, when I made remarks on its specialities, such as the unusual form of cristation, this doubtless being what is now known as the prothalloid growth.

It will convey to general readers a better idea of the abnormal if I first give the characteristics of the normal plant. The plant attains the ordinary size of *Polystichum angulare*, and the frond is of the usual outline, as are also the outlines of the pinnae, but the pinnales, which are generally normal on the upper or anterior side, are flabellate and pedicellate on the under or posterior side; they are also greatly extended and curved upwards, giving the pinnae a falcate or sickle-shaped outline. The prothalloid growth about to be described obtains pretty equally on all parts of the fronds.

Fig. 174, which is full size, shows the general characteristics from a pinna with some of the prothalloid or aposporous growths, and the very beautiful habit on account of which the name of the variety, *pulcherrimum*, has been given. Figs. 175 and 176 are greatly enlarged pinnales, which show the prothalloid excrescences more fully. Fig. 177, being still more highly magnified, shows the remarkable and most interesting club-shaped form at fig. 175, a.

This is composed of granular tissue, but at and towards the apex is covered with glands, leaf-like or scale-like appendages, as well as curiously noduled hairs. Fig. 178 is another form of prothalloid growth, showing seven or eight arthogonia, and a thickening of the substance of the prothalloid growth, from which I have no doubt another prothallus would have been projected. Fig. 179 shows a triple prothallus from the tip of a pinna. Fig. 180, the same greatly magnified at a rather later date, in which will be seen at E, the prothallus doubled, and at F, the commencement of a further growth. Fig. 181 is a pinna laid down by J. W. Morris, Esq. (mentioned in a letter May 7, 1885), on which will be seen three or more of the true Fern growth further advanced, and more so at fig. 182.

I must now thank my kind friends, Col. Jones, Charles T. Drury, H. M. Stoltenhoff, and J. W. Morris, Esquires, for the interest they have shown and the great assistance they have been to me in my experiments, more particularly the last named gentleman, who is the first and only person who has succeeded in raising the true Fern. *Geo. B. Wollaston, Bishop's Well, Chislehurst, Nov. 12.*

Florists' Flowers.

DAHLIAS IN 1885.

I THINK it was generally admitted that the Dahlias shown at the Crystal Palace in September were very much finer on the whole than could have been expected, regard being had to the prolonged drought which prevailed during the summer. In localities where the drought was most keenly felt, the flowers were undersized, and somewhat rough also; but the Northern flowers were as large as usual, although the dry summer was felt in many parts of the North as in the South. The usual mulching was never put upon the ground in which the Saltsbury Dahlias were grown; a heap of manure was lying ready, but Messrs. Keynes & Co. waited for the rain which did not come until it was useless to apply it. They were freely watered, but the parched soil drank up eagerly any water that was poured over the plants, and in a few hours appeared to be as greedy for moisture as ever. Perhaps something was due to what is generally recognised by Dahlia growers as an acknowledged fact, that the improvement made in the newer varieties has also resulted in causing them to be "easier to get" than they were a few years ago.

In passing in review some of the Dahlias seen during the past season, it must not be forgotten, as previously stated, that it was a peculiarly trying one. Not only did drought affect the plants, but many of them were infested with the black-fly, and there was great need for drenching showers to cleanse them. When atmospheric conditions are favourable to the increase of this pest, and showers do not fall, it is hard and unceasing labour to keep the flowers clean; therefore, it may fairly be assumed that varieties that, despite adverse circumstances, were in good form during the summer of 1885, are those worthy of being cultivated.

That constant pure white flower, Annie Neville, must be set down as a very useful variety. Cardinal, rich scarlet, was a little undersized, but very bright and thoroughly constant, good outline centre and petal, and dwarf habit of growth; Condon is of a very peculiar colour—buff, shaded with orange, very fine and constant, good petal and centre, but small, owing to the drought; Constancy, yellow ground, deeply edged with lake, is both good and pleasing, and decidedly useful for exhibition purposes. Earl Radnor, an intense plum-coloured self, was very fine as usual. Georgina was very late, which should be noted—it was not even in bloom by the third week in August; it is a good useful creamy-white self when caught, dwarf habit, and the flowers thrown up well on erect stems. Henry Walton, yellow, deeply edged with vermilion, is very constant, and always useful to the exhibitor; Herbert Turner is a good white self, but apt at times to come with the petals somewhat curled; Hope, light rosy-lilac, was a favourite flower with the late Charles Turner: he could thoroughly appreciate its good constant qualities; Imperial is a good and useful deep purple self, sometimes lit up with a pretty shade of lilac; James Cocker, a large purple self, is

APOSPORY IN FERNS. (SEE P. 780.)

one of the most constant of Dahlias, and can always be depended upon; the same can be said of James Service, a rich dark crimson self. John Neville Keynes is certainly the best of all the older yellow selfs, if not the newer ones also, very fine and constant; Joseph B. Service, also a yellow self, is pure in colour, and very good and constant; Julia Wyatt is a very pretty creamy-white self, and a variety that can be depended upon to produce some good show blooms. Lady Glady's Herbert is always largely shown at a Dahlia competition, light orange, deeply edged with crimson; Lord Chelmsford is a fine dark maroon self, but shy; but when caught in good condition it makes a fine show variety. Miss Cannell is a very fine Dahlia, good in outline and centre, creamy ground, deeply ridged with purplish-crimson, and very constant; when sent out by Mr. Cannell this variety came single, but a cutting was obtained from Mr. Eckford, which produced double blossoms. It will sometimes produce some semi-double flowers, but such plants as this are never propagated from. Mrs. Gladstone was undoubtedly the finest Dahlia of the season, very constant and good, and a real model when in good condition. Mrs. Harris, light ground edged with pale lilac, is also a first-rate Dahlia, fine in shape and pleasing in character; Mrs. Stancomb, canary-yellow tipped with deep fawn, is very pretty indeed, and good and constant; Mr. Harris, one of Mr. Rawlings' seedlings, is a crimson-scarlet self of dwarf growth, and a good useful show flower; Mr. Spofford, a large crimson self, is also a constant useful variety. *Ficotee* is well named, because of its slight bright crimson edge on a golden-yellow ground; this season the lacing was very slight indeed. Prince Arthur is a very fine and useful yellow self, and makes an excellent show flower. Prince Bismarck should have a place in every collection of show varieties, because so good all round. Prince of Denmark, very dark maroon, shaded with bright crimson, has petals of the most approved form. It has an excellent centre and outline, but came small this year: it is very fine and bright. Royal Queen is also a purple-edged flower on a white ground, and something in the way of Mrs. Cannell. Shirley Hibberd, dark flushed with crimson, is a fine shaded flower, but apt to come a little quilled in the petals. Thomas Goodwin is a very dark and constant self, which can be relied upon. William Rawlings, rich crimson-purple, is a very fine self, of good size, full, fine petal and outline.

This list is intended, not so much to set forth all the good show Dahlias in cultivation, but those merely that stood the dry summer well at Salisbury. A season may be too dry or too wet—both have their disadvantages, and probably the first has the least where watering can be efficiently done. But let the prevailing character of the weather be what it may, Dahlia growers manage to produce good flowers at the time they are required: in the various tussles man has with Dame Nature the latter is not always victorious, R. D.

THE BILLING ROAD NURSERY, NORTHAMPTON.

This old established nursery lays just out of the town of Northampton, and occupies about 115 acres of a gentle southern slope. Much of the soil consists of a reddish loam, moderately free, rather shallow, but well suited to the growth of trees and shrubs generally, and which do not make rank growth in it. This is no doubt attributable to the fact of the sub-soil being of such a nature that the roots do not strike deep into it, but keep more to the surface. Coniferous trees do well, soil and situation alike favouring sturdy but somewhat slower growth than obtainable in places where the roots have a deeper run. All the leading fashionable kinds are grown in moderate quantities and in various sizes.

But it is in the way of what may be termed specialties that this nursery is remarkable, Messrs. Perkins finding it more to their purpose to cultivate a limited number of things in all but unlimited quantities, rather than to divide their attention equally between the thousand and one subjects for which there is comparatively little demand. Amongst the things grown extensively are Thorn Quicks. To those unacquainted with the demand that each succeeding year brings, a sight of the seed beds here in autumn would give an impression that there were more than enough to suffice for all the hedge-planting in the kingdom,

yet each winter the whole of the stock that is big enough to plant is cleared off, the annual sale amounting to two and a half millions. Of these about two millions are raised by Messrs. Perkins, and the remainder, in the seedling state, procured elsewhere.

Of deciduous trees Oak and Ash head the list. Much as the present generation of planters run on quick-growing, soft-wooded species, there are evidently more than might be supposed who plant these representative hard-wooded trees, as seen by the quantities of seedlings annually raised in the Billing Road Nursery.

Of coniferous trees the Austrian Pine, *Pinus austriaca*, and the Corsican Pine, *Pinus Laricio*, now stand a long way ahead of all others in the quantity here grown. Mr. Perkins considers that the last-named is the tree more than any other which those who plant extensively for timber purposes would do well to use. It outstrips everything else amongst Conifers, wasting less strength in lateral growth, whilst the quality of its timber leaves nothing to be desired. Many have refrained from planting this Pine on account of its having the character of being a ticklish subject to deal with. Like most other quick-growing trees if allowed to stand any time without transplanting, it makes long coarse roots that do not like removal. Mr. Perkins' advice is to plant only stock that has been kept regularly moved from the seed-beds onwards, and not more than from 18 inches to 2½ feet high.

Elms and Limes, such as used for avenue planting, are made an especial feature, and unusually well done, the last named in particular, with stems as straight and even as possible. One essential in the cultivation of these trees when to be used in this way, is that through the course of their preparation they should stand far enough apart. Where the reverse of this has occurred the trees make little progress for some time after planting where they are to remain permanently; the obvious cause being that the growth of which they consist is too soft to bear exposure to the wind. Here the trees are kept from the first well clear of each other. Green Hollies and Yews receive their full share of attention; immense stretches of these are present in all stages from a foot upwards.

The different kinds of plants used for covert planting occupy a large extent of the nursery. Of these *Prunus Myrobalana* is now much in favour both for game and fox covert. The plant, although not so generally known as it might be, will adapt itself to almost any kind of soil, however poor and sandy, making good progress where many things would starve. Of this, and the common Sloe, there is an immense stock.

Common Laurel, in hundreds of thousands, cover long stretches of ground, whilst the less known but better kinds, such as *rotundifolia*, *caucasica*, and a round-leaved form of the last-named, with much darker coloured leaves, are only somewhat less in quantity.

Mahonia (*Berberis aquifolium*) occupies several acres—nice young stuff, from a foot to 2 feet high.

The old evergreen Privet holds its own as a covert plant against all the other sorts, keeping closer to the ground, which it covers where many things could not grow. A large breadth of Gorse is sown annually so as to always have a supply in the right condition for hazel.

Of Hazel and Hornbeam large breadths are grown to meet the demand where more of a mixed character of covert is required. Covert planting, where to be carried out on an extensive scale, is an operation that swallows up immense quantities of plants, necessitating the price being low; but it often happens that the stuff which, to the uninitiated in such matters, looks cheap, turns out to be the reverse, through being nothing more than the products of the seed or cutting beds, in which they have stood crowded together without ever being moved, until they are not worth planting, even if to be had for nothing. The character of growth present in the immense stock of these plants in this nursery shows at a glance that they are in right condition for moving.

Fruit trees are grown in immense numbers and very well done; all the best kinds usually asked for are represented, but the principal object is to meet the demand occasioned by the more sensible course which planters of fruit trees are at last beginning to follow, by confining their selection to a few of the heaviest

bearers of good quality, with, amongst Apples and Pears, a sufficient number that are good keepers.

Gooseberries.—Of these London, Crown Bob, Roaring Lion, Rifleman, and Whinham's Industry, are the kinds most to be depended on, and most wanted.

Currants, black—Prince of Wales, Lee's Prolific, and Black Naples, are held as the best. Red—Wilmot's Long Bunch and La Versaillaise. White—White Dutch and Transparent White may be relied on as combining the best properties.

Of Raspberries the new Baumforth's Seedling has quickly established its reputation as one of the very best sorts; it is largely grown here.

Plums.—Of these Victoria, Potts' Emperor, Goliath, Pond's Seedling, Prince of Wales, and Rivers' Prolific, are most planted by many of the market growers, and they are equally worthy of the attention of those who cultivate fruit for their own use.

Apples.—The all but limitless number of varieties of this, the most useful of all fruits, perplex ordinary planters to such an extent that in their bewilderment they hitherto have as often as otherwise got kinds that are little worth. But, thanks to the way in which the subject has been unceasingly ventilated in the gardening Press of late years, more light has been thrown on the matter, the result being that a few of the best proved varieties are now planted in the proportion of a score or a hundred to one of what they used to be. Here the principal run is on such sorts as Lord Suffield, Lord Grosvenor, Keswick Codlin, Stirling Castle, Blenheim Pippin, Dumelow's Seedling (Wellington), Cellini, Cox's Orange Pippin, King of the Pippins, Ribston Pippin, and Lane's Prince Albert.

Horse work is largely employed in preparing the ground, to facilitate the use of which the crops of the various trees and shrubs occupy long parallel stretches, which when cleared are manured and ploughed over deeply, harrowed, and brought into condition for the next crop. Potatoes and Mangels as a change often occupy for one season the ground that has been under trees and shrubs.

Those who have not had an opportunity of seeing the amount of work that can be got through by a well-trained staff where systematic and cleanly cultivation is practised would be led to suppose that the transplanting of so many millions of plants annually could not be got through, but the land is of a nature such as admits of being got on to when the weather is not too wet to stand out. From eighty to a hundred thousand seedlings is the usual quantity planted per day. The work is mostly done by the piece. Altogether this is one of the best appointed and best kept nurseries I have seen. T. B.

The Rosery.

TEA ROSES IN POTS.

IF there is one flower more than another that the amateur longs to cultivate well it is the Rose, and preferably the Tea Rose, on account of its beauty and the delightful fragrance of the blooms. One amateur, writing some years ago in reference to Tea Roses, said he resided within a few miles of London, and was necessarily compelled to grow the Roses in pots, but after a season or two they turned out a complete failure. The blooms deteriorated after the first year, and the plants rapidly declined. The same amateur tried another plan. He planted out about fifty half-standards and dwarfs in well-prepared soil, and erected a low span-roofed house over them, with glass sides to the ground, and side windows for ventilation, and then the Roses looked remarkably healthy, the shoots most vigorous, and covered with buds. It would have been a wonder if Roses had not done well in such a happy state of things, planted out in suitable compost and protected from all inclement weather by a light screen of glass, which admitted ample light and sufficient ventilation. But if planted-out Roses succeeded well in such a house, why should pot Roses not do equally well? Given the best cultural requirements, it is quite certain that where planted-out Roses succeed pot Roses would not turn out a complete failure after a season or two. Very few amateurs can afford to plant out a bed of Tea Roses, and then, to make sure of success, erect a house over it. Hundreds can afford to grow a few pot Roses, and

success is certain if the cultivator is sufficiently interested in the work to pay sufficient attention to the plants, and to keep them in a clean, healthy state. I do not know any plants more easily injured by the attacks of parasites than the Rose, especially Tea Roses. Mildew, orange fungus, red-spider, and greenfly attack the Rose by turns, or all at once. It is neglect of keeping the leaves and young shoots clear of these pests that causes debility and ultimately the death of the plants. Careful potting and re-potting at the right time is a most important and necessary part of good culture, but good soil must also be used. Take, for instance, a Tea Rose growing in an 8-inch pot. Unless the soil in which it is growing is of the best quality, and also richly manured, the results cannot be quite satisfactory. A good compost for Tea Roses is formed of four parts good turfy yellow loam, one of peat, one of decayed stable manure, and a good proportion of white sand. An 8-inch potful of crushed bones should be added to each barrowful of loam. Drain the pots well and place over the drainage some decayed manure and turf from which the fibre has been shaken. A two-year-old plant may be flowered in an 8-inch pot; three-year-old in a 9 or 10-inch; the strongest plants the fourth year may be flowered in 11-inch. Again, whether the plants are to be forced or not, they must be placed in such a position when they are making their growth that they have a very large supply of light and air. They ought to be close to the glass, and when the flowers are opening the atmosphere must be dry and moderately warm. If they are forced early in the year the growth must be brought on gently. A little bottom-heat is excellent to begin with, and a temperature at night of about 45° to 50°.

During the last few years many new Tea Roses have been introduced, but some of the best of the old varieties are so popular that they will hold a high position for years to come. Niphetos, for instance, as a white kind, is not yet equalled. Devoniensis still reigns supreme in its lovely colour; Madame Falcot and Safrano are most beautiful in the bud state; Souvenir d'un Ami, too, has long been popular, and its popularity has not declined. Still, with all the good qualities belonging to these good old varieties, we cannot ignore the new and beautiful forms which have been so lavishly distributed in recent years. The best of them are Anna Olivier, flesh colour; Amazone, lemon-yellow; Belle Lyonnaise, Catherine Mermet, flesh-coloured or salmon-tose; Comtesse de Nadailac, orange and coppery-coloured; Hon. Edith Gifford, beautiful in bud; La Boule d'Or, a fine pot Rose, golden-yellow flowers; Madame Jules Margottin, yellow with a pinky tinge; Madame Chedane Guinoisseau, sulphur-yellow, fine form; Madame Lambert, very distinct; Marie van Houtte, a very pretty yellow kind; Perle des Jardins, canary-yellow; Rubens, white, rose-tinted, fine. The above are not strictly new, and we must add to them the lovely Souvenir d'Elise. *J. Douglas.*

Orchid Notes and Cleanings.

CATTLEYA LUTEOLA.

This distinct and very pretty species is now in flower in Messrs. Veitch's nursery, King's Road, Chelsea. It is not only distinct in itself, but it is also valuable from being an early winter flowering species. It is not such a handsome plant as *C. citrina*, the shade of yellow is paler, the lip is orange with a rosy tint at the throat. There were several plants in flower. This species has several synonyms—*C. modesta* of Meyer; *C. Meyer*, Regel; and *C. flavida*, Klotsch. It was described by Dr. Lindley as *C. luteola* in *Gardeners' Chronicle*, 1853, p. 774, and I believe recognised by Reichenbach fils under that name. It has also been grown under the name of *C. Holfordi*, but on what authority I am not able to say. It is a Brazilian species, and probably requires to be grown in the warmest end of the Cattleya-house. It is well figured in the *Botanical Magazine*, t. 5032, from a specimen with five flowers on a spike grown in Messrs. Rollisson's nursery in November, 1857.

CYPRIPEDIUMS.

C. vexillarium is also very nicely in flower; it is, perhaps, not such an elegant plant as one of its

parents, *C. Fairricanum*, but it has a considerable resemblance to that fine species, showing just a trace of its seed-bearing parent, *C. barbatum*.

C. Leeanium superbum is plentifully in flower, and is remarkably beautiful; the difference between this and *C. Leeanium*, raised at Burford Lodge, is very striking. The highest prize fell to Messrs. Veitch, owing to the use of the pollen from *C. insigne* var. *Chantini*. The variety from which Sir Trevor Lawrence's plants were raised was evidently not so good as *C. insigne* *Chantini*. The other parent is *C. Spicerianum*.

In Messrs. Veitch's nursery there are also groups of *Laelia autumnalis* and *L. anceps*. There are many spikes, and amongst them some handsome varieties. The recently introduced white forms of *L. anceps* have so far been a failure. I do not hear of any one having it in flower. In some cases the plants have made a second growth, but even these do not seem to show flowering-sheaths. A number of distinct white forms intermixed in such a group as that in Messrs. Veitch's large Cattleya-house would be charming.

CATTLEYA MAXIMA (Lindl.) DOCTORIS, Rehb. f.

The Hon. and Rev. J. Townsend Boscawen kindly sends me a two-flowered raceme of this Cattleya. Though it is very meritorious in its deep bright rose tints, yet it appears to be even more remarkable in the dark reticulations of the lip, which are much more conspicuous underneath than is usual. It is a very fine thing. *Reste à prouver* whether it is an accidental sport, or a constant individual, or a variety. *H. G. Rehb. f.*

ÆRIDES LEONARI.

The Bulletin of the Royal Tuscan Society of Horticulture for November contains a coloured figure of this beautiful species, in which the flowers are more loosely arranged than usual in the genus, and the segments as well as the lip tipped with rosy-lilac.

The Flower Garden.

The sharp frost has made it impossible to proceed with ground work of any kind or the replanting of trees and shrubs for the present; but there are many jobs that can be done nevertheless. Conifers would be better if they were looked over annually for the purpose of pinching out the points of any branches that are making excessive growth, and in any case where more than one central leading shoot has been formed, the best placed one should be retained, the others being cut away. Due attention to these matters assists to keep the trees in symmetrical form. The Coalifer would be greatly benefited by a good top-dressing of light rich mould or sandy loam, or any other similar material at hand, as no other kind of ornamental trees sooner repay labour and attention than Conifers, and now is the best time to perform this kind of work. If weather permits, all leaves now having fallen, every corner should be raked out, all dead wood cut out, and all rubbish collected into heaps and burnt. The ashes make excellent manure for lawns and for the flower-beds. The high winds and storms of late will have broken many of the old tree stakes, which should have attention at once, and have new stakes put to replace them and firmly tied—such as standard Roses, shrubs, and deciduous trees. *W. Smythe, Basing Park, Alton.*

FRUITS UNDER GLASS.

LATE GRAPES.

Experience has shown that no advantage, as far as the Grapes are concerned, is obtained by keeping them on the Vines after the end of December, although in some cases, to economise time and labour, it may be more convenient to extend this limit a little longer; but even under such circumstances the cutting of them should not be deferred beyond the end of January, because if after this date the Grapes are left on the Vines, it interferes with the proper course of pruning them. This should be done in dead

winter, in order to ensure a simultaneous break, and to avoid the risk from bleeding, which would ensue afterwards if the pruning was long deferred. For these reasons I therefore recommend, as far as practicable, to cut the bunches at the earlier date if possible. As the time for this operation is drawing near, any preliminary requirements should be attended to forthwith, and in the meantime, should unfavourable weather prevail, advantage could be taken of such an opportunity to prepare the utensils for their reception. If bottles are to be used, these will require to be well cleaned, and a few pieces of fresh charcoal be put into each, and then be filled with pure water. In cutting the shoots off the Vines let them be cut back as far as the spur will admit, so that a good length of shoot is available to insert into the water; this will diminish the risk consequent upon inattention to filling with water, as the lack of it is fatal to good keeping, and results in much loss of fruit.

In the case of shoots with but little wood below the bunch it is not possible to put them far into the water; these will consequently require much more frequent attention as regards a supply of this element, and therefore should be placed together. When the Grapes are placed in the room, attend regularly to giving the needed supply of water; remove decayed berries from the bunches at short periods of time; keep an equal temperature of 40° or 45°, and use no fire-heat unless actually required at any time. Our ventilators open into a space beneath another roof, and therefore can be left partially open at all times.

After the Grapes are cut proceed to prune the Vines at once, and enforce this rule in respect to this important matter in earlier compartments, if not already done. At this season of the year the necessary cleansing of the houses should also be completed with the utmost despatch. *G. T. Miller, Wycombe Abbey.*

The Hardy Fruit Garden.

MANURING THE TREES.

ADVANTAGE should be taken when the weather is frosty to wheel manure into the fruit tree plantations. All kinds of trees should not receive the same treatment as to manuring. Dwarf trees on the Paradise stock can hardly have too much manure, as it is only by judicious feeding that good results can be expected. Trees grafted on the free stock require more care, for, as a rule, they are more inclined to grow to wood than to form fruit-buds. By manuring these we often do more harm than good. As an instance, we have here a number of trees of that very handsome Apple, Peasgood's Nonsuch, on the Paradise stock, which bear yearly fine crops of large well-coloured fruit. Now, these trees bearing heavily, can hardly have too much manure given them in the growing season. We have also a number of trees of the same variety on the free stock, which hardly ever bears any fruit, although the trees are very healthy and grow vigorously. The fruit produced is also small and badly coloured; and all the strength of trees seems to go to produce wood instead of fruit. This is a point that ought to be noted by all growers if they wish to be successful. These trees will now be root-pruned, but no manure will be applied.

POOR KINDS OF FRUIT.

Another important matter which ought to engage the attention of growers is the large number of worthless varieties of both Apples and Pears. It would be much better, both for nurserymen and growers, if half or more of our present varieties were exterminated.

PRUNING AND TRAINING.

The pruning and nailing of wall-trees should be pushed on when the weather is favourable. Our chief aim should be to get the walls covered as quickly as possible; and if the cordon system of tree training is adopted this can soon be accomplished. Should any of the trees not be making satisfactory progress, I would advise their being placed perpendicularly up the walls for a season. I have often seen this simple plan improve the trees in one year.

Any vacant space on south walls might be filled by planting Vines of Royal Muscadine, a variety which I consider the best for outdoor cultivation. When pruning Apples, grafts should be saved of any varieties that it is desirable to increase. I should always recommend a few varieties of Crabs to be planted in fruit gardens. The trees are very handsome in spring when in bloom, and also in autumn when covered with bright light fruit. One of the prettiest and freest bearers is the old Siberian Crab. There is also a new variety, very handsome, and larger, called the Dartmouth Crab, which ought to be planted by lovers of ornamental trees. *J. Smith, Mentmore, Bucks.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Dec. 21	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms Sale of Azaleas, Roses, &c., at the City Auction Rooms, by Frotheroe & Morris. Sale of 5000 Lilium auratum, from Japan, Tigridias, Dutch Bulbs, &c., at Stevens' Rooms.
TUESDAY, Dec. 22	Special Sale of Orchids in Flower, at Frotheroe & Morris' Rooms. Sale of Lilium auratum, Shrubs, and Plants, at Frotheroe & Morris' Rooms.
WEDNESDAY, Dec. 23	Sale of Hardy Plants and Bulbs, Roses, and Fruit Trees, at Stevens' Rooms.

TWO letters, and as yet two letters only, have appeared in our columns with reference to the question of HONOURS FOR HORTICULTURE. They are, in tone and substance, diametrically opposite. For our purpose that is just as they should be. Our readers like, and we like, to see both sides of a question; nay, more, as it is very rarely that we have to do with a flat plane of two surfaces, but more generally with a polygon or many-sided matter, we prefer to lay before our readers all that can be said on one side or the other. For ourselves, we have the advantage of knowing our correspondents, and the point of view from which they respectively regard the question. We are not about to reveal anything that has been entrusted to us confidentially, nor intentionally to mislead by any pretence of exclusive information. It will suffice to say that the burning desire of one writer is to advance horticulture in public estimation; the ardent endeavour of the other to promote its welfare by every means in his power. The one thinks that stars, and ribbons, and gewgaws, and arrangements of initial letters appended to a man's name are matters to be ridiculed or even despised. The other feels that horticulture "wants a lift," and is really not particular in what way the rise comes, so long as the craft prospers in public estimation; and, moreover, considers the prospects of the proposed International Exhibition to be more or less directly concerned in the matter. The ultimate desire of both is the same. This being so, the only question between them would seem to be one as to the proper means of effecting what they both are yearning for; but really the question is not so simple. Are our two correspondents likely to agree upon the main point at issue—What is advance in horticulture? As it seems to us the one sees in it material prosperity for the individual—a big business, a large capital, a satisfactory balance at the banker's, an unclouded trade reputation—all excellent things no doubt. The other looks abroad and sees successful traders and honourable men of all callings decorated with this or that or the other Order. He feels that the whole class is honoured by the selection of special representatives as recipients of State honours. He sees that the colleagues of the recipient take occasion to celebrate the event with congratulatory banquets and the like; and if—poor human nature!—there should be some envious, and jealousies, and heart-burnings, at least they are kept out of sight. Again, he looks at home, and what does he see? Honours and State recognition accorded to military and naval men, to Government servants generally, and in most cases most deservedly—honours and State recognitions to politicians as a reward, not for services to the State, but as an acknowledgment of loyalty to party—honours and State recognition to hereditary grandees whose claim to such honours is mysterious to all save, perhaps, the recipient—honours and State recognition to ladies, not only of the FLORENCE NIGHTINGALE type, but to ladies who take part in petty party political warfare. This is what he sees, and he naturally thinks, Why should not horticulture participate in these good things? Surely his claims are as great as those of many others among the classes above mentioned? And to this question we can but answer in the affirmative. But, as things go in this

country, where the conditions are so different from those which obtain on the Continent, we may ask, Would horticulture be benefited by such honours paid to its representatives? Was literature or poetry in any degree benefited when ALFRED TENNYSON became Lord TENNYSON? Was electrical science or the progress of telegraphy in the slightest degree enhanced when Professor WHEATSTONE became Sir CHARLES? Or, to come nearer home, was horticulture materially benefited when PAXTON became Sir JOSEPH? Is railroad engineering or steam navigation a bit the worse because WATT or GEORGE STEPHENSON remained Commoners to the end of their days?

Turn to individuals—who is there that thinks NEWTON is in any way glorified because he was knighted? Who thinks any the more of MACAULAY because he became Lord MACAULAY? Who

particular department of which the individual is the representative.

We agree therefore with the one correspondent that horticulture would be the better for a lift. We agree with the other correspondent that State honours, except under special circumstances, are of no benefit to the community, but only to the individual.

It does not, however, follow that State aid of another character might not give the fillip which is required to advance horticulture. A Ministry of Agriculture and Horticulture, to look after our material interests—a National School of Agriculture, Forestry, and Horticulture, to secure adequate training in the principles and practice of our profession—laboratories, libraries, experimental gardens, facilities for research of all kinds—these are things which, it appears to us, are far more urgently needed and far more likely to give the profession the desired impetus, than honours paid to successful individuals, however worthy.

We are trenching on a well-worn theme, but it is incumbent on us to do so at the risk of telling thrice-repeated tales, when we point out our own deficiencies in the matter of technical education as compared with the continents of Europe and America. We have perhaps fuller opportunities of seeing the results of the educational system adopted in other countries than many of our readers. We see men occupying only equivalent positions to our "young gardeners" coming here from Germany, from Denmark, from Belgium, and from America, to complete their practical education. Many of these men are not inferior in point of general education to the average of our University undergraduates, and they have this great advantage over our undergraduates in that they are not only capable of manual labour, but think it no derogation to undertake it at the lowest remuneration. These are the men who will give a lift to horticulture, and they will give it at our expense if we do not follow their example.

— THE CHRISTMAS SEASON.—We must request our correspondents to send all matters intended for insertion in our next issue on, or previous to, Tuesday, December 22.

— DR. PATERSON'S TESTIMONIAL.—We are informed the subscription list will close on Christmas Day, therefore intending subscribers to the fund will greatly assist the movement by sending early to Mr. K. F. CAGIE, Bridge of Allan, N.B.

— ROYAL APPOINTMENT.—We learn that Messrs. WEBB & SONS, of Wordsley, Stourbridge, have recently been appointed Seedsmen to the QUEEN.

— THE NEW MAJOR OF CHESTER.—Mr. G. A. DICKSON, senior partner in the old firm of JAMES DICKSON & SONS, Dolgelly, gave a supper on December 12, in commemoration of his being made Mayor of Chester this year, to all those employed at these nurseries, at the "Angel" Hotel, Dolgelly.

