The Big Vine of Kinnell.—Auchmore, one of the seats of the Marquis of Breadalbane, is situated at the top of Loch Tay, and near to the pretty village of Killin. This district partakes strictly of a beautiful and romantic character. On rising ground in the neighbourhood of the village is pointed out by tradition the grave of Fingal, and to the west of the village, immediately below the bridge that crosses the river Lochy, on a little island clothed with Fir trees, in the middle of which is the burial-place of the MacNabs, once the potent chieftains of this district; and on the north of Loch Tay stands the lofty Ben Lawers, the monarch of mountains in this district, and well-known to botanists for its native plants. Being in this district some time ago I took the opportunity to visit Auchmore, to see the famous Vine planted in the gardens at Kinnell, the old residence of the MacNabs, and a short distance from the mansion house. It is a Black Hamburgh, and was planted fifty years ago in a lean-to house over 200 feet long, and the stem measures (1 foot from the surface) 18 inches in circumference, and has carried for the last six years the following crops:—

Year.	Bunches carried.	Bunches taken off.	Bunches matured
1879	1199	379	803
1880	1274	560	714
1881	1858	1168	700
1882	1625	1105	570
1883	2102	1602	500
1884	2170	1650	520
1885	2544	2294	550

I may state that the Vine is in excellent health, and everything about the place is in perfect order. On visiting Kinnell I was fortunate to meet Mr. Cant, the head gardener there, who is justly proud of his grand Vine and its extraordinary productions. Professor Blackie, when in that district, spoke of this Vine in the following terms:—"I visited the grounds of Kinnell, which contains one of the greatest natural curiosities, or rather one of the grandest natural productions. Like Ben Nevis among the mountains so is the Vine of Kinnell among Vines. I have seen the old Yew in Fortingall, in Glenlyon, certified to be more than 50 feet in girth, and more than 200 years old, but it is a vegetable ruin, and, like old churches, can live a long time with a green outside; but the Vine of Kinnell is as lively as a young salmon, for it fills the whole house of 200 feet, and there are gathered from it yearly hundreds of bunches of luscious juicy purple Grapes, and although fifty years old it is as healthy as the heather on the hills." Professor Blackie states that he wrote the following lines as a memorial of so elevating a spectacle:—

"Come hither all who love to feed your eyes
On goodly sights, and join your joys with mine,
Beholding with wide look of grand surprise
The many-branching glory of this Vine.
Pride of Kinnell, the eye will find its due,
And God provides rich banquet, amply spread,
From stailt cope to huge Ben swathed in blue,
And this empurpled growth that overhead
Vaults us with pendent fruits. Oh, I would take
This lordly Vine, and hand it for a sign
Even in my front of estimate, and make
Its presence teach me with a voice divine.
Go hence, and in sure memory keep with thee,
To shame all paltry thoughts, this noble tree."

John Dewrie, Edinburgh.

New Pea, Ameer.—A writer in the *Gardeners' Chronicle* at p. 107 says that Laxton's new seedling Pea, Ameer, certificated by the Fruit Committee of the Royal Horticultural Society on July 2 after trial at Chiswick is but a reproduction of William I., with pods a trifle finer. The suggested similarity of these two Pea potentes has never presented itself to my mind, as the raiser—the two varieties differing widely in origin, habit of growth, and shape and colour of

the seed, and in the shape, as well as in the larger size of the pod, William I. showing its green marrow or Prizetaker origin—Ameer, on the other hand, being a blue Pea from Laxton's No. 1 Early Blue Wrinkled (a Pea now almost lost sight of), and having in it the blood of Little Gem. T. Laxton, *Belford*, July 29.

Passiflora foetida.—It would appear from the sample of *Passiflora foetida* which I enclose, that my statement that the fruit was not "dry inflated" needed "confirmation," as the green fruit I have just cut through are not juicy. It may be the juice, &c., is secreted in a later stage. I do not recollect that I ever cut through a green fruit before; but I have grown the plant for many years, and have no recollection of having ever found a ripe fruit which was

FIG. 39.—THE CABBAGE AND PEACOCK BUTTERFLIES. (SER. F. 180.)

not as I described it. What I am now growing is a self-sown seedling of this year; it may be that the plant varies in this respect. When the fruit is ripe I will send you in that condition, *Edmund Tonks*. [The fruits of *Passiflora* sent are, as we have seen, sometimes always, dry and inflated. There is, however, a little pulp around individual seeds. ED.]

Potato Disease.—This, I fear, will be had this year, for, though we have had a dry time, which is generally considered unfavourable to the spread of the Oidium, the tops of many kinds of Potatoes are showing the dreaded spot and tainting the air with the odour of decomposition; and no doubt when we get rain or a moister condition of the atmosphere the spread of the disease and the rot which follows will be rapid, and therefore the sooner the tubers of such sorts as are fully grown are out of the ground the better. If the skins are not quite set it matters but little so long as they are lifted and handled carefully,

and laid in a cool dark airy place till wanted for use. Those for seed may be left out for a few days to get a little green and hardened, but not to that extent one sometimes sees them, as they lose too much of their sap and vitality. J. Sheppard.

Turner Memorial Prize.—I met at the Carnation show Mr. Glascock, of Bishop's Stortford, who told me that it was intended to raise funds for the purpose of providing certain prizes at the Grand National Dahlia show as a memorial of the late Mr. Turner. I was too busy to take any notice of it at the time. I now read a paragraph in most of the gardening papers that subscriptions may be sent in to the Hon. Treasurer, Mr. T. Moore. May I be allowed to say, first, that sufficient prizes are already offered to make a first-rate Dahlia show in the schedule already published, and if larger prizes were offered the best blooms would be merely shifted from one class to another—an arrangement which would scarcely make any difference to the general effect. I wish to say, in the second place, that raising a few pounds to provide prizes at an exhibition for Dahlias is an arrangement totally inadequate to provide a memorial for Charles Turner. Now that the idea of a memorial has been started it must not be a restricted affair, as this promises to be, but a national one. In order to carry this out I propose that a preliminary meeting be held at South Kensington on August 11, immediately after the various committees have completed their labours, which will be at 12.30 P.M. The name of Turner is honoured and respected all over the country, and an appeal for funds, backed up by the leading horticulturists of the metropolis, would meet with universal approval and support. *Jas. Douglas, Great Gearys, Ilford.*

Will you allow me space to remark concerning a proposal made by Mr. Douglas in reference to the Turner Memorial Prize to be offered at the forthcoming Dahlia Show, that the latter will in no way interfere with his larger scheme. It is specially appropriate as an acknowledgment of what Mr. Turner did to establish that show; it is prompt as to time, and, moreover, it has been widely announced both in the Press and by private means. Why attempt to disturb it? The larger scheme could not possibly be brought to any satisfactory head before next year, and should be established as a permanent Memorial, like the Veitch Memorial, whereas the Dahlia Memorial Prize is to be offered once for all. I hold several subscriptions towards it, and hope to receive more before Tuesday next, when the sum in hand must be dealt with, and the nature and conditions of the prize settled. *T. Moore, Hon. Secretary, Dahlia Show.*

Fungus Poisonous to Pheasants.—In my notice of this subject on p. 148, I omitted to say that *Agaricus fibrosus*, Sow., a close ally of the plant described, is—judging by its deterrent odour—also probably poisonous. Mr. Mills's fungus presents considerable resemblance to *A. fibrosus*, as well as to *A. scaber*. *W. G. S.*

Disease in Plants.—I enclose a Cockscomb affected with the same disease as the Myrtle which I sent to you about twelve months ago, when you requested me to send you another specimen worse affected. I had not one in a worse condition, I thought that bad enough—however, perhaps this plant will meet that description. For years I have been unable to grow a healthy Cockscomb, the same with *Capsicum*, and many other plants. I notice that the *Begonias* and *Fuchsias* at Chiswick are very badly affected with the same disease. Mr. Barron once came to my place to advise me on the disease, but he could make nothing of it, nor can he now with his own experience. It is a very formidable disease, which appears to me to be spreading, and certainly demands more attention on the part of scientific horticulturists than it has yet received. *Edmund Tonks*. [We shall advert to this later on. ED.]

Fertilisation of Passiflora.—I have a *Passiflora Buonanapartea* which at the present moment has seven fruits about 5 inches in length, all the flowers having been fertilised with their own pollen before the house had been opened in the morning. As to whether the fruits contain perfect seeds, of course at present I cannot say; but on the said fruits becoming ripe (if you would care to know) I will let you know the result—or, what would be better, I will send you some of the seeds, so that you can judge for yourself. *A. J. Hemmerle.*

Winter and Spring Lettuces.—To supply the above without stint during the winter and spring months is a matter of no small importance. Such has been ably treated in your columns before; still the subject is so urgent, that it may be retold with profit. For early winter supply we rely on such sorts as All-the-Year-Round and Hlick's Hardy Cos, which are sown, say in the middle of July, then dried up, cut, and before severe frosts come on they are lifted carefully and planted in cold frames. For late winter and spring use we sow the first and second week in August: Grosse Blonde d'Hiver, Lee's Immeuse, and Hardy Hammersmith, are the varieties sown. When fit to prick out they are put three rows in a 4-feet bed, in clumps of five, to be covered with *cloches* or French bell-glasses, as the season comes round that they are wanted to come in. In case of damp they are to be tilted up a little from below. The *cloches* are invaluable for such purposes, as they seem to concentrate the light during the dark days of winter. We find Grosse Blonde d'Hiver Lettuces to be most excellent for the above purpose, as, being so tender, every leaf can be used. *L. L.*

Phorum tenax.—Doubtless the fine wain summer of 1884 had a good deal to do with the flowering of this Australian Flax, in ripening up the crowns; here we have a plant with a spike quite 12 feet high within 400 yards of the sea. *H. Carter, The Gardens, Downhill, Coleraine.*

Cockscomb, McLachlan's Glasgow Prize Dwarf Crimson.—This novelty, sent out by Messrs. Veitch, of Chelsea, merits all that has been said in its praise. We grew an early batch of two dozen for carpet bedding; our object was to grow them as dwarf as possible. Not having a suitable pit or frame at our disposal, they were grown on a shelf 2 feet from the glass in the Melon-house, where they grew with great vigour, showing a dwarf, compact habit. After the combs developed they were the admiration of all who saw them, the colour being of such a brilliant deep crimson, the plants being at the same time of a uniform size. Several weeks ago, after selecting what we required for bedding, three which were of a superior quality to the others were placed in an intermediate-house amongst some *Adiantums*, &c. To-day (July 27) we measured them; the first was 2 feet 3 inches from tip to tip, 10½ inches in breadth, and 7½ inches high from the rim of the pot; the tips meet within 1½ inch. The dimensions of the other two are not so good. The above are in 7-inch pots. Had the above pots had a more generous treatment the dimensions would have been larger. We were told 10-day by a veteran Cockscomb grower of forty years' standing they were the best strain he had seen. *William Kettlewell, The Gardens, Balrath Barry.*

Campanula Hendersoni.—In the *Gardeners' Chronicle* for July 21, 1883, p. 75, are several remarks upon this interesting Campanula. Firstly, Mr. Wolley Dod supposes it to have originated from a cross between *C. carpatia* and *C. pyramidalis*, and the Editor says it is stated to be *C. turbinata* × *C. alliarifolia*. Mr. E. Jenkins has a note on the same page in which he doubts if *C. pyramidalis* played any part in this plant, because he found it lacking in vigour. Now we have lately had a new Campanula sent out by an Irish firm under the name of *C. Tymonsii*, a hybrid raised by the Rev. C. Tymons, of Cloughran. It was stated to be a natural hybrid between *C. turbinata* and *C. pyramidalis*, and quite intermediate between these two most distinct species; of low bushy pyramidal growth, and blooming profusely all through the season; colour clear blue, paler in the centre (see the *Newry Catalogue*, p. 8). Now this proves to be exactly the same plant as *C. Hendersoni*, sent out many years previously, and it therefore confirms Mr. Wolley Dod's original surmise, as there is very little difference indeed between *C. turbinata* and *C. carpatia*. One thing is, I think, quite certain, viz., that *C. alliarifolia* had nothing whatever to do with *C. Hendersoni*. The leaf and habit of that plant are altogether differing. *W. Brockbank.*

A Nice Point.—A somewhat curious question affecting exhibitors at flower shows was submitted to me a few days ago, with the request that I would, as far as I could, express an authoritative opinion upon it. At a flower show there was a class for a group of plants arranged for effect. The prizes were good,

and there appears to have been a keen competition in this particular class among the gardeners residing in the neighbourhood. The awards were duly made, and later in the day a protest was lodged against the awarding of the 1st prize on the ground that the cultivator of the plants had engaged some one outside of his own garden to arrange his group for him, and it was surmised, if not asserted, that he who had arranged had at one time been engaged in this work while serving a firm of well-known floral decorators in London. The point submitted to me was this: Did the employment of an outsider contravene the regulations of the schedule of prizes? The class was set forth as follows:—"A group of plants arranged for effect, to fill a space of 120 superficial feet; a tasteful arrangement to be primarily regarded by the judges." It will be observed that the way of stating the conditions of the class does not assert that the cultivator is required to arrange what he sets up for competition, though, it may safely be stated, this is generally understood. The rules and regulations governing exhibitors state that "All articles exhibited for prizes must have been grown by and have been the property of the exhibitor, and in his possession at least two months previous to the day of exhibition;" and further, that there "must not be the exercise of any artifice to deceive the judges, or attempts to gain prizes by unfair means." On consideration, I thought the generally understood spirit of the regulations had been violated, because it is an invariably recognised principle that an exhibitor arranges his or her exhibits; but no letter of the law had been transgressed. I could not say that the exhibitor had employed artifice in order to deceive the judges; nor dare I assert that there had been an attempt to gain a prize by unfair means. I therefore recommended that the decision of the judges should be allowed to stand, but suggested that in the future a proviso should set forth that the cultivator of the plants, or one of his assistants, should be required to arrange the subjects forming the group. I think it not unlikely that some—perhaps many—will be disposed to dissent from this decision; but it was not made until the facts of the case had been carefully weighed, and I was greatly comforted in respect to my decision by what I witnessed at the exhibition of the National Carnation and Picotee Society, at South Kensington, on the 28th ult. I saw a well-known cultivator, raiser, and exhibitor of Carnations and Picotees—who I believe afterwards acted as one of the judges—dressing the flowers of a brother exhibitor. This, I have no doubt, an occasional practice at exhibitions of this description and sanctioned by usage. But I could not see the slightest difference between the two cases—there was in each the employment of extraneous aid to give effect to the exhibit; only it might be said that the act of dressing Carnations and Picotees gives an artificial value to the flowers, but this can scarcely be said of the mere act of grouping plants. Perhaps some of the readers of the *Gardeners' Chronicle* will give their opinions on the two cases. *R. Dean, Ealing, W.*

Valerianella eriocarpa, Desv.—A correspondent has sent a *Valerianella* badly affected with a fungus, and asking if the parasite is a *Pernospora*. The curious point is this: *Valerianella dentata*, Voll., Koch, or Deitr. was growing plentifully in the neighbourhood without the parasite, but wherever the fungus was detected the host plant appeared to be *V. eriocarpa*, Desv. The change in appearance was entirely brought about by the fungus growth. *Querc.* Were the plants found by Mr. E. Lees in Worcestershire, and referred by him to *V. eriocarpa*, Desv. (according to Babington), mere fungus-attacked forms of *V. dentata*? I venture to think this is very probable, and that *V. eriocarpa* will have to be expunged from our Floras even as a mere "reputed casual." The fungus which caused the transformation was *Oidium Balsamii*, not *Pernospora Valerianella*. Wooliness and hairiness in plants often follow the attacks of both fungi and insects. *W. G. Smith.*

Industrial Exhibitions at Flower Shows.—It is customary in the case of some flower shows about the country to have what is known as an industrial department, in which prizes are offered to cottagers, their wives, and daughters, for examples of needlework—many different objects being required, such as underclothing, children's frocks, stockings, hearthrugs, patchwork, patches of calico, darned stockings and linen; prizes are also offered for children under fifteen

years of age, while another division is for children under ten. The male head or member of the family is encouraged to send specimens of cottage handicraft or other industrial work done in leisure hours, other than that which belongs to a man's own trade. Prizes are offered to the wives of cottagers for home-baked bread, plum cakes, fruit and jam tarts, jam, &c. It does not appear to be necessary that the prizes be of large amounts, at the same time they should be high enough to encourage competition. Such an exhibition as this has recently been held in connection with the Warwick Amateurs' and Cottagers' Horticultural Society, which took place in the exhibition buildings at Warwick on the 29th ult. This department was managed by a committee of ladies, a few of whom formed themselves into a jury for the purpose of inspecting the exhibits and making the awards. At Warwick, notwithstanding this was only the second exhibition of such industries, a large number of articles, especially in the way of needlework, were shown; and the stands appeared to interest the company greatly. Some managers of flower shows might doubtless be disposed to look upon such an addition to their exhibitions in the light of a startling innovation, but it is a matter of high practical importance, and in the case of cottager exhibitors, it is well, while the head of the family is encouraged to till and keep his cottage or allotment garden to the best of his ability, that the female members of the family may also be stimulated to rise to a higher level of excellence in regard to domestic pursuits. Some of the goods are ticketed according to their value, and sales take place, though, as in the case of plants, &c., the exhibits are not removed until the close of the shows. The practice appears to be a beneficial one, and worthy of wider application. *R. D.*

Royal Horticultural First-class Certificates.—There is something ludicrous in the way in which some hardy herbaceous plants, after having been for several years common both in nurseries and private gardens where such plants are cultivated, and having been rejected by some and retained by others, at last find their way to a committee of the Royal Horticultural Society, and are rewarded with a First-class Certificate as novelties. I always look at the record of certificates given, in the hope—a forlorn one—of sometimes finding something new; and not infrequently I see that plants which I have long discarded as worthless have been honoured by a certificate, though I freely admit both that people have a right to differ in taste, and that difference of soil and climate may make a great difference in the merit of a plant. In illustration to what I have said, I read on page 152 of the *Gardeners' Chronicle* that at a meeting of the Royal Horticultural Society, on July 28, three, and only three hardy herbaceous plants received First-class Certificates. The first is called *Dracocephalum virginicum* album. I presume the plant meant is the white variety of one of the many forms of *Physostegia virginiana* (Asa Gray, *Synoptical Flora of North America*, vol. ii., part 4, p. 383). The best garden form of this very polymorphous plant, of which I have had, including the so-called white, four distinct forms, is figured in Sweet's *British Flower Garden*, tab. 93, as *Dracocephalum speciosum*. A white variety of this form has been distributed from the nurseries of Messrs. Dickson, of Chester, and Messrs. Sutton, of Reading, and probably others, for the last five years, and is certainly not among his *Cheshire gardens*. If this is the plant intended—and I think it can be no other—I certainly should not call it of first-class merit. But however this may be, it should at any rate have been certified under its right name, which is *Physostegia virginiana* var. *speciosa* flore-albo. The second plant is *Campanula Hendersoni*. This is a garden hybrid between *C. carpatia* and probably *C. pyramidalis*, which I, and many of my gardening friends, have cultivated for at least six years. It has also been commonly offered in nursery catalogues during that time. It flowers so freely as almost to simulate a biennial habit, and is easily lost, so that few nurserymen will be at the trouble of keeping it. It had begun to get rather scarce when it recently reappeared from Ireland as a novelty under the name of *C. Tymonsii*, by which name it will probably receive another certificate in a few years more. Lastly we have *Helenium pumilum*, one of the many forms and names by which *H. autumnale* has for long been offered to us. If it had been a novelty, a better name than *pumilum* might have been found, as it grows in good soils more than two feet high. I consider it a fairly good garden

plant, though some of the visitors "cannot admire those horrid yellow Daisies with round buttons in the middle of the flower." It entails, too, a good deal of weeding, as it runs about the bed like the garden variety of *Anemone japonica*. At any rate it has no claim at all to be considered a novelty in gardens. *C. Wolley Dod, Edge Hill, Malpas, August 1.* [It is right to say that the plants are certificated, not necessarily as novelties, but if they are shown in good condition, so as to take the fancy of the committee, and have not previously been certificated, they receive an award by vote of the members present. In the case of the *Helenium* the ordinary form was shown for comparison with the new variety, and the latter was so far superior that it obtained an award which probably the original plant would not have gained. *Reporter.*]

A Specialist's Garden.—Aim high throughout is a good maxim in gardening, and the more it is exercised the more evident is the corollary. Aim at a limited highest. Colonel Powell, of Drinkstone, near Bury St. Edmunds, intends that Orchids, Roses, and Grapes should be the specialties of his garden. Mr. Palmer, his gardener, carries out his wishes, so that they really are remarkable even in these days of testing and competition. It is a bad time now of course to look over Orchids. The gem of the Drinkstone collection—I mean of those in flower—is the rare *Sobralia xantholeuca*. The plant there is probably one of the largest in the country, and is still continuing to make vigorous growths. The three sepals are of a light cream colour, the petals, two in number, are of a similar tint, but much lighter; the labellum is canary shading down to pure white at the edges, the surface is wavy, and the rim charmingly crimped. *Dedrobrum Devonianum* is subjected to cool treatment, and flowers and prospers well. Mr. Palmer, who knows Cornwall well, and its more favoured spots, such as the Fal valley, suggested that *Epidendrum vitellinum majus* might perhaps be grown without any artificial heat at all in that county. Have any of your correspondents tried? A plant of *Odontoglossum pulchellum* was carrying two well-developed seed-pods. The little *Ileaths* and Ferns which grow up from the sphagnum moss are left, and care is even taken to insert various little things, such as *Sirexcarpus bifidus*. It would be well if this kind of thing were more frequently done, and also to try and tame little Jenny Wrens to fit about the plants. In a cool fernery, unheated, I believe, *Netera depressa* is extremely well grown on pillars of slag, stone, or clinkers. The secret appears to be to bed the plants on moss. It is a great mistake to coddle *Todea pellicuda*; it will even bear freezing. *C. A. M. C.*

What is a "Border Carnation?"—As I have hitherto understood, a border Carnation is planted out permanently during winter in a bed or border, and flowers the succeeding summer. I have read carefully the description of the splendid collection of Messrs. Veitch in the *Gardeners' Chronicle* and your contemporaries, but have since been informed that most desirable city flowers were housed during the winter, and would therefore not be "border Carnations" in the ordinary acceptation. I do not make this reference—if true—to in any way detract from the splendid show them at Chelsea, but to draw attention to a point that would probably be a *sine quâ non* towards attaining the same success in most parts of the British Isles, as every Carnation will not equally succeed permanently planted out. *W. J. M., Clonmel.*

The Rating of Nurseries.—I was pleased to see an account of the Finchley rating case in the *Chronicle* last week. As this is a matter of importance to market growers round London—and, indeed, everywhere they are situated in Local Board districts—it is a good opportunity to fix the principle, and make it known to the gardening world. I may say that our Board have decided not to appeal, although it may perhaps at some other time arise in another part of the country. The points that might be remarked upon are, first, the illogical contention that glasshouses whenever in the form of vineries or greenhouses are not part and parcel of a market-garden or nursery ground and necessary adjuncts thereto; secondly, the unfairness of such places contributing to the general district rates, which are used solely for sewerage, curbing, lighting, &c., in an equal manner

as dwelling-houses. In my own case the nett annual value is arrived at—as indeed in all assessments—in the same manner as dwelling-houses, and it must be unfair for them to contribute equally while the benefits are unequal. *Peter E. Kay.*

Reports of Societies.

INTERNATIONAL HORTICULTURAL EXHIBITION: Antwerp, August 2—6.

This great gathering of horticulturalists, which was intended to be—as its title designates—an international affair, but which in reality was an exhibition of the horticultural treasures of the Netherlands, with an insignificant contingent from France and Germany, forms a portion of the greater International Exhibition of Antwerp which was inaugurated in May last. This last is, perhaps, as regards completeness, one of the best which has been held in Europe, and in so far as the machinery productions of Belgium stand unequalled, so the gardening exhibits are thoroughly worthy to be associated with them. As is well known, the large trade establishments of Ghent, Antwerp, Haarlem, and Liège, possess unrivalled collections, especially rich in Palms, Cycads, Anthuriums, Crotons, and Dracenas; and we found these fine plants brought out in great numbers, and either exhibited as decorative objects, without being intended for competition, or else were shown for honours. Notwithstanding the choicest groups of foliage plants, &c., was the property of a lady at Antwerp, and Madame Le Grellé D'Anis, and the next best came from M. Vander Wouwer of the same town. The flowering section of the show was perhaps its weakest side, the late season of the year having fewer first-class flowering plants to compare with the months of May and June—Lilies, Pergonioms, zonal and Ivy-leaved, Orchids, tuberos Begonias, and Carnations, forming the bulk of these. Other flowering plants, which appeared occasionally in competing and other groups, consisted in many instances of species which it is unusual to find in our less varied if more brilliant collections, and which will be noticed in their proper place. We may perceive from this that our Continental brethren are by no means so gregarious as we, as any plant which has a decorative value, and which may be improved by culture, is pressed into the service of the gardener. There is one matter in which the gardeners there might take a useful lesson from the converted practitioners here, and that is in the matter of training their plants. We noticed the same stiff and unnatural system of tying in closely all the shoots so as to make formal-looking balls, balloons, pyramids, &c., that for so many years appeared the best of all possible methods among English gardeners. Given a lot of tight-laced plants and place them almost as contiguous as it is possible, and an arrangement exists that is anything but pleasing to our taste. Foliage plants seldom need much attention in this respect, and so escape the ill-treatment meted out to the others, and it must be confessed that here the Continental growers excel.

NEW PLANTS INTRODUCED INTO BELGIUM SINCE 1882.

The 1st prize for this year, a Gold Medal, given by the King, was won by MM. Jakob-Makoy & Co., nurserymen, Liège; the group consisted of the following:—*Dieffenbachia Regina*, a native of Colombia, 1883; the leaves dark green, with paler markings over the larger part; *Dieffenbachia Jenmani*, from British Guiana, 1884, dark green foliage, with blotches of pure white on each secondary rib—the habit is distinctly climbing; a useful decorative plant; *Nidularium acanthocroton*, Brazil, 1884—the inflorescence is rosy-red, with leaves short and broad; *Kempferia Gilberti*, East Indies, 1882—a pretty sub-tuber shrub with lanceolate foliage of green marginated with white; *Philodendron Sodiroi*, Ecuador, 1883, having a cordate leaf of light and dark tints of green, the habit in the plant seen being dwarf and compact; *Croton Witterianus*, Dutch Indies, 1885—dark green leaf entire, above ordinary size, possessing a yellow midrib, and some coloured blotches—it is a distinct-looking species; *Alcaocia Van Houttei*, Indian Archipelago, 1883, with leaves cordate, the leaf-stalks light green, with a marbled appearance; *Alcaocia Sanderiana*, Indian Archipelago, 1884, with sagittate foliage, the midribs and secondary ones being tinged greenish-white; the leaves are coarsely dentate, the plant is showy and striking, but not altogether pleasing; *Alcaocia Bernardi*, Borneo, 1885, with large sagittate leaves, the ribs of which are all coloured white; *Leca amabilis splendens*, Borneo, 1884, with dark green, serrate, lanceolate

foliage of a bronzy green and narrow white markings on the midrib; *Cryptanthus Renelli*, Brazil, 1885, a Bromeliaceous plant with marbled foliage light and dark green, the margins of leaf being spiny; *Brocchinia demerensis*, British Guiana, 1885, also a Bromeliad, with foliage long and broad, boldly channelled—a striking plant; *Piper ornatum*, Malacca, 1885, described in *Gardeners' Chronicle*, 1885; *Cardobolus Martiana*, Brazil, 1885, New Granada, 1885, foliage long, entire, of a cheerful tint—the plant was young, and the foliage too little characteristic; *Aralia Kerchoviana*, South Sea Islands, 1883, an elegant small-growing species, with palmate foliage, the leaflets being of considerable length and serrated at the edge; *Hopliophytum robustum* fol. var., a Bromeliad, with recurved foliage on which are longitudinal green and white bands—a pretty plant that will become a favourite when plentiful; *Schismatoglottis decora* Wittiana, Borneo, 1885, a dwarf tropical herb with greyish-green, marbling on the leaf; *Dichorisandra Sieberii*, Brazil, 1884, foliage obtuse-lanceolate, of dark green with broad bands of greenish-white running longitudinally—a distinct plant of some merit; *Pandanus discolor*, India, 1884, has foliage of a dark green tint, light brown on the underside, and in young plants the leaves are of considerable length and serrated, as in *Pandanus* generally; *Selaginella cognata*, India, 1884, of arboreal habit when not a climber, fronds dark green and much divided when young—a pretty species; *Philodendron Maurei*, Ecuador, 1883, cordate foliage, dark green with marbled spots.

M. Louis Van Houtte, Ghent, was awarded the 2d prize for twenty-five new plants, consisting of the following:—*Alcaocia Van Houttei*, a robust example, with foliage 2½ feet by 2 feet; *Selaginella grandis*, 1883; *Heliconia metallica*, a plant with Canina-like foliage, bronzy in colour, with midrib brown; *Schismatoglottis crispata* purpurea, 1883, a stout herb with leaf greyish-green in the centre, the margin being of a lively green and the habit dwarf; *Anthurium splendendum*, 1883, with foliage cordate-pinnulate, of two shades of green; *Alcaocia Regina*, a striking plant of a grey metallic lustre on the upper surface, ribs of dark green, leaf-stalks bright green with thinly-scattered black points, the under-surface of the leaf being of a crimson colour—an acquisition of much merit; *Dieffenbachia magnifica*, 1883, of robust habit, leaf green, with numerous white blotches; *Ardisia picta*, 1885, a plant too young to speak with confidence of the leaves of the next year, but of a green colour, the margin, whilst the rest of the leaf is bronzy-green; *Gynogramma schizophylla* var. *gloriosa*, 1885, a graceful fern; *Anthurium Gustavi*, with immense foliage at least 3 feet by 2 feet, and leaf-stalk of 1½ inch in diameter, which is the largest of the group in colour; *Trochodendron Eeckhautei*, marbled green foliage, the central portion of the plant being violet-rose; *Pritchardia grandis*, 1885; *Phoenix gracillima*, 1884, an elegant Palm; *Alcaocia Rebecce*, a species with fronds long and slender, colour dark green; *Tillandsia hieroglyphica*, with marbled foliage—a handsome species; *Pandanus D'Hernei*, a dark green variety, dark green foliage, with meanness on the lower surface of leaf. Some of the plants shown by M. Van Houtte were found in M. J. Makoy's collection, and were there described. M. Aug. van Geert, Ghent, showed likewise a collection of new plants, almost all awarded species, and varieties, as were mentioned previously. Other than those we may name *Eucephalartos Thielckei*, Transvaal, 1885, an imposing-looking plant; *Tillandsia Pasluchoviana*, Brazil, 1885.

For flowering or non-flowering plants introduced for exhibition into Belgium, but not yet in commerce, shown by MM. Jakob-Makoy & Co., were the following: *Clusia*, *Clusia Clousii*, *Cryptanthus Lubbersii*, *Dieffenbachia gemmata*, *Eugenia elegantissima*, *Hopliophytum robustum* foliis variegatum, and *Schismatoglottis Watteriana*, all being introductions of the present year. MM. Makoy & Co. took the 1st prize for a collection of plants, consisting of *Anthurium loriticum*, Colombia, 1885; *Kempferia spectabilis*, India, 1885; and *Schismatoglottis rotundifolia*, Borneo, 1885.

For a collection of twelve species of New Palms, shown by nurserymen, M. Aug. van Geert took the 1st prize, and M. D'Herne, Ghent, the 2d. In the first of these *Thrinax graminifolia*, *Phoenix graminifolia*, *P. hybridâ*, a robust growing species; *Calamus calocarpus*, an elegant Palm, with spiny leaf-stalk; *Williamsia speciosa*, *Cocos hexauosa*, *Licuala grandis*, broad entire foliage, at least in the young state; *Kentia*, *Chorizanthe*, *Pritchardia grandis*, *Aceathorphenix Houtteana*, a plant of an elegant pendulous habit; *Phoenix Andersonii*, of similar habit to the preceding, but with numerous leaflets. M. D'Herne was the winner also for the 1st prize for a collection of twenty Palms, and for a collection of twelve Palms—good examples of cultivation. *Zamia tonkinensis*, a slender, light green-coloured Cycadaceous plant; and *Pandanus D'Hernei* were exhibited as new.

In a class for new plants not as yet in the Belgian trade, we noticed *Maranta Arriati*, shown by MM. Jakob-Makoy & Co., with lighter, narrower foliage of greenish-green, 6 inches in length; the plant is of the habit of growing sparingly low; *Dieffenbachia aureo-variegata*, a white-blotched leaf, one-half the leaf being sometimes white, and the other green. And among plants remarkable for their foliage was a *Clivia* which was distinctly erythron variegated; it was found in the same class was *Phorum tenax roseum pictum*, the variegation being of pleasing character; *Croton Prince Haudouin*, *Tradescantia alba vittata*, *Begonia M. De Cock*, *Arca Bausei variegata*, *Dracena Veitchii* and *variegata*, with white stripes; *Phormium tenax*, of an open sort of a notable character shown as *Clivia pungens*, of Californian origin, the seedlings of blue-grey, and habit very compact, not to say stunted, but the specimens having been grown in a pot, the style of growth could not be ascertained with certainty.

FERNS, NEW AND RARE,

Of these, the prizes for which fell to M. Van Geert, Ghent, and the 2d to Messrs. Wallem & Son, there were *Adiantum dolabriforme* var. *obovata*, with slender, wavy black frond-stalks; the pinnae oval, and dense-habited species, with thick hairy rhizomes running on the surface of the soil; *Hemadiantum marginatum*, a coarse-fronded species, the pinnae being quite 9 inches in length and 2 inches in width, the total length of frond being 6 feet; a variety of *Pteris serrulata* named *W. G. H. G. H.*, the fronds of which are often crested—it is a distinct and pretty kind; *Platycaerium Hillii*, a Fern differing from the other Elkhorn species by the fronds being of abnormal height; and, lastly, *Adiantum cuneatum* strictum.

ORCHIDS.

Of these plants three collections were shown, and if the plants, taken as a whole, were smaller than we are accustomed to see here, yet they were well grown and flowered and exceptionally clean. The best groups were not staged for competition, and only two smaller groups were so entered.

In the non-competing groups, among which that of M. Pecters, Brussels, was specially remarkable, plants of the following were noticed:—*Odontoglossum*, *vesicarium* Lehmanni, O. Alexandre, O. luteo-purpureum, O. Alexandre Triane, with two spikes; many *Cypripediums*, as *Stonci*, with eight blooms; *Curtisi*, *Morganii*, which is the first plant having flowered in Belgium; *selligerum* *veitchii* Veitchii, with five flowers; expanded *Platanium*, *Argus*, and a few other of not so recent introduction. *Cattleyas* were not in any abundance, exhibited but few blooms, and consisted of *C. gigas*—a very rich form of it, *guttata*, bearing a splendid bloom-spike; *Gaskelliana*, of which in one collection the several spikes and an odd specimen were seen; *Veitchii* Lindleyi, *Laelia majalis*, so rarely seen in collections; a good piece of *Oncidium*, *Lanceanum*, and *O. macranthum*.

The rare *Phalaenopsis Esmeralda*, the flowers of deep rose-purple, small, but set in numbers on a long slender spike. Of *Saxifraga* and *Primula* plants, the *Primula majus*; a nicely flowered plant of *Dendrobium Dearei*, carrying about a dozen of its snow-white flowers; five or six plants of *Disa grandiflora* were distributed in the group, lighting up the paler tints of the other Orchids capably. The second-best group contained an over-abundance of *Odontoglossum*, and a few other species. As regards the judges, although the award was finally given to the one we have just mentioned, *Odontoglossum*, shown by M. Vuylsteke, numbered sixteen species; of these there was a fine piece of *O. Stewartianum* and *O. odoratum*, and the seldom seen *O. Lindleyanum*. *Acemeta Humboldtii* had three beautiful specimens of its massive rich brown flowers, and was really the best plant in the collection; *Dendrobium fornosum giganteum* and *Cattleya Sanderiana* and *C. gigas*, together with *Disas*, as in the other group.

In a competitive group were noticed some very large *Vandas*, *Acemeta Humboldtii* and *Hamalea*, as *suavis*, *Veitchii*'s variety, with two fine spikes of bloom; *Lindley's* variety of *V. suavis*, 8 feet in height, bearing also two fine spikes; and *V. insignis* with two spikes—all these plants being remarkable for healthy foliage development. In an *Oncidium* superabundant and good bloomed, it having two flowers on its stamens in length, smothered with its diminutive brown and green blossoms; *O. phlegiferum* had nine spikes of its yellow, brown, and green blossoms; and a *Cattleya Mendelii* had four flowers of very large size and good colours, open. The 1st prize for the best group of orchids was awarded to M. Hye-Leydens, Ghent, consisting of pretty bloomed specimens of *C. Stonci*, *C. Veitchianum*, *C. Lawrenceanum*, *C. marophyllum*, *C. Robelinii superciliosum*, *C. Ashburtoniae*, *C. barbatum*, *C. selligerum*, and *C. Parishii*, &c.

NEPENTHES AND SARACENIAS.

These were well shown by M. Louis van Houtte, who took the 1st prize for twelve excellent baskets, the plants carrying generally abundant pitchers. Extra fine were *N. Outramiana*, *N. Hookeriana*, *N. Dominiana*, *N. intermedia*, perhaps the finest plant in the group; *N. Martensiana* and *N. Wrigleyana*; equal 1st being M. P. F. Boutmans, Lille, whose best were *N. coccinea*, *N. rubra*, *N. maculata*, *N. Stewartiana*, *N. Morganii*, *N. robusta*, and *N. compacta*. M. P. F. Boutmans took the 1st prize for a collection of *Saracenia* and *Dionaea*—a good representative collection of plants of small size; MM. Jacob-Makoy & Co., Liege, being 2d.

M. Alex. Dalliere, Ghent, showed a nice collection of sorts of *Nepenthes*, which were arranged in a small octagonal glass house; but although the arrangement was a good one, it did not secure a prize, owing to the paucity of pitchers on his plants.

EPHORBIAEAE, PROTEACEAE, AND ARALIACEAE.

Crotons were largely shown. For fifteen plants, Madame Le Grelle D'Hanis, of Berchem, took the 1st prize, and Messrs. Wartel Brothers the 2d. It was remarked that these plants were wonderfully well grown, but were deficient in leaf colour, the green tint predominating. The sorts in the first-named exhibition lot consisted of the following:—*Rosea picta*, *avifolia*, *President Chircaux*, *Mort*, one of the best when well done; *magnolioides*, also a valuable one; *oblong*, yellow and green; *Barnesii* *Rothschild*, and *Managersii*, the two being among the highest coloured of the collection. For six specimens, M. D'Hane was 1st, and Messrs. Wartel Brothers 2d. Of *Araliaceae*, fifteen specimens were shown by M. D'Hane.

MARANTAS.

These plants were shown abundantly, as is the case in most Continental exhibitions, and were unconsciously well grown by all those who exhibited. The 1st prize fell to Madame Le Grelle D'Hanis, whose twenty specimens it would be difficult to match in our country. The species and varieties were *Kerchovina*, M. Kegejlanina, 6 feet across; *fasciata*, *Roseo-picta*, *Selosi*, *Wagneri*, *Berchemiana*, a distinct, narrow-leafed variety, grey-green in colour; *ligna*, 4 feet by 5 feet, a very fine specimen; and *M. Fortiana*.

DRACAENAS.

These plants were far better coloured and as well grown as the Crotons, both being specially cultivated in Ghent and Belgium generally. In most cases the plants were furnished with foliage, but in some instances they had suffered from want of space or too great distance from the glass.

For twenty distinct varieties, Messrs. Wartel Brothers were placed 1st, M. De Duivier 2d, and M. L. van Houtte 3d.

GENERAL COLLECTIONS.

For the best collection of fifty species and varieties of plants, flowering or non-flowering, there was an immense group in one corner of the great hall, where the most important exhibits were arranged. The 1st prize was awarded to Madame Le Grelle D'Hanis, whose twenty specimens it would be difficult to match in our country. The species and varieties were *Kerchovina*, M. Kegejlanina, 6 feet across; *fasciata*, *Roseo-picta*, *Selosi*, *Wagneri*, *Berchemiana*, a distinct, narrow-leafed variety, grey-green in colour; *ligna*, 4 feet by 5 feet, a very fine specimen; and *M. Fortiana*.

In the nurserymen's class for the same number and description of plants M. Louis van Houtte was 1st, the group of decorative plants of large size and superb cultivation, containing the choicest species and varieties found in any European nursery. *Anthurium Veitchii* was a magnificent specimen, the leaves being immense; *Lilacua grandis*, a much larger plant than Madame Le Grelle D'Hanis; *Spherozygia latifolia*, a very beautiful dark foliage; the young leaves being pink; *Croton Hanburyana*, *Diefenbachia splendens*, grand dark foliage with bright green spots; *Alcaesia Thibauti*, *Schismatoglottis Robelinii*, a very fine piece; *Pothos aculea*, a very large *Maranta zebra*, and numbers of superb examples of *Palms*, *Zamiis*, *Ficus*, *Crotons*, &c.

Madame Le Grelle D'Hanis had twenty-five species of ornamental foliage plants, taking therein the 1st prize; the 1st prize in the nurserymen's class going to M. D'Hane for fifteen species; M. De Bencker, Antwerp, being 2d.

Twenty-five plants (specimen), with coloured or variegated foliage.—1st, M. L. van Houtte; the plants shown were not remarkable for large size—we noticed *Maranta picturata*, *Dracaena Lindenii*, *Croton Imperator*, *Diefenbachia magnifica*, *Phyllotenum Lindeni*, a splendid specimen; the pretty *Alcaesia vitata*, and the highly coloured *Alcaesia* and *Tillandsia fenestrata*. M. D'Hane was awarded 2d prize for a collection but little behind that of the 1st.

(To be continued.)

LIVERPOOL HORTICULTURAL ASSOCIATION: Aug. 1 and 3.

The summer show took place on the above days, in the grounds of Scton Park. Two very long tents, besides others of lesser size, were brought into use, and here were brought together a very creditable lot of plants and flowers. The Crotons and their fine foliage plants of C. W. Neumann, Esq., were superb, and the *Ixoras* and *Allamandas* from W. H. Wats, Esq., were examples of no ordinary culture. The cut Roses were very fine, and, since the greater part had travelled for very long distances, they were fresh, and highly admired. The fruit classes a little falling off was observable in the quantity, but the quality made amends for any slight deficiency in this respect. The weather on the opening day was very fine and pleasant, and a large number of visitors entered the show grounds.

Taking the classes somewhat in detail, for twelve STOVE and GREENHOUSE plants (six foliage and six flowering), C. W. Neumann, Esq., Allerton (W. Mease, gr.), was 1st. For foliage, we observed *Lataoa borbonica*, *Croton Weismanni* and *Queen Victoria*, grand masses, 6 feet by 6, superb in colour and form; *Alcaesia macrozygia*, very well done; *Kentia australis* and *Forrestiana*, *Ixora Pilgrimii*, grand heads; *Dipladenia amabilis*, *Erica Irybana* and *Paxtoni*, 3 feet across; and *Anthurium Andreanum*.

For ten stove and greenhouse plants, W. H. Wats, Esq., Warrington (W. Cox, gr.), was well to the front with choice and well-grown examples of *Croton Victoria*, *Dicksonia antarctica*, *Alcaesia macrozygia variegata*, *Ixora Dixiaea*, with over 200 heads of bloom; *I. coccinea superba*, with sixty; and *I. regina* with forty-three plants of exceptional merit; *Allamanda*

Hendersonii, covered with bloom, and *Statice Bulcheri*, with ten large spikes. 2d fell to J. H. Gossage, Esq., J. Jelliffe, and W. Cotton, who had a grand *Fritschia pacifica* and *Vinca alba* in good form; 3d, B. Hall, Esq. (A. Crosbie, gr.); *Wavertree*: in this group a good plant of *Croton Mooreana* was staged.

For six stove and greenhouse plants in bloom, Messrs. J. Cypher came 1st, showing *Allamanda nobilis* with thirty fine spikes; *Dipladenia amabilis* with forty flowers, *Ixora regina*, thirty trusses, *Erica ampullacea Barnesii*, tricolor major, and *Phaenocoma prolifera Barnesii*. Very close came C. W. Neumann, Esq., with fine plants of *Clerodendron Balfourii*, 4 feet through; *Ixora Hendersonii*, *Erica tricolor Wilsoni*, and *E. coccinea*, *Phaenocoma*, *Bougainvillea*, scarcely at its best, and a small *Dipladenia*.

With four stove and greenhouse plants in bloom, W. H. Wats was 1st, and the same exhibitor was 1st with six stove and greenhouse in 12-inch pots; nice examples were to be seen in this group—*Calamis ciliaris*, *Croton nobilis* and *Distracti*, *Kalassia* the Dr. E. Regel, *Allamanda Hendersonii*, and *Ixora coccinea superba*.

For one stove plant C. W. Neumann was 1st with *Anthurium Andreanum*. H. Drysdale, Esq. (G. Buller, gr.), was 2d with *Allamanda Hendersonii*; 3d, Mr. A. Johnson, with a fine greenhouse plant, J. Cunningham, Esq. (T. Gowen, gr.), was placed 1st with a grand plant of *Kalossanthus*, very effective and well done; C. W. Neumann being 2d, with *Erica Irybana*.

For eight FINE-FOLIAGE PLANTS, C. W. Neumann, Esq., was again to the front, showing grand examples of *Gonolobus*, *Alcaesia* of Wats, 6 feet high, as much through *Countess*, *Mort*, grand colour and fine in form; *Weismanni*, 6 feet by 6; *Area lutescens*, and *Lantana borbonica*, 2d, Mrs. A. Johnson (C. W. Waterman, gr.), having *Cycas revoluta*, *Alcaesia Lowi*, very good; *Croton Weismanni* and *Alcaesia nobilis* variegata, a very fine specimen; *Alcaesia* plants were awarded to F. H. Gossage, Esq., who had *Maranta Veitchii* and *Dracaena Veitchii*, good; J. Branker, Esq. (T. Foster, gr.), was 2d. Three *Palms* were awarded to Mrs. A. Johnson, who had a nice *Cycas Stevensonii* and *Area lutescens*, and a fine *Wats*, 6 feet high, whose plants were *Area lutescens*, *Scaevola elegans*, and a *Thrinax*.

For eight exoté FERNS, Mrs. Horsfield (Mr. G. Rhodes, gr.) succeeded in getting 1st with well-grown examples of *Dicksonia antarctica*, *Alphollia Moorei*, *Davallia Mooreana*, 5 feet across; *Dicksonia squarrosa*, a nice compact plant, with three dozen very large, 2d, W. H. Wats, Esq., with *Gleichenia dichotoma* and *Davallia Mooreana*; 3d, W. B. Baring, Esq. (J. Hurst, gr.). For six ferns, J. Cunningham, Esq., was 1st, showing good plants of *Adiantum farleyense*, *Davallia Mooreana*, *Gonolobus subauriculatum*, with fronds 5 feet long; *Gleichenia microphylla*, *Pteris scabra*, and *Polystichum Veitchii*; 2d, Mrs. A. Johnson, in whose collection was a large specimen of *Microlepia birta cristata*. In the class for three *Filix* Ferns, W. Holland, Esq. (W. Moss, gr.), was 1st with *Todea superba* and *pellicuda*, and *Trichomanes radicans*; and the same exhibitor was 2d with *Polystichum Veitchii*, 3d, Mrs. A. Johnson. For eight *Ferros* were shown by Mrs. Barseley, J. Branker, and Mrs. A. Johnson, and prizes awarded in the order in which the names occur. Good plants of *Athyrium*, *Lastrea*, *Polystichum*, and *Oncoclea* were among the things shown, but the most interesting was *Polystichum*, which was shown by J. Branker and Mrs. A. Johnson, the former winning with good plants of *Valchii*, *Wildenowii*, *caulescens*, *Mastersii*, *umbrosa*, and *dichrous*.

Ericas were not numerous, only two exhibitors appearing in the class for form, the 1st falling to C. W. Neumann, the 2d to Mrs. J. Cypher.

Four lots of four Orchids were staged, Mr. C. W. Neumann being placed 1st with *C. Gaskelliana* with several blooms; *Thunia Marshalliana*, with seven heads; *Saccolabium Blumei majus*, with four spikes; and *Cypripedium Lawrenceanum*, with three blooms. Messrs. J. Cypher were 2d, with small but clean plants of *Cattleya Lindleyi*, *Cypripedium Stonci*, and *C. Parishii*. W. Holland was 3d, in whose group was a good plant of *Galaeandra Devonianica* and *Oncidium crispum*.

For one Orchid, Mr. A. Johnson was 1st, with a fine plant of *Cattleya Leopoldi*; J. Branker with *Cattleya crispata*, very fine; *Brachyotum* and *Dendrobium*, and *Phalaenopsis*. A capital plant of the rare *Zygopetalum Sedeni* was shown by the latter gentleman, having a spike with five beautiful flowers.

The *Fuchsias* were numerous and good. Plants of 6 to 8 feet were shown by several of the exhibitors. For six *T. Drysdale* and *W. B. Baring*, Esq., was well to the front with *Fuchsias*, *Magdali*, *Liverpool*; the 3d falling to J. Hughes, gr. to H. McIver, Esq.

Three *Fuchsias*, confined to amateurs, were shown by W. H. Wats, Esq., H. McIver, and W. B. Bowring, *Aigburth*, and were successful as their names appear in the following list.

The double and single zonal *Pelargoniums* were in excellent condition. For six zonal *Pelargoniums*, Mr. Fleming was 1st, with plants just 3 feet across, full of bloom. Here we noticed *John Gibbons*, *Mrs. W. Paul*, *Caxton*, *Madame Vaucher*, and *Lucey Bosworth*. 2d, Mrs. Horsfield; 3d, J. Lewis, Esq., *Aigburth* [J. Bussard, gr.]. With three zonals J. Cunningham was 1st, W. B. Clark 2d, and J. Bussard 3d.

The doubles were shown by J. Cunningham, who again was 1st, R. Fleming & Sons 2d, and W. B. Bowring 3d. These made a very striking and important feature in one of the tents.

Tuberous *Begonias* were moderately well done. Being had things to travel several of them evidently suffered somewhat in transit. With six *B. B. Bowring* was 1st

With three W. H. Watts was 1st, C. W. Neumann 2d, and W. C. Clarke 3d.

With Caladiums C. W. Neumann, who was the only exhibitor, was 1st for six, showing well grown examples of Chantini canna; J. Ker & Sons had a very effective, Luddennant, Anguste Lemoine, and Bicolor magnifica.

Six Coleus were shown by A. Johnson, who was 1st, having well shaped plants of compact growth; J. Lewis 2d, and H. Melver 3d.

Gloxinias were shown by W. S. Taylor, Esq., who was 1st for six; J. Pitts 2d, J. Cunningham 3d.

Cockscombs and Achimenes were also well shown by the latter exhibitor, who won in both classes.

C. W. Neumann was 1st, with eight large plants and good varieties; J. W. B. Bowring, with good plants also.

Circular groups of miscellaneous plants were shown by C. W. Neumann, W. H. Watts, and F. H. Gossage, and were placed in the order in which their names appear. Similar groups were arranged by nurserymen, and here Messrs. R. Ker & Sons had a very effective group, made up in their best style; 2d, Mr. F. Francis, Waverley. The Liverpool Nursery Company (Mr. J. Cowan) had five large groups of plants of Roses and Liliums, and others of mixed character; these were well done, and very useful in the exhibition; a large mass of Delphinium and Peonies, in a very effective arrangement of one group, and a D. Dalhousienum, with many spikes of flowers, stood up above the plants over another group. Many table plants were shown, the best six coming from Mr. J. Harrison, Esq. (T. F. Fleetwood, gr.), Mr. Watts and Mr. A. Johnson, Esq. (C. W. Neumann, gr.). The cut flowers were numerous and very fine.

ROSES

were exceptionally good. For forty-eight cut blooms, Messrs. Harkness & Sons, Bedale, Yorkshire; Messrs. Cocker & Son, Stanning Park Nursery, Aberde. R. Mack & Sons, Rose Nursery, Gatterick Bridge; and T. B. Small, Rock Ferry, staged magnificent stands. After much deliberation the prizes were awarded in the order the names appear, the latter two being equal 3d. For twelve Tea and Noisettes, T. B. Hall was placed 1st, Messrs. Harkness and Sons 2d, and Messrs. Perkins & Sons, Cove-nant, 3d. For twenty-four Ragain wren, T. B. Hall was 1st, the 2d falling to A. Tate, Esq., Wootton. Messrs. Mack & Sons were 1st for twelve, and H. J. Robinson 2d. Twelve Roses, any dark variety.—The 1st went to Messrs. Mack & Sons, 2d, to Messrs. May, 3d, to Messrs. A. Dickson & Son, Belfast. The stand being composed of Alfred Colomb. Twelve blooms, one light variety, was taken by Messrs. Cocker & Sons, with Merveille de Lyon; Messrs. Mack & Sons 2d, with Baroness Rothschild; and Messrs. A. Dickson & Son 3d, with Le France. For the best arranged by Mrs. A. Sale, Esq., was successful, Mr. T. B. Hall coming a good 2d.

Cut stove and greenhouse flowers were shown by Mr. C. W. Neumann and Mr. J. Lewis, who were 1st and 2d for twenty-four trusses—Mr. W. H. Watts and Mr. R. Cocker securing similar honours in the class for twelve trusses.

Hardy herbaceous plants were well shown by Mr. C. W. Neumann, Messrs. J. Dickson & Son, and Mr. J. Lewis. In these stands I observed Liliun Harrisii, tetaecium, perfoliatum, perfoliatum, Allium, cupat, cicutaria, fl.-pl.; Alchemilla, aurea, Telium speciosissimum, Genm coccineum, fl.-pl.; Carnation Annihilator, and numerous others. Mr. J. Cypher was 1st with two bouquets, Messrs. Perkins & Sons 2d, and Mr. G. Downs 3d. For one bouquet, Mr. B. Hall was 1st, Mr. T. Robinson 2d, and C. H. Wynne 3d. With one specimen for dinner-table decoration, Mrs. S. Barnesley was 1st, Mr. J. Lewis coming 2d, and Mr. J. R. Rogerson 3d.

FRUIT.

The fruit was of excellent quality. For eight dishes the Duke of St. Albans (Jr. Edmond) gr. won with Muscats, Black Hamburgs, Pine Melon, Bellagard Peach, Elruge Nectarine, Figs, and Cherries. 2d, T. H. Oakes, Esq. (J. Ward, gr.), who also showed a very fine lot. With six dishes, A. R. Gladstone (T. Ellisworth, gr.) was 1st, having Black Hamburgs, Muscats, Madresfield Court, and Nectarines, and Figs; 2d, Duke of St. Albans; 3d, C. W. Neumann. The Hon. C. H. Wynne (J. Bennett, gr.) was 1st with two Pineapples, Lord Newborough coming in 2d.

Four bunches of Grapes were shown by J. Evans, Esq. (C. Young, gr.). Prescott, who was 1st, with Madresfield Court in hand form, Foster's Seedling, Black Hamburgs, and Muscats; R. Pilkington, Esq. (G. Middleton, gr.) was 2d; Duke of St. Albans 3d. Black Hamburgs were shown by Alderman Rayner, who was 1st; J. Hargreaves, 2d; and W. B. Bowring, 3d. White Grapes, three compact bunches of well formed fruit, were shown by W. G. Holland, and W. C. Clarke, who were respectively 2d, 3d, and 3d. For black Grapes, Black Hamburgs excluded, Alderman Rayner showed grand examples of Madresfield Court, and was placed deservedly 1st, T. H. Oakes 2d, and J. Evans 3d. White Grapes, Muscats excluded, The Hon. C. H. Wynne showed Duke of Bedford in good condition, and was 1st; S. S. Parker coming 2d, with the same variety; the Rev. W. Sneyd (J. Wallis, gr.) being 3d.

Splendid Peaches were shown by R. C. Naylor, who was 1st, and also by the Duke of St. Albans, who was 1st in a similar class for six.

First prizes for Nectarines were taken by the Hon. C. H. Wynne for six, and also by W. B. Bowring for the same number in another class.

For green-fleshed Melons, Mrs. Horsfall was successful; Mrs. Patterson securing a 1st prize for scarlet-fleshed Melon.

One dish of Strawberries was won by J. Branker, Mr. A. R. Gladstone, being 1st with a dish of Cherries,

For the best basket of miscellaneous fruit, C. W. Neumann, Esq., was 1st, with a very effective lot, Mr. A. R. Gladstone showing also well, and coming in 2d.

VEGETABLES.

With twelve varieties of vegetables, Colonel Wingfield came well to the front, W. Chambers being placed 2d, and R. M. Biddulph 3d.

In a class for twelve, open to exhibitors within ten miles of Liverpool, C. W. Neumann was to the front, J. Rainford coming 2d, and Sir T. Earle 3d.

With six dishes of Peas R. Pilkington was 1st, Mr. W. Hosker coming in with three dishes.

C. W. Neumann was again in the front place with six dishes of Potatoes, the same honour falling to Mrs. J. Rainford with four dishes.

Tomatoes were well shown, R. Pilkington being 1st, with three dishes; J. Branker 2d, and Colonel Wingfield 3d. The same exhibitors showed one dish of Tomatoes, and came in again into the same positions.

Lord Newborough, Colonel Wingfield, and J. Davies showed Cucumbers, and were successful in order as their names appear.

A very nice lot of Vines and Tea Roses in pots were shown by the Liverpool Nursery Company. Good stands of stove plants, &c., were exhibited by Messrs. R. P. Ker & Sons. From Messrs. R. Pearson & Sons came a good stand of Pelargonium blooms. Mr. J. M. John Laing & Co., Forest Hill Nursery, London, showed several stands of cut flowers, including single and double Begonias, in their best form, and also a stand of Hollyhocks, that many were pleased to see. Messrs. F. & A. Dickson, of Clatter, had a capital display of mixed stove and greenhouse plants.

Numerous stands were erected about the grounds, exhibiting the many requisites pertaining to horticulture, the summer-houses of Mr. L. Caesar, of Knutsford, being much admired.

NEWBURY HORTICULTURAL: Aug. 3.

The exhibition as a whole, notwithstanding the absence on this occasion of two or three prominent and regular exhibitors, was nevertheless highly satisfactory, the large tent devoted to plants alone was well filled in a very effective manner.

The chief class, open to all England, comprised a collection of six stove and greenhouse plants in bloom, Mr. J. F. Mould, Pewsey, Wilts, was a good 1st; and Mr. C. Howe, gr. to Sir Richard Sutton, Bart., Benham Park, 2d.

For a collection of six variegated or remarkable plants, Mr. C. Howe had 1st honours, and Mr. J. F. Mould 2d.

The class for twelve exotic Ferns was well contested, Mr. C. Howe being 1st, and Mr. R. Gammon, gr. to J. Rishop, Esq., 2d.

For six distinct kinds of Kalmias, Mr. J. Davis, gr. to Major Furlow, secured the 1st prize; and Mr. R. Gammon 2d.

Fuchsias.—Only two collections were staged, but these were most creditably done—the 1st prize falling to Mr. J. Davis, and the 2d to Mr. R. Lye, gr. to W. H. Kay, Esq.

Two prizes for the best group of plants, 12 feet by 8 feet, quality and taste in arrangement to be considered, brought four competitors, all of which were highly creditable, so much so that extra prizes were added subsequently. Mr. C. Howe was 1st, and Mr. J. Davis 2d. This was also the class. The class for twenty-four bunches of miscellaneous cut flowers for artistic arrangement brought forth a good display, the premier prize falling to Mr. Phippen, nurseryman, Reading, who also took 1st for six buttonhole bouquets and a bridal bouquet.

FRUIT.

In the fruit classes for gentlemen's gardeners, Mr. C. Howe was a very prominent exhibitor; he had a 1st prize for a collection of eight kinds of fruit—"an excellent lot." His best dishes were very fine—Grosse Mignonne Peaches, Lord Napier Nectarines, Moor Park Apples, Figs, and a Melon. In the single classes for fruit, Mr. C. Howe also took 1st prizes for the same kind of Peach and Nectarine—both very fine dishes. For three bunches of Black Hamburg Grapes eight competed, 1st prize going to Mr. Davis for three large well-coloured bunches, rather small in berry; Mr. Walker, gr. to H. P. Powell, Esq., being 2d, and the other somewhat smaller-sized bunches, finely finished, but unfortunately slightly rubbed in transit; the 3d and 4th lots were also good examples. Muscats brought out these lots, the 1st prize dish being rather over-ripe, and small in berry; the 2d lot had fine berries, but not finished; the 3d lot fine bunches, but insufficiently ripe. In the class for other kinds of black Grapes the 1st prize fell to Mr. H. Brown, gr. to Viscount Exmouth, Bedford, with fairly good examples of Black Prince; and in the other class for white Grapes, three compact bunches of well formed fruit, Foster's Seedling secured the 1st prize. Melons were plentifully shown, but poor in quality. Plums and Green Gages were not numerous, and still unripe; and the same may be said with regard to dessert Apples. In culinary kinds the samples were most plentiful, but not so large in size as usual. Currants were well represented in all kinds. Some particularly fine reds were shown by Mr. Maker, gr. to A. Waterhouse, Esq., and obtained the first award. Figs were also fine, especially those from Mr. H. Brown, gr. to Viscount Exmouth.

AMATEURS.

In the classes for amateurs there was a fine competition, the Fuchsias and Petunias being very good, and the bedding and variegated Pelargoniums and Coleuses

from Mr. Charles Midwinter, which secured 1st honours in their respective classes, were excellent. Fruits were not so plentiful, Peaches, Nectarines, &c., not yet being sufficiently ripe. Currants were good. Three prizes were offered for competition among the ladies for a group of three vases, stands or dishes, arranged with flowers and foliage for table ornamentation was keenly contested; ultimately the 1st prize was awarded to Mrs. J. A. Johnston, Biddington, Messrs. Sutton & Sons graciously offering two prizes for eight kinds of vegetables in baskets. Several competitors staged for these prizes, and Mr. Wm. Pope, gr. to the Earl of Carnarvon, won the premier prize with a very good assortment. In the vegetable classes for mechanics, artisans and cottagers, some very nice dishes were shown, but in many instances the subjects were not so good here as I have seen them on former occasions; doubtless this is accounted for in the lack of rain for so long a period. G. T. M.

CARMARTHEN HORTICULTURAL.

THE summer show of the above Society was held in the Market Place on July 30. The exhibits were both numerous and good, and the Market Place presented an unusually gay appearance, decorated with so many choice specimen exotics. Great credit is due to the arrangements for the manner in which the arrangements were carried out.

The competition in the plant classes was very keen. In the class for twelve stove or greenhouse plants the premier prize fell to Captain Phillips, of Penly Park, with a clean well grown lot, including a good Reading collection of plants, all of them very fine and very finely coloured Crotons. This collection was closely followed by a good 2d.

In the class for six flowering plants the Penly Park collection was again to the front, the most noticeable plants being Allamanda grandiflora, splendidly flowered; Anthurium Scherzerianum, and Begonia glabra.

For six plants in 8-inch pots the 1st prize was awarded to J. Bickley, Esq., for a clean, healthy lot.

Two exhibitors staged specimen plants—a large but thinly flowered Stephanotis by C. B. Mansfield, Esq., and a nicely coloured Croton Disraeli by C. E. Phillips; the judges awarded the prizes in the order named.

Selaginellas were not quite so well grown as we have seen them. The best lot was shown by J. Bickley, Esq., and a nicely coloured Croton Disraeli by C. E. Phillips; the judges awarded the prizes in the order named.

The dinner-table decorations were greatly admired, the 1st prize being taken by Mr. W. J. Buckley, with a light and tastefully arranged table.

Some excellent FRUIT was exhibited. Splendid Black Hamburg Grapes were shown by C. B. Mansfield, Esq.; Muscats were also shown by the same exhibitor. A pair of handsome Queen Fines were exhibited by C. E. Phillips, Esq., of Pleton Castle, and obtained 1st prize. Collection of fruit was won by C. B. Mansfield, Esq., with good Grapes, Lord Palmerston Peaches, and finely coloured Pinaut Orange Nectarines.

The show of VEGETABLES was a large one, but some excellent productions were staged. Cottagers were well represented by some highly meritorious exhibits, particularly in the class for window plants.

One of the most noticeable features of the show were the exhibits not for competition, including a large collection of plants, and cut flowers, staged in the Llanelly Gardens, and some splendid specimen Roses from the Mount Hill Nurseries.

NORTHAMPTON HORTICULTURAL: August 3.

THIS Society held its annual summer show on the Bank Holiday, at the usual place, Delapre Park, where, as on previous occasions, there was an immense concourse of people. On the present occasion the general character of the exhibitions which the Society has hitherto had was well maintained, although in one or two departments there was a marked falling off, notably in the principal classes for stove and greenhouse plants, and fruit, the latter of which was not forthcoming in such quantities as might have been looked for in a part of the country where doubtless plenty is grown. On the other hand vegetables, which the all but unrepresented exhibitors have made it their object to produce in presentable condition, were not so deficient in unusually large quantities but in excellent order.

In the class for 12 STOVE and GREENHOUSE PLANTS, Sir-Melbourn and six fine-foliaged, there were three exhibitors.—Mr. Coyle, The Gardens, Newbold Level, Rugby, taking 1st, his best plants being Lapageria rosea, a well furnished plant, nicely flowered; Allamanda Hendersoni a large example, full of flowers; and a very fine specimen of colour that it is usually seen. Noticeable among the foliage specimens in this group were Croton Weismanni, C. angustifolius, and Cycas revoluta. Mr. Holland, gr. to W. Jelfery, Esq., Northampton, was a good 2d, staging amongst others, a very beautiful plant, Erica Maronekana, Diplopentia anabilis, Rondeletia speciosa major, and Stephanotis floribunda, the best foliage examples being Lantana borbnica and Yucca Stokesii, the latter nearly 6 feet high, and well furnished with large highly coloured leaves.

FERNS

were well shown, the most of the competing plants being in fresh condition. With six Mr. Holland took the lead, having an even well-grown group, the best of which

were *Gleichenia*, Mendelii, Adiantum Farleyense, and *Gymnogramma chrysophylla*; 2d, Mr. Coysh.

COLEUS.

These were forthcoming in beautiful order from Mr. Underwood, gr. to J. Bouvieri, E. Colap, Delapre, who took 1st; 2d, Mr. Holland.

CALADIUMS.

With these Mr. Holland had 1st, staging medium sized plants with stout leaves, that showed no signs of flagging in the way that these plants usually do in the exhibition, but when not grown with enough light and air.

FUCHSIAS.

1st, Mr. Garfirth, gr. to P. Phipps, Esq., Collingtree; 2d, Mr. Beard, Brighton.

ZONAL PELARGONIUMS.

With these the order was reversed, Mr. Beard taking 1st, Mr. Garfirth 2d.

TABLE PLANTS

were very well shown, Mr. Holland being 1st, with a beautiful dozen, in every way suitable for the purpose; Mr. Cole, gr. to Earl Spencer, Arbury, who was a close 2d, also had a very good lot of plants.

CUT FLOWERS.

Roses were surprisingly well shown, both as to quality and quantity, considering the parching weather we have had, showing in a way that cannot be misunderstood what can be done by good cultivation, even under adverse conditions. There were twenty-four varieties, single blooms, Messrs. Perkins & Sons, Warwick Road Nursery, Coventry, were well in front with a beautiful stand, the flowers as large and full of substance as often seen earlier in the season. Mr. Prince, Oxford, who was also had a very good lot, well in front with Messrs. Perkins were likewise 1st, here again staging a fine lot of blooms. Twelve Teas.—In this class Mr. W. Jackson, Stagen Vicarage, had 1st, with fresh young flowers in beautiful order; 2d, Mr. Prince.

Miscellaneous specimens were present in quantity, and in splendid condition, 1st honours for twenty-four bunches going to Mr. Coysh, for a very good collection, which included *Ixoras*, *Dipladenias*, *Anthurium Andreanum*, *Stephanotis*, *Allamandas*, and a very fine variety of *Cattleya Leopoldi*; Mr. Parker, who was 2d, also had a good lot, mostly *Ixoras* and green *Ixoras* kinds.

Among a number of bouquets some charming examples were staged, Messrs. Perkins & Sons, Coventry, taking 1st, with a very good one, remarkable alike for the colours and arrangement of the flowers; 2d, Mr. F. Perkins, whose exhibit was also highly commended. Table decorations were in great excess, occupying almost the entire centre of a large tent. The arrangements were more varied than usual, in competitions of this kind some of the exhibitors still retaining the tall glass stands that once were looked on as the correct sort of thing to use in arrangements of this description, and were using one or three plants, with flowers or Ferns and other foliage; others again discarding stands and plants, relying wholly on flowers and leaves, with or without fruit. For a table of the ordinary size Mr. Parker, Rugby, was 1st, with a very nice combination of three small Palms down the centre, the base of each furnished with a few flowers and green foliage, and some small glasses with two or three flowers and bits of green each; Mr. F. Perkins was a very good 2d. On this table plants and stands were dispensed with, the foliage and flowers being arranged in low dishes. 3d, Mr. Coysh.

FRUIT.

With six dishes, Mr. Garfirth was 1st, his best examples being Black Hamburg and Muscat of Alexandria Grapes and Peaches; 2d, Mr. H. Collins, Berry Wood. Three bunches of black Grapes.—Here Mr. Cole was well in front with good bunches, very large in berry; 2d, Mr. Harlock, gr. to Lord Lilford, Lilford Hall. Three bunches of white Grapes.—1st, Mr. Farr, gr. to Sir R. Knighley, Fawsley Park, with Buckland 3d, Swanton, good bunches in nice condition; 2d, Mr. Cole, with Muscat of Alexandria. Dish of Peaches.—1st, Mr. Harlock. For a Melon, Mr. Coysh took 1st, with a nice fruit of Newbold Revel, a scabrous-fleshed variety of medium size; 2d, Mr. Cole. Six dishes of Apples.—1st, Mr. Coysh, gr. to Sir R. Knighley.

Mr. F. Perkins exhibited several plants of his new *Pelargonium Volonté Nationale* alba, a frilled-petalled variety with perfectly white flowers, except the faintest streak of colour in the top petals. It is a dwarf grower, and a profuse flowerer; here a good number of the leading shows, including the Horticultural at South Kensington, the Regent's Park, and the Crystal Palace, it received a First-class Certificate.

A large and beautiful lot of tuberous Begonia flowers, single and double, were exhibited, not for competition, but for Edward Budge, Leighton Buzzard; the single varieties, mostly seedlings, were especially fine, in both form and colour, with plenty of size and substance; they comprised all the shades of red, from the darkest crimson to scarlet, pink, old gold, yellow, and white.

THE OXFORD UNION CARNATION AND PICOTEÉ

MR. F. S. DODWELL made no empty boast when he promised his visitors a feast of Carnations. His Carnation and Picoteé garden, with its Carnation and Picoteé houses and stands and frames, containing some 3500 plants, in some 1500 pots, besides beds of seedlings aglow with blooms, is worth a journey to see, but

in addition there was an exhibition of great importance. Northern and Southern growers were well represented, and regard being had to the state of the weather—hot, dry, and withering, the quality of the flowers was a 1st, erected in Mr. Dodwell's garden, at the centre of his Carnation houses, and under the flowers. A large number of growers and admirers of the Carnation were present, and during the afternoon many visitors came to see the flowers.

CARNATIONS.

In the class for twelve dissimilar blooms of Carnations, six prizes were awarded, and the awards went as follows:—Equal 1st, Mr. M. Rowall, 36, Manor Street, Clapham, London; and Mr. Joseph Lakin, Temple Cowley, Oxford, the two stands being so good that it was difficult to separate them, and with one or two exceptions the flowers were very fine. The usual plan in fixing twelve blooms is to have them in three lines of four each, and following the old plan of reading from left to right across the box, the flowers were placed as follows:—George, S.B., extra fine; Black Prince, C.B.; Jessica (Turner), R.F.; Arthur Medhurst, S.E.; Squire Littlewell, P.F.; Annalator (Jackson), S.E.; Master Fred (Hewitt), C.B.; William Skirving (Gordon), P.P.B.; Mrs. Francis Whitbourn, C.B.; Master Slender, P.F.; Mrs. Austiss, C.B.; and Florence Nightingale (Sealey), P.F.; all the foregoing flowers without raisers names attached are Mr. Dodwell's, and the awards went as follows:—1st, Mr. Lakin had a very refined lot of 2d blooms of the following:—George Melville, P.F.; John Harland (Adams), C.B.; Henry Cannell, S.F.; Florence Nightingale (Sealey), P.F.; Admiral Curzon (Eason), C.B.; Rifleman (Wood), C.B.; Master Fred (Hewitt), C.B.; 2d, Mr. B. Martin Rowan, P.E.; Arthur Medhurst, S.B.; John Ball, S.F.; and Master Slender, P.F.; 3d, Mr. W. Meddick, Bath, with Dr. Masters, C.B.; Henry Cannell, S.F.; James Douglas (Simonite), P.F.; John Hines, S.B.; Duke of Grafton (Hooper), S.B.; and John Harland (Adams), C.B.; 4th, Mr. William Stock, Cliftonville, 6th, Mr. Bacon, Derby; a Bloom of the Etoile Wemyss, R.F., in this stand was remarkably good.

In the class for six blooms, dissimilar, there were eight competitors, and Mr. Robert Lord, Todmorden, was placed 1st with a pair of flowers, the most beautiful seen at the report, Mr. Hestall (Hestall), C.E.; Admiral Curzon (Eason), S.B.; George Melville, P.F.; John Harland, C.B.; John Keat (Whitehead), R.F.; and Sportsman, a sport from Admiral Curzon, S.F.; 2d, Mr. W. L. Walker, Reading, with George, S.B.; Sarah Payne, P.B.; M. R. Phillips, with Walter Ware (Ware); 3d, Mr. B. Simonite, with James Merrywether (Simonite); 4th, Mr. B. Simonite, with Master Fred (Hewitt); 5th, Mr. J. Lakin, with Master Fred (Hewitt); 6th, Mr. W. Slack, with Walter Ware (Ware); 7th, Mr. W. Slack, with Walter Ware (Ware); 8th, Mr. B. Simonite, with James Merrywether (Simonite); 4th, Mr. B. Simonite, with Master Fred (Hewitt); 5th, Mr. J. Lakin, with Master Fred (Hewitt); 6th, Mr. W. Slack, with Walter Ware (Ware); 7th, Mr. W. Slack, with Walter Ware (Ware); 8th, Mr. B. Simonite, with James Merrywether (Simonite).

In the class for single blooms there were a great many flowers, and the judges had a very enormous task to perform. The first prize went to Mr. W. Slack, as follows:—S.B., 1st, Mr. H. Startup, Bromley, with Fred; 2d, Mr. R. Lord, with Thomas Austiss; 3d, Mr. R. Lord, with Rayner Johnson; 4th, Mr. Tom Chapman, Leicester, with Fred; 5th, Mr. J. S. Hedderley, with Fred; C.B., 1st, Mr. W. Slack, with Sarah Payne (Ware); 2d, Mr. Phillips, with Faust (Phillips); 3d, the same, with Miss Henderson; 4th and 5th, Mr. H. Startup, with Harrison Weir. P.F.: 1st, Mr. R. Lord, with Dr. Foster (Foster); 2d, Mr. W. Slack, with Dr. Foster; 3d, Mr. B. Simonite, with Mrs. F. Whitbourn (Simonite); 4th, Mr. T. R. Rowan, with Mrs. Payne Corpus; 5th, Mr. R. Lord, with Dr. Foster. S.F.: 1st, Mr. J. S. Hedderley, with Sportsman; 2d, Mr. J. Lakin, with Tom Lord; 3d, Mr. R. Lord, with Sportsman; 4th, Mr. J. Lakin, with Tom Lord; 5th, Mr. Hedderley, with Sportsman. R.F.: 1st, Mr. R. Lord, with Fred (Whitehead); 2d, Mr. W. Slack, with a seedling; 3d, Mr. R. Lord, with Lovely Ann (Ely); 4th, Mr. B. Simonite, with Cristigalli, a Lancashire-raised flower; 5th, Mr. Tom Chapman, with Rob Roy (Gorton).

Frederic Carnation.—This was George, S.B., one of Mr. Dodwell's finest flowers in the 1st prize stand of twelve blooms, shown by Mr. W. Rowan, who states, it always comes in the best character in his garden at Clapham.

PICOTEÉS.

In the class for twelve dissimilar blooms there were seven competitors, and six prizes were awarded, as follows:—1st, Mr. Robert Lord, Todmorden, Rose E. Constance Heron (Fellows); P.E. Clara Penon (Willmer); Red E. (Princess of Wales (Fellows), Rose E., (Fellows) (Wood), Rose E. (Hudson); 2d, Mr. R. Lord, with Red E. (Princess of Wales (Fellows), Rose E. (Hudson), Rose E. Royal Mite (Abercrombie), P.E. Her Majesty (Addis), Rose E., Liddington Favourite, Rose E. Edith D'Ombrain (Turner); P.E. Novelty

(Matthews), Red E. Mrs. Gorton (Simonite), Rose E. Daisy (Dodwell), Red E. John Smith (Bower). 3d, Mr. M. Kowan, with a very good lot of flowers, having Zelia, Mr. Dodwell, Nelly, a lovely light rose edge, Dr. E. Heron (Thomas Dodwell), Evelyn (Hewitt), Mrs. Gorton, Edith D'Ombrain, Attraction, Constance Heron, Nymph, and Mrs. Payne. 4th, Mr. W. Slack, Chesterfield. 5th, Mr. Hedderley. 6th, Mr. T. E. Henwood. In the class for six blooms there were eight competitors, and seven prizes, raised by John Whitton, Eton Bridge, Yorkshire, with Edith D'Ombrain, Mrs. Dodwell, Clara Penon, Liddington Favourite, Miss Horner and Zelia, a very pretty lot indeed; 2d, Mr. T. Austiss, Brill, with Purple Prince, Liddington Favourite, Baroness Burdett-Coutts, Dr. Epps, Edith D'Ombrain, and Edith D'Ombrain; 3d, Mr. J. Lakin, with Purple Prince, Oxford, with Mrs. Payne, Dr. Epps, Tonic (Dodwell), Medium Purple E., Faonny Helen (Niven), Edith D'Ombrain, and Zelia; 4th, Mr. W. L. Walker, Reading; 5th, Mr. W. Bacon, Derby; 6th, Mr. C. Phillips; 7th, Mr. H. Startup.

As the case of the Carnations, so with the Picoteés, five prizes were awarded in each of the three divisions for single blooms, as follows:—Heavy Red E.: 1st, Rev. J. P. Sharp, with a seedling; 2d and 3d, Mr. J. Lakin, with Dr. Epps; 4th, Mr. T. Austiss, Brimsford (Epps); No. William Light, with W. Brazil (Austiss); Light Red E.: 1st, Mr. Startup, with Thomas William; 2d, Mr. C. Phillips, with the same; 3d and 4th, Mr. H. Hedderley, with Mrs. Bower. Heavy Purple E.: 1st, Mr. B. Simonite, with Mrs. Niven; 2d, Mr. T. Austiss, with Mrs. Niven; 3d, Mr. R. Lord, with Mrs. Niven; 4th, Mr. J. Lakin, with Baroness Burdett-Coutts; 5th, Mr. W. Slack, with Muriel. Light Purple E.: 1st, Mr. J. P. Sharp, with a seedling, and 3d, with the same; 2d and 4th, the same, with a seedling; 5th, Mr. J. Lakin, with Mrs. Niven; 6th, Mr. W. Slack, with Mrs. P. Sharp with Mrs. Sharp (Sharp), a seedling, heavy scarlet edge, of a very bright and soft shade of colour, pure ground, very fine petal; and 2d, with the same; 3d, Mr. J. Lakin, with Edith D'Ombrain; 4th, Mr. J. P. Sharp, with a seedling; 5th, Mr. Tom Chapman, with Sporty Light, a seedling. That charming variety, Liddington Favourite, took all the prizes in this class; Mr. R. Lord was 1st, Mr. T. Austiss 2d, 3d, and 5th, and Mr. J. Lakin 4th.

Premier Picoteé.—This was Nettie, a lovely light rose edge, raised by the late Mr. George Rudl, and shown by Mr. M. Kowan.

SELF, FANCY, OR YELLOW GROUND CARNATIONS AND PICOTEÉS.

Some beautiful flowers were shown in this class, especially in the way of scarlet and crimson grounds, flaked with maroon. There were six stands, twelve blooms, and the six prizes were awarded as follows:—1st, Mr. J. Lakin, with Captain Owen, a rare flower; Florence, a pale buff self; Jaina, Mrs. Pratt, Mrs. Dowdell, Mrs. Ganlin, Sir B. Seymour, Husion Morris, and seedlings. 2d, W. Head, gr. to Lord H. Dowdell, Esq., 2d, Mr. J. P. Sharp, with Mrs. King, King of Wallow's Mrs. Holiday, and some very fine seedlings; 3d, Mrs. W. Sharp; 4th, Mr. B. Simonite; 5th, Mr. T. Austiss; 6th, unnamed. With six blooms, Mr. J. A. Wallington was placed 1st out of fifteen competitors with Governor, Florence, and four seedlings, a beautiful yellow ground, scarlet edged with mauve; 2d, Mr. W. Meddick, with Red Rover, Robert Lord, a rare flower; Mrs. Coleman, John Bailey, and seedlings; 3d, no name; 4th, Mr. C. Phillips; 5th, Mr. Walker, Reading; 6th, Mr. Startup.

PREMIER SELF OR FANCY.

This was a superb bloom of Husion Morris, shown by A. H. Dodwell, Esq. It has a rich rosy-scarlet ground, flaked with maroon.

First-class certificates of Merit were awarded to light range Picoteés of Mrs. Sharp, shown by Mr. J. P. Sharp, Birmingham; and fancy Picotee Ada, yellow ground, with a tricoloured edge, rose, mauve, and pink, very pretty and of fine quality. It was raised and shown by Mr. J. A. Wallington, Basingstoke.

SOUTHAMPTON: August 1 and 3.

THE Royal Horticultural Society of Southampton, on the dates above named, well sustained its reputation as being one of the best shows in the South of England. Competition in most classes was keen, while the exhibits were so close in merit as to cause the judges no small amount of trouble to justify their awards. In the sports tent, wherein was displayed the principal plants and groups of plants for effect, viewed from the entrance, reflected great credit on the management and way in which they were disposed. It is easily understood what plants there were shown in such cases as Messrs. Cypher, Rann, Tudgey, and Mould put forth their utmost in friendly rivalry. Local growers, too, are making great strides in this branch of horticulture, particularly in the case of Mr. E. Willis, gr. to Mrs. Pearce, The Firs, Basingstoke. In the case of Messrs. Cypher, Rann, Tudgey, and Mould put forth their utmost in friendly rivalry. Local growers, too, are making great strides in this branch of horticulture, particularly in the case of Mr. E. Willis, gr. to Mrs. Pearce, The Firs, Basingstoke. In the case of Messrs. Cypher, Rann, Tudgey, and Mould put forth their utmost in friendly rivalry. Local growers, too, are making great strides in this branch of horticulture, particularly in the case of Mr. E. Willis, gr. to Mrs. Pearce, The Firs, Basingstoke. In the case of Messrs. Cypher, Rann, Tudgey, and Mould put forth their utmost in friendly rivalry. Local growers, too, are making great strides in this branch of horticulture, particularly in the case of Mr. E. Willis, gr. to Mrs. Pearce, The Firs, Basingstoke.

Vegetables were perhaps not quite so good as other years, and no wonder, when the lengthened period of

drought is considered, but still they would be hard to beat anywhere, those which took the lead. A few words of praise are quite deserving to the committee, who have striven hard to encourage horticulture in their district, and provide exhibitions worthy of the place, they have had many drawbacks to contend with, such as bad weather and sites to hold their shows; nor that they have secured Westwood Park on a long lease, let us hope great success is in store for them in the future.

To the indefatigable Secretary the thanks of the exhibitors are specially due for the way in which he manages everything for their convenience, evidently he understands that exhibitors have a large share in making a show a success in a horticultural point of view, and is accordingly to procure a good result, which goes a long way towards encouraging the general public to appreciate the treat provided.

STOVE OR GREENHOUSE PLANTS.

For twelve, six to be in bloom and six foliage. Mr. J. Cypher, Cheltenham, was an easy 1st, with grand specimens—*Cycas crinalis*, grand in colour, and extra large size; *Latania borbonica*, so often seen that it is needless to describe it; *Croton Smet.* 6 feet in diameter, beautifully coloured; *Enecephalartos villosus*, *Phenocoma prolifera* Bainesii, 5 feet across in the pink of condition; *Allamanda nobilis*, freely bloomed; *Dipladenia Brearleyana*, rich in colour; and a freely bloomed plant of *Erica Thomsonii*, to the Earl of Radnor, Longford Castle, Salisbury, whose best dishes were Black Hamburg Grapes, a very large and well ripened Captain Lack's Melon, weighing 12 lb; Moor Park Apricots, and Queen Pine; 3d, Mr. J. Budd, with good Muscat of Alexandria Grapes and Violet de Laitive Nectarines. For six dishes, Mr. E. Molyneux obtained 1st honours with Muscat of Alexandria and Madresfield Court Grapes, and Golden Perfection Melon.

For three bunches black Grapes, Mr. Ward was 1st with Madresfield Court, in grand condition, the berries large and carrying a beautiful bloom; 2d, Mr. C. Warden, with Black Hamburg, well finished samples; Mr. Molyneux was 3d with same variety, equally well finished; 4th, Mr. Thompson, with Madresfield Court.

For three bunches of white grapes, Mr. Budd was 1st with very large well-coloured samples of Muscat of Alexandria; 2d, Mr. Molyneux; 3d, Mr. Thompson; 4th, Mr. W. Hills, gr. to Viscount Gort, East Cowes Castle, Isle of Wight, all showing the same variety; for two bunches of black Grapes, Mr. J. E. Axford, gr. to C. M. Shipley, Esq., Twyford, Winchester, was 1st, Mr. W. Sanders was 2d, and Mr. Molyneux 3d; Mr. J. Allen, gr. to J. Bailey, Esq., Ellenfield Hill, Southampton; 3d, Mr. J. Cox, gr. to R. King Wyndham, Esq., Corhampton House, Bishops Waltham; 4th, Mr. Pope—all showing well. For the same number of white Grapes, Mr. Pope was 1st, with Muscat of Alexandria, fine and well finished; only requiring more time to make them perfect; 2d, Mr. Osborne; 3d, Mr. Axford; 4th, Mr. Amsy. For single bunch black Grapes, Mr. Ward followed up his previous success with Madresfield Court, again in splendid condition. Mr. W. Sanders was 2d, and Mr. Molyneux 3d; Mr. J. Allen, 4th, Mr. W. Sanders, gr. to J. East, Esq., Longstock House, Stockbridge. For one bunch of white Grapes, Mr. Budd took the card, with an excellent sample of Mrs. Pearson; 2d, Mr. Thompson; 3d, Mr. Sanders; 4th, Mr. W. Ward.

For the best dish of Peaches, Mr. G. Windebank was 1st, with Chancellor, large in size and rich in colour; 2d, Mr. Thompson; 3d, Mr. W. Cotton, Hamilton Nursery.

For the best dish of Nectarines: 1st, Mr. West, gr. to J. R. Wygram, Esq., Northlands, Salisbury; 2d, Mr. W. Sanders; 3d, Mr. Axford; 4th, Mr. W. Ward; 5th, Mr. W. Sanders. For the best dish of Apples, Mr. W. Sanders was 1st for scarlet Melon, with Plenheim Orange; 2d, Mr. Ward; 3d, Mr. Axford. For best green-flesh Melon Mr. Thompson was 1st, with Victory of Bath; 2d, Mr. Sanders; 3d, Mr. Cotton.

VEGETABLES.

For twelve varieties there were five competitors. Mr. G. H. Richards, gr. to Earl of Normanton, Somerley, Kingwood, was an easy first with Elephant Onion, Autumn Giant Cauliflowers, International Potatoes, very fine, Perfection Tomato and Intermediate Carrots as fine. Mr. W. Sanders was 2d, and Mr. Molyneux 3d. For the best dish of Peaches, Mr. G. Windebank was 1st, with Chancellor, large in size and rich in colour; 2d, Mr. Thompson; 3d, Mr. W. Cotton, Hamilton Nursery.

For four sorts of Potatoes, 1st, Mr. West, gr. to J. R. Wygram, Esq., Northlands, Salisbury; 2d, Mr. W. Sanders; 3d, Mr. Axford; 4th, Mr. W. Ward; 5th, Mr. W. Sanders. For the best dish of Apples, Mr. W. Sanders was 1st for scarlet Melon, with Plenheim Orange; 2d, Mr. Ward; 3d, Mr. Axford. For best green-flesh Melon Mr. Thompson was 1st, with Victory of Bath; 2d, Mr. Sanders; 3d, Mr. Cotton.

Obituary.

JAMES CUTBUSH.—The announcement of the sudden death of this gentleman will be read with great sorrow. Few men in the horticultural world were better known, or commanded more respect. On Saturday night, August 1, he was present at the distribution of prizes by the Baroness Burdett-Coutts in connection with the Brookfield Horticultural Society, South Highgate, of which the Baroness is the patroness. The Baroness had distributed the prizes and addressed the meeting. Mr. James Cutbush, who with his usual liberality had lent a number of plants for the decoration of the platform, was seconding a motion for a vote of thanks to the officers of the Society, when he was

seized with an apoplectic fit and fell forward against those who were sitting near to him. Medical aid was summoned, and Mr. Cutbush, who had somewhat recovered, was removed to his home at Highgate, where, however, he was seized with another fit, and died at midnight. Mr. Cutbush was the head of the well-known firm of W. Cutbush & Son, at Highgate, Barnet, and Finchley, an establishment which ranks among the oldest in the kingdom, having been in existence for more than 180 years, and which has been greatly extended since Mr. James Cutbush assumed their management more than thirty years ago. Heaths and other hard-wooded greenhouse plants such as have gone somewhat out of fashion now-a-days were cultivated by him with great success, and he was one of those by whom the bulb trade, which has now assumed such large proportions, was first developed, and he was the first to exhibit forced bulbs at the London and provincial shows. Mr. Cutbush was not only a successful cultivator, but his large knowledge of plants of all descriptions, his correct judgment and strict impartiality, led to his being frequently called on to give his services as a judge at the leading exhibitions. Mr. Cutbush was in his fifty-eighth year, and was born at Ashford, Kent.

HENRY THOMAS ELLACOMBE. — We have to record the death of a venerable arcbologist, the Rev. Henry Thomas Ellacombe, Rector of Clyst St. George, near Topsham, Devon, which occurred on Thursday, July 30. The deceased, who was ninety-five years of age, graduated at Oriol College, Oxford, taking his bachelor's degree in 1812, and proceeding M.A. in due course. He was ordained deacon in 1816 by the Bishop of Exeter, Dr. Pelham, and was admitted to priest's orders in the following year by the Bishop of Gloucester, Dr. Monk. Having held for a few years successively the curacies of Cricklade and Bitton, he was appointed in 1835 to the vicarage of the latter parish, which he held till 1850. He afterwards held the rectory of Clyst St. George. Mr. Ellacombe was the author of several privately-printed works on church bells and other historical works, including *The Bells of Devonshire, Practical Remarks on Belfies and Ringers, The Bells of Exeter Cathedral, The Bells of Somerset, The History of Clyst St. George, and History of the Manor of Bitton.*

To gardeners Mr. Ellacombe will be best known for the large collection of hardy and herbaceous plants which he gathered together and tended with such loving care at Bitton for many years. Mr. Ellacombe began collecting when such plants were in vogue, and, undeterred by the fleeting influence of fashion, he continued their culture during the years when such plants were the subjects of undeserved neglect, and was happy enough to live to witness and enjoy the reaction in their favour. A catalogue which he drew up of the plants cultivated by him shows how catholic were his tastes, and the topographical indications manifest how well he studied the varying requirements of the plants he loved so well. Removal to Devonshire was not suffered to interfere with his gardening tastes, and he repeated at Clyst St. George, so far as circumstances would permit, the collecting and cultivation of plants, retaining his interest in them up to the last. It is pleasant to think of the venerable clergyman cheered and supported through a long and responsible career by his appreciation of matters archeological and botanical, and the numerous friendships with men of congenial tastes and similar pursuits. The pleasure they afforded him was manifest even in his letters, and it is only a short time since we had evidence of the extent to which his mind was influenced by them as a relief from graver matters.

It is pleasant also to remember that the mantle of the father has fallen on the shoulders of the son, and Bitton now, as in the past, remains one of the pilgrimage places for those who love plants, and esteem those who cultivate them for their intrinsic qualities of head and heart.

PLUM ST. ETIENNE.—This extremely early and valuable little Plum is comparatively unknown. It ripens somewhat in advance of Rivers' Early Prognon here, being in fact the earliest of all Plums grown here. At the present time August 3, the greater portion of the crop on a standard tree, is lying on the ground. The fruit is of a medium size, almost quite round—orange-yellow, with firm sweet flesh like the Orleans class, parting freely from the stone. It is well worthy of cultivation as an early variety, and is described in Hogg's *Fruit Manual*, A. F. B.

For a collection of Orchids, space 6 feet by 4, 1st, H. J. Buchan, Esq., Wilton House, Southampton (gr. Mr. T. Osborne), whose collection was composed of choice, well-grown specimens, such as his *Stipites*, plants of the same class can produce. The following were some of the best—*Dendrobium Dearii*, *Cypripedium Veitchii*, *Oncidium anosum*; 2d, Mr. Blandford, Messrs. Oakley & Watling had the best collection of nursery stock in pots, not to exceed 8 inches, followed by Mrs. Kingsbury, Bevois Nursery; 3d, Mr. G. Windebank and Messrs. Ransom, the other 1st named.

For six Begonias, Mr. Wills was again an easy 1st; 2d, Mr. Osborne; 3d, Mr. Blandford. Mr. Wills again followed up his previous successes with six Ferns; 1st, Mr. Amsy, 2d; and Mr. Peel, 3d. *Fuchsias*, double and single zonal *Pelargoniums*, were staged in rows and named by Mr. G. H. Richards, Messrs. Ransom, and Mr. Wills were the leading prize-winners.

For six Celosias, Mr. Amsy was 1st with richly coloured specimens; 2d, Mr. Osborne; 3d, Mr. Wills. Mr. Wills was 1st for table plants.

Coleus.—The other prize winners were Messrs. Budd, Thompson, and Mr. G. H. Richards.

For single specimen Heath.—1st, Mr. J. F. Mould, with a fresh freely-bloomed plant of *Austriana*; 2d, Mr. Cypher; 3d, Mr. Tudgay.

For specimen Orchid.—1st, Mr. Wills, with *Dendrobium formosum giganteum*; 2d, Mr. Budd; 3d, Mr. Osborne.

For specimen foliage plant.—1st, Mr. Rann, with *Croton Youngii*, beautifully coloured, 8 feet over; 2d, Mr. Kingsbury; 3d, Mr. Wills.

Amateurs came out strong in the classes devoted to prizes for the principal prize-winners were Mr. Burch, Avenue Hotel; Mr. Bettridge, Bassett; Mr. Chamberlain, &c.

For the best-dressed table for dessert, 8 feet by 4 feet, Mr. Cypher was an easy 1st, with a table almost perfect as regards table, 2d, Mr. J. Chard, Clapham Common, London.

Carnations, zonal *Pelargoniums*, double and single, were well represented by Mr. Molyneux, Mr. W. Gilbert,

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, AUGUST 5, 1885.

July 31.—Dull morning, fine and bright afterwards.
 — 31.—Dull morning, fine and bright afterwards.
 Aug. 1.—Dull day.
 — 2.—Dull day, sun shining at times.
 — 3.—Dull day.
 — 4.—Very fine morning, dull afternoon and evening.
 — 5.—Slight showers of rain during the day. Thunder-storm at 7 P.M.

LONDON: Atmospheric Pressure.—During the week ending August 1, the reading of the barometer at the level of the sea increased from 30.28 inches at the beginning of the week to 30.33 inches by 9 A.M. on the 26th, decreased to 30.26 inches by 5 P.M. on the same day, increased to 30.36 inches by 9 A.M., decreased to 30.23 inches by 1 P.M. on the 27th, increased to 30.36 inches by 9 A.M., decreased to 30.29 inches by 5 P.M. on the 28th, increased to 30.33 inches by 9 A.M. on the 29th, decreased to 30.29 inches by 9 A.M. on the 30th, and was 30.12 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.25 inches, being 0.03 inch higher than last week, and 0.31 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 87° 1, on the 26th; on August 1 the highest was 86°. The mean of the seven high day temperatures was 76° 2.

The lowest temperature was 54°, on August 1; on the 27th the lowest temperature was 58° 5. The mean of the seven low night temperatures was 56° 7.

The greatest range of temperature in one day was 28° 9, on the 26th; the smallest, on the 20th, was 13° 3. The mean of the seven daily ranges was 19° 5.

The mean temperatures were—on the 26th, 72° 2; on the 27th, 69° 9; on the 28th, 61° 9; on the 29th, 60°; on the 30th, 60° 5; on the 31st, 59° 6; and on August 1st, 60° 1; of these the first two were above the average by 1° and 7° 7 respectively, and the rest were below by 0° 3, 2° 3, 1° 5, 2° 7, and 2° 2 respectively.

The mean temperature of the week was 63° 5, being 0° 1 lower than last week, and 1° 2 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 138° on the 27th. The mean of the seven readings was 127° 5.

Rain.—No rain fell during the week.

ENGLAND: Temperature.—During the week ending August 1, the highest temperatures were 89° 1 at Nottingham, 89° at Truro, 87° 8 at Cambridge; the highest at Newcastle, 68° at Sunderland 69° at Liverpool 74° 8. The general mean was 81° 5.

The lowest temperatures were 44° at Hull, 45° at

Leeds, 46° at Sheffield; the lowest at Blackheath was 54°, at Brighton 52° 3, at Plymouth 52° 2. The general mean was 48° 8.

The greatest ranges were 41° at Truro and Leeds, 38° 8 at Cambridge; the smallest ranges were, at Newcastle 18°, at Sunderland 22°, at Liverpool 25° 3. The general mean was 33° 1.

The mean of the seven high day temperatures was highest at Truro, 77° 4, at Blackheath 76° 2, at Wolverhampton 74° 7; and was lowest at Newcastle, 63° 1, at Hull 64° 7, at Sheffield 66° 7. The general mean was 71°.

The mean of the seven low night temperatures was highest at Blackheath, 56° 7, at Brighton 56° 3, at Plymouth 56° 1; and was lowest at Bolton, 51° 5, at Wolverhampton 52° 2, at Truro 52° 3. The general mean was 53° 8.

The mean daily range was greatest at Truro, 25° 1, at Wolverhampton 22° 5, at Bristol 20° 4; and was least at Sunderland, 9° 3, at Newcastle 11° 6, at Hull 12°. The general mean was 17° 2.

The mean temperature was highest at Brighton, 63° 5, at Truro 62° 9, at Plymouth 62° 7; and was lowest at Sunderland 55° 4, at Newcastle 56° 5, at Hull 56° 8. The general mean was 60° 5.

Rain.—The largest fall was 0.30 inch at Newcastle, 0.21 inch at Sunderland, 0.03 inch at Preston. No rain fell at Truro, Plymouth, Brighton, Bristol, Blackheath, Wolverhampton, Nottingham, Sheffield, Liverpool, Bolton, Hull, or Bradford. The general mean fall was 0.03 inch.

SCOTLAND: Temperature.—During the week ending August 1, the highest temperature was 82°, at Edinburgh; at Aberdeen the highest temperature was 68° 6. The general mean was 76° 2.

The lowest temperature in the week was 45°, at Glasgow; at Greenock the lowest temperature was 51° 2. The general mean was 47° 6.

The mean temperature was highest at Paisley, 64° 3; at Leith the lowest was 57° 6. The general mean was 60° 7.

Rain.—The largest fall was 0.25 inch, at Edinburgh, and the smallest fall was 0.02 inch, at Aberdeen. The general mean fall was 0.14 inch.

JAMES GLAISHER F.R.S.

Answers to Correspondents.

ADDRESS WANTED.—The present address of Messrs. Hancock & Gankroger, seedsmen and florists, late of 77, High Friars Street, Newcastle-on-Tyne, is inquired for.

CARNATION: C. & Co. It does not seem to differ from the Rose Malinois a sport of which several years ago is now in many gardens, but which does not find favour like the old variety.

CYATHEA DEALBATA: L. Yes, you might certainly include this among "six exotic Ferns," if nothing is said to the contrary.

INSECTS: G. H. The minute white semi-transparent worm-like insects with small black heads (of which we found a number in the earth in your box) have nothing to do with the Encharis mite; they are the larvae of a very small midge often seen in greenhouse pots kept too damp (Molobrus, sp.). A pupa of the midge was also found. Water with lime or gas-tar-water, or Gishurst fluid, J. O. W.—A. H. The insect seen is the caterpillar of one of the smaller species of Hepiabus, a "swit" moth. J. O. W.

INSECTS ON EUCHARIS: D. McS. Your plant is affected with the Encharis mite: see Gard. Chron., pp. 440, 448, April 4, 1885.

NAMES OF PLANTS: G. F. G. 1. Rubricella laciniata; 2. Cnicus oleaceus; 3. Anaphalis margaritacea; 4. Bulbocodium flavum a sport of which several years ago is now in many gardens, but which does not find favour like the old variety; 5. Malva moschata.—T. S. Lilium Leitchii.—H. H. D. Rosa hibernica.—Dimmock & Sons. 1. Commelina celestis; 2. Origanum dictamnus.—K. S. L. Acanthus spinosus.—A. H. Diplomatix muris variegated. The fungus is the common Sinker (Phallus impudicus).—A. B. Desfontainia spinosa, hardy in some places.—Inquirer. 1. Carex paniculata; 2. Carex axillaris; 3. Sison Amomum; 4. the American Waterweed (Anacharis alismarum); 5. Ranunculus aquatilis; 6. Potamogeton praelongus.—Delta. Delphinium Madame Keteleer, not wild.—Camille. A form of Berberis Darwini.—F. Gunning. Valeriana dioica.—Redwood. Dracocephalum pergrinum.—S. W. H. Your flower is a Dipladenia, we cannot say which one.—J. J. W. 1. Morina longifolia; 2. Phytolacca orbiculata; 3. Stachys Betonica; 4. Crepis setosa.

NEW SEEDLING CARNATION: H. G. S. A nicely shaped bright orange-scarlet flower, which would be very showy in the border if of good habit.

PEA CHANCELLOR: Webb & Sons. A very fine looking Pea, pods very long and well filled—something too old to allow us to judge of the quality. At Chiswick,

where we have noted it growing this season, it is well thought of.

STRAWBERRIES: W. L. & Son. Your method of culture is, without doubt, the correct one, but it is not new or original; all good growers adopt the same system. The fruit sent is but a poor sample. As for any benefit to be derived from selecting plants that show a tendency to develop four or five leaflets on a petiole, there can be none except for curiosity. More than twenty-five years ago a selection of the Filbert Pine Strawberry, under the name of "Cinquefolia," was in cultivation; so that your five-leaved selection of Filbert Pine is nothing new.

VINE LEAVES INQUIRED: W. B. S. We regret that we cannot explain the dried and browned condition of the leaves sent. There are no parasites present, either vegetable or animal. Something is probably going on in your mode of culture, either in ventilation heat, or possibly dryness at roots.

* All communications intended for publication should be addressed to the "Editor," and not to the Publisher, or to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

INTELLIGENT READERS, PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

Markets.

COVENT GARDEN, August 6.

[THE subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. Ed.]

LARGE consignments of Grapes and Tomatoes from the Channel Islands are now reaching us, and this being holiday week, trade has been quiet, and clearances only made at lower prices. James Webber, Wholesale Apple Market.

SEEDS.

LONDON: Aug. 5.—The market to-day was very thinly attended, and presented quite a hazy appearance. There is rather more inquiry for *Trifolium incarnatum*: the quality of the new crop is exceptionally fine. In Mustard seed there is no quotable change: small sowing orders come to hand freely. This season's Rape seed is very good, and extremely low prices at present prevail for same. New winter Tares are now offering: opening rates are moderate. Holders of blue boiling Peas have increased their prices as crop accounts continue so bad. Feed Linseed tends upwards. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

There was no business transacted in Mark Lane on Monday, it being Bank Holiday. On Wednesday the lack of demand was not relieved, and with inactivity prices remained unchanged for both Wheat and flour. Barley, Beans, and Peas met a quiet demand at late rates. Maize was steady, with a moderate demand.—Average prices of corn for week ending August 1:—Wheat, 34s. 11d.; Barley, 27s.; Oats, 22s. 6d. For the corresponding period last year:—Wheat, 37s. 6d.; Barley, 27s. 6d.; Oats, 22s. 7d.

CATTLE.

At Copenhagen fairs on Monday supplies were in excess of demand in the best market, and prices consequently ruled against the seller. Sheep realises about the previous Monday's prices, with a steady sale. Prime lambs were the turn dealer, and calves a very dull sale. Quotations:—Beasts, 3s. 10d. to 4s. 8d., and 4s. 8d. to 5s; and 5s. to 4s. 8d.; sheep, 4s. to 4s. 8d., and 5s. to 5s. 6d. lambs, 5s. to 5s. 6d. — On Thursday the trade for beasts remained very quiet, and late rates were not maintained without difficulty. Sheep and lambs were in fair supply. A rather better inquiry prevailed, and rates, though without quotable change, were steady. Calves were dull and weak. Pigs somewhat dearer.

HAY.

Tuesday's Whitechapel Market report states that trade was very dull, with moderate supplies. Quotations:—Clover, prime, 80s. to 107s.; prime second cut, 85s. to 107s.; inferior, 60s. to 75s.; hay, prime, 70s. to 82s.; inferior, 20s. to 60s.; and straw, 30s. to 38s. per load.—On Thursday there was a moderate supply on sale. The trade was dull at late rates.—Cumberland Market quotations:—Clover, best, 85s. to 105s.; inferior, 60s. to 80s.; hay, best, 85s. to 107s. 6d.; second, 75s. to 84s.; inferior, 40s. to 60s.; and straw, 30s. to 36s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that harvest work is shortening supplies a little, but they are still quite adequate to demand, which is limited. Quotations:—Regents, 110s. to 120s.; Magnum Bontons, 110s. to 120s.; Shaws, 90s. to 100s.; Early Roses, 85s. to 95s.; Jersey rounds, 85s. to 95s.; kidneys, 110s. to 140s. per ton.

COALS.

The following are the prices current at market during the week:—Belside West Hartley, 14s. 9d.; East Wylam, 15s. 6d.; Holywell Main, 14s. 6d.; Ravensworth West Hartley, 14s. 9d.; Walls End—Tyne (unscreened), 11s. 3d.; Hetton, 15s. 6d.; Hetton Lyons, 13s. 6d.; Lambton, 15s. 6d.; Wear, 14s.; Binchester, 13s. 9d.; East Hartlepool, 14s. 9d.; South Hartlepool, 13s. 9d.; Tees, 15s. 6d.; Downias Merthyr, 16s.

TO SEEDSMEN.—A young man (age 26) desires a situation in the Seed Business. Good knowledge of Bulbs, Seeds, Horticultural Sundries, &c.—ALPHA, 65, Blantyre Street, Chelsea, S.E.

SHOPMAN (HEAD), or MANAGER.—Thorough knowledge of every detail connected with Seed and Bulb Business routine, having had upwards of twenty-five years' experience in first-class Wholesale and Retail Houses. Good Correspondent, and well versed in Plants.—THE MANAGER, Royal Seed Stores, Yeovil.

SALESMAN, in Flower Market, Covent Garden.—Four and half years with Messrs. Gregory & Evans, Sidecup. References good.—A. HILL, Longlands Nursery, Sidecup.

HOLLOWAY'S PILLS and OINTMENT.

It is impossible entirely to prevent the noxious vapours which are given off in mines and tunnels, and those who, like miners and railway operatives, have to work day after day in such vitiated atmospheres, suffer in health and strength in consequence. The Chest and Liver often become clogged with the products of coal combustion, necessitating great attention to the health of the lungs. Holloway's Pills, like the like that Holloway's Pills, as they carry off all effete matter from the blood, and healthily stimulate the Liver. They are also invaluable for Costive Bowels and for all Bilious Disorders. The Ointment is a priceless remedy for Piles, Sprains, Ulcers, and all manner of Sores.

EARLY ORDERS SOLICITED.

VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

AUTUMN CATALOGUE OF FLORAL GEMS, GRATIS & POST-FREE on APPLICATION

Before ordering elsewhere please send for our Illustrated CATALOGUE. In it will be found useful instructions to amateurs, enabling them to procure botanical novelties correctly, besides much further interesting information.

It is divided into sections, as follows:—

BULBS. In this department will be found many species, new, rare and beautiful, and which are not to be found offered in any other English Catalogue, whilst the prices of popular species, such as Hyacinths, Tulips, &c., will be found exceptionally low, &c. White Roman Hyacinths, plentiful healthy sample, in quantities of 250 and upwards, 9s. 3d per 100.

FERNs. We are offering some most beautiful specimens of rare and seldom seen species, many of which have been specially collected for us; and as the stock of several is limited we would strongly advise early attention, and thus save disappointment.

ORCHIDS. Hardy Orchids have received our special attention—the result of which is that we are enabled to offer many novelties, comparatively unknown here in England. We also offer these in collections at lowest figures possible, purposely to bring these beautiful novelties within the reach of all.

PLANTS. These comprise a list of herbaceous, in succaceous, curious, and a general collection of rare and other beautiful plants. This section will be found unusually interesting to botanists, &c., in general.

SEEDS. We are in a position to place before our patrons unique stocks of all the very best strains, and would respectfully draw the attention of all "unique" collectors to the same.

MISCELLANEOUS. In this section we offer a miscellany of interesting items calculated to please both the professional and the amateur.

N.B. To Amateurs who are in the habit of purchasing Guinea and other collections.

Instead of doing so this season send the order to us, leaving the selection to our judgment simply giving particulars as to nature of soil, position of garden, if any glass, &c., when we feel fully certain that we can by that one lot afford them much more gratification for their money than if they pursued the ordinary method.

VICCARS COLLYER & CO., BULB MERCHANTS, &c., CENTRAL HALL, LEICESTER (where all letters are to be addressed and Central Nurseries, Glenfield, near Leicester.

A. W. CREWS, Manager.

- PREPARED COMPOST, best LEAF-MOULD, best only, 1s. per bush. (sacks included.)
- PEAT MOULD, 12s. per bush.
- SILVER SAND, coarse, 12. 9d. per bush, 12s. half ton, 22s. ton.
- PAFFIA FIBRE, best only, 12s. per 100.
- TORRACO CLOTH, finest imported, 8d. lb., 28 lb. 18s.
- TOBACCO PAPER, (SPECIAL) 2d. lb., 28 lb. 18s.
- MUSHROOM SPAWN, finest Mill-track, 5s. per bushel.
- SPHAGNUM MOSS, all selected, 2s. per bush, 6s. per sack.
- COCOA-NUT FIBRE REFUSE (by Chubb's special process), 5s. lb. 11. 2s.; 10s. 2s. 6d.; 15s. 2s. 6d.; 20s. 2s. 6d.; 25s. 2s. 6d.; 30s. 2s. 6d.; 40s. 2s. 6d.; 50s. 2s. 6d.; 60s. 2s. 6d.; 70s. 2s. 6d.; 80s. 2s. 6d.; 90s. 2s. 6d.; 100s. 2s. 6d.

CHUBB, ROUND & CO., WEST FERRY ROAD MILWALL, LONDON, E.

COCOA-NUT FIBRE REFUSE: newly made. The same as supplied to the Horticultural Society.—1 truck-load of 4 tons, 25s.; twenty sacks of same, 14s.; 1 yard, 2s. 6d., sacks included. All Free on Rail, Cash with order.—SHEPHERDSON AND CO., 65, Cannon Street, Fibre Merchants, "Greyhound Yard," and 153, High Street, Battersea, S.W.
SILVER SAND, excellent coarse, 7s. per ton. PEAT, excellent quality, 6s. 8s. and 9s. per cubic yard. LOAM, excellent quality, 9s. per cubic yard. By truckloads. In sacks and sacks at moderate rates. W. SHORT, Horticultural Company, Highbury, Surrey.

HYACINTHS, EARLY WHITE ROMAN.—May be had in bloom before Christmas. The best pure White for Forcing. Fine bulbs now ready.

IRIS KÆMPFERI—in about twenty different shades of colour. This grand Japanese Iris is hardly yet known in this country, but should be grown by every lover of flowers. It is by far the largest flower of this family, with most striking colours. We offer well established English-grown Roots; also many other varieties of Iris.

IXIA CRATEROIDES—Brilliant Crimson. This is about the most showy of this useful family of Bulbs.

IXIA VIRIDIFLORA—a most uncommon colour amongst flowers—very striking, being a decided green with black eye. Also many other varieties of Ixia, a family which only requires to be more widely known to be grown as largely as the Tulip or Hyacinth.

LILIUM CANDIDUM—the Old White Garden Lily. Fine Bulbs now ready for Planting or Forcing.

NARCISS and DAFFODILS—in great variety—Choice and Common.

SCILLA SIBERICA.—This charming rich Blue variety is now as cheap as the Snowdrop, to which it makes a good companion and contrast.

SEE OUR WHOLESALE BULB CATALOGUE for prices of above, and all other varieties of DUTCH and ENGLISH BULBS. May be had on application.

WATKINS & SIMPSON, SEED and BULB MERCHANTS, 13 EXETER STREET, STRAND, W.C.

New Hybrid Also. ALOE INSIGNIS.—A very beautiful and highly ornamental Aloe, raised from A. drepanophylla fertilised by A. chinata. Flowers remarkable and beautiful; requires ordinary greenhouse culture. Described and figured in this volume of the *Chronicle*, p. 12, l. 41. Orders received will be sent out later in the season. Every one should possess this plant. Price 3s. Guineas. Also the new plant, ALCANTARA RHYNCOCARPUM, with graceful Fern-like foliage, very ornamental. Now offered for the first time: referred to in *Gardeners' Chronicle*, vol. xxi., p. 22. Price 3s. Guineas. Also a large Collection of SUCCEULANT PLANTS for sale. THOMAS COOPER, Exotic Nursery, Brighton Road, Redhill, Surrey.

By Special Warrant. "Superb SEEDS for PRESENT and Later SOWING."

DICKSON'S CHOICEST strains of PRIMULA, CALCOPHILA, CINERARIA, CYCLAMEN, BEGONIA, and ADURICULA in packets, 1s. 6d., 2s. 6d., 3s. 6d., and 5s. each. Double German WALL FLOWER, superb strain, 12s. per packet. Extra selected Single Dark Blood-red WALLFLOWER, 6d. and 12s. per packet. Also all other FLOWER SEEDS for Spring Gardening, as well as VEGETABLE SEEDS for Present Sowing. Carriage and Post free. Seeds and Plants of every description. Descriptive Price List, 1s. Post-free.

JAMES DICKSON & SONS, 108, EASTGATE ST., CHESTER.

Now New for Early Flowering in Spring. ROEMER'S Superb Prize FANSY SEED.

THE Best FANSY Seed in the World. FANCY VARIETIES, saved from named flowers, splendid, mixed, 10s. per ounce, 6d. per packet. SHOW VARIETIES, saved from named flowers, splendid, mixed, 5s. per ounce, 6d. per packet. FANCY and SHOW VARIETIES, fine, mixed, 3s. per ounce, 6d. per packet. ASSORTMENT of 18 splendid distinct varieties, containing each 1 packet, 3s.

CAREFULLY SAVED only from named Exhibition Flowers, of all varieties, splendid, mixed, highly recommended, 2s. 6d. per ounce, 6d. per packet. GIGANTIC-FLOWERED SHOW VARIETIES, new and distinct, flowers up to 4 inches in diameter, 5s. per 1000 seeds, 1s. per packet, 6d. per packet.

GIGANTIC FLOWERED FANCY VARIETIES, very choice collection, 10s. per 1000 seeds, 1d. 6d. per packet. My Fancies awarded at the Berlin Exhibition, 1874. For Separate Lists, see CATALOGUE, forwarded Post-free on application. FRED. KOEMER, Seed Grower, Quedlinburg, Germany.

DANIELS'

DEFIANCE CABBAGE.

GIANT EARLY MARROW.

The Best Early Cabbage for General Use.

1s. per Packet, POST-FREE;

7s. 6d. per pound; 4s. per half-pound.

Testimonial from Mr. J. M. CLEMENS, East End, New Quay: "We have grown your 'Defiance' Cabbage for eight years with various other sorts, as a test, and always find your 'Defiance' beats all, being earlier, heavier, and of better shape and flavour."

ONIONS FOR AUTUMN SOWING.

DANIELS' GOLDEN ROCCA, per packet, 1s. 6d.

DANIELS' GIANT ROCCA, 1s. per ounce, 6s. per pound.

Priced Descriptive LIST of all kinds of Seeds for present sowing, gratis and post-free to all applicants.

DANIELS BROS.,

SEED GROWERS and MERCHANTS, NORWICH.

The Liverpool

Horticultural Co.

(John Cowan), Limited,

GRAPE VINES.

Have this season a stock of GRAPE VINES which have never been surpassed, if indeed equalled. Intending purchasers are requested to come and see them during the growing season. The Black Hamburghs for fruiting in Pots are especially fine, and the entire stock are from eyes this season. Planting Canes, 1s. and 7s. 6d. each; Fruiting Canes, 1s. 6d. and 2s. 6d. each.

TEA ROSES.

The Company have a very large stock of TEA and NOISSETTE ROSES, comprising all the leading varieties. The plants are healthy and in good condition for sending out. 12s., 18s., and 24s. per dozen.

MANURE.

COWAN'S VINE and PLANT MANURE. This is too well known to need recommendation. 18s. per cwt.

ORCHIDS.

The Company have a large stock of established and Imported ORCHIDS, all in fine condition, and they are constantly receiving fresh importations from various parts of the world.

CIRCULARS WITH FULL PARTICULARS ON APPLICATION. Special Prices to the Trade.

THE VINEYARD and NURSERIES, GARSTON, LIVERPOOL.

ROSES

IN POTS; all the best New and Old English and Foreign sorts, from 18s. to 36s. per doz.

Gardeners' Chronicle.

SATURDAY, AUGUST 15, 1885.

NORMANHURST.

IN driving from Ashburnham to Normanhurst, which you may do in a quarter of an hour, you pass from old to new. Mr. Brassey built the house of Normanhurst, and formed the gardens for his son, the present Sir Thomas Brassey, whose taste and judgment, I believe, contributed that which money cannot purchase in laying out the grounds. Two things desirable in landscape gardening are cash and a congenial soil, and both were here available—the great contractor finding the first and Nature the second.

A description of Normanhurst should not be in words, but in colours from the palette of a Turner. I was there on a beautiful day, and, having made my call and request, found myself under the brisk guidance of Mr. Allen. The day was lovely. Some foreign birds—emus, I believe—stalked about the park below the terrace, and these, and the gorgeous flowers and exotic shrubs, and the grass-green foliage of the Pinus insignis, which abounds here, gave the place something of a foreign aspect. All the landscape was bathed in the sunbeams of a summer day, that seemed almost too glorious for England. The sea danced blue in the distance as we looked beyond the boundaries of the domain from where we stood, among Oranges, Tree Ferns, Yuccas, and brilliant Crassulas, on the terrace outside the luxurious drawing-room. We seemed to be in fairyland. It was exquisite—equal, I should think, to Tahiti, that wonderful island which Lady Brassey has herself so well described.

The house and grounds of Normanhurst were built and planted in 1866 and following years. Conifers were chiefly used, for the sake of their beauty, suitability to the soil, and their rapid growth; and the result has been that, in less than twenty years, the grounds, though really so recent, are thoroughly well furnished, and do not appear new. The place is situated on the side of a hill, which raises it sufficiently above the general level of the country to afford from the windows a long view of the sunny side, which is always the best side, whether of a Peach or a landscape, and westwards to where the setting sun dips below the Southdowns. The nearest of several villages seen among the trees is Catsfield, just beyond the gates; Ninfield and Battle are further off; and, following the sun from Hastings to Eastbourne, the waters of the Channel are many times visible.

In laying out the grounds, which are now so ornamental, and which within twenty years was a waste or "rough," worth 2s. 6d. per acre, the few scattered Oaks on the site were skillfully mixed with the newly planted specimens of Conifers. No earthworks were required, since this is not a place of "Capability," in the sense that all the hills and valley, must be artificially formed, the site being already extremely undulating and, from the landscape gardening point of view, perfect. The soil is too light, sandy and dry for the growth of Oaks of large size, but it suits the Conifers. All ever-

greens grow here in perfection. The ground was carefully prepared by trenching, and the various trees were thickly planted, which is always desirable for the sake of shelter and nursing, though in some cases, unfortunately, the subsequent work of transplanting the overcrowded specimens is neglected. That, however, has not been the case here, where a great deal of remodelling has been effected by means of material already on the ground.

Some pinetums are distinguished as complete collections, while the arrangement of the specimens is formal, especially on flat ground. Normanhurst, which means Normanwood—and is well called so, since the battle of Hastings was fought hard by, and the district was always well wooded—became a pinetum through the suitability of its soil for the cone-bearing tribe, and the object in view has clearly been the picturesque arrangement of beautiful trees and shrubs. I have rarely wandered in such charming grounds, but, as Lord Beaconsfield says in his *Home Letters*, "description is a bore!" and I must be content with giving a list of some of the Conifers, and mentioning the names of a few of the shrubs, with a few facts which may perhaps be useful.

Entering the grounds with a friend, who has not mixed much in the society of exotic evergreens, his astonishment at coming suddenly upon some specimens of *Abies nobilis* standing in great pomp by the side of the carriage drive in glorious attire of purple and pea-green, recalled the earliest accounts of Mr. Douglas, the collector of the Horticultural Society of London, who introduced it in 1831. He spent several days among forests of this Silver Fir in Oregon, where the tree towers to a height of 300 feet, and during the whole time he "could not cease to admire" this greatest of his discoveries. It is awkward dragging a staunch pointer by the neck when his nose is near a pheasant, and my friend being quite entranced it was hard work getting him past the noble specimens of Conifers, especially the different *Cryptomeria japonica*, *Pinus insignis*, and *Sequoia sempervirens*. He made a set, too, at several *Thuas*, and especially at *Thuopsis dolabrata*, which Thunberg discovered 6000 or 8000 feet high up on the mountain slopes of Central Japan, and which Mr. Veitch and Mr. Fortune introduced to England by seeds sent in 1861. The variegated variety of this very handsome arboreal pyramid, with its cream-coloured branchlets and picturesque habit, grows here vigorously. As my staunch pointer refused to move I began to descend on the services of the great firms who introduced the noble Fir from the furthest West, and this exquisite *Thuopsis* from the far East, when he moved towards some more rare game, and presently we overtook a specimen of the silvery variety of the Mount Atlas Cedar, *Cedrus atlantica*. In such beautiful grounds, when the senses are feasting on objects of delight, who would listen to a lecture? And yet these three Cedars flourishing here—the Deodar, that of Lebanon, and this African one—would form fit subjects. Their respective habitats maintain ranges widely and completely separated, and yet Sir Joseph Hooker has said "that as species the three Cedars cannot be distinguished, and that they must all have been derived from one common stock." An interesting account of the Cedars, whose introduction formed in the last century and since 1831 the epochs in the decoration of parks and shrubberies, will be found in that best of recent works on the Conifers, published by James Veitch & Sons—*A Manual of the Coniferæ*.

We must pass rapidly through the rest of the grounds, noting on the way *Abies cephalonica* and *A. excelsa*, which both do well here, as well as the rapid growing red-barked *A. Albertiana*, growing in numbers 35 feet high, resembling the Hemlock Spruce, but more robust and spread-

ing—a most ornamental tree, or shrub till it becomes a tree again—which made my staunch pointer stiffen his tail evenly. The *Wellingtonia* grows here so full of foliage that the tree, rigid as it is, becomes almost ornamental. The *Escalonia macrantha*, with its bright shining leaves and handsome blossoms, is a favourite shrub. There are banks of purple-blooming *Menziesia polifolia*, or Irish Heath, and of *Andromeda floribunda*, the soil suiting both of them, while the winter here does not hurt them. Among the many Heaths that do well here some are always in flower. *Rhododendrons* and *Ghent Azaleas* form the margin of many a gracefully winding bed of evergreens, and there are similar banks of *Gaultheria Shallon*.

The Conifers, which were planted, as I have said, seventeen or eighteen years ago, have attained already a height of from 30 to 50 feet. *Pinus insignis*, planted when $2\frac{1}{2}$ feet high, has now reached 33 feet, and gains about 3 feet a year in good seasons. *Athrotaxus selaginoides*, which is perhaps as hardy as any of the *Athrotaxus*, succeeds well here; but the single and double *Camellias*, turned out of the greenhouse and blossoming well in the pleasure grounds, are still a better test of the mildness of the climate. *Thuia gigantea* is 30 feet, and *Cupressus macrocarpa* 37 feet high. *Abies Douglasii* has run up as quickly towards the sky, but when it overtops the other foliage its shoots are injured by the strong current of the west wind. The best shelter trees here are the Austrian and Corsican Pines, which are planted on the north side, the former making a grand tree when well advanced in growth.

In one of the vineries I was pleased to recognise that beautiful climbing Fern, *Lygodium scandens*, the very specimen described by Mr. James Hudson in the *Gardeners' Chronicle*, p. 823. It was cut down in February, and has now attained a height of 15 feet, running up the perpendicular rods on the back wall of the vinery. As a contrast a small Banyan tree, trained artificially, with its roots enclosing a bird-cage, offers an example of inelegance brought from Japan by Lady Brassey. Another queer specimen of similar character is a *Euphorbia* trained into the shape of a Chinese junk! Another specimen plant is a Tamarind, a seedling from a tree planted by Captain Cook in the island where he lost his life, now called Tahiti, the Otahite of our school-days.

The grotto beneath the terrace on the south side of the house must not be overlooked. It is a fernery with iron pillars concealed by a covering of coke and cork, planted with Ferns. The roof is of the same sort of blue sandstone of the neighbourhood used in the building of the house. The grotto is lighted with gas and Chinese lanterns, and is opened to the house on *file days*.

The shrubberies around the house extend to 30 acres, and these and the kitchen gardens, and pits and frames, and houses, are admirably kept by seventeen men. Besides four vineries, a Peach-house, three greenhouses, and a fernery, in one range 190 feet in length, I observed an Orchard-house, several small houses for decorative plants, another for Tomatos, &c., a large cool-house for Chrysanthemums and for hardening off plants in spring, a Rose-house, containing among the many others that fine Tea Rose coloured like the Apricot, and exquisitely scented, Madame Françoise Jamin.

Enthusiasm is a quality not absent from this spot, and in these days when the rage for decorating houses with plants and cut flowers burns so hot that large resources are required to feed the flames, a decorator is employed here whose sole employment is to dress the house with floral tributes from the garden. A neat range of buildings in a convenient position is devoted to a residence for the young men, which in deference to the nationality of the majority of gardeners, we call a bothy, and to

potting sheds and a fruit room. A gateway, covered with the Virginian Creeper, and forming the entrance to the court at the back of the house, is one of the prettiest of the architectural adornments of Normanhurst. But the clock-tower and buildings generally are all admirable, and the back walls are well smothered with *Ampelopsis* and *Ivy*. Banks of *Crataegus* are well introduced for edgings, or coverings of bare places, and the *Hypericum* (St. John's Wort), has been used as a favourite shrub for the edges of borders. *H. E.*

New Garden Plants.

DENDROBIUM ERYTHROGON, *n. sp.* (*hyb. nat.?*)

This came with plants of *Dendrobium Lowii* to Messrs. H. Low & Co. Mr. H. Low informs me the plants are just like those of the species, named in 1861 by Dr. Lindley, in honour of Mr. H. Low. The flowers are smaller than those of *Dendrobium Lowii* in my herbarium, the grandest of which was kindly sent by Mr. Day, 1877. I have at hand a four-flowered raceme with well developed, very nigro-hisute bracts. The sepals are partly most pallid whitish-ochre, partly ochre coloured, and are decid in that fine yellow of the typical *Dendrobium Lowii*. The keels on the mid-lines are well developed. Petals oblong, well undulate. Column nearly white, with the two scarlet spots at the base as in *D. Lowii*. The lip offers the very remarkable marks of distinction. It is very much like that of *Dendrobium radicans*, and may be compared to that of the Burmese *D. xanthophlebium*. The side-laciniae are much developed, blunt, rectangular, white, edged crimson, quite distinct from the narrow things of *D. Lowii*. Mid-lacinia of lip obcordate, undulate, toothletted, with a very short constricted base. There are seven thick crimson keels on the disc of the mid-lacinia, the two external ones have short crimson hairs on each side, and want the long yellow beard of *D. Lowii*. There is a crimson wash between the crimson keels. It is a very good *Dendrobium*, as is *D. Lowii*, both being uncommon, and very peculiar. *H. G. Rehb. f.*

ACRIDES BALLANTINIANUM, *n. sp.*

A fine conspicuous *Acrides*, which appears to have usually rather short bilobed leaves. The flowers show such a great variation, that I had some time ago a dozen at once, no one being exactly like the other. The odd sepal and petals are somewhat toothed, and those three being white while the lateral sepals are usually adorned with a purple eye blotch at the top. Side-laciniae of the lip equal or shorter than the mid-lacinia, retuse and toothed at the top, orange or lighter and sometimes self-coloured, at other times with purple streaks and transverse bars of different dimensions. Mid-lacinia toothed at the sides, bidentate at the top, white. Spur remarkably short, now green, now whitish-purple, now purple. Rostellar process rather short. This species partakes of the characters of *Acrides suavisimum* and *virens*. Had it not been imported in such numbers I should have suspected it to be a natural male. Some English growers suspect such males were the consequence of the presence of our excellent veteran, the pride of English collectors, Thomas Lobb. It has been imported by Mr. F. Sander, at whose desire it is named in honour of Mr. Ballantine, the excellent gardener of Baron von Schroeder. *H. G. Rehb. f.*

TRICHOCESTRUM FUSCUM (Lindl.) KRAMER, *n. sp.*

This is a singular variety with a greater flower and a longer, much thinner spur than usual. I can not, however, think it specifically distinct. It was sent from Brazil by the collector Mr. Kramer, to Mr. F. Sander, who kindly sent me twice flowers. *H. G. Rehb. f.*

* *Dendrobium erythogon*, *n. sp.* (*hyb. nat.?*)—Aff. *Dendrobium Lowii*, Lindl. *Labelli* laciniis lateralibus triangulis obtusis magnis, lacinia mediana brevissima; sepalis obcordatis undulatis, carinis in disco septem, utroque lateris obtusis geminis incambrato-barbatis. Ex ins. Soud. Imp. c. Low. *H. G. Rehb. f.*
† *Acrides ballantianum*, *n. sp.*—Folius abbreviatis laris apice obtusis bilobis; racemis densis; sepalis impari ac tepalis obscure densiculatis, labelli laciniis lateralibus apicibus abrupte denticulatis serratis, lacinia mediana subulteriori; antice lateribus serrulatis apice bidentatis, coracellis geminis in calcaris ostio antico, callo obtuso lamellari emarginato postice inferius, rostellulo brevissimo. *H. G. Rehb. f.*

A CLASSIFICATION OF GARDEN ROSES.

I AM reminded by your review on p. 136 how much a good general monograph of the genus *Rosa* is needed. Lindley's *Monograph* was published in the year 1820, and since then a great number of new species have been discovered, and a very large number of books and papers have been written bearing upon the subject in one way or another. The difficulty which one finds at the outset in using Lindley's book is that his primary groups are characterised so briefly, and that the points of contrast which they present are not fully and clearly brought out into view. The following key shows the best way of getting over these difficulties, which, after having had a large number of specimens through my hands during the last thirty years, I am able to suggest. The list of species is only intended to be exhaustive so far as garden roses are concerned, with the addition of a few well marked types not yet brought into cultivation. What I have aimed at, is to give a separate number to well marked types only, and to place under these the subspecies and varieties into which they deviate. Of course I am well aware that in *Rosa*, of all genera, even if independent observers work from the same standing-point, it is not in the least likely that any two of them will draw the line between species and subspecies in the same way. What follows must therefore be taken as a rough draft of a very condensed guide to the determination and classification of the garden types.

ANALYTICAL KEY TO THE GROUPS.

- Leaf simple, exstipulate. 1. SIMPLICIFOLIA.
 - Leaf compound, stipulate. 2. SYSTYLE.
 - Styles forming a column, protruded beyond the disc. 3. SYSTYLE.
 - Styles not united nor protruded beyond the disc. 3. BANKSIANA.
 - Stipules nearly free, deciduous. 3. BANKSIANA.
 - Stipules adnate above the middle, persistent. 3. BANKSIANA.
- DIACANTHÆ.—Main prickles in pairs at the base of the leaves.
- Fruit persistently pilose. 4. BRACTEATA.
 - Fruit glabrous. 5. CINNAMOMEÆ.
- HETERACANTHÆ.—Prickles scattered, numerous, passing gradually into aciculi and setæ.
- Leaves not rugose; large prickles long and slender. 6. PIMPINELLIFOLIA.
 - Leaves rugose, coriaceous; large prickles short and stout. 7. CENTIFOLIA.
- HOMOCANTHÆ.—Prickles scattered, comparatively few, subequal.
- Prickles slender; leaf not glandular below. 8. VILLOSA.
 - Prickles stout and hooked; leaf not glandular below. 9. CANINA.
 - Leaves very glandular beneath. 10. RUBIGINOSA.

CLASSIFIED ENUMERATION OF THE GARDEN SPECIES AND SUBSPECIES.

Group I. SIMPLICIFOLIA.

- 1. *R. simplicifolia*, Salisb. (= *R. berberifolia*, Pallas = *Lowea berberifolia*, Lindl. = *Hultheimia berberifolia*, Dumort.)—Siberia and Persia.
- R. Hardii*, Paxt.—A hybrid between *berberifolia* and *laxa*.

Group II. SYSTYLE.

- 2. *R. repens*, Scop. (*R. arvensis*, Huds.)—Europe, capreolata, Neill (the Ayshire Rose).
 - 3. *R. sempervirens*, Linn., South Europe and India, prostrata, DC. scandens, Miller. Leschenaultiana, Thory and Redoute. longispicus, Bertol.
 - 4. *R. moschata*, Miller.—Southern Europe and India, Dupontii, Desgl. (nives, Dupont). Brunonii, Lindl.
 - 5. *R. multiflora*, Thunb.—China and Japan. polyantha, Siebold (Lucie, Franch. and Roehb.).
 - 6. *R. abyssinica*, R. Br. (Schimperiana, Hochst., and Steud.)—Abyssinia.
 - 8. *R. phœnicea*, Boiss.—Orient.
 - 9. *R. setigera*, Michx. (rubifolia, R. Br.), the Prairie Rose.—United States.
 - 10. *R. stylosa*, Desv. (collina, E. B.)—Europe. leucochroa, Desv. systyla, Bast.
- Connects Groups II. and IX.

Group III. BANKSIANA.

- 11. *R. banksia*, R. Br. (inermis, Roxb.)—China. laeta, Lindl., Bot. Kew., t. 1105.
- 12. *R. micrantha*, Lindl. (amoyensis, Hance).—China.
- 13. *R. fortuneana*, Lindl. in Paxt. *Floes. Gard.*, t. 171.—China.

- 14. *R. sinica*, Murr. (levigata, Mich.; ternata, Poir.; triphylla, Roxb.; nivea, DC.; cherkensis, Donn.)—China, hystrix, Lindl., *Mon.*, t. 17.

Group IV. BRACTEATA.

- 15. *R. bracteata*, Wendl. (the Macartney Rose).—China.
- 16. *R. involuerata*, Roxb. (Lyellii, Lindl.; palustris, Hamilt.)—India.

Group V. CINNAMOMEÆ.

- In some of these there are only the pairs of prickles at the base of the leaves, but in several of the species there are few or many aciculi in addition. These latter form a connecting link between Groups V. and VI.
- 17. *R. cinnamomea*, Linn.—Europe and North Asia. majalis, Retz. davurica, Pallas.
 - 18. *R. carolina*, Linn. (corymbosa, Ehrh.; pennsylvanica, Mich.; Hudsoniana, Red.)—North America.
 - 19. *R. lucida*, Ehrh. (haltea, Roth.; Rapa Bosc.)—North America.
 - 20. *R. humilis*, Marsh. (parviflora, Ehrh.)—North America.
 - 21. *R. nitida*, Willd.—North America.
 - 22. *R. laxa*, Retz. (cinophylla, Red.)—Siberia.
 - 23. *R. Woodii*, Lindl. (Maximiliani, Nees)—North America, west side, californica, C. and S. piscoarpa, A. Gray. Fendleri, Crépin.
 - 24. *R. nutkana*, Presl.—North-west America.
 - 25. *R. gymnocarpa*, Nutt.—North America.
 - 26. *R. ussuriifolia*, Boiss.—Orient.
 - 27. *R. fedtschenkoi*, Regel.—Central Asia.
 - 28. *R. rugosa*, Thunb. (ferox, Lawr.; Regaliana, André)—Japan and Siberia. kamshatica, Vent.
 - 29. *R. verticea*, Lindl.—India.
 - 30. *R. microphylla*, Lindl.—China. Connects the Cinnamomeæ and Bracteata.
 - R. laura*, Siebold.—Supposed to be a hybrid between *rugosa* and *multiflora*.

Group VI. PIMPINELLIFOLIA.

- 31. *R. spinosissima*, L. (pimpinellifolia, L.; scotica, Miller)—Europe and Siberia.
 - 32. *R. alba*, Willd. (grandiflora, Lindl.) nyriacantha, DC.
 - 33. *R. W. bobbiana*, Wall.—Himalayas.
 - 34. *R. playtcantha*, Schrenk.—Central Asia.
 - 34. *R. rubella*, Smith.—Europe. stricta, Donn. gentilis, Sternb. reversa, W. and K.
- These perhaps hybrids between *spinosissima* and *alba*.

- 35. *R. hibernica*, Sm.—Ireland and England. Perhaps a hybrid between *spinosissima* and *canina*.
- 36. *R. involuta*, Sm.—Europe, principally Britain. Sabini, Woods. gracilis, Woods. Wilsoni, Borrer.
- 37. *R. macrophylla*, Lindl.—India.
- 38. *R. alpina*, L. (inermis, Mill.)—Europe. pendulina, L.
- 39. *R. lauda*, Ait.—North America. framifolia, Boikh. arkansana, Porter.
- 40. *R. acicularis*, Lindl.—North Temperate Zone. carulea, Fries. Savi, Schwein.
- 41. *R. hamiflorica*, Hieron. (glaucophylla, Ehrh.; sulphurea, Ait.; kapini, Boiss.)—Garden origin.
- 42. *R. hispida*, Sims (intescens, Pursh.)—Garden origin.

Group VII. CENTIFOLIA.

- 43. *R. gallica*, L. (austriaca, Crantz.)—Europe and Western Asia. pumila, L. fl. inermata, Miller. provincialis, Miller.
- 44. *R. centifolia*, Miller.—Orient. muscosa, Miller. pomponia, DC. parvifolia Ehrh. (burgundica, Rossig.; rementis, Desf.).
- 45. *R. damascena*, Miller (bifera, Pers.)—Orient. belgica, Miller. portlandica, Hort. calendaria, Monch. variegata, Andrews.
- 46. *R. turbinata*, Ait. (francofurtensis, Desf.; campanulata, Ehrh.)—Garden origin, perhaps hybrid between *gallica* and *canina*.
- R. hybrida*, Schlegel, and *R. arvensis*, Krock, probably hybrids between *gallica* and *arvensis*.

Group VIII. VILLOSA.

- 47. *R. villosa*, Lindl. (molis, Smith; molissima,

- 'Fries)—North Europe. Numerous varieties pomifera, Hern.
- 48. *R. orientalis*, Dupont.—Orient.
- 49. *R. tomentosa*, Smith.—Europe. Numerous varieties. fucta, Bast. scabriscula, Smith.
- 50. *R. spinulosa*, Dematra.—Switzerland.
- 51. *R. Hackiana*, Tratt.—South Europe.

Group IX. CANINA.

- 52. *R. canina*, Linn.—Europe, Orient. Varieties innumerable; 150 are treated as species, with full synonymy, in Desglès's catalogue of the Roses of Europe and Asia. One series of forms has erect subsistent sepals, and another leaves slightly glandular beneath.
- 53. *R. alba*, L.—Garden origin, perhaps a hybrid between *canina* and *gallica*.
- 54. *R. rubrifolia*, Vill.—Europe.
- 55. *R. montana*, Chaix (Reynieri, Hall. n.l.)—Central Europe.
- 56. *R. indica*, L. (chinensis, Jacq.)—Native country not clearly known. fragrans, Red. (odoratissima, Sweet). semperflorens, Curt. (diversifolia, Vent.; bengalensis, Pers.). longifolia, Willd. caryophylla, Red. minima, Curt. (Lawrenceana, Sweet). anemoniflora, Hort.
- R. Noisetiana*, Seringe, and *R. Ternuxiana*, Ser., are supposed to be hybrids between *indica* and *moschata*; *R. borbonica*, Red., between *indica* and *gallica*; *R. reclinata*, Red. (Boursault Rose), between *indica* and *alpina*; *R. ruga*, Lindl., between *indica* fragrans, and *arvensis*; and *R. fortuneana*, Lemaire, *Jard. Fleur.*, t. 291, is doubtless also a hybrid, of which *indica* is one of the parents.

Group X. RUBIGINOSA.

- 57. *R. rubiginosa*, L. (Eglanteria, Miller; suaveolens, Pursh.)—Europe.
 - 58. *R. micrantha*, Smith, Europe.
 - 59. *R. sepium*, Thuill.—Europe. Numerous varieties. agrestis, Savi. inodora, Fries (Klukki, Besser).
 - 60. *R. ferox*, M. B.—North Asia.
 - 61. *R. glutinosa*, S. and S. (pulverulenta, M. B.)—Orient.
 - 62. *R. lutea*, Miller (Eglanteria, L.)—Orient. italica, Miller (Eglanteria, L.).
- J. G. Baker, *Kew Herbarium*, August, 1885.

THE GENUS ODONTOGLOSSUM.

A REVIEW of the genus, even so far as we have already got with it, reveals a most complicated and perplexing but interesting state of things, the number of intermediate forms which are continually increasing going a great way towards obscuring those which have formerly been regarded as distinct, and causing one to question whether such a thing as a pure species exists among them all, and to long for one, no matter how insignificant, which would in all the different specimens of it bear the same features unchanged, for doubts as to the stability of the species are still further strengthened by their extraordinary variability the difference between a bad and a good form of the same species being often as great as that in a closely allied supposed hybrid which cannot be regarded the name of the species itself. Let the mind pass before its mirrors a stary-petalled form of *Odontoglossum crispum*, and then in their turns all the different grades until the gigantic white form and the unapproachable purple blotched and tinged *O. Veitchianum* be reached—what endless variety is revealed! Could but the whole be divided into six or even a dozen distinct branches, according to the leading types now known, and all the intermediate forms eliminated, the members of the *O. crispum* group itself would give material for so many distinct species. The same line of argument also hold good in a lesser degree; in most of the other species their innate variability and their inter-connection by cross-breeding seem to weave them one into the other with but few breaks, and those they probably require but time and fresh importations to clear away. If but a reliable foundation and starting-point could be found, it would be interesting to construct a genealogical tree of the genus showing the prime ancestor, if the botanical heraldry could point him out, and thus the history of the great and complicated family might be traced. We should see where crispum joined luteo-purpureum, and resulted in Wilckeanum;

where *crispum* became allied to *odoratum* and produced *Ruckerianum* and a score others; where *crispum*, mated with *Lindleyanum* and had issue *Coradinei*; and where the same *crispum* merged into *Pescatorei* with *Pescatorei* Lehmanni, and being a great group formed innumerable other connections. All the other main types seem to have been equally intent on being fruitful and multiplying, and replenishing that portion of the earth allotted to them; and it needs only experience in them to be able to connect all the branches in the same manner as that running from *luteo-purpureum* and triumphs through *pranitanis*, *polyanthum*, *nevadense*, *Sanderianum*, and so on, by the assistance of their collateral aids, until the meanest forms of construction are reached, and even they are found to be as unstable as the others—some of these flowers mimicking the features of *Lindleyana*, and others those of *blandum* on a small scale: the smaller the flower the more profusely branched the spike.

The only *Odontoglossum* we have in cultivation which is distinct and unvarying is the lovely little *O. nevium*, and that quality it is only due to the fact that all the plants originated from the few specimens originally imported. Should it ever get over in quantity it will probably be found to be no exception to that changeableness which they seem so eager to exhibit. Dr. Lindley himself remarks that out of the two or three specimens of *O. pardinum* he had examined one of them was not spotted all yellow, and culture often reveals the unspotted panther mentioned by him.

But all this only makes the botanist's work more necessary and more difficult, the innumerable lovely things which are continually cropping up positively demanding distinctive names for all considerations, scientific and commercial. The weight of the work, therefore, which has fallen on Professor H. G. Reichenbach will be readily understood, and too great praise cannot be given to him for the readiness with which he has recognised distinct things, and the acuteness with which he has detected chance varieties. Considering the gradual growth of the now great and increasing genus, and the often scanty materials submitted to him, one can only wonder that the names given stand the test of time as they do. No man under the circumstances could have done better, and nothing remains but to adhere to the names given without considering whether the plants named be species or hybrids, for after all, the cross-parentage ascribed to the plants is only founded on conjecture, although those who know the peculiarities of column, crest, and labellum of the reputed parents, can form an idea on the subject which admits of no doubt.

Altogether the genus *Odontoglossum* is the Orchid growers' greatest pets—the beauty, variety, and amenability to good culture of its members rendering it exceptionally useful and desirable. The facilities given of late years for acquiring the plants through the great importations, has contributed largely to the popularity of the *Odontoglossums*, giving, as they do, a seemingly never-ending supply of novelties. These novelties are almost wholly obtained from the cross-bred varieties flowering in the importations, or from local varieties, and in the matter of showy distinct new kinds we, in recent times, have little to plume ourselves about, as the fine old enumerated species discovered by Hartweg, Warszewicz, Skinner, Jamieson, and those other early travellers, have merely been reintroduced in our times, and many of them have not even yet been got over. The famed Schiller collection in Hamburg, in which so much was done by good culture to foster and spread a love for these plants, contained, in the year 1856, a fine lot of *Odontoglossums*, comprising most of those we now call rare (except the hybrids) and several others which are not now in cultivation. Among Schiller's rare things may be noted *Odontoglossum revolutum*, a noble, large, yellow-flowered species, discovered by Hartweg at an elevation of 11,000 feet; the *Costa Rica O. Warszewiczii*, and the profuse flowering *O. Schillerianum*, which was only imported here by Sander last year.

Before enumerating the species a word as to the botanical characteristics of the genus will not be out of place, as we frequently see certain species mentioned both as *Oncidium*s and *Odontoglossum*. In a recent sale catalogue. *O. retusum* is so described, and *Oncidium orientale* spoken of as a very fine *Odontoglossum*, while in a paper before me I see *Oncidium laxense* mentioned as one of the best

Odontoglossums Hartweg ever discovered. This arises from carelessness, as although *Odontoglossum* and *Oncidium* in certain sections approach very near each other in some features, things are not so mixed that they cannot be determined, and the plants must be either one or the other, unless further complications arise by a home raised hatch of seedlings between the two genera.

The pollinia (2) are the same in both *Odontoglossum* and *Oncidium*, and therefore give no assistance in separating them, but very marked features will always be found in *Odontoglossum*, consisting of the long projecting column, generally thin at the base, and of the base or keel of the lip always running parallel with the under-side of the column for some distance before expanding into the showy portion, which turns down at an angle and faces to the front of the flower. These and other minor features, more easily to be understood by dissection of the flowers than by the aid of description, afford a ready means of correctly determining the genera. Let us hope that all those with the necessary material at their command will turn their attention to this interesting side of the question, so useful in tracing the parentage of chance varieties, as well as in determining their genera. *James O'Brien*.

(To be continued.)

FIG. 40.—ODONTOGLOSSUM CORADINEI.

NOTES FROM A BUCKINGHAMSHIRE GARDEN.

July 3.—The thought of June Roses would have been marred had the grievous blight that fell upon some of them been spoken of at the time. Happily ours, which are affected thus, are few, and the disfigurement they suffer slight compared with the reports from other places. The Roses most dear to me have, however, suffered most. The leaves of the Damask Roses, filling up the corner of the old south wall, are white with blight; some of the York and Lancasters the same; and the leaves of some few other kinds are spotted all over with brown. Not one of the Tea Roses is touched, nor any of our new Roses. Where the green leaves are affected the flowers themselves also suffer, and look pale and stunted. Far worse than blight are the ravages of that cruel caterpillar which skins the leaves. He seems to prefer the old Blush Rose to all others, and its leaves are the first to be attacked. I confess I hate the skinner, and destroy as many as I can lay my finger on. He is as wily as he is destructive, and being the same colour as the leaf, is very hard to find. He has a way of lying close along the very edge of a leaf, or stretched out in such a position as to be almost indistinguishable from the veins. At mid-day, when the skinner has turned in under the leaf for shade, it is useless to hunt, for he cannot possibly be seen. The best time for a successful massacre is in the morning, as early as you please. A little patch of

fresher colour betrays a fresh-skinned portion of a leaf; there the enemy lies, invisible, except to the long-practised eye. As soon as he is discovered turn the leaf over and squeeze him tight; there are grounds, however, for a dismal suspicion that unless the head be crushed the creature refills himself, the skin being tough, and next day he is at work again as hungry as ever. This suspected occurrence, however, I refrain from too closely verifying. The Rose pest of former years—that little bright green caterpillar who after a while sewed himself up in a leaf, became a tiny black chrysalis, and then emerged a smart little yellow moth, was not nearly so bad as the voracious skinner. It is long since that little moth used to be too common in the garden. To see it again would at once bring back the past, with a feeling of dark summer evenings in long-lost years, and a pervading sense of the smell of rain upon the summer leaves.

There are some insects which would seem to be less abundant now than formerly. It gave me pleasure to meet a cockchafer one morning! The burnished Rose-beetle who used to sit like a green jewel in the heart of a Rose, or burr over the Roses in the sunshine, I never see here now. Even the little leaf-cutter bee has deserted us. His neatly rounded cuttings, sawn out of the Rose leaves, disfigured them infinitely less than one day's work of a skinner! The

Musk Rose that we planted last year is flowering freely; small flowers with a small delicious scent. I wonder if the delicate pink of its petals is the "musk-colour" of some old writers! Does not Shakepeare write somewhere of a "musk-coloured coat?" The white *Noisettes* climbing all over our old Stone Pine droops down to the very grass in trails and wreaths covered thick with bunches of little white Roses in lavish beauty. The curious strong fragrance fills all that end of the garden. A child, a little elf of blue eyes and pink cheeks running here and there, through and through the Rose-falls, was one day like a dream from fairyland! *Rosa microphylla* has grown herself into a great green bush in the Fantaisie. But as to flowering, she seems to think little of that; two or three red flowers only, of no account. The darlings of the year are the great broad-flowered York and Lancasters. I count them over morning after morning as a miser counts his gold. It is worth a visit just after sun-rise to see and smell them with the dew upon their petals. They are what Chaucer would call "brode Roses," so wide do their firm and well-set petals spread. The white Cabbage—which used also to be called within my memory the Neapolitan Rose and the Provence—is this summer more than ever honteous in its pure white bloom. White Roses, however, are not my favourites, excepting perhaps *Niphotos* the waxen *devoniensis* and the Japanese *rugosa*. There are summer days when it is too hot for any but white flowers "to deck the house," and in such sultry heat white Roses help to cool the

shaded room. A Rose-de-Meaux, a little perfumed nest of prim pinkness, has bloomed like an old-fashioned woodcut under the Holly hedge. I want to have near it the tiny Fairy Rose of former years, a wee bush pinked over with the weest-of China Roses. Several new plants of Souvenir d'un Ami are blooming well. No Rose lasts so long when gathered as this does. The old *Marchal Niel* in the greenhouse has renewed his youth, and has given up his hundreds this spring, while one planted under a north wall (according to advice) failed to do better for us than give a few greenish buds. The Roses of the *Bocage* are superb in size and colour. The new ground suits them, and for half the day they are shaded by the Elms. For a modern Rose I like *Beauty of Waltham* as well as any; its form and luminous colour, emitting rays of crimson that "bid the rash gazer wipe his eye," are as perfect as any such Rose can be. In the shade, behind the others, modestly blooms a lovely new Rose, *Madame Audot*, scarcely differing, however, from our old friend the *Maiden's Blush*—perhaps a little richer in colour, and in scent a little poorer. It is pleasant to come suddenly upon this blaze of Roses at a distance from the house, and divided from the nearer

Constancy for their text. It is as good as a meditation by *Jeremy Taylor*. We were very grave about it last year; only a very little was to be permitted; it was denounced as too encroaching; and a quantity of it was ruthlessly cut away. We believed its humiliation to be secure. Not a bit of it! Never did it spread and flourish and flower more abundantly than it has done this summer. It ran round the corner of the house and made a blooming bower of itself in the shade under the east porch. It gave a rich deep pink background for the white *Irises*, and *Blush Roses* to the south; it actually climbed up and looked in at the dining-room windows, and nodded to us as we sat at breakfast. "J'y suis et j'y reste!" it said, as plain as words; and after all I had to confess its conquering beauty. The gardener would say I am rather weak about some things. "Peace Everlasting," has overcome; and so has the *White Briony*. I had said, that this *Briony* should not advance beyond a certain point. And I found myself to-day surrounded by the beauty of ten thousand ice-green blossoms, overspreading a low ivy wall, at least twelve feet beyond the bounds I had set! With unnumbered lengths of out-shot tendrils stretching all over it every way in eager quest for the

June has budded, bloomed, and fallen; and like the quickly passing sweetness of them many a friend has come and gone. The dry, green paths hedged in with *Beech* or *Rose* are haunted in this parching weather, not alone by waving shadows on the grass, but by dear memories of a face or a voice that was here and is not. The garden, though in all its prime, was remarkable for its blue. Cloudy pillars of *Blue Clematis* rose everywhere on the borders, showing well especially among the *Cryptomerias* of the *Fantaisie*. There were many shades of blue, from pale sky to ultramarine. The dark blue double kind is a desirable plant, for its quality of lasting longer than its single sisters. Within the walls there grew a love group of white *Lily* with pink *Roses* against a misty background of blue *Larkspur*, while on the other side the walk reigned in brilliant confusion, *Himalayan Poppies* of every red and rosy tint. People say that these *Poppies*, which we call *Himalayan*, or annual *Poppies*, are common. Yet nobody seems to grow them! They have been from *May* till now, to ourselves and every visitor, the wonder and joy of the garden. Whether double or single, like the field *Poppy*, they are full of a happy radiancy of colour which cheers both the eyes and heart. New combinations of colour and pattern

FIG. 41.—A, ODONTOGLOSSUM NEVADENSE; B, ODONTOGLOSSUM POLYXANTHUS. (SEE P. 199.)

pleasance by grassy paths and lines of trees. So much for our *Rose garden*.

The garden is more fragrant this summer than its wont. One cannot tell which sweet scent does most prevail, whether that of *Sweet Peas*, or *Mignonette*, or honey-scented *Alyssum*; while about the iron gates in the old brick walls flexuous *Honeysuckle* flings perfume far and near. The *Sweet Pea* hedge round half the tennis-lawn is full of lovely caprices of colour. One set of white blossoms is tinged with pale bluish tinge. That quaint, patchy, greyish and white kind, which, by some absurd association of ideas, reminds me always of the old sign of the "Bald-faced Stag" on *Putney Heath*, is frequent, and so is the old-fashionedest of all—the pretty pink and white. We have not yet the new pink *Sweet Pea*, the colour of a *Moss Rose* or *Raspberry cream*. Plain white is, after all, the best perhaps. Nature never planned a lovelier flower of such airy lightness. It might shake its butterfly-wings and fly, it is so lightly poised upon the slender stalk! Perhaps to the name "Sweet Pea," and to the sweet freshness of the flower, memories of childhood cling more closely than to any other garden name. *Sweet Peas* and *Mignonette* should always grow together. Even the down-trodden *Everlasting Pea* ("Peace everlasting," and "Save everlasting," as Gerard calls them), with its large frank blossoms, has this year won its way to favour. That plant is in itself an epitome of all the sermons of the year, with *Courage* and

touch of some sympathetic branch, with glossy *Ivy* and blue *Berberis* berries mixing through the flowers and foliage, it is certainly as people say, "a Picture." Near a little wicket gate at the end of a grass walk grows a female *Briony*, smaller and more reticent, wreathed about with round green fruit. During a short absence this was written to me—"No one has passed through the little green gate since you left, I am sure; the *Briony* has put out a tiny hand which clasps it so tight." Totally different, and most charming in its way, are the clumps of *Alströméria*, whose orange blossoms pass "wreath through many a rose change" into pink and white. It is invaluable in nosegays for the flower-glasses. It will have to be transplanted from its rather obscure corner at a distance from the east by the garden-men's cottage. It would keep the house "furnished" until the time of *Phloxes*. Ever since mid-winter the flower-glasses on my table have glowed with a rich succession of *Amaryllis formosissima* and double scarlet *Hibiscus*. The long firm petals of this *Amaryllis*, well named the most beautiful, burn red beneath the silken surface—a just imitation of old red enamel. I never tired of watching the play of inner light; the turn of each petal shone like a piece of old jeweller's work.

July 24.—One month has passed since the garden lay flushed with the full glory of midsummer. It is a little sad that nothing now remains but a memory of it; that thinking of the garden flowers one must say that this, and this, has been! Many a flower since

are perpetually coming; and I do not despair of the scarlets some day running into pure orange-yellow. There is one low-growing double kind scarcely distinguishable from a pink *Carnation*. There is one half-double with white petals hemmed with pink, and one streaked with crimson. The colours are all bright and clean, set off by the yellow stamens. One or two are rather handsome with black centres; but these have none of the clear joyous grace of my favourites. For "decking the house," to use again *Parkinson's* quaint phrase, they are admirable, lasting fresh for days, if gathered in the heat of the sun. To me the petals are like fairy shells; my housekeeper is reminded by them of the muslin gowns her grandmother used to wear. The whole race of French *Poppies*, so called, are far inferior, despite their grand seed vessels and their fine grey foliage. . . . I am rebuked by the sweet face of one of these very *Poppies* looking reproachfully at me across the table. Some one has gathered it and placed it in a glass of water for me. The colour is vermilion-red and white, most delicate and pure. The seed of that *Poppy* must be marked.

In the white splendour of their contrast to the *Poppies* how beautiful the blooming of *Madonna Lilies* has been! (It is all "has been," now!) Does any one know why the *Lily* leaves almost always fall? Before their buds flowered our *Lilies* for the most part looked deplorable—their withered leaves hanging down around the tall stems. In due time, when the

stems were crowned with the majesty beside which the glory of Solomon was as nought, we forgot the dreary deadness of the foliage. In Switzerland, where the cottage gardens are filled, like those in England, with white Lilies, I am told the stalk-leaves remain green. Two or three of our finest clumps failed suddenly—in one night, it seemed—the doomed plant withering down to the very bulb. This was an unusual disaster, and I blamed "the invisible worm that flies in the dark and howling storm." In the same border we have several great plants of *Lilium auratum* without a speck upon their leaves.

The Evening Primrose (*E. nocturna*) came into bloom before its appointed time, and her fair flowers are even larger than usual. Downy-winged moths hover round them in the dark warm evenings. It is said that those who watch may see the buds open. I have watched, but had never patience to wait long enough. Most flowers are best in the morning, when they are refreshed with dews and darkness; but to see *E. nocturna* aright she must be visited "by the pale moonlight," when the air is still and heavy with the odours of night-scented flowers under the full golden moon of July. On such a dewless night *E. nocturna* expands her broad Primrose flowers, and seems to throbb through all her being with a strange moon-life. Once seen the Evening Primrose takes care of itself ever after. We have them growing in a line along the Larch walk, all twined about and dressed with a large-blossomed wreathing pink *Convolvulus*. Another company of them edging an evergreen border shine in the light of their loveliness out of the sombre brown of Cryptomerian darkness. Alas! *E. nocturna* owns one fatal flaw. It is hard even to whisper of its repulsive smell—a smell which is also so sensitive that the flower seems to give it out or retain it at will. At night, if the stem be shaken, or if the flower-cup trembles at the touch of a moth as it alights, out pours the dreadful odour. I shall hope some day for the perfumed white variety. Another old love of former years is the Indian Moonflower. Some of the large white seeds were sent us in the winter from Madras, and now I am anxiously watching the growth of two fine plants which sprang from them. It used to blow at the end of July, when the moon was full, between 9 and 10 at night, opening wide, like a pure white *Convolvulus*, with a delicious scent.

Night-blowing flowers are mostly pale or white. The *Nicotiana* hanging on its stalk half dead by day, is radiant as a silver star when night draws on. In the Bocage we have two fine clumps of Spiderwort (*Tradescantia*), a flower I remember set amongst childhood's wonders, earliest almost of all flowers. Buds mass themselves in clusters all over the plants, and every day on each cluster appears a new three-cornered purple gem. The old fanciful likeness to spiders' legs can be but barely traced in the leaves. There is a sense of mysterious awe in the way Gerard says the leaves are good "for the bite of that great spider," without naming the creature more particularly.

John Tradescant lived once at Dorney Court, not far from here. There is some tradition that there be presented his Pine-apple to Charles II. [?], and it is not many years since a little wayside public-house, retained still the sign of a Pine-apple. "Deborah's" little mount in the Parterre was a white ago parcel-gilt with the silver of small white Harebells, and the gold of yellow Stonecrop. It is grieving to recall thus, the garden as it was. Sweet things do still remain, but after all the daily waterings—sometimes whole days are spent in watering—the place as a whole is hard parched up with long drought. Some things dwindle, and cannot by any means be saved. Eleven weeks without rain!

Long weeks when the sun burns unclouded, and the only clouds are clouds of greenery, that is the worst; greenery that destroy whole rows of Sweet Peas in a single night, and blackly that smother the fruit trees, and distort the stalks of lovely Popples. If one sits in the garden they settle all over one, and outside the garden, down along the roads, one encounters storms of flying aphides. Flycatchers sit stupidly on the Rose arches, bewildered by the myriads that float in the air. The Lime avenue is dried up, and yet dripping with honey-dew. Rain will come at last, however, and meanwhile the trees will ripen their wood, and it may be that good will fall rather than harm, even to the queer things that claim our pity now.

THE PEAR CONGRESS.

THE recent thunder showers have materially improved the prospects of the Pear Congress in the sense that more perfect samples of the various kinds of Pears sent for exhibition and comparison will certainly now be found than promised to be the case a few days since. Interesting as may be collections of the fruit, howsoever grown, certainly good samples are both more pleasing to look upon and much more useful for purposes of comparison, whilst to the grower they are financially all the more valuable.

Probably not a few persons interested in Pear culture have asked what good results to them or to Pears and their culture are likely to result from the proposed Conference? That is a difficult query to answer if put, and it is one which should be answered if the necessity for the holding of the Congress is to be established.

As far as the late Apple Congress was concerned the report issued by the committee which conducted it is the chief answer, so far as one can be afforded. Whether any considerable stimulus to Apple culture has resulted therefrom, or whether any improvement has been effected in the sorts commonly grown, or in the general nomenclature of our common Apples, are points upon which it would be difficult to offer an opinion at present. Probably several years must elapse ere results will show. Certainly, should no good results follow, whilst presenting much to be deplored, yet such failure cannot be laid at the door of the committee promoting the Congress. It did the best it could with the materials at its disposal; it offered a singularly favourable opportunity for getting useful instruction concerning Apples, and if the public fail to benefit thereby the public is to blame. But Pears, though coming so near to Apples in our lists of hardy tree fruits, yet stand usually in a very different category, for the simple reason that, whilst the latter may be grown abundantly by all, and in almost any way, Pears are very much more capricious, and require diverse treatment. It is true that we may get with little trouble on ordinary trees and soils oftentimes big crops of such common kinds as Hessele, Swan's Egg, Beuré de Capiaumont, and rather better Williams' Bon Chrétien, but these are evanescent kinds, of different quality, useful enough on costermongers' barrows, and that is all. Really our best Pears must be grown either on walls, or as espaliers or pyramids, worked on the Quince, if we are to look for good fruit such as is worth cultivating. We do not grow Apples on walls, and in the open we do so with small difficulty; indeed, nothing can be easier in favourable seasons than to secure a good crop of very fine fruit on bush and pyramid trees worked on dwarfing stocks; hence, between good Pear and Apple culture there is a great gulf, which, if it be possible for the Congress to bridge over, it will indeed render to the fruit loving and growing world great service.

Perhaps there may be hidden away in nurseries gems in the Pear republic which have been unable to shed their lights for the benefit of humanity, and which if brought forth into the full glare of day may prove valuable agents in the direction indicated. If the Congress can help to bring these forth, and will proclaim their merits as kinds which, under common treatment and culture will be for us as Pears what Blenheim, Cox's Orange, and Ribston Pippins are amongst Apples, then indeed will the gathering merit glorification. Ordinarily in gardens there is small want of good Pears because of the methods of culture adopted—methods that are not common because out of the reach of the majority. Such fruits, however, do not add much to the national wealth, because the greater portion go to supply private needs and tastes. We want to see Pear culture made a prosperous profitable trade, by which not merely the grower, but the public generally may benefit, and to create such a trade would be indeed a worthy object to keep in view. Looking over the large list of names which forms the Congress Committee, it would seem as if the promoters had scarcely realised that phase of the subject as market growers of Pears are specially noticeable by their absence. Indeed, with so large a number of private gardeners included, it would seem as if the chief object of the promoters was to get together the best fruits from private gardens to compare them for purposes of nomenclature, and other unimportant purposes, and there leave them.

On the other hand, the inclusion of some half dozen of the leading market growers of Pears in the metro-

politan district would indicate that the promoters had objects truly national as well as pomological at heart, and that all that could be done to popularise Pear culture and promote the cultivation of the very best cropping and edible kinds for market purposes should be done. If in the end it has to be frankly admitted that the production of first-class sorts, whether new or old, be practically impossible under ordinary culture, and that we have not in reserve Beuré Diels, Marie Louise, Chaumontels, Glou Moreaux, and Duchesse d'Angoulême of harder constitution and far more productive, under other designations—then it will be useless to look for benefit to Pear culture in that direction.

It but remains to consider how far it may be safe and profitable to invest capital in the production of high-class Pears under the most approved systems of culture—such, for instance, as those employed in the best private gardens. Will it pay to erect walls over wide areas, and against these plant Pears in the best aspects, and Plams, Morello Cherries, and some other profitable fruit on the worst ones? It is obvious that although the outlay would be considerable at the first, the after expense would not be excessive; hence, if good crops, or fairly good crops, can be obtained from year to year the speculation may prove profitable in the end. Were it so we may expect that very many such Pear gardens would be planted, and that in time the public would benefit by having good Pears offered at reasonable cost. Our hardest and most prolific Pears are those which soonest come to maturity, hence, to the public, the Pear season is a short one. Here again it would be of great public service could the Congress call forth some few Pears which, whilst hardy and prolific, would also give good fruits as abundantly at Christmas as Williams' Bon Chrétien and some others give so plentifully in the autumn. Whilst, however, we may lay great stress upon the useful work which may be hoped for in the direction indicated, we may not overlook the very instructive results looked for in the direction of nomenclature correction—work in which nurserymen and gardeners generally may well take part with good effect. To that end it does seem as if it were not enough to send to the Congress good samples of the kinds grown in the various districts, and under various names in collections. Most persons doubtless prefer that their contributions should be grouped as sent and not be widely distributed; the doing so doubtless gratifies the natural pride of the exhibitor, but does not add to the value of the Congress so largely as might be. We may be singular in the assumption, but still hold that were only fifty of the best kinds sent in and left absolutely at the disposal of the committee for arrangement in position, each dish labelled with the name of its owner, that of the sort, and of the place of growth, very much good would result, and the labours of the committee enormously lessened. Even if collections from gardeners and trade growers were sent, some half dozen fruits of certain kinds might perhaps be added for the purpose named. We venture even to suggest that the committee prepare and publish a list of some fifty, or even a hundred kinds, and invite from all over the kingdom, say six fruits of each, with some concise information as to how and where produced. It will be unwise to select samples that are fully ripe if other fairly good ones may be had, for Pears travel badly, and soon collapse when soft. It will be well that those who purpose assisting at the Congress should obtain in time a good supply of clean dry moss for packing, for Pears need almost as much care as Peaches do when packed for exhibition.

In the outline of the promoters' proceedings recently issued it is suggested that samples in number from two to six of divers kinds be sent, but it is to be hoped that the lesser number will not be accepted literally, as the small number would in the first place indicate great poverty of crop, in the second it would offer but poor range of form or feature for comparison, and in the third place it would sadly limit the value of the exhibit were but one of the fruits to come to grief. Six fair-sized, clean grown, and characteristic fruits would certainly present more useful material than would two fruits abnormally large, and perhaps because so somewhat out of character with the known features of the kind. The division of the kingdom into counties, as done at the Apple Congress, seemed to involve much labour without corresponding benefit. The committee can hardly desire to make the Congress a means of gratifying some local vanity by enabling

one county to show that it furnished a score more dishes than another. What would be more to the point would be the grouping of counties, as, for instance, putting Kent, Surrey, Sussex, and Hants into a south-east group; Cornwall, Devon, Somerset, Dorset, and Wilts into a south-west group; then making a midland group, a north midland, and finally a northern group, with Scotland, Ireland, and Wales as separate districts. Some such geographical arrangement would satisfy all requirements. A.

CONIFER GRAFTING.

ALL of these may be propagated by grafting, if not too resinous, and succeed as well as Roses or fruits. It is necessary to have stocks of several years' growth growing in pots, well established, of the various species suited to the purpose. For Abies or Silver Firs the best stock is *A. pectinata*, and *Pinus sylvestris* is found to be a good stock for those species which resemble the Scotch Pine. *Pinus austriaca* makes also an excellent stock. *P. monticola* does well on *P. Strobus* (Weymouth Pine), and *P. Lemmoniana* on *P. Pinaster*. *Retinosporus* grow well on the stock of *Thuja occidentalis*, easily raised from seed, *Cypress* on *Cupressus pyramidalis*, *Juniperus* on Red Cedar (*Juniperus virginiana*), fine varieties of Yew on seedling *Taxus baccata* or *T. fastigiata*, *Libocedrus* on seedling *Thuja sinensis*. On this last stock, which is readily raised, *Biota chamecyparis* and *Thuiopsis* take very well. Several species of Conifers which as seedling plants grow sprawling or bushy, are made to grow erect by being grafted. The operation is best done by cleft-grafting in the winter, using wood of the last season's growth.

To the spring what is termed terminal grafting may be practised with soft growth. In cleft-grafting the foliage of the scion is not shortened, and on either side of the cut-off end of the stock a bud and foliage must be left entire till union has taken place, when they may be removed. Below these tufts the needles must be taken off for a depth of several inches, so as to allow of the scion being securely tied in *Glochers*, handlights, or a close glass case in a propagating-house where the temperature is about 62°-70°, are suitable for enclosing the grafted stocks. A.

ARCHITECTURE AND LANDSCAPE GARDENING.—III.

WE this week give a further abstract from Mr. Julian's lectures on the above subject, and as a Supplement publish another of his sheets of illustrations.

After tracing the history and describing the characteristics of the architecture of the Renaissance from the period of its commencement in the fifteenth century down to that of its decadence in the eighteenth, the lecturer, speaking of gardenesque architecture in this style, said:—

"Terrace walls in connection with buildings in the pure Renaissance or Italian style, should as a rule be balustrades, using the word in its proper sense, which excludes pierced parapets, to which it is often incorrectly applied.

"Sir William Chambers, in his treatise on Civil Architecture, has a chapter on balustrades, from which I will make a few extracts. I do not wish you to feel bound to accept all that he says as 'gospel'; I certainly do not myself—but for students there are many very useful hints. He says, 'Balustrades are sometimes of real use in building and at other times they are merely ornamental. Such as are intended for use, as when they are employed on steps or stairs, or to enclose terraces or other elevated places of resort, must always be nearly of the same height, never exceeding 3½ feet, nor ever being less than 3, that so a person of an ordinary size may, with ease, lean over them without being in danger of falling.'

