The work of growing chestnuts and preparing them for the market is extensively carried on in France, and Lyons is the centre of this industry. Many varieties of chestnuts are grown in a number of Departments, and are called 'Marrons' and 'Chataignes.' The latter is the smaller and the less desirable of the two. The marron is cultivated only by grafting, while the chataigne grows wild. Among the different varieties are the following:—'Chataignes des Bois' (wild chestnuts), small but of little savour; 'Chataignes Ordinaires', a little larger and taller than the former; the 'Yellow Spring,' early and very productive; 'Exalade,' the best of all; the 'Pealoue,' a large, good eating fruit. The best marrons are those known as 'Marrons de Lyon,' of which the fruit is large and almost round, the shell is thin and the epiderm light; the 'Dauphinoise,' the 'Great Red,' the 'Great Green,' the 'Partalonne,' the 'Peligrine,' the 'Marron d'Aubray,' the 'Marron d'Agen,' and the 'Marron du Luc.' In the Department of the Correze the favourite marrons are the 'Early Black,' the 'Early Red,' the 'Early May,' the 'Humineaux,' the 'Humineaux Rouge,' the 'Matronne' and the 'Correze.' In some parts of France in what are called the schist lands, chestnuts from a very important article of daily food. They are boiled, pulverised, and eaten like mashed potatoes. In every city, and nearly every village, during the autumn and winter, they are sold in doorways and at street corners fresh from large roasting pans. The chestnut occupies a conspicuous place in confectionery. Every confectioner buys them and prepares them. There are large establishments all over France where chestnuts are prepared. According to the United States Consul at Lyons, the principal one in that city employs from 200 to 250 hands, chiefly girls and women. In this establishment over 25,000,000 lb. of chestnuts are dealt with annually. In the preparation, the nuts are first peeled and then boiled in clear water, when the second skin is removed. They are then placed in a syrup highly perfumed with Mexican vanilla. It is said that this vanilla retains the perfume better than other kinds. The fruit is left three days in the syrup, and then set to drain. Afterwards it is treated to a thin coating of vanilla packed in boxes and shipped. The work of preparing chestnuts for the market goes on night and day for three or four months of the year, while the fruit is in condition. During the rest of the year the establishment is engaged in preserving other fruits. Chestnuts are grown in Limousin, Perigord, Cevennes, Alpes, Isère, Pyrénées Ardeche, Var, Auvergne, Sarthe, and in Corsica. The wood of the chestnut tree is considered valuable for many purposes. It is strong and tenacious, and may be subjected for years to the influence of air, wind or water without decaying. In some places the trees are cultivated solely for the wood. It burns well and produces a great heat, but is considered dangerous as fuel on account of its tendency to throw out sparks. It makes excellent charcoal. The wood finds many uses in France, the smaller branches for hoops, bread tally sticks (short pieces containing a number of notches which mark the number of loaves of bread sold to a customer), lattice work, small baskets, supports for vines, ladders, &c. The tree flowers in May and June, and requires no special care in its cultivation on account of its hardy character. It flourishes on gravelly soil or shale. A calcareous soil is fatal to

its growth. In many parts of France the trees have been planted on hill sides, and it is said that losses from inundations have greatly decreased in the Cevennes since these trees have been planted on the mountain slopes there.—*Journal of the Society of Arts*, August 30.

COPRA AND COCONUT OIL IN THE STRAITS SETTLEMENTS.

On account of numerous inquiries from the United States in regard to copra, coconut oil, poonac and also an allied substance, vegetable tallow, Consul O F Williams submits the following report:

Copra.—During the calendar year 1900 there was imported into the Straits Settlements 93,074,933 1-3 pounds of copra, the import value of which was \$4,455,489 Mexican. Of this, Bali Island sent about 24 per cent.; Natunas 17 per cent.; Dutch Borneo, 16 per cent.; Celebes, 11 per cent.; the Netherlands Archipelago, 7 per cent.; Sulu, 7 per cent., and Johore 6 per cent.

During the same year there was exported 91,160,026 2-3 pounds of copra, valued at \$4,416,937 Mexican (\$2,102,462). The following countries received the greater part: Russia 39 per cent.; France, 32 per cent.; Italy, 10 per cent.; Spain, 5 per cent.; Germany, 4 per cent.; Austria, 3 per cent.; and Belgium, 2 per cent. About one-fourth of 1 per cent. went to the United States.

Coconut Oil.—Of coconut oil there was imported during 1900 10,105,733 1-3 pounds, the import value of which was \$1,011,679 Mexican \$381,599. About 97 per cent. of the oil came from Ceylon. During 1900 coconut oil was exported to the amount of 14,740,533 1-3 pounds, the export value of which was \$1,500,910 Mexican (\$714,433).—*Oil Paint and Drug Reporter*, Aug. 19.

INDIAN TEAS FOR ODESSA : COLOMBO AND SINGAPORE AS PORTS FOR TRANSHIPMENT.

Our special telegram from Calcutta shows us that the Indian Tea Association are keenly on the alert as to the merits of Colombo and Singapore respectively as ports of transshipment. Misled by information which we believe appeared in the local "Times", Messrs. Aitken, Spence & Co., quoted freight from Calcutta to Singapore at R25 per ton, whereas it should be only half that amount or the same as to Colombo. The comparison therefore runs:—

<i>Via Colombo.</i>	
Freight from Calcutta ..	R12·50
Transshipment charges ...	R 4 00
Freight to Odessa at 30s say	R22·50
Total ..	R39·00
<i>Via Singapore.</i>	
Freight from Calcutta ..	R12·50
Transshipment charges ...	R 1 50
Freight to Odessa	R22·50
Total ...	R36 50

Doubt may well be felt as to whether transshipment charges at Singapore can really be less than half those prevailing here or R1½ against R4 for Colombo? Then, there are chances, we understand, of freight being got

at Colombo for Odessa at 25s in place of the 30s quoted, which would make a considerable difference. Messrs. Aitken, Spence & Co. deserve thanks for taking up this matter in the public-spirited way they have, and we trust in further correspondence, they will be able to show that the economic, as well as every other advantage rests with Colombo. Apart from gain in time, there must surely be many more opportunities for freight between Calcutta and Colombo than between Calcutta and Singapore. The latter part of our telegram refers to liners which are willing to book tea from Calcutta to Odessa, for 47s 9d—that is 28s 9d, to Port Said and 19s thence to Russian ports, the latter freight being guaranteed in vessels flying the Russian flag. But Colombo steamer Agents should do better than this.

THE "PODHI-TREE."

["The Committee will be greatly helped in their work of gaining knowledge of cocoa in relation to profitable cultivation if you will make experiments and carefully record notes of their results."—Extract from *memo of suggestions* (to planters) issued by the Sub Committee, March 1901.

"Mr. Carruthers has denied having seen the final draft of the *memo* before it was attempted to circulate it, which narrows the Sub-Committee down to Mr. Huxley, *ipsissimus solus*."—"Pop" in the "Times of Ceylon," September 13th.]

The cultivator then ringed the branch with nine cuts over the original cut at intervals of three inches. From the original cut the principal and from the other cuts the minor roots, ten from each, shooting forth like a network, descended (into the famous casket). The Theras [of the P.A.] on witnessing this miracle (with uplifted hands) set up a shout which was echoed by the surrounding spectators. A delighted deva expressed his joy by shouts of 'Sadhu' and the crowds of cultivators, waving thousands of shade-trees over their heads, cheered.

Thus this (branch of the) great 'Podhi-tree' established itself in the begrudged casket with a hundred roots, filling with delight the whole attendant plantinghood. The stem thereof was ten cubits high; there were five branches, each four cubits long, adorned with five pods each [at the rate of 2½ cwt. per acre]. From the five main lateral branches (others) amounting to a thousand were formed. Thus was this great 'Podhi-tree' endowed with a fullness of beauty that entranced the mind of Peradeniya, the cultivator.

From the pods of the great Podhi branch, brilliant rays of the six primitive colours issuing forth, illuminated the whole island.

On the fifteenth, being the full moon day of the bright half the month Assayuja the deva took possession of the great podhi branch. At the end of two weeks from that date, being the fourteenth day of the dark half of the month Assayuja, canker appeared. On the first day of the bright half of the month Kattika, having compounded some *bordo mittchcha*, he made many cuts applying the *mittchcha*. On the seventeenth day after the deva had received charge of it, its new leaves a turned yellow. From that circumstance the deva, no longer overjoyed, dedicated

a third of Kalpa to the great podhi-branch. Thus this excellent and pleasing experiment on the great podhi-branch, radiant with the mingling of divers colours, became the means of its attaining 'Nirvana.'

The gifted Theras, for the purpose of ascertaining the capacity of the cultivators, interrogated him:—

'O Peradeniya! what is this tree called?'

'It was called a podhi-tree.'

'Besides this one, are there any other podhi-trees?'

'There are many *cankered* podhi-trees.'

'Besides this podhi-tree, and those other *cankered* podhi-trees, are there any other trees on the earth?'

'Lords! there are many trees, but they are not *cankered*.'

'Besides the other *cankered* podhi-trees, and the trees that are not *cankered*, is there any other?'

'There is this tree.'—Worse luck!

Then, still for the purpose of ascertaining capacity, the gifted Theras interrogated the deva:—

'*Ipsissimus solus!* have you any questions to ask?'

'O Lord!—I have many.'

'*Ipsissimus solus!* are there any questions you have not asked?'

'There are many, but they are not my questions.'

'Besides the questions you have not asked, and those that are not thy questions, are there or are there not any others in existence?'

'Well! there are always *my* questions.'

'*Sadhu!*' 'shouted with one accord the Theras, thou art wise!'

A chapter in the 'Podhivansa,' entitled 'The introduction of canker,' calculated little to delight but to afflict poor planters.

THE INDIAN BOUNTY ON GREEN TEAS.

The Indian Tea Association (Calcutta) has issued the following circular, dated 9th Sept., 1901:—

At the meeting of the General Committee held on the 30th July last, a sub-Committee was appointed to consider and to report upon the feasibility of inducing growers to manufacture green teas of like qualities, and of making arrangements for bulking them in Calcutta.

2. I am now directed to subjoin for your information a copy of a memo., dated 26th August, containing the outlines of a scheme which the sub-Committee have suggested. For the reasons stated in the concluding paragraph of the memo., the scheme cannot be put into practice until next season. And before definitely accepting it, the General Committee desire to ascertain the views regarding it of those members of the Association who are interested in the manufacture of green teas. The scheme is based upon the assumption that the money required will be forthcoming, but this will depend upon the measure of support given to the new levy for the Foreign Market Fund. I am however instructed to suggest that members should now submit samples of the green teas which they will be able to manufacture next season; and should also state the quantity which they will be prepared to offer, and the time when it will be delivered in Calcutta. As will be understood from clause 7 of the memo., it is proposed that the bounty should be paid at the present rate, *i.e.*, 1½ anna per lb.

3. The whole question is one of great importance, and the General Committee are most anxious that any scheme which may be ultimately adopted should first be thoroughly approved of by the industry. They trust therefore that if you have any criticisms to offer upon the memo., you will kindly submit them without delay.

**"PARA RUBBER IN BURMA";
A MEMORIAL FROM THE CEYLON
PLANTERS' ASSOCIATION.**

The Memorial of the Planters' Association to Mr. Chamberlain, on the above subject, will be found given *verbatim* below. At first sight, the protest it embodies may seem narrow-minded and altogether unworthy of the planters' representative institution in the first of Crown Colonies. But a little further consideration and reflection will, we think, show the movement to be both justifiable and well-timed, in order that a clear understanding may be arrived at as to the purpose to be held in view by the Indian Government in forming experimental plantations for rubber-growing in Burma. One enthusiastic writer, some time ago, went so far as to anticipate a large increase to the revenue from the extension of rubber plantations by Government in suitable localities in Burma. The Memorial speaks of 5,000 acres; but we think one estimate was that the Government might extend their planting to 10,000! Now, this undoubtedly would be an interference with private enterprise; because the produce would have to be sent to Europe or America to find a market. The case of Cinchona is very different; for, all the produce of the Government plantations of this bark is required for local consumption in the laboratories at work for the benefit of poor fever-stricken people in India. No such philanthropic object can be pleaded in the case of "rubber." True the authorities are fully justified in leading the way in exploiting a new product either in their Botanic Gardens or in an experimental plantation. To such a mission in the case of Burma, where private capitalists interested in planting are few and far between, there can be no valid objection, and the Government of India is to be congratulated on having in the spot one so well-qualified to take an interest in rubber experiments as is Major J. A. Wyllie of the Indian Staff Corps who recently addressed us on the subject of certain rubber varieties. It is when successful results have been attained and when the industry has been established on a profitable basis, that the Indian Government must stand on one side, refrain from shipping the product and be prepared to sell their plantation to the highest bidder and look for their reward through an influx of capitalists and practical planters ready to purchase or rent Crown land suitable for rubber plantations and to go ahead as cultivators. This, we feel sure, is all that the Planters' Association requires. Their Memorial is not intended to stop an interesting official experiment in rubber planting; but to make it clear from the outset that the Government of India is not to compete as producers in the home market; and we have no doubt that the required assurance will be forthcoming.

Incidentally, the Memorial before us affords Mr. Chamberlain and all its readers, a good deal of interesting information respecting the rubber-growing enterprise, more parti-

cularly as it stands at the present time in Ceylon and the Straits Settlements; and enough of progress is reported to show that for the Indian Government to plant up 5,000 acres with the view of becoming rubber growers for the markets of the West, would be a serious and unjustifiable interference with private planters in the adjacent Colonies if not later on in Burma itself. To an experimental plantation of a few hundred acres, no such objection could be raised, provided it were understood that Government would be prepared to dispose of their successful venture to private capitalists whenever such came forward with a price adequate to the outlay incurred.

The following is the text of the Memorial sent by the Planters' Association of Ceylon to the Secretary of State of the Colonies on the subject of experimental cultivation of Para Rubber in Burma which we were obliged to hold over Monday:—

To the Right Hon. JOSEPH CHAMBERLAIN, M.P.,
His Majesty's Secretary of State for the Colonies,
Downing Street, London.

The Humble Memorial of the Planters' Association
of Ceylon, and others.

Respectfully Sheweth:—

1. That your Memorialists, having received information that the Government of India is taking steps to develop the cultivation on a large scale of Rubber-producing trees in Burmah notably the Para Rubber tree—*Hevea brasiliensis*, Mull. Arg.—in the Tenasserim division of Burmah, desire to bring the question under your consideration.

2. Since 1880, when the late Director of the Royal Botanic Gardens, Peradeniya, drew up notes on some trees yielding India Rubber, considerable interest has been taken in the cultivation of Rubber both in Ceylon and in the Straits Settlements, and your Memorialists now approach you in the hope that His Majesty's Government may make such representation as will prevail upon the Government of India not to enter into the field as competitors with private enterprise in the Markets of the World.

3. In a report of the Planters' Association of Ceylon a few years ago the following sentences appear:—"The increasing demand for Rubber both in Europe and the United States has again of late drawn the attention of the Planting Community to this product, and the area being planted with the Para variety is rapidly increasing. Several of the lower district estates have a fair acreage under this cultivation." Since the above was written the planting of Para and other varieties of Rubber yielding trees has been considerably extended and from the returns furnished for "Ferguson's Handbook and Directory" it has been estimated that there are now over 2,500 acres planted with trees of all ages and varieties in Ceylon alone.

These trees have in most cases been planted on tea and cacao estates as a subsidiary cultivation with a view to mitigate the losses sustained by planters through the serious decline in the price of Tea.

The following is from a report of Mr. Willis, Director of the Royal Botanic Gardens, Peradeniya, dated 1898:—"From what I saw of the condition of the trees and the results of the tappings, I am strongly confirmed in my previous opinion that the cultivation of rubber bids fair to form a profitable industry in Ceylon and a useful adjunct to the larger industry of tea and coconut cultivation." In his report for 1899 Mr. Willis points out that six or more years must elapse before any returns are forthcoming and warns planters that in a few years substitutes for Rubber may be largely used and cause a drop in the price.

The above is quoted as showing that the results of private enterprise in the planting of Rubber would not be apparent for some years, meanwhile it is known that considerable quantities of seed have been exported to the Straits and elsewhere so that it can hardly be necessary to commence an extensive experimental plantation in a similar climate and under similar conditions.

4. In a recent Report of the United Planters' Association, Malay States, the following sentences occur:—"Rubber (*Hevea brasiliensis* of Para). This variety of rubber continues to come on exceedingly satisfactorily, the average growth of trees from nine months upwards amounting to about 1 foot per mensem, whilst at three years their average circumference at 3 feet from the ground is about 16 inches. This far exceeds anything reported from Ceylon and other countries where Para is being planted, and we consider that Mr. Curtis' description in the 1900 annual Report on the Botanical Gardens of the Colony, of the tapping of the 15 year-old Para tree in the Gardens at Penang, is conclusive evidence of the contention of the writer 'that in this cultivation lies a source of wealth of the greatest importance.' In two years 12½ lb of dry marketable Rubber were procured 'without any apparent injurious result to the health of this tree', and the conditions under which it is growing are reported as anything but favourable. It appears in the opinion of the different Directors of the Botanical Gardens, that the size of a tree more than its age indicates its fitness for tapping, and probably a circumference of 30 inches 3 feet from the ground is the limit at which attempts to extract the Rubber should be commenced. Reports from London show that prices of Para have of late declined, one reason alleged being the falling off in the demand for bicycles; but in Para Rubber we have undoubtedly the most valuable and highest quality rubber in the world, and your Committee feel that the large number of trees amounting now to several millions, planted in the Federated Malay States, must, in the not very distant future, prove a source of revenue which will largely recoup the planters for the losses which they have sustained through the decline in value of Liberian coffee."

5. From the above quotations it seems plain that the success of the planting of Para Rubber in a suitable climate is apparently assured and that, therefore, no extensive experimental plantation of 5,000 acres is necessary, and your Memorialists submit that Government rivalry with private enterprise in the production of Rubber is to be deprecated. The industry is already threatened with the production of cheap substitutes, and prices are declining and it is felt that the production by the Government of India of such a large amount as is likely to be secured from the plantations in contemplation would be a serious and undue competition with private growers who have, as it is, to contend with the enormous productions of the indigenous trees in the forests of South America and East and West Africa.

6. An authoritative statement that the Government of India had no intention of placing Rubber on the London market nor competing with private enterprise by large operations, would, of course, tend to remove any cause for alarm. In 1882 representations were made to your predecessor Earl Kimberley on the subject of Government sales of Cinchona bark, and at that time Government was asked to obtain all possible information regarding the Indian Plantations, and the intention of Government as to the future disposal of the product of the Cinchona tree. Government then gave a distinct assurance that it was not intended in any way to interfere with the ordinary course of trade or to do anything prejudicial to private interests. The two cases seem to be sufficiently analogous to call for similar treatment, and your Memorialists venture to express a hope that His Majesty's Government will respond to the representations submitted.

7. Wherefore your Memorialists pray that the present position of British-grown Rubber Producers may be considered by His Majesty's Government, and that any necessary action may be taken in the matter. And your Memorialists as in duty bound will ever pray. On behalf of the Memorialists.

(Sgd.) A. PHILIP, (Sgd.) EDWARD ROSING,
Secretary. Chairman.
Kandy, Ceylon, 3rd Sept.

THE KING ACCEPTS A BOOK ON
"COCOA" PLANTING.

BY OUR CORRESPONDENT, MR. H. H. SMITH.

The King has graciously accepted a copy of Mr. Harold Hamel-Smith's book entitled "Some Notes on Cocoa Planting in the West Indies."—*Daily Express*, Aug. 31.

INCREASE OF OVER £1,060,000 IN THE
BRITISH TEA DUTY REVENUE.

(Extract from the Report of the Commissioners of Customs.)

The annual report of the Commissioners of His Majesty's Customs for the year ended March 31, 1901, which was issued as a Blue-book on Saturday, is rather more interesting than usual. The gross Imperial Customs Revenue collected in 1900-1901 amounted to £26,614,609, or, after deduction of drawbacks and repayments, to £26,270,959. This is £3,227,487 more than the produce of 1899-1900 and £2,659,959 more than the Budget estimate for the year.

The amount received from the tea duty was £6,264,515, an increase of £1,655,569 over the previous year. The Commissioners say:—

The progress of the increased consumption of tea in the past three financial years has been obscured by the quantity held over from one year and by the forestalments of the other two years. A truer comparison is afforded by the quantities retained for consumption in the past five calendar years, viz:—

	lbs.		lbs.
1896 ...	227,722,000	1899 ...	242,506,000
1897 ..	231,3280,0	1900 ..	249,751,000
1898 ..	235,353,000		

The forestalments by the tea trade occurred in the last quarter of the financial year; and so disturbed the normal out-turn of the year; but by comparing calendar years these irregularities are corrected by adjustments of the trade during the rest of the year. In each of the past two years there have been increased quantities taken for consumption of about seven million pounds or 3 per cent. over the preceding years. In the last calendar year the increase of duty from 4d. to 6d. per pound commenced on March 6, so that there was ample time in the succeeding year for the effect to be observed. The result showed a continued increase of consumption. But while this testifies to the well-being of the population, another cause, that of low prices, has also contributed to bring about this satisfactory result.—*London Times*, Sept. 2nd.

PEARLS IMPERVIOUS TO RÖNTGEN RAYS.—An experiment conducted by Professors David and Pollock at the instance of Messrs. Fairfax and Roberts, demonstrated that pearls are impervious to the Röntgen rays, though somewhat transparent under powerful electric vibrations. Thousands of pounds worth of pearls are lost annually through paring to discover a better skin or lustre, and it was desired to ascertain the internal layers of a very large pearl.—*Sydney Mail*, Aug. 10.

EXPERIMENTS WITH WHITE ANTS.

BY A PHILIPPINES FOREST OFFICER.

Capt. McCabe, in charge of the Forestry Bureau in the Philippines, has commenced a series of experiments to test the extent of damage done to wood by white ants or termites, and to learn remedies or checks for these tropical scourges. He is obtaining specimens of the wood boring ants and testing their damage to the various classes of woods grown and used here, and the tests extend also to American woods in use. To this end he is inviting all those interested to send him specimens of ants wherever they are found committing their injuries, and most probably his experiments will result in a highly interesting report.—*O. China Mail*, Sept. 9.

MAJOR ROSS'S ANTI-MALARIA MISSION.

AN INTERESTING ACCOUNT FROM LAGOS.

The Liverpool School of Tropical Medicine received on Saturday the following account of the progress of Major Ross's mission at Lagos:—

The praiseworthy activity of the Lagos Government in health matters has been prominently brought to public notice during the visit of Major Ronald Ross, F.R.S., of the Liverpool Tropical Medicine to the colony. Major Ross, having inaugurated his campaign against mosquitoes in Sierra Leone, arrived on a brief visit to see what was being done here in the same line, and received a very warm welcome. He was entertained at dinner by his Excellency the Governor, Sir William MacGregor, and by Mr. C. Tambaci, president of the Chamber of Commerce, most of the leading people of Lagos being present on both occasions. He was also conducted by his Excellency in his yacht to Badagry, and by Dr. Henry Strachan, the chief medical officer, to the great native city of Ibadan, by the new railway, 120 miles from Lagos.

On August 2nd at a lunch given by the Governor for the purpose of introducing Major Ross to

THE LAGOS LADIES' LEAGUE,

speeches were made which indicated the nature of the important sanitary efforts now being attempted in Lagos to control malaria—efforts which will probably soon be followed in many other parts of the tropical world. His Excellency remarked that there was something very appropriate in bringing together Major Ross and the ladies of the league, for it was quite likely that, had there been no Major Ross, there would have been no league. He felt it a great honour to have Major Ross at his table and in the colony; he took a pardonable pride in presenting to him a society of ladies who had voluntarily come forward to work in the cause of humanity, and he believed that no other governor on the continent of Africa could produce before Major Ross a similar band of workers. Sir William Macgregor continued:—

"You have seen, Sir, that Lagos is not the charnel-house it has often been represented. You have observed something of the country between this and Ibadan, and will have noticed that the land is fertile and lends itself readily to agriculture. Indeed, Sir, in the 30,000 square miles which form this territory there are probably not 400 or 500 square miles unfit for cultivation. We are proud of our country and of our people. We feel that this race has taken the foremost place in West Africa. The Yorubas have shown that they are capable of attaining to a high degree of civilization. We hold unanimously a clear and concise policy. We believe that Lagos, already the first town in West Africa, will become a great city. We are of opinion that our energies must be

devoted to three great undertakings in order to work out the future of the country—

RAILWAYS, ECONOMIC DEVELOPMENT, AND
SANITATION.

You have seen that we have 122 miles of railway now working to Ibadan—a city of 150,000 souls. That railway must be extended towards the interior. We are alive to the fact that in the extensive province of Northern Nigeria there lies a great, a magnificent *Hinterland*, of which Lagos is the natural inlet and outlet. There are no other European possessions in West Africa which can claim to have behind them a population of 20 millions. We see clearly that military and commercial invasion of this great country can best be prevented by the extension of the Lagos railway to Northern Nigeria. Accordingly, Sir, we shall never rest content until our railway arrives not only at the Niger but at Kano. The economic development of the country we are fostering by setting apart forest reserves; by making numerous roads; by opening model-farms; by establishing a proper botanic garden for the distribution of economic plants; and we are educating a similar number of the young men of the country in industrial pursuits. You see, Sir, what immense value we attach to our railway and our industrial life. But now I must add our conviction that these undertakings must be carried on hand in hand with sanitation. The first condition of Lagos is improved sanitation, without which these undertakings will not raise the country to the place it should occupy. It is in connection with this point that I bring you and this ladies' league together.

"The primary object in forming this league was as follows:—We have an appalling infantile mortality in this town. We lose 42 per cent of all our children before they reach one year of age. In 1899 we lost 864; in 1900, 842. The principal causes of death are fever and bowel complaints. Fever is our great enemy. It was

TO COMBAT FEVER BY THE ADMINISTRATION OF QUININE

that the ladies' league was created. We are building additional dispensaries; we are earnestly trying to improve the water supply, we are reclaiming swamps, we are delivering courses of public lectures on sanitation and a medical officer has been appointed for the sole purpose of attending the sick poor. But it was felt with all this that there would remain a residuum of the population which we should not be able to reach—and it was to reach it that the ladies' league was formed. The league today numbers 95 members, who are the most refined and highly-educated ladies in the community—all animated by the right spirit to assist the less enlightened people of their country, to preach the use of quinine, the prevention of fever by scientific methods, and the cleanliness of private houses; and that they will succeed in doing very much good I have no doubt whatever."

In introducing Major Ross, his Excellency dwelt on the importance of his work in connection with malaria. Great Britain, Germany, and Italy had taken up the work. Liverpool stood pre-eminent in this, perhaps because it possessed Major Ross and Mr. A. L. Jones. The Romans were acquainted with the connection between fever and marshes, and even suspected mosquitoes. The same notion had arisen even in the wild- of Africa. Unfortunately, for 20 centuries philosophers and men of science had surrounded and obscured the subject with unfertile hypotheses. The disease had been attributed to water, to earth, to bad air without proof. The speaker continued by describing the progress of research, and particularly the investigations of Major Ross, who first determined with experimental exactness the mode of infection in malarial fever, and concluded by referring to the vast importance and far-reaching influence of his work, in the light of which steps were now being taken to deal with malaria.

MAJOR ROSS ON THE PROGRESS MADE.

Major Ross, in thanking his Excellency for his speech, said that he had been on the point of believing that his countrymen were becoming an unscientific and unpractical people. More than two years ago the fact that malarial infection is communicated by mosquitoes had been established by the most stringent scientific and experimental proof; and yet to his knowledge practically nothing had been done by his countrymen to act on this new information, in spite of its economic importance. He had therefore accepted with alacrity the offer of a large sum of money and other facilities from a generous philanthropist and from Mr. A L Jones, Mr. John Holt, and others in England to pay the expenses of practical work against malaria in Sierra Leone. This work had been commenced with every promise of success by his friend, Dr. Logan Taylor, and he had therefore felt himself free to proceed to Lagos to watch the work being done there. He was delighted to find that his pessimistic attitude was not justifiable as regards Lagos. He strongly eulogized everything that was being done against malaria by Sir William MacGregor, himself a distinguished member of the medical profession, by his most able friend, Dr. Henry Strachan, and by the enlightened medical profession and the Ladies' League in Lagos. He had witnessed the rapid and successful filling up of marshes by sand from the lagoons, and the rational utilization of gaol prisoners for this useful work. He had inspected numerous houses rendered mosquito-proof by fine wire-netting, which, while it did not exclude the breeze, as he expected it would, did exclude insects and damp, much to the comfort of the inmates. He highly commended the efforts of the Government to induce their officials and others to take quinine—a prophylactic which was much neglected in consequence of ignorance and faddism. He expressed himself as much delighted with the popular sanitary lectures of Drs. Strachan, Best and Rice—a most useful and striking innovation in Africa, or indeed anywhere. Above all he was delighted with the admirable measures—prompted by the highest scientific knowledge—taken

TO PRESERVE THE IMPORTANT LINE OF RAILWAY FROM THE DEADLY FEVER OF THE FOREST TRACT

through which it passed; and with the Ladies' League, to which he offered, through the president Mrs Sapara Williams, an annual prize on behalf of the Liverpool School of Tropical Medicine. The speaker said that he had come prepared to teach, but had remained to learn; and concluded by exhorting all present to support Sir William MacGregor in the splendid work which he was undertaking not only for the benefit of Lagos, but as an example to the rest of the Empire.

The proceedings terminated with speeches by Bishop Tugwell and Bishop Oluwole.

Before the departure of Major Ross for Accra, Mr C Tambaci and other leading merchants promised to place an annual subscription of £150 in the hands of the Governor to pay for a "Mosquito Brigade" for Lagos.—*London Times*, Sept. 2.

MAJOR ROSS'S RETURN FROM WEST AFRICA.

Major Ronald Ross, Royal Army Medical Corps, landed yesterday at Plymouth on his return from West Africa and proceeded to Liverpool by train. Before leaving Plymouth he gave a Press representative on account of the work which is being done in Freetown and Lagos under his direction as leader of the expedition sent out by the Liverpool School of Tropical Medicine, of which an account was given in *The Times* of yesterday.

Major Ross said it was too early to speak of the gangs employed in sanitary work at Freetown, but the number of mosquitoes in the centre of the town had certainly been largely reduced. There were hardly any to be found in Dr. Logan Taylor's house, where formerly they used to swarm, and the same state of affairs prevailed at Government House, where Major Ross stayed with the Governor. Dr. McKendrick, of the Indian Medical Service, who had been deputed to watch over the operations of the expedition on behalf of the Government of India, was not bitten once during a whole month. In former days he would certainly have been bitten at least five or six times a day. Major Ross said he had no doubt that the expeditions would be successful and that they would be continued as long as necessary. At Lagos the measures adopted by Sir William Macgregor, were admirable and he was confident of success. The Governor of Accra, Major Nathan, was anxious to start similar work there at once, and doubtless experts would be sent out immediately by the Liverpool School of Tropical Medicine. On the whole, Major Ross expressed himself as being well satisfied with his tour. Personally he did not think the health of the Coast was as bad as was painted. He believed that by minute attention to details the place would be made as healthy as India for Europeans. Old West Africans were sober and careful and generally live in very good health. It was the improvident newcomer who generally seemed to suffer. He had been informed that there was a high rate of mortality amongst such on the Cape Coast.—*London Times*, Sept. 3.

QUININE.

The following table will be of interest, showing as it does the highest and lowest prices quoted for quinine by manufacturers during the past ten years. Thus far this year the lowest price quoted by manufacturers in this market has been twenty-seven cents, and the highest thirty-six cents:—

Year.	High.	Low.	Year.	High.	Low.
1891 ...	30	24	1896 ...	27	17½
1892 ...	24	20	1897 ...	28	15
1893 ...	25	20	1898 ...	25	18
1894 ...	27½	25	1899 ...	40	21
			1900 ...	37	29

—*New York Drug Reporter*.

PLANTING NOTES.

SEEDLING APPLES FOR GRAFTING.—It is claimed that fully 90 per cent. of the Apple tree seedlings used in the United States for grafting purposes are grown near Topeka, Kans. Shawnee County, Kans, is said to now have at least 600 or 700 acres devoted to the growing of these seedlings.—*Journal of Horticulture*.

WOOD ASHES as a fertiliser are specially valuable used in conjunction with stable manure. They contain the elements of potash and phosphoric acid in proportions of about 5 and 2 per cent., the potash sometimes running to 7 per cent. The Canada wood ashes made from hard woods are the richest.—*Journal of Horticulture*, Aug. 29.

"TROPICAL TIMBERS AND THEIR RINGS OF GROWTH" is the title of a paper contributed by Mr. Herbert Wright, A. R. C. S., of the Peradeniya Staff, to "Indian Gardening and Planting." It is of considerable and permanent interest, and we are reproducing it in the *Tropical Agriculturist*.

TO DRIVE MOSQUITOES AWAY.—Oil sassafras oil wintergreen, equal parts. Apply to exposed portions of body. The oils of cajuput and origanum are also very effective, but they have a rather unpleasant odour.—*Journal Trop. Med.*

POOR TEA!—WHAT NEXT?—A recent post has brought us from the Department of Land Records and Agriculture, Madras, Agricultural Branch, Vol. II, Bulletin No. 45, namely, on "A Tea-Eelworm Disease in South India," by C. A. Barber, Government Botanist, Madras. And we read:—

The disease in question was first brought to notice by Mr. A. Brown of Glenfruen Estate, Devala, who sent a parcel of tea seedlings to Dr Watt while he was on tour in Madras. After a hasty examination the plants were forwarded to the Royal Gardens, Kew. It turned out, however, that the seedlings had been destroyed by nematode worms. The whole correspondence, which was freely reported in the *Madras Mail*, has caused a good deal of perturbation among the tea planters of the Wynaad district, and the object of the present notice is to allay their fears, while at the same time it is hoped that their attention will be drawn to this class of parasite and that a sharp look-out will be kept in case of the spread of the disease to other nurseries. I wish at the same time to direct the attention of planters and others interested in agriculture to the whole subject of root-nodules. These are not always beneficial, nor do they at once determine the plant bearing them to be leguminous and therefore nitrifying. It will also be seen later on that leguminous plants may also be attacked by the eelworm, and sowings of such plants for the purpose of green-dressing must be conducted with a certain amount of caution. The particular outbreak at present referred to is undoubtedly caused by the root-eelworm, *Heterodera radicecola* (Greef) Muell. The attack has proved to be a very destructive one for tea seedlings and is confined to the nurseries of the Glenfruen Estate. A careful examination on the spot has brought to light several interesting facts. The virulence of the outbreak fully justified the fears expressed by the manager of the estate, on the other hand it is strictly localised and there does not appear to be any great fear of the pest spreading.

And then follows a full account (and illustrations) which we may give in our *Tropical Agriculturist*. There is no need for alarm: persistent neglect of weeding, etc., is to blame for the visitation for we are told:—

Heterodera is particularly fond of old and ill-kept garden land, and I accordingly attempted to trace it to some place whence it might have been distributed in the manure. The examination of the manure heaps near the house and their weeds, however, completely disposed of this idea, and the plants found near the house seemed to be free from the disease. The conclusion arrived at was that the eelworm had been on the place for a long period, probably dating from the time when the coffee bushes were allowed to run wild. They had then gradually established themselves, and this especially in the Ageratum, which, lying about in half-dead heaps, would form an ideal ground for the pest. Having adapted itself to this composite it was carried all over the estate, and, arriving at the nurseries, found the young tea plants and the neighbouring weeds suitable hosts.

CIRCUMVENTING THE MOSQUITO.—One of the most dangerous breeding grounds of Anopheles is the pool generally to be found outside the bathroom of an Indian bungalow, says the *Madras Mail*. It is more dangerous even than the pools to be found in the native quarters, because, being composed of cleaner water, it is more likely to be fit for the growth of the green water-weed on which the larvæ principally live. In searching the pools, etc., in our compound for larvæ it is little use attempting to do so by merely looking into the water. Dip a tumbler into the water and hold it with its contents up to the light. If the water is muddy, wait till it settles. If there are any larvæ present, it will be easy to see them. They are minute worm-like bodies more or less transparent, with a large head and a pair of black eyes. The tail looks as if it were forked, and the animals are characterised by vivacious wiggling movements. Once seen they will always be easily recognised again.

INTERESTING PLANTING EXPERIMENTS.—The German Foreign Office Report for 1901 contains an interesting account of an attempt to improve the vegetation in the vicinity of Swakopmund, the port of German South Africa. The neighbourhood is a dreary and barren desert of sand, and it was necessary to choose such plants as required but scanty soil, could stand considerable changes of temperature, and resist excessive dryness. It was also desirable to guard against the strong sea wind. The latter difficulty was met by planting a screen of wild Tobacco, which, while flourishing well, presented an interesting instance of adaptation to altered conditions. The leaves, which at a distance from the sea are well known to be large and thin, became in the new habitat narrow and thick. Young trees of Oak, Pine, Juniper, Eucalyptus, Date Palm, Vine and Fig quickly perished, but the seeds of the Date Palm and Port Jackson Acacia promised good results, another instance of adaptation to environment.—*Journal of Horticulture*, Aug. 15.

PRESERVING THE FORM AND COLOUR OF FLOWERS.—From a French botanical journal we extract several recipes for preserving the form and colour of flowers. One method is to immerse the stem of the fresh specimen in a solution of 31 parts by weight of alum, four of litre, and 186 of water, for two or three days until the liquid is thoroughly absorbed, and then to press in the ordinary way, except that dry sand is sifted over the specimen, and the packet submitted to the action of gentle heat for twenty-four hours. Another method is to make a varnish composed of 20 parts of powdered copal and 500 parts of ether, powdered glass or sand being used to make the copal dissolve more readily. Into this solution the plants are carefully dipped; then they are allowed to dry for ten minutes, and the same process is repeated four or five times in succession. Plants may also be plunged in a boiling solution of one part of salicylic acid and 600 of alcohol, and then dried in bibulous paper. But this act should be very rapidly done, violet flowers especially being decolorised by more than an instantaneous immersion. Red flowers, which have changed to a purplish tint in drying, may have their colour restored by laying them on a piece of paper moistened with dilute nitric acid (one part to ten or twelve parts of water), and then submitting them to a moderate pressure for a few seconds. But this solution should never be allowed to touch the green leaves, as they would be decolorised by it.—*Journal of Horticulture and Cottage Gardener*, Aug. 29.

PENRHOS ESTATES COMPANY.

THE DIRECTORS' REPORT

was as follows :—

The Directors have pleasure in laying before the Shareholders their Report and Accounts for the year ending 30th June, 1901.

The amount of Tea secured was 234,171 lb.—199,143 lb. on Estate account as against an Estimate of 200,000 lb., showing an increase over last season of 2,539 lb., and 35,023 lb. manufactured from bought leaf, a decrease, as compared with last season, of 11,259 lb.

The Comparative Table for the past five seasons is appended, and will doubtless be found of interest :—

	Crops in lbs.	Cost laid down in Colombo in cents.	Or without Manure.	Nett average Price.
1896—1897	155,625	27.52	26.31	36.42
1897—1898	145,250	26.23	25.65	39.12
1898—1899	158,106	25.41	24.05	41.03
1899—1900	196,554	23.74	22.32	37.46
1900—1901	199,143	26.29	23.83	34.89

These figures apply to the Estate Tea only and although the average price realised has fallen below that obtained last season, yet in view of the extremely depressed state of the market during a great portion of the year the result cannot be regarded as otherwise than satisfactory.

The total Crop secured cost, including Manure, 25.67 cents per lb. laid down in Colombo, and realised a nett average price of 33.25 cents.

The comparatively heavier expenditure during the present season is accounted for by the fact that it has been found necessary to lay out some R1,200 on the erection of new lines, and repairs to existing ones. A portion of the Estate has also been re-drained, and on Dahanaike a field of twenty acres, which was making no progress, has been experimentally manured, and it is anticipated that this will show considerable improvement in the near future.

During the year a sum of R3,101 has been spent on the Planting and upkeep of new clearings and R1,082 on extensions to Factory, this latter being found necessary in order to make thorough provision for the rush of crop in the busy months of the season. After payment of the Interest on Debentures viz. R3,030, the amount available for distribution inclusive of R285 brought forward from last account, and a surplus of R155.58 on the estimated proceeds of last season's Tea, comes to R12,142.38, which is equal to slightly over 8 per cent on the Capital of the Company. The Directors recommend that this should be apportioned as follows:—

By payment of a Dividend of 4 per cent	R.	c
By payment of Bonus to Superintendent	6,000	00
By placing to Reserve Fund	500	00
By carrying forward to the next Account	4,500	00
	1,142	38
	12,142	38

The acreage of the Company's Estate is as follows:—

Old Tea	548½	acres
Tea under 4 years	7½	do
Tea under 2 years	44	do

Forest	600	do
Chena, &c.	42	do
	296	do

Total acreage 938

During the year Mr. W Kingsbury retired from the Board owing to his departure from the Island, and his place has been filled by Mr. G W Suhren.

It will be necessary to appoint an Auditor for season 1901-1902.

THE AMALGAMATED TEA ESTATES COMPANY, LIMITED.

REPORT OF THE DIRECTORS,

for the year ending 30th November, 1900, to be submitted to the fifth annual ordinary general meeting of shareholders of the Amalgamated Tea Estates Company, Limited, to be held in the registered office of the Company, 22 West, Nile Street, Glasgow, on Tuesday, the 27th day of August, 1901, at 2 o'clock p.m.

The Directors beg to submit the accounts for the year ending 30th November, 1900. The crop gathered amounted to 2,532,657 lb. against 2,143,710 lb. in 1899. The effect of the increase in yield from the Company's estates was, unfortunately, neutralized by a drop in the price. The average price was 9.90d per lb. against 10.29d during the previous year. The accounts now submitted show a balance at credit of profit and loss account of £52,869 3s 8d. Against this sum are chargeable:—Commission on profits to managers of estates, Agents in Calcutta, and Secretaries; interest, discount on bills, &c. and dividends paid to the preference shareholders, which total £29,125 17s 6d, leaving a balance to be dealt with of £23,743 6s 2d. Out of this balance the Directors propose to pay a dividend at the rate of 5 per cent per annum, payable on the 31st August to the ordinary shareholders, on the amount called up, which will absorb a further sum of £14,350 10s 0d, and leave a balance of £9,392 16s 2d to be carried forward to next year. Considering the crisis in the tea market, this result is encouraging and satisfactory.

As explained in the circular letter of 7th August, addressed to the shareholders, Mr P R Buchanan, the Special Adviser to and Visitor for the Board, proceeded to India by mail of 4th January last, and he, along with the managing Agents in Calcutta and Colombo, and the Company's Visiting Superintendents, has been able to effect considerable economies in working without impairing the efficient up-keep of the estates, which should help the results of 1901 and subsequent years. In the circular letter of 7th August above referred to, and in the circular of 9th ultimo, the Directors gave information regarding the position of the tea industry and the prospects of the Company.

Advices from the estates show that they are maintained in good cultivation. The estimated yield for 1901 is 2,915,760 lb. The total area now under cultivation is 13,355 acres. The Company's investment in the Kanan Devan Hills Produce Company, Ltd., remains as before, and the Directors are pleased to be able to report that the prospects of that Company continue to be favourable. This is especially the case in regard to its cinchona properties, the visible supply of that product being at the moment moderate and the prices remunerative. In terms of the Articles of Association, one of the Directors, viz., Mr A B Murray, retires at this time, and is eligible for re-election.

The Auditors, Messrs. Alexander Sloan & Co., C.A. retire, and offer themselves for re-election.

RATWATTA COCOA COMPANY, LTD.

The annual meeting was held today at the offices of Messrs. Geo. Stenart & Co. The business was entirely formal as indicated in the notice calling the meeting. Mr. Jeffries was re-elected a director and Mr. MacDermott was re-appointed auditor for the current season.

The directors were also authorised to borrow further money as mentioned in the notice.

REPORT.

The Directors beg to present their Report for season ended 30th June, 1901, together with the audited accounts for the same period.

The Cocoa Crop amounted to cwt. 324-0-12, and sold at an average of about R44-17 per cwt. The estimate was cwt. 400.

The Tea Crop secured, including about 7,600 lb. from bought leaf, was 86,229 lb. and sold at an average of about 25cts. per lb. The estimate was 81,000 lb.

The profit for the year after charging all expenditure to Revenue Account is R3,410-86, which, however, disappears and becomes a deficit of about R4,000 when interest, Directors' Fees, Secretariat, &c. are brought into the reckoning.

The future outlook from an agricultural point of view is satisfactory. Young fields are coming into bearing, and there will be no more Capital Expenditure, with the exception of the cost of additional withering room to meet the increase of the crops. The monetary position of the Company, however, is embarrassing, and the Directors beg to invite the Shareholders to come forward and assist them in placing the finances on a good sound basis. This is the most important business before the Company at present, and it is hoped that Shareholders will not neglect this opportunity of providing the necessary help.

The estimated Crops for the coming year are 400 cwt. of Cocoa and 120,000 lb. of Tea against an expenditure of R36,895-01.

The acreage of the property as at present cultivated is

Cocoa planted in	1893	72 acres.
do ..	1894	85 "
do ..	1895	56 "
do ..	1898	10 "
		— 223 acres.
Tea in full bearing		119 acres.
do planted in	1896	24 "
do do ..	1897	100 "
do do ..	1898	75 "
		— 318 acres.
Total in cultivation		541 "
Jungle		180 "
Grass		3 "
Total acreage		724 "

Mr. Gordon Pyper having been appointed Managing Director for a term of years, Mr. Edmund Jeffries only retires from the Directorate by rotation, but he is eligible for re-election.

An Auditor has to be appointed for the current year. The appointment rests with the meeting.

EILA TEA COMPANY OF CEYLON, LTD.

THE REPORT.

The Directors herewith submit their Report and Accounts for the year ending 30th June.

The crop on Eila estate was 244,775 lb. against an estimate of 281,500 lb. and on Kanangama estate 88,668 lb. against an estimate of 135,000 lb.

The average price of the tea, which has all been realized, was 24-16 cents per lb. as against 30-38 for the previous season and the cost of the same was 22-83 cents.

During the year a further instalment of £500 was paid to the Standard Assurance Company, in reduction of their loan per £7,000. The amount now standing is £5,500.

The Directors have great regret in reporting the low prices which the Company's teas have fetched during the season, especially as every effort has been made to maintain them by finer plucking than has been hitherto customary. This however is the experience of practically all tea estates. The crop on Kanangama turned out very short of the estimate, for which two facts are

accountable—namely the finer plucking resorted to in consequence of the depression of the market and the unusually severe and persistent attack of helopeltis which has visited the estate. The Superintendent is now taking further measures in order to try and cope with this pest which he hopes will be successful.

The result of this combination of low prices and short crop and the necessary consequence of enhanced cost of production is a loss of R4,096-65 on Kanangama's working for the season. Eila has made a profit of R11,712-73 and a matter of congratulation is that the young tea has come on well and will in time be the finest tea on the estate.

The net profit for the season is R779-54, which the Directors propose to carry forward to the next season's account.

The Estimates for the current season provide for a crop of 367,050 lb. Tea at a cost of R78,815-65 which the Superintendent considers he will be able to work to.

The Estates of the Company now consist of:—

Eila	... 626 acres	5 years old and upwards.
	90 do	4 do
	240 do	Forest.
		—
		956 acres.
Kanangama	... 215 acres.	5 years old and upwards.
	108 do	Forest.
		—
		323 acres.

During the year Mr H G Bois was elected to the Boards of Directors in place of Mr F W Bois who has left the Island.

Mr G F Walker retires in accordance with the Articles of Association, but being eligible offers himself for re-election.

It will be necessary to appoint an Auditor for season 1901-1902.

—

AUSTRALIAN EUCALYPTUS TIMBERS.—The Journal of the Society of Arts, for September 6th, contains interesting information about the Australian Hard Woods of commerce. The "Jarrah" (*Eucalyptus marginata*, Sm.) is the principal tree in the forests of Western Australia and attains a diameter of 2 feet in 40 or 50 years. It grows best in that part of the country upon which the heaviest rains of the season fall. The wood which is very hard resists the attacks of *Cheura*, *Teredo*, and *termite* and in consequence of this property may exist in an almost perfect condition of preservation for nearly 100 years. Such a wood can be used to advantage in the construction of houses, harbours, bridges, etc. The "Karri" (*Eucalyptus diversicolor*, F Muell.) often known as the "white gum," comes a good second to "Jarrah." When mature the trees are of straight growth and tower skywards for great heights without branching. It is not unusual to fell trees 200 feet in height. This species grows well in the humid portions of the temperate region of West Australia where the annual rainfall is from 30 to 40 inches. The wood is extensively used for street blocking and in the paving of the London streets a very large quantity has been used. In the Peradeniya Gardens, there are half a dozen species, including "Karri," "Iron bark," and the "Lemon-scented gum tree." In the Hakgala and Nuwara Eliya districts there has been a recent importation of "*Eucalyptus robusta*."

THE FRUIT OF UGANDA.

AN INTERESTING CHAT.

We had a call yesterday from Mr. A. Whyte, F.Z.S., F.L.S., director of the scientific department of the Uganda Administration, who is on his way Home on leave of absence. In the course of his visit, Mr. Whyte informed us that Uganda is a beautiful country. Its great drawback is its distance from the sea—700 miles from the port of Mombassa. The railway from Mombassa, however, is being vigorously pushed on, and some 500 miles have already been laid. Some very heavy cuttings and embankments occur on the remainder of the route, but it is expected that the line will be finished about April of next year. Two new steamers are being built to add to the one at present plying on Lake Victoria Nyanza, which will take goods from the railhead to Entebbe, the present capital of Uganda, on the western shore of the lake, where a breakwater is being constructed. It is very probably that this will be the permanent capital.

Mr. Whyte has opened up what he himself already regards as beautiful botanical gardens, and believes that in course of time they will be amongst the finest gardens in the East. The climate of Uganda is almost perfect. The temperature seldom rises above 80 degrees, or falls below 60 degrees. It is difficult to say what will not grow in Uganda, excepting European cereals, which have not proved satisfactory. There are two wet seasons in the year, and scarcely a month without rain all the year round. The rainfall is not very heavy, but is well distributed, and therefore of greater value. Uganda is a great rubber country, and Mr. Whyte informs us that he has seen more rubber-yielding plants in the forests of Uganda than in any other tropical forest. We may say that Mr. Whyte has had a large experience in the interior, being formerly Director of the British Central Africa Administration. There is a dense native population. He describes the Waganda as a very intelligent and interesting people, especially amongst the better classes. The lower orders have been rather chief-ridden, but are now developing into good labourers. Some of the Waganda are remarkably well educated, and write a good hand. This is the result of missionary enterprise, both Protestant and Roman Catholic, extending over a long period of years. It is a curious fact that right over the long distance of country between Uganda and the coast only barbarians are found. The development of the Waganda can only be attributed to the work of the missionaries; indeed, the celebrated Missionary Mackay, when he desired to leave the country, was practically made a prisoner by them, so loth were they to lose him. Trade is being gradually opened up by the Banyans, who are beginning to arrive in the country, and it is well-known that these men are expert traders.—*Natal Mercury*, Aug. 23.

OUR PEARL OYSTERS AND THE EXPECTED EXPERT.

SPECIMENS TO BE SENT TO PROFESSOR HERDMAN.

Professor Herdman who is expected in January next year to make personal investigation of our pearl banks is to be supplied with a few specimens of the oysters beforehand. A representative of this paper learnt from Captain Donnan today that these specimens will be forwarded shortly, and was also informed that this fact will in no wise affect the projected visit of Professor Herdman. It is likely that Captain Donnan will visit the pearl banks shortly to secure these specimens but the date of his departure has not been settled yet. The actual reason for the sending of these specimens could not be ascertained.

CACAO PLANTS FROM THE DUTCH EAST INDIES.

The following regulations made by the Governor, with the advice of the Executive Council, are published for general information:—

Regulations under Section 3 of "The Insect Pest and Quarantine Ordinance."

1. The importation of Cacao "plants" from any part of the Dutch East Indian Colonies is prohibited.
2. The Principal Collector of Customs shall destroy all Cacao "plants" imported from any part of the Dutch East Indian Colonies and no compensation shall be payable in consequence of such destruction.—*Gazette*.

A MOSQUITO NET FOR THE TROPICS.

Mr Carmody, in the American "Journal of Tropical Medicine," has sketched a mosquito net for travellers in hot countries. It is attachable to the ordinary umbrella or sunshade, and serves the double purpose of keeping off the sun by day and the insects by night.—*Globe*, Sept. 13.

USEFUL NOTES ON EVERYDAY TOPIC.

DIPHThERIA AND HORSES.

In a leading Bacteriological Magazine, Dr. L. Cobbet puts on to horses some quilt with relation to the spread of diphtheria. He shows that horses are peculiarly liable to this disease. In 9 out of 13 animals he found the diphtherial bacillus and he infers from his observations that the horses acquire diphtheria naturally and do not in many cases suffer any serious inconvenience from it.

GRAFTING.

A recent investigation of the physiological and practical sides of grafting by Dr. S. Daniel lead him to lay down the following conditions for successful grafting:—1. The maintenance of the adhesion of the plants. 2. The maintenance of the vitality of the scion and stock. 3. A suitable temperature neither too high or too low. 4. The maintenance of the life of the graft up to a definite level. 5. The possibility of the graft to get back the moisture lost in cutting. 6. The necessity of never leaving, after the operation, the level of the graft under water.

MALARIAL MOSQUITOS.

Messrs. Grassi & Noe have discovered that the filarial or malarial organism passes from the mosquito to man only in the act of biting. They explain the

interesting way in which these larvæ are passed in the act of biting and not when the mosquito is sucking the blood. Dr. Stephens and Mr Christophers have examined a series of native villages in Sierra Leone and find that 50 to 90 per cent of the children were infected with malaria. In all the villages the malarial mosquito (*Anopheles*) was present and each hut contained one or more cases of infected children and infected mosquito. Thus the native in these parts is the prime agent in spreading malaria to Europeans.

MANGO GRAFTS FROM BOMBAY FOR FLORIDA.

The American Consul at Bombay has lately sent a dozen mango-grafts from nine selected varieties grown in Bombay to Florida, as a horticultural experiment. They were packed in boxes with plate glass lids, and he hopes that as tropical fruit introduced into America generally improves on cultivation, some very superior mangoes may be the result of his enterprise.

PRODUCE AND PLANTING. THE TEA DUTY.

We are glad to find that the question of the tea duty is not allowed to slumber. The increased duty was a blow to the industry which there have been attempts to minimise, but no apathy on the subject or acceptance of the inevitable can alter the fact that an act of injustice has been committed against the tea grower. In a letter to the *Financial Times*, "Kar Guzar" deals with this duty question, and he protests against this burden on the producer. He says: "Messrs. Finlay & Co., in their circular addressed to the shareholders in their companies, and published in your issue of the 10th inst., rightly stated that the sudden increase of 50 per cent to the duty previously levied on tea has prejudicially affected the industry. They place the amount of their losses by it at £60,000, and at the rate of 1½d per lb. The lower the tea produced is classed the greater is its producers' loss. The quality of tea depending upon the lay of the land, the altitude at which it is grown and the qualities contained in the soil, it is not in the producers' power to vary its quality at pleasure; he may pick finer or coarser, he may improve the appearance of the tea, but its chemical qualities will remain the same to the end of the chapter. We are told that the average price of Indian tea before the levying of the surcharge was 8d without duty. To get an average of 8d a lb. much tea must have been sold at 4d per lb, some at 1s, but we must not think, because one producer received 12d a lb for his tea and another received only 4d, that the one was intrinsically worth three times the price of the other. The difference in price is not regulated by its intrinsic properties—the prices the consumers pay the merchant are regulated by the relative intrinsic values of the teas—but the price the merchant pays producers by the amount of duty plus the price he can afford to pay to equalise its cup value to the consumer.

THE INEQUALITY OF THE IMPOST

is pointed out. "The duty falls unequally on teas of different qualities, and it forces merchants to buy the higher-classed teas to the neglect of the others. A rate of duty which produces a revenue equal to 75 per cent. of the whole value of the industry, a rate of duty varying from 50 per cent. to 150 per cent., is out of all proportion to its value. The price to be paid to the producer will be reduced by every penny that the merchant will not be able to recover from the consumer. If the merchant wishes to sell two teas to the consumer,

the one at double the price of the other, it will be necessary for him to purchase the lower-classed one at a third of the price of the other—hence we may conclude that every 2d added to the duty takes a penny per lb off the prices received for all teas below a certain value. When the duty stood at 4d low-classed teas were handicapped 2d per lb, and the average, or 8d, teas by 1d. Now that the duty has been raised to 6d, low-classed teas are handicapped 3d on the pound of tea, and average teas 1½d, as against the higher-classed teas. The duty as it is now levied acts as a direct tax on the majority of us producers. The amount levied from me as a war tax I estimate at £2,000 per annum. It would have been less had the merchants not succeeded in passing so much free of increased duty and would have been greater had my teas not been in some request for outside markets. It is, I think, much to be regretted that Messrs. Finlay & Co. limited their statement to a bare chronicle of results, and did not boldly state in what manner and why the duty has borne, and is still bearing, hardly on our industry. The Chancellor of the Exchequer, when introducing his Budget, stated his reasons for having selected tea as a fit article for increased taxation: (a) because it was not an article of manufacture in this country; (b) it is largely consumed, and (c) at the time of the Crimean war the duty on tea stood at 1s 6d per lb, and that it was promptly raised 3d with practically no objection from anybody concerned. He then went on to state that even with the addition of 2d per lb tea would still cost the consumer 2d per lb less than it cost the consumer in 1889, before the duty was reduced from 6d to 4d per lb, and wound up by saying that he did not think the population at large will have any very fair ground for complaint at the amount which they will be called upon to bear towards the cost of what the vast majority of them believe to be a necessary war. It is very evident from what fell from the Chancellor's lips, as from the tenour of the debate in Parliament, that the Chancellor and also Parliament intended that the tax should be levied from the tea-consuming public, and not from the producers. I am one of the vast majority who deem the war to have been a necessary war, but I deem it wrong to attempt to levy any special portion of its cost under a special tax from the persons we made war to protect. If we are to be taxed, by all means tax us, but levy the tax in such a manner that it will not act unequally in its incidence. Had the duty fallen to the lot of the consumer to pay, as it was intended it should have done, the reproach that it added to the poor man's burden would have been a just one. Why an article produced and manufactured by a large number of His Majesty's subjects residing in His Majesty's colony, as also in a Dependency of the British Crown, should be taxed, and articles manufactured within the United Kingdom should be exempted, we can leave those who talk so glibly of consolidating our Empire to inquire into; the principle therein propounded found favour with Parliament, and with the rest we have no concern, and it is most certainly largely consumed."

THE OBJECTIONS TO THE TAX

are urged. "At the time of the Crimean War the duty certainly stood at 1s 6d, and was promptly raised 3d per lb, but in 1852 it stood at 2s 1d. was reduced in 1853 to 1s 10d, and again in 1854 to 1s 6d per lb. Thus, when it was raised 3d it still stood at 1d per lb less than it had previously done. A duty levied on trade will fall either on the consumer or the producer, in no instance on the merchant, and in some instances, as in the present instance, it may act to his direct advantage. In 1854-55 the consumers, acknowledging the necessity of levying a duty to meet war expenditure, could not fairly object to having the rate of duty raised, more particularly as the duty and surcharge together left them a penny better off than they had been in the habit of paying. Producers could not object, as the article taxed was of foreign origin, and they had no cause to object, as

they had possession of the markets of the world. What they could not sell to us they could sell elsewhere; our custom or our values did not rule their prices. Our case at the present day is wholly different. The major portion of the tea brought for sale to the English market is of British production, owned by British subjects. It is not an article that can be increased or decreased at will, and it is an article which spoils after a time in keeping. Our home market was, until recent times, our sole market, and is still our principal market; its prices regulate the prices for all; whatever we make must come forward, and we must accept the prices offered or not sell at all. When it was suggested in Parliament to substitute an *ad valorem* duty for a duty on weight, the Chancellor voted against the suggestion mainly on the ground that it had been tried and found wanting—I presume on the ground that it left openings to the quick-witted merchant to pass his goods through the Customs House at lower values than he should do. I cannot help thinking that where there is the will the way will be found, and that an industry which yields a revenue of several millions sterling is worth trying to do justice to, and for my own sake and for the sake of others I sincerely hope the Chancellor of the Exchequer will see his way to perfecting one. For my own part, I believe, a duty of 4½d on all teas valued at 6d and under and *ad valorem* duty of 75 per cent on all teas from 6d to 10d (all teas over 10d paying 7½d) would more than make good the loss the revenue might incur from the acts of the quick-witted merchants and if the Customs House officials find difficulty in assessing duty on the fractions of a penny, fractions of a penny might count as one."

Whether the views of the majority of producers are for or against "secret" or, as the supporters of the movement prefer to call them,

"PRIVATE" SALES OF TEA,

they continue to be bitterly resented by grocers. "Spectator," writing to the "Grocer," says, in the course of his letter: "Regarding Wednesday's secret sale itself, it was somewhat remarkable in that it partook of a more mysterious nature than anything we have yet seen. Competition amongst buyers to buy their own property afforded a special feature of interest, and the good old games of 'bluff' and 'puff' were merrily played, to the satisfaction of all concerned. It is, however, very apparent to the ordinary mortal that a scratch lot of Calcutta-bought tea is not the class of article which promoters of private sales have in view. The auction might perhaps be best likened to a bird-catcher's nest, with many decoy birds in various false feathers hopping about and greedily picking up gilded oats. Its attractions do not, however, so far appear to have ensnared any of the wary old birds who own the bulk of the fine tea gardens; perhaps they do not care to risk having their marks prejudiced in the country, or perhaps the Ceylon merchants who have tried the scheme may have whispered that the gilded oats only chaff after all. I understand that the 'Tea Buyers' Association anticipates that private sales may 'by a more extended range of prices in some way confer a benefit on the retailer.' There can be no doubt as to the question of 'extended prices,' as they will most certainly extend down for the merchants and up for the grocers, but with regard to the benefits to the retailers the prospects do not appear to be so clear. I would, therefore, suggest, Sir, with all due deference, that the General Purpose Committee of the Grocers' Federation invite the Chairman and a few other members of the Committee who drew up the private sales scheme, and have taken a leading part in the movement, to meet them next month and explain the advantages likely to accrue to the grocer. By this means the grocers would be enabled to gather much valuable information, and the representatives of the Tea Buyers' Association would not only be afforded an opportunity of gaining increased notoriety but if their scheme is found to possess the merits claimed

for it, their names would probably also be handed down to posterity as public benefactors. If I recollect rightly such a meeting took place at the time of the ponnd-draft dispute three years ago, when, I believe, the grocers were given to understand that the protection of their interests was one of the principal objects for which the London wholesale trade existed. It is probably fresh in the memory of many of your readers the quarter from which that unfortunate disturbance emanated. In conclusion, I would venture to take the liberty of most strongly impressing upon the General Purposes Committee the extreme importance of giving this subject of secret auctions their most serious attention, as if allowed to continue without protest or action from the country it may, although the Ceylon merchants destroyed the recent public sale boycott, yet develop into a most dangerous situation for the retailers. I understand on good authority that many leading Indian and Ceylon merchants intend to adhere to the policy of the 'open door,' and I know that there are several powerful blenders and many old-established leading dealers who look upon the new movement with suspicion, and are prepared to support the public saleroom. To these firms I would most earnestly recommend the grocers to accord their support and countenance, and, by making common cause with them, stamp out once for all the most mischievous scheme that ever was concocted for benefiting a few at the expense of many."

PARA RUBBER IN CEYLON.

Sir,—It may interest some of your readers to know that the last consignment of 2 cwt. of Para rubber from this estate sold in the London market at 3s 9d per lb.

My coolies are regularly bringing me in at the rate of ½ lb. dry rubber per cooly. Considering that some of the trees now being tapped are not in a very favourable location for a good yield, being up a hillside, the result is very satisfactory.

	R.	c.
Taking value 3s 9d in rupees as	...	2 70
And 1 lb. rubber, costing two coolies,		
C R average, if 35 cents	..	0 70

Leaves a clear profit per lb. of ... 2 00

This includes cost of curing it, as the same coolies have to do it, in the middle of the day. The result may not be so satisfactory as some well-known Kalutara estates, but is still good enough.

If only all our "dadap" trees were Para rubber!
—Yours, &c. FRANCIS J. HOLLOWAY.
Kepitigalla, Matale, Sept. 22nd.—Local "Times."

INDIAN TEA NOTES.

GREEN TEAS.

(From a Planting Correspondent.)

"You will probably find that the Indian Tea crop will not be short at all. I believe on pretty good Calcutta authority the 'short crop of output' report will not long hold good; however, we shall soon see. It is difficult to say much about the future of Ceylon "Green Teas," but it would be interesting if Mr J N Campbell of Moray or Mr Hamlin of Darrawella or Mr Wright of Brunswick would publish their *nett* average for last twelve months' shipment. If the returns have been reasonably fair ones the output of these teas would be increased, which is to be desired, especially from low-country estates where black tea averages would be lower than Dikoya and Maskeliya ones.

"I still think that all estates getting the bonus should send their account sales or copies to the 'Thirty Committee,' not necessarily for publication, but to enable the Committee to judge if the business is likely to prove a paying one in the future."

THE CAMPHOR TRADE OF FORMOSA: INFORMATION FROM MR. DAVIDSON, AMERICAN CONSUL.

Pending the arrival of a copy of Mr. Davidson's exhaustive book on Formosa, it may be well to mention a few of the facts contributed by him in the course of conversation. First of all, it is a mistake now to talk of camphor from Japan, China or even Borneo. The high prices and monopoly during the war, completely used up all the available camphor in both China and Japan; while the Bornean article is so inferior as scarcely to be worthy of the name of camphor proper. Still, a considerable quantity of camphor enters the American market even now as "Japan," and Mr. Davidson found it difficult to convince merchants in New York that it was really the product of Formosa, but exported *via* Japan and there packed differently. Two years ago, Japan shipped 1,500 lb. of camphor, the very last got from her own trees.

Mr. Davidson does not give much encouragement to Ceylon or any other country to grow camphor trees in order to secure a profitable, as well as marketable, product. The indigenous forests of Formosa are of a very large extent, and it will take a long series of years before they are exhausted, even if

THE WORLD'S REQUIREMENTS

should increase a good deal over the present standard. So large and rich are some of the Formosan forest trees, that Mr. Davidson has known one tree yield as much as

£200 WORTH OF CAMPHOR.

Four per cent is about the best yield from the richest part of the tree. Should competition by any chance arise, the Formosan monopoly can be worked to run down the price for a time, in order to shut out rivals. All this is not encouraging.

GREEN TEA.

Mr. Davidson further made reference to Ceylon Green Teas and mentioned how he was in the office of a leading New York tea firm and witnessed a testing of a package of Ceylon "Greens." The verdict was,—a fair average green tea as to make and appearance, but with the Ceylon flavour, to which American consumers are not attracted. We mentioned how we learned in 1884 from the largest American buyer of Japan tea, that every ounce was artificially faced; and remarked that surely now the Americans would prefer to use a pure article. "Yes," replied Mr. Davidson, "but then your Ceylon Greens are fermented." (There he must be mistaken; no fermentation takes place in the preparation of Ceylon green tea; but this shows how a wrong belief arises and spreads.)

"But the Oolongs of Formosa are quite pure and natural, and they must long remain a favourite tea in America."

It will be seen from all this, that Mr. Davidson is a firm believer in Formosa and her products; and it is pleasant to find the most made of one's adopted home. Mr. Davidson is a great lover of botany, horticulture and tropical cultivation generally. He has long known and appreciated the *Tropical Agriculturist*, and he was delighted to be able to study our Review of all planting products prefixed to the "Handbook and Directory." Mr. Davidson was curious to know whence the first camphor seed or plants received in Ceylon, came? He supposed from Japan.

PEPPER AND COFFEE EXPORTS FROM WESTERN INDIA.

We are indebted to Mr. C. W. Layard, the successor of our lamented friend, Mr. Ralph Tatham, as agent for Messrs. Arbuthnot & Co., Tellicherry, for the annual report and statistics of the above products for the year ending 30th June. [Given as a *Supplement* to this issue]. It is surprising to see how well coffee keeps up, considering all that has been said of disease and decay in Coorg and Mysore. The large proportion, too, of native-grown coffee is noteworthy and seems to indicate that if prices were only satisfactory, the export of our old staple from Southern India could be maintained, for some time to come. As regards Pepper, the same rule of an alternate good and poor crop seems to prevail: the returns for five past seasons comparing thus:—

1896-97	...	Export of Pepper cwt.	222,383
1897-98	...	"	125,231
1898-99	...	"	237,041
1899-00	...	"	168,001
1900-01	...	"	211,987

The value of last season's pepper crop (July 1900 to June 1901) is given at ₹7,949,512, or close on 8 millions of rupees. Would that Ceylon could produce enough pepper for its own requirements and still more export even as much as it did in 1739 when the Dutch sent away 465,000 lb. chiefly from Kandyan districts.

NEW PRODUCTS IN ASSAM.

The Report of the Director of Land Records and Agriculture in Assam contains notices of the cultivation of "sisal" hemp at Dauracherra, in Sylhet, which is being energetically pushed, and of experiments made by Babu Debeswar Gohain and Mr. Matilal Haldar in growing sugarcane on a considerable scale, and the manager of the Bamgaon tea estate in growing "balam" rice and husking paddy by steam machinery. These experiments, as well as the experimental cultivation of the rubber tree on a considerable scale in the Charduar plantation by private enterprise and of rhea fibre in more than one locality, are all of interest and fraught with importance to the future prosperity of the province, and the Chief Commissioner remarks that he is glad to encourage them in every reasonable way.—*Bombay Gazette*, Sept. 24.

PLANTING "DAYS OF OLD"
IN CEYLON.

BY A VETERAN WHO ROSE FROM S. D.
TO BE CHAIRMAN OF THE P. A., AND
M. L. C.;

BUT NOT TO MAKE £50,000!
1864-5 AND ——— 1901.

Thank you very much for sending me so promptly a copy of the "1901 Ceylon Handbook and Directory," which is to me most interesting and which I find almost as necessary as when I lived in Ceylon. I have beside me while I write—I have unearthed it for purposes of comparison—your Handbook and Directory of 1864-65, which I remember considering at the time a most imperfect and inaccurate work because I had been a few months in Ceylon before it came out, and my name did not appear in it. I suppose I was fonder of seeing my name in print then than I am now, and felt the disappointment.

But despite this (to me) great blemish, I am prepared at the present moment to pass an examination in 1864-65 Handbook against any man living, the Editor not excepted!

At that time I lived in the usual Sinne Durai's mud-but with a library consisting of a Bible and Prayer-book, Smile's Self-help, Burns' Poems and a few greasy yellow-backs which had been read and re-read, and often by the dim light of a cotton wick floating in coconut oil in the inverted top of a bottle as a red pedestal, have I read myself to sleep over the Ceylon Directory. To go to sleep once, when reading a book is a doubtful compliment to the author; to go to sleep many times over the same book is the highest compliment you can pay him.

How times have changed in those thirty six years is vividly brought before me by your new Directory. A generation of planters and merchants has almost passed away; districts and estates have changed their names and vanished from view; the only things which strike me as not having changed are the native names of estates. I began life in Ceylon under Bas Gray on Algotenne, the situation being procured for me by my good old friend and neighbour in Aberdeenshire, W. D. Gibbon. I think George Beck and myself are the sole survivors of the Hunasgiriya I knew at that time. I moved on from there to Gona Adika: Spencer Shelley and myself are the only survivors I know, of the Kadugannawa of that time. I look back with great pleasure on my Sinne Durai days; there was not much expected of Assistants in those days and though salaries were small, a rupee was worth 2s, and we had enough for our wants. Beer was sometimes 2ls per dozen, so we did not drink it; but occasionally when a neighbouring Sinne Durai came on a Saturday night, a bottle of bazaar brandy—which seemed nectar then, but would be poison now—was procured.

I was fledged as a Periya Durai on Kinrara; but when I had been there a couple of months, I was sent down to take charge of

Mahaberiatenne and Keenegahawella in the Dumbara Valley. George Greig and H. G. MacKenzie, now in London, were my neighbours, and after two years of Dumbara, I was promoted to the management of the Pendleton Group of estates where I remained for five years.

In 1873 I made my first investment: in Malvern estate, one of the group I had been managing. I bought early in the year when parchment coffee was worth about 1½s per bushel and before the end of the year 25s and even 26s, I think, was paid for coffee. The result was that the value of the crop was considerably more than I paid for the estate, and the latter I sold immediately afterwards.

I think it must have been about this time that, at a social function, I said two things which I have very often been twitted with since:—1st, That every twenty-year-old planter should be shot to make room for younger men, as if he had not made his fortune in twenty years, he could not be much good. 2nd, That I had come to Ceylon to be Chairman of the Planters' Association, Member of the Legislative Council—and to make £50,000!

I lived long enough in Ceylon to modify the first statement, and I did not succeed in carrying out the last clause of the second.

From Pendleton I moved to Dimbula and Dikoya, and my life is much brightened by many friendships formed there.

Your Directory always carries me back to days far away, but they seem but yesterday, and it creates in me a great longing to re-visit Ceylon, which I live in hope of some day doing. Again thanking you for the big volume, which not only serves the practical purposes of today, but awakens pleasant memories of the past.—J. L. S.

CINCHONA.

Mr. John H. Stallman, of New York, is the author of a brief but interesting article on "Peruvain Bark as viewed from a Commercial standpoint," which appears in the July number of the *Journal of Pharmacology*. The article is mainly historical, and although Mr. Stallman finds a difficulty in saying anything new, he deals concisely with the data of the industry up to the present time. Mr. Stallman calls attention to the enormous increase in the consumption of cinchona of late years. The average annual production of bark in all countries twenty years ago, he says, was about 6,000,000 lb; in 1890 the production had increased to over 18,000,000 lb, which seems to have been the high-water mark. In 1900 the production was not over 14,000,000 lb, but of a high test, while the accumulated stocks in Europe had become much reduced. Appended to the article is an extract from a London price-list which says:—

To sum up, it appears that consumption has at last overtaken production, and increased shipments from Java will be required to supply manufacturers and make up for the expected deficiency from British East India and Ceylon, and in any case we fancy the days of quinine selling below 1s per oz. are numbered, and we think it safe to prophesy that the average value of the unit during the next three years will be above the average of 1896-98. The present state of the cinchona and quinine markets do not now seem to favour this view, especially if the increased shipments from Java (which already show an excess of 1,710,000 Amsterdam lb over 1900) should continue.—*Chemist and Druggist*, Aug. 24.

* Well done! and yet we can recall many months of toil over that old-fashioned volume which stands Number 6 in our list.—Ed. T. A.

‘ WHAT IS THE MOST CONVENIENT
AND PROFITABLE SIZE FOR A
TEA GARDEN IN CEYLON?’

This is a question which has recently come before us from several directions and owing to differing circumstances. For instance, it has been said that one reason why certain Limited Companies do not prosper as they ought, in proportion to the total area, and quality, of their tea-planted land, is that some of their “gardens” are very much detached and of too small an area to be worked profitably. Again, in answer to an enquiry as to why So-and-so does not make more out of his property,—we are often told that his acreage is too limited and he is weighted with a fully-equipped factory equal to double the leaf he has to bring in. All this makes one ask in turn as to what may be considered the proper average of extent planted to constitute a really profitable plantation. Now, of course, we are aware how great is the diversity in soil, in jāt, in climate and other conditions in Ceylon, and how 200 acres of tea at a high elevation may be more fitted to be worked as a profitable property than 400 acres in the lowcountry, both being supposed to have adequate factories and sufficient labour supply. We directed an enquiry as to our problem to an experienced Visiting Agent and had, for answer, that in his opinion, “100,000 lb. of made tea” was the proper gauge of a really profitable plantation if turning out fairly good teas, and that the nearer the outturn was to 200,000 lb. the more certain the proprietor should be of an adequate, handsome margin of profit. That would clearly mean, estates of not less than 200 to 250 acres in bearing under any circumstances; and we suppose that this may really be taken as a minimum area for an efficient Superintendent and well-equipped factory? How then about detached estates in the hands of Limited Companies of as low an area as 150 acres? Should these be sold or exchanged as a favourable opportunity occurs, and would it not be a wise policy generally to aim at amalgamating small adjacent properties, so as to save in superintendence and factory working. The subject is one on which we should like to hear from practical planters.

PROGRESS IN B. C. AFRICA.

A RAILWAY TO BLANTYRE SANCTIONED.

(From Our Planting Correspondent.)

Mlanji, B.C. Africa, 22nd Aug., 1901.

A telegram was received last week by the Manager of Sharrer's Zambezi Traffic Company that the Foreign Office had granted the necessary concession for the construction of a railway from Chiromo to Blantyre; but no further information has been received to date. Sharrer's Z. T. Company have been pressing the home Government for 3 per cent. guarantee on the capital required for the construction of our railway for some years and it has doubtless

been granted. For some years back it has been known that Mr. Sharrer had the promise of the capital to build our railway, provided 3 per cent. guarantee was given by Government.

Lord Stanmore, formerly Sir Arthur Gordon, Governor of Ceylon, is one of the Directors, and has been using his best efforts for years back with the home Government to secure our much-needed line. Great credit is due to Mr. Sharrer, the Managing Director of this enterprising company, for sending out a Mono-Railway to relieve the human traffic on the road from the lower Shire to Blantyre. It is now being laid down from Katnugs to Blantyre. An attempt was made to lay this line from Chiromo or Maqueras some miles further up the river to Blantyre, but it was found that the gradients were too steep and now there will be no need for it on the Chiromo-Blantyre route. The gauge of our line is likely to be 3 ft. 6 in., the same as in all the South African Railways.

The opening up of the country from Chiromo to Blantyre should do much good, leaving out of the question the capital to be spent and the labour set free for agriculture. H. B.

RUBBER FROM YOUNG “FICUS
ELASTICA” TREES.

In recent proceedings of the Selangor Planters' Association, we read:—

Letter, dated 20th June, 1901, from Mr. Derry, Government Plantation Office, Perak, to the Hon. Secretary, Selangor Planters' Association, enclosing copy valuation of sample of rubber sent some time ago by Mr. Tan Chay Yan, of Malacca, from *Ficus elastica* trees four years old. The following is the valuation made by Messrs. W. J. and H. Thompson:—“This is a good rubber and well prepared. The value is about 3/- per pound, provided the blk is fully equal to the small sample (one kati), equally clean and equally dry.”

IMPERIAL RUBBER.

It is stated that the present annual consumption of rubber all over the world is about 54,000 tons, with a production of only 54,600, so that the margin between consumption and production is extremely small, and may easily vanish altogether in a year or two, says a contemporary. In looking through the list of countries which supply the world with rubber, it is rather annoying to note that Imperial Britain takes a very small share in the trade; a share which could surely be greatly increased, were attention and capital to be drawn to the industry. It is one of these occupation wherein a brisk market at high prices is a matter of practical certainty, and hence the risk of sinking capital is reduced to a minimum. We have many colonies where rubber could be grown; and especially is the colony of Queensland suited for the business. In many parts of that great country conditions exist similar to those in Brazil, Peru, and Bolivia, from which countries at present half the world's supply of rubber is drawn. The value of the material produced by these South American States cannot be far short of £8,000,000 sterling per annum—a sum sufficiently tempting to induce the employment of capital on a large scale. We have yet hopes of seeing a big Queensland rubber trade established which shall rival the Brazil and Peru in quantity and quality of exports.—*India-rubber Trades' Journal*.

TEA INSPECTION AT THE PORTS.

REDUCTION OF DUTY.

SIR,—There are two circumstances affecting the tea trade at the present time which demand attention. The first is the excessive duty, for it is against all the traditions of the country that the most wholesome of non-alcoholic stimulants, which has become the staple beverage of the masses, should bear a tax 30 per cent over the cost of production, while a tax representing only one-third of the same ratio is raised on beer. That the temperance party has not taken this up is a matter of surprise. The second circumstance which equally calls for attention is the necessity of preventing the importation of really bad and unsound teas.

These two questions are inter-related, and should be taken up as parts of one scheme of reform, for it will be useless to reduce the duty if the result is only to flood the country with bad tea, and so prejudice, instead of stimulating, consumption. The year 1900 gave a good sample of what some producers can do in that respect, and that a stop must be put to the practice is proved by the admissions of the planters' own newspapers, which would have been very prejudicial to the sale of tea had they been read in this country. It is also becoming daily more necessary to disarm the medical opposition to the use of tea, which is justifiable only if confined to badly manufactured teas, none of which need be passed by the Customs.

One fact no generally known about tea is that it is the only commodity of universal consumption the supply of which can be indefinitely increased at a few weeks' notice by the action of a few large companies.

We cannot instantly increase the supply of coffee or cocoa, because these are fruits. Even a grain crop requires new cultivation, and a full year must elapse before much increase can occur. It is not so with tea. The same bush can at a fortnight's notice be made to increase its production 30 per cent by "coarser plucking." Nor does the evil merely end in glutting the market and so injuring the stability of the industry. In coffee, cocoa, or wheat the article—whether it be a bean or grain—remains the same in quality; but in tea simultaneously with this sudden increase of the supply the quality is deteriorated and the consumption—a very serious matter alike to the consumer and the distributor—is prejudiced. If these are facts they must be met by any remedy that may be practicable and within the limits of fair legislation.

The Food and Drugs Act is provided by the nation in this spirit, but is inoperative in tea, because it deals with teas after they have passed through the "blending process," instead of detecting the bad constituents before they have left the Custom House. No grocer wants "rubbish teas," but if tea, however bad, may be offered without restriction at public sale—which is the delightfully permissive state of the law at present—there will always be people to buy it and pass it on, flavoured with something else, to the grocer.

It is this, specially bad tea, which will not keep that ought to be put under the ban of the Customs, specially in view of the extortionate duty levied. Now I am no supporter of the principle of Government interference, such as might be attempted on the unfortunate retailer through the Food and Drugs Act, but I do believe in prevention being better than cure, and can show that prevention in this instance is the more easily applied. All that the Government need do is to appoint a few trade tea experts—the only people who have an instinctive knowledge of tea—to detect the really noxious teas. These men, as inspectors, should have the necessary authority to draw samples at will, as the shipments are landed, from the teas indicated by the brokers' published sale-lists to be under suspicion.

It would mean sampling but a very small percentage of the supplies, but the mere risk of a mark being condemned would deter unscrupulous producers from taking the risk of plucking for quantity regardless of their ability to convert that quantity to wholesome tea.

If it is said that this form of Government interference is objectionable it may be replied that the Government do employ inspectors as it is, but they merely examine the dry leaf—a test which is practically useless, and may just as likely stop good tea as bad. This actually did occur a few months ago, a mark of a well-known Ceylon estate having been condemned by the Customs on its appearance, but proved on analysis to be of excellent quality. Yet the Customs authorities who had condemned this were passing millions of pounds of offensive teas. From amongst them a set of samples was obtained in the ordinary trade way for the purpose of the pamphlet, "The Tea We Drink," recently noticed in your columns. These samples proved to be of a very objectionable description. They can be produced and verified, and they represent estates owned by some of the first tea companies in India and Ceylon.

Obviously, then, a change of the system of inspection from a mere ocular examination of the dry leaf to an infusion test by experts is necessary if the public and distributor are to be protected. There is no necessity that the test, in the first instance should be an analytical one, but only that the analyst should report on what the trade expert has condemned. By this means much assistance might be rendered to the planter in avoiding faults of manufacture. If it is said that now is not the time to introduce the reform because little bad tea is coming in the reply is that it is of all others the very best time on that account. If it had been introduced last November, when much bad tea was coming in, it would have created a great deal of trouble.

Now the person who should lead the way in pressing for these reforms, viz., the reduction of the tea duty and the stoppage of really bad tea, is the grocer. In doing this he will be fighting both the people's battle and his own for it is, to start with, a trade question requiring some technical knowledge. The public do not possess this, but will support what is in their interest if pressed for by the grocer.

I am, &c., E. H. SKRINE.

5, Victoria avenue, Bishopsgate-street, E. C., July 30.—*Grocer*. Aug. 3.

FRUIT CULTURE IN JAPAN.

(To the Editor, "North-China Daily News.")

SIR,—The subject of fruit culture has always been of interest to me, and when I first came out to the East in 1863 we always used to wonder why it was that the Japanese insisted upon gathering their fruit before ripe and that even then you could hardly ever get a peach that had not a grub in it. I thought I would try for myself, and got a collection of peach and pear trees out from England. I also got some of your excellent peach trees from Shanghai.

Under my care, for a variety of reasons, chiefly that I had not room, they never really succeeded. I gave the plants away in various directions, and now in the country hereabout, partly thanks to these trees, the cultivation has increased and is rapidly increasing.

It is found that a light, sandy soil, especially where it is well watered by a river, is best suited for fruit culture and some of our peaches are really splendid; whilst among the pears I have seen fruit of a size that I never saw in France or England. But my object is chiefly to tell you how the Japanese have managed to get good crops of peaches with no grubs in them, for in talking with an old Shanghai resident the other day, he told me you were still unable to secure a crop of peaches free from this pest. The Japanese select the peaches they wish to keep on a tree, and when the fruit is the size of a walnut they cover it with a paper bag made from the ordinary cheap Japanese paper, which has been steeped in what is called here "Shibui," a preparation of the juice of the persimmon tree. This has a peculiar acrid odour that insects will not approach. The bag is virtually air-tight, and the throat is fastened by a string round the branch to which the

fruit hangs. The special grub against which you take these precautions is the produce of a fly which is generally seen about the month of April. It lays its eggs one by one on the young fruit generally close to the stem. There the egg sticks for some weeks, until just about the period when the fruit commences to swell and take its sugar; then it hatches and the first object in life of the young grub is to bore its way into the fruit where it proposes to live. Prevent the fly from laying its eggs on your fruit and you save it. It is not very material if you leave the bags on or take them off when the fruit has increased in size. If you have provided by making the bags large enough, the fruit will generally ripen inside and it has one advantage: if your fruit falls when ripe, it will fall into your bag and not get bruised but on the whole if you have the time and can give the necessary attention you should take the bag off about June, for the flies are no longer to be dreaded then and the fruit will generally be better for having ripened in the sun.—I am, etc.,
E D ROBISON.

Yokohama, 9th Sept.—*N China Herald*, Sept. 18.

THE ROMANCE OF TEA.

The cold reality of a grocer's price-list would suggest to few of those who read it any poetical or romantic associations, and yet the part of it which relates to tea is full of veiled poetry. Most of us leave it to our wives or house-keepers to select the brand they prefer, ladies being commonly supposed to take more interest in the cup that cheers than the sterner and more alcoholic sex. But in these days of Temperance men are beginning to lose their former shame at being discovered "in their tea cups," and it is well that they should understand a little of what the names in the grocer's list are meant to tell them. Not that worthy tradesman intends to tell them anything by the names he uses, for he is quite ignorant of their real meaning. Nevertheless, these names were not given by the Chinese without a reason, and they are the more worthy of notice because in spite of the talk of adulteration in connection with Chinese teas, the fact remains that tea is one of the very few things that fires the enthusiasm of the Chinese mind, and leads the growers of that pretty canellia-like plant to take a pride in its quality apart from mere cash considerations. Let us deal first with some of the uncouth names to be found in our aforesaid grocer's list. Hyson will probably be found to figure among them. This is a corruption of two Chinese words, one of which signifies "before the rains;" while the other Hi-chun is the name of a young girl, which, being translated, signifies Flourishing Spring. About two hundred years ago this girl suggested to her father an improved method of sorting his tea. He adopted it, much to his advantage, and his tea having become famous, he gratefully called it after his daughter. To this day members of the same family are selling this same tea, and the "ehop," or brand, of this particular kind of Hyson is Li Ya-hing, *i.e.*, Li's Extra Perfume. But this is a name which we must not look for in the grocer's list until the public knowledge of tea and its various qualities becomes very much greater than it is at present. Oolong is a name we may look for with more confidence. This word means Black Dragon, owing to the fact that one Sn was the first to bring to notice the peculiar excellence of a tea plant in which he had discovered a black snake coiled up. Congou is a name commonly applied in this country to tea suitable for breakfast. It simply means "well-worked."

Applied to Ceylon tea it used to mean tea made from the lower and coarser leaves of the plant as opposed to the Golden Tips, which sufficiently indicate the young buds growing higher on the main stem. This Golden Tip tea is mostly allotted to the Court and to high Chinese officials. The writer was once favoured with a cup

OF A VERY SPECIAL BRAND

of the Ceylon variety. After first being handed round to be inspected and admired in its dry form, it was infused with the aid of a sand glass, and then poured off to be drunk, it is needless to say, with no allaying mill. Comet Port could not have been produced with more ceremony, and the feeling of respectful awe with which the golden beverage was imbibed has survived the memory of its exquisite flavour.

It is not perhaps generally known that the flower petals of roses, *olea fragrans tuberosa*, orange, jasmine, gardenia, and azalea are largely used to perfume the teas we drink though the name Orange Pekoe might, perhaps, have suggested this fact. The Chinese call this tea by a name meaning superior perfume, while the pure Pekoe is called Lau-tsze's eyebrows. It should be explained that Pekoe means "white hair," and is applied to the young tea leaves owing to the fact that they are covered with a fine white down. Most of this tea is sent to this country or Russia, where it constitutes the bulk of the famous caravan tea sent overland. Lanteze was the founder of the Taoist religion, but as he was born about a thousand years before the earliest mention of tea, we may presume he never realised the virtue of his own eyebrows as a beverage. Other interesting Chinese names are "Carnation Hair," "Red-Plum-blossom," "Lotus Kernel," "Sparrow's Tongue," "Dragon's Pellet," "Dragon's Whiskers," "Autumn Dew" and "Pearl Flower." The name Sonchong simply refers to the mode of packing the tea. It is odd that the grocer should have fastened on this word for the purposes of his list. Ceylon growers however, used to apply it to the leaves growing above the so-called Congou leaves. Gunpowder tea, it needs scarcely be remarked, is an English term which, though the Chinese are sometimes said to have invented the explosive, they have never thought of applying to the tea themselves. So is "Imperial tea;" the Chinese call this variously "Sore Crabs' Eyes," "Sesamum Seeds," or "Pearls." To remove the bad impression which it is feared the name Sore Crabs' Eyes may have produced, it should be added that the vast majority of Chinese names for various kinds of tea are very picturesque, as, for instance, Hearts of the Water Lily, Hearts of the Nine Curves, Eyebrows of Esteemed, Old Age, Palm of the Gods, Tea of the Princess Peak, Tea of the Clouds and Mists of Mount Mung, Tea of the Dragon's Well, Spikes of Silver, and Interwoven Branches. There is

A CHARMING CHINESE BALLAD

which the tea-pickers sing as they gather the leaves. It describes the hardships undergone by the girls who do this work, and makes mention both on the Sparrow's Tongue and Dragon Pellet kinds incidentally. One of the stanzas runs as follows:—

"My face is dirty: out of trim my hair is, and away; Oh, tell me, where's the little girl so ugly now as I? 'Tis all because whole weary hours I'm forced to pick the tea,

And driving winds and soaking showers have made me what you see."

After alluding to the fact that early hours and hard work have made her thin, the singer continues:—"But if my face be somewhat lank, more firm shall be my mind;

I'll fire my tea that all else shall be my golden buds behind;

But yet the thought arises who the pretty maid shall be

To put the leaves in a jewelled cup, from which to sip my tea.

"Her griefs all flee as she makes her tea and she is glad; but oh!

Whereshall she learn the toils of us who labour for her so?

And shall she know of the winds that blow, and the rains that pour their wrath,

And drench and soak us through and through, as plunged into a bath?

The Chinese, it may be mentioned, dread rain. The pathos of the situation described by the little bedraggled girl in the ballad will, therefore, be duly appreciated.

Naturally, the Chinese think very highly of their national beverage. It is not, perhaps, generally known that no less a person than one of the Chinese Emperors has laid down instructions for the proper infusion of it. You are to take, he says, clear spring water, and heat it to the extent that would be sufficient to turn a clay fish red. You pour this on the leaves and forthwith drink it. Whether these directions are generally observed in China we are not aware. The native made tea that one gets in the Far East generally seems slightly insipid until the palate has grown used to its delicate gradations of flavour. Stewing and the abominable habit of "cosying" are, of course, unknown; though in Tibet tea of a coarse quality is literally made into soup with milk and butter vinegar, and pepper being added when procurable. Other things are sometimes mixed with it by the poor, as will be seen from the following notice of tea, by a Chinese expert, written nearly three centuries ago:—"Tea is of a cooling nature, and if drunk too freely will produce exhaustion and lassitude. Country people before drinking it add ginger and salt to counteract this cooling property. It is an exceedingly useful plant; cultivate it, and the benefit will be widely spread; drink it, and the animal spirits will be lively and clear. The chief rulers, lords and great men esteem it; the lower people, the poor and beggarly will not be destitute of it; all use it daily and like it." And it is because this is still true that the Chinese are one of the most temperate and sober peoples in the world.—*Evening Standard*.

CEYLON TEA ON THE CONTINENT.

We make the following extracts from a letter from Mr. J. H. Renton, dated "Bückeburg, Germany, 11th Sept., 1901":—

I am sending you by this mail a little

PAMPHLET IN GERMAN

which gives a short, but clear account of the rise of the Tea Industry in Ceylon, the culture of the tea bush, and the manufacture. This is known in Germany as the defence pamphlet ("Abwehr Brochüre"). It was written as a reply to the numerous libels on Ceylon tea which appeared in numerous Continental market reports in the early part of this year. It does not enter into any controversial points,

nor does it attack China tea. It simply shows our teas are clean, well-made teas and that our cultivation is good and sound. This pamphlet has been distributed to every wholesale tea dealer, most of the wholesale colonial produce dealers, 3,000 newspapers and 1,000 hotels in Germany. The demands for more copies are numerous and the notices which have been received are very flattering.

Well, now to give a very brief summary of what I have done this year:—

I visited Western and Southern Germany, Austria, Bohemia, Hungary and Trieste, Northern Italy, Southern and Western France and Paris in the first four months of this year. In May I went to Hamburg, Berlin, Leipzig, Dresden, Magdeburg and I have now been round the Baltic and Eastern Germany, going as far north as Königsberg. These visits have not only been made to thoroughly acquaint myself with the tea trade in these places, but also with a view to preach Ceylon tea to the dealer and the grocer, leaving as I do copies of your book and of Bamber's pamphlet. Apart from those visits I have been carrying on the campaign in Switzerland and Scandinavia by correspondence.

IN GERMANY,

a Bremen importer furnished me with the names of all the wholesale dealers in the inland towns, and although several of them have been induced to give small orders for Ceylon tea, only three of his friends have been found willing to take it up, make a speciality of it, and put *their own money* into the pushing of it. These three firms are in Breslau, Strassburg and Holstein. A special circular (I sent you one in the book marked Talanda tea) has been printed for these firms. The circular is illustrated and they bear two-thirds of the cost. The same firm in Bremen has also induced (K—Co.) the great coffee distributing firm, with their 780 shops throughout Germany, to take up Ceylon tea. They get 500,000 circulars and a special mark and label. They bear half the cost of all this expenditure. Their campaign does not open till November as the teas are all put up in ½-lb. and ¼-lb. packets. If properly managed and run, we want no better agencies in Germany. In addition to these firms I have secured other wholesale dealers who are making a speciality of Ceylon tea—one important firm in Frankfurt, a smaller one in Berlin, another beside Böhringer in Stuttgart. Böhringer is doing excellent work in Stuttgart. In Dresden and Königsberg there are two firms who use it largely in their mixtures, but will not advertise it, because they maintain that, owing mainly to —'s association with Ceylon, and the poor teas he has put on the German market, the name Ceylon has got into bad repute for tea. In Munich a lady, —'s sister, carries on an active propaganda for pure Ceylon tea.

IN AUSTRIA.

Mr. Marinitsch has done well in Karlsbad and got the gold medal at the Exhibition. We have three agencies in Vienna. A dealer in specialities, who has for years imported it direct and sold small quantities, is now getting aid to advertise it. Mr. Marinitsch has

associated with himself a wholesale coffee dealer with a connection amongst town and country grocers and is working hard, not with much success though, Toifl the client of the Bremen importer, is doing better. He promised me to place the tea with 500 of his clients throughout the Austrian provinces. He has got 350 up to date, he has to pack the tea in 1-16th lb., $\frac{1}{8}$ lb. and $\frac{1}{4}$ lb. packets for them; and then the Anglo-Continental Company of Paris are working from Trieste, so is also another house in Trieste.

IN FRANCE.

We have three Paris houses, and in Marseilles two smaller firms at work. The Paris firms are working hard; one has specially distinguished itself by its enterprise in starting the big new tea rooms in the Rue Caumartin, by its display at the Exhibition in the Petit Palais this year, and at the Exhibition Culinaire, and by its handbill posters, bills and general advertising. Another has done very well in various advertising schemes; but more particularly by taking up at my express with a demonstration scheme. A man is going round the Provinces, and in all the big towns where he can get the grocers to buy the tea, he gives a demonstration of from four to ten days. It is advertised in the local press that free teas will be distributed in cup at that grocer's shop from 4 to 7 o'clock. Samples of the tea are given away free—and lots of literatures on how to make it etc., and Bamber's book, in French. Here is a resumé of the work done in June and July in Normandy:—Six towns visited. Tea distributed in cup on 28 days, 4,425 cups served; tea sold to the public 2,055 people: advertised in 11 local papers; tea sold, 650 kilos. New grocers secured, 24. Printed matter distributed, 41,500. Placards posted in and on windows of shops, 110. Both these firms are spending far more than three times my grant on their work this year.

IN SWITZERLAND

we have four firms at work, in Sweden two, in Christiania two, in Copenhagen two.

IN ITALY

in Naples one, in Florence one. The arrangements I made in Genoa have fallen through, unfortunately.

I go to

SCANDINAVIA

tomorrow to inspect the work there and on my return start immediately for Frankfort and Stuttgart. In the latter town a client of Böhlinger's opens a tea room on 1st October. From Stuttgart I proceed to Switzerland to inspect work and accounts and then to France. I shall go to all the towns in France where the demonstrator has been, to see personally how the work agrees with his report. In Paris I inspect accounts and talk over schemes for next year.

I then go to London to see the British Commissioner for the

ST. PETERSBURG EXHIBITION

and obtain letters of introduction from our Foreign Office to the British Embassy there. End of November I shall probably go to St. Petersburg to inspect the land and make the necessary arrangements

for our show in the autumn of 1902. From Germany, Austria, and France I receive *half-yearly reports* and an abstract of accounts and expenditure. All vouchers in these three countries are examined and compared with the accounts in my visit in each town. From Scandinavia and Switzerland the vouchers are sent to me and then returned. I keep a most watchful eye on all expenditure and I feel quite certain the Committee get full value for their money. In Germany I know I could get an agent in each large town to run, push and advertise Ceylon tea; but then I should have to bear *all* the expense. The difficulty is to get them to put their hand into their own pockets and bear even half the expenditure.

PEARLS IN THE PHILIPPINES.

Colonel Clarence R. Edwards, chief of insular division, War Department, is preparing a Gazetteer of the Philippine Islands which will contain much valuable information from official and other sources. He has just completed a comprehensive account of the pearl and shell fisheries of the Sulu archipelago. During the year 1899 the value of shells, not sawed, cut, polished or otherwise manufactured, imported in to the United States for home consumption was \$969,349, and in 1900 \$1,016,728. The manufactures of shells, mother-of-pearl, etc., are now almost entirely confined to the United States. In the years above mentioned but \$82,610 40 and \$88,362 32 respectively of shell and mother-of-pearl manufactures of all kinds were entered for consumption. In regard to pearls, the best English expert says that the Sulu archipelago produces the finest round pearls in the world. The known pearling area in the Sulu and Celebes seas possessions of the United States is 15,220 square miles. More than double that area possesses the physical conditions necessary to the best form of pearl oyster life and the nacreous shell which contains it. Siassi, in the Tapul group of the Sulu archipelago, is the strategic centre of the most active pearling industry in United States territory, and should be made the station. There are a number of fishing villages and several thousand fishers in the vicinity. The value of pearls, in their natural state or split, imported into the United States for home consumption during nine months ending March 31st 1901 was \$1,686 40, ranking next in value to diamonds.—*Straits Times*, Sept. 23.

PLANTING IN PERAK.

COCONUTS—COFFEE—RUBBER—TAPIOCA—GUTTA.

COCONUTS.—Next to the cultivation of sugar that of coconuts at present finds most favour with planters. Where the soil is suitable, either coconuts or para rubber, and sometimes both, are being planted between the rows of coffee on the estates hitherto devoted to coffee alone. Applications covering many acres have been received, more especially in the district of Lower Perak, between the Perak and Bernam rivers, where an extraordinary energy has been displayed. Here 318 applications have been received from natives, chiefly foreign Malays, for small holdings to be devoted to this form of cultivation. In the same part of the districts the Straits Plantation Company has planted up between three and four hundred acres of the two thousand owned. The Government is devoting special attention to opening this country by roads and bridle-paths, &

recently visited this part of the State and was struck by the richness of the soil as evinced by the extraordinary growth and strength of the coconuts, many of which were in bearing at four years old.

COFFEE.—The prospects of coffee have shown but little signs of improvement during the year. On the estates that have been maintained in good order the crops have been good, but the present price of coffee, it is feared, prevents its being cultivated with success except in connection with other products such as rubber or coconuts.

RUBBER.—Para rubber is now extensively planted on many estates. Where well tended it grows well and the young trees are strong and healthy. In many places, however, white ants, which attack the roots of the trees, are a dangerous enemy, and one against which the planter will have to guard. On no estate have the trees arrived at sufficient maturity to enable them to be tapped.

TAPIOCA.—Go Hooi Chew's tapioca estate at Temerloh is well reported on. It is kept in excellent order and coconuts, duians and other valuable trees are planted throughout it at regular intervals. A tram line runs through the estate connecting the outlying fields with the mill.—Mr H C Hill, the Conservator of Forests, I.F.S. is of opinion that the State has an ample area of

GUTTA PERCHA-PRODUCING FOREST—and that no course is necessary to the establishment of special plantations outside the limits of its natural growth. A working plan is advocated whereby the *palaquium* forests be divided into a number of areas, which should come under operation at regular intervals of five to ten years; the operation would consist in giving more light and space to each *palaquium* tree, and in transplanting seedlings to blank spaces.

KUALA KANGSAR GARDENS.—The result of a sale in London market of a parcel of Para Rubber (*Hevea brasiliensis*), was received early in the year. 327 pounds of the best quality rubber fetched 3s 10d per pound, and twenty three pounds of scraps, *i.e.*, the fragments of rubber picked off the stems of the trees after tapping, were sold at the rate of 2s 6d per pound. Eighty two trees, of an average age of fourteen years, were tapped to give this result; the yield is thus a little over four pounds to the tree, but the Superintendent, Mr Derry, reports that exceptionally heavy rains frequently interrupted the work and threatened in conjunction with the tapping, to damage the seed crop, and that therefore the tapping was stopped in many cases long before the supply of latex was exhausted. From the eleven best trees over ninety seven pounds of dry rubber were obtained, one tree yielding twelve pounds and one and half ounces. A small sample of Gutta Rambong (*Ficus elastica*) was reported on in England as "good clean Java character," and sold at the rate of 3s 10d per pound. A tree in the Kuala Kangsar garden yielded twenty five pounds at a single tapping; this nineteen years old, and about ninety feet high, measured round the aerial roots at three feet from the ground, it has a girth of eighty eight feet. Mr Derry's report on the preparation of the rubber for the market is most interesting, and a copy of it will be supplied to the Managers of the Plantations in the State.—*Perak Administration Report.*

KING LEOPOLD, RUBBER MERCHANT.

The interest of the king of the Belgians in Congo rubber is mentioned so often, in his own country as well as elsewhere, that it must amount to something. In fact so far as the Congo Free state is Belgian at all, it may be considered as King Leopold's private property. The value of the rubber resources in the Congo was no sooner appreciated than a "private domain" was established, within which rubber gathering without official permission was prohibited. It happened that the richest rubber forests were included in the

reserved district. Every steamer from the Congo which arrives at Antwerp with rubber includes on its manifest a liberal shipment on account of the "Domaine privé"—in other words state rubber. But this is not all. Some time ago. *The Speaker*, an English journal, published an article pointing out that several of the supposedly private companies in the Congo rubber trade were in reality permitted to operate there only on condition that the state—practically the king—should be admitted as a shareholder, in most cases to the extent of 50 per cent. of the capital. The amount of rubber coming from that country from really private companies, therefore, is comparatively small. Taking the reports of Congo rubber arrived at Antwerp during the first half of 1901, as published in detail each month in the *India Rubber World*, the figures permit of the following analysis, in the light of the article published in the English paper:—

	Kilograms.
Domaine privé Etat du Congo	.. 1,592,101
Companies in which the state is interested	.. 614,087
All other companies	.. 761,831
Total	... 2,968,019

While these figures may be subject to revision, the salient fact remains that the rubber output is largely in the hands of the government. And if half the reports be true, the rubber collectors who work for the government agents do not receive such high wages, but that a very comfortable profit exists, at the prices commanded by Congo rubber at Antwerp for several years past. King Leopold may fairly be recognized, therefore, as one of the greatest of rubber merchants. And he can afford to laugh at competition.—*India Rubber World.*

MATÉ LEAVES.

Cador, in an interesting paper on this subject (*Jour. de Pharm. et de Chim.* 1901, ii. 162) points out that various observers have established the fact that not only the leaves of *Ilex paraguaiensis*, but also leaves of other species and even plants not belonging to this genus, go to make up to what is known as maté. Cador has examined twenty-five species histologically in order to determine differences in the structure of the leaves, and also the relative amounts of caffeine in the various portions of the leaf. Nineteen of the species belonged to the genus *Ilex*, two were of *Villarexia*, and four were of *Symplocos*. All these plants grow in South America, in the basin of the Rio de la Plata and its tributaries, in the basin of the Rio Uruguay, and in those of the Rio Paraguay, and the Rio Parana. All the *Ilex* leaves have a bifacial structure. The upper epidermis is usually a single layer, is doubled in *Ilex affinis*, and partially doubled in certain varieties of *I. Theezans*. The cells of the mesophyll enclose corpuscles of a fatty nature and crystals of oxalate of calcium. Numerous peculiarities are noted in certain species, which enable one to differentiate between many of them. Such, for example, are cuticular striations on the lower epidermis, and spherocrystals of hesperidine found in certain parts of the leaves. In the two species *Villarexia* which are utilised, the cells of the lower epidermis are characterised by very thick walls, and in *V. Conghonga* very large isolated crystals are observed. Species of *Symplocos* are distinguished by the brownish

green contents of the cells of the upper epidermis, and by the disposition of the cells annexed to the respiratory apparatus. These are so placed as to have their long axis parallel to the ostiole. Of the various reagents suggested for the histological chemical examination of maté, Cadot prefers concentrated hydrochloric acid and a three-percent solution of gold chloride. By means of these reagents well-defined groups of crystals of the double chloride of gold and caffeine are obtained. The reaction is particularly marked in the case of *Plex paraguayensis*—*Chemist and Druggist*, August 31.

PEARL OYSTERS.

Mr. Lyster-Jameson, B.A. Ph. D., sent us by a recent mail a copy of his paper:—"On the identity and distribution of the Mother-of-Pearl Oysters: with a revision of the Subgenus *Margaritifera*"—reprinted from the proceedings of the Zoological Society of London, April 16th, 1901. This instructive paper, of some 23 pages, opens:—

"Acting upon a suggestion made to me by Professor E Ray Lankester, I have recently been engaged in rearranging the collection of *Margaritifera* in the British Museum of Natural History, and in revising and extending the series illustrating the commercial forms. The nomenclature of these forms has hitherto been in a chaotic state, and it has occurred to me that this revision of the genus may be worth publication if only to prevent further confusion of the common commercial forms by zoological and economic writers." Can Mr. Lyster-Jameson be coming out with Professor Herdman to Ceylon, Professor E. R. Lankester having been originally consulted by the Colonial Office? The passage of special interest to us in Ceylon, in the paper is the one we quote below:—

MOTHER OF PEARL OYSTERS.

(From paper by H. Lyster Jameson, B. A., Ph. D.)

Species 13. *MARGARITIFERA VULGARIS*.

Perlamater vulgaris Schumacher, 1817 p. 108, pl. xx. fig. 8; no loc.

Chemnitz, 1785, tab. 80. fig. 717 (referred to by Schumacher as a second figure of his *P. vulgaris*).

Avicula fucata, Gould, 1850, p. 309 1852. p. 441, pl. 39. fig. 551; New Zealand

Avicula fucata, Reeve, 1857, sp. 74; Japan. Type in B.M.

Avicula occa, Reeve, 1857, sp. 24; Red Sea. Type in B.M.

Avicula aerata, Reeve, 1857, sp. 32; Australia. Type in B.M.

Avicula perviridis Reeve, 1857, sp. 20; Australia. Type in B.M.

Avicula (Meleagrina) varia, Dunker, 1872, p. 17, tab. 4. fig. 6; Red Sea.

Avicula (Meleagrina) badia, Dunker, 1852, p. 79; 1872 p. 12 tab. 2 fig. 7; no loc.

Savigny, 1811, pl. 11. figs. 8 & 9.

As Schumacher's figure, and the one by Chemnitz to which he refers, are evidently typical Eastern Lingah shells (from convexity, posterior "anicle" of hinge-line, sharp separation of the inner surface of the rostrum from the general surface of the naere by a well-defined ridge, and distinct anterior and lateral teeth in Schumacher's figure), the name *vulgaris* must replace the more familiar *fucata* (Gould) for this species.

This shell is extremely variable, and young examples have been described as distinct species over and over again, while, until comparatively recently, the grown shell has been confused by many writers with *M. margaritifera*.

It is highly probable that some of the described forms which I am still treating as separate species will, on better acquaintance, prove to be merely geographical races of *M. vulgaris* Schumacher.

Geographical Distribution and Variation:—

Ceylon and Southern India. The Ceylon Pearl-Oyster is the best known local form of this species. It frequents the Gulf of Manaar, Palk Straits, and the Southern coast of India. It differs from most other local races in its lighter colour, and the whitish or pink ground-colour of the interior of the lip.

Maldiv Islands. Mr J Stanley Gardiner, on his recent visit to the Maldives, found this species fairly plentiful there, but not in extensive beds. Unlike *M. margaritifera*, this shell is not fished by the natives of the Maldives. Mr Gardiner's specimens closely resembles those from Ceylon, and were at once referred by Captain Donnan to the same species.

Persian Gulf. The Lingah shell of the Persian Gulf belongs to this species. It is distinguishable from the Ceylon form by its darker colour, the exterior being usually more purple and the radial markings almost black. The interior of the lip is dark red. The shells attain somewhat larger dimensions than in Ceylon waters. It is shipped in quantities to the London markets, but is of small and fluctuating value, owing to large supply and limited demand.

Red Sea. Throughout the Red Sea this shell is common, but is fished almost exclusively for pearls. There are a number of specimens from the Red Sea in the British Museum, but with one exception (Aden, Major Verbruy) they are very young. The Aden specimen is very like a Ceylon shell.

Mediterranean. Since the opening of the Suez Canal this species has wandered into the Mediterranean. There are typical examples from Alexandria (W B Tegetmeier) and Malta (Col. Feilden) in the British Museum. An account of this interesting immigration has been published by Vassel, 1896.]

East Africa. Specimens from Mauritius (B M; Mus. Cuming), S. Africa (B M; J. H. Pousonby Coll.), Bazaruto Isl. (do.), and Durban (do.), although differing slightly from normal Lingahs in form and markings, are probably merely a local race of this very valuable species. I do not feel disposed to describe them even as a geographical variety on the small amount of material available.

Malay Peninsula and Archipelago. Specimens from Malacca and Singapore in the Brit. Mus. are hardly different from Ceylon examples. I have found typical examples associated with the young of *M. margaritifera* in a trade sample from Flores.

Australian Waters. "The Australian Lingah" shell of the London markets, most of which comes, I believe, from West Australia, and the "Bastard Shell" of Torres Straits (Pace, 1898) are preferable to this species. There are immature examples of *M. vulgaris* from various localities on the north coasts of Australia in the British Museum. Two specimens from Sydney, presented by the Earl of Derby, are the most southerly record. On the West coast it occurs as far south as Sharks Bay (Saville Kent). Australian Lingahs closely resemble those from the Persian Gulf in colour,

New Guinea. The Pearl Shell of the Trobriand Island, which is fished almost exclusively for its pearls, belongs to this species. The fishing is carried on entirely by the natives, in 02 ins., and the live shells are purchased in bulk by the traders. They yield quantities of pearls mostly of inferior value. The shell has been exported and sold as Lingah in small quantities. The external colour of the Trobriand shell is as in the Persian Gulf form, but the nacre is more smoky and leaden in lustre. I have occasionally found isolated examples in other localities in Eastern New Guinea.

New Zealand. Gould (*M. fucata*).

Japan. Reeve (*M. fucata*) (locality doubtful).

A 1,500 YEAR-OLD TURTLE.

The largest turtle in the world rejoices in the appropriate name of Jumbo. He weighs a trifling 500 lb., and is credited with having celebrated a modest 1,500 birthdays. He was brought to San Francisco from the Galapagos Islands last year, and had to be carried by his proud, but exhausted, captors over no fewer than eighteen miles of the lava beds which characterise certain parts of these islands. "Jumbo" is over 5 ft. in length and is a valuable property. It is estimated that he is likely to live 500 years longer, and he is valued at nearly £1,000. He seems none the worse for his cruise or change of air. If "Jumbo" should live out his allotted number of years there is no knowing what disposition will eventually be made of him—*Daily Express*, Sept. 12.

PRODUCE, PLANTING, AND COMMERCIAL NOTES.

Commenting on the table published by Mr George Seton, giving results of Indian tea companies during the season 1900, the "Financial Times" says: "It will be observed that despite an increase in the output of tea amounting to nearly 10 per cent. the profit per lb. has fallen to nearly one-half of what it was last year, the working cost being little under that of 1899. There is, however, one encouraging feature. Over-production is admittedly the root of the evil, and it is therefore gratifying to find that notwithstanding the failure of the scheme to effect a combined reduction in the output, there is evidently a disposition on the part of the companies to follow out this principle individually. A glance at the figures representing the acreage shows that the increase in the area planted is only a little over 1 per cent. This can only be regarded as a very moderate proportion to meet the depreciation in the gardens, and goes to show that the different managements have fully realised the folly of large extensions. As to the outlook for the current season, it is as yet too early to express any reliable opinion. We are informed that in all districts, with a few exceptions, there was a considerable shortage in the tea crop at the end of August, owing, to a large extent, to the weather, which curtailed the pickings, and this being the case it is certain that unless this falling-off is made up by the end of September the crop will be materially reduced. It must not be overlooked, however, that there was a large surplus from the past season at the end of May, and the question is as to what stocks are held in private hands. The opinion expressed by an authority is that it is now but small, and in that event, if there should be, as is not unlikely, a shortage in the current crop, it is not improbable that we shall see better prices at Mincing Lane before very long. This view is corroborated by Messrs. Gow, Wilson and Stanton in their weekly report, issued yesterday, but, at the same time, they emphasise the warning that as

young tea from the recent extensions of tea plantations in India is now coming into bearing, every effort will be required on the part of planters to reduce the output. In the meantime it is interesting to note that the direct export of Indian tea to places outside the United Kingdom for the first half of the year was largely increased, no fewer than 5,774,600 lb. having been shipped, as compared with 3,544,200 lb. in the corresponding period."

A writer in the "Trade Press List," published at Boston, U.S.A., seems more scornful than hopeful on the subject of tea-growing in the Southern States. He says: "For over a hundred years different individuals have used the United States Agricultural Department as a nursing bottle to draw funds from the Treasury, to let them pose as tea-planters. Secretary Wilson has lately slooped over in a statement, 'we are succeeding admirably in producing tea in the United States.' As a fad, supported by the Treasury of the United States, it is a very pretty occupation, but, from a commercial stand-point, the quality of the stuff as yet produced, makes his remarks rank nonsense."—*H. and C. Mail*, Sept. 20.

LONDON-INDIAN TEA COMPANIES.

We have received Mr George Seton's annual table setting forth the results for the season 1900 of the working of forty-five Indian Tea Companies registered in London. There is no more carefully compiled or, within its range, more valuable compilation of Indian Tea Company statistics than this. Year after year Mr Seton's figures enable tea shareholders and the trade to follow the course of business and to estimate future probabilities. For the past year we regret to say the figures in the table confirm all that has been advanced in our column about the unsatisfactory position of Indian tea cultivation. Running through the totals but omitting a comparison of the total capital, because this year debenture issues have been added in the table to the share capital figures heretofore alone given, raising the total by nearly £300,000 to £8,760,000, we find first of all that 10,600 acres additional matured garden were harvested in the past season, the total having risen to 162,690 acres. This involved, however, a decrease of 8,491 acres in the area of immature gardens under cultivation, so that the aggregate increase of cultivated area was rather less than 2,200 acres. From the plants on this ground 79,272,489 lb. of tea were gathered, or 6,932,320 lb. more than in the season 1899. That this increase was not the product of the small net increase in the acreage, is proved by the fact that 12 lb. per acre more tea were harvested last season than in the previous one, the 1900 total being 487 lb. per acre. In the present state of trade that additional output was not any benefit to the companies, whose working expenses alone ran up £149,397 to a total of £2,136,407 so that, even had the price obtained for the leaf averaged as much as in the preceding year, the net results would have been unsatisfactory. As it was, the average price receded 0.13d per lb. or 17 per cent to 6.47d.

Taking the lower average price and the somewhat higher working cost together, it followed as a matter of course that the profit fell off £245,100 to £279,554. It was in fact 0.89d per lb. lower, although the gross income fell off only £95,703 to £2,415,961. This represented a decline of fully 1d in the lb, and the ratio of expenses to receipts rose to 88 per cent, compared with 79 per cent the year before. This again invol-

ved a decrease of £1 13s 10d in the profit per acre, which fell from £3 8s 2d to £1 14s 4d, and meant that the profit on the total capital was only 3·20 per cent compared with 6·59 per cent in 1899. From all this a decline in the average dividend naturally ensued, and the distribution on the total capital fell to 3·90 per cent compared with 5·65 per cent for the season 1899. Even so, however, the dividends paid exceed the profits, their aggregate amount being £346 9s 8d or £102,386 less than in the preceding season. But to pay even this the reserves and balance carried forward had to be reduced by £70,469 to £498,684. How disastrous the season was to the companies may be measured to some extent by looking in detail at some of the figures relating to individual companies, but we can do this only in the most summary way, for lack of space. In 1899 there were three companies whose teas commanded upwards of 11d per lb in the market and eight that obtained more than 10d, while there was only one among the whole forty-five whose crop realised less than an average of 6d per lb. In the past season not one single company secured as much as 11d per lb for its tea, and only five got more than 10d, while there were eleven Companies that received less than 6d, and five whose average sales yielded between 4·45d and 4·56d per lb. How far the additional weight marketed had to do with the decline in price thus roughly exhibited, and how far it was due to increased British taxation, we are unable to say, but would naturally ascribe the fall to the increased supply more than to any other cause. By another year we shall perhaps see more clearly.—*Investors' Review*, Sept. 21.

PLANTING NOTES.

"BLUE MOUNTAIN" SEED.—Those who were fortunate in getting a pound of the new Blue Mountain seed from Jamaica report that this seed is germinating splendidly and shows every sign of coming on well.—*Central African Times*, August 17.

"CEYLON TEA ON THE CONTINENT."—We direct attention to the long and interesting letter from Mr. Renton which will be found on another page: he is evidently covering a great deal of ground and making some interesting experiments in different countries which ought to bear fruit.

SUGAR.—It is claimed that the price of raw sugar has reached a point where it barely covers the cost of production. Only the most modern plantations in Cuba can expect to secure the coming crop without actual loss. Beet sugar is also down close to the line of actual cost of production.—*American Grocer*, August 28

COFFEE OVER-PRODUCTION.—The over-production of coffee in Brazil has become very serious. According to the following paragraph, one great coffee producing country at least seems even in worse case than any great Tea producer:—

"Letters reaching Lisbon from Brazil report that the coffee-growing industry of that country is threatened with ruin. The Province of San Paulo is already reduced to a state almost bordering on famine. At the depots of Santos and Rio de Janeiro, stocks are accumulating to an extent which makes them a drug in the market, and the fall in prices is ruinous. The crisis is attributed to the large quantities of coffee now in Central Africa, the Congo, German East Africa, and Uganda. From these regions it is shipped at Aden or Hodeida, where it becomes "Arabian," if not actually "Mocha."

TEA IN JAVA.—It is very satisfactory to learn, on the authority of Mr. R. C. Wright, that no matter how much the cultivation of tea extends in Java, the production is not likely to exceed the local demand, so greatly is the drinking of tea extending among the Javanese, Malays, &c. This is good news in the interest of the people, as well as of tea planters everywhere. It will be a grand thing when tea becomes the universal drink in India and Ceylon to the ousting of arrack in a large number of cases.

THE MOUNTAINS OF THE MOON.—The volume which Mr J E Moore has just published on this subject has two main lines of interest, says the *Spectator*. It describes the chain of lakes which lie like puddles up the central rift valley, in proper relation to their geological time and formation, and it pieces together the great central ranges of mountains east of these lakes, until it is difficult not to agree with him that there exists there what is practically an immense central range, often snow-capped and glacier-worn, almost as long as the Rocky Mountains in their United States section. On this subject, he has also proved that instead of there being some single "Mount Ruwenzori" north of Albert Edward Lake, there is a splendid snowy range, "composed of as many different elemental peaks as the Alps seen from the Italian plain." In a length of seventy-five miles visible from one spot were four immense distinct groups of snowy peaks. To talk of "ascending Ruwenzori" is as absurd as to talk of ascending *the Alps*. The forests and their bases, the snow speaks, the glaciers, the astonishing views looking up and looking down, form the subject of the most interesting chapters of the book. We can only touch on a few of the main discoveries. The vegetation is extraordinary. Above the tropical forest in a cold zone lies a *forest of heather*. The heather grows in trees to a height of 8 ft., and these trees, fallen and decayed, cover the old watercourses like rotten platforms. Both the men and the goats which the explorers ingeniously selected to drive up the mountain with them, and so to ensure a food supply, constantly fell in through natural flooring. Various points were reached on a line as long and as high as that between Mont Blanc and St. Gothard. Mr. Moore ascended above the line of snow and ice to a connecting ridge, where calculations showed an altitude of 14,900 ft. and immense snow-fields and green glaciers shone around. Mr Moore admits that South Africa has the finest climate in the world, and says nothing against the high plateaux over which the Uganda railway runs, and from which English ladies have recently returned, after accompanying their relatives on hunting-trips, in the best of health and spirits. Somaliland, too, is all that could be desired in regard to the conditions of health. But Mr Moore deals with the centre, the lakes, the adjacent mountains, the river outlets, and casts an eye over the Upper Nile swamps. Below, to the west, are the endless marshes and feverish forests of the Upper Congo tributaries. Consequently, when he pronounces Central Africa to be unfit for habitation, he passes a verdict on the whole country from the Zambesi north to Gondokoro, and from the central line to the western ocean. It is perhaps as well to know and remember this. It may narrow the area which a certain class of Englishmen think we are bound to police, settle, and "develop."

Correspondence.

To the Editor.

CACAO PLANTING IN COSTA RICA.

[A melancholy interest attaches to the following letter from Costa Rica, the writer—a cacao planter there—being the son of the late Rev. S. Coles, to whose address the manuscript came.—ED. T.A.]

Costa Rica, August 10th, 1901.

(To the Editor of the "Tropical Agriculturist," Colombo, Ceylon.)

DEAR SIR,—In reply to your foot-note appended to my article "Coffee in Costa Rica," I give you the benefit of what knowledge I have been able to acquire about Cacao in this country. What is most surprising about it is that with such facilities as exist for its production, it should not be able to supply even the local market, which is a very small one, a few hundred quintals sufficing to supply consumption throughout the republic: one may go to several stores in the cities and villages and enquire for cacao in quite a few before he will find it, and then most likely have to pay about one colon per pound of native best, lower grades from Colombia and Ecuador selling for 60 centimos upwards. It is generally supposed that there are some millions of acres specially adapted for the cultivation of cacao in the following districts of the republic, Golfo Dula, El General, Talamanca, San Carlos, and Matina, the last-named being the only one with railroad advantages. This, however, should not be considered much of a drawback to the others on taking into account the high prices realised in the capital. The principal hindrance to the development of cacao culture on lands known to be of the best, is that unwise legislation has allowed anybody with or without intentions of cultivation to grab up enormous tracts of land wherever they chose by merely "denouncing" them according to a prescribed law: 99 out of 100 who did so, are doing nothing with the land, and are only waiting or somebody to turn up some day, and pay them a big price for it, meanwhile they are stubbornly fighting any small road-tax that is levied once or twice a year: the only lands of account that a poor man can work on are small lots of 50 hectares a piece, along the sea-coast or banks of navigable rivers known as the maritime mile, which can be taken up and held according to what is known as squatter's right, which is indisputable to all-comers as long as it is not abandoned for over one year.

The Government is just beginning to offer some inducement to the culture of cacao by giving premiums of 30 centimes per tree on what is in production, Mrs. Arnold of Limon thereby coming in for a bonanza of some 1,000 colones on her farm in Matina: Messrs. Codleman and Heinsen, who have been planting for the past seven years in San Carlos, also received a considerable benefit from the same source. This coming season should give them splendid returns, and they are well-prepared for it, having put in a great deal of drying apparatus this year, as well as a tramway to different parts of their estate.

It is to be regretted that cacao will not flourish in the most populated part of the country, the central plateau, and it is difficult to foretell when

conditions will change for the better as regards the present tenure of lands. Many are looking hopefully for the opening of the Nicaragua canal, which they believe will be the means of foreign capital developing the enormous plains of San Carlos, and give a river and ocean outlet for all products. In the hands of the present owners the land can never improve.

I am indebted to Mr. Hugo Karl'sen of San Carlos for the following details of a farm of 80 acres, that has been run for several years by Mr. W. Armstrong of Bluefields, Nicaragua, and hope that the same may be of interest to your readers. To abbreviate as much as possible I will summarize small items by stating that they call for:—gathering, planting, and taking care of seed; planting, cleaning, pruning, marketing of produce; tools, houses, foreman's salary, mules and equipments, boats, drying houses, stationery, etc; values are given in American gold.

First year.—Cutting down forest, planting and cleaning once of 12,000 banana suckers, gathering and planting 10,000 rubber seeds, gathering and planting of 13,000 cacao seeds, erection of houses, etc.

					\$2,957
Second year.—	Transplanting and cleaning rubber and cacao, marketing of 15,000 bunches of bananas	...	1,832		
Third year.—	Cleaning, replanting, and marketing of bananas	..	1,845		
4th year,	cleaning, replanting and marketing of bananas	...	1,920		
5th year	do do 10,000 lb of cacao		2,405		
6th year	do do 18,000 lb do		2,575		
7th year	do do 30,000 lb do		2,805		
8th year	do do 48,000 lb do		3,425		
9th year	do do { 60,000 lb do 15,000 lb rubber 19,200 lb rubber		4,365		
10th year	do do 60,000 lb cacao		4,475		
Total of expenses for ten years...					\$28,604

<i>Proceeds.</i>					
2nd year,	by sale of 15,000 bunches of bananas at 16c			\$	2,400
3rd year	do 20,000 do do				3,200
4th year	do 20,000 do do				3,200
5th year	do 20,000 do do				3,200
	do 10,000 lb cacao at 18c				1,800
6th year	do 20,000 bunches of bananas at 16c				3,200
	do 18,000 lb cacao at 18c				3,240
7th year	do 12,000 bunches of bananas at 16c				1,920
	do 30,000 lb cacao at 18c				5,400
8th year	do 6,000 bunches of bananas at 16c				960
	do 4,800 lb cacao at 18c				8,640
9th year	do 15,000 lb rubber at 60c				9,000
	do 60,000 lb cacao at 18c				10,800
10th year	do 19,200 lb rubber at 60c				11,520
	do 60,000 lb cacao at 18c				10,800

Total of proceeds...\$79,280
Total of expenses...\$28,604

Profits...\$50,676

I would remark that these are favorable returns, all of which cannot be obtained in some parts as represented here; in the case of bananas nothing could be sold to advantage where the distance from the port or railroad is great. The Bluefields climate must always be a drawback to foreign settlement, whatever advantages it may have in the question of cheap labor; otherwise I see no reasons why similar results should not be obtained in favorable districts in this republic.—I remain, yours truly, E. A. C.

TEA CROPS AND MANURE.

London, E.C., Sept. 6th, 1901.

DEAR SIR,—Under the above heading the *Overland Observer* received this week contains a short editorial comment upon the increased imports of manure and especially upon the marked increase in the quantity sent Upcountry by rail during the year 1900.

Appended to these annual returns for the past few years, there is given a statement of the average yield of tea per acre, and for convenience of reference these several returns are repeated as follows:—

Average yield of Tea per acre.		Manure Im- ported.		Manure carried by rail.	
		tons.		tons.	
1896	396 lb.	1896	12,487	1896	7,213
1897	403 do	1897	11,576	1897	8,186
1898	400 do	1898	10,874	1898	8,431
1899	400 do	1899	12,745	1899	9,025
1900	424 do	1900	14,200	1900	11,126
			20,341		17,717

The average yield of tea per acre cannot be taken as being dependent upon the manuring, as in the majority of cases it is reasonable to suppose that no manure had been applied, for at present it will be admitted that manuring has only been generally adopted on comparatively a very small number of estates. The increased yield of tea per acre, therefore, given as 424 lb. in 1900 as against 400 lb. per acre in the preceding year of 1899 may fairly be ascribed to the coarser plucking which was so generally resorted to in order to increase the outturn as a consequence of a demand for tea of low quality.

The real interest in these returns is in reference to the increased imports of manure which have risen from 14,200 tons in 1899 to 20,341 tons in 1900.

Further, of this 20,341 tons imported 17,717 tons were carried Upcountry by rail as against only 11,126 tons so carried in 1899. Obviously, therefore, the great bulk of the manure imported is sent Upcountry, presumably for application on tea and coffee estates.

In 1895 the manure carried by rail was only 7,213 tons so that in six years the quantity of manure so carried had more than doubled.

It would, of course, be interesting to know what proportion of the 17,717 tons was carried up during the first six months of 1900, also whether the returns for the first six months of the present year at all correspond in tonnage. Probably the low prices which have been obtained for the past year have materially checked the application of manure on certain estates.

But nevertheless the very remarkable increase in manuring is evidently the result of practical experience. Planters on estates above 2,000 feet, are finding out that an exhausting crop like tea cannot be maintained in a flourishing condition on a naturally poor soil with a heavy rainfall, without some manual assistance. As the writer has frequently pointed out in private reports the manure for Tea, or rather the judicious combination of different manures, should be so arranged that only a moderate percentage of nitrogenous ingredients in different degrees of solubility should be supplied, in union with a more generous quantity of potash salts which constitute the dominant element in the mineral portion of Tea, to which also must be added Phosphate of lime in an alkaline form, readily available as plant food.

From the reports of the practical results of such a system of manuring which the writer has received direct from planters, there certainly is every prospect that judicious manuring will continue to be carried out on the tea estates of Ceylon.

In conclusion it may be mentioned that in order to withstand the attacks of grubs and bugs it is very desirable that Bone dust, dried Fish, dried Blood or even crushed Cake should be chemically treated or mixed with chemical salts before application; otherwise such dressings may encourage insect life rather than benefit the Tea shrub.

JOHN HUGHES.

ANTIQUATED NOTIONS ABOUT THE DATE-TREE.

(To the Editor of the *Tropical Agriculturist*.)

12th Sept., 1901.

SIR,—There are some persons that still believe that the Date-Palm grows and flourishes in deserts—which it never did, and never will do.

The Date-tree, like other trees, requires certain conditions of climate and soil. But apart from these, one of the first conditions of its healthy development is *irrigation*. In the desert of the Sahara it can be grown only in oasis, where there are springs of water. It does not seem to mind brackish water, and to bring out the luscious quality of the best varieties, they require in-addition manure.

The following quotation, from the Journal of the Royal Horticultural Society of England for August 1901, p. 213, may interest the readers of the *Tropical Agriculturist*: "Date-trees in Spain (Rev. Hort. Belg., May 1901)—Contrary to the usual opinion that Dates do not ripen in S. Europe, there is at least one locality where trees produce excellent fruit. Elche is a small town near the Mediterranean which has an 'oasis' of Date trees, yielding excellent fruit equal to those of the Algerian Sahara. They were introduced and grown by the Moors when ruling Spain; to whom also was the introduction of the orange due into Valencia and Portugal. The Dates are of a good variety. They are multiplied, just as the African Arabs used to do it, by separating the shoots from the base, and not by sowing the stones. Twenty-five female trees are fertilized by means of one male."—G. H. The probability is that the Date-Palm was introduced into Spain by the Moors, but it is doubtful whether what is known as the Valencia or Portugal orange was known to the Moors. The bitter, or Seville orange, was known to the Arabs, and it is *that* which the Moors probably introduced into Spain.

In Oranges and Lemons of India and Ceylon p. 225, there is a letter from Sir C F Bonham which points to the introduction of the Portugal orange into the Peninsula by the Portuguese from China, or the Malay Archipelago, after they had doubled the Cape. It is probable that in many parts of Queensland, and perhaps other parts of Australia, and of South Africa, the Date-Palm would flourish, and become of importance to the inhabitants. Its requirements are a suitable climate and soil, and water; and the two former can be discovered only by experiment. If the stones of the best Dates (Taflet, and others) were sown as an experiment, they might reveal whether the climate and soil were suitable to the healthy growth of their palm. There would be uncer-

tainty about the sexes that would result from the seeds, but they would undoubtedly show whether the climate and soil were suitable. It is reported that the Americans are making an effort to introduce the Date-Palm in Arizona.

E. BONAVIA, M.D.

CACAO AND CRITICISM.

Sept. 28.

DEAR SIR,—“Pod” has the *cacoethes loquendi* (*et scribendi*) and gets inebriated with the exuberance of his own verbosity. Is he not the gentleman who lectured before the Uva Cacao Committee in June last on the *academic* question of growing suckers? He is more adept in dialectics than in practical enquiry or application. His accusation of tactlessness in the Committee's questions is ridiculous. It is quite optional to answer or not, any or all or none, of the questions submitted in the amended circular of 28th July. District Associations can have as many copies as they please for distribution among those interested (if they will apply to Secretary, P. A.)

Having asked the aid of a Scientist in formulating the queries and some experienced planters having passed in Committee the questions aforesaid, it is absurd of “Pod” to pose as one who desires information he cannot reach, and yet himself act only as a captious and not too well-informed critic.

The parody in your issue of the 20th on the “Mahawansa,” is clever as a literary *jeu d'esprit* and was worthy of a good hearty laugh. Even the poor casket incident, though in questionable taste, was irresistible to anyone knowing the original. Those who are curious enough will find enlightenment in Barthelemy Saint Hilaire's “The Buddha and his religion” (in the appendix at the end of the volume.)

Questions which may seem unimportant to some, may be most interesting to others. We have undoubtedly to thank the Mycologist for *identifying* the worst pest cacao has yet suffered from. Sunlight is the best cure, and we have had very sunless weather this year in many districts, and yet the battle is, I think, in our favour, using the various methods suggested by Mr. C. If that gentleman could give more time to cacao interests, and if he credited average planters with more knowledge, intelligence and common-sense generally than he has implied in some of his imperfectly prepared lectures, we should all score in the end, for his abilities are undoubted. Kew and Peradeniya are somewhat too prone to scorn the practical agriculturist, and to encourage too exclusively the scientific work of the Gardens.

But I must stop. It might be wise to enlarge the Cacao Committee and try to increase interest in this product; but we do not want over-production! —Yours truly,

IN CACAO.

SIZE OF “TEA GARDEN” FOR ECONOMICAL MANAGEMENT.

Sept. 29.

DEAR SIR,—I have never given the question of the best size of a tea garden, from an economical point of view, any special thought; so much depends on the bearing qualities of the estate.

But an ordinary decent place for one man to work should not, I think, be more than 300 to 350 acres. With a good assistant he could do double that. — Yours truly,

PROPRIETOR AND MANAGER.

LARGE vs. SMALL TEA GARDENS :

THE BEST SIZE FROM AN ECONOMICAL
POINT OF VIEW.

Oct. 5.

DEAR SIR,—As to the profitable size of a tea garden, it depends very much on the age, elevation, soil, &c.; but I think about 300 acres is a workable average. Where manufacture can be centralised I believe in the grouping of estates under a *permanent* staff. As things are, every superintendent has to spend a great deal of his time in correspondence, finessing and arranging about labour, doctoring coolies, &c., which on larger estates could be more organized and combined. This is, from the purely commercial point of view, the desideratum to be aimed at; but a more ideal system I consider to be a smaller and individual proprietorship, growing the leaf and supplying it to central factories; these being worked as separate concerns, like the creameries and butter factories in Australia. But it is too late in the day for this now and it is no use crying over “spilt milk.” — Yours truly,

AN OLD HAND AT TEA.

THE CACAO CIRCULAR: A SEVERE CRITIC.

Wattegama, Oct. 10.

DEAR SIR,—I welcome P.O.D.'s challenge to “In Cacao”, but I would much prefer to listen to the combatants in the Planters' Hall and in the presence of any cacao planter who may wish to listen to or take part in the argument; for our Cacao Committee has sent out circulars—like the one I have received—with a number of foolish questions which at least some of the Committee ought to have been able to answer on the spot, if they are entitled to serve on the Committee. I have no desire personally for further information *re* Cacao as I can tell from appearance of leaf, bark, and pods, the requirements of the trees; and the taste of the dye extracted from the soil around the trees is of further use to prove the correctness. As we have so many planters able and willing to speak out, I, as an old planter of 43 years' experience and 70 years of age, left younger men to carry on correspondence, &c., of late; but this circular is so silly that I welcome P.O.D. —Yours faithfully,

JOSEPH HOLLOWAY.

THE JAVA COFFEE CROP, 1901.

According to a telegram sent to Europe by the Governor-General of Netherlands India, the Government coffee crop in Java is estimated for the year at 95,000 piculs. — *Straits Times*, Sept. 30.

SIR JOHN MUIR COMPANIES.

ANGLO-AMERICAN DIRECT TEA TRADING COMPANY, LIMITED.

At last we have been able to get sight of the report of this Company for the year ended November 30th last, but it has not illuminated us much. It is printed on the same coloured paper as the reports of other subsidiary companies of the Consolidated Tea and Lands parent and the directorial report signed by "James Finlay and Company, Secretaries," is divided into the same kind of paragraphs telling us about the quantity of tea marketed, the extensions of the acreage cultivated, the balance at credit of profit and loss, and sundry other matters, but into the true position of the company we get not the slightest glimpse. Very little profit has come from the company's estates in Ceylon, we are told, because of the fall in prices, but the directors are glad to state that Ceylon producers generally are now "plucking much finer," therefore it is hoped that an enhanced averaged price will be realised by the company in 1901. Even so, we cannot think it will be benefited much, for coffee is falling in price, and the company does seem to produce a little of that berry, although its directors are careful to avoid confiding to their shareholders how much. What, though, has become of the "direct trading" portion of the business? It is all very well to inform shareholders that "Cardamoms are produced in the form of three-celled capsules, containing numerous seeds which yield an aromatic pungent spice with a peculiar but agreeable taste." This is interesting and quite nice, but where is the market for the company's teas in America of which so much was originally made? There is not a syllable about the subject in the report, nor can we trace anything relating to it in the accounts.

In order to bring the statistics of these various and fascinatingly peculiar emanations of Sir John Muir's company-framing industry into uniformity we have drawn up tables to exhibit the figures of this company on the same lines as those laid down for his other companies in last week's issue. These tables show that the Anglo-American Direct Tea Trading Company offers as good an example of the financial "rake's progress" as any one of them. It has extended the acreage under cultivation somewhat in the year ended November 30th last, and marketed a much larger crop of tea but the price exhibited a disastrous fall, and worse, than all, the company has to lean more and more upon borrowed money, while dividends on the ordinary shares, have become impossible. Twelve months before, the directors boldly paid a five per cent dividend, with a four per cent bonus, making nine per cent for the year on those shares and for last year they got nothing, in spite of the large amount of additional money poured into the business. This "manœuvring with capital" has become quite appalling. The paid-up share capital remains much as it was twelve months before, but loans and advances from shareholders have risen from £156,000 to £233,000, and advances by bankers from £171,000 to £202,000. The company thus owes £108,000 more than it did twelve months previously, and has not a rag of a Scotch £1 note to show for the money. All that we can discover is a slight increase in the value of the tea pledged to the bankers against advances, but that increase left the bankers un-

covered at the date of the balance sheet to the extent of £145,000. What have they got for that money? Adding it to the debt of the other companies, over £500,000 has been advanced by bankers to the various companies known as the Muir group, apparently without security unless the "investments" paraded in the accounts are pledged to them. But these investments have all shrunk in value, so far as we know, and probably could not now be realised at one-half their cost price. It is only necessary to state facts of this description to indicate what a bottomless quagmire of unstable credit the accounts of these companies present. We must, however, congratulate the directors on being able to write off £434 on account of preliminary expenses during the past year, although this is almost balanced by the increase in the suspense account for coolies, &c. That, however, is the only word of commendation it is possible to utter, and against it we must place a decrease of over £2,700 in the cash, the total of which is now down for £1,117. No wonder it was deemed prudent to abstain from declaring any dividend on the ordinary shares. Who holds these ordinary shares? Not the public, it is to be hoped. If the public, may the gods help them! Sir John won't.

—Investors' Review, Sept. 14.

THE CONSOLIDATED ESTATES CO., LTD.

The tenth annual report of the general managers, to be submitted to the shareholders at the general meeting, to be held at 34, Great St. Helens, E.C., on Wednesday next, states that the profit and loss account shows a balance (including £596 18s 7d brought forward from last year) of £3,488 2s 9d, after paying interest on the Debentures, and an interim dividend of 4 per cent on the Preferred shares. Out of this sum the general managers propose to pay a balance dividend of 4 per cent on the Preferred shares, making 8 per cent for the whole year, which will absorb £1,450; to set aside for redemption of 2 per cent of the Debentures at 103, £927; carrying forward the balance, viz., £1,081 2s 9d. Total £3,488 2s 9d. (By the articles of Association it is provided that no dividend can be paid on the ordinary shares in any one year unless 5 per cent of the debentures have been redeemed for that year). The following shows the result of the year's working viz:—Net proceeds of Crop—1,787,560 lb of tea at an average net price of about 5 5-16d per lb realised £39,715 17s 9d; cocoa, cardamoms, cinchona bark, and cinnamon, £961 19s 7d; surplus on estimated value of produce brought forward from 1899-1900, £330 1s 6d; interest on account, £109 12s 3d; total, £41,117 11s 1d. Expenditure on Estates—Messrs. George Steuart and Co.'s drafts—R450,732 at an average of 1s 4 2-6d per rupee, £32,784 2s 6d; balance of coast advances, £300 3s 3d; bonus to superintendents—R4,000 at 1s 4 1-16d, £267 14s 2d. The shareholders are no doubt aware that, owing to the heavy fall in the price of tea, the past year has been an unfortunate one for tea-producing companies, and the general managers much regret that they are unable to recommend the payment of any dividend on the ordinary shares, but they think the result of the year's working is not unfavourable as compared with that of other similar companies. They are also glad to say that the prospects for the new season are much more satisfactory, for not only is the market in a much stronger position, but also some further economy in the production may be looked for, while the crops are still increasing, and with normal weather it is hoped that a further addition of about 50,000 may be expected. During the past season the weather in Ceylon was favourable for the growth of tea, and it will be seen that the actual crop exceeded the estimate by over 100,000 lb., so that, but for the heavy fall in price, the results would have been quite satisfactory. The fall was mainly due to over-production, but planters are now thoroughly alive to the danger of this, and shipments from

Ceylon show a considerable reduction, while the consumption continues to increase. The cost of production on the company's estates was slightly in excess of that of last year, which is due to the large sum spent in manuring; the arrangements for this had been made, and in fact nearly all the manure had actually been applied before the serious fall in price of tea took place, but during the new season it will not be necessary to spend nearly as much on this item, as the company's estates are now in a high state of cultivation; but the subject is one which engages the special attention both of the general managers and the company's agents in Ceylon. Exchange during the past twelve months has been slightly more favourable for the company, the average rate for three months' drafts having been 1s 4 23-64d, against 1s 4 31-64d last year. The amount realised from products other than tea is rather less than the estimate, which is mainly due to the fact that it was found necessary to let a good deal of the cinchona bark stand over till the present season, and consequently only about half the quantity estimated for was actually harvested. The crop of cardamoms was also somewhat short of the estimate. No new properties have been acquired since the date of the last annual report, and the total acreage of the company's estimates remains unaltered—viz., 5,484 acres. But it has been decided to abandon the cultivation of a plot of about 70 acres on Wariagalla which does not pay, and the land under tea is thus reduced from 3,927 to 3,857 acres.

The usual tabulated statement showing the distribution of the acreage is appended, but a careful survey of the reserve land suitable for Tea is being made, and this will probably result in some slight alteration of the figures given below:—

Name of Estate.	Ceylon District.	Tea Full Bearing.	Tea Partial Bearing.	Tea Recently Planted.	Reserve Suitable for Tea.	Other Products, Grass Waste, Water, &c.	Total Acreage.
Wattegodde	Dimbala	800	Nil	23	Nil	70	895
Hoonocotua	Kotmale	560	25	15	45	117	762
Tallagalla	Kalutara	515	48	54	60	23	700
Allagalla	Matale	225	6	9	38	167	445
Rutland	Hewaheta	443	6	70	85	59	663
Wariagalla	Nilambe	423	61	26	57	694	1,261
Sorana	Kalutara	422	79	45	81	131	758
Total		3,388	225	244	366	1,261*	5,484

The capital expenditure last year somewhat exceeded the estimate, as the requirements on factory and machinery account were found to be rather larger than had been anticipated, the estimate having been £1,800, whereas the actual expenditure amounted to £2,210 10s 7d, thus bringing the total amount at debit of the factory and extension account to £6,544 4s 1d. To provide for this and further small requirements in the future the general managers made an issue in July, as the shareholders are aware, of £2,000 in £10 Preferred shares, and £5,000 in 5 per cent. Debentures, which have all been taken up, but mainly by the general managers under their guarantee. As, however, this issue was made in July, the figures in connection with it do not appear in the annexed

* Of which more than 300 acres are planted with Cardamoms, Cocoa, Cinnamon and Cinchona.

accounts, which are for the year ending June 30. For the present it has been decided to discontinue the extension of cultivation, as the shareholders seem for the most part disinclined to provide the additional capital that would be necessary, and the expenditure on factory and extension account will therefore in the future be small. It is estimated for next year at about £600 to £700, and is chiefly required for the upkeep of the extensions of tea and cardamoms made during the last two or three years, which are not yet in bearing.

The Estimates of Crop Expenditure and Yield for the New Season have as usual been very carefully prepared, and are as follows:—

	EXPENDITURE.		CROP.	
	R.		lb. Tea.	
Wattegodde ..	114,141	..	410,000	
Hoono cotua ..	78,687	..	280,000	
Ellagalla ..	28,469	..	120,000	
Tallagalla ..	62,785	..	250,000	
Warriagalla ..	60,196	..	230,000	
Rutland ..	62,309	..	240,000	
Sorana ..	66,422	..	275,000	

Totals R473,009 @ 1,835,000
1/4³ = £32,273.

Also about 20,000 lb. of Cinchona from Rutland 5,500 lb. Cardamoms, and 1,680 lb. Cocoa from Warriagalla, and 15,000 lb. Cinnamon from Sorana; the value of the whole of such products being estimated at about £1,000 to £1,200.

The general managers are glad to be able to state that the reports they have received as to the condition of the company's estates continue to be very satisfactory, and there is almost an entire absence of blight or pest of any kind, so that with normal weather and even moderate prices for tea, the prospects for the coming season appear to be decidedly hopeful.

NAHALMA TEA ESTATES COMPANY, LIMITED.

The report states that there is a loss for the year ended December 31st, 1900, after providing for general expenses, directors' and auditors' fees, interest on debentures, &c, of £1,544. It is proposed to adjust the accounts in the company's books by writing £910 off the balance of the amount set aside for the redemption of debentures, and £109 off the amount set aside for provision against loss on coolie advances. There was also a credit balance carried forward from profit and loss for 1899 of £100, which leaves a debit balance to be carried forward to 1901 of £423.—*Home & Colonial Mail*, September 27.

REPORT OF THE DIRECTORS

to be presented to the shareholders at the seventh annual ordinary general meeting, to be held on Wednesday, October 16th:—

The Directors beg to submit the general balance sheet and profit and loss account for the twelve months ending 31st December, 1900, duly audited, which results in a loss for the year ending 31st December, 1900, after providing for general expenses, Directors' and Auditors' fees, interest on debentures, &c., of £1,544 7s 9d. It is proposed to adjust the account in the Company's books by writing off this sum the following items:—The balance of the amount set aside for the redemption of debentures £910 2s. 6d; the amount set aside for provision against loss on coolie advances £109 11s. 6d; there was also a credit balance carried forward from profit and loss for 1899 of £100 14s. 8d; which leaves a debit balance to be carried forward to 1901 of £423 19s 1d.

The Directors beg to hand their report for 1900. The crop obtained was 208,419 lb as against an estimate

of 230,000. The debenture holders and shareholders have been fully advised as to the various causes tending to contribute towards the disastrous position of the Company. Messrs Bosanquet & Co., Colombo, have been appointed the agents to the Company in Ceylon as from 1st April, 1901.

The acreage of the Company's properties on 31st December last remained unaltered, at—Tea in full bearing, 446 acres; jungle, 246 acres; total 692 acres.

The Directors report that Mr. Arthur Marshall has resigned his seat upon the Board; they have also to record the resignation of Mr. William Forsythe. Mr. Richard Arthur Bosanquet was elected a Director of the Company at an extraordinary general meeting of the shareholders in November last.

Mr. John Abernethy, the Director retiring by rotation, being eligible, offers himself for re-election. Mr. Richard Arthur Bosanquet being eligible also offers himself for re-election.

Messrs Fox, Sissons & Co., Auditors to the Company, offer themselves for re-election.

DOOMOO TEA COMPANY OF CEYLON, LTD.

REPORT OF THE DIRECTORS.

Your Directors beg to submit their Report and Accounts for the season ending 30th June, 1901.

The Tea produced on the two Estates was 240,130 lb costing 26'95 cents per lb and realising 40'39 cents per lb as against 40'57 cents for last season, a result which may be considered eminently satisfactory in view of the condition of the tea market during the financial year.

During the year a new bungalow has been built on Verellapatna at a cost of R3,000 and the estimates for the present season provide for the erection of fans on Verellapatna factory at a cost of R3,500, which it is hoped will improve the manufacture of the tea.

R.

The amount available to be dealt with is	37,481'22
and your directors recommend that a	
divided of 7 per cent be paid absorbing	28,000'00
That there be passed to Depreciation account	
a sum of	2,500'00
That there be passed to Reserve account	
a sum of	5,000'00
That there be carried forward a sum of	1,981'22
	37,481'22

The estimates for the current season provide for a crop of 260,000 lb tea at a cost of R69,838 exclusive of Capital Expenditure.

The acreage of the two Estates is as follows:—

Doomoo ..	213 acres	Tea 5 years old and upwards,
	9 "	" under 2 years old.
	19 "	Timber.
	58 "	Chena and Patana.

299

Verellapatna 465 acres Tea 5 years old and upwards,

	35 "	" 4 "
	24 "	" 3 "
	10 "	Grass.
	154 "	Chena and Patana.

680

In accordance with the Articles of Association Mr. W D Gibbon retires from the board, but being eligible offers himself for re-election.

It will be necessary to appoint an Auditor for season 1901-2.

THE MAZAWATTE COMPANY: CHOCOLATE AND COCOA.

NEW "ALL-BRITISH" ENTERPRISE.

(Globe, Sept. 27.)

One may fairly describe chocolate as the queen of sweetmeats. Thanks to the foreigner, who often supplies us with what we could well provide for ourselves, eating chocolate has long usurped whatever position drinking chocolate may have held in the past, and where the cocoa bean is used in liquid form it is as cocoa pure and simple that we know it. After all, the difference between chocolate and cocoa is largely one of degree—the degree of butter, in fact, which is extracted or is allowed to remain. A cocoa bean contains something like 50 per cent of butter; for cocoa essence this is nearly all extracted, but in making chocolate of the best quality the rich vegetable oil is not to any considerable extent interfered with, whereas in chocolate of the lower grades (and it is to be feared a good many people know none other), for the natural butter, which is a very marketable commodity, there is substituted inferior animal fats, while arrowroot, sago, and all kinds of colouring matter find a home in the cheaper chocolates that have but slight acquaintance with the cocoa bean, and that only with the husk discarded by the high-class manufacturer.

Holland, France, Switzerland, and Germany have, so far, almost monopolised the trade in the best chocolate and the finest cocoa essence in this country, and it is interesting to learn that an attempt is to be made by the Mazawattee Company to capture some of this trade from the hand of the foreigner. Of course, competition being what it is, the public is not prone to extend any particular favour to an article simply because it is British-made. This fact is often deplored, but the answer (and one which the Mazawattee Company would surely make) is that the buyer seeks the best article for his money, whether it bears a Dutch name or a French title. It is such a commodity that the vast undertaking so long identified with packet teas promises to place on the market, and, having regard to assured reputation, no less than to the elaborate preparations, extending over five years, for entrance upon the new enterprise, and to the unique facilities for distribution possessed by the firm, promise may almost be taken as performance. Something not far short of half-a-million sterling has been sunk in the enterprise, which is not only already giving work to about 3,000 hands at New Cross, but is further stimulating trade with our Colonies.

Some of the finest of the cocoa beans come from Ceylon, while a large quantity is imported from Trinidad; and in the making of the chocolate in all its varied form—but of one quality—at New Cross, including the most popular milk chocolate, in regard to which again the foreigner must now look to his own, cocoa from our British Colonies is alone being used by Mazawattee. At New Cross this new and self-contained enterprise, with which the public will make more intimate acquaintance in a few days, is now in full swing. Everything is done there—from washing the cocoa bean to turning out the chocolate with that bloom and smoothness of surface known to the connoisseur and producing the best of cocoa essence, and from cutting the tin to finishing the boxes in which the chocolates

are so daintily placed. Cardboard is said to contaminate, and is therefore to be rigidly excluded. The works cover an immense acreage, divided almost equally between the tea trade and the new industry, which has its centre at New Cross. It is a bold venture and a big one, which, as a purely British enterprise, may be wished that success which is already assured.

DISEASES OF CHILDREN AND THEIR TREATMENT:

BY J. L. VANDERSTRAATEN, M. D.*

This very valuable work, which has been out of print for some time, has now passed through a fourth edition. It used to be the book to which every English-reading mother in Ceylon, turned in time of sickness, and in which she seldom sought in vain for guidance. Dr. Vanderstraaten had had so many years' experience in Ceylon that he knew just how to direct and advise. The first Edition appeared in 1873 and now the work has been completely revised; the chapters on the management of children in Health and in Illness have been re-written and several additions have been made to the Table of Ailments, while another chapter on Directions for Infant Feeding is given. The book itself is divided into two parts:—Part I contains a concise account of each disease so that the symptoms may be readily recognized before the treatment is attempted. The List of Medicines in general use and the Table of Prescriptions, contain the doses suited to children, from under one year to ten years of age. In addition to the results of the Doctor's own experience, much of the valuable information in this part is obtained from the works of Drs. Goodeve, Hooper, Kesteven Rees, Tanner and West. A section on Accidents and Poisons is also added. Part II. is composed mostly of extracts on the Hygienic and the General Management of the Young, the most valuable extracts being from Goodeve's Hints for Management of Children in India. The Address to Nurses, by Dr. West should be studied carefully by mothers.

The work is one that every mother ought to keep close at hand. It tells when a doctor ought to be called in, and gives such clear directions what to do when symptoms are first observed that no time is lost before the Medical man can appear. Especially on tea and other estates should this little volume be valued. Goodeve's work is a larger and more expensive one and, for fevers especially, is fuller, but, in a general way, this book will be found the more handy. The prescriptions are such as any one can understand and copy for the chemist and then the Alphabetical List of Medicines, giving their Operation, Diseases in which gives doses according to age, and remarks, is one to be often consulted.

Equally valuable is the chapter on the Preparation of Invalid's Food, that on Nursing and what not to do, and one on cholera, precautions against it and the treatment of it

Published by A. M. & J. Ferguson, Colombo. Price R2/60 by V. P. P. Post.

PLANTING NOTES.

MR W WATSON has been granted a special license for the purpose of issuing certificates to any persons having control of any boiler or boilers used in any factory.—*Gazette*.

COCOA AND BANANA PLANTING IN CENTRAL AMERICA.—We direct attention to a letter on this subject on page 333 from a British planter in Costa Rica. He gives us figures of a highly satisfactory kind; but these are not on his own experience, and seem almost based too good to be true. However, we give them *quantum aleant*.

TROUT IN NEW ZEALAND.—Twenty thousand trout ova were received at Rotorna from the Okoroire trout hatchery a few weeks ago. The ova has now developed into healthy little fry.—*Auckland News*, September 12.—An enormous male trout was recently found lying dead near the mouth of the Mimihau river, a tributary of the Mataura river. It was 3ft. lin. in length, and although in very poor condition, weighed no less than 18lb.—*N. Z. Mail*, September 11.

ALOE IN FLOWER.—There is now being exhibited in the conservatory at the West Park, Wolverhampton, a fine specimen of the American aloe which is said only to flower once in about a hundred years. It has been given to the Park Committee by Mr H Lovatt, of Law Hill Hall, and as it is now commencing to flower it will doubtless be an object of interest for several weeks. It is 18ft high, and it is estimated that it will develop about 2,000 blooms.—*Globe*, Sept. 27.

DOOMOO TEA COMPANY.—Elsewhere we give an account of the proceedings at the annual general meeting of this Company which discloses a state of affairs upon which the shareholders may very well be congratulated, considering the condition of the market during the year. A dividend of 7 per cent has been declared and considerable additions made to the depreciation and reserve accounts while there is a balance of nearly R2,000 to be carried forward. A good deal of attention has been paid to Verellapatna estate and there is every reason to believe that the new factory which it is proposed to erect there, will help very materially in improving the manufacture of tea.

FRUIT AND LEAF CROPS.—We have in the Island hill districts whose climate hardly suited coffee, so far as fruiting at least went, as well as it suited the health and comfort of the European Proprietor and Superintendent, and in the low-country there are tracts in which the coconut tree flourishes luxuriantly, but which are too rainy to bear paying crops. In the Upper Shillory Experimental Farm in Assam, they are just beginning to realise that, while there is no difficulty in raising fodder crops, and in preserving them for cattle in the winter. When natural grass is very scarce in parts, seed crops yield disappointing results. Grasses, cloves and even root crops have been successful; but wheat, barley, oats and linseed have proved very disappointing owing to the rains setting in about the time of flowering, and preventing the development of seed,

“THE AGRICULTURAL GAZETTE” of New South Wales. Issued by Direction of the Hon. John Kidd, M. P., Secretary for Mines and Agriculture. Edited by W. H. Clarke, for August 1901 has the following contents:—Introduction by the Under Secretary for Mines and Agriculture; Report of the Chief Inspector of Agriculture; Report of the Chemist; Report of the Entomologist; Report of the Dairy Expert; Report of the Fruit Expert; Report of the Wheat Experimentalist; Report of the Viticulturist; Report of the Inspector of Agriculture and Timber; Report of the Fruit Inspectors; Report of the Principal, Hawkesbury Agricultural College; Report of the Manager, Wagga Experimental Farm; Report of the Manager, Bathurst Experimental Farm; Report of the Manager, Wollongbar Experimental Farm; Report of the Manager, Pera Bore Experimental Farm; Report of the Manager, Coolahah Experimental Farm; Report of the Secretary, Board for Exports; List of Agricultural Societies' Shows, 1901.

CENTRAL AFRICA AND SEED IMPORTATION.—The mail from Central Africa brings us news of importance to those who have coffee and cocoa seed for sale, in the announcement that the B C A Chamber of Agriculture and Commerce has asked the Commissioner to permit a specially chosen committee to consider applications to import economic seeds from countries at present prohibited under the Coffee Leaf Disease Regulation Act of 1894. Coffee seed will be imported as “cherry-dried” only, and all seeds will be chemically disinfected. The need of new products is being felt, and the following (*Central African Times*, Aug. 24th) is germane to the subject:—

Mr. J W Moir, of Lauderdale Estate, Manje, who has for many years imported Jamaica Coffee seed, has another consignment on the way now which we trust will prove successful. Mr. Moir deserves credit for his persistent efforts to introduce not only new Coffee seed, but also to establish the Cocoa plant in this country.

SEED FOR CENTRAL AFRICA.—With reference to this subject, upon which we quote fully elsewhere, the *Central African Times* has the following:—

We think it may be said that the Planters have supported the Administration throughout and that the present untoward result is due to the extreme stringency imposed upon both the Administration and the Planters by the Kew authorities with, we may remark, the very best intentions. The Regulations so far have been completely successful and as yet we have been able to keep the leaf disease at bay. In barring the importation of seed from all countries where leaf disease is known to be, or has been, we have, however, handicapped ourselves to a tremendous extent as, unfortunately for a young country like ours, we have been unable to import seed from all those countries which are our immediate neighbours. We have, in fact, had to face the problem of importing our seed from the uttermost ends of the earth and seed is a commodity which cannot stand long carriage. For example, it is practically impossible to establish cocoa here because in ninety-nine cases out of a hundred the germinative power of the cocoa seed is lost by the time the seeds arrive in this country from the East Indies, the Leaf Disease Regulations absolutely prohibiting the importation from our nearest neighbours such as Natal, Mauritius, India or Ceylon. It is, however, apparent to all that this risk must be taken and we have no doubt but that H. M. Commissioner, recognising the urgency of the case, will at once accede to the Chamber Committee's proposals.

TO ALL PARTS OF ASIA, AFRICA, AMERICA AND OCEANIA.

Seeds & Plants of Commercial Products.

Hevea Brasiliensis.—Orders being booked for the coming crop, August-September delivery 1901; booking necessary before the end of April; quantities of 100,000 and over at special low rates. Plants available all the year round. 100,000 and over at special low rates. A leading Rubber planter in Sumatra, who purchased 50,000 seeds in 1899, and 100,000 in 1900, writes us, under date 15th November, 1900:—"I received your letter of 20th October, from which I learn that you added another case of 5,000 seeds to replace the loss, &c. I am satisfied hereby, and even after this adding I am satisfied by the whole delivery of this year."

Castilloa Elastica.—True superior variety cultivated in Mexico, seeds from specially reserved old untapped trees. Orders booked for August-September delivery, 1901, booking necessary before the end of March; large quantities on special terms; Plants in Wardian cases.

Manihot Glaziovii.—Seeds and Plants available all the year round, 100,000 and over at special low rates. A Mexican planter, in sending an order for this seed, wrote on the 22nd August, 1900:—"If they arrive fresh and germinate easily I may send you larger orders, as they are for high ground where the Castilloa does not thrive."

Kickxia Elastica.—(*Euntumia Elastica*).—Seeds and Plants, orders booked. (Lagos rubber.)

Ficus Elastica.—Seeds available in May-June; booking necessary before the end of March; also plants.

Urceola Esculentata and U. Elastica.—Same as above. (Burma rubber.)