— HERTIERA MACROPHYLLA.—We are indebted to the courtesy of Professor MAXIME CORNU, the Director of the Jardin des Plantes at Paris, for a magnificent specimen of the Looking-glass tree, mentioned in our last issue. The largest leaf sent measures upwards of 18 inches in length, and 8½ inches in breadth. The silvery colour of the under-surface is very beautiful. But what is of more interest is a raceme of the curious seed-vessels, resembling the samaras of the Maples, but in fives instead of in pairs, and little less in size than native specimens. The flowers are unisexual; whether in the Paris specimen, the flowers were artificially fertilised we do not know.

— JARDIN D'ACCLIMATATION OF GENEVA.—We have received from M. CORREYON a catalogue of seeds of alpine plants, which may be had from the Director of the garden, and which is well worth the attention of those interested in such plants. Copies may be had on application to M. H. CORREYON, Jardin d'Acclimatation, Plainpalais, Geneva.

FIG. 183.—PINUS TUBERCULATA. (SEE P. 785).

thinks any the less of FARADAY because he remained plain MICHAEL FARADAY? Upon the answer to be given to these questions depends, we think, the solution of the problem—Should horticulture receive State recognition? Looked at in this way, we can but think the respect and honour a man gets from his own fellows is the highest boon that can be conferred upon him *à extra*, and that to confer a State honour upon him—always excepting Government servants—is to reduce him to the level of successful party politicians, successful party politicians' wives, and successful municipal dignitaries. We would not be supposed to undervalue such distinctions when honestly won and appropriately awarded. Human nature hankers after such things, and the feeling is not necessarily ignoble nor unworthy. We are merely urging that the distinction, whatever it be, should be one appropriate to the individual and specially calculated, not merely to honour the man, which is the smallest part of the matter, but to give an impulse to the progress of the

FIG. 184.—PINUS TUBERCULATA. (SEE P. 786.)

— THE "BOTANICAL MAGAZINE."—The following plants are figured in the December number:—

Aloe Bainesii (t. 6348).—This is one of the Tree Aloes figured and described in our columns in 1874 by Mr. DYER. It forms a tree with stout trunk, 40–60 feet high, branching in a forked manner near the top, each branch bearing a number of recurved, channelled, lanceolate, remotely toothed leaves. The flowers are very numerous, and arranged in dense cylindrical erect racemes; each flower rosy-pink, oblong cylindrical, with a short six-parted limb, the segments of which are green. It is a native of Natal and Kaffiraria.

Raphithamnus cyanocarpus (t. 6349).—A Chilean evergreen tree, 15–20 feet high, conspicuous for its small ovate bright green leaves, gold-coloured spines, and numerous small tubular lilac flowers, with an irregular spreading 5-lobed limb. The flowers are succeeded by small bright blue berries. *Verbenaceae*, t. 6350.

Rhododendron javanicum var. *tubiflora*.—A form of javanicum with paler flowers and longer calyx-tube. Introduced from Sumatra by Mr. CURTIS for Messrs. VETCH (t. 6350).

Pogonia pulchella.—A curious terrestrial Orchid from Hong Kong, with globose annulate tubercles, cordate ovate leaves, bronzy-green above, red beneath, with prominent convergent nerves, studded with whitish hairs. The flower-stalks leafless, 4–5 inches high, and bears two flowers near the top, each about 1½ inch across, with linear yellowish segments, and a scoop-shaped rose-coloured lip (t. 6351).

Crocus Korolkowii and *C. erius* (t. 6352).—Two spring flowering Crocuses. *C. Korolkowii* is like the common yellow *Crocus*, but has the segments of the perianth flushed with brown at the back. It is a native of Turkestan, and has recently been discovered in Afghanistan. *C. erius* is like *C. biflorus*, but is not feathered on the back of the segments. It is a native of Asia Minor.

— "THE CITY DIARY FOR 1886."—The public will much appreciate this useful publication, containing as it does, besides blank pages for entries for every day in the year, a great deal of information about matters connected with the City proper, and with larger London as well.

— CALVERT'S "MECHANICS' ALMANAC."—An almanac and something more, there being a miscellaneous collection of facts of service to workers in metal, wood, and other materials; and as being of service to horticulturists may be mentioned measurement of areas of solids, the preservation of materials from the effects of the weather, cost of buildings by cubical contents, strength of boiler-plates, colours and the eye, &c.

— PEAR GILOGLI.—The origin of this name has been asked for by a correspondent. The French way of calling this Pear is Gilles-o-Gilles, and no doubt the word Gilogli is merely a corruption of the foreign one. According to *Le Dictionnaire de Pomologie*, the Pear received this name from the following circumstance:—A bishop was inspecting his espaliers in company with his gardener, and being struck by the beauty and size of this Pear, exclaimed, "Gilles! ô Gilles, what fruit!" The author of *Le Dictionnaire* says he made the extract from a book on fruit trees without the author's name, in the library of the Jardin des Plantes, and cannot give a nearer clue.

— VINE DISEASES.—The Italian Ministry of Agriculture has authorised the formation of an International Exhibition in the Royal School of Vine Culture and (Enology) (wine making) at Conegliano, near Venice, for the special purpose of getting together a collection of implements and machines destined for the application of lime and other remedies for mildew and Peronospora, in Vines. The implements, such as pumps, syringes, spray producers, will be tested practically, and prizes awarded as follows:—One Gold Medal and 500 lire (francs); three Silver Medals and 150 lire with each; five Bronze Medals. The Government will also purchase premiated instruments to the value of 1000 lire, for the purpose of distributing them in agricultural schools. Applications for permission to exhibit should be sent to the "Direzione della R. Scuola di Viticoltura ed Enologia in Conegliano, Italy," before February 22,

1886, and all machines must be sent to the model farm of the School before March 1, 1886. The trials will commence on March 2.

— COVENT GARDEN MARKET AND CHRISTMAS SUPPLIES.—The market is now showing the approach of the Christmas season by the quantities of Christmas trees and decorative material, such as Mistletoe, Holly, Ivy, Laurel, Privet, &c., within its boundaries. For some days past Mistletoe has been arriving in wagonloads, and doubtless will continue to do so until the 25th. Of Holly entire trees of 8–10 feet or so in height, and covered with berries, besides large quantities of cut branches (which are also full of berries) have been received at Covent Garden for about an equal time; both these plants appear to be more rich than usual in berries, which form the real decorative feature. Oranges and Lemons are arriving in large consignments from abroad, chiefly Spain, and from there also come various nuts and other fruits, as Barcelonas, Chestnuts, Pomeles, Melons, and inferior Grapes. Home-grown Grapes, of very good appearance, such as Lady Downe's Seedling, Black Alicante, &c., are rather plentiful. Some Oranges, besides Apples, may be seen from America. Nuts from other parts than Spain consist of Cocoa-nuts, Brazils, Lee Chees, &c. Custard Apples, principally from Madeira, are very plentiful. Salads of a nice size are now in, and consist of Lettuce, Endive, Celery, Radishes, &c. In the way of cut flowers, Azaleas, Violets, Narcissi, Gardenias, various Orchids, and Eucharis, are the leading things, and a few Roses are seen here and there. Lilies of the Valley in pots have begun to come in, chiefly in combination with Tulips and Ferns.

— HORTICULTURAL CLUB.—The usual monthly dinner and conversation took place on Tuesday, December 8, at the rooms, 1, Henrietta Street, Covent Garden. Amongst those present were Mr. John Lee, Chairman; the Hon. and Rev. J. T. Boscawen, Dr. Masters, and Mr. C. Elliot, Boston, U.S.A.; Dr. Hogg, Rev. F. H. Gale, Rev. T. Flintoff, Messrs. C. T. Dreary, Collings, Upcott Gill, G. Bunyard, H. Turner, and the Secretary. The discussion was opened by Dr. Masters on "Town Gardens and the Plants most Suitable for them," and a very interesting discussion arose on the subject, many of the facts and illustrations brought forward by Dr. Masters being evidently new to most of those present.

— THE DIRECTORATE OF KEW.—We believe that Mr. W. T. HISSELTON DYER, who has acted for some years as Assistant Director, has been appointed Director of the Royal Gardens, Kew, although no official announcement has yet been made. As to the propriety of this appointment there cannot be a dissentient voice. Mr. DYER has shown himself a competent and zealous administrator; he has not only a wide knowledge of botany, but has the tact and instinct of a good cultivator and the eye of a landscape gardener. The duties of the office are now so multifarious, and involve so many important interests, colonial as well as domestic, beyond the mere supervision of the gardens, that the selection of an assistant to Mr. DYER must needs be a matter of serious consideration. Formerly, before the work undertaken at Kew had become so extensive and laborious, a clerk or two could do the work of Assistant Director, but under existing circumstances the appointment of Assistant Director, and the duties to be fulfilled by him, become almost as serious matters for determination as the Directorate itself. It would seem to us that the requirements of the case demand a man of administrative ability, one with a special knowledge of economic botany, familiar with the natural resources of our colonies, tropical and otherwise, and of the best means of promoting their development—one competent to deal with the requirements of Indian and colonial plantations.

— BOOKS, &c., RECEIVED.—*The Golden Gate and Silver Steps*. By SHIRLEY HIBBERD (E. W. ALLEN, 4, Ave Maria Lane, E.C.).—*Transactions of the Royal Irish Academy of Science* (Academy House, 19, Dawson Street, Dublin).—*Orchid Growers' Manual*. By B. S. — GARDENING APPOINTMENTS.—Mr. CHAS. HEWETT has been appointed as Head Gardener to E. C. BARING, Esq., Daylesford House, Chipping Norton.—Mr. WILLIAM THORNHILL, of Holker Gardens, has been appointed Head Gardener to CHARLES T. HOARE, Esq., Bignell, Bicster, Oxon.

PINUS TUBERCULATA.

The specimen from which our illustration (fig. 184) was taken was obligingly furnished us by Mr. Baker of Bayldorbury. In his rich pinetum the plant forms a bushy tree of medium height, with rough brown bark. The smaller branches spread horizontally, and turn up at the tips. The young herbaceous shoots are greyish-green, destitute of leaves at the base. The buds are cylindrical, pointed, purplish, covered with whitish resin. The foliage is of a greyish-green colour. The leaves are in threes, each 4–6 inches long, 3-sided, saw-toothed, and pointed at the top. In cross-section the hypoderm cells are seen to encircle the whole leaf, and to wrap round the resin canals, of which latter there are two near the lower epidermis. The male catkins (observed on a tree at Pampesford in 1883) are in dense cylindrical masses, each about half an inch long, rich chestnut-brown in colour. The young cones are in whorls, each stalked, erect, or slightly inclined downwards, oblong-obtuse, purplish-green, with the scales strongly spine-pointed. As to the matured cones, we may refer to Mr. Smith's drawing, which shows their appearance better than words could do. The botanical history is so well known, that happily there are few synonyms to record. It is not necessary either to give a full botanical description of the tree, which may be found in the recognised text-books, but the following particulars, taken from an article in *Harper's Magazine*, may appropriately be given. The sketch of the tree, obligingly furnished by Sir Joseph Hooker (fig. 183), will show one aspect of the tree in its native home on the Californian Sierras:—

"PINUS TUBERCULATA.—This curious little Pine is found at an elevation of from 1500 to 3000 feet, growing in close willow groves; it is extremely slender and graceful in habit, although trees that chance to stand alone outside the groves sweep forth long curved branches, producing a striking contrast to the ordinary grove form. The foliage is of the same peculiar grey-green colour as that of the Nut Pine, and is worn about as loosely, so that the body of the tree is scarce at all obscured by it.

"At the age of seven or eight years it begins to bear cones, not on branches, but on the main axis, and as they never fall off, the trunk is soon pictorially dotted with them. The branches also become fruitful after they attain sufficient size. The average size of the older trees is about 30 or 40 feet in height and 12 or 14 inches in diameter. The cones are about 4 inches long, exceedingly hard, and covered with a sort of silicious varnish and gum, rendering them impervious to moisture, evidently with a view to the careful preservation of the seed.

"No other Conifer in the range is so closely restricted to special localities. It is usually found apart, standing deep in 'chaparral' on sunny hillside cañon sides, where there is but little depth of soil, and where found at all, it is quite plentiful; but the ordinary traveller, following carriage roads and trails, may ascend the range many times without meeting it.

"While exploring the lower portion of the Merced Cañon I found a lonely miner, seeking his fortune in a quartz vein, on a wild mountain side, planted with this singular tree. He told me he called it the Hickory Pine, because of the whiteness and toughness of the wood. It is so little known, however, that it can hardly be said to have a common name. Most mountaineers refer to it as 'that queer little Pine tree covered all over with buds.' In my studies of this species I find a very inter-

resting and significant group of facts, whose relations will be seen almost as soon as stated:—

"1. All the trees in the groves I examined, however unequal in size, are of the same age.

"2. Those groves are all planted on dry hill-sides, covered with "chapparal," and therefore liable to be swept by fire.

"3. There are no seedlings or saplings in or about the living groves, but there is always a fine hopeful crop springing up on the ground once occupied by any grove that has been destroyed by the burning of the chapparal.

"4. The cones, all of which are persistent through life, never discharge their seeds until the tree or branch to which they belong dies.

"A full discussion of the bearing of these facts upon one another would perhaps be out of place here, but I would, at least, call attention to the admirable adaptation of the tree to the fire-swept regions where alone it is found. After a grove has been destroyed the ground is at once sown lavishly with all the seeds ripened during its whole life, and which seem to have been carefully held in store with reference to such a calamity. Then a young grove immediately springs up out of the ashes—beauty for ashes. *The Coniferous Forests of the Sierra Nevada.*

Notices of Books.

The Orchid Grower's Manual. 6th edition.
 By B. S. Williams, F.L.S., F.R.H.S. London, 1885.

Orchidists, wherever they may be, will hail with pleasure Mr. Williams' new work, which in every respect far exceeds the former editions of the *Orchid Grower's Manual*, which have hitherto been so useful as a reference for the identification of Orchids, and a guide to their culture in every part of the world where the English language is spoken, indeed its usefulness has not been limited to those regions, for it has been translated into Russian by Mr. Wolkstein, and published in that language—a fact which gives one of the highest possible testimonials to the esteem in which the author's vast knowledge of Orchids and their culture is held by Orchid growers in all parts of the world. In the handsome volume before us Mr. Williams has succeeded in producing a work well worthy to bear his name, and with what care and research it has been produced a perusal of its contents discloses, for in addition to the description of each species, the country from whence it comes, its commonest synonyms and references where figured are given, the last item being the chief new feature in the edition, and one likely to be of inestimable service to those who wish to make acquaintance with the plants before they see them in flower.

The volume of 660 pages commences with the introduction, followed by exhaustive articles on all the important operations connected with Orchid culture, such as potting, watering, resting, temperature, &c., also pleasant and instructive matter on the habits of tropical Orchids, the collecting of Orchids, and the treatment of those newly imported, raising Orchids from seeds, &c. Then follows an alphabetical list of genera, species, and varieties, each carefully described, and many illustrated by cleverly executed engravings; the whole being brought up to date by an addendum and completed by an index of all the plants enumerated. The work is profusely illustrated, the larger number and the most striking of the illustrations having appeared in our own columns—well printed, and elegantly bound, and, considering the amount of accumulated knowledge requisite to produce such a work, and the time and patience necessary for the verification of the references given, it is a

marvel how it can be published at the price. We are surprised to see little or no reference to our Orchid Supplements of this year, which contain a greater amount of original matter within the necessary limits than has ever before been got together. The *Orchid Grower's Manual* is published by Mr. B. S. Williams at the Victoria and Paradise Nurseries, Upper Holloway, London, N.

"Brownsmith's Boy." By G. Manville Fenn.
 (Blackie & Son.)

Mr. Fenn in this work shows himself to be a good practical gardener as well as a first-rate writer of books for the amusement of boys. The story is that of an orphan lad who is adopted as an apprentice by a kindly market gardener, and who goes through many stirring adventures in what might have been expected to be a hum-drum profession. We feel inclined to quarrel with the concluding chapter, in which the hero deserts the pruning-knife for the sword. The proper ambition for a gardener is well put by the charmingly described "Old Brownsmith":—"A man who has brains may go on learning and making discoveries, not discoveries of countries and wonders, but of little things that may make matters better for the people who are to come after him. Then he may turn a bit of the England where he works into a tropical country by covering it over with glass and having a stove; then some day, if he goes on trying, he may find himself able to write F.R.H.S. at the end of his name." But though there is, perhaps, rather a superfluity of fusticuffs, the book is as thoroughly sound in moral tone as in horticultural common sense, and we can cordially recommend it as a present for boys generally or for juvenile gardeners in particular.

NURSERY NOTES.

CYCLAMENS AT MESSRS. PAGE'S, TEDDINGTON.—In an age that has seen more improvements in horticulture than any time previous, one is not surprised to find a class of plants only a short time back looked upon as "very bad to do," and even when successfully cultivated hardly repaying for the labour, &c., expended on them, now grown in vast numbers and brought to a degree of excellence by the skillful and patient crossing of the best types, and weeding out of the poorer varieties, that must surprise even the cultivators themselves. Several firms have become famous for their own particular strains, and it would be almost an impossibility to mention one strain and affirm its superiority over the others, although some strains are better known and brought vividly before the public by continual advertising. While writing of advertising we must admit that as yet we have not come across a flower in any way resembling the "fearful and wonderful" woodcuts of Cyclamens (?) that one sees in catalogues, &c., and which many people would fail to recognise as a Cyclamen if it were not named as such. We trust that the flower (?) represented by the above-mentioned woodcuts is not the type that specialists are aiming at.

At Messrs. Page's nine houses are devoted to the culture of this flower, and over 30,000 are grown. The plants for the most part are fifteen months old, and for vigour, compactness of habit, and abundance of excellent flowers are well able to compare favourably with other well known strains.

The fifteen-months old plants are all in 4½ to 5 inch pots, and their flowering qualities may be estimated when we state that three dozen fully-expanded blooms are a fair average; and from this statement some idea can be formed of the imposing spectacle of a houseful. As may be supposed, there is a great diversity of colour, but even in such a grand even strain some plants are conspicuous by their superior blooms, one variety in particular, named Albion, a massive ivory-white, could easily be distinguished amongst two or three dozen other good types of white, by even an ordinary observer. The petals of this flower were 1½ inch in breadth, and nearly 2 inches in length. Two other plants could not fail to be recognised, both good forms—one the colour of a bright Phloxopsis Schilleriana, and the other just the colour of a La France Rose. From a florist's point of view, any flower that deviates from its true points would, of course, be condemned, but we think exception may be taken to a "break" that has its petals neatly twisted over, so that they form a level surface; plants of this description have a striking appearance amongst

the others. The persicum type is the more largely grown, in fact some of them are so large as readily to be confounded with a giganteum. Other things besides Cyclamens are well done here, including Odontoglossums, of which a nice batch were looking very vigorous. Gardenias and Camellias, too, are largely grown, and look in the pink of condition.

MESSRS. CLARKE, TWICKENHAM.

The collection of Cyclamens grown here has been before the public for some time, in fact we believe it is one of the oldest strains, and the fact of holding its own for so long says much for it. A great number were not in flower at the time of our visit lately, but judging from their appearance expectations formed of their success will not be misplaced. Amongst those in bloom no colour could be said to predominate very largely, as the shades of colour were most numerous, and all good, no "washed" ones being visible. The various colours of the eyes of flowers, with the rest of the petals white, was remarkable, nearly every possible shade, from almost purple to the most delicate blush, was to be found. Some very fine salmon-tinted blooms could not be observed in passing, and of the whole collection, in flower, nothing but the highest praise could be accorded. When the main part of the collection is in bloom it must present a fine appearance as the plants are well shown off on sloping stages.

MESSRS. WALKER, TEDDINGTON.

Here, too, Cyclamens have found a congenial home, and thrive and bloom luxuriantly. A large portion of this collection is yet to bloom, and as the part in bloom is used for cutting from, one cannot expect too much; but notwithstanding, an opinion highly in their favour could not but be formed. In this collection, too, were to be found specialities, the best in our opinion being a splendid white with greenish stems—a real gem; a semi-double persicum, lightly tipped with carmine, was very telling; also some very dark darks, salmons, and pinks, made a fine contrast. The flowers in this collection are for the most part nice and short in the petal, and consequently are broader than usual, giving the plants a very robust appearance: the foliage, too, is correspondingly "stocky." C. I.

THE ORIENTAL PLANE TREE.

PLATANUS orientalis [and its varieties], that ornamental introduction of 300 years ago, native to the Levant, Asia Minor, and Persia—not the American or Western Plane tree, P. occidentalis—has been largely planted in recent years in situations where, as on the Thames Embankment, the million can admire it, and where, as time passes, our Planes, like our Oaks, will inspire veneration, and elevate the thoughts.

Referring briefly to the Planes of history, among the many famous trees growing on the shores of the Mediterranean, one of the greatest antiquity, most justly venerated, grows in the pass of Thermopyle. None of the Planes of our own country have yet lived long enough to have attained old age, according to the period of their existence in the East. There are, for example, the so-called "Seven Sisters" growing on the shores of the Bosphorus whose age has never been discovered, and no remaining record is likely now to reveal it; but they are known as a matter of undoubted history to have sheltered a party of English Crusaders in the eleventh century. They are believed to be the oldest Planes in the world.

Such was the beauty of a large Plane tree standing in its prime on the soil of Greece, on land which was no doubt sheltered, watered, drained, and fertile, that Xerxes, on his invasion of that heroic little country, was fascinated by it, and remained chained to the spot for a whole day. A Napoleon or a Gladstone would have cut it down and marched on, but Xerxes remained quite entranced gazing upon the tree and sitting down beneath it. In war and gardening delay of this kind is fatal, and so it proved to the luxurious monarch, who passed on at last and was completely beaten by the Greeks. Among other famous and historic Planes Pliny mentions an aged tree which he himself had seen in Phrygia, and among whose boughs the vain musician Marsyas, as the story ran, had been suspended by Apollo when he flayed him alive after his defeat, the unhappy mortal having challenged Apollo to a trial of skill. Another Plane of romantic interest was that which

Helen of Troy planted in Arcadia, and which Pausanias described as a tree of great beauty, as well as size, at the age of 1300 years.

Interesting notices of another tree were successively published by the three travellers, Hobhouse, Buckingham, and Chandler, who each described a noble Plane growing on the banks of the Selinus, near Nostizza. To this tree has been assigned a diameter of 15 feet, a deceptive measurement, which must have included spurs at the base, and which conveys to the mind no idea of the size of the tree. In Persia this stately tree, called there the Chinar, is frequently met with in avenues, or in company with the Lombardy Poplar, affording shade and ornament to the dwellings of the peasants, or along the margins of the streams and watercourses.

Planes may readily be found in England 14 feet in circumference, measured fairly at 5 feet from the ground, and reaching a height of 80 feet. They require suitable soils and situations for their greatest growth. They are not perhaps fastidious, but there are two or three essentials to their most successful cultivation, which must not be overlooked in planting them.

Unlike the Sycamore, an Acer which was dubbed Pseudo-Platanus, and which runs over the hills of Europe, a native of Italy, Switzerland, and Germany, and doubtfully indigenous in Britain, a hardy tree, with stout twigs bearing storms well, the Plane loves shelter. It is a tree for vales rather than hill-tops, and requires proper soils, while the Sycamore can accommodate itself to a variety of soils as well as sites. The Plane cannot endure a clay soil, and the shade of other trees proves obnoxious to it. It also requires good land, light rather than heavy, with natural drainage, but at the same time moisture at the roots, and a deep, free soil. In proper situations, in short—and, it may be added, wherever the Lime grows best, as single specimens or as groups upon the lawn, where it spreads itself wide and may be distinguished from the Maples at a glance by the scaling off of the bark and the round rough fruit—the Plane may be often observed. I noticed some very noble specimens last summer at Hursley in the shrubbery among other trees, all favourites of the late Sir William Heathcote. The Plane is a common ornament of English parks and gardens, as any observer of trees may know if he consults his memory (having travelled much), or Mr. Loudon, if he has read that delightful writer.

An enthusiastic admirer of the Plane has said of it that there is a mild majesty in its aspect and a grace in its form and in the disposal of its foliage, which admits light playing amongst its leaves and creates shade beneath the canopy of its branches, and renders it one of the best models of elegance which the vegetable kingdom can exhibit. Owing to its great beauty, therefore, as well as its tolerance of smoke, the Plane is obviously the best tree for the embellishment of great cities, the best for populous and conspicuous places for the improvement of public taste. *H. E.*

PROLIFERATION IN FERNS.

(Continued from p. 595.)

ROOT proliferation, too, which is generally gemmiferous, but occasionally tuberous, as before described, is among the most prolific forms of reproduction, though from its nature not so obvious as are the other forms, and unless closely examined likely to be passed as ordinary cases of spore production. The species possessing this form of proliferation spread something after the manner of the stoloniferous and radicate species, covering, however, less ground, and form large or even extensive masses, in proportion to the stature of each, by prolific reproduction alone. The foregoing instances are sufficient to show that proliferation acts as a very considerable aid to reproduction in many of the species in which it occurs, and to some extent in all. It also operates as an aid to diffusion. This diffusion, so far as we can observe, is relatively limited, but extending over many years or generations would, no doubt, be considerable; in some it is automatic, performed by the plants themselves, which stretch their fronds to their farthest limit, there root and form a plant, and repeat the action indefinitely. This may be described as rambling by regular strides. In root proliferation, where the threads are extended through or along the surface of the ground, the locomotion is of a more humble character, and may be

called creeping, being more decidedly in character with the snail's pace. These methods of spontaneous volition are best described as migrations. In other cases the process is involuntary, and results from the ordinary operation of external agencies, of which water is the principal. The disconnected buds are carried along by the rills, which are formed on sloping ground in heavy rains, or floated in the water which accumulates and often floods more level surfaces. Rivers and their tributaries aid the dispersion, carrying the buds of the aquatic species which grow on their banks often miles in their course. Indeed, it is quite conceivable that but for the destructive influence of sea-water some of these buds, with their acquired strong vitality, might be carried by currents, when washed out to sea (as the buds of the Guiana plants often are), and landed on other shores, just as seeds frequently are, there, should fortune strand them in a favourable spot, to become established. Newly formed islands acquire their vegetation in this way, but on such Ferns are rare. This rarity is, perhaps, as much due to the absence of the humid and sheltered situations of growth on the shores of such islands that the majority of Ferns require, as to the inimical effects of salt-water on spores or buds in their transition from one land to another. It is probable, in fact, that the spores, of some species at least, will bear immersion for a time, for it is most likely to this manner of distribution, carried adhering to, or embedded in, other floating material, that *Acrostichum aureum*, Lin., which grows in the brackish water in river estuaries, is found in most warm temperate and tropical lands. Even within the limits of immersion they will bear there is doubtless much sacrifice of life, incidental to the varied fortuitous circumstances of such a mode of transference, among the buds which are dependent on water for their dispersion, but those that survive are enough to make the means as a distributive agency a success.

We have now seen that proliferation is a successful agency both in reproduction and distribution; in the former more or less largely in the several species affected, and in the latter to a limited but decided extent, with the possibility of great effect in the long course of time. Let us now enquire whether there exists any defect in the ordinary generative condition of the prolific species that makes this supplementary form of reproduction necessary. As an evolutionary result so greatly assisting reproduction it seems remarkable that in the majority of instances, or almost all, proliferation is accompanied by abundant spore fecundity. The reverse of this one might have expected would obtain—that is, that this vegetative form of propagation would prevail, if not exclusively, at least most in plants with a restricted spore fecundity; just as certain mosses, which infrequently fruit, possess the facility of propagating otherwise; or, as I have several times witnessed, *Fourcroyas* retrieve the loss of their failure to produce fruit in flowering, by developing an aerial bud-plant in the place of every flower; and instances of somewhat similar propagation, apart from the normal generative method common to nearly all other forms of organic being, might be drawn from certain protoplasmic states of life. But this is not the case, and I have observed nothing to indicate that nearly all the proliferate Ferns could not maintain their own in every way in the competition of life with the non-proliferate if they were destitute of this aid. They are equally as prolific of spores, and generally exist under conditions equally, if not, as a rule, more, favourable for the generation by spores to succeed. As to the latter it is just possible that the conditions of life which in rare cases have been adopted may operate unfavourably, as, for instance, when the plants grow in or over running water, and the greater part of the spores as they fall are carried away by the current, and fail to reach any place in which they could succeed.

I must guard myself here, parenthetically, from the possible imputation of having overlooked numerous plants in which it may be urged analogy to this subject exists, which habitually reproduce their kind from buds, such as bulbs and various arundinaceous subjects, while still, in nearly all cases, retaining and exercising undiminished sexual generation; but a little consideration will show that this form of bud production, while of a character to afford an assured permanence to the species (in cultivation, at least), as is shown by the Banana, Plantain, Sugar-cane,

Bread-fruit, &c.—plants which have abandoned the exercise of generative functions—is radically distinct. But beyond the fundamental difference of character of the budding in those cases alluded to, it is an integral and uniformly constant feature, common to large assemblages, while in Ferns it is limited to relatively few species, and fortuitous and acquired where it exists, as its presence or absence among the individuals of a species—of which I have before given instances, and shall have occasion to mention others presently—is proof. But now to return from this explanation.

I have before said that I write merely as an outdoor observer, not an experimental investigator, and consequently I may be in ignorance of facts which close investigation and experiment could alone reveal; in which facts might possibly show that some of the prolific species, from some condition of impotency in the spores, are not so fertile as their prolific spore production seems to indicate. But any general participation in such a condition, if it exists and operates at all, is exceedingly improbable. To determine it a series of careful experiments in cultivating the spores of the different species, with full knowledge of all the circumstances necessary to success, would be required.

I have, however, in mind a few cases, which may be taken as probably indicative of all, observed in their wild state, that are undoubtedly produced prolifically from spores. Such are *Ceratopteris thalictroides*, Brong.; *Aspidium vivarium*, Fée; *A. Planchetianum*, Kze.; *Nephridium scolopendrioides*, H. K.; *Polypodium reptans*, Sw.; *Gymnogramma schizophylla*, Baker; *Hemionitis palmata*, L., and others. These I have noticed springing up plentifully on the rocks and banks, or other surfaces on which they grow, under and about the old plants from which the spores had been shed. Some of these species, it may be objected, are not very freely prolific. That is true, but then it must be acknowledged that, on the other hand, others of them constantly and abundantly are so; and for these reasons I cite them as, on the whole, average examples, not sought, but casually observed, where doubtless others might have been detected if examined with this view, which prove that proliferated Ferns are not generally sterile. I admit, as just before suggested, that physical conditions of growth may in rare cases make this reproductive agency more or less ineffective. *Ceratopteris* presents an instance of how such a result does in its case to a very considerable extent occur. This is an aquatic species, and during the rainy season in Guiana it vegetates in far greater profusion than elsewhere from spores on the moist surfaces about the lakes and treaches in which the plants live, perishing to the same extent as the water shrinks with the advent of dry weather. The bud-produced plants, however, nearly always succeed, as, springing from the prostrate leaves of plants that from their favourable location have reached maturity, their permanent aqueous circumstances insure their survival. The aquatic state of *Aspidium macrophyllum*, Sw., in which most of the spores fall on running water, and are carried away, is a nearly similar instance, the bud-produced plants supplying the loss of spores. But there are exceptional cases in which proliferation seems to meet accompanying exceptional physical disabilities, and that do not affect the unquestionably favourable and successful general rule.