On this extract I will observe, that Sir William's maximum height, 3½ feet, is, in my opinion, certainly 3 inches too high; 3 feet 3 inches is always enough, and you must not forget that if the balustrade is made too large in its parts, it will dwarf the building to which it is attached. On the other hand, you may often add to the apparent size and increase the importance of a building by keeping a balustrade low and small in detail; in this point, the relative scale of subordinate features to that of the architecture with which they are associated, is of the utmost importance, and is, of course, the first to be settled in pre-

paring to design them. To proceed with my quotations. 'The best proportion for balustrades of this kind is to divide the whole given height into thirteen equal parts, and to make the height of the baluster eight of the parts, the height of the base three, and that of the cornice or rail two; or, if it should be required to make the baluster less, the height may be divided into fourteen parts, giving eight to the baluster, four to the base, and two to the rail.' Speaking of the double-belled baluster Sir William says:—'The base and rail of these may be of the same profile as the single-belled ones, but they must not be quite so large; two-ninths of the baluster will be a proper height for the rail, and three for the base.' As to the proportions of the individual balusters the single-belled are generally about three diameters high, and the double-belled about five, the diameter being that of the thickest part. The distance between two balusters should not exceed half the diameter of the baluster, nor be less than one-third of it. The pedestals that support the rail should be at a reasonable distance from each other. The best arrangement is when room is left in each interval for eight or nine whole balusters, besides the two half ones engaged in the flanks of the pedestals. It frequently happens, however, that it is desirable to place the piers so far apart as to allow of sixteen or eighteen balusters between them. In this case, each range may be divided into two, or, which is better, three intervals, by placing a die or two dies in the range, each flanked with two half balusters. The breadth of these dies may be from two thirds to three-quarters of the breadth of the principal pedestals or piers. The rail should be continued over, and the base under these dies without breaks.

"The piers or pedestals may carry statues or vases; I prefer vases, as if the statues are made—as they usually are—to face outwards, those who are walking on the terrace, or looking from the windows, get a view of their backs only, which is, to say the least, uninteresting. This objection is only to a row of statues; one on each end pier of a long balustrade does not seem to offend."

Attention was then called to the pierced parapets found in connection with Elizabethan buildings and other forms of "free" Renaissance, illustrations being given of several examples, and on this part of the subject the lecturer said that "any form of piercing, beautiful in itself, may be used, provided that it be not of distinctly Gothic or of Oriental character. The piers in these parapets are often terminated with balls, or with small ornamental obelisks."

Mr. Julian continued:—"I called your attention to the arrangement of the parapets at the Château de Blois—in the description of the François-Premier style—small carved balusters alternating with ornamental initial letters, or with the crest of the owner; this, I think, produces a rich and artistic effect, and possesses an individuality that gives it an additional interest. I have often wondered that this form of parapet has not been adopted for enclosing a forecourt to a mansion, or in some similar position; it would, I think, be an agreeable change from the usual forms, which have become somewhat hackneyed."

Passing to another part of his subject, the lecturer said:—"Gate piers, or piers at the entrances of forecourts in their simplest form, should have a plinth at the base, and a small cornice at top. As these piers have to carry no weight, strongly marked vertical lines, such as flutes, should be avoided; while strongly marked horizontal lines—which may be obtained by slightly projecting the alternate courses and rustication them, add to their apparent breadth and solidity. It is well to crown these piers with some sort of terminal, either a ball or other ornamental form; such an addition gives finish and completeness to the design, and its omission (although very common) always produces an effect of meagreness. In modern French examples small ornamental pediments are often used at the top, and with excellent effect [see the illustrations in our Supplement of two examples from Paris]; many variations can, of course, be made in the treatment of these features, and greater richness obtained by the introduction of panels containing carving, shields of arms, and so on; it is impossible to enumerate them all, but in designing them you should bear in mind what I have said about the use of horizontal bands, to which I would add that any ornamental cap should not have too great a projection, or, when viewed from any position other than from in front of one of its faces, the pier will appear top-heavy." [See Supplementary Sect.]

ALPINE PLANTS.

CYANANTHUS LORATUS.—A beautiful and interesting plant, but one, more than perhaps any other, that has puzzled our best cultivators to coax into even a short-lived existence. Straggling bits, with perhaps a stray flower or two, are indeed to be met with in rare alpine collections throughout the country, but a good-sized tuft, covered with its handsome Periwinkle-like flowers, is a pleasing rarity that unfortunately one does not meet with every day. Edge Hall, if I remember rightly, is one of the few homes of this plant, for there, growing amongst rough stones, but in apparently the best of soil, this Indian plant may be seen in its element, roaming at will, and blooming so profusely as to quite surprise the ordinary cultivator. With me it grows and flowers as freely as could be desired, and with but the care that is bestowed on one of the commonest garden occupants.

THE CRESTED GENTIAN (*G. SEPTEMFIDA*),

although hardly equal as regards beauty of bloom to some of the other species, has yet a distinct and peculiar value of its own. A native of the Caucasus, this is at once a desirable species for the rock garden, with clusters of cobalt-blue flowers produced on stems of from half a foot to a foot in height. It is of the easiest culture, growing well in sandy loam and a somewhat shaded situation, where it blooms with a profusion that is surpassed by few others of the tribe to which it belongs. Other species now in bloom are *G. gelida*, *G. cruciata*, and *G. Oliverii*, the latter a rare, lovely, and consequently very desirable plant. Amongst miniature Bell-flowers *Campanula garganica*, with its heart-shaped, deeply toothed foliage, and pretty light blue erect flowers, is at present very effective. For hanging baskets or pot culture this pretty *Campanula* is admirably adapted, the trailing branches of flowers, 10-12 inches in length, being borne in rich profusion, and heightened in effect by being placed near the level of the eye.

THE VIOLET HAREBELL (*C. FULLA*)

is a delicate and lovely plant, and one that requires a more than ordinary amount of care in cultivation. Having a tendency to spread underground and send up shoots at a considerable distance from where the plant originally grew, it should be allotted a patch of ground to itself where the rather tender shoots can roam at will without being molested by neighbouring plants. Sandy rather damp peat suits this *Tyrolæ Harebell*, and it is equally at home in a pot, pan, or the open border.

ERAIANTHUS DALMATIENSIS

is a charming rock plant, with a neat and curious habit, which renders it a decorative subject of much merit. The grassy, Thrift-like foliage is arranged in tufts, and the pale purple bell-shaped flowers in terminal clusters at the end of stout pinky stems. Full exposure to the sun and a free sandy loam suits this plant best, and all the better if the roots can wander by the side of a perpendicular stone or edging—at least under these conditions we have known it to do best. It dislikes coddling, and is by no means so well suited for indoor as outside culture.

THE VACCINIUM-LEAVED KNOTWEED (*POLYGONUM VACCINIIFOLIUM*)

is a pretty shrubby creeper from the Himalaya, and one that, although perfectly hardy, is seldom seen in this country. The flowers are individually small, but arranged in neat tapering spikes of 2 or 3 inches in length, and of a delicate rose colour. In habit the plant is remarkably neat, and is seen to best advantage when hanging over large stones or elevated portions of the rockwork. As to soil, it is by no means particular, although it seems to do best in that of a light sandy nature and in a southern exposure. As an autumn flowering plant of great beauty we cannot too strongly recommend this beautiful member of the Dock family.

ERIGERON CAUCASIENSIS

is a pleasing subject when in flower, and being of neat compact habit is well suited for the more prominent portions of the rock garden. The flowers are rosy-purple, but vary considerably in colour at their different stages of development, and are borne in loose masses on erect stems of over a foot in height. A rather dry soil and shady situation does well with

this plant, and where it finds these requirements is certainly a distinct and ornamental representative of the Fleabane family.

DRYAS OCTOPETALA

is, amongst our native plants, at present one of the most effective. In moist peaty soil it is of the easiest culture, and being of neat habit, and abundantly floriferous, should be largely grown in every collection of rock plants. The large, creamy-white flowers, surmounted on stems that seldom exceed a couple of inches in height, are just now very effective, and offer a rich contrast to the usual run of alpine plants.

ACHILLEAS.

Amongst the Yarrow family there are several well worthy of cultivation, indeed we might, and feel inclined to add that deserve prominent positions, either on the rockwork or in the herbaceous border. Of these none is at present more effective than the Egyptian species (*Achillea ægyptiaca*), which with its finely cut Fern-like foliage and handsome beads of rich clear yellow flowers, possesses a distinct grace that is quite its own. Other worthy members of the same family are the white alpine Yarrow (*A. Clavenneæ*), with its silky, silvery foliage; the downy Yarrow (*A. tomentosa*); and the rose coloured form of our native *A. millefolium*.

MONTERETIA POTTSI.

A plant somewhat similar in growth and habit to the well known *Tritonia aurea*, is now covered with its beautiful branching spikes of bright orange-scarlet flowers. Being rather expensive to purchase, and in many places somewhat difficult to establish, this plant is but little known; but now that its requirements as regards soil and situation have been found out, and its value as a decorative plant thoroughly established, we may expect to find it ere long included in most collections. It likes a warm, sheltered border, and where slight protection to its young growths is afforded. Division of the bulbs is also to be recommended, as the plant is so prolific of offsets that, unless frequently divided, these are inevitably starved—ill-grown plants with but few blooms being the result. *Emergo*.

ORCHIDS IN FLOWER AT ST. ALBAN'S.

SOME very interesting things are now in bloom with Messrs. F. Sander & Co., whose immense establishment becomes more interesting every month as the last new house approaches completion. The large structure just finished, and which is to be devoted to *Lælia elegans* and *L. purpurata*, contains a novel feature, consisting of a bold ornamental rockery, with a miniature waterfall at each end, and these are to be planted with *Lælias*, to grow as they are frequently found in their native habitats. The experiment is worth trying, as the effect of the plants growing and flowering on such cleverly constructed pieces of rockwork would be charming.

Throughout the seemingly endless quantities of healthy, well-grown plants, many novelties are in bloom, and in the ends of the principal houses some very effective displays are made, one of the most beautiful and effective being two large groups composed entirely of the scarlet *Disa grandiflora* and a fine lot of the superb strain of *Odontoglossum Alexandrae*, for which Mr. Sander's establishment is noted. The *Disas* have grown with the *Odontoglossums* and kept perfectly healthy and clean, and are now furnished with a great display of flowers of the finest quality which, mingling with the snowy blooms of *O. Alexandrae*, form a combination in scarlet and white which, shown off by the other tints which the flowers possess and the backing of green foliage, leaves nothing to be desired as a floral arrangement. It is a pity that such an arrangement is beyond the reach of great numbers of those who could fully appreciate it, but on the other hand there are many small amateurs who grow both the plants of which it is composed to perfection and consider them neither difficult nor expensive. The group next in interest and which has perhaps never before presented itself to the Orchid grower at one view before, is composed of almost the whole of the species of *Anguloa* in flower, comprising the lemon-yellow *A. Clowesi*, many plants each with several large blooms; *A. Ruckeri*, yellow, spotted with red; *A. R. san-*

guinea, with flowers tinted with bright brownish-red; *A. eburnea*, with pure ivory-white flowers, of the size and shape of *A. Clowesi*; *A. Turneri*, with large wax-like flowers, white, spotted with dark rose; *A. uniflora*, with white flowers like, but narrower, and much less showy than those of *A. eburnea*; and *A. vaginalis*, with flowers like *A. uniflora* but spotted in the centre with red. The whole group is very effective with the large upright Tulip-like flowers, all of which emit such a penetrating and grateful aromatic odour. *Anguloas* are coming to the front, and well they deserve notice, for they are handsome and free growing if treated like *Lycaste Skinneri*, and

Also in bloom in the Cattleya-house are *C. superba splendens*, *C. elegans*, *C. guttata*, and the varieties of *C. Eldorado*. In the long intermediate-house a good batch of the ivory-white *Mormodes luxatum eburneum* is in bloom, and also a new rose-spotted variety of it; *Cynoches chlorochilon* (the Swan Orchid), *Barkeria cyclorella*, *Galeandra dives*, *Calanthe pleiochroma*, *C. Textorei*, *C. D'aminiana*, *Oncidium Limmingshei*, and a new yellow *Trichopilia*, and a white *Epidendrum*. In the *Odontoglossum*-house, on the roof of which *Lapageria alba* is blooming, a good sprinkling of flower yet remains, the varieties bearing it being chiefly of the large massive white-flowered kinds—the

FIG. 42.—ODONTOGLOSSUM RUCKERIANUM. (SEE P. 199.)

grown in a house a few degrees warmer than that in which the *Odontoglossums* are kept.

Cattleya Gaskelliana supplies the whole of a bank in the Cattleya-house with bloom, and the great size, beauty, and variety of tint in the different specimens admit of it making a charming and varied display without aid from other species. Some of the plants have rose sepals and petals, and crimson and orange lips, and others are almost pure white, the intermediate forms being abundantly supplied, indeed *C. Gaskelliana* seems to exhibit as great variability as *C. Mossie*, and from its free growth and certainty to flower it will probably run equal with *C. Mossie* and its varieties in public favour. All growers alike seem to grow this plant well, and all now agree in praising it as a beautiful and fragrant plant, and all the more useful that it has such a protracted time of flowering.

spotted ones, which are showing up profusely, being not now much in bloom. The many thousands of plants are in the most perfect health, and never yet since their importation has any insect except a few common aphids appeared among them.

In the warm house *Phalenopsis Schroederii*, *P. Sanderiana*, many plants of the new *Agroecum Leonis*, the new white *Aerides Wilsoni*, the equally handsome new *A. Ballantinei*, *A. Lawrencei*, *A. Sanderianum*, *A. Robaneanum*, and several other new *Aerides* and *Saccolabiums* are in bloom or bud, one species of the last-named genus being particularly distinct, with dense spikes of white flowers with carmine lips, the blooms resembling in shape *S. cælestis* more than they do *S. guttatum*, after which the habit of the plant takes.

The long covered way which connects and shelters

the ends of all the houses is now filled with thousands of Mexican Orchids, which thrive grandly in their airy and cool quarters. This lean-to structure is 350 feet in length, and in it are fine batches of *Lælia majalis* (some in bloom), *L. autumnalis* and its varieties, *L. albida*, *Odontoglossum Cervantesi*, *O. Rossi*, *O. citrosimum*, *O. Inseleyi leopardinum*, &c. The sprays of *O. citrosimum* look very handsome hanging overhead, and the flowers on the *O. Inseleyi leopardinum* are of the best quality, perfect in shape and

CHERRIES IN POTS! A CHERRY-HOUSE.

"COME and see my Cherry-house." Such has been the oft-repeated invitation of Mr. Rivers for the past two or three years. Like many others, I had often feasted my eyes on the beautiful dishes of Cherries exhibited at South Kensington, Regent's Park, and elsewhere by Mr. Rivers: it had even been my good fortune to have the privilege of tasting these tempting

ordinary gardens except Morellos. Peaches, Pears, Grapes, Apples, &c., are grown in quantities and receive special culture, but not so Cherries; and yet so easy are they to grow and so well worthy of all the care that can be given to them. Why not a Cherry-house as well as a Peach-house? There would be more enjoyment with the one than the other. It is not always that one cares to eat a Peach, but a Cherry ripe is always pleasant. Such a house as that of Rivers may be constructed for comparatively nothing. It is but a structure—a long span-roofed covering of glass, some 60 feet in length, and about 14 feet wide, with abundant ventilation on both sides—an important matter for Cherries when in flower. It is unheated, no expense in that way being required. There is not even the usual trim pathway, or anything of that sort, the pots, &c., standing on the maiden earth, the freshness of which, as Mr. Rivers observes, is so much better for the well-being of the trees than neat appearance.

Simple and unpretending as the house itself may be, the appearance of the little trees themselves, laden with their dense clusters of fruit, is truly charming. Seldom have I seen trees more heavily cropped, the quantity of fruit seeming to exceed the leaves, and yet all in the most robust health and vigour; no insects, or appearance of any, to be seen. For the most part the trees are growing in 10 or 12-inch pots, and vary from 3 to 5 or 6 feet in height, every one being heavily laden with fruit, ripening in succession. The first fruit, Mr. Rivers stated, was gathered on June 1 off the Early Rivers, a large and very excellent variety of the Black Circassian class raised by Mr. Rivers; and here, at the end of July (two months), the same variety was still being gathered. This is another charming and important feature of Cherry culture under glass—the great length of season the fruits will keep fit for use. I tasted some ten or twelve varieties, which were all excellent, but to my mind none possessed that rich sweetness of flesh to such a degree as the Early Rivers. It is a variety that should be cultivated everywhere.

In regard to culture Cherries require nothing special, they delight in good loamy, somewhat calcareous soil; the chief care is in providing plenty of air for the setting of the flowers in spring, and keeping clear of insects. I hope to see Cherry-houses in every good garden, and am quite sure nothing would give greater satisfaction. *A. F. B.*

MARKET GARDENING.

(Continued from p. 170.)

HOWEVER much practices may have varied, as explained in the past, as between market garden farmers and that of gardeners in private places, a greater divergence still has to be explained in connection with the Vegetable Marrow, and indeed, as I shall show in due time, the Cucumber also. Gardeners, as is well known, invariably prepare heaps of manure, or some form of garden waste representing heaps of manure, upon which mounds or layers of soil are placed, whereon young Vegetable Marrow plants are placed, and generally afforded some form of artificial protection, such as handlights, frames, &c. Such protections have their advantage in connection with tenderly reared plants, and in forcing on the plants so that they produce fruits a week or so earlier than would otherwise be the case. As against this system, field culture is of the very simplest description. The land receives a thorough manuring to the extent generally of an outlay of £10 or £12 per acre. This manuring must not, however, be considered an excessively high quantity, as will be better understood when I explain that ordinary manures for Potato crops all but invariably give a relative cost also of £8 to £10 per acre. But I have thus far described the more favourable practice followed in connection, as not infrequently manure is placed down the middle of "lands," upon either side of the centres of which crops are still growing. It is ploughed in, and at the proper season the seeds are sown. Mark here the difference between field and garden culture: in the latter nursed and potted plants are planted out, and subsequently protected, whilst in the former case the seeds are simply dibbled into the ground in the exposed open fields, and, as regards the season or date when the seeds are sown, it also appears exceptional. They are dibbled three seeds in a circle, a few inches apart, and about 3 or 4 feet apart in the rows, during the early days in

FIG. 43.—ODONTOGLOSSUM WILCKEANUM. (SEE P. 199.)

FIG. 44.—ODONTOGLOSSUM TRIUMPHANS. (SEE P. 199.)

extraordinarily fine in colour. The whole establishment is of great interest, and it is rather a relief to visit it when none of the large sections are in full bloom, as the rare things are the more readily found and examined.

TRADE MEMORANDUM.

A GOOD many nurserymen, it appears, are anxious to know the present address of Messrs. Hancock & Gankroger, late of Newcastle.

fruits, and of comparing their merits. All that was very well and good—but, as Mr. Rivers said, "You should see them growing." Thus tempted, I went the other day and had a feast of Cherries! Literally a feast! One can form but a very faint idea of the wonderful beauty of a house of Cherries in pots without seeing it. Amongst fruits, Cherries are probably the most tempting of all, their bright glossy appearance renders them peculiarly so, and yet how little attention is paid to their cultivation. Beyond having an old tree or two on the walls, the fruit of which is mainly grown for the birds, there are no Cherries in

the month of May of each year. So soon as the seeds have germinated, and the plants are well through the ground, they are carefully hoed between, and subsequently the land on either side is ploughed up simply to give a clean surface, over which the plants extend and grow. It may be useful to add, the space accorded to the plants consists of an ordinary "land," as ploughed per row as described. Excepting a hand-hoeing, should it be subsequently required, this is all the labour given to them. The results are, the plants rapidly extend and cover the whole space, and for early cropping and prolificacy they greatly exceed every form of garden grown on the mound of manure or any other system. The Marrows form readily; flowers being numerous and the fertilising process certain, the fruits are rapid in development, and, if left to grow, large in size.

Here, again, we are brought face to face with the fact that the excessive use of manure and loose soils are opposed to free, full, and abundant fruitfulness. But beyond this, whilst great prolificacy is assured, so also is longevity linked with sustained vigour. If private garden growers would only take these facts into consideration, and as far as possible act upon them, we should have less complaint of Vegetable Marrow plants "dying off," the female blooms dying away fruitless, and that the plants are infested with "fly" beyond recovery. Under the above very common system of field culture these disheartening drawbacks are simply unknown.

Whilst I have given general dates as to the early planting or dibbling in of the seeds, it will be well to qualify these statements with the explanation that each grower must judge of the fitness of the weather each year, and sow his seeds accordingly. Should a cold late spring with much rain and its consequent very wet soil result, it will be necessary to defer sowing the seeds, as under such circumstances they are likely to rot in the ground in lieu of the healthy "spearing," and subsequent growth desirable. And I would add this remark in their behalf—if from the exigencies of space any desire to utilise and clothe existing rubbish heaps, &c., and it is desirable so to grow Vegetable Marrows, always take the precaution to tread down such materials and to make them with as firm a base as possible, so that the roots can ramify and extend, forming as firm a root-hold as possible, which is the best means to attain a desirable fruitfulness with lasting health.

As regards the artificial heat often sought by small growers, the facts I have given above amply dissipate the notion that any actual need for it exists. Finally the thoughtful grower must ere now have been met with the query, In what habitat can Vegetable Marrows have formed loose mounds, such as is often formed for them artificially whereon to grow? The answer should, as I believe it will, lead to an improvement in the methods adopted; even Melons delight in firm soil, and it is a mistake to imagine that plants do not appreciate a firm root-hold. *William Earley.*

(To be continued.)

The Herbaceous Border.

ONOSMA TAURICA.

In recommending this very desirable plant to the notice of your readers "J. S." advises that it should be propagated by division, or by seeds. I have had a very familiar acquaintance with this *Borage*-wort for many years past, and a tolerably extensive knowledge of seed catalogues, wholesale and retail, and I have never yet seen the seed offered by any vendor, neither have my plants ever yielded any. I am therefore induced to ask "J. S." if he was ever fortunate enough to obtain any; if so, it deserves to be put on record as a remarkable fact. *Saixante-deux.*

EPILOBIUM LATIFOLIUM.

"Oxon," in his notes on the botany of Iceland, in the *Gardeners' Chronicle* of August 8, speaks of having seen this when travelling there, and it being by "far the most beautiful flower he found there." I do not wonder at his remarks, for when grown in this country it is a most interesting plant; the flowers are so large, being more than 1½ inch in diameter, and the foliage is also distinct from all other species of Willow-herbs. It is, however, by no means a difficult plant to cultivate. I remember once seeing more than a yard square of it growing in an orchard, and a

pretty sight it was, the ground being completely carpeted by its glaucous foliage. An example on the rock-work, and also a nice stock of healthy plants in pots, may be seen in the York Nurseries, where it has been grown for many years. *R. P.*

THE PROPAGATOR.

ONOSMA TAURICA.

IN calling attention to this truly lovely Boraginaceous plant, I think your correspondent (see p. 150) has decidedly overlooked the best means of propagating it. "J. S." observes—"The way to propagate it is by division, which should be effected in spring, just as the plants begin to grow." I wonder who would care to disturb a fine plant of this gem at this season? for just as it begins to grow it also begins to show flower-spikes, and then what a sacrifice must follow. It certainly may be increased in this way; still it is a risky business to part its woody rootstock, and to witness the death-rate, too, is by no means a pleasant thing. I have had a fair experience with it, and to lift it would be the very last step I would take. If success must be obtained it will be by cuttings. During June and July these are abundant. Strip them with a heel attached from the main body of the plant, and insert them without further preparation in very sandy soil in well drained pots. Keep quite close under handlights till rooted. This takes about three weeks; then expose by degrees. I have rooted hundreds in this way, and one thing I always strictly adhere to, and that is, never to use a knife in making the cuttings. "J. S." also mentions seed, but where may seed be bought? I have tried over and over again to seed plants, but in vain, and I remember once some years since asking Mr. Thompson, of Ipswich, respecting same, and his reply was that if I waited for seeds he was afraid I should wait a long while. Has your correspondent succeeded in seedling this plant?—if so, will he confer a favour on many readers of the *Gardeners' Chronicle* by stating his *modus operandi*. *E. Jenkins.*

Orchid Notes and gleanings.

TRICHOPILIA LEPIDA.

In this beautiful Orchid the leaves are solitary, evergreen, oblong-acute, the flower-stalks emerging from the base of the oblong, smooth pseudobulb. Each flower measures about 5 inches in length, and has linear lanceolate sepals and petals, rosy-lilac, with white edge; the lip is large, folded round the column, and expanding in front into an oblong, crenelated limb, with a purplish throat, and numerous smaller and paler spots. The plant blooms in spring. The species may be grown in pots or baskets hung from the roof, but where they can be shaded from the burning sun. Rough fibrous peat, with a few lumps of charcoal, is the best potting material. *Orchid Album*, t. 197.

MAXILLARIA STAFELIODES.

This pretty little Orchid has been flowering in the Birmingham Botanic Gardens for the last month. It reminds one very much of a *Stapelia*. Although an old inhabitant of our Orchid-houses it is now seldom seen. A native of Brazil, and flowered in the Glasgow Botanic Gardens in 1830, from which a figure was taken for the *Botanical Magazine*, plate 3877. *W. B. Latham.*

ONCIDIUM PRÆTEXTUM LEANUM, *Reh. f.*

It is with great pleasure I state, that Mr. W. Lee was so kind to send me once more a fresh inflorescence of this gorgeous variety, proving the stability of the tri-labellia, or, if you like better, *Peloria*, though you might at least not call it regular. *H. G. Rchb. f.*

DENDROBIUM HILLII.

A fine evergreen species with fluted pseudobulbs

and oblong leaves. The dense racemes of flowers proceed from the top of the bulb. Each flower is star-like, with narrow spreading, creamy-yellow segments, and a short trowel-shaped acute lip, barred with violet rays. It has been figured in the *Gardeners' Chronicle*.

CYPRIPEDIUM LEEANUM SUPERBUM X.

A pretty coloured illustration of this hybrid is given in the last number of the *Orchidophile*. It was raised by Mr. Seden from *Cypridium insigne* var. *Maulei*, fertilised with pollen of *Cypridium Spicerianum*, itself a hybrid. The flower is intermediate between its parents. The upper sepals broad, white, marked with violet spots, the lateral petals linear, oblong, undulate, of a yellow ground colour, overlaid, except at the margin, with brown and spotted with purple. The lip is rich bronzy-brown.

MILTONIA CANDIDA GRANDIFLORA.

The flowers of this plant, which has the habit of an *Odontoglossum*, are borne in erect racemes. Each is 3 inches across, with five oblong, spreading segments of a yellow ground colour, heavily blotched with brown. Lip projecting, folded over the column at the base, dilated in front into an oblong, lobulate white limb. This plant should be grown in the Cattleya house, shaded from the direct sun, and well drained. *Orchid Album*, t. 200.

CURIOS PLANT OF HABENARIA BIFOLIA.

Last week I had sent me from the island of Anglesey a curious plant of the Butterfly *Habenaria*, widely different from anything I had seen before. The whole plant was much less in size than *Habenaria bifolia* generally, the spur and two lower sepals being much shortened, and the labellum upturned. The tuber, leaves, and stem agreed in every part with those of *H. bifolia*, only they were proportionately less. On examining the pollinia I found them placed relatively much closer than in the normal form, and the viscid discs being black gave to the interior of the flowers a rather striking appearance, and very different to those of *H. bifolia*. That the up-turned labellum prevented, to a great extent, insects entering the flowers was apparent from the seedless capsules. *A. D. Webster.*

CATLEYA HARDYANA.

During the month of May the Cattleya *Sanderiana* flowers of which measured 11 inches across, was bloomed by G. Hardy, Esq., Timperley. In the month of June and July a number of other forms of the same species, much darker in colour, though less in size, were open, and admired by many, for then there were blooms open by the dozen for comparison, but though the dimensions of the May blooms were startling, and the number and colour of the June ones equally bewildering, there is one in flower at the present time that outstrips all it has been my pleasure to see. I am warranted in that statement, for many of the best growers and authorities have seen it, and each declares it to be the finest Cattleya bloom that has ever come under their notice. It is not gigas, nor is it *Sanderiana*; but if the best points of these were worked together, with a dash of *aurea* thrown in, some near approach to *C. Hardyana* may perhaps be the result. The plant was imported about five years ago, and was purchased for Mr. Hardy by another grower when buying a lot for himself, who naturally enough took them all to be *C. Sanderiana*. However, in a couple of years the plant in question opened its first blooms, when it was plain to the owner that a fresh form had appeared; it has flowered once again, and now for the third time it is in bloom, bearing four flowers on a spike, which have come away immediately on the development of the new growths. The blooms are 8 inches across, the sepals and petals of a deep mauve colour, the petals having their outer edges somewhat reflexed, as is the case with *Laelia purpurata*. It is, however, the lip that the distinction occurs—this is 3 inches across, and about the same in depth, the lower part being of a most intense rosy-purple. About half way up this abruptly ceases, though the centre is still of the same colour, beautifully lined with yellow. The sides again of this purple and yellow lining are taken up with a grand piece of golden-yellow, which again is margined with the shades of rosy-purple; the upper part of the labellum is of the same purple, whilst on the inside of the throat the golden and purple stripes are carried right through to the column. It is strongly excited,

and would appear to require treatment exactly similar to that given to *C. Sanderiana*. This plant has twenty-four bulbs, with three leading growths, though it is not as yet a large plant. I venture to say that if it was put up by auction at King Street or Cheapside it would fetch a higher price than as yet has ever been given for an imported or established *Ochid* in England. *W. Swan, Oakley, Fallowfield.*

not later than the end of November, in order that the necessary preparation of the ground may take place. Ground to produce handsome clean roots requires the highest cultivation and the timely application of dressings to cleanse it from insects, &c., which so much disfigure them; Lettuce, Endive, Turrips, and early Coleworts, will be suitable crops. *S. H. Richards, Sowerley Gardens, Ringwood, Hants.*

FRUITS UNDER GLASS.

STRAWBERRIES IN POTS.

OWING to the prevailing dryness, Strawberry runners will at most places be somewhat scarce, and probably not quite so good as usual, excepting where the method of setting apart a portion of young vigorous plants for the purpose is adopted. In this case, this year, it will prove very advantageous, as the yield of good runners will more than compensate for the fruit that was sacrificed for this particular purpose. Runners layered at about the customary period will now (August 6) in most cases be fit to remove from the parent plants altogether, and placed in a convenient place near where the potting will be done. This operation should be proceeded with forthwith, first attending to early kinds, as these plants should develop and mature a growth early in the season. They should not be over-potted, 4½ and 5-inch pots are amply large for the purpose. Keep the crowns of these plants well up above the surface soil in the pot. This will in some degree counteract the effects of damp when they are started, and subsequently also newly potted plants will be benefited if left in a moderately shady place out-of-doors for a few days until the roots have taken hold of the new soil, when they should at once be taken to the place appointed for them. This should be where every ray of sunshine can reach them, and, for convenience sake, as near the water supply as possible. As a base to stand the pots on nothing surpassing a good hard bed of ashes. The after-culture, as watering, especially, should be entrusted only to careful hands, for if this operation is unskillfully done it will soon cause many plants to become sickly and fade away. As the plants advance in growth and the pots fill with roots some stimulating manure should be mixed with the water, and be given to the plants about twice a week in dry sunny weather; and particularly whenever dew is absent the plants should be syringed with water through a fine rose once or twice a day, at morning or evening, as may be necessary. When runners appear pinch these out at first sight, and keep the plants free from weeds, and above all other matters see that adequate space is given the plants to develop growth properly. The current season is unusually favourable to the increase of insect pests, and at most places the plants will be more or less infested with the red-spider, and if this pest cannot be exterminated its effects can be materially checked by means of dipping the foliage of the plants into a solution made with strong tobacco and a little soft-soap added. This should be done prior to putting the plants into the rooting pots. *G. T. Miles, Wycombe Abbey.*

The Kitchen Garden.

FRAMES.

In many gardens it will be desirable to keep the frame Cucumbers in a healthy bearing state as late into the autumn months as possible. To accomplish this a little careful management will now be necessary, in respect to watering, airing, and closing the frames early in the afternoon to make the most of sun-beat. A good lighting should now be made up round the frame. Henceforth the plants should not be damped during dull weather; but when water is required it should be applied when bright sunny weather offers a favourable opportunity. The first signs of mildew should be checked by the timely application of sulphur sprinkled over the affected parts.

PLANTS FOR WINTER.

If seeds or cuttings were put in when recommended in a former Calendar, to supply the plants for the first division of the winter Cucumber-house, they should now be large enough to place in their winter quarters. Before bringing in the fresh soil the house should receive a thorough cleaning by well washing the glass and woodwork, and by applying a couple of coats of fresh lime-wash, which should have a little sulphur mixed with it, to the brickwork.

A somewhat lighter and more porous soil than is generally used for summer plants will be found most suitable for the winter ones—say not quite three-fourths of good fibrous loam, which has been in stock some time, the remaining part good leaf-soil or well-decayed manure, free from worms, &c.; to this should be added a little broken charcoal and a little road-scrapings or rough brown sand.

TOMATOES FOR WINTER.

Small-fruited varieties are best for winter and early spring fruiting, such as Ricke's Victoria and Orange-field. These plants should be in their fruiting pots, or planted out to grow on a trellis, by the end of August or beginning of September; they should then yield fruit in succession to the outdoor plants. Winter Tomatoes should always be placed in a house where there is a good command of fire-heat, otherwise they are scarcely worth the trouble of growing with a view of producing ripe fruit in mid-winter; but if the plants remain in a healthy state until the following spring, they would then ripen fruit much earlier than spring-raised plants.

MUSHROOM BEDS.

As soon as a supply of droppings and short litter can be had it should be collected, and preparations made for the first bed of the season.

SECOND EARLY POTATOS

The skin on the tubers is now firm, and the haulm indicates that the lifting time has arrived. This should take place before rain saturates the soil. The eyes on the tubers are very prominent, and moisture after this long season of drought will be sure to start them into growth and bring on disease. For the above reason they should not be put in large heaps when stored, but spread out somewhat thinly, and well covered over to prevent the tubers becoming green. Select those tubers of an even medium size for seed purposes; they are best placed on shelves with a circulation of air beneath, and the tubers should lay thinly.

PLANTING OUT, &c.

In finally planting out the remaining winter stuff, the plots whereon three important crops are to be grown next year should be decided upon—viz, Carrots, Onions, and early Potatoes. It is not absolutely necessary that these plots should lay vacant all through the autumn and winter; but a crop should be placed on them, which can be cleared off

Plants and their Culture.

GREENHOUSE HARD-WOODED PLANTS.

INDIAN AZALEAS.—The latest event of these to make their growth should, ere this, have completed the same; and if not already shifted from their growing quarters into the open air, the sooner it is done the better for the future cleanliness of the plants as well as being a great aid in the perfect maturation of the young wood and the development of the flower-buds for another season. A gradual course of exposure to the full power of the sun's rays should be adopted; this needs to be more closely followed out if any part of the stock has been of late under the shade of Vines or Peach trees: should the young foliage become burnt a check will be given to the perfecting of the flower-bud as well as being a disfigurement to the plant. A close watch must be kept against any inroad of a colony of black thrips, which will quickly do irreparable injury, increasing so rapidly as they do at this season of the year. Fumigation is the most effectual remedy, but where this is not desirable, a thorough good syringing with a solution of soft-soap and tobacco-water, rather stronger than one would be disposed to use it on Peach-trees, will be found to answer the purpose. Use should also be made of the syringe to give the plants a good damping as the sun declines on bright and warm days. If any of the stock requires attention in the way of potting, this month is about the best in our experience to perform the same. The growth for the present season being made, no over-luxuriance can follow that operation, as would be the case if the potting were done immediately the plants were out of bloom, they being kept in a moist growing atmosphere for a few weeks. However advisable in the case of many types of plants, it is not to be recommended in the culture of the Indian Azaleas. Fibrous peat of the best quality obtainable should be the staple compost; if, in the opinion of the cultivator, this should not be quite up to the mark, some charcoal about the size of common nuts (larger or smaller according to the size of the plants) should be added. This, with a liberal addition of silver-sand, will be found to suit their requirements. The potting of these, as well as of all hard-wooded plants, is not an operation to be hurried over in the least; a little extra time spent on the work will amply repay itself. Firm ramming of the soil around the old ball should always be practised; and large shifts are not desirable in any case. An inch of space all around the ball of the plant is ample at any time, even less can well be made to suffice. Azaleas will thrive best when somewhat pot-bound, and are not nearly so liable to injury from excess of water at the roots at such times, besides being decidedly more floriferous. After the potting process is completed be careful in the arrangement of the plants to see that none are left out of the level. This is an omission that is frequently made, and thought to be of little importance. It is desirable at all times, but with newly potted plants it should be made imperative, an equal absorption by the soil of all the water that is applied being of the first importance, particularly with these.

RHODODENDRONS.

The greenhouse section of Rhododendrons, including those which thrive best in an intermediate-house, should at all times be kept in the smallest pots possible, consistent with their health, in order to induce them to develop flower-buds. It is not desirable to expose these in the open air, particularly the more tender varieties, but a light airy greenhouse would suit all of them well for the present. *James Hubbon, Gunnersbury House Gardens, W.*

The Hardy Fruit Garden.

APPLES.

THE young growths of these should when not required all have been cut-back by this time, and the small shoots removed, so as to allow the sun and air to ripen the branches left; without this it is impossible to obtain thoroughly fruitful wood. The gathering and storing of early kinds will now demand attention. Early varieties should never be gathered before they are thoroughly ripe, for if gathered a day or two too soon they are sure to shrivel, and become worthless; and again, if left on the trees till over-ripe, many varieties turn mealy instead of being crisp and juicy; therefore, where good fruit, fit for dessert, is wanted, it should have great care and attention in gathering. Where Apples are appreciated for dessert it is important to know the best varieties that ripen early. The following varieties are grown here, mostly on the Paradise stock, which to me appears to favour early ripening:—Our first variety to ripen was *Juneating*, closely followed by *Margaret* or *Striped Juneating*, which as grown here is much larger than *Juneating*, and is a very free bearer. *Early Harvest* is an excellent variety, and should be included in every collection. *Mr. Gladstone*, now ripe and producing fine handsome fruit. *Irish Peach*, the first to flower (April 25), will not be ripe for a few days. *Oslin*, in flower April 27, now ripe. These are the best early kinds grown here.

PEACHES AND NECTARINES.

Remove portions of the leaves where they shade the fruit, and keep the trees nailed closely to the walls: insure having the wood thoroughly ripened. Trap earwigs on walls; a simple plan is to place small flower-pots, filled with hay or short grass, among the trees; examine them occasionally, and destroy the insects. Give water to wall trees when required, and protect all fruit that is ripening from birds. *J. Smith, Menmore, Bucks.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Aug 17	Sale of Dutch Bulbs, at Protheroe & Morris's Rooms.
TUESDAY, Aug 18	Weston-Super-Mare and East Somerset Horticultural Society's Show. Shropshire Horticultural Society's Show, at Shrewsbury (two days). Sale of Bulbs from Holland, at Stevens's Rooms.
WEDNESDAY, Aug 19	Greenhouse Plants, at Lynton House, Clapham Common, by Protheroe & Morris. Wilts Horticultural Society's Show, at Salisbury.
THURSDAY, Aug 20	Sale of Valuable and Imported Orchids, from F. Sander & Co., at Stevens's Rooms. Sale of Dutch Bulbs, at Protheroe & Morris's Rooms.
FRIDAY, Aug 21	Sale of Imported and Established Orchids, at Protheroe & Morris's Rooms.
SATURDAY, Aug 22	Sale of Bulbs from Holland, at Stevens's Rooms.

THOSE who take a narrow view of what is called Nature have been known to object to what they regard as the artificiality of lawns and flower borders. The owner of a terraced garden around his dwelling, and of a beautiful park beyond it, remarked lately, "I make myself at home here with Nature." "Do you?" said a critic. "It seems to me you have given the dear old Dame the cold shoulder. You have at all events turned her out of your garden and thrust her beyond the park." In a certain sense, and taking a limited view of Nature, this is true. But here let us ask "What is Nature?" Seen from the windows and sparkling amidst the old Oaks upon its emerald green shores, is a bright sheet of water. "That is Nature!" says the critic, very truly, as we think, though the lake is artificial, formed as it was by a happy stroke of genius on the part of a landscape gardener who dammed the valley down which a stream ran, and thus created a lake of 70 acres, and performed the feat within a fortnight. The critic claims, too, as belonging to the realm of Nature, the noble Cedars of Lebanon in the park, the huge Pinasters and Stone Pines, as well as the Scotch Firs, with the grand Silver Firs near the water, and some Tulip trees blossoming where they were planted probably on the first introduction of that tree; and he claims of course the sweet Chestnuts as well as the Oaks, the Deodars as well as the Yews, exotics as well as natives. In point of fact the true "domain of Nature" has no existence in this landscape, unless he will concede that foreign trees are natural to it, though they were domiciled here by art and by the scientific efforts of man.

It seems to us that the term Nature is sometimes misused by those who criticise the ornate state of gardening. Good taste and common sense have long since decided that the immediate surrounding of a house must be in some degree artificial, in order that they may be harmonious, but it does not follow that they are for that reason unnatural. The love of flowers is displayed even in great cities, and however artificial the various methods of producing them may be, they are as much Nature's own, foreign in extraction though they be, as a mountain Daisy.

In the country we all endeavour to surround ourselves with a cultivated plot, however small, called THE GARDEN. It may boast a few fruit trees, most of them probably natives of a foreign country. More than half the vegetables are foreign, and nearly all the flowers; but Nature, like genius, is of no country, and exotics in England, from the stately English Elm, to the Tree Ferns and European Palms, which are planted out in shrubberies in summer, are all subjects of Nature, foreign though they be in origin. Looking at the matter broadly, Thistles and Brambles, and other such "rubbish," growing in old corners and waste places, are not a bit higher or lower in Dame Nature's view than the most ornamental of the plants of culture. We prefer the latter around our houses, the former in our game coverts, and we have ransacked the world for novelties, which are to us exotics, though the critics of the flower borders

will please observe that they are not foreign to Nature.

It seems, then, that the lover of flowers may find himself at home with Nature even in a flower garden of the most ornate description. Perhaps there are a few statues and vases of bronze or marble among his bright parterres, with a fountain bringing by artifice a liberal flow of water into the midst of what is certainly a very artificial acre of ground. Let us hope so, since Art is not unnatural, but, on the contrary, it serves as an agency which unites and harmonises Nature with the mind of man. "The excuse of artificial gardens," said the late Lord LYTON, a lover of gardens and a good gardener at Knebworth, "is, that the statue, the fountain, the harmonies of form and colour into which even flower-beds are arranged, do bring Nature into more familiar connection with all which has served to cultivate, sweeten, elevate the mind of man." Both Nature and Art speak in flower gardens, reminding cultivated minds of the symmetries of form and beauty expressed in geometric figures, of the harmonies of hue and tint, and of the secrets of light and colour revealed by modern research. An artistic garden under such scrutiny as is here suggested is relieved of its alleged monotony through the images and reflections it occasions, and by its obvious connection, to the philosophic eye, with the æsthetic history of man's relationship with Nature. As SHAKESPEARE most truly said of the art which "mends Nature," "the art itself is Nature."

— JACOB BOBART.—The gardener whose portrait we now give was the predecessor of the AITONS, the SMITHS, the MACNABS, the BAXTERS, and others who have rendered our Botanic Gardens famous. The Oxford Garden, of which we lately gave some illustrations, is the oldest Botanic Garden in this country, and JACOB BOBART was the first gardener. It is evident from a mere glance at his countenance that he was a man of strong character, and could hold his own among the dons of the University. His name occurs frequently in the *jeux d'esprit* and "skits" of the time. Of him the late Dr. DAUBENY writes:—

"During the period that the professorship was held by MORISON, JACOB BOBART the elder, a native of Brunswick, was gardener or supervisor. There is a small whole-length portrait of him in the frontispiece to *Vertumnus*, a poem on the garden; 8vo, Oxford, 1713. In this he is dressed in a long vest, with a beard, which, it is said, on feast-days he used to have lagged with silver. He died February 4, 1679-80, at the age of 81, leaving two sons, JACOB, who became Professor, and TILLEMONT, who was also employed in the physic garden. The elder was buried in the churchyard of St. Peter's-in-the-East, where there is a small tablet to his memory against the south wall. He printed a catalogue of the plants in the garden in the year 1648, which was reprinted in 1658, and from this it appears that about 2000 species were then cultivated, 600 of which were English. On the death of MORISON, in 1683, the son of this BOBART, also named JACOB, succeeded to the Chair of Botany, and continued the labours of his predecessor by the publication of the third part of the Oxford *History of Plants*. He died in 1719, in the 79th year of his age."

— THE ROYAL HORTICULTURAL SOCIETY.—Even in the dull season there is always something interesting at the meetings of this Society. Mr. WARE continues his permanent exhibition of herbaceous plants to a degree that excites astonishment at the amount of his resources. Think what it must be to keep so large a space filled from day to day from May to the present time with such a collection. On Tuesday last Mr. WARE's efforts were supported by the New Plant Company who filled the air with the fragrance of their golden Lilies; by two fine lots of Gladioli from Messrs. KELWAY and Messrs. J. VEITCH & SONS, the latter particularly interesting, as affording illustrations of a new break. Messrs. RIVERS' collection of fruit and fruit trees was very remarkable. The collections of wild plants from Harpenden excited great attention from the general public, and forcibly recalled the days, some thirty years ago, when the late Rev. Professor HENSLWOOD did so much good service in this way, and gave the village children a source of interest and amusement of

the keenest yet most innocent kind. On this occasion we were pleased to see the intense purpose manifested by some of the schoolboys whom Mr. HENSHAW has inculcated with the love of plants. The specimens were well arranged and correctly named. They furnished mute but irrefragable evidence of a calcareous soil, or of growth along the river's bank and similar moist places. On another occasion it would be interesting to see other collections from sandy or clay soils, collections illustrative of the floras of woods, downs, heaths, &c., and others showing the root-development, the adaptations to particular soils, insects, &c. Among the Orchids were two or three of exceptionally interesting character, such as the varieties of *Mormodes luxatuna*, so curiously twisted, and adapted not only by the twist, but by the blotches of colour, to secure that the pollen masses shall be removed by some insect and conveyed to another flower. We wonder what is the insect which does the work in the native country—a rather thick-headed one, with a long antennæ or proboscis, perhaps, if we may judge from the effect produced by a pencil point. *Cypris levis* and the beautiful *Catleya Harayana*, elsewhere noticed, were also noteworthy. A beautiful *Aristolochia*, exhibited by Mr. BULL, under the name of *elegans*—a new species we hope soon to describe and figure—should remove the prejudice of those who think that these flowers are more singular than beautiful. These are only a few of the most striking objects shown on this occasion, for a detailed account of which we refer the reader to another column.

— A TURNER MEMORIAL.—It would be surprising if some movement were not made to establish a memorial to CHARLES TURNER, and thus to commemorate his services to horticulture. And now two such memorials are mooted. We should have preferred one, but as the two have been started we can only wish success to both. The one is specially connected with the Dahlia, and is to take the shape of a prize to be offered at the forthcoming Dahlia Show—the other is of wider scope and more prominent interest, and comprises all varieties of "florists' flowers," or, as there seems to be in some quarters an objection to this term, to "garden varieties." We are not greatly concerned with names in such a case, the object being to commemorate the labours of CHARLES TURNER; and as he was wide in his sympathies and in his actions, so the memorial should have a broad basis. At a meeting held at South Kensington on Tuesday last, SHIRLEY HIBBERD, Esq., in the chair, the principle that a Turner Memorial Prize or prizes should be established met with unanimous assent. A committee was formed of those present, with power to add to their numbers; Mr. POLLETT was named as treasurer, and Mr. DOUGLAS as honorary secretary. Thus started there should be no difficulty in securing funds for an adequate commemoration of the long services of one who was as much esteemed for his personal qualities as for his labours towards the advancement of horticulture.

— TURNER MEMORIAL DAHLIA PRIZE.—The committee of the National Dahlia Show have decided to offer a special prize as a memento of the help rendered in the establishment of this show by the late Mr. CHARLES TURNER, of Slough. The prize is to take the form of a silver cup, value ten guineas, to be competed for by amateur cultivators only, and to be offered for twelve show and six fancy Dahlias. The cup is to be competed for annually until it has been won three times by the same exhibitor, when it will become his property. In the meanwhile the winner of the cup at each competition is to hold it for one year only. Intending competitors must send in their entries before August 25, in accordance with Rule II. of the published schedule, to the Hon. Secretary, Mr. T. MOORE, Botanic Gardens, Chelsea, London, S.W.

— FORESTRY AND FOREST PRODUCTIONS.—Under this heading Messrs. RATTRAY and MILL have edited a series of essays presented to the late Forestry Exhibition in Edinburgh. In the introduction is given the history of the rise and progress of the Exhibition, while the body of the work consists of the selected essays, varied in subject and treatment. We confine ourselves for the present to the mere announcement of the publication of the volume (Edinburgh, DAVID DOUGLAS), and shall take an early opportunity of alluding at greater length to its contents.

SUPPLEMENT TO THE GARDENERS' CHRONICLE. AUG. 15, 1885.

AVENUE DES CHAMPS - ELYSÉES N° 129.

RUE. BLANCHE N° 5.

GARDEN ARCHITECTURE IN PARIS.
ENTRANCE GATES.

— "THE HEREFORDSHIRE POMONA."—In the original prospectus of *The Herefordshire Pomona* the Woolhope Club announced that "it was not intended to make any profit from the work. The whole money subscribed would be spent on the publication, and therefore the greater number of subscribers there were the more valuable could each part be made by addi-

and, as a matter of course, a proportionate increase in the cost of production. No trouble has been spared, nor any expense necessary to produce the work in an accurate and artistic style. With such rapid increase in size, and so well brought out, it could not be expected to be remunerative at the price at which it has been issued, and it has not been so. The total

of Tunbridge Wells, sent a cheque for £20, with the kind request "that he might assist the Woolhope Club by contributing towards a work of such national importance." These thoughtful gifts have been highly esteemed, quite apart from their value, since they show so kind and generous an appreciation of the work itself. *The Herefordshire Pomona* has been

JACOB BOBART. (SEE P. 208.)

tional plates." This promise has been faithfully kept, and there is thus no want of delicacy in giving some details as to its actual cost. The work has grown so much in size in the course of its production that it has greatly exceeded the original ideas of the promoters. The first part contained six coloured plates, and in the succeeding parts the number advanced to eight, ten, twelve, thirteen, and in the present concluding part the number given is sixteen. There is a corresponding increase in the letterpress ;

receipts, including an estimate of those expected from the part now about to be issued, amount to £1883 7s. 11d., while the total expenditure has been £2233 5s. 2d., leaving a deficiency of £349 17s. 3d. This deficiency will be somewhat lessened by the sale of the few remaining copies. It would have been greater but for some generous donations which it is very pleasant to record. Mr. ARTHUR HUTCHINSON has given donations as the parts appeared, amounting together to £30; and Mr. THOS. WALKER, F.L.S.,

printed by Messrs. JAKEMAN & CARVER, of Hereford, under the immediate superintendence of the committee. The number of copies has been confined to six hundred, and the low price at which they have been issued, when compared with the cost of production, has not left much margin for the usual trade profits. We earnestly hope that financial loss will not be the reward of an enterprise carried out so thoroughly well, and one which is of so much value.

— THE ROWE ORPHAN FUND.—The Rev. F. S. THORNTON writes:—"I have received the following contributions for the family of the late Mr. and Mrs. ROWE, in response to your appeal. Perhaps you will kindly acknowledge them in the *Gardeners' Chronicle*:—Miss Freeman, 5s.; Mr. W. Denning, 10s.; Mr. A. S. Kemp, 1s. 6d.; Mr. T. Elden, 5s.; Miss Downay, 20s.; Mr. W. Kettlewell, 4s.; Mr. J. Wallis, 5s.; Mr. G. Summers, 10s.; Anon., 5s.; Mr. J. Hussey, 3s.; A Friend, 5s." In addition to the sums already mentioned in our columns we have received subscriptions from W. Miller, Combe Abbey, 21s.; George Lambert, Oakwood, 2s. 6d.; H. W. Picher, 2s. 6d.; Through Mr. J. George, 10, Victoria Road, Putney;—Mr. C. Harding, Bristol House, Putney, 2s. 6d.; Mr. Davis, Manresa House, Putney, 5s.; Mr. Higgins, Altmarle Lodge, Wimbledon, 2s. 6d.; Mr. Smith, Basing Park, Alton, 12s. 6d.; Mr. Seaton, Mount Clare, Roehampton, 5s.

— TWO-LIPPED CYPRIPIEDUM.—Messrs. COCKER & SONS, of Aberdeen, have obligingly forwarded us two flowers of *Cypripedium superbiens*, or Veitchii, from the same plant, in each of which there are two lips. An examination of the flower shows that the supernumerary lip is in this case not a transformed stamen, but there are really in these flowers four petals, two lateral and two lip-like.

— BALSAMS, MESSRS. CARTER'S STRAIN.—We have had sent for our inspection a beautiful strain of these, when well grown, handsome plants. The flowers at first sight might be taken for very full-flowered Carnations, the petals being slightly reflexed, and in one instance marked as are flaked blights of those. The colours, mostly selfs, were very clear and decided.

— LÆLIOPSIS DOMINGENSIS.—A dwarf evergreen species, with oblong acute leaves. The loose, branching panicle springs from the top of the bulb, and bears numerous flowers, each about 2 inches across, with spreading, narrow lilac segments, and a trumpet-shaped lip, the lilac limb of which is traversed by purple veins, and the throat of which is marked by a yellowish blotch. It requires abundance of water in the growing season, and to be hung up near the light. *Orchid Album*, t. 199.

— THE AMERICAN APPLE CROP.—We learn from our American correspondents that the Apple crop is likely to be light even for the "off-year"—that is, the year when the "Baldwins," which comprise a larger part of the crop than any other variety, do not bear freely. The Secretary of the Ohio Horticultural Society reports that the crop in that State will be very light. The Secretary of the Nebraska Society reports half a crop. The Secretary of the Massachusetts Horticultural Society endorses these statements from information received by him and courteously forwarded to us. The prospects in Nova Scotia have already been reported upon.

— CHAMBRE SYNDICALE DES HORTICULTEURS DE BELGE.—At a meeting of this Society, held on August 10, the following awards were made:—

First-class Certificates.—To MM. Vervae & Co., Ghent, for *Dendrochilum filiforme*. To M. James Bray, Ghent, for *Cattleya Dowiana* and *Cypripedium Stonei*. To M. Ad. D'Haenc, Ghent, for *Pandanus D'Haenci*; and to M. A. Peeters, Brussels, for *Cypripedium Morgane*.

Cultural Certificate.—To La Compagnie Continentale d'Horticulture, Ghent, for *Vanda Batemanii*.

Commendations for Novelty.—To MM. Blanquet & Vermeiren, Gendbrugge, for *Begonia Souvenir de l'Exposition*. To La Compagnie Continentale d'Horticulture, Ghent, for *Oncidium Lanceum superbum* and *Ardisia metallicum*. To M. L. De Smet, père, Ledeburg, for *Yucca elegans* fol. var.

Cultural Commendations.—To La Compagnie Continentale d'Horticulture, Ghent, for *Oncidium incurvum*. To M. L. Spaec-Ver den Meulen, Ghent, for *Pandanus ornatus*.

— ROSES AND CHEMICAL WORKS.—A correspondent writes:—"I send you a parcel of Rose 'foliage' (what a mockery!) which is a sample of what the chemical works about a mile away has done for me. Of course they are not all as bad as this, because some sorts are able to resist it better than others, and while such sorts as Marie Baumann, Alfred Colomb, and Marie Rody are almost destroyed

by it, Baroness Rothschild and M. de Castellane are not a very great deal the worse, although, of course, they all feel it more or less. It begins by a sort of purple discoloration on the young foliage, which afterwards turns brown or black, and in some cases the leaves are burnt through. Some of my neighbours won't admit that it is due to chemicals, but I have no doubt on the subject. What do you think? It is a great disappointment to me, as I used to get such pleasure out of them, and now out of 400 plants I have not got one that I could call really healthy, as besides ruining the foliage it takes all the colour out of the blooms." We share our correspondent's opinion, as the appearances on the leaves are quite consistent with his statements, and, so far as we know, there is no other cause that would produce such an effect.

— THE "BOTANICAL MAGAZINE" for the present month contains illustrations and descriptions of the following plants:—

Allium giganteum, t. 6828.—The most striking of a group of *Alliums* which inhabit Central Asia, characterised by their tall stature, broad leaves, small lilac flowers, and exserted stamens. Bulbs were collected by O'DONOVAN near Merv.

Sisyrinchium filifolium, t. 6829.—A tufted herbaceous perennial, with linear erect leaves, erect stems, bearing a tuft of flowers at the extremity, each flower nearly an inch in diameter, with oblong acute, creamy-white segments, traversed by pink veins. Native of the Falkland Isles. See *Gardeners' Chronicle*, p. 696, vol. xiii.

Delphinium cashmirianum var. *Walkeri*, t. 6830, is a dwarf form, covered with spreading white hairs, long-stalked, rounded lobed leaves, the uppermost leaves or bracts are ovate oblong, entire, on long stalks; flower stalks elongated, collected in tufts near the top of the stem; flowers pale blue, petals yellowish. Native of Kashmir.

Eucharis Masterii, t. 6831.—A species intermediate between the two finest species known, *E. grandiflora* (= *E. amazonica* of gardens), and *E. Sanderii*. It is a native of New Granada. As a complimentary name it should, by botanical usage, have been called *Masteriana* as Dr. MASTERS had nothing to do with the plant. Indeed, it would be better to avoid such names altogether in cases where the person commemorated has had nothing to do with the discovery or history of the plant.

E. Sanderii var. *multiflora*, t. 6831b, is smaller than the type, and the stripes of the staminal cup are green. This plant was introduced by Mr. SANDER, and rightly bears his name.

Alpinia pumila, t. 6832.—A curious little Scitamineous plant, native of the Lo-Fan-Shan Mountains, on the coast of China opposite Hong-Kong. The rosy-lilac flowers are borne on short spikes proceeding direct from the rootstock—the leaf-stalks are dilated and spreading at the base, the sheath longer than the scape, the blade elliptic acuminate, 6 inches long.

— SARCOCEPHALUS ESCULENTUS.—Probably many will recognise in this an old friend, as it was said to be common in the gardens around London many years ago, but had not fruited. It is known as the Guinea, or Negro Peach, from its size and shape, but of course has no relationship with the real Peach. It is a member of the Cinchona order, and remarkable in the first place for producing its flowers in densely packed, globose heads; and secondly, for the exceptional manner in which the separate fruits become amalgamated with one another, and with the receptacle, forming a sort of compound fruit, as we have in the Custard, or Pine-apple, the resemblance to which, however, in the present instance is merely superficial, not one of affinity. The flowers are creamy-white, and agreeably fragrant, with long projecting styles, that give the heads a bristly appearance. A flowering specimen may now be seen in the Economic-house at Kew, and the plant was figured in the *Horticultural Transactions*, v., t. 18, where it was described by SABINE.

— NEW HYBRIDS OF AZALEA MOLLIS.—These are said to form quite a new race of Azaleas, obtained by Mr. CHARLES VUYLSTEFKE, Loochristi, near Ghent, from "crosses between different species." They are said to be "quite distinct from all other sorts; the colours do not resemble those of *Azalea mollis*, the flowers are even larger, the leaves fine and the plants of vigorous growth, and adapted for culture in the open ground as well as in pots. They are

easily forced, and flower a little later than *A. mollis* and sooner than the Ghent Azaleas." The varieties are:—Edison, flowers bright rose, shaded with carmine, the upper lobes heavily spotted with chrome-orange and bordered with violet and white; large bold trusses of flower, very free; *Dulcinea*, orange-red, shaded with scarlet, very effective, the petals charmingly crisped, a very fine variety; *Esmeralda*, reddish-orange, distinct in colour, the upper segments spotted with dark vermillion; *Gloire de Belgique*, large red flowers shaded with clear lilac, the upper lobes dashed with violet and white and spotted with sulphur-yellow, also bordered with lovely rose; extra fine; *Henri Conscience*, medium-sized flowers, the ground rosy-white and having a larger saffron blotch on the upper segments, very charming in colour; *Ch. Rozier*, lively rose flowers, shaded with violet and having a deep chrome-yellow blotch on the upper leaves, the edges creamy-white; a charming variety; *Mons. Desbois*, flowers salmon-red shaded with scarlet, the flowers borne in large bold trusses of from fifteen to eighteen each; fine quality and very free; and *Mignon*, a very pleasing shade of rose, dashed with satin, the upper lobes clear magenta, with dark blotches; extra fine. It is possible some of these new hybrids will be seen in flower in London next season. They will be looked for with considerable interest.

— EUCHARIS MASTERII.—Whatever be the history of this plant, its whole aspect and bearing points to its being a hybrid between *E. grandiflora* and *E. Sanderiana*. The foliage is intermediate in character, and likewise the flowers in size and many other respects. The corona, so nearly suppressed in *E. Sanderiana*, is here much more conspicuous, with a well developed tooth on either side of the anther—bearing one, as in *E. grandiflora*. The interior is greenish-yellow. The segments of the perianth are comparatively very broad, and assume a semi-erect position, while the three inner ones are conspicuous by the manner they are pushed into the interior of the flower by a median longitudinal fold, thus almost presenting the appearance of a semi-double flower. A specimen has been flowering for several weeks in one of the stoves at Kew, and appears in every way as robust and floriferous as the above-mentioned species; and should it flower as frequently as there is every reason to believe it will under proper treatment, it will be a valuable addition to the cut flower basket, as well as for ordinary decorative purposes.

— DOUBLE SARRACENIA.—Mr. E. S. WILLIAMS obligingly sends us a double flower of *Sarracenia Atkinsoniana* ×, in which the doubtless consists in the formation of one additional series of petals (multiplication), and not in any transformation of stamens.

— QUEEN SPACES IN LONDON.—On Monday afternoon last Lady MARIAN ALFORD formally declared the enclosure of Red Lion Square, High Holborn, to be open to the public as a garden and place of recreation. The space which is thus thrown open to the people of the neighbourhood has been secured by the Metropolitan Public Gardens Association, of which Lord BRAZONOV is Chairman, on a peppercorn rent for a period of twelve months. The enclosure was decorated with flags, and presented a favourable contrast to its ragged and untidy appearance a few months ago. It may be mentioned that Red Lion Square, which was built at the end of the seventeenth century, has numbered among its residents Lord Chief Justice RAYMOND, JONAS HANWAY, who introduced the umbrella, and SHARON TURNER, the historian of the Anglo-Saxons.

— AUTOMATIC IRRIGATION.—In very dry seasons there is a great demand for water in most gardens, and any apparatus which effects a saving of the gardener's time must of necessity prove invaluable. Messrs. MERRYWEATHER, of Long Acre, have devised various systems for automatically distributing water. They devised a system of non-corrosive metallic tubes in short lengths mounted upon easy running carriages and connected with flexible joints. The metal pipes being perforated throughout their entire length, the water will run through a length of 60 or 90 feet, dispersing itself on the land through the whole course of the pipes by means of the perforations. It is very easy to move the apparatus from place to place at intervals. Another system consists in similar movable pipes

without the perforations, at the extreme end of which a distributing nozzle is attached. This nozzle is capable of throwing the stream in either a jet or a spray at the will of the operator, who can of course walk about freely dragging the tubes after him. A third apparatus is both ornamental and useful, as it consists in a portable revolving fountain upon a stand to which hose may be connected. Garden hose or lead or iron pipe so small as $\frac{1}{2}$ inch diameter can be connected to the inlet-coupling, and the water supply taken from a source 8 feet or more above the fountain. The sprinklers rapidly rotate by the action of the issuing water, scattering a fine shower over a wide area. The adaptation of this latter appears to be a happy, idea as it is arranged inverted to screw up to the ceiling of fernery or conservatory, and thus scatter the water downwards and sideways.

— FRENCH BEAN.—We received recently two plants of a selected French Bean of great prolificacy, accompanied by the following note from Messrs. EWING & CO., Havant, which may be of interest to our readers:—"We herewith send you two specimen plants of a dwarf French Bean which we have been selecting for the last five or six years for its great fruitfulness, dwarf habit of growth, and its earliness. As this Bean now, in its highly selected state, occupies but very little room on the ground, and produces a large quantity of Beans in a very small space, the rows may be sown more closely than is the case with other kinds, and a much larger produce can be gathered from a given piece of ground and in a much shorter time than is the case with other varieties. We have tried many kinds (especially the new ones) against it, but have only found one to nearly approach it in earliness and dwarf compact habit of growth, added to extreme productiveness."

— CIDER AND PERRY.—The Woolhope Naturalists' Field Club has been engaged during the last nine years in obtaining practical information in the orchards, with a view to improve the varieties of fruit cultivated in them, and to restore the commercial position of their products. The result of this long series of inquiries is embodied in *The Herefordshire Pomona*. This valuable work, now just completed, is far too richly illustrated, and too costly for everyday use. It is proposed, therefore, to publish, immediately, a cheap edition of all the information contained in the larger work, with reference to the cider and perry fruits, from the counties of Hereford, Devon, Somerset, Worcester, and Gloucester. The present work embraces a history of the orchards and their complete management, a description of the best varieties of fruits, the chemical analysis of their several juices, and the manufacture of cider and perry. M. PASTEUR'S discovery of the true causes of fermentation, which explains so clearly the best modes of controlling it, is fully given. The orchard in its commercial aspect is also entered into with much detail. A century has nearly elapsed since any systematic British work on the subject has been published, and it is hoped that the present volume may become a text-book for practical use with nurserymen and orchardists, until further experience and information enables a better one to be supplied in its place. This work will be published in octavo form, and in the usual green cloth cover of the Club. It will contain nearly 300 pages of letterpress, with woodcut sections of the most esteemed varieties of fruit. It will be in form a handsome volume. The cost to subscribers will be 5s., and to non-subscribers, 7s. 6d. each copy. The printing has already commenced, and the publishers, Messrs. JAKEMAN & CARVER, High Town, Hereford, will be pleased to receive subscribers' names.

— PACHIRA MACROCARPA.—The species of Pachira, from their partaking of the size and character of trees, are seldom seen in collections, at least of dimensions suitable for flowering. This is to be expected, at least in private collections, where space is frequently of prime importance. They are natives of Tropical America, and closely related to the famed Baobab of Africa, and are probably better known under the name of Carolina. *P. macrocarpa* was introduced from Mexico, and figured in the *Botanical Magazine*, t. 4549. A specimen about 12 or 14 feet high has been flowering intermittently for some time in the Palm-house at Kew. In its native habitats it attains double that height, and must, when well

flowered, be a conspicuous object. The large dissimily digitate leaves alone should obtain it a place amongst stove plants. The flowers apparently are sparingly produced, but of great size, and strikingly attractive. The long, linear white petals recurve gracefully in a radiating manner, as do some species of Crotium. They by themselves, however, would be tame in the absence of the stamens, which branch off from the staminal tube and project in all directions, occupying the whole upper surface of the expanded flower. These are white at the base and crimson upwards, offering a marked contrast with the other parts of the flower.

— CURIOSITIES OF FLORICULTURE.—We have received the following paragraph from so many of our Scotch friends, that we are constrained by politeness to present it to our readers, for their edification:—

"Shieldaig, Lochcarron, August 3, 1885.
"The following fact in floriculture may interest, and possibly surprise, some of your readers.

"Last year I sowed, among other annuals, several patches of the lovely *Linum rubrum grandiflorum*, which grew and blossomed luxuriantly. When the seed-vessels were thoroughly matured, they were taken in and laid aside till this spring, when the seeds were beaten out and sown; but instead of growing up scarlet Flax they have grown and blossomed into pure white Candytuft. There is no difference either in colour or smell from the other patches of real Candytuft in the garden.—I am, &c.
"JOHN SHAND."

"P.S.—I may state that not a single plant of *Linum* appeared. J. S." *Scotsman*, Aug. 12.

— SHOW FIXTURES.—The great summer show of the Shropshire Horticultural Society will be held on August 19 and 20. The Wilts Horticultural Society will hold its show at Salisbury on the latter date. A grand horticultural show in connection with the Warwickshire Agricultural Society will take place on September 2 and 3, at the Jephson Gardens, Leamington. The Bath Autumn Show will be held likewise on September 2 and 3.

— GARDENING APPOINTMENT.—MR. CHARLES RUSSELL, late Foreman at Byrkeley Lodge, Burton, has been appointed Gardener to Mrs. HOPKINSON, West Court, Finchamstead.

FRUIT NOTES.

ALEXANDER PEACH.—This Peach is now (July 25) ripe with us on a south-west wall in the open garden, where it is bearing fair-sized, highly coloured, nice-looking fruit, that is full of rich juice and of a capital flavour. So far as I can judge of it, it is a decided heat on Early Beatrice, Louise, or Rivers, the latter of which is not yet in with us, and is very pale in the skin, and not of the high quality of the Alexander, besides which it is very liable to split in the stone. Hale's Early I have not yet tried, but it is said to be synonymous with the Alexander, which last-named must not be mistaken for the Alexandra, as that is an improved Noblese, and quite a different thing. *J. Sheppard*.

GOOSEBERRY HENSON'S SEEDLING.

This variety was figured in the *Florist and Pomologist*, in May, 1874, with the following remarks:—"Henson's Seedling is a novelty brought before the Royal Horticultural Society last year, by Mr. Henson of Newark, near Peterborough, when it was found to be of exceedingly good quality, and was awarded a First-class Certificate as a new and distinct variety. It is stated to be a chance seedling, having been originally taken from a hedge in the neighbourhood of Peterborough, and not a garden raised sort. However this may be it is a finely flavoured variety, well worthy of cultivation as a dessert fruit, and though not large enough to rank among the show kinds, is quite large enough for general purposes. It belongs to the hairy red section." Now I have taken up at random two fruit catalogues issued by two of our largest fruit nursery firms in the kingdom; one enumerates thirty-seven varieties of Gooseberries, the other seventy-nine. Considering that this variety has been before the public over ten years, and received a First-class Certificate from the Royal Horticultural Society, it certainly seems strange to me that two of our most eminent nursery firms should omit such a useful sort. It ripens before Warrington, and will keep up a supply till that old, though most worthy variety is ready for dessert. I may here mention that last season we had Henson's Seedling good till the middle of September, and Warrington trained on an east wall, protected with netting, until the end of October. *J. Smith, Mentmore*.

THE DATE PALM.

(Continued from p. 179.)

In Lucknow I introduced the Date Palm from the Persian Gulf, through the Government of India, both by seeds and by imported offsets. There are some hundreds of many varieties of both kinds in Lucknow, and many hundreds from seeds in many parts of Oadh. In Lucknow they were imported between 1859 and 1873. These had been under my care and close observation up to 1877-8. Since then I have often seen them. They are growing very luxuriantly, and are irrigated during the hot winds from wells 20 feet or so deep. During the rains they are subject to an average annual rainfall of 36 inches. In the winter there the temperature has been down to 5° Fahr. below freezing point, and in the hot winds I am afraid to say what temperature they are subject to, and there is no sea-air. Many of the Lucknow Date Palms have been flowering and fruiting—artificial fertilisation is practised in most cases. Mr. Ridley, under whose care they are at present, has stated that their fruit is good, and it is stated that some are delicious. I have tasted some, and found them very sweet and nice. Another officer from Peshawar says, that those which ripens fruit are delicious. Even the small skinny fruit of the *P. sylvestris*, when not tapped for "toddy," is eaten by natives. I cannot, therefore, understand how it is that the Date Palms in the South of Europe are said to be without fruit, and that "the cause is the dry summer, there being no subterranean wells, as is the case in the Sahara."

From the study I have made of the *Phoenix sylvestris* and the *P. dactylifera* (which are in reality two varieties of the same species) I am of opinion that neither subterranean wells nor a desert climate are essential to its luxuriant and successful growth. We must, therefore, look for some other reason to account for its being "without fruit," or for its fruit "never being fit for food" in the South of Europe.

I have shown that the *P. sylvestris* grows luxuriantly in a moist climate like that of Bengal, and in all other climates, from North to South India. But as it is annually bled, and its sap converted either into sugar or toddy, its fruit, when it is able to give any, and when it becomes fertilised, is not fit to eat. The *P. sylvestris* is nowhere irrigated as far as I know, but depends for moisture upon rain or upon what it can suck up from the subsoil. I have shown also that the *P. dactylifera* will bear a variety of climates and conditions, and still give good fruit. In the oases of the Sahara and all along North Africa and in Murcia, in Spain, probably it does not receive any special cultivation. In the interior of Arabia, where there is not much commercial intercourse, and where the poor people are almost wholly dependent for food on their Date crop, the probability is that a great deal of care is given to it. In Mooltan, Sind, and adjacent countries Mr. O'Brien says it is nowhere cultivated, but grows spontaneously from seeds. There are many varieties in Mooltan, and he sent me samples of five varieties. They were small (about the size of the Mascat Dates) but sweet, and they formed a great part of the food of the Mooltan and Sindhis. In Lucknow, where the conditions are different from the places before mentioned, it also grows well.

But the climate where it appears to come to great perfection, and where it is cultivated with great care and skill, is that of the Persian Gulf. There it is tended as if it were a child—irrigated regularly, manured with either fish or other animal manures. As there are only female plantations the flowers of each bunch are carefully fertilised by males brought from anywhere (sometimes from another district). The irrigation is stopped for several weeks after fertilisation, and finally only from eight to twelve bunches of Dates are left on the tree out of the twenty-four or so that it bears. Nevertheless, with all this care and skill they say that those Dates which by accident have not been fertilised are "stoneless and insipid, and only fit for goats."

Falgrave, in his *Journey through Arabia*, says that of all the kinds of Dates he had eaten the "Khālis" of El Hasa in the Gulf is the *facile princeps* of the Date kind. He says it bears the same relation to the ordinary Date which the jungle Mango bears to the Bombay Mango. In the Gulf the Date tree receives as much cultivation as Oranges or any other choice fruit trees receive in Europe.

Let us glance now at the cultivation of Date Palms in the Riviera. Irrespective of any irrigation, manu-

ing, &c., which are not mentioned, the leaves at certain seasons are swathed, like Lettuces, to blanch them for church ceremonials. They are cut at Easter, for supplying leaves for Palm Sunday to Rome and other places, and also in August for Jewish observances. Now, considering that the leaves to the plant are what the stomach and lungs are to the animal—that they are required to be, not only luxuriant, but in large numbers, to supply healthy sap for the growth of the tree and the production of its fruit—we need not, I think, trouble ourselves about either "underground wells," or dry summers to account for the Bordighera Date Palms giving either "had fruit, or none at all." [All the Palms on the Riviera are not so treated, and yet ripe fruit is almost unknown. En.] In the Persian Gulf, they say, the Date Palm is not tapped for "toddy." It could be tapped, however, they say, "but at the expense of the fruit." It is a wonder to me that the Date Palms of the South of Europe continue to exist at all, under such treatment; I should say, however, that they can be swathed, and that their leaves can be cut off, to supply bleached leaves to Rome and other places, leaving the whole place with a "disreputable look," but all this can be done "at the expense of the fruit." Moreover the Bordighera Palms may all happen to be of the kind which does not become soft and sweet, and goes no further than the red or yellow stage, called "Kharck." In my opinion, the borders of the Mediterranean basin are eminently suited to growing first-class Dates. The sea air appears to be an advantage to the choicer varieties. It is not so partial to a desert climate as one would suppose. All it wants for the production of choice fruit is careful cultivation, like any other fruit tree, with irrigation when necessary, manuring and stirring of the surface earth; artificial fertilisation when the males are not well intermixed with the females. It requires also, like other fruit trees, that half the bunches should be removed to produce fine large Dates. The condition which I think is a great advantage to the perfection of the fruit of the Khoorma kinds is that during softening and ripening time the atmosphere should be dry. Finally, to obtain choice fruit the Date Palm should not be tapped or swathed, or have its leaves blanched and cut off; but that there should be many of them, and the more direct light they get the better, as long as water is supplied to the roots. Whether this come from underground wells or from rivers, or springs, or the clouds, I think signifies little.

I should say Cyprus, Candia, Greece, and its archipelago, Sicily, Sardinia, and the south and east coast of Spao, are all eminently suited to the cultivation of the choice kinds of Dates. Offsets from the Persian Gulf could be obtained with the greatest ease, and planted in nurseries, and watered regularly till they root, when they could be put into permanent plantations. I think there is no part of the world to which, if the climate and soil were suitable, Date offsets of the proper age and weight could not be taken. They will bear a great deal of exposure before planting without injury. The woody stump acts like a bulb, and throws out roots when planted under proper conditions. If we do not expect the cow to give good and abundant milk without proper feeding and careful treatment, it is hardly reasonable to expect the Date Palm to give good and abundant fruit with no feeding and "atrocious" treatment. E. Bonavia, M.D., *Étawah*.

The Rosey.

MADAME PIERRE OGER.

A SPORT from Queen Victoria (Eourbon), with flowers of medium size, globular, creamy-white tinted on the edge with rose. Well may the *Journal des Roses* say of it, that the colouring is quite peculiar if it answers to this description. Beautiful delicate lilac, coppery-rose.

EUGÈNE APPERT.

We were surprised to see a portrait of this old friend in a late number of the *Journal des Roses*. It is well nigh discarded from English gardens, but, although unsuited for the exhibition table, it is well worth growing, as it is so very distinct in its purplish wood, stout, straight, densely set thorns, dark foliage, pale plum-coloured on the under-surface, and with medium-sized flatish deep carmine flowers. The

Editor remarks that this Rose is very liable to mildew, and so we find it in the very different climatal conditions of the London Clay.

EUGÈNE FÜRST.

A Rose raised by Souperet & Notting, of Luxembourg, with medium sized cup-shaped well filled flowers of a rich crimson colour. It is figured in the *Revue de l'Horticulture Belge* for August.

THE BALATA INDUSTRY IN BRITISH GUIANA.

A VERY interesting and detailed report on this subject has been furnished to the Government by Mr. G. S. Jenman, Government Botanist, and Superintendent of the Botanic Gardens, Demerara. The report is

FIG. 46.—ODONTOGLOSSUM FESCATOREI. (SBE P. 199.)

FIG. 47.—ODONTOGLOSSUM LUTEO-PURPUREUM. (BOGOTA VAR.)

especially valuable, as it deals with a substance which has attracted a considerable amount of attention at different times for several years past, but has never found its way into commerce in any considerable quantity, though balata has always been highly spoken of, as Mr. Jenman reminds us, as intermediate in character between indiarubber and gutta-percha, combining the properties of both, and for certain purposes is better adapted than any other of the natural caoutchouc substances. "Its strength also is very great, and as it does not stretch under tension, for special appliances, such as bands for machinery, it is unequalled." It has recently been pronounced by an American firm of manufacturers as the "best gum in the world," and that it has not had a greater success is due more to the hitherto limited supply than to any defect of quality intrinsically in itself." This opinion is fully borne out in a report by Dr. Hugo Muller, F.R.S., which Mr. Jenman quotes at length.

Balata, as many of our readers will already know, is the concrete milky juice of *Mimusops globosa*,

Gaert. A large, hard-wooded forest tree, sometimes reaching a height of 120 feet, and ranging from Jamaica and Trinidad to Venezuela and French Guiana. The introductory part of Mr. Jenman's report is devoted to a sketch of the Balata tree in Berbice, with notes on the characteristic vegetation. Speaking of the savannah region, he writes as follows:—"The flora I found naturally very largely identical with that of the Corentyne savannah, which, though remote, are part of the same region. It presents great variety, is generally rich in colour, and very interesting. Flowers are not plentiful enough, though abundant, and in many instances beautiful in an exceptional kind of way, to give colour to the ground; they are partly concealed, too, by the rather long grass, yet it would be difficult to gather anywhere a more charming bunch of wild flowers than this savannah afforded at the time of my visit. Much of the novel effect is due, I have no doubt, to the exquisite shades of colour above alluded to, combined with unusual and unique or quaint forms." A list of the plants seen follows this description. Some of the discomforts of the savannah are stated to be small flies, one of which swarms about the face and creeps into the eyes, and the other "stings and leaves a durable extravasated red speck." After a few notes on the population and their mode of living, a very careful description is given of the Balata tree and its distribution. From the east bank of the Berbice river to the Corentyne is the regions of its greatest plentifulness in the colony, but its distribution extends still eastward beyond the Corentyne into Dutch Guiana, where a grant of several hundred thousand acres has recently been acquired by an American firm for collecting balata. The trees are more plentiful in this region, in the depths of the forest, than near the rivers, hence the creeks form arteries to the balata grounds. Several of the creeks on both banks of the Cauje are instances of this. The woodcutters of this district regard the Balata tree as inexhaustible; in the interior of the forest it exists in profusion, and abundance lies beyond the reach of the balata collectors as they at present conduct their operations. As the trees near at hand become exhausted they will no doubt alter their habits and make clearings as drying places in the heart of the forest, but now they are under the obligation of returning to the settlements on the creeks with the milk they have collected, to dry. Under this necessity they can at most only penetrate about two days' journey, but so far as they have explored they report there is no diminution in the abundance of trees. The forest at this depth, of course, has never been touched by woodcutters, as for convenience in getting their timber out they have to confine their operations to the banks of the river and creeks, rarely going in more than a mile or two."

The balata collector's life is described as a very hard one, as the ground is not only swampy, but often up to the armpits in water; moreover, they are often badly clad and short of food, they consequently suffer much from rheumatic affections.

The trees are tapped either standing or after felling. In the former position gashes are made through the bark in a slanting manner, meeting each other half way across, so that the milk trickles from one channel into the other till it is received into a calabash placed beneath the lowest gash to receive it. Tapping the trees is often done in a very careless manner, and the trees much injured in the process.

The yield of the tree varies considerably, according to circumstances. Sometimes three pints of milk only are obtained in the course of a day, while at other times, and by a practised hand, as much as 5 gallons can be procured.

To dry the milk it is poured into shallow wooden trays and exposed to as much air as possible, as well as to the sun's influence. It is, however, a slow and tedious operation. Mr. Jenman remarks that some quicker system of evaporation than that at present practised is very desirable.

With trees of so valuable a character as that yielding balata it is most important that very great care should be taken of them, and means adopted rather to increase than diminish their numbers. The ruthless felling of trees is, therefore, to be condemned, as well as the careless tapping from which the tree receives mortal injury. Mr. Jenman justly says:—"The forests should be so worked that the fullest measure of present benefit could be taken from them without impairing in any degree their future value." The report concludes with some considerations or

suggestions on the better conservation of the forests, some of the remarks on which might be almost equally applied to trees other than those furnishing balata.

SHUTTER-BAR SYSTEM OF GLAZING.

OUR illustration (fig. 48) is that of an elegant conservatory, standing in the South Promenade, Inventions Exhibition. The house seems adapted by its construction to stand in a sheltered spot in a garden, but scarcely to weather the rough usage of an exposed site. This applies only to that particular style of work, but doubtless the makers, Arthur Dashwood & Co., would put up conservatories and other glass-houses strong enough to fit them for any situation.

These gentlemen have several points in the matter of glazing which offer marked advantages to the cultivator. By means of what is called a shutter-bar, fitted with perforations, the moisture collected on the inside of the glass is deposited on the outside of the pane below it, and so on till the gutter is reached; while on the outside there is no accumulation of dirt or lodgement for water, as in some horizontal glazing.

reach from 3 to 4 lb. The berries were above the average in size, perfectly black, and well covered with bloom.

The next house on the same line of wall is 70 feet long, and is filled with one Vine bearing a crop similar in finish to that of the big house, the bunches averaging considerably more in weight. Like the preceding this Vine has seven rods running from end to end of the house. The Vine in question affords one amongst the many instances that have occurred, showing the effects that arise from one part of the head being in a lower temperature than the rest is subjected to—such, for instance, as sometimes seen where one or more rods of a Vine have been taken into a house where forcing has been going on, with other canes in an adjoining house kept cool, consequent on which the crop on the forced part of the head is ripe, whilst on the remainder that is cool it is yet quite green. The case under notice is somewhat different. This house is separated from the large vinery already described by a passage that leads into the walled garden in which these vineries are situated—the passage is boarded overhead, with a glazed roof above, similar to and in continuation of the range. The Vine which fills the 70 feet house is planted

time are to be retained. To let these get the light and sun they require only four canes are allowed to this Vine, three running on the lower part of the roof above the front wall, and one under the ridge. The Vine enters the house at one end, and the rods have traversed about 70 feet of their journey; the aspect is nearly east. At the opposite end of this range, leading from the big house first noticed, there is a lean-to range of wider houses, with about 20 feet length of rafter. The first of these is 70 feet long, and is now occupied by strong Black Hamburg Vines, with two or three rods each, carrying, as they have done for years, a heavy crop. This house is also to be devoted to one Vine. Against the back wall at the adjoining end of the big house is a very strong Black Hamburg, several canes from which have been taken through the division wall; these also are to run lengthways from one end of the house to the other. Some idea may be formed of the vigour this Vine has in it by the fact that some of the rods had by the middle of July made 34 feet of growth, and proportionately thick.

Large houses filled with single Vines are sometimes compared to big ships, wherein if anything happens to the proportionately big cargo it becomes a serious

FIG. 48.—AN EXAMPLE OF SHUTTER-BAR GLAZING.

Another improvement is a continuous spring, running the whole length of each row of glass, in that way securing the glass effectually in stormy weather. The long edges of the panes are secured by what is called a subsidiary or bedding bar, thereby attaining freedom from leakage, and the avoidance of the unsightliness of edge-to-edge glazing, and damage from expansion of the panes under heat. The glass is easily removable, and the ventilation is secured at the sides and roof by very simple applications of the screw and the lever.

GRAPES AND PEACHES AT MANRESA HOUSE, ROEHAMPTON.

THE large Black Hamburg Vine at this place, which has before been noticed in the columns of the *Gardeners' Chronicle*, now fills the house built for it, 224 feet long; its seven long canes stretching the entire length of the house. When the fruit was ripe this season, at the middle of July, the Vine presented a sight such as might, we think, challenge the whole annals of Grape growing to surpass. Seen from either end of the house, the rows of bunches arranged in longitudinal lines, as straight as the rods that bore them, had a remarkable appearance; they were 750 in number, ranging from the smallest, about a pound each, up to the largest, a good many of which would

within the big vinery at the opposite side of the passage, and the canes are brought over it through the enclosure formed by the boarding over the said passage and the glazed roof above. As a matter of course the hot-water pipes in each vinery can only come up to the ends of the houses, doing little to warm the enclosed space above through which the rods are brought, consequently the bunches within this space had not finished swelling, and were quite green, whilst the crop further ahead within the house was just on being ripe. Here is a case in which the stem of a Vine is located in a house where heat is used, and the head in another house similarly heated, but with an intervening part of the rods passing through a space that is much colder, yet without the least derangement in the growth or crop. Such instances as this show how baseless is the notion that the whole of a Vine, roots and head alike, require to be in a similar temperature.

The third house, in continuation of this straight run of wall, is 154 feet long, and, like the two preceding, is about 11 feet wide; each house has a low front wall. In each case the length of rafter is some 13 feet 6 inches to the ridge, with 3 feet hip-lights. The wall against which they are built is about 12 feet high; the portion which forms the back to the house now being described is covered with a fine lot of Peach trees in excellent condition, which for some

matter. The question might be asked, What is Mr. Davis object in filling houses like these with one Vine each? Before giving his reason for following his course it may be well to say a word about the origin of these Vines, which are all Black Hamburgs. They were planted twenty-two years since by Mr. Davis against the wall where they now stand, and which at that time were uncovered and happened to afford a little space. The object in planting them was to grow leaves for garnishing, so as not to have any to take off the bearing Vines in the houses. There was no preparation of any kind made, but the roots had the unrestricted run of the garden; they grew away vigorously, showing an ability to cover a large space. The idea then occurred that it might be worth while to build a house for the strongest one, which was accordingly done. It bore so well, and finished the crop up so exceptionally, that the house was extended to its present size. After this, each year heavy crops continued to be taken from it, yet, with similar treatment in every way to that which was given to other Black Hamburg Vines in several other ordinary-sized houses on the place; the colour continues to be always some shades deeper than that of the others. The result is that each of these Vines has now virtually got a house to itself. Nothing will be wanting in attention to get the whole space filled by the two that do not yet occupy all the room provided for

them. The space inside the house allotted to the biggest Vine gets frequent soakings of liquid manure through the growing season, and openings are now to be made in the back wall to let the roots out in this direction, where liberal help will be given them. In front the roots have stretched out into a quarter of the garden planted with Currants; these Mr. Davis is about to remove, so as to be able to encourage the Vine roots here without anything in the way of a dual occupation of the soil.

In the early Peach-house, now filled with trees that have taken the place of the big old *Grosse Mignonne*, that may be set down as the King of Peach trees, the fruit had been cleared some time. In the larger house that succeeds this, the crop was also over. This house contains half-a-dozen good trees—five Peaches and a Nectarine; from these 178 dozen fruits were taken this year. Nothing in their way could be more satisfactory than the condition of these trees, with wood as strong as can be relied on to bear, and the leaves still as green and free from the appearance of insects as possible.

OUTDOOR PEACHES.

The south Peach wall here is one of the best we know of, covered, as it is, with a number of trees in the best condition. They are this year, as usual, carrying a crop such as nothing short of careful attention would enable them to bring up to the requisite size. The east wall, which is something like the preceding in extent, is occupied by twelve or fourteen good trees, similar in condition to those on the south wall; but here the crop is thinner through the continued north-east winds in spring, which caused a good deal of dropping. On this aspect here Princess of Wales Peach seems to bear no matter what the weather during spring may be. This season it is as full of fruit as the trees on the south wall. One of the main points in Mr. Davis' success in Peach cultivation, out-of-doors especially, has hitherto consisted in a constant use of the garden engine, with enough moisture at the roots in addition. He has now got the water laid on all round in front of the wall, so as to be able to use the hose-pipe freely. If provision of this kind existed in all gardens where it might be introduced half the failures in Peach culture that occur would not be likely to take place. Sprinklers and garden engines are useful appliances, and in the absence of a supply of water with pressure must be employed, but their use entails more labour than is at all times available, hence the trees have often to go short of the needful quantity to top and roots alike.

ORCHIDS FOR AMATEURS.

(Continued from p. 167.)

Lælia crispata, Rehb. L. (*Cattleya crispata*, Lindl.).—This plant is quite distinct in habit, colour of foliage and flowers, although it has a close relationship with the four species of *Lælia* described in my last paper. Like *L. purpurata* it is a native of Brazil, and was one of the first *Lælias* introduced. It is a very variable plant, and one which is not often well grown. In my experience it is not easy to manage by any means, and it is sometimes years before it flowers. It is apt to become sickly, and is very liable to mealy-bug. I believe it requires more heat than the majority of *Lælias*, although this has been denied. I have tried this plant under varied conditions, but have not had any great success. The pale green natural to the whole plant indicates a deficiency of chlorophyll, and is perhaps an indication that it should have a full allowance of sunlight. The flowers are pure white except that the lip is veined with purple or crimson. As its name implies, the petals and sepals are strongly crisped or crimped round the edges. Some of its varieties are equal in beauty to anything in cultivation, but there are so many with poor flowers, and it so seldom blossoms, that it is not in very great demand. Even specimen plants have lately been sold for very small sums. A good variety is, however, a valuable acquisition.

L. Perrini.—A Brazilian species, which flowers freely. It is a medium-sized and vigorous plant, having a very distinct habit. It has large pseudobulbs supported on a stalk-like stem; each bulb is surrounded by five brown or purple scales, and bears a long purple or dark green coriaceous leaf. Sometimes a second shorter leaf is also developed. The flowers are from 3 to 4 inches across, and from three

to five in number, supported on a stout peduncle, surrounded by a great green spathe, spotted or edged with deep purple. The petals and sepals are rose or lilac, the labellum is narrow, with a pointed median lobe. The labellum is brighter than the rest of the flower, and edged with a deep band of crimson or purple. It flowers in October or November, and does well in the coolest part of the Cattleya-house.

L. xanthina.—Also a native of Brazil. It has the habit of *Cattleya Mossie*. The flowers are ochraceous, yellow, with a bright yellow lip, bordered with white, and ornamented with crimson ridges in the throat.

L. grandis is a closely allied but very rare species, from Bahia. It is distinguished by a white labellum striped with longitudinal purple lines in the throat. All the above species of *Lælia* form a very well defined group which may be said to represent the *Labatia* section of the genus *Cattleya*. Two other well marked groups or sections occur in Brazil. One with long cylindrical pseudobulbs which may be said to represent the *Cattleyas* with cylindrical bulbs; the other a small group of dwarf plants with long ovoid pseudobulbs, never exceeding 2 or 3 inches in length. The first contains *Lælia cinnabarina* and its allies, the second *L. pumila*, *L. prestans*, and *L. Dayana*.

L. cinnabarina.—This plant was introduced in 1836, and is therefore one of the old-fashioned kinds. It is a native of the Organ Mountains. The pseudobulbs are thickened at their base and gradually taper upwards, and each bears one or two strong coriaceous leaves. The flowers are nearly 2 inches in diameter, six or more on each peduncle which grows from a small bract. The petals and sepals are narrow, of a bright orange or cinnabar-red colour. The lip is orange streaked with diverging vermilion lines. This plant is difficult to grow and flower unless it is treated very differently to its congeners. In its native country it grows on barren rocks near cracks filled with sand, into which it sends its roots. I grow it in a mixture of ballast (burnt clay) and sand, and in this it does very well. A plant which I thought dead quickly recovered when so planted, and is now doing well. *L. cinnabarina* needs a free supply of air and a moderate supply of water. The roots cling firmly to the ballast, and penetrate the sand deeply.

L. harpophylla is allied to the last. It differs in having long cylindrical pseudobulbs, 1 foot or 15 inches long, without the expanded base. Each bears a spear-shaped leaf, from whence the name. The flowers are similar to those of *L. cinnabarina*, but are larger and more brightly coloured. I do not know whether it would grow in sand. It is much esteemed, and is a comparatively recent introduction. It is also a native of Brazil.

The last section of Brazilian *Lælias* consists of the dwarf forms. These plants resemble each other closely in habit, and may at once be recognised by their small pseudobulbs and large coriaceous leaves, three or four times as long as the bulbs.

L. pumila, also known as *Cattleya marginata*.—The flowers of this little plant are solitary, and measure 3 inches or more across. The colour is pink; the median lobe of the labellum is deeply notched, and has a white border, which in the best varieties is broad and well marked.

L. prestans has larger, flatter, and more waxy flowers than the preceding, with which it is easily confounded. It has a much broader column, distinctly winged towards its summit. It is a rare plant.

L. Dayana.—A comparatively recent introduction, distinguished by its free growth and very floriferous habit. The flowers are somewhat smaller than those of *L. pumila*; they are more brightly coloured, and the lip is deep crimson, with broad crimson lines extending back into the throat of the labellum. The flowers of some varieties do not open fully, but remain campanulate. The three last species all do well in the Mexican-house, and require much air. They also flower twice a year from the young shoots, which are formed in spring and autumn. The autumn flowers are usually the best. *L. Dayana* flowers much more freely than the other two.

MEXICAN LÆLIAS.

The Mexican species of *Lælia* differ considerably from the Brazilian species. They may be grouped from four very distinct groups, of which *L. anceps*, *L. albida*, *L. erubescens*, and *L. majalis* may be regarded as types.

L. anceps is the only species of the *anceps* group.

It is very distinct, and is also a most charming plant. It is easy to grow and flower when properly treated, but it is very difficult to deal with it under faulty management. Like all Mexican *Lælias* it is a mountain plant, and cannot stand heat or close air. Its roots are also easily destroyed by excess of moisture; whilst its leaves suffer much in a dry atmosphere—indeed, they must be frequently syringed during the growing period. If the leaves are not wetted well two or three times a day the gummy secretion on the scales and bracts becomes dry, the plant becomes diseased, and thrips attack it. After the flowers open water should be entirely withheld until the new growth makes its appearance in the spring. A distinct and decided winter rest is absolutely essential to success. The pseudobulbs of *L. anceps* are four-sided, with two acute and two obtuse angles—hence the name, which means "double edged." The bulbs are surrounded by a single dark green glistening leaf. The young bulbs and shoots are enclosed in a sheath of very gummy scales. The flower scape is very long, and bears a double row of sheathing bracts at its extremity, from the axils of which the flowers are developed. The bracts are covered with a gummy secretion. The flowers, three or four in number, are 3 inches or more in diameter. They are very flat, the sepals and petals are sharply pointed, and of a rose or violet colour. The labellum is three-lobed, the lateral lobes rolled up over the column. The terminal lobe is bright crimson towards its edge, and yellow veined with crimson streaks towards the centre of the flower. Several magnificent varieties are recognised, of which the best are—

L. anceps Dawsonii, which has very large white flowers with purple radiating stripe on the lateral lobes of the labellum, a yellow throat, and a broad purple band between the white base and margin of the terminal lobe. It is very rare.

L. anceps Barberiana has rose-coloured sepals and petals marbled with a deeper rose.

L. anceps delicata has white flowers veined with rose-purple, and a white labellum shaded with violet, with a brilliant orange-coloured throat. *B. T. L.*

(To be continued.)

FEEDING OF PLANTS.

As the food of plants existing in soils is subject to distribution, and does not remain in solution for any length of time, it is evident that there cannot be a circulation of such food towards the growing plant, but the roots of the latter must go in search of nourishment.

When we consider the vast root surface in the case of a Vine, and that myriads of rootlets and root-hairs unite their action to feed the comparatively narrow stem, we can understand the importance to the gardener of studying the ramification of the roots of all the various species of plants he cultivates in order to adapt his system of manuring to the feeding capacities of these plants.

Plant-roots may be considered in three distinct stages of growth, namely, in their primary development, their stage of ramification, and their enlargement in receptacles of nutriment.

Supposing, then, moisture, warmth, and air, to be ready in their proper measure, the water is absorbed by the substance of the embryo of the seed, dissolving its contents, carrying them into the young plant as rapidly as they are required; in fact, the seed may be considered as a miniature laboratory, in which numerous chemical actions are taking place for the nourishment and development of the young growing plant.

As the radicle breaks its bonds from the mother seed it will be nourished and fed after a short time directly from substances existing in the soil, and will profit very indirectly by any nutritive matters which may yet remain in the seed itself.

So important to the future welfare of the plant is the addition of elements which can be obtained from the soil only, even in the earliest stages of growth, that before any secondary rootlet is produced the young radicle in many cases pushes out from its superficial cells a mass of delicate fibrils, every one of which is employed in active food-absorption; therefore, while the first wants of the young plant depend directly upon seed nutrition, it must never be forgotten by the gardener that this supply lasts for a short time only, and that the ultimate vigour and productiveness of the plant must depend upon the

fertility of the soil; consequently, for the successful raising of any plant from very minute seeds, it is absolutely necessary that suitable food should be within easy reach of the delicate and small roots, and also in an extremely soluble condition. Thus we find pounded rape-cake, soot, or a moderate dressing (10 to 20 lb. per square yard) of superphosphate among the very best materials for manual applications to soils when it is required to raise a crop of healthy young plants in a short period of time.

It is, however, a great mistake to suppose that because plants are often grown without a direct supply of nitrogen in manures they are not dependent upon this substance for their very life and sustenance. Those gardeners who do not apply manual dressings with their seed depend naturally upon the store of nitrogenous plant-food in the soil. Many a plant which looks vigorous enough on its first appearance aboveground soon wears a sorry aspect when the food-supply is deficient or of the wrong kind.

Nowhere is this fact better exemplified than in the extensive experiments at Rothamsted, where the conditions as to sources of nutriment and disintegration of the soil by root development are so various. In early spring each description of plant experimented with, whatever may be its character or its manual supply, starts much alike; there is but little difference to be discerned between one plot and another; very soon, however, those without any manure at all begin to show signs of weakness, then the imperfectly manured plots lag behind, while those receiving a full supply of all the necessary ingredients of plant-life—potash, phosphoric acid, lime, and nitrogen—advance steadily on to perfection.

This is further illustrated by the following table, which shows the average annual produce of various crops, and the increase obtained by different manures. The quantities are in pounds per acre:—

Description of Crop.	Without Manure.	Superphosphate, 3½ cwt. alone.		Nitrate soda, 5 cwt. alone.		Mineral manure and nitrate soda.		Farmyard dung, 14 tons.
		Lb.	Lb.	Lb.	Lb.	Lb.	Lb.	
Potato tubers	Produce	5,208	8,246	7,168	16,430	10,486		
	Increase	...	3,038	1,960	11,262	5,778		
Swede bulbs	Produce	1,232	5,024	2,128	11,474	13,888		
	Increase	...	4,592	856	10,192	12,656		
Mangel bulbs	Produce	9,632	17,312	29,792	43,456	31,584		
	Increase	...	7,680	20,160	33,824	21,952		
Mealow hay	Produce	2,350	2,492	3,9	6,384	4,662		
	Increase	...	112	1,582	4,004	2,312		

We gather from these results that while a certain amount of increase of crop is obtained when superphosphate, which supplies to the plant phosphoric acid and lime, or when nitrate of soda, which furnishes soda and nitrogen, it is not until the complete fertiliser (minerals and nitrate soda), which supplies phosphoric acid, potash, lime, soda and nitrogen combined, is given that a full crop is harvested. This is further illustrated by the fact that farmyard dung, which is supposed to furnish all the essential elements of plant food—but the effects of which are spread over a considerable number of years—rarely yields so much produce as the minerals and nitrate soda together, the latter being so much more easily assimilated by the growing plants.

The next question which arises in connection with plant-roots is the power they have in the selection of their food.

That they have some is apparent from the fact that different species of plants in the same soil will appropriate different quantities of chemical ingredients, and that some exhaust the soil more rapidly than others.

Fibrous roots have frequently enormous power of penetration, which enables them to search for food at great depths. This property sometimes becomes a serious evil if the subsoil does not contain the particular ingredients required by the plant. In the orchard many a fruit tree thrives so long as the roots are superficial; but when they penetrate deeper, nutriment, either insufficient or of an improper character, is absorbed, vitality is impaired, and various forms of canker and unproductiveness are the consequences.

One great end attained by pressing the ground of

light soils before or immediately after setting out plants, or sowing seeds, is to encourage lateral roots as much as possible, that they may avail themselves of the more abundant and more suitable food constituents accumulated in the surface soil.

The third stage to be considered in the feeding of plants and root development is, that many roots become reservoirs of nutriment for future use. Roots vary considerably in character: some penetrate deeply, remaining fibrous and thread-like to the end; some throw out laterals, and luxuriate in the surface soil; some merely absorb the necessary daily food, while others, as Asparagus, Turnips, Carrots, Parsnips, &c., devote certain of their parts or ramifications to the special office of storing up nutritive matters, often in enormous quantity, and in great rapidity. All underground plant ramifications which serve as storehouses are, however, not to be included in the same category. The bulb of the Onion, the Leek, the Tulip, the Hyacinth, or the tuber of the Potato, &c., though answering to the same end, are either furnished by the base of the leaves, or are underground stems.

In certain biennial plants there is a strong disposition to deposit stores of nutriment for the perfection of seed in the ensuing year, while in the case of perennials and in some Orchids a special part is devoted to this purpose.

In fruit trees the deposit often takes place in the bark and branches, hence the necessity of rest, and the notorious fact that many trees will bear a crop only in alternate years. Doubtless this, which is the result of exhaustion to a very great extent, might be obviated if proper feeding with nitrogen, potash, and phosphoric acid were adopted. J. J. W.

HOME CORRESPONDENCE.

The Wholesale Destruction of Caterpillars, &c.—May I be permitted to suggest that Mrs. Watney is perhaps rather too sweeping in her recommendation (*Gardeners' Chronicle*, Aug. 1) that all caterpillars and chrysalids should, without exception, be destroyed when found? Any one who has the smallest knowledge of entomology must know that the number of species of insects which inflict any really serious damage upon plants cultivated by man is, comparatively speaking, by no means great; but Mrs. Watney's advice, if taken seriously, would lead to the destruction of individuals or families of very many of our most beautiful lepidoptera—e.g., the caterpillars of the peacock and the small tortoise feed (often in large numbers) on the Nettle, and do no harm whatever to the plants useful to man. I could instance scores of like cases, but these may suffice. Why, I would ask, seek to diminish the number of these creatures, the most beautiful which inhabit our gardens and woods? Many a lubberly boy may come across the caterpillar of a rare and beautiful moth or butterfly, and his native instinct of destruction may be strengthened by Mrs. Watney's advice, read out to him by his father over the breakfast-table. I have certain Oaks in which I believe the Purple Emperor to breed; I should not be at all gratified by finding that some boy, inspired by Mrs. Watney's teaching, had been occupying himself in smashing the caterpillar or chrysalids. The place where I live is usually somewhat remarkable for the quantity of butterflies and other lepidoptera (some of them by no means common) which are to be seen. This year they are very few, comparatively speaking; there are few even of the common Cabbage butterfly about. Is this the case generally in England? and if so, can any one suggest the cause? *Jusciumsis, Uckfield.*

Bedding Pelargoniums.—A charming display is now being made by a selection of these in Messrs. Wood & Ingram's branch nursery, at St. Neot's. They occupy long narrow beds in patches according to their varieties, and growing in a fairly light sandy soil they had made a good, lushy, medium growth, and had flowered grandly. Looking upon the charming picture the beds presented, one was made fully aware of the great value of the old subject as a bedding plant. As an effective bedder nothing can beat *Vesuvius*. It appears likely to hold its own for years to come. The deeply-marked zonate foliage is close and compact, and rising about it is a dense even mass of bright pale orange-scarlet flowers. It is the

very *beau idéal* of a bedding Pelargonium. Near it is *West Brighton Gem*, the counterpart of *Vesuvius*, except that it appears to be of dwarfier and closer growth, and the flowers of a slightly softer shade of scarlet. Both are invaluable bedding plants. *Hunri Jacoby* is clearly at the head of the crimson-flowered varieties for bedding purposes; the habit of growth is a little irregular, but this is almost hidden by the number of very fine and striking trusses of dark crimson flowers. *John Gibbons* is also a good and showy bedder, the flowers deep orange-scarlet, and so forming a good contrast to the varieties already named. Of the pink-flowered varieties, *Master Christine* holds its own as a grower, for its wonderful freedom of bloom, for its persistence, and for its stiff stocky habit of growth. The trusses of bloom are produced on such stiff footstalks as to defy heavy rains. *White Clipper* is a good white in all respects, and with it can be bracketed a variety named *Huntingdonian*, very like *White Clipper* in general character, but having some more deeply marked coloured veins on the flowers. Both are excellent free and durable bedders. Among the gold and bronze sector, one of the very best is *Zulu*, of a dwarf and compact habit of growth, the leaves marked with a broad lively dark bronze or chestnut zone. In the soil of the St. Neot's Nursery, it was perfect and very striking. It produces soft salmon coloured flowers. The old *Beauty of Calderdale* was particularly attractive, very distinct and bright—a good hot, dry weather bedder, showing itself in admirable character in a light soil. *Maréchal McMahon* has green and gold leaves, and a broad dark zone, excellent habit, and very free; one of the best bedders. *Black Douglas* has a bold chestnut zone on pale golden leaves; a good grower, and highly effective. All the foregoing are worthy of being noted as of great value in the flower garden. R. D.

Onion Seed Growing.—Some of the best pedigree stocks of Onions have been sent out by Mr. Deverill, of the Royal Seed Stores, Banbury, who it is well known devotes the greatest possible care in the selection of the various stocks of Onion seed, no expense being spared in testing and proving the different kinds offered. No fewer than eighteen varieties are grown this year for exhibition purposes on ground within a few miles of Banbury. I lately inspected a plot of ground, the soil of which is a deep loam, planted in February last with six or seven hundred selected bulbs of the now famous "Rousham Park Hero," Onion, many of the bulbs weighing from 1 lb. to 1½ lb. each. These were planted in rows 3 feet apart, and 1 foot from bulb to bulb; in April the ground was top-dressed with Clay's Fertiliser (no dung having been used for the two years), and well hoed in, and in May moulded up twice, like Potatoes, which is undoubtedly a good plan to keep out the drought. The result thus far is most encouraging. Many of these bulbs have thrown up six, eight, and nine stalks with extraordinary heads, the like of which I have never witnessed before. They are now in full flower, with thousands of bees among them, thus proving that the Onion (at least the Onion blossom) is not unsavoury to them. Here and there in the plot I noticed some heads carefully tied up in muslin. The cause of this I was informed was that there were in a few instances a slight difference in the colour of the pipes, as also the flower-heads, and the muslin would keep the bees from carrying the pollen to others, and thus do mischief. Hundreds of yards of string and hundreds of 4-foot sticks are used, and each head is tied that it may not rub its neighbour; in fact, it could be plainly seen that such stocks of Onions, if they are to continue to carry off the leading honours, as they did at so many of the shows last year, cannot be produced without great expense and attention. Many of our leading nurserymen and seedsmen have specialties from which they are known: Mr. Deverill's speciality is Onion-culture. I might add that Mr. Deverill does not place all his eggs in one basket, but that he has several patches growing in different counties under personal inspection. W. S. W.

Weevil Grub.—In the cultivation of *Primulas*, some *Saxifrage*, *Echeverias*, and other succulents, I am much annoyed by the ravages of a subterranean larva of a species of weevil (*Charançon*). The grub is of a white colour, not larger than a small Pea, and it attacks the roots, causing the destruction of the plants almost before one is aware of its presence. It is difficult to find and destroy the

perfect beetle, which is small and of the same colour as the soil. Is there any means of destroying the grub without injuring the plant? The species is not native to the part of Switzerland in which I live, and has not been observed here beyond the limits of my garden. I must have imported it with soil from the Alps, where I have seen it. *Edmond Boissier, Valeyres, Orbe.*

Exhibition Peas.—I think the finest exhibition Pea I have met with this season is Evolution; the pods large, handsome, full of large Peas, and covered with a pleasing white bloom. I have seen more than one lot of it on the exhibition table, and always good. Next to this came Telephone and Telegraph, the former especially, and always large and taking to the eye, though the pods have not filled out so well as usual owing to the drought. Stratagem, and Pride of the Market, have been greatly to the fore also, and especially Stratagem; when the pods are large and well-filled, with a good bloom on them, it is hard to beat. During the end of July and early in August Dr. McLean and Ne Plus Ultra have been very fine. The former, from a good stock, is a valuable exhibition Pea, when its long well-filled pods are covered with a dense white bloom. For late shows Ne Plus Ultra, or Walker's Perpetual Bearer, are undoubtedly the best. I regard them as the two best late Peas in cultivation. For early shows the best early varieties are William the First and Bliss' Abundance, but they want some growing to have them both early and good. The latter is undoubtedly a very useful Pea for early crops. *R. D.*

Orchid Pruning.—I am asked by Mr. De B. Crawshaw, "Is cutting away old worn-out, leafless bulbs of Cattleya or Lælia pruning, as used and performed [on Dendrobiums by some growers?]" I put the question in so vague a form, that I cannot meet it with a direct Yes or No; but he gives, as his opinion, that "I cannot claim these facts to establish the superiority of pruning, for really it is not pruning, but only the work of ordinary cultivation." I at once admit this as the truth; but all who have read the various correspondence on this matter will know that it was the ordinary cultivators who condemned the practice of removing the old bulbs, and bemoaned their departure with bitter wailing, that I was answering in my former letters on the pruning system. See Mr. Swan's letter of Feb. 21, p. 250; Mr. Walker's, March 7, p. 318; and one or two from Mr. Baines. Besides, Mr. De B. Crawshaw was surely of the same way of thinking then, as his allusion to the Veitch Memorial Medal plainly proves (p. 318). But what does he mean by "ordinary cultivation?" Simply to remove all decayed bulbs? It must be very ordinary if these were not removed. I go far beyond this, for I have pruned out all the bulbs of the Orchid in question which had lost their foliage. And from what I have seen of collections exhibited at the great shows in London or the provinces, or the collections at nurseries or private establishments, I have ample proof that cutting out these back growths is not regarded as a work of "ordinary cultivation." Mr. De B. Crawshaw seems surprised that no one has contradicted me. Well, how could they? I have only been recording my own mode of cultivation. Then he very kindly follows with a "neither do I." Now I have no wish or desire whatever that Orchid growers should cut out the leafless backgrowths of their Cattleyas. They may leave them on the plants till they die, as they always have done, and try to make themselves believe that their plants are all the stronger for it. But singlehanded as I now approach the subject, or appear to be, I venture to challenge my opponents to prove their case. I hope I shall be understood as to what should be pruned out. I put it this:—A well-grown bulb of Cattleya, say Mendellii, may retain its leaf for five or perhaps seven years, or even longer, but this leaf will naturally die sooner or later. Now prove what benefit that bulb is or can be to the plant after the loss of its leaf. I am supposing the case of home-grown plants, not of imported pieces which have been torn about in bandling. So strongly convinced am I that these bulbs are of no more service to the plant that I mean, as soon as I have opportunity, to enter more fully into the subject and recommend growers to follow the course of treatment which I have tried and found so satisfactory in the few cases already mentioned in my former notes. I beg to thank Mr. De B. Crawshaw for giving me this opportunity of further ex-

plaining the principle. I can now leave it in other hands for a time. *N. Blandford.* [A microscopical or chemical analysis of the old bulbs of such a Cattleya as our correspondent speaks of would settle the matter. *Ed.*]

Store-roots on Bulbs.—These curiously thickened store-roots are quite commonly produced by some of the Squills, as also by the corms of some kinds of Crocus, and they are represented on Ixia (*Titanonema*) bulbocodium, on plate 265 of the *Botanical Magazine*. Just now my friend, Mr. Smith, of Newry, sends me bulbs of Elwes' Snowdrop, in which these thickened store-roots are developed beautifully. I here simply record the fact, but it would be most interesting to know under what conditions or environment they are produced. Their use seems to be that of auxiliary storage space, from which the bulbs can draw nutriment at their leisure. I hope some of our bulb-growing friends will enlighten us further on this matter. Mr. Maw, who has studied the corm growth of Crocus intimately, could no doubt tell us somewhat of these store-roots. *F. W. Burbidge.*

Fruiting of Passiflora quadrangularis.—Plants of this Passiflora here bear delicious fruit and good seeds, when a flower is fertilised with its own pollen. *A. D. Webster.*

The Turner Memorial.—I doubt if Mr. Douglas was any too precipitate in his letter on this head. Some time has now elapsed since Charles Turner's death, but until recently the general public outside the coteries have heard nothing of any comprehensive scheme to do honour to his memory. His kindly graces of manner and genius for floriculture need no monument for those of his own generation, who had the privilege of knowing him, and "sitting at his feet." However, although a goodly number of horticulturists know little or nothing of Sir Joseph Banks except that he was a shining light some time or other, a similar memento is necessary. The number of individuals who say "they have no time for reading" seems to increase. How are these to know of our friend's talent, and the deeds he did? *Autre temps, autre mœurs*, is very often falsified, and it is in our power to make the term "Turner" as well known to our descendants as "Banksian." It is a genial sign of English nature to notice Mr. Douglas leading the way with a practical suggestion; only, let him secure the doughty provincials, as well as the leading metropolitans, to back up the appeal. *C. A. M. C.*

Mr. Douglas' meeting at South Kensington in relation to the above object hardly indicates wide sympathy. He does not even give an invitation to those interested in the object to attend, but probably means that he will invite some half-dozen persons to confer with him as to what steps should be taken in the matter. It must be deplored that at the outset there seems to be conflict of opinion in a matter which should have been dealt with on broad grounds, and in a generous spirit. Mr. Turner was a florist, and specially a Dahlia fancier, but he was very much more, and his range of interests was by no means limited to florists. On the other hand, it is difficult to see how any memorial can be set up to a man simply because he had a wide circle of friends in life, and was by them very highly esteemed. Were we to devise memorials on that ground alone where should we stop? The late Mr. James Cutshaw had a host of personal friends; so also had many illustrious horticulturists who have passed away, and over whose names only silent tears have been shed. It is obvious that if we agree to commemorate Mr. Turner's memory it must be on the ground that he was one—perhaps the most potent force—amongst improvers of florists' flowers of recent days. It was even more than a warm friend and a successful tradesman—a great florist; and it is in that sense his memory should be perpetuated, and fitly. The collecting of a sum of money, the interest of which is to be given in prizes from year to year for Dahlias or some other florists' flower, would be but annually to enrich some one who grows these or other flowers to obtain meretricious fame and some riches, without having the least regard for our old friend's memory. Far better would be the institution of some handsome and really valuable memorial medal, which, given annually to some new and meritorious florists' flower—*Auricula*, *Carnation* or *Picotée*, show *Perlargonium*, *Dahlia*, or *Chrysanthemum*, for instance—would prove a worthy memento of one who loved these flowers above all

others. *X.* [This letter, it need hardly be said, was written previous to the meeting on the 11th inst. *Ed.*]

Seed Sowing.—It does not seem to be the general practice with gardeners, when sowing seeds in pots and pans, to cover them with something that will make them germinate in darkness. Now it has been ascertained that all seeds will germinate more readily when so covered with a piece of slate, tile, or board—which must be removed as soon as it is seen that germination has taken place—than when not so covered. It is also found that the seeds of hardy plants germinate best when in a temperature of 55° to 60°; and if seeds are to be sown as soon as gathered, it must be ascertained that the germ or embryo is fully developed; when that is so it is not necessary to wait till the seed is perfectly ripe. Perfectly ripe seeds, owing to the amount of carbon contained, and which must be consumed before it will grow, will be found to require a longer time to germinate. *A.*

A Novel Method of Planting a Cottage Garden.—I lately saw in an amateur's garden what seemed to be an unusual arrangement of, or combination of, flowers and vegetables. The plot was an oblong, 50 yards by 12 yards, with an oval centre bed half way down. The central path was of nicely kept turf, on either side of which was the small *Mentha* and *Pyrethrum*; next a row of Stocks, then double *Perlargoniums* and *Asters*, next a row of Peas and parallel pyramids of *Scarlet Runners*. These are charming objects just now, and the Beans may be gathered far more conveniently than when planted in rows, besides yielding a better crop. There was in the same garden until quite lately a long bed 3 feet wide under a north wood fence. It consisted of a belt of Dean's Sweet Williams, a foot wide, then a row of *Antirrhinum* of Ware's excellent strain, and then a back line of Canterbury Bells of mixed colours, among which white was conspicuous. For weeks past this bed was a dense mass of varied and beautiful colours, and one might cut and come again every day without marring its beauty. *T. W.*

The Germination of Cyclamen and Yucca.—It will be generally known to gardeners that seeds of Yuccas do not germinate in the usual way, that is, by thrusting up a plumule from the apex of the seed, and pushing the root downward as in nearly all dicotyledons, but throw out a curved neck-like growth [the cotyledon], the end of which is swollen and contains the embryo; this, after the neck has grown an inch or thereabouts, brings forth a leaf and root fibres simultaneously. Cyclamen seeds, among dicotyledons, germinate in a similar manner. So that in these the embryo is thrown out previous to germination, and is fed by the stored up food in the seed itself, previous to the roots drawing sustenance from the soil. This points, in the Yuccas at least, to their adaptability for germination in dry hard soils. *H.*

Tomato Chiswick Red.—This fine and distinct variety is both a free grower and a wonderful bearer. A small span-roofed house of this Tomato in Messrs. Wood & Ingram's nursery at St. Neot's shows vigorous plants with the main shoots thickly hung in large clusters of fruit. This variety promises to be of the greatest value for market purposes, because of its great productiveness and its free growing character—free growing in the sense that it is of a hardy vigorous character, and not likely to succumb to conditions that sometimes make it difficult to cultivate less hardy sorts. It is said of this Tomato that it is one of the very best for winter culture, because it requires less heat than some of the larger fruited sorts. Messrs. Sutton & Sons did good service to gardeners of all degrees when they put this useful Tomato into circulation. *K. D.*

Flowering of Chamærops Fortunei and Eucalyptus.—If the note on the Palm that is now flowering in the open air at Bonchurch refers to this variety, and not to *C. excelsa*—which I think must be the case—I beg to say that it is no new occurrence, as we have a pair of grand plants that have never failed to throw up immense spathes of flowers every season for the last fourteen years, and very fortunately also our plants are a pair, that is, male and female; and from seed thus obtained we have young plants, that are eventually destined to be also planted in the open air, where our plants have wintered for the last

seventeen years without the slightest protection, other than their own natural beads—if I may so term the thicket of cocoa-matting-like substance with which the trunks are covered from top to bottom. The blue and Red Gums (*Eucalyptus*) are also now flowering, and I promise to make fine (I was going to say) timber trees, and such indeed would be the fact if appearance only constituted timber. Their beautiful glaucous coloured and tremulous, or constantly moving foliage, adds a charm to tree landscape effects that none of our native trees possess. But there's a dark side to the picture, namely, that the first really severe winter will destroy them. *W. Wildsmith, Heckfield, Hants.*

Amerc Pea.—A very much regret that I should have, according to Mr. Laxton, so inaccurately represented his new Pea Amerc. I went to Chiswick to get some independent notes on the Peas grown there, not based on the raiser's information, but upon the evidence there offered, and upon what I could gather from those who had superintended the trial; hence my connecting the Amerc with William I. for purposes of comparison. That is, I think, quite enough for the general public, who are little concerned about origin, colour of seeds, &c. *The Writer.*

Reports of Societies.

ROYAL HORTICULTURAL: Aug. 11.

FALLING considerably in regard to quantity being the earlier summer shows held in the conservatory in the Society's Garden at South Kensington, there was quite enough to interest both the gardener and the public generally.

Mr. Ware's fine bank of hardy perennials—bulbs of various species—afforded much interest to visitors, and was in itself a good show. The classes for *Fuchsias*, *Caladiums*, *Hollyhocks*, and *Gladioli*, with the exception of the last-named, were not numerously filled. The *Gladioli* of Messrs. Kelway & Son were superb, both in old and new varieties; and in the fruit shown by Mr. F. T. Rivers, Sawbridgeworth, was seen the best collection of *Gooseberries* brought under public notice for many years past. The same nurseryman exhibited *Plums* and *Cherries* in pots, proving, beyond doubt, the adaptability of both for the method of culture, for the miniature trees were loaded with fruit approaching ripeness; and in the case of the *Cherries* perfectly so.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. H. Bennett, T. P. Kinghorn, A. Perry, J. Child, H. M. Pollett, J. Douglas, J. Hudson, J. J. Jones, J. James, J. C. Conry, J. Smith, H. Ballantyne, W. B. Kellock, J. Walker, H. Turner, H. Cannell, E. Hill, H. Williams, Masters, and J. O'Brien.

MISCELLANEOUS PLANTS.

From Messrs. J. Veitch & Sons the hybrid *Rhododendron*, Indian Yellow, shown at a previous meeting—the best of its colour in greenhouse varieties—secured the proper attention it deserves. From the same nursery came *Cyathea divergens*, a graceful Fern, with stalked pinnae; *Acer Holcortianum*, leaves of copper-red, and acute in form, the reverse of leaf deeper in colour than the upper side, young shoots bright brown; *Davallia retusa*, a Fern of an elegant appearance; *Lælia monophylla*, a Jamaican species, showing a single bloom of an orange colour, the plant being very slender and weak in growth; *Clethra arborea*, rarely seen flowering at so young an age, was covered with Lily of the Valley-like flowers; *Berberis trifoliata* with Holly-like foliage of a greyish-green, and the habit erect; *Fragaria*, with deep purple flowers in the terminal corymbs, and first sight looking like a *Lianthus Russellianus*. Some fine *Gladioli* were shown likewise, viz.—*L. France*, a flower of medium size, pink in the upper segments, the inferior ones tipped with bright yellow, the lowest segment is pink with a clear stain; *G. André*, Chene, a flower of large and regularly formed; the colour is decidedly nink in *Gladiolus*; *G. Henri Conscience* is purple-rose, with a stain of the same hue in the throat, the lower segments are marked boldly with white.

Mr. Bull, Chelsea, showed a pretty *Aristolochia* named *elegans*, a flower 4 inches in diameter across the face, beautifully tessellated with purple on a white ground, the inner portion of the flower being of a rich purple: the sac, or part resembling a pipe, is green, and not conspicuous; *Alcæcia Sanderiana*, dark green, Oak-leaf form of foliage, margins and ribbed with white; *Enteroplymna*, a pinnate-leaved Plant, with the foliage rather more pendulous than in *E. edulis*; *Cyæas siamensis*, a specimen resembling in leaf-growth *C. circinalis*, and differing in the rootstocks from it; *Alcæcia exculpta*, green digitate leaves, and white variegation; a white blossomed *Mussaenda*, named *thelma*; *Lælia Amanda*, a small flower, with flesh-coloured sepals and petals, and a frilled lip of purple, having the margin pale rose; *Kentipis macrocarpa*, a bold-habited Palm, the young leaves being of a coppery-red colour.

Mr. Holab, gr., Redleaf, Penhurst, showed *Galeandra devoniata*, the creamy-white tubular flowers striped purple down the middle, and of sepals and petals bright green, on tall, erect stalks, was a noticeable plant.

Messrs. Sander & Co. showed *Phalenopsis Reichenbachiana*, a single richly-coloured flower on a little plant.

Mr. White, gr. to Mr. Dorman, Laura Park, Sydenham, showed a very fine piece of *Mormodes*, *Doronicum*, with glaucous leaves, and carrying two blooms on a massive spike; the blooms are ivory-white, but densely spotted with minute lilac dots; the column is lilac.

George Hardy, Esq., Timperly, Cheshire, had *Cattleya Hartiana*, a splendid species, with heavy, large flowers of the richest combination of rich purple and green. A fuller account of this grand plant will be found in our *Orchid Notes* of this number.

Messrs. Laing & Co., Forest Hill, had some *Begonias* from the open ground, as Madame Dubois, Louis de Gosancourt, Leon de St. Jean, and a few novelties in *Caldium*. The best of which was *beckhamii*, with a leaf with a crimson centre, and margin dull white; next was *Auguste Carpentier*, also crimson, but a margin of a deep green shade.

A great quantity of *Lilium auratum* and *L. longiflorum*, and *Gladiolus Lenoine* came from the New Plant and Bulb Company, of which we have spoken before.

The rich bank of flowering plants from Mr. T. Ware's nursery, Tottenham, which was full of a most varied collection, received a Silver Banksian Medal. In this group was an interesting collection of shrubby New Zealand *Veronias*, including *carolinensis*, *Doronicum epacridæ*, *Colensoi*, *Chathamica*. Many of these would make excellent window plants, resembling dwarf *Boxes*, or *Euonymus*.

Messrs. H. Cannell & Sons, Swanley, showed a small collection of *Begonias*, of which *Blanche Duval*, a flower of creamy-white, full of large size, and with a thin very margin of pink; *B. Gabrielle Legros*, yellow; and *King of Crimsons*, a single flowered variety, were the best.

A grand plant of *Sarracenia Patersoniana*, a hybrid between *S. purpurea* and *S. Drummondii*, was shown by Dr. Paterson, Bridge of Allan, N.B. Of this unique variety the plants, which were in December, were few in number, the others being in the Royal Botanic Gardens of Dublin and Edinburgh, and one at Sandringham. The pitchers are of a crimson colour, appearing beautifully veined when the sun shines on them, and when fully developed, a feet high. It is very like *S. Chelsoni* x *S. Drummondii*, and Williams, showed *Mormodes luxatum punctatum*, a paler form than that of Mr. Dorman. The well-known *Amaryllis*, Mrs. Lee, and *Chysis levis* superba, the rich brown and yellow colours making up a lovely subject.

From the Harpenden School there came a capital collection of wild plants found in the Harpenden district. These plants were correctly named, the order, botanical name and the popular name being severally given. Each of the boys who showed had thirty distinct specimens, tastefully set up and in sufficient quantity to make a respectable show. Amongst the rarer species may be mentioned *Dianthus Armeria* (Deptford Pink), *Epipactis latifolia*, very scarce in Hertfordshire, a good spike of *Hypericum Androsæmum*, growing in woods to the height of 6 feet, *Verbascum nigrum*, *Erythraea centauria*, *Symphium tuberosum*, *Louisa*, the slender-leaved *Scilla*, and *Scilla* very scarce; *Lysimachia vulgaris*, *Melilotus leucantha*, *Eupomus*, umbellatus, found in quantity on the banks of the river Lee, the hunting ground of the Harpenden boys. A good piece of *Atropa Belladonna*, bearing flowers and berries, was shown. A Silver-gilt Medal was awarded the collection, than which a more instructive one is seldom seen at flower shows.

For a collection of *Phloxes*, shown by Mr. T. Ware, a Silver Medal was awarded; and a Bronze Medal to Mr. Rivers for cut Roses.

COMPETING CLASSES.

For *Fuchsias*, six distinct (open).—The 1st was withheld by Mr. J. Lambert, gr. to H. W. Seegerle, Esq., bifandale Lodge, Herne Hill, taking the 2d. In the amateurs' class for the best four Mr. Lambert was again 2d, no other prize being awarded. For twelve plants, distinct, in 6-inch pots (open), Mr. Lambert secured the 1st, and Mr. H. James, Castle Nurseries, Lower Norwood, the 2d.

For six *Caldiums*, distinct (open).—Messrs. J. Laing & Co., Forest Hill, were 1st, for rather large plants, well assorted as to colour; 2d, Mr. Chadwick, gr. to E. M. Nelson, Hanger Hill House, Ealing; 3d, Mr. H. James, Lower Norwood, for smaller merit.

Mr. J. Bass, gr. to A. S. Price, Esq., Parkside House, Ewell, was 1st; Mr. J. S. Cooper, Windmill, Bishop's Stortford, 2d; equal 3d being Mr. J. Morgan, gr. to Major Scott, Wray Park, Reigate, and Mr. W. Smith, Windmill, Bishop's Stortford.

Messrs. Kelway & Sons took the 1st prize for a very choice lot of *Gladioli*, some of his best new flowers being *Opium*, crimson; *Lord Leigh*, cerise; *Lady Newport*, rose-carmine; Mr. Thornton, deep crimson; *Ilex*, pale pink; *Lady Carington*, lilac-rose—a very fine flower; *St. John*, white, cerise-scarlet; *Abas*, cerise-scarlet, with white flame.

Hollyhocks in twelve distinct varieties, single blooms, and in twelve distinct spikes.—The prizes—two 1st—were taken by Mr. T. Ware.

Tomatoes in pots, four plants.—The 1st prize was taken by Mr. Chadwick for seven bushy plants, well fruited.

SPECIAL PRIZES.

offered by Messrs. Sutton & Sons, Reading, for the best three dishes of *Tomatoes*, twelve in a dish.—1st, Mr. Beckett, Cole Hatch Farm, Penn, Bucks, his best fruit being *Stamfordian* and *Reading Perfection*, the other

being *Chiswick Red*; *Mr. Castle*, West Lynn, took 2d, Messrs. Webb & Son, Stourbridge, offered prizes for the best collection of vegetables, consisting of not less than eight kinds. The 1st prize was taken by Mr. Waite, gr., Glenhurst, Esher; and the 2d by Mr. J. A. Beckett. The various items shown were very good, especially the *Girford Giant Runners* and *Intermediate Carrots*, and *Snowdrop* and *Woodstock Potatoes* in the first collection, and the *Leicester Red Celery* and *Green Globe Artichokes* in the second.

FIRST-CLASS CERTIFICATES.

To Messrs. Kelway & Son, for *Gaillardia St. Blaise*.

To Messrs. Kelway & Son, for *Gladiolus Galatea*.

To Messrs. Kelway & Son, for *Gladiolus Lorna*.

To Messrs. Kelway & Son, for *Gladiolus Abas*.

To Messrs. Kelway & Son, for *Gladiolus Milton*.

To G. Hardy, Esq., for *Cattleya Hartiana*.

To Messrs. J. Veitch & Sons, for *Gladiolus La France*.

To Messrs. J. Veitch & Sons, for *Gladiolus André* (henia).

To Messrs. J. Veitch & Sons, for *Gladiolus Henri Conscience*.

To Messrs. J. Veitch & Sons, for *Rhododendron Indian Yellow*.

To Messrs. J. Veitch & Sons, for *Cyathea divergens*.

To Mr. Bull, for *Aristolochia elegans*.

To Mr. Bull, for *Alcæcia Sanderiana*.

To Mr. Bull, for *Enteroplymna*.

To Messrs. Cannell & Sons, for *Begonia King of Crimsons*.

To Messrs. Cannell & Sons, for *Begonia Blanche Duval*.

To Messrs. Cannell & Sons, for *Begonia Gabrielle Legros*.

To Mr. T. Ware, for *Campubula pyramidalis* var. bicolor.

Charles Owen, for *Ivy-leaf Pelargonium Souvenir de Charles Turner*.

Fruit Committee.

Present: G. Banyard, Esq., in the chair; and Messrs. G. T. Miles, J. Woodbridge, J. Roberts, Harrison Weir, Sidney Ford, R. D. Blackmore, T. Francis Rivers. Several seedling fruits, as *Grapes*, *Plums*, *Gooseberries*, and some few early varieties of *Apples*, were shown, also a few *Melons*.

Mr. Rivers showed *Golden Eagle* and *Lord Palmerston Peaches*, *Bigarreau Cherries*, *Gros Coueret*, and *Monstreu de Metz*, two fine varieties, and a fine black *Cherry* named *Noir de Guben*. Over 100 dishes of the best varieties of *Gooseberries* were shown from the same nursery, the fruits bearing evidence of having been well grown. Some excellent specimens of trees in pots, as *Cherries*, *Plums*, well fruited, were also shown, the latter being especially good.

Messrs. Rivers & Sons received a Silver-gilt Medal for the collection of *Gooseberries*.

INTERNATIONAL HORTICULTURAL EXHIBITION: Antwerp, August 2-6.

(Continued from p. 184.)

MISCELLANEOUS.—For the best Bromeliaceæ plant, either in flower or not, the prize, a 2d, was taken by M. P. T. Boutman, Lille, for a capital specimen of *Vuesia Gazouiana*, 4 feet in height by 6 feet in diameter. In a class for three plants in flower, shown by M. L. van Houtte, was a well-flowered small specimen of the difficult *Theophrasta Jussii*, the buff coloured tubular flowers of which spring from the axils of the leaves, making it a singular-looking object; *Globba cœnea*, so rarely seen, was likewise shown by him in the same competition.

Anthurium Hookeri, shown by Madame Le Grelle D'Hanis, in a class for a single Aroidaceæ plant, was a splendid specimen, with its leaves from 5 to 6 feet long and 1 foot in breadth.

At M. Valleron's, Ghent, showed a collection of *Gleichenias* that were of medium size for the varieties shown, and that were lightly tied out. The best plants were G. Mendeli, G. Rabellatum, and G. dichotoma.

A new specimen of *Arctostaphylos elegans* was shown by Jakob-Makoy & Co., and in a class of *Conocys* B. E. J. van Spaendonck, and to feet high, was shown by M. E. J. Spee, Ghent.

A novel collection of *Platycyrtis*, by Jakob-Makoy & Co., was quite interesting as such; it included *P. alcockii*, *grandis*, *biformis*, *Hilli*, *alcicornis majus*, and *Willdingii*. Of the first two, grown in pots, was a Madame Le Grelle D'Hanis was the winner of the highest prize for a collection of thirty specimens of Ferns, and M. M. Vallem & Sons, the 2d. The first collection contained plants of medium and useful sizes, of which the following were the best specimens:—*Gymnogramma Wetticiana* (Flandria); with considerable white neatness; *G. Lauchiana*, *G. intermedia*, *Adiantum macrophyllum*, *A. gracillimum*, *A. cuneatum*, and *A. Neo-Caledoniae*, together with the seldom seen *Acrostichum squamosum*, the foliage of which is entire, and much powdered with white.

In the class for fifty plants in flower, M. Pawells, Antwerp, took the leading prize, and if nothing in the collection was of exceptional merit culturally, it will be yet of interest to note some of the best things in it; as, *Arctostaphylos elegans*, *Arctostaphylos*, *Arctostaphylos virginicum*, *Callistemon rigidus*, *Hyacinthus candicans*, *Cyrtis platycyrtis*, grown as a dwarf standard; *Ligustrum lucidum*, an *Aster* like *dimosus*, but not named, very pretty and full of bloom; *Montbretia crocosmiflora*; *Russelia juncea*, *Pavonia Wiotii*

with a flower of crimson thread-like rays; a dwarf growing Nerium or two, Lantanas, Fuchsias, Lilies, &c. In a nursery class of thirty plants, the 1st prize was awarded to M. L. van Houthe, the collection comprising, amongst others, Hydrangea Dr. Hogg, apparently a valued variety in Belgium, and one that is seen usually very well flowered; Nerium Madoua, a dwarf variety, well blooming, white, growing in a small pot; Bonardia Humboldtii, Veronica atropurpurea, a beautiful Habrostrum corymbiflorum, bearing scarlet flowers, Begonias, &c.

Caladiums were exhibited in considerable numbers, but we saw nothing that approached in beauty of leaf markings M. Bie's collection shown at the last Paris show. The 1st prize was awarded to M. L. van Houthe for a pretty, well assorted lot, amongst which Ibis rose, a pink-leaf, Isis, Marbled white and buff with veins of crimson colour; L'arboré, white and red; and Madame Metzana, were the most 1st prize for an Aroid of remarkable growth, Philodendron Melinoni paraneuse, with sagittate-cordate foliage of a large size, the leaf-stalk being greenish-red spotted with crimson. The 1st prize for a single Dracena, or Cordyline, was also taken by M. van Houthe, a D. L. Linnæi, a grand plant; M. Ed. Pynaert being 2d, and MM. Waarte, 3.

For a single herbaceous Fern the 1st prize went to M. Vermeers de Baerdemaeker, for a large plant of *Gymnogramma gigantea*; and for a single warm-house plant of merit, M. Frisson, who, with *Dasylium* plant, an Anacamptis, an specimen with a stem 1 foot in height, carrying a large head of foliage.

Hymenophyllums were shown in twelve species by M. Louis de Smet, who obtained the 1st prize; and MM. Wallen & Son, 2d. The collections were interesting, the following:—*H. nitens*, *Calceolium crispatum*, *Wilkesianum demissum*, *intermedium*, *Hymenophyllum*, and *flexuosum*.

Several collections of Cactuses, Echinocactus, &c., were shown, but the specimens were mostly small, if rare, and but few were of merit. The 1st prize was awarded for a smaller lot to M. Verschueren, Antwerp. In this lot were the rare and curious *Scopa cristata* and *Opuntia polyacme*, the latter bearing yellow flowers. Foliage Begonias were not equal to what our growers can show. M. J. Moens, Ledt, took the 1st prize, and M. Aug. Fuchs, 2d.

M. Blanquart took 1st prize for flowering tuberous varieties, that did not equal the best we have on this side, either in quality or culture.

M. L. van Houthe was awarded the 1st prize for double-flowered varieties of erect flowered Gloxinias in five classes. Souppert & Notting, Luxembourg, had eight large boxes of cut Rose blooms, not by any means bad, in spite of the late season and the hot weather, to which a 1st prize was awarded.

A handsome collection of erect flowered Gloxinias was shown by M. E. Kegeljan, Namur. They were well bloomed, and possessed excellent foliage and densely spotted flowers.

A collection of varieties of Ixoras in 48's was shown by M. L. de Smet, Ghent, and would probably convince all that are known to our gardeners, each plant bearing two or three heads of bloom.

A very pretty collection of Bertolonias and Sonerilas was shown by M. P. T. Boutanin, Lille, the plants being fresh-looking, strong, and the leaf-markings charming. It was a very complete assortment. From Mr. C. Turmeau, Slough, there came a collection of Carnations, extra large, and clear in the markings and ground colours. Border Carnations by Belgian growers were shown surrounded with their foliage, but were of an inferior size, although most useful in every way. Madame E. Mayer received the 1st prize.

Among the minor features of the large pavilion was a group of *Dracena Douceti*, a creamy-white striped variety, apparently, of *D. indivisa*. It is a plant that will be much heard of in the future, as it is a highly decorative subject for indoors and for grouping, or as a solitary plant in flower garden designs.

M. Jeanne, Berchem, Antwerp, showed the curious *Rubus australis*, trained as a column of 10 feet in height, very dense in growth, and seemingly of a great age. Two splendid plants of *Corypha Geringii* were exhibited by the same exhibitor. A pair of *Isotria medeolae* 10 feet high, *Coleus* from M. Pynaert van Geert, and a variety of soft stuff, such as *Zonale* and *Ivy-leaf* *Pelargoniums*, *Lilium auratum*, Carnations in pots. Tuberous Begonias were grouped in beds on the ground-level in the central portion of the pavilion, and gave just the welcome amount of colour and brightness the great masses of foliage plants stood in need of, permitting, by their low growth, an unobstructed view from the centre towards the sides.

The two finest groups of foliage plants were those of Madame Le Cras, and of M. Van der Wouwer, of Antwerp, the latter not being in the competition, the former obtaining the 1st prize in its class. The effect of the great masses and groups of Palms, Tree Ferns, Philodendrons, Anthuriums, Dracenas and the like, in which Belgian gardeners are so richly fond, arranged as it was with great judgment, was such as can be seen but on rare occasions.

good collection of exhibits, both in plants, flowers, and fruit, and also to find a good number of visitors. The exhibitors were confined exclusively to those living in the parish of Barlow Moor; another year, it is to be hoped, Didsbury and Withington will be permitted to compete.

For six stove and greenhouse plants, S. Baerlein, 1st, *Erica*, *Kentia australis*, *Croton Queen Victoria*, *Ixora amoensis*, with very frutescens of bloom; *Erica tricolor rosea* and *Erica tricolor dunosa*; T. J. Bolland, 2d, *Erica*, [J. Fletcher, gr.], was a good 2d, with *Colocas Weddelliana*, *Arctostaphylos*, *Pandanus*, *Erica æmula*, *E. Parmentieri rosea*, among his best plants.

S. Baerlein also carried off 1st for four stove and greenhouse plants, showing *Erica tricolor Wilsoni* and *Ixora Williamsi*, in excellent condition.

The same competitors again in the class for six Ferns, S. Baerlein, 1st, showing *Cyathea debata*, *Dicksonia antarctica*, *Gleichenia flabellata*, *Cibotium Schiedei*, *Polystichum capense*, and *Microlepia polyta cristata*; T. J. Bolland's lot comprising *Davallia polytaantha* and *Moorea*, 8 feet across; *Brainea insignis*, a grand plant 6 feet in diameter, *Gleichenia dichotoma* and *Adiantum conicum latum*; J. G. Silkenstadt (C. Humphreys, gr.), was 3d.

S. Baerlein was 1st for one Fern, with *Cyathea Burkei*, and J. G. Silkenstadt 2d, with a good plant of *Dicksonia fibrosa*.

T. J. Bolland was 1st with three Fuchsias, T. Brockbank winning with one.

S. Baerlein was 1st with three *Dracenas*, J. G. Silkenstadt 2d.

With twenty miscellaneous plants S. Baerlein, W. Brockbank, and J. G. Silkenstadt competed, the former just carrying off the 1st prize. The 2d group seemed to come nearest the idea of what is expected in a group of a miscellaneous character.

T. J. Bolland came first with table plants, S. Baerlein 2d. J. G. Silkenstadt showed good *Caladiums*, and was awarded 3d.

W. Brockbank (A. Mottershead, gr.) was successful with white and black Grapes, showing good Black Hamburgs and Buckland Sweetwater; A. Galbraith was 2d in the class for Black Hamburgs.

For a dish of Peaches and also a dish of Nectarines J. G. Silkenstadt was 1st, with Royal George Peach and Elrue Nectarines.

W. Brockbank was 1st with Melons, showing Scarlet Premier.

For a collection of vegetables, eight varieties, T. J. Bolland and J. G. Silkenstadt were placed equal 1st.

A lot of five kidney Potatoes, Mr. W. Bennet came in 1st, W. Dutton 2d. W. Bennet was also 1st with a dish of Peas, eighteen pods; G. Lamb, 2d. Model gardens are always a feature at shows of this character, and this formed no exception. W. Brockbank, who was 1st; he also was successful with Stocks and with a collection of hardy herbaceous plants. In this group we observed *Lychnis coronaria* and *chalcidonia*, *Artemisia lanuginosa*, *Rudbeckia laciniata*, *Helianthus autumnalis*, *Lilium maculatum*, *Androsace chalcidonia*, and *seeding Delphinium*; *Actea racemosa*, *Senecio*'s species, *Liatris spicata*, *Lathyrus latifolius*, *Harrison's Seeding Phlox*, and many others.

For six trusses of stove and greenhouse flowers, S. Baerlein, who was 1st, showed *Allananda*, *Androsace*, and *nobilis*, *Lilium maculatum*, *Androsace*, *Ixora subserifolia*, *Senecio*'s species, and *Statice profusa*.

H. Hooley, Edgely Road Nurseries, and W. G. Caldwell & Sons, had each a good group of mixed stove and greenhouse plants; in the latter group we observed three of the rarer *Crotons*, viz., *mosaicus*, *Neumannii*, and *Flamingo*.

A nice collection of fruit, also of vegetables, were staged by J. Dömmert. In this latter stand were some Tomatoes that turned the scale at 10 oz.

Mrs. E. Mellor, Chorlton, had a group of small *Begonias*, also about two dozen nice seedling *Begonias* of five size and substance.

W. Brockbank showed some sticks of *Stiort's Monarch* Rhubarb, measuring 9 inches round. Many other exhibits were staged of a satisfactory character. The committee were highly gratified at their first venture. (J. Correspondent.)

LATIMER FLOWER SHOW.

ONE of the prettiest country shows we have seen of late years was that of Latimer, the beautiful seat of Lord Chesham, on the river old house is situated on the right side of the valley of the Chess, which, in front of the mansion, assumes the proportions of a lake. The horizon is bounded by wooded hills, the Chilterns, which stretch in nearly parallel ridges from Rickmansworth to Chesham, and the neighbourhood is numerous and sufficiently liberal prizes is restricted to the labourers, under-gardeners, and mechanics employed by his Lordship of the tenantry on the estate. The two latter form a separate class, although the same number and amount of prizes is allotted to each. This was well attended, and the competition for almost every entry was sustained. The specimens, which consisted chiefly of useful vegetables, were on the whole rather small, but of excellent quality. Potatoes were neatly arranged within circular hoops. Chesham and neighbourhood has a great number of hoops, wooden bowls, chairs, and farm implements. Judging from the quantity of produce exhibited, and the large number of entries, cottage gardening must be in high repute at Latimer.

The show was held in a very large tent, down the centre of which was arranged a handsome group of plants, and a stone, the head garden at Latimer. The scene in the grounds was extremely picturesque.

The country folk for miles round had assembled in their Sunday best, the farmers with their wives and daughters in smart vehicles, the numerous carriages, and the groups of young people listening to the strains of the band, and waiting to trip it on the green, formed altogether, with the delightful surroundings, a scene only to be equalled on such an occasion as a country flower show. The praterre was in its summer glory, and the grounds altogether in excellent keeping. A number of the historic Chelsea, the family seat of the Russells, along the valley of the sparkling Chess, through the heart of the Chilterns, by Latimer to Chesham, is one of the most enjoyable. The rules and regulations seem to be concise and sensible, and placing the under members, which they all tend to later conditions than is usually the case at county shows. In the present instance the under gardeners and mechanics would have had a monopoly of the prizes. T. H. Harion.

SCOTTISH ARBORICULTURISTS ON THE BORDERS.

THE annual excursion of the members of the Scottish Arboricultural Society was held on the 5th and 6th inst., both sides of the Borders being visited. On Wednesday, the first day, the members visited Edinburgh, Glasgow, and Northbury, the 2d day, for the second day including a visit to Lowther. On Wednesday at Langholm the members were joined by a number of friends from Carlisle, including a few of the members of the English Arboricultural Society. The places visited at Langholm included the grounds of the Earl of Dalrymple and the woods of the Esk as far as Burnfoot Bridge.

On Thursday morning the members of the Society, together with some members of the English Arboricultural Society, assembled at Knowfield Nurseries, where, after inspecting the grounds under the guidance of Mr. Greig, nursery manager, they were taken to the nursery (previously called the nursery by Mr. James Watt, sole partner of the firm of Messrs. Little & Ballantyne. Those present included Dr. Cleghorn, of Strathivie (President of the Scottish Arboricultural Society), the Mayor of Carlisle; Mr. Dunn, Mr. Hull, and Mr. Duguid (representatives of the English Arboricultural Society); Mr. Kennedy (Appleby Castle), Mr. Balden (Naworth Castle), Mr. Wilson (Greystoke), Mr. Kirk (Anglesey, Wales), Mr. Baty (Netherby), Mr. Kay, Mr. Davidson (Secretary of the English Arboricultural Society), Mr. Dods (forester for Lord Selkirk), Mr. Manson (Toum Clerk, Carlisle), Mr. H. D. Dickson, Mr. G. R. Crowder (Carlisle), Rev. T. W. Anderson (curate of Stanwix), Mr. Tinning (Carlisle), Mr. Sutherland (Longtown), Mr. Greig (nursery manager, Knowfield), Mr. Ferguson (Knowfield), and Mr. Taylor (Knowfield). Mr. Mackenzie (in the name of the Hotel, and served under his personal superintendence.

Dr. Cleghorn said there was a duty upon them this morning. They had long known Mr. Watt as a very active, earnest, and learned friend. Mr. Watt had paid a great debt of obligation by his very kind and hospitable reception; and they could not leave without according to him a vote of thanks for his generosity. They had on Wednesday, as well as on many former occasions, to acknowledge Mr. Watt's very friendly and generous regards to them. He had himself been the recipient of the extensive nurseries of Knowfield, but he had seen this morning for the first time. He had been very much struck by the extent of the nurseries, a compact area seldom found near a large town. He had been struck by the beautiful proportion and the accuracy of the nomenclature. Dr. Cleghorn then referred to the want of nurseries in India, and laid stress upon the necessity of young planters who intended to go out to India becoming thoroughly acquainted with the practice of the nursery before they left this country.

The Mayor of Carlisle seconded the vote of thanks to Mr. Watt for his hospitable entertainment. He might say, representing the town, how glad they were to see and hear also to the presence of the Mayor, that the visit of the Society had not been favoured with better weather. It seemed to be their lot in Carlisle to have wet weather when meetings of important societies took place; they suffered a sad disappointment in that respect when they visited the Scottish Arboricultural Society, and they Royal Agricultural Society had been so long pursuing them. He hoped that their ill-luck was still pursuing them. He

Mr. Watt, in acknowledging the vote of thanks, assured them that it was extremely gratifying to him to have an opportunity of offering the hospitality of his home to the Scottish Arboricultural Society, presided over as it was by such an able and distinguished man as his friend Dr. Cleghorn. He was extremely indebted to the Mayor for so kindly coming to Knowfield and showing him friendship upon an occasion of this kind. He was glad he could so much gratify the Society, and he was glad to have an opportunity of introducing a sister society to the members of the Scottish Arboricultural Society, a Society smaller in membership, but which was doing very much good in fostering the art of forestry. There was not a branch of the industry that had languished so long in Scotland, and he felt sure that in the interests of the nation there was no industry that would, if properly developed, do more for the enrichment of the country at large. He gave them a hearty welcome, and trusted that this meeting would be a happy one to all concerned in the Society. Mr. Watt then intimated that he had received letters of apology for absence from various noblemen and gentlemen. One of these, the only one which he would read, was from Dr. Lyons, the Member

BARLOW MOOR FLOWER SHOW:

August 8.

FOR the number of years a show in connection with the Didsbury and Barlow Moor Floral Society was held annually in the neighbourhood but has been discontinued until on Saturday last, when the first show of a newly formed Society was held in the National Schools. Entering the show we were pleased to observe a very

for Dublin University. Mr. Watt then read Dr. Lyons' letter, in which that gentleman stated some of his well-known views on the subject of forestry, and expressed the opinion that forestry offered an opportunity of getting out of the slough of depression in the trade of this country. In conclusion, Mr. Watt hoped that the remainder of the day would be filled in with great pleasure, and that they would afterwards look back upon their visit with pleasant recollections in years to come.

The members of the two Societies shortly afterwards left Knowlesford for the Citadel Station, from which they travelled by train to Lowther. *Carlisle Journal*, Aug. 7.

SCOTTISH HORTICULTURAL ASSOCIATION.

The fifth ordinary meeting of this Association for the session was held at 5, St. Andrew Square, Edinburgh, on the evening of the 4th inst., Mr. Matthew Todd presiding. Mr. Alex. Milne, of Dickson & Sons, read a paper on "Potatoes—their early history and culture." He traced the growth of the tuber from its introduction by Sir Walter Raleigh, and dwelt on the great national calamity caused by the failure of the crop in 1845. He maintained that on no similar acre of land could so much food be produced at so little expense as by the cultivation of the potato. In the discussion which followed, Mr. MacKenzie, Warriston, referred to potato culture, and gave his recollections of the year of the potato famine. The Secretary (Mr. Munro) made some remarks on the question of the disease, pointing out, what he had previously stated in a letter to the *Scottian*, that the potato was not the only plant liable to parasitic fungi, and so long as man continued to direct his attention to a single part of the plant—the tuber—to the general neglect of the health of the plant itself, so long would it be liable to disease. Hollyhocks were given as an instance in which growers had directed their attention entirely to the enlargement of the flower, with the result that in a few years the plant succumbed to parasitic fungi. The Chairman, in directing attention to the exhibits submitted by members, suggested that a Society like theirs should have a conference on small fruits, for the cultivation of which the climate was suitable, and by that means they might be able to find their correct nomenclature and the best varieties, instead of having, as at present, to grope in the dark and obtain what they wanted from nursery catalogues. Messrs. Dickson & Co. exhibited the newer forms of Rasp in cultivation; from Hay Lodge, Trinity, herbaceous flowers were sent; and Mr. Finlayson, Redhouse, exhibited a new seedling Gooseberry, for which he was awarded a First-class Certificate.

DUNDEE HORTICULTURAL ASSOCIATION.

The monthly meeting of this Association was held in the Young Men's Rooms on Friday evening: Mr. W. R. McKeivie in the chair. Mr. W. Williamson, gr., Tarvit, Cupar, read a paper entitled, "Judging at Flower Shows." He contrasted the outside of a popular error that gardeners who are in the habit of competing in fruit competitions frequently undercrop their fruit for the purpose of having extra large specimens. He held that to take less fruit from a tree than what it can bear and bring to perfection is a waste of tissue and a strain on the veins of the plant, and a detriment to the object and defeats the end desired to be attained. Nothing, therefore, can be gained by undercropping, and the charge ought rather to be of moderate cropping. Mr. Williamson then described the qualifications necessary in the judge selected for the office of the flower shows. He thought those connected with the nursery trade, or gardeners who made any particular branch a specialty, were the most suited for this office. The present system of judging by points he thought defective, in so far that the maximum number of points was always struck too low, which made it almost impossible, in the case of large collections, to arrive at a just result. He submitted a specimen card suited for a competition of twelve varieties of fruit, a copy of which could be handed to the judges before commencing. One column contained the maximum number of points assigned to each specimen, commencing with a maximum of seven points for a Fine-apple, and gradually decreasing the maximum number as the intrinsic or commercial value of the article decreased, till at Apples and Cherries he allowed a maximum of only two and one respectively. The points being fixed on before commencing to judge, it was only remained for the judges to fill up the blank columns with points proportioned according as the different exhibits approached nearest perfection or the maximum number; then by adding each column it would be found which had the highest number of marks. The paper gave rise to an interesting discussion, and was admitted to be a valuable contribution towards a recognised scheme of judging, whereby the individual and sometimes erratic tastes of judges may be authoritatively guided. Mr. W. Alison, Seaview, exhibited fine specimens of a seedling double Begonia.

RICE FERMENATION.—In the last issue of *New Commercial Plants and Drugs*, Mr. T. Christy pointed out the practical importance of the study of fermentation, and this has been further proved by some subsequent experiments. We understand it has been discovered that if Rice is reaped shortly before it is actually ripe, and laid in a heap for a time, so that slight fermentation is induced, a delicious flavour is given largely imparted to the grain. Later on we hope to give fuller information on this matter. *Planters' Gazette*.

INDIAN NOTES.

CHICK HOUSES.—Some notes have lately appeared in your journal under the above heading, and although they contain many assertions which would barely pass unchallenged were they published in India, I do not propose to criticise them generally; but I must take exception to an assertion in the *Gardeners' Chronicle* of June 20 in which the writer of the notes claims to be the originator of the Chick-house, and must protest against the claim. "Chick-houses," better known as "Betel-houses," have been used for ages in India for the cultivation of the Pan leaf (Piper betel, Linn.), and the credit for adopting the principle is due to the late Dr. Anderson, Superintendent of the Royal Botanic Gardens near Calcutta. Dr. Anderson died in 1870, and as the writer of the notes states that it was in the year 1873 he constructed the first chick-house, there can be no question as to who was the first in the field. That my assertion may not stand by itself, I add the following extract from the late Rev. T. C. Firminger's well-known *Manual of Gardening for Bengal and Upper India*, 3d edition, p. 36—"Some time ago the happy thought occurred to Dr. Anderson that structures somewhat similar to which the natives of Bengal have from time immemorial grown the Pan, or Betel plant, might be employed with advantage in the cultivation of plants that in Nature exist in a climate nearly alike to that in which the Betel does. The attempt was made, and proved a wonderful success." I may add that "Firminger" (as the book is generally called) is no obscure work, but may be seen in almost every home in India. *Bhandari, Duttapore, July 11.*

CANADA.

OFFICE FOR AGRICULTURE, HALIFAX, NOVA SCOTIA, July 24.—I am glad to be able to say that, since writing to you a week ago, we have been enjoying delightful weather, the thermometer not going much below 70° Fahr. in the shade, and usually standing at about 5° higher. We have had frequent genial showers of rain without any wind, and the fruit on the Apple trees, which was beginning to drop on account of the drought, is swelling well; there is every prospect of an excellent sample, and of a fair yield for most sorts, with the exceptions mentioned in previous reports. Strawberries have been very fine and abundant this season, prices unusually low. During the last and present week we have had in the Halifax market a fruit not known in Covent Garden, viz., the "Bake Apple" (*Rubus chamaemorus*). It grows abundantly in swampy ground at sea level. We have no hills in Nova Scotia as high as those on which it grows in Scotland, *George Lawson, Secretary for Agriculture.*

MANITOBA.—It may be interesting to some of your readers to know a little about the wild fruits of Southern Manitoba, Canada. At the time I write (July 6) the following are the wild fruit prospects:—Plums, two sizes, a light crop. Cherries, two sizes—small red and small black—good crop. Currants (black) fair size, good crop—red, small crop, light. Gooseberries, fair crop. Strawberries, ordinary crop, now ripe. Cranberries, heavy crop. Raspberries, heavy crop. The wild Hops grow in abundance here, and one kind of hardy Azalea; a few Ferns, also a hardy ground Cedar, a trailer, and evergreen. The Tiger Lily grows wild, and is now in its glory. I shall be happy to supply information respecting this fine country. There are good openings for farmers with capital, good farms, and plenty of wild game. I should like a visit from English farmers, and would show them this fine country with pleasure. I am preparing packages of seed of some of our native plants which have been asked for by some correspondents. *James Rooke, Pilot Mound, Southern Manitoba, Canada.*

Obituary.

MR. W. SEALE.—With regret we announce the death of Mr. William Seale, the respected nurseryman of The Gardens, Wilderness, Sevenoaks. He had been in failing health for some time, and died on August 6, aged sixty. He will be remembered by many friends in Kent and the adjoining county as figuring in the prize-lists of Dahlias, Gladioli, &c.,

and also at the London and other shows with table decorations. He was held in great respect by a large circle of friends in the neighbourhood, where he had been a nurseryman all his life.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, AUGUST 12, 1885.

Aug. 6.—Fine day; thunderstorm at 6 P.M.; lightning from 10 to 11 P.M.
7.—Fine day; thunder heard at 11 A.M., 4 P.M., and 11 P.M.; rainbow at 6 P.M.; lightning at night.
8.—Fine day and night.
9.—Fine day, sun shining occasionally.
10.—Fine day, dull morning; brighter in afternoon; lightning at night.
11.—Fine day, alternately clear and cloudy; very windy.
12.—Fine day, bright mostly; very windy; rain from 6 P.M.

LONDON: Atmospheric Pressure.—During the week ending August 8, the reading of the barometer at the level of the sea decreased from 30.05 inches at the beginning of the week to 29.91 inches by 5 P.M. on the 4th, increased to 29.98 inches by 5 P.M. on the 5th, decreased to 29.75 inches by 5 P.M. on the 7th, and was 29.96 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.95 inches, being 0.30 inch lower than last week, and 0.02 inch higher than the average of the week.

Temperature.—The highest temperature in the shade in the week was 72.5°, on the 6th; on the 3d the highest was 65°. The mean of the seven high day temperatures was 70°.

The lowest temperature was 48° on the 4th; on the 2d the lowest temperature was 53.8°. The mean of the seven low night temperatures was 51.9°.

The greatest range of temperature in one day was 24°, on the 4th; the smallest, on the 3d, was 11.6°. The mean of the seven daily ranges was 18.1°.

The mean temperatures were—on the 2d, 59.8°, on the 3d, 57.8°; on the 4th, 59.2°; on the 5th, 58.2°; on the 6th, 60.6°; on the 7th, 58.9°; and on the 8th, 59.7°; and these were all below their average by 2.5°, 4.4°, 3.3°, 3.9°, 1.5°, 3.1°, and 2.3° respectively.

The mean temperature of the week was 59.2°, being 4.3° lower than last week, and 3.0° above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 129°, on the 7th. The mean of the seven readings was 120.4°.

The lowest reading of a minimum thermometer placed on the grass was 39.1°, on the 4th. The mean of the seven readings was 44.1°.

Rain.—Rain fell on four days to the amount of 0.53 inch.

ENGLAND: Temperature.—During the week ending August 8, the highest temperatures were 78° at Truro, 74° at Cambridge, 72° at Plymouth and Blackheath; the highest at Sunderland was 63°, at Newcastle, 64° at Bristol 67°. The general mean was 69.6°.

The lowest temperatures were 40° at Truro, 42° at Bristol and Sunderland; the lowest at Nottingham 51°, at Newcastle 50°, at Cambridge, 48.5°. The general mean was 45.7°.

The greatest ranges were 38° at Truro, 28.5° at Plymouth, 26° at Leeds; the least ranges were, 14° at Newcastle, 18.3° at Nottingham, 20.6° at Liverpool. The general mean was 23°.

The mean of the seven high day temperatures was highest at Blackheath and Cambridge, 70°, at Truro 68.7°; and was lowest at Sunderland, 59.8°, at Newcastle 60.1°, at Bolton 61.7°. The general mean was 64.8°.

The mean of the seven low night temperatures was highest at Newcastle, 52.5°, at Nottingham and Preston 52.4°; and was lowest at Truro, 46.9°, at Wolverhampton 47.3°, at Bolton 48.9°. The general mean was 50.8°.

The mean daily range was greatest at Truro, 21.8°, at Cambridge 18.6°, at Blackheath 18.1°; and was least at Newcastle, 7.6°, at Sunderland 8.8°, at Sheffield 10.6°. The general mean was 14°.

The mean temperature was highest at Blackheath, 59.2°, at Cambridge 58.9°, at Brighton 58.1°; and was lowest at Wolverhampton and Bolton, 53.5°, at Sunderland 53.7°. The general mean was 56.0°.

Rain.—The largest falls were 3.17 inches at Newcastle, 2.81 inches at Sunderland, 2.02 inches at Truro; the smallest falls were 0.21 inch at Brighton and Preston, at Bradford 0.26 inch. The general mean fall was 1.06 inch.

SCOTLAND: Temperature.—During the week ending August 8, the highest temperature was 76°, at Greock; at Leith the highest temperature was 63.8°. The general mean was 69.4°.

The lowest temperature in the week was 39°, at Perth; at Leith the lowest temperature was 48.6°. The general mean was 44.8°.

The mean temperature was highest at Paisley, 58.8°; at Edinburgh, 55.1°. The general mean was 56.4°.

Rain.—The largest fall was 1.53 inch, at Leith, the smallest fall was 0.47 inch, at Aberdeen. The general mean fall was 1.02 inch.

JAMES GLAISHER F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, Aug 10, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W. 1.—The weather has been very cloudy or dull in all parts of the kingdom, with rather heavy falls of rain in most places, accompanied in some localities by thunder and lightning.

The temperature has been below the mean in all districts, the deficit varying from 1° in "Scotland, N.," "England, N.E.," "England, S.," and "Scotland, W." to 3° in Ireland and over central and north-western England, and to 4° in "England, S.W." The maxima, which were generally registered on the 10th, varied between 63° and 69° in Scotland, between 69° and 75° in Ireland, and from 71° to 77° in most of the English districts. The minima were recorded either on the 6th or 7th, when the thermometer fell to 37° in "England, S." (at Marlborough), to 40° in "England, S.W.," and to between 41° and 50° elsewhere.

The Rainfall has been rather less than the mean in "England, E." and "England, S.," but more in all other districts, the excess over north and central England, in the south of Ireland and west of Scotland being considerable.

Bright Sunshine has been less prevalent than for some time past, the percentages of the possible amount of duration ranging from 15 to 25 in the more northerly parts of the Kingdom to 37 or 38 in the S.W. and south of England, and to 56 in the Channel Islands.

Depressions Observed.—At the commencement of the period a small shallow depression was moving in a south-west direction over the St. George's Channel, finally disappearing to the southward of Ireland. This was succeeded by numerous small and very shallow depressions; which, after forming a large, low-pressure system over England, moved slowly away to the eastward. During the prevalence of these conditions north-easterly winds were general in the north and west, and light airs—chiefly from the westward—in the south. By 8 A.M. on the 9th the distribution

had undergone a decided change, the barometer being highest over France, while deep depressions passed along our west and north-west coasts. The wind became south-westerly and south generally, and on the 9th and 10th it blew a gale in the west and north.

Answers to Correspondents.

ARABUCARIA DOING BADLY: P. E. T. As this tree suffers much from a wet subsoil, except in hilly well drained sites, it is always best to plant it on a hillock of, say, 12 feet in diameter at the base, and if the soil is at all stiff to mix up massive lumps of rag or sandstone. If your soil is adhesive and the ball which contains the roots would be likely to hold together in such suitable precautions, it would be advisable in this month or September to raise it a feet, and under-plant it with the fresh compost. It would then stand on a mound, which could be readily made of an unobjectionable loam.

BEGONIA: C. Fieldes. A very fine yellow.

BOOK ON PROPAGATING CONIFERS BY GRAFTING, AND OTHER TREES BY SEED-CUTTINGS: G. S. Smith. For guiding principles in the art, and practical directions of various methods, times, and seasons. The Propagation and Improvement of Cultivated Plants, by Mr. F. W. Burbridge, published by Blackwood & Sons, Edinburgh and London, would suit your purpose.

CARNATION: S. H. You would do well to send them to some nurseryman who grows the plants. We do not make any charge for naming plants.

EUCALYPTI: A. N. Quite impossible to name them from your specimens.

FRANCISCA AND PLUMBAGO ROSEA: Mrs. Torfous. The first-named must be potted in a mixture of fibrous peat and leaf-mould, well rotted, in equal proportion, about an eighth of the bulk of the mass of sifted loam, and a plentiful quantity of silver-sand being added. Plants must be shifted immediately after flowering, and be placed in a stove, pit, or dung-bed frame, where the temperature ranges from 60° to 70°; and when well-rooted they must be liberally supplied with water. They can remain in this warmth till the autumn months, when the flower-buds will begin to appear, at which time syringing must be discontinued, and the plants removed to an intermediate-house.

Cuttings strike easily under a bell-glass, in bottom-hung Lambigo roses grow well in a mixture of fibrous peat and leaf-mould, using a liberal admixture of silver-sand. The old plants may be shaken out in February or March, dividing the roots and re-potting well drained, as the plants is greedy in the matter of water when growing freely. Bottom-heat not essential, but the plants do very well in a Pine or forcing-pit. They require to be grown near the glass, or spindly growth is made, and the lower leaves are apt to fall, which disfigures the plants. Sufficient shading should be used to prevent scorching, but enough must be allowed to fall on them to thoroughly mature the growth, or but little flower can be expected in the autumn and winter months.

FUNGUS ON ONIONS: W. H. B. The destruction of the Onions is brought about by a fungus allied to the fungus of the Potato disease, named Peronospora Sclerotienaria. As in your case the plants are perhaps mildewy, the first of the places which have been injured by the Peronospora. You are quite right in supposing that sowing too often in the same ground aids the disease, as the fungus produces resting-pores, which were first illustrated by Mr. W. G. Smith. These resting-spores hibernates in the ground during the winter, and germinate and attack the young Onions in the following summer.

FUNGUS UNDER PALM: F. S. T. The fungus under Palm is a kind of semi-subterranean Puffball, named Scleroderma vulgare. Yours is the smooth-skinned variety. It is common, and sometimes mistaken for the Truffle. Not edible. H. G. S.

GOOSEBERRIES: A. Z. Whitesmith. It may be obtained of almost any nurseryman.

GRAPES WITH MEALY-BUG, &c., AND PEACH STONES SPLITTING: T. H. The Grapes are of a fine size, but deficient in bloom and colour. You are perhaps cropping too heavily, and ventilating insufficiently. The mealy-bug on them, which you ought to strain every nerve to eradicate in the winter, may be washed off by applying pure water by means of a hose with a nozzle. In the state they are now you need not be squeamish. You can cut bunches intended for use in a day or two, and hold them under a tap of running water, and thus rid them of bug, hanging them up in a shady airy place till dry. The Peaches are getting too much water at the roots. It is almost too late to expect much benefit from a drier treatment now, the damage being beyond remedy as regards the ripening fruit.

GUMMING OF ARABUCARIA IMBRICATA: Mrs. Crowley. In reply to the inquiry as to the probable cause of gum exuding from the main stem of Arabucaria imbricata, and also whether a styptic would be likely to stop it, I may say that, except under very favourable circumstances, this Arabucaria is rarely seen at all in this country; it is a great many soils it grows fairly for ten, twenty, or even thirty years, when indications of distress not unfrequently exhibit themselves,

in impaired vigour, as described above, exuding gum on the main stem, and portions dying off. This may be occasioned by a variety of causes—amongst others by exposure to a very low temperature, which does not alter either kill, but often seriously injures and induces exudation of gum. In this case the gumming process has been going on for more than two years, and as the tree is still comparatively vigorous the chances are it may recover, if this has been the cause. Another common cause of Arabucaria becoming unhealthy is where the roots have reached a cold wet subsoil, it may be, at a very considerable depth. As the Arabucaria will only thrive in an open porous subsoil the remedy is deep draining, to remove the stagnant water. They delight in a deep, rich, loamy soil, and where the roots have reached in districts where considerable rainfall occurs. Top-dressing might improve the vigour of the tree. No styptic is likely to be of the slightest use in stopping the exudation of gum. A. Fowler, Castle Kennedy, Wigtownshire.

MORMIDES: B. From the Greek mormo, signifying a bogey, or some object of idle fear; and eidon, likeness as by the latter word is meant, the neuter form un has; been used.

NAMES OF PLANTS: H. Stott. 1. Funkia lanifolia; 2. Betonica officinalis; 3. Veronica longifolia; 4. Stachys.—R. G. B. Silaus pratensis.—J. W. Narthemum ossifragum.—G. W. B. 1. Spiraea arifolia; 2. Thalictrum flavum; 3. Hemerocallis flava; 4. Stenactis speciosa; 5. Broomrape garden; 6. Veronica longifolia; 7. W. longifolia var. E. J. Achillea ptarmica, double variety; a very old plant.—F. P. Spiraea verista.—Oscar. Lysimachia nummularia.—T. Denny. Spiraea arifolia, Platycodon grandiflorum, the others too imperfect to name. G. J. Trachelium, and C. olympica.—H. Reeves. Mutisia decurrens, Tritonia Pottii.—H. T. Cuttleigh. Cuscuta europaea.—Harden & Co. Chicory, Cichorium intybus.—J. 1. Juncus bulbosus; 2. Aiza cespitosa; 3. Agrostis vulgaris; 4. Melilotus alba; 5. Hieracium umbrosum; 6. S. subaudum.—J. E. M. Mellilotus officinalis.—J. Turton. Probably Brassica Keitiana.—W. H. S. Dipladenia ambalis.—G. Greig. Cateleya gigas, a singular mottled variety, whether constant or not remains to be seen.—A. C. Stanhope insignis.

ONCOTHOSSUMS DOING BADLY: H. H. The plants are probably growing in too high and moist temperature; the ventilation is also deficient, and shading may not have been carefully attended to.

ONCIDIUM LANCAEUM: H. M. H. Yes; a good variety.

PICEA PUNGENS, &c.: A. C. There is a P. pungens, and there is a P. Engelmanni, and there are glaucous varieties of both. It is very difficult to distinguish them from small scraps. What you call pungens is, we believe, Engelmanni; what you name Menziesii glauca is, we believe, Engelmanni; and your Engelmanni glauca is correctly named. From this you will see that you have not the true pungens at all. The variety pungens glauca, better known as Parryana glauca, is far the best when really good, but it is often confounded with Engelmanni glauca. In the case of seeds from the same cone the diversities are great, so that it is no wonder there is confusion. The best way is to go to a nursery and pick the best, irrespective of the name.

PURPLE CARNATION: W. C. The flower sent must be reckoned a very good one of its class. It is full of much substance, and of a colour as unusual. That you should have raised it from the white Susan A-key is also remarkable.

	Tropæolum, 12 bun. 1 0-1 6

SEEDS.