Parameria Gandullifera.—Orders booked for seeds for January-February delivery; also plants; immediate booking necessary. (A good rubber creeper of Malacca.)

Landolphia Kirkii.—Seeds in July-August, early booking necessary. Plants can be supplied all the year round. (A highly-recommended species.)

Chonemorpha Macrophylla.—Seeds and Plants; orders booked. (A very valuable rubber-yielding creeper.)

Memusops Globosa and Payena Leerii.—Seeds and plants in July-August, booking necessary before April.

Achras Sapota, Willughbeia Firma, W. Edulis and other Rubber and Gutta Percha yielding Trees and Creepers, Seeds and Plants.

Cinnamomum Zeylanicum (Cinnamon superior variety). New crop of seed in April to June, booking necessary before the end of February; also plants.

Coffea Arabica, Liberian Hybrid and Maragogipe Hybrid.—New crop March-April; immediate booking necessary.

Cinchona Ledgeriana.—Seeds now ready, also other varieties.

Seeds and Plants of Nutmeg, Clove, Sandalwood (white and red), Pepper, Cardamom, Vanilla, Cacao, Tea, Coca, Fibre, Medicinal and Fruit Trees, Shade and Timber Trees, Eucalyptus various varieties, also Palms, Bulbs, Orchids, &c.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products of Foreign countries for 1901-1902, now being prepared, and will be ready in a few months.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says:—"An interesting Catalogue reaches us from the East. It is issued by WILLIAM BROTHERS, Tropical Seed Merchants, of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbing. We recommend the great Powers and Concessionaries under them to go to William Brothers."

Price List of Seeds and Plants for CEYLON use, post free, on application.

Our new Descriptive Price Lists of Seeds of Shade Trees for Coffee, Cacao, Tea, Cardamoms &c., Timber Trees, Trees for Avenues, Hedges, Wind and Shelter Belts, Ornamental Trees, Shrubs and Climbing Plants; and Seeds and Plants of Palms, Calamus, Pandanus, Cycads, Tree and other Ferns, Crotons, Orchids, Bulbs, Dracenas, now being prepared, and will be ready shortly.

Special Arrangements made with foreign Governments, Botanical and Agricultural Departments, Planters and others for supplying seeds and plants of Commercial Products in large quantities.

Agents in London:—MESSRS. P. W. WOOLLEY & Co., 90, Lower Thames Street.

Agent in Colombo, Ceylon:—E. B. CREASY, Esq.

Telegraphic Address:

J. P. WILLIAM & BROTHERS,

WILLIAM, VEYANGODA, CEYLON.

Tropical Seed Merchants,

Lieber's, A.I. and A.B.C. Codes used.

HENARATGODA, CEYLON.

A FLORAL DISPLAY.

We were very much struck, during a few days' stay at the Sanitarium recently, with the rich display of flower on a shrubby specimen of the "Strobilanthes" or "Nelus"—which we learn from Mr. Nock to be *Strobilanthes gossypinus*, an introduction from the Nilgiris. Hence, we do not find it entered in Trimen's "Flora," although he gives a long list of "Nelus" and much interesting information derived from Mr. T. Farr who is a special authority on the habits, and particularly the flowering of these plants, from his long residence in our hill country and habits of observation in respect of much concerning local natural history, botany, &c. The shrub we refer to with its profusion—a perfect covering of flowers—is certainly a notable addition to our hill gardens. Mr. Nock reports that a plant of it was got from the Nilgiris about twelve or fourteen years ago, and having propagated it from cuttings, he sent it out as an ornamental plant. "It has flowered in Ceylon before; but this year it has flowered very generally." One of the most beautiful of local varieties is "*Strobilanthes pulcherrimus*" and is thus referred to by Trimen:—

"Montane region, 4000-7000 feet; gregarious, rather rare. Ambagamuwa; Madulkelle; Elk and Horton Plains, abundant. Fl. November-Feb.; pale pink-violet, cal. bright pink.

"A lovely plant when in blossom, the whole inflorescence densely covered with long pink-purple spreading gland-tipped hairs, causing a rose-coloured halo in the sunlight. This is too striking a plant to be overlooked when in flower, and it is pretty certain that there was no general flowering between the seasons 1881-2 and 1893-4.

"The Nilgiri plant referred to this by Wight, and figured in Wight, Ic. t. 15C7, is different, *S. amabilis*, Clarke, and is said to be even more beautiful.

Beddome in writing of the Flora of the Nilagiri district" makes special reference to the "Nelus" and speaks of some of them (*sessilis*, Kunthianus) as

"often gregarious and covering several acres in extent, and when out in flower is one sheet of blue, and some people say that it is from this that the Nilagiris, or Blue Hills, derive their name."

But of *S. gossypinus*, *pulcherrimus* and some others he "says they are well worthy of introduction into gardens and hothouses as among the most beautiful plants found on these hills."

PEARLING OFF WESTRALIA.

A VALUABLE PEARL: PEARLERS' PARALYSIS.

Broome, Sept. 10.—Mr. A E Gummow's pearling skipper brought to his employer today a beautiful pearl, absolutely perfect in shape and lustre, weighing 63 grains. The stone is valued at about £600.

Several divers have been paralysed here lately. One, a young fellow named Tillen, who recently undertook diving, stayed down below too long, and was totally paralysed. The doctor, however, has hopes of pulling him round.

London, Sept. 14.—Pearlshells.—The pearlshell market is firm. Australian have all been sold at from par to 10s advance, but West Australian inferior are cheaper.—*Perth Herald*.

MOSQUITOS' NETS AND MALARIA.

Calcutta, Oct. 8.—The experiment has been sanctioned of supplying mosquito curtains to the men of the R G A doing duty at the River Forts, Rangoon, to ascertain whether any reduction in malarial fever amongst them can be thereby effected.—*M Mail*, Oct. 9.

ALGERIAN EXPERIENCE: THE MOSQUITO'S BREEDING-GROUND.

In a paper read to the Académie des Sciences, Paris, M Billet shows that the malaria fever of Constantine, Algeria, is due to the anopheles mosquito. It begins regularly at the end of June, when these mosquitoes appear in the unhealthy spots. Mr. John Chamberlain, an American, believes that the Mosquito does not always hatch its young in pools, but sometimes makes shift with heavy grass and thick woodlands. In such places the food of the larvæ, decaying vegetable matter, is abundant.—*Globe*, Sept. 20.

MOSQUITOES VIRULENT IN LONDON.

The mosquito has again appeared in London, and his bite is more vicious than ever. Every summer and autumn, the victims of the mosquito become more and more disfigured. The swelling caused is now often as big as a duck's egg. The eye, head, hands, and legs are attacked. The cause is attributed to the neglect of the authorities to drain the marshy ground and running brooks in the suburbs, which, with the growth of London, become more and more filthy, and are the breeding beds of the mosquito or gnat. Unless something is done to clear out these beds, London before long will be as mosquito-ridden as Italy.—*Daily Express*, Sept. 19.

PLANTING "CASTILLOA ELASTICA" IN OPEN PATHWAYS.

By Francis Child Nicholas, Ph. D.

[To the Editor of *India Rubber World*.] On the rubber estates belonging to The South American Land and Exploration Co., Limited, the following results have been obtained: Rubber trees (*Castilloa elastica*) on the company's property in the Sierra Nevada de Santa Marta of Colombia are now two years old. The company has had the advantage of almost unlimited land for its operations. The seeds were collected in Costa Rica, and reached the property in fair condition; after their arrival, planting was commenced almost immediately. The plan adopted was to cut pathways through the forests by the side of streams, and along rivers. The seeds having sprouted before they reached the property, there was urgent necessity to plant in haste.

The seeds were put in the ground about the middle of June, 1899, and the paths were cut with a view of maintaining a deep shade to protect the young trees for the first four months, July, August, and a part of September, being dry and hot in that region. It was intended, when the autumn rains should set in, to cut away overhanging trees and underbrush for the purpose of providing sufficient sun and plenty of air for the development of the young trees. Where the seedlings were too close together, cross paths were to have been made for transplanting. Before this plan could be carried out, the civil war, so lately disastrous in Colombia, made it necessary to suspend operations, and for eighteen months the young rubber trees were almost abandoned. The only thing that could be done was to clean away the dead leaves, which falling from surrounding

trees, threatened to smother the seedlings; but even this work was not thorough, and for months at a time the young rubber trees were without any care.

Work was resumed on the company's plantations during the spring and early summer of the present year, and is now being regularly carried on. It was found on cleaning up the rubber plantation that, while losses had been heavy, there were thousands of "young rubber trees," and that some of them were doing remarkably well, showing the first developments of that enormous length of trunk, found among trees of the forest which have grown upwards until the sunlight above the woodlands has been reached—a condition that produces a great length of trunk for breeding, promising pounds of rubber where less favourable trees would yield only ounces. Many varied conditions of development were found at the company's plantations, the most important being as follows: Trees on moist, but not wet land, where the surrounding forest had been opened to allow a fair amount of sunlight, but not enough to burn the young trees, were the best. At such places many of the trees presented a growth sufficiently vigorous to promise the development of strong rubber producing trees without any further attention. After these the most favourable were those trees growing on moist land, but with the sunlight and free circulation of the air impeded by the surrounding forests these, however, were doing well, and while their growth was not phenomenal it was very satisfactory. Trees showing a rather unfavorable development were those on moist ground but too much in the open sun. Growth had been vigorous, but there were too many sunburned buds to give much promise of successful maturity. Of very poor development were trees growing in rather dry places in the hot sun. Many of these were dead the few that remained were very small, some being only two or three inches high. Of very bad appearance were those trees which were on rather dry land in the deep shade, almost entirely cut off from the sun. Nearly all of these were dead, among the very few remaining alive none were vigorous, many had not progressed beyond the first stages of growth, though wood was forming where the tender shoot had been, they were simply dwarfed trees, that had never progressed after the cotyledons had been absorbed.

It appears from these results, that under ordinary circumstances, the *Castilloa elastica*

REQUIRES FOR ITS BEST DEVELOPMENT

damp soil, open shade, and some sunlight. The best trees on the plantations of the South American Land and Exploration Co., Limited, at their Sierra Nevada de Santa Marta properties, are on rather damp land, and have had about one hour's full sunlight each day. The very favourable results that have been obtained on these plantations, after subjecting them to nearly eighteen months' abandonment, is to my mind strong evidence that the best method for planting *Castilloa elastica* is along open pathways through the forests which enable the planter to make an adjustment of shade and sunlight suitable to the special requirements of the locality selected for planting; and further I am fully convinced that to clear all the land, and keep it clean is a useless expense, that a series of pathways intersecting at right angles will give quite as many trees to the acre as on cleared land and, that under some climatic conditions at least, too much sun will burn the tender buds of young rubber trees, and, influencing older trees, will harden the bark, thereby checking the flow of latex through the ducts, which in *Castilloa elastica* are just under the bark, a condition which when the bark is too hard may impair the tree's capacity to produce rubber.

While I advocate open pathways for *Castilloa elastica*, justice to all conditions requires a brief notice of results obtained at

PLANTATIONS IN JAMAICA,

owned by the same company. These plantations are in Portland parish, where rains are excessive, the ground usually saturated with water, and penetrating fogs are frequent. Here the most vigorous among the young rubber trees are those where there is an abundance of sunlight. At places where there is some shade, the trees are vigorous and healthy, but are not so large as those in the more open places, their leaves are a deeper green, and perhaps they are rather more healthy than those grown in the sun. Trees which were planted where there is a very limited amount of sun, are straggling and unhealthy. In the few places where there is little, if any sun, the trees are nearly all dead.

The advantages of open pathways were demonstrated in Jamaica; for, on my last annual inspection of the company's properties, it was a simple matter to order that overhanging branches should be cut away to provide sufficient sun to meet the requirements of this region, and at present all the company's trees in Jamaica are growing vigorously.

These results furnish strong evidence that *Castilloa elastica* requires an adjustment of sunlight and shade, varying with the climate, and the geological conditions of the region that has been selected for planting. Whether the best means of providing this adjustment is to be found in open pathways, is, perhaps, not fully proved; but at any rate they have given good results at the plantations which are being developed under my direction.—*India Rubber World*, September 1st.

SEED IMPORTATION FOR CENTRAL AFRICA.

A special meeting of the B C A Chamber of Agriculture and Commerce was held on Wednesday afternoon to consider a motion with reference to the importation of seed from countries prohibited under the present coffee leaf disease regulations. There were present:—Messrs. Beaton, Metcalfe, Hynde, Stark, Lunke, Partridge, Lloyd, and MacMorland, Secretary. Being a special meeting the Chairman called upon Mr Hynde to make his motion. Mr Hynde moved the adoption of the scheme which we publish below and supported it for the following reasons:—

He stated that it was quite evident that there was a want of stamina in the coffee, and while he did not attribute the bad condition of many of the coffee plantations to this cause alone, but thought that the recent labour troubles, bug and borer, had a great deal to do with the weakening plants; still there was no doubt that a large influx of new seed was necessary. He pointed out that hitherto seed had been only imported from Jamaica, and that many of their importations were failures. The Government scheme had not worked out, while valuable time was being lost. Importing seed from Jamaica meant that we were importing from one little island, and from one particular district of that island, whereas it was essential to get new seeds from widely different places. Especially was it necessary to get some of the seeds from the Indian coffee districts. It was also necessary to import shade seeds. Under the present regulations we had been compelled to make experiments with new seeds, and these experiments had been costly in the extreme, and in many cases had ended in failure. Such experiments were unnecessary when tested shade trees could be imported direct from the Indian coffee districts under proper safeguards. It was further absolutely necessary to import new economic plants and many of these could only be got from prohibited countries. There would be, in many cases, no danger as they could be got from districts where no coffee had been grown, and where the disease was not likely to be. It was a question, he thought, for the planters to decide whether they were willing to take the risk. He proposed a scheme in which every precaution which could be suggested by science and experience would be taken against the in.

roduction of leaf disease, and he thought that with these precautions we might well take the risk. The gravity of the situation demanded that some such steps should be taken. After some discussion it was unanimously agreed to support Mr Hynde's motion.

DETAILS OF THE SCHEME DECIDED ON.

It is hereby notified for general information that at a special meeting of the Committee of the above Chamber held in the Labour Bureau Offices on 28th August, 1901, Mr. R S Hynde brought forward the following motion, viz., "That H. M. Commissioner and Consul General be asked to temporarily amend, for the period of one year from 1st October next, the Regulations at present in force for the Prevention of the Introduction of Coffee Leaf Disease into this Protectorate to the following effect:—

1. That a Committee consisting of the Resident Government Medical Officer, the Secretary of the B. C. A. Chamber of Agriculture and Commerce, and one elected member of the Chamber, be formed to specially consider applications to import economic seeds from countries at present prohibited under the Coffee Leaf Disease Regulations of 1894.

2. Anyone desiring to import seeds for economic purposes, from countries at present prohibited under these Regulations, must first make written application to this Committee. Should their application be approved they may then import the seed, but it must be addressed to the care of the Committee and all charges paid to Blantyre.

3. The Committee will then take such steps towards disinfecting the seed as they may deem necessary, and after disinfection the seed will be forwarded to the applicant without delay, the applicant paying all charges for carriage if such be necessary.

4. Applicants must agree to waive any claims against the Committee for any loss or damage arising from delay, the disinfecting process, or any other cause, while the seed is being dealt with by the Committee.

5. Applicants must engage to carry out any other precautions which the Committee may think fit to prescribe and the Committee must give written notice of special precautions to particular cases when agreeing in applications.

PRECAUTIONS.

The Committee will take the following among other precautions:—

1. Coffee seed will only be allowed to be imported from a prohibited country as cherry-dried.

2. The Committee will cause the pulp to be removed and it, along with all packing material, will be incinerated under their supervision. The seed will then be further chemically disinfected.

3. Other seeds will be treated in a similar manner according to the degree of danger, and special instructions, which must be adhered to by all applicants, may be issued at the discretion of the Committee in special cases."

The above scheme was unanimously approved of by the Committee owing to the urgent need for the importation of new seeds of economic plants and it was decided to publish the scheme before the Annual General Meeting and to request members to lodge any objections they may have to its adoption by the Chamber on or before the General Meeting called for the 18th September.

It is hereby notified therefore that members are requested to signify their approval or otherwise of the above scheme on or before the 18th September. Members who cannot attend the meeting personally are requested to send their opinions on the subject and to indicate their vote to the Secretary of the Chamber Committee. (Signed) J. MACMORLAND, Secretary.
—*Central African Times*, August 31st.

GOOD CULTIVATION NEARLY AS EFFECTIVE AS RAINFALL.

In a letter to the Department concerning his experience in farm and orchard work at Ellerston, Mr J Stephens says:—"I have followed the advice of the *Agricultural Gazette* in respect to thorough cultivation of crops, and in pruning and working among fruit-trees, and I have often raised good crops in both farm and orchard in very dry seasons. I consider good cultivation amongst growing crops nearly equal to rainfall."—*Agricultural Gazette of New South Wales*.

COFFEE AND BLACK BUG.

A correspondent writes to us:—Government is making enquiries of the planters on the Nilgiris as to the damage done to coffee trees by black bug, from which many estates have suffered severely. Planters will be interested to know that all hybrid Maragogipe plants in the Mekanad District are free from the pest. This cross seems to be immune.—*M Mail*, Oct. 16.

PEARLS.

Mr C Burt, of Victoria square, has in his possession a number of pearls obtained from Shark's Bay, Western Australia, which he has been informed are of most uncommon size and rare value. His attention was directed a short while ago to an illustration of a specimen $\frac{1}{2}$ in. in length which was valued at £600. Until then he had not regarded his own as of any considerable worth, but several jewellers in the city have since told him that they are beautiful specimens and of immense value, and he intends sending them to England for sale. The largest is a cluster $1\frac{1}{2}$ in. long, and contains some hundreds of small round pearls; another is of purer quality about half the size; a third cluster consists of three pearls almost circular, each about $\frac{3}{8}$ in. in diameter. There are also two large single ones and three smaller clusters.—*E A Register*, Oct. 2.

The most famous pearl discovery in Australia of late years is that known as the Southern Cross. It consists of a cluster of nine pearls in the shape of a crucifix, and is almost perfect in proportion. This freak of nature was picked up at low water on the Lacipede Islands by a beachcomber named Clark; it was last sold for £10,000.—*Ibid*, Sept. 26

Not a hundred miles from Piccadilly-circuit there is a sight at present to be seen in a jeweller's window calculated to afford mucus food for the cynical. Preserved in spirits of wine is a large oyster, whose succulent body beloved in its fresh state by the gourmet, has taken a yellow parchment-like appearance, which irresistibly recalls the unholy horrors one sees in a hospital museum. Close to the sickly-coloured flesh of the bivalve is a large pearl, milky and lustrous, its beauty contrasting oddly with the dead hideousness which adheres to the shell by it, and underneath is a card which informs the spectator that 'the pearl if it grows large enough kills the oyster.' Nature must have been in a malicious mood when she 'started in the pearl line.' It is nothing short of ironical of her to have ordained that the

diseased mollusc should bestow upon the world as a result of its ailment that 'white wealth of the sea,' which, from the night when Cleopatra feasted with Antony to the present time, human beings have valued as the queenliest of gems. For who is there who is not aware that the finest pearl is only, as the dictionaries coldly say, 'the calcareous concretions produced by certain molluscs, valued as articles of personal adornment'? And further inquiry proves the fatal card in the jeweller's to be only too accurate: for whether it be as some believe a parasitical growth, or a malignant eruption which attacks an oyster who lives 'not wisely but too well' it is certainly the experience of all pearl-fishers that the shells which bear the most beautiful pearls are those which by their distorted shape and ugly excrescences give most signs of disease in the creature itself. Someone once criticised the Norwegian author Henrik Ibsen as a man 'who mistook every pimple on the face of humanity for a cancer.' But in the matter of the pearl the human race has reversed this and 'gone one better' for we have mistaken the cancer of the oyster for a jewel. But even if he could give the lie to the cynical man of science who would have us believe that we owe these natural wonders to a diseased mollusc, the pearl is at its best but a lowly object, nothing grander in fact than carbonate or silicate of lime. In old days few mortals had such disagreeable knowledge. For the early inhabitants of the globe the pearl was simply a lovely miracle of Nature, and many were the beautiful myths which were current to account for it. But even today 'the treasures of an oyster' are able by sheer loveliness to survive the fatality of fact. Much can be pardoned to beauty, and no one is so impolite as to inquire into the pearl's past.

A perfect pearl is indeed one of the most beautiful objects in the world. But jewellers will tell you that it is hard to come by. First, it must be accurately spherical, and not spilt in shape by its contact with the shell. And then it must have a faultless 'skin' and a fine 'orient,' which are jewellers' terms for the delicate texture and delicious milky color of the natural product. The "pearl of pearls" is said to be a specimen in the Zosima Museum at Moscow, called La Pellegrina and weighing 28 carats. It is absolutely perfect in form and color. The famous pearl of the Hope collection at South Kensington weighs 3 oz., and has a circumference of $4\frac{1}{2}$ inches, but it is of irregular shape. It is specially in the oyster of the Persian Gulf and that fished in the Straits of Manaar, near Luticorin, that the finest pearls are found. But there are many other places where they are to be found. Philip the Second of Spain had a pearl, 250 carats in weight, fished off the island of Margarita, in the West Indies, and Columbus found the natives fishing for them all round the Gulf of Mexico. One of the most important industries of the Bahama Islands is the gathering of pink pearls. It is the only place in the world where the variety is found. They are not taken from the oyster shell, but from a shell resembling a large snail shell called a 'conch.' These pearls, when perfect,

fetch very high prices, ranging from £10 to £1,000! In the East Indies, whence, as has been said, the world's supply comes, the month of March is the pearling season. The fishing lasts four or five weeks; the boats go 60 or 70 together, beginning work at sunrise and leaving off at noon. The men labor in pairs, one diving naked without apparatus except a 'sinking-stone' while the other holds the cords and the diver, himself descending in his turn when his companion returns wearied to the surface. Hard labor enough, and risky too is the industry, but round it has grown a romance which must be always irresistibly associated with the wondrous chances of the work. The pearl fisher has symbolised for poets those entrancing vicissitudes of fortune which must secretly fascinate even the most sober of the supporters of the Anti-Gambling League. The bard will have it that there are two periods in the ideal pearl-seeker's life:

One, when a beggar he prepares to plunge;

One, when a prince he rises with the pearl.

—*Morning Leader*, Sept. 27.

NEW COMPANY: BRAZILIAN RUBBER TRUST, LIMITED.

Registered on September 28, by Maddisons, 6, Old Jewry, E.C., with a capital of £37,500 in 5s shares. Object, to acquire certain rubber-producing properties in the State of Para, in the Republic of Brazil, to adopt an agreement between the Rubber Estates of Para, Limited, of the one part and T Y Curtis, for the Company, of the other part, and to carry on in Brazil or elsewhere the business of planters, growers, collectors, manufacturers, curers, merchants, salesmen, importers and exporters of and dealers in india-rubber and other articles and substances, timber growers and merchants, and farmers and planters generally. No initial public issue. The first directors (to number not less than two nor more than five) are to be appointed by the subscribers. Qualification, £250 shares. Remuneration, £100 each per annum (£150 for the Chairman,) and a share in the profits (latter not to exceed £1,000 each in any year).—*Financial News*, October 4.

PLANTING IN SAINT LUCIA.

According to the latest report of the Administrator of Saint Lucia, last year was, on the whole, the most prosperous in the history of the colony since the time when sugar was supreme. There were no hurricanes, earthquakes, or fires in populous places, the cocoa crop was the largest ever exported and prices were good for this as well as for sugar, while the coal trade was the largest of any year since Castries became a coaling-station. The Administrator hopes that soon the means of communication may be extended, the cultivation of the land increased, and the harbour improved. "Saint Lucia seems now to be established in a career of prosperity, and I can foresee nothing in the near future which is likely to interfere with it." The total exports amounted to £229,436, of which bunker coal was valued at £124,554, or 54 per cent., while sugar and its products amounted to 24 per cent. and cocoa 17 per cent. The population is very nearly 50,000, and 1900 was the first year in the history of the colony in which no death from snake-bite was recorded.—*London Times*, Sept. 30.

CEYLON AT THE PARIS EXHIBITION.

We give the following extracts from Lord George Hamilton's Report on "the Indian and Ceylon Sections":—

The exhibits of Ceylon occupied the large portion of the eastern side of the Indian Pavilion, as well as a considerable space in the grounds, which as before mentioned I was able to allot for this purpose. In the Commercial Court the great staple products of the island, such as tea, coffee, cocoa, cinchona, spices, etc., were well represented by exhibits from every important garden and estate in Ceylon, and the adjoining verandah contained a fine collection of plumbago and graphite, shown by the Morgan Crucible Company, of Battersea.

In the main Ceylon Court the attention of the visitor was immediately arrested by a jungle trophy, which occupied a large space in the centre of the court. This trophy, which comprised, among other animals, a full-sized elephant, a leopard, bears, samburs, axis deer, boars, crocodiles, a gigantic python, birds, insects, and characteristic flora, was excellently arranged by Mr E Gerard, of London, in four realistic tableaux. The conception of this impressive exhibit was due to Mr W E Davidson, the secretary of the Ceylon section, and it proved a never-ending source of enjoyment to the crowds who visited the pavilion.

The collection of precious stones, exhibited by Mr J Hayward, of Argyl Street, London, attracted special attention. It was the largest and most comprehensive collection of gems of the island that has ever been brought together. The exhibit of this important industry could not have been placed in better hands, and Mr Hayward deserves great credit for the success which resulted from his enterprise and special knowledge. Samples of coir and other fibre products were also shown in this court, as well as silver, ivory, tortoise-shell, and the artistic manufactures of the island. In the gallery above, a large number of paintings and photographs of the people and scenery of Ceylon were exhibited, also excellent examples of art furniture and beautiful curios.

In the grounds of the Ceylon Tea House, a characteristic pavilion, in which tea and coffee in the cup were sold, soon became one of the most fashionable centres of the Exhibition, and it is gratifying to know that the strenuous exertions of Sir William Mitchell and Mr J H Renton, the representatives of the Ceylon planters to make Ceylon tea better known and appreciated in France and the Continent generally, have met with the recognition that the commercial enterprise of the planters so well deserved.

The creditable position taken by Ceylon at the Exhibition is due to the able manner in which the whole of the details were carried out by Sir Montagu Ommanney and Sir C Clementi Smith, aided by Mr W E Davidson, the energetic secretary of the section, Sir W Mitchell, Mr J H Renton, and the other gentlemen associated with the Ceylon Court.

The popularity of the Indian and Ceylon exhibits may be judged by the fact that not less than six millions of people passed through the pavilion during the period it was opened to the public. It should be mentioned that the main buildings of the Exhibition, being entirely unlighted had to be closed at dusk, whereas, owing to a wise resolution of my sub-committee, the Indian and Ceylon Sections were brilliantly lighted by electricity, and could thus be kept open later and give admission to the inquisitive crowds who had little else to see after dark.

From the Reports of British Jurors we quote:—

REPORT BY MR. J. H. RENTON,
British Juror in Class 39: Vegetable Food Products.

COFFEE.—The only exhibitors of this article were Ceylon and the Madras Presidency. The British West Indies were not represented. Notwithstanding the fact that in Ceylon, owing to the ravages of leaf disease, this article is rapidly disappearing from the list of this

Colony's products, the exhibits, though small in number and from only four plantations, were excellent in quality and appearance. One plantation made a very handsome exhibit of Liberian coffee, and the Grand Prix was awarded to Messrs. Lipton, Limited, in this section for their collective exhibit of coffee and cocoa. The United Planters' Association of Southern India made a very good exhibit of coffee, to which a Gold Medal was awarded. Awards were given to all the other exhibitors of coffee.

COCOA.—Ceylon was the only British Colony that made any exhibit in this article; the exhibit, so far as number of exhibitors was concerned, was not to be compared with the large exhibits made by Ecuador, Guatemala, Salvador, and Mexico; yet the appearance and quality of the Ceylon cocoa was admitted to be very superior, and created a favourable impression. It is much to be regretted that Trinidad and the other West India Islands made no exhibits. Trinidad cocoa is very much appreciated in France. The export of cocoa from Ceylon has grown from 16,000 cwt. in 1890 to 42,700 cwt. in 1899. Cocoa was exhibited from seven plantations; they all obtained awards.

A very interesting sample of cocoa was shown by the Administrator of the Gold Coast. I understand this was collected from a few experimental trees at Accra. The quality of this cocoa leaves nothing to be desired and if suitable labour can be obtained, there is evidently a future for this product in West Africa. There will not be a large increase in the export of this article from Ceylon, as much more suitable land is not now available in that Colony.

REPORT BY SIR W. W. MITCHELL, C.M.G.,
Member of the Ceylon Executive Committee;
British Juror in Class 41: Non-Edible Agricultural Products.

Non-edible agricultural products comprised:—

OILS.—Animal and vegetable.

FIBRES.—Cotton, wool, ramie, aloe, coconut, palmyra, and kintil.

PLANTS.—Medicinal and oleaginous.

France and her colonies were represented by eleven jurors, and the following countries by one each, viz., Germany, Bulgaria, United States, Great Britain, Japan, Mexico, Peru, St. Salvador, Hungary and Russia.

The products of the various countries exhibiting under Class 41 were examined in a painstaking manner, and the awards of merit were judiciously bestowed on the recipients of them; the proceedings of the jury were characterised by fairness and cordial co-operation throughout.

OILS.—Animal and vegetable.—The exhibits from French manufacturers were all of a high order, but notably in animal oils, the finest display being made by M. Arnis, 13, Rue Montmartre, Paris.

In vegetable oils, after palm oil, coconut oils occupied a prominent position amongst the exhibits, and those from Ceylon claimed a leading place, their purity and good colour being pre-eminent. Improvements in machinery have contributed towards this, together with care in the selection and preparation of the nuts from which the oil is made. The oil is used in the manufacture of candles, but it is also largely utilised in soap-making, principally owing to the peculiar property it possesses of carrying water to about sixty per cent. of its weight.

Fair samples of copra (coconut kernel) and oil were exhibited from the South Sea Islands.

A new product is now being manipulated from the oil expressed from the coconut, called "cocoa-hutter" or "vegetaline," and this edible substitute for ordinary butter is free from objectionable smell and without colour other than that artificially imparted to it. This industry is being prosecuted more especially at Marseilles, where there is an extensive trade in expressing the oil from the kernel of the coconut; but there is every probability of a further development of it elsewhere.

Another industry closely allied to the one above alluded to is that of desiccated coconut. This con-

sists of the nut operated upon by machinery, which cuts it into various sizes from the ribbon to the granulated form. It is used largely for confectionery and domestic purposes, and the principal centre of manufacture is in Ceylon, which sent forward some fine exhibits of it from the Orient Co., and others. Linseed Oil and Cake.—The Gonrepore Jute Co., Ltd., exhibited good samples of these, and were awarded a Silver Medal.

Cotton-Seed Oil.—Some samples of this useful oil were deserving of interest. The oil is used by soap makers, and as a lubricant, and as the area planted with cotton in America goes on increasing, it has resulted in a large production of seed, from which the oil is expressed, its cheapness enabling it to some extent to replace more costly oils.

Essential Oils.—There were several exhibitors of cinnamon, lemon grass and citronella oils, chiefly from Ceylon. These are used principally for perfuming soap and to a small extent in drugs, and in cooking.

A number of oils used in native medical practice were exhibited. Some of these possess ascertained definite properties, whilst others have traditional reputations, but they are of no commercial importance.

FIBRES.—Cotton.—The exhibits from the United States, as might be expected, were exceptionally fine, and the award of a Grand Prix for the collective exhibit is one that is well merited for its excellence in every respect. Specimens of cotton from other countries received attention, but all of them represented a growth insignificant as compared with that of the United States of America.

Wool.—The exhibits of wool were numerous and interesting, but those of New South Wales were of surpassing excellence, and the collective exhibit was awarded the Grand Prix.

The Collaroy Company, Ltd., exhibited some fine specimens—one fleece merino ram, two years, growth of wool 368 days, the largest ever shorn in one piece, the texture being remarkably fine, close and very firm and tough. A Grand Prix has been awarded to this exhibit.

The Glen Moan Station.—I. C. Manchee—submitted three very fine samples and a bale of wool weighing 300 lb. this latter being of uniform excellence, long in staple, thick cluster, fine, and very tough in fibre. For this exhibit a Gold Medal was awarded.

These wools serve to show that great advances have been made in scientific agriculture and in producing sheep giving large size and heaviness in the fleece, combined with a high-class wool.

A collective exhibit of flax from Canada claimed attention and approval, and a Gold Medal was awarded.

Alc.—Many very fine specimens of alc fibre were exhibited, but those from Mauritius were remarkable for their excellence, those of Messrs. Rougier, Lagane & Goupille were of a stand-out description, and obtained the award of a Gold Medal.

Ramic.—Several samples were contributed, which gave evidence of the great value that may rightly be attached to this article in future from a commercial point of view.

Thus far the endeavours to perfect the process of decortication, and to separate the fibre from the substances enclosing it, have only been partially successful. A conference on the subject is about to be held, when it is expected that special efforts will be made for the achievement of what is so much to be desired.

Palmyra fibre and kital fibre were shown, and attracted the attention of those interested in the brush-making industry.

Coir Fibre, Rope, and Yarn.—These are produced from the husk of the coconut, and a large export trade is done from Ceylon. The finest range of exhibits was contributed by Messrs. C P Hayley & Co., of Galle, to whom was awarded a Gold Medal.

Cinchona.—Some choice specimens of cinchona bark were exhibited, chiefly from Ceylon, and a Gold Medal was awarded to Mr. F G A Lane for succubus description.

REPORT BY MR. C. A. PAYTON, H.M.'s CONSUL AT CALAIS,
British Juror in Class 53: Fishing Appliances.
CEYLON.

The Ceylon exhibits were incomplete, a valuable collection of pearls having been lost on the voyage but some interesting things were shown, including an excellent collection of marine shells from Trincomalee.

REPORT BY PROFESSOR C. LE NEVE FOSTER, F.R.S.
British Juror in Class 63: Mines and Quarries.

The Geological Survey of India sent a very excellent collection of economic minerals, decidedly superior in extent and value to that of the Home Government.

Ceylon fared badly. A fine collection of specimens of plumbago had been got together, and then much of the labour was lost owing to the sorry manner in which they were displayed. Magnificent blocks of plumbago were huddled under a counter in a narrow passage, and other specimens were in dirty boxes on the floor unneared for. Printed information and proper explanatory labels were lacking. Plumbago was sacrificed to tea.

“FERGUSON'S CEYLON HANDBOOK AND DIRECTORY, 1901.”

(By an ex-Ceylon Colonist.)

“Give us your ideas about it: a post-card will do.” I was dreaming that something was being handed to me, light and effervescent, with ice in it, invigorating. I awoke to find before me a huge red tome measuring $3\frac{1}{2}$ inches by $5\frac{1}{2}$ by $8\frac{1}{2}$, weighing exactly 2 kilogrammes—say 4-2-5 lb avoirdupois, and containing 1,403 pages of subject matter, with about 150 pages of advertisements, illustrated and otherwise! Hardly to be dismissed by a post card. The book is divided as follows:—Planting and Agricultural Review; General and Useful; Statistical; Directories; Errata and Addenda; and anything about Ceylon that is not contained within these limits, is not worth knowing. As a reliable book of statistics it has held its own for many years. Its accuracy has never been challenged. Its compilation has been undertaken and accomplished with the most scrupulous care; and with regard to other Directories, if the late lamented Artemus Ward were still in the land of the living, he would certainly say,

Ekalled by few, and excelled by none!

I am not sure that he would not go further. The writer certainly has never come across a “Handbook and Directory” the equal of this in completeness of information and accuracy of detail.

In a book of this description a good *Index* is not the least important part, and here we are well-provided, the *Index* covering 44 pages and being exceedingly well-arranged. Take for instance *ad valorem customs duty*. A friend once told me that when he was a youngster in an office, making out some documents, the chief looked over his shoulder and asked, “Are you stamping these with a penny stamp? or *ad valorem*?” The youngster looked up with “I beg your pardon, Sir?” “I asked you, are these to be stamped with a penny stamp? or *ad valorem*?” “Thank you, Sir, I’ll take a cup o’ coffee” was the impudent reply. Small wonder that that youngster was soon after drinking his coffee on the hill-sides of Ceylon.

The Planting and Agricultural Review is of great value, not alone to the Ceylon planter

but to everyone who is interested in Tropical Agriculture, be it in the Eastern or Western Hemisphere.

General and Useful should be gone through, not for what you expect to find in it; but for the unexpected. There is much useful information that one does not look for usually between the boards of a Directory, *e.g.*, Method of Dressing and Softening Skins; a Monograph on Ceylon Woods with matter of interest to others than those who only need planks for tea-chests, Snake-bites and Antidotes; Compass Variations and many other odds and ends of useful knowledge. It should also be a happy hunting ground for those seekers after curious tit-bits of information with which some folks delight to astonish their friends.

Statistics there are in plenty for those who love to read in figures; and these are relieved from their usual dryness by 25 very interesting pages on "Curiosities of our Customs." Here, for instance, we learn that in 1899, nine elephants valued at R15,750, and two cats value R210, were exported. But, what in the name of wonder is Benjamin? It sounds like the name of an American Bar Drink!—and was imported to the value of R16,715. As I suppose we are within almost measurable distance of adopting the Metrical system, I would with all humility suggest that the next issue of this really wonderful work should contain a comparison of British with metrical weights and measures. This rather comes home to one who sends away his produce in Kilogrammes, and gets account sales in Kilogrammes, Piculs, or Cwts., according to the country it is sold in!

The *Directories*, like all else in this volume, are a marvel of detail and accuracy. The Book itself is indispensable not only to Ceylon residents, but to everyone who has any interest or connection whatever with Ceylon, no matter where his domicile and, as I have pointed out above, it contains much information of great value to the cultivator of Tropical products, be he in the East or West.

For my part, whenever I am reading the *London Times*, Whitaker is at my elbow. Whenever I am reading my *Ceylon Observer*, I have beside me for reference "Ferguson's Hand-Book and Directory."

MADRAS ELEPHANT CATCHING OPERATIONS.

The Report received from the Conservator of Forests, Southern Circle, on the conduct of elephant-capturing operations during the year ending the 30th June, 1901, has been submitted to Government. No elephants were captured during the year, as, owing to the additional work thrown on the department in connection with the supply of sleepers to the Madras Railway Company, neither men nor elephants could be spared for the removal of captures. The pits were accordingly kept open in South Coimbatore and North Malabar. In South Malabar, three sambhur and one bear fell into the pits. Of these, the sambhur were all extricated, while the bear was shot. In his endorsement forwarding the report, the Conservator remarks that there is a want of suitable elephants for capturing purposes in South Coimbatore as well as in North Malabar. In its order, Mis. No. 2152,

Revenue, dated 15th June, 1899, Government sanctioned the purchase of four elephants for this purpose from the Mysore Darbar at a total approximate cost of R10,000; but this sanction was not acted on, as the elephants on inspection proved to be too old to be of use. The Conservator reported that he was in correspondence with the Conservator of Forests in Mysore and the District Forest officers of North and South Malabar as to whether any good elephants could be hired or purchased, but the Board has no information as to what the results of this correspondence have been. Mr. Gass will be requested to report on the point.—*Madras Mail*, Oct. 7.

PLANTING NOTES.

THE DATE PALM.—We attract attention to Dr. Bonavia's useful letter on page 331. It may be a question whether date or palmyra should be the palm to plant in our unoccupied Northern regions—probably the latter will stand drought better, but the date should do well on the borders of coast "backwaters" and marshy places.

TROUT IN NEW ZEALAND.—The number of trout hatched at the Masterton fishponds this year is approximately 450,000. This is one of the poorest returns for some years past. There are at present at the hatcheries about 350,000 fry ready for distribution. Of this number, 300,000 are brow trout, and the remainder rainbow. About 150,000 brown trout fry will be liberated in the streams in Wellington province this year.—*Auckland News*, September 19.

PLANTING IN THE FEDERATED MALAY STATES—The following is from a despatch dated 1st July 1901 from Sir Frank Swettenham, the High Commissioner for the Federated Malay States to the Secretary of State for the Colonies:—"The direct interests of planters have never been neglected by the Residents of the Malay States, and, while the Government expended large sums, years ago, in experiments with Arabian Coffee, Indian Tea, Cinchona, Pepper and South American Rubbers, it is now, as already explained, constructing great works for the irrigation of 60,000 acres of Rice land, and last year appointed an Officer to superintend an Experimental Plantation and specially to advise on the cultivation of various kinds of Rubber and its extraction from the tree. I believe that the European Planters, who have hitherto gained but poor reward for their determined efforts in the Malay States, fully recognise that they have the warm sympathy of the Government which will continue to afford them all reasonable assistance. The planting of sugar, originally introduced by Chinese, promises great developments with European capital under European management."

TO KEEP THE BUYING PRICES DOWN.

The Belgian Associations of Kassai, in the Congo, whose competition raised the buying prices of indiarubber considerably, have formed a trust to keep the prices down to a moderate level, and they are receiving the support of the Congo State in the matter.—*Daily Mail*, Sept. 12.

Correspondence.

To the Editor.

BOTANIC GARDENS ON THE GOLD COAST, WEST AFRICA.

(Editor, *Tropical Agriculturist*, Colombo, Ceylon.)

Abnri, Gold Coast, Aug. 26.

SIR,—Enclosed please find a list of the plants cultivated in these Gardens, which I thought might be of interest to you.

I am very grateful for the copy of the *Tropical Agriculturist* which I receive regularly through the Colonial Secretary,* and I need scarcely add I find the information it contains most useful.

I very much regret that I have not been able to reciprocate, but I shall always be happy to supply you with any information you may require from this part of the world, if it is in my power.—Yours very faithfully,

W. H. JOHNSON, Curator.

[The list of plants is very interesting and embraces representatives from all parts of the world including Ceylon cinnamon. Among those peculiar to West Africa are the following:—

Abrus precatorius, *Acrostichum punctulatum*, *Alpinia nutans*, *Anchomanes Hookeri*, *Angiæcum bilobum* and *imbricatum*, *Begonia macrostyla*, *Calamus decratus*, *Clerodendron fallax*, *fragrans* and *splendens*, *Cola acuminata*, (the kola tree), *Crinum giganteum*, *Cyperus esculentus*, *diffusus* and *fertilis*, *Dioscorea prehensilis*, *Dracaena Godseffiana*, *Goldieana*, *Elæis guineensis*,—(oil palm), *Eriodendron anfractuosum*, *Eulophia engloa guineensis* and *Saundersiana*, *Funtumia* (*Kickxia*) *elastica* and *africana*, (rubber), *Garcinia Hanburyana*, *Gladolius* sp., *Gloriosa superba*, *Gymnogramme lanceolata*, *Kalanchoe crenata*, *Laudolphia owariensis* and *florida*, (rubbers), *Mussaenda erythrophylla*, *Nephrodium albobunctatum* and *variable*, *Nephrolepis acuta*, *Psilotum triquetrum*, *Pteris atrovirens*, *Sol-nostemon ocyroides*, *Spathodea campanulata*, *Strophanthus* sp.; *Tabernaemontana crassa*, *Thunbergia erecta*, *Urena lobata*, *Vanilla crenulata*, *Vittaria lineata*, *Voandzia subterranea*.—Ed. T.A.]

CEYLON TEA IN N. AMERICA AND ITS PROSPECTS GENERALLY.

London, Sept. 27th.

DEAR SIR,—I enclose copy of another letter I have written to the Secretary of the Ceylon Association. Much of its contents will have appeared in the *Observer*, but there are a few points which are new.

I see amongst the many suggestions for getting rid of what is called rubbishy tea, is to buy it up and burn it! I think mine, to convert it into brick tea, is better. It appears that, after all the fuss about Japan tea in Canada, she only takes 5,424,000 lbs. per annum. Now 10,000,000 lb. is to be captured out of that by Ceylon Greens is a puzzle which Mr Larkin will perhaps be able to solve when he comes back next week. I missed seeing him by a couple of minutes. If Ceylon planters continue their restrictive policy six months longer until the duty is reduced, they will set the industry on its legs again, because there will be an expansion in the home trade. I believe, however, even this is going on satisfactorily, but it will probably be checked by the rise in common tea.

I am not sure whether the statement in the Yokohama Prices Current includes shipments from Kobe, but I will find out. The Japan Blue Book is rather confusing; first they are given in kins, (100th part of a picul) and then the pan-fired and basket-fired are given separately. I shall no doubt find out all about it at the American Consulate and the Colonial Office; perhaps I may find it in the "Encyclopedia Ceylonica." 50 millions from China, 20 from Japan, and 17 from Ceylon and India—make up in all 87 millions.—Yours truly,

C. S.

The Secretary of the Ceylon Association, London;
52, Longridge Road, 25th September, 1901.

DEAR SIR,—In my letter of the 9th inst., I asserted that the importers of Japan tea into America held an impregnable position, from which they could not be ousted by the costly and unpractical methods adopted by the Ceylon Planters' Association.

As this opinion is contrary to that of many intelligent and experienced planters, it will certainly be disputed. I, therefore, think I may as well anticipate criticism, by stating my reasons for making so bold a statement, and, by thus raising the question, give my critics an opportunity of refuting my arguments, if they can do so.

That importers of Japanese tea in America have an advantage of thirty per cent in the difference between 25 pence per yen, and 16 pence per rupee will not be denied. There are none better qualified to appreciate this advantage than Ceylon Planters, for has not the action of the Indian Government in factitiously raising the sterling value of the rupee to the extent named, been, for the last four years, a standing grievance of India and Ceylon Planters?

There is little doubt that Ceylon Planters can, if they choose, make better Green Tea than the Japanese, but to do so, fine-plucked leaves must be used, and as the lower grades are not admitted into America, and cannot be sold elsewhere at prices that would cover the cost of packages and transport, they have to be eliminated, and this adds considerably to the cost of the exportable grades, which I think cannot be less than 36 cents per pound, laid down in Colombo.

That the leaves used in making superior Greens, would, if made into Black Tea, give more profitable results is proved by the fact, that very little Green Tea is now being made in Ceylon, and it looks probable, that there will be even less during the next few months.

Hitherto very little has been publicly written regarding the cost of tea in Japan, except vague statements that the prices of labour having advanced, there, the cost must be greater than in Ceylon. It is very difficult to obtain accurate information on this point, as there are very few merchants here who are interested directly in the trade between Japan and America. I have interviewed every one likely to be able to give me information on the subject, and Mr Comes of Messrs Comes & Co., was the only one I found practically acquainted with it. From him I learned that Japan tea was not sold packed ready for shipment, as in China, India and Ceylon; but was sent to the shipping ports, in a half manufactured state, and there refined, sorted, and packed by exporters, and that the cost of doing this was about five yen per picul. By adding this sum to the market quotations, the price ready for shipment is obtained. This was

* Ordered officially.—Ed. T.A.

confirmed by Mr Walters, Manager of the Hong-kong and Shanghai Banking Corporation, who has been in Japan.

I find by the Yokohama Prices Current of the 13th August, that common teas including re-firing &c., cost 28 yen per picul; this at an exchange of 25d is equal to 5.26d per pound. Good medium tea at 25 yen equals 6.37d, and finest at 40 yen equal 7.52d.

Taking good medium to correspond with the quality usually shipped from Colombo, it would appear that there is not much difference between the cost of Japan, and Ceylon Greens.

It is authoritatively stated that, to capture the Japanese stronghold, it will be necessary to expend a very large sum in advertisements, and that Ceylon Green Tea must be made to resemble in every way Japanese, and moreover, for a considerable time, Ceylon planters will have to carry on the trade on philanthropic, and not on business, principles.

I will not dwell in this letter on the subject of the bonus paid by the "Thirty Committee" of the Planters' Association, because in a letter to the *Financial Times* in April last, copy of which you obtained, I fully explained its nature and object. I would simply ask what effect could the substitution of a couple of million pounds of Green for Black Tea have in counteracting the over-supply to Great Britain?

Those who are old enough to recall the time when China was the only source of supply, will remember that the consumption of Green went *pari passu* with Black.

Outside the producing countries, and North America, who now drinks Green Tea? I gather from the subjoined statement, taken from the Yokohama Chamber of Commerce Prices Current, that, even in the United States and Canada, the taste for it is diminishing; whilst that for Black, as in all other Anglo-Saxon countries, is increasing.

Is it worth while Ceylon's spending large sums to try and revivify a declining trade?

I learn from Ferguson's "Encyclopedia Ceylonica" that the American campaign costs no less than £20,000 per annum.* This amount if diverted to practical purposes, would pay five per cent dividend on £400,000 of capital.

Your Committee can imagine what this vast sum could be made to do in promoting the consumption of Ceylon tea in Muhammedan countries.

It appears that the chief part of the annual cost of the campaign, is the secret services! One year's savings would cover the expense of erecting in Colombo a Brick Tea Factory, to use up those grades which every one, but the Chinese are anxious to get rid of. Those astute people are, I gather from the Ceylon newspapers, beginning to find out their value.

It would only cost £2,500 per annum to subsidise a Joint Stock Company with a capital of £50,000 to work the factory.—Yours faithfully,

C. SHAND.

* £10,000 per annum 'is' more like the amount: £20,000 is above the total realised for the Cess last year.—Ed. T.A.

TOTAL EXPORTS OF JAPAN TEA FOR THE PAST SIX SEASONS.

Shipments.	1900-1901.	1899-1900.	1898-1899.
To U. S. America...	19,859,749	19,846,372	15,947,030
To Canada ..	5,424,678	6,859,829	7,979,284
	1897-1898.	1896-1897.	1895-1896.
To U. S. America..	21,890,953	19,641,751	23,436,023
To Canada ...	5,565,810	7,708,267	6,500,277

You know that of the \$4 million pounds of tea imported into America 50 millions is from China—the consumption of tea in the U. S. appears to have made no progress during the last twelve years.

BLANTYRE AND EAST AFRICA, LIMITED.

DEAR SIR,—I send under separate cover prospectus of the above Company. It was only begun to be issued by the public yesterday and it remains to be seen whether sufficient capital will be raised. The opening of the Railway to Blantyre would greatly improve the prospects of planters there and I don't think anyone could say the Company was over capitalised. The Nyssaland Coffee Company's estate has not been a success, but there may have been reasons for that such as the opening of too much land at once, and unsuitable sites.—I am, yours truly,
A. L. C.

[We give a brief summary of the prospectus.—Ed. T.A.]

BLANTYRE AND EAST AFRICA, LIMITED, has sprung from an amalgamation of some of the best Planting Interests in British Central Africa. The main objects of the Company are the cultivation of coffee, tobacco, rubber, Chillies, Capsicums, sugar, tea, cocoa, camphor, and other products.

BUCHANAN BROTHERS.—These early Planters are dead, and their Trustees wish to realise their Assets, and have been willing to accept £21,250—a very reasonable sum—for their extensive interests.

HYNDE & STARK have sent the best coffee lately to the London market, and have made large profits on their tobacco. Their senior partner, a man of large experience and much energy, is to be the Company's Manager in Africa.

JOHN W MOIR, by properly preparing and grading coffee on the spot, has secured the highest prices in the South African Market.

THE SCOTTISH CENTRAL AFRICAN SYNDICATE LIMITED, is a newer Company, whose estates are not fully developed. This Company has been reorganised, and has become the nucleus to which the other estates have been added.

The land under coffee amounts to over 3,000 acres, and only costs the company an average of about £13 5s. per acre or £39,970. There are also included 154,385 acres of uncultivated land costing on average about 1s 4d. per acre, or £10,047, although part of this acreage, being Township blocks, is worth about £100 per acre.

The Shiré Highlands Railway, which has just been contracted for with H. M. Foreign Office, will increase immensely the value of these lands, besides rendering the working of this large Company more economical and more effective.

Central African coffee has already made a great name for itself in the coffee market, and this new Company, with its Experienced Staff, and with the economies and improvements to be effected, should give excellent results and substantial Dividends in the near future, for Coffee is indigenous, the quality is excellent, while labour is plentiful, and costs under twopence per day.

The detailed Prospectus, on page 14, shows an estimated Profit on the first complete year's working of

£3,654, which would permit of a Dividend of 7 per cent on the Ordinary Share Capital called up.

The Directors confidently expect that this profit will be largely increased in succeeding years.

LARGE HARE SHOT AT PUTTALAM.

Puttalam, Oct. 14.

DEAR SIR,—I am sending you by this post the skin of a hare I shot, on the 20th ult., at Nindeniya, 2½ miles from Puttalam town, and shall feel obliged if you can inform me whether you have a record of a hare shot, larger than the one whose skin I send you. The shot caught her full on the head, and the animal, when skinned, was found to be with young. Please forward the skin to the Maha Mudaliyar, Mr S D Bandaranaike, after you have done with it, as he may be able to say something about it, as a better sportsman than he cannot be found in the lowcountry. I have seen him bring down ten, out of a possible 12, snipe, and his estates and forest reserves are always abounding with hare.—Yours very truly,

FRED. GINGER.

[The skin, measuring 21 by 18 inches, certainly looks unusually large. The following is from "Clark's Sport in Ceylon":—

HARES.

The hare found in Ceylon is the "black-necked hare," *lepus nigricollis*. The Sinhalese name is háwá, and the Tamil músal. They are found almost everywhere, but are most common in the sandy coast-forests. In some places in the northern parts they can be kicked out of almost every bush. They also swarm round the tanks and open places and in abandoned over-grown fields in the interior. The best time to go after them is at dusk. The weight of a well-grown one will be from 5 to 8 lb.

Possibly Mr. Clark, as well as the Maha Mudaliyar, may have something to say about this skin.—ED T.4.]

Elie House, Colombo, Oct. 17.

DEAR SIR,—I have read with interest Mr. Ginger's letter to you dated 14th instant, re the large hare shot by him. From the description given I am inclined to believe that it belongs to a breed called by the natives "Góna Háwa" ("Blk hare"). This species is of an unusual size, and I have come across and shot some on my "owitas" on Attanagalla, but they are very rare. The general opinion is that this large size is due to the result of a mono-birth, and good grazing ground on land abounding with "Undupialy" or "Rabbit leaf" (trefoil). It may also have been one of this species of full growth, if not of venerable age.—Yours truly,

S. D. BANDARANAİKA.

CARDAMOMS FOR AUSTRALIA.

Colombo, Oct. 15.

DEAR SIR,—I feel sure there is nothing remarkable in the absence of a direct supply of cardamoms to the Southern Colonies. With such a limited population, a very small quantity of cardamoms would go a long way in Australia. There could not be any inducement to ship except on order and I expect orders would be of a very retail nature.—Yours faithfully,

MERCHANT.

CEYLON TEA ON THE CONTINENT OF EUROPE.

Kandy, Oct. 17.

SIR,—I herein enclose for the information of those interested copy of letter from Mr. J H Renton to Mr. Rosling with reference to Ceylon tea in Sweden, Norway and Denmark.—I am, sir, yours faithfully,

A. PHILIP,

Secretary, "Thirty Committee."

TEA IN SCANDINAVIA.

My dear Rosling,—I have been for the last 12 days in Sweden, Norway and Denmark, and give you herewith impressions of my visit.

SWEDEN.

Ceylon tea has been well introduced into this country, owing to the fact that two or three planters are connected with Sweden, and have introduced the tea and pushed it through their agents and friends. Some ten years ago the Messrs Seton of the Agras began the work, and others have followed, viz., Mr Dickson, who is himself a Swede, the Lethenty Co., and Mr Luck. With the exception of the agents and friends of the Ceylon planters, I found only one other firm importing tea in Stockholm, and this firm has tea only as one of its departments. It is a large firm importing all Colonial produce. I called on two other large firms whose names had been given to me as tea importers, and found they did not touch the article. I was somewhat puzzled therefore as to how the 216,270 kilos of tea consumed in Sweden got into the country. But when I got to Gothenburg I found nearly as much tea is imported here as in Stockholm, and that tea is imported into Sweden through no less than 22 other ports. Detailed statistics are as under:—

	From	1899.	1900.
Norway		1,106 kilos	1,242 kilos
Finland		675 do	3,522 do
Russia		22 do	687 do
Germany		64,598 do	60,618 do
Denmark		55,117 do	52,108 do
Holland		5,659 do	7,820 do
Belgium		7,201 do	14,056 do
Great Britain		67,105 do	75,084 do
France		26 do	223 do
Total		201,509 kilos	216,270 kilos

These statistics give no information as to original country of production. Tea transhipped at Hamburg, Amsterdam and Antwerp for instance, is all entered as coming from Germany, Holland and Belgium, and these countries figure therefore as the countries of export. The population of Sweden is just over five millions. The consumption of about 0.09 English lb. per head is very poor, especially when it is considered that the duty is only 50 öre per kilo., say 3d per English lb. The consumption, however, is increasing slowly. Ten years ago the quantity imported for home consumption was only 80,000 kilos. From careful enquiries, I think, quite one-third of the above quantity of 475,794 English lbs (I should say it was over a third but not a half) is of Ceylon tea. With the exception of the quantity imported by the Messrs. Seton's and Dickson's agents via Antwerp and Hamburg, all the rest of the Ceylon tea imported into Sweden is bought in London. Even Messrs. Seton's friends are buying now more in London. The reasons of this are mainly, the London market is cheaper, the dealer gets samples in advance of the auctions and

buys exactly what he wants, and finance is easier. For teas shipped from Colombo the drafts come forward by the mail in 3 weeks' time, and have to be laid at once, whereas the teas themselves are always 7 weeks on the road, sometimes longer. Credit is much abused both in Norway and Sweden. The dealers have to give their clients the grocers a nominal four but generally six months' credit, because private individuals pay their accounts sometimes once in six months, sometimes in a year's time. On teas bought in London the Swedish and Norwegian dealers obtain the usual London terms and are not called upon to pay for the teas till long after their arrival. I called on the following:—

IN STOCKHOLM.

Firm A. General importers of colonial goods with a tea department—has imported direct from Colombo and are quite satisfied with their work, but prefer to buy in London. Use however, mostly China tea and keep Ceylon only for clients who ask for it, are not inclined to go out of the way to push it; think the taste is growing for Ceylon.

B. Tea importers only. Ten or twelve years ago took up Ceylon at the instance of the Messrs. Seton of Preston estate, now purchase only Ceylon and push it entirely. This firm received a grant from the Committee in 1897 I believe, and one through me this year of £100. Last year they expended on general and special advertisements 8,550 kronen say £475, their travellers' expenses were 14,000 kronen, say £777.

In 1901 to date they have expended in general advertisements, signs to grocers,

aposters, &c. ..	5,350 kronen = £297
Travellers' expenses ..	10,000 „ = £555

They well deserve our support.

Their imports in 1900 were 61,000 lb. To date 1901 only 25,500 lb but 22,200 are on the way from London, Ceylon and Hamburg. They anticipate that they will import about 6,000 lb less in 1901 than in 1900 as they got a large quantity just at the end of last year, but they are buying more in London this year, and quantity from there will be 10,000 lb over last year and correspondingly less from Ceylon direct.

C. A small limited Company called Ceylon Plantage le Dépôt commenced by a coffee broker who unfortunately has failed by plunging in coffee. This firm has been in existence four years—and seems to have spent a great deal on advertising in many ingenious ways. To instance one, they have a number of neat little match boxes, which they give away. Up to date they say they have lost money. They are supplied exclusively by the Lethenty Estates Company from London. I have promised them a grant for next year, and will, if I have funds, make them a contribution for this. As vouchers were not ready for me, their accounts are to follow me.

D. Mr Dickson's agent has Dickson's tea and placards in three or four shops, but he is working mainly through private persons, and has only commenced his general propaganda.

E. Is a firm of first-class grocers with five shops in Stockholm. The head of the firm, a born Englishman, but now a naturalised Swede has a nephew, a proprietor in Ceylon. This firm some three years ago imported packet teas direct from Colombo, but now they have their own Ceylon Packets packeted in London. They also run a pure Indian blend—and give the preference to the Indian. The London firm which supplies them

having a branch in Calcutta naturally tries to push Indian teas in preference to Ceylon. This Calcutta firm seems to be doing a good business in Norway, Sweden and Denmark.

As we have quite enough firms in Stockholm making Ceylon teas their speciality I did not try to get any of the Gothenburg firms to take it up specially and push it. A special return is issued yearly of Gothenburg trade which gives amongst other things the quantity imported by each firm. The return for 1900 is not out yet, but in 1899, 73,000 kilos were imported by 14 different firms. Two of these only are purely tea firms, the others are general Colonial produce importers. I called on the principal—entirely tea.

F. By far the biggest importer has correspondents in Colombo, but buys now always in London, is favourably disposed towards Ceylon tea and buys about 20,000 lb. per annum, which is about one-third of his total import.

G. 2nd largest importer, total import though only 15,000 lb. buys principally Ceylon and Indian, all in London.

H. Imports 12,000 lb., principal retail mostly China from Hamburg, uses Ceylon for mixing purposes.

I. Entirely tea, imports only 2,000 lb! all China—was at one time the biggest tea business in Sweden.

J. General importer, buys blends from a firm in Putney, London, S.W. !!!

NORWAY.

The consumption in Norway is as follows:—

	1899.	1900.
	Kilos.	Kilos.
From Sweden	1,656	4,799
Denmark	20,340	18,805
Germany	51,884	58,571
Holland	2,091	1,640
Belgium	7,262	907
Great Britain	34,030	38,960
East India, China and Asia	673	807
Other Countries	51	47
Russia	108	339
Total..	118,095	124,875

Last year the consumption was 274,725 English pounds. The population is 2,000,000, so the consumption per head of 0.13 of an English lb. is better than Sweden, and this notwithstanding the fact that the duty on tea in Norway is 2 kronen per kilo, or about 1s 2d per lb. The Norwegian importers have petitioned their Parliament on successive occasions to have the duty reduced. The justice of their demand has been acknowledged, but the Government cannot do without the revenue. The dealers say if the duty were only reduced by half, the consumption would be doubled. I have not been able to find out through whom most of the tea comes, and think Hamburg and Copenhagen dealers must supply the retail firms direct. I hear there is a firm in Bergen importing a good deal of tea direct from London, but I could only learn of five firms in Christiania interesting themselves to any extent in tea. Of these five three are general colonial produce houses.

K. A big firm, tea is a minor article with them, and they confine their purchases almost entirely to China. What little Ceylon they get, they buy in Bremen or Hamburg.

L. Also another large firm with whom tea is only a minor article, all of which they buy in London, and they sell principally their Assam blend.

M. A smaller firm who took up Ceylon tea in 1897 and import it in packets direct from Colombo. They advertised and pushed it vigorously in 1898-99, and last year. It is gradually displacing their China, as this year they will import two-thirds Ceylon, one-third China, but their total imports will not exceed 7,000 lb. this year. They got a grant last year, and I have promised one for next to include this year's expenditure.

N. A new firm started two years ago and entirely tea. They are to put up and run a pure Ceylon tea of three qualities, are getting special placards for it and circulars. Their first purchases of Ceylon have just been made, and we will see what they can do.

O. Is the Christiania branch of the Stockholm firm B. They opened in Christiania four years ago—and only sell Ceylon. Have worked up the importation to 8,000 lb. but have lost money every year. They have advertised very largely, but the expensive part of the business is their travellers as it does not pay in travel only for tea. If I have funds available I will give them something towards their expenditure this year and have promised them £50 for next. I fancy that nearly one-third of the tea sold in Norway is Ceylon tea, if not sold pure it is sold in blends. I have urged on the dealers the importance of getting grocers to reduce their prices. Tea especially in Sweden is far too dear; until it is much cheaper the public will not take to it. The drink of these countries is, of course, coffee. I fear nothing can be done at present in the way of tea rooms. The customs of these countries do not lend themselves to afternoon coffee, and consequently not afternoon tea. The cafés are deserted between 4 and 6, as this is the dinner hour of the dwellers in towns. Coffee is drunk at breakfast and at supper. In a few families tea is taken at 4 o'clock occasionally, but when it is drunk it is at 9 or 10 o'clock at night. The peasants and fishermen will have no tea. Still the taste for tea is growing, and there is no reason why the $\frac{1}{2}$ million lb. of tea drunk now in these two countries should not be all Ceylon.

DENMARK.

In Denmark much more tea per head is drunk. Quantity entered for home consumption in 1900 was 910,000 Danish lb. The total import was 1,490,000 Danish lb., but as Copenhagen is a free port, a good deal is transhipped there for Russia and Sweden and Norway. The steamers of the East Asiatic Company receive the same privileges as steamers flying the Russian flag. The import for home consumption in 1899 was 900,000 Danish lb. but, in 1898 it was 990,000 Danish lb. The population is a little over 2½ millions, of which nearly half a million is resident in Copenhagen and suburbs. 900,000 Danish lb. equal to say 990,000 English lb. is equivalent to 0.35 per lb. per head of the population. I am convinced that the Copenhagen dealers supply the retailers in South of Sweden, so that Denmark offers a good field for Ceylon tea. In Copenhagen I see no less than 5 large shops and 3 smaller ones selling only tea. In addition to these special tea businesses, tea is displayed in many grocers' windows. But in Denmark Ceylon has

made but a very small beginning, and where other than China is used it is all Indian, that is used and prepared. The usual story is, it keeps better and is much better adapted for mixing.

IN COPENHAGEN

there are four large Colonial Importers with tea departments. Four firms selling tea only wholesale, and five semi-wholesale, with good warehouses and offices but with retail shops as well.

1. The oldest and most important in the first group—do put (*sic*) Ceylon tea, but frankly told me they only kept it if it was asked for. They had sold China tea for 50 years and did not intend to sell any other, if they could help it.

2. Keep only China—and their tea is a very minor article.

3. A small house principally coffee and exclusively China tea.

4. One of the partners in this firm has been in Colombo, and has correspondents there. Their business is principally other articles, but he takes a keen interest in Ceylon tea and has tried to open up a trade in it though he finds it very difficult to do so.

The second group, all keep Ceylon tea and buy it in London or through Bremen firms. One of them gives all the preferable Indian. But another tells me he imports 100,000 lb. of which one-third is Ceylon and Indian, mostly Ceylon bought in the London market. I have hopes that in time this man will take up and push Ceylon. The 3rd firm have agreed to make Ceylon a special feature in their trade, to run it in packets in 3 qualities under a special label and will issue special circulars. I am to contribute the cost of placards and circulars, and this is a beginning at any rate of the 3rd group, I found one who said he sold practically no China. He keeps to the China designations but his teas are all Indian blends. He maintains the public do not care for Ceylon. The other four firms all keep Ceylon, but use it mainly in their blends. The demand for pure Ceylon is they say very small. They buy all their Indians and Ceylon teas in London; one of them has the agency for the *Santhol Mission* teas from Bengal!

You will see from the above that the work in the interests of Ceylon tea was begun in Sweden and Norway long ago; and that what has been done there, has been through the initiative of the individual Ceylon Planter. The increase in the consumption has been very slow, but continuous, and the work has been a very uphill work. We have made a beginning in Denmark and I hope it will not be either so slow or such hard work as in Norway and Sweden.

The duty on tea in Denmark is 66 öre per kilo say 3½d. per English lbs.—Yours, &c.,

J. H. RENTON.

Copenhagen, September 26th, 1901.

THE DEAF HEAR.—No. 479 of the *Illustrated World* of 626, Chiswick High Road, London, W., England contains a description of a remarkable Cure for Deafness and Head Noises which may be carried out at the patient's home, and which is said to be a certain cure. This number will be sent free to any deaf persons sending their address to the Editor.

DOUBLE-HEADED BROWN TROUT.—Freaks of nature, in the shape of two brown trout each with two heads, and two fish of the same species joined at the fins, in Siamese twins fashion, were exhibited at the Mining Exchange on Monday by Mr. Robert Taylor, of the Acclimatisation Society. The fish were obtained in the hatching boxes at Lake Wendouree, and were three weeks old.—*Melbourne Leader*, Oct. 5.

ECUADOR—exported during 1900, 1,103,511 pounds of India-rubber, valued at 1,076,068 sucres (=about \$460,000, gold). These figures are larger than the average for a good many years past. The exports from Guayaquil in 1876 reached 1,013,00 pounds, after which there was a heavy falling off. only 380,300 pounds having been exported in 1893. A recent visitor to the "India Rubber World" offices is about to begin, in company with some other Americans, the planting of *Castilloa elastica* rubber near Guayaquil.—*India Rubber World*, October 1,

NOVEMBER, 1901.

[No. 5.

SCHOOL GARDENING IN CEYLON.

THE scheme for establishing gardens in connection with village schools may now be said to be fairly launched. The object of the scheme is threefold: (1) To make the surroundings of school children pleasant and attractive to them; (2) To evoke a healthy interest in the study of plant life and Nature in general, and to encourage methodical observation and reasoning therefrom; and (3) To introduce and extend the cultivation of vegetables and fruits in the localities in which the schools are situated. To this end the gardens will be planted with both ornamental and useful plants.

In order to ensure a constant supply of such plants and seeds as will be required for school gardens, a "stock garden" has been established in the grounds of the late School of Agriculture, Colombo, where vegetables and flowers are kept under cultivation and nurseries of fruit trees maintained. The chief ultimate sources of supply are the Botanic Gardens at Peradeniya and Henaratgoda. This stock garden—no doubt only the first of many—is under the supervision of the Superintendent of School Gardens, but in direct charge of a manager and a small staff of coolies.

The difficulties in selecting sites for school gardens are considerable, for the reason that the grounds which have been allotted to schools were

not in the first instance selected with any idea of providing space (for sport and gardening) beyond the bare foundation area for the school building. Indeed, the conditions at present attaching to Government school buildings are far from satisfactory. To begin with, many of the sites are private property given gratuitously by the owners, but for purposes of gardening they are unsuitable owing to their being either too limited in extent, or already fully planted up with perennial trees (such as coconuts), while often they are badly provided as regards soil and water supply. At present there is also some difficulty experienced as a result of the ignorance of the principles of gardening among teachers. There are, however, a number that either from having come in touch with the late School of Agriculture or through previous experience, make very fair amateur gardeners, but they unfortunately often have little scope for gardening, while better favoured teachers are found to have little knowledge of, or no aptitude for horticulture. This latter anomaly will no doubt be remedied in time and suitable places may be brought to suitable sites, but until all Government schools come to stand on Crown land, and a large enough area for all purposes be placed at the disposal of the Department of Public Instruction, there will be many obstacles in the way of school gardening. Once, however, this is brought about, the land will be at the disposal of the school garden authorities to treat as is thought best for the object in view, so that, given a fair water supply the possibilities of gardening should not be wanting.

At present there are in the Western Province six schools (originally selected to be worked by way of experiment) which have established gardens that should in a general way serve as types for other school gardens. There are the schools at Kirriwattuduwa, Jambureliya, Handapangoda, Homagama, Kumbaloluwa, and Kahatuduwa. The first two and last gardens reflect great credit on the teachers, and go to prove that we have among that body, men who are both able and willing to carry out the requirements of the new scheme. The names of these teachers deserve to be mentioned in this account of the initiation of the school garden scheme, and we mention them trusting that their example will be speedily followed by all others who have the welfare of the children and the people of the village at heart, and wish to see their pupils proud of their school.

Kirriwattuduwa—M. D. Peiris.
Kahatuduwa—W. A. Perera.
Jambureliya—M. D. Neris.

OCCASIONAL NOTES.

Mr. Alexander Perera, late Clerk and Foreman Botanic Gardens, Hakgala, has been appointed assistant to the Superintendent of School Gardens. Mr. Perera assumed duties on the 10th October.

The Superintendent of School Gardens made a tour through the North-Western Province during July and September, visiting the schools at Karukuliya, Medagama, Walahapitiya and Nattandia (in the Chilaw district), and Nickaweratiya, Wariapola, Weuda and Watareke in the Kurunegala district.

We have been permitted to look through a new work on "Nature Teaching" by Mr. F. Watts, Government Chemist, Leeward Isles, issued under the authority of Dr. Morris, Director of Agriculture, West Indies. It is really an elementary textbook on Agriculture, in which the lessons are presented in a very practical way calculated to create an interest in the minds of the scholars. We agree with the *Imperial Institute Journal* in thinking that "teaching conducted on these lines should be attended with the best possible results."

The following reference to Agricultural Education occurs in H.E. The Governor's address at the opening of the new session of the Legislative Council on October 18th :—"The School of Agriculture has been closed, and in its stead a scheme has been started for the extension of School Gardens, whereby it is hoped eventually to improve the supply and increase the variety of vegetables and fruits throughout the Island, and to teach just so much practical horticulture and botany to the boys as will really be of use to them in their home life. The progress of this effort will be watched with interest." While in the "Message to the Council" we read: "The School of Agriculture has been closed with a view to its transfer to Kandy. Meantime, as against the expenditure

thus saved, provision is made for the encouragement of school gardens, the supervision of which has been entrusted to the late Superintendent of the School of Agriculture."

Among our latest exchanges is the *Agricultural Gazette of New South Wales*, an excellently got up and edited publication, specially well illustrated. In our last number we omitted to mention that the notes on Poultry Parasites were taken over from this paper.

DIET FOR THE POOR.

Dr. J. L. Vanderstraaten, M.D., late Principal of the Ceylon Medical College, has very thoughtfully sent us some copies of a leaflet on "Diet for the Poor" written by him many years ago for the "Miscellany," and specially draws our attention to the value of the pea or more correctly Pigeon Pea (*Cajanus indicus*), and the facility with which the plant grows, thriving well in the sandy soil in Colombo and round the tank at Nickaweratiya. This pea is the "Dhall" which forms so important an element in the vegetarian diet of the Hindus in India. We have always felt that the value of dhall has never been sufficiently recognised in Ceylon, and some years ago did all in our power to popularise it by distributing seed, and in other ways. While reserving further remarks with reference to this pulse, we here reprint the paper referred to as worthy of perusal, just at this time when a special effort is being made to improve the diet of the people. We would merely add by way of preface that despite the many services which Dr. Vanderstraaten has rendered in connection with sanitation and in other ways, he will always be remembered as the home physician who always spoke with authority.

on questions of domestic economy, and especially on the subject of diet. We now give the paper referred to:—

The subject of "Diet" for persons in health, for the invalid, and for the poorer classes, in particular, is one which will not only be interesting to the readers of the "Miscellany," but be productive of much good to the individual and to the community, if the principles which regulate the supply of nutriment to the body are clearly understood and carried out in practice, daily.

There is no doubt that there is much ignorance and neglect in the daily selection of articles of food, and it is with the object of pointing out what articles have more nutritive value than others that I send you a few notes on the diet of the poorer classes for daily use in health.

The staple article of food in this country is rice, which is plentiful and cheap, within reach of the poorest labourer who earns from twenty-five to thirty-seven cents per diem, and even of the street beggar who accumulates a large quantity from the small handfuls doled out to him from house to house. If the readers of this paper, particularly the Chief Mudaliyars, Ratamahatmeyas, Presidents of Village Tribunals, Headmen, Officials, and Clerks in the various Kachcheries throughout the island could induce the ignorant villagers to cultivate other articles of food, and not to depend upon rice cultivation alone, much destitution and misery could be averted in the remote villages of the interior.

The value of meat is well known, it is true, but its cost is prohibitive, and when indulged in, in the interior it is generally by dishonest means. The flesh of wild boar, elk, deer and smaller game is appreciated, and even the uncivilized denizens of our forests, the *veddahs*, preserve venison in the dry state and eat it with honey; these are nutritious and are "flesh and fat formers." In Batticaloa, Badulla, Hambantota, dry venison called "din ding" is eaten by the better classes in the same way as dry Maldivé fish is prepared—with onions, lime juice and chillies. Pork is freely consumed, when obtainable, in the domestic or wild state. Mutton is only consumed in the Northern and Eastern Provinces by the Tamils, and by the better classes of Hindus and Moormen in the larger towns. Beef is forbidden flesh to the *Sivites*, who pride themselves on being strict vegetarians. It is well known that man cannot live on meat alone, but these vegetarians try to convince us that "they live on vegetables alone," which is also an impossibility, as pure and strict vegetarianism cannot keep a person in health and enable him to "live and move" about. These so-called vegetarians consume a large quantity of milk, curds, butter-milk, and clarified butter called "ghee," and many of them eat eggs in curry. The poorer classes eat fish in small quantities in the fresh and in the dry or salted state, and vegetables in large quantities in their curries; and in a dry compound of chopped up vegetables and scraped

coconut, flavoured with dry Maldivé fish and condiments, called *mellun*.

Europeans, who do not know the composition of the native diets often express their surprise to find strong able-bodied men among those who live on such simple fare as rice and curry, without meat as an ingredient. They do not know that the national dish is a rich compound of "flesh-forming" and "fat-accumulating" substances.

The milky juice of the scraped coconut, which is thoroughly squeezed out after two or three washings, forms an oily ingredient of all curries, one coconut being sufficient for 4 or 5 persons for two meals. In India, where coconuts are very scarce, ghee is used instead, and then the curries are drier in consequence. Most vegetables are consumed accordingly as they are plentiful and in season, without reference to their nutritive qualities. Green vegetables not of the bean tribe are poor in nutritive properties, but all beans and peas are rich in flesh-forming properties and are well calculated to supply the place of animal flesh. During the Franco-German war, the German soldiers were well fed on a portable dry compound of compressed vegetables of the bean tribe, principally the flour of peas, mixed with a small proportion of bacon or lard, all compressed into small cakes, which when boiled with water formed a most nutritious pea-soup.

The stalwart Afghans whom we see in our midst eat pancakes made of wheat flour with a curry composed of "Dholl" or dry peas to which ghee is added, and this is a close imitation of the substance alluded to above as used in the German army.

In this country, all vegetables of the bean tribe grow freely, and it is with the object of suggesting a larger cultivation of them in the interior, so as to induce the villagers to keep them in stock, in their fields and gardens, when the paddy crop fails, that I indite these notes. When rice is abundant they can form the principal ingredient of their curries; and thus a flesh-forming substance can be substituted for meat which is not obtainable.

The dry pea used in India is called "Dholl" or "Dhall," and it can be readily cultivated even in dry sandy localities, for I notice its ready growth and fruitfulness in the sandy soil of the Cinnamon Gardens. The other grains of the pea tribe are ulundu; native peas (pasee pyaru); native bean (thala pyaru), etc., etc.; kurakkan (a millet) can also be used.

In conclusion, I desire to impress one and all who read these notes to spread the knowledge far and wide that all leguminous vegetables, such as beans and peas are the most nutritious, and can supply the place of meat. Green herbs and vegetables contain principally water, and very little actual nutriment. Farinaceous substances such as rice, kurakkan, sweet potatoes, yams, green plantains, breadfruit, jak, with all the various pulses, lentils, beans, peas, etc. should be regularly cultivated as articles of food; the other esculent vegetables as pump-

kinds, gourds, cucumbers, are useful, but deficient in nutriment.

[For the benefit of our readers we append a list of the commoner leguminous food products or "pulses," together with their popular names:—

- Dolichos biflorus*—Horse gram or kollu.
Canavalia ensiformis var. *Virosa*—Sword bean or awara
Cicer arietinum—Chick pea, common gram or kadala.
Cajanus indicus—Pigeon pea, dhall or paripoo.
Arachis hypogoea—Ground or earthnut or rata-kaju.
Canavalia obtusifolia—Mudu awara.
Phaseolus trilobus—Bin-me.
Phaseolus max—Green gram or mun-eta.
Phaseolus radiatus—Black gram or ulundu.
Vigna cutians—Nil-me and li-me.
Vigna sineusis—Long bean or mē-karal and wandaru-me.
Dolichos lablab—Dambala.
Glycine hispida—The soja bean.
Phaseolus lunatus—Bonchi.
Phaseolus vulgaris—French or kidney bean, bonchi.
Lens esculenta—Lentil.—Ed. A.M.]

HOW TO LAY OUT A MARKET GARDEN.

The following hints given by Mr. H. W. Gorrie, Horticulturist, appearing in the *Queensland Agricultural Gazette* should prove [useful to our readers who are amateur gardeners. The remarks of the writer apply equally well to Ceylon. For wind belts, however, there are many suitable trees locally available instead of those named, while horse labour is of course a thing unknown here; but all the same, the remarks as to the necessity of so planting as to admit of working up the soil during the growth of the plants is one to be remembered. Mr. Gorrie's directions are particularly useful at this time when School Gardens are being established in the colony.

THE SITE.

In selecting the site of a garden there are four essential points to be considered—namely, water, soil, aspect, and shelter. Of course in growing garden stuff for sale there is also the question of convenience to rail and market to be taken into account.

I have placed water first in my list of essentials, because to attain any degree of success in gardening a good water supply is an absolute necessity. As a rule, the best situation for a garden is on the bank of the creek, or near a lagoon or waterhole; but if none of these are available then you had better sink a well in your garden, for *water you must have*.

True there may be months and months during which no watering will be required; but it is quite certain that sooner or later a dry spell will come, and then, if no water is to be had, you will probably lose the result of months of labour, and perhaps, as in the case of valuable fruit trees, of years.

Therefore, above all things, be certain that, whether you are going to plant twenty acres or only one, you will be able to command a sufficient supply of water in time of need.

Now as to soil—

THE SOIL.

In the first place you may be assured that you cannot have soil too good for gardening; but at the same time, if it is impossible to obtain very rich soil, a liberal and judicious use of manures will ensure the same results, although, of course, at some additional expense. For plants of the Brassica family, such as cabbage and cauliflower, which are greedy feeders, you *must* have rich soil; and, if not rich naturally, it must be made so by liberal manuring.

The deep alluvial flats commonly found near the banks of many of our creeks and rivers are ideal soils for this class of produce, being, as a rule, very rich in humus, and containing all the elements necessary to produce high-class vegetable crops.

A light sandy loam is better for such crops as onions, carrots, &c.; but as it is not always possible to get several kinds of soil within the limits of a garden, it follows that the soil must be made, as far as practicable, to suit each different crop by varying methods of treatment and manuring.

In locating the garden it is well not to have it too far from the dwelling; in fact, if the house is *in* the garden, so much the better.

As to aspect, if the garden is on a slope, the fall should be to the east, but a level site is preferable, as level ground can be more easily and economically worked than a slope; and there is not the danger of both soil and crops being washed away during heavy rains, which is always to be feared when the garden is on a hillside. Then, if possible, the garden should be protected from the prevailing winds by a ridge or a belt of timber. In clearing scrub lands for a garden it is advisable to leave a belt of trees standing on the side from which the prevailing winds blow. This belt should be two or three chains wide, and not sufficiently close to the garden to interfere with the free access of light and air to the plants.

If no natural shelter exists, it is advisable to plant a belt of such trees as camphors, silky oaks, or loquats on the exposed side.

This belt should consist of two or three rows of trees; the trees in the rows not being all in one line, but alternating with each other. This mode of planting breaks the force of the wind more effectually than straight rows. It is, of course, impossible to obtain a garden site fulfilling all the conditions you would like; but get the best you can, and then try to supply yourself what Nature has left out.

PREPARING THE LAND.

In preparing the land for gardening, I should recommend deep working to be given. Get down 15 or 18 inches with a subsoil plough if you can. The advantage of deep working will be chiefly apparent in a long spell of dry weather,

when plants in deep soil will be found to grow and thrive, while others in shallow soils will require constant care and watering to keep them alive.

Having thoroughly broken up your land, the next step is to mark it off in sections for various kinds of vegetables, trees, &c. This will be largely a matter of convenience and circumstances, as no hard-and-fast rule can be laid down, but always bear in mind that even in a small garden horse labour is cheaper than hand labour; therefore, arrange things in such a manner that as much of the work as possible may be done by means of horses.

In this connection, I would say, never sow garden crops of any kind *broadcast*. This is an obsolete custom which should have been done away with long ago.

Always sow or plant in rows, and have the rows far enough apart to enable you to use either horse or hand cultivators between them. By following this system it is easy to keep the ground clean, and also to keep it open, and conserve the moisture by cultivation—a thing which cannot be done where crops are sown broadcast.

This broadcasting of garden crops cannot be too strongly condemned; as it is wasteful, untidy, and unprofitable, except to the seed-sellers, who are the only people benefiting much by it.—*Queensland Agricultural Gazette*.

EXTERNAL PARASITES OF POULTRY.

(Concluded.)

The Supposed Connection between "Gapes" and "Lice."—It has been stated that there is a connection between the nematode worm *Syngamus trachealis* (the "red worm" of game-keepers), that produces "gapes" in fowls and pheasants, and lice. The one is thought to give rise to another in some mysterious way, needless to say there is no connection whatever. The life story of that destructive scourge, the gape worm, has been clearly traced, and it is known that no intermediate host is required for its development.

Feather Eating or Depluming Scabies.—Feather eating in poultry is due to a minute parasitic mite (*Sarcoptes laevis*) at the root of the feathers. It is generally supposed to be due to a "vicious habit" numerous theories, such as idleness and thirst, having been put forward to account for it. There are two kinds of feather eating, viz., Self-feather eating and the plucking of other birds' feathers. The former is chiefly due to the mites living upon and irritating the roots and quills. The form on the fowl makes its appearance about April, and is most prevalent in Spring and Summer. The mites can be easily found amongst the white powdery matter at the base of the quill. The minute young are transmitted during copulation. The fowls pluck out the feathers to destroy the irritation caused by the mites at their base. Lice, also, are partly accountable for feather plucking. The birds in picking off the mites and lice pull out the feathers.

Prevention and Remedies.—As the mite disease is contagious, isolation of the affected bird is the first step, especially if it be a cock. The mites readily yield to treatment with oil of cloves rubbed into the infected area. One part of creosote to twenty of lard or vaseline is still more successful.

Scaly Leg.—This well-known disease is again due to a mite (*Sarcoptes mutans*). This complaint is a serious matter and very prevalent. The scales of the legs and feet become raised and separated, and a chalk-like excretion accumulates between and over them. Rough lumpy crusts are formed, and under these and the scales the mites live and breed. The disease is slightly contagious.

Prevention and Remedies.—Isolating of diseased birds is most essential. Removal of the crusts without causing bleeding, and the application of creosote (one part) and lard (twenty parts) will be found sufficient. A mixture of equal parts of flower of sulphur and vaseline rubbed into the limb also cures the complaint. In every case the limb, some days after treatment, should be well cleaned with hotwater and soft soap.

It is most important that any new stock should be examined, especially the cock, and if any signs of parasites are seen they should be cleared off before the birds are given their freedom. If exhibits of poultry infested with parasites were prohibited by Poultry Show Committees, it would force attention to the subject in a way that could not fail to greatly reduce parasitic infestation.—*Agricultural Gazette of N.S. Wales*.

SOME BIBLE PLANTS OF CEYLON.

Ebony (Diospyros Ebenum).—The Hebrew word *Hobnim* which occurs in Ezekiel xxvii. 15 (They brought thee for a present horns of ivory and ebony") has been translated Ebony. The generic name *Diospyros* was the name of Dalechamps (1586) for the original (Mediterranean) species *D. Lotus* with edible fruit, from *Dios*, Jupiter, and *pyros*, grain. There are twenty known species native to the Island, and nearly all have the dark-coloured heartwood characteristic of true ebony. The ebony tree is chiefly found in the dry region (especially in the north-eastern portion and near Puttalam) where it is common and often gregarious. Though the heartwood (ebony) has been known from distant times, the tree is not mentioned by Hermann and the wood only by Burm who quotes from Grim (1679) as to its medicinal virtues. Rumph records the fact that ebony trees are abundant about "Trinkenemale" (1750), and this is the earliest record. A large export of ebony wood takes place from Ceylon.

The Sycamine tree (which must not be confounded with the Sycamore) is the black mulberry (*Morus nigra*). In Luke xvii. 6, we read: "If ye had faith ye might say to this Sycamine tree be thou plucked out of the root and be thou planted in the sea, and it should obey you." So common and familiar a tree as was the mulberry in Palestine would be peculiarly suited for such an illustration. In North Palestine the mulberry was usually planted in the courtyard and the juice mixed with water in which violets were infused

formed one of the most favourite sherbets. A writer says that in the neighbourhood of Mount Lebanon the land-tax of the peasants is assessed according to the mule-loads of mulberry leaves their little farms yield, so that the cultivation of the tree is directed to favour the growth of the leaves (for feeding silkworms) at the expense of the fruit. Even at the present day the black mulberry is known in Greece as *Sycamenia*.

The Castor-oil tree (*Ricinus communis*) is the gourd of the Scriptures (Hebrew *Kikayar* and the *Kiki* of the Greeks). The plant is referred to in Jonah iv. 6, ("He had prepared a gourd and made it come up over Jonah"), also 7, 9 and 10. "Palma Christi" is another old name for the Caster-oil plant, which belongs to the order *Euphorbiaceæ*. The oil is the chief product and is got from the seeds, though the refuse cake has also a commercial value as a fertilizer. It is said that the modern Jews in London use the oil for their Sabbath lamps. In China a peculiar fungus called *Exidia auriculata*, used in soups, grows on the decaying stems of *Ricinus*.

AN EXTRAORDINARY DISEASE AFFECTING ARECANUTS.

Agricultural Ledger No. 8 of 1901 consists of a report on the above subject by Dr. George Watt, Reporter on Economic Products to the Government of India. As the arecanut is now being cultivated pretty extensively in the Island, the information contained in the report should prove of much interest to local growers of the so-called "betel nut palm," but as it consists of no less than 179 pages (illustrated), the reproduction of the whole would not be possible in our limited space. We, however, make a few extracts which will give our readers a fair idea of the purport of the report.

The indications of the disease are first, the withering of a few leaflets (pinnae) of one of the innermost leaves. In about 8 or 10 days the whole leaf is seen to be withered. The next leaf to be affected is that immediately outside. In 20 or 30 days the bud and innermost leaves, which still remain green, fall off through the decomposition that is set up at the point of their union to that of the stem. If a tree be felled just before the crown of leaves falls off, it will be found to emit an offensive smell—and the bud when it falls to the ground of its own accord gives out the same smell. It would appear that the older trees become first affected, but that eventually both old and young suffer alike.

What is most alarming is that many Indian cultivators affirm that the disease even extends to coconuts. If this is really so, there is all the more reason for our planters to be forewarned.

Dr. Watt states that he has not had a fair opportunity of investigating this 'very remarkable and alarming disease,' as it had reached its inactive stage when he was deputed to examine it. We may therefore expect further information of fresh research. He, however, suggests that the disease

is due to a pathological condition known as *Tyloses*, which may be briefly described as the destruction of the vascular by means of the fundamental tissue, a condition brought about by certain unfavourable climatic conditions. We will not here refer to the opinions of various Botanical writers (Bohm, Mohl, Reess, Sachs) as to the exact nature of *Tyloses*, but will only mention that the observations of Dr. Watt coincide more with the views of Bohm than with those of the other writers.

To briefly explain these views: The Thyllen or cells seen within the pitted vessels of the xylem or wood are produced by a protruding expansion (a kind of hernia) of the adjacent (parenchymatous) cell, which penetrates the pore and either tears through or causes the absorption of the primary membrane of the vessel,—the expansion being supposed to be due to rapid development of fundamental tissue under the conditions previously referred to,—and pushing through the pores of the pitted vessels as presenting little resistance they practically fill these vessels. And not only are the vessels of the xylem ruptured, but the so-called sporules or vesicles soon produce great caverns and rapidly effect the complete destruction of all the tissues. At this stage fermentive and other saprophytic organisms find a way into the young growing parts, and in a few days the terminal bud and all the young leaves emit an offensive smell. With the fall of the terminal bud the destruction extends to the stem, so that in a marvellously short time, says Dr. Watt, what was a valuable property is converted into a forest of dead stems. This disease in arecanuts is said to be the first record of this extraordinary suicidal degeneration having assumed the form of a serious malady; but it must be viewed (as Dr. Watt thinks) as far more of the nature of a constitutional malady than of an infectious or contagious disease. It clearly originates from climatic conditions, but, most fortunately, conditions (so far as India is concerned) that do not often occur. According to the observations of Dr. Watt the sprouting of the cells of the fundamental tissue is to be explained by a pressing need for moisture in the young growing terminal bud, which impels them to enter the xylem in order to absorb the crude sap. With the filling of the vessels by sprouting fundamental tissue and the consequent interception of circulation, the starvation and death of the terminal bud and ultimately of the whole palm ensues.

The above is the theory of Dr. Watt, and the only means of averting the disease is, in his opinion, more careful cultivation and drainage so as to better control the water supply to the growing plants. He recommends that the trees should be put far enough to admit of the interplanting of other trees, preferably leguminous trees which would tend to preserve the natural balance in the soil that can hardly help being disturbed by planting up forests of arecanuts put 4 to 6 feet apart. It was indeed found that where *Erythrina indica* (Erabodu) was found growing with arecanuts, the liability to disease seemed greatly lessened.

PLANT LIFE.

[A SERIES OF SIMPLE LECTURES INTENDED
FOR A CLASS OF JUNIOR STUDENTS.]

LECTURE II.

Respiration or Breathing.—In human beings respiration consists as you know of breathing in and out, and you no doubt further know that what is breathed in is "pure air," and what is breathed out "impure air." Now the essential difference between these two is that the former consists almost entirely of a gas called oxygen and the latter of a gas known as carbonic acid. At present I do not mean to go fully into the nature and properties of these gases as taught us by chemistry, but in order that you may correctly understand the process of respiration, I must tell you one or two facts about them. The air which we breathe consists of a mixture of two gases called oxygen and nitrogen. It is the oxygen of the air which is the essential element for the purpose of respiration, though in breathing we take in both gases. Chemists tell us that nitrogen exists in the atmosphere as a diluent of the oxygen, as pure oxygen is, so to speak, too strong and by itself is unsuitable for human respiration, just as certain medicines cannot be taken without reducing their strength by the addition of water. As the derivation of the word signifies, oxygen is the "life giver," and when a person is suffocated for want of air, it is the absence of oxygen which causes the loss of life. The chief function of the oxygen which is breathed in may be said to purge the blood of the waste matters which occur in it as the result of wear and tear. Now the element which predominates in the human body (as well as in the plant) is carbon, and hence carbon is the chief waste material found in the blood. It is removed by oxygen combining with it and carrying it away in the combined form of carbonic acid, the compound of carbon and oxygen which is found in the expired breath. This carbonic acid is in any appreciable quantity hurtful to man, that is it is poisonous. Hence the necessity of well-ventilated dwellings. You know how uncomfortable any one feels in a crowded room in which many people are breathing out carbonic acid and there is no free current of air. As a rule his head aches and he begins to feel sick under such circumstances, while some people faint off. These are all indications of the presence of too much carbonic acid in the air. If you have read Indian History you will recall to mind the incident of the Black Hole at Calcutta where a number of English soldiers were crowded into a small room and left to be suffocated. In cleaning old and abandoned wells people have to be careful that there is not a collection of carbonic acid at the bottom which will suffocate them. The gas being heavier than air has a tendency to remain at the bottom of wells and tan pits in which organic matter has been left to decompose. Under such circumstances it is safe to first employ some means for disturbing the gas and mixing it with ordinary air, and one way that this is done is by letting down a bundle of straw by a

rope and moving it up and down frequently till the gas has been sufficiently mixed with air to render it less harmful than it would otherwise be. Some people think that if a lighted lamp which is lowered into the well does not go out, it is safe for a man to venture, but though a light may burn in it, the air in the well or pit would still be dangerous for a person to breathe. For the present I think I have told you quite enough about oxygen and carbonic acid, but later on I mean to show you in a practical way something of the properties and behaviour of these gases that would interest you more than the mere description I have given you.

Now the process of respiration in plants is practically the same as that of animals, for in breathing plants take in oxygen and give out carbonic acid just as animals do. You might well ask how is it, if all plants and animals take in oxygen and give out carbonic acid that the atmosphere does not become poisoned, so to speak, by the exhaustion of the oxygen of the air, and the increase of the carbonic acid. Well this is prevented by a provision of nature whereby the composition of the atmosphere is practically the same at all times. But I will not make any further explanation as regards this matter, because I shall have to refer to it more fully under the subject of nutrition.

There is another point I might refer to in order to explain the importance of respiration, namely, the maintaining of the internal heat of the organism, for the combination of oxygen with carbon produce a certain amount of heat which is necessary for a healthy condition. The machinery for respiration is, of course, not the same in plants and animals, no more than it is the same in different animals such as man, fish, insects and so on. You would no doubt like to know by what means plants take in oxygen and give out carbonic acid, or how gases pass in and out. In our case the mouth is the external opening through which respiration takes place. Well, the plant too may be said to have a mouth or rather several mouths. On the leaves, and particularly on the under surface of ordinary leaves, are openings called stomata (each being called a stoma which in Greek signifies a mouth.) These openings are guarded by two more or less curved cells which we may compare to our lips. It is through these stomata that respiration in plants takes place. They are so small that we cannot see them with the naked eye, but we can do so by the aid of the microscope, and I will close my lecture to you to-day by showing you these minute mouths through that instrument. There are other duties required of these stomata which I shall tell you about later on in another connection.

C. D.

DIFFERENT SYSTEMS OF HOUSING CATTLE
AND CONSERVING MANURE.

[REPORT BY THE PRINCIPAL, CAWNPORE
AGRICULTURAL SCHOOL.]

At the Cawnpore Experiment Station this subject has been under experiment and observation during the past five or six years, and the object

of this bulletin is to place before the public the results of this study accompanied by such general remarks as are thought necessary for a clear understanding of the subject.

Farmyard Manure or Cattle Manure is the chief mainstay of farmers in all countries, and especially in India, where artificial or chemical manures are not practicable at present. It contains all the elements of plant food, nitrogen, phosphoric acid and potash. It also exerts a powerful influence in improving the mechanical texture of the soil: by its application heavy clays are rendered more open and easy to work and light sands get greater coherency and absorptive and retentive power. Of the several plant food ingredients supplied by cattle manure nitrogen is by far the most important as it is most deficient in Indian soils, gives the quickest results when applied as manure, and is most difficult and costly to get. So the aim of every farmer should be to get the largest quantity of nitrogen in a form readily available for growing crops.

Farmyard manure consists of the dung and urine of cattle and of other farm animals. Its quality and composition will depend upon:—

- (1) the kind and condition of the animal producing it;
- (2) the quality and quantity of the food supplied;
- (3) the care bestowed in collection and preservation.

1. *The Animal*.—Sheep yield more concentrated dung and urine than horses; horses than cattle; and cows than buffaloes. The following table shows the average amount of nitrogen in 100 parts of the excrements of these animals:—

Percentage of nitrogen in animal excrements.

	Dung.	Urine.
Sheep ...	07	1.4
Horse ...	05	1.2
Cow ...	03	0.8

This table brings out clearly not only the difference in the composition of the excrements of different species of animals, but also the fact that in every case the urine is much richer than the dung.

Amongst cattle themselves an adult animal gives a richer manure than a growing calf; a dry cow better than a milking or a pregnant one, because in the latter cases a part of the food is spent in putting forth the fresh growth or in forming the milk.

The food used in feeding the animals is a more important factor in determining the quality of the manure than even their kind or condition. The excrements of the animals of which farm manure is chiefly made up are simply the food sent out of the body after it has performed its functions. So what comes out as manure is what has been put in as food: the richer the food is in valuable ingredients the richer will be the manure. Foods vary very largely in their composition, i.e., in the proportion of nitrogen and other valuable ingredients they contain. The foods given to cattle may be broadly divided into (a) the staple straws or green fodders which

are given in large quantities, when possible, as much as the animals will eat, and (b) the concentrated foods generally given in small quantities at so much a day per head, as cotton seed, rape or mustard cake, juár seed, gram, arhar, lobia, moth, &c. Practically speaking, the bulky foods of the former kind are more or less uniform in their composition and may be taken to contain about 4 lb. of nitrogen in 1,000 lb., while the concentrated foods named contain about 35 to 50 lb. of nitrogen in 1,000 lb. Thus these concentrated foods contain about 10 or 12 times as much nitrogen as the straws, and the manure produced by an animal as well as its health and condition will depend not so much upon the straw or fodder given to it as upon the quantity of concentrated food given daily.

This was clearly shown by the analyses made by Dr. Leather, the Agricultural Chemist to the Government of India, not to speak of the countless analyses that have been made in Europe and America. He took 13 samples of dung, six of which were produced by cattle that were daily getting concentrated food in addition to their straw, and the remaining seven by ordinary village cattle that depend upon grazing and the ordinary ration of straw, but get no concentrated food. It was found that the former six samples contained on the average 0.54 per cent. of nitrogen, against the average of 0.17 per cent. of nitrogen contained by the latter seven samples. That is, the dung of cattle that get concentrated foods contained three times as much nitrogen as the dung of cattle that do not get concentrated food. By allowing concentrated food it is not the dung alone that becomes richer as a manure but the urine also, and that in a greater proportion.

In fact with adult working animals *the whole of the nitrogen and ash constituents* contained in the food eventually comes out into the manure either through the dung or the urine. A clear grasp of this fact by the farmers of England and other advanced countries has not only contributed to their collecting and preserving the excreta of their live stock more and more carefully in proportion to the cost of the food; but has led them to purposely adopt a more liberal feeding of their stock. For they see that the money they spend in the purchase of food secures them a double advantage: stronger and more useful animals, and a richer manure as well.

The care bestowed in Collection and Preservation.—All the dung and all the urine excreted by farm animals, together with any litter that may be used, when well-rotted without undergoing any loss of plant food ingredients, make the best possible farmyard manure. But in the general practice of the cultivators a great part of the dung, almost the whole of that collected during the dry months, is burnt as fuel either in his own household or sold outside to be used as such. Thereby the organic matter of the burnt dung and the nitrogen contained in it are lost. Assuming that a pair of working cattle will produce about 100 maunds of fresh dung per annum during nights and the non-working hours

in the day, and assuming that the cultivator burns $\frac{2}{3}$ of this quantity he loses about 11.6 lb. of nitrogen if his cattle do not get concentrated food, and 36 lb. of nitrogen if they do, as in the case of cart bullocks or plough cattle belonging to the better cultivators in the Meerut Division.

The case of this objectionable practice is the want of sufficient fuel. This can be met to a certain extent by live fences, by fuel plantations and by greater attention to those crops that supply in their stalks fuel also, such as arhar, cotton, castor, &c. Under present conditions, however, it cannot be expected that the whole of the dung will be saved.

In certain parts of India, as in parts of the Madras Presidency, the Panjáb and Gujerat, where the fuel supply is better, or where the general agricultural practice is of a higher order, the cultivators do not burn their cattle dung but carefully preserve it to be put to its legitimate use. In this respect the North-Western Provinces and Oudh appears to be the worst, probably on account of the more crowded population and greater scarcity of fuel.

The Urine is weight for weight, a richer Manure than the Dung.—We have seen this already. Dr. Voelcker found one specimen of the urine of Indian working cattle to contain 1.16 per cent. of nitrogen, and Dr. Leather found in another specimen that he analysed, 0.87 per cent. of nitrogen. A pair of working cattle can be taken to void about 4,000 lb. in the year during nights and non-working hours, and this would mean about 35 lb. of nitrogen. But the cultivator in his ordinary practice not only does not utilize it, but allows it to ferment in the sheds and become a nuisance to his cattle and the people living in the house.

The nitrogen in the urine is in the form of urea, and this substance speedily undergoes fermentation and changes into ammonium carbonate and passes off into the air. The loss of nitrogen in this way occurs chiefly in the cattle shed. The strong pungent smell so common in ordinary cattle sheds is due to the formation and evaporation of this ammonium carbonate. The best and surest way of getting most of this nitrogen into the soil is to have tile cattle sheds on the land of the farmer, and failing it at least to tether the cattle on the land as long as circumstances and weather will permit. So long as this is not done and cattle are tied in villages a certain part of the nitrogen of the urine cannot but be lost into the air, do what we may; and only a varying fraction of it can be got to do work as manure.

The way commonly adopted in Europe and in the United States of America for securing the urine and preventing the loss of its nitrogen is the use of litter. In this country the want of bedding material is the difficulty, but this can be got over in many places, by careful collection and preservation of the leaves of sugarcane, sheesham, mangoes, jack or other trees, and all kinds of vegetable refuse. The following system of housing cattle, known as the Box system, is well suited for absorbing urine and supplying a well-rotted, rich farm yardmanure.

Box system.—Dig the floor of the ordinary cattle shed about 3 to 3½ feet deep. Plaster the

bottom and sides with clay and sprinkle a little ashes and spread a thin layer of whatever litter may be available. The manger for holding the straw and other fodder will be in front of the cattle. For a pair of cattle, the shed may be about 7 feet broad and about 10 feet long. When more than a pair are to be housed a long shed of the above width may be used, allowing at the rate of about 10 feet length of shed for each pair. It may be found convenient to separate the lot of each pair by two or more bamboos put across the shed. Every morning after the cattle have gone out for work the cattle attendant enters the shed, takes the dung dropped during the previous day and night, sprinkles it all over the shed; covers it with the dry part of the bedding in the seed and spreads about 5 or 6 lb. more bedding for each pair of cattle. That part of the bedding which is wet with urine may be spread likewise, before using the fresh bedding of the day. In the rainy weather somewhat more bedding will be necessary, and especially when the roof happens to be leaky. The manure will go on accumulating and the box will get full in about six to eight months according to the size of the cattle and the amount of litter used. When the box is full, the fresh accumulation at the surface may be first removed, and the rest of the manure dug out and carted to the field for immediate use. The manure thus made will be moist, well-rotted and of a rich-brown colour. In the corners and those parts of the shed where the cattle do not tread much, the manure may be dry, mouldy and very hot. A little care on the part of the cattle attendant while sprinkling the wetted straw in the mornings, and his treading down these parts with his foot will less this mouldiness considerably. The unrotted top portion may be put back into the box to be taken out with the next removal of the manure. The box-system of housing cattle is now frequently adopted by the more enterprising farmers of Europe and America for fattening as well as working cattle, one of the objects being to make as large a quantity of rich well-rotted manure as possible. For one thing well-known to the western farmers and practised by them is that if they want a large quantity of manure they must *make* it, and they can if they like. The box system has been under trial at the College Farm in Saidapet (Madras) for the past 22 years and at the Cawnpore and other Indian experimental farms for some years. The cattle have been found to keep perfectly healthy like those in other sheds, and the objection that is raised against it by those who have not tried it, as affecting the feet and health of cattle, is against all experience in India and other countries. By this means about 12,000 lb. or 150 maunds of rich manure can be made from every pair of working cattle.

(To be concluded.)

GENERAL ITEMS.

The temperature, pulse and respiration of domestic animals varies considerably. The artery usually selected for taking the pulse of the horse is the sub-maxillary where it winds around the

lower jaw-bone. On the inner side of the artery may be readily felt and pressed against bone, the number of beats in a minute, the regularity, and the strength are to be noticed as indicating the condition and action of the heart. In the cow the same artery should be felt, the precise location being at the lower edge of the flat muscle on the side of the cheek. When the cow is lying down the metacarpal artery on the back part of the fore fet-lock may be felt conveniently. For both horse and cow the temperature is taken by inserting a clinical thermometer in the rectum. Care should be taken that mercury is below the normal temperature of the animal, and the thermometer should remain in the gut for three or four minutes. The following table give the normal temperatures etc. of the principal domestic animal. The frequency of the pulse and of respiration even in repose depends somewhat upon the temperature of the air stable, or house, and upon whether the observation is made before or after feeding.

Periods of incubation or latency of disease; anthrax $\frac{1}{2}$ to 1 day; canine distemper 7 to 21 days; cattle plague 5 to 8 days; contagious foot rot 3 to 6 days; foot and mouth disease 2 to 4 days; glanders or facey 7 to 42 days; pleuropneumonia 21 to 100 days or more; rabies 10 days to months; tuberculosis 14 to 60 days or more; Variola (cow) 6 to 9 days; Variola (horse) 6 to 8 days; Variola (sheep) 8 to 12 days.

There are many who depend blindly on rainfall for supplying moisture to plants without making any effort to preserve the moisture already in the soil. The following are some useful figures regarding the breeding of cows and horses: Age to begin breeding—horse 4 years, cow 3 years; period of gestation—horse 317, 342, or 419 days,

cow 226, 280 or 316 days; duration of oestrus—horse 5 to 7 days, cow 2 to 4 days; return for breeding after parturition—horse 7 to 10 days, cow 21 to 28 days; return to ascertain pregnancy—horse 14 to 21 days, cow 21 to 28 days; age of weaning—horse 5 to 8 months, cow 4 to 6 months; females to each male—mares 20 to 30, cows 20 to 40; period of usefulness for breeding purposes—horse or cow 10 to 12 years.

Here in Ceylon where Guinea grass and Mauritius grass are so largely cultivated (they are indeed the only cultivated fodder crops) we never hear of either being grown for pasture. In the *New South Wales Agricultural Gazette* we find a correspondent recommending that 5 to 6 lbs. of the seed should be sown broadcast for grazing.

Mr. Albert Gale, writing in the *New South Wales' Gazette*, draws attention to the misapprehension that wax is got from flowers, and that bees gather it there from and carry it on their hinder legs. What is seen on the hinder legs is pollen, and bees' wax is really a secretion from the body of the insect.

Mr. J. Stephens, writing with reference to his farm and orchard work says:—"I have followed the advice of the *Agricultural Gazette* (of New South Wales) in respect to thorough cultivation of crops and in pruning and working among fruit trees, and I have often raised good crops in both farm and orchard in very dry seasons. I consider good cultivation amongst growing crops nearly equal to rainfall." This report of a practical test should induce all cultivators to follow the example of Mr. Stephens in keeping the soil in good tilth so that the stores of moisture within so far from being dissipated by evaporation, may be taken advantage of by the roots of growing plants.

COCOA AND CHOCOLATE.

EARLY a century before Sir Walter Raleigh astonished the English people by bringing tobacco from America and teaching them how to smoke it, to the great scandal of the "unco' guid" of those days, Columbus had introduced cocoa

into his native land. How long the inhabitants of Mexico and Peru had been acquainted with its nourishing properties we do not know; but certainly it was carefully cultivated and so much esteemed that the cocoa bean was an article of currency when the Spanish explorer first visited those shores. There is not the halo of tradition and sentiment which centers around that most popular drink, tea; mainly, perhaps, because while nearly all the traces of the aboriginal South American have been swept away, Chiu, the home of the tea plant, with all its ancient civilisation, has endured. Now is it clear how the botanists who first named the *genus* to which the cocoa tree belongs fixed on the scientific term it bears. Anyhow *theobroma* means "food of the gods," and there are those who think that, considering what valuable properties it possesses, the plant was not inaptly christened. A long time went by before it was introduced into England, for the earliest intimation of it as an article of commerce is to be found in the *Public Advertiser* of June, 1657, when it is notified that "in Bishopsgate-street, in Queen's Head-alley, at a Frenchman's house, is an excellent West India drink called chocolate to be sold where you may have it ready at any time, and also unmade at reasonable rates."

It is not a little curious that the introduction of tea and coffee dates almost from the same time;

Just a year after we find in the *mercureius Politicus* an advertisement of "that excellent and by all physicians approved China drink, called by the Chineans 'teha,' by other nations 'tay,' *alias* 'tee,'" which was to be had "at the Sultanness Head Cophee House in Sweeting's-rents by the Royal Exchange." This notice would seem to show that as a drink coffee, as far as this country is concerned, has the palm of years, though now it has fallen on, comparatively speaking, evil days. Chocolate, from the first, caught the taste of the town. It was the fashionable temperance beverage—to use a modern phrase—perhaps because it was so dear—during the greater part of the Eighteenth Century, and the cocoa tree was a favourite sign and name for places of public refreshment. The writers of that time frequently refer to it. But its price kept it beyond the reach of the bulk of the people, and when fashion changed its consumption fell. In Spain and Italy chocolate—which is a rather different thing from the cocoa as we know it—has always been very largely consumed. In England it early became the subject of taxation, and in the middle of last century a customs duty of sixpence had the effect of limiting the consumption to some 440,000 lb. a year. With the new financial era the use of it began to revive, but it is only during the present generation that it has become at all popular. Of course, the Frenchman in Queen's Head-alley was wrong in calling it "a West India drink." Then it came almost wholly from South America. Now it is grown also in Dutch and British Guiana, in our Indian Empire, Ceylon, the Straits Settlements, West Africa, and the West India Islands, so that the Frenchman after all only anticipated events.

THE MODERN ARTICLE.

Its popularity in recent times is usually accounted for by the fact that it has been largely recommended by the medical profession. Unlike tea and coffee—

which are infusions and more stimulants—the whole substance of cocoa is absorbed. But a late Chancellor of the Exchequer—Mr. Goschen if memory serves aright—attributed the growth of its use as against coffee to the extensive advertising of rival manufacturers. He spoke regretfully because, as between the two in the raw state, coffee pays the higher duty. Whatever the cause, the consumption has enormously increased, and continues to grow. The cocoa we drink and the chocolate we eat—for the chocolate powder from which the beverage is made is not very popular here—are two very different things. The cocoa bean contains from 40 to 50 per cent. of cocoa-butter, the greater part of which has to be extracted in order to make the liquid digestible. In the best makes some 10 per cent. is retained. The cheaper qualities have very little left, and, moreover, the powder is mixed with the bean shell, while arrowroot or sago is added, to say nothing of colouring matter. But with chocolate confectionery in its almost countless forms the case is different, or should be. Here the fat is kept, sugar and milk is added, with a very small proportion of flavouring essence, and generally speaking, the chocolate is simply used to cover a cream, an almond, a walnut, and things of that sort.

FOREIGN COMPETITION.

In a few articles of daily consumption has the non-British producer laboured so hard to catch trade as in this. Of course, there are first-class English makers, both of cocoa and of chocolate confectionery. But we believe it is the fact that of the first named some of the best comes from Holland, and of the second from France, Germany, and Belgium. How much the home trade has grown, however, is shown by the latest Blue-book from the Statistical Department of the Customs House. In 1896 we imported the raw material to the extent of 32,218,803 lb.; in 1900 the total had mounted up to 52,647,818 lb. We exported five years ago to foreign countries 474,500 lb. and to British possessions 2,146,300 lb. of the manufactured article; the figures for 1900 being 758,000 lb. and 3,850,800 lb. respectively. In other works, taking both sets of figures we nearly doubled our exports. But when we turn to the other side of the scale we find that there is room for apprehension. The record of imports is:

	1896. lb.	1900. lb.
Manufactured cocoa or chocolate...	3,794,422	7,754,879
Manufactured with the use of spirits	51,603	106,087
Confectionery containing not more than 50 per cent. of chocolate .	12,095	37,546
Ditto, with the use of spirits.....	22,796	36,937
Totals	3,877,916	7,935,449

When it is remembered that the bulk of our exports is within the Empire the statistics show how keen and successful has been the rivalry of the foreigner,

A NEW ASPIRANT.

It is in these circumstances of the trade that another home-made cocoa has entered the field. In the old days when a man had a good thing he used to start making it in a small way and gradually push his ware. But other times other methods. Now the plan seems to be to perfect arrangements—taking, if need be, years in the process—and then, having prepared the ground as thoroughly as von Moltke would calculate a campaign, to spring the new product on the consuming world. This is what the Mazawattee Tea Company has done. For five years experts have been studying the question, experimenting and investigating; and very soon the "Lateriba" cocoas and chocolates will be proclaimed from the housetops. The company's large new works at Newcross are divided by a corridor into two portions. One is devoted to their tea, which the sweet uses of advertisement have made known in every part of the country, and the other to cocoa and chocolate. The factory is one of the most perfectly equipped places

for the preparation of food stuffs; it is possible to conceive. Electricity is the motive power, generated by gas made on the premises. Cleanliness and perfect ventilation have been sought after and attained. The completion of an immense laundry has enabled the company to provide linen overalls for every employee, though, from the time tea chest or cocoa bag is opened to the moment the finished product is sent out in its leadfoil packages or dainty tin, hand never touches either article.

MODEL WORKS.

Every manufacturing country contributes to the collection of machinery to be found; and many trades and crafts go on within the walls. The work of eminent artists in lithographed and printed on tins and boxes—themselves made in the works—labels are printed, lead and tin mixed to pack tea in—as little, in fact, as possible is left for outsiders to supply. The process of cocoa and confectionery making are most interesting to watch, especially the second. The maternal care which the high-class sweetmeat receives would astonish the ladies who eat it. In the "covering" room, for instance, the rich brown substance is simmering over hot water, but the upper air is cooled by brine-charged pipes fixed half way up to the ceiling, so that when a little of the delicate mixture has enclosed cream or praline it may settle quickly enough to preserve its taste and aroma. Then in the packing there is a notable departure from the custom of the trade. The sweetmeats are placed in tasteful airtight tin boxes, and the chocolates rest on layers or crepe paper coloured in harmony with the box. This is not merely for effect—though that is pleasing—but to ensure that the contents shall remain in perfect condition. Chocolate with its large proportion of fat is very susceptible to damp and to odours of flavours which may arise from the materials composing the cardboard and the coloured paper which surround many of the most expensive forms of this kind of sweetmeat. Contamination of that sort is of course, deterioration, and this the Mazawattee Company claims will be impossible with its system of packing. The company's experience with tea has shown it the importance of this consideration, and, as only one quality of cocoa and chocolate is to be made—the best, and all grown in the British Empire—precautions are doubly necessary. The cocoa, too, will be all put up in airtight cans, which, like the boxes, will be advertisements in themselves. For the Mazawattee Company believes in educating the eye as well as the palate of the people. It has shown this in the past. It intends to prove it again immediately. A well-known artist has painted an allegorical picture—Britannia welcoming the new cocoa—the reproduction of which by colour-photography makes a distinct step in the art of the hoarding. The actual process is not novel; what is new is the size to which it has been found possible to make the various blocks. In the character of the tones—particularly the dusky flesh tint of the female figure representing cocoa—and in the way the individuality of the painter is preserved the new process is unquestionably better than the best chromolithography.—*Morning Post*.

QUEENSLAND TREES &c.: IN BRISBANE BOTANIC GARDENS.

Between the central entrance and the one on the river bank is the cricket-field, a considerable stretch of ground, ample for the purpose. From this entrance, running the whole length of the garden, is a row of *Ataucaia B. dwilii*, from 40 to 60 feet high. As here seen, little can be said in praise of this tree for ornamental purposes: its branches, 10 to 15 feet long, are almost invariably leafless, except from 12 to 24 inches at the end. The immense cones, of several pounds weight, are clustered at the top, hidden from view, and difficult to obtain without the assistance of a storm,

Ficus macrophylla, also a native tree, is very handsome. In the gardens is a broad-spreading specimen, with a stem 2 feet in diameter, the roots exposed for many square yards around the base; the fruit, not large, is freely borne, and the brown under-surface of the leaf offers a pleasing contrast to the solid green of the whole. *Kigelia pinnata* is at home, and bears many loose racemes of large deep carmine blooms, on pendent stalks 3 to 5 feet long.

The rose-garden, containing many beds surrounding the finest *Arancaria Bidwillii* in the grounds (a specimen about 70 feet high), is filled with well-grown plants, almost exclusively Teas and Chinas, as one might expect. A box-wood tree, *Hæmatoxylon campechianum*, with a much-divided stem, is close to *Quercus suber*, *Q. Tca*, and *Q. cerris*, from South Europe; they are, however, scarcely fine specimens, though the English Oak, *Quercus pedunculata*, seeds well, and makes a good tree. *Liquidambar* and *Liriodendron* are also both evidently thoroughly at home.

Near Mr. MacMahon's house is a fine bed of Arabian Coffee, loaded with berries. A bed of *Allamanda nerifolia*, close by, was one mass of flower.

Cedrus Deodara, *Magnolia grandiflora*, and *Eriobotrya japonica*, are not good, the climate being evidently too dry and hot for them, though a *Camellia* seems in a very fair condition. *Plumeria acuminata* is as fine and free-blooming as in India; as is a species of *Terminalia*, with its peculiar oblong sessile foliage. Near a *Poinciana regia*, its stems carrying many immense *Platynerium alicorne*, a group of Palms, two of which are probably the best specimens of the order in the gardens—one a *Jubcea spectabilis*, the other a *Sabal Palmetto*. Also fine, are an *Oreodoxa regia* 30 feet high, and some broad masses of *Rhapis flabelliformis*.

The most successful examples of growth here, as in Bowen Park, are unquestionably the Bamboos. Several large clumps of *Bambusa arundinacea*, with thickly interlaced tough stems, 40 to 50 feet high, cracking and bending in every breeze, shade, near the centre of the grounds, one of its prettiest spots—a large open-air fernery, containing *Alsophilla Dicksonias*, *Asplenium nidus*, *Platyneriums*, *Ravenalas Cannas* with flower-spikes 8 feet high, *Caryotas Livistonas*, &c. At the end is a neat avenue of *Gnavas* (*Psidium guava*), the smooth *Stuartia*-like stems, and pale glossy foliage, through which now peep the innumerable fruits just commencing to swell, being very pretty.

The Moreton Bay Chestnut (*Castanospermum australe*), of course does well, as do *Butea frondosa* and *Strychnos nux-vomica*. A curious tree is *Davidsonia pruriens*; each leaflet of its large pinnate foliage is nearly of the substance, size, and colour of a good-sized Lognat leaf. *Sterculia rupestris*, the narrow-leaved Bottle-tree, is more noticeable still; of one specimen, the smooth circular stem is 4 feet in diameter at the base, but narrows gradually to 1 foot at 8 feet from the ground, whence for the remainder of its height (another 7 feet) only the smallest branches are seen.

The native trees do not, as here represented, strike me as particularly ornamental, though in the bush, from all accounts, some must be very fine. In the gardens, however, some trees are not particularly interesting. *Agathis robusta* is an exception. This can be picked out anywhere by its tall, slim clean stem and pear-shaped head of dark foliage. Two good specimens are not less than 70 feet in height.

Bloocarpus grandis, *Spondia pteogyne* (the Burdekin Plum-tree), *Alcuries moluccana* (the Candle-nut-tree), with long-lobed foliage and bunches of green fruit each as large as a good-sized egg-Plum; *Erythrina Vespertilio* the Australian Bark trees, and *Cassia Brewsteri*, its thin, circular, brown pods, 12 to 15 inches long, hanging in profusion, are all representative of the native flora. On leaving I passed beneath an Indian Cluster Fig, *Ficus glo-*

merata, the fruit on short stalks in thick bunches of every shade of colour, from green through yellow to bright red, cluster on the old branches 18 inches in diameter. The masses of fruit rotting on the ground beneath the tree testify to its extraordinary productiveness. I also noted on leaving *Combretum purpureum*, and *Beaumontia grandiflora*, growing luxuriantly. At the end of the garden Mr. MacMahon has erected a tail house, composed of loug twigs so tied on rafters as to give partial shade. Beneath, sheltered from the sun's fiercest rays, are *Philodendrons*, *Anthurium Scherzerianum*, *Dracænas*, *Marantas*, *Gymnostachyum Pearcei*, *Lomaria gibba*, *Selaginellas*, *Aspleniums*, *Platyneriums*, *Dicksonia antarctica*, *Al-sophila australis*, flowering *Begonias*, and a few *Orchids*, chiefly the native *Dendrobium undulatum*.—*Gardeners' Chronicle*.

GUTTA-PERCHA IN DUTCH INDIA.

(TRANSLATED FROM THE "GUMMI-ZEITUNG.")

About the year 1845 the first gutta-percha, the milk of several tropical trees, appeared in the market. The gutta-percha comes almost without exception, from the Malay Archipelago, and its greater part from Dutch India, especially from Borneo and Sumatra. The natives collect his valuable product in the virgin forests, whence it is brought, through Chinese buyers, to the Singapore Market. As long as the request for it was only a small one, the natives were content with getting the gutta-percha by means of incisions in the trees, but when the export from Singapore, which was in 1845 only 10,140 kilos, and in 1848, 720,000 kilos., increased, they began to fell the trees, in order to get more sap, without providing for the after-growth. The consequence of this bad policy, which must have been increasing during recent years, cannot be definitely seen from the figures of export from Dutch India, which were:—

1,598,330	kilos.	in	1889
2,277,326	"	"	1890
1,402,923	"	"	1891
1,201,631	"	"	1892
1,270,533	"	"	1893
1,281,664	"	"	1894
1,347,834	"	"	1895
1,337,745	"	"	1896
1,448,973	"	"	1897
4,361,514	"	"	1898
7,263,048	"	"	1899

but they are proved through the exhaustion of several districts which produced gutta-percha in earlier years. If the number of the felled trees can be estimated according to the export at some millions, and if the export increases in the same proportion as in recent years, one can imagine how we are drawing closer to the end of the gutta-percha export, whereas the request for this indispensable insulating material for telegraphic cable is, on the other hand, daily increasing. Dr. W. Burck, at that time sub-director of the Botanic Gardens at Buitenzorg, first drew attention to this danger in 1883, when, taking an official journey to the Pandangchen Boveulanden, on the west coast of Sumatra, in order to study the gutta-percha trees, he noticed the felling of the trees. As an official law preventing the felling of the trees could not be enforced in the districts, Dr. Burck proposed a way out of the difficulty by systematic cultivation of trees. This proposal found approbation with the Dutch-Indian Government, and in 1884 Doctors Burck and Treub, now director of the Botanical Gardens at Buitenzorg, were commissioned to find some land not far from Buitenzorg suitable for a plantation of gutta-percha trees. They chose for this a hilly ground of 625 acres in Tjipetir, about 1,640 feet above the sea-level, and at a distance of eight miles from the railway station of Tjibadak, in the country of Preanger Hill. In the

west monsoon, April, 1885, they began with the planting of over twelve acres. In the following year the plantation was so extended that it was necessary to bring it under constant European supervision, and it was put under control of the Council for Forests in 1891, with the order to plant only the best sorts of Palaquium. But as it did not flourish so well under this council, it was in 1900 once more brought under the supervision of the directors of the Botanic Gardens. The directors have taken the matter at once in hand in order to effect the purposes of the plantation, namely: (1) To find out the best kind of Palaquium suitable for forest-culture; (2) Study of the botanical derivation; (3) To ascertain which climatological and other conditions are the best for the growing of the plant; (4) Study of the way in which they multiply, if by seeds or otherwise. To make these tests on a bigger scale, the Government allowed a considerable amount in 1901 for the Indian Budget. In the west monsoon of this year the plantation will be enlarged by 250 acres and 1901-1902 by 552 acres. In this way an extension of 963 acres will be reached, and it is hoped to plant in the next five years 3,625 acres more. Only good kinds of Palaquium will be employed as Palaquium gutta (Isonaudra gutta in earlier times), Palaquium borneense and Palaquium oblongifolium. If the old seed, which the tropical garden of Tjikemeuh, Tjipetir itself and a Palaquium oblongifolium plantation at Poerwokerto give sufficient it will all be used, and there will be just enough material for the planned extension of the plantation, so that no seeds can be given away from the Botanic Gardens at Buitenzorg for other purposes. This new enterprise promises to open fresh means for the settlement of the burning question of gutta-percha production, and will become a guide for private enterprise in this field later on. With regard to profit, these experiences in Tjipetir will hardly be as authoritative regarding other questions, as labour is rather dear in that district on account of the great amount of private plantations, and as a Government enterprise of this kind, which answers in the first place general purposes and not the gaining of profit, works under quite different circumstances and is generally dearer than a private business, chiefly establishes with economical views. In any case the trial plantation at Tjipetir, which has been put under the leadership of the experienced expert Dr. P. van Romburgh, late director of the trial garden in Tjikemeuh, promises to become of a high technical and economical interest. The market for the gutta-percha obtained in Dutch India lies not in the district of production but in Singapore. This fact is proved by the figures given below which

give the export for 1899, giving origin and destination of the gutta-percha:

The dominant position which Singapore takes according to this as a market for gutta-percha from Dutch India is owing to its favourable situation in the centre of the Malay Archipelago and partly to the smartness of its European and Chinese merchants. Singapore gives to a buyer of gutta-percha all possible advantages of a great market, where he can buy all kinds of gutta-percha according to sample, whereas Dutch India puts only certain kinds of gutta-percha out. If Java, which is more independent than Singapore, and where gutta-percha plantations are now flourishing, should develop and create a market for this article in its own district, cannot as yet be decided upon, but it is hardly to be expected. Besides the gardens in Tjipetir and Tjikemeuh there are only two more plantations at Java, near Poerwokerto, in the country of Banjoemas, of which the elder one, from 1856, consists only of 58 trees, whereas the younger and a bigger one was founded in the early eighties. But both plantations have been neglected up to now. In other parts of Dutch India the gutta-percha plantation, for which the natives seem also to show more interest, now is only cultivated in a few districts, and in recent times through some private enterprise. In 1898 a Nederlandsch-Indische Getah Pertja Maatschappij was founded in Medan, on the east coasts of Sumatra; another recent plantation exists on the island of Bintay, in the Riouw Archipelago. Two other companies, an English and a German one, are said to be at work on the west coast of Borneo, near Pontianak, and another firm has been established under the style of Gutta Rubber Syndicate for the production of gutta-percha and caoutchouc, the plantations of which are in the territory of the Sultan of Johore. And, lastly, the Nederlausche Getah Pertja Maatschappij, established at the Hague, has still to be mentioned. All these companies use the process of extracting the gutta-percha out of the leaves by a mechanical process, which a Dutchman, P. J. Ledebor, now a French subject, has invented. Not much has become public about the process, but it is said to be a perfect success. If, through this process, a material is created which is equal to the gutta-percha gained from the trees, and if the trees can be deprived of their leaves without being interrupted in their growing, as seems to be possible, a further important step has been made in the production of gutta-percha, for through this process quicker and larger results can be effected than through the old simple way.

CURE FOR THE BLACK SPOT IN TOMATOES.—Ever since this fungus disease of the Tomato made its appearance in this country, gardeners have been helpless in the matter of cure or alleviation; and beyond removing the fruit and burning it, so as to prevent the diffusion of the spores, nothings could be done. Now, Mr. J. Thomas, landscape gardener, 1, Warwick Grove, Surbiton, alleges that he has found the remedy for attacks of *Cladosporium lycopersici*, and certainly some fruits, which he brought to us a few days ago, and which are lying before us, show that

he is correct in his statement, for the fungus is killed superficially, and appears as a dry, brown incrustation; even the flesh below it is quite sound and uninjured and the fruit as good as possible, barring the little blemishes of about the size of a shilling. The inventor would willingly dress any diseased fruits if requested to do so, but until he has patented the substance, he will not let it out of his hands. It is obvious that the remedy should be applied to the leaves and to the berries when quite young. It must be remembered also that the spawn of the fungus is internal, so that external applications, however useful, are only of a palliative nature.—*Gardeners' Chronicle*,

TIPS FOR RUBBER GROWING.

Mr. James Maunier writes to us from San Juan Evangelista, Vera Cruz, Mexico, under date 24th June:—

I will send rubber seed to you and others during the next 10 or 15 days. Seed is now well ripened, and just begun to come in. Instead of writing another letter *re* Nursery making, I send you a copy of a letter I have just written to the President of the Company I am working for. In it I have described the *modus operandi*. The Nursery described is, I think, the largest one ever made in this, or any other country. I am surprised that more attention is not paid to rubber cultivation all over India. In Travancore and Mysore there are thousands of acres of land adapted to the cultivation of rubber, from which the respective Governments only get a little money from graziers of cattle. I remember many years ago, while on a shikar expedition out in the western part of Wastara Taluq of Mysore, along the Budra River, near Balehunoor, also on the Toongabudra, I saw some of the best kinds of rubber lands. I shall send a few hundred seed to the Amildra of that Taluq, as well as to parties in Munzerabad, asking them to give them a fair trial. I will send you 2lbs. of seed. Please make up your mind to whom you will give them, so that there will be no delay in sending them out on arrival. The seed must be planted on arrival, as I am afraid that many will have lost their germinating power on so long a journey. If the parties receiving the seed will follow the instructions as per letter herewith, all good seed will germinate; the seeds are large and well packed in charcoal as per instructions received from the best experts in the seed business. If we can make rubber pay here in Mexico where we pay a little over Rs. 2 per day, what could not your people do in India, where you have the cheapest and best labour in the world?

Following is the letter referred to above.

The work been done this week on this place is the planting of rubber seed in the large nursery now being laid out near the banyan tree. We selected this place for the nursery on account of its excellent soil, being near to our next year's location for planting, and because there were about 15 acres of very level land, so necessary for making a good nursery.

The forests having been cut down by the contractor, and burnt, we went to work, cut up and burnt the remaining logs, then dug out all the small stumps, roots and creepers; after this stump pullers were set to work, with a good pair of strong oxen, with the yoke tied to the horns, Mexican fashion, they did excellent work, in fact saved the Company hundreds of dollars, besides testing up the ground so much there was no necessity of digging it over.

The earth having been dug out from among the roots of the stumps, they were piled in heaps and burnt. After this the ground was levelled, raked over smooth, roads laid out; then the lines were laid off at right angles to the roads 18 inches apart, and just one inch deep. Rubber seed sown about one inch apart in the lines, and covered as soon as possible after sowing.

Any of the readers of the *Planter* having a fancy for figures they might find out the number of seed sown in this rubber nursery. Here is the sum:—The nursery is 15 acres in extent. Deduct for a road 8 feet wide, and 900 feet long. The lines are 18 inches apart, and seed sown one inch apart in the lines. Now, if one-third of the seed sown grows, how many plants will we have to plant out next season?

We also had a gang of men planting corn, of which we have about 160 acres planted, and seed corn enough to plant about 90 acres more.

I will explain to you the Mexican method of corn planting; the forests having been cut down

and burnt for planting rubber, the lines staked out seven and a half by seven and a half feet; two lines of corn are planted between the lines of stakes, each hill of corn being three feet nine inches apart. Yesterday we had forty men planting. Each man had a stick about seven feet long sharpened to a point at one end. This was stuck into the ground about four inches. Three or four grains of corn were then put into each hole, and the corn planted. Nothing more is done to it till "breaking down," the ear season comes. If, however, the weeds become too high for the young rubber plants, they are cut down, thereby weeding corn as well as rubber. Your farmers of the West will naturally ask "how many bushels of corn does such outlandish planting produce." I will answer the anticipated question, and say the average crop is about 40 to 45 bushels per acre. We will send to the Chicago office a few ears from this crop, so that your people may see for themselves the kind of corn produced by this Mexican mode of planting. It is all right for *this country*. Corn planted 10 days ago is now 10 to 12 inches high.

We are going to sow a large cattle pasture with Para and other grasses as soon as we get through with our coffee and rubber nurseries. In my next letter I will give details of the 5 acre rubber nursery we are going to plant out near the river, as well as the seven coffee nurseries already cut down and burnt; these have been selected near the land to be planted, as the system of "pilon" or ball planting is a very expensive mode of planting, seeing that 6 to 8 pounds of earth is carried with each plant from the nursery to the place of planting. I said above that the pilon system is expensive; it is, but it is the best in the long run. Last year's failures do not amount to over two per cent.; *i. e.*, not over two per cent. of the plants planted last year have died, we got no rain after the first week in February till the second week in June.—*Madras Mail*.

BREEDING FOR BEEF IN TRINIDAD.*

By C. W. MEADEN,

Manager of the Government Farm, Trinidad.

It is a general belief in Trinidad that our native grasses are not sufficiently nutritious to enable the Colony to produce its own meat supply and particularly of beef. A sum of £40,000 is annually spent in the supply of meat, so that the question is one of sufficient interest to demand thorough consideration. From a purely agricultural aspect the production of beef would form an additional industry, and bring into a healthy and remunerative condition land which is now waste and a burden to its owners.

In order to bring our natural grasses into good grazing condition systematic treatment is required. Sub-division for the purpose of rest and change, and, where the formation of the land permits, the use of agricultural implements such as the hay-mower, horse-rake, and the harrow, should soon result in the formation of sound feeding pastures.

The present paper deals only with the conditions of Trinidad for the production of beef; that is to say, whether there is suitable land and other facilities, and sufficient inducement in the way of profit to encourage the industry.

That there is land enough is evident from the areas lying idle on abandoned sugar estates, and the great Caroui Savannah,—a menace to health

* This subject has already been dealt with by the author in two communications presented to the Agricultural Society of Trinidad, which form papers Nos. 98 and 131, in Volume III, pp. 119 and 310 respectively, of the Society's Proceedings. The information contained in the present paper summarizes and carries to a conclusion the history of these experiments. (*Ed. W. I. B.*)

and unproductive. With regard to facilities, there are good roads and railways cutting through what might be the heart of the industry. The market value of the product has already been shown, and a recent rise in the price of meat shows that, at present, there is little danger of oversupply. The present meat trade in Trinidad is open to serious interruptions which often renders it difficult to meet the demand, and the poorer people are deprived of meat in consequence. It is therefore very desirable that a reserve supply should be available, that the market should not continue in its present dependent position.

During the last year an experiment in breeding for beef was brought to a satisfactory conclusion, although only carried out in a small way. The subject of the experiment was a cross between a Red Polt sire and an ordinary Creole cow. This steer, when turned out to grass at fourteen months old, weighed 465 lb. He was kept under conditions such as might be expected would be given in the general way in the Colony, to test the value of grass feeding. The season proved exceedingly severe and grass was scarce. At two years old, he had gained only 83 lb. As grass became more plentiful a rapid increase in growth ensued, and at the end of his third year, he scaled 770 lb. showing a gain of 222 lb. for the latter period. This rate of gain would probably have continued so that at four years old he would, in all likelihood, have scaled 1,100 lb. the weight of a prime beast in Trinidad. The cost of rearing this animal amounted to \$4.80 including milk and feed. The gain in weight during his last year cost two shillings, one shilling land-tax and one for upkeep of fences and land, calculated on the average cost of the herd of oxen running together.

The dead weight was 384 lb. The animal was in a perfectly healthy condition, every organ sound and, to use a butcher's term, "cleaned well." The meat was tender and juicy and altogether superior to what is generally obtainable, and realised in the open market, sold under the same conditions as any other beef, \$32.28, which after paying for slaughtering, market dues and commission left a profit of \$27.48 or \$9.16 per annum. With a large herd, sufficient working capital, and sound management such returns indicate the possibility of a lucrative industry.—*West Indian Bulletin*.

LIGHTNING AND ITS EFFECTS.

The day after one on which a thunderstorm took place I came across a chir pine (*P. longifolia*), which had then been struck. The tree was mature, standing on the top of a hill, and he had no leader, which had evidently been broken or cut off in its youth. The lightning had struck one of the uppermost radiating branches and took a straight course for a short distance, when it encountered a branch which turned it off its course, and from this point the direction taken was a spiral one, the turns being closer together at the top of the tree, where there were more branches with the fluid avoided. About 5 feet from the ground the electric current encountered a swelling, evidently caused by the heating up of an old wound, and at this place it left the tree, joining it again about one foot from the ground. A strip of bark about 4 inches in width was removed the whole way down the tree where the fluid took its course. This strip was not removed in one broad piece, but in two slips of 2 inches each in width, for its full length, the division being exactly in the centre and quite clean. The length of the strips varied from 2 feet to 4½ feet in length some of them being found on the ground, whilst others remained on the tree, usually being fixed to it at their upper ends, the lower ones being quite free and curling outwards. The outer rough bark was totally removed, not a single piece

remaining on the strips mentioned above. It was found lying in small pieces under the tree. In no case were any actual signs of burning to be found, although the long strips of underbark were dried and curled up with the heat, and neither the bark on either side of the course taken by the lightning, nor the needles at the foot of the tree where the current entered the ground were damaged in any way. Both the inner and outer edges of the strips of underbark were quite clean as if cut by a knife.

Curious to relate, down the whole length of passage a thin narrow layer on underbark was left, exactly in the middle, firmly fixed to the tree; of the blaze where the separation of the two strips took place and at the foot of the tree where the electric fluid joined it again, two distinct courses could be traced as if the fluid had become separated in its leap.

The tree I had cut down, and it was examined carefully. Judging from appearances it would seem that the lightning threw off, simply by shock, the rough outer bark which opposed its passage, thus uncovering the smooth underbark, over which the fluid passed uninterrupted. The great heat dried up this underbark and turned the sap underneath it into vapour, which forced it up causing to divide at its centre, leaving the thin line of bark where the separation took place, caused also by the contraction of the underbark. The pressure underneath caused by the formation of steam, coupled together with the fact that the strips of underbark were quite shrivelled up and contracted, is quite sufficient to explain the clear way in which they were separated from each other and from the bark on each side of the course taken. There would appear to be no doubt that lightning, if possible, will avoid all serious obstacles by going round them, and this being impossible, it will either remove that obstacle or be broken itself into two or more currents by trying to do so.

It would be interesting to know if in any other parts of India lightning has been observed to have had similar effects as the above

E. RADCLIFFE, *Forest Officer*.

Camp Choch, Mirpore, Jammoo: February 8th, 1901
—*Indian Forester*.

CASSAVA.

We have had many inquiries since we wrote on the cultivation of cassava as to its commercial value, and with reference to the method of cultivation. Cassava is sometimes called Brazilian arrowroot. It resembles arrowroot in one respect, so far as manufacture is concerned, in that tubers are rasped, and the starch precipitated as in the case of arrowroot. There are two species of the plant (which is one of the Euphorbiaceæ)—viz., the Bitter Cassava, *Manihot utilisima*, and the sweet, *M. Aipi*. Both furnish highly nutritious food starches. The bitter contains a poisonous element, hydrocyanic acid (prussic acid), and, as a consequence, cannot be eaten in a fresh state, whilst the sweet variety may be used as a table vegetable without any preparation. The poison of the bitter variety is, however, rendered volatile by heat, after the application of which the juice may be safely used as the basis of cassareep and other sauces. In Brazil great use is made of the bitter cassava. The dried roots are rasped, and a kind of flour results, from which cassava cakes are made.

The plant is easily cultivated and finds a congenial home in Queensland. When the land intended for cassava is well broken up and reduced to a good tilth, the rows are laid off much in the same manner as for sugar-cane, but only 4 feet apart. The sets consists of portion of the stalk cut into pieces about 6 inches long. Four inches is a better length, because the roots springing from the cut ends are those which produce the tubers. Like all other such crops, they must be kept clean. There is no need

for deep cultivation, indeed, shallow works is the best. A very fair profit may be made by growing cassava, as is shown by the *Florida Agriculturist*. That Journal, quoting from the *Leesburg Commercial*, says—

While there is no great big money in growing cassava, there can be reasonable profit made in growing it, and it is not subject to be killed out by the frost like some crops, for it is planted after the first frosts are over, and matures before the frost comes again.

The following information on this important subject is furnished us by Mr. George E. Pybus, of Fruitland Park, who has been growing cassava for several years. He estimates the cost of growing cassava as follows:—

	Per Acre.	\$	s.	d.
Ploughing	1:50	=	6	0
Harrowing	0:35	=	1	5½
Seed, planted 4 × 4, 2,700 hills, 6-inch pieces, 1,500 feet, at 1½ cents	1:70	=	6	11
Planting... ..	1:07	=	1	0
Six cultivations at 35 cents	2:10	=	8	5
Four hoeings at 1 dollar ..	4:00	=	16	0
Fertiliser, 350lb. at 23 dollars per ton	4:00	=	16	0
	14:65	=	58	8½
Digging and hauling, say 1 mile	1:25	=	5	0
Value, f.o.b.	5:00	=	20	0
Net	3:75	=	15	1½
Necessary to make, say, 4 tons to pay expenses	14:00			

Leaving a net profit of 3:75 dollars per ton on all above 4 tons. Of course, two of the above items, cultivating and hoeing, may vary, but to make a success of the crop, it must be kept clean until it can take care of itself, and he believes his estimate to be a fair one. Notwithstanding the ill-luck which attended all who adopted fall planting, in 1899, he has just finished planting 10 acres, being determined to give cassava-growing as a farm crop a fair trial.

The resulting crops with good fertilisers will amount to from 6 to 8 tons per acre, and the digging can be done for about 2s. per ton. The cost of hauling will, of course, depend on the distance. On sandy soil it will yield more feed than any other crop that can be grown. For feeding pigs, horses, cows, and chickens no better crop can be grown. It will produce the best of pork and bacon; it will make excellent pastry and delicious breakfast cakes.—*Queensland Agricultural Journal*.

COMBATING SAN JOSE SCALE ON FRUIT-TREES.

At the present time San José scale is being found in many orchards, and although advice as to the best treatment has been given repeatedly in the *Agricultural Gazette*, many growers may have overlooked it, and are in doubt as to the steps to take to rid their trees of this extremely destructive pest. The scale itself is not unlike red scale in appearance, and during the winter months when the peaches, pears, plums, and apples which it chiefly affects are bare of leaves, the scale may be noticed on the wood of the trunk and branches. When the scale is picked off on the point of a knife a little yellow-coloured mass is seen inside. As the result of numerous successful trials the Fruit Expert is able to recommend a painting of pure kerosene for smaller trees and spraying with lime, salt, and sulphur for larger trees which could not be readily gone over with a brush. Before applying the kerosene the affected tree should be pruned, and the prunings burned. Then the kerosene should be applied

so as to wet the tree but not trickle down to the roots; care to be taken not to miss any portion of the stem or limbs. It does not injure the buds, and apparently has little or no effect on the cuts.

The lime, salt, and sulphur wash is prepared as follows:—

Formula:—

Lime	30 lb.	(fresh slacked)
Sulphur	20 lb.	
Salt	15 lb.	
Water	60 gallons.	

Take 10 lb. of lime and 20 lb. sulphur, and boil them until thoroughly dissolved, then add the rest of the lime and the salt and water to make 60 gallons. Strain and spray when rather more than milk warm.

The only difficulty likely to be experienced in making up this mixture is in getting the sulphur thoroughly incorporated. To do this requires continuous boiling, with constant stirring, until the liquid is of a deep yellow colour. If possible, the sulphur should be first ground up with a small quantity of water into a paste, in the same way that mustard is made, so that the grains of sulphur may be thoroughly wetted. This will greatly hasten the process, and if as much as 20 lb. of sulphur is to be used, this may be ground up a little at a time in a largish mortar and added to the boiling solution.

The best thing to use for boiling this mixture in is an enamelled vessel. If only a small quantity is made at a time, an ordinary enamelled preserving pan is the very best kind of vessel. In the absence of these, an iron vessel or an ordinary oil-drum may be used. On no account use copper vessels.

The actual manner in which the ingredients are added does not matter. It will be found best to slack the lime on a board in preference to slacking it in the vessels. Hot water is not necessary for slacking it.

The main point is that the lime and sulphur should be well mixed and thoroughly boiled together.

The action of this spray is to smother and destroy the scale and eggs. Some people scrub the bark of the trunk and main branches with a brush before spraying them with this wash.

This is a splendid spray for clearing trees of all sorts of pests that escape notice, and it is really worth while giving all deciduous trees in the orchard a spraying with it immediately after the annual pruning.—*Agricultural Gazette of New South Wales*.

MANURE FOR TOMATOES.

The Chemist, at the request of several tomato-growers in the Mimbi district, has furnished the following information as to the best means of fertilising tomato and cucumber crops with dry and liquid manures:—

For Tomatoes.

A complete dressing for an acre would be—

	Costing about.
	£ s. d.
Sulphate of ammonia... .. 160 lb.	0 13 6
Superphosphate 250 lb.	0 10 6
Sulphate of potash 150 lb.	1 0 3
Total, 560 lb. or 5 cwt. 2 4 3	

For Cucumbers.

	Costing about.
	£ s. d.
Dried blood 250 lb.	0 12 6
Superphosphate 235 lb.	0 10 0
Sulphate of potash 75 lb.	0 10 0
Total 5 cwt. £1 12 6	

This quantity will be rather much for an acre, the exact amount being 4½ cwt., which would come to about £1 10s. per acre.

Both the above formulæ are based on the actual manurial requirements of a crop of the kind mentioned in a soil of fair average quality. Where materials like well-conserved and rotted stable manure, fowl-yard sweepings, and wood ashes are available, the quantities of commercial fertilisers can be reduced; but it must be remembered, especially as regards bones, that the principal manurial requirement for good crops is potash, and the proportion of it in most of the manures that can be home-saved is very small.

The fertilisers mentioned may be used as liquid manure, by dissolving in water, though the best plan is to add in the dry state mixed with earth and to water the plants afterwards.

In the case of dried blood, this does not dissolve in water and would have to be added separately.—*New South Wales Agricultural Gazette.*

CASTOR-CAKE, CASTOR-OIL, AND CASTOR-SEED AND ITS PRO- PERTIES.

Many people are under the impression that the castor-cake contain 7 per cent. nitrogen and 12 per cent. of moisture, and is thereby considered a manure sufficiently lucrative for cheena barley and other *rabi* crops. Such is not the case. Castor-cake contains 11.86 per cent. of moisture and 5.23 per cent. of nitrogen and can be used for all purposes. Moisture is of very little consequence to the agriculturist, whereas, on the other hand, nitrogen potash and phosphoric acid are considered the most valuable ingredients in a manure, especially for leafy crops, and it is needless to say that the castor-cake contains all these properties, which renders it a manure of the very first class. The reason why it may be looked upon as a manure of the very best, is because it contains 2.53 per cent. of nitrogen, more than any other manure. We all know that potash, which forms one of its component parts, is by itself equal to any ingredient in a manure. Besides phosphoric acid, the other component part is in such a condition of chemical combustion as to be easily assimilated by the plant. Further, it may be stated that the cake contains a certain amount of oil. This oil in itself acts as a manure, and at the same time prevents the cake from decomposing rapidly in the ground; thus allowing the cake a fertilizing action of more than a year. When once a person has studied closely and scrutinizingly the properties of the castor-cake manure, it does not take him long to testify to the effect it has on potatoes, wheat, oats, cheena and makai. If on eight biggahs of land you strewed 180 maunds of well pulverized castor-cake, and sowed this land with oats, you would find that your return would be 143 maunds or thereabouts, of good clear oats, with an exceedingly heavy crop of straw. Again, if you were to sow on 14 cottahs of this land dug out into trenches, Naini Tal seed potatoes, you would get a return of 82 maunds of crop from about four maunds of seed. After these two crops were cleared out, if cheena was sown, your return would be just as much. Again, after the cheena crop was taken up, if makai was planted on the same eight biggahs of land, your yield would be 122 maunds from not a very liberal sow. Thus in one year you have realized three substantial crops from the same piece of land without any trouble of manuring for each crop. This manured land will answer the following year without any trouble, to rear up another supply of the crops mentioned above, excepting that the potatoes this time will not be so large as on the former occasion. The husk obtained from the castor-seed, also, acts as a very good manure for flower-

beds, but great care must be taken in the administration of it, as the ingredients with which this husk forms a manure, have a tendency to either burn up the plants or prevent them from budding. Too much cannot be said on this score, as the making of this manure is a secret. Another mistake idea is that castor oil cannot be bleached. It can be done, and the process is very simple. Pass the oil through thin folds, say two, of pure white blotting paper, and then expose it to the rays of the sun, under the cover a pane of glass. Oil of a reddish hue is of course beyond bleaching, as it contains a large portion of moisture, which is obtained from the husk. It may be remarked that castor-seeds are of various sizes, though more or less of the same shape and form. It will be observed that the smaller the seed, the more oil you get. Seeds of a large form generally contain very little moisture; as the shell, which is of an absorbing nature, derives its moisture from the kernel.

The foregoing statements may call forth comments from those in the manufacture of oil, owing to there being a keen competition in the trade, but reliance can be put on what has been stated above, as the statements to a certain degree are the outcome of the experience of the late Chief Engineer of the Suran Oil Mills, Mr. Edward Austin Neame.—*Indian Planters' Gazette.*

COFFEE CULTIVATION IN THE FRENCH CONGO.

The following interesting particulars with regard to the cultivation of coffee in the French Congo, based on information supplied by the Director of the experimental Cultivation Gardens at Libreville, in reply to questions addressed to him by the "Office Colonial" in Paris, were given some time back in the *Board of Trade Journal*:

Liberian coffee is the kind principally grown in the French Congo, the cultivation of the San Thome coffee (*Coffea arabica*) being now almost abandoned. Kouilon (*coffea canephora*) and Oubangi (*coffea Chalotii*) grow wild, but the latter variety is now beginning to be cultivated.

The amount of coffee exported from the French Congo during the past four years was as follows:

	Kilos.
in 1896	4,471
„ 1897	30,094
„ 1898	57,660
„ 1899	41,281

In January, 1900, 30,473 kilogs., valued at about 33,500 francs, were exported. The coffee is exported in bags of from 50 to 70 kilogs each, the freight for coffee, unhusked, being 68 francs per ton of 1,000 kilogs, by the Chargeur-Reunissteamer from Libreville to Havre. The bagging in which the coffee is packed is imported from abroad. The coffee planters who are themselves merchants export their coffee to Europe themselves without the intervention of middlemen. Only a small quantity of the coffee is sold for local consumption, the retail price at Libreville being 2 francs 50 cents per kilog.

There are at present about 1,800 hectares of coffee plantations in the colony in bearing; in addition about 150 hectares have been planted, but will not yield a crop till about 1905.

There is no export duty on coffee coming from the Gaboon district, but that produced in the conventional basis is dutiable at the rate of 5 per cent, *ad valorem* on a valuation of 60 francs per 100 kilogs. Note.—Kilog.=2.2 lb. Hectare=2.47 acres, Franc=96 1/2.—*Tea.*

RUBBER IN RHODESIA.

In a report received from North-West Rhodesia Major Colin Harding, the Acting Administrator, says:—

The indigenous rubber found in North-West Rhodesia is of three distinct species, which should be classed as: (1) *Landolphia-Florida*, (2) *Kickxia-Elastica*, (3) *Capodinus-Lanceolatus*. I will first take the *Landolphia-Florida*, which is a species of vine rubber in this country, growing to a considerable length, varying from 20 yards to 60 yards, and in size from $\frac{1}{2}$ in. to $1\frac{1}{2}$ in. in diameter. It is found growing usually in marshy tropical localities.

This rubber first came under my notice on a small tributary of the Zambesi, north-west of Nyakatoro, during my journey to the source of the latter river last year. Again I saw and collected portions of this vine in the same latitude, also found in a very marshy and verdant spot, on an east bank tributary of the Kabompo River, called the Mumbasi. This vine at the latter place was seen to perfection, extending round the adjacent trees, forming an impenetrable thicket, and affording, besides a lucrative employment for the native, a shelter and protection to the kraal which was built beneath its shade. I am forwarding samples of this vine for your identification. Judging from the quantities of prepared rubber which I have found in the possession of different natives during my journey, I am convinced that considerable quantities of this valuable species are found surrounding the majority of the numerous tributaries which flow into the Kabompo and Zambesi Rivers, or, to put it more concise and plainly, the *Landolphia-Florida* is found between the twelfth and fourteenth parallels, throughout the whole of Barotseland.

The mode of collecting and preparing the *Landolphia-Florida* is similar to that adopted by the natives when making the ground rubber into a marketable commodity. Without thought for to-morrow, they promiscuously hack and cut the vine, selecting, when their work of destruction is complete, the best and largest branches only, leaving the smaller, which in another year would have attained maturity, to rot on the ground. Divided into various lengths of from 3ft. to 4ft., the vine is taken to the kraal where, after forty-eight hours' continual soaking, it is hammered and pounded with the idea of removing the bark, which secretes the rubber from the stem; this process complete, the rubber—or blanket, as it is termed—is again immersed and continually boiled for three or four days, or, in fact, till the bits of bark are completely removed. In examining a piece of vine rubber before boiling, you would find no aluminoid or resinous matter. The rubber seems a part and parcel of the bark, and, unlike *Kickxia-Elastica*, the juice could never be extracted by incision or tapping. The boiling operation being complete, the rubber whilst warm is rolled into sticks about 6 in. long, called matallas. It is then hung under the various roofs to dry, and later made up into chetotes, ready for Mombari traders, who periodically visit the kraals to purchase and transport this valuable product to the West Coast. Whilst on my tour I purchased several chetotes of rubber, for which I paid two yards of calico, each valued at 1s. 8d. per yard, on the spot. The weight of a good chetote should be about 2lb., and the price of this class of rubber at Benguela would run from 1,800 to 2,000 reis, or in English money from 2s. 9d. to 3s. 6d. per lb.

(2) *Kickxia-Elastica*.—My knowledge of this rubber, which I have set down as *Kickxia-Elastica*, is very limited. Undoubtedly it is a true rubber found in the same districts and in close proximity to the *Landolphia-Florida* described above. Several samples were shown to me when east of the Kabompo; also I inspected the same species of rubber in the possession of natives north-west of the Zambesi, near the Kasi River. It is of a superior quality to either of the

other two kinds; and as it is procured by an incision made in the trees, it is absolutely free from all dirt and bark, the only damaging ingredient being grease, which is infused by the natives whilst collecting and rolling it into various shapes. In selling the inferior species of rubber the natives will mix the *Kickxia-Elastica* with other unsaleable root rubber. I saw a rubber much resembling the *Kickxia-Elastica* at Kota-Kota, some two years ago, the only appreciable difference being, as far as I could see, the different shapes in which it was rolled.

(3.) *Capodinus-Lanceolatus*.—Accepting Sir William Dyer's authority, the third and last species of indigenous rubber which I am about to describe must be the *Capodinus-Lanceolatus*. Its description as being worthless is, I think, unwarranted. On the contrary, I have seen *Capodinus* growing, prepared, and finally sold at good and remunerative prices, although admittedly it is of inferior quality, still it is a rubber that thrives in the soil where no other root could exist, and will, with an ordinary amount of care in collecting it, eventually prove a valuable asset to Western Barotseland. To substantiate my statement, I might point out that already, both east and west of the Kwito River, the Portuguese have erected stations and conducted trading expeditions for the object of collecting this rubber, and apparently for that object alone. Again, at Katende, a large village situated some sixty miles north-west of Nyakatoro, and well within the boundaries of King Lewanika's kingdom, during the last two years no less than ten waggons have penetrated to the heart of that country for the object of collecting and transporting this rubber to the west, and I am led to believe that these expeditions met with an ordinary amount of success. The *Capodinus-Lanceolatus* is found in considerable quantities between the Kwando and Kwito Rivers, and also west of the latter. At the head waters of the Luugwe-Bungo and in the Balachazie country its growth is also noticeable; in fact, the whole Barotse country west of the East Lunga River, above parallel 15, is dotted with portions full of this indigenous root. The process of manufacturing and preparing this root I have described under the heading of *Landolphia-Florida*. Strange to say, the root of the *Capodinus-Lanceolatus* and a portion of the *Landolphia* vine are, when gathered, so alike that only the most competent judge could correctly define the species. This *Capodinus* is phanerogamous, growing from 6in. to 10in. in height. The roots are found about 4in. under the surface of the soil, and, spreading themselves evenly and uniformly, cover a considerable quantity of ground. At present this plant is so plentiful that in rubber districts the natives collect only the larger roots, leaving the smaller exposed and perishing under a tropical sun. The surface, after the natives have collected their rubber, resembles an orchard or meadow which has been upturned by a grub-seeking hog. For two or three years the production of rubber from such a spot is nil, and treated on similar lines to his garden, the native never returns for a second crop, but seeks pastures new, where the same work of destruction is carried on in the same reckless and extravagant manner. It is useless disguising the fact that, with one or two exceptions, the most prolific and thriving rubber districts are found outside of the present provisional boundary, and until the question of demarcation is satisfactorily settled, the idea of preserving or encouraging the production of rubber in this country to any great extent is out of the question. In the meantime, whilst we are arbitrating and settling the boundaries, the Portuguese are extending their power to within 100 miles west of Lialui, destroying districts which beyond all doubt must eventually come under the control of the Chartered Company.

The fact that North-West Rhodesia is a rubber-producing country has been proved beyond doubt, although the full extent is yet unknown. Each

journey has resulted in further ocular demonstrations, and I am convinced that the more we see of this country the more we shall become confirmed in the knowledge of the existence in considerable quantities of this valuable plant, which only awaits the early settlement of the boundary question, the prevention of the slave traffic, and the establishment of police posts, to secure a successful future for the development of the rubber industry.—*India-Rubber Trades Journal*.

CINCHONA AND QUININE IN JAVA.

The following is based on an interview with and memo-
randa supplied by Mr. F. L. Seely, St. Louis, Mis., in
regard to his recent journey of investigation in India and
Java. The illustrations of Java scenes are repro-
duced from photographs taken by Mr. Seely.

Java is generally supposed to have come later into
the cinchona-field than Ceylon and India, and some
say that Java started where the British dependen-
cies left off—not an uncommon thing with Britain's
trade-rivals. But this is scarcely the case. As early
as 1829 the cultivation of cinchona in Java was
mooted, but it was not until 1832 that the Dutch
Government sent Hasskarl, who had been director
of the Botanic Gardens at Buitenzorg, to Peru and
Bolivia, where he got with much difficulty seedlings
that he took to Java, but these did not come to
much. In 1855, Dr. Franz Junghuhn, an eminent Dutch
botanist was sent to Java with a number of seed-
lings, commissioned also in the following year to
superintend the cinchona culture. Junghuhn was
one of the most diligent workers in the field up to
sixties of the nineteenth century, indeed, by the
end of 1860 there were about a million cinchona plants
in Java, but 939,809 were the comparatively valueless
Cinchona Phudiana, which had been propagated
from the seeds of *C. ovata* brought from South America
by Hasskarl, and renamed after Pahud, Governor
General of the Netherlands India. Dr. J. E. de
Vrij was sent out to Java in 1857 as a chemist,
but he was really the man who recognised that
the future of cinchona-cultivation in Java depended
upon the adoption of the particular kind of calisaya
that Charles Ledger had obtained in South America
and which is now known by the generic name of
the man who risked his life to get the seed. Ceylon
and India might still be the centres of profitable
cinchona-cultivation had the British Government
realised that Ledger's work was the consummation
of a long and expensive inquiry; but the Dutch
Government, thanks to De Vrij, was sufficiently
fortunate to try the new seed well, and within
twenty years planters had proved that *C. Ledgeriana*
(at first regarded as a rich calisaya) is the tree best
worth cultivating. De Vrij's great service to quino-
logy was the early recognition of the necessity for
cultivating plants with a high quinine yield.

The Island of Java is only 673 miles long and about
125 miles wide. About 25,000 acres of the Island
are under cinchonas. There are 25,000,000 natives
in the Island, and only two of them speak the
English language. The first thing Mr. Seely did
was to secure the services of one of these men,
whom he kept through his visit. He was a very ac-
complished young man, and somewhat of an aristocrat
as compared with his countrymen. His main ac-
complishment lay in the fact that he had two wives,
and he claimed that for a man to be a sincere
Mahomedan he should have four, if his means
permit. He explained to Mr. Seely, however, that
one wife did not know of the other's existence, and
he was quite confident that matters would run
somewhat smoother if he maintained that ignorance
on their part. The day after Mr. and Mrs. Seely
arrived they proceeded to Bandung, which is about
eight hours' ride from Batavia, at which port they
landed. It is a delightful little town of about 1,000
Europeans and probably 60,000 natives, and the hotel

was as comfortable as any one could hope for.
Nearly all houses in Java are one storey high, and,
in the case of hotels, only one room wide, and
sometimes a mile long. This is to prevent serious
injury in case of earthquakes, which are common
out there.

After resting for a few days Mr. Seely made trips
to the plantations, which lay in different directions
around Bandung, ranging from 9 to 30 miles distant,
all of which had to be covered by pony-carts, pony-
back, or in mountain-chairs each carried by four
natives. Cinchona was seen growing in all its stages,
beginning with the seed and the little plants just
above the ground, to immense forest trees which
have been allowed to grow for nearly half a century,
and some of which are 100 feet high, and could not
be spanned more than half-way round by the em-
brace of a full-grown man.

Over 20,000 trees grow from Ledger's seeds, and
a large number of the trees are still standing, as
is evident from one of the photographs. These trees
have been allowed to go to seed, and are simply
used for their seed, as they are now about 45 years
old, and a tree is harvestable at six years.