If, then, they possess no general countervailing defect, the proliferate species have a great reproductive advantage over the non-proliferate. I cannot assert, however, that the result which might be expected to follow this, viz., a greater preponderance in individuals of these species, obtains. Some of those which possess this reproductive advantage exist no doubt in large communities and vast abundance, but so also to an equal extent do others in which it is never found. Possibly there is some equalising law ruling the matter not readily detected or easily observed, when known, in its operations. Overproduction in relation to area would defeat itself, and area is more or less restricted by the operation of the necessary atmospheric, physical, and mechanical conditions, beyond which, each according to its needs, these plants cannot extend.

The conclusions, then, these observations lead to are—that proliferation is a great aid in reproduction, but except, possibly, in some unusual instances in which the conditions of the environment are unfavourable, and which are very rare, there is no evidence that it is essential to the purpose which it

serves so greatly. This, however, does not cover the whole scope of its potential and operative agency. G. S. Jenman.

(To be continued.)

RARE OLD GARDENING BOOKS.

(A.D. 1612 TO A.D. 1641.)

ONE sunny Saturday in November last, having a leisure hour to spare, I wandered down by the side of the silvery Liffy in that particularly literary locality in Dublin known as the Essex Quay. It is a place thickly besprinkled with second-hand book-shops, into one of which I was tempted by being in the dusty window a thin octavo volume ticked in "The Complete Herbal, plate 11." The book proved to be full of small figures of plants copied from those in Gerard, Parkinson, and other works, "curiously engraved on 176 copper plates." It was, moreover, "a new edition," printed in London by J. D. Dewick, of Aldersgate Street, for Lackington, Allen & Co., Temple of the Muses, Finsbury Square: 1805. The published price, as stated on the plainly printed titlepage, was "Fourteen shillings, boards." In turning over the leaves of this little volume, after glancing at the portrait of the author or compiler—"James Newton, M.D."—as it appeared opposite the title, I found it contained "an alphabetical table of the names of such authors, both ancient and modern, as are often cited in this volume, their principal botanic writings, the year they were published, and the number of their icons [or plates] of plants, and also the country the authors were of." This list of old authors tempted me to buy the book, and one of the first entries to catch my eye was this:—"Joh. Theodorus du Bry wrote *Florilegium*, 1612, enlarged by Matthias Merian, 1641, folio." The principal reason why this particular entry appealed to me was the fact, that but a short time previously Caoon Ellacombe, of Bitton, had very kindly lent me a copy of Merian's *Florilegium Renovatum* (1641), and in the absence of the original, by Du Bry (which, by the way, I should be very glad to see) this is the work to which I shall first refer. The book was published at Frankfurt, and is a small folio about the size, and, say, half the thickness of Parkinson's well known *Paradisus, or a Garden of Pleasant Flowers*. In the beginning are various designs, plans, &c., and thirty-two plates, and after these come 142 plates of old garden plants, beginning, as do so many of the old works of the fifteenth and sixteenth centuries, with a plate of the "Crown Imperial," and ending with a double plate of what appears to be *Yucca gloriosa*. The last plate is unnumbered, and represents a leafy branch protruding through the centre of a flower of a double Rose, this, no doubt, being thought a very singular freak of Nature at the time. Merian tells us at the end of his preface that he has re-edited the work of Bry, and added more than thirty plates, these being those previously alluded to at the commencement of the book.

The plates represent, for the most part, the then popular garden flowers, such as Lilies, Tulips, Narcissus, Iris, Crocus, Fionies, &c., and the beginning of the passion for "Fionies" flowers" is shown in the illustrations of Primulas, Auriculas, French and African Marigolds, double Roses, Poppies, Pinks, and Carnations, which, with Stocks single and double, Anemones, Ranunculus, and Sweet Williams, are scattered here and there through these pictured pages. I commend this old work to the attention of the ever-increasing lovers of Queen Iris, since many English, Spanish and German forms are figured, as also the great speckled flowers of *S. susiana* major (t. 50), and *S. susiana* minor (t. 60) (? = *I. ibérica*). The Carnations have fringed edges, but some are very remarkable in size, those figured on pp. 52, 53, and 54, being nearly 4 inches in diameter, and very double.

Personally I am more interested in the Narcissi here represented than in the other flowers, and so in the main purpose to devote my more critical remarks to these lovely flowers of the springtide days. Plate 12 is devoted to three forms of *N. Tazetta*. On plate 13 is a four-flowered scape of Musart's orientalis, the "double Roman," the Jonquil both single and double (the latter being a peculiarly small variety), *N. odoratus*, and *N. serotinus*, the small white autumnal species. Plate 14 shows *N. poeticus*, two forms of *N. Tazetta*, *N. bulbocodium*, and the small

single-flowered Jonquil. On plate 15 are three or four forms of the Daffodil, single and double, a curious form of *N. incomparabilis*, having a wrinkled yellow cup like that of *N. montanus*, and a smaller variety of Hooped Petticoat or Corbularia. A very curious semi-double form of *N. poeticus* is figured on p. 16. The smallest flowered single Jonquil is figured on p. 117, and a form of *N. "double Roman"* on plate 123. On plate 134 is a fine seven-flowered spike of Musart's orientalis, also a three-flowered scape of a similar variety with larger flowers, and two forms of *N. poeticus*, one the late and the other the early-flowering stellate flowered kind.

Plate 135 shows three very singular long-crowned Daffodils resembling *N. muticus*, one yellow, and a larger and a smaller white. "Narcissus anglicus albus calice luteo," on the same plate, may be a deep cupped *N. Tazetta*; and there are also two figures of double flowered kinds, one, if not both, being *N. poeticus* fl.-pl.

Plate 136 contains figures of a large double Daffodil, also of a fine form of *N. incomparabilis*, a double yellow Daffodil called "double yellow Trombon," the cup only being double. On this plate, also, is the small white Hooped Petticoat, and three varieties

FIG. 185.—NARCISSUS HISPANICUS MINOR LUTEUS AMPLEX CALICE FOLII REFLEXIS.

which are called "Narcissus de Campe," and may possibly be wild hybrids near *N. Bernardi*. One has two flowers on a scape, the other two have larger stellate perianth lobes, the one white with a yellow cup, the other white with an orange-rimmed yellow calice as crown.

All these plants, more especially the two last-named, are worthy of the attention of those interested in the early history of the Narcissi.

There are one or two double-flowered varieties of Iris illustrated in this book, also a giant form of the Lily of the Valley on plate 132. The Passion-flower is illustrated as a great rarity, and there are two engravings of the Mexican Tiger Iris, which, however, had not been introduced to gardens.

In Johnson's edition of Gerard's *Herbal*, p. 121, chapter 83 is devoted to figures and descriptions "of two feigned plants." One appears to be a Barbaena, and the other is, without doubt, intended for *Tigridia pavonia*. Old Gerard did not believe there were such plants, or as he puts it (v., p. 122) "we assuredly persuade ourselves that there are no such plants but mere fictions and devices as we term them to give his friend a gudgeon!"

Johnson, however, has appended a note in which he says, "These two have been thought comendiculous or feigned, yet Bauhinus seemeth to vindicate the latter, and John Theodorus de Bry in his *Florilegium*

bath set it forth. He gives two figures thereof, which we here give you being the one, but the other is far more elegant and better resembles a natural plant. . . . All that De Bry saith thereof is this: 'Flos Tigris ruber egregie, circa medium tamen pallet, albusque et maculatus: ex Mexico a Casparo Bauhino.' That is, 'Flos Tigris is wondrous red, yet it is pale, and whitish about the middle, and also spotted. It came from about Mexico; I had it from Caspar Bauhin.'" All of which proved to be quite true, seeing that the Mexican Tiger Flower is one of the most gorgeously beautiful realities in our gardens to-day!

In this fine old book we see that the English Iris were as fine then as now, particularly the large white variety, which has for many years existed as a great favourite in old gardens in the North of Ireland, to which tradition says it was brought by the Huguenots, who brought also the art of damask weaving, when driven from their homes in France. Double Anemones were also many and various, and the great-flowered Iris *susiana* also seems to have been a favourite of the time.

Another interesting old folio is the *Jardin du Roy*, by Pierre Vallet, Brodeur Ordinaire du Roy; 1623. It has a fine architectural frontispiece, having a view of a formal garden of the epoch in the centre, and effigies of Clusius and Lobel, one on either side. The plates are etched on copper, the short descriptions being in French at the commencement of the book. There are several plates of Narcissi, some original and the others for the most part copied from the *Florilegium* of Du Bry. The first Narcissus illustrated in this work is a most singular one. It is called "N. hispanicus minor amplo calice, foliis reflexis," and has the reflexed perianth of *N. triandrus*, with a long trumpet like that of a Daffodil. Fig. 57 represents *N. triandrus pulchellus*, several *N. Tazetta*s from Du Bry's book being also arranged on the same page. Fig. 65, "N. totus candidus patulo calice major," is a singular variety, unknown to-day, having four-flowered scapes of *N. Macleay-like* flowers. Nos. 67 and 68 represent two fine large-flowered forms of *N. triandrus*.

The last work I shall now mention is *Theatrum Floræ*, folio, published in 1637. Both the frontispiece and ornate titlepage are well designed and beautifully etched on copper, flowers and figures being combined in a pleasing manner. The full title is as follows:—"Theatrum Floræ. In quo ex toto orbis selecti mirabiles, venustiores ac precipui Flores, tanquam ab ipsius Dei sinu proferuntur." The imprint is, "Lutetie Parisiorum, apud Petrum Fiens, A.D. 1637." It is a very interesting book, the plates being both faithfully and artistically drawn evidently by some masterly hand. The Narcissus pictures commence at t. 15, on which page there are shown two forms of the "double Roman" variety, as also the single *N. poeticus* and its double variety. Plate 16 shows three forms of *N. Tazetta*, including a very fine form of the "paper-white" variety, so much esteemed as a forcing bulb in our gardens to-day.

Two varieties of *N. Tazetta* (and a good specimen of the mole cricket) are illustrated on plate 17, and so also the eighteenth plate shows us forms of *N. Tazetta* large and small, both yellow and white. Plate 19 is interesting as containing one or two varieties not often seen in modern gardens. One of these, called "N. onium maximum sub albus, calice luteo," is as large as Sir Watkin or the Welsh Peeler, but is, as I imagine, in reality the same as a yet rarer kind which our good friend Mr. Walker has introduced to notice recently under the name of Dr. Gorman. Another peculiar variety, called "N. candidus medio luteus, patulo calice," looks very much like a small broad-petalled variety of *N. Nelsoni*—say *N. pulchellus* of our friend Mr. Barr. Another, "N. pyrene (?) flore albo amplo calice," resembles *N. Macleay*, and there is on the same plate a two-flowered scape of a similar variety. Plate 20 shows us figures of seven or eight Daffodils (Ajax), both single and double. "N. hispanicus, pumilus, flore luteo amplo calice," is either a small *N. minor* or *N. minimus*. Another, this time a giant variety, is called "N. luteus hisp. major amplo calice," and if not really the *N. maximus* of our modern gardens (Dutch form), it closely resembles that variety. The lovely white, or "Silver Trumpet," *N. cernuus*, is well figured under the name of "N. silvestris luteus albus amplo calice," and a yellow variety, quite like Mr. Barr's *N. princeps*, is called "N. luteus hispanicus amplo calice flore nutante." A form of the common

double Daffodil is also shown along with a good figure of *N. Eystelensis* (= *N. capax*). Here again we find a figure of the extremely singular "*Narcissus hyspanicus*? minor luteus amplo calice foliis reflexis," having a long drooping crown or trumpet like a Daffodil, and reflexed narrow perianth lobes like some forms of *N. triandrus*. This is such a curious thing that I give a small tracing of the flower (fig. 185) in the hope that some modern grower of older Daffodils may recognise this as an old friend if he should perchance meet with it in his rambles during the next spring. On plate 21 are figures of three or four "*Snowflakes*" and of the "*Snowdrop*," also two forms of *N. bulbocodium* (*Corbularia*). A small variety, perhaps *N. nivialis*, is called "*Pseudo-Narcissus montanus hyspanicus flore-aureo*," being a small golden Hooped Petticoat. A very large variety, which I take to be the giant *N. citrinus*, or "*straw-coloured Hooped Petticoat*," is called "*Pseudo-Narcissus Pyreneus flore subulato, amplo calice junctifolius*." As figured in this old *Theatre* it is evidently a large, bold flower, of good substance. On plate 22, *N. odoros* (*Campanelle*), *N. odoros heminalis*; the true Jonquil, single and double, are shown, and also the late-blooming white *N. serotinus* of Taegiers, under the name of "*N. albus medio obsoletus autumnalis*." Or is it *N. elegans*? At any rate, the leaves are shown as synchronous with the flowers, so that the last-named may, after all, be the one intended. On this same plate is a faithful figure of *N. triandrus* var. *albus*, so that one looks on the curious little "*reflexed Daffodil*" on plate 20 with all the more interest, seeing that this one is so truly drawn.

Of the many other garden flowers alluded to in this old work I need say but little. The Tulips were as good, perhaps, then as now. Not so the Hyacinths, which were thin and spike-like in spike.

Ornithogalums, Alliums, the "*St. Bruno's Lily*," and true Lilies are well represented. There is on plate 33 a sketch of the bulb of *Lilium caudense* most beautifully drawn; so, too, the bulb and inflorescence of *Lilium chalcedonicum* on plate 36. The "*Chequered Daffodils*," or *Fritillarias*, *Crocus*, *Dog's-tooth Violets*, *Colchici* and *Iris* "of sorts," as the bulb lists say, are also gracefully shown. That the *Anemone* was then a most popular "*florists' flower*" these old folio volumes amply prove, and the sketches of the Asiatic *Ranunculus*, of *Cyclamens*, of *Roses*, *Carnations*, *Hepaticas*, *Primroses*, and *Bell-flowers*, are enough to make one take up the ardent culture of hardy flowers as a very labour of love. One thing these old works put clearly before us, is the fact that the modern liking for hardy flowers is a *renaissance*, seeing that they were thus popular two centuries and a half ago. *F. W. Burbidge.*

A SELECT LIST OF THIRTY PEARS, SUITABLE FOR GENERAL CULTIVATION.

(Concluded from p. 527.)

16. *Marchal de la Cour* (syn. *Conseiller de la Cour*).—Large, handsome, and good, is the general verdict given of this Pear. Although handsome, it is singular how diverse and irregularly shaped they generally are, no two fruits being quite of the same form. When well grown the fruits are often very large—long pyriform shaped, skin uniformly freckled, greenish-russet, flesh tender, melting, very juicy, with a fine brisk acid flavour; should be gathered beginning of October, becoming fit for use middle of November. Tree of free growth, only moderately fruitful.
17. *Doyenné du Comice*.—Unquestionably the finest Pear in cultivation. Fruits large, roundish turbinate in shape, skin greenish-yellow, sometimes splashed with netted russet on one side and frequently coloured on the exposed side. Flesh white, buttery, extremely tender and juicy, sweet and richly flavoured. Fit to gather in the beginning of October, becoming fit for use during November. The tree is a free grower, succeeding well on the Quince. A moderate cropper; should be grown in every garden.
18. *Burré Diez*.—This is one of the oldest of the good French Pears, and still one of the finest in certain situations. The fruits are large and handsome, turbinate in shape, and covered with freckled russet throughout. Flesh somewhat gritty, but sweet and pleasantly flavoured. Ripens generally at the end of November. Tree, a great bearer and a free grower.
19. *Pitmain Duches*.—One of the largest and handsomest of Pears in cultivation, and although not

of the first quality it is held in the highest repute by growers for market. The fruits are very large, of regular pyriform shape, greenish-yellow in colour, becoming bright yellow when fully ripe. It bears some resemblance to examples of *Marie Louise*, both in appearance and the texture and quality of the flesh, although inferior to that variety. It requires to be grown on a wall to secure it in the best condition. It should be gathered early in October, and ripens towards the end of the month or in November. It was raised by Mr. Williams, of Pitmainston, and sent out under the name of Williams' Pitmainston Duchesse d'Angoulême—which name, being too long and misleading, was subsequently altered to Pitmainston Duches.

20. *Gloû Morcean*.—A general favourite. This is one of the standard Pears in cultivation, of large size, fine handsome appearance, of excellent quality, and a free and constant cropper. When grown against a wall the fruits grow to a large size, and have a very clean skin, but they are not equal in quality to the smaller and rougher examples grown on pyramid or standard trees. The flesh of the *Gloû Morcean* is particularly tender and buttery, and sometimes richly flavoured, but is somewhat uncertain. The fruits should be allowed to hang on the trees until the end of October—as late as possible, or if gathered in succession a supply from the middle of November until Christmas may be maintained.

21. *Winter Nellis*.—By many this is considered to be the very best of Pears, and in its season it has certainly few rivals in point of quality. One great merit it possesses, that is, in being uniformly good, every fruit grown being of uniform quality. In regard to size it is wanting, for, excepting it is specially well grown, the fruits are small. The skin is greenish-yellow, almost entirely covered with rough brown russet, and the eye is nearly always wanting. The flesh is greenish, very melting, juicy, sweet, and richly flavoured. The tree is a tolerably free bearer, and the fruit requires to be gathered late in October, becoming fit for use about Christmas. It succeeds best on a wall or sheltered pyramid.

22. *Passe Colmar*.—In some situations there is no finer Pear grown than *Passe Colmar*. In others it is wanting in flavour somewhat. The fruits are generally below medium size, but where well cultivated they are sometimes large. Skin greenish-yellow, flushed on the exposed side with crimson. Flesh white, firm or crisp, juicy, and richly flavoured. Tree a great bearer. The fruit should be gathered at the end of October; fit for use during December.

23. *Zephirin Grégoire*.—This is by no means so generally cultivated as it deserves to be. The fruits are a little below medium size, roundish, skin pale green or greenish-yellow, somewhat uneven surface. Flesh white, melting, very juicy, and almost always richly flavoured. Tree a moderate bearer on the Quince, and requires a wall. The fruit should be gathered at the end of October; it becomes fit for use at the end of December and January.

24. *Burré Rance*.—An old, greatly valued, and truly excellent Pear, but somewhat varied and uncertain in regard to quality. A good warm season is required to secure it in the very finest condition, and then it is extremely rich; at other times it is very watery and insipid. Fruit large, pyriform; skin green, rough, occasionally flaked with russet, and flushed bronze on the exposed side. Flesh green, somewhat granular, very juicy or watery, sometimes very richly flavoured. Tree a great bearer, requires a wall or sheltered bush or pyramid. The fruit should be allowed to hang late on the tree before gathering; it is fit for use December and January.

25. *Burré Sterckmans* or *Doyenné Sterckmans*.—This fine Pear is slowly gaining reputation. It is of the *Passe Colmar* type. Fruit of medium size, pyriform shape, flattened at the apex, skin greenish-yellow, beautifully streaked and flushed with crimson on the exposed side. Flesh white, firm, crisp, moderately juicy and sweet, and pleasantly flavoured. Tree a very free bearer on the Quince as a pyramid. Gathered late in October, becomes fit for use in January.

26. *Josephine de Malines*.—This is a universal favourite, being uniformly good at all times and in all places. The fruits are only of medium size, of a flattened pyriform shape, and very regular; skin smooth, greenish-yellow, with small patches of russet near to the eye and stalk; stalk long, flesh buttery, melting, and juicy, of a reddish tinge, very richly flavoured. Tree a moderate cropper; requires

a wall. Comes into use from Christmas to February. A very valuable Pear.

27. *Burré de Jonghe*.—This is comparatively a new Pear, but one which is destined to become largely cultivated. The fruits are of medium size, long, pyriform in shape, very short, with a thick stalk, skin thick, greenish yellow, with patches of dull russet; flesh white, buttery, melting, juicy, and rich. Tree a free bearer, succeeding well as a pyramid on the Quince. The fruit becomes fit for use during the month of January.

28. *Bergamotte d'Espéran*.—A very fine and useful late Pear, becoming pretty generally cultivated. Fruits of medium size, roundish, Bergamot shape, with a very long stalk. Skin thick, green, very profusely spotted with dull russet; flesh white, buttery, melting, juicy, and very pleasantly flavoured. Tree a most profuse bearer, succeeding well as a pyramid on the Quince. The fruit is fit for use during January and February.

29. *Easter Berré*.—One of the oldest and best known Pears in cultivation, a variety that cannot readily be dispensed with, although it is extremely uncertain in regard to quality in many places and in some seasons. Fruits large, obovate, skin smooth, greenish-yellow, sometimes flushed on the exposed side. Flesh white, very buttery, melting, and of fine flavour. Becomes fit for use in December, and continues ripening in succession through the winter.

30. *Olivier de Serres*.—A comparatively new Pear, but very highly esteemed by those who have cultivated it. Fruits of medium size, round or obovate. Eye very large, skin thick, coated with a uniform dark brown russet. Flesh white, buttery, melting, and very pleasantly flavoured. Tree a very free bearer, succeeding well on the Quince. A first-class late Pear, in season during January and February. *A. F. B.*

FERN CULTURE.

FERNS are so universally popular, and are now used in such a variety of ways, that the demand for plants of all sizes has considerably increased during the last few years; and it requires some skill and management to keep up a supply throughout the year; especially of small plants suitable for the fancy pots which are now so much used. For this purpose the plants must be of a limited size, and to have nice healthy plants it is necessary to make successive sowings. Although the spores germinate most freely during the spring and summer, yet, under favourable circumstances, they may be induced to grow at any season of the year, even during the dull months of November and December.

To ensure success in raising Ferns from spores it is of the first importance that the fertile fronds should be collected at the proper time, and they should always be selected from plants grown in isolated positions as far as possible; as, where several sorts come in contact with one another the spores, which float about freely, will often settle on the fronds of different sorts, and it becomes difficult to ensure a crop of the particular sort that is desired. *Nephrodium molle*, *Pteris longifolia*, and some of the *Gymnogrammas*, are among the most troublesome Fern-weeds, and should never be allowed to come in contact with those that are required to be increased. The best time to collect the fertile fronds is just as the spore-cases begin to open; as soon as the fronds are taken off they should be folded up in paper, and if put in a warm dry place, in a few days there will be plenty of spores ready for sowing; or they will keep in good condition for a very long period. As good fertile fronds of many sorts are only to be had at certain seasons, it is necessary to be on the look-out so as to secure them when they are obtainable, bearing in mind that it is better to have a little extra stock, rather than to run short of any particular sort.

SOWING THE SPORES.

The plan we adopt is somewhat different from that which is usually advocated—viz., we usually use 48-size pots, which are filled firmly to within about an inch of the top with good loam, using no drainage whatever, and after the pots are filled they are thoroughly watered. Before sowing the spores, we sprinkle a little burnt ballast over the surface of the soil, or potsherd powdered fine and sifted through a fine sieve. As soon as the spores are sown, each pot is covered with a piece of glass and stood in a saucer of water; the saucers are not kept constantly filled with water, but sufficient is given to prevent the pots

requiring any surface watering; the pots are placed under a stage near the hot-water pipes, where they remain until the spores begin to germinate, they are then removed to a lighter position, and the glasses are taken off every morning until the prothallia are well developed, when the glasses may be dispensed with altogether. As soon as they are sufficiently developed we prick them off into pots or boxes, the compost for which consists of equal parts of loam and peat, with a liberal allowance of sand added: plenty of drainage is also used.

Ferns, when pricked off in a small state, must be lifted and replanted in patches, and these require dividing again when potted off into small pots, though in some cases they are not divided singly, as when grown in tufts of three or four together they are more useful, and are useful much sooner; this especially applies to *Adiantums* of different kinds, *Peris serrulata* and its varieties, *P. hastata*, *P. cretica* and its varieties; while such sorts as *P. tricolor*, *P. argyrea*, *P. tremula*, *Cytomium falcatum*, or any of the *Gymnogrammas*, are better grown singly. *H.*

HOME CORRESPONDENCE.

Honours to Horticulture.—Your correspondent "X," is, I think, ungenerous in assuming that I am seeking my own gratification rather than the advancement of the profession in public estimation. My letter certainly affords no just grounds for such an assumption, which is altogether contrary to fact. "X," seems to me to set too low an estimate on the intelligence of the horticultural body, and moreover shows a want of kindly feeling towards it by insinuating that there would be a "general scramble" for what he calls the "glittering baubles" of honours. Why here more than elsewhere? His letter recalls to my memory a passage from the writings of one of the sages of the seventeenth century, Sir Thomas Browne: "Diogenes I hold to be the most vain-glorious man of his time, and more ambitious in refusing all honours than Alexander in rejecting none." *F. R. H. S.*

Odontoglossum crispum.—In your issue of the 5th inst. I am glad to see "T. H. A." commence a discussion in connection with Mr. O'Brien's writings upon "the genus *Odontoglossum*." I hope it will be joined in by many writers who have had longer experience than myself, though, with all due deference to Mr. James Anderson, "growers in their long clothes" now and then do pick up some experience after they have paid for it. I think there is no need to "endeavour to find out the so-called species of *Odontoglossum* that grow in company with the varieties of *O. crispum*." My experience is, that this is found out easily enough without any "endeavours," as *O. Lindleyanum* blooms out of all importations of bad and good varieties alike. I should be far more satisfied in one way, had I only to believe these two grew "in company" and not see it, but as a point in deciding the parentage of a hybrid it is of course valuable. I have had large batches, which in one case failed to bloom a single thick-petalled round form, and in the other failing to bloom, a single thin-petalled stellate form, both producing *O. Lindleyanum*. Personally, I do not think the other species growing "in company" with it, therefore, have the slightest influence over the varieties, but the hybrids out of that batch are their progeny. I cannot agree with "T. H. A." that "*O. odoratum* or *O. gloriosum* is the male parent of many of the narrow reflexed-petalled *crispums*." What does he do with all his spots and colour of these two species? Again, they both have a habit the reverse of "reflexed." I consider that the reason for "locality" of bad *O. crispum* producing thin flowers is as Mr. O'Brien says on p. 588, or it may be as explained by the Editor's note. I always find that in the bad thin

forms there are no hybrids (at least such is my luck), therefore I think they are not influenced by their "companions." *O. gloriosum*, if you buy it in a batch of *O. crispum*, is ready enough to bloom; being a good grower, you find out fast enough if it is one of the "companions," but out of the finest importations that I know of, I have not yet bloomed one. It is impossible for a collector, no matter how good a judge he may be, to discern and discard every *O. gloriosum*, as the bulbs occasionally are indistinguishable. I was once given a magnificent plant, with ten large bulbs, by one who, I suppose, sees more of *O. crispum* than anybody else, with the words, "You may have that for nothing; that is only an old *gloriosum*." It bloomed a very fine *crispum* with a heavy pendulous spike, flowers as white as snow; a ready-made bridal wreath. Again, if *O. crispum* does "readily cross-fertilise" with companion species, we should get far more hybrids were the "seeds matured proving very fertile," but hybrid seeds are seldom very fertile. On the other hand, it is out of the fine *crispums* that the greater majority of hybrids come, thereby showing that the fine varieties "cross-fertilise" with their "companions" far more than the bad ones. "T. H. A." in the end of his letter says, "The thinly-grown plants will produce the fine flowers . . . for a time after being imported," therefore he infers that culture after time will mar the form of the fine flowers. If this is his own experience, I am sorry for him. I think I am not alone in enjoying just the reverse, and in one case, the second year of blooming, one of my fine varieties developed into the form *O. c. Rothschildianum* described on p. 559, having had the previous year *no spots at all*; it has never lost these spots since, as some people fancy the spots come and go. Does "T. H. A." think the wretched thin form will ever grow into its more valuable *crispum's*? If so, I shall be glad to let him have my poor ones as I bloom them at cost price. One word more as to the cross-fertilisation, and seeing the parents' features in the progeny if "T. H. A." will look at the figure, on p. 681, of *O. Andersonianum lobatum*, the crest and column must remind him of *O. Lindleyanum*, as also the wretched shape of the flower. *De B. Crawshay*.

The White Hoop-Petticoat Daffodil.—This elegant little flower, which comes out at a time when flowers are scarcest, may be successfully raised by any one possessing a greenhouse, for I am quite sure that the conditions of climate in Cheshire are as unfavourable for it as those of any part of England. I potted fifty bulbs in the summer of last year in rich light soil, and a seed-pan a foot square and 4 inches deep. Most of them flowered about Christmas. They were left in the greenhouse where they had flowered until about the end of April, when the leaves began to wither. After this they were put in the sunniest position I could give, either on a south shelf in the greenhouse or beneath a light under a south wall, and not a drop of water was given for five months, but the pot and bulbs were left to be baked. About the beginning of October they were well watered and brought into the greenhouse, and since then the soil has never been allowed to dry. They were not reported or even dressed on the surface, but are now flowering well, most of the bulbs making two flowers. I find this drying and baking in the sun in summer by far the best treatment for all these Mediterranean bulbs, including *Anemone fulgens*, which is greatly improved by being dug up in May and left baking in all the sun there is till the end of September. Turning pots on their side under a stage may do as a makeshift where sun is plentiful, but here I never waste a sunbeam if I can help it. *C. Wolley Dod, Edge Hall, Dec. 14.*

Pruning and Planting Fruit Trees.—Mr. G. H. Richards says in the middle of his article on this subject at p. 758 that "As to trees planted in good and deep, well-drained soil, and in favourable localities, very few remarks are necessary as to their ultimate management either in respect to pruning root or branch. Fibrous roots and firm wood well set with flower-buds will develop simultaneously," adding, "and only after several years' barrenness will it be necessary to sever a few of the strongest roots in order to restore the balance of root and branch." But why allow an interval of "several years' barrenness" to elapse before taking steps to "restore the balance of root and branch, and the fertility of the trees"? By way of supplementing Mr. Richards' remarks, I would advise that cor-

rective measures be taken as soon as possible after any tree or trees, indicate by scantiness of crop not attributable to meteorological influences, an unmistakable proof of waning fruitfulness. And the earlier in the summer that these remedial measures are carried out the better chance will there be of securing a full crop of fruit from the trees operated on the following year. A trench should be opened to the depth of 3 or 4 feet, and a like distance from the trunk of the trees more or less, according to the size of the latter—working the soil partly out from underneath the ball of earth and roots, and cutting all the latter that the operator comes in contact with outside the prescribed space with a sharp knife, afterwards replacing the soil. The check thus given to the trees will prevent them from making an over-luxuriant growth, but on the contrary it will induce them to make short consolidated wood thickly set with fruit-buds. *H. W. Ward*.