LONDON: Aug. 12.—In consequence of the recent rains there has, during the last few days, been an improved inquiry for those descriptions of seeds needed for present sowing. White Mustard seed, in particular, has been in active request to a substantial advance in value. Trifolium, also, is somewhat firmer, and meets a fair sale. The supplies for the moment are not over-abundant. Essex Rape seed continues exceedingly cheap. New winter Tares are coming forward at very moderate rates. For sowing Rye the inquiry is small. English Italian Rye-grass opens very cheaply. There is nothing yet doing in Clover seeds. Canary and Hemp seed are without quota variation. *John Shaw & Son Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday there was no animation in the trade, and but little, if any, change in prices as compared with the previous Friday. The broken weather and occasional rain are against the condition of the English supplies. Flour had a hardening tendency; passing transactions were, however, upon a very moderate scale. The trade in Barley, both English and foreign, was slow. With increased arrivals Beans and Peas were 6d. lower. Maize was firm, flat corn more especially. Oats were quiet, and inferior qualities about 3d. lower. On Wednesday there was not sufficient doing in Wheat to influence quotations, there being very little disposition to buy, and no pressure to sell. Flour remained quiet, but firm; Barley was dull; Beans, Peas, and Oats were a slow sale at late value; and Maize was firm, but quiet.—Average prices of corn for the week ending August 3.—Wheat, 37s. 6d.; Barley, 27s. 11d.; Oats, 23s. 6d. For the corresponding period last year.—Wheat, 37s. 6d.; Barley, 23s. 3d.; Oats, 23s. 1d.

HAY.

Tuesday's Whitechapel market report states that supplies were rather large, with somewhat dull trade. Quotations.—Clover, prime, 80s. to 107s.; prime second cut, 85s. to 107s.; inferior, 60s. to 75s.; new clover, 80s. to 95s.; bay, prime, 70s. to 98s.; inferior, 35s. to 60s.; new hay, 65s. to 90s.; and straw, 28s. to 38s. per sale.—On Thursday there was a rather large supply on sale. The trade was dull at Tuesday's rates.

POTATOS.

The Borough Market report states that moderate supplies are to hand, and meet a quiet demand. Quotations.—Regents, 120s. to 140s.; Magnum Bonum, 120s. to 140s.; Early Roses, 110s. to 130s.; Shaws, 95s. to 120s.; Kidneys, 120s. to 140s. per ton.—The imports into London last week consisted of 20 bags from Boulogne, 351 boxes Barleux, 37 packages Rotterdam, 103 bags 33 barrels from Hamburg.

Government Stock.—Consols closed on Monday and Tuesday at 99½ for both delivery and the account. The figures of Wednesday and Thursday were 99½ to 99½ for both transactions.

12-oz. Sample Packets, free by post, 12 Stamps. FIBROUS PEAT FOR ORCHIDS, &c.—BROWN FIBROUS PEAT, best quality for Orchids, Stove Plants, &c., £6 6s. per Truck. BLACK FIBROUS PEAT, for Rhododendrons, Azaleas, Heaths, American Plant Beds, &c., per ten per Truck. Sample Bags, 2s. 6d. per Bag, 100 Bags, 45s. Bags included. Fresh SPHAGNUM, 100 lbs. per Bag. SILVER SAND, Course or Fine, 52s. per Truck of 4 Tons. WALKER and CO., Farnborough Station, Hants.

A GREAT SUCCESS. JEYES' "GARDENER'S FRIEND."

One Gallon of this Fluid, diluted with water according to directions and applied with an ordinary watering-can, Effectually Removes all Weeds, Moss, Worms, and Insects on Gravel Paths, Lawns, &c. Price, 3s. 6d. per Gallon, including drum; 40-gallon Casks, £4 10s. Carriage paid.

JEYES' SANITARY COMPOUNDS CO. (Limited), 43, Cannon Street, London, E.C.

GISHURST COMPOUND, used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Insects. 2 to 4 ounces to the gallon of soft water; 4 to 16 ounces as winter dressing for Vines and Orchard-house Trees; and in lather from the cake against American Blight. Has outlived many preparations intended to supersede it. Boxes, 12s. 6d. and 12s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s. from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

SUPERIOR VARNISH.

This Varnish is the cheapest and best covering, which can be used for all outdoor purposes, and has many advantages over oil paint. It is applied cold, and may be laid on by any farm labourer or other unskilled person. It dries quickly, giving a hard, brilliant polish, and looks equally as well as oil paint, yet at one-fourth the cost. FRESH in Casks, containing not less than 9 gallons, delivered free at most railway stations.—Best prepared Jet or Black, 15s. 6d. per gallon.

Catalogues of all kinds of Iron and Wire Fencing, Gates, Poultry Fencing, &c., free on application.

BAYLISS, JONES, & BAYLISS, WOLVERHAMPTON, and 139 and 141, Cannon Street, London, E.C.

R. HALLIDAY and CO. desire to draw special attention to their Cucumber Frames, of which they always have a large stock, ready glazed and painted. They are made of the best materials, and can be put together and taken apart in a few minutes by any one.

Prices, delivered to any station in England:— 2-light frame, 8 feet by 6 feet Packing 3 10 0 3-light frame, 12 feet by 6 feet Casing 5 5 0 6-light frame, 24 feet by 6 feet Casing free 10 0 0 The glass is nailed and putted in. Lights and framing for back pits in proportion to above prices.

R. HALLIDAY and CO., Hothouse Builders and Engineers, Royal Litchfield Works, Middleton, Manchester. W. H. LASCELLES & CO., HORTICULTURAL BUILDERS, 121, BUNHILL ROW, LONDON, E.C.

W. H. LASCELLES and CO. will give estimates for every description of HORTICULTURAL WORK, free of charge, and send competent assistants when necessary. LASCELLES' NEW ROCKWORK material in various colours. Samples can be seen and prices obtained at 121, Bunhill Row, and 35, Poultry, Chesapeake, E.C. Illustrated Lists of Wood Buildings, Greenhouses, and Conservatories, and Concrete Slabs for walls, paths, and stages, sent post-free on application.

C. G. FRAZER & CO., Horticultural Builders, Norwich.

SPAN-ROOF GREENHOUSES made in Lights, glazed with 27-oz. glass, and painted three coats of good oil colour. Tenants' Fixtures, 12 by 8 feet, £23 10s. For Brickwork, £16 17s. Carriage paid to any Railway Station in England and Wales, also to Edinburgh, Glasgow, Dublin, and Belfast. Illustrated Catalogues, post-free two penny stamps.

BOULTON & PAUL, NORWICH, HORTICULTURAL BUILDERS AND HEATING ENGINEERS.

VILLA GREENHOUSES. Good workmanship and lowest prices in the Kingdom. With all the latest improvements, best materials, ventilation without draughts, and perfect glazing.

Estimates and Lists post-free. Gentlemen waited upon in every part of the kingdom. References to every county in England. Surveys made. Plans and Estimates prepared for any description of Horticultural Buildings. Hothouses of any design estimated for, and built of the best material and workmanship, with strict regard to economy in price.

COVERED SHEDS FOR CATTLE. THE GLOUCESTER WAGON CO. (LIMITED)

Have attached to their extensive works a large Joinery Department with the latest and most improved Machinery, for the Manufacture of Covered Sheds or Yards for Cattle, Conservatories, Greenhouses, Garden Seats, &c., at extremely moderate prices. Full particulars may be had on application to ALFRED BLETNER, General Manager, GLOUCESTER.

HILL AND SMITH'S BLACK VARNISH,
for Preserving Ironwork, Wood, or Stone.
(Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and it is used on the grounds at Windsor Castle, West Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 30 gallons each, at s. 6d. per gallon, at the Manufactory, or 1s. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
"Pierceland Park, June 21, 1876.—Sirs, I have this day forwarded from Chepstow to your address a black varnish cask, and returned with it as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierceland Park, Chepstow.—I am, Sirs, yours respectfully, W. M. Cox."

CATION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised. H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated Catalogue of Fencing Hedges, Field and Entrance Gates, sent free on application to **HILL AND SMITH, Brierley Hill Ironworks, Staffordshire;** 118, Queen Victoria Street, London, E.C.; and 73, Elmbank Street, Glasgow.

Under the Patronage of the Queen.
J. SMITH'S IMPERISHABLE STRATFORD LABELS.

The above Labels are made of a White Metal, with RAISED BLACK-FACED LETTERS. The *Gardener's Magazine* says:—"We must give these palm before all other plant labels, as the very first in merit."
Samples and Price Lists free.
J. SMITH, The Royal Label Factory, Stratford-on-Avon.

BUY ONLY ENGLISH THREE-QUARTER PLATE WATCHES.

BENSON'S NEW PATENT (No. 4658)
"LUDGATE" WATCH,
SILVER, GOLD,
£5 5s. £12 12s.

Is a "Special Strength" Silver English Lever, my best London make, with Three-quarter Plate Movement.
Year tested throughout.
Chronometer balance, with damp and dust-proof Patent ring-band, and extended barrel, in massive sterling silver dome case. With crystal glass front.
Winds, set hands, and opens at back.
The superiority in value, accuracy, and durability of the "Ludgate" Watch over the Swiss and American Keyless and Non-Keyless Watches, made in imitation of and sold as English work, and the ordinary Full-plate English Watch is enormous. "Ludgate" Watches are made in three cases, simple, and durable. Being Three Quarter Plate, it is superior in value and appearance to any £10 Watch sold, and, being compensated, it keeps perfect time; fitted with crystal front, it combines the strength of the Hunter and convenience of the open face. Of my best London make, it will last a lifetime, stand rough usage of all and every kind without damage, and, being made in three sizes, it is for the above reasons suited for Home, Indian, and Colonial use by Gardeners, Workmen, and Gentlemen.

The "Ludgate" Watch is far superior to any Watch at the price yet made, and will be sent free and safe at our risk to all parts of the world for £5 5s. Cash or P.O.O., or in hunting cases, £6 6s. Price in 18-carat gold, crystal glass case, Twelve guineas.
SPECIAL NOTE that J. W. BENSON is the only Maker of a Three Quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. A Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent free on application to **J. W. BENSON,** Watchmaker to Her Majesty the Queen, The Steam Factory, 62 and 64, Ludgate Hill, E.C.
Illustrated Family of Prices, £2 to £1,500. Gold and Silver Jewellery, Clocks (House, Chime, and Curved), and Musical Boxes, free on application.

"SIMPLES" FLOWER-POT CLEANSER.

Will Clean any sized Pot Inside and Out at same time without alteration. Can be Fixed to any Tub or Tank.
Price of Cleanser, without Tub, 2s. 12d. 6s. Less 25% per cent. for Cash with Order.
Tub supplied if required. Price on application.

Orders to be sent to Sole Proprietor, **W. E. BENNETT, Thurston, Leyland, near Preston.**

105,000 Accidents.
For which Two Millions have been paid in Compensation by the **RAILWAY PASSENGERS' ASSURANCE Company,** 64, Cornhill. Accidents of all kinds. Paid-up and Invested Funds, £250,000. Premium Income, £235,000. Chairman, HARVEY M. FRIBOURG. Apply to the Clerks at the Railway Station, the Local Agents, or West-end Office, 8, Grand Hotel Buildings, Charing Cross; or at the Head Office, 64, Cornhill, London, E.C.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it. N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

Gardeners, Farm Bailiffs, and Foresters. JAMES DICKSON AND SONS, "Newton" Nurseries. Character, are always in a position to RECOMMEND the best respectability and thoroughly practical at their business.—Full particulars, with names of previous employers &c., on application.

TO NOBLEMEN, GENTLEMEN, &c., requiring smart, sound, and thoroughly competent STEWARD, GARDENERS, &c.—We have on hand Applications from several Men of tried ability, and shall be pleased to Assist any Nobleman, &c., in obtaining Men generally suitable for their requirements.—VICARS COLLYER AND CO., 1, Essex-Row, A. W. TREWES Manager.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. J. St. John's Nurseries, Worcester.

TO LANDED PROPRIETORS, &c.—A METROPOLITAN (City of Victoria Falls) is now at liberty to take the Formation and Lining of New Roads and Paths, Grounds, &c. Remodelling existing Gardens. Plans prepared. 115, Victoria Park, Stamford Hill, N.

To Noblemen and Gentlemen requiring Land Agents. STEWARDS, BAILIFFS, or GARDENERS. JAMES CARTER AND CO. have at all times upon their Register 12 tables and competent MEN, several of whom are personally well known to the Gardeners. Equally well suited to be made to 237 and 238, High Holborn, W.C.

Seed Trade. ASSISTANT.—Age 21; five years' experience. Excellent references.—ALPHA, Nursery Cottage, Green Lane, Old Swan, Liverpool.

HOLLOWAY'S OINTMENT and PILLS. Abscesses, Erysipelas, Fleshes. Unvarying success attends all who treat these diseases according to the simple printed directions wrapped round each pot and box. They are invaluable to the young and timid, whose bashfulness sometimes endangers life. Though applied to local diseases of this nature are essentially blood diseases; but a little attention, moderate perseverance, and trifling expense will enable the most diffident to conduct any case to a happy issue without exposing secret infirmities to any one. The Ointment checks the local inflammation and alleviates the throbbing pain. These directions also clearly point out the happy issue without exposing secret infirmities to any one. The Ointment checks the local inflammation and alleviates the throbbing pain. These directions also clearly point out the happy issue without exposing secret infirmities to any one. The Ointment checks the local inflammation and alleviates the throbbing pain. These directions also clearly point out the happy issue without exposing secret infirmities to any one.

AUTUMN CATALOGUE OF FLORAL GEMS, GRATIS & POST-FREE on APPLICATION

Before ordering elsewhere please send for our Illustrated CATALOGUE. In it will be found useful instructions to amateurs, enabling them to pronounce botanical names correctly, besides much further interesting information. We also

It is divided into sections, as follows:—

BULBS. In this department will be found many species, new, rare and beautiful, and which are not to be found offered in any other English Catalogue, whilst the prices of popular species, such as Hyacinths, Tulips, &c., will be found exceptionally low, e.g., White Roman Hyacinths, splendid healthy sample, in quantities of 250 and upwards, 9s. 3d. per 100.

FERNS. We are offering some most beautiful specimens of rare and seldom seen species, many of which have been specially collected for us; and as the stock of several is limited we would strongly advise early attention, and thus save disappointment.

ORCHIDS. Hardy Orchids have received our special attention—the result of which is that we are enabled to offer many lovely novelties, comparatively unknown here in England. We also offer these in collections at lowest figures possible, purposely to bring these beautiful novelties within the reach of all.

PLANTS. These comprise a list of herbaceous, insectivorous, curious, and a general collection of rare and other beautiful plants. This section will be found unusually interesting to botanists, &c., in search of "rarities."

SEEDS. We are in a position to place before our patrons unique stocks of all the very best strains, and would respectfully draw the attention of all "unique" collectors to the same.

MISCELLANEOUS. In this section we offer a miscellany of interesting items calculated to please both the professional and the amateur.

N.B. To Amateurs who are in the habit of purchasing Guinea and other collections.

Instead of doing so this year send the order to us, leaving the selection to our judgement simply giving particulars as to nature of soil, position of garden, if any glass case, when we feel fully assured that we can do this more than afford them much more gratification for their money than if they pursued the ordinary method.

HYACINTHS, EARLY WHITE ROMAN.
 —May be had in bloom before Christmas. The best pure White for Forcing. Fine bulbs now ready.

IRIS KEMPFERII—in about twenty different shades of colour. This grand Japanese Iris is hardly yet known in this country, but should be grown by every lover of flowers. It is by far the largest flower of this family, with most striking colours. We offer well established English-grown Roots; also many other varieties of Iris.

IRIS CRATEROIDES—Brilliant Crimson. This is about the most showy of this useful family of Bulbs.

IRIS VIRIDIFLORA—a most uncommon colour amongst flowers—very striking, being a decided green with black eye. Also many other varieties of Iris, a family which only requires to be more widely known to be grown as largely as the Tulip or Hyacinth.

LILIUM CANDIDUM—the Old White Garden Lily. Fine Bulbs now ready for Planting or Forcing.

NARCISSUS and DAFFODILS—in great variety—Choice and Common.

SCILLA SIBIRICA.—This charming rich Blue variety is now as cheap as the Snowdrop, to which it makes a good companion and contrast.

SEE OUR **WHOLESALE BULB CATALOGUE** for prices of above, and all other varieties of DUTCH and ENGLISH BULBS. May be had on application.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 22, 1885.

BAYFORDBURY.

A SHORT distance from the town of Hertford lies the domain of Bayfordbury, the residence of W. R. Baker, Esq., a gentleman long known as a keen lover of the arts of gardening and tree culture. The garden, by its intrinsic and varied interest, at once affords indications of the knowledge and taste of the master. The place has also claims on the attention of artists, literary men, and students of social and political history, for here are Kneller's portraits of the members of that celebrated club which immortalised its host and landlord by adopting the name of Kit Cat. There they are—the masons of the period, in wig and smart attire, such as makes those of the present generation thank their stars they have not to array themselves like one of these. But, interesting as they are, it is not of them that we have to speak. The Cedars on the lawns, the Oaks and Pines, the rock garden, the woods—these must engage our notice.

The garden front of the mansion faces south, a long terrace with flower-beds separates it from the lawn. On the sides of the house Passiflora coccinea runs wild, cut-leaved Vines enwreath the portico, Arauca albens shows that the shelter of a stove is not indispensable for its growth; Escallonia macrantha and the blue-leaved Berberis trifoliata—these and many others clothe the walls.

A few steps and we are in the rock garden—a sheltered nook, encircled by trees and hedges, over which latter ornamental Gourds throw out their feelers and display their great and brilliant fruits, and under whose protection Cannas and Ricinus and other sub-tropics unfold their charms. A Chamæropis stands here all the winter, and has stood for several, without protection. Bamboos—Metake, Thammocalamus Falconeri, and others—form striking clumps, contrasting strangely in their grace and elegance with that great mammoth of a plant, Gunnera scabra.

The rock plants are grown on mounds or turfs, forming so many islets amid a sea of turf, encircled with trees. The turfs are not, one would say, the most suitable of materials for a pictorial rockery, but experience shows that, here at least, they tone down into soft gradations of colour, and become time-stained and lichen-covered in a way most pleasing to the eye, while rampant vegetation, creeping slugs and wily woodlice do not find many inducements to take up their quarters. The best thing to say about its appearance is this, that no one would know without careful inspection, what the material was. We shall not attempt an enumeration of the rock plants that were in bloom. The list would have to be reconstructed to-morrow. Suffice it to mention a group of hardy Cacti, such as Opuntia missouriensis and O. Rafinesquiana, the latter in full bloom, and surrounded by brilliant Mesembryanthemums. Plumbago capensis is a plant one does not often see in like situations, yet here it is quite at home, as if frost were unknown. Another Cape plant,

the Aponogeton, grows in the pools and beds in a way that shows that it endures the climate of Hertfordshire almost as well as that to which it is native.

Terrestrial Orchids are over for the year, but here are Cyclamens still in bloom, Ramondias, Linnaea, Ferns galore. Tropaeolum speciosum looks as if it would establish itself, but its brother, T. polyphyllum, as in so many other places, refuses to grow. Over the Laburnum trees climbs the delicate tinted Wistaria. Mr. Baker hoped the two flowers might make a match of it, but there seems no signs of such a consummation. Perhaps if a little gentle pressure in the shape of artificial aid were applied the union might be effected, but if it were we expect the result would only interest the botanists—to them it would, of course, be of great interest, but to the lover of flowers for their beauty only we fear the result would not be satisfactory.

From the rock garden back to the lawn is but a few steps, and those massive Cedars compel respect. They seem to say, Rock plants and subtropicals have their attractions, no doubt, even the bedding plants on the terrace are gay and bright, but look at us!—and they are noble trees, not of such spreading habit as some are, but solid, bold, well grown, comparatively little hurt by wind or snow. They are as handsome as the Goodwood trees, and nearly as large. They were planted about 1765, and one is said to have been a seedling from Dr. Uvedale's Cedar at Enfield. (This latter was planted between 1665 and 1670.) A third generation of Cedars is springing up at Bayfordbury, so that there is no doubt that, were the place left to itself for a few years, a miniature Cedar forest would result. M. de Candolle has noted a similar occurrence at Geneva. Mr. Baker is a great advocate for clearing away the soil from the buttresses at the base of the trunk of these old trees, and thus of facilitating the access of air and water.

As there are representatives of three generations of Cedar here, so there are of Oaks. A family tradition ordains that the heir presumptive shall plant an Oak so soon as circumstances permit after his birth, and in accordance with this we have in the park here a fine symmetrical Oak (*pedunculata*), planted by the present possessor of the estate in 1811—a sound, hale tree that must make its planter proud to see. Not far off is another Oak—this of the sessiliflora breed—planted in 1840, also a fine tree; while third in the list is a stripling tree of some twenty summers. The slowness of growth for the first few years, and the rapid development subsequently is very remarkable.

Fine trees of the Turkey Oak are here to be seen, but, however beautiful, they are not looked on with favour by the timber merchant. Crossing a ravine, now dry, but filled with traces of winter flood, we enter the pinetum. Mr. Baker began his collection soon after Douglas sent home his precious introductions, and availed himself largely also of the subsequent importations of Hartweg. On looking round at these fine trees one wonders if there are not more worlds for the Royal Horticultural Society still to conquer. We know it is said that the nurserymen now-a-days do that work better than the Society could do, and we remember, as all must, with thankfulness, how much has been accomplished by the Veitches, the Lows, the Standishes, and others. Still, the man of business naturally devotes his attentions to the fashionable plants of the day, and while Orchids are so important commercially, it is to be feared that other things of equal interest may be passed over. But this by the way. At any rate, this pinetum, seated on a gentle slope, tells unmistakably of Douglas and Hartweg, as others of later establishment do of Fortune and John Veitch, and those of the future will do of Maries. There are fine specimens of *ponderosa*

and other nearly allied forms, such as *Parrayana*, *Beardsleyi*, *Jeffreyana*, *Benthamiana*. *P. macrocarpa*, a stately tree, is once more bearing its giant cones near the summit. Two or three from this very tree were figured in our columns some time ago (March 28, 1885, p. 413). About one of the trees of *P. macrocarpa* here there is a curious history. Joseph Knight, the predecessor of Messrs. Veitch at Chelsea, gave to Mr. Baker a cone of this species, from which the seeds, as was thought, had all been taken. The cone was laid aside for a considerable time, and when it was again brought to light a seed was discovered—a seed now represented by a stately tree. Under the name *P. californica* we find a species (better called *tuberculata*) which has its trunk beset with whorls of cones which are not easy to detach, and which open nobody knows exactly when. The report is, that it is only when forest-fires cause the cones to crack open that the seed is liberated, and wafted to some spot where it can germinate. In any case, it is observed by travellers that the young trees of this species they meet with are all of about the same size and age, as if they all started into growth together. *P. tuberculata*, then, is similar in habit to the *P. muricata*, of which we have already given a figure (p. 53, January 12, 1884, vol. xxi). *P. Parrayana*, so called after Mr. Gambier Parray, is one of the handsomest Pines, stately and massive. It has not, we believe, produced cones, but is considered to be a form of *ponderosa*. *Pinus contorta*, *P. pinea*, *P. monticola*, and *Abies Nordmanniana* and *nobilis* are all producing cones, as well as a host of smaller and less interesting species. *Abies lasiocarpa* is here a strikingly beautiful tree, quite distinct from *grandis* or *concolor*. The Douglas Fir in several variations does well here, and with *Laricio* and *austriaca* gives hopes that it may be serviceable as a timber tree. *Picea ajanensis* (generically called *Alcockiana*), and which is usually so beautiful, does not do well here.

Not unduly to extend the list and weary the reader we will not specify more of the fine and interesting specimens to be seen in the Pinetum, but it should be mentioned that in addition to the Pinetum proper the Pines have welled over into some outlying woods, where, mid the shelter of Oaks, Beech, and Hornbeam symmetrical Wellingtonians of large size abound and a pair of Nordmann's Fir, planted in 1855, are now the finest and most symmetrical of any that we know of—pyramids of combined grace and strength. Here, too, is a group of fine *Taxodium sempervirens* (Redwood) with more slender, pendulous branches, and finer, more delicate foliage than ordinary. The trees are now 60–70 feet high, and all of Fern-like aspect and of the same variety, which by a lucky accident were planted near to each other.

Adequately to deal with Bayfordbury and its treasures would require far more space than we can command. We shall have failed in our task, however, if we have not conveyed some slight inkling of the manifold and varied interest attaching to the place.

CULTIVATION OF LAVENDER AT BRIGHTON.

DURING the past three years an attempt has been made to cultivate Lavender and Peppermint at Brighton; and although the experiment has hitherto been made on a small scale, the amount of success obtained appears to be worth recording. The difficulties attending the culture of medicinal plants are so great that any light that can be thrown upon the subject will, it is hoped, prove useful, and Mr. Sawyer, who has long taken an interest in plants affording perfumes, has kindly placed the results of his experience at my disposal.

It might be supposed that so distinct a plant as Lavender would not exhibit many varieties. This, however, is not the case. The first plants experimented on developed in the form of dense level-

topped rounded tufts of foliage, with comparatively few flower-heads. Each flower-head formed a continuous spike, except the lowest whorl or verticillaster, which is separated from the upper portion of the spike by a short distance. This variety neither grows rapidly nor flowers freely, and the perfume is not so fragrant as in other varieties. This was, therefore, discarded. Another variety was then tried, in which nearly all the floral whorls are distinct, so as to form an interrupted spike. This variety grew rapidly, flowered freely, and was found to be delightfully fragrant, and was therefore adopted. It has the disadvantage, however, that the plant soon forms woody stems, which if the plants are much exposed to wind easily break, and loss of flowers results. Although this variety has been largely propagated by cuttings it does not always come true, several specimens being pointed out to me which were of sparing habit, and flowering very scantily, with herbage of a much whiter hue, and others with few flower-heads of a more purplish hue than the rest, and deficient in fragrance. It should be observed that all these varieties presented the characteristic rhomboidal bracts of the true *Lavender*.

It is obvious, therefore, that the cultivation of Lavender requires constant attention and habits of close observation on the part of the cultivator, and that the quality of the oil produced is likely to depend not only on the care with which the oil is distilled, but on cultivating only the best and most fragrant varieties, as well as on the character of the soil, as mentioned in my previous notes on this subject. It may be here noted that the chalky character of the soil on the hills near Brighton, especially in the ground selected by Mr. Sawyer, seemed peculiarly suited to the culture of Lavender, most of the plants being 2½ to 3 feet in diameter, with flower-stalks 2 feet or more in length.

The Peppermint cultivated by Mr. Sawyer has not succeeded so well as the Lavender, since, being grown on a slope, the suckers, instead of burying themselves in the soil, stand out and get dried up by the sun, and the plants do not multiply. The cultivation of this plant is obviously not suitable to the nature of the ground.

Rosemary, however, as might be expected, grows with rapidity and flourishes well, and should the quality of the oil prove as much a success as that of the Lavender has done, the cultivation of this plant will be extended. *E. M. Holmes, F.L.S.*, in the "Pharmaceutical Journal."

New Garden Plants.

DENDROBIUM PARDALINUM, n. sp.*

THIS is very like *Dendrobium Macraei*. It has its scendent stem covered with narrow ligulate monophyllous bulbs. Both the bulbs and the leaves are narrower than in the species just mentioned. The flowers are arranged in the same way. The sepals and petals are not whitish, but ochre-coloured, with dark purple spots. The lip offers a good mark of distinction in its very long stalk (isthmus) having two long undulate plicated keels, the central one being straight. The anterior part is pentagonal, both parts running backwards, which produces a sagitate appearance. As in *Dendrobium Macraei*, this part is very thick, and has some tumours. It was kindly sent to me by Mr. Harry Veitch, and thanks to the good packing, the very fugacious flower could be well understood. *H. G. Rehb. f.*

CHLOROPHYTUM RHIZOMATOSUM, Baker, n. sp.†

THIS is a new species of *Chlorophytum*, which has just flowered at Kew, remarkable for its very long,

* *Dendrobium pardalinum*, n. sp.—Aff. *Dendrobium Macraei*, Lindl.; pseudobulbis toli-que angustioribus, floribus solitariis (semper 3); mento obtusis, lobellii lacinus lateralisibus semi-ovato triangulis, ungue (isthmus) longo, carinis a basi in basin; laciniis antice geminis, pro unguem (isthmum) plicato-undulatis interfecta supra unguem carinis rectis in laciniam anteriorem decurruente, laciniis antice pentagonis, cruribus retrorsis limbo externo undulatis, superficie hinc illic incrassata. Col. c. Veitch. *H. G. Rehb. f.*

† *Chlorophytum rhizomatosum*, n. sp.—Rhizomate longe perennis crassitie digiti; foliis subdistichis linearibus firmis glabris acute cuneatis; pedunculo brevi furcato; racemis erectis confertis; bracteis minutis dehiscentibus, pedicellis brevissimis; perianthio segmentis oblongis obtusis dorso nervis tribus; cruribus percussis; staminibus perianthio aequalibus; antheris linearibus magnis; pistillo foreae aequalibus. *J. G. Baker.*

wide-creeping rhizome, which is about the thickness of a man's finger. In leaves and flower it most resembles the well-known Indian *C. tuberosum*, of which the synonymy will be found fully worked in my monograph of the Anthericeæ in vol. xv. of the *Journal of the Linnean Society*, p. 332. It came from Zanibar, from Sir John Kirk, in 1832.

Rhizome wide-creeping, the thickness of a man's finger, with a greenish epidermis, sending out distant erect flowering tufts. Leaves five or six to a tuft, sub-distichous, linear, falcate, bright green, glabrous, firm in texture, acutely keeled, $\frac{3}{4}$ –1 foot long, $\frac{1}{2}$ inch broad. Peduncle erect, shorter than the leaves. Racemes two, erect, dense, 2–3 inches long; bracts minute, deltoid; pedicels very short, solitary, articulated. Flower white, $\frac{1}{2}$ inch long; segments oblong, obtuse, with three green ribs on the back. Stamens as long as the perianth; anthers linear, $\frac{1}{4}$ inch long. Style white, $\frac{1}{2}$ inch long, rather curved.

J. G. Baker.

CULTURE OF CACTUSES.

HERE in Utah, *Echinocereus phoeniceus*, *Echinocactus Simpsoni*, *Mamillaria vivipara*, var. *Neo Mexicana*, and *Opuntia missouriensis*, stand out in their native places and do well with frost 22° below zero; but they grow upon well-drained gravelly hillsides, and are usually covered with snow from Christmas to the following May. So much for the iron-clad Cactus. Then there are *Cereus Engelmanni*, *Echinocactus Whipplei*, E. *Sileri*, E. *cyliodracus*, *Opuntia rutila*, *Mamillaria chlorantha*, that grow with the *Agave utahensis* on the sandstone ledges, in many instances with hardly sand enough to cover their roots, and there are two Cactuses that stand out exposed to the fierce heat of the summer sun where hardly a lizard is to be found, with the thermometer down to zero in the winter.

In the Beaver Dam Mountains, west of St. George, growing in the sand on the limestone ledges with *Yucca brevifolia*, are *Echinocactus Johnsoni* and E. *Le Contii*. In this locality there is but little snow, but the thermometer often falls within 10° of zero.

The question has been asked of me very often lately as to when it rains and when it does not. Snows and rain commence about December 15 and continue until about May 1, when a period of drought sets in, lasting until about July 24. This being a holiday, it always rains, and it continues to rain until the last of August. At the higher altitudes, where the first-named Cactus grows, frost usually follows a rain, let it be at what season of the year it may. Last night, June 11, ice formed a quarter of an inch thick, following a very unusual rain storm that came off last week.

A few years since I had a number of *Agave utahensis* that I wanted to keep until I could get orders for them. I planted them with a *Mamillaria vivipara* in a box of clay soil, and told the lady in charge of the place to water them occasionally. I was away for some two or three months. When I returned to get my *Agave* plants to send away, I found them swimming in water, and was informed that they had been sitting on a back porch, where they got the morning sun only with a pail of water from the well every morning. I expected that they were ruined, but to my surprise they were well supplied with new roots. I have, when collecting Cactus, set out on dry ground in favourable locations what I had left over after filling orders; but I have never had the good fortune to have any of them root as well as the *M. vivipara* set with the *Agave* noted.

A number of the readers of the *Gardeners' Monthly* have asked me to tell them about the soil that our Cactuses grow in. *Cereus Engelmanni* arrives at its greatest perfection on the ragged edges of limestone ledges with a soil of clay and gravel. *Echinocactus Johnsoni*, E. *Le Contii*, *M. chlorantha* and *Opuntia rutila*, delight in a south-westerly exposure on the side of sandy and gravelly ridges with bed rock of limestone. *Echinocactus cyliodracus*, E. *xeranthoides*, E. *Whipplei*, *Opuntia chlorotica*, *M. pheliosperma*, are found on the west side of canyons facing the morning sun, but never on the east side; sand, on sandstone ledges generally. *Echinocactus Sileri* on low hills, soil rotten gypsum. *Echinocactus phoeniceus*, E. *Simpsoni*, *Opuntia missouriensis*, gravelly soil facing to south-west, or on top of high gravelly hills about the rim of the great basin. *Mamillaria vivipara Neo Mexicana* gain their greatest perfection

in very tight clay soils amongst Sage brush. A. L. Siler, *Ranch P. O., Kane Co., Utah, June 12.*

[This account of the kind of soil and the habits of some of our native Cactuses will be very interesting to the lovers of these curious plants—a continually increasing circle. What Mr. Siler says about water for Cactuses we can confirm by experience. Even pot Cactuses we plant in the open ground during summer, and, whenever we have very hot weather for a few successive days, pour on the water, and it is wonderful how they seem to enjoy it.]

In this section we find *Mamillaria Nuttalliana*, *M. vivipara*, *Echinocactus Simpsoni*, and *Opuntia missouriensis* entirely hardy, though singularly enough it never flowers. This peculiarity follows others. In Southern Utah the writer dug up (with the swingletree of a wagon, while his wife held the horses' heads) three large masses, weighing 20 lb. each, of *Echinocactus phoeniceus*, then covered with their magnificent wine-glass shaped flowers. On returning from the Pacific they were found safely at home. Though they are in charming health they have not had a flower the past two summers—though the dry mesa soil on which they were growing has been imitated as nearly as possible. Under culture we cannot always rely for success on imitating natural conditions. We must learn from experience. Ed. G. M.] *The Gardeners' Monthly.*

TERRESTRIAL ORCHIDS OF SOUTH AFRICA.

(Continued from p. 136.)

CORYCIUM.—Flower hooded. Sepals membranous, narrow, the upper one either free or united with the petals into a hood; lateral sepals connate, spreading. Petals concave or saccate, unlike the sepals, fleshy. Labellum adnate to the face of the column, entire, with or without a large simple or 2-lobed appendage. A small genus, with narrow or lanceolate leaves clothing the whole of the stem. Flowers small and numerous, in a very dense spike, dull coloured; not so ornamental as some of the other genera.

C. bicolor, Lili. —Leaves lanceolate-attenuate, crisped at the edges. Flowers small in a long rich dense spike, pale yellowish and brownish. Labellum broader than long, notched at the apex. A native of the southern districts of Cape Colony, flowering in October and November.

C. crispum, Sw. —Leaves lanceolate-attenuate, crisped at the edges. Flowers not so crowded as in *C. bicolor*, and larger, yellow and brown. Labellum spatulate, slightly notched at apex. Sandy hills near Gröne Kloof, &c., at about 300 feet elevation. It flowers in October.

C. excisum, Lili. —A small species, with linear-lanceolate leaves, and a short dense spike of small flowers, with an oblong lip, deeply notched at the apex. Sandy plains at low elevations near Cape Town. Flowering in November.

C. orobanchoides, Sw. (*Bot. Reg.*, 1838, t. 45). —Stouter and taller than the last. Leaves lanceolate, slightly undulate, but not crisped. Spike dense. Flowers greenish-yellow, purple at the mouth of the hood. Lip transversely oblong, slightly notched. Sandy places on the Cape peninsula, at low elevations; flowering in September and October.

CYMBIDIUM.

Sepals and petals subequal, free. Labellum free, spurless, entire or three-lobed, with crests or tubercles on the disc or front lobe. Pollen masses two, waxy, united to one gland. A large genus, of variable habit and considerable geographical range, the bulk of the species being natives of India and the Malay Archipelago, a few in Australia, New Caledonia, and Africa. Of the five South African species all but one are terrestrial, of which I only note the two commonest.

C. aculeatum, Swartz. —Leaves linear-acute, plaited, 6–12 inches long, 2–3 lines broad. Flower-stems appearing with the leaves, clothed with lanceolate acute sheaths, 1– $\frac{3}{4}$ inches long. The flowers are pale yellowish, about $\frac{1}{2}$ inch in diameter, and collected in a short, compact spike. This species appears to be common in several parts of the Cape Colony. On Table Mountain it grows in heathy and grassy places at from about 2200 feet to 3500 feet elevation, and on Mount Boschberg, in the eastern part of the colony, in stony, grassy places, up to 4800 feet elevation. It flowers in December and January.

C. Buchananii, Rehb. f. —This resembles the preceding in habit, but is stouter, taller, and the leaves broader, the flowers are more numerous, and in a longer spike, the sepals are green, and the petals and lip blackish crimson. It is a native of Natal, Orange Free State, Griqualand East, &c., and is probably a more striking plant than *C. aculeatum*. It appears to grow at high elevations, up to 5000 feet.

DISA.

Dorsal sepal larger than the others, helmet or hood-shaped, with one long or short spur, or sometimes merely saccate, or quite spurless. Labellum free, varied in form, spurless.

A large genus, chiefly South African; varied in habit, flowers solitary, few or numerous in a spike. Some of the finest of the South African Orchids belong to this genus, of which those enumerated below are among the handsomest, though several other species would be worth growing, and would look well in a mass.

D. atricapilla, Bolus. —Stems 6–10 inches high, laxly clothed with linear-lanceolate sheathing leaves, somewhat folded lengthwise. Flowers, $\frac{1}{2}$ inch in diameter, in a small dense corymb; dorsal sepal white, lateral sepals blackish except the basal part of the upper edge which is whitish; petals purplish? South-western districts, Worcester, &c. "Moist grassy places near streams," and Mr. Cooper once found it at Slang Hoek, Goudine; "growing in a stream 3 or 4 inches deep, the water being quite hot to the hand." It flowers about December and January. See *D. melaucua*.

D. barbata, Sw. —Leaves slender, grass-like, erect. Stem with four to six distant adpressed membranous sheaths. Flowers, one to four, about an inch in diameter, nearly white, the dorsal sepal with a few blue veins, and a short greenish conical spur. Labellum beautifully cut into a deep fringe of slender, slightly clavate filaments. It grows near Cape Town, on the sandy downs, a little above sea-level, and flowers in October.

D. Charpentieriana, Rehb. f. —A highly curious species. Leaves grass-like, narrow, linear, radical; stem 12–18 inches high, with five or six distant adpressed membranous sheaths, and a lax few-flowered spike of bluish-purple flowers, about $\frac{1}{2}$ inch in diameter; the spur is short and conical, but the greenish labellum is 2½ to 3 inches long, very slender, less than one line broad, and ending in a number of thread-like, slightly clavate divisions. This appears to be a rare plant, but grows in the south-western region at an elevation of about 1300 feet, and flowers in November. It is well worthy of cultivation on account of its very peculiar looking flower, which is scarcely approached by any other species except *D. spatulata* and *D. multifida*.

D. cornuta, Swartz, *Bot. Mag.* t. 4501. —A fine robust growing species, usually a foot high, the stem closely beset with broad lanceolate acute leaves, which towards their bases are transversely marked with irregular red brown bars or more or less confluent spots. The flowers are about $\frac{1}{2}$ inch in diameter, and arranged in a rich dense spike; the dorsal sepal is dark dull blue, with a $\frac{1}{2}$ -inch long curved green spur, greenish inside; the lateral sepals are white, and the short obovate lip velvety purple-brown, with a white base. "A very hardy plant, with a remarkable range, both vertical and horizontal, reaching from sea-level to the summit of Table Mountain, 3500 feet, and from Cape Town to Grahamstown. It prefers a sandy soil, and flowers from October to January, according to elevation."

D. castornii, Lindl. (*D. megaractis*, Hook. f., *Bot. Mag.*, t. 6329). —A fine handsome species 1–2 feet high, with lanceolate-acuminate green leaves, and a somewhat lax spike of whitish flowers spotted inside with purple, the individual flowers about 1½ inch in diameter, with the dorsal sepal funnel-shaped and going off into a spur $\frac{1}{2}$ inch long. It is a native of Natal and the Eastern districts ranging to an altitude on Boschberg Mountain of 4500 feet.

D. dracuncus, Sw. —This species has a few long, broadly linear, weak radical leaves, and a stem 1 foot high, invested in membranous sheaths with a comparatively short spike of rather large flowers having a slender spur about 1½ inch long or shorter. This is an inhabitant of the South-Western region, and seems to like a sandy soil near the banks of streams, &c.

D. fasciata, Lindl. (*Harv. Thes.*, cap. 1, t. 85). —A beautiful little species, with 2–3 cordate leaves passing

above into 2-3 stem-sheaths; the leaves are bright green above, dull red beneath, the sheathing part and stem-sheaths being pale greenish or whitish, prettily banded with dull red. The stem bears 1-2 flowers, 1-1½ inch in diameter, the sepals and labellum spread out flat and are pure white with one or two purple dots on the middle of the lateral sepals and labellum; the small hatchet-shaped petals are tinted with yellow and dotted with red and dark brown. The flowers are large for the size of the plant, and chaste in appearance, the tubers are very small, not larger than a Pea. It grows in light soil in moist places and between rocky ridges on Table Mountain, at an elevation of 2000 to 3000 feet. This appears to be very uncertain in its appearance, as Mr. Bolus states that it was not seen by him "during ten years until October, 1884, when a fine season with unusually continued rains in October seem to have brought this into flower."

D. ferruginea, Sw. (Hook., *Icon. Pl.*, iii., t. 214).—Leaves radical, grass-like; stem a foot or more high, with distant acuminate sheaths, and a shortly ovoid or conical dense spike of brilliant orange flowers, about ½ inch in diameter, with a slender spur ¾ inch long. Dry places on mountains in the neighbourhood of Cape Town and elsewhere, at an elevation of from 2500-3500 feet. "It does not flower till long after the rains are over, viz., in February. The tubers are buried rather deeply, or lying under stones."

D. filicornis, Thunb.—One of the smaller species, 5-7 inches high, with numerous linear radical leaves about an inch long, and acuminate erect stem-sheaths. The flowers are about ¾ inch in diameter, deep rose-coloured, and vary from two to ten in a lax spike. It grows in the neighbourhood of Cape Town in mountainous places, up to, and perhaps beyond, an elevation of 1100 feet. "In moist, sandy places, which become dry after the rains." It flowers about October to December.

D. graminifolia, Ker.—This, the "blue Disa," as it is sometimes called, is an exceedingly pretty species. It has numerous, very narrow, long grass-like leaves, a stem 18 to 24 inches high, with distant, membranous, acuminate, adpressed sheaths, and a lax spike of brilliant blue flowers about an inch in diameter; the spur is short, and the lip entire. "On the sides of Table Mountain, &c., from 1800 to 3000 feet elevation, growing in rather stiffer soil than the usual light sandy. It flowers in February and March, and is very abundant in some years."

D. grandiflora, L.—This is a synonym of *D. uniflora*, which see.

D. longicornu, Linn. f.—A handsome showy plant, 6 to 10 inches high, with four to six narrow, lanceolate, somewhat stalked radical leaves, and one to three stem-sheaths. The flower is solitary, lavender coloured, and 1½-2 inches in diameter, the dorsal sepal, including the spur, being 2-2½ inches in length. It is somewhat surprising that this fine and handsome species has never been introduced into cultivation, as, next to *D. uniflora*, it has the largest flowers of any of the genus, and several of them together in a good sized pot would certainly make a very handsome appearance. "It grows in crevices of damp rocky ledges on Table Mountain, that face away from the sun and are dripping with moisture during the winter and spring months—that is, about June to October; it does not require much soil, but its tubers require to be covered with moss." It flowers in December and January.

D. ingens, Bolus.—This closely resembles *D. graminifolia* and *D. venusta* in foliage and habit, and the three would scarcely be distinguishable when not in flower; the flowers, however, are distinct from either and more numerous. The dorsal sepal and its short conical spur is of a metallic greenish-blue, the lateral sepals and petals dull purple, and the labellum green; this latter organ is deeply cut into a fringe of numerous, somewhat flabellately branched, slender segments. This grows on the Cape Flats in moist sandy soil among Restiaces, &c., at an elevation of about 100 feet, and flowers in October and November. The beautifully fringed green lip renders this rather a striking plant; the flowers are about ¾ inch in diameter.

D. melaleuca, Sw. (Harv., *Thes.*, cap. i., t. 81).—In stature, foliage, and in general appearance, this pretty Orchid much resembles *D. atricapilla*, but the colour of the flowers is different, all the sepals being white, whilst the petals and labellum are blackish, except at their base and apex, where they are whitish or pale yellowish. Like *D. atricapilla* this is found

"in moist grassy places near streams" in the south-western districts. On Muizenberg Mountain it grows (with *D. atricapilla*) at an elevation of 1400 feet, and flowers in January. Mr. Bolus writes that in some years *D. melaleuca* is abundant, but *D. atricapilla* is rarer.

D. patens, Thunb.—A dwarf species, 3-6 inches high, with several radical linear leaves, about ¼-1 inch long, and adpressed stem-sheaths, with acuminate, sometimes slightly spreading points. The flowers are solitary, or from two to eight in a lax spike; they are bright yellow, and about ½ inch in diameter. This grows on Table Mountain, Muizenberg Mountain, &c., at an elevation of about 1500 feet, in moist sandy places which become rather dry after the rainy season, flowering in January and February.

D. polygonoides, Lindl. (*Bot. Mag.*, t. 6532).—Leaves lanceolate acute, passing into sheaths on the stem, which is 9-24 inches high, the dense cylindrical flower-spike occupying from a quarter to a half of it. Flowers small, but crowded, varying in colour from bright yellow to brick-red and scarlet. This species is a native of Natal, Zululand, &c., where it appears to be common, growing in marshy places in what appears to be a sandy peat, flowering in October. Grown in a mass this would make a good show; the *Bot. Mag.* plant seems to have been a poorly developed specimen.

D. pulchra, Sond.—A showy and distinct-looking species, with rather rigid linear-lanceolate acuminate leaves, rather closely pressed to the stem, and a fine lax spike of large pink flowers, an inch or more in diameter; the spur is slender, and ¾-1 inch long. It is a native of the eastern frontier districts and the Orange Free State, and from the appearance of dried specimens would seem to be a very handsome plant.

D. racemosa, L. f.—A fine tall species, 15 inches to 2 feet high, with several lanceolate-acute radical leaves, about 3 inches long by ½ inch broad, passing into sheaths on the stems, and a several-flowered lax, usually one-sided spike of handsome rose-purple flowers, 1¼-1½ inch in diameter. Next to *D. grandiflora* this is perhaps one of the showiest of the genus, for although the flowers are not so large as either *D. grandiflora*, or *D. longicornis*, yet they are of goodly size, and being several together, would appear to be effective. It seems to have an extended range, as it grows on Table Mountain and as far eastward as Grahamstown. I have no notes as to habitat, but it appears to grow in wet, sandy soil, and has thick fleshy roots; its tubers I have not seen.

D. Richardiana, Lehm.—A pretty delicate little species, 3 to 4 inches high, with narrowly elliptic, green uspotted radical leaves, and adpressed stem sheaths. Flowers ½ inch in diameter, in a small dense flat-topped head, white, with just the tips of the sepals tinted with pink. This charming little Orchid grows on Table Mountain, at an elevation of about 3400 feet, inhabiting "the crevices of steep wet rocks dripping with moisture during the winter and spring months (that is about June to October), and usually on the side that faces away from the sun. Very little soil seems to content it, and it likes its tubers covered with moss." It flowers in September.

D. rosea, Lindl.—A somewhat larger plant than *D. Richardiana*, but of similar habit, with elliptic and somewhat stalked radical leaves, acuminate stem-sheaths, and a sub-corymbose head of pretty pink flowers, about the same size individually as those of *D. Richardiana*, but arranged in a rather more lax and larger head. It grows on Table Mountain in similar situations and will require the same treatment as *D. Richardiana*.

D. spatulata, Sw. (Harv., *Thes.*, cap. i., t. 86).—An interesting little species, about 6 inches high, with linear grass-like radical leaves, two or three membranous acuminate stem-sheaths, and about two flowers, which appear to be purplish, and are remarkable from the lip having a slender stalk ¼ inch long, and an extended cordate, or somewhat three-lobed blade. It grows at Tulbagh.

D. tabularis, Sond.—A small species about 6 inches high, the stem clothed with erect linear green leaves 2-4 inches long. Flowers rather more than ¼ inch in diameter, crowded in a cylindrical spike 3-4 inches long, the dorsal sepal with a very short spur, reddish brown, with pale yellowish edges, lateral sepals yellowish with brown margins. A pretty little Orchid if grown in a mass. It grows in moist places on Table Mountain, 2400-3400 feet above the sea, flowering in November and December.

D. tenella, Sw.—A pretty little species, 3-4 inches high, with erect linear twisted leaves 1½ to 2 inches long, and a close flower-spike 1 to 2 inches long of small flowers, sweetly scented and coloured different shades of purple and lilac. Mountainous places in the south-western part of Cape Colony, flowering in August.

D. uniflora, Berg. (*D. grandiflora*, L., *Bot. Mag.*, t. 4073).—This, the finest of all known Disas, is sufficiently well known to Orchid lovers as to need no description, but it may be well to give an account of its natural habitat (for which, as already explained, I am indebted to the kindness of Mr. Bolus), as it may be of use in conveying a hint to those who cultivate this fine Orchid. In Nature it grows along "the banks of streams which are wet or moist from May to November, and which become drier from November to May, but never so dry as most other Cape Orchids. On Table Mountain its range is from about 1500 to 3300 feet above the sea; but this is a locality where the temperature varies according to elevation very much less than on inland mountains. It flowers in January and February."

D. venosa, Sw.—This is very similar in appearance to *D. racemosa*, and might easily be passed for it, but it is fewer flowered, the flowers are more distant, the dorsal sepal narrower, and the lateral sepals are distinctly elbowed towards their base, which is not the case in *D. secunda*. The flowers are about 1½ inch in diameter, rose coloured, and showy. Not a common species; it grows in marshy places on Table Mountain, &c., at an elevation of from 1300 to 2400 feet, and flowers in December.

D. venusta, Bolus.—In foliage, habit, and general appearance, this much resembles *D. graminifolia*, and is equally pretty; the sepals are of a cheerful blue, as in that species, but the lip is creamy-white, and beautifully cut into a fringe of clavate filaments. It grows among shrubs, Heaths, &c., on the sandy plains called the Cape Flats, about 100 feet above sea level, and flowers in October and November.

D. Zeyheri, Sond.—A very striking species, 12 to 18 inches high, with grass-like, linear radical leaves, numerous green or purplish stem-sheaths, and a 2 to 3 inch long spike of about twelve to twenty scarlet flowers. The diameter of the open part of the flower is about one-third of an inch, but the dorsal sepal is prolonged into a stout, cylindrical, erect spur, 1-1½ inch long. A native of the south-eastern region of Cape Colony, growing in crevices of rocks on mountains in the division of Somerset at an altitude of 4500 feet. This is a very remarkable-looking species, the long, stout, brilliantly coloured spurs standing erect around the spike give it a very peculiar appearance, and if it could be introduced and successfully cultivated would form a conspicuous and attractive plant.

DISPERSIS.

Dorsal sepal united with the petals into a hood; lateral sepals spurred or saccate, spreading, free or connate. Labellum clawed, adnate to the face of the column, ascending between the lobes of the anther, with or without an appendix. A curious genus, of several species, variable in habit; natives of India, Madagascar, Tropical and South Africa. They are remarkable for the way in which the narrow labellum passes between the anther cells up into the hood. Some of them appear to be ornamental, of which those here enumerated are some of the principal in South Africa.

D. capensis, Sw.—A slender plant 6-12 inches high, with a more or less bairy stem bearing two distant narrow lanceolate leaves at about the middle, and a solitary flower about 1½ inch in expanse with long pointed sepals and concave galea. The colour of the flower seems variable, most generally purple, sometimes "yellow," or "white with pale green helmet." This species is common near Cape Town "on the downs in pure sand and on the mountain sides" apparently at low elevations; it flowers in August. Massed in a pot this would be rather effective, and ought not to be difficult to cultivate.

D. Fanningii, Harv. (Harv., *Thes.*, cap. ii., t. 171).—Stem a foot high with three lanceolate acuminate leaves, embracing the stem by their cordate bases. Flowers 1-6, delicate, white, ¾-inch in expanse; bracts leaf-like. Galea helmet-shaped, obtuse. A native of Natal, Orange Free State, and Eastern districts. This appears to grow in very sandy soil, but probably requires more moisture and shade than the preceding species. It flowers in February.

D. paludosa, Harv. (Harv., *Thes.*, cap. ii., t. 143).—Stem about a foot high, 1-5 flowered, with three narrow lanceolate acute leaves, and smaller leaf-like bracts. Flowers about ¾ inch in expanse, galea

broad, concave, purple, with green along the margins, near which are rows of dark purple points, lateral sepals acuminate, with curved spurs, dull purple, as are also the ovaries. This species grows on Table Mountain, &c., "in shallow running water or boggy places, but not in stagnant pools," and flowers in October. Harvey states that "it throws out subterraneous fleshy runners, that form buds at a distance from the parent tuber, thus increasing after the manner of Couch-grass, although not so rapidly." There are several others of this curious genus, but not such as would probably find favour with the general public, being generally more curious than beautiful. *N. E. Brown, Kew.*

(To be continued.)

CORNER OF CONSERVATORY AT BLETCHLEY PARK.

THIS conservatory (of which an interior view is represented in fig. 49) is erected in the angle between

heat is invariably lost in underground trenches; while the ugliness of the large black pipes is hidden by a trellis-work screen framed in the stage. The heavy lines of framing necessitated by architectural requirements are relieved by mouldings and "loothings," which have a good effect, avoiding the objectionable use of strong lines of colour.

Altogether, we think Mr. Warhurst (who commenced his London work under the training of Sir Joseph Paxton) may be complimented on the way he has carried out this work, and also the range of vinerias, plant and forcing houses, in the adjoining garden.

CHELSEA BOTANIC GARDEN.

It soon becomes evident to the visitor that the leading object of this garden's existence is the cultivation and representation of the leading medicinal and other economic plants. Out-of-doors a miscellaneous

which yield the gamboge of commerce, and differ only in the number of parts in the flower. Some specimens of the camphor tree are also prominent. Its proper appellation is *Cinnamomum camphora*, but it has been subject to change from the time of Linnæus downwards. It merely differs from the type by its perfectly deciduous perianth and scaly buds. The Calabash tree is a stumpy unattractive plant at all times, especially when the narrow clustered leaves have fallen; but economically it must be of vast importance to the natives of Tropical America, where it grows. The woody shells of its large fruits are made into various domestic utensils, and are sometimes beautifully carved and painted.

Plants producing tonic bitters and other similar medicinal properties are represented by *Quassia amara*, *Picræna excelsa*, and various species of *Cinchona* from which quinine is manufactured. Aromatic, carminative, and other flavouring materials are obtained from plants represented by *Canella alba*,

FIG. 49.—INTERIOR OF CONSERVATORY AT BLETCHLEY PARK.

dining and drawing-rooms of a many-gabled house, recently built on the site of an old farm-house at Bletchley Park for H. S. Leon, Esq.

Externally the building is almost as varied in outline as the mansion, of which it may be said to form a portion; and as good views of the park are to be had from the widows, the whole of the sides are glazed with polished plate instead of the sheet glass ordinarily used, which distorts the outlines of anything seen through it. The leaded lights, too, are made with clear glass, not the usual coloured patterns, which harmonise with nothing natural in flower or plant. Being situated at the north-east corner of the house, the troublesome question of blinds, or shading, has not had to be considered, the roof being of ribbed glass in large panes.

As the conservatory is high, and it was desired to have many of the smaller plants in pots (which would be lost comparatively if planted out in the large beds behind), a portion of the space is fitted with a flat stage of such a substantial-looking character as to be mistaken for stone. Underneath this stage the hot-water pipes are carried above the floor-level, as much

collection of all sorts meets the eye, such as is to be met with in botanic gardens generally, and in this instance is needed for the use of students attending the lectures, and others. The houses, on the other hand, are filled to overcrowding with plants, which, although not absolutely confined to those of economic importance, are nearly so. One objectionable feature is noticeable, that is, the deficiency of room for the plants to display anything like their natural habits. This is not a solitary instance of an attempt to grow trees, shrubs, herbaceous plants and climbers, in narrow, low-roofed houses, but is probably a universal complaint, wherever their cultivation is attempted. It is to be regretted, however, that more attention is not devoted to this important branch of a botanical collection.

Conspicuous amongst others in a span-roofed house near the middle of the garden is a large specimen of *Xanthochymus pictorius* in fruit. This it does frequently, and at present the fruits are numerous and vary in size from that of a small marble to that of a pigeon's egg. They are yellow when perfectly mature, and edible, with a delicious taste. The three known species are closely allied to *Garcinia*, the species of

Hlicium anisatum, and *Pimenta officinalis* — the latter name hampered with a labyrinthic synonymy. There is a specimen of *Bertholletia excelsa*, the Brazil-nut tree, seldom seen in cultivation. *Strychnos nuxvomica* is an instance of a deadly poison being made a valuable medicine under skilful management; and *S. potatorum* is used for clearing muddy water. Both are vexatious plants to the cultivator, because liable to throw off their leaves if the temperature of the house suddenly suffers depression.

Two rather tall lean-to houses are occupied with large specimens in pots or planted out, but to mention a title of them in any of the houses would occupy a considerable time. The leathery-leaved *Clusia flava* is fruiting, a property not shared in by many of the species, at least in a small state. Large specimens of *Ficus bengalensis*, *F. Sycomorus*, and *F. religiosa* have well nigh occupied their available space. The curious and remarkable habit of *Castilleja elastica* must be noticeable to every intelligent cultivator or keen observer. A short stout leader is annually produced, with several long, stout, lateral branches that assume a horizontal position. These latter in-

variably become disarticulated with the main axis every winter, and fall away, leaving a naked and unbranched trunk. They are morphologically branches, but functionally partake of the character of compound leaves. In striking contrast to this is a fine large plant of *Ruscus androgynus*, whose lengthy stems are well furnished with flattened, leaf-like, evergreen branchlets. This highly ornamental plant is suitable for cultivation in large cool conservatories, but unfortunately is seldom seen outside botanic gardens.

Immediately outside one of these houses is a large specimen of the singular Conifer, *Ginkgo biloba*, that has battled with the smoke and dirt of a London atmosphere for many years, and probably owes its existence to the fact of its being deciduous, and thus getting rid of the sooty deposit that settles upon the leaves of evergreen Conifers, and renders their cultivation in towns all but impracticable.

Many other rare or interesting plants are trained against the walls of this compact, closely cultivated garden, amongst which may be noticed *Habitzia tannoides* and *Syrax officinalis*; the former an anomalous member of the Amarantaceae, whose herbaceous stems often climb to a great height and flower most profusely; the latter a large specimen of a plant producing the Gum Storax of the ancients. This kind of Storax is now completely lost to commerce, and its place supplied by Liquid Storax, obtained from *Liquidambar orientalis*. Why this should be the case, however, is not very evident. A low spreading tree of *Koeleuteria paniculata*, with a stout trunk, must not be overlooked, as it is over a hundred years old, and probably the oldest, if not the largest tree in the country.

A miscellaneous collection of herbaceous plants, arranged in their natural orders, occupies the body of the garden, while a rather extensive collection of annuals is cultivated by themselves in the lower part towards the river. *Ilyoscyamus niger*, of medicinal importance, loves the neighbourhood of towns, and is evidently at home here, judging from its frequency, and the fact of its being self-sown. Some fine seedling Carnations and single Dahlias are noticeable. The latter are said to have regained their popularity here.

Last, but not least, I cannot forbear mentioning a cool fernery devoted to the cultivation of British and half-hardy exotic Ferns, a class of plants long studied by Mr. T. Moore, the Curator. What a valuable plant *Athyrium Filix-femina plumosum* would be if its feathery fronds were firmer and more lasting in a cut state! A large bush of *Berberis Fortunei* keeps fresh the memory of Robert Fortune, who gave up the curatorship of this garden in order to travel in China. Many other useful and valuable garden plants frequently crop up in other gardens to remind us of this successful traveller. *F.*

ALPINE PLANTS AND ALPINE GARDENS.

THREE years ago I gave a description of the alpine garden of M. Prévost, Chambéry, near Geneva, in the columns of the *Gardeners' Chronicle*. I thought I should not have to recur to this garden, but on a visit which I made lately, I noticed such an extension and improvement, that it is impossible not to speak of it again.

M. Prévost now puts on one side all alpine plants, properly so called, which spread over the rocks to such an extent that he is obliged to cut them in, in order to occupy himself more with the sub-alpine species, and those which belong to the snowy regions.

Let us run through the garden. Under large and old *Sambucus nigra* M. Prévost has got together all sorts of material suitable for draining his rockery, and has covered these with a loose layer of soil composed of Pine-needles, moss and vegetable earth (humus). He has bordered it with large trunks of trees, arranged pictorially, and over which a tuft of *Linnaea* falls in a most natural way. It is here I saw the largest extent of *Linnaea borealis* that I have ever noticed, and full of flowers; from a distance it looked like a rose-coloured carpet. This tuft measures at least $\frac{1}{2}$ or 2 metres in diameter (4 to 6 feet). It is absolutely covered with *Linnaea*, except in some corners, where *Campanula pusilla* and *Oxalis acetosella* annoy the cultivator by spreading over the plant. At the base of this carpet of *Linnaea* are tufts of *Pyrola rotundifolia* in full flower. I have not seen them more prosperous in a state of Nature. M. Prévost gives

them almost the same soil as the *Linnaea*. One very curious thing to notice is a tuft of *Primroses* on which the flowers appear in a very remarkable state of transmutation. M. Prévost planted some years ago a plant of *Primula Auricularia*, and another of *P. viscosa alba*. Soon the flowers of *P. Auricularia* began to vary and to become very distinct from the type of the species. This year they produced bright rose flowers, and the leaves of *P. Auricularia* were bordered with small teeth, which gave them the appearance of *P. viscosa major*, for the plant has become very large. Now the plant, or the three plants, which have thus varied, are not seedlings produced on the rocks in a wild state, they are the old plants planted by M. Prévost, and are not the result of any kind of hybridisation.

So as not to repeat what I have already said about this garden in No. 452 of the *Gardeners' Chronicle*, I shall only speak of those species not mentioned in that article, or of those whose present condition cannot be compared with what it was then.

Campanula cenisia abounds on the rockery; they are in full flower, but the flowers here are borne on peduncles of varying length, which is not the case on the Alps, or in those which we cultivate in the alpine garden at Geneva. I attribute that to the fact that M. Prévost grows them in a soil with plenty of humus instead of in pounded slate mixed with very little humus, as I do. *Viola cenisia* is also very vigorous with M. Prévost, and I have never seen them so fine even in the Alps.

As to *Androsace lactea*, *carnea*, and *villosa*, they are all over the garden, and appear to be at home there. *Aretia helvetica* is seen here in all positions to the north, south, east, and west. Moreover it succeeds, although always placed in a vertical position and planted in the crevices of the rocks. M. Prévost has also constructed a small rockery specially for cultivating this plant, and there I saw a number of plants which had come up naturally from seed. M. Prévost has placed above these tufts, slates, making a roof, shading the plant, allowing it to remain dry, whilst the roots are kept moist. The same may be said of *Aretia glacialis*, which is in full flower just now, and is very vigorous. *Eritrichium nanum* is as full of flower, and I saw some seedlings of it.

Everything which enters into the category of sub-alpine plants is grown here with great care; *Gentiana bavarica*, *Saxifraga oppositifolia*, *S. biflora*, *Achillea alba*, *Dianthus alpinus*, *Lepidium alpinum*, *Geum reptans*, *Potentilla nitida*, various *Primulas*, *Ranunculus glacialis*, and *R. parnassifolius* seem to grow naturally here.

M. Prévost also makes a speciality of white and pale-coloured flowers; he has introduced into his garden many white varieties of the plants of our mountains which he has found wild—*Aconitum napellus*, with flowers of a very pure white; *Lilium Martagon*, the same; *Globularia vulgaris*, *Erius alpinus*, and *Primula viscosa* flower with him of a pure white. But what struck me most in M. Prévost's garden was his seedlings of alpine plants. *Aretia montana*, *Androsace* of all species, *Eritrichium nanum*, *Primula viscosa*, and a number of others, are raised by him with ease. He sows them in autumn, most of them in the open ground in a bed facing the south. *H. CORCORAN, Geneva.*

VEGETABLE MARROWS.

THIS present season has proved one in which it was needful for growers of these fruitful vegetables to take heed to Mr. Earley's warning with respect to sowing seeds too soon in the open. Certainly the spring was not wet, but it was cold, and although seeds were sown as usual at the end of April, germination was very bad, and not only had many to sow twice to secure a plant, but those who neglected to do so or had no more seed found to their sorrow later that they had largely missed a season.

The practice of sowing seeds of Marrows in the open is not universal, as I know more than one large grower who raises all his plants—some hundreds—by sowing a few seeds in 48-sized pots and keeping them in a frame until the weather is favourable for turning out; these usually have large crops. In other cases—and this is notably the case with a famous grower at Ealing—perhaps, also, with many others—wide trenches are thrown out and filled with manure, which soon heats, and being covered with soil, and seed sown, the seed soon germinates. The beds are, of course, covered with long lengths of frames, and

ere these can be with safety removed fruit is formed. I saw long rows of plants so raised early in July, then some 15 feet across, and producing enormous quantities of fruits, and, of course, thus early securing much better prices than a month later. I tried the open-air sowing this season for the first time, but fortunately had some pot-raised plants as well, and thus filled up where the greater portion of the other seed failed.

No doubt, some small wooden frames a foot square, 6 inches in depth, and having a pane of glass fixed in the top, would give outdoor seed great help and protection, and would not prove costly, as they might be used for many years; still, during the present season the low average temperature which prevailed early proved very detrimental to germination even where some light protection was given. Probably many plants suffered from the drought all the more that spring growth was so slow. *A. D.*

THE CROSS-BREEDING OF CEREALS.

AS the improvement of cereals is a matter of national importance, we are pleased to announce that experiments in cross-breeding different varieties of Wheat have been resumed in this country, for the first time since the operations of Mr. Patrick Shirreff in the same department some thirty years ago. Hitherto the cross-breeding of cereals has been cursorily neglected. It is possible that Thomas Andrew Knight, to whom horticulturalists owe so much, may be in some measure responsible for this, since he maintained that any number of new-raised varieties of Wheat might be raised by merely sowing several sorts in close proximity, whereas, in point of fact, this does not happen, and the florets are, in all ordinary cases, self-fertilised. After close observation on this subject and many experiments at a period when time was cheap and the days longer to us than they are now, we made this entry in our notebook:—"The stamens are fully developed, and the pollen begins to shed before the florets expand, and their task is accomplished before they (the stamens) make their appearance outside the ear." We received therefore with perfect faith the statements of Mr. A. S. Wilson in his paper read before the Botanical Society of Edinburgh, and published in the *Gardeners' Chronicle*, 1873, pp. 362, 400, and March 14, 1874, p. 340, that self-fertilisation is the rule among cereals. Mr. Wilson observed that the flowers of Wheat, Barley, and Oats, open to a slight degree to allow the anthers to protrude. It is then they are seen outside the ear, and any person walking through the corn at that particular period will have his garments smudged with pollen. Mr. A. S. Wilson has found from actual counting of pollen grains, each being a separate cell, that an anther of Wheat contains 6864 grains, that 399,000 of them weigh but one grain, and that an ear of good Wheat produces about 50 lb. of pollen, while an ear of Rye produces about two cwt! "And yet," says Mr. Wilson, speaking of the flowers of Wheat, Barley, and Oats, "they are fertilised before the anthers are visible outside." The clouds of pollen in excess of customary requirements are but the exuberant provision by which Nature has rendered the assurance of reproduction doubly secure. In proportion to the infrequency of cross-fertilisation among cereals, is the chance that artificial crossing of well selected varieties of Wheat—a process, not very correctly called hybridisation—may secure variation with vigour and all the accustomed advantages which result from such operations. For the sake of improving the cereals, why should not agriculture borrow the art and the skill which in horticulture have afforded such marvellous results in improving ornamental plants and vegetables? With regard to the effects of crossing, farmers are aware of the results of matching different breeds of the domestic animals. The offspring of sheep of the same breed, but of different families, will resemble their parents far more closely than in cases of interbreeding between varieties which are more distinct and distant. As with sheep so with Wheat. Mr. C. G. Fringle, of Charlotte, Vermont, United States of America, crossed two widely separated varieties called the Black Sea Wheat, a full bearded variety, and the Golden Drop. He selected the former as one of the very hardiest varieties ever cultivated in America, one which most successfully resists attacks of insects and fungus, and best endures bad farming and indifferent seasons; but its quality is below the

average, and he, therefore, fertilised it with the superior Golden Drop, hoping to impart to the offspring the hardness of the one sort and the fine quality of the other. The results of this far-off cross gave him such a medley of varieties that he spent four years in rigid selection of the most promising among them before they consented to reproduce themselves true from seed. But even if far more time had been required in producing an improved breed, it would hardly have discouraged the experimenter, considering the immense value of the Wheat crop of the world, and especially of the United States. Mr. Pringle's relative, Mr. F. Horsford, of Charlotte, is now following in his steps, and has already placed upon the markets improved varieties both of Wheat and Barley.

It seems to us, however, that very few farmers will be likely to expend the time and care that are necessary for the improvement of the cereals by cross-breeding. Mr. Shirreff's mantle is perhaps more likely to fall on some enterprising firm of seedsmen having professed hybridisers in their service who are familiar with the most delicate manipulations connected with their art. Agriculture is already deeply indebted to the seedsmen for improvement by cross-breeding and selection of Turnips and other "root" crops. A wide and hitherto almost unexplored field is still open to them in the crossing of cereals and of various forage and leguminous crops. We have, therefore, watched with great interest the experiments in crossing different varieties of Wheat, which during several years have been in progress at Messrs. Carter's trial grounds at Forest Hill. The results this year look promising. Vigour has certainly been attained, and other merits, such as superior quality, will, we trust, be made manifest after the harvest.

FRUIT CULTURE.

PEACH AND NECTARINE TREES IN POTS AND PLANTED OUT.—I have for several seasons sent seasonable notes on orchard-house culture, and this mostly at a time when we had a very large orchard-house, containing a mixed collection of fruit trees entirely in pots. Now we are growing them both in pots and planted-out. Pot trees require considerable attention during the growing season, but their culture is most fascinating, and when one is sufficiently interested in the work labour is a pleasure. The quality of the fruit obtained from well grown pot trees is in every respect equal to that grown any other way. We have now cleared off all the fruit from both the planted out and pot trees in the earliest house. This allows the trees to be thoroughly cleansed from red-spider by the garden engine or syringe. They should be thoroughly washed as soon as the fruit is removed, and as I have repeatedly stated that all trees requiring to be repotted should be attended to soon after the fruit has been gathered. By that time the growth has been made, and the blossoms buds are in course of formation. The roots are in a highly active state at this time, and they soon lay hold of the fresh compost, running freely through every part of it before the end of the season. The fruit in the late house is now ripening, and producing a good succession; as it is coming in quite fast enough, we keep the ventilators open night and day to their full extent. Under those conditions the fruit is of excellent quality. We look over the whole crop daily, and gather such of it as can be easily removed, into flat baskets. A layer of cotton wadding is placed in the bottom of the basket, and over it a sheet of clean soft paper. The fruit is laid on it carefully, and need not be removed again until it is ready for use. The planted-out trees trained to a trellis when in a young state, have a tendency to make too vigorous growth. This is checked by stopping the gross growths in an early stage, and causing them to break again into several weaker shoots. The shoots must be well thinned out during the time of growth, and each ought to be well exposed to the sun. Some people tie the young shoots far too close together in summer, and at pruning time cut more than half of them out. This is a bad system, and cannot be recommended under any circumstances. It is always necessary to look over the trees in winter, pruning knife in hand; but all or nearly all the thinning out of the growths must be done during summer.

The harder fruit trees, such as Plums and Pears, succeed well if grown in the house until the blossoms are set, and the fruit firmly established on the trees. They may then be taken out-of-doors and placed

in a warm position, the pots plunged to half their depth in cocoa-nut fibre refuse. They require plentiful supplies of water at the roots, and the leaves should be kept quite free from insect pests. Excellent Pears of sorts that do not ripen well altogether out-of-doors, will produce good fruit when treated in this way. The Plums are generally large in size, well-coloured, and excellent in quality.

Cherry and Apricot trees have to be grown in a house by themselves, or they must be grown in a light part of the house set apart for Peaches and Nectarines. They require a dry atmosphere when in blossom, and a much drier atmosphere and a free circulation of air afterwards; neither do they like so much water upon them from the syringe; indeed, it is better not to syringe Apricots at all. J. Douglas.

The Apiary.

I PROMISED in my last to give instructions this time how to take the honey and double-up stocks for winter. And here the benefit of the modern system is at once apparent, for we do not kill the bees. One old lady said to me once, that if the bees were not killed that same day there would be too many. Do not trouble yourself about that.

The honey season is now over in all parts of our country, except where there is Heather, so that we may at once proceed to take our honey.

If you are afraid of stings, put on your gloves and veil, light your bellows and walk to your hives. Do not be at all excited, but what you do, do in a quiet determined manner, with no jarring, but as quickly as possible. If you are going to remove sections, just lift off the covering gently, and puff a little smoke over the bees; they will at once rush downwards, instead of flying out. If your sections are in crates, twist the crate about gently, so as to loosen the prothesis, and when you find you have disconnected the crate from the frames, remove it bodily, and cover up the frames. Some people take the sections to a distance, but I do not do that. Lift out the sections one at a time, sweep off the bees with a feather into the hive, or in front of the hive, and as the sections are cleared of bees, pop them quickly into a box with a lid, and when you have finished take them right away indoors. The bees will all quietly go home.

If you want extracted honey go to the hives in the same way; lift the quilt gently, puff smoke over them to drive the bees downwards, and lift out a frame that has plenty of sealed honey in it, and shake the bees down into the hive, sweeping off any that may remain on the comb with a feather. Shut it up immediately in a box. A special comb-box is very useful. If you are not going to double your hives, you can take out all the frames except six or seven—the latter number is the safest. You can then cover them up. They will be perfectly safe with that quantity of honey all the winter. Some people say that it is as cruel to take the honey as to kill the bees; but this is not so. If the bees have as much honey as they want, what more is required? Enough is said to be as good as a feast. Besides, if there is honey to be obtained, bees will fill their hives, whatever their size. I must leave the doubling till next time, when I will also give some hints about extracting the honey from the frames. Agnes.

THE EXTINCTION OF SPECIES.

At the last meeting of the American Association Mr. Meehan read a paper on "The Extinction of Species," of which the following is an abstract. In it he endeavoured to point out that, under what had come to be called the law of environment alone, which had been called into account for the rise and fall of species, things could hardly occur with the method and regularity which we saw prevailing everywhere around us.

It was enough to show that, under the law of absolute selfishness which was involved in the theory of a struggle for life, and the doctrine of mere accident, which was all there was in environment, there could not be order or system except under intelligent direction and foresight. Instead of selfishness, selfishness was manifest in the actions of living things; and, so far as vegetable life could be compared with animal life in its behaviour, unselfishness prevailed.

If we now glanced at the ratio of deaths at various ages we should see that no advance had been made through all the long ages in a victory for humanity over death. A few years had been added to the average duration of life, but the proportion of deaths at various ages remained the same, in spite of the great advances in knowledge of the medical sciences.

In like manner in births the average proportion of the sexes continued about the same in all ages and climes. It must be evident that a mere chance co-ordination of environment or an undirected struggle could not result in such systematic order.

Looking at plant life, he thought he could discern absolute provision for death; and, if so, this would indeed involve a weakness in the prevalent idea that a mere struggle for life, or conditions of environment, were the sole factors in the origin of species. Colour was an element of extinction, to a great extent. Fruit did not colour till near maturity. Leaves coloured when about to die. The petals of flowers were but modified leaves, and had far less hold on life than the leaves out of which they are transformed. While a leaf might have vital power enough to live three months, three weeks would witness the birth and death of the transformed leaves or petals. The races of coloured flowers, also, had, evidently, a shorter life than those with inconspicuous ones. Just in proportion as they are invested with bright colours do they seem to become imbecile, and unable to take care of themselves. Many fail to produce seed, except through the friendly aid of insects; and, when they find themselves in localities where their special insects cannot attend them, they barely hold their own by offsets, or finally die away. If, as seems probable, coloured flowers have been evolved from inconspicuous forms, we see that it has been with limited facilities for running alone in the world, and by so much an advance on the road to extinction. One of the most interesting chapters in Darwin's treatise on this subject is where he shows that, in the highly-coloured order of Orchidaceae, the amount of extinction must have been enormous; and, in comparatively recent times, dichogamy was also referred to as evidently an agent in the law of extinction. This disarrangement of simultaneous maturity in the sexual organs of flowers had been traced in a great degree to questions of temperature. The male organs were excited to growth under a lower temperature than required by the female. In climates or seasons when the warm spring came suddenly, the pistils would mature simultaneously, or before the stamens. In climates or seasons where milder winters occurred before the spring-time set in for good, the males would mature before the female. In Pennsylvania the catkins of the Hazel bush, or of some Coniferae, were often thus brought to maturity long before the females appeared, and there were no seeds in such seasons. The facts were indeed well known. The operation of such a law on the confinement of a species to a certain locality, or of total extinction, in case of a change of its own climate, was apparent. It was certainly a law of extinction which no struggle for life could prevail against, whether we admit that the conditions were under intelligent guidance, or mere accident. The plants had taken on, under some evolutionary views, conditions which only insured the more speedy destruction of the species. There was no chance for any one developing some "profitable" element that would fit the race to be better adapted to the changed conditions. Insects, or the wind alone, could aid such dichogamic changes in some few instances; but how when the difference in time was so great that the fertilising element was wholly lost? Mr. Darwin has frankly stated that "If we ask ourselves why this or that species is rare, we answer that something is unfavourable to its conditions of life; but what that something is we can hardly ever tell." We cannot tell if we are to look at the selfishness which is at the foundation of the origin of species by "profitable efforts," or the accidents of environment; but, when we see that colour and dichogamy are directly in the line of unfavourable conditions to easy and fruitful reproductions, and that, in whatever way we look at it, death is as orderly and systematic as life itself, why should we not be permitted to look about for some influencing cause where Mr. Darwin professes to be unable to find an adequate one? He thought an unprejudiced view of the whole question would lead to the great probability, at least, that there was some power leading all things forward into one harmonious effort,

and to which the life or death of the individual was wholly subservient; and we might even go so far as to say that natural science had advanced so far as to take in to itself many of the subjects which were supposed to be the special prerogatives of natural theology. *New York Independent.*

FRUIT NOTES.

FLUED PEACH WALLS.—There are some old contrivances connected with gardening that have been all but given up which might, with advantage, have been still retained. Amongst them are flued Peach-walls. In many old gardens where such walls exist the flues have been allowed to get out of order, and in others, where they are still in a workable condition, they are never used. In parts of England where the climate is such as to enable the wood in most seasons to get sufficiently ripened to insure its blooming, dependence is now altogether placed on some or other of the various protecting materials used to preserve the bloom in spring, but which much too often are found insufficient to secure a crop. Repeated failures have not unfrequently ended in an outcry to the effect that Peaches on open walls could so little be depended on that to secure crops it was necessary to cover the trees with glass, or in other words to build houses for them, which houses, unless provided with heating apparatus, are so far from sure of attaining the desired object that blanks occur through the natural consequence of the bloom being brought on to open sooner than it would in the open air and getting destroyed by frost. In the northern parts of England, where it is only now and then that a season occurs which brings the wood up to the requisite fruitful condition, the plea for houses has more force. Yet even in such localities it is a question if flued walls, with some protecting material in spring, are not quite as reliable as unheated houses. With this in favour of the flued walls, that where a couple of heated Peach houses exist in addition, to come in in succession, the season for this fruit can be extended longer than with the aid of a cold house to follow those that are heated. At Temple Newsome, near Leeds, the Hon. Mrs. Meynell-Ingram's fine old place, there is an instance of what can be done by the help of flued walls in a cold, bleak locality, where little might be looked for in the way of the fruit under notice without means of securing the wood in right condition when the leaves fall in autumn. Again this season Mr. Dawes has as fine a crop of Peaches and Nectarines as could be desired, and, in addition, a greatly improved condition of the trees. In this locality it is often found necessary to resort to artificial warmth by the end of August, keeping on with it more or less according to the weather, until the leaves are about ready to fall. One great advantage with flued walls is that with little in the way of protecting material an attentive eye kept on the appearance of the weather so as to put on the fire early enough in the afternoons when there is likelihood of sharp frost when the trees are in bloom there is little danger of losing a crop. The comparatively little additional cost of putting in flues when a wall is being built, with the light additional expense in fuel and attention as compared with the continual cost in paint and the perishable nature of the woodwork in glass structures renders the abandonment of the old-fashioned flued walls anything but an unmixing gain in Peach cultivation; as with their assistance, where the trees receive the requisite attention by keeping the shoots thin enough, the foliage free from insects, and the roots sufficiently supplied with water, regular crops may be relied on. A word in favour of the old-fashioned flues may be voted behind the times in these days of cheap glass, but there is no disguising the fact that there are plenty of places where regular crops of Peaches were got by the help of the flues, where, since they have dropped out of use, little in the shape of fruit has been forthcoming. *T. B.*

STRAWBERRY ABERDEEN FAVOURITE.

In the autumn of 1883, Connors & Reid, seedsmen, Aberdeen, advertised a very late Strawberry under the above name. Not wishing to be behind in anything in the fruit way, I ordered it, and to give this said new sort a fair trial, I planted it on a north border, well mulching every spring; and now I write to call attention to this really valuable kind. It is a very strong grower, free bearer, and producing fruit later than any other kind, for we gathered our last dish on

August 12, really good sized fruit, of a bright colour, and not a bad flavour. This has been a most trying season for Strawberries—a cloudless sky, a tropical heat, and a deficiency of rain, and yet we have gathered Strawberries from the open exactly two months, the Black Prince, or Black Seedling from a south border first, and the Favourite on a north aspect. With several mid-season varieties between, it is rather singular that both kinds (the earliest and latest) should hail from the Granite City, but if Laxton's two new kinds should prove what they are represented, we shall from them get Strawberries from the open a week before Black Prince. Your northern readers will bear in mind that south of London, Strawberries are seldom gathered in any quantity in August, hence the report of the variety with which I head this article. *J. Rust, Erldge Castle.*

PEACH DR. BURKARD.

Fruit large, globose, orange-yellow, deep red on the sunny side, flesh yellow, detached from the stone. It is a hardy variety, and bears well in or out-of-doors. It is said to reproduce itself from seed—a very unusual occurrence. A coloured representation is given in the July number of the *Bulletin d'Arboriculture.*

REINETTE HERMANS.

Fruit large, globose-conic, with a large open eye, clear red on the sunny side, yellow on the shaded side; flesh delicate, somewhat acid. It keeps well, and retains its freshness and crispness for many months. It is a good cropper, and the fruits are not easily detached from the branches. *Bulletin d'Arboriculture.*

The Rosery.

ROSES IN POTS.

I AM constrained to make a few remarks on Roses in pots at this season, because they are more likely to be neglected now, while they ought, as a matter of the first importance, to be in preparation for next season's bloom. The insect pests which are most injurious to the Rose are red-spider and greenfly, while that insidious pest, mildew, is sure to appear at this season on the plants standing out-of-doors. Besides these three I was horrified one season to find in addition beautiful examples of the orange fungus appearing on some plants recently purchased. We very speedily stamped that pest out by cutting off the affected parts and burning them. The plants were then dipped in a mixture of soft-soapy water, to which was added a small quantity of tobacco liquor, and a handful of flowers of sulphur to each pailful of the liquid. This mixture destroys all the insects and parasites I have alluded to. With good management none of these pests of the Rose grower ought to gain any headway. The red-spider would not appear if the plants were syringed well under the leaves in hot weather every evening, using, if possible, rain-water or water that had stood out in the sun all day. The position in which the plants are placed is of some importance. I have seen them arranged in front of a south wall, as this position was thought to mature the growths better than any other; but I fear the excessive heat from a brick wall is not sufficiently considered during very hot weather. I was at work close to a brick wall facing west on the 14th of this month, and felt uncomfortably warm at 4 P.M. I went into one of the houses and brought out a thermometer which was placed in a pot half full of sand on the temporary potting bench, and it at once rose to 105° Fahr. A temperature anything like this continued for several days would check growth, and red-spider would make a good fight for the mastery. The right place for the plants in summer is an open quarter in the kitchen garden, where they can be exposed to the sun and air all day long, but not to artificial or reflected heat. There

could be no harm in placing the plants on a border well exposed to the sun after the middle of September, as the wood ought to be well ripened by that time, and a warmer position would complete the perfect formation of the buds.

Potting is one of the primary operations, and should be carefully done. Indeed, I attribute much of my success as an exhibitor to the care with which all the plants are potted. Perhaps the young gardeners associated with me in the garden could pot plants as well as I can, but I never trust to anybody, and pot all my exhibition plants, Orchids, Amaryllises, Hyacinths, Auriculas, Carnations, &c., myself. It is impossible to get good results if the roots are not in the best condition to take up the food with which they are supplied. All pot plants require perfect drainage, to begin with, and the potting of the plants must be done in such a way that the drainage does not become choked afterwards. We repeat our Roses any time this month, and the first operation is the preparation of the soil. Good clayey loam, with plenty of decayed fibre from grass roots, should be mixed with a fourth part of decayed stable manure, as much leaf-mould, some charcoal broken up, and an 8-inch potful of crushed or powdered bones to each large barrowful of the loam. Do not use the dust from factories where articles are made from so-called vegetable ivory, as this is injurious. The pots, if they have been used once, must be washed clean; if new, they should be soaked in clean water a few hours before using them. The crocks ought also to be clean, and carefully placed in the pots. Place some tough fibre over them to prevent the compost from filtering down and choking the drainage. The plants soon become established at this season, if the shoots are well clothed with foliage.

Tea Roses ought always to be kept under glass. They are more truly perpetual than many of the so-called hybrid perpetuals, and when kept in good health the quantity of flowers produced by them is truly astonishing. Tea Roses may be repotted at the same time as the others, and in the same way, but the compost for them may be made lighter by adding to it a fourth part of light fibrous peat. If they are kept in a greenhouse all the ventilators and doors must be open night and day during fine weather. Syringe them well every evening. They must have plenty of light as well as air, and do not succeed huddled up among other flowering plants, and shaded, as greenhouses usually are; better place them out-of-doors than treat them in that way. *J. Douglas.*

DAVID LOCKHART.

In consequence of the early records relating to men entering the service of the Royal Gardens having been destroyed the date of Lockhart's entry, as of many others, cannot now be ascertained. In 1816 he was appointed assistant to Christian Smith, the botanist attached to Captain Tuckey's expedition for surveying the river Congo, in West Tropical Africa; this expedition proved unfortunate, as the captain and a great part of the crew were struck down with fever. Lockhart and a few others escaped, but not with impunity, for on the ship arriving at Bahia he and others were placed in the hospital. On becoming convalescent he returned to England.

In 1818 he received the appointment of Superintendent of the Colonial Gardens, Trinidad, which, under the patronage of Sir Ralph Woodford, he greatly improved by making excursions to many parts of the island, and finding many new plants. He also visited Venezuela, on the Spanish Main. He found Humboldt's Cow tree, Galatodeadron utile, also the famous Zamang of the Spaiarsis, Pithecolobium Saman. These, with many other plants, especially Orchids, were introduced by him to Trinidad. The Zamangs have become large trees; its pods, like the Carob tree of Europe, being found to be good cattle food, has led to its becoming cultivated in many warm countries. He took much interest in endeavouring to promote the cultivation of the Clove and Nutmeg, and wrote a treatise on the subject. He from time to time forwarded new plants to Kew, many being Orchids—the most remarkable of that time being Stanhopea insignis, Catasetum tridentatum, and the Butterfly Orchid, *Oncidium Papilio*; also the curious floating aquatic, *Pontederia crassipes*. In 1825-6 he formed large collections of trees and shrubs, of which may be mentioned the curious epiphytes, *Nolantea coccinea*, *Carolina princeps*, *Lecythis oleara*, and *Pandaus candelabrum*.

In 1844 he visited his native country and spent some time at Kew, making lists of such plants as he considered suitable to the Trinidad garden; he appeared then in good health, but shortly after his return to Trinidad he was taken ill, and died at Trinidad in 1845.

A small but curious Orchid was named *Lockhartia* (*L. elegans*) by Sir Wm. Hooker, but it was afterwards found to have been already named, by Ruiz and Pavon, *Fernandezia*; and at the present time no other plant has been honoured with the name of Lockhart. *J. Smith, ex-Curator, Royal Gardens, Kew.*

and reach to the height of 9 feet or more in the sandy soil of Mr. Faulkner's garden. The leaflets are large and pointed, and of a silvery hue beneath. The fruit is produced freely in the axils of the leaves on the summer branches, and is large, roundish, or slightly conical, and of a deep crimson colour. The variety is a summer bearer, continuing to produce and ripen its fruit for a considerable period in succession."

TREES AND SHRUBS.

DOUGLAS FIR.—For some time past I had intended sending a note to the *Gardeners' Chronicle*

for whether we regard its hardness or its economical properties, I take it that although it is equal to any of the Pine tribe, one would not recommend a stately tree of this growth for exposed situations, but in planting there are always valleys and mountain brows where it will be quite at home, while the more exposed places can be devoted to the Scots and Austrian Pines. I ought to mention that at the same time and place we planted a quantity of the Wellingtonias, but they are only about half the height, viz., 30 feet. The time of planting will soon be here, and that is my reason for calling attention to the tree which bears the name of this distinguished and amiable collector, a statue of whom ought to adorn the city of Perth. *J. Rust, ErIDGE Castle.*

GREENHOUSE PLANTS: THEIR CULTURE AND MANAGEMENT.

MONOCHÆTUMS.—Amongst the various useful plants cultivated under glass that attain only a comparatively small size may be included the different varieties of *Monochætum*; they are easily grown and possess the advantage of blooming through the dull winter months; they are most profuse flowerers, for when well managed every bit of the preceding season's growth is thickly studded with flowers. They do not occupy much space, and by growing a considerable number their flowering may be prolonged over a lengthened period. When *M. ensiferum*, the first species introduced, came into the country, it was more generally seen than at present—why, it would be difficult to say, for as a manageable subject quite distinct in character from the general run of plants, it has merits not possessed by many things to be met with in almost every collection; and what holds good of this plant may be said respecting the others. When first cultivated in this country it was thought that they would require stove heat—a supposition not unnatural from the parts of the world in which they were found indigenous; and in their case, as in that of many other plants, sufficient data as to the elevation and other local conditions under which they flower naturally being wanting, strengthened this view. It may be well here to observe that, although the temperature of a stove is so far too high for them that it induces a soft delicate condition in the foliage, with a more straggling, loose growth, and a correspondingly shorter duration of flowering during the winter, they succeed much better if kept in a night temperature of from 44° to 48° than in a cooler greenhouse. In a house where they can be so treated, there are few plants that possess a more bright lively appearance through the dull season, when profusely studded with their rosy-purple tinted flowers, when introduced in sufficient quantity on the stage of a greenhouse, or in a similar position in the conservatory—where, as is usual, a suitable temperature is kept up—they are amongst the most effective plants that flower at this time. They are particularly adapted for cultivation by the immense number of people who at the present day possess a few small houses, and are desirous of introducing as much variety as they can into what they cultivate; a desideratum that is often completely defeated by attempting to grow in such houses plants that naturally occupy a large space, and which, if kept restricted to such limits as to prevent their too far encroaching upon others, generally results, as might be expected, in their never developing their true character in a satisfactory manner. The plants deserving of cultivation are anything but few in number; there is a wide field to select from, and those who have small houses will find it much better to choose plants that do not attain a size to render them unsuitable for the places they have to occupy. If small plants in 4 or 5 inch pots are obtained through the autumn or winter and kept to a temperature such as already indicated, by the middle of March root-growth will be sufficiently active to admit of their being moved on into larger pots; they root freely, yet there is no necessity for a large shift; 2 inches additional room will be sufficient, as it will be found better to move them again later on than to give a larger shift at once. They will succeed in either peat or loam, or a mixture of both, but in common with most plants of a somewhat soft nature, I have always found good peat to impart more strength to the wood and leaves than loam, although in the latter description of soil the leaves are usually larger, and of a deeper green colour. The more fibre the loam contains the better, and as much sand should be added to it as will insure its porosity, as during the growing

FIG. 50.—RASPBERRY LORD BEACONSFIELD.

RASPBERRY LORD BEACONSFIELD.

THIS Raspberry (fig. 50), which was sent to us by Mr. Faulkner, is a chance seedling, produced in his garden at Inkpen, near Hungerford, in 1876. Being of vigorous growth, even in a poor soil of a sandy nature, and also a heavy cropper, it was brought before the Fruit Committee of the Royal Horticultural Society, and obtained a First-class Certificate in 1883. A large plant of this Raspberry was also exhibited at South Kensington this year, which was remarkable for its vigour and prolific habit. It would be an excellent variety for preserving on that account.

The following is a description of the plant by Mr. T. Moore, Chelsea, as given in the *Florist and Pomologist*, January, 1884.—"The canes of this Raspberry are stout, with a clear smooth nut-brown skin,

on this tree, and your interesting woodcut of David Douglas in a recent issue brought it fresh to my mind. Twenty years ago this very autumn we were planting some choice Conifers, and amongst the rest a good many Douglas Firs, and curiosity led me to have a good look at them lately, and although the situation is anything but sheltered and nothing very wonderful in the soil—a light loam, still the trees have done exceedingly well. The tallest is 57 feet high, and supposing it to have been 3 feet high when planted it has thus grown 54 feet in twenty years. It is now full of cones; and seeing that the seed ripens perfectly in this country and as far north as Perth, and farther for aught I know, there is no reason why the tree should not soon become as cheap and plentiful as any other forest tree with which it may now fairly be classed;

season they will require a considerable amount of water; for this reason the pots must also be well drained. Do not disturb the roots more than can be avoided, simply removing the old drainage from the bottom of the ball, press the new soil sufficiently to make it quite firm, keep the plants a little closer for a week or two, at the same time using a little shade if the weather is bright. They are naturally of a fairly bushy habit, yet nevertheless it is necessary at this time to keep them tied out, drawing the stronger branches to the outside, keeping them well down so as to insure the base of the specimens being properly furnished with leaves. A position on the front stage of a greenhouse or in a light pit will now be suitable for them, giving air proportionate to the state of the weather. The nearer they are kept to the glass the better, slightly damping them overhead in the afternoons when the weather has become warm. Any shoots that evince a disposition to outgrow the others must be shortened well back, pinching the points out of the others about the beginning of May. The roots will by this time be fast laying hold of the new soil, and they will require more water at this season than many things that grow to similar dimensions.

By the end of June it will be well to move the whole into pots a couple of inches larger, using soil of a similar description to that previously advised, giving less side-air for a few days, with sufficient shade to keep the temperature from rising too high, and keeping the surface on which they stand moistened. They should now again be gone over, tying them into shape, using neat sticks to support the shoots in their places, without carrying this so far as to give them a stiff, formal appearance. After this there should be no more stopping further than pinching out the points of any shoots that are too much outgrowing the rest. Syringe them freely every afternoon, and do not allow them to stand so closely as to induce a weak condition of the lower branches; they require little or no shade except in the very brightest weather. Continue to treat in this way until the beginning of September, when cease syringing overhead; after this time also less water at the roots will be required. Do not allow them through the autumn to remain where it is too cold in the nights, for if subject to a low temperature the foliage sometimes suffers through an attack of mildew, in which case the leaves quickly fall off to such an extent as not only to disfigure the appearance of the plants, but to injure their flowering capabilities as well. By this time they will be nice little pyramidal or bush-shaped specimens according as they have been trained, from 12 to 14 inches through. If a portion of them are wanted to flower earlier than they will come in the temperature already advised, this can easily be effected by placing them in a few degrees warmer quarters.

After blooming the plants should be moderately cut-in, reducing them to about two-thirds their size, and the atmosphere kept a little closer, damping them slightly overhead. As soon as they have fairly broken into growth turn them out of the pots, remove the drainage, and work out as much of the soil from the surface of the ball as can be done without mutilating the roots. Place them in pots 2 or 3 inches larger, using soil such as already recommended, and treat as during the previous year, except that another shift will not be necessary, as any further sustenance they may require can be given by the application of manure-water, which they much enjoy if not used too strong. It is necessary to be careful on this latter point, as I have seen the roots so far injured by manure-water being applied so strong, as to cause considerable quantities of the leaves to fall off. Through the autumn and winter treat as in the preceding year. It is seldom advisable to keep the plants more than two years, consequently it is well to start a few young ones every spring to supply the place of such as are discarded. The following are well worth a place:—

M. ensiferum.—Bright rosy-purple flowers, compact habit of growth; from Oxaca.

M. Humboldtianum.—Bright rose; introduced from Caracas.

M. stricatum multiflorum.—Flowers rose colour; a garden variety, probably the best of the family.

Insects.—Monochetums are little troubled with insects, though liable to the attacks of red-spider if enough attention be not paid to syringing, or if in the operation the water does not sufficiently reach the under-surface of the leaves. Should aphides make their appearance, famigate. If any of the worst description of insects, such as scale or mealy-bug, affect them, it is better to discard the plants, as from

their quick and easy growth this is preferable to the loss of time in cleaning, as the leaves of plants will not bear the application of any insecticide that will affect their total extermination. *T. Baines*.

FORESTRY.

FORESTRY, while in theory it may properly be divided into two classes, namely, ornamental and useful, is in practice very difficult to define. The line of distinction, though it truly exists, is not easily drawn—like the blending of colours it is no easy matter to say where the one ends and the other begins. Ornamental forestry is often as useful as it is ornamental, and useful forestry cannot well be other than ornamental. There is not, however, so great difficulty in showing wherein they agree as in showing wherein they differ.

In carrying out extensive improvements on the Seafield estates, in Banffshire, during the last twenty years or thereby, amongst other departments planting of various kinds was extensively undertaken, and there, as on all well managed estates, very strict accounts were kept of each separate department, so that at a glance might be seen the gain or loss in any of them.

In the management of 5000 acres of plantation there was necessarily a large overturn of money, both in what was laid out and what was brought in, and in order that nothing might be charged against the woods and plantations beyond what was actually done for profit, or to ensure a profitable return in due course, a line of distinction was drawn between those plantations formed for profit and others formed for shelter and beautifying the estates generally. The one class was termed useful, and the other shelter and ornamental. The ornamental class of plantations differed principally from those termed useful in the former being small and the latter large. There were, also, other distinguishing features between them, but, as will subsequently be seen, that which led to this line of distinction being drawn was the difference in cost of fencing between that of a large and small plantation, acre for acre. The actual cost of planting an acre, whether in a 5 acre or a 50 acre plantation, ought to be very nearly the same, but the difference in cost in fencing, acre for acre, in the one compared with the other, will surprise those who have not done it, and it was this item of expense of fencing alone that indicated what was and what was not the size of the plantation that would pay, or should be classed with the useful or ornamental.

To enclose a square piece of ground of 5 acres it requires 622 lineal yards of fence to go round it, which, if a wire fence, at *8d.* per yard, would cost $\pounds 20$ 14*s.* 8*d.*, equal to $\pounds 25$ 11*d.* per acre. To enclose 10 acres in the same way, and at the same price per yard, it takes 880 yards of fence = $\pounds 29$ 6*s.* 8*d.* = $\pounds 2$ 18*s.* 8*d.* per acre. To enclose 20 acres in the same way it takes 1244 yards of fence to go round it, equal to $\pounds 41$ 9*s.* 4*d.* = $\pounds 2$ 1*s.* 5*d.* per acre. Again, to enclose 50 acres of a square-sided piece it takes a fence 1968 yards in length = $\pounds 65$ 12*s.* = $\pounds 1$ 6*s.* 2*d.* per acre. To enclose 100 acres the fence required is 2784 yards in length = $\pounds 92$ 16*s.* = 1*s.* 6*d.* per acre; and to enclose 1000 acres in the same manner described, it takes 8800 yards of fence = $\pounds 293$ 6*s.* 8*d.* = 5*s.* 1*d.* per acre. To enclose a circle of a given area rather less fencing is required than for a square, but the cost of erecting a circular fence, and its future maintenance, being considerably greater than for that of a square straight-sided enclosure, the latter is fully as cheap as the former. For the sake of comparison, however, and guidance to those requiring it, the annexed table is given:—

Square Acres.	Length of Fence Yards.	Circular Acres.	Length of Fence Yards.
5	622	5	551½
10	880	10	779½
20	1244	20	1102½
50	1968	50	1744
100	2784	100	2466
150	3408	150	3021
500	6224	500	5515
1000	8800	1000	7798

From the foregoing statements it is shown that to

enclose a 5 acre plantation at *8d.* per yard, it costs $\pounds 25$ 11*d.* per acre, which would not pay, while to enclose 1000 acres at the same rate per yard, it costs only 5*s.* 1*d.* per acre, which would pay; and if interest is charged equally upon both during the growth of the plantation (seventy years) it will at once be seen why large and small plantations yield such very different returns, or why the one class pays and the other does not. Therefore it was that in the cases exemplified the two were kept separate and distinct. *C. Y. Michie, Cullen House, Aug. 18.*

CHERRIES IN POTS.

"A. F. B.'s" picture of Mr. Rivers' Cherry-house is enough to make one mouth water, and having regard to the superb quality of the samples of fruit which that eminent grower has exhibited at South Kensington, it is not at all difficult to understand how tempting must have been the appearance of the crop. But Mr. Rivers sent to South Kensington last week with some Plums in pots, three Cherries, one old and rather large black kind, and two smaller plants of Bigarreau Gros Couché, the fruit on each very fine. These were in 10-inch pots, and were of varying ages. The larger tree had at the most a crop of 2½ lb. of fruit, and the other two about 2 lb. between them, or 4½ lb. in all. That was probably the outside quantity. Whilst looking at them I heard a gardener remark that such fruit would cost about half a crown a pound to produce in that way, and as my attention was arrested by such a statement, I asked him to demonstrate how such could be the case. He first priced the three trees at 2*s.* 6*d.*, 3*s.* 6*d.*, and 5*s.* 6*d.* each respectively, or 11*s.* 6*d.* in all. Then he said the cost of housing them, attending, and otherwise cultivating these trees all the year round, would be quite as much more, or a total of 23*s.* That would really make the prime cost of the fruit to be 5*s.* per pound; but of course something must be allowed for the fact that the trees might continue to thrive and fruit in pots for three or four years at least. Still in his estimation it seemed difficult to understand how house grown fruit from plants in pots could be obtained for less per pound than his original estimate. Well it must be admitted that beautiful, nay tempting, as must be a houseful of Cherries, the question must be answered at what cost are they obtained? Perhaps some gardeners—Mr. Miles for instance, or Mr. Ludson, both of whom produce grand samples of fruits under glass—would tell your readers how theirs are produced, and whether they think the cost is greater or less than the above estimate. It is certain that methods of culture under glass have been favoured in past years that have proved not only illusive in results, but also far too costly even if otherwise successful. Orchard-houses were at one time to have revolutionised fruit culture, and eloquent panegyrics upon them were liberally penned. Orchard-houses for Peaches, Plums, Apples, and Pears, have had their day, and a short one it was. The question, therefore, is this—Is there in Cherries any distinctive feature, which removes them as fruit from the ordinary category, and fits them far more for house cultivation in pots than other kinds? We ought to grow plenty of grand Cherries in our climate outdoors but for two reasons—first, the destructive spring frosts; and second, if the frost spare the bloom, the hardly less destructive birds. Such being the difficulties which Cherry growers have to encounter, the point for consideration is, whether the ordinary market price at which Cherries are sold is a fair test, and whether such grand samples of Cherries as are obtained by Mr. Rivers are really dear at even 2*s.* 6*d.* per pound. Of course his position differs very much from that of a private grower, because, even if the fruit cost him double that amount per pound, still they might pay well as means of advertising the kinds he has in stock. Gentlemen would perhaps take a more matter-of-fact view of the subject, and the cost to them would have no other compensating advantages than that to be found in the consumption of the produce of the trees, be it large or small. Trade growers can have no desire to mislead the public in this matter, because such course would only result in eventual loss; therefore, when fruits of such grandly tempting aspect are presented for public inspection, and gentlemen who may desire to grow their own ask what is the probable cost of the fruit per pound, they are but seeking for information, which is to them of primary importance. Some doubt was thrown on

the *bona fides* of Mr. Rivers' pot-grown trees because the pots in which they were growing were so new and clean that it was very hard indeed to realise that the plants had been grown in them all the season. Some of the plants, too, showed decided evidences of flagging later in the day, and whilst that fact naturally provoked attention it was explained that the plants had been stood on or partly plunged in the soil floor of the house, and the roots emitted from the bottom of the pots had been severed; hence the check to the plants. No doubt on that head Mr. Rivers will be only too ready to afford full information, but when the culture of Cherries in pots under glass is advised of course we want to know all about it even to the most trifling matters, as one year's failure only would sadly discount the hopes of those who built upon making the practice profitable. "A. F. B." very pertinently asks "Why not a Cherry-house as well as a Peach-house?" and the only rejoinder that I can offer is "Why not?" But then Peach-houses to prove profitable are planted with just a few trees, the primary cost of which is small, perhaps half-a-dozen at 3s. 6d. each, and being of diverse kinds their season of fruiting may in this one house be made to extend over several weeks. Then Peach trees are certain bearers, and continue to thrive well for many years. They are usually trellis trained just under the glass, as Vines are, indeed a couple of trees will often occupy a house which would hold thirty Cherry trees in pots. But if Peaches may be thus grown trellis trained why not Cherries, and upon that point we should like to have a practical answer. We do not want Morellos under glass—they do so well outdoors, but sweet Cherries, especially of the finest kinds, are most certain under glass, therefore why not plant and train them as Peaches are? If that method be both feasible and profitable then Cherry houses for ever. *Cerasus*.

THE GENUS ODONTOGLOSSUM.

(Continued from p. 200.)

THE *Pescatorea* section of *Odontoglossum* is a very lovely one, and a great favourite with all Orchard growers, on account of its easy culture in a cold-house, and the freeness with which it produces its flowers. Variable though it is, it does not produce varieties to which a distinctive name can be reasonably put in such quantity as the *O. crispum*, but where a really distinct form does appear there is nothing uncertain about it, and the work of naming and fixing the features by which it may be recognised is not difficult. The typical *O. Pescatorei*, with its white flowers sometimes tinted with pink, and the yellow blotch and the crimson marking on the lip, is well known, and proved so constant that anything very distinct was despaired of, when, at last, came—

O. P. VEITCHIANUM, that wonderful introduction of Messrs. Veitch's, which once seen is ever remembered, its clear white petals, so heavily marked with mauve blotches, constituting it not only a grand form of *O. Pescatorei*, but one of the very finest of all *Odontoglossums*.

O. P. SCHREGERIANUM, which flowered among Messrs. F. Sander & Co.'s importations in 1883, runs *Veitchianum* pretty closely for honours on account of showiness, it being like the last-named variety, but differs in having the blotches purplish-mauve, and in their not reaching so near the tips of the segments. Messrs. Protheroe & Morris obtained 70 guineas for it, and hence it may be inferred that it is good.

O. P. THOMSONIANUM, exhibited by Messrs. W. Thomson & Son, of Tweed Vineyards, Clovenfords, at the Orchid Conference, is of the same strain as the two previously named. It is a grand thing, with finely formed flowers, with some large and many small mauve blotches, and a delicate tinge of pink over the whole flower. The two, if not the three, of these lovely things are in the noted collection of Baron Schröder, which has its doors always open for the best things, but for them only.

O. P. LOWIANUM is another finely marked variety, with flowers coloured like those of *O. P. fastuosum*.

O. EXCELLENS.—This supposed hybrid between *O. Pescatorei* and *O. triumphans*, or *O. tripidantis*—a glance at whose likenesses at pp. 205 and 212 may assist the reader in tracing the resemblances—is in the

possession of Sir Trevor Lawrence alone, and to him we are indebted for the grand inflorescence here illustrated (fig. 51, p. 241). It is one of the handsomest of *Odontoglossums*. The sepals and petals are bright yellow on a white ground; lip white, with yellow centre; the blotches on it and the rest of the flower being brownish-red. It was introduced by Messrs. Hugh Low & Co.

O. STELLIMICANS.—This is also a grand form, introduced by Messrs. F. Sander & Co., of St. Alban's, and having the same supposed parentage as *O. excellens*, as it has also the same general characteristics. Sepals and petals yellow, mauve-tinted outside, and sparsely blotched with brownish-crimson inside; lip white, changing to lemon-yellow, and having a few crimson blotches. *J. O'Brien*.

The Flower Garden.

RAIN is badly wanted for this part of the country as lawns are parched and newly planted trees and shrubs are suffering greatly. Where water can be had it should be supplied in abundance, and also to the flower garden, which should now be at its best, though in some instances this will not be the case, by reason of the parching the beds have had. *Calceolarias* and *Violas* suffered most, but even these are good where they are well watered with manure-water. The most effective arrangements are the carpet and succulent beds—this style of planting is equally well adapted for hot and dry seasons as for wet and cold ones—nothing can be better than they are at this period.

Propagation of summer bedding plants should now be proceeded with as early as possible, so as to get well-rooted plants before the autumn frosts, and *Pelargoniums*, especially the most approved kinds. The following are the most effective this season:—The golden variegated section—Mrs. Pollock, Star of India, Lady Cullum, and Crystal Palace Gem; silver-leaved section—May Queen, Happy Thought, Bijou, Queen of Queens, and Flower of Spring; bright scarlet—the best are *Vesuvius* and *Clipper*; crimson—Henry Jacoby; pink—Master Christie, Mrs. Halliburton and *Amaranth*, and many other names might be mentioned equally good; the semi-doubles, *Wonderful*, *scarlet*, and the double kinds do well this season, and flower freely. I have a mixed bed of them, all the best kinds, and they flower splendidly, and make effective beds.

In propagating *Pelargoniums* and other easy rooting plants they do not require at this season the usual protection of pits, as they will succeed far better if placed in the most sunny position in the open garden, and sprinkled with clean water every morning during the hot dry weather; if thus treated they strike roots quickly, and make good plants. I like 5-inch pots best for cuttings, as they are much more convenient, and do not damp off so much in winter, nor do the plants get so much drawn up, although they strike fairly well in boxes, and are used by many gardeners for economy. One important point should not be overlooked—the pots should be so arranged as to prevent worms from entering the pots, otherwise the drainage soon becomes clogged, and the advantage of pots is lost. It is best to place the pots on slates or on fresh coal ashes; the pots should not be placed too close together, so as to prevent the air passing through between them. The best mould is any light sandy soil, or loam and leaf mould and sharp sand in equal parts, well mixed and sifted, and pots or boxes well drained. As a rule it is not necessary to propagate a great quantity, but a few stock-pots only of such plants as *Coleus*, *Resine*, *Alternantheras*, *Verbenas*, *Heliotropes*, *Petunias*, and *Lobelias*, &c.; all such are best struck in spring, but it is quite necessary to ensure safe wintering that they should be got in as early as possible. They will strike quickly in light sandy soil if placed under a frame or pit with slight bottom-heat. Sow seeds of annuals for spring flowering, either where they are intended to be grown, or for transplanting to other positions. Mixed borders may be made very gay by sowing a few patches of *Silene pendula*, *Limnanthes Douglasi*, *Collinsia bicolor*, and *Candytuft*; the new kinds are first class; dwarf hybrid, carmine and white (new), all of which stand the winter well.

Gladioli are now throwing up their flower-spikes, and will require support, as the wind will injure them if not staked. The beds should be well mulched and watered; also tie and stake, as growth progresses, *Dahlias*, *Hollyhocks*, and herbaceous *Phloxes*, *Chrysanthemums*, &c.

Every effort should now be made to keep the gardens gay and effective. This can only be accomplished by a good supply of liquid manure three times a week during the hot, dry weather. The only thing to lead to success is to keep the water-pots in constant use, if not, most plants will perish under the trying season. We have no mowing to do here; the grass is completely burnt up. Let all dead flowers be kept picked off, and all kept neat and in the best possible order. *Wm. Smythe, The Gardens, Dasing Park, Alton, Hants.*

Plants and their Culture.

CAMELIAS.

THE next few weeks will be an excellent time wherein to give the stock of these winter and early spring blooming plants a general overhauling as to their condition at the roots. With plants in pots and tubs some fresh shifts may be found requisite. I do not advise frequent repotting with this genus any more than with the *Azaleas* commented upon in my last Calendar. With proper attention to their wants and the use of good sound lasting soil to grow them in, they will remain in the best of health for several seasons after having attained large dimensions. In the case of vigorous growing young stock a shift every other season may be necessary, it being a mistake to allow a young *Camellia* to become stunted and severely pot-bound in its earlier stages of existence. Close attention to watering at all times is most essential; any haphazard mode of performing this routine work is strongly to be condemned; this is particularly the case when the plants, after having filled their pots with roots, are very susceptible to any omission in keeping them well supplied with water. Again, discretion must be exercised when having to deal with freshly potted plants so as not to sdden the soil at the start. When the plants to be repotted are suspected of being dry in the centre of the ball it will be a good plan to stand them in a tub of water for a time to thoroughly soak the old ball. After doing this a pointed stick may be used with good effect in easing the roots at the sides where closely matted together. Allow room in the pot for a good drainage, also if possible secure a moderate covering of new soil on the top of the ball, as well as some rougher pieces over the cracks. Pot firmly as in the case of *Indian Azaleas*, keeping the soil thereby in a better condition for a greater length of time. Opinions vary as to the kind of soil to be recommended for the *Camellia*: some advise peat alone, others prefer loam; in my experience I have had uniform good success by selecting good sound lasting peat and turfy fibrous loam in about equal proportions, adding thereto a little quantity of small-sized crushed bones, and a liberal amount of sand or road scrapings. We have them in this mixture now, and in vigorous health too, intending, however, to pot afresh this season, some which have not had that attention paid them for four or five years past. Any of the stock that hardly requires a shift may be benefited by the removal of some of the surface soil and a fresh top-dressing to carry them over to another season. Plants and large bushes that are growing in the open border will also at times need transplanting into fresh soil; no better season can be chosen for this work than the present, the growth for the present year being made and sufficiently hardened so as not to suffer by the severance of some of their roots. In lifting such plants examine the drainage, and renew where necessary, afterwards placing some of the roughest pieces next the same. Comparatively speaking, the soil for such can be used much rougher and with better effect than when dealing with pot plants; press down the border firmly, however, and give one good watering as soon as completed, and frequent dampings during the afternoon, when the weather is bright and warm. Plants in pots, that have become somewhat unhealthily, may be brought round in a shorter space of time by having some portion of their old balls removed, and then planted into an open border. *Wm. Hudson, Gunnersbury House Gardens, Acton, W.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Aug 24	Special Trade Sale of Dutch Bulbs, at Frothero & Morris' Rooms. Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 11 A.M.; Sale of Imported Orchids, at Frothero & Morris' Rooms.
TUESDAY,	Aug 25	Special Trade Sale of Dutch Bulbs, at Frothero & Morris' Rooms. V. Cattaneo's Show, from 1 to 6 P.M.
WEDNESDAY,	Aug 26	Harpenden Horticultural: Seventh Annual Show.
THURSDAY,	Aug 27	Special Trade Sale of Dutch Bulbs, at Frothero & Morris' Rooms.
FRIDAY,	Aug 28	Sale of Imported Orchids, at Frothero & Morris' Rooms.
SATURDAY,	Aug 29	Special Trade Sale of Dutch Bulbs, at Frothero & Morris' Rooms.

THE INTERNATIONAL FORESTRY EXHIBITION at Edinburgh was well timed. Public attention had been aroused, and people who usually take but a languid interest in such matters began to feel that something must be done. It is worth while inquiring for a moment what it was that stimulated the public. Was it the teaching of the class journals? Was it the warning of botanists? Was it the zeal, the enterprise, the unflagging industry of the Indian pioneers? No—it was none of these. More than forty years ago the state of British forestry was laid bare in these columns, and from that time to this the subject has never been lost sight of. Since that time other journals, and some specially devoted to the subject, have unceasingly "pegged away," but to little purpose. So far as India is concerned—that is too far off; the climate and all the conditions are so different from anything that exists in the home country that it is not surprising that the British public, always slow to take in first principles, and slower still to act on new ideas, paid little heed to the splendid services, and still less to the warnings, of that band of botanists from ROXBORGH to BRANDIS, not to mention those now in harness, who constitute one of the glories of our empire in the East.

The class journals might have gone on preaching, the botanists and foresters of our Asiatic empire might have gone on protesting and working to the top of their opportunities, but all would have been of no avail, or if that be too strong an expression, action would have been indefinitely postponed but for the writings of an American diplomatist and man of letters, a man of good observation and keen judgment, who occupied his leisure in writing of matters of which he had probably no more than the acquaintance of a *diletante*. His book, *The Earth as Modified by Human Action*, aroused general attention, and is constantly cited now even by professional writers.

Be the cause what it may, however, it is certain that public attention is at last aroused to the importance of forestry, and as a consequence the attention of our Legislature has been turned in the same direction. Responsive to such stimulus the Edinburgh Forestry Exhibition was planned and carried to a successful issue, as recorded in our columns at the time. But exhibitions have but a transient effect, unless associated with some permanent record, and such record we have now before us in the shape of a selection of the prize essays written on the occasion in question.*

The introduction to the volume is taken up by historical details relating to the origin and organisation of the Exhibition. Then follow no fewer than twenty-one essays on subjects whose variety may be judged from the following brief summary. Two of the essays are devoted to the formation and management of tree nurseries, two to the formation and management of plantations in various localities, two to the consideration of Teak, four to the manufacture of pulp for paper. Besides these, there are papers on the Afforesting of Waste Land; the Culture of Trees on the Margins of Streams; on Pine

Planting; on Cinchona Planting; on the Vegetation of Western Australia; the Formation and Management of Eucalyptus Plantations; the Timber Supplies of Great Britain; the Ravages of Timber-destroying Insects; Charcoal Manufacture (previously published in these columns); Utilisation of Coppice, and the Preparation of Lacquer, the latter by a Japanese gentleman. To attempt a critical analysis in one article of so many papers, of such varied interest, would obviously be futile. We confine ourselves, therefore, now to generalities, and may take further occasion to discuss details. In the work of so many hands we may naturally expect to find diversities of treatment and differences of opinion, and as things go it is desirable it should be so in order that matters may be looked at from different points of view, but this diversity of treatment does not, in our opinion, absolve the editors from securing something like uniformity of method if not of matter. It is, for instance, of little practical consequence whether a particular tree be assigned to the genus *Abies* or to the genus *Picea*. There is plenty of evidence in favour of either, but it is puzzling and vexatious to find when the editors had the choice of either that they should have adopted both. Again we are told that *Abies canadensis* is a "native of North America," and A. Douglasii is also a native of "North America." As North America extends from the arctic regions to the Gulf of Mexico, and from the Atlantic to the Pacific, it must be admitted that the statement made is somewhat vague. This is not a matter of minor moment when the influence of climate and the methods of cultivation are considered. Misprints of botanical names and information taken from second-hand sources, when original information was or might have been at hand, are matters which may be condoned; but when the same tree is treated of under two different names the matter is of more consequence. In fact, much of the matter of some of the essays, such as those on the management of forest tree nurseries, might very advantageously have been suppressed, and the discussion strictly confined to practical matters within the experience of the writers. A simple reference to the works where authentic information on the botany of the subject will be found would have sufficed. As it is, however, the essays furnish incontrovertible proof of the great necessity that exists for the establishment of forest schools.

As usual in such publications, the practical portion of the essays is in advance of that devoted to first principles, but even in the more strictly practical portions we find evidence of the want of that strict comparative and orderly method, and of that accurate keeping of records which constitute the essence of modern forestry. Maps and surveys, and the block system of management, are recommended, as if for occasional purposes, and not, as they should be, for universal employ. For those who look to forestry as a means of relieving agricultural depression, and obtaining a better income from the land, we commend the statements of Mr. DAVID CANNON. "Taking into account (Mr. CANNON is writing of Pine planting in sandy wastes) all delays and disappointment encountered during the work, and the difficulty in the remote and poor districts where Pines are mostly grown of disposing to any advantage of the first small thinnings, it is improbable that, on the average, any proceeds worth mentioning can be got before twenty years after the time when the land was reserved for afforesting. Compound interest on that period amounts, at 3 per cent. per annum, to 80.5 per cent., and at 4 per cent. per annum to 119 per cent. on the market value of the land. To these figures must be added the yearly taxes on the land, and the expenses of keeping up the plantations until their first remunerative yield with compound interest from the successive dates at which this expenditure is incurred.

These items form the heaviest part of the cost, and as they are invariable, it must be borne in mind that they are the same for a bad plantation as for a good one, and such is the case with fencing, where that is required. The mere work of planting hardy Pines can of itself be carried out at a comparatively very small cost. From these considerations we may draw two important lessons:—First, that it is highly imprudent to buy land or to sacrifice rent on what one already possesses, with the purpose of planting and keeping it, without being certain of being able to sustain such a large loss of income without inconvenience; second, that it is the falsest economy to buy defective plants, to supply defective methods of planting, or to put down species of trees not perfectly suited to the soil, on the pretext of cheapness. The heaviest charges on planting, as in agriculture, being invariable, the only way of making our cultivation pay is to obtain the maximum of crop, which can only be got on land regularly covered with vigorous trees of the sorts best adapted to the nature of the soil. In afforestation work, therefore, though strict economy should be exercised and all useless expenditure carefully avoided, nothing should be spared that is really and practically required for the success of the enterprise." The whole of Mr. CANNON'S article is eminently worth reading from a practical point of view, though we may say that the test by fire that he relies on to determine the quality of seed certainly does not apply to all cases, while *Pinus insignis* cannot be recommended, in this country, as resisting spring frosts unless under special circumstances. The article on the Lacquer-tree of Japan by Mr. HIKOROKURO YOSHIDA is very interesting, and contains much information of a novel and heretofore not readily accessible kind. The author *inter alia* recommends the introduction of Lacquer-trees (*Rhus vernicifera*) into Scotland, where the climate and soil are well fitted for its cultivation. With this we conclude for the present our notice of a volume which of the whole is of very great interest and value.

— PROPOSED EXHIBITION OF PLUMS.—It has been suggested that, as a great variety of Plums are fruiting this season, it would prove extremely interesting as well as instructive if examples of as many sorts as possible could be sent to the meetings of the Fruit Committee on the 25th of the present month, and on the 8th of September next. An excellent opportunity would thus be afforded of comparing the merits of the varieties of Plums in cultivation, and also in the correction of their nomenclature. It is felt that many inferior varieties of Plums are grown throughout the country, whilst many new and greatly improved sorts are comparatively unknown. Intending exhibitors who cannot be present should address their packages to the Secretary of the Fruit Committee, Royal Horticultural Society, South Kensington, taking care that their packages arrive in time. The carriage of the same will be paid by the Society. It is very desirable that young shoots with foliage should accompany the fruit, so as to facilitate identification.

— BULBS IN THE PARKS.—We understand that the Metropolitan Board of Works has this year accepted the tender of Mr. B. S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, to supply their London parks with Hyacinths, Tulips, Narcissi, &c.

— THE "INVENTORIES."—We learn that Messrs. FOSTER & PEARSON'S exhibit of plant-house, frame, boiler, &c., at the Inventions has received a Silver Medal, no Gold Medal having been given in this section.

— SPANISH BOTANY.—With the tenth part the first volume of Professor WILKONM'S *Illustrations Flora Hispanica* is completed. The text is written in Spanish and in French, the technical descriptions in Latin. The coloured plates are remarkable for their strict fidelity to Nature. The work may be had from Messrs. WILLIAMS & NORGATE.

* *Forestry and Forest Products*, &c. Edited by John Rattray, M.A., B.Sc., and Hugh Robert Mill, B.Sc., &c. Edinburgh: David Douglas.

FIG. 51.—*ODONTOGLOSSUM EXCELLENS*: FLOWERS YELLOW, SPOTS REDDISH-BROWN, LIP WHITE. (SEE P. 239.)

— FLORA OF FRANCE.—M. BAILLON, whose power of work seems to exceed that of most mortals, is now issuing a series of small coloured plates representing the wild flowers of France, and of Paris especially. The plates are intended for popular use apparently, but are better, both in execution and letterpress, than anything we have of the same kind. The work is published in packets, each containing ten cards, the descriptive letterpress being at the back. An index and analytical key will be given later on. Messrs. WILLIAMS & NORGATE are the English agents.

— ROWE ORPHAN FUND.—We have received the following amounts, collected by Mr. C. ORCHARD, The Leigh, Coombe Warren, Kingston-on-Thames:—C. Orchard, 5s.; A. Friend, 2s. 6d.; G. Woodgate, 2s. 6d.; J. Puttock, 1s.; W. Brown, 1s.; Quelch, 1s.; W. Howard, 2s. 6d.; Jas. Foster, 2s. 6d.; — Kent, 2s. 6d.; Geo. Frofitt, 2s. 6d.; Wm. Rosier, 2s.; Geo. Sheppard, 2s.; Wm. Lane, 2s. 6d.; H. Pinnock, 1s.; E. S., 1s.; Total, £1 11s. 6d. From E. Williams, 2s. 6d. A third collection, by Mr. GEORGE T. PUTOEY, is as follows:—Mr. Windsor, Roehampton, 10s.; Mr. Morrison, Roehampton, 2s. 6d.; Mr. Wright, Wimbledon Park, 2s.; Mr. Grant, Argyle Lodge, Wimbledon Common, 2s. 6d. Total, 17s.

— COVENT GARDEN MARKET *v.* ASIATIC CHOLERA.—The following letter has been sent us for publication:—

"A rumour having spread in London, assisted no doubt by a statement made in Parliament, and the cartoon in *Punch* of the 12th inst., alleging that Covent Garden Market is in a dirty state, and likely to promote an outbreak of this dreadful epidemic, I beg to say that both statement and cartoon are incorrect, as the market is swept clear of all refuse each day, and during the summer season twice daily, the refuse being at once carted from the market, loaded in barges, and freighted as manure; in fact the refuse of fruit and vegetables is cleared from the market quite as soon as the consumer gets the sound goods from his fruiterer. Taking into consideration that the supply is now ten times as much as it was ten years since, it seems a wonder how this large quantity of goods can be placed on the market, sold and removed without causing serious inconvenience to the neighbourhood. The market is no larger now than it was fifty years ago, and if it were not for the admirable management of the Duke of BEDFORD'S agents, it would be impossible for the goods to be delivered, sold, and removed, as they now are, in many instances, in a few hours. In the year 1832 a rumour was started in London warning people against eating fruit and vegetables, alleging it to be the means of inducing and spreading Asiatic cholera. The result of this rumour was ruin to several fruit and vegetable growers, and the matter became so serious that the Market Gardeners, Nurserymen, and Farmers' Association were compelled, in defence of the trade, to obtain and circulate through London the opinions of forty-two of the leading medical men of that date, who were unanimously of opinion that fruit and vegetable diet would not in any way promote the spread of cholera, but by keeping the blood pure it would do much to prevent the spread of the epidemic.

"As this matter is of vital importance to the fruit and vegetable growers, I have felt it my duty to contradict the unfounded rumour, and the statement as made in the House last week, and I shall be pleased to allow any of your readers to inspect the copies of the forty-two medical opinions as given in 1832. *Richard James Steel, Secretary to the Market Gardeners, Nurserymen, and Farmers' Association, 30, Wellington Street, Covent Garden, W.C.*"

We willingly insert our correspondent's letter, and we are in a position to say that something is really done to keep the market and the adjoining streets clean, but that the measures taken are generally quite inadequate. Occasionally, for a week or two, an access of Dutch cleanliness leads to the streets being washed by a hose daily, to the great improvement of the streets and the comfort of inhabitants and passers-by. This we believe is done by the Local Board of Works, and we most earnestly hope that they will pursue the plan daily throughout the year. The slush in wet weather, and the dust and decaying refuse in dry weather, are alike adapted for the propagation and dissemination of germs, but it does not follow that those germs are always poisonous; if it were so, the staff of this journal would be but short-lived. If fever or cholera germs were present, as they may be any day, the matter would become more serious. The arrangements for the spread of the germs of the Potato fungus when it is present are, as we have

often pointed out, admirably adapted for the purpose. As to the moderate use of ripe, wholesome fruit, it is no more likely to cause cholera than so much dry bread. Common sense, prudence as to clothing and diet—especially drink—and strict cleanliness, are the best preventatives that individuals can adopt.

— DROUGHT.—Our friends on the other side of the Atlantic have had a dry time like ourselves. At Philadelphia, where the usual rainfall for June amounts to from 3 to 5 inches, less than one inch fell, and the early part of July added nothing to the store.

— CYANANTHUS LOBATUS.—Since its first introduction in 1845 this charming little Campanulad has probably been many times reintroduced, as it has proved very troublesome to preserve in gardens generally. There is a beautiful patch of it in the new rockery at Kew, in a sheltered peat bed. It is thoroughly exposed, but gets direct sunshine only for the first part of the day, and seems perfectly at home, judging from the number of flowers in all stages of development. There is a figure of the species in the *Botanical Register*, 1847, 6, and the older botanists included it in the Polemonium family, from which it differs, however, in the usually greater number of cells to the ovary, and the numerous seeds. The superior ovary is rather abnormal in the order to which it belongs. The calyx is densely clothed with black hairs, and the comparatively large corolla is a pleasing pale blue, with a broad nearly white band round the orifice, heavily bearded with long hairs, forcibly reminding one of *Menyanthes trifoliata*. There are half a dozen known species inhabiting the Himalayas, some of which are annual, the rest perennial, including *C. icanus*, an extremely pretty alpine, but rarer than *C. lobatus*.

— FRUIT CROPS IN BORDEAUX.—In a report on the trade and commerce of Bordeaux for the year 1884 it is stated that the crop of French, or, as they are generally called, Imperial Plums, was a good one, both in quantity and quality, but the demand was smaller than usual, especially from America, and the consequence was that prices were very low—lower, indeed, than they have been for years. The Plums, which are exported to England in glass bottles or tins, are cured and packed almost exclusively at Bordeaux itself by several English firms of long standing. For exportation to America they are usually packed in wooden boxes. The crop of Prunes was also a good one, and as the old stock of the preceding year was not exhausted when the former appeared, the supply exceeded the demand, and prices were accordingly low. In former times very large quantities of Prunes used to be shipped from Bordeaux to the North of England, to Northern Europe, and to Canada. Of late, however, the competition of Bosnian Plums has caused a gradual diminution in the exportation of French Prunes. Of Walnuts the quality of last year's crop is said to have been very superior, though the quantity was below the average. The chief market for French Walnuts was, as usual, Germany, the demand from England and America being smaller than usual. Regarding forest produce it seems that a new branch of industry has arisen which has attained to considerable importance. The Pine trees (*Pinus Pinaster*), as is well known, are tapped for the purpose of collecting the turpentine, and from this a new lighting material called Pine oil is made, which is cheaper than refined petroleum, while it burns more brightly, and is stated to be entirely free from explosive properties. When the trees are tapped carefully the wood is not injured for general use, but, on the contrary, is found to be even better fitted for certain purposes, such as for paper making, and for the preparation of pyroigneous acids.

— SEED ADULTERATION.—The Act that was passed a few years ago does not, it appears, suffice to entirely prevent the evil practices of seed-doctors, or probably the fault lies with those who should avail themselves of its provisions and do not. We have before us samples of very old *Trifolium* seed and other samples of the same seed sulphured and repolished, and intended presumably for mixing with genuine seed. We are informed that, as it is requisite to wet the old seed to enable it to take up the sulphur there is an increase of weight of about 20 per cent., which more than pays all the expense of the operation. The value of the old seed, we are informed, is about 4s. the cwt., while the

doctored seed sells for 20s. or thereabouts the cwt. We do not know where or by whom this bit of meanness is perpetrated, but are astonished that farmers do not if not taste at least try before they buy. The much decided flower-pot experiments are sufficient to reveal the state of the case, for on trial we find about 23 per cent. of failures in the old seed as against 90 per cent. of failures in the doctored seed.

— UTRICULARIA ENDRESII.—Few species of this large, extremely variable, and most interesting genus of plants are cultivated in gardens. This is the more remarkable, seeing how easily they yield to cultivation, judging from those few species introduced. Apart altogether from the interest attached to them as carnivorous plants, and their wonderful mode of action, the flowers of some species are curious and beautiful, resembling in a measure some of the Orchids. In habit the species under notice is a close ally to *U. montana*, and has linear spatulate leaves, bearing its comparatively large flowers on a leafless scape; the two-lipped calyx is green, fading to white or pink, and the pale violet-blue corolla fades to a lavender colour with a conspicuous yellow blotch on the palate. It is a native of Brazil, and forms an excellent subject for a pot or basket, preferably the latter, hung up against the glass. It associates well with Orchids, and a specimen has been flowering for some time in the Orchid-house at Kew. This species forms the subject of the plate 6564 of the *Botanical Magazine*.

— CLOVE CARNATION, CHISWICK RED.—Many good things have originated at Chiswick, but one of the most useful is Clove Carnation, Chiswick Red. It is remarkable for its brilliant red colour and fine rounded petals, its freedom of bloom, and capital habit of growth. It has the good qualities the florist requires, and its habit and freedom of flowering especially suits it for cultivation by those who, caring nothing for what the florist requires, wants plenty of pretty bright-coloured flowers. Chiswick Red is in all probability a seedling from Coroner, a pretty rose-crimson coloured Clove, raised also at Chiswick; also of good petal, a free grower, and profuse of bloom. Close by these Mr. BARRON has several beds of named varieties of Carnations and Picotees. These plants have done so well considering the dryness of the season, that they serve to correct a prevalent impression that the fine named varieties of Carnations and Picotees are too delicate to succeed well in open ground. This is a great mistake. Only plant them in suitable soil, and give them proper attention, and the fine bizarre and baked Carnations and edged Picotees will be found to be admirable border flowers. But to have them up to the mark of those flowers shading, and the intervention of the dresser is necessary.

— CASTILLEJA INDIVISA.—It is a matter of regret that this curious and showy plant is not sufficiently hardy to withstand the severity of our winters unprotected, for a more attractive or engaging rock-plant is seldom seen. It belongs to an order where we should little expect to find highly-coloured and showy bracts. The flowers themselves are small, greenish-yellow, inconspicuous and almost concealed in the deep carmine-red bracts of the inflorescence. The nearest allies of this plant amongst the British flora are *Euphrasia* and *Bartsia*, where, however, we have no showy floral leaves; but the inconstancy of this character, even within the limits of the same genus, is sufficiently demonstrative of its little value from a classificatory point of view. For mere decorative purposes it might be used in various ways, and a dry sheltered position on the rockwork would meet most of its requirements. It is furthermore sufficiently showy to warrant its being raised annually from seed. A fine clump of it may be seen in the new rockery at Kew, and the species is figured in the *Botanical Magazine*, t. 6376.

— GERMAN CARNATIONS.—A small group of these, originated by M. ERNEST BENARY, of Erfurt, Germany, is now flowering at Chiswick; and it can be said of the strain that the plants are of a singularly vigorous growth, somewhat dwarf and compact, and decidedly free flowering. The leading varieties are, Anna Benary, white, with bright rose-pink stripes, large, full, and very fine flowers, free growth; Queen Victoria, crimson, flaked with maroon, good habit, bold, and very showy; and Emperor William,

rosy-carmine, margined with white, very distinct and pretty. This variety has also sported to a very pretty, bright, pinkish-rose self, that is very attractive. M. BENARY terms the foregoing his Victoria Strain of Carnations. They are quite distinct from any of our ordinary English Carnations, and they are well deserving of being grown in pots for conservatory and house decoration. The stout, but short and compact habit of growth fits them for this purpose; and there need be no difficulty in increasing special varieties, for all the varieties make a free growth of grass suitable for layers and pipings. Now that Carnations are being so much grown for border and cutting purposes, a notice of this fine German strain will not be out of place.

— SUMMARY OF AGRICULTURAL RETURNS OF GREAT BRITAIN FOR 1885.—We have received from the Agricultural Department, Privy Council Office, August 14, the following statistics, which are of cardinal interest to the cultivator. The returns were collected on June 5, in the year 1883, and on June 4, in the years 1884 and 1885:—

ACREAGE OF LAND IN GREAT BRITAIN UNDER

	Wheat.	Barley.	Oats.	Potatos.	Hops.
1883	2,613,162	2,291,994	2,975,381	543,455	68,016
1884	2,677,038	2,168,820	2,915,363	565,018	69,258
1885	2,478,318	2,257,346	2,940,680	548,731	71,314

— TUBEROUS-ROOTED BEGONIAS AT READING.—Recently Messrs. SUTTON & SONS erected on their Portland Nurseries, at Reading, two span-roofed houses, each 73 by 12 feet, in order to provide accommodation for the increased number of plants of their very fine strain of Begonias. These two houses are now quite full of plants just in the very height of their beauty, and they make up a floral display of such great attractiveness that it is worth a long journey to see them. Many of them are the finest selected seedlings of last year, and these are in 16 and 24-sized pots, large specimens, as finely grown as they are flowered; perfect in habit and heads of bloom. A considerable number are seedlings of this year, obtained from carefully recorded crosses, and flowering for the first time. What strikes one on entering these houses is the close, short-jointed, compact, yet free habit of these plants, resulting, no doubt, in great measure, from the use of B. Pearcei in the earlier crosses—Messrs. SUTTON & SONS having from the commencement made habit a first consideration. Then as to the flowers, it is impossible to praise their high quality too highly. They are not only of large size, stout and finely formed, but they display such a great variety of colours, from the purest white to the richest and deepest crimson. Particularly striking are the shades of cream, primrose, yellow, buff, orange and apricot. Many deserve to be named, but once this commenced it would be difficult to stop. Messrs SUTTON & SONS are content

with a fine strain with which to supply their customers; and it is only in the case of some special results that they venture upon a name. Is a blue-coloured Begonia possible? In looking through the Reading collection, magenta-coloured flowers taking on shades of violet are distinctly noticeable; and may not these become the progenitors or types that shall eventually result in purely blue and purple flowers? As variety has become of the utmost importance, Messrs. SUTTON & SONS are making special crosses, not only with a view of deepening the shades of violet, but also of securing other combinations. Already flaked and Picotee-edged flowers have been produced: some of the latter are very beautiful—such as sulphur edged with red, and white deeply edged with pink; pink and flesh-coloured flowers are distinctly striped and flaked with rose. In fact, you shall attempt to limit the capacity for developing colours found in the tuberous-rooted Begonia?

— SATYRIUM CORIFOLIUM.—Notwithstanding the many terrestrial Orchids that were introduced many years ago, comparatively few of this type are

and since then (in accordance with the popular opinion connected with the name of the good old Winchester bishop) we have had frequent and heavy rains, alternating with bright sunny days, local showers, and coast fogs. The reports received from the orchards are less favourable than those previously communicated to you, and the weather is not sufficient to account for the difference. I presume that as the fruit swells, and is being more narrowly watched, it is now seen that we are to have a poorer crop than was anticipated some weeks ago. Mr. W. V. Vroom writes from Clement's Port that in Western Annapolis the orchard crops are almost a failure, Non-pareils, Baldwins, and Bishop Pippins (Yellow Belle fleur), the most staple kinds, promising a very small yield, although some of the early kinds are better; but the crop, on the whole, will be much below average in that district. Pears and Plums (only partially grown) give better promise. Mr. A. B. Parker, South Farmington, also in Annapolis County, reports in similar terms that the orchard prospects are not in general promising by any means—below average, even for a short year. From King's County, however, where the orchards are very extensive, more encouraging reports are being received."

— EDWARD VON REGEL.—The 71st birthday of Dr. REGEL, the Director of the Imperial Botanic Garden at St. Petersburg, was celebrated on August 13. As a mark of esteem and recognition of his long and eminent services to botany and horticulture, several of his friends availed themselves of the opportunity of presenting Dr. REGEL with a silver dinner-service for twenty-four persons, and an illuminated address from the pen of Dr. BOLLE of Berlin. Dr. VON REGEL is one of the few who, beginning as a garden apprentice, has raised himself by his energy and merit to the dignity of "Excellency," and the title of "von," though his modesty often forbids his making use of the nobiliary particle. Our readers are familiar with the services rendered by EDWARD VON REGEL and his son Dr. ALBERT VON REGEL, and they will heartily sympathise with the spirit of the demonstration in honour of the Director of the Imperial Botanic Garden.

— CRYPTOGAMIC SOCIETY OF SCOTLAND.—The eleventh annual conference of this Society will be held on the island of Arran on September 29 and 30, and October 1 next. Circumstances have prevented the meeting taking place at Inverness, as proposed, and as it is contemplated the Society should meet at Aberdeen in 1886 the Council have determined that the Conference should be held at Arran this year. Further particulars may be learned on application to the Secretary, the Rev. JOHN STEVENSON, Glamis, Forfarshire.

— MAP OF LONDON.—Messrs. LETTS & CO. have published an excursionist's map of London, which will be very useful to the visitor to the metropolis. The principal feature of the map is that all unimportant detail is omitted, and only that which a visitor wants to know is given—viz., the places of amusement, public buildings, &c., with the principal streets and railways leading thereto.

— PROSPER JULIFLORA, known in Jamaica as Casbau, is (says Mr. MORRIS) an admirable tree (often attaining a height of 50 to 60 feet) to grow in dry gravelly soil, and in situations where rain does not fall for months together. It is fast-growing; the timber is excessively hard and remarkably durable. It is used for making knees of boats and all work requiring strength and tenacity. Posts of Casbau in wire fences last longer than any others, and are in great request for that purpose. Kingston is supplied annually with hundreds of tons of Casbau, which is the only firewood immediately accessible. The pods are of a sweetish succulent character, eagerly sought for by cattle; indeed, in some parts of the island during droughts they subsist largely on them. For horses and mules the pods are also admirable food, but it is very undesirable to allow them to feed upon the pods immediately after they have been exposed to rain, as ill-effects have been known to arise from the partially germinated seed being taken into the stomach, causing great pain and not infrequent death.

— GARDENING APPOINTMENTS.—W. J. MILCHISON, late Foreman at Kilkenny Castle, Magency, as Gardener to Mr. SMITH, Cleonard, Dundrum, Co. Dublin.—Mr. WILLIAM BYRON, Foreman to Mr. JOHN M. THOMSON, Gardener to his Grace the Duke of GRAFTON, K.G., Wakefield, Stony Stratford, Bucks, has been appointed Gardener to THOMAS EVRS, Esq., Thorple, Egham, Surrey.

cultivated at the present day. The species of Satyrium resemble the Disas in habit, or our native Ophrys. They are numerous, and vary with yellow, orange, white, pink, green and purple flowers, and are remarkable for the two-spurred or two-sacate labellum. The species under notice has medium sized uniformly yellow flowers, produced in a numerous flowered spike, terminating stout stems about a foot high. A few small bract-like leaves clothe the very base of the stem, above which are crowded a few large ovate leathery ones, spotted or maculated at the base with purple, after the manner of some species of Hemantus or Eucomis. The rest pass gradually into the bracts of the inflorescence. It has undivided tuberous roots, and succeeds with the same treatment given to Disa. There is a figure of the species in the *Botanical Register*, 703. Although introduced as early as 1820, a few other species were cultivated nearly a hundred years ago. A pan of *S. corifolium* has been flowering for some time in the Cape-house at Kew.

— NOVA SCOTIA FRUIT CROP.—"In our principal orchard districts," writes Dr. LAWSON, "the weather that has prevailed since my last writing has been favourable for the maturing of the fruit. The temperature has been high, rising, on warm days, to 80°, 85°, and, on one occasion, to 88° Fahr. in the shade. But we have had a good deal of wet weather also, during which the thermometer has run down to the 60's. The rain came on St. Swithin's Day,

WREST PARK, BEDFORDSHIRE.

HAVING heard of this fine place, and being lately in the neighbourhood, I determined to avail myself of the chance of a personal inspection, which, through the courtesy of Mr. Ford I was enabled to obtain, and derived great pleasure from my visit. The mansion, which was built in 1836 by Earl de Grey, uncle to the present Earl Cowley, is approached from the village of Silsoe through a magnificent avenue of Elms and Chestnuts in four rows, the former occupying the two central rows, and the latter the outside. Being planted a good distance apart, the limbs of the Elms do not interlace for a considerable height, and this is done in such easy and regular curves that looking up at it gives one the idea of looking at the rafters and beams of a huge church. Several other avenues occur in the grounds, but this is certainly the finest, although another one of Limes, about a mile in length, planted in the reign and in honour of William III., is very fine. In close proximity to the mansion are two flower gardens, one laid out in the Italian style, with boxed outlines, the centres of the numerous beds being planted with ordinary dwarf bedding stuff, presenting, on the whole, a rather unusual, though very pleasing appearance; the other is of more simple design, the beds being large, and consequently have a more massive appearance; both, however, are planted with great taste. The view from the front of the mansion is very fine, embracing the Italian flower garden, spacious lawns, dotted with specimen trees, mostly of a deciduous character, interspersed with ornamental fountain and lakes, with a large pagoda in the distance. The fountain, we may mention, is, when playing, fed from the top of the mansion, where the water is pumped from a tank fed by a "ram" by an engine.

Various objects of interest are to be found in the pleasure grounds, which are 120 acres in extent, and are beautifully kept, but a description of all would occupy too much space, so a short notice of them must suffice. A great many monuments and memorial slabs are erected to the memory of various celebrities who have planned and taken an interest in the grounds, also several statues, which are not arranged with the usual geometrical precision, but are discovered in most unexpected nooks and crannies. Besides the objects above-named are several "altars," with suitable inscriptions, one with ancient Greek and Arabic inscriptions, one with ancient Greek and Arabic inscriptions. In a sheltered nook one comes unexpectedly on a burial ground, set apart as the last resting-place of the favourite dogs that have ended their days in the service of the owners of the beautiful grounds, where they now lie; each one is "honoured" with a stone, giving its name and other details. The wooded part of the grounds is intersected with walks, which, however, are seen but "one at a time," owing to the luxuriant under-growth and grand Box and Yew trees with which they are edged. These walks are so arranged that at almost every turn a new scene strikes the eye, the arrangements of foliage and water being particularly noticeable; at one time a still lake, surrounded with sombre Yews, &c. suggests to the mind visions of Eugene Aram which are quickly dispelled by a sparkling stream, rustling Willows, &c., made lively by the movements of numerous waterfowl, and also by the presence of that most lovely of English birds, the kingfisher, which here seems less shy and retiring than is usually the case. Another interesting feature in the pleasure ground is a rustic cottage, built by Earl de Grey for his grand-children, in 1856, which is fitted up with kitchen, scullery, sitting-rooms, &c., and also a workshop; also a most complicated and novel sundial, for ascertaining the time in numerous parts of the world and other matters. On one of the large lawns, which originally was the site of the old mansion, a curious result of the recent drought is observable, the foundations being distinctly marked by the brown dried grass. An American garden is another pleasing feature in its proper season. One of the most delightful spots to my mind was a wild fernery, in a dense part of the wood, and where the *Osmunda regalis*, various forms of *Athyrium Filix-femina* and *A. Filix mas*, and large masses of several varieties of *Scopolopodium vulgare* and *Polypodium vulgare* were luxuriating around a miniature lake. Various trees thrive remarkably well, particularly the Yew, of which there are numerous ancient specimens, some being cut into various grotesque shapes, and others

forming a massive hedge over 20 feet high, which has been planted over 300 years; a good specimen of the Silver Fir about 100 feet high; also some Cedars of Lebanon, and a magnificent Beech, 11 feet in circumference at 4 feet from the ground, and having a beautiful clean stem of great length.

The largest glass structure is an orangery 105 x 36 feet, which was built by Earl de Grey for the reception of Orange trees bought at the sale of the last King of France, most of which are Sevilles, and are carrying a nice even crop. Next to it, in point of size, is the conservatory, built against the mansion, which contains some fine climbers of various varieties of *Habrothamnus*, *Taconia*, *Clematis*, &c. We were not fortunate enough to see this house at its best, as the family was from home; but, judging from the fine lot of decorative stuff in preparation for it, it must present a fine appearance when staged properly. The other houses are mostly small, though in good repair, and filled with highly creditable examples, the vineries, Peach-houses, Fig-houses, &c., all being well cropped with excellent fruit and very clean; the other houses are mostly used for decorative stuff. The kitchen garden was in excellent order, and consists, together with the fruit garden, of 5 acres. The fruit trees, on the whole, were carrying good crops, though somewhat blighted with the drought. We must not forget to mention the excellent fruit-room, where we saw Apples of 1883; but these were decidedly "past their best," not so, however, was a Ribston Pippin of 1884, which we greatly enjoyed.

PROLIFEROUS FERN.

APPENDED I send you a sketch (fig. 52) of a variety of the Lady Fern which has produced two little plants

FIG. 52.—ADVENTITIOUS BUD ON ROOT OF FERN.

from true root-buds at some distance from the caudex, which for some to me, inexplicable reason, all conditions being apparently favourable, has remained dormant until now. As far as I know, *Athyrium Filix-femina* is not recorded as productive of buds of this description, and it would be interesting to know whether other instances have come under the notice of the readers of the *Gardener's Chronicle*. The buds, in my belief, constitute another new form of reproduction of *A. F.-f.*, which can thus be classified:—1, By spores; 2, by apospory (*A. F.-f. clarissima*); 3, by buds on the upper surface on the axil of the pinna (*A. F.-f. unum cristatum*); 4, by buds on the under-surface of the pinna occupying the place of sori (*A. F.-f. plumosum divaricatum*); 5, by buds which develop upon cuttings of the bases of dead fronds in the same manner as is recorded of *Scopolopodium vulgare* (*A. F.-f. corymbifera*, James); 6, by buds developed upon the root-fibres, which, like the *Athyrium* with the stoloniferous Ferns (*A. F.-f. Frizellie ramosum naum*). The plant itself I cannot send, as I wish to raise the property. Mr. T. Moore has, however, seen it. *Chas. Druery, F.L.S.*

ALSTRÖMERIAS.

DRY and trying as the weather has been for most plants *Alströmarias* seem unaffected by the heat and absence of rain, and appear rather to have liked it, as I have never seen them better, for they have been full of flower, and have made a grand show; but though they are so good and useful in beds or borders or for cutting to dress in vases, they are seldom seen in gardens, and yet there are few things to equal them when they do well. To have them in this desirable condition it is necessary to sow or plant them in a

warm sheltered spot, a border facing south under a wall or house being the best situation for them, and where the soil should be light and loose with free drainage or the tubers will die by rotting off in the winter. The way to start with them is to trench the ground deep and work in some sand and leaf-mould, after which the seed may be sown in it or the plants raised in pots and then planted out just as they are in the spring, the latter being perhaps the better plan, as then there is no fear of losing them through frost, which is apt to kill them before they have time to get down, but with a few months start they are able to take care of themselves. As we shall have a quantity of seed soon ripe that will be wasted I shall have pleasure in sending any one some who will forward stamped and addressed envelope to me by the end of this month. *J. Sheppard, Woolverstone, Ipswich.*

NATURE IN GARDENS.

As one of those who think artificiality might with advantage be excluded from gardens perhaps you will allow me space for a few remarks. The mistake made by all who attempt to defend artificial arrangements in gardens on the ground that they are artistic is imagining that true Art can ever be in any way antagonistic to Nature. So far as Art deals with forms and colours it is high and true Art when it represents and expresses the highest things in Nature truthfully; it is mediocre and commonplace Art when it represents only those things which the untrained mind and eye can see; it is low and bad Art when it substitutes for the truths of Nature, falsehoods and vulgar human inventions. As Art can never be anything else but a representation of Nature, in presence of Nature it has no place. Art therefore can only come into gardens as a humble handmaid to help Nature to be herself. What is antagonistic to Nature in gardens is artificiality, which is the antipodes of Art. Art is and always has been the expression of man's delight in and reverence for the beauty of Nature: artificiality in dealing with the beauty of Nature is always the expression of blindness or indifference to that beauty. Our gardens are of necessity artificial because we grow in them plants from all available regions, and the only Art that is properly and legitimately admissible in them is just what will hide that artificiality and enable us to preserve every line and form and habit of the plants in a state of Nature, so that we may preserve and enjoy every atom of their beauty. The present, or rather the past style of gardening came in just when public taste in this country had reached a depth of degradation never existing even amongst the least intelligent savages, even the South Sea Islanders tattooing and the carving of their war implements being beautiful and good taste compared with the domestic furniture and ornaments in vogue between 1850 and 1860.

The Art education which has been going on since then has created a revolution in taste which only those conversant with the matter would believe, so that what would have been considered good taste when many of our gardens were laid out is seen to be utter absurdity now.

Where our garden designers have gone so absurdly wrong for the last thirty years is in laying-out gardens without the slightest regard to the requirements of the plants which were to grow in them, and arranging the flower beds solidly and permanently to suit what should have been seen to be a mere passing fashion. Take the part of Hyde Park round the Albert Memorial, for instance. The soil is dry, and all flower-beds should have been level, so that they could have been flooded without trouble. Now a series of literal cinder heaps has been made in which everything starves. Gravel walks are artificial necessities, but there is no beauty in them; therefore they should be strictly confined to what are necessary.

Then on what principle of either Nature or Art can geometric bedding be defended? Nature has nothing to do with it, because she is contradicted at every attempt to develop the native beauty of the plants. Art abhors it, because it places a hideous disfigurement in just those prominent places of a garden where all the choicest and most beautiful flowers should be. Good taste condemns it because the colouring is a disgrace to civilised beings; common sense condemns it because the plants used for it require to be kept under glass all winter, and are only available during a few months in summer; reason and intelligence condemn it because it substitutes a few exotics, mostly pinched and clipped out

of all recognition for the multitudes of beautiful plants which will live with us the year round and give us a continual succession of grace, beauty, and variety—from *Iris stylosa* in January to the Christmas Rose in December.

What possible argument having even a grain of plausibility in it can be used for any style of garden decoration which tells us we must have no Pansies, Hepaticas, Anemones, Irises, Columbines, Phloxes, Hollyhocks, Lilies, Pinks, Penstemons, Stocks, Carnations, Primulas, Polyanthuses, Daffodils, Pyrethrums, florists' and Parrot Tulips, Scillas, Ranunculus, Globe Flowers, Poppies, Delphiniums, Tigrids, Heliobores, Campanulas, and all the hundreds of other beautiful things, but only a few continuous blooming plants; which vetos bush Roses and climbers in arches and arbours; which tells us we must have nothing near the house but pinched and clipped geometry, and just about as much of plant beauty as could easily be matched by filling the beds with tinsel paper and coloured rags. What is wanted in gardens is great beds of hardy plants arranged so as to give a long succession of flowers, and grouped as an artist would group them. Such groupings are of the easiest possible attainment, all that is required is that professional gardeners shall learn to grow hardy flowering plants at least as well as an average gardening amateur. Half hardy and tender plants need not be excluded, but should be used as auxiliaries. Close to the house may nestle Primroses and Primulas. Christmas Roses and other flowers which gladden the winter and early spring days, so that they may be seen from the windows of the house, while the flowers of late spring and summer may be placed further away. Then what beauty there might be in shrubberies if deciduous trees and shrubs were planted sparsely and in clumps, and, no single lalcea leaf ever disturbed, a deep bed of leaf-mould would in a few years accumulate, in which the American Wood Lily and May Flower, the beautiful Cyripediums, nearly all the Lilies, the Anemones, the hardy Primulas, our pretty native Orchids, and many other beautiful things would live and thrive year after year with no trouble except hand-weeding.

The one way in gardening—is follow Nature, avoid everything artificial, strive to produce variety; follow Nature in the cultivation of the plants grown, and every year's experience will open up fresh possibilities of beauty, until our gardens will become what we have at present but little conception of. Every one who has tried it knows that hardy flowering plants are capable of producing such a fairland of floral beauty that those who are satisfied with bedding are ever afterwards regarded as we regard Bunyan's man with the muck-rake in the *Pilgrim's Progress*. J. D. D.

CORN MILDEW.

PUCICIA GRAMINIS, PERS.—The accompanying illustration (fig. 53), engraved from Nature, and enlarged 400 diameters, shows the resting-spores of the fungus of Corn Mildew, *Puccinia graminis*, Pers., growing within the membranes of the fruit or grain of Oats. Four resting-spores are shown, each furnished with the characteristic joint across the shorter diameter and supported upon their stalks or peduncles, which arise from an involved mass of mycelium, or spawn, entirely within the substance of the grain. The fungus is growing in company with the fungus of "Smut" of corn, *Ustilago carbo*, Tulane, and the small circular bodies towards the top of the illustration near *x* are "Smut" spores.

The squarish cells at *A* belong to the outer membrane of the grain in the Oat; at *B* the basal part of a hair is shown springing from one of these cells. The long flat cells at *C* belong to the inner membrane. The seven deeply shaded cells at *D* (above *C*), are the gluten cells containing the flesh forming material of corn, the curved lines at the top of the illustration, at *E*, belong to the bases of the starch cells, the contents of which produce heat and fat in animals. It will be seen that both fungi are growing between the gluten and starch-containing cells, and these cells they have pushed apart.

The illustration now given has been engraved for more than a year, it was taken from material I was working with in June, 1884, and the block was too late for insertion in my little book on the *Diseases of Field and Garden Crops*. At that time I was examining corn in an attempt to trace the very earliest stages of growth of the "Smut" fungus in corn stems. On

cutting slices of the grains of young Oats the *Puccinia* came to light growing in company with the young Smut or *Ustilago*. I took pains to assure myself that neither fungi had grown from the outside inwards, but that both entirely belonged to the inside of the grain. The *Ustilago* always grows entirely within the host plant, till it at length bursts through the membranes of the grain. No *Puccinia* was growing on the Oats, but early "Rust," or *Uredo* pustules, were present on the leaves. The mycelium of the mildew had grown in one involved mass with the mycelium of the Smut, and both had fruited together within the membranes of the grain.

The example shows that not only the spawn-threads but the resting-spores of Corn Mildew can be, and sometimes do exist within the grains of corn when the corn is planted, that the fungus-spores germinate at the same time as the grain, and that the disease can

FIG. 53.—PUCICIA GRAMINIS, PERS., GROWING IN COMPANY WITH USTILAGO CARBO, TUL., WITHIN THE MEMBRANES OF THE FRUIT OR GRAIN OF OATS.

be, and potentially is, hereditary. It also shows that the intervention of a Barberry bush is unnecessary; in fact, in this district there are no Barberry bushes, and if there were it would not tell in favour of a connection between Barberry blight and corn mildew, for there is always an abundance of *Uredo* on the corn before Barberry bushes ever come into leaf. Professor Farlow has indicated that a similar discrepancy occurs in America with certain species of fungi allied to Corn Mildew, which have been suppositiously connected with other species of fungi allied to the fungus of Barberry blight.

In the district where I write—Dunstable—mildew-infested straw is always on the fields: it is thrown on with the dung at all seasons, either for corn, Clover, Turnips, or other crops. The heaps of mildewed straw and dung are always by the hedge-sides, and it is from these places by the hedge-sides, where the dung has lain, that mildew on the corn is

always seen at its worst. It does not extend here "like the tail of a comet" from a Barberry bush, but from the dung heaps adjoining bushes of all sorts except the Barberry. We have no Barberries.

It would appear that the Rev. J. E. Vize, of Forden, Welshpool, was the first person to see, but not recognise, *Puccinia graminis*, Pers., growing within the membranes of the grain in corn, for one of Mr. Vize's preparations sent to me before my engraving or observations were made, shows this fungus. Mr. Vize, however, had labelled his slide "Diplodia,"—he thought the brown septate spores within the grain belonged to this genus. As fungi belonging to "Diplodia" are found everywhere, and are, moreover, perhaps, the most contemptible of all so-called "species" of fungi, I placed the slide aside unheeded with other species of "Diplodia." It was not till lately that I recognised the true nature of the growth seen by Mr. Vize, and on writing to that gentleman informing him of the fact of his "Diplodia" being really *Puccinia graminis*; he replied that my information was new to him, and that he had overlooked the value of his own materials.

The publication of the illustration has been in part delayed from hesitation, and from my uncertainty as to the correct number and nature of the membranes in the grain of corn. I have, in fact, been unable to trust my own eyes. The Rev. George Henslow has published an elaborate engraving of the grain, in which five membranes or skins are illustrated and described; whilst Professor A. H. Church, in his "Science Handbook" for the Food Collection now at Bethnal Green Museum, says there are six, and adds (p. 61), "The outermost coat of the above-named six coats is the least valuable." Four of the others, I fear, are almost valueless, for up to the present time I have only been able to distinctly see two coats, and with much trepidation I have so illustrated the structure in fig. 53, at *A* and *B*. It is no light matter to differ from three famous Professors all at once—with Professor De Bary and his Barberry bushes, and the two general Professors, Henslow and Church, and their five and six "skins." Besides, the ladies of the Bread Reform League go in strongly for the "five skins" (they ignore the sixth), which they say go to form bones and teeth, and nourish the brain and nerves. The "five skins" seem to be at the very foundation of the "Bread League" department of the "Ladies' Sanitary Association." It is hard to be unwillingly compelled to deprive these good-meaning ladies of three of their valuable "skins," and my position with the esteemed ladies over this matter is likely to be worse than with the Professors, for converts to any dubious belief always stick more tenaciously to possible errors than do the original teachers. I acknowledge that I may be wrong in my estimate of the potency of Barberry bushes, as well as wrong over the matter of the five (or six) skins of the grain in corn, but the above notes reflect my thoughts. W. G. Smith, Dunstable.

THE POTATO.

It is the universal custom about here amongst cottagers when they dig up their Potatoes to divide them into three parts, according to their quality. The best they eat, the second-best they give to the pigs, and the worst they save for seed. Suicidal policy indeed. Mr. Terry, the author of the *A B C of Potato Culture*, and one who has spent the greater part of his life in the business, walks over his 26 acres while the men are digging, and selects the very best at once for seed, and so he is always improving the stock.

The next thing I would mention is about banking-up. Now, this custom is, I think, all but universal in England. Most people think that it is necessary to a crop, but the reason does not clearly appear. If it is thought that the Potatoes will grow out of the ground, then plant them a little deeper, taking care that the soil is well prepared before planting. There are many advantages to be gained by letting the ground remain level (or nearly so), especially during a dry season like that we have had lately. It is well known to gardeners that when the weather is dry it is a very good plan to water with the hoe—*i.e.*, continually stir the surface, and the sun will then draw the moisture upwards to the roots of the plants. Mr. Terry has experimented on the same soil for years and years, and he always gets the best crop from the level surface. There is also considerable judgment

required in our changeable climate as to the time when to plant late Potatoes. "To secure the largest yield Potatoes demand moisture and coolness during the latest month of their growth;" therefore do not plant too soon. I was accidentally hindered this summer from planting my late Potatoes about a month; and the result is that my Potatoes are looking green and flourishing, whilst my neighbours' are as dry as hay.

Now for a little more about the seed. I suppose most people are pleased to see a dish of Potatoes served up mealy and about one size. This can be done by careful selection of the seed, and cutting the pieces to one eye. When you get to the top and find several eyes close together, remove all the eyes save one. Take care to cut nice fleshy pieces to each eye, and let each eye have as long a piece of flesh as is possible, and let each piece be about the same size. *Agnes.*

Florists' Flowers.

SEASONABLE NOTES.

THE PELARGONIUM.—How are the Pelargoniums doing this year? was a question I put to one of the growers for Covent Garden Market at midsummer. His answer was, "We are growing very few now, and think of giving them up altogether." Why? "Because I sent up a quantity of as good plants as ever were grown up, and they brought me in 9s. per dozen, while Paris Daisies, that cost considerably less to grow, were sold for 18s. per dozen." That is a grower's experience of Covent Garden Market. No doubt the Paris Daisies last much longer as window plants in London. Pelargoniums do not stand well; and Fuchsia flowers drop off in a few days, owing to the change of treatment. The Pelargonium will always be valued as a greenhouse plant for decorative purposes; but like other flowers it has to pass through different degrees of popularity. Our earliest flowering plants are now ready to be shaken out of their pots and to be repotted in sizes smaller. The best time to repot is when the buds have fairly started to grow. The later flowering plants have just been cut down, and will be repotted later; the one lot is a month in advance of the other. If any increase of stock is required, cuttings will root freely if planted in sandy soil, and the pots are placed on a shelf near the glass in a greenhouse. They die off in a hotbed. The instant green-fly appears fumigate with tobacco smoke to destroy them.

THE CHRYSANTHEMUM.

Those who want large handsome exhibition blooms must now give their plants daily attention. The blooms must be "set," to use the term of those who grow for exhibition. During the month of August, if the points of the shoots are examined, the tiny flower-buds will be seen with shoots starting from the leaves close to the buds. These incipient shoots must be carefully removed with the finger and thumb; if they are not removed, the buds will not increase in size, and will ultimately die out. Remove the shoots as soon as they can be broken over with one finger, and the buds will grow up to produce those beautiful blooms seen at exhibitions. Leave the shoots alone, and three of them will take the lead, producing each a bloom, though inferior in size to the single specimen. Greenly have been troublesome as usual, clustering round the points of the young shoots, and checking the development of leaf and bud. They are easily destroyed by dusting with tobacco-powder. We find a penny tin pepper-box the most useful article whereby to apply the powder. As soon as the buds are set, give regular supplies of weak liquid manure, and be careful not to let any of the plants suffer for lack of water. They must not be crowded together, but should have plenty of space to develop themselves. Specimen plants ought now to be placed where they can get all the light and air possible. As time can be spared, the growths must be tied out, and regulated to form good specimens. Exhibitors do not need to be told that the plants must be trained to one stem, and they must also be of large size—the larger the better, if the shoots are well furnished with healthy green leaves and the flowers are of large size. In training the growths avoid all twisting and twining of them to get the specimens dwarf. If a large flowered or pompon specimen is trained down to an unnaturally dwarf habit, even if it is moderately healthy, it is not

a beautiful object, but the reverse. Mildew has not yet appeared, but it will do so; at least I have had to fight against its insidious advances every year for twenty-five years, and do not expect any exceptions now. Dust with flowers of sulphur as soon as it is observed.

THE CINERARIA.

The plants, whether propagated from offsets or raised from seeds, are now growing freely, and also require attention. They do very well in cold frames up to the end of September, but after that time it is better to place them in a heated pit or greenhouse. They must not be crowded closely together, as this treatment has the effect of crippling the plants, checking their development, and promoting the growth of undersized blooms and trusses. It is better to see one good large well-trained specimen than a dozen badly grown small ones. During the present hot and dry weather they have been kept free from trips and green fly by frequent fumigations of tobacco-smoke. Mildew has not yet appeared, but it may do so; there is nothing better than dry flowers of sulphur for its destruction. The powder should be puffed under the leaves with a sulphurator. As the plants make very vigorous growth at this season, they should be repotted before the roots become too much matted together. I have before stated how the potting soil ought to be prepared; but as this is the season for repotting most of the soft-wooded greenhouse plants, such as Pelargoniums, Calceolarias, &c., I may again state that the same compost may be used for the whole of them, viz. good loam, a fourth part leaf-mould, as much decayed manure, some crushed bones, and a small portion of sand and charcoal broken into small pieces, but not powdered. Avoid the use of "vegetable ivory" as a substitute for bone-meal or crushed bones. The plants cannot have too much air, indeed the lights may be removed entirely if possible when there is no wind; high winds are injurious to the plants, and they ought not to be exposed to them during any period of their growth.

CALCEOLARIAS.

These require very much the same treatment as the Cineraria. Most people purchase a packet of seeds, and from that their stock of plants for the season is raised. By this time the plants will be well up, and in most cases they have been pricked off into pans or pots. At this season they succeed best in frames facing to the north. Even in a small state, before they are potted off, greenfly gets on to the under-sides of the leaves, and cripples them sadly if it is not removed. An exceptionally good varieties must be propagated by cuttings. They can be taken off frequently with a small portion of roots attached, and be potted in small pots singly. They will soon form fresh roots if they are placed in close band-lights behind a north wall. If no roots are attached to them when taken off, they will still form roots though not so quickly as those with small portions attached. Sandy soil ought to be used for potting them in. When fairly rooted, they ought to be repotted in larger pots in the ordinary compost used for seedlings. *J. Douglas.*

HOME CORRESPONDENCE.

Phormium tenax, or New Zealand Flax.—It is satisfactory to learn that this useful plant and its varieties prove to be hardy in the Royal Gardens at Kew, and also in other parts of England. I have a small plantation of it 60 feet long by 10 feet wide, upon which there are 166 spikes of bloom, and seed-pods from 7 to 10 feet high. It is a remarkable plant, and its practical utility induces me to state that no garden should be without it if sufficient room can be spared to grow it. It does not seem to be difficult as to soil, but it produces the largest leaves where it gets more moisture. The leaves being broad, flat, and long, all elements of quantity, are easily stripped into bands which are most useful for tying purposes. The quantity of resin they contain makes them stronger and more lasting than matting, raffia, Cuba bast, or any of those materials generally used. The plant is becoming very common and plentiful, so that it is easily obtained, and once planted may remain in the same place for years. Those who can recollect the first grand International Exhibition of 1851, may also call to mind the specimens of manufacture from its fibre exhibited

there. My object is simply to point out to the gardeners of England how useful it might be to them. *C. B. S., Jersey.*

Diseases of Potatoes and Vines.—Sometimes we have printed extracts from newspapers to show the lamentable want of knowledge which exists on the part of some writers who take upon themselves to instruct others. One is inclined to deal leniently with ordinary press writers, for they cannot be expected to possess special agricultural or horticultural knowledge. When, however, ignorant and misleading statements are published in papers whose speciality is supposed to be the teaching of things correctly the case is very different. The following two extracts are taken from recent issues of agricultural and horticultural papers:—

Potato Disease.—It is well known that the disease consists of animalcula (*sic*), which first attacks the leaves, and then, as they multiply in myriads, they fall, and find their way to the tubers, where they settle (!), and destroy the Potatoes. But how they come is yet a mystery, and how they can be destroyed is yet to be discovered."

Disease of Vines.—The black specks in the leaves are the result of the decay of the fungus, which, when in growth, is a bright orange colour; it is quite invisible to the naked eye, and even through a small pocket magnifier, but is painfully apparent through a powerful microscope."

The accomplished teacher above quoted, wisely abstains from mentioning the name of the "invisible" "bright orange" fungus (probably a few grains of flowers of sulphur) found by him to be "painfully apparent" on Vines with the aid of his "powerful microscope." X.