The seed is planted in what is known as the
nurseries (see page 165). Both Ledger seed and
succirubra seed are planted. When the latter seed-
lings grow to a height of about 3 feet they are cut
down close to the root, and a Ledger shoot about
6 inches long is grafted to each. This is covered
up with wax and bound with a piece of banana-
leaf, whereupon, after a short time, the wound
heals and the little Ledger shoot comes out in leaf;
then the tall top of the little succirubra tree is cut
off, and we have the completed combination ready
to be transplanted in the forests. This is one of
the most important events in the life of the cinchona-
tree in Java—the bit of scientific culture which has
enabled Java to outstrip the world in cinchona
supply. It is done because the Ledger plant does
not grow well in the soil, while the red-bark tree
flourishes exceedingly. It is a wise procedure to graft
the rich ledger top on the poor succirubra-root, for
the Ledger bark is so rich in quinine that as much
as a fourth of the weight of the dry bark has on
rare occasions been quinine sulphate.

The so-called cinchona "forests" are clearings
made from the jungle, and the ground is kept
clean from weeds and rubbish by diligent garden-
ing. The trees are planted in rows systematically,
and the ground is so worked that the rains penetrate
to a great depth. The trees are allowed to grow
until the sixth year, when they are ready to be
harvested. The old system of harvesting was to peel
the bark of the trees. This is no longer done, but
each tree is sawed off at the roots, divested of its
bark, and a new tree planted near by. It has long
been a familiar *canard* in commercial circles that
the Java planters had tired of their work, and were
uprooting the trees in order to put tea in their place.
It will be seen that Mr. Seely's observation proves
exactly the opposite; the nroot because it pays.
The new trees grow to the harvesting stage nearly
as soon as the bark would grow on again, and the
trees are much richer in quinine than renewed
bark.

After the trees are hewn down and cut into short
lengths native women beat the bark off the pieces.
The wood is dried and used to heat the ovens in
which the bark is dried. The drying, however, is
largely done in the sun before the bark is put into
the ovens, and the quilled or pharmaceutical bark
is usually dried entirely in the sun, the native
women and children sitting in the drying-trays and
tying the bark into pipes while it is green and
pliable. After the bark has been thoroughly dried
it is coarsely ground, usually by water-power, and
it is then packed tightly in bags of 100 kilos. each;
these bags are sent to Amsterdam (90 per cent. of
the Java bark going there), and the remaining 10
per cent. is manufactured into quinine at Bandung.

This 10 per cent. yields 1,000,000 oz. of quinine per year; and will very soon be increased to 2,000,000 a year.

Mr. Seely found the Java quinine-factory to be particularly attractive, as his own business-interest in quinine is equal to the annual output of the factory. It was a surprise to him to find so finely equipped a laboratory, and especially to receive from managers and owners such courtesy as belied the current tales of mystery about the Bandung works. Most people know that the manufacture of quinine has always been treated as a very profound secret, and probably there is not a quinine-factory in the world, outside Java, where a stranger would be permitted to learn anything of the process of manufacture. For this reason it was naturally difficult for the Bandung works to secure chemists who were conversant with the manufacture of the article, particularly on account of their being so far removed from civilised countries where chemists usually are found. In the first instance, the Bandung factory was placed in the hand of a man who was not familiar with the manufacture of quinine, though he had had a large experience in sugar-making, and was otherwise a man of scientific attainments, so the quinine first produced was not up to commercial standard. The enterprise went through a trying experience for about three years, and, although it was a hard struggle, it continued to exist and to manufacture quinine—such as it was. The owners were fortunate, however, in securing the services of Dr. A. R. van Linge, who had studied under Dr. de Vrij, as manager and head chemist for the Bandung factory. He is the moving spirit of the enterprise now, and not only has he perfected the processes of manufacture, but has invented and personally supervised the construction of the machinery and apparatus used in the works.

Mr. Seely saw about 4,000 oz. of quinine made per day, which he could not distinguish when placed among the best-known European brands, and, in addition to this, every lot of quinine the factory manufactures is tested by the director of the Government plantations, and he was present at one of these examinations, where he saw for himself that the samples were above the requirement laid down in the Pharmacopœia. The quinine is sold at open auction.

A word as to the process of manufacture. When the bark reaches the factory every parcel is assayed, and the natives mix the various lots so that an average strength of alkaloid is represented in each day's work. Tons of bark are ground up every day and sifted by very improved machinery, after which it is moistened with an alkali and pumped into immense digesters containing hot crude petroleum. There are agitators inside the digesters, which mix the bark well with the oil, and the oil extract the alkaloid which the alkali sets free from the bark. The bark is then allowed to settle out and the oil is decanted off and washed with sulphuric-acid water, which again takes the alkaloid from the oil. The oil is returned to the storage-tanks to be used over again. The crude quinine sulphate crystallises from the hot solution as it cools, and is afterwards purified by recrystallisation, the mother-liquors, of course, being worked up too. It is a beautiful sight to see the immense rows of big porcelain crystallising-pans, hundreds in number, full of the crystallised sulphate, which looks like snow in water; and it was a delight to Mr. Seely to run his hand down through the solid crystals and squeeze the water out as one would in making a snowball.

After the crystals have formed in the pans and the solution is thoroughly cooled, their contents are dumped into centrifugal extractors, which throw the water out and leave the quinine sulphate nearly dry. The last crystallising solution (distilled water with a trace of quinine sulphate in it) is returned to this main building through underground pipes, sulphuric acid is added to it, and it becomes the first washing-solution as above described. The

quinine is then taken out of the centrifugal machines and spread upon trays to dry. Nearly every druggist knows that quinine sulphate should contain between 14 and 16 per cent. water of crystallisation. One of the most delicate operations in the manufacture of quinine is to produce the article without too much or too little moisture in the finished product. The Bandung factory follows a process, invented by Dr. van Linge, which enables the workers to regulate the air and other conditions in the drying-room, to the extent that the product exactly meets Pharmacopœia requirements.

After the quinine sulphate has been properly dried it is accurately weighed, under the supervision of a European chemist, like all other operations in the laboratory. The photograph of the operation of packing the salt in the tins shows the chemist whose duty it is to look after this part of the work.

The crystallising building, in which all of this work is done and in which no manufacturing operations are carried on except the purifying and crystallising of the quinine sulphate, is the most perfect specimen of absolute cleanliness Mr. Seely has ever seen. The floors are covered with porcelain-finished tiles, which are kept as clean as dishes, and he noticed that if the smallest dripping of solution was spilt on the floor it had hardly landed before there was a native after it with a cloth. The machinery and apparatus are kept in perfect order, and even the porcelain-lined crystallising-pans are washed with soap and water every time the solutions are changed. Cloths are stretched over each row of pans to keep out the dust and light.

The quinine sulphate, after being put into tins, is sent to the stock-room, where it is put in cases which are manufactured by natives on the ground. After the goods are placed in the cases, a sample is extracted from each lot that is represented in the finished product, and the director of the Government cinchona-plantation, who has spent twenty-five years in the service and who is a disinterested party, comes to the laboratory and applies the pharmacopœial tests to every sample.

The quinine then goes to Batavia, the principal business city and port of Java, where it is sold at public auction about once a month. The factory owners have no interest in the sales, as they do no business except with the planter himself, who pays the factory a stated sum (8s. for every 35 oz. for manufacturing costs), for it must be borne in mind that the planter owns the bark, and sends it to the factory simply to have the quinine taken from it, which is done on a guarantee that he shall receive the quinine that the bark assays, and he is at liberty to have assays made on his own account before he sends the bark to the factory. The quinine which comes from the bark belongs to the planters until it is sold at public auction. The factory owners have agreed not to enter into the manufacture of quinine on their own account.

The auctions in Batavia are carried on by Messrs. Tiedeman & Van Kerchem, the oldest-established bankers in Java. The quinine is bid for by various brokers, who act for any one that wishes to employ them, and who charge a stated commission for their work, but do not speculate. So strict are they with the auctions that a broker must mention the names of the persons for whom he is purchasing. The quinine is then shipped to various parts of the world.—*Chemist and Druggist,*

NOTES ON PRUNING.

By A. DESPREZIS.

Numerous enquiries reach the Department of Agriculture every season on the matter of pruning. The subject has already been discussed with detail in previous publications, and to Parts 4 and 5, Vol. V., 1898, of the *Producers' Gazette and Settlers' Record* I must refer those in search of more definite information on this subject.

Of the methods of pruning, there are two practised in the orchard, viz.; winter pruning and summer pruning. In the course of these notes, the first method alone will be considered.

Several objects are aimed at when pruning. It helps to control the growth of the plant and train it in such a way that the operations of cultivation, of treating and dressing the trees and vines whenever required, and of gathering the fruit, are made easier and more economical. It equalises the wood and fruit capacity of the tree, checking the one to favour the other if need be, suppressing rank growth of the boughs or limiting the productiveness of the plant in such a way that the quality is not affected by the excessive quantity of the fruit crop.

It checks the growth of suckers, water sprouts, and unsightly knobs and enlargements along the stem and branches; it tends to keep the plant in a thriving and healthy condition, promoting the growth of luxuriant foliage which tend to shelter the fruit and limbs from sunburn.

PRUNING OUTFIT.

The tools required for pruning are few, but it is essential that they should be of the best quality and of a type suitable for the work to be done. It is also essential that they should be kept in good order, sharp and smooth, as a jagged or a blunt blade will inflict upon the wood bruises and injuries which will either cause the sap to sour and the limb to die back or will delay the healing of the wound and thus leave a door open to the entrance of the fungi of canker and other moulds productive of rot and decay.

Secateurs, or pruning shears, are easier to handle than the pruning knife. They do the work quickly, neatly and without giving a jerk to the branches of fruit trees and vines as does the pruning knife.

The first illustration represents Riesler's Secateur, which can be procured in Perth. It is sold with a duplicate blade made of well-tempered steel, the tool is made of chilled steel, the tool is 9 inches long, strongly made and well finished.

The second illustration shows two types of secateurs and a handy pruning saw. The longer pruning shears, 15 to 17 inches long, is a two-handled one and a very powerful tool, suitable for pruning strong vines and hard and knotty wood. One of its handles is chisel-shaped and is found very convenient for suckering vines or trees, an operation which, when made with the blade, jags its edge and makes it blunt.

The edge of the blade of the secateur should be kept sharp by the use, whenever required, of a small hone or an oil stone, while the file will keep the teeth of the pruning saw well set.

When using the secateurs a clean and neat cut is given by seeing that the blade, and not the prong, faces the part of the wood which is left on the plant. As strong branches as can well be inserted between the blade and the prong can with little effort be snapped by gently pushing the top part of the branch or rod it is intended to cut away from the operator and against the prong side of the secateur.

The pruning knife, if kept sharp, will, in the hands of an experienced pruner, do very good work, and makes a very clean cut, which soon heals over. The blades should be strongly made, of the best steel, and with a beak curved at a sharp angle. A rough buckhorn handle will ensure a good grasp in the hand while in use; the blade, well-ground, will be found useful for trimming and paring the wound and giving it a smooth face after sawing.

To the other tools and appliances described, the following two will be found of great use when high trees have to be pruned and handled:—

This long pruning shear, mounted on a light pole about the size of a broom-stick, six to eight feet long, is a very handy device for reaching to the tops of the higher trees. It is found at the leading ironmongers.

An orchard ladder, properly constructed, is a very handy appliance when pruning trees and gathering fruit.

Orchard ladders of several designs are made. Some consist of a pole of a fibrous kind of timber, such as stringy-bark, bound with a strong band of hoop-iron a foot or so from the top end; this will prevent the pole, which is sawn to that point, splitting when the two lower ends are stretched and the rungs fastened.

Hinged, four-footed step-ladders, like the one here illustrated, are, as a rule, clumsy appliances, which are inconvenient on hillside or uneven ground besides being heavy and easily dislocated. Those found ready-made for sale in shops are often so lightly made as to be of little use in the orchard.

Varnish or wax paper is found useful for preventing wounds, caused by the removal of a large limb, cracking and decaying owing to exposure; it also promotes a more speedy healing. For that purpose gum shellac is often used. It is made by dissolving in a little strong alcohol as much gum shellac as will make the varnish of the consistency of paint. This varnish is kept in a well-corked flask, with a mouth wide enough to admit a brush, and is thus always ready for use. It is applied over the cut surface, well pared with the knife. Other good coverings for wounds made in pruning are also common white lead paint, grafting wax, coal tar, in the order named. The last-named is often a hindrance, while pine tar is even somewhat detrimental to healing.

CUTTING TO A BUD.

It is important before cutting off a branch of a tree or a rod of a vine to make sure that the last bud left on the plant, and which is intended to prolong the growth of the plant, is a sound, plump one, likely to grow, or whether it has accidentally been rubbed off or otherwise destroyed. Such a terminal bud should be a leaf bud, and not a fruit bud.

Leaf buds differ from fruit buds in being more elongated, flattened, and more pointed in the same species of plants; they are either single, or give growth to single shoots, or double and even triple, when grouped in small clusters, two or three together, as in the case of stone fruits, they produce either leaves or branches.

Fruit buds are distinguished from leaf buds by their rounder and fuller form, the scales that cover them are broader, and they begin to swell and burst open earlier in the Spring.

Fruit buds are also single, as in the case of apples, pears, quinces or single, double and triple, as in stone fruits and berries. They are, besides, simple or compound; that is to say they produce but one flower, as in the peach, nectarine, almond, and apricot, or two or more flowers, in clusters, as in apples, pears, plums and cherries.

All buds are leaf buds when first formed; some at a later stage develop, either by being allowed to mature naturally or by artificial means, into fruit buds. Many trees develop their fruit buds towards their terminal shoots, unless these are cut off, when those left at the base of the branch, or along it, are thus excited into growth, and transformed into lateral fruit buds.

When cutting to a bud a slight slant is generally given to the cut, at a place close to the bud, although in so doing it is advisable not to approach the bud too closely, nor on the other hand leave above it a useless stump, which might engender decay; a piece of wood about an eighth of an inch above the bud is sufficient to leave. In the case of the grape vine the practice is often to cut though the joint, above the last bud it is intended to leave on the spur, as shown at C2. A longitudinal section of the young wood of a vine shows in each joint a tubular cavity filled with pith; at each joint or node that tube is closed, as in the case of the

bamboo, and if the section is made at C1 that pith dries up and the bud below is at times endangered. The section should be made either at C or at C2 as shown on the fig., and never at C1. The buds B. are those left on the spur. D is an axillary bud which often fails to shoot. E is a piece of the previous season's wood.

WHEN BEST TO PRUNE.

For the winter pruning of deciduous trees, May, June, July and August are the best months. Pruning may be started directly the wood is ripe, when the leaves fade and begin to drop off. It is recommended to give to apricots and cherries a preliminary pruning in the late summer, after the crop has been gathered. Trees thus pruned are less subject to gumming and dying back, and the leaf buds have thus more time to transform into fruit buds, and to perfect themselves.

As a rule older trees are ready for pruning before younger ones.

In frosty localities, where stagnant cold air hangs about hollows and gullies, it is advisable to delay the pruning of vines, peaches, and plants whose sap moves early, until later in the season. This delays the period of active growth, and may save the crop. As regards the grape vine, late pruning is, if anything, also preferable to early pruning, in respect to yield of the crop and earliness of the period of maturity; but of course where wide areas have to be gone through, it is not possible to delay until the right moment this operation.—*Journal of the Department of Agriculture of Western Australia.*

SOME RECENT INVESTIGATIONS IN THE CHEMISTRY OF AGRICULTURE.

A Lecture delivered on College Day at the Saidapet College of Agriculture, Madras, by Dr. J. W. Leather, Ph. D., F.I.C., &c., Lecturer at the Imperial Forest School, Dehra Dun, N.-W.P.

When you did me the honour to ask me to read a paper on College Day, I thought that I could not well choose a more suitable subject than the one which has been announced, namely, a brief account of some of the recent work on the chemistry of agriculture.

As a matter of fact, however, I have found it impossible, without unduly occupying your time, to deal with more than one or two subjects, and I have had to leave unnoticed the greater part of the very extensive work which has been done on vegetable physiology.

SOILS.

There is perhaps no subject which has claimed the attention of the agricultural chemist more than the soil, and there is certainly no subject which is more deserving; at the same time it is one of the domains of agriculture about which, if we have learnt much in the past, we have much to learn in the future.

Playfair when editing Leibig's Agricultural Chemistry, expressed surprise that the chemist of that day should be content with the determinations of the amount of silicates and iron and alumina, leaving the potash, phosphoric acid, &c., undetermined. It was a comparatively simple matter for the chemist to free himself from this criticism, and he proceeded to determine the amount of the valuable plant foods, the lime, potash, phosphoric acid and nitrogen, with very great precision. This told us how much of these ingredients were in the soil.

As years passed on, it became evident that, valuable as this information was, it was insufficient. The chemist would find what appeared to be only a small proportion of potash or phosphoric acid, whilst if a manure were given to supply the deficiency, it might happen that the crop did not respond to the more liberal treatment in such a measure as

one might have expected. Or, conversely, it was found that whilst a few tons of farm manure, or a few hundred pounds of more concentrated artificial manures, would have a remarkable effect on a crop, the actual amount of plant food contained in such manures, was far less than the soil itself contained.

One explanation of this was provided by the teachings of the field experiments at Rothamsted, which showed clearly enough that all crops have not the same requirements. It was found, for instance, that the cereal crops were particularly effected by a nitrogenous manure though at the same time it paid to give them mineral plant food also. Turnips and Mangels showed that if the supply of phosphoric acid were not liberal, they felt it keenly, and returned, for an application of comparatively small allowances of super-phosphates, a largely increased crop.

The third class of plants which fills an important place in English agriculture, namely, the Papilionacæ, behaved again differently, and often refused to grow at all in a field, however liberal the supply of manure might be. The latter is for several reasons perhaps not quite so suitable an example as the two former, but the evidence, as you will see, went to show that the methods employed by the chemist in the analysis of soils, were by no means perfect.

One fact that appeared very striking was that soils, which either appeared poor from the chemical analysis, or were actually known to be poor agriculturally, contained admittedly very much more plant food than several, or indeed many, crops required. It was known that at the most, a good crop only required a few pounds, 10, 20 or 30, of potash or phosphoric acid, whilst on the other hand soils rarely contained less than 1 per cent. of either of these plant foods, usually indeed more than this, and such a proportion amounts to no less than about 4,000 lb. per acre in the surface soil, to say nothing of the stores which the sub-soils were known to contain.

It was clear that all this plant food could not be equally within the reach of the crops, that some portion of it must be in a different state of combination to another, the plant being able to assimilate the one more readily than the other. One commenced to speak therefore of "readily available plant food" as distinct from that which was not so.

Whilst a recognition of such a difference was easy, and the problem to be solved made clear, the method of differentiating between, say the portion of the phosphoric acid which the plant could readily utilize, and that other portion of the same material which it could not, was by no means clear.

Ville offered a method, which was at least roseate on the surface. He said, why not divide the land to be examined into plots, and to one plot give all the valuable plant foods excepting one say phosphoric acid, to another plot give all the several plant foods excepting another, say potash, and by providing a series of manures each deficient in one particular food, surely, will not such a method enable one to tell, from the weight of crop raised, what the soil is deficient in?

The Rothamsted experimenter, had however shown very clearly that one cannot accept the answer which one sort of crop might give, as being that which would be given by another sort of crop. And furthermore, that in the case of field experiments with crops one season is not sufficient to provide a definite answer, that, indeed the experiment must be repeated at least a number of times before one can eliminate from it the influences of season, and the original inequalities of the land. Such a method then becomes impracticable, for the farmer does not wish to wait years before he knows what sort of manure to apply to his crops.

Latterly, Wifart has experimented upon the value of another method, based on somewhat similar lines. He raised the question whether, supposing a crop say of wheat, be grown in a soil which is deficient

in some one food, will the grain have a normal composition, or will it prove to contain less of the element in which the soil is deficient, than is common to it? Whilst the stems and leaves of a plant vary very much in composition, that of the seed remains usually very constant, and the question was, would grain produced from a soil deficient, say in phosphoric acid, be itself deficient in this substance? He has therefore tested this question by growing plants in pots of the particular soil under examination, to which manures of different composition were added. After the grain was perfected, he has analysed it to see if, from its composition, the deficiencies of the soil might be detected. The work is comparatively new and is probably still incomplete, but the last paper published indicated that whilst the method might be used for one particular crop, any one soil would have to be tested in relation to its value for each crop separately. This naturally entails a very great deal of labour.

The foregoing relates to methods in which it has been sought to utilise the services of the plant itself to answer the question—"In what respect is this or that soil deficient?"

I turn now to the question of applying tests in the chemical laboratory.

Some investigators, more particularly in Germany, attempted to apply certain dilute solvents to the soil, which might provide a measure of the available plant food.

Such a method has a great advantage over any cultivation experiment, because it can be accomplished in a short time. On the other hand, many considered that such tests were unsuitable. If the chemist takes a portion of soil and submits it to any treatment, he is submitting the *whole* of that portion to a like treatment. The roots of the plant, on the other hand, do not come in contact with more than a certain limited number of soil particles.

About ten years ago Dr. Dyer of London took up the matter in a somewhat different manner.

The *agricultural value* of some of the experiment fields at Rothamsted was known with great accuracy. Here a plot of land was known to be deficient in phosphoric acid, there another which was with equal certainty deficient in potash, and Dr. Dyer raised the question whether it might not be possible to find a chemical standard which, though more or less arbitrary in itself, would have a definite relation to the known qualifications of some of the Rothamsted soils.

Dr. Dyer's method of procedure may be stated very briefly. It may be assumed that much of the food of plants exists in the soil in a more or less insoluble state, and that it is rendered soluble by the action of the juices of the roots, which are acid. The amount of such acidity was therefore determined in the roots of a great number of plants, and from the result of this investigation an artificial acid solution was prepared. This resembled more or less the root sap. Dr. Dyer then allowed this to act on certain of the Rothamsted soils for a given time, and determined the amount of potash and phosphoric acid which has been dissolved. In order to illustrate the result obtained, the following may be quoted:—

Proportions of "readily available phosphoric" acid in Rothamsted soils.

Thirty-nine crops of Barley had been taken off the land.

Manures used per acre.	Yield, 1890. Bushels grain.	% of readily soluble P_2O_5
Plot 1—O. Unmanured continuously	13	·0055
2—O. $3\frac{1}{2}$ cwt. super- phosphate	16·75	·0463
1—A. 200 lb. ammonia salts	24·5	·0060

Manures used per acre.	Yield, 1890. Bushels grain.	% of readily soluble P_2O_5
2—A. 200 lb. ammonia salts and $3\frac{1}{2}$ cwt. super-phosphate	33·5	·0425
1—AA. 275 lb. Nitrate of soda	29·5	·0067
2—AA. 275 lb. Nitrate of soda and $3\frac{1}{2}$ cwt. superphosphate.	47·5	·0350

In this statement is set out in the first column the manures employed on the different plots, and in the second column the yield of barley per acre in 1890, that being the thirty-ninth crop. The effect of phosphates will be readily perceived. Plot 1—O, which has always remained unmanured, yielded 13 bushels, the next plot manured with phosphates yielded 16 $\frac{3}{4}$ bushels. Similarly, from plot 1—A manured with ammonia salts, 24 $\frac{1}{2}$ bushels were reaped, whilst an addition of phosphates raised the yield to 33 $\frac{1}{2}$ bushels. The third pair of plots yield similar evidence. 1—AA, manured with nitrates yielded 29 $\frac{1}{2}$ bushels, whilst an addition of phosphates effected a yield of 47 $\frac{1}{2}$ bushels.

It is clear, then, that plots 1—O, 1—A, and 1—AA were all in need of phosphoric acid.

When these several soils and others also, for I only give here a small extract of Dr. Dyer's work in order to illustrate his method, were treated with a dilute solution of citric acid, it was found that these soils yielded the proportions of phosphoric acid which are found in the third column of the statement. From these figures you will see how very great is the difference between the amounts of readily available phosphoric acid in the soils of the several plots. Where barely had been grown for a long series of years without phosphatic manure, the proportion of readily available phosphoric acid had fallen to a very low figure, '005 or '006. Where phosphates had been annually applied to the land the proportion was many times greater.

The deduction which Dr. Dyer made, was that, if a soil contain less than '01 per cent. of readily available P_2O_5 , or less than '005 per cent. of readily available K_2O , such a soil is probably in need of an artificial supply of this plant food.

It is very desirable to bear in mind that this standard is not one made arbitrarily by Dr. Dyer, but one which was indicated by the Rothamsted soils.

It did not however follow that a standard which was applicable to Rothamsted soils would be equally applicable to soils generally. The method has been since applied to soils in other parts of the world, and apparently it has a remarkably uniform value. In India I have had a like experience. Applying it to the soils of the different experimental farms, it has shown that at Poona, Nagpore, Cawnpore and Dumraon these is rather more than the '01 per cent. of available P_2O_5 in the soil, and at none of these farms have bones proved of material value as manure. On the other hand, the soil at Burdwan contains a low proportion of phosphate, and it is only at this farm that bones have proved of any value.

The evidence which has been gained in England with Dyer's method has gone to show its general applicability for the determination of the soil's requirements for potash as well as for phosphoric acid.

In India no manurial experiments has been made at the Farms to test the question whether the soil is in urgent need of an artificial supply of potash, but I may mention that most, if not all, these soils contain more available potash than what, according to Dr. Dyer's test, is a minimum quantity. Thus, so far as these two elements are concerned, one may say that the chemist has supplied a means of detecting whether any particular land is urgently in need of an artificial supply of them or not.

NITROGEN.

It will have been noticed that in the above all reference to nitrogen has been omitted:

It has been known for a long time now that, whilst the mineral foods remain in the soil in much the same state of chemical combination, suffering within moderate periods of time but little change, the nitrogen compounds of the soil are constantly undergoing very great changes. When first placed in the soil, either by accident, such as the remains of crops or leaves of trees, or by the agency of man in the form of farm manure, the nitrogen exists as a part of complex compounds, which are classed principally under two heads, the albuminoid and amide bodies.

It then becomes forthwith the food of a host of micro-organisms which resolve it gradually into simpler states of combination, such as ammonia and nitrates. Another class of organism is unfortunately also present, which may proceed a step further than many of us consider desirable, for it liberates the nitrogen altogether, a state in which this element is useless to most plants.

Now these changes in the condition of the nitrogen of the soil are constantly going on, more vigorously at one time than at another, a moderate degree of warmth and a proper supply of moisture being among the most desirable conditions. Furthermore, since some of these nitrogenous compounds are soluble in water, they are apt to be carried away by drainage water, which is not the case with either phosphates or potash. Thus it is probable that no simple method will ever give us the answer corresponding to the one we have for valuing the supplies of the mineral foods.

At present, at any rate, we can only determine the total amount of nitrogen in a soil, and judge from it whether it will repay us to supply manure.

So far as Indian soils are concerned, I may say that, with few exceptions, they uniformly contain very low proportions of nitrogen, and at the experimental farms we have found that nitrogenous manures have given greatly increased crops. In a series of experiments at the Cawnpore farm for instance, farm yard manure has produced, weight for weight, a greater increase of wheat over a period of 15 years than it has done at either Rothamsted or Woburn in England.*

NITROGENOUS FOODS.

Chemists have, however, sought to answer another question about nitrogenous food for plants.

I have already indicated the states in which the nitrogen exists in the soil. There is in addition a very abundant supply of free nitrogen in the atmosphere. It has therefore been a problem to determine in which of these different states is the nitrogen most useful to plants.

As to the nitrogen of the atmosphere, I need not dwell at any length, more especially as I dealt fully with the subject in this room about 12 months ago. You are all probably aware, that it has been proved that elementary (i.e., uncombined nitrogen) is assimilated by the plants of the papilionacea and likewise by some of the algae, but among our farm crops, those of other natural orders are dependent on a supply of combined nitrogen.

Many years ago, experiments were made by Cameron in England, and Hampe, Knop and Wagner in Germany, to test whether the higher plants were able to assimilate various forms of combined nitrogen, and the result of the experiments was that the cereals were found to assimilate such nitrogenous compounds as urea, hippuric acid, glycocholic acid and guanidin, as well as nitrates and ammonia.

Later, however, it became evident that these experiments were open to doubt. It became known

that nitrogenous substances may be readily changed by the various micro-organisms into simpler compounds. It followed as quite possible, nay probable, that in Cameron's experiments, the complex nitrogenous compounds which he had added as manure, were, during the progress of the experiment, transformed by such organisms into simpler substances.

In order to determine definitely whether such compounds were useful to higher plants, the experiment must be conducted in the entire absence of such micro-organisms.

The question has therefore been lately taken up again, and with the result that, apparently none of these complex nitrogenous compounds are directly useful to higher plants. Lyebyedyer found that barley could not feed on them in the absence of soil-organisms. And he practically proved this result by adding, in a second series of cultivations, a quantity of organisms from a soil, when his barley plants managed to make some headway. The growth was only moderate, for the plant had to wait until the micro-organisms had reduced the complex compounds to simpler forms. Finally he showed that nitrates, supplied in the absence of bacteria, were readily assimilated. Other workers have been Maze, Lietz and Pagnoul, whose experiments generally confirm those of Lyebyedyer. These experiments are quite recent and will probably be repeated, but it is highly probable that the higher plants can only assimilate nitrates and ammonia, and that the more complex nitrogenous compounds must first be converted by the myriads of minute organisms, which inhabit the surface soils, into simpler compounds, before they can be useful to our crops.

Before passing on to the next chapter of this paper, I must not omit a very brief reference to the work on soils which Professor Hilgard, and those who are associated with him at the University of California, have undertaken. It consists of an exhaustive examination of the inherent differences which exist between the soils of the humid and the arid regions of America. Unfortunately these investigations cannot well be done justice to in any brief digest, and I must therefore refer my hearers to Dr. Hilgard's original papers. Nor shall I detain you with details of the investigations which Hilgard and Loughbridge in America, and I, here, have made on the salty land called *usar* in India, or "alkali lands" in America; excepting to say that, whilst working independently, we have arrived at corresponding conclusions. The result of those investigations has gone to show that comparatively small amounts of these salts are sufficient to prevent the proper growth of crops; that in some cases drainage may effect their removal, though in other cases the soils are in a less amenable state. Also that in some cases gypsum may be of service, in other cases useless.—*Indian Forester*.

(To be Continued.)

SUBSTITUTES FOR TEA.

At the present time, when the important question of how best to increase the consumption of tea with profit to producers and pleasure to consumers is engaging so much attention, it may be interesting to remind readers in this country that the cup that cheers does not everywhere contain the beverage with which we are all so familiar and which is prepared from the leaves of a plant that is known scientifically as *Theacoinensis*. "Tea" is, in fact, an accepted term for a good many beverages that are no more tea than beer is, any infusion or decoction made from the leaves, flowers or twigs of edible plants and shrubs being conveniently described as tea. To begin with, it is doubtless commonly known that in many parts of Southern India, the Natives prepare a palatable and aromatic beverage from the long leaves of the lemon grass. The leaves

* (An exhaustive examination of these experiments is now in the Press.)

are gathered fresh and tender, infused in boiling water, and then served with sugar and milk added, although the poorer classes do without the addition of the last luxury. The preparation is known as *pachachuya* or green tea, and it is highly valued as a night drink for patients ailing with certain disorders, for the leaves possess carminative, anti-spasmodic and other medicinal properties. The people of Arabia and Abyssinia make their tea from the twigs and leaves of the shrub known as *Catha edulis*. Slender shoots of the plant along with the attached leaves are gathered and made into bundles, and when required for use, a decoction is prepared which is said to be pleasant to the taste and very similar to ordinary green tea. The leaves are also chewed by the labouring classes in Arabia and Abyssinia when food is scarce or when work demanding physical endurance has to be accomplished, for they are believed to possess the property of sustaining human energy. *Catha*, as the beverage is properly called, had to make a struggle to obtain popularity among the Arabs, for when it was first brought into use, the orthodox condemned it on the ground that it was excessively stimulating, and, therefore, *taboo* to Mahomedans. But a Council of learned and holy men assembled to discuss the matter and arrived at the conclusion that though a stimulant, the drug was not sufficiently intoxicating to be included in the category of drinks forbidden by the Koran. It is said to produce great hilarity of spirits and to remove drowsiness. The leaves of a species of *Hydrangea* are very largely used in Japan as tea, being prepared in the form of a decoction, and the beverage is so highly valued by the Japs that they call it, with true Oriental imagery of expression, *Ama-tsja*, or the Tea Heaven. In Tasmania and the Falkland Isles, species of myrtle are used for tea, the leaves being infused and furnishing a fragrant and fairly palatable drink, which has, however, to be made weak, as the leaves possess emetic properties. Other species of trees belonging to the myrtle order, such as the *Glaphyria nitida*, in Bencoolen, the *Leptospermum*, in some of the Australasian Colonies, and the *Eugenia* in Chili, are all largely used by the Natives for the same purpose. It is almost a matter of history that a certain species of myrtle often served for tea on board the vessels of Captain Cook's expeditions in the South Seas. In parts of Siam, a leaf known as *Laoten* is the substance which furnishes the people with their drink. The leaves are steamed, tied up into bundles and buried in the earth for several days, and after they have undergone a process of fermentation they are taken out and either drunk as tea or chewed. Like the *catha* of the Arabs, this tea is supposed to impart powers of endurance to those who partake of it. The leaves are so prepared that they keep well for over a year.

A particular species of *Simlax*, the roots of which constitute the sarsaparilla of commerce, was at one time very extensively employed in Australia as the tea of the Natives, and thereby came to obtain the title of Botany Bay tea. In parts of Africa, a leguminous plant, akin to the English broom, furnishes the leaves known as Bush tea, the prepared drink possessing an agreeable smell and a pleasant taste, not very different from the tea that is served at our own tables. Another leguminous plant is used in Chili as a substitute for the more famous Mate or Paraguay tea. Mate itself is of considerable importance, being very largely used in Paraguay, Brazil and other parts of South America. It is also known as Jesuits' tea and St. Bartholomew's tea. It is plucked from an evergreen plant of the holly tribe, the leaves being roasted on the branches, stripped off when dry, and coarsely powdered. The powder, with sugar to taste, is thrown into a cup, which is then filled with boiling water. Sometimes, burnt sugar and lemon squash are added to heighten the flavour. The beverage is not drunk, but is slipped up through a glass tube. Three brews are commonly

made use of, the first one being the most pleasant to the taste and but slightly stimulating, the other two being very much stronger, and yet harmless. Mate has been drunk by the Natives of South America almost from time immemorial, and it is called Jesuits' tea merely because the Missionaries were the first to cultivate it systematically, and just in the same manner as quinine is known as Jesuits' bark. Afternoon mate is as fashionable in South America as five o'clock tea in English drawing rooms. The consumption of mate in the various South American Republics is from 30 to 40 millions of pounds annually. The Brazilian variety of this tea is known as Gongonha.

In North America, we find another species of holly largely used by the Indians for the manufacture of a kind of black tea, which is said to contain the active principle of China tea and to possess certain advantages over the latter. It is sometimes called Appalachian tea. The United States Government has lately interested itself in this shrub with a view to ascertaining whether it could not be brought under systematic cultivation. In the same region, the leaves of a species of *Viburnum* or honeysuckle are mixed with the above, the result being locally considered a fairly satisfactory blend. In Tropical and Central Africa, a species of *Eupatorium*, or daisy, makes an excellent tea, the dried leaves, which are used for the purpose, giving an aromatic smell and an agreeable taste. The use of this tea, which is now known in Mauritius, Ceylon and elsewhere, is said to be harmless. The leaves are also possessed of valuable medicinal properties. This tea, it may be mentioned, is commonly known as Ayapapa. In parts of the East, *Ocimum* leaves furnish what is known as Tuist tea, while the dried leaves of the wild marjoram are a popular substitute of China tea. Two other species of marjoram are employed in North America for the preparation known as Oswego tea, while an allied species of rosemary is another occasional substitute for tea. It may not be generally known that in Sumatra and some of the adjoining Islands, as well as in parts of India, the poorer classes, with whom necessity is the mother of invention, employ the roasted leaves of coffee for an infusion which goes under the name of coffee tea, but we would doubtless want our palates especially educated to discover anything satisfying in such a wonderful decoction. In North America, two species of heath are pretty largely used as substitutes for China tea, one variety going by the name of Salvador tea and the other of Labrador tea. Turning to Europe, we are at once reminded of the extensive use to which a species of Mullein or Figwort has been used for centuries by the Germans in the preparation of tea, the flowers and not the leaves being used, and care being taken to detach the hairy filaments which cover the flowers and which would cause a most irritating sensation if taken into the mouth. Mullein has been so largely employed that it has obtained the name of *The de V' Europe*. Finally, it may be mentioned that the familiar English cowslip was once largely used in England by the lower orders for the manufacture of a tea by the name of Paigle. It would not be difficult to mention the names of several other plants, shrubs and herbs, whose leaves, flowers or roots have at some time or other administered to the service of man as substitutes for tea, but enough has been said to show that our familiar friend, China tea, is not the only beverage that the world has drunk out of "the cup that cheers but not inebriates." Yor.

Madras Mail, 11th Oct.

MANURE FOR TOBACCO—Where wattle ashes can be procured, they are said to form an excellent manure for tobacco. Mr. J. M. Van Leenhoff, tobacco expert in Natal, states that they may be used for procuring a mild, good burning tobacco. The ashes should be ploughed in very shallow, four or five months before planting.—*Queensland Agricultural Journal*,

THE AMERICAN "BOY TRAVELLER" ROUND THE WORLD.

IN THE PHILIPPINES :

WHAT HE THINKS OF MANILA AND ITS TRADE, NEW AND OLD PRO- DUCTS, PROSPECTS, &c.

AMERICAN JUSTICE AND THE "FILIPINOS."

Manila, P. I., Sept. 28.

I am leaving on Monday for Hongkong, and this morning the spirit moves me to write and tell you something of my experiences since leaving Ceylon. It seems an age since I visited your sunny isle, not but what I have a lively recollection of your kindness and my good times, but because so much has transpired since. As you know, we proceeded from Colombo to

SINGAPORE,

where, much to my disgust, we remained five days. I didn't find the city nearly so interesting as your capital, and one day sufficed to exhaust all the "sights" there were to see: I visited the Botanical Gardens the first night, to attend a band concert, but that was the only experience in Singapore which I will remember with real pleasure. The Chinese were everywhere, and I think we have too many of them in New York to be interested in seeing them out here. I thought at first that their shops and residence streets were worth seeing, but they were all alike, and the smells were nauseating. I think you should be glad that you haven't the Chinese plague in Colombo: the Sinhalese are ever so much nicer to have around. All the English in Singapore say they couldn't possibly get along with only the Malays to do the work, and that is doubtless true, so they are wise in making the Chinaman welcome.

I have been in

MANILA

now for three weeks, and in some ways I am greatly pleased with our new possessions. The city of Manila, under proper laws, should become one of the greatest ports in the East, if not the very greatest, next to Hongkong, because the Islands are evidently rich in agricultural, mineral and timber resources; and there must eventually be built up a great exporting business. The Government has experts who are investigating these resources, and their reports have so far been very encouraging. In lumber alone there is untold wealth, and there are millions of acres of uncultivated fertile lands. The tobacco and orange plantations are by no means as numerous as they should be, and, of course, there are unlimited possibilities in the cultivation of hemp and coconuts. This must surely be one of the richest archipelagoes in the world, and I trust we Americans can make it pay.

Conditions, as you have read, have been rather discouraging until the last few months. The insurrectos kept up their guerilla warfare in several of the provinces, and the whole country was unsettled and anxiously awaiting what was to come next. But since

Civil Government was established, on July 4th, everything has quieted down. There is fighting in only two or three of the most remote districts, and the vast majority of the Filipinos seem to have become good Americans. In Manila business of every kind is on the increase, and everyone takes it for granted that the war in the Philippines is over. But the Civil Commission has still a great deal of hard work ahead of it. They have to proceed with exceeding care, for fear of making a mistake now which will have to be paid for with interest later on. Governor Taft is a strong man, and he is making a deep study of conditions, so I have faith that everything will come out all right. Business development will be slow until our Congress meets in December and decides the status of the islands. Then American banks can be established, and large corporations will not hesitate to invest their capital. It appears certain that some great fortunes will be started out here within a very few years, and I hope that there will soon be several lines of American steamers running around the islands. The line which at present does all the business is owned in England, and unfortunately the managers are not disposed to treat Americans with much consideration. The same is true of the two English banks here, so that I am afraid your countrymen are not laying a good foundation for future success here.

The streets and public buildings of Manila are being rapidly improved, but there is plenty to be done before the city can compare with Colombo, Hongkong and other English Colonial cities in the East. The Spaniards found the Philippines a source of revenue, but the revenue was certainly not spent here, from the looks of things. It is expected that an electric railway will soon be started by an American Company, and various manufacturing concerns are contemplated. The Government has erected the largest artificial ice plant in the world, so our soldiers have plenty of coolness during these hot days.

There is a large element

"AT HOME"

which is anxious to get rid of these colonies in any possible way, but I'm sure that if they saw these people and how glad they are to have American justice, they would be willing to accept this great responsibility which fate has thrown upon us. It is possible that we won't be quite so successful at first as England is now in governing her colonies, but I feel confident that we will in time do just as well. I hope we won't be looked upon as you English look upon France and her colonies,—something to be laughed at. What man has done, man can do, and after all, we're of the same blood, and should share the same capabilities for colonisation. I only hope that the extreme Republicans at home won't insist on giving the Filipinos full citizenship. They may deserve it after a while, but at present they need a lot of educating. Several hundred school teachers have recently arrived from the States and are being scattered through-

out the provinces, so in a few years we may expect to hear English where we now hear Spanish.

I must close this rambling narrative. I am looking forward with pleasure to seeing China and Japan and then to getting home, for I am rather tired of travelling. My articles on Ceylon will soon begin to appear and I will try to send you copies of some of them, so you will know I wasn't exaggerating my appreciation.

HARRY STEELE MORRISON.

THE TEA TRADE: AMERICAN NOTES.

A British Consular report from Kiukiang states that in brick tea the export shows an advance from 51,610 to 60,794 hundred-weights, but this is partly accounted for by the fact that whereas the figures for 1,900 include a portion of the 1899 crop, none of the 1900 crop was left over to be dealt with in 1901. The same remark applies to tablet tea, of which the output has, however, slightly fallen off. Expensive hydraulic

ENGINES FOR MAKING TABLET TEA

are now in use in the factories, and the old wooden presses for making the bricks are being, or have been, replaced by steel moulds of an improved pattern. At the beginning of last season the price of the dust used for brick tea ruled at about 11 to 12 *taels* for *pieul*, and against 7 to 8 *taels* in 1899. The Chinese dealers combined to demand 13 *taels*, but the outbreak of the northern troubles compelled them to accept a reduction, and before the season closed they were selling at about 6 *taels*. For tablet tea a better quality of tea, at considerably higher price, is required.

For the manufacture of brick tea the dust is moistened by steam. It is then subjected to a pressure, applied by steam power, of twelve tons to the whole surface of each brick. The pressure is only applied for a second or two, but the mould is immediately locked with wedges and kept so for about two hours. The bricks are about 8½x6 x1 inch in size, and vary in weight from one to two and one-half pounds for different grades.

The tablets are made by means of a hydraulic press. The dust is used dry, and a very high pressure is required, as it is only applied for a fraction of a second. When made they somewhat resemble cakes of chocolate, weighing about four ounces each. They are then tastefully wrapped in paper covers, and packed in baskets suitable for camel transport.

The British Army requires 1,000,000 pounds of tea annually. Brig.-Gen. John P. Hawkins (retired), late Commissary-General United States Army, stated that, during the Civil War, the troops in his division travelled farther, and sustained the fatigues of the

MARCH BETTER, WHEN TEA WAS SERVED

instead of other beverages.

W. K. King & Co., Detroit, Mich.:

"Tea-drinkers are rapidly dying-off. America is destined to become a great coffee-drinking nation."

Mau, Sadler & Co., San Francisco.:

"We decidedly think the

DEPRESSION IN TEA IS DUE TO THE PRESENT DUTY. The imposition of the duty has been a detriment,

decreasing the consumption among the poorer and medium classes. The duty has caused the importation of very much lower grades. Less fine tea is used at present than formerly. The removal of the duty would be a benefit to the consumer, and better grades would be imported."

C. W. Antrim & Sons, Richmond, Va.:

"We consider the depression in the tea trade due to two causes:

"First.—On account of the Government allowing low-class, trashy teas to be brought into this country before the duty was put on,

"Second.—When the duty was put on, it made the medium class of teas, that are great sellers, too high.

"Now, we think if the duty is taken off and low-class teas are prohibited, you will see quite a difference in the tea trade."

The above opinion are among many of similar import, given in reply to inquiries made by the *New York Commercial*. The facts are that the per capita consumption in 1901 is practically the same as in 1900, not varying over one-hundredth of a pound. The use of tea, judged by the per capita record, has been lower since the imposition of the duty of 10 cents per pound.

AMERICANS ARE NOT LOVERS OF TEA AS A

BEVERAGE,

and so because the average quality of imports has always been low—very low. Very fine tea forms a small part of the total imports. If consumers were educated to an appreciation of fine flavor, and would acquire the habit of using the beverage as a means of gratifying the palate the tea trade would be in a more satisfactory condition. But how can we expect the inexperienced housekeeper to appreciate niceties of flavor, and pay for the same, when tea experts differ as much as 20 cents per pound in their estimate of value on a sample of fancy Formosa Oolong?—*American Grocer*, Sept. 11,

THE COST OF PRODUCTION OF COFFEE IN BRAZIL.

A propos of the figures published in a late number of the *Review* on the cost of production at the Fazenda Uniao, a correspondent from Pernambuco writes under the designation of "Gold versus Exchange" as follows:—

Arrobas per	1896	1897	1898	1899	1900
1,000 trees.	170	87	121	57	217
Average exchange	91-32	711 16	7 5-32	7 27 64	9 27-64
Price per 15 kilos	8d	8s.	6s.	5s. 4d	6s.

A *reductio ad absurdum* to begin with! The table can be read to show that a low exchange causes the trees to bear less whilst a higher exchange causes them to bring forth more abundantly! This deduction is no more wide of the mark than is the assertion that exchange can affect the gold price—as great a fallacy as that it is the 'tail that wags the dogs.'

The sterling price—assuming that this is based solely on supply and demand and that Stocks and Visible Supply, are the prism through which the relative effect is foreseen, then we can arrive at an evident reason why Coffee was worth 11s. 8d. in 1896 and 8s. in 1897. In 1896 the reading of the prism was too optimistic, and so this year we got more for our Coffee than the actual circumstances warranted. In 1897 the reading of the prism was still too optimistic at 8s. for next year still shows a decline, notwithstanding a smaller crop. In 1898 the prism is still too optimistic, for next year shows a drop from 6s. to

5s. 4d. In 1899 the prism too low, for next year shows a rise from 5s. 4d. to 6s. and so we can go on *ad infinitum*.

The above seems to disclose of two fallacies, viz.—that exchange can be a factor in the fixing of the gold price—it at most, can only be a factor for accepting or rejecting the fixed gold price during, say, a month or two; the other fallacy is that of Dr Assis Brazil, and of many others, viz. that Importers and Retail dealers can combine to sell at fantastic rates. The import price, as we have seen, depends on the sanguine or doleful view of the probable effect of supply or demand, and the Coffee market is not yet nor is it likely to be collared by any one Trust, so supply and demand hold the field. As for the fantastic difference between the price of Coffee here and its retail price, this is naturally accounted for by the actual cost of retail distribution. A corollary can easily be deduced from all this, viz. that speculation can have much less to do with the price of Coffee than is often supposed to be the case.—*Brazilian Review* Sept. 3.

THE BOTANIC GARDENS AND GUTTAPERCHA.

The expedition to the hilly districts of the S W of Ceylon for determining the yield of guttapercha from indigenous species of Sapotaceae is meeting with undoubted success. The party consists of Mr Herbert Wright, the Scientific Assistant and Acting Curator of the Royal Botanic Gardens, Peradeniya, together with forest guide, plant collectors, interpreter, appu, and twenty coolies who are well loaded with boxes containing the necessary herbarium, paper, collecting utensils, preservatives, and general scientific instruments. Mr Herbert Wright, writing to a Colombo friend, states:—"Hinidookanda is just the place I anticipated. The soil is very poor, there is plenty of water, and an altitude of 2,200 ft. Under such conditions you will not be surprised to learn that I found over 70 trees of the particular species required, and some of which attain considerable dimensions. There is plenty of guttapercha in these trees and I could go on collecting for three months quite comfortably. Should the samples prove of high commercial value, it will be an easy matter to collect many thousands of seeds and seedlings of this species from Hinidook alone, to say nothing of Kittulgalla, Eratua, Singhe Raja, and Hewesse where I know this species to abound. The vegetation here is a perfect treat consisting of huge woody climbers, epiphytic ferns, abundance of pitcher plants, and that pretty leaved orchid—the finest in Ceylon—*Anactochilus regalis*, or Wana-*raja* of the Sinhalese. I had a fine stroke of good fortune with *Diospyros oppositifolia*, a species of ebony limited to, and almost extinct in, Ceylon. I did not find it until the 11th day and had well-nigh lost all hope of ever seeing it. Dr Trimen never saw it and Dr Thwaites described it as very rare. I managed to get male and female flowers, fruit and timber. You will remember that hitherto the female flower and fruit were unknown, I shall have to disagree with the opinion of Dr Thwaites about the value of the timber of this species which he asserted was equal to that of the Calamander. It is a plain white wood, and the trunk frequently

quite hollow. It grows alongside trees of Calamander and the appearance of the bark and the arborescent habit is the same for both species. Hence the source of error is obvious.

"We have some very pleasant evenings when the weather is fine, and to see the glare of a roaring fire and hear the crackling of the branches reminds one of other days along the west coast of Scotland; altogether it is a rough happy life and well worth time and money to experience."

THE SEYCHELLES.

The revenue of Seychelles last year was the largest ever collected, and amounted to R399,311, while the expenditure was R351,919. The revenue has gone on steadily increasing of recent years, and in the last 35 years it has increased more than seven-fold, while the expenditure has in most years been less than the revenue, and has invariably been so since 1895. Customs duties form more than half the total revenue. The value of the imports last year was, R908,911 and the exports R1,036,161. The chief exports are vanilla and coconut oil; small quantities of gum and tortoise-shell are also sent abroad, while rice, coal, cotton goods and sugar are the chief imports. The United Kingdom sends over a third of these, India nearly a third, Mauritius about a sixth, and France the remainder. In the preparation of vanilla, coffee, cocoa, and tobacco, the extraction of coconut oil, the manufacture of aloe fibre and lime-juice, the making of preserves and pickles, the extension of the fruit industry, and the development of the fisheries the colony offers full scope for the energies of its people. Seventy-four islands are included in the administration of a total area of 248 square miles; the chief is Mahé with an area of 55½ square miles, and nearly the whole of the land in all the islands is in private hands. The population was estimated at 20,275 at the close of the year, and has almost trebled in the last 50 years. The administrator of the colony, from whose report for the past year these facts and figures are taken, says that, in spite of the excellent climate, the islands are not adapted for white labourers, though Europeans do well as managers of estates and owners of property. Residents can lead an outdoor life without fearing the usual effects of exposure in tropical countries. "For a man of energy, perseverance, and temperate habits Seychelles affords as good an opening as any other tropical colony. But he must be provided with sufficient capital to enable him to buy land outright and to wait until the crops give a return. He must live on his estate, and make himself acquainted with the peculiarities of each vanilla vine as well as those of his labourers. He must be ready to learn and to make use of his knowledge when acquired. He should not rely, as many planters do, on the somewhat capricious return which a vanilla plantation gives, but endeavour to plant up his estate with other tropical products for which the climate and soil of Seychelles are well-suited. He should, in fact, be guided by the same principles

which actuate the skilled agriculturist in England and other countries, and remember that the chief elements of success are patience and hard work."—*London Times*, Oct. 2.

PRODUCE AND PLANTING.

The following letter signed "Taster," in the *Grocer* of last Saturday, shows that although some grocers are apathetic on the subject of the private tea auctions, others in the trade are doing their best to rouse up the sleepers. It says: "In view of the committee meeting of the Grocers' Federation in Glasgow next week, it may perhaps prove of interest for these gentlemen to learn that, so far from the secret tea sales 'fizzling out' as many grocers appear to believe, they are very much alive. Messrs. P. R. Buchanan & Co. continue well to the fore; and dealers and blenders are merrily competing every Wednesday for the privilege of squeezing the grocer. The ranks of the 'ring' have this week been swelled by the accession of Messrs. Shaw, Wallace & Co., who include tea from the Budla Beta Company in next week's private auction. This in itself is not a matter of much importance, so long as the great majority of leading merchants remain solid for the policy of the open door, but we have had some experience of the cheerful methods adopted by the 'Tea Buyers' Association in the matter of Ceylon sales, and if the supply of secret off-rings can only be made sufficiently large, there is little doubt that the private room would again be used as an engine of coercion against sellers in the public sales. The new ewe lamb will doubtless be welcomed into the secret fold next week with suitable adulation and plausible promises; a high price will probably be paid for him by his admirers, and he will be afterwards distributed to the confiding grocers. Whether the sellers obtain a better or a worse price at these sales is not a question into which I propose to enter. The seller has a perfect right to dispose of his property as he thinks fit, and in this case there may be advantages which are not apparent to other people. It is sufficient for the grocer to know that supplies are now forthcoming for secret auction from a fresh source. It might perhaps be well, however, for the retailer to clearly understand that the opposition on the part of merchants to the secret sale scheme does not arise from any special desire to protect the grocers' interests or to fight the grocers' battles; it simply arises from the fact that the great majority of merchants have the common sense to perceive that it would be as detrimental to their interests to be shut into a private room as it would be detrimental to the grocers to be shut out. The extraordinary apathy displayed by the grocers throughout the country in not grasping the fact that their interests are in this case identical with the merchants is certainly somewhat remarkable. I would venture to point out, that if the grocers do not see their way to speedily make common cause with the merchants who are combating the 'ring,' the 'fizzling out' process may develop in a way which grocers least expect."

Apropos the reference made in a recent issue to the Inland Revenue statistics about drink, a return prepared by the authorities of the Board of Trade giving information as to the consumption of alcoholic beverages in various countries contains plenty of material for thinking, and proves that there is plenty of scope for the consumption of tea, coffee and cocoa. Of the total revenue of the United Kingdom 36 per cent comes from the taxation of alcohol. The United States derive 29 per cent of their income, France 19 per cent, and Germany 18 per cent from this source. Of wine the United Kingdom consumes 0.39 gallon per head, Germany 1.45, the United States 0.33, and France 2.5 gallons per head. France is the largest wine-consuming country. The figures for our own country shows a consumption of 31 gallons of beer

per head, whilst France has 6 gallons, Germany 27, and the United States 13. In spirit drinking, as in wine drinking, France takes the lead. A comparison between Great Britain and her colonies is instructive. In New Zealand the consumption of wine amounts 0.15 gallon per head, that of beer to 8.6 gallons, and that of spirits to 0.69 gallons. Even more remarkable are the figures for Canada, where the consumption of wine is 0.08 gallon per head, of beer 4.0 gallons, and of spirits 0.68 gallon per head. It is clear that some of our colonies can give us lessons in temperance.

In this connection it is worthy of note that the writer of some special articles on the spread of temperance in the *Echo* says:—"Tea is the salvation of Australia. In Russia the whole of the vast nation would grovel under the rule of the vodka demon but for the counteracting effect of the samovar, which brews the most delicious preparations of tea to be obtained in the world; so Australia would in a few generations become a country of frivolous and volatile wine-bibbers were it not for the allurements of the teapot. Throughout the Australasian Colonies tea is taken at every meal by all classes. It is safe to say that our 'corn-stalk' cousins do not on the same average spend more than half as much on intoxicants as we do. The temperance movement is a much more powerful social factor there than here."

As will be seen on reference to the summary of the new Fiscal Bill of the Australian Federal Parliament, given in another column, the duty on tea per pound is 2d, plus twenty per cent ad valorem and on cocoa per pound, 2d, plus fifteen per cent ad valorem.—*H. and C. Mail*, Oct. 11.

KEW GARDENS.

Mr JOHN PURCELL QUINTON, a member of the Gardening Staff of the Royal Botanic Gardens, has been appointed by the Secretary of State for the Colonies, on the recommendation of Kew, Curator of the Botanic Station, Sierra Leone. Mr Aage Engelbreth Casse, Director of the Plantations and Experimental Gardens in Hayti. Messrs James G. Duncan and George Douglas, assistants in St. George's Park, Port Elizabeth.—"Kew Bulletin," April-June, 1901.

RETIREMENT OF CURATOR.—It will be a matter of genuine regret to all acquainted with Kew that Mr George Nicholson, F.L.S., was compelled by impaired health to retire on June 31st from the post of Curator of the Royal Botanic Gardens. Mr Nicholson entered the Curator's office on February 15th, 1873, after a public competition. In 1886 on the retirement of the preceding curator, the late Mr John Smith, Mr Nicholson was appointed by the Treasury to succeed him. Mr Nicholson's services to Kew are well-known. To him in a great measure is due the present efficient condition of the Arboretum. The *Hand list of Trees and Shrubs grown in Arboretum* was prepared by him, and is universally accepted as a standard authority for their nomenclature. Kew still hopes to retain the benefit of Mr Nicholson's botanical experience now that he has been relieved from the pressure of administrative duties.

NEW CURATOR.—The First Commissioner has filled the vacancy created by Mr Nicholson's retirement by the appointment of the assistant curator, Mr William Watson. This officer entered the service of Kew in 1879 as foreman. In 1886 he was raised to the position of assistant curator, in charge of the indoor cultivation; this, as curator, he will still retain. Mr W. J. Bean, the Assistant Curator in charge of the Arbo-

return, will now take the general charge of the grounds of the ligneous collections.—Kew Bulletin," July-September.

MOSQUITO BRIGADES FOR INDIA.

(To the Editor of the "Pioneer.")

Sir,—The great interest taken in the subject of malaria and mosquitoes by medical men and other persons in India suggests the hope that the time has now arrived when some general measures can be commenced to limit the propagation of mosquitoes in Indian cantonments, towns and plantations. The operations now being conducted in West Africa by the Liverpool School of Tropical Medicine, cordially assisted by the Governments of the various colonies on the coast, and by the Americans in Havana, demonstrate not only the advantage of such measures but the best means of executing them. In order materially to diminish the number of mosquitoes in any town or cantonment it is necessary only to organise a Mosquito Brigade in the following manner:—The local Health Officers, or District Medical Officer, or other person interested in the subject, should at once engage the services of an intelligent head man and a sufficient staff of workmen, who will constitute the brigade. These should first be instructed how to find the larvae of mosquitoes in vessels of water in the vicinity of houses, in pools of stagnant water on the ground, in garden cisterns, drains, and so on. Native agents, carefully selected, will be found quite capable of learning the work. The brigade should now be at once employed in getting rid of all the collections of stagnant water in which mosquitoes breed within the area of operations. Empty tins and bottles, broken flower-pots and unconsidered vessels of the kind, in most of which mosquitoes multiply during the rains, should be carefully collected from the compounds and back yards of houses and dumped in an assigned spot. Tubs or vessels of water which cannot be dispensed with by occupants of houses should be periodically emptied or treated with kerosine oil. Once a week will suffice. Cisterns and wells which are in use and are found to contain larvæ should be treated with oil; others should, if possible, be closed or filled up. Shallow rainwater pools and slushy areas in which larvæ occur can generally be easily obliterated by means of a "scratch drain" and a few basket-loads of gravel; deeper pools, and rubbish collected from houses and covered with earth. If pools occur in the course of drains or gutters, the attention of the local municipality should be called to the fact. The oil can and especially the broom are most useful until more permanent work can be done. Small driving streams, which are often prolific sources of mosquitoes at the end of the rains, can be periodically cleared by a gang of coolies with brooms, especially after the last showers of the season; but for more permanent effects, hollows in rocks should be filled with concrete and rubble. The guiding principle is contained in three words: no stagnant water.

Experience in Africa shows that these operations are not nearly so formidable as may at first sight appear. It is astonishing how much can be done even by a few men, when they are steadily employed. Thus it has been found in Sierra Leone that six men can clear fifty houses and remove ten cart-loads of broken bottles and empty tins daily. As to ways and means, beyond the salaries of the men the cost is little, a few spades, brooms, pickaxes, and kegs of crude petroleum sufficing—at least under ordinary circumstances. The local Municipality and Public Works Department will generally give much assistance in the way of carts, implements and even labour. In my opinion, however, it is best not to wait for or depend solely upon Government aid, but at once to raise a local public subscription for the costs of the local brigade. In Africa the response has been so immediate and so generous that there is no doubt a health officer will be able to raise

similar funds almost everywhere where Europeans reside. Even R50 a month will suffice to maintain a gang of five or six men, who will do much for any ordinary Indian cantonment. It is emphatically my opinion that the campaign against mosquitoes in towns can best be commenced by private enterprise. At Lagos, for instance, the merchants subscribed £150 a year at my first request; for Cape Coast Castle, a single gentleman has given £100 a year; while the Sierra Leone £2,000 was put down immediately by another philanthropist.

A warning must be recorded against commencing operations over too large an area. It is best to begin in the immediate vicinity of the houses of Europeans and other subscribers. Experience shows that in the large majority of cases, where mosquitoes abound in a house, they are being bred close at hand. But in this matter, as well as in the questions of the number of men to be employed, the superintendent of the operations must be guided by local conditions, and, needless to say, nearly all medical men are now well enough acquainted with the subject to form their own plans. A beginning once made, the work will shape itself as it proceeds; and it will generally be found that as soon as neighbouring breeding places are carefully removed, the winged insects will vanish as if by magic. In order to prevent theft or imposition it is advisable to give a distinctive badge to every man employed. No special legislation is required; and experience proves that the occupants of even the poorest houses willingly second the efforts made to rid them of these troublesome and dangerous pests. In military cantonments the officer commanding can generally be induced to give the assistance of fatigue parties of men. Planters who suffer so frequently from malaria both in purse and person should at once request their medical officers to commence the operations required. Seeing that mosquitoes are responsible for malaria, yellow-fever, and elephantiasis, and are a great source of annoyance to all, there can be little doubt that before many years have passed pretty general efforts will be made to get rid of them in the principal centres of civilisation in the tropics. It seems to me that the sooner these efforts are commenced the better.

In conclusion I should like to add that if any medical man who is desirous of employing a mosquito brigade in the town where he is stationed, but who finds after proper efforts that he cannot raise the necessary money, will represent the facts of the case to me, I shall probably be able to supply him with certain funds out of those placed at my disposal for this purpose by the Liverpool School of Tropical Medicine and by several private persons.

RONALD ROSS, {F.R.C.S., D.P.H.,
F.R.S., MAJOR, I.M.S., Retired.

PLANTING IN JAVA. WEEDY TEA NOT SUBJECT TO BLIGHTS?

(From a Practical Planter.)

Oct. 10.
I have often intended sending you a few Java planting notes, as it has sometimes struck me as so peculiar that Ceylon and Indian men seem to know so little of this island or what she is doing, and the notices that have appeared in the *T. A.* in reference to cinchona &c. have not struck me as very "inspired" or generally near the mark. Tea,—it is apparently not yet generally realized in your part of the world,—exists in Java, except in an amateur way. I only hope it won't go on increasing as it has done last five years and that Ceylon planters won't

wake up one day to the fact that Java has given them the "go by" in that product, as she has formerly done in cinchona and in a lesser degree, in coffee. These Dutch planters travel slow, but sure! I am sure it is to none of our advantages to see *more* tea—*anywhere*. [But what about local condensation?—ED. T.A.] I wonder, too, if that

ULTRA-CLEANLINESS FROM WEEDS
that every Ceylon planter I have ever met seems to think a "*sine qua non*" of good tea cultivation, has anything to do with the increase in both quality and quantity of diseases which tea in Ceylon seems more subject to than here?

After nearly 10 years planting in Java I am prepared to bet my bottom dollar that *young* tea, just as is the case with young cinchona, grows stronger and heartier, if amongst weeds. Sometimes old tea seems to do so too—of the right sort of course—not bud grasses, which should be regularly forked out in my opinion, and the fertilising weeds sometimes left though not to a *too* luxuriant amount and then dug in. Young tea on my estate and on others I have to do with, seems to me to revel in such conditions—and surely it is only following "Nature" that it should do so—for the young stems and crowns of the roots are all the time protected from excesses of sun, wind, wash and all forms of exposure and in the warm season kept cool and regularly re-dewed.

I saw really bad

"GREY BLIGHT"

for the first time in my life in Java last week and that was on the young tea estate of a Ceylon co-Director of mine, now resident in Java, on whose estate there is not a single weed of any sort to be seen. It is a perfect example of a clean tea estate and the weeding cost per bouw is very cheap, but on more or less 100 bouws the bushes were bare, from the joint attack of *Helopeltis* and this awful Grey Blight, and at that rate the weeding cost cannot be very cheap per lb. even if it is per bouw! Can it not be possible the young tea would have been hardier and better able to withstand these attacks, if let to run a bit wild at first? On this estate I am sure such is the case.

But this is all treason to write to a Ceylon man, I know! So I will refrain.

LECTURE ON TEA BLIGHTS.

BY J. B. CARRUTHERS, ESQ., F.L.S.

Coming to Ambegamuwa to talk about the diseases of tea is somewhat like taking coals to Newcastle as your Chairman has observed so carefully and knows so well the nature and effects of your common blights. Still you are already interested in them by means of Mr Collett, you may be, more willing to hear what I have to say.

We may for practical purposes group the diseases which tea and other cultivated plants are subject to as environmental and specific. Environmental are those diseases which are due to physical conditions injurious to the vigorous growth of the plant such as drought, excess of water at the roots, continuous and powerful wind, absence of nutritive substances in the soil &c. These are evils which the planter knows well and he knows the way to cure the plant suffering from a disease of this order—remove the conditions

if possible and the plant recovers if it is not too late. While mentioning this I may say that it would be an advantage if planters would make themselves acquainted with the usual symptoms in the leaf of some of these environmental diseases. If he can do it in no other way let him select a bush of no great value, somewhere that he can conveniently examine each day, and damage the roots by severely cutting them, so as to imitate to some extent the physiological effects of drought. He will then have an object lesson of a tea bush suffering from an environmental disease—a disease which he is able himself to deal with quite as well as if not better than a plant pathologist. I have frequently sent to me specimens of tea leaves and the leaves of other cultivated plants, which are merely discoloured and partially dead from the effects of drought or "wet feet." It is not always easy to say without a microscopic examination if this is so; but in many cases an acquaintance with the effects caused by drought, wind etc., would lead to the planter being himself able to remedy the evil.

In the other class—the specific diseases are more common perhaps and more difficult to remedy or cure. They are diseases due to the attacks of a foreign organism on the plant an insect, fungus or bacterium. It is the duty of all to endeavour by observation and experiment to get all the knowledge possible of these enemies, so that we may be able to war intelligently against them and reduce the loss to the tea bush. It is important to remember that though the fungus or bacterium is called the "cause" of the disease yet it is only one of the causes, strictly speaking. Such disease are the effect of a number of factors working together. In the case of leaf diseases on tea we can see what conditions in addition to the presence of the spores of fungi are needful. We have in tea in Ceylon some specific leaf diseases, of which grey blight (*Pestalozzia guepinii*) is the most widely distributed and best known; and as it is most known so well a great many leaves which are dying owing to environmental diseases, and other specific diseases not grey blight, are attributed to it. Grey blight is due to the presence of the growing mycelium of *Pestalozzia* in the leaf tissues, but the attack of blight in any spot on the leaf cannot take place unless when the spore lights on the under surface of the leaf when there is moisture in the atmosphere to allow it to germinate. Here in Ambegamuwa you have exceptionally favourable conditions for the germination of spores of fungi. Your days in which there is a moist atmosphere sufficient for spores to germinate are in a tremendous proportion to your anti-fungus growing days, i. e., with dry atmosphere. The spore of the grey blight lights on the under surface of the leaf—as in the diagram—and in a moist air—a very damp atmosphere is not needed. I have grown the spores of grey blight on dry glass plates in the evening and early morning of an average day at Peradeniya when the air was not, either by the wet and dry bulb thermometer or to one's own senses, damper than usual. The spore grows along the surface of the leaf until it reaches a breathing hole or stoma in the leaf, of which there are large quantities on the under surface of the tea or other leaves. When it reaches one of these holes it turns in and grows in the space between the cells of the leaf. After it has grown for some time in these spaces it penetrates the cells and kills them successively. The time taken to kill any definite area of tissue in a leaf varies with the condition of the leaf, the moisture of the air, and other factors. In some experiments of tea leaves I found that a discoloured patch about the size of a ten-cent piece was produced some time after the spore had been sown on the leaf. In one case a visible patch of this size was caused in 12 days, in another 19, and in a third in 24 days. It is important to keep in mind that the time of the visible signs of disease is not the same as the time of the outbreak of the disease or rather the origin planters frequently say of tea diseases as well as others "a sudden outbreak—I know exactly when it occurred"

but it must be remembered that the time responsible for the evil may have been 12, 19, 24, or even more days previously. The mycelium of the fungus is present in the leaf long before the discolouration is perceptible. In fact, there is no doubt in some of the flush picked and taken to the factory some mycelium of the fungus so that, if these leaves had been left, in a few days the disease would have been noticeable.

The methods of cultivation of tea are most fortunately the most excellent means of combating leaf diseases. The grey blight in nearly all cases is confined to the leaf tissues, not spreading to the leaf stalk, but I have in a few cases found this not to be the case, and I have received specimens from three different districts in which the fungus has spread to and partially killed the leaf stalk and the young wood of the bush. This should be looked out for by all planters carefully, and directly it is observed the bush should be pruned back below the discoloured leaf stalks and young branches. If the grey blight began to invade the permanent portions of the tea bush it would prove a much more serious enemy than it is at present.

After the grey blight mycelium has grown for some time and produced a fairly large discoloured patch, spores are produced and these becoming detached float about in the air and are carried by the wind to other tea and the same process goes on again.

A most interesting instance of the nature of the wind distribution of spores is to be seen quite near to this place. There is a belt of jungle along the crest of a hill about 30 yards wide and a road cut through the trees. The tea on the far side of the jungle was blighted fairly badly but the tea on the near side—the leeward—was only blighted just at the place where the wind blew through the gap in the jungle—a clear case of wind borne spores and a most instructive one.

With regard to the measures to be taken to reduce or avoid the evils caused by Grey Blight, our knowledge of the life history of this (though this is not yet complete) shows us the direction in which success is most likely to be gained. The destruction of as many diseased leaves as possible remove an immense quantity of spores. Burning is the only effective means of destruction. Unfortunately men who had taken trouble and spent money in removing their blighted tea leaves were discouraged when the effects were not so markedly beneficial as they hoped. This would always be so while only one man here and there went in for preventive measures. Universal co-operation in such sanitary means was essential to a complete success.

The study of the factors which are needed for an outbreak of grey blight is of importance and it is a matter for surprise that after an abnormal prevalence of this disease in 1898, followed by two years of rather exceptionally favourable weather for the spread of fungi, the quantity of grey blight is less than before. What factor is missing is not known. It is probable that the distribution of spores by the wind has been in some way favourable—perhaps a larger quantity has been carried away from the areas of tea cultivation than at other times.

The other diseases of the leaf in tea common in Ceylon are *Colletotrichum camellie* and *Cladosporium herbarum*. The former was observed in 1897, and sent home to a mycologist, Mr Massee, at Kew and named. I had not seen it on any tea in Ceylon until some months ago I got it from the same estate as it was got from before, so that in the four years intervening it has not spread, and therefore need not be considered as a serious danger. *Cladosporium* is also comparatively rare.

Turning to root diseases, for I am thankful to say we have no stem diseases, there is a disease which must be watched for and guarded against as carefully as possible. It is known to science as *Rossellinia radicipenda*, and is characterised by a white thread like mycelium which can easily be seen with the naked eye. The majority of fungi are either saprophytic *i.e.* living on dead and decaying substances, or parasitic, *i.e.* preying on living animals or plants, but in this

case of *Rossellinia* the fungus starts as a saprophyte on any dead timber, roots especially, and spreads to the living roots of tea and other plants. The white threads of mycelium can stretch out 7-10 inches from the dead root on which they are growing until they reach the young and tender rootlets of the growing tea bush. Those roots of jungle trees like *Simplocos* which are soft and spongy in tissue afford the best home for the fungus and enable it to spread more luxuriantly. In connection with this I have been working for some little time lately upon a disease of *Grevilleas* which may be due to the savager of this same root disease. I have not yet discovered whether the root disease, (*Rossellinia*) is the cause of the death of the *Grevilleas*, or whether it comes on the dead roots of that tree after the tree is killed. I am experimenting by infecting the roots of a *Grevillea* tree with the fungus to see if it is capable of killing the tree. However it is important for every planter to recognise that the *Grevillea* roots may be the harbours of this dangerous disease, and when they have a tree dying or dead to use preventive means. The best preventive means for this and other root diseases is to isolate the diseased tree or trees by means of a trench one foot wide, and at least two feet deep, over which the mycelium of the fungus cannot stretch—in addition lime should be put into the affected patch and all diseased roots should be taken out and burnt. If this is not done the roots of supplies will contract the disease, sometimes three or four supplies dying in the same way and from the same cause. Buried prunings also where this root disease existed are a source of danger as the fungus could start there on a piece of buried prunings not thicker than a pencil. In affected spots it is best not to bury prunings at all and in places where from damp or adjacency to infected places danger is feared lime should be freely used with the prunings. Damp and undrained spots were the most likely to be the starting points of this evil, and the cutting of the isolating trenches would tend to reduce his condition.

"BRACKEN FERN AS LITTER."

Under this heading the following paragraph appears in *The Field*, of the 19th ultimo:—

Mr J Hughes F.R.C., refers to the manorial value which the dung-heap supplies to the land where this fern is used, but it is not generally known that the animals which are littered with it are believed to be safe from the attacks of insect pests. The South Cheshire Foxhounds (the bitch pack) have for many years had no other litter in their kennels and the late kennel huntsman informed me that neither the puppies nor the working pack ever were troubled with insect parasites of any kind, and to all appearance it was inimical to lice, fleas, and all other insects. It was believed that the fine condition of skin and coat which these hounds always possess must be attributable to its use. The late master has a large stretch of wood some six or seven miles from the kennels, where the bracken grows in great profusion and is cut down and stacked like hay every summer being carted to the kennels in great trusses as required.—W.G.

"CACAO AND CRITICISM."—Under this heading a practical cacao planter delivers himself in reference to recent writings and criticism in general. It is, as he points out, comparatively easy to find fault with Committees and Scientists: the great matter is to lend a hand and endeavour to work for the common good, by making further useful suggestions, or additions to the questions which have been circulated.

NOTES FROM OUR LONDON LETTER.

LONDON, Oct. 12.

One day this week I spent an hour with Mr. Alex. Whyte and had a most interesting talk with him on his

EXPERIENCES IN UGANDA

where he has been for the last three years. Tropical life seems to agree with him, for he really appeared more robust and energetic than when I last saw him just before his departure. He has kept his health well and considers the climate of Uganda an ideal one. His chief work when there was the laying out of Government Botanical Gardens and introducing various new plants into the country. Grain he does not consider so far a success, but almost everything else one could mention will grow well, he says, in the Protectorate. English vegetables, rice, fruits of most sorts, save stone fruits for which winter is necessary, thrive well; and the natives who, up to the arrival of Europeans, attempted hardly anything in the way of agriculture, are now beginning to learn something of the wealth that is hidden in the soil. The native lives almost entirely on the banana which may almost be said to grow by itself. Once the trouble of stocking the banana plantation is over, the owner has little else to do for the rest of his life but to gather the fruit. Consequently he is indolent and reluctant to go in for experiments in novelties. But the labourers under Mr Whyte's instructions were brought up by the chiefs in levies of a hundred or more, who worked for a month and then retired to their homes, giving place to a fresh relay; and though the system involved extra trouble in the teaching each new lot afresh, it has been found that these men have become in many cases pioneers in their own villages and are eager to introduce the new plants to others. The country, Mr Whyte predicts, will become a magnificent coffee-growing district. Coffee already grows wild over all the more hilly parts of Uganda, and the conditions of the soil, water supply and abundance of shade present advantages such as are seldom met with for its cultivation. Local labour is cheap, and once the railway is completed and transport becomes easier, possibly no other part of Africa will be able to compete with Uganda as a coffee country.

Tea also, Mr Whyte is of opinion, has a great future before it in Uganda, where the rainfall, though less than in Ceylon is better distributed throughout the year. He places the districts in Uganda suited for tea as about equal to the medium elevation tea estates in Ceylon. But I am afraid news of districts where more tea can be grown, will not be particularly welcome to Ceylon readers at present, so I hasten to add that there is a large local demand for tea among the more civilized natives.

Rubber, it appears, is to be found in almost every thicket below 5,000 feet altitude, chiefly from the liana creepers which abound in two species (*Landolphia* and *Strobilanthus*.) The natives knew of its existence and where to find it; but until urged thereto by the Europeans, had made no attempt either to collect or sell it. Now they have begun to extract rubber, and one of Mr. Whyte's aims in

London is to get the different varieties separated and valued. The natives valued the rubber vines principally for their fruit which is eaten, but the chief, once become alive to the importance of the plants commercially, are now beginning to send their men to be taught the proper methods of milking the trees. Sir Harry Johnston has concluded an agreement with the chiefs which places all the forests of the Protectorate under the Crown, and it is no longer open to the natives to collect rubber in these forests without permission, but the people are encouraged to do so as long as the rubber gathering is carried on under Government conditions and to sell what they get to the merchants. The Government benefit by a tax of 15 per cent which is put on all rubber exported from the Protectorate. The specimens already sold, though not perfect, realise from 2s to 3s per lb. Mr. Whyte hopes to go back for another short spell, till he has seen something further of the results. After that he talks of giving up tropical life, and coming home definitely to settle. At present he goes north for a few weeks to Aberdeen, Edinburgh, not forgetting to stop off route for a look at the Glasgow Exhibition ere it closes. Mr. Whyte would be a capital subject for one of the sketches in the *Tropical Agriculturist*, it strikes me.

B. P.

THE WORKING OF RUBBER—has been begun in the department of Santa Cruz, in Bolivia, where the supplies of "fine" rubber are reported very abundant. "Caucho" has also been discovered in southern Bolivia. In order to facilitate the export of these products a national custom house has been established on a tributary of the Paraguay river, the waters of which discharge successively into the Parana and the Rio de la Plata, reaching the seaboard at Buenos Ayres.—*India Rubber World*, Oct. 1st.

JOURNAL OF THE ROYAL AGRICULTURAL AND COMMERCIAL SOCIETY OF BRITISH GUIANA.—By last mail we have received a copy of this publication being a record of the transactions of the society for 1900. From its pages we note that on November 8th, the secretary of the society read to the members a letter from the Honorary Secretary of the Imperial Institute in reference to coconut fibre. The letter indicated that it was possible for British Guiana to develop a trade in this product. As to the revenue to be derived from such a source he referred the people to the case of Ceylon, a sample of the coconut fibre of which island he enclosed them, and stated that at the present time Ceylon fibre fetched £15 per ton when landed in London. Abstracts are also published showing the land under various products, etc., in the colonised parts of British Guiana for the years 1897 and 1893. The total area given as under the production of coffee in 1897 in the four districts:—Berbice, Demerara, Essequibo, and North-Western district, is 1,553 acres. Roads are also given but in such a manner as to be unintelligible to us; cacao, 1,916 acres; kola, 48 acres; spices, 3 and coconuts 3,526 acres. In 1893 the totals given for the three districts of Berbice, Demerara and Essequibo are:—coffee, 608 acres cacao, 433 acres; kola, 82 acres; coconuts 1,159 acres.

THE LATEST VENTURE IN BRITISH CENTRAL AFRICA.

We have now studied with some care the papers sent us respecting the new Company entitled "Blantyre and East Africa, Ltd." The term "East" is rather confusing, because British East Africa is the official term given to the Uganda, rather than the Nyassa or Blantyre territory. But let that pass. The capital of the new Company is to be £60,000 and the Directors include such practical men as Mr. John W. Moir, of Lauderdale estates, B.C. Africa, and Mr. A. L. Cross, so long and favourably known in Ceylon. Now the present Company has been formed for the purpose of amalgamating the concerns known as:—

I.—Buchanan Brothers' Trust Estates, II.—Hynde and Starke's Estates, III.—John W Moir's Lauderdale Estate, IV.—The Scottish Central African Syndicate, Limited, and for the purchase of other selected estates in British Central Africa and elsewhere, and for carrying on and extending the various existing businesses connected with these properties, comprising coffee planting and curing, tobacco growing and manufacturing, ivory, rubber and general trading, and for the production of chillies, capscums, rubber, sugar, tea, cocoa, camphor, &c., and for developing the agricultural resources, Trade, and Commerce of British Central Africa, Northern Rhodesia and East Africa.

And then we read:—

Among the immediate results of the amalgamation will be the reduction of the management expenses, the more efficient distribution of the native labour supply, and generally a more economical and efficient working of the properties under the direction of a Local Board of experienced planters.

The Directors believe that planting in British Central Africa, on the high and healthy plateau known as the Shire Highlands, has a bright future before it, as the native labour is probably the cheapest in the world, and is chiefly paid in goods. Nyassaland coffee has already a reputation in the London Market, and Blantyre tobacco is gaining the premier position in Rhodesia and the East Coast. The present scheme provides for the amalgamation of the oldest and best coffee estates and tobacco businesses with the recently formed Scottish Central Africa Syndicate, Limited, on the lowest and most favourable terms, and for the working of the amalgamated concerns under the direct management of the most experienced and successful local planters in both coffee and tobacco.

The valuations certainly seem moderate enough, take for instance the "Buchanan" coffee lands:—

Coffee in bearing,	363.53 acres, valued at	£18, £6,534
Planted 1897-8,	177.44 " " "	15, 2,655
Planted 1898-9,	91.80 " " "	10, 910
Planted 1899-00,	280.60 " " "	6, 1,680
Planted 1900-1,	226.45 " " "	3, 678
Total area, 1,139.92 " "		
Total capital value,		£12,457

If coffee does not pay at these capitalized rates, there is no hope for it in Central Africa at all. But the Buchanan estate gives the Company Township and Uncultivated

Lands, Trade Goods and Live Stocks. Here is the full valuation:—

Coffee Acreage (as above)	...£12,457
Township Lands, 50 acres at £30,	1,500
Uncultivated Land,—140,000	
acres at 1s 6d	... 10,500
Trade Goods, Cattle, Buildings,	
&c. (per Report of the Trust's	
London Agents)...	... 3,000
	<hr/> £27,457
Coffee crop (per the estimate of Mr. V J	
N Cox, Estate Manager),—less expenses	
from 1st April, 1901	... 1,125

Total estimated value at current prices...£28,582
Price to be paid£21,250

Next we have Meesrs. Hynde's and Starke's estates which include coffee and tobacco, a good trading connection in the latter having been established with Rhodesia. Here is the summing-up in this case:—

The Company have acquired these estates at £12,000, one-half of which has been taken in Ordinary Shares of the Company, and the balance will be paid in cash or Debentures. The Balance-Sheets of Hynde & Starke's Estates for 1899 and 1900 may be seen at the Offices of the Company. They shew an average net Profit for that period of £820 19s 1d.

Then comes Mr. Moir's Lauderdale property of which we read:—

The Lauderdale Estate, belonging to Mr. John W Moir, late Joint Manager of the African Lakes Company, Limited, and one of the early planters of British Central Africa, is situated in the Manje District, and extends to 1,399 acres of well selected land, of which 226 acres are under Coffee. In addition to the Coffee Mr Moir has been experimenting with Tea, which is manufactured and sold locally, and which gives every promise of being a distinct success. Other economic products, such as Cocoa, Ginger, Rubber, &c., are also being tried on this estate.

The acreage under Coffee, and the uncultivated land, is valued at £2,607, and the buildings, machinery, cattle &c. at £2,270: the price has been fixed by the Vendor at £4,500, of which one-half is payable in cash, and the balance in fully paid-up Shares of the Company.

Next we have the Scottish C. African Syndicate, the report being:—

The estates of Scottish Central African Syndicate, Limited, are situated in the Blantyre, Zomba and Cholo districts, and have been carefully selected for the purposes of Coffee, Tobacco and other cultivations. Like other properties in the Shiré Highlands, the Syndicate had to face in 1900 an abnormal scarcity of labour, due chiefly to Portuguese political action, which prevented the ordinary influx of labourers during the rains, when labour is essential; but the total receipts reported to date have amounted to £3,390. Among the receipts there is included a substantial profit from experimental trading in the Lakes district in ivory and rubber. Over 7 tons of rubber were secured last season, 6 tons of which have come forward and been sold in the London market at 3s per lb., realising a total of £2,024. The remainder is now on its way to this country. The profit on these transactions represents over 30 per cent on the outlay.

As these Estates were only recently formed, and have not yet been developed to the same stage as

the other Coffee properties forming this amalgamation, the contract with this company provides that the Syndicate's Estates should be amalgamated on exceedingly moderate terms, and that the price of £17,000 will be paid, £11,990 in ordinary shares and £5,010 in debentures, and will consist, as regards more than one-half, in shares and debentures deferred as to dividend until these Estates are fully developed. In addition, the amalgamated concerns take over the whole assets of the Syndicate (including its uncalled capital of the value of £4,612 10s being 7s 6d per share on 12,300 Ordinary shares, the total number formerly offered and allotted to the public, the balance of 12s 6d per share having already been paid up), as well as its liabilities, which are fully covered by these assets.

Finally here are the immediate expectations:—

For the season 1901-2 the Directors expect that, under average conditions, the coffee crop will amount to at least 180 tons. Recent sales warrant their quoting this at 45s net per cwt. in London, and latest private advices predict an immediate advance. The prices obtained in South Africa are about double the above figure, and will greatly raise the average selling price. Taking 60s per cwt as a low average rate for the sale of the whole crop, they estimate the Profit as follows:—

180 tons at 60s per cwt	..	£10,800	0	0
Tobacco and Sundries	..	1,600	0	0
		<hr/>		
		£12,400	0	0
Less Expenses of Cultivation, Management, Superintendence, Accounting, &c. (3,003½ acres at 49s 6d per acre).	..	£7,446	0	0
Carriage of Crop	..	800	0	0
Home Expenses, Contingents, &c.	..	500	0	0
		<hr/>		
		£8,746	0	0
		<hr/>		
Leaving a Net Profit of		£3,654	0	0

On the capital required, supposing all the Preference Shares are taken up, and £15,000 Debentures in all are issued, this balance would pay—

5 per cent on £15,000 Debentures	£750	0	0
6 per cent on 10,000 Preference Shares	600	0	0
Balance available for Ordinary Shareholders
			2,304
			0
			<hr/>
			£3,654
			0
			0

This balance would equal a dividend of about 7 per cent on the ordinary share capital, so far as paid up. In 1897 the average price of Nyassaland coffee was about 85s per cwt in London, and almost half as much again in South Africa. Later, overproduction in Brazil caused a heavy downfall in prices, which however has now been checked, and recovery is taking place. A return to these earlier prices, with a like tonnage, would permit of a dividend of 10 per cent on the ordinary shares being paid, and over £3,000 carried forward. The Directors confidently anticipate both larger crops and better prices in subsequent years, and consequent handsome profits. No credit has been taken in these estimates for sales of land and rents. These have yielded annual, and sometimes very considerable profits in the past and once the Railway is undertaken would add largely to revenue. The Directors have agreed to leave the amount of their remuneration to be fixed by the shareholders.

TO FIGHT MALARIA.

£100,000 REQUIRED FOR AN ENGLISH SCHOOL.

Under the auspices of the Seamen's Hospital Society, the third winter session of the London School of Tropical Medicine was opened by Lord Brassey, K C B, yesterday afternoon at a meeting held in the large hall of the Royal United Service Institution, Whitehall, S.W. "To carry on this work efficiently," said his lordship, "more funds will be required, and I have to ask for no less a sum than £100,000. It is not a large sum to ask to establish an efficient institution, and a favourable response must come from the large section of the public who have interests in the tropics."

Dr. Patrick Manson, medical advisor to the Colonial Office, followed, and spoke about the functions the London School of Tropical Medicine wanted to fulfil. "The first was to promote the education of men for the special work. "No youths come to us in the hope that we will provide them with situations abroad. At the outset of the scheme, medical men proclaimed from platforms and in letters to the medical Press that medical schools were able to supply what was required. But those who have made a special study of tropical diseases regard such opinions as vamped-up figments of the imagination."

Dr. Patrick Manson then went on to illustrate his case by referring to errors in diagnosis made by ships' doctors and others, and to a recent case at the Seamen's Hospital, where a negro was admitted suffering from a tropical disease of which medical men who saw him knew nothing. "To enlarge our borders we must have more room for laboratories, museum, and a library. At present there are only six rooms where students can live. The big mercantile companies recognise the value of the London School of Tropical Medicine, and ask us to supply them with medical men."

A statement of unusual interest was made by Dr. Patrick Manson during his speech. "In the course of one generation the blood of the Barbarians can be freed from elephantiasis and cognate diseases."

Sir Francis Lovell, who has seen thirty years' service under Government, then spoke to the meeting in regard to his mission to obtain funds for the School of Tropical Medicine. He will visit India, Burma, Ceylon, Straits Settlements, China, Japan, New Zealand, Australia, the U.S.A., and Canada in order to put the school forward as a teaching body and provide sufficient funds for larger buildings, newer appliances, and better arrangements. The appeal will be made to wealthy residents abroad.

After the meeting an "Express" representative interviewed Dr. Patrick Manson.

"We are sending out an expedition to the Christmas Island to investigate beri-beri and study the pathology of other diseases. Dr. Durham is the senior medical, and he will be assisted by my son, Dr. P. T. Manson. They will remain on the island two years. Germany is far ahead of us in spending money on the study of tropical diseases. In a conversation I had with Professor Koch we compared notes, and I was forced to admit that they spent five times as much as we did. Men in England go out to the tropics for study and research work for a mere pittance—I am ashamed to mention the amount—but Germany pays a comparatively handsome salary to her men.—*Daily Express*, Oct. 17.

COTTON CULTIVATION.

There are many obvious reasons why the cultivation of cotton in the island should be encouraged and fostered by the Government; and these reasons find forcible illustration in the Governor's Opening Address to Council, though no direct mention is made of it. There is first the undoubted fact that the increase of the revenue "by leaps and bounds" is a thing of the past. If, with the presence of thousands of Boers consuming dutiable articles which further pay for carriage by rail almost the whole length of our Railway system and with tens of thousands of labourers engaged on the non-recurrent Public Works now in progress there is a backward tendency in the revenue, its maintenance at the figures to which we have been accustomed during the past few years is the most that can be expected. The probability is that there will be an appreciable set back when "our guests" have taken their departure, both those who are here under compulsion, and those who have come to us of their own free will. Another element which may re-act on the revenue is a diminished output of tea, whether as a means of helping up prices, or as the inevitable result of prices which cannot leave a margin of profit. But the unwisdom of placing all one's agricultural eggs in a single basket has been often preached, and occasionally experienced, so every effort to give encouragement to the cultivation of new products becomes a duty. The circumstances of the Colony do not favour the initiation of experiments with cotton by private enterprise. The European capitalist has not the attractions of climate to draw him into the Northern Provinces where alone, or chiefly, the cultivation is likely to prove successful, even if his investments in the hill country do not call for his anxious and undivided attention at this particular juncture. The native capitalist is too conservative to take the lead in experiments, though he is receptive enough of ideas, bearing on up-country or low-country cultivations which have been proved to be remunerative. The Government should, therefore, take the initiative, both on general grounds of policy, and also because the Northern Extension is specially its own work, and, in the opinion of not a few, a risky venture. If it is wise, it will anticipate events, and make a vigorous effort to demonstrate the possibility of cultivating cotton successfully in the arid districts which the line is to traverse, before its completion. By such action it will, if successful, provide *some* traffic for a line which, at its start certainly, will not have much to carry; while it may induce the settlement, in that part of the country, of precisely the classes of people who will best aid in its development—we mean the labourers and artisans from South India who have grown up under conditions which should attract, or at any rate, reconcile, them to the tank country.

We have referred to the support which our suggestion derives from His Excellency's Speech. We have specially, in view of the remarks on the helpfulness to the export

trade of the coconut industry, on the decrease in the cotton import trade under exceptional circumstances, on the evil influence on crime of the depression in various industries during the past twelve-month, on the effective equipment of the Botanical Department and the practical work which it has been able to accomplish, and on the attempts being made to encourage agriculture by means of School Gardens. No systematised effort has yet been put forth to enlist cotton among our regular products; the more reason, perhaps, why Mr. Willis will throw himself into the task of establishing the new product. Cotton may not be among the sort of plants which are to be grown in connection with village schools which, we suppose, will have to do chiefly with fruit culture and market-gardening; but there is no reason why small plots in the Northern, North-Western and North-Central Provinces should not be devoted to cotton, and placed under the care of village schools. Mr. Driberg's experience with cotton in the Agricultural School, though intermittent, should stand him in good stead in pressing on experiments. India is keeping its eyes wide open on cotton, as the following extract

A writer in *Capital* remarks:—"I observe that the Chief Commissioner of Nagpur is devoting great attention to the improved cultivation of cotton in his district, and that he has been sending Mr R S Joshe, Superintendent of the Experimental Farm, on a tour round the villages to converse with the cultivators regarding the most suitable land, the best kinds of seed, and the most improved methods of raising the finer qualities of cotton. In promoting this educational work, the Chief Commissioner is laying the foundations of enduring agricultural wealth in his province, and all other Commissioners in India ought to follow his example in reference to the chief products of the soil of their districts. Especially do my remarks apply to Lower Bengal, where the jute plant has been undergoing a slow process of deterioration during the last twenty years, and this season, although we have a bumper crop we have a 'starved' fibre. And no wonder, for the ryots go on breeding in and in, year after year, from the seed raised on the same plots. Will we have to send for a loan of the Chief Commissioner of Nagpur and the Superintendent of his Experimental Farm to show the Bengal authorities how they ought to proceed? There is an Experimental Farm over at Seebporc. Why not ask the able Superintendent there to go in at once for the culture of improved jute seed, and then send him round the jute districts to interview the ryots, and instruct them as to what they ought to do. The one thing to do is to get a beginning made, and this ought to be done at once in preparation for the next seed time."

FOREST DEPARTMENT FOR THE MALAY STATES. —The *Rangoon Gazette* says that Mr. A M Burn-Murdoch, Deputy Conservator of Forests, Burma, has been deputed to the Federated Malay States to initiate a forest department there. This is a result of the report of Mr. H C Hill, Inspector General of Indian Forests, who recently visited the Federated States and reported on the conduct of forest conservancy there and in the Straits Settlements.—*Perak Pioneer*, Oct. 22.

INDIAN COOLIES IN MADAGASCAR.

{(London "Times" Correspondent.)}

Paris, Oct. 15.—According to a letter from Madagascar, the Hindu coolies who recently went to Antananarivo are rendering good service to their employers, and a fresh convoy of 1,700 is expected. The Chinese, however, who are being set to road-making, seem to be less sluggish and better fitted for heavy labour. Two-thirds of the trade on the west side of the island are in the hands of Germans and Hindus. They are more conversant than French merchants with the native language, and give longer credit. Some Lyons firms are endeavouring to compete with them. —London *Times*, Oct. 16.

INOCULATING PLANTS AGAINST DISEASE.

Do you know that it is possible to render the plants in your garden or greenhouse disease proof by inoculation? This the latest preventive scientific discovery, and it offers the world a novel reans of fighting the numerous maladies which mttack the garden, the orchard, and the ripening fruit crops.

Briefly the system is this: hypodermic injections of certain germ cultures are given to the plants, which, being mildly sickened for a while, presently recover and are thereafter proof against infection—veritable vegetable immunes, in fact.

Moreover, it is necessary to administer the treatment to every plant in a field, for that would be far too costly and elaborate a process.

The object of the new system is to establish varieties that are immune, and these may be counted upon to transmit to their descendants the disease-proof qualities acquired by them through inoculation.

Thus all the gardener or tiller of the soil has to do is to cultivate the immune strains of vegetables, cereals, and fruit. Recent experiments have proved that plants may be made more vigorous by watering them with oxygenated water; and rendered more resistant to disease by inoculating them with apple acid or grape acid.

Ofcourse, there are certain germs which, far from being injurious to plants, are highly beneficial to them. Each kind of podbearing plant has its own species of bacteria, upon which it depends for a supply of nitrogen from the air.

Thus the modern gardener or farmer may inoculate his land with the microbes required or growing various plants in the event of the desired microbes being scarce on a given piece of land.]

Nowadays the successful tiller of the soil may be somewhat of an intelligent scientist.—*Da Express*, Oct. 16.

PROGRESS IN MANILLA AND THE PHILIPPINES.—We direct attention to an interesting letter on page 383 from Mr. W. H. Steele Morrison—"the boy traveller"—in which he gives us a good deal of useful information about the Philippines and their capital, Manilla, and what the American officials and merchants are doing and hope to do with their latest Dependency. We have no doubt that there is a great future before these splendid islands under American auspices,

THE CEYLON FERTILIZERS ORDINANCE,

1901.

The regulations under section 9 of this Ordinance, made by the Governor with the advice of the Executive Council, are published in yesterday's "Gazette" for general information. They refer to the following:—Definition of terms, Appointment of Agent, Proceedings by buyer to procure samples, Regulations as to samples taken by buyers, Regulations as to samples taken by analyst or authorised representative, General regulations for taking samples, General directions, and Regulations as to samples sealed by seller and buyer. The regulations are to take effect on the first day of January next and to remain in force until altered or revoked.

We quote the following:—

PROCEEDINGS BY BUYER TO PROCURE SAMPLES.—When the buyer of not less than a hundredweight of a fertilizer desires to have the same analysed in pursuance of the 6th section of the above Ordinance, he is, within ten days after delivery of the article to him or receipt of the invoice, whichever is later, either to give notice to the seller that he intends to take samples of the article himself, or to give notice in writing to the Analyst or authorised representative, stating that he desires that the sample shall be taken by the Analyst or authorised representative, as the case may be.

REGULATIONS AS TO SAMPLES TAKEN BY BUYER.—When the buyer intends to take the samples himself, he is to give at least three days' notice in writing of such intention to the seller, with particulars as to the place, day, and hour of sampling. If the seller does not attend, the samples are to be taken in the presence of a witness, who is to initial each sample. The buyer is forthwith to deliver or send by post to the Analyst one of such samples, with the invoice or a copy thereof. One of the remaining samples is to be delivered or sent by post to the seller and the other is to be retained by the buyer.

GENERAL REGULATIONS FOR TAKING SAMPLES.—When the fertilizer is delivered in bags or other packages, a number of bags or packages are to be selected as follows, viz:—

Not less than 2 bags or packages where		the quantity does not exceed 1 ton
	3	" " 2 tons
	4	" " 3 tons
and one additional bag or package for every additional ton or part of a ton; provided that in no case need more than ten bags or packages be selected.		

COMPRESSED TEA AND THE POPULARITY OF TEA DUST.

An up-country correspondent writes:—"The growing favour accorded to tea dust in the London market is, we understand, due to the appreciation the tea tablets (for which Mr. William Gow has acquired a patent) are acquiring among hotel-keepers, coffee room people and others who use large quantities of the articles. Concentrated foods are now so much in vogue that these cakes, as likewise the bigger 'bricks,' bid fair in the near future to supplant loose leaf to a very great extent. The several advantages of using them are self-evident, not the least being that while the necessary compression will ensure, in retention of strength and aroma; double, and more, of the quantity of material that can be got into the usual space, the tinfoil wrapping will also hermetically seal the packet. While on this subject, I may as well note that Japan bricks are being largely imported in Vladivostock for consumption in Siberia, and as the population of that great internal colony is rapidly increasing—we should enter the field. Our Ambassador at Yokohama and the Consuls at other centre

might be moved to procure samples of these bricks for the guidance of producers here. My impression is that the bulk of the home Indian trade which has been undertaken by Messrs. Yule & Co. will eventually take the concentrated form. Judging by results already obtained, I may safely predict that in much less than a decade hence, the consumption within the country will amount many millions of pounds monthly. The advantages to the planter, of compressed tea taking on with the masses, would be that he could dispense with much of the classification now used, as most of the coarser leaf could be broken down in the brick-making. In fact I see ahead realisation of my prediction that almost all our teas below the Pekoes, will be known as brick or tablet."—*Indian Planters' Gazette*, Nov. 2.

PLANTING NOTES.

CEYLON TEA IN SCANDINAVIA.—Mr. Renton's record of his work is a plain and businesslike statement, but so full of detail as to make excellent reading, even for the outsider interested only in a general way in commercial enterprise. He gets a very clear idea of the ground already gained and works upon it with rare judicial impartiality. For the amount of work he has got through and its methodical achievement, we commend Mr. Renton's letters as models for a Tea Commissioner in an even less promising field! see page 351.

THE STUDY OF RAINFALL in a really scientific way is scarcely twenty years old,—it was in 1882, as Dr. Herbertson points out, that the first good "annual rainfall map of the world" was published. Yet its importance can hardly be overrated, says the *Spectator*—since it is by the study of rainfall alone the variation of the water contained in the atmosphere can be investigated, and ultimately, perhaps, predicted. Meteorologists have recognised this, and now there are more than twenty-five thousand stations where the rainfall is watched by skilled observers. Dr. Herbertson has set himself *The Distribution of Rainfall over the Land*. By Andrew J Herbertson. (J Murray, 5s)—to co-ordinate their reports, and has adopted the graphic plan of presenting a map of the world for each month in the year, coloured and contoured in accordance with rainfall, supplemented by a map of the mean annual rainfall, and a table of the monthly distribution of rain at a number of selected stations. We are full of admiration for the truly scientific and accurate manner in which Dr. Herbertson has compressed his immense study into these simple and easily comprehensible maps. We cannot deal at length with the results of his work, which should long remain a standard authority, but we may conclude this notice by quoting his interest in deductions:—

"First of all there are seven well-marked bands of high and low rainfall girdling the earth. These are:—

- 1 Sub-equatorial wet belt.
- 2 and (3) Sub-tropical dry belts.
- 4 and (5) Temperate wet belts.
- (6) and (7) Polar dry caps.

Secondly, these hyetal belts move north and south with the sun. Thirdly, in equatorial regions there are two wet and two dry seasons every year; and fourthly, most rain falls when the sun is highest at noon, except on the west coast of temperate lands."

RUBBER IMPORTS at Antwerp during the past month included one cargo by steamer from the Congo of 1,783,540 pounds. The receipts of Congo sorts had previously amounted, for the year, to 7,725,291 pounds. This volume of trade, built up only in a few years, is a most notable development in rubber, and particularly the large single shipment here recorded. If this sort of thing can be kept up, the annexation of the Congo Free State will prove a good thing for Belgium, but there is no assurance that a decline in the Congo rubber production is not near at hand.—*India Rubber World*, Oct. 1st.

RUBBER PRODUCTION OF COLOMBIA.—Record of importations from Colombia into the United States for Fiscal Years ending June 30, and into Great Britain for Calendar Years—in Pounds:

Years.	United States.	Great Britain.	Total.
1855-1860	.. 2,300,920	17,472	2,318,392
1861-1865	.. 3,435,264	3,516,240	6,951,504
1866-1870	.. 9,608,376	5,594,512	15,202,888
1871-1875	.. 22,952,386	3,907,232	26,859,618
1876-1880	.. 17,394,793	1,194,144	18,588,937
1881-1885	.. 9,503,916	979,136	10,483,052
1886-1890	.. 4,309,306	727,516	5,036,822
1891-1895	.. 3,848,365	1,035,328	4,883,693
1896-1900	.. 3,152,957	1,146,850	4,299,837
Total..	76,506,283	18,118,460	94,624,743

—*India Rubber World*, Oct. 1st.

WANTED AN INVENTOR.—"The man who invents a really practical maize husker which will husk standing maize is assured of a fortune," says *American Agriculturist*. "As in the case of the trying work of picking cotton, but little help has been given to the farmer by the inventor. Numerous attempts have been made, but none of them machines constructed has proved practical. One of the latest is a combination of the maize binder and the husker and shredder, which is attached to the ordinary farm waggon. The fingers of the husker collect the stalks and convey them to the rollers of the shredder, where the husks are removed and the ears elevated to the waggon box. The principle seems to be all right, but the practicability of the machine is yet to be demonstrated."

MESSRS. KEARLEY AND FONGE, Ltd.—the well-know tea firm of Mitre Square—have produced one of the most tasteful and artistic little pamphlets that I have yet seen issued by the tea trade. It explains in an instructive and entertaining manner, the general principles which ought to govern the buying and blending of tea. Blending was an operation carried on at one time in a very haphazard sort of way. A great number of varieties of tea were chosen without discrimination, thrown together and left to chance for the result. Sometimes this was good, sometimes bad, and sometimes indifferent, but in no case could the blender claim any credit for it. If by a special dispensation of Providence the tea came out all right and the customer was pleased the blender considered himself lucky. As for producing the same result a second time, that was a thing of which he could be by no means certain.—*Tea*, (October.)

PRODUCE AND PLANTING.

The trade between China and Russia over the Kiakhta route is being superseded by the Vladivostock and Nicolaievsk route. It consists chiefly of tea which had been bought in Hankow, and was forwarded by camel caravans via Tientsin and Kiakhta for the Central Asia and Russian markets. The following are the most recent figures supplied by Messrs J Welch and Co., of Mincing Lane, of this year's trade, being dated Shanghai, September 4, and are compared with the figures for the corresponding periods of the two previous years, showing at a glance the change which has taken place in the past two years. May 1 commences a season. Export of tea via Port Arthur, Newchwang, and Tientsin (old route): From May 1 to September 4, 1901, 1,398,961 lb; from May 1 to September 4, 1900, 2,715,488 lb; from May 1 to September 4, 1899, 20,391,931 lb. Export of tea to Vladivostock and Nicolaievsk (new route): From May 1 to September 4, 1901, 21,787,556 lb; from May 1 to September 4, 1900, 8,908,130 lb; from May 1 to September 4, 1899, 7,285,485 lb. The same change has taken place between Bombay and Batoum. Teas which formerly found their way to Central Asia via Bombay now go in increasing quantities via Batoum.

Several letters have recently appeared in the provincial Press about the weighing of paper with tea, and now a correspondent of the "Times" calls attention to an anomaly in our laws whereby we punish for false, but not for short weight. He instances bread and tea, and says, with regard to the latter, the grocer used to blend his own tea. Now he buys it quite as cheaply, much better blended, made up into packets, ready to hand across the counter. The packet in many cases does not contain a pound of tea. The little printed notice on the wrapper to the effect that the packet weighs a pound with the paper means nothing to the ordinary purchaser. How many even of the intelligent middle-class read what is printed upon the wrappers of the goods delivered to them? Neither of the two classes is aware that the notice means thousands of pounds extra profit every year to the big packet-tea firms who use it.

A writer in the "Tea and Coffee Journal," of New York, referring to the tea market there, says:—"Ceylon and India teas must increase in popularity, so far as black teas are concerned; and from some experiments made this season in 'Ceylon Greens' it is not unlikely that before many years more they may occupy an important place in our tea distribution, and the jobber and retailer who fosters the trade in both of the tea products from India and Ceylon will not be the loser."

It is mentioned by Mr. Robert Mitchell Floyd, of the "Trade Press List," published in Boston, U.S.A., that tea culture in the Southern part of the United States was attempted as far back as a century since, the produce costing about £15 per lb. to grow. Again an attempt was made in 1848. In 1881 Congress made an appropriation for an experiment in tea culture, but when Mr. William Saunders, of the Department of Agriculture, made an examination of the work done under it, he found that owing to the illness of the expert and other causes, he had to report that there was little prospect of anything of value being accomplished. Mr. Floyd, in the April number of the "Trade Press List," published an interesting account of a visit paid to the South Carolina tea gardens of Dr. Shepard.—*H and C Mail*, Oct. 25.

EXPERIMENTAL CULTIVATION IN MADRAS.—The Madras Government has sanctioned expenditure of Rs15,000 next year on experimental cultivation, of which Rs5,000 will be spent on starting a "sugar-cane station" in Godavery. Rs2,000 have also been sanctioned for public Exhibitions and Fairs.—*Madras Mail*.

FAMOUS TEA HOUSES

LIPTON, LIMITED.

The Tea House founded by Sir Thomas Lipton, although of comparatively recent date, may fairly claim to be the most famous, as it is, perhaps the largest, in the world. It was the overstocking of the markets with very cheap growths for some years that furnished Sir Thomas Lipton with the opportunity for building up his enormous canister trade in blended tea. He uses Indian and Ceylon teas chiefly, and these are blended with scrupulous care. Nothing is neglected. Even the kind of water used in each district is taken into consideration. This was explained to our representative in the tasting department, where hundreds of small boxes filled with samples of the choicest growths of Ceylon and India are neatly arranged around the walls. The quality of water varies of course, in different parts of the Kingdom. Therefore, whenever a branch is opened, a sample of water of the district is taken; the tasters experiment therewith again and again until the special blend is obtained which is best suited to the varying chemical constituents of the water. The result is that tea which is sold in London differs from that which is supplied to towns north, south, east, or west, where the proportions of lime or other substances in the waters are different.

Apart altogether from the Ceylon estates, with their tea factories and bungalows, or the Calcutta establishment, and thinking only of the British Island, Sir Thomas has a Liverpool centre, which supplies the North of England and the Midland Counties; a Glasgow establishment, serving the whole of Scotland, and sending cakes all over these islands; and Irish stores, including the one for the collection of Irish produce situated at Clones, and the Dublin centre of distribution. Besides these, there are various depots required for the military contracts and shipstore work, and specially chartered craft which wait upon his Majesty's fleets in the Mediterranean and upon other stations with all sorts of provisions for British sailors. In London alone, the survey must needs embrace the rapidly-extending bonded and export bottling vaults at Shadwell and the central racking, vatting and bottling stores at St. Katharine's Docks; the enormous jam and preserve factories in Bermondsey, covering already two acres and about to be enlarged, which are supplied from the Lipton fruit gardens in Kent; and the premises for making extract of beef.

LIPTON'S TEA DEPARTMENT

may fairly be ranked as one of the wonderful sights of London. In the basement of the great building in City Road are immense piles of chests containing duty-paid tea from India, Ceylon and China. The "Celestial" consignments are, however, insignificant in comparison with the quantities that pour in from India and Ceylon. The tea is not allowed to remain very long in the warehouse. By rising in a lift to the upper storeys of the building the interested visitor may discover what sort of treatment it undergoes before being sent forth to carry fragrance and good cheer to the homes of the weary millions. On emerging from the lift, one's nostrils are filled with a hundred different odours, each of which the practised tea man, with his miraculous olfactory sense, seems able to trace to its origin in the plantations of India, Ceylon, or China. Each chest of tea is

distinguished by its own mark, and from each is taken a sample to be passed on to the "tasters" below. These gentlemen are engaged all day long in tickling their palates with little sips of tea, upon which they eventually pass judgments from which there is no appeal. These judgments are afterwards communicated to the foreman above by means of little slips with hieroglyphics which none but the initiated may decipher. The contents of various chests are then poured in rapid succession into a huge mouth in the wooden floor. Some six or more of such mouths yawn all round the rooms, and down each of them a black torrent is continually rushing like a little Niagara, from which rise clouds of tea-dust instead of foam. Empty tea-chests are sent out another way, and one man is employed all day long in stripping their leaden linings, the value of which amounts to about £5,000 a year.

Descending to the next floor, the visitor penetrates into the great stomach which is fed by the six gullets from above. Here a sort of digestive process goes on. The apparatus consists of great iron hoppers, with a marvellous faculty of deglutition, which devour cheerful little meals weighing about a ton.

THE WHIRL OF THE BLENDING ROOM.

When they have got as much as they can hold, they begin a wild whirl, which is kept up until the different sorts of tea are mixed up into a perfect blend. Here, too, is the tasting-room, with its nests of white cups, and the big kettle always on the boil. The tasting is an affair of great moment, and over it arise frequent debates, carried on with all the solemnity of the National Palaver at Westminster. Some new flavour is suddenly discovered, or a quality, hitherto unsuspected, begins to develop in the cup which is, perhaps, less cheering to the professional taster than it is to the ordinary tea-drinker. This furnishes subject matter for investigation by a committee of experts, whose profound and earnest mien is quite in keeping with the importance of the issues involved. The qualities that fit a man for becoming a successful tea-taster are given only to a privileged few, and these may be said to carry their fortunes in their mouths.

When the tea is thoroughly blended, it is sent down to another floor, where we find a long array of tables and an army of girls in white "chef" caps, who are continually employed in packing it in appropriate canisters. Bins are placed at the ends of the tables, and at each table sixteen girls are engaged. Then there are four scalers, two "funnellers," two girls opening bags, seven more wrapping and packing, and one girl putting the parcels into boxes. The scalers weigh up the tea, and the funnellers receive it from them for the packets. All the operations proceed together, the speed of the whole table being dependent upon the manner in which the various workers assist each other. It is interesting to learn that a money bonus awards the smartest table weekly, and, in addition, dependent upon the aggregate output, a bonus in tea, varying from $\frac{1}{2}$ lb. to 2 lb. to each girl, is made when it has been fairly earned. There are busy workers, too, in the bonded department, where tea is packed in wooden cases exactly fitting, which then, duly marked and labelled, are put on it vans and waggons ready for export. In spite of the fluctuations of prices at public auctions, Lipton's blends have continued to be offered to the

public almost at the prices with which he started, namely, 1s. 1s 4d, 1s 6d and 1s 9d per pound. There are altogether some 400 girls engaged in weighing out and packing dozens of different blends of tea, and at Christmas time their number rises to 600. The normal output is some fifty tons a day.

Another building is given over to

THE PREPARATION OF COCOA.

The processes incidental to this are exceedingly complicated, but at Lipton's they are carried on with a degree of exactness and regularity that seems little short of the miraculous. Cocoa is an increasing article of consumption, which has demanded the use of very powerful machinery. Fully £30,000 worth of steam presses, mills, and grinding apparatus are in operation in a building that has been recently enlarged, and in which work goes on night and day. Prominent features of this department are the wholesale way in which chocolate cream is made, and the practical use of refrigerators. The process of cocoa manufacture is of intense interest. We see the cocoa-nibs in their raw state, watch them put in the great revolving metal globes over the fires, rested occasionally until the exact degree of roasting has been attained, then picked over carefully by hand before they go to the mills, from which presently we see them issue in more or less minute fragments. (This is an early stage. Much sorting and sifting has yet to be done before the still semi-raw product goes into a large department, where strange-looking machines, combined with heat, are extracting the superfluous fat, though leaving just the right amount to ensure proper nutritive qualities. Hydraulic presses reduce this fat into solid blocks, and it is put on little trollies and wheeled away, to find its way latter on to the wholesale chemists. There is no more ingenious machinery on the premises than that which separates and refines the cocoa as it swishes round the great receivers in a liquid state.

As most of the products of the City Road establishment are carefully packed in tin, it follows that an immense number of such packages are daily required, and most, if not all of these are made on the premises. One department deals with the coloured lithographs, which are printed directly on the tins such as adorn the tea-canisters. In the basement of the huge block there are ponderous machines, which by sheer pressure block out and finish lids and portions of tins. On another floor of the same building more machinery, each apparatus doing its allotted part, is turning out the tins themselves— $\frac{1}{2}$ lb., $\frac{1}{2}$ lb. and 1 lb. and larger sizes still, to 14 lb. Then, too, there are coffee tins round, of $\frac{1}{4}$ kilo. to 20 lb. capacity. Some idea of

THE COLOSSAL NATURE OF LIPTON'S BUSINESS may be gathered from the fact that 2,000 workers are employed in the City Road alone. The frontage building is only one among eight separate blocks. In addition to this Sir Thomas Lipton controls tea plantations, stores, factories, buyers, agents, and upwards of 400 shops in various parts of the United Kingdom. And yet, so inexhaustible is the man's marvellous energy that, in the midst of all this, he finds time to attend to numerous schemes of philanthropy and industrial progress. Among the latter may be mentioned the Alexandra Trust, for supplying food to working classes at very little over cost price, and to which he contributed £100,000. For

Sir Thomas Lipton recreation consists simply in a charge of work, and it is certain that he has never had to endure that most inksome of all miseries, the misery of doing nothing. Any one visiting the great establishment in City Road will be able to see how organisation has served to reduce every operation to perfect simplicity, and so to economise the labours of the work-people, as well as to promote harmony and happiness among them. Sir Thomas Lipton has for his general manager Mr. Duncan McDiarmid, who has been associated with him from his start in Glasgow, and who opened the first of his London branches, which flourishes still in Westbourne Grove; and his tea department manager, Mr. T R Smith, another of the directors, has been associated with him ever since the firm began to build up the reputation which they now enjoy as the "largest tea dealers in the world." Huge as the business is, it still keeps steadily expanding. Everyone must remember the rush for shares that took place when the firm was floated into a company, under the title of Lipton Limited. The market value of the concern is now little short of five millions sterling. This implies an immense turn-over, and is an indication of the perfection that has been attained in the system of organisation and administration. The spreading branches of this wonderful business are all centralised in the private room of Sir Thomas Lipton in the City Road establishment.

Sir Thomas Lipton understands the importance of keeping

IN TOUCH WITH ALL WHO SERVE HIM, from the chiefs of departments down to the humblest message boy. Of all the thousands in his employ none is ever debarred from access to him. Much of his success, as well as his popularity, is doubtless to this, which is, after all, only the quality of a skilful organiser. His dining-room in the City Road premises seems to the visitor a most delightful oasis in a well-kept wilderness of tea-chests and packing cases. Every day when in town he dines here with his chiefs of staff, and here hangs framed the historic cheque which was drawn for one week's clearance of tea. Here also may be found several interesting mementoes of Sir Thomas's travels to his Ceylon estates elsewhere.

Sir Thomas Lipton's parents migrated from the North of Ireland to Glasgow, where he was born just forty-five years ago. Beginning life as an industrious warehouse lad, he has climbed the ladder of success from the very lowest rung. At the present moment the business operations of Sir Thomas Lipton include Kentish fruit farms, meat stores and refrigerating ears all over America, curing factories in Liverpool and elsewhere, biscuit bakeries in Scotland, and "markets" all over the United Kingdom. From the City Road he is in direct communication with Glasgow, Liverpool, and Dublin. Sir Thomas Lipton is tea merchant to His Majesty, and some two hundred tons of tea are received and sent out by him every week. Every other department of his enormous business is organised on the same scale, and, in addition to his own "markets," he employs over six thousand agents. The secret of the phenomenal success he has achieved lies in an

IMPROVED SYSTEM OF PRODUCTION AND THE ELIMINATION OF THE MIDDLEMAN.

An interesting picture has been drawn of Sir Thomas Lipton in his beautiful home at Osidge, Southgate. Although his average working hours are popularly supposed to vary from twelve to fifteen out of every twenty-four, Sir Thomas certainly looks somewhat younger than he really

is. His stalwart frame (his height is well over six feet) is as erect as that of a youth of twenty, and one is not likely to easily forget his intelligent face and strongly marked features. During the time he has resided in Osidge he has never once patronised either of the two railways which have invaded the traditional privacy of Southgate. He drives to and from his great central offices every morning and night, and his fast-going American trotters excite much admiration and attention in the neighbourhood of Seven Sisters Road, Green Lanes, and Palmer's Green. Orchid-growing is one of his favourite forms of diversion, and an electrophone connects him with all the principal theatres and concert-halls in the Metropolis.

A visit to one of Sir Thomas Lipton's tea and coffee estates

IN CEYLON.

is an event never to be forgotten. The beautiful scenery, the coolies at work in the gardens, pruning and plucking the tea, the great bags whizzing down the wire to the valley below, the coning and going of bullock waggons—all these and many other curious sights make up together a scene full of life and colour which leaves an indelible imprint on the memory. Dambattenne is, perhaps, one of the best-known of Sir Thomas's estates. It is situated in one of the loveliest and most fertile parts of the Island, being reached from Colombo by railway passing through innumerable "paddy" and rice fields and estates of every description. The first stoppage is at Kandy, or Newera Eliya, aptly described by Mr Clement Scott as a veritable paradise of lilies and roses. Starting from Newera Eliya, the journey up country is continued with relays or horses, the nights being spent at "resthouses" or hotels maintained by the Government. At Dambattenne the tea is plucked on the hills and manufactured in the valley many miles below. The tea, when gathered, used to be despatched to the factory, packed on the heads of native bearers, who had to find their way by long and winding pathways down the mountain, the journey being frequently one of considerable peril. They have changed all that, however, on Lipton's estates. The aid of science has been invoked to devise a means of transit which, besides being expeditious, obviates entirely all danger to life and limb. A powerful wire is stretched from the tea garden on the mountain to the factory in the valley beneath. The tea, when gathered, is packed with great care in bags, which are fastened with rings to this wonderful aerial railway, and sent swishing along at a tremendous rate. "It almost makes you dizzy," says Mr Clement Scott, "to see the bags dancing down, down, over forests, rocks, and rivers, until they arrive by sheer force of descent safe at the manufactory door." In order to show how quickly tea is manufactured at Dambattenne, Mr Scott relates how he picked some tea on the mountain very early one morning. He started the machinery that sent the bag whizzing into the valley. There it was dried, curled, and made into tea, a cup of which he had the pleasure of drinking before going to bed that night. The tea, when manufactured, is despatched in large bullock waggons to the nearest railway leading to the Port of Colombo, and very soon afterwards it may be purchased in the shops and stores. It is now many years since coffee planting saw its best days in Ceylon, but at Dambattenne and other estates, Sir Thomas Lipton still cultivates the fragrant berry and manages to make it pay almost as well as tea.

—Tea, October,

Correspondence.

To the Editor.

A TEAM OF ALLIGATORS FOR RIVER WORK.

New Galway, Oct. 23.

DEAR SIR,—Enclosed you will find a cutting from a home paper *re* alligators: has the experiment been tried in Ceylon? If not, why not?—Yours faithfully,

CONNEMARA.

A TEAM OF ALLIGATORS.—Jefferson Lee, who lives on the St. John's River in Putnam County, Fla., has the most extraordinary team in the country. It is a team of alligators that Mr. Lee uses to tow his boat up and down the river when he goes to market. Mr. Lee has to go six miles down the river to his post-office, and it is a hard pull against the current coming back. He noticed how swiftly alligators swam, and it occurred to him that it might be a good thing to turn the alligators that abound in the St. John's River to some account. He captured a pair of young 'gators and raised them in his yard. He taught them to swim and drag a weight behind them, and he also taught them to turn either to the right or left by pulling ropes fastened to their teeth on either side. When the alligators were big enough he put a harness that he had constructed on them and harnessed them to his boat. They swam well and pulled the boat through the water at a good speed. By pulling on the reins that passed through the mouths of the 'gators Mr. Lee was able to turn his strange water team in any direction he pleased. Mr. Lee made a point of never feeding his alligators until after they returned from a trip, when he would immediately reward each one with a fine meal. The alligators seem to be willing to perform their task of pulling his boat, and when he turns them out of the pen in which they are stabled and starts them for the water they shuffle down to the boat in the liveliest style, and after they are hitched they plunge into the water with grunts of delight. Mr. Lee says his strange team has never run away or kicked out the dash board of his river craft, but that they have one fault, for which, however, he does not blame them. They sometimes sweep their powerful tails in a curve through the water, and once smashed one of his boats into small bits and threw Mr. Lee and a party that he was taking boat riding into the river. They would have all been drowned had not the alligators swam back to them and permitted the party to climb on their backs, after which the alligators swam swiftly to the shore and all the party were saved. Mr. Lee now hitches up his team twenty feet in front of the boat, so that the sweep of their tails will not endanger the craft. Mr. Lee's success has created great interest among all of his neighbours, and now many alligators are being trained for duty as sea horses.

THE LARGEST CACAO POD IN THE WORLD:

GOOD CROPS IN WATTEGAMA;
"DAYS OF OLD" IN HUNASGERIA.

Franklands, Wattegama, Oct. 25.

DEAR SIR,—I was very glad to read in your paper about the large Cacao pods (4 to each) sent you from our friend, Mr. J. Martin, of Katugastotte estate; no doubt, grown from seed planted from pods I supplied to Mr. Fairweather and him. I have now the pleasure to send you one pod, length 13 in. girth 15½ in. which weighs 5 lb., just ripening and plucked from a tree this day. There is another pod on same tree (amongst other pods) about the

same size, but quite green as yet. This grown on land which one intending purchaser would not take as it was too steep and worn out! This shows what practical cultivation can do. You remember, I also supplied you with the largest Cacao leaf 24 inches long by 10 inches broad taken from the same land. I am glad to say my crop for this year again promises well, though I had to fell much shade and so lost some blossom.

Our neighbour, Major Pain, expects 5 cwt. per acre from Meegama cacao in full bearing. This also from land which was formerly chena; then planted with Tobacco and Cotton, after that with Cacao and Coconuts. This land has also been carefully planted and its wants attended to.

Our friend, Mr. J. L. S., is wrong when he says Mr. George Beck is the only survivor of Hunasgeria estate while Messrs. Tindall and Co. were proprietors. I joined Hunasgeria in July 1858 under the late Mr. W. Henderson on Sina Mally; afterwards was sent to Maha-oya division to put up the large bungalow and assist Mr. Geo. Harcourt in opening the estate. Then I built and lived in another bungalow under the Peak where I received a number of visitors on their way to the Peak. From thence I was sent to Gavatenne and Mr. Geo. Beck came there to learn the opening of new land, and I was always glad to hear of his great success in Diimbula. He was a most painstaking, careful planter. In those days we had Mr. Adie, as Manager of Pendleton; he had a fine Billiard Table, and we, young planters from Hunasgeria, used to spend our spare time at his bungalow. Mr. Vincent Harcourt, who was on Hunasgeria in my time as Assistant, is still alive and is now a Minister in India.—Yours faithfully,

JOSEPH HOLLOWAY.

[The Cacao pod sent by Mr. Holloway is indeed a superb one measuring 13 inches long by 15½ inches in circumference and weighing close on 5 lb.—it has lost a little in drying. Has anything larger or heavier been grown in Ceylon? We shall ask the same question with reference to Trinidad and other Cacao-growing countries in our monthly *Tropical Agriculturist*. We are to circulate the pod round the Fort, as requested by Mr. Holloway, as perhaps the largest pod ever seen.—Ed. T.A.]

Franklands, Wattegama, Nov. 2.

DEAR SIR,—*Re* Mr. P D Young's letter of 28th Oct. in the "Times of Ceylon" of 29th Oct. "Kudos and Cocoa seeds." Mr. David Fairweather of Glen Esk wrote on 29th Oct.:—"I have read your letter of 25th in the "Times" of 26th inst. The cacao pods supplied by you to Katugastotta Estate, I am pleased to say gave me every satisfaction." In reply to my letter of 30th Oct., Mr. T J Martin writes:—"I am unable to say who supplied the seed from which I got the tree which bore the large pods I sent in last year. We have had seed pods from Franklands, Woodthorpe, Goonambil and a few from other places during the last six or seven years. P D Young had no authority from me to make any statement as to the seed which produced my big pod trees." I (J H) supplied Mr. Young seed

Pods from Franklands when he planted cacao, and sold to Mr. D Fairweather 6,500, prior to February 1895, for Kutagastota when he sold the estate to Messrs Finlay Muir & Co. I had three Trinidad plants given me by Mr. F M Mackwood in 1878. These I planted on Maria; when he got 12 plants from Trinidad, balance were planted on Goonambil by me. I also got some seed pods from Goonambil afterwards from those plants for planting on Franklands.

As Mr. Young poses as possessing good cacao trees with large pods, let us now see the other side:—On same date that he wrote the letter "Kudos &c." on 28th Oct., there was a case against him in D C Kandy for trial in which I was a witness for plaintiff where one Manickrala sued Mr. Young for 2 years' lease money due, on a land said to be 3 acres in extent, taken on lease by Mr. Young in 1891, to have land 5 years free, then to give one-third profit each year from the whole land. The claim was for the one-third profit for the 2 years 1899 and 190 put at R250. Mr. Young had planted same with cacao and tea in 1891 and had 16 old coconut trees on the land, which was almost flat.

Cacao planted 8 × 8 with tea between, 600 trees to the acre (roads, etc., deducted) Mr. Young tendered R73.78 as the one third profit for two years on this garden of three acres or say (one-third of 3 acres is) 1 acre, profit as per Mr. Young's account R36.89 per annum. Coconut income would be R5 per annum—(tea not counted) leaves cocoa R31.89 profit, add working R40 or R71.89 income from cacao; this at R40 per cwt would only be 1½ cwt or even say 2cwt crop per acre. This from cacao trees on a flat land, in good deep soil and well sheltered, in its eighth and 9th year (?) where such trees must have given at least between 4 and 5 cwt per acre: here "Kudos" wishes to show poor result of his bearing cacao, so to pay less rent where in his letter he wishes to take credit for large pods. Upkeep would not have exceeded R40 per acre as cacao was in its prime and healthy: flat land, no wash, no weeds or roads and drains, expenses and no supplies required.

Measurements of some of the large cacao trees "Forestero" on Franklands:—

No.	Height.	Spread.	Girth.	From Ground.
1	33½ ft.	26 ft.	2 ft. 2 in.	2 ft.
2	31 ft.	32 ft.	2 ft. 4½ in.	2 ft.
3	33 ft.	33 ft.	2 ft. 7 in.	1½ ft.
4	30 ft.	31 ft.	2 ft. 8 in.	1½ ft.
5	26½ ft.	20 ft.	2 ft. 4 in. (2 stems)	2 ft.
6	23 ft.	25 ft.	2 ft. 4 in. do	1½ ft.

No h5 is at 1 ft. above ground, 3 ft. 4 in girth then. as 2 stems girth 2 ft. 4 in. each.

So far back as the Matale Exhibition in 1887 I send a broad basket full of large selected cacao pods weighing from 2¼ to 3lb with a card sent herewith: "Cocoa pods from Franklands estate Wa tegama.

"N.B.—This variety of cocoa is very hardy and prolific, well suited for natives to cultivate." On this card was written:—"Not according to condition. Prize for native garden-grown pods only." *Highly commended* by the Committee.—Yours faithfully, JOSEPH HOLLOWAY.

P.S.—Please refer to my letter to you of 16th Oct. when I sent you eight pods weighing as per your remarks 19th and the heaviest one was 2¾lb. You were also pleased to say:—"This is certainly the finest collection of cacao pods we have ever seen. We shall try that all interested in the Fort shall see them." Dr. Duke visited Frank-

lands on 10th December 1893, walked over the estate, could not believe my cacao would bear like that, both the crop already in and what was on the trees, yet with weeds from 2 to 3 feet high. These I told him I let grow to help on my trees in preventing wash, hacking them down and using them as manure, and it was a very great help to work up pumped out chena land by digging them up and liming soil.—J.H.

COTTON CULTIVATION IN CEYLON.

Colombo, Nov. 11.

DEAR SIR,—With reference to your article about "Cotton Cultivation in Ceylon" (see page 393) we herewith beg to hand you a pamphlet entitled "Cotton Culture" published by the New York branch of the German Potash Syndicate whose sole agents we are for Ceylon. You will observe that the book, which contains 90 pages and many interesting engravings, is very instructive and will be of great use to everybody who has an interest in cotton cultivation. We shall be pleased to supply a pamphlet free of charge to all planters who will ask for it.—Yours faithfully,

FREUDENBERG & Co.

POISONOUS SNAKE-BITES.

Mr Robert Miller, writing from the offices of the Bengal-Nagpur Railway Company under date October 17, sends us the following interesting extract from the narrative report of the company's medical officer in India for the month of August:—"On the night of the 23rd I was called to see a coolie woman who had been bitten by a large snake, supposed to be a cobra. She was said to have been bitten at about 7 p.m., and I did not see her till two hours later. She was then practically moribund, the throat paralysed, and consciousness completely lost. All the symptoms of poisoning by colubrine venom were well marked. I injected a full dose of Dr Calmette's antivenene, but was not sanguine as to the results the patient's condition being apparently hopeless. The effect of the remedy was marvellous; consciousness returned in 15 minutes, and I was so encouraged by the result of the first injection that I decided to give another dose of the serum. It acted like magic, and within three hours of the first injection the patient was well. Dr Sen, my assistant surgeon, was present at the time. I have sent the notes of the case to Dr L Rogers, the professor of pathology to the Calcutta Medical College, and propose to also send a report to Dr Calmette, who is, I know, always glad to hear of cases in which his remedy has been used. I am satisfied that in even desperate cases we have in Dr Calmette's serum a really reliable remedy for the bites of poisonous snakes, and I propose to supply all assistant surgeons with a syringe and some bottles of serum. At present only this place and Chakardharpur are so supplied. I am now convinced that the case reported by me in May would in all probability have been saved had a large dose of the serum been injected and had the patient come under treatment earlier."—London Times, Oct. 21.

DUCKWARI (CEYLON) TEA PLANTATION COMPANY, LIMITED.

REPORT BY THE DIRECTORS TO THE ELEVENTH ORDINARY GENERAL MEETING OF THE COMPANY.

The Directors beg to submit to the Shareholders the statement of the affairs of the Company, for the year ending June 30th, 1901.

The accounts, including the balance brought forward from last year, and after writing off 10 per cent depreciation on value of Machinery and Buildings, show a credit balance of £788 9s 0d. Out of this sum, the Directors recommend the payment of a dividend to the Preference Shareholders, at the rate of 5 per cent per annum, carrying forward £188 9s 0d to next year.

The season has been a very unfavourable one for tea, owing to depressed and over-supplied markets. If the present curtailment in production is maintained, the prospect of better times are confidently looked for in the future.

The returns of crop have been 301,530 lb tea, and 8,169 lb. Cardamoms, against 321,026 lb tea, and 8,779 lb. Cardamoms last season. The estimates for the coming year are 310,000 lb tea, and 9,000 lb cardamoms. Mr Hull retires from the Direction by rotation and, being eligible, offers himself for re-election. The Auditors, Messrs Brown, Fleming and Murray, also retire, and offer themselves for re-appointment.—P. G. SPENCE, Chairman; R. CROSS AITKEN, Secretary.

THE KINTYRE TEA ESTATES, CO., LTD.

The following is from the fifth report of the directors:—

The directors have the pleasure to present the accounts for the twelve months ending June 30, 1901. The estimated tea crop for the season was 521,000 lb, and this was considerably exceeded, the total secured being 565,861 lb, or 25,000 lb more than was harvested the previous year. The average cost of production was 23½ cents per lb, which may be considered a very satisfactory rate. The profit is again less, however, owing to the extremely low price of tea during the greater portion of the twelve months under review. The causes which brought about that low price, over-production and inferior quality, have now disappeared, at all events for the present, and the smaller quantities of tea now coming forward have already resulted in a much-improved market for all Ceylon teas. The net profit amounts to £1 030 2s 7d, and after paying directors' and auditors' fees, &c., income-tax, and commission to superintendents, there remains a balance at profit and loss account of £3,486 1s 8d, to which has to be added £132 19s 11d brought forward from last year. The board have paid, half-yearly as usual, the dividends on the Preference shares, amounting to £1,000, and an interim dividend of 2 per cent, on the ordinary shares, which absorbed further £900. They have written off for depreciation of machinery £250, and they now recommend the payment of a final dividend of 3 per cent, on the Ordinary shares (making 5 per cent, for the year), for which £1,350 will be required, leaving £119 1s 7d to be carried forward. The capital expenditure on Ayr estate during the year amounted to £527 0s 11d, this amount including the cost of a block of land sixty-eight acres in extent adjoining the estate, which was offered for sale during the year and acquired by this company at a cost of £187 2s 2d. It is not contemplated to spend any more on capital account on this estate. The sum of £81 16s 8d is the equivalent of the coast advance recoveries during the year. The average yield of tea in full bearing was 671 lb per acre, and the gross average price realised in London was 6·58 per lb, while the average rate of exchange was 1s 4½d. The

estimates for the current season point to a tea crop of 523,000 lb, to cost 24½ cents per lb. Mr. W. Nevett, a director, retires on this occasion, and being eligible, offers himself for re-election.—*Home and Colonial Mail*, Oct. 18.

KORALE TEA ESTATE, LIMITED.

[REGISTERED 27TH MAY, 1896]

Report of the Directors, to be submitted at the Fifth Annual Ordinary General Meeting of Shareholders, to be held at the Office of the Company, on Thursday, 10th October, 1901, at 3 p.m.

The Directors now submit the Report and Accounts for the year ending 30th June, 1901, which have been duly audited.

The net amount at Credit or Profit and Loss Account after providing of General Expenses is	£504 19 10
To which should be added the balance brought forward from 30th June, 1901	46 18 1
	551 17 11
To dispose of which, it is proposed to write off the balance of expenses of formation, which will absorb	238 19 2
To Adjustment of Income Tax	20 2 1
Directors' Fees	150 0 0
And to carry forward a balance of	112 16 8
	£551 17 11

The Directors regret that the continuous range of low prices for all classes of tea, has left so small a margin of profit over working expenditure, that they are this year unable to declare a dividend and think it well to devote the small balance at their disposal to writing off the balance at debit of "Expenses of Formation."

The reports as to the condition of all the estates satisfactory, and the new fields on Karagawawa and Wewesse give promise of considerably increasing the yield from these estates, but Directors of adopting the policy of treating the young trees rightly, and not plucking them until they have attained sufficient maturity.

A new cart road to Riverside factory which has long been promised by Government, has at length been sanctioned, which will materially lessen the cost of transport of goods, both to and from the estate and make the labourers more settled and contented.

The average selling price of Ceylon tea is now higher than it has been for two years, and the shortage from India and China as well as from Ceylon gives promise of a further improvement in prices.

In accordance with the Articles of Association Mr J L Shand retires from the Board, and being eligible offers himself for re-election.

The Directors desire to express their satisfaction with the Agents and Managers in Ceylon, who have kept down expenditure on the estates, as far as has been consistent with effective working.—By Order of the Board, H. C. DAWLING, Secretary.

THE CAROLINA TEA COMPANY OF CEYLON, LIMITED.

REPORT OF THE DIRECTORS.

Report of the Directors to be submitted at the ninth annual general meeting of shareholders, to be held at the Offices of the Agents, Messrs Frith, Sands & Co., Winchester House, Old Bond Street, E.C., on the 30th October, 1901.

Your Directors beg to submit the balance sheet and Profit and Loss Account for the year ending 30th June, 1901.

The nett profit is £2,280 8s 9d, amount brought forward from last year at credit of the ordinary shares £475 18s 1d = £2,756 6s 9d; from which has to be deducted debenture interest £2,450, leaving a balance of £306 6s 9d, which it is proposed to carry forward to the credit of the ordinary shares.

The crops secured during the season compare as follows with those of previous seasons:—

	Tea from estates.	Tea from leaf.	Tea from Cocos states.
	lb.	lb.	cwt.
1900-1901 ..	953,399	29,575	466
1899-1900 ..	1,131,333	43,195	414
1898-1899 ...	961,757	32,862	555

The smaller outturn this year is due to a system of finer plucking having been adopted on some of your estates, in order to raise the standard of quality of the tea.

The tea crop cost 4 7/8d per lb. free on board Colombo, being the same as in the preceding season. The average gross sale price was 6 3/4d, per lb., as against 7 0/6d for the previous season. This fall again prescribes about the decline established in Ceylon teas generally, and is the chief factor in the reduction of profit for the season. The yield of cocoa has been normal both in quantity and quality but market conditions have been less favourable. The total area of land now under cultivation is 2,608 acres, comprising:—Tea in full bearing 1,801 acres, tea in partial bearing 630 acres=2,431 acres; cocoa, coffee, &c. 177 acres=2,608 acres.

The Directors much regret having to present to the shareholders a report showing such disappointing results, attributable to the crisis in the tea industry, arising from the production of supplies of common teas largely in excess of requirements, and the period of greatest depression being embraced in the financial year under review. Notwithstanding the smaller output the cost per lb. of the tea has been kept down to the level of last year, while it includes the usual expenditure on manuring, &c., for the maintenance of the properties in good cultivation, thus leaving the Company in a position to reap the full benefit of a return to prosperity in the tea industry. Your Direc-

tors have to express their satisfaction with the work of the staff in the Company's employ. The Directors retiring by rotation are Mr. Evelyn Heseltine and Mr. Wharram Meggison, who, being eligible, offer themselves for re-election.—Local "Times."

THE SCOTTISH TRUST AND LOAN COMPANY OF CEYLON, LTD.

Report by the Directors of the 'Scottish Trust and Loan Company of Ceylon Limited, to the twenty-fourth ordinary general meeting of shareholders, to be held within the Company's Registered Office, No. 123, George Street, Edinburgh, on Wednesday, the 30th day of October 1901, at 3 o'clock afternoon.

The Directors present their twenty-fourth report, being for the year to 31st August, 1901.

ESTATES IN THE COMPANY'S POSSESSION.—The past season has been an anxious one, as over-production in India and Ceylon disorganised the market to a greater extent than at any previous time. The yield of tea on the Company's estates has been an average of 376 lb. per acre, as compared with 393 lb. last season. The prices realised by the Company have been well maintained, considering the low range of price which has generally obtained during the period of depression. Coffee cultivation has now practically ceased on the Company's estates.

FACTORIES, BUILDINGS AND MACHINERY.—The extension of the Factory at Alnwick has been completed, and new machinery for Brookside and Sarnia erected.

ACCOUNTS.—The balance at the credit of Profit and Loss Account 1 0454

And the Directors propose—
To pay a Dividend of 5 per cent per annum, free of Income Tax ... £2250 0 0

NOTE. Two and a half per cent of this was paid as an Interim Dividend at Whitsunday 1901.

To pay Bonus of 5 per cent free of Income Tax .. 2250 0 0 £4500 0 0

Leaving .. £941 0 4

to be carried forward to next Account.

The Board regret to record the death of Mr. Wm. Beattie, the esteemed Superintendent of Sarnia estate, while on his return voyage to Ceylon. Mr Beattie, during the period of his residence at Sarnia, had charge of the practical transformation of the estate from Coffee to Tea production, and the erection of the new Factory.

Mr W G Smith, who on the death of Mr Bowden Smith was appointed Joint London Agent, resigned office during the year to commence business on his own account, and Mr A Gordon Dickson has been appointed sole London Agent.

During the past year there has been a prolonged agitation in favour of a general reduction in the output of tea, and the Directors have fortunately been able to discuss this important question personally with the Colombo Agents, as well as the methods of plucking, pruning and manning most suitable to the Company's Estates.

The Directors retiring by rotation is Mr Henry Johnston, K C, and he is eligible for re-election.

Auditors for the current year fall to be appointed. Messrs Moncreiff & Horsburgh, C A, are eligible, and offer themselves for re-election.—By order of the board.

FRANCIS A. BRINGLEE, Secretary.

Edinburgh, October 22nd.

THE ASSOCIATED TEA ESTATES OF CEYLON, LTD.

REPORT OF THE DIRECTORS.

for the twelve months ended 30th June, 1901. During the year under review no alteration was

made in the area or the estates belonging to the Company, or in the planting of same with tea, so that the total stand as in last year's report, with the exception that at Silver Kandy estate 20 acres were planted out with fuel trees, with a view to future economy in the supply of firewood.

The yield of manufactured tea for the twelve months was as follows:—

Silver Kandy	...	112,045
Chesterford	..	345,292
Horagoda	..	42,833
Doragalla	...	229,035

Total ... 729,205 lbs.

This shows and aggregate increase of 36,847 lbs. on the total yield of the previous 12 months, but it falls short of the total of the Superintendent's estimates by 5,795 lbs. With the exception of Horagoda, each estate showed an increase in yield over the figures for the corresponding previous 12 months and had finer plucking not been introduced about the middle of the season the total crop would have been much heavier.

The cost of production per lb. f.o.b. Colombo on each of the estates was as follows:—

	Exclusive of Manure, Buildings, and New and Immature Cultivation.	Proportion of Cost of Manurings, Buildings, and New and Immature Cultivation.	Total.
	Cts.	Cts.	Cts.
Silver Kandy	35.15	2.01	37.16
Chesterford	25.34	2.50	27.84
Horagoda	31.77	.95	32.72
Doragalla	30.14	5.57	35.71

As in the previous season, the Directors considered it judicious to sell in the Colombo market all the produce of the Company's estates, except the teas from Silver Kandy and the finest grade made on Doragalla, and are satisfied that by so doing they have obtained the highest value possible.

	The average prices realised were as follows.	Against comparative prices for previous year.
	IN LONDON.	IN LONDON.
Silver Kandy	per lb. 7.81d.	per lb. 9.22d.
	IN COLOMBO.	IN COLOMBO.
Chesterford	per lb. 28.74 cts.	per lb. 34.22 cts.
Horagoda	per lb. 26.39 "	per lb. 32.73 "
Doragalla	per lb. 34.47 "	per lb. 35.81 "

The fall in prices has again been a very serious one and especially the values obtained for the tea produced on Silver Kandy have caused grave concern to the Directors. The bushes on this estate have taken a long time to recover from the effects of the severe cutting down which was found necessary two years ago and the tea has been very thin in the cup and deficient in the fine qualities which formerly caused it to realise high prices. In consequence instead of the price improving during the last working year, it has again fallen considerably, but there are at last indications of some improvement. The prices of the Teas from the other Estates have merely shared in the severe fall which, mainly because of the excessive overproduction in India and Ceylon, has effected all Tea. A turn in the course of markets has, however, come, and should there be a continuation of the moderate crops produced during the last six months, a higher

level of prices will probably be definitely established.

The whole of the Company's Estates remain under the same superintendence as at the date of the issue of last report, and the work upon same has been done generally to the satisfaction of the Directors and of the Company's Visiting Agent.

In the course of the working year a sum of £150 was accepted by the Directors in full settlement of claims in connection with the misappropriations of the late Mr. Pomeroy, formerly Superintendent of Silver Kandy.

The estimates for the 12 months ending 30th June, 1902, are based on a crop of 780,000 lbs., and there seems little reason to doubt that this should be harvested, having in view the liberal manuring policy of recent years. Having regard to the financial position of the Company the Directors with regret, decided that it was impracticable for them to continue the system of heavy manuring they had adopted. In this direction during the new season nothing will be done beyond burying with basic slag the prunings taken off the Silver Kandy, Doragalla and Chesterford Estates, a method of treatment which has been found of value in restoring important constituents to the soil.

The ordinary local expenditure for the year has shown a serious increase, but a large proportion of the increase is attributable to the larger crop, which of course entails a direct increase in many ways, also the cost of burying prunings is charged in the ordinary local expenditure, and this in itself amounts to a considerable sum. The cost of visiting agency has, for the first time, been transferred from the Colombo to the Estate Expenditure. Unfortunately, while the expenditure shows the increase referred to, the receipts have fallen off materially because of the lower prices, and the result is a loss on Revenue Account. It will be seen that including the balance brought forward and the amount or bad debt recovered, there remains at the debit of profit and loss account a sum of £963 11s. 3d. It is with extreme regret that the Directors find themselves again unable to pay any dividend. The efforts they made during the last year to obtain an increase in production, although successful to some extent in the direction intended, have been nullified by the extreme severity of the fall in the prices of all tea. The Directors have again drawn only half fees, and the Secretaries have rebated a considerable portion of the sum paid to them for managing the Company's affairs.

As is well-known, the general position of the tea industry has recently been a very bad one, and the Directors joined with others in an effort to come to a common agreement as to the restriction of production. The scheme was not, however, carried out, owing to the opposition of many producers, but the general result desired has, in some way, been attained, and the yields from both India and Ceylon having seriously fallen off, there is at the present moment a much more healthy position and a fairer prospect for those interested in tea than for a long time back. There seems little doubt that, should producers continue to work on the moderate scale they have recently operated on, and consumption at home and abroad continue to increase as it has been doing, a more healthy basis of trade for tea producers will be firmly established,

The accounts, duly audited, are presented herewith.

Under the Articles of Association, Mr. John McEwan retires from the directorate, and being eligible, offers himself for re-election. An auditor falls to be appointed by the shareholders at the general meeting. Mr. J M Henderson, F.C.A., is eligible for re-election.

MATURATA TEA COMPANY, LIMITED.

The following is from the directors' report, to be submitted to the shareholders at the fourth annual ordinary general meeting, to be held at the offices of the company on Wednesday next:—

After bringing forward £1,424 14s 7d from last year's account, and after payment of debenture interest and London charges (directors' fees, &c.), the net amount at credit of profit and loss account is £3,250 17s 3d. An interim dividend of 3 per cent has been paid on the Preference shares for the half-year amounting to £12), and the final 3 per cent was paid on the Preference shares on July 1, making 6 per cent for the year, amounting to £120. It is proposed to pay a dividend of 10 per cent less income-tax, on the ordinary share capital, which will absorb £800, thus leaving to be carried forward to next year a balance of £2,210 17s 3d. The result of last year's trading is particularly gratifying, as the past year has been the worst that the Ceylon tea-growing industry has ever had to face, yet the position of this Company today has improved as compared to this time last year—a result that is certainly highly satisfactory, and which reflects great credit on the manager of the estate, Mr. Alder Alderson-Smith, as well as the Company's visiting agent; and your directors take this opportunity of giving public expression of their appreciation of the excellent way in which the estate has been worked during the past year. During the past year £500 of the Debenture debt has been paid off. This reduces the debt to £6,500, thus enhancing the value of the Preferred and Ordinary shares. Your directors, considering it to be to the advantage of the Company, appointed Mr. G B Owen their managing director. Mr. R F Bayford retires in accordance with the articles of association, but being eligible offers himself for re-election as a director.—*H. and C. Mail*, Oct. 11.

THE NEW TEA DISCOVERY.—*Apropos* of the information appearing in our columns in reference to the new tea discovery, we quote the following from the *Indian Planters' Gazette*:—"We have advocated for years that more scientific methods are requisite in the manufacture of tea, and that in this way, to some extent, the evils of the present depression may be partially averted. Indigo has felt the pinch and is setting its house in order, with the prospect that it will be able to compete on satisfactory terms with its German rival. Tea must arise and do likewise, and by every scientific means possible, so improve its quality and reduce its cost of production as to raise itself once again to one of the most paying industries of India."

CEYLON TEA IN BOSTON, U.S.A.

After the years' labours of our Tea Commissioner and the expenditure of thousands in bringing the merits of our staple before the American people, the following extract from a Boston letter is amusing and affords food for thought:—"Ceylon tea is little known here in Boston, and you cannot get it at hotels or restaurants. There is only one hotel here where Ceylon tea is mentioned on the menu, and that is the new 'Lennox,' which has just been opened. Now why does not the Planters' Association—or whoever it is that has to do with advertising Ceylon tea—open a first-class tea-room in Boston—there is no such thing there now—and have afternoon tea served from 3 till 6 at 25 cents; while the morning hours could be used for selling the tea and taking orders. A nice large room in Boylston Street, one of the principal shop streets on the Back Bay, could be nicely got up with individual tables, etc. and three or four neat waitresses to serve the tea. A man could take charge and take the orders, etc., and the maids could be hired for the afternoon only. If wisely advertised, it would certainly 'take,' and once it was fashionable to go to the 'Tea Shop,' it would be a great success. This is merely a suggestion, but I think it a good one. Rents are high on Boylston Street. \$1,500 I think would be the cost for a large room on the ground floor (£300), but if it were done at all it would have to be done well."

Tea rooms at home have done much to spread a taste for good tea and reform morals as well, and that Boston, "the hub of the universe," should know so little of our product and have so little of it publicly on offer, does not say much for the methods which have obtained to bring our teas before the notice of the American people. The person who starts a suitable tea room in Boston for the sale of Ceylon tea, would evidently "strike it." All that is wanted is that someone would "hitch on."

THE RECENT TEA DISCOVERY: MR. BAMBER'S OPINION.

Prominence is given in the issue of *Indian Gardening and Planting* for November 7th to a paragraph which announces the discovery of a ferment having the same effect on tea leaf as one already existing there. The paragraph, which appears on page 405 is vague upon the nature of the ferment or the matter from which the ferment is to be isolated.

Recognising the discovery to be of more than passing interest to our many readers connected with the tea industry, a representative of ours waited upon Mr. M. K. Bamber, Analytical Chemist, Colombo, recently to ask his opinion, which was courteously given.

Mr. Bamber says that it is possible that the ferment discovered by Mr. Newton may have a similar effect on tea to the one already there, but this would seem to

act more on the tannic and other organic acids to produce the colouring liquor of black tea, rather than on any constituent which produces the well-known flavour of upcountry teas. It is well known that the most delicate flavour is found in very *lightly fermented*, teas, while over fermentation either removes the flavour altogether, or disguises it by the production of other odourless constituents in the leaf. If the soluble ferment (in tea) has an effect on the flavour at all, it probably takes place partly during growth, and partly during the withering process, as it is then that the distinctive flavour is most noticeable; and it would be practically impossible to employ any external fermenting agent at this stage. Mr. Mann, the chemist to the I.T.A., is working out this question of ferments and their effect on flavour in tea, and a similar enquiry is now being made in Ceylon, as to the effect of the enzyme referred to in Mr. Kelway Bamber's report to the Ceylon P.A., and other causes likely to produce flavour and quality.

Mr. Bamber has himself on a previous occasion experimented in this direction and it is interesting, in view of the present discovery, to quote from his "Report on Ceylon Tea Soils and their effect on the quality of Tea," the result of these experiments: "Quite recently, he says I have succeeded, after numerous attempts, in isolating a minute proportion of a soluble oxidising ferment, somewhat similar to the oxydases recently discovered in several plants of different natural orders. The substance in question, which evidently has a considerable bearing on the oxidising properties of the tea, apparently does not exist in the active form in the fresh green leaf, but is changed either during the withering if the leaf is bruised, or during the rolling processes, when the various organic acids &c., are liberated from the cells."

Again he says. "There is one variety of proteid present in the leaf which in dilute acid undergoes a slight decomposition, with the production of a very sweet aroma, almost identical with that of the essential oil, which has been isolated and kept some weeks. It is more than probable a similar decomposition takes place with withering leaf especially if the sap is distinctly acid from the presence, in excess, of organic acids." Further on Mr. Bamber says—"An experiment on the effect of the ferment on a solution of gallatannic acid resulted in the formation of a considerable proportion of sugar (glucose), and a slight colouring of the solution from absorbed oxygen."

Further information on the matter will be waited for with interest.

A NEW DEPARTURE IN TEA MANUFACTURE.

ISOLATION OF A FERMENT.

Mr C R Newton, of Kurseong, an old Fellow of the Royal Microscopical Society of England, and who has, under the *nom-de-plume* of "F R M S.," frequently contributed to our columns, principally

on microbes, ferments and the diseases of tea, has, we understand, after an enormous number of experiments, isolated a ferment having the same effect on the tea leaf as one already existing there and has applied for patents for its utilisation in tea manufacture. Mr Newton has always been anponent of the bacteria theory in the flavouring of tea, and has maintained that it was caused by a ferment contained in the tea itself—a *fermentum acidum vivum*. These ferments and their action are, we understand, but little known, and it is only within comparatively recent years that they have been recognised, and this is, we believe, the first occasion on which it has been proposed to make artificial use of their great power of rendering soluble many plant substances.—*Indian Engineering and Planting*, Nov. 7.

BRITISH NORTH BORNEO: NEW DUES.

A new customs tariff came into force in British North Borneo on the 15th October. Under it, imported rifles and guns are charged at the rate of \$5 a barrel, and pistols and revolvers \$3 each. Cloth, flour, rope, building materials, leather, rice, stationery, and tinned provisions are charged 5 per cent on the value, 10 per cent is the rate on chemicals, cutlery, haberdashery, machines, medicines, paints, silk stuffs, timber and pipes. Imported fireworks pay 25 per cent on the value. Liquors are rated high, gin being \$7.50 a case. Exports, barks and roots are charged 25 per cent on the value, camphor four dollars per catty, copra 5 per cent ad valorem, gutta percha 10 per cent ad valorem—or \$20 on every picul of the red kind—cattle \$5 per head, gambier and enteh to be charged under agreement, rattans and rice 10 per cent ad valorem, raw sago 16 cents per picul, timber \$2, \$1.75, and 0.75 per ton; tobacco (estate) one cent per English pound, and (native) one dollar per thousand rolls.—*Straits Times*, Nov. 2.

THE INDIAN TEA EXPLOITATION SCHEME.

SOME SEARCHING CRITICISM.

It is difficult now to make anyone believe that the exploitation scheme is really being worked for the benefit of the *whole* tea industry; and the reasons given for this non-belief are as follow. It is pointed out, that though the work has now been carried out for nearly a year, yet the Association and its Commissioners have made no attempt to take the interested public into its confidence. No reports nor accounts have been published. No statement has been announced showing the progress made,—the quality or quantity of tea sold,—the receipts and disbursements made,—the composition of the staff employed, and so on. Such information can only be rightly withheld by a purely private firm; but the Expansion Commission, which is alleged to be a national concern, is not justified in keeping the public in the dark about such matters. Further, an impression has got abroad that the Commissioners are more intent on advertising their own firm, instead of solely advertising the tea entrusted to them. In support of this, it is pointed out that tea labels on the packets now offered for sale have the full name and address of a private firm, when reference should only have been made to the impersonal "Tea Markets' Expansion Commission." And again, that this firm has included its own name in its communications; and has been receiving fulsome congratulatory messages from thoughtless Government officials, as if the whole exploitation scheme was really owned by the firm instead of the firm being merely the Commissioners, or working agents of the Indian Tea Association. It is argued that the drift

of everything points more to the existence of a private Calcutta firm, than to a public institution promoted by the tea industry for its own benefit.

All the criticism I have heard are, however, directed not against individuals, but against the suicidal and unbusiness-like methods adopted by the Tea Association for carrying out the behests of its *clientele*. Its methods are now condemned by practically everyone outside Calcutta and many even there. What is wanted is the formation of some association or company which will be owned, controlled, and worked entirely in the interests of shareholders and proprietors, or, in other words, the producers of tea. The object aimed at should be to benefit the whole Indian tea industry, and not merely, as now, to benefit a few favoured ones at the expense of the rest. If some such alterations are not immediately made, there is every probability of rival schemes springing up all over the country. In fact two such schemes are already known to be maturing; the promoters of which are only waiting to see whether the Expansion Commission means to continue its present methods or not. Should the Commission insist on continuing as it has begun, it will undoubtedly have to face a very strong opposition, and probably be kept entirely out of the markets over a large area of the country. But, on the other hand, should more enlightened principles be followed, the Commission will not only be left the field to itself, but will also gain the good will and active support of those who at present strongly oppose its methods and ways.

It now rests with the Indian Tea Association to assure the public, by full and unreserved explanations, that the exploiting scheme is really not a close preserve for Calcutta, with selfish interests behind as the motive power; but that the work will in future be carried out solely with the object of directly benefiting the whole Indian tea industry. Until some such assurances are convincingly given, the Association cannot reasonably expect to have that moral and material support from the planting community, which is very essential to the success of the scheme. Some have gone so far as to strongly advise shareholders proprietors, and others who have joined the levy, to withhold their future contributions unless immediate reforms are made in the directions indicated. But it is sincerely to be hoped no such drastic measures will be necessary, and that wiser counsels will prevail, before irretrievable damage is done to a scheme, which after all is the best that has yet been proposed for the amelioration of the Indian tea industry.

J. B. LESLIE ROGERS,

Gora Gully, Punjab.

—*Indian Gardening and Planting*, Nov. 7.

ALOE FIBRE AT MADRAS.

Mr F W Tytler is going well ahead with his aloe fibre factory at Madras. Government gave him a grant of some twenty thousand acres, part of it rent free for three, and a part rent free for five years, and he has now on this land about 300 miles of aloe hedging which should give about three tons of clean fibre per acre, but Mr Tytler is cramped for want of more machinery, so he is getting out the Todd machine, which is in exclusive use in the Bahamas and which at a minimum of cost turns out between half to a ton of fibre per day. Messrs Ide and Christian, the London brokers, have pronounced Mr Tytler's fibres to be very superior quality, and their *fiat* was borne out by the results in the sale room, as the Madras fibre fetched £32 10s a ton where the other was selling at £28, and this in spite of its being only a small lot and the packing inferior. —*I.P.G.*, Nov. 9.

AN ANALYTICAL LABORATORY FOR CALCUTTA.

We have more than once commented upon the absence of a reliable analytical laboratory in this country to which the public could resort. That such an institution has not been established before is a matter for surprise, considering the requirements of the commercial community in this city alone. We are therefore glad to see that Dr C Schulten will shortly open such a laboratory at 12, Mission Row, Calcutta. Dr Schulten holds the Diploma of a graduate in Chemistry and Natural Science of the University of Erlangen (Germany), and has acquired a thorough practical experience in testing commercial, agricultural and other articles as an assistant of Professor Dr König at the Public Station for Chemical and Scientific Research in Münster in Westphalia. He has kept up his connection with this institute and will continue to do so by correspondence. He is thoroughly experienced in the different branches of analytical testing and his laboratory will be fitted with the latest appliances for this work. The following are a few of the articles of which he will undertake the chemical analysis:—Soil, Manure, Bone-meal, Saltpetre, Lime, Stones, Shellac, Coal, Metals, Indigo, Seeds, Oil, Sugar, Spirits, Water, Food-stuffs, etc. In indigo testing he has special experience gained during the last nine indigo seasons in Calcutta and Samarang (Java). Microscopical investigations will be undertaken by him as well as chemical ones. To ensure against delay in the execution of work, he has engaged a qualified assistant who holds the Diploma of a graduate in Chemistry, etc., of the University of Heidelberg (Germany), and has for the last three years been (working in one of the largest laboratories in Germany.—*Indian Gardening and Planting*, Nov 7.

TUSK MEASUREMENTS OF INDIAN ELEPHANTS.

SIR,—In continuation of my letter in your issue of the 8th instant, under the heading of "A Notorious Rogue Elephant," I write to give particulars of some measurements of record tusks. The late Sir Victor Brooke shot a large elephant in the Mysore forests which is said to have been 11 feet high and its single tusk measured 8 feet in length, 16½ in circumference and 90 lb in weight. Another single tusk from Gorakhpur is said to have weighed 100 lb. Lieutenant Fowler, of the 5th Fusiliers, Bangkok, writing to the Bombay Natural History Society (Vol. XI. No. 2 Page 335) gives the length and circumference of the elephant tusks in the Royal Siamese Museum, Bangkok, of which there are several large ones, the largest as 9' 10" and the thickest 20½" circumference. There is a skeleton of an Indian elephant in the Calcutta Museum which measures 11' 3" so that in flesh it must have been over 12 feet in height; yet there are sportsmen who say that there are no elephants of 10 feet found in India.

Mysore, 11th Nov.

BIG BORE.

PEARLING REGULATIONS IN SOUTH AUSTRALIA.

Adelaide, Oct. 30.—The Legislative Assembly today passed a bill to regulate pearling in the Northern Territory by means of licensing dealers, and preventing illicit traffic.—*Australian paper*.

PARA RUBBER PLANTING IN TRAVANCORE,

INTERESTING ENTERPRISE: GOVERNMENT AND PRIVATE.

Trevandrum, Nov. 9.—Considerable interest is being evinced both by the Government and private gentlemen in the planting of para rubber. There is a small para rubber plantation at Maliatur worked by the Government, but it is not thriving as it should. I learn that Mr Sawyer, a Dehra Dun scholar of considerable attainments, who was formerly in the Travancore Forest Service and resigned it is to be re-employed. He will probably be placed in charge of the rubber planting as he was in charge of the rubber plantations at Mergui, in Burma. Mr Sawyer's health not being good in Burma, he has come back to Travancore.

Meanwhile, Mr Hunter, a cardamom planter on the High Range, has been traversing the unreserved forests near Maliatur which he thinks are suitable for para rubber. He purposes planting 3,000 acres if he can get them from Government, and the area will be worked by a syndicate. To be early in the field appears to be the object of everybody. Ceara rubber grows well in Travancore, but is not remunerative.—*Madras Mail*, Nov. 13.