The Past Season—Storing Gladioli (hybrids of *gandavensis*).—I cannot remember any season in which these have been so late—as a rule—in ripening their foliage, and, I ought to add, their flowers. Some well-known varieties, no matter what time planted, will rarely bloom before October. I have had Duchess of Edinburgh (Kelway) in bloom in mid-November, but this year it got seriously checked by the 8° of frost (24° Fahr.) we had on September 24, and did not bloom, but the corms continued to grow on vigorously. The same misfortune happened to Le Vesuve, Mrs. J. Epton (Kelway) Marquis of Lothian (Campbell), Maggie (Dobree), Marica (Kelway), Sir Stafford Northcote (Kelway), and, if I remember rightly, Campbell's Tel el Kebir. Fortunately Mr. Thornton, James McIntosh, and Sam Jennings (Kelway's), and as I recollect, four of Souche's, were opening the lower blooms on the spikes that evening, and seeing the threatening frost, I cut them 8 inches below the first bloom—this is important—kept some in vases in clean water, and gave away others. Every bloom on the spikes of those opened magnificently during the ensuing month. *Chrysanthemums*, especially those grown in the open air, will do this, but no other flower I know to compare with the Gladioli. The end of the stem in the water must, however, be occasionally dressed and pared—in fact some growers think they open even better indoors, and cut favourite flowers for the purpose. I should certainly do this if a storm threatened, as it makes sad havoc among tall-growing varieties like Lady Bridport, Mr. Derry, Anthony Waterer, and others, that often, with good treatment, attain a height of 6 feet, and open blooms as brilliant as the showiest *Cattleya* or *Odontoglossum* among Orchids, and so large that you could stuff your closed hand into them. The blooming period continues for fully four months: if any one doubts this they can turn to your columns of the last day in October and see Mr. Dean's description of Mr. Campbell's 163 spikes at Kensington, after travelling 400 miles from Gourcock. A short time previous to that date I had seen a large collection with Mr. Dickson at Newtownards in the North of Ireland, and they must have been in full bloom in October also. Making every allowance for the ripening advantages of the south of England as compared to Scotland, and the same of Ireland, south and north, it has been the latest season in lifting I can recollect. This is taking it for granted that proprietors of collections have left them in the ground until ripened, or otherwise until growth ceased, though both expressions are not synonymous. I take it after the 1st of December in almost all parts of the British Isles growth, or maturation, for the Gladioli has ceased. If lifted before this occurs, degeneracy and a corn of stunted size is the inevitable result. Mr. Douglas, if I remember right, to obviate this and the immense trouble incidental, such as trying to keep collections true to name, proposed leaving them in the ground. I am now speaking, of course, of the best "hybrids of *gandavensis*;" all others may safely be left out during the winter. I have frequently been tempted to do this, but my love for the flower overcame the great trouble of lifting, naming, or labelling and storing. There are at least three objections to allowing them to winter in the beds or borders:—1, the risk from frost; 2, the tendency to rot; and 3, imperfect maturation, and, I might add, premature growth in the spring, if the corn survives, and the great check sustained by having the young stem killed to the soil. Just a word on each point. In nine cases out of ten our

winters may come so mild as that frost may not penetrate the several inches of soil over the corm, but individually I plant rather shallow. There is more risk from the saturation of the soil incidental for several months, and consequent rotting. If rotting does not take place, then premature growth commences, and that growth, as observed, is burned back, and a check sustained that is never overcome, and in no case subsequently does perfect flowering take place. I maintain, lastly, as I have before maintained in your columns, the completion of the maturation—indispensable to success the following year—takes place after lifting, and especially in such a season as this, when two-thirds of my thousand corms had to be stored in sand with green, or partially green, stems attached. I frankly say I would willingly have avoided the trouble of naming and tying the labels to both stems and corms, if I ran no risk, but there is even a further disadvantage in doing that. To give them fair play and attain the best results, the ground must be manured and prepared for them; this can only be done by storing. They could not be lifted in spring, even though you knew where to find them, as the slightest movement of spade or trowel breaks off the young roots: Except to be occasionally looked over, mine will be stored in sand and require no further trouble until February. *W. J. Murphy, Clonmel.*

Bracts Falling from Poinsettias.—In reply to the enquiry by "Toki" in last week's *Gardeners' Chronicle* on this subject, I surmise it to be caused by too much guano-water being given, or given too strong, and perhaps at too early a stage of growth of the plants. I have seen these ill-effects more than once from guano-water when used of too great a strength, or too often. The manure is more beneficial if used very weak, and at the proper time, that is, when the plants have made their growth, when, to assist the bracts to develop to perfection, it should be given in a weak state, just enough guano to cover the water. *Wm. Smythe.*

—A correspondent last week, signing himself "Toki," says all his Poinsettias are gone blind, and he judges it may be through using guano during their culture, and I think his conclusion is quite the right one. The Poinsettia being a very rank grower in its young state does not require any stimulant. If for market use they should be shifted into 6-inch pots in July or beginning of August, using two-thirds good sound un-tilted loam, one-third finely-sifted rotten manure, and a little sharp sand, well mixed, and grown on during August and September in a warm greenhouse near the glass, giving sufficient air to keep them short-jointed. Give enough tepid water to keep them growing, but not to saturate the soil. Put them into a warmer house in October, where they will get from 60° to 65° of heat, with a little air in the daytime; by the first week in November they will show their bracts, and will be well in bloom by Christmas. If required before that time stand them on the tank, not plunged, which will get them ready a fortnight earlier. If larger sized plants and larger sized bracts are required, shift them into 8 or 9-inch pots in September, using the same compost; increase the tepid water as the pots fill with roots, to enable the plant to hold its lower leaves; when the bracts begin to show, and if the plants are pot-bound, a little very weak liquid manure may be given twice a week, which will help them to retain their bottom-leaves, and give more intense colouring to the bracts, taking care not to overdo the liquid manure, or more harm than good may ensue. A tablespoonful of guano to 3 gallons of water will not hurt them, or, what is still better and safer, is the drainings of the heap of horse-dung, using one part to three of water. By similar treatment to this we have a splendid lot of saleable plants in full bloom at the present time. *A Grower.*

Quince Roots as Stocks for Pears.—A large amount of valuable information has recently been given in your paper in reference to Pears and their culture, and the Quince stock generally and deservedly recommended to graft them upon; but perhaps it may not be generally known that Quince roots will answer the purpose just as well. Wishing to increase a variety last spring, and having no Quince stocks, I took off the extremities of some roots, and put on the grafts where both were nearly of a thickness. These were exposed to considerable warmth, for I put them into vacant spaces at the foot of a

south-west wall; yet one has made a sturdy shoot 18 inches long, others varying between that and mere spurs, but I hope to see the latter make up for next year. I have been a reader of one or other of the leading gardening periodicals for more than forty years, but cannot recollect having seen such a practice alluded to, so that possibly my experience may be of service to others. *R. Pickering.*

Artificially Coloured Potatoes.—Like Mr. Harrison I was surprised and disgusted to see Potatoes at the Birmingham Cattle Show artificially coloured. Not only were the red varieties so outraged, but all the coloured and parti-coloured kinds were so treated. What they were coloured with I cannot say, but speaking roughly, the red kinds, which included Priketaker, Mr. Breese, Reading Russet, Red Emperor, &c., looked as though they were coloured with red lead, and the purples—which included Vicar of Lealaham, The Dean, Edgote Purple, &c.—with black-lead. I need hardly say that they presented a most unnatural appearance. I noticed that one or two exhibitors at the late International Potato Exhibition used some greasy substance to improve, as they thought (but which I think detracts from) their appearance, but never before have I seen such a manipulation of the useful tuber as at Birmingham. *F. H.*

The Allotment Question.—Because of the unfortunate party political aspect given to the subject of allotments, whether in the form of tenancies or ownerships, one very important aspect of the matter has been unwisely overlooked. I refer to the subject of labour in the winter months. It is an unfortunate fact that throughout the entire kingdom work in both garden and field, as, indeed, in many other outdoor occupations, becomes slack always in the winter months. Very much of this lack of labour is due to the objection of employers, always anxious to get as long a day's work as possible, to give employment during the short days of winter. Still farther does it arise from the undoubted fact that such an element in good cultivation as trenching is neglected. Were that not so, and employers would cover several acres of land which needed trenching every winter with long manure or other refuse material, many thousands of able-bodied men might be profitably employed during the winter in piecework, with corresponding benefit to those who employed them at such labour in years to come. But because not so employed many thousands of hard-working industrious men have to be idle for several weeks in the short days of the year, and their labour so far is thus absolutely lost to the country. But when it is contended that poor men could not cultivate plots of land at a profit, those who take this pessimist view quite forget that the time now wasted might thus be profitably employed in deep cultivation of their own plots, and thus not only would that labour be absolutely saved, but it would give profitable results during the following season, indeed the small holding or allotment system would thus tend to solve one of the most troublesome problems of the age, viz., finding employment during the winter season. Even now some will plead that such employment cannot provide a livelihood because there will be no one to furnish a "Saturday night." But then it may be replied, neither is there such a "Saturday night" for men who have no employment of any sort. On the other hand a few weeks spent in trenching allotment ground in the winter would be more than amply repaid during the following summer, and thus the "Saturday night" would come inevitably, if late. The best solution of the question is to afford to all industrious working men an opportunity to purchase or rent land cheap, and having done so to leave them to fight their own battle with it. If they win the demand has been more than justified; if they fail, then the experiment has proved a failure and it can hardly be revived, at any rate with success. As to the much derided cow, there is one phase of that matter which so far has found scant attention. All familiar with our rural districts know that literally thousands of acres of good pasture is let run to waste annually, for the simple reason that it is not enclosed but it is found on the margins of our lanes and highroads. Were that vast area of pasture properly utilised many thousands of labourers' cows might be maintained during the summer months, and a portion of the allotment ground might grow food for the remainder of the year. I hope that when the stupid prejudice of

political partisanship which this question—one of vital interest to the welfare of the labouring population of the rural districts—has passed away that it will be taken in hand in a practical, statesmanlike way, and something useful and profitable accomplished. Many a noble idea has been killed by ridicule: it is to be hoped that this one may be rescued from such a fate, and that the proposition, made in the interest of labour, may by-and-bye bear good fruit, good alike for the rich as well as for the poor. *A. D.*

Florists' and Fruiterers' Christmas Supplies.

—At no season of the year do our metropolitan florists' and fruiterers' present a more gay appearance than when decked out with their Christmas stores. It is really remarkable the variety of cut bloom that is to be seen exposed for sale at this season of the year; as an instance of this, not later than last Saturday beautiful Rose-buds were being hawked in the City by "costers," and were selling at two and three a penny. Our growers are unable to raise Roses now, and these are grown in the South of France and Italy; but in spite of this foreign competition English-grown buds always fetch a good price. Amongst the large shops can be found in large quantity Azaleas, Bouvardias, Mignonettes, Primulas, Lilac, Roman Hyacinths, Tuberoses, Violets, Lily of the Valley, Gardenias, Eucharis, Carnations, Polyanthus Narcissus, Lapagerias, Callas, Poinsettias, Pelargoniums, and various varieties of Orchids, Odontoglossums and Dendrobiums predominating. There cannot be said to be as much variety in the fruit department, but the quality as a rule is excellent, so are the prices for the most part. *C. Z.*

Decorations.—For the next month or so the decoration of churches, ball-rooms, mansions, &c., will be an important item in the work of the garden staff. Although church decoration has made rapid strides of late in original and elaborate ideas at the various seasons when the proper decoration of the church is considered a very important item in the celebration, the decorations of ball-rooms, &c., in "out of the way places" still consist of, in a great measure, festooning of evergreen wreaths, plentifully besprinkled with various coloured tissue-paper rosettes intended to represent Roses; often, too, corresponding chains of tissue-paper are used, and with great effect; but it matters not how effective it may appear, when the same plan is continued year by year it gets stale, and any change is hailed with satisfaction, however small it may be. Where such a thing has not been attempted before, a light trellis arbour at the entrance to the ball-room, neatly covered with evergreens, has a telling effect, and besides, if provided with seats, forms a pleasant retreat to those couples who are always to be found at any ball. Another good thing in its favour is that it has a beneficial effect if there is a draught from the door. Of course this can only be introduced where there is plenty of room. I recollect once seeing the band platform of a ball-room so decorated as to represent a small thicket of Fir trees, &c., which had a most pleasing effect. Where large masses of evergreens are unavoidable, every endeavour should be made to give it a light appearance. This can be most easily effected by the plentiful use of trailing Ivy, Periwinkle, and, where not too far gone, the long shoots of Bramble with their many-bued leaves give a charm to an otherwise stiff piece of work. The careful use of Pampas and other grasses is of great benefit in producing a finish. Many gardeners are rather curtailed in the way of evergreens, and, as a rule, these are to be congratulated, as they have to "cut their coat according to their cloth," consequently the wreaths, &c., are light and thin, which always looks better than great heavy ones. The careful use of pieces of virgin cork, &c., sprinkled with water in which alum has been dissolved, which when dry has the appearance of a "frosted bit," adds a great charm by reason of the contrast with the dark evergreens and by its natural associations. *C. Z.*

Tree Carnations.—It is at this season of the year, and on till March, that these charming flowers are found most useful. Time was when but few blooms could be had until spring, but then the varieties were limited in number, and their culture not so well understood as at the present time. Not only have the varieties greatly increased in number, and

especially so in the habit of growth being dwarfed and much freer, but they flower much earlier than they used to do, and with greater profusion. Just now the collection at Slough well repays a visit. There are a very large number of plants in an airy house, and a great many of the varieties are blooming freely. It is but few gardeners, however, who can devote a house entirely to Tree Carnations; therefore they are grown very frequently with other plants, or in a frame, and under manifest disadvantages. At this season of the year sufficient heat is necessary to induce the buds to expand. Water should be given sparingly, but in sufficient quantities to insure vigorous development. The following fine varieties may be set down as earlier bloomers, as some are much later than others, viz., Burgundy, Cardinal, Countess, Enchantress, Field Marshal, Helena, Huntsman, Invincible, Juliette, Jubilee, a fine variety with dark stripes on a red ground; Lady Bramwell, Mrs. Maclear, crimson bizarres; Negro, Seraph, Vivid, and Volunter, all of Mr. Turner's raising. A. D.

THE NORTH-WEST OF NEW ZEALAND.

AN interesting pamphlet on the North-west of New Zealand as a new field for emigration has recently been published by Messrs. Bean, Webley & Co., of Foster Lane, Cheapside. The author, Mr. Alfred Cooke, Yarborough, says that he does not believe "there are fifty people in England who know anything whatever, definite or indefinite, of the present state of the extreme north-west of the colony." Regarding the culture of the Olive and Mulberry, both are said to be as yet only in their infancy, and it is to be regretted that the early settlers introduced wrong descriptions of both these trees, the result being that though the plants have grown well, and shot up into large trees, they are not adapted for the orchard, or for successfully rearing silkworms. On the subject of Orange culture the necessity of securing a site which can be readily drained, and which is not too much exposed to the westerly winds, is pointed out. "A thoroughly good site of land for an orangery is a fortune to a man, while an unsuitable locality may be the means of causing irreparable failure. With a suitable site, and other favourable circumstances, the Orange crop will pay four times better than any other crop; seventy trees should grow to the acre, and providing that the grower sells his crops at even 6d. per dozen (a very low estimate), a large sum per acre is obtained. A single tree in New Zealand has been known to yield 3000 oranges. The Vine, Peach, and various other well known fruits, grow to perfection." The following account of Kauri gum from Dammar australis will be interesting.

The Kauri tree is described as the most valuable and finest trees in the Southern hemisphere, and from it exudes a soft gum, which hardens on contact with the atmosphere, and fossilises in the ground in the course of years. How long it may have been in the ground no one can say, but it is found on the sandhills where no trace of a tree remains, in the coal-beds in a district where the Kauri tree does not now exist, and in large tracts of country from which evidently the forests have been in ages past burned from off the face of the earth. The discoloured condition of some of the gum dug up from several feet below the surface of the ground indicates that the trees were at one time exposed to the action of fire. The gum-fields are partly in the hands of the natives and partly in those of Europeans, but they are mostly the property of the Government, who have hitherto been in the habit of putting up to auction the right to dig gum on these fields. It is out of the power of a working-man to bid a lump sum for the right to dig gum over an area of 20,000 acres of land for a term of two years, and the result is that the right of digging for gum falls into the hands of some merchant or storekeeper, to whom all who dig on the land are compelled to sell at a price fixed by the lessee. This method of leasing these lands is not by any means an equitable one. The first thing a gum-digger has to do is to purchase a spear—that is, a piece of round iron pointed at the end, about 3 feet 6 inches in length, fixed into a wooden handle; this he can get on credit from the storekeeper, as likewise a spade, knife, some flour, sugar, and necessaries, on the condition that he sells his gum to him. If the storekeeper is the lessee of the gum-land this is a matter of course. Thus provided the digger proceeds to the gum-field (a sort of

moorland it would be called in England), builds a shanty of Kruop or Palm Fern, and commences to spear the country for gum. An experienced digger will know the likely spots for a good find, and can tell by the feel of his spear as it touches a hard substance underground whether it is gum, wood, or stone. If he thinks it is gum he digs it up, puts it in his kit or basket, and goes on. The gum as it comes from the ground is covered with dirt and rust, and every piece has to be scraped with a knife until the gum is fairly clean. A good deal of judgment has to be exercised in this matter, because if too much is scraped away the digger loses weight, and if not enough he receives a less price on account of bad scraping. Gum is also obtained in the forest from under the trees, and even from the tree itself. The best gum is very clear, like amber, and hard, but there are many sorts and varying prices. Though the average earnings per week of the gum-digger is from £3 to £4, a man has been known to earn as much as £20. He has to work very hard, exposed to all sorts of weather, digging all day, scraping his gum at night, and cooking his meals between while.

The trade in Kauri timber is also very important, and gives employment to a large number of hands. The Kauri forests in the district are of very large extent, and it is stated, at the present rate of supply, will last about another 200 years. The timber is of very great value, and is recognised in New Zealand and Australia as most useful for all sorts of purposes—house-building, ship-building, masts and spars, railway sleepers, furniture, &c. It is very durable, and easily worked. The tree grows to a height of 100 feet without a limb, and measures an average of 5 feet in diameter. Trees have been found measuring a chain in circumference, but such trees are of no value to the purchaser, as they are too unwieldy to handle and cut up. In all Kauri forests there are found at intervals trees of enormous size, which stand alone in their grandeur as parent trees to the less unwieldy generation around them. In the forest the young trees grow readily, but so soon as the parent trees are felled and removed a fire sooner or later clears the ground, and they perish. Altogether the Kauri is perhaps the most important tree in New Zealand.

The exportation of the fungus, *Hirneola polytricha*, from New Zealand has frequently of late been commented upon. Mr. Yarborough speaks of it as a branch of industry only entered upon by children, who make a good deal of pocket-money by it. The fungus is bought from the collector, after being dried, at prices varying from 4d. to 5d. per pound, and is exported *via* San Francisco to China, to be used by the Chinese as an ingredient for soup. In 1852 the export of fungus was 400 tons weight, valued close upon £19,000.

Since then, open-air vegetation has gradually declined, and at the end of the month had nearly reached its lowest ebb. On nine occasions the thermometer fell below the freezing point, indicating collectively 65° of frost, as against 64° for the corresponding month last year. The lowest readings were, on the 15th, 23°, 16th, 19°, 17th, 18°, 19th, 15°, 19th, 26°. The highest morning readings were, on the 3d, 56°, 7th, 51°, 8th, 48°, 27th, 45°. The lowest day temperature was 31°, on the 17th, and the highest, 63°, on the 3d. The rainfall has been very light, there were no fewer than twenty dry days during the month. Rain fell more or less daily, from the 25th till the 29th. Very few plants are in flower out-of-doors. On the rock-garden only one species came into flower, viz., *Crocus hadricticus*, and with the exception of *Jasminum nudiflorum* and *Hamanalis virginica*, which came into flower in other parts of the garden, no others have been observed as having come into blossom during November. Although there are still a few left, which had opened previously, vegetation generally has gone sooner to rest this season than was the case last, and there are fewer plants in flower. This result is mainly due to the distribution of cold having been different. The aggregate amount of frost registered during this November, is nearly the same as was registered during last November. Still, during this November the individual minimum readings have been lower in consequence of the distribution of frost having been confined to a less area, which shows that in dealing with this subject, average temperatures are apt to be misleading. For all outdoor work the month has been, on the whole, a favourable one.

Mr. Robert Bullen reported on "Temperature, Vegetation, &c., in the Botanic Garden, Glasgow, November, 1885."

During the month the temperature has been at or below the freezing-point nine times, giving a total of 61° for the seven times on which the thermometer was below 32°. The lowest temperatures registered were during the nights of the 14th, 15th, and 16th, when 13°, 14°, and 15° of frost respectively were recorded. The day temperature has been much above the average. On three days only the thermometer was at or a little below 32°. The rainfall has been light, and we have had an unusual number of fine open days, favourable to all kinds of outdoor garden work.

Amongst the miscellaneous contributions was the exhibition of a branch of a tree through the Rev. Mr. Tennant, in which chips of stones were enclosed in warty protuberances. This had been found at a considerable depth in a cutting of the recently formed Edinburgh suburban railway.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, DECEMBER 16, 1885.

- Dec. 10.—Very fine cold day.
- 11.—Dense fog in early morning; dull day.
- 12.—Very dull day.
- 13.—Very dull day; slight rain in afternoon.
- 14.—Very dull day.
- 15.—Very fine day and night.
- 16.—Very fine day.

LONDON: Atmospheric Pressure.—During the week ending December 12, the reading of the barometer at the level of the sea decreased from 29.65 inches at the beginning of the week to 29.52 inches by 9 A.M. on the 6th, increased to 30.34 inches by 1 P.M., and decreased to 30.26 inches by 5 P.M. on the 9th, increased to 30.50 inches by 9 A.M. on the 11th, and was 30.32 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.16 inches, being 0.25 inch higher than last week, and 0.20 inch above the average of the week.

Reports of Societies.

EDINBURGH BOTANICAL: Dec. 10.

The Society met this evening at 5, St. Andrew Square: Professor Dickson, President, in the chair. Dr. J. T. Buswell, Balmuto, was elected to a vacant place amongst the six British Honorary Fellows. The following were added to the list of twenty-six Foreign Honorary Fellows.—Fred. Delpino, Professor of Botany, Genoa; P. Duchartre, Professor of Botany, Paris; Grand'Eury, St. Etienne; Dr. F. Hildebrand, Professor of Botany, Freiburg; Dr. S. Schwendener, Professor of Botany, Berlin; Ph. Van Tieghem, Professor of Botany, Paris; Dr. E. Warming, Professor of Botany, Stockholm. Professor Dickson gave his presidential address, which, after some remarks on the healthy state of the Society's funds, and on the work of last session, was devoted to a subject connected with the morphology of the leafy Jungermannia. On the motion of Dr. Cleghorn, he was awarded a hearty vote of thanks. Mr. Taylor read an obituary notice of the late Dr. W. B. Carpenter, who was amongst the most prominent contributors of papers to the Society at its first session in 1835. Indeed the germs of his celebrated work on the *General and Comparative Physiology* were first given to the Society. Dr. Macfarlane contributed a short paper on "Fossil Microscopic Fungus in Stigmara, from Bowling," at the same time exhibiting the specimen. Mr. Robert Lindsay gave in his report on the "Progress of Vegetation at the Royal Botanic Garden, Edinburgh." The past month of November has been generally dry and cold. A series of low readings of the thermometer were registered from the 15th till the 19th of the month.

Temperature.—The highest temperature in the shade in the week was 40.2, on the 6th; on the 11th the highest temperature was 32°. The mean of the seven high day temperatures was 35.7°.

The lowest temperature was 21° on the 11th, on the 7th the lowest temperature was 34.5°. The mean of the seven low night temperatures was 27.6°.

The greatest range of temperature in one day was 11°, on the 9th and 11th; the smallest on the 7th was 5°. The mean of the seven daily ranges was 8.1°.

The mean temperatures were, on the 6th, 36° 0; on the 7th, 36° 6; on the 8th, 22° 9; on the 9th, 30° 3; on the 10th, 29° 6; on the 11th, 27° 3; on the 12th, 33° 4; and these were all below their averages by 4.7, 4.9, 11.5, 11.2, 11.4, 13.5, and 7.3 respectively.

The mean temperature of the week was 32°, being 11.6° lower than last week, and 9.2 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 49°, on Dec. 10. The mean of the seven readings was 44.4°.

The lowest reading of a minimum thermometer placed on grass, was 18.8° on the 11th. The mean of the seven readings was 23.8°.

Rain.—Rain fell on one day, to the amount of 0.05 inch.

ENGLAND: Temperature.—During the week ending December 12, the highest temperatures were 49.2 at Plymouth, 48° at Truro, 47° at Liverpool; the highest at Cambridge was 39°, at Wolverhampton 39.9, at Sheffield and Hull 40°. The general mean was 42.8°.

The lowest temperatures were 18.9° at Wolverhampton, 19° at Cambridge, 20° at Truro; the lowest at Liverpool was 27.4, at Brighton 23.3, and at Bristol and Leeds 23°. The general mean was 21.8°.

The greatest ranges were 28° at Truro, 26.7 at Plymouth, 21° at Wolverhampton; the least ranges were 19° at Sheffield and Hull, 19.2° at Blackheath. The general mean was 21.4°.

The mean of the seven high day temperatures was highest at Truro, 43.3°, at Plymouth 41.4°, at Liverpool 38.7°; and was lowest at Newcastle, 34.8°, at Wolverhampton 34.9, at Hull 35.6°. The general mean was 37.3°.

The mean of the seven low night temperatures was highest at Plymouth and Liverpool 30.5°, at Truro 29°; and was lowest at Wolverhampton, 23.1°, at Hull 24.7, at Cambridge 25°. The general mean was 26.9°.

The mean daily range was greatest at Truro, 14°, at Wolverhampton 11.8°, at Bradford 11.5°, and was least at Brighton, 7.6, at Blackheath 8.4, at Liverpool 8.2. The general mean was 10.4°.

The mean temperature was highest at Truro, 35.9°, at Plymouth 35.8, at Liverpool 34.5; and was lowest at Wolverhampton, 28.9, at Newcastle 29.9, at Hull 30.1°. The general mean was 32°.

Rain.—The largest falls were 0.97 inch at Plymouth, 0.64 inch at Bristol, 0.41 inch at Bolton. The smallest falls were 0.01 inch at Brighton and Nottingham, 0.03 inch at Wolverhampton. The general mean fall was 0.21 inch.

SCOTLAND: Temperature.—During the week ending December 12, the highest temperature was 47.3°, at Paisley; at Perth the highest temperature was 42°. The general mean was 44.3°.

The lowest temperature in the week was 14°, at Perth; at Aberdeen the lowest temperature was 23.2°. The general mean was 19.6°.

The mean temperature was highest at Greenock, 32.7; and lowest at Glasgow and Perth, 29°. The general mean was 30.5°.

Rain.—The largest fall was 0.44 inch, at Aberdeen; the smallest fall was 0.05 inch, at Dundee and Paisley. The general mean fall was 0.16 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGIT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, December 14, 1885, issued by the Meteorological Office, 116, Victoria Street, London, S.W. 1.—The weather was generally fine and frosty during the earlier part of the period, but at some of our northern and eastern stations rather heavy falls of snow were experienced. Towards the

end of the week the conditions underwent a change, and mild, dull weather, with showers of rain became prevalent.

The temperature has been below the mean in all districts, the deficit ranging from 2° or 3° in Scotland to 5° or 6° over the greater part of England. During the earlier days of the period the readings were very low, minima between 14° and 19° being recorded over England and Ireland, and between 19° and 22° in Scotland, while in the "Channel Islands" the lowest reading was 32°. As the week progressed, however, the thermometer rose rapidly, and on the 13th or 14th maxima between 49° and 53° were registered.

The rainfall has been less than the mean in all districts; over Ireland, southern, and central England, and the east of Scotland the fall has been very slight.

Bright sunshine does not differ greatly from that reported last week, the percentages of the possible amount of duration varying from 11 in "Scotland, N.," to 31 in "England, S.," and "Ireland, S.," and 36 in "England, S.W."

Depressions Observed.—During the greater part of this period the distribution of barometric pressure over the United Kingdom was anticyclonic. No depressions (excepting a small subsidiary, which brought snow to our northern and eastern stations on the 8th or 9th) came sufficiently near us to materially influence our winds or weather until towards the close of the week, when the high pressure area moved southwards, and some large and rather deep disturbances passed eastwards or north-eastwards outside our northern coasts. Moderate to fresh breezes from between north-west and north-east were general till the 11th, when they gave way to westerly or south-westerly winds, moderate in the south, but fresh or strong to the north.

Enquiries.

"He that questioneth much shall learn much."—BACON. RHODODENDRON FOR FORCING.—A Dutch florist wishes to know which sorts of Rhododendrons are used for forcing in this country. Will some correspondent kindly enumerate some suitable kinds?

Answers to Correspondents.

* * TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that in pursuance of the new telegraphic regulations our Registered Telegraphic Address is "GARDCHRON, LONDON." GARDCHRON being written as one word. Telegrams (but not letters) thus addressed will reach the Editor or the Publisher without other address being needed than "GARDCHRON, LONDON."

BIRD'S-NEST FERN: E. H. We cannot indicate the remedy for the malady affecting the Fern. Could you not send a frond, with samples of the soil and roots? If 67°-70° be the minimum temperature of your stove, it is in excess with what the Fern and the generality of stove plants require during the winter months.

CAMELLIA LEAVES: Young Foreman. It is an oozing of sugary juice from the substance of the leaf. The cause is not definitely known. It may be the consequence of too rich living.

CUCUMBER LEAVES SPOTTED: W. M. D. The appearance is quite consistent with scalding, and is due doubtless to incautious airing the cucumber pit during sunny parts of the day, and possibly the glass is not of good quality.

DENDROBIUM NOBILE, &c.: W. Smyth. The specimen forwarded to us is proof sufficient that fine spikes can be obtained without the wholesale pruning recommended by some, and without the consequent hard-frosting so detrimental to the well being of a plant. Your method may not result in a glut of bloom, but there is enough to satisfy any reasonable person, and the pseudo-buds and blooms are of great strength and substance. The Calanthe Veitchi and Zygopetalum Mackayii, each of much usefulness at this season, are remarkable for robustness, and in the case of the former for length of spike.

NAMES OF PLANTS: Keynes, Williams & Co. Eudanea madagascariensis.—P. W. Odontoglossum Inleyi splendens.—E. Thunberg. The light coloured flower is Zygopetalum Mackayii, the ordinary variety of garden; and with the dark lip is merely a variety of the same.

SPOT ON ORCHIDS: P. H. The plants of Cattleya Dowiana are probably kept too hot and too close during the resting season. Try them suspended near the glass in a more airy place when not growing.

SWANSEA SHOW: Ed. The explanations given, in reply to anonymous communications, by the Secretary and by our correspondent, satisfy us that substantial justice

was done by the reporter, one error only having been made; that is, that Mr. Harris, of Singleton, is accredited with first prize for the bouquet of Chrysanthemus instead of Mr. Barron, Sketty, Mr. Harris taking first prize for the hand bouquet. It is, of course, in reports of distant shows, impossible to include all the exhibits.

CATALOGUES RECEIVED.

* * These prices will vary much during next week.

SEEDS.