Peculiarities of the Orobanche.—It seems almost incredible that a tiny rootlet of the Gorse, $\frac{1}{16}$ ths of an inch in diameter, would be sufficient to provide nourishment for a parasite of over 6 lb. weight. This is, nevertheless, true, as I this season counted no less than twelve plants of Orobanche major, each fully $\frac{1}{2}$ lb. weight, growing on a single root of our common Gorse rather less than $\frac{1}{16}$ ths of an inch in diameter. The questions that naturally suggest themselves are these:—How does the Orobanche subsist? and is the Gorse plant exhausted by its parasitic friends? To the latter question I would answer No; at least, an examination of many specimens did not reveal any exhaustion of the plants, nor did the foliage appear in the least sickly. The former question I can only answer as follows:—As the Orobanche never appears above-ground until a flowering age—which is never less than three years, but usually more—the amount of nourishment taken annually from the Gorse, and concentrated in the tubers of the Orobanche, will not be nearly so much as was all drawn in one season, and consequently which may, no doubt, be attributed the perfectly healthy appearance of the Gorse. The Gorse root is usually swollen at the point of juncture with the Orobanche, but outwards from that point it dies off—no doubt from the circulation of the sap being arrested by the parasitic attachment. As the Orobanche is seldom found growing on the Gorse root at a less depth than 5 inches, the question may be asked, How do the seeds get down to this depth in the ground? Well, my explanation is this, that as the seeds are very minute (resembling those of the Poppy) and hard, and as the soil in which I have always found the Orobanche is rather rough gravel, it must be that a few of the very numerous produced seeds are washed down to that depth through the loose stony soil by heavy rains; otherwise I cannot explain it. The peculiarly constructed flowers, which contain a great quantity of sweet nectar, similar in taste and smell to that of the Clover, are visited by at least one insect, as I saw the red-tailed humble-bee visit many of the flowers on several plants in succession, and without fertilising them. The bee did not in any case visit the flowers directly in front, but crept along either of the two side channels of the lip, and in this way it was hardly possible for them to come in contact with either the stigma or stamens. I believe the flowers are fertilised in the bud state, as in specimens which had been prevented from sending up their stems by coming in contact with large flat stones I noticed that many of the ovaries had swelled, and contained what appeared to be good seed. To test the matter still further, I transferred specimens to the house before any of the flowers had opened; and, although I will not positively state that house-flies did not visit the flowers, still I never saw any, and certainly do not

think they did, and for all this seed-bearing capsules were produced. Cross-fertilisation may, however, take place, as in not a few plants the stigma protrudes beyond the calyx previous to the flower expanding, and as the flowering period extends, in good seasons, over a period of four weeks, it is not at all unlikely that small insects may deposit the pollen from open flowers on the stigma of such as are still closed. *A. D. Webster.*

Muscad Grapes.—The Grapes at Rangemore are certainly very good all round this year, but language fails me entirely to describe a long span-roof house full of Muscad of Alexandria to be seen there. I have seen a good many houses of Muscads during these last twenty years, but this is the most remarkable I have ever looked on—the even crop, the magnificent bunches, and the large berries, all go to show that the fine touch from the hand of a master of the art has been there. They are just now fast putting on the lovely amber colour, and any of our friends going that way would do well, if they have a little time at their disposal, to go and see them. For my own part, I would not mind a pilgrimage of twenty miles on foot to see such a handsome house of Muscads. *A.*

"Exhibition Peas."—I forward you a small hamper containing a few pods of the leading sorts of Peas, including Duke of Albany, a kind not mentioned by "R. D." in the *Gardeners' Chronicle* of last week, where a list of exhibition Peas is given. Duke of Albany being of a deeper green than Telephone, may be fairly called the better Pea; in other respects they are much alike; if any difference, I consider The Duke to yield a somewhat larger crop. John Ball and Robert Fenn are also At kinds. *W. C. H.* (The samples of the Peas sent are excellent, and are a very good selection of the leading varieties. The Duke of Albany, which is a green wrinkled selection from Telegraph, may be considered superior to Telephone, which is a white selection from the same; but there is really little distinction between the three. *Ed.*)

Bedding Viola.—I send you some flowers of my General Gordon Viola, will you be kind enough to give your opinion of it through your paper? For working in lines or masses, and free bloomer and habit, and blooming through the whole summer, I consider it excellent. The plants are covered with flowers, from ten to twenty blooms each, or forty-eight to the square foot, over the bed. The bed was planted last September, and received no water until last Monday. It will make a fine row of white flowers behind the blue Lobelia, it being so dwarf. Height of plants 3 to 4 inches, across 8 to 10 inches. *W. Jones.* [From the specimens sent, this appears to be a very good variety, with large flowers of good substance, clear white, fragrant, and one which, if it possess good habit and constitution, may be highly recommended. *Ed.*]

The Broad-leaved Helleborine (*Epipactis latifolia*).—In not a few of our woods and downs may now be found in flower the above stately though rather inconspicuous flowered representative of the Orchid family—a plant which, both as regards distribution and peculiarity of appearing in quantity in certain localities where it was not before known, is well worthy of more than a passing note. That the seed of this plant may lie dormant in the soil for at least upwards of a dozen years, or until circumstances favour its germinating, I am now almost convinced; but although, on several previous occasions, similar cases to the one below recorded had come under my notice, I refrained from mentioning them, having no direct proof that such really was the case. Some days ago, however, I was not a little pleasantly surprised to find in one of our woods, that had been thinned four years ago, numerous specimens of the above Orchid in full flower, as for a number of years previous to thinning of the wood I had occasion to visit it frequently, and would certainly have noticed this particular plant had it been present. The seeds must in this case have lain dormant for at least a dozen years, as the wood, previous to being thinned, was so thick that all under-vegetation was killed outright; and as no specimens of the plant occur in the neighbouring woods, their appearance could hardly be attributed to the dissemination of seeds the same space in which the wood was thinned. (It may be here noted that the *Epipactis* requires at least four years to arrive

at a flowering stage from the time the seeds are sown.) A similar instance, but more conclusive, I have noted in another native Orchid—*Habenaria bifolia*—in which both seeds and tuber may lie dormant for several years under certain conditions—a fact which I believe has been noted by several others, including Gilbert White. Another peculiarity of *Epipactis latifolia* is its singular distribution, for, unlike the generality of our native Orchids, it is by no means equally spread over a wood, but occurs in patches here and there, a fence or ditch often marking its boundary. It is also frequent in one wood, whereas in the adjoining, although only divided by a road, and similar both as regards soil, and situation, not a specimen is to be found. From observations made for some time past I am convinced either that this *Epipactis* can, under certain conditions, increase underground until it becomes of a flowering age, or that the root-stock is in some cases creeping, and new eyes formed at the extremity of particular rootlets, as is the case in the Bird's-nest Orchid (*Neottia nidus-avis*). The latter is, however, I may remark, quite different from all my observations, but for all this it may be true in particular cases. Three distinct forms of this plant are to be seen in the woods of Carnarvonshire, the handsomest of which is pure white or similar in colour to the Butterfly *Habenaria* (*H. bifolia*). This I have found on several occasions, but never plentifully. Another has the interior of the lip quite black or dark brown; and the third is of a pinky-green throughout. Some specimens have the leaves lanceolate, others oval. They are, however, but forms, as gradations passing from the one to the other are, where the plants are growing in quantity, not uncommon. *A. D. Webster.*

An Extraordinary Cereus.—In times when, as now, the cultivation of greenhouse plants is confined almost exclusively to such as are of the easiest cultivation, it seems strange that the summer-flowering kinds of Cactus, *Cereus*, are all but wholly neglected. In addition to their being the easiest of all plants to keep in a healthy condition with little attention, their flowers are amongst the most gorgeous of all cultivated plants. A specimen of *E. speciosissimus*, or some nearly allied sort, recently in flower in the conservatory at Temple Newsome, acted as a reminder of the mistake that is made in discarding these grand old inhabitants of the greenhouse. The plant in question is planted out in the central bed immediately under the ridge of the house, which is some 25 feet high. Its thick stem, trained up one of the pillars that support the roof, denotes its being old, and having long occupied its present position. The stem is quite bare nearly up to the roof, where it branches out so as to form a dense massive head of drooping shoots, that hang down some 7 or 8 feet, by nearly half as much in diameter, and were half hidden by their gorgeous flowers, scores of which, as large as tea-saucers, presented a combination of intense crimson and violet colour such as few, if any, other class of plants afford. Although the flowers, as well known, are short-lived, still, where the plants are large, they keep on giving a succession for several weeks. *A.*

Venus' Fly-trap.—I believe *Dionaea Muscipula* is not considered hardy in this country. A well-known botanist, when going over our experimental garden, said that, considering the climate it came from, he was surprised that it had stood several winters. I first planted it in a shady part of our wood; it lived there, but did not thrive, so in the spring of 1882 I moved it to the side of a pond in the sun, and put sphagnum round it; the leaves have now come up stronger, and seem quite healthy. *George F. Wilson, Heatherbank, Weybridge Heath.*

The Wholesale Destruction of Caterpillars.—I hoped that I had made my meaning clear to readers of the *Gardeners' Chronicle*, and that all who read my note would understand that it was the wholesale destruction of those caterpillars which infest our gardens, destroying fruits, vegetables, and flowers I advocated, but I find from "Jussieuensis'" note in the *Gardeners' Chronicle* of August 15 that this was not the case, and I hasten to say that I would by no means advise any one to scrape the trunks of their Oak trees in order to remove the eggs of the lovely Purple Emperor, or to wash their Nettles, unless they intended (like the old Scotch gardener) to make them do service as spring greens: I simply intended to advocate (as I do still) the destruction of all grubs and insects which infest our cultivated gardens. I believe that,

as a rule, insects deposit their eggs on those plants and trees whose leaves and produce are most likely to afford the right food for their brood, so that when we destroy garden pests, we are doing good, and need not entertain the least alarm that we should injure harmless members of the insect world, for the latter species do not affect our cultivated grounds, and if your Uckfield correspondent had seen as I did two summers ago the wholesale destruction of fruit and roots by various grubs in some Hampshire gardens, he would join in the cry of Kill, and no mercy, at once. *Helen Watney, Wimbleton.*

The Refractory Freesia.—Many and various have been the complaints of failures to grow this lovely and unique Cape bulb. Having personally experienced partial failures I could not restrain a start and exclamation of surprise on seeing a bed one mass of flower in the open air in the gardens of Tresco Abbey. The bulbs, which are now flowering so freely, were planted on April 18 last; they were simply inserted in a raised bed in the natural soil of the garden, assisted by some cow manure and leaf soil. Other similar beds have been formed, and, wind and weather permitting, there ought to be a gay show at Christmas tide. What is possible in Scilly in the open air ought to be possible on the mainland in frames. The beds at Tresco are so formed that frames can be put over them, if need be. *C. A. M. Carmichael, August 15.*

The Fertilisation of Figs: Stones in Trees.—It is a fact well known to most readers of the *Gardeners' Chronicle* and other horticultural papers that trees of the Orange, Mango, and Fig ripen heavy crops of excellent fruit annually in Malta, but it is not so well known that in order to secure a good set of Figs—even in the warm climate of Malta—the natives with that end in view grow the male or wild Fig among trees of the edible variety, asserting that if they did not do so the trees would not yield much more than half a crop of fruit. Then there is a tree—a species of the Orange, I think—which the Maltese call the Zinzilli, or stone fruit tree, the latter name resulting from the fact—which is a very interesting one botanically, and concerning which information is sought—that unless stones, say, the size of brickbats, are placed among the branches in spring it will not bear fruit. The correctness of this statement is vouched for by Colonel Crichton Maitland, who had resided in Malta for several years, and who, while visiting at the Castle last spring, kindly wrote to a military friend of long residence in that island asking him to send me specimens of the trees indicated above, and this gentleman, in generously complying with Colonel Crichton Maitland's request, communicated (February 26) the following interesting information respecting the male Fig and Zinzilli tree. Having said that he would send me a few rooted suckers which, owing to the very inclement season which they had had, and the beautiful weather which they were then experiencing would soon begin to bud, he proceeds:—"The fruit of the male Fig when rotten or decayed produces or attracts small black flies, which impregnate the female or edible Fig, and this accounts for the large crops we have. The male Fig, of course, should not be detached until ripe, and then it should be hung between the branches of the edible Fig tree. Now about the Zinzilli having fruit by the aid of stones inserted between the branches; all I can tell you is—it is a fact! but why or wherefore no expert or botanical scientist has ever, I believe, been able to say. A very clever Italian botanist brought over by Hoar some years since, told me that he did not believe it had ever been discovered, and that Colonel Murray's theory might possibly be the one sought for—viz., that certain insects in this climate (Malta) or region sheltered under the stones, and did the necessary process of impregnating the fruit blossoms at night; but who can tell? I have searched under the stones and found—nothing!" The fact that no insects have been found under the stones tends to weaken Colonel Murray's theory, otherwise one might suppose the fact of stones being conservators of moisture, as in some way attracting the insects, which in their passage to and from the stones impregnated the flowers. Then, am I right, in assuming that an atmospheric influence exists between the individual stones as inserted in the branches of the Zinzilli?—and if so, has the current thus produced anything to do in the process of fructification

by rendering the blossom and pollen more fructiferous, and afterwards disseminating the latter? I herewith enclose a small branch of the Zinzilli, which, with several others, has sprung from a sucker about an inch in diameter, and which, I trust, will enable you to name it botanically [apparently the common Jubae, *Zizyphus Jubae*]; and also, if you would kindly say in what way the placing of the stones amongst the branches of the Zinzilli tree is instrumental in securing a crop of fruit, you would greatly oblige many of your readers, particularly those who either reside, or have resided, in Malta. In conclusion, I may remark that our plants are growing in 6 inch pots, consequently the specimens sent of leaf and branch are much below their ordinary size. The plants flowered in June last, and by the aid of a camel's-hair brush I set a few, which, however, after attaining to the size of a full-grown Solanum berry, ovate-obtuse in shape, ceased to swell, and ultimately dropped off. *H. W. Ward, Longford Castle.*

The Fragrant Orchid (*Orchis* or *Gymnadenia conopsea*).—Ireland would seem to be the headquarters of this beautiful and deliciously fragrant Orchid, for some specimens sent me last week by Mr. Ramsbottom from his estate (Moorcock, King's Co.) there are certainly by far the finest I have yet seen. One plant had a dense cylindrical flower-spike $1\frac{1}{2}$ inch in length, and on which I counted no less than 142 flowers; another, rather smaller, bore 92 flowers. Accompanying these was a remarkable specimen of the rare and beautiful white-flowered form of this Orchid with a spike fully 6 inches in length of sweetly scented paper-white flowers. Considering how readily this Orchid is cultivated, and how pretty and fragrant the flowers are, one can only wonder that it is so seldom seen gracing a rather dry shady nook in our alpine gardens. *A. D. Webster.*

Rhinanthus major.—In some cultivated corn-fields in this district—Dunstable—Rhinanthus major is an exhaustive parasite of corn, chiefly, as far as my observation goes, of Wheat. It grows as a greatly branched plant, 2 feet or more high. I have a plant before me bearing 170 capsules, although many have now fallen off. I am inclined to agree with the botanist who consider this plant to be a large and robust growing variety of *R. Crista-galli*. *W. G. S.*

Bedding-out Cinerarias.—When, some weeks ago, I tried to explain to your readers the beauty of the beds of Cinerarias in the Portuguese capital, I thought I was writing of a floral device untried in England. But no such luck; perhaps "There is nothing new under the sun" was true before the golden days of King Solomon. At least we have never seen an age since when silver "was nothing accounted." The veterans of your legion of readers will remember a Cineraria, called The King, which was much cultivated when a novelty. Mr. Vallance, the experienced overseer of the Tresco Abbey Gardens, tells me that he hedged out this Cineraria in 1842 in the flower garden of Stackpole Court, in Pembrokeshire, and that for six weeks it was a thing admired of all. What can be done at Stackpole can a fortissimo be done at Mount Edgecumbe, Tregethnan, and other Cornish homes: indeed, perchance has been done. *C. A. M. C.*

Cattleya crispata.—In looking over the *Gardeners' Chronicle* of Saturday, August 15, page 214, I met with some remarks respecting Cattleya crispata, or Lælia crispata, from the pen of Professor Reichenbach, in which I feel somewhat interested, more especially as I have a very fine specimen of the above-mentioned Cattleya bearing seven splendid flower-spikes, carrying buds respectively—

2 spikes and 4 buds.
1 spike and 7 ..
3 spikes and 6 ..
1 spike and 5 ..
Total 22

At the same time it is pushing upwards of twenty new growths. *John Hawkley.*

Nuts.—Having lately made considerable journeys through the beautiful lanes of Ilants and parts of Surrey and Sussex, I have been struck with the extraordinary growth of Hazel nuts in the hedges, and a larger harvest I never remember since the summer of 1826, which was an exceptionally hot one. The

spring of this year was an unusually mild one. I merely conjecture that owing to this the catkins escaped from frost, and hence produced such a marvellous quantity of fruit. Filbert trees appeared to be equally full. The Filbert has bad reputation as a promoter of indigestion, but very often it is the adjunct in the bad pot or sherry which causes this, not the nut, although I admit the latter is oily and requires care. Of course if people eat such things like so many Currants they deserve to get dyspepsia, but in moderation and with good wine, also, in moderation, no harm will follow. *John Colebrook.*

Dodder.—There are two large fields close by here, purporting to be fields of Clover, they are only separated by a grass-grown narrow farmer's road, and they were both sown at the same time, early in April. One field is full of well grown Clover, and has for a long time been supporting a large flock of sheep. The other field, instead of being green, is red. It is a field of Dodder, with a very few patches indeed of dwindled and starved Clover. In places where the Clover and its parasite have alike perished sow-thistles and other weeds are growing. No sheep have been, or could be, supported on the Dodder infested Clover and weeds. Although the bad field is actually red all over with the Dodder I have been unable to detect a single plant of Dodder in the adjoining good field. The seeds were, of course, bought by different farmers of different dealers. One would think the bad sample must have had as much Dodder as Clover in it—perhaps more. *W. G. S., Dunstable.*

Reports of Societies.

EASTBOURNE: August 12.

The annual exhibition of this Society was held in the beautiful grounds of Compton Place, the spot chosen being the vicinity of the mansion and pleasure-grounds, the latter being thrown open to all visitors to the show. The liberality and kind consideration of Mr. and Lady E. Howard, in thus furthering the aims and objects of the Society cannot be too freely acknowledged. It might here be stated that this is a typical flower show; no exterior means are resorted to whereby to draw a larger company than can be got together by floriculture and horticulture alone. This comment is not at all realisers of such, and we think that the committee of this Society, under the guidance of Mr. Thomas Larkin, whose practical experience is of great value, are to be congratulated in having thus far been able to hold their ground without extraneous aid in any way. The exhibition on this occasion well maintained the high standard of excellence, all departments being well represented throughout the show.

In the class for eight stove and greenhouse plants, Mr. Gilbert, nurseryman, Hastings, was well 1st with excellent examples of cultivation, his best plants being a grand specimen of *Erica remula*, *Stactis Gilbertii*, *Dipladenia amabilis*, *Stephanotis floribunda*, and *Allamanda nobilis*, being equally fine; a finely coloured *Kalosanthes coccinea superba* was also in this collection. Exhibitors of flowering plants would do well to imitate Mr. Gilbert's system of cultivation, and not aim so much at immense specimens as at finely-flowered and healthy plants. Mr. Henry James, of Norwood, was 2d in this class, having good plants of *Stactis imbricata* and *Rondeletia speciosa*; Mr. Tudgey, of Waltham Cross, followed, with capital examples of *Ixora Williamsii* and *Allamanda nobilis*.

In the class for six flowering specimens the competition lay between gentlemen's gardeners only. Mr. Portnell, gr. to Sir A. Lamb, Beaufort Park, near Hastings, was 1st, with finely cultivated and floriferous plants, among others, of *Erica cernuoides coronata*, *Allamanda grandiflora*, *Bougainvillea glabra*, and *Stactis Gilbertii*; Mr. Jupp, gr. to G. Boulton, Esq., Torfield, Eastbourne, being 2d, with a good *Bougainvillea*, and the same of *Stephanotis*, and the comparatively new *Ixora Westii*; in an excellent 3d lot came from Mr. Gore, gr. to Captain Taylor, Glenleigh, Hastings.

For eight exotic Ferns, Mr. C. Rann, gr. to J. Warren, Esq., Handcross Park, Crawley, won premier honours, having grand examples of *Gleichenia repens*, *Davallia Mooreana*, and *Dicksonia antarctica*, with a 10 feet stem; Mr. Gilbert being 2d—*Adiantum polyense* in his collection being a fine plant; Mr. James 3d.

For six exotic Ferns, Mr. Jupp was placed 1st; and Mr. Clements, gr. to Mrs. Usill, Fulbourne Lodge, 2d. In the class for ornamental foliage plants Mr. Rann was again 1st, with immense bushes of *Croton interruptus* and *C. Warreni*, both grand in colour; *Cycas revoluta* and *Gleichenia Mendelii* were also fine specimens. Mr. Tudgey followed, with *Cycas revoluta* and *C. circinalis*, and a fine plant of *Pritchardia pacifica*.

For six ornamental foliage plants Mr. Portnell was placed 1st, with a clean well grown lot of plants, prominent among which were *Croton interruptus* and *C. Quercifolius*, with a good *Cycas revoluta*. Mr. Jupp followed with an excellent 2d.

The class for six *Ericas* brought good competition, Mr. Gilbert being 1st, with a fresh and healthy set of plants; Mr. Portnell and Mr. Tudgey followed.

A class devoted to groups of plants arranged for effect brought out a capital competition, evidently being looked upon with favour, and that rightly too, by the exhibitors. Mr. H. James, who is always hard to beat, was placed 1st; a young grower and fresh exhibitor in the person of Mr. Fuller, gr. to J. White, Esq., St. Leonard's Road, being 2d, with a fresh well grown lot of suitable subjects; Mr. Gore, gr. to J. G. Langham, Esq., West Down, was awarded 3d; extra prizes being allotted to Mr. J. Gore and Mr. Jupp.

For six *Fuchsias* Mr. Portnell was awarded the 1st prize, with a good lot of plants; Mr. Wise, gr. to Mr. G. C. Holroyd, The Links, Meads, being 2d; and Mr. Ligges 3d.

Fuchsias are always well shown along the South Coast, and this was no exception to the rule. Zonal *Felagium* ones are likewise exceedingly well done, as may be imagined when good growers like Mr. Gilbert can only secure a 3d prize. Mr. Portnell was placed 1st, and Mr. Wise 2d in this class.

Begonias were well represented by two collections from Mr. Costick, gr. to R. Himself, Esq., Old Orchard; and Mr. Tugwell, gr. to J. Swift, Esq., Southfields. In the class for 12 plants Mr. E. Heusley, gr. to Doré, Esq., Brunel Terrace, were such close competitors that the judges awarded them each equal 1st prizes.

Specimens of flowering and foliage plants were also good, Mr. Rann securing 1st honours with a fine *Croton* in the latter class.

Decorations for the dinner-table (flowers and fruit combined) produced excellent competition, and were a source of great attraction throughout the afternoon. The taste displayed in the winning arrangements evinced considerable skill and forethought on the part of the ladies by whom they were set up. To Miss Sutton, of South Street, was awarded the 1st prize for a very light and elegant arrangement; Miss A. M. Skinner taking 2d; and Mrs. G. H. Cork taking 3d honours. Taking into consideration the long period of drought, all the various classes for hardy cut flowers were exceedingly well represented throughout.

For thirty-six cut Roses, Messrs. F. Woodall & Son, The Cooksbridge Nurseries, was placed 1st; Mr. G. W. Piper, of Uckfield and Plitdown Nurseries, being 2d; and Mr. Slaughter (an amateur), of Steyning, taking 3d. This was a good class. For twenty-four cut Roses, Mr. Simmonds, gr. to Rev. R. C. Hales, secured the 1st position; Mr. Slaughter in this case being 2d. A good display of cut Roses (not for competition) were staged by Mr. Knight, of Hailsham.

Dahlias were well represented in the three winning collections of twelve each, Mr. Simmonds taking 1st, and Mr. W. Gower the 2d prize.

Collections of annuals, *Phlox Drummondii*, and herbaceous cut flowers were in each respective class shown in good condition.

Only one competitor entered the lists for British wild flowers, his productions and correct nomenclature are so well known, both locally and in London, he having won premier honours at the Regent's Park shows and elsewhere. Mr. M. K. Dixon, gr. to Sir S. M. Wilson, Sefton, Uckfield, was the only exhibitor, and produced such examples of wild flowers indigenous to this country as to reflect great credit on his perseverance in their collection.

Exotic cut flowers were shown of excellent quality by Mr. Portnell, who was 1st; and also by Mr. J. Blake, gr. to F. C. S. Roper, Esq., Polgate, and Mr. Jupp, who were 2d and 3d respectively.

FRUIT.—The classes provided for fruit were well represented throughout with but one or two exceptions, and the quality first-rate, as it is the invariable rule at this and other Sussex exhibitions during the season. Mr. J. Gore was the only exhibitor in the class especially provided for a collection of ten varieties, the number of dishes required being no doubt more than many growers could produce in a satisfactory manner. The same exhibitor took 1st in the class for nine kinds, also being followed in this case by Mr. J. Blake.

A capital representative collection of fruit and vegetables was staged (not for competition) by Mr. F. D. Dann, of Pevensey.

For Pine-apples the 1st prize was awarded to Mr. J. Hopkins, gr. to R. Thornton, Esq., High Cross, Framlingham, being 2d in the same position with three bunches of black Grapes; Mr. A. McBean, gr. to G. P. Wragg, Esq., Upperpton, following in this case.

For white Grapes, Mr. Foxley of Witham Cottage, was 1st; Mr. Chatfield, gr. to T. Holman, Esq., East Heathly, was 2d.

The classes provided for cottagers produced a large competition, both fruits, vegetables, plants, and cut flowers being of a high order of merit. *J. H.*

TAUNTON DEAN HORTICULTURAL: August 13.

The show in the Vinery Park on this occasion was of a similar character to those that have preceded it in recent years, so far as the excellence of the productions were, but in one or two of the leading departments, including stove and greenhouse flowering and fine-leaved plants, it was thinner than heretofore.

STOVE AND GREENHOUSE PLANTS.

In the open class of twelve, in bloom, Mr. Lock

gr. to P. W. Cleaver, Esq.; Crediton, was easily 1st with a grand dozen, large and fine flowers; they consisted of *Lappageria alba* and *rosa*, covered with their showy flowers; *Ixora* Prince of Orange and I. Duffii, each some 4½ feet through, and full of bloom; *Dipladenia ambalis*, in excellent order; *Stephanotis floribunda*, *Eucharis amazonica*, *Alamanda*, *Hendersonii*, and several *Heaths*, Mr. Cypher, with a smaller set of plants than we have usually seen him exhibit at Taunton. With six stove and greenhouse plants the order was reversed, Mr. Cypher taking 1st and Mr. Lock 2d, the winning collection were amongst the best examples of skilful cultivation we have seen for some time; they comprised *Phenocoma prolifera* Barnesii, at least 5½ feet through, and covered with its bright rose flowers; *Ixora Pilgrimii*, a splendid specimen, with the flowers unusually fine in colour; *Stancea profusa*, *Erica Thompsonii*, *E. Irbiana*, and *Alamanda nobilis*, equally well done; 2d, Mr. Lock, with a nice group.

FINE-FOLIAGE PLANTS.

Mr. Lock was the only exhibitor in the open class for eight, taking 1st with a large and well grown collection, which contained *Croton Weismanni*, *C. Williamsii*, and *C. variegatus*, and *Alamanda*, an immense example of *Lantana borbonica*, and several other Palms, with *Cycas revoluta*, large, and in fine condition.

FERNS.

Of eight exotic varieties, Mr. Lock was the only exhibitor, being 1st with, amongst others, beautiful specimens of *Adiantum* and *Polypodium*, a native *Gleichenia splendens*, *Davallia Mooreana*, and the charming *D. filix*, with *Marattia Cooperi*, a fine and distinct Fern.

TUBEROUS BEGONIAS

were very well shown, the plants collectively being large, well-flowered, and stout in growth. With eight varieties Mr. H. Godding took 1st; 2d, Mr. S. Tottle 2d.

ORCHIDS.

Mr. Cypher was the only exhibitor of four, taking 1st honours with well-bloomed plants, including *Saccolabium Bureii* major, bearing three good spikes; *Cattleya sepulchralis*, *Dendrobium Dearei*, and *Laelia purpurata*.

FUCHSIAS

were well represented, most of the plants being staged in medium in size, fresh and profusely bloomed. Mr. H. Godding and Mr. Henley, gr. to F. Woodland, Esq., were 1st and 2d, with six, in the order of their names.

ZONAL PELARGONIUMS

are better shown at Taunton than in many places, the plants individually not so large as sometimes met with, but well-flowered and less formally trained. For eight Mr. H. Godding was 1st, with a meritorious collection; 2d, Mr. S. Tottle. Eight nosegays,—1st, Mr. H. Godding. Eight variegated varieties, four gold and four silver treclores,—1st, Mr. H. Godding. Double zonals were also well shown, Mr. H. Godding and Mr. Henley being bracketed equal 1st.

DIVISION II.—AMATEURS.

Stove and greenhouse plants.—With twelve, Mr. Lock again scored 1st honours, staging a nicely bloomed set of plants, the best of which were *Ixora Prince of Orange*, the white flowered I. Colei, *Erica ampullacea* Barnesii, and *Phenocoma prolifera*; 2d, J. Paine, Esq. Six stove and greenhouse plants.—1st, Mr. Thomas, gr. to W. G. Marshall, Esq., with a well managed half-dozen, the best of which were *Ixora Williamsii*, *Erica tricolor* Wilsoni, and *Bougainvillea glabra*.

FINE-FOLIAGE PLANTS.

Here also Mr. Lock had 1st, again staging a beautiful lot, including *Croton Prince-Prince* of Wales, one of the best of the long narrow-leaved sorts, and *Kentia Fosteriana*.

FERNS.

In the class for six exotic kinds, the 1st prize went to Mr. Lock, who had well managed examples of *Davallia Teyrnaanii*, *Gleichenia Mendehii*, *G. rupestris* glaucescens, and *Adiantum concinnum latum*; 2d, Mr. Henly, who likewise had a pretty set of plants. Mr. Lock was to the fore with hardy Ferns, having a very fine collection; 2d, Mr. Huxtable, gr. to F. W. Newton, Esq.

COLEUS.

These were present in fine condition.—With six Mr. Thomas had 1st, his plants being well grown and highly coloured; 2d, Mr. Bradbeer, gr. to W. R. Richards, Esq. Four Achimenes,—1st, Mr. Thomas, with nicely flowered examples.

GLOXINIAS

in nice condition came from Mr. Bradbeer, who was 1st with four.

CUT FLOWERS.

Roses were much better represented than the advanced season and the exceedingly dry state of the weather would have led us to expect. With forty-eight kinds, distinct varieties, open, Messrs. Keyns & Co., Salisbury, took the lead, having a very good lot of flowers; Messrs. K. Mack & Sons, Catterick Bridge, Yorkshire, a good 2d. For twenty-four varieties, three blooms each, open, Messrs. Keyns were again 1st, they also stage fine blooms; equal 2d, Mr. Campbell, gr. to S. P. Budd, Esq., Bath, and Messrs. Mack, both showing well.

In the amateurs' classes, Roses were also well shown. Mr. Campbell was 1st with twenty-four, staging a meritorious set of blooms; 2d, Mr. W. Davis. Twelve

Fuchsias (amateurs)—1st, Mr. Campbell; 2d, Mr. W. Davis. Twelve L. Roses (amateurs)—1st, Mr. Campbell; 2d, Mr. W. Davis. Twelve bunches of cut flowers.—1st, Mr. Lock with a fine collection, which, amongst others, contained *Dipladenias*, *Ixoras*, *Alamandias*, *Heaths*, &c.; 2d, Mr. J. Paine. Twenty-four *Glaucoliums*—these Mr. Deane was the only exhibitor, taking a well-merited 1st with a magnificent lot of spikes. *Hollyhocks*—With twenty-four, and also with twelve, Mr. W. Smith had 1st; Mr. W. Davis being 2d in the class for twelve. *Phloxes* were very good, Mr. W. Smith taking the lead with twelve spikes, Mr. H. Godding 2d. *Dahlias* were as well represented as often seen later in the season, the 1st prize for twenty-four going to Messrs. Keynes, who had a beautiful stand of full-sized flowers; 2d, Mr. J. Keynes, Stapleford. Twelve *Dahlias*—1st, Messrs. Keynes, here again staging twelve *Dahlias* were as well represented as often seen later in the season, the 1st prize for twenty-four going to Messrs. Keynes, who had a beautiful stand of full-sized flowers; 2d, Mr. J. Keynes, Stapleford. Twelve *Dahlias*—1st, Messrs. Keynes, here again staging twelve *Dahlias* were as well represented as often seen later in the season, the 1st prize for twenty-four going to Messrs. Keynes, who had a beautiful stand of full-sized flowers; 2d, Mr. J. Keynes, Stapleford. Twelve *Dahlias*—1st, Messrs. Keynes, here again staging twelve *Dahlias* were as well represented as often seen later in the season, the 1st prize for twenty-four going to Messrs. Keynes, who had a beautiful stand of full-sized flowers; 2d, Mr. J. Keynes, Stapleford.

TABLE DECORATIONS.

Miss Cypher was the only exhibitor in the class for a table laid out in the usual way, with flowers and fruit, taking 1st with a tasteful arrangement. Single stand of flowers.—1st, Miss Cypher; 2d, Mrs. E. Blake. For a hand bouquet Miss Cypher was 1st, with one of the best specimens we have seen for some time, alike noteworthy for the arrangement of the flowers as for the good combination of colour. Bouquets of wild flowers were numerous and very well arranged, Mrs. S. Reed being 1st, Mr. T. H. Bennett 2d.

FRUIT

is generally well represented here, and on the present occasion was better than usual. In the class for ten dishes, Mr. Iggulden, gr. to the Earl of Cork, Marston, Frome, stood prominently in front with a very good collection, containing Black Hamburg and Muscat of Alexandria Grapes, good Smooth Cayenne, Fine, Grosse Mignonne Peaches, Lord Napier Nectarines, Henskirck Apricots, Down Turkey Figs, Easton Castle Melon, and Jargonelle Pears, all good. The three bunches of Black Hamburg Grapes in this collection were as near perfect as they ever likely to be met with, medium-sized, beautifully-shaped bunches of large, even berries, in every way up to the mark in condition. 2d, Mr. Crossman, gr. to J. Bruton, Esq., also showing a nice collection. Eight dishes.—With these Mr. Crossman took the lead, the creditable lot of fruit, the best being Black Hamburg and Muscat of Alexandria Grapes, Fimiston Orange Nectarines, Early York Peaches, and Victory of Bath Melon; 2d, Mr. Reed, gr. to F. J. C. Parsons, Esq. Four dishes.—1st, Mr. Iggulden, here also staging excellent fruit, consisting of Black Hamburg Grapes, Crimson Galande Peaches, beautifully coloured; fine Apple Nectarine and Hero of Lockinge Melon; 2d, Mr. Dafurn, gr. to Mrs. Walker.

Three bunches of Black Hamburg Grapes.—1st, Mr. Iggulden, who here again staged faultless examples of this fine old sort; 2d, Mr. Cooper, gr. to G. L. Colliard, Esq. Three bunches of any other Black Grape—Here Mr. Cooper was placed 1st, Mr. Dafurn 2d, and Mr. Crossman 3d; the last-named exhibitor having the most meritorious exhibit in the class—Madresfield Court, beautifully finished.

Three bunches of Muscat of Alexandria.—With these Mr. Lloyd, gr. to V. Stuckey, Esq., took the lead, having good bunches, nicely coloured; 2d, Mr. W. C. Rafale. Three bunches of white Grapes, Muscats excluded.—1st, Mr. W. C. Rafale, showing Duke of Buccleuch, in good condition; 2d, Mr. E. E. Esdale, Esq., with Buckland Sweetwater, very well done. Dish of Peaches.—1st, Mr. Iggulden, who had a good dish of Royal George, full-sized fruit, nicely coloured; 2d, Mr. Lloyd, with Bellegrade.

Dish of Nectarines.—1st, Mr. Dafurn, with Newington, handsome fruit, highly coloured; 2d, Mr. Crossman. Single Melon, any colour.—1st, Mr. T. Paul, with Hero of Lockinge; 2d, Mr. G. Ricks, showing Blenheim Orange.

VEGETABLES

were wonderfully well shown, considering the dryness of the season.—With six dishes Mr. T. Frost had 1st. Six dishes.—In this class also 1st honours went to Mr. Frost, Mr. H. Moore being 2d. Collection of Potatoes.—1st, Mr. W. Greedy; 2d, Mr. H. Moore. Messrs. Lucombe, Pinee & Co., Exeter, and Messrs. R. Vaid & Son, Exeter, also contained fine and useful miscellaneous plants and cut flowers, not for competition. From Messrs. Kelway, Langport, came a fine lot of *Gladolius* and *Gaillardia* flowers.

Mr. T. S. Ware, Tottenham, had a beautiful collection of cut flowers; 1st, *Viola*, *Verbena* in fine condition; 2d, *Staphylea trifoliata*, *Viola*, *Verbena* in fine condition; and Mr. E. J. Jarman, Chard, Gloxinias, Begonias, and Roses.

GRANTHAM HORTICULTURAL.

The fourteenth exhibition of the above Society was held August 13, and was a great success. The entries were far in excess of the previous one. The weather was very fine, and the company very large. The show was well arranged, and the arduous duties of the secretary were performed very perfectly, ably assisted by the committee. We trust they will have a financial success, as the Society is worthy of being established upon a firm basis. Every inducement is offered to the cottagers. The Society annually distributes gratuitously seeds and plants to those willing to compete. This liberal offer is taken advantage of. The products of those in the cottagers' class were

highly meritorious. The principal feature of the show was the groups of plants arranged for effect, the 1st prize of £10 going to Mr. Thacker, of Nottingham, for a very fine artistic arrangement; 2d, Mr. Lyon, gr. to Lady Ossington, Newark, who had a good group of fine-coloured, well-grown plants, a little too crowded; 3d, Sir J. H. Thorold, Syston Park; gr. Mr. Ashley.

For six stove and greenhouse plants in or out of flower.—1st, Mr. Thacker; closely 2d, Mr. Lyon. For six Ferns the 1st prize was easily taken by Mr. Lyon for a well-grown half-dozen; 2d, J. R. Boyall, Esq. (gr. Mr. Melville).

Table plants were good, and competition strong. 1st prize for six, a pretty even lot from Mr. German, gr. to J. Cutts, Esq., Nottingham; 2d, Mr. Lyon, who also had a nice light graceful half dozen. *Coleus* were good, *Begonias* and *Gloxinias* poor, except those awarded 1st prize.

CUT FLOWERS.

Roses were fairly shown, the principal prizes going to Mr. House, nurseryman, Peterborough, and Messrs. J. & W. Brown, Stamford. *Dahlias*, both single and double, were good, the 1st prize going to Mr. House. *Bouquet*, *button-hole*, and *ergerie*.—These were well to the fore. *Bouquets* good, both those composed of wild flowers as well as of garden flowers. *Epergnes* were also good. Wild grasses and flowers were likewise well shown, one stand alone having over 150 varietal properly named.

FRUIT

was good. Fine collections were staged by Mr. Lyon, who was 1st, closely followed by Mr. Melville, gr. to Mrs. Hornsby, Grantham. Grapes were good, fine bunches, well coloured, good berries. 1st prize for whites.—Good examples of Muscats were shown by Mr. Edwards, gr. to His Grace the Duke of St. Alban's; Mr. Gilbert, Burghley, 2d. Black Grapes.—Mr. Melville, gr. to J. R. Boye, Esq., was 1st; Mr. Gilbert 2d—both showed fine examples. Longest and heaviest bunch.—1st prize, Mr. Edmond, Eastwood; 2d, Mr. Melville, Grantham. Peach Nectarines, Apples, Plums, &c., were well shown, likewise Melons.

Cottagers came to the fore well; good examples of vegetables and fruit were shown extensively, likewise flowering plants.

The Blackskin Potato, raised by the late Mr. Don, attracted attention. A splendid new yellow Tomato, of fine flavour—many fruit weighing over 13 oz.—was exhibited by Mr. Fish, Curator, Botanical Garden, Churchtown, which was highly commended by the judges, whose decisions seemed to give every satisfaction in the various departments. A. O.

ATHERSTONE FLORAL AND HORTICULTURAL.

The sixth annual exhibition of the above flourishing Society was held on August 3 in the beautiful grounds of Mereville Park, which was kindly placed at the disposal of the committee by Mrs. Edwards. The show, despite the dry weather, was superior to any of its predecessors, the lowest estimate of visitors being 14,000, the sum of £251 being taken at the gates, exclusive of tickets to the value of £25 sold in the town previous. The productions of the professional gardeners occupied four large tents. The first contained a collection of specimen stove and greenhouse plants; the second collections of plants arranged in groups for conservatory decoration, of which there were four fine lots well set up, also a strong competition in single specimens of Palms, Orchids, Ferns, &c. The third was filled with fruit and cut flowers, generally very good, the grapes especially being in quantity and fine. Plants for table decoration were also in this tent, and a large group of useful flowering and foliage plants from the nurseries of Mr. Woodford, Atherstone (not for competition). A fourth contained the vegetables, very good indeed, especially when the dry weather is taken into consideration. A very large tent was well filled by the cottagers, many of whose productions would have held their own in competition with the professionals. Here the competition was especially keen, and the standard of excellence and skill to the utmost. A sixth tent contained the productions of amateurs, also honey and dairy produce from the neighbouring farmers—a very fine lot indeed.

NATIONAL GOOSEBERRY SHOW: AUGUST 3.

This meeting was held at the Royal Botanical Gardens, Old Trafford, Manchester.

DISHES OF TWELVE BERRIES.

Exhibitor.	Name of Berry.

Charles Leicester, Secretary, Nurseryman, Crompton Road, Macclesfield.

regular intervals with living sugar cones, and to observe trees seriatim, that the view of an artless imitation of Nature affects our consciousness of beauty in the same way as an undreamt-of pleasure flushes the *blasé* man of the world. The mind feels full of it, nor is it any transient enthusiasm.

This arboretum is the exact mean between being too far from and too near the mausoleum. The approach is by a shrubby path, and you come upon the object of your quest without any sure conviction that you have reached your destination. This is owing to the admirable admixture of deciduous trees, which now overhang the path, now leave a gap of lawn, disclosing an aspiring Conifer. When there is open space everything is not cut away for a particular tree; the upper half perhaps is visible, but you must get to the other side of a spreading *Magnolia acuminata* to see its proportions. Again, the branches of the trees very often interlace at the foot. One tree is not removed because it is within reach of another. And who will say that the two together, whether fluttering at the behest of the winds or peacefully absorbing the sunlight, are not as pretty as one statueque tree, looking as conscious of deperiment as a sculptured figure of Hermes on one leg? This clear reach of 60 feet of channelled particoloured bark with the stumps of whilom branches, looking like fangs, still remaining, who will say that it is one whit less impressive than yonder *Thuja gigantea* as regular in shape as if it were a witch's hat? There is nothing formal about the planting of the trees at Barton, and yet within a small space are contained a very large and varied collection of foreign trees that will endure our winters.

Taking the deciduous trees first, the most superficial observer could hardly help leaning on the beauty of *Juglans nigra*. The large striking foliage, brightly coloured, makes it one of the best lawn trees possible. It is very effective when planted by the side of smaller-leaved trees. There is a fine wide-spread specimen of *Gleditsia triacanthos*. This is the Honey Locust tree of North America. *G. horrida*, from China, is also well represented. This is a dwarf tree, and is very suitable for mixed masses of foliage. A very ornamental tree in a full grown state is *Gymnocladus canadensis*. The leaves, which are made up of pairs of secondary leaflets, are long, and dull green in colour. The flowers are white, and are produced in racemes from the axils of the leaves. The timber is durable, and is made considerable use of in the United States of America, where the first settlers are said to have used its seeds as a substitute for Coffee; hence its *soubriquet* of Coffee tree. The meaning of the botanical name can easily be realised by the appearance of the branches when denuded of their leaves. Another prominent tree in this collection is the American Nettle tree (*Celtis occidentalis*). The German name, "Lotusbaum," immediately awakes a chord of interest, for people are apt to forget that *C. australis* probably furnished the oftentimes evaded food of the "Lotophagi." Certainly the American variety forms a good tree for a lawn, and one under which a mortal, if so minded, could well sit of a summer's day, and wish it was "always afternoon." Other noticeable trees are *Fagus sspicifolia*, *Pyrus spectabilis* (Chinese Apple), *Crataegus orientalis*, *Syrca Maple*, and *Acer caryocarpum*, *A. c. indicum* and *flava*, *Onus striata*, and *Carya amara* (the Bitter Hickory). A pretty group consists of a *Cladrastis* (*Virgilia*) *lutea* by the side of a *Judas tree*, which it resembles in habit, though quite different in the hue of the foliage: both contrast with an overhanging *Cryptomeria japonica* and an adjoining *Thuja filiformis*. A large *Catalpa* now in flower affords a still greater contrast to an arroyo *Pinus monticola*, which seems to rear itself from the midst of the lighter coloured foliage.

The Conifers are not a large collection, but the greater part are exceedingly well grown. The *Pinus monticola* mentioned just now is a remarkably fine specimen, and there are likewise good examples of *P. excelsa* and *Lambertiana*. There is no better coloured Pine than the last-mentioned, and it was a pleasure to observe it in so thriving a condition. The soil is calcareous. A tall specimen of *Cedrus atlantica* has the ground beneath the branches covered with ground Ivy, from which protude in many places healthy and vigorous Fern fronds. The *tout ensemble* of the glaucous foliage, the dark and bright greenery of the Ivy and the Fern, was very beautiful. All over the lawn, wherever practicable, on tree stumps, or in shaded angles of the bounding wall, the same carpeting of any bare ground was used. A specimen of the Douglas Fir is almost a rival of the famous one

at Dropmore, and there are few, if any, better examples of *Meziesii* than the two tallest at Barton. *Picea Morinda* succeeds well; one tree, not so healthy as the others, is loaded with cones. This is also the case with *Squouia sempervirens*, the tallest trees of which are leaderless. It is seldom also a *Cupressus Goveniana* can be seen without a heavy crop of cones. In South Portugal, where it is an extremely common tree, the beautiful foliage is much marred by the numbers of brown cones still clinging to the shoots. The same was the case with the Barton specimen. One of the gems of the collection is a grand specimen of *Taxodium distichum*. A free use is made of this *Taxodium* to brighten up any more sombre foliage, such as that of the *Yews*. In the distance it quite belies its name of *Yew-like*. An extremely useful variety, but much dwarfed, and exactly adapted for a shrubbery, or for planting among flowering plants, is the Chinese *Taxodium* (*Clyptostrobus heterophyllus*). The foliage has the same bright effective hue as *T. distichum*, and although rather tender, would succeed well enough in sheltered positions in most parts of the country. C. A. M. C.

LONDON: Atmospheric Pressure.—During the week ending August 15, the reading of the barometer at the level of the sea increased from 29.96 inches at the beginning of the week to 29.98 inches by 9 A.M. on the 9th, decreased to 29.67 inches by 5 P.M. on the 10th, increased to 29.85 inches by 9 A.M., decreased to 29.72 inches by 5 P.M. on the 12th, increased to 30.36 inches by 9 A.M., decreased to 30.29 inches by 5 P.M. on the 14th, increased to 30.34 inches by 9 A.M. on the 15th, and was 30.26 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.99 inches, being 0.04 inch higher than last week, and 0.04 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 73°.5, on the 10th and 15th; on the 14th the highest was 66°.5. The mean of the seven high day temperatures was 70°.7.

The lowest temperature was 43°.0, on the 14th; on the 10th the lowest temperature was 57°. The mean of the seven low night temperatures was 50°.7.

The greatest range of temperature in one day was 28°.5, on the 15th; the smallest was 16°.5 on the 10th. The mean of the seven daily ranges was 20°.

The mean temperatures were—on the 9th, 61°.4; on the 10th, 60°.7; on the 11th, 61°.4; on the 12th, 60°.2; on the 13th, 57°.2; on the 14th, 54°.7; on the 15th, 58°.9; and these were all below their

SIR CHARLES BUNBURY'S ARBORETUM.

THERE are several residences near Byur St. Edmund's notable for environments of coniferous and forest trees. Hardwick, Mr. Milner Gibson's beautiful home, over which the presiding genius is D. T. Fish, has the lawn, grounds, and park studded with fine trees. A Copper Beech planted on a mound, $\frac{1}{2}$ Dropmore, is a perfect specimen, and near it is a gaunt-limbed Cedar of Lebanon, that might well have been brought to England by a Crusader! But a few strides apart is a *Meilard*, never more than 12 feet high, but which takes fifty-seven good paces to circumnabulate. No need to form a clump of dwarfed Laurels or other shrubs when the same effect can be produced by one tree, and that useful to boot. In the grounds are some noble *Araucarias* and Pines, including a *Pinus excelsa* that would be hard to surpass here in England. Within a mile is Nowton Court, where there grows a *Vellingtonia* that will also challenge comparison. Six miles to the south-east is Drinkstone Park, where the H-mocks murmur over the highway, and where the plantations exhibit an absolutely flawless prosperity. But I have chosen Sir Charles Bunbury's arboretum at Barton, because in every sense it justifies the term, and may be taken as an example of natural arrangement. We have got so used to trim lawns dotted at

averages by 0°.7, 1°.4, 0°.8, 2°.5, 7°.3, and 2°.8 respectively.

The mean temperature of the week was 59°.2, being the same as last week, and 2°.9 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the fall rays of the sun was 133°, on the 11th. The mean of the seven readings was 120°.1.

The lowest reading of a thermometer placed on grass was 30°.4, on the 14th. The mean of the seven readings was 40°.9.

Rain.—Rain fell on two days to the amount of 0.07 inch.

ENGLAND: Temperature.—During the week ending August 15, the highest temperatures were 77°.8 at Cambridge, 73°.5 at Blackheath, 73° at Sheffield; the highest at Preston was 67°, at Bolton 67°.4, at Wolverhampton 67°.5. The general mean was 70°.4.

The lowest temperatures were 37° at Wolverhampton, 38° at Sheffield and Hull; the lowest temperatures at Plymouth 47°, at Brighton 46°.3, at Liverpool 45°.3. The general mean was 41°.5.

The greatest ranges were 38°.7 at Cambridge, 35° at Sheffield, 34° at Hull; the least ranges were 21° at Plymouth, 22°.7 at Liverpool, 25° at Preston. The general mean was 28°.9.

The mean of the seven high day temperatures was highest at Cambridge, 72°.5, at Blackheath 70°.7, at Brighton 68°.2; and was lowest at Bolton, 61°.4, at Preston 61°.6, at Bradford 62°.3. The general mean was 65°.5.

The mean of the seven low night temperatures was highest at Brighton, 53°.5, at Plymouth 53°.1, at Liverpool 51°.1; and was lowest at Wolverhampton, 46°, at Bolton 46°.6, at Sheffield 47°.3. The general mean was 49°.6.

The mean daily range was greatest at Cambridge, 24°.4, at Blackheath 20°, at Sheffield 19°.4; and was least at Preston 11°, at Liverpool 11°.9, at Plymouth 12°.4. The general mean was 15°.9.

The mean temperature was highest at Brighton and Blackheath 59°.2, at Cambridge 58°.6; and was lowest at Bolton 52°.3, at Wolverhampton 53°.2, at Bradford 54°.2. The general mean was 55°.9.

Rain.—The largest falls were 1.48 inch at Bolton, 1.52 inch at Preston, 0.64 inch at Liverpool; the smallest falls were 0.07 inch at Blackheath, 0.08 inch at Cambridge. No rain fell at Brighton. The general mean fall was 0.45 inch.

SCOTLAND: Temperature.—During the week ending August 15, the highest temperature was 68°.4, at Dundee; at Greenock the highest temperature was 62°. The general mean was 40°.

The lowest temperature in the week was 36°.9, at Dundee; at Leith the lowest temperature was 43°.9. The general mean was 40°.

The mean temperature was highest at Leith, 55°.6; and lowest at Dundee and Perth, 53°.2. The general mean was 54°.

Rain.—The largest fall was 2.47 inch, at Greenock, the smallest fall was 0.86 inch, at Leith. The general mean fall was 1.45 inch.

JAMES GLAISHER F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE IN THE UNITED KINGDOM, for agricultural and sanitary purposes, for the week ending Monday, Aug 17, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W.—The weather was rough and unsettled during the earlier days of the period, with very heavy rain in some parts of Scotland and the north-west of England, and a few showers over Ireland and the south and east of England. As the week progressed, however, the sky cleared, and fine, dry weather became general.

The temperature has been below the mean in all districts, the deficit varying from 1° in the "Channel Islands," and 2° in "England, S.," to 3°.4°, or 5° elsewhere. The highest of the maxima were registered either on the 16th or 17th, when they varied from 83° in "England, S.," and between 73° and 78° in most other districts, to 63° in "Scotland, N." The minima, which were generally recorded during the early morning of the 15th, were as low as 32° in "Scotland, N.," 33° in "Ireland, N.," and 34° in "England, S.W.," whilst elsewhere they varied from

35° in the southern and north-western parts of England, and in the south of Ireland, to 39° in "England, N.E.," and to 51° in the "Channel Islands." On the grass the readings were much lower, and frost being experienced over the inland parts of the country.

The rainfall has been more than the mean in "Scotland, E.," but less in all other districts. Bright sunshine shows a decided increase in all districts, the percentages of the possible amount of duration ranging from 36 in "Ireland N.," and 37 in "Scotland N.," to between 60 and 65 over S.W., S., and S.E. England, and 78 in the "Channel Islands."

Depressions observed.—During the earlier parts of this period the distribution of pressure continued similar to that of the close of last week, the barometer being highest over France, while depressions travelled in an eastern or north-eastern direction over the northern parts of the kingdom. Strong winds between S. and W. prevailed on all our coasts; gales were experienced in many places, and in some parts of Scotland the force of a strong or whole gale was attained. By the 14th, however, these depressions were disappearing, and from this time to the close of the period the conditions were anticyclonic, and the winds light and variable on all our coasts.

Answers to Correspondents.

VINE INSECTS: *Sp. Short.* The caterpillar is that of a moth described and figured in our columns previously, and here reproduced. The caterpillars eat the fruit

FIG. 54.—TORTRIX ANGSTORIANA A VINE MOTH.

and fasten the berries together by a silky web. You can do nothing but endeavour to catch the marauder. ADDRESS: *Agnes.* We cannot give you the address you want.

BOOKS: *A Young Beginner.* There is no separate book on the subject that would suit you. Burbridge's *Cultivation of Plants*, &c. (Blackwood) would be very useful to you. The *Fruit Manual* is published at 17s. Fleet Street, price about 15s.—*H. W. B.* Bentham's *Handbook of the British Flora* (Lovell Keave & Co.).

CARNATION: *J. B.* Your sport from the white Clove is curious. The petals are fringed in the ordinary way, but each tooth is marked by a tiny purplish spot as in a *Picotete*. It should be useful as a border flower.

CELOSIAS: *W. Tomk.* The disease, whatever it be, is not caused by fungus or insect, at least, no traces of them can be found. Has the soil been analysed?

CROTONS: *T. S. T.* The condition is the result of some check to growth. Perhaps you have been using too strong a dose of liquid manure.

DOUBLE BIGNONIA: *B.* The history of these and the story of their extraordinary transformations was given in the *Gardeners' Chronicle*, August 26, 1882, p. 261, with illustrations. The subject has also been thoroughly discussed in France by M. Fournier.—*R. O.* A good flower, resembling *Marchal Niel* in colour and arrangement of the petals. If all the flowers are as good as the one you send, we should think highly of the variety. The petals are curious botanically, in bearing ovules at their base.

ERRATA.—In the article on "The Genus *Odontoglossum*," p. 200, col. 4, line 15, for "forms of construction," read "forms of construction."—In the report of the Carmarthen Horticultural Show, p. 185, col. 4, for "cut flowers, &c.," from *Lilley Garden*, read "from 'Lodestone,' the Lady Foster, Loadstone Gardens, Lilley."—At p. 219, col. 4, in obituary notice, instead of "The Gardens, 'Wisdomsley,' Sevenoaks," read "The Vine Nurseries, Sevenoaks."—In article "Notes from a Buckinghamshire Garden," at p. 201, col. 4, line 16, for "gardener" read "garden;" at col. 4, line 9, for "Clematis" read "Delphinium;" in line 14, for "love" read "lovely;" and at p. 202, last line of article, for "querc" read "green."

GINSING: *An Ono Correspondent* wants to get some points of the seed of this plant. Nowhere, we expect, will he get them. The only chance of getting a seed or two would be to apply to some botanic garden, such as that of Moscow or St. Petersburg.

GRAFTING: *M.R.C.S.* Baltes's Art of Grafting (37, Southampton Street). There is no special work on weeping trees that we are aware of, nor is the cause of the phenomenon satisfactorily explained. Such trees usually originate as "sports." One bud or shoot is found to assume a pendulous direction, and is propagated. Sometimes, but not invariably, the phenomenon is inherited. The best summary that we know of is in Darwin's *Animals and Plants Under Domestication*.

GRAPES CRACKING: *Muscat.* You have rightly attributed the cause of your Grapes cracking to cold, and, it may be, a damp atmosphere succeeding a dry one, or a dry border. When you ask for favours be careful to stamp your letters; we had twopenny to pay for yours. We are willing to give you advice gratis, but not to pay the expenses.

GRAPES MILDEWED: *N. P. P.* Your Grapes are thickly infested with the Grape mildew; they are also very badly rusted. Nothing can be done now to save your crop. Another year, if you see signs of mildew, ventilate freely, and apply sulphur, in the form of dust, on the leaves, and after a day or two wash it off with a syringe.

INSECTS: *F. B.* 1, the small Ladybird (*Coccinella septempunctata*); feeds on aphides; 2, the Cuckoo-spit insect (*Asphondylia spumaria*); sucks various plants, and discharges a white froth; 3, larva of the small Ladybird; feeds on aphides. *L. O. W.*

NAMES OF PLANTS: *W. Foster.* *Menispermum canadense*.—*L. Elliot.* *Lilium Thunbergianum*.—*W. K.* *Ostereia*, *Bignonia radicans*, and a variegated form of the Sweet Chestnut.—*P.* *Veratrum nigrum*.—*C. G.* 1, *Hypericum pulchrum*; 2, *Erigeron acer*; 3, *Erythraea centaurium*; 4, *Conyza squarrosa*; 5, *Senecio Jacobaea*; 6, *Ajuga chamaepitys*. This last is rare; you probably found it near Boxhill.—*J. B.* 1, *Spiraea Fournieri*; 2, *Artemisia argentea*; 6, *Echinos* species, we cannot tell which, without the flowers; the labels of the others are detached, but we find *Veronica Traversii*, *Berberis Darwinii* in fruit, and *Chlorophyllum ochradium* with variegated leaves.—*R. K. W.* 1, *Deschampsia caespitosa*; 2 and 3, *Molinia complanata*.—*Broomfield.* *Adiantum Moritzianum*—a large form of *A. Capillus-Veneris* (not well figured); better sent a perfect form when more advanced. It is probably a fine form of *A. Capillus-Veneris incisum*; 3, *Epiactis latifolia*.—*T. R. & Co.* *Platystemon californicum*.—*G. P.* *Impatiens Roylei*.

VINES AND TOMATOS: *T. D. P.* There are no fungi whatever on the Tomatos, and only a very slight trace of *Oidium* on the Vines. Nothing in the style of a *Peronospora* on either. As for "rust," the term is always applied to the berries, and not to scorched and dried foliage? Probably the Vines have been grown too quickly and then exposed to dry heat of some sort, and this has shrivelled the younger twigs and the edges of the young leaves; or they have suffered from sulphur.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

Obituary.

MR. ALEXANDER TWEEDIE NEWBIGGING.—We record with regret the death of Mr. Alexander Tweedie Newbigging, of Kirkbank House, Dumfries, which occurred on the 19th inst. The deceased gentleman was in his 70th year. "Baillie" Newbigging, as his friends delighted to call him, was born, we learn from the Dumfries papers, at Kirkbank, Broughton, near Biggar, in Peebleshire, but he came to Dumfries and entered the service of the late Provost Kennedy, nurseryman, who he was only sixteen years of age. With the exception of one brief period, when he went to the firm of the late Mr. Skirving, nurseryman, of Liverpool, Mr. Newbigging remained the rest of his life in Dumfries. It has been truly said that he was a born nurseryman, so thoroughly, enthusiastically, and successfully did he enter into his profession. In early life he devoted much of his time to the study of tree life, gradually raising himself to the position of an arborist, to whom the term "recognised authority" might in all truth have been applied.

The nurseries over which he presided for a long period of years have enjoyed a well-merited reputation for the forest and ornamental trees that are reared in them. There is hardly an estate in the South of Scotland that has not been planted, more or less, from the nurseries of T. Kennedy & Co. Nor have their grounds been places merely for delving and transplanting. They have been beauty-spots in the suburbs of the town. Mr. Newbigging was careful as well as skillful and energetic. He displayed it in the arrangement of his grounds, and in the architecture of his buildings. While in the service of Provost Kennedy he married that gentleman's daughter. In 1856 Provost Kennedy—who, by the way, was one of the first Councillors elected under the '32 Reform Act—retired from active business, and henceforth this establishment, which was founded in 1787, was carried on by Mr. Newbigging, in conjunction with Mr. Robert Cowan, under the title of "Messrs. Thomas Kennedy & Co."

In addition to his profession of nurseryman, he carried on the farm of Nether Dargavel, which he rented on the decease of Provost Kennedy in 1867; and as a practical agriculturist he achieved much success. In respect of the high quality of crops and stock Nether Dargavel came, in his hands, to be regarded as a model farm, and was considerably improved, his fat stock being the talk of the district. It was impossible to know him and not to admire him; there was a pawky humour in his conversation which captivated strangers; and a charm about his social bearing which was irresistible.

Mr. Newbigging leaves a widow, two sons, and four daughters, for whom much sympathy is felt. His daughters are all married, while his sons—Thomas Kennedy and John—are being brought up to the business, one devoting his attention to the seeds, and the other to the nurseries.

Markets.

COVENT GARDEN, August 20.

MARKET remains with little alteration. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing various plants in pots such as Aralia Sieboldii, Ferns, Foliage Plants, and Begonias with their respective prices.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing various cut flowers such as Alutian, Bouvardias, Carnations, and Gardenias with their respective prices.

SEEDS.

LONDON: Aug. 19.—The trade now passing in farm seeds is confined wholly to those varieties wanted for present sowing. Trifolium incarnatum sells freely at last week's quotations: supplies are not at all overwhelming. There is a good inquiry for white Mustard at the advanced prices: stocks on hand are now reduced to narrow limits. Rape seed is the cheapest article at present on the market—the values of this season's crop are low, but has been the case for many years past. New winter Tares offer very sparingly, and do not keep pace with the demand. Sowing Kye continues slow. Blue boiling Peas are scarce and wanted. In feeding Linsed the tendency is adverse to buyers. JOHN SHAW & SONS, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday the rates obtained for the new Wheats which are of a natural weight, and range from 34s. to 37s. for white; and 32s. to 35s. for red. Old native Wheats sold at 1s. per quarter decline on the week, and foreign at 6d. to 1s., while descriptions giving way most. Flour, with a dull sale, was not notably altered in value. Stout qualities of Barley were fairly firm, but the general trade was dull. Beans and Peas sold slowly at late value. Maize was inactive, but about steady in value. Oats were quiet and unchanged. On Wednesday there was little or no demand for Wheat, and the tone was flat, prices remaining nominally unchanged. Flour was inactive, and unchanged in value. Maize was steady; and Barley, Beans, and Peas met a retail demand at previous rates. For Oats the inquiry was very dull.—Average prices of corn for the week ending August 15:—Wheat, 33s. 1d.; Barley, 24s. 10d.; Oats, 21s. 11d. For the corresponding period last year:—Wheat, 38s. 2d.; Barley, 29s. 2d.; Oats, 22s. 6d.

CATTLE.

At Copenhagen Fields on Monday English cattle supplies were not well up in condition, although some very prime qualities were among them, and with a slow sale prices ruled at about previous figures. Sheep realised about steady value, with a quiet trade. Lambs met less demand, and barely supported late value. The calf trade was without improvement, and the pork trade was reported dull. Quotations:—Beasts, 3s. 10d. to 4s. 8d., and 4s. 10d. to 5s. 4d.; calves, 3s. to 4s. 10d.; sheep, 4s. to 4s. 8d., and 4s. 10d. to 5s. 8d.; lambs, 5s. 4d. to 5s. 10d.; pigs, 3s. 8d. to 4s. On Wednesday beasts were steady, and quiet as dear as on Monday. Sheep, 4s. 10d. and 4s. 8d. per lb. lower. Lambs also were weak, and calves and pigs were quiet, but firm.

POTATOS.

The Borough Market reports that supplies continue fully adequate to demand, which is slack at the following quotations:—Regents, 100s. to 120s.; Magnum Bonums, 105s. to 120s.; Early Roses, 95s. to 110s.; Shaws, 90s. to 100s.; kidneys, 120s. to 130s. per ton.

COALS.

The following are the prices current at market during the week:—Ebside West Hartley, 14s. 9d.; East Wylm, 15s. 6d.; Ravensworth West Hartley, 14s. 9d.; Walls End—Type (increased), 11s. 3d.; Hutton, 16s. 6d.; Hutton Lyons, 14s. 6d. and 15s.; Lambton, 16s. 6d.; Wear, 15s.; Chilton Tees, 15s.; Haswell, 16s. 6d.; Dowlais Merthyr, 16s. 9d. and 17s.; Radford Navigation, 16s. 6d. and 17s.

Government Stock.—Consols closed on Monday at 100 to 100½ for delivery, and 100½ to 100¾ for the account. Tuesday's prices for delivery were as on the preceding day, and 100½ to 100¾ for the account. Wednesday's closing prices were a repetition of those of the preceding day. The final closing quotations for Monday were 99½ to 100½ for both delivery and the account.

THE COLONIAL MANURE.

Unequalled for Excellence of Quality and Productive Powers.

Table showing supply in tins and bags, with prices per bag and per tin.

Special Prices to the Trade on application.

The COLONIAL MANURE being powerful and lasting in its effects, very little need be used; consequently it will be found more economical than any other Chemical Manure.

The COLONIAL MANURE is to be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

Sole Proprietors and Manufacturers,

HAYMAN & BENJAMIN, 3, 4, 5, 6, CAMOMILE STREET, LONDON, E.C., who only supply the Wholesale Trade and Export Merchants.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil point on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 12s. 6d. per gallon, at the Manufactory, or 15s. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. "Firefield Farm, June 21, 1876.—Sir, I have this day forwarded from Chepstow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Firefield Bank, Chepstow—I am, Sir, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL and SMITH, Brewery Hill Ironworks, Staffordshire; or 18, Queen Victoria Street, London, E.C.; and 75, Elmbank Street, Glasgow.

WANTED, a PARTNER, to join Adventurer in a large Market Nursery. Rent very low. An unusual opportunity for a nurseryman. Write to the Editor of the Gardeners' Chronicle, 41, Wellington Street, Strand, W.C.

WANTED, a HEAD GARDENER (experienced)—Apply to E. G. LODGER, Esq., Flore, Weedon, Northamptonshire.

WANTED, a HEAD GARDENER, where one other is kept. The residence of the Head Gardener is in the lodge, and his wife has to attend to the gate. There is no accommodation for a family, except it be one child over ten years old. The garden is small, but there are several Vines and a Cucumber-house—all requiring experience in forcing.—Apply, by letter, stating age and particulars of last situation, to W. Z. Willing's Advertising Offices, 125, Strand, London, W.C.

WANTED, an UNDER GARDENER, married, with family, not over 30 years of age. Must thoroughly understand all Outdoor Work, and be able to assist in the Houses when required. Wages 8s. per week with cottage. First-class character indispensable.—Address, by letter, GARDNER, Balls Park, Hertford, Herts.

WANTED, a FOREMAN, for the Houses. Must have a good knowledge of Fruit and all Plants, including Orchards. Not under 21 years of age. Wages 10s. per week and baby.—W. REID, the Gardens, Norbury Hall, A.bourne.

WANTED, AT ONCE, a good FERN GROWER.—Apply, stating wages and giving references, to W. R. CROWE, Boleyn Nursery, Gipton, Essex.

WANTED, an unmarried middle-aged MAN, thoroughly experienced in growing Grapes, Peaches, Melons, Tomatoes, Cucumbers, Cut Flowers, &c. on all Green-house Plants; also Cultivation of Vegetables and Hardy Fruits. Man preferred accustomed to Management of Bees, Poultry, and Higs; able to take charge of one Cow and Pony if required. Wages 12s. a week, with board and lodging.—MR. LANGSTON, Sunnyside, Sandown, Isle of Wight.

WANTED, a young MAN, about 21 or 22, for the House.—Must have had good practical experience under a good Gardener. Good character indispensable. Salary and cooking found.—The GARDENER at Woxall Abbey, Warwick.

WANTED, a young MAN to Assist in the Potting, Stove and Greenhouse Plants. Abstainer preferred.—HEAD GARDENER, The Grove, Gosport.

MESSRS. WM. CUTBUSH AND SON require of a thoroughly competent, energetic MAN, to take charge of their Landscaping, Jobbing, and Floral Department. Must be able to give particulars of his qualifications, and to furnish references.—Apply, by letter only, to Highgate Nurseries, London, N.

Seed Trade. WANTED, a TRAVELLER. Must be well acquainted with Covent Garden Growers.—Apply by letter, stating age, salary required, and experience, to A. B. Hayward's Advertising Office, 40 Fleet Street, E.C.

MESSRS. WM. CUTBUSH AND SON REQUIRE a young man as CORRESPONDENT. Must be able to take letters down to the Nurseries, and be acquainted with the Nursery and Seed Business.—Apply in own handwriting, stating age and full particulars to Highgate Nurseries, London, N.

WANTED first-class BOUQUET MAKER, well up in the trade.—Apply, stating wages, references, &c., to J. R. PEAKINS and SONS, Chitwell Nurseries, Notts.

WANTED, IMMEDIATELY, a young LADY—experienced hand in Making Wreaths, Cosses, Shoulder Straps, Bouquets, &c., for a superior Shop, where Cut Flowers, Seeds, and Dessert Fruit are combined.—Address, with full particulars, salary, references, and experience, to J. J. LLOYD-TONER, The Lady's Court, 1, Lincolns, Granar, Essex.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. J. N. Nurseries, Worcester.

TO FLORISTS, &c.—Situation wanted by a young Lady (age 24). Over seven years' experience. Able to take Management. First-class references.—K. 9, Sepulchre Street, Spalding, Suffol. I.K.

HOLLOWAY'S PILLS and OINTMENT are remedies which should invariably be taken by Travellers in search of Health, Pleasure, or Business. Many dangerous illnesses occur during a journey, and are tending to deteriorate the health; these and the altered conditions of life, will entail on those who travel the necessity of carefully attending to early symptoms of disease, and they will find the use of these remedies to be highly necessary, the action of the Pills being purifying and strengthening, and of great service in cases of fever, ague, and all inflammatory diseases, whilst the Ointment is a sovereign cure in cases of piles, bad legs, bad cuts, wounds and ulcers. Holloway's remedies do not deteriorate by change of climate.

E. J. JARMAN,

The People's Seedsman,
 CHARD, SOMERSETSHIRE.

A BLESSING.

THE CULTURE OF THE ZONAL PELARGONIUM flower brilliantly all the year.
 A blaze of colour all the winter sounds like an impossibility, but it has been a reality for years. Perhaps in no neighbourhood is the enthusiasm in growing them so great as at Belvedere, where A. F. MOENS, Esq., invites the neighbouring Gentry to bring their Friends all the winter. Mrs. MOENS says openly that she blesses the day she first visited Cannell's. Our flowers have given her innumerable pleasure ever since. Thousands of plants now ready. Send for a CATALOGUE.
 From A. C. HARCOURT, Esq., 139, *Lewisiana Road, S.E.*, November 15, 1884.—"If you will write me out every and full particulars to grow Zonal Pelargoniums as you grow them to keep them in full bloom all the year as you do, I will give you three guineas for your trouble."
 The above, with full particulars, sent post-free for Six stamps

HYACINTHS, EARLY WHITE ROMAN.

—May be had in bloom before Christmas. The best pure White for Forcing. Fine bulbs now ready.

IRIS KÄMPFERI

—in about twenty different shades of colour. This grand Japanese Iris is hardly yet known in this country, but should be grown by every lover of flowers. It is by far the largest flower of this family, with most striking colours. We offer well established English-grown roots; also many other varieties of Irises.

IRIS CRATEROIDES

— Brilliant Crimson. This is about the most showy of this useful family of Bulbs.

IRIS VIRIDIFLORA

—a most uncommon colour amongst flowers — very striking, being a decided green with black eye. Also many other varieties of Irises, a family which only requires to be more widely known to be grown as largely as the Tulip or Hyacinth.

LILIAM CANDIDUM

—the Old White Garden Lily. Fine Bulbs now ready for Planting or Forcing.

NARCISS AND DAFFODILS

— in great variety.—Choice and Common.

SCILLA SIBIRICA.

— This charming rich Blue variety is now as cheap as the Snowdrop, to which it makes a good companion and contrast.

THE Gardeners' Chronicle.

SATURDAY, AUGUST 29, 1885.

OSTERLEY PARK.

OSTERLEY PARK is the only private residence within 12 miles of St. Paul's Cathedral which still offers to the admiring view of visitors an expanse of greensward reaching 650 acres in extent—a good old English park, heavily laden and beautifully timbered. Railways threaten it, and populous places surround it. A mile to the north is Hanwell, with Ealing a little on the right, the spires of each form landmarks as seen from the house as that of Harrow, is still further off. On the south are Hounslow, Isleworth, Twickenham, and Richmond, all opened up many years ago, as are the good old towns of Brentford and Kew, due east. There are other great houses in the neighbourhood; Sir Lion House is within 2 miles, and Ham House, a residence of the Earl of Dysart, is just across the river from Twickenham; but, although the thickly-populated world of Greater London roars louder and nearer Osterley Park than it did of old, and a railway station, called by its name, has been opened within a stone's throw of one of its lodges; the Park itself is as quiet within its walls as when the herons built on the high trees, or when Queen Elizabeth honoured her favourite merchant prince, Sir Thomas Gresham, as his guest.

Three hundred years and more have passed since this worthy knight, the founder of the Royal Exchange, received Osterley as a gift from the Crown, built a stately mansion, but not the present one, to replace the old manor-house, and enlarged the park by enclosing some common ground, much to the annoyance of certain poor folk in the neighbourhood.

During the visit of Queen Elizabeth, her majesty, having in view the recent alterations, observed that the court before the house would be improved in appearance by dividing it with a wall. Sir Thomas sent over-night to London for workmen, and in the morning the Queen was surprised to find that the improvement she had suggested had been effected. "Ah!" said one of the wits, "no wonder that Sir Thomas Gresham, who built the Exchange, can so soon change a building." In reference to some family disputes which, of course, the Court had heard of, another gossip remarked that any house is easier divided than united. According to report, Sir Thomas Gresham found both pleasure and profit in starting some unusual manufactures within the boundaries of his park, including oil and corn mills, and a paper manufactory of his own device, the first of the kind in England. All trace of these works has long since been removed, and the ample sheets of water, fed by a small stream which drove the machinery, are now purely ornamental.

It is always interesting to reflect on the striking changes that have overtaken great estates, and nothing more remarkable has happened in connection with Osterley Park than the growth of its surroundings, as already noticed, and the augmented value of the land which Sir Thomas cribbed from the adjoining common [as being of small account, and, which

in its present improved condition as a fruit garden carefully cultivated for the supply of the London market, is worth a rent of more than £10 any acre; so that the 60 acres of orchard within the boundaries of the old park are worth quite twice as much as the 660 acres which Sir Thomas Gresham emarked and empaled. Those, then, who regret the enclosure of commons which could rarely attain a higher value than about half-a-crown an acre, should bear in mind the enhanced value of the ground. Half-a-dozen idle "commoners" and squatters feed their geese and donkeys on land which the Earl of Jersey, the present owner of Osterley Park, lets to a fruit grower, who employs forty or fifty respectable workpeople.

Osterley Park found another millionaire owner and great improver in Mr. Francis Child, the great banker of Fleet Street, the Rothschild of his time; and during his reign and that of his brother and successor, Robert, the present house was built—a quadrangular red-brick mansion with stone facings, a cupola at each corner, and a handsome flight of steps on the north front leading to a covered court. At this period the famous collections of pictures and books were made. *Sic transit!* It often happens in families that sons fail and daughters succeed, and it was so with the Childs when the granddaughter of Robert inherited Osterley. She, of course, married; and thus during several generations the place has belonged to the Earls of Jersey, whose chief residence is elsewhere—at Middleton Park, Oxfordshire.

We are told that the great banker received here, in his day, ambassadors, foreign agents, loan-mongers, and other company of the kind. His descendant, the present owner, exercises a still more bounteous hospitality in the form of fashionable garden parties and of *fêtes* of another description, when the park becomes the camping-ground of numerous schools and useful societies. A large orangery, strongly built by Mr. Child after the fashion of the last century, is at the present time filled with forms and benches which, with a copper in the corner, suggest the mild but joyous festivities which young people, and their seniors too, delight in. Mr. Child spent large sums of money on the gardens, but as Lord Jersey and his family are only here about six weeks in the summer, though the copper boils all the same for their absence, the extensive kitchen gardens formed by Mr. Child are not now required by them, and the ground managed by the gardener, Mr. W. King, is chiefly ornamental shrubbery and lawn.

The grounds are laid out in that best old English style which is free from formality, and which, after the lapse of a century, is now as worthy of a great house as the more elaborate style of terraces and extended grounds, adorned with the most costly ornaments. The house is surrounded on the north, south, and east sides by the park and lawns, the latter dividing it from the former by a not very wide margin, except on the east, where the best and biggest lawn, reaching to the water, is beautifully planted with great Cedars of Lebanon breaking from the ground and producing heads almost unexampled in size, and full of branches. Several great Planes stand near the house, and especially a grand one in the park. The English Elm, tall and stately, is the prevailing tree; but there are others, and especially some Spanish as well as Horse Chestnuts, which are also much admired. The pale red colour of the house is relieved by some creepers, Ivy, and a large Wistaria, and Bignonia radicans, with its conspicuous trumpet-shaped blossoms, on the east wall. *H. E.*

ST. PETER'S, HAMMERSMITH, AND DISTRICT GARDENERS', &c., IMPROVEMENT SOCIETY.—This Society will hold its show on Thursday, November 19.

New Garden Plants.

ERIA (HYMENARIA) LINEOLIGERA, n. sp.*

A VERY interesting species, with a fusiform pseudobulb, bearing four rather thick cuneate oblong-lanceolate leaves of parchment-like texture. The nearly basilar ascending raceme has retroflexed lanceolate acute orange bracts, which are nearly as long as the stalked ovaries. The white flowers are very thin; the sepals and petals lanceolate acute, curved. Chlo moderate; lip cuneate dilatate, trifid; side-lacinie triangular, curved; shorter than the mid-lacinie—very short. Projecting mid-lacinie triangular apiculate crenulate undulate, three keels from the base to the disk. There are purple lines on each side. The peduncle and stalked ovaries have very few and very short thin hairs, which are scarcely seen. Hence I regard the species as best placed in *Hymenaria*, notwithstanding the presence of some such organs. The plant was imported from Siam by Mr. T. Christy, F.L.S., of Sydenham, where it flowered, under the management of Mr. E. Leaney. Mr. Christy was also so kind as to send me a sketch, so that I could understand the position of the peduncles. *H. G. Rehb. J.*

SELENIPEDIUM KAIETEURUM, N. E. Br., n. sp.

Leaves 7—9 inches long, 2—2½ inches broad, lanceolate-oblong, acute, glabrous, very coriaceous, bright dark green above, paler beneath. Scape many-flowered, pubescent, with complicate, acuminate, glabrous sheaths and bracts, of an olive-green, with brownish-red nerves, and suffused with the same colour. Ovary 2½ inches long. Dorsal sepal 15—20 lines long, 9 lines broad, oblong, hooded at the apex, margins recurving, crisped-undulate; lower sepal 15—16 lines long, 1 inch broad, elliptic, entire, or slightly bifid at the apex, concave, margins crisped-undulate; both sepals are pale green, with reddish-brown nerves on the outside; they are pubescent on both surfaces, but more minutely within. Petals 2½ inches long, 6—7 lines broad, falcately linear-oblong, apex very obtuse and emarginate, margins recurved, undulate and ciliate, the cilia towards the apex becoming longer, and dark purple-brown; inside and out the petals are pale green, prettily marked with brownish-crimson veins; on the outside towards the margins and apex, and on the inside at the base, and along the lower margin, they are pubescent. Labellum 1½ inch long, ¾ inch broad, with the inflexed sides very obtusely rounded, glabrous, bright light olive-green, with brownish-crimson veins, and densely dotted on the inflexed sides, and more sparsely on the front part of the lip, with the same colour; staminode somewhat squarely trapezoid, pubescent, greenish-white.

Although the leaves are not variegated, and the flowers are not brilliantly coloured, yet on the whole the plant is rather a pleasing one, and many Orchid lovers would consider it a great prize. The plant was sent to Kew by Mr. G. S. Jenman, who discovered it growing abundantly on the rocks, under the magnificent Kaieteur Fall, on the Potaro River, British Guiana, where it is not very likely to be disturbed by collectors for some time to come; it is No. 879 of Mr. Jenman's dried specimens. Specifically it is allied to *S. Lindleyana*, but differs in having more glabrous sheaths and bracts, and differently coloured flowers. *N. E. Brown.*

THE CARAWNDA BUSH.

THIS is one of the Apocynaceae, and known to botanists as *Carissa carandas*. It is a small bush, not much higher than a man, with densely-packed dark green shining foliage, and stipular sharp thorns, about an inch long. The leaves are coriaceous, and about an inch long, and about as broad, sometimes thickly emarginate, at others oval. The

* *Eria lineoligera*, n. sp.—Pseudobulbo fusiformi bitripliciflari apice quadrifido (erre non semper); foliis pergamenis cuneato lanceolatis acutis (4—5 pollicibus longis, dus tertius latis); pedunculo subbasilari erecto levissime pubescente; b. acris ligulatis acutis deflexis ovaria pedicellata subsequantibus; sepalis lanceolatis acutis, lateralibus curvis; tepalibus falcatis; labello cuneato oblongo trifido, incisus lateribus triangulo falcatis acutis abbreviatis, lacinia mediana transverse crenulata, carnis tercia a basi in discum. Lict laterribus puberula in pedunculo ac in ovario pedicellata tantum. Hymenaria adocinauda similis. Ex Siam imp. cl. T. Christy, *H. G. Rehb. J.*

flowers are small, white, and Jasmine-like. They come out in the hot weather. But the charm of this bush is in July, when its half-ripe waxy berries hang in clusters all over the bush. They are of the size of Olives, a brilliant red on one side, and a cream on the other—a most aesthetic combination. No red-cheeked Apple could be handsomer; and these berries are infinitely more elegant and decorative. When ripe they are of a uniform dark red, with a bland milky juice. There is another variety with dull red and green berries, which turn of a deep plum colour when ripe. Their juice is then of a rich beet-red. The Carawnda fruit is sour, and much used by natives for making "chutney." The little unripe berries, with the skin and seeds removed and cooked in pastry with sugar and Cloves, make a fair substitute for Apple tart. If this elegant bush could be grown in pots in English conservatories and made to fruit, it would really be a great acquisition. The beauty of its berries, hanging in clusters, against the shining dark green foliage, is unique. For decorative purposes, worked in vases with fine foliage and some elegant white flower, such as *Tabernaemontana*, or Evening Primrose, its value ought to be great. I do not remember ever having seen it noticed or pictured anywhere as a decorative or useful plant. In India a hedge of Karwanda of the red and cream variety, would be worth seeing in the month of July. The wild *Carissa carandas* is found in many parts of India, and if so handsome and useful a bush has come from this wild thing, it stands to reason that if worked and selected further, by crossing the two cultivated varieties, something much finer and more useful might be developed. *E. Bonavia, M.D., Etawah, July 21.*

HARDY PLANTS.

OURISIA COCCINEA.—This, one of the prettiest and most distinct of hardy plants, cannot well be over-praised, for it is certainly a decorative subject of the highest merit, and one of which we cannot have too much. It is said to be shy—indeed, some persons cannot get on with it at all, do what they will to coax it, their summing up being that it is a fickle plant, difficult to grow, and a shy bloomer. In some gardens, and under certain conditions this may be true, but with a reasonable amount of care in the selection of a suitable soil and situation—for it will not do everywhere and in any soil—the above difficulties will ere long be overcome, and the plant be found as easily managed as any other alpine. A cool, rather damp, stiffish soil and shady situation—at least, where not exposed to the mid-day sun—are its chief requirements, and where it is once established slowly creep about, and form grand masses of its waxy, deep green foliage. The lax clusters of dazzling scarlet flowers, although never borne in great profusion, are both distinct and beautiful, and set off to the best advantage by the intense deep green and finely cut foliage.

HUSTONIA CERULEA

is a pretty and neat little North American plant, that is only suited for associating with the smallest and choicest of alpinists. This delicate plant produces dense, low cushions of leaves, and an abundance of pale blue flowers, surmounted on stems rarely exceeding a couple of inches in height. There is also a white-flowered form, but as it is in every respect, unless colour of flowers, similar to the one under consideration, we will pass it by. It is of the easiest culture, succeeding well in sandy peat, and where fully exposed, although in ordinary garden soil and in both sun and shade, we have it thriving luxuriantly and flowering freely for three months in the year.

THE ALPINE HUTCHINSONIA (H. ALPINA)

is in every way a fit companion for the latter plant. Dwarf in habit—for it seldom reaches 2 inches in height—with deeply cut shining foliage, and small glistening white flowers, this is a very desirable rock plant, and one which, from its ease of culture, can be specially recommended. For the ordinary border it is also well adapted, and when planted in good free loam soon becomes a compact mass of pure white very enduring flowers. It is a native of South Europe, and a perfectly hardy evergreen in our climate generally,

ONONIS ROTUNDIFOLIA,

although introduced to our gardens more than 300

years ago, is but too little known as a neat evergreen flowering shrub that is well adapted for the rougher parts of the rock garden. Growing from 12—20 inches in height, with roundish, trifoliate leaves and handsome, rose-coloured flowers, which are well set off by the thick deep green foliage, it will be seen that this is both a distinct and pretty plant, and, being of the easiest culture, it deserves a place wherever choice old-fashioned flowers are grown. As to soil it is by no means particular, thriving well in that of very opposite characters, although preferring good loam and a rather dry situation.

THE OLYMPIC ST. JOHN'S WORT (HYPERICUM OLYMPICUM),

with its plentiful production of bright yellow flowers nearly as large as the common Rose of Sharon (*H. calycium*), is just now one of our most attractive rock or border plants. A bluish glaucous hue pervades the whole plant, and sets off to perfection the large golden flowers. Planted in loamy, rather dry soil, this pretty St. John's Wort soon forms a bushy, vigorous plant of the most pleasing description, and is alike suited to the rockwork or herbaceous border.

Several other members of this family are well worthy of attention, and amply repay by their distinct foliage and abundance of bloom the small amount of attention that is required to be expended on their cultivation. Amongst these we would particularly note *H. repens*, which makes a lovely carpet, dotted over with bright yellow flowers; *H. empetrifolium*, a dwarf bushy shrub, not unlike some of the Heaths; and our native Tutsan or Sweet Amber (*H. androsimum*). The latter is, indeed, a worthy companion to any of the exotic species, for, apart from its handsome foliage and clustered cymes of flowers, it bears a very attractive, berry-like capsule, pinkish at first but becoming of a glossy black as winter sets in.

STONECROPS.

Amongst the numerous Stonecrops none is at present more lovely in both leaf and flower than the *Pyrenean* species, *Sedum brevifolium*. Although, perhaps, rather delicate for general use in our climate, yet when planted in rather dry soil, on sunny parts of the rockwork, it usually succeeds and soon forms healthy tufts of short mealy foliage. For frame culture it is admirably adapted, and where, better even than in the open ground, the foliage and flowers attain a size and healthy appearance that is rarely seen in the border or rockwork. In appearance it closely resembles *S. farinosum*, and to which it is, in our idea, a superior plant for general use.

THE IVY CAMPANULA (*C. HEDERACÆ*),

besides being a native, has much to claim our attention, for there is a peculiar delicate grace about it that is entirely wanting in the more robust members of the same family. The prostrate thread-like branches, minute glaucous-green leaves, and suffusion of pale bluish-purple flowers, all go to render this plant of particular interest and well suited for adorning the damper portions of our rock garden. It is of the easiest culture, and when left unmolested soon covers a considerable surface of ground. For carpeting the taller semi-marsh plants, this little native has but few equals, indeed at present, when the foliage is almost hidden by bloom, we can think of no equal amongst dwarf rock plants.

ST. DABOEC'S, OR THE IRISH HEATH (*MENZIESIA POLIFOLIA*),

with its dark shining green leaves and terminal racemose crimson-purple flowers, is just now at its best. For a moist peat soil it is well adapted, and blooms profusely from year to year, in this latter respect yielding to none of the miniature peat-loving shrubs. Although usually grown as a peat plant, still this is by no means necessary, as it will succeed and flower well in good sandy loam. The variety *alba* is a very desirable acquisition, the pure white, wax-like flowers being copiously produced, and remain for a long time in perfection. Another variety—stricta or globose—differs but little from the natural form; the foliage is perhaps more compact, and the plant usually of smaller size.

THE OSWEGO TEA, OR BEE BALM (MONARDA DIDYMA,

is by far the showiest of this family that finds a place in our gardens. Hailing from North America, from

where it was introduced nearly 150 years ago, this handsome plant is well suited for our climate. It bears large brilliant flowers, the shaggy forms of which rise up from afar, and lend quite a novel feature to the adjoining plants. Rising from 18 inches to sometimes over 2 feet in height, this highly esteemed plant is best adapted for the rougher portions of the rockwork, or, better still, for planting at the backs of wide borders, and in front of the taller growing shrubs, and where at present it forms a fine feature.

M. Russelliana and *M. fistulosa*, though of value in their own way, are weedy when compared with the above.

(*ENOTHERA FRASERII*.)

In this plant will at present be found one of the prettiest and most attractive of the Evening Primroses. The rich dark green foliage, and abundance of golden-yellow flowers, which are produced for many weeks at a time, together with the graceful arching stems, renders this plant very suitable for rockwork, where, indeed, it feels quite at home, overhanging large boulders, or leisurely scrambling amongst loose stones. It will repay generous treatment, for although it will grow anywhere and in almost any soil, yet, like the various other members of this rather extensive family, a light rich soil and sunny situation produces by far the finest specimens. *E. taraxacifolia* surprises most people who have not seen it before, for the spreading mass of finely-cut foliage, interspersed with large open blossoms, some white, some pink, and others rose, have a very telling effect. To enjoy their fragrance and beauty the *Enothera* should be seen in the "gloamin'." *Emergo*.

ARCHITECTURE AND LANDSCAPE GARDENING.—IV.

In continuation of our extracts from the lectures of Mr. G. Richards Julian, A.R.I.B.A., on the above subject, we this week give some of his remarks on the subject of ornamental bridges, and illustrate them by a reproduction, in our Supplement, of his drawing of the bridge in Osterley Park, near Hounslow (see also p. 267). In speaking of bridges of Gothic character the lecturer said:—

"The full-pointed arch will rarely be appropriate, the form should, as a rule, be either simple-segmental or pointed-segmental, the latter giving generally the most satisfactory effect; the arches should be ribbed, that is, a transverse section through the bridge would show a series of ribs on the underside of the arch, and these ribs should have splays or mouldings at their angles. The piers produce the best effect when carried out with bold cutwaters, which should be reduced as they rise by weatherings somewhat similar to those on early buttresses. These cutwaters may either be stopped below the parapet, or their lines be carried up through it; in the latter case they form convenient recesses, in which pedestrians may stand while a carriage passes if the bridge be narrow.

"The parapets can of course be treated in a manner similar to that before described for terrace walls, but, in my opinion, are generally more pleasing when set solid than when pierced; an excellent effect may be obtained by overhanging the parapet a little, carrying it on a corbel-table of small arches. If it is desired to give to a design a Late Gothic character, the form of the arches should be the depressed four-centred Tudor one, when the spandrels could be decorated with panels, similar to those common in the doorways of the Perpendicular period; an example of this kind of bridge, but executed in iron, may be seen at Westminster, designed thus with the object of harmonising it with the adjoining Houses of Parliament."

Coming to the Renaissance style, Mr. Julian said:—

"In dealing with ornamental bridges in this style a wide field is open to you. They may range from the simplest form of small, uncovered bridge to that which is covered, from end to end, with a highly ornamental architectural structure.

"As a rule, these ornamental bridges should be constructed of stone—it is more monumental in character than iron, less suggestive of being a mere work of utility, and has this great advantage, that age im-

proves it. Stone weathers well, whereas an iron structure requires repainting; and the beautiful tints given to stonework by lichen and moss are never added to iron.

"The form of arch should generally be the segmental, but the semicircular may be used when the spans are small. For the lower part of these bridges rustication, in one of its various forms, is most suitable—it gives an air of solidity and strength which satisfies the eye.

"In the simplest kind of bridge, the arch—whose voussoirs should be well marked and deep, with an ornamental keystone in the centre—should be flanked by wide, simple, projecting, rusticated piers. Piers of some sort should always be introduced, they seem to strengthen the abutments, and serve to frame the arch, making an architectural composition. The lower part—that is, the part below the roadway, should be separated from the parapet by a horizontal cornice or string course, which also serves to mark the line of the road. The lines of the abutment piers must be carried up through the parapet, and this part of the parapet is best when kept solid: it may, however, be decorated by panels and carving. The wall between these piers may be balustraded, or pierced in a similar manner to that described for terrace walls.

"Where an increase of ornamental effect is desired, pilasters or columns may be added to the abutments, as shown in the fine old bridge from Osterley Park (see our Supplement). This bridge also shows an excellent arrangement of parapet, the mixture of solid, carved panels, with the open balustrades; and the broken line of the coping, give play and picturesqueness to the composition, and suggest a method of obtaining artistic effects by simple means.

"I hardly know whether it is necessary for me to warn you never to put a pier in the centre, in cases where it is desirable to have more than one arch; at any rate, I think it worth mentioning. The rule "always an opening in the centre" applies to almost all architectural compositions. If you have three arches the effect of the whole may generally be improved by making the central one wider, and consequently higher, than the side ones.

"The most beautiful form of bridge for a park is, however, the covered one. The best example, known to me, of this kind of bridge is the one in Prior Park, Bath. It is quite small, and would without its upper part be very insignificant; but by the erection on it of an excellently proportioned Ionic colonnade, terminated at each end by an arcaded pavilion, it was made into an architectural decoration which, contrasting with the masses of foliage behind, adds materially to the natural beauties of the place. In the position of this bridge, as well as in its design, we at once recognise the hand of the true artist. If stood on an open flat it might appear pretentious and self-assertive, but closing a vista in a valley, the regular lines of its architecture heightening by contrast the beauty of the woods around, which in return seem to soften the contours of the stonework, the whole blends harmoniously into a picture which completely satisfies the artistic sense."

GEORGE CALEY.

At the commencement of the present century George Caley, residing at Birmingham, practising the veterinary art, had acquired a love for plants through collecting certain kinds for horse medicine. This in some way brought him under the notice of Sir Joseph Banks, who, after due examination, considered him qualified to become a botanical collector, and he was accordingly appointed botanical collector for Kew in New South Wales. We have no record of his appointment, but it appears certain that he was in that colony in 1801. In *Hortus Newensis* *Jacksonia scoparia* is recorded to have been introduced by him in 1803. He spent ten years in the colony, during which time he made journeys to various parts in what may be called the Sydney district. He was the first person who attempted to cross the Blue Mountains. Twenty years later, Allan Cunningham, in his *Journey Over the Blue Mountains*, says, "We came to a heap of stones marked 'Caley's Repulse,' indicating the farthest point that indefatigable and persevering botanist reached in his endeavours to cross the mountains to the westward." His name does not appear very often in *Hort. Hov.*, as having introduced many living plants to the garden collection. He returned to England in 1811, and in 1817 was appointed superintendent of the Botanic Garden, St. Vincent, where he made

large herbarium collections which were (as also the Australian specimens) forwarded to Sir Joseph Banks, for his herbarium in Soho Square, as also a collection to the great patron of botany, A. B. Lambert, Esq., who presented the writer of this with nearly the whole of the Fern collection. On the breaking up of the St. Vincent garden he returned to England, and took up his residence at Bayswater. He occasionally visited Kew—the last time, I think, was in 1828, when he had been at Kingston Hill to see the *Orobanchae* which grew there, and on the return home called at Kew, leaving fine specimens of *Orobanchae* with us. He died at Bayswater some time before 1832.

A genus of *Orchidaceae* was dedicated by Robert Brown to his honour: one species, *Caleya major*, was cultivated at Kew; it was introduced in 1810. *J. Smith, ex-Curator, Royal Gardens, Kew.*

THE ROCK-GARDEN AT ST. ALBANS.

MAY I comment on one or two of your criticisms that appeared in the *Gardeners' Chronicle* for July 4? I entirely admit the anomaly of a sandstone formation cropping out of the chalk. I was perfectly aware of this when I set to work. But this must be borne in mind, that I never intended my rocks *per se* to form a feature. I wanted to grow alpine—and rocks of some sort I then believed I must have, though I have had reason to modify that opinion since, as far as many alpine are concerned. Well, then came the question as to what rocks? Chalk boulders, very picturesque as they are, no doubt, in what you well describe as their "pell-nell confusion by the sea," never could possibly have answered the end for which they were utilised. The nearest local rock deposit offered itself in the limestone quarries at Hlythe (Kentish rag). No doubt some plants would have been at home on this, but there were several objections to the use of the limestone. It is exceedingly hard, non-absorbent, and a great radiator, and in addition to this the worked beds are very shallow, running from about a foot to 15 inches, and offering neither variation in their thickness, so as to afford picturesque contrast in the substance of the beds, nor any massive boulders to break the tameness of the simple stratification. Now the Tunbridge Wells and Wadhurst sandstone quarries offered all these desiderata; and above all, these rocks are pre-eminently absorbent and retentive of moisture. This clenched the matter, and to those localities I went. My first intention was to employ Mr. Pulham, of Broxbourne, and he came down, but I soon found that his ideas and mine differed as widely as the poles. He was all for effect, to be attained by piling up masses, with a liberal supply of cement. I was all for suppressing feature, and my one aim was to construct as unostentatiously as was possible, and to let my rock crop out from the slopes of the hollow with which I had to deal. I ended therefore, by retaining one of Mr. Pulham's foremen, to assist me mechanically in getting the rocks into position, every stone being placed under my personal direction, and on my own design. No pains were spared. The whole space assigned to the rocks was scarped away, a 9-inch wall in cement built behind the position to be occupied, just to a surface level, in order to keep out tree and shrub roots, and an average depth of prepared soil from about 4 feet in front to about 8 to 10 feet at the back was thus obtained, giving (with variation, of course) some such section as that shown in fig. 55.

Ample drainage was got by coarse limestone rubble at the bottom; and the soil was formed in proportions of loam and broken limestone. For the first three or four years, while the loam was unexhausted, all went well. I grew splendid cushions of *Myosotis alpestris* and *M. pyrenaica*, *Androsace carnea*, magnificent pieces of the Mount Dore variety, *A. villosa*, the smaller *Gentian*, *Primula farinosa*, &c., all growing and blooming in juxtaposition. In three or four years the loam wasted away, became impoverished, and soon it was clear that the limestone was overdone. The whole rockery was well covered. I took up every plant, emptied all the made soil, got fresh loam (and very poor it proved), and went through the whole carting, wheeling, disorder, and horrors of that kind, and replanted again. Very little gain resulted. However, for several years I

went to the Pyrenees, Switzerland, Italy, France, and came back with from one to three large cases of plants, and so by dint of perpetual replenishing for about eight or ten years I kept up a sort of appearance. *Androsace imbricata*, wedged with steel out of the volcanic rocks; *A. pyramidalis*, *Eriythrium nanum*, *Saxifraga intermedia*, were brought year after year to live perhaps two or at most three summers. I once had a grand specimen of *S. imbricata* (till a thrush found a worm behind it. So with *Saxifraga flourentia*: worms used to work them out of the crevices. At last by night-gathering I extinguished the worms. Still I had woodlice, who delight in the roots of *A. carnea* above all other plants; and then ants drove me wild. With scarcely an exception I planted for years every single plant with my own hands, and heavy work it was getting them into the stony rubble soil. Every spring I did all the clearing, cutting, thinning, and putting in order, and generally had a bad illness from chills after it.

A good deal of the small weeding I also did myself, though the bulk was done by a woman whom I trained for the purpose. Gradually frequent disappointments, with the loss and failure of plants, the falling energy of years, other pursuits and demands on my time, brought slackness, and the hobby has run its course. The plants you saw are the survivors of a once interesting collection. It is true, as you have observed, that "there are no signs of that desperate conflict for existence where the strong overpowered the weak," for I never allowed that, but the gems of the mountain sides and summits are no longer there, because they cannot and will not endure the fogs of November mingled with frost—worse still, sharp white frosts following heavy rain, with no protecting carpet of snow, and all other noxious influences. *Primulas* entirely decline to grow here, the smaller *Gentians* very nearly the same. Many of the alpine *Ranunculi*, numbers of bulbs, in fact countless things, have persistently refused to live in this part of East Kent. I believe Mr. Ewbank grows easily in the Isle of Wight plants that baffle me here, and I know Mr. Maw grew numbers at Broseley. *W. Oxenden Hamond.*

CARNATIONS AT OXFORD.

MENTION has been made of Mr. E. S. Dodwell's Carnation and Picotee garden at the Stanley Road, Oxford. In it there is not only an immense number but a great variety of the *Dianthus* tribe. In order to have his plants under due protection, five or six houses have been erected—substantial wooden structure, two of them having span-roofs of glass, but fully open at the sides where necessary; the pots stand on low benches about 12 inches or so from the ground, open underneath, so as to secure a free circulation of air; between and about the houses and frames (of which there are several) run well kept gravel walks, a good portion of them being covered with Staffordshire tiles, which enables a wheelbarrow, with a load of soil, to be trundled without doing any damage to the paths. The potting benches are perfect in their way; there are sheds for layering and other purposes; it is indeed a *Dianthus* garden, where all the newer, and a few of the choice old varieties of Carnations and Picotees are grown, largely, healthily, and successfully. There are to be seen some 3500 plants growing in 1500 pots. In pots 9 inches in diameter, three plants of one variety are placed; in 8-inch pots two plants; and in 7-inch pots a pair of weak plants, or a single strong one. Generally the plants have produced strong healthy grass, and the work of layering (now being prosecuted) is a great and lengthy task—As Mr. Dodwell contemplates he will make 20,000 layers, which will give him this number of fine plants for distribution next year, and mainly of his own seedlings. In addition there is a large bed of seedlings, comprising 1000 seedlings, which have flowered this season, and anything of promise is lifted from the ground, placed in a pot, and layered in the usual manner.

Mr. Dodwell's conception of an early Carnation is that of a poor, starchy, fringed, saw-leaved, five-petalled flower. A flower figured by Parkinson represents one of the *D. Heddewigii* type; these and seminal forms

sported, and became striped on the surface, and from this were gradually evolved the Carnation and Picotee of the present day. Mr. Dodwell is of opinion that the flaked and bizarre Carnations came from the Picotee; that the original Picotee was a flower with three bars or stripes of colour on the petals; these by selection became defined flakes, and afterwards came colour upon colour, or bizzarses. The attempt to fix the colour upon the edge of the Picotee in the form of a dense margin, rather than as stripes, Mr. Dodwell regards as a later attempt than that of improving the Carnation, and this may appear reasonable from the fact that the Picotee is smaller than the Carnation, though the difference in size is more apparent than real. A curve on the outside of the petal of a flower, a resting colour on the margin of the petal, always carries the eyes round the circumference, and apparently limits the size. In the case of flakes of colour running along the length of the petal, the dimensions of a flower look larger in consequence. Picotees generally are certainly a little later in developing than Carnations.

Sixty years ago the named Picotees were very poor. As flakes and bizzarses came out of them—was definiteness, clearness, and distinctness came to be regarded as valuable qualities—selections were made of flowers coming up to these requirements. Up to thirty years ago the named Picotees were more or less characterised by an edging deepening in depth in the centre of the edge of the petal. It was then Mr. Dodwell proclaimed as a standard of quality that the margin of colour should be of the same depth and dimensions all round the petal. Previous to this Mr. Dodwell had left London and settled in Derby—about 1844—and in 1845 he commenced raising Picotees from seed. One of his first varieties was Alfred, purple-edged, bloomed in 1849; followed by Mary, a red-edge; and both these showed the truth of Mr. Dodwell's contention. He grew Picotees continuously up to 1860, exhibiting for the first time in 1846. Amy Robart, Mrs. Bayley, and Florence Nightingale were also raised. All these were of Princess Alice blood, a variety raised by Wood & Ingram, of Hunnington. In 1858 Mr. Dodwell purchased John Holland's nursery (Chadderton Gardens), at Middleton, and here he raised Countess of Wilton and other Picotees. He also raised Carnations while at Derby, such as Fanny, P.P.B.; Hester, P.F.; John Bayley, S.F., a variety grown in the present day, and others.

"In the florists' world of the *Dianthus* tribe," remarks Mr. Dodwell, "nothing lives beyond ten or twelve years, and a variety that holds its own beyond this time is of exceptional merit. There is a marvellous variety found in the Carnation—no two petals can be found exactly alike, and no two stripes are exactly alike in size and density." Its capacity for taking on new shades of colour is particularly noticeable; shades have deepened to the densest purple, and nearly black; and from black through shades of lilac, mauve, rose, and pink, to the purest white. It is found that the character of the flowers is much affected by treatment and circumstances; those of climate and soil will sometimes have a great effect upon the bloom.

In 1859, having been in business at Chadderton for the space of twenty-one months, Mr. Dodwell removed to London, and took up his residence in the Devonshire Road, South Lambeth, where he lived for the space of fourteen years. Here he attempted to grow Carnations and Picotees, but owing to prolonged absence from home, during which the plants suffered greatly, he had to give up their culture.

In 1873 he went to reside at Chatham Terrace, Larkhall Rise, Clapham, and here, having better opportunities for cultivating, the old floral tastes revived. In the autumn of 1874 he began to make a collection, and in 1875 commenced fertilising his best flowers, but it was not until 1876 that he obtained a good lot of seed, and from this came S.E. Robert Lord, S.B. Ben Simonite, S.B. Arthur Medhurst, S.E. George, S.B. Fred, C.B. Stanley Hudson, C.B. Thomas Moore, and others; and also some seedlings subsequently named by Mr. Turner. Picotees would not develop in the Clapham atmosphere, but Carnations came in excellent character. Here Mr. Dodwell remained until the end of 1881, when he removed to the Stanley Road, Oxford, the house he now inhabits being in process of building, the garden a deep pit resting on clay. The clay, being of a very stiff, adhesive nature, was burnt to

the extent of from 400 to 500 tons, and all the Carnation soil that had been gathered together at Clapham was brought here at a considerable cost. It is now a perfect, and, it may be said, unrivalled Carnation and Picotee garden. This season Mr. Dodwell has proved forty selected seedlings of 1882-83, and 120 of 1884. He has this summer flowered 1036 seedlings; in 1844, 1750 were bloomed; and in 1883 rather over 1500. It is computed that 20,000 layers will be made this season, all of seedlings of Mr. Dodwell's own raising.

The "running" of Carnations, *ie.*, the breaking of a flower into a coloured instead of a white ground, is one of those matters that baffles the speculations of cultivators, as it did many years ago. [Reversion to an ancestral condition.] Carnations are much more disposed to "run" than Picotees; it is not often that the latter take on the run character. Run Carnations will occasionally revert to the original character, but run flowers are never propagated for purposes of sale, except as self or fancy varieties. The Carnation occasionally sports; thus, that fine S.F. Sportsman is a sport from the S.B. Admiral Carzon; and other instances might be mentioned.

Most of Mr. Dodwell's fine self and fancy varieties

together with the old florists' favourite toast, "May we never be fun' out."

In dressing Carnations it is considered fair to remove what leaves the operator chooses, and, with a pair of tweezers, to put what remains in the best and most regular form, the petals overlapping each other, with a few short ones in the centre, forming the crown; but extremely wrong to make any addition thereto from other flowers. The art of the dresser tells powerfully on the exhibition table.

To show how actively Mr. Dodwell has been engaged in raising new varieties of Carnations since the time he commenced operations at Clapham, he has named and distributed sixty-one bizarre and forty-eight flaked varieties, and thirteen Picotees, besides seedlings which have been named by others. In addition there are many fine self and fancy varieties, and all this is simply an earnest of what is to follow. Year after year Mr. Dodwell crosses his best flowers, and from them raises seedlings. He has this season flowered for the second and third time 160 selected seedlings; and considerable augmentations of flowers of high character will no doubt be made to our lists of named varieties from such a numerous batch.

rate difficult to imagine why a sharp point should be made especially for protection, and points less sharp for no protective use at all.

I have often reflected on the fact referred to by Dr. Newberry, that our thorniest plants are in much greater proportion in places where animal life is scarce, and the immense police force sustained by the great vegetable community absolutely thrown away. Cactuses and other thorny things I have seen covered with thorns and spines on deserts where the hot air seemed to be bounding up and down like the surging ocean, and where not even a lizard could have dared to show its face. Thorns cannot be, so I have thought, for protection where the climate gives all the protection desired. I am not one who doubts that Nature has a purpose in every move she makes, but the main purposes, I think, we seldom reach, and that we do ourselves an injury in research by assuming mere incidental uses as the main purposes for which structures seem to be "adapted."

One of these uses in the spines of Cactus has occurred to me after reading Dr. Newberry's remarks on *Pinus edulis*. They break the full force of the sun on the plant, a force it is made to endure, and not to love, as we know who have learned to cultivate it. Plant lovers set out their treasures in summer under "arbores" of fish-netting or galvanised wire, and those who have no experience would be surprised to find how the moving shadows of the twine or wire lowers the temperature. A mass of spines on a Cactus must certainly have the same effect. A Cactus does not need much light on its epiderm to keep healthy. On the dry mesas along the Uncompahgre River I have seen some aggregated masses of *Echinocactus phenicus* forming dense hemispheres a foot high and as much wide, with spines so thoroughly interlaced with spines as to rival the hedgehog, and leaving not a particle of the green surface visible; and there are species not cespitose, such as *E. pectinatus*, which no one can see for spines without cutting apart, and forming a complete protection from the hot suns under which they are doomed to live.

I do not suppose I have yet reached the final purpose of spines in a Cactus, any more than we have the final purpose in the existence of the Cactus itself, but that one use of Cactus spines is to furnish a partial shade I feel to be beyond a doubt. *Thomas Meehan* in "Bulletin of the Torrey Botanical Club."

ORCHIDS FOR AMATEURS.

(Continued from p. 214.)

QUITE recently several new varieties of *Lælia* aneeps of great beauty have been imported, these, which are closely allied to *Lælia aneeps* Dawson,

Lælia aneeps Schradleriana, Rehb. f., is stated to be the finest white *Lælia* that has yet been introduced. Professor Reichenbach speaks of it as distinct; the flowers are larger than those of *L. a. Dawsoni*, with broader petals, and a very remarkable labellum. This is very flat and broad, three-lobed, the lateral lobes quadrate, and the middle lobe very large and notched in the centre. The flowers are white with an orange base to the labellum, marked with five parallel lines of crimson-purple.

Lælia aneeps stella is also related to *L. aneeps Dawsoni*. The flowers are described as stellate; the median lobe of the labellum is not notched, but has an entire margin; the base is orange coloured, and there is a scarlet blotch, or macula, on each side. This last character is the distinguishing mark of a variety called *L. aneeps vestalis*, which resembles *L. aneeps stella*, except that the base of the labellum is white instead of orange coloured.

Lælia albida.—This forms the type of the second group of Mexican *Lælias*. It is an old species, which was introduced in 1838 from the mountains of Oaxaca. It is a dwarf plant, with numerous ovoid pseudobulbs closely crowded together, and when young surrounded by thin silvery scales. The young bulbs are surmounted by two narrow, strap-shaped, coriaceous leaves, of a pale green colour. The old bulbs are leafless, and deeply furrowed. The flowers are borne on long, upright peduncles, six or more in a panicle. They are 2 inches in diameter, of a beautiful ivory-white colour, or white shaded with pink or buff. The labellum is rose coloured, with yellow radiating lines in the throat. The flowers are very fragrant in the early morning.

L. albida Mariana has glaucous leaves, and white

FIG. 55.—SECTION OF THE ROCK GARDEN AT ST. ALBAN'S COURT. (SEE P. 264.)

are seedlings, and a considerable proportion of seedlings will come self-coloured. Occasionally a good fancy comes from a sport, as in the case of Mrs. Mostyn Owen, a very rich crimson and dark purple; this originated as a sport from C.B. Thomas Moore, and in common with others its character is quite fixed.

A "split pod," in which the green calyx divides and shows the base of the petals, though still a disqualification at some shows, is not so at South Kensington. It is mainly caused by the rapid expansion of a full flower, and by other influences operating. Instances have been known, where the pod has burst, of putting the flower into a fresh one; but they belong to a time now somewhat remote. A case once occurred of a split pod being patched up with a piece of green silk, tied close up to the petals. Bad petals have been removed, and good ones substituted; a pellet of cotton-wool being crammed down to keep them in their places. A neater way of doing this is by drawing the petal down into the pod with a piece of green silk. Mention has been made of a Carnation composed of petals taken from other flowers, not one of which belonged to the pod in which they were put, but were the best that could be selected from perhaps a dozen flowers. Practices like these have passed away into the limbo of things that once were,

The seeds saved in any year are held over until the following March, when they are sown. Up to this year they have been sown in seed pans and pots. This season a coating of cocoa-fibre was spread over a peat hotbed, and on this was laid a layer of fine soil of a light free nature; and over this was spread about 2 inches of some finely sifted leaf-soil; drills are drawn, and the seeds sown thinly in them. It would appear that last season's seeds came indifferently well, as only some 3000 of them germinated out of the large number of 7000. Whether this was owing to the drought of 1884, or not cannot be determined. *R. D.*

USE OF SPINES IN CACTUSES.

WHEN young and vigorous—*ie.*, in early life—the teeth are very spiny; when the tree is aged, and the branches then a distance above the surface of the ground, losing vigour, the spines are weak or absent. Sir John Lubbock and others, following the poet Southey, see in this a beautiful adaptation for protective purposes. When within the reach of animals spines are borne, when high up, where animals cannot reach, spines are unnecessary. Numbers of species of plants have mucronate points to the leafy serrature, which are wanting in maturer years. It is at any

or buff-coloured flowers, with a mauve labellum, salmon or buff coloured in the throat.

CULTURE.

Lælia albida, and indeed all the remaining Mexican species of *Lælia*, require cool treatment and plenty of air. They are also all impatient of moisture, and in this respect resemble *Cattleya citrina*. All its varieties flower in the dull months of winter. When well grown nothing can exceed the beauty of the flowers of this species. A warm greenhouse in winter, and the coolest possible corner of a verandah in summer, are the best places to grow *Lælia albida*. It is one of those plants which do best in the open air, and I feel sure that any one living in the country could grow this plant to perfection in a shady porch, or in a cool verandah, suspended in an Orchid-basket, in summer, and I believe it would flower well in a conservatory, or even in a south window. The experiment is worthy of a trial, as plants can be obtained for a mere trifle at the present time, and the great beauty of its flowers make it a universal favourite. I am sure any one who can flower *Pelargoniums* in winter could grow *L. albida* in the greenhouse, and as the flowers last for six or eight weeks, it would be a very desirable plant to have.

L. furfuracea has pale pink flowers and broad thick leaves; it is apparently intermediate between *L. autumnalis* and the last species, but is quite distinct from either. The culture is the same as for *L. albida*.

L. autumnalis.—Also a mountain plant, but one of much larger size than either of the last. Its ovoid pseudobulbs, attaining a length of 3 or 4 inches, bear two or three broad bright green coriaceous leaves. The flowering stems are from 1 foot to 18 inches long, and support from six to nine large showy sweet-scented flowers, but unfortunately they only last two or three days. The sepals and petals are rose-coloured, shaded with deep purple, the labellum varies from white to rose colour or lilac, and in some varieties there are two deep purple blotches on its base. The throat is marked with spots or lines of yellow. This species flowers in winter and requires the temperature of the Mexican-house, or a warm greenhouse for its cultivation.

The three species described above are all easily damaged by excess of moisture, and are sure to lose their young shoots in a damp close atmosphere. The compost in which they are grown should be of the most porous description, little billets of charcoal and peat fibre, and should never be kept wet, only damp, even in summer, and in winter they need less moisture. Indeed the compost will absorb sufficient from the air to keep the plants healthy.

L. erubescens, also called *L. peduncularis*, may be taken as the type of a third group of Mexican *Lælias*. It has compressed ovoid dark green pseudobulbs surmounted by a single dark green shining leaf. The flowers are about an inch in diameter, from three to ten in number, with an umbellate inflorescence. They are of a pale rose colour, with dark purple shading; the lip is of a sulphur colour. These beautiful and delicate flowers only last one or two days. It is, however, a gem, although an evanescent one. This plant can be grown easily either in the *Cattleya* or Mexican-house, but it is much damaged by excess of moisture in the former. The compost in which it grows should be merely kept from getting quite dry, as even a moist compost destroys the slender rose-coloured roots of this plant. It requires a well-marked resting period after flowering in a cool dry airy situation. It flowers in autumn.

L. acuminata.—A larger species, closely allied to the last, but needing cool treatment. It has similar but larger bulbs, and much thicker and broader leaves than *L. erubescens*. The flowers are from six to eight in number, of a delicate lilac colour, with a cornet-shaped labellum, yellow in the throat, with three lobes. The central lobe plicated or crenulated at its margin. It flowers in winter.

L. majalis is very unlike any other *Lælia*. It has small ovoid silvery bulbs, each bearing a pair of bright green leaves. Its flowers are solitary, five or even 6 inches in diameter, of a delicate rose colour, mottled or veined with a deeper rose. The labellum is rose coloured, or white sometimes with a deep purple border in some varieties, marked with reddish-brown or chocolate spots.

CULTURE.

The secret of success with this mountain gem is cool

treatment, free circulation of air, and a very decided winter rest. Like all the alpine Mexican species, excess of water is fatal to it, and free air is absolutely essential. A slight frost does it no harm if it is dry. I believe it would do perfectly well in the shelter of a verandah except in the cold winter months, when it needs the protection of a greenhouse, which should also be afforded it until after flowering. I believe a vinery would suit it better than any other treatment. The flowers appear with the young shoots, and precede the bulbs.

The last species of *Lælia* which I shall describe is a native of the mountains of the West Indies; it differs from all the above in having no pseudobulbs, and known as

Lælia monophylla.—This species occurs on trees at an elevation of from 3000 to 5000 feet above the sea. It grows very much after the manner of a *Carex* or *Sedge*, its rhizome is horizontal, and its leaves are from 5 to 6 inches high. The flowers are small, and resemble those of *L. cinnabarina* in colour, but are campanulate in form; it is interesting rather from a botanical than a horticultural point of view. *B. T. L.*

(To be continued.)

MESEMBRYANTHEMUM EDULE.

AT page 145, in your number for August 1, you refer to this plant as being hardy at Torquay, and describe it as producing yellow flowers. Both Loudon and Johnson describe it as producing pink flowers. Which is correct? The plant you refer to is growing in large quantities along the sea coast in light sandy soil, and on rocky walls here. The name it is known by is *M. acinacifolium*, on account of its bayonet-leaved foliage; but I presume that is incorrect also, as it best answers to the description given to *M. crassicaule*. Both the authorities above quoted are agreed that the latter variety produces yellow flowers. Its growth is vigorous and rampant, producing ramified shoots from 4 to 8 feet long in a season, thickly set with large succulent leaves, but it does not produce many flowers. Here and there one large sulphur yellow flower is produced, 2 to 2½ inches in diameter. In light, bright, sunny places it grows as freely as Ivy does in damp places. The poorness of the soil, and the strong glare of the sun seem congenial to its development. As a window-box plant, where much growth is desirable, its heavy pendent growth make it acceptable, as it is not liable to be much damaged by the wind, which is the bane of many of our beautiful creeping and trailing plants. I have thought that if it could be grown as a fodder plant, its luxuriant growth would make it a profitable crop to grow. As far as my experience goes, most animals refuse to eat it; but that may arise from not being used to it. Should any of your numerous correspondents have any knowledge of its merits in that respect, I should be glad to share it. As a vegetable it is "a marvel of beauty," developing size, form, and colour in unmistakable proportions. I enclose you a specimen of the growth, the name you have applied to it inducing the enquiry. *C. B. S., Jersey.*

[The above note was forwarded to me by the Editor, since I was responsible for the name *M. edule* as applied to the Torquay plant. "C. B. S." and others, as I learn from the Editor, are in doubt as to this being the correct name of the plant alluded to on p. 145 of the present volume, but I can assure them that there can be no question that the Torquay plant and the specimen from Jersey sent by "C. B. S." both are *M. edule*! The difficulty is in reconciling the statements of authors as to the colour of the flowers. In the original description in Dillenius' *Hortus Elothamensis*, p. 283, t. 212, f. 272, and in Lionoux's *Species Plant.*, ed. 2, p. 695, the flowers are described as yellow; but Pappé, in his *Flora Capensis*, ed. 2, p. 16, describes the flowers as "yellow or purple," giving after his description the following account:—"Few South African plants are so much in domestic use as this species and *Mesembryanthemum acinaciforme*, Lin., both of which are common in the sandy tracts of the colony. They are astringent and sourish in taste, on account of the acidulated alkaline salt with which they seem to be impregnated. The expressed juice of the succulent leaves, taken internally, checks dysentery, and acts as a mild diuretic; while it is also for its antiseptic property used as an excellent gargle in malignant sore throat, violent salivation, and aphthæ, or, in the

form of a lotion, in burns and scalds. At the Cape these plants are called 'Hottentots' Vyge (Hottentot Figs)." In Harvey and Sander's *Flora Capensis*, ii., p. 412, the flowers are also described as "yellow or purple." Johnson and Loudon state the flowers to be "pink," but these, as compilers only, can scarcely be considered as authorities on the subject, and, in my opinion, they are undoubtedly wrong. Mr. Cooper, who collected in South Africa, writes me as follows:—"There are plants growing near Cape Town alike in appearance, differing only in the colour of the flowers—namely, purple and yellow; they are both called 'Hottentots' Fig.' I considered one of them to be *M. edule*, but was puzzled by the different colour of the flowers. I think it most likely Dr. Pappé considered them both to be *M. edule*. The fruit of both plants is alike, and I know of no other *Mesembryanthemum* with such large fruit. The growth of the two is alike, spreading from a centre many feet in every direction, the new growth covering the old, and smothering it, forming a thick bed of dead stems."

Now all this, to say the least of it, is unsatisfactory and indefinite, and I cannot but think that two species have been confused by the later authors. Concerning the typical *M. edule* there can be no doubt, as Linnaeus, the author of this species, states that it is yellow; but whether there is really a purple flowered variety of it, or whether *M. acinaciforme*, which has purple flowers, and much resembles *M. edule*, has been confused with it by those who say the flowers of the latter are sometimes purple, I cannot positively say, but incline to believe in the confusion of these two species. *M. acinaciforme* and *M. edule* are both called "Hottentots' Figs," the fruit of both species being eatable, and they grow in the same districts. The distinction between them is as follows:—*M. edule* has yellow flowers, and triangular leaves with nearly equal sides; *M. acinaciforme* has purple flowers and triangular leaves with the two outer sides broader than the upper or inner side, especially towards the apex, where the keel becomes somewhat dilated. Another species, *M. equilaterale*, is very like *M. edule* in its leaves and habit, but has purple flowers; it is not a native of the Cape, although, as it has long been in cultivation, it may have been mistaken in gardens for *M. edule*, and have given rise to the statement by Loudon and Johnson that the flowers are pink.

M. crassicaule, mentioned by "C. B. S.," is a very different plant, much smaller, different in habit, and the leaves are not acutely triangular as in the species above-mentioned, but very obtusely rounded on the edges, and very obscurely and obtusely keeled on the back, with a channel down the face.

It is remarkable that such a fine species as *M. edule* has not been figured since the time of Seba and Dillenius; it does not even find a place in Prince Salm-Dyck's splendid monograph of the genus. A good coloured figure would be serviceable. *N. E. Brown.*

NELUMBium LUTEUM.

SOME half-a-dozen species of *Nelumbium* are recorded in gardening books as having been introduced to this country, but the *Genera Plantarum*—doubtless with much propriety—reduces the number to *N. speciosum* and the species under notice. Owing to the wide distribution of the former, both in the Old and New Worlds and Australia, it is not surprising that we should find considerable variation, amounting to the extent of what would be called geographical varieties. On the other hand, *N. luteum* is confined to America, and was originally introduced from Carolina in 1810.

A small specimen obtained for Kew a year or two ago has been growing slowly but progressively, and having made excellent growth this season, is now flowering in the Water-Lily house, probably for the first time at Kew. Four or five flowers, a number that may yet be augmented, appear in various stages of development; and, recollecting that the plant is small, and the long rhizomes confined within the limited compass of a pot, plunged in the tank, its flowering may be considered a success. On some parts of the Continent where it has been flowered it is believed that frequent removal—or, in fact, disturbance at the root—is detrimental to its well-being, or hinders it from flowering altogether. Whether or not this is in accordance with fact, this much is certain, that *N. speciosum* in the same house was entirely removed last spring, and a new plantation

made in fresh soil. The flower-stems and leaves are unusually strong. Some of the flowers measured a foot in diameter, and the leaves twice that, or more. These are facts that speak for themselves, and, bearing in mind the difficulties that the early cultivators of this plant encountered, it is highly probable, when thoroughly understood, that *N. luteum* will be as tractable and amenable to cultivation as the former.

The flowers are of medium size, with pale green sepals and pale lemon or soft yellow petals. Although wanting in the gorgeous appearance of *N. speciosum*, it is a handsome flower, and by its quaint unassuming colour contrasts beautifully with its bold and showy congener. The leaves are peltate, and of a soft glaucous green. The primary and weaker ones float on the water, while the stronger ones are borne well above it, overtopped, however, by the flower-stems. The obconical receptacle projects prominently above the numerous yellow stamens. *F.*

HERBACEOUS PLANTS.

EPILOBIUM FLEISCHERI.—Botanists have long been puzzled how to determine the limits and characters of the British species of *Epilobium*, to one of which this plant is said to belong, as I saw it in the gardens at Kew labelled *Epilobium rosmarinifolium* var. *Fleischeri*. The two plants may present no distinct characteristics to botanists, but to gardeners they are very different. *E. Fleischeri* is dwarf and bushy, seldom exceeding 9 inches in height, whilst *E. rosmarinifolium*, grown under the same conditions, frequently exceeds 3 feet. The section of *Epilobium* to which this plant, as well as the more common *E. angustifolium*, belong, has long been separated by some botanists under the name *Chamaenerion*—a genus retained in Nymman's *Conspectus*, but disallowed in the *Genera Plantarum* of Hooker. The plant of which I am writing came to me several years ago from Messrs. Fröbel, of Zurich. Finding that it was a good rock plant, and that it ripened seed freely, I distributed the seed to my friends, and amongst others to Mr. W. Thompson, of Ipswich. After a year or two, Mr. Thompson wrote to me saying that he had the plants raised from it identical with *E. Dodonai*, a plant in size and form intermediate between *E. Fleischeri* and *E. rosmarinifolium*. I found the same result in my garden; in fact, these three varieties came up here simultaneously from the same seed—the plants forming an unbroken series from the smallest to the largest. Knowing how readily the species of many genera cross when grown together in gardens, I should not be justified in concluding from this that these species are identical. I find, however, in Nymman's *Conspectus* all the three names given as synonyms or varieties of one species, which he calls *Chamaenerion lacustre*. In Britain the species is said to be native in Glen Tilt, but very rare. The dwarf form I have mentioned is pretty and neat, but must be grown from divisions of the plant, which are easily made.

MALVASTRUM MUNROANUM.

This is the name given in the herbaraceous garden at Kew to a plant sent to me from Devonshire by a friend as *Malva Munroana* last autumn, and which I find to be the best hardy plant of which I have made the acquaintance this year. The plant is by no means new in cultivation, and appears to have been introduced by Douglas in 1826; but it is not as well known as it deserves to be. It makes drooping or prostrate branches a yard or more long, followed at the end of summer by upright shoots from the same centre. The leaves are much incised and lobed, like those of the Oak-leaved Pelargonium, but in the late shoots they are rounder and less cut. The flowers, which are produced on short paniced stalks from the axils of the alternate leaves, are about as large as those of the Crab, which they resemble in shape, of a clear bright red colour. They drop as soon as they wither, making no attempt at forming seed—a habit which greatly improves the appearance of the plant, which continues quite covered with flowers from June to the end of autumn. My plant is now one of the most attractive sights in the garden, and shows no sign of deterioration. Like all plants from Western America, north of California, it is probably very hardy. I am informed that the short and late shoots strike readily. It should be planted on the edge of a raised bed or bank, where its long shoots can fall over at least 4 feet without reaching the ground; and poor strong soil seems to suit it best. It has been figured and

described under the old generic name *Malva* in *Bot. Mag.*, t. 3537, and *Bot. Reg.*, of 1834, t. 1300.

MALVA LATERRITA.

Now that taste in colour is so much cultivated, I find many of my visitors very fastidious about flowers, and few of them will admire anything to which the words "mauve" or "magenta" can by any stretch of meaning be applied. About the colour of this flower, however, I have never heard any opinion but of unqualified approval. It is a clear and soft light red, with a darker spot at the base of each petal. The flowers are about the size of those of a large garden Strawberry, but more cupped, and are produced from the middle of July until the frost stops them. In these consists the whole merit of the plant, which cannot be called of neat or ornamental habit. The leaves in shape resemble those of the common Mallow. The stalks are long and straggling, generally prostrate, and 2 or 3 feet long when flowering, but I have seen it cultivated in pots, or in dry soils, flowering with upright stalks. This, however, cannot be called its ordinary habit. Being a native of the Cape of Good Hope, it may be expected to be tender in cold gardens, though it has survived two mild winters here. It is increased very easily either by cuttings or by laying the long shoots, which then root at every joint. A pot of cuttings should be kept through winter in a frame by those who wish not to lose it. It likes good soil, and a warm situation under a south wall.

SILPHIUM LACINIATUM.

Better known by name as the Compass plant than by its appearance in gardens. It is said in America that on the prairies where it grows wild the points of the compass may be recognised by the disposition of its leaves, and Asa Gray favours the notion. It probably loses its indicating habit in gardens, as I have frequently tried in vain to recognise any consistent direction in the leaves. It is a handsome and distinct plant, and, though coarse, is not more so than many with less showy flowers more frequently cultivated. It grows 6 feet high or more, with leaves often 2 feet long, elegantly cut up into narrow lacinate pinnae. The flower-stalk is leafy to the top, and the flowers come five or six in a loose panicle. They are 5 inches across with a dark centre and numerous clear, pale yellow rays. I raised it from seed which my son brought from Minnesota, where it is called the Gum plant, on account of the secretion of gum, especially on the outside of the bracts of the involucre. I have been told that it often dies after flowering unless the root is taken up and cut into pieces like a Potato and replanted.

CHRYSOGONUM VIRGINIANUM.

The generic name occurs in Dioscorides, and was applied by Linnaeus to a small genus of plants of which the only hardy member is North American, as its specific name implies. The genus in Hooker's *Genera Plantarum* comes next to *Silphium*, but to ordinary observers two plants could hardly be more distinct in habit and appearance than this and the last described. This grows hardly a foot high, its leaves are serrated, cordate ovate, and much resemble those of *Campanula trachelium*. The flowers would hardly be recognised as a Composite without close examination. The centre is small, and the rays, which seem to be always five in number, are evenly arranged and of bright golden-yellow. It begins to flower early in June, and continues through summer and autumn, never becoming untidy, and making a good border plant, very distinct in appearance. Easily increased by division of the root.

CAMPANULA ZOYSII.

The limits of distribution of this species, as given by Nymman, are Styria, Carinthia, and Carniola. It is well worthy of cultivation, for the very distinct and peculiar form of the flower, which is a sort of pentagonal cylinder tapering towards the end, near which it swells out and again contracts at the mouth so as to leave hardly any visible aperture. The plant is difficult to obtain, being very diminutive, spreading slowly, and apparently making no seed in cultivation. I obtained it two years ago from Fröbel, of Zurich, at a rather high price. It is now well established in soil well mixed with finely broken stone in an exposed part of a rockery. The flower-stalks, which are branched, are not more than 2 inches high, and the flowers, which are produced abundantly, about three quarters of an inch long. *C. Wolley Dod, Edge Hall, Malpas, August 22.*

FRUIT GROWING AT OSTERLEY PARK.

As the owner of Osterley Park, the Earl of Jersey, resides here only a few weeks in the year, the gardens have been left for some years past to Mr. E. Poole. The present extent of the occupation, including the original gardens, and the additions made by the present tenant and his predecessor, consists of 50 acres, covered with orchard trees, with a lesser growth below, the whole being under spade cultivation.

The original garden attached to Osterley Park was formed by Mr. Child, the banker, and a great improver here, at a cost, according to Horace Walpole, of £30,000. The soil is a strong loam, resting on brick earth 8 or to feet deep, with the gravel of the Thames valley below. Mr. Child drained the garden, but thorough drainage by means of pipes could not possibly be long effective on ground thickly planted with deep-rooting trees. Probably the gravel subsoil secures sufficient drainage, while the evaporation from the dense mass of foliage must tend to dry the surface by dissipating the winter's downfall of water. The soil is well suited to fruit trees of all sorts, though it is a little too cold for the ripening of the best sorts of Pears except on walls. Farmers who read this please observe that this capital strong soil is not warm enough for some fruits, or at least for some sorts; it is not so warm as those parts of the Thames valley where the porous gravel subsoil is more readily permeated by the atmosphere, and where, as in the neighbourhood of Chiswick, the water of the river percolates during high tide to the roots of the Pear trees, feeding them without remaining long, enough to stagnate. In those warmer parts of the valley the superior sorts of Pears are grown as standards.

The walls of his kitchen garden were constructed by Mr. Child in a manner that secures their dryness, that is, they are built double with a 9 inch space between the brickwork. Mr. Poole has been the occupier here seventeen years, and during that time he has reworked many of the Pear trees of his predecessor, who planted the sorts in fashion at that time, which have now been replaced by the best modern sorts. Those which are at present most in request as good cropping Pears for walls, are Williams, Jargonelle, Pitmaston, and Louise Bonne of Jersey. It was pleasing to see, too, a well-loaded specimen of that delicious Pear, Gancell's Bergamotte. This is one of the earlier-planted wall trees, and does well occasionally.

A common standard here was *Beurré de Capiaumont*, which bears well, but is not of superior quality, and has therefore been replaced to a great extent by grafting on to *Beurré Clairgaut*. In walking through the gardens, and strolling in and out of various compartments which we visited, so as to see everything, we came upon another wall Pear—*Glou Mouceau*—which is an excellent sort, but not adapted to the soil here, being sometimes spotted black, as it is this year, though occasionally the fruit proves sound and good. The *Ne Plus Meuris* has also failed to hold its own, having been reworked with *William*, though the *Ne Plus Meuris* from this garden has sometimes been produced at the great City dinners. One Pear, largely planted forty years ago, is still numerous and conspicuous in the garden from its tall pyramidal form. This is the *Hesse Pear*, a common sort, but such a heavy cropper and so hardy that it is still retained as a profitable sort.

The old rule of planting the larger orchard trees a half rod apart has not been rigidly observed. Mr. Poole is a large grower of Plums, sending the various sorts to market from July to October, and Plums will bear a deal of shade. The crop this season is surprising, the trees being loaded, and some of the branches so heavy with fruit that they hang down as if ready to break, and even in this sheltered garden, amid high walls and taller park timber in the level Thames valley, I noticed that some of the branches had been torn off by the recent high winds. This is considered a "holding soil" for Plums, which is in unfavourable situations are apt to drop off when young. The first and earliest sort is *Rivers' Prolific*. *Victoria* and *Prince of Wales* supply the main crop, and other good sorts are grown.

Mr. Poole has himself planted many additional acres of fruit trees to the extent of ten thousand of the modern sorts, besides grafting, expending under lease from the Earl of Jersey—a helpful landlord, who enables his tenants to improve—a large amount of

capital. He invariably trenches the land. It is also manured heavily. Farmers have no idea, perhaps, that at least 20 tons of dung per acre, all round, are required for a fruit garden of this sort, and that is the average dressing here, every acre being cropped and completely covered with fruit-trees and bushes, large and small. It would seem impossible to dig it, yet it is dug, or forked rather, once a year, every inch of it, and kept perfectly clean. I scarcely saw a weed.

There are few gardens so compact as this, the trees standing regularly in the rows, and the various sorts admirably disposed in their several divisions.

The walls are planted on both sides, being guarded by lesser walls, and the slips between are planted with fruit-trees. There are many acres of flower-beds, too, under the walls or between the fruit-trees, the Lily of the Valley being the chief favourite in shaded situations, and the Rose and Gladiolus in more sunny places. The first-named plant is grown by acres in strips, and the Narcissus, though buried now, will spring up by acres in the season. About thirty men and boys are employed in the garden throughout the year, and when the crops are heavy many extra hands are needed.

One of Mr. Child's old vineries must be mentioned. Mr. Poole does not find glass profitable, but this particular house is retained for its great Vine—a Black Hamburgh, which extends the length of the house, or 28 yards, and carries now a crop of 500 bunches, weighing over 1 lb. each. The house is otherwise filled with numerous pots of Maidenhair Fern. Mr. Poole does his own marketing, goes to London three times a week, sleeps there, and is at his stand in Covent Garden Market at 4 o'clock A.M. sharp. This he considers a *sine qua non*. He sends in his produce by his own vans, and brings back manure. H. E.

DISEASE AND DECAY IN FRUIT.—II.*

PENICILLIUM CRUSTACEUM, Fr.

THERE is, perhaps, no microscopic fungus in the world more abundant and generally diffused than the "blue mould" fungus named *Penicillium crustaceum*, Fr. It grows abundantly at all times and seasons, and in all parts of the world. It may be found in almost every conceivable place, and upon the most varied substances. "Blue mould" is familiar to the most unobservant person on preserves, fruit, bulbs, paste, bread, &c. Although the fungus is powerless to start disease on sound substances, yet few fungi have greater power for accelerating disease upon slightly injured bodies.

Hitherto this fungus has received but scant attention in this country. It has only been described in the briefest possible manner; and as for illustrations, I am not acquainted with any presentable or complete drawings of this fungus in any English book. Under these circumstances it seems desirable that a description should be given in the *Gardener's Chronicle*, with figures engraved from Nature to scale. The subject is not one of the easiest to follow, as the life-history of the fungus is somewhat intricate. I recommend its study to the readers of this journal, together with two other papers which will follow, on *Aspergillus* and *Mucor* (also fruit-infecting fungi) as a good, very useful, and not too difficult mental exercise.

Penicillium crustaceum, Fr., or, as it is frequently printed, *P. glaucum*, Greville, is the most common of the fungi which cause the verdigris blue mould so frequently seen on provisions, preserves, fruit, paste, &c. It also attacks liquids, as beer, ink, gum-water, syrup, &c., and it often grows on the surface of water in which plants or other organisms have decayed. It at times grows on various diluted acids and chemical solutions. It is common on and in oil, and in alum water. When the fungus grows in fluid the spawa or mycelium often forms a gelatinous substratum or crust, hence its specific name—*crustaceum*, and the dusty greenish or bluish spores are borne on vertical threads on the surface. The peculiar and disagreeable odour belonging to mouldy provisions is in part owing to the presence of vast numbers of the spores of *Penicillium crustaceum*, Fr.

A profuse growth of this familiar blue mould is very common on stale and decaying Oranges in the spring months. The brilliant orange tint of the rind of the fruit is seen in strong contrast with the verdigris blue

of the mould. In Oranges, as every one knows, the fungus grows upon bruised places, and penetrates and softens the rind of the fruit in patches; the mycelium then lives in the pulp beneath. The mycelium when in the pulp lives on the juice, and gives rise to a peculiar and somewhat bitter taste in the fruit, not altogether disagreeable when the Orange is not affected to too great a degree.

The name of the fungus is derived from the Latin word "penicillium," which means a painter's brush, in reference to the general form of the fungus growth; this form is illustrated, enlarged 400 diameters, at A and C, fig. 56, when the general resemblance to a

FIG. 56.—PENICILLIUM CRUSTACEUM, Fr.
A to C enlarged 400 and D, E, 1000 diam.

miniature whitewash brush, or a flat painting brush, is clear.

A remarkable character in *P. crustaceum*, Fr., is the unusual and extreme smallness of its size, and the smallness of its spores or conidia. The smallness of its parts is in contrast with its generally profuse growth, for the spore production of even a very moderate growth of this fungus is so large as to be almost inconceivable.

The general habit of the fungus, as it grows in brush-like form, is shown, enlarged to 400 diameters, at A, B, C, fig. 56. The supporting stems, which are jointed throughout, arise from a bed of mycelium, as at B, all the threads of which are also jointed or septate. Each stem branches and rebranches

FIG. 57.—PENICILLIUM CRUSTACEUM, Fr.
Reproductive organs enlarged 400 diam.; I, resulting sclerotia enlarged to diam.

towards its upper part, and on the ultimate branchlets are borne upright or slightly curved chains of extremely minute spherical verdigris-green spores, or conidia, as shown at C. When one of the last formed branchlets, with its chain of spores, is magnified 1000 diameters, it is seen as shown at D. It will now be observed that every conidium is attached to the adjoining conidium, or conidia, by an excessively small and almost invisible neck, as illustrated. The conidia germinate very readily in water, thin syrup, or moist air, as shown at E. In moist air the germinal thread constantly turns over on itself in a wavy or screw-like fashion, and at length gives out branches to the right and left, which are also at first undulated or twisted. These lateral branches soon produce innumerable small vertical stems, and upon these stems vast numbers of conidia are borne in a chain-like manner on branched stems as shown in fig. 56 C.

The spiral or screw-like manner of growth is frequently seen in the germinal threads of many fungi, as well as in the stems of flowering plants, as the *Convolvulus*, and a spiral contortion may also be seen in the trunks of forest trees, as in Oaks, Beeches, &c. In fungi it is probably caused by a more rapid growth on one side of the germinal thread than on the other; this habit causes the growing point to turn slightly on itself; in flowering plants the cause is probably similar—a certain part of the plant structure grows with greater rapidity than the part to which it is opposed. *Penicillium* spores germinate most readily in 22° Cent., the minimum for germination being 1° to 2° Cent., the maximum 40° to 43° Cent.

Within the substratum upon which *Penicillium crustaceum*, Fr., grows, and when the fungus is kept dry and in darkness, other organs are developed from the mycelium, which at first grow in the form of minute knots, as illustrated at A, B, C, in fig. 57, enlarged 400 diameters. These knotty little growths are believed to be reproductive, and each larger screw-like growth, as at A, B, C, is considered female, and termed an ascogonium or carpogonium. The two words mean bearers of ascus (small bladders containing spores) and fruit bearers. The more attenuated growth, as at D, E, F, is considered male, and is termed an antheridium or pollinodium; these words have obvious reference to their male nature and to the anther and pollen in flowering plants, with which they may be compared. The ascogonium is said to be fertilised by the contact of the antheridium, the result being that the former organ at length gives rise to a second form of fruit contained in small sacs or asci. After the cells of the ascogonium have begun to germinate the growth of the threads which now surround it as at G, fig. 57, so hinders development that the ascogonium with its investment of threads rests in a condensed or sclerotoid condition. The illustration at G, enlarged 400 diameters, represents an infant sclerotium in which is embedded a fertilised ascogonium, shown by darker lines in the middle, capable under favourable conditions of producing spores in asci. The growth of the investing mycelium goes on till the sclerotia attain about the size of a pin's point. During this growth several or many ascogonia may be involved in the growing sclerotium, and several sclerotia may become confluent. A series of sclerotia of different sizes are drawn, enlarged ten diameters, at H, J, K, L, and M, fig. 57. Under favourable conditions the threads belonging to the ascogonia form asci within the centre of the sclerotium, as illustrated in fig. 58, enlarged 400 diameters. The illustration is an enlargement of one half of the sclerotium at J, fig. 57, and this half is divided into four equal portions, A, B, C, and D, to show the gradual development of the asci within. At A, towards the centre of the sclerotium, a jointed ascogonium is shown, germinating and producing threads. At B ten asci are shown towards the centre, the mycelium which has borne them is seen growing towards the outside of the sclerotium. Each ascus really contains eight spores, but the asci being extremely small are here shown empty to prevent confusion in the engraving. At C still more asci have been formed, and the mycelium has progressed in growth towards the exterior of the sclerotium. The interior substance is consumed like the albumen of a growing seed. The interior substance of the sclerotium is obviously the nutritive of the contained spores of the asci. Many asci have now broken up or dissolved, and the free spores are seen towards the centre. At D the whole interior of the sclerotium has been consumed by the growing mycelium and the production of asci, the asci in turn have perished, and the extremely thin layer of external cells of the destroyed sclerotium encloses a vast colony of ripe spores, ascospores, seeds, or sporidia.

At A, fig. 59, an isolated group of asci with mycelium belonging to a germinated ascogonium is shown, enlarged 400 diameters; the asci, owing to their exceeding smallness, are again shown empty, so that confusion may be avoided, but a group of three asci, each containing its normal eight sporidia are shown (enlarged to 1000 diameters) at B. The ripe sporidia are drawn in the right hand ascus. Four free sporidia in different degrees of ripeness are shown enlarged 1000 diameters at C, and a ripe germinating spore, enlarged to the same scale, is seen at D. These ascospores on germination reproduce a *Penicillium* like the one from which they originally arise, as shown enlarged 400 diameters at E, and so the somewhat involved life cycle is completed. If for any

reason the sclerotium does not produce asci and sporidia, it germinates and produces the conidioid, or simple, common form of the fungus.

The spores of *Penicillium crustaceum*, Fr., will not effectually grow on perfectly sound fruit, the nature of the fungus is to live on the escaped juices of the fruit, and it is therefore necessary that fruits should become slightly injured and the juices escape before the *Penicillium* can establish itself upon them. All experiments to make *Penicillium* spores grow upon sound fruit fail. If fruit pulp, infested with *Penicillium* is placed upon sound fruit the contact of the infested pulp will so injure and soften the skin of the sound fruit that the juices will escape and the sound fruit will be speedily invaded by the fungus. The case is exactly similar with the infectious spawm-infested gum belonging to gummed bulbs (see p. 149); the gum spreads the disease by contact.

Penicillium crustaceum, Fr., is generally associated with the so-called "vinegar plant" for the reason that if a "vinegar plant" is taken out of its nutrient syrup and allowed to dry, it invariably presents a crop of this mould upon the surface; it is therefore assumed that the gelatinous growth called the "vinegar plant" is no other than a dense mass of mycelium belonging to *Penicillium crustaceum*, Fr.

A few years ago I noticed a vinegar plant growing naturally in lime juice, and the example at the time of observation was completely covered with *Penicillium crustaceum*, Fr., and that species only. The *Penicillium* grew on the upper surface of the vinegar plant whilst the latter was still moist and upon the lime-juice. On counting the mycelial filaments I found that 1 cubic inch contained no less than 150,000,000 of them; vinegar plants will attain a thickness of several inches.

A remarkable form of *Penicillium crustaceum*, Fr., which grows upon decaying fruits has been described under the name of *Coremium leucopus*, Pers., *Byssus scoparia*, and *Floccaria glauca*, Grev. In this form the erect fruiting threads of the fungus form a curious confluent mass, and resemble a compound cellular pedicel with chains of spores. We have also seen the fungus growing in a somewhat similar manner in sweet oil, the mycelium absorbing the oil, and forming a compact mycelial substratum upon which the *Coremium* form of *Penicillium* grew.

The life history of this minute fungus was first worked out by Dr. Oscar Brefeld, and published at Leipzig in 1874 in the *Botanische Untersuchungen über Schimmelpilze*, ii. heft. The original work is a truly admirable one, and most beautifully illustrated with excellent plates. Amongst many original and accurate observations the author came to one startling conclusion, one that, according to my view is utterly untenable; in fact M. Ph. van Tieghem has already shown in the *Bulletin de la Société Botanique de France*, 1877, vol. xxiv., that Brefeld's view must be abandoned as erroneous.

Brefeld says, in describing the sclerotium of *Penicillium*, with its contained asci, that it is not only resembles a Truffle in structure, but it is a Truffle, and that the *Penicillium* is only its conidioid fruit. In this he is entirely mistaken. Van Tieghem shows at considerable length how wrong this position must be, for instance some species of *Penicillium* produce asci like *Aspergillus* without a sclerotium, and it is impossible to imagine a Truffle with asci only, and no compact environment. The structure of Truffles will shortly be illustrated in the *Gardener's Chronicle*.

The structure of the sclerotium in *Penicillium*, I may say, is foreign to all Truffles and resembles Ergot; the sclerotium of *Claviceps purpurea*, Tul. Germinating Ergot produces asci and ascospores, but these are generally protruded from the central mass of the Ergot on a short stalk. In infancy the head of the *Claviceps* may sometimes be seen within the Ergot. In such an instance we have a sclerotium containing asci exactly in the style of *Penicillium*. The growing *Claviceps* with its asci absorbs the substance of the Ergot exactly in the style of the asci and their mycelium in *Penicillium*. It would be less unreasonable to place *Penicillium* with Ergot than with Truffles. Moreover—and this fact is of the highest importance—no Truffle has ever been seen to produce conidia either from its simple cells or its sporidia. In Truffles the asci are formed during the gradual growth of the Truffle itself; they do not come into existence by the internal germination of special organs after the plant is fully formed, as is the case with the asci of the sclerotium of *Penicillium*; neither is the interior of a Truffle consumed by the

mere production of asci within its substance, any more than a common Mushroom is consumed by the production of its spores.

There is only very remote affinity between *Truffle* and the sclerotium of *Penicillium*; there is not

ing to the *Encyclopedia of Agriculture*, article "Yeast," this "fact" has actually been "proved." Dr. Oscar Brefeld has in turn said that one condition of the smut of corn, *Ustilago carbo*, is not to be distinguished from yeast.

If these startling statements are to be all accepted, it follows that blue mould, Truffles, yeast, and the smut of corn (to which ergot may be added), are all forms of one fungus. They are probably completely and entirely distinct; there may be certain specious resemblances, but a resemblance, however close, must not be accepted for identity. The untenable positions just mentioned reached their maximum point of weakness when Carnoy asserted that every species of fungus was at one period of its growth a *Penicillium*.

It is difficult to prevent the growth of *Penicillium* on fruit, preserves, &c. The spores can be killed with chlorine gas, but this gas has no effect on the spores if they are dry. When the spores are moist, however, the fumes of chlorine gas set up a change of colour from grey green to dirty yellow, and when thus operated upon they will not germinate. The amount of cold and heat requisite for killing the spores has already been mentioned. A 1 per cent. solution of carbolic acid will kill the spores of many fungi, and paste made with water saturated with salt will not support blue-mould. *Worthington G. Smith, Dunstable.*

FIG. 58.—*PENICILLIUM CRUSTACEUM*, FR.
Section of part of a sclerotium, showing the gradual development of asci and spores. Enlarged 400 diam.

even a genuine resemblance, and most certainly there is no identity of structure.

Mr. Dyer, in his essay on the "Classification and Sexual Reproduction of Thallophytes," published in the *Quarterly Journal of the Microscopical Society*, in 1875, adopted Brefeld's views, and placed *Penicillium*

FIG. 59.—*PENICILLIUM CRUSTACEUM*, FR.
Asci, containing spores and germinating ascospores, enlarged 400 and 1000 diam.

lium crustaceum, Fr., amongst the *Tuberaceæ*, or true Truffles. Mr. George Murray has also given *Penicillium* the same position in the article on fungi published in the *Encyclopedia Britannica*; and in 1878 *Penicillium* was so placed in Hentfrey's *Botanical Course of Botany*.

Other writers have said that the yeast fungus, *Torula cerevisia*, is a mere vegetative form of *Penicillium* developed under peculiar conditions. Accord-

THE PROPAGATOR.

CHINESE PRIMULAS: DOUBLE FLOWERING VARIETIES.

This is a most valuable group of plants, and with the exercise of some care and skill, they may be so kept as to produce flowers from November to the following September. The present is a very good time to put in a good batch of cuttings, and finish up the propagation of all the varieties required for next season's blooming.

The first step to take is to prepare the plants for cuttings; that is, all the yellow leaves should be cut off close to the plant, and all the old dried-up leaf-stalks should be trimmed off the main stem. Any green that may appear on the surface of the soil should be removed, and any plants which are dry should be watered. When these things have been done the plants should be placed in the warm house, where it is intended to propagate them. They should be stood on the front platform as near the glass as possible for about eight days before taking the cuttings. Here they must be watered as they become dry, and lightly syringed morning and afternoon. The house should be ventilated a little and lightly shaded from the sun. In taking the cuttings about an inch of the old stem should be left to each one.

After cutting off a few of the bottom leaves and removing any scales or dried remains of leaf-stalks, and having cut the base of the main stem level, each cutting can be potted into a long thumb-pot. Care should be taken to keep the centre of the cutting well above the surface of the soil; they should be pegged-in firmly with small deal pegs, and the soil should be firmly pressed around the cutting as well as in the pot generally. The leaves should be loosely tied up to a stick. A little sand should be sprinkled over the surface of the soil, and the cuttings should be well watered with a fine-rose pot. They must be placed in a cutting-case or frame upon a gentle bottom-heat; but before they are moved the material in which they are to be plunged should be well turned and watered, and made level again. In the case the cuttings must never be allowed to flag, and to prevent this they must be shaded from the sun, and the lights of the case must be taken off for a short time only every night and morning. At these times of the day the cuttings should be carefully examined to see whether there are any spots of decay on the foliage, and if any such spots are detected they should immediately be cut out, in order to prevent it spreading.

The cuttings should be watered with a fine spout pot as soon as they become dry, but the whole of the cuttings should be sprinkled very lightly overhead morning and evening, or at any other time when symptoms of flagging appear. When the cuttings have rooted a little air should be left on the case for a few days to prepare them for removal from the case. For a few

days they should be stood outside the cutting case and kept well sprinkled with water, and at the end of that time they should be potted into large 60-pots. After having been watered they should be placed on the front bed of the house or platform; care must be taken never to allow them to become dry. They must be sprinkled overhead three times a day (only just enough to moisten the foliage) and shaded from the sun. A little air should be given them every day—the quantity being increased as the plants gain strength. When the plants have rooted they should be removed to a cold ash bottom in the front of the house and as near the glass as possible. The instructions as to watering and shading should still be observed. The plants require a good supply of fresh air, but the house must be so ventilated as to prevent a draught playing upon them. All the flower-spikes that appear while the plants are in 60-pots should be picked off so as to form strong plants before they flower. As soon as they are strong enough they can be potted into well drained large 48-pots, and after being watered they can be replaced upon the cold ash bottom. When the plants get a little stronger it is advisable to discontinue sprinkling them overhead.

Primulas require very little heat, only just enough to keep the house in which they are wintered up to 45° to 55°, and care should be taken that this be not much exceeded, or the plants get weak. During the winter they require to be very carefully watered; it should be done in the morning, and as soon as it is finished, or while it is being done, the house should be ventilated in order to dry up any moisture that may have settled on the foliage. Primulas very readily "damp off" during the winter months if this matter is not attended to.

There is still one point to be noticed with regard to watering—the spout of the pot should be turned towards the centre of the flower-pot and not towards the centre of the plant.

The soil for the cuttings should be composed of equal quantities of good loam, peat, leaf-mould and sand, with the addition of a small quantity of finely broken potsherds. These must be well mixed together and sifted and rubbed through a fine sieve, and if it is dry it must be moistened before it is used.

When the cuttings are potted into 60-pots, and for the older plants, the following compost should be used, viz., half good turfy loam, the other half being made up with peat, leaf-mould, and river sand. Small quantities of potsherds finely broken up, charcoal in pieces of hazel-nut size, and a sprinkling of Clay's Fertiliser, should be added. T. O'E.

ERYTHRINA SUBEROSA.

In March this leguminous tree becomes covered with bloom. The disposition of the blossom is in horizontal, closely set racemes, resembling spikes, of about ninety or more flowers, all looking upwards. They begin to open from the base. They are of the pea-shape section, and owe their brilliancy to the shell-like vexillum, which is $\frac{1}{2}$ inch long, and of an intensely vivid vermilion, with transparent parallel veins. The colour approaches that of a velvety-red sealing-wax, only it is far more brilliant. The alea is abortive, and scarcely visible. The carina is small, shovel-like, and of a transparent pale green. It simply supports the nine united stamens. This bundle of stamens is very like a diminutive hand, of the colour of pale coral, with five diminutive fingers, the anthers tipping the fingers, like nails. There are four other shorter stamens in the spaces between the fingers. In the palm of this microscopic hand, which is lengthened, lies the pistil. The tenth, or vexillar stamen, is quite separate, and rests upon the pistil.

This is one of the charming flowering trees of India, which natives call "Nasoot." It has a spongy bark, covered with small and permanent stipular thorns. It drops its leaves in the winter, and as soon as it feels the returning warmth of spring it glows with its marvelous masses of vermilion flowers. The unexpanded blossoms are not unlike the tips of neatly-pointed red pencils. If I were a poet I should like to pen a description of this fine tree in verse.

To get up at sunrise towards the end of March and cast your eyes on a group of these trees, with their scarlet bouquets illuminated by the morning sun, is a great treat. This is not all. On each tree there is an assembly of elegant birds—the "Goolabi maia" or

Pastor roses, with their salmon-pink breast and jet black head, neck, and wings. They are all twittering, fussing, and merry-making, while they discuss the merits of the nectar. Often attracted, no doubt, by the fuss, comes a solitary crow on the scene, which, like a "bobby," fancies it is keeping order. These pretty Pastors are not often seen in other seasons; as soon as this Erythrina is in bloom, every morning they assemble in crowds. No other bird appears to patronise this tree while in flower.

I have seen the pods, and the seeds also, although they are sparingly produced as a rule; they are eaten while green by parrots. They are not unlike French Beans. This tree strikes readily from cuttings: I have seen large branches, taken at the proper season, root and grow, as if nothing had happened. I do not know that any economic use is made of this tree. Its wood is soft and spongy, and is only used as an inferior firewood. As an ornamental tree, however, there are few that come up to it.

The leaves are trifoliate, about 18 inches long, resembling those of French Beans. The odd leaflet is 6 inches across, and nearly four-cornered. The petioles are short, and have a pair of glands at their base. The colour of the leaves is a greyish-green, paler underneath, and rusty green and downy, when young. At the base of the leaf is a pair of sharp stipular thorns.

The *E. indica* is more spreading, flowers later, and is of a darker red. In my opinion it is not half so beautiful as the *suberosa*. The latter is a fine tree, fit for avenues, alternating with some dark-foliated tree. When the flowers cease, and the leaves come out, it is still a fine tree. One would, however, enjoy its charming flowers infinitely more if they were not the forerunners of "punkahs," flies, and mosquitos. *E. Bonavia, M.D., Etawah.*

Florists' Flowers.

THE AMARYLLIS.

THE plants have now arrived at the period when they require rest. The treatment must of course be different from what it has been since the plants were in flower. The house must be more freely ventilated, and so artificial heat will be required; neither will they have any more water at the roots. If the plants had all the roots confined in the pots where they were grown it would scarcely do to quite give up watering them; but the roots have run out freely into the tan bed, and even if no water should be applied from now until January the roots will not die—in fact, they will remain in a healthy state, and ready to start into good growth as soon as they are potted.

We have a number of plants growing under Vines which have done remarkably well. Indeed, those who have no other convenience to grow their plants may succeed well by starting them in theinery, when the house is started, about the end of January. The good old-fashioned way of making up a bed of leaves and fermenting manure in the early vineries supplied an excellent medium in which to plunge the pots of Amaryllis bulbs, and many other plants, for forcing. Keep the leaves free from red-spider and black thrips by washing with tobacco-water. When the plants are plunged in a tan bed the leaves have to be washed with a sponge, but when they are merely growing in pots it is best to dip the entire plant in a large pail of the diluted tobacco-water.

THE AZALEA.

The flower-buds are now well formed, even on the plants that have not been forced. The leaves ought to be kept quite free from insect pests; indeed, the plants are seldom attacked by anything except red-spider and black thrips, but these troublesome pests cannot do much mischief during the summer months, when the plants are being daily syringed. I like to place all the large and medium-sized specimens out-of-doors after this time; it promotes a more perfect development of the buds. This is seen in a week or two after the plants have been placed in a favourable position out-of-doors; the leaves speedily become stiffer, and their deep green colour takes a slightly reddish tinge.

There are frequently heavy dewfalls during the month of September, and the nights are chilly, so

that no insect pests will interfere with the leaves. I like to go into the garden at 6 o'clock in the morning and see the leaves saturated with dew. The flower-buds on some varieties set too thickly, and if they are not thinned out there is quite a mass of blooms crowded together so closely that they cannot open out to their full extent, and the leaves cannot be seen at all when the flowers are open. It may in some cases be necessary to thin out nearly the half of the buds. If the plants have not been repotted, a dressing of some rich compost is necessary on the surface. Clay's Fertiliser, or Standen's Manure, mixed with an equal portion of sandy peat, is as good as anything. J. Douglas.

ATHROTAXIS CUPRESSOIDES.*

SOME time since we were favoured by Mr. Noble with cones of this plant which, so far as we know, had not previously been produced in this country, and which, therefore, we are glad to have an opportunity of figuring.

Athrotaxis is a small genus of Conifers closely allied to *Sequoia*, but differing in the scales of the cone being provided with a conical point near the apex. The species are confined to the mountains of Tasmania and were first described by Don. Subsequently they have been investigated by Sir Joseph Hooker and others. The three species described are *A. cupressoides*, *A. laxifolia*, and *A. selaginoides*. The plant we now figure (fig. 60, p. 273) is in our experience named in the nurseries *A. selaginoides*, but so inspection of native specimens, or even of the illustration cited, shows that this is an error. *A. selaginoides* has looser, larger leaves, lanceolate, and much more acutely pointed. *A. laxifolia* is in some respects intermediate in regard to the shape of the leaves between *A. cupressoides* and *A. selaginoides*; so that, bearing in mind the known variability of the leaves of allied species of the order at various stages of growth, it is not improbable that there is in reality only one species of variable habit. Time and cultivation will show whether this be true or not. In the meantime we may say that *A. cupressoides* as seen in English gardens is a hardy, low-growing tree, of dark green colour and singular habit, the loosely arranged younger terete branches resembling whiff-cord, so rigid-looking are they, and so closely appressed the leaves. Sir Joseph Hooker speaks of it as a conical tree, 40–50 feet in height, with a trunk 15 feet in circumference at 3½ feet from the ground, branches ascending, with spreading distichous branchlets obscurely 4-farious. Leaves minutely ciliated, rhomboid ovate, blunt, bluntly keeled. Cone generally cernuous.

GUAN (n. 365), in the *Kew Herbarium*, has a manuscript note to the effect that "the tree is very plentiful on the margin of Lake Saint Clair, growing 23–30 feet high, and with trunks 18 inches to 2 feet in diameter. One very old and hollowed trunk measured 15 feet round at 3½ feet from the ground. The trunks taper rapidly from the root upwards, so that to cut a walking-stick you have one end unreasonably thick and the other disproportionately small." A microscopic examination of the leaf shows a single layer of hypodermis beneath the epidermis, and surrounding a loose mass of branching cells containing chlorophyll, and traversed by one central rather large resin canal, which is surrounded by a double layer of strengthening cells. Bertrand states that each leaf receives a single fibro-vascular bundle from the stem; but in the cultivated plant we examined we were unable to find any trace of vascular bundle in the leaves. The generic name, often erroneously written *Arthrotaxis*, is derived from *ἄρθρος*, crowded, in allusion to the overlapping leaves, and *τάξις*, arrangement.

PINUS EDULIS AND P. MONOPHYLLA.

PINUS MONOPHYLLA, Torr. and Frem., was described in Fremont's *Report of the Exploring Expedition to the Rocky Mountains in the Year 1842, and to Oregon and Northern California in 1843 and 1844* (Washington, 1845, House Doc. No. 166, p. 319, pl. 4). The specimens upon which the description was based were obtained from "Northern California, longitude 111° to 120°," mostly from an area now included in the State of Nevada. Among the specimens

* *A. cupressoides*, Don, in *Linn. Trans.*, xviii., t. 13, f. 2; Hook. f., in *Fl. Pl.*, t. 539, and in *Flor. Tasmaniae*, i., 354.

mens brought in by Fremont were some in which the leaves were both single and double, but the double leaves were rare exceptions to the general rule.

In the years 1857, '8, and '9, and later, I passed in many directions through most of the country occupied by *Pinus edulis* and the so-called *P. monophylla*, in the Northern States of Mexico, Arizona, New Mexico, Colorado, Utah, and Nevada, and I found the facts in regard to the relations of these two forms to be essentially these:—

The chosen habitat and home of *Pinus edulis* is the belt or area of dry country lying between the saline and treeless portion of the "Great Basin" in Nevada and Utah and the higher and better watered mountain ranges which border or divide the desert areas.

In Southern Utah, between the summits of the Wasatch and the Western Sage plains in Western New Mexico and Eastern Arizona, as well as some portions of Northern Mexico, the Nut-Pine attains the largest size, and stands thickest on the ground. Here it ranges from 20 to 50 feet in height, has a trunk sometimes 2 feet in diameter, and is universally two leaved. In Nevada and Western Utah the trees are smaller in size, more scattered, and usually have but a single cylindrical leaf. Where the areas of these two varieties meet it is very common to find trees in which the foliage is about equally divided between the single and double forms. Hence it would seem that the single-leaved variety is a somewhat dwarfed and depauperate form, the effect of aridity of climate; and the single solid leaf is apparently an exhibition of the tendency so conspicuous among desert plants to reduce the ratio of surface to mass in the leaves, or the parts of the plant which perform the functions of leaves. In *Cactus*, *Holochotha*, *Canotia*, *Ephedra*, &c., we see the extreme form of this self-protective modification,—no leaves, but an epidermis which does what little there is for leaves to do, and in *Cactus*, *Holocantha*, &c., a formidable array of spines to protect this from possible injury. Dr. Torrey, to whom more than twenty years ago I showed my specimens of *Pinus monophylla* and *P. edulis*, agreed with me in considering them only varieties of one species. Mr. Thomas Meehan, in his interesting note lately published on this subject, considers the two forms as of common origin, but as constituting distinct species. It seems to me, however, they are typical varieties of common origin and shading into each other, and of unusual interest, since their relationship can be easily traced, and, if I am right, the causes which have produced the differences are easily comprehensible. J. S. Newberry, in "Bulletin of the Torrey Botanical Club."

above freezing-point in sharp weather then choose the plants accordingly, never omitting the *Lapagerias*, giving them a cool, moist, and, if possible, a slightly shaded position. *Lonicera sempervirens* minor, *Bignonia Chere*, *Acacia Riceana*, and *Chrozema Chandlerii* or *C. Lawrenceana* would be among the best to select in such a case, and give far better satisfaction than the more tender kinds.

GREENHOUSE HARD-WOODED PLANTS.

The stock of these that have now for some time been past their best in regard to bloom should have all faded flowers removed, and young growth encouraged in every instance. In some cases this will already be considerably advanced, such plant, therefore, should be thoroughly exposed to the genial warmth of the sun, to ripen up the wood to that condition which is requisite to ensure a successful crop of flower another season. Where repotting is contemplated lose no time in getting the same completed. Avoid large shifts; an extra inch all around the old ball is enough for any plant of this class.

Keep a watch on any attack of red-spider upon the *Pimeleas* and *Chrozemas*. Mildew will also attack several of the *Ericas*; this insidious enemy will soon seriously affect the health of the plant. Preventive measures with the sulphur duster, or by means of mixture in water to the denser growing kinds, will be the safest plan to follow. *Epacris* for autumn and winter blooming must also be exposed to the full sunshine now until housing time is to hand again. If the condition of any of these at the root is not so satisfactory as one would wish, it is not too late to re-pot such: it may possibly save their lives or at the least it will start them into renewed vigour another season.

The stock of *Lachenalias* should be repotted without delay, root-attack will soon commence, and if performed then a check to the bulbs will be the result. After potting we advise them to be placed in a frame with a south aspect, but the lights entirely removed therefrom both by night and day till any danger from autumn frosts is apprehended. *L. luteola* is a most desirable addition, so also is *L. Nelsonii*, and both should be thought of when the regular bulb order is being made out for the season. *JAMES HUDSON, Gwersbury House Gardens, Acton, W., Aug. 25.*

FRUITS UNDER GLASS.

FIGS.

THE second crop of Figs on the trees which was started into growth at an early period in the current year will now be ripening, or fast approaching this condition, assuming the trees have had the treatment as advised for them after the first crop of fruit was gathered, namely, a brisk heat, with plenty of moisture combined. This condition should, as soon as signs of ripening are indicated in the fruit, be somewhat abated, and replaced by a slightly arid and more airy state; for this purpose it will at certain times be necessary to use a little fire-heat, in order to maintain constantly in the house a degree of heat of about 70° at night, and 80° in the daytime, with a little air at both the top and front of the house always on, otherwise the fruit will be insipid, and almost colourless. In the usual course of treatment it is customary, just prior to the fruit taking the second swelling, to give the trees an abundant supply of water, and, if needful, a little stimulant with it. If this matter has not been attended to, defer it no longer, but copiously water the borders in which the trees are growing, and keep the mulching material which is on the surface-roots well supplied with it too. As soon as this crop of fruit is gathered attention should be given to the maturation of the wood. Go over the trees and remove all superfluous growths, and others where they are too thickly placed, leaving only those that will be required to yield the fruit the subsequent year. The growths should be brought up near the glass, where, by the direct operation of sunshine, heat, and air they will become hardened and fruitful. Trees in pots which now are placed out-of-doors should be kept free from insects by a frequent

use of the syringe. Abundantly supply water at the roots whenever the trees need it, and as soon as they are in a dormant state the necessary preparations before starting them into growth again should be executed, which consists in examining the state of the drainage, the shifting of those trees which need it into larger pots, and in disrooting such as may need it before starting them again. *G. T. Miles, Wycombe Abbey.*

The Hardy Fruit Garden.

THE most important work here will be the gathering and storing of Apples and Pears. Apple trees of such varieties as Lord Suffield, Lane's Prince Albert, Cellini, &c., bearing heavy crops, should be gone over two or three times, gathering the largest and ripest fruits each time; by doing this the trees will be able to bring the fruit to greater perfection, and it will also considerably prolong the season of each variety. Pears should be treated in the same manner. By adopting this plan such varieties as Williams' Bon Chretien and Winter Nelis may be had in season for six weeks or even two months, and many others in the same way. It is a great mistake to leave the fruit on the trees till perfectly ripe and then gather all at one time.

Now is a good time to make a thorough examination of the orchards by making notes of the free-bearing varieties, and also marking those which should be cut-back for grafting in spring with the varieties which have proved most suitable for the district. It is waste of ground and labour to continue growing year after year varieties which seldom produce anything but wood and leaves. It is not timber that should be our object in growing orchard trees but healthy free-bearing varieties. As instance—here Waltham Abbey Seedling, although recommended as a free bearer, is almost worthless, and is now condemned, and again Cellini on the Paradise stock is a grand cropper, and as an orchard tree is a failure. The same with Plums: Orleans, Victoria, and Jefferson's, produce more fruit (taking one season with another than any other kinds grown here, although we grow a great many.

STRAWBERRIES.

A space of ground should now be prepared for making fresh plantations, the size of plantation must depend on the space available and the demand. When the ground is limited they may be planted 6 inches apart in the rows, and 18 inches from row to row, this would allow for the plants being destroyed as soon as the fruit was gathered next season. *J. Smith, Mentmore Bucks.*

The Kitchen Garden.

FRAMES.

THE late sowing of French Beans growing planted out in unheated frames for the purpose of giving a fortnight or three weeks' supply between the last outdoor gathering and the first indoor gathering from plants grown in pots in heated houses should now have the lights placed over them at night. Should the plants not yet be showing flower the lights may be placed over them for good, giving ample ventilation during favourable weather, and syringing and closing with sun-heat in the afternoon, otherwise they may be too late to do any good. At the beginning of September a batch should be planted in pots; the Beans will come up well if the pots are placed in an unheated frame, and closed with sun-heat, from whence they can be top-dressed and placed in a warmer position.

CUCUMBER-HOUSE.

As the nights are now getting chilly care should be taken that the night temperature and bottom-heat do not fall too low. The plants should now be making good progress, and as the sun wanes in power earlier syringing and closing should be practised, in order that the afternoon temperature may run up to 85° or 90°. *G. H. Richards, Sumerley Gardens, Ringwood, Hants.*

Plants and their Culture.

CLIMBING PLANTS FOR THE CONSERVATORY.

SHOULD the Camellias in the open border, and to which we alluded in our last Calendar, be situate in the conservatory the present will be a capital time either to renew the soil around their roots, or to plant fresh stock where any are giving indications of vital exhaustion. It will be advisable also to take into consideration the extirpation of insect pests that may be giving any serious trouble; when such an excellent opportunity presents itself by all means make the best of it, and if necessary summon up courage and destroy the climbers rather than be troubled with either mealy-bug or white-scale another season. Young plants of healthy growth will soon make rapid progress, and by the end of another year no regret will be evinced that the old ones were destroyed and advantage taken of the new soil wherein to start a fresh lot.

When this is decided upon, and prior to replanting, some two or more coats of paint may be necessary both to add to the appearance and to more effectually exterminate the insects we have named. Consider well the temperature at which the conservatory is maintained during the winter months; if kept slightly warm beyond ordinary greenhouse culture some few climbers may be introduced that would not otherwise succeed. *Bignonia venusta* is an instance of this. *Hexacentris lutea*, *Douglasvillea speciosa*, and the *Tacsonias* will all thrive well in such a case. If the temperature is only maintained at a few degrees

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Aug. 31	Sale of Bulbs from Holland, at Stevens' Rooms.
		Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	Sept. 1	Sale of Plants at Horn Lane, Acton, by Protheroe & Morris.
		Glasgow and West of Scotland Horticultural Society's show at St. Andrew's Hall, Glasgow.
		Bath Autumn show (two days).
WEDNESDAY,	Sept. 2	Sale of Bulbs from Holland, at Stevens' Rooms.
		Sale of rose and Greenhouse Plants at the Ceylon Nursery, Eastbourne, by Protheroe & Morris.
		Albion Horticultural and Botanical Societies' Annual Show.
		Sale of Established Orchids, at Stevens' Rooms.
THURSDAY,	Sept. 3	Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
		Sale of the Freehold of the Weststone Nurseries, at The Mart, by Protheroe & Morris.
FRIDAY,	Sept. 4	Sale of Imported Orchids, at Protheroe & Morris' Rooms.
		Sale of Bulbs from Holland, at Stevens' Rooms.
SATURDAY,	Sept. 5	Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.