THE COMMONWEALTH STANDARD FOR TEA.

UNDER THE NEW CUSTOMS REGULATIONS.

Sec. 54 of the Customs Act, clause e, states:—“Any tea not complying with the prescribed standard of strength and purity shall be deemed unfit for human use.” Clause 15 of the regulations, which have been issued only a few days, provides that “Tea which does not comply with the following standard of strength and purity shall be deemed unfit for human use:—

“The analysis to be made on the tea dried at a temperature of 212 deg. F., and then powdered and totally exhausted with boiling distilled water. Total aqueous tea extract, not less than 30 per cent.; total ash, not more than 8 per cent.; soluble ash, not less than 3 per cent.”—*Australian Grocer*, Oct. 24.

TEA PRUNING,

[From Our Special Correspondent.]

The various systems of pruning the tea bush are the result of experience, and consequently each manager holds on strongly to that system which he has proved to give the best results.

But, as time goes on, and conditions change, systems which apply to any branch of tea cultivation or manufacture, should be adapted to the altered conditions.

As a rule, men who have themselves proved any fact, are inclined to be conservative, and there are only a few who move with the times, and adapt their systems to their present conditions. Of these again a few look ahead, and prepare for what they see as an inevitable necessity.

This is the reason why a scientific enquirer is necessary at this period of our history, so that he shall go ahead and save us the trouble of making trials, and give authority for any necessary change,

The remarks I propose to make are intended to call the attention of anyone who will make pruning his special study. A change in the system of pruning is required, because of our altered conditions. In the old days when tea was worth a rupee a pound it became the natural tendency to get as many pounds as possible, without any regard to the future welfare of the property. It is a fact that light pruning will give the greatest possible yield in the coming season, and so the general system has been to prune as lightly as possible until, after a succession of years, the bush gets choked up with a superabundance of small twigs, and the yield begins to get less, because it is more difficult to pluck the small new shoots. Then the bush has to be cut down, and will again, within a few years, get nearly up to its maximum yield. If in its prime, a plot has yielded ten maunds of tea per acre, it may, after cutting down, reach nine maunds per acre. After the second “cutting down” it may get up to seven maunds. I hold that each successive “cutting down” reduces the vitality of the bush, and of its roots, so that eventually the bush will die. I am speaking from long experience, and am ready to argue out this point if necessary. The haste to get yield succeeds at the time, but leads eventually to the ruin of any property. As prices fall it becomes all the more necessary to keep up the bushes to a fixed standard. In the old days the loss of a maund of tea per acre did not make much difference in the course of ten years, because economy of expenditure kept pace with the fall in prices; but now when economy cannot be carried further, the loss of yield is a dead loss, which cannot be replaced. The system of pruning must look to the future welfare of the bushes. They cannot be strained now without fear of actual ruin.

I will propose a system, and will leave it for others to improve on my suggestions. If it is true that each time a bush is cut down it receives a shock which reduces its vitality, it stands to reason that “cutting down” must be abolished. But it is a fact that each branch of a tea bush sooner or later gets hide-bound and covered with mosses, and ceases to yield. Therefore each branch must be cut out whenever it reaches this stage. I have pointed out that the custom is to allow the majority of the branches to grow too old, and then cut them all out at once. This renders the pruning simple and inexpensive. One man can cut down 100 bushes, and the operation will last for five to ten years, whereas it will take one man to cut out only old wood from 100 bushes, and this must be repeated every second year. But in the first case the bush is injured, and in the second it is actually benefited by the removal of old wood. Let it be accepted then that no bush to be cut down all at once, but at stated periods old, useless wood must be removed carefully, and with discrimination. If this is done the bushes will always remain at their best, with due consideration of soil exhaustion. Beyond the health of the bush there is a very important consideration for Indian estates, one which gives Ceylon a distinct advantage over India, and that is the

REGULATION OF SUPPLIES

to the market. The Editor of *Indian Gardening and Planting* made out a table of offerings to London in 1900.

	Packages. Average offerings.	Excess over average.	Deficiency under average.
India	135,026	100,142	125,478
Ceylon	107,443	55,116	40,492
Average of Variations.			
India	...	33,861	67,206
Ceylon	...	27,333	19,803

This shows at a glance that India has greater variations, and I will propose a system of pruning, which is certain to lessen the variations without decreasing the yield,

PRUNE ONLY HALF THE GARDEN.

Ceylon gardens prune at long intervals; they always have the bulk of the garden unpruned at the beginning of each year. The unpruned parts yield well as soon as warm weather comes, but the Indian gardens, having pruned all the bushes, have to wait till April before the bushes yield well. The maximum yield is attained in September and October. The Indian offerings in 1900 were greatest in November, 235,168 chests, and least in June, 10,548 chests. The Ceylon heaviest was in June, 162,562, and the least in July 66,954. That means that Ceylon had the run of the market in June, when Indians were practically unobtainable. The remedy is, as stated above, to prune only half the garden, the other half can either be left entirely unpruned or merely tipped, an inch or two only of growth being removed. The unpruned parts will give more leaf from February to June, and less from June to November, so that the total yield will be the same but more evenly distributed over the year.

I do not wish to claim too many advantages for this system, but there is one more which I think of great importance, and that is allowing the *new wood* to grow for *two* years instead of one. It gets stronger and will send out stronger shoots. There is one danger in not pruning a plot for two years, but I do not know how it would affect the low lying districts. In the second year after pruning the bushes may die back in a severe drought. The new flush will start from lower down, leaving dead twigs above. This will certainly affect the yield of the early part of the season, but I doubt whether it would injure the bush permanently, or even reduce the total yield in that season.

Each writer on pruning advocates the common-sense system of clearing out old wood, and deprecates the entire cutting down of the bushes. But in practice the advantage of this system must be clearly seen, and up to this time the advantage has been hidden by the urgency of getting in the largest possible yield. The advantage of this system is, of course, not visible until it has been carried out for several years, and the bushes have been proved to remain in good condition. As a rule, the manager of an estate cannot wait; he is forced by the proprietors to gather in the largest possible crop with the least possible expenditure. The system I have proposed would consist of three different sorts of pruning. Firstly, one-half the garden would be only light tipped, and would cost very little; secondly, one half the garden would be thoroughly pruned; thirdly, the old wood should be cleaned out of (secondly) the pruned bushes, which are then open to inspection, as they are quite bare of leaf or twigs. The cost of these three operations should not be more than that of an ordinary pruning of the whole garden. But the value of the system cannot be proved for a year or so. I myself am convinced of the value of it, both in theory and in practice, but the gardens I work are in an isolated district, and the conditions of climate are quite different from those of the plains gardens. Chota Nagpur is 2,000 ft. elevation, rainfall from 35 to 85 in. April, May, and part of June are very hot and dry, and the bushes are dormant at that time (if no rain has fallen) as well as from December to March. We prune from May 1, and get it done early in June, and we prune only half the area. But besides the off time in the cold weather, the pruned bushes take two months to start again, and three months to get into full yield. I argue that if tea will stand the above treatment in such a severe climate, the same treatment will be more beneficial in better climates. But whatever system of pruning is adopted it is more than ever necessary to look to the future welfare of the bushes, and to prevent them from deteriorating for the fancied gain of the coming season.

In the case of taking over an ill-used estate it might be best to cut the bushes below the surface level, and "also to cut the roots," so that there may be reciprocal

growth between the branches above and the roots below. I have dug up seedlings with their roots "entire," and I found that when the upper growth was "at rest"—i.e., Bangi, the roots were longer, but when there was upper growth (i.e., Pekoe Bud) the roots were shorter. And so I conclude that "both" the roots and branches must have periods of rest and activity. If a bush is cut down, the roots cannot rest until the upper growth stops. But if the roots are cut off there will be a natural and reciprocal growth which should be beneficial. Having once cut down and renewed the bushes they should never again be subjected to the trial. The fact that many bushes die after being cut down proves that the trial is severe. If anyone doubts whether the biennial pruning is of any benefit, and not practicable, on account of droughts, etc., etc., I recommend that pruning at the end of April should be tried. If half the garden should be pruned in December and half in May, this also would equalise the yield of the year. We practise this safely in Chota Nagpur, because the bushes are dormant in May, and in Assam or Cachar they would be in vigorous growth. There is an idea that it is harmful to prune a plant when it is growing, but as the tea plant is "leaf pruned" constantly, I doubt whether wood pruning would injure it. At the first glance this latter plan appears absurd, because it gives two periods of rest instead of one, but it is worth trying. The systems of pruning will never be changed unless proprietors recognise the damage done to their property by cutting down, and put an end to it once for all. If cutting down is forbidden the managers will find the best system under the circumstances, and will soon find that no deficiency in yield comes from letting the bushes remain at their full size permanently.—*Tea*.

ABOUBE.

COPRA FROM ZANZIBAR.

MORE CARE WANTED.

We wonder why Zanzibar planters are so hopelessly apathetic and stupid. Produce is often brought into town in a very disgraceful condition, coprah especially being frequently offered for sale in a half dried and almost rotten state. This is either due to sheer laziness or else it is done deliberately because half dried coprah weighs more than the properly prepared article, and the fact that the loss in weight is more than compensated for by the price on the quality is completely lost sight of. For this reason Zanzibar coprah has lost much ground on the European markets of late years, and were it not for the fact that our coprah yields a very large percentage of oil, we would probably be unable to hold our own in the face of the keen competition of other countries.—*Zanzibar Gazette*, October 23rd.

PROSPEROUS MALAY STATES.

Here are striking "bits" from Sir Frank Swettenham's latest Report on the "Federated Malay States":—

The value of trade for the year 1900 reached nearly a hundred million dollars or ten millions sterling. In the twenty-six years during which the Malay States have had the advantage of British advice and protection, the revenue has grown from about £100,000 to over £1,500,000. Over 250 miles of railway, 1,300 miles of cart-road and 1,400 miles of telegraph have been constructed. Waterworks, wharves, hospitals, prisons, schools, and many other public buildings have been constructed, while, at this moment, the Government of Perak is engaged upon an important scheme of irrigation which will benefit about 60,000 acres of land and cost about a million dollars. The four States under British protection were federated in 1896, their total revenue for that year being a little over eight million dollars. As some proof of the

success of this step it is not a little remarkable that in 1900 the revenue should have almost doubled, thus securing in less than five years as large a measure of increase as had been gained in the previous twenty years. About 500,000 tons of tin, worth over £10,000,000 sterling, have been exported during the last fifteen years.

A MANUAL OF THE NORTH CENTRAL PROVINCE.

We have to welcome the appearance of an excellent and handy manual of a province before which perhaps there lies the richest future in contrast with its recent past of any in the island. We refer to the "Manual of the North-Central Province, Ceylon" compiled by the Hon. R. W. Ievers, M.A., present Acting Colonial Secretary, but who was formerly for nearly seven years—from May 7th 1896 to April 14th 1893, Acting Government Agent of this province. The book issues from the Government Press. The preface explains the *raison d'être* of the work and we are glad to quote it in full:—

When Agent of the North-Central Province I was directed by Government to prepare a *Manual of the Province*, and the materials which I then put together are now printed. I regret the incompleteness of the work, and hope that my successors may be able to bring it up to date in a later and more useful form. I have to acknowledge obligations to many who have assisted me with information, and especially to Mr H. C. P. Bell, Archaeological Commissioner, who has helped me in various ways.

Jaffna, 1899.

R. W. IEVERS.

We are not prepared to admit that it contains any serious omissions. The maps alone—North-Central Province, Nuwarakalaviya, and Tamankaduwa—are most valuable, while the titles of the chapters—Physical Features and Topography, Ancient History, Modern History, Political History, Population, Inhabitants, Climate, Health, Religion, Oaths, and Ordeals, Revenue and its Collection, Irrigation, Agriculture, Food Supply Roads, Archaeology, Trees, Shrubs, &c., Beasts and Birds, List of Sinhalese words used in a peculiar sense or used only in the North-Central Province, and Forests,—quite belie—superficially, at least—any apology for incompleteness. We notice Mr. Ievers quotes from White's *Selborne*: "Every Kingdom, every Province, should have its own Monographer" and—following in the footsteps of Sir A. C. Lawrie with the Central Province—Mr. Ievers could hardly have been surpassed as the chronicler of things as they have been, and are, and might be, in the North-Central. On a cursory glance we have found this manual of 276 pages in every way admirable and its translation into Sinhalese, and even Tamil, should prove a profitable as well as most useful task for an official.

COOPER, COOPER, & JOHNSON.

THE DAWN OF RECONSTRUCTION.

After months of delay owing to the fact that a promised £10,000 was not forthcoming there seems at last some chance of the reconstruction of this business taking shape. It seems that there

are really to be two concerns, the retail shops being separated from the plantation properties. Existing shareholders will have an opportunity of taking up the shares in the shops business, and it is satisfactory to note that all debenture or other first charges are to be got rid of. Of course the re-organisation proposals will involve a wholesale reduction in the capital, and shareholders will be asked to contribute 1s 6d per share, but this assessment will be reissued in the shape of second debentures. We await the full details with some curiosity, and shall be glad to know that something has been saved from the wreck.—*Investors' Review*, Nov. 2.

THE GEOLOGY OF SOUTH-CENTRAL CEYLON.

We direct attention to an interesting paper by Mr John Parkinson, read before the Geological Society, on the Geology of South-Central Ceylon. Mr Parkinson visited Nuwara Eliya, Hakgala, and other popular places during a visit, with Mrs Parkinson, last year—on their way round the world. The "notes" are published below.

NOTES ON THE GEOLOGY OF SOUTH-CENTRAL CEYLON.

BY JOHN PARKINSON, ESQ., F.G.S.

I.—INTRODUCTION.

The following notes are the result of a tour of a few weeks duration in the south-central parts of Ceylon. The time spent in the island was brief, and the work was done entirely upon inland sections; but in many places the exposures of rock are good, especially along the lines of railway. Petrological descriptions of Ceylon rocks are not wanting, but details of their field-relations are few, and it is hoped that the following paper may direct attention to the interesting problems which are likely to arise from such an investigation.

II.—THE GNEISSOID GRANULITES.

(a) ON THE CEYLON GOVERNMENT RAILWAY FROM RAMBUKKANA EASTWARD IN THE DIRECTION OF ALAGALA.—Leaving the station at Rambukkana, and proceeding along the metals, we walk over country which is flat, or nearly so, for about half mile, when we come to a small cutting. Here is exposed a rather coarse* granitic rock with pinkish brown felspars up to 3 across. In about six yards this gives place to one more finely grained, rather saccharoidal in appearance, and speckled with patches of mica.

On the opposite side of the railway line the rock is banded, but not in the clear even way which, for instance, characterises the gneiss on the south side of the St. Gotthard Pass. The darker parts are rich in hornblende and brown mica, and contain little or no quartz. These bands often have a wavy habit, as though torn, and sometimes small black patches, like fragments of bands, appear isolated in the more granitic rock. Rather frequently we find large felspars rounded in outline, and an inch or more in diameter. In 25 to 30 yards a very hornblende rock crops out, followed in turn by one conspicuously banded. We find next the hornblende rock veined by the

* Granite and granitic are used merely as field terms; as will be seen, the structure of the rocks here described is not that of a granite.

granitic: some of the veins are only 5 inches across, and frequently contain a fair proportion of the darker minerals. The hornblende rock itself often exhibits much felspar. Sometimes long lenticular bands of the dark rock appear; at others it is represented merely by a few broken minerals.

A very fine section is exposed near the 54 benchmark. This shows in some places the rock beautifully and wavyly banded, the darker parts varying somewhat in their proportions of hornblende and mica, and hence in colour. In places a light-coloured vein cuts across an older banding and yet seems to form an integral part of the rock; at others, the bands are disjointed and lie in fragments in the lighter matrix as though broken, while occasionally we find strongly-marked pucker. The gigantic rock varies in texture, and sometimes for a foot or so, is almost free from dark folia.

Thin sections show the dark rock to consist of a mosaic of green hornblende-crystals, extremely irregular in shape, and plagioclase, the former predominating in quantity. Occasionally, rounded grains of the hornblende are enclosed in the felspar. Apatite is very plentiful, and small zircons are not uncommon. The section also contains a little pleochroic augite with the characteristic colours of hypersthene. The specific gravity of the rock is 2.95.

The granitic rock, taken at a point where it possesses a minimum of hornblende or mica, is of medium grain or rather pink in colour. A thin section discloses microcline in considerable quantity, some orthoclase with micropertitic intergrowth, and a good deal of plagioclase. Quartz is plentiful. In addition, the rock contains a few irregular flakes of biotite, zircon, and iron-oxide.

Specimens from the banded part of the same mass are characterized by rather small hornblendes and micas, often with a few larger individuals of the former scattered through the rock. The specific gravity of such a rock is 2.82.

One possessing well-marked bands has a peculiar though quite distinct foliation, making an angle of about 45° to the direction of the bands. Under the microscope the rock is seen to consist of plagioclase, orthoclase, quartz, green hornblende, a little brown mica, zircon, and apatite: the darker minerals predominating in certain parts, and, together with less quartz than in the remainder of the slide, constituting the banding. The proportion of mica varies and in several instances it is associated with hornblende in a way which suggests very strongly its formation from that mineral. Iron-ores are abundant: for the most part they are probably ilmenite, together with some pyrites. The rock shows no indication of crushing and the foliation referred to above seems probably due to a fresh movement preceding final consolidation, causing the mica-flakes to take up a new position oblique to the plane of banding.

(b) ON THE CEYLON GOVERNMENT RAILWAY: WESTWARD FROM KADUGANNAWA.—Along the railway-line good but monotonous sections are exposed, essentially resembling those just described. The rock is both finely and coarsely banded, in some places the granitic veins measure 4 inches across, and although they frequently remain straight for some distance, yet they often vary in thickness, thinning out, then swelling. Occasionally the rock is gnarled, but this is not characteristic; while not frequently the veins, by inter-

secting, produce an appearance of brecciation. This seems incompatible with any theory which would impute the banded structure to crush. A little farther west the rock, banded in its lower part, has a much more brecciated look in its upper. The whiter veins seem partly to enclose lenticular masses of the darker rock, and, in a few cases, to form a rather high angle with the underlying bands. In one case a long band of the darker rock, containing one or two small white bands, has been broken in two (fig. 3), so that probably the granitic rock is not all quite of the same age (fig. 4). Some coarse felspar-veins are certainly younger than the granitic rock which constitutes the more regular bands.

The cross-cutting granite-vein of fig. 4 is fine-grained and white in the hand-specimen, thereby differing from the granite described on p. 199. A thin slice exhibits large and very irregular grains of quartz, orthoclase in considerable quantity, microcline rare or absent, plagioclase, and a few greenish flakes of mica. The rock has a granulitic structure, the quartz usually penetrating the felspar, or in some places forming quartz vermicule. Its specific gravity is 2.62.

A dark band (specific gravity 3.23) in the banded rock below Kadugannawa shows in a thin section much pale green angite, altering to darker green hornblende. A brown mica is present, often presenting the appearance of a further product of alteration, but at others seemingly independent and in well-formed flakes with a distinct orientation. The rest of the slide consists of pyrites with some magnetite, untwinned felspar (not very plentiful), perhaps a little dolomite, and apatite.

A thin section, from a well-banded specimen from the same cutting, exhibits both in constituent minerals and in structure a great resemblance to those already described in § (a). In the lighter bands the only ferro-magnesian mineral is mica; the remainder consists of grains of quartz, plagioclase, and some orthoclase. The extinction of the plagioclase symmetrically with regard to the trace of the composition-plane varies from 7 dg. to 9 dg. The darker parts of the slide are distinguished by large plates of green hornblende and a quantity of brown mica. The two minerals are intimately connected the one with the other; in one instance the mica seems to be an alteration-product of the hornblende. The constituent grains of the light and dark parts interlock, and there is nothing approaching to a sharply defined line of contact. Quartz is less plentiful in the darker parts, a few grains of an apatite-like mineral occur, and an occasional crystal of zircon. There is very little quartz vermicule, but no micropertite.

In the cutting just below Kadugannawa (that is, on the west) the banded rock becomes strikingly garnetiferous. The garnets favour the dark parts in their distribution, but occur also in the lighter. One or two are of the size of a very small pea, but this is exceptional. A typical specimen is dark and micaceous, markedly foliated, slabby in fracture, and crowded with small garnets, about .025 inch in diameter. A thin section shows that hornblende is entirely absent, its place being taken by the garnets. These are irregular in shape, rather cracked, and may be either pyrope or almandine.* Occasionally we find mica-flakes embedded in the garnet. The plagioclase gives symmetrical

* M Lacroix refers the garnet to almandine, Bull. Soc. min. France, vol. xii (1889) pp. 288, 306, etc.

extinctions from 18 dg.—18 deg. to 22 dg.—22 dg.

A thin section has been cut from a specimen taken near the small wayside station of Balana, on the Colombo side of Kadugannawa. Here the darker rock is in excess, but the white bands are still clearly seen in places. Under the microscope we see it to be closely related to the series already described. It contains a considerable quantity of hornblende and mica in approximately equal proportions.

A thin section has been cut from a very similar rock cropping out on the path to Lanka Pileka near Kandy. It is a black and white speckled, rock, the white constituents being granular and saccharoidal. Under the microscope the resemblance to the Balana rock is very great: the ferromagnesian silicates are somewhat less strongly developed, but iron-ores are not uncommon.

(c) RAILWAY TO THE NORTH OF MAHAIIYAWA (KANDY).—A well-preserved banded rock is found the north of Mahaiyawa. It sometimes contains quartz-grains of considerable size and, locally, garnet. Not far from this is a small quarry near the railway, excavated in a grey biotite-gneiss, streaked rather regularly by a red coarse granite, which occasionally contains large black mica plates. The rock is often very coarse, and exhibits big eye-shaped teispars such as were seen near Rambukkana. The bands which this granite forms run parallel with the general foliation, and from the field-evidence seem clearly to be an integral part of it. A slide cut from a fairly coarse specimen of the granite shows that it is essentially the same rock as that which forms the lighter-coloured part in the cuttings near Rambukkana (p. 199). Both rocks are characterized by microcline and micropertthite, and by the presence of large, very irregular quartz-grains, while the ferromagnesian silicates are represented in both by a few flakes of mica. A thin section taken from a specimen showing the banding of this rock with the biotite-gneiss, demonstrates that no line of demarcation can be drawn between the two varieties, that is, that whole must have solidified at the same time. The darker part, that called biotite-gneiss, consists of an interlocking mosaic of quartz and felspar, with orthoclase and plagioclase. A little microcline is found, and one or two grains of orthoclase contain micropertthite. Biotite with a slight foliation is the sole ferro-magnesian silicate, and possesses the same characters as before. The specimen is almost identical with one from near Rambukkana.

A little farther north we come to a very slabby, rather fine-grained, and uniform pinkish 'granite,' the planes of parting being determined by mica-flakes. This 'granite' forms the greater part of the cutting, but the gneiss also appears, and specimens were taken showing the junction of the two. A thin section proves a perfect gradation between the two rocks and both are characterized by the same type of structure.

The pink rock contains no ferromagnesian silicate at all (except the black mica just referred to), and is distinguished by a quantity of orthoclase with micropertthitic intergrowth, though the mineral does occur without it, and a little plagioclase. The rest of this rock consists of quartz in small and very irregular grains, which frequently occur as inclusions in the felspar and *vice versa*. The other part of the slide (that is, the gneiss) contains orthoclase without a micro-

perthitic intergrowth, large and very irregular quartzes, some plagioclase, and no microcline in addition, we find a few flakes of mica. In passing from the pinker rock to that just described the first sign of change is the appearance of the larger grains of quartz, and then the gradual disappearance of the micropertthitic structure. It seems clear that the pinkish 'granite' is a fine-grained representative of the coarse rock which streaks the biotite-gneiss in the small quarry above described.

The rocks of Kadugannawa, Rambukkana, and Mahaiyawa are usually well foliated, and commonly banded. The dark bands are characterised by green hornblende in varying quantity, and the association with this of a brown mica. Garnets are found locally. Field-evidence shows that the inter-relationship of the light and dark bands may be best explained by the streaking together of the component parts of a magma which had undergone differentiation, and that occasionally this process was carried to a rather unusual extent.

III. CONTACT OF LIMESTONE AND PYROXENE-GRANULITE.

Railway between Matale and Ukuwela.—On leaving Matale Station we see, first, a few outcrops of white crystalline limestone, followed and overlain by hard red soil. This exhibits a number of small ferruginous concretions, which are, however merely the outcome of a weathered condition, for internally it is mottled red and yellow, and is apparently an argillaceous soil rich in iron.

In a short distance we come to a level crossing, and on the left hand side or the track a small section is disclosed by the railway-cutting. The dominant rock is a crystalline limestone, but in this, and looking like an approximately horizontal dye, is a fine-grained rock rather saccharoidal on a fractured surface, but with a greasy lustre. This very closely resembles the pyroxene-granulites exposed on the road to Hakgala from Nuwara Eliya (see p. 207). This rock which I will call 'the Band,' in order not to prejudice the question of its intrusive nature, is about 4 inches thick at the only place where its upper and lower surfaces are seen. It can be traced for about 5 yards, the base not been seen; and in one place it forks, and partly includes a mass of limestone about a yard square.

After this exposure, we find a good cutting of well-crystallized limestone (specific gravity=2.86), followed by another of red rock similar to that seen before, but less concretionary on the weathered surface. This is succeeded in turn by limestone, and again by the red soil, which must be a kind of laterite.

Thin sections from the 'Band' and limestone will now be described. In a slide cut from a specimen of the former (specific gravity=2.96) the dominant mineral is a pleochroic augite. In an orthopinacoidal section the colour for vibrations normal to the prismatic cleavage is a pale pink with a slight tinge of crimson; at right angles a pale, rather bluish, green. The pleochroism thus closely resembles that of hypersthene. The polarization-tints are brilliant, rather recalling those of olivine. Occasionally this augite is of a medium shade of sage-green, non-pleochroic or but feebly so, and probably merely a variety. Mixed in with this augite area few irregular grains of pale red garnet, which are absent in a second slide. The augite is altering to brown hornblende, pleochroism of which

ranges from a yellow to a red-brown. There are also a few grains of pyrites. Brown mica occurs in other specimens. These darker minerals constitute the greater part of the rock. The rest of the slide is made up of clear and colourless plagioclase, with well-marked twins and extinction-angles of 14 dg. to 17 dg. (agreeing with oligoclase) on either side of the trace of the plane of composition.

A thin section, cut from a specimen showing the contact between the 'Band' and the mass of limestone which appears to be included in it, exhibits points of interest. The aspect of the 'Band' is greatly altered. It is fine grained, rather pink in colour, and discloses no distinctive minerals when examined by the naked eye. The limestone is not so coarse as in the cutting nearer Ukuwela, but is crowded with green malacolites. At the junction exists a line of dark minerals. Under the microscope the 'Band' is represented by a fine-grained aggregate of calcite and malacolite, the latter preponderating, the former interstitial. The smaller grains of malacolite are full of inclusions, perhaps of a carbonate. The limestone consists of plates of dolomitic calcite,* and is exceptionally rich in malacolite, thus resembling the rock on the other side of the junction, except that the carbonates predominate over the malacolite, and the whole is coarser. The last-named mineral becomes more plentiful as we approach the boundary, and is also serpentinized along cracks and edges; while near the junction many grains are converted into yellow and green serpentine. The line of demarcation between the two rocks consists of greenish and yellow serpentine, without definite form and showing but few traces of its origin from malacolite.

A second contact-section, cut from another specimen a couple of yards or so away, unfortunately gives but little information about the composition of the 'Band' near the junction. We find the same serpentinized zone; and the line of demarcation between the two rocks is not strongly marked, so that it is difficult to say where one begins and the other ends. This section is, however, noteworthy for the grains of spinel embedded in the serpentine-zone. There is some iron-oxide, possibly of the nature of a residue, and a few small flakes of reddish-brown mica, almost colourless for vibrations normal to the basal plane. The spinel is of a dull sage-green, considerably cracked, and occurs in rounded subangular grains up to 0.25 inch in diameter.

Perhaps some monticellite may be present, as well as malacolite. The limestone 12 inches from the junction contains abundant grains of malacolite, fresh and not serpentinized, and a few plates of slightly-coloured augite. The dolomitic calcite here and in the cuttings to the south often has a vermiculated structure, owing to the presence of threads of a colourless mineral with an exceedingly low index of refraction and apparently no action on polarized light.† Very rarely we find a few flakes of yellow-brown mica, and still less frequently a grain of spinel.

* The rock effervesces sharply with cold hydrochloric acid. See Bull. Soc. Min. France, vol. xii (1889) p. 336, where the presence of both calcite and dolomite are recorded by M. Lacroix.

† An identical structure is described and figured by M. Lacroix in the dolomite of these rocks; see Bull. Soc. Min. France, vol. xii (1889) pp 337-33 and fig. 60.

Prisms of pale blue apatite are common, ranging up to 0.7 inch in length. When detached entirely from the rock and examined in polarized light we find them to be strongly dichroic (pale blue to pale claret-red).*

A specimen of the 'Band' distinguished by the presence of large brown plates of mica, 1 to 1½ inches across, deserves a few words. The rock is much lighter in colour than normal specimens. A thin section shows that there are three primary minerals and one secondary—the former are malacolite, mica, and spinel, the last named brownish hornblende. This replaces the malacolite completely in many places †. It is yellowish-brown for vibrations parallel to the prismatic cleavage, and possesses a fairly strong absorption. The mica includes plates of the hornblende, and extends its irregular edges amongst the hornblende-crystals. It is brownish-red for vibrations parallel to the basal plane, and pile straw at right angles to this direction. The mica also encloses small grains of green spinel, which make only the faintest attempt at an idiomorphic outline. The same mineral occurs embedded in the malacolite, and occasionally forms conspicuous aggregates which measure 1 inch across. The malacolite-grains are closely packed together, cracked, and rather stained. Very commonly the hornblende and mica contain a large number of small rounded greenish inclusions, with a high refractive index. They are so minute that their double refraction cannot be safely estimated, but it seems that a regular gradation can be traced from them to indubitable grains of spinel, and it may be inferred that they are that mineral.

The laterite-exposures found alternating with those of the limestone must originally have been represented by a crystalline rock of some such type as that described from the west of Kandy or from the neighbourhood of Bandarawella.‡ Accordingly we find the less difficulty in correlating the small rock-mass termed the 'Band' with those between Nuwara Eliya and Hakgala, which it closely resembles. The presence of crystalline limestone above and below this 'Band' and the way in which it partially encloses a mass of the former are unaccountable by any explanation other than that of intrusion.§

IV. HORNBLende AND PYROXENE-GRANULITES.

(a) THE NEIGHBOURHOOD OF BANDARAWELLA.—In the quarry on the hillside above the station we find a garnet-bearing hornblende-felspar-quartz rock with a very granulitic structure (specific gravity = 2.76). It is often well banded,

* See A. K. Coomara-Swamy Quart. Journ. Geol. Soc. vol. lvi (1900) p 600; Lacroix, Bull. Soc. Min. France, vol. xii (1889) p. 339; and C. Barrington Brown and J. W. Judd, Phil. Trans. Roy. Soc. vol. clxxvii (1893) A, p. 212.

† Some iron must be present in the original mineral.

‡ Decomposition *in situ* seems to be the true explanation of the formation of this type of soil in Ceylon.

§ I am of opinion that the peculiar mineralogical composition of the two rocks described above, namely, the representative of the 'Band' at the junction with the limestone, and the malacolite-mica-spinel rock, may be best accounted for on the hypothesis that local incorporation of the limestone accompanied the intrusion.

the more felspathic containing much quartz, but frequently such parts, instead of forming bands, occur as patches coarser than the rest. The felspar is greenish, which gives the rocks a rather dark appearance, and, by the aid of the quartz, a greasy lustre. Occasionally we find large eye-shaped felspars about 1.5 inch in length. A typical specimen is a finely-banded rock, the darker parts being composed of garnet, magnetite, and hornblende. These bands vary in breadth from about .1 inch to mere lines. To these three constituents the microscope adds a mineral, which I think is apatite. The magnetite is often embedded in the garnet; its outlines are irregular or sinuous. An angle or a side of the garnet is often finished off by hornblende, and flakes of the latter frequently connect small outlying grains of the former. A few crystals of zircon are present. Quartz is abundant, and occurs in the usual elongated grains, which occasionally divide and ramify among the other constituents. The felspar is, for the most part, orthoclase with micropertthitic inter-growth; but a little plagioclase is found.

In some specimens the garnetiferous parts of the rock are represented by a short band, about .4 inch broad, composed almost entirely of garnet, while in other places the mineral is aggregated into patches.

A specimen collected at the station before Bandarawella is essentially the same as the banded rock of the quarry above described. It is compact and greenish in colour, slightly banded, and with a greasy lustre. The irregular outlines of the garnet and their association with green hornblende, magnetite, and the apatite-like mineral, merely repeat the characters of the Bandarawella rock. A very few flakes of brown mica are found. The largest garnet is about 0.10 inch in diameter.

Similar rocks are met with by the new road which runs along the side of the hill above Bandarawella village. The numerous cuttings usually show the common sandy soil, which seems certainly to result from the disintegration *in situ* of the gneiss. The bands which characterized that rock are still clearly visible, and even the remains of the garnets can be seen as reddish spots. A few small quarries and road-cuttings show a little variation in the character of the rock. Sometimes no garnets at all appear, and the rock is uniform when seen from a distance. Frequently, however, closer inspection reveals the presence of a few dark bands (specific gravity = 3.16). Such and one possessed green hornblende as its dominant constituent, while a pleochroic augite was common, and biotite not rare. The rest of the slide was composed of plagioclase, as usual quite translucent.

A thin section cut from a banded rock near here showed that, as in all instances met with of banded rock in Ceylon, no line of demarcation could be drawn between the dark and light portions of the slide. The darker parts contain hornblende and pleochroic augite; and more sparingly, magnetite, brown mica, and garnet in order of frequency. The greater part of the hornblende is an alteration-product from the augite. The remainder of the specimen is a light greenish rock containing large quartz crystals, but as a whole much finer in grain than those from the Station Quarry at Bandarawella. Some red garnets about .03 inch in diameter catch the eye, and also a few flakes of mica,

(b) ROAD FROM NUWARA ELIYA TO HAKGALA.—In the quarry at the end of the lake at Nuwara Eliya occurs a dark greenish rock, with greasy lustre and some variation in degree of coarseness. Felspar is present in considerable quantity, and also conspicuous elongated grains of quartz.

A specimen, less finely grained than usual, has been sliced for examination. The ferromagnesian silicates (both biotite and horn-blende) are inconspicuous. The two constituents which build up the greater part of the rock are quartz and orthoclase with micropertthitic structure. Some of the felspars measure .4 inch across. The quartz is occasionally micropegmatitic, and accessory minerals are plagioclase zircon, pyrites, and (?) apatite.

Cropping out by the side of the road to Hakgala, close to the quarry just mentioned, is a garnet-bearing rock closely related to the above, but more finely grained and richer in the ferromagnesian silicates (specific gravity = 3.11). A little farther on, in a quarry on the left bank of the stream, the rock of the Nuwara Eliya quarry appears. The rock is traversed by coarser quartz-felspar veins, essentially the same as the coarse patches from the Nuwara Eliya quarry, and in these rather large flakes of mica are scattered. Occasionally the mica-flakes have a distinct orientation.

A small exposure above and to the right of the road consists of a banded garnetiferous gneiss, containing some quantity of pink felspar and a good deal of quartz. A vein or band of pink felspar and quartz, recalling the pinker parts of the gneiss (from which indeed it cannot be separated), traverses the rock roughly parallel to its foliation. It measures about three inches across, and contains patches of mica. No hard-and-fast line as of a contact can be drawn between the two.

About 230 paces down the road we find the compact greenish rock of the Nuwara Eliya quarry (specific gravity = 2.63). Its sections prove that this type is identical with the pinkish banded gneiss, in spite of the rather striking difference of colour: hence there can be, I think, no doubt that they form one group.

A well-banded rock crops out about $\frac{1}{2}$ mile below the entrance to Hakgala Gardens. The more felspathic part is compact greenish-yellow, of uniform texture, of specific gravity 2.59, and contains a pyroxene and a few inconspicuous red garnets. The pyroxene is monoclinic and pleochroic, but the pink colour which distinguishes this mineral elsewhere is almost imperceptible. The rest of the section consists of an aggregate of quartz orthoclase (micropertthite and microcline absent) and plagioclase (extinction 7°), and a few grains of zircon.

(c) OHIYA.—The rocks of the railway cutting between Ohiya and the ascent to Horton Plains are identical with those of Nuwara Eliya and the road to Hakgala, so that a detailed description is unnecessary.

Taken as a group, these rocks are distinguished, with a few exceptions, by a greenish colour accompanied by a greasy lustre, and usually by the presence of garnets. These garnets are associated with hornblende, a pleochroic pyroxene, magnetite, and frequently biotite. Irregular grains of quartz are common. There can be, I think, no doubt that these rocks are closely related to those of § II, p. 202.

Mr T H Holland,* in a most valuable memoir, describes 'a group of Archæan Hypersthene Rocks in Peninsular India' under the name of the Charnockite Series, and states that members of it occur in Ceylon. Some stress is laid by Mr Holland on the presence of the rhombic pyroxene. So far as my work goes, it tends to show that hypersthene is not distinctive of the Ceylon rocks. I have not, in fact, found the indubitable mineral at all (though it has been recorded by Mr A K Coomara-Swamy), but a monoclinic pyroxene with the pleochroism of hypersthene does occur.

The preceding observations show that the series of igneous rocks studied are closely related one to the other, and have arisen through the variation of a single magna. This variation, in places, has resulted in a well-marked differentiation into acid and basic parts which, by subsequent intermingling, have produced a banded gneiss. Further the evidence brought forward indicates that these rocks are younger than the crystalline limestone and are intrusive into it.

In conclusion, I wish to express my indebtedness to Prof. Bonney, D Sc F R S, for valuable suggestions and help during the preparation of this paper.

PRODUCE AND PLANTING.

On the subject of "Teas of Low Grade" the Grocer, says: "Keep your tea customers together," an old grocer used to say, 'and other goods will virtually sell themselves. People who come to buy good tea,' he would add brightly, 'stop to buy other things, and the net all-round profit is satisfactory.' Many grocers are now acting on that advice, and are working energetically to keep their tea customers together. Moral suasion, taking the form perhaps of a little personal homily, is not a neglected method. It tickles the ears of consumers, so to speak; whilst in numerous cases printer's ink is largely employed. During the winter season a number of persons drink more tea; consequently they become, in a sense, more important to their grocer, and, like a wise man, he is handling them accordingly. He keeps in touch with them, telling them what is good, giving small samples and excellent advice. One of our subscribers, addressing his tea patrons, states that 'recent exhaustive experiments by an eminent physician have demonstrated the value of pure, high-class tea as a stimulant and dietetic . . . Many low-class and adulterated mixtures of so-called teas are placed on the market by large advertising firms, and it behoves every householder to view with considerable suspicion brands retailed at prices which, with the cost entailed in advertising them, render it impossible to give anything like value for money.' It is also pointed out that teas of low grade 'contain an excess of tannin and other ingredients injurious to the nerves and irritating to the alimentary canal.' Harping on the same theme whilst eager to keep their tea customers together and attract fresh buyers, another firm of grocers describe how they have established a reputation for the sale of good tea. 'We watch,' they write, 'what other people are doing; we personally sample all the advertised and unadvertised teas in the town, and do not rest until we have beaten or at least equalled them; thus our blends are the concentration of years of study and skill.' It will be perceived that, so far as tea is concerned, the education of consumers is now taken in hand with some degree of confidence; and we are glad to notice that they are being warned off low-grade stuff. That article does not give much satisfaction to the buyer; it is not really economical in use since it does

not 'go far' whilst retailers get little profit or credit from the sale of an inferior commodity. Their present action by way of pushing finer qualities, is worthy of hearty commendation. It is pretty sure to be successful in the long run."

While efforts have lately been made and with success, to improve the condition of the tea market by restricting production in India and Ceylon, there is apparently the prospect that tea cultivation in Natal will tend to expand. In the latest report of the Commissioner for Agriculture in Natal it is estimated that the yield for the year ended June 30 last was 1,600,000 lb. in contrast with 1,300,000 lb. in the preceding twelve months and 1,000,000 lb. in 1899. Something like 500 acres more land have been planted in tea in the Colony since 1899, and it is expected that within two years the yield will reach 2,000,000 lb. while the hope is expressed that it will shortly be increased so much as to supply the whole requirements of South Africa.—*H & C Mail*, Nov. 1.

CULTIVATION OF THE OYSTER-SHELL.

Geraldton, Nov. 6.—Some years ago, at the instance of Messrs. Broadhurst, McNeill and Co., the Government of the day sent Mr Saville-Kent to inspect the waters of the Abrolhos with a view to the cultivation there of the Nor-West coast variety of mother-o'-pearl shell. This expert reported in favour of the experiment, and some of the Nor-West pearl oysters were deposited in the shoal waters of the Pelsart lagoon. Mr. Broadhurst, while recently visiting the islands, had as company the Rev. P U Henn, who was collecting conchological specimens for the Sydney Museum. This gentleman picked up a young live m.o.p. shell, and Mr. Broadhurst sent the specimen away for expert examination and it has been pronounced, true Nor-West shell, 'Meleagrina margaritiferae, and identical with those planted by Mr. Saville-Kent. There are doubtless many others there by this time, and the above discovery tends to show that the Nor-West shell will thrive in the Abrolhos waters.—Perth (W A) Herald.

PLANTING NOTES.

THE CLOVE CROP AT P.M.B.A.—News from Pemba states that the clove crop which promised to be a very good one this year, is practically at an end, there being nothing left on the trees. The Labour Bureau which was established by the Zanzibar Government a few months ago, has rendered great services to the Sister Island where Mr. Commissioner Farler who had charge of the movement at Chaki-Chake has been able to help many a planter to collect cloves which otherwise might have been lost.—*The Gazette*, Oct. 30.

PRUVIAN RUBBER SYND, LD. (71,664).—Regd.—Oct. 23, with capital £1,500 in £1 shares to acquire any estates, lands, plantations, premises, etc., in Peru or any part of the world, and to carry on the business of cultivators, collectors, and manufacturers of and dealers in India rubber, gums, coffee, cocoa, rice, grain, tobacco, spirits, gold, silver, copper, tin, timber, wood, hides, skins, ivory, etc. No initial public issue. Registered without arts of association by Waterlow Brothers and Layton, Ld., Birchin Lane, E C.—*Investors' Guardian*, Nov. 2,

* *Men, Geol. Surv. India*, vol. xxviii (1900) p. 119.

TO ALL PARTS OF ASIA, AFRICA, AMERICA AND OCEANIA.

Seeds & Plants of Commercial Products.

Hevea Brasiliensis.—Orders being booked for the coming crop, August-September delivery 1901; booking necessary before the end of April; quantities of 100,000 and over at special low rates. Plants available all the year round. 100,000 and over at special low rates. A leading Rubber planter in Sumatra, who purchased 50,000 seeds in 1899, and 100,000 in 1900, writes us, under date 15th November, 1900:—"I received your letter of 20th October, from which I learn that you added another case of 5,000 seeds to replace the loss, &c. I am satisfied hereby, and even after this adding I am satisfied by the whole delivery of this year."

Castilloa Elastica.—True superior variety cultivated in Mexico, seeds from specially reserved old untapped trees. Orders booked for August-September delivery, 1901, booking necessary before the end of March; large quantities on special terms; Plants in Wardian cases.

Manihot Glaziovii.—Seeds and Plants available all the year round, 100,000 and over at special low rates. A Mexican planter, in sending an order for this seed, wrote on the 22nd August, 1900:—"If they arrive fresh and germinate easily I may send you larger orders, as they are for high ground where the Castilloa does not thrive."

Kickxia Elastica.—(*Puntumia Elastica*).—Seeds and Plants, orders booked. (Lagos rubber.)

Ficus Elastica.—Seeds available in May-June; booking necessary before the end of March; also plants.

Urceola Esculenta and U. Elastica.—Same as above. (Burma rubber.)

Parameria Glandulifera.—Orders booked for seeds for January-February delivery; also plants; immediate booking necessary. (A good rubber creeper of Malacca.)

Landolphia Kirkii.—Seeds in July-August, early booking necessary. Plants can be supplied all the year round. (A highly-recommended species.)

Chonemorpha Macrophylla.—Seeds and Plants; orders booked. (A very valuable rubber-yielding creeper.)

Memusops Globosa and Payena Leerii.—Seeds and plants in July-August, booking necessary before April.

Achras Sapota, Willughbeia Firma, W. Edulis and other Rubber and Gutta Percha yielding Trees and Creepers, Seeds and Plants.

Cinnamomum Zeylanicum (Cinnamon superior variety). New crop of seed in April to June, booking necessary before the end of February; also plants.

Coffea Arabica, Liberian Hybrid and Maragogipe Hybrid.—New crop March-April; immediate booking necessary.

Cinchona Ledgeriana.—Seeds now ready, also other varieties.

Seeds and Plants of Nutmeg, Clove, Sandalwood (white and red), Pepper, Cardamom, Vanilla, Cacao, Tea, Coca, Fibre, Medicinal and Fruit Trees, Shade and Timber Trees, Eucalyptus various varieties, also Palms, Bulbs, Orchids, &c.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products of Foreign countries for 1901-1902, now being prepared, and will be ready in a few months.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says:—"An interesting Catalogue reaches us from the East. It is issued by WILLIAM BROTHERS, Tropical Seed Merchants, of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbing. We recommend the great Powers and Concessionaries under them to go to William Brothers."

Price List of Seeds and Plants for CEYLON use, post free, on application.

Our new Descriptive Price Lists of Seeds of Shade Trees for Coffee, Cacao, Tea, Cardamoms &c., Timber Trees, Trees for Avenues, Hedges, Wind and Shelter Belts, Ornamental Trees, Shrubs and Climbing Plants; and Seeds and Plants of Palms, Calamus, Pandanus, Cycads, Tree and other Ferns. Crotons, Orchids, Bulbs, Dracenas, now being prepared, and will be ready shortly.

Special Arrangements made with foreign Governments, Botanical and Agricultural Departments, Planters and others for supplying seeds and plants of Commercial Products in large quantities.

Agents in London:—MESSRS. P. W. WOOLLEY & Co., 90, Lower Thames Street.

Agent in Colombo, Ceylon:—E. B. CREASY, Esq.

Telegraphic Address:

HENARATGODA, CEYLON.

THE TEAK TRADE OF NORTHERN SIAM.

The British capital invested in the teak forests of Northern Siam is about two millions sterling, and three-fifths of the total teak trade of the country is in British hands, the bulk of the remainder belonging to Chinese and Siamese. British foresters and British companies were the pioneers of the trade, and those now concerned in it have lately been caused some anxiety by a change in the old conditions and the concentration of the forest administration as well as the establishment of new rules by the authorities at Bangkok. There are two main channels for the trade one down the Salwin to Moulmein, the other by the Me-nam and its tributaries to Bangkok. The timber floated down by the former, where the rains are plentiful and the valley deep, reaches its destination in a month or two; by the Me-nam Valley the time taken is often more than a year. Nevertheless, the trade by the Salwin, according to the last report of the British Consul at Chieug-mai (Zimmé), has steadily decreased in the last three years, probably because of the indiscriminate felling of the Burmese and Shan foresters prior to the new leases of 1897, since which time the work of extraction has been restricted and controlled by the leases, as well as by a British firm which finances the foresters. This firm has spent a large sum in making the new arrangements, and the increased inaccessibility of the timber causes a large and permanent outlay, so that some years must elapse before the returns will be commensurate with the outlay. On the Me-nam side there was a large and well-distributed rainfall, which floated out the streams a large number of logs (as the stripped trunks are called), which had accumulated for years awaiting a favourable floating season, so that 120,000 full-sized logs, valued at about £3 a log, reached Bangkok, the largest number in any previous year having been 73,000 in 1893. These logs having thus got beyond the boundaries of the forests, escaped confiscation under the provision that timber lying within the boundaries on the expiration of the lease becomes the lessor's property, and this gave great relief to the British companies and traders engaged in the staple industry of Northern Siam, who would otherwise have suffered heavy losses. But, on the whole, under the new leases and the new regulations for forest conservancy, the Consul's opinion is that if the regulations are enforced with impartiality against all concerned, "British foresters and traders are entitled to anticipate, if not the same profits as heretofore, at least a maintenance in the future of the same proportion of the teak trade in their hands as in the past." Last year the value of the teak sent down the Salwin to Burma was over £75,000, that sent down the Me-nam and its tributaries about £350,000.—*London Times*, Oct. 25.

PLUMBAGO IN TRAVANCORE.

"C." writes as follows in *Capital*:—

In a recent order of the Madras Government reviewing the Administration Report of the Travancore State for 1899-1900, a three-line reference is all that is made to the important plumbago industry which has been introduced into the country, mines being for some time past in excellent working at Vellanad, a place about 15 miles

from Trevandrum. They have timbered shafts underground, are worked by Cornish miners, and turn out more than a hundred tons of plumbago each month. Last year, 1,609 tons were shipped to Europe. At present the main disadvantage is with regard to the existing arrangements for shipping. Shippers, including those of plumbago, have frequently to send their goods a hundred and forty miles to Cochin for shipment. This is certainly a lamentable state of affairs. Recently, the facilities which Quilon offers for the construction of a harbour have been ventilated, and the Travancore Durbar might do worse than examine the question seriously. We believe that the plumbago industry in Travancore has now emerged from the experimental stage and is justifying the enterprise of its promoters. The existence of the mineral in the country was established long ago by the late General Cullen, a former British Resident, but it wanted the boldness and enterprise of Europeans to found an industry out of it. There are said to be more than one or two deposits of the mineral within the State, but in the mines which are now working, though the plumbago is not always easy to find, experience has shown that good "pockets" exist to a paying extent. The plumbago is taken out in irregular lumps, stored in an open shed, broken up into small pieces, and all its sand, etc., separated. It is then washed, cleaned and sorted, and after a further process of picking and sorting, is packed for shipment. The shafts which descend to a depth of about 150 feet are well timbered, and the mines solidly and safely constructed. Labour is cheap in the Travancore State, and no difficulty, we believe, is experienced in obtaining a sufficient number of men, women and children for work, underground and on the surface, in the different departments of the industry. In fact, the labourers on the mines have already attained so much skill that those who are employed to sort the mineral after it has been washed are well able to differentiate the ore and to select from the entire mass the particular ore which is called "needle plumbago" and which fetches a higher price than the ordinary ore. The enterprise is a most laudable one, and it is for the Travancore Durbar to render it all possible reasonable assistance.—*M. Mail*, Nov. 15.

PLANTING NOTES.

THE TEA CAMPAIGN IN FRANCE.—In a letter from Mr. Renton, dated Grand Hotel, Calais, October 27th, are very glad to read:—"Our demonstration goes on right merrily. At Boulogne, Dunkerque and here we have now got several dépôts besides those at Havre, Rouen, Caen, Dieppe, etc. Those shops may not sell much tea, but the result of those 'degustations' will be that in course of time we will knock China tea out of France."

TEA PRUNING.—This is the subject of a special article which we quote from "Tea" on page 407. It advocates the appointment of a scientific enquirer to give authority for any necessary change in the system of pruning, and the remarks that are made will, no doubt, receive the attention of all who intend to make of pruning a special study. The practice that prevails in Ceylon comes in for special mention, and the advice is given to prune only half the garden. Many other useful hints are thrown out.

PLANTING NOTES.

FOOT-AND-MOUTH DISEASE DISCOVERY.—A Reuters wire dated Pisa, October 27, states Signor Baccelli, Minister of Agriculture, presiding at the opening sitting of the National Congress of Medicine, yesterday, delivered a speech in which he explained more fully than in his speech at Novara the method discovered by him for the cure of foot-and-mouth disease. The speaker said that some time after having been appointed Minister of Agriculture he happened to be at Civitavecchia, and, hearing that there were cases of foot-and-mouth disease in the neighbourhood, he instructed the veterinary surgeon of the town to employ in the treatment of the diseased cattle the Baccelli therapeutic method, which consisted in injecting sublimated mercury into the veins. He prescribed the following doses:—For calves, two to four centigrammes for each injection, according to the seriousness of the case; for adult animals, four to six centigrammes; and for bulls, six to eight centigrammes. The solution was to contain 75 milligrammes of sodium chloride (common salt) for every four centigrammes of sublimated mercury. Out of 52 cases of the disease 52 were cured. In Sardinia, where the Baccelli method was also employed, there were 26 rapid and complete cures out of 26 cases. In short, all the cattle which underwent treatment at Civitavecchia, in Sardinia, and elsewhere were promptly and completely cured by the treatment. Signor Baccelli was warmly applauded and received many congratulations on his success.—London *Times*, Oct. 28.

BRITISH GUIANA—is by far the largest of the West Indian Colonies—says the London *Times*, October 28th, indeed, it is nearly fifteen times as large as all the British Antilles put together. The *Hinterland* is almost totally neglected. It contains at least 20,000,000 acres of land not beneficially occupied, “an area of country,” says Dr. Morris, an unimpeachable authority, “equal to two Ceylons quite untouched.” These undeveloped Guiana lands, says the same authority in his report to the Royal Commission of 1897, “are amongst the richest existing in any part of the tropics.” Mr. Chamberlain, at the instance of the late Governor and late Colonial Secretary of the colony, recommended the appointment of Mr. W D Barnes as Commissioner of Lands, Forests, and Mines in British Guiana. Mr. Barnes, who has had much experience of the climatic and mineral conditions of the Malay Peninsula, which are more or less similar to those of British Guiana, was recommended to the Secretary of State by Sir Frank Swettenham, the Resident-General in the Malay States, and his brother, Sir Alexander Swettenham, the Colonial Secretary of Singapore, as a person highly qualified for the proposed appointment. It was necessary, however, for the salary of the new Commissioner—which was fixed at £1,000 a year—to be voted by the Combined Court; this by a narrow majority of nine votes to eight has lately rejected the vote. We cannot but think that the action of the Combined Court was deplorably shortsighted and impolitic. The colony is manifestly unable, even if it were willing,

to develop the *Hinterland* itself. The influence of the sugar industry appears to have been allowed, directly, or indirectly to frustrate Mr. Chamberlain's well-conceived measure for setting the development of the *Hinterland* on foot, or at least for giving it a fair and promising start.

THE INDIAN TEA CROP FOR 1901-2.—The *Indian Planters' Gazette*, in its issue of Sept. 23th, enters into calculations based on the best available information which show a probable falling-off in production of 12 million lb. We extract as follows:—

In our calculations we have taken into account the reduction in output already caused by, and likely yet to ensue from, more careful plucking and abnormal and unfavourable weather. Taking also into consideration our present position, relative to the different markets in which our teas are sold, we think the following approximate forecast will prove about correct:—

ESTIMATE FOR AGL INDIAN TEA, SEASON

1901-1902.

	lb.
Australia and New Zealand...	10,500,000
America	3,500,000
All other places...	5,500,000
	<hr/>
	19,500,000
United Kingdom	157,000,000
	<hr/>
	176,500,000
Left in India	9,000,000
	<hr/>
Total	185,500,000

The total production for all India last season was 197,460,664 lb, deducting the above 185,500,000 lb, the probable shortage in output this season will amount to 11,960,664 lb, or in round numbers, (say) some 12 millions lb. The outlook is by no means so gloomy as was anticipated. * * Apart, however, from the above estimate, viewing the subject from the stand-point of the reports received from Home, we find that the average price for this season's new teas sold on garden account, is 0.51d better than last year's average. * * Calcutta averages, moreover, cannot well be compared with London averages, for the simple reason that the bulk of the fine and good teas produced is shipped Home direct, to be sold on garden account. London averages are therefore naturally higher than those realised out here. It will be seen from the statistics which we have furnished that the present position of Indian tea is strong, and the outlook a hopeful one. Our readers must not be misled into thinking that *all* gardens are realising an average of 8.42d per lb for their teas in London, or that *all* estates are only getting As. 5.6 per lb for their teas in Calcutta. The figures represent the *average* price for the sales during the periods named. There are gardens and gardens. Some will pull through the present depression and move strong in the future; others will gradually fall away and eventually become extinct. The law of the survival of the fittest must and *will* work so far as individual gardens are concerned, but the Indian Tea Industry will go on and gather strength in its course, and will come out all the better for having been tried by the fire.

MR. RENTON'S CAMPAIGN IN EUROPE.

LONDON, NOV. 1

Mr. Renton has many interesting things to tell of his European Campaign. Demonstrations and tea lectures have been given in a large number of towns on the Normandy Coast with great success. In one place, in fact, the people collected in a perfect throng, each one bringing some sort of household vessel from a bed-room ewer down to an empty can, in which to carry away the tea they expected to be presented with! In consequence of Mr. Renton's efforts also a number of depôts for the sale of tea have been established, and in Germany especially several firms have taken up the "business," and are pushing it by the aid of circulars, etc., extensively. It seems to me that Mr. Renton

CARRIES ON HIS PROPAGANDA VERY ECONOMICALLY,

and it is a pity he has not been better backed up by Ceylon this year as he is just at the critical time one might say of his work. If the money is not to be continued, it is almost to be regretted that it was given at the start. A little longer support, and Ceylon tea will be able to stand by itself—especially in Germany, where there is at present a strong temperance movement setting in, which must undoubtedly help the cause of tea immensely. This anti-beer drinking crusade pervades all ranks of society at present in Germany and Germans are not anxious to alternate beer with more coffee of which already they have sufficient. Here is where the opportunity for pushing tea comes in, and, I believe, the "Thirty Committee" by taking the moment wisely, could effect a great change in the consumption of tea at present in that country. Speaking of

THE AMERICAN TASTE FOR GREEN TEA, Mr. Renton made a good suggestion. If, he said, some Japanese tea makers could be induced to come to Ceylon and show the Ceylon planters how Japanese Green Tea is made, it would place the question of whether Ceylon grown tea can be manufactured into Greens, similar to the Japan Greens, beyond a doubt; and also teach the planters how to do it. Or alternatively perhaps one or two Ceylon men could visit Japan and take notes. Doctors differ, and so this week the London merchants have been interviewed by an American who seems to think Green Tea no such desideratum as Messrs. Mackenzie and Larkin would impress on us. Whether he has the experience sufficient to make his evidence reliable, I should rather doubt, but at all events,

MR. FELS,

representative of a firm of the same name, has come over here to study the tea question from all points, with a view of pushing the article in the States. He appears to hold that Americans are just as likely to drink Black Tea as Green, and it is Black Teas that he purposes starting with, though he will sell Greens too, no doubt if he finds them go. The more Black Tea he sells the better, so all

we can say is more power to his elbow. But the planters need not stop making Green Tea yet awhile, I imagine.—*London Cor.*

INDIAN TEA ASSOCIATION.

Royal Exchange Building, Calcutta, 5th Nov., 1901.

(Extracts from the Proceedings.)

Letters dated 4th, 11th and 18th October, from the Secretary, Indian Tea Association, London, were brought up for final consideration after previous circulation. The principal matters dealt with in these letters were:—

(a) GREEN TEAS.—The London Committee had considered the circular issued in Calcutta on the 9th September, in which proposals for bulking green teas in Calcutta were advanced. They were in general agreement with the scheme outlined in the circular. Information was also contained in the letters regarding an offer made by the Baraora (Sylhet) Tea Co., Ltd., to manufacture 200,000 lb. of "faced" green tea for 1902 in consideration of the bounty. This offer had been accepted by the London Committee conditionally on (a) funds being available; (b) the tea made by the Company in 1901 being suitable; and (c) the teas being sent to the firms in America selected by the Calcutta Committee to deal with green teas.

The General Committee observed that the offer of the Baraora Co. had reference to "faced" green teas which, they understood, were in demand in the United States. The scheme set forth in their recent circular, dealt with the unfermented or Ceylon type of green teas, which they believed was preferred in Canada. They regretted to find that, in response to the circular, only two Companies had offered to manufacture green teas on the lines suggested. The London Committee were to be informed of this. It was also to be added, in writing to London, that the Committee here intended to approach one or two of the larger agency houses with a request that they should take up the matter of manufacture and bulking.

(b) PROPOSED TEA CESS.—It was stated in the letter that a memorial to H.E. The Viceroy upon this question had been prepared, and was being signed in London. Subsequently, it would be forwarded to Calcutta for additional signatures and presentation.

(c) CROP ESTIMATES.—In the letter dated 4th October, the opinion of the General Committee was invited upon the following resolution which had been adopted at a recent meeting of the London Committee, viz:—

"That in the opinion of this meeting it is advisable that monthly figures of production with comparative figures for the two previous years should be published at the end of each month commencing from the 31st July, 1902, to the end of the Season, so as to enable people to form their own opinions as to the probable size of the coming crop, and that the Calcutta Committee be asked for their opinion on this subject. And also (as a separate matter) whether the forecast based on the tea manufactured to the 31st August (in lieu of the 15th August) should or should not be issued in future years."

The General Committee, after thoroughly discussing the whole question, came to the conclusion that the most satisfactory method of procedure would be to restrict the information published by the Association to the fortnightly statements of exports. In other words to abolish entirely all estimates and returns of the crop because of the difficulty of procuring complete and correct figures. They thought it would not be practicable to obtain the particulars required for the monthly statements proposed by the London Committee. Moreover they recognised that the Director-General of Statistics was giving special attention to that aspect of the question which was dealt with in the statements of actual crop, hitherto annually issued by the Association. And they were of opinion that the returns which the Statistical Department was in a position to procure, were gene-

rally speaking, much more likely to be comprehensive and reliable than those obtainable by the Association. For these reasons they considered that, at the next Annual General Meeting of the Association, a resolution to discontinue the existing system of preparing and publishing crop statements should be proposed. These views were to be conveyed to the London Committee.

(d) **REGULATION OF SALES.**—In the letter dated 18th October, it was stated that the London Committee had resolved to resume the regulating of sales until the 31st January 1902, on the lines of the regulation of 1893-99. A circular had accordingly been issued to all Companies and Proprietors, explaining the importance of the matter and inviting support. The Ceylon Association had also been asked to co-operate.

The General Committee noted this announcement with satisfaction, and hoped that the regulation would be successfully carried out.

In the proceedings of the meeting held on the 20th September, reference was made to correspondence with Messrs. Aitken Spence & Co. of Colombo regarding the shipment of teas from Calcutta to Black Sea ports. The letter which it was then decided to write to Messrs Aitken Spence and Co., had been forwarded in due course; and the Committee now had before them a further communication, dated 18th October, from that firm. In this it was stated that the owners of a line of Russian steamers were willing to establish a regular service between the East and Odessa, provided sufficient inducement were offered. Calcutta might possibly be included in the itinerary although it was feared that the stringency of the Russian quarantine regulations would be a serious obstacle. But even if this proved to be the case, shipments might be arranged on special terms via Colombo. And in order that the owners might have some idea of the probable extent of the trade, Messrs. Aitken Spence and Co., asked for information as to the quantity of tea which would be likely to go forward to Odessa. They also enquired whether, in the event of special terms being arranged, Calcutta shippers would be prepared to enter into an agreement to ship by the line, which was run under the Russian flag.

The Committee noted this letter with interest. They were not, however quite clear as to whether the reduced tariff on Russian railways applied to all steamers flying the Russian flag, or whether it was restricted to the vessels of the Volunteer Fleet. Messrs Aitken Spence & Co. were accordingly to be asked to furnish information upon this point. If the reduced tariff did apply, the Committee were inclined to think that the Russian line in question might, by offering sufficient inducement, secure the bulk of the trade between Calcutta and Odessa. It was difficult to estimate the quantity of Indian tea which would be likely to go forward; but they noticed that the shipments to Odessa from 1st January 1901 to 30th September amounted to 560,000 lb. They were not at present prepared to enter into the question of an agreement, but they thought that if ample notice of the arrival of a steamer were given, and if the rates of freight quoted were favourable, practically all the cargo available would be secured. A reply in these terms was to be sent to Messrs. Aitken Spence & Co.

10. Considered a letter dated 29th October, from the Director-General of Statistics, enquiring as to whether there is recognised tare for tea chests. In the case of most of the tea imported into Calcutta by rail the gross weight of the packages was registered, and a deduction of 23 per cent was made as representing the average weight of the chests. The opinion of the Association was asked whether this rate—which had been adopted twenty years ago—was still correct.

The Committee were of opinion that the principal changes during the last twenty years were (a) a reduction in the number of half chests, and (b) the introduction—since 1896—of patent chests of metal and veneer. These weighed from about 20 lb to 22 lb each, as against wooden chests at about 28 lb; and the average weight of tea per chest might be taken as 90 lb. The use of patent chests had fluctuated; but

the Committee thought that by referring to the statistics of the imports of such chests, the Director-General would be able to form a fairly accurate idea of the extent to which they were used. With the information thus obtained it would be possible to determine what correction, if any, in the deduction of 23 per cent from the gross weight, was needed. A reply in these terms was to be sent to the Director-General.

H S ASHTON, Chairman.
H M HAYWOOD, Assistant Secretary.

STATE OF THE TEA TRADE.

The recent rise in the market value of Tea, which in some cases is very considerable, has lightened the previous deep depression, it might almost be said the despair, which has for some months existed among the growers and importers. No one will grudge this piece of comfort, coming at a time when there seemed so small a chance of improvement. But a bad crop in some or all of the Indian districts is, after all, only a matter of one season. It remains to be seen, even this year, how much of the deficiency in the older gardens will be filled from new land now coming into bearing, and which it has been said will yield many millions of extra lb. for several years to come. We are certain that the home trade cordially wish for renewed and continuous prosperity in the Indian and Ceylon industry. Better times, however, if they happily come, will afford an excellent opportunity for considering how far the recent extraordinary depression (due, of course, mainly to the production outstripping the consumption) may have been added to by the obsolete and costly organisation of the tea trade.

We are called on by every hoarding to remember the delicious teas of thirty years ago, but it is not added that the average price in bond at that time was 1s 9d per lb. while at the present time to probably only averages something like a third of that amount. Yet, notwithstanding this fall to something like one-third of the old price, the expenses connected with the import, sale and distribution of a chest of tea are, if anything, higher than they were a generation ago. In the interval, every other article of consumption sold through grocers has had the expenses connected with it reduced to a minimum, and the organisation of the trade has been modernised, so much so, indeed, that our predecessors, if they could come to life again, would hardly recognise their businesses. In tea they would be quite at home, for as it was in the days of the East India Company, so it is now, and many are so conservative as to believe that so it will ever be. That it costs ten or more times to sell a chest of Tea than to sell a hundred weight of Sugar is in the minds of such people a perfectly natural and inevitable state of things. Dock charges four times what they are in Coffee and immensely greater than in any other grocery, intricate weight notes and warrants of an aggravatingly useless and costly character—are some of the marks of antiquity which hallow the trade in the mind of some of its members. Unnecessarily long prompts, coupled with a system of deposits abandoned in all other commodities in Mining Lane make matters worse. Then we have a system of public sales, well suited for potatoes or onions, but one main effect of which is to depress the price of medium and fine Teas. These points mainly affect the growers and importers of Tea, but they appear to accept the disastrous position as desirable, unavoidable, and inevitable.

It is true that we knew one respected member of the home trade, who so far agreed with them, that he said that he would as soon join attacking the four Gospels as the organisation of the Tea trade, hallowed as it was by long antiquity. We contend, on the other hand, that this ob-olete system has materially aggravated the depression caused by the over-production of Tea, and that it will continue to be most injurious, whatever the price may be. Tea at 1s 9d could stand expenses, that Tea at 7d, 8d, or 9d cannot do.

While the growers and importers have had such terrible prices to contend with, it might be thought that the home trade would have found the sufferings of their suppliers highly beneficial, and it is likely enough that many of the less informed planters think so. As a matter of fact, the home trade, whether wholesale or retail, have never done so badly in Tea as they have done during the last few years. House after house with names honoured and familiar in the trade for generations, have given up their wholesale businesses. Others go on with their profits reduced to something like the funds would yield them without any trouble. The facts are quite notorious and familiar to every one connected with the trade. An immense sum of capital has been withdrawn, which incidentally used to steady prices, and to foster and create a demand for fine Teas. If things were to go on as they are doing now, far larger sums will yet be withdrawn, and businesses will perforce be so altered as to bring all teas to an even deader level of price, than even the very unsatisfactory one now existing. Nor is the position of the retail trader any better. Taste and care in tea, in which the older generation of grocers used to pride themselves, no longer pay, and cheapness is the aim of all distributors. The public, no doubt, are the greatest offenders in this respect, for, as *Punch* humorously remarked, the male giver of a dinner party boasts how much his Port costs, while his wife in the drawing-room tells her guests how little she gave for her tea at the stores. No doubt this feeling exists to a considerable extent, but there are yet left connoisseurs who appreciate fine tea and would gladly pay a reasonable price for it. If any effort were made to meet such a demand such buyers would rapidly increase, but it is worth no one's while to foster it. More fine tea is grown than ever, but it is so blended and muddled up that it is practically lost to the consumer. If the planters still further lose the support of the wholesale houses, who practically finance the 100,000 retail grocers of the kingdom, and if the public is allowed to continue to believe that the finest Tea the world produces can be sold wholesale at something like 1s per lb., when unpacked and unadvertised—things must go from bad to worse. Teas are already not sold on their value, but according to their cost, and of course the lowest cost secures the order, so that depression simply leads to more depression.

Things, indeed, have got into such a position that to find the remedy appears to be almost impossible. Here we have the grower on the one hand and the distributor on the other complaining, while some, at any rate, of the depression can be alleviated by concerted action. Such action is difficult, for between these two sections of the trade there is a great gulf fixed, imperfectly bridged by the brokers, who, quite unintentionally, keep the two sufferers from knowing each other's names on entering into each other's griev-

ances. Yet if they would only come together they would find that to a large degree they were suffering from the same causes, and that they could do much to help each other and to bring about better conditions. We believe frankly that the interests of all parties are at the present time absolutely identical, and that by meeting together and openly talking things over they would find this to be the case. Separated, the branches of the trade are quite powerless, but jointly they can effect much. In the question of Dock charges, weight notes, and so on, the aid of the trade is essential, and would be readily given. There are many other matters in which the distributors can help the growers, and any mutual attitude of suspicion can only arise from absolute ignorance of the feelings and desires of the other side. Had there been free and constant communication between the various sections, for instance, the late difficulty as to drafts could never have arisen. In almost every other Mincing Lane product, joint interests are looked after by a body representing them all, and fairly and carefully considering what each section has to say. Tea has been poetically described as the cup that cheers but not inebriates, but those who trade in it, or grow it, have all found it very bitter and anything but exhilarating of late years. To sit at tea is the proverbial acme of domestic bliss. Why should not the importing and home tea trade meet round a table, restore internal peace and talk over how things can be bettered? If no remedy can be found and nothing is done, at any rate they would get to know each other and would find that there were no Machiavellis on either side, but simply plain, honest people, who find the position intolerable and wish to alter it.—*Produce Markets' Review*, Oct. 26,

PEARL FISHING IN THE PACIFIC.

At the beginning of 1899 a Mr Wickham held a lease of some islands in the South Pacific, and his object was to develop a trade in pearls and mother-of-pearl. In June of that year Mr Leo Ferdinand Sachs agreed to purchase of Mr Wickham his interest in the islands, and paid a deposit. In August it was agreed that Dr Henry Lyster Jameson, who had made a special study of shell fish, should go out to the islands to look into the trade, that if a syndicate were formed to take over the islands the plaintiff should receive the appointment of scientific manager of fisheries, and that if he did not receive the appointment within six months he should be paid £150 by the defendant. The plaintiff went out to the islands, where he remained for eleven months. He was not appointed as scientific manager.

Yesterday Dr Jameson, who is lecturer at the Technical College, Derby, sued Mr Sachs, before Mr Justice Darling and a common jury, to recover the £150, and obtained a verdict for that amount.—*Daily Chronicle*, Nov. 1st.

"COOLY SANITATION."

(Paper read by Mr. MacLure at the Maskeliya Planters' Association Meeting on Wednesday.)

Mr. MacLure, in introducing the following paper, read at the Maskeliya Club on Wednesday, said that his idea in meeting it was that it might be a help to some of the younger members amongst them:—

"This is a question the importance of which is not sufficiently realised by a good many people.

"We can all remember the terrible death-rate through disease among our troops at one period of the war in South Africa. In response to the popular outcry, a Commission was appointed by Government to inquire into the working of the hospitals at the front. The results of the investigations of the Commission went to show that a large proportion of the deaths must have been due to the neglect of proper sanitary precautions.

"I think we might take this lesson home to ourselves. This and last year there has been a great deal of sickness amongst our coolies, and the death-rate has been higher than usual, and we have all been rather alarmed at the prevalence in our midst of enteric fever, an epidemic which, medical men tell us, is directly due to insanitary conditions of some sort. This abnormal sickness is no doubt due in a great measure to the seasons, but perhaps some of it is also due to the neglect of proper sanitary precautions in coolie lines. Anyhow we should see to it that everything is done that can be done to keep lines and surroundings clean, and prevent all sickness that is preventable, for our own sakes as well as the coolies. Having to pass and re-pass dirty lines might very easily affect Superintendents' health too. There may be contamination in the atmosphere as well as in water or milk.

"It has seemed to me that greater efforts might be made to try and get our coolies to show a little more attention to cleanliness. It is uphill work I know. I don't suppose there is a single planter, who has the welfare of his coolies at heart, who has not at one period of his career, made an honest effort to induce his coolies to keep their lines and surroundings cleaner, but spasmodic efforts are not enough. We must keep pegging away, and in time you will find coolies begin to appreciate the efforts, and show their appreciation by complaining of dirty neighbours, suggesting that they should be fined. I know a good many men look upon it as a hopeless and thankless task to try and instil any ideas of cleanliness into the coolie. Let us not forget that it is not so very many years ago when the lower classes in our own country were every bit as careless, and sanitary officers found the same indifference and even obstruction. It may be a disagreeable duty, but it is none the less a duty to see that our coolies live decently. The Superintendent who takes some trouble has his reward in better behaved coolies, not to mention the pleasure it would be to him in passing and re-passing his lines to see them swept and garnished. If they are allowed to live like pigs, coolies will behave like pigs.

"And now if I am not wearying you and you will forgive me for my little lecture, I will try and give you the results of my experience and efforts,—in the hope that they may be some little help to the younger generation of planters amongst us.

"The Superintendent should see to it that there is ample line accommodation for his labour force, crowded lines are a most fruitful source of disease. Better to have too much than too little line room. I am sure proprietors or directors would never be so blind to their own interests as to refuse to sanction necessary expenditure on lines. We all know what an important thing it is in the busy months to get our coolies to

illturn out to work, and how the outturn depends on the condition of the coolies as regards health. A room of 10' x 10' or 10' x 12' should be provided for, at most, every 5 labourers. Coolies should not be allowed to build in their verandahs; this excludes light and air from the rooms. If there is not sufficient room without the verandahs, then additional accommodation should be built. Nor should they be allowed to erect their garden fences bang up to their lines; there should be a good open space between lines and garden fence.

"In building a new set of lines the first essential is a plentiful supply of good water. I have some lines near a good supply of water, and others where the supply is rather scanty, the difference in health is most marked, and yet such is the callousness of the coolies that they prefer the less healthy lines, as they are on flat land, the others are on the hillside.

"If a plentiful supply of good water be not available, I will tell you how a rough and cheap but effective filter may be improvised. A coolie mason could make one in a few days. Build four walls of rough masonry, enclosing a space of 4' x 4' walls, say 3 ft. high; no mud or mortar should be used, it must be dry masonry; then at the bottom of the enclosure lay down charcoal, broken into small pieces, to the depth of about 1 ft.; then on the top of the charcoal put say 2 ft. of clean river sand. The water supply should be conducted in spouting or pipes on to the top of the sand. It will percolate through the sand, then through the charcoal, and find its way through the stone walls into the drain or spouting conveying it to the lines. It should be made as near the lines as possible, and it should not be put in the natural bed of the stream, or floods will carry it away.

"Care should be taken when applying artificial or othermanure, not to put it anywhere near the sources of the water supply.

"Next in importance to the water supply are clean surroundings, and with a lot of dirty and indifferent coolies this is hard to get, but not impossible. The coolie is a selfish creature and will do nothing for the general good, so a certain amount of compulsion must be used. Regular line-sweepers are I believe a mistake. Left to themselves as they are, they do little or nothing, and that little is useless. I believe the best system is to make each line occupant responsible for the space, immediately in front of his room, and periodically to put on a small gang of coolies to clean up round about burning all rubbish that will burn, and burying the rest. This is the system in South India where the climate necessitates very strict attention to sanitation.

"I have walked through some of the villages there, and I was surprised to find how clean they were. What they can do there we can surely do here. Coolies who do not keep the space in front of their houses clean are, I find, I have found a system of rough latrines to work fairly satisfactorily, but they must be made easy of access, and kept clean. It is a common sight to see a woman come out to the door of her room with a chatty full of rice water, and just throw it down right in front of the door. This should not be allowed. A good plan, for those who have a drain and running water round their lines, is to make paved receptacles, say one to every two rooms, into which the dirty water can be thrown. For those lines that have no running water, the same kind of thing can be made, some distance

away, and leading into a drain, which should be flushed regularly. In the light of recent discoveries, no stagnant water should be allowed near lines, and swampy places should be well drained.

"We all know what an unsightly, dirty, rotten thing the usual cooly garden fence is. If I had an estate of my own, and if it were paying fairly well, I would go in for galvanized wire netting for the fencing of cooly gardens. 5 feet netting can be got for about £5 per 100 yards. It would greatly help towards keeping surroundings clean, and would prevent gardens continually encroaching on the tea or lime compounds. Another good fence can be made, cheaper but not so permanent, by those who have suitable timber available, and that is by sawing good splitting logs into lengths of say 5 feet, and then splitting up the logs into sticks, about one and half inch thick, in the same way as coolies split firewood, these sticks, which should be all the one length, can be nailed on to horizontals, fixed on to uprights in the usual way. Two good coolies I found could split about 300 of these sticks in a day. I do not believe in restricting coolies in gardens, it is a good sign to see them busy in their gardens, it means they have settled down, but they should not be allowed to make their gardens just where they please. To those who are convinced of the necessity for greater attention to sanitation in cooly lines, and wish to put their convictions into practice, I would say, tackle one set at a time, do it thoroughly, and when it is done, keep it right, and get your Kangany to help you. The coolies in the other sets will soon ask you do the same to theirs, and perhaps help you in your endeavours."

The meeting closed as follows:—

A hearty vote of thanks was proposed by Mr G M ALSTON, and seconded by Mr G GREIG, to Mr MacLure for his most interesting paper. This was carried with acclamation. The meeting closed with the usual vote of thanks to the chair.

CEYLON AND INDIAN TEA AT THE PARIS EXHIBITION.

THE LATEST, LAST AND FINAL OFFICIAL REPORT

(Extracts from the report on the Indian Section by Mr. Benjamin J. Rose, Honorary Secretary Indian and Ceylon Committee, Paris Universal Exhibition, 1900.)

THE CEYLON SECTION.

A full official report on the work of the Ceylon Section having been issued by Mr. W E Davidson, the Government Officer in executive charge of that section, it is only necessary to very briefly refer to Ceylon in this report.

By a friendly agreement with the Royal Commissioners for Ceylon, Sir Montagu Ommanney and Sir Cecil C Smith, the Indian Committee consented to place an area of 3,750 square feet of space in the Indian Pavilion at the disposal of the Ceylon Government for the display of exhibits from that Island, as well as a space of 3,065 square feet in the grounds for the erection of a tea house, in return for a contribution of £5,000 towards the cost of buildings, &c. This sum was later on reduced to £4,150 on the strong representations of Sir Montagu Ommanney. The Indian Committee were pleased to be able to give ultimately more than double the space granted to Ceylon without requiring any increase on the

contribution paid by that Colony. The actual space granted was:—

In Indian Pavilion Ground Floor	sq. ft.	4,766
Do do Gallery	...	3,715
Tea House and Grounds	...	5,728
Total	..	14,209

The arrangements made by the Government and Exhibition Committee in Ceylon, under the presidency of the Hon. Mr. F R Ellis, for the participation of the Colony in the Paris Exhibition of 1900, were admirably planned and executed. The whole of the 256 cases of exhibits were despatched from Ceylon in December, and arrived in Paris in good time, and Mr. Davidson, ably assisted by Mrs Davidson, was, by almost continuous work, under the most trying climatic conditions, able to have the whole of the exhibits installed by the opening day.

The Ceylon exhibits comprised the great staple products of the Island, tea, coffee, cocoa, cinchona, spices, plumbago, &c., as well as the largest and most comprehensive collection of gems and precious stones ever brought together. The most popular exhibit was the large and well-executed Jungle Trophy, in which among other stuffed animals, were shown a full-sized elephant, a leopard, bears, deer, crocodiles, &c. This trophy was arranged by Mr. E Gerrard, of London, and was a never ending source of pleasure to visitors.

THE CHARACTERISTIC CEYLON TEA HOUSE.

In the grounds was largely patronised, and it occupied a better and far more prominent position than the Indian Tea Courts. Mr J H Renton, the special Ceylon Tea Representative at Paris, reports that during the six months the Tea House was open 134,257 pots of tea and 12,000 lbs of Tea in small packets were sold, a result which Mr Renton states exceeded all his expectations and he attributes this marked success to the following causes:—

(1) To the good quality of the articles, the tea being very carefully made and then poured, after five minutes' infusion, into an urn, heated by hot water;

(2) To the Sinhalese boys, with their rapid and Civil waiting; and

(3) To the aid of lady friends, journalists, and others, who from the first assisted in advertising the merits of the tea and the attractions of the Tea House.

The total number of exhibitors in the Ceylon Courts was 205; and the awards they gained were four Grand Prix, 19 Gold Medals, 69 Silver Medals, 61 Bronze Medals, and 47 Honourable mentions. The success of the Ceylon Section was undoubtedly due to (a) the ample funds lavished upon it; and (b) to the skill and energy with which the Government and the Commercial Community of Ceylon took advantage of the unique opportunity placed at their disposal by the Indian Committee for an effective advertisement of the products of the Island; and (c) to the strenuous exertions of the Royal Commissioners, Sir Montagu Ommanney and Sir Cecil C Smith, aided in Paris by the unswerving zeal of Mr W E Davidson, the Executive Secretary of the Ceylon Section, and Sir William Mitchell and Mr J H Renton, the Commercial representatives of Ceylon.

The cost of the Ceylon Courts was about £16,500, of which £2,000 was paid by the Ceylon Planters' Association and the remainder by the Government.

THE BRITISH INDIAN TEA COURT.

HOW THE WORK WAS DONE.

48 Rue du Faubourg St. Honoré, Paris,
Nov. 29th, 1900.

I am in great hopes that this my final report of work done at the exhibition will satisfactorily show the Committee that the prospects of Indian Tea in France are brighter now, even than they were when I wrote on the subject in September last, and that the Association will feel how justified they were in deciding to continue a business which has commenced so well.

As the sale of tea in the cup was chiefly intended to serve as a means to popularise Indian tea in France, the Association will be pleased to note what progress was made in

THE SALE OF PACKET TEA.

At their stall in the exhibition which was opened on 13th June, the sales increased, *pari passu*, in a manner which I think the Committee will consider highly satisfactory. A tabular statement will be given at end of this report. It will show that to date over 8,000 lb. tea have been sold.

The liking for Indian tea undeniably increased during the run of the exhibition, but the increase of sales for the last few days is partly to be accounted for by the fact that purchasers had formed the idea that when the exhibition closed the price of tea would be raised. This opinion was held by the trade, but that such will not be the case is now fast becoming evident to all, and our hopes, therefore, are that we shall not lose much ground by reason of the exhibition now being closed. That the low price can and will be maintained is, of course, in consequence of the support we have received, and are to continue to receive, from the Association, and which I venture to say is of far better form than that of subsidising grocers, with whom, however, we shall have to reckon later on when Indian tea is more generally inquired for in France. Up to the present we have not been able to do very much with the trade itself, for the reason that our price does not permit us to give a discount anything approaching the customary one in France—viz., 25 per cent.—but our hopes are that the present trade price may be modified if we can buy our tea through more direct channels than we do now.

INFUSION.

Owing, as I have already said, to their somewhat unexpected secluded situation, the "Indian Tea Courts" were not easily found by many chance visitors, or by those who came especially to visit them, but once they were found they became the resort of the best society, members of which have been known to say that the Indian Tea Courts were the most *chic* of any in the Exhibition. Although in such "rushes" of business as occurred in the Tea Courts it was utterly impossible to give entire satisfaction to every one, the complaints were very few indeed, and of rather a hypercritical kind. On the other hand I am happy and content to mention that unstinted and warm praise was given by the *habitués* of the Courts, notably the Princess Malakoff (who for nine days took her seat regularly at four o'clock), the Duchess of Mecklenburg, Baron and Baroness Alphonse Rothschild, and the French

Commissary-General. The Baron and Baroness were pleased to say that the Grand Prix should have been awarded the Association for the manner in which the tea was served, as well as for the goodness of the tea itself.

THE PRETTY BOXES OF SAMPLES

were much appreciated by all visitors, and happily by the French in particular. About 20,000 sample boxes were given away during the exhibition, and the balance of our stock will be distributed in connection with the work to be continued at the Rue du Faubourg St. Honoré and Rue d'Alger.

* * * *

TO REVERT TO TEA.

By a calculation of mine that on an average no one person ordered less than 75 *centimes'* worth of tea in the cup, the 69,500 francs receipts represent 96,400 pots of tea (two cups in each); but that number is considerably under-estimated because so many people often ordered pots of tea for a smaller number than their party consisted of, and also extra cups for the rest. Tea for two and cups for three, four and five, was an order frequently executed. As also hot water in addition was served, sufficient for another two cups, the quantity of tea drunk by each person was, of course, much increased. I have not taken that into my calculations but only the number of pots of tea served. Putting it, however, at a reasonably low figure, I believe that not less than 50 to 60 people were every day served with extra cups without having to pay anything except a penny for the accommodation. At this rate, in the 210 days of the Exhibition 10,000 cups of tea can be added to the 96,400 pots accounted for. The

FRENCH DO NOT ALWAYS TAKE THEIR TEA AS THE ENGLISH DO,

but they persevere in their attempt and evidently wish to like the beverage. Some, more often than not, dip their bread and butter and even cake into the cup of tea they are drinking, and some novices seemed to consider the tea was a kind of grog to be mixed with the hot water, which they poured into the cup first. Others poured the tea into the sugar basin, half the contents of which they had previously eaten and then into the hot water jug and from that into the cup. Or, for another change, they would partially empty the milk jug and then pour the tea into that. Our American visitors liked a glass of iced water to drink either with their tea or after it. I do not mention these little peculiarities for the purpose of ridicule, but rather to show that tea-drinking in France is yet very much in its infancy.

THE EXPERT

was, of course, sometimes present in the Tea Courts, judging from the procedure of some of the visitors, who, to the great wonderment of the foreign waitresses, would turn the leaves out into the saucer or plate, examine them closely and then turn them back into the tea pot, and, having added more water, drink another cup of tea. [Here comes the portion we have already quoted specially criticising Ceylon methods to secure public attention, to which we have directed the notice of the "Thirty Committee" and Mr. Renton.—ED. T. A.]

The exhibit of Tea in the Commercial Court attracted much attention, more particularly so as the tea sales stall was close to two of the show

cases. The light, however, was not good, and although, with the object of showing up the tea better, I did not fill the globes more than three-quarters full, the exhibit at certain hours of the day was not so effective as could be desired. I may mention that the exhibit of very fine tip from some of the gardens, apart from all other merits, was most useful, in that many of the purchasers of our packets became disabused of the idea that tea with tip in it was not good, but contained some foreign matter. I do not know if it is within my province to allude to

THE "JUDGING,"

for, of course, the reputation of the gentlemen appointed by the British Commissioners as jurors is undisputed; but I may, I hope, without presumption, ask to be permitted to say that no one could have taken more pains than Mr Wilson did to have the tea properly judged and the awards fairly given. All the samples, more than R400, which were in the show cases were carefully examined in the leaf by all the jurors of class 59, who, however, not being experts in tea, often deferred their opinion to Mr Wilson and that of Mr Dérode, the French expert, on the jury, and I would particularly mention how hard Mr Wilson fought to have awards given to individual gardens independently of the Grand Prix which was to be awarded to the Indian Tea Association for the collective exhibit and how, too, he won his point in spite of very great opposition offered seemingly only on technical grounds.

The gold medal for coffee was, by a clerical error, first of all awarded to Ceylon, but was ultimately given to the United Planters' Association of Southern India, after repeated and strenuous representations on my part. Summary of quantity and value of Tea in packets sold at the Exhibition and at Dépôt, 3 Rue d'Alger, Paris :—

	K.	Frs.
From 17th to 30th April at Dépôt	13,125 ...	90.40
For May do	3,890 ..	737.60
For June at Exhibition & do	88,010 ..	2,704.60

(Equals 8,364 English lb.)
(Signed) EDWARD F. LANGDALE.

THE GOOMERA (CEYLON) TEA ESTATES COMPANY, LIMITED.

REPORT OF THE DIRECTORS.

The directors beg to submit herewith their seventh annual report and balance sheet for the year ending 30th June, 1901.

The accounts after paying debenture interest and London expenses, show a loss of £2,205 12s which amount after deducting the credit balance of £29 16s 2d brought forward from last year leaves a loss of £2,175 15s 10d to be carried forward.

The total crop from the Company's estates amounted to 245,313 lb, realising a net average of 4.13d per lb, against 223,758 lb. harvested from the Company's estates last year, which realised net average 5.27d

During the past year the system of high cultivation advocated by Mr Joseph F. Asar and mentioned in last year's report, has been entered upon by the

Directors. The result of this expenditure have not shown themselves to the extent that was hoped during the past season, the figures for which, including as they do all manuring expenditure, show a very heavy loss. It is believed that the present season will show the effect of the money that has been spent, and the directors consider that, in face of the present and past conditions of the tea market, the only hope for the Company is by a continuance of a policy of liberal cultivation.

The Directors have not drawn their fees for the year, and propose waiving them.

During the year, Mr. B F White, who was re-elected as a director at the last general meeting, resigned his seat in favour of Mr. F E Cobb, a large shareholder in the Company, who was so kind as to accept a seat on the board.

Mr. A V Holland retires in accordance with the articles of Association, and being eligible, offers himself for re-election.

The auditor, Mr. J D Stewart Bogle, C.A., retires, and offers himself for re-election.

THE LANKA PLANTATIONS COMPANY, LIMITED.

REPORT.

Presented at the twenty-first ordinary annual general meeting of the Lanka Plantations Company Limited, held at the offices of the Company on Wednesday the 13th November, 1901, at twelve o'clock noon precisely,

1. The Directors now submit their report for the twelve months ending 30th June last, together with the Balance Sheet and Accounts of the Company made up to that date and duly audited.

2. The Coffee crop amounted to 139 cwts. 0 qrs. 17 lb, and realised £490 12s 5d. Last year the crop was 174 cwts. 3 qrs. 13 lb, and realised £573 8s 5d. The cultivation of this product being no longer remunerative has ceased, but there will be a little crop for a year or two from the trees that remain among the Tea.

3. The total crop of Cocoa gathered on Yattawatte amounted to 1,026 cwts., and realised £3,610 8s 10d, against 1,099 cwts. last year, which realised £5,121 8s 5d. The expenditure on clearings not yet in bearing is charged to Capital Account. On the same Estate 310 lb of Cardamoms were gathered, realising £19 2s 10d.

4. The total yield of Tea was 974,511 lb plucked off 2,164 acres, being at the rate of 450 lb. an acre and realised £23,979 17s 2d the average being 6 64d. per lb. net. Last year the crop amounted to 947,194 lb. which realised £27,566 4s 7d the average being 6.98d per lb. net

5. The average rate at which drafts were negotiated on account of the season's crops was 1/4 3-8 per Rupee against 1/4 1/4 last year.

6. The following Statement shows the approximate acreage and state of cultivation of the Company's Estates on the 30th June last, as per recent surveys:—

Estate.	Coffee,	Tea.	Cocoa.	Grass.	Chena and Pa tana & Waste.	Forest and Timber Trees.	Total.
Ampitiakande	.. 291 4 70	365	
Arnhall	.. 174 255 429	..	
Fruit Hill	.. 227 10 237	..	
Fordeye, Garbawn, Gonnagalla & Paramatta	.. 798 5 135	938	
Rappahannock	.. 322 31	.. 30	.. 90	473	
Rillamille	.. 195 343	.. 22	.. 560	..	
Thotulagalla	55 327 60	.. 114	.. 556	..	
Yattawatte	751 95	312	82	1,240	..	
	562,334	751 185	1,010	513	4,793		

7. The Net Profits of the past year amounted at £5,115 3s 1d, to which must be added the sum of £614 18s 9d, the balance brought forward from the year 1899-1900 making together £5,730 1s 10d.

8. Having already paid a half years' interim dividend on the 6 per cent Preference Shares to the 31st December, 1900, amounting (less property tax) to £418 19s 0d, the Directors recommend the payment of the dividend on these shares to 30th June last, requiring (less property tax) £417 2s 3d, and they further recommend a dividend of 5s per share (free of income tax), being 2½ per cent on the ordinary shares, amounting to £3,750 carrying forward the balance of £1,144 0s 7d to next account. The Directors do not consider it necessary to make any deduction from the Suspense Account this year, as they deducted last year in anticipation £999 4s 5d, being one-tenth of the sums charged to this account during the ten years ending 30th June, 1900.

9. Mr. Henry Bois, the Director retiring on this occasion, being eligible, offers himself for re-election. Mr. John Smith, the Auditor also retires, and being a shareholder offers himself for re-election.—By order of the Board,

C. M. ROBERTSON, Secretary.
12, Fenchurch St., London, E.C., 1st Nov., 1901.

THE YATIYANTOTA, CEYLON TEA COMPANY, LIMITED.

27, Mincing Lane, London, E. C., 29th October, 1901.

To the Shareholders,

DEAR SIR (OR MADAM).—An Interim Dividend of 3 per cent. for 1901 on the Preference Shares was declared and paid, as usual, on 1st July last, but the Directors regret to announce that the working of the Company for the first half of this year does not admit of the payment of an Interim Dividend on the Ordinary Shares, as is usual at this time.

At the annual general meeting of the Company, held on 25th April last, the Chairman referred to the movement then under the consideration of producers, having for its object a curtailment in the output of tea, in order to meet the adverse position caused by the then existing accumulation of stocks and serious depression in prices. Although concerted action was found impossible, growers generally have taken steps to lessen their production, with the result that the excessive stocks have been absorbed, and market prices have lately shown appreciable improvement.

The latest advices from Ceylon indicate that, consequent upon the alteration in the method of working adopted this year, the crops from the Company's estates will show a falling off of 10 to 12 per cent on the quantity produced last year, and that the cost of production, per pound of tea, is likely to be about three-eighths of a penny higher than it was in 1900. The net average price obtained for the first half-year's production, however, shows but a very trifling advance on the average secured for the whole of last year's crops, notwithstanding a marked improvement in quality, resulting from the higher character of the leaf plucked. The margin of profit for the half-year has thus been reduced to about three farthings per pound of tea, which does little more than meet the Preference Dividend, after making the usual provision for depreciation, &c.

Present market prices, however, show fully a penny per pound advance on last season's average, and if this improvement should continue until the balance of the current crops has been sold, the net profit on the years' working will, in all probability, equal that of last year.

The Directors desire to take this opportunity of informing the Shareholders that Mr. Walter J Smith, having assumed charge of the working of part of the Company's property, has resigned his seat on the Board as at 30th September. The Directors have appointed Mr. John McInnes Skinner to fill the

casual vacancy thus created.—I am, dear sir (or madam), yours faithfully,
T. A. WILLIAMS,
Secretary.

CENTRAL TEA CO. OF CEYLON, LD.

Report of the directors submitted at the sixth Annual Ordinary General Meeting of shareholders held at 20, Eastcheap, E.C., on Monday, the 18th November, 1901.

The directors beg to submit the general balance sheet and profit and loss account for the year ending 30th June 1900, duly audited.

The net amount at credit of profit	£	s	d	£	s	d
and loss account including the balance brought forward at 30th June 1900, and after providing for general expenses, directors' fees, income tax, etc., is						1,885 1 9
Dividends on the 6 per cent preference shares were paid for 1900/1901 to 30th June (less income tax) amounting to				960	9	4
The 1½ per cent unpaid on the preference shares at 30th June (less income tax) has since been paid amounting to				317	16	3
It is proposed to write off for depreciation				300	0	0
And to carry forward to next year a balance of				306	16	2
						1,885 1 9

Owing to the heavy fall in the market price of tea and a diminished yield the directors regret the results for the past year have been disappointing.

The gross average price realised for the tea was 6,55d per lb, as against 7,03d per lb last season, and the rate of exchange was 1s 4 13-32d as against 1s 4-31-64d.

The yield of tea was 374,383 lb, being 418 lb per acre over a plucking area of 895 acres.

The increase of expenditure under the head of Cost of Estates during the past year is due principally to necessary additions to machinery for Somerset; and for an installation of an aerial tramway; factory extension; and cart road for Kabragalla. These works have all been made with a view to reducing the cost of production.

The vendor having surrendered the 400 ordinary shares allotted but not issued, the agreement and the allotment for the same have been cancelled.

The current year has opened with better prospects for tea, and encouraging reports have been received as to the future of the acreage under cardamoms.

Under clause 24 of the Articles of Association, Mr. W H Anderson retires on this occasion from the Board, and being eligible, offers himself for re-election.

The auditors, Messrs. Harper Brothers, Chartered Accountants, also retire from office, and offer themselves for re-election.

By order of the Board, Wm. JOHNSTON, Secretary.
London, Nov. 8th.

THE CEYLON LAND AND PRODUCE COMPANY, LTD.

Report of the Directors, submitted to the seventeenth annual general meeting of shareholders held at the Registered Office of the Company, Nos. 353 and 354, Leadenhall House, 101, Leadenhall Street, in the City of London, on Friday, the 15th day of November, 1901, at 2 o'clock p.m.

Your directors have the pleasure to submit the annexed Profit and Loss Account and Balance Sheet for the Crop year ending 30th June 1901, duly audited.

The amount at credit of Profit and Loss Account is £6,533 18s 11d which with the sum of £745 11s 7d brought forward from last year, leaves £7,279 10s 6d to be distributed.

On the 22nd July last an Interim Dividend of $7\frac{1}{2}$ per cent on the Ordinary Shares and 3 per cent on the Preference Shares was paid, and your Directors now propose to pay on the 14th day of December 1901, the balance of the fixed Cumulative Dividend on the Preference Shares (3 per cent) making 6 per cent for the year, $7\frac{1}{2}$ per cent on the Ordinary Shares making 15 per cent for the year, all free of Income Tax. It is also proposed to set aside the sum of £100 as a provision for possible losses on Coast Advance Account, and carry forward the balance of £1,172 12s 6d subject to the Directors' remuneration for the year under review and to the payment of Income Tax, &c.

A sum of £1,693 17s 6d spent upon permanent improvements during the year has been debited to Revenue.

In accordance with a resolution of the Board, a call of 10s. per share was made upon all the members, holding preference shares upon which only £4 had been paid, and the same was payable on the 1st July last. Your Directors take this opportunity of pointing out that the security of the debenture-holders is thereby increased, as the borrowing powers of the Board on debenture are restricted to the amount of the subscribed but uncalled share capital at the time of such borrowing.

Your Directors have to report that the total crop of tea from the Company's estates for the year fell short of the estimates by 28,462 lb., but on the other hand, there were increases of 79,167 lb. made from purchased leaf, and of 138,935 lb. made for others, the total excess amounting to 189,640 lb. It is regrettable, however, that the net average price secured has fallen from 6²/₁₀d to 5²⁸/₁₀d per lb; during the currency of the season the mean rate of exchange has receded from 1s 4¹/₂ to 1s 4³/₈, whilst freights have also shown a lower tendency as compared with the previous financial year.

Your Board specially wish to inform the members that no expense has been spared to bring the Company's estates into the best possible state of cultivation even in face of the low prices that have prevailed: not only has extensive manuring been done, but in every case where tea bushes were cut down they were lightly plucked for six months, and in consequence, the Company's Manager in Ceylon reports that each estate shows improvement in the cover of tea.

Your Directors are of opinion that the important work of manuring should be continued judiciously year by year, not in order to increase the yield, but principally to give nourishment to the bushes and keep up their strength and vigour, with the result that they will be better able to resist blight, which has not been at all prevalent during the past year.

A total sum of £31,350 (£2,138 19s 8d) has been expended on manuring Tea and Cocoa during the season, the whole of which has been debited to Revenue account.

The cocoa crop totalled 2,378 cwt. against an estimate of 2,165 cwt.

Your Directors have to report that the greatest precautions continue to be taken to keep cocoa disease in hand, gangs of coolies being frequently employed in searching for and treating canker, in accordance with the advice given by the Government Mycologist. The opinion is generally held, by those competent to judge, that this disease can be kept down, by continuous care and attention, to a point when the resultant loss from it is not serious; your Directors concur in this view, and think that canker will be a great obstacle to the successful cultivation of cocoa; indeed, the probability is that it may be eradicated.

A census of coconut trees was taken on or about 30th June last, showing a total number of 46,709 growing amongst other products; this is equal to over 600 acres, at the rate of 76 trees per acre. Your Directors are pleased with the progress made with this cultivation, and believe that in the course of time it will be a valuable asset.

A tea factory has been erected on Strathisla Estate and is working well. A satisfactory contract has been entered into, to manufacture the total output from a neighbouring Estate for a term of years.

Two hungalows, situated on New Peradeniya and the grounds pertaining thereto, have been disposed of at good prices and proceeds applied to the reduction of the Estate's Capital Account.

Your Directors have purchased from natives 18¹/₂ acres of land within the boundaries of North Matale Estate, of which 12 acres were under cocoa in full bearing.

TEA.—This industry has passed through a very trying time since the issue of last report and balance sheet. Owing to favourable weather, heavy flushes of leaf were experienced generally throughout the Island, and many growers, encouraged by the high prices ruling here for common kinds during the first half of 1900, were induced to take advantage of the situation and pluck somewhat coarsely. The market was consequently overburdened with supplies of inferior quality and the inevitable reaction set in, resulting in a serious drop in the value of most grades. The anticipation of a possible rise in duty also led buyers to make clearances largely in advance of immediate requirements and hampered their purchasing power. Fortunately the seriousness of the position was realised, and successful efforts were made by more careful plucking and manufacture to remedy the state of affairs, and this, combined with climatic influences more favourable to a smaller and better crop resulted in a curtailment of shipments and improved quality, which has gradually brought about a more healthy condition of the industry. Unpleasant as the experience has been to all interested it has perhaps not proved an unmixed evil, as Ceylon tea, on account of its cheapness, was used more freely than before, both at home and abroad, and it is to be hoped that the taste for the article once implanted may be fostered by the more careful cultivation and manufacture now bestowed upon it.

From 1st January to 31st ult. 1,053,000 packages of estate tea passed through the Mining Lane Sale Room realising 6¹/₂d per lb against 7¹/₂d per lb for 100,700 packages, and 8¹/₂d per lb for 964,500 packages in the corresponding ten months of the two preceding years. The lowest point of the market was touched in February, the average for that month being 6¹/₂d per lb whereas for October it was 8¹/₂d per lb.

During the first nine months of this year to 30th September Exports to Foreign Markets from London were:—

1901.	1900.	1899.
13,305,000 lb	10,279,000 lb	8,913,000 lb.
In the same period shipments from Ceylon to the undermentioned countries were:—		
To AUSTRALASIA.		
1901.	1900.	1899.
15,669,000 lb	12,894,000 lb	11,967,000 lb.
To RUSSIA.		
6,977,000 lb	6,657,000 lb	2,719,000 lb.
To AMERICA.		
2,692,000 lb	3,463,000 lb	2,344,000 lb.

Cocoa.—The Market has been disappointing. At the commencement of the season there was a good general demand with an improvement in prices but as the season developed and arrivals were plentiful and continuous, the demand suddenly subsided and prices became almost nominal business assuming a retail character, with accumulating stocks. Holders generally adopted a firm attitude for some time, awaiting the resumption of demand, but this being too prolonged, pressure to sell became manifest, and a break in prices was the result. The statistical position of the article is satisfactory, consumption in nearly all countries shewing an encouraging increase. The quality generally has been inferior, with only a few really attractive lots, which are mostly firmly held.

ACREAGES.—The following statement shows the ap-

proximate pro acreage of the Company's properties at date :-

THE CENTRAL PROVINCE Ceylon TEA COMPANY, LTD.

REPORT OF THE DIRECTORS.

N.B.—In the absence of detailed surveys these figures, as mentioned above, are approximate only.

The Estimates for current year provide for a Crop of 1,069,750 lb tea from the Company's Estates, 80,000 lb from bought leaf, and 295,000 lb made for others, or a total of 1,444,750 lb, as compared with the aggregate of 1,400,140 lb secured in 1900-1901. The crop of cocoa is estimated to be 2,325 cwt. Owing to unfavourable weather and finer plucking, the total in take of tea at date of last reports was somewhat less than at same time last year. It is hoped that the cocoa estimates may be realised, but at the moment your Directors cannot speak with any certainty; with favourable weather the estimates should be secured.

It may be interesting to note that income tax now amounts to over 11 per cent of the full dividends for last year.

Mr Alex. D Wilson, by rotation, retires from the Directorate, but being eligible, offers himself for re-election.

Mr James B Laurie, the Auditor, also retires, but he is eligible, and offers himself for re-election.—By Order of the Board, JAMES WILSON, Chairman; ALFRED E LOCK, Secretary.

Leadenhall House, 101, Leadenhall Street, London, E C, 6th November, 1901.

a Including Sales made in Colombo.

Submitted to the shareholders at their fifth annual ordinary general meeting, held in the Council Room, London Chamber of Commerce, Botolph House, Eastcheap, E.C., on Monday, the 4th November, 1901.

The Directors beg to submit to the shareholders the audited accounts for the year ending 30th June, 1901.

The total crop of tea from the estates for the past season was 809,358 lb, against 843,388 lb, of the preceding year, being a decrease of 33,530 lb a great part of this reduction being caused by finer plucking.

The total sales, including bought tea, were 1,058,683 lb, averaging 5.341d. per lb net, being 312d. less than last year, equal to a loss of profit on the estate crop of over £1,000 by the fall in price alone.

As regards cocoa, the crop amounted to 521 cwt, against 315 cwt last year, the average price being 66s. 10d. per cwt as against 66s. 9d. Small consignments of minor products have been received, showing a profit of about £300, mostly from pepper.

There were during the season 194 acres of tea not yet in full bearing.

The rate of exchange, averaged 1s 4.21d per rupee as against 1s 4.3d last season.

The net profits for the year amount to £3,036 2s 5d after writing off £200 from estates account for depreciation of machinery, which with £1,723 6s 9d brought forward from last year, shows a sum of £4,759 9s 2d to be dealt with. Of this amount £1,500 has been applied to the payment of an interim dividend at the rate of 6 per cent per annum on the preference shares to 31st December, 1900. The Directors now recommend a dividend of 6 per cent per annum on the preference shares to 30th June, 1901, absorbing £1,500 and leaving £1,759 9s 2d to be carried forward to next account.

Mr. S R Pryor is the Director retiring by rotation, and, being eligible, offers himself for re-election.

Messrs. Fuller, Wise and Fisher, Chartered Accountants, offer themselves for re-election as Auditors.

THE DEAF HEAR.—No. 479 of *the Illustrated World* of 623, Chiswick High Road, London, W., England contains a description of a remarkable Cure for Deafness and Head Noises which may be carried out at the patient's home, and which is said to be a certain cure. This number will be sent free to any deaf persons sending their address to the Editor.

BARK STRIPPING.—A short time since some strips of Larch-bark were sent to us, with a request for information. The rectangular strips were 1 or 2 inches long, quarter to half an inch wide, very regular and straight-edged. Squirrels were at once thought of, but we had never seen an injury of this kind effected by these animals, nor had the numbers of the Scientific Committee, to whom they were submitted. Nuthatches were suggested, but now the culprits have been seen at work, and turn out to be as at first suspected—squirrels. Mr. Rothery, gr. to O. O. Wrigley Esq., Wansfell, Windermere, writes:—"The speed with which they can tear off the bark would greatly astonish anyone. They have destroyed about 350 trees, ranging from 25 to 35 feet high, and some of them are stripped 7 and 8 feet down, and the whole of them appear to have been attacked some 5 feet from the top. Their object is no doubt food, for they scrape off the gultinous substance between the bark and the wood.—Gardeners' Chronicle."

The following pages include the Contents of the *Agricultural Magazine* for December :—

Vol. XIII.]

DECEMBER, 1901.

[No. 6.

OCCASIONAL NOTES.

R. L. A. D. Silva, an old student of the late School of Agriculture, and at present in charge of the Experimental Garden at Mahawalatenne, was awarded a prize for onions at the Show lately held at Ratnapura.

St. Benedict's Institute has made a small start with School Gardening, and with the limited extent of land available for the purpose the results are very creditable. Two other private schools are likely to follow the example of St. Benedict's.

The Superintendent of School Gardens has been travelling in the Three Korales, Kegalle district, with a view to selecting suitable sites for school gardens. The Kegalle district has been described as "The Paradise of the Pedagogue," for the reason, no doubt, that the attendance at the schools is excellent, the accommodation for scholars and teachers most satisfactory, while the interest taken by the revenue officer and the chiefs of the district is an important factor in the success of the schools. Where land is available school gardens may be expected to be found flourishing before long, as the natural conditions for successful cultivation are nearly always present in that favoured district.

Mr. F. C. Fernando, late of the School of Agriculture, who left for South Africa some months ago, says in a recently received letter: "I have enlisted in a medical corps, and am off to Maritzburg *en route* for the front."

In our last issue we referred to a letter received from Mr. John Spencer, Deputy to the Chief of the Bureau of Nature Study (Cornell University, College of Agriculture.) In response to Mr. Spencer's request for a communication from a Ceylon child, a letter was des-

patched some weeks ago containing a lively description from the pen of a youthful correspondent. The last mail brought the following reply from "Uncle John": My dear———, Your Uncle John is delighted to receive your letter of September 2nd, which was four days before our President McKinley was shot, an event you no doubt know about, but you cannot conceive the shock and grief the tragedy gave everybody. When we have our presidential elections, the feeling of the different parties would seem to be very intense, but I think it must be on the surface. Men who did all they could to defeat Mr. McKinley at each election mourned his death most sincerely. I thank you for your letter. I shall pass it along to my junior Naturalists, my nephews and nieces as I call them, for they address me as Uncle John, and you will no doubt hear from some of them. In a short time I will send you some photographs. Your description of your bullocks and coolies is very good indeed. I wonder if my boys and girls can do as well. Perhaps some of them will tell you about their flower gardens and some of them had flower shows. You will no doubt think I have a novel way of giving my friends an idea of their number. I do not measure them by the bushel or by the ton. I count them by churchfuls. I have enough to fill forty churches, and each church holds 500 boys and girls. Can you compute the number in thousands. Out of that number 6,700 bought flower seeds and had gardens all their very own the past summer. I am fond of every one of them. I cannot help it, for they are so very kind to me. Just now they are engaged in watching crickets. If you have none in Ceylon your father will no doubt tell you about them. Hoping you will let me be your Uncle John the same as with the others, I am, yours cordially and sincerely, JNO. W. SPENCER.

An official of the New Administration in the Transvaal, who has but lately taken up his duties at Pretoria, writing under date the 11th

October, says: "This is a country of great promise—not yet fulfilled—with very rich soil and plenty of water, but the water has not been stored or made available. Its possible future might be anything. The climate is a little too variable, bright and bracing generally; but just now the mists are down on the hills and the rains have commenced. It is very like Nuwara Eliya when the mists are hanging low down. Indeed, Pretoria is situated in a basin like a large Nuwara Eliya. Johannesburg is much higher (5,600 ft.) and is colder. My three Sinhalese servants have done excellently, and we are now installed in a charming little house."

Agricultural Banks for Ceylon have been more than once advocated in our columns. The description of the system as it exists on the Continent and in England will be read with interest by those who are calling for the adoption of some measure (such as exist in India) for helping the small cultivator.

School gardens appear to be making headway in distant Samoa, as to judge by the following extract from a letter kindly placed at our disposal by Mr. J. P. Williams, the well-known seedsman of Henaratgoda. The writer (Rev. J. W. Hills) says: "I am introducing new plants of commercial value for the benefit of the agricultural department of our Boys' High School, and the Directors of the Society make me only a small grant for the purpose. However, I am asking you to send me one case filled with specimens of the various plants mentioned in your note as near as you can do it. I may say that our garden here at the school is beginning to attract the notice of planters and officials, so that in the long run you will end in increased business in this quarter of the world."

Greatest amount of rainfall registered in 24 hours on the 24th Nov. 3.72 inches.

Recorded by C. DRIEBERG,

MARKET GARDENING--THE RAISING
OF SEED.

Having prepared the soil, and decided upon what to grow, and marked out the ground in sections for the different crops, the next most important question is that of

SEEDS.

Seeds to be profitable must be of first-class quality, and it will be found cheaper in the end to pay a good price for good seeds than to buy inferior rubbish, which is dear at any price. Always purchase your seeds from a reliable seedsman, who has his reputation to maintain, and who can be depended upon to send out only seeds of good germinating power, and free from mixtures of any kind other than the variety of which the name appears on each packet.

Some kinds of seeds retain their germinating power unimpaired for several years, cabbage and turnip seeds, for instance, and cucumbers, melons, &c.; while others, such as onions, carrots and parsnips are of very little use when more than a year old.

Peas, beans, &c., are also at their best during the first season.

As it would be a difficult matter for the amateur to distinguish in all cases between good seeds and bad, the only plan is to always purchase from a reliable seedsman. [Seeds may be tested by placing them on damp flannel and noting whether they germinate or not.—Ed. Q.A.J.]

SELECTING VARIETIES.

In making your choice of the kinds of vegetables to grow, do not be misled by glowing descriptions of certain kinds of cabbages or peas, and purchase them under the impression that you have got something wonderful.

It is much safer and more satisfactory to buy varieties which are catalogued as *standard varieties* or *good market sorts*. It is also worth while to find out from your neighbours the names of any varieties which they have grown successfully, and you will thus be enabled to plant something which has already been proved good, and will be likely to have some measure of success with it yourself.

Many beginners in gardening are disheartened at the commencement by the miserable results of their first attempts, which are in many instances attributable to trying to grow varieties unsuited to the soil or climatic conditions.

If you have no reliable data to go upon, your seedsman will probably be able to help you in the selection of good varieties.

In any case, until sufficient experience has been gained in growing well-known and tested kinds of vegetables, it is not advisable to experiment with anything new or rare. The results of such attempts are sometimes far-reaching, inasmuch as a certain kind of crop is frequently condemned as suitable for a district, because "So-and-so tried it and proclaimed it a failure." People are very apt to accept statements of this kind without going to the trouble of verifying them for themselves.

I have often been told that a certain kind of vegetable will not grow here, because it has already been tried by someone, when, as a matter of fact, it has proved to be as easy of cultivation as pumpkins or maize, if accorded proper treatment. It is always safe, however, for the beginner to profit by the successes of his neighbours at first. There are many things which only experience can teach, and it is rather expensive to go experimenting with unfamiliar kinds of plants, before learning how to grow the known and established varieties.

SOWING THE SEEDS.

Some kinds of vegetable seeds are sown in seed-beds, and when large enough transplanted to the open ground; others are sown directly in their permanent places. For a seed-bed, I know of nothing better than the plan recommended by Mr. Nevill for raising young tobacco plants. A full description and illustration of this form of seed-bed appeared in Vol. II., Part 3 (March, 1898), of this *Journal*, and I can confidently advise its adoption for raising young plants of any kind.

Cabbages, cauliflowers, lettuce, tomatoes, and numerous other kinds are always raised in seed-beds; and it will be found better to sow these all in narrow shallow drills in the bed than to sow broadcast. Young plants grown in drills are much easier to lift and transplant than if broadcast, and as a rule are stronger and sturdier. In preparing the bed, the soil should be raked as finely as possible, and the seeds must not be sown too deeply. A quarter to a half inch of soil above the seed is usually enough. If the drills are covered in with a little very fine and thoroughly rotten manure, germination takes place quickly, and in transplanting a ball of the manure will stick to the rootlets, thus increasing the chances of success in planting.

In preparing soil for seed-sowing in the open ground, always have the soil thoroughly tilled, cleaned from weeds, and well pulverised. An Acme harrow immediately following the plough will reduce most soil to a very fine tilth; and if not, the rake must be used to finish off, especially with such seeds as carrots, onions, &c.

Where enough ground is available, I should recommend sowing all such crops as these in drills from 2 to 3 feet apart, so that horse cultivators can be used among them.

However, this subject will be more closely gone into when dealing with crops in detail,

TRANSPLANTING.

For transplanting, the ground should be prepared, more especially for delicate plants, in precisely the same way as for seed-sowing. The finer the surface soil is, the more easily will the young tender rootlets be able to force their way down in search of food and sustenance; and as a consequence leaf growth will necessarily follow.

If the soil is hard and lumpy, the attempt of the rootlets to strike into it becomes to some extent useless, and it naturally follows that the top growth also becomes retarded, and it will only be by good luck if the plants come to

anything. When taking the plants from the seed-bed, be careful not to break the roots too much, and endeavour to lift them with a little of the soil adhering. Never pull young plants up, but lift them carefully. It is a good plan to give the bed a thorough soaking with water some time before beginning to lift the plants.

Always, if possible, choose a dull or showery day for transplanting; but should the weather be warm and dry, do the work in the afternoons, and water well after planting; and if suitable material is procurable, mulch the ground for a few inches round each plant. Set the plants a little deeper in the ground than they were in the bed, and firm the soil well around the roots without bruising the necks of the plants.

Take care always to make the hole for planting just deep enough, so that the plant will not hang in it, and give the plants plenty of room to grow, by setting them a little wider in the rows than the size of the plants when fully grown.

For example, if a cabbage will cover 2½ feet on the outside leaves, set the young plants of that variety out 3 feet apart each way.

Should the weather be dry for some time after planting, it will be necessary to water the young plants several times a week until they become established; the watering being done either early in the morning or late in the afternoon.

A great deal of watering and hoeing will however, be saved if *mulch* is used as already advised. The importance of mulching cannot be over-estimated. Almost anything will do—stable manure, grass, or litter of any kind, provided it can be easily and conveniently placed round the plants. Mulching prevents the ground from baking after watering, and so saves hoeing; and it also helps to arrest evaporation, to us saving watering; and also it tends to keep the temperature of the surface soil equable, and so tends to promote healthy and vigorous root-action. I confidently recommend mulching for any kind of vegetable crops which require transplanting, and am sure that the grower will never give it up again so long as he aims to get the best possible results for his work with as little labour as possible.—[H. W. GORRIE in the *Queensland Agricultural Journal*.]

[We shall reproduce Mr. Nevill's instructions for making seed beds and raising seeds in over next.—ED. A.M.]

POULTRY NOTES.

(Culled from Various Sources.)

There is a great similarity between the various poultry-powders and foods. The powders are popularly supposed to increase the egg-laying powers of hens. The following are a few typical formulas:—Powdered eggshell, or phosphate of lime, 4 oz.; iron sulphate, 4 oz.; powdered capsicum, 4 oz.; powdered fenugreek, 2 oz.; powdered black pepper, 1 oz.; silver sand, 2 oz.; powdered lentils, 6 oz. A tablespoonful to be mixed with sufficient food for 20 hens. Oyster-

shell—ground—5 oz.; magnesia 1 oz.; calcium carbonate, 3 oz.; bone—ground— $1\frac{1}{2}$ oz.; mustard bran, $1\frac{1}{2}$ oz.; capsicum, 1 oz.; sodium chloride, 1 oz.; iron sulphate, $\frac{1}{2}$ -oz.; sodium carbonate, $\frac{1}{2}$ -oz.; sulphate, $\frac{1}{2}$ -oz.; beef—lean, dried and powdered—10 oz.; fine sand, 10 oz.; corn meal, 20 oz.; linseed meal, 20 oz. Reduce all to moderately coarse powder and mix well. The above are formulas that are recommended by poultrymen, and are based upon practical experience in poultry-feeding, not upon the theoretical knowledge of pharmacists.

Indian corn will fatten geese quickest, but it makes the fat very yellow; and when the bird is put before the fire to roast, an undue amount of it becomes goose-grease. Oats are much better. They may be given crushed or whole. The former is the better; and a barley-meal and oat-fattened goose is always a heavy-weighting, firm, well-flavoured bird.

There are many readers of a poultry column, as well as fanciers and others, who consider that too much is made of *Cleanliness*. Writers of the poultry columns are constantly harping on the subject, but it is in duty bound and in the best interests of those who keep poultry that this subject receives so much attention. I should not be far wrong in saying that 60 per cent. of the fowlhouses in the colony are so dirty that it is impossible for fowls to live in them in a healthy condition. Filth is the sure cause of disease, and oftentimes death; indeed, it is the one great curse in keeping poultry. If your fowls droop, or are ailing, see if the house is infected with lice or tick. If it is, so are the hens, and also are the nests. Do you think you would enjoy life yourself if a myriad of insects were forever boring into your skin, preventing all comfort during the day and all rest at night? Yet this is the usual experience of the vast-majority of fowls. They are overrun with lice or tick. Many of them have broken-down, draughty houses, fœtid runs, impure water, and then their owners wonder why they don't lay a plentiful supply of eggs. Cleanliness is second only to godliness in the human creature; in poultry-keeping there is nothing comes before it. It is the first and most important condition of success. It is advisable, therefore, to occasionally examine your birds for the purpose of detecting any parasites that may from time to time molest them. This remark also applies with regard to the houses. As the moulting season draws to an end, it is advisable to thoroughly lime-wash all poultry-houses, coops, &c., and if you have any suspicion that tick or other parasites are present use Little's Phenyle profusely in all the crevices, corners, and other places where these pests are likely to congregate. If this is neglected, the fowls which should in a very little time present quite a gay and glossy appearance will be found with their feathers eaten away to such an extent as to entirely spoil their appearance, and may eventually be found dead just for the want of proper attention.

The secret of raising chickens is to keep the growing all the time. To do this they should have nourishing food, a fair range, and not be overcrowded. Poor feed is expensive at any price where chickens are concerned. It is best to let chickens run at large, providing they do not go so far as to keep them tired all the time. A young chicken can be run down the same as the young of any kind, and when this is the case they will not prosper. They thrive unusually well in orchards, the reason being they are shaded, and insects are more plentiful. A piece of land where a fair amount of grass, old trees, and loose soil abound is the very best place imaginable to raise chickens, and especially after they have reached the age of four to six weeks old. Under the old leaves, and along the logs and fallen timber there is an abundance of insects, &c., which make splendid food, the shade is plentiful, and the green food contains the elements for building up the body. It is essential to give them all they can eat in the morning and evening, and if the range or run does not afford "good picking" it is best to scatter cracked grain where they can find it by scratching. A chicken that receives every attention and is pushed right along for the first few weeks must not be neglected, for if permitted to stop growing it will never fully recover.

The question is often asked, "How many females should be mated with a male bird?" To answer this correctly is not easy, for much depends on the male himself; besides each variety or breed will differ more or less. For instance, the Asiatics, or large breeds, will not take as many females as the Mediterranean, or lighter breeds. I have become a believer in mating a larger number of females than the orthodox rule, and I find I get better results, especially with the lighter breeds. Early in the season fewer hens are needed, but as the season advances the numbers may be increased. For the lighter breeds I generally mate up five or six hens, and add as the seasons advances, up to nine or ten, and even twelve hens. With the medium breeds—Wyandottes, Orpingtons, etc., four or five at first, and increase up to eight or ten. With the larger or heavier breeds, three or four hens early in the season and increase up to eight. Of course, a good, lively, vigorous male bird must be at the head of affairs to get best results. The hen should be considered as well as the male bird, and must be sound and healthy if we wish to get good fertile eggs. On her depends the greater part of the production of the future chick. She should produce a perfect egg, stored with the proper nutriment for the development of the embryo, and the foundation of health, growth, etc., for the future bird.

During the hot summer months the fowls' drinking pots should be kept out of the sun, and should be filled with water as we would use ourselves. Shade of some kind should be provided for all birds; if no trees, or sheds are handy, a shade can be made of boughs, bags, or anythings; it will shade a part of the run from the hot day.

sun. Green food should be supplied regularly every day to young—as well as the old stock—if we wish to keep our poultry in perfect health. The best time to feed green-food is at mid-day, and there should not any left about the pens or yards.

In rearing ducklings there are two objects to be kept in view, that of rearing to maturity for stock birds, or for fattening for table, as the two methods differ very materially. When ducklings have been hatched for twenty-four hours they will require their first meal; hard-boiled egg mixed with pollard or bread crumbs is a good first meal. When the duckling are two or three days old, their food should consist of pollard and bran (3 to 1 respectively) mixed into a nice crumbly mass—not too sloppy—green food—cut up fine, and a little animal food. Of course clean water should always be before them, and nice clean sand which they will use as grit.

In the large majority of cases (writes an English weekly, where fowls are kept in thickly-populated districts, the only object is to obtain eggs, not to rear chickens. Under these conditions there is no occasion whatever for the presence of the male bird. Numberless experiments have proved this. The United States Government maintain, at considerable expense, an Agricultural Department to investigate all matters of interest to the farmer. That Department has closely and scientifically examined the question as to whether the male bird is needed for the production of eggs, and the conclusion arrived at was that the laying of the hens is greater if they are kept alone. It has also been proved again and again in this country that the "crowing gentleman" is not necessary where eggs only are needed, if the town poultry-keeper will stock his yard with hens only. Even if it is considered necessary to hatch some chickens, a sitting of eggs, guaranteed fertile, can be easily purchased for a small sum.

THE AGRICULTURAL BANK.

[Mr. Sutton Nelthorpe, a Large Land holder in Lincolnshire has succeeded in establishing, and, with the assistance of a Managing Committee and an excellent Secretary (Mr. Spencer) in efficiently maintaining an Agricultural "Credit Society" since 1894.]

Most people, writes Mr. H. Rider Haggard in the *Daily Express*, have heard of the Raiffeisen system of agricultural banks, of which the object is to promote and foster co-operative personal credit, and to advance moneys to small agriculturists wherewith to enable them to carry on or extend their business.

The underlying principle of these banks is collective guarantee; thus all the members are responsible for the default of any one of them, the basis upon which the system is built up being the established character for probity and sobriety of the individual members of each association.

The success of these banks upon the Continent has been colossal. I believe that there exist at the present moment nearly 2,500 of them, and that their transactions in 1893 amounted to a total of about £11,000,000.

Further, it is the boast of this foreign Raiffeisen Agricultural Bank Association with its two thousand odd affiliated societies, that since the beginning of the enterprise in 1840, neither member nor creditor has lost a shilling by them, whereas the good they have done to struggling agriculturists can scarcely be expressed in words.

That this is the opinion of the Prussian Diet is shown by the fact that, in July, 1895, a Bill was read a third time in the House of Deputies establishing a Central Co-operative Bank, of which the object is to grant loans to and receive deposits from co-operative unions and co-operative credit banks. To further this end the State granted to the said bank as original capital a sum of £250,000.

When we turn to England it is, as might be expected, to find that in the matter, having to do with agriculture and the welfare of the rural population, little or nothing has been done.

In 1895, at the instance of Mr. Yerburgh, M.P., some information was obtained from the Continent through the Foreign Office officials, and there the thing stopped. Also I believe I am right in saying that largely through the enterprise and energy of Mr. Yerburgh, the Co-operative Banks Association has been founded, but as yet, I understand, has not progressed very far. How can it, fighting against such a sea of prejudice, ignorance, and Parliamentary indifference?

Our Governments can squander millions and tons of millions upon foreign enterprises and wars, some of which at least are of doubtful advantage, but what amount of pressure would it take to extract from them even £250,000 to assist a movement of this sort? That sum is about the sixteenth of the cost of, let us say, the Uganda railroad, and the benefit which would result from its judicious use in the establishment of people's banks must, I firmly believe, be a truer defence and benefit to this country than a dozen East African railways.

Yet, as it would benefit not trade but agriculture and the land, what chance is there that it will ever be forthcoming, or indeed, any earnest and heartfelt Government assistance in this and kindred matters?

The Scawby Credit Society started with the modest capital of £200 in 1894. Today it is quite solvent, and even boasts a reserve of £3 12s., having since its origin granted loans to the extent of £577—twenty-two in all, running from £50, the maximum allowed, to £5. During this period of activity it has suffered no losses and incurred no bad debts.

To exemplify the working and usefulness of the bank, I do not know that I can do better than quote two or three specimen cases, names only being suppressed.

Case 1.—A farm labourer, an industrious man who had brought up a large family and managed

to save a little money. He took half an acre, then three acres and the proverbial cow, then, when nearly sixty years of age, seized the opportunity to hire a small farm of fifty acres, which he managed to enter and stock, except with sheep.

To purchase these the Scawby Society granted him a loan of £30 on his own security, consisting of his live and dead stock and corn in stack, which he insured at the instance of the society for £150. But for this loan the borrower would have had to sell his sheep food to his own loss and to the damage of the farm. Having punctually discharged his debt, he applied for a fresh loan of £40, again to buy sheep, as his roots were more plentiful than in the previous season. The loan was granted on the same security as before, and duly discharged.

Next, one of £20 was granted, and paid off to the day. After a year the borrower saw a chance of placing his sons on a small farm which he partially stocked for them. To do this, however, and replenish his own holding, he applied for another loan of £50 which was granted on the same security.

This chain of loans, therefore, has assisted in starting the tenants of two small holdings and it is estimated that if the original borrower were now to go out of farming after six years he would have been found to have quadrupled the capital with which he started.

Case 2.—A working foreman heard of the Scawby Credit Bank and deposited with it a sum of £50. When the chance offered of taking a farm of seventy-three acres, he borrowed £50 on the security of his deposit, and a further £50 on that of his stock and implements and the guarantee of two sureties.

Even in the present bad season this man's farm looks well, and, as he is hardworking and knows his business, his success is fairly certain.

Case 3.—A foreman in a commercial concern established himself independently in the same line of business, and locked up his small capital in manufactured goods of his own production. He was granted a loan by the Scawby Society on the security of his stock in hand and of two sureties. This loan was repaid and a fresh one for a smaller sum granted, which, after an extension of time, asked for on the ground that it would enable the borrower to establish himself, was duly repaid. This man has now secured a connection of customers, and has a good prospect of success.

But for these loans he would have been obliged to sell his first manufactured stock at a sacrifice, and must have drifted to his old position, and thus lost the independence he coveted.

It will, I think, be submitted that the above sample instances demonstrate the utility of co-operative people's banks more clearly than could be accomplished by any amount of argument.

And if these things are done in the green tree, what might not be done in the dry? The Scawby Bank, with its tiny capital of £200, has in the course of a few years succeeded in assisting quite a number of industrious

struggling folk to advance themselves in life and attain to independence. What, then, might not happen if there were hundreds of such institutions scattered up and down the land, having the strong support and sympathy of some central authority, and engaged, each of them, in the judicious dissemination of capital among deserving folk, who mutually guarantee its repayment, that it may be used again to help others in their turn?

It is said that the great banks would be hostile to any such movement, but why should they be hostile, seeing that the business is not of the class which they would care to do, and that being co-operative, it produces no profit except to the co-operators? On the contrary, I believe that if it were put before them in a proper light, they would be glad to assist in the establishment of such societies, seeing that these would in due course manufacture customers for themselves, and, by increasing the wealth of the country, give them more money to handle.

The utter indifference of our Governments is, I think, much more to be feared than any hostility on the part of the large banking institutions. That these co-operative credit societies can be made to do good work in England as well as on the Continent has, I think, been demonstrated by Mr. Sutton Nelthorpe and his Committee at Scawby. Possibly also there may be other successful instances with which I am not acquainted. Now it remains for the country to follow this excellent example, and thereby help to satisfy one of its most pressing needs—the multiplication and development of the desirable class of small holders.

DIFFERENT SYSTEMS OF HOUSING CATTLE AND CONSERVING MANURE.

[REPORT BY THE PRINCIPAL, CAWNPORE AGRICULTURAL SCHOOL.]

Dry Earth System.—Where litter is scarce or when the quantity of manure made in the year is deemed subordinate to perfect cleanliness of the shed the following method will be found the simplest:—

Beat down the floor of the cattle shed with clay, to make it level and hard, give it a gentle slope, and at the bottom of the slope have a small drain lined with ordinary tiles. Let this drain lead into a small pit holding an earthen vessel; a common *ghara* will do very well. When the cattle are tied in the shed the urine soaks into the earth on the floor, and any extra urine not so soaked in, flows down the slope into the earthen vessel. Every morning the cattle-attendant removes the dung, scrapes the wet parts of the floor and puts over it fresh dry earth, at the rate of about 10 lb. for a pair of cattle. The urine in the pot (if any) and the scraped earth are thrown into the manure pit, either separate from the dung or along with it, according as the farmer intends using the urine-earth at shorter intervals than the dung or all together. Naturally, in this method also, a little more earth is necessary in rainy

weather, for which period the farmer will have to keep a store of dry earth in a place protected from rain.

By this method the urine is fully utilized and the shed remains as neat and clean as a cattle shed can possibly be. It has been under trial for about four years at the Cawnpore Experimental Station, and so far presents no difficulty that will fall in the way of its general adoption by cultivators. To what extent the earth applied to the shed increases in manurial value by absorbing the urine, will be seen by the following figures. Dr. Leather analysed the earth used at the Cawnpore Station, before using it, when it was used once, and when it was used twice; and found the percentages of nitrogen to be respectively 0.031, 0.224, 0.395. From the shed of a pair of working cattle about 4,000 to 5,000 lb. of earth may be expected to accumulate in the year which means that about 7 to 10 lb. of nitrogen has been saved. In producing immediate effects on a growing crop the nitrogen of this earth acts like that of salt-petre or sodium nitrate and can be reckoned as equal to not less than 20 to 30 lb. of nitrogen of dung or straw or litter. Instead of accumulating the earth the whole year, in which case the earth must be losing a part of the nitrogen by fermentation, the accumulations of shorter periods can every now and then be used as a top-dressing to any crop standing at the time. If this plan be adopted and the daily scraping of the wet earth be thoroughly done and the use of dry earth be liberal, there is no reason why the year's urine-earth of every pair of working cattle should not be sufficient to give the cultivator an additional yield of from two to four maunds of wheat, maize or other food grain. Fresh urine-earth unlike fresh dung does not encourage white-ants in a growing crop.

When some litter is available, as is often the case when a cultivator has some area under sugarcane, it may be spread on the floor of the shed during the cold weather months from November to February to give the cattle a warmer bed to lie on. And this bedding may be removed once a week or so. It should, however, be remembered that this plan is recommended only with a view to the better comfort of the cattle, and that for preserving the urine and making the most out of it as a manurial agent the mere dry earth system is one of the best and simplest.

The Manure Heap.—Whatever be the system of housing cattle that the farmer adopts a manure heap will be a necessity. If the box-system be adopted the dung will be preserved in the box itself; but there will be a lot of rubbish to collect and preserve for using as manure. For this purpose a pit should be dug on comparatively high ground so that it may not get submerged under water in the rains. The sides and bottom should be plastered with clay, and a cheap thatch put over it to protect from sun or rain. The dung, the sweepings of the household, all vegetable refuse as the leaves of sugarcane, useless weeds and straw, fallen leaves of sheesham, mango, or other trees and also any animal remains available should be put into it. The dry leaves shed by trees in the autumn and those of sugarcane con-

tain in 100 lb. about $\frac{1}{2}$ and 1 lb. of nitrogen and so make generally as good a manure as cattle dung, while animal remains make much richer manure. By taking care throughout the year in this way a cultivator can make in the year about 150 to 300 maunds of manure for every pair of cattle kept by him, according to varying circumstances.

If no thatch be put up over the heap it should be covered with earth to prevent the loss of nitrogen. Even in the presence of a shed, covering the heap with earth will be a good plan; when the heap gets very dry in the cold or hot weather some water may be poured on it just to moisten it. By this means not only will the heap rot or ferment well and become a readily atinge manure, but the loss of free nitrogen which takes place when the heap gets dry and mouldy will also be prevented.

MUSHROOM CULTIVATION.

We have been asked for information regarding the cultivation of mushrooms, and we fancy we cannot do better than quote from an article on this subject contributed some time ago of Mr. A. J. Boyd of the Queensland Agricultural Department to the *Queensland Agricultural Journal*:—

The directions for raising mushrooms without the aid of spawn are also given, and we shall be glad if some of our readers will give the process a trial and report results to us.

PREPARING THE BED.

During January or February a quantity of fresh horse-droppings should be collected. They must not be piled up in a heap, but rather spread out thinly under a shed until required. Dig trenches 1 foot deep and about 4 feet wide; into the trenches throw the droppings to a depth of 9 inches. Then ram or tread them down firmly to exclude the air as much as possible, thus preventing the droppings from heating too much. Now break up the spawn bricks into pieces the size of a large marble, and set them a foot apart almost on the surface of the manure. If no rain should come, give the beds a fair sprinkling of water, and a few days afterwards cover the manure and spawn with 3 inches of fine soil. In Queensland we often have heavy rains in February. Too much water is injurious to the spawn, so it would be well to provide some shelter for the beds. If the weather is suitable, within a month or six weeks after covering up the spawn with earth, tiny white buttons spring up at intervals all over the bed, the spawn being distributed in spaces about 1 foot apart. These little buttons rapidly develop into mushrooms, and in about three weeks they are large enough to cut for the market.

They do not grow steadily, but after a week or two of slow progress they suddenly begin to expand, and in a few days double or quadruple in size.

One of the strangest things about them is that they can be produced spontaneously, as it were,

from a bed of manure and earth properly prepared and cared for.

Without spawn or seed of any kind, if the work is properly done, after a few weeks the mushrooms will spring up from a bed of this kind, and for about three weeks they can be gathered. But that exhausts the bed, and you will never get another mushroom from it unless spawn is introduced. It would appear that the seed is in the mixture of manure and earth naturally, and needs only proper conditions of warmth and dampness to bring it to perfection. These mushrooms produced in this way are rather an inferior grade, however, and do not compare with those raised in the usual manner from purchased English spawn.

Cultivated mushrooms also are far superior to the wild variety. The latter do not attain the size and fleshiness of the former, owing to want of proper conditions and sudden changes of temperature. To raise them in perfection, a heat of from 60 degrees to 70 degrees Fahr. is sufficient. To be palatable, they must be fresh. In very warm weather they will not keep well, and in wet weather will become maggoty. The gills (or underside of the mushroom) turn black when too old or damaged by weather, and a few black-gilled mushrooms will damage a whole basketful if they are kept together for even a whole day. They also lose their flavour, and get tough if picked for any length of time. Fresh mushrooms are very brittle, and must be picked with great care, and broken mushrooms are not eagerly bought up by lovers of this edible. In France, and I believe also in America, mushrooms are grown in cellars. In Paris there is a vast number of cellars devoted to their cultivation, and also to that of the "Champignon," a more slender kind of mushroom and of more delicate flavour. It is, however, difficult to distinguish between the Champignon and poisonous fungi of similar appearance, and many persons have suffered from eating what they, in their ignorance, had gathered for Champignons, but which were, in English, "Toadstools." I have not seen the Champignon in Queensland; but there is no reason why it should not be found here as well as the mushroom and the truffle.

CELLAR CULTIVATION.

The first requisite is equable temperature; the next, dampness; and the third, gloom. The best way to prepare the cellar is to build shelves all round the walls and in the centre, indeed anywhere, so long as room is allowed to pass between the shelves. On these shelves boxes a foot deep are placed. They may be of any suitable width and length, but they must have the depth. As soon as the boxes are in position, the next thing is to prepare the beds for the reception of the spawn. I have already shown how to prepare the bed in the open, and the same method will serve for the cellar bed, the spawn being put in a little further apart than was the case in the garden, the reason being that we shall have a larger crop on a given area owing to the superior conditions of temperature and damp. Sixteen

inches is not too great a distance between the fragments of spawn. The temperature must be kept at about 60 degrees or at the most 70 degrees F., and such a temperature is easily maintained in a cellar even in our hot months. Next comes the question of dampness. This is essential. But it is not always necessary to water the beds. As before said, too much water is injurious to the spawn as well as to the mushroom. The plan adopted in Paris cellars is to water the stone or brick floor and also to sprinkle the walls. In America the same thing is done by cellar growers. I lately came across a Chicago paper in which some account was given of a celebrated mushroom-grower (W. C. Blakemon) in Chicago, who realises a handsome income by growing mushrooms in a dark cellar-like barn in the heart of the city. He has a number of boxes of earth, piled over each other, resting on shelves arranged like the bunks in an emigrant ship. Narrow aisles run between to enable him to attend to his crop. Except for the light of a lamp he carries, all is darkness in this moist warm den. The mushrooms are not picked by hand. This often results in the top breaking away from the stem, and thus the market value is lessened. Mushrooms should be snipped off about half an inch below the head. A long stick with a sharp brad in the end is used to harpoon each button or formed mushroom. The area of earth space in the boxes under notice is $1\frac{1}{2}$ acres. Every morning 50 lb. of fresh crisp mushrooms are taken from the beds and sold. The business is a very profitable one, and the crop never ceases. The expenses after the first outlay are not heavy. Mushroom spawn in America is worth from £1 to £1 10d per 100 lbs. It can be purchased in Queensland in small quantities for 1s. per lb. brick.

But the intending grower can produce the spawn artificially in this way: Mix two or three kinds of dung—horse and sheep or horse, sheep and cow dung—and keep up under cover, treading it down as the heap grows. Then cover the lot with fermenting horse dung or with bags. In a month or six weeks, if the compost heap has not been over-heated, you will find on taking out a handful of it that there are small white threads running through the dung. This is the mushroom nucleus. It will not keep, however, and should be used at once. In a stable which had not been cleaned for some time I have found the white mushroom fibres on breaking a piece of the trampled dung. Seeing that mushrooms can be raised in any odd, dark, damp shed with very little labour, and that there is always a ready sale for these in the cities, the business should be a profitable one.

PLANT LIFE.

[A SERIES OF SIMPLE LECTURES INTENDED FOR,
A CLASS OF JUNIOR STUDENTS.]

LECTURE III.

Nutrition.—Plants, like us, require food and water for their sustenance, but the means by which

nutrition is supplied to the plant as well as the elements and sources of plant nutrition are very different from those of animal nutrition. All animals, including human beings, are either carnivorous, herbivorous or both, that is to say, they consume animal food or vegetable food or subsist on a mixed diet. But vegetation is the ultimate source of all animal food, for either directly or indirectly it is to the plant that we must trace the source of animal nutrition. We can imagine, for the sake of argument, a man becoming independent of animal food, in the absence of animal life, but we cannot imagine the opposite state of affairs, for granted that human beings can maintain themselves on a purely meat diet, the latter would not be available inasmuch as vegetation would still be necessary for the nutrition of the lower animals whose flesh we consume. It comes to this then, that plant life is absolutely necessary for human nutrition.

Let us now enquire how plants get their food. The source of plant food are the atmosphere and the soil. From the atmosphere the plant draws one very important element of plant food, namely, the carbon which helps to build up the framework of the plant. I have already been speaking to you about the carbonic acid which is present in the atmosphere. It may be said to be an adulterant in an otherwise pure atmosphere consisting of nitrogen and oxygen, and is produced as the result of respiration (expiration) of all animals and plants, as well as of the combustion and decomposition of organic substances. As a result the oxygen of the atmosphere has a great tendency to be exhausted and to be replaced by carbonic acid, for it is the oxygen of the atmosphere that combines with carbon from whatever source to form carbonic acid. But the composition of the atmosphere, as I have already told you, is practically constant in spite of this, that is the proportions of nitrogen and oxygen vary very slightly, at any rate not to a sufficient extent to cause any inconvenience to human beings. Under normal conditions there are to every 100 parts of atmospheric acid, 79 of nitrogen and 21 of oxygen, and this quantity of pure air is ordinarily adulterated with 1-25th part of carbonic acid.

Now the means by which the composition of the air remains practically unchanged is the same means by which plants obtain carbon from the atmosphere. This process is technically known as *assimilation*, and consists of carbonic acid being taken by the plant from the air through the stomata, the carbon retained or fixed, and the oxygen given out. It is like a sum in subtraction; the plant takes in carbon and oxygen in combination as carbonic acid, abstracts the carbon and liberates the remaining oxygen. Now you will see how the plant purifies the atmosphere while it secures the carbon necessary for its nutrition. This process is, indeed, the exact opposite of the process of respiration, which consists of the taking in of oxygen and the giving out of carbonic acid. There is no difference in the process of respiration as carried on by

plants and animals; but assimilation in plants is the opposite process which counteracts the effects (the vitiating of the atmosphere by accumulation of carbonic acid), of respiration in plants and animals, and not only respiration but also the combustion and decomposition of organic matter. Thus is the atmosphere preserved in a condition suitable for human life.

GENERAL ITEMS.

According to an American paper the *Public Health Journal*, the dreaded mosquito, which is such an intolerable nuisance in the summer months, more particularly along river banks and on the sea coast, can be easily abated by the use of a very simple remedy. It is stated that but two and a-half hours are required for the development of the full-grown mosquito from a mere speck, its first stage. It can be instantly killed either in its infancy or at maturity by contact with minute quantities of permanganate of potash, the cheap purple salt which is used so much for disinfecting purposes. It is said that a solution of the salt containing only one part in fifteen thousand of water, distributed in the marshes where the mosquito breeds, will render the development of their larvae impossible. To quote the *Journal* itself:—"A handful of permanganate will oxidise a ten-acre swamp, kill its embryo insects, and keep it free from organic matter for thirty days at a cost of 25 cents. With care, a whole State may be kept free of insect pests at a small cost. An efficacious method is to scatter a few crystals widely apart. A single pinch of permanganate has killed all the germs in a 1,000-gallon tank."

Not many people are aware that the onion contains a principle which acts on the nerves in a manner similar to the action of opium. Unfortunately, the persistent odour of the vegetable makes sensitive persons disinclined to use them at all events in the raw state. Now, an onion taken at night is one of the best sleepinducers. The element above mentioned has the effect of calming the nerves, and consequently of lulling the brain to rest.

A correspondent to the *Queensland Agricultural Journal*, writing of the Brinjal as a neglected vegetable, says: "It is a vegetable of considerable excellence and has the merit of being hardy and very easily cultivated. Care should be taken to gather the brinjal before it passes its prime; otherwise it is unpalatable. The purple-fruited, of which there are several varieties, is usually cultivated for the table; it should be picked before it loses its brilliant purple hue. There are several ways of cooking it; an approved way is first to boil it from 20 to 30 minutes, then to slice and fry it. When thus treated, it is a delicious vegetable. I noticed when in London and Paris, last season, that the brinjal was frequently in evidence. The price quoted was about 2d. or 3d. each. It is known in London by

its French name, "aubergine": this is probably because the London market is supplied from France. The brinjal is largely grown in India; it is also esteemed in Germany, Italy, and other European countries, but more especially in the United States of America. It is an annual, but it continues bearing for some time in Queensland. I have had it fruit three years in succession. I have grown the white kind, which is also edible, and recently a white, striped with purple, which was as good as the purple.

How great are the possibilities of Hawaii as a fruit and vegetable growing country, will be understood, says an exchange, when it becomes known that four crops of potatoes have been produced in succession on the same piece of land within twelve months. Radishes become edible in ten days after sowing. Strawberry vines bear fruit all the year. The berries are of the finest flavour. Cabbage grows all the year, and it apparently makes no difference whether it is planted in the spring, summer, autumn or winter. Parsley once sown, grows forever, apparently. Lima beans continue to grow and bear for over a year, and they have to be gathered every week after starting to bear. Cucumbers bear the entire year, and so do tomatoes, which, with proper attention bear for years. Raspberries bear for six months. Pineapples come into bearing when the plants are four months old and bear in abundance for years. Lettuce can be planted at any time and it develops quickly. The same is true of celery.

Those who have been interesting themselves in rhea cultivation in Ceylon will be interested to learn that there is at the Buffalo Exhibition a machine which defribates ramie from the green stalks. The exhibitors of the invention are the Eggsan-Packer Defribator Co. of New York. It is reported to have been worked with success in the field in Florida, cleaning 4 tons of green stalks

per day and requiring less than one horse-power to operate.

Indian Gardening publishes a most interesting article, detailing a curious discovery made by Mr. N. G. Mukerjee, M.A., M.R.A.C., Professor of Agriculture, Civil Engineering College, Sibpur, in the cultivation of rice, which should have an important practical bearing on this crop—in Bengal at any rate. Mr. Mukerjee has, in fact, succeeded in evolving an *aus* paddy with *aman* tendencies, in addition to producing superior varieties of *aus* paddy. It is expected that the discovery will be of material benefit to cultivators, and our contemporary recommends that steps should be taken to make known the discovery far and wide.

Here is a simple, inexpensive and practical contrivance for keeping birds out of fruit trees, which might answer for scaring away sparrows from paddy, parakeets from Indian corn, squirrels from cacao, custard apples, &c. It consists in hanging a small mirror on the top limb of the tree. There should be at least six inches of string to the mirror, so that it can swing about when moved by the wind. It is said that the flash of the mirror creates a scare. One or more cheap mirrors used thus on each tree are said to have answered well in the Philippines, and the birds do not grow familiar with the contrivance as in the case of scare crows. The experiment suggested is well worth trying.

Soot and lime are very useful in keeping off slugs. The material should be sprinkled around the rows so that the slugs cannot cross the line formed. When this is done there will be little to fear from slugs, and where the operation is neglected, they are in the vicinity of crops, they will come out and devour the leaves in the most destructive manner. Land affected with slugs should be kept free of weeds and rubbish and the land constantly stirred up and kept open.

CACAO CANKER IN CEYLON.

HISTORY OF THE DISEASE.

It is difficult to arrive at the exact date of the appearance of cacao canker in Ceylon: it had most probably been growing on cacao for a long period before it was noticed by planters. In 1896 it was generally noticed, and various theories put forward as to its nature, some favouring the view that it was caused by an insect, others that the methods of cultivation were at fault.

We may safely assume with our knowledge of the rate of growth of the organism causing the canker that it had been present in cacao trees at least five years previous to 1896, when in the public press and at planters' meetings the existence of the evil was recognized. The number of trees affected and the wide area over which the canker existed in 1898, when the investigation of its nature and life-history commenced, supports the presumption that cacao canker began in Ceylon not less than ten or twelve years ago. unhappily the disease was until 1898 only treated in various empiric ways, without definite knowledge of the nature of the evil. It was said to be a fungus attacking the root, to especially attack weak trees, and to be a consequence of the attacks of boring and other insects, and from these premises various suggestions for the prevention of further spread of the disease were formulated. This has been almost invariably up to the present time the history of diseases of cultivated plants, and the experience has been dearly bought that in plant life, as in human sanitation, sporadic diseases should be carefully investigated as soon as possible, and when their nature is discovered prompt measures taken to prevent them becoming epidemic.

In 1898 I began an investigation into the causes of the disease, spending a year in observing the life-history of the fungus causing the mischief, and also in visiting and examining more than forty cacao estates in different districts of the Island and at various elevations (from 100 to 4,000 ft.). The results of this investigation were published in three reports by the Ceylon Planters' Association, and an abbreviated account, with rules for dealing with the canker, was printed in Singhalese and Tamil and circulated by the Government.

The amount of damage done before any steps were taken to combat the evil is hard to estimate, but a most serious loss in crop was caused by the canker and a still more serious loss of trees; some estates, for reasons which may perhaps be understood by the following account, were free, or almost so, from the disease, while others were entirely, or in great part, wiped out.

Had the organism causing the disease invaded the root—as it was erroneously supposed to do—as well as the stem of the cacao trees, the loss would have been more disastrous. When the stem was cut down suckers were produced from the stump and grew vigorously, without disease, producing fruit, in some cases when only a year old, in addition, new plants supplied grew healthily beside the stumps of the old cankered trees, and these circumstances retrieved a great deal of the loss on many estates.

On some estates the methods laid down for combating the spread of the disease have been most carefully carried out, on some others partial trials (which, as a rule, are a mere waste of money) have been made, but in a large number of cases, notably native holdings, no measures have been taken to decrease the ravages of the disease.

Since I have taken up my duties as Government Mycologist I have more than once had inquiries as to a "new disease" noticed, which on specimens being sent proved to be typical canker, and from its hold on the trees and the number attacked must have been present in the state for many months, probably even years.

That there are also many false impressions current as to the nature of this disease appears in letters of inquiries received as well as in the local newspapers, which show that some of the facts recorded in the reports issued by the Planters' Association have been misunderstood. The object of this Circular, therefore, is to recapitulate the knowledge gained by the investigation and to record observations and experiments carried on since the reports were published.

It is to be hoped that every cacao planter, especially those whose experience and observation has given them definite views on the question, will read and carefully consider the evidence and the facts deduced therefrom.

The methods employed in gaining these facts are described with a view to encouraging planters to gain for themselves knowledge, not by general observations recorded only in the memory, but by experiments and observations—simple perhaps in themselves, but conducted carefully and the results permanently noted.

It say here be stated that, for reasons which our readers will readily understand, the names of states where the various observations mentioned in this Circular were made are not given, yet these cases, like the inoculation and other experiments, are not mere general observations, but exact instances, of which the place and conditions were recorded at the time of observation.

EXTERNAL EFFECTS OF CANKER.

The first question in investigating any disease is—What is the nature of the departure from the normal health of the trees? Briefly, in the disease in question the external signs are a lack of vigour in producing fruit and leaf, similar in its appearances to the lack of vigour caused by long periods of drought or by severe mechanical injuries to stem or root. The period during which the tree continues to exist depends on the amount of disease on the tissues and the quantity of nutrition the roots can take up. The fact that trees of all varieties, at all ages above three or four years and in some cases less than that, in the best soils as well as on poor land, in various aspects and at different elevations, are attacked naturally leads to the supposition that this disease is not due to conditions under which the trees are growing, but to the effects of an extraneous parasitic organism.

No injuries caused by insect or other animal can be found exclusively on diseased trees, so that the disease cannot be due to the attacks of an animal. The next point is—What portion of the tree, if not the whole tree, is affected, and in what manner? The roots of badly diseased trees show no sign of injury, and when the tree is cut down near the ground healthy suckers are formed, which grow without any sign of disease. These, as well as many other facts which will appear in the course of the Circular, show that the root is not affected by the disease, and it is indeed a happy thing for the cacao planter to be assured on this point, as root diseases are much more difficult to battle with, and consequently much more to be feared.

The leaves of diseased trees, except in rare cases, are free from fungi, and present on microscopic examination all the features to be found in leaves dying from want of moisture, showing that there is no disease in the leaf, but that some malady in another part of the plant has cut off their supply of nutrition from the root.

The stem and branches must now be examined, and here it is not hard to find the cause of the disease. If we examine the external bark of the

stem and branches of diseased cacao trees, we shall notice darker patches, where in some cases (where there is an injury in the bark, and insect puncture, or an abrasion) claret coloured drops exude, and where they have run down and dried up a rusty coloured streak is seen. On scraping these darkened patches the bark is found to be discoloured, sometimes of a deep claret hue, but in earlier stages of a brownish or "neutral tint" colour, quite evident if these places be compared with the yellow or reddish yellow colour of healthy cacao bark. This discoloured bark is always very wet, and on being cut exudes copious moisture—the darker the colour the more the moisture—and feels soapy to the touch. If such a diseased patch be carefully shaved, its difference from the healthy bark surrounding it can be clearly seen, as it stands out as a bright claret coloured patch surrounded by the light yellow healthy tissue.

MICROSCOPIC CHARACTERS OF THE DISEASE.

A microscopic examination of the tissue in these discoloured parts shows a quantity of mycelium of a fungus permeating the tissue.

Mycelium is the vegetative portion of a fungus, that is to say, it is to a fungus what the root, stem, branches, and leaves are to a flowering plant. The quantity of mycelium is much greater in the darker coloured parts than in those of a neutral tint, and in cases where the discolouration is only just perceptible the mycelium is scanty.

The mycelium also penetrates into the wood of the stems and branches, running generally in a longitudinal direction. It can be observed when it is present in any quantity as a thin black strand as thick as a piece of cotton; this strand may crop out into the bark at another place higher up or lower down, and produce a fresh cankered spot on the bark. The time the fungus takes to kill a tree or part of a tree depends upon many conditions. It is possible for it to produce death in a few months: as a rule it takes two or three years. Death occurs when there is sufficient mycelium to prevent any sap being conveyed from the roots to the parts above.

To return to the external appearance of the cankered tree. If we observe a number of patches of disease we shall find on many of them whitish pustules on the surface of the bark, varying in size from that of a pin's head to a ten-cent piece white gray or pinkish gray in colour, and bursting through small ruptures in the bark. If these be examined microscopically they will be seen to consist of masses of oval-shaped bodies, and some larger bodies crescent-shaped and septate, *i.e.*, having a number of partitions, usually eight. They are the spores of the fungus, and a section cut through the centre of one of these masses into the discoloured bark will show that they are produced on the mycelium which permeates the tissues. Spores may for purposes of popular explanation be considered as the seeds of the fungus. These spores are excessively minute; some notion of their size may be gained by the rough calculation that about five million could be placed on a ten-cent piece only one layer thick; those which are crescent-shaped are larger, being about six times the size of the oval spores.

When these spores are sown in a suitable medium and kept moist (a form of microscopic gardening which must be always used in gaining a knowledge of these small organisms), in the course of twelve or fifteen hours they begin to grow, pushing out a tube, which, as it grows, branches, frequently coalescing with neighbouring branches, and in about fifty hours producing more spores similar to those from which it originated. This minute gardening is of great interest, but it is of less practical value than observing the processes of growth in the living cacao tissues (which is unfortunately impossible), because the nature of the "bed" in which the spores are growing affects the rapidity and character of

the mycelium, and in a good nutritive solution the conditions of resistance to growth and the amount of food available are much more favourable than in the hard tissues of cacao. On carefully searching diseased and dead cacao trees, and especially those which have been attacked for a long period, we shall find a third form of spore enclosed by a fruit wall, which is very characteristic in colour and size. These fruits are of a bright crimson colour, and occur in clusters about the size of a pin's head; if looked at with a lens, they will be seen to be in shape and colour like a strawberry, minute in size, about twelve or fifteen making a mass equal to a pin's head.

These are the fruits or perithecia of the canker fungus, the name of which, botanically, is *Nectria*, and they are hollow spheres containing a series of sacs or "asci," which in their turn contain each eight spores. They are to be found only on dead wood or dead patches of dying branches and stems.

The name "canker" is not strictly correct, though it may be used, as the other *Neotrias* parasitic on trees are "cankers." Properly a canker is a disease causing malformation of the tree at the point where the fungus is. In the case of the cacao *Nectria*, however, no such excrescence or other irregularity occurs, the contour of the stems of cankered trees being the same as those unaffected by disease.

This completes the life-story of the canker fungus: the small oval spore producing mycelium, which in its turn produces spores of three kinds: first the oval and crescent-shaped spores in whitish masses, and then the ascospores enclosed in crimson spherical fruits.

INOCULATION EXPERIMENTS.

We have a fungus which will account for the diseased condition of the cacao tree, but in order to prove absolutely that this organism is the chief and only cause of the canker, it was necessary to artificially produce the symptoms of the disease by inoculating a previously healthy tree.

The table on page 322 gives a record of thirty-two inoculations made on previously healthy trees in full vigour, showing the variety of the tree experimented on, the material used to infect it, and the time occupied before the characteristic symptoms of the disease were produced. As will be seen, twenty five out of thirty, or more than 80 per cent., of the trees inoculated acquired the disease, the majority showing unmistakable symptoms after eight weeks.

As would be expected the inoculation of diseased tissue produces a cankered spot sooner than the sowing of spores in the bark, just as in the case of the production of new plants from cuttings instead of seeds.

The time taken to affect a certain area of the bark is very variable; in the case of quickest growth (No. 13) a space of nearly 10 inches long by 4½ inches wide was permeated and discoloured by the fungus in five weeks, while in the one of slowest growth a piece not larger than a rupee was diseased after ten weeks. The spread of the canker fungus in the bark depends upon the amount of sap in the tree at the time, and in a vigorous tree where the roots are taking up plenty of nutrition the diseased spots increases more rapidly, because the mycelium of the fungus obtains more food. From the table it will be seen that in the cases of inoculation of suckers only one out of three cases succeeded. This fact and observations as to the comparative rarity of canker on suckers led me to make further observations and experiments in this direction. I examined 200 suckers on 135 trees, most of which (113) had disease on stem and branches, and in only five cases were the suckers cankered. I also inoculated thirty suckers, and in only twelve (40 per cent.) was canker produced.

The smoothness of the outer bark on suckers and the fewness of wounds and abrasions give less chance for the lodgment and subsequent growth of the canker spores. This, together with the fact that even when it has a footing the spore does not invariably grow on them, make the "suckers" of more value than other branches. In cankered estates, therefore, whatever method has been previously practised, it will be well to spare the sucker. In the limits of the Circular, though it may be treated in a subsequent one, it is not possible to discuss the *pros* and *cons* of pruning for fruit in cacao. Dealing with the matter from the point of view of combating the canker, the use of the knife, or, still worse, the nipping or tearing off suckers, leaves a vulnerable spot for the cacao spores, and since the suckers are more protected from canker than other parts, it is well to allow the tree to produce these branches, which like the lateral branches, bear their fair proportion of fruit. We have seen that the roots and leaves of the cacao tree could in no case be found affected by the canker fungus, and in order to still further prove this point I made some inoculations of exposed roots and of underground roots; seventeen cases were inoculated, nine exposed roots and eight in which the earth was temporarily removed, but in none of them was any canker produced. I also attempted to get the spores of the fungus to grow on the leaves by sowing them on both the upper and under surfaces and by scraping the epidermis away and then introducing spores. Fifty of such experiments produced no growth of the canker, so that we may definitely state that the canker does not affect roots or leaves.

DISEASE OF THE PODS.

The fruit, which has so far not been mentioned, cannot however be so classed, for upon it the fungus grows vigorously. For many years the great loss of pods in various stages of maturity has been a serious question. To understand the pod disease it must be stated that there are a number of causes why large numbers of pods which are set do not reach maturity. There are in many trees hundreds of pods which blacken, dry, and shrivel up when they are from 2-5 inches long; in these there is no specific organism causing disease to be seen, and this is a physiological effect, it is an evil which I am continually observing and investigating, and all exact knowledge as to its nature is of importance, as leading us nearer to some way of preventing this immense loss of energy in the fruit-producing power of the cacao tree. The planter is satisfied, as a rule, with the comforting explanation that the tree has set more fruit than it can bear, and as he has frequently in his mind a dread of what is called "over-bearing," he is not much distressed at this waste. This Circular, however, treats of the canker, and further discussion of drying of young fruits must be deferred.

The attacks of insects and other animals cause the death of many pods. From the squirrel to the *Helopeltis* many animals feed on cacao pods or lay their eggs in them; but of these I have no authority to speak, they are dealt with by my colleague, the Government Entomologist.

The canker fungus is, however, responsible in many estates for a very large loss of crop. The disease can be readily recognized on the pod. A characteristic discolouration accompanied by an excess of moisture which gives a slimy feeling to the touch when cut, and as in the bark the colour is darkish brown, and a clear line can be drawn between the healthy and the diseased parts. The disease attacks the pod most frequently either at the point or at the stalk; this is due to the fact that a drop of moisture in which the spore can germinate often hangs on the point, and the cup formed round the stalk holds moisture which aids the growth of the spore at that end of the pod. The life-history of the canker fungus on the pod

is similar to its progress in the bark, except that it is much shorter. We have seen that under favourable conditions the time taken from the germination of the spore to the production of new spores in the bark is a question of some weeks and often months, but the whole of this is passed in the pods in a few days, and vast numbers of spores are produced in every pod that is allowed to hang on the tree for a week or more.