LONDON: Dec. 16.—The seed market to-day was thinly attended, and no feature presented itself either of importance or interest. In fact, business in farm seeds seems to be generally postponed until the New Year. Values all round show no alteration. Of red Clover seed the total shipments to America now make up a considerable bulk. The recent advance in Trefoils, of fine qualities, is well maintained. The tendency in blue boiling Peas and Haricot Beans is in favour of holders. The trade for feeding Linseed is quiet. Canary and Hemp seed sell slowly on last week's terms. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

By Special Appointments to H.M. the Queen and H.I. and R.H. the Crown Princess of Germany.

CHARLES SHARPE & CO., SLEAFORD.

SHARPE'S SIR F. A. MILBANK PEA.

This, the latest of Mr. Culverwell's many excellent introductions, is a Blue Wrinkled Marrow much of the Paragon type in habit and growth, but earlier, and differing in being of a beautiful dark grass-green colour, and even more prolific than that celebrated variety; the pods are produced in abundance, are large, square, and closely filled with the extra large dark green Peas, so closely packed that it would appear when opened as if the pods could scarcely have contained them. The flavour is all that could be desired by the most fastidious connoisseur, and in every respect it is a variety that we can with the greatest confidence recommend, either for exhibition or table purposes. It is robust and hardy in constitution, and may be sown early; for Market Garden purposes it cannot fail to prove a great acquisition.

Price, 2s. per Quarter Pint sealed packet, post-free.

SHARPE'S TRIUMPH PEA.

Triumph is one of the very best of the many fine varieties Mr. Culverwell has given to the public. It is a Blue Wrinkled Marrow Pea of exquisite flavour; the pods are large, very much curved, and are well filled with large Peas closely packed in the pod. The habit is good, being dense and bushy, attaining a height of 2 to 3 feet. The plant is covered with pods from the ground to the extreme top of the haulm. On one plant no less than sixty-nine pods have been counted, containing from nine to eleven Peas in a pod. The pods are of a bright green, in clusters of two or three; and are not easily affected by drought, remaining green for a long time. In constitution it is robust and hardy; and, without hesitation, we can say that it is the perfection of Peas for either the Market Gardener or the Private Grower—for exhibition, or for ordinary use.

Price, 2s. per Half-pint sealed packet, post-free.

SHARPE'S EARLY PARAGON PEA.

FIRST-CLASS CERTIFICATE, ROYAL HORTICULTURAL SOCIETY, 1884.

Chiswick Report, 1884, accompanied with First-class Certificate:—"PARAGON—A very fine Second Early Variety, and of good quality. Pods large, and well filled."

Price, 2s. per Pint Packet, 1s. per Half-pint Packet, post-free.

PARAGON, one of Mr. Culverwell's recent introductions, shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkled Marrow of fine flavour; height from 4 to 5 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of an unusual size, broad and thick-backed, containing from twelve to fourteen large Peas.

PARAGON is the earliest of the large Wrinkled Marrows, being ready before Prize-taking; in fact in the Gardens at Torpe Perrow it was gathered at the same time as William the First; it is very hardy, and will stand earlier sowing than any Pea of its class. It is most valuable for succession crops as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

TRADE PRICE and SPECIAL LIST of NOVELTIES for 1885 and 1886,

25, November 3, 1885.

PONTEY'S SUPERFINE LATE WHITE BROCCOLI.—This is one of the finest stocks of Late White Broccoli ever offered, producing large heads of a creamy white colour, and coming in for use as late as June. See following extract—

From the Gardeners' Chronicle and Agricultural Gazette, London.—"Monsieur Broccoli a few days since. Mr. C. Kessel, of the Coombe, Pezance, who has been a Broccoli grower for upwards of half a century, and was one of the first to get the Early Broccoli of Cornwall into the London and Western Markets, and two years ago, at Broccoli, which together weighed 50 lb. They were the sort known as Pontey's Late White Broccoli. The huge scales at the smelting-house had in the calling in question to ascertain the weight of the plants."

Retail Price, 2s. 6d. per ounce. Special quotations to the Trade. Apply to E. WILSON SERPELL, 21, Cornwall Street, Plymouth.

PALMS.—A few hundreds of splendidly grown healthy Scawthorpe elegans, Latania borbonica, Corypha australis, Phoenix reclinata, Areca lutescens, and Euterpe edulis, 12 inches high, 6s. per dozen, 65s. per 100; same sorts, 20 inches high, 12s. per dozen, less quantity, 2s. 6d. each.

FERNS.—Strong, healthy, and handsome Lomaria gibba, Adiantum cuneatum (Maidenhair), Pteris tremula, Pteris serrulata, Pteris cristata, Pteris cretica alba lineata, Pteris aquilina, and small varieties, 6s. per dozen, 2s. 6d. per packet. GARDENIA INTERMEDIA (true), 6s. per dozen. Packages and parcels post-free. P. W. J. STANTON, Florist, London, N.

TELEGRAPHIC ADDRESS—

THE YORKSHIRE SEED ESTABLISHMENT, HULL.

The best and most interesting Floral Sight in or near London, and when visiting the Metropolis, don't fail to see the HOME OF FLOWERS, as some family of Plants is sure to be in perfection, and repay a journey even from Lord's End to John O'Groats.

From WILLIAM BARR, Esq., 335, Broadway, New York, U.S.A., December 1, 1885.

"The Plants arrived safely, and thank you very much for your attention. Mrs. BARR and myself are very sorry indeed that time would not admit of my paying a visit to the HOME OF FLOWERS, as we fully intended; especially after the description given us by our friend, Mr. PETER HENDERSON, nurseryman, of New York, with whom we crossed and recrossed the ocean, but we have a treat in store if we are spared to visit England again."

SATURDAY, DECEMBER 26, 1885,

HURSLEY.

THERE are few country churches within whose sacred folds, dotted over with gravestones, some worthy of national or provincial note has not been laid to rest. The name of Hursley naturally recalls that of its famous Vicar, Dr. Keble, who was mentioned disrespectfully, like many other good men, by T. Carlyle, in a letter written from The Grange. That delightful writer, and very disagreeable person, was unaware, probably, that Hursley was the burial place of Richard Cromwell, the eldest son of one of his own heroes, the great Protector; and when a party from The Grange, including Stirling, the famous curate of Hurstmonceaux, and Wilberforce, Bishop of Winchester, drove and rode over to Hursley to visit the Editor of the *Christian Year*, he wrote to poor Mrs. Carlyle, and spoke of the Vicar of Hursley as "an ape named Keble." In spite of the man of genius who used this expression, Hursley has become a place of deepest interest to those who believe that in our future progress Cromwells and cataclysms may be averted by the good influence of teachers of another sort.

The church here also holds the dust of that aspiring old gentleman already named, who succeeded his father Oliver as Protector, sat several times on the throne, and narrowly escaped a crown and burial at Windsor, where the Georges now moulder. Richard Cromwell—called in the domestic circle Dick—acquired Hursley by marriage, lost possession of it at the Restoration, and on his return to England some years afterwards, his son Oliver, being then in residence, refused to go out. Richard did not care to dispute the usurpation, but when Oliver's sisters took possession at the death of their brother, the old man, then eighty years of age, determined on pressing his claim to the property. The story of his evidence in the Court of King's Bench, and of the claims of his two daughters, cruel and unnatural as those of Lear, forms a touching episode in the history of one of the most retired spots in Hampshire. On his appearance in court the Lord Chief Justice, to his honour, treated the old man with great respect, and desired him to be covered, in recognition of the almost regal position which he had held as Protector in succession to his father. Having given his evidence and gained his suit, he strolled into the House of Lords, where an official asked him if he had ever been in that Chamber before; "Not since I sat in that chair," he replied, pointing to the throne. Richard Cromwell died at Theobalds, Herts, and lies buried, with about a dozen of his family, within the walls of this quiet country church at Hursley.

I reached the spot from Chandler's Ford, the nearest station, close to Bishopstoke, on the South-Western Railway. Changes have overtaken Hursley, and to some extent disaster has befallen it. In 1718, after Richard Cromwell's death, his daughters sold the estate to Sir William Heathcote, who pulled down the stately old Elizabethan house, and built a more modern

mansion in its place. The story runs that Sir William refused to occupy the house of the Cromwells. The descendant of this staunch royalist, the late Sir William, died a few years since, and Hursley is at present under a cloud, being hard hit as regards the revenues of the estate by agricultural distress and the fall of prices. The soil of the park is good, and the Elms and Beeches are fine. A wonderful Yew hedge fences the forcing department from the rest of the kitchen-garden, having been planted to defend it from wind, which it does very effectually, and to screen it from observation. Nothing could be grander of the kind, but a brick wall covered with fruit trees must be more useful than a vegetable rampart 10 feet thick, which harbours insects and other garden pests, and which requires an annual expenditure of labour to trim and clip it.

The vicarage at Hursley, the home during thirty-one years of John Keble, author of the *Christian Year*, is an unambitious, but comfortable residence, built of flint—a gem, so far as appearance goes, sheltered by ornamental trees of several sorts, such as the Plane, Elm, Beech, evergreen Oak, Yew, and Cedar of Lebanon, many of them overtopping the house at a little distance from it. The north wall is covered by that good old domestic creeper, the ever-present Ivy. The whole group formed by the church and vicarage and adjacent schools occupies a corner of the park, while the lych gate of the churchyard opens on the village street. A lawn and flower beds are interposed between the house and the west wall of the churchyard, and on entering the latter with its surrounding screen of Limes, Elms, and Yews, you see on your right a very plain building of the dairy and dove-cote order of architecture—the unsightly tomb-house of the Heathcotes; a most uncomfortable looking place to be buried in, and a great discredit to any churchyard. At a little distance from this erection, close to the pathway leading to the church, lies, as we read on the granite pediment of his plain monument, “the body of John Keble, Vicar of this parish.” It is also recorded that he died on Maunday Thursday, March 29, 1866, aged 74 years. His wife, who died six weeks later, rests by his side. The church is now a large one, having been restored and enlarged in commemoration of Mr. Keble. There is no monument to any of the Cromwells, and nothing prominent in memory of Richard the Protector; but a member of the family placed a slab against the wall of the church in an inconspicuous corner, where it can attract no attention, and on this the names of a number of Cromwells who were buried here are recorded.

H. E.

Orchid Notes and Gleanings.

“LINDENIA.”

THE last issued part of this journal contains coloured figures of several first-class Orchids, among them the ivory-white

Vanda Denisoniana (t. 21), for which Comte du Buisson recommends basket culture, abundance of light without direct exposure, and generally the culture requisite for the species of *Arides*.

Cypripedium selligeyum majus × (t. 22), a magnificent hybrid from *C. barbatum*, fertilised with the pollen of *C. levigatum*. The dorsal sepal is broadly ovate acute, white, with purple ribs; the lateral petals are narrow, strap-shaped, and hairy at the margins, and the bag-shaped lip is glazed and purplish-brown.

Phalenopsis Sanderiana (t. 23) is worthy almost any adjective in our repertory, only it is a general editorial rule to strike out adjectives of comparison. The flowers are as large as those of *P. amabilis*, but of a lovely rosy-lilac colour as to the perianth segments, the lip being white.

Trichocentrum tigrinum var. *splendens* (t. 24).—

The flowers of this variety are 3 inches across, the segments lanceolate, dull yellow, with purple spots, the lip obovate, white, rosy-lilac at the base. The plant itself is not more than 5 or 6 inches high, so that the large size of the flowers produces a remarkable effect. The culture is easy. It should be grown in small baskets filled with sphagnum, peat, and wood charcoal. It should receive abundance of water in the growing season, and a very moderate supply at other times.

CALANTHES.

What wonderful additions have been made to this useful winter flowering section during the last few years! Messrs. Veitch were, as usual, first in the field. *C. Sedeni*, raised by them, is distinct and handsome; so, also, is the beautiful *C. Bella*, for which a First-class Certificate was awarded by the Royal Horticultural Society in 1881. It has a handsome spike of rose or pink-coloured flowers. *C. Sandhurstiana*, raised by Mr. Gosse of Torquay, and exhibited by Sir T. Lawrence, Bart., in December last year at South Kensington, where it received the First-class Certificate it so well deserved, is a great gain. Again, Mr. Cookson, of Oakwood, Wylam-on-Tyne, exhibited a charming group of seedlings raised by himself on October 27 last at South Kensington. The certificated varieties are described at p. 566. At the Floral Committee meeting on December 8, Sir T. Lawrence, Bart., exhibited another group of seedlings in some respects very similar to those exhibited by Mr. Cookson, with the exception of that richly-coloured variety, *C. porphyrea*, which is certainly distinct from any hitherto exhibited; it was the only one selected by the committee for a First-class Certificate. The old forms of *C. vestita* have done good service not only as ornamental flowering plants at this dreary season of the year, but as furnishing the parentage of these very superior varieties above alluded to. They will now have to give place to superior merit. *Calanthe vestita* Williamsii must not be omitted, as it is also a real acquisition; it is figured in the *Orchid Album*, plate 134; the bulbs show it to belong to the *Turcei* group, but the rich rosy-crimson lip, and the peculiar suffusion of the same colour in the sepals and petals, on a white ground, have a charming effect. *C. Regnierii* is also very distinct as a species; it has recently been introduced from Cochinchina, and as there are many distinct forms of it which flower late, it will be of some value on that account. *Fl. D.*

ONCIDIUM JONESIANUM.

Some grand varieties of this lovely Orchid are now in bloom with Messrs. Fred. Horsman & Co., of Colchester, one of them being really superb. Its flowers are borne eight on a spike, each flower 2 and 3/4 inches across. The sepals and petals are yellowish-white blotched with dark-reddish crimson and margined with white. The labellum is broad and beautifully crimped at the edge, snow-white on the expanded portion, the upper part around the column being bright yellow showing marked with bright red. Any variety of *O. Jonesianum* is pretty enough, but some of them, like that described, are simply lovely. There is no doubt that the plant does best on a block and hanging head downwards.

JEWISH FLOWER GARDENS.

THERE are in the Bible no direct references to the culture of flowers. Indeed, it is curious to note that in the usual generic sense of the word there is no Hebrew equivalent for the term “flowers.” We should be disposed to say that mere beauty of form in these “gems of the field” appealed less to the Hebrew than fragrance of odour. Not that he was insensible to the beauty of the blossom—its rich colouring and graceful growth; but he was always subjective rather than objective, and thought, characteristically enough, more of the perfume of a plant than of the beauty of its flowers. And aromatic plants he especially seems to have delighted in, as the reader would infer from the number of such referred to in the Bible. Hence, the nearest approach to our generic term “flower” is to be found in the Hebrew word “bosom,” really signifying “fragrant or scented plants,” as used in the Song of Solomon: “I have gathered my myrrh with my fragrant balsam-plant.”

The translation of the Authorised Version in this passage is altogether out, for “spice” is ridiculous in such a connection, since spices are not gathered from growing plants in a flower-garden, *Bible Flowers*,

COCOA-NUT FIBRE.

It was Linnæus who first called the Palms the “princes of the vegetable kingdom,” but it has been reserved to writers of the present day to designate the Cocoa-nut and the Palmyra respectively the “prince of Palms;” which of these two plants, however, is most entitled to the term it is difficult to say, for we read that the Palmyra (*Borassus flabelliformis*) has been immortalised in a poem in the Tamil language, and though 801 uses of the Palm have been thus recorded, the list is by no means exhausted. Whether it would be possible to enumerate so many uses for the Cocoa-nut Palm (*Cocos nucifera*) I have not been at the trouble to enquire, but I venture to believe that for sterling value as a commercial plant the Cocoa-nut can compete any day with the Palmyra, or any of its allies.

It would seem that with a plant so well known as this, and about which so much has been written, nothing new remains to be said. It is an old story to be told that the outer husk yields coir; that the inner hard shell can be, and is, generally carved into ornamental cups; that the kernel of the nut itself is edible when fresh, and that it yields large quantities of oil when dried. These are facts known to all who know a Cocoa-nut when they see it, and what schoolboy is there who is not acquainted in some way with this familiar nut? But each one of its uses might be dilated upon, and to use an oft-repeated term, “volumes might be written” upon each; but our business at present is only with the husk, apparently a minor portion of the Cocoa-nut commercially considered. A glance at the engraving, however, will show that a large trade must be centred about these “unconsidered trifles,” and that such is the case I shall endeavour to show by briefly recording what I saw on a visit to the Cocoa-nut fibre works of Messrs. Chubb, Round & Co., situated in West Ferry Road, Millwall. This firm is one of, if not the largest importers and manufacturers of Cocoa-nut fibre, and their stock of material, which is well shown in the engraving, is a very striking sight. The enormous heap of husks—which, indeed, is known in the locality as the “mountain”—comes upon view immediately upon entering the premises, and one can scarcely, at first sight, realise the fact that the enormous pile is composed entirely of these apparently useless portions of the fruit. At the time of my visit this reserve stock of husks was estimated at considerably over a million and a half, and presented an appearance as shown in the engraving (fig. 186), which is from a photograph taken by Mr. John G. Horsey only a week or so previously. Before proceeding to describe the various processes through which the husks pass to convert them into marketable material, it will be well to say something about the nuts themselves.

Cocoa-nuts, or as they are generally termed in the trade Coker-nuts, to distinguish them from the *Theobroma Cacao* which furnishes cocoa and chocolate, are shipped principally from Trinidad, Jamaica, Demerara, Tobago, several of the other Leeward Islands in the British West Indies, Ceylon, Belize (British Honduras), all round the coast of America, and the Fiji Islands; the quantity landed in the United Kingdom being about 12,000,000 yearly. Nearly all the nuts are imported in the husks or outer covering, from which, on arrival, they are stripped by men using two fine-pointed steel chisels, and who, by constant practice, become so skillful in the art that many are able to open 1000 to 1200 nuts per day. The nuts themselves after being removed from the husks are generally sold to wholesale fruit dealers, who, in turn, supply the retailers, costermongers and others, but they are likewise often sold under the hammer at public auction.

After removal from the husk they are sorted into seven sorts or varieties, known respectively as large milk, middle size, small, starters, milky growers, green and dry. Those from Trinidad are the sweetest in flavour, and are mostly preferred by the manufacturing confectioners, biscuit-makers, and others, though the Ceylon nuts run them very close in quality. Cocoa-nuts are largely used in the North and West of England, and they are also in great demand at holiday times, at fairs, on races, and such-like gatherings in all parts of the kingdom. The husks, after the nuts have been cracked, are stacked in the yard in the open air, as shown in the engraving, until they are required for conversion into fibre; for this purpose they are first passed singly through a powerful “crusher,” or

FIG. 186.—COCOA-NUT FIBRE MANUFACTORY. (SEE P. 808.)

"back-breaker," driven by steam power, with large revolving, corrugated wheels, which flatten the husks, and to a certain extent make them more pliable; but after this severe pressure, so springy is the nature of the husk that, somewhat like a sponge, they immediately assume their original shape on emerging from the crusher. They are then thrown into huge stodge tanks, each holding many thousands, where they undergo several hours' steaming and soaking. Great care and skill are required to know how long to keep them in the tanks, husks from different countries requiring more or less time according to circumstances, such as age, thickness of outer cuticle, substance of fibre, and other peculiarities known to the manufacturers. In the tanks the husks swell considerably, and have to be kept down by heavy pressure. One of the tanks filled with husks is shown in the centre of the engraving.

After the husks are sufficiently soaked they are ready for the mills, which are technically known as "Teasers" or "Devils," and consist of cylinders or drums, each being studded on the outer circumference with about 3000 fine or thick 3-inch steel teeth, specially tempered. The mills vary slightly according to certain requirements. They are driven by steam, and revolve with great rapidity, requiring the utmost care and constant attention of the workmen. Each husk is divided longitudinally into thin pieces, and each piece is passed into the mill separately by the workman between two steel rollers, the workman retaining a firm grip of it so as not to allow it to pass out of his hands; but the few moments he holds it there the drum with its numerous steel teeth is revolving, and combing out the irregular fibre and refuse. After one-half of the slice of husk is thus cleaned the workman reverses it, passing in the other half. The continual feeding of these mills gives such strength of wrist and dexterity to the workmen that what appears a very dangerous operation is gone through with wonderful rapidity, and each slice of husk is passed through three of these mills in succession, occupying but a few seconds from the time that the crude husk is passed into the mill until it comes out a perfectly cleaned bundle of light brown separated fibres; by these bundles are next laid out in drying rooms on heated iron tables to perfectly dry them, when they are ready for making brushes and brooms of various kinds.

But to return to the mills. It will be seen that the principal attention has been given to the long clean fibres used for brush-making, but there are other products to which I have not yet alluded. If a Cocoa-nut husk is cut through transversely it will be found that immediately under the outer woody coating the long brush fibres, if we may so call them, are deposited to the thickness of about half-an-inch; nearer the centre, and immediately surrounding the nut the fibres are more irregular, somewhat matted, and mixed with soft brown refuse. In the process of passing through the mill and separating the brush fibre this finer fibre and refuse is thrown out at the back, from whence it is collected and placed on elevators, and carried automatically into the mouths of double rotary screens, or "willows," peculiarly made for the purpose, a spindle fitted with arms or rods running the entire length, and after many revolutions and much tossing about the fibre is separated, and falls out at the lower ends clean and ready to be dried. This fibre is used for matting, and is not only supplied by the firm in large quantities for mat makers, but also to the Government for mat-making in prisons; it is further largely used for stuffing mattresses, saddles, &c. The refuse, by a special process of the present proprietor, is separated into two different qualities, the ordinary coarse kind being used for general horticultural purposes, and the granulated for conservatory use and potting.

Enormous quantities of this Cocoa-nut fibre refuse are produced by the firm. A heap is shown behind the tank in the engraving, and I was informed that it was no uncommon thing for them to dispatch 20 tons in one consignment, and that the material is sent to all parts of the world, including America, Africa, Australia, Sweden, Germany, France, Holland, &c.—the latter countries using it extensively for bulb growing. It is not a little remarkable that this refuse Cocoa-nut fibre should, in some cases, find its way back in a changed form to the countries from whence the outs were originally brought.

In conclusion, I have to acknowledge my indebtedness to Mr. Thomas Nevell, the present proprietor, for his kindness in allowing me to inspect the works,

for his courtesy in personally showing me over them, and carefully explaining the details of manufacture, as well as for much of the information contained in this paper. *John R. Jackson, Museum, Royal Gardens, Kew.*

A SYNOPSIS OF THE SPECIES AND HYBRIDS OF NERINE.

(Continued from p. 779.)

4. *N. PUDICA*, Hook. fil., in Bot. Mag., t. 5901.—Bulb globose, about 1 inch diameter. Leaves 4—6, glaucous, contemporary with the flowers, sub-erect, 8—9 inches long, $\frac{1}{2}$ — $\frac{3}{4}$ inch broad. Peduncle slender, suberete, 1— $\frac{1}{2}$ foot long. Umbel centripetal, 4—6 flowered; pedicels slender, 1— $\frac{1}{2}$ inch long; spathe-valves lanceolate, as long as the pedicels. Ovary globose-trigonous, $\frac{1}{2}$ inch diameter. Perianth erect or deflexed, $\frac{1}{2}$ inch long, with a very short tube. Segments oblanceolate, thin in texture, scarcely at all crisped, white with a pink keel. Stamens declinate, the three longest a little shorter than the perianth-segments. Anthers oblong, $\frac{1}{2}$ inch long. Style declinate, reaching to the tip of the perianth-segments. Seeds globose.—*Flore des Serres*, t. 2454.

Var. *N. Elzevii*, Leichtlin.—Leaves much broader, bright green, more persistent, distinctly veined, furnished with a prominent midrib. Umbel more compact; pedicels stouter. Perianth segments pale rose, with a darker keel, thicker and more waxy in texture.

The history of this plant is not clearly known. It was first described from a plant that flowered in Kew Gardens in 1868.

5. *N. FILIFOLIA*, Baker, in Bot. Mag., t. 6547.—Bulb globose, under an inch in diameter, with pale tunics produced a short distance over its neck. Leaves 6—10, contemporary with the flowers, grass-green, subulate, very slender, sub-erect, 6—8 inches long. Peduncle slender, terete, green, finely glandular-pubescent, a foot long. Flowers 8—10 in a centripetal umbel; pedicels slender, 1— $\frac{1}{2}$ inch long; spathe-valves lanceolate, green, under an inch long. Ovary globose-trigonous, green, $\frac{1}{2}$ inch in diameter. Perianth deflexed, bright red, an inch long, cut down to the ovary; segments oblanceolate-unguiculate, $\frac{1}{2}$ — $\frac{3}{4}$ inch broad, crisped. Stamens, declinate, shorter than the perianth-segments; anthers oblong, reddish. Style equalling the longer stamens.

Hay, Orange Free State. Sent to Kew by Mr. Ayres in 1879.

6. *N. UNDULATA*, Herb., App., 19.—Bulb ovoid, $\frac{1}{2}$ —1 inch diameter; tunics pale, membranous. Leaves linear, contemporary with the flowers, bright green, 1— $\frac{1}{2}$ foot long, $\frac{1}{2}$ — $\frac{3}{4}$ inch broad. Peduncle slender, 1— $\frac{1}{2}$ foot long. Flowers 8—12, in a centrifugal umbel; pedicels slender, 1— $\frac{1}{2}$ inch long; spathe-valves lanceolate, as long as the pedicels. Ovary globose-trigonous, $\frac{1}{2}$ — $\frac{3}{4}$ inch in diameter. Perianth-limb pale pink, 8—9 lines long, cut down very nearly to the ovary; segments oblanceolate, much crisped. Stamens declinate, about as long as the perianth-segments. Style declinate, as long as the perianth-limb.—Herb. Amaryll., 283, t. 45, fig. 2; Kunth, Enum., v. 621. Amaryllis undulata, Linn. Syst. Veg., 264; Miller, Icones, t. 8; Hill, Hort. Kew., 352, cum iconc; L'Herit. Sert., 16; Bot. Mag., t. 360; Red. Lil., t. 115; Jacq., Hort. Vind., iii., t. 13; Tr. Tab., t. 303. *Hemanthis undulata*, Thunb. Fl. Cap., edit. 2, 297. *Nerine crispa*, Hort.

Var. *N. major*, Tratt., Tab. I. 594.—Perianth-limb larger and less crisped. *N. aucta*, Roem. Amaryll., 107. Amaryllis aucta, Tratt., *Text.*, ix., t. 45.

Hab., Southern Provinces, Thunberg; Cooper, 1539, 320; Bolus, 2686; Orange Free State, Cooper, 2235.

7. *N. HUMILIS*, Herb., App., 19.—Bulb ovoid, 1— $\frac{1}{2}$ inch in diameter; tunics pale, membranous. Leaves about six, contemporary with the flowers in November, linear, bright green, suberect, channelled down the face, about a foot long, $\frac{1}{2}$ — $\frac{3}{4}$ inch broad. Peduncle slender, suberete, slightly glaucous, $\frac{1}{2}$ — $\frac{1}{2}$ foot long. Flowers 10—20, in a centrifugal umbel; pedicels slender, 1— $\frac{1}{2}$ inch long; spathe-valves lanceolate, greenish, about as long as the pedicels. Ovary globose-trigonous, $\frac{1}{2}$ — $\frac{3}{4}$ inch in diameter. Perianth-limb bright pink or rose-red, cut down very nearly to the ovary, 1— $\frac{1}{2}$ inch long; segments oblanceolate, acute, crisped. Stamens declinate, the three longer, about equalling the perianth-segments; anthers oblong, purple, $\frac{1}{2}$ inch long. Style declinate, as long as the perianth-limb.—Herb. Amaryll., 283; Kunth, Enum., v. 621. Amaryllis humilis, Jacq., Hort. Schoen., i., 36, t. 69; Bot. Mag., t. 726; Red. Lil., t. 449.

Hab., Southern Provinces, from Cape Town eastward to Kaffraria, Thunberg, Drege, Zeyher. Differs from flexuosa by the centrifugal expansion of its inflorescence, and by its dwarfer habit and narrower channelled leaves.

8. *N. LUCIDA*, Herb., Amaryll., 283, tab. 26, fig. 3.—Bulb globose, 3—4 inches in diameter, with the membranous tunics produced round the neck 2—3 inches above its apex. Leaves 6—8, contemporary with the flowers, linear, bright green, spreading, flaccid, a foot or more long, $\frac{1}{2}$ — $\frac{3}{4}$ inch broad, scabrous on the margin. Peduncle short, acuticarpis, 3—8 inches long, $\frac{1}{2}$ — $\frac{3}{4}$ inch diameter. Flowers 20—30 in a centripetal umbel; pedicels stiff, moderately short, 3—4 inches long; spathe-valves ovate-lanceolate, much shorter than the pedicels. Ovary globose-trigonous, $\frac{1}{2}$ inch in diameter. Perianth-limb $\frac{1}{2}$ —2 inches long, pale or bright red, cut down to a cup $\frac{1}{2}$ inch long; segments oblanceolate-unguiculate, $\frac{1}{2}$ inch broad, hardly at all crisped. Stamens and style declinate, nearly as long as the perianth-segments. Capsule depresso-globose, $\frac{1}{2}$ — $\frac{3}{4}$ inch in diameter.—Kunth, Enum., v. 620. Amaryllis lucida, Burchell, Cat., No. 1969. *Brunsvigia lucida*, Herb. App., 16; Roem. et Schultes, Syst. Veg., vii., 847. Amaryllis laticonia, Ker in Bot. Mag., t. 497.

Hab., Central Province, in the Gariep district; Burchell, 1959; Macowan, Sand River; Burke, Transvaal; Todd, Baines. A very distinct species, not, so far as I am aware, now in cultivation.

9. *N. MARGINATA*, Herb., Amaryll., 283.—Bulb ovoid, 2—3 inches in diameter, with imbricated dark brown membranous tunics, and very stout root-fibres. Leaves four, produced after the flowers, spreading, ligulate, obtuse, 6—9 inches long, 2—2 inches broad, with a reddish crisped cartilaginous margin. Peduncle stout, compressed, $\frac{1}{2}$ foot long; flowers 12—20, in a centripetal umbel; pedicels, $\frac{1}{2}$ —2 inches long; spathe-valves, deltoid, shorter than the pedicels. Perianth erect, bright scarlet, cut down to the ovary, $\frac{1}{2}$ inch long; segments oblanceolate, but little crisped, $\frac{1}{2}$ inch broad. Stamens sub-erect, a little longer than the perianth segments. Style suberete, a little longer than the stamens.—Kunth, Enum., v. 615. Amaryllis marginata, Jacq. Hort. Schoen., i., 34, t. 65. *Brunsvigia marginata*, Act. Hort. Kew. edit. 2, 230; Gawl., in Bot. Mag., sub t. 1433. *Lulu-fu marginata*, Herb. App., 18. *Eliessa marginata*, Roem. Amaryll., 63.

Hab., South-western Provinces; known to me only from Jacquin's figure. There are no dried specimens in the London herbaria.

HYBRID FORMS.

The following hybrid Nerines were raised long ago by Dean Herbert, viz. 1—

1. *N. Mitchamie* ×, Herb., Amaryll., t. 45, and *N. varicolor*, hybrids between *curvifolia* and *undulata*.
2. *N. Havlocki* ×, between *curvifolia* and *pulchella*.
3. *N. pulchella* × *undulata*.
4. *N. Spoorthille*, between *venusta* and *undulata*.
5. *N. pulchella* × *humilis*.
6. *N. humilis* × *undulata*.
7. *N. curvifolia* × *venusta*.