THE notes on the approaching PEAR CONFERENCE by our correspondent "X" at p. 202, are timely, and suggestive as to what a really representative Conference on Pears might accomplish. Perhaps the article savoured a little too strongly of the market element, and did not lay sufficient stress on the fact that Pears, however cheapened, can never take an equal position with Apples or Plums as culinary fruits for the million, and therefore it is hardly worth while to bestow much attention on this phase of the question. It might be well if the Conference confined its deliberations, firstly, to deciding on the best kinds of Pears for certain districts and soils, naming the kinds that should be grown in those districts on walls, and those that do well as standards, bushes, cordons, &c., and those that are best on Quince or Pear stocks. Secondly, the best modes of training and pruning—root and branch—in summer and winter; and, thirdly, the correction of nomenclature and the reduction of the long list of varieties to, say, thirty for each district from which we may rely on a supply of dessert fruit from the beginning of August to the end of February.

Supposing that the Conference decides on taking all or but one of these phases into consideration it is obvious that the decision must be based on observations made by persons in different districts, and, therefore, every gardener interested in Pears ought to make it a point of conscience to render what assistance he can by notes to the gardening papers before the Conference takes place, and at the time of it, by sending specimens of fruit with notes as to soil, site, &c, in which the fruit has been grown. Mr. WILDSMITH, writing to us on the subject from Hampshire, says:—

"I have under my charge, perhaps, as good and large (too large) a collection of varieties of Pears as there are in the majority of private gardens, and from notes made of most of them under varying conditions of weather, stocks, pruning, training, soils, and manures, I may be able to aid in some degree the determination of varieties, &c, best suited for growing in the southern or eastern group of counties that your correspondent 'X' suggests—a suggestion that, with certain modifications as to soil, is the best that can possibly be made. I divide my notes as follows:—First, stocks, soils, manures, and when and how to apply the same. Secondly, pruning, training, aspects and forms that are best suited to certain varieties; and thirdly, a general list of varieties, their season of ripening, &c., with allusion to the merits and peculiarities of each.

"First: Stocks and soils.—Well, in some measure the one must determine the other. For the light sandy soil of this district the Quince—speaking generally—may be said to be unsuited and short-lived—fruits to death in fact: and yet some varieties on this stock in this soil grow much larger, ripen better, and colour more perfectly, than they do even when double grafted on the Pear stock; and that they are more productive, or rather, I should say, bear full crops at earlier stages of growth, goes without saying. To such varieties allusion will be made at another time, for the present it must suffice to say, that for light soils generally the Pear stock is by far the best, but it requires more skilful treatment in regard to pruning and

general management, to induce young trees to bear full crops at a very early period after first being planted, but it can be accomplished, as it is solely a question of labour.

"Any one accustomed to observe the differing forms of root formation made by trees of all descriptions, will at once understand why Pears on the natural stock should be longer in attaining fruitfulness than they are when grafted on the Quince. The roots of the latter are invariably to be found on, or perhaps I should say, immediately under the surface of the soil; but Pear roots will go down, and unless we go after them—that is, root-prune—a full fruiting state is an impossibility. The natural deep rooting of the Pear furnishes the reason why, in a general way, it is the best stock for light soils, simply because the roots in dry, hot weather are out of harm's way; but unfortunately also their depth excludes them from the benefit they would derive at certain seasons were they within reach of sun and air, and this fact gives the clue as to the lack of colour and size that is sometimes so marked, between the fruit grown on the Pear and of the same variety grown on the Quince.

"In a season like the present the differing conditions may be less marked, for the Pear stock will, this droughty season, have the advantage, though in cases where abundant surface mulchings and waterings have been given, the fruit from the Quince stock may be expected to be finer than ever; and here I may as well confess that my leanings are all in favour of the Quince stock; indeed, given certain conditions as to labour, manure, and renewal of exhausted plantations, and the Pear stock would be nowhere; but [we gardeners are terribly handicapped with] 'but' the attaining of fresh sets of trees, at intervals of from four to six years, is probably not so much an easy matter, or if it is, sufficient ground is probably not at command for growing two sets, not to mention the additional labour involved, besides the extra manure, particularly as surface mulchings, that trees on the Quince require, if the fruit is to be of the first order. Of course, it is possible so to manipulate natural soils as to make them suitable for either stock, but for the most part it is so expensive a procedure that it is better to keep to the general lines of growing Pears in very light soils on their natural stocks, and in heavy (not undrained clay soils though) on the Quince.

"We have a quantity on this last stock, and when preparing the soil for them, all the heavy soil we could get—which was not much—we mixed with the light, and added as manure a small percentage of 1-inch bones, and wood ashes. Potash, which, for light soils, is an invaluable ingredient for the retention of moisture (for which purpose we use it, rather than as manure), and, by way of substitution for lack of tenacious soil the whole was well pounded, both before and after the trees were planted. Though I have had but slight experience of heavy soils it has been ample enough to enable me to say that by the addition of abundance of opening material, such as mortar rubble, oyster shells, small pieces of brick, burnt earth, and charcoal, a soil in every way suitable for Pears on the Quince may be made by any that are desirous of thus growing them.

"Now, as to manures and time of applying the same; none whatever other than that in the ingredients just mentioned—if any but the bones can be so designated—should ever be used directly with the soil, but always as top-dressings, or what, in gardening parlance, are styled mulchings. The best time to apply them is always—i.e., full-bearing trees should never be without them, but renewal of them is another matter. There are certain stages of growth where additional help is doubly valuable, and the most important of all is immediately after the fruit has set and begun to swell: then it is that fresh mulchings should be applied, and be again renewed early in July, and supplemented by three or four waterings with liquid manure, or, in lieu thereof, over the mulchings may be sprinkled soot, guano, Besson's manure, Clay's manure, or some other good fertiliser; and in the absence of rain they should at once be washed in by watering over them. Too much stress can scarcely be laid on the importance of giving some or other kind of manurial dressing during the early stages of the swelling of the fruit—their effect is then most marked; whereas, if delayed till the fruit is nearly full grown, such dressings are all but useless. The veriest novice will understand the necessity of discernment in respect of certain trees between proper feeding and excess. The other part of my subject must be deferred to a future issue."

— THE ROYAL HORTICULTURAL SOCIETY.—If the show in the conservatory on Tuesday last was not so attractive as some that have preceded it, it had at least the beauty attaching to appropriateness and utility. The main feature of the display consisted in the competitions for the cottagers' and artisans' show of fruit and vegetables. We have heard the Society blamed for catering for the luxuries of the rich and ignoring the necessities of the poor. This is not fair.

The Society has its own coiffers to look to, and must be justly before it is generous, but Tuesday's show is a proof that the interests of the poorer classes are studied as well as of those blessed with a larger share of goods. The collections of vegetables reported on in another column were generally excellent. We might suggest to the Council the desirability of supplementing the money prizes by seeds, plants, and grafts in due season, of the sorts known to be best adapted to particular localities. The diffusion of good sorts, with instructions for cultivation, would be more useful than prizes of 10s. downwards to 2s. 6d. In addition there were interesting collections of fruit, and a miscellaneous lot of things were brought before the Floral Committee, including the singular *Ærathus Leonis*, two beautiful *Lelias*, one a hybrid—*L. Sedeni* x, with rosy-lilac segments, and a very deep magenta lip, white on the under-surface; the other an imported plant—*Lelia elegans* Littleana, a fine variety, in which the segments were of a dull pink or puce colour, the lip rich magenta, with the under-side clear white. Four flowers were open for the first time on August 24. The curious *Aganisia cœrulea*, with pale blue hooded flowers, and a reddish lip, was also shown, and secured the appropriate award of a Botanical Certificate. A hybrid *Gastroena*, raised between *Valloia purpurea* and *Gastroena lanuginosa*, was interesting; but, apart from its interest, scarcely so noteworthy as its parent. The flowers are broadly trumpet-shaped, pale orange-pink in colour.

—The following has been forwarded to us for publication within the last few days:—At the general meeting of the Society on July 23, the following persons were, on the nomination of the Council, elected:—

Honorary Members.

Edmond Boissier, Geneva.
Licutenant-General Gray, Cambridge, Mass., U.S.A.
Licutenant-Alfred H. E. de Greig, President of the Imperial Society of Horticulture, St. Petersburg.
George King, M.B., F.L.S., Superintendent, Royal Botanic Gardens, Calcutta.
Sir Ferdinand von Mueller, K.C.M.G., F.R.S., Government Botanist, Melbourne.
Dr. Richard Schomburgk, Director of the Botanic Gardens, Adelaide.

Foreign Members.

Lewis A. Bernays, F.L.S., Clerk to the Legislative Assembly, Queensland.
Professor Maxime Corau, Director, Jardin des Plantes, Paris.
Count Oswald de Kerchove de Denterghem, Governor of the Province of Hainaut, Mons.
A. De la Devansaye, President of the Horticultural Society of Angers and Maine et Loire.
Professor Du Breuil, Institute Nationale Agronomique, Paris.
Dr. A. W. Eichler, Director of the Royal Botanic Gardens, Berlin.
O. Fenzl, President of the Royal Tuscan Society of Horticulture.
F. de Cannart d'Hamale, Malines.
Dr. A. J. Kerner, Director of the Imperial Botanic Garden, Vienna.
Professor Peter Macowan, B.A., F.L.S., Director, Botanic Garden, Cape Town, South Africa.
Max Lechtzin, Baden-Baden.
Charles Moore, F.L.S., Director, Botanic Garden, Sydney.
Dr. Edouard Morren, Professor of Botany in the University of Liège.
Professor C. S. Sargent, Director of the Arnold Arboretum, Brookline, Mass., U.S.A.
Henri L. de Vilmorin, Paris.
Serenio Watson, Keeper of the Herbarium, Harvard University, Cambridge, Mass., U.S.A.
H. Wendland, Director of the Botanic Garden, Herrenhausen, Hanover.

— THE SUPPLY OF THE PAPER.—The Publisher asks us to request that those subscribers to the *Gardeners' Chronicle* who experience any difficulty in obtaining their copies regularly, should communicate at once with him at the Office, 41, Wellington Street, Strand, W.C.

— THE "FLORA OF BRITISH INDIA."—The twelfth part of the *Flora of British India*, completing the fourth volume, has just been issued. This important instalment contains the remainder of the Anacanthaceae, and the Verbenaceae, monographed by Mr. C. B. CLARKE, while Sir JOSEPH HOOKER, the editor, himself contributes the description of the Selaginaceae, Labiateae, Plantaginaceae, Nyctaginaceae, Illecebraceae, and Amarantaceae. It will thus be

BRIDGE, OSTERLEY PARK, MIDDLESEX.

seen that this represents an important addition to this standard account of the plants of British India.

— POTATOS.—A cultivator of Bruges, ANTOINE VERHULST, was, if not the first to grow the Potato in Belgium, the one, according to the *Revue de l'Horticulture Belge*, who first undertook its culture on an extended scale. He distributed tubers to the members of the Brotherhood of Gardeners of Bruges, otherwise called the Confraternity of St. Dorothy. This was in 1702, and in 1740 the Potato was sold in abundance in the Bruges markets. In France the introduction of the Potato into general use as an article of diet dates from 1785, when PARMENTIER, who had been encouraged by the King, LOUIS XVI., offered his Majesty at the Tuilleries a bouquet of Potato flowers on August 25, 1785. The King placed one of the flowers in his button-hole, caused the Potatoes to be served at his table, and warmly congratulated PARMENTIER. In this way the prejudice against the tuber was ultimately dispelled, and now PARMENTIER is to have a statue.

— THE PYRACANTHA AS A HEDGE PLANT.—This plant may be recommended as forming an impenetrable hedge. It grows rapidly, is indifferent to soil, and in most seasons bears a profusion of berries, which give it a handsome appearance, and by means of which it can be reproduced.

— TIGRIDIA GRANDIFLORA ALBA.—The species of this American genus are few, but popular favour is almost or quite confined to *T. grandiflora* and its varieties. This is easily accounted for by its being by far the largest flowered member of the group. The so-called white variety is peculiarly handsome, and, forms a striking contrast to the type. The ground colour is indeed pure white, but the interior of the broad saucer-shaped base is heavily maculated by large crimson spots. The effect of this, combined with the huge dimensions of the flower, may be more easily imagined than described. It is rather disappointing that the duration of the flowers is so ephemeral; this, however, is partly compensated by several flowers being produced in succession

not being subjected for ages to the selective agency of man. Hence we might expect to find considerable variation in the fruit, as in truth we do, but fewer variations in the other parts of the plant. Thus in the series of varieties grown at Chiswick the calyx is alike in all cases, though the foliage is different—the leaflets in "Chiswick Red," for instance, being distinctly stalked—and the inflorescence, cymose in all cases, forms two distinct types, one in which it is spreading, the other in which the flowers are arranged in long zig-zag racemes. The latter type would seem to be preferable for cultural purposes. The principal differences, omitting those of purely botanical interest, may be thus marked:—

	<i>Fruits Red.</i>		
	{ smooth .. eg,	Trophy ..	
Globose ..	{ ribbed .. "	Large Red ..	
	{ prolificous .. "	Turk's Cap ..	
Pear-shaped ..		Fig Tomato ..	
	<i>Fruits Yellow.</i>		
Globose ..		Green Gage ..	

In addition, account must be taken of the early or late ripening, the abundance or paucity of fruit, the size of the berries, which varies from the size of a Currant, as in the Red Currant Tomato, to that of a medium-sized Apple. In the prolificous forms a second row of carpels is formed within and above the first, so that the ripe fruit is in two storeys, upper and lower.

— CATALOGUE OF ROSE SPECIES.—MR. BAKER asks us to insert the following, which was accidentally overlooked in the catalogue at p. 199:—
R. R. setigera, Michaux, = *R. rubifolia*, R. Brown.—North America.

— PRESERVING VEGETABLES IN FRANCE.—The old saying that "It is an ill wind that blows nobody good" is being verified in France in the Department of Morbihan, where the principal industry is that of preserving sardines and tunny fish in oil, there being no less than seventy establishments on the coast, employing 20,000 fishermen, and over 10,000 workmen, consisting of the plate-workers, labourers, and women who preserve the fish. As is well known, the production of the sardine and tunny fisheries has been decreasing for the last five years, and it is estimated that during the present year not more than twenty-five out of the seventy workshops will be in operation owing to the want of funds. The catch of sardines on the coast of Morbihan, which formerly sufficed to provide on an average of about 400,000 cases of preserved fish, representing a value of about 14,000,000 francs annually, has decreased of late years to about 70,000 cases of the value of about 3,000,000 francs. The consequence of this depression has been the cause of stimulating the cultivation of various kinds of vegetables, and several manufacturers have erected large works for the preserving of vegetables, such as green Peas, French Beans, &c. This increased consumption of vegetables has greatly benefited the farmers and cultivators, and gives employment to a large number of women who earn on an average 1 fr. 60 c. per day.

— PICEA ENGELMANNI AND P. PUNGENS.—These two species are very much alike, at any rate in the young state, as seen in gardens. Of each there is a green form, and of each a glaucous form with intermediate variations. The very glaucous form of *P. pungens* is that known in gardens as *Parryana glauca*, and it is the handsomest of all. The young shoots of *P. Engelmanni* have greyish bark, the bud-scales form a tube round the base of the young shoot and are flattish, not recurved at the tips; the leaves are slender and straight. *P. pungens* has reddish-brown bark (on the young shoots), bud-scales falling off in a little cup, each markedly reflexed at the tips; leaves shorter than in *P. Engelmanni*, stouter, curved like little scimitars, and with a longer stiffer point. *P. Engelmanni* is sometimes called *P. commutata*.

— BIGNONIA PURPUREA.—It is a little puzzling to account for the paucity of representatives of this large genus in gardens, seeing that their cultural requirements are by no means beyond the skill of horticulturists at large. Considerably over 200 species are known to science, although probably not a third of them are in cultivation at the present time in the gardens of this country. Possibly one of the chief objections to the various members of this genus is the amount of space required in order to get them into

FIG. 60.—CONES AND MALE SPIKES OF ATHROTAXIS CUPRESSOIDES. (SEE P. 270.)

— CONES.—We have lately received from Mr. A. D. WEBSTER cones of *Abies (Picea) grandis*, of a dull olive-green colour. We do not remember to have heard of this tree coning in the country before. In the grounds of the Cranston Company at Hereford we hear that *A. magnifica* is producing cones, while Mr. GEORGE PAUL tells us that *A. concolor* is to be seen in cone at High Beach. *Pinus macrocarpa* is in cone at Bayfordbury, as mentioned some time since. These are fortunate occurrences, not only that they add to the beauty and interest of our plantations, and furnish means of increasing our supply by seed, but also because they enable us in some cases to throttle the confusion that was inevitable in olden time, and in some measure to do away with, or bring into order, the complicated synonymy that has arisen.

— ARAUCARIA IMBRICATA.—The *Times* ought to have a horticultural editor, and a geographical "sub." In mid-silly season it has been entertaining its readers by recording a Chilean tree as tropical, and publishing the production of cones on *Araucaria imbricata* almost as if it were an unheard of phenomenon.

from the same spathe. A fine clump of alike has been flowering freely in a border at Kew along with a large collection of Cape bulbs, with which it associates very well, although a native of Mexico. *T. grandiflora* is synonymous with *T. Pavonia*, and figured in the *Botanical Magazine*, t. 532.

— FLORICULTURE IN THE CITY.—DOG BERRY, in the *City Press*, describes a visit to the roof of the hall of the Armourers and Braziers' Company, in Coleman Street, where the unexpected sight of a well-kept miniature garden of no mean order repaid his curiosity. Here in the open air were cultivated the sweet-scented *Hellebore*, *Lobelia*, *Calceolaria*, *Nasturtium*, boxes of *Mignonette* in full bloom, *Pelargoniums* of varied hues, with *Tobacco* plants in bloom. In a small conservatory were Cucumbers ready for the knife, and many specimens of choice Ferns. Such a garden shows what can be done with energy in this direction even in the City.

— THE TOMATO.—Tomatos are grown exclusively for their fruits, and compared with some other plants they are young in cultivation, that is, they have

flowering condition, but this inconvenience is more than counterbalanced by the gorgeous display of flowers when produced. The particular species under notice is seldom seen in cultivation, although introduced as early as 1822, probably by LODDIGES, of Hackney, by whom it is named. A splendid specimen trained up close underneath the curvilinear roof of the Palm-house at Kew, shows off its long, pendent, floriferous branches in the best possible manner to visitors passing underneath. The great secret to be kept in view is to allow these slender laterals to hang down, while at the same time due attention to regulating the leading shoots is made. The leaves are medium-sized and evergreen, while the clear, uniformly purple flowers are borne in two to five-flowered axillary cymes, producing a pleasing and attractive effect.

— **VEGETABLE PRODUCTS OF NICE.**—In a report from the British Consul on the trade and commerce of Nice for the past year, it is stated that the Olive crop suffered considerably from the long droughts. As the harvest commences in October, and lasts till March, when the drought is very prolonged, the Olives shrivel up and drop off before coming to maturity, while when suffering from drought they seem to be more easily affected by the ravages of the "keiron" insect. The damage done to agriculture in this department by the wholesale destruction of birds is said to be incalculable. The subject is attracting the serious attention of the local agricultural society, and is also being ventilated from other motives by the Societies for the Prevention of Cruelty to Animals of Nice, Cannes, and Mentone, and it is hoped that their united efforts may lead to a beneficial change in this respect. Another instance of short-sighted policy referred to is the wholesale destruction of the forests. The wise *reboisement* commenced during the Empire has been discontinued, probably from motives of economy, until the last three years, and the ignorant mountain communes have been growing rich on the profits of the destruction of their remaining timber. The matter has, however, been taken up once more by the Government, and the *reboisement* of some districts is now being energetically carried on. The cultivation of flowers for perfumery purposes and the manufacture of perfumery for exportation have been carried on for years on this coast, but the cultivation of flowers for direct exportation is an industry of quite recent birth, and is due to the additional railway facilities, the accelerated service, and to the establishment of the Parcel Post. They have led to the establishment of the Societè Florale Company, who grow their own flowers, and export them to all parts of Europe. The British Consul expresses himself as being satisfied that this is an industry which is capable of great development, and which will well repay the producer. What is wanted for the local grower is to be put into direct communication with the flower shops of London and Paris.

— **SHREWSBURY HORTICULTURAL EXHIBITION.**—The attendance at the recent Shrewsbury Show, we understand, exceeded any which this flourishing Society has ever previously had. On the first day a larger number were present than on any previous opening day; on the succeeding day some 22,000 people entered by payment at the gates, the sum taken in shillings and sixpences being over £1074. To this number must be added 10,000, who held tickets purchased before the show, making altogether 32,000, which, we suppose, is a larger attendance than has ever before been known at a provincial horticultural show on one day.

— **PUBLIC IMPROVEMENTS AT CHEPSTOW.**—Every person who has visited Chepstow this summer must have been pleased with the beautiful garden which Messrs. PILLINGER & CO., the local horticulturists and seedsmen, have laid out immediately adjoining the railway station. The triangular patch of ground, opposite to the nurseries, was until recently filled with rank grass and rubbish, and occasionally "enlivened" by the presence of a "Gospel tent," or a "three-penny theatre;" and most people were glad to get past it as soon as possible. Mr. HAY, the managing partner in the firm of PILLINGER & CO., has taken the unpromising "patch" in hand, and converted it in a short space into a delight for the eye, and a continuous spring of delicious perfume. The show of Roses a month or two ago was glorious; and now that the golden harvest time has come there is a

display of other flowers, so nicely arranged that quite a jewel-like effect is produced. In the avenues some pleasing contrasts are caused by introducing the silvery foliage of the variegated Maple amid the darker shades of Irish Yews and deciduous trees, while the ground glows with the bright colours of the borders and beds of Gladioli, Verbenas, Pelargoniums, Petunias, Calceolarias, Lobelias, Nasturtiums, and other favourites. Every one who has seen the place will endorse this tribute to Mr. HAY.

— **"BULLETIN OF THE ROYAL BOTANICAL SOCIETY OF BELGIUM."**—The fascicle for 1885 contains a list of the Cryptogamic plants of Belgium, by M. E. PAQUES; a further instalment of M. MARCHAL's description of the Coprophile fungi, with illustrations; and an elaborate monograph of the species of the genus *Thalictrum*, by M. J. C. LECOYER.

— **ABIRES MORINDA AS A HEDGE PLANT.**—This plant, though somewhat "spring-tender," grows rapidly and in some seasons produces a succession of new growths. Its thick-set, sharply pointed leaves make good shelter.

— **SEEDLING DAHLIA PRIZES.**—In addition to the Turner Memorial Prize for Dahlias, which is represented by a handsome Silver Cup value ten guineas, the overflowings of the subscription, which was necessarily limited to Dahlia fanciers, have been devoted to three prizes (£1, 12s. 6d., and 7s. 6d.) for the best seedlings exhibited at the Crystal Palace Show on September 4 next. The prizes are to be additional to the Certificates offered in the schedule. The growers of Dahlias should note that this Grand National Show will soon be upon us.

— **PRESENTATION TO MR. JAMES MACLEAN.**—The name of MACLEAN is so well known in Leicestershire to the lovers of horticulture, that it is almost superfluous to state that he has for a great number of years occupied the onerous position of head gardener at Beaumanor Hall, near Loughborough, which post, in consequence of his declining years, he is compelled to vacate. On Thursday evening last occasion was taken of his retirement from active service to pay him a well earned compliment, and at a supper at the "Cherry Tree" Inn the veteran was presented by Mr. D. ROBERTS, gardener, Prestwold Hall, on behalf of Mr. MACLEAN's numerous friends who had contributed towards it, with a gold watch and chain and a framed illuminated address as a small token of their respect for him. The address bore the names of upwards of forty subscribers, and was the work of Mr. JAMES WALKUP, Secretary of the Loughborough Horticultural Society, in which Society, as well as in the Quorndon Society, Mr. MACLEAN ever took a deep and active interest both as a member of the committee and a judge.

— **VEGETABLE CULTURE AT MOBILE.**—Under the above head Mr. Consul CRIDLAND reports that this industry has not yet received the attention or assumed the proportions which its value and importance should command. The excellent water and mild climate of the district for eight months of the year, the average healthy condition of the farm lands, and other advantages, clearly demonstrate what profits can be derived from the industry. The present small area under cultivation is in the immediate vicinity of the city, and there are 600,000 to 700,000 acres of just such lands in the country of Mobile awaiting cultivation. An increased acreage was planted in vegetables during the past year, and good crops were realised, except in Cabbages, which were most seriously damaged by most unusual and severe weather in January, and a general replanting was necessary, resulting in a very short yield as compared with former seasons. The large production of Peas, Beans, and Tomatoes, in a measure counterbalanced the partial loss of the Cabbage crop. The vegetables cultivated consist besides, those mentioned, of Potatoes, Turnips, Tomatoes, Cucumbers, Water Melons, &c., the total value of which amounted in 1884 to over 178,532 dols.

— **GARDENING APPOINTMENTS.**—Mr. A. STEVENS, of Moor Park Gardens, Farnham, Surrey, has been appointed Gardener to G. TOLBURST, Esq., Northfleet House, Northfleet, Gravesend, Kent.—Mr. A. GREAVES, late Foreman at Braintingham Thorpe, as Gardener to A. K. ROLLITT, Esq., Thwaite House, Cottingham, Hull.

HOME CORRESPONDENCE.

Tribulus platypterus as a Poison.—As it seems not to be known that any species of *Tribulus* have poisonous effects, it may be worthy of notice that Mr. Henry Cooke informs me of poison cases on his sheep-run at the Ashburton River, ascribed to this plant. This gentleman writes as follows:—"I have sheep constantly dying in the neighbourhood where it is growing. It will kill pigeons, as the natives in their wild state steep the bark in water and lay it close to springs; the birds then come and drink out of the yandus that hold the water, and die. It also stupefies or kills fish, so that the natives can get them." As other *Zygophyllum*, at least some *Zygophyllum*, have proved poisonous to pastoral animals both in South Africa and various places in Australia, we can hardly doubt that species of *Tribulus* are deleterious also. To overcome this difficulty in North-Western Australia, I have sent seeds of the *Teosinte*, which giant grass I first introduced into the Australian colonies and Polynesia, and which on the Ashburton River would thrive to perfection, so as to soon overpower the *Tribulus*. *Ferd. von Mueller*.

Pear Congress.—I hope something will at last be attempted at the forthcoming Pear Congress to classify the good varieties by their flavour. It is a point which I have again and again urged on the attention of pomological authorities, but hitherto they have not responded to any useful extent. Every one who eats Pears knows that as regards flavour they include several very distinct types—not the variations arising from good or bad soil, good or bad seasons, or good or bad situations, but intrinsic differences of a most marked character, of which the musky lusciousness of Williams' Bon Chrétien and the honied sweetness of Seckel are familiar instances, and others with the Almond, the Pear, and the Noyeau flavour are not far to seek. Those who are about to plant or to re-graft their trees would find such a classification extremely useful, and I cannot understand—obtusely though I may be—that there is any great difficulty in making it. *T. Moore*.

Gloxinias at Rangemore.—Ooe of the most pleasing sights may be seen at the present time at Rangemore, Burton-on-Trent, the seat of Sir Arthur Bass. Mr. Bennett, the energetic head gardener, has a splendid collection of well grown Gloxinias. Instead of, as is usually the case, cramming together these useful and showy plants, he has arranged in a span-roofed house a quantity of *Adiantum cuneatum*, and dotted here and there Gloxinias in bloom amongst them. On the roof the house is a white *Lapageria* in full bloom, covering one half, and a red *Lapageria* covering the other half; the effect produced is most chaste and novel. The Grapes this season at Rangemore are a sight: Mr. Bennett has especially in a house 60 feet long and 15 feet wide, a splendid lot of Muscat of Alexandria, the bunches and berries unusually large and good. It is not often, if ever, that such a house of Muscat has been seen in any part of the country. *H. E. C. Highgate*.

Dahlias.—Dahlia shows are now taking place in many parts of the country: that is to say, flower classes are taking place in which are to be found shows for Dahlias. The annual exhibition of this fine flower takes place on September 4 and 5; but having regard to the character of the season, it can scarcely be expected that so fine a display as that which was seen last year will be forthcoming at the Crystal Palace on the above date. The season has sorely tried the plants owing to the prolonged drought; but little rain comparatively has fallen during the past six or seven weeks, while the Dahlia being a vigorous growing succulent plant, requires plenty of moisture at the roots, as well as overhead. When looking through Messrs. Keynes, Williams & Co.'s at Salisbury, I noticed that, for want of rain, the Dahlia ground had not been mulched as usual; heaps of manure were lying by the side of the quarters, but the rain which was needed to thoroughly saturate the soil had not fallen, and the plants were kept growing only by means of copious waterings overhead and at the roots daily. Other growers are in a like predicament, and the earwig, and especially the black-fly have infested and disfigured the blooms. On the whole, the flowers in not a few instances, and especially

in the case of those amateurs who cannot give much close attention to their plants, must be small. Those who grow Dahlia blooms for exhibition need to watch closely the opening buds, and the instant they detect any defect in the opening flowers, they should be removed. Every flower that opens weakens the plants, except in the case of some few varieties that may be allowed to carry a good quantity of blooms to ensure some free from coarseness. But the grower for exhibition will not allow a single flower to remain on the plants if they are not likely to be of service to him. There is urgent necessity for as constantly hunting after vermin. I have already stated they are unusually plentiful this season. A single earwig can soon destroy a promising bloom by nibbling some of the petals. The black-fly is infesting the flowers to a remarkable degree; it is an unwelcome visitor, difficult to get rid of. In the case of all delicately tipped flowers, close shading is necessary. A few days since I saw a bloom of Lady Golightly that was exquisitely pure and delicately tipped, but it must have been closely shaded. Lastly, copious supplies of water are necessary, so long as the weather keeps dry. X.

Tomato Culture.—Tomatoes are cultivated by Mr. Vallance in the Tresco Abbey Gardens in a manner which will be new to a number of your readers. The first consignments of new Potatoes to English markets are grown in frames. By the middle of April the long lines of frames stand empty. The same soil used for the Potatoes is levelled and planted with Tomatoes, the plants having been reared from seed sown in pans in the preceding January and potted off singly when old enough. No fresh manure is added, the intermixture previous to the planting of the Potatoes being deemed sufficient. The fertilising matter then introduced into the soil is taken from a pile composed of seaweed and farmyard manure. To this is added a quantity of artificial manure in the proportion of 14 cwt. to the acre. This latter admixture consists of 8 cwt. of guano, 4 of bonedust, and 2 of superphosphate of lime. Two plants are allowed to each light. After planting, the treatment, excepting bottom-heat, almost identically corresponds to that of Cucumbers. To keep the fruit clean a matting of reeds is spread on the surface of the ground. The all-important items of ventilation and watering are strictly attended to. Air is given directly the men come to work, *i. e.*, between six and half-past; and if the day turns out hot, the lights are lifted off. At four a copious watering is given, and the lights replaced, so as to shut in the sun-heat. By this method of treatment ripe fruit was cut before the end of June. At the present moment the plants are as healthy as could be wished, and the show of fruit enormous. It is needless to say what a good and economical plan this is. Frames that have been used for forcing Asparagus and Seakale can be turned with little extra work to the same use. For small villa gardens what could be better? If carefully managed, a three-light frame would supply quite a sufficient quantity. Growing Tomatoes in frames is doubtless often adopted, but nevertheless is not so frequent as the unvarying success under proper treatment demands. In the matter of manuring caution is necessary: a superfluity only induces foliage, not fruit. C. A. M. C.

The German Grass Crops.—Information received from the grass-growing districts of Darmstadt show that in the early part of the season there was a time of unfavourable weather, which created fears that the crops would be unsatisfactory, but a change for the better worked a corresponding improvement in the outlook, and at present prices rule lower than at this period last season. But a recent personal inspection leads to the opinion that the expected crop will be smaller than was at first supposed. The crops of Cocksfoot in the United States of America, as well as in Germany, have turned out to be very small, and as the consumption of this leading sort is now very great on account of the Ray-grass (*Lolium perenne*) not being so much used in grass mixture as formerly, for the past few seasons large supplies of Cocksfoot came into Germany from New Zealand; but recent crops having been light and of poor quality, the importations now made are scarcely worth consideration. Next to Cocksfoot, the grass most extensively used is Meadow Fescue, of which very heavy quantities are now consumed. Reports from the United States make mention of very heavy crops, but when threshed the yield

was much less seed than that expected. The crops in Germany are large, but scarcely large enough to supply all demands should America fail to export larger quantities than last season. Hard and Sheep's Fescues, Meadow Foxtail and Poas have been harvested in good condition. The smallest crop is *Poa nemoralis*, *Poa trivialis* is rather more plentiful. It is reported that large quantities of these are forthcoming from the United States, but they are not true, only *Poa pratensis* being grown there. Small-leaved Sheep's Fescue is forthcoming only in very small quantities, and high prices are demanded for true seed. The crops of Alsike are smaller than last season, but quality is decidedly satisfactory. The same is reported of white Clover; on the other hand red Clover is a fair crop, but the samples are poor in colour. Sainfoin has been harvested in such quantities and such good quality that a good deal will this season be available for exportation. D.

Erucastrum inodorum.—This new British plant has been found at Saffron Walden, Essex, in abundance this season. *J. Clarke, F.L.S.* [Can our correspondent oblige us with a specimen? Ed.]

Narcissus poeticus var. stellaris.—Some time since we were favoured by Mr. Morse, of Epsum, with a bloom of this variety, originally figured in *Sweet's British Flower Garden*, ser. ii., t. 132, but nearly, if not quite lost sight of since that time. The

FIG. 61.—NARCISSUS STELLARIS.

illustration (fig. 61) gives a good idea of the flower, which has narrow segments, a pale cup, and is further remarkable for the late period at which it blooms. M.

Rhus Cotinus.—A large clump of this beautiful shrub is just now an object of great beauty in the pleasure grounds of the Bishop's Palace, the Close, Salisbury. Planted some years ago, it has grown into large dimensions, and at the present time it is a huge mass of large panicles of a feathery inflorescence of a peculiar reddish tint and very striking in appearance. R.

Extraordinary Crop of Filberts.—I send you a bunch of Nuts taken from one of the trees in the grounds of the Rev. Mr. Fletcher, of Bicker, Lincolnshire. He says that it is not a specially selected one, but quite an average, and the branches laden with fruit. The bunch referred to is certainly an extraordinary one, containing 18 Nuts. The reverend gentleman is to be congratulated upon his successful crop. *W. H. C.* [The specimen suggests that the male catkin has assumed female dress, so numerous are the Nuts, Ed.]

Mildew on Roses.—A friend of mine had lately to submit to a surgical operation and used as an antiseptic the last one which has come into use, *viz.* a solution of one-half in a thousand (1/2000) of deto-chloride of mercury (*sublimis corrosivus*). When he could begin to move, he went to his garden to see the Roses he is passionately fond of, and found them

covered with mildew. On the principle of the gander and the goose, he sprinkled them with a very thin spray of his disinfectant and cured them perfectly. I have not got the blight and cannot try it actually. You may object to the use of such a potent poison in careless hands. The best way to prepare it, as it does not dissolve well in water, is to have it in a strong alcoholic graduated tincture, and to dilute it with water when wanted for use. *Jan van Volxem.*

Reports of Societies.

ROYAL HORTICULTURAL: Aug. 25. Floral Committee.

Present: Mr. J. Fraser, in the chair; Messrs. M. T. Masters, M.D., G. F. Wilson, Shirley Hibberd, T. Bates, H. Cannell, E. Hill, H. Turner, F. R. Kinghorn, W. Wilks, V. Bealy, J. Child, J. James, H. Bennett, G. Duffield, C. Noble, J. Dorniny, H. M. Follett, H. Williams, J. Hudson, J. O'Brien, A. Perry.

The subjects brought before the committee were somewhat numerous, the most noteworthy being two splendid hybrid Orchids, *Lechl. Sedem* from Baron Schroeder's collection, and *Leclia elegans Litiæana* from that of Mr. Little.

Angræcum Leonis was shown by no less than five different growers.

From Sir Trevor Lawrence, Bart., came an interesting bulbous plant of hybrid origin named *Gastronema hybrida*, raised from *G. sanguinea* x *Valloia purpurea*, and a fine form of *Blandfordia flammea*.

Mr. W. Bull showed a good variety of *Odontoglossum Inseleyi* named splendens. It is an improvement upon *Inseleyi* in all its parts, broader in sepals and petals, and more distinctly marked on the lip. Three *Caladiums* were likewise sent from the same establishment, in each case the leaves were almost void of chlorophyll; C. *Comtesse de Maille* with foliage suffused with rosy-red midribs and veins on a light ground, and C. *Isis Rose* with leaves of a salmon colour, slightly edged with green. Mr. Bull also sent *Aceres flavidum* like *A. suavisimum*, but not so freely spotted; and also a good form of *Cattleya crispa*, likewise *Dion edule lanata* with a well developed tuft of leaves (certificated in 1885).

Cattleya majenta from Mons. Linden, Ghent, was considered to be a good variety of C. *splendissima*.

A cut spike of *Stanhopea inodora* was shown by Mr. Little.

From G. F. Wilson, Esq., came a finely flowered spike of *Lilium auratum*, with twenty blossoms in good condition; also a form of *Androsace lanuginosa* var., with pale coloured flowers and a purple eye, and some tall spikes of *Gentiana asclepiadea*, and its white variety.

Messrs. Veitch & Sons exhibited three hybrid greenhouse *Rhododendrons* of considerable promise, R. *Pearl* being almost a pure white and of good habit; R. *The Dyak*, with a fine truss and well formed flowers of great substance, orange shaded with scarlet; R. *Gloria Mundi*, deeper in colour than R. *Princess Royal*, and a vigorous grower. The same firm again exhibited some distinct forms of the hardy race of *Glaudiolus*, which will prove valuable additions to our herbaceous borders: G. *Masque de Fer* is a fine dark kind, and G. *Alsace*, a pale yellow, with dark centre, being also very distinct. Some novel varieties of *Salpiglossis* were in the same collection, and a robust growing South African *Asparagus*, called A. *verticillata*.

From H. J. Buchan, Esq., Southampton, came *Agalinia cœrulea*, with one flower of a pale slaty-blue colour—a distinct species.

A new *Eucharis* with one spike and two expanded flowers was shown (the exhibitor's name did not transpire), supposed to be identical with E. *Margaritana*. Some few new varieties of *Dahlia* were exhibited, one from Messrs. Cannell, of the decorative type, called *Germania nova*, bids fair to become a promising kind; in form more compact than the *Cactus Dahlias*, in colour deep rose-pink. Messrs. Cannell also showed a fine bushy form of *Delphinium*, a pleasing flower of the same type, pale primrose in the centre, shading off to a buff.

From Messrs. Kelway came some fine new kinds of *Glaudiolus*, with well formed spikes and robust habit, the best being *Prince Henry*, light centre, shading off to purplish-crimson; Sir H. D. Vane's very intense scarlet centre; Viscount Cranbrook, deep crimson; Prince Albert Victor, bright scarlet; and Princess Olga, a flaked rose on light ground.

FIRST-CLASS CERTIFICATES.

- To Baron Schroeder, for *Leclia Sedem*.
- To Mr. Little, for *Leclia elegans Litiæana*.
- To Sir Trevor Lawrence, Bart., for *Blandfordia flammea*, *Gastronema sanguinea* x, and *Angræcum Leonis*.
- To W. Vanner, Esq., for *Angræcum Leonis*.
- To C. R. Dorniny, Esq., for *Angræcum Leonis*.
- To R. H. Measures, Esq., for *Angræcum Leonis*.
- To Mr. W. Bull, for *Angræcum Leonis*.

To Mr. W. Bull, for *Odontoglossum Inseleyi* splendens.
To Mr. W. Bull, for *Caladium Comtesse de Maille*.
To Messrs. Veitch & Sons, for *Rhododendron Pearl*.

To Messrs. Veitch & Sons, for *Gladiolus Masque de Fer*.
To Messrs. Cannell, for decorative *Dahlia Germania nova*.

To Messrs. Kelway & Son, for *Gladioli Prince Henry, Sir H. D. Wolfi, Princess Olga, Viscount Cranbrook, Prince Albert Victor, and Prince Irene*.

To Max Leuchlin, Esq., for *Androsace lanuginosa* var.
To Messrs. Rawlings, for show *Dahlia Mr. Geo. Walker*.

BOTANICAL CERTIFICATE.

To H. J. Buchan, Esq., for *Agnisica cernua*.

Medals were awarded as follows:—Silver-gilt Banksian, to Messrs. Kelway & Son for a collection of 144 spikes of *Gladioli*, consisting of the choicest and best varieties in commerce, being a finely grown group that formed a great attraction to the show. The same medal was also awarded to Mr. Ware, for *Dahlias* (shows, fancies, pompons, decorans, and single kinds), forming a most varied assortment of clean, well-developed blooms; *Liliums*, consisting of *L. auratum* in variety, *L. tigrinum*, *L. longiflorum*, and *L. superbum*; herbaceous and bulbous plants, prominent among which were *Hyacinthus candicans*, *Gallardia grandiflora* in variety, *Phlox* (herbaceous), *Statice* (hardy), very attractive, *Harpalium rigidum*, *Tritoma uvaria*, *Pentstemon* and *Helianthus* in variety; six varieties of dwarf *Veronica* from New Zealand, suitable for rockwork, and *Zauschneria californica*, orange-scarlet, bearing a close resemblance at a distance to a highly-coloured form of *Libonia*.

Bronze Banksian to the New Plant and Bull Company, Colchester, for a varied assortment of *Liliums* (including some well marked forms of *L. auratum*), and *Gladioli* (hybrids of *G. Lemnolii*).

Dahlias (show, decorative) were shown in good condition by Messrs. Turner of Slough, and Keynes, Williams & Co., of Salisbury; several promising seedlings were included in the collection from the latter firm, of which we shall hear more without doubt a little later in the season.

Fruit Committee.

Present: T. F. Rivers, Esq., in the chair; and Messrs. Harrison Weir, J. Willard, J. Ellam, J. Roberts, Dr. Hogg, W. Faul, K. J. Blackmore, J. Woodbridge, G. T. Miles, and F. Rutland.

Mr. Rivers, who showed a fine collection of twenty dishes of fruit, was accorded a letter of thanks. In the collection, Pears Clapp's Favourite was very good in size and colour. The Peaches included Ballet, which had been forced, and Rivers' Crimson Galande, grown in a cold house. Plums formed by far the largest division, and were very fine; among them were Oullin's Golden Gage, Prince of Louvain, and the small Cherry Plum. Rivers' Dryden Nectarine was also shown.

From the Society's gardens at Chiswick also came a collection of Plums, consisting of twenty-six varieties, among which Damas' Musqué, a small yellow Plum; Large Black Imperial, Prince Engelbert, Belgian Purple, and others were noticed for their good appearance. The Society also showed a collection of Apples, in which Lord Suffield and Duchess of Oldenburg were well grown specimens. Both these exhibits obtained a Cultural Commendation.

Cultural Commendations were also given to G. F. Wilson, Esq., for Plum Transparent Gage, which had been grown in a house. The fruits were over more than half their surface red, only the lower part retaining its usual appearance. The following received the same awards:—Messrs. Kelway & Sons, for three varieties of Cucumbers; Messrs. W. Faul & Son, Walham Cross, for the three varieties of Cucumbers; Mr. Ward, Longford Castle, for three bunches of Buckland Sweetwater Grape, which were very fine, weighing over 4 lb. each. A Bronze Banksian Medal was awarded to this exhibit.

A Silver Banksian Medal was awarded to Mr. G. Bunyave, Maidstone, for a collection of sixty-five dishes of fruit, chiefly Apples, all very well grown. Cellini Pippin was very large, Cox's Orange, Oslin, Stirling Castle, Lady Henrick, Eckinville, Lord Derby, Stone's Apple, and others were very fine. Some had been grown under cover. The Pears in this collection included Marie Louise d'Uccle, Trompe de Vienne, very large, and Bijou, which was thoroughly ripe. Pond's Seedling Plum was well shown, and also four varieties of nuts.

Mr. G. W. Cummings, the Grange, Wallington, Surrey, received a letter of thanks for an exhibit of Pears Apples, and a collection of six dishes of fruit.

"Mrs. Gladstone" Currant, a variety with large berries and an abundant cropper, was shown by Mr. P. Robertson, Hartbrig Gardens, Jedburgh.

Cottagers' and Artisans' Exhibition of Vegetables and Fruits.

ANOTHER opportunity offered to the cottagers and artisans of the United Kingdom to exhibit in the metropolis the best of their fruit and vegetable products has now been afforded, and in a highly satisfactory manner to all those concerned in the arrangements.

In some classes the exhibits, in point of number, far exceeded those of last year, whilst in others, particularly in the Potato classes, a slight falling off was

visible, doubtless owing to the dryness of the season—this crop at certain places being materially affected by a diminished yield. It is scarcely saying too much to affirm that finer samples of some kinds of vegetables could hardly be found, even in the collections from the most noted growers; and it is to be hoped, for the credit sake of those most interested, that the produce is the result of their own labour and attention in the way of cultivation. In looking over the awards the historic county of Buckingham is seen to take the foremost position this year, no fewer than twenty prizes out of a total of ninety-four which were offered falling to the lot of residents in this county, and among these was from the premier prize in the show, for six dishes of distinct kinds of vegetables, in a competition of thirty-three lots, was awarded to Mr. A. Beckett, of Tyler's Green, near High Wycombe, Bucks. Small collections of fruits or vegetables in general were well and keenly contested, and on this occasion the task of the judges was somewhat an onerous duty, the judges having to resort even to half-points to determine the final issue.

Class 1. Collection of six distinct kinds of vegetables. In this, the premier class in the show, a marvellous display was made, occupying more than a fourth of the entire ground, and including over thirty lots, many of which comprised very fine individual dishes of different subjects and favourably comparable with the same subjects that are to be seen in the collections of most eminent gardeners. After much discrimination the 1st prize was given to Mr. A. Beckett's collection, from Penn, near High Wycombe, Bucks. His dishes consisted of fine Giant Rocca Onions, excellent Long Red Carrots, good Cauliflower, Veitch's Autumn Giant, Scarlet Runner Beans, Excelstor Tomatos, and a superb dish of Woodstock Kidney Potatoes. Mr. G. North, Miret Street, Buckingham, had a good set of dishes, including three Mr. W. Cooper, Rose Cottage, Shriveham, Berks, with 3d; 1st lot included the best dish of Giant Rocca Onions in the show. Mr. J. S. Pallett, 50, Russell Street, Loughborough, came in 4th, having excellent Cauliflowers and good Intermediate Carrots; the 2d prize was awarded to Mr. J. Hillam and Mrs. J. Kite, both of Sherborne, Dorset, in the order named. In addition to these prizes four other exhibitors had Commendatory Cards for their collections.

Class 2. Potatoes, three varieties, round, nine tubers of each.—Twenty-seven lots were staged in this class, most of them of good quality. Mr. G. North, Buckingham, took the 1st prize with nice even dishes of Vicar of Laleham, Sutton's Giant King, and Adirondack; Mr. G. Beckett, Penn, coming 2d, with Reading Russet, Radstock Beauty, and Vicar of Laleham, somewhat smaller; 3d, Mr. G. Castle, Nettlesand, Kent; 4th, Mr. R. Hill, Park Road, 5th, Mr. H. Gibbs, Sevenoaks.

Class 3. Potatos, three varieties, kidney, nine tubers of each.—Out of twenty-one exhibitors Mr. H. Gibbs, Sevenoaks, won the 1st prize with good dishes of Beauty of Hebron, Essex Challenge, and Trophy; the 2d awarded to Mr. J. Diver, Epsworth, with three very even white kinds; 3d, Mr. S. North, Buckingham; 4th, J. Willard, Eynsford; and Mr. J. Conway's exhibit was Commended.

Class 4. One variety, of nine tubers, round.—Mr. J. Diver, Petworth, took 1st with 4th, with three even dishes; 2d, Mr. J. Diver, Epsworth; 3d, Mr. S. Crock, with a good dish of Schoolmaster; 4th, Mr. J. Fasham; and to Mr. Wm. Dredge was awarded a Commendation for his Vicar of Laleham.

Class 5. One variety kidney, nine tubers.—1st, Mr. Diver, Epsworth; 2d, Mr. J. Diver, Epsworth; 3d, Mr. D. Davey, Walton Place, Aylesbury.

In looking over the varieties in the foregoing classes, the suitability and popularity of some kinds were manifest, as, for instance, in Class 2, which contained eighty-one dishes of Potatos, to fewer than twenty of these were Vicar of Laleham and thirteen of Reading Russet. Again, in Class 4, for single dishes, thirty-seven lots, there were eleven dishes of each sort, Vicar of Laleham and Reading Russet.

Class 6. Peas, five varieties, fifty pods each.—A weak class. 1st, Mr. Burrows, Luttermuth; 2d, Mr. Jacob, Petworth; 3d, Mr. Cooper, Shriveham; 4th, Mr. Diver, Petworth.

Class 7. Peas, one variety, fifty pods.—Mr. Burrows was 1st; Mr. Moore, Dingwall; 2d, Mr. Harris, Bradfield; 3d, Mr. J. Kite, Shriveham.

Class 8. Onions, twelve.—This class contained some remarkable specimens; Mr. T. J. Pallett, Loughborough, took 1st, with Giant Rocca, fine; Mr. T. Nunn, Malden, 2d, with Giant Rocca, fine; Mr. W. Cooper, Shriveham, 3d, with Improved Reading; 4th, Mr. G. Hacker, Colchester; 5th, Luttermuth Reading.

Class 9. Cabbages, three.—There were mostly old and very coarse, excepting the prize lots: Mr. H. Gibbs, Sevenoaks, 1st, with three very fine heads; 2d, Mr. Richardson, Enfield; 3d, Mr. Peacock, Hemel Hempstead; 4th, Mr. Nor, Epsworth.

Class 10. Lettuce, three heads.—1st, Mr. Warren, Shriveham; 2d, Mr. D. Nunn; 3d, Mr. J. Garder, Yalding; 4th, Mr. Burrows, Luttermuth.

Class 11. Scarlet Runners, thirty pods.—1st, Mr. J. F. Harvey, Hertford; 2d, Mr. W. Cooper, Shriveham; 3d, Mr. G. Mallett, Great Brickhill, Bucks; 4th, Mr. Kite, Sherborne.

Class 12. Kidney Beans, thirty pods.—All the prizes in this class were secured by that fine variety, Canadian Wonder. 1st, Mr. G. Kirkland, Bletchington; 2d, Mr. J. D. Hestall, Sybil, and J. Douglas, 3d, Mr. Burrows, Luttermuth; 4th, Mr. Kite, Sherborne.

Class 13. Broad or Longpod Beans, thirty pods.—

Weakest class in the show. 1st, Mr. D. Munroe, Dingwall; 2d, Mr. S. Saunders, Sherborne; 3d, Mr. G. Hacker, Colshill; 4th, Mr. W. Dredge, Shenley.

Class 14. Turnips, six.—1st, Mr. J. Diver, Petworth; 2d, Mr. H. Gibbs, Sevenoaks; 3d, Mr. J. Kite, Sherborne; 4th, Mr. T. J. Pallett, Loughborough.

Class 15. Carrots, six.—Prize dishes in this class were as near perfection as possible. Mr. G. North, Buckingham, took 1st prize with fine specimens of a beautiful colour. Mr. Kite, Sherborne, coming in a class 2d, and Mr. Kirkland, Bletchington, and Mr. B. Gillam, Sherborne, taking 3d and 4th prizes respectively.

Class 16. Best, three.—1st, Mr. S. Saunders, Sherborne; 2d, Mr. Warren, Shriveham; 3d, Mr. Gillam, Sherborne; 4th, Mr. J. Diver, Petworth.

Class 17. Cauliflowers, three.—Mr. J. Diver, Petworth, 1st, with compact heads; 2d, Mr. T. J. Pallett, Loughborough, with three very large heads; 3d, Mr. Beckett, Penn; 4th, Mr. Munroe, Dingwall, with small compact heads.

Class 18. Cucumber, one.—Mr. Beckett took 1st honours, with a good example of Tender and True; Mr. Dredge, of Shenley, was 2d, with Telegraph; Mr. G. Fasham, 3d, for the same kind; Mr. S. Kirkland, Sherborne, 4th, for a large rather coarse prickly variety.

Class 19. Vegetables, miscellaneous, very large class, requiring much discretion; ultimately the 1st prize went to Mr. H. Gibbs, Sevenoaks; 2d, Mr. J. Kite, Sherborne; 3d, Mr. Neal, Ealing; 4th, Mr. Beckett, Penn.

Class 20. Tomatos, six.—Mr. G. Kirkland took 1st prize with an even dish; Mr. Ware, Ealing, 2d; Mr. J. Hillam and Mrs. J. Kite, 3d; the 4th prize went to Mr. Beckett, of Penn, for a dish of Chiswick Red.

Class 21. Herbs, six bunches, distinct kinds.—Mr. Beckett, Penn, 1st, with Parsley, Sage, Marjoram, Mint, Thyme, and Savory; 2d, Mr. Naylor, Allington; 3d, Mr. Peasey, Ealing; 4th, Mr. Peacock, Hemel Hempstead.

FRUIT CLASSES.

In class 23, for three dishes of dessert Apples, Mr. W. Jacob, Petworth, took 1st, with Duchess of Oldenburg, Lady Sadley, and Devonshire Quarrenden Apples; the first two samples of good quality, and Mr. T. J. Pollett, Loughborough, who showed Red Astrachan and Irish Peach in good condition. Mr. J. Willard, Eynsford, Kent, was next; and Mr. J. Conway, of Boughton Monchelsea, took 4th.

In class 24, for three dishes of kitchen Apples, Mr. Conway took 1st, with Stone's Apple as his best. 2d, Mr. J. Willard, with good specimens of Keswick Codlin and Warner's King; and Mr. T. J. Pollett and Mr. W. Jacob took 3d and 4th with fair fruit.

Class 25 was for one dish of any sort of Apple and Mr. G. Crock, Maidstone, took the lead with Lord Suffield. Mr. Pollett and Mr. Hook, Chersey, both took 2d, with the same variety. Mr. Bowers, Eynsford, followed; and Mr. J. Conway made the 4th, all running closely together.

For class 26, the dish of Gooseberries, Mr. J. Gardner, Yalding, came out 1st, with a small red berry; 2d was taken by Mr. J. Kite, Sherborne, with a yellow fruit; and 3d and 4th were taken by Mr. J. Willard, and Mr. T. Munn, Heybridge, near Maldon, both with red varieties.

For class 27, for one dish of Currants, Mr. W. Jacob was best, with a dish of fine large red Currants; Mr. W. Peasey, Ealing, followed with some good specimens of a white variety; 3d, came Mr. G. W. Keatish, Bedmont, Herts, with black; and Mr. Bowers took the last place with a dish of black Currants.

In class 28, for thirty Morello Cherries, Mr. W. Wagborn, Allington, Kent, was 1st, with some magnificent fruit. In the class for nine Plums, Mr. W. Newman, of Yalding, Kent, was 1st, and Mr. J. F. Dobson, West Wycombe, Bucks, followed. Mr. J. Conway's exhibit was Commended. The fruit in this competition was all good.

MISCELLANEOUS.

In this class there was a large collection of fruits and vegetables. The 1st prize was taken by Mr. C. Beckett with a dish of fine Apricots and some very fine heads of Celery. The second place was won by Mr. W. E. Gamm, Newland, Dorset, who showed a dish of enormous Parsnips. The 3d was given to Mr. S. Saunders, Sherborne, Dorset, for Shallots and Celery; and the 4th place was occupied by Mr. J. Kite with three heads of Celery. Mr. G. H. Hazzard's exhibit of Celery and Mr. T. J. Pollett's of Apricots were both Commended.

THE NATIONAL CARNATION AND PICOTEÉ (Northern Section).

This Society held its annual show in the new Town Hall, Manchester, on August 11. The following is the list of awards.

For twelve Carnations, all dissimilar.—1st, Mr. R. Lord, with Curzon, John Harland, Ranger Johnson, Hextall, Sybil, E. S. Dodwell, James Douglas, Clipper, Mrs. Dodwell, E. Adams, Unexpect, Mercury; 2d, Mr. B. Simonite, with Sybil, Sarah Payne, Florence Nightingale, A. Medhurst, H. Cannon, Master Fred, J. D. Hestall, Sybil, and J. Douglas, 3d, Mr. B. Simonite, with No. 6, rose flake, Jos. Crossland, Sportsman, and a seedling; 4d, Mr. G. Geggie, whose best flowers were Master Fred, W. Skirving, Sybil, and J. Douglas; 5th, Mr. F. Law, whose best flowers were Squire Meynell, J. D. Hestall, Sybil, and J. Douglas, 6th, Mr. B. Simonite.

For twelve Picoteés, all dissimilar.—1st, Mr. R. Lord, with Mrs. Lord, John Smith, Ann Lord, Thomas

William, Clara Penson, Master Norman, Liddington Favourite, Miss Wood, Mrs. Niven, Zerlina, R. Scott, and Elise; 2d, Mr. B. Simonite, with Constance Heron, two seedlings, Mr. Gorton, Brunette, John Smith, Princess of Wales, Dr. Horner, Mrs. Nevin, Muriel, J. B. Bryant, and Mary; 3d, Mr. G. Geggie, whose best flower was Clara Penson; 4th, Mr. F. Law, whose best flowers were Clara Penson and Mr. Gorton, and Mrs. Carnation, nine to be dissimilar.—1st, R. Gorton, Esq., with E. S. Dodwell, Skirving, Merryweather, Foster, R. Johnson, Master Fred, Harrison Weir, E. Adams, and F. Nightingale; 2d, Mr. J. Bleachley, with Master Fred, J. Douglas, Sybil, Sportsman, Falconbridge, Curzon, Cooper, Keats, Lord Napier, Southwell, and M. Nottingham.

For twelve Picotees, nine to be dissimilar.—1st, Mr. J. Bleachley, with Brunette, Zerlina, Thos. William, Edith D'Umbraïn, Alliance, Her Majesty, Liddington Favourite, Miss Wood, and another; 2d, Mr. J. Whitham, with Zerlina, J. B. Bryant, Admiral Curzon, Miss Horner, Thos. William, Miss Wood, Brunette, John Smith, Ann Lord, and Edith D'Umbraïn; 2d, R. Gorton, Esq.; 4th, Mr. W. Slack.

Forsik Carnations, all dissimilar.—1st, Mr. J. Whitham, with Dorothy, Lord Raglan, and Tim Bobbin; H. Cannell, J. Douglas, Admiral Curzon, and Mr. G. Thornley, with Curzon, Raglan, Squire Trow, J. Douglas, Clipper, and Keats.

Six Picotees, all dissimilar.—1st, Mr. E. Shaw, with Daisy, Clara Penson, Alice, Her Majesty, Miss Horner, and Mrs. Carnation; 2d, Mr. Thorsall; 3d, Mrs. Rudd, Nymph, Miss Horner, Mrs. Prescott, Burdett Coutts, and Norfolk Beauty.

Extra class for twelve fancies.—1st, Mr. R. Lord; 2d, Mr. F. Law.

Premier Carnation.—Mr. R. Lord, with Curzon.
Premier Picotee.—Mr. J. Bleachley, with Zerlina.

SINGLE SPECIMENS.

Scarlet bizarre Carnation.—1st, 2d, 3d, 4th, and 5th, Mr. R. Lord, with Curzon.

Crimson bizarre Carnation.—1st, R. Gorton, Esq., with Harrison Weir; 2d, G. Geggie, with Master Fred; 3d, J. Bleachley, with E. S. Dodwell; 4th, G. Geggie, with Master Fred; 5th, R. Lord, with Master Fred.

Purple bizarre Carnation.—1st, J. Whitham, with E. S. Dodwell; 2d, S. Barlow, Esq., with Sir G. Wolsey; 3d, J. Whitham, with Harrison Weir; 4th and 5th, R. Gorton, Esq., with Harrison Weir and Skirving.

White bizarre Carnation.—1st, G. Geggie, with H. Cannell; 2d, B. Simonite, with Tom Powell; 3d, J. Bleachley, with Sportsman; 4th, J. Chadwick, with Ivanhoe; 5th, B. Simonite, with seedling.

Rose flake Carnation.—1st, R. Low, with J. Keats; 2d, W. Taylor, with Christa-galli; 3d, G. Geggie, with Christa-galli; 4th and 5th, W. Taylor, with Christa-galli.

Purple flake Carnation.—1st, B. Simonite, with J. Douglas; 2d, G. Geggie, with M. Nottingham; 3d, F. Law, with J. Douglas; 4th, J. Bleachley, with M. Nottingham; 5th, G. Thornley, with Squire Trow.

Heavy red Picotee.—1st, G. Geggie, with Master Norman; 2d, F. Gorton, Esq., with John Smith; 3d, W. Taylor, with John Smith; 4th, W. Taylor, with Brunette; 5th, G. Geggie, with Haversley.

Light red Picotee.—1st, 2d, 3d, 4th, 5th, R. Lord with Thos. William.

Heavy purple Picotee.—1st, R. Lord, with Mrs. Nevin; 2d, J. Whitham, with Zerlina; 3d, J. Bleachley, with Mrs. Nevin; 4th, R. Gorton, Esq., with Mrs. Nevin; 5th, J. Bleachley, with Zerlina.

Light purple Picotee.—1st, J. Whitham, with Ann Lord; 2d, G. Geggie, with Clara Penson; 3d, R. Lord, with Alice; 4th, J. Bleachley, with Clara Penson; 5th, E. Shaw, with Clara Penson.

Heavy rose Picotee.—1st, 2d, 3d, R. Lord, with Mrs. Lord; 4th, G. Geggie; 5th, F. Law, with Miss Wood.

Light rose Picotee.—1st, 3d, 4th, 5th, R. Lord, with Miss Wood, Elegant, and Miss Horner; 2d, J. Whitham, with Miss Wood.

HEAVY BUDDED HORTICULTURAL:

August 19.

This is one of a few highly popular and extensive, as well as high-class flower shows held in the West of England; in the case of Trowbridge it is the thirty-sixth consecutive annual exhibition, continued through good and bad seasons, and it is the twenty-second year the office of Hon. Secretary has been held by Mr. James Huntley, to whose efforts a great deal of the success of the Society is due. The exhibition took place as usual in the show field close to the railway station, and the day being fine and enormous throng of people attended it from Bath, Bristol, Bradford-on-Avon, and the district round. The financial results were most satisfactory in every respect. The town was profusely decorated with bunting, and had a gay and animated appearance.

STOVE AND GREENHOUSE PLANTS.

In the class for nine plants, a local grower, Mr. Matthews, gr. to W. R. Brown, Esq., J. P., Trowbridge, was in good form, showing very good specimens of *Allamanda Hendersoni*, *A. nobilis*, *Rondeletia speciosa* major, *Lasiandra macrantha floribunda*, a very fine plant, superbly grown and flowered, displaying a colour much wanted among stove and greenhouse plants; *Erica Marockiana*, *E. Antonia hybrida*, *E. MacNabiana rosea*, *Urtica aurantiaca*, and *Bougainvillea glabra*; 2d, Mr. G. Tucker, gr. to Major W. P. Clark, Trowbridge, whose best specimens were *Bougainvillea glabra*, *Eranthemum Andersoni*, *Dipladenia Brearleyana*, *Allamanda Hender-*

soni, *Ixora Williamsi*, and *Plumbago rosea*; 3d, Mr. W. Drummond, nurseryman, Bath.

Mr. Tucker had the best six plants, staging very good examples of *Bougainvillea glabra*, *Clerodendron Balfourianum*, *Allamanda nobilis*, *Anthurium Scherzerianum*, *Dipladenia amabilis*, and *Ixora Fraseri*; 2d, Mr. H. Pocock, gr. to J. P. Haden, Esq., Trowbridge, who had *Dipladenia Brearleyana*, *D. amabilis*, *Allamanda Hendersoni*, *Lapageria alba*, *Ixora coccinea*, and *I. Williamsi*; 3d, Mr. J. Matthews.

In a class for three plants Mr. Matthews was 1st, and Mr. Tucker 2d.

FUCHSIAS.

As usual, these were numerous, and very fine; those who attend the show regularly state they were the finest plants ever seen. On this occasion Mr. J. Matthews was 1st in the class for six specimens with magnificent examples of *Charming*, *Poor's Favourite*, and the *Hon. Mrs. Hay*, dark; *Rose of Castile*, *Arabella*, and *Marchioness of Bath*, a white corolla variety, light; 2d, Mr. H. Pocock, with very fine plants of *Doel's Favourite*, *Charming*, and *Bountiful*, dark; *Arabella*, *Beauty of Hillvale*, and *Beauty of Wilts*, light; 3d, Mr. J. Lye, gr. to the *Hon. Mrs. Hay*, Cliffe Hill.

In the class for four varieties, Mr. Matthews was also 1st with superb specimens of *Doel's Favourite*, the *Hon. Mrs. Hay*, a seedling, light, and *Wiltshire Lass*. Mr. George Tucker was 2d with *Load-me-Well*, *Doel's Favourite*, *Charming*, and *Arabella*; 3d, Mr. J. Lye.

MISCELLANEOUS FLOWERING PLANTS.

These included the fine *Petunias* and *Verbenas* for which Trowbridge is so famous; *Pelargoniums*, *Balsams*, *Gloxinias*, &c., all of which were well and numerous shown.

FOLIAGED PLANTS.

The best collection of nine plants came from Mr. H. Clack, gr. to C. E. Colston, Esq., Roundway Park, Devizes, who had *Scarfonia elegans*, *Lantana borbonica*, *Chameroops humilis*, *Portulac. variegatus*, *C. pids*, *C. pids*, *C. pids*, *C. pids*, and *C. pids*. Mr. G. Geggie, gr. to Mr. G. Geggie, had whose best plants were a fine *Cycas revoluta*, *Lantana borbonica*, *Thrinax elegans*, &c.

FERNS.

These are always a very fine feature at Trowbridge, the leading class being for *filices* specimens, including mosses, &c.—The best—a very fine lot it was—came from Mr. Tucker, whose plants showed the highest cultivation. The leading plants were *Asplenium udus avis*, *Gymnogramma sulphurea*, *C. chrysophylla*, *Adiantum farleyense*, *A. cucumatum*, *A. gracillimum*, *Gymnogramma peruviana argyraphylla* and *peruviana cristata*, *Asplenium tuberosum*, *Dicksonia antarctica*, &c. Equal 2d prizes were awarded to Messrs. Clack and J. Cope, gr. to A. P. Stancourt, Esq., Trowbridge, both of whom had remarkably good groups; Mr. H. Pocock was 3d.

TABLE DECORATIONS.

These were a very pretty feature indeed, and it is satisfactory to know that this department of the exhibition has materially improved during the past few years.

Button-holes and bouquets were also a very pleasing feature, and it is observed that the cottagers have abandoned the absurd devices in garden and wild flowers they used to set up a few days ago, and produce now something elegant, light, and pleasing.

CUT FLOWERS.

Messrs. Keynes, Williams, & Co. had the best twenty-four Dahlias, staging a lot of very fine blooms; Mr. Thomas Hobbs, Lower Easton, Bristol, being 2d. Messrs. Keynes & Co. also had the best twelve fancy Dahlias, putting up a very even and well finished lot of flowers; Mr. George Humphries, Kingston Langley, Chippenham, being 2d.

In the class for seedling Dahlias of 1884, six blooms of each, First-class Certificates were awarded to Messrs. Keynes & Co., for Richard Dean, a very fine purple shaded self-form of the best quality, and to Salamander, a fancy flower of the General Gordon type, but faked with crimson instead of scarlet, very bright and pleasing. *Eric Fuchs* was also shown in fancy form, heavily striped and faked with deep scarlet on a buff ground, very bright and pleasing.

In the class for seedling Dahlias of 1885, First-class Certificates were awarded to Messrs. Keynes & Co., for *Princa Grand*, the centre piece, very crimson, the basal petals heavily faked with purple, fine petal and centre, and very promising; and to William Slack, a singularly bright scarlet flower somewhat reflexed, but of full substance, and likely to be very useful; *Geo. Sanger* (fancy), J. W. Cross, and Thomas Hobbs—the two latter plain shaded seedlings were very promising also. Mr. A. A. Walters, of Bath, had the best stand of single Dahlias.

The best stand of twelve Roses (trebles) came from Messrs. Geo. Cooling & Son, of Bath, who had capital blooms of *La France*, *Le Teas*, *Francis Michollet*, *M. A. Williams*, *Merveille de Lyon*, *Louis van Houtte*, *Madame Victor Verrier*, *Comte d'Orléans*, *Alfred Colomb*, *Charles Lefebvre*, &c.; 2d, Messrs. Keynes & Co. The best twenty-four varieties, single blooms, were from Messrs. Keynes & Co., who had a very fine lot of blooms; Messrs. Geo. Cooling & Son being 2d.

FRUIT.

This department is always a good one at Trowbridge, but this season it was remarkably fine; not only was the fruit numerous, but the quality was very high throughout. The show consisted of ten dishes, and as the number comprising a dish is an unlimited one, and im-

posing looking quantities are staged, the effect is greatly heightened.

The best collection came from Mr. A. Miller, gr. to W. H. Long, Esq., M.P., Rood Ashton, Trowbridge, who had very fine Alicante, Black Hamburg, and Foster's Seedling Grapes, Barrington and Bellegrade Peaches, very large Walsington Plums, Hawth's Nectarine, Moor Park Apricots, Best of All Eastnor Castle Melons; 2d, Mr. Ridge, gr. to James Derham, Esq., Bristol, who had Muscat of Alexandria and Black Hamburg Grapes, Early York and Ford's Seedling Peaches, Downton Nectarine, Shipley Apricot, Jargonelle Pears, Green Gage Plums, and Morello Cherries; 3d, Mr. Thomas Smith, Bath. A collection shown by Mr. G. Garraway, of Bath, was highly commended.

The only exhibitor of a Pine was Mr. Miller, who had a very fine Queen.

The best bunches of Black Grapes were large and finely fruited bunches of Black Hamburg, shown by Mr. A. Young, gr. to B. Thomas, Esq., Clifton; 2d, Mr. G. Hodges, Bath, with the same, in excellent form; 3d, Mr. H. Gay, gr. to L. Dobney, Esq., Bath, with the same.

In the class for black Muscats, Mr. H. Clark, gr. to C. E. Colston, Esq., Roundway Park, was 1st, with two very fine bunches of *Madresfield Court*; 2d, Mr. E. J. Hill, Westbury-on-Trym, with the same.

Mr. A. Young had the best two bunches of white Peaches (*Muscats* excluded), and the best examples of *Foster's Seedling*; Mr. A. Miller being 2d, with the same—also very good; 3d, Mr. A. G. Hodges, with the same.

In the class for white Muscats, Mr. G. W. Shelton, gr. to W. K. Wait, Esq., Bristol, was 1st, with two fine bunches of *Muscats*; Mr. G. Smith, the Palace Gardens, Salisbury, with the same; and 3d, Mr. J. Loosemore, gr. to E. Cooper, Esq., with the same.

Apricots were largely shown. There were twenty-one dishes of very fine fruit, mostly Moor Park, and a single dish of Peaches and Nectarines, and also of Green Gage Plums were numerous and very fine, so were dessert and culinary Apples, Lord Suffield and Warner's King among the latter being very fine. Jargonelle Pears were largely and finely shown.

The best collection of fruit was staged by Mr. G. Hodges, who was shown by Mr. E. Cole, gr. to W. Pethick, Esq., Bristol, executed in admirable taste; 2d, Mr. E. J. Hill, also with an excellent stand; 3d, Mr. Hoskins, Clifton.

VEGETABLES.

The display of these was remarkably fine, and they were very numerous, mostly Moor Park, and a beautiful display in any part of the country than that produced at Trowbridge, and especially by cottagers.

Potatoes were a remarkable sight, numerous, fine, clean, and handsome.

The cottagers' plants (which in some respects are much better than are frequently seen staged by gentlemen's gardeners) are remarkable for their high culture, and the cottagers' tent at Trowbridge is an interesting show in itself.

CHEADLE FLORAL AND HORTICULTURAL AUGUST 21 and 22.

The eighteenth annual exhibition of this Society was held on the above dates in a large meadow kindly placed at the service of the committee by Dr. G. W. Jones, and respects this show was a decided improvement on previous exhibitions held on the same ground, notably in regard to the stove and greenhouse flowering plants, the splendid show of fruit, and the miscellaneous groups of plants arranged for effect. There were eighty-eight classes in the schedule, and in almost every case the prizes were well contested, while in some of the classes the number of exhibitors ran up to six, eight, and even beyond that number.

In the open class for ten stove and greenhouse plants, J. Leigh, Esq., J. P. (J. Kirk, gr.), came well to the front, with fine examples of *Croton angustifolius* and *C. Disraeli*, well grown, and of good colour; *Anthurium Andreanum*, *Eucharis amazonica*, with thirty-six spikes of bloom; *Dipladenia amabilis*, covered with flowers; *Clerodendron Balfourianum*, and *Erica* *remult*. The 2d prize was awarded to S. Everitt, Esq. (G. Williams, gr.), who had *Croton Queen Victoria*, *C. Evansianus*, *Kentia australis*, *Ixora Williamsi*, *Erica Irbiana*, and *Allamanda grandiflora*, covered with bloom, among his best plants. The 3d fell to J. Watts, Esq. (R. Mackellar, gr.), in whose collection we observed *Ixora Colei*, with over thirty trusses of bloom.

In the class for amateurs of the same number and description of plants, J. Watts, however, was a long way ahead. Mr. Mackellar here staged some excellent examples of *Ixoras*, certainly never so good as have been seen in the neighbourhood of Manchester for the last few years, for since Messrs. Cole, Baines and Samson have ceased showing, *Ixoras* have not been very frequent at our shows. *Ixora Prince of Orange* had 120 good trusses of bloom, and *I. Williamsi* over 200; these stood out against clean and healthy foliage, and were much commended upon; *Eucharis amazonica*, with forty-six spikes; a *Stephanotis*, covered with flowers; and *Dipladenia amabilis*, with forty trusses. For foliage, *Cocos Weddelliana*, *Cycas revoluta*, and *Croton Queen Victoria*, were most prominent; J. Lamb came 2d, showing *Allamanda Hendersoni*, *J. Francisca calycina* in good form; Mrs. Hodgkinson (D. Boardman, gr.) was 3d, in whose group we observed good plants of *Dipladenia boliviensis* and *amabilis*, and *Rondeletia speciosa* major.

For six stove and greenhouse plants in bloom, Mrs. Sykes (G. Kemp, gr.) came well to the front with *Statice*

With eight dishes, Mr. Iggluden, gr. to the Earl of Cork, Marston House, Frome, was 1st, having finely finished Black Hamburg Grapes, Muscats in nice order, and Smooth Cayenne Pine, George Peaches, Pine-apple Nectarines, Moor Park Apricots, Hero of Locking Melon, and Morello Cherries; Mr. Nash, gr. to the Duke of Beaufort, Edminton, Chippenham, who was 2d, had a good collection containing Muscat of Alexandria and Black Hamburg Grapes, Grosse Mignonne Peaches, and Black Tartarian Cherries, very well kept, being still quite fresh in appearance; Mr. Rye 3d, also stinging a nice collection.

Three bunches of Black Hamburg Grapes.—Here Mr. Iggluden was 1st, with beautifully finished examples; 2d, Mr. Elliot, gr. to H. W. Tugwell, Esq., East, who likewise showed handsome fruit.

In the class for any other variety of black Grapes Mr. Nash had 1st, with excellent examples of Black Alicante; Mr. E. F. Hall taking 2d, with Madresfield Court.

Three bunches of Muscat of Alexandria Peaches.—Mr. Shelton, gr. to W. K. Wait, Esq., 2d; Mr. Whitwell, 3d. Three bunches of any other white variety.—1st, Mr. A. Young, Clifton, with good bunches of Foster's Seedling, splendidly finished; 2d, Mr. Miller, with a promising seedling with a flavour not unlike Ferdinand de Lesepes; the fruit being long and tapering, berries in the way of Muscat of Alexandria.

Eight Peaches.—1st, Mr. Seagers, gr. to Mrs. Temperley, who had Crimson Galande, very well coloured; 2d, Mr. Dufurn, gr. to Mrs. Walker, with good examples of Grosse Mignonne.

Eight Nectarines.—Mr. Dufurn, with a beautiful dish of Elrue coloured to perfection; 2d, Mrs. Woolven, showing unusually large examples of Pimston Orange. Eight Apricots.—1st, Mr. Fear; 2d, Mr. Hill, Bower Ashton.

Dish of Figs.—1st, Mr. Matthews; 2d, Mr. Fear. Green-flesh Melon.—1st, Mr. Rye; 2d, Mr. Holland. Scarlet-flesh Melon.—1st, Mr. Miller; 2d, Mr. H. Mardon.

SHROPSHIRE HORTICULTURAL

August 19 and 20.

The summer show of this society was, as usual, held at Shrewsbury, in The Quarry, which, notwithstanding the large extent of ground it comprises, afforded no more room than needful to allow free movement to the thousands who were present on the second day, which fact, coupled with the numbers who visited the exhibition on the opening day being largely in excess of the attendance on any previous year, speaks well for the prospects of the Society, which, by the way, had in the comparatively short time of its existence, attained a position such as is equalled by few similar institutions in the kingdom. The exhibition was not only a success from the essential point of view named—the numbers who thronged the market and ground—being actually so from a horticultural point of view. Plants, including both hard and soft-wooded flowering kinds, fine-leaved sorts, Ferns, and Palms, were present in large numbers, and, what is more, as fresh as they usually are seen earlier in the summer, most of the exhibitors evidently making especial preparation for the occasion. Fruit was largely shown, Goddard particularly—for which good prizes were offered—being in great force, the greater portion well up in finish.

STOVE AND GREENHOUSE PLANTS.

In the open class of twenty, half of which were required to be in bloom, there were three exhibitors, the veteran Mr. Cypher, of Cheltenham, taking the lead with a fine lot, containing beautifully flowered specimens of *Fritica obtata purpurea*, *Ixora Filigini*, *Dipladenia amabilis*, *Statice profusa*, *Allamanda nobilis*, and the brilliant red-flowered *Rhododendron Duchesii* of Edinburgh. Amongst fine-leaved plants associated with these were immense examples of *Encelpharthus roseus* and *Cycas intermedia*, with *Croton Queen Victoria*, *C. Prince of Wales*, and *C. Sunset*, each 5 or 6 feet in diameter, and densely clothed with highly-coloured foliage; the last-named sort presented a mass of glowing crimson such as rarely seen even under the most skillful treatment. Mr. J. Roberts, gr. to E. C. Glover, Esq., Highfield Hall, took who was 2d, also had a good collection, the best of which were *Ixora Williamsii*, *I. coccinea*, *Allamanda Hendersoni*, *Dipladenia Williamsii*, *Psychosperma Alexandri*, *Croton angustifolius*, and *Asparagus plumosus* nana in the form of a bushy tree, the bushy tree which way it had a light and effective appearance; Mr. Tudgey, Waltham Cross, taking 3d, with a nice group, in which were well flowered specimens of *Erica insignis*, *E. Fairreana*, and *Statice profusa*, with several large *Fuchsias* and other fine-leaved plants, the best of which were *Fritchardia pacifica*, *Kentia australis*, and *Cycas circinalis*.

Nine stove and greenhouse plants, not less than five in bloom (open).—Here 1st honours went to Messrs. Pritchard & Sons, Shrewsbury, who staged a well grown set of plants, amongst which were *Erica Marmorata*, *Ewariana superba*, *Lapageria alba*, *Croton Queen Victoria*, and *Kentia Belmoreana*; 2d, Mr. Farrant, gr. to Mrs. Jason, Abbey Foregate, Shrewsbury, who, with others, had nicely flowered plants of *Ixora aurantiaca*, *Allamanda Hendersoni*, and *Clerodendron Balfourianum*.

Six stove and greenhouse plants in bloom (open).—1st, Mr. Cypher, here again having a nicely flowered collection, the most noteworthy being *Allamanda grandiflora*, *Dipladenia amabilis*, and *Erica Irbayana*; 2d, Messrs. Heath & Sons, Sheltonham, who staged half-a-dozen nicely bloomed *Crotons*, *Cattleya Gaskelliana*, *C. crispa*, *Dendrobium formosum*, *Plumina nobilis*, *Saccolabium Blumei*, and *Messopindium vulcanicum*.

Six stove and greenhouse plants, not less than four in

bloom (gentlemen's gardeners).—1st, Mr. Roberts, with, amongst others, nicely bloomed examples of *Erica Shannoni* and *Dipladenia amabilis*; 2d, Mr. Farrant.

FERNS.

In the open class for six Mr. Cypher took 1st, his best examples being *Microlaeta hirta cristata*, *Adiantum cardiochlena*, *Alsophila australis*, and the rare *A. elegantissima*; 2d, Mr. Roberts, who also had a meritorious exhibit.

With six Ferns in the class confined to gentlemen's gardeners Mr. Farrant was well in front with medium-sized fresh-looking plants; 2d, Mr. Thurlte, gr. to J. L. Burton, Esq.

FINE-LEAVED PLANTS.

Palms.—With six, Mr. Cypher took the lead—*Kentia Canterburyana*, *C. Belmoreana*, *Pritchardia pacifica*, and *Thrinax elegans* being the best; Mr. Roberts, who was a good 2d, fine specimens of *Lantania borbonica*, *Cocos Weddelliana*, and *C. flexuosissima*; 3d, Mr. Shephard, gr. to the Misses Bauman, was 1st for six; Mr. Lambert, gr. to Col. Wingfield, 2d.

Six Caladiums.—With these Mr. Farrant had 1st, staging well managed plants; 2d, Messrs. Pritchard & Sons.

Coleus in sixes came from Mr. Shepherd and Mr. Norris, gr. to W. Laing, Esq., Shrewsbury, who were 1st and 2d in the order of their names.

FUCHSIAS, &c.

were forthcoming in good order, Messrs. Pritchard & Sons being 1st with six large well furnished examples, not too stiffly trained, the best being Royal Standard, Mrs. Huntley, and Mrs. Marshall; 2d, Mr. H. Owen, The Cedars, Shrewsbury.

Zonal Pelargoniums.—With six single varieties, Messrs. Pritchard & Sons were 1st and 2d, as also in the class for six doubles.

Begonias.—In the class for six, Messrs. Pritchard had 1st, Mr. Shephard 2d.

Collection of fifty miscellaneous plants in 5-inch pots, not less than thirty in bloom.—1st, Messrs. Pritchard; 2d, Messrs. Jones.

Dinner-table Plants.—1st, Messrs. Jones; 2d, Messrs. Pritchard.

GROUPS OF PLANTS ARRANGED FOR EFFECT.

These are beginning to present too much sameness of offer met with. It was refreshing to see Messrs. Pritchard & Son's arrangement that took 1st in the class for groups, comprising that, the principal feature in it being that it was devoid of the colour-spotted, overdone appearance which does so much to mar the effect of groups of this kind. Messrs. Jones & Sons, Cotton Hill, Shrewsbury, took the 2d and 3d prizes, their exhibits also possessing more merit than often to be found in this kind of decoration.

In the division confined to amateurs only there was a marked improvement upon what the plants have been in former years.

With six stove and greenhouse plants Mr. H. Owen took 1st, for a nice half dozen, which included a nicely-flowered *Allamanda*, and a beautiful variety of *Lapageria rosea*; 2d, Mr. E. Burd, Shrewsbury.

Four Exotic Ferns.—1st, Mr. W. R. Mansell, Wellington, with nicely grown plants; 2d, Mr. H. Gingham.

Three Coleus.—1st, Mr. G. Burd, Mayfield, Shrewsbury; 2d, Mr. J. Baker.

Zonal Pelargoniums, both double and single varieties, were present in very good condition, Mr. L. Burd taking 1st in the class for three single varieties, and also for doubles, Mr. H. Owen being 2d in each.

Collections of twenty-five miscellaneous plants in 5-inch pots, not less than fifteen in bloom.—1st, Mr. L. Burd; 2d, Mrs. Wace.

CUT FLOWERS

were plentiful. With twenty-four roses, Messrs. Perkins, Warwick Road, Coventry, took 1st; Messrs. Sandy & Son, Stafford, and Mr. R. H. Vergees, Birmingham, being equal 2d.

Eighteen Roses.—1st, Mr. E. Wright; 2d, Mr. G. H. Herrington, Ludlow.

Thirty-six Dahlias.—1st, Mr. W. Shaw, Kidderminster; 2d, Messrs. Heath & Sons.

Twenty-four Dahlias.—1st, Messrs. Heath; 2d, Mr. West, gr. to E. Wright, Esq., Halston Hall.

Nine Dahlias (amateurs).—1st, the Rev. J. H. E. Charter, Shrewsbury; 2d, Mr. R. J. Niven, Wellington.

Twelve single Dahlias.—1st, Mr. G. H. Herrington. Eighteen spikes of Gladiolus.—1st, Mr. W. Shaw; 2d, Mr. Lambert.

Twelve bunches of stove and greenhouse flowers.—1st, Messrs. Pritchard; 2d, Mr. Roberts.

Twelve bunches of hardy herbaceous flowers.—1st, Mr. R. H. Vergees; 2d, Messrs. Jones.

Single stand of flowers (open).—1st, Messrs. Jones; 2d, Mr. Cypher.

Stand of flowers (amateurs).—1st Mr. E. W. Pritchard; 2d, Mr. W. Jones, Monifrad.

Some beautiful bouquets were shown. In the open class for one bridal bouquet, Mr. Cypher had 1st, Messrs. Perkins 2d.

Ball bouquet.—1st, Messrs. Perkins; 2d, Mr. Cypher. In the amateurs' classes Mrs. Wace had 1st, with a ball bouquet, Mr. J. Barker 2d.

Bridal bouquet.—1st, Mr. E. W. Pritchard; 2d, Mrs. Bacchus.

FRUIT.

Grapes.—With six bunches of black Grapes, three varieties, Mr. Young, gr. to J. Evans, Esq., Hurst

House, Prescott, was placed 1st, with well finished bunches of Black Alicante, Black Hamburgs, large in bunch, but not quite up in colour, and Madresfield Court, first in bunch and berry, but also wanting in colour; Mr. Goodacre, gr. to the Earl of Harrington, Elvaston, was 2d, with bunches a little smaller than his opponent. They consisted of Black Hamburgs, even in bunch and berry—well finished; Madresfield Court, good; and Muscat Hamburg, handsome well filled bunches, black, and well up in finish; Mr. Wallis, gr. to the Rev. W. Sneyd, Keele Hall, who was 3d, had also very good bunches.

Three bunches of black Grapes.—These were very well shown by Mr. Lambert, who took the lead with Black Hamburgs; 2d, Mr. Bennett, gr. to the Hon. G. W. B. Knollys, Corwen, staging Alnwick Seedling in beautiful condition.

Four bunches of white Grapes, two varieties.—Here Mr. Young was 1st, with Muscat of Alexandria and Foster's Seedling, both of which were good examples; 2d, Mr. Parker, gr. to J. W. F. Corbett, Esq., Droitwich, with Muscat of Alexandria, well finished, and Golden Champion, in beautiful order.

Three bunches of white Grapes.—In this class Mr. Purser, gr. to J. Watson, Esq., Berwick House, Shrewsbury, took the lead with Muscat of Alexandria, well up in colour; 2d, Mr. Shephard.

Two bunches of black Grapes (amateurs).—1st, Mr. R. Blakeway Phillips, Hanwood; 2d and 3d, Mr. G. Burr, The Oaklands.

Two bunches of white Grapes (amateurs).—1st and 2d, Mr. Burr; 3d, Mr. Blakeway Phillips.

Collection of fruit, twelve dishes.—1st, Mr. Goodacre, his best example being Muscat of Alexandria and Madresfield Court Grapes, Charlotte Rothschild Pine, Goshawk Peaches, and Pine-apple Nectarines; Mr. Parker, who was a close 2d, had, amongst others, Muscat of Alexandria and Black Hamburg Grapes, Royal George Peaches, Elrue Nectarines, Queen Pine, and Moor Park Apricot; 3d, Mr. Bennett.

Nine dishes of fruit.—1st, Mr. Shepherd, whose most meritorious examples were nicely finished Muscat of Alexandria Grapes, a good dish of Peaches and Apricots; 2d, Mr. Lambert.

Dish of Peaches.—1st, Mr. W. Shaw; 2d, Mr. J. Meakin, The Hayes, Stone.

Dish of Nectarines.—1st, Mr. Bennett; 2d, Mr. Kennedy, gr. to Sir C. R. Boughton.

Green-flesh Melon.—1st, Mr. J. Lawkesford, gr. to Sir Vincent Corbet; 2d, Mr. Goodacre.

Scarlet-flesh Melon.—1st, Mr. J. Meakin; 2d, Mr. R. Blakeway Phillips.

Commendations were given to groups of miscellaneous plants contributed by Messrs. Pritchard & Sons, Messrs. Jones & Sons, Messrs. Heath & Sons, Messrs. James Dickson & Sons, Chester; Messrs. F. & A. Dickson, Chester; Messrs. Smith, Worcester; hardy herbaceous flowers by Mr. Vergees; a fine collection of vegetables by Messrs. Webb, Worsley; and new vegetables by Mr. T. Laxton.

SEVENOKS HORTICULTURAL

August 19.

This Society held its eighteenth annual exhibition in Central Park, by permission of Earl Amherst, the pleasure-ground, being as usual, being thrown open. The weather was fine, and attracted a large number of visitors. The show was a success in every way—quite equal to any of former years, the plants being especially good and well represented in the different classes for flowering, foliage, and Ferns.

In the open division for six stove and greenhouse plants in flower Mr. A. Gibson, gr. to T. F. Burnaby Atkins, Esq., Halstead Place, near Sevenoaks, was 1st, with fine plants of *Allamanda nobilis*, *Dipladenia amabilis*, *Lapageria alba*, *Ixora Daniina*, *Clerodendron Hal-fordi*, and *Statice profusa*; Mr. Bolton, gr. to Mrs. Spottiswoode, Combe Bank, Brasted, was a good 2d, with *Anthurium Scherzerianum*, *Allamanda Hendersoni*, *Clerodendron Fallouii*, and *C. fallax*, &c.

For a single specimen stove or greenhouse plant Mr. Bolton was 1st, with *Statice profusa*; Mr. C. Cooke, gr. to De B. Crawshaw, Esq., Rosemont, Sevenoaks, was 2d, with a fine specimen of *Epidendrum prismatocarpum*; Mr. Burt, gr. to A. B. Midday, Esq., Shoreham Place, was 2d, with a good *Cattleya*; and Mr. Bolton, gr. to Mrs. Williams.

Ornamental foliage plants were largely shown, and in fine condition, Mr. J. Goodman, gr. to Mrs. Crawshaw, Bradbourne Hall, Sevenoaks, being 1st, with *Cibotium regale*, *Lantana borbonica*, *Phoenix reclinata*, *Croton Williamsii*, *Alocasia Tibbautiana*, and *Dasyliorum acrostichoides*; Mr. A. W. Sherman, gr. to J. Brassey, Esq., Preston Hall, Aylestone, was 2d, with *Cycas revoluta*, *Brahea filamentosa*, *Croton interruptus*, and *C. undulatus*, &c.; and Mr. J. Bolton 3d.

Ferns were well represented. For six exotics, Mr. Staples, gr. to St. Orehenrich, Chippingdale Place, Sevenoaks, was 1st, with *Statice medullata*. Also six exotics, *Dicksonia antarctica*, *Adiantum cardiochlena*, &c.; Mr. Bolton was 2d, with good plants of *Cibotium regale*, *Dicksonia squarrosa*, &c.; and Mr. Goodman 3d. For six British Ferns, Mr. Bolton was 1st; Mr. Meakin, gr. to C. R. Pele, Esq., Riverhead, was 2d; and Mr. Staples 3d.

With six Fuchsias, Mr. Goodman was 1st; Mr. Huntly, gr. to the Rev. F. S. Curtis, The Rectory, Sevenoaks, 2d; Mr. S. Meakin 3d.

The class for Begonias here admits of the fibrous-rooted being shown, and the tuberous-rooted with much better effect. Mr. Meakin was 1st, Mr. Bolton 2d, and Mr. W. Searing, gr. to R. Monckton, Esq., Oak Lodge, 3d.

The classes for *Caladiums*, zonal *Pelargoniums*, and *Achimenes* were also well filled.

Plants suitable for table-decoration were contributed by a large number of exhibitors. For the 1st, Mr. H. W. Sharp, gr. to Dr. Grove Park, was 1st; Mr. F. Thorne, gr. to K. D. Hodgson, Esq., Ashgrove, 2d; and Mr. Goodman 3d.

In the division for smaller growers for four stove and greenhouse plants, Mr. J. Sharp was 1st; Mr. H. Vallins, gr. to Dr. Worship, of Riverhead, 2d; and Mr. P. Knight, Riverhead, 3d. For ornamental foliaged plants Mr. Sharp was 1st; Mr. Vallins 2d; and Mr. Noble, gr. to the Misses Austen, Old House, Sevenoaks, 3d. *Fuchsias* and zonal *Pelargoniums* were also exhibited in this division in good quantities.

One of the principal features of this Society's exhibition are groups of plants arranged for effect; this year there were more exhibitors than usual, and they were especially well done. Mr. J. Waterman was 1st; Mr. S. Cook, 2d; Mr. Pennell, gr. to Mrs. Cazzell, Fair Lawn, Tonbridge, 3d; and Mr. Meakin, gr. to Mr. Bolton and Mr. Hubbard, gr. to Captain Pratt, Dene Park, also put up good groups. For a group of Ferns, Mr. Staples was 1st with a fine group, which was almost entirely of *Adiantums*; Mr. A. Hatton, gr. to Mrs. Scoble, 2d; and Mr. Wood, 3d; and Mr. Waterman, 4th; Mr. F. Webster, of Tonbridge, also showed a good group, not for competition. In the second division, for groups of miscellaneous plants, Mr. H. Vallins was 1st, Mr. G. Wood 2d, and Mr. W. Seiring 3d.

Groups were shown in much better condition than could have been expected considering the season. For twenty distinct varieties, Mr. K. Grey, gr. to Earl Stanhope, Chevening, Sevenoaks, was 1st; the Western Nursery and Seed Co., 2d; and Mrs. Seale, Vine Nursery, Sevenoaks, 3d; for twelve, Mr. W. Webster, 2d; Mr. A. Gibson, 3d; and Mr. J. Hollingworth, Maidstone, 4th. For twenty-four *Dahlias*, distinct, Mrs. Seale was 1st, with a fine collection, and Mr. Cannell, 2d. For twelve, Mr. A. T. Walton, Orpington, was 1st; Mr. H. Jeal, gr. to The Thorns, 2d. For twelve *Asters*, Mr. T. Robinson, gr. to Colingbourne, 1st; Mr. W. Webster, 2d; Mr. J. Hollingworth, 3d. For *Glaudiolus*, six spikes, Mr. S. Cook, 1st, Mr. W. Seiring, 2d, Mr. Goodman 3d. For *Phloxes*, six spikes, Mr. Bolton 1st, Mr. Noble 2d, Western Co. 3d.

Groups of stove and greenhouse cut flowers were very good. Mr. S. Cook, 1st; Mr. Gibson, 2d, and Mr. Bolton 3d. For three pieces for table decoration, Mrs. Hatton, The Quarry, Sevenoaks, was 1st; A. Hatton 2d. For single *ergone*, A. Hatton 1st, Miss Staples 2d, Mrs. Seiring 3d, and Mrs. Hatton 4th. For *Hyacinth* and *Hyacinthus* for arrangement, Mr. Bolton 1st, Mr. Hubbard, 2d. Arranged groups of wild flowers were also shown. A dinner-table-decoration of aquatic flowers and foliage, not for competition, by Mr. F. W. Seale, of Vine Nursery, was especially good, and very much admired. A collection of *Dahlias* and other cut flowers by Mrs. Seale, not for competition, was exhibited and highly commended; as was also a nicely arranged group of perennials, not for competition, by Miss Worsnip.

FRUIT was shown in good condition and in quantity. For six varieties, *Vines* exclusive of *Waterman* was 1st, with good black and white Grapes, Peaches, and Nectarines, a Melon, and Pears; Mr. Pennell was 2d, Mr. Goodman 3d. For a *Pine* Mr. A. Henderson, gr. to Mibleton Park, Tonbridge, 1st; Mr. Pennell 2d. *Plums* were especially good. For six, Mr. Pennell 1st, Mr. Henderson was 2d, Mr. G. E. Raleigh, gr. to Birling Manor, 3d; Mr. Goodman 3d. For three bunches, white, Mr. Gray was 1st; Mr. Goodman 2d, and Mr. S. W. Hill, gr. to Sideup Place, 3d. For a collection of Grapes, three varieties, Mr. Gray 1st; Mr. T. Gunn 2d, and Mr. Pennell 3d.

For a Melon, Mr. Seiring, Mr. Hamu, Mr. Thorne, For Peaches, Mr. Goodman, Mr. Hamu, Mr. Abbot. For Plums, dessert, Mr. Waterman was 1st, Mr. Bolton 2d. For Plums, culinary, Mr. Sears, gr. to Kippington, was 1st; Mr. Waterman, Mr. Gibson 3d. For dessert Apples, Mr. Waterman, Mr. Staples, Mr. Hubbard. For culinary Apples, Mr. Waterman, Mr. Cooke, Mr. Bolton. For dessert Pears, Mr. Waterman, Mr. Bolton, Mr. Staples. For a dish of Cherries, Mr. Waterman, Mr. Bolton, Mr. Staples.

The Western Nursery and Seed Co. also exhibited a collection of hardy fruit and cut flowers, not for competition.

Collections of vegetables were also shown—Mr. Waterman was 1st, Mr. Staples 2d, Mr. Bolton 3d.

The classes for cut flowers produced a large competition, the fruit, vegetables, and plants being especially good.

HASTINGS, ST. LEONARD'S, AND EAST SUSSEX: Aug. 19.

We have to chronicle another most successful exhibition of this flourishing Society.

PLANTS.

Size has with some growers been more the object than floriferous examples. On this occasion some few of the best specimens might even have exceeded in dimensions, so densely packed were they with their respective flowers, whilst a staid plant could hardly, with the care and inspection, have been picked out in either of the classes.

In the open division Mr. Gilbert, of Hastings, repeated his success of the previous week, winning on this occasion with some of the same plants, adding thereto some most brilliant examples, notably a fine specimen of *Kalosanthes coccinea superba*, the deepest

in colour we ever remember to have seen, and then not fully expanded, and a most floriferous and dense bush of *Statice Gilbertii*. *Erica cernua* and *Allananda Hendersonii* were still very fresh and fine. Mr. Portnell, gr. to Sir A. G. Gandy, followed, a capital 2d, having *Dipladenia amabilis* one mass of flowers, and in vigorous health. *Clerodendron fallax*, with sixteen fine heads of bloom, was also a striking object, whilst his specimen of *Bougainvillea glabra* was covered with its mauve-coloured bracts.

In the next class, for six specimens, Mr. Dennis, gr. to C. H. Woodroff, Esq., Silver Hill, occupied the premier position with well grown plants of *Bougainvillea glabra*, *rev.*, *Kalosanthes coccinea superba*, and four others; the 2d prize being well won by Mr. Duffin, gr. to S. G. Jones, 1st, Oakwood, Ore, in whose collection was a very fresh example of Gilbert's variety of *Statice*.

For eight fine-foliage plants Mr. Gilbert was also in the 1st position, with a remarkably healthy collection, the Palms being of that dark green colour that is characteristic of good culture, *Brabeia filamentosus* being especially good, a fine *Croton majestus*, highly coloured, and a clean-cut *Phorranium tenax variegatum* were also noteworthy. Mr. Portnell was awarded the 2d place, with a capital lot of plants, having *Croton Queen Victoria*, very good; so likewise were three Palms in this collection. In the 3d prize collection, from Mr. Dennis, came *Pinus Lambertiana*, *Yucca filifera*, *Yucca rostrata*, and a *Cycas revoluta*, very healthy.

Mr. Gilbert also took the premier prize for eight Ferns, with a fine example of *Adiantum laryense*, and good specimens of *Cyathea dealbata*, and *Dicksonia antarctica*, amongst others. As in the previous case, Mr. Portnell again came in a capital 2d, having a very fine *Adiantum formosum*.

For six *Fuchsias* Mr. Portnell won with ease, having a well grown and freely flowered lot among which Beauty of the West, a light coloured variety, was a striking plant.

In the class for six double *Pelargoniums*, Mr. Portnell, in an exceedingly close competition, succeeded in wresting the premier honours from Mr. Gilbert, both competitors showing first-class specimens of culture, the former exhibitor having *Pirate* very bright, *Madame Hilbert*, *Candilissus* fl.-pl., with five trusses, *Madame Leah Durr*, and *E. W. Wood*, all given above, the latter freely flowered. Mr. Gilbert followed with the five latter varieties, and a fine plant of *Guillon Mangili*, very fresh and healthy.

In the next class, that for single varieties, the same two exhibitors ran each other again most closely, the awards being in the same order as given above. The two collections included finely flowered examples of *President Thiers*, *Corsair*, *Jules Grévy*, *Eurydice*, and *Mrs. Ward*.

For a mixed collection of six flowering and foliage plants, Mr. Gilbert again took the 1st prize, and Mr. Portnell the second, the latter having compact and floriferous examples of *Kalosanthes* and *Statice*, with a good *Allananda*; the latter exhibitor showing a healthy vigorous plant of *Rhopala corcovadensis* not seen in an exhibition tent nearly so good as it deserves to be.

A finely developed tree resulted from Mr. Allen, gr. to Sir Thomas Chassey, Bart., Normanhurst, took the first prize as a foliage specimen, and a very bright example of *Statice* from Mr. Gilbert that for a flowering plant.

For six *Erica* species produced good competition; it is quite a treat now-a-days to see such capital examples of culture, not over large, but healthy and freely flowered. Mr. Gilbert was, however, an easy winner with a selection of the best varieties, which, as a guide to intending growers for the autumn season, we now quote, viz., *Erica* *virgata*, dark red; *sturdy* growth; *E. Aitonii*, *virgata*, one of the best whites; *E. Denisiana*, another fine white that is void of the glutinous substance on the flowers, in other respects somewhat after *E. Hartnellii*; *E. cerinthoides coronata*, a bright red; *E. Fauriana*, a bright pink; and *E. Lindleyana*, something like *E. Massoni*, but a far better flower. Mr. Portnell was 2d.

For six flowering plants, in the second division, the latter exhibitor again showed a capital set of plants, including *Cyrtanthus* and *Androsace* flowers, and a *Yucca Wilburii* with extra trusses, and *Lapageria alba*, the latter having very fine flowers of the purest colour. In another collection we noted a good example of *Euphorbia splendens*, a plant now seldom seen exhibited. Some good examples of plants for the decoration of the table were shown, such as *F. Bicolor*, *E. Aitonii*, *Penk*, *Esq.*, *Croydon*, and by Mr. E. C. Gilbert, *The Old Nurseryies*, Brentwood, Essex.

CUT FLOWERS.

The competition was keen in most of the classes in this department, particularly was this the case with table-decoration, baskets of cut flowers and bouquets, and cuttings being nearly a feet high. It was draped with congratulatory on their respective productions.

In the class open to lady exhibitors only, Miss Stuart, Orwell House, St. Leonard's, was 1st, with a bold and striking arrangement. This basket was considerably larger than is generally allowed for the purpose, the height being nearly a foot high. It was draped with *Pussiflora cerulea* (foliage and blossoms), and the basket itself judiciously filled with appropriate flowers. In many hands such a basket would have been a failure; in this case it was a pronounced success.

Bouquets were shown in considerable numbers. The three highest prizes ran each other closely, though each displayed a different style. These were from Mrs. Baskop, Messrs. Kimmont & Kidd, of Canterbury, and Mr. Gilbert.

Cut Roses were remarkably good for the season, the

two best collections of twenty-four blooms coming from Mr. Slaughter, of Steyning, and Messrs. Woollard, of Cookbridge. The former exhibitor was strong in tea-scented kinds, thus gaining an otherwise close run with his opponents.

The other Rose classes were well filled; so also were those devoted to *Phlox Drmmndoni*, *Dahlias* (show and fancy), *Asters*, *Verbenas*, and *Glaudioli*, those of the latter from Mr. Thos. Bunyard, Ashford, were good in spite of an objection of variety.

The stove and greenhouse cut flowers were very attractive; the two best sets of twenty-four kinds came from Messrs. Gilbert and Portnell, there being little to choose between either, the former having an advantage in quality over his opponent which carried the day.

A most attractive collection of hardy herbaceous cut flowers, pompon, single and decorative *Dahlias*, came from Messrs. Cheal, of Crawley; amongst the former was included good examples of *Eryngium coleostium*, *Echinops retro*, and *E. persica*, *Statice incava hybrida*, and *Trachelium speciosum*, the latter of very good quality.

Mr. G. Gilbert, Queen's Avenue, Hastings, showed some well grown dwarf plants of that useful early *Chrysanthemum*, *Madame Desgrange*.

FRUIT.

The fruit classes were well represented, Grapes being the most notable exhibit. In three bunches of *Black Hamburgh*, in the open class, the latter of Mr. Allen was an excellent 1st with large bunches, good also in colour and berry, winning the 1st prize also for Muscats, with three good bunches. In the any other black class, Mr. Jupp, gr. to G. Boulton, Esq., Eastbourne, was easily 1st, with three splendid bunches of *Black Hamburgh*, well coloured and free from any symptoms of cracked berries; Mr. Johnston, of Bayham Abbey Gardens, taking the 2d, with *Alwinck Seedling* in good condition; whilst *Black Prince*, which a few years back would have won without much difficulty, had to be content with the 3d place.

Cherries were finely shown by Mr. Wilson, Puckley, Kent.

Two classes provided for Apples brought together some good examples, particularly the premier lot of dessert fruit from Messrs. Woollard, who had *White Transparent*, very fine; *Mr. Jupp* being 2d with *Red Astrachan*. With culinary fruit, Mr. Gilmour took the 1st, having fine samples of *Lord Suffield*.

Mr. Jupp was in the front with Peaches, in fine fruit of *Walburton Admirable*; W. Dennis 2d, with *Royal George*, *Early Rivers* being also shown in good order; the latter named exhibitor also taking 1st for Plums, with good examples of *Kirk's*.

VEGETABLES.

These classes were exceedingly well filled, some high-class examples of culture being displayed.

The 1st prize for nine sorts was well won by Mr. Foster, gr. to Mr. Smith, Gre, near Hastings; he had *Pears*, *Onions*, *Gaulflowers*, and *Celery* very fine indeed. The same exhibitor was also prominent in the other vegetable classes with excellent samples.

Peas were in fine condition from Mr. Sutton, Hollingbourne, and from Mr. Duke, of Baitle.

Several classes of several cut flowers and cottagers were well represented; the plants, flowers, and vegetables from the latter growers bore evidence of the excellence of their culture, particularly during such a long period of drought as we have of late experienced.

The growths of *Andra* dark, in which the show was held, were thronged by visitors throughout the afternoon. We also noted that Mr. Stuart, the energetic Secretary, was busy paying the prize-money, instead of leaving this important item in the programme to be gone through at some future period.

HIGH WYCOMBE HORTICULTURAL.

The sixth annual show of this Society was held in Wycombe Abbey Park on Wednesday, Aug. 19. A specially ornamental feature of the exhibition was afforded by the entries for the prize given for groups of plants; there were five entries, and the competition was very close. The 1st prize fell to a very handsome group, consisting principally of varieties of *Coleus* and *Begonia*. Another extra prize for groups of Ferns, grasses, and mosses, brought out three entries. The other prizes included specimens of table ornaments (vases, stands, or dishes), and buttonholes—the latter competition being for ladies only. The first-named class made a capital show. The 1st prize was given to an entry which was held to have excelled the others in the light and natural elegance of its disposition. In its respective half-dozens gaining 1st and 2d prizes, white Roses and Tuberoses were chiefly used; in the 3d, Roses and Carnations.

In the section for plants, embracing eight classes, there was a fair competition, but nothing calling for special notice.

In Section II, for cut flowers, some very fine *Zinnias*, *Asters*, and *Phloxes* were shown. The Roses were also very good, the 1st prize being taken by six very handsome blooms.

SECTION I.—Fruit—was well-contested in nearly every subject; Grapes, especially the black varieties, deserved every praise, and some of the dishes of Peaches were very fine. Apricots were plentifully shown, though the quality was not high; Plums were good, despite the fact that some of the dishes of little attractive specimens; Cherries, Gooseberries, Currants, and Apples were uniformly good, in fact the whole show of fruit, with few exceptions, gained high praise from the judges.

So far we have spoken of the amateurs' or open classes. In the cottagers and allotment-holders' department the

window plants were somewhat disappointing in number, only twelve plants being shown in three classes for six plants, three, and one respectively.

For vases and nosegays of wild flowers there was a close competition, some what less than last year, owing to the scarcity of hedgerow blossoms, but still meritorious.

FRUIT.—The fruit in this portion of the show was excellent in all classes, with perhaps the exception of Green Gages, for which there was only one entry. Apples, Cherries, Gooseberries, and Currants, were on the whole the best classes.

Several exhibits included in the show were not for competition, among them a stand of show and fancy Dahlias, with a collection of bouquet and single Dahlias from Gladioli from Mr. J. M. Turner's variety; a stand of show Dahlias grown by Mr. Turner; a stand including some new and very fine varieties; a stand of French Marigolds from Miss M. Coyle, Springfield; handsome Petunias and Carnations from Mr. J. Wright, Temple End; and a specimen of the curious shrub *Rhus Cotinus* from Mr. A. Pelly, Loudwater, a collection of field roots from Mr. C. Stone, Marsh Farm.

Turning to the VEGETABLES it is sufficient to say that both in the amateurs' and cottagers' classes there was a splendid show. Potatoes and Onions carried off the palm, but with the exception of Peas there was no class well represented. Much interest was shown in the collection of Potatoes from Sir Philip Rose's gardens at Rayners, sent for exhibition; this included dishes of fifty-two varieties, all in the best condition, and as each was labelled with its name a valuable opportunity was afforded of comparing the merits of different kinds of this indispensable tuber.

EXETER HORTICULTURAL.

THE annual summer exhibition of this Society was held on Friday the 21st inst., in the beautiful grounds of Northernhay, by the kind permission of the Town Council. The exhibition itself was a great success. As we should be thankful for small things the committee should take courage at the slight increase of patronage accorded them on this occasion, and continue to direct their efforts in securing still more.

Messrs. Lacombe, Pince & Co., of the Exeter Nurseries, kindly lent a fine collection, arranged on a too feet run of staging in the centre of one of the tents, which added very materially to the attractions of the day. Their Allamandas, of which there were some half a dozen specimens, were grand. *Clerodendron Balfourianum*, and *Dipladenia Brearleyana*, were also well flowered; *Anaryllis*, single and double Begonias, with a fine background of tall Palms, and smaller ones interspersed in the collection, were very pleasing to the eye. The same firm exhibited five boxes of cut flowers of the following kinds;—Carnation, herbaceous, Phloxes, Phlox Drummondii, French and Victoria Asters, &c.

Messrs. Veitch and Son, of Exeter, also contributed a very choice collection of plants, including a very fine set of new double Begonias, Liliums in variety, a set of very fine double Hollyhocks, which are now rarely seen and quite a treat to see; also boxes of Roses, Carnations, single and double Dahlias, &c.

PLANTS

were exhibited in good form, as usual. Mr. Lock, gr. to W. B. Claise, Esq., Newcombe, Crediton, took 1st for ten stove and greenhouse plants in flower, his principal specimen being *Erica Fairriana*, *Allananda nobilis*, *Dipladenia australis*, *Erica amula*, *Ixora Duffi* (nearly twenty heads of bloom), a grand plant; *Clerodendron Balfourianum*, &c., all splendidly flowered. Mr. Rowland, gr. to W. Brock, Esq., Parker's Well House, Exeter, took 2d with a very creditable lot of plants.

For six stove and greenhouse plants in flower, Mr. Teed, gr. to Mrs. Ensor, was awarded 1st honours.

Mr. Lock again secured 1st prize for nine stove and greenhouse foliage plants with *Thrinax elegans*, *Alocasia Tibubantia*, *Cycas revoluta*, a magnificent specimen; *Gleichenia rupestris glauca*, *Croton Warreni*, finely coloured, *Kenia Fosteriana* and *Boleroana*, two beautiful specimens; and *Phlox paniculata*, *Phlox* and *Croton* Willmoreana. Mr. Rowland again taking 2d with a very nice collection indeed, consisting of a fine *Thrinax elegans*, *Arca rubra*, *Croton Disraeli* and *Andreas*, &c.

Mr. Lock was again an easy 1st with a capital collection of nine stove and greenhouse plants, including *Gleichenia sphegnice*, 6 feet in diameter; *Davallia polyantha*, 8 feet diameter; *D. Tyermanii*, and *Moorea*, 8 feet; *Nephtelis davalloides* *Jurans*, *Gleichenia rupestris glaucescens*, and *Adiantum cardifolium* and *triflorum*.

For miscellaneous groups of plants arranged for effect on a stage 25 feet by 5 feet, Mr. Rowland succeeded in taking 1st, with a very beautiful collection indeed, consisting of fine *Cocos Weddelliana* at back, with some splendid bits of *Dipladenia amabilis*, *D. hybrid*, and *D. Brearleyana*, *Oreocarya*, *Valotta purpurea*, single and double Begonias, Liliums in variety, with small plants of *Cocos Eulalia japonica variegata*, *Cyperus alternifolius variegata* interspersed; the whole with a front of *Panicum variegatum*, Ferns, &c.

For miscellaneous groups of plants on a stage 15 feet by 5 feet, Mr. Teed was awarded 1st, with a very pretty collection, including, besides Palms, Liliums, *Eucharis*, *Gloxinias*, *Ericas* in variety, *Valottas*, &c., and was very tastefully arranged.

For six Fuchsias, Mr. J. Staddon was 1st.

For six Lycopodiums.—Mr. A. Truett was 1st.

For twelve Gloxinias.—Mr. Staddon, who had a very fine collection.

In the class for twelve British Ferns, Mr. Mollon was

awarded 1st; and in that for six hardy exotic Ferns, Mr. Mollon was 1st.

Six *Cockscombs*.—1st, Mr. Mollon, who had very fine heads of bloom nearly 18 inches across.

In the class for nine tuberosus rooted Begonias, Mr. Couster and Mr. Rowland were placed equal 1sts, both staging excellent plants; and for six zonal Pelargoniums (single), Mr. Staddon scored 1st honours.

CUT FLOWERS.

Messrs. Curtis, Sandford & Co., Torquay, were 1st with a beautiful box of Roses.

Mr. J. Nation, Taunton, was 1st, with very fine fresh blooms of fifty-eight *Chrysanthemums*.

J. Dalree, Esq., Taunton, was 1st, with a very fine lot of forty-eight Gladioli, but not so good as usual, no doubt owing to the dry season.

FRUIT.

Fruit was quite a special feature of the exhibition, especially Grapes, 137 bunches being staged, and each one a credit to the exhibitor.

For a collection of four ten dishes distinct, four competitors entered the lists, all putting up fine collections, and running each other very close.

For six varieties of Grapes, one bunch of each, six competitors entered for competition, and here the contest was very close. Mr. V. Smith, of Exeter, was eventually the winner of the 1st prize, though his collection was considered by many competent to judge not the best. He had Madresfield Court and Lady Downe's, fine bunches, but not coloured well; Alwick Seedling was good; Golden Champion and Duke of Buccleuch fine in bunch and berry, and Pinchard and Buccleuch rather over-ripe. Mr. Ward, gr. to Earl Radnor, was placed 2d. He had a fine collection—Gros Maroc, medium size bunch; Madresfield Court, good; Foster's Seedling, and Muscat of Alexandria, fine bunches and berries, but not so ripe; Black Prince and Alwick Seedling, fine bunches and well coloured. Mr. James, gr. to Sir J. Walrod, Bradford, was awarded an extra prize, with a very fine lot of bunches indeed, Alwick Seedling and Black Alicante being especially good.

The *Spinaea* Cup, given by R. J. Veitch & Sons, nurserymen, Exeter, was won by Mr. Ward, gr. to Earl Radnor, Longford Castle, Wilts; 2d, Mr. Howell, gr. to the Earl of Devon, Powderham Castle. The classes for single dishes of three bunches each were numerously contested.

Three bunches of Hambleton—1st, Mr. J. Langworthy, gr. to P. Benmore, Esq., Exmouth, who had one very large bunch, the largest in the exhibition, and two smaller ones, but were not well coloured; Mr. James took 2d, with three fine even bunches, good berries, and well finished and deserving of more notice by the judges.

Five bunches of Muscats.—1st, Mr. Stevens, gr. to C. D. Cave, Sidbury Manor, Sidmouth, five bunches; 2d, Mr. Barnes, with equally fine bunches, but thinned rather too much.

Three bunches any other sort, black.—1st, Mr. Stevens, with fine bunches of Pinot Noir.

Three bunches any other sort, white.—1st, Mr. Ward, with three perfect bunches of Buckland Sweetwater, weighing together 12 lb.; 2d, Mr. Barnes, same variety.

Nine Peaches.—1st, Mr. James, with Crawford's Early.

Nine Netarines.—1st, Mr. Seeward, gr. to Sir II. Davie, Credeney Park, Credenion.

Melon, Green-flesh.—1st, Mr. Seeward, with Hero of Lockinge.

Melon, Scarlet-flesh.—1st, Mr. Mairs.

Nine Appricots.—1st, Mr. Mairs.

Nine Apples.—1st, Mr. C. Gidley.

Nine Pears.—1st, Mr. Geeson, with Beurré Giffard.

Nine Apples, dessert.—1st, Mr. Mairs; 2d, Mr. Teed.

Nine Apples, kitchen.—1st, Mr. Underdown, gr. to Sir John Kenway, Escombe, with Lord Suffolk.

Twelve Plums, yellow.—1st, Mr. Powell.

One pound of Cherries.—1st, Mr. Powell.

One pound of Red Currants.—1st, Mr. Powell.

One pound of White Currants.—1st, Mr. Powell.

VEGETABLES.

These were excellent, also numerously contested. The one offered by Messrs. Lacombe, Pince & Co., for collections of twelve distinct kinds, brought six competitors, each showing superb collections. Mr. Sparks, gr. to A. Barnett, Esq., Tiverton, highly deserved the 1st prize awarded to him; he staged splendid Autumn Giant Cauliflower, International Kidney Potato, Gold-finder Peas, Wright's Grove White Celery (remarkably good sticks), Tender and True Cucumber, Snowball Turnip, Golden Globe Onion, Long White Marrows, Student Parsnips, Detham Favourite Tomato (a beautiful dish), Improved Intermediate Carrot, and an exceptional lot of six varieties of Cucumbers. Mr. Teed took 2d, with a very good collection indeed, his best dishes being Gertford Giant Runner Beans, Red Globe Turnip, Duke of Albany Peas, Sulham Prize Celery (very fine), Hathaway's Excelsior Tomato, International Potato, the Improved Intermediate Carrot, and Caroten Leeks (very fine). 3d, Mr. H. Payne, gr. to Colonel Troyte, Hunteham.

HONEY.

Best six 2 lb. sections.—1st, Mr. Geeson.

TABLE DECORATIONS.

These were not competed for so strongly as formerly. Miss Osmond taking 1st, Mrs. Sander 2d—being confined to ladies only.

A COTTAGERS' SHOW.

It was indeed a surprise at Earley the other day, after noting the excessively dried up aspect of pastures and the apparent withering of the trees, to find, in the tents set apart in the pleasure grounds of Earley Court, the residence of Captain Hall, and which overlook Reading, a display of cottagers' garden produce, the which, for the season can only be termed remarkable. How it happens that with almost every one complaining of being burnt up, and crops of all kind failing, cottagers in any locality should seem to be so much better off than even private gardeners, can only be explained by the presumption that in their small gardens watering is not absolutely impossible, and that some either have specially favoured soils, or else trench deeply. At any rate, there could have been seen hardly a severer test of good culture than was found in the singularly perfect and clean samples of the new Intermediate Carrots, about to inches long, tapering, and really beautiful. Then there were also some first-class Persnips as good as good to be wished for, although some others, if clean and straight, are conclusive evidence of the severe struggle they had had with the hard-baked soil. Potatoes were shown in collections, and in four single dish sections, and in two divisions, and consisted of many scores of plates. These were all, for the season, excellent, and raised doubts whether the reported drought was not after all illusory. There were good Peas and Onions, and other good vegetables—were indeed as could be looked for from cottagers anywhere.

Plants, too, are capitally done around Earley, especially Fuchsias, and there seems to be no lack of garden flowers also. The local Society is favoured by having active exhibitors, and numerous parks and gardens in which to hold their annual exhibitions, and it is plainly evident that it is exercising a good influence upon the cottagers of the district.

CHERRIES UNDER GLASS.

YOUR correspondent "Cerasus" desires information as to the cost of cultivating Cherries under glass. Although I have for nearly twenty years grown these in this way very successfully, still I am unable to answer his question in a definite way, simply on account of the produce not being marketed; but the price, "namely, 10s. per pound," which an eminent fruiterer in Covent Garden Market has allowed me on several occasions early in the month of May, when at his request I have obliged him with a few pounds of them, may be taken as a fair estimate of their value in the market at that date I have no hesitation in affirming, after duly considering the cost of production, that this is a crop that would be remunerative. For this object I should neither grow the plants in pots nor ripen them at their natural season, but, on the contrary, resort to the more natural process of planting the trees in suitable and properly made borders, and train them in the house in a similar way to Peach trees, and, above all, have Cherries ripe and fit for market as early in May as possible, as at this period owing to the foreign supply not being in an abundance, and from the superior flavour of English as compared with foreign ones, there would doubtless be a fair demand in the market for them at a remunerative price.

The second question, as to the distinctive features on this subject, which, above others, fits it for house cultivation, I consider to be its adaptability for the purpose. Secondly, the small relative cost involved in the operations; and thirdly, of the advantage obtained in having a most luscious kind of fruit ripe and fit for use at a period of the year at which, above all others, it is much required. With these reasons I concur with your correspondent, "Cerasus," and further add, by all means have a Cherry-house, as well as a Peach-house.

I have for many years past advocated the erection of Cherry-houses, and at different times furnished in my papers upon this subject full details under which a crop of them may with certainty be secured every year, and to show, not in an individual case, their longevity in houses, I may add that now I am "very reluctantly, through age and exhaustion," about to remove an old favourite tree, a Black Chassian of eighteen years' standing, which covers a surface of trellis of 12 by 16 feet, the fruit from which has carried me through many a contest safely.

The cultivation of Cherries in pots is a very interesting method of culture by which capital crops of Cherries can be secured for commercial purposes. However, the plan is not so simple or safe, because, unless the management is entrusted to experienced and skillful hands, the risk of failure, especially from injudicious, or neglect in watering, which makes it palpably greater than under more natural conditions of planting out. G. T. Miles, Wycombe Abbey.

NEW HOLLAND PLANTS AT KEW.

It is generally understood that the first New Holland plants introduced to this country were due to the voyage of Captain Cook between the years 1768 and 1780, who was accompanied on his first voyage by Mr. (afterwards Sir Joseph) Banks as naturalist and botanist. The number recorded in Aiton's *Hortus Kewensis* is, however, few. The next introductions were due to the voyages of Captain Vancouver, who was accompanied by Archibald Menzies as surgeon and botanist. The ship touching at King George's Sound afforded Menzies the opportunity of collecting seeds of many new plants, which were transmitted to Kew in 1794, and considerably increased the collection, especially in Proteaceæ. The next introductions were due to the voyage of Captain Flinders, who surveyed the coast of New Holland, accompanied by Robert Brown as botanist, and Peter Good, a young gardener, as assistant and seed collector. By their labours great additions were made to the Kew collection—Good's dated 1803, and Brown's 1805.

The next special collector was George Caley, a professional horse doctor, who became interested in botany through collecting plants for his horse medicine. He became known to Sir George Banks, who in 1801 appointed him botanical collector in New South Wales for Kew. He remained about ten years in the colony, botanising chiefly in the country about Sydney and the Blue Mountains, and a considerable number of plants were introduced by him. The above introductions and a number introduced by Messrs. Lee & Kennedy, of the Hammersmith Nursery, and a few by private individuals, are all recorded in the second volume of the *Hortus Kewensis*, 1813-14, the total number being 350.

In 1814 James Bowie and Allan Cunningham were appointed botanical collectors for Kew. After spending two years in Brazil, they parted, Bowie proceeding to the Cape of Good Hope, and Cunningham to New South Wales. Arriving at Sydney, 1816, during part of that time he accompanied Capt. King in four voyages of survey of the coast of New Holland; after this he not only botanised in all parts of the Sydney district, but also into the interior, over the Blue Mountains, and visited Moreton Bay and Norfolk Island. By these voyages and journeys he made large collections of herbarium specimens and seeds, and sent many cases of living plants to Kew. At that time Australian plants were much patronised by amateur collectors, which led the proprietor of the Clapton Nursery (which had just been established) in 1823 to despatch William Baxter to Australia as seed collector for that establishment. On arriving at Sydney he hired a vessel to convey him to King George's Sound, where he made large collections of seeds, especially Proteaceæ, and through this the Clapton Nursery became famed for Australian plants.

He made a second voyage from Sydney to King George's Sound and Lucky Bay, and made large collections of seeds, which by purchase became the property of Mr. Knight, the nurseryman at King's Road, Chelsea, whose establishment for a short time was famed for Australian plants. From both these establishments collections of the new plants were presented to Kew.

In 1828 the Swan River Colony was founded, and Captain Stirling was appointed Governor. He took with him William Morrison, a gardener, from Kew, who became a seed collector, and forwarded collections to this country for sale. Other collections were from time to time made in that colony, the principal being made by James Drummond, a trader, who forwarded many collections to this country for sale. By the above means and other sources the Kew collection became greatly increased.

In 1823 the whole of the collections came under my charge, and the introductions of Allan Cunningham and those above mentioned were raised and cultivated by me up to 1864, the collection at that date numbering 1037 species, of which a large number were figured in the *Botanical Magazine*, and other horticultural periodicals of the day. Among them were:—

Of the above list sixty-four species were recorded prior to the publication of Aiton's *Hortus Kewensis* in 1814. In 1823 they were with the general collection of greenhouse plants grown in two lean-to houses Dr. Lindley in his report laid before Parliament in 1840, says:—"A Botany Bay house, 110 feet long, 15 feet wide, with magnificent specimens of New Holland and other plants, especially the former, and a greenhouse (Cape-house), 60 feet long, chiefly filled with specimens of Cape of Good Hope and New Holland plants, among which are some noble Banksias." Consequent on the stage arrangement of these houses none of the plants could exceed 6 feet high, and the largest pots they were grown in were 20 inches to 2 feet. In 1848 the house called No. 1 Conservatory became empty, consequent on the removal of its contents to the Palm-house, and they were succeeded by a collection of Proteaceæ (Australian and Cape) and other tall-growing plants. From year to year they increased in size. By 1862 many of the Banksias and Myrtaceæ were growing in boxes 3 feet to 4 feet square; many of the Banksias and Dryandra having become large plants and flowering abundantly, of which the following are the sizes of a few of the principal:—*Banksia australis*, height 24 feet; girth of stem, 2 feet 5 inches; spread of branches, 12 feet; aged 40 years. *B. integrifolia*, height 22 feet; girth of stem, 2 feet 6 inches; spread of branches, 12 feet; aged 40 years. *B. compar*, height 23 feet; girth of stem, 1 foot 3 inches; spread of branches, 7 feet; aged 27 years. *B. Solandri*, height 20 feet; girth of stem, 1 foot; spread of branches, 13 feet; aged 29 years—a grand plant, the only specimen in Europe. *B. serrata*, height 18 feet; girth of swollen base, 2 feet; spread of branches, 10 feet; aged 40 years. *B. spinulosa*, height 6 feet; girth of stem, 1 foot 3 inches; spread of branches, 4 feet; aged 35 years. *B. Cunninghamii*, height 16 feet; girth of stem, 1 foot 8 inches; spread of branches, 15 feet; aged 38 years. *B. ericifolia*, height 10 feet; girth of stem, 1 foot 6 inches; spread of branches, 6 feet; aged 35 years. *B. latifolia*, height 12 feet; several stems; aged 35 years; *B. elatior*, height 12 feet; *B. Caley*, height 9 feet. *B. littoralis*, height 8 feet, spreading, aged 40 years; *B. media*, height 5 feet, thick bush, spread of branches 4 feet, aged 38 years; *B. grandis*, height 10 feet, girth of stem 1 foot 6 inches, aged 38 years; *B. Bancii*, height 4 feet, bushy, aged 38 years; *B. repens*, stem creeping, producing stiff Fern-like leaves 15 inches in length, aged 62 years.

Dryandra.—The larger growing species of *Dryandra* were bushy plants, 3-5 feet high. The dwarf species were represented by *D. seneciifolia*, *D. obtusa*, *D. pteridifolia*, and *D. nervosa*, the latter being almost stemless, forming a compact hemisphere of rigid leaves, 3 feet high and 3 feet in diameter, being 38 years old. *Grevillea robusta*, the original plant, 13 feet high, 34 years old; *Stenocarpus Cunninghamii*, height 10 feet, 33 years old.

With the exception of *Bellenden montana* and *Cenarrhenes nitida*, *Grevillea banksii* and *gibbosa*, the whole of those in the list were in the garden in 1862. In the autumn of that year the Proteaceæ and the whole of the collection of greenhouse plants were removed to the new conservatory in the pleasure-grounds, but as this was beyond my jurisdiction as Curator of the Botanic Garden, I never saw the plants again. I have, however, learnt that, in consequence of the different treatment they were necessarily subjected to, most of the Proteaceæ died, and few remain. *J. Smith, Ex-Curator, Royal Gardens, Kew.*

SEED RAISING.

TEMPERATURE.—The extremes of cold and heat which seeds are known to bear without any loss of vital energy, although not without interest to horticulturists, need not be gone into here; those conditions which are most favourable only being of direct interest to us at present. It is not always safe to turn to Nature for information on how plants may be best managed under artificial conditions. If we could be sure that a certain natural method was the best that Nature employs, then probably to follow her would be our wisest course. But Nature, like gardeners, has often to have recourse to makeshift plans. Plants are found growing under conditions which do not more than supply the bare necessities of existence. There are numerous instances on record of gardeners having been led astray through copying what appeared to be Nature's plan for the

management of certain plants. Orchids have been found growing on the ground in moist shaded forests, and it was, therefore, assumed that an imitation of the conditions would be most suited to the plants when cultivated in our houses. It was, however, afterwards discovered that the plants found on the ground had been blown down or otherwise removed from their more favoured position on the tops of the trees, where they were exposed to the fierce action of an equatorial sun. In like manner seeds are found germinating in all sorts of untoward situations. If we consider for a moment how various must be the conditions in which the seeds of plants are placed in a wild state, how they become widely disseminated through the agency of birds, water, wind, &c., it is easy to see how mistakes might be made if we were to be guided in our treatment of plants by our knowledge, often only very fragmentary, of how they sometimes exist in Nature.

Nature is a safe guide when we really understand her. In the case of the Orchids above-mentioned she showed us the best treatment for the plants. It was the misjudgment of her imitators that led them to look upon the first conditions under which the plants were found as the most suitable. Mistakes of this kind are only made when the plants are new and their nature unknown. The majority of cultivated plants, for the reproduction of which seeds are relied upon, are well enough understood to prevent errors of treatment. It may be laid down as a general rule to be observed in the treatment of all seeds, that the temperature most suited to their germination and vigorous development should never be below the mean ground temperature in which the plant grows naturally, but if possible should exceed it by several degrees. Many seeds will germinate, though very slowly, in a lower temperature than is good for them. A high temperature will, on the contrary, force all seeds into quick activity. Thus Peas, Beans, and numerous other seeds of quick-growing herbaceous plants which grow out-of-doors with us, will in a temperature of 80° germinate in about one-sixth the time they take when sown in a more natural temperature. With proper care, a degree of heat much in excess of what would prove sufficient may be applied to seeds and plants, often to their advantage. The limits of high temperature for plants are not so strictly defined as the lower limits of temperature are. It is possible that plants do not object so much to extreme heat as to extreme cold, a possibility explained by physiological laws. For horticultural purposes a high temperature often proves of service in the raising of plants from seeds. By sowing seeds of hardy plants and trees in a stove temperature, much time is saved, without any injury to the seedlings resulting. A high temperature will induce old seeds to germinate, which in a lower or more natural temperature would not be excited into growth. "Trial" seeds of vegetables, Wheat, &c., when sown in a warm house to test their health have germinated satisfactorily, but seeds of the same sample when sown out-of-doors remained inactive. Their vital force had become weakened by some cause or other, and it was only under the exciting influences of a high temperature that this could be remedied, and the seeds made to germinate.

The application of unusual warmth sometimes fails to excite into germination seeds which require to lie dormant for some time, or which do not mature until some months after they have ripened. Thus Acorns, Chestnuts, and other seeds of hardy trees were sown fast autumn in a warm house, but refused to germinate, although they remained healthy and apparently uninfluenced by the warmth. Liliu seeds, which out-of-doors often take from one to two years after sowing before they germinate, will, when sown in a warm house, be forced into growth in about three months. On the other hand, some kinds of seed will germinate much more quickly if sown just before they are ripe than if allowed to mature before being sown.

In all cases, however, a moderately high temperature will be found a useful factor in the raising of plants from seeds, and especially when applied to old seeds or those of questionable health. For seeds of tropical plants a temperature of 80° will be found suitable in every case; seeds from temperate climes will germinate freely in a temperature of 65°; those of hardy plants may be sown out-of-doors or in frames in the season at which they would naturally germinate. Where it is found convenient to employ a higher temperature for seeds than they naturally

Species.	Species.
Anadenia 3	Isopogon 14
Banksia (about) .. 3	Lambertia 4
Bellendenia 2	Lumata 4
Cenarrhenes 1	Pera nia 3
Conospermum 3	Petrophila 4
Dryandra 17	Stenocarpus 3
Grevillea 39	Trogon 1
Hakea 30	Xylomelon 1
Hemiclidia 1	

require, some care is necessary after germination has taken place, as, although the excessive heat is productive of good in so far as quick germination is desired, it would have an injurious effect on the health of the seedlings if they were allowed to remain in a high temperature too long. As soon, therefore, as they are strong enough, they should be gradually hardened off till brought into the temperature most suited to them.

Reference may here be made to the effects of climate on the characters of cultivated plants, and especially of those varieties which are the result of cultivation. Numerous facts are on record, tending to show that such plants often owe their most important characters to changes in the conditions of life, and amongst these climate is a great modifier. Varieties of Asters, Stocks, and Roses, as well as of numerous vegetables, which have originated with Continental growers, often lose the character for which they were distinguished after having existed for a time in English gardens. For hardy plants, therefore, it will be advisable to obtain seeds only from those countries whose climate corresponds with our own. *W. Watson, in "Cassell's Popular Gardening."*

(To be continued.)

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, AUGUST 26, 1885.

Aug. 20.—Dull morning, fine and bright from 12.30 P.M. to 1.30 P.M., thunderstorm from 2 P.M. to 4.40 P.M., fine afterwards.

- 21.—Dull day, fine about 5 P.M.
- 22.—Rain in early morning, dull day, fine night.
- 23.—Dull day, fine clear night.
- 24.—Fine day, very fine clear night.
- 25.—Fine bright day, very fine clear night.
- 26.—Fine day, bright mostly, windy.

LONDON: Atmospheric Pressure.—During the week ending August 22, the reading of the barometer at the level of the sea increased from 30.26 inches at the beginning of the week to 30.31 inches by 9 A.M. on the 16th, decreased to 30.05 inches by 5 P.M. on the 17th, increased to 30.13 inches by 9 A.M. on the 18th, decreased to 29.83 inches by 5 P.M. on the 21st, increased to 29.86 inches by 9 A.M. on the 22d, decreased to 29.81 inches by 1 P.M. on the 23d, and was 29.84 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.02 inches, being 0.03 inch higher than last week, and 0.04 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 77°.5, on the 17th, and on the 21st the highest was 61°.9. The mean of the seven high day temperatures was 67°.7.

The lowest temperature was 47°, on the 19th; on the 18th the lowest temperature was 55°.5. The mean of the seven low night temperatures was 51°.3.

The greatest range of temperature in one day was 26°.7, on the 17th; the smallest on the 21st was 9°.7. The mean of the seven daily ranges was 16°.4.

The mean temperatures were—on the 16th, 63°;

on the 17th, 63°.1; on the 18th, 58°.5; on the 19th, 53°.9; on the 20th, 55°.9; on the 21st, 55°.3; and on the 22d, 55°.4; of these, the 16th and 17th were above their averages by 1°.6 and 1°.9, respectively, and the rest were below by 2°.5, 7°.4, 9°.5, 4°.4, and 5°.3, respectively.

The mean temperature of the week was 57°.9, being 1°.3 lower than last week, and 3°.1 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 127° on the 16th. The mean of the seven readings was 104°.5.

The lowest reading of a minimum thermometer placed on grass was 34°.7, on the 19th. The mean of the seven readings was 40°.3.

Rain.—Rain fell on two days to the amount of 0.19 inch.

ENGLAND: Temperature.—During the week ending August 22, the highest temperatures were 78°.9 at Cambridge, 78° at Truro, 77°.5 at Blackheath; the highest at Liverpool was 66°.9, at Newcastle 67°, at Preston 67°.5. The general mean was 73°.1.

The lowest temperatures were 40°.4 at Bolton, 41°.2 at Wolverhampton, 42° at Truro and Hull; the lowest at Newcastle was 49°, at Nottingham 48°, at Sheffield 47°.5. The general mean was 45°.2.

The greatest ranges were 36°.4 at Cambridge, 36° at Truro, 32° at Hull; the least ranges were 18° at Newcastle, 19°.9 at Liverpool, 21°.5 at Preston. The general mean was 27°.9.

The mean of the seven high day temperatures was highest at Truro 73°, at Plymouth 70°.5, at Cambridge 70°, and was lowest at Newcastle, 60°.5, at Sunderland 61°.7, at Sheffield 63°.3. The general mean was 66°.

The mean of the seven low night temperatures was highest at Liverpool, 52°.5, at Leeds 51°.4, at Blackheath 51°.3; and was lowest at Truro, 44°.6, at Wolverhampton 47°, at Bolton 47°.5. The general mean was 49°.5.

The mean daily range was greatest at Truro 28°.4, at Cambridge 22°, at Plymouth 20°.4; and was least at Newcastle, 9°.8, at Sunderland 11°, at Liverpool 12°.4. The general mean was 16°.5.

The mean temperature was highest at Plymouth, 58°.6, at Leeds 58°, at Blackheath 57°.9; and was lowest at Hull and Newcastle, 53°.8, at Truro 54°.2. The general mean was 56°.

Rain.—The largest falls were 0.70 inch at Hull, 0.65 inch at Nottingham, 0.31 inch at Cambridge and Sheffield; the smallest falls were 0.03 inch at Preston, 0.06 inch at Brighton and Bradford. No rain fell at Truro or Plymouth. The general mean fall was 0.20 inch.

SCOTLAND: Temperature.—During the week ending August 22, the highest temperature was 77°.1 at Paisley; at Aberdeen the highest temperature was 65°.6. The general mean was 42°.

The lowest temperature in the week was 37°.3, at Glasgow; at Aberdeen and Greenock the lowest temperature was 45°.2. The general mean was 42°.

The mean temperature was highest at Paisley 59°.1; and lowest at Aberdeen, 55°.3. The general mean was 57°.1.

Rain.—The largest fall was 0.06 inch, at Aberdeen; the smallest fall was 0.02 inch, at Edinburgh. The general mean fall was 0.02 inch. No rain fell at Glasgow, Dundee, Greenock, Paisley, and Perth.

[JAMES GLAISHER F.R.S.]

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE IN THE UNITED KINGDOM, for agricultural and sanitary purposes, for the week ending Monday, Aug. 24, 1885; issued by the Meteorological Office, 116, Victoria Street, London, S.W. 1.—The weather has been again fine and bright over the south-western parts of the kingdom, but generally cloudy or dull elsewhere. Some heavy showers were experienced over England between the 20th and 22d, accompanied by thunder and lightning; but in most places the amount of rain was very slight.

The Temperature has been about equal to the mean in Ireland, but below it both in England and Scotland, the deficit over eastern, southern, and central England amounting to 4°. The maxima, which were generally registered either on the 23d or 24th, ranged

from 65° in "Scotland, N.," and 69° in "England, N.E.," to 75° in "Ireland, S.," and 76° in "England, S.," and "England, S.W." The minima were recorded at most stations on the 19th, when the thermometer fell to 36° in "England, E.," and "England, N.W.," and to between 37° and 44° in all other districts excepting the "Channel Islands," where the thermometer did not sink below 52°.

The rainfall has been slightly in excess of the mean in "England, E.," but less elsewhere, the fall in most places being scarcely appreciable.

Bright Sunshine shows a decided decrease in most of the English and Scotch districts, but not elsewhere; the percentage of the possible duration varied from 14 in "England, N.E.," and 24 in "England, E.," and "England, S.," to 40 in "Scotland, E.," 68 in "Ireland, S.," 70 in "England, S.W.," and 74 in the "Channel Islands."

Depressions Observed.—The only depressions observed in our neighbourhood moved in a south easterly and southerly direction, over Scandinavia, Denmark, and the Netherlands, while over our islands the conditions were generally anti-cyclonic. Light or moderate northerly winds were consequently prevalent during the greater part of the week; on the 20th and 21st, however, they blew freshly on our eastern coasts while at the close of the period very light and variable winds were reported.

Variorum.

WHO IS THE LARGEST STRAWBERRY GROWER IN KENT?—Such was the nature of a query which came to hand a few days ago, with a request that we (*Illustrated Gardening World*) would furnish the most reliable information. Our old friend, Mr. Henry Cannell, who resides at Swanley, in the very midst of the Strawberry gardens, tell us that Messrs. H. & E. Vinson, Swanley, are unquestionably the largest growers of Strawberries in the world, and they are at present much too busy to know the exact quantities they have sent away this year, but they despatched 15,000 peck sieves to commence with. It is computed that they grow 500 acres of Strawberries, and probably pick something like 1000 tons. Mr. Cannell states that he has often seen ten and twelve Midland and Great Northern vans in Swanley Station loading fruit, most of which goes to the great northern towns. These vans take the pickings of the early part of the day, and they are despatched early in the afternoon. They employ about 300 pickers resident in the parish of Swanley, and they employ about 1000 altogether. Any one walking through the Strawberry fields at the time picking is in full swing will find the pickers living in tents set up round the sides of the fields, making a journey to the localities for the purpose, just as the Hop-pickers do in the autumn. At the present time a good deal of the fruit is made into jam on the spot. What a prodigious industry is the Strawberry trade while it lasts! And it is singular to note that so much of it is comprised in that fertile part of Kent known as the Cray Valley.

COCA.—We learn from the *Planters' Gazette* that it seems very probable that the preparation of Coca leaves will before long form an important industry both in India and Ceylon. The plant (*Erythroxylon Coca*) grows well in Malabar, and is easily propagated by seeds and cuttings, while a sample of the dried leaves sent home by Messrs. Hindle & Co., Calicut, was valued at 10s. a pound, and a consignment sent by Dr. Trimen from the botanical gardens at Peradeniya, was valued at 13s. a pound. At present the supply of Coca leaves sent to the market is, for the most part, of very low quality, as sufficient care is not taken in drying and packing them. The leaves ought to be treated with as much care as Tea, or even more, for cocaine, the active principle in the leaves, is very easily decomposed. A brisk demand for the seed has sprung up in Ceylon, but complaints are made that supplies obtained from the Peradeniya garden have failed to germinate. We happen to know, however, that a packet of seed from that source received in this country proved very successful. From what Dr. Trimen says in his last report it is evident that there is in Ceylon already a closely allied species growing wild, *Erythroxylon monogynum*, and we would suggest that samples of the leaves of this plant should be sent home to Messrs. T. Christy & Co. for examination. Dr. Trimen says that the leaves are strikingly like those of *E. Coca*, and it is interesting

to note that in South India they were largely used as food by the poor during one of the late famines, as recorded by Dr. Indie. They may possibly contain cocaine.

Answers to Correspondents.

BUILDING CALCICOLARIA: J. P. We are afraid you will have a difficulty in finding a substitute. The dwarf yellow Ligetes is very useful, and early in the season some of the yellow Panics.

BOOKS: DINNER-TABLE DECORATION: J. B. S. There is a chapter on the subject in Burbridge's Domestic Floriculture (Blackwoods), but we do not know of any separate book on the subject.

CUCUMBERS: Tinsed. Your Cucumbers are affected with the root-rot so often described and figured in these columns. Burn your plants, turn out the soil, and begin afresh.

NAMES OF PLANTS: H. H. The so-called Viburnum viburnum Spruce quadriloba—C. H. Lystichium vulgare, Polygomon persicaria, Caltha palustris, yellow; Cnicus arvensis, white-flowered variety—Lander, 1, Centaurea nigra; 2, Thalictrum flavum; 3, Cephalaria tatarica, so far as we can tell without leaves; 4, Phlox frutescens. S. M. D. Hedyochium grandifolium. One of the tanger-wort family, remarkable for their beautiful Orchid-like flowers and aromatic properties. Ginger and Carlemons belong to the order. Stove treatment or even a greenhouse will suffice if frost be kept out. J. Barm. Orthogonallium thalictroides. It was figured in our vol. six, p. 756, in 1883. J. G. 1, Viburnum Opulus; 2, variegated Sycamore. Of course, it is not a Rose—H. M. 1, Hemizonia pungens; 2, Fimbristylis Pollichi was the plant for which the Horticultural Society many years ago gave a Gold Medal, when discovered as a new British plant!—G. B. Epidendrum campylostach. J. D. P. Spira Lindleyana.—M. P. 1, Anemolium vulgare; 2, Clematis Sieboldii; 3, a variety we cannot name.—G. Abner. Lonchitida Lachmanni.—J. U. Lysimachia grandiflora. J. B. L. Andropogon saccolobus.—Theo. R. C. Cattleya Gaskelliana.

PEARS: H. T. 1, Comte de Lamy; 2, Windor. REMOVAL OF SILBES, &c.: C. B. Your question is an intricate one, which a lawyer could only answer. Probably the best way would be to arrange matters, if you can, with your landlord.

CUT FLOWERS: AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower name and price per unit. Includes Anemone, 12 bunches, 2s. to 4s., Asters, 12 bunches, 2s. to 6s., Bouvardias, per bunch, Carnations, 12 bunches, 1s. to 2s., Chrysanthemums, 12 bunches, 1s. to 2s., Dahlias, 12 bunches, 1s. to 2s., Gladioli, 12 bunches, 1s. to 2s., Helianthus, 12 bunches, 1s. to 2s., Lilies, 12 bunches, 1s. to 2s., Pinks, 12 bunches, 1s. to 2s., Ranunculus, 12 bunches, 1s. to 2s., Roses, 12 bunches, 1s. to 2s., Sweet Peas, 12 bunches, 1s. to 2s., Tulips, 12 bunches, 1s. to 2s., Violets, 12 bunches, 1s. to 2s., P. d. d.

SEEDS.

LONDON: Aug. 25. The attendance on the seed market to-day was poor, and not much business was done. There is still a good demand for Trifolium incarnatum. White Mustard continues in narrow compass, and full prices are made. New Essex Rape seed is held more firmly; quotations are still very moderate. For sowing Rye there has been a better demand; these weeks rates remain unchanged. Winter Vetches more oily freely; supplies only just equal the demand. It is daily becoming more evident that blue Peas are even a shorter crop than was anticipated, values are consequently advancing. For sowing Linseed in ground, J. B. & Co. Ss. Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday English Wheats of the new crop ruled fully 1s. lower, making 3s. to 3s. 1/4; quotations for foreign, including American, were 6d. to 1s. lower. Flour was weakened by the position of the Wheat trade, though quotations were not lowered. New maling barley samples were quoted 3s. as nominal value. Malsters showed no hurry to buy. Barley, Beans, Peas, and Maize may be quoted as without essential change. Common Oats tended in favour of buyers, and the trade generally was very slow. On Wednesday, for Wheat, the tone of the market was depressed, although there was not much further change in quotations. The flour trade was stagnant at rates nominal. All spring corn was very quiet. Average prices of corn for the week ending August 23.—Wheat, 35s. 6d.; Barley, 26s. 2d.; Oats, 26s. 1/2d. For the corresponding week last year:—Wheat, 36s. 4d.; Barley, 28s. 3d.; Oats, 20s. 9d.

HAY.

Tuesday's Whitechapel Market report states that the supplies were not so large, and prices were firm, except for old hay, which was rather lower. Quotations:—Clover, prime old, 80s. to 100s.; prime second cut, 85s. to 107s.; inferior, 60s. to 75s.; new, 80s. to 95s.; hay, prime old, 70s. to 95s.; inferior, 55s. to 65s.; new, 65s. to 81s.; and straw, 28s. to 30s. per load.—On Wednesday there was a moderate supply, for which there was a dull trade at the recorded rates. Cumberland Market quotations:—Clover, best, 50s. to 100s.; inferior, 60s. to 80s.; hay, best, 80s. to 95s.; inferior, 50s. to 70s.; and straw, 30s. to 36s. per load.

POTATOS.

The Borough Market report states that the supply is in excess of demand, which continues dull. Quotations:—Regent, 50s. to 100s.; Magnum Bonum, 80s. to 100s.; Early Rose, 80s. to 95s.; Maincrop, 95s. to 105s.; Shaw's, 80s. to 90s.; kidneys, 100s. to 110s. per ton. The imports into London last week consisted of 489 bags from Boulogne, 46 from Rotterdam, and 220 from Hamburg.

COALS.

The following are the prices current during the week:—Bedale West Hartley, 14s. 6d.; Ravensworth West Hartley, 14s. 9d.; Walls End—Harton, 15s.; Tyne (unscrened), 14s. 3d.; Hutton, 17s.; Hutton Lyons, 15s.; Lambton, 17s.; Wear, 15s.; Carrado, 17s.; East Hartlepool, 10s. and 12s. 6d.; South Hartlepool, 12s. 3d., 12s. 1/2d., 12s. 1/4d., 12s. 1/8d.; Downias Merthly, 10s. 6d.; Radford Navigation, 10s. 6d.

Government Stock.—Consols closed on Monday at 100 1/2 for both delivery and for the account. Wednesday's figures were 100 1/2 for delivery, and 100 1/4 for the account. Thursday's closing figures were 100 1/4 for both transactions.

DEFICIENT CLOVER LEYS SPECIAL NOTICE.

MESSRS. SUTTON Recommend their New EXTRA LATE RED TRIFOLIUM

as particularly valuable for mending deficient Clover Leys, it coming in from two to three weeks later than any other Trifolium, and being ready to cut at the same time as the Common Broad Clover.

Price, 1s. per pound; 105s. per cwt. 2 1/2 lbs. and upwards carriage free.

Seed very scarce. Early Orders requested.

SUTTON & SONS, SEEDSMEN BY ROYAL WARRANTS to H.M. the Queen and H.R.H. the Prince of Wales, READING.

BUY ONLY ENGLISH WATCHES. BENSON'S NEW PATENT (No. 4658) "LUDGATE" WATCH, has obtained the Highest Award of Gold Medal at the Inventions Exhibition, 1885

SILVER, GOLD, £5 5s. £12 12s.

The "Ludgate Watch" is a Silver ENGLISH Lever, of my best London make, with "Special Strength" Three-quarter Plate Movement. Jewelled throughout in rubies—true Chronometer balance—adjusted for extremes with damp and dust-proof patent ring-band and extended barrel—moisture resisting silver case with crystal glass front, which combines the strength of the flatter with the convenience of the Open Face Watch—Holds 36 hours and opens at back.

The immense superiority in Value, Accuracy, and Durability of the "Ludgate" Watch to Swiss and American (made in imitation of and sold as English) and to the Old Full-plate English Lever (sold by other makers), from the great defects of which the "Ludgate" is exempt—is proved by the Award of a GOLD MEDAL the only one adjudged to English Watches. The "Ludgate" is of better quality and runs more than any Swiss watch hitherto made. The "Ludgate" is my best London make—strong, handsome, and reliable—will stand the hardest wear and roughest usage and is therefore the best watch for Home, Indian and Colonial wear by Gardeners (No. 3, large size), Workmen, and Artisans (No. 2, small), Gentlemen, Officers and Men in H.M. services, "Boats" and Boys' (No. 3, small), will be sent, free and safe at all risk, to all parts of the world, for £5 5s. or in 18-carat Gold, crystal glass case, Twelve Guineas (No. 3, small).

A remittance by P.O. Draft, or Cash, must accompany Order. SPECIALLY NOTE that J. W. BENSON is the only Maker of a Three Quarter Plate English Watch for £5 5s. in Silver, or £12 12s. in Gold, and that our Patent "Ludgate" Watch cannot be had through or of any other Watchmaker in the Kingdom. Any infringement of the Patent Rights will be prosecuted against. An Illustrated and Priced Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on application to—

J. W. BENSON, Watchmaker to Her Majesty the Queen, The Steam Factory, 62 and 64, Ludgate Hill, E.C.

And 25, Old Broad Street, London. Consequently under the award of the GOLD MEDAL, the demand, always great, has so increased as to necessitate more extensive Machinery, which now enables us to execute all orders for the "Ludgate" Watch without delay. Illustrated Pamphlets of Watches from £5 to £200, Gold and Silver Jewellery, Clocks (Horse, China, and Turin), Electroplate and Musical Boxes, free on application.

Oil Paint no Longer Necessary.

HILL and SMITH'S BLACK VARNISH,
for Preserving Ironwork, Wood, or Stone.
(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully twenty times cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.
Sold in Casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 8d. per carriage paid to any Station in the Kingdom.

DISCOUNTED TESTIMONIAL.
"Piercefild Park, June 21, 1876.—Sirs, I have this day forwarded from Chestnut to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Piercefild Park, Chestnut.—I am, Sirs, yours respectfully, Wm. Cox."
CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

HILL & SMITH's Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.
Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to
HILL and SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 73, Elmlich Street, Glasgow.

PAVNAERT, E. ROUGIER, and H. J. VAN HULLE, Professors at the Horticultural School of the Belgian Government at Ghent. Post-paid, 10s. per annum.

H. J. VAN HULLE, Botanical Gardens, Ghent, Belgium.

Farms, Estates, Residences. Any one desirous of Renting a Farm or Residence, or Purchasing an Estate, can have copies of the

MIDLAND COUNTIES HERALD supplied free for six weeks on stating the purpose for which the paper is required, forwarding name and address, and six halfpenny stamps for postage, addressed to "Midland Counties Herald Office, Birmingham." The Midland Counties Herald always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to Let.

WANTED, a PARTNERSHIP.—A GENTLEMAN, aged 40, a thorough man of business, with a Capital of £1000, is desirous of joining some well-established Nurseryman. Would give the whole of his time to the business.—HENRY, Knight & Co., 12, Abchurch Lane, London, E.C.

WANTED, a PLANT FOREMAN.—Apply to A. LANCASTER, Holkham, Norfolk.

WANTED, for a Small Nursery, a MAN used to General Nursery Work, where Forced Strawberries and Cut Flowers are grown for Market. If married, a cottage provided. Wages must not be high.—W. DALE, Nurseryman and Fruit Grower, Knockholt, Kent.

WANTED, a SALESMAN with a good knowledge of Seeds and Bulbs. Salary 30s. per week.—A. E., Barr & Son, 12, King Street, Covent Garden, W.C.

Seed Trade. WANTED, a WAREHOUSE PORTER.—Must be experienced. Wages 2s.—H. V. CLARKE and SONS, 29, King Street, Covent Garden, W.C.

WANT PLACES. POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

TO LANDED PROPRIETORS, &c.—A. J. MCINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Garden and Park Grounds, and Remodelling existing Gardens. Plans prepared. 15, Listeria Park, Stamford Hill, N.

Gardeners, Farm Bailiffs, and Foresters. JAMES DICKSON and SONS, "Newton" Nurseries, Chester, are always in a position to receive the highest and most reliable and competent MEN, and thoroughly practical at their business.—Full particulars, with names of previous employers, &c., on application.

To Noblemen and Gentlemen requiring LAND AGENTS, STEWARDS, BAILIFFS, or GARDENERS. JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter.—Enquiries should be made to 237 and 238, High Holborn, W.C.

TO NOBLEMEN, GENTLEMEN, &c., requiring smart, sound, and thoroughly competent STEWARDS, GARDENERS, &c.—We have on hand Applications from several Men of great ability, and shall be pleased to Assist any Noblemen, &c., in obtaining Men specially suitable for their requirements.—VICARS COLLYER and CO., Leicester; A. W. CREWS, Manager.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

GARDENER (HEAD).—Age 38, married, no family; has lived in good establishments, Twenty years' experience. A. P. & S. H. Hants.

GARDENER (HEAD).—Married, no family; through practical knowledge in forcing Fruit, Flowers, Vegetables, and Stove and Greenhouse Plants, five years' excellent reference from last situation, and two years from previous as Head.—F. C. May's, 159, Piccadilly, W.

COACHMAN.—Age 37, married; respectable. Six years' good character.—G. C., Barley House, Queen Hill, near Tewkesbury, Gloucestershire.

HOLLOWAY'S PILLS.—Indigestion and Liver Complaints.—The digestion cannot be long seriously disordered without the derangement being perceptible to the countenance. Good Pills prevent both serious and consequences: they improve the appetite, and with the increase of desire for food they augment the powers of digestion and assimilation in the stomach. Holloway's Pills deal most satisfactorily with deranged or diseased conditions of the many organs engaged in extracting nourishment for our bodies from our various diets—as the liver, stomach, and bowels; over all of which they exercise a most judicious control. By resorting at an early stage of this malady to these purifying and laxative Pills, the dyspeptic is speedily restored to health and strength, and his salowness gradually vanishes.

LOVELS' STRAWBERRY RUNNERS. Strong, healthy, and well-rooted. Sample of Plants, 3d. Price LIST free. W. LOVELL AND SON, Strawberry Growers, Driffield.

HERMAN BUDDENBORG, BULB GROWER, Hillegom, near Haarlem, Holland (formerly BUDDENBORG BROS.), begs to inform his numerous Friends in Great Britain that he has established himself under his own name, and on his own account, as BULB GROWER, NURSEYMAN and SEEDSMAN; and kindly solicits the continuance of the same patronage and confidence as was entrusted to him for so many years. He will be pleased to receive the Wholesale Price LIST of his Commercial Friends, and will mail his own free on demand.

To Nurserymen, Seedsmen, and Florists. DUTCH BULBS—Season 1885. WHY pay Freight from Holland to London on Dutch Bulbs, when you can buy at a cheaper rate, the same quality, and get them brought over free by ordering from LEWIS ISAACS, WHOLESALE IMPORTER OF DUTCH BULBS, at 3, Victoria Warehouse, Mansell Street, Aldgate, E.C.? Established since 1856. Wholesale Catalogue sent post-free on application. An immense stock of all kinds of Bulbs is kept at the above address from August up to end of Dec. in each year.

B. MALLER and SONS beg to offer to the Trade a very extensive and unusually well grown stock of ERICAS (Hymenalis and other varieties) FICARIS, SOLANUMS, GEMMATA CYCLAMEN, BOUVARDIAS, ADIANTUM CUNEATUM and other FERNS, GARDENIAS, STAPHANOSIS, FICUS ELASTICA, GREVILLEAS, VINES in Pots, &c. An inspection is invited. Trade CATALOGUES forwarded on application.

THE ANNUAL SALE by AUCTION will be held on TUESDAY, September 15. Burnt Ash Lane Nurseries, Lee, S.E.

NEW STRAWBERRIES, "LAXTON'S KING OF THE EARLIES" and "THE CAPTAIN." Orders for these remarkable New Strawberries, which are again being largely taken up by Market and Private Growers, should be sent at once, and will be executed in strict rotation, as the continued drought will materially limit the supply. Particulars with prices from T. LAXTON, Seed and Novelty Grower, Bedford.

TO COLLECTORS OF NEW and RARE, HARDY and HALF-HARDY ORCHIDS.

The following exceedingly rare species are being collected for us; special prices (if ordered now), as follows:—

- Bletia variegata**—Height, 3 feet; flower beautiful purple, 2s. 6d. and 3s. 6d.
- Calopogon multiflorus**—Comparatively unknown, very attractive, 2s. 6d. and 3s. 6d.
- Catipso borealis**—Small but uncommonly beautiful species, dark rose, on the lip red dots and rose stripes, a decided acquisition, 1s. 6d. and 2s. 6d.
- Corycium orobanchoides**—Flowers in July, when its most beautiful yellow blooms form a splendid sight, 1s. 6d. and 2s. 6d.
- Cypripedium montanum**—Lovely white and rose, a perfect gem, 2s. 6d. and 3s. 6d. each.
- Cypripedium fasciculatum**—New, magnificent, a few plants A 7s. 6d. and 10s. 6d.
- Disa barthala major**—Most delicate and enchanting pale blue, 3s. and 5s. 6d.
- Disa cornuta**—White and violet with splendid velvety black spots, 5s. and 7s. 6d.
- Disa porrecta**—Very rare and most beautiful, 5s. and 7s. 6d.
- Epipactis gigantea**—Stems to 3 feet high, terminating with very large flowers (five to ten on each), of a splendid purple most beautifully touched with green, 2s. 6d., 3s. 6d., and 5s. 6d.
- Habenaria nycholida**—When well treated this will attain a height of from 3 to 4 feet; flowers these its most beautiful, "the upper part of which is densely studded with large violet-purple flowers edged with the most delicate fringe; the divisions of the lip are fan-shaped and very pretty." *Garden*, 2s. 6d. and 3s. 6d.
- Herschella celestis**—Magnificent form, &c., variety, belonging to the same family as the *Disas*, 3s. 6d. and 5s. 6d.
- Pterygodium alatum, catholium, and cruciforme**—We are open to offer the set of three varieties of this beautiful family at 6s. for the set.
- Satyrion carnum, candidum, cucullatum, erectum, and marginatum**—We are open to offer the set of above five at the low price of 7s. for the set.

N.B.—We are open to offer the above set of twelve species (Pterygodium and Satyrion not included) at the reduced price of 35s. 6d. for the set. This reduced price only refers to this advertisement.

Our Autumn Illustrated CATALOGUE OF FLORAL GEMS gratis and post-free upon application.

VIOCARS COLLYER & CO., CENTRAL HALL, LEICESTER (where all letters are to be addressed), and Glenfield Nurseries, near Leicester. A. W. CREWS, Manager.

PICTA, NEW, BEGONIA REX TYPE.—Silver centre, bright light green margin with silver spots, very beautiful. Good plant, 2s. 6d. post-free. TEA ROSES, own roots, best varieties, 5s. per dozen, carriage paid. Strong plants NIPHETOS Marie Henriette, &c. MAIRIS and CO., Weston in Gordale, Bristol.

Notice to NURSEYMEN, SEEDSMEN, and FLORISTS. WHY PAY Freight from Holland to London on DUTCH BULBS when you can buy at a cheaper rate the same quality and get them brought over free by ordering from M. RAINS AND CO., 34, Mansell Street, Aldgate, E.C. The Old-established Firm since 1856. Named HYACINTHS, first-size Bulbs, at 4s. 6d. 10d. per 100, or 25d. each. Bulbs true to name and colour. Price LIST may be had free on application. Bulbs will be found at this establishment from August until the end of December in each year. HYACINTHS from 5s. per 100; Early Romans, 8s. per 100; Bermuda, Easter Lily.

LILIAM HARRISII.—This Lily, coming direct from Bermuda, must not be confounded with the variety generally sent from America under the above name, to which it is much superior, and different in bulb, growth, and flower.

MR. WILLIAM BULL has just received his usual large importation direct from Bermuda, and can supply good bulbs at 2s. 6d. and 3s. 6d. each; gigantic bulbs, 5s. and 7s. 6d. each; a few rubies, 1s. 6d. and 2s. 6d. each.

LILIAM AURATUM.—MR. WILLIAM BULL is now booking orders for good plump, sound bulbs at 6s., 9s., 12s., 18s., and 2s. per dozen. All other good bulbs at equally low prices. Establishment for New and Rare Plants, 535, King's Road, Chelsea, London, S.W.

Prize Gooseberries and the National Gooseberry SHOW.

ON SALE, the heaviest and best sorts of GOOSEBERRIES, that were shown at the above named show, as inserted in the *Gardener's Chronicle*. Also for Market purposes, CROWN JOBS, LANCASHIRE LADS, ROARING LIONS, KEPSKAFES, and others. They are all on the stocks in the clean healthy tops, and will be offered at unusually low prices. A printed LIST, with price per dozen or hundred may be had post-free on application.

EDMUND SALSÉURY, Melbourne, near Derby. Ferns.—Ferns.—Ferns. TO THE TRADE ONLY.

ADIANTUM CUNEATUM, A. PACOTTI, A. DECORUM, A. CANTON, A. GIBBERN, LASTREA ARISTATA VARIEGATA, nice Plants, in small pots ready for potting on, 20s. per 100, 4s. per 1000. ADIANTUM LE GRANDIE, nice plants, ready for potting on, 20s. per 1000. ADIANTUM CUNEATUM, fine plants, in 4 1/2 and 5-inch pots, 40s. and 50s. per 100. THE LIVERPOOL HORTICULTURAL CO. (John Cowan) Limited, The Vineyard and Nurseries, Garston, Liverpool.

To the Trade only. E. H. KRELAGE and SON, NURSEYMEN, Wholesale Catalogue (No. 3790) of Dutch Flower Roots and Miscellaneous Bulbs and tuberous-rooted Plants for 1885-86, is now ready, and may be had free on prepaid application by Nurserymen, Seedsmen, and Florists. The Catalogue, although giving only an extract of the collections, forms a pamphlet of 488-890, in two columns, and is doubtless one of the most complete sent out of this speciality. The prices of Hyacinths in general are considerably lower than before. The prices of other Bulbs, too, are in many instances inferior to former quotations. German and French editions as well as a separate English edition for America, are published.

The Success of the ROSE SHOWS. P. A. T. U. L. AND SONS' H.P. MADAME NORMAN NEURDA—The perfection of a show Rose. First-class Certificate Royal Horticultural Society, July 14. H.P. LONGFELLOW—The new Moss Rose, vigorous, violet. Charles I. felicitate. H.P. PRIDE OF REIGATE—The finest striped real autumn flowering Rose. First-class Certificate Royal Horticultural Society, July 14. The Set of the Three, good Plants in pots, for budding from; or strong good Plants in November; 21s. the Set. Order at once. The "Old" Nurseries, Cheshunt, Herts.

AFRICAN TUBEROSES,

GROWN BY

WM. RISLEY, Maritzburg, Natal
(the Original Grower).

Consignments of these beautiful Bulbs have already been landed, and are now offered at very low quotations. They are far away superior in every respect to any hitherto imported, and they have never opened up in such exceptionally fresh and healthy condition.

The undersigned is prepared to show samples at his office, or to give full facilities for inspection of bulk, and to receive orders. Intending buyers are advised to make an early application, as the supply is limited.

Terms—Cash in exchange for Delivery Order.

HYACINTHS, EARLY WHITE ROMAN.
—May be had in bloom before Christmas. The best pure White for forcing. Fine bulbs now ready.

IRIS KÄMPFERI—in about twenty different shades of colour. This grand Japanese Iris is hardly yet known in this country, but should be grown by every lover of flowers. It is by far the largest flower of this family, with most striking colours. We offer well established English-grown Roots; also many other varieties of Iris.

IRIS CRATEROIDES—Brilliant Crimson. This is about the most showy of this useful family of Bulbs.

IRIS VIRIDIFLORA—a most uncommon colour amongst flowers—very striking, being a decided green with black eye. Also many other varieties of Iris, a family which only requires to be more widely known to be grown as largely as the Tulip or Hyacinth.

LILIAM CANDIDUM—the Old White Garden Lily. Fine Bulbs now ready for Planting or Forcing.

NARCISS and DAFFODILS—in great variety—Choice and Common.

SCILLA SIBIRICA.—This charming rich Blue variety is now as cheap as the Snowdrop, to which it makes a good companion and contrast.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 5, 1885.

DR. VON REGEL.*

WE have already briefly noted the cele-
bration of Dr. Regel's seventy-first
birthday, and, to fire the ambition of our
young gardeners, we now add a few particu-
lars of his career, which commenced as an
apprentice in the ducal gardens of Gotha,
and has culminated in the title of Excellency,
and the position of Director of the Imperial
Botanic Garden of St. Petersburg. Regel's
father was a Professor in the Gymnasium or
College at Gotha, and garrison preacher at
the same time, but it was not considered
beneath his son's station to enter the ducal
gardens as an ordinary apprentice, which he did
at the age of fifteen. Here he spent three years,
and during this period he attended the com-
mercial school to improve his knowledge of
modern languages, and study the higher mathe-
matics and arithmetic. He very early evinced
a love for gardening and botany, keeping his
father's garden in order, and taking lessons in
botany and entomology at the age of thirteen.
When he left Gotha for Goettingen in 1833, at
the age of eighteen, he was well acquainted with
the flora of Thuringia. For two and a half years
he worked in the Goettingen Botanic Garden as a
volunteer, and attended the botanical lectures,
and then for a year and a half longer worked
regularly in the garden, associated with Preiss,
subsequently well known for his botanical
collections in West Australia. During this
period it was his mother's desire that he
should devote himself entirely to the study
of natural history, but Regel demurred, fond
as he was of it, preferring to pursue the
career he had entered upon of a practical gar-
dener, and devoting his leisure time to scientific
studies. Here he benefited greatly from the
lectures of and personal intercourse with Bart-
ling. From 1837 he served as journeyman
gardener in the botanic garden at Bonn, where
he had charge of the hardy plants and seed
department. During the day he worked prac-
tically, and studied regularly every morning
from 2 till 6 before beginning his daily
task. Indeed, it is stated that during his
stay at Goettingen and Bonn he slept
on an average only five hours out of
the twenty-four. On holidays and Sundays he
made botanical excursions, often starting on
Saturday evening, walking six or eight hours'
journey before sunrise, and then botanised all
day, and walked back on Sunday night, never
failing to be at his work at 6 o'clock on Monday
morning. Of course, this demanded something
more than perseverance; physical strength and
a sound constitution were necessary. At Bonn
Regel formed an acquaintance with Trevisanur,
Wichura, Seubert, and J. Schmitz, and jointly
with the last published a *Flora Bonnensis*.
In 1839 he proceeded to Berlin, where he
remained in the same position as at Bonn until
1842. Here the friendship of Klotzsch and the
near herbarium were of great assistance. Link

* Extracted from a memoir by Dr. Wittmack in the *Berliner Gartenszeitung*.

and Kunth, the directors of the garden, troubled themselves little about it. The herbaceous plants, annual and perennial, had been neglected for years, and were in a sad state of confusion, but by dint of labouring from early morning till late in the evening Regel reduced the collection to excellent order. It was during this period, too, that he wrote his *Hauptmomente des Gartenbaus durch Physiologie begründet* ("The Principles of Horticulture based on Physiology") which appear in the *Gardeners' Chronicle* in the form of a translation and preceded Lindley's *Theory of Horticulture*.^{*} Among life-long friendships here cemented were those of Warszewicz, H. Wagner, and Dr. Klotzsch.

In February, 1842, Regel was appointed head gardener of the Zurich Botanic Garden, which, although beautifully situated, was poor in plants, and insignificant in every respect. The institution derived its funds from trade in plants, but Regel found no plants to sell—the first year's income therefrom being only 300 francs, against 30,000 francs in 1855, the year he left. Through his friend Warszewicz he obtained many fine novelties from Central America, which he cultivated and described, and which afforded him material for exchange with German and Belgian gardens. The Gesneraceæ were his special favourites, and he succeeded in raising a number of beautiful hybrids. Finally he founded a trade in seeds, and by these various means raised the reputation of the garden, which his successor, M. Orgies, has well maintained. During this period Regel did not merely superintend others, he worked with his own hands. Here his literary activity may be said to have begun. In conjunction with Professor Heer he founded, in 1843, the *Schweizerische Zeitschrift für Land und Gartenbau*. Later the agricultural and horticultural parts were issued independently, and Regel continued to edit the latter until 1852, when it was replaced by his well known *Gartenflora*, which he carried on himself until last year. Of his many writings of this period an article on the hybrid origin of *Ægilops triticoides* is one of the most remarkable, for in this he clearly refuted Lindley's view that *Ægilops ovata* was the plant from which Wheat had descended. He also demonstrated that hybrids between distinct species are not invariably sterile. Before he left Zurich the University bestowed on him the title of Doctor of Philosophy. In 1845 he married a Swiss lady, and settled down as it were in his adopted country; but in 1855 he was offered the post of Scientific Director of the Imperial Botanic Garden of St. Petersburg, which he accepted though not without many regrets for the beautiful land he was leaving. This post he held until 1867, but in consequence of the administration being in other hands, he was unable to

effect so much for the establishment as he wished. On the other hand, in spite of all difficulties, he founded, with the assistance of others, the Imperial Horticultural Society of St. Petersburg, which has now eight affiliated branches in distant parts of the empire. In 1868 Regel's intimate friend, Trautvetter, was appointed Practical Director of the garden, and thenceforward their gradual improvement has proceeded without any check. Since 1875 Regel has been sole Director, and his efforts for the advancement of horticulture and botany generally are so well known as to need no further comment. The success his exertions have attained in Russia must be highly gratifying to him, and the splendid recognition of his services on his seventy-first birthday prove how much they are appreciated. He has further the satisfaction of cultivating and describing the numerous novelties collected by his son, Dr. Albert von Regel, in the most remote parts of the vast Russian empire. Honours and dignities have been showered upon him by the Russian, Prussian, Italian, and Brazilian sovereigns, to say nothing of the numerous learned societies in Europe and other parts of the world; and we wish him many years to enjoy them. He is an instance of what may be effected by untiring industry, and such an example should stimulate beginners to aim at the combination of theoretical and practical knowledge to the fullest attainable extent, and it should stimulate those who have passed the threshold not to relax their efforts, for although few become leaders in their profession, all should strive to do so, as knowledge is of itself a reward and consolation.