The diseased tissue of the pod if examined microscopically will be found to be permeated in the same way by the mycelium of the fungus, but this mycelium is of a more luxuriant character, because there is more moisture in the pod for it to grow on and less resistance to its growth.

If a planter wishes to observe for himself the life-history of the canker fungus, he can by placing a cankered pod under a glass and keeping it from drying up see the production of the two early forms of spore (gonidia), and later the red spherical bodies of perithecia containing the ascospores.

That the canker fungus grows on the pods has been proved by numerous observations, and in order to test by inoculation I experimented with twenty pods of fairly typical Red Cacao trees and twenty of *Forastero* trees. These I inoculated with both gonidia and ascospores, seventeen of each variety being painted with gonidia spores and three of each kind with ascospores. In the case of the Red Cacao all the seventeen grew at once, twelve in the first three days and the rest within eight days; in the *Forastero* twelve grow within nine days, the remaining five did not acquire the disease, the fact that the typical *Forastero* fruit has a thicker epidermis or outer skin no doubt gives it a greater power of resistance to the growing spore of the canker fungus.

On all these inoculated pods the spores—both gonidia and ascospores—of the fungus were produced in from four to nine days, and these spores were exactly similar in character to those on the bark.

RELATION BETWEEN POD AND STEM DISEASE.

In order to prove the relation between the canker on the bark and on the pods, and how far the one spreads to the other, the following experiments were made:—

(1) Small pieces of cankered bark were placed in selected healthy pods on sound trees. Five pods were so treated. In all cases the pods became diseased after eight days, and in less than fourteen days spores of the fungi were produced in abundance.

(2) Small pieces of diseased pods were placed in the bark of sound trees. Eight of these inoculations were made. In all cases canker was produced in the bark after ten days, and the spores of canker were found after eighteen days.

(3) Small pieces of cankered bark were placed in the bark of sound trees just above the stalks of healthy pods. Seven inoculations were made. In all cases the bark became diseased, and it spread to the pods, which were plainly diseased, in nine days, and spores produced both on the pods and on their stalks.

(4) Pieces of diseased pods were placed in healthy pods on sound trees. Six of these inoculations were made. All the pods became diseased, and in three cases the canker spread through the stalk to the adjoining bark; in the other three cases the stalks of the pods were cankered, but not the adjacent bark. In one case the mycelium of the canker went through in to the wood of the tree through the stalk without affecting the adjacent bark.

We learn from these experiments that the canker fungus can spread from the bark of stems or branches to the pods; that the fungus can spread from the pod to the bark of stem or branch.

Another matter of interest in connection with the disease on the pods is that they are invaded by another fungus *Phytophthora*, *sp.*, one which is

common in many climates and grows on the soft tissues of numerous plants. On examination of some hundreds of diseased cacao pods I always found this fungus associated with the canker fungus. I was unable to get a pure culture of the spores of the second fungus, so that I could not observe the action of the *Phytophthora* alone on the pod. The canker fungus I have found by itself on the pod, but in the great majority of cases it is soon joined by the *Phytophthora*, and this latter I have never found by itself in the pods in nature.

A very large series of observations of the relation between the canker in the bark and on the pods shows that in a certain proportion of cases the canker originates in the bark from a cankered pod which has been left on the tree sufficiently long—three or four days—to enable the mycelium to penetrate through the stalk; also in a smaller proportion the canker in the pod has been caused by the mycelium growing from the bark through the stalk and infecting the pod.

To sum up the knowledge gained by this investigation of the cacao canker. The disease is due to a fungus (*Nectria*) growing in the bark "wood" and pods of the cacao tree. It spreads by means of an abundant production of spores of three kinds. It grows more rapidly on the pods than in the bark, and its rate of growth in both cases is regulated by the amount of sap in the tissues.—*Royal Botanic Gardens, Ceylon.*

(To be concluded.)

SOME RECENT INVESTIGATIONS IN THE CHEMISTRY OF AGRICULTURE.

(Continued from page 381.)

SOIL MOISTURE.

I must now refer, though with great brevity, to another department in the investigation of soils, namely, the *Moisture conditions*.

This subject has a particular interest in India where the rainfall is unequally distributed.

Some parts of America suffer likewise from an unequal distribution of rainfall, and Professor Whitney of the U.S. Department of Agriculture, has for some years devoted his time to an examination of the moisture conditions which obtain in soils. Although his work has already been productive of most valuable and interesting information, it is at present in its infancy, and it is impossible to say what this department of research may eventually tell us. But some of the information gleaned is of great interest.

In the first place, mechanical analyses of soils made by Whitney, Hilgard and others, have demonstrated that it consists largely of very minute particles, many of them measuring only a few micro-millimetres in diameter, some indeed being even smaller than this, or to put the statement popularly, they are little larger than bacteria. In loamy soils about one-half of the silicious matter consists of such material.

The result of this state of minute sub-division is that it offers a very large surface, not only to the plant, to whom it is important, but also to the water; Perhaps will appreciate this if I say that each cubic foot of soil offers a surface area amounting to many thousand square feet. One of the results of this is that water is held, long after rain has ceased to fall, in very thin films on the surfaces of these small particles, and does not at once evaporate into the air or run away as drainage water, as would be the case if the soil consisted of coarse pieces.

Turning from the soil for a moment, we may enquire how much water an ordinary crop will require during its growth. This is a much larger amount than one might suppose. The results of the most recent investigations go to show that the quantity varies from about 300 to 500 lb. of water per 1 lb. of dry crop. For example, an average good wheat crop

at Cawnpore will weigh (corn and straw) about 4,500 lb. per acre in the dry state, and such a crop will require something like 1,800,000 lb. or roughly 800 tons of water. Or again a cholun crop, including stems, leaves and grain, may weigh from 4,000 to 7,000 lb. in the dry state, and such crops will require 2,000,000 to 3,500,000 lb. of water, or say 1,000 to 1,500 tons.

These are of course very large amounts, but when we state them in terms of rainfall, they are not so very surprising. The former is equivalent to 9 inches and the latter to about 10 inches to 15 inches of rainfall. One would be inclined to ask why even more than this rainfall is necessary in order to grow heavy crops. If the rainfall were well distributed over the seasons, it would indeed go much further towards satisfying our Indian crops than it does, but unfortunately it is apt to fall in heavy showers, and a part runs off the land, whilst there is always some lost by drainage, the latter being indeed a necessary condition for all healthy soils. It follows however that, in order to grow heavy crops, even larger amounts of water are required than the few inches I have spoken of.

It is necessary therefore that the soil shall hold, for periods of weeks and months, very considerable quantities of water, and this it does in the manner I have indicated, namely, as a very thin film on the surface of the soil particles.

A further part of Whitney's work consists in the determination of that proportion of moisture, or to state it popularly, that degree of dampness of any soil, which is most suitable to the crops grown. I have already told you that these investigations are merely in their infancy, and I cannot do more at present than to say that there is every probability of reaping a rich harvest of information.

In some soils, crops will grow best with very much less water than in others. The following examples will better show the importance of the work.

One soil was found to be too wet with 10 per cent. of water to be too dry if the proportion fell below 5 per cent. and that the crop fared best with from 5 to 8 per cent. In another case, the soil was too wet if the moisture rose to 25, and it was too dry with 15 per cent.; in yet a third case 23 per cent. of water was too little.

What this line of research may ultimately indicate, it is of course impossible to say, but one thing seems probable, namely, that although we cannot alter the rainfall, it may tell us in what manner we should irrigate our land, so as to produce the best crop with the least waste of water, and without damage to the land.

SEWAGE.

The last subject which I shall refer to is the so-called biological treatment of sewage. It may appear at first sight that this matter belongs rather to the domain of the sanitary engineer than to the agricultural chemist. As a matter of fact, the disposal of sewage should engage the attention of both. To the one the question is—"How am I to get rid of this material at any price, and with the least possible amount of nuisance to the inhabitants?" Whilst to the other, the deposition of such matters in the soil, means an increased manure supply.

That the land is the proper destination for the town "night-soil" has been admitted by all who have had to answer the question, but when the practical details of the working arrangements were taken in hand, the difficulties proved great. In many parts of Europe, America, and in fact wherever the sanitation of towns has been seriously taken in hand, the excrementious matters have been conveyed down closed sewers by water and emptied, with, or without previously "purification," into the nearest river, and sanitary authorities have been very well satisfied if they could do this successfully.

The regular return to the land of those matters which had been withdrawn from it, although so desirable, has been considered as generally impracticable, and has had to be classed among the many

other interesting problems which remained unsolved.

To sanitarians and to agriculturists alike, therefore, the discovery of a means of disposing of sewage without causing any nuisance whatever, void of technical difficulties, with a minimum of cost, and including as an integral part of itself, an effluent which no one would object to put on their flower garden, much less on their fields, has come as a matter of unusual interest. It is now, of course, a very old story, that animal and vegetable refuse matters of all kinds disappeared when allowed to remain in either water or the soil, and that this resolution is effected by lowly organisms which are commonly spoken of as "microbes," better known to the scientific world as moulds, yeasts, fungi, and bacteria, organisms small of stature, but performing nevertheless an all-important work. For many years attempts were made to utilise this army (for the number of such organisms is very large), for the disposal of town refuse. It was argued that because these matters do disappear if left in either soil or water, then why not put them on the soil or into the river? And for a long time this procedure has been followed, but with the result, that in the majority of cases the river was rendered foul, or the land unapproachable. There was clearly something very wrong in our method of utilising the services of the wily microbe.

For the last 10 years, however, efforts have been concentrated by a number of investigators on the value of what is termed the "Biological Filter." The general meaning of the term "Filter" is a porous medium, through which a liquid will pass, but which will arrest solid matters, and prevent them flowing on with the liquid. Thus we use blotting paper in the chemical laboratory to separate our precipitates. Drinking water (with the idea that only solid substances did us harm) has been filtered through such things as sand or charcoal, or more recently by the aid of the Pasteur cylinder of finely porous earthenware. The "biological" filter is, however, in reality very different, at least in principle. It consists, it is true, of such material as broken charcoal or stones, but there is no attempt to make it impervious to the passage of fine solid matter. It had indeed become recognised that at least one of the reasons why the soil of the sewage farm did not purify its daily allowance of sewage, was because it was too fine, and contained too small an allowance of atmospheric oxygen, resulting in harm to the army of microbes which it was hoped would consume the sewage. The idea of the biological filter was then to offer to the sewage as large a surface as possible, with, at the same time, plenty of air. Liquid sewage run into such filters (which had been previously aerated) and allowed to remain in them for a few hours, was found to have lost one-half or more of its organic matter.

The Massachusetts Board of Health, in the U. S. A. and Mr. Dibdin, and Mr. Scott-Moncrief in England, must be named among those who carried out the first experiments in this direction. At first, only a comparatively weak sewage was run into the biological filter, but the process worked so exceedingly well, that very shortly these filters were supplied with the raw and unadulterated sewage, in the hope that this might be equally palatable and digestible to our friend the microbe. And indeed it was found to be so. The solids of the crude sewage disappeared, that is, they were dissolved and broken down, and this, as also the matter already dissolved in the sewage, actually disappeared to the extent of about 85 per cent. It thus became evident that the microbe could be persuaded to perform his duties most efficiently, if the sewage were only given to him in a proper manner.

Before telling you anything more about the form of the biological filter, or its analogue the Septic Tank, I must digress to say a word about micro-organisms generally.

In the first place, as you know, they consist of

minute cells, having a very brief individual existence. They are divided into groups, such as moulds, algae, fungi, yeasts and bacteria, and it is principally those of the latter class with which we have to deal. An important point in the life history of Bacteria is that, whilst some of them thrive in the presence of a plentiful supply of atmospheric oxygen, others have a more healthy existence in its absence. The former are called aerobic bacteria, the latter anaerobic bacteria. Another point is that they all live on food of complex character. Whilst the higher plants feed on very simple foods, such as carbonic acid and nitrates, building up from these the complex compounds, carbo-hydrates, oils and albumens, these lowly organisms perform the reverse operation, and, feeding on complex material, break it down, with the production of simple substances, some of them proceeding so far as the production of carbonic acid and nitrates. Furthermore, whilst one organism will prefer the most complex material as food, producing therefrom simpler substances, others have a particular appetite for these simpler substances and reduce them to compounds of a still more simple constitution.

It is indeed, as has been mentioned in a former part of this lecture, owing to the existence of myriads of such organisms, that the vegetable and animal matter, which accidentally or by the agency of man are annually deposited in the surface soil of our fields, rapidly disappear and become changed into the simpler compounds on which the higher plants feed.

The action of these bacteria has very pertinately been likened to that of a child, who after assisting in building up a castle from a pack of cards, proceeds to take a card first from one part of the structure, then from another, with the result that the castle is rapidly converted into a heap of cards again.

Finally, I must refer to another characteristic of these organisms, and that is, they don't like their food to be too concentrated. If they have too much, they suffer in the same way, as a boy does who eats too many sweetmeats at once. They get ill and may die, if the excessive food supply is persisted in. This really explains why the sewage farm has been a nuisance instead of a blessing. Vast quantities of material have always been poured upon a small area, without any consideration for the health of our microscopical friends, and the result has been that they couldn't perform their duty satisfactorily, and the sewage farm proved a failure.

We may now return the biological treatment of sewage, with a clearer understanding of the conditions involved in its arrangement. For it to proceed satisfactorily, we must offer the material to these organisms in such a manner that each class may perform its appointed task—the anaerobic organism prefers to be without air, the aerobic microbe must have an abundance; the food must also be in a reasonably diluted state; and thirdly, we must not upset the home or colonies which these classes make for themselves, for they sort themselves out, and one class will inhabit one spot in the biological filter, another class another, and if we give crude sewage to the class which lives on the partly simplified material, the result will be destruction, not to the sewage but to the microbe.

Thus in the case of the filter which Dibdin, Scott-Moncrief, Garfield and others have used, the crude sewage passes first into one vessel, which Mr. Scott-Moncrief has called a "cultivation tank." This is simply a large tank filled with broken brick or some other coarse material. Here those organisms which prefer the more complex organic foods thrive particularly, dissolve it and reduce both this, as likewise the other soluble matters, to simpler substances. In this tank little or no air is admitted. The resulting effluent then passes to a series of so-called "filters," to which I will return presently.

I leave the "cultivation tank" to describe very

briefly what is called the "septic tank." The author of this is Mr. Cameron, the City Surveyor of Exeter, who also took up the biological treatment of sewage a few years ago. His experiments took a slightly different line. Whilst Dibdin and others passed the sewage into a tank filled with broken brick or coke, Cameron tried the effect of allowing the sewage to remain in a simple closed tank (containing no broken material) for some hours, and found as a result that the sewage was rapidly purified in a great measure. A tank was then erected of such dimensions, that the sewage of a portion of the town might constantly flow into it at one end and pass out at the other, the time occupied being about 24 hours. It was then found that in fact great changes took place in the sewage. By means of a "manhole" from which the interior of the tank could be observed, it was seen that the solid matter would first settle to the bottom, then rise with bubbles of gas to the surface, then fall again, and apparently this process goes on from one end of the tank to the other. A scum, consisting of organic matters, forms on the surface, which seems to be thicker in winter than in summer, but never requires removal, and an ash-like deposit collects very slowly on the bed of the tank, which consists largely of mineral matters. Gases are evolved in this tank consisting largely of methane, with some carbon dioxide, and this is utilised to illuminate the works at night. The effluent from this septic tank is free from smell and is clear. Like the effluent from Dibdin's bacteria tank, it then passes to the biological filters.

These consists of simple vessels filled with broken material, such as coke, and here the effluent is allowed to remain for several hours, after which it passes out, and the filter is left empty for purposes of aeration before being filled again.

By an ingenious device, due to Mr. Cameron, the flow of water from the septic tank, opens the tap of one, or closes that of another filter at the proper time, thus enabling the series to work automatically. The raw sewage runs directly into the septic tank continuously, and passes from it again similarly uniformly to the filters, which, as I have said, work automatically. The apparatus requires therefore a very small amount of supervision.

The effluent from the filters is not only free from odour, it is so pure that it remains perfectly clear and bright for any length of time in closed bottles, which is one of the severest tests of the purity of water, and it has been drunk by more than one person without any ill effects whatever. Thus putting the matter very briefly, one class of organisms inhabit the septic tank or "bacteria tank"; these thrive on complex organic food, and are largely anaerobic in character. Then, secondly, the biological filters are inhabited by another class of organism, which are aerobic and feed on the more or less simplified material, converting it into still simpler matters. The chemical changes may be very briefly described as follows: the carbo-hydrates are reduced to carbon di-oxide and methane, the albuminoids and amides first to ammonia and then largely to nitric acid.

And now you will doubtlessly agree with me that the value of the biological treatment of sewage is just as important to agriculture as it is to the sanitary authorities. Especially is this so here in India. Not satisfied with converting the farm manure into fuel, the attempts to utilise the city manure have been generally of just as ruinous a description. A dry-earth system, which if it could be perfectly carried out, could not readily be improved upon, has been converted into a general nuisance; the whole of the manure has been placed in a few square yards of land, to the utter ruin of our friend the microbe. Suggestions that the manure should be given in smaller doses over a large area have been met by the rejoinder that such was impracticable. Now, likewise in the case

of the biological treatment of sewage, we have a means of converting our city manure supply, without any nuisance at all, into a most valuable liquid manure, which may be run on the fields all round the town, and thus a material increase of plant food will be recovered from the hopeless wreckage which at present prevails. But this result will not be attained if we are ungenerous to our microscopical friend. He requires to be treated well, to have his home *i.e.*, the particular part of the septic tank or filter which he has colonised, left undisturbed, and, above all, if we are stingy with the allowance of water, he will be unable to serve us well.—*Indian Forester.*

THE CASSAVA-PLANT.

The Cassava is, *par excellence*, the nutritive plant of the African races and of the indigenous populations of the West Indian Islands, of Central America, and of equatorial South America. It will, therefore, be seen that it supports the life of a goodly part of the world's population. It is also very much made use of in Europe, and especially so in England, in the preparation of biscuits and of dietetic articles. Its principal product, *tapioca*, is known universally.

The prevailing opinion in France is that tapioca and, especially, the good quality of tapioca, is obtained only in Brazil. Now it is a fact that cassava is cultivated in all French colonies, and the making of tapioca is one of the rare manufacturing industries in the colonies, one of the most interesting of all colonial manufactures. Tapioca grown in the French colonies comes chiefly from the island of Reunion.

There is sold, besides, enormous quantities of tapioca into the preparation of which not an atom of cassava enters, but which consists simply of potato-starch. This is a falsification which the consumer may readily recognise. The grains of European tapioca are, in fact, more regularly rounded and whiter than those of genuine tapioca. Besides which, however well purified it may be, the spurious tapioca always keeps, more or less strongly, the characteristic odour of potato-starch.

The Cassava plant is a shrub with tuberous roots, which sensibly call to mind those of the dahlia. Two sorts are distinguished—sweet cassava and bitter cassava. The tubers of the latter—(*Manihot utilisima*)—the most useful, contain a poisonous principal (hydrocyanic acid) which makes their use dangerous in the raw state, but which in the preparation of starch is caused to disappear completely.

[Hydrocyanic acid being volatile, completely disappears on the application of heat, as in baking or boiling.]—*Translator.*

In preparing cassava the pulp of the tubers is rasped, and the material is soaked in water. The sediment which is formed at the bottom of the water, when collected and dried, is the cassava-starch of commerce. It is employed as a food-stuff, either as the *pulp* itself or as *starch*, properly so-called.

The grated pulp, washed and dried, is known under the name of cassava-flour or *farina* when it has been heated and pounded. Cassava-farine replaces bread in the food of the natives. In Guadeloupe, but more especially so in Brazil, it is seen every day, by habit, fancy or necessity, on the table alike of the poorest and of the richest of the inhabitants of the country.

When reduced into small lumps and only slightly heated, it is called *conague*, a native term. When simply grated and dried at the fire in the form of a pikelet or muffin [the *torta* or *bunelo*, of Spanish America] *Tr.*—it is called *cassava*. It is generally consumed under this form in French Guiana.

The starch dried in the open air is known as *cispa* or *moussache*. From this sweetened cakes are made, and other very agreeable dishes and pastry. When slightly damp and grilled upon plates of copper at the temperature of boiling water (100deg. Centigrade) it constitutes *tapioca*. The dregs and residues from the operations of preparation are made use of in producing alcohol.

The cultivation of cassava should be encouraged in our [French] colonies, for its product are sure to find a sufficient market in France. Besides its uses as a food, which are very numerous in form, and which we shall have frequently the opportunity to point out, cassava-starch can be employed in many manufactures:—paper-making, soap-making, in the making of glucose, or starch-sugar, and in making size and adhesive paste.

Let us say, in concluding, that we shall be glad to see the employment of tapioca from Reunion, which yields nothing to any foreign tapioca, and also to see the use of cassava-farine more general amongst us, the reason why their use is not more common being entirely due to simple ignorance of the delicious pastry and the exquisite dishes which can be prepared from these two forms. We shall deal with this subject in future special articles.

Cassava-starch can be made use of in the preparation of all kinds of cakes, just as flour or the common starches. It gives them a particularly agreeable flavour, and greatly increases their hygienic and nutritive properties. One of the best preparations that has ever been made is wheat-cassava.

[Translated for the "Journal" from the French journal *Les Produits Coloniaux dans l'Alimentation*, March 31, 1901, by JAMES NEISH, M.D., Old Harbour.]

N.B.—The author of this interesting communication appears to be a little antiquated in the matter of botanical nomenclature. The name now universally applied by botanists is no longer *Manihot*, but *Jampha manihot*, and it applies equally to both varieties, the sweet sort and the bitter. The old name *utilisima*, applied to the bitter kind, was in respect of its greater *yield*, not greater *usefulness*.—J.N.

[The real Farine is not powdered. It is simply the grated pulp of Bitter Cassava, with the juice pressed out; the pulp being then spread on an iron pan, not hot enough to burn it and make it stick to the bottom of the pan, but with enough heat to dry it; and, as the mess is kept constantly stirred and turned over, it falls into various degrees of coarse and fine granules, like biscuits ground into a rough meal.]—*Ed.*

CASSAVA.—Almost in every issue we endeavour to direct attention to Cassava and its preparations, more especially the dry meal we call here Farine. In the further article on "Cassava" published in this issue, translated from the French by Dr. Neish, it is shown that Cassava and its products are much used in French colonies not only in the West Indies, but also those in the Indian ocean. The Curator of the Botanical Station at Belize writes in the "Journal" for June, the Cassava is the chief food of the Carib Indians of British Honduras who are the hardiest, healthiest and strongest lot of people in the country. The Indians of Colombia who perform tremendous journeys among the mountains carrying immense weights, subsist largely on Cassava or Yuca as it is there called; so do the Indians of Guiana; while the Mendioca and Farinha (Cassava and Farine) are the chief support of the labouring people along the river Amazon, whose strength and endurance, on scanty portions of farinha and fish, and nothing else save pacovas or plantains have been the marvel of travellers in these regions. Yet withal, Cassava and its preparations are much neglected as food in Jamaica. Notwithstanding the precarious state of poverty much of our population is in at present (and the people

-APROPOS OF CASTILLOA TUNU
HEMSL. AND OF OTHER NEW
CASTILLOAS.

(Appeared in the "Journal d' Agriculture Topi-

cale" of 31st August 1901).

[EDITOR'S NOTE.—We draw the special attention of our readers to the letter from Mr. Eugene Poisson, printed below. Mr. Poisson has been good enough to respond to the appeal we made, in our July number, to his zeal in the cause of science; we are most grateful to him for it.

With regard to the facts Mr. Poisson gives on the origin of his specimens of *Castilloa Tunu* HEMSL., details are so absolutely precise that no doubt whatever remains as to the difference existing between the had *Castilloa* of KOSCHNY, called TUNU by the inhabitants of the valley of San Carlos, and the *Castilloa Tunu* HEMSL. of the San Jose country and of British Honduras, sold by Mr. GODEFROY-LEBEUF.

To discover what exactly the TUNU of KOSCHNY is, we must have a little patience; the Berlin botanists will perhaps tell us shortly.

The letter of Mr. E. Poisson contains two other hints of great practical value; the first is as to the varieties of the *Hevea brasiliensis*. On this head the observation of our correspondent, made at Para, has just found confirmation in an analogous remark made on the cultivated *Hevea* by Mr. Derry in the Malay Peninsula; we will again refer to it in our September issue of the *Journal d' Agriculture Tropicale*. The second observation in Mr. Poisson's letter refers to the remarks of his father and of Mr. Jules Guerin upon a *Castilloa* giving a fishy extract, which is met with in Guatemala. Planters will be indebted to Messrs Guerin and Poisson for letting them know of this "LIGA," for which the place in botany has yet to be determined, and they will know they have to beware of this *Castilloa*.

Unfortunately, to be able to avoid a species, one must know it well, but a precise and useful description of a plant can only be given when it has been duly classed in the botanical hierarchy; and that is what is now being done at the Museum of Natural History in the matter of the *LIGA*. (Signed J. Vilhouchevitch.)]

Paris, 12th August, 1901.

Dear Sir,—In reply to the article "GOOD AND BAD CASTILLOA" contained in No. 1 of the *Journal d' Agriculture Tropicale*, in which you are kind enough to mention, may I offer you the following reflections:—The botanic and economic study of the genus *Castilloa* is far from being exhausted. This is as much the case for this genus of Artocarpaceae as it is for the *Heveas*, of which the numerous species are not yet disentangled in any satisfactory manner, in spite of the ability and the ceaseless labours of Mr. BOTTEG HEMSLEY. This savant has set himself to elucidate the question of the *Heveas*, the *Castilloas*, and the *Sapinds*, the three principal American genera producing caoutchouc.

Many other sorts of plants are cited in the books as yielding a utilisable latex, but a great number have not been studied at close quarters; many calculations will be upset when well-conducted experiments have been made.

As to what bears upon the *Castilloa* of Costa Rica, which I know a little, I have not heard Mr. PITTIER DE FABREGA say that there are other species, and I myself have only seen one kind of tree, the *C. Tunu*. It is possible that elsewhere, on the Pacific slope for instance, there may be *Castilloa elastica* and perhaps other species besides, since Mr. HEMSLEY has just published a new *Castilloa C. australis*, in *Hooker's Icon. Plantarum* (February 1901) of the Peruvian region.

Of the *Tunu* I have brought back

- (1) Branches bearing fruits taken by me from the trees themselves;
- (2) Herbarium specimens, in Flower, given me by Mr. PITTIER. These materials have been sent to the Museum of Natural History.

At my request, some fruit-bearing receptacles have been sent to Mr. B. HEMSLEY, the learned curator of the Kew Herbarium, who I knew wished to complete his description before the publication of this *Castilloa*, which until then had only been remarked in British Honduras. A little time afterwards, my father inserted a note in the *Bulletin du Muséum* 1900, (p. 137) on this new plant, and shewed, at one of the monthly reunions held in that establishment, a fine specimen of the caoutchouc furnished by it. After a testing carried out by Mr. Lamy Torrilhon, this caoutchouc was valued as first quality. At the same time, my father soon regretted having misunderstood a page of the *BULLETIN OF MISCELLANEOUS INFORMATION*, of Kew (June 1895), which he would have cited, and in which Mr. Hemsley gave the history of the *C. Tunu* before his publication. Already Sir J. Hooker in (*Transac. Linn bot. ser.*, 2, II, p. 212) had spoken of this *Castilloa*, which to him appeared distinct from the *C. elastica*; Mr. ROWLAND CATER would have confirmed him in this idea, but there was a doubt on the point, and the uncertainty could not end until samples complete and in good condition could be had. Thus it has required long years for a full knowledge of this species. If I have dwelt on this point, it is in order to shew what perseverance is necessary to clear up questions of this kind; they are liable to remain indefinitely in obscurity without sustained efforts made. The geographical area of the *C. Tunu* is thus very extensive, relatively for it reaches from British Honduras to Costa-Rica; perhaps even going further yet to the south. We must not forget that in the identification of botanical species trouble often arises from the fact that popular names vary from one region to another; at times these local names are different in one and the same country. Thus, in Honduras, the *C. Tunu* has two or three distinct trivial names; in Costa Rica it is called ULE MACHADO in the district of San Jose, and perhaps something else on the western slope of that State.

As to what relates to the work of Mr. KOSCHNY, I think it ought to be taken into consideration, but without going further until the sorts, varieties or species of which he speaks are clearly distinguished botanically. It is besides quite possible that there may be a correlation between the abundance or the quality of the latex of these different *castilloas* and the appreciable organographic characters of each of them. This fact would accord with what I have seen in Amazonia in certain races of *Hevea*, mentioned in the Report I am preparing for the Minister of Public Instruction. Another interesting observation on the *Castilloa*, which I have from my father, Mr. Jules Poisson, is as follows:—Mr. JULES GUERIN, commissary-general for Guatemala at the Universal Exhibition of 1900, had brought herbarium specimens of two *Castilloas*, with samples of latex. One of them, recognised as being the *C. elastica*, gives a latex coagulable as is customary in that species. The second, called *C. Liga*, produces a milk which will not coagulate or gives a useless material. Nevertheless, the herbarium specimens are hardly distinguishable by the most experienced observer. The *Liga* has the leaves a little less silky, the tints a little less clear, but are these characters constant? One can understand how, in practice, mistakes are easy, since the collectors mix without noticing the two latices, whence irreparable damage to the gathered material when the labourers come upon the bad kind of *Castilloa*. The herbarium samples are unfortunately unaccompanied by flowers and fruits, which perhaps would decide the question. We must only wait until Mr.

J. Guerin, who directs the Central Chemical Laboratory at Guatemala, sends more complete materials so as to determine the point. It follows from these facts that it is prudent to maintain a reserve when treating of a subject such as the botanic determination of economic plants; and otherwise one runs the risk of spreading errors and often even leading colonists into ruinous enterprises.

I am &c.

(Signed) Eug. POISSON.

CASTILLOA TUNU HEMSL.; DOES IT CONTAIN CAOUTCHOUC?

(Appeared in the "Journal d' Agriculture Tropicale" of 31st October, 1901.)

We have already given upon this question, in our July issue, a note entitled "Good and Bad Castilloa" extracted from a recent German monograph by Mr. Th. F. Koschny, also a reply by Mr. Godefroy Lebeuf; in our No. 2 (August), a Note by Mr. Eugene Poisson. Today we are in receipt, on the same subject, of an article by Mr. H. Pittier, and a letter from Mr. Th. F. Koschny which we will publish as soon as possible hereafter. We add to this an extract by Mr. Pearson, completing the indications of Mr. Koschny.

We are very fortunate to have elicited this series of communications.

It is impossible to draw any immediate conclusion from it, the contradiction of the two opinions being absolute, and one of the parties to the debate being absent; for Mr. Eugene Poisson has just resumed in Dahomey the sequel to his economic and agricultural exploration of last year, and from now to his return to Europe, we must not count upon him.

Be that as it may, it is already something to have fixed the point at issue; the "Journal d'Agriculture" can take this much credit to itself.

As for giving the final solution of the question set, that is not within our competence; it is not to be reached by any retrospective discussion; we must have new materials and fresh researches on the spot. For this reason we propose to close the discussion at this point, and not to go back again upon *Castilloa Tunu*; at least not until the botanists of the Botanic Garden at Berlin have pronounced upon the specimens of Mr. Koschny. As soon as their specific determination has been made, we shall hasten to let our readers know of it.

The best way to disentangle these vexed questions would be to send to America a professional botanist, whose mission would be to study on the living subject, in their several countries, the different species, forms and varieties of the genus *Castilloa*. He must have in view this sole object, and be in a position to devote a sufficiently long time to it.

If people were willing to assign to the botanical study of the *Castilloa* one-hundredth part of the money invested up to now, more or less blindly, in its culture, there would be the wherewithal to organise a very complete mission of research.

What we are asking to be done for the *Castilloa* is what the Germans are this moment doing for the *Hevea*; the initiative being due to Dr. K. Schumann, Conservator of the Botanic Museum at Berlin; the money having been furnished by Mr. Witt, a merchant at Manaos, and Dr. H. Traun, a manufacturer at Hamburg.

The botanist appointed in the first place by these gentlemen, Dr. Kuhl, having succumbed to yellow fever before he could enter upon his campaign, he was replaced by Dr. Ule, assistant-director of the Botanic Gardens of Rio de Janeiro. The *Notizblatt* of the Berlin Botanic Garden (issue for July) gives a first report from this savant; at the present moment it can be affirmed that the practical results, as regards the culture of the *Hevea*, will be most important.

The genus *Castilloa* deserves to be taken up a fresh on its own account in its own environment, both in the botanic and the economic sense; at the stage now reached, this work can only be carried out to advantage on the spot.

This is the only conclusion we would draw from the debate on the *Castilloa Tunu*.—THE EDITOR.

THE CASTILLOAS OF COSTA RICA.

(By Mr. H. Pittier; Director of the Physico-Geographic Institute of San Jose de Costa Rica.)

Under the title "Good and Bad Castilloas" the first number of the "Journal d' Agriculture Tropicale," publishes a short article which, we regret to say, will hardly contribute to clear up a question in itself quite entangled enough.

Castilloa plantations existing in Costa Rica.—There is no plantation of *Castilloa* in Costa Rica over twenty hectares in extent or three years of age. The only old experiment, dating some fifteen years back, has been a regular failure as such. The plantation referred to is "La Pepilla," in the plains of Santa Clara, a plantation exploited by me in 1899 on behalf of the United Fruit Co.; in spite of its age, it has never produced more than the absurd quantity of eight grammes of dry caoutchouc (*burrucha*) per tree (average of 1,500 trees fit for tapping.) Our friend Mr. Eugene Poisson visited "La Pepilla" along with us, and can confirm what we say of it. Moreover, the example of "La Pepilla" is not conclusive; the land chosen (about 20 hectares) was detestable for the most part, marshy in some places and too clayey in others. After some years the plantation was invaded by a grass forming a carpet, a very bad thing for the *Castilloa*; then later on they turned cattle loose to pasture on it, a much worse thing, for the trampling of the soil is fatal to trees whose roots are so superficial. In spite of this by no means encouraging experiment, other enterprises have been inaugurated during these latter years, one at Las Lomas, in the valley of Reventazon, another near Jimenez in the plains of Santa Clara, a third near Las Canas, on the Pacific slope. There are perhaps some others, but all are certainly recent and the total of conclusive experiments they can bring towards the solution of the problem of *Castilloa* culture is consequently very low.

A thoroughly trustworthy person, a landowner at San Carlos and familiar with that region, assures me that he does not know of any plantation or *Hule*, old or new, except a few recent attempts the extent of which does not exceed half a hectare. By what has preceded this, I do not at all mean to dispute the very real advantages the valley of San Carlos possesses for the cultivation of *Castilloa*. On this point I am quite in accord with Mr. Koschny, and I believe that in no part of Central America can the cultivation be undertaken with better prospects of success. *Castilloa* abounds there in its natural state, and develops in a manner truly marvellous, but as to all that concerns its cultivation, past experience remains *nil* or next to it.

The question of Species.—Turning to the question of species of *Castilloa*, as far as I know, the four following have been described up to now:—(1) *Castilloa elastica*, Cerv.—Found throughout Central America. It is undoubtedly the predominant species in Chiapas, Soconusco and a part of Guatemala. (2) *Castilloa Costaricana*, Liebmann.—Gathered for the first time at Turrialba Costa Rica, by Oersted. (3) *Castilloa Markhamiana*, Markham.—The species of the isthmus of Panama, or Darien, and probably of the whole area of dispersion of the genus throughout South America. May it not have been to this species that the *C. australis* cited by Mr. Godefroy Lebeuf belongs? A species cited without name of the author (p. 20 of the 1st No. of the *Journal d' Agriculture Tropicale*.) 4) *Castilloa*

Tunu Hemsl.—The *hule macho* (not *Machado*, as Mr. Poisson writes it), or *hule colorado* of the Costaricans. *Macho* means male. *Tunu*, and in some cases *tanu*, is the Mosquito name of this species.

This is not the place to discuss the value of the three first species, which are distinguished one from another by characters drawn from the carpels and other parts of the organs of fructification. We will say but one thing, and that is that all the specimens of *Hule* gathered during the botanic explorations of the Physico-geographic Institute, directed by us in 1888, correspond with the description given by Liebmann of his *Castilloa Costaricana*. This certainly does not exclude the presence in the country of the *Castilloa elastica*, Cerv, which besides cannot well differ specifically from the foregoing; if this last hypothesis is not confirmed, the presence in Costa Rica of the species of Cervantes remains yet to be proved. We will say the same of the *C. Markhamiana*, a species equally doubtful and to be studied anew.

Castilloa Tunu, Hemsley.—As for *Castilloa Tunu*, it is a species absolutely distinct from the foregoing, described recently by Mr. Hemsley, if we mistake not, from samples collected by us personally, in March 1898, in the valley of the Diquis, on the south-western slope of Costa Rica, and distributed by the Physico-geographic Institute under the No. 12,051. The original label, accompanying the examples from the National Herbarium of Costa Rica, says they come "from a tree abounding by groups in the region of Diquis, attaining a height of 8 to 12 metres, and distinct at first sight from other *Castilloas* by its coriaceous, glabrous, sharply entire leaves, and by its female receptacles being very small, and flanked by seeds of which the glabrous envelope shews from three to six sutures keeled." Among the specimens now before us, there is one bearing three cupules with seeds, answering to the description above, with a solitary male receptacle near the end of the branch; two other pieces of branch only present male flowers of which the receptacles seem mostly twin, as in the other species.

Lastly, we are in a position to state that Mr. EUGENE POISSON, to whom we have made a present of a part of the samples mentioned above, has taken away from here neither the milk nor the caoutchouc of the *Castilloa Tunu*. There has simply been a lamentable confusion of names and specimens. The milk carried away by Mr. EUGENE POISSON, drawn by us together, is that of the *HULE* proper (*C. Costaricana*), at "LA PEPILLA"; the specimen of gum of which Mr. Godefroy Lebeuf speaks, was extracted from our own gatherings, and from the same species in the plains of Santa Clara. Some botanical specimens, of which Mr. Poisson has taken away a portion while the rest figures in our herbarium and has been distributed under the number 13,429, were gathered at the same time and place as the milk, and can in no way be confounded with the *Castilloa Tunu*.

The latter, which has not been reported with certainty until now on the Atlantic side of Costa Rica, gives, it is true, an abundant milk, but the rubber drawn from it gets brittle and falls to powder in a very short time. In the New York market it is said to have been quoted, a few years ago, at from 12 to 14 cents, a price so unprofitable that the exploitation of this species has been completely abandoned.

Opinion on the species noted by Mr. Koschny.—As for the new species or varieties of Mr. Koschny, I cannot make up my mind to give them a botanic value; the distinction through the colour of the bark, by which he is guided, is insufficient.

I am convinced that we have here to deal with no more than individual differences, the result of immediate environment and changing with its conditions.

(Signed) H. PITTIER.

[Note by the Editor. We must bear in mind that Mr. Koschny has taken care to send herbarium specimens to Berlin; the only thing to be done is to await quietly the decision of the botanists charged with their examination.]

APROPOS OF THE ARTICLE: "GOOD AND BAD CASTILLOA."

(A letter from Mr. Koschny.)

Mr. Koschny, who is one of the oldest colonists of San-Carlos in Costa-Rica, like all educated Germans, reads French, but is not well enough acquainted with it to write articles in that language; his letter is therefore written in German; we will summarise its contents.

USELESSNESS OF THE GUM OF THE TANU.—Mr. Koschny maintains that the latex of the *Tanu* only furnishes a hard gum, brittle and devoid of elasticity; he is convinced that his *Tanu* is really the contrary to Mr. *Castilloa Tunu*, HEMSLEY. Let us leave the professional botanists to settle this point after comparison of the herbarium specimens.

The *Tanu*, Mr. Koschny writes to us, is abundantly represented on the Mosquito Coast, but it exists also on the Pacific. The name is reserved expressly for the trees of which the gum is brittle. The reputation of this gum is so atrocious that the merchants of New York refuse the "Sheet Rubber" of Nicaragua in spite of its cleanness and careful preparation; and this is simply from fear of coming upon goods falsified by the latex of the *Tanu*. Indeed the preparation of the sheets makes this falsification possible, while it cannot be effected in the case of "scrap" (*Castilloa* caoutchouc coagulated spontaneously on the trunk itself or at the foot of the tree.)

Everyone in this country, says Mr. Koschny, knows the evil repute of *Tanu* gum; the French Consuls at Panama and Bluefields can, if necessary, certify to the fact.

We sincerely thank Mr. Koschny for having given himself the trouble to pick out what appeared to him inexact in our article of July. We hope he will do so again whenever he meets with, in the *Journal d'Agriculture Tropicale*, any question falling within his competence. We have no preconceived opinions whatever, and far from evading discussion we invite it, so long as it keeps inside the field of fact.

INDUSTRIAL USES OF TUNU ACCORDING TO MR. PEARSON.

What Mr. Koschny says of the stuff known in commerce under the name of *Tunu*, is quite in accordance with the information to be read in the volume "Crude Rubber and Compounding ingredients" of Mr. Pearson, Editor of the *India Rubber World*, the great New York caoutchouc review; here is the text in question:—

"*Tunno*, *Toonu* or *Tunna*, is a name of uncertain origin, applied in commerce to designate a caoutchouc gathered chiefly in Nicaragua and Honduras. . . . Its coagulation is effected by heat. The rubber obtained has but little elasticity; it becomes very fishy when heated; its selling price is low. It is used in the making of pencil erasers, and, mixed with *balata*, in the manufacture of driving belts.

"Sometimes this rubber is sold under the name of "Seiba Gum," after it has been made to lose its natural appearance by a laborious soaking under water. The true caoutchouc of Nicaragua is sometimes adulterated by the addition of *Tunu*, just at the moment of coagulation; this mixture makes the rubber lose in a short time its suppleness and its industrial qualities."

THE FERMENT OF THE TEA LEAF, AND ITS RELATION TO QUALITY IN TEA.

BY HAROLD H. MANN, B. Sc.,

SCIENTIFIC OFFICER TO THE INDIAN TEA ASSOCIATION.

From the commencement of the manufacture of Black Tea in India the nature of the process of fermentation, which plays such an important and essential part in the manufacture of tea, has been a subject of controversy. In the years before 1880 for instance, a most energetic discussion took place.* On the one hand it was contended, and with good show of reason, that the process was merely one of incipient putrefaction. On the other, with equal vigour and with equal reasonableness, that the result obtained was entirely independent of any tendency to rot and, though it might run parallel with it, was an entirely independent process. Inasmuch as all these views were based entirely on speculation, and were put forth without an attempt even at a microscopic examination of fermenting leaf, they naturally led to no better understanding of the question.

MR. BAMBER'S EXPERIMENTS.

The investigations of Mr. Bamber were, in fact the first of any importance on the subject, and he has remained practically ever since the standard, if not the only, authority on the subject. His investigations, which it is well to recall, led him to make certain experiments, the following account of which I quote from his "Chemistry and Agriculture of Tea."†

"The following experiments were made in Assam to determine whether the changes, which take place during the process, were due to the presence of either an organised or soluble ferment or merely to oxidation:—

1st.—Freshly rolled leaf was placed under a receiver, and the air exhausted as completely as possible. Little or no change took place, and the leaf at the end of 24 hours was still a dull green colour, with a little brown colour on the stems. Admission of air or oxygen at this period had no effect on the colour, probably owing to the comparatively dry condition of the leaf.

2nd.—In this experiment the air was exhausted as before, and pure dry oxygen gas admitted; in half an hour the leaf had attained a bright coppery colour, and in two hours the whole of the leaf was a uniform dark red, and had gone beyond the stage required for ordinary manufacture. Duplicate experiments were made of the above with similar results, and in each case a sample of the same leaf was treated in the usual manner for comparison with the experimental leaf, the flavour of the teas treated with oxygen gas did not differ from the ordinary teas, but the infusion had a brighter appearance.

3rd.—The rolled leaf was treated in vacuo with pure carbonic acid, which is an inert gas, with the result that at the end of 5½ hours it was still a dirty green colour, while a sample treated in the usual manner attained the required colour and condition in 3 hours.

4th.—The leaf was exposed to a limited supply of air and even after 20 hours was still of a greenish colour, and the tea manufactured from it was very pungent, showing that little of the astringent properties had been destroyed.

5th.—The rolled leaf was treated with dry steam at a high temperature for a few minutes, and was then treated as usual, when it attained a good bright colour.

6th.—The rolled leaf was treated with air and oxygen gas, which gave a bright colour; the liquor was flavoury, but not very pungent, and infusion bright.

"All the above experiments tend to show that the change in the leaf in the so-called 'fermentation,' is due to oxidation. Microscopic examination has failed to show any organism; and the fact that the change will take place in an hour or less from the breaking of the cells is, I think, conclusive evidence that it cannot be due to the development of living organisms."

These experiments, thus reported, formed an enormous advance on the preceding condition of ignorance on the question. But yet on careful examination it will be seen that Mr. Bamber's conclusions were not quite justified by experiment. In one case he has since* withdrawn from the position he then took up, and has himself announced the discovery of an oxidase or soluble ferment to which he now ascribes the changes occurring during fermentation. He announced this last discovery in the following words:—

"Quite recently I have succeeded after numerous attempts in isolating a minute proportion of a soluble oxidising ferment, somewhat similar to the oxidases recently discovered in several plants of different natural orders. The substance in question, which evidently has a considerable bearing on the oxidising properties of the tea, apparently does not exist in the active form in the fresh green leaf, but is changed either during the withering, if the leaf is bruised, or during the rolling processes when the various organic acids, etc., are liberated from the cells.

The discovery here made has been confirmed by one or two independent observers since the time.†

In another point Mr. Bamber was also in error in the views expressed in 1893. He states that he found no living bacteria or other organisms on the fermenting leaf, but I have never been able to find tea during this process on which a comparatively large number of organisms could not be found. Whether they have any part in the process is another question, but they are in evidence on every sample which I have examined.

FERMENTATION AT A HIGH TEMPERATURE.

But assuming that the conclusions are in general correct, certain results would naturally follow. It would seem likely that a high temperature would be the best and quickest for fermentation, since oxygen is then most active and the action of stray microbes would be entirely eliminated above a temperature of 110° F. It therefore seemed advisable to try whether fermentation would proceed normally and correctly if the mass were raised above that temperature. Two samples of rolled tea leaf were therefore taken, one fermented at ordinary temperature (73°-74° F.), and the other, with due precautions that no drying of the leaf took place, at 120° F. As a matter of fact to all appearance, both coloured normally, that at the higher temperature a little more rapidly. When apparently ready both samples were fired in the same way, and the tea examined. In the result it was found that the hot fermentation gave a slightly lighter, but a little duller liquor. It had a tendency, though not a very marked one in the present case, to be soft to the taste.

So far, however, the result is in conformity with the idea that bacterial action could have nothing to do with the operation, seeing that no organisms could be active at the temperature employed, and yet a fermentation, not quite normal, certainly, but nearly so, could be carried out.

OXIDATION BY CHEMICALS.

It might, however (still on the basis of the above assumption that oxidation by contact with oxygen gas is all that takes place), be possible to assist the action by some substance energetic in giving

* See Tea Cyclopædia, p. 211.

† Calcutta 1893.

* Report on Ceylon Tea Soils, Colombo, 1900.

† See Also Bull. Roy. Agricultural College, Tokio, 1901, &c.

oxygen to any body with which it was mixed. Two such substances, both of which could not damage the tea were therefore tried. These were Hydrogen Peroxide and Permanganate of Potash, either of which could be bought, were a demand to arise, at a comparatively cheap rate.

With Hydrogen Peroxide 4 oz. of a "one volume" solution was added to 2 lb. of leaf just from the roller, and fermentation allowed to proceed. After 45 minutes the lot of leaf treated was distinctly brighter in colour. The fermentation was considered complete in each case after 1½ hours, and both were dried in the same manner. I sent the teas to an expert taster who was good enough to make the following report:—"I give preference to 'B' (without Hydrogen Peroxide) samples which have much better appearance than 'A' (with Hydrogen Peroxide) and have more body. On the other hand 'A' samples have fine Darjeeling flavour, and almost perfect infusions. They only want a little more body in the cup, and less greyness in the dry leaf to make them very desirable teas." Eliminating all reference to the appearance of the dry leaf, it appears that the addition of an oxidising agent had little effect on the quality. A repetition of the experiment gave the same result."

In similar manner Permanganate of potash was added to another lot of rolled leaf (4 oz. of 1 per cent. solution to 3 lb. of leaf) and on drying after being fermented for the same time no difference could be detected in color of liquor, taste, or pungency.

The mere addition of Oxygen in an active form was therefore not capable of making the fermentation go either perceptibly more quickly, or more evenly. This would afford, were it needed, strong evidence against any theory of mere oxidation as explanatory of the changes which undoubtedly take place.

BACTERIA IN TEA FERMENTATION.

Though the first experiment above described appeared to have eliminated the possibility of bacteria being the cause of the changes, another effort was made to isolate such as were present, and likely to be of any importance, so that one might then ascertain whether they had any influence on the fermentation of rolled tea leaf. This was done by grinding up some fresh tea leaf to a pulp, then sterilising it by means of steam, and finally introducing into it a piece of fermenting tea leaf. After two days it was evident that growth of some organism was taking place, and on examination this was found to be a small rod-shaped microbe. I only succeeded in isolating this one type of organism from all the cultures that I made, but it was nevertheless invariably present. After a second culture in tea juice, freshly rolled tea was inoculated with this microbe, and allowed to ferment. After 1½ hours the tea was sour, while a check lot of rolled leaf to which nothing had been added was fermenting normally. This, I think, therefore, finally sets at rest the question as to whether actual living organisms play a part in the ordinary fermentation of tea. Though they are present always, they are present as impurities, and have nothing to do with the action which it is desired should go on, and they should be eliminated, so far as is possible, from the fermenting leaf, and the fermenting house.

FERMENT OF THE TEA LEAF.

But nevertheless there must be some active cause in the tea leaf which causes the production of the desired colour and flavour, especially as we have shown that oxygen alone is not capable of producing the effect. And this cause is the presence of a representative of a class of ferments—not actually living but always produced by living cells,—the discovery of which in tea was, for the first time, as stated above, made by Mr. Bamber in the early part of 1900. These "unorganised ferments" or "enzymes" as they are

termed have been discovered in recent years to play a most important part in many operations where their presence previously had been hardly suspected. Taking the "oxidases," for instance, the class of enzymes which is active in the case of tea, it has been shown that ferments of a similar type also take a principal part in the production of Japanese lacquer,* and further, as has been still more recently discovered, in the curing and fermentation of tobacco.†

(To be concluded.)

THE RUBBER PLANTING SITUATION IN MEXICO.

(To the Editor of the India Rubber World.)

Regarding rubber culture in the Soconusco district, state of Chiapas, Mexico, I desire to say in the first place, that on the low lands of said county, and down near the Pacific coast, the rubber tree grows wild in profusion and in many instances is found of enormous sizes. On the "San Carlos" tract, for example, belonging to Mr. Alejandro Cordova, of Tuxtla-Chico, Soconusco, there are rubber trees which cannot be less than fifty years old, having a diameter of seven feet, and the space shaded by the foliage a diameter of at least seventy to seventy-five feet. Similar trees can be seen at the "Jesus Maria" tract belonging to Mr. Richard Bado, of Tapachula; on the different properties of Mr. Porfirio Aparicio, Tuxtla-Chico, towards the Guatemala frontier; and on "Los Cerros" and "Santa Isabel" tracts belonging to the Escobar family, also of Tapachula.

Now, as to the cultivation of the rubber tree in the same district, enough has been written lately to demonstrate that its returns provide plenty of margin for contingencies. I hereby give you some data in reference to this industry, the truth of which can be also easily verified.

In 1871 Romolo Palacios planted over 100,000 rubber trees in connection with cacao on the tracts "San Antonio" and "Pumpapa" of his property, about five miles distant from Tapachula, and near the seaport of San Benito, in the district of Soconusco. These trees have been gradually reduced in number by reason of forest fires until probably only about 6000 remain. The owner of the property, dying about ten years ago, left it to his son Teofilo Palacios, who now manages the estate. The rubber trees are tapped every year, and some of the product has been shipped at various times to New York, to Marquardt & Co., and W. Loaliza & Co.,* and to London. I have never seen the trees tapped, but from what I have seen in the district I should say that trees of the age mentioned should yield readily at a single tapping 10 pounds of milk, which will afford 4 pounds of dry rubber per tree.

In 1872 the late General Sebastian Escobar, a well-known agriculturist, thoroughly acquainted with the nature of the Soconusco lands, and enthusiastic in the matter of agricultural progress, planted over 1,000,000 rubber trees on his properties called "Los Cerros" and "Santa Isabel." These trees were also planted in connection with cocoa, at a time when the Mexican government was seeking to encourage

* Bertrand, 1894 and 1895.

† Oscar Loew. Bulletins of the United States Department of Agriculture, 1899-1901.

* It seems proper to state here that Messrs. Marquardt & Co. and also Messrs. Loaliza & Co. advise THE INDIA RUBBER WORLD that no rubber which they may have received from Mexico at any time has been described to them as being the product of planted trees.—THE EDITOR.

the planting of rubber by the payment of a premium or bonus. It was also at the time that an interest in rubber planting was being stimulated by Mr. Matias Romero. This plantation has also been frequently ravaged by fires, particularly such as result from the annual burning of the old grass to make the new growth more available for the cattle. Grazing, by the way, is the chief interest on this estate, and little attention really has been given to rubber. There are now perhaps 75,000 of the original trees standing, and from these more or less rubber is taken every year which reaches the agents of the Escobar estate. A greater amount, however, is probably stolen by neighbouring Indians. The rubber from this estate is sold in the Tapachula market, lots having been taken at different times by William Henkel & Co. for shipment to Hamburg, O. H. Harrison for London, and Louis Tomelen & Co. and others for Hamburg and New York. The "Santa Isabel" property is about $6\frac{1}{2}$ miles from Tapachula, and the "Los Cerros" property thirty-six miles distant, near Guatemala.

In 1873 the late Mexican ambassador to the United States, Mr. Matias Romero, started, on the "Suchiate" tract of his property a plantation of over 100,000 rubber trees, and, as for political reasons he was compelled to abandon the property, when the trees planted grew large enough to yield rubber, they were tapped by the natives and nearly destroyed, but still there are many of them growing and yielding rubber to show what a cultivated tree will produce. This tract consists of 14,868 acres, about three miles from the port of Ocos beyond the Guatemalan border, and sixty miles from Tapachula. It is owned by the wife and sons of Mr. Romero, whose agent is Ricardo de M. Campos, collector of customs at Tapachula. Perhaps 2,000 or 3,000 pounds of rubber are sold each year through Heury Pincon, of Tapachula, who represents some English firm in handling the cedar wood which is the principal article of export from the estate.

In 1883, Mr. Rafael Ortega planted at "Los Carritos" over 50,000 rubber trees which can be seen while going by the country from San Benito to Tapachula. This is a sugar cane estate, devoted to the making of rum for consumption within the country. The trees were planted in the open, bordering on both sides of the road, and probably 40,000 are still standing. Naturally all of the original planting would not survive, besides which some of the trees have been injured by the crowding of wagons when forced out of the regular roadbed by its bad condition in the muddy season. Mr. Ortega was a large coffee planter on another estate owned by him, and, getting into financial difficulties, was obliged to surrender all his properties, including that on which these rubber trees stand, to a German house, on account of advances made to him, and who are represented at Tapachula by the import and export firm of Louis Tomelen & Co. The rubber gathered from these trees is shipped to the various connections of the house of Tomelen.

In 1898, Mr. Ferdinand Nehlsen started in planting rubber trees on the "Ulapa" tract of his property, where there are many wild rubber trees. He has to-day over 1,000 plants handsomely growing. These trees were planted in the open in the grass lands, such as are maintained for grazing, which is the principal interest on this estate. The estate is near the Indian town of Excuintla, about 28 leagues from Tapachula.

In 1899, La Zacualpa Rubber Plantation Co. planted over 30,000 rubber trees, to duly appreciate the development of which they must be seen personally. This company is already tapping cultivated trees, which were planted by the former owner of said "Zacualpa" tract, to shade his cocoa plantation, some twelve years ago, and during the last year has planted over 500,000 young rubber trees.

The Soconusco Rubber Plantation Co., organized by me and incorporated under the laws of California, October 16, 1900, owns 17,858 acres, with over 5,000 wild rubber trees yielding gum, and intends to transplant from its nurseries this year as many young trees as possible to enhance its production.

What precedes is sufficient in my opinion to demonstrate incontestably the possibilities of rubber culture in the Soconusco district, and persons who are interested in this important source of wealth, if considering the matter seriously, will find out that the industry has long since passed the experimental stage in Soconusco, and today there are many companies and individuals gathering and shipping rubber from wild and cultivated trees, or selling it in the Tapachula market.

The time required to produce gum from the *Castilloa elastica* rubber tree depends upon the locality, rainfall, and methods used for its cultivation. My estimates of production and tapping age are based upon my personal experience and close observation, and not upon what others have written. The cultivated rubber tree blossoms after the sixth year, and cannot be tapped before this time without injury. The rainfall of the previous year generally determines the earliness of the season, the number of the blooms, the quality of the seeds, and the flow and quality of the milk itself.

The sap furnished by a seven year old rubber tree should yield a minimum of $1\frac{1}{2}$ pounds of pure rubber, and as every tree increases its yield by no less than half a pound of gum annually until its twenty-fifth year of age, at least from 15 to 20 pounds of pure gum should be obtained yearly there after during the life of the tree. So an acre of land containing 220 rubber-trees planted 14 feet apart each way, will give at the end the sixth year—or to be more exact, in the first crop made during its seventh year of existence—330 pounds of pure rubber, which at the rate of 50 cents gold, would give a revenue of \$165. If this estimate of $1\frac{1}{2}$ pounds per tree should not seem conservative enough, let it be one pound to the tree, and the return per acre will be \$110.

The hardiness of the *Castilloa elastica* tree simplifies its culture very much, and as it possesses a vitality superior to that of the weeds or of any other kind of vegetation, it does not require heavy expenses for frequent weeding. If without any help from man such trees can grow for hundreds of years in wild woods full of vines, briars, and many other plants, under cultivation, they can certainly outlive the weeds.

I shall be very glad if the data contained in this letter contributes to its object, which is to increase among agriculturists and business men of enterprising the desire to plant on a large scale fields of rubber-trees in the localities suitable for that purpose.

CHAS. G. CANO, C. E.

New York, June 21, 1901.

[The writer of the above letter has spent nearly ten years in the district to which the letter relates. He went there first, at the request of President Diaz, to reform the customs service at Tapachula. He next became manager of the large coffee plantation "Guatima," of L. R. Brewer, in Soconusco. He was later employed as civil engineer on the line of the Occidental railroad, in Guatemala, after which he became engaged in the importation of Guatemala coffee at San Francisco. He has thus had ample opportunity to study the resources of southern Mexico, and has taken special pains to become acquainted with the prospects for rubber cultivation.—THE EDITOR.]

PROGRESS IN NICARAGUA.

A letter from James S. Nodine, manager of the Manhattan Rubber Plantation, at Bluefields, to the *India Rubber World*, states that on the day of writing—June 21—he gathered seeds from cultivated

Castilloa elastica rubber plants two years old. The plantation, he reports, is showing the most satisfactory progress, leaving no room for doubt as to ultimate success. There are, altogether, about eighteen rubber plantations at Bluefields. Mr. Nodine writes that this year two of the planters in the district will tap their rubber for the first time. On the Manhattan plantation last year some Para rubber seeds were planted, a large percentage of which germinated, and the plants are now growing well. Mr. Nodine has shipped rubber seed from wild trees this year to planters in Mexico.

RUBBER PLANTING IN THE MALAY STATES.

We think that this is a great rubber-growing country, and that if prices only hold there is a lot of money in it. Labor and suitable land are cheap and plentiful, and we have no fault to find with the yield either of *Hevea Brasiliensis* (Para) or *Ficus elastica*, locally known as "Gutta rambong." A certain amount of *Castilloa elastica* has been introduced, but it does not promise well, though apparently yielding large quantities of Caoutchouc, because, having a pithy and very brittle trunk, it is peculiarly liable to the attacks of the worst of our termites (*Termes gestroi*)—a white ant—which thrives on such food, and, commencing from below the ground, eats up through the centre of the tree. Borers, too, attack and destroy the branches. *Kickxia Africana* has been introduced in small quantities, but it is impossible to predict the success or failure of this rubber, as our biggest trees are scarcely more than seedlings yet.

For Para rubber and *Ficus elastica*, however, there seems to be a great future, and any of your friends who are interested in the subject, and who would like to see what we are doing, might do worse than try a run over, with a note from you. I would gladly show them round and put them in the way of seeing all we have to show, and possibly they might think this small corner of the earth, not so bad after all. Rich in minerals, gold, and tin, with a great agricultural future before it, the Malay peninsula will hold its own with many countries better known at present. All we want is money and confidence, and the country will boom like wildfire.

Coffee has gone down with such a rush that many of us have lost pretty well all we have put in it, but we calculate in another three years to be on our legs again with rubber, and fancy that the rise in the sterling value of the *milreis* will knock agriculture pretty hard in the Brazils, while our coinage practically follows bar silver values.—A PLANTER.

India Rubber World.

RHODESIAN REPORTS.

We have received from the British South Africa Company, *Reports on the Administration of Rhodesia, 1898—1900*. It may well be imagined that the effects of the South American war have not yet been fully felt or realised in Rhodesia; still, it is pleasant to hear that, so far, "the principal result of the year which has seen so much disturbance and trouble in South Africa has been to confirm and strengthen the belief of the settlers, and also of the board of directors and the shareholders, in the reality of the resources of the country. . . . In agriculture cultivation is extending, and live-stock is increasing. . . . In Mashonaland many farms are being occupied and worked by Europeans. Locusts disappeared almost entirely in the season of 1898-99, and this happy result is, no doubt, largely attributable to the use of antitoxine. The contentment of the native mind is largely dependent on the excellence of the crops, and in this respect the season of 1900 has been a satisfactory one. From reports received, I [Sir A. Lawley] estimate that the native crops this year have been more abundant than in any year since the occupation of the country. As railway facilities increase for the conveyance of farm produce to the various markets, the development of the agricultural

industry in this country should be ever increasing. Both at Salisbury and Bulawayo most successful agricultural shows were held in May, and in point of quality and quantity the exhibits were remarkably good. Throughout Rhodesia fruit-trees have been imported in great numbers, and many thousands of various kinds have been planted. Perhaps the most interesting experiments that are now being made are in the growing of Coffee in Umtali, and of Rubber in the Melsetter districts. Coffee seeds were imported by the Government from Nyasa; they have germinated well, and the young trees are thriving. Mr. Renwick, of Melsetter, furnishes an interesting report on the possibility of developing a Rubber industry in that country. At present the prospect of successfully establishing such an industry is a matter for conjecture; but there is every reason to hope that Southern Melsetter, from the nature of its soil and its climatic conditions, is a country where this valuable industry may be introduced and conducted on a large scale with every prospect of success." The above sentences are mostly taken from the Report of the Administrator of Matabeleland, Captain the Hon. Sir Arthur Lawley, K.C.M.G. (resigned), and the sentiments expressed in them are borne out by the reports from North-eastern and from North-western Rhodesia, though over so large an area details naturally vary in the different districts. It should be mentioned that the British South Africa Company is now directly responsible for the administration of the following territories:—1, Southern Rhodesia, or the provinces of Mashonaland and Matabeleland; and 2, Northern Rhodesia, or the whole of the British sphere lying between the Portuguese Settlements, German East Africa, and the Congo Free State, with the exception of the strip of territory forming the British Central Africa Protectorate. It [Northern Rhodesia] is divided into two provinces—North-eastern Rhodesia, and North-western Rhodesia. The total population of Southern Rhodesia is estimated at 13,365 Europeans, and 449,901 natives. From the brief notes here extracted, some notion may be gathered of the importance of the book before us which deals with the state and prospects, political and industrial, of our African territories. The reporters seem, on the whole, sanguine that the country is one rich in resources, and with inhabitant, well qualified to appreciate and to develop them.—*Gardeners' Chronicle*, Oct. 5.

INSECT ATTACKS ON TERMINALIA CHEBULA.

The myrobalans of *Terminalia chebula*, commonly called *harra*, being one of the most important minor forest products of this Division, this tree received considerable attention; and the time of its flowering and fruiting and the development of its fruit are duly noted. Last season on the *harra* crop was practically a total failure, and this was caused by (1) the depredations of a defoliating caterpillar and by (2) the attacks of a gall insect.

In July, 1900, *harra*, together with several other trees including teak, *Acogeissus latifolia*, *Adina cordifolia* and *Stephegyne parvifolia*, were absolutely defoliated. I was unfortunately unable to leave headquarters at the time, and I did not succeed in getting specimens of the attacking larvae from the *harra* trees themselves. Simultaneously with this defoliation in the district, however, an equally severe attack was made on the various garden and avenue trees in Jubulpore itself. Larvae clustered on the trees in enormous numbers and teak, *Millingtonia hortensis* and *Albizia Lebbeck* were, among others, completely defoliated. I collected several of these larvae and the moth which emerged from them proved to be *Hyblaea puera*. At the same time as this occurred, the forests in the neighbouring district of Damoh were also attacked by a defoliating caterpillar, and specimens of the insect collected by the

Divisional Officer were subsequently also identified as *Hyblaea puera*. I am therefore inclined to think that this insect is also the culprit in the case of the damage done to harra.

In consequence of this wholesale destruction of foliage, the teak and harra trees were practically devoid of flower and fruit, and the majority of the harra flower which was produced never developed on account of the attacks of a gall insect. In September, 1900, I noticed that the flowering spikes of many harra trees were covered with round bodies of a dark-red colour, bearing a superficial resemblance to the fruit of a species of small fig. It appears that the flowers instead of developing into the usual myrobalans had, owing to the attack of a cynipid insect, merely produced these small galls.

Specimens of the galls were sent by me to the Indian Museum for identification in October, 1900.

The insects which emerged from the galls were pronounced to be chalcids, and were forwarded by the Museum authorities to Mons. Andre, France, for identification. Mons. Andre, however, has been unable to do more than identify the insects as chalcids, and he surmises that they are parasitic on the cynipids which produce the galls. If this surmise is correct, and nothing but chalcids emerged from the considerable number of galls sent by me, it appears that the gall insect is subject to very widespread parasitic attacks in face of which it can scarcely develop to any extent or do any considerable damage. There appears, however, to be a possibility that the chalcids themselves are primarily responsible for the formation of the galls, and it is hoped that further observations and the collection of additional specimens will settle this point which is of considerable importance in harra-producing tracts.—*Indian Forester*

MINERALS IN KUMAON AND GARHWAL.

Many parts of the Himalayas are rich in minerals, but there is hardly a portion of the world which has been less prospected than these mountains. While such out of the way places as Ashantee, the interior of Central America, and even Borneo and Sumatra, have been well examined by prospectors and command lakhs of British capital, the fine range of the Himalayas, which has railways to its foot-hills at many points, has hardly been examined in the least by the Geological Survey of India, much less by professional mining engineers. It is astonishing that so little has been done. Here is an immense range of mountains stretching from Afghanistan and Kashmir through Nepal to Burma, the geological structure of portions of which is not even known. The mountains consist of a great central range of granites and gneisses and crystalline rocks, with nearly 50 miles of lower hills on either side stretching into India and Tibet. Most of this vast range of country consists of formations more or less favourable for minerals. It is about the finest scenery in the world and the climate is excellent, hot for a month of two in summer but always cool at nights and cold in winter. Food is cheap and abundant, and the labour is docile, easily trained and cheap. The writer, who has for eighteen months or more been engaged in mining and prospecting in various parts of Kumaon and Garhwal, has rarely seen a country in which the indications are more promising. As far as can be seen these two provinces are full of minerals. Gold exists in the sands of almost every river, washed down from the reefs in the higher and central ranges. There are alluvial flats in some of the valleys, consisting of sands and gravels, which readily show a good colour in the pan. Some of these gold-bearing rivers take their rise in mountains not more than three days' journey from the

plains. Quartz reefs occur in schistose rocks in many places, and some of these are known to be aniferous graphite of excellent quality, more easily mined than in Southern India, and asbestos, good in colour and long in fibre, is frequently found. Prophyritic granite, associated with much schist is found in parts of Eastern Kumaon, and here true lodes have been observed traversing both the granite and the adjacent clay-state, and containing traces of oxide of tin. Sapphires and other precious stones are sometimes brought down by the Bhotian traders, who frequently come through the passes, driving flocks of sheep laden with borax and salt. Copper and lead have been abundantly worked in the past, and copper-bearing rocks are found all over both Kumaon and Garhwal.

At half-a-dozen places there are most extensive old works covering many acres of hill-side, and there are also mountains which here and there are literally covered with ancient slags, which have been assayed and are sometimes found to contain as much as 2 per cent of copper.

The revenue derived as royalties from the copper ores was pretty considerable, even in the first half of the last century. There is every indication that the copper ores mined before the country was taken over by the British must have been enormous, judging from the extent of old mines. The copper ores occur mostly in limestone formations, often associated with talo slates and schists. Both irregular deposits and true lode formations are met with, some of the lodes being of great size. The ores mined long ago by the natives were mostly green and blue carbonates and the oxides of copper. Sulphides and sulphurets they usually put aside as being too refractory for their primitive methods of smelting, and beneath the deposits of carbonates which they worked out many extensive deposits of copper pyrites and grey copper are still left. In several cases known to the writer, lodes of copper and iron pyrites of considerable width crop out very close to the surface, which have been absolutely unworked by the natives. One feature is the number of gossan "backs" to be noticed in the copper districts. The natives have occasionally worked these, presumably for iron, to a little depth, but there can be little doubt that systematic exploration would reveal in depth great masses of copper pyrites. The hill copper was formerly noted for its purity, and even now the natives prefer to obtain their metal from Nepal, owing to its being so much softer and purer than that obtainable from Europe. Assays of copper and lead ores from Kumaon and Garhwal show the presence of a considerable amount of silver, and occasionally a gold value is obtained.

The climate of Kumaon and Garhwal is excellent. All the hills which range from 6,000 feet upwards are clothed with forests of good-sized pine oak, and rhododendron. There are deep valleys between, often only 1,500 feet above the sea-level, in which oranges, lemons, peaches, bananas and other fruit flourish exceedingly. The land is so fertile that two crops of corn are reaped every year. The great difficulty is transport, all loads being carried up into the hills by coolies. Good roads can easily be constructed up the main valleys, and ample water power and facilities for wire rope railways occur everywhere. It is a matter of surprise that this vast country, so fertile and teeming with mineral wealth, has remained so long unexploited. If only the attention of capitalists were called to the possibilities of the Himalayas it would undoubtedly be explored, and found to be as rich a mountain range as the Rocky Mountains or the Andes.

Nearly the whole of the southern portion of the Himalayas is British territory, and there should be few, if any, difficulties in the way of prospecting these magnificent heights. F.G.S., A.I.M.M.—*Pioneer*.

UVA DISTRICT REVISITED.

AFTER AN INTERVAL OF TWENTY YEARS.

(By an old Planting Correspondent.)

There is a pleasant and a very unpleasant way of travelling through some of the tea districts of the Central Province, especially when twenty miles or more must be traversed on a dark night and there is no resthouse or shelter. Any "stranger" who wants to go to Nuwara Eliya via Gampola and Pussellawa should be armed with a letter of introduction or he will most certainly come to grief, there being now

NO RESTHOUSE IN PUSSELLAWA.

If we had known this and that, after travelling ten miles to Pussellawa, we should be obliged to push on another ten miles to Ramboda when very tired and hungry and the little bullocks of the hackery completely played out, we should most certainly have let Pussellawa slide and quietly stepped into the upcountry train at Gampola station for Nannoya, and so avoided making a miscalculation and spending a miserable night on the road and going to bed without any dinner. Under such circumstances it is not to be expected that a very cheerful account of

PUSSELLAWA DISTRICT

can be written. The Gampola resthouse (or rather hotel) appoo tried very hard to get two coolies to carry baggage and, after a long search round the town, brought two men who asked for *one rupee and fifty cents* each, very reasonable certainly, but they did not get it all the same. Then a hackery was sent for and the bullocks were a failure; we made very slow progress even where the road was easy. At the bridge toll the fat kine was exchanged for the lean kine and two miles an hour was about the rate of progress. However, we wanted to look at the tea on some of the estates including Orwell, Sanquhar and Sogamawattie. So far we felt "sogam" because we had daylight and it was the first fine day for a long time! The scene is changed since we knew Ryan, Inman and Mason on the three above estates. The places have grown out of knowledge, particularly the two latter estates with over one thousand acres of tea between them and large factories. The tea is not as good as may be seen in Assam and seems to require manure in an old district like Pussellawa.—Rothschild we could not see at 7 p.m. We caught a glimpse of some of the fields next morning,

"And distance lent enchantment to the view,

And clothed the hills in all their verdant hue."

We should always associate Pussellawa with a big miscalculation we made of "*spending a happy day*" and going to bed without any dinner at 12-30 a.m.

We had also promised ourselves a great treat—to see the Ramboda Falls fall in their majestic glory; but the Fates denied even this

and we could only hear them thundering above and below as the miserable hackery wended its way in the dark over bridges and culverts. We should never have fetched Ramboda with the two Gampola bullocks. An old planter was good enough to lead us a white coast bull who had to pull the Gampola bullock as well as the hackery. We paid ten rupees for twenty miles, according to agreement to the hackery man in addition to paying for two tolls and other small charges including one rupee to the driver of the white bull (being night work.) We regret very much passing through a large district like Pussellawa containing as it does over twenty thousand acres of tea and seeing so little of it. It is a *contrast to the good old days of coffee* when we often spent Christmas week up there and saw all the estates and all the planters of the district and had a *Government Resthouse* to rest our weary bones if unfortunate enough to be benighted. Ramboda was the first halting place from Gampola and here we enjoyed the hospitality of the oldest planter in the district, Mr. de Lemos who is still strong and hearty and walked to the top of the Condegalla Pass with me by the short cuts. Ramboda, including Bluefields, Condegalla and Labookelle all look in good order with nearly two thousand acres of tea between them and large factories. Westward Ho is a series of tea fields near the cart-road to Nuwara Eliya, the property of Mr. G W White.

We much preferred the old forest shade of Nuwara Eliya to the present innovation of much over-produced tea; and as we entered the Town of Nuwara Eliya we thought the ridges—planted with tea—no improvement whatever, but on the contrary robbing the Sanatorium of its original picturesqueness and pleasant resorts for family pic-nics.

NUWARA ELIYA

is very greatly improved as regards new buildings and the business appearance of the town, but we did not feel happy until out of civilisation and on the borders of the Lake where we found shelter for the night through the kindness of the proprietor of one of the snug cottages situated to the left of the Lake. We started at daylight for Uva and called in at the Hakgalla Gardens, but saw too little of them to make any comments, good, bad, or indifferent; we just went in at the grand entrance and out at another gate on to the Patana taking a short cut down to the cart-road from whence we came. Mr. Nock was engaged with a visitor and we much regret not seeing more of Hakgalla. There are many good vegetable market gardens between Nuwara Eliya and Wilson's Bungalow and great quantities of vegetables packed and labelled for Colombo. Cabbages, carrots, beet, onions and parsley seemed flourishing. We quite agree with your correspondent "Progress" that the Ceylon Government should construct a lake or large dam to hold the waters running to waste in one of the healthiest climates of the island. It would certainly attract settlers to that part of Uva between Nuwara Eliya and New Galway to Wilson's Bungalow and the desolate patanas would come under cultivation,

We were kindly received at Albion near Ambawela. The Railway Station is only five miles from the cart road. This must be a very great convenience to travellers and estate proprietors in the immediate neighbourhood.

Mr. A. J. Kellow has still some good coffee on his property and also some good tea with valuable orchard of English fruit trees. Mr. Kellow's coffee was very nice in the cup, and any of your readers wishing for *good coffee* would do well to try the Albion fragrant berry, the *old original Arabica*. Twenty-five acres still remain and seventy of tea. Beautiful English flowers do well here and are well cultivated. The climate of this part of Uva is delightful and the views of the mountain ranges surrounding are very grand indeed.

People who visit Nuwara Eliya should have a peep over the other side. Before dismissing Old King Coffee, we may mention that *the old king is by no means played out. He still lives.* We saw *good coffee* all the way from Gampola to Pussellawa almost free from disease. Our dear old friend H.V. was still there, but indulgent to coffee "within sound of the human voice." There is no doubt it likes to grow native fashion and cultivation and patent manures helped to kill it. We had a very long and hot journey from New Galway to Attampitiya, but we were welcomed by our old friend Walter Stewart, one of the proprietors of the estate called Attampitiya. We were also glad to see another old planter, one of the pioneers of Haputale, Mr. MacPhail. The old Government rest-house has been purchased by the proprietors of Attampitiya and the new factory is some distance from the tea fields down on the cart road below the bridge. Attampitiya is nearly 400 acres of tea and is well roaded and drained. Over the gap there is a very good view of Narangalla and other Badulla estates.

The drive from Attampitiya was very enjoyable and we found old

BADULLA TOWN

very much improved with handsome buildings, shaded by beautiful trees including the Flamboyant. The Government officers have planted a large number of shade trees along the cart roads and they are doing well.

Dr. Johnson very truly remarked "that Regions Mountainous and wild form a great portion of the earth's surface and that he who has not seen them has missed seeing much of the nature." So it is with the mountains of Uva, thousands of acres exist which have never been cultivated and are comparatively uninhabited; and yet the climate is delightful, what can be the drawback? Is it the wind during the monsoon or is in the want of water?

The Ceylon Government could store the water and make this beautiful country inhabitable in the same way they have restored old tanks in parts of Ceylon where the climate is not so bracing and where the scenery is not so grand and picturesque in parts of the lowcountry.

The tea estates are few and far between and we passed underneath one with its factory looking like a "mansion in the sky" somewhere in the neighbourhood of Dick-yella,

BADULLA TOWN,

with its new public buildings, pretty gardens and well kept lawns under grateful shades, looks better than ever and we enjoyed our breakfast at the resthouse after a pleasant drive from Attampitiya. Passing a very large factory near the town and over the bridge in the evening, we reached Telbedde the old property of George Wharton Brown, our little experimental garden adjoining we called Rorke's Drift in honour of Bromhead and Chard, is extended to sixty-four acres of tea and amalgamated with Telbedde. Another piece of land we cleared for tea in the seventies, called Carolina, has also been included and a large factory down in the hollow. Telbedde is over 450 acres of tea and the coffee all disappeared, some of the stumps still being used for firewood. Next morning we passed through Stisted estate, opened in the seventies by our friend L d'Espagnac, first in coffee, then in cinchona, then Liberian and other products, but now enlarged to a fine tea estate. Then we call at Mahapahagalla another old coffee property converted into a valuable tea estate of 250 acres. Stisted with 295 acres and Mahapahagalla with 252 acres under tea, make 547 acres of tea fields to travel through from Telbedde to Debedde Gap under the picturesque range of hills called "Yerli Mallie" or seven hills opened by good old Geordie Morrice and profusely planted with fruit trees which I fear have disappeared for timber and tea bushes. Ury is now all tea and there is a factory near the cart-road.

Another of my experimental gardens named Cyprus in honour of Lord Beaconsfield is located at the 8th-mile post to the left. We remember taking Geordie Morrice to see Cyprus and when he saw what a pretty place it was, he said "you are a badly used mon" and we returned to Ury and that was the last we saw of good old Geordie who spent over 30 years in Uva.

Mr Moorhouse, junr., of Mapahagalla walked as far as Ury with me and after rather a warm walk we pulled up at Passara. Mr. Stewart Taylor, now in charge, received me kindly and we had a talk over old times. There is a great change in this estate and very fine sheets of tea on the Gonakelle Group, 847 acres, with fine new factory fitted up with the best machinery, large withering house &c. In going for a walk round the lower tea fields we came to the boundary and saw another little garden called the Khyber Pass, a piece of land on the gap we bought at a Government sale; on looking for it, found a group of Afghans armed with sabres so we called it the Khyber Pass and planted it with cinchona succirubra. How many natives we have cured of fever with the crop it is difficult to estimate.

We had the pleasure of meeting Mr Mathew, the Assistant on Gonakelle (a son of the late Archdeacon Mathew who contracted a fever in the Northern Provinces and died very suddenly.) Mr. Mathew is very much like his father; we remember him very well in Colombo.

PASSARA

has now developed into a very important district containing over 5,000 acres of tea. The new bungalow near the factory on the Gonakelle Group is very substantial and a pretty piece of lawn well kept, improves the frontage surrounded with dense shade trees.

The Lunugala and Badulla coach passes just underneath and blow their horns, announcing the arrival of the daily mail. "Things are looking up" as poor old Hebenton used often to remark in the old coffee days in Uva. After enjoying the kind hospitality of Mr. W S Taylor, we pass on to see some old friends, the Cottons, of Dammeria. This is another valuable property with great improvements made during the past twenty years—with 659 acres under cultivation, really a compact and pretty estate with tea looking very promising. A handsome new bungalow commands a comprehensive view of Peacock Rock or Monaragala. It appears that all the estates on this extraordinary formation are on the side facing Dammeria and the other side is sheer precipice. We met Mr. S Sparkes at Gonakelle and he was good enough to invite the writer to see some of the estates on Monaragala, so we must make up our minds for another long and warm journey on returning to Passara. Mr. J B Cotton was kind enough to drive me part of the road to Lunugala, putting me down at Galboda, one of the properties incorporated in the Passara Group—including Galboda, Medumpitiya, Hanipha, and Polgahalande, comprising 500 acres of tea. Being alone on the Lunugala road I was unable to glean the amount of information regarding the new estates above and below the cart-road required to do justice to the great improvements made since I was last passing this way.

There are many pretty fields of tea and new bungalows and factories smoothing the monotony of this once rather tedious and steamy

JOURNEY BETWEEN BADULLA AND LUNUGALA.
One feels more inclined to be poetical when comfortable and riding is better than walking in a five-rupee pair of ammunitions.

Ramasamy does not grumble and he, poor fellow, carries all the kit on his head bare-footed, so why should your correspondent complain of a few nails sticking up in his boots and a blister occasionally, how nice it is to have a bath and a change after a troublesome journey; yet after all said and done, there is no disputing the fact that riding is far and away better than walking especially in the tropics.

Well—"there is no rest for the wicked" and we go on like the Wandering Jew of E. S. (the name of the French Author is E. S.)

We pass through Hopton estate and between two small bungalows and sight old Clifton, the former some 400 acres of tea and Clifton, with Kehelwatte, about 340 acres. We remember John Darley on Clifton in the "seventies" and afterwards Carey. Coffee has given place to tea and is doing well.

When our old friend, G. H. Hall, opened Shawlands, he little thought it would some

day be converted into such a large tea estate, now nearly 500 acres, with new bungalow and factory—the tea coming right down from a respectable elevation to the cart road. Poor old Hall: he died in the Straits Settlements somewhere, I believe in Perak—another good planter gone.

G. H. Hall was a regular correspondent of the *Observer* and often wrote some very smart things. He was a well read man and very good company, and we passed many pleasant evenings at Shawlands.

We were very sorry on arrival at the Park to find our friend, Fred. Hall, away from home, especially as we had walked ten miles in a very hot sun and we felt very tired indeed. However, we rested our weary bones that night. Next morning at 6 o'clock we made the ascent to Madulsima.

The view of the lowcountry from Madulsima is very grand with occasional glimpses of the silvery sea, and "Westminster Abbey" and "Friar's Hood," two well-known land marks on navigators' charts of the Eastern Province of Ceylon. From Mr. G B Cotton's bungalow we could see distinctly the little Basses' light with its minute and fifteen-second flashes or rather two fifteen-second flashes at intervals of about one minute. We will bring this letter to a conclusion now that we have arrived at Verela Patna.

There are only two old planters we remember up in Madulsima. In about six years the district has completely changed and a new generation has sprung up who knows not Joseph. We can look down on the Logaloya Valley, where we put in six years in the "seventies" before going into Government service at Perak in the Malay States.

Poor old Garrioch, Donald Reid, Sandy Brown, Ned Linton, Isham, Karlake, Dolly Osborne, Beneson, Richard Mant, Dick Sterling, and many others have been gathered to their fathers. Still the old district is flourishing, and risen out of its own ashes.

The new bungalow at Verela Patna is nicely situated commanding a very extensive view of the surrounding estates, including the Gonakelle Group—Part of Ury and the new tea fields of Mr. J Peris.

To the right, Sarnia and Dotlands, Ledgerwatte and Keena Kelle Group and Ganpaha the back ground.

There will be many changes in and about Badulla within six months or so. Planters at home on leave will return to their change and their Locum Tenens will have to find new billets. Ceylon seems very full of Superintendents and Assistants just now and re-auction of expenditure is the order of the day. South Africa after the War, may offer a new field for young men, and Canada can provide for those who can find a little capital. The Canadian Government give 160 acres of land in the Far West.

We regret to hear of Mr. Marshall's sudden death from lightning in Dolosbage.

The greatest improvements in the district of Madulsima is the substantial cart road with its new bridges and railed-in cuverts passing through all the best tea estates.

Starting from Passara through over five hundred acres of tea on El Teb Group, and through over eight hundred acres of the Mahadava Group, including many well-known old coffee estates converted into tea plantations, entering the centre of Galloola and winding round Doomoo into Battawatte, forming a horse-shoe round the centre at Forest-Hill and descending through Wevebedde to Dandea and Cocugalla Group. The Madulsima-Passara cart-road is eighteen miles in length and enables the visitor to the district to get a more comprehensive view of each estate without the fatigue of climbing up short cuts as in the old days of coffee planting.

We arrived in this district at a good time when the planters could meet and play at tennis on the Galloola Court, the annual holiday of Ramasami's

"TEEVALI,"

taking place on Sunday last and accordingly give the planters a little time to themselves. Teevali festival, however, seemed to me rather a quieter one than those we knew in the days of coffee. Ramasami did not seem so cheerful as usual and we were able to sleep through the nights which we expected to be disturbed by the beating of tom-toms. We heard no singing and saw no dancing. The old stick-dance seems to have gone out of fashion. Ramasami seems somewhat depressed and no doubt indirectly feels the general depression caused by the low prices of tea during the past year or two. We can remember when our old friend from the Malabar Coast of India sang his cheerful song when pulping his master's coffee and a hundred bushels of good cherry coffee pulped into fifty bushels of No. 1 Parchment coffee was worth as much as four thousand pounds of green tea leaf made into one thousand pounds of "made tea." The coffee planter could call his soul his own in

THOSE GOOD OLD DAYS OF COFFEE.

but now he trembles when looking over the price-lists and tea sales and is often disgusted to find that although he has been plucking fine and reduced his crop of leaf considerably, his prices are no higher and sometimes his tea fetches less per pound than his neighbour who has not taken the same precaution of plucking fine.

If he gets better prices, his crop will turn out short of the original estimate; so it is as broad as it is long, whereas in the palmy days of old king coffee, crops would sometimes be purchased at one pound sterling per bushel before the crop was harvested. With regard to general cultivation, estates in Ceylon seem to be comparatively clean; it is an exception to rule to find a weedy estate. Tea, undoubtedly, covers the ground better than coffee and the shade trees dropping their leaves particularly the grevillea, keep the ground thatched and prevent weeds growing amongst the tea bushes.

Then, again, the estates are older and cannot grow the luxuriant weeds we had to hack down and bury and burn in the days of coffee. The old coffee planters made the roads and drains and put up the stores, bungalows, lines etc. Many old coffee stores have been converted into tea factories—in some cases into Crystal Palaces—light being a great factor in the manufacture of tea. The machinery for the tea factory is more costly than the coffee-curing machinery of old and many turbines are now used. There is a turbine at Galloola estate I saw working yesterday. Galloola looks better now under tea

than when I saw it last under coffee. It is now a valuable property, although I believe in 1869 the coffee leaf disease first made its appearance in a field just in front of the bungalow. I remember Marshall Ward, the Cryptogamist from Kew, coming to see

THE HOME OF HEMILEIA VASTATRIX

and could suggest no remedy for combating the disease except burying the weeds and leaves of the coffee and keeping the ground swept clean of all prunings and rubbish. Both Galloola and Verelapatana are planted with high jāt Assam Hybrid tea and both estates are very promising for both quantity and quality. Galloola estate has four hundred acres of good tea well shaded by grevilleas and other useful timber trees. Mr. Nuttall has returned to his charge and is a very popular man in the district, as also Mr. Mason of Verelapatana, who is living in a fine new bungalow commanding a grand view. The new V P bungalow, is above the old V P bungalow where the great Garioch once presided in Madulsima.

Sir Hercules and Lady Robinson once paid him a visit at

UVAKELLIE

and planted two grevilleas in front of the bungalow. There was an odd plant sent to Verelapatana and it is now growing on the site of the old bungalow, more than three feet in circumference. The grevillea was then almost a new introduction from Australia and was naturally thought a great deal of in those days. Now you find the grevillea all over Ceylon, grown for fuel more than for its grateful shade and fat leaves manuring the grounds. I am a great believer in the grevillea and notice it does not prevent tea from growing underneath it as some trees do, for instance the Casuarina or She-Oak of Australia and Noka Noke of the South Sea Islands. The five hundred acres of Verelapatana are in fine order and there is a steam engine driving the best tea machinery. Patent fans are to be added immediately, to facilitate withering, the roofs being of ceiling-cloth.

A large withering-house has been erected above the factory and four thousand pounds of green leaf can be converted into one thousand pounds of "made tea without overcrowding."

The moon-son is now on and over two inches of rain per day have been registered on some days during November both on Verelapatana, Galloola and Battawatte estates, there is a good flush on the trees or tea bushes just now.

DOONHINDA

117 acres of tea, is included in the Doomoo Estates Company or worked with them by the same Superintendents. All the old coffee estates down in the Logaloya Valley, Guelten-gawa, Deyanawatte and Allagallawatte are out of cultivation, though the two latter named places have been purchased and may be brought under cultivation again some day. The land is suited for tea, though the climate is unhealthy for coolies Battawatte and Forest Hill of the Estates Company of Uva, Ltd., 750 acres with 592 cultivated, of which 587 are under tea, with a new factory and withering house at the foot of the estate below the cart-road, are still flourishing under the supervision of Mr. A. V. Ryall. I accompanied that gentleman through Forest Hill this morning and saw the site of the old bungalow and the gap leading over to Uvakellie—another large Estate in the district

of Madulsima and a place we knew well in the days of Daddy Hamilton, the then Superintendent. We well remember.

DADDY HAMILTON,

the keen sportsman, keeping up with his dog round some of the steep parts of Forest Hill and on one occasion the writer got stuck on a slab-rock very slippery, unable to move up or down, and Hamilton came to the rescue just as it was getting dark, and we were glad to take his hand and be put on an old path. The last time we met was in Montserrat, on the Montserrat Lime Juice Company's estate, where Daddy was Manager and we went out to him to doctor the lime trees. Since then I believe Montserrat has been devastated by hurricanes. The inhabitants of Montserrat are Irish Niggers, they are very black, but talk with an Irish accent and rejoice in the names of Bourke, O'Bryan, O'Finnagin, Irish, &c. Some of them are well off, owning large sugar plantations. The Island is small, between St. Kitts Nevis (where Nelson married the widow) and Antigua, the seat of Government for the Leeward Islands. I went there in an open boat sailing past Guadeloupe, Martinique and Dominica from Trinidad. Perhaps Daddy Hamilton, once a great favourite in the district of Madulsima, will return to Ceylon and cultivate tea instead of lime juice. He was one of the Superintendents of the late R. B. Downall, who liked him none the less for being a good sportsman. I must bring this letter to a close and visit Cocagalla, Roeberry and Uva, a description of which will be given in my next. It is rather a rough journey and the weather is bad after mid-day; it is raining hard now.

Leaving my hospitable host, Mr. Ryall of Battawatte, a little above his tea factory, thereby saving a tremendous long trudge round the cart road through Forest Hill and a long swoop in the direction of Wevebedde or Tavellumplussie, down to Dunedin, we simply joined the zig-zag approaching the factory from the bridle path. To our minds this seemed to be the ugliest piece of the Madulsima cart-road, yet the object is obvious, being to pull up at the Cocagalla tea factory on the old and compact little estate known to coffee planting days as "Dunedin," now expunged from your Directory and amalgamated with the Cocagalla Group, formerly named the "Madulsima Coffee and Cinchona Company, Ltd."

We have a faint recollection that Cocagalla once belonged to Lord Lawrence, the Viceroy of India, before the Company was formed. We remember George Osborne as Superintendent of Cocagalla twenty years ago and the pride he took in his crack cinchona fields. There are still signs of them remaining on steep slopes now out of cultivation, suckers of cinchona succinbra and hardy hybrids, growing from the twenty-year-old stumps amongst the mana-grass and chena growth above and below the roads.

Queen tea is now supreme and little Dunedin possesses a hundred acres of a very fine jât and very healthy in appearance, some leaves as large as a man's hand and of good colour as well as strongly embossed. It is a very stiff pull up from the Cocagalla Tea Factory at Dunedin to the Cocagalla bungalow. There are some Jacob's ladders in the form of stone steps, but we preferred the bridle-path though exposed to the heat of a very hot sun. Of course, the tea is well

shaded by grevilleas and other timber trees and is naturally more pleasant walking than the zig-zag paths on the exposed patana or mana-grass fields. As we neared the bungalow, there is another high class or good jât field of Assam-Hybrid tea looking remarkably healthy and promising good flushes since the North-East monsoon broke on the Uva ranges with thunderstorms and refreshing showers of rain generally falling in the afternoon and evening not much interfering with estate work. My old friend Mason gave me a letter of introduction (which I asked for) to Mr Williams; the letter to Mr John Williams introduced me to Mr Williams, jun., now on

COCAGALLA

and I was made very comfortable for the rest of the day. It is the same old bungalow, on an excellent site, commanding a grand view of the estates around and the bright green patanas. The green tea leaf is shot down to the Factory by wire-shoots five in number, branching off from different stations; the bulk of the leaf travels by two very long shoots with patent rollers. It is very interesting to watch the bags swinging through the air at the rate of a mile a minute and coming down with a bump into each station and finally into the grand depôt or factory, withering house, built for its daily reception, where it is immediately spread out thin on the tats, a pound of green-leaf covering about six square feet of jute-hessian.

I did not enter the factory in the absence of some one to take me round. The fact of the matter is tea factories are all very much alike and I don't see why I should give the manufacturers of rolling machines, siroccos, steam engines sifting machines, &c., &c. a free advertisement every time.

I well remember taking a lot of trouble to advertise the tea roller when first invented in 1876 in Assam and received some very fine photographs of a new roller from the inventor, in Assam (then on a visit). I went so far as to send them to the Secretary of the Planters' Association of Ceylon and they were duly acknowledged by a special vote of thanks to your correspondent on his return to Ceylon, but within a few weeks from this time the inventor turned up to make a tour round the tea districts and to book orders. I met him in a bungalow somewhere, I forget where, and claimed his acquaintance, but he pretended to forget me, saying "I only saw you for five minutes."

The energetic superintendents of Cocagalla Group are making plenty of tea. The acreage of Cocagalla is one thousand one hundred and four with over six hundred acres of tea in bearing: added to this is Hewa Eliya and Elemane with another four hundred acres of tea, making a large charge of one thousand acres of tea in cultivation. We spent a very pleasant evening with Mr W A Williams and discussed many subjects of mutual interest. Next morning we rose early and with our mountain staff climbed to the top of Cocagalla estate and passing over the gap descended into Hewa Eliya.

With the exception of Hewa Eliya and Elemane estates, now under tea cultivation, all the old coffee properties between Cocagalla and Roeberry are out of cultivation. We remember many of them including Mousa and Kosgahadova, Quedgeley, Rathkele, and others, including some

two thousand acres of land under coffee and cinchona. Good old Roeberry has held its own through all these ups and downs of this far-off district known as Hewa Eliya. Roeberry estate, once the property of poor old Richard Mant, who toiled all his life in Ceylon and tried his best to make his fortune out of coffee and cinchona, sunk in the attempt like hundreds more of good men and true. Had Mant lived and developed this estate into its present valuable condition as a tea property of six hundred and fifty acres, he would have been a rich man; but "Man proposes and God disposes." It is a mystery how some men lead isolated lives and work so hard in tropical climates too, without winning the prize of independence in their old age. We all think we shall make our fortunes before we turn gray, but somehow some of us miss the mark. It is all very fine to say the "rolling stone gathers no moss;" but how often do we find the moss at a discount?

ROEBERRY ESTATE

is a beautiful place, shaped like a horse shoe, with lovely green patanas tapering down on both sides; and from the new bungalow, located on a lawn-like flat, there is a view of Nannukula range, Cocagalla, Doomoo, Galoola, Ury, Gonakelle, and other well-known Madulsima and Passara estates. Mr. John Williams is to be congratulated on his comfortable bungalow and its park-like surroundings, tennis court, kitchen garden, poultry house and stable, grazing ground for cattle, &c. A few Australian or English sheep with a few ponies would add to the homestead-appearance of this healthy corner of the Uva Province. Many of the Madulsima and Hewa Eliya bungalows, though occupied by bachelors, would do credit to married men, well-furnished drawing-rooms, dining-rooms and bath rooms close to the bedrooms. We are more civilised now on estates than in days gone by and, with the daily *Observer*, are kept well-posted up in the doings of the world. Mr. Vaughan came over to Roeberry from Uva estate on the next range and we played tennis. Mr. Vaughan kindly invited me to visit him at Uva and we did so, Mr. John Williams accompanied me to the top of Roeberry, where Mr. Vaughan met us to point out one of the most beautiful views in Ceylon. The elevation was nearly 5,000 feet looking out on to the lowcountry Bintenne, the Rock of Bible, Moneragala, Westminster Abbey, Friar's Hood, Horaborawewa lake further eastward, with the Logaloya Valley below us and a grand view of Hapntale, Maturata, Hewaheta, the Knuckles and the Mahaweliganga flowing past us in the distance absorbing the Logaloya and Badulla-oya and on through the lowcountry to Trincomalie where the river empties into the sea. The view yesterday was magnificent, and we were indebted to Mr. Vaughan for the trouble he took in meeting us and pointing out the different places of interest in so large and comprehensive a view of mountains and plains. The tea factory for final packing and despatch is called Arawa at the foot of Uva estate. From Arawa Factory the old Badulla road passes Megahazalla village on to Taldena village, then on to Badulla town. This old Badulla road leads to Alutnuwara, to the east of Horaborawewa lake. There is a "Dagoba" there and many Sinhalese visit Alutnuwara by this road. Uva estate is divided into three sections and being very steep requires a strong young planter like Mr. Vaughan to manage it. The leaf is shot down by wire shoots strongly shored up by heavy weights and made fast by concrete. Timber is

lowered from the top; the factory by the bungalow is built of stone and the tea despatched by wire shoot to Arawa Factory. There is an engine giving power enough for two rollers and other machinery. Everything is in apple-pie order and the tea of good sample in the cup, nice and creamy and golden colour—the best tea in the cup I tasted in the district. The jāt is a good working Assam-Hybrid and the roads and drains are in good order throughout the estate. Kalugala is the chief point of the range. Out of 1,276 acres of land there are 471 acres of tea. There is a very large quantity of valuable timber grown on Uva and much cinchona scattered about in ravines and wind belts. We remember visiting Uva when John Stuart was in charge and James Reid (brother of the late Donald Reid of Galloola) was assistant on one of the divisions. The present Superintendent, Mr. Vaughan, is a C.M.I. and just about to attend drill at Nuwara Eliya. We spent a very pleasant evening together on Monday last, 18th November, returning *via* another route to Roeberry estate in rather heavy rain; on arrival at the bungalow a plunge bath prevented catching cold.

The leaf of Roeberry is shot down to the factory located between Lunugala and Bible, the two villages and the factory forming a triangle. Karaghawella is the name of the village, eight miles from Bible and Lunugala. The tea is then carted to Batticaloa and shipped to Colombo.

There are a few acres of cardamoms on Roeberry.

HENRY COTTAM,

(To be continued.)

INDIA RUBBER IN NATAL.

ITS CULTIVATION AND PRODUCTION.

[By Anthony Wilkinson in the *Natal Agricultural Journal*.]

Some years ago I tried an experiment of planting an acre of "Manihot Glaziovii," or the Ceara rubber tree of South America. Mr. Medley Wood, curator of the Durban Botanic Gardens, was kind enough to furnish me with roots and cuttings of Ceara trees from trees he had growing in the Gardens, and wished me to try an experiment on a larger scale. I planted an acre of Manihot with coffee plants between. The rubber trees grew well and seeded abundantly, and at four years old, when the trees got a good size, four to five inches in diameter, on scoring the bark to extract the rubber, although the rubber was of good quality and very elastic, the collecting or getting it was slow and costly. Accordingly, I came to the conclusion that the experiment would not pay, unless the trees could be tapped, and the juice collected in quantity, as is done in South America, and further, that Natal was not sufficiently tropical to make a good flow of sap. Coming to those conclusions, I cut the trees down, but still the trees come up again from the seeds every year, and grow luxuriantly five or six feet high in the first year, showing the climate to be suitable to their growth. Among my coffee I have a self-sown Ceara only three years old, and over 20ft. high. The red sandy soil of the coast such as that of the Berea, Durban, would be the most suitable. The seeds left to nature do not come up for a year or two. By some, felling is recommended, but this is a tedious process; tapping them with a small hammer until they crack serves as well, and is much quicker. The plan adopted to collect the

rubber, with the Ceara rubber trees, is to strip off the thin outer bark, which is like brown paper, and expose the green bark. This inner bark is then scored across with a knife at an angle, and the milky juice or sap then exudes and dries on in an hour or two, and can be peeled off and wound up in balls, but the process is so slow with the coolie women employed at 61 a day, that I found it would cost about 5s per lb. for the labour of collecting, and the product would be worth only about 2s per lb. Now it strikes me very forcibly that if a cheaper way of extracting the rubber were adopted it would pay well. The rubber is there of good quality, but the question is how to get it out. My idea is this: To plant the trees in rows, 12 or more feet apart, like large helges, and at two or three years old, when large enough, in the spring or early summer, when the sap was rising, to slash off the small branches and leaves, and crush them in a small steam sugar-mill, and let the juice run into a tank of water. The residue of branches and leaves would then be put into a hydraulic press, with steam outside, and pressed as long as the sap would flow. The rubber juice would coagulate in the water, and could be raked out and squeezed by hand into balls and dried. By this method the trees would be pollared and dwarfed, and could be trimmed and cut once or twice a year, as found advisable. It would be necessary to keep the land well ploughed and scarified between the rows, for all would depend on the cultivation received. The rows, if in hilly land, would require to be run on the level, so as to cultivate cheaply with horses or mules. There are several other plants which would give good rubber if treated in this manner and well cultivated. The *Beauantia*, a white flowering creeper of the order "Apocynaceae," the Borneo rubber creeper, grows well here in Natal, and I have no doubt many native plants would be found to produce good rubber. If this plan of extracting rubber from the plant were found to answer, it would revolutionise the rubber trade in a few years, and rubber could be grown to any extent, like sugar. Moreover the supply of rubber, owing to the destruction of the trees, is decreasing, whilst the demand for the article, which is now being applied to so many different purposes, is steadily increasing, and therefore there is no fear of the market being over-stocked. India rubber being so valuable an article, worth £20 to £300 a ton, there is a large margin for profit. For an energetic young man wanting something to do and to try a new industry, I would recommend it, but remember the old American sage's saying: "Be sure you are right; then go ahead." I feel pretty sure there is money in it.—*Natal Mercury*, Oct. 29

NATIVE NOTIONS ABOUT TEA AND COFFEE.

Tea planters in India, unless they can discover new markets for their produce, are in a parlous way. Now, if it were coffee, Indians would take to it—as they have largely taken to it wherever possible—like a duckling takes to water. Coffee is a seed and the poor coolie can understand it containing some nutriment. But tea—Bahl! It is only a leaf, and the golden liquor obtained from it is neither sweet nor intoxicating. Probably the way the *dorasmar* drink it may make it good, but where is a poor coolie to get milk? And sugar? That is seen, and tasted, only during festivals and when it is offered to some great man as a peace offering. Then, it is so expensive! Tea may be bought for a few pies, or an anna in the bazaar, it is true, but then it has no taste, no aroma, and one might

as well infuse blotting paper. The servants of large institutions and households gather up all the used tea leaves, dry them and then sell them to bazaar men, and with the proceeds buy coffee of some kind, which they can make drinkable at least. Tea is not in it. If tea is to be made popular it must be tolerably good, made up into small packets of an ounce or two, and sold cheap. Coffee is looked upon as a food by natives. A pound of coffee, at say six annas, with half a pound of coriander and half a pound of rice, all boiled, makes two pounds of powder, which will last a man, taking a drink twice a day, 15 to 20 days. A pound of bad tea can be got for six or eight annas, but it cannot be adulterated and is not half so tasty as coffee; and infinitely less nourishing. In Northern India coffee is not so easily obtained and tea is much more appreciated by the people, who are accustomed to drink hot drinks during intensely cold months. In regard to the tea habit, it may be interesting to speak of another community, the poorer members of which always drink coffee in preference to tea. I refer to the Eurasian and poor whites of this Presidency. Coffee is the staple drink, and is preferred—by the women and children at all events. The Colombo arrack which counts many victims in Madras is often given up for coffee. Coffee is a stimulant. Coffee is a drink on which one can stay. Some people make a compromise and use coffee in the mornings and tea in the afternoon. All this is to show that tea has much headway to make if it is to oust the favoured berry of Mocha, or to take the place of toddy or arrack.

It is my conviction that among the people of South India tea will never become a favourite beverage. My reasons for this are that, in the first place, the labouring classes in the Districts are too poor; in the next they are too conservative. There is one section of the South Indian population that may yield good results—the Mahomedans. The richer Mahomedans are all tea drinkers, and that being so, the poorer members may follow suit. But it is not good to despair. Very much depends on the way it is pushed. Coffee shops are common in towns, and if tea is sedulously advertised, who knows but that it will succeed?—*Madras Mail*, Nov. 18.

VANILLA CULTIVATION.

In our issue of the 9th May 1901, we published a special article regarding an experiment inaugurated this year in the gardens of the Agricultural Society of India, Calcutta, with a view to demonstrate the practicability of growing the *Vanilla planifolia* on a commercial basis in India. This week we paid a visit to the gardens, and were much pleased to note that the experiment has so far proved a complete success. The cuttings put down in April last have all struck, and the plants have climbed up the stakes, and have taken a firm hold of them. They have been trained along the horizontal stakes, and are looking healthy and vigorous. One plant has flowered. In March next most of the plants are expected to set flowers and fruits. We congratulate the Society on having established the fact that Vanilla cultivation can be carried on in India with profit if planted on the lines of this experiment. An acre put down with Vanilla would prove a valuable addition to any tea estate in Assam, Cachar, Sylhet or Dooars, provided the manager knew how to fertilise the flowers to enable them to set fruit. The process is a very simple one, and can be easily learnt in a few minutes. It should be remembered that the *Vanilla planifolia* loves shade and moisture. These two conditions are essential to successful cultivation. Both are always available on almost every tea estate in our north-east province.—*Indian Gardening and Planting*, Nov. 21.

TEA FERMENTS.

The hunt for the tea ferment seems to go on apace. Some three years ago the theory of tobacco gaining its flavour from the ferment caused by bacteria, was widely circulated, and the idea was entertained by some that it might be the same with tea. The American Government took up the subject and employed Mr. C. Loew, a botanical specialist, to conduct a series of investigations which he embodied in three Bulletins of the U.S. Department of Agriculture. He was unable to find any bacteria, and gave a long explanation as to why they could not be the cause, explaining how, under the conditions of manufacture, they were unlikely to live and multiply; but he isolated from the Tobacco leaf first an enzyme, then a perenzyme, and lastly a catalase, all belonging to the class of oxidising ferments. Soon after the publication of his first paper an enzyme, showing the same reactions as his, was demonstrated in the tea leaf. Now after the publication of his third Bulletin on Tobacco last year, he has left America and taken up a professorship at Tokyo, Japan, with the result that the Japs are likely to forestall us in the scientific manufacture of tea; as, in a Bulletin of the Agricultural College of Tokyo, recently published, Mr. Aso, evidently inspired by Mr. Loew, has been investigating the difference in colour between green and black tea, and finds that the finished black tea contains much less tannin than the green. He also shows that the original tea leaf contained an oxidizing enzyme that is destroyed by heating at about 77° C. Also that during the fermentation of the leaf in manufacture of black tea, the enzyme oxidises the tannin, giving rise to a brown product. This is going rather further than anything that has been previously published in India, but we are glad to know that our investigators are not far behind, if they are not actually to the front, for one of them professes to have discovered an enzyme extraneous to the tea plant, which, like that found in tea, has the power of rendering the tannins and other cell contents soluble, and can be used to increase the power of the original article. He is evidently pretty confident of the results, as he has taken out a patent to protect his discovery, as we announced in a recent article. —*Indian Gardening and Planting*, Nov. 21.

 THE NEW DIRECTOR OF THE COLOMBO MUSEUM.

Dr. Arthur Willey, of Cambridge, has, I hear, been appointed Director of the Museum at Colombo, Ceylon, which will be vacant early in the spring of next year. The appointment is under the Colonial Office, and is considered one of the best posts of the kind in the service. Dr. Willey is an accomplished naturalist. Zoologists will readily recall the excellent scientific work he did during the Cambridge zoological expedition to the South Seas in the years 1894-7. The main object of his journey was the investigation of the life history of the pearly nautilus, and his researches added very considerably to our knowledge of that little known genus. Latterly Dr. Willey held an appointment as lecturer in biology at Guy's Hospital, which he resigned on being appointed to a post in British Guiana, and he was about to proceed to South America when he heard of his advancement to Ceylon. —*Local "Times."*
Cor.

PLANTING NOTES.

A FIVE-POINTED TEA LEAF.—A remarkable tea leaf has been brought under our notice by the courtesy of a Colombo gentleman. The leaf, which was brought in in a basket of leaf in the Agras, is extraordinarily malformed and consists of five distinctly formed leaves all joined together on one stem. One wonders how such a freak occurred and one also wonders how it came to be in a basket of tea! Alas!—has some one returned to replucking?

GREEN TEA BULKING AT CALCUTTA.—The idea of a central green tea factory for Colombo was first advocated locally in a letter from America to a local firm which we published some months ago. *Indian Gardening and Planting* understands from the I. F. A. Committee minutes that there is on the tapis a project for establishing a sort of central Hong in Calcutta for equalising, sorting and bulking green teas from various sources and placing them on the American market on the Chinese and Japanese system. It would be of great advantage to establish such a central factory in Calcutta, where half cured teas could be worked up into finished homogeneous breaks. The teas in bulk here, says our contemporary, could, in the final stages, be turned out far better under the eye of a practised expert for whom we would not have far to seek, and the result would be more satisfactory than that produced by many different planters making small breaks in the districts. The proposal has everything to recommend it and it is hoped to see some enterprising syndicate take it up.

TEA COMPANIES.—We publish in our daily reports concerning three Ceylon Tea Companies. Mr. J. Holmes who presided at the sixth annual meeting of the Central Tea Co. explained the falling off in crop that there had been in comparison with the previous season in consequence of the unfavourable weather, and the lower average price obtained. Money has been very wisely expended we think, in making necessary alterations to factories and machinery and in providing improved, and, in the end, cheaper, means of transport on Kahagalla. The condition of the estates, we are glad to observe, is satisfactory, and there is a gratifying improvement in prices. A very hopeful account is given of cardamom cultivation. The question of over-production is dealt with in a practical manner, the practice of manufacturing quantity at the expense of quality being condemned. It is also pointed out how we are benefiting India in exchange, and how the extra duty affects the cost of production. The Caledonian and Hornsey estates have also suffered from over-production and low prices, but a hopeful view is taken of the prospects as will be seen from the directors' reports. The directors of both Companies have expressed the opinion that the outlook for Ceylon tea is more promising than it has been for some time past.

THE INDIAN TEA ASSOCIATION
AND GREEN TEA.

The Barooa Company are in possession of the latest appliances for producing teas of the true unfermented or Ceylon type having intended for the Deane and Rae Green Tea-making machine advertised in our columns, some time ago. "Facing" is an optional process, and we may trust the able managers of the Company not to adopt any course that will injure the teas produced. They are moreover in possession of Mr. Drummond Deane's system of glazing or glossing teas, which adds much to their appearance and which may very properly take the place of "facing," without the introduction of any of the foreign ingredients which have earned faced teas a bad name. It is possible of course that some of teas offered for inspection by the Company may be made on a different system, but from the fact of their possessing the steamer we infer that part at least will be of the successful steam-made unfermented Japanese type, and these are certain to pass muster. Since the acceptance of the offer by the Indian Tea Association is contingent on the teas being 'suitable' we may be equally certain that whichever type of tea is found most suitable will be selected for the bulk of the Company's production, and the object of the Committee will be achieved. If 'faced' teas of China type are taken and wanted let them be made by all means but we very much doubt whether they will pass muster with the American authorities. A sample of North-Western faced Indian tea, which we recently submitted to Messrs Moran and Co., was at once rejected with the verdict "would not be admitted into America."

This important offer from Sylhet will be followed with interest. The disappointment of the Committee that more offers than these three have not been made hardly seem to us to be warranted. The amount of tea for which the grant is made is not very large and the three tenderers, all of whom possess Deane and Rae steamers to our knowledge could very easily produce all that is required each recouping themselves tenfold out of the bonus for the purchase money of the machines. Even on this scale, though, there is room for more enterprise and we are aware of many centres where the manufacture of unfermented green teas are being taken up on a small scale with a view to ultimately installing machinery, if successful in experiments. Indeed we have ourselves furthered these attempts by bringing intending green tea makers into communication with the inventor of the process. We expect to see the movement grow.

Another point of interest in the matter of green tea is that the local I.T.A. Committee announce that they intend to approach one or two of the larger agency houses with a request that they should take up the question of manufacture and bulking. If this refers to a project for establishing a sort of central Houg in Calcutta for equalising, sorting and bulking green teas from various sources and placing them on the American market on the Chinese and Japanese system, we are of opinion that no better scheme could be formulated. Indeed it is possible with advantage to go even further. Green tea differs from black in that, the manufacture may be stopped half way and the half cured leaf transported, without risk of spoiling to great distances to be finished off at a central factory. It would be of great advantage to establish such a central factory in Calcutta, where half cured teas could be worked up into finished homogeneous breaks. The teas in bulk here could, in the final stages be turned out far better under the eye of a practised expert for whom we would not have far to seek, and the result would be more satisfactory than that produced by many different planters making small breaks in the districts. It is not likely that many will take up the manufacture in any but a small way at present and to produce the best tea it is necessary that it should be handled in quantities and on system. To

steam and half fire is easy and could be carried out without trouble everywhere. The finishing processes could be better managed at a central factory which could be placed at any distance preferably at a centre such as Calcutta. The proposal has everything to recommend it and we trust to see some enterprising syndicate take it up.—*Indian Gardening and Planting*, Nov. 21.

THE NEW TEA DISCOVERY:
MR. C. R. NEWTON ON ITS SIGNIFICANCE.

We have pleasure in directing the special attention of the Ceylon planting community to the interesting letter Mr. Newton is good enough to send us on his discovery of a tea "enzyme" which is more or less essential to the process of fermenting tea. Mr. Bamber's opinion on the discovery, has created considerable interest throughout all planting circles in India; and Ceylon planters may rest assured that all the latest and most informing details, both in subject-matter and in criticism, will appear in this journal from time to time. Since we gave Mr. Bamber's views, nothing so much to the point has appeared in the local press as the letter to which we now turn our attention.

At the outset, we are glad to note that Mr. Newton entertains, as was only natural, the highest regard for Mr. Bamber's knowledge of and attainments, through original investigation, in the chemistry of tea manufactured. On the heels of this we are surprised to read that he has had "little experience with plant enzymes" or he "would not say they increase in quantity after plucking." Mr. Bamber's reputation is not likely to be shaken by such a statement, and we invite him to offer a reply on the subject; but meanwhile, referring to our article of the 13th ult., we cannot see that the matter clause, even, is at all well founded. What Mr. Bamber did say was that if the soluble ferment, the enzyme, in tea has any effect on the flavour at all, its *activity* was not apparent so much during growth as during the withering process. It was not a case of actual quantity of enzyme increased, but of a greater effect of the same quantity of enzyme in the tea leaf after plucking—when the withering stage was reached. Apart from this Mr. Newton brings out the full importance of the isolation of the enzyme in tea, if only this "soluble oxidising ferment" (as Mr. Bamber calls the substance he was able to separate from the tea leaf) can be produced apart from the tea leaf, and applied to it—to increase its flavour and develop its general excellence, aroma, and strength. Mr. Newton hopes that such a contingency will not come to pass because he fears a general leveling up of all kinds! But "much water will flow under the bridges" before that day arrives, or at least before the process of fermentation with external aid becomes sufficiently cheap to make the betterment of the tea involved decidedly profitable to the producer. Many will now look forward to the results of the experiments which continue uninterrupted

in Mr. Bamber's laboratory, with increased interest. Mr. Newton is unfortunately hampered from further progress in his researches, as far as manufacture is concerned, by the cessation of the Indian tea season; but we hope that those he will make in the laboratory may meet with success and further interesting results. Of these we shall be glad to learn from time to time, so as to keep the Ceylon planters constantly informed of the latest strides achieved by scientific work in the study of tea.

A GREEN TEA FACTORY FOR COLOMBO,

THE FIRST OF ITS KIND NEARLY COMPLETED.

BEING CONSTRUCTED BY MESSRS. FINLAY,

MUIR AND CO.

Only a few months ago, as we had occasion to state this week, the idea of a central Green Tea Factory for Colombo was first mooted in these columns through an American letter. Definite particulars, however, of such a factory being started, have since been wanting and it was not known by whom the first enterprise of the kind would be promulgated, nor where the factory might be erected. Rumours had been abroad that one would shortly be commenced, but the task of tracing them had so far baffled us, until this morning a representative of the *Observer* was attracted by the red-brick columns and walls, and the massive iron beams, of a building in course of erection in the yard behind the stores of Messrs. Finlay, Muir & Co. in Vauxhall Street. Enquiry elicited from an intelligent workman, busy engaged on the structure, that the building was intended for a Factory for the manufacture of Green Tea; that in the course of a few weeks it was expected to be completed; and that on its completion the production of "greens" would be immediately commenced. The structure, the better part of which is now erected, is an extensive and commodious one. From end to end it measures 200 feet by 40 feet, while in addition along half the length of the building (100 feet) on the side facing the stores, a verandah 25 feet wide will be erected. The Factory is, we further understand, to be appointed with the most modern and approved machinery of British manufacture, some of which has already arrived and is lying by ready for erection. The building, it is expected, will be completed, and work commenced before the end of the present year. The system of manufacture will, we learn, be the same as that followed in Japan. The leaf will be partially treated on the upcountry estates of Messrs. Finlay, Muir and Company, to allow of its being conveyed by train to Colombo, and then finished in the Colombo Factory ready for despatch to the markets awaiting it.

AMERICAN SCIENTISTS IN SUMATRA.

Dr. H M Hiller and Mr. A C Harrison, the American scientists who have been exploring and investigating zoological and ethnological matters in Sumatra, returned to Singapore yesterday after a most successful stay of over three months in the Dutch possessions. They have brought back a large collection of valuable specimens which will mostly be presented to different scientific institutions in the United States. Dr. Hiller and Mr. Harrison leave for America *via* Japan by the German mail steamer "Koenig Albert" on Friday (22nd inst.)—*Straits Times*, Nov. 19.

RAILWAY CONSTRUCTION IN NYASSALAND: THE NEW LINE.

A contract for the construction of a railway between Chiromo and Blantyre, with provisions for an extension to Lake Nyassa, has just been concluded between the Imperial Government and a company registered under the title of the Shire Highlands Railway Nyassaland (Limited). During the past five years proposals for such a line of railway have been repeatedly laid before the home Government. The carriage of goods through the Protectorate, at present, conducted altogether by native portage—a slow, costly, and ineffective process. Under the agreement now entered into between the Imperial Government and the Shire Highlands Company, the railway is to be constructed on the 3ft 6in gauge with a single line and is to lie wholly within the Protectorate. This line of railway between Chiromo and Blantyre will connect the centres of the coffee industry with the sea by way of the Shire and Zambesi rivers and will otherwise benefit the chief industries of the country by releasing for labour in the plantations the natives who have hitherto been engaged in transport work; and when the Lake Nyassa extension is built a valuable trade route of some 1,200 miles in length will have been established through the heart of the lake country.—*Globe*, Nov. 8.

"COOPER, COOPER & CO."

Cooper, Cooper & Co. (1901), Ltd. (71,774).—Registered Nov. 2, with capital £70,000, in £1 shares (20,000 pref), to acquire the business referred to in agreements (1) with the Le Vallon Synd. Ltd, and (2) with J C Goode, and to carry on the business of merchants, traders and dealers in tea, coffee, cocoa and all kinds of produce, wholesale and retail grocers and provision merchants, restaurant keepers, refreshment contractors, licensed victuallers and buyers and sellers of and dealers in merchandise, goods and property of any description. The subs. are:

	Shares:	Pref Ord.
F Kempton, Crow Lees, Springfield Rd, Leics ..	1,000	250
J C Goode, 29, Mincing Ln, E. C., mcht..		5,000
N F Nalder, 94, St George's Sq, S. W., mcht ..		250
L E Thornton, 8 Montagu Sq, S. W., gent ..		250
J C Wells "Tattershall," New Bannet, Herts, gent ..		250
E J Davis, Granville House, Granville Place, W. barrister ..		100
H G Hemmerde, 18, Cyril Missions, Battersea Pk, secy ..		10

Minimum cash subscription 200 shares. The no. of directors is not to be less than 3 nor more than 6; the first are J F Kempson, J C Goode and N F Nalder; qualification £250; remuneration £100 each per annum. Registered by Hollams, Sons, Coward and Hawksley, 30, Mincing Lane, E. C.—*Investors' Guardian*, Nov. 9.

THE NEW GREEN TEA FACTORY.

Since publishing our article announcing the erection of a green tea factory in Colombo, which by the way was by a couple of days the first public intimation made of this new and important departure, information has been supplied to us to the effect that the manufacture of tea in the new factory will be superintended by a Chinese expert who has had extensive experience in his own country and in Japan. This gentleman, who was in Colombo about nine months ago when the matter first began to be contemplated by Messrs. Finlay Muir & Company, giving his advice, is now daily expected to arrive and will personally superintend the arrangements and fitting up of the machinery. With the new factory in full working order, Canada and the States need have no fear that Ceylon greens will not be turned out in a manner suitable to the most fastidious taste, accustomed only to Far Eastern manufacture. They are convinced of this and once the local enterprise is proved successful we foresee prosperity for the Green Tea industry in our midst, and increased progress for blacks in the world's markets owing to the relief effected in the supplies.

"THE TEA SOILS OF ASSAM."

We have to thank the Secretary of the Indian Tea Association for a copy of a pamphlet containing a most interesting paper on "The Tea Soils of Assam and Tea Manuring" by Mr. Harold H. Mann, B.Sc., Scientific Officer to the Association. The pamphlet is illustrated and from it we quote the following:—

SUMMARY.

Summarising therefore it may be said that—(1) The older parts of the Assam gardens are gradually deteriorating in yield and it may be also in quality. (2) It is unsound to try and make up for this loss in yield by putting out new clearances. (3) This deterioration can be largely stopped by the judicious use of manures, principally obtained locally. (4) No new clearances should be put out unless the old area is producing its maximum, or it is intended to abandon an area equivalent to the new clearance. (5) A system should be laid down for the future pruning and treatment of every plot on a garden, only to be departed from for very trenchant reasons.

PRODUCE AND PLANTING.

The following remarks about packet tea and the Merchandise Marks Act appear in the annual report of Mr George F Allwood, inspector of weights and measures to the Wolverhampton Corporation: "Local conditions have operated this year to necessitate the institution of legal proceedings in regard to packages of tea sold and exposed for sale upon which the weight was marked. A common custom now in

vogue is for large firms of tea-dealers to import consignments of tea in bulk, and cause it to be wrapped in packages of various weights from 1 oz to 1 lb. These packages are then despatched for sale by the numerous small shopkeepers, who retail as received. Several quantities of these weight-marked packages have from time to time been tested in the shops, and the results go to show in some instances a large proportion of the packets were deficient in net weight. It is considered desirable, wherever blame appears attachable, to proceed against the wholesale dealer. Great difficulties, however, are found to operate against this being done with the prospect of a successful termination. Under this Act, if a defendant can prove to the satisfaction of the court that he has taken reasonable precautions to ensure full weight, he is exonerated from liability. The two cases dismissed were in this manner adjudicated upon, although the retail shopkeeper was shown to be in possession for sale (in one case) of no fewer than thirty-four packets short weight, out of a total of forty-two tested. The cases against the shopkeepers were then withdrawn, although it is only a fair requirement that these traders should take the precaution of ascertaining how far such weight-marked packages are safe for sale before offering them to the public. How important a matter the subject dealt with in the above paragraph is will be fully realised when I mention it was stated in evidence that one of the firms concerned disposed of no less than 20,000 marked packets per week—and this by no means a leading firm in the tea trade!"

Commenting on last week's tea market, the "Produce Markets Review" says:—"The market for Indian teas has been less active, and a considerable quantity of the larger supply was withdrawn from the public sales, as the prevailing fog made it difficult to value the teas. Prices for the common grades are easier, more tea being obtainable at 5½d and under. With a continuance of lower values the demand will probably materially increase, as several of the larger buyers of these descriptions hold only moderate stocks. The medium and finer qualities have shared in the decline which will probably prove, but temporary under more favourable conditions for dealing with the teas. The stock is about 8,000,000lb larger than last year, which is mainly accounted for by the quicker transit, several of the districts being able to forward their teas two or three weeks earlier than in former seasons. Although the market for Ceylon teas has been only poorly supplied, a flat tone was displayed at the sales on Tuesday, and a lower tendency generally was manifest. This was most apparent in whole leaf descriptions from about 7½d downwards, and these in some cases showed a fall of ¼d to ½d per lb. There was, however, very little sold under 6d, this being practically the lowest quotation."—*H. and C. Mail*, Nov. 15.

THE ACETYLENE LAMP TO KILL TEA BLIGHT.

MORE ABOUT THE APPARATUS.
CONSTRUCTED FOR THE GOVERNMENT

ENTOMOLOGIST.

We had the pleasure recently of inspecting the simple apparatus which Mr. E. B. Creasy has constructed for Mr. E. E. Green, Government Entomologist, with a view to the destruction of tea blight and insect pests. To begin with the generating chamber itself: this, we saw, is a light tin vessel containing two chambers, in the inner one of which gas is generated through the contact of water with calcium carbide. The water remains in the outer chamber, but is so connected with the inner one—up which passes a series of spiral trays bearing

"the chemical required—that the production of gas is continuously going on. A tube on one side connects with a safety valve through which the gas, if over-produced, is allowed to escape. The chamber containing the gas in the centre of the generator rises automatically with the gas produced. On the other side from the safety valve, is a tube connecting with the inner chamber, through which the gas is borne off for consumption.

The whole generator weighs a very few pounds and can be conveyed about the estate by any ordinary cooly. The destructive apparatus itself consists of a tin basin soldered on to the end of an alavanga, a burner passing up through the basin-centre, attached to the end of a tube—which for a few inches passes down along the alavanga and then connects with a rubber tube leading from the generator. The basin contains water and a little kerosine oil on the top. When the burner is lit, a flame of about 50-candle power is produced, and though we were not able to see the apparatus working last night, a wet evening having been threatened, we were told by Mr. Creasy that flies and insects of various sorts have already proved their affection for the powerful light emitted by the acetylene flame, and fallen in quantities into the kerosine oil in the basin round it. This successful result is most noticeable on the darkest nights. The apparatus is extremely simple and for planters who find their bungalows dull of an evening, few more interesting excursions could be made than with cooly, generator, basin, and acetylene flame—to collect and kill their vile enemies, tea blight and insect pests.

CEYLON TEA AT ODESSA.

Mr. Consul-General O. S. Smith, in his report, states that the tea trade during the past year was very bad in South Russia on account of the universal scarcity of money and the bad harvest. "Ceylon and Indian teas are far stronger than Chinese tea, so that if consumers took to their use only half the quantity would be required. Though the consumer may not be aware of it, Indian and Ceylon teas are already largely used for mixing with China teas. It is likely that Indian and Ceylon teas will gradually make their way in the Russian market, but at present, as they are only required for mixing, only particular kinds find a market. Planters who wish to send tea to Russia would do well to employ a regular exporting house for the purpose, and no doubt would recognise that uniformity of quality is much to be desired."—*L. & C. Express*, Nov. 15.

GAME PRESERVATION IN INDIA. PROPOSED LEGISLATION.

Calcutta, Dec. 4.—The Government of India has under consideration the question of taking steps to prevent the wanton destruction of game in India, and a Bill for their protection, on the lines enunciated by Sir Allan Arthur in his speech in the course of the Budget Debate last year

will, in all probability, be brought forward during the ensuing session of the Legislative Council in Calcutta.—*Madras Mail*.

MR. CHAMBERLAIN ON COOLIE LABOUR.

ADVICE TO WEST INDIAN PLANTERS.

The West India Committee has received the following letter from the Colonial Office:—

"I am directed by Mr. Secretary Chamberlain to acknowledge the receipt of your letter of the 28th ultimo, on the subject of the payment by the planters of Trinidad of such portion of the cost of the repatriation of coolies is not payable by the immigrants themselves. I am to point out that such payments from the planters will only be demanded in respect of coolies introduced in the season 1902-3 and following seasons, and not from 1898, as stated in your letter. With regard to your suggestion that the right of the coolie to an assisted return passage should lapse if not exercised within two years of the completion of his period of industrial residence. I am to observe that such a limitation of the immigrants' rights could not be introduced without the consent of the Indian Government. Mr. Chamberlain proposes shortly to approach the Indian Government on the subject in connection with a similar proposal emanating from the Government of Jamaica, but in the meantime he would be glad if the West India Committee would consider whether the effect of the change you propose might not be that nearly all the coolies would elect to return on the completion of ten years' residence, instead of as at present remaining, some for many years, and some for ever; so that the result would be to substitute for a prospective and contingent liability an immediate charge of almost equal amount.—I am, &c.,
—*Daily Chronicle*, Nov. 12. "BERTRAM COX."

"THE TEA SOILS FOR ASSAM."

We have carefully perused the excellent little work on "The Tea Soils of Assam" by Mr. H. H. Mann, B.S.C., received lately from the Secretary, Indian Tea Association, but do not propose to enter into an extended review of it—a task which only an expert in the subject would be capable of usefully performing. Mr. Mann, in his introduction, wisely points out that though the essential importance of suitable soil for tea is pretty generally known, he has noticed (in Assam, in three years) numbers of pieces of tea put out without reference to the character of the subsoil, afterwards proved unsuitable. He is of opinion that Assam gardens do deteriorate, with age, and therefore require culture. He was surprised to note the carelessness with which cattle manure (available at 1,000 lb. per annum per head of stock) is preserved for use. Mr. Mann deprecates the Assam system of constant extensions and abandonments, and maintains that extensions are inexcusable unless the tea already in existence is producing its maximum of best quality tea. Mr. Mann's usefully summary regarding Assam we quoted when acknowledging his book; he points out the high importance of the independent results arrived at by Mr. Bamber, regarding tea soil and the relation of soil to quality, but regards them altogether as forming "a most inadequate commencement to the study of the most difficult parts of the tea culture." The first, third and fourth chap.

ters of the work under notice deal with:—(1) Assam soils, (3) Manures available, (4) Notes on the tea soil of each Assam District. These are mainly special to the great Indian tea region. But the second, which takes up "Chemical Characteristics," contains much that is of universal interest. This we have carefully extracted and quote in our daily and T.A. The point, we notice, most emphasized is that it is not alone *what* chemicals a soil contains, but *how they occur* there, that determines their effect on and usefulness for tea; sandy soil contains chemicals in the free state, but in clay, combined, and therefore not so readily nourishing the tea bush. We commend the additions Mr. Mann has made to the study of tea soils to the attention of all interested.

CHEMICAL COMPOSITION OF TEA SOILS.

(From "The Tea Soils of Assam" by Mr. H. H. Mann, B. Sc.)

Both Mr. Bamber's and my own results are however almost entirely derived from analysis of soils obtained from various tea gardens of Ceylon and Assam, and it remains to consider how far such analyses can be of value in the decision of such points as the suitability of land for planting, or the manuring requisite for such land. In considering Assam soils one is met at the outset by a difficulty, judged by all standards of English agriculture. Many of the best tea-soils, as shown by the percentage figures, seem much poorer than would be expected of virgin and good tea yielding land, and poorer even than other soil which is really much inferior for tea production. It would seem, at first sight, that analysis is of no value here, and that the poorer soils chemically are the better ones actually and agriculturally. But if these analyses be considered in another way the apparent contradiction disappears. There is in every soil a very large amount of sand which acts as a support to the plant, but in every other respect merely as a diluent of the valuable soil constituents. It would, therefore, seem that in order to ascertain the real actual richness of the soil for plant production, one's figures should be calculated not on the soil as a whole, but on that part which is not sand. What previously seemed to be the worst soil by far, now proves richer in every important ingredient (save the Potash). This is so universal in Assam soils, that one may lay down as a general rule that the power of land to produce luxuriant tea must in the future be determined not by the percentage of valuable matter in the soil as a whole, but rather in the soil less the sand, which latter acts in large measure as a diluent of the other materials. But in this argument we have lost sight of one important matter. While the amount expressed in percentages of the soil as a whole may not represent the power of giving luxuriance to the plants, it undoubtedly shows the extent of the soil resources, *i.e.*, the ultimate amount of plant food contained in the soil. Such a conclusion would be justified if the soils were of the same depth, and if the roots penetrated as easily in one as in the other. And in practice the conclusion is shown to be just by the rapid exhaustion of sands overlying clay, which at first give exceedingly luxuriant and fine tea, but which become exhausted more rapidly than any other type of land in Assam. Though, calculated in the non-sandy part of the soil, they were very rich to start with, yet the total amount of plant food was small, and was rapidly exhausted, while the roots were unable to seek fresh supplies further afield because of the underlying clay. In the example I have taken, however, it is otherwise. The soil No. 1 has at

least twenty feet depth of soil in which to range without meeting clay or water, and hence produces luxuriant tea at the beginning, and in addition lasts an almost indefinite time.

We have therefore to consider in a soil analysis:—
1. The concentration of the soil constituents, *i.e.*, the amount of the valuable matters in the part of the soil other than sand. This determines the luxuriance of the plants and probably the value of the tea.

2. The absolute amount of the ingredients of value as represented by the percentages in the soil as a whole. This determines the permanence of the plant without manuring, but only if taken in conjunction with.

3. The available depth of the soil, which may counterbalance the apparent *absolute* poverty (No. 2) of the land if this depth is sufficiently great.

METHODS OF TAKING SAMPLES OF SOIL FOR ANALYSIS.

In sending a soil for analysis, therefore, in order to satisfy consideration No. 3, the character of the subsoil should always be stated, and in addition the depth of the subsoil water, as these may have a paramount influence in determining the meaning of the analysis. The actual sample sent should always be taken in the following manner. Dig a hole in the plot of which an analysis is desired, fifteen inches deep, leaving a block in the centre of the hole 6 inches square. This block is therefore 6" by 15" in size. Have a box made of these inside measurements and invert it over the block of soil, and then remove the whole,—box, soil, and all,—by putting a spade underneath the block. Then fasten a cover on the box and send to the analyst, marking the end of the box which contains what was originally the surface soil. The analyst has thus a block showing the layers of soil as they occurred *in situ* down to 15 inches deep, and valuable results may often be drawn from mere observation of them, which would be entirely missed if merely a shovelful of soil down to the same depth were sent for examination.

IMPORTANCE OF VARIOUS SOIL CONSTITUENTS.

Although the constituents always present in soil are many in number, yet those which have any interest from an agricultural point of view are comparatively few. Some seem to have no necessary functions in regard to plant life. Such are the silica, the alumina and the soda. Others are, one may say, always present in far greater amount than the plant requires. Such are the oxide of iron, the magnesia, and the Sulphuric acid, but with these constituents it may be that they have to be present in some particular form to be useful to the plant, and thus they may be an essential element in the fertility of a soil. And third there are those ingredients required by every plant, and upon whose absolute and relative quantity depends primarily the fertility of the land. Such are the organic matter, the lime, the phosphoric acid, the potash, and the nitrogen.

ORGANIC MATTER AND NITROGEN.

These two constituents of the soil are intimately connected. In fact the total useful nitrogen in the soil is or has been contained in the organic matter. I say "has been" because at the time the tea plant utilises it, it usually has been converted into nitrates by the microbes of the soil. For many years it has been supposed that this conversion into nitrates always took place before absorption of nitrogen by the plant, and it is only recent investigations which seem to have shown that the nitrogen in the organic matter itself without previous change, may form the food of plants. The determination of the nitrates actually present in soil generally, however, gives little information as to the resources of the soil in food supply since the nitrogen in this form is so soluble a condition, that the first rain storm may wash the whole into the drains. The permanent supply of soil nitrogen is that contained in the "organic matter" or "humus," and

the amount of organic matter and the nitrogen form the first and most important measure of the fertility of a soil for tea, of the likelihood of its being of permanent value, and also of the probability of its giving high quality tea. Unluckily the amount of organic matter is one of the most difficult things to measure, and the figure in the analyses called by that name is only valuable when a similar class of soils are compared. These constituents are however so essential and important that, unless they are present in large enough quantity, the other ingredients of the soil are all but useless.

"LAW OF THE MINIMUM."

But organic matter and nitrogen are not the only constituents required in the soil for the production of healthy and luxuriant bushes and of high quality tea. For both these results they occupy essentially the most important position, but without other ingredients they would be utterly useless. There is a law in agriculture known as the 'law of the minimum,' which states that if the minimum required by a plant of any constituent be not obtainable, all others are there in vain and the plant cannot be grown. Inasmuch as the tea plant requires Phosphoric Acid, Potash, Oxide of Iron, and Lime at least, and probably Magnesia as well, it is absolutely necessary that these should be present in sufficient quantity and in a sufficiently available form for the plant to grow well. I say 'in a sufficiently available form' because they may and often are present, but in such a condition that the plant cannot use them. Thus, for instance, the quantity of potash in a clay soil is invariably several times greater than in sandy land, and yet the latter may be actually richer agriculturally in this constituent at any particular moment than the former, simply because in the former case it is so combined in the clay as to be in large measure useless for the plant: again, Phosphoric Acid is always less useful in the presence of large quantities of Oxide of Iron and Alumina than in their absence, &c.

RELATION OF PHOSPHORIC ACID TO QUALITY.

Why does Phosphoric Acid play such a preponderating part in the production of high quality teas? No albumens, no cells, and hence no tissue can be formed in its absence. Now as those parts of the plant used in tea manufacture are those in which the production of new cells is extremely vigorous and energetic, so is this constituent of more importance for the perfect production of the crop than with ordinary agricultural products. There is another reason also. It has recently been shown that the acidity of plant juices depends on the amount of Phosphoric Acid in the soil. Now the younger leaves and hence those which make the best tea are more acid than the older ones, and so one is, I think, entitled to assume that a certain proportion of acidity is necessary in the leaf for making the best tea, and this is rendered more certain by the presence of much Phosphoric Acid in the soil.

POTASH.

The constituent next of importance to the tea plant is without doubt the Potash. Its function in the plant is most important, and there is little doubt that it plays a fundamental part in the production of tannin (the essential element in the pungency of tea), as well as in the formation of albumens and the production of new cells and new growth.

BALANCE AMONG SOIL CONSTITUENTS.

Finally, what seems of greater importance for the luxuriant growth of high quality tea than the presence in large quantity of any particular constituent, is that the constituents of the soil should be well balanced—that is, that it should contain enough organic matter and nitrogen to satisfy the utmost needs of the plant (say not less than 0.3 per cent. of nitrogen calculated on the soil less the sand), and then a sufficient quantity of other constituents to prevent the plant having any trouble in obtaining them. If there is a large quantity of readily available

nitrogen—with the necessary organic matter—and not sufficient readily available Phosphoric Acid, etc., there will probably result a rank growth giving sappy wood, and leaf without the special qualities of high class tea. If, on the other hand, the nitrogen is too small in amount and the other constituents in excess, a high quality tea will be produced,—but only little of it. And further if both nitrogen and phosphoric acid are low, then neither luxuriance nor quality are obtained, and the garden is worn out—becomes the prey to blight after blight—fills with vacancies and probably ultimately disappears or is abandoned.

OUR BELGIAN SCIENTIFIC VISITOR.

M Lippens, our Belgian scientific visitor, is immensely charmed with his visit to Ceylon and looks forward to revisiting it at a later date. Meanwhile he proceeds to India and Burmah, studying tropical products as he goes, and afterwards to Java, Sumatra, &c. before returning to Belgium and thence to the Congo—to introduce new products. M Lippens, we may add, is correspondent to that famous continental paper which has made so many startling but often correct announcements during the war, *L'Indépendance Belge*, which, unlike the *Petit Bleu*—a purely popular paper—is the medium for communications from all classes of impartial and cosmopolitan critics of national and international events.

SIR HARRY JOHNSTON ON

"UGANDA."

BEFORE THE GEOGRAPHICAL SOCIETY.

The opening meeting of the new session of the Geographical Society was held last night in the theatre, Burlington-gardens. The president, Sir Clements Markham, was in the chair, and there was a very large audience.

Sir HARRY JOHNSTON delivered a lecture on "Uganda Protectorate, Ruwenzori, and the Semliki Forest." The lecturer took the Uganda Protectorate province by province, and gave original information about each province in turn.

THE PROVINCES

are six in number—Eastern, Rudolf, Central, Nile, Kingdom of Uganda, and Western. He said that the traveller from Mombasa, before reaching the frontier of Uganda, passed through the country of Kikuyu, which was well forested and thickly clothed with vegetation. As he descended into the Rift valley the Kikuyu vegetation decreased in luxuriance. In the vicinity of Lake Naivasha there was a short sweet grass, which was probably kept low by the browsing of innumerable antelopes and the herds of Masai cattle. The Masai of the Naivasha, district belonged to the essentially cattle-keeping semi-nomad division of that race. Quite recently, for political reasons, it had been thought advisable to make the Masai dwelling within the eastern province of the Uganda Protectorate independent of any political connexion with those of the adjoining East Africa Protectorate or of German East Africa. Unfortunately at the present moment the Masai race was on the road towards extinction, either by dying out or by fusion with other tribes. The last year or so, however, there had been a marked increase in prosperity among the Masai of Naivasha, and he was therefore in hopes

that in this region they might increase and multiply and preserve their purity of race. From the north-eastern buttresses of Mount Elgon, and the headwaters of the Weiwei river on the north, to the frontier of German East Africa on the south—a distance of about 240 miles—extended at altitude ranging between 5,000ft. and 10,000ft. one of the most beautiful and healthful districts to be found anywhere in the Dark Continent. This lofty region he would style the Nandi plateau, as it was mainly inhabited, so far as it had any human inhabitants at present races of the Nandi stock. The scenery on the Nandi plateau reminded the homesick official and traveller over and over again of England, of Wales, of Scotland. This beautiful land had not in it a single ugly or unfriendly spot, and as it was almost entirely without native inhabitants it seemed to be awaiting the advent of another race which should make it a wonderland of wealth and comfort, a little England, half a Scotland, or a large Wales lying exactly under the equator at an average altitude of 4,000ft. above the Victoria Nyanza, of whose silvery gulfs and ghostly mountain coastline strange glimpses at a distance of 90 miles might be caught occasionally from some breezy height or through the interstices of woods which themselves might be in Surrey. He travelled completely round Mount Elgon. On its southern as on its northern side the awful mountain cliffs which marked one of the lower terraces of this tremendous crater were honeycombed with deep recesses or caverns.

IN THE FOOTSTEPS OF JOSEPH THOMSON.

These were the well-known caves of Elgon, the caves which were first discovered by Joseph Thomson. He visited several caverns, but among others the one which was the first cave reached and discovered by Joseph Thomson, whose visit the natives still remembered vividly. This cave was marked by a splendid waterfall. It was the descent of the Sasuru river, and he would propose to name the waterfall the Thomson Falls. It was hardly necessary to add that Joseph Thomson left behind him there, as wherever else he passed in Central Africa, the most pleasing memories. Fate had ordained that he should often travel in Thomson's footsteps, and he had always noted that where Thomson had been the first white pioneer his admirable treatment of the natives had ensured a kindly welcome to those who followed. The native inhabitants of West Elgon were of the greatest interest. They were of rather a mixed stock, but all were of very low and ape-like appearance. The greatest interest they possessed lay in the fact that they spoke a Bantu language which, of all those discovered, possibly came nearest to the original form of the Bantu mother tongue.

THE FIVE-HORNED GIRAFFE.

From the Sabei country he was obliged to travel for 16 days to the ravine station without a road, simply guiding his caravan by the map and eye. From the north-east of Elgon to within sight of the ravine station they passed through a land whose only human inhabitants were a few wandering and fugitive Andorobo—a land simply swarming with big game. They saw large herds of elephants first, then many rhinoceroses, then literally countless hartebeestes, water-buck, reed-buck, Cobus antelopes, bastard hartebeestes, and oribi. Herds of zebras would follow the caravan, snorting and kicking up their heels. There were lions

leopards, warhogs, jackals and many ostriches. Last of all, in the middle of the Gwas 'Ngishu plateau, where forests of acacia still lingered, they came upon giraffe, upon that five-horned giraffe which appeared to be a new species of that remarkable animal and apparently the common form of giraffe between Elgon on the west and Lake Barugo on the east. Seen from a distance, these giraffe appeared, when adult, to be black and white, black with white bellies and limbs. Here and there monsters stood on the tops of large anthills or small hillocks, sentries posted to warn the feeding herds of the approach of the giraffe's only enemies, man and the lion. Yet so little had man harassed these creatures during recent years, since the plateau was divested of its human inhabitants, the Gwas 'Ngishu Masia, by civil wars, that these sentinels seemed to have taken little or no notice of their caravan. With the aid of Mr Doggett, he secured four specimens—two males and two females—for the British Museum.

THE CONGO FOREST.

After describing Bvsoqa, the Baganda people, and the southern part of Unyoro, the lecturer said that he crossed the Semliki River opposite Fort Mbeni and travelled for three days in the dense Congo forest. He could fully endorse all that Stanley had said about the awesome nature of those appalling woods. He could only say that the whole of his expedition, as well as himself, longed to be out of them, although they were in search of the now well-known Okapi, and of other wonders, some of which were found and some of which still remained undiscovered. He employed his time in this forest by visiting the Pygmies at home and seeing their little settlements of tiny huts constructed of withies and leaves. He also encountered there those strange prognathous ape-like people who seemed to be a race of pariahs dwelling on the fringe of other tribes. He also ascertained that the real gorilla comes pretty near to the Semliki in its distribution. He had reason to believe that other remarkable discoveries of hitherto unknown mammals would be made besides that of the Okapi. As it was, in that forest they obtained skins of several other beasts new to science. He was accorded the kindest hospitality by the Belgian officials, and given every possible facility for visiting that portion of the Congo Free State. He found the natives everywhere on friendly terms with the Belgian authorities, and the excellent roads and well-built stations, together with abundant supplies of the comforts and necessaries of existence from Antwerp merchants, introduced a strange element of civilization into those otherwise trackless wilds. Sir Henry Stanley would indeed be amazed at the change which had taken place in parts of the forest which some 12 years ago were to him and his expedition more remote from civilization than the North Pole.

THE DISTRICT OF ANKOLE.

The south-western part of the Uganda Protectorate consisted of the district of Ankole. A portion of that noble country rose to heights of 8,000ft. and 9,000ft., and here reappeared the alpine vegetation of Ruwenzori, Elgon, and the Nandi plateau. Among these mountains were scattered almost innumerable crater-lakes, which provided landscapes of exquisite beauty. They nearly all contained fish. The scenery round these crater-lakes was so extravagantly beautiful

that he felt that, coupled with the fact that they were in a country possessing a very healthy climate and few inhabitants, they might some time become the seats of small European settlements. The northern part of Ankole was somewhat drier and less equatorial in climate. It had a more parched appearance, at any rate during the dry season, and it fell in altitude. Here and there was a certain amount of big game, including buffalo, rhinoceroses, and eland? The people of Ankole, as was well known, consisted of a race of sturdy negroes—the Ba ivo—and an aristocracy of Ba-hima, who were, as Speke, their original discoverer, guessed at once, obviously descended from a Gala, Somali, or other Hamitic stock. As regarded features and complexion, one often saw men and women among the Ba-hima who were more like Egyptians than was the case with the Galas and the Somalis. But, strange to say, the hair of the head was much more woolly and negrolite than was the case with Galas and Somalis. He had seen some men and women so light in complexion that he actually thought they were some of Emin Pasha's refugee Egyptians, until it was proved to him that they had been born and bred in Ankole. These people, no doubt, were the origin of many of the legends of a white race dwelling in Equatorial Africa. Among other points they were remarkable for their domestic cattle, which had more or less straight backs, were of large size, and had enormous horns. On the whole, the breed agreed remarkably closely with the long-horned cattle depicted in the Egyptian frescoes, and he believed that this race was the stock from which the long-horned South African cattle were derived.

THE RUWENZORI MOUNTAINS.

The lecturer concluded with an account of his exploration of the Ruwenzori range of snow mountains. He said that Ruwenzori was still the most mysterious and least known mountain in Africa, and it was certainly, of all African mountains of his acquaintance, that which was the most constantly cloud-covered. He was personally convinced that the highest point of Ruwenzori was not under 20,000ft. in altitude, and that it would, therefore, be found to attain the greatest altitude on the continent of Africa. When, after the most arduous climb he had ever experienced, he reached his highest point on the flanks of the snow range—14,800ft.—the mountain above him seemed a thing he had only begun to climb, and towered, so far as he could estimate, another 6,000ft. into the dark blue heavens. Permanent snow, however, lay as low as 13,000ft. To effect a complete and successful ascent of the highest points of Ruwenzori required as elaborate a preparation as the exploration of the Andes or the Himalayas. An enormous deal remained to be done in the exploration of this, the most important range of Africa.

Sir Harry Johnston illustrated his lecture with a large number of beautiful lantern-slides made from photographs taken by himself, and created considerable amusement by reproducing by means of the phonograph specimens of native singing. At the conclusion of the lecture.

Sir H M Stanley, Mr JES Moore and Dr. Bowdler Sharpe addressed the meeting, which was brought to a conclusion by a vote of thanks to Sir H Johnston, proposed by the President, and heartily carried.—London *Times*, Nov. 12.

PRODUCE AND PLANTING.

“Mr William Mackenzie, Ceylon tea commissioern, was in Toronto a few days last week,” says the *Canadian Grocer* of November 8. “After calling on the wholesale trade he was much impressed with the progress that was being made with Ceylon greens. He said they were making equally good progress in the United States.”

In its comments on last week's tea sales, the *Produce Markets Review* says: “There is an improvement in the demand for Indian teas, and prices on the whole have shown a somewhat firmer tendency. A considerable quantity was again withdrawn from the public sales, as holders evidently were not disposed to accept the lower prices established last week. A large quantity of the withdrawals has, however, since been sold, and, in most cases, at an advance on the bids made at the auctions, the market closing with a stronger tendency. The lower qualities, although much dearer than in the early part of the year, are about equal in value to those of the past few seasons, and there appears to be every prospect that present prices will be well maintained. A shortage in the season's production is practically certain, the deficiency being generally placed at 10,000,000 lb. but as there was a large surplus stock on the arrival of the new crop, there is apparently no reason for any material rise in prices. The offerings of Ceylon teas have been somewhat heavier, but a better tone prevailed generally, and, with good competition, the fall of last week was fully recovered.—*H and C Mail*, Nov 22.

“SO LONG” TO OOLONG!

Mr A R Robertson, writing in the first number of the “Tea and Coffee Journal,” published in New York, describes the progress made since 1893 in the sale of Indian and Ceylon Tea in the United States.

“Formerly,” he says, “it was exceptional to go into a grocery store and be able to buy this tea; now every store keeps it. The jobber until a year or two past was satisfied to carry a few chests for mixing, but now it is necessary for his business to have a fair selection of grades and quantities to supply demand; in conjunction with bulk teas, many wholesale grocers and jobbers have their own lead package tea in pounds and halves, which meet steadily with increasing sales. Why is all this? Because the teas have *virtues and values*. There is something satisfying in a well brewed cup of Ceylon tea and it is making tea drinkers, although only one half the quantity of leaves is required, in comparison with Oolong and other China teas. Thus it is cheaper to consumers, and although the total consumption of tea does not increase greatly estimating by number of pounds imported, it goes so much further that it demonstrates clearly that more tea is being consumed.”—*Tea*.

£5,000 REWARD.

FOR DESTROYING THE PRICKLY PEAR.

Brisbane, Nov 27.

The Government today decided to offer a reward of £5,000 for the discovery of a method of eradicating the prickly pear, subject to certain conditions, one of which is that the cost shall not exceed a fixed maximum sum per acre.—*Adelaide Observer*.

ESSENTIAL OILS FROM CEYLON.
IN THE GERMAN MARKET.

(From the Semi-Annual Report of Schimmel and Co., (Fritzsche Brothers,) Miltitz near Leipzig, October 1901.)

Since the publication of our last report, important changes in the economic condition of Germany have been developing, changes which are casting their shadows ahead, and are making their influence felt on the general state of affairs. In the front rank appear the new Customs Tariff and the Commercial Treaties with other countries. With regard to our own line, after exertions extending over several decades, the general desire to exempt the various seeds, such as anise, coriander, fennel and caraway, which are used in the manufacture, has at last been taken into consideration. It is proposed to admit these seeds in future free of duty for the distillation of essential oil, subject to an official permit and control. But in order to render this concession of real value to our industry, it is necessary that the residues of the distillation should be left to the manufacturer and not (as is the case with spices) that they should be required to be destroyed. These residues namely are dried, and form a valuable food for cattle. Successful competition with abroad is only possible if, in addition to the duty saved, these residues can be turned to account. On the other hand, it cannot be denied that the essential oil may only partly be abstracted from these seeds, and that the latter may be subsequently dried, with the view of using them dishonestly for mixing with normal qualities of seed.

For this reason it is necessary to grind or crush these seeds before the distillation; they should, moreover, be completely exhausted in the distillation process, so that it may be possible to exempt them from duty when worked up into food for cattle. We have no doubt that the proposals made by us, which meet both cases, will be accepted, and that this contentious point may thereby be settled once for all. But, as nothing has been inserted in the draft Tariff without a *quid pro quo*, the import duty on the seeds mentioned above—in so far as those seeds are not used for the preparation of essential oils—has been raised from 3 marks to 4 marks per 100 kilos, and that on essential oils from 20 marks to 30 marks per 100 kilos. The last-named increase is not only injurious to the German middleman, but has also the effect of raising the price of a large number of foreign essential oils which are indispensable for the home manufacture of perfumes and soaps.

CAMPHOR OIL.—An important change in this Japanese product is highly probable in the near future. The Japanese Government, encouraged by the results of the camphor monopoly, has given notice of its intention to stop the sale of camphor oil altogether, and to undertake itself the working up of the oil into its different constituents. It will soon be known whether the Japanese Government actually realizes the hoped-for profit, or whether it has not largely over-estimated the consumption of safrol. In our opinion the working up of camphor oil, as an independent industry, can never be made to pay. In the two by-products "Desinsectol" and "Insectol" it may be possible to recognise two old friends, viz., light and heavy camphor oil. As, however, neither is soluble in water, the information given above as to the dilution of the former with water needs scarcely be taken seriously.

CARDAMOM OIL.—The Ceylon cardamom oil mentioned in our price-lists is no longer made by us from the fruits of *Elatteria Cardamomum var. β*, but is now distilled from the seeds of another species from which the pericarp has been removed. As the seed is shipped from Ceylon under the name of 'cardamom seeds,' the designation 'Ceylon cardamom oil' is quite justified for this oil. It differs, however, from the oil previously supplied by us according to various deter-

minations our present Ceylon cardamom oil has approximately the following constants; specific gravity at 15°, 0.9336; optical rotation +24° 15'; saponification number 109. The oil makes a clear solution with three parts by volume of 70 per cent alcohol.

CINNAMON OIL, CEYLON.—Since the date of our last report the price of fine cinnamon chips has undergone a further important reduction, and along with it also the quotation of the distillate, which we were the first to produce, now some 27 years ago. At that time the price of cinnamon chips was about 176 marks per 100 kilos; now it is about 55 marks; the imported oil cost then about 220 marks, whilst its present quotation is about 70 marks per kilo.

CITRONELLA OIL.—Contrary to all calculations the value of this leading article has gone back still further in the course of the last six months. It has now reached a level which would have been considered scarcely possible. This points to a considerable over-production of this oil also, an over-production which it is impossible to stem by ordinary means, and it will therefore be necessary to wait until this unhealthy state corrects itself. It will be remembered that already several years ago, when the price was 1/- per lb., the Ceylon papers described the distillation as wholly unremunerative, and shortly before the publication of our April report we were informed from Galle, that in many districts in Ceylon the citronella cultivation had been entirely given up. If, in spite of this, the prices have declined about 20 per cent, this fact throws a very peculiar light on those statements.

The shipments from Colombo and Galle were as follows:—

From 1st January to 1st July 1901 ...	634,608
do do 1900 ..	605,644
do do 1899 ..	657,080
do do 1898 ..	616,784

The first-named amount is made up as follows:—

United Kingdom ...	374,607
America ...	138,749
Australia ..	2,304
Germany ...	110,373
France ...	2,399
India ..	174
China and Singapore ...	1,582
Austria ...	4,420

Total .. 634,608 lb.

A considerable increase is shown in the sale of the fine Java citronella oil, the quality of which has so far remained the same, and which has a constantly increasing number of friends. Several large consumers who used to employ exclusively Ceylon oil, have gone over to the product from Java, and appear to find it worth while. For the better quality soaps only Java oil should be used, and the proportion be reduced by one half as compared with Ceylon oil.

SANDALWOOD OIL (EAST INDIAN).—The use of this oil, both in medicine and in perfumery, makes such rapid progress, that we found it necessary to make special arrangements in our new Works for the manufacture on a large scale, which arrangements have answered exceedingly well. The distillation process has not only been considerably shortened, but has also been so much improved from a technical point of view, that the product may now be said to have reached the highest pitch of perfection. The rumours about the monopoly, which were circulated in London early in the year and caused a great sensation, have not been confirmed, but, on the contrary, have been officially contradicted.

GERANIOL FROM CITRONELLA OIL.—(German Patent No. 76,435.) Since the completion of our new factories, the manufacture of this product has now entered upon another stage, and we hope in a short time to be at last able to keep it in stock. In view of the difficulties met with in the supply of palmarosa oil, geraniol will be called upon to play a more im-

portant part than hitherto, and we hope that the possibility of obtaining it now in sufficient quantities will stimulate new trials. Pure geraniol, such as supplied by us, is a magnificent body with an intense and pure rose odour.

SAFROL.—When reporting on camphor oil we already mentioned the changes which are imminent in the production of safrol. The Japanese Government is no longer willing to let us make the "large profits" which are said to have been made here, and it has erected at Kobe a safrol factory, which has been placed under the management of a Japanese chemist, Dr Shimoyama, who has made his studies in Germany. It is stated that in this factory in future the so-called brown camphor oil (in which we discovered safrol in 1885) will be worked up into safrol, and placed direct upon the market. This industry has already been carried on in Japan for several years by Americans, but does not seem to have prospered; as a matter of fact it has been limited to the production of an inferior product for the American market. The Japanese Government has now the intention of placing pure safrol on the market, and of monopolising the article. The future will show whether this project can be carried through.

VANILLIN.—Enormous competition has brought the price of this product to a level which nobody would have considered possible. For the price of one kilo of the finest vanilla, one can now obtain the same quantity of the 50 times stronger vanillin—a fact which calls for admiration. In this connection the question rises involuntarily, what the present value of vanilla would be without the competition of vanillin? Whether it is to the interest of the consumer to take the price as the only criterion, is a question which for this preparation we would decidedly answer in the negative, and we would point to the many possibilities of adulteration which have already made themselves felt in previous years. Benzoic acid and acetanilide have been special favourites for this purpose. (See our Reports of October 1894, p. 79 and October 1898, p. 64.)

CANADIAN TEA TROUBLES.

The following appears in the "New York Tea, Coffee, and Sugar Journal," which quotes the "Montreal Herald" as its authority:

"It will cost more to satisfy Canada's thirst during the next twelve months than it did during the year just past. This increase in expenditure for beverages will not be due to the fact that more alcoholic stuff is to be consumed—some people say that is never done to the limit—but because the price of tea has advanced and is still going up. The tea men all say when asked as to the condition of the tea market, 'Prices are firm.' This means teas have advanced from a cent and a half to two and a half cents a pound. An increase this look like a very small affair, but most men would find it very embarrassing to settle the increase for the whole of Canada. Last year the Dominion brewed twenty million pounds of tea. There will be as much consumed this year. Now an increase of two cents a pound in the price amounts to four hundred thousand dollars on a year's supply. General shortage in tea crops of India, Ceylon, Japan, and reductions in the production in China are the causes of the scarcity of tea, which will be more severely felt in London than elsewhere, as London is the greatest of tea towns. Half the crop of the world finds its way into the capital of England in the course of the year, and from there is distributed all over the world. In Japan this year shortage of a million pounds in the crop is anticipated. Prices have already advanced there. India and Ceylon are suffering from over-production. The plantations of these two countries were extended so rapidly during the last few years that they produced more tea than the world wanted. With cheap labour and favourable climate and soil, the planters were able to put a fine

quality of green tea on the market so cheaply that China could not compete, and Chinese growers were driven from the market. This is shown by the export figures of Foo Chou, the port from which all the China greens come from. Last year 5,000,000 were sent from this port. So far this year, and the exporting season is almost over, 92,000 pounds only have been shipped. The Japanese teas are of higher quality, and were not affected to the same extent by the Indian and Ceylon invasion. The planters of these two countries, in spite of a splendid crop and the driving of China from the market, did not make money. So this year, before the planting period, they combined to curtail production. The area devoted to tea cultivation was materially reduced. Then the unexpected happened. This year's crop has been largely a failure. The reduced area given up to tea did not produce more than half a crop. Now the world's tea supply is away below what it should be. Montreal is the great tea town of Canada and conditions all over the country can be judged pretty well by those here. Last year tea was very cheap, and everyone loaded up at the beginning of the season with enough to last a year. This year, with prices up, the trade will probably buy in smaller quantities, and watch for a break in the market. The quality of tea sold is likely to be inferior. Canadians have fallen into the habit of buying teas at a special price. There are 25c teas, 30c, 40c and 50c, which are favourites with housekeepers, and they will not change their prices to accommodate any fluctuation in price in Japan. The wholesaler and the retailer are not going to sacrifice their profits, so a poorer quality of tea will be put up in the 25c, 30c, 40c and 50c packages this year. And everyone will be happy.—*H & C Mail*, Nov. 22.

INDIAN TEA ASSOCIATION'S MEMORIAL AGAINST THE CEYLON DUTY.

(No. 1246-0.—From the Secretary, Indian Tea Association, to the Secretary to the Government of India, Finance and Commerce Department.)

Royal Exchange Building, Calcutta, 23rd Nov. 1901.