These, I believe, have all died out, but the following are in existence in cultivation at the present time, viz. 1—

8. *N. amblylox*, a cross between *pudica* and *humilis*.
9. *N. Cami* ×, between *curvifolia* and *undulata*.
10. *N. atrovirginica* ×, between *Plantii* and *flexuosa*.
11. *N. cinn-barina* ×, between *Fothergillii* and *flexuosa*.
12. *N. O'Brieni* ×, of which *N. carinata* and *carulea* are forms, between *pudica* and *Plantii*.
13. *N. erubescens* ×, between *flexuosa* and *undulata*.
14. *N. elegans* ×, between *flexuosa* and *sarriensis* rosea.

7. *G. Baker, Kew Herbarium, October, 1885.*

THE NEGLECT OF SHRUBBERIES.

YOUR leading article on this head will strike a responsive chord in the thoughts of many of your readers. There is a great and increasing treasury of fine-limbed and flowering shrubs scarcely ever drawn upon. Last spring there was a paragraph in your contemporary *The World*, which, from the tone of its dictum, evidently pretends to omniscient knowledge, stating that the only Judas trees in England were in the Dulwich College grounds. Such a mistake is almost excusable. Conspicuousness on account of its absence is, indeed, the lot of this tree. Why so few are met with is a fact hard to be explained. The *Cercis* flowers almost as early as the daring *Dafodils*, and is one of the first inmates to awaken the shrubbery from its winter somnolence. One of the most beautiful landscapes of arboreal colouring I ever saw in South Europe was the side of a valley in which many Judas trees had been planted. The purple of their flowers and the bright spring leafage of the other trees formed a picture which one came to view every day. Coming nearer

home, the same combination, albeit on level ground, makes in the early spring Sir Charles Bunsbury's arboretum at Burton, near Bury St. Edmund's, an ineffaceable recollection. *Cercis siliquastrum* is indeed an object for a villa garden. Can any of your readers say that he has seen *Judas* trees in six different villa gardens? I very much doubt if any can. In very many cases a new villa holder gives a *carte blanche* to a nurseryman to send him a certain number of suitable trees. Nobody can blame the tradesman for continually sending the same evergreens his regular clients seem mostly to plant and desire. As your leader says, "The popular taste wants educating." Another beautiful old shrub, very much neglected, is *Colutea arborescens*. Is it that people get so tired of the *Laburnums* that they do not care about a similar effect in July or August? or is it that comparatively few out of the additional brightness and charm given to any part of a shrubbery, not only by the flowers but also by the seed-vessels of this *Colutea*? A multiplication of like examples would be easy—the *Spindle tree* for one. The *Samachs* and *Rosa rugosa* seem to be becoming popular, and one has only to see Canon Ellacombe's garden at Bitton to wish the same fate for many other species of the *Rose*, as well as many of the *Brambles*. One of the most instructive lessons upon the additional beauty supplied by flowering shrubs and plants to shrubberies, to be gained in the British Isles, is a thoughtful stroll through the pleasure of Mr. Smith Durrien's home in Scilly. Although September is not a good month for such a purpose, a list of what is in flower (omitting many common sorts) on September 7, may be reading from which some may care to conjure up a mental picture. The list may also be of value to dwellers in Cornwall, South Devon, Pembrokeshire, and parts of Ireland.

- Fourcroya longvava*
- Aralia trifoliata*
- Cassia corymbosa*
- Cytisus calycinus*
- Salvias*, of sorts
- Phoradend.*, flowers and seeds of nearly all the varieties
- Banksia serrata*
 - ↳ *littoralis*
- Correa virens*
 - ↳ *speciosa*
- Polygala Dalmanisiana*
- Olea* *ragraris*
- Habrothamnus fasciculatus*
- Solanum robustum*
 - ↳ *lanceolatum*
- Dolichos lignosus*
- Physellus capensis*
- Melaleuca hypericifolia*
 - ↳ *pulchella*
 - ↳ *busifolia*
- Baccharum frutescens*
- Candollea tetra-oides*
- Eurybia purpurea*
- Erythraea cristata-galli*
- Melicope arborea*
- Diplazium glumosum*
- Santolina chinensis*
- Clethra arborea*
 - ↳ *semilobata*
 - ↳ *papillosa*
- Escallonia ovata*
- Psoralea sericea*
- Elaeagnus grandiflorus*
- Platyedon autumnalis*
- Trifolium mimata*
- Milla laxa*
- Francoa ramosa*
- Oxalis*, of sorts
- Eucrocin punctata*
- Campanula celestis*
- Colchicum Parkinsonii*
- A. campbelli*
- Neja gracilis*
- Lilium Harrisii*
- Cinnam. Moorei*
- Lenocium autumnale*
- Hemerocallis fulva*
- Dietes bicolor*
- Nerine sarraceni*
 - ↳ *Fothergillii*
- Clivia nobilis*
- Solanum jasminoides*
- Mandevilla suaveolens*
- Clethra paniculata*
- Aloe saponaria*
 - ↳ *spicata*
- Apiosera pentaginta*
- Haemorrh. limboldii*
 - ↳ *semilobata*
 - ↳ *papillosa*
- Rochia falcata*
- Gasteria decipiens*

C. A. M. C.

The Apiary.

BEES are now in repose, and on no account whatever must that repose be disturbed. It is worse than useless to manipulate them in any way or to feed them till March, whether they have much honey or little. If they only have a little honey opening hives would cool them, and the bees would probably eat all the honey to restore warmth, and would then give up the ghost. But this is just the time when lots of things can be done to forward the summer work. Even as a good gardener will now be preparing all kinds of things for summer, so will the good bee-keeper do the same for his bees. For some days past I have been spending all my leisure time in getting section-boxes all ready for supering. A very good size of crate is one to hold fourteen of these boxes, seven in a row. I fix little pieces of thin foundation in the sections the shape of a triangle, with the apex pointing downwards. There are various

ways of fixing the foundation: I have found the following eminently successful.—Melt a little wax, then take a triangular piece of foundation, and dip a side of it in wax, and immediately put in position. The wax will at once cool, and the foundation will be fixed firmly enough. Then put these section boxes in the crate, and put separators between the sections. It is quite necessary to put separators, or the bees would stick all the boxes together in a solid lump. Many bee-keepers use very thin wood for this purpose, as beir wax—I always use perforated zinc, and have found it very successful. Perforated zinc has this advantage—the bees can see one another at work through the perforations, and the sight of each other at work seems to act as a stimulant to further exertion. When I have filled the crate with the sections, and put them in position, I wrap the crate up in newspaper, and then put them away in a dry corner for spring and summer use. When the busy season comes you will be very pleased to take these boxes down, and put the crates on the hives. Many other things can be done, such as cleaning all the articles not in use, repainting hives, &c. If you want to paint hives which are out-of-doors, do it on a windy and cold day; the hives will soon dry and the smell soon pass off; it is better in such cases not to paint the alighting board. I hope in my next paper to give my readers a few hints on the management of different kinds of bees. *Agnes.*

Florists' Flowers.

WINTER FLOWERING CARNATIONS.

THIS type of the Carnation is exceedingly valuable during the months of December and January if the weather is sufficiently favourable to the perfect development of the blooms. This is not always the case, as the present season so far is proving. We have had great difficulty in obtaining good flowers owing—not to the want of the best horticultural appliances, to which has been added careful culture—but owing entirely to the want of sun, and not only to the want of it, but also to the unusually heavy state of the atmosphere. The winter flowering zonal *Pelargoniums*, grown in the same house, which in ordinary seasons are a blaze of colour, are also most unsatisfactory. All this is matter for regret; but over it we have no control, and the careful, zealous cultivator will plod on, to the even tenor of his way, and trust to have better luck next time. I would like to point out to cultivators of these plants, or to those intending to take up their culture, that in order to command anything like a fair measure of success the plants must be well cultivated from the first. How can plants that have been allowed to grow for two or three months in small 60-pots during the months of March, April, and May, be expected to grow into good flowering specimens by the end of the season? In less than a month we shall plant our cuttings. In most cases they can be readily obtained from the old plants; the slender side growths are the best to make cuttings from, and they do not take long to form roots, if they are placed in a little bottom-heat in a forcing-house. I place the pots containing the cuttings close together, and as at this early season it is sometimes necessary to apply a good deal of artificial heat, the cuttings shrink a little unless protected in some way. The plan I adopt is simply to place a square of glass over the cuttings; it is kept just above the cuttings, resting on the ends of the labels. This is sufficient to prevent evaporation, and retains the moisture about the cuttings, but not so much as to cause them to damp off. The secret of success, after the cuttings have formed roots is to keep them growing on without any check until flowering time. The plants are very slender at first, and may be potted into thumb-pots, or, at least, not larger than small 60's; they may still be kept in the forcing-house, but, if possible, on a shelf near the rock glass; this will promote stout, short-jointed growth from the first. In April the plants may be placed in a cold frame, and early in June they will do best out-of-doors, in an open position, where they may remain until the end of September. By that time the plants will be established in 6, 7, and 8-inch pots, according to their strength. The potting soil for these winter-flowering varieties should be, of good loam four parts, one part light fibrous peat, one part

leaf-mould, and one part decayed stable manure, and as much coarse sand as may be necessary to keep the compost open.

We do not grow a large number of varieties, but such as we do grow have been well proven; they are mostly decided colours—rose, pink, crimson, scarlet, yellow, and white of course. The best white variety is the Queen (*Abercrombie*); *La Belle* (*Blackley*) flowers earlier and more profusely, and is a good white. Pale rose or pink colours are represented by *Miss Jolliffe* (*Masters*), and deep rose by *Juliette* (*Turner*), and *Mrs. Llewellyn* (*Turner*); they are both splendid varieties of good habit.

Worthington Smith is our best scarlet, though the plant cannot be recommended as of good habit. *Nimrod* is another scarlet that has done well. *Mrs. Keen* (*Veitch*) is the finest dark crimson. *Mrs. McLaren* (*Fitch*) is a perpetual flowering crimson bizarre, the flowers well marked, and of good form.

The different forms of *Souvenir de la Malmaison* should be grown, but they do not flower until the spring. *Dorcas*.

The Kitchen Garden.

ROOTS AND TUBERS.

THESE are not nearly so well grown in most gardens as the Brassica tribe of plants. Of course it must be admitted that the soil in some districts is unsuited to the production of fine samples; however, on the other hand, when the soil is of a proper character to bring the best results (if properly prepared), it does not receive the necessary preparation to enable it to perfect clean, handsome samples. Why is this? I think it may be principally attributed to the presence of too many insects in the soil—soil overcharged with humus through being constantly manured with material which is not brought in to a thoroughly purified condition by the action of frost or other agencies. Growing roots simply for weight of crop, and growing clean, handsome samples, necessitates a different treatment of the soil. Fine straight samples of such roots as Parsnips and Carrots, free from scab and other blemishes, are much more welcome in the kitchen than forked and inferior samples.

Depth of tillage is most necessary for long roots, inasmuch as no direct impediment must exist in the soil to arrest or turn aside the main roots. Frost being one of the most active agencies to which we must look to bring sweetness and cleanliness to the soil, therefore those who do not make the best use of its power, by exposing alternately fresh surfaces of soil to its immediate action, neglect one of the most important operations towards bringing complete success. There are various ways of accomplishing this work: ridging may be resorted to, or the soil in the quarters chosen for next year's root crops may be dug over with the spade occasionally during the winter, exposing a fresh surface each time to the action of the weather. If one could thoroughly expose the top spit of soil to the action of frost before trenching, and subsequently be fortunate enough to experience a second spell in order to rectify the lower spit of soil then placed on the top and providing the soil in itself was of a proper character for roots, a perfect seed-bed would be the result. This being accomplished the application of dressings applied as correctives and cleansers of the soil would be of much less importance. I allude here to such cheap and effectual remedies as salt, soot, and lime. The two former are best, and most beneficial to light and medium soils; the latter two on heavier land. There yet remains time to apply these dressings to land to be cropped in spring with roots or tubers, and the work should not be driven off later than five or six weeks prior to sowing, &c.

Land that has occasionally received a dressing of artificial manure, such as nitrate of soda, sulphate of ammonia, or superphosphate of lime, does not contain so many insects as that which has year by year been enriched with applications of ordinary dung, and this should be taken into consideration when applying dressings. *G. H. Richards, Somerley.*

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, Dec. 30	Sale of Roses, Fruit Trees, Bulbs, &c., at Stevens' Rooms.
THURSDAY, Dec. 31	
FRIDAY, January 1	Sale of Valuable Orchids, 500 Tallum auratum from Japan, at Stevens' Rooms.
SATURDAY, January 2	Sale of Imported, Established and Semi-established Orchids, at Frotheroe & Morriston's Rooms.
	Sale of Hardy Plants and Bulbs, in variety, at Stevens' Rooms.

THERE can be no question that, in spite of trade depression, and latterly of the disturbing element of a General Election, this has been a busy year for Horticulture. In isolated gardens in the country, perhaps, things have gone on much as usual, or, it may be, there has been rather a diminished than an enhanced activity. Establishments have had to be cut down and expenses curtailed to meet the fall in rents and the pressure of taxation. But in the great centres of population, and in London especially, the year now fast drawing to a close has been one of almost perpetual activity. Whether Horticulture, in the abstract has been benefited by all this will be seen in the future. Those in the thick of a fight see little of the progress of the campaign. The weather, that foremost topic of interest, has been propitious to us. The winter was not severe, the spring was no worse than usual, summer and autumn were light, sunny, and hot; the present winter so far, at least in the South, has been favourable to outdoor work. A period of drought threatened to produce evil consequences, but, taking into consideration the fair average crops, the general absence of Potato blight and other pests, we have much to be thankful for—as, indeed, we always have—and little to grumble at, which may be disappointing to some people!

Turning to the proceedings of the Royal Horticultural Society as the representative Society, we find it has had a year of unending labour. Whether all this work will tend to rehabilitate the Society in public estimation we need not, but assuredly it ought to do so. The fortnightly shows were of more than average magnitude, owing to the concurrent Inventions Exhibition; and throughout the whole period many of our nurserymen kept up a continuous display, not only of shrubs that could be planted out once and for all, but of cut flowers, herbaceous plants, bulbous plants, Roses, &c., that required frequent renewal. It would seem as if the resources of the nurseries must have been severely taxed, but no evidence was forthcoming at South Kensington to that effect. In spite, however, of the magnitude of the shows there has been, we fancy, a marked falling off in the introduction of new and interesting plants (always excepting Orchids). It will be our duty, however, in the following numbers to give some details upon this subject, which may or may not confirm our present general impression.

The tendency to give special prominence to particular groups of plants at particular seasons has been accentuated. The Daffodil Conference of last year clearly did not exhaust the interest felt in the subject, for the Daffodil meeting of the present year, though less formally organised, excited almost as much attention as its predecessor, and evoked almost as much literature. Soon after this came the Orchid Congress, which—thanks to the energetic action of the Council, and in particular of Sir TREVOR LAWRENCE and Mr. LEE—was a most gratifying success. How far it served to fill the coffers of the Society and to attract new Fellows we do not know. Later on came the Pear Congress, rivaling the Apple Congress of 1883 in extent, and equally interesting to gardeners, but far from being so to the general public, to whom Pears seem to present little interest as compared to Apples—partly, no doubt, because a crop of Pears is a rarer phenomenon than one of Apples, which are pre-eminently the English fruit, and partly

owing to unfavourable weather. These conferences or congresses on special subjects, as it seems to us, effect a great deal of what the special societies have hitherto failed to do. Special societies have confined themselves too much to mere exhibiting and prize offering the prizes, moreover, falling to the share of a very small number. But these congresses or conferences, or whatever they may be called, have been for the most part independent of the attractions of prize money, and yet the exhibitions connected with them have been larger and decidedly more generally interesting than those in which the prize system is exclusively adopted. Moreover, they have evoked an amount of interest on the part of the general public which ordinary flower shows, general or special, fail to do, and have stimulated the publication of information in character and in amount far beyond the ordinary flower show report. The exhibitions and congresses in Paris, Antwerp, and Edinburgh—all of which were successful—illustrate the same remark. For our own part, the Orchid Congress and the Pear Congress enabled us to produce a series of articles and an amount of information on the respective subjects such as has never before been gathered together in like compass, and which will furnish a quarry for future workers for years to come.

Before quitting the subject of societies we may, in passing, mention the "Gardeners' Benevolent." It will be remembered that great efforts were made last year to increase the Pension Fund, and with such success that the pensions now granted are £20 for men and £16 for women; and so successfully have the finances been managed that no fewer than twenty-five candidates are now to be placed on the list without the trouble or expense of election. This is most satisfactory, and ought to give great confidence to gardeners.

Horticultural literature has been as active as ever. In addition to the eight weekly publications now devoted to the subject the year has witnessed the commencement of the publication of two Cyclopædias of gardening—that of Messrs. CASSELL, entitled *Popular Gardening*, and that published by Mr. L. UPCOTT GILL, under the title of the *Illustrated Dictionary of Gardening*. In the former the articles are arranged in their natural sequence, in the latter they are disposed alphabetically. But the point to which we would specially allude is this—that both of them are in the main, and, barring occasional exceptions, up to the high-water mark of Horticulture. Too often we have to lament that writers on horticultural matters write as if the world had not moved on during the last fifty years, and not only give us nothing original but compile their matter from books which were excellent at the time of publication, but naturally left more or less behind by the progress of science.

It is, of course, impossible to notice all the publications of the year, but some may be mentioned as specially valuable. For comprehensiveness there is nothing to equal Professor SARGENT'S *Census Report on the Trees and Forests of North America*. This is a work which, from its magnitude, is only likely to be found in public libraries, but it is so full of information that our English arborists and foresters will find it to their interest to make themselves acquainted with it. The new edition of MASON'S *Burma* is also full of interest for cultivators. Of more strictly horticultural value are BAINES' *Greenhouse and Stove Plants*, the English edition of VILMORIN'S *Les Plantes Potagères*—a most useful book, only just published; and the new and greatly improved edition of the *Orchid Growers' Manual*, by Mr. B. S. WILLIAMS. The Report of the Edinburgh Forestry Exhibition, and the *Dictionnaire des Roses*, are both books which will not be suffered to remain on the top shelves

of one's bookcase. Herr ANTOINE, of Vienna, proceeds with the publication of his magnificent work on Bromeliads. Baron VON MUELLER'S *Eucalyptographia*—a most valuable publication—has been brought to a close with its tenth decade. Mr. FITZGERALD continues his interesting labours on the *Orchids of Australia*, and has brought to light a large amount of hitherto unknown particulars. Mr. BROWN is issuing, at regular intervals, his *Forest Flora of South Australia*, concerning these interesting plants.

Of strictly botanical books this is not the place to speak, but as these words may fall under the notice of students we may mention the publication of Messrs. VINES and BOWERS' *Practical Course*—an excellent handbook for practical work in the laboratory.

For our own part we have endeavoured to keep our readers *au courant* with what is passing in the horticultural world, to furnish practical suggestions and directions on points of cultivation, and while constantly bearing in mind the daily practical requirements of our readers, to furnish them all with a store of permanent utility for future reference. Of this nature are the descriptions and figures of new and interesting plants; the monographs of particular genera; the articles on the structure and mode of life of the plant; on the insects injurious to plants; and on the diseases to which they are subject. These matters are treated of by the most competent authorities, and of their value we can form some idea by the frequency with which they are translated in foreign journals—an indication, it is said, of the verdict of posterity!—and by the use made of them by writers of standard books, as testified by their citations. We confidently look to our correspondents for help and suggestions to make our work more worthy their consideration, and more useful both for present needs and future reference.

The year has been signalled by the retirement of Sir JOSEPH HOOKER from the Directorate of Kew, and the appointment of Mr. DYER in his place. We have so recently commented on these matters, that there is no need to refer to them, save to express a most earnest wish that the standard of Kew may be kept up to its present high level, and that its opportunities for usefulness will increase with the progress of science. To this end not only must the commanders be men of first-rate capacity, but the subordinates must be picked men also.

The obituary list contains some names whose removal causes a great gap in gardening circles, such as those of CHARLES TURNER and JAMES CUTBUSH. It seems difficult to realise the existence of some departments of our work without these men, and they are not the only ones. CHATER, of Saffron Walden; BROWN, of Carnation notoriety; FORSYTH, and, quite lately, FROTHEROE, have been taken from us. The botanists have to lament the loss of BOISSIER, not before he had accomplished work which will for ever render him a benefactor to his brethren. The genial, spirited, and spirit-inspiring Dr. BULL, and the venerable, many-sided HENRY ELLACOMBE have gone to their rest, and ROEHL—who we should have imagined would have shared the fate of most botanical collectors—was suffered to meet his fate at home. And so in this, our last number for the year, published with Christmas preparations all around us—with thankfulness for the past and hope for the future—we thank our correspondents and friends for their help, and bespeak their aid in the year that is to come.

— NEW PLANTS.—In our next number we shall follow our usual custom by giving a brief account of the principal new and interesting plants brought forward during the year 1885.

WROXTON ABBEY.

THE PHOTO. SPRACKLE & CO. LONDON

— THE ASSISTANT DIRECTORSHIP AT KEW.—We understand that the post of Assistant Director of the Royal Gardens, Kew, has been offered to Mr. D. MORRIS, M.A., F.G.S., the Director of Public Gardens and Plantations, Jamaica. The appointment is in the gift of the First Lord of the Treasury.

— THE LOQUAT (*ERIOTRYA JAPONICA*).—Some time since one of our correspondents made inquiries as to whether this plant had produced fruit in the open air in this country. We were not able to give an answer at the time, but we now notice that Mr. CHISHOLM, of Oxenbath Gardens, near Tunbridge, records in the *Journal of Horticulture* the production of a fruit against a wall of a house. The fruit was seen from an upper window by a lady—a happy accident, as otherwise it might not have been observed.

— THE "GARDENERS' MAGAZINE."—The Christmas number of our contemporary has been issued, and is as full of brightness and variety as usual. The view of the Dripping Well in the new rockery at Kew may serve to induce those who have not paid a visit to this attractive spot to do so forthwith, for even in winter it is beautiful.

— "LITTLE FOLKS."—We have received the January number of a magazine long known and admired by juvenile readers—*Little Folks*. It is profusely illustrated, and possesses the additional attraction of a coloured plate, and is published by Messrs. CASSELL & CO.

— *CIRRHOPETALUM WALLICHII*.—The typical form of inflorescence in this genus is umbellate, but in the species under notice it is racemose or more or less spicate towards the top. It is deciduous, and flowers in this condition both in a wild state and under cultivation. Although it differs from the type in its elongated inflorescence, the great inequality existing between the lateral and upper sepals demonstrate its affinity with the other members of the genus. The flowering part of the raceme is pendulous, and the lateral sepals, having their edges more or less parallel and slightly cohering, are also drooping. They are pale yellow, attaining a length of 1 or 2 inches, in a wild state at least, giving the flower a very curious appearance. The figure or coloured plate given in WALLICH'S *Plante Asiaticæ*, 67, for this species, is altogether wrong, having an umbellate inflorescence and flowers stained at the base with blood-red. A piece grown on a block in the Orchid-house at Kew has been flowering for some time, and flowered this year.

— NORTH OF SCOTLAND HORTICULTURAL ASSOCIATION.—The monthly meeting of the members of the North of Scotland Horticultural Association was held in the Young Men's Christian Institute, Aberdeen, on the evening of the 18th inst. Mr. PETER HARPER, the President, in the chair. There was a good attendance. The "Lessons and Experiments of the Year" formed the subject of discussion. Several gentlemen took part in the debate, and Mr. D. EDWARDS, Sunnypark Nursery, read a paper on "Flowers," which commenced an interesting discussion. Some conversation took place as to the advisability of continuing the annual Chrysanthemum show under the auspices of the Society. It was questioned whether it would be advisable to continue the exhibition, seeing that the last two had been unsuccessful from a financial point of view. Mr. REID, the Secretary, explained that the exhibition was connected with the Society nominally only, the Society guaranteeing to give £5 of a subscription in case of a deficiency. It was eventually agreed to continue the show under the auspices of the Society. Votes of thanks to the speakers concluded the meeting, and the members then had an opportunity of inspecting the fine collection of plants that adorned the exhibition-table.

— PARAMERIA BALSAM.—The *Pharmaceutical Journal* draws attention to an article in the *Archiv der Pharmacie* for November on the structure of the root of *Parameria vulneraria*, which is used by the natives of the Philippine Islands, as well as by the residents there, to furnish a kind of balsam that possesses remarkable healing properties. This, it is said, is known by the name of Cebû, or Tagulaway Balsam, and is prepared by boiling the bark of the roots, twigs, and leaves of the plant in Cocoa-nut

oil, when a yellowish-white oily liquid is formed, having a peculiar odour. From an examination of the plant it was found to contain 8.5 per cent. of caoutchouc to its tissues, and 3 per cent. resin soluble in alcohol, and to these constituents its value appears to be due. Dr. ZIPPERER, the author of the paper, states that during two years' residence in the Philippines he had seen the balsam used by European doctors, as well as by the natives, with great success in various skin diseases and for healing wounds. It appears to promote an unusually rapid cicatrization. The plant is a climber belonging to the Apocynaceæ, and growing in the mountainous declivities of the Island of Cebû, whence it is chiefly obtained. Only two other species of *Parameria* are known, namely, *P. glandulifera*, BENTH.; and *P. philippensis*, BENTH.; the former of which has been referred to as a caoutchouc yielding plant in the Kew report for 1881.

— TREE PLANTING AT FINCHLEY.—In reference to the advertisement which appeared in the *Gardeners' Chronicle* of the 28th ult., we are requested to state that the tender of Messrs. RICHARD SMITH & CO., of Worcester, has been accepted.

— ST. NEOT'S HORTICULTURAL SOCIETY.—The report and balance-sheet presented at the recent annual general meeting of the members of this Society is most satisfactory, for it shows that the balance in hand at the close of 1884, amounting to over £18, has, with the close of this season's operations, grown to the sum of over £44, which is a satisfactory state of things. A summer show will be held on Bank Holiday in August.

— *CRINUM ANGUSTUM*.—A considerable number of species of *Crinum* have flowered from time to time in the Palm-house at Kew, but none more conspicuous than this one. It belongs to the section *Platystræ*, and was described in BAKER'S synopsis of the genus in the *Gardeners' Chronicle*, 1881, xvi., p. 180. This section is characterised by a straight tube, and lanceolate spreading or ascending segments. The tube in this instance is 4 to 5 inches long, and the segments of the perianth about 6 inches. Externally, before expansion, both tube and lamina are of a deep crimson-red, but internally the segments are almost white. The inflorescence contains from twenty to thirty of these huge flowers, which open successively, and exhale a powerful but not disagreeable odour. The bulb is elongated or drawn out into a long, thick neck. It is a native of Mauritius, the Seychelles, and some of the East Indian islands, and requires a stove temperature. There is a figure of the species in the *Botanical Magazine*, t. 2307.

— *XANTHOSOMA ROBUSTUM*.—This Mexican Aroid well deserves its specific name, as it probably produces the largest leaves of any in cultivation. The petioles attain a length of 6 feet or more, and are very thick, but by no means proportionally strong, owing to numerous large internal cavities or air spaces. The huge cordate lamina also lacks that firmness of texture common to many of the *Alocasias* and *Anthuriums*. In this respect it agrees more with the well known *Colocasia esculenta*. Such a subject would have little room to develop if cultivated in a pot, but if planted out, as at Kew in the Palm-house, where it is exposed to light, its bold and telling appearance may be more easily imagined than described. It is planted near that noble foliaged Palm, *Stevensonia grandifolia*, sometimes known as *Phœnicophorium*, and where visitors can walk underneath the leaves. The flower-spathe has a green tube and a creamy yellow lamina. It has flowered previous to this, in 1877, probably for the first time.

— *RHODOSTACHYS ANDINA*.—This is a very striking Chilean Bromeliad, of which a coloured figure is given in the last number of the *Revue Horticole*. The long, linear, recurved, strongly-toothed leaves are silvery-white on the under-surface. The tufts surround a dense head of rose-coloured flowers of great beauty. It is suitable for greenhouse cultivation.

— *ILEMANTHUS BAURII*.—As a rule, the flowers of this genus are some shade of red, and the generic name suggests as much. This species, however, is an exception to the general rule. It is a new species, as yet unrecorded in gardening books, and dried specimens were sent to this country in 1874 from South Africa by the Rev. R. BAUR, after whom

it is named. It belongs to the two-leaved section, and is allied to *I. rotundifolius*, but is easily distinguished by its broader, blunter leaves and pure white flowers and bracts, while the latter has a deep red or scarlet inflorescence. The inflorescence resembles that of *I. pubescens*, or the variety known as *I. albiflorus*, but the leaves of the latter are strap-shaped. The leaves of *I. Baurii* in good-sized specimens would be 4 to 5½ inches long and 6 to 7½ inches broad. The peduncle emerges from between the leaves, which are persistent during the period of flowering, and is from 1 to 1½ inch long. The bright yellow anthers contrast well with the purity of the other floral organs. A bulb has been flowering for some weeks in the Cape-house at Kew.

— PORTSMOUTH CHRYSANTHEMUM SOCIETY.—On Wednesday, the 16th inst., a dinner was given at the Royal Albany Hotel, Portsmouth, to commemorate the occasion of the holding of the first show for Chrysanthemums in that town. The chair was taken by Mr. F. POWER, the Secretary, Mr. G. ELLIS being Vice-Chairman. Amongst those present were the present Mayor and the ex-Mayor of Portsmouth, as well as most of the members of the Town Council and representatives of the principal trades of the town and neighbourhood. Much satisfaction was expressed by the speakers at the amount of success which had attended the Society's first venture, and with the love of flowers shown by the townspeople who had flocked to the show in great numbers. Next year it was proposed to add a challenge cup of the value of £25 to be competed for in the class for thirty-six cut blooms.

— *PRIMULA PROLIFERA*.—This is a handsome Primrose, with bullate leaves, and a tall central flower-stalk, bearing two to three tiers of yellow flowers, one above another. It is a native of the Khasia Hills, and is figured in the *Gartenflora*, t. 1204.

— CAPETOWN BOTANIC GARDENS.—We hear that retail orders can no longer be attended to at the Botanic Gardens, Capetown. As long as the opportunity lasted it has been of great use to the lovers of these beautiful things. The reason for this alteration is purely financial. The Director writes thus:—"It is a great pity we are condemned to mere nursery work for a living—but so it is. As soon as we have anything good we must sell it. Our expenses are £1400, and the Government subvention is £500." Mr. EVBANK tells us that he has been more than pleased with what he has got from the Capetown Botanic Gardens, and we have had similar reports from other correspondents. Many things have come into his hands which are not in the trade in this country at all. In the Isle of Wight he finds that a large proportion of Cape bulbs will do perfectly well in the open ground all the year round. All he does for them is to put a covering of "Willden paper" stretched on a frame over their heads for some eight or ten weeks in the winter. This answers perfectly, as it keeps the bulbs dark and dry, and so retards their appearance above-ground till all danger from frost is over. In the scorching days of summer it is well to give Cape bulbs a mulching of cocoa-nut fibre; this tends to preserve the foliage.