New Garden Plants.

ADIANTUM MAIRISII, n. sp.

FRONDS triangular, quadripinnate, papyraceo-membranaceous, dark green, somewhat pale beneath; pinnae ovate, and as well as the pinnules and pinnules furnished with rather long, slender stalks; ultimate pinnules cuneate-trapezoid; those near the base of the pinna smaller, cuneate, with an irregular truncate apex, those towards the end of the pinnae larger and more trapezoid, with a lobate margin, the terminal one largest, with a distinctly cuneate base, the two external edges unequally lobed; fertile pinnules, with the anterior and exterior sides lobate and soriferous, the edge cut out into oblong, concave sinuses, which gives a sort of bluntly cuneate aspect to the principal pinnules; sori linear-oblong, slightly curved, with an open sinus, from $\frac{1}{2}$ to $\frac{3}{4}$ inch long, the few shorter ones oblong-reniform; rachis clemous, glossy; caudex not seen.

This is a very characteristic and handsome Maiden-hair Fern, which at first sight is suggestive of a large form of *A. cuneatum*, but which is soon seen to be quite distinct therefrom in its coriaceous pinnules. Were it not for its strongly marked cuneate pinnules, especially all the smaller ones in the central parts of the frond, its oblong fructification would lead us to think of it as belonging to the type of *A. Capillus-venerei*. It is supposed to be a hybrid having, we presume, been found as an accidental seedling amongst other Ferns; and if it be so, as seems very probable, it may be a cross between *A. Capillus-venerei* and *A. cuneatum*. It was sent by Messrs. Mairis & Co., nurserymen, of Weston-in-Gordano, Bristol, and may well bear their name, since that of *A. hybridum*, which they had applied to it, is not in these days sufficiently definite.

The largest specimen before us, a fully fructified one, is about a foot high, and 8 to 9 inches across, loosely branched, the pinnae, pinnules, and pinnules having all rather long and slender stalks, so that the centre of the frond is somewhat open. The lower branches of the pinnae bear distinctly wedge-shaped pinnules, with the upper end obliquely truncate, and showing less of the coriaceous character than the larger ones situated towards the apices of the pinnae and frond, which measure $\frac{1}{2}$ an inch or more along the lower margin, the larger ter-

mal pinnules being often 1 inch long. The sori are much elongated in most cases, slightly curved, with the concave side outwards, so that the two ends project like short blunt horns from the margin. The recurrence of this character in a prominent degree throughout the fronds, gives to the variety its most distinctive peculiarity. We regard it as one of the best of the ornamental group of Maiden-hair, and presume it requires the treatment. *T. Moore*.

DENDROBIUM CHRISTYANUM, Rehb. f.

I was much pleased to get a fine specimen of this, full of leaves, from Mr. A. H. Smee, from The Grange, Carshalton, Surrey. The leaves are rather thick, the longest exceed two inches in length, not surpassing much half an inch in breadth. They are cuneate, oblong, ligulate, neatly covered with hairs, which are very conspicuous on the pallid inferior side. Their top is unequal, one side prolonged into a blunt tooth, the other shorter, abrupt. The lamelloid three ridges on the lip are red in the centre, orange at the base and apex, while they were totally red in Mr. Christy's original plant. *H. G. Rehb. f.*

ORCHIDS FOR AMATEURS.

(Continued from p. 256.)

BOTH Cattleya and *Leelia* belong to the great division of the Orchid family known to botanists as the Epidendreae—"Growers upon trees." These plants are so named from their epiphytic habit, but the division by no means contains the moiety of Orchids which grow upon the branches of trees. Those of the other group—the Vandeeæ—are equally epiphytic. The botanical characters distinctive of the Epidendreae are the following:—

The anther—that is, the cavity which contains the pollinia—is at the apex of the column; the pollen masses are waxy, four or eight, rarely two in number; and the caudicles to which they are attached are not united to a viscid disc-like glandular structure which separates with them, as they are in the Vandeeæ. It needs some little practice and care to distinguish between the Epidendreae and Vandeeæ, and the comparison of the flowers of the two groups should be carefully made with reference to the structure of the pollinia, so that the Orchidologist may learn to distinguish between them.

The type genus of the Epidendreae, *Epidendrum*, is a very large one; over 400 species have been described, all from Tropical and Subtropical America, the northern limit being Texas, and the greater number flourish on lofty mountains.

The majority of these plants, though very fragrant, have small green, or unattractive flowers, so that they are not often cultivated, but a few are exceptionally beautiful, and are eagerly sought for by collectors and growers. These plants fall into five very distinct sections, which, but for the botanical characters of their flowers, might well form as many distinct genera. They are—

1. The Nemorale section, distinguished by their ovate pseudobulbs.
2. The Aurantiacum section, which have bulbs resembling those of a Cattleya.
3. The Bicoloratum section, with cylindrical jointed pseudobulbs, resembling those of the thick-bulbed *Pendulobulbs*.
4. The Barkeria section, usually regarded as a distinct genus by horticulturists. These have thin cylindrical pseudobulbs, each new bulb growing from a joint of that of the preceding year instead of from a rhizome.
5. The Radicans section—plants without pseudobulbs, having the habit of a Vanilla, or a long straggling Vanda, with a thick jointed stem clothed with a double row of alternate fleshy leaves.

I. THE NEMORALE SECTION.

Epidendrum nemorale majus, a native of Mexico, with large flask-shaped pseudobulbs 2 or 3 inches in diameter, each with two pale green, strap-shaped leaves on its summit. The flowers form a panicle which springs from the top of the pseudobulb. The inflorescence is often 3 feet long, with from twenty to fifty flowers, each flower 4 or 5 inches in diameter. The flowers are pale mauve, with the apex of the column and three lines at the base of the lip of a darker tint. The petals and sepals are narrow and pointed (lanceolate), and the blade of the labellum is very broad, and folded fanwise. The main peduncle

* We have reproduced this statement for the purpose of correcting it, especially as a fair inference therefrom is that Lindley may have been misled by the impression which they worked quite independently of each other, whatever the merits of their respective theories; for their writings were published so near the same time as to render it impossible that either was aware of the existence of the other's work. In the first place, Lindley's *Theory of Horticulture* was published in full before any part of Regel's articles on the same subject appeared in the *Zeitschrift für Land und Gartenbau*, and this fact disposes of the claim of priority for Regel. This assertion is supported by dates. The first edition of Lindley's *Theory of Horticulture* appeared early in 1840, so early, indeed, that it was noticed in Loudon's *Gardener's Magazine* for February, 1840; and the first instalment of Regel's *Hauptmomente* was published in the *Berliner Gartenzeitung* for March 14, 1840; indeed there was just a possibility of Regel having seen Lindley's work before sending his own to press. A German edition of Lindley's book was published at Vienna in 1842, and another, translated by Trevisan, at Erlangen, in 1842.

It is also an error to say that Regel's *Hauptmomente* appeared in the form of a translation in the *Gardeners' Chronicle*; indeed we can find no mention of the work, and it is not likely that it was mentioned because the first volume of the *Chronicle* came out the following year, 1841. We doubt even whether a complete English translation of Regel's series of articles existed in the *Chronicle* at the time of its publication. Lindley without any intention of casting a doubt on the good faith of Dr. Wittmack, and without the wish to detract from the merits of Regel's work; indeed great credit is due to him, for he is a much younger man than Lindley, for his perception of the need of scientific method in practical gardening and for his attempt to supply the want.

of this beautiful species is covered with little asperities, which are a very good guide in choosing the bulbs, as these are so similar to many other species with flowers of no great beauty, that even the best judges are often deceived in buying imported plants.

CULTIVATION.

This plant flowers in June or July, and should be kept at rest and cool for four or five weeks after flowering. As the rest is needed in the hottest months of summer this can only be insured by withholding water, but the bulbs must not be allowed to shrivel. Growth, when once it commences, continues through the winter, and the plants should be placed in the lightest and most airy part of the Mexican-house. As water must be supplied stagnant air is most hurtful. In spring, when the flower-shoots appear, the plants should be removed to the Cattleya-house until the flowers are expanded, otherwise these will not be fully developed. Unlike most Orchids, this species only requires a very short rest. It has been cultivated with *Epidendrum verrucosum*, a plant of little or no horticultural interest.

Epidendrum prismatocarpum.—A plant with ovate somewhat compressed pseudobulbs, each bulb with a long narrow neck, so that it may be well described as flask-shaped, bearing two bright green leaves. The flowering stem arises from the top of the bulb, as it does in nearly all *Epidendrum*s, provided with bulbs, and bears from eighteen to twenty flowers in a panicle; flowers $\frac{1}{2}$ inch in diameter, sepals of a pale green or cream colour spotted with large black spots, lateral petals of the same colour as the sepals, but without spots; labellum three-lobed, terminal lobe rose-coloured and broad. This plant is very rare; it is a native of the mountainous regions of Central America, and was originally imported from Panama.

CULTIVATION.

This plant requires the same treatment as the last, and I may here remark that good drainage, so essential to all Orchids, is, if possible, even more essential to the well-being of the *Epidendrum*s, which must be kept growing through the winter. The plant is so named from the prismatic form of the seed-pod.

E. Brassavola has the habit and appearance of the last species, but the flowers have some resemblance to those of a *Brassavola*, hence the name. They are 4 inches in diameter, and a number are borne on a raceme. They are very persistent, lasting some weeks. The sepals and petals are of a rich yellowish-brown, but the labellum is white and mauve. It flowers in spring, and is fragrant in the evening. It should be grown in the Mexican-house.

E. vitellinum.—From the lofty mountains of Mexico. This plant flourishes at an elevation of from 3000 to 6000 feet, amongst Lichens, Dog-Roses, and Strawberry-beds, facts which sufficiently indicate cool treatment, without which its cultivation cannot be successful. The pseudobulbs are almost spherical, and about the size of a pigeon's egg. They are surrounded by broad scales, and are surmounted by two glaucous green ligulate, or strap-shaped leaves. The inflorescence is racemose, each raceme consisting of from twelve to fifteen flowers. These are of a bright orange-yellow colour, with a small yellow labellum. The petals and sepals are arranged in the form of a fan. It is best grown in the *Odontoglossum*-house, or a cool greenhouse, where the summer maximum temperature never exceeds 75°, and the winter minimum is never less than 45°. The variety called *majus* differs only in the size of the flowers, and in having broader sepals and petals, which overlap each other.

E. phoeniceum.—A very beautiful species with large ovoid pseudobulbs not unlike those of *E. nemorale*. The flowers form a large branching panicle, and the flowering stem is from 2 to 3 feet long, and bears twenty or more flowers of a deep purple colour and fleshy texture. The flowers are 2 inches in diameter. The lip is three-lobed, the lateral lobes square and directed forward, so that they are nearly parallel with each other. The central lobe is rounded and folded like a fan. This plant requires the temperature of the East Indian-house to bring it to perfection. It is a native of Cuba. It is not generally fragrant, but a variety,

E. phoeniceum var. vanillosum, has the perfume of Vanilla. The petals and sepals are edged with yellow, and the labellum is white. It is imported from the Antilles.

E. atropurpureum, also called erroneously *E.*

macrochilum.—This plant was discovered by Humboldt and Bonpland in Venezuela, but it is also a native of Panama, Guatemala, and Columbia. The pseudobulbs are large, and somewhat pyriform, measuring 2½ inches in diameter. When young they are smooth and dark green, but the old bulbs are paler, and rough; each has two or three broad strap-shaped leaves. The flowers are very large, nearly 3 inches across, sessile on the peduncle. The petals and sepals are green, deeply blotched, and shaded with a rich chocolate-brown. The labellum is three-lobed, the lateral lobes embracing the column. The terminal lobe is white, with a deep crimson spot at its base. A variety is described in which the ground tint of the labellum is rose. This species requires the temperature of the Cattleya-house.

E. ambiguum.—A native of Guatemala. This plant has small ovoid pseudobulbs, strongly ridged when mature, with three or four narrow strap-shaped leaves. The flowers are $\frac{1}{2}$ inch in diameter, star-shaped, with narrow pointed sepals and petals of a very pale green colour—"eau de Nil." The labellum is very broad, strongly plicated, like a fan, white, with fine rays of deep violet and crimson. The inflorescence is a branched panicle, composed of twenty or thirty flowers. It flowers in June or July, and requires an intermediate temperature. It should be grown in the Mexican-house. The flowers last several weeks.

(To be continued.)

ASHTON COURT, BRISTOL.

In connection with the extensive internal alterations in the mansion here, that have been completed during the present summer, is the construction of a winter garden, or more correctly speaking the conversion of what was originally the clock tower into a structure of this description. Before attempting to describe this new glass-covered garden, it may be well to say a word about the approach leading to it from without. The entrance is by the central door on the south front of the building, and leads from the terrace which overlooks the flower garden.

Here a large massive door of carved oak gives ingress to the hall, which is situated immediately under the clock tower.

The old ceiling to this hall has been replaced by a beautiful groined roof, exquisitely traced; and the arms of the family forming an appropriate decoration in it. This hall admits to the winter garden, the roof of which, being constructed of iron of ornamental character, and roughened plate glass, gives a pleasing diffused light, sufficient for the needs of the plants intended to be grown in it. The floor is tessellated, and is laid with sufficient fall each way from the centre to cause the water—a liberal use of which is indispensable where plants are to be kept in health—to run readily off. The internal arrangement consists of an open central space, with beds around abutting on the walls; these beds are irregular in size and outline, the margins being curved in some places, and acutely angular in others.

At the eastern end, opposite to the principal doorway leading to the rooms at the western end of the Court, a piece of water has been introduced; this also is irregular in shape; at the back of it, and in other places, a little rockwork, composed of well-chosen rugged stones, has been pruned with good effects. Pockets for Ferns and other suitable plants have been made here and there against the walls, and at other points where green drapery was required. In the selection of the plants, and in their disposal, Mr. Bethell has been very successful. I have known him as an adept at this kind of work before, having previously seen what he could accomplish in this line, but have never seen anything of the sort more effective than the arrangement here, although the time available for arranging the whole was limited to some two or three days. Tall Palms, Tree Ferns, Araucarias, Dracaenas, Dasylirions, and other plants with handsome foliage form the leading feature in giving a tropical appearance to the place. The filling in is composed of small Palms, Ferns, Lycopodiums, *Asparagus plumosus*, *Imantophyllum*, and such flowering plants as are in season. The rustic stonework, and also the outer edges of the beds, are draped with trailing plants, the margins of the miniature pond being alike clothed with suitable things. The walls have been draped with climbing and hanging plants, as also the roof, from which a number of baskets depend, filled with Achimenes, drooping Ferns, and

plants of like character, collectively, giving the whole a finished appearance, such as might only have been looked for after a much longer period had elapsed from the time when the builder had completed his work. This garden, as well as the hall adjoining, is lighted by electricity, some twenty-four burners being used.

Amongst the different houses filled with plants in beautiful condition, the conservatory is especially worthy of notice. In it are a host of flowering and fine-leaved subjects, with climbers overhead including *Bougainvillea glabra*, which to be seen at its best must, as here, have plenty of head room. On the back wall there is an immense example of *Cassia corymbosa*, occupying a large space and covered with hundreds of its bright yellow corymbs of flowers. Few summer bloomers make so telling a display as this fine old plant when seen as it is here.

ORCHIDS.

Both cool and warm species, are making free growth. Amongst summer flowering kinds there is a plant of *Scaccolobium Blumei*, with eight spikes of bloom on a single growth, presenting collectively such an amount of flowers as are rarely met with.

INDOOR FRUITS.

Amongst these still remaining the crop of late Peaches is very good, the fruit abundant, and highly coloured. In the houses occupied by Muscats and late Black Grapes there are good crops that give promise of finishing up well. Mrs. Pince is particularly fine, carrying handsome bunches of full-sized berries well up in colour.

THE GARDENS.

The extensive flower garden was in splendid order; the arrangement differs from that usually met with, inasmuch as there are large clumps of evergreen shrubs and single specimens interspersed freely through the garden. There is also less formality in the form of the beds, varying, as they do, much more in size and general appearance than where a strictly geometrical arrangement exists. The planting has been well done in the different styles of mixed beds of flowering subjects, whilst in others the occupants consist of a single colour, edged in the usual way with something different. Others again are planted carpet fashion; these also are very effective, with the soft, delicate tints predominating over the brighter colours. T. B.

THE APPLE CROP IN NOVA SCOTIA.

THE principal orchards where a supply is obtained for the English market are in Annapolis and King's Counties, and from them the following notes have been received.

ANNAPOLES COUNTY.

Mr. W. V. Vroom, Clementsport, reports "almost a failure," Nonpareils, Baldwins, and Bishop Pippins yielding "almost nothing."

Mr. A. B. Parker, South Farmington, reports crop below an average even for a short year.

Colonel Starratt, Paradise, confirms his previous report, that the crop will be under average, but that quality never showed better at this season of the year, the fruit being of good size and free from blemishes. A wind storm on August 4 and 5 caused damage in some localities.

Mr. Albert Beckwith, Nictaux, reports Nonpareils almost an entire failure; Baldwins and other winter sorts will give a very small crop; some Gravenstein orchards are pretty well filled, but the crop will be half that of last year. Taking all kinds there will not be more than a quarter of a crop.

The Hon. George Whitman, Round Hill, reports not more than half a crop. The quantity grown in the county last year was estimated at 200,000 barrels; this season's crop will not be half that quantity. The trees are making good growth, and look healthy.

Mr. L. W. Elliott, Clarence, reports under average. Orchards in grass not well mulched have a light crop; those under cultivation either very well filled, or making a good growth. Baldwins, that did not bear last year, will give a fair crop. Bishop Pippins look well, large and smooth, free from spots (this variety had become so poor of late years as to lose caste in the market); Nonpareils very light. Quinces were very much injured by the cold winter.

KING'S COUNTY.

Mr. R. W. Starr, Starr's Point, reports, as before

that the crop will prove nearly up to the average in quantity, and, judging from present appearances, the quality will be much better than last year, as the fruit is well advanced for the season, and there is very little appearance of "black spot" or "mildew," that have been prevalent during recent years.

Mr. James Patterson, jun., Aylesford, reports below average and not exceeding half of last year's crop in quantity. Plums a complete failure.

Mr. Henry J. Chute, Elm Farm, Somerset, reports below average; Baldwin's short, as it is not their bearing year; Ribston Pippins looking fair, and most other sorts as well as could be expected after the heavy crops of last year.

Mr. C. F. Eaton, Lower Canard, confirms his previous report, that there will not be an average crop, although some orchards look well.

In other counties of Nova Scotia, Apples are grown chiefly for home consumption. *G. Lawson, Secretary, Agricultural Department.*

THE MARIANNE NORTH GALLERY AT KEW.

THIS grand collection of paintings of "plants and their homes" is now very widely known and appreciated, yet doubtless there are still many persons visiting Kew Gardens who are unaware of its existence. From time to time notices of the pictures have appeared in these columns; and it is worth repeating, if only to show what can be accomplished where there is a will, that they are the work of one person—Miss Marianne North, who presented the building and all its beautiful contents to the public. The gallery is free to all, as everything else is in Kew Gardens, and open from 1 till 6, or dusk in winter. It was thrown open three years ago last June (see *Gardeners' Chronicle*, n.s., xvii., 1882, p. 763), when there were upwards of 600 pictures representing nearly 1000 of the most beautiful and singular forms of plant life in the most remote and diverse parts of the globe. There were pictures enough indeed to fill the gallery, but the painter did not intend ceasing to wield her deft brush for the pleasure and instruction of those of her less fortunate fellow creatures who are unable to visit distant shores; and accordingly a new wing was at once planned and built for the reception of the results of other distant journeys. First came a splendid addition from South Africa (see *Gardeners' Chronicle*, n.s., xx., 1883, p. 564), followed by the rare and elegant Palms and other plants of the fast disappearing native flora of the remote Seychelle Islands; and this year have been added many of the glories of the vegetation of extra-tropical western South America. Both the original gallery and the new wing are now full to overflowing, the walls being actually covered from dado to cornice. Familiar and unfamiliar flowers and fruits are there from almost every clime, often associated with dull or brilliantly coloured birds, or butterflies, or curious insects, or mammals, or reptiles. There may be seen more or less numerous examples of the vegetable and animal, and sometimes of the human life, of Teneriffe, of South Africa, the Seychelles, Ceylon, and India (from Bombay and Calcutta to the slopes of the towering Himalayas), of Java, Borneo, and Japan, of East, West, and South Australia, of Tasmania and New Zealand, of Chili, Brazil, and the West Indies, and finally, of California and eastern North America. What wealth of form and colour! Everybody should go to see them, especially every gardener, for there may be seen portrayed many magnificent plants which, from various causes, cannot develop their full beauty in this country, even under the most careful and skillful treatment.

The last addition, which is from Chili, is particularly interesting, alike for the paintings of well-known trees, and shrubs, and herbs, in their homes, and of almost unknown plants of great beauty. As Miss North says herself (*Pall Mall Gazette*, March 11, 1885), her chief object in going to Chili was to see and paint the old forests of *Araucaria imbricata*, "known in England as the Puzzle-monkey tree, rather unexpressably, as there are no monkeys here to puzzle; probably they crossed the Cordilleras in disgust at the general prickliness of all plants here, especially the *Araucarias*, and never came back again." Miss North had previously seen and painted the Brazilian *Araucaria*, and the more important food-yielding *Bunya bunya* (*Araucaria Bidwillii*) of Queens-

land, besides the small-leaved *A. excelsa* and *A. Cunninghamii*; so she approached her task with all the advantages of a critical knowledge of her subject. *Araucaria imbricata* is the most familiar of its genus to the inhabitants of this country, being planted in all sorts of suitable and unsuitable places, including the tiny fore-garden of many a suburban cottage. Living plants of it were introduced into this country in 1796 by Archibald Menzies, who accompanied Vancouver on his voyage round the world; and one of them still survives at Kew, though it has lost its lower branches and is not in a vigorous condition. In favourable situations in this country, as is well known, it retains its branches from the ground upwards to a height of 60 feet and more; but in its native country, as Miss North's pictures show, the branches successively die upwards, and the artist describes the Chilean *Araucaria* forests in the following words:—"Soon after reaching the first *Araucarias* we found ourselves surrounded by them and all other trees gave way to them, though the ground was still gay with purple Peas and orange Orchids, and many tiny flowers whose name I did not know, and which I had not time to paint—such flowers when picked die almost directly. Many hills and the valleys between were covered with old trees, covering some miles of space, and there are few specimens to be found outside of their forest. I saw none over 100 feet high or 20 feet in circumference, and, strange to say, they seemed all very old or very young. I saw none of those noble specimens of middle age we have in some English parks with their lower branches resting on the ground. They had not become flat-topped like those in Brazil, but were slightly domed, like those of Queensland, and their shiny leaves glittered in the sunshine, while their trunks and branches were hung with white lichen, and the latter weighed down with cones as big as one's head. The smaller cones of the male trees were shaking off clouds of golden pollen, and were full of small grubs, which, I suppose, attracted the flights of parrots which I saw so busily employed about them. These birds are said to be so clever that they can find a soft place in the great shells of the cone when ripe, into which they get the point of their sharp beak, and fidget it until the whole cracks, and the nuts fall to the ground. It is a food they delight in, and men too, when properly cooked, like chestnuts. The most remarkable thing about the trees was the bark, which was a perfect child's puzzle of knobby slabs of different sizes, with five or six decided sides to each, and all fitted together with the neatness of a honeycomb. I tried in vain to find some system on which it was arranged."

This bark is, indeed, truly wonderful, and very effective it must be in Nature. *Gay (Flora Chilena*, v., p. 415) describes it as being built up of polygons of various sizes, like a piece of mosaic work.

Perhaps the most striking object in the Chilean paintings is the colossal Bromeliacea, a species of *Puya*, the name of which is a little uncertain, because several names have been proposed for what in all probability are differently coloured varieties of the same species. Miss North's own description of the specimen she painted (reproduced from *Gardeners' Chronicle*, n.s., xviii., 1885, p. 78) conveys a good idea of the aspect of this noble plant, which is hardy in favourable situations in this country:—"The flower-spike is over a yard long, its stalk 6 feet. It has sixty spikes, arranged screw-fashion, round its stalk, each about a foot long, and round these are rosettes of flowers, and some score of buds of the tenderest green or lemon colour. The great heads, before the flowers come out, are wrapped up in covers of white kid tinted with salmon, getting darker as they fall aside and the lemon buds push themselves out, and the first flowers which open round the base of the spikes near the stalk are of the purest turquoise-blue; is the new rosette which replaces them is darker, metallic blue, and then all the others seem to get more and more green and faded the farther they get from the stalk, and more separate, with a background of brown bracts or leaves, the original white kid covers."

The foliage, it should be mentioned, is like that of the Pine-apple. *Gay* recognises only one arboreal species of *Puya*, the flowers of which, he says, are of a somewhat greenish-yellow, adding that the plant was rather common in dry places in the central provinces, where the stem was called *chagual*, or *masqueu*, the leaf *cardon*, and the flower *puya*. *Puya Whytei* (Hooker, *Bot. Mag.*, t. 5732) is almost certainly the same species as Miss North has painted, and this is

not specifically different from *P. cœrulea* (Miers, in *Bot. Rep.*, 1840, t. 11); it is a superb plant, and flowered in the open air in the establishment of Messrs. Veitch, of Chelsea; and in Mr. Tyerman's garden at Tregony, Cornwall, from a plant in which our page illustration, October 1, 1881, was taken. *Puya chilensis*, syn. *P. concolorata* (see *Bot. Mag.*, 4715), apparently differs very little, if at all, except in the colour of the flowers, which are of a greenish yellow. Miss North's picture represents the whole inflorescence of the *Puya* natural size, and the plant is shown growing in several of the views. In the dry region, visited and painted by Miss North, various *Cacti* abound, and are very conspicuous, notably a *Cereus* (probably *C. quisco*), and the common *Opuntia* (*Cereus quisco*) is related to the (in Europe) more familiar *C. peruvianus*, and is, according to *Gay*, of magnificent aspect, and the commonest in Chili, growing as much as 20 feet high.

Another conspicuous plant in the Chilean paintings is *Embothrium coccineum*, which was in its full beauty at the time of Miss North's visit. The *Acaea* (or *Prosopis*?), and bird's nest referred to in the letter cited above, is one of the artist's characteristic pictures of birds and flowers. Among many unknown forms gardeners and amateurs will recognise such old friends as *Schizanthus*, *Loasa*, *Fabiana*, *Tricopelium*, *Tacsonia*, and *Eccremocarpus*. But this notice is already long enough, and readers, who can, are again advised to go and see the pictures. They are immediately to the left on entering, where the Teneriffe ones were first placed, and near to the Brazilian. The present edition of the catalogue does not contain descriptions of the South African, Seychelles and Chilean pictures; but this want is in a measure supplied by written names and notes on cards below them. *W. B. Hensley.*

COMMON GARDEN INSECTS.

THE grass at our feet is the abode of countless numbers of insects. The roots often pierce the roof of underground habitations, and many a stalk is cut down by eager little teeth to make way for the opening of subterranean passages leading to insect-dwellings. No better example of this numerous grass-life could be given than that of the tribe of grasshoppers. Trees, especially the Oak—which it has been calculated gives support to no less than 200 distinct species of insects—are much frequented by this class of insect, as a type of which we give the large species (*Acrida viridissima*), shown in fig. 62, amongst the grass at the foot of the Oak. The loud buzz emitted by this insect is caused, as in crickets, by the friction of the bases of the elytra or wing-cases. They sing during the months of July and August, and a portion of September, especially in the evening; the males only sing, the females produce no sound. It is a remarkable fact that the Grass-hopper Lark, which feeds upon these insects, emits a similar noise. When multiplied by thousands of individual insects, the song of the grasshopper merges into a loud and continuous murmur. It is a pretty insect, of yellow-green colour of variable depth of shade which harmonises so well with the leaves that it is frequently a difficult matter to discover the singer; moreover, the slightest alarm given to the insect in the way of moving a neighbouring leaf, &c., is sufficient to cause its instant silence. When walking in the vicinity of grasshoppers those immediately around cease to chirp, and their ears, or rather organs of hearing, seem to be no less acute and sensitive than are the wonderfully sharp eyes of butterflies. The leaping power of the grasshopper is surprisingly great; we had the curiosity to measure accurately the leap of a grasshopper measuring three-quarters of an inch from head to tip of folded wings or elytra. We found that this insect sprang at one bound on level ground a distance of 4 feet 5 inches, or over seventy times its own length. Another insect, however, must have immensely greater leaping power than this—though we have never actually used the measuring tape in this case—namely the common "frog-hopper," to which curious little insect we shall refer hereafter.

The great green grasshopper has sharp and powerful jaws, and can inflict a slight wound on the human hand. The ovipositor of the female is a curious instrument, and gave rise to the generic name applied by some entomologists to this insect—*Phasgonura*, meaning sword-tailed. The eggs are hatched in early spring, the larvæ being very minute, somewhat similar in appearance to the fully grown insect, but devoid of wings. On the Oak tree, on that portion where the bark is removed, is seen in our drawing

(fig. 62) one of a class of insects exceedingly destructive to many trees. This is one of the long-horned beetles which, both in the larval and perfect states, are destructive to timber. The species given is *Aromia moschata*, or the Musk beetle—a pretty insect possessing, as its name implies, the pleasant odour of musk. It emits, like the last-mentioned insect, a sound or squeak, which is produced by the friction of the head-shell against the thorax-shell. It generally frequents the Willow, but does not confine itself to that tree. The eggs are deposited in holes bored in the bark of the tree, and the larva eats its way into the wood, especially the wood immediately beneath the bark, the diameter of its borings increasing as it grows.

Another interesting tree-devourer is the Sawfly (*Cimbex lutea*), shown in the figure in the act of flying, nearly above the grasshopper. The instrument from which it has derived its name is a most ingenious structure, being, in fact, two veritable tenon saws with sharp compound teeth at the tail end or abdomen of the insect. The saws work side by side and in

scales, which impart to some species remarkable beauty, but which readily rub off. A gorgeous little beetle, found plentifully on the Hawthorn, especially in blossom-time, and named *Otorhynchus picipes*, is possessed of a brilliant green and gold covering which sparkles in the sunshine with uncommonly fine effect. Another common but not so pretty weevil, styled *Phytomyza tigrinus*, is shown on the left of the sawfly, on an Oak leaf. It is notable, not on account of its beauty, but for its remarkable cocoon, which is considerably larger than the insect, and constructed of a silken netting spun from the body of the larva, and resembling the webbing of some large spiders. It is attached by silken threads by the upper portion to the underside of a leaf or other convenient object, and hangs suspended.

Ladybirds (*Coccinellidae*) are another well-known tribe of beetles, which somehow or other are always treated with more tolerance and excites more interest than any class of insects except butterflies—of which assertion no better evidence exists than in our children's nursery-rhyme books. There are many species

SEED RAISING.

(Continued from p. 282.)

MOISTURE.—We sow seeds in soil, not because the chemical nature of the soil itself has any influence on the germinating process, but because of its being a suitable medium in which the conditions essential to germination—*i.e.*, warmth, moisture, and air—are brought to bear upon the seed; it also is there ready to receive the roots of the seedling as they develop, and to supply the plant with food as soon as it begins to shift for itself. Moisture and heat are two principal causes of germination; without them germination is impossible. The water supplies oxygen sufficient to enable the seed to get rid of the large amount of carbon which was necessary so long as the seed remained dormant, but which alone was detrimental to growth. Water also has a softening influence on the often hard shell in which the seed is enclosed, thus rendering the escape of the embryo from the seed much easier than if the outer coats remained hard. To afford

FIG. 62.—COMMON GARDEN INSECTS. (SEE TEXT.)

opposite motion. When the female is about to deposit its eggs it adroitly cuts a groove in a twig or leaf, and passes an egg between the two saws into the groove, accompanying it with a glutinous secretion which firmly fastens the egg and retains it in its groove. One egg after another is deposited in a similar manner until all have been disposed of. The larvæ, as soon as hatched, commence the business of eating, and some become full-grown, as seen in the figure on a leaf at the top left-hand corner. This larva has the property to discharge from tiny apertures along the sides of its body a greenish fluid, which serve no doubt as an efficient protection from many of its enemies. The chrysalis, or cocoon, is of brown colour, and leathery material, seen in the figure as an oval mass attached to a twig. The cocoon and its dormant inmate survive the colds of winter, and in early spring emerges the perfect fly.

A class of insects, well known under the general term of "weevils," are to be found in great numbers and variety, the different species of which vary in colouring from the most brilliant green and gold to the dullest brown and black, inhabiting the Oak and other trees. Most of the tribe of weevils have, like butterflies and moths, a covering of microscopic

of ladybirds which are difficult to distinguish one from another, as the same species varies greatly in colouring, and in the number of its spots on the wing-cases. In the illustration we have figured a common species (*Coccinella septem-punctata*) in the act of flying. It has seven black spots—as its name indicates—on its elytra; it feeds alike in the larval and perfect states upon the destructive greenfly, or plant-lice, the diminutive but powerful enemy of gardener and farmer.

One of those elegant and active little butterflies recognizable in our figure as being one of the blues is represented on the right of the grasshopper with its wings folded over the back. This is the Bedford blue (*Polyommatus Albus*) the smallest of British butterflies. *C. Francis Young.*

"LUSIADAS" ROSE.—Some of the Continental horticultural journals narrate how a Portuguese nurseryman has offered a new carmine coloured Rose for sale at a high price. Unfortunately it has been discovered that this splendid new Rose is simply *Celine Forestier*, which has been suffered to absorb some aniline dye, in the same manner that the blooms of the white Lily are occasionally treated.

the seeds the amount of moisture they require, we either bury them in moist soil or sand, or place them under atmospheric conditions such as would fulfil the same purpose. So soon as absorption takes place, germination will or ought to commence. Old seeds or immature ones will often fail to grow if kept very moist, but may be induced to push into activity by keeping them comparatively dry till germination has commenced, increasing the amount of moisture as growth continues. "When the vital energies of a seed are diminished, it does not lose its power of absorbing water, but is less capable of decomposing it. The consequence of this is that the free water introduced into the system collects in the cavities of the seed and produces putrefaction; the sign of which is the rotting of seeds in the ground."

At Kew, where all kinds of seeds are received in large quantities annually, it is the custom to treat old or sickly-looking seeds as follows:—The seeds are first thoroughly dried, so as to destroy any germs of decay or disease of any kind which may have attacked the seeds before their arrival. They are then spread out thinly upon slates, placed in a warm and moist atmosphere, and covered with a sheet of paper. If vitality has not been destroyed, this

treatment generally brings about germination, on the first sign of which the seeds are placed in soil. Any healthy seed will germinate if immersed in water of the required temperature, but unless the plant be an aquatic the excess of water soon proves fatal. For all seeds of terrestrial plants, therefore, no more moisture should be allowed than is sufficient to keep the medium on which the seeds are sown in a moist condition. An excellent guide to follow is that of the plants to which the seeds belong, giving their seeds the same amount of moisture as would be enjoyed by the plants themselves.

In the case of very fine seeds which are sown on the top of the soil, it is wise either to stand the pots containing the seeds in shallow pans of water, so that the soil may be kept moist by capillary attraction, or to effect the same purpose by dipping the pots almost up to the rim in water, and holding them there for a few moments till the soil has become thoroughly moistened. The length of time seeds may be allowed to remain in water without injury depends on the nature of their outer coverings. Mr. Darwin made numerous experiments for the purpose of discovering how long the seeds of land plants might be immersed in sea-water without losing the power to germinate. He found in many instances the time was unusually long, some of the seeds thus tested germinating after an immersion of 137 days. In like manner many seeds may be kept in fresh water for a long time, if the temperature is not high enough to excite germination.

It is quite a common practice with gardeners to steep hard-coated seeds in warm water for a few hours before sowing, the effect of which is the softening of the seed-coats and the excitement of the vital principle, so that germination is much quickened. Peas, Beans, Erythrins, Acacias, in fact all those seeds belonging to Leguminosae, may be thus treated before sowing. The effects of soaking in warm water are sometimes of a startling character. At Kew, some time ago, a number of large seeds of various kinds were examined after having been sown in a warm house for over a year, and were found to be quite intact, but showed no signs of germination. They were then placed in water heated to 160°, and allowed to remain in soak for twenty-four hours, after which they were re-sown. In less than a fortnight after this most of the seeds had begun to germinate, and nearly every seed eventually grew and formed a strong plant. In the same establishment large numbers of Brazil-nuts, Sapucaia-nuts, and other large hard-coated seeds, are annually sown, and it is found that by carefully removing the shells before sowing, germination takes place much more speedily than when they are allowed to remain. The same plan is often had recourse to in the treatment of seeds of Olives, Coffee, &c.

Aquatic plants such as Nymphaeas, Victoria, Euryale, the Buckbean, &c., naturally shed their seeds in water, where they remain dormant as long as the temperature of the water is low, germinating freely and developing into plants on the return of a higher temperature. Although it appears to be Nature's plan to preserve these seeds in water, yet they may be kept for a long time in a perfectly dry condition without losing their vitality. Seeds of Nelmium have been known to germinate after having been kept dry for over one hundred years.

These seeds may be kept equally well in water if the temperature is not allowed to approach that which induces germination. There are instances recorded of seeds which had commenced to grow having been dried again, and which, on being replaced in a moist situation, grew freely without suffering materially from the check. But these are exceptional cases, and by no means such as need be regarded as of horticultural importance. There can be no doubt that when once germination has begun, any check to its progress is as likely to prove fatal as it would be in the case of eggs after incubation had commenced. All seeds, therefore, should be kept dry and in a low temperature till required for sowing, and when once wetted, no check in the shape of drought or low temperature should be permitted, for even if such check do not prove fatal, it cannot but prove highly injurious to an organism of such extreme delicacy as a germinating seed or seedling.

LIGHT.

It is generally believed that darkness assists germination, and that light retards it, but whether

the presence or absence of light alone affects the germinative process either one way or the other has not yet been clearly shown. Various and numerous experiments have been made to test whether the action of light on germinating seeds is for their good, and the general conclusion thus arrived at appears to favour the view that it is not. If this were not so, it might be asked, why cover seeds with earth, or, if fine, place them in a darkened position? The answer to this question must be, that seeds are covered, not so much to exclude light as to keep them uniformly moist, and to prevent irregularities in temperature. For all seeds sown out-of-doors we know that a covering of soil, varying in depth with the size of the seeds, is necessary, and the same is understood to apply for seeds under glass, unless they be very small. Yet we know that moisture, and a certain degree of heat, along with atmospheric influences, are sufficient to cause any seed to germinate, whether placed in darkness or in bright light.

Frequent proofs of this occur in the propagating department at Kew, where, as is stated above, many kinds of seeds are sown annually. In addition to this, the discussion on the question of darkness for seeds, which took place in the horticultural papers some time ago, led to various experiments at Kew to test how far light affected the process of germination. Seeds were sown on the surface of soil, on cocoa-nut fibre, and in water in a bell-glass, and to prevent evaporation squares of glass were placed over the seeds in such a way as would admit sufficient air without excluding any light. The result of these experiments appeared to show that light did not prevent, nor appreciably interfere with, germination, the seeds starting into growth at about the same time as those which were covered with soil in the usual way. Before it can be satisfactorily proved that these conclusions were safe more experiments will be necessary, but so far as we have gone the evidence gathered favours the opinion that light alone does not interfere with the germination of seeds. Every gardener knows how freely the smallest seeds will vegetate if sown on the surface of soil, covered with a pane of glass and placed on a shelf near the light; seeds of such plants as Gloxinia, Gesnera, Primula, Calceolaria, Begonia, and Bertolonis are commonly sown in this way. Orchids, too, are raised from seeds scattered upon the surface of living sphagnum moss, where darkness is out of the question. If fine seeds are not injured by light, may we not conclude that larger ones are equally unaffected by it? Experiments like the above prove that such is most probably the case.

As already stated, seeds are covered with soil to afford them the necessary moisture and warmth; it is also necessary, at least, in the case of large seeds, to enable the root to take firm hold of the soil, by presenting an opposing force to the pressure of the root as it prolongs itself and pushes its point into the ground. For these reasons, irrespective of the question of light, a covering of soils is beneficial to all but the smallest seeds. Various scales have been given of the different depths at which seeds of different sizes should be sown, but the best we can suggest, and the one found least likely to mislead, is that the thickness of the covering of soil for seeds should not exceed their own diameter. For seeds sown out-of-doors it is perhaps better to sow a little deeper, for the sake of a proper degree of moisture, and to prevent their being eaten by birds, &c. Under glass this rule can never be far wrong. Deep sowing is often unfavourable to germination, rather because of the exclusion of a due amount of air, than through darkness or the absence of any other condition. Numerous instances of this are not unfrequently recorded; as, for instance, when land has been cleared of trees, or when the earth has been turned over to any depth, a new vegetation springs up, which is often composed of plants unknown in the near neighbourhood of the newly-cleared land, and must therefore have sprung from seeds buried in the earth at too great a depth to permit vegetation. Seeds thus buried retain their vitality for a very long period. At Kew it sometimes happens that seeds which on first sowing were buried too low down in the soil have remained dormant for a long while, but on bringing them nearer the surface they generally germinate soon.

Dr. Lindley mentions an instance of how seeds of Flax were covered by deep sowing: "The injuriousness of covering seed with too much earth arises less

from the superincumbent pressure of the soil than from the exclusion of atmospheric air, which is quite indispensable to germination. The seed of the common Flax comes up at different periods, according as it is planted in 1, 2, or 3 inches depth of soil; if it be sown 4 inches below the surface it will not come up at all. Not that air does not penetrate to this depth in the soil, but the quantity of air will very much depend on the looser or denser character of the soil."

SOIL.

For all seeds of any size and the vegetative power of which is strong and quick-acting, the soil most suitable is such as the plants would thrive best in when large. It is always best to use a finely-sifted soil, at least for delicate-rooted seedlings: for the smallest seed the mixture ought always to be sifted through a sieve with a $\frac{1}{4}$ -inch mesh. Various mixtures have been proposed as suitable for all seeds: Lindley suggests equal portions of peat, loam, and sand, others advise all sand, and others prefer sandy loam. If what has already been stated is accepted, it will be seen that the plan here advised is a safe one—viz., to use a mixture similar to what the plants would prefer, plus a larger quantity of sand. If it be borne in mind that the nature of the soil does not in any way affect the process of germination, providing it does not exclude essential conditions, it will be seen that the soil most likely to satisfy the wants of the young plant as soon as it begins to search for its own food is that which it thrives in when strong. Mr. Anderson Henry, who was a most successful raiser of delicate seeds, preferred a compost of equal portions of peat, loam, and sand with a little pulverised leaf-mould added. It is, however, difficult to lay down a hard-and-fast rule in this matter, owing to the varying nature of different soils in different localities—what is good for a certain plant in one place being unsuited for it in another. In this and in all other questions that concern the management of seeds a great deal must be left to the intelligence of the gardener, to whom, if the fundamental principles of germination are properly grasped, the special conditions essential to the welfare of seeds and seedlings will readily suggest themselves. By first of all inquiring into the nature of the plants from which the seeds have been obtained, and ascertaining the conditions under which they are known to thrive, the treatment necessary for their seeds may be soon arrived at. *W. Watson, in "Casell's Popular Gardening."*

(To be continued.)

ENSILAGE OF MULBERRY LEAVES.

DURING the silk-worm rearing season in Northern Italy a large quantity of Mulberry leaves are sent by rail from one place to another, and in many cases the railway administration run special night trains for this purpose. The leaves are packed loosely in sacks, and often arrive at their destination far from fresh, and consequently, if not totally unfit, at all events cannot afford a wholesome food for the nourishment of these insects. An experiment was made during the present season, by a silk producer in Lombardy, in sending the leaves compressed, and for this a bale was made, weighing 116 kilos., by placing the leaves between two round pieces of board (in this case the bottoms of barrels), and compressing them in an ordinary wine-press; the bale was then firmly secured with iron wire. By some oversight this bale of compressed leaves, made on May 23, was not forwarded to Milan, and from thence to Nigarda, until the morning of the 31st, and consequently it did not arrive at its destination until later. On opening the bale the leaves, with the exception of about 2 inches in thickness round the outside, were found to be perfectly fresh and sweet, and even these were only faded, and found to be not unfit for food.

This is a conclusive proof that the nutritive qualities of the leaves can be preserved for some time, if compressed, and the air thus excluded from them; care, however, must be taken not to crush them, and injure their tissues by excessive pressure. From that it would appear that a system of ensilage might be adopted with advantage for preserving Mulberry leaves in the same way that it is for forage. Another advantage of such a plan would be that the leaves so compressed would be reduced in bulk, and conse-

quently fewer trucks would be required to carry a given quantity of leaves than there is in the ordinary way; and by ensiling the leaves grown on the warmer side of the Apennines—as, for instance, on the “Riviera” of Genoa, &c.—it would be possible to supply the silkworm rearsers of Piedmont and Lombardy during backward seasons, or when, from other causes, the leaves are scarce and expensive. *Journal of the Society of Arts.*

FORESTRY.

CLEARING UP AFTER STORMS.

The severe storm with which this country was visited on the 9th and 10th of the past month, and which did so much injury to farm and garden crops in general, will no doubt have given most foresters extra work in the way of removing fallen trees, pruning broken and twisted branches, fence-repairing, road-clearing, and the bestowal of extra vigilance on all watercourses, including ditches, closed drains, and culverts. Wherever trees have been uprooted, the policy grounds should receive first attention. These should be cut up, removed, and the roots buried or otherwise disposed of without delay. A good way to get rid of upturned roots is to dig a hole of sufficient size immediately behind them, and into which they will fall when severed from the trunk. Dig the hole of sufficient depth that the root may have a covering of at least 2 feet of soil. In some cases where an out-of-the-way place is contiguous to the timber, it may be convenient to have the roots conveyed there, but usually the quickest and least expensive method to dispose of such is by burying. In removing broken and twisted branches, prune off close to the stem, and paint the seal with tar, or deface by rubbing with a damp sod of earth. Marks of pruning being objectionable when they are within view of drives and walks, should always be obliterated.

NURSERY WORK.

With the present mild, damp weather, weeds are growing apace, and to keep them down will require the utmost vigilance and perseverance on the part of the nurseryman. The old adage, “A stitch in time saves nine,” is perhaps nowhere more applicable than in nursery management during the later and present months, for if once weeds are allowed to run to seed, and these to ripen on the plant, the work of eradication is vastly increased. During wet weather hand-weeding is preferable to using the hoe, but should it be necessary to resort to the latter method all weeds should be raked off without delay. Take advantage of damp weather for the weeding of seed-beds, as the risk incurred by injury to the young plants when removing these will be thus greatly obviated.

Transplanting of two years seedlings may now go on, for if left later the winter frosts are apt to lift them from the lines, thereby causing considerable damage to their tender rootlets, whereas by planting now they will get well established in their new quarters before severe weather sets in. The size of the plants will be the best guide as to their distance apart, although we may state that for the ordinary run of two years' seedlings 9 inches between the lines and 4 inches from plant to plant will be ample, more especially as it will be found advantageous to again transplant at the end of another year. Should dry weather set in after planting, a thorough watering in the evening and slight protection of Spruce Fir branches for the first week or so will materially assist in keeping down the death rate.

Keep a sharp look-out amongst young nursery stock for insect pests, which are more or less abundant in various districts at present. Infested plants should be pulled out and burned, although in the case of rare and valuable Conifers it may be well before resorting to such extreme measures to hand-pick and syringe with some of the numerous advertised insecticides.

SEEDS.

An occasional look to the store boxes of Yew, Holly, and Thorn seeds should be given, and the sand moved gently about, so that fermentation of the fleshy outer covering may go on evenly and gradually.

Birch seeds may now be collected from trees of good habit, sound constitution, and medium age, part of which

may be sown at once in well pulverised sweet soil, and the remainder, after being thoroughly dried by placing in flat, shallow boxes, stored away in a dry, airy loft, until required for use in spring. The method often adopted of storing seeds in bags is highly objectionable and should never be tolerated, the best plan being to place them thinly on shelves or in shallow boxes, in either of which places their germinative powers are, if properly dried previous to storing, unimpaired.

FENCING.

Fences of all kinds, but more particularly such as enclose woodlands, will at present require a greater amount of attention than at any other time, as cattle naturally seek the shade to avoid extreme heat and are being troubled with flies. Specimen trees in the park and grounds should also be ensured against the attacks of stock, more particularly horses, which often work wide-spread destruction by nibbling the bark from both stem and branch. Rabbit-proof nettings, hurdle and continuous wire-fences should also receive attention in the way of repairs and painting. As wire expands with heat and contracts during cold weather, the hint should be taken to have these tightened at present, and slackened, so as to avoid breakage, at the approach of winter. See that young trees that were planted out during the past season are not swaying about with the wind, and that the moorings of large transplants have not become broken and do not chafe the bark.

FAGGOT MAKING.

Branches intended for faggot-making should be collected in heaps along the outskirts of plantations, or contiguous to woodland drives where they may be bundled and conveyed to the faggot-shed for use as required. Here we find it well to divide faggots into two kinds, large and small, the latter for fire lighting, and composed principally of Larch and Spruce branches of not over 3-inch diameter, but usually less; and the former of almost any branches up to 2½ inches in diameter, and used for stove and heating purposes. Small faggots bound tightly and of not less than 1 foot in length by 6 inches diameter should realise at least 5s. per 100; while the larger which, are usually 9 to 10 inches in diameter by about 18 inches in length, cannot be made and delivered at a less cost than 10s. per 100.

HEDGING.

The pruning or whittling of all fences will now be well advanced, but where the work is in a backward condition extra assistance should be rendered until the work is got well in hand. Hedges in the park or other conspicuous positions may, for the sake of neatness, receive two trimmings annually—the first when the growth is fully perfected, and the second during the latter part of August. A sharp tool in the hands of an experienced workman may be used with the utmost benefit to hedges generally, but an ill-kept tool used by a novice is frequently productive of very unsatisfactory results. Young fences that have been formed during the past year will require a little extra care and attention in the way of cleaning and weeding, neglect of which tells sooner or later on the vigour and growth of the plants as well as ultimate value of the fence. *A. D. Webster, Penrhyn Castle, North Wales.*

MARKET GARDENING.

(Continued from p. 205.)

BEFORE I continue my remarks in the order originally marked out, I shall digress briefly to acknowledge “A. D.’s” useful remarks in a recent number of the *Gardeners' Chronicle*, having reference to my past notes upon the field culture of Vegetable Marrows. The practice he describes of growing somewhat earlier crops than can be secured by open field culture, pure and simple, under temporary frames or hand-lights, is occasionally practised in this neighbourhood also. My intention was, however, to show how the bulk—ninety-five per cent. of all that are marketed is grown as freely as the hardiest of summer crops. Nor do I see my way to admit, judging of the expense of preparing the beds referred to by your correspondent, that the slightly enhanced prices early grown produce secures compensate for the outlay.

Vegetable Marrows never do or will fetch fancy prices, and it is astonishing how (with all the nursing

—I may call it codling—under glass) rapidly outdoor grown marrows follow up those that have been protected; indeed, a case of action at law, or threatened action, is going on near me at this time wherein a jobber offered such a grower an exceptional price for what he considered early forced produce, but which, when he took them to market, he could not realise, and so elects not to pay his loss.

But there is an important consideration connected with manure-beds, protected or glass-hastened, *versus* field culture, I had not intended to touch upon, but for “A. D.’s” remarks; but it will evidently be of some service to gardeners that I should refer to nevertheless. It is this. Whereas field culture produces large numbers of Marrows of a large size under such methods as I have described—taking the fruits continually until the frosts of autumn cut down the foliage—garden growers, even with their heaps of manure, glass protections, &c., usually, because their employers like them to cut all the fruits young, whereas the market growers cut tons of fruit, for the crop is very weighty.

In gardens where only a moderate quantity of immature fruits are secured, heaps of manure, frames, hand-lights, &c., are employed! Certainly “A. D.” can have no desire to uphold such an anomaly, though his useful remarks may, to some readers, imply this to be the case. I could understand a theory where the inverse was advocated, comprising all these outlays for heavy crops in continuity with large fruits, not otherwise. There is, as “A. D.” would wish to emphasise, danger from placing such seeds into the open ground too early, and apart from cold and excess of moisture, mice and rooks prove very troublesome, but by attention it is soon seen how first sowings succeed, and duplicate sowings are easily made. We rarely if ever observe actual failure, not even this season, with its cold spring months. Besides, seeds are easily saved in immense numbers to meet all demands, though exceptions occur, as I had myself to pay 8s. per pound for it only a few years ago. Finally, as regards this matter, I hope yet to see Vegetable Marrow seeds sown in sunny sites in open quarters, even though I may not see the total abandonment of the older practice.

CUCUMBER GROWING in the open fields, or what is perhaps accurately described as the growth of ridge Cucumbers and Gherkins, is still plentifully carried out in certain districts in the home counties, &c. This industry, however, all but invariably associates itself with kindly, suitable native soils, without which it would be, if not difficult, certainly expensive, to grow them profitably. The seed bed is prepared in a similar way to that explained for Marrows but with more liberal supplies of manure. As a rule, also, screens or “nurses” consisting of rows of Rye are sown thickly between the future rows of Cucumbers. The Rye grows up early in spring and protects the plants from cold winds and maintains a little additional warmth around them. The seeds are dibbled out into the open ground during the month of May in the same way as are Vegetable Marrow plants, generally germinating and forming robust plants upon which are produced a plentiful succession of fruit. These are very acceptable, being sold by itinerant vendors throughout the poorer parts of the metropolis and all large towns, the dwellers within which would rarely taste Cucumbers but for such vendors. Nor is the crop to be despised. In the matter of flavour black-spined, ridge, and Gherkin Cucumbers, field grown, are thought by some to be better flavoured than others grown under glass. Besides disposing of these crops in this manner, growers have moreover heavy purchasers in the pickle makers.

BET, CARROT, AND PARSNIP crops occupy a large area under culture, and the cultivation of Beetroot is extending beyond its former limits. Probably this is a fact applicable to the other two kinds of root also. At a time not very remote such crops had become more or less a monopoly in a very few hands and were confined to certain districts; demand, however, invariably creates supply, and so much so in the case of these, that the produce now is in excess of demand.

Field culture here again, possesses a decided advantage over and above that of the large majority of private gardens. It is well known to good judges that field-grown Beetroot is the more palatable of the two—and the same applies to Carrots and Parsnips, already referred to. The reason is not far to seek. Field ground has its virgin earth less exhausted than worn gardens. But a more important fact than this exists. All these root crops

require free and uninterrupted air and sunlight, which they do not get in a large majority of gardens, and where tree ornamentation (in itself so desirable) does so much injury. Thus, with such freedom from all that is inimical, the leaves grow and make growth, such as enclosed garden crops—the foliage upon which is generally drawn—cannot attain to.

In the face of such facts as these is it to be wondered at that enclosed gardens, with all the skill possible, fail to give the yield? Nor should employers complain on the score of quality, seeing it is not within the resources of the gardener to counteract such drawbacks. The lands are habitually cultivated deep and well for these crops—deep stiff loamy soils being chosen for Parsnips, sandy soils, similar in depth for Carrots, and one midway between them for Beet, all being grown in drills, with often greater distances between rows and plants than is habitually given in gardens.

Parsley often during or following hard winters, is a very profitable crop, as it is occasionally sold by parts of a pound weight. The practice is to sow in drill rows during the month of July, and to "set out the plants" to proper distances in process of hoeing them. Market garden farmers possess, as a rule, an excellent selection. Immense quantities of it are dug up and bunched with the roots entire, though during severe frosts in winter this is not done. *William Earley.*

(To be continued.)

STRIKING ROSES FROM EYES LIKE VINES.

An examination of the base of the accompanying Rose plant (fig. 63) will afford conclusive evidence of the fact that Roses may be propagated in a similar way to Vines. In the present case a few dormant buds were cut out of the Rose shoots early in April last with half-an-inch of the bark and a little of the wood on either side of it attached. They were then inserted in a pot filled with mould, and having a surfacing of sand, they were placed in a cutting frame, and afterwards watered when necessary. The idea of thus experimenting with the Rose with a view to working up a stock of choice varieties on their own roots expeditiously occurred to me at pruning-time. And this, I think may be done by putting the buds in closely together in boxes filled with sandy soil late in the autumn, and then placing them first in a cold frame for a few weeks until they have callused, and afterwards in gentle heat, potting them off singly into small 60's as soon as they have made an inch or two of growth, and again placing them in a growing temperature near the glass, and shading them for a few days from bright sunshine until the roots have taken to the soil. *H. W. Ward, Longford Castle.*

[We believe the method practised by our correspondent was made use of by Mr. Shirley Hibberd and others many years ago, but it has never found general adoption, owing, probably, to the large proportion of misses to hits. Ed.]

Foreign Correspondence.

THE TOBACCO AND CIGAR TRADE IN CUBA.

CUBAN Tobacco, which has hitherto held a very high position, has, it is stated in a recent report on this subject, lost its *prestige* through forcing and the use of artificial manures, so that it has to sustain a sharp competition from abroad where it formerly commanded the market, and it is considered that it will take some years before the soil can recover from the excessive and indiscriminate use of artificial fertilisers. A few years ago the leaf harvested in the Vuelta Abajo was not sufficient to meet the large demand, and in order to increase the yield growers made use of guanos of all sorts, with such bad results that they find it now difficult to place on reasonable terms more than half and sometimes less of their crops, at very low prices. In a few localities only the soil has not been spoilt by spurious manures, and the leaf grown there commands very high prices, and is warmly competed for by local manufacturers and buyers for the United States.

Notwithstanding the last crop was of a better quality than heretofore, growers were compelled to abandon the Tobacco cultivation for a certain time,

and devote the ground to other purposes. This change of cultivation appears to be absorbing the fertilisers, and restoring to the soil its former good qualities. From the splendid appearance of the leaf, and the ready sale it now meets with, it would seem that the Vuelta Abajo fields are becoming fitted for the growth of the best quality of leaf. As is well known, the Tobacco grown in the Vuelta Abajo, or district west of Havana, is the best kind, and has given Cuba its well earned reputation. About 67,000 acres are cultivated.

Havana alone. One of the largest establishments is that supplying the Henry Clay brands, which is stated to turn out from 80,000 to 120,000 cigars daily, and there are many others of considerable importance with a well-earned and old-established reputation for fine goods. Except in the case of the few rich owners of plantations in the eastern parts of Cuba, brands and names are no guarantees for a permanently good article. Even these favoured few are exposed to bad seasons, if in a minor degree than less fortunate owners, for the quality of Tobacco, like other pro-

FIG. 63.—ROSE PLANT FROM AN EYE.

There seem to be no trustworthy statistics to show how much of the raw produce is manufactured in the island, probably not more than one-fourth. Very large quantities of the leaf are exported in bales, and rolled abroad. It is evident, however, that given the total production and corresponding result in the manufactured form, but a small portion of the cigars sold in Europe and elsewhere as Havana cigars have the slightest claim to a connection with Cuba. The chief and only important manufacturers of these cigars are in Havana, and much care and money is expended in producing a handsome looking article. As much as 40 dols. gold are paid to skilled labourers per 1000 for making up first-class goods. About 17,000 operatives are employed in this manufacture in

duce, depends on season, soil, and many natural causes which may baffle the most careful cultivator.

The manner in which the wholesale trade is carried on in Havana is incomprehensible to an outsider, to whom it would appear that the manufacturers prefer a prospective loss abroad to a present and certain gain at home. They will only execute orders, large or small, for cash over the counter, giving no, or, in some cases, the smallest discount. No manufactured goods are kept in stock, but are made to order after sample, and unless examined in a warehouse before delivery—and that means little—must be paid in full on delivery, and the consequence too frequently is, that on arrival at their destination they do not correspond with the sample, and the deluded buyer finds

that he has made a bad bargain, and (if an Englishman) discovers that he could have bought the same article cheaper in the English market with the additional advantage of examining and testing the goods before purchase.

It is stated that sensitive smokers, with sensitive palates, find no cheap Tobacco in Havana worth smoking; 50s. per hundred and upwards is what must be paid at present for really fine flavoured aromatic cigars; beyond 80s. or 85s. prices become fancy ones, and are paid for the smart cases and envelopes. Even at the rates quoted, it is stated not to be easy to find what is wanted. There is an abundance of dark powerful Tobacco of fine quality at much lower rates, but not light Tobacco with flavour or aroma or without strength such as an Englishman with a refined taste for Tobacco seeks. Perhaps not more than 10 per cent. of the Tobacco harvested in ordinary years is of the light colour referred to; hence the difficulty in

of different kinds, and in the early part of September it is intended to open another of a strictly horticultural character in the fullest sense of the term, that is to say, not only flowers and plants, but fruit, seeds, and vegetables, as well as everything else more or less relating to gardening, will be shown. The plan and arrangements of the show, which promises to be on a grand scale, are under the direction of some of the leading nurserymen and gardeners of the town, as Messrs. Ulrick, Bardet, Hozer, and others, who take a very active part in the necessary preparations. But the enterprize is under the auspices and guaranty of the horticultural society, the most energetic members of which are the proprietors of the extensive seed nursery near Warsaw, Messrs. Yankofski, Katchinski & Shanor. This firm issues a monthly paper called "Ogrodnik Poloki" (the *Polish Gardener*). Some 10,000 or 12,000 roubles, at least, will be required to finish the necessary preparations for the

ARISTOLOCHIA ELEGANS,

SP. N.*

THERE is a general prejudice against these plants in that they take up a good deal of room, are difficult to keep free from insects, and if their flowers are peculiar they have a lurid hue, and their perfume is objectionable. None of these objections can be urged against the very beautiful little *Aristolochia* recently introduced from Brazil by Mr. Bull (fig. 64). It is something like *A. Duchartre* hort. = *A. Ruiziana* Duchartre, but the present plant bears solitary flowers, proceeding, not from the old wood, but from the young shoot. The plant flowers in a young state, has cordate ovate leaves, glabrous above, glaucous beneath, and long-stalked flowers, whose slightly distended tube is suddenly bent upward at a very acute angle. The uppermost part of the tube is dilated into an obliquely cordate-ovate somewhat cup-shaped limb 2½ inches long by 2 inches in width, the colour of which is like that of cream thickly sprinkled with dendritic markings of a rich purplish-brown colour; the wide aperture of the tube is of a golden-yellow colour, surrounded by a deep blotch of velvety texture and rich purple colour. The interior of the tube is lined at the base with white cottony hairs, and on one side, just below the bend of the tube, are two crescentic raised blotches of a purple colour. The column is about ¼ inch long, 6-parted.

The plant is a native of Rio, where it was collected by Glaziou, No. 13,163 Herb. Kew, and it has recently been introduced into cultivation by Mr. William Bull, to whom we are indebted for the opportunity of figuring the plant and by whom it was recently exhibited at the Royal Horticultural Society, where it received a first-class certificate.

It is singular that so beautiful a plant, native of so well known a botanical district, should not previously have been introduced or described. *M. T. M.*

FIG. 64.—ARISTOLOCHIA ELEGANS.

Cream-coloured, with purplish-brown markings; throat golden-yellow, surrounded by a deep purple blotch.

The Apiary.

TAKING THE HONEY.

To get extracted honey in a nice form is not easy without a little practice, and requires a certain amount of real hard work. I have been at it about four hours to-day, and do not require any more physical exercise for the day. To do it nicely get everything you are likely to require at hand, so that there shall be no delays and running about. We will suppose you have eased the bees of say twenty frames. Take them right away into some convenient out-house where you can shut yourself up. Get the following things ready:—Honey extractor, uncapping knife, jug of hot water to stand knife in, basin of warm water to rinse your hands in occasionally, a nice flat table, and a strainer made of cheese-cloth. Now to business. Take a frame of honey, lay it flat on the table, and with the honey knife carefully shave off the cappings. Turn over and do the same to the other side, and then put the frame into one of the cages of the extractor. Now take a second frame and uncap it exactly like the first, and put it into the opposite cage. Now begin to turn, gently at first, gradually increasing the speed to a fair rate. When all the honey is out on one side, reverse the frames and turn the machine again, to clear the other side. If this is carefully done with a good machine, you will get all the honey out. Of course small portions of honey will stick to the comb. You can, after you have finished, give the combs to the bees to lick out clean, and then put them away till the following spring. You can proceed thus till you have extracted the honey out of the twenty frames. If the frames are very heavy you will probably have to empty your machine after extracting ten or a dozen frames. To do this best lift the machine and honey, and put them on the table. Now put your cheese-cloth

supplying the demand, and the artifices resorted to to supply the deficiency.

Cuba's annual Tobacco crop may be estimated at between 300,000 and 400,000 *tercias* of 125 lb. each. About 30,000 persons are employed in its cultivation, and its value when harvested may be reckoned at between 8,000,000 and 12,000,000 dollars of 4s.

It is said to be difficult to estimate the number of persons engaged in working plantation (*vescueros*) and other cigars for home consumption as well as the quantity consumed, but the higher class of operatives employed in cigar-making for export number about 20,000, and turn out at present probably 200,000,000 cigars annually. The export trade has fallen off of late years considerably. In the five years from 1870 to 1874 about 350,000,000 cigars were annually shipped to foreign ports; whereas in the period between 1879 and 1884 the annual average export was only 200,000,000.

THE WARSAW EXHIBITION.

This year Warsaw has been fertile in exhibitions

show. It is expected that a good number of exhibitors from the neighbouring provinces, and even from the nearer parts of Prussia and Austria, will arrive. It will last about two weeks, and no doubt it will be a very interesting display.

There is one serious drawback to all these exhibitions in this quarter; they are more or less improvised—nothing is heard about them till a week or two before opening. Many people have not time to think over the matter, and prepare for a good turn-out. So it happens on this occasion there are great complaints of indifference on the part of gardeners and others, whereas the reason is simply that the promoters failed to give notice of their enterprise in good time. *P. F. K.*

LARGE BEECH.—REGINAL KELLY, Esq., of Kelly, North Devon, has some splendid timber in his park. As an example there is a Beech growing in the rocky and near the ornamental ponds which has a trunk 18 feet in girth at 3 feet from the ground. This noble tree aspires to a height of at least 70 feet, and is about 300 feet around.

* *Aristolochia elegans*, sp. n. Mast. — *Glabra* volubilis; foliis longe petiolatis, petiolis gracilibus, laminais cordato-ovato-obtusis, lobis basilaribus rotundatis late divergentibus, nervis pedatis, venis remotiusculis; floribus solitariis longe pedunculatis tubo cylindrico basi paulo ventricoso, medio abrupte resmo tereti, limbo oblique cordato ovato diametro 2-pollicaris, sub concavo colore cremoreo maculisque dendriticis purpureis dense obsito, fauce aperto aureo-flavido maculique velutina, brunneo-purpurea circumdata; columna apice 6-loba. Folia subtus glaucescentia ad ½ pol. lat. ¾ pol. long. Pseudo-σ-stipula reniformes; flores longe pedicellati e novellis prodehant. Perianthii tubus intus araneosa superne maculis duabus reniformibus purpureis notatus. Brazil, Rio. Glaziou, 13,163, et hort. Bull.

strainer (which ought to be made the shape of a cone, with apex downwards) under the tap. Put some kind of receptacle under the strainer, and then turn the tap. Every particle of small comb will remain in the strainer, and only beautiful clear honey will trickle through. When you see the kind of honey which comes from the strainer, you will feel well repaid for the work of uncapping and turning the machine. Always put two frames in at once, never only one, or your machine will shake about, and probably smash the comb. Some machines are made for three, and some for four frames, but practical experience seems to suggest two as the best for most persons. If you want to get four frames uncapped, the honey will get cool, and is then harder to sling out. When you have finished, rinse out your machine with warm water. *Agnes.*

THE STRAWBERRY.

MR. ROE (speaking before the American Institute Farmers' Club on June 19) said that development and improvement of the Strawberry is slow. He had abandoned the idea maintained a few years ago, that all the varieties of the day were soon to be superseded by new and better ones. In our endeavours for improvement we have to observe three principal points:—

1. Development in the Strawberry should be sought in the line of native (American) stock. The highest excellence of foreign Strawberries is combined in *Triomphe de Gand*, and its equal has yet to be found. The leading qualities to be aimed at are beauty, firmness, flavour. Without these size is nothing.

2. We should not discard the old standard varieties that have stood the test of many years. Varieties like *Charles Downing* cannot easily be surpassed. Typical plants of such should be singled out and grown on fair Strawberry land, to start a new and vigorous strain from.

3. In developing new varieties we should have in mind that they are intended for the people. For propagation, fair dry soil should be chosen, such as would not be considered fit for the very highest cultivation; and only selected plants should be used for the purpose. Plants grown on a very rich soil will, as a rule, fail on poor and sandy soil, while those that have sufficient inherent vigour in them will make their way. The right kind to succeed will grow even under adverse conditions. The old *Champion*, for instance, is a good variety to use as a mother, if crossed with rich high-flavoured varieties.

Mr. E. W. Durand, the originator of *Jersey Queen*, *Prince of Berries*, *Black Deiance*, and many other varieties, thought there was something like intuition that guided him in the selection of varieties for crossing, and that it required constant attention and application to accomplish anything in this direction. Most varieties change, the foliage giving way to the fruit. The change may be so gradual that it becomes impossible to foretell the fixed permanent character of a new variety before six or even ten years, and he had known seedlings to retrograde even after such a period. To expect much improvement from chance seedlings he considered a fallacy.

Mr. T. P. Quinn was satisfied with his crop. On 7 acres of ground near Newark, N. J., he raised 9000 bushels of Strawberries last year, and expects to do nearly the same this season. Whoever expects to make money in Strawberry growing must have good land, deep soil, give high manuring, and be convenient to a good market. Southern Strawberries have entirely revolutionised Northern Strawberry culture. So far only two varieties, the *Wilson* and *Neunan*, have been found adapted for cultivation at the South, and at the North earliness is not the leading consideration, as was formerly the case. After experimenting with every new variety, he finds the *Charles Downing* still the most profitable Strawberry to grow for market. Berries are grown for the masses, therefore we must have varieties which yield enough, so that they can be sold within the means of the masses, at a retail price of from 8 to 20 cents. The average net cost of his berries to him he estimates at 6 to 7 cents a quart.

Summer planting he has abandoned entirely, and plants now in spring exclusively. The plants are set 15 inches apart, in rows 4 to 5 feet apart, and allowed to run. They are always mulched in the fall, the covering being removed in the spring, the ground cultivated lightly, and the mulch replaced between the rows before picking. He was convinced that

Strawberry culture will yield a fair profit if proper application is given to it; and that even in seasons of light crops there is always the compensation that the crop will bring better prices.

Mr. A. S. Fuller spoke on fertilisation, and the influence of the pollen on the berry. He described the construction of Strawberry blossoms, and the differences between staminate and pistillate varieties. That the influence of the pollen reaches further than the seed, and that the berry itself becomes affected by the pollen he had become convinced of more than twenty years ago. Several instances in proof thereof were cited, and the fact that when pollen is not applied to imperfect flowers the blossoms wither and the stems die, while when after pollen is applied the fruit stems expand and become more vigorous, shows plainly that the whole plant becomes changed by fertilisation.

CATERPILLARS.

If it were possible to take seriously the advice to destroy every caterpillar in the garden, a great deal of amusement and of interest would be at an end for some who observe with delight the fauna as well as the flora of their pleasure grounds. There exist certain beautiful caterpillars who feed only upon what can easily be spared, and who, appearing as they do season after season, grow to be like old friends—children who never get old. I am now looking for the advent of a handsome fellow on the Rose trees. He wears black velvet and scarlet tufted with white along the back, while from his shoulders sprout black hairs in bunches, dotted like a peacock's crest. He goes very fast, and I have known him all my life. There is another, very much the same in appearance, only heavier and with some dots of blue: the colours of this last are not so well mixed. Less commonly seen, and always received with an admiring welcome, is a pale green caterpillar tinted with rose, banded with black velvet, and bearing silken tufts of primrose-yellow along the back, a luxurious slow-paced, well-fed fellow. One of the same, order appeared on a Japanese variegated *Maple* last autumn. He was "got up" with the most perfect good taste, all in black velvet and light chestnut. There was a black chain down the back, with a double row of chestnut tussocks, and long golden-tawny hairs all over. I was selfish enough to secure this beautiful creature, requiring of him to chrysalise in a dull flower-pot full of earth instead of enjoying free burial in the open ground. The moth should have been set at liberty so soon as it appeared; but this never happened, and the *denouement* of the tawny one's history remains unknown to me.

Once or twice in a lifetime one may chance to find a treasure; such as the great larva of the *Death's-head Sphinx*, whom once I met walking alone in the garden, big enough to frighten an unlearned person. An old labourer, digging Potatoes in a Potato-field, has been known to cry out in terror at the sight of this "worm," believing it to be the Devil. I have found also a *Privet Hawk-moth* caterpillar, very beautiful with lilac and white stripes laid upon brilliant green.

Then, on the Currant bushes often come long slender green geometers, or looper caterpillars. The consumption of Currant leaf by such thin threads of emerald cannot reasonably be supposed to injure the trees in any way. What advantage to themselves may be the inconveniently exaggerated length of their bodies it is difficult to guess; we may feel pretty certain, however, that Nature has made no mistake. Then there is the old Currant moth, who begins life as a rather stout spotted looper, coloured with a remarkable forecasting of the pattern of its future wings. (Several of these I observed in the moth state last month, enjoying the coloured lamps and fountains at the Inventions with the rest of the crowd.) I do not personally care much for the Currant moth, except for the sake of "auld lang-syne;" but I believe it never does any very important mischief. The worst is done by the gregarious larvae of sawflies, and to them little mercy need be shown. They are distinguished by a general greenness of appearance, and by their feeding—from an absence of prolegs—with their tails in the air. Sometimes on Gooseberry bushes one finds brown loopers, like dead sticks. These are most amusing in their clever mimicry, and are innocent of all harm to the Gooseberries, beyond eating a few spare leaves. Then, who would dream of destroying woolly bears?—the beautiful travellers in glossy brown fur coats, whom we so

often meet, late in the summer, making their way rapidly across the garden-walks. Or the flat little blue and yellow ladybird grubs, who devour herbs of aphides? All these, with many another such-like charming creature, we can but reckon amongst our humble friends. They are surely welcome to a share in our green plenty, and their "wholesale destruction" would doubtless be felt as a real loss by others, as well as by *E. V. B.*

The Rosery.

MARÉCHAL NIEL ROSE.

SOME doubts have been expressed as to the popularity of this Rose, and it has been stated that *Niphetos* is a far more popular flower now. The question opens up a curious phase of fashion, which rules so much in all things at all times. I do not believe in the waning popularity of this grand Rose, though I am quite prepared to believe that it does not represent so much marketable value as it used to do. There are two reasons, however, for this. I was talking with one of our most eminent cut-flower merchants some little while ago, and said what an enormous business it had become—it was then the height of the London season. "Well," was the reply, "if it were not for the great demand for bouquets at weddings and wreaths at funerals, we should say that the season was a bad one." Of course if this be so *Niphetos*, as a white flower, would be in much greater demand for either of these purposes; by the way, the extent to which the custom of sending wreaths at funerals has gone to, may be guessed from one fact, that at the funeral of the wife of a medical man at —, who was greatly beloved, it was necessary to get a waggonee to convey them to the grave! But there is another reason. The *Maréchal* has proved such a mine of wealth to those who have cultivated it (many persons in two years paying the expense of the house they built to grow it in) that a great many have tried the same thing with the usual result—the increased supply has cheapened the commodity; in fact, it is one of those cases which are constantly occurring of supply and demand; still, that it has ceased to be profitable is certainly not the case. The schoolmaster in the parish of a friend of mine had put up a rough greenhouse in which he planted a *Maréchal Niel*; the Rose had in a short time paid for the house. He, poor man, died, but his sister still lives at the same house, and continues to grow the Rose. This year she sent up to *Covent Garden* 216 blooms, for which she obtained £5 8s. 6d., the earlier blooms producing 8s., and the later ones 4s. per dozen—a result by no means to be despised.

And for gratifying one's own taste how better can one employ a piece of glass structure?—for it may be done in a way that does not interfere with other things, as I can vouch for from my own experience. I put some three or four years ago a plant of it into a large pot and placed it on the ground in a small rough glasshouse in which I grow a *Vine*. The size of the house is 14 feet by 10. This was placed at the back with the idea that it might last for a year or so, but it has pushed its roots through the pot, and is now firmly rooted in the soil. It has made long and vigorous shoots, blooming so well that I cut this year 120 blooms from it. I thought that best of its day was over, but it seems vigorous and gives promise of doing well for at least another year. I am more than ever convinced that it is essentially an indoor Rose. It will doubtless grow and bloom well in the open in some parts of the country, but the flowers, although higher-coloured, are never what they are under glass. I have another in a small glass structure which I have used for blooming *Hycinth*s in, and have had a somewhat curious experience with it; it was in the early spring badly attacked by mildew, owing, I imagine, to its being in a position facing the east, and getting too great changes of temperature. The earlier flowers were very indifferent, but I have lately been cutting some very fair blooms of a very deep colour. I am inclined indeed to think that the Rose after it has become established is much more perpetual in its blooming, as indeed it ought to be from its parentage.

It is a sad thing that a Rose so popular, and deservedly so—so much the "cynosure of all eyes"—should be of so short-lived a character, and that just when

you are luxuriating in what you think is well-nigh its full development, it begins to perish, owing to what is commonly known as the *Maréchal Niel* canker. I gave a plant of it to a neighbour of mine, who planted it in a house, which in a few years it completely covered, both the back wall and the roof; hundreds upon hundreds of its brilliant blooms were produced, but the decay set in, and it had to be entirely removed, and another planted in its stead; and indeed, those who have grown these large plants always think it safe to provide for such a contingency, and after it has attained the full size to be ready with another to take its place. This was the plan adopted by Mr. Vallance at Bristol, who had one the stock of which measured $8\frac{1}{2}$ inches.

What the cause of this canker is I believe has never yet been ascertained, or why this one Rose should be subject to it; but that it exists is, unfortunately, too true. It has been assumed by some that it is caused by the hot-water pipes, but it occurs as frequently where there is no heated apparatus. That it is caused by some injury is, I suppose, pretty certain, and it has been assumed that this is due in many cases to accidents—that the tree gets bruised; but here again we can hardly suppose that accidents should always happen to this Rose and not to any other. It is usually, I believe, the case that it occurs at the thickest part of the tree; that the bark at first splits longitudinally, and then across, as if it were "hide-bound," and that there is too unequal growth for the bark to retain it. I have seen where in a large bole canker was developed, the tree cut and slashed about in all directions, but without any success. Some have (seeing that it shows itself in the grosser and thicker shoots) suggested that it would be better to cut these away and get a more twiggy growth—there are indeed some rossians who condemn in all Roses these gross shoots, and ruthlessly cut them away, a proceeding I never could agree with. It is unquestionably on the smaller growth of *Maréchal Niel* that one gets the bloom, but then I think that these shoots must be left for the purpose of supplying that small wood. I know it has been thought by some that the *Maréchal* is a fast fellow, and that if he must live a fast life he cannot expect it more than "humans" to live long; but then a cousin of his, *Gloire de Dijon*, lives quite as fast, blooms as freely, and yet is not paid out for it by canker.

And if, then, we cannot define the cause, there must be an impossibility in suggesting a remedy. The true physician must diagnose the disease before he treats it, the quack does not trouble himself on that score—he prescribes, and leaves it to chance; but there is one point in connection with it on which I should like to know the experience of others, as I have none myself. Does *Maréchal Niel* canker when it is on its own roots? I have been told it does not, and if so there is a remedy which only requires patience, patience—that is, to wait for a longer time to grow the plant. It is possible now-a-days to get own-rooted plants, and, indeed, it strikes very freely. Either this or having a plant to take the place of the decaying one is the only plan one can suggest of grappling with the fatal malady.

Another Rose which it was said would prove a formidable rival to the *Maréchal* is *Perle des Jardins*, doubtless a very beautiful Rose, but withal it has not, at any rate on this side of the Atlantic, dethroned its rival. In America it is said to be very fashionable and to be a formidable competitor, while great things are spoken of a sport that has been raised from it, *Sunset*, which is said to be of the colour of *Madame Falcot*. It has not, however, been much exhibited here, and we must perhaps wait for another season to decide on its merits. One of our best rosarians, Mr. George Paul, has a very high opinion of it, and has largely propagated it, but I do not think that it or any other Rose is likely to displace the *Maréchal*. Cloth of Gold has indeed many claims to superiority, but then how few can bloom it satisfactorily, whereas the *Maréchal* almost kills itself by its freedom of flowering. *Wild Rose*.

TEA ROSE SUNSET.

This is undoubtedly a lovely Tea Rose, a decided acquisition, and a fine addition to the already large list of Tea-scented varieties. It is a sport from *Perle des Jardins*, bearing flowers similar in form and substance, but of a very pleasing bright pale apricot colour. It was very finely shown by Mr. Slaughter, of Steyning, at the exhibition of the West Grinstead

Horticultural Society, in West Grinstead Park, on August 26, who informed us that when well established on the Brier it furnishes him with very fine flowers. R. D.

Plants and their Culture.

SEASONABLE NOTES—DUTCH BULBS.

The season has again come round for the general orders for these to be given, and we would advise that no delay be allowed in securing the requisite quantity in good time. In spite of every honest endeavour by the vendors to serve all alike, first and last, the best bulbs will get chosen in many instances, and justly so, when growers make their own selection for special purposes. The first batch of Hyacinths should have been potted ere this, as previously advised; if not done, lose no time in its completion. As soon as the general stock comes to hand, another lot should be potted, to have them in readiness for starting with the New Year. For late work a few more weeks may be allowed to elapse prior to potting.

HYACINTHS, ETC.

Good Hyacinths, both in variety and colour, can be obtained now at such moderate prices that there is no need to go to any great expense in the purchase of scarcer kinds, except it be in the case of their culture being made a speciality. A few good and cheap kinds are as follows, viz.:—Shades of pink and red—*Gigantea*, *Macaulay*, *Norma* and *Robert Steiger* among singles; and *Lord Wellington* and *Noble par Mérite* of double kinds. Of bluish and white, singles—*Mad. Van der Hoop*, *Queen of the Netherlands*, *Grandeur à Merveille*, and *Mammoth*; of doubles—*La Tour d'Auvergne* and *Prince of Waterloo*. Of blues in various shades—*Baron Van Tuyl*, *Argus*, *Charles Dickens*, *King of the Blues*, *Grand Lilas* and *Prince Albert* among singles; and of doubles—*Laurens Koster* and *Van Speyk*. From the yellows—*Anna Carolina* and *Alida Jacoba*, both singles; and *Hlaydn*, a lilac-mauve. These would be good kinds to select for general purposes. Of Polyanthus *Narcissus*, *Gloriosa* and *Soleil d'Or* are two good kinds; *Bazelman major* is, however, by far the finest of any, but somewhat expensive, still it is strongly to be recommended.

DAFODILS.

Some of the cheapest and most distinct kinds of *Dafodils* are well worth a trial in pots, imported and well ripened bulbs of home growth are to be relied upon to give every satisfaction; the more robust kinds will not be so well adapted to this mode of culture as the dwarfier sorts with medium-sized flowers.

TULIPS.

Where any large amount of furnishing has to be done the *Duc van Thol* Tulips should be grown for early work. *Vermilion Brilliant* is now being used for forcing also, being found reliable and of good constitution, and possessing finer individual flowers than the first-named; the *Tourneforts* are still the best of the double kinds. *Lilium excelsum* and *L. longiflorum* are two most useful *Lilies* for pot culture for the first season, then turn them out of pot after blooming.

MISCELLANEOUS.

Imported *Spirea* (*Hooteia*) *japonica* are by far the best for early work, being less disposed to push forth foliage so far in excess and advance as home-grown stock. *Schizostylis coccinea* and *Richardia aethiopia* at present in the open ground should be abundantly supplied with water during this long-continued period of dry weather, for in a few weeks it will be necessary to take them up for repotting. *Bouvardias*, *Salvias*, and *Eupatoriums* will not need too liberal encouragement in this way, a healthy hard growth being preferable to a soft and sappy one. *Solanums* now having set a good crop of berries will need to be gone over carefully, and all the stronger shoots pinched, to concentrate all possible vigour in the development of the fruit; liberal doses of water, with occasional artificial or other stimulants, will be necessary, where a heavy crop has been set; should greenfly attack them a dusting with tobacco-powder will set matters right to as simple a manner as is possible. The same remedy is also valuable from now for the *Chrysanthemums*. *J. Hudson, Gunnersbury House Gardens, Acton.*

The Flower Garden.

TRANSPLANTING TREES AND SHRUBS.

My experience of many years' transplanting work with evergreen shrubs proves the advantage of early autumn planting. The soil at this season has a higher temperature during the next two months, and there is more humidity in the atmosphere than in the spring or during the winter. I have always thought trees and shrubs of all kinds succeed best when transplanted in the months of September and October. The roots are then quickly developed, and the injury and check caused by transplanting are soon rectified, the plants becoming re-established before winter sets in. Where alterations and new plantations are contemplated, every available means should be used to complete the work as early as possible. Where large specimen trees or shrubs have to be removed, they should have been prepared twelve months previously by cutting a trench completely round and partially underneath them, so as to sever all the roots at a proportionate distance from the stem, according to the size and nature of the tree. Many trees which furnish fibrous roots plentifully will succeed with a comparatively small ball of earth, but others, especially the *Conifers* and many tender kinds of evergreens, require a larger ball and greater care to ensure success. Great care and attention should be given by refilling the trench with rich light soil, so that the trees may more easily form a mass of fresh roots which can be much easier removed without injury in transplanting. Having prepared the trees, the site to which it is intended to remove them should next be considered. One thing important is to provide thorough drainage, as without this few trees or shrubs will succeed where the subsoil is not sufficiently porous. To prevent water stagnating at the roots, drains of rubble or stones should be used for the purpose, about a foot below the bottom of each hole, and it is advisable to get out good large holes, and as deep as requisite for the subjects to be operated on. The soil that I find suitable for most kinds of trees and shrubs is a good, light, turfy loam; the more turf the better.

Having made all preparations beforehand, and having the proper mechanical arrangements in readiness for conveying the tree to its intended position, care should be taken not to injure the roots in transit and in placing it again in position; the roots should be laid out straight at various level and afterwards covered with fine soil, which should be well washed down with an abundance of water, and then the soil should be filled in and well rammed and made quite firm all round the tree; a good mulching of long manure, 5 inches thick, should be spread over the surface; the tree should be staked and tied firmly. The operation will be complete if the above instructions are carefully carried out, and early autumn planting and greater care in the operations of transplanting trees and shrubs, will succeed, and be sure to give satisfaction.

HARDY FERNERIES.

These will require to be constantly picked over for the removal of all decayed and broken fronds, which are apt to accumulate at this season; and all weeds should be rooted up, so as to keep up a neat and trim appearance as long as possible; and give a good supply of water, as the plants will require it this hot dry season.

CARNATIONS AND PICOTEES.

The strongest layers should now be potted in pairs in 5-inch pits in any good rich light soil, and placed in any well ventilated pit or frame through the winter. Any root-layers not required for potting may be planted out on a raised mound rather than in patches in mixed borders.

TRELLISES AND WALLS.

These will still require attention; as all kinds of climbers go out of flower they will become unsightly, and will require to be picked off; all superfluous growths should be removed, tying out the remainder neatly.

VIOLETS.

If the beds of *Violets* which were placed out last May have been well supplied with manure water, and well cared for, they will now begin to bloom. I see my first bed of *Marie Louise* is in bloom, and if a mild winter the plants will continue to flower till March and April. *Wm. Smythe, The Gardens, Easting Park, Alton, Ave. 31.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Sept. 7	Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms. Show of Grapes and Dahlias, at South Kensington.
TUESDAY, Sept. 8	Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 17 A. St. Show of Royal Caledonian Horticultural Society.
WEDNESDAY, Sept. 9	Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Importations of Orchids from Mr. F. Sander, at Stevens' Rooms.
THURSDAY, Sept. 10	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms. Sale of Imported and Established Orchids, at Frotheroe & Morris' Rooms.
FRIDAY, Sept. 11	Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
SATURDAY, Sept. 12	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.

THE recent Botanical and Horticultural Congress at Antwerp devoted much attention to the subject of the best methods for ensuring a sufficient education for those who are destined to pursue their calling either as gardeners or farmers. With much judgment the authorities printed and circulated beforehand preliminary reports relating to the subjects proposed to be discussed at the Congress. To one of these memoirs—that of Professor KICKX—we have already alluded, Professor KICKX, as the head of the School of Horticulture at Ghent—an institution to which we have often referred—is in a position to speak with great authority on this subject, and as may be seen from our report (p. 168, Aug. 8, 1885) has grasped the necessities of the case. He recognises the quality of the material with which he has to deal, and the best methods of adapting the instruction given, alike to the needs of the case and to the capacity of the pupil.

It is, now-a-days, generally recognised, that the rule-of-thumb instruction derived by a pupil from the practical instruction of his master, and from the work he is set to do, has reached its limits. Far be it from us to undervalue what has been effected in this way by the accumulated teachings of experience. The existing condition of practical horticulture in this country as in Belgium bears sufficient testimony in the results obtained to the value of the system heretofore followed. But the most enthusiastic *laudator temporis acti* will admit that we must not stand still. New circumstances crop up, conditions alter, and in view of these, to stand still is' practically to retrograde. What, then, is to be done? This is the question which the Antwerp Congress among other matters set itself to discuss. As to the preliminary education of the population in general, from which all classes of handicraftsmen are to be drawn, there is no dispute. An elementary education in the "three R's" is an absolute *sine qua non* for gardeners as for other members of the community. It places within the reach of every one the means of further advancement which, without it, is impossible. So far all are agreed. The difficulty of the situation appears when the next stage is reached.

Are we to leave the lad who can read, write, and sum, without education in his future profession further than what he can pick up by washing pots, thinning Grapes, or pruning Peach trees? The horticultural schools of the Continent proceed on the notion that something more is required, and we are entirely of the same opinion. Much of the time of the Congress was taken up with the question of botanical laboratories, but this we may leave aside. The training for a future botanist is one thing, that for the man who has to get his living by the practical exercise of his profession as a gardener or a farmer is another. By all means let us have the best equipped laboratories for botanical and physiological research—by all means let us have the most thoroughly and the most practically educated botanist that circumstances admit of; but such men are to be the teachers of the future, not the operatives. It is the education of the latter that we have here to

consider. What amount of scientific knowledge shall be required of the aspirants to the practical horticulture of the future?

In considering this question let us confine ourselves now strictly to botany and vegetable physiology. No one will deny that some amount of knowledge of these subjects is necessary—no one will deny that the present attainments of the majority fall far below what is really requisite. So far as botany is concerned an acquaintance with the outward conformation of plants in general, the nature of roots, buds, flowers seeds, a knowledge of the points of distinction and of the points of resemblance between plants of the more important natural orders of plants, Orchids, Ferns, Crucifers, Leguminous plants and the like, we should look on as absolutely essential. The means for obtaining such information are not difficult of access. Materials for study are at hand in every garden and in every field, books and illustrations abound, and the head gardener or the village schoolmaster ought to be in a position readily to give such assistance as may be necessary to help the aspirant on his onward course.

A general acquaintance with the ascertained facts of vegetable physiology is also pre-eminently essential. The acquisition of this knowledge by young gardeners is in this country at present difficult. Botanical text-books are in general too advanced for the class of pupils we have in view, and the physiology taught in gardening books in general, even in those which enjoy the greatest repute, is miserably inadequate or out of date even in the best books, and wretchedly inferior and misleading in the ordinary compilations made for gardeners' use. At present there is an interval between the high-water mark of advanced physiology and the ebb tide of the general run of gardening books which makes one shudder to contemplate. It would be absurd and futile to attempt to educate gardeners and farmers up to the high-water mark we have mentioned—that will come in the future; for the present we must be content with a more moderate programme, convinced, as we are, that the highest point reached to-day will become the low-level of a future generation. For the present we must deem ourselves fortunate if the merest rudiments of vegetable physiology can be instilled into the young gardeners we have to deal with. But in this country the means of obtaining even the rudiments of physiology are very deficient. We are quite aware that here and there pupils may be so fortunate as to be able to attend a few lectures and demonstrations; but such opportunities are few, and not within the reach of the majority. To give some precision to our remarks, we would point out the necessity that exists for giving the cultivators of the future some practical acquaintance with elemental facts of vegetable life.

A few simple experiments carefully explained would show the pupil how water is absorbed by the roots, and what are the consequences of withholding it. The effects of preventing the access of light, as shown in the blanching of Celery, might be accentuated by the very simple means requisite to show the presence or absence of starch in the tissues. To talk of chlorophyll and of starch is one thing—actually to show their importance to the health of the plant, their mode of formation, and the way to prevent or to promote it, is quite another, and so far there is no difficulty—any schoolmaster or foreman gardener could perform the simple experiments needed, or, better still, teach the pupils to do them for themselves. So, too, the effects of temperature, as seen in the process of germination, the way in which plants derive sustenance from the air or from the soil, the manner in which they breathe, and the consequences of these processes—the different modes of life of plants with chlorophyll, and of plants, like Mushrooms, destitute of this substance, can all be made mani-

fest by the simplest and easiest experiments, with no more elaborate apparatus than a glass jar, a few tubes, and a solution of iodine.

Facts of this character, which form the very basis of physiology, and lie at the very root of all cultural processes, can be demonstrated easily, and brought home to all minds, not excepting the very dullest. It is not book knowledge that is wanted—that is only a secondary matter, it is actual practical knowledge gained by the pupil himself, as it may readily be with the slightest modicum of assistance.

A knowledge of general principles thus practically obtained is every bit as valuable as an adequate knowledge of the use of tools, and there is no more difficulty in obtaining the one than there is in familiarising one's self with the other. It is not lectures, we repeat, it is not even demonstrations that are of first importance—these have their value, but it is distinctly and decidedly less than the practical knowledge obtained by a man's own exertions with his own eyes and hands. We state these things without fear of denial—they are self-evident. The corollary is that all young men destined for the practical professions of gardening and farming should have the opportunity of learning for themselves, not cramming from a text-book, such elementary facts of vegetable physiology as circumstances permit, and these, as we have seen, are not burdensome as to number while their importance is cardinal.

— TRACHYCARPUS (CHAMÆROPS) FORTUNEI.

—The illustration at fig. 65 shows a plant of this Palm which is now in flower in the garden of J. SNOWDON HENRY, Esq., of Bonchurch, Isle of Wight. The flowering of such a plant in the open air is always a matter of interest, but it is not very uncommon. We have notes of the plant flowering at Kew a quarter of a century ago, and repeatedly since that time. A correspondent in the South of Ireland speaks of *T. excelsa* as flowering in the open air, in 1878. At p. 216 of our issue for August 15 Mr. WILDSMITH alludes to the two fine specimens (figured in our columns in vol. xv., Jan. 1, 1881) which were planted in 1869, and which in 1881 had attained a height of 12 feet, with a girth of 3 feet 8 inches at 3 feet above the ground. Mr. WILDSMITH says these plants have never failed to throw up flowering spathe for the last fourteen years, and as one plant is a male and the other a female, young plants have been obtained. The Ickfield plants are not protected in any way, but those at Kew and at Gunnersbury Park receive the protection of a mat in winter. The tree in question was introduced from Northern China by ROBERT FORTUNE. There is but little difference between *T. Fortunei* and *T. excelsa*; but FORTUNE'S Palm, or the Chusan Palm, as it is called, is, as pointed out by Count OSWALD DE KERCHOVE, the harder and more robust of the two, with long, thicker leaf-stalks, and with the divisions of the leaf broader. In our number for May 17, 1879, will be found a useful note on the cultivation of this Palm, which the writer finds perfectly hardy.

— CONES.—The present seems to have been a propitious season for the production and ripening of cones. Mr. CHRISTY sends us splendid specimens of Lebanon Cedar, Lawson Cypress, Chinese Juniper, Thuopsis dolabrata, which hitherto has not often produced cones in this country, but which may now be expected to do so freely. Mr. WESTER sends us from Penrhyn cones of Picea Morinda, Abies Pissapop, Cunninghamia lanceolata. Seeds of Conifers ought to be plentiful this season, but not necessarily so, for if the male flowers have not been formed, as is often the case in young trees, of course the seeds will not be formed, even though the cones may be well formed. This is the case this year with Picea Alcockiana in our own garden.

— BOTANICAL APPOINTMENTS.—Professor DELPINO, lately of Genoa, has been appointed Professor of Botany and Director of the Botanic Garden at Bologna.—Professor WARMING has been recalled from Stockholm to undertake the Professorship of Botany and the Directorship of the Botanic Garden at Copenhagen.

— A CHRYSANTHEMUM SHOW at CHISWICK.—Some time during the month of November next, a show of Chrysanthemums, as cut blooms only, will

be held in the Vestry Hall, in connection with the Chiswick Horticultural Society. It is many years since Chiswick, so famous for its exhibitions in another place, has had a show of Chrysanthemums, and we hope the promoters of the enterprise will reap a good reward for their endeavours.

— THE HARVEST IN THE LOTHIANS.—We hear that splendid harvest weather has been experienced, and that the crops are turning out decidedly better than they have done for the last decade.

— "FAMILIAR TREES."—The second part of this new illustrated periodical, published by MESSRS. CASSELL, is devoted to the wild Cherry, *Prunus*

he was the first to introduce from the East into France. The *Belgique Horticole* publishes a portrait and biographical notice of this pioneer of horticulture, little known to his compatriots and still less known on this side of the Channel.

— CEYLON PLANTS.—A systematic catalogue of the flowering plants and Ferns of Ceylon has been published by MESSRS. DULAU & Co. for Dr. TRIMEN. This must needs be a very useful publication.

— MONTREAL BOTANIC GARDEN.—It is proposed to establish a botanic garden in the vicinity of this city. Seventy-five acres of land in a suitable situation have been selected. A botanic garden now-

country, it would be an immense advantage to be able to study in the class-room the whole of its life-history, as Mr. WORTHINGTON SMITH seems to have done."

— AMERICAN FORESTRY CONGRESS.—The American Forestry Congress holds its fifth annual meeting in Boston, September 22, 23 and 24. The Massachusetts Horticultural Society has invited the Congress to occupy Horticultural Hall during its sessions.

— NEW SPECIES OF SPRUCE.—Since the list of trees was published in the American Census Forestry Report, a new species of Spruce, named after Professor

FIG. 65.—FLOWER OF TRACHYCARPUS (CHAMÆROPS) FORTUNEI, THE HARDY CHINESE PALM. (SEE P. 304.)

avium. Mr. BOULGER knows how to write pleasantly without sacrifice of accuracy—a matter of extreme importance.

— PIERRE BELON.—It is proposed to erect a statue to PIERRE BELON at Mans. BELON was the contemporary of DODOENS and DE L'ESCLUSE, having been born near Mans in 1517. In 1546 he undertook a long voyage in the Levant, Egypt, Palestine, &c., which enabled him to publish his "Observations," not only on natural history, but on archaeology, and the religious and moral features of the countries he traversed. In 1557 he visited Italy, Savoy, Dauphiny, Auvergne, &c. At Touvoine, near Mans, he established under the patronage of RENÉ DU BELLAY, Bishop of Mans, the first French botanic garden. In 1558, twenty-five years before its introduction into England, BELON had the Cedar of Lebanon in cultivation, as well as the Plane, which

a-days requires to be an experimental garden—experimental, that is, both from the point of view of pure science and of practical utility. We earnestly wish the promoters success.

— SCLEROTIA OF PENCILLUM.—On this subject Mr. W. T. THISELTON DYEK writes—"I am sure that many persons besides myself who are interested in the life-histories of typical fungi would be very much indebted to Mr. WORTHINGTON SMITH if he would describe with as much detail as possible the mode in which he has been so fortunate as to obtain these curious structures. The directions given by BREFFEL have been repeatedly followed by Dr. VINES and myself, but without success, and I understood from Professor DE BARY that there is no method which can certainly be depended upon for obtaining them. As *Pencilium* is now generally included in courses of elementary biology in this

BREWER of Yale College, *Picea Breweriana*, has been discovered in the Siskiyou Mountains. It grows high up toward the timber line, attains a height of 100 feet, has long drooping branchlets, like some Norway Spruces, and is altogether distinct and striking in appearance.

— A BIT OF REALISM.—It is stated that at the performance of *As You Like It*, at Stratford-on-Avon recently, under the auspices of Miss MARY ANDERSON, the Turnip eaten by AUDREY in the course of the play, was procured from the garden of ANNE HATHAWAY'S cottage. Canon ELLACOMBE thinks the Turnips of SHAKESPEARE'S time were like ours "and probably as good," a statement that would be vigorously challenged by the great seed-brokers. At any rate we have no record in SHAKESPEARE of any other curiosities in the way of Turnip seed. The old name for Turnips was *neep* or *neeps*, a term still used in

Scotland, and which is clearly a derivative from the Latin *napus*, while Turnip is "the corruption of *terre naps*." The only passage relating to Turnips cited by Canon ELLACOMBE is one from the *Merry Wives of Windsor*, where ANNE PAGE is made to say, "Alas! I had rather be seck i' the earth, and bould't to death with Turnips" (*Act. ii., sc. 4*).

— "DICTIONARY OF THE NAMES OF BRITISH PLANTS" (BAILLIÈRE, TINDALL & COX).—Under this title Mr. HENRY PUREFOY FITZGERALD has prepared a handy little book "intended for the use of amateurs and beginners as a help to the knowledge of the meaning and pronunciation of the scientific names of British wild flowers." The book is likely to be very serviceable, and has been carefully compiled. We miss the word "Aquillegia" altogether, and we do not understand why the first o in Eriophorus is marked long, or why the g in Potamogeton is given as soft. *Spathulata* would be more correctly spelt *spatulata*. But in a book of this character slips of this description are sure to occur.

— JUST ONE BOOK.—We have received from EMMA S. BUSK, Honorary Secretary, Literature Distribution Branch, Kyle Society, 14, Nottingham Place, W., the following appeal. The lady will also furnish further particulars to any address:—

"Will you spare a few lines in your widely read paper to plead with the tourist readers in behalf of the stay-at-homes who have no books to read? At this season many interesting and amusing works are purchased at railway bookstalls, and thrown aside after having served for the recreation of a few hours' journey. These would be greatly valued by the sick, the poor, the old and infirm who have few pleasures but reading. The Kyle Society, 14, Nottingham Place, W., will take charge (through their Hon. Sec. of the Literature Distribution Branch) of any books sent, and will see that they reach an appropriate hand either in hospitals, infirmaries, workhouses, boys' or men's clubs, or wherever they may be wanted. The applications far exceed the supply already. Magazines, whether of general interest or of a technical character, such as the medical or engineering, &c., periodicals, are specially acceptable. I will not trespass on your space; those that enjoy reading will, I am sure, like to help us, and will all (if they can do no more) send us just one book."

— THE ROVE ORPHAN FUND.—The sum of £17 3s. 6d. sent to this office for the benefit of the orphan children of the late Mr. ROVE, who were left in a destitute condition, has been handed over to the Rev. F. S. THORNTON, St. Sepulchre's, Northampton. Mr. THORNTON has also received £4 16s. 6d., sent direct to him for the same purpose. Of subscriptions not previously acknowledged we add 5s. from Mr. WILLIAM RAYSON, and 2s. 6d. from Mr. G. POTTS. These are included in the above total.

— AN EXHIBITION OF GRAPES.—The special exhibition of Grapes announced by the Royal Horticultural Society, to be held in the conservatory, on Tuesday and Wednesday next, promises to be one of great interest to Grape growers of all classes. There is the charm of novelty in the arrangement of the classes at this show, that in the first place attracts our attention. Instead of the usual prizes for collections of so many varieties of Grapes, the competition for which is necessarily restricted to a few large growers, and which as a matter of course always includes the most showy and attractive, if not the most useful sorts, prizes are here offered for all the leading varieties separately, so that each sort will be examined on its own merits. In all, twenty-six varieties are invited as follows, viz.:—Alicante, Alawick Seedling, Black Hamburgh, Black Prince, Buckland Sweetwater, Duke of Buccleuch, Dutch Hamburgh, Dr. Hogg, Foster's White Seedling, Golden Queen, Gros Colmar, Gros Guillaume or Barbarossa, Gros Maroc, Lady Downe's Seedling, Madresfield Court, Mrs. Pearson, Mrs. Pince, Mill Hill Hamburgh, Muscat Champion, Muscat Hamburgh, Muscat of Alexandria, Raisin de Calabre, Royal Muscadine, Trebbiano, West's St. Peter, White Tokay, making twenty-six classes, and one more for "any other variety," whatever that may prove to be. It is a matter for speculation already as to what other variety there may be really worthy of cultivation. We may name the following as likely to be included, viz.: Black Monukka, Canon Hill Muscat, Grizzly Fronting-nan, Trencham Black, Black Morocco, Aramon, Royal Asot, &c. Should the competition prove at all equal to what we anticipate, this meeting should prove one of

most interesting that has yet been held. No better opportunity has ever been afforded of seeing so many varieties in competition together or of gaining information as to their distinctive merits. The season being a late one, many varieties it is feared may not be quite ripe, which is a slight drawback. In addition to the twenty-seven classes enumerated, there are the prizes offered by Mr. ROUFFEL for varieties of the somewhat neglected Fronting-nan, and Messrs. WEBBER's prizes for Grapes properly packed; Messrs. LANE & SONS, Berkhamstead, have signified their intention to exhibit examples of their wonderful Vines in pots, and we are also promised a consignment of Grapes from Southern Germany.

— SCOTTISH APPLE AND PEAR CONGRESS.—At a meeting of the Council of the Royal Caledonian Horticultural Society, held on August 14, it was resolved to hold a Special Exhibition and Conference on Apples and Pears, in connection with the Society's winter show, in the Waverley Market, Edinburgh, on November 25 and 26.

"While collections of Apples and Pears are solicited from all parts, for comparison and instruction, the chief object of the Conference is to utilise the favourable opportunity presented by the fine crop this year, for the purpose of gaining information about the Apples and Pears grown in Scotland, comparing their merits and correcting their nomenclature. All fruit growers, especially in Scotland, are therefore invited to send as complete collections as possible of the Apples and Pears grown in their district; and as the object is solely educational, there will be no competition and no prizes. It is not necessary that the fruit should be grown by the sender.

"No limit will be put upon the number of kinds which any contributor may desire to send; but the number of each variety should be from two to four, according to circumstances. The Council are anxious to procure as complete representations as possible of the Apples and Pears grown in each district, and each variety should be distinctly labelled, with the name or names under which it is grown in the locality. It is also most desirable that each collection be accompanied by all the information possible about the climate, altitude, exposure, soil, stocks, method of cultivation, and other particulars, which will be of much value to the committee in drawing up their report. For this purpose forms will be supplied on application to the Secretary.

"The specimens being strictly for examination and instruction, they must necessarily be at the disposal of the Council where required.

"Intending exhibitors must give notice to the Secretary or Assistant-Secretary, in writing, not later than Monday, November 16, stating the number of varieties to be exhibited, and the amount of space that will be required. Collections of fruit may be consigned to Mr. WILLIAM YOUNG, Assistant-Secretary, 18, Waverley Market, Edinburgh, and delivered there on or before Friday, November 20. The Council will pay the carriage of fruit and take all possible care of it, and will also see that it is properly staged for the inspection of the committee; but they will not be held responsible for any error, damage, or loss of any fruit consigned to them. Exhibitors staging their own fruit can do so on Tuesday, November 24; and all must be staged and the hall cleared for the committee by 20 o'clock on the morning of Wednesday, November 25.

"Each exhibitor will receive free tickets of admission to the exhibition for himself and such number of assistants as the Council may deem necessary."

— A MAMMOTH PRESERVE FACTORY.—We are informed that Mr. WM. P. HARTLEY, who has earned a high reputation in Liverpool and throughout the kingdom for the manufacture of preserves, has succeeded in purchasing a farm of 47 acres, about four miles north of Liverpool Exchange, and about two miles from his present premises. On this farm Mr. HARTLEY intends to erect new works, which, when completed, will be capable of producing 100 tons of preserves per day.

— MISS WILKINSON, who is the lady gardener of the Metropolitan Gardens Association, may be congratulated, says the *Queen*, upon the taste she has displayed in laying out the little garden of Trafalgar-square, Mile-end Old Town. She has transformed the spot that was once a square of rank grass and mouldering tombstones, into an oasis of flower-beds and trim paths. Her idea is to light the gardens after dusk with Chinese lanterns, and bring into the grimy East-end quarter a glimpse of the charm of twinkling many-coloured lights, such as attract, on a larger scale, the *habitués* of the Inventories at South Kensington. Another lady, Miss ISABEL GLAD-

STONE, as hon. sec. of the Association, does good work in the cause of redeeming open spaces for the people. Both ladies work "for love," and deserve the gratitude of many dwellers in over-crowded rooms.

— THE TURNER MEMORIAL.—This has been so favourably received that the promoters have now only to join their forces and apply themselves to the administrative business to be assured of complete success. The exhibitions have until now prevented any general action, but it is intended to hold a meeting on the subject on Tuesday next, immediately on the conclusion of the business of the Floral Committee. Intending subscribers may send their subscriptions direct to the Treasurer, H. M. POLLETT, Esq., Fernside, Bickley, Kent; or to the Secretary, Mr. JAMES DOUGLAS, Great Gearies, Ilford.—A general meeting will be held in the Conservatory at South Kensington on September 8, at 12.30 P.M., to appoint a sub-committee to manage the details of the "Memorial," and to consider a circular that has been prepared for distribution.

— TROPICAL FRUITS AT CHERKLEY COURT.—In one of the fruit-houses of the particularly interesting garden at Cherkley Court, near Leatherhead, a Pomegranate is now ripening some ten or a dozen of its fruit. This is certainly an unusual occurrence. Tropical fruits form a feature here, for in addition to Banaans Mr. DIXON grows the big-fruited *Passiflora macrocarpa*, so very distinct from *P. quadrangularis*, the Water Lemon; *Passiflora laurifolia*, the Loquat, while the Shaddock covers a back wall with its rich foliage and abundant fruit. The Orange trees planted out have that rich black-green foliage which is so conspicuous in the Orange gardens of the Riviera, but which is so seldom seen in the case of plants grown in tubs.

— NYMPHÆA ZANZIBARENSIS is doubtless the richest in colour of all the blue Nymphæas. Its dark blue or purple flowers are singularly beautiful and fragrant. While comparatively few can find room for the Victoria many might grow the Nymphæas, than which a more beautiful set of plants does not exist. At Cherkley Court not only is the Victoria grown in a specially provided tank, already figured by us, but various Nymphæas are grown in a separate tank of dimensions that would not alarm those who have comparatively little space at command.

— NETTLES FOR STOCK.—The system of ensilage has been found to render even Nettles fit for food, as we learn that Vicomte CHEZELLES, the French nobleman who gave evidence before the Ensilage Commission, is accustomed to place large quantities of Nettles in his silo, and states that the silage they yield is not only highly nutritive, but that the stock eat it readily.

— SEED ADULTERATION.—With reference to our article on this subject on August 22, Messrs. HURST & SON, 152, Houndsditch, London, have offered a reward of £10 to be paid to any one giving such information as will lead to the conviction of the parties engaged in this practice.

— CAMPHOR IN CHINA.—Reporting on the trade of Tamsin, China, the Commissioner of Customs says that the trade in camphor is represented in the returns by such an insignificant figure that there is great fear of its total extinction in the near future. The immediate cause of its rapid collapse may be traced to the eagerness of the Chinese to acquire, by all possible means, as much territory as possible. During the last three years hills thickly wooded with camphor trees have been burned over by the Chinese, in order to compel the savages to withdraw. Destruction on so large a scale naturally tends on the camphor trade. Forests of camphor trees do still exist further inland, but the absence of all beaten tracks across the mountains renders them difficult of access.

— GARDENING APPOINTMENTS.—Mr. JOHN DAVIES, late Foreman, Woodland's Castle, Dublin, has been appointed as Gardener to A. O. WALKER, Esq., Chester.—Mr. J. W. SEDGLEY, late Gardener to Lord COLERIDGE, Heaths Court, Ottery St. Mary, Devonshire, has been appointed Gardener to WALTER HOLLAND, Esq., Rose Hill, Worcester.—Mr. JAMES MYERS, late Foreman at Grove Park, Walford, Herts, has been appointed Gardener to the Earl of SANDWICH, Hinchinbrook, Huntingdon.

TERRESTRIAL ORCHIDS OF SOUTH AFRICA.

(Continued from p. 233.)

EULOPHIA.—Sepals oblong or lanceolate. Petals similar to the sepals, but usually broader. Labellum saccate or spurred at the base, more or less 3-lobed, with keels and crests down the middle. Pollen masses two, waxy.

A large genus of terrestrial pseudobulbous plants, dispersed through India, Malaya, Australia, Polynesia, Tropical and South Africa, Madagascar, and Brazil. Some few are pretty species, others are dull coloured and unattractive. Some flower with the leaves, others before the leaves appear. The leaves are equitant, plaited or rigid, and many nerved, and the flowers are pedicellate. The following are about the best of the South African species:—

E. barbata, Spreng.—In habit and general appearance this resembles *E. Dregeana* (which see), but the flowers are only about half the size of that species, the narrow, oblong, lanceolate acute sepals and broader oblong obtuse petals being but half an inch long; and the front lobe of the lip is roundish, and there are fewer crests on it; the spur is slender, and about 2 lines long, not clavate. The flowers are said to be whitish. This grows in grassy places in the eastern part of Cape Colony, up to an elevation of 4500 feet, and flowers in December.

E. cochlearis, Lindl.—Similar to *E. tristis* in foliage and habit, and with panicle flowers, but the flowers are smaller, the labellum has the front part concave with crimped edges, giving it a shell-like appearance; and the colour is said to be brown and yellow. This species ranges from near Cape Town, as far eastwards as Graham's Town; growing in sandy, grassy places up to an altitude of 2000 feet, flowering in November and March, according to collector's labels.

E. Dregeana, Lindl.—Leaves 6—12 inches long, $\frac{1}{2}$ inch broad, recurving. Flower stem a foot high, arising at the side of the leaves, clothed with 5—6 acuminate sheaths. Bracts lanceolate acute. Flowers in a rather close raceme, large, according to Mr. Cooper "pikish-white, beautiful." The three-lobed lip has the front lobe subrectangular, and the side lobes rounded; there are about seven callus-ridges on the basal part of the lip, five central ones being cut into filamentous teeth on the front lobe; the spur is barely $\frac{1}{4}$ inch long, and clavate. It is a native of the Transvaal and Orange Free State, flowering in December.

E. ensata, Lindl.—Leaves a foot or more long, grass-like. Flower-stem as long as the leaves, and apparently arising at the side of them, clothed with 4—5 long acuminate sheaths. Flower-spike contracted and somewhat corymbose at first. Bracts linear acuminate; flowers large, "primrose-yellow"; the sepals and petals are about $\frac{3}{4}$ inch long, oblong-lanceolate acute; labellum oblong, very obtuse, sparsely ciliate on the edges, and the whole upper surface covered with fine hair-like processes; spur $\frac{1}{2}$ inch long. This grows in Natal and on sandy flats near the sea in the district of Lower Albany. It appears to be a fine showy species, flowering from October to December.

E. tristis, Spreng.—Leaves narrow, rigid, folded lengthwise, margins rough. Flower-stem arising from amidst the leaves, 1—2 feet high, panicle. Bracts linear acuminate. Pedicels, including the ovary, 6—10 lines long. Flowers about $\frac{3}{4}$ inch in diameter, "brown and white," spur short, $\frac{1}{2}$ —2 lines long, slightly clavate. This appears to be a common species, with a tolerably wide range, since it is found on Table Mountain at about 1400 feet elevation; near Simon's Bay, and in the eastern districts of Cape Colony. It flowers in December and January. The flowers are very numerous, in large panicles; the sepals and petals appear to be brownish, and the lip whitish, and, if not too dull coloured, ought to be an ornamental plant.

HABENARIA.

Sepals and petals nearly alike, or the petals narrow, and sometimes 2-parted, all converging over the column, or the lateral sepals spreading or reflexed. Labellum 3—5-lobed, or entire, spurred or saccate. A large and widely dispersed genus. The flowers are very variable in size and form; in colour they are most generally white or greenish; some of them are very beautiful, others insignificant. The following are among the best of the South African species, although there are several others equally fine; but I

have no information concerning them that would be of value to a gardener.

H. castida, Rehb. f.—(Stem 1 foot or more high, with strap-shaped acute leaves, 2 $\frac{1}{2}$ —6 inches long, the upper ones much smaller. Bracts 4—5 inches long, and rather dense. Bracts lanceolate acuminate, $\frac{3}{4}$ inch long. Flowers $\frac{3}{4}$ inch in diameter, milk-white, with pale green sepals and spur; dorsal sepal hood-shaped, acute; lateral sepals semi-elliptic acute, their upper edges straight, their lower strongly curved; petals narrow linear, slightly adhering to the edges of the dorsal sepal, and with it forming the hood; labellum apparently 5-lobed, the lateral lobes falcately oblong, the middle one narrow-linear, the two seemingly basal lobes of the lip are the two lower segments of the petals, adaxial to the lip; spur slender, $\frac{3}{8}$ inch long. This grows in woods in the districts of Somerset, and is said to flower only in very rainy seasons, and will therefore require shade and moisture when under cultivation. It appears to range from low to high altitudes, since it grows "in the deepest parts of the woods near the mouth of the River Kier," and "in shady places on the sides of Mount Kagaberg, at 4000 feet elevation." It flowers in February.

H. clavata, Lindl.—A fine species, 12—18 inches high, with elliptic-oblong acute leaves on the stem, and a rich raceme of goody sized flowers, which according to one collector are yellow, and to another green. The upper sepal is oblong acute, and the lateral sepals broadly falcate-oblong, and becomes twisted when the flower is fully expanded. The two-parted petals, have their lower segments nearly three times as long as the sepals, thread-like, and curved round half a circle, the upper segment is also filiform, straight, and about as long as the sepals (8—9 lines). The labellum is divided to the base into the five filiform segments about $\frac{3}{4}$ inch long. Spur equalling the ovary and its stalk, $\frac{1}{2}$ inch long. Bracts 1 $\frac{1}{2}$ — $\frac{3}{4}$ inch long, broadly lanceolate acuminate, embracing the pedicel of the ovary and the end of the spur. A native of Natal, the Orange Free State, and the eastern districts of Cape Colony, growing at an altitude of 5000 feet, in wet grassy places, and flowering in February.

H. robusta, N. E. Brown (*D. natea speciosa*, Wild, Bot. Mag., t. 2926).—A fine showy species, 1 $\frac{1}{2}$ —2 feet high, with a stout leafy stem, and a large many-flowered ovoid spike, 5—7 inches long, and 5—5 inches broad. Leaves elliptic acute, 4—5 inches long, $\frac{1}{2}$ — $\frac{3}{4}$ inches broad, the upper ones gradually smaller, and the lower part of the stem with sheaths only. Bracts elliptic-acuminate, concave, shorter than the $\frac{1}{2}$ —2 inch long ovary. Flowers, 1 $\frac{1}{2}$ inch in diameter; sepals and labellum green, petals and stigmas white; dorsal sepal hooded, apiculate, lateral sepals falcate ovate-acute; petals 2-parted, upper segments linear, with a tooth behind, erect under the hood, green, lower segments falcate, adnate at the base to the lip, which is divided into three linear flexuose segments. The rostellum forms a remarkable hood in front of the anthers (as in several other species) and the stigmas are long cylindrical processes projecting between the lower segments of the petals. This grows among shrubs on the sand hills at Mossell Bay and Platteberg's Bay. It was introduced about sixty years ago, and grew and flowered freely; it requires a rich sandy loam, and should be placed in the shade; the flowers last a considerable time.

H. tenuior, N. E. Brown.—Stem leafy, 6—12 inches high. Leaves 1— $\frac{1}{4}$ inch long, ovate-lanceolate acute. Flower-spike 2—5 inches long; bracts like the leaves, but rather smaller. Flowers $\frac{3}{4}$ inch in diameter; dorsal sepal oblong obtuse, lateral sepals spreading, falcate, oblong obtuse; petals erect, somewhat S-shaped, as broad as the sepals; labellum ovate obtuse, with recurved waxy margins; spur very large for the size of the flower, $\frac{3}{4}$ inch long, curved forwards at the very blunt apex. A native of Natal and the Transvaal, growing at an altitude of 2000 feet, and perhaps more, probably in marshy ground, but I have no information upon this point. It flowers in January. This was originally described by Reichenbach as *Brachycorythis tenuior*, but as the labellum is spurred it should go into *Habenaria*, and seems closely allied to some of the Indian species of that genus, in the section *Platanthera*. To judge from the dried specimens and a drawing, it appears to be rather a pretty species; the flowers are bright rose-pink, the sepals dotted with darker, and the spur green.

H. tetrapetala, Rehb. f.—Stem leafy, 8—18 inches

high. Leaves strap-shaped, acute, folded. Raceme 3—9 inches long. Bracts $\frac{1}{2}$ — $\frac{3}{4}$ inch long, lanceolate-acuminate. Flowers small, $\frac{1}{4}$ inch in expanse, numerous, greenish-white; dorsal sepal elliptic acutish, narrowed at the base; lateral sepals much broader falcately obovate; petals 2-parted, upper segment narrow, oblong-lanceolate, attenuated at the base; lower segment broader, lanceolate; labellum divided to the base into three linear segments, the middle one longest; spur slender, $\frac{1}{4}$ inch long. A native of Natal and the eastern districts of Cape Colony, and seems to have a wide altitudinal range, growing in moist sandy soil on the flats near Durban, up to an elevation of 5000 feet in Giqualand East, flowering, according to locality, from December to May.

IIERSCHELLIA.

H. celestis, Lindl.—This is identical with *Disa granulifolia*, which see.

HUTTONEA.

Sepals ovate, flat, united in one piece at their base by the bases of the claws of the petals, which have long claws, and a hood-shaped or concave fringed limb. Labellum free, flat or concave, fringed.

This genus consists of but two elegant species, both worthy of cultivation, and very remarkable on account of the long-elongated, concave, or hooded petals.

H. fimbriata has both sepals and petals fringed, and the limb of the petals concave; it is a native of Natal. *H. pulchra* has the sepals entire, and the limb of the petals hood-shaped. It is described as "a most lovely Orchid, with snow-white, sweetly-scented flowers of singular shape, and glossy, dark green, expanded leaves." One collector describes the flowers as "green." It grows on the Katberg at "4000 feet elevation under trees" in the Orange Free State, and in Natal, "on damp rocks," at 4500 feet elevation. Both species are from 12—18 inches high, and have cordate-elliptic leaves. They probably require moisture and shade.

LISSOCHILUS.

This genus is scarcely to be distinguished from *Eulophia*, the only difference being that in the larger species the petals are very much broader than the sepals, and more brightly coloured. It may be said to consist of the finest and most showy of the *Eulophias*. The genus seems to be confined to Tropical and South Africa, and some of them appear to be fine showy plants, especially the tropical *L. macranthus*, with large apparently purple flowers. The following are South African:—

L. arenarius, Lindl.—A fine showy species, flowering before or with the leaves. Leaves narrow, grass-like, but rigid. Stem 1—2 feet high, with distant sheaths. Raceme lax, with lanceolate acuminate bracts, and several handsome flowers nearly $\frac{1}{2}$ inch in diameter. Sepals lanceolate acute, all erect, greenish-brown. Petals large, elliptic obtuse, bright light mauve-purple. Labellum with a short pouch-like yellow spur, and a broad three-lobed limb, the front lobe quadrate, except in the throat; the labellum is light mauve-purple like the petals. Although this plant grows in Natal it appears to be much more common in Tropical Africa, both Eastern and Western. Barter, who collected it on the Niger, has the following note on his label:—"Flowers purple, base of labellum lined with orange. Flower-stems appear after the first rains in April, leaves later, tuber large and flattened. Sivanahns, in a sandy soil, abundant, ornamental, worth cultivation." To Natal it flowers in November.

L. Buchananii, Rehb. f.—Leaves 2—3 feet long, $\frac{1}{2}$ —2 inches broad, lanceolate, acuminate, plicate. Flower-stem 3—4 $\frac{1}{2}$ feet high, with distant acute sheaths, and a many-flowered raceme of fine yellow flowers. Bracts oblong-obtuse or subacute. Sepals reflexed, erect, spatulate, oblong, apparently brownish. Petals elliptic-oblong, very obtuse, yellow. Labellum yellow, with a short cooical spur, and an ovate, obtuse, slightly emarginate limb, the sides erect towards the base, recurved and crisped towards the apex, with three median crested keels. A fine bold and handsome species, a native of Natal, flowering in February. I have no information as to habitat.

L. Sandersonii, Rehb. f.—This fine species has recently flowered at Kew in the Palm-house, where it produced broad, lanceolate, acute, plicate leaves, about 3 feet long, and a stout flower-stem 5 feet high, with distant acutish sheaths, and a long lax raceme of flowers about 2 inches in diameter. Bracts elliptic, acute. Sepals oblanceolate, acute, all dull green, re

flexed. Petals very large and broad, elliptic, obtuse, white, with a very delicate mauve hue outside. Labellum three-lobed, with a conical spur, that is towards its apex rather abruptly bent backwards, dull green, with the oblong-obtuse front lobe bright mauve-purple; there are three strong median keels much crested towards their apices, where they become yellowish-green, or pale purplish. It is a native of Natal, but I have no information as to habitat. Planted out in one of the beds in the Palm-house at Kew, it has thriven well, but whether it will continue to do so remains to be seen, and should be reported upon.

L. speciosus, R. Br. (*Bot. Beech.*, t. 573; *Paxton's Mag.*, iv., p. 25).—Leaves ensiform, a foot long. Flower-stem stout, 3–4 feet high, with distant sheaths, and an elongating lax spike of large, showy, bright yellow flowers, with small green ovate acute reflexed sepals, large elliptic obtuse petals, and a somewhat saddle-shaped lip, with a short conical spur, and a series of slightly raised keels without crests on the limb. This is an exceedingly fine and ornamental species. Lindley, writing in 1821 (*Colletanea*, t. 31) says of it:—"We think, without any exception, it is the finest plant in the order we ever saw alive." The flowers are fragrant, and it is said to last two months in bloom, the spike elongating to about 2 feet. It is a native of the eastern districts of Cape Colony and Natal; in Lower Albany it grows "among the sand hills near the mouth of Kleinemont River, flowering in December and January." In *Paxton's Magazine* above quoted it is stated that "It will thrive in a temperature much below that in which orchidaceous plants in general delight, but will not succeed well with the treatment of greenhouse plants, unless the house in which they grow is kept at a higher temperature than is usually recommended or suitable for them. One intermediate between these will suit it. It prefers good rich loamy soil mixed with a little peat and sand; it should be put into a well drained pot, not over large, and the plant in summer liberally watered, but in winter it should scarcely have any." To the above I would only add that I believe if the soil was about half loam and half sharp sand the plant would probably have a better chance of establishing itself with us.

PERYGODIUM.

Dorsal sepal and the very large concave petals united into a hood, lateral sepals free, spreading. Labellum adnate to the face of the column, with a large or small tongue-shaped appendage at the base. A genus of about a dozen species, all South African. Most of them would appear to be worth cultivation, but those noted below are perhaps the chief.

P. acutifolium, Lindl.—Stem leafy, 6–12 inches high. Leaves few, lower ones 2–3 inches long, $\frac{1}{2}$ inch broad, strap-shaped, acute, upper smaller, ovate-lanceolate acute. Flower-spikes short and rather dense; bracts ovate-lanceolate acute, $\frac{1}{2}$ inch long; flowers about $\frac{1}{2}$ inch in expanse, deep golden-yellow; labellum very small, broadly ovate at base, contracted about the middle into an oblong point, the linear-lanceolate appendage, which ascends under the very broad hood, is entire. This grows in moist grassy places, on the Cape peninsula, from 1400–2500 feet, flowering in November and December.

P. caffrum, Sw.—Stem 6–12 inches high, with a few elliptic-oblong, or oblong, lower leaves, passing upwards into stem-sheaths. Flower-spikes 2–4 inches long, compact; bracts $\frac{1}{2}$ inch long, elliptic ovate, acute; flowers $\frac{1}{2}$ inch or more in diameter, bright yellow; labellum very broad, two-lobed, with somewhat rounded lobes widely diverging so as to somewhat resemble the form of a fish's tail; the appendage is short, broad, and hooded at the apex. This grows at a lower altitude on the Cape peninsula than the preceding, being found between "100–1000 feet elevation, and can do with less moisture." It flowers in October and November.

P. carnosum, Lindl.—Stem a foot high, with linear acuminate leaves about 2–3 inches long. Flower-spikes 2–5 inches long, dense; flowers about $\frac{1}{2}$ inch in diameter, purple. A native of the Cape peninsula at an elevation of from 1300–2200 feet, growing in moist grassy places, and flowering in November and December.

P. catholicum, Swartz.—In habit and general appearance this closely resembles *P. acutifolium*, but the leaves are more obtuse, with a small apiculus; the flowers of a rather paler yellow, and the appendage of the labellum is serrulated on its edges, otherwise the flower is like that of *P. acutifolium*. It is found at much lower altitudes than that species, and flowers in August and September. There is a variety of it with purple flowers. *N. E. Brown, Kew.*
(To be continued.)

DISEASE OF ANEMONES.

PERONOSPORA PYGMÆA AND ITS RESTING-SPORES.—The accompanying illustration (fig. 66) shows a section through a fragment of a leaf of *Anemone nemorosa*, with *Peronospora pygmæa* growing out of a stoma, and with oospores or resting-spores of the fungus within the substance of the leaf,

FIG. 66.—DISEASE OF ANEMONES: PERONOSPORA PYGMÆA. Passing through a breathing pore on the lower surface of the leaf, here shown in a reversed position.

enlarged 400 diameters. The oospores were found by me in *Anemone nemorosa* at Aboyne on Saturday, June 13, 1885. When ripe they have a darkish brown, irregularly rough external covering with one or more internal coats, just as in the oospores of the

FIG. 67.—FERTILISATION OF PERONOSPORA PYGMÆA. (SEE TEXT.)

fungus which causes Potato blight—*Peronospora infestans*; to the latter oospores the oospores of *P. pygmæa* have a decided resemblance. The contents are generally coarsely granular, suggesting the idea that the protoplasm may break up into a number of zoospores. In fig. 66 two oospores at the lower part of the illustration are shown, and it is common to find

an irregular expansion at one side of the oospore, which probably represents the antheridium or its remains.

At A, B, C, and D, fig. 67, is represented, enlarged 400 diameters, the process of fertilisation, A being the oogonium, or female body, and B the antheridium, or male. The envelopes of the oogonium are pierced by the antheridium, as shown at C, and this process of piercing is again shown diagrammatically at D. The fertilising substance of the antheridium appears to pass through the minute transparent passage or tube into the oogonium, in the manner illustrated and described under *Peronospora infestans* by Mr. Worthington G. Smith in his *Diseases of Field and Garden Crops*, p. 298. The illustrations here given are from permanent unstained glycerine preparations. The slide from which the figure A B was taken is no longer in my possession, otherwise it would have been submitted to the Editor of the *Gardeners' Chronicle* for verification. However, Dr. Trail, Professor of Botany at the University of Aberdeen, vouches for the accuracy of the representation. The accuracy of the observations has also been confirmed by Mr. W. G. Smith, who has examined fresh examples of the oogonia and oospores whilst still attached to the ordinary fruiting threads of the fungus which grow through the stoma of the leaves. A mounted preparation will also be given by me to the Department of Botany, British Museum, South Kensington, for placing with the other mounted examples of the resting-spores of species of *Peronospora*. I have now found the resting-spores of this fungus from three different localities—Aboyne, banks of the Don, near old Aberdeen; and beside Walker's Dam, near Aberdeen. Soon after the above-mentioned oospores were found by me, Dr. Trail met with the oospores of *Peronospora arborescens* on *Papaver argemone*. They are similar to those belonging to the *Anemone Peronospora* and the process of fertilisation is traceable in one or two cases in Dr. Trail's prepared slides. *Geo. Brehner, 11, Garden Place, Aberdeen.*

THE MILFOILS.

Of the genus *Achillea*, over a hundred have been described as species by different authors, but this is greatly in excess of the number that should be retained as distinct species. For horticultural purposes, size of the leaves, height of stem, and colour of the flower-heads, are all important distinguishing marks in the eyes of the gardener, and undoubtedly they serve his purpose; but the discriminating eye of the botanist is able to overlook all these trifling differences, especially when he finds them connected by numerous intermediate gradations. Moreover the differences may be too insignificant, or too inconstant for the subjects to merit the rank of species from a scientific point of view. A considerable number have been introduced to British gardens from time to time, but at present they are a comparatively neglected class as a rule. All are herbaceous and perfectly hardy with few exceptions, and their cultural requirements are few. Many are dwarf alpine, suitable for rockwork, others for the herbaceous border, and some can be put to a variety of purposes in garden economy. The following is by no means an exhaustive selection, but contains a number of the most useful sorts:—

Achillea tomentosa.—Taking all things into consideration this species is one of the best for general cultivation. Its neatness renders it available for planting in the front line of the herbaceous border, or on the rockery. For this latter purpose its densely tufted habit, finely cut foliage, and yellow flower-heads are excellent recommendations. Its date of introduction from the Continent seems to have been lost, for most of the older botanical books consider it as a native of Britain, and accordingly we have it figured in *English Botany*, 2532. The best authorities, however, consider it as a garden escape, scarcely even naturalised. It sometimes does duty in gardens under the name of *A. aurea*. The distinctness of the two, however, is unquestionable, for besides differences in the leaves, the flower-heads of the former are borne on a repeatedly branched umbel, while in the latter they are solitary, or simply umbelate.

A. aurea.—The leaves of this plant are bipinnate and downy, forming a closely tufted and fitting background for the golden-yellow flower-heads. The species was originally introduced from the Levant in 1739, and requires for its well-being a dry, sheltered situation. At present it is scarce, or is altogether got lost to cultivation. Beside the above-mentioned

species, it is said to be confounded with *A. ageratifolia*, a comparatively recent introduction from Greece, with white flowers.

A. umbellata.—Like several other species, this is cultivated chiefly on account of the beauty of its hoary foliage. The leaves are densely arranged on the decumbent stems, finely pectinate, generally under, and seldom exceeding, 1 inch in length, with narrowly spatulate segments. When bruised they are rather powerfully odorous, but this is a matter of no consequence when the plant is used as an edging, or, better still, for clothing an overhanging ledge of the rockery, where these conditions seem to make it perfectly happy. The flower-heads are white, produced in simple umbels, terminating short, somewhat leafy stems. It is a native of Greece.

A. moschata.—As a companion for the foregoing plant this is eminently suitable, and abundantly distinct. The foliage is green, slightly hairy, and dotted with sessile glands on both surfaces, exhaling an agreeable, faintly musky odour, as the specific name implies. The individual leaves range from 1½ to 2 inches long, and are finely pectinate, with linear, entire, or slightly toothed segments that are more irregular in length than those of *A. umbellata*. The flower-heads are white in a loose umbel, and the whole plant is decidedly dwarf and tufted. It is used medicinally by the Swiss, and cattle are said to relish it, recalling to mind the use to which our native *A. Millefolium* is put in some of the colonies, and sometimes at home. *A. moschata* is figured in Jacquin's *Austrian Plants*, 5, tab. 33.

A. ageratium.—Here the leafy stems average about 18 inches high, supporting a terminal densely-packed umbel of yellow flower-heads. The rays are extremely small and inconspicuous, and gain appearance solely by their dense arrangement. The leaves are oblong, doubly serrated, and tapered into the petiole, bearing shortened branches in their axils, giving them a fasciated appearance. The plant is inferior in point of beauty to any of the above-mentioned, but is recommendable as a thoroughly distinct subject for the herbaceous border.

A. filipendulina.—For the back line of a herbaceous border, or even for the shrubbery, few better or more conspicuous of the taller Composites could be named for the months of July and August. It is a native of the East, and was originally introduced to this country from the shores of the Caspian in 1803. The finely divided Fern-like leaves are pinnatifid, with long narrow, more or less, pinnatifid and cut segments, clothing stems from 3 to 6 feet high. The golden-yellow flower-heads (individually small) are produced in broad, repeatedly branched umbellate panicles. A good figure is given in these columns, October 1, 1881.

A. Clavenna.—The flower-heads are closely umbellate, on short leafy stems, and are somewhat conspicuous from their comparatively large white rays. The striking feature of this plant, however, lies in its dwarf habit, densely tufted leaves, and hoary appearance. On this account it is sometimes used as an edging or dividing line in a design, with excellent effect. The leaves are pinnatifid, with oblong slightly toothed segments. The silvery-grey colour seems to develop most intensely by growing it in rather dry situations. It was introduced from Austria more than 200 years ago, and is figured in the *Botanical Magazine*, t. 1287.

A. asyriaca.—The silvery-white feathery leaves of this species are linear-lanceolate in outline, pinnatifid, with oblong serrated or somewhat lobed segments, and are even more effective than those of *A. Clavenna*, as the plant is also rarer. The woolly flower-heads are small, bright yellow, and densely packed in terminal umbellate panicles that contrast beautifully with the foliage. The leaves are strongly odorous when bruised, but otherwise unobjectionable for mixing with cut flowers. It will succeed perfectly in a dry warm situation on the rockery, although it was formerly considered a greenhouse plant. For outdoor work it merits extended cultivation. It comes from the Levant, and is figured in Tournet's *Relation d'un Voyage du Levant*, i., t. 87.

A. parmica flore-pleno.—The typical form of this species is by no means an attractive garden plant, but the variety under notice is a gem of the first water, whether for the herbaceous border or the back part of the rockery. It is moreover of great value for cut flower purposes, on account of the snowy purity of the perfectly double flower-heads and their long-lasting

properties. The so-called doubling consists in all the florets, except about half-a-dozen in the centre, being transformed into females, and ligulate like those of the ray. The leaves are deep green and finely serrated—the serratures being again serrulate, a fact frequently overlooked in botanical works. It is of the easiest possible cultivation and requires frequent trimming to prevent it monopolising the ground to the exclusion of its neighbours. *F.*

HOME CORRESPONDENCE.

Patent Clip or Holder.—This most useful little invention, designed for holding sheets of glass, metal, slate, or other material (fig. 68), is certain to prove of great use to the gardener. We have been hitherto without a simple and inexpensive contrivance for holding glass in position, so as to enclose a small area, such as is required for striking cuttings in the open air or otherwise, grafting, and protecting from wind, rain, and cold. By means of these simple screw clips, square or half-square forms can be made with glass of any ordinary thickness, and of any useful dimensions, suitable for uses identical with those to which hand-lights and cloches are put; and, moreover, with the advantages of great stowability when out of use, and the rapidity with which broken glass may be removed or extensions made. One use to which the contrivance permits glass to be put is that of protecting lines of early vegetables, in the

FIG. 68.—PATENT CLIP.

winter and spring months, as Parsley, Peas, Salads, Cauliflower, Beans, Potatoes, &c. On the rockery they would be invaluable with the ends open, to form penthouses over alpine plants that suffer from overhead moisture, but which are not injured at all by frost. In the dwelling ingenious people will find sundry uses the clips can be put to in forming little enclosures for the better growth of Ferns, Mosses, Begonias, Bertolonias, Sonerilas, Gloxinias, Masdevallias, and the preservation in longer beauty of various of the less delicate Orchids. The inventor is Mr. J. Goddard, 13, Radipole Road, Fulham, S.W., who supplies them at a moderate cost per dozen. Our sketch was taken from a specimen exhibited.

Reversion in Iris.—Two years ago my gardener gathered the seed—only one or two seed-vessels—of a fine yellow and red-purple Iris, very similar to the Iris named Darius. The seeds were sown and the young Irises planted out this spring. The leaf appeared totally different in shape and colour to that of the parent Iris. When the flower came, the character of the leaf was confirmed—it is a wild yellow flag! It bears not the slightest resemblance to the Iris from which the seed came. The seed was the only Iris seen in the place that ripened. *E. V. B.*

Market Vegetable Growing.—Your correspondent, Mr. Easley, gives but small grace to the gardeners of this country, when they do not happen to be market growers, or reside elsewhere than in Essex. If all he states about the wretched methods of growing crops of vegetables were true, I fear many of us would not hold our situations for any long period, as the cooks and their employers would readily find out our deficiencies in that all-important particular. The differences lie in the fact that we do

not grow for market, thus we neither want the quantity nor the bulk of crop a market man does. We look for continuous, moderate supplies, of well-grown succulents, and not over-large specimens of almost everything that is required in a gentleman's kitchen; and it may be here stated that that which enters into the servants' dietary should be as good in quality, if less in variety, as that which goes to the employer's table. The absurdity of planting Cabbages a foot apart, as advocated in Mr. Easley's paper, is apparent to any one managing a private garden. The market grower would clear them off at once or twice cutting, the former must take some few weeks to do so, during which time growth would take place continuously, and all the evils of an excessively crowded crop, with all its attendant stench and loss, would occur. The winter greens and small varieties of Cabbage may be so planted, and be kept from spoiling each other by the timely removal of the plants for daily consumption. Again, Marrows are but in comparatively small demand in private gardens, as are likewise Cucumbers, so that there is rarely a need to plant largely. That is the reason dunghills or masses of garden refuse are found suitable places for the growth of the first-named, and in such materials the plants grow rapidly, and the foliage hides that which in certain states is an unpleasant object. Out-of-doors Cucumbers are not much liked for the reason that the better kinds of frame varieties are grown in sufficient numbers during the summer, and our domestics do not know the simple methods of Continental people of preserving them for winter salads in weak brine. In writing for the information of gardeners the writer of these papers seems quite to ignore the differences existing between the practices required by the grower of vegetables for a family and the grower for market. No allowances are made either for different parts of the kingdom, for particular tastes, for variation in soil, elevation, water supply, quantity or quality of manures, and a few other considerations beside, that will occur to any one having to keep up either a constant or an intermittent supply in suburban or purely country establishments. *M. W.* [It should be remembered that Mr. Easley writes under the heading "Market Gardening." Ed.]

The Dodder.—The note on the above by "W. G. S." is interesting, and proves pretty conclusively that the Dodder seed had been present in that of the Clover when sown. An almost similar case has occurred here in which two large fields of Clover, situated nearly 500 yards apart, sown with seeds procured from the same source were infested, indeed partially ruined, by the greater Dodder (*Cuscuta europæa*). There could be no doubt, in this case at least, that the Dodder seeds were imported with those of the Clover, more especially as other fields on the same farm, but sown with Clover obtained from a different source, were perfectly clean, and which should make seed-vendors very careful before disseminating the germs of such a ruinous as well as troublesome plant. *A. D. W.*

Stocks Degenerating.—Can any of your readers give a satisfactory reason why the high-coloured annual Stocks (*Matthiola annua*) so often fail to develop their proper colours—say crimson or purple—and produce flowers which are blotched with white, often so heavily as to have a thoroughly motley, and anything but ornamental aspect? It is not in the particular variety, as some plants come true, and sometimes plants from the same seed packet are true one year and mottled the next. It scarcely seems to be caused by the chemical constitution of the soil, as it happens in various positions, and some few plants come high-coloured beside the degenerated ones. Mine have been very badly affected this year, though the plants seemed healthy enough, those which should have been crimson showing more white than crimson in their flowers. Can anything be done to prevent this degeneration?—which no doubt has been experienced and regretted by others besides *M. C.* [It is so with us, but we own to an appreciation of the variety. The appearance is due to deficient vitality, but how produced we cannot say. Ed.]

Notes from the Banbury Show.—I was one of the judges of vegetables at this show on Tuesday last, and amongst the good things shown the Rousham Park Hero Onion and Neal's Ne Plus Ultra Runner Bean were well to the front. The Hero Onion, notwithstanding the past dry season, was staged in mag-

nificent form by Mr. Wingrove; the bulbs were very large and handsome, some of them scaled nearly 1½ lb. Two or three lots of the Improved Banbury were shown, as also other kinds, but none could come near to the Hero: it gained all the prizes in the first class. *Ne Plus Ultra* Bean was shown by Mr. Wingrove, and it is not too much to say that the prize dish of fifty pods was the finest lot I ever saw. I have grown the Champion Runner, as also Girtford Giant, both very good things, but they are not equal to this variety. It is, I understand, the result of several years' careful selection by Mr. Neal, gardener to P. Southly, Esq., Bampton; it is longer than Girtford Giant, but not so broad, but as straight as it is possible for a Bean to grow. Mr. Deverill, of the Royal Seed Stores, Banbury, has purchased Mr. Neal's stock, and he showed a grand lot of pods, "not for competition," as also twenty-six varieties of Onions, which proved a very interesting feature of the show. Mr. Deverill did not go in for size, though they were large enough certainly, but placed before the public true types of the various stocks, and they did him great credit, proving the great interest he takes in the selection of his various stocks of Onions. Doubtless we shall hear more about this collection. H.

Fertilisation of Figs, &c.—The facts mentioned in your journal, No. 608, August 22, p. 247, under the heading of "The Fertilisation of Figs: Stones in Trees," are well-known to me, but it is doubtful whether both practices may not be mere prejudices. Figs ripen abundantly in many countries, certainly in Central Italy and Egypt, not to mention England, without the aid of the wild fruit, Jujubes, in Maltese *Ziozzelli*, in Italian *Guigliolo* (*Zizyphus vulgaris*, *Lion*), ripen their fruit abundantly in this country, and at Bagdad, like other trees, without being laden with stones. Nor do the natives of Central Italy even know that such a practice exists anywhere. It is a singular circumstance, however, that in Apulia, near Taranto, the southern Italians load the prickly Pear or Indian Fig with stones in the same manner and with the same intention as the Maltese do the Jujube; whereas the Maltese, who also largely cultivate the Prickly Pear, do not do so. Thus we see the same practice applied by two southern European races to two widely different plants; we must, therefore, suppose it is the tradition which has survived of some very remote superstition. It may interest some of your readers to know that the tree and fruit of the Jujube, respectively *Guigliolo* and *Guigliola*, have given rise to the following Italian proverbs:—"Quando il *Guigliolo* si riveste e tu ti spoglia, quando si spoglia e tu ti veste."—"When the *Guigliolo* puts on its leaves you strip, when it casts its leaves you dress"—in allusion to the Jujube being one of the latest trees to bud and earliest to shed its leaves. Of the fruit *Guigliola*, "Questa e la *Guigliola*?"—"This is the question." "Cavare da alcun luogo la *Guigliola*, o?"—"Gnabagnare altro che *Guigliola*?"—"To derive a large gain." "No disgrado l'acqua delle *Guigliole*?"—"I do not despise the water of the *Zizyphus*" is the literal translation—is said ironically of one who is very precise. The allusion refers to a decoction of the dried fruit used for colds, &c. H. J. Ross.

Grapes at Exeter Show.—The judging of Grapes at the above show gave, I believe, general dissatisfaction, and in one of your contemporaries has drawn forth some rather plain and strong criticism. I have no desire myself to enter into any controversy on the subject, but I observe in the report of the show in your columns your reporter states that in the 2d prize collection of six bunches (that of Mr. Ward, Longford Castle), Foster's Seedling and Muscat of Alexandria were not quite ripe. If appearance goes for anything, I should certainly say they were ripe, for their colour left little or nothing to be desired; indeed, regarding the first-named variety I can say that only on one previous occasion have I seen it better. *Grape Grower*.

Slaughter's Rose Tube.—This is neither registered nor patented, but is a great and desirable help in the way of setting up cut Roses for exhibition. It is in two parts. First of all there is a rimless well containing the water. Then the portion that holds the Rose is furnished with a circular flattened rim like that of an ordinary Dahlia tube, but the hole which contains the flower is much smaller. The flower is placed in this, and being hollow at the bottom, the

water in the well rises within it, and the stem of the flower is immersed in it. But this is not all. According to the usages of the National Rose Society blooms of Roses may be wired. For this purpose, Mr. Slaughter uses a somewhat thick and serviceable but decidedly flexible galvanized wire. At one end is a loop through which the stem of the flower is passed until it is immediately above the blossom; the stem is fastened to the wire, it is then placed within the tube, and there it is in a position favourable to showing off the Rose to the best advantage. A stand of flowers set up by Mr. Slaughter is highly attractive. What an improvement this is on the old plan of simply placing the stem of the Rose in damp moss without the assistance of the tube. One thing militates against the wide introduction of Mr. Slaughter's tube, namely, that at some country shows the use of the wire would lead to disqualification. But the new tube and the use of the wire will gradually find their way into general use, to the advantage of Rose exhibitions. R. D.

Erythrina Crista-Galli.—It is singular that this beautiful old plant commands at the present time very little attention, judging from its extreme rarity in gardens. Why this should be perplexes me. I can call to mind but few instances where it has come under my notice. It is cultivated at Messrs. Lucombe, Pince & Co.'s nursery at Exeter, and I remember seeing a fine specimen some years ago on the open wall and in bloom at the Exotic Nursery, Chelsea, and another at St. Michael's Hill Nursery, Bristol. Just recently, however, I have discovered a beauty, enough to make one's mouth water, which, according to the obliging gardener's (Mr. Syme's) testimony, has been flourishing in its present position for a great number of years. It is growing under the shelter of a greenhouse wall in the open border at Lady Drake's charming residence, near the mouth of the Exe in Devonshire, and in its many shoots—which, by the way, spring up annually from the root-stock—are in reality large racemes of gorgeous bright scarlet flowers. This fine species is certainly worthy of extended cultivation, at least in the Southern Counties, where it is hardy, or almost so. W. Napper.

Mesembryanthemum edule.—Virgil speaks of certain shores as being *myrtalis letissima*; write instead mesembryanthemis, and you have a description applicable to the coast line of Trecco, one of the Cassiterides. In Mr. Dorrien Smith's garden this *Mesembryanthemum* completely hides a steep and rocky escarpment, hangs down 10 feet or more over the face of a granite cliff, opposite the *Sic vos non nobis* written over the entrance; and thirdly, forms a charming bank of flower and foliage, 60 feet long, on one side of the tennis lawn. The two harbours of the island are named Old and New Grimsby. The curving shore above high-water mark is covered by broad patches of it. The flowering season begins in May and continues to the end of August. Blossoms now are few and far between, but a copious crop of the fruit is ripening off. Stretches of wall are completely hid. Where it cannot root this succulent must derive some nourishment from its own dead leaves and shoots, over which it densely clambers. It only seems to rot, however, when growing in sand or other soils. The use that can be made of this plant on the south coast of England in binding sandy banks by the sea shore, or trailing over rocky or stony ground, promises to be immense. There can be no doubt, after Mr. Brown's explanation, that the *Mesembryanthemum*, so common in the Scilly Islands, is *M. edule*. C. A. M. C.

Frost in Scotland.—It is worth recording as something unusual that we had 6° of frost on the night of August 30 all along this pleasant valley. Its blasting effect is visible on every breadth of Potato and other tender crop, the Potato especially being quite black, and giving off a disagreeable smell to-day. Dahlias, Heliotropes, dwarf French Beans and Scarlet Runners—always a late crop here (we gathered our first dish on August 25—are blackened, and of course are done for this year. The summer has been unusually dry, and everything is suffering for want of rain. J. Macaulay, Castle Lead, Strathpeffer.

Begonia Princess Beatrice.—Among the varieties of the flowering *Begonia* adapted for bedding, this—one of Messrs. Sutton & Sons' seedlings—must take a high place. It is a dwarf growing type of the semperlorens section, with dark bronze foliage, and bearing in the most profuse manner large numbers

of pink and creamy-white flowers, that almost hide the foliage from view. There is a large bed of it in the Portland Nursery at Reading, affording an excellent test of its bedding qualities. Dry as the season has been, it is seen to the very best advantage, dwarf, compact, yet free branching plants, flowering with great persistence. There is one point in its favour as a continuous-flowering bedding plant—it produces very few, if any, pods of seeds, and so the energies of the plants are not expended in maturing seed-pods. A few weeks ago, a basket of this *Begonia* was sent up to one of the meetings of the Floral Committee at South Kensington, but, as frequently happens, it was not seen to the best advantage. If this body could see the large bed of this *Begonia* at Reading, I am persuaded an unanimous vote would award it a First-class Certificate of Merit. R. D.

Pear Congress.—It is to be hoped that Mr. Moore's excellent suggestion (see p. 274) will meet with the attention it so well deserves at the forthcoming Pear Congress, viz., a classification of Pears in accordance with their ascertained flavour, which would be a valuable assistance to all about to plant or regraft, and of the latter at least there will no doubt be many who will feel grateful for reliable information on the subject. The influence of soil and situation, as well as methods of training, are also matters worthy of the consideration, which they will doubtless receive at the hands of the Congress. Fruits grown in soil of a light character are frequently found to differ very materially from those of the same variety produced upon a heavy soil, or a soil in some way differing in character. Even in the same garden such variety as the Marie Louise produced upon a standard differs so materially in appearance from the same variety grown upon a wall-trained tree, that at first sight they might well be regarded as distinct varieties, while the difference in flavour is equally distinct—the produce of the standard tree being decidedly the best flavoured, while the fruit of the trained tree has the advantage in appearance. P. Greive.

The Wild Clematis.—It is impossible, even if one had never read Carlyle, to feel a great interest in towns like Bury St. Edmund's. The broad open space between the Angel Hotel and the Botanic Gardens is unlike anything in any other town, and imposing in a very high degree. The magnificent entrance into the gardens needs the art of the photographer or the pen of one versed in architecture or archaeology; without one or both description would be beggarly. But there is something about the high wall on one side of the entrance that everybody can understand the beauty of without word-painting or exact description. The something is, that for a long distance it is overhung by a fluttering garland of the wild Clematis. Stray bits of walls in ruins are often taken possession of in the same way:

"Nature's kindly store
Of generous richness compensating Art
For Time's dread ravage." C. A. M. C.

Beds of *Lilium giganteum* in West Grinstead Park.—These are a great feature in that portion of the gardens in West Grinstead Park, the residence of Sir W. W. Burrell, Bart., M.P., in which Mr. H. Bwvel, the gardener, has naturalised not a few valuable things. There are three complete beds, and a fourth in course of being filled, as offsets are available. Two of them flowered this season: the flower-stems and seed-pods remain, and the visitor can glean some idea of the beauty of these stately plants a few weeks ago. The beds are on the grass in a cool and shady position, open to the sun in the earlier part of the day, and facing the north. The oldest was planted some years ago, and it has remained untouched; the second was made with the earliest obtainable offsets; and others are being completed in the same way. It takes two or three years at least to get into the flowering state, and then the plants flower annually. The offsets are formed in the shape of small bulbs round the base of the flowering stem just below the surface of the soil, and when sufficiently advanced they are taken off and replanted. During winter leaf-mould and leaves are heaped upon the beds to keep the roots without the reach of frost. As soon as the flowering stems begin to show signs of growth, Mr. Bwvel has a flower-pot inverted over each, and when cold weather threatens some leaves or other protecting material is heaped upon them. When too big to be covered by pots they are removed,

and a canvas screen is placed around the beds to keep the biting winds from burning the adjoining stems; and all this care is amply repaid by a very fine head of bloom in July and August. It is computed that in the oldest beds the tubs originally planted are some 3 feet below the surface, in consequence of the leaf-mould being heaped upon the beds in winter and spring. R. D.

and greenhouse plants, Mr. Phippen came 2d with hardy flowers, a very fine lot.

In the class for six bunches of hardy flowers, Mr. Summers was 1st; and Mr. Durman, jr. to J. W. Workman, Reading, 2d.

TABLE DECORATIONS, &c.

The best three vases for table decoration came from Miss Phillips, Abbot's Walk, Reading; Mrs. Johnstone, Donnington, Newbury, being 2d.

The same number in wild flowers came from Miss Cole, Reading, a charming arrangement; Miss Barrett being 2d.

Miss I. Phillips had the best basket of sweet-scented flowers; Miss N. Cole, Reading, 2d.
Mr. Phippen had the best bridal bouquet; Mr. Jackson being 2d.

Mr. Elliot had the best three buttonholes; Mr. Phippen being 2d.

FRUIT.

Grapes were a great feature, they were numerous and very fine. As usual, Mr. Ashby, jr. to W. Fanning, Esq., Whitechurch, was 1st, with three bunches of Black Hamburg, staging superbly finished examples; Mr. Turton was a good 2d, and Mr. Cakebread, The Gardens, Rayner's Penn, 3d.

In the class for any other black Mr. Ashby was 1st, with very fine Madresfield Court, Mr. Cakebread being 2d, and Mr. Goodman 3d, with superb Alicante.

Mr. Maher, jr. to A. Waterhouse, Esq., Newbury, was 1st, with Muscat of Alexandria, Mr. Ashby being 2d, and Mr. Robinson 3d. These were very good.

In the class for any other white Mr. Kneller, jr. to W. S. Portal, Esq., Malshauger Park, Basingstoke, was 1st, with very fine Buckland Sweetwater; Mr. Ashby being 2d, with Golden Hamburg; and Mr. Maher 3d, with Buckland Sweetwater.

In the class for any other notes being taken of the awards for Peaches, Apricots, Nectarines, and Figs, shown in single dishes, but there was a fine display.

Mr. Bridgman had the best three dishes of Plums, Mr. Ross the best six dishes of dessert Apples, Mr. Turton the first six dishes of culinary sorts, and Mr. Howe 2d, with four dishes of Peas.

Collections of fruit were a great feature. The best eight dishes came from Mr. Howe, jr. to Sir R. Sutton, Bart., Beahan Park, Newbury, who had Madresfield Court and Muscat of Alexandria Grapes, Peaches, Nectarines, Apricots, and Apples; 2d, Mr. Goodman, Bourne End; 3d, Mr. T. King, The Gardens, Devizes Castle.

Mr. Ashby had the best six dishes, setting up Muscat of Alexandria and Black Hamburg Grapes, Peaches, Nectarines, Figs, and Melons; 2d, Mr. Lockie, The Gardens, Oakley Court, Windsor; 3d, Mr. Cakebread.

VEGETABLES.

Of these there was a wonderful show. Messrs. Sutton & Sons offered special prizes for nine dishes, Mr. Iott, jr. to Major Allfrey, Wokefield Park, being 1st; Mr. Elliott 2d, Mr. Ross 3d, and Mr. R. Lye, The Gardens, Symonton Park, Nursery, 4th.

The 1st of their special prizes for six dishes went to Mr. G. H. Richards, The Gardens, Smerley, Ringwood; Mr. Lye being 2d, Mr. Kneller 3d, and Mr. Lockie 4th.

Mr. Howe had the best brace of Melons, Mr. Ross 2d, and Mr. Turton 3d.

Messrs. Webb & Sons, seedsmen, Stourbridge, offered special prizes for six dishes of vegetables, Mr. Bowerman, The Gardens, Hackwood Park, Basingstoke, being 1st; Mr. Elliott 2d, and Mr. Lye 3d.

Messrs. Cartledge & Co., seedsmen, High Holborn, offered special prizes for a brace of their Model Cucumber; Mr. Elliott was 1st, and Mr. Beckett 2d.

Mr. Lockie was 1st, with a brace of Blenheim Orange Melon, the special prizes offered by the same firm; Mr. Howe being 2d.

Mr. C. Miller, Potato merchant, Reading, also offered special prizes for six dishes of Potatoes. Mr. Iott was 1st, with very fine examples of Lady Truscott, Fitties, Annie, Prizetaker, International, Reading Ruby, and Standard; 2d, Mr. Elliott; 3d, Mr. Ross; 4th, Mr. Lye.

HARPENED HORTICULTURAL:

August 26.

The seventh annual show of this Society was held, as in former years, near the entrance to the charming Park of Sir J. B. Lawes, Rothamsted, President of the Society. The day, although cloudy and somewhat threatening, proved fine and enjoyable, and the influx of visitors was accordingly large. The show has now entirely developed from a village gathering to a county exhibition, and enrolls amongst its patrons most of the principal aristocracy in the neighbourhood. The committee may well be congratulated, not only on the number of their long list of subscribers, but for the collection of floral and horticultural productions brought together. The exhibits were contained in three marquees, the two largest being each of them over 100 feet in length by 60 feet wide; the third, a smaller one, being devoted exclusively to diorama decorations and exhibits in the ladies division forming a pretty and, to the fair sex, one of the chief attractions of the show.

PLANTS.

In the class for six stove and greenhouse plants, distinct, not less than three in flower, there were but two competitors—C. R. Fenwick, Esq. (jr., Mr. G. Underwood), High Firs, Harpenden; and J. B. Maple, Esq. (jr., Mr. C. Pollard), Childwickbury, St. Alban's; both showed plants of great merit, those of the former, to

which was awarded 1st prize, including *Dipladenia boliviensis*, *Allamanda Schottii*, *Bougainvillea glabra*, *Vinca oculata*, *V. rosea*, and *Croton variegatus*.

For a group of plants, arranged for effect, on staging 14 feet by 6 feet, special prizes were offered by C. R. Fenwick, Esq. High Firs, and were won by J. B. Maple, Esq. (jr., Mr. B. Goodell), Esq. (jr., Mr. T. Freeman, Beechwood Park); both were very good, but the collection of the latter contained less colour and more foliage, imparting a somewhat heavy appearance.

The entrance to the largest tent was adorned with an exceedingly useful set of flowering plants, in competition for a special prize offered by W. S. Brown, Esq., Digswell House, Welwyn, and was deservingly awarded to C. R. Fenwick, Esq. (jr., Mr. S. Underwood), High Firs, Harpenden.

Rapid strides of late years have been made in the improvement of tuberous-rooted Begonias. Few would have thought a few years ago that this deservingly popular class of free-flowering plants would have attained to such a high standard of perfection as they now have done. No firm has done more towards effecting this improvement than Messrs. J. Laing & Co., of Forest Hill.

There was a special prize offered for six named tuberous Begonias in flower, Mrs. Waide (jr., Mr. G. Smith), Bennetts, Harpenden, staged six of the handsomest and cleanest grown plants we have seen for a long time, including *President Burelle*, a double fiery red with brims 3 to 4 inches across; *Princess Beatrice*, a fine pure white; and *General Wood*, a velvety-crimson, of great beauty.

Only two entries were made for exotic Ferns for a special prize offered Mrs. Olive, Wheatthamstead House, premier honours going to C. R. Fenwick, Esq. (jr., Mr. G. Underwood), for *Adiantum formosum*, *Asplenium*, *Trapeziforme*, *Dryas Mooreana*, *Microlepia lina cristata*, and *Lygodium scandens*, which was especially worthy of attention. The 2d prize went to A. B. Twining, Esq. (jr., Mr. A. Rumbold), The Elms, St. Alban's, whose Ferns were remarkably good. In fact there was a close race for the 1st prize.

There were some well grown *Fuchsia* shown in fine bloom, the 1st prize being taken by H. T. Hodgson, Esq. (jr., Mr. C. Sibley), the same exhibitor taking 1st for zonal *Pelargoniums*.

Plants for decoration of the dinner-table were shown in quantity. J. B. Maple, Esq. (jr., Mr. C. Pollard), was 1st; the 2d prize for an equally creditable lot going to P. Bosanquet, Esq. (jr., Mr. H. Tilbury), Little Berkhamsted.

CUT FLOWERS.

The cut flowers exhibited on the side tables comprised a magnificent collection of Roses, Dahlias, and herbaceous flowers from the nurseries of Messrs. W. Paul & Son, Waltham Cross, and an equally attractive group of stands from Messrs. Paul & Sons, the Old Nurseries, Cheshunt, which afforded abundant interest to all lovers of good flowers and imparted a bright and cheerful appearance to the show.

The Roses which seemed to us most worthy of attention were: *Duchesse de Connaught*, H.F.; *Madame Eugene Verdier*; *Madame Remont*; *Madame de la Reine*; *Darling*, White Baroness, H.P.; *Beauté de l'Europe*, Tea-scented; *Madame Fanny de Neuf*, *Noisette Perpetuelle*; *Queen of Queens*, H.P.; *Sultan of Zanzibar*, *Victor Hugo*, *Fride of Reigate*, and Mrs. Baker. The charming *Archibute Rose*, *Madame Vivand Morel* is worth notice, and for general cultivation *Charles Lamb* and *Garden Favorite* are recommended, while *Empress* and *Empress* are both valuable varieties for button-hole bouquets.

The recent change in the weather came just in the nick of time, and enabled a charming lot of Dahlias to be staged, remarkable both for size and colour, the 1st prize for a collection of forty-eight varieties being awarded to Mr. Henry Glascock, Bishop Stortford, whose association with Dahlias is well known; Messrs. Paul & Son, Cheshunt, took 2d, for a good lot in excellent condition.

In the class for twenty-four Dahlias, Mr. Thos. Garrett, Bishop Stortford, exhibited varieties of the greatest excellence, with some stands of seedlings, not for competition, the blooms of which for size and depth of hue almost rivaled any we ever remember to have seen.

Messrs. Paul & Sons, Cheshunt, obtained 1st place for twelve Roses;—the Rev. W. H. Jackson, Stagden Vicarage, coming 2d;—one of the best exhibits in this class, that of W. G. Brown, Esq., Digswell House, being unfortunately disqualified by reason of the added foliage not being allowed.

FRUIT.

In the fruit classes some capital exhibits were shown. Grapes being particularly well represented; but Peaches and Nectarines were of poorer quality. The chief prize for Grapes was won by J. Macandrew, Esq. (jr., Mr. J. J. Lowry), Belmont, Mill Hill, for three bunches, comprising *Muscat*, *Alicante*, and *Madresfield Court*, fine in both size and colour.

For special prizes offered by H. T. Hodgson, Esq., Treasurer of the Society, for a collection of fruit, eight dishes, distinct kinds, there were several competitors, the winners being J. B. Maple, Esq. (jr., Mr. C. Pollard), Childwickbury, St. Alban's; Mr. E. G. (jr., Mr. J. Freeman), Beechwood Park; and P. Bosanquet, Esq. (jr., Mr. H. Tilbury), Pondefield, Little Berkhamsted.

VEGETABLES.

Notwithstanding the unfavorableness of the present season for vegetables as a whole, there was but little to complain of in the numerous and well-grown productions brought together. The Potatoes being particularly remarkable both for size and symmetry.

The special prizes offered by Messrs. Webb & Sons, Stourbridge, for the best collection of vegetables, consisting of six distinct kinds, to include at least

Reports of Societies.

READING HORTICULTURAL AUTUMN SHOW: August 27.

This old Society appears to have fallen upon evil times this season. On the occasion of their summer show on May 21 it was a drenching wet day. The autumn show day was cold, and threatening, and there must have been in both cases a serious falling off in the exchequer receipts, and it may necessitate the abandonment of one of the two shows. The exhibition took place, as usual, in the Abbey ruins, a second tent being necessary to take the vegetables; and the exhibition was in all respects up to the average of former years, the show of fruit being very fine indeed.

STOVE AND GREENHOUSE PLANTS.

In the class for nine specimens Mr. J. F. Mould, nurseryman, Pewsey, was 1st, with a finely good lot; Mr. H. James, Castle Nursery, Lower Norwood, being 2d. Both collections appeared to have done good service previously, and it is not necessary to give their names.

Mr. Mould had the best specimen in flower, staging a good *Erica*; Mr. James being 2d, with a *Heath* also.

Mr. Farham, jr. to H. J. Sinnmonds, Esq., Caversham, Reading, had the best new and rare plant, staging a very fine specimen of *Adiantum Williamsii*, and Mr. G. O. May, Esq., Caversham, being 2d, with *Cattleya Gaskelliana*.

In the amateurs' class for four stove and greenhouse plants Mr. Farham was 1st, with excellent specimens of *Cerandium foliosum*, *Croton variegatum*, and *Vinca rosea* and *V. alba*; 2d, Mr. Lawrence, jr. to Mrs. Owen Knox, Caversham.

Fuchsias were numerous and finely shown. Mr. Brooker, jr. to R. Tompkins, Esq., Reading, was 1st, with six large and finely grown plants, a little past their best; Mr. Bright, jr. to P. Karlske, Esq., White Knights, Reading, being 2d; and Mr. E. Jones, nurseryman, Henley-on-Thames, 3d.

Mr. Bright had the best four plants, and Mr. Mayne, jr. to Miss Moon, Bath Road, Reading, was 2d.

Cockscombs were good, especially those shown by Mr. Elliott, jr. to J. Hibbert, Esq., Braywick, Maidenhead. *Bilsons* were not up to their usual mark at Reading; and *Achimenes* poor.

Mr. Hatch, jr. to S. B. Stevens, Esq., Reading, had a group of six good *Lilies*, well grown and flowered, of the specimen type.

Bedding *Pelargoniums* were also a good feature.

FOLIAGED PLANTS.

Mr. Farham was 1st, with six fine specimens, having *Maranta zebra*, *Alcaecia Lowii*, *Pandanus Vetchii*, *Maranta Veitchii*, *Croton variegatum*, and *C. majesticum*; 2d, Mr. Mould, with good specimens also.

Mr. Farham also had the best six Ferns, showing well-grown plants of *Asplenium australe*, *Davallia Mooreana*, *Cibotium Schmidtii*, *Davallia Tyermani*, *Cyathea dealbata*, and *Schizandra chrysophylla*; 2d, Mr. James; 3d, Mr. Mould. Mr. Brooker had the best four specimens. *Colons* were good, so were table plants.

Mr. James had the three best *Palms*, Mr. Farham running him very close.

Mr. Mayne had the only six *Lycopodiums*, smaller than usually seen at this show.

GROUPS OF PLANTS FOR EFFECT.

Five of these competed; Mr. Sumner was 1st with a very tasteful arrangement; Mr. Sumner, jr. to J. H. Millard, Esq., Reading, being 2d; Mr. James, of Norwood, and Mr. Phippen, Reading, being placed equal 3d. At Reading it is usual to arrange these groups in the form of squares on a sloping bank. Mr. James put his in the form of a half-circle, which made it much more effective.

CUT FLOWERS.

These were numerous and good. *Cut Phloxes* were finely shown by Mr. Woodford, jr. to A. Palmer, Esq., Reading; Mr. J. Tranter, Upper Assenda, Henley-on-Thames, being 2d. The stands were composed of nine bunches.

Messrs. J. Cheal & Sons, nurserymen, Crawley, had the best stand of eighteen Dahlias, Mr. Tranter being 2d—the flowers very good indeed; and the same specimens were maintained in the class for twelve fascines.

Messrs. Cheal & Sons, Crawley, had the best twelve bunches of single Dahlias, setting up a very fine lot, admirably arranged; Mr. Jackson, Kidderminster, being 2d.

The best eighteen Roses.—A remarkably good lot came from T. W. Girdlestone, Esq., Sunningdale; Messrs. J. Cheal & Sons 2d.

Mr. Girdlestone had the best twelve Roses; Mr. Turton, jr. to J. Hargreaves, Esq., Maiden Edilgh, being 2d. *Asters* in three classes, *Gladioli* and *double Zinnias* were all well shown, the season considered.

Mr. James had the best eighteen flowers of stove

two of Webb's varieties, and named in their Spring Catalogue for 1885; there were no competitors, and the showy vegetable plants left little to be desired. The cottagers' classes were well contested.

WILD FRUITS.

A particularly interesting feature, and one that attracted a vast amount of attention, were several collections of wild fruits, separately arranged, and named for prizes offered by Mr. Martineau, Esq., Clapham Park, open to boys and girls of any of the schools in the parish of Harpenden. The youthful competitors showed great discrimination and skill in their selections, and gathered as many as forty different species.

DINNER-TABLE DECORATIONS.

There were four tables in the decorative competition, prizes for which were contributed by ladies in the neighbourhood. In this display the 1st prize was awarded to Miss Bloomfield, of Luton; with a few flowers of various colours, mixed with Maidenhair Ferns and grasses, a light and graceful adornment was produced. Miss Stimpard, of Wharfedale, was placed 2d. Here the arrangement was somewhat heavy, although choice, consisting chiefly of variegated foliage of Coleus, with the bright yellow flowers of Allamanda; the small size vases contained little bouquets in which scarlet Pelargoniums predominated. The fruit was of first quality. The 3d prize was awarded to Mrs. Stevens, of Harpenden. Here, again, the Allamanda prevailed, a central basket being almost over-filled with flowers of that intense bright yellow colour. This table was, however, much admired, and great diversity of opinion was expressed as to the several merits of each.

HONEY.