Sir,—I am directed by the General Committee of the Indian Tea Association to invite the attention of the Government of India to certain matters relating to the duty levied upon teas imported into the island of Ceylon.

2. In the first place I am to state the facts concerning the duty. The most important fact is that it is a protective duty; for it is levied at a rate of 4 as per pound on all imported teas of whatever origin. The consumption of tea in Ceylon is said to be comparatively speaking insignificant. It is unlikely therefore that the duty was imposed for the purpose of conserving the local market for the Ceylon planter. But in Colombo the blending of teas for exportation, forms a considerable trade; and it was no doubt with the view of preventing the admixture of low grade China growths with the produce of the island that prohibitive taxation was determined upon. It is, the General Committee think, only natural and right that Ceylon should have taken stringent measures in order to preserve the good reputation of its teas. But the duty has also the effect of practically excluding from the Colombo market all Indian teas which might otherwise be sold at the public auctions there. This exclusion does not closely concern the industry in Northern India; but it is of very great consequence to those Gardens which are situated in the Madras Presidency. The cultivation and manufacture of tea in Travancore and the neighbouring districts are assuming large proportions. The extensions of the planted area during recent years have been considerable; and the annual production now amounts to about five and a half, or six millions of pounds. But the planters labour under one great disadvantage: they are not present without an accessible market for their teas. Calcutta is too remote, and neither Bom-

by nor Madras, nor any of the smaller ports on the south coast are, or are likely to become, centres of the tea trade. The only market within easy reach of the grower in Southern India is Colombo; and that market he is practically debarred from using by reason of the protective duty.

The hardships which this barrier entails have been forcibly represented to the General Committee by the United Planters' Association, and the other kindred Associations, of Southern India. It has been pointed out in these representations that under existing conditions Indian teas cannot be sold in Colombo on an equality with Ceylon teas. The reason for this is that, being dutiable, they are stored in the Bonded Warehouse, from which they cannot be removed except on payment of the duty (which is equal to about 70 per cent of their average value) or on their being shipped. This precludes their being used by dealers for blending purposes, and consequently has a distinctly adverse influence upon prices. The Ceylon planters are—as has been already conceded—doubtless right in taxing foreign teas, because they object to their own being mixed with inferior growths. But this objection does not apply to teas produced in Southern India, because these are equal in quality to ordinary Ceylon teas. For the protection of the latter, therefore, it is not really necessary to tax the former; and the Southern Indian Associations are very strongly of opinion that their produce should be admitted free into Ceylon.

4. As has been already stated the duty does not to the same extent affect the Northern Indian industry, which this Association more especially represents. But in one respect it indirectly exercises a prejudicial influence upon the distribution of teas produced in the northern districts. This is particularly so in the case of teas destined for the Black Sea ports, where a great prospective market is believed to exist. There is no direct steamer service between Calcutta and Russian ports, and consequently transhipment at Colombo or elsewhere is unavoidable. Moreover the Russian Government gives certain advantages in inland transit to goods landed from the steamers of the Russian Volunteer Fleet trading between China and the Black Sea. And in order to put Indian tea on equal terms with that from China and Ceylon, it is therefore necessary that these steamers should be carriers. It is almost needless to say that Colombo in view of its geographical position in relation to Calcutta is the natural point for transhipments. But the charges which are levied there are so heavy—because the tea has either to be stored in the Bonded Warehouse or to be cleared by payment of the duty—that it is less expensive to tranship at Singapore, notwithstanding the greater distance. If Colombo were a free port such a detour would be unnecessary and much valuable time would be saved. In this respect therefore the existence of the duty is a distinct disadvantage to teas shipped from Calcutta.

5. It is the opinion of the General Committee—after having given the whole question their most attentive consideration—that the facts disclosed in the preceding paragraphs justify an application being made to Ceylon for the abolition of the duty, so far as Indian teas are concerned. They have consequently instructed me to enquire if the Government of India would be disposed to assist the Indian industry by preferring such a request to the Ceylon Government, or if need be to the Secretary of State for the Colonies. In making this enquiry the Committee have not omitted to take into account the possibility that the Colonial authorities if they consent to admit Indian teas free, may be willing to do so only on the condition that the 5 per cent. duty now levied in India is likewise remitted in the case of Ceylon teas. So far as Indian growers are concerned the Committee are unacquainted with any reason why such a demand, if made, should not be complied with. And seeing that the revenue derived from this source cannot be large, they presume that the Government of

India would raise no serious objection; for any readjustment of taxation which might be required would apparently be trifling and easily arranged. The proposal which the Committee venture to advance is, therefore, of a two-fold nature. Firstly, that an attempt should be made to induce the Ceylon Government to exempt Indian tea from the payment of duty; and secondly that, if necessary, Ceylon tea should be likewise exempt from the payment of duty in India. In the case of non-British teas the Committee consider that the existing duties should be maintained.

6. It has been suggested that if the Ceylon Government definitely decline to make the concession asked for the Government of India should seriously consider the advisability of enhancing the Indian duty to a protective rate. That the present position as between India and Ceylon is unfair to the former is evident. For while Indian tea—as has been shown—is practically excluded from Colombo, Ceylon tea is being sent to India in increasing quantities. The rate of duty is so low as to present no real obstacle to its importation, either for consumption in India or for re-exportation to Central Asia. The Indian tea industry have determined, as you are doubtless aware, to make a strong effort to extend the consumption of Indian tea in both the markets indicated, especially that of India itself. And it does not seem fair that Ceylon should enjoy the benefit of developments effected at the cost of India, while itself retaining a practical embargo on Indian tea. Statements have also been made to the effect that the quality of a large portion of the tea now being imported from Ceylon is so inferior as to necessitate a protective rate of duty. Upon this point the Committee are at present unable to express an opinion; but they are distinctly opposed to the continuance of the inequality as between the two tariffs. The removal of this inequality would, they think, be best effected by abolishing both the duties in question. But if the Ceylon Government are not agreeable to this being done, then the enhancement of the Indian tax would appear to be the only alternative.

7. In conclusion the General Committee respectfully venture to ask that this letter may be submitted to His Excellency the Viceroy for such orders as His Excellency may see fit to pass.

I have the honour to be, Sir, Your most obedient Servant.
W. PARSONS, Secretary.

BRITISH NEW GUINEA UP-TO-DATE.

The report from British New Guinea for the year ended June 30th last shows that during the past ten years the revenue has more than quadrupled, while the expenditure has increased by about 50 per cent. In the last five years the trade has almost trebled. The rubber industry is at present languishing, probably because the accessible country near the coast is worked out. But there is an enormous area of good rubber country waiting to be worked in a scientific and rational way: "until and unless it is treated so, it had better be left alone, and it is infinitely preferable to see a diminished export than an apparently flourishing trade being carried on at the expense of its capital sources and ultimate ruin." The accounts of the visits of inspection to various parts

* The imports for the past five years are stated by the Director-General of Statistics to have been as follows:—

	lb.		lb.
1896-97	748,127	1899-1900	570,161
1897-98	1,059,716	1900-1901	1,496,700
1898-99	1,108,686		

of the colony are, as usual, very interesting. It is noted that considerable progress has been made in the spread of the authority of the Government everywhere. The year, however, has been unfortunate, as whooping-cough, which was introduced by two white children from Cooktown, has ravaged the country, with dire consequences to native life. The malady first spread rapidly along the coasts, and then into the interior. "But the mischief does not end there, for as each village is attacked, and as no death can, in the belief of the native, be the result of any natural cause, but must have been compassed by some unknown enemy, who can only be discovered by witchcraft, the sorcerer is at once consulted, and some unfortunate villager of some other tribe is designated as culprit, and a midnight massacre of innocent people is the result." A curious circumstance which is noticed is that a wide gulf generally exists between prisoners and free men in the native mind. Free natives will not work or camp with prisoners. Yet no stigma rests on the prisoner who has served out his sentence and is released. He is regarded as having purged his offence against the law. In civilized societies the stigma always remains, and "this is the real difference between the degree of intensity in the punishment of civilized and uncivilized men."—*London Times*, Nov. 22.

THE ORIGIN AND DISTRIBUTION OF THE COCONUT PALM

forms the subject of an interesting paper by Mr. O F Cook in a recent issue of the United States National Herbarium. It is contended that this most useful tree must have originated on the Pacific Coast of South America and spread from thence to Polynesia and Asia. It is pointed out that all the other species of cocons are natives of South America. The coconut palm was found upon the Pacific coast by early Spanish explorers. Mr. Cook also claims an American origin for the banana and yam.—*Nature*, Nov. 28.

THE NEW TEA FERMENT.

(Specially communicated.)

The original discovery of the oxidising plant enzymes is principally centered round the investigations of G. Bertrand who investigated the peculiar properties of Japanese Laquer and proved that their hardening property was caused by the action of an oxydase which he named laccase acting on the peculiar juice, of the plant *Rhus vernicifera*. The juice which is of the consistency of thick pale cream, remains unchanged when stored in well stoppered bottles, but almost immediately commences to turn brown and harden when exposed to the air. Here was a clear case of oxidization and it was proved that the juice had not the power of hardening in the absence of its enzyme, only a resinous soluble grease being obtained under such circumstances.

The above discovery gave an impetus to the enquiry into many domestic problems, amongst others as to why an apple turns brown when the rind is cut or broken and it is exposed to the atmosphere. L. Lindet

in 1893 explained this discoloration as resulting from an enzyme to which was subsequently given the name of malase. The rapid discoloration of the cut slices of beet in the sugar works even when they had not been in contact with iron or steel was traced to an enzyme which was named tyrosinase. C. Loew in America, when investigating the cause of the flavonring of tobacco for the U.S. Government, after deciding that it was not caused by bacteria, described first an enzyme, then a per-enzyme, and lastly a catalase as present in the leaves, all of which had the power of oxidising some constituents of the leaf, and it was entirely to their action that he attributed the different flavours of the tobacco. One named olease is also present in the olive which is the principal agent of its decomposition before being put in the press, it also passes into the oil expressed at a temperature below 70°C. and continues to carry oxygen thereto forming oleic acid, acetic acid, sabacic acid, &c. Mustard oil, as such, is not present in the seed, but is a product of an enzyme myrosin acting on a glucoside sinigrin, or potassium myronate, which is also present in the seed. In the presence of water the myrosin decomposes the potassium hydrate, splitting it into potassium hydrogen sulphate, sugar and allylthiocarbined (mustard oil). Flax castor oil and many other plants contain in the seed an enzyme called lepose. Care must be taken in experimenting with these enzymes as they are not all harmless compounds. In the Rosaceae is found an enzyme, emulsion, often associated with a glucoside amygdalin, which it decomposes into benzaldehyde (oil of bitter almonds), sugar and the very poisonous prussic acid. The above are some of the well-known enzymes from the action of which, by analogy, we can to some extent trace that of the one found in tea. In almost all these cases oxygen is carried by the enzyme to the tannin and thus dark coloured oxy-compounds are produced which are precipitated in the cell walls as a fast permanent dye. While the cell remains intact the oxygen cannot obtain access to the enzyme or to the tannin, but as soon as the cell walls are ruptured oxygen gains access and the action commences at once.

A number of people have discovered different enzymes and have assigned to them different powers; but the broad fact remains that the majority of them have the power of oxidising lacoll, other polyatomic phenols, as also their acid derivatives gallic-acid and tannin,—as well as the polyphenols contained in the group OH or NH₂, either in the ortho or in the pari position. The known enzymes all appear to belong to the proteid class of organic substances and a small quantity of each is enabled to transform a large bulk of the object on which it acts without increasing or very much diminishing in bulk. They are generally destroyed at a temperature of about 70°C., are very much more active in the dark, and are gradually destroyed by bright light. Now

TO TURN MORE DIRECTLY TO TEA,

an enzyme is present in the leaf, also a per-enzyme and a catalase, the former of which we may not inaptly call

these. This enzyme, when isolated, has most if not all the above chemical reactions, beside probably a few others which up to the present time I have not fully investigated. Its function in the living plant is probably in conjunction with some plant acid to act on the tannin, which in this case is a glucoside, converting it into aldehydes and phenols which are absorbed in the nutriment of the plant. Isolated it converts tannic acid into glucose and during the fermentation or rather oxidation of the leaf it is the principal factor, as when extracted the leaf does not colour; its quantity seems to vary, the better the tea the more enzyme. The enzyme is probably in the sap of the tea plant and not in the cells in contact with the tannin, as, if small pieces of leaf and young stems be soaked for some days in an alcoholic solution of acetate of copper, then thin micrometer sections cut from them, after some of the copper is precipitated in the cells by the action of the tannin, and then the sections treated for one or two seconds with a weak solution of acetate of iron, and put under the microscope, it will be seen that almost every cell contains tannin; if now some Tinc. Guaiac. and H_2O_2 be gently run in under the cover glass, the outside cells first turn a brilliant blue, and small globules of blue also occur in other parts of the leaf, leading to the fibrovascular bundles. The latter part of the experiment is a very delicate one and the investigator must expect many failures, the whole section generally turning an intense blue obscuring every thing. If now we take sections of the root we have the enzyme in very much larger quantities than in the young shoots, and this is the first time that it has been noted in this position. It is also present in the seed, and seems to exert an oxidising influence on the tea oil when expressed cold, as under certain conditions I have detected a decided aroma, but up to the present I have not been able to spare sufficient time to investigate it. I have found that a large number of plants of the most diverse orders, in fact the majority that I have experimented with, contain in some one or other of their organs an enzyme. If it cannot be found elsewhere it is generally present in the roots, and it is from this source that I propose to procure suitable ones to aid and intensify the action of the enzyme already existing in the tea leaf, and for this I have applied for a patent in India and Ceylon. In some teas the enzyme is often deficient in quantity for the full oxidising effect to take place in the leaf; a proper enzyme added to the tea during the process of manufacture considerably improves the quality, and in all cases in which I have been able to try it there is an improvement in the tea.

This is, I believe, the first time that it has been proposed to make any practical use of an extracted enzyme, hence a considerable amount of experiment is required. The subject is a vast one if successful: it will have greater effect on the tobacco manufacture than on that of tea. In the tanning industry it shows how a large quantity of tannin can be lost through improper harvesting. Oak-bark, I have

found, contains a considerable quantity of enzyme, also canaigre and the other docks, which is capable of rapidly converting tannin into glucose: hence probably some of the failures to transport canaigre roots from India to Europe.

C. R. NEWTON, F.R.M.S.
Kurseong, 24th Nov. 1901.

TEA IN BRAZIL.

BUT NO LABOUR TO PRODUCE IT.

We learn that a tea plantation of considerable extension exists near Ouro Preto which might easily, it is claimed, produce 2,000 kilos of different qualities of tea if skilled labour could be obtained. —*Brazilian Review*, Oct. 29.

TEA SPECIMENS WANTED AT BOURDEAUX.

AT A COLONIAL MUSEUM.

We are requested by our Paris correspondent to state to our readers that M. Pittard, "professeur adjoint à la Faculté des Sciences de Bourdeaux, at present in charge of the Museum of the useful vegetable products of the colonies, would be greatly obliged for specimens of shoots of the tea plant with leaves, twigs with and without seed and flowers complete, sent as botanical specimens "without value." We are sure that many planters will be glad to advance the cause of science by complying with this request. The specimens should be simply pressed between sheets of blotting paper and packed between cardboard covers. —*Indian Gardening and Planting*, Dec. 5.

CALCUTTA OPINION ON THE GREEN TEA FACTORY IN COLOMBO.

THE METHOD APPROVED.

The news of Messrs. Finlay, Muir and Co's Green Tea Factory in Colombo, as announced in the *Ceylon Observer*, found its way to Calcutta quickly enough by telegraph, and *Indian Gardening and Planting* (Dec. 5th) has the following reference to it:—

We note from a telegram to a daily contemporary that Messrs. Finlay Muir and Co., are constructing a Green Tea Factory at Colombo, adjoining the Stores, which is now rapidly approaching completion. The size is 200 feet by 40. The leaf partially treated upcountry will be finished off here. This is the scheme which we urged on the attention of Indian tea men in our leader of 21st November ultimo. If our green teas are to have a good chance in America this method of working including all that is best in the Japanese system is most desirable. There is absolutely no bar to it as the leaf after the first rough treatment will keep in prime condition for a long time, and if contributions from various gardens are finished off in bulk we shall be able to offer those large homogeneous breaks which American buyers prefer. Green manufacture on the factory would be so simplified by the scheme that any manager with proper appliances to hand could work off surplus leaf at a time when free flushing had glutted the factory and here the advantage of a reduced amount of leaf to go through the elaborate processes of black tea manufacture would in nine cases out of ten result in a better tea being turned out, at an enhanced price, which, together with the revenue derived from the green, show an actual profit on the whole transaction. We have indeed in green tea manufacture a means of obviating the losses sustained in excessive quantities of black tea, and looked at from this point of

view the movement is most desirable. Those who look upon green tea manufacture entirely by itself and gauge its returns without reference to its reaction on black, miss the crucial argument in its favour. We are not in a position at present to promise large profits on green *per se*, but the profit exists when the effect of a withdrawal of leaf from black tea manufacture and the convenience of reducing large rushes of leaf is considered.

PROGRESS IN UGANDA.

In October, 1900, and May of the present year (says the "Agricultural Journal") samples of India-rubber were obtained from the Maputa district of Zululand. The rubber was drawn from the Ibungu tree, a tree which grows all through the district. The samples were forwarded to the scientific and technical department of the Imperial Institute for analysis and report. Professor Wyndham R Dunstan, the director of the department, in the course of his reports, states that the samples were subjected to critical tests and are genuine rubber, but of varying quality. The samples were submitted to commercial experts in rubber for the purpose of determining their value. The best was valued at 3s. 2d. per lb., and the worst at 1s. 11d. Whilst freely giving testimony to the good quality of the rubber, the reports draw attention to the large quantity of extraneous matter in the samples—bits of woods, &c.—which necessarily affected the commercial value of the rubber.—*Natal Mercury*, Nov. 25.

According to a letter which has just reached London, the material progress which is being made in far-off Uganda is extremely rapid. The Protectorate is now included in the postal union, and cart roads are being constructed to the Nile at Ripon Falls, and also to Lake Albert. The latter will, it is understood, be replaced at no distant date by a light railway. Two steamers, very much larger than the William Mackinnon, are to be run on the Victoria Nyanza, and a smaller one is to be placed on Lake Albert. Brick buildings for native chiefs and British officials are everywhere springing into existence, new plants are being introduced, and the rubber industry is being carefully fostered.

TEA PROSPECTS BAD.

An expert has reported unfavorably upon the prospects of tea growing in the Protectorate, but coffee appears to be more promising. Experiments in the cultivation of cocoa, oranges, pineapples, and other fruits are being made. Changes in the habits and customs of the Baganda are also taking place as a result of their association with Europeans; many of them now sit at table, and even recognise the use of knives and forks, whilst one of the leading chiefs has gone to the unheard-of length of permitting his wife to eat at table with him and to walk arm-in-arm with him down the public streets.—*Morning Leader*, Nov. 22.

MR. STANLEY GARDINER'S EXPEDITION TO THE MALDIVES. NARRATIVE AND ROUTE OF THE EXPEDITION.

[BY THE LEADER, MR GARDINER.]

At the end of March, 1899, I left England for Ceylon in the company of Mr L A Borradaile. On arrival at Colombo we found that the Board of Trade S. S. *Ceylon* had just left for Minikoi owing to a wreck

on that atoll. This necessitated a delay of seven weeks, before we could hope to sail thither, a detention further increased to eight weeks owing to stress of weather. Mr Borradaile accordingly proceeded to the Jaffna Peninsula, where he spent a month in familiarising himself with the life and conditions on coral reefs. I meantime prepared our stores, and made arrangements for the Maldive cruise, subsequently visiting the raised limestone hills and area of the north of Ceylon.* After returning to Colombo I traversed the entire coast between Negombo and Dondara Head, a distance of about 120 miles. Mr Borradaile joined me, and then settled down for a fortnight at Weligama—the Beligam of Prof. Haeckel—where there is a deep bay with reefs of small size across its entrance. The rich variety of animal life on the reefs both here and off the Jaffna coast as compared to the reefs of the Maldives and Minikoi is a most noticeable feature.

After a tedious week's detention in Colombo, we finally left Ceylon for Minikoi on June 17th, experiencing a very heavy north-west gale the whole way; in spite of this the sea one night was white with phosphorescence, a very unusual phenomenon in these waters. We located ourselves, and built a hungalow at a distance of about one-third of a mile from the south-west end of Minikoi island, under the shadow of the lighthouse, the boat belonging to which was through the kindness of Capt Channer, R N, freely placed at our disposal. The island here is about 470 yards across between tide marks, and a broad ride has been cut, giving the only open space of any size in the island. The vegetation is extremely dense, and forms a low jungle of *Pandanus*, *Nipisicus*, *Hernandia*, *Ricinus*, coconut and other trees, with *Penphis aciculata*, *Seavola koenigii* and *Tournefortea argentea* on the shores. At the south-west end of the island is a shrine, the grave of a holy, Moslem sheik, connected by a good, shaded path with the village in the centre of the island. A small settlement formerly existed round the shrine, but it has long been abandoned, and the jungle near it is now far thicker and less trodden than elsewhere. The land has the same character up to the village, but further north it is much more open, and can indeed be traversed almost anywhere.† Our situation then was not unnaturally the best possible for the land fauna, on which the lighthouse lamp too had doubtless no inconsiderable influence. The open ride formed both by night and day our best collecting ground, sugaring never meeting with any measure of success elsewhere.

* Vide *Report Brit. Ass.* pp. 460—2, 1900.

† Owing to an old arrangement the produce half the island is deemed to belong to the Bebe of Cannanore. An arbitrary line of division exists near the village with gates and guards, who rigorously exact three-fifths of the coconuts gathered south of the fence. In this portion no timber of large size or old growth exists, the whole surface at one time having been cleared and planted. Subsequently on the hold of the Bebe becoming weakened or relaxed, vegetation was allowed again to assume its sway, resulting in the present dense, jungly growth. On the management of the Bebe's dominions being undertaken by the British Government, the old line of division as found was retained permanently with much injustice to the inhabitants, as it had been formerly periodically open to revision. Since that time the north half of the island has been very rapidly washing away, while the south half has, if anything, been increasing somewhat in breadth. The north half cannot now annually support one-third of the present population, while the south has become a dense jungle, rapidly going to waste. It produces annually under the present system only a few hundred rupees' worth of coconuts, which the Government might well commute for a fixed annual charge.

For the marine observations and collecting, we had within a stone's throw of the house on the seaward face of the island a broad reef-flat, on which the sea continually breaks. Towards the north this gradually narrows, but westward broadens, and continues round the atoll. A broad boulder zone, which can be waded conveniently up to half-tide, extends the main (Minikoi) island inside the reef-flat to Wiringili and thence to Ragandi and round the atoll. These islets are merely rocky patches, the former with a few coconut trees, under the shade of which strangers are buried. Towards the lagoon there is a great sand-flat, exposed at spring tides from 100 to 200 yards from the beach. The situation was also chosen, as during the summer months the south-west monsoon blows, the effect of which I wish particularly to study. Unfortunately the monsoon of 1899 was very abnormal, the prevailing winds coming from west to west-north-west until the second week in August, when the proper monsoon commenced, bringing heavy rain in its train. The latter made work extremely difficult and unpleasant; the bottom could nowhere be seen on account of the surface disturbance; bottom living animals contracted, or retired into the sand or other shelters; the surface fauna sank to considerable depths.

The disadvantages of the position lay in the considerable distance of the house from the village and from the north passage into the lagoon, through which alone access to the open sea could be obtained in this monsoon. Natives had to be hired from the village for each several job, and it was too far for the children or fishermen to bring any strange animals they might find. The wind being dead in our teeth, and the numerous shoals making short tacks necessary, it was difficult to visit the northerly reefs of the atoll, and on no occasion was I enabled to approach them from seaward within about 200 yards.

During the month July and August a heavy easterly swell came up with large rollers, three times dying down and again regaining force. This swell was very abnormal at the time of year, and apparently was due to some cause completely outside the ordinary winds and currents. On enquiry I ascertained that it was also observed on the east coasts of Ceylon and India and on the large Ocean Liners proceeding from Ceylon to Albany. Subsequently I found that it had been felt throughout the whole of the Maldives; in Suvadiva and Addu it did considerable damage, sweeping over islets and land, which had never been affected before. The origin of the swell can only, I consider, have been due to submarine volcanic disturbances probably towards the East-Indian region.

During the first five weeks of our stay at Minikoi, while I was engaged in a survey of the land and shores, Mr Borradaile occupied himself mainly with a thorough study of the land Crustacea.† An incantious exposure of the reef, while collecting, then laid up with sunstroke, so that I had no option but to send him to Ceylon, whence he was ordered to return as soon as possible to England. For the remaining eight weeks I was absolutely alone, being deprived by illness even of my Singhalese servants.

I returned to Ceylon in the middle of September, Mr Forster Cooper shortly afterwards joining me from England. After some unavoidable delay we left Colombo on Oct. 18th for Male, the capital of the Maldives and residence of the Sultan. Owing to succession of accidents we did not arrive until Oct. 23rd, when we at once landed our stores, transferring sufficient for a three months' cruise to our schooner. The latter was lent to us by His Highness the Sultan; she was a vessel of about 16 tons, built in the island, of coconut wood, moderately seaworthy, but not laying within six points of the wind. The Sultan also appointed Hassan Divi Velanamankofanu, his third vizier, to accompany us, and gave orders that every facility should be granted to us. After presenting our offerings to the Sultan

and his viziers, we sailed from Male for Goifurfe-hendu (Horsburgh) atoll.

We at once had a house built on Goidu island, from which as centre we visited all the other land of the atoll and the greater part of the reef. A stay of altogether eleven days was made, and everything was unpacked and properly stowed on the schooner; the dredges and instruments were overhauled, and indeed all preparations were completed for the work in Mahlos and other atolls. The reef-animals were collected and preserved, being sent by native boat to Male to await our arrival. On leaving Minikoi I brought with me two boys, whom I had taught to collect in that atoll; these I largely employed in Goidu and subsequently in other islands in collecting the land fauna and flora.

The remainder of October, 1899, was spent in S. Mahlosmadula. This group of reefs really consists of three atolls, a small central one separated from larger on each side by narrow channels of over 100 fathoms in depth. The three lie on a shallow bank, which tapers to the north but has a broad base to the south-east. The plateau is studded all over with reefs, the outside ones forming a chain round the perimeters of the three parts. The reefs along the west side of the bank are for most part ring-shaped, small atolls (atollons or *faros*) with deeper water (the lagoon or *velu*) in the centre. On the east and south sides, however, are isolated islands with fringing reefs mostly from the boundaries. The general depth of the atolls is about 27 fathoms, most of the channels between the numerous encircling reefs having over 20 fathoms.

The weather during our stay in S. Mahlos was extremely calm, our vessel indeed being towed by boats from island to island. This was singularly unfortunate, as usually strong winds may be depended upon in November. We had hoped to systematically dredge a large number of the deep channels between the reefs, that edge the atoll. As their general depth is about 25 fathoms, this was found to be impracticable, rowing boats not having sufficient weight to carry even the smallest dredges along a rough bottom at this depth. Accordingly would be confined ourselves to a traverse of the whole south of the atoll. Our first anchorage was off Turadu, an island situated on the rim of a somewhat ill-defined *faru* at the south-west corner of the bank. We visited every part of its reef and collected a few animals. The lagoon (*velu*) of the *faru* was dredged, yielding *Asymmetron* and *Psychodera* from 29 fathoms. The island itself proved most interesting. Its rocky barrier of beach-sandstone had in 1896 been overlapped by the waves of a cyclone. These attacked the sand behind, eating deeply into the island, with the result that the beach-rock has been left in lines many yards from the shore. The natives have now erected breakwaters round a great part of the island—and also a new mosque—but in spite of these no trace of it is likely to be left in 20 or 30 years' time, unless some considerable change in the currents or reefs alters its conditions.

From Turadu we visited all the reefs to Mabarau, the most easterly point of the whole group, anchoring at Hitadu, Heddufuri, Mahrus and Duravantu. At Cumfinadu we found some large rocks, standing up in the lagoon well inside the boulder zone; *Bonellia* was living on the reef-flat, and *Psychodera* was the most abundant form of life on the shores of the island.

We finally left for N. Mahlos on Nov. 29th, but meeting with strong currents to the west-south-west, we only fetched Kuderah-Heelu in the central atoll that evening. However we reached Fainu in N. Mahlos on the following day, and remained there at anchor three days, which were devoted to dredging and an examination of the islands of Fainu, Kennrus and Ingurahdu, and Berriam-furu *faru*. We then separated from Mr. Forster Cooper dredging with the schooner along the east side, and examining its islands and reefs. I meantime embarked in a small open boat for the western side, where the lagoon of the atoll is filled up with a perfect maze of small reefs and shoals,

† Vide Mr Borradaile's account in the same part of this publication.

I first visited five of the lagoon islands, and then, a strong north-east breeze setting in, worked up along the edge of the atoll, sailing from down to dusk, and anchoring at night to leeward of the nearest reef. I examined all the reefs and islands, and sounded the velu (lagoons) of all the faro (atollons) along the western rim, rejoining the schooner on Dec. 11 at the north of the atoll. Unhappily a series of collections, made by myself and my boys, to illustrate the populating of sand-banks by both animals and plants, was ruined by my capsizing our fishing boat near Cunderudu.

On Dec. 12th. after taking in wood and water, we sailed for Miladamadulu, a similar bank to Mhlosmadulu but with relatively far fewer reefs and a less determinate rim. We anchored the same night at Guthardu, and at daybreak made sail towards the east side of the atoll. Owing to a strong south-westerly set of the current we took two days in reaching Doreadu in the middle of the bank, a distance of seven miles. This is the island of a round faro, one mile in diameter; its lagoon has 19 fathoms of water, a depth which makes the faro peculiar among all its fellows in the Maldives. We landed the same night for firewood and water, but, none of the latter being obtainable, were compelled to sail at dawn. A strong north-east gale coming out, we stood up at the atoll and watered at Rymaggu, anchoring that night at Furnardu, a large island on the east edge of the atoll. The islands of this rim of Miladamadulu tend to be closely fringed by the reef on all sides, and to have a *kuli* (shallow lake, French *barachois*) in the centre, surrounded by mangroves, through which the sea has in some found access. While Mr. Forster Cooper dredged with the schooner down to Kendikolu, I visited ten of these islands in a fishing boat; two were very small, three had definite *kuli* or else mangrove swamps (*Ekasdu*, a large lake swarming with a species of *Leander*), and four were crescentic in shape, their *kuli* now open to the sea. Kendikolu is one of the largest islands in the Maldives, being two-and-a-half miles long by two-thirds of a mile in breadth. There are four *kuli* down the centre surrounded by mangroves, which abound in rails; on their surfaces we saw a few duck, while their waters, which are quite fresh, four to five feet deep, teem with small fish. However, as Ramazan, the Mahomedan fast month, was approaching, we had to hurry on, and only stayed two nights. We accordingly, on December 19th, dredged down to Landu, obtaining a large variety of sponges and Polyzoa with a quantity of red *Polytrema* and some nullipores, in addition to corals, of which the black *Dendrophyllia ranea* was very abundant in 12 to 20 fathoms off the reefs: We visited and dredged Ma and Eddu faro with three to four fathoms of water in their velu, obtaining a few Cephalochorda, and examined some of the central islands of the atoll. At Manadu we caught a single specimen of *Typhlos*, which is evidently very rare in the archipelago, since it has no native name.

Fadifolu atoll was reached on December 23rd; it differs from the preceding in being a true atoll, having a well-defined, encircling reef, especially to the east, and an open lagoon with but few shoals. We first moved down the east side examining the reefs but then dredged across to Inawari. The natives although not actively hostile, were very unfriendly, so that on Christmas morning we sailed down to Naifaro. The winter rains now commenced and continued intermittently with heavy squalls from the north-east for a month, making navigation among reefs difficult. The schooner too was decidedly unpleasant as the whole of our cabin accommodation had to be utilised for storing our books, instruments and various collections. We remained at Naifaro four days resting and repairing our vessel, as she had been somewhat strained in the recent heavy weather. The time was occupied in a survey of the neighbouring islands and reefs, and in thoroughly dredging some of the passages into the atoll.

The shores of all the islands at the north end of Fadifolu I found abundantly strewn with the shells

of *Spirula*. Enquiring of the natives as to its "fish," I was surprised to receive an accurate description of it. It appeared that the animals were extremely abundant in January of 1897 in the channel towards Miladamadulu. "They float on the surface, and may be picked up with the boat-bailer. They are never seen inside the atoll, but periodically occur in the north-east monsoon in the open sea. None were seen in 1898." I offered a reward of 50 rupees for the first specimen, but, although, eight or nine boats went out daily during my stay, I did not secure one. That the people of Naifaro and Inawari really know the animal is undoubted. Yet this is peculiar, to I did not find on close enquiry that it was known as the natives of any other part of the whole archipelago, though its shell occurs sparingly everywhere. The native name for the shell is *markana taludandi*, the heron's key.

Leaving Naifaro we again dredged across the atoll on a more southerly course, subsequently cruising along the eastern side, dredging and examining the islands and reefs. On Jan. 2nd, 1900, we set sail for Mle atoll, anchoring off Helengeli the same afternoon. This atoll is intermediate in its characters between Mahlos and Fadifolu; except at the south end it has practically no islands in the lagoon. There are evidently great changes in its topography since the original survey, two islands of the eastern edge at least resting on their own reefs, having disappeared. There seemed to be still greater alterations in respect to the shoals in the lagoon, but in our somewhat dependent position any real survey was impossible owing to constant interference from Male. We, however, saw some of the western reefs on our way to Goifurfehendu, and on our return journey to Male, which we reached on Jan. 5th, 1900, we dredged down as close as possible to the eastern reefs. Further Mr Forster Cooper in the middle of February made a most successful dredging cruise of eight days in the atoll, taking 34 hauls, to ascertain the character of the bottom in every position, and I at the same time visited most of the islands and reefs within five miles of Male.

Ramazan had now commenced, and dependent as we were entirely on Mohammedan boys, it would have been useless to continue our cruise. Our vessel too was in want of a thorough overhaul, the rigging being very bad. After a couple of days in Male, we had house erected on Hulule, the island of a neighbouring faro, and at once transferred to it sufficient stores for a stay of four or five weeks' duration.

Hulule island is about $1\frac{1}{2}$ miles long by 800 yards broad; it is about 2 miles distant from Male. The greater part of its surface is covered with coconut trees, but a large patch along the western side has been allowed to revert to jungle. The principal trees are the banyan, candle-nt and *Calophyllum*, the branches of which abound in frugivorous bats. On account of the island's proximity to Male, where all foreign vessels for the group have to enter, many plants have been introduced. For few of the fruits thrive, but half-a-dozen brilliant flowers relieve the everlasting green. Sweet-smelling plants, jessamine, frangspanni, roses and various herbs, make the proximity of the mosque and village pleasantly fragrant. The western shores are fringed with *Pemphis acidula*, the white, perfumed flowers of which prove a great attraction to insects. As some of our boys delighted in this work, the land fauna and flora was exhaustively collected. As compared with Minikol, we found the insect and spider faunas to be decidedly poor except in butterflies, although it may be deemed to be thoroughly representative of any rich island in the centre of the Maldives. A certain number of insects must have been introduced with the plants, but the successful acclimatisation of any considerable number of the latter only dates back to the eruption of Krakatao in 1883. Before this time pumice (*Jengbo-ga*, the water-swimming stone) was not known in

the group. Its fertilising properties have now been discovered, and in many islands baskets of it are collected and strewed over the garden land. The capture of two specimens of snakes on pandanus trees at Hnlule was of interest.

The whole faro is $4\frac{1}{2}$ miles long by $1\frac{1}{2}$ broad; its lagoonlet or velu, in the centre has a depth of 6 to 7 fathoms. The reef everywhere is awash at low tide, and, though differing greatly in its characters, quite well defined on the side towards the lagoon of the large atoll. Besides numerous rocks there are two islands respectively at the north and south ends, Farukolufuri and Hnlule. During our stay every part of the faro was surveyed, and the fauna carefully collected for comparison with that of Minikoi atoll. *Asymmetron* was very abundant in certain places in and around the velu, and at least three species of Enteropneusts of two or three genera were found, each in its own characteristic environment. Two specimens of a remarkable *Thalassema*, 2 feet long when alive, were secured from the boulder zone, besides a number of specimens of similar species. The sand was remarkably rich in Actinians of any species, all of which withdrew into the shelter of the sand at every rain-squall. Mollusca were not numerous, but *Cryptoplax*, *Chiton*, and each of the three families of the Zygobranchiata were represented; autotomy of the foot seems to be a widespread phenomenon as several forms with the foot thus cut off were obtained.

We returned to Male in the middle of February. Mr. Forster Cooper at once sailed for his dredging cruise in the atoll, while I remained to carry on a series of observations on the currents in the channels on each side of the island. During my whole stay I dispensed medical aid freely to the people. At this time there was in one district of Male an epidemic of Malaria, with which I was naturally much brought into contact. Mr. Forster Cooper returned to find that I had caught the infection. I saw, however, our collections to date properly packed for England, and the schooner victualled and equipped. As complications set in and I was getting worse instead of better, Mr. Forster Cooper on February 28th took advantage of the chance visit of a British India Steamship Co.'s steamer to place me in charge of Capt. Pigott, R.N.R.* for Colombo. He himself determined to carry out his part of the projected work, and sailed from Male on March 3rd for the southern atolls.

I cannot speak too highly of the pluck, determination and resource, shown by Mr. Forster Cooper who had had no previous experience of the topics. He worked his native crew in a manner, which I have never seen excelled even in the Pacific, and took no less than 83 dredgings in five different atolls. However, I append Mr. Forster Cooper's report, which may be allowed to speak for itself.

"On March 3rd, accompanied by Mahommed Didi as interpreter and representative of the Sultan, I crossed over to S. Male, in which three days were spent. Gurahdu island and reef were visited, but neither land nor reef in the atoll appeared to exhibit any novel features. The group consisting of a series of almost isolated reefs, I dredged principally in the outer passages and in the centre to ascertain the differences in the bottom-fauna. The hauls in the centre was very unproductive, but in the channels a large quantity of the same sessile forms, as in the northern atolls, was brought up. Just inside the northern passage a coral, *Goniopora stokesi*, was obtained; it forms round heads on thick stalks, covered by any epitheca, which is completely buried in the sand or mud.

"On March 6th we sailed on to Felidu atoll, where we visited Alimata and Tinadu islands alone, at night anchoring generally to the nearest reef. We

remained eight days, but only took 18 hauls of the dredges owing to head winds, strong current across the atoll and dead calms. Indeed throughout the whole cruise the unfavourable winds and the poor sailing qualities of the schooner prevented us from surveying as much of the atolls and from taking as many dredgings, as I would have liked. We attempted for three successive days to get up the almost completely enclosed eastern horn of the atoll, but were unable to tack up more than half-way. The lagoon in it is open with few reefs or shoals, and has a general depth of 40 fathoms; its bottom is hard, covered with sand, and absolutely unproductive to the dredge. In the rest of the atoll weed and broken shells were found towards the centre of the lagoon and rubble in the channels. *Diasera* is very common almost everywhere and its skeleton forms one of the chief constituents of the rubble.

"We fetched Mulaku atoll on March 14th, and remained six days, taking 17 dredgings. The atoll is remarkable for the broad, almost continuous reef; along its eastern side. There are a number of very narrow, shallow passages to the north, but from Maduveri to Curaille a distance of 30 miles, the reef is continuous safe for a single passage opposite Mulaku island. All the islands lie on the seaward side of this reef; extending down its centre is a series of long, linear velu (small lagoons), which off Raimandu is double, two series lying parallel to one another and the edges of the reef. In dredging I ran two lines across the lagoon and then moved down along the eastern side. Among other forms we collected a large number of soft-bodied echinoids, a few black crinoids and some holothurians, with which were associated a number of Polychaeta, crabs, caribs and molluscs. All were of the same ground shades as their various Echinodermata, whose colour was, as it were, photographed upon them.

"Kolumadulu atoll was entered on March 21st, but no work could be done from the schooner owing to the calm weather until the 26th inst. I meantime took the small boat out, and made various scattered dredgings in the north-east corner of the atoll with but indifferent success, while I sent the collecting boys to Kolumadu to obtain the land fauna and flora. I did not personally visit any of the islands in this atoll nor Haldumati, which we next dredged, as they all appeared to me to present the same features as in the northern groups. I was also anxious, as these two atolls are almost completely encircled by reefs, to ascertain precisely the characters of the bottom in every part. I sailed finally right across the centre of Kolumadulu lagoon, taking 16 dredgings down to 45 fathoms and incidentally running the vessel ashore on a small reef, off which we warped her without any great difficulty. The centre was found to be covered with fine mud, on which a few Crustacea, molluscs and flat-fish of small size alone appeared to exist. We obtained also a larval form of *Fierasfer* out of a holothurian from 25 fathoms.

"In Haddumati atoll I took 16 dredgings in the centre and eastern part of the lagoon, where the bottom was mostly covered with fine mud. They were very unproductive owing doubtless to the all but continuous reef of the eastern side. Relatively little work could be accomplished, as the schooner was in a horribly dirty state with bilge, etc.; she also had been somewhat striven on the reef, and her bottom was thickly covered with barnacles and weed.

"To summarise, the cruise yielded between March 3rd and April 8th 88 dredgings in every part of the lagoons of five different atolls. The hauls must have averaged at least one mile each, and hence 88 miles of the bottom was covered. The latter was found to be of an almost uniform dead-level between the reefs and shoals, which arising precipitously, uniformly reach to within a few feet of the surface. It was to most remarkable that we did not meet with a single

* I cannot sufficiently express my indebtedness to this gentleman for all his kindness to me.

knoll of any sort jutting up to indeterminate depths.*"

After paying a second visit to the Jaffna district, I returned to the Maldives, having secured Sheikh Jeevunjee Noorbhai's steamer *Deafae*, Capt. Molony, for a short cruise. I took on board at Male Mohammed Didi, Chief Vizier and uncle to the Sultan, Mafekilgefaun, the religious head of the community, and Hassan Didi, third vizier, with their suites as well as a Saïd, descendant of the Prophet, who had a family in Addu. After discharging some of our Male cargo we steamed south down the deep central basin of the group, coasting S. Male and Kolumadul atolls. We steamed into Haddumati atoll on April 8th, and relieved Mr. Forster Cooper, who joined us. After transferring the collections, instruments and nets, we sent the schooner back under the native mate to Male, and at once sailed on to Suvadiva atoll, which we entered by the north-east passage on the morning of the 9th. This atoll lies between the equator and lat. 1°N.; it is separated from the central group by the "One and a half Degree Channel," 55 miles in breadth. It has a well-defined rim with passages at intervals, and is about 34 miles long by a little less in breadth; its lagoon has a maximum depth of 50 fathoms. As Addu atoll was to be our turning point, we now spent only two days in Suvadiva, dredging and sounding along the east side of the lagoon. We anchored with banked fires for two nights at Nilandu and Gaddu, and I further, leaving the dredging to my companion; visited Wilgili and Kondai.

Addu is a small atoll, 10 miles long by 6 broad, lying about lat. 0°40'S. Its reef is perfect except for two small passages to the north and two larger ones to the south. The lagoon has a maximum depth of 36 fathoms; it is fairly open in the centre, but against the encircling reefs has a perfect maze of coral heads, arising from 7 to 10 fathoms. It is noticeable that the greater part of the circumference of the atoll is surrounded by land. The "Equatorial Channel," 48 miles across, separates Addu and Suvadiva. In its centre is the island of Fua Mulaku, said to have a deep kuli (lake) in its midst; it is two miles long by one broad, and has a fringing reef only. On our passage to Addu, and subsequently on our return journey, we tried to visit it, but the heavy sea made both anchoring and landing quite impossible. We remained at Addu until April 15, examining the reefs and islands, in both of which there have been great changes since Moresby's survey. We also checked the soundings on the chart, and took 14 hauls of the dredge in the lagoon and on the outer slopes. In one of the latter from 40 fathoms we obtained a large quantity of *Helionora carulea* with almost colourless corallum. The vegetation of the islands was far more luxuriant than any we saw in other parts of the Maldives, but the land fauna was very scanty as compared with Hulule. The animal life of the encircling reefs seemed to be both poorer and less varied than to the north; the growth of fixed forms of life in the lagoon was, however, decidedly lavish.

Revisiting Suvadiva on our return journey, we dredged and sounded within the lagoon along the south and west sides, anchoring for three nights at Gaddu, Nadalle and Havara-Tinadu, beyond which I did not land anywhere. On April 19th we entered Kolumadulu, having in the morning coasted along the east of Haddumati. We dredged the passage, as we entered and dropped anchor at Buruni, at once going on shore.

On April 20 we ran a line of sounding across to S. Nilandu, an atoll somewhat similar to Male. We twice traversed the lagoon, anchoring that night at Rimbudu. Six dredgings were taken in 19 to 35 fathoms; they proved to be in their result the richest series that were obtained in the whole archipelago,

although I do not think we found any forms of which we had not previously preserved specimens.

On April 21 we sounded the channel across to N. Nilandu atoll, which we crossed. We then ran a line of soundings to Wattaru atoll across the central basin, which has very generally been supposed to owe its origin to the lagoon of a much larger atoll, now completely lost. We further sounded the channel between Mulaku and Wattaru atolls, anchoring for the night off Rakidu in Felidu atoll. On April 22nd we sounded the channel between Felidu and Wattaru atolls, and then ran a second line across to the western chain, about 15 miles north of the first. We sounded the channel between N. Nilandu and Ari atolls, continuing northwards sounding at intervals to Mahiadu in the latter atoll, where we dropped anchor. On April 23rd we made a straight course for Male, putting down our third line of soundings across the central basin. We ran our line out along the channel between N. and S. Male atolls, obtaining finally a depth of 1005 fathoms, two miles S. W. $\frac{1}{2}$ W. of the S. Point of the reef of Hulule faro. That night we anchored off Male and, after taking our collections on board, bade good-bye to the Maldives on April 25, 1900.

The collections may be allowed to speak for themselves in the subsequent parts of this publication. A word is necessary as to the dredgings, of which 273 were recorded in the Maldives. They were intended to ascertain the character of the bottom within the atolls as well as its fauna in every position, in which the physical conditions might vary. Naturally a considerable number were under these circumstances absolutely barren, but all served their purpose. Seven dredges were used, both rectangular and triangular, of Naples or Plymouth models, as well as an otter and three beam trawls of 3, 4½ and 6 feet. The latter were made to my own design, and adaptation of Prof. Agassiz' model; they were always thrown overboard, when we were at anchor, about one fathom of rope being allowed beyond the depth, if the bottom was fairly level. For sounding from the schooner and small boats, besides regular lead lines, we used loosely spun cod-fishing line, as recommended by Mr. J. Y. Buchanan. On the steamer we had an old Lucas deep-sea machine, which was lent us by the Admiralty, Mr. Lucas kindly providing about 3,000 fathoms of wire. Of leads we employed the Telegraphic Construction and Maintenance Company's snapper, and valved leads of the Admiralty pattern. Other apparatus and instruments will be referred to where necessary in the account of the work of the expedition. J. STANLEY GARDINER*.

[Note. The collections of plants have been presented to the Royal Botanical Gardens, Peradeniya, Ceylon. A full report on them will be shortly published in the "Journal of the Gardens" by Mr. J. C. Willis, the Director.—J. S. G.]

PEARLING IN TORRES STRAITS.

BY R. F. T.

The average person in the Southern States seems to comprehend very little about that portion of the Commonwealth known as Thursday Island, and to know next to nothing about the industry which gives employment to fully 3,000 coloured men and 300 or so of whites who make their home there.

People in Sydney have asked me, "How many pearls does a diver bring up in a day?" They imagine that the bottom of the ocean is strewn with pearls, and are quite surprised when told that pearls are only "perks," and that the pearl-fisher is quite content to gather up his tons of shell and chance to luck to once in a while get a pearl.

* It is scarcely necessary to point to the great importance of this fact, as bearing on the question of the formation of the atolls and reefs of the Maldives.

* This account has been checked by Mr. L. A. Borradaile and Mr. Forster Cooper.

I was on Thursday Island last year (1900), and accepted the position of a clerk on one of the pearling schooners. I deemed it would be a splendid opportunity for studying the trade, and also would extend my knowledge of anthropology.

The fleet that I was to join was stationed about 50 miles out, and there happened to be a 15-ton lugger taking stores out to the schooner on which I was to work. I went on board, and in about two days' time we reached the schooner, and as soon as I set foot on board the captain said, "Pick up a knife, and my son will show you the way to open the shell to look for pearls." So I went and sat by a big heap of shell, and was soon busily engaged probing the knife in and looking under the shellfish for them.

There were coloured men all round me seated near little tubs, scrubbing the barnacles off the shell, and washing away any superfluous shellfish that adhered to the mother-o'-pearl.

The number of these tubs was about four or five, and seated round each one were four or five men scrubbing away and keeping their eyes on the skipper, who was here, there, and everywhere, and growling all the time. He seemed to confer mostly with his bos'un, a big Arab, who stood about 6 feet 4 in. in his stockings, or more correctly, the bare soles of his feet.

We were then, three whitemen, amongst, perhaps, one of the most motley mixtures ever seen. There were Japanese, Javanese, Filipinos, Arabs, Cingalese, Southsea islanders, Murray islanders, boys from Rotumah and New Guinea. We even had two Esquimaux. They were a trifle out of their latitude, were they not?

The tower of Babel seemed to be in the course of construction by the multitudinous variety of tongues that were spoken.

It was just on 12 o'clock, and the cook pat his head out of the galley, and sang out "Chow, chow," and the island boys, accompanied by all the rest, rushed towards a dish of steaming hot beef, and commenced to fill their plates up with beef and rice, and to dip their pints into a big bucket of the most horrible ration tea that one could imagine. This then seemed to be their bill of fare—salt horse, rice and tea. The knife was the only requisite to assist in the repast, for instead of using forks most of them shovelled the rice into their mouths with their hands. The top of the hatches served as a table.

Now some of these poor fellows could hardly eat the beef, as most of it was bad, and as there was nothing else on this sumptuous board they had to go to the ship's clerk (myself) and get tins of fish and jam, which were debited to their accounts at about twice the price that the same goods would have cost on Thursday Island. In fact, I have seen a sheep sold to one of these boys for £3, and a sucking-pig brought out about Christmas time was sold for two guineas. As most of the crew on these schooners get only 30s a month, and they are literally starved into slop-chesting about a shilling's worth of goods everyday, they very often leave when their time is up, say after two years of service, without any money to draw at all, and are very often in debt a pound or two to the master of the vessel.

In the afternoon the ship set sail, and the crew, including myself, left our shell clipping and cleaning and engaged ourselves in sailing her. The captain came out with his telescope, and looking all round the horizon at last spotted a lugger that had been absent for about a week, and wishing to collect her shell accordingly set sail after her. On the way towards this boat we must have passed about 20 or 30 other luggers, some of them belonging to our fleet, and others working on their own account. One of these boats, a lugger belonging to our fleet, hailed us, and we luffed up to see what she wanted. The diver on the lugger, a Jap, called out, "Me got sick man; you take him back along a schooner." Our captain replied, "You make the animal work; he's only shamming." The Jap retorted, "No fear, him been

sick two tree day." "All right, send him to the schooner." So the sick man, who was evidently suffering from a bad attack of sea sickness—he was vomiting terribly—was conveyed in the lugger's dingy to the schooner. When the dingy came alongside the captain caught him by the scruff of the neck and hauled him over the ship's side. He called out to the bos'un, "Come here, bos'un, and make this man well;" and the Arab commenced throwing a bucket over the drawing water, and whilst the captain held the poor shrieking wretch he poured bucket after bucket of water over him, and when he had drawn about 20 buckets the next part of the cure started, which consisted in kicking this Manila man round the deck three or four times, the captain swearing at the bos'un for not kicking him hard enough.

It was a pretty sight to see all the luggers at work. We passed hundreds of them, and divers were seen in all sorts of dress and address. The divers work as scientifically as possible, and some of them handle boats with a command that is simply astonishing. The boats are placed bows to the wind, so that they will not drift too much; although, of course, the boat is continually drifting, and the diver walks many miles on the ocean floor in his search for shell. Probably, in very much worked ground, he may walk a mile without getting a single shell. A diver told me that in one part where he was working the muddy bottom below was just like a ploughed field, the boot-marks of previous shell-seekers giving it that appearance. The diver also walks against the tide, otherwise the mud stirred up would make it impossible for him to see shell. Perhaps he sees a school of whitefish. As these fish are the heralds of sharks, he gives the signal to be pulled up, or as he would probably tell you, 'I see shark, I fright, I give single to be pull up.' Now I have not, among all the coloured men I have met on Thursday Island, heard one who could pronounce the word signal properly—they say 'single' to a man.

One of the most amusing things to be seen down below, a diver will tell you, is the 'monkey fish.' These fish have enormous eyes, and in many respects resemble monkeys. They make hideous faces at the diver, and are very hard to catch, diving in among the weeds and mud when he tries to get hold of them.

Divers work on contract, getting from £15 to £25 per ton for their shell. It takes them, however, a long while now to get a ton, as the grounds are so constantly worked. There was a time when a diver need only work for a month or two and he would bring back to the island enough pearlshell to keep him in food and champagne for the rest of the year. Those were the days when whisky was not sold by the bottle, but if a man wanted any he would have to buy the case full. Now it is merely a miserable existence, and a man may perhaps clear one hundred pounds in the whole year, but then look at the wear and tear on his constitution to do so! He rises at 5 in the morning, has a hasty cup of coffee, puts on his diving dress, and takes his first plunge, remaining under the water until breakfast time; after breakfast he is down again, walking miles on the bottom of the ocean until mid-day; after about an hour's rest he is at it again, and works until as late as the light permits.

Fancy working 12 hours a day at such an unhealthy employment, and for the remuneration of about £2 a week and rations of the vilest kind! There is not a white diver now in all the fleets. They have cleared out long ago, as they were convinced there was not a living in it.

Of course in the deeper water, say, for instance 30 fathoms, a man cannot possibly stay under all day, the pressure of the water is so great that he cannot remain under any longer. Some of the divers through greed often lose their lives. The tender—the man who looks after the life-line—sends down the signal that the five minutes is up, but perhaps the diver just at the moment he gets the signal to ascend espies a nice patch of shell and tries to get it into his bag,

One, two, three minutes pass, then he frantically pulls at the life-line as a signal to be drawn up; but too late! They pull him up, and what was but a few minutes before a healthy, living man is an inert paralysed mass. The Japanese seem to be the most reckless in this respect; probably it is on account of their greed and eagerness to make money quickly but more than likely it is because, being fatalists, they regard death as a mere nothing, and as soon as one man is brought up dead in the dress another is eager and willing to put it on, and take his chance as a diver. They tell you that 'There are plenty more Japanese in Japan,' and if one dies it does not matter so very much.

About a month after I had been on board, in which time I had acquired a fair knowledge of Malayo, and a smattering of Spanish—picked up from the Filipinos—and was well on the way to becoming a fair seaman, a lugger came out from Thursday Island with the captain's wife on board. She, I learned, often used to make these trips, spending sometimes three or four weeks on board, and could steer and give orders for the sailing of the vessel after the manner of the skipper himself; but one day her nautical knowledge received a great shock. It was beautifully calm, and she was whistling, as is the wont of sailors, for the wind to spring up. She was gazing over the starboard side, when suddenly she espied a great green turtle floating along asleep on top of the water.

'Oh, Captain,' she called out to her husband, who was in the cuddy, 'throw a tow-line over; there is such a big turtle out there.'

'Get some salt,' said the captain to a nigger who was standing by, 'and jump over and put some on that turtle's tails.'

Two of the coloured men jumped over and caught the turtle, but did not need any salt. The laugh, however, was very much against the skipper's wife when in due course the yarn got round Thursday Island that she had tried to catch turtle with a hook; and so I have heard lately the mere mention of "turtle" one her enemy for life.

We used to fare pretty well out on the water owing principally to having a splendid cook. This man could make fine bread, beautifully light and well cooked. He made his own yeast out of rice and salt water. The "Bombay curry" that he served up was a savoury thing, and contained besides apples and coconuts about 20 different ingredients. Then there were "beche-de-mer" soup and all kinds of fish as our crew were always catching hundreds of them.

In those tropic waters aquatic snakes are very numerous. They are great flabby things mostly about 9ft or 10ft in length, and when they are captured and placed on the deck of a ship they wriggle about, but cannot move an inch ahead. They appear to be adapted for water for water only.

I had a slight attack of fever, which I must have contracted on one of the mangrove islands, at which we were in the habit of landing; and feeling life getting monotonous I resolved to return to my native State—New South Wales.

If the Alien Restriction Act does force the majority of the pearlers to relinquish their business, it will be a very good thing, as these beds are now nearly totally worked out, and cessation of work for at least five or six years is required. By this time the young shell will have grown a good size and there probably will be enough of it to induce while men to dive for shell once more.—*Sydney Mail*, Nov. 23.

NATAL RUBBER,

(To the Editor "Natal Mercury.")

SIR,—Respecting the paragraph from the *Agricultural Journal*, regarding Professor Dunstan

experiments with rubber grown in Zululand, I think the professor must be sadly mistaken regarding its value. At the present time Para rubber is selling at 4s and 4s 1d. per lb. It is a well known fact that Para rubber is worth twice as much per lb as any African rubber. In 1895 and 1896 I had Natal rubber offered me repeatedly at 1s 8d per lb, but I always thought it too dear at the price. I remember Para rubber going up to 4s 9d per lb just before the Baring Bank failure; and at that time there was some splendid Madagascar rubber on the market, for which they were asking 3s per lb, but it would not sell at the figure, although it is the cleanest and strongest rubber next to Para. I have bought flake rubber as low as 6d per lb. I do not know any African rubber which does not lose from 25 to 30 per cent in washing and masticating. I have known Mozambique rubber to lose 60 per cent in washing and masticating, and all African rubbers lose from 25 to 60 per cent. I was never asked above 2s per lb, either in London or Liverpool, for Congo Ball, and it is one of the cleanest and strongest African rubbers known. Let him (the Professor) send a sample to Moseley's, of Manchester, or Maclellan's, of Glasgow, or W Warner, Tottenham, and they will give its proper market value. Rubber-growing ought to pay in Natal, if kept clean, and not too much sand is put in.—I am, &c.,

JAMES GREGSON.

P.S.—I simply write so that people may not be disappointed if they invest their money in collecting rubber, and then get half the price they expected. African rubbers run from 1s to 2s per lb, both in London and Liverpool, according to quality.—*Natal Mercury*, Nov. 28.

PLANTING NOTES.

ASSAM TEA RETAILED IN CALCUTTA.—It is a healthy sign of the times to find energetic tea planters turning their attention to the retail sale of their product. The latest recruit in this line is Mr D H P Madden Manager of the Singlijan Tea Estate, Lahoal, Assam, who has opened a depôt at Calcutta for the retail sale of Assam tea.—*Indian Gardening and Planting*, Dec. 5.

ANTI-MOSQUITO WORK AND THE HEALTHINESS OF SIERRA LEONE.—The Governor of Sierra Leone Sir Charles King Harman has stated in a letter which he has written to Major Ross of the Liverpool School of Tropical Medicine that out of four hundred public servants, only three were on the sick list towards the end of October, and those were not suffering from malarial disease. The Nursing Home was empty. His Excellency added that he had inspected the work which was being done by the Liverpool expedition under Dr Taylor in draining and clearing up the town, and was surprised at the improvement Dr Taylor had effected. The population are much interested in this anti-mosquito work, and have the intelligence to understand the good that is being done for them by the united forces of the Liverpool School and of the Government of Sierra Leone. The figures quoted suggest that the sick rate in Sierra Leone has fallen below 1 per cent. This, if it last, will be phenomenal. Even in India the sick rate amongst European troops is about 10 per cent, and amongst native troops about 3 per cent.—*Reuter*, Nov 20.

Correspondence.

To the Editor.

AN "AD VALOREM" DUTY FOR TEA
IN THE UNITED KINGDOM.MR. C. SHAND'S VIEWS AND LETTER TO
SIR MICHAEL HICKS-BEACH.

Kensington, Nov. 15.

DEAR SIR,—I enclose copy of a letter I have written to the Chancellor of the Exchequer. It will not please high country planters. I have read the Ceylon Chamber of Commerce's correspondence on the subject of the Commonwealth's proposal to lay an *ad valorem* duty on tea. It has not induced me to change my opinions. I have always thought that what is sauce for the goose is sauce for the gander. If an *ad valorem* duty in Australia would be a premium or bounty on the importation of cheap China tea, would it not be the same on cheap Indian and Ceylon tea? The memory of the Chamber of Commerce appears to be very short! They seem to have forgotten the history of the Tea Trade during the past 10 or 15 years; they also ignore circumstances passing under their own noses. I have noticed that upwards of 300,000 pounds of Ceylon tea, have been shipped to Hankow, in the centre of the Chinese Empire! What that tea would cost by the time it arrived there, you probably can calculate. No doubt it was used to make Brick tea; but it appears that if China wanted cheap tea, she has to go to Ceylon for it. Does this show that there is in China large stocks of cheap tea to send to Australia? The incident appears to me to be a hobgoblin set up to frighten His Excellency the Governor into action in what does not concern him. There is no use in hiding any longer the fact that the interests of high and low country planters are not identical. The former, who are the minority, have ruled the roost too long. They only pay 25 per cent of the Cess, the lowcountry planters paying 75 per cent. No wonder they propose to double the Cess, to fritter it away in unpracticable schemes. They will doubtless console themselves, when they read my letter, with the reflection, that the Chancellor of Exchequer is not likely to pay any attention, to the representation of a single private individual.—yours truly,

C. SHAND.

I see by today's newspapers that the Commonwealth has decided to impose a fixed duty of 3d per pound. I wonder if the Chamber of Commerce would have protested, if tea had been admitted free. Logically they should have done so—a high rateable duty is experienced of high priced tea. Thus

6d per pound is equal to 100 per cent on common tea selling on an average at 6d, whilst on 10-penny tea it is only about 60 per cent, thus the consumers of cheap tea are unfairly taxed.—C.S.

52, Longridge Road, November, 1901.

SIR,—As the period is approaching when the programme of the National Ways and Means will be under your consideration, I have again the honour of soliciting your attention to the question of the Import Duty on Tea, which falls so inequitably on the cheap descriptions, which are chiefly consumed by the bread-winning classes. In the event of the War in South Africa being prolonged, and the exigencies of the Public Service precluding the possibility of your reducing the Duty, however desirous you may be of doing so, I venture to suggest that the injustice of its incidence would be redressed by your substituting an equivalent *ad valorem* duty in the place of the present rateable one. As the principle of *ad valorem* duties is, as I think you will admit, the basis of all equitable taxation, whenever it can be applied, and is the one adopted in nearly every civilised country when it is desired to make those articles of imported and exported merchandise, which vary greatly in quality and value, contribute to Revenue. There is, I think, nothing unreasonable in my suggestion, especially as there would be neither difficulty nor trouble in assessing the value and levying the duty. You are aware that practically all the Tea imported into the United Kingdom is sold by the Importers (chiefly by auction in bond, and that the duty is paid by the buyers when they wish to take delivery of their purchases. In their entries at the the Custom House the buyers would assess the value at the prices they paid for the Tea, and calculate the duty to which it was liable. The Custom House clerks would check the valuation by simply inspecting the duty-payers' "bought-notes" or contracts. Thus little more trouble is involved in levying an *ad valorem* duty than in collecting the rateable one. I invite you kindly to compare the facility and simplicity of this method with the trouble entailed in levying the duty on Sugar, Tobacco, Spirits, and other dutiable goods. The adoption of the suggestion will be doubtlessly opposed by all those who believe that expediency and not justice is the predominant principle that directs your actions.—I have the honour to be, sir, your obedient servant,

C. SHAND.

The Right Hon. the Chancellor of the Exchequer.

COCONUT PALM WITH 27 BRANCHES.

Hanwella, 15th Nov.

Dear Sir,—With reference to your *para re* "coconut trees with branches" in your paper of the 8th instant, I have much pleasure to inform you that I have seen a palm with several branches on it, I counted up twenty-seven branches but there were some more—some of them had nuts, like the parent palm, which looked very vigorous and sound, having a nursery of palms on its crown as it were. The branches were flimsy and a great many had withered away. The palm I am alluding to was at Negombo, in a garden near the lake. I happened to pass by it in 1870, in a boat, when my attention was drawn to it by the boatmen. I am not aware whether the palm is still alive or not.—I am, yours faithfully,

AN EYE WITNESS.

JAPAN TEA: RECORD LOW EXPORT.

Kandy, Nov. 27.

SIR,—I herein enclose extract from the New York *Journal of Commerce* for the information of those interested.—Yours, etc., A PHILIP,
Secretary, Thirty Committee.

(Enclosure.)

Mail advices received from Smith, Baker & Co., dated Yokohama, October 3rd, say: Since about the middle of August the current prices of tea in Japan have been below the cost of production, and but little tea has been picked meantime. The available stock has dwindled to a small supply, and will soon be worth more for home consumption than for export. With this issue we are approaching the close of the buying season more near enough to predict with a fair measure of accuracy what the total export of Japan teas will be as compared with last year, and we believe the shortage will approximate one and three-fourths millions pounds, in other words, that the total export will not exceed thirty-six million pounds. So small an export has not been recorded in fifteen years. The reason of this is becoming more apparent and clear with each season's declining export. The cost of production in Japan has steadily increased from year to year for the last decade, and the value of tea in America and Canada at points of distribution has not advanced in like ratio. Consequently the tea industry in Japan does not pay as well as in former years, nor as well as other industries to which labour and land in Japan can be applied. Yokohama—Arrivals, 190,634; settlements, 185,054; stock, 5,580. Hiogo—Arrivals, 90,823; settlements, 89,303; stock, 1,520. Arrivals at both ports, 281,457 piculs, against 298,312 do. same time last year, and 330,153 piculs in 1899. Settlements at both ports 274,357 piculs, against 294,507 do. same time last year and 321,716 do. in 1899.

ON THE USE OF ACETYLENE GAS LAMPS IN TRAPPING INSECT PESTS.

Peradeniya, Dec. 2.

DEAR SIR,—Some interesting experiments in trapping insects by means of Acetylene gas lamps have recently been conducted by Messrs. G Gastine and V Vermorel, in France. They have published the results of their work in a small pamphlet, of which the following is a resumé:—

For several years the vineyards in the Beaujolais have been infested by a destructive Pyralid moth. Many vine-growers had tried without success to check the pest. The authors of the paper attempted its destruction on the vineyard of Liergues, in July last, by means of illuminated traps. The lamps used were served with Acetylene Gas: the burner, with a naked flame, being fixed in the centre of a metal basin with a diameter of about 18 inches. This was partly filled with water covered with a film of petroleum: the burner projecting a few inches above the level of the water. The small generator was charged with 150 grammes (about 4½ oz.) of Calcium Carbide, which quantity kept the light in action for six or seven hours: the flame being of a little over one "carcel."* The generator supported the basin and was fixed on a post at a convenient height. The lamps were lighted between 8-30 and 9 p.m., and burned all day break. During the dusk it was found that few moths were captured. The big catches commenced after dark, when clouds of the moths were fettered by the brilliant light. Some were singed by the flame itself, but the greater number precipitated themselves directly into the basins. When the insects are very numerous, a greater proportion of oil should be used to ensure their capture. The trials commenced on the night of 13th—14th July, with two lamps. One basin was accidentally overturned: the other captured 4,650 of the moths, besides an assortment of other insects. On another night as many as twenty lamps were employed, a total of 64,000 moths being accounted for, giving an average of 3,200 for each lamp. The biggest catch in a single basin was 5,000. From the 13th to 31st July, 170,000 of the moths had been destroyed in this manner. The average proportion of the sexes was 42 per cent females and 58 per cent males.

It is evident that such wholesale destruction of the moths must have a marked effect in checking the pest. This method of catching noxious insects deserves a thorough trial in Ceylon. It would be particularly applicable in such cases as "Tortrix", "Nettle-Grubs", "2. Red-slug", and other pests due to the caterpillars of moths. Whether it would be equally effective against *helopeltis*, "Shot-hole Borer", and other miscellaneous pests, can only be proved by separate experiment in each case. I have tried small oil lamps, with out result upon either *helopeltis* or shot hole borer. But insects that take no notice of a small light, may be readily attracted by a more powerful one. A special apparatus, with which I hope to conduct experiments against our various winged insect pests, is now being constructed for me.

E. ERNEST GREEN.

GOVT. ENTOMOLOGIST.

THE NEW PROCESS FOR FERMENTING TEA.

FURTHER INFORMATION ON THE ISOLATED ENZYME.

FROM THE DISCOVERER, MR. NEWTON,

Kurseong, Nov. 22.

SIR,—It was with great pleasure that I read Mr. Bamber's criticism on my proposed new process of fermenting tea. I have always looked up to him as the greatest authority on the chemistry of tea manufacture, and his difficulty in finding and isolating the tea enzyme in Ceylon goes far to corroborate my contention, that the better the quality of the tea the more enzyme it contains, as in the best class Darjeeling teas it is easily demonstrable and there is no difficulty about isolating it.

Mr. Bamber has evidently had very little experience with plant enzymes or he would not say they increase in quantity after plucking, it being one of their peculiarities that they neither increase nor diminish in quantity, when separated from their original source, although they have the power of oxidising quantities of the product to which they are adapted.

In the Chemistry and Agriculture of Tea by Mr. Bamber, he says that the essential oil is considerably increased in quantity

* "Carcel" is the French unit of artificial illumination, and is equal to the light emitted by a standard lamp with a flame 40 mm. high and burning 42 grammes of colza oil an hour.

1. *Capua coffearia*, Nietner.
2. *Thoesa cana*, Wlk.: *T. recta*, Hmps.: *Natada nararia* Moore, &c.
3. *Heterusia cingala*, Moore.

during the process of manufacture. This hardly agrees with his present statement, but this is immaterial, my contention being that during the process of oxidation certain ethereal flavouring substances are formed which give flavour and aroma to the tea, and that by the addition of a proper enzyme more of the cell contents are rendered soluble, thereby increasing flavour and strength. Undoubtedly if a large excess of enzyme is added, or it is allowed to act for too long a time, there will be a loss of delicate flavour through the over-oxidation and rendering insoluble these delicate flavouring materials, the same as there would be by over-fermentation, but the one can be guarded against as easily as the other.

By the addition of the enzyme to most teas, the infusion is considerably improved in body and colour, by the larger quantity of the cell contents rendered soluble, and it remains to be seen whether with all teas an improvement in the flavour takes place. I sincerely hope that for the sake of the tea industry it does not, as that would mean a levelling-up of all qualities.

I have known of the oxidising enzyme in the tea for a considerable time, but have always hitherto thought it inadvisable to try to introduce chemistry into tea manufacture, in case we might reduce the industry to a level with that of Indigo. But now that the Japanese and the Ceylon and Indian Tea Planters' Associations have taken the matter up, it behoves all of us to do our best.

Unfortunately our tea season up here is over for this year, so I am precluded from continuing my experiments in manufacture and am reduced to those of the laboratory.

The enzyme can be demonstrated in the tea leaf by crushing a leaf, and then adding a few drops of tincture Guaiac, when a blue colour will appear. It may be necessary in some cases to add a few drops of Peroxide of Hydrogen, to intensify the reaction or, in extreme cases, when there is deficiency of enzyme and an excess of tanning, to dissolve out some of the latter first with alcohol. If the chemically pure article is required it can be dissolved out of the tea with water, the tannin absorbed with gelatin, and the enzyme precipitated by adding five volumes of alcohol. -Yours faithfully,
C. R. NEWTON.

PLANTING NOTES.

FIJI UP TO-DATE: USEFUL INFORMATION FOR PLANTERS.—*Appropos* a correspondent's request for further information with regard to Fiji, we have pleasure in publishing a few paragraphs from "the Statesman's Year Book" for 1901, which may be of interest to him and other readers:—

For the purposes of native government the colony is divided into 17 provinces, in 11 of which a superior native chief exercises, under the title of Roko Tui of his province, a form of rule which recognises to a large degree the customs and the system of administration by which the people governed themselves prior to the establishment amongst them of a European form of government. In six of the provinces there are European officers

as commissioners. About 175 native chiefs of inferior degree are employed by the Crown in subordinate administrative capacities, and receive salaries from the Government. There are also 35 native stipendiary magistrates associated with 10 European magistrates in the administration of justice. A European commissioner resides in Rotumah.

With regard to religion we learn on the same authority, that the number of persons attending worship in the native churches of the Wesleyan Mission in 1899 was 94,032 and attending the churches of the Roman Catholic Mission, 9,195. Two public schools receive state aid to the extent of about £75 a year, one in Suva and one in Levuka. During 1899 the Wesleyan Mission had 1,499 schools with 26,461 scholars, while the Roman Catholic Mission had 146 schools with 1,832 scholars. The revenue and expenditure (exclusive of that on account of Polynesian and Indian immigration) for the four years providing to 1900 have been as follows:—

Year.	Revenue.	Expenditure.
1896 ..	£73,869 ...	£73,099
1897 ..	74,492 ...	73,232
1898 ...	94,165 ...	87,594
1899 ...	98,621 ...	95,568

Production and industry are described as follows:—

There are five sugar mills in the Colony, with an aggregate nominal daily output of 204 tons of dried sugar, one tea factory, with an aggregate nominal daily output of 400 pounds of dried tea, 16 boat-building yards, two soap works, two saw mills. In 1899 there was under cultivation by European settlers:—Bananas, 2,228 acres; coconuts, 29,891 acres; maize, 518 acres; sugar-cane, 23,160 acres; yams, &c., 177 acres; tobacco, 34 acres; peanuts, 230 acres; tea, 210 acres; rice, 714 acres; pine-apples, 157 acres. There were in the colony, at the end of 1899, 2,083 horses; 16,940 cattle; 995 sheep; and 9,146 Angora goats.

In 1899 the value of the total foreign trade for the year was £744,900, of which £263,044 was imports and £481,856 exports.

The principal exports in 1899 were—sugar, 23,403 tons, valued at 340,603*l.*; copra, 7,617 tons, valued at 77,330*l.*; green fruit (consisting chiefly of bananas), 30,607*l.*; Colonial distilled spirit, 132,440 gallons, valued at 16,343*l.*; pea-nuts, 220 tons, valued at 3,182*l.*; pearl-shells, 39 tons, valued at 3,092*l.*; bêche-de-mer, 37 tons, valued at 2,344*l.*; maize, 13,660 bushels, valued at 1,366*l.*, vanilla, 9 cwt., valued at 1050*l.*

During the year 1899 the total number of merchant vessels entered at the ports of entry as arriving in the colony was 96 steamers of 115,237 tons, and 34 sailing vessels of 13,462 tons. Of these vessels 115 were British, two American, eight Norwegian, two German, one Danish and two Tongan. Total tonnage entered and cleared in 1899, 235,447 tons.

In 1899 there passed through the post office in local correspondence 267,910 letters, 163,077 papers, and 30,570 book-packets; and in foreign correspondence 153,536 letters, 145,637 papers, 23,009 book-packets, and 1,278 parcels. A Money Order system has been established with the United Kingdom, Canada and the Australian Colonies. An overland telephone from Suva to Ba, 120 miles, has been constructed.

Moneys, weights, and measures are the same as in the United Kingdom.

PRODUCE AND PLANTING.

Referring to Kenghung tea, the British Consul at Chiengmai, Siam, says:—"The import of this tea to Chiengmai and Moulmein is a novel one. The Yunnanese purchase the tea chiefly in circular bricks for convenience of pack transport in the town of Kenghung which is the centre of a large tea-growing district. This tea brought south is of an inferior kind, being the older shoots of the 'mieng,' or tea plant. It is steamed like rice in copper pots, with a cloth over the mouth of the pot and when sufficiently steamed is turned out and squeezed in the cloth till fairly dry, when it is ready for sale. The weight of one of these pudding-like bricks has been found to be 1 lb. 12 oz. The price in the Kenghung market is from 6d to 10.1 per choi (3 1-3 lb); in Chiengmai, from 1½ rupees (1s 8d) to 1½ rupees (2s); and in Moulmein, from 2 rupees (2s 8d) to three rupees (4s). The tea is rather strong to European palates, but is appreciated by Burmese and Shans, who steep it in water before using. The best class of Kenghung tea does not come south, but is transported in cubes to the Yangtze, where it finds a better market. The medium class is taken by Talifu muleteers to Mandalay for Burmese consumption. This same 'mieng' grows wild on all the hills sound Chiengmai, and there is a large local consumption of the leaf, not as a beverage, but is a quid for chewing and eating."

The Mexicans grow coffee, but they do not drink much of it, and as for tea, the rural Mexican scarcely knows what it is. They have their own fermented drinks, and very deadly they are. There are three beverages which in Mexico supersede wine in the taste of the common people, and convert thousands of fine men and women into wrecks. These are pulque, mescal, and aguridente. Pulque is the favourite drink of the respectable class who are not satisfied with ordinary wine. It is regarded as an exquisite luxury. The Mexican writers generally glorify this concoction. It is peculiar to the country, being the product of a magnificent plant of the aloe tribe, the *Agave Mexicana*, which is amazing in its sugary richness. A far more deadly drink is the famous mescal, another fermented extract of the amaryllidæ or aloe tribe of plants. For the rural Mexican this mescal is the most precious of all potations. It is distilled from a very different species of the aloe—very different from the ordinary pulque-producing agave. The mescal plant is a kind of century flowering giant cactus; that is to say, it shoots out a magnificent spike of bloom only after an interval of many years.—*H & C Mail* Nov. 29.

 TRINIDAD AND TOBAGO.

The report of the Colonial Secretary of Trinidad for last year shows considerable prosperity in the colony, in spite of the export of sugar being the smallest for 20 years past. The revenue was greater than in any of the previous five years, and was much in excess of the expenditure. The pub-

lic debt at the end of the year was £918,472, or less than 18 months' revenue, and more than three quarters of it represented directly remunerative public works, especially the railway. Large harbour improvements are in contemplation, and a complete system of roads, connecting the settled districts and opening new country, is about to be carried out. The margin of taxable capacity is large, for the taxation is light and is mostly indirect. The imports amounted to 2½ millions sterling, and the exports to a little more. Cocoa, sugar and asphalt are the staple exports. Of the countries sending imports Great Britain sent about a third last year, Venezuela and the United States about a fourth each. The transit trade, which forms about a quarter to the total trade of the colony is almost wholly with Venezuela. Even the heavy additional duty of 30 per cent on imports from Trinidad, imposed about ten years ago by Venezuela, has not killed this trade, thanks to the natural advantages of the position of Trinidad. The island, too, is favourably situated for commanding the trade of the rich Orinoco valley, which is now being in some measure developed from Trinidad. Cocoa is now the staple product of the colony; the area under its cultivation is nearly twice that under sugar, and is extending daily. Cocoa, however, is not, like sugar, a manufacture, and a given quantity of it represents far less expenditure on wages than is the case with sugar; but it maintains a large number of peasant proprietors. As to the sugar industry, the old system of a boiling house attached to each plantation has passed away; the planter is now primarily a manufacturer, and cane farmers have come into existence who do nothing but grow the cane and then sell it to the mills. The farmers are in many cases peasants with only a few acres cultivated by themselves and their families. The population is about 272,000, the East Indians numbering about 78,000. "Throughout the bulk of the population the proportion of African and European blood in each individual is unascertainable. The oldest Creole families of European extraction are of French or Spanish origin, and a Corsican element has contributed many Italian names. A French *patois* is the common language in the north of Trinidad, and in certain places Spanish is generally spoken. In Port-of-Spain there are always Venezuelan, Spaniards, and many Portuguese shopkeepers. In the country the shops are frequently kept by Chinese." The report states that life is easy in the colony, the demand for labour is in excess of the supply, and so wages are high; the Creole labourer values leisure above all things, and so East Indian labourers are imported. These almost invariably remain at the end of their term, and swell the ranks of free labourers and peasant proprietors, though they are entitled to be restored to their own country if they so desire. The Indians are always thrifty, and there is no intermarriage between them and the negroes.—*London Times*, Nov. 26.

NOTES FROM THE NORTH.
HARVEST AND OLD COFFEE DAYS IN
CEYLON.

TEA AND WEEDS VS. CLEAN TEA AND BLIGHT.
Aberdeenshire, Nov. 25.

I see you are off to the land of the wild Hindu, and am sure you'll enjoy it. I always think Hindustan and its people are so high caste compared with any other nation. There is something swagger about those high caste Rajahs that we can't come up to in our sober Britain. I'll be looking forward to your notes on your travels. We have had a very good harvesting, although, of course, farmers are never pleased. I am, however, struggling along, glad to have good health, and always working beneath my estimates. That is the only plan to keep on the safe side. Grain is going up very much in price, which we rejoice in, but beef and mutton are drooping, the people are eating too much foreign stuff. Live stock killed at the port of landing must be poor eating, as they have been sea-sick and the meat soft. In an interesting article in the *Observer* under the heading of "Planting in Java," the writer deprecates an ultra-cleanliness from weeds as being conducive to an increase of diseases in tea, and that 'grey blight' first made its appearance, in Java, on an estate, kept extra clean by a Ceylon planter. I quite agree with him, and have always maintained that hand weeding was the worst thing that could be done, as it caked the surface, and kept the air from getting at the roots. Of course it is very pretty to see a clean estate, but one, not quite so clean, with the weeds dug in with forks, is much more profitable. I also observe that Mr Henry Cottam, in his "Uva Revisited," in reference to the coffee which he was still flourishing, says that it evidently likes to grow native fashion, and that cultivation and artificial manures helped to kill it. This is also quite true: the coffee estates which were most highly cultivated, and got the greatest quantity of artificial manures applied to them, are now the most dead of any in the Island,—Queen Anne is much more lively than they. This same penchant for artificials has ruined many a farmer in this country, beside leaving the farm, which he had on lease, as barren as the desert of Sahara.

In JLS's notes of his planting career, he refers to the Directory of 1854-65, and does so in a somewhat disparaging way, because it appeared without his name in it, although he had been several months in the Island. I also have the same complaint to find with the 1864-65 Vol. for I had been several months in K D & Co's. office in Kandy before it came out, and yet my name was conspicuous by its absence. I remember visiting Gona-Adika, when JLS and Spencer Shelley were *sine durais* to Greenwood, and we played cricket on the barbecue, with a gang of coolies to field for us; and, although that was 36 years ago, I have no doubt we three are still good for a game of cricket, if we had the leisure and the opportunity. I dare not write more of those old days, else I'll weary you; so with plenty salaams and best wishes for a Merry X'mas and a Happy New Year,
COSMOPOLITE.

THE LATE SIR GEORGE BANNER-
MAN, BART.

(By one who knew him)

"Mr. Bannerman' had been settled in Canada for ten years when he took a run home to Aberdeen, where he was born and his family had been located from time immemorial down to modern times, and a city his uncle, Sir Alexander Bannerman, had represented in Parliament. In Aberdeen he met R B Tytler who told him that Ceylon was the place, and coffee the means, by which to acquire a fortune. The advice sounded good to the Canadian; so he determined to follow it, and clear out of Canada as soon as he could. He came out to the island, bringing many letters of introduction, including more than one to the great firm of that day as agents for coffee estates—Keir, Dundas & Co., Kandy—and sought a billet. None of the introductions provided a berth for him. John Gavin, the managing partner then of K D & Co., a rough diamond, brought out more of the roughness of his nature than the better side when the applicant for a berth sought him. But this better side was amply shown afterwards when Bannerman, ill with fever, lay almost friendless in Nuwara Eliya. Often in after years did he talk of the great kindness he there received from the Gavins. Often also did he 'yarn' about his experiences when after first landing at Galle he proceeded to Colombo; but any one of that date could probably very fairly fill up the details of that journey themselves.

"One of the first estates he stayed on was Charles Dixon's

MAHABEERIATENNE IN DUMBARA.

They had travelled by the same steamer. Here he made acquaintance with Ceylon parrots and pigeons, and afterwards used to declare they were not to be equalled in beauty elsewhere, any more than the road thither from Kandy was easily excelled in beauty. He was always a keen admirer of nature, and especially interested in birds, which he skinned skillfully and very readily for friends who formed collections. At Mahabeeria was a tall old Scotchman, named Bruce, of about 6 feet 6 or 7 in height, to whom he at once took. Bannerman was well above 6 feet and broad in proportion; but he felt small beside Bruce who came from some sugar estate in Jamaica, and used to tell of having yellow fever there and of his coffin being prepared by an enterprising carpenter, and not being required that time was kept by the tradesman standing in his shop on end like a great sentry-box. It was there when Bruce left the West for the East Indies! Bruce got on well with coolies though he could master no Tamil, and only addressed them in broadest Scotch. He was when first Bannerman saw him stoking an engine with ebony—no doubt small wood and worthless but

one fresh from England was accustomed to regard all ebony with a certain amount of respect and the proceeding rather startled the newly arrived! He took Bannerman to neighbouring estates and introduced him to planting life. Amongst other places he took him to Rajawella (then lately recovered by the Lindsays and Aberdeen Haddens from the Oriental Bank, as the result of their great law-suit); and showed him the fine coffee trees planted by Colonel Lindsay between the road and the bungalow, then over seven or eight feet high, some nine feet apart, now represented only by stumps in the rooms of the Ceylon Association in London, taken home by the late Peter Moir. On Bannerman asking how the fruit was gathered, Bruce said they keep some 'climben boys' (*anglicé* climbing boys) to pick it.

"The first berth was given to Bannerman by Dr. Kelson, to whom he was on a visit, and who had

A WATER-WHEEL

he wished put up. He asked his visitor if he could erect it, and received as answer 'Certainly.' Kelson asked if he had ever put one up, and was answered 'Never.' "Then how do you know you can put it up?" The question seems almost ridiculous to the visitor who was ambi-dextrous and could do anything with either hand from fine fretwork to building a house or factory: and in rough building had had great experience in Canada. The answer on the other hand seemed mere self-confidence. At last Kelson offered a sum down to be paid when the water-wheel was satisfactorily in its place. On this Bannerman made 50 per cent, and never after that did he lack a berth. He was always fond of Kelson who gave him a start as planter. He afterwards was superintendent of one of the Haddens' estates under James F Moir, and was the first with him when he was poisoned. There are still some alive who remember that tale.

"Bannerman left the island with Stewart and McIntyre for Cochin, where he suffered severely from fever and afterwards went to Goa, where he cleared land for coffee and where he suffered more severely still from fever. He finally left India in June, 1868, for England, and never afterwards quitted Britain's shores. He married in 1869 the eldest daughter of Mr. Richard Brooke, F.S.A., niece of Mr. Charles S Hadden. He was also uncle to Mrs. John Anderson, of Gorthie, Dikoya, and stood as great uncle to her children, so he had many ties with Ceylon beside those of friendships.

"He used to be interested in 'the Ceylon Mounted Infantry,' for in Canada he had raised the St. Thomas Troop of Volunteer Cavalry when the Crimean War had denuded of regulars all those colonies and they found they had to provide their own forces. The Canadians were not slack in that respect than any more than now. Captain Bannerman retained the command of his troops until 1860 when he retired, retaining rank and right to wear the uniform.

"He succeeded to the baronetcy on the death in 1877 of his cousin Sir Alex. Bannerman of Crimonmogate, Aberdeenshire, the estate of

Crimonmogate falling to Sir Alexander's only child, Ethel Mary Elizabeth, now married to Lord Carnegie, son of the Earl of Southesk. The baronetcy was conferred by Charles II. upon Sir Alexander Bannerman for 'his constant loyalty during the rebellion and of the heavy calamities he had suffered on that account.' The history of the family is written in that of Aberdeen and lately Brown, the publisher there, has been printing a good deal about the later members, including that inveterate joker, the first M.P. for the town, Sir George and Lady Bannerman settled at East Hill, Brackley, Northamptonshire; and when Brackley received a new charter granting the place a Mayor and corporation Sir George was named in the charter as the first mayor.

Sir George was a good shot and fisherman, a fine man physically, a fond father, and true friend. He will be long missed. His successor as the eleventh baronet is his only son, now Sir Alexander Bannerman, Bart., in the Royal Engineers, who is serving in South Africa. He received his orders the day after war was declared, immediately embarked and has ever since been hard worked in almost every part of the field of operations. He was honourably mentioned by Lord Roberts.

TIGER MEASUREMENTS: MR DEANE'S RECORD BEAST.

(To the Editor, "Madras Mail.")

I had the pleasure of measuring a male tiger shot by Mr Deane on the 23rd ultimo, which taped 10ft. 3½ in. measured from tip of nose to tip of tail, as he lay. Subsequently, on reading "Tiger Measurements" in the "Encyclopædia of Sport," I see that the record authenticated measurement is that of a tiger shot by the Maharajah of Cooch Behar, measuring 10ft. 2½ in. It would be interesting to know whether the tiger shot by Mr Deane is a record one.

Peermaad, 15th Dec.

D W ARTHUR.

NEW RUBBER COMPANY.

Anglo-South American Rubber Synd, Ltd. (71,918).—Registered Nov. 20, with capital £1,000 in £1 shares, to acquire lands, plantations or estates in Bolivia, Peru, Brazil or elsewhere, and to carry on the business of India rubber, gum, coffee, tobacco and general planters and merchants, explorers, etc. No initial public issue. Registered without articles of association by T T Hull & Son, 22, Chancery Lane, W.C.—*Investors' Guardian*, Nov. 30.

HINTS FOR ORANGE GROWERS.

Treatment of the soil with gypsum, followed about ten days after by very weak solutions of iron sulphate, enables many possessors of orchards of Portugal oranges to retard the ripening of the fruit for some considerable time, at the same time these substances tend to fix the fruit on the tree. The blood orange, which can be successfully cultivated in so few countries, in Egypt improves in every genera-

tion upon its parent. It is grown from seed. Those whose crops do not come up to expectations, especially those who are experimenting with new varieties, should recollect that orange trees require plenty of soil, copious watering, accompanied by perfect drainage and plenty of manure. They can rest assured that the orange will most surely give a full return for all nutriment properly given to the soil. From an average of several analyses of orange trees the following percentages have been obtained:—Fresh fruit contains 0.38 nitrogen, 0.40 phosphoric acid, 0.38 potash; fresh leaves contain respectively 0.70, 0.10, and 0.38; while fresh wood contains 0.70, 0.50, and 0.73 of nitrogen, phosphoric acid and potash. In returning these substances to the soil it should be noted that the effect of nitrates is to produce excessive growth of wood, leaves and skin; phosphates promote quantity, but poorness in the fruit; potash dwarfs the size of the tree, but increases juiciness, sweetness and flavour in the fruit. Accordingly none are in themselves sufficient fertilisers but combined in proper proportions they complement each other, counteract each other's bad qualities and produce the desired results.—*Egyptian Gazette*, Dec. 2.

THE DEVELOPMENT OF BRITISH GUIANA.

INDEPENDENT PLANTING EFFORTS VINDICATED.

With reference to a letter signed "Fair Play" and published in our issue of November 15th, dealing with the development of British Guiana, we have received letters in reply from Mr. J E Tinne and Mr. Allan Messer, from which we give the following extracts. Mr. Tinne writes:—"Dr. Morris spent ten days in British Guiana with the Royal West India Commission in 1897, and during that time he attended the inquiry and visited my own and other sugar estates, and delivered an address to the Royal Agricultural and Commercial Society upon the possible agricultural products of the colony other than sugar, and after the issue of the report of the Commissioners the retiring president of the society, Professor Harrison, subsequently replied as follows:—"Dr. Morris has alluded to the great fertility of the interior of this colony. I do not know on what grounds he based his supposition of this great fertility. I can find no grounds for believing that, in a country having the geological structure the interior of this has, great tracts of land of exceptional fertility will occur, although possibly tracts of limited area may occur in valley land and river bottoms or on the lines of dykes of certain classes of intrusive rocks. I may mention that as far as my analytical examinations of some hundreds of the soils of the interior and seaboard of this colony extend, no indication of exceptional fertility in soils other than those of our alluvial coastlands have been obtained. All point to the wisdom of our Dutch predecessors in ceasing their attempts to raise economic agricultural products on many of the soils of the interior." The proprietors of sugar estates do not deserve 'Fair Play's' sneer; they have never claimed to be held up as benefactors of the colony because they expended money liberally from private resources to keep their estates and labourers in existence. They did so for self-preservation for sugarcane is a continuous crop (unlike beet-root), and machinery unused even for a year in the tropics rapidly deteriorates. As regards their contribution to the general revenue, I would refer

him to the tax ordinances, which will give him the information he desires. I am totally unaware of Mr. Laing's reason for voting as he did; he certainly does not take his instructions from my firm, nor do we fetter his judgment in any way, and in the combined Court he represents Berbice, and not us." Mr. Messer writes:—"Sugar estates in British Guiana do pay a direct land tax, while in addition, as the revenue of the colonial Government is principally derived from Customs duties on imports to which the estate owners are large contributors, the colony would be bankrupt in a day without their assistance in this respect. It seems to be assumed that the planters are responsible for the failure to develop the resources which the interior of the colony undoubtedly contains. Nothing could be more unfair. The sugar estates are all on the coast line, and their owners, while the importation of beet sugar into the mother country continues to be assisted by foreign bounties, have all their work cut out to meet that competition without being saddled with a responsibility which does not really concern them."—*London Times*, Nov. 29.

SNAKE HAD NO TOOTHBRUSH. CURIOUS STORY FROM DR. CALMETTE.

Paris, Sunday, Dec. 1.—Dr. Calmette, director of the Pasteur Institute at Lille, who was recently bitten by a most poisonous snake, tells the following story of the occurrence:—

"I was handling the snake, when one of his fangs touched the third finger of my right hand. I felt nothing at first, but presently found blood began to flow. It was easy to understand what had happened. I ran and placed my finger under a tap. Without delay one of my assistants inoculated me under the skin of the stomach with an injection of serum, and in less than five minutes the numbness and the pain had ceased."

A day or two later, finding that the wound did not heal, a surgical operation was performed. This had nothing to do with the snake venom, which had been completely eliminated from the wound. Necrosis had set in from infection of the open wound, and the doctor concluded with a laugh. "I suppose the reptile had forgotten to wash his mouth."—*Daily Express*.

MR. HENRY BROWN'S PLANTING EXPERIMENTS IN B. C. A.,

Many readers will remember the specimens of fibre, Gum Arabic, etc., which were exhibited at the last Agri-Horticultural Show by Mr. H Brown, Mianjc. These were given by Mr. Brown to Mr. Cox, the President, and he sent them home to Messrs. H J Gardiner & Co., with a request that they would procure a report and valuation. Mr. Cox has now sent this report for publication, along with the specimens of the fibres which may be seen at this office. A sample of India rubber made from the Ceara tree and exhibited by the African Lakes Corporation, Limited, was also sent home at the same time and is included in Messrs. Lewis and Peat's report, which is dated June 1901, and is as follows:—

We have carefully examined the samples contained in the box *ex* Illovo and beg to report upon same as follows.

Aloe:—Good length and strength, rather brown—(should be got white if possible)—value about £25 to £27 per ton; perhaps more, readily saleable,

Plantain:—Fair length and strength, value about £20 per ton, readily saleable.

Pine Apple:—Nice length and strength. Saleable in small lots. Value £15 to £17 per ton, if whiter possibly £20 per ton.

Sansevieria Cylindrica:—Of good strength and fair length; rather poor colour, about £10 to £20 per ton.

Sansevieria Guineensis:—Same character as above but not so good—value about £15 per ton.

China Grass:—Very poor quality and probably next to no value.

Rope:—Would not sell in this market.

India Rubber:—Fine neat clean ball, worth about 3s per lb and readily saleable.

Gum Arabic:—(labelled Animi): Of no value and insoluble.

Anatto Seeds:—Of no commercial value being very dull in colour. If bright good colour 1½d to 2d per lb. might be obtained.

Turmeric:—Of no value in its present condition; it must be dried before shipment.

This report is distinctly encouraging, especially as regards the Fibres. The Aloe, for example, grows well all over the Shire Highlands and if a machine exists for successfully treating it in large quantities it should pay at the prices mentioned in the report. It would require to be planted on a large scale however, treated by machinery, packed in a press and sent down river at a low freight in addition to a low freight from Chinde to London. £25 a ton is a little less than three pence per lb, so that it will be clearly seen that after the expenses of growing, preparing, and packing are calculated, the freight would have to be a very low one to allow of any profit at all. It is calculated that at present freight rates it takes about £12 per ton to sell a ton of coffee of which freights are roughly £7-10 and were the fibre to cost the same amount it means that only about fifty per cent of the value in London would be available to pay cultivation, manufacture, interest, etc., and profit. On the other hand were the freights reduced by 25 per cent perhaps that very 25 per cent reduction would be the profit and would therefore decide the question as to whether the industry could be taken up or not.

The only other item in the list which is of special interest is the Rubber specimen. We have, however, no information as to the age of the trees when tapped, the method of tapping, and the effect on the trees after being tapped, and most important of all the amount of rubber yielded per tree. If the A L C can furnish these particulars it might be possible to come to some definite judgment on the worth of the Ceara as a rubber yielding tree.—*Central African Times*, Nov. 2.

INTRODUCTION OF COCOA INTO BRITISH CENTRAL AFRICA.

In my circulars on this subject, it was stated that the importation of cocoa seed was likely to be unsuccessful, the supposition being based on previous importations having failed. Fortunately, however, through the kindness of Sir W. Thisilton-Dyer, Director of the Royal Gardens, Kew, I am now able to state that cocoa plants may be successfully transported from England to British Central Africa. A consignment of 210 plants in two Wardian cases were despatched from Kew on the 14th June and arrived at Zomba on the 4th September having thus been 82 days in the cases. Although on arrival the

lower leaves of the plants were withered and had fallen off, the plants looked in excellent condition, and just as if they had left the hothouse only a few days previously. Each plant was in its place and only three were dead. After the covers of the cases had been opened for several days to admit air, and allow syringing with water, the plants were taken out, and the roots of each were covered with sphagnum (moss) and securely tied—a few threads of any fibrous plant being sufficient—after which all were planted in a previously selected and prepared piece of ground. This was well dug and watered and was in a suitable state for their reception. It was considered advisable to top each plant so that strong plants with good roots will be ready to plant out at next rains. With frequent syringing and watering, the plants have now burst into foliage and promise well. To those who desire to import cocoa plants in quantity the following points should be observed. Seedlings should have matured a season's growth in three inch pots before they leave Europe, which should be at any time from June up to end of September, as there will be less danger of the plants suffering from frost at this period of the year before they reach the tropics. Plants leaving in June will allow of their reaching here in time to be treated in the nursery bed and become established before planting out in the succeeding rains. Nursery beds—which should not be in an exposed position—need not be shaded, as this would cause the plants to be weakly and “drawn.” Plants leaving Europe in June or July will most likely have completed their season's growth, and be in a condition to stand shifting out of the pots and packing in the cases, and travel without much fear of their breaking into active growth on the way. This is a most important point, and one to which much of the success of this last consignment from Kew is due, together with excellent packing. The bottom of the case should be covered with two inches of sphagnum, with just a little soil, leaf mould and sand preferably. On removal from the pots the plants may then be placed closely together, one ordinary case holding just over the hundred. A little soil should again be placed over the roots so as to leave no empty spaces, and over this, say an inch or two of sphagnum, while above this may be placed three or four straws between each row of plants. These will keep the sphagnum from getting loose, and thus retain sufficient moisture. To securely fix the plants in the cases for the journey, some stout pieces of wood an inch and a half thick should be placed between each row just over the sphagnum and securely held down by means of two other pieces nailed along the side.

I was lately favoured with a price list of plants of economic products from the Colonial Horticultural Society at Brussels, and amongst these I observe that Cocoa plants may be obtained from Brussels at £5. 10s per hundred plants, cases and packing included. This, altogether with freight, appears rather costly; but when it is remembered that the importation of seed is so unsuccessful, this figure may be considered a fair one.

It is proposed that 100 of the plants lately received be distributed—at a nominal sum each to cover freight—to planters in B C A who are willing to give them a fair trial.—J McCLOUNIE,

Head of Scientific Department.
—*B C A Gazette*, October 31.

THE ACCIDENT TO DR. CALMETTE,
SNAKE-POISON AND MALARIA.

Mr. J Claine, the French Consul in Rangoon, writes as follows to the *Rangoon Gazette* :-

MR. EDITOR,—I have the honour to forward herewith the translated copy of a letter just received from Dr. Calmette, Director of the Pasteur Institute at Lille (France), and inventor of the serum anti-venomous against the bite of snakes. Although this letter is private, the directions and advice therein contained having a general interest, I cannot resist to communicate it to you, sure that its publicity in your estimable newspaper, will prove an humanitarian boon.

The following is Dr. Calmette's letter :-

DEAR MR. CLAIINE,—I wish to thank you immediately for the kind sympathy extended to me by your letter of the 25th October, with reference to the little accident of which I have been very nearly victim. I have had the bone-joint of the fourth finger traversed by the tooth of an enormous "Cothrop." Without the serum I certainly would have been in the other world. But the tooth of the animal being dirty caused a deep phlegmon of the one, and it was found necessary to take out a piece of it which was mortified. Now there is nothing the matter and I have resumed my work. I have just received from an English Doctor from Bombay a great quantity of dry venom of cobra. I am delighted! There are some good apostles—of whom you are one—who will very soon lessen the mortality by snake bites, for which the peoples of India shall bless us. I learn with regret that you have had to pay your tribute to malaria. Preserve yourself from mosquitoes which transmit it. Destroy their larvæ in stagnant pools of water in your neighbourhood. It is very easy; pour some petroleum over these pools every eight days, and do not sleep without a mosquito net. If necessary place some nailed round a frame to the windows of all the rooms where you are at night between sunset and sunrise. The mosquitoes that transmit malaria (anopheles) do not sting during the day, but solely after sunset. This notion is for your benefit.—Believe me, etc.,

Lille, Nov. 9.

DR. CALMETTE.

—*M. Mail*, Dec. 24.

NEW RUBBER.

A new source of supply for rubber has been found out by M Deiss, a French scientist at Saigon. The forests inland in that quarter abound with lianas—creeping and twining plants which grow to a large size. These lianas yield rubber out of the juice from cuttings in the bark (the usual mode of gathering) but not in paying quantities. The fact that the bark, apart from the juice, holds rubber, had long been known; but nothing had been done to turn this knowledge to profitable account. M Deiss was struck by this, and sought for means to get at the stores of rubber in the bark. It is said that he has met with success. The bark is treated chemically, and undergoes sundry processes including treatment by currents of hot and cold water alternately. The result is said to be the extraction of rubber of the best quality, which soon thickens and hardens. It took repeated experiments to show the right way to go to work. The out come is that a syndicate of capitalists in France has undertaken to start, in Cochin China and Tonquin, works for turning out rubber from bark, on the new system.—*Malay Mail*.

THE CALEDONIAN (CEYLON) TEA
ESTATES, LIMITED.

REPORT OF THE DIRECTORS

to be submitted at the Fourth Annual Ordinary general meeting of shareholders to be held at the offices of the Company, on Thursday, 28 November, 1901, at 12 o'clock noon :-

The Directors beg to submit the balance sheet and Profit and Loss Account for the year ended 30 June, 1901, duly audited.

The working account, after providing for London charges, shows a profit of £4,191 13s. 10d., and the Profit and Loss Account, including the balance brought forward from the previous year, and after payment of interest on Debentures, &c., leaves an available balance of £2,019, 11s. 6d.

From this sum the Directors now recommend the payment of a dividend of 6 per cent. on the preference shares for the year to 30 June last, amounting to £1,920; leaving to be carried forward to the next year the balance of £99 11s. 6d.—£2,019 11s 6d.

The Directors regret that they are again unable to declare any dividend on the ordinary shares.

The yield of tea from the Company's estates for the past and two previous seasons was as follows :-

	1900-01.	1899-1900.	1898-99
	lbs.	lbs.	lbs.
Lawrence and Venture...	399,087	402,535	378,501
Selegama ...	167,378	111,415	94,278
Wavina ...	94,979	40,763	16,908
	661,444	554,713	489,687

The gross average prices obtained in London were :-

	1900-01.	1899-1900.	1898-99.
Lawrence ..	6 84d. ..	7 40d. ..	8 27d.
Venture ..	7 13 " ..	7 59 " ..	8 28
Selegama ..	5 79 " ..	6 52 " ..	7 03
Wavina ..	5 64 " ..	6 39 " ..	(Sold in Ceylon)

70 cwt. of cocoa were secured from the Kahawatte and Wavina estates, and sold in Ceylon.

The above figures show that the total quantity of tea produced was 106,731 lbs. more than the previous season's crop, and 41,444 lbs. over the estimates. Owing, however, to the low prices prevailing during the greater portion of the year, in consequence of the continued excessive supply, the profit shows but a small increase, although the cost of production was considerably reduced.

The statistical position of tea generally has lately much improved, and it is estimated that the supplies from all sources for the current season will be much below last year's yield. Prices have consequently shown a marked improvement during the last few weeks, and the outlook for Ceylon tea is at the present time more promising than it has been for some years past.

The estimates for the current season are given by the Manager in Ceylon as follows :-

Lawrence and Venture ...	400,000 lbs.	Tea.
Selegama ...	175,000 "	"
Wavina ...	100,000 "	"
	675,000 "	"

and about 82 cwt. cocoa.

The Directors have to record with much regret the death, in March last, of Mr. Stanley Ross, who had acted as general Manager in Ceylon since the formation of the Company. They had in consequence to make other arrangements for the administration of the Company's business, which have so far proved quite satisfactory.

In accordance with the articles of Association, Mr. David William Rennie retires from the Board, and, being eligible, offers himself for re-election.

The Auditors, Messrs. Singleton, Fabin & Co., also offer themselves for re-election,

THE WYNAAD TEA COMPANY.

The following is from the report of the directors to be presented at the seventh annual meeting of shareholders, to be held at No. 7, Mincing Lane, at the office of the company, on Monday next:—

The directors regret to have to report the loss of their esteemed colleague, Mr. Donald Andrew, who died in February, 1901. They thoroughly appreciated his valuable services during the short time he was in office. The vacancy created on the board by his death has not yet been filled. The past season has only partially fulfilled the expectations of a year ago. The crops have very nearly reached the earlier estimates of both tea and coffee, but prices have proved extremely disappointing, and account for a deficiency in the year's results of about £1,900. The coffee crop, estimated roughly at 40 tons, has yielded about 36 tons, which sold for only £40 per ton against an average of £70 per ton in the four previous seasons. The tea crop, estimated at about 150,000 lb, has reached 146,750 lb, and was sold for an average of 5½d per lb against 7½d per lb the year before. The pepper crop estimated at 18 tons, has actually turned out 20 tons, and has realised £187 over the estimate. The net proceeds of the three crops amount to £5,134 12s 5d, against and expenditure in India of £3,716 10s 2d. The directors have again transferred a large proportion of the revenue from tea to capital account, representing the 410 acres not yet in full bearing. The result is consequently a loss of £1,290 14s, carried to the debit of profit and loss, whilst £1,640 0s 9d have been debited to capital account. The tea and coffee trades have passed through a severe crisis during the past eighteen months, but both are now in a healthier condition, and are gradually returning to a more normal state. The over-supply of tea from Ceylon and Assam is finding fresh outlets, whilst crops are reported to be somewhat smaller, more attention is being paid to the production of a better article, and prices have recovered fully 1d per lb. from the recent lowest level. Prices of coffee have recovered considerably during the past three months and although the present Rio and Santos crops are the largest on record, the reports about the Brazil crops of 1902-1903 are extremely unfavourable, and point to a much higher level of prices for next year. The estimates for the current season are based upon a tea crop of 190,000 lb, a coffee crop of 20 tons, and a pepper crop of 20 tons, and with the strictest economy in working the estates, without sacrificing efficient cultivation, the directors hope for better results. In making provision for the current year's upkeep, the directors have found it necessary to issue the balance of the debentures—viz., £2,000, and they have shown their confidence in the undertaking by subscribing for them in conjunction with Messrs. R and J Henderson.—*H. and C. Mail*, Nov. 29.

HORNSEY TEA ESTATES COMPANY, LIMITED.

The Directors beg to submit to the Shareholders the report and audited accounts for the year closing the 30th June last.

The crop of tea has weighed out 176,885 lb, against last year's crop of 191,844 lb, or a decrease of 14,959 lb. of made tea.

The period under review has been the most disastrous in the history of the tea trade. Largely

increased crops, both from India and Ceylon, brought prices down to a level never before known, and in the case of many gardens below the cost of production. Unfortunately, the Hornsey Estate has had to suffer with all estates in accepting lower prices for its produce; but owing to the excellent tea produced, the result is not so unfavourable as might have been expected.

Turning to the future, the directors are able to state that prospects are more hopeful; the severe lesson in over-production has had a marked effect in reducing crops, and prices are considerably higher since July last.

The cost of production with manufacture has been 30·84 cents, against last year 29·30 cents, or, in sterling, 5d per lb. Colombo against 4½d per lb.

The London sales have totalled 27,915 lb. of tea, selling at an average of 8½ per lb. gross, and the balance of the crop has been sold in Colombo, and realised an average 38·68 cents per lb. The average sale price for the whole crop has been equivalent to a London price of 7·47 per lb. gross against last year 7·94 per lb.

A factory has now been finished and fully equipped with the necessary machinery, and the Company since July has manufactured its own leaf. The first invoice made at the factory is advised as selling at an average of 49 cents.

Against the expenditure on the factory £2,000 in Preference Shares have been issued.

The audited accounts show that after paying all fixed charges and the Preference Dividend for the twelve months, there is a balance of £43 15s to carry to the debit of profit and loss account.

The Directors desire to express their thanks to Mr W S T Sandlers and to Messrs. E Beuham & Co, the Colombo agents, for the attention given to the Company's interest during the year.

In accordance with the Articles of Association Mr Charles A Reiss retires from the board, and, being eligible, offers himself for re-election.

The Auditors, Messrs. Singleton, Fabian & Co., also offer themselves for re-election.

CHARLES A. REISS and WALTER S. SICHEL,
Directors.

ALBIN B. TOMKINS, Secretary.

51, Lime Street, E.C.
London, 6th Nov., 1901.

THE CALEDONIAN (CEYLON) TEA ESTATES, LIMITED.

The following is from the report of the directors to be submitted at the fourth annual ordinary general meeting:—

The working account, after providing for London charges, shows a profit of £4,191 13s 10d, and the profit and loss account, including the balance brought forward from the previous year, and after payment of interest on debentures, &c., leaves an available balance of £2,019 11s 6d. From this sum the directors now recommend the payment of a dividend of 6 per cent on the preference shares for the year to June 30 last, amounting to £1,920; leaving to be carried forward to next year the balance of £99 11s 6d. The directors regret that they are again unable to declare any dividend on the ordinary shares. The total quantity of tea produced was 106,731 lb more than the previous season's crop, and 41,444 lb over the estimates. Owing, however, to the low prices prevailing during the greater portion of the year, in consequence of the continued excessive supply, the profit shows but a small increase, although the cost of production was considerably reduced. The statistical position of tea generally has lately much improved, and it is estimated that the supplies from all sources for the current season will be much below last year's yield. Prices have consequently shown a marked improvement during the last few weeks, and the outlook for Ceylon Tea is at the present time more promising than it has been for some years past. The

directors have to record with much regret the death, in March last, of Mr. Stanley Ross, who had acted as general manager in Ceylon since the formation of the company. They had in consequence to make other arrangements for the administration of the company's business, which have so far proved quite satisfactory.—*Home and Colonial Mail*, Nov. 22.

NEW COMPANY: KALKUDAH COCONUT ESTATES, LTD.

This is the title of a new Company, the memorandum and articles of Association of which are given in the *Ceylon Government Gazette*. The principal object for which this Company has been formed is to purchase the Kalkudah coconut estate in the district of Batticaloa, containing 507 acres for R113,000 as from 1st October last. The signatories are A O Tranchell, Winifred Z Tranchell, Oliver Collett, E F Tranchell, F L Tranchell, F J de Saram and George de Saram who take one share each. The original capital of the Company is R250,000 divided into 2,500 shares of R100 each. The qualification of a director is the holder of shares or stock of the nominal amount of R500. The first directors of the Company are Messrs. E F Tranchell A O Tranchell, and Oliver Collett.

"TEA TRUST, LIMITED:" A NEW COMPANY.

Registered on November 16, by Walker and Rowe, 8, Bucklersbury, E.C., with a capital of £20,000 in £1 shares. Object to carry on the business of tea merchants, brokers, and planters, tea, coffee, and cocoa dealers, general grocers, wine and spirit merchants, manufacturing chemists, and dealers in chemicals and chemical products and appliances, &c. No initial public issue. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers. Remuneration as fixed by the company.—*Financial News*, Nov. 22.

BRITISH CENTRAL AFRICA PLANTING NOTES.

Our hopes of good prospects for next year's Coffee output, which were raised considerably by the very fine blossom showers we had are diminishing in exact ratio to the time the rain holds off. It is certain that the blossom however well set cannot stand an indefinite prolongation of this strong November sun. This is exactly where the shade would come in. For a large part of the year shade is not required but at this critical time it is all important. Where the young berries in the open will be scorched those in the shade will be able to hold out until the rain comes and this is the great argument for shade in a country where the blossom showers and early rains are so uncertain. It is to be hoped however, that before many days are past more rain will fall and put the young crop beyond danger. It is certainly most discouraging that such splendid blossom showers should be followed by a spell of abnormally hot weather. It is apt to make some people despair of Coffee. To our mind it simply emphasises the need for shade and—irrigation perhaps.

We say "perhaps" because irrigation is not a panacea for all the ills under the sun. Like shade it may do harm or good. Some people have tried irrigation and have met with nothing but failure; others have been more successful. Irrigation requires almost expert skill in application or else it is

not only useless but worse than useless—harmful. With regard to Coffee, experience so far has resulted in a number of "Don't" maxims. Don't run on irrigation in the hot sun but only in the very early morning the evening or night. Don't flood your field or run it on wholesale. Don't try it on very steep land. The only successful method we know of is to run it slowly, very slowly in small quantities between the lines of coffee or into catch pits between every four trees and let it soak in. Never put it round the tree or directly to the roots. It must soak in gradually through the earth and in doing so it gets heated to the required temperature. The best plan is to catch pits filled by small rills and after allowing the water to soak in turning it off for a time. Probably it would only require to be done once, but that once might save a crop.

We have received from Mr. J. Dickie of Mr Sharer's Mpenda Estate and leaf off the West African tree and on comparing it with the plates in the monograph on *Funtumia Elastica* it appears to be identical. It is satisfactory to know therefore that we have specimens of this tree growing in the country and in a few years' time there ought to be seed for distribution. Mr Sharer certainly deserves credit for his persistent efforts to carry on the planting industry, and we hope that success will attend his efforts to introduce new plants. We hope also the Scientific Department will make further inquiries with reference to the possibility of getting seed of the *Funtumia Elastica* as it worth a considerable amount of trouble if only it can be established. Failing seed then a few more Wardian cases of Plants should be imported and the different plants set out in different districts as it is just possible that the trees already introduced might not come to seed through accident or otherwise. The conditions of such districts as Manje, Blantyre and Zomba vary so widely that it is well to test new products in each district. The rainfall of each district and the mean annual temperature vary considerably and a product might be a success in one and not in the other. These local variations are not sufficiently taken into account. For example tobacco grows well at Manje nearly all the year round. On the other hand in the Blantyre and Zomba districts tobacco will not grow well from May to October and should be planted always in the rains if heavy crops are wanted. Tobacco seed should be sown now and planted out in December, January and February or March if rains are favourable.—*Central African Times*, Nov 9.

PLANTING NOTES.

PLANTING IN BRITISH CENTRAL AFRICA.—In this issue we give the latest planting information from British Central Africa which shows how the country is going ahead with new products. In the latter we are glad to note Mr. Henry Brown's success, with fibres especially; and cocoa, too, it will be seen, is making a good start. As into every other corner of the British Empire, the volunteering spirit has reached British Central Africa and a volunteer reserve had taken shape, before the King's first (regal) birthday, at Blantyre.

A LARGE MANGO.—During the present season I was favoured by Adam Smith, Esq., with a fruit from a mango tree purchased as a seedling from the Botanic Gardens. The fruit measures 7.5 inches in length, and 4.5 inches wide. Its weight was over 2 lb. The flavour was excellent and proved it to be from the 'Gordon' mango, a well-known type described in a former Bulletin, —*Trinidad Bulletin* for October.

CINNAMON SALES IN LONDON.

ADVANCE IN PRICES.

The particulars received of the Quarterly Sale of Cinnamon held in London at the end of November, and published by us elsewhere, confirm the tenor of the private telegraphic intelligence we published some weeks ago. The very small proportion of which the finer qualities of bark bore to the total offerings, explains the notable advance of 1d. to 2d. per lb. which the leading marks obtained. The 291 bales catalogued as "worked," represent the crops of the Kadirana Estates which have always secured top prices; and Golua Pokuna, as a matter of course, stands first in the list. It is something to make the mouth of the Tea Planter water, to read of Firsts fetching 1s: 8d. per lb., and Seconds and Thirds realising respectively 1s. 6d. and 1s 5d. while Fourths (the 'souchong' of spice) command 10½d. But, then, there is no Mariawatte among Cinnamon Estates prospering on an outturn of 1,000 lb. a year? The average, happily, is only about one tenth of that formidable figure, while the cost of production and cultivation must, we fancy, average above one-fourth of the gross prices realised in London. Even so, there has been over-production, through the opening of new land, and the conversion of paddy-fields, through raised ridges into Cinnamon gardens, with the result that prices receded fully 50 per cent, and even as much as 66 for the coarser barks, during the 'seventies and 'eighties. It is only during the last decade that prices have reverted to something approaching those of thirty and forty years ago—to go no farther back to the time when cinnamon was a Government monopoly. The extent to which production has grown is evidenced by the fact that quilled bark is exported now to the extent of 2½ million lbs. and upwards, while chips which were formally treated as refuse, or were used only for the distillation of oil, have run up to nearly two million lbs. in recent years. When we say that, in the first years of British rule, the exports (on which the duty at one time reached 3s. a lb.) seldom approaches half-a-million lbs., and that as late as 1850, the total quantity exported was only 665,000 lbs. some conception may be formed of the wonderful development of the trade during the past half-century. Almost the sole uses to which the spice was put then, were connected with the culinary art and the preparation of incense for Roman Catholic worship in Europe. Since then it has been very widely used in confectionery—notably chocolate creams and lozenges and in puddings and custards—in specially prepared cattle food (like Mr. Thorley's), in the sick room as an antiseptic of recent discovery, though the natives from

time immemorial burnt it to keep off flies and dropped a piece into boiling milk to keep it sweet, and in far larger quantities than before, both medicinally and in public worship. With all that, the supply is even yet somewhat in excess of the demand; but, happily, there are two important factors which operate against a rush of over-production. Manuring coarsens the bark and renders it less valuable, so all the cultivation the bush gets is from the burial of the leaves and weeds; and, secondly, the manufacture of Cinnamon is a caste industry. The castes which consider themselves above the Chaliyas will not take part in the preparation, and thus the outturn is to a great extent limited by the available skilled labour which is now secured with difficulty under a demoralising system of advances with much resulting chicanery.

To return to the last Quarterly Auctions for the year, which are generally the heaviest, the quantity offered was more than double that brought to the hammer in August last, but almost the same as was offered at the corresponding sale in 1900. Of this large quantity, the whole of the "worked" spice was sold outright, realising an average advance of 1½d a lb.; and of the 1,399 bales "unmarked"—i.e. not examined and repacked in London—1,212 bales found buyers at a decline of about ½d, which is a very moderate fall, considering the quantity cleared. The prices realised for the quillings and chips were also satisfactory; and a yet further pleasant feature was the neglect of the fraud known as "wild cinnamon" which, as often as not, means bark of jungle bark other than *Cinnamomum Zeylanicum*, but saturated in a decoction of cinnamon chips. The statistical position of quilled bark being good, present prices ought to be maintained at the February sales unless there is a rush of spice into the London Market within the next few weeks. The following is the Report on the sale of the well-known firm of Messrs. Forbes, Forbes & Co., Ltd.:

London, E.C., 26th Nov. 1901.

CINNAMON.—The last auction for this year were held yesterday with an offering of 1,690 bales plantation quill, compared with 834 bales in August last and 1,687 August period last year.

The "unworked" spice comprised 1,399 bales and "worked" quill 291 bales.

With a good attendance of buyers there was improved competition, the 291 bales "worked" being sold, firsts, seconds and thirds of the finer grades at about 1½d average per lb advance. Fourths and lower qualities being steady.

Of the "unworked" 1,212 bales sold, medium and common sorts at about ¾d per lb average decline.

"Worked" firsts range from 11½d to 1/8 per lb seconds 10½d at 1/6, thirds 9½d to 1/5 and fourths 8d at 10½d per lb.

"Unworked" firsts 8½d at 11d, seconds 8d at 10½d, thirds 7½d at 9d and fourths 7d at 9s per lb.

Of 762 packages quillings, &c., and chips about 200 were cleared the former at 7d at 10d and the latter at 3½d at 3½d per lb.

"WILD" Cinnamon, 207 bales and 56 bags were quite neglected.

Stocks of Plantation	2,291 bales	against	3,032 bales
Do Chips	3,154 do		2,743 do
Do Wild	2,408 do		2,446 do
Do Bark & Chips	7,891 do		7,460 do

The next sales will be held, 24th Feb. 1902,

TO THE PLANTING WORLD.

Seeds & Plants of Commercial Products.

Hevea Brasiliensis.—Orders being booked for the coming crop August-September delivery 1902, booking necessary before the end of April, quantities of 100,000 and over at special low rates. Plants available all the year round, 100,000 and over at special low rates. A leading Rubber planter in Sumatra, who purchased 50,000 seeds in 1899, and 100,000 in 1900, writes us, under date 15th November, 1900:—"I received your letter of 20th October, from which I learn that you added another case of 5,000 seeds to replace the loss, &c. I am satisfied hereby, and even after this adding I am satisfied by the whole delivery of this year." Special offer, post free on application.

Castilloa Elastica.—True superior variety cultivated in Mexico, seeds from specially reserved old untapped trees. Orders booked for August-September delivery 1902, immediate booking necessary; large quantities on special terms; Plants in Wardian cases.

A foreign firm of Planters writes under date 11th October, 1901:—"We beg to enquire whether you would procure us 100,000 Castilloa seeds, in which month we might expect them, and what would be the average price." Special offer, post free on application.

Manihot Glaziovii.—Seeds and Plants available all the year round, 100,000 and over at special low rates. A Mexican planter in sending an order for this seed wrote on the 22nd August, 1900:—"If they arrive fresh and germinate easily I may send you larger orders, as they are for high ground where the Castilloa does not thrive."

Ficus Elastica.—Seeds available in May-June; booking necessary before the end of March; also plants.

Mimosa Globosa (Balata) wood of the tree is much sought for buildings, fruits sweet like a plum and eaten, oil from seeds, said to yield as much as 45 lbs. of dry rubber per tree per annum, the milk is drunk and when diluted with water used as cow's milk, grow from sea-level up to 2,000 feet, orders being booked for seeds and plants, price on application.

Cinnamomum Zeylanicum (Cinnamon superior variety).—New crop of seed in April to June; booking necessary before the end of February; also plants.

Coffea Arabica, Liberian Hybrid and Maragogopie Hybrid.—New crop March-April; immediate booking necessary.

A foreign Agricultural Department writes dating 9th September, 1901:—"Please accept our order for 175 lbs. of Tea seed and for 2,000 Coffee beans. In regard to Coffee seed I would say that this will be the first importation made by this department, and we will leave the selection of the varieties to be sent to your judgment."

OUR DESCRIPTIVE PRICE LISTS.

The following six Descriptive Price Lists are now being forwarded with Circulars and special offer, of Seeds and Plants of Rubber and other Economic Products:—

1. Tropical Seeds and Plants of Commercial Products, enlarged edition for 1902.
2. Seeds and Plants of Shade, Timber, Wind-Belts, Fuel, and Ornamental Trees, Trees for Roads sides, Parks, Open Spaces, Pasture Lands, Avenues, Hedges, and for planting among crops (Tea, Coffee Cacao, Cardamoms, &c.)
3. Seeds and Plants of Tropical Fruit Trees including Mango grafts.
4. Bulbs, Tubers and Yams.
5. Orchids—Ceylon and Indian.
6. Seeds and Plants of Palms, Calamus, Pandanus, Cycads, Tree and other Ferns, Crotons, Roses, Dracinas, Shrubs and Creepers.

Special Arrangements made with foreign Governments, Botanical and Agricultural Departments, Planters and others for supplying seeds and plants of Commercial Products in large quantities.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says:—"An interesting Catalogue reaches us from the East. It is issued by WILLIAM BROTHERS, Tropical Seed Merchants of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbing. We recommend the great Powers and Concessionaries under them to go to William Brothers."

*Agents in London:—*MESSRS. P. W. WOOLLEY & Co., 90, Lower Thames Street.

*Agent in Colombo, Ceylon:—*E. B. CREASY, Esq.

*Agent in British Central Africa:—*T. H. LLOYD, Esq., Blantyre.

Telegraphic Address:

Tropical Seed Merchants,

HENARATGODA, CEYLON.

THE FOOD VALUE OF VEGETABLES.

Tomatoes rouse torpid liver and do the work, ordinarily of a doctor's prescription.

Lettuce has a soothing quieting effect upon the nerves, and is an insomnia remedy.

Celery is an acknowledged nerve tonic, and is more and more used in medicinal prescriptions.

Onions are also a tonic for the nerves, but people will be forever prejudiced because of their odour.

Potatoes should be eschewed by those who "have a horror of getting fat," as that is one penalty of eating them.

Parsnips, it is now contended by scientists, possess almost the same virtues that are claimed for sarsaparilla.

Beets are fattening, and even a moderately-learned man will understand that it is because of the sugar they contain.

Ordinary Lima beans, some one has said, are good to allay thirst, but the same can be said, with equal truth, of a pitcher of water.

Asparagus is efficacious in kidney ailments to an extent that it is not yet, perhaps, thoroughly appreciated.

Cucumbers, aside from sunbeam emitting properties known to readers of facetious paragraphs, contains an acid that is helpful in some cases of dyspepsia.

Parsley will assist good digestion, like cheese and nuts, but a quantity in excess of ordinary capacity has to be consumed. Therein lies the joke.

Pumpkins are an ingredient in a patent medicine that is guaranteed to cure quite a variety of ailments flesh is heir to, but the world is increasing in inhabitants who do not believe all they hear.—E. N. NOYES, in "What to Eat," in the *Queensland Agricultural Journal* for November.

BANANA CULTIVATION IN ZANZIBAR.

The cost of planting will depend upon circumstances. This year 6,165 bananas have been planted at Danga in a young clove plantation at a cost of R74-15-3 which is at the rate of about 17 annas per 100. Three gangs of prisoners were, for the most part, employed at this work: one gang of four digging up the suckers, another of four carrying them to their destinations, and a third gang of four digging the holes and planting. 367 men planted 6,165 bananas which is at the rate of 16-8 per man per day. Prison labour is of course cheaper than ordinary labour ever, when, as in this case, the wages of the police in charge are taken into account. Had ordinary labour been exclusively employed the cost would have amounted to within a fraction of one piec per plant, which is at the rate of 25 annas per 100. Thus the cost of prison labour compares in this instance with the cost of ordinary labour in the proportion of 2 to 3, assuming that a paid labourer would have done no more work in a day than a prisoner; not an altogether fair assumption.

The above calculation refers to planting in among young trees. Clearing and lining operations were dispensed with as these had already been performed for the young clove plants.

At Danga suckers were obtained within half a mile of the spot. When plants have to be fetched from any great distance the cost of planting will be proportionally increased.

In two years time a clump of bananas will, if the suckers are not pruned away, present the appearance of a miniature forest, while the bunches of fruit will be light and of little value. At

most half a dozen stems should be permitted to grow in one clump, the rest stubbed out. From time to time the earth may be hilled up round the stems, to invigorate the growth, and the dead leaves and stems cleared away to admit of air.

Returns.—The same proportion is not maintained in the money value returned. A plantation of 1,600 trees (clumps) planted at Danga in 1898 to shade cocoa and kola has yielded during the last 12 months about two annas per tree. At the rate of 193 plants per acre (15 by 15) this amounts to about R24 per acre. The cost of gathering the fruit and selling it in the local market may be set down at, approximately, R3 per acre; leaving a net return of R16 per acre. Coconuts return from R14 to R17 per acre. Both are subject to theft and in neither case has the cost of cultivation been taken into account. There is this difference, however, between the two products: coconut trees will get along without cultivation, bananas will not. The cost of cultivation in the case of the trees referred to above, would amount to not less than R12 per acre, which, if charged to the bananas, would leave a margin of profit too narrow to permit of their being cultivated. As however they have been grown especially to shade the experimental plots of cocoa and kola the proceeds of their produce may be counted as profit. Considerable loss takes place through theft and in order to reduce this loss as much as possible the fruit is often cut sooner than it otherwise would be. But when so cut the bunches command a lower price in the market than if they had been allowed to remain till they had matured. The bunches are cut green and buried in a hole in the earth which has been previously heated with fire. In four or five days they will be ripe and ready for eating. Or they may be hung up to ripen, in which case the process will occupy ten or twelve days. The trunk is always cut down when the fruit is cropped as it will not bear a second time.

Bananas bear in about 12 months from planting, a month or two less if the suckers were large when planted and the season favourable. They bear all the year round, that is to say there are always bunches coming in.—*Shamba*, Nov. 6.

INDIAN TEA TRADE.

The following letter from Mr George Seton, of 120, Bishopsgate Street, E.C., appears in today's *Standard* in reply to a long and rather belated article:—

"My attention has been called to an article in the *Standard* on Monday last, headed 'The Indian Tea Trade: A Gloomy Outlook,' which article (and more particularly its heading) seems likely to cause some misapprehension—hardly justifiable from the facts of the case. As indicated in the report on the tea trade of India, which you quote, the Indian tea planting industry has lately passed through something in the nature of a crisis. Owing to the great stimulus given to tea-planting by the fall in the value of the rupee and other causes, very large extensions of cultivation were made, not only prior to but even after the closing of the Indian Mints to the free coinage of silver, with the result—as shown by you—that a very great fall took place in the price of all teas. The decline reached a climax in 1903, and in the earlier part of the present year, when the full stream of overproduction, both from India and Ceylon, surged upon a surfeited market. Since then, however—thank

partly to the self-restraint of planters, who curtailed production by a finer system of plucking, and partly to the hand of Nature (which, after two successive years of abnormal fertility, stayed production in a great measure)—a complete change has supervened, and supplies for the present season seem unlikely to do more than barely meet the consumption. So far only the prices of the lower grades of tea have responded materially to the improved conditions, but now that the shortage of supply—especially from the Indian plantations—is becoming an accomplished fact, it is fully expected that a higher range of prices will prevail. I do not wish to assert that we are yet altogether 'out of the wood'; indeed, I believe that planters may, for some time yet, have to strain every nerve to reduce cost of production, and utilise every device for attaining greater efficiency in the management of their plantations. But the outlook cannot exactly be said to be as gloomy, as it has been during the last three years. On the contrary, I believe we are just beginning to see a little daylight ahead, and that your correspondent's article ought rather to have borne the device 'a gloomy past.' Considerable efforts are now being made to foster and extend new markets—as is, indeed, pointed out by your correspondent—and this with a fair measure of success; but I admit still greater efforts are yet wanted in this direction. One point further only will I refer to, which is the allegation that planters in 1900 'pickled the tea more closely, and so increased the output—thus intensifying the evil.' They were only prompted to do so (unwisely, I admit) owing to the extraordinary and unexpected rise which took place during 1899, when, owing to the peculiar position of the market, the veriest rubbish of tea (*i.e.*, the coarsest grades) commanded as good a price as those of a much higher standard, which state of affairs continued up to well on in the Spring of 1900.—*H & C Mail*, Dec. 13.

MICA.

A meeting of the Optical Society was held on November 28th at the Technical Institute, Leonard Street E.C. The President (Mr Dixey) was in the chair, and after the routine business has been disposed of he called on Professor Silvanus P Thompson to give a lecture on

MICA.

The resources of the Institute enabled the lecture to be experimentally illustrated, and it was further made attractive by a collection of the various kinds of mica lent for the occasion by Messrs. Wiggins. Professor Thompson began by describing the uses of mica, it being used most extensively for lamp-chimneys and oven-windows, and for insulating-purposes. Mica is often mis-called talc, which is a substance possessing very different properties. The following table shows the chief varieties of mica, and the differences in optical properties:—

	Sp. Gr.		Angle	Index of Refraction
Muscovite	2.7-2.9	Biaxial	55°-75°	1.56-1.67
Phlogopite	2.72	Biaxial	70°-180°	1.75-1.73
Biotite	2.7-3.1	Uniaxial	{ 50° cr } { nearly }	
Lepidomelane	2.9-3.1	{ Uniaxial } { & Biaxial }	—	
Zinnwaldite	2.9	Biaxial	50°-67°	
Lepidolite	2.8	{ Biaxial & } { Uniaxial }	76°-86° 0°	

Mica is a complex silicate commonly containing aluminium, sodium, potash, and magnesium. Lepidolite contains a good deal of lithium, easily demonstrated by holding a piece in the flame, whilst lepidomelane, a black mica, contains much iron. Muscovite, the commonest kind, known in the middle ages as "muscovy glass," is found in Russia; the other kinds coming from the United States, India, and Australia. The colour of mica varies according to its composition, and is also altered by "inclusions" some specimens shown being coloured by inclusions of thin plates of garnet and tourmaline. Crystals of mica belong to the monoclinic system, although they appear to be hexagonal. The characteristic of mica is its cleavage into flexible layers. Large blocks of mica are opaque, but, curiously enough, are quite transparent in the edge direction. Among the properties of mica are to be noted asterism, or the star-shaped figures which show on viewing some kinds of mica by transmitted light. A phenomenon of star-shaped figures (*schlagfiguren*) is also produced on striking a plate of mica, the figure resulting varying with the kind of mica, the figure and bending some kinds of mica flashes of light are seen, due to electrical disturbances. The optical properties of mica were shown in the tourmaline forceps, and by means of a polarising microscope adapted to the optical lantern. The optic axes were by this contrivance shown to vary, those in which the angle between the axes is very small being called uniaxial. The axes, as seen in the polariser, have the appearance of an eye, and are called "houppes." Professor Thompson pointed out that even when plates of mica are revolved before a strong light "houppes" are seen, this being a phenomenon that has not been previously pointed out. An artificial mica much used for insulating-purposes is made from waste pieces of mica by mixing with shellac and baking the plates under pressure.

Votes of thanks concluded the meeting.—*Chemist and Druggist*, Dec. 7.

PRODUCE AND PLANTING.

THE DELINQUENCIES OF THE TEA GROWER

seem to supply inexhaustible material for criticism. Between those good-natured friends who have theories upon the subject of tea planting, tea making, the labour question, and all kindred matters connected with tea garden life and work, and others who are always ready to come down heavily upon those who cannot command success all the year round, the tea industry in its adversity has suffered much of late. We print in another column a communication on the Indian tea trade which appeared in the *Financial Times* on Friday last from a Calcutta correspondent of that Journal. It is not pleasant communication, and the shareholders in tea companies, for whom we imagine it was primarily intended, might reasonably think that not only had the Indian tea industry gone, to use the language of Mr Mantalini, to the "demillion bow-vows," but that the majority of tea growers, directors, and managing agents of tea property, together with the Tea Associations, were grossly incapable people, deaf to the good advice showered on them from all sides, and deserving of punishment which should include "something lingering, with boiling oil in it." Only two people come out of the business triumphant, and conscious that they have done their duty. These are the far-seeing writer in the financial paper, to whom reference is made, and the correspondent himself. One, or perhaps both of them, scenting destruction coming full speed ahead upon the tea industry five years ago, and divining that unless new markets, &c., were found at once, the position would go from bad to worse, are now in the Olympian position of being able to say, "I told you so."

Planters ignored advice and rejected prophecy. Now, therefore, every self-respecting seer washes his hands on the tea industry, and says, "It serves you right." This is perhaps a free translation of the Calcutta communication to the *Financial Times*, but it is the inference to be drawn from it. Effusions of this kind are wearisome. Criticism directed against the policy of companies whose directors may have laid themselves open to it is understandable, but a sweeping condemnation of growers, tea agency firms, and everyone connected with tea, because profits have fallen away, is perilous. Mistakes have been made in the tea industry, and planters are quite aware of the fact. The sum of the tea growers' offence (brought to his notice pretty often of late, and the blame is distributed evenly between India and Ceylon) includes in its main items reckless extension of cultivation, an unwise glutting of the market with tea, and the pursuance of a policy known as that of "the devil take the hindmost," as evidenced in the days of their prosperity by neglect of wider outlets for the ever-increasing supply of tea. And then worst of all, some of them yielding to the wiles of the company-promoting fraternity, were tempted into the paths which lead to overcapitalisation, to the detriment of the entire tea industry and the eclipse of its good name with the investing public. And in addition, the Fates have been unkind, and the Chancellor of the Exchequer has been very inconsiderate.

No sooner, therefore, did dividends diminish than the storm of criticism broke. The tea grower, who in prosperous times had been regarded as the pink of commercial enterprise and the acme of astuteness in the management of his own affairs, was sniffed at in all directions. His enormities were catalogued, and the past, present, and future of the tea industry were the subject of bitter comment in the Press. Having received this baptism of fire, the planter, anxious to right himself and smarting under the injustice of many of these tirades, begins to feel that not only is the critical process everdone, but in the interest of the industry itself it is time there was a lull. He has had enough both of criticism and good advice and has no further use for either at present, while a rebash of the old indictment, with the suggestion that he goes on planting tea and committing other offences out of "pure cussedness," is irritating. But to reproach garden proprietors with indifference to new outlets for their produce is the last straw. If there be one subject which the planter has learned to accept as the fixed rule of his life for years past, it is that he must at all costs find new markets for his tea. This doctrine has been preached to him in blue books, shouted into his ear in public and in private, wired to him, written to him, and in his festive moments it has disturbed his peace of mind, and almost forced him to use strong language. As a consequence, he may be said to have gone "baldheaded" for new markets, and that indifference about the matter should now be urged against him is too much. As to the question why he has not cultivated other products, he probably has an effective reply, although his critics endeavour to maintain that in this respect he has not lived up to his chances. These same critics think he might have grown sugar or fibre products, and a dozen other things, or searched for gold, and in fact, readily played the part of Jack of all trades, in addition to growing tea and studying how to do this well. The modern tea planter should, in their opinion, be a kind of Admirable Crichton with commercial instincts and a dash of the J Pierpont Morgan about him. No doubt a great deal of the criticism of the tea producer is meant mainly for the eye of the shareholder. But it may be doubted if shareholders in Tea Companies desire to hear the story of the past dished up again and again. Like the growers, they are waiting and hoping for better times, and it does not inspire confidence in the future to be wrong ly

told that the majority of the men who control their interests lack "common business capacity," and that the Tea Associations are no wiser. Whether good times come or not, all connected with the tea industry have had an ample opportunity of testing the uses of adversity, and it is not a fascinating method of pointing a moral to recall warnings issued five years ago either at first or second-hand. The planter will, we trust, be able to work out his own commercial salvation, and whether he succeeds or fails, neither he nor anyone else connected with him will profit anything by frequent croaking that "all is lost."

Referring to

TEA GROWING

in the United States, "Tea, Coffee and Sugar," of New York, says: "It having been shown that tea can be grown in South Carolina, it follows that with the same attention it may be produced over a wide area of the United States. Already the experimenters, as is usual in the importation of new industries or processes into the United States, have adopted a number of improvements over the Old World methods in the growing and handling of the plant and its product, and it may not be impossible that in the future we may find ourselves selling tea in China. But, however this may be, tea growing gives every promise of becoming an important industry, and its introduction is one of the many evidences of the value to the country of an intelligent and energetic administration of the Department of Agriculture." It would be interesting to learn something about the new methods here referred to. If the experimental growers of tea have improved upon Indian and Ceylon methods we shall be surprised.

In Hayti the

COFFEE GROWER

is not a free agent in the disposal of his produce. According to a Consular report, a planter is prohibited by law from dealing direct with the exporters, and must, therefore, have recourse to the "Haytian speculator," whose charges are very high. In Hayti there is an export duty on coffee of 3 8/8 2-3dols. per 100 lb. (18s per cwt.) It is not surprising, then, concludes the Consul, that the cultivation of cacao tends to be substituted for that of coffee, although the coffee plantations cover an area of 50,000 hectares (123,500 acres).

In her interesting book entitled 'Mexico as I saw It,' recently published, Mrs Alec Tweedie mentions that during a fatiguing journey in Mexico she was served, after a meal, with

ORANGE TEA

(Hojas de Narango), made from the fresh young leaves of the orange tree, infused in the same way as ordinary tea. She refers to its invigorating and refreshing qualities.—*H. and C. Mail*, Dec. 13.

THE EAST INDIA AND CEYLON TEA CO., LIMITED

SHAREHOLDERS' COMMITTEE WORK REVIEWED.

At last has the worm turned? Is the redoubtable, pious, artful, and wealthy Sir John Muir really to be called to account? We almost begin to hope, for here is a report by a committee of shareholders in a "Finlay-Muir Company," endowed with all the usual characteristics and barnacles, actually

PROPOSING THAT SHAREHOLDERS SHOULD MAKE THE MANAGEMENT

into their own hands. They have excellent grounds for this proposal in the facts that they succeeded in unearthing, although the overbearing or overshadowing Glasgow house

effectually barred the way to information about the Hopewell Tea Company, through the promotion of which this India and Ceylon Company has been nearly ruined. Its own history is but enough. Beginning in 1896 with a profit of £12,657 it ended in November, 1900, with a loss of £2,911, and between these dates profits bobbed up and down like corks in a toy fountain. Prices for tea and rupees had something to do with the decline in profits, but agency and working charges more, and, in fact, these charges have had a good deal to do with the determination of some independent shareholders to get at the bottom of things. They do not seem to relish the idea of existing merely for the glory and gains of Sir John Muir and his doughty retainers.

This committee has found that during the existence of the company the amount paid in commission alone to Messrs P R Buchanan & Co., the agents in London, and Messrs Finlay, Muir & Co., the agent in Calcutta and Colombo, amounted to £11,141 or over 4½ per cent on the gross proceeds of all the tea sold. It rightly says that this percentage is excessive and out of all proportion to the results attained. But has it really got to the bottom of these charges with this statement? We note, for instance, that "a new tea house" was to be erected on the Mookham Estate, and that a variety of materials was forwarded for this purpose, although it was not carried out. Some of the articles were disposed of at cost, but "the girders and pillars still remain unused on the ground." What we should like to ask is, Was no commission received by the agents upon these purchases, apart from that paid by the tea company? No insinuation is made; we only ask the question because of facts that have come to our knowledge in other directions. Why was the tea house ordered? The Calcutta and Colombo charges are very heavy, says the committee, and apparently the company's agents have recognised this by handling back a trifle of money, just to prevent friction, we suppose. In illustration we are told that the customary and

PROPER CHARGES FOR SHIPPING TEA IN COLOMBO,

including harbour dues, is "one-half rupee cent" per lb (does this mean per cent?), whereas Messrs, Finlay, Muir & Co. are in the habit of charging "three-quarters rupee cent" per lb exclusive of harbour dues. When this was brought to the notice of the great house it refunded £165 3s 4d for 1900, being the amount of the harbour dues, but on condition that the company paid the visiting agents' fees for inspecting the estates. This is thoroughly "Muirish," and exquisite in its way. But the accounts for the year 1893 and 1899 showed harbour dues and cartage amounting respectively to £315 and £347, and these sums do not seem to have been handed back, while the accounts for the preceding two years "cannot be found" at all any more. The committee thinks that Messrs. Finlay, Muir & Co., should be "approached" by the directors, that is to say by the nominees of the said Finlay, Muir & Co. to see whether these moneys could not also be handed back. It is very meek of it, in its place we should be inclined to try the Court of Session.

One of the most curious revelations in this fascinating report is the story of what the Scotch would call the

"INTROMISSIONS" OF THE ANGLO-AMERICAN DIRECT TEA TRADING CO., LIMITED,

another of the Finlay-Muir corporations, as

handy agent in the commission-earning line. It seems that the Anglo-American Company is one of the East India and Ceylon Company's best customers, and that the tea it buys is shipped direct to the United States *via* Hong Kong. It consequently never comes to London at all, and is in no way subject to London charges; nevertheless, the London agents take the commission on the sales, and have done very handsomely by the business. This portion of the report had, we think, best be given in the investigating committee's own words, together with the results. It is a most interesting and curious revelation.

The prices for the tea so sent are fixed by the London agents' tea-man with the assistance of an independent broker after valuing samples sent to London. A calculation seems to have been made on each consignment of the amount of freight, insurance, warehouses charges and sale expenses which would have been incurred if the tea had been sent to London, and the amount so ascertained has from time to time been allowed to the Anglo-American Direct Tea Trading Company; but Messrs. P R Buchanan & Co., the London agents, have charged in their accounts against the company full commission on the gross amount of the tea sold before making any such allowances, as if such tea had actually passed through their hands and been sold in London.

Then the

HOPEWELL TEA COMPANY COMES UNDER REVIEW.

It also is a product of the fertile commission-distilling energy of Sir John Muir and his associates. This company bought some of the East India and Ceylon Company's land, but did not pay for it in cash. On the contrary, the East India and Ceylon Company had to take payment in shares, and to subscribe also for further shares, and part of these shares carried a liability of £67,000, of which £63,300 has been called up, thus stripping the vendor company of money instead of strengthening its resources. And the Hopewell Company seems to be so completely in the hands of Finlay Muir & Co., that no accounts at all are issued, nor have any shares been allowed to get into independent hands, so that the all-sucking Glasgow firm just piously smiles at those who want to know things. All insight into the accounts has been refused to this committee, which declares that its report has been "greatly delayed" by the difficulty in obtaining information. It has, however, found out that a loss of nearly £22,000 has been incurred by the Hopewell enterprise, although how is not revealed, and it also seems to have unearthed the fact that a circular letter issued by Messrs. P R Buchanan & Co., London agents, to the shareholders of the East India and Ceylon Company, accompany a prospectus soliciting subscriptions for Hopewell shares, made a statement not at the time true. The statement was to the effect that the directors had at that date entered into an agreement to form to Hopewell Tea Company, a copy of which agreement, the circular stated, could be seen at the office of the East India and Ceylon Company, and the terms of which agreement it went on to recite. There wa

no signed agreement in existence at that date, the committee declares, the said date being July 23rd, 1897. On August 6th and 17th in the same year, after the shares had been allotted in the manner set forth in the circular, an agreement was executed but apparently not considered sufficient, for on December 14th and 15th following another agreement was entered into which introduced modifications upon the previous one and imposed new terms and conditions. In this latter document Messrs Finlay, Muir, and Co. were appointed expressly, and without any reservation, managing agents of the Hopewell Company and Messrs P R Buchanan and Co., the London agents, while Messrs J Finlay and Co., of Glasgow, were made secretaries. No shareholders' meeting was called to sanction any of these agreements. To all appearance there

NEVER HAS BEEN A REAL SHAREHOLDERS' MEETING

of the Hopewell Tea Company. It does not seem necessary to call one. Messrs Finlay, Muir, and Co. merely use the name in their commission business, and the shareholders in the victimised companies find the losses, a most excellent arrangement for sweet Sir John while it lasts. We have read this report with great interest, and trust it is the beginning of many things not least of reforms in the method of handling the affairs of the Finlay-Muir group of companies, a method that we have again and again done our best to present in its true light as a scandal and a disgrace to the business community. The morality of Scotch merchants and bankers must have fallen very low indeed if this sort of thing is to continue to be looked upon with indulgent benevolence, and "prayerfully" tolerated.—A notice has been issued by the board of the East India and Ceylon Tea Company, calling

"AN EXTRAORDINARY GENERAL MEETING."

at the close of the adjourned general meeting, to be held on the 17th instant, at 12 noon, in River Plate House, Finsbury-circus. Accompanying the notice is a circular drawn up in rebuttal of the committee's charges, and a very lame performance it proves to be. The gravest allegations of all those relating to the formation of the Hopewell Company are ignored, as also the story of the Anglo-American Direct Tea commissions. In a word, the circular seems to us little better than derisory, and if there are any public-spirited men among the shareholders they ought to do their utmost to change the entire management, board and all. Unfortunately, the date of the meeting leaves them little time, and they may count upon obstruction of the cunningest sort when it is held. But for all that they should be up and doing.—*Investor's Review*, Dec. 14.

TROUT AT THE DARGLE, NATAL.—Mr C W Methven's total bag for four days' fishing was 41 trout, the average weight being 1lb. 3 oz each. In addition to this large catch, there have been many baskets of 20 and 30 made since the opening of the season—amply justifying the belief that a big future is in store for the Natal trout-fishing grounds.—*Natal Mercury*, Dec. 9.

THE DEAF HEAR.—No. 479 of the *Illustrated World* of 626, Chiswick High Road, London, W., England contains a description of a remarkable Cure for Deafness and Head Noises which may be carried out at the patient's home, and which is said to be a certain cure. This number will be sent free to any deaf persons sending their address to the Editor.

COLOMBO PRICE CURRENT.

COPRA IN FIJI.—Our Fiji correspondent states that tenders for the Government copra contract were opened on the 30th ultimo. Lever Brothers, Limited, Sydney, were the successful tenderers at £10 13s 5d per ton, which is considered a very satisfactory price.—*Sydney Mail*, Dec. 21.

RICE IN AUSTRALIA.—Rice grows to every degree of perfection in the Port Douglas district and we ("Gazette") allude to the desirability of farmers including it among their products, and as instancing the possibilities here with that crop, we are enabled to inform our readers that one experimenter in Mackay this season realised over 10 tons of paddy from 10 acres of land selling the lot at £7 per ton on the wharf. The crop was harvested with the sickle, and doubtless a large quantity of the grain was lost, as rice sheds very freely. With up-to-date machinery in our favour, there is a lot in rice and it should be grown more abundantly in this district, which is equally adapted for it as Mackay.—*Sydney Mail*, Nov 30.

COLOMBO, FEBRUARY 1ST, 1902.

No 8.

PLANTING IN JAVA : SUPPLEMENTARY CULTURES IN BY-PRODUCTS.

(Translated for the "*Tropical Agriculturist*,"*)

It is a pleasure to me to follow the honouring invitation of the Sub-Committee of the "Allganeer Syndicaat voor Koffiecultuur en andereberg cultures in Nederlandsch Indie" dated 12th June a.c. in giving a lecture on Supplementary Cultures.

The cultivation of *Cacao* which in the Eastern Provinces of Java may still be considered a supplementary culture is with me and other planters in Central Java a principal culture; I shall, therefore, begin with cacao; if I should have the occasion later on I shall treat successively of Liberian Coffee, nutmeg, randoe (?) with pepper, and the different kinds of caoutchouc, which I know. In 1878 I became administrator of the factory at Djati Roenggo, and had for Superintendent Mr. N. de Vicq de Cumplich. Then already he recommended to the factory not to stop at one cultivation, but to grow also on their lands Liberian coffee, nutmeg, cacao, pepper and karet (?) trees. The factory did not follow his advice; they only ordered 5,000 nutmegs from Banda for Djati Roenggo, which I planted in 1879; I shall return to them later on. Djati Roenggo, he said, with its 1,500 acres can easily bear different cultivations, and he was right; what he would have started nearly a quarter of a century ago, is now done not only in Central Java but also in the Eastern Provinces. I thought this introduction necessary, as

I wanted to give the honour to my former chief, who again, about 1886, ordered a new kind of cacao, not being content to stick always to the same red Java cacao, which was cultivated here and there; whether he discovered then already the diseases in cacao tree and pods I do not know, for I did not see him again since 1885. Mr. Van Gogh, who was with me in 1898, had likewise small confidence in red Java cacao; he spoke from experience of cacao estates in Java and the rest of Nedeol, East India, which he had visited, and where the trees were suffering from the *Helopeltis* pest and the pods from a boring beetle, called *Adela*, I think. In 1884 I planted 12,000 cacao trees, which remained good till 1895, and since 1888, when I became owner of Djati Roenggo, this estate was successively planted with red Java-cacao. From 1895 until today the two diseases mentioned above kept on spreading.

In 1888 my brother brought me two little cacao plants which Mr. de Vicq ordered from Caracas, under the name of *Caracas cacao*. In "*der Tropenpflanzer*," No. 7, year V, you, will find mentioned a kind of cacao growing on the western shore of Venezuela and called *Caracas* with splendid feeding properties and very rich in fat; further, cacaos from Guayaquil, Bahia, St. Domingo, Trinidad, Granada and Surinam with the same proportion of Theobromine. One of those little *Caracas cacao* plants died from rajap (?), the other grew luxuriantly and gave beautiful healthy pods, about the size of those from red Java cacao; but the young pods were white and the ripe ones orange.

In 1892 I made nurseries from the seeds and kept this on till 1896. Then the mother tree died, but two *Gjangkokans* (3) remained, which were sent at my request through the Colonial Bank, one to Ngrangkah and another to one of the Kawi enterprises; both trees are still alive.

* From the "*Nieuwe Gids*" of 15th October, 1901.

What the mother-tree's name is I cannot say with certainty; according to Jumelle it should be a kind of *Forestero* by the pinkish break of the beans and the more flat form thereof; but, after all, the name does not matter much; only so much I know that by natural crossing of this new kind with red Java cacao a hybrid has developed. This variety grows rapidly and gives an abundance of big fruit. From the 6 to 7 year old trees I get on an average fully 5 cattles (=about 7 lbs.) of marketable cacao, a (production) crop which I could not get from Java cacao. Yet, in Siloewok Sarvangan, there are, as the owner, Mr. Ebeling informs me, red cacao trees from 7 to 8 years old which produce up to 6 cattles (=8 lbs.) marketable cacao. At Ngeopit, I am told, in a good year, an average of 10 cattles (=13½ lbs.) of marketable cacao per tree was got from red Java cacao. The seed for my own use and that of other planters whom I supply I take from my plantation of trees of first generation.

Prices of first-class cacao of this kind prepared at Samarang are more than satisfactory; although the nicest and biggest pods were sold for planting; one lot brought fl. 3.50 per picol, (1 picol about =136 lbs.) and another lot fl. 8 per picol more than first-class red cacao. A big sample of this cacao was taxed in Holland, a few years ago, at 2½ cents p. ½ kilogr. (or about Rs. 0.03 per lb.) higher than red cacao.

When I noticed that this variety resisted better the prevailing disease, I stopped planting red cacao since 1895. Yet, if you plant the Djati Roenggo variety among red Java cacao trees which were suffering from both diseases, then they were also attacked by the paloges (?); but, owing to their more robust growth these trees recover sooner and therefore resist the diseases better than red Java cacao.

In Jumelle's "Le Cacaoyer" is stated that in all cacao-producing countries the "Criollo," to which cacao, according to this writer, also the red Java cacao has to be reckoned, is abandoned and replaced by other kinds of stronger growth. All red Java cacao trees which are poorly and much attacked by *Helopeltis*, are now taken out and replaced by the Djati Roenggo variety. This variety grows at Djati Roenggo ± 1,000 ft. above sea just as well as at Terwidi ± 1,500 ft., at Assinan and Tlog. ± 1,700 ft., and at Lerep about 1,800 ft. high; likewise it answers very well at Siloewok Swangan, ± 75 ft. high. To my idea all kinds of soil, if not too bad, will grow cacao; at Djati Roenggo on a substrate of heavy clay and "padas," at Terwidi and Tlog on light clay and even sand, red Java and the Djati Roenggo variety answer very well.

Cacao withstands drought well; with an East monsoon of six months' drought, nutmeg and Liberia coffee trees were already fading, while cacao, the red as well as the Djati Roenggo variety were still fresh, and even put on flush; nor did a wet East monsoon damage it at all. On poor and old soil, such as at Djati Roenggo, fully 60 years old, they grow well, of course with liberal manuring. On lands of the Eastern Provinces already ten to twenty years under coffee, Djati Roenggo will still grow beautifully; but after some time you will have to start manuring. If there is no manure to be had in the neighbourhood, one has to keep some cattle. In place of big cattle runs small grazing lands on different spots should be recommended, so as to (simplify) shorten the transport of the manure to the trees. Grass fields should be supplied; kolondjono-grass, a fine fodder, grows rapidly. The cattle should not graze later than 8 or 9 o'clock; afterwards they should be kept in the stable, so as to obtain more manure. The manure of a herd of cattle kept in this way comes to about 10 to 12½ cts. p. cubic ft., and it is good manure. The grazing fields must be fenced in with barbed wire on "randoe" trees which must be high enough to prevent the cattle from eating the highest shoots. In the beginning cacao requires good shading; it

grows very well between coffee trees, and within four years supplants both Java and Liberia coffee. While 2-year old plants of red Java cacao have an average height of 4 ft., the Djati Roenggo variety reaches fully 6 ft., and trees of 6 to 7 years old are about 20 ft. high with branches of about 9 ft.; Java cacao of the same age is about 15 ft. high with branches of 7 ft. If you do not plant the cacao in abandoned coffee plantations you may surround it with three or four shoots of dadap or "ketella pohoong" as temporary shading.

The cacao tree reaches an age of 40 to 50 years; there are here still some specimens of red cacao trees fully 50 years old; it is from these trees that the seeds were obtained for the Djati Roenggo plantations. As no dadap can live so long, at least not here, I planted Castilloa trees in between squares of 36 ft. In one plantation of Castilloa of ten years with seven year old trees of the Djati Roenggo variety in between, both are in good condition. On estates which are not exposed to long drought, the cacao, after having once closed, does not want shading any more, but protection from wind should be provided; cacao is easier injured by wind than by sun. *Caesalpinia dasycarpis* is also a good shade tree, which does not drop its leaves in the East monsoon.

Nurseries are made as for coffee, but I plant the seeds directly one foot from one another. The seeds are put only so deep in the ground, that one-half remains above ground, with that end where they were attached in the pod downwards. You may also put them flat on the ground, again to the middle in the ground, but there is this disadvantage, that on heavy clay and with heavy rains the seeds may be covered with a crust of clay which will hinder the upright growth in budding. I begin to lay out pits in April and May, and not later, as I want big plan's; the soil here is easy to loosen ("pocteren.") If the soil cannot easily be loosened, one has to resort to baskets or pots of manure, in which you may put the pits in July or August, as I was told by planters who had no fit soil. Other planters start later towards the West monsoon; they put out the plants in nurseries and transplant them into the lands as soon as they have budded. Others again plant directly two or three pits out into the gardens; the different proves which I have taken of this way of planting have given very poor results.

In planting cacao in "pocteren" or baskets the protruding taproot may safely be cut off with a sharp knife. From my own experience I strongly object to planting "Tjaboetans," since a drought of one or two days after putting them out will surely kill the young plants. About pinning of cacao there is no agreement of opinion as yet; I am opposed to pruning; I allow free growth. After the second year shoots come out at the top, at least one; this I keep, as it makes afterwards the continuation of the stem; after a year or so the tree gives another shoot at the top which becomes stem in its turn, so I have trees already three or four stories high.

Other plants again form low on the stem two or three strong shoots, which I keep all; for their formation is, to my idea, a consequence of sickness in the mother tree; these shoots grow rapidly and the mother tree is cut down.

Only three branches are pruned down after the first or second picking. Other planters allow no shoots, but keep the first three or four top branches, which afterwards spread as with topped trees. I have here a few specimens which accidentally grow like that, but the three or four top branches give too many secondary and tertiary branches, so that their pruning becomes a serious matter; and these branches, must be pruned to render the picking easier.

Picking gives here no trouble; the picking gang, provided with small knives on bamboo sticks, cut the ripe pods easily off, and it happens but rarely that

they pick unripe fruit. It must not be forgotten that cacao is a stem-flowering tree, although the branches bear also a good deal of fruit. Red cacao trees bear for the first time when 3 or 4 years old.; the Djati Roenggo variety already with 2 to 3 years; some trees of this age bear already up to 80 pods. The time of development of cacao from flower to ripe fruit is from 6 to 7 months.

The planting distance is here 12 feet, for bed cacao as well as for the Djati Roenggo variety; if the trees should begin to hinder one another, then one tree in the cross is pruned down to that extent that only the crown remains; the amount of stem-fruit on trees thus pruned is amazing. This practice is successfully carried out at Flogo, the only place which I know, where red cacao grows splendidly with but little damage through helopeltis; the trees stand there, as a rule 12 by 12 feet. This pruning should be done with the bursting of the West monsoon.

The cultivation of the soil is the same as with coffee; round the trees must be hacked (gepatjoold), and besides "gebabat" owing to the considerable distance of the plants. (After the trees have once closed, they will themselves kill all weeds, and only manuring is wanted.)

In selecting seed-pods I prefer pods with thin shells and many large pits. Many big pods have thick shells and few but large pits; these I rather reject. (Teysmannia, No. 4 and 5, year 12, page 216.)

SELECTION OF SEED FOR CACAO.

Mr. J. B. Carruthers, who since some years is busy with investigations in cacao cultivation in Ceylon (there were formerly already some reports acent this in Teysmannia) has made some important experiments about the selection of cacao seed.

He examined fully 300 pods of different sizes, and came to the result that selecting the largest and nicest pods for seed is altogether useless, as the good size of pods is very often due to heavy and thick shells, and that their size is not at all proportionate to the size, number and weight of the seeds on which all depends. A better method to improve the species is to select the trees of which you wish to propagate the seed. Trees which bear abundantly, whose pods contain many and heavy seeds and not much subjected to disease are of course preferable.—*The Tropical Agriculturist*, No. 10, 1901.

The curing is done this way: The shells are taken off in the garden, and the seeds after being "takkered" are fermented in troughs. My fermenting troughs are made of wood and placed in stables one above the other. The fresh seed goes to the first trough and remains there, covered with sacks, to the next morning, when the whole contents are emptied into the second trough twenty-four hours later this trough is emptied in the third and after another twenty-four hours the cacao is washed and left for twenty-four hours under water; after another washing the cacao is dried as quickly as possible. If the cacao should not become perfectly dry in open air (which makes a drying shed indispensable for large production), it becomes mildewy and loses considerably in value. When drying in sheds one has to take care lest the cacao which is of a nice light brown colour, should be spread directly on galvanized iron sheets, as its sour juice in contact with the flask, causes brown spots on the pits which is the more to be feared with the light brown Djati Roenggo than with red Java cacao. To prevent this trouble I have the drying floor covered with coccmatting.

About the diseases of cacao I have already spoken in the beginning. The best ways of treatment are now thoroughly investigated in by Dr. Zehntner. In order to learn the results of his investigations planters ought surely become members of the trial station at Salatiga.

Every cacao planter ought, to my idea, become a member; this would reduce to a minimum the cost per acre.

It was in order to avoid all kind of reclame that I did not recommend the Djati Roenggo variety earlier. But as I had been requested to say something on supplementary cultures, I thought it of general interest, to make known the little I know about it.

Mr. du Bois, jr, wishes to draw attention with a few words to the conflicting advices given by different writers concerning the amount of shade which cacao needs. Mr. MacGillawry, he says, would give as little shade as possible. I should not recommend to follow Mr. Mac Gillawry too closely in the Eastern Provinces. In the literature you find, that shade, as a rule, is highly recommended, so that we, at least, are bound to give it our full attention.

The Chairman remarks that his experience coincides with Mr. du Bois. It was always in well-shaded gardens that he found the freshest trees with the healthiest fruit. But, perhaps, the climatological conditions of Djati Roenggo are different.