— THE TEA SHRUB, *FICUS BARBATA*, &c., IN SCOTLAND.—From the Edinburgh Botanic Garden, through the medium of Messrs. OWEN, we have received a good specimen of the Te plant, which has been grown out-of-doors in that establishment for more than fifty years. *Ficus barbata* is used for covering walls, as *F. repens*. The specimen is remarkable for the small ovoid pointed fruit, which we do not remember to have previously seen. *Veronica lycopodioides* proves hardy in Edinburgh, and is one of a group of dwarf shrubs that look more like little *Conifers* or *Lycopods* than *Veronicas*. Mr. WARE, of Tottenham, cultivates several varieties of this character, and showed a group of them at one of the meetings of the Royal Horticultural Society. A seedling *Nepenthes*, between *Rafflesiana* and *Chelsoni* x, has much of the character of *Rafflesiana*. The ground colour of the pitcher is greenish thinly speckled with purplish blotches.

— GARDENING APPOINTMENT.—Mr. W. SWAN, late of Oakley Gardens, Fallowfield, Manchester, has been appointed as Head Gardener to E. G. WRIGLEY, Esq., Howick House, Preston, Lancashire.

WROXTON ABBEY.

THIS fine old place (see Supplementary Sheet), the Oxfordshire seat of Lord North, lies north-west of the town of Banbury, from which it is some 3 miles distant. It dates back from a remote period, as here a Priory was founded by one Michael Belet about the close of the twelfth or beginning of the thirteenth century. At the dissolution of the religious houses Wroxton shared the fate of most other institutions of a like character—a fate very different from that which the founders, when bestowing their wealth upon them, intended that they should come to. The Priory appears, then, to have come into the hands of Sir Thomas Pope, who gave it to Trinity College, Oxford, of which he was the founder. After that it was held by the Gaildford family, through whom it descended to its present owner, through his mother, the Baroness North, second daughter of the third Earl of Gaildford.

The original Priory is understood to have been partly burnt—the present noble building was erected by Sir William Pope, and completed in 1661. Some portions of the original pile are still existent, and form part of the present mansion, notably part of the old chapel, a window of which, in good preservation, is an object of particular interest. Wroxton has not been wanting in honours from the presence of royalty; James I. was here, and also Charles I., with his Queen, whilst in later times the two sons of George III., who afterwards sat on the throne—George, Prince of Wales, and William, Duke of Clarence—both visited the place. An obelisk standing in a commanding position in the grounds commemorates the first visit made by the elder Prince, and which he twice subsequently repeated. The mansion is built of stone, is very substantial, and, as will be seen by the accompanying view of the entrance front, has architectural merits of a high order. Not its least attractive feature is the beautiful mantle of luxuriant Ivy which the walls are clothed. This grand old plant never fails to add by its presence to the appearance of a dwelling, be it palace or cottage, yet it is never so happily associated as when adorning an old building.

The road to the Abbey leads from the old-fashioned village of Wroxton, the numerous houses of which, with their Heather-thatched gables standing here and there in picturesque irregularity, have an old-world air about them that carries the imagination back to times remote, when they whose hands first brought the place into existence moved about the then silent paths with little of the whirl and turmoil that has since come upon the world to disturb them, with less to think about, and more time to weigh their thoughts. If their lot was cast in an age whilst yet the world was rude, and had less pleasing polish about it, still if men had been seemingly less to live for, if they had fewer pleasures, they had fewer pains. The gain is not so much on one side as it might seem to be. But this is digressing. Leaving the village we pass through the handsome entrance gates, where there is a lodge in keeping with the character of the place; the road here descends, leading through a grove of old trees, consisting of lofty Beech, Sycamore, Chestnut, and the like; following on further there are a number of Conifers, that here, in the deep soil of the sheltered valley, grow at a rate which, under less favourable conditions, would not be possible. They consist of Wellingtonias, Cryptomeria japonica, Taxodium sempervirens, Pinus Cembra, P. exelsa, P. austriaca, P. Strobus, P. Lucidus, and others, in association with Libanum Cedars. Leaving these, the road, still descending, leads to the entrance front, which is to the north-west. Here is a remarkable example of an Ivy-clad tree, an old Ash; its dense mantle of green clothes some 50 feet of its tall trunk. The position the mansion occupies is near the head of a valley, completely sheltered by high densely wooded ridges. On the south-east or garden front there is a wide terrace on which through the summer are stood a number of big Orange trees. From this point the valley gradually widens and stretches out with a gentle slope for a considerable distance, thus giving some 12 or 15 acres of level, composed of the greenest of green turf. To the left, looking from from the building, are several fine Cedars, the glaucous spreading branches of which give an agreeable contrast to the erect growth of the tall deciduous trees which form a background to them. On the slope at the opposite side of the valley are a number of very large old Elms, and other native trees

whose massive trunks and vigorous growth give promise that to the long ages of sentinel duty they have here done many more are likely to be added. In company with these are examples of *Araucaria imbricata*, *Taxodium sempervirens*, and *Cryptomeria japonica*, the two latter about 40 feet high, and growing at a rate such as never seen unless where the soil and situation are exceptionally favourable to them. At the lower end of the lawn are numbers of big old trees, amongst which is a Larch that has reached unusual size; an Ash not far from it girls 18 feet at 4 feet from the ground; several Elms about the same size; a Beech with its lower branches lying on the ground has a spread of some 100 feet, whilst it measures 15 feet round the trunk. Several old trees hereabouts are overgrown with Ivy that has attained a size such as rarely met with. Amongst these is an immense Holly, which, including the stems of the Ivy that cling tightly to its trunk, measures over 13 feet round. The Ivy stems on these trees have grown to the thickness of ordinary ship cables, whilst the dense mass of green foliage above has extended until it has formed huge columns 60 feet high and almost as much in diameter as the walls of a windmill. Neither does it seem to have the injurious effect on the growth of the trees it clings to that it has the bad reputation for. No one acquainted with matters arboricultural is likely to suppose that the presence of Ivy can benefit a tree, but the reverse; yet I am under the impression that it does not injure by strangulation in the way generally supposed, but simply by its roots robbing the tree of the food and water that should, and in its absence would, be available for the tree. Doubtless the extremities of the tree roots extend much further than those of the Ivy, although the latter stretch out a deal further than many suppose them to, and lying as they do near the surface they suck up every particle of moisture within their reach to such an extent that, in the many cases that I have examined the soil beneath, I have invariably found it as dry as tinder—a condition that in time induces an unhealthy state. In the valley where these Ivy-draped trees grow, at distances far enough apart, and in a position where their roots can find the requisite moisture, they have suffered little, through the simple fact, that the land contains enough of the elements of fertility necessary to sustain this dual kind of occupancy: hence their healthy condition.

(To be continued.)

Notices of Books.

The Vegetable Garden: Illustrations, Descriptions, and Culture of the Garden Vegetables of Cool and Temperate Climates. By MM. Vilmorin-Andrieux. English edition, published under the direction of W. R. Binson, Editor of the *Garden*. London: John Murray.

The original French edition of *Les Plantes Potagères* is the work of an expert, whose knowledge of his subject is probably as large or larger than that of any other individual that could be named—one, moreover, who is conscientious to a high degree, who spares no pains to acquire accurate information from all or any sources. The consequence is that he has produced a book of first-rate value for its immediate purpose, and one which will be consulted not only by practical gardeners but by botanists and men of science desirous of obtaining trustworthy information on the history and range of variation of cultivated plants. As we stated our opinion of the work on its first appearance, it will suffice now to announce the issue of an English edition. This will be so great a boon to gardeners that we may say without hesitation that no garden library can afford to be without it. The work has been adapted for English readers, and cultural details added by various persons, of whom the initials are sometimes, but not always, given, without other indication of their identity being furnished. The interpolations are clearly shown by a difference in the arrangement of the type, and it would have been more just, alike to reader and to writer, to have mentioned the names of those responsible for the cultural details given.

The alphabetical arrangement is adopted, as a curious result of which we have Broccoli and Cauliflower separated by some eighty pages, and both separated from Cabbage; Beetroot and Leafbeet are divorced by 200 pages—Dorset is sandwiched in between Beet and Broccoli. The desire to give English names is

also curious. Who ever heard of the "Unicorn plant"? Certainly *Martyrula* is not grown in this country as an esculent, but it is common enough as an ornamental annual. We remember some few years ago to have seen beds of it in remarkably good condition in the Zoological Gardens, which leads us to trace some significance in the name of Unicorn plant. Other zoological names are "caterpillars" and "snails," delicacies not often seen on English tables, and which we do not care to import. Any inconvenience that might ensue from this method of arrangement and nomenclature is, however, amply compensated for by the excellent and full index provided. French weights and measures have been retained, from the difficulty of expressing their equivalents unless by means of troublesome fractions. May this help on the speedy and utter disestablishment of our maddening system of weights and measures.

The editor has strong views as to the superiority of French over English vegetables. Had he confined his partiality to French cooks we could have more fully agreed with him. Any one who will compare the quality of general market produce of the two countries and disregard exceptions on each side will, we think, come to the conclusion that there is no very great difference between the two countries; in some cases—Potatoes, for instance—we are infinitely superior. The present volume will, we hope, be as serviceable in stimulating among us the culture of the delicious Cardoons, Aubergines, Celeries, Fineschio, and other vegetables scarcely known in this country, as it will in teaching our neighbours that Rhubarb is nice, Celery excellent, and Seakale not to be despised. If the editor could persuade them that the combination of uncooked vegetable with hot meats, as in the inevitable *potlet et salade*, was incongruous, many a traveller, wearied with the monotony of Watercress and chicken, would thank him. But this is wandering into the culinary department, where, although we have no business, we may yet repeat our acknowledgments of the general marked superiority of the French practitioners over our own.

Indigenous Flowers of the Hawaiian Islands.

By Mrs. Frances Sinclair. (Simpson Low, Marston, Seale & Rivington.)

Orchids, the Royal Family of Plants, with Illustrations from Nature. By Harriet Stewart Miner. (John Stark, 12, Essey Place, Camden Town.)

Here are two books which each in its degree illustrates that unhappy facility of the pencil we have so often reason to deplore. Here are time, labour, skill, talent—money to a large extent—thrown away. Those blessed with artistic talents need unfortunately to be reminded that skill without knowledge is little worth. The two books before us, that on Orchids especially, are little more than drawing-room table books. A more degrading fate for works which have cost much labour can hardly be conceived, unless it is to be consigned to the fire-screen.

The flora of the Hawaiian Islands, though fairly known to a few professed botanists, is so little known to the rank and file, and so almost unknown to horticulturalists, that Mrs. Sinclair's volume has much interest. The illustrations are faithful as far as they go, but they are "scrappy," give little idea of the "habit" of the plant, of the way in which it grows, nor of the botanical details of the flower. Again, it seems a waste of labour to figure common tropical trees and weeds by no means peculiar to the Hawaiian Islands, and some, indeed, not really native to them. This is the more to be regretted, as the artist has evidently quite unusual skill in draughtsmanship. Witness the perspective of the leaves in plate 4—*Smilax sandwicensis*. The text contains so many interesting details, that it is a matter for great regret that so observant and appreciative an artist should have lacked the botanical training requisite to give value to her labours. It is very desirable to preserve and fix the native names, but surely it would have been better to give them a secondary place in a book intended for European use.

It would be ungracious and ungrateful, however, not to express our thanks to the artist for the publication, among many better known plants, of such specialties as the *Mao*, *Gossypium tomentosum* (which does not, however, yield any of the cotton of commerce), the *Lycium sandwicense*, the very curious *Geranium cuneatum*, and *Hillebrandia sandwicensis*, plants of very great botanical interest, or various reasons not alluded to by Mrs. Sinclair, but which it

would have added greatly to the interest of her volume to have mentioned.

The Orchid book is a less favourable specimen than the work above mentioned, and its plates will not be considered by Orchid lovers as adequate representations. Mrs. Miner has not been fortunate in her selection of good varieties.

The Praise of Gardens: a Prose Cento. Collected and in part Englished by Albert F. Steveling. Elliot Stock.

Not unaturally perhaps our first thought on opening this dainty volume was of George III., and his wonder that an "apology" was needed in the case of the Holy Scriptures. Praise of gardens in the ordinary sense of the word is assuredly superfluous, though in another sense there is no one more sensible to flattery, delicate or gross, than your gardener, gentle or simple. The present volume is, it would seem, specially intended for arm-chair gardeners. "It is a natural consequence," says the compiler, quoting from an unnamed source, "that those who cannot taste the actual fruition of a garden should take the greater delight in reading about one." The book before us will, however, delight all classes of garden lovers, workers, lookers on, or sedentary students. It will, of course, appeal to each in a somewhat different way, and the success of the compiler will, we fancy, be shown by the manner in which, if we mistake not, he will be found to have catered for all tastes. He has done less perhaps for the plant lover proper than for other devotees of the garden, but we shall pick no quarrel with him on that score. The work is an anthology, a series of extracts from writers on gardens and gardening from the time of an unknown Egyptian who wrote some 1300 years before Christ down to the times of the writer of *My Summer in a Garden*. The collection is, as might be supposed, most varied and most interesting as an illustration of the history of gardening, and the course of fashion and taste. The temptation to systematise and arrange these extracts so as to form a history in chronological sequence is almost irresistible, but it would take more time and space than we could afford, and, above all, it would spoil the reader's pleasure.

Not only have we indications of the fluctuations of taste, but delightful side views of the characters of men. Here is Sir Joshua interceding for a clipt hedge at Beaconsfield and loving "to see the footsteps of man about a human habitation"—no advocate for the abolition of terrace gardens near to the house. Old Sam Johnson, the friend of Reynolds and Burke, was of opinion "that was the best garden which produced most roots and fruit, and that water was most to be prized which contained most fish;" and, again, "after one has gathered the Apples in the orchard one wishes them well baked and removed to a London eating-house for enjoyment." He sneers at Shenstone, and is a Philistine of Philistines in matters of landscape gardening. Hear what the old boy says:—"Whether to plant a walk in undulating curves and to place a bench at every turn where there is an object to catch the view—to make water run where it will be heard, and to stagnate where it will be seen—to leave intervals where the eye will be pleased, and to thicken the plantation where there is something to be hidden—demand any great power of the mind, I will not inquire. Perhaps a surly and sullen spectator may think such performances rather the sport than the business of human reason. But it must at least be confessed that to embellish the form of Nature is an innocent amusement, and some praise must be allowed by the most scrupulous observer to him who does best what multitudes are contending to do well." This is a fine piece of English prose writing; but if the surly and sullen spectator derive no other inspiration than this from the sight of a well-ordered garden, he had better "take a walk down Fleet Street." Macaulay was insensible to the charms of a garden, and Johnson and Thackeray cared little for them. Pope and Southey and Ruskin and Morris know better what a garden is capable of—what to do, and what to avoid. The true art is how to shun such artificiality as prevailed in the time of Pliny the Younger, which was revived at the Renaissance, and was readed ludicrous less than a quarter of a century ago, in the days of coloured stones and bits of glass, and to eschew the absurdity of bringing the forest and the alpine meadow immediately in contact with the

Hall door and the portico, and to study in all things the beauty of appropriateness. How seeming easy this may be—in practice it is very generally ignored. For proof look into almost any garden anywhere, or amuse and instruct yourself by the perusal of this volume.

The Golden Gate and Silver Steps, with Bits of Tinsel Round About. By Shirley Hibberd. (Allen.)

This is a "Christmassy" book—that is to say, that it is above and beyond criticism. It is not to be gauged by any artificial canons of art, literature, or science. The author and his readers have quite enough to do with such matters on most of the days of the year. Let the readers for once in a way dip—dig deep if they like—into this charming medley of sound sense and nonsense. They will laugh at the humour, be touched with the pathos, and be all the better for the high tone which pervades the book. Some of the notes, such as "Water-cresses," and the Cotton yarn are old friends, and none the less welcome on that account. Others are new—at least, to us. The fragments are unequal—of course they are—however, no criticism can be allowed at Christmas. We may, however, assure the author that Mr. Joseph Miller, the jester, was not buried in Chiswick Churchyard, but in the graveyard of St. Clement's Church, in the Strand, the site now occupied by King's College Hospital.

The Live Stock Journal and Agricultural Gazette Almanac for 1886. (Vinton & Co.)

This is as full of meat as an egg, and will be found a most acceptable Christmas card to send to agricultural cousins. In addition to the usual calendrical matter there are no fewer than twenty-six original essays on various points interesting to farmers, graziers, and cattle breeders.

TREES AND SHRUBS.

THE TULIP TREE (LIRIODENDRON TULIPIFERA).—It is a pity that specimens of this splendid North American flowering tree are so few. It always arrests attention whenever a well-grown specimen is seen, for no tree has a more elegant appearance as a park or garden tree. Its habit somewhat resembles the noble *Platanus occidentalis*, yet the Tulip tree possesses charms entirely its own, because it is not at all unusual to see it during the month of July covered with its solitary terminal, variegated, six-petaled, fragrant flowers, which, together with its singularly distinct foliage (the leaves being three-lobed, with terminal lobe cut short), should command the greatest admiration. A fine tree is flourishing on Mr. A. F. Lindemann's lawn at Sidhote, Sidmouth, Devon. It is situated in an open yet sheltered situation within a short distance of the front of the mansion, and reaches a height of at least 60 feet. Its trunk, at 3 feet from the ground, is 9½ feet in circumference, and the spread of its branches is some 70 to 80 feet wide. *W. N.*

SALISBURIA ADIANTIFOLIA

(the Maidenhair or Ginkgo tree).—I have explored most of the gardens throughout the West of England with the view of finding a larger specimen than the fine example in the famous rock garden at Messrs. Locombe, Pince & Co.'s establishment at Exeter of this deciduous and scarce coniferous tree, and I have not succeeded in searching out even one worthy of being compared with it. Doubtless it would prove interesting to some of your readers, as well as myself, to ascertain through your pages whether there are any in Britain of greater size. The dimensions are:—Girth of trunk at 3 feet from the ground, 4½ inches; girth at base, 56 inches; and height, as given by Kay's dendrometer, 39 feet 2 inches. Its erect trunk is free from branches to a height of 14 feet, and after that gives off branchlets and limbs much after the style of the Larch tree (*Larix europæa*), so that the stem or body may be said to taper from the base—in fact the topmost growth or leader is whip-like, and forms the pinnacle of a conical-headed tree. *W. Napper.* [Is it male or female variety? Ed.]

BERRY-BERRY PLANTS.

In his article on berry-bearing shrubs Mr. Webster mentions *Skimmia japonica*. I presume he means the hermaphrodite form usually sold under this

name. The diceious female form sold as *Skimmia oblata* is, however, far superior, both in size and colour of berries, as well as in the profusion in which they are produced, if a male plant, generally sold as *S. fragrans*, be planted near it. The best way is to plant the female first, and allow it to grow without fertilising for a few years, as it makes a larger and finer bush when it does not produce berries, and it is well worth growing for its very fragrant flowers. I enclose specimens of both forms from my garden at Colwyn Bay. I am surprised at Mr. Webster's statement that the birds soon devour the berries of *S. japonica*. With me, on the contrary, they do not touch the berries, which remain on the bush till the end of the following summer. This is the more remarkable, as my garden is only about 12 miles from Mr. Webster's, and on the same coast. It is not for want of birds, as a *C. pyrrhanta*, growing a few yards from the *Skimmias*, is already entirely stripped of its berries—not one is left. Is it possible that the birds with me are not educated yet to like the *Skimmia* *A. J. Walker*.

HOME CORRESPONDENCE.

Hollies.—The text-books give the Holly as a monoecious plant, bearing flowers of both sexes, and each plant consequently sufficient for its own fertility. In these gardens, as elsewhere, there are fine Holly trees standing side by side fifty or sixty years old, and, to all appearance, perfectly healthy and vigorous. The one is habitually fertile, and is now crowded with berries, the other never has a berry. Can you or any of your correspondents oblige me by an explanation of this sterility, which is noticeable in every plantation? *R. J. II.* [The Holly is polygamous. Some of the flowers are male, others female, others hermaphrodite. Sometimes one kind of flower only is produced on a tree—sometimes all three; again, they vary from season to season. Ed.]

Bonâ fide Exhibits.—May I ask the committee of the National Chrysanthemum Society, through your columns, whether they consider it fair and honourable to allow an exhibitor for certificates to show specimens of cut flowers unless they are vouchered for as having been grown by the exhibitor, and not obtained from extraneous sources? Many are under the impression that certificates have been awarded for blooms not grown by the exhibitor. Should the committee not deem the above condition necessary I cannot help thinking it would be fairer to all that each exhibitor should state whether the blooms are grown under his own charge or not. *W. G.*

Rhododendrons for Forcing.—Referring to the request of a Dutch florist on p. 794 of the last issue of the *Gardener's Chronicle*, I presume he does not mean the greenhouse varieties of the *R. javanicum* type. What I would desire to commend to his notice is the group of sweet-scented types raised by Messrs. Isaac Davies & Son, Brook Lane Nursery, Omskirk. They were obtained from *R. multiflorum* × *R. Edgworthii*; they are bushy growing, very free blooming, and easy of cultivation, in addition they are sweet-scented. The varieties are Countess of Derby, Mrs. James Shawe, Lady Skelmersdale, Countess of Sefton, and Duchess of Sutherland—all white, one or two of them tinted with rose, but distinct in colour. There are three other hybrids of a very different character, viz., *R. Davisii*, *R. floribundum*, and *R. Pixy Queen*, that are excellent varieties for forcing purposes. The first-named group, with their fine flowers, do not require a great deal of fire-heat, but the application of this depends upon the time when it is desired the plants should be in bloom. *R. D.*

Heritiera macrophylla.—I forward you a branch of this plant, mentioned lately in the *Gardener's Chronicle*, with some young fruits on it. Our plant is 4 to 5 metres high, and seems to be in a very healthy and vigorous state. It was reported in the spring of 1884. It then lost its leaves. The new leaves appeared quickly; they showed themselves at first with a fine pale pinkish-yellow or *café au lait* colour, and white underneath; now they are of a bright green, and silvery on the lower side. This summer the flowers have been abundantly produced. I recommended that the flowers should be shaken, in order to facilitate fertilisation, and almost every day the plant has been shaken to disperse the pollen. In the specimens preserved in the herbarium the plant flowered in 1877. These dried specimens show a

number of very young leaves, but not on the flowering branches, where the leaves are quite green. It would be curious to know whether the new leaves do, as they have done twice at the Museum, precede the flowering. In the herbarium the specimens grown were sent from the Calcutta Botanic Garden by Wallich, as a new and remarkable plant. Is the plant I sent you really and truly *Heritiera macrophylla*? *Maxime Cornu, Jardin des Plantes, Paris.* [From Kew we have received even finer specimens, with clusters of ripe fruit, each about the size of a small Walnut. The fruit is hard and woody, slightly tubercled, and with a broad strap-shaped wing attached. We do not observe the young leaves as described by Professor Cornu in the Paris specimen, or those from Oxford or from Kew. Ed.]

The Bracts Falling from Poinsettias.—May not the heavy but smoky fogs we have had of late,

between the two, for the purpose, on the one hand, of transfusing the fine soft shade of *sarniensis* with the brilliant vermilion-scarlet colouring of *Fothergilli*; and on the other hand of securing a free-flowering form of the *sarniensis* type. Growers of *Nerines* know how shy the latter form is under greenhouse cultivation, and how free and facile dealt with, from a flowering point of view, is *Fothergilli*. I effected the cross successfully, and the result was the form now under discussion. It turned out exactly as I wanted. I obtained the soft orange-scarlet colour without affecting appreciably very much the habit of the female parent, and I also secured—what is very desirable in all horticultural crossing—freeness of flowering. True, the constitution is not quite so vigorous, and the leaves are a little more strap-shaped than its female parent, but it is so unlike the pollen parent in everything else but colour, and the colour is much more pronounced and eye-pleasing in

value of the produce sent into market by private growers. Any trustworthy information on these points we shall be glad to receive. *Smith & Lark, Ashford, Middlesex.*

Stephanotis Fruit.—A correspondent sends us the fruit, of which we give an illustration (fig. 188). As the flowers require the aid of insects in order to "set," it is comparatively rarely that we meet with the fruit. In the flower there are two ovaries, but in the case before us only one has set, the other has withered away. The fruit in question is thick and fleshy, the constituent cells containing nourishment for the seeds; these are flattened oblong bodies, in shape something like Melon seeds, but broader, and each provided with a long tuft of silky white hairs, by means of which the seed is dispersed by the wind. In the unripe fruit before us, however, the tuft of silky hairs detaches itself so readily from the seed that it would

FIG. 187.—HURSLEY VICARAGE. (SEE P. 807.)

especially during the prevalence of those cold easterly winds, have had something to do with the bracts falling off, when we remember how our glass structures become coated with smutty smoke, and thus clear light is at a disadvantage? A few years ago many of our trade and private collections of winter flowering Orchids in the suburbs suffered very much by the falling of the buds, and to the above cause was ascribed the evil. *J. F. M.*

Nerine Meadowbankii.—Mr. Baker (see p. 779) is not quite accurate in placing *Meadowbankii* under his divisional code with *sarniensis* as the type—indeed I am in doubt whether he has seen this form (*Meadowbankii*), which is in limited bands. If it is allied at all to *Cerroxa* it is in a cousin-german way. Its history and parentage is this:—Some dozen years ago I had a fine semital form of *N. Fothergilli*, and I had also a good flowering potful of *N. sarniensis*. [I desired to effect a cross

the form under question, that if I were consulted in the final diagnosis I would ask Mr. Baker to transfer it to his *curvifolia* division as a distinct variety, from a horticultural point of view, and one, too, the longer it becomes known the better it will be appreciated. *James Anderson.*

Taxed vs. Untaxed Trading.—Our attention has only just been called to the remarks of Mr. James Anderson, of Meadowbank, Lanarkshire, under the above heading, in your issue of the 5th inst. It may, we think, be satisfactory to Mr. Anderson and other of your readers to know that the subject of "Untaxed Trading" was fully and carefully considered in our report on the nursery trade to the "Royal Commission on the Depression of Trade and Industry." We were, however, unable to give definite information on two points—1, the number of landowners, gentry, and noblemen, sending their spare produce, or growing especially for market; 2, the

not be of any service in this way. Perhaps as the seed ripens the attachment becomes firmer.

Luculia gratissima.—At Messrs. Lucombe, Pince & Co.'s Camellia-house, at Exeter, a specimen is just now loaded with about 150 of its terminal cymes of fragrant flowers, and covers a wall some 14 feet in height by 12 feet. This fine plant is one of the finest examples in the country. *W. Napper.*

—This plant is largely grown in an intermediate temperature at Comely Bank Nurseries, near Edinburgh; a house about 40 feet long is filled with large plants of it, which flower profusely in mid-winter. There is also a large stock of young plants. The foliage is fine, many of the leaves being 6 or 8 inches long. The large bunches of pale pink blossoms are singularly beautiful, and are strongly scented. If not exposed to the air, Mr. Fraser says, the dried flowers retain their scent for at least a year. *L. Pinceana* flowers less freely

than *L. gratissima*. *C. M. Owen*. [A stout corymb of this beautiful flower, together with some unusually fine foliage, accompanied this communication. Ed.]

Daffodil Notes.—What is the average rate of increase in Daffodils? So far as I am able to judge by my own experience as an amateur, the greatest rate of increase is threefold in three years. Thus one bulb would become nine in six years, and twenty-seven in nine years, and so on. At this rate it would take about thirty-two years from the birth of a seedling until the stock of it had multiplied, under the most favourable conditions, to 20,000. The result would be nearly the same if we took the rate of increase by doubling every two years, as it would take about

probably escaped from Mr. Leeds' garden at Longford Bridge. Now, we know that there was a stock of it at Maesmynan of at least 20,000 large bulbs in 1883, when it was sold to Messrs. Dickson, and we can say at once that the origin of the plant must have been remote. Mr. Pickstone stated to me at that time (see *Gardeners' Chronicle*, April 26, 1884, p. 551) that he found this Daffodil in Merionethshire sixteen years before. By the quickest rate of increase, as above stated, it would take that bulb thirty-two years to become 20,000; so it is quite evident that Mr. Pickstone's statement cannot be relied upon, or else that he found a large stock of it all ready, which is the most probable conclusion we can come to on the matter. As to Mr. Leeds having raised Sir Watkin (a most

question may be elucidated, and not as absolutely accurate. I hope some of your readers will be able to carry the subject a little further, and give us a reliable basis upon which such calculations may be made. The results satisfy me that Sir Watkin is an old Daffodil, and not to be credited to any modern gardener, and I still believe it to be as old as the plate in Hale's *Eden*. *W. Brocchbank*.

Unseasonable Flowering of Fruit Trees.—If your correspondent, Mr. C. Sheppard (p. 758), wanted to give a knock-down blow to the Quince and Paradise stocks, why did he not do it openly?—as he only surmises that that wonderful "pyramidal Pear in full flower" is "likely" to be worked on the Quince stock. Why, I thought every one had seen fruit trees in flower at unsuitable seasons before the Quince stock was used for Pears to the extent it now is; and if your correspondent wants proof of untimely flowering of fruit trees, let him spend an evening or two in search of the same in some of the back volumes of the *Gardeners' Chronicle*; he will find scores of instances there without going further afield. Again, if he means to keep abreast of the times in Apple and Pear culture, he must get rid of his prejudice for these stocks, for to a certainty they will be the fruit producers of the future, and, indeed, are at the present. "The proof of the pudding is in the eating," and I have had more than enough of Pear-growing on its natural stock, with its constant hard work, lots of pruning top and roots, and often little fruit when done. With trees on the Quince stock much of all this is avoided, and with a minimum of labour there is always a maximum of fruit, finer in colour and size, and equal in quality to the best grown on the Pear stock, and that without having to wait so long a time either for returns. *W. W. H.*

Large Seed Potatoes.—Is the inference drawn from the product of the big 15 oz. palmate Potato planted at Chiswick last season a fair one? Certainly one of such peculiar form would have more than the ordinary quantity of eyes, and would therefore furnish more than the ordinary number of stems; and, planted in good soil and ample room, might reasonably be expected to produce a good crop. On the other hand, the greater portion of large tubers being of the ordinary shape would not throw more than the usual number of shoots, hence the produce would not so greatly exceed that from a similar set or tubers one-half the size. Had the palmate Potato been cut into five sets, and each one planted separately, no doubt the root produce would have reached 10 lb. or 12 lb., so that cutting would, in that case, have proved a gain. This simply shows that such an illustration of the results of planting big tubers as that given does not go for much. Again there is some slight misconception in the assumption, common enough no doubt, that the bigger the seed tuber the stronger must be the resulting growth. That does not always follow, because it is found that under no circumstances can a big tuber force or carry the growth of its shoots beyond a certain stage, unless aided by moisture to develop roots. Place any number of large tubers and also small ones upon a dry shelf in a warm house and close to the glass, and it will be found, if all moisture be carefully excluded, that in neither case will the shoots exceed 1 inch in length, let the tubers remain ever so long; thus evidencing that the innate power of the tuber to furnish nutriment to its shoots is limited. Add moisture so that roots are developed from the shoots, and growth will go on *ad libitum*. *A. D.*

FIG. 188.—FRUIT OF STEPHANOTIS. (SEE P. 816.)

thirty-three years for a seedling to increase to 20,000. I believe, however, that this would be an extreme rate in ordinary hands. The professional bulb grower could possibly do far more than this, but I am considering ordinary garden work. It would not be safe to reckon upon the taking up and replanting of every bulb each fourth year, so as to get the greatest result. I should say, therefore, that if we take for the rate of increase a doubling every third year it would be a fair average basis on a large scale, and at this rate it would take forty-seven years from the seedling to the stock of 20,000 bulbs. Now, if we apply these calculations to the case of the Sir Watkin Daffodil we shall find some curious considerations to arise out of it. Mr. Barr, Mr. Burbidge, and others, have stated their suspicion that Mr. Pickstone's Daffodil

unlikely thing indeed, from my point of view), I believe there was no Longford Bridge Daffodil ready to be shown in flower before 1851; and supposing that an odd bulb had escaped from Mr. Leeds' fold in that year, and come into Mr. Pickstone's possession, and that he had grown it on first in Merionethshire, then in London, and lastly at Maesmynan (where I saw it in large clumps amongst Rhododendrons and in a wood, certainly not under favourable circumstances for the greatest possible increase), it could not possibly have increased to 20,000 in 1883. At the quickest rate of increase it would have taken thirty-two years, which would have just made it 1884, whilst at the most probable rate of increase it would have been 1898. I merely throw out these rough calculations with a view of suggesting a way by which this

GRASSES—CHEMICAL COMPOSITION AND AGRICULTURAL VALUE

A MOST comprehensive and instructive treatise upon the agricultural value and chemical composition of the grasses of the United States, either native or naturalised, has been published by the Department of Agriculture in Washington, under the authorship of Dr. George Vasey, Botanist of the Department, and Clifford Richardson, assistant chemist. As the subject is one of such vast importance to all cultivators of the soil in this country as well as in America, we make no apology for bringing the matter before our readers.