In this division the exhibits were more numerous than usual, and of marked excellence, bee culture having made great progress in the immediate neighbourhood during the last few years, owing mainly to the praiseworthy exertions of the Hertford branch of the British Beekeepers' Association. J. J. W.

SANDY AND DISTRICT HORTICULTURAL: August 28.

This is undoubtedly one of the most important and successful of the exhibitions of this character held in the county of Bedford. Some forty-four towns and villages, mainly the latter, are represented upon its district committee, and it is, therefore, no wonder that its shows, when favoured by fine weather, are so successful that on this occasion, in 1885, the sum of just over £700 was taken in admission. It may be termed a universal show, for it includes plants, flowers, fruits, vegetables, farming and market garden produce, needlework and darning, honey, butter, eggs and dressed fowls, and also cage birds, pigeons, poultry, rabbits, and bees. The show was, as usual, in the grounds of Sandy Place, the residence of J. H. Foster, Esq., the tents containing the above exhibits being ranged in a circle round a considerable space of ground.

PLANTS.

The handsome prizes offered for collections of ten stone and greenhouse plants were sufficiently good to enable Mr. J. Cypher to bring a group from Cheltenham, and he had no difficulty in taking the 1st prize, his leading plants being *Phenocoma prolifera* Barnesi, a very fine specimen *Statice profusa*, *Erica retorta* major, *E. hibernica*, *E. obovata purpurea*, *Rhododendron Duchesse* of Edinburgh, *Ixora Pilgrini*, and *Bougainvillea glabra*. Mr. Rabbitt, gr. to General Pearson, The Hasells, Sandy, came in a good 2d; and Mr. J. F. Mould, nurseryman, Pewsey, 3d.

In the class for six flowering plants, open to all except nurserymen, Mr. G. Kinnaird, gr. to J. H. Goodfames, Esq., Eymestry, St. Neot's, was the only exhibitor, having a very fine lot consisting of a *Statice profusa*, a magnificent *Bougainvillea glabra*, *Ixora javanica floribunda*, *Siephania floribunda*, *Dipladenia insignis*, and *Justicia carnea*.

One class open to all was for twelve plants of zonal Pelargoniums, and here Mr. Rabbitt was 1st with a very good lot, fresh and nicely grown; Mr. Redman being 2d.

Tuberous-rooted Begonias were an excellent feature, especially those shown by Mr. W. H. Apthorp, Cambridge, good varieties, and very fine and flowers fully illustrated, and that admirable exhibition plants they make when well managed.

Other flowering plants comprised *Liliums*, *Achimenes*, *Balsams*, *Fuchsias*, the production of local growers, and generally well done.

Foliage plants were represented by a good group of six specimens from Mr. G. Clayton, gr. to J. Hastell, Esq., Woodbury Hall, Sandy, *Croton Queen Victoria* and *C. Weismanni* being well grown and coloured; Mr. W. Rabbitt was placed 2d.

Groups of six stone and greenhouse Ferns were also a good feature, the best coming from Mr. T. Tibbrook, gr. to B. Brown, Esq., Houghton, Huntingdon; it included a very fine *Adiantum Williamsii*, which makes a charming exhibition Fern; *A. concinnum*, *A. c. latum*, &c.

CUT FLOWERS.

There was a good competition in the class for forty-eight roses, no less than twenty-four varieties; Messrs. Paul & Son, Old Nurseries, Cheshunt, were 1st; Mr. G. Prince, Oxford, 2d; and Messrs. Burrell & Co., Cambridge, 3d; all with capital flowers for the season. The best twenty-four blooms came from E. B. Lindsell, Esq., Hitchin; the Rev. G. H. Gall, of the same

place, being 2d, both local growers of considerable reputation.

The only exhibitors of twenty-four spikes of *Gladioli* were Messrs. J. Burrell & Co., Cambridge, who staged a very fine stand of blooms of the best quality.

In the class for twenty-four Dahlias, show varieties, Mr. R. Petfield, gr. to A. J. Thornhill, Esq., M.P., Didcot, Huntingdon, was 1st, with a remarkably fine lot of flowers, including excellent examples of the Rev. J. Goodhay, Ethel Britton, Statesman, Rosetta, Herbert Turner, Shirley Hibberd, J. W. Lord, Perfection of Primroses, Vice-President, Mr. P. Wyndham, George Kewlings, Mrs. Harris, Mrs. Glanville, Justice, and James' Victory. Goldfinch, Imperia, Umbraem, John Wyatt, Harrison Weir, and John Henshaw; 2d, Messrs. Paul & Son; 3d, Mr. J. House, Peterborough. In the classes for twelve blooms of show, and for six fancy Dahlias, Mr. Petfield was again 1st, his flowers being of the highest order of merit. Mrs. Zimms, and Martineau, owing to the drought, were not so good as they are usually seen at Sandy.

The best stand of twelve bunches of cut flowers came from Mr. Kedman, a very fine lot indeed, including *Lagotis*, *Antirrhinum*, *Dipladenia profusa*, *Allamanda Hendersonii*, *Anthurium*, *Antirrhinum*, &c. Mr. T. Smith, gr. to Miss Cheere, Papworth Hall, St. Ives, was 2d.

A very fine lot of cut blooms of single and double Begonias came from Mr. E. Edwards, florist, Leighton Buzzard, who staged a fine collection of colour, and they were deservedly highly commended.

FRUIT.

This was one of the best exhibitions of fruit seen at Sandy for some time, baskets of eight varieties being strongly recommended. The best came from Mr. G. R. Allis, gr. to Major Shuttleworth, Old Warden, Biggleswade, who had black and white Grapes, Peaches,ectarines, Figs, Cherries, and Apricots; Mr. Tibbrook came in a close 2d. Mr. W. H. Murfin, Great Stoughton, St. Neot's, had the best two bunches of Black Hamburg Grapes. Mr. Tibbrook had the best two of any other kind, being strongly finished Gros Maroc, and also the best two bunches of Muscat of Alexandria; Mr. Aldis being 1st with any other white, putting up good Buckland Sweetwater. All other kinds of fruit were well represented, especially Plums, Apples, and Pears.

VEGETABLES.

Owing to the drought these were not so numerous as usual, but they were very fine in quality. Mr. Ellis, Bedford, had the best collection of twelve varieties—a very fine lot indeed.

In the class for six sorts of Potatoes Mr. Arthur, gr. to P. Meyer, Esq., Orwell, Royston, was 1st, with a very fine collection, the sorts being Reading Russet, The Dean, Schoolmaster, Prime Minister, Chancellor, and Mr. Bresse; 2d, Mr. Carter, gr. to Captain Duncombe, Waresley Park, St. Neot's.

In the classes for single dishes of round varieties Schoolmaster, Reading Russet, and The Dean were especially good. Onions were a great feature. Sandy is one of the great Onion growing districts, and is famous for its fine produce. Among the many varieties shown one marked a new variety, staged in the White Globe class, and said to have been raised from *Lagatum Bonum* crossed with Nuneham Park, was especially fine.

Carrots, Parsnips, Beans, Turnips, &c., were in strong force, and generally of very fine quality.

HANDSWORTH HORTICULTURAL: August 25.

The twenty-second exhibition of the Handsworth Floral, Horticultural, and Cottage Gardeners' Society was held on the above date. The show, as a whole, was much better than usual, and the attendance very good. The principal features of the exhibition were the groups of plants arranged for effect, the space to be covered not less than 400 feet, and the collections of fruit in the open class.

Mr. Thacker, of Nottingham, carried off 1st honours in groups (open) with an exceedingly attractive arrangement in "greens" (to use a Whistlerian expression), which had a very sombre appearance. Palms were the predominant feature, and the groundwork was of dark green moss, the whole giving one an idea of a tropical forest in miniature. Ravines, plains, and gullies were represented, and in suitable positions, *Alocasias*, *Anturiums*, *Ferolias*, *Calatimas*, *Gymnostachys*, *Darlingtonias*, &c., were placed flowers were meagrely introduced, the "high lights" and "middle lights" being dependent upon a few representatives of *Alocasias*, *Anthuriums*, and *Crotons*: a little more colouring would have rendered the group more satisfactory, claiming as it was. The 2d prize was deservedly won by Mr. Hiram Shaw, nurseryman, Richmond, Sheffield, with a splendid group; here flowering and foliage plants were more equally represented, and excellent taste was displayed in the arrangement of the colours, but Mr. Shaw did not aim at artistic effect in the sense as applied to Mr. Thacker's group, and evidently relied upon the quality of his plants individually and collectively, without any reference to "scenes from Nature," and the effect produced was magnificent. Mr. Benjamin Grosland, of London, was good 3d, with a very meritorious arrangement, reflecting great credit upon his young sons, Mr. Webb, gr. to J. H. Manners-Sutton, Esq., Newark, was the fourth exhibitor, who would in all probability have secured a better position had he elevated a few of his grandest foliage plants, instead of merely burying them amongst their stiffer neighbours, and presenting

a nearly even surface to the eye; "a word to the wise" is sufficient.

Five collections of fruit were staged in the open class, all of good quality. The premier position was deservedly won by Mr. E. Gilman, gr. to the Earl of Shrewsbury and Talbot, Ingestre, Stafford, who staged good Grapes, Pines, Melons, superb Peaches and Nectarines, and dishes of Figs and Apricots; Mr. Edmonds, gr. to the Duke of St. Alban's, Bestwood, was a good 2d; and Mr. Ward, of The Reddings, Alfreton, was 3d.

In single dishes of Grapes, Mr. Ward was 1st, and Mr. Shaw was 2d.

Six Peaches.—1st, Mr. Webb; 2d, Mr. Gilman.
Six Nectarines.—1st, Mr. Gilman; 2d, Mr. Ward.
Six Apricots.—1st, Mr. Gilman; 2d, Mr. Goodacre, Elvaston Castle.

Roses and Dahlias were well shown by Messrs. Proctor, of Chesterfield; Clark, and Boston. In the class for gentlemen's gardeners, Messrs. Walker, Broomhall Field Gardens; Foggin, Tipton Hall; Albiston, Rotherham Park; Urton, of Greenhill; and Needham, of Ridgeway, were the chief prizetakers. The Grapes exhibited in this class would have been much better hidden from the popular gaze by means of their own foliage.

Competition amongst vegetables in the amateurs' and cottage gardeners' classes was very keen, the prizes being taken by growers in the surrounding localities.

BANBURY.

The thirty-ninth annual show of this Society was held on Tuesday, August 2d, in the beautiful grounds of Neithrop House, the residence of Captain Benyon. The exhibition on this occasion fully maintained its former standard of excellence throughout.

For the best collection of ornamental and flowering plants arranged for effect, the prize went deservedly to Mr. Doherty, gr. to Lord North, who displayed judgment and taste in his arrangement; he was also 1st for Ferns, six varieties (British), 1st for black Grapes (not Hamburg), and 1st for white Grapes (not Muscats).

The 1st card for eight varieties of stone or greenhouse plants went to Mr. Pearce, gr. to Foster Melliar, Esq., followed closely by Mr. Doherty.

For cut flowers, twenty-four bouquets, and not less than eighteen varieties, Mr. Wirovno, gr. to R. N. Byass, Esq., carried off the 1st prize.

The 1st prize for white Muscat Grapes, as also Black Hamburg was carried off by Mr. Parker, gr. to M. P. W. Boulton, Esq., in both instances very meritorious exhibits.

The 1st honours for the best collection of fruit went to Mr. Wiles, gr. to R. A. Cartwright, Esq., and the 1st honours for a collection of nine varieties of Potatoes, nine tubers of each, was awarded to Mr. Smith, gr. to the Ven. Archdeacon Holbeck.

The Onion classes produced a good competition, and proved a feature of the show. Mr. Wirovno, gr. to R. N. Byass, Esq., for the third year in succession, produced a fine lot of the 1st prize, with a fine bulb of *Deverill's Rousham* Park Hero, some of which girthed 15 inches, and weighed 1 lb. 6 oz. each; the 2d, 3d, and 4th prizes were awarded to the same variety. Mr. Deverill, of the Royal Seed Stores, Banbury, exhibited one of the best collections of Onion ever staged, comprising no less than twenty varieties of the leading kinds, all named and tastefully arranged. This stand proved a source of great interest. The same collection will be exhibited at the Dundee and Royal Caledonian shows next month.

One of the best things in the vegetable classes was the new Runner Bean, *Neal's Ne Plus Ultra*. Mr. Wirovno exhibited fifty specimens, the like of which have never been seen in this district before, and which gained the 1st prize, being a long way before any other variety.

SCOTTISH HORTICULTURAL ASSOCIATION.

At a largely attended meeting of this Association, held on Tuesday, September 1, at 5, St. Andrew's Square, Edinburgh—Mr. J. M. Deakith, of Dalkeith, Glasgow, presiding—Mr. Peter Fairgreave, Dundee, read a paper on "The Formation of Borders for Hardy Fruit Trees." If, he said, the ground was at all inclined to be damp, or the soil adhesive, by all means let the border be properly drained. After the drainage was finished, the best thing to do was to trench the entire border to the soil. With regard to the site he thought sloping ground to the south a great advantage; a dry bottom was indispensable; and it was necessary that the site should be protected from the north and east. Soil and a very great deal to do with the successful cultivation of all fruits, and he believed a good garden soil properly managed would grow most of their fruits most successfully. He did not think it proper to plant on the same place and in the same soil the identical fruit trees that were there previously.

Referring to the danger pointed out that a proper quantity of soil was a most important matter in the formation of a fruit border, and that, again, had to be determined by the nature of the soil and subsoil. In thin borders roots suffered very much from drought in summer, but that evil could be met by deepening the border to the soil.

Twenty-four inches of soil was not too much if resting on the chalk or gravel. Less would do if the border rested on heavy impervious till. By regulating that matter properly gardeners would be able to avoid the necessity of watering fruit trees border by border. He regarded that matter that suffered more from inattention in regard to that matter than Apricots. What was the border to be composed of? For wall fruit generally

too much sand, clay, or dead heavy loam was desirable. Substantial loam was no doubt what was wanted for Apples and Pears; but for Plums, Nectarines, Peaches, and Apricots loam with a little sand in it was best. No doubt under different circumstances different compositions might be adopted with success. Where the soil was a good fresh loam in its natural state trenching was about all that was necessary.

If a place was being newly constructed for the purpose of growing fruit, a first-class border being desired, and the natural soil not being suitable, either from its being too stiff or too sandy, the original soil ought to be taken away, and fresh soil introduced. Nothing would suit better than a nice maiden loam with the turf in it, especially when brought from the banks of a river. It would not be necessary to add any manure, as most likely the wood of the trees would be quite strong enough without it, but a little charcoal added would be advantageous. It would be desirable to give the border a slope to face the sun.—Discussion followed the reading of the paper, and Mr. Fairgrieve received a vote of thanks.

The meeting concluded with a hearty vote of thanks to Mr. Dunn for his conduct in the chair. The exhibits consisted of a new seedling red Currant, named Mrs. Gladstone, from Mr. Peter Robertson, Harrogate House, Jedburgh. Messrs. Dickson & Co. exhibited a collection of Carnation blooms, and also a bundle of seedling Vines, which are grown from Raisins on the tract of the old Wroughton burn in their nurseries. Mr. P. Martine, Corrielee, Eckhiville Apple; Mr. A. Laing, Stanhopea oculata grandiflora.

WHY WOODLANDS DO NOT PAY.

In these days agriculture is becoming a source of loss instead of gain, and in spite of the best of seasons and abundant crops, the farmer declares it cannot pay. Rents are reduced to a minimum, and even then too frequently are but badly paid. The natural question, then, arises among desponding owners of land, "What are we to do with it? We can neither sell it nor cultivate it, except at a loss, and yet we are compelled to pay ruinous charges upon it of various kinds. Is it to remain idle and barren, and England become a desert?" One answer says "Plant it; trees grow while you sleep." Yes, let those who can afford to do so, plant, and plant freely, but remember you plant for others; you sow and they reap, while you find the capital.

It is my object now, while advocating the idea of planting, to show shortly what are the real difficulties and obstacles which lie in the way of arriving at the period of the first ripe crop of timber. I wish also to avoid entering into any details relating to the planting and general management of the young woodlands which are to be found in many useful works on the subject; and strongly advising the intending planter to secure the services of a skilled, active, and intelligent woodman, and one who obeys orders, I must proceed to say a few words as to the only trees which I consider worth growing in woods, solely for the sake of timber and with a view to the best profit.

These are the Oak and the Ash, both nearly equally valuable as timber, and in case of accidental losses the one will readily replace the other. The Ash also, for the first forty or fifty years, by decennial fellings, produces underwood for hurdle making and other useful purposes, and so will bring in some small returns—better than anything else which could be grown—Hornbeam and other kinds of underwood for burning purposes being now in most places nearly unsaleable. Spanish Chestnut makes good underwood, and is useful as timber, but I prefer the Ash myself. With respect to other trees, most of the Coniferæ, under the general name of deals, are now imported ready sawn up, and are to be bought cheaper than we can grow them. The following trees have occasionally, and locally, very considerable value, and will grow on soils less suitable for Oak; they are also better grown singly in the open, where they are both useful and ornamental: these are the Lime, Sycamore, Alder, Horse Chestnut, Walnut, Spanish Chestnut, and Beech, all of which frequently command high prices, but are not so generally marketable as the Oak and Ash, which are always in high demand, and are not likely to be interfered with by foreign importations. The Larch also is invaluable for home use, although buyers will not give its full worth.

In speaking of decennial fellings, I mean that of necessity, as well as for convenience, whatever may be the amount of land that the planter has determined to turn into woodland, he should divide it into equal portions, one of which is to be planted each year, till the whole is completed, when he will turn back, and begin with felling the Ash on

the portion first planted, leaving the Oaks at 12 feet apart, which is the distance at which they should have been planted at first, and at which distance they may be allowed to remain till the first felling for timber takes place, at the age of fifty or sixty years, on the first planted portion, always taking care to replace any failures among the young Oaks by a corresponding number of Ash; this will always keep up the number of young trees reserved for timber to about 300 trees to the acre. I have preferred the decennial period to any other because the Ash of ten years' growth is then quite fit for hurdle-making, or other useful purposes; it also grows quicker than the Oak, so much so that I have often found it desirable to fell it twice in the course of the first ten years, lest it should overgrow the young Oaks, until they have grown high enough to out-top the Ash underwood, which must be left to the planter's discretion.

We have seen by this arrangement, that after the first cutting of the Ash on each of the ten portions of woodland, there should be left for timber 300 Oaks or Ash where the former may have partially failed, and a little further calculation would show that it ought to be quite possible to fell annually thirty trees to the acre, commencing at fifty years' growth, and to last out at that rate for 100 years, by which time the whole crop of timber originally planted on the whole extent of woodland will have been felled, and if proper care and management should have been taken by the various owners through whom the property may have passed, there ought to be another crop of young trees growing up in succession for future generations.

To those who have practically observed the rate of growth of the Oak, whether planted or from the acorn, it will be well known that the early increase is comparatively very slow, but that after the first thirty or forty years the ratio of growth rapidly increases. This is shown curiously by a very fine Oak (Q. pedunculata), which now contains by measurement 99 cubic feet of timber, and which I was made to sow as an infant, in October, 1811. In a similar way, an acorn of Q. sessiflora was sown by my son in September, 1840, which now only measures 19 cubic feet. Again, an acorn of Q. pedunculata sown by my eldest grandson in October, 1865, girths only 15 inches at 6 feet from the ground. And many Oak plantations which I made about the year 1835 would not yet average 15 cubic feet per tree. These are interesting facts and would almost seem to show that it is just possible for the same individual to sow, or plant Oak trees, and live to see them in perfection, but as a rule every one ought to consider that when he plants it is for the benefit of those who come after him. It will be seen, however, from these data that if a tree fifty years old might possibly measure 15 cubic feet, it might very well attain to 60 or 80 cubic feet at 100 years' growth, and at the final termination of 150 years from the commencement of the planting, the remaining number of trees on the last felled portion would very possibly average 120 cubic feet per tree. Thus, at a moderate value of 2s. 6d. per foot, and supposing the original extent of the planted woodland to have consisted of 200 acres, the value of the fall of this last decennial portion of 20 acres would amount to £9000, which would give an average of from £4000 to £5000 per annum for 100 years on the 200 acres of woodland, from which would have to be deducted rent of land, interest on invested capital, and other charges, taking also into consideration the loss sustained during the first 50 years before there was any return.

Here let the curtain drop without daring to venture further into the uncertainties of a distant future. If I have given too favourable a view of the case I have spoken of it more as it might be and could be, but for serious obstacles and unavoidable difficulties which more or less must intervene to prevent it, and of which I now propose briefly to make mention.

It will appear quite evident from the foregoing statements that no one individual, however early in life he may commence planting Oaks for a future crop of timber, should venture to expect any beneficial result for himself during his lifetime; he, therefore, makes the outlay for his successors, and it will depend entirely upon his knowledge, skill, and careful watching for the whole of his life as to whether it will prove a very valuable or a worthless inheritance to those who come after him.

Many and various are the causes and accidents which may irrevocably defeat the successful result of

his labours, and one of the most fatal would arise from rabbits, which, if not sufficiently kept under, destroy many a thriving plantation in a hard winter's night, with snow upon the ground. But now we arrive at one of the irremediable obstacles in the way of the tree cultivator, inasmuch as his outlay and labours and the future cropping extend over a period of at least 150 years, during which time several generations may have passed away; and under no many changes it is contrary to the usual course of human events to expect that each successive inheritor or possessor of this woodland property will follow out the plan proposed by the original planter. And yet to obtain the full profit from the timber it is absolutely necessary that it should be so; indeed, it too frequently happens that on its first lapse into new hands frequently, reckless indifference, or fatal ignorance induces the new owner to make serious inroads into the half ripe crop, which, with proper management, should have formed an annual source of income for himself and his heirs; and here, then, would end the history of this woodland farm, and the property would become one of those very common and sadly hopeless spectacles of a treeless extent of bad and profited underwood.

This frequent change of hands which the shortness of life renders unavoidable, is then the real cause of the ill-success of woodland farming, as change of hands means usually change of management, which is fatal when the work of a good and skilful planter falls into the hands of an ignorant or obstinate successor. Nevertheless, this need not always be so, and in my own case, having benefited greatly by the good deeds of tree-loving predecessors, I have full hopes that the results of the efforts of a long life in the pleasant pursuit of woodcraft will be equally cared for and as long enjoyed by those who come after me. W. K. Baker, Bayfordbury.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, SEPTEMBER 2, 1885.

Aug. 27.—Rain from early morning till 1 P.M., finer afterwards.
 — 28.—Dull day, windy throughout.
 — 29.—Fine bright day, small amount of cloud, rough wind.
 — 30.—Fine day.
 — 31.—Rain about 10 A.M.; dull day.
 Sept. 1.—Fine day, bright at times.
 — 2.—Dull day; rain began to fall at 9 A.M.; frequent slight showers afterwards.

LONDON: Atmospheric Pressure.—During the week ending August 29, the reading of the barometer at the level of the sea increased from 29.84 inches at the beginning of the week to 30.03 inches by 1 P.M., decreased to 29.99 inches by 5 P.M. on the 24th, increased to 30.05 inches by 9 A.M. on the 25th, decreased to 29.99 inches by 1 P.M. on the 26th, increased to 30 inches by 5 P.M. on the same day, and was 29.81 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.94 inches, being 0.08 inch lower than last week, and 0.08 inch below the average of the week.

Temperature.—The highest temperature in the

shade in the week was 72°.5, on the 25th, on the 23d the highest was 62°.5. The mean of the seven high day temperatures was 66°.9.

The lowest temperature was 47°, on the 25th; on the 27th the lowest was 52°. The mean of the seven low night temperatures was 49°.4.

The greatest range of temperature in one day was 25°.5, on the 25th; the smallest on the 27th was 11°. The mean of the seven daily ranges was 17°.5.

The mean temperatures were—on the 23d, 51°.7; on the 24th, 58°.7; on the 25th, 58°.7; on the 26th, 59°.3; on the 27th, 55°.7; on the 28th, 55°.3; and on the 29th, 56°.4; and these were all below their averages by 6°, 1°.9, 1°.5, 1°.1, 4°.6, 4°.9 and 3°.7 respectively.

The mean temperature of the week was 57°, being 0°.9 lower than last week, and 3°.4 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 124°.5, on the 29th. The mean of the seven readings was 103°.6.

The lowest reading of a minimum thermometer placed on grass was 38°, on the 23d and 24th. The mean of the seven readings was 40°.1.

Rain.—Rain fell on the 27th to the amount of 0.58 inch.

ENGLAND: Temperature.—During the week ending August 29, the highest temperatures were 76°.4 at Cambridge, 75° at Truro and Bristol; the highest at Sunderland 62°.4, at Sheffield and Newcastle 64°. The general mean was 69°.4.

The lowest temperatures were 38° at Hull, 41°.1 at Cambridge, 41°.9 at Wolverhampton; the lowest at Sunderland was 49°, at Blackheath 47°, and at Plymouth and Nottingham 46°.2. The general mean was 44°.4.

The greatest ranges were 35°.3 at Cambridge, 30°.2 at Bristol, 30° at Truro; the least ranges were 13°.2 at Sunderland, 19° at Newcastle, 20° at Sheffield. The general mean was 25°.

The mean of the seven high day temperatures was highest at Truro, 69°.9, at Plymouth 69°.2, at Bristol 67°.3; and was lowest at Sunderland, 57°.4, at Newcastle 59°.5, at Hull 60°.3. The general mean was 63°.3.

The mean of the seven low night temperatures was highest at Plymouth, 53°, at Truro 52°.7, at Nottingham and Sunderland 50°.5; and was lowest at Cambridge, 46°, at Wolverhampton 46°.2, at Hull 46°.7. The general mean was 49°.4.

The mean daily range was greatest at Cambridge, 21°.2, at Bristol 18°.7, at Truro 17°.2; and was least at Sunderland, 6°.8, at Newcastle 9°.7, and at Sheffield 10°.1. The general mean was 13°.9.

The mean temperature was highest at Truro, 59°.7, at Plymouth 59°.5, at Blackheath 57°; and was lowest at Hull, 51°.9, at Sunderland, 52°.4, at Bolton, 52°.5. The general mean was 54°.7.

Rain.—The largest falls were 1.06 inch at Bristol, 0.96 inch at Plymouth, 0.68 inch at Truro; the smallest falls were 0.01 inch at Newcastle, 0.02 inch at Hull. No rain fell at Leeds or Sunderland. The general mean fall was 0.31 inch.

SCOTLAND: Temperature.—During the week ending August 29, the highest temperature was 71° at Edinburgh; at Aberdeen the highest temperature was 60°. The general mean was 65°.9.

The lowest temperature in the week was, 38°, at Perth; at Aberdeen the lowest temperature was 44°. The general mean was 41°.6.

The mean temperature was highest at Greenock, 53°.8; and lowest at Leith, 52°.2. The general mean was 53°.1.

Rain.—The largest fall was 0.10 inch, at Aberdeen; the smallest fall was 0.01 inch, at Perth. No rain fell at Glasgow, Greenock, Paisley, or Perth. The general mean fall was 0.02 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, Aug. 31, 1885, issued by the Meteorological Office, 116, Victoria-street, London, S.W. —The weather has been fine and bright in the north and east of Scotland, but very cloudy or dull in nearly all other parts of the kingdom. Very little rain has fallen, however, except in the extreme south-west of Scotland.

The temperature has been below the mean in all districts, the deficit ranging from 1° in "Ireland, S." of the "Channel Islands," and 2° in "England, S." and "England, S.W." to 5° over central and eastern England and to 6° or 7° in Scotland. The maxima, which were recorded in most places on the 25th, ranged from 59° in "Scotland, E." and 60° in "Scotland, N.," to 76° in the "Midland Counties," and 78° in "England, S.W." Towards the end of the period the maxima were very low for the season, the thermometer at many stations not rising to 60°. The minima, which were registered on different days in the various districts, were as low as 31° in "England, N.W.," and 32° in "Scotland, N." and "England, S.W.," in most other districts they varied from 33° to 41°, but 45° was the lowest reading recorded in the south of Ireland, and 51° in the "Channel Islands."

The rainfall has been rather more than the mean in "Ireland S." and the "Channel Islands," but less elsewhere.

Bright Sunshine has been more prevalent in the south and east of England and in the north and east of Scotland than it was last week, but less in all other districts. The percentage of the possible amount of duration varied from 7 in "Ireland, N.," and 8 in "England, N.E.," to 35 in "England, S.," 42 in "Scotland, E.," and 58 in "Scotland, N."

Depressions observed.—The distribution of barometric pressure has been rather more complex than of late, the barometer being comparatively high over the United Kingdom, while depressions have been observed over the southern parts of Scandinavia, and also to the south-westward and southward of our islands. The depression which most influenced the winds in our neighbourhood travelled in an easterly and south-easterly direction over France on the 29th, causing violent gales and heavy rains in all parts of that country, and strong north-easterly winds or moderate gales in the south and south-east of England. At the close of the period a small shallow depression was moving over our south-west coasts from the westward.

Obituary.

MR. PHINEAS BROWN HOVEY, so well known to the horticultural public from his business connection, died recently at his residence on Brookline Street, Cambridge, Massachusetts, at the age of eighty-one years and nine months. He was born in Cambridge, September 3, 1803, and had always resided not only in that city but in the place where he was born. In early life he took a great interest in flowers and flower culture, and in 1834 became senior partner of the seed and nursery firm of Hovey & Co. Mr. Hovey retired from the Boston house in January, 1883, but retained his connection with the nursery and greenhouses on Cambridge Street, Cambridge, at the time of his death. He was a member of the Massachusetts Horticultural Society from the first year of its existence in 1829, under the presidency of General Dearborn. He served as vice-president four years, was chairman of the committee of arrangements for the annual exhibitions for ten years, and a member of the fruit committee for twenty-four years,—a longer term of service, it is believed, than that of any other member. His judgment in all matters pertaining to every department of floriculture and horticulture was considered unimpeachable.

The death of Mr. Hovey closes a long and honourable business career; and the Society with which he was so long and so prominently connected loses an earnest and useful member, and the community where he had resided for nearly eighty-two years a good citizen. He leaves a widow and three children.

Answers to Correspondents.

AFRICAN MARGOLDS: *W. Cauldwell*. A very pretty strain of these old favourite flowers, the bar markings on the single flowers being very clear and regular as to width and outline; but the doubles are more pleasing.

APPLE RINAKHONSKI: *Cranston*. We do not know the Apple under this name. We have, however, fruited a very Russian Apple greatly resembling it. Although a pretty enough fruit, we do not consider it of any great value.

ARTICHOKES: *W. Cutbush & Son*. There are several dwarf varieties of Artichokes in existence—notably the Violet de Provence—but we have never noted this to be any particular advantage.

BEGONIA PICTA AND ADIANTUM: *Mairis & Co.* The

Adiantum looks quite distinct, and is, we think, very elegant in character. We publish a description of it, by Mr. Moore, at p. 294. There are now so many hybrid or supposed hybrid Adiantums that the name *A. hybridum* would not be a desirable one for it to bear. It has therefore been called *A. Mairisii*. The Begonia is a very pretty and distinct form of those varieties of which E. Rex is the best known type.

BOOKS: *J. L.* The book you mention has no special interest now.

CROSS FERTILISATION: *A. D. W.* This can only be said to be effected when the pollen is taken from the flower of one plant and placed on the stigma of a flower of another; for when the pollen is taken from a flower on the same plant it can be only a form of self-fertilisation, and therefore as little likely to produce variation in the progeny as when the pollen of a flower applied naturally or intentionally to the stigma of the same flower.

DISEASED BULBS: *J. G.* Yes, the Eucharis-mite. Burn the bulbs and get fresh soil. The "larvæ" are, 1, small worms, and 2, larvæ, of some two-winged fly, which have nothing to do with the mites. The Crotons have been checked by cold probably. The other leaves were rotten when we unpacked them.

ERRATUM.—By error our reporter gave Messrs. Cannell & Son credit for exhibiting the plants at the last meeting of the Royal Horticultural Society, when it should have been Mr. Thomas Ware.

FERNS: *A. F. G. L.* *Scelopendrium vulgare laetivium*; 2, *Athyrium Filix-femina plumosum*; 3, *Polypodium vulgare cretanicum*; 4, *Scelopendrium vulgare form of var. marginatum*; 5, *Athyrium Filix-femina depauperatum*; 6, *Lactra Filix-mas crispata*.

GALL ON OAK: *Dr. P.* The g-all in question is the Artichoke gall, always found in the axils of the leaves, and consisting of a number of overlapping scales, surrounding a central gall. It is the working of a cynipid (*Aphlothrix gemmea*).

GARDENERS' SITUATIONS IN THE CHANNEL ISLANDS: *C. R.* Of course you could not do better than to advertise in our paper, which circulates largely in those parts. Any one possessing a good character, and our knowledge of the facts of the case, would find difficulty in obtaining a post there. We do not suppose the wages given are so high as in some parts of England, but they are not likely to be under those commonly given to young gardeners in the South and West counties.

GRAPES: *A. O. Mrs. Peifson*.

GROS COLMAR GRAPE CRACKING: *J. A. C.* As the other varieties you grow are not affected in the same way, can it be that on your giving water to the borders after a long period during which it had been withheld, the large foliage of this Grape has pumped up the sap from the soil quicker than the skin of the berries could expand to receive it?

INSECTS: *C. F. D.* Your Cyclamens are attacked by the larvæ of one of the Curculionidae (weevils), differing from those of the *Oti* family, which are also often destructive to Cyclamens. The weevils are much more active, with rows of fine setæ around the back. They have no legs, but have fleshy warts in their stead on the underside of the three segments following the head. We will try to rear those sent, to *H. W. J.* Your *Phylloxera* are infested by aphides, which we suppose are the cause of the minute patches of white matter. The small brown insects are very young larvæ of Dipterous flies, which are feeding on the aphides. Fumigate and well syringe the plants. You do not state from what plants the seeds with very long delicate hairs have been gathered.

MELON PLANTS DYING: *Donald McClean*. It is a case of the ordinary Melon disease, which has been alluded to frequently in our columns.

NAMES OF FRUITS: *G. J. W.* As the fruits you send are not nearly developed we cannot name them with any degree of certainty. No. 1 is most probably King of the Pippins; 2 may be so also; and 3, most nearly resembling the Cambridge variety, but I think it is that variety. —*L. G. A.* 1, Louise Bonne of Jersey; 2, Beurré Giffard; 3, Beurré Hardy; 4, Williams' Bon Chrétien; 5, Summer France Real; 6, Fondante d'Automne; 7, Souvenir du Congrès; 8, not recognised; might be a small Cataline.

NAMES OF PLANTS: *Hodgson*. 1, *Lysimachia vulgaris*; 2, *Achillea*; 3, *A. plarica*, double-flowered variety; 4, *Veratrum nigrum*; 5, *R. & Co.* *Clethra arborea*. —*A. B. C.* 1, *Juniperus japonica aureo-variegata*; 2, *Æschynanthus splendens*. —*Kob.* *Eriogonum macrocarpa*. —*X. Y. Z.* 1, *Thilia filifera*; 2, *Gleditsia schiz. sp.*; 3, *Kerria japonica* (not a climber); 4, *Clematis flammula*; 5, *Comilla Emerus*. —*C. W.* Skull-cap (*Scutellaria galericulata*). —*Reid & Co.* *Clethra arborea*. —*H. J. P.* 1, *Cryptomeria japonica*; 2, *Juniperus virginiana*, probably; 3, *Cupressus Lawsoniana*; 4, *Thuopsis borealis*; 5, *Berberis Darwini*. —*H. G. B.* 1, *Rhus Cotinus*; 2, *Solidago virga aurea*; 3, *Pernettya mucronata*; 4, *Spiræa callosa*; 5, *Calycaanthus occidentalis*; 6, *Acer platanoides* (Norway Maple); 7, *Cotoneaster affinis*; 8, *Ribes aureum*. —*C. W.* *Beachy Head*. —*Carrum* *Onosmodium*. 1, *Crepis*; 2, *Thunbergia occidentalis*; 3, *T. Lawsoniana*; 4, *T. orientalis*; 5, *Leontodon hirtus*; 6, *Juniperus* (?). The insect that causes the Bedeguar gall on the Rose is *Cynips roseæ*. —*Hortus*. 1, *Laetrea renalis*; 2, *L. Filix-mas pumila*; 3, *Athyrium filix-femina multifidum*; 4, *Cystopteris fragilis Dickkiana*; 5, *Polystichum*

aculeatum; 6, Athyrum Filix-foemina Fieldrie.—Red Wood, Vanda Pennoni; the others were withered when received.—Zostera, Probably Cattleya labiata Warneri.—Camæa, Cattleya Eldorado.—John Edwards, Cattleya Eldorado Leena, and Pescatorea Kichboorum, G. Wall, 7, Fuchsia Riccartoni; 2, a floriferous var., name not known to us; 3, Salvia coccinea.

NEW RUNNER BEE, NEAL'S NE PLUS ULTRA; H. Deverill. A very fine example of the Scarlet Runner Bee, measuring over 12 inches in length.

PRIMULAS: R. M. The flowers are pretty, and of good form, but deficient in size.

SUMMER-HOUSES, URINALS, &c. FOR PUBLIC PARK: N. Cooke. Consult G. R. Juliard, Esq., 8, Delahay Street, Westminster, W.

Enquiries.

"He that questioneth much shall learn much."—BACON.

POISONOUS PROPERTIES OF YEW.—Is it a fact that the fastigiate or upright-growing Yews are less poisonous to cattle than Yews of the ordinary spreading habit?

DIED.—We regret to have to announce the death, on August 23, at Upper Clapton, of FRANCES SARAH, the wife of Mr. F. CASEY, the well-known and able Foreman at Messrs. High Low & Co.'s nurseries at that place.

Markets.

COVENT GARDEN, September 3.

PLUMS, Damsons, and early Pears are now in heavy supply, considerably affecting foreign stuff. Hothouse fruit quiet. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Apples, Pears, Grapes, etc.) and prices per dozen or bushel.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with columns for vegetable types (Artichokes, Onions, Peas, etc.) and prices per dozen.

POTATOS.—MAGNUM BONUM, 70s. to 100s.; REGENTS, 70s. to 110s.; MYATT'S, 67s. per ton.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Aralia Sibordii, Begonia, etc.) and prices per dozen.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Abutilon, Bouvardias, Carnations, etc.) and prices per bunch or dozen.

SEEDS.

LONDON: Sept. 2. The trade for autumn sowing seeds continues exceedingly active. With regard to Trifolium, supplies have suddenly stopped, and much higher figures are consequently asked; the tendency continues in favour of holders. Mustard firmly maintains the late rise in values; there are more buyers than sellers of this article. Rape seed continues at the low figures previously reported. There being an increased demand for Rye has caused rates to harden. Winter Tares sell at last week's currencies; supplies are now rates. Flour was very quiet, but the small sales showed previous value. Beans moved off in retail quantity at steady prices; Peas, with large supplies, were easier to buy. Flat Maize was scarce and firm at 22s. 3d. to 22s. 6d.; round corn dull at 21s. 6d. to 21s. 9d. A small sale of prime new English Barley was made at 39s., but there was no demand to establish current value. Grinding stores were slow. Oats found a very dull dragging sale.—On Wednesday there was little if any change to note in the general condition of the trade, which was still dull. In Wheat there was no quotable change, but the market was also very slack. Flour quiet and unchanged. The small transactions in spring corn did not alter quotations of any description.—Average prices of corn for the week ending August 29:—Wheat, 33s. 3d.; Barley, 28s. 4d.; Oats, 20s. 6d. For the corresponding week last year—Wheat, 35s. 1d.; Barley, 32s. 1d.; Oats, 20s.

CORN.

At Mark Lane on Monday, although the market opened flatly for English Wheat, a fair business was eventually concluded at, for white, 32s. to 36s.; red, 30s. to 33s. Foreign Wickets were not relatively so cheap as English, and remained as dull and inactive as before. There was not, however, any pressure to sell at lower rates. Flour was very quiet, but the small sales showed previous value. Beans moved off in retail quantity at steady prices; Peas, with large supplies, were easier to buy. Flat Maize was scarce and firm at 22s. 3d. to 22s. 6d.; round corn dull at 21s. 6d. to 21s. 9d. A small sale of prime new English Barley was made at 39s., but there was no demand to establish current value. Grinding stores were slow. Oats found a very dull dragging sale.—On Wednesday there was little if any change to note in the general condition of the trade, which was still dull. In Wheat there was no quotable change, but the market was also very slack. Flour quiet and unchanged. The small transactions in spring corn did not alter quotations of any description.—Average prices of corn for the week ending August 29:—Wheat, 33s. 3d.; Barley, 28s. 4d.; Oats, 20s. 6d. For the corresponding week last year—Wheat, 35s. 1d.; Barley, 32s. 1d.; Oats, 20s.

CATTLE.

At Copenhagen Fields on Monday there was a better market for cattle, and prices in favour of the seller, especially for good second and prime qualities. Beyond this there was no improvement. Sheep and lambs were less numerous than in recent markets, and although the prices were only in occasional demand, better the pens cleared rather more readily of English stock. Imported sheep were more difficult to sell. The calf trade was stagnant. Quotations—Beasts, 4s. to 4s. 6d., and 4s. 8d. to 5s. 4d.; calves, 3s. to 4s. 10d.; sheep, 3s. 8d. to 4s. 6d., and 4s. 10d. to 5s. 8d.; lambs, 5s. to 5s. 8d.; pigs, 3s. to 4s. 1d.—On Thursday a fair inquiry prevailed for beasts, and prices were maintained. Sheep were a dull market, at about Monday's rates. Calves were firm, but quiet for choice qualities. Pigs were steady.

HAY.

Tuesday's Whitechapel Market report states that trade was dull, with few supplies, especially of new Clover and new hay. Quotations—Clover, prime, 80s. to 110s.; prime second cut, 85s. to 107s.; inferior, 60s. to 75s.; new, 80s. to 95s.; hay, prime, 70s. to 95s.; inferior, 35s. to 60s.; new, 65s. to 84s.; and straw, 28s. to 30s. per load.—Cumberland Market quotations—Clover, 90s. to 100s.; inferior, 80s. to 85s.; hay, best, 80s. to 92s.; inferior, 50s. to 70s.; and straw, 30s. to 35s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that supplies are fully adequate to demand, which is still dull. Quotations—Regents, 80s. to 90s.; Magnum Bonum, 80s. to 90s.; Early Regents, 70s. to 80s.; Shaw's, 70s. to 80s.; kidneys, 100s. to 110s.; Hebrons, 100s. to 120s. per ton.—The imports into London last week consisted of 6066 bags from Boulogne, and 2853 from Hamburg.

COALS.

The following are the prices current at market during the week:—Bebide West Hartley, 14s. 9d.; Ravensworth West Hartley, 14s. 9d.; East Wylam, 15s. 6d.; Walls End—lyne (unscreened), 11s. 3d.; Hutton, 15s.; Hutton Lyons, 15s.; Lambton, 17s.; Wear, 15s.; East Hartlepool, 15s. 9d. and 16s.; South Hartlepool, 15s.; Harton, 14s. 6d.; Haswell, 17s.; Hulham, 15s.; Tees, 17s.; Dowlais Merthyr, 16s. 6d.

Government Stock.—Consols closed on Monday at 100½ to 100½ for both delivery and the account, Tuesday's figures were 100½ to 100½ for delivery, and 100½ to 100½ for the account. Prices closed on Wednesday at 100½ to 100½ for both transactions. Thursday's transactions closed at 100½ to 100½ for delivery, and 100½ to 100½ for the account.

THE COLONIAL MANURE.

Unqualified for Excellence of Quality and Productive Powers.

Table showing supply in tins and bags with prices per each or per bag.

Special Prices to the Trade on application.

The COLONIAL MANURE being powerful and lasting in its effects, very little need be used; consequently it will be found more economical than any other Chemical Manure.

The COLONIAL MANURE is to be obtained from all Nurseries and Seedsmen in the United Kingdom and the Colonies.

Apply, A. E., Oak Hill, Dawlish.

The Best Kept Collection of DAHLIAS IN ENGLAND.

As lovely and complete as our stock is (2 acres) of the whole family of DAHLIAS, yet the most interesting, is our 300 plants (seedlings) from "Juarez". These are wonderfully interesting, and will give the world new colour and shapes, and another class probably as beautiful as the Fancies and Show kinds.

Pot Plants, 450 named varieties, in bloom mostly 6d. each. Send for the best illustrated CATALOGUE, post-free.

GEORGE FARMLOE & SONS, GLASS, LEAD, OIL and COLOUR MERCHANTS, 34, St. John's Street, West Smithfield, London, E.C. Stock List and Prices on application. Quote Chronicle.

HILL and SMITH'S BLACK VARNISH,

for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark)

Oil Paint no Longer Necessary. This VARNISH is an excellent substitute for oil paint on all outdoor work, where it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, the Gardens at the Palace at the Hague, and hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 14. 6d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL "Piercedfield Park, June 21, 1876.—Sir, I have this day forwarded from Chestnut to your address a black varnish cask, to be filled and returned with its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, the Gardens at the Palace at the Hague, and hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 14. 6d. per gallon carriage paid to any Station in the Kingdom.

H. S. & S.'s Varnish has been an article of common use so much of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to HILL and SMITH, Bentley Hill Ironworks, Staffordshire; 126, Queen Victoria Street, London, E.C.; and 73, Elmbank Street, Glasgow.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

SCOTCH GARDENERS.—JOHN DOWNIE, Seedsman, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting re-employment. Will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, Seekers, and others, and that they will admit and employ a trustworthy gentleman with particulars, &c.—St. John's Nursery, Worcester.

R. B. LAIRD AND SONS (Successors to the late Firm of DOWNIE & LAIRD) can at present recommend with every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended on, either for large Establishments or Single-handed Situations;—also FOREMEN, UNDER GARDENERS, and FARM BAILIFFS.—177, Frederick Street, Edinburgh.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, or FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, with the best selections for the different capacities will be made.—Holloway, N.

Gardeners, Farm Bailiffs, and Foresters. JAMES DICKSON AND SONS, "Newtown" Nurseries, Chester, are always in position to RECOMMEND MEN of the highest respectability and thoroughly practical at their business.—Full particulars, with names of previous employers, &c., on application.

TO LANDED PROPRIETORS, &c.—A. McTearney (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Gardens and Parks, and Remodelling existing Gardens. Plans prepared. 115, Lastria Park, Stamford Hill, N.

GARDENER (HEAD).—Age 38, married, no family; has lived in good establishments. Twenty years' experience.—A. POLLEY, Bighton, Alresford, Hants.

GARDENER (HEAD WORKING).—Age 26, married; thoroughly experienced in Vines, Peaches, Stove and Greenhouse, Flower and Kitchen Gardening.—Good references.—A. B., 5, Dyers Lane, Upper Richmond Road, N.W.

GARDENER (HEAD WORKING).—A Gentleman can highly recommend to any Nobleman or Gentleman a Gardener who is thoroughly experienced in Early and Late Forcing of Fruit, Cut Flowers, Stove and Greenhouse Plants, Flower and Kitchen Gardening, Land and Stock.—Y., 23, Salisbury Road, Upper Holloway, N.

GARDENER (HEAD WORKING).—Married, no encumbrance. Twenty-five years' thorough experience in Gardening in all its branches. Also Meadow Land and Stock. Good character.—G. JONES, The Elms, Grass, Essex.

GARDENER (HEAD WORKING, or good SINGLE-HANDED, with a Lad).—Age 42, married; thoroughly experienced in all branches. Three years' good character.—W., Rose Cottage, Tatsfield, Westerham.

GARDENER (HEAD WORKING); age 38.—A Gentleman wishes to recommend his late Head Gardener, through having sold his establishment, who is a thorough experienced man in all branches.—A. L., 14, Alpha Road, Regent's Park, N.W.

GARDENER (HEAD WORKING).—Age 36, married, two children (youngest 10 years). Fourteen years' good practical experience as Head. Satisfactory reasons for leaving. Good references.—GARDENER, Woodlands, Nightingale Lane, Clapham Common, S.W.

GARDENER.—Age 41, no family; thorough practical. Wife good Laundress. Personal character if required.—GARDENER, 118, Wellfield Road, Sireatham, S.W.

GARDENER (GOOD SINGLE-HANDED).—Age 24, married; abtainer. Eighteen months' excellent reference.—E. F., 25, Alford Road, Union Grove, London, S.W.

GARDENER (GOOD SINGLE-HANDED, or other).—Age 25, single; seven years' experience. Good references.—The Engineer.—W. C., 6, Portland Villas, Windsor Road, New Hampton, Middlesex.

GARDENER (GOOD SINGLE-HANDED, or where help is given).—Age 32, married; thoroughly practical in all branches. The highest.—W. C., 6, Portland Villas, Windsor Road, New Hampton, Middlesex.

GARDENER (SINGLE-HANDED OR SECOND), where four or five are kept.—Age 25; very good reference.—WILLIAM FELSTEAD, Barkly, near Leicester.

GARDENER (SECOND), or JOURNEYMAN, in a good establishment.—Age 24; ten years' experience. Good references.—Apply, with particulars, to C. WILLIAMS, Goldsworth Road, Woking Station, Surrey.

GARDENER (UNDER).—Age 20.—Mr. G. NORWOOD, Mr. Buzenage, Stammore Common, Middlesex.

GARDENER (UNDER), in a private establishment.—Age 22, single; total abtainer. Practical knowledge in all branches, Mulchroom, Pot Strawberries, Pines, Grapes, &c.; no objection to assist with Scythe in busy time, take turn with Fires, &c. Prefers to live in Bofhy. Can have good references. Inquire of the Engineer.—HEAD GARDENER, Gillingham Hall, near Beccles, Norfolk.

FOREMAN.—Thoroughly experienced in every branch of the profession. Very highest references. Bofhy preferred.—S., 180, High Street, Southampton.

FOREMAN, in a Gentleman's place, at once or later on.—Age 27; thirteen years' practical experience in all branches. Excellent references.—1, Heath Terrace, Twickenham.

FOREMAN; age 23, single.—C. CHIDLEY, Gardener to C. Norrington, Esq., Abbotshild, Plymouth, can strongly recommend Edwin Gibbins. Has been over three years in present situation.

FOREMAN, in the Houses.—Age 24; five years' experience. Well recommended. Lying to better. Abtainer.—W. SAVAGE, Hamble Cliff Gardens, Netley, Southampton.

FOREMAN, in a good establishment.—Age 25; eight years' experience in all branches of the profession, two years in present situation. Well recommended from present and previous places.—G. HARR, The Gardens, High Firs, Harpenden, Herts.

FOREMAN, in a good establishment; age 28.—C. ROBERTS, Gardener to E. C. Glover, Esq., Highfield Hall, Leck, Staffs, wishes to recommend his Foreman, W. Smith, as a thorough good practical man. Fourteen years' experience to good establishments, and three years in present place.

FOREMAN AND PROPAGATOR (INDOOR).—Age 36; twenty years' experience in some of the leading Nurseries; of Roses, Clematis, Rhododendrons, and General Nursery.—Address, stating terms, to H. L., 25 Chester Street, Gloucester.

FOREMAN PROPAGATOR AND GROWER (INDOOR).—Many years' experience. Grass, Cucumbers, Tomatoes, Cut Flowers, Plants, &c. Market or otherwise. Good references.—A. B., 86, Hawthorn Cottages, Hawthorn Grove, Pease, S.E.

To the Trade. FOREMAN PROPAGATOR AND SALESMAN.—Advertiser seeks re-employment; good Wreath and Bouquet hand. First-class references.—E. JENKINS, Woodstock Cottage, Leckhampton, Cheltenham.

To Market Growers and Others. PROPAGATOR AND GROWER.—Age 25; ten years' experience in Pelargoniums, Fuchsias, Hydrangeas, Bouvards, Solanums, Bedding Stuff, Fickins, &c. Good character.—J. LAMBERT, 2, Coles Avenue, Lower Edmonton, London.

To Nurseries. PROPAGATOR (SOFTWOOD) or GENERAL ASSISTANT, in the Houses.—Steady and trustworthy. Low wages.—L., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

ORCHID GROWER, CULTIVATOR, and PROPAGATOR of Stove and Greenhouse Plants in General.—Age 24; native of Germany, but speaks English well.—Messrs. THOMAS KRIPPS AND SONS, The Tunbridge Wells Nursery, Kent, can confidently recommend the above, and will have pleasure in answering any inquiries.

JOURNEYMAN.—Age 22; 0 years' experience. Good character.—A. BELL, 8, Agar Street, Charing Cross, Strand, W.C.

JOURNEYMAN, in the Houses.—Age 21; seven years' experience. Good references. Bofhy preferred.—C. FERMER, Louis Villas, 26, Westera Road, Tooting Wells.

JOURNEYMAN, in the Houses; age 25.—Mr. J. ANDERSON, The Gardens, Streatham Grove, Norwood, S.E., can highly recommend a young man as above. Singularly industrious, obliging, and pre-erecting.

JOURNEYMAN, in a good establishment.—Age 21; over two years in present place. Excellent references.—J. BROOKS, The Gardens, Worktop Manor, Worktop, Notts.

IMPROVER, in a Nobleman's or Gentleman's establishment.—Age 20; eighteen months' experience. Premium £5. Good references.—H. BECK, 30, Corfield Terrace, Eastbourne.

IMPROVER, in a Gentleman's Garden.—Age 20; three years' good character. Bofhy preferred.—W. SALISBURY, 23, Stammore Street, Caledonia Road, London, N.

TO HEAD GARDENERS.—T. LOCKIE, Oakley Court, Windsor, would be pleased to highly recommend a young man (age 24) as FIRST JOURNEYMAN in Houses, or FOLIAGE MANAGER in Parks. He has been five years under his charge, and is strong, able, and willing; honest, sober, and industrious, with a good general knowledge of his work.

TO GARDENERS, &c.—Wanted, a situation in a Gentleman's Garden, by a young man (age 24). Five years' experience. Good character.—C. R., 16, New Bent Street, Hendon, N.W.

SHOPMAN, or SECOND.—Age 27; eleven years' experience in all branches. First-class reference.—E. E., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SHOPMAN, or SECOND.—Seven years' experience; good knowledge of Seeds and Bulbs, also Plants. Can be well recommended.—A. B., 15, Dublin Street, Edinburgh.

Seed Trade. SHOPMAN, or ASSISTANT.—Age 21; six years' experience. Good reference.—J. S., Thos. Innie & Sons, Ayr, N.B.

Seed Trade. SHOPMAN or WAREHOUSEMAN.—Young; eight years' experience. Exceptional references.—ALPHA, H. Laird & Son, Edinburgh.

TO SEEDSMEN, &c.—Wanted, a situation in a Seed Business. Good knowledge of Seed and Bulb Trade, Book-keeping, &c. Part of time in large London House.—H. A., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S PILLS.—Liver, Lungs, and Kidneys.—Most diseases of the digestive organs arise from obstructions, or the removal of which these celebrated Pills exercise the most perfect control. A course of them is strongly recommended as a remedy for such affections of the Kidneys, and other Functional Disorders which cause much present suffering, and if neglected by the foundation of organic diseases. Holloway's Pills are specially adapted for the young and delicate; their gentle and purifying action ranks them above all other medicines. In Indigestion, Nervous Affections, Gout, and Rheumatism, these Pills have achieved for themselves universal fame. They expel all impurities from the blood, and thus restore cheerfulness and vigour.

St. Martin's, Chichester.

TO GRAPE GROWERS, FRUITERS, CAPITALISTS, AND OTHERS.

Sale of a FREESHOLD PLOT on the GROCESTERIES.

MESSRS. WYATT AND SON will SELL by AUCTION, on THURSDAY, September 17, at The Dolphin Hotel, Chichester, at 3 o'clock precisely, by direction of Mr. Isaiah Baker, a large and valuable plot of ground, very suitable for productive FREESHOLD GARDEN, known as THE GRAPERIES, ST. MARTIN'S, CHICHESTER, with eight Glasshouses therein in capital condition, heated with tiles, and supplied with water from a pump; 31 Strawberry and an area of 9646 feet of glass. Four of the largest houses are well stocked with the choicest Vines for market produce and in the bearing, and the other four contain Raspberry, Strawberry and Tomato bushes. The garden is planted with Plum, Pear, and Mulberry trees, and well stocked with fruit bushes. There is also a plot of 6000 ft. square, containing three large trees and three large water tanks, and a Tool and Fowl-house thereon. The above garden is situated in the centre of the city of Chichester, within a couple of minutes' walk from the station, and it has been for many years in the possession of Mr. Isaiah Baker, who has done a lucrative trade with the London market and trade customers at Southsea, the Isle of Wight, Salisbury, and other places. Possession will be given at Christmas next, with the exception of the vines where the Grapes are not then cut, with right of access thereto. One half of the purchase money may remain on mortgage at 4 per cent. The garden may be viewed on application to Mr. ISAIAH BAKER, at the Auctioneers, 25, Abchurch Lane, Chichester, and particulars, with conditions of sale, obtained of Messrs. KAFER AND FREELAND, Solicitors, West Street, Chichester; and of the Auctioneers, 67 and 68, Cheapside, London, E.C., and Messrs. Auctioneers, East Street, Chichester, and Auctioneers, 67 and 68, Cheapside, London, E.C.

Upton Nurseries, Stratford, E.

MR. CURTIS will SELL the above by AUCTION, on the Premises, in suitable lots, on SATURDAY AFTERNOON, September 19.

Catalogues can be obtained at the place of Sale, and of the Auctioneer, the Broadway, Plaistow, E.

Highfield Nurseries, Matlock, Derbyshire.

To Noblemen, Gardeners, Nurserymen, and Others. HIGHLY IMPORTANT and ATTRACTIVE SALE OF NURSERY STOCK.

MESSRS. ELSE and SON have received instructions from Mr. J. J. Marriott, who is giving up a portion of his ground, to SELL by AUCTION, without reserve, on MONDAY, TUESDAY, and WEDNESDAY, September 25, 26, and 27, the whole of the very Superior Stock of the above-named ground, all in the best possible condition for removal, including large quantities of ROTUNDIFOLIA, CAUCASICUM, LATIFOLIA, COLCHIC, and other LAURELS; extra strong over-laid PRIVET; a choice collection of Variegated and Green HOLLIES; COPRESSUS, RETINOSPORA, ARAUCARIA, and ARBOR-VITAE; choice named RHODODENDRONS. Tree PEONIES, 15,000 Transplanted Seedling RHODODENDRONS from the finest named sorts, and 30,000 from hybrids; 3000 ROSES on their own roots, in CHOICE variety; a very select collection of Herbaceous PERENNIALS in strong flowering plants; 40,000 transplanted LARCH, clean, stout, and well-rooted; extra good PINUS AUSTRIACA, &c.

Particulars of which are given in Catalogues, to be had one week prior to the Sale, from Mr. MARRIOTT, Lime Villa, Walsall, or the Auctioneers, Matlock Bridge.

Messrs. ELSE & SON desire to call special attention to this Sale, the stock to be offered being of unusually good quality, particularly worthy of the notice of THE TRADE as well as PRIVATE BUYERS, there being nothing old or over-grown, or spoiled by over-crowding.

London, W.

TO FLORISTS and GARDENERS.—Commanding position, in one of the principal main thoroughfares. Capital FLORIST'S BUSINESS—Show House, 3 Greenhouses, several Pits, Dwelling-house, and Stable. Lease 52 years at a low rent. Price £500. Stock optional. Excellent opportunity.

Full particulars of Messrs. PROTHEROE and MORRIS, 67 and 68, Chesham, E.C. (Folio 6242.)

Important Notice to Florists, Nurserymen, and OTHERS.

TO BE SOLD, by Private Treaty, a very valuable Enclosure of LAND, containing about 5 Acres, well adapted for the above purposes, also Poultry Farm, Public Institution, or Building Purposes. It has a frontage to a high road, rich gravel subsoil, only a short distance from Hampton and Fulwell Railway Stations, S.W.K., and in order to effect an immediate sale will be sold at a bargain. Apply to Mr. J. EMBLETON, Suffolk House, New Hampton.

To Nurserymen.

TO BE SOLD, the Old-established NURSERY BUSINESS of Mr. William Hounslow, of Kingwood, which was established in 1800, and has been successfully carried on by the family to the present time, old age being the sole reason for retiring from the same. The Nurseries are admirably adapted for growing Seedlings of all descriptions, and contain about 7 acres. The stock consists of Forest Trees, Conifers, Flowering Shrubs, and American Plants, to be taken at valuation. The Nurseries are within 100 yards of the Railway Station, thus offering a rare opportunity for an enterprising man, as the business can be greatly increased. For further particulars, and to view, apply to F. AVLES, Auctioneer, Kingwood.

In case the Business should not be disposed of, the ANNUAL SALE will take place EARLY IN NOVEMBER, of which due notice will be given.

To Nurserymen and Beginners

FOR SALE, a SMALL NURSERY, situated in Tottenham—held for 3 years on agreement, at a rent of £6 per annum—comprising 4 Acres, 30 feet long by 11 feet wide; 1 House, 15 feet long by 9 feet wide—a row of 4-6ft Pit in front of one House. Siting, Shed, and good Stock. Price £400. Reason of selling, death. Apply to Mr. SOUTH, The Pottery, Angel Road, Edmonton.

Sutton Sons

SEEDSMEN BY ROYAL WARRANTS

To Her Majesty the Queen, and H.R.H. the Prince of Wales, READING.

HYACINTHS, EARLY WHITE ROMAN.
—May be had in bloom before Christmas. The best pure White for Forcing. Fine bulbs now ready.

IRIS KEMPFERI—in about twenty different shades of colour. This grand Japanese Iris is hardly yet known in this country, but should be grown by every lover of flowers. It is by far the largest flower of this family, with most striking colours. We offer well established English-grown Roots; also many other varieties of Iris.

IRIS CRATEROIDES—Brilliant Crimson. This is about the most showy of this useful family of Bulbs.

IRIS VIRIDIFLORA—a most uncommon colour amongst flowers—very striking, being a decided green with black eye. Also many other varieties of Iris, a family which only requires to be more widely known to be grown as largely as the Tulip or Hyacinth.

LILIAM CANDIDUM—the Old White Garden Lily. Fine Bulbs now ready for Planting or Forcing.

NARCISS and DAFFODILS—in great variety—Choice and Common.

SCILLA SIBIRICA—This charming rich Blue variety is now as cheap as the Snowdrop, to which it makes a good companion and contrast.

SEE OUR **WHOLESALE BULB CATALOGUE** for prices of above, and all other varieties of DUTCH and ENGLISH BULBS. May be had on application.

BULBS, &c.,

ALL CARRIAGE PAID.

UNSOLICITED Testimonial.

From J. OVENDEN, Esq., Strood, Kent, Sept. 5, 1885.
"Dear Sirs,—Box and contents safe on the 4th; am much pleased with the fine appearance of the bulbs."

NAMED HYACINTHS

(For POTS or GLASSES).

What are sold elsewhere at 5d., 6d., 8d., and 10d. we sell at 3d., 4d., 5d., and 6d. (See our CATALOGUE, gratis and post-free).

The following Collections comprise only specially picked bulbs, first size, and are heavy, plump, and sound. They are specially adapted either for exhibiting, forcing, greenhouse, conservatory, or window culture.

- Col. A., 100 in 33 splendid nmd. vars. our selection £2 2s. (Other houses charge £2 3s. and upwards)
 - Col. B., 50 in 25 or 12 " ditto " £1 1s.
 - Col. C., 25 in 12 or 6 " ditto " 5s. 3d.
 - Col. D., 25 in 25 or 12 " ditto " 10s. 6d.
 - Col. E., 25 in 25 or 12 " ditto " 5s. 3d.
 - Col. F., 6 in 6 " ditto " 2s. 6d.
- (Other houses charge 4s. 6d. and upwards)

UNNAMED HYACINTHS,

Splendid samples for bedding, or may be grown in pots if names are of no consequence and perfection of bloom is not an absolute necessity.

- REDS, splendid shades (crimson, ruby, scarlet, rose, &c.) 2s. 6d. p. doz.
 - WHITES, splendid shades (pure white, cream, blush, &c.) 1s. 6d. p. 100
 - BLUES, splendid shades (black, purple, azure, lavender, &c.) 13s. per 1000
- All colours mixed (as these are above beautiful hues), 2s. per dozen, 13s. 6d. per 100, 120s. per 1000.

TENBY DAFFODIL.

We offer the true type.

This possesses one of the most perfect flowers of the whole family: splendid for cutting, and should certainly be given a prominence amongst Daffodils.

"Undoubtedly one of the best of all, on account of the solidity and fine shape of its flowers, and their rich yellow hue."—Garden.

We offer this at the following special low price:—1s. 3d. per dozen, 9s. 6d. per 100, 92s. per 1000.

ANEMONE FULGENS & PLENA

We are in a position to offer totally different sized roots (of both varieties) to those generally sold. As well known, the miserable little bits of roots usually bought fail to give that satisfaction expected from the "glowing" accounts heard of this wonderful Anemone. Aware of this, we have had grown specially for us, in English soil, many thousands of roots, which by generous treatment and unflinching care have attained enormous proportions (when we state that we find there are many hundreds of roots having a circumference of over a foot, it will be seen that they are indeed of enormous size).

These have been specially inured into the changeable climatal influences of these Isles, and cannot fail to produce enormous and innumerable quantities of bloom. Plant a bed of these, and see if it is not found to be the most brilliant sight within the whole garden.

Magnificent bulbs only offered of both Single and Double flowers, either separate or mixed, at 6d. each, 5s. 3d. per dozen, 40s. per 100.

SCILLA SIBIRICA

(Siberian Bluebell or Squill).

Charming sky-blue. Adapted either for outdoor bedding, or for potting in fine samples, specially picked bulbs, at 1s. per dozen, 7s. per 100, 50s. per 1000.

"BLUEBELLS" (Scilla nutans).

We have had a large quantity picked for us, and can offer fine selected bulbs at 1s. per dozen, 6s. 6d. per 100, 50s. per 1000.

YELLOW FLAG (Iris pseudo-acorus).

Splendid for edges of streams, unsightly wet places, where nothing else can be made to grow. Splendid strong plants, at 6d. per dozen, 50s. per 100.

N.B.—Before ordering anything elsewhere please see our Illustrated Autumn CATALOGUE of FLOWERAL GEMS, gratis and post-free upon application.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 12, 1885.

MR. FENN AT HOME.

AWAY at Sulhamstead, and perched on the hillside overlooking the pretty valley through which the Kennet flows from Newbury way towards Reading and the Thames, Mr. Robert Fenn reigns over a wider domain than was known to his former visitors within the walls of the old Woodstock Rectory. There, very often mistaken for the Rector himself by strangers, now almost a Rector in reality—for being one of the three or four freeholders of his parish, and one of the most active and useful of its inhabitants, he has assumed the responsible duties of overseer, highway surveyor, and even of churchwarden; so that the energy which rendered him so famous in certain spheres of garden life has also lifted him into a niche in that Temple of Fame wherein the services of energetic and conscientious officials of the body parochial are duly recorded.

But these same energies are not all exhausted in the occupation of parochial offices, for there seems no limit to the agricultural or horticultural enterprises into which Mr. Fenn embarks—so far, at least, as the area of his small farm and its resources will permit. Agriculturally the visitor is charmed with the plethoric horses which draw the wains, plough the soil, and otherwise assist to convert Mother Earth into a gold mine, if not a too productive one. There are some handsome Alderney cows, free of milk and butter, of which not a whit too much is found to satisfy the cravings of consumers. Pigs galore—and splendid pigs, too—almost enough to make 'overs of rashes long for a slice from the living hog. Mr. Fenn is a great believer in the efficacy of Potatoes to create pig meat, and certainly the fine litter of porkers in their ample run speaks volumes for the belief, for are they not well cultured on Solanum tuberosum? Every pig is killed at home, and being covered into good wholesome Berkshire bacon, is almost entirely sold in small quantities to the neighbours, such is the love for this comestible which pervades the hard-working fraternity of that rural locality. Certainly, if there be merit in good pigs, Mr. Fenn is to be congratulated, not only on the excellence of his breed, but also on the capital appearance the stock presents. Fowls, too, run about the farmyard and grass orchard, and give their eggs daily in considerable abundance, forming for the housewife a constant source of income. These poultry are of a cross-bred strain, half Dorking, half Brahma, and turn out for table juicy fleshy bodies of perfect whiteness, as a well cooked sample showed. A few ducks luxuriate in a meadow pond, but these are created from eggs in the spring for autumn killing only, and are not permanent part of the live stock.

Mr. Fenn has resuscitated his bee stocks, for as a bee-master he had a reputation when some now classed as experts were in their long-clothes. One of these, doubtless, useful personages called upon the old Woodstock bee-master not so long since, and began to expa-

WALTHAM CROSS, N.

tiate upon proper aparian methods. The greybeard quickly produced from his literary store some numbers of the *Cottage Gardener* of nearly forty years since, and showing how ancient was his knowledge of the subject, put the expert to flight. Now the old hives of his own and others' design, once so useful in the old Woodstock garden, where we have often gazed out upon the Blenheim domain, have been refurbished and brought into renewed activity. A dozen or so, some as big as washing-tubs, are full of fine stocks, three of which are producing honey, and in that direction adding sweetness to the life of the toiler in a double sense, for some will be converted into current coin. Out in the meadows may be seen a noble haystack, chiefly of Clover, for the cattle have needed the pasturage, and this stack presents no mean or valueless item in the year's production. The Clover leys have given two good swaths, and now only need moisture to enable them to throw up a rich supply of herbage for the autumn production of milk.

On the arable land out on the brow of the hill—for the lay of the 13 acres within the farm boundaries is varied, and considerably undulated—may be seen growing a piece of Mangel of some rich golden and exceedingly handsome strain, to which Messrs. Sutton & Sons are looking to give them seed next year. We have seen Potatos so handsome as to be mistaken for wax models. Wurzels seem to be becoming as æsthetic, for those growing at Sulhamstead are as smooth as mahogany, and as handsome as can be; then there is a big piece of ripening Broad Windsor Beans for seed; also an extensive breadth of the Canadian Wonder Bean, between the rows of which may be seen peeping up lines of white Turnips, to follow in quick succession, dwarf Peas, and specially (Mr. Fenn affirms by his excellent namesake) Robert Fenn Marrows are being harvested, whilst a big breadth of Potatos of many kinds, and chiefly of the Woodstock seed, are being gradually got up, for the drought has ripened these off early. There are large quantities of Alderman De Keyser; a fine white kidney; Antagonist, and others, old and new; specially taking is a white kidney named Faith, which got very high mention at Chiswick the other day. With the faith which becomes a prophet, and he courage of an old soldier in literary, and especial'y in Potato, warfare, Mr. Fenn contends, first, that whilst many of the beautiful kinds he has raised have been put aside for larger or bigger cropping kinds, yet not a monarch in the world—not a nobleman or gentleman in the kingdom, with all the wealth and fine gardens at their disposal—ever dines off better Potatos than he does; or perhaps, as a rule, half so good. Sulhamstead soil produces fine quality usually in Potatos, but always the finest quality in the first-class eating kinds which Mr. Fenn has from time to time put into the market or the seed trade. Rector of Woodstock, Woodstock Kidney, Early Regent, Lady Truscott, Puzetaker, Reading Russet, Early Market, King-leader—these are but a few of this raiser's productions, and stocks of all which are duly preserved, so that samples in great variety may be partaken of from day to day, and thus maintain a perfect feast of Potatos all the year round. After all Mr. Fenn is quite content to rest his reputation as a raiser of Potatos upon what he has given to the world, and whilst it is possible for others to produce bigger sorts none can excel in the production of such excellent quality. Though almost determined to leave the field to younger men, yet the old fire has been potent enough to create in him an interest in some of the species, and a successful cross, it is anticipated, has been made with Solanum maglia and the white kidney Antagonist, for there are pendent a couple of fine berries, which will probably prove the progenitors of something interesting. S. maglia, as grown under glass in a small tub, is some 4 feet in height, with stems and foliage like to those of any ordinary Potato, and it rather sets adrift doubts as to whether it is not, after all, one of the chief progenitors of our present race of Potatos. Very diverse is the other species, Solanum Fendleri, which is dwarf, small-leaved, hoarily stiff and erect, and apparently a long way removed from the garden Potato. Mr. Fenn has succeeded in crossing this with Reading Russet Potato and a couple of small speckled berries

have been produced, but it will need very much faith in this species to believe that anything good can result.

To utilise garden fruits to his fancy, after the needful stock of preserve has been made, fallen Apples are being brewed into cider, Pears into perry, and hush fruit made into wine. Very interesting still are the representative bottles of the old Woodstock brews which Mr. Fenn exhibited in London, Manchester, Birmingham, and elsewhere years ago, and which obtained medals and honourable mention. A bottle of Khubarb wine made forty-two years ago is pronounced by competent judges to be equal to the best Madeira; whilst of other samples are Esperino, Muscadine, and Muscat of Alexandria Grapes wine some thirty to twenty years of age, with Gooseberry wine, honey-beer, and other home-made liquids of high-class quality.

THE BRITISH ASSOCIATION.

SIR LYON PLAYFAIR'S address at Aberdeen is so full of instruction and suggestion for all concerned in progress, mental or material, that we greatly regret our inability to print it in full, the more so as the named abstracts in most of the daily papers give a very inadequate idea of the scope and practical wisdom of the address. Dr. Playfair's aim is to emphasise the importance of scientific training if Britain is to hold its own in the great race—pre-eminence it can scarcely be now in the old sense. The following are a few extracts from this remarkable address:—

ENLARGED SCIENTIFIC TRAINING.

Passing from learned or public professions to commerce, how is it that in our great commercial centres, foreigners—German, Swiss, Dutch, and even Greeks—push aside our English youth and take the places of profit which belong to them by national inheritance? How is it that in our colonies, like those in South Africa, German enterprise is pushing aside English incapacity? How is it that we find whole branches of manufactures, when they depend on scientific knowledge, passing away from this country, in which they originated, in order to engraft themselves abroad, although their decaying roots remain at home? The answer to these questions is that our systems of education are still too narrow for the increasing struggle of life. Faraday, who had no narrow views in regard to education, deplored the future of our youth in the competition of the world, because, as he said with sadness, "our schoolboys, when they came out of school, are ignorant of their ignorance at the end of all that education." The opponents of science education allege that it is not adapted for mental development, because scientific facts are often disjointed and exercise only the memory. Those who argue thus do not know what science is. No doubt an ignorant or half-informed teacher may present science as an accumulation of unconnected facts. At all times and in all subjects there are teachers without æsthetic or philosophical capacity—men who can only see carbonate of lime in a statue by Phidias or Praxiteles; men who can look at trees without getting a conception of a forest, and cannot distinguish a stately edifice from its bricks. It is, however, true that as science teaching has had less lengthened experience than that of literature, its methods of instruction are not so matured. Scientific and literary teaching have different methods; for while the teacher of literature rests on authority and on books for his guidance, the teacher of science discards authority and depends on facts at first hand, as in the book of Nature for their interpretation. Natural science more and more resolves itself into the teaching of the laboratory. In this way it can be used as a powerful means of quickening observation, and of creating a faculty of induction. In England manufacturers cry out for technical education, in which classical culture shall be excluded. In the schools of the middle classes science rather than technics is needed, because when the seeds of science are sown, technics as its fruit will appear at the appointed time. Epictetus was wise when he told us to observe that though sheep eat grass, it is not grass but wool that grows on their backs. Should, however, our grammar schools persist in their refusal to adapt themselves to the needs of a scientific age, England must follow the example of other European nations, and found new modern schools in competition with them. For, as Huxley has put it, we can-

not continue in this age of "full modern artillery to turn out our boys to do battle in it, equipped only with the sword and shield of an ancient gladiator." In a scientific and keenly competitive age an exclusive education in the dead languages is a perplexing anomaly. The flowers of literature should be cultivated and gathered, though it is not wise to send men into our fields of industry to gather the harvest when they have been taught only to call the Poppies and to push aside the Wheat.

STATE ENDOWMENT OF UNIVERSITIES.

The State has always felt bound to alter and improve universities, even when their endowments are so large as to render it unnecessary to support them by public funds. When universities are poor, Parliament gives aid to them from Imperial taxation. In this country that aid has been given with a very sparing hand. Thus the universities and colleges of Ireland have received about £30,000 annually, and the same sum has been granted to the four universities of Scotland. Compared with Imperial aid to foreign universities such sums are small. A single German university, like Strasburg and Leipsic, receives about £40,000 annually, or £10,000 more than the whole colleges or Ireland or Scotland. Strasburg, for instance, has had her university and its library rebuilt at a cost of £711,000, and receives an annual subscription of £43,000. In rebuilding the University of Strasburg eight laboratories have been provided, so as to equip it fully with the modern requirements for teaching and research. The cost of these laboratories has been as follows:—Chemical Institute, £35,000; Physical Institute, £28,000; Botanical Institute, £26,000; Observatory, £25,000; Anatomy, £22,000; Clinical Surgery, £26,000; Physiological Chemistry, £16,000; Physiological Institute, £13,000. Prussia, the most economical nation in the world, spends £391,000 yearly out of taxation on her universities. The recent action of France is still more remarkable. After the Franco-German war the Institute of France discussed the important question—"Pourquoi la France n'a pas trouvé d'hommes supérieurs au moment du péril?" The general answer was because France had allowed university education to sink to a low ebb. Before the great revolution France had twenty-three autonomous universities in the provinces. Napoleon desired to found one great university at Paris, and he crushed out the others with the hand of a despot, and remodelled the last with the instincts of a drill-sergeant. The central university sank so low that in 1868 it is said that only £8000 were spent for true academic purposes. Startled by the intellectual sterility shown in the war, France has made gigantic efforts to retrieve her position, and has rebuilt the provincial colleges at a cost of £3,280,000, while her annual budget for their support now reaches half a million of pounds. In order to open these provincial colleges to the best talent of France, more than 500 scholarships have been founded at an annual cost of £30,000. France now recognises that it is not by the number of men under arms that she can compete with her great neighbour, Germany, she has determined to equal her in intellect. Other European nations are advancing on the same lines. Switzerland is a remarkable illustration of how a country can compensate itself for its natural disadvantages by a scientific education of its people. Switzerland contains neither coal nor the ordinary raw materials of industry, and is separated from other countries which might supply them by mountain barriers. Yet, by a singularly good system of graded schools, and by the great technical college of Zurich, she has become a prosperous manufacturing country. In Great Britain we have nothing comparable to this technical college, either in magnitude or efficiency. Belgium is reorganising its universities, and the State has freed the localities from the charge of buildings, and will in future equip the universities with efficient teaching resources out of public taxation. Holland, with a population of 4,000,000 and a small revenue of £9,000,000, spends £136,000 on her four universities. Contrast this liberality of foreign countries in the promotion of higher instruction with the action of our own country. Scotland, like Holland, has four universities, and is not very different from it in population, but it only receives £30,000 from the state. The wealthy universities of Oxford and Cambridge are gradually constructing laboratories for science. The merchant princes of Manchester have equipped their new Victoria University with similar laboratories.

Edinburgh and Glasgow Universities have also done so, partly at the cost of Government and largely by private subscriptions. The poorer universities of Aberdeen and St. Andrews are still inefficiently provided with the modern appliances for teaching science. London has one small Government college and two chartered colleges, but is wholly destitute of a teaching university. It would excite great astonishment at the Treasury if we were to make the modest request that the great metropolis, with a population of 2,000,000, should be put into as efficient academical position as the town of Strasburg, with 104,000 inhabitants, by receiving, as that town does, £43,000 annually for academic instruction, and £700,000 for university buildings. Still, the amazing anomaly that London has no teaching university must before long cease. It is a comforting fact that, in spite of the indifference of Parliament, the large towns of the kingdom are showing their sense of the need of higher education. All these are healthy signs that the public are determined to have advanced science teaching, but the resources of the institutions are altogether inadequate to the end in view. Even in the few cases where the laboratories are efficient for teaching purposes, they are inefficient as laboratories for research. Under these circumstances the Royal Commission on Science advocates special Government laboratories for research. Such laboratories, supported by public money, are as legitimate subjects for expenditure as galleries for pictures or sculpture. Nevertheless our wealth is proportionately much greater than that of foreign States which are competing with so much vigour in the promotion of higher education. They deem such expenditure to be true economy, and do not allow their huge standing armies to be an apology for keeping their people backward in the march of knowledge. Preparations for war will not insure to us the blessings and security of an enlightened peace. Protective expenditure may be wise, though productive expenditure is wiser.

Universities are not mere storehouses of knowledge; they are also conservatories for its cultivation. Professors in a university have a higher function, because they ought to make new money as well as to store it. The widening of the bounds of knowledge, literary or scientific, is the growing glory of university life. Germany unites the functions of teaching and research in the universities, while France keeps them in separate institutions. The former system is best adapted to our habits, but its condition for success is that our science chairs should be greatly increased, so that teachers should not be entirely absorbed in the duties of instruction. Germany subdivides the sciences into various chairs, and gives to the professors special laboratories. It also makes it a condition for the higher education that the candidate shall give proofs of their ability to make original researches. Our universities are still far from the attainment of a proper combination of their resources between teaching and research. Even Oxford and Cambridge, which have done so much in recent years in equipment of laboratories and in adding to the scientific staff, are still far behind a second-class German university. There are too few autonomous universities in England in scientific life. The growing glory of university life, a population of 3½ millions, has four universities with 6500 students, England, with 26 millions of people, has only the same number of teaching universities with 6,000 students. Unless English colleges have such ambition, they may be turned into mere mills to grind out material for examinations and competitions. Higher colleges should always hold before their students that knowledge, for its own sake is the only object worthy of reverence. Beyond college life there is a land of research flowing with milk and honey for those who know how to cultivate it.

THE APPLICATION OF SCIENTIFIC FACTS.

Though the accumulation of facts is indispensable to the growth of science, a thousand facts are of little value unless the progress that is a single one when it is scientifically comprehended, for it then becomes generalised in all similar cases. Isolated facts may be viewed as the dust of science. The dust which floats in the atmosphere is to the common observer mere incoherent matter in a wrong place, while to the man of science it is all-important when the rays of heat and light act upon its floating particles. It is by them that clouds and rains are influenced; it is by their selective influence on the solar waves that the blue of the heavens and the heauteous colours of the sky glorify all Nature. So, also, ascertained through isolated facts, forming the dust of science, become the reflecting media of the light of knowledge, and cause all Nature to assume a new aspect. It is with the light of knowledge that we are enabled to question Nature through direct experiment. The hypothesis or theory which induces us to put the experimental question may be right or wrong; still, *præterea quæsitio dimittit scientiæ errorem*—half-way to knowledge when you know what you have to inquire. David described

hypothesis as the mere scaffolding of science, useful to build up true knowledge, but capable of being put up or taken down at pleasure. Undoubtedly a theory is only temporary, and the reason is, as Bacon has said, that the man of science is "lovelier than man, his theory." The changing theories which the world despises are leaves of the tree of science, drawing nutriment to the parent stems, and enabling it to put forth new branches and to produce fruit; and though the leaves fall and decay, the very products of decay nourish the roots of the tree and reappear in the new leaves or theories which succeed. When the questioning of Nature by intelligent experiment has raised a system of science, then those men who desire to apply it are sufficient for scientific progress by the same methods to make rapid progress in the arts. They also must have means to compel Nature to reveal her secrets.

In illustration of how slowly at first and how rapidly afterwards science and its applications arise, I will take only two out of thousands of examples which lie ready to my hand. One of the most familiar instances is air, for that surely should have been soon understood if man's unaided senses are sufficient for scientific progress. It has been the notice of mankind ever since the first man drew his first breath. It meets him at every turn; it fans him with gentle breezes, and it buffets him with storms. And yet it is certain that this familiar object—air—is very imperfectly understood up to the present time. We now know by recent researches that air can be liquefied by pressure and cold; but as a child still looks upon air as nothing, so did man in his early state. A vessel filled with air was deemed of no worth. But, as soon as he began to speculate, felt the import of air, and discerned it to be a soul of the world upon which the respiration of man and the god-like quality of fire depended. Yet a really intelligent conception of these two essential conditions to man's existence—respiration and combustion—was not formed till about a century ago (1775). There was no intelligent conception as to the composition of air until Priestley in 1774 repeated with the light of science, an empirical observation which Eek had made 3000 years before upon the union of mercury with iron filings, and discerned the position of this compound by heat. This experiment now proved that the active element in air is oxygen. From that date our knowledge, derived from an intelligent questioning of air by direct experiments, has gone on by leaps and bounds. The air, which mainly consists of nitrogen and oxygen, is now known to contain carbonic acid, ammonia, nitric acid, ozone, besides hosts of living organisms which have a vast influence for good or evil in the economy of the world. These micro-organisms, and their contributions to our knowledge of air, form great analytical functions in organic nature, and are the means of converting much of its potential energy into actual energy. Through their action on dead matter the mutual dependence of plants and animals is secured, so that the air becomes at once the grave of organic death and the cradle of organic life. The consequences of the progressive discoveries have added largely to our knowledge of life, and have given a marvellous development to the industrial arts. Combustion and respiration were a few of the processes. The economical use of fuel, the growth of plants, the food of animals, the processes of husbandry, the maintenance of public health, the origin and cure of disease, the production of alcoholic drinks, the processes of making vinegar and saltpetre—all these and many other kinds of knowledge have been brought under the dominion of law. No doubt animals respired, fuel burned, plants grew, sugar fermented, but we knew how they depended upon air. But as the knowledge was expanding, it was not intelligently directed. Now all these processes are ranged in order under a wise economy of Nature, and can be directed to the utilities of life; for it is true, as Swedenborg says, that human "ends always ascend as Nature descends." There is scarcely a large industry in the world which has not received a mighty impulse by the better knowledge of air acquired within a hundred years. If I had time I could show still more strikingly the industrial advantages which have followed from Cavendish's discoveries of the composition of water. I wish that I could have done this, because it was Addison who foolishly said, and Paley who as unwisely approved the remark, "that mankind required to know no more about water than the temperature at which it froze and boiled, and the mode of making steam." When we examine the order of progress in the arts, even before they are illumined by science, their improvements seem to be the results of these conditions.—The substitution of natural forces for human animal power, as when Hercules used the waters of the Alpheus to cleanse the Augean stables; or when Kamchad of Eastern Asia, who has been three years hollowing out a canoe, finds that he can do it in a few hours by fire. 2. The economy of time, as when a calendaring machine produces the same gloss to miles of calico that an African savage gives to a few inches by rubbing it with the shell of a snail; or the

economy of production, as when steel pens, sold when first introduced at one shilling apiece, are now sold at a penny per dozen; or when steel rails, lately costing £45 per ton, can now be sold at £5. 3. Methods of utilising waste products, or of ennobling them with methods which render them of increased value to industry, as when waste scrap iron and the galls on the oak are converted into ink; or the badly-smelling waste of gasworks is transformed into fragrant essences; brilliant dyes, and fertilising manure; or when the effluvia of animals or old bones is changed into lucifer-matches. All three results are often combined when a single end is obtained—at all events, economy of time and production invariably follows when the natural forces substitute brute activities for human industry. The sweat of the brow is lessened by the conceptions of the brain. Slaves are mere machines, and machines neither invent nor discover. The bodmen of the Jews, the helots of Sparta, the captive slaves of Rome, the serfs of Europe, and uneducated labourers of the present day, who are the slaves of ignorance, have added nothing to human progress. But as natural forces substitute and become cheaper than slave labour, liberty follows, advancing civilisation. Machines require to be substituted for men. One shoe-factory in Boston by its machines does the work of 30,000 shoemakers in Paris, who have still to go through the weary drudgery of mechanical labour. The steam power of the world, during the last twenty years, has risen from 1½ million to 29 million horse-power, or 152 per cent. Let me take a single example of how even a petty manufacture improved by the teachings of science affects the comforts and enlarges the domain of human kind. When I was a boy that way of obtaining a light was by the tinder-box, with its quadruple materials, lint and steel, burnt rag, tinder, and a sulphur match. If everything went well, if the box could be found and the air was dry, a light could be obtained in two minutes; but very often the time occupied was much longer, and the process became a great trial to the serenity of temper. The consequence of this was that a fire or a burning lamp was kept alight through the day. Old Gerard, in his *Herbal*, tells us how certain flints were used to carry fire from one place to another of the country, by the tinder-box. A man held its position as a great discovery in the arts. Time had to elapse before chemical analysis showed the kind of bodies which could be added to phosphorus so as to make it ignite readily. So it was not till 1833 that matches became a partial success. Intolerably bad they were then, dangerously inflammable, horribly poisonous to the makers, and injurious to the lungs of the consumers. It required another discovery by Schroter in 1845 to change poisonous wax into innocuous red-brick phosphorus in order that these defects might be remedied, and to give us the safety-match of the present day. Now what have these successive discoveries in science done for the nation, in this single manufacture, by an economy of time? If before 1833 we had made the same demands for light that we do now, when we daily consume eight matches per head of the population, the tinder-box could have supplied the demand under the most favourable conditions by an expenditure of one quarter of an ounce. The lucifer match supplies a light in fifteen seconds on each occasion, or in two minutes for the whole day. Putting these differences into a year, the venerable ancient who still sticks to his tinder-box would require to spend ninety hours yearly in the production of light, while the use of lucifer matches spends twelve hours; so that the latter has an economy of seventy-eight hours yearly, or about ten working days. Measured by cost of production at 1/2d. daily, the population of 26,000,000, multiplied by this is a curious instance of the manner in which science leads to economy of time and wealth even in a small manufacture. In larger industries the economy of time and labour produced by the application of scientific discoveries is beyond all measurement. Thus the discovery of latent heat by Black led to the inventions of Watt, while that of the mechanical equivalent of heat by Joule has been the basis of the progressive improvements in the steam engine which enables power to be obtained by a consumption of fuel less than one-fourth the amount used twenty years ago. It may be that the engines of Watt and Stephenson will yield in their turn to more economical motors; still they have already expanded the wealth, resources, and even the territories of England more than all the battles fought by her soldiers or all the treaties negotiated by her diplomatists. The coal which has hitherto been the chief source of power, probably represents the product of five or six million years during which the sun shone upon the plants of the carboniferous period, and stored up its energy in this convenient form. But we are using this conserved force wastefully and prodigally; for, although horse-power in steam engines has so largely increased since 1864, two men only now produce what three men did at that date. It is only 300 years since we became a manufacturing country.

RESULTS DUE TO NEGLECT OF SCIENCE.

According to Professor Dewar, in less than 200 years more the coal of this country will be wholly exhausted, and in half that time will be difficult to procure. Our not very distant descendants will have to face the problem—What will be the condition of England without coal? The answer to that question depends upon the intellectual development of the nation at that time. Few would ask now, as was constantly done a few years ago, "What is the use of an abstract discovery in science?" Faraday once answered this question by another, "What is the use of a baby?" Yet round that baby centre all the hopes and sentiments of its parents, and even the interests of the State, which interferes with its upbringing so as to insure it being a capable citizen. The processes of mind which produce a discovery or an invention are rarely associated in the same person, for while the discoverer seeks to explain causes and the relation of phenomena, the inventor aims at producing new effects, or at least of obtaining them in a novel and efficient way. In this the inventor may, sometimes succeed without much knowledge of science, though his labours are infinitely more productive when he understands the causes of the effects which he desires to produce. A nation in its industrial progress, when the competition of the world is keen, cannot stand still, or even retrograde, if it is possible for it. It may go forward, retrograde, or perish. Its extinction as a great nation follows its neglect of higher education, for, as described in the Proverbs of Solomon, "They that hate instruction love death." In sociology, as in biology, there are three states—the first of balance, when things grow neither better nor worse; the second, that of elaboration or evolution, as we see it when animals adapt themselves to their environments; and third, that of degeneration, when they rapidly lose the ground they have made. For a nation, or state of balance is only possible in the early stage of its existence, but it is impossible when its environments are constantly changing. The possession of the raw materials of industry and the existence of a surplus population are important factors for the growth of manufactures in the early history of a nation, but afterwards they are bound up with another factor—the application of intellect to their development.

RESULTS DUE TO SCIENCE.

Science has in the last hundred years altered altogether the old conditions of industrial competition. She has taught the rigid metals to convey and record our thoughts even to the most distant lands, and, within less limits, to reproduce our speech. This marvellous application of electricity has diminished the cares and responsibilities of Governments, while it has at the same time altered the whole practice of commerce. To England steam and electricity have been of incalculable advantage. The ocean, which once made the country insular and isolated, is now the very lifeblood of England, and of the greater England beyond the seas. As in the human body the blood bathes all its parts, and through its travelling corpuscles carries force to all its members, so in the body politic of England and its pelagic extensions, steam and electricity have become the great life of the nervous system. The colonies, being young countries, value their raw materials as their chief sources of wealth. When they become older they will discover it is not in these, but in the culture of scientific intellect, that their future prosperity depends. Older nations recognise this as the law of progress more than we do; or, as Jules Simon tersely puts it—"That nation which most educates her people will become the greatest nation, if not to-day, certainly to-morrow." Higher education is the condition of higher prosperity, and the nation which neglects to develop the intellectual factor of production must degenerate, for it cannot stand still. The true cultivators of the tree of science must seek their own reward by seeing it flourish, and let others devote their attention to the possible practical advantages which may result from their labours. There is, however, one intimate connection between science and industry which I hope will be more intimate as scientific education becomes more prevalent in our schools and universities. Abstract science depends on the support of men of leisure, either themselves possessing or having provided for them the means of living without entering into the pursuits of active industry. The pursuit of science requires a superfluity of wealth in a community beyond the needs of ordinary life. Such superfluity is also necessary for Art, though a picture or a statue is a saleable commodity, while an abstract discovery in science has no immediate or, as regards the discoverer, proximate commercial value. My argument is that no amount of learning without science suffices in the present state of the world to put us in a position which will enable England to keep ahead or even on a level with foreign nations as regards knowledge and its applications to the utilities of life. Take the example of any man of learning, and see how soon the direct consequences resulting from it disappear in the life of a nation, while the discoveries of a man of science remain productive

amid all the shocks of empire. As I am in Aberdeen I remember that the learned Dutchman Erasmus was introduced to England by the encouragement which he received from Hector Boece, the Principal of King's College in this University. Yet even in the case of Erasmus—who taught Greek at Cambridge, and did so much for the revival of classical literature, as well as in the promotion of spiritual freedom—how little has civilisation to ascribe to him in comparison with the discoveries of two other Cambridge men—Newton and Cavendish. The discoveries of Newton will influence the destinies of mankind to the end of the world. When he established the laws by which the motions of the great masses of matter in the universe are governed, he conferred an incalculable benefit upon the intellectual development of the human race.

Newton's discovery cast men's minds into an entirely new mould, and levelled many barriers to human progress. This intellectual result was vastly more important than the practical advantages of the discovery. It is true that navigation and commerce mightily benefited by our better knowledge of the motions of the heavenly bodies. Still, these benefits to humanity are incomparably less in the history of progress than the expansion of the human intellect which followed the withdrawal of the cramps that confined it. Truth was now able to discard authority, and marched forward without hindrance. Before this point was reached Bruno had been burned, Galileo had abjured, and both Copernicus and Descartes had kept back their writings for fear of offending the Church. The recent acceptance of evolution in biology has had a like effect in producing a far profounder intellectual change in human thought than any mere impulse of industrial development.

Already its application to sociology and education is recognized, but that it is of less import to human progress than the broadening of our views of Nature. Abstract discovery in science is then the true foundation upon which the superstructure of modern civilisation is built; and the man who would take part in it should study science, and, if he can, advance it for its own sake, and not for its applications. Ignorance may walk in the path lighted by advancing knowledge, but she is unable to follow when science passes her, for, like the foolish virgin, she has no oil to her lamp. An established truth in science is like the constitution of an atom in matter—something so fixed in the order of things that it has become independent of further dangers in the struggle for existence. The sum of such truths forms the intellectual treasure which descends to each generation in hereditary succession. Though the discoverer of a new truth is a benefactor to humanity, he can give little to futurity in comparison with the wealth of knowledge which he inherited from the past. We, in our generation, should appreciate and use our great possessions—

"For ye our tributary stores combine,
Creation's heir; it, the world, the world is mine."

K. EMPFERIA ORNATA.

THIS is a Bornean introduction of the Compagnie Continentale of Ghent, and figured at t. 537 of the *Illustration Horticolæ*. The plant has long-stalked, lanceolate leaves, bright green above, with a central band of white. The lower surface is wine-purple, and the margin somewhat undulate. It is a handsome stove foliage plant, the general habit of which is shown in our illustration (fig. 69), which we owe to the courtesy of the Compagnie Continentale.

SEED RAISING.

(Continued from p. 293.)

VITALITY OF SEEDS.

With very few exceptions all seeds retain their germinating power for at least a year under ordinary conditions; and, when placed in circumstances specially favourable, they remain fresh for a very lengthened period. Several remarkable instances of this have already been mentioned, but cases even more remarkable than these are recorded. In the ground, when buried deeply, the length of time seeds will retain life is indefinite—according to some authorities, even unlimited. The accounts of seeds which had been taken from ancient Egyptian tombs germinating on being placed under favourable conditions, and other similar cases of an astonishing nature, might be mentioned. These are, however, of little or no practical moment, beyond showing us how wonderfully tenacious of life is the tiny germ which lies enclosed in its often thin and delicate wrappers. How long a seed will remain good when placed under the conditions supplied in

the seed-house, or when sown and treated for germination, is a question to which we may turn for more useful information. A seed, when properly matured and kept dry in an even and suitable temperature, will remain healthy for a more or less lengthened period, according to whether it is oily or starchy, or whether it belongs to the exalbuminous or the albuminous kinds. Oily seeds usually perish in a comparatively short time, so that it becomes necessary to sow them as soon as possible after they are ripe; such seeds are those of Tea, Coffee, Camellia, Theobroma, Acorus, Brazil-nuts, Walnuts, &c. Seeds of a starchy nature are generally much longer-lived. It is, however, impossible to draw a hard-and-fast line between long-lived and short-lived seeds, as there are so many conditions other than those we perceive, and often altogether beyond our control, which affect the vitality of seeds. Lindley says—"Seeds are probably possessed of different powers of life, some preserving their vital principle through centuries of time, while others have but an ephemeral existence under any circumstances. The reasons for this difference are unknown to us." In the case of many of our most popular and long-cultivated plants, however, we have data sufficient to enable us to perceive how long their seeds may be expected to remain capable of germinating. The following list was prepared by the well-known seed merchants, Vilmorin-Andrieux & Co., of Paris, and with it is incorporated a portion of a list printed in Burbridge's *Propagation and Improvement of Plants*—

AVERAGE DURATION OF THE GERMINATING POWER OF THE SEEDS OF SOME CULTIVATED PLANTS.

	Years.	Years.	
Acacia	many	Lentil	3
Alder	1	Lettuce	3
Amaranth	5	Maize	2
Angelica	1	Marlow	5
Antennaria	1	Marjoram	2
Artichoke	5	Melon	5
Aster, China	1	Muscard	5
Asparagus	1	Nasturtium	5
Balsam	many	Onion	2
Basil	6	Parsley	3
Beans, Broad	1	Pea	3
Beans, Kidney	3	Pest	4
Beetroot	5	Potato	4
Borage	3	Purslane	8
Burnet	2	Radish	5
Cabbage	5	Rampion	7
Capsicum	4	Rhubarb	5
Celery	2	Rocket	2
Cardoon	7	Rosemary	4
Carrot	4	Salsify	3
Celery	6	Savory	2
Chicory	1	Suzouza	2
Chicory	8	Seakale	3
Chrysalis	1	Squash	2
Cress	3	Sprach	5
Cucumber	5	Strawberry	8
Egg-Plant	7	Thyme	3
Elder	2	Tomato	2
Leek	2	Turnip	5

The above table does not profess to give in every case the longest time possible for the seeds to remain good, but only the average time during which, under the conditions supplied in an ordinary seed-room, they might be expected to retain their power to vegetate. Cabbage seeds have been known to germinate after being kept for ten years, and Kidney Beans after five years. As above stated, the conditions which affect the duration of life in seeds are too often beyond control, or altogether hidden from us.

It has been already pointed out that under certain conditions some seeds will remain dormant in the ground for a long time without losing their vitality; in like manner seeds will sometimes lie for years without commencing to grow, even when the conditions under which they are placed are what we consider favourable to germination. Lindley mentions various instances of this, all tending to show how necessary it is to have patience in the management of seeds, and more especially when the age of the seeds is unknown. Old seeds always germinate more slowly than young ones; the hardening of the testa or seed-coats through long exposure, no doubt, accounting to some extent for their tardiness in starting. By steeping in warm water or by removing the outer shell from seeds, germination, as shown above, is much forwarded. Fruits of Hawthorns, Hollies, Birch, and other hardy berry-bearing trees are generally subjected to a softening process before their seeds are sown. This process is what is termed the "rot-heap," and is managed as follows:—The fruits are gathered in the autumn as soon as ripe, and are thrown in heaps. A quantity of sand, ashes, or light soil is mixed up with them by frequently turning them; they are then buried in a pit, or placed in heaps and covered with turf, where they remain till the following spring. The whole is then prepared for sowing by partly

drying and then sifting. In this manner the seeds are separated, whilst the warmth and moisture in which they were stored through the winter has softened the hard shell of the seeds, and, no doubt, has excited the germinative process.

Seeds of plants belonging to the Ranunculaceae and Primrose families sometimes remain in the ground for several years without moving. Mr. Anderson-Henry states that some seeds of Ranunculus Lyalli, the Shepherd's Lily, sown by him in 1878, did not germinate till 1881; and in the case of seeds of a second species of Ranunculus, germination took place four years and a half afterwards. The same extraordinary slowness has often been observed in seeds sown at Kew. How far this slowness to vegetate may be considered as natural to the plants, or whether it is due to some untoward influence to which the seeds had been subjected, is not clear. Seeds of Ranunculus Lyalli vegetated in about eleven months at Kew. I suspect that with most of those plants the seeds of which usually remain in the soil a long time before growing, it would be better to sow the seeds immediately on their becoming ripe. Mr. A. Henry found *Primula japonica* and *Centiaens* slow to germinate, but when the seeds of these plants are gathered and sown as soon as ripe, they generally germinate in a few weeks. It is said that *Colchicum*-seeds generally take over two years to start into growth. It is always best to select the largest and heaviest seeds in all cases where robustness of growth is the first aim; smaller seeds being slower to get away, and containing less vital force than larger ones of the same kind. It is also supposed that large seeds retain life for a longer time than smaller ones do. *W. Watson, in "Casell's Popular Gardening."*

MESSRS. W. FROMOW & SONS' NURSERY, CHISWICK.

"CHISWICK" and "horticulture,"—the terms would appear to be synonymous from their connection with the historic gardens of the Royal Horticultural Society. But it is not our province just now to dilate upon the aforesaid gardens, nor upon the good work performed there. The heading to these remarks will sufficiently explain our purpose. The Messrs. Fromow have been established at Chiswick for upwards of half a century, the dwelling-house in the nursery carrying our thoughts back to a far more remote period, it having been built about 200 years ago, and it will bear favourable—ay, very favourable—comparison with structures of modern date. In the old coaching days it was known as the "Corner Pin" inn, and there may still be seen the spacious wine cellars and vaults in which were kept the "good things" for the revellers in those good "old times." Blue ribbonism was not in the ascendant then. What is now known as Wellesley Road, running on one side of the nursery, was formerly the main road to Hampton Court. The front of the old house is just now wreathed with the intense violet-purple flowers of *Clematis Jackmanni*, giving it quite a picturesque appearance. In passing, how profusely the *Clematis* appears to be flowering this year. Query, has the season anything to do with it? This is perhaps one advantage of a peculiar season, such as has been the present one. It brings out the capabilities and merits or otherwise of certain subjects, which under ordinary circumstances would not be observed, and in some cases cultivators (in consequence) may strike out "new lines" of procedure, preconceived notions being quite upset.

But we have been digressing—so to the matter under consideration. Amongst what, for want of a better term, may be called "suburban" nurseries, the establishment under notice holds no mean position; for Chiswick can now no longer be, as it was once, termed a "village." It has been quite transformed—"swallowed up," in fact—in mighty Babylon, London.

Messrs. Fromow may be said to have "stepped into the shoes" of those once famous nurserymen—the Messrs. Glendinning—whose productions at the renowned Chiswick shows of the Horticultural Society are recorded for our edification in the journals of that day.

The attention of horticulturists has been directed to the nursery under notice by the charming groups "arranged for effect" sent from it of recent years to some of our leading horticultural exhibitions, and

which have generally occupied a high position in the prize lists. It might, therefore, be not unreasonably supposed that "at home" also there would be something worth seeing, and it was with this object in view that the writer of these made a pilgrimage to Chiswick recently, and the "notion" was not a mistaken one.

The visitor who went there filled with the idea of seeing a grand "show" place would be disappointed; the proprietors are severely business people, and it is owing to this very important and—to be successful—indispensable factor in their method of procedure that their present position is due.

The houses, some fifteen in number, are built with the special object of plant growing, and are therefore plain, commodious, useful, well-built structures.

And now for a few brief notes on their occupants. Rightly gauging the public taste, a collection of Orchids, good, useful, and varied, is being formed, which will, when established, be a special feature. Of course, it is now the wrong season of the year to see what these plants are principally grown for—their flowers—but we noted a few in bloom. *Cattleya Eldorado*, the pale pink variety; *C. labiata speciosissima*, and *C. Gaskelliana*. *C. Mossie* is grown

nassa ativa variegata (variegated Pine-apple), represented by a noble specimen; *Aspidistra lurida* and *A. lurida variegata* also claim attention here, as being useful, effective plants, and withal standing hard treatment.

Of Palms a good and select collection is grown, a house being specially devoted to their culture, and comprising the best and popular sorts, grown in 32 and 24-sized pots, and therefore manageable and come-at-able plants. We noticed *Seaforthia elegans*, *Areca rubra*, *A. lutescens*, *Kentia Canterburyana*, very graceful; *Phoenix sylvestris*. Before we dismiss the Palms a word must be said in praise of *Cocos Weddelliana* as grown in 60's. It is a variety much used for table decoration, for which it is eminently suited; in this stage the plants for this purpose are transferred from their pots to suitable vases, and these being surface-mossed give them a neat, attractive, and dressy appearance.

Ferns are well cared for, the popular *Adiantum cuneatum* being grown in quantity, and well done. *Peris crerica* and *P. serrulata*, with its varieties *cristata* and *cristata major*, deserve special mention.

As it will soon be *Chrysanthemum* time it may not be out of place to mention that a good collection of

FIG. 69—KÄMPFERIA ORNATA: LEAVES DARK GREEN, WITH A CENTRAL WHITE STRIPE. (SEE P. 328.)

somewhat largely, but is not now in bloom; *Aërides Lobbi* just coming into flower with its long sprays of pale pink blossoms resembling a wreath.

The well-known *Sophronites grandiflora* was in bloom, in fact it keeps in this stage for months, so that it is useful on this account, even although its red flowers be somewhat small—the trio to complete those in flower (and good plants they were) are *Cypripedium Sedeni*, *Lælia Dayana*, and *Oncidium crispum*. Of that useful cool Orchid, *Odontoglossum grande*, a good batch was seen, the foliage plump and healthy. *Eucharis amazonica* was represented by a numerous batch of specimens in rude health, just showing flower, these will be invaluable a little later on when flowers will be getting scarce. The new form, *E. candida* (true), is also grown—not quite so large in flower as *amazonica*, but still a useful acquisition amongst white flowers.

Amongst flowering greenhouse climbers we noted finely bloomed specimens of these favourites, *Lapageria rosea* and *L. alba*. A good collection of *Camellias* is grown, well known and good sorts; the plants are in vigorous health, and will well repay a visit when in flower.

In ornamental foliaged plants were seen some well coloured *Crotons*; they were light and effective, quite "lighting up" the sombre foliage Palms, with some of which they were associated. *Pandanus Veitchii*, so excellent a plant for table decoration; *Eulalia japonica variegata*, a graceful and effective grass; and *Ana-*

this best of autumn flowers is grown, and they give promise of a good display of bloom. There are about 1000 plants grown of the incurved and Japanese varieties, of various sizes, from those in 4's, short and thick, to large plants, 3 to 4 feet in height. The large plants are disbudded, so as to get very fine flowers, which come to a great size, and are sold to the London florists for table decorations, vases, &c., who get as much as 6*l.* and 1*s.* per bloom for them. Appended are the names of a few of the best amongst the large flowering varieties (necessarily space forbids any lengthy lists), viz.:—*Antonelli*, salmon-orange; *Golden Eagle*, red and gold; *White Eve*, white, fine; *Avalanche*, snow-white; *Barbara*, golden-yellow; *Refulgence*, dark crimson. Of the Japanese varieties the following were noted:—*Triomphe de la Rue de Chatelet*, salmon, shaded rose—good; *Garnet*, bright blood-red; *Boule d'Or*, bright gold; *George Gordon*, chestnut-red; *Source d'Or*, golden-yellow, extra good; *Elaine*, white.

A large stock of *Pelargoniums* of the various sections is grown, and to those whom it may concern it may be somewhat of interest to know that amongst golden tricolors *Mrs. Pollock* (even now, though old, an unsurpassed variety), *Lady Cullum*, and *Mr. H. Cox* are considered the best varieties, and in the gold and bronze class *Maréchal McMahon*, *Black Douglas*, and *W. E. Gumbleton*.

Conifers, Ornamental Trees, and generally Hardy Plants are principally grown at the two

branch nurseries of the firm at Hounslow, and contain some special features, which it is our intention to refer to in a future issue. Meanwhile there are some plants in this way at Chiswick that deserve a passing notice. We may well begin with

Ampelopsis Veitchii.—Of this hardy, valuable, and peculiarly graceful variety of Virginia Creeper, over 1000 plants are grown from 2 to 3 feet in height, established in pots.

The Golden Elder, *Sambucus nigra* var. *aurea*.—Leaves of a rich golden hue, making it very effective when planted amongst other shrubs. A round-leaved variety of Laurel, aptly called *rotundifolia*, deserves mention as an acquisition. It is not yet very common, but would appear to be a very desirable kind. What may be well described as one of the finest hardy deciduous plants grown, is *Hydrangea paniculata grandiflora*, a low growing shrub, covered with its pyramidal panicles of large white flowers.

Golden Yews impart quite an air of attractiveness when viewed in contrast with other Conifers of more sober hues. Adjacent to their Chiswick nursery, and near to the Acton Green station of the District Railway Company, Messrs. Fromow have a plot of ground which is used principally for striking young cuttings of evergreen shrubs, such as *Euonymus*, *Aucubas*, *Laurels*, *Privet*, &c., and for various kinds of hardy climbers, and then sent to the other nurseries for growing on. There also may be seen a large stock of *Ivies*—green and variegated—in pots, for immediate use. There are some thousands of small shrubs grown here for filling London window boxes for the autumn season; already preparations are being made for the commencement of this work. To meet the requirements of a rapidly extending business a substantial block of buildings has been erected at Chiswick, at some considerable cost, for the purposes of seed and bulb stores, offices, &c. 7. B.

PERENNIAL SUNFLOWERS.

DURING the months of August and September perennial Sunflowers ought to be amongst the most conspicuous ornaments of herbaceous borders. After collecting and testing about twenty species, I have come to the conclusion that all the forms worth retaining in ordinary collections, where decoration is the chief object, are included in six or seven species. Nearly or quite all of these do best when replanted every spring. This should be done when the green shoots are just appearing above the ground. The soil should be prepared, rich and well pulverised; and about half-a-dozen well rooted shoots, more or less, planted in an open but sheltered place, and never allowed to flag from drought. If not too large or crowded the plants may be left for a second year, but the flowers are not so fine as the first, and after the second nearly all kinds degenerate rapidly. The kinds I recommend are—

1. *Helianthus decapetalus*.—The typical form of this is one of the earliest to flower, being fully out by the end of July. It grows about 5 feet high, and the flowers are many, but not large. It is, however, far surpassed as an ornament by its garden variety, *H. multiflorus*, a very well known plant, easily becoming double, and often producing double and single flowers on the same plant. Its forms of doubling are also various, but the large flowered single forms are the finest. Any one who carefully examines the botanical characters may observe that in spite of the great difference in appearance and size of flower and leaf, *H. multiflorus* is identical in species with *H. decapetalus*.

2. *H. rigidus*.—The best of all the Sunflowers is a month late this year in flowering. This plant is now in nearly every garden. I do not know whether a perfectly double form of it has yet been grown, but I expect to have one in a year or two, as one of my plants, quite single three years ago, has been annually adding another row of rays, and has now very little disc left.

3. *H. latiflorus*.—I have had some difficulty in identifying this plant. The living collection at Kew, which I examined a week ago, did not help me, as the plant marked *H. latiflorus* had not then even a bud visible, and was so like *H. rigidus* in leaf and habit that I could not distinguish it; but Asa Gray tells us that it "resembles tall forms of *H. rigidus*;" that the leaves are rather thinner, and less rigid; and the bracts of the involucre longer. I have a very beautiful Sunflower, which came to me some

years ago from Mr. W. Thomson, of Ipswich, as *H. doronicoides*. It is taller than *H. rigidus*; flowers fully a month later, and the bracts in all stages of bud meet over the disc, whilst in *H. rigidus* the disc is bare even in early bud. This answers in all respects to Asa Gray's *H. latiflorus*, except that he puts the plant under the heading of "disc yellow." He tells us, however, that he adopts the *H. latiflorus* of De Candolle, who describes the disc of this plant as "sub-atro-rubescens," which certainly cannot be translated "yellow." The disc of my plant is, in fact, less dark than that of *H. rigidus*, but is not yellow. I may mention that a plant which has become common in gardens, having been sold by London nurserymen as *H. latiflorus*, with a tall very branching habit, a black stalk, and many rather small flowers, does not bear the least resemblance to Asa Gray's *H. latiflorus*, nor can I identify it with any of his species. It is a good late garden plant, but, I suspect, a hybrid.

4. *H. doronicoides* is hardly inferior as an ornament to *H. rigidus*, and its flowering season comes between that plant and *H. latiflorus*. The flowers are quite as large as those of either of the others, but the disc is narrower, and the rays more upright. The height is about 7 feet. It increases very fast, and soon suffers from crowding. It has an elegant habit, but not a very long flowering season, lasting good for about a month. It ripens seed in abundance, from which, no doubt, varieties might be obtained, as well as hybrids. My plants vary in the shades of yellow.

5. *H. giganteus*.—Would be an excellent plant if 5 feet high, instead of 8 or 9. The flower, which is about 3 inches wide when stretched, is elegantly cupped, and the rays very regularly arranged, not unlike those of a *Doronicum*. Of course so tall a plant requires to be staked; but it branches very freely and produces flowers from half its height. All the kinds I have mentioned are exceedingly easy of cultivation, and with the attention I have advised, may be grown by any one to perfection. There are many other perennial Sunflowers, either of inferior merit or less enduring of ordinary English climate, or of cold soils I have adopted Asa Gray's names, and the synonyms and cross-naming will be found somewhat puzzling. But except *latiflorus*, of which the characters are rather obscure, all those I have described are very distinct. I may add that *H. atro-rubescens* of De Candolle (*Prodr. v. v.*, p. 580), and of *Bot. Mag.*, t. 2668, is the *H. rigidus* of to-day. The former name was given from the colour of the disc, the latter from the stiffness of the leaves. *C. Wolley Dod, Edge Hall, Malpas, Sept. 1.*

FUCHSIAS.

THE grand plants of these popular flowers seen at certain of the West of England shows, and occasionally at some in the South, do but serve to show that the art of specimen Fuchsia culture is still existent, although very localised, and it is to be feared even in those few favoured localities it is dying out. Really fine specimens Fuchsias are indeed rare at any shows, whilst in not a few exhibitions very good ones are never seen. Probably very many who grow Fuchsias have never seen such grand pyramids as may be witnessed at Trowbridge or Devizes, or as were shown the other day at Southampton, plants some 7 to 8 feet in height, and as perfectly formed massive outlines as it is possible to create. Till such are seen it is evident that very many have no conception of what a first-class Fuchsia is; hence, having no standard of quality, no ideal is aimed at, and specimens so-called are grown in a very perfunctory way.

Londoners never see a really good Fuchsia, but it may be well worthy the consideration of some of our exhibition authorities whether it is not worth while to offer show *habitués* wearied with the constant repetition of metropolitan show plants a chance to see what country growers can produce, by offering prizes such as shall encourage them to bring their finest plants to London, and show them to wondering and admiring multitudes.

We saw a single plant, the other day, at a country show, carrying off a prize value 5s., worth in beauty and quality alone more than the six plants which took

a 1st prize of £5 at South Kensington last month. If three classes, as at that show, could be made open to all exhibitors, three prizes to each, and of a value of not less than £40, no doubt the finest Fuchsias in the kingdom would be brought to compete. In offering prizes for these big things it must not be forgotten that they are big—indeed, very much so—each plant needing some 8 to 9 feet of head-room, and an area of 6 to 7 feet square. Hence it is evident that transit is costly. If, therefore, these grand plants are to be seen by Londoners, prizes of tempting value must be offered.

It is very evident to the most casual readers of flower show reports, as also to observers, that the very best kinds for the production of grand specimens, which will also travel well—that is, retain their flowers through a long journey—are comparatively limited in number, and include chiefly sorts raised by that Fuchsia veteran, Mr. J. Lye. Even if that famous grower had not been the pioneer of specimen Fuchsia culture as seen in the West, he would have merited the gratitude of every admirer of Fuchsias for his energy and success in producing so many new and fine kinds. Mr. Lye has given his labour to the production of sorts having good free-blooming habits rather than to the production of huge flowers, and the present race of show kinds is his worthy monument.

It would be a serious error were it assumed that Fuchsias are difficult to grow into these huge and perfect pyramids. It is hard enough, no doubt, to those who do not know, but it is not hard to learn how, and, once having learned, the art is simple enough. Employers would be delighted to see grand Fuchsias about their gardens, even if not grown for exhibition, but there are few who would not be as pleased to permit their gardeners to show the results of their cultural skill to the public.

We have seen for the present enough of hackneyed things, most of which may well be termed hothouse Khubarb and Cabbages, and shall hail with satisfaction a return to specimen flowering plants, amongst which none are more beautiful, few more graceful, than are really finely grown pyramid Fuchsias, *D.*

HARDY ORNAMENTAL SHRUBS.

CATALPA BUNGEI.—Although of somewhat rare occurrence in this country, yet where they thrive the various species of Catalpa are singularly beautiful, and well worthy of extensive culture, if even for decorative purposes alone. The charming effect produced by the ample foliage and large clusters of deliciously fragrant flowers of *C. Bungei* prompts me to recommend it as a first-class garden or lawn subject. Although not generally hardy in this country, and usually cut back during severe winters, it soon recovers, and throws out dense masses of new growth in spring. In Britain it is a dwarf shrub of 5 or 6 feet in height, with glabrous, generally entire, ovate, acuminate leaves. Here this singular plant seems quite at home planted in rather stiff loam and an open situation, and is at present covered with its racemose inflorescences of *Horse Chestnut*-like flowers—greenish-yellow with red spots.

C. BIGNONIODES.

The better known *C. bignonioides*, or Indian Bean, is another highly ornamental as well as useful timber tree (it is usually shrubby in this country), with large leaves, downy beneath, and pretty white flowers tinged with violet, and speckled with purple and yellow in the throat. The variety *aurata* is about one of the best golden-leaved shrubs that we remember having seen. Other desirable species are the Japanese plant, *C. Kämpferi*, a near ally of the latter, and *C. speciosa*, a finer and more rapid growing tree than *C. bignonioides*, and with larger flowers, fruit, and seed.

BERBERIS WALLICHIANA.

The second flowering of this lovely shrub puts me in mind of its value as a decorative plant. It is a remarkably handsome and very distinct species, with a compact easy habit and clear yellow flowers, which contrast strangely with the deep green tint of its evergreen foliage. As a wall plant we find it to do best, although several clumps planted out in the grounds for ornamental effect have given general satisfaction. This plant is known in not a few collections under the name of *B. Hookeri*, but as it was first discovered and sent home by Wallich, and ulti-

mately reintroduced by Sir Joseph Hooker, we think the latter name should be disused, and priority given to that of the finder. There is another variety under the name of *B. Jamesi*, which if not identical with Wallichii, is certainly so closely allied as to have quite puzzled us to point out a difference. Almost any quality of soil comes alike to these plants: light peat, sandy loam, or even vegetable refuse, growing them very successfully.

HYDRANGEA PANICULATA GRANDIFLORA, AND
II. THOMAS HOGG.

These are now well in bloom, and when grown under peculiar circumstances are decided improvements on the older and better known *H. hortensis*. The former, when well grown, is certainly a magnificent plant, with large panicles of pure white sterile flowers, which last for a considerable time, frequently from July till frosts set in. It is much improved by a yearly pruning, which not only induces good habit, but materially assists in enlarging the flower-clusters. It is readily propagated by cuttings of well-ripened wood from last season's growth. *H. Thomas Hogg* is a beautiful plant with pure white very handsome flowers; indeed, the great point in growing these plants should be to procure pure white flowers, for in the "greenery gallery" too often seen half their beauty is lost.

II. HORTENSIS.

The flowering of *H. hortensis* is this season unusually fine, and specially recommends this old-fashioned plant for extensive outdoor use in the more favourable parts of England. Planted in good bold masses, at a respectable distance from drives and walks, and backed up by taller-growing, dark-foliaged evergreens, this lovely plant has, during the flowering period especially, few equals for beauty of effect or general lasting qualities. *A. D. Webster.*

FROM A DUBLIN GARDEN.

A LITTLE gathering from an old garden of things not generally common. *Imbricis*, fruits of *Pœonia corallina*, from the steep Holue Island in the Bristol Channel, where only in Britain it grows wild, and where for company the odorous parent of our garden Leek, *Allium ameloprasum*, grows also. If these as yet unopen capsules of the *Pœonia* be placed on a mantelshelf or in a warm room they expand and form beautiful objects just as they do if left upon their parent plants. There is a *Pomegranate*-like richness of colour, the fertile black seeds contrasting so forcibly with the abortive crimson ones. *Lotus tetragonolobus* is a pretty crimson or yellow-flowered annual, its winged pods being peculiar, with its longish tap-root densely covered with tubercular growths, which are found in all Leguminous plants. The scarlet berries of *Sambucus racemosa* are a little *passé*, but still beautiful as seen against the sky, or in contrast with the soft dove-like *Magnolia* flowers in the sun.

Aster Ptarmicoides is quite a little gem amongst *Michaelmas Daisies* with its slender stems a foot high, covered with grassy leaves and terminated with milk-white flowers? I think it most beautiful as seen growing. It is very bright and useful for cutting, as its little rounded heads retain their colour well, as also do those of its larger cousin, *E. Olivierianum*.

When in flower the *Billiardiera longiflora* is not very winning, but now all our visitors are most enthusiastic in their admiration for its lovely purple fruits, so gracefully strung on leafy string-like shoots. It is hardy on a warm wall, and well deserves a place among rare or select shrubs. The "Carrot-bush," or "Hare's Ear," *Bupleurum fruticosum*, is now covered with golden-green umbels above its soft glaucous leaves, and so contrasts well with its relations, the *Eryngiums*. "Let it rain kissing comfits, hail Potatoes, and snow Eryngoes," as Shakespeare says, in allusion to the former custom of candying the roots of our common *Sca Holly*.

Here also are the little hedgehog-like fruits of the "Calvary Clover" (*Medicago echinus*), a hardy annual, or prettier if a few of its seeds be sown in a basket or hanging pan in greenhouse or window, so that its trailing shoots and red spotted leaves are seen to advantage. Its pods are curiously twisted up spirally into a ball, and being prickly along their outer margins gives them the "hedgehog" appearance whence, no doubt, their specific name. Having red or blood-like spots upon its leaves, of course

superstition has invented a legend to fit the spots; but the legend belongs to Palestine, and does not the plant belong to sunny Spain? *F. W. B.*

TERRESTRIAL ORCHIDS OF
SOUTH AFRICA.

(Continued from p. 208.)

SATYRIUM.—Sepals and petals nearly alike, forming together the five-parted lower lip of the flower. Labellum helmet or hood-shaped, with two short or long spurs, forming the upper lip of the flower. Natives of India, Madagascar, Tropical and South Africa, the majority of the species inhabiting the latter region. The flowers are usually numerous, in a dense spike, many of them being very handsome.

S. Atherstonei, Kchb. f.—A tall, slender species, with linear-lanceolate, three-ribbed leaves, and a rather dense spike, 2–3 inches long, of small flowers, which are described by various collectors as "white and yellow," "pure white," and "creamy-white;" the bracts are lanceolate acuminate, spreading or reflexed, two or three times as long as the flowers, and, judging from their appearance when dried, seem to be white, or cream coloured. This appears to be a very distinct and striking species; it is a native of Natal and the Transvaal, where it grows in swamps.

S. bracteatum, Thunb.—A small but pretty species, 4–6 inches high, with elliptic lower leaves, the upper ones decreasing in size, and becoming more ovate-lanceolate. Flower-spike 1½–2 inches long, many-flowered; bracts broadly ovate acuminate, spreading or reflexed; flowers small, white, with purple lines, spurs reduced to small pouches. A very neat little plant, growing in moist sandy places amongst grass, on the mountains of the Cape peninsula, flowering in October.

S. candidum, Lindl.—Stem 6–12 inches high, with two large roundish, or very broadly ovate radical leaves, and three to four large open obliquely cup-shaped stem sheaths. Flower-spike 3–6 inches long, many flowered, bracts elliptic acute, reflexed. Flowers about ½ inch in diameter, pure white, with an aromatic fragrance, spurs slender, an inch long. A beautiful species, which was first introduced by the renowned astronomer Sir John Herschel, about 1838, and was described from his plants. It grows on the Cape peninsula, in sandy boggy places, at low altitudes (50–100 feet), and flowers in Septem or October.

S. carneum, R. Br., *Bot. Mag.*, t. 1512; *Flore des Serres*, iv., t. 329; Reichenbach, *Flora Exotica*, t. 266.—A fine robust species, the lower leaves large and orbicular, those on the stem becoming more and more sheathing and cucullate. Spike elongating, bracts broad, pale green, edged with reddish. Flowers large and handsome, an inch or more in diameter, light rose-pink, with spurs an inch long. Mr. Bolus writes of this as follows:—"Less common than *S. coriifolium*, grows in moist sandy places, ascending the mountains up to 800 or 1000 feet; does not approach within 8 or 10 miles of Cape Town; has robust spikes of rose-pink flowers; soil, &c., nearly as in *S. coriifolium*" (which see). "The *Botanical Magazine* figure" of which the two other figures above quoted are exact copies) "represents a specimen much below the average beauty as it grows here, either wild or in cultivation. In gardens it grows and flowers freely." This appears to be a very handsome Orchid, and well worth cultivation.

S. coriifolium, Swartz, *Bot. Reg.*, t. 703; *Bot. Mag.*, t. 2172; Sweet, *Flora Gard.*, ii., t. 3.—Stem 12–30 inches high, robust, with 3–4 oblong-lanceolate acute, concave, leathery, deep green basal leaves, passing upwards into stem sheaths, and a many-flowered spike, 3–6 inches long, of rich yellow flowers, about an inch in diameter, suffused on the hood with deep orange, spurs 4 lines long. Bracts broadly ovate-lanceolate acute, reflexed. A fine handsome Orchid, which has this summer flowered at Kew, but did not appear to me to equal the wild specimens in beauty, concerning which point and its habitat Mr. Bolus writes as follows:—"The *Bot. Mag.* and *Bot. Reg.* figures of this species represent specimens much below the average of beauty as they grow here, either wild or in cultivation. It is one of the commonest Orchids near Cape Town; it grows on moist sandy downs between Table Bay and False Bay, and has an unusually long flowering season, say from September 10 to November 10. It reaches a

height of 24 to 30 inches, with spikes of brilliant orange or flame-coloured flowers; the tubers in their native soil are in a constant state of moisture from about May 15 to September 15, when they gradually dry, and become very dry between November and April, when there are usually only occasional showers." The stem and sheaths of the leaves are sometimes spotted with purple-brown.

S. erectum, Swartz (*S. pustulatum*, Lindl., *Bot. Reg.*, vol. xxvi., t. 18).—Stem 8–18 inches high, with two roundish radical leaves 2–4 inches long, 1½–3½ inches broad, several stem-sheaths, and a rather dense flower-spike, 3–6 inches long. Bracts broadly lanceolate acute, reflexed. Flowers ¾ inch in diameter, rose-pink dotted with darker, spurs 4 lines long, galea with an obtuse recurved or erect apex. A showy species, growing in clay soil, which becomes baked hard by the sun, in the south-western part of the Cape Colony, and extending eastwards as far as the district of Albany; it flowers in October. Mr. Bolus writes of it, that it "grows to twice the size of the figure in the *Botanical Register*, in the warmer inland country, and stiffer soil. Flowers rose and spotted, handsome." Lindley writes of it:—"The flowers are of a deep clear rose colour, melting into white, and richly spotted with purple in the throat; they smell like sweet vernal-grass. I know no Orchidaceous plant prettier than this."

S. Hallackii, Bolus.—A tall, robust plant with leafy stem; leaves broadly lanceolate or linear-oblong acute, the lower ones 5–6 inches long, the upper gradually smaller, and cucullately sheathing. Flower-spike dense 3–6 inches long; bracts ovate-lanceolate acute, reflexed as the flowers open. Flowers nearly ½ inch in diameter, bright rose, spurs 4 lines long, slender. A fine and handsome plant, growing in moist sandy places, near Port Elizabeth, Knysna, Zeeloo valley, &c.; flowering in December and January.

S. longicula, Lindl. (= *S. maculatum*, Lindl.).—In habit and general appearance this much resembles *S. erectum*, but is at once distinguished by its much longer ovaries and spurs, the latter being a full inch long, and exceeding the ovaries a little. The flowers are white, tinted with pink, the petals and labellum marked with rosy-purple spots, and the throat of the galea striate with purple. A rather fine species, that would seem to be tolerably common in several parts of Cape Colony, but I have no notes as to its habits, &c.

S. sphaerocarpum, Lindl.—About a foot high, lower leaves (2–3) elliptic-oblong obtuse, upper ones more or less sheathing. Flower-spike 3–5 inches long; bracts broadly ovate-lanceolate acuminate, reflexed; flowers ¾ inch in diameter, white pencilled with pink; spurs 4–6 lines long, longer than the short ovary, which becomes ellipsoidal in fruit. A native of Natal and the eastern districts of Cape Colony, ascending to an altitude of 800 feet, flowering from October to December, and appears to be a very ornamental species.

SCHIZODIUM.

Dorsal sepal helmet-shaped, with one spur, lateral sepals channelled, spreading. Petals small, unequally 2-lobed or twisted, attached to the column. Labellum free, narrow, lanceolate acuminate, or broader and more or less undulate, constricted at the base.

A genus of but few species, consisting of small plants, remarkable for their rigid, very flexuose stems and small, radical leaves; all are natives of South Africa. The flowers are not numerous or remarkably showy, but the two following species appear to me worthy of cultivation.

S. flexuosum, Lindl.—Stem flexuose, 8–12 inches high, slender. Radical leaves about an inch long, stalked, elliptic obtuse, stem leaves coriaceous, oblong acute, concave. Spike few flowered. Flowers ¾ inch in diameter, white, with a deep golden-yellow labellum spotted with dark purple-brown. This grows in moist sandy or clayey soil near Paarl, &c., at low elevations, in a warmer climate than the Cape peninsula species enjoy. The flowers are not numerous, but of fair size and open, and in a mass would be very effective. It flowers in September and October.

S. rigidum, Lindl.—Dwarfier than *S. flexuosum*, and with smaller leaves. The flowers are about ¾ inch in expanse, and are said to be "delicate pink-spotted (or spotted with brown);" the dorsal sepal has a horizontal or upwardly curved spur 4–6 lines long, the lateral sepals are narrow

linear-oblong, and the lip arched, narrow, lanceolate acuminate. It grows in sandy places near Cape Town at a very slight elevation above sea-level, and flowers in August. *N. E. Brown, Kew.*
(To be continued.)

NATURE IN GARDENS.

As one whose views are somewhat at variance with those of "J. D. D.," as set forth in your issue of August 22, permit me a brief space in order to examine what appears to be the drift of his contentions. Unfortunately it is not given to mortals—and particularly to that section of mortals whose lot is cast in the world of gardening—to see with that intensely critical (hypercritical, I had almost written) vision which characterises the remarks of "J. D. D." What is true in Art must be very dear to every true lover of Nature; as Nature must also be the true basis upon which Art is built. But is it not somewhat too sweeping to describe as worse than savagery all that does not accord with "J. D. D.'s" views of the beautiful?

I fear I shall shock the susceptibilities of those who think with your correspondent when I aver that I can trace beauty in the curves of a well formed gravel walk quite as distinctly as in the circuitous windings of some silvery stream, though, of course, in a different degree. Then as to geometrical bedding, which seems to come in for a large share of declamation. I do not intend to pose as an apologist for this system or style of bedding; although from my own knowledge it is a style which affords much pleasure to thousands of persons for whom the vivid colour of the Poppy, or the brief glories of the Columbine have no charms. True, they may be incapable of criticising either what is truly artistic or truly natural, from the high pinnacle from which "J. D. D." evidently writes; but who shall say that their enjoyment is one whit the less real because of this inability? Fashion, no doubt, plays strange freaks with other things besides costumes; but to declare that a well arranged bed of this description is a hideous disfigurement because it happens to be found where "J. D. D." would have his flowers, is, to say the least of it, using adjectives somewhat indiscriminately.

I am afraid I can hardly lay sufficient claim to good taste, to acquiesce in the statement that the colouring of these beds is a "disgrace to civilised beings," and if that great potentate, common sense, condemns everything which it is necessary to keep under glass during the winter, he is a more arbitrary being than I thought him. But may it not prove, upon close examination, that this is hardly in strict accordance with the fact? What, for instance, would be the use of a greenhouse for such plants as these:—*Herniarias*, *Antennarias*, *Sedums*, *Sempervivums*, *Stellarias*, *Spargula*, *Mentha*, *Achilleas*, *Pyrethrums*, and a host of other good things? (The hardy kinds, are, of course, meant.) Let us have the beautiful things mentioned by "J. D. D." by all means, but do not ask us to discard every plant whose flowers are not as striking as a Poppy or a Parrot Tulip. If we must follow Nature implicitly, let us at least be consistent, and to the glowing picture of scrubberies with all their splendour of fallen leaves and glorious disorder let us return—to the simple style of dress favoured by our forefather before the Fall, so that all may be in delightful harmony. Cowper in one of his beautiful poems says:—

"But 'tis not timber, lead, and stone,
An architect requires alone
To finish a fine building—
The palace were but half complete
If he could possibly forget
The carving and the gilding."

And as the carving and gilding are essential to the palace, so also are neatness and order in our gardens, as well as those hundred and one little touches of Art which reclaim the waste to make it blossom as the Rose, or even the Poppy. By Art, however, I do not mean the distorted trees one sometimes sees clipped into the supposed resemblance of some extinct mammalian monster, or the broken glass, powdered spar, red brick, and coal-slack, considered by some to be necessary adjuncts to the flower garden, but that Art which removes the superabundant branch from the tree in order that he may "mend Nature," or the disposing of a bit of colour here, and a striking form yonder, the enlivening of this, or the subduing of that; let us have the wilderness also, but not in the garden, I beseech you, my masters—not in the garden, but where old Mother Nature may revel undisturbed.
H. L., Leamington.

THE SEED-VESSELS OF ORCHIDS.

THE publication of our previous illustrations attracted so much attention to a hitherto neglected field that we now lay before the reader further

sent the midribs and the combined edges of the three constituent carpels which constitute the fruit. Another feature worth notice is the retention of the column (see fig. 70), which even becomes thickened in some cases after fertilisation. The segments of the perianth also, in some cases remain attached to the fruit, while in others it not only persists, but enlarges in size, and assumes a more or less leafy condition, just as the sepals of the *Heliborus niger*, or Christmas Rose, often do after flowering. It is reasonable to suppose that this resumption of the leafy character may facilitate the development of the seed by ensuring a further supply of nutriment. Another point worth attention is the manner in which these flowers become fertilised in our hothouses. Some are purposely impregnated artificially; but others are fertilised, either by insects or by close fertilisation, in which the pollen of any particular flower impregnates the stigma of the same flower. This is a subject which has excited a great deal of attention on the part of Mr. Darwin, Professor Meehan, the Rev. George Henslow, and many others. The last-named observer in particular points out the frequency with which self or close-fertilisation may occur without injury to or deterioration of the seedling; but however true this may be in individual cases, it does not invalidate Darwin's doctrine, that an occasional cross is necessary for the prolonged vitality or perpetuation of the species. Latterly Mr. H. O. Forbes has added considerably to the number of Orchids which are known to be close-fertilised, and to those in which the structure is such that access of insects is prevented, and close-fertilisation must ensue or none at all. In illustration of this subject we may cite one or two extracts from Mr. Forbes' paper in the *Journal of the Linnæan Society*, lately issued:—

"One of the prettiest and commonest Orchids of the neighbourhood [in Java] was the pure white *Dendrobium cruceumatum*, Swartz, of which I have examined thousands of flowers; scarcely one in eighty ever sets a seed-capsule.

"*Calanthe veratrifolia* produces quite a dense head of elegant white flowers, but the number of these that become fertilised is in enormous disproportion to those that fall off barren. I have examined plants in numerous situations, on heights amid the dense forest, as well as in open places. I have studied them low down, both in sun and in shade, and I have invariably found that a very small proportion of flowers produce fruit. Generally the pollinia are found in the anther after the fall of the flower, but they are often absent without any pollen being left in return on the stigma.

"In five different plants (taken at random from my note-book), out of 360 flowers 109 were withered with intact anthers, or had lost their pollinia, and were unfertilised; 245 had fallen off; six only had produced capsules. . . .

"My first acquaintance with *Phaius Blumei* was in a specimen which had been under cultivation for about a year, but I have since found numerous examples, in a state of Nature, presenting the same appearance in every respect.

"Here, then, we have an Orchid presenting every attraction to insects to pay the flower at least a first visit (when they would find no nectar), a large showy flower, with some perfume which is not disagreeable, a distinct nectary, an attractive labellum embracing the column, yet self-fertilised, and rarely, if ever, anything else. The above account of *Phaius Blumei* would perfectly suit all the species that I have examined growing in their wild state or in cultivation. . . .

"One of the most singular Orchids that has come under my observation is of a species unknown to me, and nearly related, if not belonging, to the genus *Chryso-glossum*. It carries the contrivances for self-fertilisation to the utmost limit. It is terrestrial, has long pointed fleshy leaves, and produces a spike about 1 foot long, with alternate flowers at short intervals. It is not only self-fertilised, but cleistogamous. I first found it at a height of 3000 feet, where I observed that all the flowers were fertilised, but to all appearance none had ever opened. I brought several plants home and planted them in pots, where they at length threw out new spikes, which appeared to be perfectly healthy. The flowers remained as buds nearly two weeks, during which the ovary daily increased in size; then they shrivelled and dried up, while the ovary enlarged to its full size. On opening it I found it to be well filled with seeds. The labellum is beautifully marked with lines of purple-carmine; the column with carmine and yellow; but no insect could ever be fascinated and allured by its painted whorls. . . .

"The great family of the *Vandees*, however, seem rarely, if ever, to be self-fertilised; they are either cross-fertilised, or altogether fail to set seed capsules. Terrestrial Orchids seem more liable to self-fertilisation than epiphytic species. . . .

FIG. 70.—SEED-VESSEL OF EPIDENDRUM NOCTURNUM.

FIG. 71.—EPIDENDRUM VENOSALE: SEED VESSEL AND FECONDUE.

illustrations taken from specimens in the collections of the Royal Gardens, Kew, of Sir Trevor Lawrence, and of Sir Charles Strickland. The drawings are for the most part sufficiently illustrative to obviate the necessity for detailed description. One or two points, however, demand explanation. The ribs which vary so greatly in degree of prominence repre-

"In the foregoing pages I have drawn attention to the facts—(1) that a number of Orchids with showy flowers never set any seed capsules; and (2) have given additional examples to those mentioned by Mr. Darwin of Orchids of different genera being invariably self-fertilised, and in many cases possible to be other than self-fertilised; I have also described the mechanism of their fertilisation, such as occurs in the species of *Phaius*, in *P. pathoglottis plicata*, and other species of the genus, and especially in *Arundina speciosa*. *Eria albido-tomentosa* and *E. javensis*, I have never found otherwise than self-fertilised; and a species belonging to a genus near to *Chrysoglossum* I have shown to be cleistogamous. The observations above given would seem, therefore, to support the Rev. G. Henslow's conclusions so ably given in his *Memoir on the Self-fertilisation of Plants*, already published in the *Transactions of this Society* (n. s., vol. i., pp. 317—398, pl. 46, 1879)."

FRUIT NOTES.

TRAINED PYRAMIDAL FRUIT TREES.—TRAINING AND PRUNING.—Apple and Pear trees of the above form grafted on the dwarfing stocks are now very handsome in some gardens, and are also bearing very freely where they have been well trained. But the trees are not always well trained. They are sometimes very badly managed, and the fruit produced is consequently of poor quality. Some trees are easily trained into the pyramid form, indeed they take almost naturally to it; others are not so easily managed. It is now a good time to prune them. Some people pinch and cut the young wood too early in the season, with the result that a later growth is made, which is not satisfactory, and buds start into growth that ought not to do so. If the summer pruning, as it is termed, is not done until the end of August or September, the buds do not start to grow, or at least, if they do, it would be to a very limited extent. The blossom-buds form well, and all the buds plump up better when the superfluous growths are removed. The trees have a tendency to become too much crowded with wood; and it requires some judgment on the part of the cultivator to remove what is not required. But even a skilled operator will know better how much wood ought to be removed when the trees are in leaf than they would in winter when all the leaves have fallen. The fruit produced near the centre of a pyramid or bush tree is not of a large size or good quality, unless the outer branches are cut out to admit light and air to them. If the pruning is rightly performed now, the trees will take the form desired by the operator next season. The young wood must be shortened less or more according to the way the tree is furnished. If there is plenty of bearing wood, the ends should just be cut off the young wood, but if the bearing wood is not sufficient to furnish the tree the young wood must be well shortened in proportion, and in cutting it is necessary to observe that the terminal bud left will grow into an open space, rather than into a part of the tree where it is not needed. Many persons with a limited experience do not take any notice of this, and cut away without any thought of the direction in which the main or terminal growth will develop itself. Sometimes I have pruned the trees when the fruit has been gathered, at other times before. Not infrequently the young wood both on Apple and Pear trees is so dense and covered with leafage, that the fruit is not sufficiently exposed to the sun until it has been removed. J. Douglas.

CHERRIES UNDER GLASS.

The Cherry tree as a standard in the open air is seldom found to be satisfactory, the bloom being so frequently destroyed by late spring frost. And even in very favourable seasons, when a crop has been so far secured, there is in most localities a great difficulty in protecting it from the ravages of birds. This is more easily accomplished, it is true, when the trees are trained to walls, but even when grown in this form the crop frequently suffers from the effects of inclement weather in spring. I am alluding to the varieties of the sweet Cherry. As regards the Morello variety, it is different; it blooms later, and it is possible that its flowers can resist the spring frosts better than the flowers of the sweet sorts, at all events the crop of Morellos seldom altogether fails, and birds are less likely to attack them, although they will occasionally do so, if the fruit is allowed to hang upon the trees after it is quite ripe, when the protection of a net is found necessary. But, as regards the varieties of the sweet Cherry, which are so delicious, and so generally esteemed as

a fruit, they are without doubt well worthy of the protection of glass, and as your correspondent "Cerasus" says, "Why not have Cherry-houses as well as Peach-houses?"

As has been frequently shown, the Cherry may, like

FIG. 72.—SEED VESSEL OF PHAIUS WALLICHI.

FIG. 73.—SEED VESSEL OF PHAIUS GRANDIFOLIUS.

the Peach and other fruit trees, be grown in pots under glass, but to successfully cultivate fruit trees in pots, unremitting attention in the matter of watering, &c., is necessary. And they are found to be, at least, equally successfully grown, and with less trouble, when the trees are planted out, in properly prepared borders or beds of soil.

I have had some experience in growing the Cherry, as well as the Peach, &c., according to both methods, but must admit that I greatly prefer the latter, that is, planting out the trees.

In a large unheated span-roofed structure, at one time under my charge, the finest varieties of the sweet Cherry, together with Peaches and Nectarines, were planted out and successfully grown in the form of standards. The various varieties of the Cherry bore freely, while from similar trees of the same varieties planted in the open air, little or no fruit could be obtained.

The Peach and Nectarine trees in the form of standards and pyramids bore also good crops of fruit, but this fruit was always found to be inferior to the fruit of similar varieties planted out in so in all respects similar structure, where the trees instead of being in the form of standards, were trained under the roof at a distance of 20 inches from the glass.

This circumstance leads me to think that Cherry trees trained in this fashion will be likely to produce finer fruit than that produced by trees in the bush or standard form. The Cherry, whether out-of-doors or under glass, frequently suffers severely from the attacks of the black or Cherry-fly, and the trees trained in the form recommended will be found to be more readily freed from this pest by fumigation or the use of the syringe than when grown in the bush form, whether under glass or in the open air.

It will be admitted that if any of our hardy fruits are deserving of increased attention it is the Cherry, which has even in some respects the advantage of the Peach and the Nectarine, inasmuch as the fruit of the Cherry when quite ripe will not fall from the trees, as is the case with the two former fruits, but will continue to hang upon the trees in good condition for a length of time. And it is somewhat strange to think that this delicious fruit is not more generally grown in the form referred to than appears to be the case. P. G.

FLAVOUR IN PEARS.

It is hard to see how a classification by flavour is to be effected, No doubt Williams' Bon Chrétien, Seckle, Tillington, Beurré d'Arenberg, Gansel's Bergamot, and others, are quite distinct, as regards flavour, from the general run of Pears, and in most cases from each other. But how is their flavour to be termed? There is nothing exactly like. Musky is an example, and has the merit of antiquity, being used by Parkinson. BATTERY is tantamount to mellow, and vinous to very juicy. The flavour of such Pears as the above is known to everybody who has any knowledge of pomology, and must be enumerated in any description to distinguish them from the "reasonable faire and good Peares" which have no such relish. It would be impossible to get three Pears, differing in outward appearance and time of ripening, that could be classed together as regards flavour, except under such epithets as melting, which if a Pear is not, it is hardly worth growing. The best method of classification is, after all, the time of ripening. The peculiarities in this respect, and long-keeping qualities, could be well studied if exhibitors, and those who really desire to make the report of stable value, would continue to send collections of ripe fruit to the Fruit Committee throughout the winter, and not only to the Congress. The influence of stock on scion ought to form an especial feature of utility to the Congress, and the facts educed, together with the influences of soil on quality, put into a connected and readable chapter. C. A. M. C.

FRUIT GROWING AND JAM MAKING.

If the men who farm the broad acres of England had been naturally the veriest dullards to their own interests the world ever saw, it might have been supposed that, with the never-ending advice vouchsafed to them, they would have been able to see their way as to what they should do to make the land pay. The most amazing thing connected with the subject is that one rarely meets with a fairly intelligent individual, no matter what his calling or occupation may be, even if he does not know a clod-crusher from a winnowing-machine, or is unable to distinguish the difference between a crop of Mangels and another of Turnips, still he considers himself quite capable of telling you what the farmers ought to do with a view to their own benefit and the prosperity of the country. If corn, the staple commodity in all countries where agricul-

ture flourishes, does not pay, they are children for their stupidity in not giving up corn growing, and confining their attention to live stock. If foreign competition, and cattle disease, make this a risky proceeding, they are reminded that they should cultivate vegetables and fruit. Yet the would-be monitors never seem to have given a thought as to the comparatively little that can be done in this latter direction before the limits of production exceeding demand are reached. If proof of this were wanting it is now presented in a way that admits of no mistake by what has followed the extension of fruit culture in a single district in Kent, and about Swanley, St. Mary Cray, and the surrounding parts, where, in addition to the Apples, Pears, Plums, and Cherries that have long been grown, Strawberry and Raspberry cultivation of late years have been largely increased, with the result that prices have been so reduced that after the cost of production is deducted the profits remaining are insufficient. To meet this state of matters one of the largest growers, Mr. Wood, of Woodlands Farm, Crockenhill, Swanley, has this year started an extensive factory adjacent to Swanley station, so as to be able to convert the fruit he grows into jam, in place of, as hitherto, like other growers, having to dispose of it to the jam-makers. The structure is built of bricks, and is a very good-looking substantial erection; it was completed during the spring of this year, and the requisite plant put in ready to commence operations when the earliest fruit, Strawberries, &c., were ripe.

The boiling-house is a large roomy place on the ground floor, with fifteen copper boilers ranged in line on one side. The process is effected by steam, to provide which a 60-horse power boiler has been put down in a shed adjoining the boiling-house; from this the main pipes conveying the steam are carried along under where the boilers are placed. The arrangement is such that a branch pipe connected with the main can easily be attached to, or detached from, each of the boilers; these branch pipes are provided with taps, so that the volume of steam can be regulated at will. The sugar is first put in the boilers with a little water to liquify it; the steam is then turned on, and in about two minutes it is reduced to a clear, transparent syrup; during this time it is kept stirred, the fruit is then put in, and in a few seconds is boiling furiously; it is kept stirred until boiled sufficiently with a long flat utensil of polished wood, in shape like the paddle of a canoe, with which the attendant on each boiler is provided. When boiled sufficiently it is removed to another big room adjoining, where it is put in the jars; after cooling it is sent up to the second store, where making-up and labelling is done. About seventy hands are employed, most of them young women, who do the lighter work of picking the fruit, and making it up. The boiling is done by men, under an experienced foreman.

It is quick work all through. Plums were the fruit in hand on the day of my visit; they were gathered that morning, and came to hand covered with their blue bloom, and in fifteen minutes from the time the sugar was put in the boiler the steam was shut off, and the boiling completed. As soon as cool enough the jam was put in the jars, allowed to stand a short time, and then the capsules, made of vegetable parchment, were put on, and tied down as tight as the head of a drum, and the labels denoting the kind of fruit the jars contained were attached; with this the process was complete, and the jam ready for packing, to be sent away the same evening. The packing-shed attached to the main building occupies a large space, admitting of the carts and waggons being loaded and unloaded under cover.

Strawberries, Raspberries, Gooseberries, Red Currants, Black Currants, Green Gages, Apricots, Damsons, and coloured Plums, are each preserved separately. No mixtures of any kind are made except one of Apples and Plums, and the household jam, which is a mixture of whatever fruits are ripe at the same time. The sugar used is all of the best quality, superfine Dutch crushed, and American granulated. The sizes of the jars are 14 lb., 7 lb., and 4 lb., glazed earthenware; 14 lb. and 7 lb. tins, 3 lb., 2 lb., and 1 lb. glass jars. Jelly of different kinds is put in 1 lb., $\frac{1}{2}$ lb., and $\frac{1}{4}$ lb. glasses. Nothing in its way could be finer than the different kinds of fruit, as seen in the glass jars, with much of it showing its natural form, so different from the indescribable "smash" often met with. The jelly is as clear as the "moulds" turned out by a first-class confectioner. A large amount of fruit has been got through—260 tons of

jam were made in July, and only something less in August, and the work will be continued until the last of the Plums are over.

Mr. Wood, besides the Swanley Farm, has two others—Greatness Farm, at Sevenoaks; and Horn Park Farm, Lee. Altogether he has 250 acres devoted to the various kinds of fruit. All the fruit that has been converted into jam and jelly during the summer has been his own growing except a few Plums, and in addition 70 tons of Strawberries were sold. Nineteen tons of Raspberries were gathered in one day. Even those who have some knowledge of fruit growing will have a difficulty in fully realising the amount of labour that has to be employed in the gathering alone when such figures as the above are taken into account.

Much is often said, and possibly not without some cause, about the mysterious materials of which some jam is composed, and about the stale half-rotten state of the fruit when it reaches the makers; but here, as already said, every kind is kept separate except the two mixtures named. The superiority of jam when made, as here, from fruit fresh gathered and virtually grown on the spot, is so obvious as to need no comment. The whole process is carried out with scrupulous cleanliness; the floor of the boiling house is composed of channelled vitrified bricks laid in concrete, and is daily scrubbed and flushed with water. Mr. Wood's undertaking is a move in the right direction, which is to bring the producer and the consumer nearer together, which is a matter of vital importance in these days when the cultivators of the land are under a cloud of depression, through which unfortunately there is no break discernible. A word may be said about the trade mark on the labels of the jars of jam—a traction engine. This has some connection with a successful enterprise Mr. Wood embarked in some years ago, and still continues. When cultivation by steam came into vogue he began with several engines to plough and scarify for others in addition to what he required in this way himself. The business has gone on extending until he has now between thirty and forty of these engines, which besides cultivating the land may be seen on the roads in the surrounding district, hauling manure, gravel for the roads, builders' materials, or anything of a like description. T. B.

Orchid Notes and Gleanings.

CYRTOPODIUM PUNCTATUM.

Pseudobulbs 3 feet high. Leaves sheathing, broadly lanceolate, acuminate. Flowers very numerous, in erect branching panicles, at the base of which are lanceolate undulate bracts marked like the sepals, and producing an appearance as if they were detached sepals. Each flower is about 2 inches across; sepals greenish, undulate, marked with narrow crowded transverse brown blotches; petals of like form, yellow; lip 3-lobed, lateral lobes erect, rounded, chocolate-brown, anterior lobe rounded, yellow, with marginal brown spots. A specimen in the collection of E. J. Partington, Esq., Heaton House, Cheshunt, 4 feet high, bore a panicle containing 175 expanded flowers. *Orchid Album*, t. 202.

LELIA CRISPA.

On page 214 of August 15, I see "B. T. L." finds this plant "not easy to manage." I cannot agree with this, and as it is one of my pet Orchids, permit me to defend it. Treat the plant like *L. purpurata* and it will thrive. It has always been, to my mind, a regularly conducted species as to its flowering. We count on its blooms at a stated time almost as if it were a calendar point. *De B. Crayshaw*.

EPIDENDRUM PRISMATOCARPUM.

I have lately had a plant of this in bloom (of which I sent you a spike with forty blooms), with twelve spikes, carrying respectively 24, 26, 30, 31, 33, 35, 39, 40, 41, 44, 41, and 43 blooms. I think "B. T. L." underrates this fine species when he says, at page 295, it "bears from eighteen to twenty flowers." My plant, though a very fine one, has narrow lips, yet more than one good judge has pronounced it to be the finest they ever saw. I hope "B. T. L." will pardon a correction, as I feel sure

he would not like to misrepresent Orchids. *De B. Crayshaw*.

ONCIDIUM ROGERSI.

Mr. Lee has found out how to grow this plant. Tie it down to a board, hang it up horizontally near the glass, and keep it wet. So treated it grows well, and flowers abundantly. It will not do either freely if treated otherwise.

MASDEVALLIA CHIMERA.

Accompanying a figure of this remarkable species in the *Orchid Album*, t. 203, we find the following suggestive hints as to the culture:—"We find the plants of this group of *Masdevallias* to thrive best in baskets, or in a kind of boat-shaped arrangement, made after the manner of a basket, with a semi-circular bottom and wooden ends, as their flower-spikes often protrude between the woodwork; it is indeed natural to some of the species to bloom in this way, which also shows the flowers off to better advantage. The basket should not be large—just a little larger than the plant; and as a compost, rough fibrous peat on a little sphagnum moss seems to suit them, with sufficient drainage to admit of a good supply of water being given in their growing season. Even when at rest the material should be kept moist, as they have no thick fleshy pseudobulbs to support them, which makes them impatient of drought. They thrive best suspended from the roof, but shaded from the sun, as the leaves are apt to get scorched and turn yellow if exposed. The cool *Odontoglossum*-house suits them, but we keep ours in the warmest part of it. They are propagated by dividing the plant when in vigorous health. It is very necessary to keep these plants free from insects."

ODONTOGLOSSUM KRAMERI.

This species, described by Professor Reichenbach in our columns in 1868, is figured in the last number of the *Illustration Horticole*, t. 562. The flowers are borne in racemes from the base of the roundish two-edged pseudobulb. Each flower is flatish, $1\frac{1}{2}$ inch across, with white oblong segments; lip narrow at the base, dilated in front, with a reniform blade, white, flushed with pink. It is a native of Costa Rica.

HOYA GRIFFITHII, HOOK. F.*

THIS very fine species was sent to me (through the Editor of the *Gardener's Chronicle*), in July, 1879, by Mr. W. Swan, of Fallowfield, Manchester, for a name. At that time it was undescribed, and it was intended to figure it in these columns, but a good specimen was not forthcoming, and now a specimen has been again received from the same source, and will be figured in the *Botanical Magazine*; but as the plate may not appear for some time, I take the opportunity of calling attention to it here, as it is one of the finest species in the genus. It is a native of Khasia, in North-eastern India, where it was originally discovered by Griffith, and afterwards collected there at an altitude of 2000 feet, by Sir Joseph Hooker. Concerning the plant in cultivation, Mr. Swan, writing in 1879, states that it "was sent with a quantity of Orchids, &c., about three years ago, to Mr. Leach, from "Northern India."

Hoya Griffithii is a large climbing species, with oblong leaves $3\frac{1}{2}$ –6 inches long, $\frac{3}{4}$ –1 inch broad, narrowed to an acuminate apex and an acute base, glabrous, as is the entire plant, bright green above, paler beneath. Peduncles stout, 2 inches long; pedicels $1\frac{1}{2}$ inch long, stout. Calyx segments spreading, green, $\frac{3}{4}$ inch long, 2–2½ lines broad, oblong obtuse, concave from the margins, being strongly incurved. Corolla when expanded about $1\frac{1}{2}$ inch in diameter, pale reddish outside, cream-coloured, tinted with the same reddish hue inside; the lobes are broadly ovate, acute. Corona wax-like, the segments elliptic in outline as seen from above, with ascending subulate apices, the sides are perpendicular with the upper edge overhanging at the back, and beneath at the base they have a Δ -shaped notch.

This species is at once well distinguished by its unusually large calyx segments. The rather delicate red tint of the corolla is somewhat difficult to describe intelligibly, but perhaps the nearest well-known colour-tint is that of red blotting-paper diluted. *N. E. Brown*.

* *Hoya Griffithii*, Hook. f., in *Hook. Flora Indica*, vol. iv. p. 59.

Florists' Flowers.

THE GLADIOLUS.

WE were again favoured with a very fine display of this beautiful autumn flower at the Crystal Palace exhibition on September 4. The amateur growers did not come out in great numbers, but those who did exhibit had reason to be proud of their productions. Perhaps the best dozen spikes ever exhibited by an amateur were those that easily gained the first prize to the Rev. H. H. D'Ombrian. I question if it would have been possible to have picked a dozen such spikes out of the large trade collection adjoining. One spike of the good old variety, Meyerbeer, had thirteen open flowers on it. Murillo is superb; it is a fine variety, the flowers large in size, well formed, of a rich rose colour, flaked rose-crimson. Leander, soft pale lilac, a delicious contrast to the more richly coloured forms. Flamboyant, rich vermilion; Hesperide, pale salmon, densely striped rose-salmon. Besides the above, which were of great merit, the same exhibitor received a First-class Certificate for Rabout, a very fine seedling, of a distinct pale lilac colour, flamed purplish, a long spike with well formed flowers.

Messrs. Kelway, of Langport, exhibited some very distinct seedlings in their large collection. Three of them being awarded First-class Certificates, viz.:—Princess Maud, the best and most distinct of the trio; it has large flowers well placed on the spike, the colour is rose-purple, with a white line, or band of white, in the centre of each segment; it is also a white blotch on the lip. Dora Thorne, straw colour, with reddish flame and a reddish blotch on the lip. Lord R. Churchill, vermilion, with blotch of lake at the lower part of the throat.

The 1st prize in the large class was again won by Mr. Alex. A. Campbell, florist, Gourcock, N.B. The collection as a whole was inferior to that exhibited by him last year; but it contained some splendid spikes, mostly of the older French raised varieties. Indeed I was greatly surprised on comparing some of the older varieties, such as Meyerbeer, Horace Vernet, Celimene, Mons. Legouve, Norma, Orpheus, &c., which can be purchased at 6s. to 9s. each, with the new ones at from 6s. to 10s. each; and did not find any points in favour of the recent introductions. It is some satisfaction to intending cultivators to know that a good selection can be made at from 6s. to 12s. a dozen. In Mr. Campbell's collection I noted Marquis of Luthian, a variety raised in Scotland; it is of a rich lilac colour, has a very handsome spike, and so easily propagated that Mr. Campbell has increased his stock of it to 1600 bulbs. Ondine, a distinct white, with violet-purple blotch, is sold at 10s. a bulb; and Belladonna, which I marked as the best formed flowers with handsome spike, is sold at 1s. 6d. for good bulbs. This is all evidence that a good collection can be formed by those to whom even an extra shilling or two is an object. In looking over a collection such as this one naturally forms the different varieties into groups of allied colours, and I found amongst those comparatively cheap varieties ample material to produce seedlings of first-class merit. Murillo, for instance, which would have gained the premium as the best spike in the show, is one of the cheapest. Leda is in the same class, and very fine. Lullu, Lady Bridport, De Mirbel, and Orpheus are six cheap varieties that cannot be matched for quality amongst the best new ones of allied colours. Of the deep red, crimson, and scarlet shades Horace Vernet still stands first. Maréchal Bazaine is a distinct and striking kind—scarlet and white. Le Vesuve is not a large kind, but of dazzling brightness. Of the white or bluish-white kinds Ondine ought to be the parent of some grand white varieties if used as a pollen parent for crossing with Madame Desportes, Princess Mary of Cambridge, and Norma. It is now late to hybridise the flowers, but it would depend much upon the weather during the remainder of September and October; if it is dry and not too cold the seeds will ripen. In cold districts it is best to plant early where it is intended to obtain seeds from the plants. J. Douglas.

FRUITS UNDER GLASS.

THE EARLY VINERY.

EARLY forced Vines, such as were started last December and January, will by this time be in a fit condition to be pruned, and if the Vines are to be forced again the ensuing season, the sooner this operation is performed the better. If at any time doubt should exist as to the fitness of Vines to be pruned, it can at any time be readily removed by means of cutting back a growth or two on each Vine; if bleeding does not ensue, the pruning can safely be done. When this matter is completed, the cleaning of the Vines should be effected. This is an operation which in late years is considerably altered in practice, as formerly it was customary, generally speaking, to remove every particle of bark possible off the Vines, and then smear them over with mixtures composed of different ingredients, which in most instances, in the course of syringing when forcing was commenced, was washed off again. But now-a-days the method (very properly in my opinion) is nearly abolished, and is substituted by one more consonant with the requirements of Nature, by simply washing them with a brush, with a strong solution of soft-soap and water, merely removing the loose bark, and giving the Vines the benefit of the rest, for the purpose which was intended by Nature. In certain cases, as for instance where the Vines are infested with mealy-bug or thrips, more severe measures must of necessity be employed. The next operation demanding attention here will be the cleansing of the structure so as to free it from insect pests. This year, owing to the favourable nature of the season for the increase and diffusion of insects, the matter will need even more than ordinary care and attention. Firstly, the woodwork of the structure should be washed with strong soft-soap and water, and then be painted—painting is one of the best means to adopt under the circumstances. The walls also should be washed over with hot lime water, in which a little paraffin oil should be mixed. Subsequently take away one, two, or three inches off the surface of the borders, taking care not to injure more than possible the roots which abound there, because these, after the new material it is added, and the effect of forcing is felt, will speedily be excited into growth again, and become active feeders, the effect of having a congenial medium to work in. When the foregoing operations are completed, keep the house open, unless the weather is exceptionally severe, until the time arrives when forcing operations are to be commenced, which now-a-days, owing to the excellent means adopted for keeping late Grapes, need not be enforced before the beginning of December at the earliest. G. T. Miles, Wycombe Abbey.

The Hardy Fruit Garden.

WHERE a large area of ground is devoted to hardy fruit cultivation much attention will have to be given to the storing, and in some cases to the marketing of the fruit. It is no use storing away great quantities of early varieties of Apples or Pears; and Plums are more perishable still. All of these should be packed for market before they are over-ripe; the firmer they are packed the better they travel. It is much better to err on the safe side, by packing very firm, as the contents will always bear a journey best when the hampers are securely packed. Many varieties of the above will require going over almost every day, and picking off the largest and best each time. Last week we went over a large number of Plum trees (Victorias), and gathered all the largest and ripest only; to-day those that were left have been gathered, and they have swelled and ripened off considerably. Had they been gathered last week they would have been almost worthless through being so small and deficient in colour. The same rule applies to Apples and Pears, although it may not be so perceptible in such a short time.

Flies and wasps are often very destructive during this month to ripe and ripening fruit, not only from the amount they eat, but also from what they damage render unfit for storing, or selling. A very simple

method of destroying them is the well-known plan of fixing two hand-glasses one on the top of the other, with a small hole in the top of the bottom one. They fly up, and cannot find their way out again. Some small and half-decayed fruit should be placed under the lights every day.

WALL TREES.

Wall trees should be looked over weekly, and all secondary shoots that may have pushed out removed—not cut back, but entirely removed—as after this date there is not much danger of the trees making another growth.

ORCHARDS.

Those that require filling up or renovating should now be thoroughly overhauled; and where it is intended to plant young trees in established orchards where trees have died, or where unsuitable varieties are to be replaced, great care should be taken to have all old roots and stumps removed, and the ground for a certain distance well trenched and broken up, always leaving the bottom spit, but breaking it thoroughly up, and when required adding manure. Where possible it is always advisable to add a cart-load or two of fresh soil round each tree. For planting enclosed spaces, where the ground can be kept under cultivation, I much prefer planting pyramid or bush Apples on the Paradise, and Pears on the Quince stock. Where planting is intended during the autumn it is always advisable to pay a visit to some good fruit tree nursery early in the autumn. There is no doubt that early autumn is the very best time to plant fruit trees where the ground can be got ready to receive them. J. Smith, Mentmore, Bucks.

The Kitchen Garden.

ONIONS.

THE spring sown Onion crop, if not already pulled up, and preparations made for storing the bulbs, should now receive attention during favourable drying weather. The bulbs are not so large as usual, but firm and sound, and will keep well. In the first instance the crop should be looked over and all stiff-necked bulbs removed from the bulk; these should be placed aside for immediate use. The tops are not gross this season, and a few sunny days after the bulbs have been pulled up and laid out, will render them fit for storing. After the tops are dried they may be reduced according to the method of keeping them through the winter. If they are placed on the floor of an airy loft the tops may be cut off much shorter than for bunching or roping.

AUTUMN CABBAGE PLANTING, &c.

It is an old practice to place the above crop (at the end of September) on the ground from which the spring sown Onions were cleared. Wherever they are placed the ground should be well enriched with farmyard or artificial manure. When time admits the plants are best placed in shallow drills. After the plants have made a little growth, the drills can be filled in when hoeing, and the additional soil about the plants will protect and steady them. Such dwarf and compact varieties as Ellam's Early may be allowed 1 foot from plant to plant, and 16 or 18 inches between the rows; larger growing varieties 18 inches each way.

After the nice rains, and when the plants are dry, some Celery for early use should be earthed-up. Clear off all the short leaves and offsets from the base of the plants. They should then be temporarily tied up as near the top as possible with broad pieces of matting. Two workmen will accomplish this best, one to gather up all the leaves into their proper position, whilst the other ties on the matting. The soil should then be fined down into the trench to the required height and the matting removed. Young Turnips are now making up for lost time, and they will require watching in order that fly or slugs do not devour many seedlings and cause blanks. The above, in conjunction with winter Spinach, should be thinned as soon as large enough; both crops are backward owing to the drought. G. H. Richards, Somerley Gardens, Kingwood, Hants.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Sept. 14	Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.
TUESDAY, Sept. 15	Annual Sale of Heaths, &c., at the Burnt Ash Nurseries, Lee, by Frotheroe & Morris.
WEDNESDAY, Sept. 16	Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Heaths, at the Lea Bridge Nurseries, Leyton, by Frotheroe & Morris. Sale of Flowering, Established, and Improved Dutch, at the Brunswick Nursery, Tottenham, by Frotheroe & Morris.
THURSDAY, Sept. 17	Sale of Dutch Bulbs and 12,000 Tuberoses, at Frotheroe & Morris' Rooms. Trade Sale of Imported Orchids, at Frotheroe & Morris' Rooms.
FRIDAY, Sept. 18	Annual Sale of Heaths, at the Longlands Nursery, Epsom.
SATURDAY, Sept. 19	Sale of Dutch Bulbs, at Stevens' Rooms. Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms.

THE main features of the week, so far as the metropolis is concerned, have been the exhibitions of DAHLIAS and FRUIT at the Crystal Palace and the Royal Horticultural Society respectively. Show Dahlias have arrived at such a pitch of perfection in certain lines that little can be said of them beyond this, that Messrs. COMPOSITE & CO maintain their old reputation, and that Messrs. SIMPLEX BROTHERS have justified the increasing admiration that is felt for single Dahlias. Form, substance, colour, size, all seem to have arrived at this limit of perfection, and what we see exhibited are mere kaleidoscopic variations of what has been seen for many years past. So much was this felt at one exhibition, that the body of experts constituting a special sub-committee approached the general body in a somewhat deprecatory fashion, and uttered a judicious caution respecting the granting of Certificates, and uttered a discriminative note of warning as to the difference between exhibition varieties and those to which the prefix "decorative" should be applied. The general public will be slow to appreciate a degree of difference which will be keenly felt by specialists, but which after all is of some importance, because, while it is undeniable that the difference is real, and that while the exhibition varieties, so called, are likely to be the best according to the standard followed by the experts, yet that the merits of such flowers are not to be judged simply from the exhibition standard, because they exert a secondary influence on the so-called decorative varieties, and raise the standard of such flowers likewise. It is satisfactory also to see that some attempts are being made to break away from the old lines, and to introduce new forms and fresh sources of attraction. This is manifest in the new race of Gladioli, as seen in G. Lemoinei, the result of the crossing of G. purpureo auratus and others, and in the increasing numbers of the so-called Cactus Dahlias of the Juarez type. These latter do not at present satisfy the strict exigencies of old Dahlia lovers, but there is no doubt that they are looked on with favour by the public, and that when "improved" by the art of the florist they will ultimately take a high place. When we say "improved," we mean judiciously improved by the adoption to a reasonable extent of the florists' rules, but not to such an extent as to ensure that rigid formalism so dear to the typical florist of the old school, so offensive to the eye of the artist and physiologist. Life, the evidence of adaptations to the struggle for existence, confer a degree of beauty, and especially of interest, which no mere geometric formalism can ever supply.

Another feature of the week has been the display of Grapes. These have the keenest interest for gardeners, and deservedly so. In the judging of Grapes, too, at our metropolitan exhibition, it is gratifying to observe the judicious practice that is followed. No mere size of bunch or berry is allowed to outweigh more substantial attributes of ripeness and finish. The premediated bunches are not the biggest, but, as a rule, they are unquestionably the best as regards quality—and quality in this case means

flavour. It is comparatively easy to secure sensational bunches, but the care required to put on the exhibition table exquisitely finished samples such as were to be seen at South Kensington is quite another matter. It would add greatly to the practical value of these displays if the Royal Horticultural Society would institute competitive examinations of the vineries at a given time; competent judges might be appointed to visit the graperies entering for competition, and adjudicate, not upon one particular bunch of one Grape, but upon the general condition of the crop. Of course, it would be impracticable to do more than deal with generalities, as the conditions would be so different in different establishments. Still, with a little care and judgment it would be quite possible to arrive at satisfactory conclusions, and a healthy impulse would be given to Grape culture apart from the display of picked samples on the exhibition table. Even on the exhibition table there is room for improvement in the mode of display. It would add immensely to the popular interest, and would, moreover, be useful in the matter of identification, if foliage and ripened wood were exhibited with bunches of each variety. One exhibitor to whom we mentioned this matter replied, "Ah! but that is just what I did on one occasion, and have reason to believe that it acted prejudicially to me." We can conceive the possibility of this, but if it were so it would be obviated if all competitors were desired to exhibit in the same manner, and to specify in particular whether the foliage came from the same cane as that on which the bunches were produced, or was taken from another—possibly less productive rod.

Another very important matter was brought before the gardener on Tuesday last in the competition for the best method of packing Grapes to send to a distance. On former occasions we have figured various methods of packing which have been found meritorious, but on this occasion there was a general consensus of opinion that the very best method of packing Grapes for transit was the simplest. A shallow basket, tapering slightly to the bottom, and with a stout arched handle crossing it in the middle, was found to be the best. The Grapes are lightly placed around the sides of the basket, the centre being filled up with other bunches. The tapering form of the basket allows the Grapes to slide down gently into position, and to accommodate themselves to the space to be filled, without the intervention of moss, wadding, or any other packing material whatever. A few withies may be bent lengthwise over the basket beneath the handle, so as to prevent any stray article pressing on the Grapes. The contents of the basket being known, and the basket lifted, as it must be almost of necessity, by the handle, ensure the precious freight being carefully handled, and passed from hand to hand, instead of being unceremoniously pitched about, as is the case with closed boxes.