Mr. MacGillawry mentions the estates of Ngobo, Ngoepit and Groot Getas as instances where a good produce of cacao is obtained with little shade. He has observed that heavy shade decreases the amount of dew; he had even to thin out shade trees here and there. But before all wind-protection must be provided. Referent mentions besides that, if he had to choose between different shade trees, he would give preference to castilloa before cispalina, as the former gives some little profits.

The Chairman remarks that in the Eastern Provinces cacao seems to be more sensible for drought than in Central Java. Mr. MacGillawry relates, that with him young trees even after two months' drought are still full of leaves. But then he spends fl 16,000 (=Rps 19,200) per year on manure, and manuring begins with the planting. He uses almost exclusively buffalo and cattle manure. His lands are already for 60 years under cultivation, and, at first sight, valueless. The Chairman remarks on the probability that the trees acquire through this a greater power of resistance.

CINCHONA ON THE NILGIRIS.

(EXTRACTS FROM ANNUAL ADMINISTRATION REPORT ON THE GOVERNMENT CINCHONA DEPARTMENT, NILGIRIS, FOR THE YEAR 1900-1901.)

The area under cultivation on the old estates is 831.46 acres and the area of the first two extensions at Hooker is 160 acres. The total expenditure on the upkeep of these 991.46 acres including the charges for head office was Rs. 50,547-7-3 or Rs. 50-15-8 per acre. The total expenditure on factory account is detailed as follows:—

	RS.	A.	P.
Purchase of 167,200 lb. of bark ...	53,863	12	2
Machinery and plant	29,985	2	2
Manufacturing and distributing charges	22,785	1	2
Total	1,06,633	15	6

The balance sheet (statement 15) shows a profit balance of Rs. 41,315-13-7 and statement 13 shows an excess of revenue over expenditure from the commencement of the plantations to date of Rs. 47,861, and, after allowing interest on receipts as well as on charges, the net surplus to date is Rs. 14,43,886.

Dodabetta.—The pruning that was done in 1899-1900 proved very beneficial to the trees by admitting more light and air, and during the past year the area pruned was 32.90 acres. This pruning was confined to the removal of the larger branches and extra stems in places where the trees were crowded, and in carrying out this work the importance of maintaining a good crown to each tree was kept in view. It has long been supposed that the leaves of the

cinchona tree constituted the laboratory in which the alkaloids are formed and this conjecture has now been proved to be corrected by Dr. Lotsy of Buitenzorg, Java. Pruning should therefore be a work carried out with caution and discrimination. In dense plantations the removal of some of the lower branches and extra stems is decidedly beneficial as it tends to the more vigorous growth of the crowns of the trees and admits more light and air to the soil, but where the trees have ample space in which to develop naturally it may be said that pruning should be left as much as possible to nature. The difficulty experienced in recent years in filling up gaps in the plantation with seedling plants, or rather the difficulty in establishing these supplies, has been so great that it was decided to make a trial with stumps of well matured plants. 36,407 of these stumps were put out in different parts of the estate in the gaps formed by the removal of old trees, and it is hoped that on account of their more vigorous root system the stumps will succeed where seedlings failed. Allusion was made in the last report to an experiment that had been made with the object of ascertaining if the protection of the stems of old trees by means of a covering of grass increased the alkaloidal value of the bark. Bark from a number of the covered stems and from a similar number of trees on the same plot, which had not been grassed, was analysed with the result that the former yielded 6.36 per cent. sulphate of quinine, while the latter gave 5.58 per cent. The increased yield of sulphate of quinine was thus .78 per cent. Taking the yield of dry bark at 4,000 lb. per acre which is low estimate, the increased number of units obtained was 3,120. The present value of the unit is 1½d. so that the gross increase in the value of the bark which had been covered was Rs. 341-4 0. The cost of the grassing per acre Rs. 58-2-10 so that the net increase in value amount to Rs. 283-1-2.

The total expenditure on the estate was Rs. 13,806-2-3 or Rs. 42-12-0 per acre. The crop obtained was 68,411 lbs. and the cost of the bark was therefore 3 annas 274 pies per pound.

A peculiar condition of the roots of some of the old trees on the estate was observed during the year. The roots were found to be covered with nodules or galls. Specimens of the affected roots were submitted to Mr. O. A. Barner, the Government Botanist, who reported that they were attacked by the root gall nematode *Heterodera Radicicola*. This nematode attacks tea and coffee and a large number of wild and cultivated plants, but its presence in the roots of the cinchona tree has not, it is believed been noticed before. The affected trees at Dodabetta do not show any traces of impaired vitality, although it is evident from the condition of the roots that the disease is not of recent date. Pot experiments are being made in order that the effect of the nematode on the cinchona plant may be better observed. Several cinchona stumps on whose roots the galls formed by the nematode were numerous were put into pots and in the same pots healthy cinchona and tea seedlings were planted. At the time of writing the stumps have thrown up healthy shoots and are growing freely and the cinchona and tea seedlings are doing well. The roots of these seedlings will be examined from time to time to ascertain if they have been attacked by the nematodes from the cinchona stumps. The disease has not been noticed among the old trees at Nedivattam, but the nematodes have been found on that estate in the roots of young plants on old land. The young plants thus affected were stunted in growth and unhealthy in appearance, a condition which was attributed to exhaustion of soil. It has yet to be proved whether the unhealthy condition of these plants was due to the attack of the *Heterodera Radicicola* or to the exhaustion of the soil by previous crops of cinchona.

(b) *Nedivattam*.—There has been a great improvement in the appearance of the trees on this estate during the year, the result of the more liberal system of cultivation that has been followed in recent years. The good effect of deep digging and the burying of weeds on 129 61 acres was well marked and the pruning of plots 21 and 28, as well as the removal of dead branches and twigs from the older trees improved the appearance of the estate. At the commencement of the year the remaining *succiruba* on plot 2 were coppiced. These trees were the oldest of any on the Government estates, having been planted in 1862, and it is satisfactory to note that at the end of the year the young growth from the stools was healthy and vigorous. The condition of the trees on plot VII which were coppiced in 1879 is very satisfactory, and other coppiced plots on the estate show very good growth. On the Nilgiris, where the successful replanting of old land is a matter of considerable difficulty, there can be little doubt that the most profitable method of working a cinchona plantation, in order to obtain a sustained yield, is to combine the system followed in Java with that of the copice system. Close planting and gradual thinning out followed by coppicing offers a better chance of success than thinning out followed by uprooting of the trees, and a replanting of the ground which is the course adopted in Java. The systems of shaving and stripping seriously affect the growth and vigour of the trees, and although renewed bark is generally richer in quinine than natural bark the yield of quinine per acre over a series of years is greater in the case of thinning and coppicing than by either the shaving or stripping system.

During the south-east monsoon 46,400 *encalyptus* plants were put out on plot XI as an addition to the fuel reserve, but the excessive rain during June, July and August caused a number of the plants to damp off and the planting was not a success. The vacancies will be filled during the coming monsoon with well-grown plants of which a considerable stock is in the nurseries.

The expenditure during the year was Rs. 15,279-0-3 or Rs. 48-8-1 per acre. The crop obtained was 64,317 lbs. at cost of 3 annas 9-61 pies per pound.

(c) *Hooker*.—The old estate has improved in appearance during the year. All sickly and dying trees were coppiced, dead branches and twigs were removed and pruning was done where it was required. The estate was sickle weeded during the monsoon and dug over before the dry whether set in. The new extensions now consist of 240 acres, of which No. 1 was planted in 1898-9, No. 2 in 1899-1900 and No. 3 during the past year. The growth of the plants on No. 1 has been rather uneven. Some portions of the 80 acres have come on very well, but the excess of moisture during June, July and August proved fatal to a certain number of plants. These vacancies will be filled in during the coming monsoon with well-grown plants raised from seed received from Java. Out of the 50 plants on this plot whose height measurements are taken quarterly, three died during the year. The average height of the 47 survivors was 7 feet 3 inches. The tallest of these plants was 10 feet 10 inches. These plants were from 3 to 4 inches high when put out in 1898 and the growth they have made in a little over 2½ years is very satisfactory. The No. 2 extension is more even than No. 1 and promises to do very well. The plants have made good growth and look strong and healthy. No. 3 which was opened during the year promises well. The plants were small when they were put out, but owing to favourable weather in the dry season they have already made good growth. The fourth extension of 80 acres will be planted in 1901-1902.

The total expenditure on the old estate was Rs. 5,261-3-9 or Rs. 27-2-10 per acre and the crop ob-

tained was 61,686 lbs., the cost of which was 1 anna 4-37 pies per pound. The low expenditure on the Hooker estate is due to the fact that it is managed by an overseer under the orders of the Superintendent of the Nedivattam estate. Taking the two estates together the expenditure amounted to R. 40-6-3 per acre and the cost of the bark from both estates was 2 annas 7-29 pies per pound.

IV. MANURE.—On the Dodabetta estate 1,875 cart-loads of cattle and stable manure were put out on different plots, at Nedivattam plots 9, 14 and 28 were manured with cattle manure and at Hooker plot No. 1 was thus treated. In the last administration report mention was made of an experiment with a mixture of fish and chemical manures. The mixture consisted of 1 ton fish, 2 cw. superphosphate, 4 cwt. of basic slag, 4 cwt. of potash and 1 cwt. of sulphate of iron. This quantity was evenly distributed over one acre and lightly forked in. The cost of the manure including the cost of application was Rs. 165-6-4. The stems of the trees were covered with grass at a cost of Rs. 58-2-10, so that the total cost of the experiment was Rs. 243-9-2. The bark of the trees thus treated yielded 6-91 per cent. sulphate of quinine, while the bark from unmanured and ungrassed trees on the same plot gave 5-11 per cent. There was thus an increase of 1-80 per cent. Sulphate of quinine. Of this increase 78 per cent. may be attributed to the covering with grass, so that the net gain from the manuring was 1-02 per cent. Taking the yield of the acre at 4,000 lbs. there was an increased yield of 4,080 units due to the manure which at the present rate of the unit (1-34d) represents Rs. 446-4 0. The cost of the manuring was Rs. 185-6-4 and the net gain was consequently Rs. 260-13-8. It was shown in paragraph 3 that the net increase in value of bark from covering the stems with grass amounted to Rs. 283-1-2 per acre, so that the total gain per acre by the combination of manuring and grassing was Rs. 543-14-10 per acre. With a unit of 1d. the experiment would have shown a slight loss, but with a unit of 3/4d. the net gain would be Rs. 93-14-10.

V. NURSERIES.—At Dodabetta the nurseries did well. There has been no mortality among the seedlings, the seed germinated freely and the young plants are thriving well. At Nedivattam and Hooker the nurseries are well stocked with healthy seedlings. Ten lb. of eucalyptus seed and 1 lb. of grevillea seed were put down in the nurseries in order that there may be an ample supply of plants for the fuel reserves. The Java Ledger grafts referred to in last year's report are doing well in a sheltered position on No. 2 extension at Hooker. No attempts at grafting were made during the year and it is doubtful if the succirubra seedlings will be large enough to graft upon in 1901-1902. There is a good stock of these seedlings in the Nedivattam nurseries and as soon as they are sufficiently well grown experiments in grafting will be made. 48 1/2 lbs. of seed were sold during the year at the rate of Rs. 4 per pound. The amount of officinalis seed sold was only 8 1/2 lbs.; the largest demand was for hybrid seed of which 22 1/2 lbs. were sold and the remaining 17 1/2 lbs. was succirubra seed.

VI. CROP.—The total quantity of bark harvested during the year was 194,414 lbs. or 54,135 lbs. in excess of the previous year's crop. The actual cost of harvesting and drying this crop was Rs. 2,678-1-0 as shown in statement 3 or 2-64 pies per pound. The crop included a large quantity of bark from prunings. On Dodabetta the result of pruning 32.90 acres was a yield of 36,933 lbs. of bark or 1,122 lbs. per acre. The bark from branches of officinalis trees does not contain more than about 2 per cent. of sulphate of quinine; but although this is a very small yield it can easily be shown that in the Government estates with a quinine factory at hand it is profitable to harvest such bark when the market value of the unit is high. With branch or other bark costing only 2-64 pies per lb.

to harvest and analysing 2 per cent of sulphate of quinine the cost of each unit is 1-32 pies. Bark analysing 1 per cent. would cost 2-64 pies per unit. The present price of the unit in the London market is 1 1/2d or 21 pies. When pruning is being done the question arises whether or not to harvest the branch bark, and in this connection it has to be borne in mind that although the cost of the unit of quinine in such bark may be very low the cost of manufacture per unit or per lb. of quinine is, roughly speaking, four times as high in the case of 1 per cent. bark as in the treatment of 4 per cent. bark. The following statement shows that when the price of the unit in the London market is 1 1/2d or higher it is profitable to harvest even 1 per cent. bark when it can be delivered at the factory at the low rate of 2-64 pies per unit:—

	One per cent. bark at 2-64 pies per unit.			Four per cent. bark at 1 1/2d per unit.			Four per cent. bark at 1 3/4d per unit.		
	Rs.	A. P.	Rs.	A. P.	Rs.	A. P.	Rs.	A. P.	
100 lbs. bark cost	1	6	0	43	12	0	37	8	0
Manufacture of 100 lbs. bark costs	10	0	0	10	0	0	10	0	0
Total cost	11	6	0	53	12	0	47	8	0
Cost of 1 lb. sulphate of quinine	11	6	0	13	7	0	11	14	0

The year's crop of 194,414 lbs. consisted of 144,106 lbs. crown and hybrid barks and 50,308 lbs. red bark. The total cost of the crop was Rs. 48,147 which was the whole expenditure on oil plantations and head office and the cost of each pound of bark was therefore 3 annas 11-54 pies. The amount of bark purchased during the year was one 167,200 lbs. which cost Rs. 53,863-12-2 or 5 annas 1-85 pies per pound. Statement 7 shows that at the commencement of the year the stock of bark was 305,822 lbs., while at the end of the year the stock was 350,404 lbs.

VIII. FACTORY.—The total quantity of bark worked up in the factory during the year was 316,469 lbs. consisting of 292,069 lbs. crown and hybrid barks and 24,400 lbs red barks. The alkaloids extracted from these barks were 7,648 1/2 lbs of sulphate of quinine and 2,972 lbs. of febrifuge or a total of 10,620 1/2 lbs. The output was 4,182 1/2 lbs. less than in the previous year, the reduction, in the quinine output being 2,539 1/2 lbs. and that of febrifuge 1,643 lbs. The consequence of this reduced output has been an increase in the cost of the products obtained during the year.

At the close of the year 1899-1900 there remained a balance of 11,400 1/2 lbs. of quinine and 13,213 lbs. of febrifuge in store. The issue of quinine and febrifuge during 1899-1900 were 7,378 1/4 lbs. and 2,676 1/2 lbs. respectively, so that with a normal demand there was in store about two years' supply of quinine and five years' supply of febrifuge. In these circumstances the opportunity was considered favourable for taking the preliminary steps towards a radical change in the working in the factory. No fusel oil was purchased during the year, and the sum provided for its purchase was utilised in procuring an entirely new and up-to-date quinine manufacturing plant. The reserved stock of fusel oil was used for manufacture and although it was found that there was not a sufficient stock of this oil to manufacture 10,000 lb. of quinine, it was considered better that the large stock of quinine should be drawn upon than that an extra supply of oil should be procured. The oil to be used in the new factory is shale which

is very much cheaper than fusel oil, but the machinery in the old factory is not adapted for shale so that when the stock of fusel oil ran out the manufacture of quinine had to be suspended. The introduction of the new machinery, which is now in course of erection, was not practicable without some interference with the work in the old factory but it is confidently expected that the saving effected by the introduction of new and improved machinery will amply compensate for the extra cost of the quinine and febrifuge made during the past year. The quantity of bark purchased during the year from private growers was 167,200 lb. and the price paid was Rs. 53,863-12-2 or As. 5-1-83 per lb. The output of sulphate of quinine from this bark which was of poorer quality than that purchased in 1899-1900 was 278 per cent. so that the price paid for each unit was As. 1-10-24. The average price of the unit in the London market during the year was 2*d*. In 1899-1900 the average cost of each pound of bark purchased was As. 5-2-13 and the cost per unit of sulphate of quinine was As. 1-6-16. The estate crown and hybrid barks (including the bark from Bikkatti) which were worked up amounted to 124,869 lb. These barks yielded 2-39 per cent sulphate of quinine, the average cost of the bark was As. 5-4-57 per lb. and the cost of each unit of sulphate of quinine was As. 2-3. The poor quality of the bark is explained by the fact that the greater portion of it was from sickly and dying hybrid trees copied at Hooker and Nedivattam prior to 1899-1900. The high cost per pound of bark is owing to the small crops taken in 1897-98 and 1898-99 and this high price taken together with a low quinine yield raised the cost of the unit per pound of bark and the cost of the quinine. At the time when bark was to be purchased at $\frac{3}{4}$ *d*. per unit it was considered advisable to husband the resources of the estates by taking small crops. The consequence was naturally a high price per pound for the bark harvested in those years. If this high priced bark had been worked up at the time when cheap bark was being purchased the average cost per pound and per unit of all bark worked up would have been low, but as it has been manufactured when bark was purchased at a comparatively high figure, the result is an increased cost per pound of quinine. It is proposed to so regulate the cost of the estate crops in future with reference to the price paid for purchased bark that there may be no great fluctuations in the cost price of the quinine from year to year. When the market price of bark is high the plantations should be made to yield a large crop a low cost and this low-price bark should be worked up with the higher priced purchased bark. When bark can be bought cheaply, a smaller crop of more expensive bark can be taken from the plantations and worked up with the cheaper purchased bark. During the past year the cost of the quinine in the crown and hybrid barks used in the factory was Rs. 12-8-6 per pound before manufacture.

BANANAS UNDER IRRIGATION.

STRUCTURE—The banana is a herbaceous plant, that is, the stem is composed of green, fleshy matter, as opposed to the woody substance of a tree. The true stem is underground, as in the great family of lilies, to which the banana is closely allied. What we call for convenience sake the stem is composed of the bases of the leaf stalks.

THE TREE CUT OVER.—When a banana tree is cut over, we can clearly see the method of its formation. Taking from the centre and working out, we find leaves tightly rolled up, or in the case of more mature trees the continuation of the flower stalk; then what appear to be cells, but are really intercellular spaces, enclosed by walls made up of cells proper. These spaces increase in size as we approach the outer part of the tree.

LEAVES.—The leaves are long sometimes as long as fifteen feet, with a distinct channel down the middle. They come out of the stem rolled up as we have seen, unfold, and in the case of the earlier leaves, finally break down and dry up; their bases going to make up the stems. In the earlier stages of its growth, the tree sheds off the outer coverings formed by the bases of its earlier leaves, as it increases in girth.

THE FLOWER.—The flower comes out from the stem, from what is generally called the heart, in appearance just like a cob of corn. It is enclosed in an envelope or spathe, which envelopes the whole blossom. Immediately prior to the appearance of the flower, indeed almost immediately simultaneously with it, we see a short leaf, from one to four feet long, which seems designed to hang over the bunch and protect it from the direct rays of the sun.

THE HANDS.—The first spathe fallen, we see a bract concealing at its base the object of most interest to the planter, the first hand. This consists of the female flowers, as do its successors in varying numbers according to the size of the bunch to be. Bract after bract drops off disclosing hand after hand, this process continuing till the bunch is ripe. Taking a nine-hand bunch as an example we find, the first nine-hands composed as has been stated, then two or three hands of hermaphrodite flowers; and then a succession of pollen-bearing flowers. These may easily be recognised by noting the difference in length between the ovaries, or apparently solid green parts at the base of the flowers.

FERTILIZATION.—This arrangement of the flower seems to make cross fertilization certain; as, when the pollen-bearing flowers are exposed nearly all the upper flowers are past the stage when they can be fertilized.

FRUIT.—Any description of the fruit would be unnecessary, except to state that many fingers contain undeveloped seeds. In some cases, these seeds are no doubt fully developed, and experiments are being made as to the possibility of raising different varieties from seed, with a view to improving the productiveness and general utility of the banana. One point of interest in connection with the fruit is that at first they stand out at right angles to the stem and afterwards turn up.

ROOTS.—The root is fleshy, containing little fibre. Hence we see the importance of a free open soil. It branches little. The branches are covered with fine, hair-like rootlets, which are the feeders. Cutting the ends of the roots tends to increase branching, and to increase the number of hair-like roots, and therefore the feeding powers of the root system. The underground stem or bulb is a white mass, composed of fibre. From this are given off the suckers by which the plant is propagated. In their earlier stage, these suckers feed on the parent, at the same time putting out roots for themselves; and when the parent is cut down feed on the reserve laid up for them in the bulb. Such then is a general description of the plant. The Botanical Department have 21 varieties of the banana growing at Hope Gardens. That cultivated in Jamaica is the Martinique variety.

SOIL—In his "Text Book of Tropical Agriculture," Dr. Nicholls gives the composition of the best soil for bananas as follows:—

Clay	..	40	Per Cent.
Lime	..	3	"
Humus	..	5	"
Sand	..	52	"

100

This he classifies as a rich loam with lime. The banana will, however, grow on very poor soils, producing inferior bunches; some containing only three fingers. The soil described above would be free and warm, two qualities indispensable for the

best growth of the plant. Good drainage is a necessity. Wherever stagnant water is present, the leaves take on a reddish-yellow appearance the bunches are inferior, ripening before they fill out properly; and the whole structure of the plant is weakened.

CLIMATE.—The banana requires a good supply of moisture and a good deal of heat for its proper growth. Well sheltered valleys are very suitable. While it thrives best under such conditions, it will also grow at a considerable height above the sea, though in such cases taking longer to bear.

SANTA MARTHA.—I had an opportunity some three years ago of seeing what may be called a banana planter's Paradise. This was at Santa Martha, Republic of Columbia. Imagine a stretch of level land, a free soil, rich in vegetable matter accumulated through centuries of luxuriant growth, an intense heat, frequent showers of rain, and a wind-break in the shape of a mountain range running up to a snow-capped peak 17,000 odd feet high—this is a place not to grow bananas, but for bananas to grow themselves! Acres upon acres with not a broken leaf what a contrast to this wind-swept irrigation district of St. Catherine? Immense trees with huge bunches met the eye on every side. One part in particular struck me very much. For about three months in the year, irrigation is sometimes needed. This is necessary to be kept in mind in order to understand what follows. The main plantations are situated at Rio Frio, where at the time of my visit about 800 acres were in cultivation.

A few miles further inland, a piece of land was thought suitable for cultivation without irrigation; and about 250 acres were planted out. I saw some mahogany logs taken from this land. They averaged four feet in diameter, by about 16 feet long. One crop was taken off, and then a long spell of dry weather set in, with the result that the cultivation went to pieces and was abandoned. Some two years after, seasonable rains having fallen in the meantime, the land was inspected. When I visited the place, a gang of labourers were busy bushing out the tangle of weeds that had sprung up, and thinning out the tremendous growth of banana suckers. Huge bushes hung all around, and everything promised for as heavy a spring crop as one could desire—and this without care of any kind. A planter there told me that two-thirds of the bunches were cut in the spring months, as a result of the natural growth of the bananas. I should think it possible to bring in 90 per cent. of the crop in these months. Lest anyone should feel inclined to pack off bag and baggage to Columbia, I might mention that on the other side of this very bright picture there is the spectre of revolution, with its consequent stoppage of trade. Thank goodness we have peace and quietness here, if we have not such rich land.

CLEARING LAND.—On the system of cultivation to be followed depends the method of clearing the land. Everything is cut down, as shade is detrimental to the banana, causing an undue growth of stem and leaves and a poor bunch. The wood and brushwood are burned or carried off. This leaves the stumps, which will hinder the use of the plough and cultivator; but where hand cultivation is to be followed, the stumps are rather an advantage as their gradual decay keeps up the supply of humus in the soil, and assists drainage.

STUMPING.—Where the plough and cultivator are to be used, it is really better and cheaper to stump the land from the commencement. This sounds rather formidable, but it is after all easier than digging the stumps after the lapse of a few years, the weight of the tree helping to uproot itself. A relative of mine who settled some fifty years ago in New Zealand described to me how he uprooted a large tree to make room in his garden. Choosing the side of the tree which appeared to be the heaviest, he cut off the larger roots on that side, thus removing the support. Tracking out the larger roots on the other side, which now had the strain on them, he began cutting through them. Very

soon the strain proved too much; there was a rending of roots, a tremendous crash, and there lay the tree with its roots in air, leaving behind it a hole large enough to contain a cart and horse, at a small expenditure of time and labour, considering the size of the tree.

COSTA RICA.—A Costa Rican planter told me that he merely cut down the forest and burned off the lighter wood, leaving the rest to rot. This plan, however, could only be followed where the natural conditions favour the quick rotting of the wood. It is to be preferred where practicable, as it adds a very large amount of humus to the soil, which would be lost where burning is resorted to.

PLANTING.—Cleaning up being finished, the land is lined for planting. Where irrigation is used, it is usual to follow the lay of the land for convenience in irrigating. Various distances apart are used, 7-6 x 7-6, 8 x 8, 6 x 10, 7-6 x 15, 12, x 12, 14 x 14, 15 x 15, 16 x 16, 24 x 12 being the favourites. Various opinions are held as to the most economical distance at which bananas should be planted. I think the planter should be guided by circumstances. Where a method such a 7 6 x 15 is adopted, I would recommend that this wider distance should run north and south, so as to admit the sun. My own experience shows that in establishing bananas in hot land, close planting is the best method, say 8 x 8. Once the bananas are established, every other row can be taken out leaving them 8 x 16.

HOLES.—I have found it advisable, when the land has not been ploughed, to dig fairly large holes, say 18" x 18" x 12", so as to give the suckers a good start.

SELECTION OF SUCKERS.—The selection of suckers is a most important point, and one which will repay closer investigation than it has hitherto received, as on this depends the vigour of the young suckers and in a measure the strength of the stool or root. Selection of seed, cutting, stock, and bud will always repay the careful cultivator. Small bulbs contain little nourishment for the growth of the young suckers; very large bulbs throw up too many young suckers; which are apt to be weak. I have found true eye suckers from six to eight months old to give the best results, as they generally possess very vigorous eyes and contain a large amount of nourishment, possibly that which would go to make the final bulk of the tree, and part of the material from which the bunch is formed. Where the centre sucker is allowed to grow, fair bunches may be looked for, which is not the case where indifferent suckers are planted. Then again, a quicker return will be got, entailing a lessened cost of upkeep in cultivating, weeding and watering.

SPLIT SUCKERS.—Personally, I have never tried planting split suckers, but do not consider this a good method. I have seen half an acre planted this way, the results not being satisfactory.

POSITION OF SUCKERS.—The suckers are generally placed upright in the hole. Some lay them in slanting, even right on the side. This, too is a method hardly to be recommended as the natural growth of a sucker is to turn up, and not to grow straight up from the eye. Then when the eye sucker has exhausted the nourishment in the bulb, the latter, or the greater part of it, rots off, leaving a hole. This makes the stool liable to damage from wind, as it weakens the hold on the ground. The earth is raked into the hole, and preferably over the sucker, so as to protect it from the drying influence of the sun, and consequent loss of moisture. The soil should be moist when planting is being done. If, however, dry weather prevails, and the suckers are found to be slow in making their appearance, irrigation may be started, care being taken not to put on too much water, which is apt to rot the bulbs.

TRENCHING.—Trenching should immediately follow, or even precede planting, so that the young suckers may not suffer any check to their growth from want of water. The method of laying out a field for irrigation is very simple. A main trench is dug from the point of intake, and led along the highest

part of the land; sub-mains branch along the minor ridges, giving off smaller mains and twigs where necessary. Care should be taken to run the twigs, so that the water may thoroughly wet the soil without saturating it unduly; and also that the water should not run so quickly as to scour the land. Forcing the water along the twigs should be avoided, as it leads to ponding, which is detrimental to the plants and a waste of water; besides settling the soil and making aeration faulty. Various methods of overcoming minor difficulties will suggest themselves by practice.

SANTA MARTHA.—In Santa Martha a different plan is adopted. The land is divided into squares by means of banks, the squares being larger or smaller as the land is flat or slopes sharply. The upper squares are filled with water, which is then allowed to run into the next set, and so on to the lower part of the field. This is really flooding the land, and is apt to cause water-logging. This system is called "catch-work" irrigation. The object of irrigating is to put sufficient water on to the land to supply the plant with water and to render the plant food in the soil soluble and so available to the plants. Any water put on in excess of the necessary quantity is, I take it, wasted, is apt to wash out, through drainage, part of the plant food from the soil, and to deteriorate the carrying qualities of the fruit. It is therefore important that a method should be followed which will enable the planter to wet the land without bringing it to the saturation point, and to ensure that, the water being put on, it is not evaporated too quickly by the action of the sun and wind. This brings us to the important question of cultivation.

ACCUMULATION OF ALKALIES.—Before dealing with this, it may be well to point out that with intensive cultivation there is some danger of the rising water in the soil leaving behind it on the surface an excess of salts which will prove injurious to vegetation. In the more extreme cases, such lands are known as "alkali lands." For full information on the subject, I would refer you to the "Bulletin" for March 1901. The remedy for such a condition is good drainage, and an occasional excess of moisture, such as we get during the May and October seasons. Danger from this source is hardly to be apprehended in this district, however, though in one case it actually occurred to my knowledge. This was on a piece of land recently taken up, which from its location was naturally adapted to the accumulation of alkalies. A cure was effected by digging a deep drain at the lower end of the field, thorough ploughing, and a free use of irrigation water. The water in the drain ran brackish for a time. In such a case it is of course highly necessary to stop the application of excess water as soon as the accumulated salts have been washed away. Continuation of the process beyond this point would result in washing away much valuable plant food.

CULTIVATION.—The object of cultivating the soil are to destroy weeds, to loosen the soil to admit air and moisture, to keep the soil at a fairly even temperature, to admit the free passage of roots, to assist drainage and the escape of surplus water, and to assist the retention of moisture in dry situations.

WEEDING.—The prevention of the growth of weeds is an important point, as every weed, however small, is busily engaged in pumping up water from the soil, and robbing the cultivated plants of the moisture and mineral substances which are absolutely necessary for their growth. Where cultivators are not in use, the hoe is the most useful implement for the purpose; but the use of cultivators will be found cheaper and better, besides giving better results as regards yield and quality of fruit.—*The Journal of the Jamaica Agricultural Society.*
(To be concluded.)

IMPORTATION OF INDIAN ORANGES.

The late Minister for Agriculture, Mr. C. Sommers, having submitted to the Department of Agriculture

the following paragraph relating to the famous Sylhet orange of India, the matter was referred to Mr. Despeisis, the viticultural and horticultural expert of the department, whose report also follows:—

Our orange-growers should endeavour to obtain seeds of the famed Sylhet orange. Dr. Bonavia, in the *Gardeners' Chronicle*, says that this fine variety is grown solely from seed in Eastern Bengal, and is sent in large numbers to Calcutta. The tree is an upright grower, the fruit is of the loose-skinned kind and of fine quality. At Shalla, amongst the hills, there was an orange-garden of about 1,000 acres, and one might walk for a good hour or two, always under the shade of orange trees, without reaching the limits of cultivation. Ripe oranges of this variety were sent from Lucknow to England, and although the fruits decayed on the way, the seeds remained fresh; they were sown, and a number of plants were the result. The seedlings fruit in five or six years. As the Sylhet orange is to be had in many parts of India, there should be no difficulty in obtaining seeds, and there seems no reason why this variety should not do well in Australia.

Oranges grown from seeds, seldom reproduce without altering the characteristics of the parent plant, the flowers being often cross-fertilised by bees and other insects. The "Sylhet" of Calcutta is, however, one of the varieties which show fairly constant results when raised from seeds. The Director of the Botanical Garden at Calcutta, would, I dare say, undertake to forward to this Department a few cases of Indian oranges, and also a Wardian case with plants raised from layers from trees noted for the excellence of their fruit, or raised by budding on seedling trees. There are several varieties of Indian oranges I would like to see introduced, and a case each of the following varieties could be shipped to Western Australia. The fruit should be carefully picked and clipped at the stalk and not pulled; it should be well covered, but not fully ripe, and should be free from punctures caused by thorns or, by scale insects. The cases should be firmly packed and each fruit wrapped up in tissue paper three or four days after picking, so as to rid the rind of any surplus moisture, and thus minimise the chances of bruising. These oranges would be about 18 days in transit, and should land in good order at Fremantle.

(1.) The "Sylhet" of Calcutta, derives its name from the station of that name in the Khosia Hills of Eastern Bengal, where it is said to be generally propagated from seeds. The "Sylhet" is a tall upright tree and belongs to the "Santolah" group of loose-skinned oranges; as does also.

(2.) The "Nagpore" of Bombay, which is much like the "Sylhet"; the tree of this variety however, is of a spreading habit. Both are excellent varieties for exportation.

(3.) The "Santolah," a very small but extremely sweet orange, which grows wild in the hot, humid part of India, between the Himalayas and the Ganges. Naturally, it requires very little attention. It is sweet almost before it is quite yellow.

(4.) The "Keoula" greatly recommended on account of its lateness. Long after the oranges have been gathered the "Keoula" hangs on the tree, when it turns a beautiful dark red colour and only then becomes sweet.

(5.) The "Mussemhi" brought from Poona and sold in Bombay. It is said it can be left to hang on the tree for a whole year without hardly deteriorating. The fruit is orange yellow, and shows longitudinal furrows from stalk to eye.

The Minister having approved of the expert's recommendation, the Secretary of the Department of Agriculture has communicated with the Director of the Botanical Garden, Calcutta, to procure both fruit and plants of the varieties enumerated in the above report, and ship them to Perth.

On arrival of the fruit they will be submitted to leading growers and dealers, and thus an opportunity will be afforded of comparing some of the most famous oranges from oriental stock with the varieties from Portuguese origin mostly cultivated in Australia.—*Journal of the Department of Agriculture of Western Australia.*

THE EFFECT OF FORESTS ON THE CIRCULATION OF WATER AT THE SURFACE OF CONTINENTS.*

The whole of this subject is exceedingly complicated, because it depends largely on a number of elements liable to vary widely within narrow limits of time and place. It is thus difficult to frame any rule of general application, and for the present the enquiry must be limited to defined localities in the hope that a large number of observations continued for a long series of years, and the progressive improvement of scientific methods, may eventually permit of their being combined into one harmonious whole.

The subject, "circulation of water at the surface of the soil," must be understood to include movements in the atmosphere, as well as in the soil and on its surface. The water in the soil may be more or less stagnant if the subsoil strata are level and impermeable.

It may now be considered a fact that large forests in the plains do indeed act like hill ranges as regards the precipitation of moisture.

Numerous experiments carried out by the Ecole Forestiere of Nancy in the Forêt de Haye, by M. Fauriat in the forest of Halatte, by M. de Pous in the forest of Troucais, also in Germany, Austria, Russia, and even in India, show clearly that more water falls on forests than on the open lands adjoining. The difference is not very great, but may be 12 to 20 per cent.

The additional height due to the trees seldom exceeds 130 feet, and is often only half as much. The effect is nevertheless noticeable. Throughout the year, but especially during the moisture seasons, the forests evolve a considerable amount of humidity into the atmosphere, and so render valuable assistance to the surrounding crops. If this were visible as fog, it would be seen that apart from wind, each forest gives rise to a moist and cool layer extending, as shown by ballooning experience as high as 4,500 feet. Resinous species liberate more water than broad-leaved ones. The tree crowns prevent a portion of the rain from reaching the ground at all. This quantity instead of being carried away by the streams, is re-evaporated and passed on further in the atmosphere, and so does double duty. Sooner or later this mass of moist air meets a current at a different temperature, and the result may be that the same water falls a second time as rain in a different place. Hence a country possessing a fair share of forests can pursue agriculture under much more favourable conditions, and a country without forests, like the Deccan, Central Asia, and parts of America, is in a fair way to become a desert. Consequently the creation of forests in the plains is hardly less a measure of expediency than in the mountains, and the expediency is greater when the plains have naturally a light rainfall. Engineers, even of eminence, especially if interested in irrigation, will dispute this, but they do not know everything any more than foresters do, and the foresters' side is the side of safety. The question divides itself into two parts, plains forests and hill forests. In the former the benefits desired are largely atmospheric, in the latter they are rather in the direction of protecting the soil itself and of regulating the flow.

I.—PLAINS FORESTS.

What becomes of the atmospheric precipitations?—

- (a) part is retained and evaporated from the trees, &c.,
- (b) part is evaporated on or in the soil,
- (c) part flows away along the surface and streams.

- (d) part soaks into the soil up to saturation point,
- (e) part is absorbed by plants for their growth and transpiration,
- (f) the remainder sinks to lower levels, where it either forms subterranean reservoirs or percolates till it again comes to the surface as springs.

Calling R the total rainfall—

$$R = a + b + c + d + e + f.$$

On a level plain there is no surface flow, and the equation becomes—

$$f = R - (a + b + d + e.)$$

In the simplest case, that of a perfectly bare plain, *a, c, e* becomes zero, and the equation is

$$f = R - (b + d.)$$

Of all these factors the only one that can be measured with any-thing like accuracy, is the portion *a* evaporated off the trees. Even this factor, according to the Mariabrunn observations, is liable to very considerable errors of determination, since no two rain-gauges will give the same readings even under the same tree. It is necessary to employ a large number of rain-gauges, including some embracing the trunks of the trees. Even employing 20 rain-gauges, totalling 10 square feet of opening, the probable error is at least 1 per cent. of the fall. The measurements should be made either (1) for each individual shower, (2) for a long series; (3) by grouping the showers according to their intensities.

It has been found in Europe that a broad-leaved forest prevents 1 to 3 tenths, and a conifer forest as much as 5-tenths, of the total precipitation from reaching the ground at all. But these figures hold good only for those localities where they were obtained. In countries where the rainfall is heavy and continuous, the forest soil in any case will be about as thoroughly watered as a bare soil.

All the other fractions, *b, c, d, e, f*, composing the total fall, are still very undetermined in forests and other lands alike, and they vary so much with every possible local difference that they are hardly likely ever to be capable of satisfactory measurement.

Reasoning from the known facts that, in spite of obstruction by the crowns, the forest soil is as well watered as the soil outside, and that the evaporation in a forest is much less as proved by the greater moisture of the surface soil; it was supposed that forests contributed more than anything else to the maintenance of subterranean supplies (level plains are still referred to). The results obtained in Russia, therefore, came as a great surprise. Soundings taken during the growing season (1st June to 1st September) inside and outside the forest of Chipoff (Government of Woronej) showed that the water level below the forest was some 32 feet lower than outside. In the Black forest (Government of Kherson) the level was some 12 to 16 feet lower. Presumably these figures are extremes for the following reasons—(1) the measurements were taken at the season when transpiration is greatest, (2) they were made in localities where the rainfall was only 12 inches in the year, where there was as a probable natural consequence of the dryness an almost complete lack of natural forest, and where consequently the forest would have to pump all it could in order to maintain itself. An increase of forest area would probably reduce the necessity for so much pumping by the roots. The experiment was repeated by M. Ototzky much farther north, under the 59th degree of latitude, in the Government of St. Petersburg, where the climate is cooler and moisture and the rainfall averages 20 to 30 inches. The subterranean water is plentiful, yet again, the forest lowered the level, but this time only by 20 to 46 inches. In order to check the Russian results, an experiment has been started by

* Derived principally from an article by M. E. Henry in the *Revue des Eaux et Forêts*.

the French forest officers in the forest of Mondon, near Luneville. It is a level forest of about 5,000 acres situate on a low plateau formed of alluvial sand gravel and pebbles. Eleven sound-holes were bored, in 1899, six in the forest and five outside. The water level was found to be lower in the forest by 6 to 64 inches during the season of active growth. This result confirms the Russian observations and accords with the known facts concerning the action of forests in drying up swamps and stagnant sub-soil waters.

Nevertheless it would be a great error to jump to the conclusion that plains forests always and in all countries lower the level of subsoil waters. It has in fact been shown by Mr. Ribbentrop that near Trichinopoly wells, 6 to 10 feet deep inside the forest, held water throughout the dry season, whilst the river beds and wells, 15 feet deep outside, were dried up. Each locality must be studied under its own conditions. In a general way it may be said that plains forests render service of various kinds:—

(1) They dry up swamps and malarious places, as, for instance, the Landes, the Sologne, the Pontine marshes, and many others.

(2) They suck up from great depths water which is otherwise not utilisable, and cause it to again circulate in the atmosphere where it forms fresh rain.

(3) They do not injure the springs, since there are none in level plains where man is obliged to have recourse to irrigation. They may lower the subsoil water level to a degree which is seldom serious if the rainfall is enough to be of any practical use to the crops.

(4) They cool and moisten the air and render showers more frequent during the growing season.

MOUNTAIN FORESTS.

A rainfall chart bears a great general resemblance to a contour or relief map, the more the hills, the more the rain. In reality the rainfall is more complicated. All mountain chains show rain maxima, and these maxima are very generally proportionate to the elevation. There is more rain at 6,000 feet than at 4,000, more at 4,000 than at 2,000, and so on. Even small elevations suffice to attract an appreciable maximum. Wooded mountains are still more effective, especially in the summer months. Mountain forests are mostly coniferous, and conifers exercise an influence even more powerful than that of broad-leaved forests. A forest is always covered by a great layer of moisture which is there none the less, though it is not visible as mist. Whence comes all this vapour? Is it due to evaporation from the leaves, or is it produced by some action of the millions of points of the pine needles? Science cannot tell, but the effect is certainly not due to transpiration alone. Transpiration is indeed less active in conifers than in broad-leaved species, and it would consequently be expected that the former would give rise to a smaller layer of invisible mist than the latter, but the contrary is the case. The cause must therefore be sought in the soil or in some other unknown factor. One cause may be the soil, but another is surely to be found in the greater portion of the rainfall that is intercepted by conifer crowns. It was shown in France that in 1876 the conifer forests intercepted and restored to the atmosphere over 100,000 cubic feet more water per acre than the broad-leaved forests. Other years have given even greater differences, and there are no means of making exact measurements, but there is no doubt that wooded mountains attract more rain than bare ones.

In all Europe, Spain is the country that gets least rain. Notwithstanding the great mountain chains running up to 10,500 feet in Grenada, Murcia, &c., the rainfall of July and August is not half an inch. If these mountains were wooded instead of being absolutely bare, the South-east of Spain would not suffer so much from drought, and

the country would not have had to deplore the disastrous floods produced in Murcia by the Segura. Spain is at last awake to the fact, and has undertaken a series of reboisement works, an account of which was read at the international Congress of Sylviculture of 1900 in Paris by M. Ricardo Codorniz, Chief Engineer thereof. There is plenty of moisture in the sea breezes, but nothing to condense it on to the hot mountains. In the mountains the rainfall is divisible into the same kinds of fractions as in the plains, with this difference, that the proportion of surface flow, being zero in the plain, becomes considerable on the mountain. The quantities *a*, *b*, *d*, *e*, may first be examined. The quantity *a* has not been directly determined, and the plains results cannot be quite applicable on account of the preponderance of snow, and the great differences of intensity and distribution. The evaporation from the soil surface *b* must be less than in the plains, because the temperature becomes lower as the altitude increases. For the same reason the water fixed in or evaporated by the plants, *e*, is also less, as may be verified by the proportion of ashes. The growing season is shorter and heat less great. Consequently the transpiration is less and the quantity of organic matter formed annually per acre is smaller. At Aschaffenburg (400 feet) a thousand beech leaves will cover about 35 square feet, while at 4,000 ft., near the upper limit of the species, the same number of leaves will only cover about 9 square feet. The percentage of ashes and the total weight are also less, being 4.03 per cent. for beech and 3.58 per cent. for spruce, against 9.91 and 10.19 respectively. Even the grass at high levels contains one-half less ash than in the valleys.—*Indian Forester*.

(To be concluded.)

THE FERMENT OF THE TEA LEAF, AND ITS RELATION TO QUALITY IN TEA.

(Continued from page 452)

EXTRACTION OF THE FERMENT.

Their discovery in the present instance was doubtless much delayed by the presence of the large amount of tannin in the tea leaf, which makes it difficult, if not impossible, to extract the ferment unless special means are used to previously remove this tannin. My final method was as follows:—A known quantity of leaf (10 grams of fresh or 6½ grams of withered) was ground up to a pulp, and then hide powder (5 grams) was added and the mixture thoroughly ground together. This hide powder has the faculty of removing the tannin from the liquid in which it is present. When a known quantity of water was added, therefore, the tannin having been removed from solution by the hide powder, the enzyme was allowed to exude into the liquid. After standing for two hours the whole mass was pressed through cloth, and all the extractable part, at any rate, of the ferment was obtained in the liquid thus squeezed out. On the addition of alcohol the enzyme was deposited as a slimy mass, which on being again dissolved in water and filtered, gave a clear liquid containing the ferment required. If it was wished to determine its quantity use was made of the fact that on addition of "guaiacum resin tincture" a blue colour was produced, and by measuring the intensity of this blue colour the relative quantity in two similarly prepared solutions could be ascertained. Further it was found that all the enzyme thus extracted was by no means equally active, and that it could be divided into two parts one of which gave the blue oxidation product with "guaiacum resin" alone, and the other only in presence of a small amount of hydrogen peroxide. In this report I have called the former of these "active enzyme," and the whole present, includin

the latter, "total enzyme," though probably a part of this does not exist ready formed in the leaf, and may hence be known as "zymogen" or "pro-enzyme."

OXIDISING ACTION OF THE FERMENT.

After isolating these substances the first question would naturally be as to what effect they have when added to fermenting tea leaf. The experiment was therefore made, and it was found that the leaf coloured more quickly in their presence and at the same time the colouring proceeded normally. The same happened if tea juice instead of tea leaf was taken. It may therefore be taken that the ferment which I have isolated does play a part in the fermentation of the tea. This was confirmed by its action on several other easily oxidisable substances. Pyrogallic Acid, for instance, coloured (i. e., oxidised) with great rapidity in its presence. Hydroquinone did the same. So that we have here an oxidising enzyme or oxidase, present in the tea leaf, capable of causing increased rapidity of fermentation in the tea, and capable of oxidising various easily oxidisable substances like Pyrogallic Acid and Hydroquinone.

EFFECT OF HEAT, &C., ON THE FERMENT.

The next point appeared to be to ascertain the effect of heat upon this oxidase, especially as this has an important bearing on the temperature necessary to stop the fermentation at the commencement of firing. It was found that a temperature of 160-165°F. had no appreciable effect in three minutes, that at 176°F. the oxidase was partly destroyed on the same time, but it was not till over 180°F. was reached that the ferment was completely destroyed in this period. On the other hand its activity is considerably modified at a much lower temperature. I could not ascertain the precise point at which it ceased to be effective, but while very active at 130°F., it was much more feeble at 143°F., and doubtless at a very short distance above this it ceased altogether to exercise its functions. It is therefore absolutely necessary that the whole of the tea in the drying machine (and not merely the machine, thermometer, which is a very different thing be raised considerably above 150°F. immediately on putting in the firing machine, and to ensure the destruction of the ferment at least 180°F. should be reached. This is of course what is attained in the best practice, but the reason and necessary for it become obvious when considered in the light of the above observations.

The effect of various chemicals on the oxidase was next considered. It acts best in slightly acid solution, but if this acidity be increased especially with mineral acids, beyond a small amount, all action ceases and the enzyme may be destroyed. .4 per cent. of Sulphuric Acid in a liquid was sufficient to absolutely destroy the ferment at once. .04 per cent apparently hindered all oxidising action. To organic acids such as those which occur in tea juice it was much less sensitive, and 3 per cent. of Acetic Acid were required to destroy it in 2 hours. Alkalies were less effective, but here 3 per cent. of Ammonia or Caustic Potash were sufficient to practically destroy the active part of the enzyme after four and a half hours. The result in manufacture of these observations I have not as yet been able to ascertain. Whether it may be wise or practicable to make up the leaf to a certain definite acidity, being the point at which the ferment was most active, before fermentation, one cannot at present say. It is well known that Hydrochloric Acid added to the roll softens and weakens the liquor,* but in this case the acid itself is objectionable, and we have no record of the amount added. This is a matter for experiment.

DISTRIBUTION OF FERMENT IN THE FLUSHING SHOOT.

If the various leaves on a flushing shoot be taken, the amount of enzyme is by no means the same in every part. The fresh leaf, for instance, contains about an equal amount in the unopened tip leaf and in the stalk, but below the tip the percentage decreases in every leaf. Taking the leaf as plucked, for instance, on a China-hybrid bush in September, the following table gives the relative amount present in each leaf separately, calculated both on the fresh leaf and on the dry matter in the leaves (taking that in the tip leaf as unity):—

	Active Enzyme.		Total Enzyme.	
	On fresh leaf.	On dry leaf.	On fresh leaf.	On dry leaf.
Unopened tip leaf ..	1.00	1.00	1.00	1.00
First open leaf ..	.64	.65	.64	.61
Second open leaf48	.48	(.80?)	(.80?)
Stalk ...	1.13	1.64	.95	1.39

These figures apparently seem to indicate that where the largest quantity of enzyme is present; the best tea is made, and yet not wholly so, because the stalk, which is objectionable in the tea, contains as much as any part. The reason of this is seen however if the relative amount of acidity, of tannin, and of phosphoric acids in the same samples of these leaves are taken. These give the following figures:—

	Acidity.		Tannin.		Phosphor Acid.	
	In fresh leaf.	In dry leaf.	In fresh leaf.	In dry leaf.	In fresh leaf.	In dry leaf.
Tip unopened ..	1.00	1.00	1.00	1.00	1.00	1.00
leaf						
First open leaf94	.94	1.03	1.03	.88	.88
Second open leaf..	.94	.94	.91	.91	.75	.75
Stalk47	.70	.59	.86	.55	.79

It therefore appears that, where a large amount of enzyme is combined with the greatest acidity, and with the greatest amount of tannin, there the tea produced is the best. Such is only a preliminary conclusion, and it must strictly be considered applicable to similar conditions. It is, however, one to which the next set of experiments gives support.

RELATION OF FERMENT TO QUALITY.

Several gardens were taken in the Darjeeling District. A produces average or rather better than average Darjeeling tea; B has for many years produced absolutely the best tea in India; C is during the present season giving the highest priced product in the district. Conditions being therefore as near as possible equal, the quality, if the above condition be true, should vary according to the amount of enzyme present, provided the same amount of stalk, or approximately so, be present in the samples. Comparing, first, garden B with garden A. B No. 2 is from a young Assam or high hybrid extension giving very fine tea; B No. 2 is from a low level Assam extension giving the worst tea on the garden, but yet an above-average quality; B No. 3 is from China tea giving an excellently flavoured product. Determining the enzyme present in each of these samples in September 1900, and comparing the amount with that in A (China hybrid plant), we have, taking A as unity.

* See Tea Notes. A. F. Dowling, 1885.

	Active Enzyme.	Total Enzyme.
A ..	1.00	1.00
B No. 1 ..	1.88	1.30
B No. 2 ..	1.17	1.32
B No. 3 ..	1.83	1.32

In this case the active enzyme seems therefore to be a fair measure of the quality-producing character of the leaf. The same result is shown on garden C, as follows:—

	Active Enzyme.	Total Enzyme.
A ..	1.00	1.00
C No. 1 ..	2.17	2.18
C No. 2 ..	1.44	1.63

Here C No. 1 represents the very highest quality Assam bushes, and C No. 2, similarly, the best China plants in the garden. In C No. 1, probably a little larger amount of stalk occurred, but A and C No. 2 are absolutely comparable, and here it will again be seen that flavour in the tea follows the enzyme in the leaf. Hence one may, I think, conclude that, other things being equal, the flavour in the product is materially connected with the quantity of oxidase in the leaf from which is made. This conclusion, as stated above, will have to be supported by many more experiments before one can consider it satisfactorily established, but in the meantime there is strong and consistent evidence of its substantial accuracy.

How then can this oxidase be increased in the leaf? In a table on page 8, it was shown that, taking the various leaves on the same stalk, the amount of phosphoric acid varied very closely with the amount of oxidase. In addition to this I have, in a previous report,* brought forward very strong evidence that the "quality" of tea is materially influenced, at any rate in Assam, by the amount of phosphoric acid, and especially of available phosphoric acid, in the soil. Now not only is phosphoric acid present in greater quantity in the leaves on the same stalk which give the most enzyme and produce the best tea, but also there appears to be most of this constituent in the soil of those gardens giving leaf containing the most oxidase, and making the best tea. The following figures for the soil of the gardens A and C, where the leaf mentioned above was obtained, show this very clearly.

	A	C
Percentage of Phosphoric Acid in Soil	.061	.124

The conclusion drawn in my previous report above mentioned, that in order to obtain high quality tea, there must in any case be a large quantity of phosphoric acid present in the soil, is here confirmed, and this phosphoric acid becomes, in addition, apparently connected with the quantity of enzyme in the tea leaf.

INCREASE OF FERMENT DURING WITHERING.

One method by which the amount of oxidase present in the leaf may be, and is normally, increased, must not go by unnoticed. Withering has usually been considered to mean partial drying of the leaf at a low temperature so as to make it fit for rolling—and no more. My experiments show, however, that it has a fair more important function, which may explain to a certain extent the failure of artificial methods by artificial heat to give a wither of the best kind. During this process, in fact, the amount of active ferment materially increases, in some cases by as much as 80 per cent. of its original amount. Taking the leaf from gardens A and B above, the following increase took place during withering, due allowance having been made for the loss in water during the process, and taking the amount in the fresh leaf from Garden A as unity.

	ACTIVE ENZYME.		TOTAL ENZYME.	
	In fresh leaf.	In withered leaf.	In fresh leaf.	In withered leaf.
A ...	1.00	1.81	1.00	1.69
B No. 1	1.88	2.48	1.30	1.87
B No. 2	1.17	1.88	1.32	1.87
B No. 3	1.83	2.19	1.32	2.19

The increase in active ferment hence varies from 20 per cent. to 80 per cent. of the amount originally present, and this accounts very well for the fact that leaf rolled fresh without withering will never colour like properly withered leaf.

CONCLUSIONS.

What practical conclusions can therefore be drawn from the investigations which have just been described? Will it be possible to prepare this enzyme, and at a time when the quality of the tea is inevitably low to add it to the fermenting leaf in order to improve the flavour? This may be so, but is, to say the least of it, very doubtful. It must always be remembered in discussing the value of the presence of any ferment whatever, that it is not only the ferment which is of importance, but also the substances to be fermented. And in all vegetable products the growth of the material to be changed is coincident with that of the enzyme which is to change it. This is, for instance, the case in leaves or in seeds containing starch. So soon as starch appears, there also appears the diastase which is to transform it into sugar. This is the same with other ferments and fermentable substances. It would therefore not seem likely at first sight that by merely adding the ferment alone from outside any great improvement would be effected. But, so far, we are in ignorance what the substance is by which flavour is produced. The property may reside in the tannic acid, but this there is every reason to doubt, though of course to that constituent we do owe undoubtedly the purgency of the tea. It may be due to some changes in the resins, in the pectins, or in other products of the leaf of more or less obscure character. What these are and how they are changed will form the next step in this investigation.

For the present it has been established—

- (1). That the fermentation of tea is independent of living organisms, and is caused by an unorganised ferment or oxidase which can be extracted from fresh or withered leaf.
- (2). That the quantity of this oxidase is greatest in the tip leaf of the shoot, and becomes less and less in the leaves as one descends from the growing point. It occurs in two forms, one more active than the other.
- (3). That the oxidase acts best in a slightly acid juice, but excess of acid destroys its power, as well as any free alkali in the liquid in which it works.
- (4). That it is materially increased during withering, and hence this process has a very important function in tea manufacture, independent of its necessity in making the leaf fit to roll.
- (5). That, given leaf of the same character, the quality of the tea produced varies with the amount of oxidase, the larger the amount of oxidase the better being usually the quality of the tea.
- (6). That the amount of oxidase in the leaf is, in some way not yet known, dependent on the amount of phosphoric acid in the soil.

The work here detailed was done principally on the Moondakotee Tea Estate, Darjeeling, and to the manager, the agents, and the owners of that garden, I must here tender my heartiest thanks for help in every direction. To the Reporter on Economic Products to the Government of India, my thanks are also due for the use of his Calcutta laboratory in connection with this work.

CACAO CANKER IN CEYLON.

(Continued from page 444.)

SPORE DISTRIBUTION.

The spreading of the spores over an estate is a most interesting, and the most important, question in relation to the canker, and has received a great deal of thought and attention from me, as it is by means of the spores that all the increase of the disease comes about. Though I have seen cases of infection from pod to stem and *vice versa* by actual contact, these cases are so rare that we can neglect them and consider that the spores are responsible for all the extension of the disease.

The methods of infection of different trees are very various, but we can distinctly point to three or four chief means of attack which have been constantly observed. In the first place, the wind has no doubt the largest share in spreading the spores, especially over large distances, and it is the wind which enables the disease to spread from estate to estate. Instances of this may be mentioned. In one case an estate was chiefly and first attacked at the point nearest to a native garden which had been entirely killed out by canker, and the trees allowed to remain after they were dead, a prevalent wind blowing from this direction. Cases similar to this are numerous. On the other hand, the disease is often absent from sheltered hollows, even though there were present all the conditions which favour it, because the wind passed right over and not through the cacao.

The next and nearly as important an agent is water—both rain and river. Rain washing down the trees and dripping off the pods on to other pods or parts of branches and stems carries with it the spores from infected places, and leaving them causes fresh spots. I have seen a tree covered with a mass of small fresh diseased places, all independent of each other, below an old patch of canker which was covered with spores. There have been many and clear proofs of rivers spreading the disease. In some cases, I fear, by the dead timber being thrown into the stream and conveying its deadly cargo to other places lower down; and also a number of instances of cases of flood washing the spores over a flat area of cacao and infecting the trees. A very clear case of this was found in one young clearing, where practically every tree was cankered just above the surface of the ground, where a few inches of water had stood for a short time during a flood.

But, in addition to both wind and water, ants and other small animals are the means of spreading the disease to an extent that I think is hardly recognized. Any one who has watched the ceaseless activity of ants in running over stem, branch, and pods of cacao tree cannot fail to see how they must be the means of carrying from one place to another the spores when they pass over them. I have examined the legs and bodies of some ants which had been travelling over a tree having spores on its bark, but without discovering these spores on them. But, considering the extremely small size of the spores, this does not materially weaken the contention, and, indeed, I should have been surprised if in any of the few cases I examined I had discovered any spores. The fact that the ants frequent the pods, where they feed on the secretion from the backs of the white *Coccidae* that live on the juices of the pod, alone makes it probable that in the case of the pods the ants are responsible for a good deal of damage in carrying infection.

How much part the pods take in spreading the canker in comparison to the stem and branches it is very hard to determine, but the rapidity with which the fungus grows in the pods, produces its spores, and spreads to other pods and to the bark leads to the supposition that in many cases the majority of the damage is due to the disease in

the pods. It is unfortunate that in most estates the time when the largest number of pods are on the trees is the wet season, which is most favourable to the fungus, and a suggestion may be offered in this connection. It is well known to cacao planters that the amount of fruit produced by each tree at the different crop times varies, that one tree produces a bigger spring crop and not so big an autumn one as another; this is an individual characteristic, which is in many cases quite pronounced. If such characteristics are carefully selected in propagating (as has been done to produce the early and late varieties of cereals and many other cultivated plants), a plantation may be formed which will, in normal seasons, habitually produce its largest yield of fruit in the spring, when the dangers of attacks of fungi are much less, and when the planter has the advantages of sun in ripening his pods and curing his seeds. By continually using seed which has been produced in the spring, no doubt this would be gradually done; but it would be more effectually and quickly brought about if the planter would observe for a year or two those individual trees which bear their fruit more in the spring, and by using the seed from them get in time a spring crop variety. The attention of planters might also with reason be drawn to the practice of grafting, which Mr. Hart of Trinidad has shown to be practicable in cacao, and which would, without doubt, lead to most interesting results.

TREATMENT OF CANKERED TREES; CUTTING OUT CANKER.

Before proceeding to discuss methods of prevention and cure—which are in this paper the most important matters to be dealt with and laid down—it is necessary to understand under what conditions fungi of the nature of this canker fungus grow and spread.

The fungus grows in the stem, branches, and fruit of living cacao trees, and cannot grow for any length of time on dead portions or on the leaves or roots of the tree.

For the growth of a spore of a fungus certain conditions are necessary: heat, moisture, and air. In Ceylon there is always enough heat, at any rate in the cacao-growing areas; air is present, but moisture enough is not always found. In dry weather there is not enough moisture, unless under a heavy shade, for spores to grow, consequently they dry up and in a majority of cases perish. In wet weather and under heavy shade spores alighting on cacao stem, branch, or pod will grow and produce an infected patch. The fungus growing in the bark takes some months before it produces its spores and can affect other trees on the pods; these are formed in two or three days. We therefore have to direct our efforts for prevention and cure to removing diseased tissue before the spores are produced on it, and to reducing as far as possible the conditions under which the spores of fungi can germinate on the surface of the bark.

In my last report published in the end of 1898, nearly three years ago, certain rules were laid down for prevention and cure. These have been carefully and continuously carried out on one or two estates, partially on a good many others, very spasmodically and half-heartedly on others, and in a large number—in unfortunately the largest number—of cases, especially those estates in native hands, no means whatever have been adopted to stop the canker or prevent it producing spores to the danger of all other cacao.

If this Circular has no other effect than to induce cacao growers, as a whole, to take concerted measures against the spread of the disease, it will have fulfilled a useful purpose. Some three years have therefore passed—a sufficient time to judge of the benefit of the measures adopted.

The first rule laid down for treatment of the canker in stem and branch was "the whole of the

diseased tissue and a wide margin should be entirely excised." This has been carried out on many thousands of trees. I have personally visited more than forty estates where disease is prevalent, and on many of which trees have been so treated, and from observations jotted down in my field note-books I estimate that in practically all cases where it was carried out carefully the disease has been entirely eradicated at that spot. In a proportion of the cases the treatment led to the death of the tree, as the canker had grown for so long in the bark and permeated so large an area that cutting it out left no connection at all between the roots and the leaves of the tree, which is essential to life.

The cost of this treatment has naturally varied on different estates according to the amount of the work and the skill with which it has been done by the coolies, also naturally according to the amount of canker existing in each estate treated. The maximum amount spent in this work on a previously badly cankered estate has been less than Rs. 15 per acre in a year, and in the majority of cases a much smaller sum than that. Such work, the only insurance possible against damage in an estate at present free from canker, should cost under Rs. 3 per acre in the year.

In considering this matter of curative means two things must be remembered: First, that the presence of mycelium does not always show itself by a discolouration. The brownish and claret colours are only produced when there is an immense amount of the mycelium of the fungus in the tissue. In the early stages of a diseased patch the change in colour of the tissue is almost imperceptible, and the absence of discolouration must not be taken as meaning absence of the fungus mycelium. Second, the mycelium may be present in such quantity as to cause a patch of distinct discolouration, but the tissue surrounding this patch also contains mycelium, though in less quantity. If, however, this is left behind, the patch will spread again. It is thus essential to cut a wide margin round the discoloured spot of at least 2 inches. I have observed many patches cut out partially, i.e., all the claret colour taken away, which a few weeks later showed signs of living and spreading mycelium at the sides. Even when the patch has been vigorously and carefully treated the tree should be some weeks later again examined to see that the fungus has been entirely removed.

A second element of danger which requires care is the habit of the fungus—previously mentioned—of penetrating to the old wood of the tree growing up behind the bark, running longitudinally along the tree, and cropping out at another place above or below the initial patch. This has been on one estate most carefully searched for and eradicated in a way that reflects great credit on the aptness of the cooly to carry out skilled work when taught well how to do it. The mycelium can be detected in the wood behind a patch of canker as a black line about the thickness of a piece of thread, which runs sometimes for more than a foot up or down the stem.

Three years' trial of cutting out cankered patches in cacao trees in Ceylon has, I think, proved to all observers that this method of dealing with the disease is at once practicable and efficient. When one comes to examine carefully cases of cankered patches said to be cut out and still spreading, the explanation, as a rule, is that the fungus mycelium was not entirely removed, or that a fresh inoculation by a new spore has begun the canker at the same place or near it.

TREATMENT OF CANKERED TREES: SHAVING.

The cutting out the cankered tissue entirely was, however, too drastic and too expensive a cure for some planters, as in some badly diseased estates it would have killed a large proportion of trees, and in my reports of 1898 I recommended as an alternative method, though not promising such good

results, the shaving of the affected parts and allowing the shade to be light enough for the sun to dry up these shaved parts. This has proved successful, but as was expected not so entirely successful as the more thorough cutting out. In cases of estates where shade was light and the sun got free access this light shaving has freed the trees from disease in more than 50 per cent. of the cases treated.

The explanation of the success of this method of shaving in eradicating canker is that the mycelium of the fungus is cut, broken, or burnt at countless places by the shaving knife (or what is still better for quickness and clean work, the spoke-shave), and with the drying effect of the sun on the tissues it cannot recover itself, and dies. Though many of the cells of the bark are killed, a portion of them are active below the surface, and the tree does not suffer very seriously from the operation.

If this treatment is carried out under dense shade or in damp weather, the effects are seldom good, and in the majority of cases the fungus is not eradicated. Some interesting experiments have been brought to my notice of an artificial heat being applied to the shaved surfaces, charcoal braziers being held within a few inches of the newly-shaved surface, and the results of this were almost as marked as direct sun light.

I tried this process on a small scale on four trees, and in the parts shaved and scorched (one of which was 13 inches by 10 and nearly encircling the tree) the mycelium was killed, and the bark tissues were not entirely killed, so that in a short time the trees recovered entirely from the disease.

Though this "hot potting" is almost equal in its results to the effect of the sun, it is not so good, because it is too local; and unless very carefully carried out there is too much scorching, and the tissues are damaged to a great extent. The experiment is, however, interesting, as showing the *modus operandi* of the cure after shaving. The moisture is dried up, and the mycelium of the fungus cannot get sufficient supplies of nourishment to counteract the great damage done, while the plant tissues below, which are unharmed, drawing their supplies eventually from the root, gradually recover.

TREATMENT FOR POD DISEASE.

The eradication of the canker in the bark is of vital importance, but of no less importance is the removal of diseased pods. As was stated previously the fungus spreads and produces its spores ten times more rapidly in the soft tissue of the pod than in the bark, so that prompt measures must be taken if the spreading of the canker fungus by means of the pods is to be prevented. All diseased pods, however slightly affected, should be at once removed and the husks burnt, or if that is impossible during wet weather, buried with lime. By this means a very great, if not the greatest, source of infection is destroyed, and no loss accrues to the estate, as the value of the pods (even though unripe) with a small patch of disease is greater than a few days later, when they are entirely diseased and the seeds also blackened. The unripe and partially diseased seeds produce "black cacao" but the pods which are left till the disease has spread entirely over them are often unfit even for "black cacao."

The simplest method of carrying out this important work is to have all diseased pods, however little affected, collected when the ripe pods are being plucked, and to send round at periods between the plucking times, and have any which have since acquired the disease taken away. In this way no pod could remain on the tree diseased for more than four or five days. This could be done at a very little cost.

All these preventive and curative means, cutting out, shaving, and destroying diseased pods, should be done during the dry weather as far as possible,

though they should not be entirely stopped when the rainy seasons are on. In dry weather the disease on the bark is comparatively easy to detect, while when the stems and branches are wet the slightly darker appearance on the outside of the bark is masked; and further, the sun and dry air being most important agents in the destruction of the fungus, any work done while the air is highly charged with moisture is less likely to be effective.

OTHER REMEDIES.

Various other remedial and preventive means have been tried by myself and others, which should be mentioned here. The desire of the planter is generally for an application either to the tree or to the soil which shall cure or drive away the evil he fears. This is natural, and the wish is shared by cultivators in all parts of the world. The object of cure however is, in the first place, to be as far as possible absolutely effective; and in the second place, practicable in regard to its cost and probability of carrying it out faithfully. In dealing with cures and preventions in Ceylon for cacao canker we must attempt to get some method which, while effective, is simple, and requires a minimum of skill and apparatus.

The vaule of Copper Sulphate either by itself or mixed with lime as in the Bordeaux mixture has long been recognized by all who are interested in sanitary work for plants. This substance is the best deterrent of the growth of spores, and if a covering could be continuously kept on the surface of stems, branches, and pods, no new patches would occur. But in the dry weather (when the blue stone if applied will stay on) is a time when spores can seldom germinate, as there is little or no moisture which is necessary for them. If the application is made in rainy weather it is washed off by the next shower, and it would be impossible to keep the tree covered with it. For these reasons, while blue stone is an excellent preventative, the benefits gained in the case of cacao canker would not be commensurate with the cost of application.

Another favourite remedy is the application of tar, either to the outside of the tree before cutting and shaving or to the cut surfaces. This a most treacherous method, as it deludes the planter into a false security. The fungus not being entirely removed, the mycelium grows vigorously underneath (in some cases I have seen spores produced and breaking through the tar), so that it prevents second examination to see if the fungus has been exterminated. It is often therefore a coverer of bad work. In some cases cow dung has been applied to the cut surfaces. This also is harmful, as it keeps the part damp, harbours spores, and conceals the place, when it should be again examined.

Many cultivators favour the application of lime—thrown on dry—to the trees and on the ground beneath them. The drawbacks to the application of blue stone apply also to lime as regards the part of the plant above ground. In regard to its effects on the soil, while in some land it has beneficial manurial qualities, its effect as a fungicide is limited. Spores do not grow on dead leaves or on the ground. I have tried to cultivate them on both, but though if kept moist they germinated, they did not persist. It is therefore almost superfluous to take any measures against spores lodged on the ground or on dead leaves and other debris. We have seen that the fungus does not affect the roots, and the effect of lime in the soil does not help the tree in its battle with the canker fungus or make it any less liable to attack.

PREDISPOSITION OF TREES TO DISEASE.

The question of liability of cacao trees to infection by the canker fungus has caused a good deal of misunderstanding with regard to the question of the disease.

In the case of the cacao canker, I stated in my second report of 1898, and it seems well to repeat it, that "No special predisposition of the tree is

necessary for the attack of the fungus." There is a belief, which is very general both in Ceylon and other lands, that all diseases of plants can be prevented by keeping the plants in a high state of health and vigour. This is true of many diseases, and the opposite is also true in some cases that excessive quantities of nutrition taken up by the root predisposes to certain diseases. Every specific disease, *i.e.*, disease in which an animal, fungus, or bacterium is the prime factor, must be considered by itself, and no general law as to lack of health predisposing to disease is accepted by plant pathologists.

In the case of cacao canker, my observations over thousands of acres of cacao in all parts of Ceylon, from Rambukkana to Moneragalla, at all elevations and aspects and on all soils, show that cacao in all conditions of vigour contracts the canker, provided the spores are there and conditions present to allow them to germinate. There are many instances of "shuck" cacao adjacent to more vigorous trees with the disease equally prevalent on both, and there are cases of the best cacao suffering while some adjacent poorer trees for some reason have escaped.

Mr. Marshall Ward, now Professor of Botany at Cambridge, found this equal liability to be the case in the coffee leaf disease, and it has probably since come under the observation of many readers of this Circular that this leaf fungus attacks equally both healthy and "shuck" coffee. In his report on the leaf disease (1882.) Professor Ward says: "No special predisposition on the part of the coffee is required for its infection, and no other conditions are necessary to the spore than moisture and the presence of air, &c., as with any germinating seed."

In order to further test the truth of my observations in regard to this question of predisposition, I sprayed four trees of old red cacao which were showing all signs of abundant health, and four others shuck and ragged. Only seven out of the eight acquired the disease, and one of the healthy ones was not affected, for the reason, I believe, that it was more exposed to air and sunshine and the spores were dried up.

It is important to grasp this fact of the vigour of the cacao tree being no safeguard against the canker, as, if the planter does not realize it, he may be neglecting to take any precautions or keep any look out for the enemy which does not spare the best trees.

The question of predisposition of unhealthy trees leads us to the consideration of the possibility of obtaining a variety of cacao which would be immune or less liable to canker than those now grown. When canker first appeared it was held by some that the *Forestero* variety was to a great extent immune. It is a hardier breed than the old red, and stands wind, drought, and all other inimical conditions better than the red variety, but it has not been attacked markedly less than the red by the canker, and experiments of inoculation show that it is equally liable.

Whether a variety will be found that will be "disease resisting" or not cannot be said, but it is a search well worth the while of the cacao planter, and in prosecuting it some facts should be remembered. The pod disease is a most important factor in the spread of canker, and when pods are produced in the rainy season, they are more liable to acquire canker. A variety, therefore, which produces and ripens its fruit during the dry months will have a certain protection from disease owing to its time for bearing fruit "dodging" the dangerous season. The typical *Forestero* green pods have a thicker epidermis, and this gives a partial protection against canker spores.

In selecting seed for breeding a variety of cacao which will be "disease resisting," the characters to use are thick skinned pod, smooth surface of periderm, *i.e.*, outside of bark, production of fruit at dry seasons,

hardiness to live in the open exposed to sun and dry air, where the fungus gets less chance of germinating. The whole question of selection in cacao growing is one of great interest and promise, nothing having been done seriously to breed improved forms, and it is probable that our cacao tree is little, if any, improvement on the native cacao of the Amazon Valley. I purpose to discuss this question, when some experiments I am making have progressed a little further, in a future Circular.

SUMMARY.

The position of cacao in Ceylon to-day is hopeful, and yet not without cause for some anxiety. The canker is much decreased in quantity since 1898, owing to means having been taken meanwhile to combat it, and the fact that no season specially favourable to the fungus has occurred. But it has been growing in many places, chiefly native holdings, and these diseased places are a menace to the rest of the cacao in the Island. It behoves all owners or managers of cacao property to satisfy themselves, as practical men, by reading this Circular, by personal observations of estates where any treatment has been carried out, and by information from all whose experience and knowledge entitles them to be heard, whether this disease can be lessened by any practicable methods. If they are satisfied as to this point, it is their duty to see that the cacao places which they control shall be treated, and that pressure is brought to bear on all cacao growers to take similar steps.

If a general crusade were carried out in every cacao district in Ceylon for a few years, the canker would be reduced to a minimum, and the cost of guarding against and removing it would in turn be decreased.

I have not been able to get a pronouncement by cacao growers as to their views on the effect of the curative and preventive means used, though some questions bearing on the subject have been sent out by the Cacao Sub-Committee of the Planters Association, and the answers given will no doubt show the opinions of practical men. The following are the rules for treatment of cacao in relation to canker which were previously published in my reports, and having seen them carried out with a large measure of success, it is well to again lay them down:—

Prevention.—Regulate the shade so that the sun and air can reach all parts of the cacao trees, and keep the cacao from being so close as by its own leaves to densely shade the ground.

Prevent dampness by surface draining, especially in low hollows.

Allow suckers to grow on all trees that show any sign of disease.

Burn all dead cacao trees and branches.

Burn all discoloured pod husks from whatever cause they are discoloured. (If this is not possible bury with limo.)

Bury all pods under at least two inches of soil with a sprinkling of lime.

Cure.—Cut out all diseased patches on bark or branches, removing also a wide margin—not less than two inches—of apparently healthy bark, and burn all the pieces removed.

If this method is too expensive or too drastic, shave lightly over the diseased areas and around them, and burn the shavings. This latter treatment is not so effective as cutting out. Such work should be done vigorously in the dry weather, when the results are vastly better.

Keep a gang of expert coolies continually on the look out for new canker patches, and have these parts removed before they spread far or produce their spores.

Notice any dead cacao trees or branches on neighbouring small holdings, and endeavour to get these moved and burnt.

These sanitary measures should be carried out on all estates, even where the canker is very rare, and the personal oversight of the superintendent seems to be the only way to prevent small patches of disease being missed in going round. It is much better to take a longer time in going round the estate and have the work thoroughly done than to cover large areas and overlook some canker.

The number of trees a cooly can examine and cut in a day depends, of course, on the amount of disease, but it is preferable to spend a day in finishing fifty trees than to run over an acre, and on the next round it will be found that much less work has to be done. On several estates, where the gang consisted of from fifty to a hundred coolies, the number is now reduced to ten to twenty. It must be remembered that the time when the spores grow is during wet weather, and not until some weeks later can the place be detected and cut out. The mistake is common of talking of an "outbreak" of disease, when the evil has arisen, *i.e.*, the spores grown, some time before. The smallness of the acreage of cacao in Ceylon, the chances of success owing to the nature of the disease, and the amount of the profit on healthy cacao in good bearing, make this disease one which should be reduced or even expelled with exceptional ease. Half measures, and these adopted only on a portion of estates, are sure to be disappointing.

Perhaps I may hope that this Circular will induce many, if not all, to take their part in the crusade against the cacao canker.

Government Mycologist and

Assistant Director, Royal Botanic Gardens.

Peradeniya, September 19, 1901.

CURIOUS BEHAVIOUR OF A FLIGHT OF WAGTAILS.

I send you an extract from a letter received by me the other day from a planter friend at Balur, Mysore, which I think will be of interest to some of your readers.

The wagtails, which is a migratory bird, as every body knows, comes down south with, or just before, snipe, and a flight of them must have been passing over Balur when the rain stopped them,

"A very funny thing occurred here the other night. I was reading in the sitting-room at about 9 p.m., and it was raining heavily outside, when a water wagtail flew into the room, and after a little while I found there were four of them. I did not take much notice of them until one flew on to the lamp and put it out, and then I thought it was high time to go to bed. So I went into my bed-room, and to my surprise found it was full of these birds. They had come in evidently to take shelter from the rain. They seemed quite tame, and several of them sat on my shoulder and on my hands. However, I did not want them flying about my room all night, so I caught them one by one and set them free in the drawing-room. In the morning two were found dead, evidently killed by the dogs, but the rest had all gone!"

"LOBELIAS"—are common enough in and around Nuwara Eliya: can anything be done to utilise them in view of this report in *Chemist and Druggist* of Jan. 4th:—

LOBELIA.—Herb is very scarce in New York, 5d per lb, *c.i.f.*, being quoted.

THE TEA ESTATE WITH THE
PREMIER YIELD.

MARIAWATTE'S CROP FOR 1901.

We are obliged to the Superintendent, Mr. D. M. Salmond, for the figures showing the yield of Mariawatte, the premier-yielding tea estate of the island. In the van of all output-restricting properties, —largely perhaps from necessity, as well as to some extent from set purpose—Mariawatte shows a decrease of 265 lb. per acre for 1901 on 1900, and of 16 lb. on 1899, though 1,092 lb. average is above those of 1899 and 1898:—

MARIAWATTE ESTATE.

YIELD OF OLD TEA	Made Tea	101A. 1R. OP.
Year.	lb.	Yield per acre lb.
1884	109,230	1,078
1885	117,842	1,163
1886	105,925	1,046
1887	115,996	1,145
1888	103,410	1,050
1889	113,834	1,124
1890	140,144	1,384
1891	120,366	1,188
1892	119,909	1,184
1893	115,440	1,140
1894	110,448	1,090
1895	118,560	1,170
1896	113,360	1,119
1897	105,729	1,044
1898	108,423	1,073
1899	111,987	1,108
1900	137,066	1,357
1901	110,302	1,092

YIELD FOR THE WHOLE ESTATE.	458A. 1R. 17P.	RAINFALL.
	lb.	
1892	643	95.74
1893	817	86.22
1894	750	72.00
1895	886	100.28
1896	896	115.41
1897	926	111.25
1898	738	79.90
1899	749	106.81
1900	996	114.63
1901	792	84.38

We congratulate the management on the result achieved, satisfactory from the general point of view of tea production everywhere, and also from the particular standpoint of the estate, where a shortage of rainfall of over 20 inches (17 per cent) has been experienced during the past year.

TEA IN TASMANIA.

The growing of tea for home consumption is, we learn from a Launceston paper, attracting attention in Tasmania. The writer on the subject while fully admitting the hopelessness of producing tea in quantities for competition with China, Japan, India or other places where there is a superabundance of cheap labour, suggests that the plant should be put down as hedges, the clipping of which in the spring, about August and September, would furnish leaf enough to meet household requirements, and perhaps also the wants of the non-agricultural population of the smaller townships.—*Madras Mail*, Jan. 1.

UP-TO-DATE NOTES FROM SUMATRA.

TYPICAL OF SUMATRA'S EAST COAST.

Dec. 10, 1901.

RACIAL.—The cosmopolitan nature of the population has often been pointed out. Within a two-mile radius of where I am writing are representatives of the following *European nations*:—British, Swiss, Danish, French, Dutch and German; *Asiatics*:—Malay, Javanese, Battak, Chinese, Tamil, Bengalee, Sikh; and sub-divisions of Javanese race, each having a different language, Sundanese, Barneanese, Madurese.

There is a story of a mixed gathering of Europeans, where the Tower of Babel was so nearly approached, that recourse was had to Malay as a *lingua Franca*. Of course, all were united on one point, and that was abuse of England. One, more travelled than the rest, was describing a visit he had paid to what he called 'Kampong London.' Kampong is the Malay word for village! There is one eminent personage that foreigners are never tired of discussing, especially delighting to picture him in an everlasting maelstrom of financial worries. After a very free criticism, so the story goes, one gentleman of liberal tendencies closed the discussion with 'Ya! itu P— of W— tidak dapat chukup blandja!' 'Yes: that P— of W— does not get enough allowance!'

POST OFFICE.—An Englishman, stamping his letters at the P O window with stamps he had just bought, muttered to himself: 'These d—d stamps won't stick.' The clerk, a Dutchman of course, at once politely replied: 'We have a gum-bottle here, Sir!'

RAILWAYS.—There is a narrow-gauge railway connecting Lower Langket with the Deli Spoor-engg Moratschappij which serves the more central part of Deli. Two friends of mine recently missed the 'Sural-spoor' (narrow-gauge) at the terminus. So, bag in hand, they started to run after it, and caught it up at the next station! I wonder if a Bank Manager and a well-known planter will ever emulate this feat on the Kelani Valley line? The following is a good story of the 'Deli Spoor' broad-gauge. The Stationmaster, as usual, saw the train off the platform as it went out. At the next station the passengers were astonished to see the same official on the platform as the train glided in. 'Hullo! what are you doing here?' 'I am in temporary charge here.' 'But we left you behind at the last station! How on earth did you get here?' 'Oh! after you left, I went to the buffet, took a whisky and soda, and came along on my bicycle.'

POVERTY AMONG TOBACCO-PLANTERS!—Some time ago I sent you an account of a stupendous commission said to have been earned by a Head Manager. But there is another side. A most heart-rending story was told me the other day about a Head Manager of an apparently successful Tobacco Company who *could not afford to buy a new hat*. The reason why? His commission this year is only 30,000 guilders. Can't you feel pity for a man reduced to such extremities? He cannot afford himself a new hat because his commission is only £2,500! Poor miserable devil! This sort of thing draws a tear of compassion from his neighbour, the coffee-planter, whose very vitals are being eaten out by caterpillars.

W. T. M'K.

TEA IN THE CAUCASUS.

Our Consul at Batoum, Mr. Stevens, in his last report, has something to say about tea cultivation in the Caucasus, which bears out the views formed by practical people of this budding industry, about which there has been so much optimistic talk. He points out that possibly the climate of Batoum and its environs is all that can be desired for the growth of tea, but there are other local conditions which stand in the way, and accordingly the area under the plant is not increasing as might be anticipated in the case of a promising industry. The two chief tea-growers are the Imperial Domains and Messrs Popoff, and both have added to the area of their gardens, but hardly any other growers of importance exist in the neighbourhood of Batoum. The landholders are reluctant to put their land under tea because the results hitherto obtained are so uncertain that they prefer to await further experience. Thus, during the present year, the total crop, which was the largest ever obtained in the Caucasus, was only 13½ tons, although ten years have elapsed since the first experiments were made, and neither money nor pains have been spared by the two pioneer growers to produce tea that will be commercially successful. In the estates of the Imperial Domains the crop was gathered this year from 102 acres, the quality being chiefly that of the Kangra Valley and the system of harvesting being that prevailing in Ceylon. Messrs. Popoff's gardens extend to 312 acres, and the leaf produced is stronger than Chinese, and is gathered on the Chinese system. But, as has been said, the whole industry has not yet emerged from the experimental stage. Last season 117,000 lb. of silkworm eggs were imported from the Caucasus through Batoum, about a sixth of which went to Persia and Central Asia; but the Russian papers are clamouring against this trade on the ground that it injures the silkworm rearers of the Caucasus, and makes the industry dependent on foreigners. The silk, except what is used locally, goes for the most part to France. But the industry is not of great commercial importance, nor is cattle-rearing, which is carried on mostly to supply local needs.—*H. and C. Mail*, Dec. 20.

— — —

A LONDON OPINION ON THE INCREASED TEA CESS. THE CHANGE NOT APPROVED.

We learn that the following reply has been forwarded to the Secretary of the Ceylon Association in London in answer to his letter sent with that of Mr. Rosling's asking for votes relative to the increase of the Tea Cess:—

17th Dec., 1901.

The Secretary, Ceylon Association in London, 62, Gracechurch Street, E.C.

DEAR SIR,—We are in receipt of your circular of 13th inst., relative to the Ceylon Tea Cess, and we have to say in reply that we are not prepared to agree to the proposed increase, but on the other hand, are willing to join in any movement to abolish the existing Cess.

We consider that no adequate result has from the beginning, come from the work and expenditure of the Commissioners in America and in Europe, and that the existing channels of distribution in the tea trade are amply sufficient to dispose of all the production. The appointment of Commissioners who are inexperienced in the regular business of tea distribution, merely gives offence to regular traders, and the unfairness with which grants are made tends to retard, rather than to advance, the efforts to extend the use of Ceylon tea.

We think that, in all probability, the consumption of black teas of Ceylon production would have been as large in the United States and Canada today, had your Commissioner never been sent there. In any case, we do not attribute to his efforts the development in demand. The constant lowering in prices of Ceylon tea has displaced China tea in most of the markets of the world, until there is comparatively little trade left in black China teas to be displaced.

We point out to you, as significant proof of our argument that Special Commissioners do little good, the fact, that for very many years no special efforts have been made by Ceylon producers in Australia, and none at all, until recently, in Russia, and yet those two countries show very large increases in the volume of consumption, the reason being that the extreme lowness of price for Ceylon tea has rendered it impossible that China tea could be shipped in competition. Progress of the same character has been observable in Great Britain. The place where the greatest effort has been made, has shown the least return, viz: the American Continent, the reason being that there was a comparatively limited black tea market to be changed from China to Indian or Ceylon teas.

The business of tea distribution throughout the world is one that is carried on under very keen competition, and tea merchants are so thoroughly alive to their own interests that they have been most willing, wherever possible, to substitute a better for an inferior tea, and consequently black China tea has given way before Indian and Ceylon, the process of substitution having been greatly accelerated of recent years by the fall in the value of the latter.

Some credit is due to your American Commissioner for the suggestion that part of the Ceylon growth should be made into green tea, and if your Association were to direct their efforts to the production of green teas of such a character and at such prices that they would compete with Japan green tea, some good might result.

We have just had furnished to us, through a private channel, the official figures of the Canadian Government for the last completed trade year of tea importation, which go to bear out the opinions we have expressed. They are as follows:—

	Black Teas,	Green Teas
China	... 3,629,286 lbs.	862,379 lbs.
Japan	... 831,307 "	6,619,296 "
Ceylon	... 6,250,963 "	335,815 "
Indian	... 3,936,544 "	81,578 "

It will be shown that there is ample room for displacement of green tea in consumption.

It would lessen the objections to the Cess, were all distributions from it made to the producers or shippers in Ceylon on a publicly announced basis, and not to the ultimate distributors in secrecy, at the discretion of one individual.—We are, dear sir, yours faithfully,
McMEEKIN & CO.

CEYLON TEA ON THE EUROPEAN CONTINENT.

On the rule of *audi alteram partem* it is well to see what a gentleman of Mr. Marcel's continental experience and interest in Ceylon has to say on Mr. Renton's work in trying to extend the demand for our tea. And in the letter which we print elsewhere today, Mr. Marcel makes not a few observations which are both pointed and pungent, and which may be useful in reference to the future guidance and action of the "Ceylon Tea Commissioner." But we are certainly not prepared to go with our correspondent in his general condemnation of the Continental Tea Campaign. No doubt France is one of the most difficult of European countries in which to gain much support for our tea; but there should be far less difficulty in Germany and still less in Russia, where tea is already so well-known and popular. By the way, cannot Mr. Marcel show us how the fact that Russia—the special ally of France—is a great consumer of tea, could be utilised to win over the French people to this average. If he would do so, Ceylon planters would, indeed, reckon our correspondent among their benefactors. But in the letter before us, there is too much of criticism and censure, and too little of alternative suggestion. If Mr. Renton is going the wrong way to work, in his "degustation" system, what would our correspondent propose as a substitute? No doubt, if the notables—and especially the ladies—in each town could be gathered together to a "five-o'clock tea," and a suitable discourse on the virtues of Ceylon tea, the immediate result should be more satisfactory. But we must not despise the masses—the *hoi polloi*—nor the benefit of inculcating a taste for Ceylon tea by a free distribution in the cup; for in our experience from successive visits to Vichy and other parts of France, "tea" was regarded as a medicine and until within a few years back we were generally referred to the pharmacist when we wanted to purchase any of the fragrant leaf. That being the case, if Mr. Renton can only help to get the French people, even of the lower classes, to see from their own experience, that Ceylon tea is really a pleasant and refreshing beverage, the money voted should be well spent. But if Mr. Marcel will only suggest a more excellent way of going to work, we can promise the fullest consideration. As to the Continental Campaign generally, there ought certainly to be no slackening in the support of Mr. Renton, so long as his engagement lasts. When that comes to an end, it may be necessary to reconsider the whole posi-

tion of the necessity for a Cess and its expenditure in the light of what mercantile firms in the tea trade, experts with Continental and American experience, have to tell us, and we certainly count Mr. Marcel among the number. For ourselves, we should be inclined to close the American campaign—it has lasted a good many years—save, so far, as the payment of a bonus on "green teas" at this end is concerned, and to continue the Continental Campaign for some years longer, with such modifications in the working as experts may recommend.

INDIAN TEA AND OTHER TRADE WITH KASHGAR.

Mr. George Macartney, Special Assistant for Chinese Affairs at Kashgar, gives a rather gloomy account of the trade between India and Chinese Turkestan. One of the causes of the depression is an enhanced duty on charas, and some difficulty is caused by the exchange question in converting tengas into rupees and *vice versa*. With a view to improving the trade Mr. Macartney suggests a system of bounties on Indian exports, the development of the tea trade and the mule traffic and the importation of Kashmir opium. With regard to the tea trade no care is shown by the British traders in considering the requirements of the market, for which Kangra Valley tea in its present form is unsuited. A tea similar in taste and shape to the brick tea from China is required, but care will have to be shown in avoiding collision with the Chinese traders from Hunan. The mule traffic from Turkestan to India is also of special importance as the Commissariat and Ordnance Departments have great need of a regular supply of these animals. Mr. Macartney says that a fair number could be obtained annually at Yarkand if it became known in the outlying districts that we would purchase them.—London Times, Dec. 18.

MANGABA: OR MANGABEIRA RUBBER.

On the Pará side of the Tocantins and Araguaya rivers, between the Itacayuna and the Tapirepe, there is in the *campos* (land covered with lower vegetation) a shrub, the "magabeira," which gives a milk more or less similar to that of the Para rubber tree, but which does not coagulate so easily and not at all through the smoking process. The mangabeira is never to be found in the forest; it is only in the *campos*, where the vegetation is not high. It is about 7 or 8 inches in diameter; the average height is 16 feet; it is not very resistant and perishes quickly when overworked. It gives quite enough milk, yet as the stuff has at present no great commercial value, this advantage disappears. Among the Rio do Sonno, which is one of the places of production, 33 pounds are sold at less than 20 milreis [—equal \$4.40, gold, with exchange at 11d. per milreis] and in the town of Para itself the value is seldom double. As the milk is abundant, the production is equally so. A man gets easily 11 pounds per day, but as the price is low, this industry is not so advantageous for the working man. Something like 5 milreis per day is not very much in such a place where a man has to

provide his own food. Yet in spite of that, in spite of the great distance to the nearest market towns, and in spite of the uncertainty of the sale, there are already some working people coming from the state of Maranhao and from Bahia. The total production is less than 22,000 pounds (in weight). EUGENE ACKERMANN, Engineer.

Para Brazil, Oct. 23, 1901.
—*India Rubber World*, Dec. 1st.

ZULULAND MICA: COMPANY FORMED.

A company has been formed in Durban with a capital of £10,000, for the purpose of purchasing and working mica mines in Zululand. Samples of the mica have been sent to England, and replies have been received that the sample is worth £560 per ton. The whole of the capital has been subscribed locally. The directors proceed to Zululand this week to inspect the property.—*Natal Mercury*, Dec. 10.

THE PRODUCTS OF STRAITS SETTLEMENT AND MALAY PENINSULA.

Mr. H N Ridley, Director of the Botanic Gardens, Singapore, delivered a lecture at the Imperial Institute on Monday entitled "The Economic Resources of the Straits Settlements and the Malay Peninsula." He remarked that the forests, which originally covered the whole peninsula, contain many valuable products, such as timbers, wood-oil, benzoin, gutta-percha and rattans. Owing to the felling of trees by the Malays, gutta-percha, so indispensable for electric work, has been nearly exterminated. Fortunately, however, the product can now be extracted from the leaves and twigs without injury to the trees, which are being planted by the Government. A very large area of the Federated States is under coffee, but on account of the present glut of the market and the consequent low prices, most of the planters are adding Para-rubber to their estates—a tree which thrives marvellously well and produces a very satisfactory amount of rubber of the first quality. India-rubber from the *Ficus elastica* also promises well, but although it is being planted, its product is less highly valued. Accounts were given of the cultivation and preparation of sago—one acre of the sago palm gives as much nourishment as 163 acres of wheat—tapioca, gambir, mangrove-cutch, pepper, nutmegs, cloves, indigo and pineapples. The greater part of the preserved pines of commerce come from Singapore, where the price of the fruit varies from a farthing to a penny each, and the lecturer remembered a time when they had been as cheap as sixteen a penny. The mineral resources of the colony include gold and tin, the latter being found in great abundance.—*Nature*, Dec. 19.

"PARA RUBBER" IN THE STRAITS SETTLEMENT.

[To the Editor of the *India Rubber World*.]

A few weeks ago I posted you a copy of the annual report of the botanic gardens in this colony, containing, among other rubber notes, the result obtained by tapping a single Para rubber tree (*Hevea Brasiliensis*) growing in the Waterfall botanic garden, Penang. The result of four tappings within two years, as shown in that report, is 12½ pounds of dry, marketable rubber. Within the past month the same tree has been again tapped, and yielded per 2 pounds more, so that this

one tree has given 14½ pounds, without being excessively tapped. How long it will continue to yield at this rate is a matter of conjecture, but so far as can at present be seen there has been no apparent injury to the tree. I am sending you by post a sample of the rubber and shall esteem it a favor if you will kindly submit it to some expert engaged in the manufacture of rubber goods for an opinion as to its quality and value.

In a few years' time this will be a large article of export from this region, and also what is known here as "gutta rambong" (*Ficus elastica*). Many large plantations here and in the adjoining Federated Malay States were commenced about four years ago and tapping on a large scale is anticipated by the time the trees are eight years old. New plantations are being formed as fast as seeds are obtainable, but the supply is not equal to the demand. The tree from which the rubber I am sending you was taken is sixteen years old but in good soil such as most of the planters are using the trees will be quite as large in eight or ten years. Ours is growing on a dry gravelly bank conditions quite the opposite or those under which it naturally grows so far as one can judge from the reports of those who have seen it growing in Brazil. Here it will grow anywhere, though of course not equally well in all places and there is no doubt that in the future this country will have to be reckoned with as regards rubber. As a field for investment in this particular cultivation it would be hard to beat. Land is abundant and cheap and roads, railways and rivers afford easy access to all parts of the Malay peninsula.

C. CURRIE, F.L.S.
Superintendent of Forests Section Botanic Gardens.
Penang Straits Settlements, September 24, 1901.

COMMENT BY THE EDITOR.—The tree from which was obtained the sample of rubber referred to above was stated in the annual report of the botanic gardens for 1900 to be 55 feet high, with a circumference at 3 feet from the ground of 66 inches. The record of yield of this tree as stated in the annual reports is as follows, the tree having been tapped for 14 alternate days in each of the seasons mentioned:

	Lbs.	Oz
November-December, 1898	..	3 0
April-May, 1899	...	2 8
November-December, 1899	...	3 4
October-November 1900	...	3 12
August-September 1901	...	2 0
		—
Total	..	14 8

From the same reports it is to be inferred that the rubber produced has been smoked with coconut husk after first having been allowed to coagulate and then rolled into thin sheets. Where the rubber milk has happened to contain rain water, alum or spirits of wine has been used to hasten coagulation. The method of coagulating rubber on the Amazon is by submitting the fresh latex to the hot smoke of palm nuts quite a different method from that employed by our Penang correspondent. The Penang rubber has been examined quite carefully, and is worth about 60 cents a pound, with fine Para at 80 cents a pound. In fact it does not resemble fine Para very strongly, but is much more like Pernambuco. The rubber is much softer than fine Para, or even than coarse Para, and has nowhere near as strong fibre. In fact, it is quite short. It could not be used, for example, in thread, elastic bands, or any fine pure gum goods. In solution it loses its tenacity very quickly, so that it would not do for high grade cements. Another thing about it is that it softens with age, whereas the Para rubbers grow hard and oxidize. We think the reasons for these differences are two: one being found in the manner of coagulation, which does not seem equal to the smoking process; and the other being due to the undoubted change wrought upon the tree by a different climate from that in which the tree naturally flourishes. It is to be understood, of course, that the rubber is valuable, and

will find a ready market at a good price, but it is not the equal of either fine or coarse Para. We think this is another proof that rubber will be cultivated most successfully in the regions where it grows wild.

KAMERUN (GERMAN WEST AFRICA).

The Moliwe Pflanzungs Gesellschaft, of Hamburg, (Germany, at the end of their second business year of July 1st 1900—June 30, 1901), reported that 42 acres of their estate at Moliwe in this colony had been planted in rubber, 32½ acres being devoted to *Kickxia elastica*, the tree which yields the Lagos rubber. The number of trees was 3,960 which gave 300 to the hectare, or 121 to the acre. Dr. Paul Preuss, director of the botanical gardens at Victoria (Kamerun), writing to the editor of *Der Tropenpflanzer*, makes an unfavorable report on the growth of these plants, while the *Castilloa elastica* has done well. The late Herr Stammler, head planter of the Moliwe company, reported favorably on the *Castilloa elastica*, and the company, on the advice of Dr. Otto Warburg, of Berlin, and with the aid of Herr Th. F. Koschny, of San Carlos Costa Rica, obtained from the latter country this year 400,000 seeds of the *Castilloa*. Although the larger part of these seeds, by reason of the long voyage, were found to be spoiled on reaching Hamburg, it was hoped that at least 100,000 *Castilloa* plants could be grown for Kamerun from the lot. The Moliwe company are experimenting with various other rubber species.—Of the rubber under cultivation in the gardens at Victoria, Director Preuss reports that the seedlings of *Kickxia elastica*, from seeds planted in November, 1898, had, in two years and a half, reached a height of 3 meters, and were flowering. Besides, the bark was found to contain latex. The *Ficus Vogelii*, another African tree under cultivation, yields rubber liberally and of good quality. *Sapium utile* and *Hevea Brasiliensis* (Para rubber) are each represented in the gardens by a few good specimens, the young trees of the latter species having begun to bear seeds. —*India Rubber World*, Dec. 1.

PLANTING.

ILLUSTRATED LECTURES AT THE IMPERIAL INSTITUTE.

(From a correspondent.)

In case you have not received particulars of the last two lectures at the Imperial Institute, I am sending you a few notes herewith:—

On December 2nd a lecture entitled PLANTERS AND PLANTING IN TROPICAL GREATER BRITAIN

was given by Mr R. Hedger Wallace, Sir Edward Noel Walker being in the chair. The gist of the lecture, which could not be said to have done justice to the subject, was (1) the definition of a Planter, and (2) the necessary qualifications of a Planter. The duties of a planter, said the lecturer, vary in different colonies, as, for example, in Tropical Africa he has to teach the natives how to work, whilst in India he has only to see that the work is done by them in accordance with certain methods. The best planters were obtained from the middle classes, and men who have not had a sound education were generally failures as planters. Young men intending to try planting, in India especially, should have a good training in agriculture and book-keeping, and also have a knowledge of engineering and domestic medicines. He should also be naturally of a sociable character in order to meet certain

social demands on his time. The first (and best) of the lantern slides shown was a group of coconut palms on the sea-coast in Ceylon, yet Ceylon was not referred to in the lecture; but, perhaps, India was meant to include the little island.

Last Monday evening, [the 16th instant, Mr. Ridley, Director of Botanic Gardens, Singapore, gave an interesting lecture on

"THE ECONOMIC RESOURCES OF THE STRAITS

SETTLEMENTS AND MALAY PENINSULA,"

the chair being taken by Sir Cecil Clementi Smith, formerly Governor of the Straits Settlements.

Being favoured with a precis of the lecture I send it to you, adding slightly to it:

Probably, said Mr. Ridley, no portion of the Empire was so little known to the English public as that of the Straits Settlements and the attached Federated States. It was, however, one of the most thriving of the smaller colonies, and possessed, in Singapore, the most important port in Eastern Asia. Its heavy rainfall, of over 100 inches annually, was evenly distributed throughout the year; so, unlike other tropical regions, there were no seasons. The trees, which were ever-green and for the most part bore flowers and fruits irregularly all the year round, grew with great rapidity; consequently it had been found more suitable to cultivate plants whose produce was derived from the vegetative portion rather than from the fructificative. The climate though hot was neither unpleasant nor unhealthy, and cases of sun-stroke were almost unknown, coolie labour on the estates was supplied by Javanese and Tamils; the Chinese, though very industrious and invaluable when working for themselves in agriculture, commerce, or mining, had not been found amenable to European methods and discipline. The forests, which originally covered the whole peninsula, contained many valuable products, such as timbers, wood-oil, benzoin, guttapercha, and rattans. Owing to the felling of the trees by the Malays, in order to extract it, guttapercha, so indispensable for electric work, had been nearly exterminated. Fortunately, however, the product could now be extracted from the leaves and twigs without injury to the trees, which were now being planted by the Government. A very large area of the Federated States was under coffee, but on account of the present glut of the market and the consequent low prices, most of the planters were adding para-rubber to their estates—a tree which thrived marvellously well and produced a very satisfactory amount of rubber of the first quality. In the Straits this tree grows to a height of 30 feet in five years, giving a yield of rubber at this age; even a tree three years old has given a yield of 3 lb. of marketable rubber. This I am afraid puts Ceylon entirely in the shade, unless new data are forthcoming. India-rubber from the *ficus elastica* also promised well, but, although it was being planted, its product was less highly valued. The coconuts grown in the colony were in large demand, both for copra and as food. The adage that the

coconut palm would only grow within sight of the sea was more or less true, as the palm would only grow for about 20 miles inland in the Straits. This is, however, quite disproved in Ceylon. Accounts were given of the cultivation and preparation of sago—one acre of the sago palm gave as much nourishment as 163 acres of wheat, (one palm stem giving 600 to 700 lb. of sago) tapioca gambir, mangrove-cutch, pepper, nutmegs, cloves, indigo and pineapples. The greater part of the preserved pines of commerce came from Singapore where the price of the fruit was said to vary from a farthing to a penny each, and the lecturer remembered, a time when they had been as cheap as sixteen a penny. The mineral resources of the colony included gold and tin, the latter being found in great abundance. It was chiefly alluvial, and the mines, which were shallow, were worked by the Chinese who employed very simple appliances. The country was as yet hardly properly explored, and Mr. Ridley was of opinion that immense fields for development yet remained open; that both agriculture and mining were still in their infancy; and that thriving as the colony now was, it had before it a future of greater and long continued prosperity.

PROPOSED PURCHASE OF TEA ESTATES.

BY THE WHOLESALE CO-OPERATIVE SOCIETY.

Tea garden proprietors may be interested to learn that at the quarterly meeting of the Co-operative Wholesale Society, held in Manchester on Saturday afternoon, representing 300 shareholding societies, an agenda to the report included a request from the committee for authority to purchase tea estates when a suitable opportunity occurs. For some time past this question has been under consideration and a few years ago a deputation was sent out to make full inquiries into the feasibility of the society working such estates. Since then there has been a continual expansion in the tea trade of the society, and the committee are of opinion that the time is now ripe to make an initial move in the direction of co-operators becoming their own tea growers. After some discussion, the request was unanimously acceded to. So that "when a suitable opportunity occurs" the society will possess its own tea gardens.—*H. and C. Mail*, Dec. 27.

TROUT AT OOTACAMUND.

Major Bagnall concludes his last Report on trout thus:—

"I have fished, I think everywhere where a trout would lie but have nothing to report. All this evidence goes to prove that trout have not bred on these hills." Yet an experienced angler tells me that he has more than once seen trout rise in the "St. Lawrence" lake, and on one occasion, not long ago, found one dead on the banks of the lake which scaled between 5 and 6 pounds. The attempt made by the District Forest Officer to drag the lake, in the opinion of this sportsman, proved a failure for the reason that this officer used a net quite unsuited for a water of the depth of the St. Lawrence Lake, and suggests the using

of a net 100 feet by 30 feet, which he thinks, can be easily made up of discarded tennis nets. Carp and tench are affording really grand sport, especially the former at Sandy Dulla, where the golden fish of quite the size of the Madras pomtret can be plentifully had. These fish must have escaped from the Ootacamund lake when that body of water was lowered, and in fact almost drained, while the reclamation of the upper lake was in course of progress, and appear to have become very plentiful within the last two years.—*Asian* (Ootacamund Cor.)

COCONUT PLANTING NOTES, N-W. PROVINCE.

THE WEATHER.

Marawila, Jan. 8th.

The New Year dawned auspiciously for us with seasonable, i.e. wet weather. We have not had much rain so far, only slow, persistent drizzles, but the indications of rain and the non disappearance of the rains of the N.-E. monsoon, are much to be thankful for. Most of the rain that fell during the last three months was from the S.-W. It was only in December that we had a little rain from the N.-E.

COCONUT PLANTING.

The last crop of the year has been a bit better than the previous one, but this has not been of much help to the desiccating mills in this district for it pays sellers better, it seems, to convert nuts into copra, than to sell to the mills. This is the first time, I believe, in the history of the mills in this district, that they had not sufficient nuts to keep them constantly going. A record price for coconuts in the heap—R50 12 per 1,000—was lately announced from the Negombo district. With what truth I cannot say, but it was stated that the rice paid was due to rivalry between bidders. In this district the nuts of an estate were put up to auction and fetched R50 50 per thousand for making copra. Considering that the cost of transport of nuts is R2 per thousand more from this district than from Negombo, the price realised must be considered eminently satisfactory by the lucky, youthful proprietors.

PLANTING NOTES.

POISONS IN INDIA AND CEYLON.—In the course of an exhaustive review of the Pharmacy and the Drug-trade in 1901 the *Chemist and Druggist* says:—"India and Ceylon are practically without pharmaceutical organisation, although their trade interests, so far as medicine purchasing power is concerned, are great. The sale of poisons has been centralised in Ceylon during the year by a new Ordinance, which, however, does not call for special fitness in the sellers. Several suggestions have been made for better controlling the sale of poisons in India. The subject deserves the serious attention of the Governments, but is attended with greater difficulties than can be imagined by people at home."

SWEET SMELLING PLANTS,—such as woodruff—were recommended for medical purposes by Linæus, in his *Philosophia Botanica*, where it is stated that such plants not only drive away moths and other destructive vermin, but also, "when chewed, preserve people from infectious disorders." In recent years Dr. Klein

PLANTING NOTES.

RUBBER PRODUCTION OF THE CONGO RIVER COUNTRY.—The output of India-rubber this year from the Congo Free State alone (says the *India Rubber World*) can hardly fail to reach 12,000,000 pounds, besides which portions of French Congo and other regions adjacent to the Congo river help to swell the rubber shipments by that great water-way. It is one of the wonders of the crude rubber trade, how rapidly it has been developed in this particular state, and how well the production has been maintained. The explorer Stanley proved to be right when eleven years ago, on emerging from a journey across central Africa, he described the Congo forests as a "reservoir of rubber." Already some rubber had been marketed from the Congo Free State; some of it, indeed, had appeared the year before—in 1889—at Antwerp, thus affording a beginning to what has become one of the world's great rubber markets. But the world had yet to learn how vast were the rubber resources of "the dark continent." While other sources of African rubber supplies—as Sierra Leone, Gold Coast Colony, Lagos, Angola, Mozambique, and Madagascar—have had their "boom" followed by a decline in production, rubber from the Congo continues to come, in an ever-swelling volume. The following table denotes the total quantity of the rubber arrivals at Antwerp, in each year, and also (in parenthesis) the amount of rubber other than Congo sorts during the past six years:—

Years.	Pounds.	Years.	Pounds.
1889 ...	10,340	1896 ...	(20,900) 2,454,925
1890 ...	66,000	1897 ...	(266,844) 3,694,139
1891 ...	46,200	1898 ...	(616,629) 4,432,100
1892 ...	138,523	1899 ...	(903,025) 7,486,336
1893 ...	367,831	1900 ...	(1,751,270) 12,535,677
1894 ...	609,076	1901 ...	(Partly estimated)
1895 ...	1,168,363		(1,020,956) 13,096,409

[Arrivals for 1901 reported only to October 31.]

WASTE PRODUCTS.—Perhaps among the most remarkable discoveries of the past half-century, has been the utilisation of substances which had been thrown away as useless in times past. The uses of saw dust and waste wood have been wonderful. Here is something worth noting:—

"The Swedish journal 'Jernkorst' describes a process for converting waste wood at saw mills into dry saw-dust, which is carbonised, the liquid by-product distilled, and the charcoal made into briquettes. It is profitable, 9,000 tons of waste wood yielding 6,000 tons of briquettes at £3 6s a ton, beside fuel to drive the plant, acetate of lime, methyl spirit, and acetone."

PLANTING IN SUMATRA.—We commend the "Planting Notes from Sumatra" appearing in another column to the perusal of our readers. Coming from the pen of an old Ceylon Planter, and a true Highlander endowed with all the broad humour characteristic of his race the article makes diverting and light some reading. It is indeed cheering to see our old friend writing in such a buoyant spirit notwithstanding the inconveniences and discomforts of their railway system, &c. in Sumatra. Although we in Ceylon are ahead of them in so far that we are unable to outstrip the Government

trains on bicycle and are independent of the gum bottle at the P.O., yet in the quality of their head gear they seem to be far in front of us. When "W.T.M.K." tells us of a tobacco planter indulging in that operation which has rendered the name of Oliver Twist immortal, "hollering for more," owing to his inability to afford a new hat as his commission for the year has fallen so low as £2,500, one wonders what kind of hats they wear in that country—probably gold frames, studded with jewels. If perchance any billetless Ceylon P.D. should wander towards this Eldorado it might interest our readers were he to let them know this through our columns.

"ON SOME NEW SPECIES OF EUCALYPTUS," by R. T. Baker, F.L.S., Curator, Technological Museum, Sydney.—There seems no end to the species of Eucalyptus. Mr. Baker describes some ten new species and gives a number of plates. Perhaps the most useful is:—

Eucalyptus Woolfsiana, sp.nov., "Malce Box."—A large tree up to 80 feet high, and more than 3 in diameter. Bark persistent half-way or more than half-way up the trunk; smooth, chiefly of a rich brown colour. Timber.—Hard, close-grained, interlocked, heavy, durable timber, of a brownish colour. Useful for bridge-decking, posts, railway sleepers, and general building purposes. It is in great request at the Cobar mines for shoring the roofs.

"ANNALS OF THE ROYAL BOTANIC GARDENS PERADENIYA."—We have to acknowledge receipt of No. 2 of this publication, edited by Mr. J C Willis, M.A., F.L.S., containing *inter alia* papers on "Fungus Cultures in the Tropics" by Mr. C Holtermann; "Flora of Minikoi" by Mr. J C Willis; "The Botany of the Maldive Islands" by Messrs. J C Willis and J G Gardiner; "Observations on *Dracena reflexa*" by Mr. Herbert Wright; reviews, notes and supplement. In Carl Holtermann's paper on fungus cultures it is pointed out how it is possible with two solutions to undertake in the tropics many interesting developmental investigations; and Mr. Willis in his note on the "Flora of Minikoi" referring to Dr. Prain's statement that the plants hitherto known to grow wild or to be cultivated on the island number 113, says:—"During the south west monsoon of 1899 the island was visited by J Stanley Gardiner, in the course of his work on coral islands. A collection of fifty-three plants was made by him, and has since been worked out in the herbarium at Peradeniya by Mr. W de Alwis and myself; for determination of two or three doubtful specimens I am indebted to Dr. Prain. Sixteen new plants are thus added to the list, raising the total to 129 and there are also five others with doubtful names, but certainly other species. The total is therefore 134." Mention is also made of the visit to Male in October 1901 of Mr. F Lewis of the Forest Department who "made a large collection there and on two neighbouring islands, for which five further species, including the Baobab, have been added to the list. It is improbable that further survey of the islands would add many more species." The volume altogether is a most interesting one.

OUR EXPORT, IMPORT AND SHIPPING
TRADE FOR 1901.

I.—EXPORTS.

In our review of the Export Trade of Ceylon for the year 1900, comparison with the preceding year was found unfavourable; but exports for 1901 compare favourably with previous years, so far at least as volume is concerned. Excepting coffee and cinnamon chips all our more important products show an increased export. For some exports prices ruled high, especially the products of the coconut palm, which as the year closed, advanced in value above all former records. Overtrading in one or two articles, which was a feature of 1900 and the earlier part of 1901, has practically ceased, and it is anticipated that business in the current year will be generally of a stable nature.

Exchange fluctuated somewhat during the year as the following rates prove :—

6 months credits, highest	1/4 9/16	lowest	1/4 1/2
3 do do	1/4 3/8	do	1/4 7/32

Again between credits and documents on payment bills the margin fluctuated only from 1/32 to 1/16. Money was not dear during the year and became very cheap towards the close.

Last year will be memorable for the passing of an ordinance making sovereigns legal tender for R15. Already a quantity of gold has been imported from Australia and deposited in the Treasury, releasing silver for local circulation.

CARDAMOMS.—More land came into bearing during the year, and the crop exported is ahead of 1900 by 22,249 lb. The Indian demand was good, showing an increase of 26,407 lb. The better parcels went to London where the market has been a fairly good one for well-known marks. Exports aggregated :—

1899	499,959 lb.
1900	537,455 lb.
1901	559,704 lb.

Over one-fifth of the entire crop appear to have been shipped in December, owners would appear to have been holding for better rates.

CINNAMON.—Returns show the largest export of Quills yet recorded, notwithstanding which prices fluctuated very little, and remain at a high average. 54 cts. per lb. would appear to be the average price realised for usual assortment quills in Colombo, which must mean a good return to the grower.

Germany is now the chief buyer both of Quills and Chips, the United Kingdom only taking second place, while Spain and America took large supplies compared with previous years. The continued increase in direct business with foreign countries is a marked favourable feature in connection with cinnamon, and planters may reasonably look for present values being maintained. The exports of chips was smaller, but prices were good, averaging from R70 to R72.50 per candy.

Most of the cinnamon shown as exported to America goes eastward to San Francisco, which is now becoming the port of distri-

bution for Mexico and other countries of Central America, and the west coast of South America. Exports to America were :—

Exports	1900	bales.	Quills.
do	1901	259,425	do
		358,300	

Total exports were :—

		lb.		lb.
1899	Quills	2,515,031	Chips	1,829,127
1900	..	2,678,111	..	1,863,406
1901	..	2,756,270	..	1,516,083

Exports of wild cinnamon have practically ceased. Some old stock in London was reported as sold at 3d per lb. during the past year.

CINCHONA.—Market has been better of late, and returns show a small increase in shipments.

COCOA.—Crops gathered during the year were large—the largest on record—and there were shipped 49,459 cwt. against 33,476 cwt. in 1900. Quality on the average has not been good, and prices ruled low both locally and in London. Well-known marks, which as the year opened were selling at R55 to R57.50 per cwt., were at the close to be got for R45 to R47.50 per cwt. Out of the total export of 49,459 cwt. there were shipped to the United Kingdom, mostly for spot sale 42,344 cwt. More direct business with foreign countries is very necessary, and our American and Continental Commissioners ought to be addressed on the point by the 'Planters' Association. Total exports were :—

1899	42,745 cwt.
1900	33,476 ..
1901	49,459 ..

COCONUT PALM PRODUCTS show a large increase in shipments compared with 1900. Crops were generally reported as small, owing to unfavorable weather during the preceding 12 months, which if generally correct, would, in view of the exports detailed later on, go to prove that a considerable acreage must have come into bearing during the year. Short supplies of copra from the Philippines, the Straits and other main sources of supply for the copra oil mills of the Continent, brought about a rapid advance in Europe for copra and oil, as the year closed, which was followed here by a rise in value above any previous records. In reviewing trade for 1900 we predicted a continued good demand for these products, and although present extreme prices cannot be expected to last very long, everything points to a steady demand at high rates during the year just entered upon.

A., COCONUT OIL fluctuated in price during the first half of the year, and then advanced rapidly, more especially as the year closed. The following prices ruling during the year are of interest :—

1901.	per ton.
On 1st Jan. Coconut oil was worth	R325
1st April do	335
1st June do	322.50
1st October do	375
31st December do	445 to R437.50

The latter transactions marking the record prices paid in Colombo. The danger of a continuance of present values for any time,

would be the natural tendency for consumers to adopt other greases as substitutes.

Exported in 1899	..	400,979	cwts.
do 1900	...	443,959	do
do 1901	...	453,531	do

The United Kingdom took over 50 per cent of exports, India coming second, whilst the America offtake shrunk to 1,360 tons. The year 1892 still remains the record year for quantity exported, viz. :-550,977 cwts.

B. COPRA.—The rise in value during the year was remarkable :-

On 1st Jan.	Calpentyn was worth	R45.50 to R46
1st April	do	48 to 48.50
1st June	do	49 to 50
1st October	do	55.50 to 56
31st December	do	62 to 62.75

with every prospect of high rates being paid for a few months of this year. The cause of the advance has already been explained under the general heading of coconut palm products. Germany was by far the largest buyer, France, Belgium and Russia following; India took only 1,487 cwts. Owners of coconut property have every reason to be satisfied with the year's working, in view of the increase in acreage which came into bearing.

C., POONAC.—A rise in export of poonac naturally follows an increased export of coconut oil, 10,218 tons being shipped last year, compared with 9,299 tons in 1900. Prices ranged from R70 to R80 per ton in robbins. Offtake is practically confined to Belgium and Germany.

D. DESICCATED COCONUT show an increased export last year.

E. COCONUTS show a trifling decrease compared with 1900.

F. COIR ROPE, YARN AND FIBRE.—Rope and fibre show an increase, but yarn shows a slight decline.

COFFEE.—This continues to shrink in volume. Ceylon's small export still commands fair prices, when the enormous stocks from other countries (especially Brazil), and the low prices they command, are taken into consideration.

ESSENTIAL OILS.—Both citronella and cinnamon oil show an increased export over the preceding year.

PLUMBAGO.—The decline in values which was a feature of 1900 continued during the past year, but towards the close there was, if anything, a steadier feeling. It is understood that most of the dearly bought stocks have now been liquidated, and that the shipping of unsold lots for spot sale has been much curtailed. Nothing forms a stronger lever in reducing values than the shipping of plumbago for spot sale either in London, New York or the Continent. London was the largest buyer, New York, Hamburg and Antwerp following. Shipments were—

In 1898	..	473,075	cwts.	In 1900	..	383,350	cwts.
In 1899	..	616,385	do	In 1901	..	453,267	do

Prices obtained for most qualities must still show a good return to pit owners, as the

following comparative figures for one recognised standard of lump will show.

In 1895	..	value	R300
1896	...	do	R325
1897	..	do	R400
1898	...	do	R600
1899	...	do	R750
1900	..	do	R900
1901	..	do	R375

Up to 30th November last deliveries in London (largest buyer) exceeded imports, and when we remember that prior to 1895 fine, bright lump was considered dear at anything over R275, surely the position of this industry would still appear to be a good one. A careful study of prices and shipments for the past 10 or 15 years, should convince most readers that those who talk of present prices not paying miners, and of the great depression in the industry, cannot surely lay claim to an old acquaintance with the mineral either as miners or as dealers.

TEA.—This staple is so constantly before our readers by correspondence, by Association meeting minutes, by leaders, &c., that most are no doubt "fed up" with it. All we will, therefore, say here is that if planters do not go back to coarse plucking and give "real supervision" over the factory, there is hope for the future.

The following Chamber of Commerce returns are interesting :-

II.—IMPORTS.

EXCHANGE fluctuations during the year show demand remittance ranging from 1/4 1/2 down to 1/3 29/32. 30 d/s paper London on Colombo on the other hand was steady, highest rate being 1/3 13/16 and lowest 1/3 3/4. Money was easy, compared with preceding years, and more especially so for the last six months. Money at short call would only command 3 per cent. as the year closed.

The past year was one of concern to importers, more especially from April to September when the suspension of a number of traders in the Pettah gave cause for some alarm. Overtrading on the part of many dealers in 1900 was the cause of the deadlock; but most of the stocks held against dishonored bills are understood to be liquidated by now, and it is hoped business during the current year will be better. It is thought that the experience of the past year of several exporters and Commission Agents in Europe trading direct with the Pettah will curtail business of this kind in future. During the past year the Chetties owing to some dispute with the brokers of importing houses, refused to buy goods unless sellers accepted demand notes in payment of goods, in place of in notes at a fixed usance as had formerly been the custom of the trade. A compromise was arrived at, and those firms which prefer notes at a fixed usance obtain them readily enough from the Chetties. An Importers' Association was formed during the year with the object of furthering their interests. Some appear to be of opinion that a special Sub-Committee of the Chamber of Commerce on Imports would be sufficient to protect their interests. The greater the number of Associations or bodies the mercantile community is divided into, the less influence each can bring to bear on mercantile affairs.

COTTON GOODS—From the Customs Returns—which are now issued monthly to subscribers—we find that for the 11 months ending 30th November last, only 11,961 packages of cotton goods were imported against 19,542 during the corresponding period of the preceding year, or a shrinkage of 38 per cent.

Locally the offtake has been comparatively small. The following are details of importations of cotton goods for the past 11 months of the last 3 years:—

	1899.	1900.	1901.
Grey Cottons ...	2,628	5,108	3,956
White do ...	2,259	4,135	2,304
Printed do ...	1,142	835	1,344
Dyed do ...	91	1,720	2,418
Colored Woven do	,572	7,441	1,661
Sundry Cottons ...	112	81	82
Yarn Plain ...	1	30	48
Do Dyed ...	171	102	148
	<hr/>	<hr/>	<hr/>
	15,976	19,542	11,961

Cotton as the year opened was worth 5 12/32 (Mid Uplands) and fell during the year to 4 1/4, but rose again to 4 9/16 before the year closed.

PRINTS.—A considerable clearance of prints at reduced rates was reported at the close of the year.

WOOLEN GOODS.—The importation of woolen goods was overdone during the latter

part of 1900 and early last year, but the consumption of flannel and cloth of woolen and cotton mixture is increasing among Burghers and Natives, and if future importations are kept moderate, present stocks should be re-realised readily, although prices shewed an easier tendency during the latter half of the year. Importations for 1901 show a considerable increase over 1900.

TOBACCO.—The consumption of tobacco has been heavy. For eleven months last year 11,124 lb. were entered for home consumption against 6,519 lb. during the corresponding period of the previous year. The large force of troops and prisoners in Ceylon is no doubt responsible for the increase. The consumption of cigars also shows an increase.

MALT LIQUOR AND SPIRITS.—Here we have a large increase in quantities bonded and entered for home consumption. The figures from 1st January to 30th November are:—

	Bonded.	Entered for Home consumption.
1900 ...	14,637 pks.	12,978 pkg.
1901 ...	18,176 „	15,253 „
	<hr/>	<hr/>
	Increase 3,539 „	Increase 2,275 „

The increase is chiefly on malt liquor in bulk for the use of European troops, and in cased gin and whisky.

WINES.—Especially French wines in cases show a considerable increase.

MATCHES.—The prices of these remained fairly steady all the year, but for a short period they could be purchased for considerably under the laid down cost. According to the Customs returns the importations show a large falling-off compared with 1900. In the 12 months of 1900, 287,484 gross were imported, of which 287,434 were entered for home consumption, whilst the first 11 months of 1901 show importations amounting to 72,983 gross only, of which 72,833 were entered for home consumption. The falling-off in importations may be attributed to large stocks having been carried over from 1900.

CEMENT.—Here again the quantity imported in 1900 greatly exceeded that of 1901. In the 12 months of 1900, 114,820 cwt were imported against 82,882 cwt for the first 11 months of 1901. Prices were very firm, the greater part of the year, but towards the close they were from 7 to 10 per cent easier.

METALS: TEA LEAD.—Importers of this possibly suffered some loss during the year, owing to the great drop which occurred in values. Locally at the beginning of the year 4-oz. lead fetched R390 per ton, while at the close of the year it could be purchased for R290 per ton.

BAR IRON.—Prices here were lower at the close of the year than they were at the beginning by some 15 per cent, whilst the reduction in price which has taken place since January 1901 is about 50 per cent. Although values are so much lower, the quantity imported in 1901 is not half that of 1900. In 1900 no less than 2,806 tons were imported, against 863 tons for the first 11 months of 1901. The reduction in price is more marked in Belgium than in Scotch or English brands.

ANGLE AND SWEDISH IRON.—Swedish iron dropped some 22 per cent in value during

the year. Against 1,007 tons imported in 1900, 270 tons only were imported in the 11 months ending 30th November, 1901.

HARDWARE.—Under this heading the Customs returns give the value of imports in 1900 as R1,727,225, whilst the value for 11 months of 1901 is R888,920. This falling off is no doubt due to over-trading in 1900.

RICE.—The quantity imported during the year is somewhat under figures for 1900, but the shrinkage is trifling. Prices fluctuated very little during the year.

COALS.—Imports of coal up to 30th November of last year aggregate 598,721 tons against 590,099 tons for the whole of the preceding year, showing an increase of 8,622 tons for 11 months of last year over the whole import of 1900. Indian coal did not make such a great stride last year compared with 1900 as the latter year did compared with preceding years; still the import of Indian coal keeps increasing in volume.

Prices were comparatively cheap, and during the year just entered upon, steamship owners are reckoning on a "small coal bill."

SHIPPING.

CEYLON EXPORTS IN RELATION TO FREIGHT AND TONNAGE 1888-1901.

The following figures—compiled from the Ceylon Chamber of Commerce annual returns of exports and shipping—give the quantities of cargo exported from Ceylon, and the number of vessels by which this cargo was taken. In this instance the Chamber's figures are reduced to "Shipping Tons" according to the Ceylon tonnage scale.

Readers must bear in mind that cargo brought for transhipment in bond at Ceylon ports is not included in our returns:—

In Year.	No. Vessels cleared with cargo.	Cargo taken in Shipping tons.	Average taken per vessel. tons.
1888	573	120,431	210
1890	698	156,159	223
1891	872	174,316	200
1892	871	200,986	230
1893	848	197,823	233
1894	808	200,489	248
1895	784	213,843	272
1896	830	216,844	261
1897	756	245,830	325
1898	773	297,211	384
1899	856	293,507	343
1900	826	316,004	382
1901	984	309,716	314

These figures show a nett decrease last year of 6,288 shipping tons, compared with the year immediately preceding, but they are well ahead of all other former years. The following are the more noticeable fluctuations last year compared with 1900:—

	Shipping tons.
Tea	shows a decrease of 2,133
Cinnamon Chips	do do 560
Coir Yarn	do do 1,935
Palmyra Fibre	do do 923
Copra	do an increase of 3,870
Desiccated Coconuts	do an increase of 450
Plumbago	do an increase of 3,495

As coir yarn when in ballots only pays half freight, the falling-off in this is not of so much importance to shipping.

Grouping together the products of the coconut palm—coconut oil, copra, poonac, coconuts, desiccated coconut, coir rope, yarn and fibre—we find last year shows 128,243 shipping tons, and the following figures for previous years in connection may interest readers:—

COCONUT PALM PRODUCTS EXPORTED.

	Shipping tons.		Shipping tons.
1888	61,375	1896	80,570
1891	69,879	1897	100,614
1892	94,550	1898	139,334
1893	79,935	1899	119,154
1894	85,711	1900	135,137
1895	84,567	1901	128,243

Of the total exports last year,

Tea gives 47½ per cent of shipping tons;

Products of the coconut palm 41½ per cent shipping tons;

Plumbago 7 per cent of shipping tons;

Other products 4 per cent of shipping tons.

These figures show how dependent is tonnage calling at Ceylon on the tea and coconut industries.

The number of vessels which cleared with cargo last year was 984 compared with 826 in the preceding year. Tonnage was in ample supply all the year round with the exception of an occasional tightness for Australian ports. As the carrying capacity of most steamers calling—especially those of the regular lines—is yearly increasing, exporters have good grounds for relying on ample tonnage being in supply during the current year.

Freights ruled on the average low all the year round, if we except those to Australian ports—as the following table will show:—

	Rough Cargo.		Tea.	
	Max. rate.	Min. rate.	Max. rate.	Min. rate.
London	20s.	10s.	25s.	20s.
Antwerp	20	10	25	20
Hamburg	20	10	25	20
Marseilles	20	10	25	20
Genoa	20	12/6	25	20
Trieste	25	20	25	20
New York	32/6	27/6	35	32/6

The exorbitant rates of freight ruling last year from Colombo to Australasia are still in force, notwithstanding the frequency with which these are commented upon in the press. How to get a reduction, to put the Ceylon tea exporter on a level with the exporter of China tea to Australasia, is a question which should receive the early and earnest consideration of the Planters' Association and the Chamber of Commerce. The following are fluctuations in rate of freight on tea to London during the last decade:—

	Max.	Min.	Max.	Min.	
1892	35	15	1897	35	10
1893	30	12/6	1898	40	20
1894	35	20	1899	30	25
1895	30	17/6	1900	30	25
1896	25	7/6	1901	25	20

Among the more important articles (produce and manufactures of the island) not so far enumerated in the Chamber of Commerce returns of exports, we notice:—

Unmanufactured tobacco, 2,785,164 lbs. for eleven months of 1901,

Arecanuts, 92,538 cwts. for eleven months of 1901.

These two important exports are chiefly shipped to Southern India, and provide tonnage for native craft.

Exports by native craft are not included in these returns—

THE COCONUT PALM INDUSTRY IN CEYLON: DISTRIBUTION OF OUR COCONUT PRODUCTS.

Our annual review of the distribution of the various products of the coconut palm, as shown in our Export Tables, should be of increasing interest, as the Coconut industry advances. So far, its progressive development has been nearly continuous, and has received no check, such as has been experienced in connection with most of our exports—such as coffee, tea, cinnamon, and even with so useful a mineral as plumbago, of which Ceylon holds practically the monopoly. Not that Coconut proprietors have always escaped hard times, or that they have been exempt from the incidents which attach to fluctuations in the market for Oil and other manufactures from the nut. The history of some, or perhaps most, of the plantations in the North and East of the Island tells a different tale; but notwithstanding these occasional set-backs, the extension of cultivation has steadily advanced—has, so far as we can ascertain, never been arrested even for a year,—and has made notable progress during the Administration of Sir West Ridgeway, especially in the new Southern Batticaloa district and in Chilaw and Puttalam divisions. Apart from European enterprise, a great reason for steady, continuous progress is that the industry is so largely in the hands of natives, that the palm is both food and shelter to them, and that, even if the European investor should be dissatisfied with the results—and many plantations in the Jaffna and eastern districts were planted but afterwards sold by Europeans—the native is content to go on planting and extending heedless of the time he has to wait for returns (in some districts as much as twenty years!), and of the smallness of those returns as viewed from the European standpoint. Time is of no consideration to him; to luxuries he is indifferent; his wants are small; and the habits of the tree correspond with his own characteristics. It needs little attention and less cultivation,—though responding handsomely to both,—and if he fail to pluck the fruits off it, his children will do so, and to them it will be a source of sustenance, if not of income, for scores of years; and that is all he cares for. It is this characteristic of the coconut industry—that it is an investment and not a speculation—which has ensured its steady growth; and though the growth and development of trade and commerce has once more brought the European capitalist into close relations with the industry—apart from the milling section of it, in which he has always held the lead—to the native the extension of Coconut

planting remains what it always was, a safe investment of capital yielding perennial, even if slow and scanty, returns. During last year, however, the returns were far from meagre, chiefly owing to the brisk demand for Copra; and that is one of the reasons why special interest attaches to the figures we are now reviewing in pursuance of our annual programme.

The exports of Oil last year were about 10,000 cwts. in excess of those for 1900 when we sent away 443,959 cwts. and were the largest on record, if we except 1892 when the quantity ran up to 550,797 cwt. We are unable to say off-hand what the circumstances were which led to an out-turn of Oil ten years ago which has seldom been since approached within 100,000 cwt.; but it is of importance to remember that the exportation of Copra at that time was only about one-third of the figures reached during the last four years, and that the trade in Desiccated nut was then in its infancy. The mother country continues to be our largest customer for Oil, having taken 236,514 cwt. or somewhat more than a half of our total exports; but the proportion shipped to the United Kingdom was larger in 1900, notwithstanding a smaller local out-turn. It is satisfactory to find that the falling off in the exports to the mother-country though it is neither very heavy nor indicative of a shifting of the trade into other channels, was more than covered by the increase in the quantity of Oil which her great Indian Possessions took over no less than 141,139 cwt.—quite a record quantity—found its way to our big neighbour; and it is undoubtedly matter for congratulation that we have a customer close at hand to take over one of our chief products at the exceptionally high prices which ruled last year. Thus, considerably more than three fourths of our total out-turn of Oil was taken by the United Kingdom and India! The former, no doubt, took it chiefly for distribution; but were India's requirements only or mainly, for local consumption? Some curiosity on this point might well be felt when we see that America has had only 27,205 cwt. direct from here, while on one occasion at least she had nearly four times that quantity! The suspicion that part at least of our shipments to India found its way to other countries, as Cochin Oil which, somehow, commands higher prices than Ceylon Oil, is not unreasonable. Our other big customers for 10,000 cwt. and upwards, were Germany, Italy and Austria.

As with Oil, so with Copra, the figures for 1901 were the largest on record, save for one year; and the year of largest exports in regard to Copra was 1898, when the phenomenal quantity of 506,277 cwt., or 60,000 cwt. more than for the previous seven years combined, was sent away. Germany was our largest customer for Copra last year, having taken 153,335 cwt. out of 439,865—or considerably more than one-third the total exports—and has thus displaced Russia which had hitherto held the lead; but probably the Copra finds its way yet to Russia from German ports. Both France and Belgium, with

98,944 and 68,859 cwt. respectively, stand ahead last year of Russia which has 66,246 to its credit. The United Kingdom comes sixth on the list, with only 19,816 cwt.—evidence, we fancy, that the local Copra trade is passing out of British into Continental hands. In Desiccated Coconut the mother-country easily leads the way with over ten million lb. to her credit out of fourteen millions exported; and she is followed by Germany with 1½ million, America and Australia coming next with nearly a million, and three-quarter million lb. respectively. Belgium took one-half of the 204,256 cwt. of Poonac we exported, and Germany 93,577 cwt. leaving only 8,462 cwt. for the rest of the world, of which the United Kingdom had 7,960. In Coconuts again the mother-country led, having absorbed 11½ millions out of less than 15 millions sent away, followed by Africa with over 1½ million. Germany was bad a third with 845,000, followed by India with 741,000 nuts. The distribution of our Coir exports calls for no special comment; but we must express satisfaction at the growth of the Fibre industry—the quantity sent away last year being 122,826 cwt. the largest on record, or 7,800 cwt. in excess of the exceptionally heavy shipments of 1900.

AN INTERESTING REPORT BY PROFESSOR HERDMAN.

We have to acknowledge, with thanks, a copy of the fifteenth annual Report of the Liverpool Marine Biology Committee and their Biological station at Port Erin, Isle of Man. The report is prepared by Mr. W A Herdman, D.Sc., F.R.S., F.L.C., F.R.S.E., who will shortly be in Ceylon to report on our oyster beds. Profusely illustrated it deals with a variety of subjects and is in many respects fascinatingly interesting. At the outset the writer says:—

The most important event that falls to be recorded this year is the arrangement concluded with the Government of the Isle of Man, as a result of which we shall in future occupy increased Laboratory accommodation and be responsible conjointly with a committee of the Tynwald Court for the conduct of a large Aquarium and Fish Hatchery.

Proceeding he says that:

During the past year the usual work, both educational and in research, has been carried on steadily. A party of students and investigators occupied the Laboratory in the Easter vacation, and several collecting excursions were arranged for their benefit.

Dealing with Fishery work the report states that:

Although a certain amount of work, both directly and indirectly bearing upon local fisheries, has gone on in the past at Port Erin, it is evident that much more will have to be done in the future. In the past we have had, for example, the experimental hatching of various flat fish and Gurnards and the experimental and observational work on Oysters and disease, but in future fish hatching and lobster rearing will be undertaken on a large scale in the new hatchery, and various fisheries problems will be investigated in the adjoining Aquarium and Laboratory.

The report, as we have indicated, is interesting and the "wonders of the deep" unfolded even in the illustrations are very marvellous. We feel sure from the evidences betrayed in this report that if anything can be done to revive our dor-

mant pearl industry Professor Herdman is the man most likely to devise the means whereby that end can be attained.

THE INTRODUCTION OF STEAM MOTOR "LORRIES"

A LONG-FELT WANT IN CEYLON TO BE
SUPPLIED.

An undoubted drawback in many parts of our island has been the want of proper passenger and transport facilities. Some districts, it is true, have had fairly good coach services established; other districts are very inadequately and irregularly supplied by the primitive as well as slow process of bullock carts, while other districts leave each individual to provide his own means of transport. The want has latterly become more acutely felt, and all who have the interest of progress at heart will, we feel sure, hail with pleasure the announcement that steps are being taken and that ere many days have passed the public will be invited to take shares in a Company to be known as "The Ceylon Rapid Transit Company Limited," and the object of which will be to import into Ceylon Steam "Motor Lorries" and to institute services of such between certain specified districts. Messrs Boustead Bros are interesting themselves in the venture, and in conversation with Mr Money of that firm, a representative of the *Observer* learned the following particulars:—During the last four or five years, said Mr Money, the question of mechanical transport on roads both for passengers and goods has been making tremendous strides all over the world and of course

MOTOR CARS

have been introduced and come into general use. The attention of manufacturers and others has been turned to the transport by waggons and carts, and as far as efficiency and promptitude are concerned they seem to be agreed that it is not equal to what is possible by mechanical means. The type of vehicle which has been found most successful for heavy transport is a vehicle propelled by means of steam and practically all the makers of these lorries for heavy transport have adopted steam as the most suitable means of propulsion. We know more of steam machinery than we do of the newer types of engines such as explosive engines, for instance. In Lancashire and in the North of England generally these lorries have been in constant use for the last four years and they have proved a very great boon on account of their large carrying capacity and the much higher rate of speed they are capable of compared with the ordinary lorry. There are in Ceylon a good many places where obviously it would be a very great advantage if one could effect transport more expeditiously than is done at present. There are districts where transports are carried on with very great difficulty by means of carts and it occurred to Mr Beamish, Engineer-Planter, in the Pussellawa district, who is the gentleman with whom the idea originated, to form this Transit-Company. Mr Beamish, who has taken an interest in the subject of road conveyance of this kind, was much interested in England in these lorries and it occurred to him that the time was ripe for introducing some such thing into Ceylon; accordingly he ordered six lorries

when in England with a view to starting this Rapid Transit Company in which he himself is to take a large interest financially. It is proposed to commence operations on the

GALLE-MORAWAKKORALE

road. This road has been chosen to start with because, for one reason, it is a road on which there is a large amount of estate business which is directly available and has already been promised at certain definite ascertained rates. Again the conditions for working there appear to be favourable because there is no other means of transport except by carts which is most unsatisfactory and very, very slow when going the long distance of 53 miles. It has, therefore, been considered a good road to work as a commencement. The aim of the Company is by no means to confine itself to six lorries or to any one particular road or district. Having once made a start it is proposed gradually to extend our field of operations; to import more lorries and put them to work in every district wherever favourable opportunities are offered or seen to exist. Of course they will serve a useful purpose in many ways; for instance they will obviously serve as feeders to Railways and be of great importance in that way.

The prospectus of the new Company will be issued early next week and we hope that the capital will be wholly and rapidly subscribed. We congratulate all concerned on their enterprise, and, wishing them all success, hope that what proves a benefit to the districts in which the service will be instituted, may also prove of benefit to the energetic promoters.

RECORD PRICES FOR COCONUTS.

From a well-known coconut planter, we have received the following interesting information:—

“Referring to the *Observer* of the 14th inst., the coconut crop gathered on this estate during November-December last was sold, on the 6th instant, for R52·62½ per mille, the September-October gathering having realised R50·12½ just two months before. On both occasions the buyers were Desiccators. Such prices, or anything approaching them, cannot be found in the records of the estate during the past 45 years: hence they were spoken of as ‘record’ prices. The next highest record was R47·87½ in March 1896.

“The prices got for last year’s crops (there has not been a better year in this respect) ranged from R40 to R52·62½, an average for the six pickings being R44·35 and I doubt whether any other estate in the Negombo or Chilaw districts has beaten, or even equalled, this.

“Nuts of an estate in the Chilaw district, located close to Messrs. Vavasseur & Co.’s Desiccating Mills, are said to have fetched R53 early in January and a small parcel—probably not more than 30,000 to 40,000 nuts—of a Negombo estate, R54. It would be interesting to know the average prices on these places for the year. The demand for nuts has been great during the whole of the past 12 months and the supply has not been equal to it. The greatly-increased demand abroad for copra and poonac (the latter is now selling at R120 to R125 per ton) and the expansion of the trade in

desiccated nuts are, I believe, the chief factors in the present high price of coconuts. The failure of last year’s crop in Singapore is said also to have influenced the market.

“In September 1894 I sent, in response to your request, a table of the ‘Value of Coconuts’ from the year 1865 up to that date (published in the *Observer* and reproduced in *Tropical Agriculturist* for October 1894), and I now enclose figures from 1894 to 1901”;

VALUE OF COCONUTS IN NEGOMBO DISTRICT.

Years.	Range of prices, per thousand per 12 months.	Average value per thousand for 12 months.
1894	R37 25 to R41·75	R39 25
1895	R36·25 to R46 25	R39·88
1896	R36 50 to R47 87½	R39·44
1897	R30·12½ to R33 62½	R32 35
1898	R31·00 to R36 00	R33·92
1899	R33·25 to R37 25	R35 00
1900	R32·50 to R39·12	R34 96
1901	R40 00 to R52·62½	R44 35

BORNEO PLANTING PROGRESS.

In North Borneo it is satisfactory to report progress and to tell of an increase in the Chinese population—a fact that in those latitudes makes for headway in the opening up of a country. The railway from Jesselton and Beaufort is within measurable distance of completion, and some progress made with the Beaufort-Tenom section, the opening of which, it is hoped, will lead to tobacco estates being started in that district. Tobacco still remains the leading staple. Rubber and gambier are receiving much attention, while excellent lighting oil has been struck at great depths. The labour problem has been helped by the arrival of Chinese coolies from Fochow, and of Hakkas from Hong Kong, and it is satisfactory to think that there is one part of the world that will not “be ruined by Chinese cheap labour.” Indeed, that is its most urgent requirement.

In Sarawak there has been a great increase in commercial prosperity. The pepper crop, which is now finished, shows a large increase, and prices having been good, the planters have made money; and again a considerable number of new gardens have been opened. There has been some extension of gambier planting, but it is doubtful whether this is profitable on such prices as ruled during the first nine months of the year. We do not think the sago industry has been so profitable as before. There has been an increased business in timber for China, and a fair increase in the output of gold, to extract which further works are in prospect.—*L. and C. Express*; Jan. 3.

GERMAN COLONIAL ENTERPRISE.

Amongst the first fruits of the German Empire was the scheme of colonisation which the late Prince Bismarck founded, and which Kaiser Wilhelm has assiduously nourished. Up to the present it has been a costly business to the German people, like everything else at the beginning, but he would be a bold man who would say that the policy is not good business. Germans are as fond of emigrating as anybody; why should they not have colonies of their own to live in? They are a pushing people in the way of business, and emulate the Britisher in regard to foreign trade, but have the advantage of starting where we leave off. In the matter of colonisation it may be possible to get a point from the working of their Colonial Department, espe-

cially that which is called Kolonial-Wirtschaftliches Komitee—that is, the commercial and scientific bureau which was founded in 1896. From the last report of this bureau for 1900-1901, we gather the following scientific particulars to show what the colonies are:—

GERMAN EAST AFRICA, with 6,000,000 inhabitants, exported 3,900,000m. worth of goods in 1899, and imported to the value of 10,800,000m, being a decrease in exports of 400,000m, and in imports of 1,000,000m.

THE CAMAROONS, population 3,500,000, exported in 1899, 4,600,000m. worth of commodities, and imported 9,300,000m worth. The figures for 1899 are not yet available.

Tooo, population 2,500,000, in 1899 had imports valued at 2,600,000m, and the exports were 3,300,000. In this, as in the case of the Camaroons, there was an increase over the preceding year.

GERMAN SOUTH-WEST AFRICA, 250,000 inhabitants, imported in 1899 to the value of 9,000,000m, an increase of thirty per cent over the preceding year and the exports were valued at 1,250,000m.

THE SOUTH SEA COLONIES, (Samoa, &c.) 500,000 inhabitants, and the exports and imports were about equal—namely, 2,700,000m of exports, and 2,800,000m of imports.

KIAW CHOU (China) has a population of 48,000, and for its size is the best possession, as the exports were valued at 4,000,000m, and the imports at 6,500,000m.

Thus the total population of the colonies 12,000,000 and the entire trade for the last year amounted to 60,000,000m. (£3,00,000).—*Chemist and Druggist*, Dec. 27.

DRUG TRADE REPORT.

LONDON, Jan. 2.

CINCHONA.—The shipments from Java during December amounted to 1,278,000 Amst. lb. against 1,091,000 Amst. lb. last year, 626,000 Amst. lb. in 1899. The total for the twelve months is 12,606,000 Amst. lb. against 10,741,000 in 1900, and 11,399,000 in 1899. The exports from Antofagasta (Chili) during 1900, amounted to 1,240 cwt.

KOLA.—The following figures relate to the shipments from the Gold Coast:—

	1900.	1899.	1898.	1897.	1896.
Packages ..	1,907	2,671	3,092	4,278	4,156
Value £ ..	43,132	57,020	35,789	37,869	33,278

LEMONGRASS OIL.—The lowest spot price is 7½d for ordinary Cochin, and 6d to 6½d, c. i. f. nominally. For Java oil 8½d is asked on the spot.

QUININE.—There has been no business of importance this week, but the market has remained firm with small sales on the spot at 1s 1½d per oz. March delivery is quoted 1s 1½d.—*Chemist and Druggist*, Jan. 4.

PROF. W. A. HERDMAN, F. R. S.

Says *Nature*:—Sailed for Ceylon on Dec. 26th, 1901, to undertake for the Government an investigation of the pearl oyster fisheries of the Gulf of Mannar. He is accompanied by a first rate assistant, and in Ceylon the Inspector of the fisheries and his staff will co-operate and provide boats and divers. A suitable steamer for dredging and trawling will be placed at Prof. Herdman's disposal by the Government of Ceylon and the necessary gear and apparatus for collecting and observational work, and for biological experiments have been sent out

in advance. We understand that Prof. Herdman has arranged to take samples of the plankton throughout the voyage to Ceylon, and to launch current-floats at particular parts of the course.

PLANTING NOTES.

RICE CULTURE—is regarded as no longer an experiment in Southwest Louisiana and South-east Texas. Although all records for drought and heat in those sections have been broken this season, more than an average crop of rice has been saved by the irrigation systems. The average yield an acre has been increased, the average quality has been greatly improved, and new varieties have been developed.—*American Grocer*.

RICE IN BURMA.—Though we do not obtain our rice mainly, or even regularly, from Burma, occasional attempts, more or less successful, have been made to lessen our dependence on India, and on the Chetties who practically monopolise the trade there. It is of interest, therefore, to see what an immense, and yet increasing, area is under rice cultivation in Burma. An Indian contemporary writes:—

The area reported to be under rice cultivation in the fourteen principal rice-growing districts of Burma is 6,461,649 acres, an increase of 152,616 acres, or 2.42 per cent over the area actually cultivated last year. The crop is reported to be in good condition in all districts. Heavy rain in the Arakan division caused only slight damage. The outturn is expected to be slightly above normal, and the surplus available for export is estimated to be 2,200,000 tons of cargo rice equivalent to 37,288,135 cwt. of cleaned rice. A small part of this surplus will probably be used in Upper Burma.

CATTLE DISEASE IN INDIA.—We cannot be too strict in our precautions against the introduction of disease from India. When vigilance has been relaxed, we have had outbreaks of small-pox and cholera in our midst—as is the case now in Jaffna; to which Dr. Rockwood has wisely drawn attention; but it is only very recently that steps have been taken locally to guard against the introduction of cattle disease from India. The following shows considerable divergence of opinion between authorities across the water, but it is well to on the side of caution in such matters:—

From Veterinary Lieut.-Holmes's Report will be noticed that cattle disease prevails in nearly every district of the Madras Presidency in a virulent form. Rinderpest in Ganjan and anthrax in Godaveri are perennial, and carry off thousands of beasts every year. The Madras Board of Revenue, in a resolution upon Mr. Holmes's figures, says: "Whilst admitting that the cattle mortality statistics show that most lamented losses occur from disease in this Presidency, the Board does not consider that it has been demonstrated that these losses are preventable by any method at present practicable, nor do the figures lend any countenance to the view that cattle disease was virulent during the period under notice."

TO THE PLANTING WORLD.

Seeds & Plants of Commercial Products.

Hevea Brasiliensis.—Orders being booked for the coming crop August-September delivery 1902, booking necessary before the end of April, quantities of 100,000 and over at special low rates. Plants available all the year round, 100,000 and over at special low rates. A leading Rubber planter in Sumatra, who purchased 50,000 seeds in 1899, and 100,000 in 1900, writes us, under date 15th November, 1900:—"I received your letter of 20th October, from which I learn that you added another case of 5,000 seeds to replace the loss, &c. I am satisfied hereby, and even after this adding I am satisfied by the whole delivery of this year." Special offer, post free on application.

Castilloa Elastica.—True superior variety cultivated in Mexico, seeds from specially reserved old untapped trees. Orders booked for August-September delivery 1902, immediate booking necessary; large quantities on special terms; Plants in Wardian cases.

A foreign firm of Planters writes under date 11th October, 1901:—"We beg to enquire whether you would procure us 100,000 Castilloa seeds, in which month we might expect them, and what would be the average price." Special offer, post free on application.

Manihot Glaziovii.—Seeds and Plants available all the year round, 100,000 and over at special low rates. A Mexican planter in sending an order for this seed wrote on the 22nd August, 1900:—"If they arrive fresh and germinate easily I may send you larger orders, as they are for high ground where the Castilloa does not thrive."

Ficus Elastica.—Seeds available in May-June; booking necessary before the end of March; also plants.

Mimusops Globosa (Balata) wood of the tree is much sought for buildings, fruits sweet like a plum and eaten, oil from seeds, said to yield as much as 45 lbs. of dry rubber per tree per annum, the milk is drunk and when diluted with water used as cow's milk, grow from sea-level up to 2,000 feet, orders being booked for seeds and plants, price on application.

Cinnamomum Zeylanicum (Cinnamon superior variety).—New crop of seed in April to June; booking necessary before the end of February; also plants.

Coffee Arabica, Liberian Hybrid and Maragogopie Hybrid.—New crop March-April; immediate booking necessary.

A foreign Agricultural Department writes dated 9th September, 1901:—"Please accept our order for 175 lbs. of Tea seed and for 2,000 Coffee beans. In regard to Coffee seed I would say that this will be the first importation made by this department, and we will leave the selection of the varieties to be sent to your judgment."

OUR DESCRIPTIVE PRICE LISTS.

The following six Descriptive Price Lists are now being forwarded with Circulars and special offer of Seeds and Plants of Rubber and other Economic Products:—

1. Tropical Seeds and Plants of Commercial Products, enlarged edition for 1902.
2. Seeds and Plants of Shade, Timber, Wind-Belts, Fuel, and Ornamental Trees, Trees for Roadsides, Parks, Open Spaces, Pasture Lands, Avenues, Hedges, and for planting among crops (Tea, Coffee, Cacao, Cardamoms, &c.)
3. Seeds and Plants of Tropical Fruit Trees including Mango grafts.
4. Bulbs, Tubers and Yams.
5. Orchids—Ceylon and Indian.
6. Seeds and Plants of Palms, Calamus, Pandanus, Cycads, Tree and other Ferns, Crotons, Roses, Dracinas, Shrubs and Creepers.

Special Arrangements made with foreign Governments, Botanical and Agricultural Departments, Planters and others for supplying seeds and plants of Commercial Products in large quantities.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says:—"An interesting Catalogue reaches us from the East. It is issued by WILLIAM BROTHERS, Tropical Seed Merchants of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbing. We recommend the great Powers and Concessionaries under them to go to William Brothers."

*Agents in London:—*MESSRS. P. W. WOOLLEY & Co., 90, Lower Thames Street.

*Agent in Colombo, Ceylon:—*E. B. CREASY, Esq.

*Agent in British Central Africa:—*T. H. LLOYD, Esq., Blantyre.

Telegraphic Address:

J. P. WILLIAM & BROTHERS,

WILLIAM, HENARATGODA, CEYLON.
Liber's, A.I. and A.B.C. Codes used,

Tropical Seed Merchants,
HENARATGODA, CEYLON.

PROFESSOR HERDMAN, F.R.S.

We give a hearty welcome to Ceylon to this distinguished scientist and his Assistant, Mr. James Hornell, and express the hope that their connection with the island may prove a pleasant, satisfactory and, indeed, eminently successful one. At the same time we most fully recognise the great difficulties and uncertainty which must attend the very important investigation and "culture" experiments entrusted to Professor Herdman in connection with our Pearl Oyster Fishery. All that science and experience can do, will, we may be sure, be done under his direction, and then as to results we must all hope for the best; while Mr. Herdman and his Assistant may tell us:—

"Tis not in mortals to command success;
But we'll do more, Sempronius, we'll deserve it.

W. D. CAROLIS' GREAT CEYLON
LEATHER TRADE.

AN ENTERPRISING AND SUCCESSFUL BUSINESS.

Slowly, but undoubtedly and surely, do the native capitalists of Ceylon seem to be acquiring the taste for commercial enterprise and that their efforts do not run in one groove is well-known; but many perhaps are not aware that Ceylon amongst its various enterprises, carries on a comparatively large trade in hides and leather with other countries—a trade which has been almost entirely developed and maintained by one firm of Sinhalese merchants, the well-known W D Carolis. Hearing that after the recent Paris Exposition, trade between Ceylon and other countries had increased in various articles, not to mention tea, a representative of this journal called at the leading "leather" house in Ceylon on Friday and was shown round the premises. To begin with, it should be mentioned that the firm of W D Carolis, has, by reason of its very extensive business, been carrying on trade in Kandy and Galle with head offices at No 18, Kayman's Gate, Pettah.

A FULLY STOCKED WAREHOUSE.

At the Kayman's Gate warehouse one was surprised to see the amount and variety of leather and other articles stocked for sale and export purposes. Here was to be found the well-known, but expensive "Russian calf" exported together with high quality leathers from England and Austria in order to supply the varied demands of its customers. A large amount of English black kid leather was carefully stocked in cases together with fine-coloured leather called skivers for book-binding purposes. Fine Russian leathers with black and white English kid for boots and shoes hardly surpassed the excellent show made by the country manufacture of these leathers in Mr Carolis' own tannery. The black and brown country-calf seemed of excellent quality and in great demand locally as well as abroad. Special mention should, however, be made of the variety of fancy leathers procurable here. For instance, our representative was shown a crocodile skin cured and tanned in the firm's own tannery. It presented quite leathery properties, all the scales being softened so as to make the skin very pliable. These skins are said to be used for hand-bags, belts and even

boots and shoes. Then there were cheetah skins and goat hides with bristles cured to a nicety and adapted for rugs and door mats. English buck-skin is exceedingly well imitated in a clever preparation of country elk hide cured and refined to such an extent that, to the uninitiated, it would appear to be the same as the imported article. This elk-hide is to be got in light brown and white colours and is largely used for boots and shoes. The skin of a large scaly field lizard of Ceylon shown here is said to have taken over a couple of months in the tanning. Then there was a stock of stout hides for machine belting, harness and such purposes. In order to make the establishment complete there was also a large stock of shoemakers' tools of various kinds and qualities, boot trees of all sizes and English make, and boot dressing. The varied nature of the orders received made it necessary long ago to establish

A HARDWARE DEPÔT.

in No. 16, Sea Street where a large amount of carriage building requisites are available as well as other building articles. A special feature of this depôt is the large and varied stock of paints available. Enamel paints and the dry article are imported regularly from England direct from the great works of Aspinall's and other houses, some of the paints being consigned solely to Mr W D Carolis. Amongst the articles sold here is also a large stock of estate tools and hardware such as enamelled household vessels, and here are also carriage varnishes of different qualities, brass cabinet furniture in a large variety, different cloths for upholstery purposes, oil cloths, brushes, mixed paints and even carriage shafts, not to speak of the many housebuilding requisites such as nails and screws, locks, window glasses, &c.

A BOOT EMPORIUM.

If the large shoe depôt at No. 110, Main Street, Pettah, known as the Oriental Boot Emporium and belonging to Mr. W D Carolis, were established for the sole purpose of advertising its leathers by manufacture, then its purpose happens to have been easily gained for not only does the clever staff of Indian workmen here turn out some excellently made "feet clothing" for exhibition, but a brisk and profitable business is also done by them.

THE LEATHER MANUFACTORIES.

The increasing demands of the trade only recently made it necessary for the firm to purchase a second tannery in order to retain its customers and over R20,000 is said to have been spent in purchasing a large tannery in Kandy, a place not unknown to leather merchants. But by far the most important portion of the business of this enterprising firm is carried on at Bambalabitiya where is

THE LARGEST LEATHER MANUFACTORY IN

THE ISLAND

This establishment is situated in fifteen acres of ground and the numerous buildings and pits where the important process of tanning is carried on cover over seven acres. There are about four large buildings in which are numerous cemented pits where the raw hide are put together with what is known as rewa-bark or *cassia auriculata* for the purpose of colouring and softening. About 100 hides are tanned in each pit, the process lasting from three weeks to two months. It was ascertained that

monthly about 30,000 cow hides, 10,000 buffalo hides and 2,000 sheep skins were tanned here. The large outside demands soon clear the warehouses. For instance, this morning our representative observed over 500 buffalo skins fully tanned and prepared being despatched to Messrs Clark Young & Co., for export. There was also observed in process of tanning the skin of a large boa-constrictor or rather python, certainly measuring over 12 feet. Also there were about 30 cheetah skins excellently cured and well adapted for rugs. Altogether W D Carolis' business established in 1879 and which has obtained seven Ceylon medals for its manufactures, not to mention a silver medal and bronze medal at the recent Paris Exhibition, is one of the most important houses, of the leather trade in the East.

ABOUT JAVA COFFEE.

Mr. B F Sherburne writing in a recent issue of the *Eureka Standard* says:—

The first cargo of Java coffee has yet to be brought to the United States, but every grocery store in the country is selling what they believe to be the real article, sometimes mixed with imaginary Mocha. I was in the East India trade six years, sailing from Boston with a miscellaneous cargo to Batavia, Singapore and Penang. Part of the cargo I sold in Batavia, such as was in demand there, buying such produce as was required by our home market, going thence to Singapore and Penang for the same purpose, finishing our home cargo at the last-named port. While in Batavia I purchased, among other things, a few thousand Java bags, or pockets, that would contain half a picul (about sixty-six pounds) of coffee; when in Singapore I would purchase a hundred tons or so of coffee, raised in Macassar, Rhio, and other islands (very good coffee too), employ coolies to pick it over, discarding all dirt and imperfect berries, I would then fill the Java bags and take it to Boston, where it was sold as "Java" coffee, and no one could tell the difference as there was no Java coffee to compare it with. The coffee raised in Sumatra is probably as good as that raised in Java, which is all shipped to Europe. But the Sumatra coffee is shipped to all countries, being bought at auction from the Dutch Government at their annual sales. The Dutch rule their subjects with an iron hand in India. In Sumatra, where the bulk of their coffee is raised for foreign shipment, the plantations are leased to the natives and an inspector visits them all and compels them to raise a certain amount of coffee on pain of having their plantations taken away from them. This crop the government agrees to pay a certain price for, to be delivered at the port of Padang, where agents of purchasers assemble to buy from the government at auction, and the difference between the price, or what it is sold for, and what the government gives the natives, is their profit. No purchaser can buy more than a certain amount at that time, all being served alike. From Padang the coffee is shipped to this country and Europe. It is nearly as good coffee as that grown in Java, and is sold as such in the United States.

JAVA CINCHONA.

From the report for 1900 on the Government cinchona plantations at Java to hand, we learn that at the end of the year the number of plants standing in the ground was 2,930,000, compared with 2,567,000 at the termination of 1899. The increase was not attributable to the area under cultivation being extended, but to the filling up of the spaces in the existing plantations, and, but for the unfavourable

weather prevailing throughout the 12 months, it would have been greater. In the nurseries the plants totalled 1,731,000 or 24,000 more than at the end of the previous year. The total area cultivated by the Government was 1,179 hectares (hectare=2.47 acres), consisting of: *Cinchona ledgeriana*, 744 hectares; hybrid species, 155 hectares; and *cinchona succirubra*, 280 hectares. The total crop for the year was 1,123,530 half kilos of bark, of which 756,907 half-kilos were shipped to Holland, 2,404 half-kilos were taken by the medical profession, and 364,219 half-kilos were handed to the Bandung Quinine Factory. With the exception of 2,336 kilos, of sulphate quinine delivered to the Government Army Medical Stores at Batavia, the production of the factory will be sold by auction during the current year at the latter city. The crop the previous year amounted to 798,991 lb., so that the increase was 324,539 lb. for 1900. The total expenditure for the whole year was 123,826 florins (florin=1s 8d). The net profit on the sales of the produce of 1899 at the different auctions in Amsterdam in 1900 was 305,568 florins. During the year experiments were made with so-called "boengkil," the residue obtained in making oil from the *Ricinus spectabilis*; the beneficial influence upon the verdure and growth of the plants was very marked, and to a less degree upon the quantity of the alkaloid, in which a slight increase is noticed after the first year. In consequence of the greatly enhanced demand for this manure, its price has gone up 300 per cent, so that the directors of the Government cinchona plantations are planting the *Ricinus spectabilis* on considerable tracts of land, so as to be able to themselves prepare the "boengkil." The oil they will obtain can be utilised by the State railways. Other experiments were also made with chemical manures manufactured at Rotterdam.