Every thoughtful farmer, dairyman, or grazier realises the importance of the production on his land of a good supply of grasses for pasture and for hay. Yet this is a subject which has been, and still is very sadly neglected by farmers generally.

The grasses which we have in cultivation were once wild, and are still such in their native homes.

The question is asked, Can we not select from our wild or native species some kinds which will be adapted to cultivation in those portions of the country which are not yet provided with suitable kinds? Many observations, and some experiments, especially those of Sir J. B. Lawes, at Rothamsted, Hertfordshire, have already been made, and if proper research be followed up by the agriculturist himself, there is no reason to doubt that proper species will be found for successful cultivation in all parts of our own country, as well as in the New World.

Dactylis glomerata (Cock's-foot or Orchard-grass).—This is one of the most popular grasses of Europe, of strong and luxuriant habit of growth. It is more highly esteemed and commended than any other species by both farmers and graziers—a most decided proof of its great value and wonderful adaptation to many soils, climates, and treatments. Yet strange to say, though growing in England for many centuries, it was not fully appreciated in this country till brought here from Virginia in 1764. But as in the case of Timothy-grass (*Phleum pratense*), soon after its introduction from America it came into high favour, and still retains its hold as a grazing and hay crop. It is less adapted for lawns or pleasure grounds, on account of its tufty habit of growth. It will grow well on any soil containing sufficient clay and not holding too much water. If sown alone on good soil it will furnish two or three cuttings the first year, according to season and manurial treatment, yielding from 1 to 3 tons of excellent hay per acre.

It is a peculiar feature with this grass, that it can be easily cured and handled; but after a year or two it is disposed to develop into clumps and leave much of the ground uncovered. This may be in great part obviated by thick sowing, using from 2 to 3 bushels of seed per acre. The gaps may further be prevented by sowing with it a few pounds of *Poa annua*, *Phleum pratense*, or *Trifolium repens*. After being cut it has been found to grow 6 inches in less than three days, and affords a large amount of aftermath. Sheep leave all other grasses if they can find this, and acre for acre it will sustain more head of stock than any other species of grass. Cut at the proper stage it makes good hay, which is easily masticated, digested and assimilated by animals.

The testimony that has been collected from all parts of the world for two centuries past establishes the place of this species among the best of our forage grasses, and there is not the shadow of a doubt that the interests of our graziers and dairymen would be greatly promoted by its more extended cultivation. It is always found in the rich old ox-pastures of England, where an acre of land can be relied on to fatten a bullock and four sheep. It is admirably adapted for growing in the shade, no grass being equal to it in this respect, except the rough-stalked Meadow-grass (*Poa trivialis*), hence its American name of Orchard-grass.

Poa pratensis (smooth-stalked Meadow or Kentucky Blue-grass).—A well-known species, producing an abundance of long radical leaves. There are several distinctly marked varieties, which are much modified and improved by good cultivation. It is a species that has not a very high estimation in this country, but on the marly soils of America it is all in all, both for summer and for winter keep. It is indigenous to mountainous regions, and has been freely introduced into cultivation in the mixed herbage of grass-lands.

From the unexampled success this species has met with in Kentucky, it has acquired the name of Kentucky Blue-grass, although in New England it is known by the name of June-grass. In all the middle portions of the United States it forms the principal constituent of pastures, though its excellence is said to be rather depreciated in the Eastern States.

It has frequently been employed alone for curing into hay, but its chief value is exhibited as a pasture grass. It endures the frosts of winter better than most, and its long narrow leaves grow in such profusion that on rich soils it covers the ground with most luxuriant foliage, but on poor sandy land it degenerates sadly.

It would prove a capital variety to introduce upon railway embankments owing to its running sub-eranean stems; from 4 to 6 lb. is recommended for an acre of land when sown with other grasses.

Percentage Composition of *Poa pratensis*.

	Protein.	Fibre.	Carbo-hydrates.	Fat.	Ash.

In full bloom ..	12.61	23.76	51.43	3.99	8.30
In seed ..	12.49	24.34	39.54	4.25	6.38

Poa trivialis (rough-stalked Meadow-grass).—This species much resembles *P. pratensis*, but is chiefly distinguished by its fibrous roots, whereas *P. pratensis* produces runners from the root-stock, and is classified as one of the Couch-grasses. *P. trivialis* has been but little cultivated by itself, nor is it adapted for that purpose; it, however, forms an excellent pasture grass in mixed herbage, especially in shady meadows and by the borders of streams; it imparts a lively green, and is very useful in lawns and pleasure grounds.

Phleum pratense (Timothy or Cat's-tail grass) is one of the commonest and best known grasses. For a hay crop it is perhaps the most valuable. The height of the plant depends on soil and cultivation; in poor ground it may be reduced to one foot, while in good deep loam it readily attains to 3 or 4 feet, and in the United States it is said to occasionally grow to twice that height. It is a perennial grass, with fibrous roots, but the base of the culm is sometimes thickened and inclined to be bulbous. About the year 1720 it was taken to Maryland by Timothy Hanson, and received the name of Timothy-grass. It is now the favourite and prevailing meadow-grass over a large part of the United States. As a crop to cut for hay it is probably unsurpassed by any other species. Though somewhat coarse and hard, especially if allowed to ripen seed, yet it cut in blossom, or directly after, it is greatly relished by all kinds of stock, and especially by horses. The following table shows it to contain a large amount of nutritive matter:—

Percentage Composition of *Phleum pratense*.

	Protein.	Fibre.	Carbo-hydrates.	Fat.	Ash.

We shall hope to continue the subject on a future occasion. *John F. Willis, Harpenden.*

Obituary.

We regret to announce the painfully sudden death of Mr. Edward K. Harrison, the publisher of Merton House, Salisbury Square, the principal proprietor of *The Young Lady's Journal*. It is only a few months since a notice of Mr. Harrison's beautiful collection of Orchids at Shortlands appeared in these columns, he being a most ardent horticulturist, and his extensive grounds and ranges of glass being the receptacles of much that was new and beautiful in the floral world. In accordance with the popular taste *Crysanthemums* formed regularly a very striking autumn display—one whose beauty was remarkable, the selection embracing all that was worthy of the grower's care.

—MR. ALEXANDER PROTHEROE.—It is with much regret that we announce the death, on the 9th inst., of Mr. Alexander Protheroe, in his eighty-second year. Mr. Protheroe was brought up by his uncle, Mr. Thomas Jenkins, the owner of the once famous nurseries at Regent's Park, and to which business he would in all probability have succeeded had he chosen to remain with his uncle. Old Mr. Jenkins' strict disciplinarianism, however, was too severe for his nephew, who left to start affairs on his own account. He commenced business as a horticultural auctioneer and valuer, and with his knowledge of plants he soon suc-

ceeded in establishing a reputation. Mr. Protheroe continued to sell and value for nearly forty years. About sixteen years ago he handed over this branch of the business to Mr. G. F. Morris and to his son Mr. W. H. Protheroe, who continued to carry the business on under the old name. Mr. Protheroe then devoted his attention to his nurseries at Leytonstone, and continued in harness to the end.

Variorum.

A CHRISTMAS ROSE.—The following piece of folklore is quite new to me, and may be so to most of your correspondents:—"Our maid Betty tells me, that if I go back-wards without speaking a word into the garden upon Midsummer Eve, and gather a Rose, and keep it in a clean sheet of paper, without looking at it, till Christmas Day, it will be as fresh as in June; and if I then stick it in my bosom, he that is to be my husband will come and take it out." *F. C. Birbeck Terry, in "Notes and Queries."*

ORANGES AND LEMONS IN SICILY.—Regarding the development of the green fruit trade in Sicily, it is stated that efforts have recently been made to form an Association to further its growth. Within the last few years this traffic, which is so important to the island, has suffered considerably. The fruit markets of the United States, of England, and of the Adriatic, have been overstocked by a superabundance of Oranges and Lemons supplied to them from Spain and Portugal, as well as Sicily, and in the United States this trade will eventually suffer still more from the rivalry which California is creating. It is to be hoped, for the interests of the grower of Oranges and Lemons, of the trader in these articles, as well as for those of the shipowners, mostly English, who are engaged in this particular trade, that the efforts now being made to give a more healthy tone to this branch of trade may be successful. Success very much depends on selection of the fruit, its speedy transmission to its destination, and regularity in reaching the same, so as to avoid overstocking the market. Amongst the commercial transactions the Association proposes to make is to establish agencies in different parts of the world, and to establish factories for the manufacture of Lemon-juice and other essences. In November, 1884, eight steamships left the port of Palermo for the United States laden with green fruit, numbering 24,811 boxes of Oranges, and 47,269 boxes of Lemons, being 4603 boxes of Oranges less, and 11,993 boxes of Lemons more, than in the same month in 1883. In December, 1884, thirteen steamships left the port of Palermo for the United States with green fruit on board they loaded at the above port, besides the fruit they had taken on board at other ports in the island, 80,293 boxes of Oranges, and 54,191 boxes of Lemons, showing, as compared with the same month in 1883, a diminution of 40,185 boxes of Oranges, and 63,234 boxes of Lemons. The green fruit crop of Spain having totally failed, it is hoped that Sicily will reap the benefit of this disaster, and towards the beginning of the present year prices had gone up in England. In January last sixteen British steamships and two Italian vessels were employed in the fruit trade with the United States, carrying a total of 54,778 boxes of Oranges, and 62,359 boxes of Lemons from Palermo; a diminution of 55,416 boxes of Oranges, and 62,359 boxes of Lemons. The exporters thus have kept back their produce, and not overstocked the market. While the preceding facts come from the British Consul in Palermo Vice-Consul Franck, of Catania, says, under the head of Oranges and Lemons:—"These important products, which a few years ago promised to become a branch of commercial resource to the island, have proved instead a failure to all those who tilled their fields and grounds to Orange and Lemon groves. Prices in America (the chief country where exported) are so very low that it is more convenient for the producers to let the fruit rot on the tree than to go to the expense of packing it up for exportation."

VEGETABLE GLASS-PAPER.—Under the name of "Uisasa" the leaves of *Ficus asperifolia*, Miq., are used by the natives in Zanzibar for polishing sticks. As the specific name indicates, the surface of these leaves are very rough, and it is on this account that they are used for the same purpose as we use glass-paper. Some of these leaves having been sent to Kew by Sir John Kirk, I submitted them to Mr. Robson J. Scott, the well-known Boxwood block

maker, of Whitefriars Street, for his opinion as to the probability of their being found useful in producing a surface to the engravers' blocks. To this Mr. Scott replied that they could not compete with glass-paper at twenty-four sheets for 9d., which has an uniform and durable surface. The difference between the action of the glass-paper and the Fig leaves is, that the former abrades the surface of the wood, while the latter only polishes it, showing that the cutting particles on the leaf must be very fine. John R. Jackson, Museum, Kent.

THE CULTIVATION OF USEFUL PLANTS IN TENERIFE.—A recent commercial report from Tenerife says that the great desideratum of the island is the discovery of some agricultural product to replace the "Tunira," or Cochineal Cactus. A few though feeble attempts were, however, made during the year in cultivating fibre-yielding plants, such as the Aloe, &c., which, although growing in wild profusion all over the land without care or culture, and requiring no outlay of capital, came to nothing beyond making use of the tall pole-like stems, which grow to a height of 12 to 15 feet, and when cut down and dried are split for water-pipes or courses for irrigating and other purposes, or as props of all kinds. The Sugar-cane, Coffee and Tobacco, continue to be successfully cultivated, still the yields are too insignificant to contribute as articles of export, with the exception of some Tobacco, which is shipped to Spain. Sugar is being manufactured both in Tenerife and at Grand Canary, but as yet only for local consumption, while Coffee is consumed chiefly by the growers themselves.

The general mean of the seven daily ranges was 7°·9. The mean temperatures were, on the 13th, 39°·2; on the 14th, 43°·1; on the 15th, 42°·6; on the 16th, 38°·7; on the 17th, 45°·5; on the 18th, 44°·1; and on the 19th, 37°·7; of these the 14th, 15th, 17th, and 18th were above their averages by 2°·4, 1°·9, 5°, and 3°·9 respectively, the rest were below by 1°·4, 2°, and 2°·3 respectively.

The mean temperature of the week was 41°·6, being 9°·6 higher than last week, and 1°·1 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 67°, on the 15th. The mean of the seven readings was 52°·7.

Rain.—Rain fell on three days, to the amount of 0·04 inch.

ENGLAND: Temperature.—During the week ending December 19 the highest temperatures were 50°, at Newcastle, 54° at Truro and Leeds; the highest at Preston was 48°, at Bradford 48°·8, at Blackheath 49°·1. The general mean was 51°·3.

The lowest temperatures were 29°·6 at Wolverhampton, 30° at Cambridge, 31° at Blackheath; the lowest at Newcastle was 35°, at Leeds 37°, at Bradford 36°·8. The general mean was 33°·6.

The greatest ranges were 21°·6, at Cambridge, 20°·9 at Nottingham, 20°·4 at Wolverhampton; the least ranges were 12° at Bradford, 13° at Preston, 16°·9 at Bolton. The general mean was 17°·6.

The mean of the seven high day temperatures was highest at Truro, 51°·4, at Plymouth 49°·6, at Leeds 48°·7, at Blackheath the highest was 44°·9, at Wolverhampton 45°·2, at Bolton 45°·5. The general mean was 47°·1.

The mean of the seven low night temperatures was highest at Truro, 43°·3, at Plymouth 40°; at Liverpool 40°·5; and was lowest at Wolverhampton, 34°·7, at Nottingham 36°·2, at Bolton 36°·5. The general mean was 38°·5.

The mean daily range was greatest at Nottingham, 10°·6, at Wolverhampton 10°·5; at Bristol 10°·1, and was least at Liverpool, 6°·5; at Bradford 6°·7, at Preston 7°·1. The general mean was 8°·6.

The mean temperature was highest at Truro, 47°·3, at Plymouth 45°·3, at Newcastle 44°; and was lowest at Wolverhampton, 40°, at Bolton 41°, at Nottingham 41°·5. The general mean was 42°·8.

Rain.—The largest falls were 0·18 inch at Bristol, 0·11 inch at Preston, 0·10 inch at Nottingham. The smallest falls were 0·04 inch at Plymouth, Blackheath, and Wolverhampton, 0·05 inch at Brighton and Cambridge. The general mean was 0·06 inch. No rain fell at Bradford and Leeds.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

* * OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that in pursuance of the new telegraphic regulations our Registered Telegraphic Address is "GARDCHRON, LONDON." GARDCHRON being written as one word. Telegrams (but not letters) thus addressed will reach the Editor or the Publisher without other address being needed than "GARDCHRON, LONDON."

AUSTRALIAN HOLLY: *F. T. M.* The so-called native Holly of Australia is *Lomaria filicifolia*; of course, it has nothing whatever to do with the Holly, but that is a peculiarity of popular names.

BOOKS: *R. W. A. Natal, Refugium Botanicon* (Van Voerst, Patenter Row).—*G. L. The Clematis as a Garden Flower*, by Moore and Jackman (J. Murray, and Woking Nursery, Surrey).—*J. Beattie, Get British Apples*, published by Macmillan & Co., 21, ed., paper—there is no cloth edition.

EARLY DAFFODILS: *Collins Eros*, and *Gabriel*.—The flowers of *Narcissus pallidus procyon* were very nice, and acceptable for the season.

HORTICULTURAL SOCIETY *H. Mobbs*. According to the rules wherever there is a clear distinction laid down between "annual subscribers" and "ordinary and cottager members." Again, the committee is ordered to consist of twelve "members," and the mode of electing such "members" is also specified. We are, therefore, of opinion that no annual subscriber can be made a member of the committee unless he becomes a member according to the provisions of rule 6. We can find no trace of the receipt of your fruit.

NAMES OF PLANTS: *W. S.*, 1, *Thuiopsis borealis*; 2, *Retinospora obtusa*; 3, *Juniperus virginiana*; 4, a Juniper, which we cannot name. — *W. F. B.* As far as we can tell, *Amaryllis fulgida*.

PEAR CONFERENCE: *Errata*. In giving the return of the exhibits received from the various counties those

of Dorset were omitted—the magnificent collection of 112 dishes exhibited by Mr. Brantley having been included in those of Devonshire. For Lord Chester field, Derbyshire, read Lord Chesterfield, Herefordshire. A. F. B.

PINUS LEMONII: *J. L.* A dwarf variety of *Pinus Finaster*, figured in *Louder's Arboretum*.

UNHEALTHY GARDENIAS: *Z. Y. X.* The roots and moss were too dry to report on with certainty. No life was found on the root or soil round it. Some eggs in white flocculent matter were found on the moss, but it cannot be said that they are without reaching them. They have been put into a cell, and if they are reared the result will be made known. We fancy they are not *Acaeus* eggs. In some moss wrapped in paper some mites were seen, but were in a stage when identity is difficult, but they may be *Rhizoglyphus*, which are root-eaters. If a root, just when it began to fail, were dug up, wrapped in oil-silk, and put in a tin box, so that no evaporation and drying up could take place, we might be able to speak with more certainty.

SEEDS: *Waite, Nash & Co.*—The seeds are those of the Japan Wax-tree, *Rhus succedanea*, L.

WATER ANALYSIS: *Foster & Pearson*. The substances in the water make it quite unsuited to feed a boiler.

WORKS ON GREENHOUSE STOVE PLANTS: *J. C. G.* Choice Stove and Greenhouse Plants, by B. S. Williams, The Nurseries, Upper Holloway, N.

* * All communications intended for publication should be addressed to the Editor, and not to the Publisher, or to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 47, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

INTELLIGENT READERS, PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

Markets.

COVENT GARDEN, December 23.

HOTHOUSE fruit selling freely at higher quotations, otherwise our market is dull, considering this is Christmas week. James Webber, Wholesale Apple Market.

FRUIT—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit and Price. Includes Apples, Peaches, Grapes, etc.

VEGETABLES—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable and Price. Includes Artichokes, Beans, Broccoli, etc.

POTATOES.—Majumdar, Bomsal had trade, 50s. to 80s.; Regents, 60s. to 80s. per ton; German Reds, 25s. to 25s. 6d. per bag.

The Weather. STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, DECEMBER 22, 1885.

Table with columns: Month and Day, Barometer, Temperature of the Air, Hygrometrical Deductions from Glaisher's Tables 7th Edition, Wind, Rainfall. Includes data for Dec 16-22.

Dec. 16.—Very fine day. — 17.—Dull day; darkness from noon till 5 P.M.; misty at night. — 18.—Dull day; misty. — 19.—Dull day. — 20.—Dull day. — 21.—Dull day; misty at night. — 22.—Dull day; misty.

LONDON: Atmospheric Pressure.—During the week ending December 19 the reading of the barometer at the level of the sea decreased from 30.32 inches at the beginning of the week to 30.24 inches by 5 P.M. on the 13th, increased to 30.40 inches by 9 P.M., and decreased to 30.38 inches by 1 P.M. on the 14th, increased to 30.53 inches by 5 P.M. on the 15th, and was 30.21 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.41 inches, being 0.25 inch higher than last week, and 0.40 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 49°·1, on the 17th; on the 19th the highest temperature was 38°·6. The mean of the seven high day temperatures was 44°·9.

The lowest temperature was 31° on the 16th, on the 18th the lowest temperature was 42°. The mean of the seven low night temperatures was 37°.

The greatest range of temperature in one day was 14°, on the 16th; the smallest on the 19th was 1°·6.

SEEDS.
LONDON: Dec. 23.—The seed market to-day presented quite a holiday appearance, all business in farm seeds being apparently postponed until the New Year. As regards values, there is a firm feeling all round, and a strong healthy demand in the ensuing spring is confidently looked for. Hemp and Canary seed are quiet, and other values remain unchanged. Linseed is neglected. Blue boiling Peas and Haricot Beans sell slowly on former terms. Other articles call for no remark. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.
MARK LANE: Dec. 21.—Quotations for Wheat can hardly be altered, because there is nothing doing to test them; but lower offers for quantity would, probably, not be refused. For American flour rather easier rates have been taken. Grinding Barley is inactive and unchanged in value. Beans and Hops are reported as steady.
Average prices: Corn for the week ending Dec. 19:—Wheat, 30s. 5d.; Barley, 29s. 3d.; Oats, 18s. for the corresponding period last year.—Wheat, 31s. 5d.; Barley, 31s. 3d.; Oats, 19s. 4d.

FRUITS AND VEGETABLES.
COLUMBIA (East London): Dec. 21.—The demand for good Potatoes is fair, prices moderate. Trade for other qualities slow. Quotations:—Apples, 2s. to 5s.; and Peas, 2s. to 5s. per bushel; Drumhead Cabbages, 3s. to 9s. per tally; Savoys, 4s. to 7s. do.; Spinach, 2s. 6d. to 3s. per sieve; Brussels Sprouts, 3s. 6d. to 4s. do.; Cauliflowers, 2s. to 3s. per dozen; bunch greens, 3s. to 3s. 6d. per dozen. do. Turnips, 2s. 6d. to 3s. do.; do. Carrots, 1s. 6d. to 2s. 6d. do.; do. Beetroot, 2s. 6d. to 3s. do.; do. Celery, 4s. to 8s. per dozen bundles.

POTATOS.
BOROUGH AND SPITALFIELDS: Dec. 22.—Fair demand for best samples, but inferior sorts very unsaleable. Regents, 80s. to 100s.; Magnum Bonum, 70s. to 90s.; Champions, 60s. to 70s.; Victorias, 60s. to 80s. per ton.
COLUMBIA (East London): Dec. 21.—Champions, 90s. to 60s.; Victorias, 90s. to 60s.; Regents, 55s. to 65s.; Magnums, 90s. to 70s. per ton.

Imports.—The imports into London last week consisted of 71 packages, but inferior sorts were 127 casks, 10,602 bags Hamburg, 4 Ostend, 352 Boulogne, 41 bags Rotterdam.

HAY.
WHITECHAPEL: Dec. 22.—Supplies continue large and the trade very dull. Prices have not notably altered. Quotations:—Clover, prime, 95s. to 105s.; inferior, 60s. to 85s.; Hay, prime, 70s. to 85s.; inferior, 50s. to 60s. Straw, 28s. to 37s. per load.

CUMBERLAND (Regent's Park): Dec. 22.—A fair supply, with no improvement in prices. Quotations:—Clover, best, 90s. to 105s.; second, 70s. to 90s. Hay, best, 72s. to 85s.; second, 60s. to 70s. Straw, 30s. to 35s. per load.

Government Stock.—Consols closed on Monday at 99½ to 99¼ for delivery, and 99½ to 99¼ for the account. Tuesday's prices were as on the previous day for delivery, and 99½ to 99¼ for the account. The final quotations on Thursday were, for delivery, 99½ to 99¾, and for the account, 99½ to 99¾. These quotations are ex div.

THE COLONIAL MANURE.

Unequaled for Excellence of Quality and Productive Powers.

Supplied in Tins, *s. d.* each.

"	"	2	6
"	"	5	0
Or in Bags, $\frac{1}{4}$ cwt.	12	0	per Bag.

VINES and VINE CULTURE.

By ARCHIBALD F. BARRON,

Superintendent of the Royal Horticultural Society's Gardens.

Opinions of the Horticultural Press:—

The Journal of Horticulture says:—"It is the most complete, and it will be accepted as the standard work on the Vine."

The Gardener's Chronicle says:—"It is eminently practical and useful."

The Garden says:—"It is undoubtedly the most exhaustive volume upon Vines and Vine culture ever published."

The Gardener's Magazine says:—"It will certainly take, and probably keep, a leading place in the class of literature to which it belongs."

The Florist and Pomologist says:—"There is nowhere to be found in our language so complete and thorough a descriptive list of the best varieties of Grapes."

The Midland Counties Herald says:—"The whole subject is dealt with exhaustively and authoritatively in plain, expressive, and singularly concise language."

The Irish Farmer's Gazette calls it:—"The most complete work of its kind that has ever been issued from the British Press."

WANT PLACES.

POSTAL ORDERS.—To Advertisers Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any individual into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

SCOTCH GARDENERS JOHN DOWIE, Seedman, 244, Princess Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILEY, FOREMAN, or JOURNEMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

GARDENER (HEAD).—Age 30; can be highly recommended as a high-class Plotsman, Fruit Grower, Flower and Kitchen Gardener. Excellent personal testimonials.—JESSE JONES, Clerk, Dealburgh.

GARDENER (HEAD); age 35, married.—Advertiser can be highly recommended to any Lady or Gentleman requiring a thorough practical man, all branches. Sober, industrious, and trustworthy.—A. R., Mrs. Lawrence, School Lane, Ringwood, Hants.

GARDENER (HEAD).—A GENTLEMAN wishes to recommend his Head Gardener to any one requiring a thorough practical man in all branches of the profession. Understands Land and Stock if required. Highest references.—J. HITEK, The Gardens, Rock Mount, Anston, Rotham.

GARDENER (HEAD), where several Men are kept.—Married, no inebriance; thoroughly practical, high honours for Grapes, other Fruits, and Plants. Having a small income, willing to accept 24 weekly, with house and fuel. Total abstemious.—WM. ALDRIDGE, Fern Bank, Timperley, Cheshire.

TRAVELLER, MANAGER, or HEAD SHOPMAN.—Thoroughly experienced in every department of the Seed Trade. Fair knowledge of Plants. Good Book-keeper and Correspondent.—L. M., 99, Craven Street, Bickenhead.

SHOPMAN.—Age 25; eleven years' experience. Well educated, and of good address. First-class references.—K. KNOW, High Street, Acton, W.

To the Seed Trade. SHOPMAN, or ASSISTANT, Wholesale or Retail Trade. Age 21. High school. First-class references.—L. F. 13, Albert Road, Plymouth.

SHOPMAN (ASSISTANT).—Age 23; nine years' experience in all branches. For reference, &c., apply to HENDERSON and SONS, Seed Merchants, Brechin.

HOLLOWAY'S OINTMENT and PILLS. Counsel for the delicate.—Those to whom the changeable temperature is a protracted period of trial should seek the earliest opportunity of removing all obstacles to good health. This cooling Ointment, perseveringly rubbed upon the skin, is the most reliable remedy for overcoming all diseases of the throat and chest. Quinsy, inflamed tonsils, sore throat, swollen glands, ordinary catarrh, and bronchitis, usually prevailing at this season, may be arrested as soon as discovered, and every symptom banished by Holloway's simple and effective treatment. This Ointment and Pills are highly commended for the facility with which they successfully contend with influenza; they ally in an incredibly short time the distressing fever and teazing cough.

CHARLES SHARPE & CO., SLEAFORD.

SHARPE'S SIR F. A. MILBANK PEA.

This, the latest of Mr. Culverwell's many excellent introductions, is a Blue Wrinkled Marrow much of the Paragon type in habit and growth, but earlier, and differing in being of a beautiful dark grass-green colour, and even more prolific than that celebrated variety; the pods are produced in abundance, are large, square, and closely filled with the extra large dark green Peas, so closely packed that it would appear when opened as if the pods could scarcely have contained them. The flavour is all that could be desired by the most fastidious connoisseur, and in every respect it is a variety that we can with the greatest confidence recommend, either for exhibition or table purposes. It is robust and hardy in constitution, and may be sown early; for Market Garden purposes it cannot fail to prove a great acquisition.

Price, 2s. per Quarter Pint sealed packet, post-free.

SHARPE'S TRIUMPH PEA.

Triumph is one of the very best of the many fine varieties Mr. Culverwell has given to the public. It is a Blue Wrinkled Marrow Pea of exquisite flavour; the pods are large, very much curved, and are well filled with large Peas closely packed in the pod. The habit is good, being dense and bushy, attaining a height of 2 to 3 feet. The plant is covered with pods from the ground to the extreme top of the baulm. On one plant no less than sixty-nine pods have been counted, containing from nine to eleven Peas in a pod. The pods are of a bright green, in clusters of two or three; and are not easily affected by drought, remaining green for a long time. In constitution it is robust and hardy; and, without hesitation, we can say that it is the perfection of Peas for either the Market Gardener or the Private Grower—for exhibition, or for ordinary use.

Price, 2s. per Half-pint sealed packet, post-free.

SHARPE'S EARLY PARAGON PEA.

FIRST-CLASS CERTIFICATE, ROYAL HORTICULTURAL SOCIETY, 1884.
Chiswick Report, 1884, accompanied with First-class Certificate:—"PARAGON"—A very fine Second Early Variety, and of good quality. Pods large, and well filled."

Price, 2s. per Pint Packet, 1s. per Half-pint Packet, post-free.

PARAGON, one of Mr. Culverwell's recent introductions, shows in many respects a great improvement upon any variety at present in the trade. It is a Blue Wrinkled Marrow of fine flavour; height from 4 to 5 feet. The pods are produced two and three together in such abundance as to almost conceal the foliage. They are of no unusual size, broad and thick-backed, containing from twelve to fourteen large Peas.

PARAGON is the earliest of the large Wrinkled Marrows, being ready before Prize-taker; in fact in the Gardens at Taorpe Perrow it was gathered at the same time as William the First; it is very hardy, and will stand earlier sowing than any Pea of its class. It is most valuable for succession crops as it is not liable to mildew, and a constant supply of Peas for four months can be obtained from this one variety.

TRADE PRICE and SPECIAL LIST of NOVELTIES for 1885 and 1886,

POST-FREE ON APPLICATION.