So many of the complaints made by gardeners as to the low price their productions fetch in the market depend upon the mode of packing, that we call special attention to this matter! Gardeners who pack produce, often of a superior quality, have little idea of the state in which their cherished productions arrive in the market, and in seeking a remedy, in this case as in so many others the simplest is best. Had we not seen this repeatedly we should ourselves have feared that so simple a means of packing as what we have described appears would have been as ruinous as it proves by daily experience in the market to be satisfactory.

— ANEMONES IN SEPTEMBER. — We owe to Mr. BURBRIDGE the pleasant surprise of receiving a box of large-flowered double Anemones such as one might expect to see in spring. Mr. BURBRIDGE tells us that unless the winter prove very severe the plants

may be expected to bloom continuously until next June. These flowers are from seed sown in March of this year, so that they are only about six months old. "St. Bridg," to whom horticulturists owe this strain, has thereby earned their gratitude. The following directions for their culture show that, as with most other good things, the method of management is simple —

"For winter bloom, choose a sunny, open spot; put on a good dressing of rotten manure—cow-manure is best—and dig well, covering the manure at least 5 inches deep; and as soon in February as the surface of the ground is dry and friable, sow the seed (this must first be separated by rubbing with a quantity of sand), taking care to distribute it as thinly as possible—it is almost impossible to sow too thin. Keeping clear from weeds, and an occasional watering during very dry weather, is all the after-attention they will require. Bloom will commence in October, and continue through the winter and spring months. They are best not transplanted. For spring and summer flowering, plant bulbs in autumn and spring. They can also be transplanted quite safely, although in full flower; if carefully watered for a few days, they will not go back in the least. Thus those who wish flowers at once can secure them."

— GARDENERS' ROYAL BENEVOLENT INSTITUTION. — We have received the following communication from Mr. E. CUTLER:—"I beg to inform you that I have received a letter from the solicitors to the estate of the late J. S. LAW, Esq., of South Lodge, Enfield, stating that he had left a legacy of £100, free of duty, to this Institution, which will be paid in the usual course."

— "FLORE COMPLÈTE DE LA BELGIQUE." — We have received a copy of this volume, prepared by M. A. DE VOS, and which is so good and likely to be so useful, that we can now only mention its publication, and defer fuller notice till we can do it more justice.

— TURNER MEMORIAL PRIZES. — At a general meeting held in the Conservatory at South Kensington on Tuesday last, SHIRLEY HIBBERD, Esq., in the Chair, a committee of seven persons was appointed to carry out the project. The committee so constituted consists of Messrs. H. VEITCH, G. PAUL, H. V. GLASSCOCK, J. JAMES, G. T. MILES, H. CANNELL and Dr. MASTERS, together with SHIRLEY HIBBERD, Chairman, H. POLLETT, Treasurer, and J. DOUGLAS, Secretary. More than £100 was announced, and various suggestions made as to the scope of the Memorial, which it is desired to make as general as possible.

— WOOD'S PATENT BOILER. — Mr. WOOD, hot-water engineer, Eastville, Bristol, has been awarded a Gold Medal for his greenhouse and kitchen range boiler, from the Inventions' Exhibition, also a First-class Certificate from the Bath Industrial Exhibition. Several advantages are claimed for these boilers—economy in fuel, combined with great heating power, and the facility with which the tubes can be cleaned out without disturbing the setting; and, moreover, skilled labour in stoking is dispensed with. Being on slow combustion principles, the fire may go without attention from eight to nine hours.

— THE KING OF THE PUMPKINS. — The heaviest Pumpkin (according to M. DE VOS), presented at the Paris market in 1884, weighed 130 kilograms. Translated into English, this means that the Gourd in question weighed about the same as twenty-eight legs of mutton of 10 lb. each.

— THE JUDAS TREE. — The hot summer has sufficed to ripen the pods of this singular and beautiful tree, and to give them a richness of colour we do not often see. The pods as they hang are now more brilliant than the flowers to which they succeeded.

— THE STRAWBERRY GRAPE. — Apart from its peculiar flavour, the Grape is worth growing for the sake of its foliage. The leaves are well suited for table decoration, and assort better with the ordinary furniture of the table than to the more deeply cut leaves of other sorts.

— THE COAST FLORA OF JAFYVIA. — In the *Journal of the Linnean Society* Mr. HENRY GROVES, of Florence, gives an interesting account of the flora of the province of Lecce, better known as Otranto. It is a low-lying district, producing abundance of *Sellia maritima*, and where Chicory and the bulbs of

Bellevalia comosa form articles of food, and the leaves of *Heliosciadium nodiflorum*, usually considered poisonous, are eaten as salad; *Juncus acutus* is made use of for fish-pots, while *Schœnus nigricans* is made available for ropes; *Clematis balearica* finds its Western limit here; *Crocus Thomasii*, an autumn-flowering species, occurs abundantly near the Gravina di Leucaspide, near Taranto.

themselves at the nodes, by which the plant may be propagated. It is clear, then, that the reserve food and growing power of the old bulbs are not exhausted.

— RHODODENDRON KOCHII, STEIN, *Gartenflora*, July, tab. 1195, is a Philippine Island species, with stalked, lanceolate, acuminate leaves and trusses

of Erith. The wood was found in the lower part of the stratum with flint-flakes. Rhinoceros bones have been found in the same pit. Mr. RIDLEY's note is confined to the mere announcement of the discovery, but much more is needed to substantiate a discovery of so interesting a nature.

— LARGE TURKEY OAK.—W. H. DUNSFORD,

FIG. 74.—HOYA GRIFFITHII (SEE P. 334.)

— ORCHID PRUNING.—A good deal of information is likely to be gained incidentally by the discussion of this subject. Some people ask whether the old pseudobulbs are of any use; because, if not, they might be cut away. At Mr. LEE's the other day we saw the use to which they, or some of them, are put in that establishment, where the requirements and peculiarities of Orchids are so thoroughly met and understood. The bulbs of *Dendrobium nobile nobiliss* are tied down horizontally to a board just as babies are in some countries still, and hung up near the glass, kept in suitable temperature, and with sufficient moisture, when, after a little, buds present

of white Jasmine-like flowers. In the same number a much smaller species with rosy-pink flowers, reminding one of *R. hirsutum*, is also figured. It grows on the volcano of Apo, in the Philippine Islands.

— THE SWEET CHESTNUT A NATIVE OF BRITAIN.—In the August number of the *Journal of Botany* Mr. RIDLEY gives some reasons for supposing that this tree (*Castanea sativa*) was at one time native to Britain. Mr. RIDLEY's "conclusive evidence" is derived from a small fragment of the wood which he obtained in a brick-earth pit near

Esq., of Ashley Court, Tiverton, possesses one of the finest Turkey Oaks known to us. It is growing on an elevation overlooking the lawn and tennis court. Ninety feet is about its height, and 180 feet around; its huge trunk is straight and free from limbs to a height of 8 or 9 feet, where it forks away on every side, forming a particularly handsome tree.

— GRINLING GIBBONS.—The following reference was made in one of Mr. HUNGERFORD POLLEN's lectures on wood carving before the Society of Arts:—"The carver whose name is associated more particularly with the name of WREN is GRINLING

GIBBONS. He was first heard of by EVELYN, in 1670. A pot of flowers which he did outside of his widow in Belle Sauvage Court was so delicately carved that the leaves and blossoms shook with the rumbling of passing coaches and carts. The carving of GIBBONS consists of hanging-swags, composed of fruit and flowers, with birds and animals among them. There are examples to be seen over the communion tables of St. Paul's Cathedral and of St. James', Piccadilly, where the marble font, with figures of Adam and Eve, is by him; over the doors and chimney-pieces of the state rooms at Hampton Court, where also the carved mouldings, by other hands, are well worth careful examination. Chisworth House and Petworth House, in Sussex, have excellent examples of the best carving of GIBBONS. These carvings surround a series of full-length portraits. They represent hanging trophies of the attributes of the seasons, including ears of bearded Wheat, cut with the utmost delicacy; musical instruments, with low reliefs on their surfaces; medals, one said to represent GIBBONS himself; face Steinikr cravats, classic vases, with figure work on their sides; an immense variety of objects."

— NATIONAL PEAR CONFERENCE, 1885.— Suitable "Forms," have been prepared by the committee of the National Pear Conference, and may be had by intending exhibitors on application to the Secretary, Mr. A. F. BARRON, Royal Horticultural Garden, Chiswick, W. It is hoped exhibitors will make their returns as complete as possible. In order to insure uniformity in the naming of the fruit exhibited, and to obtain as much precise information as possible on individual fruits, a "card" has also been prepared by the committee and will be supplied to all exhibitors on application. Exhibitors are requested to make application to the Secretary before October 14 next, stating the exact number required.

Description of Tree

.....

— THE WEST INDIAN CEDAR (CEDRELA

ODORATA).—This tree is a native of Jamaica, Cuba,

Antigua, Mexico, &c., and grows to a height of

80 feet or more, with a diameter of from 3 to 5 feet.

It is a near ally to the Mahogany, to which the wood

has some resemblance, though it is softer, rather more

open-grained, and not so durable; nevertheless, when properly seasoned it is a valuable wood, and has an agreeable fragrance, very unlike that of the fresh plant. It is used for wainscoting, cabinet work, drawers, &c., as it is stated that no insects will attack it, on account of its scent. Shingles made of it are reported to be very durable, and they, moreover, have the advantage of lightness. LUNAN, in his *Hortus Jamaicensis*, says, "The trunks of the trees are often so large as to be hollowed out into canoes and periaquas, for which purpose it is extremely well adapted, as, from the softness of the wood it is hollowed out with great facility, and being light it carries great weight on the water. Canoes have been made of it 40 feet long and 6 feet broad." It is from this wood that the Cuba cigar boxes are made, and the wood is also imported into Hamburg in logs for the purpose of making boxes for holding German-made Havanas; these boxes are made in exact imitation of those which come direct from Cuba. The wood recommends itself for this purpose on account of its even grain, freedom from knots, and its non-liability to split or crack, and also on account of the ease with which it can be cut into thin planks, suitable for box making. Three remarkable logs of West Indian Cedar were recently landed at the West India Docks from Cuba, our attention having been drawn to them by Messrs. CHURCHILL & SIM, of Clement's Lane, to whom they were consigned. These logs were from the bases of three separate trees, and were each of pretty nearly similar bulk, measuring about 7 feet high, and 3 feet or more in diameter. They all had their bark removed, and their peculiarity was that instead of the grain running up and down or perpendicularly it ran round the trunks in a spiral manner. So distinctly defined was the course of the grain that the logs attracted the attention of the habitual workers on the timber wharf, and one of the attendants who cut off a few chips for us from what in an ordinary trunk would have been the transverse section remarked, that in order to obtain a section showing a longitudinal grain it was necessary to cut it across the trunk. The three logs were sold by Messrs. CHURCHILL & SIM to Messrs. W. OLIVIER & SONS, of Bunhill Row, who obligingly cut for the Kew Museum a large slice from one of the trunks. From this it would seem that the arrangement of the woody fibres of the trunk was in their younger state quite normal, but after they had attained about half their full diameter the course of the grain changed from a perpendicular to a spiral direction, so that in planning what must for convenience be called a longitudinal section the course of the grain was cut through at three different angles. A section cut across the trunk showed no decided rings, but a continuation of a longitudinal grain running round the trunk. These logs, though curious, would be almost useless for working, in consequence of the continued crossing of the grain.

— TURNIP-ROOTED MUSTARD.—The *Revue Horticole* mentions a Chinese Mustard with roots like a Turnip, the leaves of which may serve as forage. The root is stated to be of agreeable flavour. According to the analysis given the roots contain:—

Starch	12.10
Albumen	4.62
Fatty matters	0.44
Lignin cellulose	2.75
Mineral matters	2.24
Water	75.87
	100.00

The plant has been introduced into France from Peking by Dr. BRETSCHNEIDER. We have not yet heard of its introduction here, but it would seem to be a valuable introduction and well adapted for our climate.

— WOTHERSPOON'S HORIZONTAL TUBULAR BOILER.—At the last meeting of the Royal Caledonian Horticultural Society in Edinburgh the above boiler was unanimously commended by the judges, who also expressed a wish to see it at work.

— GARDENING APPOINTMENTS.—Mr. JOHN GREEN, late Gardener to W. P. COSIER, Esq., at Wilmington Hall, Dartford, Kent, has been appointed Gardener to J. B. LEE, Esq., Sonning, Reading, Berks.—Mr. CORNELIUS PRICE, late Foreman in the Gardens, Powderham Castle, Exeter, has taken charge of the Gardens of the Earl of LISTOWEL, Convmore, County Cork, Ireland.

THE NARCISSUS FLY.*

THE Narcissus-fly (*Merodon equestris*) fig. 75 is not a new discovery. It is described by Reaumur in his *History of Insects*, published in 1738, as well as by Fabricius, the pupil of Linnaeus, in his *System of Entomology*, written near the end of the last century. About forty years ago the damage caused by it to the *Dafnoid* growers of Haarlem attracted public attention, and from that time the insect seems to have become naturalised in Holland. The present monograph has been written at the request of Mons. J. H. Krelage, of Haarlem, who supplied materials for laborious and exhaustive investigations recently made by Dr. Ritzena Bos, the results of which are contained in fifty octavo pages, accompanied by illustrations. This monograph, reprinted from the Archives of the Teylerian Museum at Haarlem, has just been sent by M. Krelage to the members of the Narcissus committee of the Royal Horticultural Society.

The Narcissus-fly is indigenous to Italy and other parts of the South of Europe, from which it has been introduced in imported bulbs—chiefly those of *N. tazetta*—to Holland and England, in both of which countries it has in some measure established itself. It suffers, however, from the effects of severe winters, after which there is for a time a marked diminution in its ravages. The appearance of the perfect insect is not unlike that of a small and rather slender hum-blee-bw with two wings. Like the plants upon which it feeds, one species runs into many forms. The colour and markings vary much. In one of the illustrations we have coloured figures of seven different types. The generic name *Merodon* (with toothed thigh) is explained by another figure. We should infer from its specific name that it has the habit of settling upon horses, but Dr. Bos does not inform us on this point, telling us, however, that it is partial to honey. It lays its eggs, one or two together, at the base of the full-grown Narcissus leaf in June. The larva, when hatched, makes its way down into the interstices of the upper scales, and feeds towards the heart of the bulb. The grubs are full-grown, or nearly so, in November, but it is not quite certain when they undergo their next transformation. It is thought that many remain dormant during winter, and complete their growth in early spring, when they eat their way out of the bulb, generally at the base, and mount upwards through the soil, entering the chrysalis stage near the top of the bulb, but outside it. The fly comes out in May.

Besides the mechanical damage to the structure of the bulb which the larvae cause with their mouths, they excrete an acid which causes the neighbouring parts to rot; so that even if a *Dafnoid* attacked by them flowers in spring, the floral axis having escaped unharmed, still the flowering is stunted and unhealthy, and no subsequent growth is made. The decomposed portion of the bulb is found to be full of bacteria not unlike those which are known to cause the very destructive Hyacinth-rot. Dr. Bos tried, by experiments on sound *Dafnoids*, whether these bacteria are capable of developing rot in healthy subjects, and concluded that they are harmless, merely occupying the parts already decomposed by the larvae of the *Merodon*. Dr. Bos also tried many experiments, the result of which he gives in detail, to determine the best way of getting rid of a pest which threatened to become so serious to growers of *Dafnoids*. He believes that the simplest he tried is also the most efficacious. It is to immerse in water all bulbs for a space of eight days before planting. This, he assures us, may be done without danger of injury to the bulb, and with the almost certain result of killing the larvae, which in August, when *Dafnoids* ought to be planted, are small, and near the crown, and have as yet done little or no injury.

It seems doubtful whether the *Merodon* could maintain a permanent footing in England—at any rate in the colder parts of it—unless reinforced by fresh importations; so that we may hope to be able to look upon it more as an object of interest to the naturalist than a pest to the gardener. C. Wolley Dod, Edge Hall, September 5.

* *La Mouche de Narcisse (Merodon equestris)*. By Dr. T. Ritzena Bos. Haarlem, 1885.

HOME CORRESPONDENCE.

The Proposed Edinburgh Fruit Show.—We hope to get together a thoroughly representative exhibition of the Apples and Pears grown in Scotland, as well as a good selection of the best Apples and Pears grown in other parts of the United Kingdom. The date of the exhibition is rather late, but there are several reasons why it could not be fixed for an earlier date. First, our Apples and Pears in Scotland are not generally fit to gather till the latter half of October; second, the Royal Horticultural Society's Pear Congress comes off at that time, and we did not wish to run in opposition to it; and third, the new winter show of the Royal Caledonian Horticultural Society was fixed last spring for the date chosen, November 25 and 26, and we did not care to spoil it by holding another fruit exhibition a week or two before it. At the date fixed upon, we shall still have the most of the early Apples and Pears, grown in Scotland, in fair condition; and we must just take what we can get from our more favoured Southern friends. There is a very good list of prizes offered for fruit at the new winter show, which may induce a good many of our friends from the South to compete, as well as to exhibit their specimens at the Conference. *S. L.*

Mildew on Plants, Aphids, and Red Spider.—Some months ago an article appeared in the *Gardener's Chronicle* from the pen of Mr. Edmund Tonks, B.C.L., on the merits of sulphide of potassium as a remedy for mildew. I was struck by Mr. Tonks' statements, and knowing him to be a careful observer I thought I would take some pains to get his observations tested, and accordingly I arranged for samples of the sulphide of potassium to be forwarded to a number of our best gardeners, and at the same time drew their attention to Mr. Tonks' article. I felt that if the sulphide of potassium should prove to be as efficacious as Mr. Tonks represented in destroying such a universal pest in our gardens as mildew, I should render some service to gardening generally by getting assurance of its merits from those most competent to judge, and should then feel at liberty to make its merits widely known by the aid of the gardening journals. I am now enabled to send two testimonies to the efficacy of this remedy, which I am sure will at once arrest attention. The first is from Mr. Coleman, of Eastnor Castle, who says:—

"I have given the sulphide of potassium a fair trial, and the excellent effect it has produced is more than satisfactory—it is marvellous. The first trial was made on old winter Cucumbers, badly infested with mildew. One syringing nearly cleaned them, a second completely destroyed the pest. This was in April, and the plants still (August) remain clean and healthy. The second attack was made on red-spider, also on Cucumbers. Two dressings destroyed the spider, and the plants were in no way injured. The third and most important trial was made on an old Vine attacked by spider and mildew, and although my stock of sulphide ran short the result was equally satisfactory. On Saturday last a young Melon plant, infested with a very troublesome pest, black aphid, was well syringed. The plant is now clean, and growing freely."

Mr. Coleman then proceeds to state that he intends trying the new remedy on Hops, and will report the results in due course. I am glad to be able to add to the above the experience of Mr. R. H. Vertegans, of Chad Valley Nurseries, Edgbaston, who has within the last few days drawn my attention to a large number of double Cinerarias which were badly attacked by mildew a fortnight ago. They have been syringed twice with a weak solution of sulphide of potassium, and are now quite free from the pest. Every gardener should test this new remedy, and report his success or failure with it for the general good. *Edward W. Badger, Moseley, near Birmingham.*

Ficus repens.—I enclose specimens of *Ficus repens*, all taken from the same plant, with specimen of fruit, showing its polymorphous forms, and the state of development it is apparently necessary to bring it to in order to produce fruit. The plant was originally planted on the back wall of a stove; after reaching the top, there being no further space for it to cling, it branched out vigorously in quite a different form of branch and leaf, and is now bearing fruit. It appears somewhat analogous to the Ivy, which when

its climbing power is finished, assumes another form of growth and becomes fruitful. [For a figure of shoot see p. 560, vol. xiv., and of fruit, p. 717. Ed.] *George Stanton.*

Dendrobium Pruning.—I have only now received my *Gardener's Chronicle* of August 15, hence the delay in replying to Mr. N. Blandford's letter on p. 216. I am glad to see that Mr. Blandford admits that his "pruning" of *Laelia anceps* is not such "pruning" as advocated by "J. S. W." and practised on his *Dendrobia*. He there does reply to the question he quoted from my letter. Mr. Blandford said he removed "leafless bulbs." Now I maintain that when a healthy plant loses leaves on its back bulbs, whose leaves are done with by Nature, and the bulb will follow. Unless the leaf is injured or affected by a cause foreign to the plant the bulb will not shed it till it wants it no more; therefore I consider that bulb may be taken away, but we seldom do it till its colour begins to change, or the sap tastes bad and otherwise to a healthy bulb. Mr. Blandford having looked for my "ordinary cultivation" in plants "exhibited at the great shows in London or the provinces," may have seen but few plants with every bulb having been made in England. No man would cut off leafless bulbs of the imported plants for years after, provided they were healthy. I am writing on his plant, which I believe to be all "English manufacture." If Mr. Blandford will permit me to come and see his plants I shall gladly do so, as I see we are on the same "track" with but a "guard rail" on each side. *De B. Crawshaw.*

FIG. 75.—THE NARCISSE FLY. (SEE P. 338.)

The Orchid Map.—The idea of showing the distribution of Orchids by a map, appears to me to be an excellent one, but in that given by Mr. Burbidge, in the *Gardener's Chronicle* of May 9, 1885, it certainly is not correctly carried out as regards Australia. The genera are represented as located in parts of that continent where they are never found, while their true habitats are left vacant. No Orchids are known to have been obtained in the northern and north-western portions of Western Australia, with the exception of *Cymbidium canaliculatum*, and that only in the neighbourhood of the northern portion of South Australia (known as the Northern Territory), an Orchid which is also the only epiphyte which extends from the seaboard into the interior in the Northern Territory, Queensland, and New South Wales. The great majority of Australian Orchids are confined to the districts along the seashores to which the seabreezes extend. The exceptions are a few species belonging to the truly Australian forms of terrestrial Orchids, and not including any belonging to the genera connected with, or the same as, those apparently derived from Asia, excepting the one above referred to. The principal genera in which some species extend to the area on the inward slopes of the coast ranges are *Thelymitra*, *Caladenia*, *Diuris*, and *Prasophyllum*. The Orchids of Western Australia affect the sea coast, and are only to be found between the great Australian bight and the Murchison River. They are all of the Austral type, except *Cryptostylis*. In South Australia the Orchids are also almost wholly confined to the southern slopes to the ocean, but approach in character much more nearly to the Eastern forms, though also destitute of epiphytes. In Victoria the species extend more inland, and include two genera, at least, of epiphytes; while in New South Wales the terrestrial are balanced by the tree Orchids. The terrestrial in Queensland

become comparatively rare as to species, being replaced by epiphytes till, through the Northern Territory," a region is reached (on the boundary of Western Australia) of utter absence of all Orchids. I enclose a sketch map, in which the numbers given to the genera are those attached to them in the *Flora Australiensis*, to which a few are added. The localities only are marked where specimens have been procured, but of course the genera, in all probability, exist in intermediate situations. *Robert Fitzgerald, Hunter's Hill, Sydney.* [We are greatly indebted to our correspondent, who gives details that could not be extracted from the general statement in the *Genera Plantarum*, moreover, the requirements of space necessitated our placing figures in the central, almost unknown districts of Australia, but the self-same requirements have forced our correspondent to put numerous figures in the ocean! Ed.]

Trachycarpus Fortunei.—The two best specimens of this Palm in the open air are probably in the grounds of Mount Edgumbe. As at Heckfield, the male and female are growing close together. From the dimensions given on p. 304 Devonshire would be before Hampshire by about 2 feet. At Hewell Garage, near Bromsgrove, which is more than 100 miles north of London, there is a good-sized plant in a tub which has stood out through the last three winters. I do not remember Mr. Ward, the gardener, saying that he had protected it in any way. Once gradually injured to our climate, a long-continued and severe frost, such as Mr. Blackmore tells us of in *Lorna Doon*, would be necessary to kill it outright; in fact, the wind is a more dangerous enemy than frost. Given a sheltered position, this Palm would be available for gardens all along the west coast, and for some way inland. When the time is fulfilled for having glasshouses that will take down in the summer, to cover beds of greenhouse shrubs, all will be enabled to appreciate Fortune's Palm as they ought. *C. A. M. C.*

Aristolochia elegans.—After seeing this plant in Mr. Bull's nursery, and comparing with it an *Aristolochia* recently brought to Kew by Baron Capacema, of Rio, I think there is little doubt that the two are identical, and, therefore, the following information from Baron Capacema will be worth adding to Dr. Masters' description of this species. Writing about a collection of living plants which he had brought with him in a *Wardian* case from Brazil the Baron says:—"Among them was a climber, an *Aristolochia*, which is not described by Duchartre, in *De Candolle*, or by Masters in *Flora Brasiliensis*. The labellum of the flower is peltate, and very symmetrically cup-shaped, the inside covered with a thick network of narrow veins of a dark brown colour, and a nearly black spot on the centre. I have, therefore, named it *A. melanostoma*. I had it from Paraguay some years ago, and as it is very ornamental it soon was cultivated in many gardens. Perhaps it may be described by somebody else." As the name proposed by the Baron is already occupied by a species of *Aristolochia* it cannot stand for this plant, which is now named and described as above by Dr. Masters. *W. W.*

Clematis Jackmanni.—In the beautiful gardens at Castle Hill, North Devon, this favourite plant revels in beauty, where Mr. Nicholas, the gardener, grows it in rather a novel way. Stretched across one of the kitchen gardens adjoining a path are wires placed and strained as is usually done for espalier fruit trees, and on these are trained the abundance of luxuriant growths, the result being a beautiful hedge 100 feet in length and about 4 feet in height. At the present time it is a mass of lovely deep violet-purple flowers—a gorgeous sight. Mr. Nicholas believes in a deep rich loamy soil for the *Clematis*, liquid manure frequently, and liberal dressing on and under the surface. *W. Napper.*

Gas Lime as Manure Insecticide.—Some correspondence having taken place in your journal relative to the value of gas lime for manuring purposes, I will briefly state that in December, 1884, the gardener of the Lock Hospital, Harrow Road, put 5 tons of the lime to every half acre of the garden ground, he allowed it to be exposed to the weather for four weeks, and then it was spread all over the grounds; then manured and dug in. The results have been wonderfully satisfactory. For numbers of years it had been almost useless to sow Onions or plant Cab-

bagas. The soil had become so impregnated with wireworms and the chrysalis of the Cabbage butterfly, that caterpillars were so abundant it seemed utterly hopeless to attempt to cultivate Cabbages at all. I admit that, prior to the lime dressing, thousands of chrysalids had been destroyed by manual labour, but thousands probably remained undiscovered. Be this as it may, there is a remarkably fine crop of Onions this season where the gas lime had been dug in, and the produce of Cabbages has been very good—the latter now looking healthy and almost free from caterpillars. I am myself a most thorough believer in gas lime as witnessed in this garden. I am informed that in the Isle of Wight it is used on farms with excellent effects in destroying the enemies of the Turnips. *John Colebrook.*

Beccimocarpus scaber.—This is a very showy and ornamental plant. It is well adapted for training over columns, trellises, &c. It was formerly much grown and used for these purposes, but of late years its cultivation has been neglected. I have not seen a plant of it for some years until a few days ago, when I called on an old friend. In looking around I came to a fine specimen of this beautiful plant in full flower, covering a considerable portion of a wall facing west. In coming to the gardener's cottage I was surprised to see the south side of the cottage nearly covered with this plant, forming a mass of floral beauty. Both plants I ascertained had been planted out about two years, and had withstood the cold of the last two winters. Whether it is hardy enough to stand a severe winter I cannot say—a little protection would no doubt save it. It is deserving of any little care or trouble bestowed upon it, and should be planted in a compost of sand, loam, and peat. The plant can be increased by cuttings put into a sandy soil and plunged in a gentle heat in a pit or frame. When rooted they should be potted off singly and tied up to stakes and be put into a frame with a little bottom-heat until they begin to root freely; afterwards they will do in cooler structures. When a large space requires covering good plants should be planted, which will fill up vacant places much more rapidly than smaller plants would do. *M. Sault, Holgate, York.*

Laxton's Open-air Tomato.—This is a variety which gardeners residing in localities adapted for the out-of-door growth of this esculent should always cultivate. It is a most abundant bearer, the plant carrying from 10 to 12 lb. of well-developed fruits, and which almost invariably ripen thoroughly. The habit is dwarf, and thus the fruit is carried at such a short space from the soil that but a few small stakes are required as supports. Its nearness to the soil may have something to do with its good property of ripening off the fruit. The flavour is fine, and the form not so much corrugated as some of the older kinds. *M. W.*

Datura (Brugmansia) suaveolens.—This is a splendid greenhouse flowering tree when it has sufficient space to flourish. Just lately I met with two very fine specimens in the handsome and spacious conservatory at Sibbury Manor, Devon (A. D. Cave, Esq.). The extent of their fruit will be 20 feet by 15, and there were quite 250 flowers open at the time of my visit. These are tumel-shaped, 8 inches in length, and white, deliciously perfumed, the scent being strongest in the evening. The foliage, too, is highly ornamental, and remains on the plants in a large proportion during the winter months. *M. W.*

A Dahlia Exhibition for the North.—At the recent exhibition of Dahlias at the Crystal Palace, Sydenham, I heard from some of the growers of Dahlias from the North the expression of a desire that an annual show of Dahlias, similar to that held at the Crystal Palace, should be held in some central place in the North—York being mentioned as the most suitable centre midway between London and Scotland. There is at present scarcely an exhibition of Dahlias in the North worthy of the name. It is true that prizes are offered at Bishop Auckland, at Alwick, and other places, but they are scarcely of a character to rouse the enthusiasm of the Midland and Northern growers. And yet the Dahlia is largely grown in the North by many who are content to exhibit at merely local shows. There are, no doubt, more growers north of Doncaster than there are south of it. I think that were such a project as a National Show of Dahlias in the North started, it

would find a great deal of support. The best time to hold such an exhibition would be about the last week in August. This date would be likely to suit alike the Northern and Southern growers, and it might be made a national exhibition in the strictest sense of the word; and would attract cultivators and fanciers of this still popular flower from all parts of the country. If Mr. John Wilson, the Secretary of the York Floral Fête, could be induced to take the matter in hand, it could scarcely fail to be less than highly successful. Will the committee of the York Floral Fête lend their support to such a movement, and aid it by subscribing something substantial out of the surplus funds at their command? Mr. Wilson's co-operation would command universal confidence. Then there is the Ancient Society of York Florists, headed by their Secretary, Mr. John Lazenby. Will this body lend their aid also? Such a show would be quite in keeping with the objects of their association. If such a show can be undertaken, all sections of Dahlias should be fully represented in the schedule of prizes. If this is done, great interest will attach to such an exhibition. York is quickly reached from London. In this city there are spacious buildings, in one of which such a show could take place, if it be not held in the open air. Now is the time to stir in the matter. What do the Northern growers say? What will the Southern growers do? *R. Dean, Ealing, W.*

Grapes at the Exeter Show.—I endeavoured to give a correct report of this exhibition. The Grapes were especially good, the different classes for them being numerous and contested. I made special notes of them at the time, which were printed correctly in last week's issue. *Reporter.*

Reports of Societies.

ROYAL HORTICULTURAL :

September 8, 9.

This meeting proved to be one of the most attractive which the Society has held this season, and seemed to be also a source of pleasure to the thousands who thronged in from the Inventions Exhibition, and to whom it must have afforded a welcome relief after gazing on man's handicraft in its unending galleries. The exhibition of fruit found quite as many admiring gazers as did the gorgeous stands of Dahlias, Gladioli, Heponias, and Lilies. Certificated plants were few, and fruits for the same honour still more so, the only items being a red-fruited Raspberry, a Melon or two, and a dish of Plums.

Floral Committee.

Present—Shirley Hilbert in the chair, and Messrs. J. Hricen, J. Williams, J. Pomroy, C. J. Jones, J. Child, G. Duffield, J. James, T. Barnes, W. Beatty, W. Wilks, H. Bennett, W. B. Kellock, J. Fraser, H. Turner, J. Hudson, J. Walker, Dr. Masters.

MISCELLANEOUS.

Mr. Thos. Ware had his usual stand of flowers from the open air, as well as his bright as ever, consisting of great bunches of *Tritoma avaria*, Lilies, *Vulcotas*, great numbers of single *Dahlia*, curly *Chrysanthemums*—by the way, than which nothing can be less interesting in the presence of the abundant late summer flowers of far brighter colours. A few single Dahlias with small flowers, for which many uses could be found, were noticed on this stand; these were *May Anderson*, a bright scarlet; *Chrysan*, a deep crimson; *J. James*, T. Barnes, W. Beatty, scarlet; and *Little No. 2*, deep crimson, striped with maroon. *Cactus Dahlias*, scarlet and white, pompon and show varieties, were seen in numbers, and noticeable among the Lilies were some spikes of the delicate cream-coloured *Lechlini*, and the late-flowering *Silene Shasta*, red colour, and *dwart*. A Silver-gilt Medal was awarded Mr. Ware for the collection.

Messrs. W. Paul & Son, Waltham Cross, had the autumn red-flowering *Rose*, *Waltham Chimber No. 1*, of bright crimson colour; *Tritoma nobilis*, fine spikes of yellow and scarlet, superior to the ordinary forms of *T. avaria*; *Hypericum nepalense*, a slender, dwarf *St. John's-wort*, suitable for the rockery.

Mr. E. Ylving, of J. Hollington, Esq., Ferny Hill, Enfield, showed a slender-growing *Eucharis*, named *Hollingtonensis*, small-flowered, and long-stalked. From Messrs. R. Veitch & Son, Exeter, there was the pale rose-coloured *Escanlonia exoniensis*; and from Mr. Astley, of Colonel Butler, Warren Wood, Hattfield, a double-flowered pink *Begonia*, a fine plant of *Vanda Sanderiana*, with fourteen blooms on two spikes; a *Chrysan*, named *Waltham Cross*, awarded the grower.

Messrs. J. Veitch & Son, Chelsea, showed the singular-looking Fern, *Lomariopsis bustifolia*, with a climbing habit of growth, and *Box-like* foliage, apparently a capital object for covering small objects in damp places in the stove; *Dryopteris Norwegiensis*, a variety with dark green foliage, edged and striped with rose colour; *Amasonia punicea*, showing habit of plant in a very young state.

A pretty, small plant of *Odontoglossum Kramerii* came from H. J. Buchan, Esq., Wilton House, Southampton; it received a Cultural Commendation.

The New Plant and Bulb Co., Colechester, had a large group of *Lilium auratum*, mixed up with plants of *Valota purpurea*.

Messrs. J. Carter & Co. showed a variety of the same with a dull dark brown band in place of a golden one on each petal. It is by no means an improvement on *auratum*. *Ponceroa longeva*, with a flower-stalk bearing young bulbs developing into plants as is customary in this species was shown by the same firm.

Some good specimens of the Glasgow Prize *Cockscomb*, one of which had a comb 2 feet in length and 6 inches in width, were sent by Mr. H. Crichton, Bellaire Garden, Greenock.

Messrs. Kelway & Son had, as usual, a large assortment of *Gladioli* from Langport. Many very fine kinds were to be found in it, but especially all allows of the certificated kinds being alluded to, as *Prince Waldemar*, purple-rose and white throat; *Lord Carnarvon*, orange-scarlet; *J. L. Toole*, crimson-red and white throat; the spikes of all three being of more than average height, as shown. We do not know how it is that certificated *Gladioli* have become smaller when seen the next day following receipt. The Cankers Medal was awarded for the general collection.

A fine effective group of *Begonias* was placed by Messrs. John Laing & Co. in the space facing the refreshment buffet, comprising many of their fine varieties, and of which a sketch is given on page 341.

Messrs. Rawlings Brothers' new Dahlia, *Bird of Passage*, is a bright looking white bloom, tinged and edged on the petals with purplish-rose: the size is medium, centre full and quality very high. *Dahlia Mrs. G. Rawlings* has the same tints as the foregoing in the interior way—form being as good. Some flowers show less colour than others. *Dahlia G. Paul* is called a decorative kind in opposition to show kinds, the petals are suffused pink, tipped with lake, and the habit of flower rather wanting in refinement.

FIRST-CLASS CERTIFICATES.

To Messrs. J. Carter & Co., for *Lilium auratum var. rubro vittata*.

To Messrs. Jas. Veitch & Sons, for *Lomariopsis bustifolia* and *Dracaena Norwoodiensis*.

To Mr. T. Ware, for *Dahlia Mrs. Hawkins*.

To Messrs. W. Paul & Son, Waltham Cross, for *Rose Waltham Chimber*.

To Messrs. Rawlings Bros., for *Dahlia Mrs. G. Rawlings*, *Dahlia Bird of Passage*, and *Dahlia G. Paul*.

To Messrs. Cannell & Sons, for *Dahlia Faust* and *Dahlia Kelpack*.

To Messrs. Kelway & Son, for *Gladiolus Waldemar*, *Gladiolus J. L. Toole*, and *Gladiolus Lord Carnarvon*.

Fruit Committee.

Present: F. D. Goldman, Esq., in the chair; Messrs. G. Banyard, J. Roberts, J. Willard, G. T. Miles, T. F. Rivers, J. Ellum, C. Silverlock, C. Ross, G. Goldsmith, W. Paul, J. B. Hayward, R. D. Blackmore, A. W. Sutton, Harrison Weir, G. Paul, R. Hogg, J. Woodbridge.

Mr. Beckett, The Gardens, Aldenham Park, Ectree, exhibited six brace of *Cuembres*, and received a Vote of Thanks.

Messrs. R. Veitch & Sons, Exeter, showed a seedling Peach, a cross between *Belle de Vitry* and *Galande*; and also one a cross between *Late Admirable* and *Belle de Vitry*. They were accorded a Vote of Thanks. From the same exhibitor came a bunch of one of the American Fox Grapes, under the name of *Garibaldi*; it had been introduced from France.

Mr. Miles, The Gardens, Wycombe Abbey, exhibited *Gros Marce* Grape; the bunch was a splendid specimen with well-bloomed, large berries.

Mr. George Banyard, Maidstone, showed a branch of *Crittenden Danson*, full of fruit; and Mr. R. Dean, Ealing, exhibited fruit of the same variety. Mr. Banyard had also a dish of the fruit from budded trees, which was larger than that raised from suckers.

Bunches of seedling Raspberry, named *Late Profire*, were exhibited by Mr. Herrin, Gerard's Cross. The committee desired to see the fruit again at the next meeting.

Messrs. Webb & Son, Worsley, exhibited a seedling *Beauty of Worsley*, but it was over-ripe.

Mr. George Banyard, Maidstone, showed *Pears Dr. Jules Guyot*, *Souvenir de Congrès*, and *Williams' Bon Chrétien*, and received a Vote of Thanks. The first named *Pear* was a handsome fruit, but of an inferior flavour.

Mr. R. A. Bray, Bedford, sent *Pear Williams' Bon Chrétien* from standards.

Mr. T. Laxton, Bedford, sent *Self Help*, a seedling Plum, in appearance like a large *Musel*: it is a cooking variety, but inferior to *Diamond*.

Bronze Banksian Medals were awarded as follows:—

Mr. S. Ford—Pears and Plums.

Mr. J. Ross, Locking Gardens, Wantage—Plums.

Mr. Abel Phillips, Glaston Gardens, Uppingham—Plums.

Mr. J. G. Gore, The Gardens, Glenleigh, Hastings—Plums.

Mr. W. H. Divers, Maidstone—Plums.

Mr. Bates, Pontefract Lodge, Twickenham—Plums.

Mr. W. Dance, The Gardens, Gosfield Hall, Halstead—Plums.

Mr. G. Hawkins, Ewening Priory, Bridgford—Collection of fruit.

DAHLIAS.

For the best forty-eight blooms, distinct, show varieties (nurserymen)—1st, Mr. C. Turner, Slough, the flowers being of the usual first-rate quality which the Slough Nursery turns out; and without wading through a long list of names, we will indicate a few of the choicest in the stand, as Seraph, Goldfinder, J. Saltmarsh, Mrs. Langtry, G. Rawlings, Newark, Rev. J. Godwin, W. Williams, V. Rawlings, Imperial, Constancy, Chas. Wyatt, and Lady Gladys Herbert. 2d, Mr. W. Boston, Carlsruhe, Bedale; his best examples were Fred Smith, Shirley Hibberd, Jos. Ashley, Hope, Constancy, and Annie Neville; 3d, Messrs. Keynes, Williams & Co., Slough.

Twenty-four blooms, distinct, show varieties (nurserymen)—1st, Messrs. Rawlings Brothers, Norfolk—Flag of Truce, H. Glascock Professor Fawcett, Mrs. Glascock, James Stephens, Bird of Passage, Mrs. Harris, and Ethel Britten, being some of the best blooms in the stand; 2d, Messrs. Saltmarsh & Sons, Chelmsford, the blooms of H. Walton, Earl Beaufield, Goldfinder, Ethel Britten, Imperial, and Acme of Perfection; 3d, Mr. J. Walker, a fine-wellished lot of blooms, but which were deficient in size.

Twenty-four blooms, distinct, Dahlias (nurserymen)—In this class, that contained some very pretty examples, Messrs. Keynes, Williams & Co., were 1st, the best flowers being Rev. J. B. Cann, Rebect, Hercules, Neptune, Mrs. Saunders, Gaiety sport, Ed. Peck, Fanny Short, General Gordon, and Miss A. Nelson. 2d, Mr. G. Tucker, with such fine flowers as Annie Pritchard, Miss Lily Large, Duke of Albany, Grand Sultan, and Mr. G. Head; 3d, Mr. W. Boston, Bedale.

Twelve blooms, fancy Dahlias (nurserymen)—1st, Messrs. Saltmarsh & Sons, some fine flowers being seen in Gaiety, Gaiety, The Duke, Eagle, Rebect, Mrs. Saunders, Hercules, Egyptian Prince, and Richard Dean; 2d, Messrs. Rawlings Brothers, whose Frank Pearce, Annie (seeding), A. F. Barron, and Professor Fawcett, were superior blooms; 3d, Mr. J. Walker.

Twenty-four blooms, show Dahlias (amateurs)—In this class the 1st prize went to the North country, Mr. Spoor, of Prospect Cottage, Musgrave, Low Fell, Gateshead, and in the stand were excellent specimens of Earl of Ravensworth, Emperor, Rev. J. B. Cann, Hon. Mrs. P. Wyndham, Mrs. Gladstone, Prince Bismark, Seraph, Clara, W. Rawlings, Newark, Rev. J. Godwin, W. Williams, Kye, Earle, Bishops Stortford, whose flowers of the undetermined nature were very fine.—G. Rawlings, Mrs. Gladstone, Jas. Cocker, Mrs. Harris, Senator, Ethel Britten, and Bugleman. 3d, Mr. C. Hockney, Stokesley, Yorkshire, with good blooms, but which were uneven in size and unequal as to quality.

Six blooms, distinct, fancy varieties (amateurs)—1st, Mr. J. T. West, gr. to W. Keith, Esq., Cornwallis, Brentwood—Hugh Austen, Mrs. Saunders, H. Glascock, and Chorister being his best blooms. 2d, Mr. H. Glascock, the blooms of Clara Wyatt and John Lamont being very good. 3d, Mr. J. Bass, gr. to A. S. Hieley, Esq., Park House, Isle, Ewell.

Twenty-four blooms, distinct, pompon varieties (open)—1st, Messrs. Keynes, Williams & Co. In this class there were many pretty useful flowers that may be put to a variety of purposes; and certainly, some of the more striking kinds being Lady Blanche, white; E. F. Junker, sulphur and red; Favourite, crimson; Brunette, pink centre, carmine outer petals; Darkness, crimson, very dark; Little Bobby, crimson; Fanny Weir, yellow and orange; Gem, sulphur; Giant, the same; White Rose, Flacomb, rose coloured; Rev. J. C. Turner, with Carl Mendel, crimson; Louis Rodain, lilac; White Aster, white, suffused lilac. 3d, Messrs. Chelk & Sons, Crawley.

Twenty-four blooms, distinct, single varieties (open)—1st, Messrs. Chelk & Sons, with some very well displayed in grandish bunches; flowers large and well contrasted; 2d, Mr. C. Turner; 3d, Messrs. Keynes, Williams & Co.

SPECIAL PRIZES.

These prizes were awarded by Mr. Charles Turcor, Slough, to amateur growers only.

For twelve blooms, distinct, show varieties—1st, Mr. J. T. West, good examples of the following being observed—Mrs. Rawlings, Mrs. G. Harris, Henry Walton, Mrs. Langtry, Geo. Rawlings, Mrs. Harris, Joseph Green; 2d, Mr. H. Glascock; 3d, Mr. J. Walker.

Twelve blooms, distinct, fancy varieties—1st, Mr. J. T. West, with such fine flowers as Annie Pritchard, 2d, Mr. H. Glascock, with a handsome stand of fine blooms; 3d, Mr. T. Garratt, Bishop's Stortford.

Six blooms, distinct, pompon varieties—1st, Mr. Glascock, with pretty bunches of Guiding Star, Mabel, Isabel, Gem, Favourite, and Lady Blanche; 2d, Mr. J. T. West; 3d, Mr. J. Henshaw, Harpenden.

Six blooms, distinct, single kinds—1st, E. M. Nelson, Esq., Ealing (Mr. Chadwick, gr.). Show, fancy, and other kinds of Dahlias, were in great numbers shown at the meeting, many of the more notably Messrs. Cannell & Sons, and Messrs. Rawlings Brothers. Cut flowers were shown by Mr. Boothroyde, gr. to H. Coleman, Esq., Woodville, Dover, to whom a Bronze Banksian Medal was awarded. Messrs. Cannell obtained a Silver-gilt Medal for their Dahlias, Begonia flowers, &c.

FRUIT.

Fruit was confined on this occasion exclusively to Grapes, and then not at all in the ordinary form of collections of several kinds, as is so common, and by which arrangement sorts are repeated *ad nauseam*; but by inviting, through separate classes for each, no less than twenty-six kinds to the same class for any other kind; and thus it happened that some thirty distinct sorts were staged. Probably the effect of such a

system of classing was detrimental to the exhibition as a spectacle, and as an educational effort it was worthy of all praise, and it was specially pleasing to find, as the various classes were judged, that few mistakes in nomenclature had been made. In few classes was the competition large, no doubt a two-days' show operating somewhat against the entries. In some classes the competition was most meagre, showing that few gardeners comparatively cultivate many kinds that are, as a rule, not favourites, though, perhaps, having superior flavour.

The classes were somewhat mixed, as they ran alphabetically, hence the list opens with Alicante, of which there were seven pairs of bunches, including some grand samples—Mr. Howe, gr. to H. Tate, Esq., Park Hill, Streatham Common, coming 1st, with high-class bunches, and clusters which superbly finished. Mr. Pratt, gr. to the Marquis of Bath, Longleat, with other large bunches, a little rubbed, and Mr. J. Lowry, gr. to J. MacAndrew, Esq., Mill Hill, who had if rather smaller some perfect samples, were placed equal 2d; and Mr. J. Hollings worth, gr. to E. Campbell, Esq., Uttoxeter, was 3d, with really good bunches.

The next class was Alawick Seeding, which comprised five lots only, but the quality was remarkably even, and, indeed, has in that respect rarely been exceeded. Mr. Clayton, Crinoid, with high-class bunches, and deep hue; Mr. Wallis, gr. to R. Sneyd, Esq., Keele Hall, who had smaller but very perfect bunches, and Mr. Roberts, Gansersbury Park Gardens, were placed equal 2d, the latter having beautiful samples; and, finally, Mr. Lowry, gr. to J. H. Burd, Esq., was 3d, with a well-shaped, but not so perfect bunch. The classes were placed equal 3d, all samples being so good.

Of Black Hamburgs, of which there were but four lots, Mr. Pratt, who had again large, massive bunches, was placed equal 1st with Mr. Roberts, whose samples, if smaller, were exceptionally perfect in form, and finely matured; Mr. Vert, gr. to Lord Braybrook, Audley End Gardens, came 2d, with loquacious tapering bunches, rather wanting colour; and Mr. J. Read, The Gardens, Mount Mount, Mill Hill was 3d.

There were but two lots of Black Prince, fairly good samples of this moderately grown Grape—Mr. Baird, gr. to J. A. Daw, Esq., Ealing, coming 1st; and Mr. C. J. Goldsmith, gr. to C. A. Hoare, Esq., Beckenham, was 2d.

Buckland Sweetwater only five lots were staged, Mr. Roberts having the best in solid bunches and large berries, well finished; Mr. S. Castle, West Lynn, came 2d; and Mr. G. M. Allis, The Gardens, Old Warden Park, Biggleswade, 3d.

There were but three exhibits of the Duke of Gloucester, Mr. Pratt having the best, in rather loose bunches, but with fine berries; Mr. G. Tucker, gr. to J. L. Lovbond, Esq., Farnborough, was placed next, with smaller samples; and Mr. J. Baird came 3d. The Duke is evidently not a popular Grape, as Messrs. Knowlton, Dalhamburg, found only one lot to represent it, moderate bunches, about 1 lb. each, berries large and well hampered like those of Frankenthal. These came from Mr. Read.

This superbly-flavoured white Grape, Dr. Hogg, also found only one lot to exhibit its merits—handsome bunches, and well finished, from Mr. V. V. W. H. to Lord Rothchild, Tring Park. These were pretty tapering bunches, and showing high cultivation.

Foster's Seedlings brought only five lots; one other, a handsome sample from Mr. Allen, proving on careful scrutiny to be White Tokay, and from Mr. V. V. W. H. to Lord Rothchild, Tring Park. No blame was attached to the exhibitor, as it is known that this Grape has been sent out for Foster's Seedling.

The best bunches of the real Siona Pure came from Mr. G. T. Miles, Wycombe Abbey Gardens, whose samples were excellent, and of a fine colour, and were 1st, and Mr. Wallis, Esq., M. P., Hemel Hempstead, was 1st, and Mr. Wallis, Esq., M. P., Hemel Hempstead, was 1st, and Mr. Wallis, Esq., M. P., Hemel Hempstead, was 1st, and Mr. Wallis, Esq., M. P., Hemel Hempstead, was 1st.

That better known Grape, Gros Colmar, brought five lots only, the finest, about 3 lb. bunches, coming from Mr. M. Dawes, gr. to the Hon. Mrs. Meynell Ingram, Temple Newson, gr. to A. Smith, V. V. W. H. to Lord Rothchild, Tring Park. These were pretty tapering bunches, and showing high cultivation.

Foster's Seedlings brought only five lots; one other, a handsome sample from Mr. Allen, proving on careful scrutiny to be White Tokay, and from Mr. V. V. W. H. to Lord Rothchild, Tring Park. No blame was attached to the exhibitor, as it is known that this Grape has been sent out for Foster's Seedling.

The best bunches of the real Siona Pure came from Mr. G. T. Miles, Wycombe Abbey Gardens, whose samples were excellent, and of a fine colour, and were 1st, and Mr. Wallis, Esq., M. P., Hemel Hempstead, was 1st, and Mr. Wallis, Esq., M. P., Hemel Hempstead, was 1st, and Mr. Wallis, Esq., M. P., Hemel Hempstead, was 1st.

That better known Grape, Gros Colmar, brought five lots only, the finest, about 3 lb. bunches, coming from Mr. M. Dawes, gr. to the Hon. Mrs. Meynell Ingram, Temple Newson, gr. to A. Smith, V. V. W. H. to Lord Rothchild, Tring Park. These were pretty tapering bunches, and showing high cultivation.

Placed in the schedule as Gros Guillaume, but best known as Barbarossa, this fine Grape found only one pair of bunches to represent it, but some very excellent samples from Mr. R. Dawes, and well merited the 1st prize awarded.

Gros Maroc was also moderately represented, only five lots being staged, but the quality was good. Curiously enough of these five samples, the best was staged by Mr. J. Wallis, Esq., M. P., Hemel Hempstead, but the other bunches were perfectly round; yet in all other respects, even to the wood, there was no difference. Mr. Roberts had medium sized but superbly finished berries of the oval type. Mr. Miles came 2d with the same form, and Mr. Wallis was 3d.

That smaller late Grape, Lady Down's, brought six pairs, Mr. Hollingsworth coming 1st with big bunches, but rather wanting colour; Mr. Wallis coming 2d, his bunches, if smaller, being more highly coloured; and Mr. Allis was 3d.

Fine lots again were staged of Madresfield Court Grape, the finest—if not handsome, at least deep coloured in berry—coming from Mr. Jackson, whose bunches were had very handsome even bunches a trifle smaller, Mr. Vent and Mr. Roberts being placed equal 3d, as both lots were so good.

Mrs. Pince brought no less than seven competitors, Mr. Pratt coming first with large samples, very fresh but a little being finished; Mr. Horsfield was next, with smaller but neat bunches; and Mr. Allen was 3d, with large loose bunches, badly coloured.

Only two lots of Mill Hill Hamburg put in appearance. Mr. Taylor having the best, and Mr. Read the others, which were rather ruined.

Muscot Champion was the only Grape invited that did not put in an appearance.

The best filled class was that for Muscat of Alexandria, there being eight lots staged, the finest coming from Mr. Lowry, who had massive bunches, very fresh but little being finished; Mr. Pratt came 2d with other grand bunches, even less well coloured; and Mr. Roberts was 3d, with solid medium sized bunches, but the best coloured in the class.

Only one pair bunches of Raisin de Calaire put in an appearance, and these proved to be Trebbiano. Mr. Harrold showed the true Raisin de Calaire from Chiswick, and that presented a very different form of bunch and berry, with very diverse flesh and flavour.

Only one lot of Royal Muscadine was shown, and so poor a sample that only a 3d prize was awarded. Four lots of Trebbiano, fine bunches, were put up, Mr. Hollingsworth having the best in large clusters, berries rather uneven, but still good; Mr. J. Edmonds, Bestwood Lodge Gardens, was 2d, with smaller but handsome bunches; and Mr. Roberts was 3d.

Mr. Baird had the only lot of the variety, St. Peter, good bunches, richly coloured, and worthy the 1st prize.

Of White Tokay there were but two lots, Mr. Roberts having the best in finely coloured 4 lb. samples, and Mr. Hollingsworth was 2d, his samples being too green.

The class for any other kind brought five lots. Mr. J. W. G. G. of the Dublin Estate, Dublin, with Vindus being 1st, with Cooper's Black, finely berried and coloured, and as close as two Peas like to the round form of Gros Maroc before noticed. Mr. Horsfield was 2d, with Chatsworth Seeding, a black kind not unlike Verm's Muscat, still, in colour, rather like Mr. Roberts was 3d, with fairly good Duchesse of Beaufield.

Of other kinds shown were Black Frontignan and Black Monnik, the latter presenting large loose bunches and pointed reddish berries that were the reverse of pleasing in appearance.

Mr. Couper's special class for Frontignan Grapes brought no entry, whilst for

MESSERS. WEBBER & CO'S GRAPE PACKING PRIZES.

the boxes or baskets sent by rail as parcels, each to contain 12 lb. of fruit, the 1st prize went to Mr. S. Castle, for a capitally packed basket, which was a simple cross-handle white wicker one, and oval in shape, having a round head, and a long stem. This was simply lined with two sheets of tissue paper, and bunches being dropped in all round the sides so that the stems could be tied to the basket at the top; other bunches were dropped into the middle and these closing down fixed the whole firmly. When some of the bunches were opened over the basket, and the handles had stout paper taped over, and in this way the packing was complete. Certainly, nothing could be lighter or simpler, whilst the Grapes within were perfect. Mr. Goodacre came 2d, with a similar basket, his Grapes showing off better, as he had buried his stems in packing, but that is no advantage as in packing the berries get rubbed. Mr. Turton, Maiden Erlegh Gardens, was 3d, his Grapes being in a deal box, well packed, but of course much greater in bulk than are baskets. There were four lots in baskets and four in boxes, but Mr. Castle had two baskets out of five.

Mr. Couper's special class for Frontignan Grapes brought no entry, whilst for

Mr. Kouell showed an interesting collection of Grapes, small in bunch; and Messrs. Lane & Sons, Berkhamstead, had seven of their grand pot Vines, huge circular trained plants, in monster pots, each plant carrying from fifteen to twenty fine bunches, of the finest quality, and including Ethel and Harrold. Gros Maroc, Foster's Seedling, Alicante, and Gros Colmar.

GRAND NATIONAL DAHLIA AND FRUIT SHOW, CRYSTAL PALACE: September 4 and 5.

The Dahlia Show took place in conjunction with the fruit show at the Crystal Palace, and it was a source of great gratification to the exhibitors that they were once more able to stage their blooms in the western portion of the nave, instead of in a tent in the open ground, as last year.

The entries in all the classes were numerous—much more numerous, indeed, than could have been expected, considering the dry character of the summer; but the showers of the two or three days previously kept a few away that would otherwise have come. One grower from Scotland stated that his plants had been injured by frost in the previous year. Mr. Turner was in good form, the flowers of good size, and of remarkable quality; while those of his rivals, Messrs. Keynes, Williams & Co., were small and rough, showing the effects of the dry weather. The Northern growers were well represented, and they gave a good

account of themselves. On the whole it was a thoroughly representative exhibition, all classes of flowers being well represented, and the seedlings, especially those of Messrs. Rawlings Brothers, were most promising.

SHOW DAHLIAS.

In the nurserymen's class for forty-eight distinct varieties there were five competing collections, Mr. Charles Turner, Royal Nursery, Slough, being 1st, with a very good and well-balanced lot, in the selection of which for the premier position the judges could have found but little trouble, the varieties being Miss Cannell, Mrs. Lantry, James Stephens, William Rawlings, Mrs. Hodgson, Harry Turner, dark maroon, nearly black, extra fine; Lady Winborne, Mrs. G. Harris, Goldfinder, Joseph Green, Staatsman, Julia Wyatt, Georgina, Joseph Ashby, Mrs. Harris, J. N. Keynes, Mrs. C. Reid, Champion, Mrs. E. S. B. Service, J. B. Service, Burgundy, F. J. Salmars, y-flow, deeply edged with red, distinct and pleasing; John Standish, Mrs. F. Foreman, Seraph, Lady G. Herbert, Prince Bismarck, Canary, Prince of Denmark, Henry Walton, Rosetta, Mrs. F. Foreman, Shirley Hubbard, Mrs. M. S. Cannell, and tipped with purple; Mrs. Henshaw, Mrs. Douglas, vivid scarlet, bright and showy; Imperial, Jas. Bennett, Muriel, Constance, Hope, Chris, Kidley, George Rawlings, Mrs. Gladstone, Hon. Mr. P. Wyndham, Sunbeam, and Ruby Gem, all of which were of Boston, Mass. origin, and well defined, Yorkshire, with larger flowers generally, but not so refined as those from Slough, still a very good contribution indeed from the North. The varieties were—Henry Bond, Sunbeam, Emily Edwards, Charles Leicester, James Vick, Clara, Mrs. Stancomb, Mrs. C. Reid, John Green, James Stephens, Thomas Goodwin, J. N. Keynes, William Rawlings, Joseph Ashby, Egyptian Prince (self), The Rover, Flag of Truce, Triumphant, James O'Brien (self), Vice-President, Miss Henshaw, Lord Chelmsford, H. W. Ward, Harrison Vener, Hope, Senator, Constance, Mr. J. T. West, Mrs. H. Harris, Ethel Britton, Prince of Denmark, William Dodds, a fine orange-buff self; James Cocker, Hon. Mrs. P. Wyndham, Mrs. G. Harris, Mrs. Gladstone, very fine; Goldfinder, Ethel Britton, Henry Walton, Imperial, John Wyatt, Prince Bismarck, J. C. Reid, Mrs. F. Foreman, Shirley Hubbard, Mrs. M. S. Cannell, and Annie Neville, 3d, Messrs. Harkness & Sons, florists, Grange, near Bedale; 4th, Messrs. Keynes, Williams & Co., Castle Street Nursery, Salisbury.

A similar number of competitors contended in Class B, in a twenty-four show varieties, and here Messrs. Salmars & Co. of Slough, and Mr. Geo. E. Footroy, were 1st with a very good, fresh, well developed lot of flowers, consisting of Criterion, Goldfinder, James Cocker, Mrs. Dodds, Hon. Mrs. P. Wyndham, J. B. Service, Ethel Britton, Joseph Ashby, Lady G. Herbert, J. Leicester, Mrs. Gladstone, Shirley Hubbard, Mrs. M. S. Cannell, Mrs. Harris, Henry Walton, Mrs. Shirley Hubbard, Earl of Radnor, Hope, J. N. Keynes, Mrs. G. Harris, Sunbeam, Revival, Mrs. Hodgson, and John Standish, 2d, Messrs. Rawlings Bros., florists, Old Church, Romford, with a very good lot, consisting of Mrs. John V. West (seedling), Mrs. H. Harris, F. J. Salmars, y-flow, Imperial, Flag of Truce, Rev. J. Goddard, Mrs. Glasscock, a pure white self of promise; Mrs. E. Rawlings (seedling), Mrs. Glasscock (seedling), John Henshaw, Clara, William Steer, Mrs. Harris, J. T. West (seedling), Mrs. Salmars, F. J. Salmars, y-flow, Bid of Passage (seedling), Mrs. Douglas, Hon. Mrs. P. Wyndham, Goldfinder, William Dodds, Georgina, Minnie, and R. F. Rawlings (seedling), 3d, Messrs. Paul & Son, Old Nurseries, Chesnut, N., 4th, Messrs. J. Cheal & Sons, Longfield Nurseries, Crawley, Sussex.

There were five competitors in the class for twelve varieties, and here Mr. John Walker, nurseryman, Thame, Oxon, was a good 1st, with admirable blooms of John Standish, Mrs. Gladstone, William Rawlings, Champion Rollo, George Rawlings, Earl Radnor, James Cocker, Hon. Mrs. P. Wyndham, Monarch, Mrs. F. Foreman, William Green, and George Bennett, 2d, Messrs. J. Gilbert & Son, St. Margaret's Nursery, Ipswich, with a C. Quennell, Mrs. G. Harris, Hon. Mrs. P. Wyndham, James Stephens, Mrs. G. R. Jefford, James Steer, Constance, Rosetta, Harrison Veir, J. T. West, John Bennett, F. J. Salmars, y-flow, Mrs. J. Burrell & Co., Howe House Nursery, Cambridge; 4th, Mr. G. Humphries, Kingston Langley, Chippenham.

AMATEURS.—In the amateurs' division the best twenty-four blooms came from Mr. George Boothroyd, 1st, with a very good lot, as follows—Prince Bismarck, Mrs. Gladstone, Mrs. Dodds, Ethel Britton, Earl of Beaconsfield, John Henshaw, Rev. J. Goddard, Goldfinder, Flag of Truce, Hon. Mrs. P. Wyndham, Mrs. G. Harris, Jos. Bennett, Clara, Henry Walton, George Rawlings, J. Rawlings, Mrs. Henshaw, Harry Veir, Lady G. Herbert, Mrs. Henshaw, James Cocker, Miss Cannell, John Standish, and one unnamed, 2d, Mr. John Spoor, Prospect Cottage, Musgrave, Longfield, with Clara, Chorister, Mrs. Gladstone, and William Rawlings, 3d, Rev. J. Goddard, 4th, Mr. M. C. Mamm (self), Earl of Ravensworth, Lord Chelmsford, Harrison Veir, Jas. Vick, Countess of Ravensworth, J. B. Service, Hope, H. W. Ward, James Cocker, Joseph Ashby, J. N. Keynes, Imperial, J. C. Reid, John Henshaw, Harry Veir, F. J. Salmars, and the Hon. Mrs. P. Wyndham; 3d, Mr. Henry Glasscock, Rye Street, Bishop's Stortford; 4th, Mr. John Nation, Whitmore, Staplegrave, Taunton. Eight collections were staged in this class.

Some of the best blooms there were as many stands competing, and here Mr. J. T. West, gr. to W. Keith, Esq., Cornwallis, Brentwood, was 1st, with very nice fresh blooms of the following—William Rawlings, Mrs. Gladstone, John Henshaw, very fine; Henry Walton, Mrs. Harris, Joseph Ashby, Prince of Den-

mark, Mrs. P. Wyndham, George Rawlings, Harrison Mrs. S. Hibberd, and H. W. Ward, 2d, Mr. John Walker, Alnmouth Road, Low Fell, Gateshead, with Mrs. Gladstone, Mrs. Henshaw, Mrs. M. S. Cannell, Earl of Ravensworth, Buttercup, a fine yellow self; Prince of Denmark, Hon. Mrs. P. Wyndham, James Cocker, J. N. Keynes, Imperial, Henry Walton, and Emily Edwards, 3d, Mr. J. Tranter, Upper Assenden, Henley-on-Thames, with fine extra large fine blooms of Mrs. Gladstone (selected as the premier show flower), Champion Rollo, James Cocker, Hon. Mrs. P. Wyndham, James O'Brien (self), Vice-President, Prince Bismarck, Earl of Ravensworth, Annie Neville, Mrs. F. Foreman, Sunbeam, and Miss Cannell; 4th, Mr. Thomas Garratt, Canine's Store, Romford.

There were eleven collections of 16 blooms in class H, and here Mr. Jonathan Harris, Broomfield, Chelmsford, was 1st, with admirable examples of Ethel Britton, Emperor, Mrs. Harris, Prince of Denmark, Goldfinder, and Mrs. G. Harris; 2d, Mr. A. T. Burrell, gr. to the Rev. Mr. Trimmer, Broomfield, Chelmsford, with Ethel Britton, Shirley Hubbard, Mrs. Dodds, Mrs. G. Harris, Hon. Mrs. P. Wyndham, and Prince of Denmark; 3d, Mr. W. H. Aphorpe, Albion Brewery, Romford; 4th, Mr. Thomas Coote, North Terrace, Bishop's Stortford.

FANCY DAHLIAS.

In the nurserymen's class for twenty-four varieties there were four competitors, and here Mr. C. Turner again scored 1st honours, having a remarkably good lot of blooms of the following—Gaiety, Grand Sultan, Frederick Smith, Henry Glasscock, Miss Annie Melsome, Romeo, Annet, and Richard, W. G. Head, Charles Wyatt, Professor Fawcett, Duchess of Albany, Peacock, Edward Peck, Mrs. Saunders, Chorister, George Barnes, Laura Haslam, Rebecca, Miss Lily Large, General Gordon, James O'Brien, Robert Burns, and two seedlings, 2d, Messrs. Keynes, Williams & Co., with Gaiety, Charles Wyatt, King of Clubs, Duchess of Albany, Hercules, Rebecca, Madame Saubrey, Parrot, George Barnes, Flora Wyatt, Romeo, Chorister, Peacock, Miss Annie Melsome, General Gordon, Professor Fawcett, Mandarin, Fanny Surt, Gaiety, sport and seedlings; 3d, Mr. H. Boston; 4th, Mr. H. Clark, florist, Rodley, near Leeds.

Messrs. Rawlings Bros. had the best twelve, staging good blooms of Gaiety, Edward Peck, Lotty Eckford, Peacock, Mrs. Saunders, Professor Fawcett, Polly Sandell, Frank Pearce (seedling), extra fine, selected as the premier fancy; Mrs. H. Boston, tipped with white; Mrs. Stevens (seedling), Annie (seedling), and Gem, 2d, Messrs. J. Salmars & Sons, with Edward Peck, Canine, John Lorton, High Austin, Rebecca, Mrs. Saunders, John Forbes, Fanny Surt, Litty Coles, General Gordon, Chorister, and Galatia, 3d, Messrs. Cheal & Sons, 4th, Messrs. Paul & Son.

In the amateurs' class for twelve varieties there were seven collections, the best—and a very good lot they were—came from Mr. Henry Glasscock, who had capital blooms of J. Lamont, Goldrich, Professor Fawcett, Mrs. Saunders, Henry Glasscock, Polly Sandell, Miss L. Large, Canine, Peacock, Flora Wyatt, Chorister, and Lotty Eckford, 2d, Mr. R. Petfield, The Gardens, Duddington, Buckden, Hunts, with Edward Peck, Gaiety, Peacock, Jeanette, Lotty Eckford, Romeo, Fanny Surt, Mrs. Harris, August of Albany, Mrs. H. Vincent, Alderman, and High Austin, 3d, Mr. H. Vincent, The Gardens, The Poplars, Keyner; 4th, Mr. Barnabas Clark, Spottesham, Norfolk.

There were eleven competitors in the class for six flowers, Mr. William Steer, 2, Hamilton Terrace, New Ethelton, Kent, was 1st, and Mr. Geo. Footroy, 2d, Mr. Thos. Garratt, 3d, and Mr. J. T. West, 4th. The varieties did not differ from those already given.

POMPON DAHLIAS.

These were as usual effectively shown in bunches, and they made an exceedingly pretty display. The best twenty-four distinct varieties came from Messrs. Keynes & Co., a very fine lot indeed, and an excellent assortment of varieties; they had the Khedive, Dora, Gem, Flora Macdonald, Little Prince, Catherine, Sappho, Wilhelm Nitsche, White Aster, Cupid, Garnet, Mabel, Rosetta, E. F. Jungker, Isabelle, rich scarlet; Nemesis, Fanny Weiner, Golden Gem, Julie, Valentine, Ernest, 2d, Mrs. Dora Carter, Lady Blanche, Brunette, and Kosabe, 3d, Mr. C. Turner, with E. F. Jungker, Mabel, Little Beauty, The Khedive, Dr. Rauch, Nymph, Louis Rodan, Gem, Nemesis, Jessie McMillan, Olivette, Thomas Moore, Titania, Rossy Morn, Dove, Princess Zita, Sophie, Fanny Weiner, Hilda, Fair Play, Little Arthur, Formosa, Professor Bergaet, and White Aster, 3d, Messrs. Rawlings Brothers.

Messrs. J. Gilbert & Son had the best twelve, staging charming bunches of Handel's Gaetner, Little Mabel, Lady Blanche, Guiding Star, H. Miesley, Seraph, Little Bobby, Pure Love, J. E. O. Enke, Garnet, and Cupid, 2d, Messrs. Paul & Son, with Dove, H. Miesley, Dora, Lightning, A. Hubner, Little Bobby, Favourite, F. Weiner, Lady Blanche, Mabel, Gem, and Anna Zuechmann, 3d, Messrs. F. J. Smith & Co., nurserymen, Salisbury.

The best six bunches came from Messrs. J. Burrell & Co., who had Coquette, White Aster, Gem, Little Duchess, Prince of Liliupatians, and Titania, 2d, Mr. J. T. West with E. F. Jungker, White Button, Gem, Little Ariste, Mabel, and Fanny; 3d, Mr. J. Walker, Thame; 4th, Mr. G. Humphries.

SINGLE DAHLIAS.

These were, as usual, superbly shown, and they made a very effective display, shown in large triangular shaped bunches. J. Cheal & Sons had the best twelve, staging

Junco, Charles Lewis, Queen of Singles, Silver King, Negress, Alba perfecta, Brutus, Fashion, Paragon, Sunset, Fomental, and Henry Walton, 2d, Mr. C. Turner, with Harlequin, Alba, Lucy Ireland, Sealife Defiance, Queen of Singles, Sunbeam, Mandarin, Defiance, Duchess of Westminster, Ellen Terry, Aurora, and Lutea grandiflora; 3d, Messrs. Keynes, Williams & Co., who had fine bunches of King of Clubs, Princess, Marie Queen Improved, Velvet Mantle, John Cowan, Defiance, Queen of Singles, and Acquisition; 4th, Mr. John Walker, Thame.

Messrs. J. Gilbert & Son had the best six bunches, staging the following in fine form—Lucy Ireland, Dr. Coote, Charles Lewis, Mrs. Bowman, White Queen, and William Castle, 2d, Messrs. J. Burrell & Co., with Ascalon, White Queens, Mrs. Bowman, Gracilis percutus, Dr. Moffatt, and Lutea grandiflora; 3d, Mr. J. Jones, gr. to J. S. Pope, Esq., Cedar Lodge, Bath; 4th, Mr. T. Hooper, florist, Widcombe Hill, Bath.

PREMIER DAHLIAS.

The premier show Dahlia was a magnificent bloom of Mrs. Gladstone, shown by Mr. J. Tranter, Upper Assenden, Henley-on-Thames; and the premier fancy a seedling named Frank Pearce, shown by Messrs. Rawlings Bros.

SEEDLING DAHLIAS.

The Dahlia show of 1885 will be remarkable for the great success achieved by Messrs. Rawlings Bros. of London, with seedlings, some of which they showed, somewhat late in the season, a batch, a half-dozen of which were distributed by Mr. C. Turner, and these proved they had hit upon a fine strain. This year they produced a batch of some ten seedlings, and to five of these First-Class Certificates of Merit were given—Eva Fisher, E. Rawlings, delicate pink, with faint stripes and tip of purple, good petal and outline, high centre, distinct, and very constant, as a dozen blooms of it were shown; Mr. Glasscock, the centre maroon, the circumference bright purple, somewhat flat, good outline and centre; Bird of Passage, light ground, tipped with pale lilac purple, very pretty and pleasing; Mrs. John Walker, delicate pink, the centre sulphur, with a wire edge of purple to the petals, good petal and outline, high full centre; and Frank Pearce (fancy), bright deep lilac-purple, flaked and striped with crimson, the petal, outline, and centre, and in every way first-rate. Other seedlings were Mrs. Keith, of the Miss Cannell type, the well-formed petals heavily edged with purple; Robert Petfield, bright orange-red, good centre, flat, and the petals a little reflexed; and Mrs. Stevens (fancy), light ground, outlined with purple, the petals with crimson and mauve. Messrs. Keynes, Williams & Co. had Pelican (fancy), delicate ground, striped and flaked with purple, the petals a little ribbed, good high centre and outline; Richard Dean, a distinct bright purple self; William Slack, bright red, very showy; Thomas Hobbs, maroon shaded with purple; Eva Fisher (fancy), orange-buff, flaked with scarlet; and Salamander (fancy), yellow-ground, flaked and striped with crimson. Mr. C. Turner had Irene, delicate lilac lightly shaded with pale purple, good petal and outline, high centre, and centre; Orlington, had Lady Holmedale, white, flaked with purple; Chieftain, a yellow self; Freedom, buff, striped with ruby red; and Draughtsman, crimson, shaded with maroon.

The following three money prizes were offered for seedlings were awarded to Messrs. Rawlings Bros. of London, 1st, Mrs. E. Rawlings; 2d, Mrs. John Walker; 3d, Bird of Passage.

TURNER MEMORIAL PRIZE.

This is a handsome silver cup offered for twelve show and six fancy Dahlias, and it has to be won three times before it can be claimed, the property of the holder. There were five entries for this memorial, but one only was forthcoming, that from Mr. Henry Glasscock, Bishops Stortford, who had the following show flowers—George Rawlings, Miss Cannell, Imperial, Hon. Mrs. P. Wyndham, Sunbeam, Shirley Hubbard, Mrs. Gladstone, Fanny Gardner, Prince of Denmark, Cyprus, Senator, and Mrs. Harris; and the following fancies—Henry Glasscock, Peacock, Professor Fawcett, Canine, Mrs. Carter, and Lotty Eckford.

Miscellaneous contributions included a very fine lot of pompon, single flowers, Mrs. Gladstone, of Longfield Nurseries, Crawley, the latter in a ware, a pretty new variety named Mrs. C. Hawkins-cream-white, edged with delicate purple on the side, petals; a collection of Cactus Dahlias from Messrs. Keynes, Williams & Co., a fine collection of pompon and single Dahlias and hardy flowers from Messrs. J. Cheal & Sons.

CUT FLOWERS: OPEN CLASSES.

For a collection of Gladioli spikes, the 1st prize was well won by Mr. A. E. Campbell, Cove Gardens, Gourock, N.B. This was a collection of the property of the holder, and accustomed to witness from Cove, an account of whose novelties and finest blooms will be found in another part of our issue.

French and quilled Asters were rather numerously shown, but they were of great variety, and some of the most beautiful hadered the development of very fine examples. Messrs. Salmars & Son, Chelmsford Mr. J. Jones, gr. to J. S. Pope, Esq., Cedar Lodge, Bath, Mr. F. Hooper, Bath, Mr. J. Morgan, gr., Wray Park, Reigate, being the principal prizetakers.

Some rather large and fine collections of Hollyhocks, twenty-four blooms, distinct, were shown by Mr. Finlay, gr. to Mr. M. Proud, East Layton Hall, Leighton, who obtained 1st prize; Mr. Hy. Clarke, Hodley, Leeds, was 2d; Messrs. Harkness, Grange Nursery, Bedale, 3d. Collections of cut stove and greenhouse flowers were

well shown by Mr. A. Gibson, 1st; Mr. J. Hudson, 2d. This exhibitor had inserted the stalks of the blooms into pits growing in Adamantiums, Mr. G. Parrot, 1st, to W. Wright, Esq., The Grange, Denmark Hill. There was an entire absence of any novelties amongst the flowers shown, these being of the usual showy class seen at this season of the year.

Mr. Percy, 89, St. John's Road, Forest Hill, S.E., took 1st prize for the collection of early flowering Chrysanthemums, the best kinds being Mrs. Cullingford, Petite Marie, Nanun, Lyon, Mademoiselle [l'olivier, Madame des Granges, and Mons. Dufoy; Mr. H. James, Lower Norwood, took 2d prize, sorts nearly similar to the foregoing; and Mr. N. Davis, Camberwell, 3d.

AMATEURS.

For the best twelve *Gladiolus* spikes, Rev. H. H. D'Ombrian was far away the 1st with his collection—Meyereber, Murillo, Leandre, Tamerlane, Seduction, Flamboyant, and Texter Gem being the finest spikes. Mr. A. Whitton, Askew, Bedale, was 2d, the spikes being likewise of much beauty—Ninon de l'enclou, Meyereber, Adolphe Bronziang, and a few of the same kinds as in the premier collection; Mr. J. Nation, Whitmore, Stroud, was 3d.

The prizes for *Hollyhocks*, twelve distinct, fell respectively in the order of their names to Mr. G. Finlay, Mr. A. Whitton, and Mr. H. Cattle, Claverton Buildings, Widocombe, Bath.

MISCELLANEOUS.

Messrs. J. Laing & Co., Forest Hill, brought a beautiful collection of their newest strain of tuberous *Begonia*, amongst them being many with self-supporting stems, the plants being compact, and very sturdy. An extra prize was awarded.

Messrs. H. Cammel & Sons, Swanley, had also a large group of these useful plants, the central portion of his group being composed of *Begonia* Rosamund, a heavy flowered pendulous kind of the colour of there were heavy flowered *Begonia*, *Cactus*, *Dahlia*s, single *Dahlia*s, bunches, the best of the latter being Kate Green, Thérèse, and Defiance. Flowers of single *Begonias* and pompon *Dahlia*s were noticed as being conspicuous on this stand.

Mr. J. Neighbour, Bickley, received an extra award for a new collection of fruit, Mr. Butler for Pears, and Mr. Boothroyd for cut blooms of out-of-door flowers. Mr. James Don, seedsman, Chappel Street, Nottingham, exhibited a peculiarly rough-skinned *Potato*, named the Village Blacksmith—a well reputed good character. It was a handsome, thick looking tuber, and a prolific cropper; but nothing quite definite can be said about it until after further trials.

First-class Certificates were awarded to Rev. H. H. D'Ombrian, Ashford, for *Gladiolus* Rabourt; Messrs. Kelway & Son, Langport, for *Gladiolus* Churchill, Dora Thorne, Princess Maude, Lord Ashbourne.

FRUIT.

The quality of the fruit of all kinds was of an unparelleled degree of excellence, more especially the *Grapes* in all the various classes. Perhaps the most striking of the *Alexandria* Grapes, *Dahlia*s in appearance than in the case in those years when the amount of sunlight is greater than it has been this year. We have enjoyed heat, and we have been free from the usual drenching rains of an English summer, both of which factors in first-class Grape culture, will account for much of the general excellence of the fruit shown, and from which the *Grapes* would more particularly benefit. Peaches were not so large as in wetter years, but the colour left nothing to be desired, so far as high coloured kinds are concerned. Morello Cherries, Plums, Figs, were mostly finely grown and of a large size. In the Pines, but few were shown, the best sort being *La Grasse Sucrée*, now much plumed in colour—a decided advantage in point of appearance. Quatre Saisons followed next in point of size, and is in point of flavour the superior of the first named kind, but being merely an underling pine, and relatively small, would find fewer connoisseurs. Garibaldi, a well-known variety, found place in one of the winning collections.

COLLECTIONS OF NOT LESS THAN TWENTY DISHES.

For the prizes in this competition five collections were entered, and the merits of most of them were keenly discussed. Eventually the prizes fell to—1st, Mr. J. Roberts, gr. to Messrs. de Rothschild, Gunnersbury Park, the sorts of fruit shown being—*Grapes*, Black Hamburg, white variety; Alnwick Seedling, good; Muscat of Alexandria; Fine Apple, Pears—Lord Napier, Victoria, Sea Eagle (very tall); Plums, Transparent and Kirkes'; *Melon* W.illery, Pear Bon Chrétien, Apple Red Astrachan, &c. Mr. Goodacre, gr. to the Earl of Harrington, Elvaston Caste, was 2d, his best dishes being—*Grapes* Madresfield Court, Nectarine Fine-apple, Peach Downshire, Strawberry Garibaldi, Cherries Morello, Plum MacLaughlin's Gage, Black Hamburg *Grapes*, and Charlotte Rothschild Pine. Mr. Ward, gr. to the Earl of Radnor, Longford Castle, Salisbury, secured the 3d prize, his being—Pears, Foster's Seedling Grapes, Queen's Figs, and Morello Cherries being very good produce.

FOR COLLECTIONS OF TWELVE DISHES

There were four entries, the 1st prize going to Mr. Coomber, gr. to J. H. Rolls, Esq., M.P., The Hendre, Monmouth. In this capital lot were five Brunswick Figs, *La Grasse Sucrée* Strawberries, D'Alsace Apricot, Clapp's Favorite Pear, Downton and Lord Napier Nectarines, and the delicious Reine Claude, du Bayly Plums. Mr. G. T. Miles, gr. to Lord Carrington, Wycombe Abbey, was the winner of the 2d prize, the Gros Maroc and Foster's Seedling Grapes, Morello Cherries, Smooth Cayenne Pine-apples, and Sea Eagle

Peaches being amongst the more noticeable fruits. Mr. A. Miller, gr. to H. W. Long, Esq., M.P., Rood Ashton, Trowbridge, was 3d.

FOR THE BEST EIGHT DISHES OF FRUIT,

from which Pines were excluded.—1st, Mr. W. Pratt, gr. Lougale Gardens, Warminster, the Black Hamburg and Muscat of Alexandria, Pears, Cherries, and Figs being excellent; 2d, Mr. Edmunds, gr. to the Duke of St. Alban's, Bestwood Lodge, Nottingham, whose Alicante Grapes and Barrington Peaches were superb; 3d, Mr. Elphinstone, gr. to E. M. Mundy, Esq., Shipley Hall, Derby.

COLLECTIONS OF GRAPES, TEN KINDS, TWO BUNCHES OF EACH.

Here as in the collection of miscellaneous fruits, Mr. J. Roberts took the lead, proving the excellence of the management of the Vine as noted before. The sorts shown were Madresfield Court, fine in berry and colour; Buckland Sweetwater, also extra good; Lady Downe's, Foster's Seedling, Black Hamburg, two very fine bunches; Muscat of Alexandria, large in bunch, but not extraordinary in colour; Gros Maroc, fine in every point; Trebbiano, medium-sized bunches of Black Alicante, and Alnwick Seedling, the colour, bloom, and size of berry and bunch, being all that could be wished for. Mr. Ward, Longford Castle Gardens, was 2d, his bunches of Black Pine, Gros Guillaume, Gros Maroc, &c. were all well, but were less well finished; the Black Hamburgs were rather loose in the bunch, but very fine in bloom and colour. Mr. J. Wallis, gr. to Rev. W. Sneyd, Keele Hill, Newcastle, was 3d, the Barbarossa and Gros Maroc being of much merit.

COLLECTIONS OF FIVE KINDS OF GRAPES.

Here Mr. Pratt was awarded the 1st prize; his bunches of Black Hamburg were superb, not over large of berry, and for size of bunch and unblemished bloom were unapproachable. His other kinds were Lady Downe's, Alicante, &c. Pines—fine in bunch and colour; Muscat of Alexandria, very large bunches, not apparently over-ripe, and somewhat irregular in size of berry. Mr. J. Hudson, gr. to H. J. Atkinson, Esq., M.P., Gunnersbury House, Acton, was 2d; the bunches in this collection of Gros Maroc, Madresfield Court, and Alnwick Seedling were very superior. Mr. Smith, gr. to W. H. Sewell, Esq., Warren Hill, Longholm, Essex, 3d; this lot contained some not handsome or symmetrical bunches of Gros Maroc, but which were large in bunch and berry; Black Alicante was likewise excellent.

For the best three bunches of Black Hamburg.—1st, Mr. Pratt, with massive bunches, heavily shouldered, well coloured throughout, and the individual berries were sufficiently large; 2d, Mr. J. Bury, gr. to A. Richards, Esq., Tewkesbury Lodge, Forest Hill, the bunches large, but berries rather small; 3d, Mr. F. Jordan, gr. to B. Esler, Esq., Witley, Goring.

For the best three bunches of Muscat of Alexandria.—1st, Mr. J. Lowry, gr. to J. McAndrew, Esq., Belmont, Mill Hill, Hendon—massive compact bunches of the highest excellence; 2d, D. P. Blaine, Esq., Fowley, Liphook, Wiltshire (gr. Mr. P. Edwards), fine well coloured ripe bunches; 3d, Mr. Pratt.

For the best three bunches of Gros Colmar.—1st, Mr. R. Dawes, gr. to Hon. Mrs. Maynell Ingram, Temple Newsham, Leeds—four bunches but not up to the mark in colour and finish; 2d, the 2d was withheld, and a 3d prize was awarded to Mr. Elphinstone, gr. Shipley Hall, Derby.

For three bunches of Madresfield Court.—1st, Mr. Goodacre, Elvaston, with compact symmetrical bunch, that was not too long in proportion to the width—a peculiarity often met in this kind, and decidedly desirable.

For the best three bunches of Gros Maroc.—1st, Mr. H. Hudson, with bunches first-rate in every point; 2d, Mr. H. Folkes, gr. to T. F. Halsey, M.P., Gaddesden Place, Hemel Hempstead.

For three bunches of Alicante.—1st, Mr. W. Howe, gr. to H. Tat. Esq., Park Hill, Streatham Common, with massive bunches, in which the berries were much too crowded; the weight of three was 16 lb.; 2d, Mr. W. Pratt, very fine bunches in every way, but less in weight than the foregoing; 3d, Mr. T. Osman, gr. to Mr. T. Butler, Esq., Church Park, Chertsey, with good specimens, having beautiful bloom upon them.

An extra prize was accorded Mr. J. Neighbour, gr. Bickley Park, Kent.

For three bunches of any other white Grape.—1st, Mr. Osman, for very fine bunches of White Frontignac, well shouldered; 2d, Mr. Fouldes, with Golden Queen; 3d, Mr. Roberts.

For the best three bunches of any other black Grapes.—1st, Mr. Dawes, gr. Temple Newsham, with bunches of Barbarossa weighing together 25 lb. the colour, form of bunch, and regularity of shape being quite remarkable, even in this large and varied variety; 2d, Mr. J. Roberts, his fine Gros Maroc looking small beside the Grapes of Mr. Dawes; 3d, Messrs. T. Rivers & Son, Sawbridge-worth, with the last-named variety. The Grapes generally in this class were of superb quality; but space forbids our referring to the unsuccessful exhibitors.

Although prizes were offered for two Queen Pine-apples, there was no competition. The prizes for two Pine-apples of any other variety were taken respectively by Mr. G. T. Miles, 1st, and Mr. Goodacre, 2d, the 3d prize being withheld. For the best four dishes of Peaches, distinct.—1st, Mr. DIVERS, gr. Kitton Hall, Stanford, who had some splendid Barringtons, Princess of Wales, and Belle-gardes; 2d, Mr. Goodacre, with smaller fruits, but finely coloured; 3d, Mr. J. Roberts.

For the best four dishes of Nectarines in the order of the names was somewhat altered, Mr. J. Roberts being placed 1st, Mr. DIVERS 2d, and Mr. Goodacre 3d. In the best collection good Pimston, Pine-apple, and

Lord Napier were noticed; and in the 2d lot Rivers' Orange and Stanwick.

In the best dish of Peaches—1st, Mr. A. Gibson, gr. to T. F. B. Atkins, Esq., Halstead Place, Sevenoaks, with Barrington; 2d, Mr. Pullman, gr. to R. B. Sheridan, Esq., Frampton Court, Dorchester, he having the same kind; Mr. G. Holliday, gr. to J. Norris, Esq., Cuckfield Hill, Bletchingly, was 3d.

For a dish of Nectarines, Mr. Pullman was 1st, with Pine-apple, a capital sample of fruit; Mr. Evans, gr. Lythe Hill, Haslemere, 2d; and Mr. DIVERS 3d, the sorts shown being in both instances the first-named sort.

The collection of six dishes of Peaches and six of Nectarines was appropriate too much for gardeners and nurserymen alike, only one competing lot appearing—that of Messrs. T. Rivers & Son, who were awarded the 1st prize; amongst the sorts of the former shown were Exquisite, a fine-looking yellow-skinned one; Madeline Bunch, a very pale Peach; and Raymaker, a pale oblong fruit.

For a Melon, green-fleshed, Mr. R. Spinks, Victoria Road, Horley, was 1st, with a medium-sized example of Best of All; and the veteran exhibitor, Mr. T. Bailey, gr. Shardeloes Gardens, was placed 2d, with a small Golden Queen; 3d, Mr. Ward.

In scarlet-fleshed varieties Mr. T. Bailey was 1st, with Victory of Bristol; Mr. G. Boothroyd, gr. to H. Coleman, Esq., Woodville, Dover, 2d, with Scarlet Gem; and Mr. E. Gillman, gr. to the Earl of Shrewsbury and Talbot, Ingestre Hall, 3d.

For four dishes of Plums, distinct, Mr. Neighbour was 1st.

For four dishes of green and yellow Mr. J. Wallis, Fernhill, Winkfield, Berks, was 1st.

For four dishes of purple kinds Mr. G. Holliday was 1st.

The 1st and only prize for Figs was awarded to Mr. J. Wallis.

The highest prize for a basket of black Grapes was taken by Mr. C. J. Salter, gr. to J. Southgate, Esq., Selborne, Streatham—the variety was Black Hamburg that were of excellent quality; Mr. T. Osman, Otter-shaw Park, was 2d, with Black Alicante, also a capital lot in every way; 3d, Mr. J. Hudson.

The prizes for the best baskets of white varieties were taken by Mr. C. J. Goldsmith, Kelsey Gardens, Becken-ham, 1st, with Muscats; 2d, Mr. W. Pratt; 3d, Mr. S. Castle, West Lynn, New Romney.

For twelve kinds of Apples, distinct, 1st, Mr. A. Waterman, gr. to H. Brassey, Esq., Preston Hall, Aylesford, Kent, with well known approved varieties; 2d, Messrs. T. Rivers & Son; 3d, Mr. W. Layzell, gr. to H. Hartley, Esq., Witley, Goring.

For ten kinds of Pears Mr. J. Bader, gr. to A. J. Thomas, Esq., Orchard Lane, Sittingbourne, was 1st, Messrs. T. Rivers & Son 2d, and Mr. Waterman 3d. The sorts shown, Louise Bonne de Jersey, Windsor, Belle Hardy, Conseiller à la Cour, Doyenne Boussolet, Clapp's Favorite, Beurré d'Ananias, Princess, Madame Treveur, Pitmaston Duchesse.

For three dishes of ripe Apples, distinct.—1st, Mr. Butler; 2d, Mr. Waterman; equal 3d, Mr. J. Neighbour and Mr. W. Layzell, the sorts exhibited being Hunt's Early, Worcestershire Pearmain, Red Astrachan, and Quarenden.

For three dishes of ripe Pears, distinct.—1st, Mr. Butler; 2d, Mr. Waterman; 3d, Mr. DIVERS, sorts being Desre, Cornelius, Windsor, Bon Chrétien, Beurré Giffard, Dr. Jules Guyot, Souvenir du Congrès.

For the Golden Apple, which took the 1st prize for the best collection of Tomatoes, six dishes, distinct; Mr. Goodacre the 2d, and Mr. S. Castle the 3d, most of the well-known large-fruited kinds finding place in one or other of the collections.

Stores and greenhouses for collections of native and foreign fruits brought two competitors—Mr. G. H. Wingfield, 37, Market Street Brighton, 1st; and Mr. G. Wood, 75, St. James' Street, S.W., 2d.

BRIGHTON AND SUSSEX: Sept. 2 and 3.

The annual autumn show of the above Society was held as usual in the Royal Pavilion and the grounds contiguous. The exhibition on this occasion was a thoroughly representative one, both plants, cut flowers, and fruit were of a high order of merit. The rooms and the large esplanade were lighted on the evenings of both days by the electric light; the large number of visitors present testified their appreciation of this advantage, which afforded many an opportunity of viewing the exhibition who otherwise would not during the daytime have been able to do so.

Stores and greenhouses plants were shown in good numbers; those in the winning collections were in first-rate condition, with but few exceptions. We noticed a few specimens that had nearly run their course, having become somewhat scrubby; it is a mistake to keep such as these, as young plants taking less rooms would be far more effective.

FLOWERING PLANTS.

In the large class for eight specimens in bloom, the Ashbury Cup was offered for the best collection; this was well won by Mr. Gilbert, of Hastings, with specimens in his best known and capital style, all being most numerous. These consisted of *Kalanchoe* the cocoones superba, of intense colour; *Allamanda Hendersoni*, and *A. cathartica*, both well done; *Erica remlia*, a fine plant; and *E. Exquisite*, very fresh and healthy; *Statis* Gilbert, a fine example; *Erica Williamsi*, a good bush; and *Erica* the coronata of *Erica cerinthoides coronata*, Mr. Rann, gr. to J. Warren, Esq., Handcross Park, Crawley, took 2d place with a very fine *Erica cerinthoides coronata*, the picture of health, and freely flowered; *Alla-*

manda Hendersoni, good; and Ixora Fraseri, in capital order. Mr. Meachen, gr. to C. Armstrong, Esq., Woodlee, Brighton, followed, and among whose collection was an excellent specimen of *Pimenta densata*, as fresh and healthy as it is seen in May, and a large bush of *Rondeletia speciosa* major, not sufficiently in flower to be effective.

For four specimens Mr. Gilbert repeated his previous achievement, winning with medium-sized bushes densely flowered of *Erica Eweriana*, fine colour; *Allamanda nobilis*, with flowers of extra size; a good *Dipladenia* *ambalis*, and a bright piece of *Statice*. Mr. Rann again came 2d, having a finely-coloured example of *Dipladenia hybrida*.

FOLIAGE PLANTS.

For six fine-foilage plants and six exotic Ferns, Mr. Rann turned the tables on his opponent winning with grand specimens, the best being *Thrinax elegans*, some 12 feet by 12 feet, very healthy; *Dicksonia antarctica*, with a fine head of fronds, and a stem some 10 feet in height; *Cycas revoluta*, of large size; a healthy plant of *Croton Weismanni*, and two good *Gleichenias*, *G. Mendellii*, well developed, and *G. Gleichenias*, *G. Croton* variety, a rare Fern, somewhat resembling *Balanium culcita*, but much finer in all its parts, was also in this collection. Mr. Gilbert followed in this case with a good *Adiantum* *latifolium*, the best of which were *Dicksonia antarctica* and *Adiantum latifolium* among the Ferns, and *Brahea filifera* and *Croton majesticus* among the foliage plants. Mr. James, of Norwood, came 3d, having a grand example of *Davallia Mooreana*, and a fine *Areca lutescens*—*Macrorhiza Demissionia* being likewise a striking plant.

PELARGONIUMS.

Mr. Gilbert won premier honours in all three of the open classes for zonal Pelargoniums—viz., for four zonals (not scarlet), four scarlet, and four in which having a very high and diversified arrangement well combined in colour. Mr. Meachen followed with a group that was showy by reason of the quantity of flower, but lacking in artistic taste, white sticks being very prominent, and two bushes of *Crotons* employed that greatly spoil the effect of the whole.

GROUPS OF PLANTS.

Two competitors only entered for the substantial prizes offered for groups arranged for effect. Mr. Turner, gr. to Major Way, Wick Hall, won with ease, and finished in colour. Mr. Meachen followed with a group that was showy by reason of the quantity of flower, but lacking in artistic taste, white sticks being very prominent, and two bushes of *Crotons* employed that greatly spoil the effect of the whole.

Two groups of Ferns were very pleasing, they would, however, have been considerably enhanced in effect if a few *Liliums* could have dotted amongst them, these came from Mr. Jupp, gr. to G. Boulton, Esq., of Eastbourne, and Mr. Meachen, of London.

For three varieties of cut plants, the latter exhibited best Mr. Rann in a close competition, having very bright and fresh examples of *Anthurium crystallinum* (seldom seen in better condition) and *Croton Queen Victoria* (a fine young plant). Mr. Rann's best plants being *Croton angustifolius* and *Peperomia*, the latter, though rich in colour is not a variety that brightens up a group.

For two of *Fuchsias* and *Coleus* of decorative size, Mr. Fluck and Mr. Jupp took the 1st prizes, having capital examples of cultivation—the latter exhibiting also the 1st place with fine small but fresh plants in flower (limited to the county only).

TABLE PLANTS.

For twelve table plants, Mr. Turner won with a clean lot of plants, *Euhalia japonica* variegata being one of the best. Mr. James taking 2d.

For six, Mr. Miles, Victoria Nursery, Dyke Road, was 1st, with a good set—*Cycas natalensis*, a green variety, with narrow foliage, and *Acalypha tricolor* were both good in this collection.

In the cut flower classes, in which there were numbers provided, *Roses*, *Dahlias*, and cut stove and greenhouse and herbaceous plants were the most prominent features.

ROSES.

In the Rose classes Mr. Slaughter, of Steyning, was the most successful exhibitor, taking 1st for twelve varieties in bunches of three trusses, for twelve *Tea* and *Noisette* in each division, and for twelve single trusses. The *Tea*-scented kinds were strongly shown by him in each of these classes—the best were *Marie van Houtte*, *Madame de Tart*, *De la Lyonette*, *Madame Lambert*, *Antoine Olivier*, *Catherine Mermet*, *Jean Pernet*, *Madame Cosin*, *Innocente Pirola*, *Madame Falcot*, *Comtesse Riza du Parc*, and *Jean Ducher*—his best Hybrid Perpetuals being *A. K. Williams*, *Engne*, *Furst Etienne*, *Levet*, *Baroness de Rothschild*, and *Marquis de Castlane*.

Messrs. Wollard were 1st, and Mr. Balchin 2d, for twenty-four varieties, showing, besides some of those above-named—*Prince Camille de Rohan*, *Duchesse de Wellington*, *Charles de Brin*, *Duke of Edinburgh*, *J. S. Hill*, and *Alfred Colomb*, of Hybrid Perpetuals, and *Bouquet d'Or* and *Niphetos* among *Tea*-scented kinds. Mr. Piper, of the Uckfield and Piltwood Nurseries, also showed some good boxes in both sections.

DAHLIAS.

For *Dahlias* no less than eleven classes were provided, and in each the competition was keen; an excellent

standard in quality pervaded the entire lot. For forty-eight show kinds, and twenty-four fancy ditto, Mrs. Seale, Vine Nurseries, Sevenoaks, was awarded the 1st prizes, with fine *Chrysos*; *Messrs. Chesham*, The Nurseries, Crawley, being in each case 2d; and with pompons and single kinds the latter firm won with comparative ease, having good collections.

In the smaller and limited classes, Mr. Vincent, gr. to Mr. Hart, Keymer; Mr. Boothroyde, gr. to H. Coleman, Esq., Dover; and Mr. Simmons, gr. to Rev. R. C. Hales, Woodmancote Rectory, were the chief and most successful competitors.

HERBACEOUS AND HARDY CUT FLOWERS

was a prominent feature, making an excellent display. Mr. Balchin was placed 1st, Mr. Van der Rees, Exotic Nursery, Tooting, 2d; and Messrs. Cheal, 3d, the latter collection containing striking features; each collection containing some *Montbretia Pottsii*, *Lathyrus latifolius roseni*, *L. alba*, *Trithuria uaria*, *Hyacinthus candicans*, *Acanthus mollis*, *Aster besarrabicus*, *Statice latifolia*, *S. incana* *hybrida*, *Pentstemon Mr. Gladstone*, *Gypsophila gigantea*, *G. paniculata*, *Helianthus multiflorus*, *Thryallis*, *des Granges*, *Eriogon grandis*, *Stromeria brasiliensis*, *Gaillardia picta grandiflora*, *Harpallium rigidum*, *Anemone japonica alba*, *Rudbeckia Newmanii*, *Ceropepis lanceolata*, *Anchusa italica*, *Chelone barbata*, *Geum coccineum plenum*, *Echinops ruthenicus*, *Eriogon californicum*.

In the smaller class for twelve varieties, Mr. Vincent was 1st, with a good box.

The competition for stove and greenhouse cut flowers was not so good as usual, a capital box, however, from Mr. Archer, gr. to Mrs. Gibson, Saffron Walden, took the 1st prize, in which *Cattleya crispata*, *Lepogasteria*, *Dipladenia*, *Allamanda*, *Ixoras*, and *Ericas* (*E. Irybana*, *E. Atonia*, &c.), were the most prominent. In Mr. James' 2d prize collection were *Cypripedium Lawrenceanum* and *C. Harrisianum*, *Saccolabium Blumei* majus, and *Acerides quinquevulvatum*, were very good. Mr. Dixon, gr. to Mr. Wilson, Birtley, was 3d, with *Scirpus Flemingii*, was 1st for a large collection of wild flowers, staged in three boxes; Mr. Budd, of Pound Hill, Crawley, being 2d.

FRUIT.

Abundance of exhibits was the feature of the fruit classes. Mr. Goldsmith, gr. to N. Hoare, Esq., Kelsey Manor, Eckenham, was 1st for twelve dishes of fruit, with an excellent assortment of good specimens. Mr. Dixon followed with a good lot, *Victoria* and *Red Roxton* *Nectarines*, *Royal George Peaches*, *Brunswick Figs*, and *Williams' Bon Chrétien Pears*, were among the best dishes, besides the *Muscats Grapes* in the 1st collection.

Mr. Bates showed a good Queen Pine in his class, no other competitor having come forward.

The Grape classes, however, produced most abundant displays.

For six varieties, three bunches of each, Mr. Chatfield, gr. to T. Holman, Esq., East Hoathly, was a capital lot, with *Black Hamburg* (a good), *Buckland Sweetwater*, and *Black Alicante*, *Gros Colmar*, and *Muscats Hamburg*, the latter fine in bunch but not coloured. In the 2d prize lot, from Mr. Gore, The Gardens, Glenleigh, Hastings, were two good bunches of Mrs. Pearson.

Some fine bunches were shown in the Muscat of Alexandria classes, but most of them lacked finish.

Mr. Miles, of Kemp Town Nurseries, was 1st, both for six and for three bunches, wanting a week or two more to perfect them in colour, otherwise they left nothing to be desired; Mr. Goldsmith followed in each class with smaller bunches, but better coloured on the whole.

In the corresponding classes for Black Hamburg Mr. Holton, gr. to R. H. Penney, Esq., Dyke Road, staged some first-rate examples of culture, and won 1st honours in either case; Mr. Inglis, gr. to F. C. Lister, Esq., Cuckfield, being 2d, for three; and Mr. Warren, gr. to Mrs. Hankey, Balcombe, for six bunches, each showing well.

In the county classes Mr. Spottiswoode, gr. to G. Duddell, Esq., was 1st, with Muscat, fine in berry; whilst for Black Hamburg Mr. Godley, gr. to Dr. W. Moore, Burgess Hill, was 1st, having good bunches, fine also in berry.

For Peaches, Mr. Miles was 1st, with very fine *Baringtons*; and Mr. Balchin 2d, with handsome fruit of *Princess of Wales*; and in the county class Mr. White, gr. to H. V. Shaw, Esq., Keymer, 1st, with the *Voltaire*.

For Apples, Mr. Burgess, gr. to W. H. Loder, Esq., Crawley, took both 1st prizes, with *Hunt's Tawny* and *Violette Hâtive*, both fine dishes.

Figs are always fine at this show, but the competition was not so good as on former occasions, Mr. Butler, of Lancing, taking both 1st prizes, with fine large fruits of *Black Turkey* and *Madagascar*.

For Plums Mr. Maxted, gr. to the Marquis of Ely, Kearsney Abbey, took 1st place, with fine *Jefferson*; and Mr. Inglis the 2d, with large *Washington*.

Mr. Holman was the prize winner for Green Gages, showing a good lot of fruit.

Cherries (*Morello*) were a fine lot in each class, Mr. Booth, gr. to W. Yates, Esq., Uckfield, taking both 1st prizes with large fruit.

Apples were not so fine as usual, but many good dishes were shown. *Lords' Seedling*, *Hawthornden*, *Worthing*, *Pearmain*, and *Astrachan* were the most prominent.

Mr. Booth took 1st for culinary, and Mr. Virgo, Womersley Nursery, Guildford, for dessert fruit. *Williams' Bon Chrétien* *Pears* were the favourites in their class, Mr. James' *Williams' Bon Chrétien* taking the 1st prize.

For six kinds of Apples Mr. Gore came 1st, Nelson's *Gold* and *Wellington* being good; Mr. Remnant 2d.

Tomatos were shown finer than we have seen them all the season, *Trophy* taking the 1st prize for Mr. Walter, gr. to F. C. Cornish, Esq., Burgess Hill, and *Reading Perfection* also very fine from Mr. Stringer, Rose Cottage, West Brighton, being 2d.

MISCELLANEOUS.

Mr. Balchin filled the entire available space of one of the rooms in the Pavilion with a collection of decorative plants, prominent among which were a specimen of *Cattleya crispata*, having forty-one flowers on five spikes, just at their best, and a large plant of *Pancretium fragrans* with six spikes, *Tuberoses*, *Vallotas*, *Rochea falcata*; small and choice *Ericas*, with handsome *Palms* and *Drazenas*, *Acalypha tricolor*, *Essia japonica*, variegata, and other plants, making the group very attractive.

Messrs. Leing & Co., of Forest Hill, sent a number of choice single and double *Begonia* blooms, varied and rich in colour.

Mr. James contributed a group of choice and rare plants; prominent among which were *Sarracenia* and other insectivorous plants.

Mr. W. Miles, West Brighton Nurseries, contributed a large group of fine-foilage plants, among which were some *Musas* and a plant of *Areca sapida*, also well grown *Nephrolepis davallides furcans* in better form than it is usually seen. J. H.

WARWICKSHIRE HORTICULTURAL

September 2 and 3.

The exhibition that was held in the Jephson Gardens, Leamington, on the days above named, gave abundant evidence that horticulturists in this and the surrounding district are in no way behind their brethren in other parts of the country in the several departments of gardening. Plants, both flowering and fine-leaved, were very well shown, as also cut flowers, fruits, and vegetables. A notable feature of the show was, that few exhibits of an inferior description were present. In many cases exhibitors, who had to be content with a 2d or a 3d award, staged productions little inferior to those of their more fortunate competitors.

STOVE AND GREENHOUSE PLANTS.

In the open class for ten in bloom, Mr. W. Finch, gr. to James Marriot Esq., Coventry, was a good 1st, staging a good group, the best of which were *Lagerania rosea*, a very large plant, splendidly flowered; *Sobralia macrantha*, with about a dozen blooms; the seldom-shown *Strelitzia Reginae*, bearing eight or nine of its singular heads; and *Clorodendron fatiha*, *Bougainvillea glabra*, and *Allamanda Hendersoni*, and *Bougainvillea glabra*, well bloomed and fresh; 2d, Mr. Coys, gr. to E. H. Wood, Esq., Newbold Revel, Rugby, whose most noteworthy specimens were *Lagerania rosea*, *Ixora coccinea*, *Allamanda Hendersoni*, and *Tabernaemontana* *forepeltii*.

Six stove and greenhouse plants.—With these Mr. C. Finch, gr. to W. R. Mann, Esq., Leamington, took the lead, having in a well-managed half-dozen a grand example of the white *Lagerania*, covered with its charming flowers; *Clorodendron fatiha*, *Bougainvillea glabra*, and *Allamanda Hendersoni*. Mr. Hopkins, gr. to J. D. Barbour, Esq., Leamington, who was a close 2d, had, with others, an unusually fine specimen of *Lagerstromia indica* some 8 feet high by 6 in diameter, profusely studded with its remarkable pink flowers, and *Dipladenia ambalis*, nicely bloomed.

Six stove and greenhouse plants, three in flower and three fine-foilage (amateurs).—1st, Mr. Morris, gr. to R. Moon, Esq., Coventry, showing in a creditable collection *Eucharis amazonica*, with about three dozen good spikes, and *Dipladenia ambalis* carrying numerous and unusually fine flowers; *Croton angustifolius* and *Alcoccia metallica* in the same group were well grown; 2d, Mr. W. Finch, who had *Oncidium flexuosum* and *Allamanda cathartica* very nicely bloomed. With these were good specimens of *Cocos Weddelliana* and *Kentia Belmoreana*.

FINE-FOLIAGE PLANTS.

With ten in the open class Mr. Coys had 1st, staging a bright looking group, the best being *Croton Weismanni*, *C. undulatus*, *Phoenix dactylifera*, and *Cycas revoluta*; 2d, Mr. W. Finch, who had *Thrinax elegans*, and *Allamanda Hendersoni*, who was a close 3d, with fine examples of *Senarolia elegans*, *Alcoccia Veitchii*, and *Maranta Veitchii*.

Six Coleus.—1st, Mr. C. Finch, with large specimens; 2d, Mr. Morris.

ZONAL PELARGONIUMS

were very well shown, and being present in considerable numbers made an effective display. Mr. Hopkins took 1st, with six; Mr. West, gr. to F. W. Arkwright, Esq., 2d.

FUCHSIAS.

With six nicely flowered moderate sized plants, Mr. Morris had 1st, Mr. West 2d.

TUBEROUS BEGONIAS

in sixes, were shown in good condition, good kinds, well flowered, Mr. West taking the lead with nicely managed plants, Mr. F. Perkins 2d.

GROUPS OF PLANTS ARRANGED FOR EFFECT formed quite a feature in the exhibition, and being unusually well done were very attractive, Mr. F. Perkins, Regent Street, Leamington, taking a decided lead, with an arrangement in which some originality was displayed than in the ordinary sloping combinations of flowers and

foliage, now becoming almost irksome to look upon. Less colour, with more green surface, was the leading feature in the arrangement, the flowering plants being more concentrated than usual; several mounds raised somewhat above the level of the green setting material, in which the taller plants were stood, contributed no little to the effect of the group; Messrs. Jones & Sons, Shrewsbury, who were 2d, had also a nice group.

Prizes were likewise offered for small groups or baskets, such as suitable for a recess, the 1st prize going to Mr. Coysh, and the tastefully arranged exhibit, 2d, Messrs. Jones & Sons.

AMATEURS' DIVISION.

Four stove and greenhouse plants.—1st, Mr. F. Astell, showing small plants, nicely flowered.

Three Ferns.—1st, Mr. Rogers, with nicely grown plants.

Six Coleus.—1st, Mr. Astell.

Four Fuchsias.—1st, Mr. Astell, who had small plants beautifully bloomed.

Four Begonias.—1st, Mr. Astell.

With a window-stand Mr. Rogers was 1st, showing a tastefully constructed stand nicely filled with flowering and foliage plants.

CUT FLOWERS.

There was a very large display of cut flowers of various kinds, hardy and exotic.

With twenty-four Dahlias, Mr. W. Burbury, Kenilworth, was well to the fore with well-developed, full-sized blooms, 2d, Messrs. Kimberley & Sons, Coventry.

Twelve Dahlias.—1st, Mr. Burbury; 2d, Messrs. Jones & Sons.

Roses were in nice condition for so late in the season and the ungenial weather. With thirty-six, Messrs. Perkins & Sons, Coventry, took the lead, staging a nice lot of young flowers; 2d, Mr. F. Perkins, who likewise had a creditable lot of blooms.

Gladioli.—Here Messrs. Jones & Sons were a long way ahead, with about a hundred spikes, nicely showy; 2d, Messrs. Kimberley & Sons.

Hardy herbaceous flowers, twenty-four varieties.—1st, Mr. F. Perkins, having a beautiful collection, nicely set up; 2d, Messrs. Jones & Sons.

Twenty-four bunches of stove and greenhouse plants, distinct varieties.—1st, Mr. F. Perkins took 1st prize, with a very fine lot, in which most of the best kinds of stove flowers were represented; Mr. Coysh, who was 2d, also had a very good stand.

DINNER-TABLE DECORATIONS.

These had a tent to themselves, and made an effective display. The competition was close in the class for a table to dine two people at, honours being taken by Mr. F. Perkins, with a table on which the tall now-out-of-fashion glass stands were elegantly arranged with flowers and green foliage; one of the best features in this exhibit was that the flowers were not too much crowded. Messrs. Jones & Sons were a good 2d, their table being similar to its arrangement to that which took 1st; 3d, Mr. Coysh.

Single centre-piece (amateurs).—1st, Mr. Stevens, Warwick, with a March stand, nicely filled; 2d, Mr. Barrett, Rugby.

Some beautiful bouquets were shown in the open class for two—bride's and bridesmaid's—by Messrs. Perkins & Sons and Mr. F. Perkins, who, in a very close run, took the prizes in the order their names are given; both the competitors are noted for their productions in this interesting branch of floral art, and evidently both had been training a point to win.

In the amateurs' class for bouquets, Miss A. Rogers had 1st; 2d, Mrs. Lloyd Evans, Warwick, was 2d.

FRUIT

was well shown, especially Grapes, and the different hardy kinds now in season, and which the climate and soil hereabouts are well suited to. With ten dishes Mr. Hopkins took 1st, having a nice collection, in which Black Hamburg and Golden Hamburg Grapes, Pimston Orange and Elrage Nectarines were the best.

Single Pine.—1st, Mr. Hopkins, with a Queen; 2d, Messrs. Kimberley & Sons.

Two Melons.—1st, Mr. Smallman, Leamington, with a good sample of Golden Gem; 2d, Mr. Coysh.

Three bunches of Black Hamburg.—1st, Mr. W. Finch, who had nice bunches very well finished; 2d, Mr. Thompson, gr., to Colonel Woolcombe, Coventry, who also staged good bunches, quite black, but a little bit of bloom. Three bunches of white Grapes.—Here Mr. Smallman took a decided lead, with fine and finely finished examples of Buckland Sweetwater; 2d, Mr. W. Mills, gr. to E. Flower, Esq., Stratford-on-Avon, having Muscat of Alexandria, fine bunches and even berries, but wanting in colour.

Three dishes of hardy fruit, limited as to number of varieties.—1st, Messrs. Kimberley, who, in a good exhibit, had nice examples of Moor Park Apricots, Figs, Peaches, and Nectarines; 2d, Mr. S. Corbett, Coventry.

Three dishes of Plums.—These were well shown, Mr. Hopkins taking the lead with Belle de Louvain, Washington, and Pond's Seeding; 2d, Mr. Smallman, having Rivers' Golden Gage, Washington, and Victoria.

Three dishes of Apples.—These also were in great force, Mr. Hopkins again coming to the front with Red Astrakhan, Kentish Filbasket, and Lord Suffield; 2d, Mr. F. Perkins.

Three dishes of Pears.—1st, Mr. S. Corbett; 2d, Mr. Hopkins.

Six dishes of fruit (amateurs).—1st, Mr. Corbett, staging nice examples of Black Hamburg Grapes, Royal George Peaches, and Terminus Hybrid Melon.

Messrs. Smith, of Worcester exhibited, not for com-

petition, a group of miscellaneous stove and greenhouse plants, and cut Roses, Gladioli, and herbaceous flowers.

From Messrs. Hewitt & Co., Solihull, near Birmingham, came Begonias, Ferns, and various other plants, very well grown and nicely flowered.

Mr. F. Perkins contributed his new Pelargonium Volonté Nationale white variety, Lilies, and double and single Dahlias.

Mr. S. Harston had a large collection of fruit and vegetables.

SHIRLEY, MILLBROOKE, and FREE-MANTLE: August 26.

THIS Society, which exercises horticultural jurisdiction over a large and prosperous suburb of Southampton, held its twentieth summer show in Whitewood Park on the above date, and, contrary to its too frequent experience, was favoured by delightful weather. The show displayed many excellent features, well maintaining its reputation for the average quality of its exhibits. Plants were shown generally in capital form, the competition between such admirable local growers as Mr. Wills, gr. to Mrs. Pearce, The Firs, Basset, and Mr. Amsy, gr. to the Hon. Mrs. Yorke, Netley Castle, in the collections of twelve stove and greenhouse plants, was exceedingly close, and gave the judges a long time to deliberate. It was eventually placed 1st, having a fine *Alphosia excelsa* Tree Fern, a huge *Cycas revoluta*, good *Croton interruptus*, *Davallia Mooreana*, *Allamandias Schottii* and *Hendersoni*, *Bougainvillea glabra*, and *Ericas purpurea* obtusa and *Austrian*, the latter of the two most grandly bloomed, and other plants. Mr. Wills' chief features were a fine *Latania borbonica*, good *Cycas revoluta*, and *Arca lutescens*, a grandly flowered *Statisia prostrata*, 5 feet over; fairly good *Clerodendron Balfoerianum*, and *Phloxocombis proflera* Barnesii, &c. Messrs. J. C. & H. Ransom, Hot Nurseries, came 2d.

In the usual decorative group class those two latter were the only competitors. Mr. Wills showing the best arrangement, a little too heavily dressed with Palms, but containing one the less many good decorative plants, among which some fine tufts of the crimson *Arisaema* told with good effect. The Messrs. Ransom's group included the too little seen *Fraxina rosacea*, with the usual combination of *Begonias*, *Gloxinas*, *Ferns*, &c.

In the competition for single specimen plants, Mr. Wills was long way ahead of others with a truly superb *Fuchsia*, *Lyle's Charming*, a grand specimen some 8 feet in height, and proportionately broad at the base, perfect in form, and one mass of foliage and bloom. The same exhibitor was 1st with six Ferns, really finely done specimens, all even and bright in colour—just the thing to dine two people at. The others comprised *Adiantum carolinianum*, and *concinnum latum*, *Dicksonia antarctica*, *Davallia polyantha*, *Nephrolepis davallioidea* forsan, and *Microlepia hirta cristata*.

Mr. A. King, gr. to A. Barber, Esq., Shirley, had four fine *Adiantums* of kinds, and *Davallias Mooreana* and *bulbosus*.

Mr. Wills always exhibits *Begonias* well, and his plants on this occasion, though a little past, were fine specimens some 4 feet in height, well grown and flowered. Mr. W. Pettegidge, an amateur grower, also staged some most meritorious, though smaller plants in proutse bloom.

Zonal *Pelargoniums* have always been well shown in this locality, and although only Mr. Wills and the Messrs. Ransom were the chief exhibitors, their specimens were grand ones. Mr. Wills had the best six single large plants, and really masses of bloom. *Dicksonia antarctica*, *Davallia polyantha*, *Nephrolepis davallioidea* forsan, and *Microlepia hirta cristata*.

Mr. A. King, gr. to A. Barber, Esq., Shirley, had four fine *Adiantums* of kinds, and *Davallias Mooreana* and *bulbosus*.

Mr. Wills always exhibits *Begonias* well, and his plants on this occasion, though a little past, were fine specimens some 4 feet in height, well grown and flowered. Mr. W. Pettegidge, an amateur grower, also staged some most meritorious, though smaller plants in proutse bloom.

FRUITS.

The best Grapes in each of the classes for two bunches came from Mr. W. Fowl, of Freemantle, who had in blacks good Hamburg well coloured and matured; Mr. Amsy coming 2d with the same kind, finer in bunch, but wanting in colour.

In the white class Mr. Fowl had good Muscats of Alexandria, and Mr. Amsy was again 2d with handsome bunches of Foster's Seeding. The latter was 1st in a good competition for six dishes of fruits, having excellent white and black Grapes, Peaches, Apricots, Melons, &c.

Apples were well shown, the best dessert kinds being Irish Peach and Red Astrakhan, and the finest kitchen Apples, Lord Suffield and Kentish Codlin.

Good Peaches, Pears, and other fruits were shown in the respective classes.

VEGETABLES.

Vegetables were so good generally as to lead to wonder how they could have been produced during such a season of drought. Mr. W. Joy, Hill Lane, was 1st, with a dish of twelve Tomatos, having as perfect and fine a sample as we have seen this season; the sort was either Trophy or Standard, and was not named.

Mr. Wills came 2d, also with a fine clean sample.

There were nine bushels of Potatos shown in the usual Hampshire oval bushel baskets, the best a capital sample of international, coming from Mr. W. Cole, Rousham; the next best were Breese's Prolific, from Mr. Wilkes, Old Shirley; and the third best, Idaho, a

pinkish round, came from Mr. Hallett. Giant King, White Elephant, and First-class Beauty were also shown.

In the collections of twelve kinds Mr. W. Cole had good clean examples of Vicar of Lealeham, Grampian, Reading Russet, Adirondack, White Elephant, Myatt's and International Kidneys.

Onions were remarkably good, Mr. G. Payne showing some grand Giant Kocca, other kinds being very large also; and Mr. Haddon had the best spring-sown samples, good white Spanish, still full of growth.

Carrots, Parsnips, Beet, &c., were very good indeed, and cotagers' plants and vegetables were excellent.

PAISLEY HORTICULTURAL: September 3 and 4.

WITHIN the George A. Clark Hall the autumnal exhibition of the Paisley Horticultural Society was held, and was remarkable for the extent, variety, and quality of exhibits, and for the vast amount of local interest manifested in it. Shows, to be successful, must be patronised in a large measure by the "upper ten," and this was abundantly evident here by the character of the audience that listened to rather a telling and effective "opening" speech by the exhibitor, which appears to the writer to be generally interesting, and might be worthy of a place in your columns. The working classes crowded the hall both evenings, so that financially as well as horticulturally the exhibition realised all that its promoters could hope for or desire.

Coming to the articles which the post of honour—that is, the filing of the large orchestra—was entrusted to Mr. James Beveridge, gr. to Archibald Coats, Esq., Woodside, and led it well. In the background were splendid specimens of *Kentia Fosteriana* and *K. Pelmoreana*, with *Cycas revoluta*, the elegant *Pritchardia pacifica*, *Flaxandora*, *Phloxocombis proflera* Barnesii, &c. which from their elegance and diversity of foliage at once gave a character to the specimen and other plants making up the frontage, comprising such popular *Heaths* as *Marrocciana*, *jasminiflora alba*, *Austriana*, *Irbiana*; and several nicely flowered *Fuchsias* and *Eucharis*; while the underground of the grosser endogenous vegetation was lightened up with several good and well flowered half specimens of show and fancy *Pelargoniums*, the immediate frontage being made up of Maidenhair and other *Ferns* again brightened by the arching spikes of the Princess of Wales specimen, and the rather striking presence of the pyramidal *Celosia*, comprising in all about half-a-dozen vanloads of plants.

The four tables running along the hall were filled with specimen plants. One table was literally crammed with highly cultivated and good looking *Adiantums*, Mr. Clarke, M.P., and put up by his enthusiastic gardener—Mr. Allan Henderson. Here were specimens of *Ericas* some 5 feet in diameter of *Marrocciana*, no less than three specimens of *E. retorta* major, all in abundant bloom; two *Ericas Irbiana*, and the two pet seedlings of *retorta*—one gone to rest, the other in flower with age, but as keen as a "laddie"—we mean *E. MacNabiana* and *E. Turnbullii*. Seldom do we see such cultivated plants at exhibitions. These were backed by several *Palms*, one of which, *Verschaffeltia splendens*, was simply a gem, and also a magnificent young plant of that dark bronze *Fuchsia*, *Charming*, *Mastersiana*, with pitchers in perfection. There were some fine lots of *Orchids* here, chiefly *Odontogloss*, a good form of *Veitch's Masdevallia*, a splendidly good plant of *Levittia elegans*, a charming *Medium incurvum*, and some beautiful specimens of *Phloxocombis proflera*.

In a *Viola* table was the collection of Mr. Coats, of Ferguslie; put up by the acting President of the show Mr. McDonald, were some very fine *Palms* and *Ferns*, chief among the former were *Arcia* spade, and among the latter, *Davallia Mooreana*, *bulbosus*, and other fine exhibitions of this kind, interspersed with effect. *Crotons*, some magnificently bloomed *Chrysanthemums*, immense plumes of *Celosia* pyramidalis, fine coloured *Dracenas*, and profuse flowered *Volatias*, which along with the usual front "padding" made up a very effective table.

Messrs. Paul & Sons, W. Dickson, and A. Pattison had effective tables of miscellaneous plants. The chief honours in the competition list went to Mr. J. Maxwell, gr. to Mrs. Arthur Barshaw, his two red and white *Lagarias*, and simply a gem, and *Antiarium* being well grown and abundantly flowered plants.

The *Mignonette* from Mr. William Cameron, Ferguslie Park, was very creditable, as were also the *Tree Ferns*, foliage plants, and table plants—particularly the latter, from Mr. James Maxwell, and from Mr. C. H. Maxwell, Kilmston, and Mr. Alexander Baird, Cheep House.

Cut flowers were numerous, and of fair quality throughout. Mr. James Anderson, Meadowbank, was awarded a First-class Certificate for a good plant of the singular succulent-looking *Angræcum Leonis*. It had two flower-spikes, each four-flowered, and its beautiful ivory blossoms, with its long tail twisted about like a tendril, together with the delicious sweetness of its perfume, commanded considerable attention.

Fruit was a fair exhibition, Mr. John McGregor and Mr. M. Donald taking 1st for black and white Grapes respectively, and Mr. Henry Maxwell having 1st honours for a basket of fruit.

Vegetables were largely and well shown.

An interesting feature was the prizes for *bona fide* well-grown and well finished "things as follows:—"Four Tree," which is one of the most enduring of plants under snuffage [Will our reporter kindly tell us what this may be?—Ed.]; *Fuchsias*, *Ivies*, *Musk*, *Thyme*, "Aaron's Beard" *Ferns*, particularly the Hart's-tongue, all evidencing from their attenuated looks "back-sley" quarters. This is a very good thing to go for, as not

tending to educate the masses, but to give them an additional interest in flowers, plants, and plant showing.
F. A.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

THE autumn exhibition of this Society was held in St. Andrew's Hall, on Wednesday, September 2, and was considered the best autumn exhibition held in Glasgow within the last twenty years. The entries in the various classes numbered nearly 1500. The most extensive and effective collection of plants was that exhibited by Messrs. J. & R. Thyne, the platform being entirely filled with Palms, Ferns, Picher-plants, rare Orchids, Crotons, &c. A First-class Certificate was awarded to a fine group of *Cereus Thynii*, also for *C. Regina*, the latter being shown for the first time. Various floral decorations, such as bouquets, wreaths, &c., were shown by the same firm (not for competition), and which were greatly admired.

Councillor Campbell, fruiterer, 18, Gordon Street, filled a large table with fine specimens of home and foreign fruit, which was deservedly highly commended for quality and tasteful arrangement.

Messrs. William Aitken & Sons, Lenzie, had fine stands of Carnations, Gladioli, Pentstemons, &c. Messrs. Dobson & Co., Rothsay, sent stands of their noted strains of florists' flowers, which were highly commended by the judges. They also exhibited their new white Turnip (Model), an excellent sort.

Mr. William Campbell, nurseryman, Auchincraigh, had a choice collection of Carnations and Plectrines, his Carnation named Snowflake being awarded a First-class Certificate.

Mr. John Sutherland, Lenzie, had a fine display of seedling Pansies, many of which will doubtless make their mark at future exhibitions, several being awarded First-class Certificates.

Messrs. A. Pattison & Son, Paisley, were also awarded a First-class Certificate for their seedling Pansy Lord Rosebery.

Mr. Thomas Smith, nurseryman, Stranraer, exhibited a fine stand of Roses, which were highly commended. Mr. Cuthbertson, Rothsay, showed some fine stands of the old Scotch Marigold, which had been much improved by him.

Mr. Lister, Rothsay, had a very fine collection of show and fancy Pansies, very highly commended. Mr. J. Baxter, Daloway, exhibited two seedling Violas, distinct and beautiful.

Mr. William Kerr, Dargavill, Dumfries, sent a splendid collection of Potatoes, comprising several varieties, some of which were seedlings raised in commerce. One of the latter was named Franc Gibb Dougal, in compliment to the energetic secretary of this Society. A Certificate of Merit was awarded to the collection.

GROUPS OF PLANTS.

Among the collections forwarded for competition 1st place must be given to the collections of plants arranged for effect, and filling tables 12 feet by 6. Five collections competed for the three prizes offered. First prize was awarded to James Mitchell, jr. to — Hunter, Esq., Newmans, for an excellent collection, beautifully arranged. This collection contained a good plant of *Cereus crispus*, Palms, Ferns, Grasses, and various variegated plants. Second prize was awarded to John Matheson, jr. to J. L. Henderson, Esq., West Bank, Partick. This collection consisted of Palms, Vallots, Nerines, a well bloomed Isora, and a few Orchids, a wand of English spouting what was otherwise a fine table. Third prize was awarded to A. Millar, jr. to Robert Ward, Esq., Baillieston, the plants in this collection being too large for the size of this table.

PLANTS.

In the class for four-stem and greenhouse plants, Thomas Hogg, jr. to John Gordon, Esq., Aikenhead, showed a grand *Statice profusa*, 3 feet across, and densely bloomed; a good *Erica Irbayana*, *Phenacocna prolifera* var. *Barnesii*, a well-managed plant; and *Anthurium Andreanum*. Mr. Hogg was also 1st for exotic Ferns, *Gleichenia Mendelii*, *dichotoma*, and *spulcra*, and also 1st for *Alumina*, *Alumina hirta cristata*. Mr. Hogg had the only exhibit of three Orchids. Mr. Combie, Greenock, was 1st for a single specimen Orchid.

John Matheson, jr. to John L. Henderson, Esq., had 1st prize for foliage plants, his *Croton Weismannii* and *Croton ornamentalis* being in fine condition.

The other collections shown in this class combined to make a most effective table.

CUT BLOOMS.

Mr. M. Campbell, Auchincraigh, was awarded the Silver Medal given by Mr. W. G. Taylor, jeweller, Tynecastle, as 1st prize in the nurserymen's class, for twenty-four blooms of Dahlias.

Some of the finest examples were Harrison Weir, a most perfect bloom; Statesman, Hon. Mrs. Wyndham, Galety, W. H. Williams, Earl of Ravensworth, Prince Bismarck, Mrs. Gladstone, Mrs. Langtry, Lottie, and Eckford.

Messrs. James Cocker & Son, Aberdeen, had 1st place for twenty-four blooms of Roses, amongst which were fine blooms of *Merveille de Lyon*, *White Baroness*, *Duke of Sutherland*, *Princess of Wales*, *Comte de Chambord*, *John Stewart Mill*, *Marie Baumann*, and *A. K. Williams*.

Pansies were well represented, Mr. John Sutherland, Victoria Nursery, Lenzie, taking the lead with a stand of perfect blooms remarkable for size, substance, and form. Single Dahlias were shown by Messrs. John Lamont & Son, Musselburgh.

Mr. S. Boys, Uddingston, had fine *Ericas*, his *E. Maroccanica* gaining the prize for the most meritorious plant in the exhibition.

VEGETABLES.

The vegetables were a wonderful show, the chief prize-taker being D. M. Bean, jr. to A. Cunningham, Esq., Craigend, Johnston. His box of vegetables was superb, and easily gained 1st position. Mr. M. Bean had also 1st for Leeks, Onions, Carrots, Cauliflowers, Savoy, Parsley, and Parsnips, most of them being of high merit.

Alexander Bogie, Kilmarnock, showed the best Potatoes, his *Village Blacksmith* being very fine.

Fruit was not largely shown. Black Grapes good; white not so well as we usually see them here. R. B.

MASSACHUSETTS HORTICULTURAL.

BOSTON. Aug. 15.—The free exhibition held to-day from 12 noon to 3 P.M. in the Society Hall, was the best of the kind that has been made this season. David Allan, jr. to R. M. Pratt, showed some fine *Bignonia*, *Lamb-ear*, and *J. S. Farlow* some *Canton Hill Muscat Grapes*. This was prize day for Gladioli and Phlox Drummond, and the display was large and fine. John B. Moore & Sons again made a good display of H. P. Roses; W. H. Spooner exhibited, for the first time, cut blooms of the *Stanwell Perpetual* Scotch Rose. H. R. Jackson showed a Certificate of Merit for *Non-pausanthes crocossiformis*; S. A. Chever, a fasciated spike of *Lilium superbum*; N. L. Wilson, a plant of *Caladium esculentum*, with a flower-spike; C. E. Grant showed a vase of *Non-pausanthes canadensis*, full of handsome red fruit; J. Zirngiebel awarded a Certificate of Merit for eight pots of dwarf French Asters. On the fruit table we noticed some fine Oldenburg, Red Astrachan, and Williams' Apples, some Clapp's Favourite, Manning's Elizabeth and Brandywine Pears. The show of vegetables was excellent; the most noticeable were four Hackensack Melons, the largest weighing 15 lb.

Aug. 22.—The exhibition to-day was very good. The most interesting and striking feature was the fine collection of Water Lilies from N. S. Simpson, of Yarmouthport, who was awarded a Silver Medal for *Cyrtosperma*, *Hyacinthus*, *Phlox Drummondii*, *Zinnia*, *aurca*, *denticata*, *alba*, *candidissima*, &c. Mrs. F. B. Hayes sent a large collection of H. P. Roses, *Zinnias*, and *Bignonia præcox*, the latter with very showy flowers as large as those of *B. grandiflora*, but, unlike that species, quite hardy here. The habit is between a shrub and a climber. The display of Gladioli made by James Cartwright was thought to be the best ever made in the hall. W. E. Endicott exhibited hybrids between *G. gandavensis* and *G. purpurea aurata*, showing the peculiar markings of the latter species. C. M. Hovey showed a *Cactus*, *Dahlia Cochisei*, also *Cannus Vesuvius*, *Ehemanni*, *Newtoni*, and *Saffrano*. Mrs. P. D. Richards exhibited a large collection of wild plants, including six pieces of *Desmodium* and six of *Gerardia*, also *Convallaria multiflora*. E. H. Hitchings exhibited pink pond Lilies, also *Chrysothrix falcata*, *Glaux maritima*, and *Utricularia clandestina*. To-day was prize day for Asters. E. Sheppard & Sons, Lowell, took the 1st prize in a class of thirty blooms, not less than ten varieties, *Truffaut's Peony* flowered, and 1st prize for thirty blooms *Victoria*, not less than eight varieties, as well as a prize for thirty sprays of non-pausanthes. This was a very fine collection in every respect. The show of fruits was very good, and included Bartlett, Tench, Rostzefer, and Clapp's Favourite Pears; Peaches, Hale's Early. B. G. Smith showed some Lima Beans, some of which measured 12 inch in length. (Correspondent.)

"HORTI FLORIDI."

(A RARE OLD GARDENING BOOK, A.D. 1617.)

By the courtesy of Mr. W. Baylor Hartland, of Cork, I saw in an April last a very curious English translation of an old Dutch floricultural work, a volume of oblong shape, the exact title of which I cannot give, as the titlepage, &c., was wanting. The first of the remaining 181 leaves, however, contains an ornamental device, in the centre of which is in Latin the verse from Matthew, chap. vi., beginning "Consider the Lilies, how they grow," &c., and below we read, "Formulis Crispiani Passæi et Joannis Waldneij." Then follow descriptions and oblong plates of flowers, fruits, and vegetables, and if we are to judge by the number of the forms represented, the Narcissus, after the Tulip, was then a most popular flower. On plate 38 N. Pseudo-Narcissus is represented. Then we come to a plate of a double variety, called Pseudo-Narcissus Calice plex, multi. colore luteo, Dod., and which seems to be the kind now called N. Capax (=N. Eystettensis). On the same plate is another double called Narcissus duplices lutea flor. lut., Clus., or double trumpet, and this bears some resemblance to the double wild English *Dafodil*. Both these figures seem to have been reproduced at a much later date in *Hale's Eden*, or a *Complete Body of Gardening*. On plate 4 are representations of *Narcissus maxi. dupli. folii*, a semi double N. *Incomparabilis*, a large single variety being also shown on the same plate beneath the

legend "Narcissus omnium maximus, or Narcissus Nonpareille," a bold yellow N. *Incomparabilis*, afterwards represented in *Hale's Eden* also.

Plate 19 shows two forms of N. poeticus, N. medio purpureus and N. medio luteus, the latter with a fasciated scape and three flowers—one semi-double.

On plate 20 two forms of *Narcissi* are shown which appear a little different from night in our gardens to-day. The first resembles N. Bernardi, having a whitish perianth and a yellow cup.

Plate 21 shows leaves, bulbs, and flowers of N. totus albidus, which is, no doubt our N. *pyracceus*, albeit that in the copy now before me the artist has put a saffron rim to the cup, of which matter of colouring in this book more anon. The other variety is *Narcissus flore multiplici*, or double Poet's *Narcissus*.

Plate 22 represents a very fine variety of N. *incomparabilis* with broad perianth and a large cup having an orange rim. The companion plant on the same plate may be *Schizanthus orientalis*, a three-flowered species, but the cup is not gashed so deeply, and the flowers seem larger, so that it possibly may be a variety not now in cultivation.

Plate 23 shows two forms of what we now know as N. *triandrus*, one a yellow-flowered and the other a white one. They are referred to on the plate as N. *juncifolius amplex. cal. lut.*, and this yellow form reminds one of the N. *calathinus* (= N. *odoros* var.) of the *Botanical Magazine*, t. 934. The white form seems to be N. *triandrus albus*, and is here called N. *juncifolius albo flore reflexo*. The habitat is given as *Pyreneæ*, "in Pyreneæ montibus frequens invenitur."

Plate 24 contains two forms of N. *odoros*, one double, and the other (N. *ragulosus*) single.

On plate 41, N. *intermedius* is well represented under the name of *Narcissus juncifolius major*; and on the same plate is a good portrait of the common *Jonquill*, here called N. *juncifolius minor*. Some plates and descriptions have been added at the end of the book, and of these two are devoted to *Narcissi*. On plate 8 D. N. *mioius* (true) is figured as N. *pumilus*, and a large form of N. *Pseudo-Narcissus*, N. *Pseudo-Narcissus hisp. mai.* is also given. On the plate following D. 9, two varieties of N. *bulbocodium* are figured, viz., a small pale sulphur (like N. *citrinus minor*) and a small white which may be N. *Graellii*. Both are said to come from the mountains of Spain.

Much more might be said of this old work, but I prefer on this occasion to limit my review of it to *Narcissus* plants, hoping that Mr. Krieger or some other of our Dutch bulb loving friends may be able to enlighten us as to its proper title and history.

To a lover of bulbous plants this book is a great treasure, and the instructions given for colouring the plates are so quaint and interesting that I may be excused for alluding to them here. One example may suffice as an illustration:—

"The great winter *Dafodil*, or *Narcissus flower*' (= *Sternbergia lutea*).—"This *Narcissus* cometh in the harvest, and is called the great winter *Dafodil*. The one is thicker of leaves (= semi-double) than the other; the single one is of the colour of mastick, being thinly laid on, shadowed with sad yellow; the knobs in the flower are like unto mastick, but the springs whereupon the little knobs do stand are of a light green. The steale or stumpe where the flower comes forth of is of a pale mastick-yellow at the upper part of it, but below it is of a pale green, and is painted with sad yellow and aghe colour, and shadowed with ombre and sad yellow, and a little black red altogether, and the vein must well be observed that passeth through the middle of the leaves because of their shynge glance."

A similar description is given for all the flowers engraved, and at the end of the volume the translator has a curious note hoping that he has made the subject sufficiently clear to an Englishman's understanding. This note is "from Utrecht, this 12th of September, 1615; yours, E. W."

In addition to the colored plates, the initial letters (wood blocks) are quaint, and are coloured with great care in the copy before me.

As before stated, the titlepage is torn away; but on the sheet at the commencement of the *Flowers of Semmer* (2d book) we find the imprint, "Arnhem, Ex-Officina Ioannis Iantzonij, Anno, 1617, or twelve years earlier than Parkinson's *Paradissus*, which was published in 1629. Should any reader possess a complete copy of this quaint old book, it would be interesting to know more of its authorship or origin. F. W. Burbridge.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, SEPTEMBER 9, 1885.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, Hygrometrical Deductions from Glaisher's Tables 7th Edition, WIND, RAINFALL. Includes data for Sept. 3-9 and a Mean row.

- Sept. 3.—Alternately clear and cloudy throughout the day.
4.—Slight rain falling from early morning till about 9 A.M., dull morning, bright afternoon.
5.—Fine and bright at times.
6.—Fine day.
7.—Frequent heavy falls of rain throughout the day, thunder heard between 11 A.M. and noon.
8.—Rain in early morning, fine and bright at times in afternoon, heavy rain at night.
9.—Fine day, rough wind.

LONDON: Atmospheric Pressure.—During the week ending September 5, the reading of the barometer at the level of the sea increased from 29.81 inches at the beginning of the week to 30.07 inches by 9 A.M. on August 31, decreased to 30.02 inches by 1 P.M. on the same day, increased to 30.15 inches by 9 A.M. on the 1st, decreased to 29.65 inches by 1 P.M. on the 3d, increased to 29.68 inches by 5 P.M. on the 4th, decreased to 29.57 inches by 1 P.M. on the 5th, and was 29.61 inches by the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.85 inches, being 0.09 inch lower than last week, and 0.23 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 71°.2, on the 3d, on August 30 the highest was 62°.5. The mean of the seven high day temperatures was 66°.9.

The lowest temperature was 45°.0 on the 2d; on the 3d the lowest temperature was 57°. The mean of the seven low night temperatures was 49°.1.

The greatest range of temperature in one day was 22°.5, on the 2d; the smallest on the 3d was 14°.2.

The mean of the seven daily ranges was 17°.8. The mean temperatures were—on August 30th, 55°.5; on August 31st, 53°.7; on September 1st, 55°.2; on the 2d, 55°.7; on the 3d, 63°.6; on the 4th, 59°.6; and on the 5th, 58°.3; of these the 3d and 4th were above their averages by 3°.9 and 0°.8 respectively; the rest were below by 4°.5, 6°.1, 4°.2, 3°.6 and 0°.3 respectively.

The mean temperature of the week was 57°.3, being 0°.3 higher than last week, and 2° below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 137° on August 30. The mean of the seven readings was 114°.

The lowest reading of a minimum thermometer placed on grass was 34°, on September 1. The mean of the seven readings was 41°.

Rain.—Rain fell on three days to the amount of 0.14 inch.

ENGLAND: Temperature.—During the week ending September 5 the highest temperatures were 74°.6 at Cambridge, 71°.2 at Blackheath, 69° at Truro; the highest at Newcastle was 64°, at Bradford 64°.8, at Preston 65°. The general mean was 67°.4.

The lowest temperatures were 36° at Hull, 39° at Cambridge, 39°.5 at Bolton; the lowest at Liverpool was 48°.4, at Truro and Plymouth 48°. The general mean was 43°.1:

The greatest ranges were 35°.6 at Cambridge, 32° at Hull, 28° at Sunderland; the lowest ranges were 18° at Plymouth, 18°.6 at Liverpool, 20° at Sheffield. The general mean was 24°.3.

The mean of the seven high day temperatures was highest at Cambridge, 67°.2, at Blackheath 66°.9, at Truro 65°.9; and was lowest at Bradford, 59°.7, at Wolverhampton and Bolton 60°.3. The general mean was 62°.5.

The mean of the seven low night temperatures was highest at Truro and Plymouth, 53°, at Liverpool 50°.4; and was lowest at Hull, 43°.9, at Sunderland 45°.1, at Wolverhampton 45°.7. The general mean was 48°.2.

The mean daily range was greatest at Cambridge, 19°.7, at Blackheath 17°.8, at Hull 17°.7; and was least at Plymouth, 10°.8, at Liverpool 11°.8, at Preston 12°.1. The general mean was 14°.3.

The mean temperature was highest at Truro, 57°.9, at Blackheath 57°.3, at Plymouth 56°.9; and was lowest at Hull, 51°.2, at Wolverhampton and Sunderland 51°.5. The general mean was 53°.9.

Rain.—The largest falls were 2.10 inches at Truro, 2.02 inches at Bolton, 1.65 inch at Plymouth; the smallest falls were 0.14 inch at Blackheath, 0.15 inch at Sheffield, 0.32 inch at Hull. The general mean fall was 0.87 inch. Rain fell on every day in the week at Truro.

SCOTLAND: Temperature.—During the week ending September 5 the highest temperature was 69° at Edinburgh; at Aberdeen the highest temperature was 63°.4. The general mean was 65°.6.

The lowest temperature in the week was 33°, at Glasgow and Perth; at Greenock the lowest temperature was 42°.5. The general mean was 36°.2.

The mean temperature was highest at Paisley, 55°.2; and lowest at Perth, 51°.6. The general mean was 53°.1.

Rain.—The largest fall was 1.05 inch, at Greenock, and the smallest fall was 0.11 inch, at Edinburgh. The general mean fall was 0.58 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

"He that questioneth much shall learn much."—Bacon.

GROWTH OF TREES.—Has it ever been ascertained at what rate a given point near the base of a tree stem will rise in proportion to the height the tree attains? In other words, will a branch situated, say, at 3 feet from the ground, ever rise above that level in the case of a growing tree? And if so, at what rate in proportion to the height the tree attains? A. D. W. [It may appear to rise above the level indicated from removal of soil at the base, but there will be no material lengthening of the trunk once formed, except at the ends of the shoots. ED.]

Answers to Correspondents.

ANEMONES: R. W. The early varieties are best planted in this month and the next, and late sorts in March.

BEGONIA BLOOMS: E. J. Jarman. We have not seen any precisely similar. If you sent up plants in flower, if thought worthy, you might obtain a recognition from the Floral Committee of the Royal Horticultural Society.—G. H. Vivid in colour, and novel in habit. Certainly it is as worthy of growing as some others.

CHRYSANTHEMUM: R. H. P. A hen-and-chicken variety, the peculiarity arising from the production of flowers-heads where only single flowers should be.

ENCEPHALARTOS VILLOSUM: W. L. The plant will be disfigured for a few years by your allowing it to ripen a cone, and if you cut the fruit away before it has attained full dimensions the plant would be benefited thereby.

ERRATUM.—In error, in our report of the Sandy Horticultural Show, Messrs. Paul & Son, Chessnut, were credited with winning the 1st prize for forty-eight cut Roses, but that award was made to Mr. J. House, Eastgate Nurseries, Peterborough.

HERMANN MÜLLER: A. D. W. This 'naturalist died some few years ago. His brother, Fritz Müller, resides at Santa Catharina, Brazil. Baron Sir Ferdinand von Mueller's address is Melbourne; but we imagine with your query that he is not the botanist you mean.

MAGNOLIAS: E. Thomas. Your flower is what you say. It is not anything unusual in size.

NAMES OF PLANTS: A. H. Rhus Cotinus.—Is it R. W. Common Alant (Ochnum basilicum, so far as we call from your script).—G. S. B. Combe Royal, Halesia, or Pterostixyris hispida (figured in Gardeners' Chronicle, August 9, 1884).—F. P. Clethra arborea.—J. Crombie. Eucumis punctata, a greenhouse bulb;—Mrs. Arbuthnot.—Brewster & May. Boccunia cordata.—M. Corey. Nephrodium molle or oryanifolium. The

other is a Ploepelis (Phymatodes of some, Polypodium of others), but not distinctly recognisable without soil; it is probably one of the broader forms of P. Billardieri.

ROWE ORPHAN FUND.—The following sums must be added to the list of subscriptions, through Mr. George, Putney.—Mr. Tegg, Bearwood, 5s; Mr. Everson, Roehampton, 5s; and also from Mr. Ollerhead, 10s. This makes the total up to £18 3d. sent from this office.

SCARLET PELARGONIUM: AND VARIATED LEAVED PHILOX HERACIA: E. Frampton. The first-named has good bold pipes, and a rich colour, but truss seems wanting in size and globosity. The variegation in the second is novel, and might be turned to useful account in the flower garden and greenhouse.

STRAMONIUM, LOBELIA, BELLADONNA, AND NOT DOUTING OF OPIUM!!! E. A. We do not doubt the excellence of your motive, nor the value of the remedy under proper restrictions and careful supervision, but to recommend such a formula for use, except under the carefully trained eye of a medical man, is to run a fearful risk. Of course the plan of treatment you mention is perfectly well known to the profession, but none would, or should, use it in the reckless way you propose.

INTELLIGENT READERS, PLEASE NOTE.—Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and NOT to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this Journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

Lavender, 12 bunch.	4 0-6 0	Tuberose, 12 blms.	2 0-3 0

SEEDS.

LONDON: Sept. 9.—A fair seasonable amount of activity continues to characterise the trade for field seeds. Of new home-grown Trifolium the supply appears almost exhausted, and prices consequently still tend upward. There is no change in Rape seed. The crop of new English white Mustard seed is now being marketed. Winter Tares meet a quiet sale on unaltered terms. More attention has lately been given to sowing red Clover seed. Not much business is yet passing in either Alsike, white, or Trefoil. Peas, both round and wrinkled, are dearer. For bird seeds the inquiry is small. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

At Mark Lane on Monday the show of English Wheat was small, but no advance was asked, and even lower rates were met in all cases refused. Foreign net a little more inquiry, but very few sales were made, and certainly not at better prices. Flour hung on hand. Foreign grinding Barley of good quality attracted more attention. For prime malting Barley 40s. was paid. Beans and Peas sold slowly, without change in value. American Oats were easier at 15s. 9d. to 16s., and the trade was dull for all imports. Maize was steady in value, but a slow sale.—On Wednesday the spot market was exceedingly dull for Wheat, but the business transacted was barely sufficient to establish any quotable change. The flour trade remained dull and adversely influenced by the flatness in the Wheat market. English Barley was in larger supply, which checked demand for foreign. Maize was quiet in all positions. Very little was done in Oats, and rates were nominally unaltered. Average prices of corn for the week ended Sept. 5.—Wheat, 32s. 4d.; Barley, 30s. 7d.; Oats, 20s. For the corresponding week last year:—Wheat, 34s. 3d.; Barley, 32s. 3d.; Oats, 20s.

CATTLE.

At Copenhagen Fields on Monday the demand for beasts was checked by increased dullness in the dead meat trade, prices being depressed 2d. per 8 lb. for best cattle, and more on the plainer kinds. No record a clemence be made. Of sheep and lambs the numbers were still further moderated, and the assisted prices, which were about supported, though the trade was sluggish. The calves were nearly all rough Irish. No change was reported in the pig trade. Quotations:—Beasts, 3s. 10d. to 4s. 6d., and 4s. 8d. to 5s. 4d.; calves, 3s. to 4s. 10d.; sheep, 4s. to 5s. 6d., and 4s. 10d. to 5s. 6d.; pigs, 3s. 10d. to 4s. 4d.—On Thursday beasts sold very slowly, and less money than on Monday had to be accepted. A moderate supply of sheep offered. Business was quiet, but prices were steady. Calves and pigs were dull.

HAY.

Tuesday's Whitechapel Market report states that trade was dull, with moderate supplies, in consequence of the wet weather. Quotations:—Clover, prime, 80s. to 110s.; prime second cut, 85s. to 107s.; inferior, 60s. to 75s.; new Clover, 80s. to 94s.; hay, prime, 70s. to 95s.; inferior, 30s. to 60s.; new hay, 65s. to 84s.; and straw, 28s. to 39s. per load.—On Thursday there was a moderate supply on sale. The trade was dull at Monday's prices. Cumberland Market quotations:—Clover, best, 90s. to 105s.; inferior, 60s. to 80s.; hay, best, 80s. to 92s.; inferior, 50s. to 70s.; and straw, 30s. to 36s. per load.

POTATOS.

The Borough Market report states that best samples uphold value fairly, but the general trade is dull and the tone depressed. Quotations:—Regents, 80s. to 90s.; Magnum Bonums, 80s. to 90s.; Early Roses, 70s. to 80s.; Shaws, 80s. to 90s.; kidneys, 100s. to 110s.; Helbrowns, 100s. to 125s. per ton.—Imports into London last week: 5750 from bags from Hamburg, 3000 Stettin, 42 Roscoff, and 457 bags 144 sacks from Boulogne.

COALS.

The following are the prices current at market during the week:—East Wylam, 15s. 6d.; Walls End—Tyne (unscreened), 11s. 3d.; Hutton, 17s.; Hutton Lyons, 15s.; Lambton, 17s.; Wear, 15s.; Tees, 17s.; Downias Merthyr, 16s. 6d.

Government Stock.—Consols closed on Monday and Tuesday at 99½ to 100 for delivery, and 99¼ to 100½ for the account. Thursday's final quotations were 100 to 100½ for delivery, and 100½ to 100¾ for the account.

CARTERS' EARLY BULBS, FOR FORCING.

To produce Beautiful White and Coloured Flowers for Christmas and Easter Decoration.

- CARTERS' Earliest White Roman HYACINTHS. Per 100, 15s. 7 per dozen, 25s. 9d.
- CARTERS' Double Roman NARCISSUS. Per 100, 11s. 6d.; per dozen, 12. 9d.
- CARTERS' Paper-White NARCISSUS. Per 100, 12s. 6d.; per dozen, 12. 9d.
- CARTERS' Red and Yellow VAN THOL TULIPS. Per 100 5s. 6d.; per dozen, 5d.
- CARTERS' Extra Large SNOWDROPS. Per 100, 3s. 6d.
- CARTERS' Double Sweet-scented TUBEROSES. Per 100, 30s.; per dozen, 4s. 6d.

All Parcels Packing and Carriage Free.

CARTERS' COLLECTIONS, SELECTED FROM THE ABOVE LISTS. A, price 5s.; B, price 7s. 6d.; C, price 16s. All for assured, packing free, per Parcels' Post.

FOR Full Particulars see CARTERS' ILLUSTRATED CATALOGUE OF BULBS, ROSES, &c., gratis and post-free.

Seedsmen by Royal Warrant to His Royal Highness the PRINCE OF WALES.

STRAWBERRIES.

Strong Roots, 4s. per 100. Plants in small pots, 16s. per 100; ditto in large pots, 21s. per 100. Descriptive LIST free. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

AFRICAN TUBEROSES,

GROWN BY

WM. RISLEY, Maritzburg, Natal (the Original Grower).

Consignments of these beautiful Bulbs have already been landed, and are now offered at very low quotations. They are far away superior in every respect to any hitherto imported, and they have never opened up in such exceptionally fresh and healthy condition.

The undersigned is prepared to show samples at his office, or to give full facilities for inspection of bulk, and to receive orders. Interacting buyers are advised to make an early application, as the supply is limited.

Terms—Cash in exchange for Delivery Order.

WM. G. MACGREGOR, LANGBOURN CHAMBERS, 17, FENCHURCH STREET, E.C.

Old Established: **Dutch Flower** — Roots, — SUPERB QUALITY. The Pick of Holland. Prices very moderate. Free Deliveries. WRITE FOR CATALOGUE (Illustrated). Reliable alwans. Address in full—**F. & A. DIGKSON & SONS, The Queen's Seedsmen, CHESTER.**

Bermuda Easter Lily.

LILIAM HARRISII.—This Lily, coming direct from Bermuda, must not be confounded with the variety generally sent from America under the above name, to which it is much superior, and different in bulb, growth, and flower.

Mr. WILLIAM BULL has just received his usual large importation direct from Bermuda, and can supply good bulbs at 2s. 6d. and 3s. 6d. each; 2 gigantic bulbs, 5s. and 7s. 6d. each; a few monster bulbs, 1 foot in circumference, 10s. 6d. each.

LILIAM AURATUM.—Mr. WILLIAM BULL is now booking orders for good plump, sound bulbs at 6s., 8s., 12s., 15s., and 24s. per dozen. All other good Lilies at equally low prices. Establishment for New and Rare Plants, 536, King's Road, Chelsea, London, S.W.

B. MALLER AND SONS beg to offer to the Trade a very extensive and valuable stock of ERICAS (Hyemalis and other varieties), EUPACRIS, SOLANUMS, GENISTAS, CYCLAMEN, BOUARDIAS, ADIANTUM CUNEATUM and other FERNS, GARDENIAS, STEPHANOTIS, FICUS ELASTICA, GREVILLEAS, VINES in Pots, &c. An inspection is invited. Trade CATALOGUES forwarded on application.

THE ANNUAL SALE BY AUCTION will be held on TUESDAY, September 15. Burnt Ash Lane Nurseries, Lee, S.E.

To Nurserymen, Seedsmen, and Florists. DUTCH BULBS—Season 1885.

WHY pay Freight from Holland to London on Dutch Bulbs, when you can buy at a cheap rate, the same quality, and get them brought over free by ordering from LEWIS ISAACS, WHOLESALE IMPORTER OF DUTCH BULBS, at Victoria Warehouse, Mansell Street, Aldgate, E.C. Established since 1858. Wholesale catalogue sent post-free on application. An immense stock of all kinds of Bulbs is kept at the above address from August up to end of Dec. in each year.

HERMAN BUDDENBORG, BULB GROWER, Hillegom, near Haarlem, Holland (formerly BUDENBORG BROS.), begs to inform his numerous Friends in Great Britain that he has established himself under his own name, and on his own account, as BULB GROWER, NURSERYMAN and SEEDSMAN; and kindly solicits the continuance of the same confidence and assistance as was entrusted to him for so many years. He will be pleased to receive the Wholesale Price LISTS of his Commercial Friends, and will mail his free on demand.

CLEMATIS

BUY ONLY ENGLISH WATCHES.

BENSON'S NEW PATENT (No. 4658) "LUDGATE" WATCH, has obtained the Highest Award of Gold Medal at the Inventions Exhibition, 1883

SILVER, £5 5s. GOLD, £12 12s.

The "Ludgate Watch" is a Silver ENGLISH Lever, of my best London make, with "Special Strength" Three-quarter Plate Movement. Jewelled throughout in rubies—true Chronometer balance—adjusted for extremes with damp and anti-rust patent ring-hub and extended barrel—massive sterling silver dome case with crystal glass front, which combines the strength of the Hunter with the convenience of the Open Face Watch—Winds, sets, hands and opens at back.

The Immense superiority in Value, Accuracy, and Durability of the "Ludgate" Watch to Swiss and American made in imitation of and sold as English) and to the Old Full-plate English Lever (still sold by other makers, from the great defects of which the "Ludgate" is exempt—is proved by the Award of a GOLD MEDAL—the only one adjudged to English Watches.

The "Ludgate" is of better quality and value than any £50 watch hitherto made. The "Ludgate" is my best London make—strong, handsome, and reliable—will stand the hardest wear and roughest usage, and is therefore the best watch for Home, Foreign and Colonial wear by Gardeners (No. 1, large size), Workmen, and Farmers (No. 2, as sketch), Gentlemen, Officers and Men in all services, Venetia and Boys' (No. 3, small), will set, free and safe at any time, in all parts of the world, for 25 5s., or in 18-carat gold, crystal glass cases, Twelve Guineas (No. 2 size).

A remittance by F.O.U., Draft, or Cash, must accompany Order. SPECIALLY NOTE that J. W. BENSON is the only Maker of a Three Quarter Plate English Watch £5 to £12 in Silver or £12 to £22, in Gold, and that our Patent "Ludgate" Watch cannot be had through or by any other Watchmaker in the Kingdom. Any infringement of the Patent Rights will be proceeded against. An Illustrated and Priced Book explaining the advantages of this Watch over the Full-plate English Watches sold by all other makers, will be sent Post-free on application.

J. W. BENSON, Watchmaker to Her Majesty the Queen, The Steam Factory, 62 and 64, Ludgate Hill, E.C.

Consequent upon the award of the GOLD MEDAL, the demand, always great, has so increased as to necessitate more extensive printing, which now enables us to execute all orders for the "Ludgate" Watch without delay. Illustrated Pamphlets of Watches from £5 to £500, Gold and Silver Jewellery, Clocks (House, Chamber, and Table), Electroplate and Musical Boxes, free on application.

Table with 4 columns: Size, Price, Size, Price. Includes 14x12, 16x12, 18x12, 20x12, 20x16, 22x10, 22x16, 22x18, 24x10, 24x12, 24x18, 20x14, 20x16, 22x10, 22x16, 22x18, 24x10, 24x12, 24x18.

21-oz. Foreign of the above sizes, in 100 and 200 feet boxes, 35s. and 40s. quantities, always kept in stock. A large stock of similar current sizes of 16-oz. glass in 200 feet boxes.

Propagating and Cucumber Glasses, and all Miscellaneous Glass Articles, can be obtained from

Apply to the Clerks at the Railway Stations, the Local Agents, or West-end Office, 8, Grand Hotel Buildings, Chancery Cross; or at the Head Office, 64, Cornhill, London, E.C.

WILLIAM J. VIAN, Secretary.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago, by the late George Hill and imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and it is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. "Piercedfield Park, June 21, 1876.—Sirs, I have this day forwarded from Chestnut to your address a black varnish cask, to be filled and returned with as good Varnish as the best we had, which I candidly admit was the best we ever had. Address Varnish to Piercedfield Park, Chestnut.—I am, Sirs, yours respectfully, Wm. Cox."

"CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised. H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent free on application to HILL and SMITH, Beesley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 75, Edinbark Street, Glasgow.

SPECIALLY CHEAP GLASS. Packing Cases free and not returnable.

Table with 3 columns: Size, Price, Size, Price. Includes 100 squares glass at 1s. 0d., 150 squares at 1s. 2d., 200 squares at 1s. 4d., 250 squares at 1s. 6d., 300 squares at 1s. 8d., 350 squares at 2s. 0d., 400 squares at 2s. 2d., 450 squares at 2s. 4d., 500 squares at 2s. 6d., 550 squares at 2s. 8d., 600 squares at 3s. 0d., 650 squares at 3s. 2d., 700 squares at 3s. 4d., 750 squares at 3s. 6d., 800 squares at 3s. 8d., 850 squares at 4s. 0d., 900 squares at 4s. 2d., 950 squares at 4s. 4d., 1000 squares at 4s. 6d.

HERNY WAINWRIGHT, Wholesale Glass Warehouse, 8 and 10, ALFRED STREET, BOAR LANE, LEEDS.

AWARDED TO JOHN MATTHEWS, THE ROYAL POTTERY, WESTON-SUPER-MARE, Manufacturer of TERRAZZO, COTTA VASES, FOUNTAINS, ITALIAN, SIKKETS'S, BORDER TILES, GARDEN POTS of superior quality, from a 10 to 30 inches diameter, stand the frost, and seldom turn green; ORCHID, FERN, SEED, and STRIKING PANS RHIBARB and SERRAILE POTS, &c.

SUPERIOR VARNISH.

This Varnish is the cheapest and best covering which can be used for all outdoor purposes, and has many advantages over oil paint. It is applied cold, and is not affected by any form of labourer or other unskilled person. It dries quickly, giving a hard, brilliant polish, and looks equally as well as oil paint, yet at one-fourth the cost.

PRICE in Casks, containing not less than 9 gallons, delivered free at most railway stations.—Best prepared Jet or Black, 1s. 6d. per gallon. Also:—Wine Fencing, Gates, Poultry Fencing, &c., free on application.

BAYLISS, JONES, & BAYLISS, WOLVERHAMPTON, and 139 and 141, Cannon Street, London, E.C.

WANTED, in a Gentleman's Garden, a YOUNG MAN, who is a thoroughly proficient in the Growing, Pruning, and General Management of Roses, to take charge of several Glasshouses devoted to the Culture of Roses, and a large stock of Roses out-of-doors. Apply, by letter, stating qualifications and details of experience, to Mount Street, Grosvenor Square, W.

WANTED, a thorough OUTDOOR MAN. Must be a good Rose Budder, and understand Growing Hardy Flowering Potables, &c. for Trade. Good references required.—X. V. Z., Roberts' Library, Lower Grosvenor Place, London, S. W.

WANTED IMMEDIATELY, a respectable young MAN, well up in Making Wreaths, Crosses, Bouquets, Sprays, &c., to manage Florist's Department in a Nursery. Must be obliging and energetic. Would have to Buy and Wait upon Customers.—State full particulars, reference, experience, salary, &c., to V. PLANT, Florist and Fruiterer, 518, Horseley Rise, London, N.

WANTED, an APPRENTICE to the WINE and SPIRIT TRADE.—A House in one of the largest towns in the Midland Counties, doing both a Retail and Wholesale Trade, has an opening for an Apprentice. No Premium required.—X. V. Z., Gardeners' Chronicle Office, 47, Wellington Street, Strand, W.C.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable at DRURY LANE, to W. RICHARDS, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

To Ladies and Gentlemen requiring Land Agents, SLEWARDS, BALIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. CARTER. Enquiries should be made to 237 and 238, High Holborn, W.C.

HANDY MAN, in Town or Country.—A Plumber and Zinc in general. Good references.—A. J., 9, Palmer Place, Hill-Way, London, N.

Read the following:—"In spite of the many Novelties, and largely advertised 'New Preparations' for the CHEST and LUNGS, I find 'DR. HOLLOWAY'S PULMONIC WAFERS' still rank as affording the speediest relief in THROAT and CHEST AFFECTIONS.—(Signed), 'W. H. TURNER, M.P.S., Tottenham, Bristol.' They instantly relieve and rapidly cure Bronchitis, Asthma, Consumption, Cough, Colds, Rheumatism, and taste pleasantly. Sold at 1s. 15s. 6d. and 2s. 9d. per box.

HOLLOWAY'S PILLS and OINTMENT are particularly recommended to persons who have to pass their lives in confined and crowded places; hundreds of thousands of our fellow creatures toil from morning until evening in factories and workshops to the detriment of their health, and the deterioration of their minds, caused in consequence from indigestion, flatulence and want of appetite, and these complaints, if neglected, bring about nervousness and failure of the vital powers. Holloway's remedies cause in consequence sufferers to their very great advantage, as they are mild in action and certain in their effects. No one need therefore lose a day's work when afflicted with any of the above ailments, whose daily bread depends on daily toil.

W. H. LASCELLES & CO.,

RICHARD SMITH & CO., NURSERYMEN and SEED MERCHANTS, WORCESTER.

Advertisement for 40 Acres of Fruit & Forest Trees, priced catalogues post-free, by J. Cheal & Sons, Crawley, Sussex.

OUR DAHLIAS. THEY are now splendid, and as a proof we simply append the following extracts. Both at the Crystal Palace and South Kensington we had, as in many previous years, very much the most complete and best representation of the whole family ever brought together; and in both instances it is fully admitted that we had the premier blooms and the greatest novelties in the Show.

JOURNAL OF HORTICULTURE, September 10, 1885 (Dahlia Show). "The most effective display was by Messrs. Cannell & Sons, Swanley, who had the most extensive collection, representing all the leading varieties, and including many novelties of great merit. Very noticeable was the large white Dahlia, Mont Blanc, 8 inches in diameter, and several pretty new forms of the Jaurent type. A magnificent bloom of Mrs. Gladstone attracted much attention. Tuberosus Begonias and many other specialties were comprised in this grand collection, for which a Silver-gilt Medal was awarded."

GARDENERS' MAGAZINE, September 22, 1885. "Messrs. H. Cannell & Sons, Swanley, exhibited a large and comprehensive collection for which they were awarded the Silver-gilt Medal. It comprised hundreds of blooms of Show and Fancy varieties, and ten or twelve boxes of Pompons and single flowers, all of which were of a high degree of excellence."

OUR BEGONIAS. Are also a grand sight, and the most largest and finest collection in the world.

FLOWERS. To all requiring the above, particularly during the winter, we should like to send them a CATALOGUE. CALCOLARIAS and CINERARIAS. We simply wish to say that we have many thousands of lovely little plants, and of the best strain in the world. 1s. 6d. per dozen; 10s. per 100; post-free. In small pots, 2s. 6d. per dozen; 18s. per 100.

Advertisement for H. Cannell & Sons, Swanley, Kent, featuring a logo and the text 'THE HOME FOR FLOWERS'.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, and Stone. (Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, and is fifty-two thirds cheaper. It was introduced upwards of thirty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, New Gardens, and the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 30 gallons each, at 12s. 6d. per gallon, and in Manufacture, or 12 1/2 Gallons at carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
"Pierrefield Park, 7th Dec. 1884. I have this day forwarded from Chestnut to your address a black varnish cask, to be filled and returned with as good varnish as the last we had, which I candidly admit was the best we ever had. Address to Pierrefield Park, Chestnut, -1 am, Sirs, yours respectfully, W. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised. H. & S.'s Varnish has been an article of common use on most of the large estates in the Kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive stamp it as a truly genuine article. Trade Mark and Seal sent from an application to the Advertisers. Large Illustrated CATALOGUE of Fencing Hurdles, Field and Entrance Gates, &c., sent from an application to **HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 73, Elmbank Street, Glasgow.**

SURPLUS STOCK.

ISAAC DAVIS & SON

Have to offer the following Plants, in which they abound, at reduced prices. All the stuff is well-grown and in fine condition for safe removal:—

- RHODODENDRONS, Hybrid Seedlings, selected when in flower and the colours labelled on each plant, good bushy plants, mostly with buds, 2 1/2 to 3 1/2 feet high, 2s. to 3s. per dozen.
Hybrid Seedlings, not selected, but of various colours, bushy plants, 1 1/2 to 2 feet, 2s. per dozen, 4s. per 100; larger, very fine, 18s. to 24s. per dozen, 4s. 6d. to 6s. per 100; extra large bushes, 3 to 4 1/2 feet, 30s. to 42s. per dozen. Most of these are well-set with buds.
Seedlings from the best named sorts (including early-blossoming seedlings), in great variety of colour, good bushy plants, 2 to 2 1/2 feet, 8s. per dozen, 50s. per 100, many with flower-buds.
choice named kinds (including numerous beautiful varieties of our own raising), fine bushy plants, 1 1/2 to 4 feet high, mostly well-set with buds, 30s., 40s., 50s., to 60s. per dozen.

HOLLIES, &c.

The following carry fine balls of roots, and are in excellent condition for removal:—

- HOLLY, Hodgins', fine bushy trees, 2, 3 to 4 1/2 feet high, 2s. 6d., 3s. 6d., to 5s. 6d. each.
Variegated, of sorts, 1 1/2 to 3 feet, 1s. 6d., 2s. 6d., 3s. 6d., 5s. to 7s. each.
Common Green, fine bushy trees, 1 1/2 to 2 1/2 and 3 feet, 6s., 9s., to 12s. per dozen.
BOX, Handsworth, fine bushy trees, 2 to 3 feet, 5s. to 8s. per dozen; 3 1/2 to 4 1/2 feet, 9s. to 24s. per dozen.
ANDROMEDA, GORLETON, thick bushes, 1 1/2 to 4 feet high, 4s. to 5 1/2 feet in circumference, 18s. per dozen; densely covered with flower-buds, 2s. each, 21s. per dozen.
DAPHNE NEZEREUM, Red, 1 1/2 to 2 feet, 2s. 6d. to 4s. per dozen; 2 to 3 feet, very bushy, 9d. to 1s. 6d. each.
LILIUM AURALUM (home-grown), from seed of our own raising, good flowering bushes, 9s. to 12s. per doz.
POPLAR, Golden, 6 to 8 feet high, 1s. to 2s. each. The beautiful golden foliage makes this a most desirable tree for mixing with other ornamental trees.
THORNS, Flowering, Climbing ROSES, RETINOSPORA, ACUBAS, Hardy HEATHS of sorts, and other stock, which we hold in large quantities, and now offer at reduced prices to clear ground.
CATALOGUE with sizes and prices on application.

PLANTS SUITABLE FOR POTTING.

- RHODODENDRONS, Hybrid Seedlings of various colours, covered with buds, bushy plants, 1 to 2 feet high, 15s. per dozen, 6s. per 100.
AZALEA NOLLIS Seedlings, from some of the best varieties, distinct light and dark colours, each colour kept separate, bushy plants, 1 to 1 1/2 foot high, ten to fifteen buds on each, 9s. per dozen, 55s. per 100, 45s. per 1000.
PONICA, bushy plants, 1 to 1 1/2 foot high, well-budded, 4s. to 6s. per dozen; larger, 9s., 12s., to 18s. per doz.
DAVISHI, beautiful trusses of white sweet-scented flowers, best of all for forcing; fine plants, well-budded, 24s. to 30s. per dozen.
AVALANCHE, pure white sweet-scented flowers, very compact and bushy habit; good plants, well-budded, 2s. 6d. each, 24s. per dozen.
PERNETTIA SPECIOSA (our own variety), quite hardy, beautiful pink berries; good plants covered with berries, 1s. each, 10s. per dozen.

All Goods Free on Rail, but a moderate charge will be made for package.

RARE and BEAUTIFUL HARDY PLANTS.

The following plants will be found to constitute a most valuable and indeed most enchanting addition to any collection.

As a present to a friend they may be presented without any fear of their being already in possession of these magnificent flowering plants now offered; the gift will therefore be found to contain exceptionally welcomed strangers, still more especially so when viewed next season habited in their uncommon style of beautiful floral array.

If one or more plants only are wanted we offer them individually at prices as respectively affixed.

Or, if the set of six is wanted, we are open to deliver same to any Railway Station in the United Kingdom, carriage paid and packing free, for the special reduced figure of 24s.

N.B.—This special offer only refers to this advertisement, which will not be repeated.

HABENARIA PSYCHODES.