It will be remembered the first quinine factory in Java was established in the year 1899. The first of the public auctions took place on February 28th, when the average price realised was 23'24 florins per kilo—the price in London is given in the report as 1s 4d per oz. or 28'22 florins per kilo. In the subsequent monthly sales the price fluctuated somewhat, but in December it sunk to 19'07fl., when the London price was 1s 1½d per oz. or 24'25fl. per kilo. The total amount of quinine that changed hands was 29,506 kilos., and the average price realised for the whole year was 22.50l. per kilo. At first, as might be expected, the quantities obtained and the colour of the alkaloid were not all that could be desired, but, thanks to the zeal of the manager, Dr. Van Linge, the establishment is now not only obtaining an excellent yield, but is manufacturing a product that is able, says the report, to compete with the old marks. The report states that if the planters content themselves with a moderate crop, and limit the shipments to Europe, the produce of Java, which contains the highest percentage of quinine, will improve in price. At the various sales during the year the total amount of sulphate of quinine sold at Batavia was 29,505'80 kilos. The total shipments of bark from the whole of Java in 1900 were about 600,000 lbs less than in 1899, and the average percentage of alkaloid was also slightly lower, being 5'26 per cent., compared with 5'38 per cent. At the 19 public auctions in Amsterdam last year, 5,262,142 kilos. of bark equal to 298,140 kilos. of quinine were offered; for the preceding year the figures are 5,583,393 kilos of bark equal to 271,259 kilos of alkaloid. The production of the whole world is stated to have been, in 1900, 8,367 metric tons, compared with 8,218 tons in 1899. The consumption of quinine for the whole world is estimated at 390 metric tons.

We ascertain from the report that the Government of British India has made arrangements for selling small packets of quinine—25 centigrams in weight—at the various post offices throughout the country, with the view of counteracting the ravages of fevers amongst the native population. This is an example

which the report hopes the authorities in the Dutch East Indies will follow, and it will probably lead to a further increase in the total consumption.—*British and Colonial Druggist*, Jan. 3.

—obvious of the advertising advantages of using his own name and address—writes to the paper referred to that 'I can say the extent of drug-taking today is simply appalling.'—*British and Colonial Druggist*, Jan. 3.

PRC MISCUOUS PICK-ME-UPING.

Why a newspaper which is supposed to treat everything on *multum in parvo* principles should, within a few weeks, devote three columns of space to matters pharmaceutical is difficult to say. First of all the public were 'Daily Mailed' with nearly two feet length of printers' ink anent the Privy Council and the sale of poisons. Then someone signing himself Chas T King followed with a long account relating to the modern herbalist, and now a Mr Sidney Thompson contributes a column under the attractive heading of 'Pick-Me-Ups.' 'If,' he says, 'the ranks of our English novelists and playwrights contained a single realist of close observation and genuine strength, he would do his country a great service by showing in play or novel, how English men and women are ruining their health and disconcerting that of the generations to come by their reckless persistence with which they indulge in all sorts of promiscuous drugs and pick-me-ups.' He goes on to relate a conversation he had with an anonymous friend whose habit was to go to 'his chemist' every morning for his pick-me-up because 'one feels beastly limp you know and this chap understands my constitution so well.' Further enquiry from other friends, supplemented by information from a doctor or two, confirmed the writer in the belief that there was a growth in the alarming habit of self-drugging. One chemist professed to be able to 'tell you tales that would make your hair stand on end,' and goes on to say that 'A man was in here an hour ago, whose name you know who comes in every fortnight or so and buys a bottle of cocaine solution as big as this'—he touched a huge cut-glass decanter of perfume. He has his doctor's prescription all right, so we can do nothing. Another comes in at all sorts of times, and asks leave to come behind the counter for a moment to inject cocaine into his leg.' People, the chemist is alleged to have said, 'does themselves according to one or two obvious symptoms, and off they rush for a bottle of tabloids.' (What chemist would use the word 'tabloid' in this general manner?) 'Some of the tabloids are really dangerous when taken indiscriminately. These things, for instance, that contain strychnine and iron and quinine—I always make purchasers sign the poison book for them, but plenty of chemists are not so scrupulous. People buy and take them by the dozen, with the result that their systems get full of strychnine, the arterial pressure is increased, with a probable resultant danger of aneurism, and they keep themselves in a constant state of mental excitement and irritation.'

Again we have a reference to tabloids later on in connection with an interview (also anonymous) with a doctor. The same doctor spoke bitterly of the evils of the tabloid drugs. 'A bad business for the doctors,' he said, frankly; 'but it's a thousand times worse for the public.' Asked how it was that people can procure poisonous drugs as alleged so easily he mentioned as a possible explanation, that it was once suggested by an ex-President of the Pharmaceutical Society, that if a customer wrote down what he wanted on a piece of paper and appended cryptic initials, a chemist would be justified in regarding the document as a prescription. The writer proceeds to speak of the use of opium, methylated spirit, Indian hemp, quinine, bromides, and winds up by asserting that we are fast developing into a nation of druggers.

And the public swallow this spicy conglomeration of anonymous conversations! Aye, the more readily, and someone professing to be a chemist

THE SCIENTIFIC EXPEDITION TO THE MALDIVES.

PROFESSOR DR. AGASSIZ RELATES SOME OF THE RESULTS.

Professor Dr. Agassiz and party, who in December last left Colombo by the B.I.S.S. "Amra," for the purpose of exploring the Maldives, which formed the only group of Atolls, which this distinguished scientist had not hitherto seen, returned to Colombo late on 22nd January. It will be remembered that when Professor Agassiz arrived in Colombo, we were able through his courtesy, to give an account of his intentions in going to the Maldives. We have now pleasure in recording the work accomplished by the learned Professor as told by him to our representative:—"We were gone for little over a month," said the Professor, "and during that time my son and Mr. Woodworth took about 300 photographs, principally of coral reef subjects. Favoured with excellent weather—being only one day prevented from proceeding with our explorations—we were able to return to Colombo sooner than we expected. The principal thing we did was to

SOUND THE CHANNELS

between the lagoons and to develop the plateau on which the Atolls of the Maldives have been formed. We found as the usual thing that the principal atolls were separated by comparatively shallow water in the central part of the group, while towards the south, between Hadumati and Suvadiva and Addu, the depths were very much greater—nearer a thousand fathoms. We also ran a line to the Westward of Ari Atoll into fifteen hundred fathoms and one to the South-ward of South Male into twelve hundred fathoms, showing that the

PLATEAU OF THE MALDIVES IS MUCH STEEPER on the West than on the East face. And again we also ran soundings between the Northern Maldives and Colombo and developed the fact that the Maldives are separated from the Indian continental slope by a deep bank of the ocean of more than fifteen hundred fathoms in depth. The aggregations of islands which had been called atolls or the Maldives are not atolls as such, with the exception of the Southern islands like Suvadiva, Addu, and Hadumati and some of the isolated islands like Goidu and Kardiva, as well as the Southernmost atolls of the Maldives. These are

ATOLLS IN THE STRICT SENSE OF THE WORD

and what has been called Ari Atoll, North Male and other Atolls of the Central part of the Maldives are only apparently Atolls as the land which binds them consists of a series of small Atolls which are just as much Atolls as the larger ones mentioned above. This is specially well developed in the northernmost parts, that is Miladamadu and Tiladamati, which, in fact, are nothing but a great plateau without definite outlines, on which Atolls exist, separated by spaces of 10 to 15 miles, just as they would be on any other plateau, while on the contrary, on the central part of the Maldives they are often

close together and separated by gaps of not more than three-quarters of a mile to a mile. This makes the

TOLLS OF THE MALDIVES SUCH AN INTERESTING SUBJECT

for those interested in coral reefs, for we found there the most simple and primitive conditions for the formation of Atolls which are found anywhere except in some parts of the Yucatan plateau in the West Indies. There are two or three small Atolls similar to those of the Maldives but no where do we find such an immense number of diminutive Atolls in all stages of growth, from a mere bank rising to a few feet above the plateau, to banks within five or six fathoms from the surface, or to banks which have just reached the surface and on which sandbanks or islets are beginning to form, so that it is comparatively simple to trace the whole development of these Atolls from the time they are bank until they form the Atoll as we understand it. One of th

GREAT REASONS OF OUR SUCCESS

in examining the Maldives has been that the Charts published more than 70 years ago are as accurate to day as they were then, and we were able to navigate through the intricacies of all the islands with the greatest confidence. The only changes we noticed were changes such as the washing away of banks or the formation of banks since the charts were published; but these are changes without any special importance and it is

CERTAINLY ONE OF THE MOST CREDITABLE PIECES OF SURVEY

with which I am acquainted, as the survey must have been carried out under more difficult conditions than those under which a similar survey would be made at the present day. The conditions which exist to modify the atolls are very slight. The North East and South-West monsoons do not blow with anything like the violence with which the "trade" blow in the Pacific where we found on the banks of the atolls an enormous swell, pounding everything to pieces and throwing up large blocks of Coral on the reef plateaux. In the Maldives the sea which is the result of the monsoons is comparatively of little strength compared to that of the Pacific swell. The

MALDIVES ARE BY FAR THE MOST INTERESTING GROUP OF CORAL REEFS

which I have visited as in less than fifty miles of any part of the Maldives one can see more atolls than there are in the rest of the world."

Professor Dr. Agassiz, who was accompanied by his son, Dr. Woodworth and Mr. Biglow, as assistants, received the greatest courtesy and kindness at the hands of the Sultan who provided him with a circular letter to the Chiefs requesting that they should give all assistance possible to the party. His Majesty also presented the Professor with an interesting collection of Maldivian curios before they left Male. Of Captain Pigott, who commanded the "Anira," Professor Dr. Agassiz speaks in the highest terms for the valuable assistance rendered by him.

The party, after a week's rest in Colombo, returned to America.

SHIKAR AND TRAVEL.

* A NIGHT'S WATCH.

I could not persuade the Pakrind tiger to kill any of my 'ties up,' though six appetizing baits had been for some days fastened in the most likely places it might be expected to pass by. But its bait was a large one, which contained much undisturbed jungle, where apparently as it had not killed village cattle for some weeks, it was able to obtain as much food as it needed. There was no water inside the jungle, but roughly speaking, at the four corners of the area which was 14 miles long by 10 miles wide, water was to be found. At three of the corners there were small nearly dried-up village tanks, and at the fourth which was in the hills was a water-hole fed by a small spring (one of those over which a native *shikari* loves to sit and shoot unsuspecting does and fawns as they come to drink on a moonlight night). My only chance of a shot at the tiger seemed to be to sit over this hole; it was a very remote chance certainly, but there were signs that the tiger had been in the neighbourhood some days before, and as I had to leave on the following day, I felt that I could not go away without having tried every means to bring it to bag. In the previous year I had tried for it, but had not been able to obtain a shot, though it had deigned to kill one of my baits. A month or two before I tried, it had been fired at, and I think slightly wounded by an officer of a native regiment who had left the wing he was accompanying on their march on relief along the trunk road some 10 miles away to try for the Pakrind tiger. Baits, beasts and bullets were therefore not new things to it when I arrived upon the scene, and it was clever enough to steer clear of all three.

The water-hole was, as I have said, in the hills. All around the jungle had been burnt and there was little covert between it and the thick grass and tree jungle in which the tiger usually lived, but it was approached by numerous gorges and ravines and was just the place to which game might be expected to come at night.

About 3 o'clock I left my camp having sent men on before me with a native *charpoy* which they were to fasten up over the water in the most convenient tree, and about 6 o'clock I reached the place. The water was not very abundant, and what there was, was very black and muddy, and looked most uninviting; but I suppose it contained some saline properties which are always such an attraction to game. Some twenty yards away from the main water-hole there was a little in a hole in the bed of a ravine; this was much cleaner-looking, but it did not seem to be resorted to by game so much as the mudhole around which were innumerable tracks varying in size from those of the little four-horned antelope to the large but old imprint of a big bull-buffalo, and some rather more recent marks of bison. There were no quite recent tiger tracks, but bear and leopard had visited the water on the previous night, and I hoped that even if the tiger disappointed me I might get a shot at one of the two latter animals. My *machan*, which was placed on a tree between the two water-holes, needed some additional screening before I considered it quite hidden, and it was nearly dark before I was settled in it. The moon which did not top the hills behind me until between 8 and 9 o'clock, was just past the full, but though the afternoon and evening had been cloudless, the night was not to be so. It might certainly have been a much darker night than it was, but every now and then a thick black cloud obscured the moon, and the water fifteen yards away, was not visible. I do not know who my first visitors were. About half an hour before the moon rose I heard some animals at the water lapping. They seemed smallish and may have been wild dogs, but they made no sounds save the lap-

ping, and next morning I could find no tracks to help me to identify them. As soon as the moon rose, and I could see a little, I had dinner, and as I finished I heard the sounds of a leopard about half a mile off in the valley below. A four-horned antelope that had been for some time near the water, but apparently rather nervous about drinking at last plucked up courage and waded through the mud to drink, and when the sounds of the leopard were repeated nearer and nearer, it gave its little barking call and scampered off. The leopard evidently did not want to drink, for though I heard it for nearly an hour, now a little nearer, and again a little further off, it never came within a quarter of a mile of me. The next sounds I heard were most weird. An appalling din arose about fifty yards behind me, as if a number of wild cats were fighting, but they never approached the water; at least I never saw them do so, and their identity remains a mystery. I must have dozed off for a few minutes for I suddenly became aware that there were some big animals walking about nearly underneath me, and cracking the dead burnt branches as they moved. They were evidently buffalo or bison, but which, I could not determine at first; however, the moon for a minute showed out clearly, and I saw that one drinking at the water was a bison. There were six of them, and they must have stayed at least twenty minutes within thirty yards of me; but it was not light enough for me to make out if there was a really good head among them, but they all looked enormous in the dim light, and it was a strange sensation to be so near to a herd of bison for so long a time without their being aware of my presence; had it been lighter, all their movements would have been visible, and the sight would have been still more enjoyable. Before the sound of the bison's tread had died away, as they went down the valley, two bears came down from the hill behind me to the water. Of course they squabbled before they reached the water, and it was the sound of their quarrel that put me on the *qui vive*.

Apparently one of the pair had been worsted, for only one came to the water in the ravine to my left. I could easily make out a large black mass as the bear walked down the ravine side, and aiming at the front part of it I fired, my bullet fortunately penetrated the lungs and broke up these. To make certain I fired a second shot which broke the spine, and the poor bear's sobs ceased. Perhaps I ought not to have fired at the bear, but two-thirds of the night had passed and no tiger had appeared, so I took what the gods sent me. There was one more visitor to the water before the night was over and this was a sambhur stag. I could hear its antlers strike against the low branches of the trees as it came up and could just see its antlers as it drank, but the moon was much obscured, and I but hazily saw what with better luck would have been a magnificent sight. Then the east began to light up as the sun rose behind the hills, and I climbed down from my *machan* and inspected the bear, which proved to be a young male nearly 5 feet long.

And so the Pakind tiger still remains to be shot.
—Indian Forester. LONG TOM.

DISTILLATION OF RUHSA GRASS OIL, CENTRAL PROVINCES.

The grass, *Andropogon schœnanthus*, or Rusha grass, commonly known as "Tikhari," is a native of Central Provinces. It grows wild in swamps with erect culms, and attains a height of three to six feet. The leaves are long, smooth and tapering, and have a strong aromatic smell

and pungent taste. The root, locally known as "Mirchia Gant," is perennial, with long wiry fibres.

The oil obtained from this plant has become an important article of commerce. It is now chiefly distilled in many parts of Central Provinces, especially in Betul, Nimar and Hoshangabad districts, by private persons, and taken to Ellichpur town, which is the chief market of export. Its current price is from R2 to R4 a pound according to its purity. The grass is very abundant, and the distilling of the oil requires only a moderate skill and very small initial capital. About 50,000 (fifty thousand) pounds are exported annually from Bombay to Arabia, and European Turkey, Jeddah and ports along the Red Sea. Its European name is Palma Rosa oil or Geranium oil.

The oil is chiefly used as an adulterant for *attar* of roses. In some places the roses are sprinkled with it and the *attar* is distilled. It is a proved fact, that "Rusha" grass oil does not solidify by cold, and this is the chief adulterant which stops the crystalizing habit of rose oil when exposed to low temperature and prevents its congealing.

Rusha grass oil should be first refined before it is ready for admixture with *attar* of roses. It is also necessary that it should lose its penetrating aromatic smell and acquire the colour of the *attar* of roses. In order to effect this change it is shaken with water, then acidulated with the juice of lemon, and finally exposed to the sun and air. The oil thus refined has a very slight difference from *attar* of roses, and can serve as an admixture which is very difficult to detect. It is very difficult in these days to procure pure Rusa grass oil, as the oil of commerce is more or less adulterated by the local distillers themselves. The chief substances to adulterate this are turpentine and the oils of ground nut, linseed-rape, &c., &c. By such adulteration the oil temporarily becomes turbid, but after a time it settles again and becomes clear. Pure oil should be of a pale sherry colour.

The oil, which is considered to be cooling and astringent, is used as a liniment in rheumatism, headache and skin diseases and has the property of curing baldness. It is a powerful stimulant when applied externally, but it is never taken internally, except in very minute doses for bilious affections. The grass, as far as I know, is not used as a fodder for cattle.

The grass generally flowers in October and November, and is then fit for cutting. It is tied into small bundles not exceeding twelve inches in circumference, and packed tight, horizontally, in a large metal cauldron, which is fitted on a rough masonry furnace, and then a small quantity of water is added. When full a roughly scooped-out wooded lid is put and sealed with a plaster of ground pulse, or the lid is more firmly fixed by means of metal clamps. Through a hole in the lid one end of a hollow bamboo is inserted and the other end passed into a small metal vessel, which is securely fixed under water in the bed of the river. This smaller vessel serves as a condenser, and the bamboo tube in it is kept in position by pieces of cotton cloth well wrapped round the tube and serving as a stopper for the condenser. The furnace is then heated and the vapour passing through the hollow bamboo tube is deposited as oil in the condenser. The oil thus

obtained contains a large proportion of water; five hundred pounds of grass yields two pounds of pure oil when the still is carefully worked, but if the grass in the cauldron is allowed to burn, it communicates a dark colour to the oil.

With better apparatus, and a more scientific method of distilling, there is much room for improvement and every possibility of success. It might be worth while, for experiment, to reserve for departmental working a certain area and to carefully supervise the results.

A. D. BHOET, Forest Ranger.

Hoshangabad, Sept. 13, 1901.

—*Indian Forester.*

ANDAMANS,

The work of the Forest Department in the Andamans is shortly described in the following extract from the Government of India Resolution:—

“Forest operations in the Andaman Islands are mainly confined to the extraction of produce, and are limited in extent by the amount of convict labour that can be placed at the disposal of the Department. A large proportion of the available labour is employed in meeting the requirements of the settlement in timber, fuel and gurjan oil, which are considerable, so that only a comparatively small quantity of timber can be extracted for export. A trade has been established in London for Andaman padauk, but the demand is greater than the present supply, and it is believed that koko (*Albizia Lebbek*) and other Andaman timbers would find a ready sale if they could be placed on the market in sufficient quantities. It is therefore important that advantage should be taken of labour-saving appliances whenever practicable, and experiments in this direction should be persevered in.”

The labour-saving appliances alluded to are a tram line which was extended 150 yards during the year, a timber sledge road, the outlay on which is said to have been out of all proportion to its usefulness, and a wire ropeway which was not a success. Nevertheless the experience gained will prove useful, and as the steep hillsides of the Andaman valleys are said to be well adapted to a system of wire ropeways, this form of extraction is to be persevered in. There were no breaches of Forest Rules, and fire protection measures are unnecessary owing to the heavy rainfall and absence of herbaceous growth. Natural reproduction was unfavourable owing to short rainfall; and an area of 5 acres, which was sown with padauk and ironwood, was for the most part practically a failure; on the other hand, twenty-nine acres of maritime swamp were successfully re-stocked with mangrove seedlings. The Department supplied the Settlement with 25,484 tons of firewood and 5,773 lb of gurjan (*Dipterocarpus*) oil, the latter presumably for lighting. In Burma its use for this purpose almost entirely ceased many years ago owing to the cheapness of kerosine oil. The quantity of timber extracted was 5,808 tons, of which 2,446 tons were padauk. The average rate per ton realised for padauk squares in Calcutta was R195 or nearly double the price obtained in the previous year. In the London market this timber realised 6s 6d a cubic foot, koko (*Albizia Lebbek*) and black chuglam (*Terminalia bratata*), 4s 6d each, and taungpeingye (*Artocarpus chaplacha*?)

4s. There appears to be a demand for all these species, which the Department is not at present prepared to meet owing to the labour difficulty. “Specimens of choice padauk taken from the junction of bole and main branch and from stumps, including crown of root, were sent to the Paris Exhibition. The branch and root pieces were cut into veneer on arrival at destination, and the latter were much admired, being valued at 9d to 2s per square foot, 1-16th of an inch thick.” Probably many other Indian species could be profitably disposed of if worked up in this way. The revenue for the year was R2,91,115 and the surplus R1,49,309,—the highest but one on record.—*Indian Forester.*

GERMAN SUGAR INDUSTRY.

Evidence continues to be forthcoming that the German sugar industry is confronted by a serious crisis, America has for the moment disappeared from the market as a buyer, and this has broken prices again. It seems evident, too, that the year's production on the Continent will be considerably greater than the estimate. Market experts calculate that there will be a surplus stock at the end of the sugar year amounting to 2,665,000 tons against 975,000 tons for the last season. Under the circumstances, it is already claimed that the reduction of 10 per cent in the acreage next year, as proposed by German producers, will prove inadequate; and that a 20 per cent reduction will be necessary. The German Sugar Syndicate is taking steps to promote consumption. At a meeting of the Syndicate the other day it was decided to give premiums to dealers showing the largest sales; and it was also voted to make special prices to chocolate manufacturers who would bind themselves to use only syndicate sugar.—*Madras Mail*, Jan. 22.

BAD ADVICE TO THE CHANCELLOR OF THE EXCHEQUER.

WHY SHOULD TEA AND SUGAR BE TAXED.

(From the *Speaker*, Jan. 4th.)

When “R. G.” comes to advise the Chancellor of the Exchequer as to what should be the new taxes, he flounders, as he did last year, into the marsh of protection. The military occupation of South Africa is undoubtedly, he says, a new burden, and the whole army must therefore be increased in number and efficiency. Consequently “expenditure must be permanently increased,” and “no reduction of the so-called war taxation is to be contemplated.” “R. G.” next proceeds to declare, without adducing any proof, that “an increase of direct taxes is out of the question, because direct taxes are necessary as a reserve for emergencies, unless the rate is very low.” This is great nonsense, considering that the income-tax is not yet as high as in 1856, when the war expenditure, and therefore the emergency, was only about one-third what it now is, and “R. G.” makes absurdity doubly absurd when he tells us that “the knotty question will perhaps be whether some new taxes of this kind (i.e., taxes on food) should not be imposed in order to diminish the excessive

weight of the income-tax." We wonder if it has ever occurred to "R. G." to look into the scale of the license duties or to examine proposals for the taxation of ground values? If his outlook were not so restricted, and if his mind were not possessed by a desire to raise artificially the price of the necessities of life, he would hardly have committed himself to the statement that "obviously to bring in money the Chancellor of the Exchequer is limited to taxes of the nature of the sugar duty, which he imposed last year." "R. G." obviously thinks that women and children should pay for war; it is a chivalrous doctrine, worthy of the City and of Printing House-square. We cannot for the life of us imagine why tea should be taxed up to double its natural market price when the State, through its magistrates, is giving away valuable monopolies in the shape of licences every year to the tune of many millions of money; but "it is safer," writes our City Pundit, "to trust to such things as tea and sugar or a moderate corn duty, such as we retained in our finance-down to 1870. There is ample room in this direction for duties that will bring in many millions and leave the country no more burdened than it was thirty years ago, when the taxes were nevertheless light." If the Chancellor of the Exchequer should attempt such a policy as this, we may look forward to a period of profound industrial and political discontent. When the depression comes (and "R. G." expects it "during the next few months") the crisis of the unemployed will be loud enough and the position of employers will be painful enough; but if the situation is aggravated by the substitution of dear bread for cheap bread, with dearer tea, dearer sugar, and dearer meat, then the Government, which entered with so light a heart upon such a war, will find that it has brought the country to the verge of a revolution. The towns of England and Scotland are just beginning to awake from a hideous dream. Their poor went mad and drunk with their rich in 1899 and 1900. But in every class in every town there was a handful of men who kept their heads, who foresaw the misery which the war must bring, not only to South Africa, but to our own doors. These handfuls have been growing into multitudes, and they will become irresistible when once it is made clear by events that the British poor are to be pinched and starved in order that Park-lane may reduce wages in Johannesburg.

THE LARGEST SUGAR PLANT IN THE WORLD.

Mr. R B Hawley of Louisiana, an ex-Congressman, and sugar planter in the Southern States, has become interested in a large enterprise in Cuba. A private syndicate of which he is the head has secured 64,000 acres of the finest land in Cuba which they intend to plant in sugar canes for export to the States. This has caused something of a sensation in planting circles, and the opinion has been expressed that the competition which will result will seriously affect the Louisiana sugar industry. According to the "Picayune" Mr. Hawley has shipped to Cuba the largest sugar manufacturing plant that has been made in America, or, for that part, in the world. The name of the company is the Chapparra Sugar Company, its domicile New York, and the plantation is situated at Puerto Padre, Cuba, extending over many miles of territory and embracing 100 square miles of the finest sugar lands on the island.

The crushing plant was built by the Whitney Iron Works, New Orleans, and consists of six Corliss engines, of 150, 250 and 30 horse power, two of each size. Two sets of nine-roller mills, with Marshall crushers in each, the rollers seven feet by thirty-four inches, fitted with hollow steel shafts, built at Bethlehem, Pa. This is only the crushing plant, and that alone was built here at a cost of something more than \$150,000. The boilers were produced in New York. They are of 6,000 horse power, of the Babcock & Wilcox type, 40-tube boilers. The refinery plant was bought in Philadelphia, with the exception of one machine, which was proprietary, and had to be produced in Europe. The refinery plant consists of three 13-foot vacuum pans, two sets of triple effects, of the Lilly type, twenty-four crystallizers in motion, and twenty-four water-driven centrifugals. The capacity of the mills and refinery is 3,000 tons per day, and it is proposed to increase the plant at the earliest moment, as it will not be sufficient for the needs of the company another year. The Company has several locomotives, and a complete transportation plant on the island already, which will be extended as the land is gradually brought into cultivation. The Deming system of clarification is to be used in the refinery, and the inventor of the system is now building the plant for the Company at the Payne-Joubert works in New Orleans. This is the largest single consignment of machinery that has ever gone out of the city, and it is to be followed by more from the same source for the same Company. Altogether it will constitute the largest sugar cane crushing plant on a single plantation in the world.—*New Orleans Picayune.*

PLANTING NOTES.

TEA.—With regard to tea-growing in the United States, the *Glasgow Herald* says:—"It will be interesting to see the practical result of the successful experiments reported in the official statement from Washington. It is, of course, likely enough that, in the vast variety of its soil and climate, the United States has good opportunities for the culture of the tea plant; but soil and climate are not the only important factors in the case. One most vital consideration is the cost of labour, and in regard to this, it is hard to see how America can compare with China, India, Ceylon, or even Natal.—*Indian Witness*, Jan. 16

COFFEE.—One-half the world's production of coffee berries is brought to the United States. Americans are the greatest coffee drinkers on the face of the globe now, and every year the consumption of coffee is increasing here. Last year it was more than 80,000,000 pounds for the whole country or more than ten and a half pounds a head of the population. Germany and France together only consume half as much coffee. Germany, less than six and a quarter pounds per head, and France only four and a half pounds per capita. The United Kingdom used little more than half a pound of the berries per head of the population, but over there they made up for it by drinking more tea than any other nation. More than a million dollars is sent out of the United States every week in payment for coffee. South and Central American countries, which supply us with more than 6,000,000 pounds of coffee a year, get most of the money. Porto Rico, Java and the Philippines get almost all the Rest, but a little goes to Hawaii. Last year the total value of the coffee imported into the United States was about \$60,000,000, and that was less than for several years, because the import price of coffee has fallen about one-half.—*Bradstreet's.*

SIR HENRY GILBERT,

In our last issue we briefly announced the death of Sir Joseph Henry Gilbert, the able and devoted coadjutor of the late Sir J B Lawes, Bart., the eminent authority on scientific agriculture and chemistry. Sir Henry passed away at his residence at Harpenden, at ten minutes past twelve o'clock on Monday morning, the 23rd inst., in the presence of his family.

Sir Henry, who had long been ailing, was first taken seriously ill in August last at Strathpeffer, Scotland where he had gone for his summer's holiday, being attacked by acute hæmorrhage, followed by nervous exhaustion and neuralgia of the stomach.

Sir Joseph Henry Gilbert was born at Hull, August 1, 1817, and was therefore in his eighty-fifth year, being three years the junior of Sir John Lawes. His father was the Rev. Joseph Gibert,, the author of several theological works. His mother Ann Taylor, of Ongar, who survived until 1866, was well known as an authoress of poems, writing originally with her sister under the names of Ann and Jane Taylor.

After his school education, and the loss of several years by a gun-shot accident, which much impaired his health and deprived him of the sight of one eye, Dr. Gilbert commenced his college courses at the University of Glasgow, where he had as contemporaries Sir Joseph Hooker and Dr. T Thomson the Indian botanist. Here, as elsewhere, he paid special attention to chemistry, devoting some time to analytical chemistry in the laboratory of the late Professor T Thomson. He next studied at University College, London, attending the classes of Professor Graham and others, and working in the laboratory of the late Dr. Anthony Todd Thomson. A short time was afterwards spent in the laboratory of Professor von Liebig at Giessen, where he took the degree of Doctor of Philosophy. Returning to University College, London, Dr. Gilbert was class and laboratory assistant to Professor A T Thomson in the winter and summer sessions of 1840-41, and attended other courses at the College at the same time. On leaving college, he devoted himself for a time to the chemistry of calico-printing, dyeing, &c., in the neighbourhood of Manchester.

In June, 1843, Dr. Gilbert became associated with Mr. (afterwards Sir John) Lawes in the Rothamsted investigations, and from that time until his death has been engaged as director of the Rothamsted field and laboratory experiments, which consisted of a systematic series of researches in agricultural chemistry and physiology of animals and plants. In the early part of his career at Rothamsted he was engaged in the manufacture of calomel in an old barn which served as a laboratory. At that time Mr. Lawes sought his services as chemist in some commercial undertakings, but Dr. Gilbert preferred to remain at Rothamsted, and commenced that brilliant series of researches which conferred so much honour on the two investigators. These researches began as "flower-pot experiments," but were gradually extended till they became field experiments on a scale hitherto unattempted.

The Rothamsted experiments may, indeed, be pronounced unique, and are certainly without parallel, either as to extent, character, or scientific and practical usefulness. It is not asserting too much to say that these researches have done more to advance agricultural and horticultural science, and have been and will be of greater service to agriculture than can ever be fully realised. Other countries can boast of very numerous agricultural stations supported by Government, whilst we have very few; but the Rothamsted experiments carried out by private individuals surpass all that has been done in any other country with or without Government aid.

Sir Henry was elected a member of the Chemical Society in 1841, the year of its formation, and was President of the Society in 1882-83. He was elected a Fellow of the Royal Society in 1860, and in 1867 the Council of the Society awarded to him, in conjunction with Sir John B. Lawes, one of the Royal medals. He received the honorary degree of M.A. at Oxford in 1844, that of LL.D. at Glasgow in 1883, and at Edinburgh in 1890, as also that of Sc.D. at Cambridge in 1894. He was Sibthorpean Professor of Rural Economy in the University of Oxford for six years, from 1884 to 1890.

In May, 1893, the President and Council of the Society of Arts awarded the Albert Gold Medal to Sir John Lawes and to Sir Henry Gilbert for their joint services to scientific agriculture, and notably for the researches which, throughout a period of fifty years, had been carried on by them at the experimental farm at Rothamsted; and the medals were presented to them at Marlborough House by H.R.H. the Prince of Wales (now King Edward VII.), President of the Society, in the presence of many members of the Council. Like his collaborator, Sir John Lawes, he was an honorary or corresponding member of numerous home and foreign agricultural and scientific societies. On August 11th, 1893, that is, about a fortnight after the jubilee celebration at Rothamsted, Dr. Gilbert received the honour of knighthood.

The Jubilee of the Rothamsted Experimental Station in 1893 was made the occasion of a ceremonial which was of an unique and interesting character. At a meeting of the Royal Agricultural Society of England, presided over by H.R.H. the Prince of Wales, it was resolved that, to mark the completion of half a century of continuous research in the Rothamsted station, some public recognition should be made of the invaluable services rendered to agriculture by Sir John Lawes and Dr. Gilbert. It was decided that the testimonial should take the form of (1) a granite memorial with a suitable inscription to be erected in the front of the laboratory at Harpenden; (2) illuminated addresses of congratulation; (3) a portrait of Sir John Lawes painted by Mr Hubert Herkomer, R.A., and a massive silver salver to Dr Gilbert, bearing the following inscription: "Presented by the subscribers to the Rothamsted Jubilee Fund to Dr Joseph Henry Gilbert, F.R.S. in commemoration of the completion of fifty years of unremitting labour in the cause of Agricultural Science, July 29, 1893." The various presentations were made, and the commemorative granite boulder was formally dedicated at a meeting of the subscribers held at Harpenden on Saturday, July 29, 1893. The Right Hon. Herbert Gardner, M.P., President of the Board of Agriculture, presided, and there was a large attendance of leading agriculturists, scientists, and others.

The Lawes Agricultural Trust, established by the munificence of Sir John Lawes, provides that someone shall periodically visit the United States of America and give a series of lectures upon the results of the Rothamsted investigations. At the request of the committee of management, Sir J Henry Gilbert undertook this duty in 1893, and thus for the third time he visited the world beyond the Atlantic, his former visits having taken place in 1882 and 1884.

The results of the Rothamsted researches are embodied in print in many forms in the records of the Royal Agricultural Society, the British Association, the Chemical Society, the Royal Society, the Horticultural Society, the *Society of Arts Journal*, and the Dublin Royal Society. In articles in technical newspapers, and in numerous reports, pamphlets, and letters to the general press, too long for enumeration here, which, as regards the agricultural history, progress, and literature of the past sixty years are, we may confidently say, to be reckoned among the most remarkable achievements of the century.

He was twice married, first in 1850 to Miss Laurie, daughter of Dr. Laurie, who died in 1853; and afterwards in 1855, to Miss Smith, the present Lady Gilbert; he leaves no issue.

It is satisfactory to know that the researches at Rothamsted will be carried on in the future under the direction of the Lawes Trustees.

The funeral of the late Sir Henry Gilbert took place at Harpenden on Friday, December 27th, and was attended by the members of the Lawes Agricultural Trust Committee, and representatives of many of the scientific societies of the country.—*Gardeners' Chronicle.*

COCONUT PLANTING IN THE NORTH. WESTERN PROVINCE. NEWS NOTES.

A Marawila correspondent writes:—The weather seems to have set fair. Save for a drizzly day on the 13th, we have had no rain since the 7th Jan. The mornings are very dewy and cold, with the temperature down to 74 deg. The afternoons are very hot with the temperature at 88 deg. The variation is not violent, yet fever, coughs and colds and dysentery are prevalent.

A little heat seems to have been evolved from the chronicling of record prices for nuts. By the time my communication appeared, the price I recorded had already been topped in several places. For the present, Kimbulapitiya heads the list. Since I took to planting in the low country, I had always heard dealers describe those as the best nuts in the Negombo district. Since then, systematic cultivation may have raised the quality of the nuts of other estates up to that standard, or even beyond it.

The present crops are better than the last crops of the last year, but they will not be available for some little time longer. Prices of nuts and copra are keeping up. The mills have been compelled to raise their prices gradually in order to attract grist to them.

There has been no confirmation to the rumour set afloat by a contemporary of yours, as to an early commencement being made with the Colombo-Puttalam railway. You must agitate for it, Sir, in and out of season. It is a crying want, with the advancement of the districts through which it will have to pass. It is a railway that will have to be opened in sections, and will pay from the start. As far as Chilaw, the route is thickly populated, and an overflowing passenger traffic is assured. It is an ideal route for motor cars, and one would have thought it would have been the first to have been occupied by the Rapid Transit Company, as a precursor to the Railway. If the Government offer this Company liberal terms to occupy this route, valuable and reliable statistics will be available from its annual report of the passenger traffic a railway will attract at the start. At the start only—for passenger, like other traffic develops with the passage of time.

FRUIT-GROWING IN CEYLON :

MR. JOHN COTTON'S ORCHARD AT NUWARA ELIYA.

Visitors to Nuwara Eliya can do no better than spend idle moments by visiting the Orchard at Lake View where Mr Cotton with genial courtesy is only too pleased to show anybody round

the sphere of his labors, where with much pride he now directs attention to an eating pear (Lecount) which after seven years' coaxing has just now one single fruit of a fairly decent size or one of its branches. With a recent importation of cherry plants from Australia, Mr Cotton has been very successful. One of the plants had been barely down six months when it flowered and came to fruit in splendid health. Mr Cotton watched its growth very attentively and was in hopes of picking a ripe cherry for the first time out in Ceylon, when some ruthless hand plucked the first before it had even a chance of getting thoroughly matured. Several apple trees which have been experimented on, and transplanted about the orchard in different soil and shade, have now got planted out to all appearances in their right places and are flushing beautifully and should get to fruit soon (as the plants are very much healthier than the plant so much fussed about at Frederic's Ruhe here and expected to bear this year). The Red-heart Plum crop this year has not come on so well as it did last year when every tree in the orchard was laden with the fruit. But this deficit by way of income will be put on a par by the exceptionally large crop of the cooking pears on all the trees in the orchard.

A NEW METHOD OF PRUNING has evidently been tried by Mr. Cotton. The writer's attention was drawn to one particular tree which has several hundred fruits on it. The tree itself, Mr. Cotton is of opinion, is at least twenty-five years old and is really worth a peep at, just now. In a shady corner of the orchard, Mr. Cotton has an artificial dam where a constant water supply is let in and out of it. Here some trout are being very carefully matured with a view of getting the trout to spawn. Should the effort succeed Mr. Cotton will commence operation on a larger scale, and who knows that it will not in this direction, too, develop so, as to induce the Fishing Club to seriously make a similar attempt.

CLUB ROOT.—The cabbage disease is being fought against by Mr. Cotton with every possible experiment. Small success has crowned much untold labour. But the demon disease has not yet been laid low. That great success attend the new effort Mr. Cotton is about to make in this connection is the hearty wish of all vegetable growers in Nuwara Eliya.—*Cor.*

DR. PATRICK MANSON ON MOSQUITOES AND MALARIA.

Dr Patrick Manson's lecture at the London Institution last night on the "Conveyance of Malaria by Mosquitoes" contained some interesting points and suggestions. It was now definitely known he said that malaria was none other than a parasite which lived in the red blood corpuscles of the human body and was carried about from victim to victim by mosquitoes. The success of the campaign against the evil would depend upon the intelligent co-operation of those whom it was intended to benefit. The necessities of the mosquitoes constituted the sanitarian's opportunities, Mosquitoes must lay their eggs in water, and in that element the larvæ could alone exist. The obvious course therefore was to render the water unsuitable which would be the radical method

of exterminating mosquitoes and consequently the diseases they carry. Already Dr Manson continued the practical application of such measures had borne good fruit. Since the English occupied Havana in 1762 that city had never been free in October from yellow fever and malaria. In October 1900 there were twenty-five deaths from malaria and seventy-four from yellow fever, but in October of this year thanks to protective measures, there were only nineteen deaths from malaria and none from yellow fever.—*Daily Chronicle*, Dec. 13.

PRODUCE AND PLANTING.

Sir Robert Giffen is an able man and a clever manipulator of figures. In some letters just contributed to the *Times* on the financial outlook he makes some suggestions, one of which will certainly not delight tea planters. He begins by telling us that we should complacently make up our minds that the national expenditure must in future always amount to £160,000,000. But Sir Robert sees that this extravagance would not be tolerated if it were borne by direct imposts, so he urges the Chancellor of the Exchequer to ease direct and increase indirect taxation in a way suggestive of the devil take the hindmost. He would reduce the income-tax to 10d, and later on to 6d, and would make up the £20,000,000 lost to the Exchequer on account of this remission by imposing a tax of one shilling on the quarter of grain, threepence additional on the pound of tea, a half-penny additional on sugar, one shilling per load of timber, one penny per gallon of petroleum, and an extra three shillings per barrel of beer. In this way the Chancellors of the future could revel in expense, *inter alia*, of the British-grown tea industry.

The *Times* commenting on Sir Robert Giffen's suggestions seems to approve them, for it says "There can be little doubt that the tea would bear a charge of 2d or 3d per lb more, and sugar an extra half penny per lb." This looks anything but cheerful for the prospect of any reduction of the duty on tea. The *Daily Telegraph*, on the other hand, says: "Two years ago, it may be in recollection, the duty on this product was raised from 4d to 6d per lb, and the result, put briefly, has been to cast the main burden of the increase upon the shoulders of the growers, whilst the public, for their part, have been paying for an inferior quality the price formerly asked for a better class of tea. On this subject the views of a prominent teabroker may be quoted. 'It has been found,' he stated, 'that the producer has paid the bulk of the additional duty—in fact, from 60 to 75 per cent in all. The public has shown itself averse to paying more for its tea than it did formerly, with the consequence that consumers have been content, for the most part, with an inferior variety, which brought about the inevitable result that smaller crops of the finer qualities have been grown. In short, people now drink tea at 1s 6d the lb. that formerly cost not more than 1s 4d.' The average price (wholesale), this authority added, is 7s 3d to 8d per lb, which means that if the additional duty of 3d were imposed, tea, which is at present taxed to the extent of 80 per cent of its value, would be included to the amount of 100 per cent over and above its market price."

A return ordered to be prepared last autumn by the House of Commons of the various duties levied upon imports by the colonies and other possessions of the United Kingdom has just been issued by the Statistical Department of the Board of Trade. This return presents a remarkably diversified tariff such as is calculated to drive a customs reformer wild. The publication of the volume was not delayed long enough to permit of the inclusion of the new Australian Federal tariff. In the case of

TEA

the import duties are sufficiently perplexing in their variety. Thus in Canada tea is admitted free; in India there is a five per cent ad val duty; in Ceylon twenty-five cents per pound is charged; in New Zealand two-pence per pound; in South Africa six pence; while in the West Indies the duty ranges from eight pence to one shilling, or five per cent ad val. In British Guiana it is three pence per pound; in Mauritius it is eighteen cents; in Fiji six pence; in New Guinea 2d per lb; while it is free in Hongkong, the Straits Settlement, and Malta. Under the new Commonwealth Tariff, not included in the return, the import duty on tea is 2d or 3d per lb and 20 per cent ad val

The Americans are proud of their

HOME-GROWN TEA,

and we have referred to the subject of their aspirations with regard to it frequently of late, because some rather wild rumours on the subject of its importance have been current. Dr. Charles U Shepard, one of the pioneers of the enterprise, is rightly accorded due praise for the part he has played during the last ten years in carrying on tea planting operations under difficulties. That there are unusual difficulties may be gathered from some particulars given in a recent number of the New York journal, *Tea, Coffee, and Sugar*, which says, referring to the gardens which Dr. Shepard controls:—"These tea gardens in February 1899, endured conditions seldom experienced in the South, when the mercury fell to two degrees below zero. The gardens had no protection from the weather, and it was feared they were ruined, but they have now entirely recovered. After the freeze the bushes were pruned liberally. Of course, this temporarily affected their productiveness." But the main point of interest to Indian and Ceylon growers is the prospect offered of tea growing becoming, in the United States, an important industry. On this point our New York contemporary is interesting, but not alarming. We do not think Indian and Ceylon tea planters need feel any anxiety at present on the score that this American home-grown tea will interfere with the development of trade in British-grown teas in the United States.

A writer in the "Grocers' Review" says, in commenting on the

TEA TRADE:

"There is one point in which the trade seems to be undergoing a change, and in my opinion a change for the better. The grocer is willing to sell tea much smaller in leaf than formerly. As long as it is not 'dirty,' that is, laden with powdery dust, he seldom complains, however small in reason it is made. This is all to his advantage, as it enables the blender to use tea which would not otherwise assimilate in leaf, and allows a good proportion of thick, rich, broken tea, and manipulation by machinery leaves all the blend a uniform size. It is to be hoped that the day is not far distant when 'tip' and 'style' may be less valued by the average grocer than at present, as there is not one householder in a thousand who regards these properties, if only the tea in the cup is pleasing to the palate. In maintaining the trade in a healthy condition it is the cup that will tell."

In their monthly tea market report, just issued, Messrs Harrisson and Crosfield, of London, review the course of the

TEA TRADE

during the past year. The most noticeable feature, they say, is the restored feeling of hopefulness consequent on the re-adjustment of the balance between demand and supply. In 1900 there was a surplus of 10½ million pounds, which, coming on the top of 3½ millions surplus in 1899, depressed the market and caused the tea-producing industry to become unprofitable. Prices fell to an abnormally low point until March last, when it became known that some restriction

of production was in contemplation by the planters, coupled with a general endeavour to effect improvement in the quality. A more confident feeling then showed itself in the market, which has since steadily strengthened, the most marked rise being in the quotation for low-grade teas, which are now 1½d per pound higher than they were a year ago. The reduction in the quantities produced this season both in India and Ceylon has been almost entirely in the lower grades of tea, whilst the supply of medium grades in all growths has been very abundant, so that while there has been an important advance throughout the year in common kinds, medium descriptions have been in large supply, and consequently have sold at rates showing an excellent value to buyers.

Of the Toronto

TEA MARKET

the "Canadian Grocer" says: "The Indian tea season is over, and the shortage is confirmed at a high point. The situation locally continues to improve. As far as we can learn, there is nothing in Indian and Ceylon low grade teas under 12c. that can be considered merchantable. The local market is still below the parity of the London market. It is said the teas arriving are not costing less than about 13½c to 14c."—*H. & C Mail*, Jan. 16.

In the last British Consular Report on the trade of Trans-Caucasus, the following occurs:—

The two principal growers of tea in the Trans-Caucasus—namely, the Imperial Domains and Messrs. Popoff, have, I am informed, added to the area under tea within the limits of their estates, but besides these two plantations hardly any other tea gardens of importance exist in the neighbourhood of Batoum, and, in my opinion, the reluctance with which holders of land have recourse to tea-growing, clearly demonstrates that the tea produced in this district is either not of the quality required to create a demand in the Russian market, or that the industry is still only in the experimental stage and the results hitherto obtained so uncertain that owners of small estates and the peasant classes prefer to wait and learn by the experience of others before embarking with any of their spare cash, in an undertaking remunerative qualities of which have not yet made themselves apparent.

The tea crop of the year 1901, although the largest ever obtained in the Caucasus, only amounted to 13½ tons, obtained after a period of over 10 years has elapsed since the first experiments in tea-growing were made in the district. It is clear that tea-planting in the Caucasus may at some remote period become sufficiently advantageous to warrant its being generally adopted.

Messrs. Popoff's estates are situated at three different points near Batoum—namely one at Chackva, the second at Salibauri and the third at Kaprshun. The area under cultivation on three estates is 312½ acres, of which 81 acres have been under tea for a period of over three years. The yield in 1900 was, I believe, nil, and in 1901, as far as I can ascertain, under 9,000 English lb. The crops on these estates, I am informed, are gathered on the Chinese system. The tea produced is stronger than the Chinese tea, none of it wasted.

RAMIE.

A most important branch of agriculture for the Trans-Caucasus would be the cultivation of the ramie plant which according to experiments made by the Imperial Domains authorities on their lands at Chackva, grows very successful on plots carefully selected for the purpose in view of the fact that the soil should not be of a marshy character and that it should be nourishing and porous. Besides the Imperial Domains several individuals have also started the cultivation of the 'Chinese nettle,' and have invariably obtained good results. Unfortunately manual labor is very expensive in this country, and this being the case it is quite out of the question to have re-

course to stripping the fibre off the stalk by hand as is done in China, where labour is excessively cheap.—*London and China Express*, Jan. 10.

PROFESSOR HERDMAN.

HIS INTERESTING WORK ON THE WAY OUT.

Professor Herdman, the distinguished Liverpool naturalist who came out to Ceylon to undertake for the Government an investigation of the pearl oyster fisheries, writes to a friend who has sent the letter to the *Liverpool Daily Post*:—

SS. "Derbyshire," Gulf of Lyons, Jan. 1, 1902.

My dear Thompson,—I think I promised to send you an occasional note in case you and others of our Liverpool naturalists are interested to know how the scientific work goes on. There is little to tell as yet, but Mr Hornell and I have sent out 200 numbered drift bottles containing postcards, and we have taken daily gatherings of plankton from the sea.

You remember that one of our fishery questions is whether the young fishes of the Lancashire coast come from spawn produced north of Holyhead, between Anglesey and the Isle of Man, or south of that in Cardigan Bay—in other words, can floating fish spawn get round Holyhead into our district? We left the Mersey about midnight on Thursday, 26th, and at 1:30 a.m., when we were clear of the banks, I started throwing over the "drifters" in batches of ten every half-hour till we got to the middle of Cardigan Bay next forenoon. About 100 went over between the North-West Lightship and the South Stack, and another 100 south of Anglesey. The captain gave me the positions on the chart and I have sent the lists back to Mr Johnstone, so he will be able to make out the drift journeys when the postcards from the bottles are found, filled in, and returned to college.

They have kindly handed a bathroom completely over to me for the plankton work. I keep the key, and the sea-water tap runs night and day through my silk nets. The amount of plankton daily has been small as yet, but it is winter, and we had a gale in the Bay of Biscay, and the weather has been continuously chilly; so perhaps we have got as much as was to be expected. As soon as we get clear of the English Channel a few Atlantic organisms made their appearance, such as diphyes, pteropod shells, acanthometra, and other radiolaria. These continued down the coast of Portugal. When we got through the Straits of Gibraltar there was a complete change. All the larger animals disappeared, and their place was taken by minute diatoms (*bidulphia* and others) in such profusion as to block up the meshes of the fine silk. That continued for twenty-four hours, but we now seem to be getting through that area into, I hope, a more varied fauna. As you know, when the diatoms are abundant we generally catch very little else. I get the microscope out every morning after breakfast in the smoke-room, where there is very good light, and examine the night's catch. It is most interesting—quite apart from any use we make of them afterwards—to have these samples of the living organisms to examine every day from the seas through which we are passing.—Yours very truly, W. A. HERDMAN.

PROFESSOR HERDMAN'S VOYAGE OUT.

Professor Herdman says that during the voyage out to Ceylon much valuable scientific work was accomplished on board, and both he and his assistant had their hands full all the way from Liverpool. In the Irish Sea experiments were made with the object of determining currents which carry the eggs of spawn. This was in connection with home fisheries, and altogether about 200 floating bottles were thrown overboard with instructions for their return to Professor Herdman by whoever should pick them up. All the way

out interesting tests were made with plankton, this being the scientific name for the myriads of microscopic floating life on the sea. This word is one which we owe to German analysis. By means of exceedingly fine silk nets—nets finer than those used by millers for precipitating the finest flour—the samples of sea water drawn each morning were made to give up their stock of floating life, and this was submitted to the closest scrutiny under the microscope. The Professor said that to the scientific mind the changes in the insect life as different seas were passed was remarkable, and from the scientific point of view the results of the experiments in the Red Sea eclipsed in interest the plankton elsewhere, according to our contemporary.

Dr Lyster Jannieson, M D, B Sc, London, whom Professor Herdman first expected to bring out as his assistant, was in Ceylon before and wrote a paper on Pearl Oysters.

TEA IN PERSIA.

In commenting on Mr. Foley's report on the prospects of Indo-Persian trade via Nushki and Seistan, the *Pioneer* said a short time ago that the only question seemed to be as to whether the opportunity for exploiting a new market was likely to be seized. A correspondent now writes to that paper and says that the actual state of the tea demand in Eastern Persia was over-estimated by Mr. Foley in his earlier letters that this has now been proved beyond a doubt, and that those who followed the advice of the advocates of sending caravans of tea to the Persians in preference to inducing the Persians to come to Quetta are likely to pay dearly for their venture. The writer then explains that the first large caravan sent from India was one consisting of 60,000 lb of Dehra Dun tea in charge of Mr. Ouseley, who reached Meshed some time ago. Messrs. Clementson and Marsh took charge of the next caravan, said to contain 40,000 lb of tea mostly from Southern India. This was followed by one from the Kangra Valley planters consisting of 30,000 lb under Mr. Greensill; and lastly another from Dehra Dun left Quetta in charge of Mr. Palmer at the beginning of November. It is probable that by means of camel caravans 200,000 lb of tea have recently been sent to Persia by the new route on the strength of Mr. Foley's early reports. The writer of the above letter continues that on his return from Persia, Mr. Foley, in an interview with an agent in charge of one of the above caravans, said he held out no hope of selling any tea at all between Quetta and Meshed, that probably at the latter place the market would be found to be overstocked, and that it was unlikely that remunerative prices would be obtainable there. He went so far as to recommend the agent to send his caravan on to Moscow. This certainly shows things in a different light, and nullifies the comment of our contemporary, that owing to lack of energy on the part of the Indian Tea Association it was only too probable that the existing trade in a favourite tea from Java, which finds its way to Meshed by caravan from Bundar Abbas will continue to expand.—*M. Mail.*

COLOMBO AND TEA.

In his speech to the Central Travancore Planters' Association, the Hon'ble Mr. G L Acworth lays great stress on the Calcutta market

as a source of relief in these congested times. He sincerely trusts that Calcutta will not starve their local market, and is confident that a good deal may be done in opening foreign markets by judiciously feeding that of Calcutta, and he considered that even more progress abroad might have been made had agents in the North fed their market more liberally. The Colombo market he regretted was still practically closed to Indian Planters, and he hoped that the time was not far distant, when "we and Ceylon shall interchange our products freely."—*M. Mail.*

THE GREY PARTRIDGE OF CEYLON AND INDIA FOR NEW ZEALAND.

We had a visitor in Ceylon from New Zealand last month—Mr. Maddox of Wellington—who is interested in Acclimatisation and is anxious to see the grey partridge of Ceylon and India tried in his adopted land. The chief reason is that the English partridge, which has been introduced, gets killed out by hawks and that it is thought the grey partridges like the Francolins, would be better able to protect themselves. From the "Manual of the Game Birds of India" we quote as follows:—

THE GREY PARTRIDGES.

The Grey Partridges are probably very closely allied to the Francolins, and as previously remarked Mr. Ogilvie Grant places them all in one genus. It seems to me, however, that the Indian Grey Partridges possess certain characteristics of coloration which render it desirable that they should be kept separate from the Francolins.

In the Grey Partridges the sexes are alike in coloration, but the males are much larger than the females. The tail is short and rounded and composed of fourteen feathers. The male has one or sometimes two spurs on each leg; the female rarely one.

These Partridges may be recognised by the first ten quills of the wing being plain or unmarked, except that in one species the outer web of some of the inner quills, say the seventh to the tenth, has some small and insignificant mottlings at the base; by the tail being more or less rufous or chestnut; and by the upper plumage being cross-barred.

THE GREY PARTRIDGE.

Ortygornis pondicerianus, (GMELIN).

Lower plumage cross-barred.

Sexes alike.

Vernacular Names:—*Titur*, *Ramtitur*, *Gora-titur*, *Safed-titur*, Hind., general; *Khyr*, Bengali; *Gowjul-kuki*, Canarese; *Kondari*, Tamil; *Kuwunzu*, Telugu.

The range of the Grey Partridge extends over the whole of India as far east as the longitude of Calcutta; and it is also found in Ceylon. It does not, however, appear to be common north of the Ganges and Gogria rivers. This Partridge does not ascend the Himalayas to above a level of 1,500 feet, but occurs sparingly in the Nilgiris up to an altitude of 5,000 feet.

According to Messrs. Hume and Marshall, the Grey Partridge does not occur in the South Konkan nor on the Malabar Coast, and it is absent from the forest regions of the Central Provinces and their Feudatory States, and of the Tributary Mahals.

Westwards of India, this bird extends as far as Persia.

Dr. Jerdon has the following note on the habits of the Grey Partridge :—

"It frequents alike bush-jungle and cultivated lands, being often found in gardens and compounds, and very generally near villages, concealing itself in hedgerows and thickets. It associates in coveys of varied numbers, from five to fifteen, is often very difficult to flush, running for a great distance and with amazing speed, and taking refuge in thick bushes and hedges, whence it is driven with difficulty. When flushed it rises with a loud whirr, flies very strongly, but does not take long flights. It frequently perches on low trees and shrubs and on the branches of thick *Euphorbia* hedges. Its call is a peculiar loud shrill cry, and has, not inaptly, been compared to the word *Pateela-pateela-pateela* quickly repeated, but preceded by a single note uttered two or three times, each time with a higher intonation, till it gets, as it were, the keynote of its call."

The Grey Partridge appears to nest twice in the year, once from February to June, and again from September to November. The eggs are usually laid in a shallow depression, well concealed under a bush, or in a large tuft of high grass, and more or less neatly and thickly lined with grass. The eggs vary in number from six to nine, and are spotless, pale buff. They are oval, a good deal pointed towards one end, and glossy. They vary in length from 1.2 to 1.42 in length and from .95 to 1.12 in breadth.

In this bird the forehead is chestnut and the crown amber-brown with darker shaft-streaks. A band over the eye and the cheeks is pale rufous. The chin and throat are buff surrounded by an interrupted black band or series of spots. The sides of the neck are delicately barred with black and white. The whole upper plumage, the visible parts of the closed wings, the tail-coverts and the middle tail-feathers are amber-brown, dashed with chestnut, especially on the back and wings, and everywhere barred with pale buff. The first ten quills of the wing are brown with a little grey mottling towards the base of the outer webs. The tail-feathers, except the middle pair are chestnut becoming black towards the extremity and tipped with buff. The whole lower plumage from the throat downwards is pale buff shaded with rufous closely and delicately but irregularly barred with black.

The male is larger than the female. Length of the former about 13; wing nearly 6; tail about $3\frac{1}{2}$; length of the latter nearly 12; wing about $5\frac{1}{2}$; tail about $3\frac{1}{2}$; legs bright red; irides dark brown; bill blackish. Weight up to 12 oz.

Mr. Maddox was on his way to Europe; and left on the 31st January by the P & O ss. "Rome," so that he had time to make enquiries as to the best mode of procuring and forwarding to New Zealand, some pairs of our grey partridge, as an experiment. We should be glad to hear from any one able to aid in this interesting attempt at acclimatising.

SIR ANDREW CLARKE ON TRINCOMALEE AND COALING PORTS.

I may introduce here what I wrote in 1883 about providing adequate defence for Trincomalee. "Having already stated the extreme importance that I attach to the retention of Trincomalee as a

station for refitting and coaling H.M.'s ships, and as a base and rendezvous for our fleet, it appears desirable that I should very briefly indicate the nature of the defences which in my opinion are necessary to deny the harbour to an enemy's warships and to secure the naval establishment and anchorage from anything but distant bombardment. The entrance to this magnificent harbour is so narrow, the naval establishment so well protected by the natural features of the country, and so useful a nucleus of works of defence is already provided, that, fortunately, a comparatively small expenditure only is requisite to attain the above-mentioned objects. . . . Under all the circumstances of the case it would, I think, be a sufficient measure of defence if the emplacements which were hastily and temporarily constructed in 1878-9 were carefully revised and adapted for the reception of 9-inch or 10 inch M.L. guns. The cost of these measures would be about £25,000, for the works and £20,000 for the armament."

Naval authorities had not then grasped the importance of coaling stations. On their safety the power of the Navy depends, and to protect them is a cheap mode of adding to the naval strength of the Empire. Their provision in sufficient numbers and at well-chosen spots on the great ocean routes to India, Australia, and China is the first essential need for the maintenance of our naval position in the East. There is no necessity to establish too many coaling stations; indeed to do so would be to introduce an element of weakness into our position by offering the enemy more objective points of attack than it would suit our arrangements to adequately defend. I would specify the following as meeting all possible requirements of the present and the immediate future :—Aden, Bombay, Trincomalee, False Point, Port Blair, Singapore, Thursday Island, Hong-Kong, and Port Hamilton.

A second line of coaling stations between the Cape and India on the one side and Australia on the other will ultimately become necessary, but probably the Seychelles in one direction and the Cocos in the other will suffice for all our requirements, especially after South Africa has been provided with several harbours of refuge.

Of these, Aden, Bombay, Trincomalee, Singapore, and Hong Kong are either completely or nearly equipped to meet all requirements as coaling stations and naval harbours. False Point for the Hooghli could easily be converted into a harbour of refuge by clearing out the river mud from the Mahanadi. A coal depot at Port Blair in the Andamans would be very useful, as supplementing Trincomalee, and as providing a set-off against any possible Dutch-German development in Achin. Thursday Island in Torres Straits has been looked after by Australia, and will become more and more the first care of her naval directors. Port Hamilton, once ours, and which gave England practically the command of the seas of China and Japan, has now unfortunately been lost to us. [But should be occupied immediately Russia takes any portion of Corea.]

Where the coaling station is used exclusively for providing coal and supplies to our ships, there the charge and responsibility should be entirely Imperial. But when the coaling station is attached to a colony that would itself be the immediate object and reward for temporary, if not permanent, occupation by an enemy, there the charge and responsibility should largely, if not wholly, devolve on the colony itself. The case of Trincomalee

comes under the former category, that of Thursday Island under the latter, while Singapore may be cited as an instance where the Imperial and colonial interests are about equal. However these stations may be protected, and from whatever source, Imperial or colonial or joint, the necessary funds may come, we have to recollect before everything that coal—ubiquitous coal—is as the breath of life to our naval power and activity.

MALARIAL INSECT TRACKED.

A DISCOVERY OF VAST IMPORTANCE TO COLONISATION.

It is now stated, on the authority of Sir Alfred Jones, who is so well known for other public services that many people may forget that he is chairman of the Liverpool School of Tropical Medicine, that a new cause of malarial fever has been discovered. It is well known that Major Ronald Ross has attributed a good deal of the malaria which is the curse of the West Coast of Africa—and many other coasts—to the bite of malarial mosquitoes. And now Major Ross is able to announce that Dr. Dutton, who is one of his assistants, has made the important discovery that there is yet another parasite which brings fever to the unhappy white man on the West Coast. It is said to be like the insect which causes "fly disease" among horses in South Africa, and, if so, the discovery will be of twofold importance. On the news being submitted to a medical expert on tropical disease, a somewhat chilling reception was given to it. This gentleman said that it might be true, but that he preferred to wait before expressing an opinion. But of one thing he was quite certain—if the cause of malarial fever in man or of fly disease in cattle had been found, then it was one of the most beneficent of the discoveries of the age. The reason why the discovery would be of such importance is that it would make possible the colonisation of vast regions of the British Empire which are now the white man's grave—*Daily Mail*, Jan. 10.

RUBBER SUPPLIES IN 1901.

(Messrs. Figgis & Co.'s Annual Review.—)

London, January 3rd, 1902.

We have to report fewer fluctuations in prices during 1901 than previous years, but at the close all rubber is cheaper than a year ago. Fine Para 3d., negrohead barely ½d, but Cametas 2d. Peruvian ball and slab about 1d per lb.

The supply of all medium rubber has fallen off considerably and nearly the whole of the old stock has been disposed of at very low prices; resulting in great losses to holders as has been the case with many fresh imports. Our stocks of these kinds are now greatly reduced and we look for an improvement in values shortly and should encourage imports.

The year has shown a continued increase of demand for the finer rubbers at relatively high prices, and the European consumption of fine Para considerably exceeds any previous year. English manufacturers have been very busy. Continental fairly so. American were less occupied till the last three months. On the whole the year has been a very active one.

The Continental stocks are very much reduced, but America holds fair stocks of Para:—

Visible supply now of Para and Peruvian 4,618 tons against 4,100 tons last year (including America 2,005 tons against 1,200 tons).

There is a further increase from Brazil—about 3,200 tons from the Amazons (including Peruvian *via* Iquitos and Manaos, 4,000 tons against 3,100 tons). The Peruvian fine has been better as a whole, but should be cut and selected before shipment. The ball has been fair and some nice hard clean brown lots realised very high prices; weaks labby and dirty sells cheaply. The slab was good. Of Bolivian we received less, but probably as much was produced and quality was satisfactory. Of Molendo increased supplies during the latter months of the year; quality good. From Venezuela *via* Orinoco the supply was less and rather poor quality. Ceara more but only good clean wanted. Manicoba—Fair supply of improved quality. Peruvian and Assare was in fair supply and realised much lower prices. The Mangabeira supply declined enormously; very good clean sold well, common at a great decline. Mattogrosso has rather increased; some parcels were rather dirty and badly prepared.

From Central America the supply has been considerably declined, and again owing to war only small lots from Colombia; these Ecuador, Tumaco, Guayaquil sell readily and scrap only 1d lower than a year ago; inferior and mixed much cheaper. Some from the Cauca, Magdalena sold fairly, also Nicaragua and Guatemala.

Of Honduras Mexico and Panama very small lots. African shows a serious falling off probably 1,500 tons—Angola 250 less; say Benguela 1,250 tons against 1,550 tons in 1900. Loanda 730 tons against 678 tons (besides 200 tons Thimbles). Quality has been hardly so good. The Congo has slightly increased but the quality has seriously declined; about 5,300 tons against 5,000 tons in 1900. The average price shows a very considerable decline because so much was poor quality. Quite an extraordinary decline in supply of Gold Coast, Accra, Lagos, etc., and only moderate from Cameroons, Sierra Leone, Gbeon, etc., and small of Senegal. Prices of nice hard only about 2d lower, but soft common and Lagos fully 4d decline for the year.—*India Rubber Trades' Journal*.

CEYLON RUBBER.

Messrs. S Figgis & Co. have the following in their latest Report:—"Of Ceylon small lots sold at high prices. We again urge planters to give attention to this valuable product. Ceylon is much liked and sells readily. We obtained 3s 9½d recently for fine and 2s 4½d for negrohead grown from Para seed."

THE SUGAR CROP OF HAWAII FOR 1901—has exceeded the most liberal estimates, having been 360,000 tons. Fine harvesting weather and an increased supply of water for irrigation from artesian sources, have been the chief factors in producing this result. Under like conditions, the next crop will be fully as large. The largest production of refined sugar in the United States for any single year was that of 1899, which was 1,773,870 tons. The production of 1900 was 1,566,038 tons. It is estimated by those in the trade best qualified to judge that the American Sugar Refining Company produced about eighty per cent of the output in each of those years.—*Hawaiian Planters' Monthly*, Dec. 15.

PLANTING IN KALUTARA DISTRICT.

(From the Annual Report of the Kalutara P.A.)

CROP ESTIMATE.

	Total acreage.	Acreage in bearing.	Black tea lb.	Green tea lb.	Total lb.
1902	16,843	15,541	6,970,763	546,000	7,516,763
1901	16,711	15,501	6,775,000	225,000	7,000,000
Increase	132	40	195,763	321,000	516,725
The actual crop for 1900					
			was 7,088,610; for 1901		6,655,025
The estimated crop for 1900			was 7,037,700; for 1901		7,000,000
Increase	50,910	decrease	344,975		

The total crop for 1901 was less than that for 1900 by 433,585 lb. This district, like all other tea districts, has been seriously affected by the low prices its teas were fetching during the greater part of the year. By finer plucking, however, and making a better class of tea, the prices have raised, though the amount of tea made is considerably reduced, and now the teas from many estates in the district command as good prices as those from some up-country estates. It is hoped that Planters will not be tempted by the higher prices paid for low-grade teas to go in again for coarse plucking, a proceeding which must result in bringing about a similar depression in tea interests to that which ruled a few months ago, with probably more serious consequences.

PARA RUBBER.

In this, the parent district in the Island, as far as this species of the rubber-producing tree is concerned, considerable attention has been bestowed on its cultivation during the last few years. Though there is no large acreage, probably not more than 150 acres in the whole District, planted with rubber only, on most estates more or less has been planted along the ravines and other suitable places through the tea, and there are now many thousands of trees of various ages, amounting in the aggregate to a very considerable acreage.

TAPPING.—Previous to last year tapping was practically in the experimental stage, but in 1901 quite an appreciable quantity, close on 3½ tons, of rubber has been shipped to London and found a ready market at from 3d—5d per lb. more than any other rubber on the market at the same time. One lot of half a ton, which was sold early in the year, realized 4s 1½d per lb. and the buyer expressed his readiness to take 20 tons at the same price.

SEED.—The foreign demand for seed, which was very considerable not very long ago, is practically over, but a very brisk demand has sprung up quite recently in the Island, and most of the estates which supply seed have their visible supply of both seed and plants fully booked already for the coming season.

EXPORT.—The increase in production for the next few years will be slow, as but few estates had much rubber planted prior to 1897. In 1906 the output of the district should be at least 50 tons, worth over £15,000. A very appreciable addition to the revenue of the district,

PLANTING IN RANGALA DISTRICT.

TEA.—The tea industry has passed through the most trying period in the whole history of this product, and with the closing months of the year prospects have brightened considerably. The unfavourable weather for growth and the producers' endeavours to curtail production by a system of finer plucking have had the desired effect of reducing the output from both India and Ceylon and as the world's consumption continues to expand the position may be considered stronger than at the commencement of the past year. It is to be hoped that the producer may not be tempted by a temporary enhancement of price to flood the markets with inferior teas. Your Committee are pleased to observe no indication of such a course in this district, the official estimate of crops for 1902 being slightly lower than the revised estimate of 1901.

CARDAMOMS.—The area in cultivation has not been extended to any extent, and crop was on the whole about the same as for the previous year.

TELEGRAPH.—It is with pleasure we can record the construction of the Telegraph to Teldeniya, which will be at the service of the public in January.—*Rangala P.A. Report.*

PLANTING NOTES.

TEA grows wild on all the hills round Chiengmai and there is a large local consumption of the leaf not as a beverage but as a quid for chewing and eating. The leaf is picked in April, August, and November. After being picked it is at once steamed, and if it is to be kept for any length of time, either packed in bamboos or wrapped in a special kind of leaf and buried to exclude the air. Before using, a few grains of salt are wrapped inside the leaf, and the quid is complete.—*Indian Planter's Gazette.*

ACCLIMATISATION IN NEW ZEALAND.—Mr. Maddox, who left for England by the P. & O. ss. "Rome" on the 31st ult. and returns to Wellington via America, has not been successful while here in seeing one of our grey partridges save in the Museum. He is afraid now, from what he hears of its running rather than flushing propensity, that it will not suit for the sportsmen of New Zealand. The two great successes so far have been in the introduction of red deer and of trout. New Zealand is going to draw anglers from all parts of the world to its trout fishing. Ordinary trout up to 27 lb. and "rainbow trout"—the best in the world for fly-fishing—of 7 lb. are available in streams and lakes amidst some of the finest scenery in the world.

LAST YEAR'S PATENTS.—The number of patents applied for in this country during 1901 was 26,766, including applications from abroad. This number compares as follows with previous years:—

1891	...	22,878	1896	...	30,193
1892	...	24,179	1897	...	30,952
1893	...	25,107	1898	...	27,650
1894	...	25,386	1899	...	25,800
1895	...	25,062	1900	...	23,922

The actual patents granted are usually about half the number applied for, owing to applicants abandoning their applications at the end of the term of provisional protection. An increase in the patents connected with improvements in electric traction is beginning to be noticeable, and this undoubtedly is the most interesting feature of the applications made last year.—*B. & C. Druggist, Jan. 10.*

Correspondence.

To the Editor.

CEYLON TEA ON THE CONTINENT
AND MR. RENTON'S VOTE FOR 1902.

FRENCH CUSTOMS DUTIES ON TEA.

Havre, Dec. 20th, 1901.

DEAR SIR,—I hope there is yet time to protest against any increase in the vote to Mr Renton for 1902. He tells us that his expenditure for 1901 will be £6,500. If you deduct from that his salary, £1,000, and another £500 for the bonus on importations of tea into France, there still remains the important sum of £5,000 to be accounted for. Is nobody going to ask how this money has been spent? The great feature of his campaign this year, I speak, of course, of France alone, has been the travelling show through the towns of Northern France for the purpose of distributing tea in the cup, gratis, "degustation"—as it is called. I know he has spoken of other projects; he has told us of tea being now sold in the absinthe bars of Paris. I don't know what he means by "Absinthe Bars." I have lived a good many years in France and never heard of such places. Anyhow I hope he has not devoted any large portion of the £5,000 to subsidising such establishments, if they do exist, for it would be a great waste of money. It may be, from a humanitarian point of view, a very laudable thing to try and convert the drinkers of this murderous and deleterious decoction to the use of tea as a substitute, but it is not business, and you will never find the prosperity of your tea trade in France upon such a basis. No, the great triumph of Mr Renton in France this year has been the "degustation" Show. It is *the* feather in his cap—the great hit of the season. He dwells complacently on the immense success that has attended it everywhere. The populations flock to it in crowds and it is evident he intends, in process of time, if he only gets money enough, to make tea drinkers of them all. I hope, therefore, your readers will bear with me for a few moments while I discuss this degustation business. The show is really only one man going about from town to town and making arrangements with a grocer or two in each place to allow the demonstration and distribution of tea in his shop. I have seen something of it as it passed through Havre. A rough crowd gathered in front of the shop where the degustation took place, interrupting the traffic on the footpath. The crowd was what you might suppose, a crowd of riff-raff, mostly of odiferous and verminiferous riff-raff. Here is Mr Renton's own description of such a gathering: "In one place the people collected in a perfect throng, each bringing some sort of household vessel, from a bed-room ewer down to an empty case, in which to carry away the tea they expected to be presented with." Does Mr Renton really suppose that because these people have got a cup of tea for nothing they are going to become regular consumers of Ceylon tea? You might as well think that they would in future drink nothing but Château Lafitte because some silly wine merchant gave them a glass of that exquisite vintage.

The *clientèle* that you have to get at are the people who go in for five o'clock tea, the ladies of the upper classes. Now I ask any reasonable man, are ladies likely to be attracted by a squalid exhibition of this kind? Does Mr. Renton want us to believe that a lady could be induced to join in this mob of rag-tag-and-bobtail and drink from a half rinsed cup that had previously been in the hands, and approached the lips, of a dozen of the great unwashed? Psha! The whole grotesque masquerade is absurd and the money expended upon it, is money thrown away. Mr. Renton himself admits that the depots where these degustations have taken place do not sell much tea, "may not sell" is his way of putting it, but that apparently is only a secondary consideration for him. So long as "the demonstration goes on right merrily" he is perfectly satisfied and he is cocksure of knocking China tea out of France. We shall see. I observe that the gentleman who organised this show for Mr Renton has written to protest against the reduction of the grant and to say that he expects to receive another £500 or £600 for next year. It is a good thing to be in the graces of the Commissioner. How long is this to continue? Mr Renton seems to plead for five years. I hope you will bring your powerful influence to bear to put a stop to such reckless extravagance.

On the question of the future customs duties on tea in France, Mr Renton appears to be very much at sea. In his letter of 23rd October to Mr Rosling, he says:—

"I much regret that there seems every possibility of the law which comes into force on the 24th February doubling the duty of tea being allowed to take effect; if it does, the result will be a disastrous blow to our campaign in France. The Central American States have been able to arrange treaties by which their products will have the benefit of the most favoured nation clause, and, therefore, a large quantity of coffee will continue to come in at the minimum tariff. I cannot understand why the benefits of the most favoured nation clause which England possesses should not be extended to the English Colonies, but our Ambassador here says he can offer the French authorities no *quid pro quo* to induce them to extend the benefits of the clause to the British Colonies. Last year he pooh-poohed the idea of a new law coming into force, this year he rubs his hands and says he can do nothing. I shall make a final desperate appeal, through the Colonial Office, when I go to London, but the outlook is distinctly bad."

That is to say that he gives up Sir Edmund Monson as hopeless and that he is going to stir them up at the Colonial Office in the hope, I suppose, that Mr Chamberlain, with the tact and amenity which characterise his references to foreign nations, will find therein an opportunity of telling the French to mend their manners, or rather—on this occasion—to mend their customs.

I may here remark, parenthetically, that Mr Renton never saw the Ambassador, so that when he tells us of what His Excellency said and of what he did in the way of pooh-poohing and rubbing his hands, he is only drawing upon his imagination.

In another letter, dated Calais, 27th October, which appeared in the *Observer*, Mr Renton recommends Ceylon people to threaten to put a pro-

hibitive duty on French champagne. I say nothing of the total absence of discretion and good taste in speaking in such terms of our respected Ambassador, nor of threatening reprisals to a friendly nation. This is all part and parcel of the new diplomacy. I will only remark that a few days after these pessimistic views were expressed I was able to inform you, upon the best authority, that the French Government were about to give us entire satisfaction and that a bill was in preparation for continuing the duty as at present existing.

I wonder if the incongruity of the situation ever strikes the Ceylon Public. Here we have a gentleman drawing a large salary, accredited to all the important British Embassies abroad, who calls himself the Ceylon Commissioner in Europe, a title to which he has no right whatever, who ought to know everything and who knows nothing; who tells us it is as good as settled that the tea duty is going to be doubled in France on 24th February next, and that it is all up with our trade, and it is left to me, a private individual who does not even enjoy the barren satisfaction of receiving a courteous acknowledgment from the "Thirty Committee" or anybody else, for the service he rendered in exposing the favoritism and extravagance of the management in Paris last year, it is left to me, I say, to inform the public that these doleful forebodings are groundless, and that no alteration is going to be made in the duty on Tea in France next year.—Yours faithfully,
J. J. MARCEL.

CEYLON GREEN TEAS IN CANADA.

Toronto, Dec. 28.

DEAR SIRS,—We read Mr. Rosling's letter to the Ceylon Association in London with very much interest, especially the figures showing the rapid increase in the production of Ceylon green tea. We, the "Salada" Tea Co., have been enthusiastic about these teas. They were first introduced to our notice by Mr. Mackenzie in 1898, in which year, we notice by Mr. Rosling's figures that there were 13,302 lb. shipped, all of which came to ourselves. In 1899, 86,327 lb. were shipped, practically all of this, over eighty thousand pounds came, also to us. Unfortunately our sales are not keeping up in proportion to the output of green tea, but they are enormously increasing and we are as enthusiastic today about these teas as we were some years ago, and we will always look with pride to the fact that we were the first to recognise their merits and to put them before the public.

Wishing you the compliments of the season, —we are, yours truly,

P. C. LARKIN & CO.

SALT IN AGRICULTURE.

DEAR SIR,—I remember reading in the *Observer*, and afterwards in that invaluable compilation the *Tropical Agriculturist*, which I have been filing from No. 1, that the husk of the Coconut is rich in Salt and Potash. It was, of course, after burning the husk that the constituents were registered by Mr. Cochran. Can you or any of our

great Manure Merchants or their Analysts tell me, whether the Salt and Potash are latent in the husk and so may be evolved by decay, or whether the agency of fire is necessary to secure these important soil constituents? I have seen great heaps of coir dust, obtained from the husk, lying idle, and have been told they have no manurial value. If mere burial of the coir dust will not secure salt and potash from it, why is it not burnt, if the ashes have a high manurial value?—Yours truly,

IGNORAMUS.

[We shall deal with this subject later on.—Ed. T.A.]

RUBBER IN SABARAGAMUWA.

SIR,—With reference to this Government advertisement, it would be interesting to ascertain who the lessee is and what he paid, it being a public property?

MERCHANT.

Tenders will be received up to noon of December 31, 1901, by the Government Agent, Province of Sabaragamuwa, at his office at Ratnapura, for the right to lease for the period of twelve months, renewable at the end of each year for a further period of twelve months, if conditions stated below are observed, of the Government rubber plantation, situated at Edangoda, near the 12th milepost on the cart road from Ratnapura to Nambapana, in the valley of the Kalu-ganga. The plantation is 27 acres in extent planted with Hevea rubber, aged from 9 to 11 years, and containing 2,800 trees. The lessee will be bound to keep the said plantation free from jungle growth or encroachment. The lessee will be entitled to collect latex or seed, but in doing so should any rubber tree be killed, he will be liable to a fine of R10 for each rubber tree so killed or damaged beyond recovery. That no rubber tree shall be felled or uprooted without the special consent of the Assistant Conservator of Forests, who shall at all times be at liberty to inspect the said plantation.

[A question should be put in the Legislative Council.—Ed. T.A.]

PLANTING IN ZANZIBAR.

Friends' Industrial Mission, Pemba, Zanzibar,
1st January, 1902.

DEAR SIRS,—I am greatly interested in *The Tropical Agriculturist*, and find it very useful. But the seasons in Ceylon are evidently quite different from here in the Southern hemisphere. Ginger and other things are, in "All about spices" and other papers, recommended to be planted in March and April. I have tried it and it does not do at all. I have now planted Ginger, Arrowroot, &c., in October and November, and find that a much better time.

I am sending you some Meteorological Observations which I have taken here, thinking they may be of interest, as no one else has taken a continuous record in this island.

The clove crop both in Zanzibar and Pemba has been small this year, but I am glad to say that on this plantation we have had the best crop on record as far as I am able to discover. After about five years' experience I can say that *free paid labour*

answers infinitely better than slave labour or any kind of forced or contract labour. We have now about 200 free labourers on the plantation. Since obtaining their freedom they have greatly increased both in bodily and mental power. They have not become idle, insolent or thievish since becoming free as was so confidently predicted.

As far as I can see, the system of contracting with freed slaves to work three days per week for the Arab or other planter in lieu of rent of such land as he likes to cultivate on the other four days is a failure.

We have recently planted out 300 rubber trees (*Hevea brasiliensis*) which are doing remarkably well. Over 1,000 young coconut palms have been planted out, but the white-ants destroyed large numbers of them. Can you recommend anything to prevent the ravages of this pest?—Yours faithfully,
THEODORE BURTT*.

Just as I finished writing, a neighbouring missionary planter called; he tells me he recently planted over 50 coconut palms and the white-ants have destroyed 40 of them already. T. B.

* PLANTING IN ZANZIBAR.—The letter of Mr. Theodore Burtt is full of charm to all interested in Industrial Missions and who desire to know how their neighbours in other lands are progressing. The labour question is present in Zanzibar, but appears to have been successfully solved by Mr. Burtt who advocates "free paid" labour. Special interest will be attached to this efforts (albeit on a small scale) in this quarter to cultivate rubber trees and coconut palms. The former appears to do well, but the latter have succumbed to the destructive incursions of white ants. Mr. Burtt wants a preventative against these ravages: has he referred to our "Coconut Planters' Manual" where several remedies or rather preventatives are given: here is one of the simplest:—

Forest or old chenias are not generally infested with white ants, but land that has been for any considerable time either completely or partially open is full of them; they are not partial to dry coconut husks, but they attack with great avidity such as are attached to young plants, and have been buried from six to nine months in the soil. When a young plant is transplanted, it requires a greater or less time, according to the weather, to throw out fresh roots into the surrounding soil, and is in the meantime supported and nourished by the husk. If, however, those insects take a fancy to it, they devour the husk in a few hours, and the plant inevitably perishes. The best way to deal with such land is to put down plants already two or three years old, but if it be necessary to plant seedlings, to dissolve eight quarts of salt in a tub of water, thicken with fresh cow-dung, cover the husks with a coating of the mixture and let it dry before planting.

A perusal of the meteorological observations shews an ample and fairly well distributed rainfall. We are gratified at Mr. Burtt's appreciation of our *Tropical Agriculturist* and glad to know he finds it useful.

THEODORE BURTT.

TEA PLANTERS BEWARE!
A LESSON FROM WINEGROWERS.

London, Jan. 5.

DEAR SIR,—The present position of "Tea" is not very dissimilar to that which obtained in the early months of 1899 and which tempted so many estates to go in for "quantity." It is sincerely to be hoped that the mistakes of the past three years will not be repeated. To judge by enclosed cutting from last night's *Globe*, tea growers have not been the only ones to fall into the fatal error of thinking that the market for common stuff cannot be over-loaded.—Yours truly,
TEA MERCHANT.

The extract is as follows:—

THE FRENCH WINE CRISIS.

The crisis in the French vineyards of the south is acknowledged to be really serious, and the cause of it is generally considered to be over-production. But there is another thing to be taken into account, and that is the abandonment of other crops for wine growing. Of late years immense energy has been shown among the wine growers of Southern France, and new and improved methods of culture have been introduced. But not content with forcing the products of their vineyards, the proprietors have, in too many instances, taken land which was formerly used for cereals or pasture and have turned it into vineyards. Old fashioned growers warned the innovators that they were going too fast, and that more than sufficient wine would be produced without planting any more vineyards, but their protests were not listened to. The result has been an enormous production of inferior wine, many of the brands having nothing wine-like about them except their colour. At first the wholesale wine merchants bought largely, but as soon as they found that they were buying stuff which would become undrinkable when the hot weather began, they only offered absurdly low prices, and merely bought enough to fill their orders. To compensate for the poor prices the wine growers produced still more wine, and so the vicious circle

continues. Only those who were satisfied with producing a small quantity of good quality have kept up their prices.

IMPORTANT FIGURES IN TEA.

London, 10th Jan., 1902.

DEAR SIR,—The Board of Trade Returns for the United Kingdom during 1901, are commented on in most of the brokers' circulars which will reach you by this London mail of 10th January:—

Tea imports	1899	289	millions.
	1900	300	do increase 11 mill.
	1901	297	do decrease 3 do
on 1900 nett			and increase 8 millions in 2 years.
Home Consumption	1899	242½	millions.
	1900	249½	do increase 7 mill.
	1901	255½	do do 6 do
			or 13 mill. in 2 years.
Exports	1899	32	millions.
	1900	43	do
	1901	43½	do
Stocks in bonded Warehouses	1899	113	millions.
	1900	119	do
	1901	116	do
Imports: China	1899	35	millions.
	1900	21	do decrease 14 mill.
	1901	20	do do 15 do
			in 2 years.
Imports: Indian	1899	143	millions.
	1900	155	do increase 12 mill.
	1901	161	do do 6 do
			or 18 mill. in 2 years.
Imports: Ceylon	1899	101	millions.
	1900	114	do increase 13 mill.
	1901	105	do decrease 9 do
			nett increase 4 mill. in 2 years.
Home Consumption of China	1899	16	millions.
	1900	13	do decrease 3 mill.
	1901	10	do do 3 do
			or 6 mill. in 2 years.
Home Consumption of India	1899	134	millions.
	1900	138	do increase 4 mill.
	1901	148	do do 10 do
			or 14 mill. in 2 years.
Home Consumption of Ceylon	1899	35	millions.
	1900	92	do increase 7 mill.
	1901	91	do decrease 1 do
			nett increase 6 mill. in 2 years.
Re-exports: China	1899	11	millions.
	1900	18	do increase 7 mill.
	1901	11	do decrease 7 do
			or nett nothing.
Re-exports: Indian	1899	8	millions.
	1900	10	do increase 2 mill.
	1901	13	do do 3 do
			or 5 mill. in 2 years.
Re-exports: Ceylon	1899	12	millions.
	1900	14	do increase 2 mill.
	1901	18	do do 4 do
			or 6 in 2 years.
The Customs Duties yielded to the Exchequer:—			
1899 ..	Sterling	£4	millions.
1900 ..	do	£5½	do.
1901 ..	do	£6½	do.

There is much that might be remarked on the above figures. The increase of India's tea from 143 millions to 161 millions in two years might be commented on in a cynical spirit in connection with their proposed restriction of output.—Yours truly,

MERCHANT.

CEYLON TEA SALES IN LONDON.

13 Rood Lane, London, E.C., Jan. 10.

DEAR SIR,—Regarding the cutting which you enclose from one of your contemporaries, we think the correspondent "Puzzled" would perhaps have shown more courtesy if he had written direct to us instead of writing to one of the newspapers. However, we cannot, of course, control the actions of your contemporaries' correspondents.

The headings given to the grades of tea he mentioned, viz:—"Pekoe Souchong—rather bold leaf, indifferent liquor. Pekoe—some-what bold leaf, indifferent liquor" are meant to imply that they are the lowest classes of the respective grades which Ceylon is in the habit of sending, and it does not always happen that these are represented in each week's sale, and indeed, prices of such teas would not be published in our circular unless they were sold on garden account, as in that circular we do not give the prices of Colombo bought teas. As a matter of fact, the week after the one in which your correspondent writes, there were several parcels of Pekoe Souchong sold at and under the price we quoted, and had they happened to have been catalogued in the week in question we have no doubt that the price would have been correspondingly low, and had there also been pekoes of a similar character, these would also doubtless have sold under our quotation; had we then given the quotation as anything higher, any one wishing to criticise, without going fully into the case, might have written that our quotations were too high instead of too low. You will thus see the difficulty of pleasing everybody in these matters, and we can only do our best to hit the happy medium which is certainly not always an easy thing to do.—We are, dear sirs, yours faithfully,

GOW, WILSON AND STANTON.

OFFICIAL RUBBER-PLANTING IN BURMA: ANOTHER PROTEST.

Selangor, Federated Malay States, Jan. 13.

DEAR SIR,—I send you herewith a printed copy of a Memorial which the United Planters' Association of the F. M. States have sent to the Right Hon. Joseph Chamberlain in support of a Memorial which has already been sent to him by the Ceylon Planters' Association, and trust that it will be of interest to you.—I am, dear sir, yours faithfully,

E. B. SKINNER.

Hon. Sec., U P A, F M S.

[We quote from the Memorial as follows:—That your Memorialists desire to bring under your consideration the intention of the Government of India to plant up 10,000 acres in the Mergui Division of Burmah with the Para Rubber tree (*Hevea Braziliensis*). That, whilst it is stated by the Revenue Secretary to the Government of Burmah that this proposed scheme on the part of the Government of India is in the nature of an "experimental measure," your Memorialists desire to point out that the acreage referred to is at least equal to, if not in excess of, the whole area planted by private enterprise in the Federated Malay States, and the Straits Settlements.

That for the last five years the cultivation of Para Rubber has been progressing steadily in this country, and promises in the near future to be the

main agricultural staple. Owing to the continued depression of the coffee market, the Liberian Coffee Estates of this Peninsula have been almost without exception planted up with Para Rubber, in the same way that Cinchona and Tea were planted, with such successful results to that Colony, on the Coffee Estates in Ceylon; at the same time, a considerable area of virgin forest has also been brought under cultivation with this product in the Federated Malay States.

That in the Botanical Gardens of Ceylon and the Malay Peninsula, Para Rubber trees, of a sufficiently mature age, exist in sufficient numbers to render it apparently unnecessary for the institution of an experimental garden of anything like the dimensions as that which forms the subject of this memorial. That your Memorialists directly contribute to the revenue of the Federated Malay States, by paying an *ad valorem* export duty of 2½ per cent, on all agricultural products, in addition to payment of rents and premiums for land; that farther, in certain cases, special arrangements have been made with the Government whereby it is incumbent upon land owners to plant up the whole of their concessions with rubber within a period of ten years. That your Memorialists submit that the production of so large an amount of Para Rubber by the Government of India must result in serious competition with private growers, who have, under already existing circumstances, to contend against an enormous supply from the indigenous rubbers of other countries.
—Ed. T.A.]

TEA MACHINERY PATENTS: "WANTED TO KNOW."

SIR,—How long have Mr. Jackson's patents yet to run? Is not the time limit 14 years unless it be proved that the patentee has not received adequate remuneration, which could hardly be said in the case of Mr. Jackson's Rollers? For instance, at present a Rapid Roller cost £160 f.o.b. Contrast the metal and work in a roller with an elaborate machine such as an oil engine of, say, 10 horse-power, at about the same price. Surely, the time limit must be near at hand, for Down draft Siroccos, Rapid Rollers, Venetian and Britannia dryers? If memory serves me right, I possessed a Down draft Sirocco in 1888 and also a Rapid Roller!

PRO BONO PUBLICO.

[We met a gentleman the other day who said he put in Abbotsford (old) Factory, the first of Jackson's Dryers introduced into Ceylon?—What strikes us about our correspondent's query is that Jackson's is not the only Tea Roller; are any others much cheaper?—Ed. T.A.]

"THE INDIAN AND EASTERN ENGINEER."

Calcutta, Jan. 16.

DEAR SIR,—We are sending you herewith a copy of our January special issue which deals particularly with the Jamalpur Locomotive works of the East Indian Railway.—Yours truly,

THE EDITOR.

[We have received the periodical referred to above and have been particularly struck with the enterprise displayed by the publishers in the production of the magazine. Printed on fine art paper, it is profusely illustrated, many of the pictures being full-

page engravings excellently brought out. The special contribution of the month's issue deals with the Jamalpur Locomotive works of the East Indian Railway. The article is well written, and the many illustrations give one an ample idea of the magnitude of the workshops of this Eastern Railway. Of very special interest is a half-page illustration showing a substantial number of men—"Jamalpur's Representatives in South Africa"—who formed a maxim gun detachment with "Lumsden's Horse" in the earlier stages of the Transvaal war. The advertisements, too, we notice, are displayed in a perfectly artistic and up-to-date manner. We congratulate the publishers on thus keeping abreast of the times.—Ed. T.A.]

TEA MACHINERY AND PATENTS.

Jan. 22.

DEAR SIR—I see by your foot note to my letter published in your issue of 16th January that you think that I am invidious in singling out Mr. Jackson and Messrs. Davidson's patents. This is not so; all I wish to do is to ascertain if these or other tea machinery patents have lapsed. If so, the same machine could be turned out by local firms at probably a saving of nearly 50 per cent and yet give a handsome profit to the manufacturer and place the machines within the means of many a planter who, like myself, is sore-pressed for capital and the necessary machinery to cope with increased crops but starvation prices. It is commonly reported that Mr. Jackson's royalty is nearer £100 than £50 on each full sized Rapid Roller.—Yours faithfully, dear sir,

PRO BONO PUBLICO.

[We have heard a rumour that both Messrs. Jackson and Brown's patents have had a period added to them, to make up for the time spent in litigation.—Ed. T.A.]

PEARL OYSTERS OFF CROW ISLAND. TRINCOMALEE.

Harbour Road, Trincomalee, Jan 26th.

DEAR SIR,—I send you part of an oyster, and the smallest pearl, out of two, found in one of them. These oysters, of various sizes, have lately drifted in abundance on the shores of "Crow Island" opposite the late "Crawford Cutch Company Mills." I believe them to be from some disturbed beds driven by the tide during the recent heavy rains and the overflowing of the Mahaweliganga, or from some of the numerous bays outside and within the harbour. The pearl oysters at Kinniyai Bay are large oval ones, and glossy throughout the outside when polished, like the internal layers, but these are quite unlike them. Professor Herdman might do well to experiment on our coast.—Yours faithfully,
J. B. COLOMB.

[It is certainly Professor Herdman's intention to visit Trincomalee and that very soon too. We shall have pleasure in sending him the shell forwarded by our correspondent—a small thin one—doubtless of *Placoma placenta*?—and the pearl, a little beauty.—Ed. T.A.]

STENNING, INSKIPP & CO'S INDIAN & CEYLON TEA MARKET REVIEW

FOR 1901,
CEYLON.

The market opened with a stock of nearly 7,000,000 lb. in excess of the previous year and prices consequently ruled low; Pekoe Souchongs were in full supply at 3½d per lb. compared with 6½d per lb. in January, 1900, and by the middle of February had further declined, sales being made at 3d per lb.—the lowest price on record. By June, common grades began to advance, Pekoe Souchongs making 3½d to 4d per lb. During August and Sept. seven sales were held by private auction, containing 24,743 packages; after this they were discontinued. All good liquoring teas were in demand throughout the year, and the market closed with a firm tone, fair Pekoe Souchongs selling at 5½d to 6l per lb. Taking it all round, quality showed improvement and the absence of coarse tea was noticeable. Some of the gardens in the higher districts sent invoices with good flavour, and these were well competed for both by home buyers and exporters.

FOREIGN TRADE.—It is satisfactory to note that the export from this country to the Continent is steadily increasing, notwithstanding the larger direct shipments from Colombo.

INDIAN.

Lane, Jan. 1902.

THE MARKET opened in January with nearly 70,000,000 lbs. stock, a large proportion of which was common and undesirable. Pekoe Souchongs sold down to 3½d per lb., or about on a level with the closing prices of 1900. Fine and finest were in small supply and were readily taken at fair prices. During the early part of February common grades still further gave way, while all good teas were sought after at full value. The heavy duty payments made about this time much occupied buyers and withdrawals from sales were numerous. As the month advanced, the market steadied and all good liquoring teas were in demand at improved quotations. A few fine Darjeelings sold well; on the other hand, very low averages were made for poor quality Sylhets, Cachars and Dooars. During March and April all good liquoring teas met a quick demand at satisfactory rates, but a large proportion of the offerings was of extremely poor quality, and prices fell to the lowest on record. When it became known on the 18th April that no alteration would be made in the Duty, the market became quiet and remained so till the season closed. The new season began on the 1st June with an excess stock of 12,680,000 lb., the figures being 38,890,000 lb., compared with 26,210,000 lb., in 1900. This heavy supply, coupled with the fact that a very large amount of tea cleared in anticipation of the Budget had not passed into consumption, told against the early arrivals of the new crop, the opening prices for which were very moderate. By July all good liquoring teas met a ready sale, especially Assams, and some satisfactory averages were made; old season's common grades also slightly improved in value. During September a trial was made of

selling by private auction, but after six sales had been held, at which 41,812 packages were offered, the experiment was discontinued. Common grades began to harden, while on the other hand, all good medium tea declined, the quantity of such being rather in excess of the demand. In October buying became more general and some slight improvement in value was noticeable for medium grades about 6½d to 7d. In November it was decided to regulate the weekly supply at auction; during this month and December quotations remained steady, the large falling-off in the exports from India and the consequent reduction in stock having brought about a firmer tendency on the part of Importers. The year closed with a better tone for all grades, ordinary Pekoe Souchong being worth 5½d per lb. against 3½d at the opening sales of 1901, about ½l per lb. of this difference being attributable to improvement in quality.

With a few exceptions it is to be feared that at the best only moderate dividends can be looked for as the result of the season's working, the general average price being not much in advance of that of the previous year; while owing to climatic conditions and greater care in the plucking, the yield of leaf has fallen decidedly short. Looking to the future it is to be hoped there will be no reverting to coarse plucking consequent on the improved prices compared with last year. Now ruling for the lower classes, it must be borne in mind that the increase from the additional area which will be coming into bearing will undoubtedly again lead to overstocked markets and unremunerative prices if this policy be resorted to. Growers both in India and Ceylon, now that they have secured so much of the world's demand, should use every endeavour to retain their customers by maintaining a satisfactory standard of quality for their produce. The stock at the close of the year was rather in excess of that in 1900, but this is accounted for by the increased facilities for despatch from some of the districts. A very encouraging feature is the expansion in the deliveries which during the twelve months amounted to almost 13,000,000 lbs., of which home consumption accounts for 10,000,000 lbs. and this in spite of the increase in duty.

THE NEW REGULATIONS regarding the weighing of tea are now in force, viz. :—

1. If the package weighs the even pound, it is to be entered as such.
2. If it weighs the even half pound or over, it is to be entered as the next pound above.
3. If it weighs below the half pound, it is to be entered as the pound below.

LOSS IN WEIGHT.—As this occasionally gives rise to much dissatisfaction we offer the following suggestions: that the gross weight of the package should be a few ounces, say four or five, *above* an even number of pounds, and that the empty package, complete with leaf, nails, bands, &c., be to a like extent *below* an even number of pounds. In weighing here the gross weight is *reduced* to the even number of pounds, whilst the tare is *increased* to an even number of pounds.

With regard to Garden Bulk Tea, it is imperatively necessary to put an equal quantity into each package of the break, and this quan-

ity should be four or five ounces over the desired weight of contents, viz., if the packages are invoiced to contain 100 lb. tea each, not less than 100 lb. 4 oz. should be weighed in; test packages, weighing here a fraction under 100 lb., are reckoned as 99 lb only, or a loss of 1 lb on each chest of the break.

Careful observance of the foregoing precautions will prevent loss and disappointment.

DRAFT of 1 lb. per package on all packages grossing 29 lb. and upwards is allowed to the buyer.

WEIGHT OF PACKAGES —When a gross weight of 129 lb is exceeded, there is an additional charge of 4d per package up to 139 lb. The following sale of charges fully explains this and deserves attention :—

Dock and Warehouse management rates, on packages of which the average gross of each break is as under, are :—

lb,	lb.	lb.	lb.
160 to 199	130 to 159	90 to 129	80 to 89
2s 2d	1s 10d	1s 6d	1s 4d
lb.	lb.	lb.	lb.
60 to 79	45 to 59	35 to 44	17 to 34
1s 2d	11d	10d	6d

The above charges do not include Rent or

Bulking (where necessary).

MARKS ON CHEST.—Nothing is wanted or is of any service here beyond (1st.), Garden Mark; (2nd.), Description of Tea; (3rd.), Garden Numbers. Gross, tare and net, are not of the least use, and should be discontinued.

MATALE PLANTERS' ASSOCIATION.

TEA.—Referring to the figures collected at the beginning of last year we have the following totals :—

Acree in tea 20,313 acres; acree in bearing 18,152 acres; estimated crop, 7,882,000 lb., In collecting figures for 1902, the Honorary Secretary got out a new form, collecting details of the three principal products of the district, and these were very well responded to, both by members of the Association and non-members, to whom thanks are due. The writer had to estimate crops, and returns, for only about five estates out of about eighty odd to which circulars were sent. The difference in acree and estimates for 1901 between the figures now compiled and those of the beginning of the year is due to the fact that a few estates have since been excluded as not actually within the district. We now have :—Total acree in Tea 19,566 acres; Total acree in bearing 17,345 acres; Reported abandoned, 1901, 407 acres; Opened in 1901, 71 acres; Original estimate 1901 7,561,500 lb. Tea; Crop secured 7,252,140 lb. Tea; Estimates for 1902, 7,613,215 lb. tea. Above figures were collected from 79 estates. The crop secured in 1901 works out at 418 lb. made tea per acre, and it must be admitted that the crop realised comes exceedingly near the amount estimated, which would seem to show that there was not much alteration in the plucking throughout the district as a whole, though the Elkaduwa district estates are reported to have gone in for somewhat finer plucking during the year. The estimated yield for 1902 shows an increase, but this may easily be due to an increase in the bearing acree, as the figures show about 2,000 acres, roughly still to come into bearing. A fair amount of manuring seems to be going on throughout the district, but probably more with a view to keep up

yield rather than increase it. This particularly applies to estates in the bottom of the valley opened in chena land. On the whole the district is holding its own in yield, whilst during the last six months very fair prices have been realised, and the outlook for 1902 is fairly good. Still we must not forget that we have gone through a severe crisis, and there may yet be another and a worse one in store for which it behoves us to be prepared.

CACAO.—The exports during the past year have been the largest on record, an increase to which this district has contributed its portion. As little new land is coming into bearing it may be assumed that this means an improvement in the agricultural position of the product, and that Canker and other pests are being successfully combated. Speaking generally, the cacao estates in this district are in a flourishing condition, and there is every prospect of a continuance of good crops. Spraying of the pods and trees has been carried out on a few estates with beneficial results. The statistical position of cacao generally is sound, consumption is increasing, and the stocks are lower than they have been for some years, but the market for Ceylon has been disorganised, and cacao is hard of sale. This is probably to be accounted for by the mixed character of the cacao now exported. Lots of pure red cacao without a mixture of dark beans are now very rare, and will become rarer still as Forestero takes the place of the red. Lots of unmixed red cacao will always command exceptional prices, but the future of the enterprise depends on Forestero, and planters must in future be content with such prices as good. West Indian commands, with which growth Ceylon will probably in future sell. Theft of cacao has occupied much attention during the last year, and the Association has succeeded in establishing the fact that as regards this evil the district is in an exceptionally bad condition. Acting on our advice the Government Agent and his Assistant have lately interested themselves in the suppression of this crime through the village headmen and police. The result has been fairly satisfactory, and theft has decreased, owing partly no doubt, to the improved supervision of the headmen, and their being compelled to interest themselves in the suppression of theft in their districts. The year, however, has been an unfavourable one for judging of the effect of the efforts of the officials mentioned, as cacao has been hard of sale, and the thieving industry has therefore naturally languished. We, however, give every credit that may be claimed for the improved state of things. We presume the Government Agent and his Assistant have done their best, and we are therefore now in a position to point out where the law fails. As it stands at present, to secure a conviction, eye-witnesses of the actual theft are necessary. This means that a man may be seen leaving an estate with a bag of stolen cacao in his possession, but unless he has been seen actually picking the pods he goes free. A store may be broken into and the cacao stolen may be found in a receiver's boutique a quarter-of-a-mile off an hour afterwards, but unless an eye-witness can be produced to the theft, and to the delivery of the cacao to the receiver, no prosecution can be carried out with a hope of success; the cacao is lost to its local owner, and the receiver can sell it openly. Under such circumstances the wonder is not so much that theft exists, as that we succeed in keeping it in all hand. Special outbreaks of crime are met by special legislation all the world over, and in the coffee days in Ceylon, Government did not shrink from such a course. The position of things now as regards cacao is very similar, and in our opinion special legislation is urgently required.

RURAL POLICE were condemned as useless by this Association last year. This year another trial has been given to them close to the town of Matale where they receive very close personal supervision from the Assistant Government Agent and the headmen are compelled to work with them. Under these circumstances the police are a success; but this fact in no way affects the utility of such a force in outlying parts of the district

where such provision is an impossibility. We further wish to point out that rural police are an expense to Government and to the planters, and that we believe that by special legislation crime could be suppressed without any expense to either. Per figures collected—Acreage under cacao in Matale districts 9,627 acres; acreage in bearing, 7,922 acres; crop secured in 1901, 14,026 cwt.; crop estimated for 1902, 15,508 cwt.; acreage opened in 1901, 194 acres. Above figures include 400 acres estimated native gardens. Yield per acre $1\frac{1}{2}$ cwt. Figures collected from 52 estates.

CARDAMOMS.—The total area in Ceylon under this product cannot be under 7,000 acres of which fully one-sixth is in the Matale district. During the early part of the year crops are so very short that it was generally supposed the total export would be under that of last year, but the shipments in December, about 120,000 lb. being far in excess of any previous months' shipment, ran up the figures to 559,704 lb. or 32,249 lb. in excess of the previous year. With favourable weather during the present year the crop will in all probability be close on 600,000 lb. As this spice is but little known in the continental and European markets, every opportunity should be seized by growers for sending samples to exhibitions of Colonial products. Per figures collected:—Acreage under cardamoms, Matale district, 1,515 acres, acreage in bearing, 1,013 acres; crop in 1901, 77,408 lb.; estimated crop in 1902, 96,100 lb.; acreage opened in 1901, 141 acres. Yield per acre 76 lb. Figures collected from 23 estates.

RUBBER.—In writing of rubber in Ceylon we include the three varieties, Ceara, Para, and Castilloa. As regards the first, "the old Ceara" as it is generally called, there is little to be said. Ceara rubber grows like a weed almost anywhere in Matale and seems to thrive where little else can get enough out of the soil to even exist. Unfortunately the market value of the rubber collected from this tree is so low that it is scarcely worth tapping. From the small amount of tapping which has been done it is very evident that a tree growing on the banks of a river gives Rubber in much larger quantities and much more freely than another tree of the same age and size planted back from the river banks.

CASTILLOA RUBBER.—This tree appears to grow well here in fairly good soil and does not seem to depend so much on the rainfall as the Para tree. We have trees on this estate said to be about 12 years old and these were tapped by Mr. Gordon Reeves about two years ago and he has supplied the following figures:—Tapping for 6 months, from October to March inclusive, 6 trees gave 11 lb. to 12 lb. of Rubber, nearly 2 lb per tree. Mr. Reeves thinks that with more careful tapping and curing the yield might be brought up to nearly $2\frac{1}{2}$ lb. per tree, though he doubts if the trees would give more than that amount if tapped twice during the year. The latex from these trees runs much more freely than that of the Para trees, hence the cost of production should be much less. The trees here began to bear seed at 8 to 9 years old, but seed has been picked from a tree only about 9 ft. high and not more than 4 years old; there were only about 4 cones containing 8 or 9 seed each, but this does not make the fact of so young a tree bearing seed at all, any the less remarkable. Mr. Willis of Peradeniya states that Castilloa trees do not bear seed in any quantity unless planted in a grove of eight or ten trees together and my own experiences bears this out. This seemed to point to the trees being male and female, but on writing Mr. Willis, he says that male and female flowers both grow on the same tree and must be pollinated. This is now done by insects and a large percentage of the flowers always fall off. Enquiries are to be made as to whether it cannot be done by hand, and if this is possible a very large crop of seed could be obtained. There is a clearing of 42 acres of Castilloa Rubber planted 15 by 15 ft. between cacao lines on Ambanganga estate in Matale North where

both rubber and cacao are doing exceedingly well; the soil is good though inclined to be "irony," but the rainfall is very low. In planting Castilloa, basket plants should be used and the basket put low in the hole, so that the earth level may come 2 or even $2\frac{1}{2}$ inches up the stem of the plant. The reason for this is that though the plant is an exceptionally hardy one, if one gets dry weather after planting, it is apt to die down to the earth level, and then if planted as I suggest the stem below the earth level will send up new shoots.

Castilloa is probably the Rubber for Matale District.

(Signed) H STOREY,
Hon Secretary.

The report was adopted.

PLANTING NOTES.

THE BANANA seem much to the front at the present day, and comes in for a good deal of laudation; the banana plant, says M de Lovedo in *El de Progreso Mexico*, will feed 150 men from the product of one hectare of land so planted, while the same area in wheat would only supply food for six individuals, for the same space and under similar conditions of cultivation, its produce is 40 times that of potatoes and 100 times that of wheat. The fruit of the banana contains 72 per cent of water, 2.14 per cent of nitrogenous matter, and 22 per cent of saccharine substances, the latter giving it its great nutritive quality.—*Hawaiian Planters' Monthly*.

THE PROTEST against the increased Tea Duty from the Secretaries of the India and Ceylon Tea Associations appears in the London *Times* of January 11th, received by the French mail, and is as follows:—

THE TAX ON TEA.

TO THE EDITOR OF THE "TIMES."

Sir,—In your leading article of this morning on Sir Robert Giffen's financial programme you say that "there can be little doubt that tea would bear a charge of 2d or 3d per pound more."

We wish to state that the whole subject of the tea duty and its incidence was fully dealt with last year in a memorial from our association to the Chancellor of the Exchequer.

The Chancellor, in his Budget speech on April 15 last, said:—

"I turn to tea. Tea has already been taxed up to 75 per cent of its value. It is produced mainly in India and Ceylon, and it is a product in which our fellow-subjects at home and abroad are deeply interested, and the trade in which, I think, largely owing to over-production, is not in a very satisfactory condition. I do not think we ought to increase the duty on tea."

Again, on June 18, in a speech on the Finance Bill, he said:—

"If it should ever be his happy lot to be able to reduce taxation, he should be disposed to reduce the duty on tea rather than on beer or spirits."

Your present proposal to increase the duty by 25 to 40 per cent on the value has hardly, we think, received due consideration.

We are, Sir, your obedient servants,

ERNEST TYE, Secretary, Indian Tea Association.

WM. MARTIN LEAKE, Secretary, Ceylon Association in London.

14, St Mary Axe, E.C., Jan. 10.

IMPERIAL DEPARTMENT OF AGRICULTURE FOR THE WEST INDIES :

HINTS FOR SCHOOL GARDENS.

This is the second Primer issued by the Government Department; the first was drawn up by Mr Watts and called "Nature Teaching."

The present pamphlet is intended for the use of the Village School Teacher, and from it he can set his pupils to work in the garden allotted to the school, or if space is too limited, he is to start the children, using flower-pots and old packing cases or portions of kerosine tins, for "box and pot cultivation." Full directions follow as to preparation of soil, the sowing of seed, and care of seedlings. The next chapter is on the garden—the laying out, preparation of the soil, seed-beds, raising seedlings, thinning and transplanting, care of plants and propagation by layering. Chapter III. is devoted to the subject of manuring—compost heaps and manuring experiments, but in no case to theories. It is all for the practical work of a garden and any school teacher with this guide in hand could give a valuable series of lessons to school children in their allotted gardening hours, thus implanting a taste for making vegetable or fruit gardens around their own homes. Every direction is delightfully clear and complete. Mr. W. G. Freeman, Mr Morris's Technical Assistant, is the writer of the pamphlet.

INDIAN TEA CROP :—1902,

THE NEED OF CAREFUL "PLUCKING," (Circular.)

To all Members of the Association.

DEAR SIRS,—I am directed by my Committee to send you a copy of the following resolution which was passed unanimously at a meeting held this day :—

"That this Committee, viewing with grave concern the disastrous results that would follow a large crop of tea in 1902, would strongly urge upon producers the necessity of restricting output as much as possible by a system of more careful plucking or otherwise, and to avoid more especially the production of coarse tea which did so much harm to the industry in season 1900."

The above resolution having been unanimously accepted by my Committee, I am desired to give you their reasons for the conclusions arrived at, which are shortly as follows :—

In their opinion the experience of the past two seasons has conclusively proved—

(a) That the coarse plucking resorted to in 1901 resulting in a plethora of common undesirable tea being forced on an already over-supplied market, led to a lower level of prices than has hitherto been known. Pekoe souchongs were sold as low as 3½d, a price which must have been well under the cost of production.

(b) That, per contra, the more careful plucking resorted to in 1901, combined with climatic influences, restricted the output to such moderate limits that the market immediately responded, thus showing that the price of tea is controlled by supply, which control is entirely in the hands of the growers themselves.

Messrs. Thomas Cumberlege & Moss, in their Circular of the 3rd inst., make the following statement :—

"Of the 187,000,000lb. and 145,000,000lb. respectively produced in India and Ceylon during season 1900-1901, the last 12,000,000 lb. from the former country and the last 8,000,000 lb. from the latter were at a moderate estimate the actual cause of an aggregate loss to Importers of over £1,000,000 sterling; this, on the

face of it, is an absurd situation, and it is not to be doubted that by individual or collective action some means will be found to prevent its recurrence."

It is, therefore, abundantly clear that it would be a disastrous policy to revert to the system of coarse plucking resorted to in 1900. It would mean that the end of 1902 would see the industry again in a position of great depression equal to, or worse than that at the end of 1900.

The position of Indian tea has not, for some years, been as strong as it is now, and this is owing to the certainty of a shortage as compared with the 1900 crop of from 10 to 12 million pounds. The shortages from Ceylon, China and Japan, also of considerable extent, further tend to strengthen the Indian position, and it is with the object of warning those who are directly connected with the industry that my Committee think it desirable that every member should carefully consider the position in framing his estimates for the coming season. One Indian Company whose estimates for the coming season were placed at 5,000,000 lbs has cut them down to 4,400,000 lb. and if this policy is adopted by all producers the result will be a far-reaching benefit to all concerned.

With a falling-off of at least 10 million lb in supplies of Indian tea during the coming season, with home deliveries here increasing in the same proportion as they have done during the past twelve months, and with the natural increase of demand from abroad, it is obvious that Importers have now an opportunity such as they may not have again for years of putting the industry once more on a sound and profitable basis.

An appeal to the same effect as the above is being issued by the Committee of the Ceylon Association to all Ceylon tea growers. Seeing how loyally these responded to a similar appeal in the past season, and seeing the direct and tangible benefit that both Ceylon and India derived therefrom it is confidently anticipated that the Growers in both countries will again loyally respond and so remove the reproach that tea planters are incapable of concerted action for the common weal.—Yours faithfully, ERNEST TYE, Secretary.

14, St. Mary Axe, E.C., 7th January, 1902.

WHEN COFFEE IS GOOD.

There are various ways of making coffee, and many places for the consumption of it. Few, it will be admitted can really make good coffee, but very often coffee but indifferently made may taste like nectar. Take for example the time when one is almost completely overcome with thirst, or when one is particularly hungry. Then coffee is at its best. The following "poem" is from *Planting Opinion* :—

The man wot keeps a early coffee-stall
And sells good stuff, and always is perlite,
Is wot I call the neighbour of us all,
And well I know the truth of wot I write.

You 'aven't got no baccy, and the dawn,
Though late is 'ardly showing up at all.
W'y all your bloomin' pleasures would be gawn
If 'twasn't for the early coffee stall.

And 'im wot keeps it—wot a lot 'eknows
From them as do not get it second 'and!
Wot nice illumination, 'ints 'e throws
On little things you could not understand!

A egg, a cup of coffee, and a slice,
A chat which i'm w'en things is goin' slow;
My brother, take and 'ark to my advice—
These are as good as aught that you may know.

I talk impartial, as a family man,
That do not walk nocturnal now at all;
Find me a chap more useful if you can
Than 'im as keeps a early coffee-stall.

THE FUTURE OF THE PLANTING
INDUSTRY IN INDIA :
POSSIBILITIES OF SUGAR.

SPEECH BY MR. COX.

A dinner was given lately at the Station Club, Muzaffarpur, by the Planters' Association. Over sixty were present. Sir William Hudson proposed the toast of the King. Mr Macnaghten gave that of Sir John Woodburn, who, he said, as Lieut.-Governor had shown an active interest and a keen insight into the requirements of the Planters excelled by none of his predecessors. His Honour, in replying, referred to the support always given to Government by the Planters which was not forgotten now that an opportunity offered for reciprocating their past services. Their position was serious. It was essential to relax no effort to place the industry in a sounder position. He appealed to the young men especially to take a keener interest in experimental work. While he was pleased to note the gallantry and buoyancy they displayed, joined with a spirit of indomitable courage, it was necessary to exercise prudence and circumspection if success were to be achieved.

Sir William Hudson proposed the health of the guests coupling with the toast the name of Mr C S Cox, who responded as follows:—

Your Honour, Mr. Chairman and Gentlemen,—While there are several present here who probably could more fitly be put in a position in which I find myself, I am not sorry to have the opportunity, which is being given me, to refer to a matter about which something has already been said tonight.

THE ATTRACTION OF CAPITAL.

This question of the sugar industry in Behar was first brought to our notice by Sir William Hudson and his brother, mainly no doubt because it was known that we had for sometime previously been interesting ourselves in the matter of the Currency Policy of the Government of India, and on that account might reasonably be expected to be prepared to enquire into any promising industrial development. It was thought by many that when India went on a gold basis, that fact in itself would be sufficient to attract capital to the country, but we found in practice that while stability of exchange is essential on many grounds, that alone is not sufficient to attract capital for investment here. I may remind you of the cases, for instance, of the Argentine and the Brazils, which continue to attract capital in spite of a fluctuating exchange. The real reason for this is that big profits have been made in the London market in connection with these countries, while no one of this generation has made profit in the London market over India. The great enterprises in India, railway, &c., have been controlled by Government, which does not allow large profits. Possibly money has been made locally in the manufacture of tea and jute, but these have had no effect on, nor have they tempted London. This is shown by the fact that there is no Indian market on the Stock Exchange in London as anyone may at once discover who has a suggestion about India business to make to a London stock-broking firm, and we had realised, before I met Sir William Hudson, that it was absolutely essential that something should be found and actively followed up, which appeared to afford a reasonable chance of making a practical demon-

stration to English financial circles of the opportunity vouchered for by the Currency Committee in July, 1899, before India had any chance of attracting English capital.

The Committee reported among other things that "the natural resources of India are beyond question, as also is the need for their development. In order to develop and reap the benefit of her resources, India requires, and must long continue to require, foreign capital. We desire to record our opinion that the effective establishment of a gold standard is of paramount importance to the material interest of India. Not only will stability of exchange with the great commercial countries of the world tend to promote her existing trade, but also there is every reason to anticipate that with the growth of confidence in a stable exchange, capital will be encouraged to flow freely into India for the further development of her great internal resources."

In another clause speaking in January, 1899, Lord Elgin said:—"India has most of the advantages which are calculated to inspire the capitalist with confidence." But these mere expressions of opinion, however influential, don't attract capital.

THE INTERESTS OF THE PLANTER.

Without knowing anything practically about sugar, I at once grasped the possibility of such an industry in India, if the figures and facts supplied to me, on investigation, proved to be reasonably correct. I was favourably placed for checking the figures given me about Queensland and other countries—I came to the conclusion that there was a reasonable probability that Sir William Hudson had not over-stated his case, and we sent out an expert to report on the correctness of the local conditions, as they had been represented.

At this stage in our progress we were not a little encouraged by His Honour's Government appointing a Commission to investigate the whole subject, in the interests of the Behar planting community. While we had made considerable progress previous to this announcement, the form in which the instructions to the Commission were given by the Bengal Government, emphasised the interests of the planters in the matter, and having a predisposition, in regard to our whole scheme for the promotion of the industrial development of India, to act on the line of the least resistance with the said Government, and the Government of India we, from the start had it very much in our minds, that the interests of planters in the matter should receive every consideration. The more I have looked into it and become acquainted with the local conditions, the more I have been convinced that everything in the direction of promoting that planters' interests has been equally the promotion of our own.

Sir William Hudson at an early stage of our intercourse made this point strongly to me, and it is due to this gentleman and to his brother that, I should state, not only in regard to this point but of all other facts and figures put before me, over two years ago, that they have been borne out by our recent experience and experiments. I have myself felt the greatest interest in this aspect of the case, for as a planter in Ceylon I had experience of the coffee crisis in 1880-82, a crisis in many respects very similar to that now being experienced here, and I trust that planters will benefit from that experience.

SUGAR AND INDIGO.

The coffee planter of 1880 was proud of his coffee and looked down upon tea. The indigo planter of today is in an equally natural manner attached to his old love, and prefers that it should not be displaced even to his own profit and it is possible even, like the Ceylon planter, he goes the length of looking down upon sugar. My impression is that the most effective way to fight the indigo battle to the issue is for the indigo planter to find something, such as I hope this sugar will prove, which will relieve any anxiety he may feel, and which at the same time will enable him to look upon his indigo cultivation as to some extent a by-product. You will then very soon find out how long the Badische Company can fight on those terms, and if he can "see" you, you will use the least expensive manure for sugar and thank heaven that he did not only see you, but break you before you could afford to let him.

We have gone into this business on a somewhat extensive scale for an experiment, in fact, what we have done already can only be regarded as the very strongest expression of our own confidence in the scheme. While the extent of the experiment has actually caused us no inconsiderable amount of anxiety, I consider we are repaid by the knowledge of the fact that there would have been serious danger, had it been on any smaller scale of its not meeting the requirement of the case. I have spoken of an experiment in sugar—I should rather have spoken of experiments, for we are growing and manufacturing sugar at five different places, and there has been at more than one of these places almost enough to have given a serious set back to the whole idea, had any individual case stood by itself for the whole experiment.

SATISFACTORY EXPERIMENTS.

At one place we have demonstrated to the planter that machinery cannot be run with an insufficient head of steam. At another, that cane planted in the native fashion, and by a mere scratching of the ground, and not afterwards properly cultivated, will entirely fail to stand such a season as the one which we are now experiencing. At another, we have demonstrated that only the best varieties of cane, even with cultivation of an approved character, will carry the plant through abnormal weather conditions, as at present obtaining. But at still another place, we have shown that where seed of native thin cane has been carefully selected, and where cultivation has been carried on in the modern way, in spite of abnormal weather conditions, we have got a result, I think, which would not be considered unsatisfactory in most countries in the world—for a start. I say for a start, because years of the highest expert attention have been devoted to the scientific cultivation of cane, to attain the highest possible of today.

But there is yet another and highly important point which we have made good. Whereas we have shown that, given fairly selected seed and proper cultivation, in an abnormal season, not unsatisfactory results can be got, we have shown at two distinct centres that seed of improved varieties, imported into the district, gives results of which any sugar-growing country in the world would be proud, and this in the face of the most unsatisfactory weather conditions for sugar tha

have been experienced in this province of Behar for the last 25 years. I cannot but feel a certain satisfaction that we should have got so far as this within less than a year of the issuing of the Government report, which report confirmed in almost every particular the report of our own expert.

I had almost omitted to remark upon the engineering difficulties which have been overcome, I believe that no 2,000 tons of machinery have been ordered, transferred many thousand miles by sea, and come so far by rail, and been erected in anything like the time, and the engineers who pioneered this business are deserving of all praise, as anyone will no doubt agree who sees the progress of our principal works at Ottur. We have had many critics who have said that sugar was tried before. Mr O'Connor's very able report entirely answers this objection in the most conclusive manner.

A WORD OF CAUTION.

With my experience of today, I can find half a dozen other reasons why sugar failed before. Just one word of caution, and take it from me that sugar manufacturing is a chemical science. Reports have been current that our machinery is not producing a hard solid sugar as made by the native manufacturers. This solid, so-called, sugar, contains all the extraneous matter and dirt originally in the juice, and this coagulating hurries the solidification. We take all this dirt out before boiling—we can give a solid result thereafter, if we wished to—but the result is to caramelise or turn a large quantity of the cane sugar, and this is absolutely lost. I can only trust that what I have said justifies the claim which I have made upon your attention, and for the very hearty way in which the toast of your guests was responded to; it only remains to me to thank you on their behalf.—*Pioneer*, Jan. 25.

CENTRAL TRAVANCORE PLANTERS' ASSOCIATION.

THE TEA DUTY PROTEST.

An extraordinary General Meeting of this Association was held at the Glenmary Bungalow on Saturday to protest against the suggestion of increasing the tea duty:—

Present.—Messrs F M Parker (Chairman), Hon'ble Mr. G L Acworth (by proxy), Messrs H M Knight, F Bisset, Buxton Laurie, G A Rutter, E Latter (by proxy), Mrs Munro (by proxy), Messrs H G Blandford (by proxy), R S Imray (by proxy) and D McArthur (Honorary Secretary).

The Chairman in opening the meeting read a telegram from the Hon'ble Mr G L Acworth regretting his absence and then addressed the meeting as follows:—"Gentlemen, I have called this General Meeting of our Association for the purpose of asking you to protest against the suggestion of Sir Robert Giffen embodied in a letter to the *Times* and which, according to the telegrams, has been endorsed by that Journal, to increase the duty on tea by another two pence or three pence per lb. I can hardly take this suggestion seriously or think that it will have any chance of being accepted by Government. It is fully aware of the depressed condition of the industry and it knows that we are already saddled with a very heavy duty, out of all proportion to the value of the article on which it is levied. We cannot forget the Chancellor of the Exchequer's last Budget speech so full of sympathy, almost of hope that this year he would propose a reduction and not an increase of duty. It is only natural that prior to the Budget all sorts of

schemes should be suggested to suit diverse interests but as this one hits us very hard I ask you to protest against its adoption to the utmost of your ability. Gentlemen, we are all loyal sons of the Empire, we are all ready to pay our share of the expenses of the war, but I ask you, are we not already doing so almost to breaking point? An increase of duty, and the subsequent check to production, would be a burden too grievous to be borne, and our industry would be crippled to the point of extinction. In these days of Imperial Federation it is surprising, that British tea grown in British possessions with British capital by patriotic Britons, should be swooped down upon to provide an increased Revenue when almost every article of foreign production is admitted duty free. This may be sound political economy in theory, but in practice I would like to see free trade in British produce throughout the British Empire and a duty imposed on all foreign articles and on every letter of the words "Made in Germany." Gentlemen, I beg to move the following Resolution:—

"That this Association emphatically protest as a matter of vital interest against the suggestion to increase the British import duty on tea."

Mr H M Knight, in seconding the resolution, pointed out that the present duty of 6d per lb, was equivalent to 100 per cent on the value of Indian teas sold in 1900-01 and that the industry cannot bear any increased burden. Many gardens did not sell their teas in these two years at a price that recouped them from the cost of production, in fact made a considerable loss, and in consequence some concerns had closed their doors, and if the proposed tax is adopted many more must follow their example in S. India. Carried *em con.*

The Meeting then ended.—*Madras Mail*, Jan. 31.

THE ROSE FOR MERRY ENGLAND.

Our American cousins are now much exercised in their minds as to what flower they shall adopt as a national badge. The discussions have been long and varied. Even now, no conclusion has been definitely arrived at. The same question has turned up here in connection with the Coronation ceremony next June. We should not have thought that there was room for any dispute on the subject. The rose has been for centuries so entwined with our history that we should have supposed no other flower could have been budded on a British stock. The rose is said to have been the badge of Edward I. in the thirteenth century; in 1397 John of Gaunt bequeathed to the altar in St Paul's his coverlet of cloth of gold sprinkled with golden Roses. We had thought it possible that on one or more of the numerous shields on the tombs of the Black Prince and of Henry IV. in the Cathedral at Canterbury, a conventional representation of the Rose might have been found. Through the courtesy of the Dean, we are enabled to say that this conjecture is erroneous, and that neither on the tomb of the Black Prince, nor on his hauberk still preserved in the Cathedral, is there any representation of a Rose. Its connection with the houses of Lancaster and of York is, of course, known to all of us, and was forcibly recalled to mind last summer when a Rose show was held in the historic Temple Gardens. In Tudor times the Rose was constantly used as an architectural adornment, and may still be seen at Westminster, and many a similar fane.

From this point of view it is interesting to quote what Evelyn, writing in 1679, says: "For even the very Damask Rose itself, as my Lord Bacon tells us, Cent. 2, Exp. 659, is little more than an hundred years old in England." Compare this with what is said by Parkinson, writing in 1629. Parkinson mentions thirty sorts in his garden, everyone notably differing from the other.

But when the Rose was adopted as a national emblem, Canada, Australia, Tasmania, and New Zealand had not been discovered; and—except in Canada—there is not a native Rose in either colony; nor is there any part of South Africa, the West Indies, Mauritius, or Ceylon. Half the British Empire then has no Rose unless by introduction.

When we get a federated Greater Britain, it is clear we shall have some difficulty in fixing upon a flower that is common to all the component elements. This being the case, it will be best to disregard points of geographical distribution as pedantic in the circumstances, and to fall back on the old heraldic, conventional Rose as the floral badge for the whole empire.

The Hon. Mrs. Boyle, in her charming *Ros Rosarum*—*Dew of the Ever-living Rose*, cites from an old ballad some lines, which are so appropriate to the occasion, that no apology need be offered for quoting them. Alluding to the White Rose of York and the Red Rose of Lancaster, the ballad proceeds:—

"These roses sprang and budded fair,
And carried such a grace,
That Kings of England in their arms
Afford them worthy place.
And flourish may these Roses long,
That all the world may tell
How owners of these princely flow'rs
In virtues did excel.

To glorify these roses more,
King Henry and his Queen
First placed their pictures in wrought gold
Most gorgeous to be seen.
The King's own guard now wear the same
Upon their back and breast,
Where love and loyalty remain,
And evermore shall rest.

The red rose on the back is plac'd
Thereon a crown of gold;
The White Rose on the breast is brave
And costly to behold;
Bedeck'd most rich with silver studs
On coat of scarlet red;
A blushing hue which England's fame
Now many a year hath bred."

The warders of the Tower still wear tunics embroidered in the manner here described.

But in spite of the claims of long descent on the part of the Rose, a claim is set up in some quarters for the Iris, which some say is the Fleur-de-Lys. Unfortunately for this contention, it is not yet settled whether the device is really intended to represent an Iris, a Lily, or a spear-head!

Again, Fleur de Louis is considered to have been the original name, and this has been converted into Fleur de Luce, Fleur de Lys, and Fleur de Lis. Prior, in his *Popular Names of British Plants*, mentions the legend that a shield charged with these flowers was brought to Clovis from heaven while engaged in battle against the Saracens. They were assumed by Louis VII. in 1137 as his device, and later on they were bestowed on Joan of Arc.

No doubt several of our monarchs did quarter of the Fleur-de-Lys on their coats of arms as a testimony of their rights in France, rights now happily long become obsolete, and consequently also the claim to quarter the Fleur-de-Lys.

Another claimant put forward for heraldic recognition is the Lily-of-the-Valley, a native plant of unsurpassed elegance and delicious fragrance, but having no claim whatever to be accepted as a national emblem. Much historical interest attaches to the rose and to the Fleur-de-Lys, but the Lily-of-the-Valley is totally devoid of any such relation. What the "Lily-of-the-Valleys" of the Canticles may have been we do not know, but we may be pretty sure it was not what we call the Lily-of-the-Valley, which is not a native of Palestine.

The Christmas Rose puts forth no claim to historical significance, but its lovely flowers, expanding at this season, are so beautiful, that they confer a right to the popular name Rose, although botanically they have nothing to do with the genuine rose.

Whatever flowers be adopted for merely decorative purposes at the Coronation, we plead that as a matter of ceremonial usage, no other than the Rose of England be adopted.—*Gardeners' Chronicle*, Jan. 4.

THE HUMUS OF SOILS.

A garden soil must contain in addition to the necessary mineral constituents of plants a suitable supply of available nitrogen or the plants cannot make the necessary growth requisite for full development of flowers and fruit. It has been found by analysis that one part of nitrogen in a soil will correspond to about 10 or 12 parts of humus. Any increase or decrease of the nitrogen in soils is followed by a corresponding increase or decrease of humus. The loss of humus and organic matter from a soil not only reduces the stock of nitrogen but also reduces the amount of available mineral-food as well. The decaying animal and vegetable matters present in all good soils produce acids which act upon the inert and inactive plant-food elements and render them available. The humates or organic products which are formed by the union of the organic acid products derived from the decay of the humus combined with the mineral matter of a soil form valuable plant food.

Experiments have shown that humate of lime is capable of being assimilated and utilised by plants. Potash, phosphoric acid and all of the mineral elements of plant-food when combined with humus and nitrogen constitute valuable forms of food for all kinds of garden crops.

The high fertility of old kitchen garden soils is due to the large store of humus. The loss of humus changes the physical properties of a soil, both as to colour, weight per cubic foot, and retention of soil-water. A loss of humus and vegetable-matter causes a lightness in soil-colour, an increase in density and compactness with a less capability to retain moisture. A dark-coloured soil becomes hotter in the sun's rays than a light coloured one; but at night all soils will cool to the same point.

Humus conserves the moisture of a soil, while a rotation of crops, the use of stable manure and the digging in of vegetable refuse conserves the humus. If the soil contains too much humus the vegetative system of plants becomes overfed by an excessive quantity of nitrogen luxuriance of foliage and stem-growth is encouraged, while flowers and fruit development are retarded. In general it may be said that an abundant supply of potash and phosphoric acid, especially the latter tends to increase fruitfulness, hardness and firmness of leaves and stems; while an abundance of nitrogen and humus has a tendency to produce just the reverse conditions. While the plant cannot be at its best without a suitable supply of nitrogen and humus, plants which are grown chiefly for their fruits may easily be injured by an amount only slightly exceeding a sufficiency.

It has been found that the store of plant-food in a soil is of little value unless the physical conditions and the available moisture which it contains are also considered. This brings into prominence the question of proper tillage. No matter how fully the soil may be supplied with plant food if it does not furnish a comfortable home for the plant or if for considerable periods there is not enough moisture present to convey the plant-food to the roots, little benefit may be expected from the real or potential nourishment existing in the ground. Plants growing in a garden suffer oftener from a lack of moisture than they do from a lack of soluble food. **J. J. WILKES, HAMPDEN,** in *Gardeners' Chronicle*, Jan. 11.

CINCHONA PLANTING IN BENGAL.

The Government made a profit of nearly $\text{Rs. } 10,000$ from its cinchona plantations in Bengal last year, a fact which reflects the greatest credit on those concerned with the working of the plantations. There was a very considerable increase in the demand for quinine at the Post offices.—*Madras Mail*, Feb. 3.

INDIAN PATENTS.

Applications in respect of the undermentioned inventions have been filed, under the provisions of the Inventions and Designs Act of 1888, in the office of the Secretary appointed under that Act:—

John Gilruth Gilruth, Engineer, Chetla, Alipore. A continuous action paddy (or other grain) combined boiler and dryer (or "conditioner.")

Henry Johnston, Engineer and Shipwright Surveyor, of the Port Office, Rangoon, Burma. A combined windlass and steering gear.

PLANTING NOTES.

A "SIGHT FOR SAIR E'EN" has been provided for passers-by in the dreary month of January by the wall of a house close to the gates of Gunnersbury Park. This is entirely covered with *Cratægus pyracantha*, upon which is still left an ample crop of scarlet berries. Among the comparatively compact branches of this creeper *Jasminum nudiflorum* is running rampant, and the clear yellow of its fully-expanded flowers forms a charming contrast to the bright berries and green leaves of the *Cratægus*. It was not our fortune to see this beautiful sight on a fine day, but when the sun is shining the effect must be truly gorgeous.—*Gardeners' Chronicle*, Jan. 18.

RUBBER IN WEST INDIES.—Mr. James Pinnock, the well-known African merchant and traveller, of Liverpool, who is at present making a journey round the world, writes to a friend from Port of Spain, Trinidad. Of the rubber industry on the West Coast of Africa. Mr. Pinnock has had great experience, and he thinks that the cultivation in Dominica of this article is, or should be, one of the most important items in the future prosperity of the island. He mentions that he during the time he carried on business, imported large quantities of rubber from the most primeval forests in West Africa, produced and treated by entirely unsophisticated natives in the great African forests. The soil of a very large portion of this most fertile country, Mr. Pinnock says, together with its tropical climate and surroundings of water, appears to be most admirably adapted for the cultivation of the rubber. In his remarks on this subject, Mr. Pinnock asks:—"If the untrained and uncivilised natives (of what, until lately, has been known as 'Savage Africa') can produce rubber in such huge quantities, why not their more advanced brethren in the West Indies do the same?" In Liverpool, says a daily contemporary, Mr. Pinnock's suggestion with regard to the growing and cultivation of rubber in the West Indies is regarded as a very valuable one. One well-known gentleman, who thoroughly understands the importance of the matter, expressed the opinion that if rubber can be produced in the West Indies, it will bring back the islands to their former prosperous condition. Mr. Pinnock was a good authority on such a question, and had great practical experience in West Africa, where he resided for many years.—*India-rubber and Gutta-percha Trades' Journal*, Jan. 6.

THE AGRICULTURAL MAGAZINE, COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for February:—

Vol. XIII.]

FEBRUARY, 1902.

[No. 8.

A VISIT FROM AN AMERICAN AGRICULTURIST.

R. David G. Fairchild, Agricultural Explorer Department of Agriculture, United States of America, left Ceylon on the 16th January after spending some time in the island. Mr. Fairchild has pre-

viously visited Ceylon no less than three times. The object of his present visit is to enquire into the cultivation of the Mangosteen with a view to introducing this much esteemed fruit into Porto Rico, where local conditions are considered favourable to its growth, so as to ultimately supply the American markets with the produce. Our late visitor thinks the possibilities of the mangosteen, as a table fruit in the West practically unlimited, and believes that fabulous prices will be paid by the moneyed men of the West for fine specimens of fruit sold in baskets of half-a-dozen or so. Mr. Fairchild paid visits to the plantations of the late Sir Henry Dias at Haluloya and Mr. H. W. Wright at Mirigama, to see the exact environments of the trees, and held conferences with the latter gentleman and Mr. H. L. Daniel of Lenawatte estate, Padukke, (who are credited with knowing more about mangosteen cultivation than any one else in the island). Regarding the habits of the tree, the method of propagating it, and all details connected with its cultivation, a good deal of valuable information was gleaned from these two sources; and a number of photographs taken on Mr. Wright's estate and coloured drawings of the fruit by a local artist will be

reproduced in illustrating the *brochure* which Mr. Fairchild intends to publish when he has completed his investigations.

Though chiefly concerned with the Mangosteen, our visitor was nevertheless interested in some of the other products of cultivation in the island. Among these the mango received his close attention, and from the grounds of the School of Agriculture, Colombo, where the various species of mango are well represented, Mr. Fairchild took ten cuttings each of the "Rupees," "Jaffna" and what was given the distinguishing name of the "Thurston" mango—a variety which is not known to be found growing elsewhere, and was planted in the grounds some 30 or 40 years ago by a Mr. Thurston who presided over the institution then known as the Industrial School. From the buds found on these cuttings Mr. Fairchild expects to be able to reproduce the abovementioned varieties of the mango on American stocks. For those who may desire to preserve cuttings for budding purposes, Mr. Fairchild has kindly drawn up the following directions:—Have made a cylindrical tin case, 10 in. long, 2 in. in diameter, with a well-fitting cap 2 in. long, in which to send the cuttings through the post. This case should be fitted in a cloth sack before despatching. Cut scions about 10 in. long, making sure they have good buds on them. Dip the cut ends in collodion or melted bees' wax, wrap each scions in a strip of light tin foil, and wrap these again in oiled paper. Do not pack more than four or five in each case with slightly moistened saw dust. Be careful to put the address on a tag,

Mr. Fairchild is also interested in finding drought-resisting wheat and other plants, with which object he is visiting the arid region around the Persian Gulf where such wheat is reported to be growing. In Ceylon what took his fancy in this connection was *Eleusine coracana*, ordinarily known as kurakkan, the common millet of the "dry or chena cultivation" of the island. Unfortunately the search for kurakkan fields and seeds was thought of after our visitor had returned to Colombo, a day or two before his departure, but we were able to discover a low-country chena for Mr. Fairchild through the help of Mr. H. D. Lewis, Sub-Inspector of Schools, who succeeded in procuring a quantity of seed for transmission to America.

Mr. Fairchild was struck with the absence of any attempt on the part of the Government or of organised agricultural bodies, to facilitate the propagation of cultivated crops, whereby only the best varieties could be selected for growing. In the case of dicotyledonous plants the perpetuation of the best varieties, when discovered, was ensured by the practice of budding and grafting, which are considered the only reliable means of making plants "breed true," and must not be neglected if the best results in produce are to be secured. He instanced in proof of the value of the methods of propagation the dissemination of the seedless variety of orange known as the Washington Navel. The advantage of budding and grafting, as regards early maturity is well-known, but it was further pointed out that by these methods it was possible to ensure that the produce of the several trees in a plantation should be practically the same in quantity and quality, and, in the case of season crops, that such produce should be borne all at the same time so as to be handled and marketed at once, as has been done in almond cultivation in America. In this connection Mr. Fairchild was surprised to observe how many kinds of coconuts were found growing side by side in one plantation, and he counted no less than fourteen different varieties on a single estate. The only way to secure one perfect type of nut, as regards size, shape, weight, development of kernel, &c, is by selection of seed. As in the case of the pedigree wheat, selection of seed in the monocotyledon does what budding or grafting does for the dicotyledon. Mere selection of seed from a tree bearing good fruit crops does not suffice, for the simple reason that the fertilization of the flowers are not under control. A good tree, therefore, while it may produce good fruit need not necessarily reproduce

a good tree through its fruit. There is thus no alternative but to control fertilization if the fruit of a tree is required to "breed true." Without doing so the orange from a good tree may quite possibly reproduce a sour orange tree or even a variety of lemon, lime or pomelo, while under the same circumstances a coconut from a selected tree may reproduce a variety different from itself. This remark is of course not intended to discredit selection of fruit without control of pollination. Such selection undoubtedly helps to secure a uniformity of good varieties in a plantation, but only partially so. What then is to be done to complete the means for the end in view? Only this, that the inflorescence of the coconut palm should be protected before it is, so to speak, ripe for fertilization, by gauze veiling or other means which will prevent cross fertilization taking place. Here we come upon the principle which underlies the practice of breeding among animals, and the principle stands in the case of vegetable reproduction as well. Who among our planters of the present day will be prepared to practice this complete means of selection, even with the tempting prospect of having all his trees uniform in development and productiveness, and the nuts of standard size, shape and quality? "The thing," says Mr. Fairchild "has been done over and over again in the West, and will come to be done in Ceylon as regards coconuts before many years are past." We can only say that we hope so.

Some of our readers will now guess what Mr. Fairchild's explanation is regarding the difference in the development and productiveness of trees often growing side by side on the same land and even raised from the same *jat* of seed nuts. Making all allowance for differences in environment and treatment, it lies he says in the one word *heredity*. The moral therefore obviously is, practice selection by controlling fertilization if you would have uniform excellence.

With the School Gardens scheme Mr. Fairchild was in the greatest sympathy, and it was only want of time that prevented him paying a visit to one of these gardens which he was very anxious to see. He thought there was much to be done by introducing budding and grafting among the people through the agency of village schools, and was kind enough to give us a note of introduction to Mr. L. H. Bailey, Professor of Horticulture in the Agricultural Department of the United States, through whose help we hope to be supplied with all requirements for carrying on and teaching these methods of propagation, of which Mr. Fairchild gave practical demonstrations at the School of Agriculture.

On his recommendation we are endeavouring to procure buds of what he considers the best varieties of plantain, viz., "Pisung Radja," "Pisung Radja Sere" and "Pisung Mas" from Java, as well as sets of the following yams from Jamaica: "Horu," "Chinese" and "Yampie," the last of which he speaks of as the "best in the world."

Altogether the visit of Mr. Fairchild was as full of interest to us as it was to him, and we shall look forward with pleasure to his next visit which will not unlikely be about the middle of the year.

OCCASIONAL NOTES.

Erratum.—In our December issue, page 55, line 1st, coloum line 19, from the bottom for "part" read "per cent."

Mr. George Weerakoon, Mudaliyar of Welaboda Pattu, Matara, contributes the following interesting note on the subject of Kiül Lands which was the subject of an article by Mr. Frank Modder, of Kurunegala, in the *Agricultural Magazine*, Vol. XI., No. 12 :—

Mr. Modder's letter *re* Kiül is interesting, see p. 103 of your journal for June, 1900.

Vapid—that is having the strength or essence evaporated—would be the meaning of the word. Kiül land is to be found nearly in every tract of paddy-fields, but not in extensive plots. Every goiya knows what it is. The soil may be well tilled and even manured, but the water left stagnant any length of time assumes a vermilion hue, and any stray seed germinating becomes a stunted plant and gives no yield. An absence of salt is one of the causes attributed. It is within my observation that a small paddy-field at Dandeniya was proverbially barren and was hardly cultivated in a decade. Four years back a citronella still was opened in proximity to this field. Of course the refuse, and chiefly the ash, found its way to the field. Kiül has completely gone, and this field is now regularly cultivated returning 10-fold, which is equal to any fertile field here. Another paddy land at Kekanadure-turned fertile by the same agency—is in the mouth of every body in the village. You will wonder how the ash of an arrack distillery differs from that of a citronella distillery? Well, in the latter the used-up grass is dried and used again for fuel. It is largely employed in manuring paddy-fields and sells 25 cts. a cart load.

The following table shows the record of the Rainfall taken at the School of Agriculture during the past year:—

	Total.	Mean.
January	7-48	'24
February	2-64	'94
March	8-94	'28
April	8-91	'29

September	3-61	'10
October	6-29	'20
November	21-26	'70
December	1-91	'03
Total	82-89	'28

A gentleman from Ceylon who is making a tour of the Australian Colonies, sends us the following chatty account of his impressions :— During the last fortnight I have had some experiences of real bush life. I left Sydney on the Saturday before Christmas, and by a coasting steamer I reached Melbourne on the following Monday night; then after 175 miles of a train journey I arrived at my destination on Christmas Eve. After duly celebrating the great day with friends whom I had come to know, I began a round of visits to what are called "Station Farms." One holding I visited was 20,000 acres in extent, only 100 acres of which are put under wheat per annum, the balance being left for sheep and a few horses. The large acreage is not surprising, considering that every head of sheep needs an acre and a half in this part of the country—often more. The scarcity of the water and the bush fires which take place

occasionally render farming a precarious industry at the best. As for the climate, it is like Colombo without the humidity. The Mercury stood at 95° at 9 o'clock in the morning, and it was just nice and pleasant; at 1 p.m. it rose to 107°. The orchard where I was visiting was laden with fruit; and the verandah of the house covered up to the eaves with grape vines, and there were thousands of clusters of huge bunches on them. I have been driving in a "sulkey" to see sheep stations at the rate of 12 miles an hour. It is pretty hot outside, the thermometer in the sun registering 125°. Driving some 15 miles out and back again I did not meet a single passenger on the road nor even a house by the roadside. The ground being all open country, one could see round for miles and miles. The Galle Face on a pretty large scale with a gum tree here and there at the rate of say 5 trees to the acre will give you some idea of the country through which I drove. The green was all parched up and the wheat fields after the harvest had a stubble as dry as the grass. Such is Australia in the North at this time of the year. The yield of wheat is 4 or 5 bags to the acre, and a bag is 4 bushels which, selling at 2/6 to 3/- makes the return about 30/- per acre for all the trouble and anxiety incidental to wheat cultivation. After my visit to North Victoria I went on to Gippsland in the South, travelling first by rail and then by boat along the river. In the wider parts of the water the banks are beautifully wooded on both sides, diversified by fen and moor. Flights of ducks and teal disturbed in their haunts among the rushes gave evidence of the country being a paradise for the sportsman. But this was nothing to the surprise I had later on. As we entered a lagoon I noticed half-a-dozen large-sized birds paddling away to avoid our boat. These turned out to be cygnets, and you might have killed a couple with a large pole. They are not protected by law and may be shot here, but ducks are better eating. Further on the water was dotted over with black swans in such numbers that when they flew they reminded me of the flying foxes swarming in the Peradeniya Gardens. They remain unmolested here. At one of the halting stations a sportsman joined us with a bag of blue-winged duck that was astonishing; the slaughter must have been wholesale like that in an English or Scotch preserve. On my arrival at Cunningham I went out to sea with the fishers, who getting into a lagoon drag their nets in the early morning. In a couple of hours they had fish enough to fill 20 boxes or more. They are put in ice and sent on to Melbourne. When too plentiful they are carefully transferred to large net bags all the while kept under water, and brought into kraals, which are called "paddocks" at Cunningham, and set free. There they are put by for stormy days, for when the fishermen cannot put out to sea, they net their homebred stock for the market. There is much to be done in this business by a man who could invest in a fishing smack with an engine so as to be independent of the winds.

The forests about here are not unlike Ceylon forests, but to clear with white labour would cost £20 an acre. Land is locked up here, but a man who can get together a selection of 1,000 acres at a penny per acre per annum, to be paid for in 20 years, could leave a fortune for posterity, though he could only eke out a living for himself and family while he lived.

A correspondent of the *Indian Agriculturist*, writing about the wood of *Anthocephalus Cadamba*, says:—"It is sold in Calcutta in pieces, 6 ft. long, 9 in. broad, and one inch thick at the rate of Rs. 8 or 10 per hundred, mango wood of the same dimensions selling for Rs. 30 per hundred. As it is cheaper than mango wood it may be of great economic value as a material for packing." He speaks of it as a wood which grows rapidly with little care and exertion, which can be planted on roadsides &c. for shade, and utilized for packing purposes without resorting to the destruction of fruit-yielding trees such as the mango. The Sinhalese name of this tree is Embul-bakmi (Tamil, Vellaidampa,) and it is found growing in the low-country up to an elevation of 2,000 feet, occurring in Karunegala, Pussellawa, and Alagalla, and other places. Dr. Watt refers to its fast growth, mentioning that during the first two or three years the rate is about 10 feet per year, the girth increasing at the rate of one inch in a month. After 10 or 12 years, however, the growth becomes very slow. The wood is described as white with a yellowish tinge, soft and even-grained; weight about 40 lbs. per cubic foot. It is used in India for building, and in Assam and Cachar for tea boxes. Cunningham mentions that it is employed for beams and rafters on account of its cheapness and lightness, and that it is suitable for joiner's work, though rather brittle. If less heavy he thinks it would be much valued, for gun-stocks.

Among the economic plants being grown in the Colombo Stock Garden are the following introduced from India:—*Trigonella corniculata*, a variety of Fenugreek, the seeds of which are used as a condiment and also medicinally; *Rumex vesicarius*, sorrel or bladderdock, used as a vegetable both raw and cooked; *Peucedanum graveolens* (*Anethum soua*) or dill, of which the fruit and leaves are used as a flavouring agent in cookery and the seeds considered of considerable medicinal value; *Chenopodium album* or white goosefoot, eaten as a pot-herb and green vegetable. Of the last Prof. Church says: "The leaves are rich in mineral matters, particularly potash salts; they likewise contain a considerable amount of albuminoids and of other compounds of nitrogen." The seeds are said to be superior to buckwheat.

SUCCESSFUL USE OF TOWN DRAINING AS MANURE.

The satisfactory disposal of town drainage is always a vexed question, and any information on this subject is to be welcomed. Mr. W. H. Moreland, C.S., Director of the Department of Land

Records, and Agriculture, North-Western Province and Oudh contributes a most valuable note on the possibility of utilising what is always an objectionable byproduct, and shows how it can be made to take the place of expensive fertilising agents in the raising of successive crops of useful produce. The experiment with town drainage as a manure was undertaken at Meerut, where there appear to have been special facilities for the successful carrying out of the trial. Given the same facilities elsewhere, there is no reason why other Municipal bodies should not suite all prejudice against the use of town sewage for agricultural purposes, and follow the example of Meerut. We now give the text of Mr. Moreland's note on the subject:—

The following particulars regarding the utilization for agricultural purposes of the town drainage of the Meerut Municipality are published in the hope that they may be of interest to the members of other Municipalities, and also to landowners who own towns or bazaars provided with a system of street drainage.

In Meerut the street drains discharge into open main drains which flow for some distance through agricultural land on their way to the water-courses which ultimately receive the drainage. The contents of these drains consist mainly of street-rubbish, sullage-water and the like, diluted by the water with which the drains are flushed. Night-soil is carted away and trenched, but much urine also finds its way into the drains. The drainage is a thick sluggish liquid, of a dark colour and offensive smell, and containing large quantities of impurities both suspended and dissolved.

Until about 1895 no use was made of this drainage as there appears to have been an impression that it was unsuitable for application to land. In that year the Collector, acting on the advice of the Agricultural Chemist to the Government of India, started some experiments at the Demonstration Farm to test the value of the drainage when applied in the liquid form to various common crops. The results were startlingly successful, and the cultivators in the neighbourhood of the Farm were quick to see the advantages of this new method of manuring. Within two years of the beginning of the experiments, cultivators were found willing to pay a fee of two rupees for each lift set up to raise the drainage from the channels to their fields; the number of lifts in use has latterly been about 45, bringing into the Municipality about 2,701 per annum, the whole of which is clear profit; and the annual charge per lift has recently been raised from Rs. 6 to Rs. 12 without, it is understood, restricting the application of the drainage. Of course it would be preferable to charge according to the area irrigated, and in Meerut most of the advantages derived from the drainage have been intercepted by the landowners.

The water is raised from the drains by lifts of the type ordinarily used with wells, and is applied to the land exactly like irrigation-water. The ordinary method of cropping land treated with this drainage water is to take three crops in the year, maize, potatoes and tobacco being grown

successively without any manure other than that supplied by the drainage, which serves also for irrigation. It would scarcely be possible to devise a more exhausting rotation, but the manurial constituents of the drainage enable it to be maintained without loss of fertility. The Superintendent of the Cawnpore Farm, who has close practical knowledge of high farming, writes: "The condition of the potato and tobacco crops which I saw on good many fields was all that could be desired, and was simply excellent; no potato crop was seen which could have been put at less than seven or eight tons of tubers per acre. The oral reports of the cultivators about the maize were equally favourable. The gross money value of the three crops taken together may be put at not less than Rs. 400 and as much as Rs. 500 or even more, per acre per annum."

Enquiries show that formerly this land received heavy dressings of poudrette, costing about Rs. 50 to Rs. 100 a year; the replacement of this manure by drainage water, costing twelve rupees for as many acres as can be watered by one lift is an obvious saving to the cultivator, and the landowner has not been slow in claiming a share of the advantage. The rents of the land treated in this way have risen all round and in some cases have doubled; they now range from Rs. 50 to Rs. 100 per acre.

The facts enumerated above show better than any results of analysis or artificial experiment the value as manure of this material which previously ran to waste; on sanitary grounds, too, it seems preferable that the drainage water should be run on to a large area of absorbent land, rather than that it should stagnate in the drains. From this point of view the best results will be obtained if the land to be irrigated is a light, rather sandy loam, and this is just the sort of a land where such an application should be most profitable to the agriculturists.

The following hints may be of service where it is desired to imitate the success attained in Meerut.—

The first step should usually be to take a small area of land near the drains and raise fodder crops on it: these are remarkably successful in Meerut, and the produce can generally be fed to the conservancy cattle. When cultivators see the crops so raised they will probably want to try the drainage, and it will be wise to let them have the use of it free of charge for at any rate one season. When they have become accustomed to it a charge can be introduced. The exact nature of the charge must depend on the arrangements which can be made by the Municipality. The system in Meerut is particularly simple, but as has been shown most of the benefit goes to the landowner: an acreage rate is fairer to all parties if the area irrigated can be easily ascertained: while the most profitable system of all would be to hold the irrigable land directly and let it out by auction to cultivators.

In conclusion it may be noted that in some cases it is possible the use of drainage water may lead to a slight decrease in the demand for poudrette: but the manure supply is nowhere excessive, and

there will usually be ample scope for using all the available poudrette on land which lies out of reach of the drains.

MEMS ABOUT MILK.

There is probably no substance of which so many analyses have been made as milk, and consequently its composition and variations of composition are pretty well known.

The following table, based on the authority of Keith and Richmond, gives the average composition of pure new milk: Fat 4.0, proteids 3.6, sugar 4.5, ash 0.7, total non-fatty solids 8.8, water 87.2.

The fat in milk is of course what confers on it its riches. The sugar is a special variety to which the name of lactose has been given. It differs from cane sugar in that it is far less sheet, and hence it is not so powerful a flavouring agent as the latter. The proteid matter, like the white of egg, has no very pronounced taste, but yet it confers on milk a fullness and roundness of flavour, which a simple solution of lactose in water would not possess. New milk thus gives richness through its fat, sweetness through its sugar, and what may be called mellowness through its proteids. Separated milk is practically new milk less its fat.

The composition of new milk has been indicated in the analysis already quoted, but these figures must not be received as by any means the lowest obtainable from undoubtedly pure samples. For the purposes of the Food and Drugs Adulteration Act, the limits in England have recently been adopted of 3 per cent fat and 8.5 per cent solids not fat. In the case of a milk falling below these limits, the onus of proof of its purity lies with the vendor. But a direct estimate of value is of more importance than knowing whether or not a particular sample of milk passes the limits of the public analyst. Thus milks containing respectively 3 and 4 per cent of fat, would so far as the fat is concerned, be passed as free from adulteration; but it is obvious that the former sample has three-fourths the value of the latter. For some years this subject of the valuation of milk has engaged the attention of Mr. William Jago F.C.S., F.I.C., who suggests, and has for some considerable time employed, a standard of valuation worked out on the following lines:—From an examination of a considerable number of commercial milks an average conventional standard of quality was first determined, the aim being not to go so low as the Government limit for adulteration, but to take figures which a buyer might reasonably demand to be reached in milks supplied to him. These were ultimately taken as being for new milk. Total solids 12.5, fat 3.5, non-fatty solids 9.0.

Where both new and separated milk are marketable products it would be possible to value the constituents, thus: Taking the market value of new milk at 10*d.* per gallon, and separated milk at 2½*d.* per gallon, and the difference between the quality of the two as being an excess of 3.2 per cent fat in new milk, then the excess of

fat must be given a value of 7½*d.*, and in the same proportion 3.5 per cent fat would be worth 8.2*d.* From this the value of the conventional standard samples can be expressed in terms of their constituents, this is, in new milk 3.5 per cent fat=8.2*d.*, 9 per cent non-fats=18*d.* or 10*d.* the gallon.

If the value of the standard be called 100, then the value of any sample can from the analysis be expressed in terms of percentages of the standard. For instance, the 3.5 of fat would be represented by the standard percentage 82 (*i.e.*, of the total of valuable constituents) and 9.0 non-fatty solids by the standard percentage 18. This will enable two tables to be drawn up for comparative valuation of fat and non-fatty solids in terms of the standards.

We give below the standard figures and those in three other cases for the purposes of comparison:—

Description.	Con- position.	Value in terms of stand.	Relative value per gallon.
1. Mr. Jago's conventive standard:			
Fat ...	3.5	82.00	
Solids not fat	9.0	18.00	
	12.5	100.00	10.0 <i>d.</i>
2. Present Government limit :			
Fat ...	3.0	70.29	
Solids not fat	8.5	17.00	
	11.5	87.29	8.7 <i>d.</i>
3. Very rich milk watered :			
Fat ...	4.3	100.72	
Solids not fat	8.1	16.20	
	12.4	116.92	11.7 <i>d.</i>
4. Unsweetened milk diluted to three times its volume:			
Fat ...	3.5	82.00	
Solids not fat	8.2	16.40	
	11.7	98.40	9.8 <i>d.</i>

Looking at No. 3, it will be seen that the milk though of the highest value in terms of the standard, shows nevertheless evidence of having been watered, and would probably be made the subject of a prosecution if analysed for the purpose of the Food and Drugs Act. The public analyst being concerned simply with adulteration, while the commercial user is more vitally interested in the question of actual value.

In ascertaining the value of condensed milks it is usual to dilute them to three times their original volume. Then such a milk as No. 4 is, as nearly as possible, of the same degree of concentration as the standard milk.

[We are indebted for the information in the above to Mr. William Jago's lectures on the Chemistry of Confectioner's Materials and Processes, delivered before the Society of Arts last November.—Ed. A.M.]

DISTOMATOSIS.

Veterinary Capt. H. Pease, Principal of the Veterinary College, Lahore, draws attention to the occurrence of this disease among cattle and buffaloes in India, in a note contributed to *The Agricultural Ledger*. The writer's investigations into the disease were undertaken as the result of serious mortality occurring in the vicinity of the Collair lake in the Madras Presidency. Since that outbreak the disease was observed to be more or less prevalent wherever lowlying swamps were found to occur, particularly in such country as is subject to periodic inundations.

Some years ago the dry cattle and growing animals belonging to the Government Dairy herd were removed to the premises known (by name only) as the Model Farm at Kanatte, with the result that many of the stock were attacked by and succumbed to an affection which there seems to be little doubt, from the description of the disease given in Capt. Pease's note, was Distomatosis. As a result the use of the premises referred to as pasture land for the Government Dairy herd had to be abandoned. The Model Farm is just such an area as is described above, where *Distoma* would find a congenial habitat.

We give below the more useful portion of Dr Pease's note for the benefit of our readers:—

Most marked Symptoms.—The most marked symptoms of this disease are gradual emaciation, unhealthy appearance of the skin, watery condition of the mucous membranes, and what is more especially noticed by the people, the appearance of œdemata on the dewlap, and sometimes also in the sub-maxillary space and under the abdomen. The skin becomes dry and the animal hidebound. Digestion is deranged, rumination and the action of the bowels irregular, the animal sometimes being constipated and at others suffering from diarrhoea. These symptoms gradually increase in intensity, and diarrhoea becoming marked death supervenes from exhaustion at between two and four months after the first symptoms have been noticed.

Post-mortem appearances.—The following *post-mortem* appearances may be observed in the buffalo and ox. Body extremely emaciated, the skin hidebound and dry; dropsical effusions into the subcutaneous tissues, the fat replaced by a gelatinous-looking material. All the tissues are pale and flabby. Liver greatly enlarged, all ducts and gall bladder filled with large flukes. Over 100 have been removed from the gall bladder. The bile black in colour, duct dilated.

The Parasite.—The parasite causing the disease is *Fasciola hepatica angusta*. Considerable interest attaches to the parasite which causes this disease. Its occurrence has not previously been recorded in this country. It has, however, been described by Railliet in 1895 from specimens taken from Cattle slaughtered at St. Louis, Senegal. Blanchard thinks it identical with *Fasciola gigantea* of the giraffe. Laoss has described under the name of *Fasciola Egyptiaca*, a parasite occurring in *Bos taurus* and *Bos bubalus* in Egypt which Blanchard considers identical with the fluke we are at present dealing with. The pecu-

liar features of this fluke are its great length as compared with its breadth: it is a long and narrow and flat fluke. Railliet's specimens measured from 26 to 38 millimetres in length and were from 6 to 8 millimetres broad, or roughly from one to one and a half inches long and a quarter of an inch broad. All the specimens I have are well over an inch long and $\frac{1}{4}$ inch broad. The parasites when freshly taken are of a flesh colour and semi-transparent. They present all the characters of *Fasciola*. The intestines are branched and ramified. The body tapers in front so as to form a cephalic prolongation at the end of which the mouth is situated. The acetabulum opens very close to this on the ventral surface; it is of fair size and salient, with a triangular orifice the base anterior: the body then rapidly gains its greatest breadth which gradually tapers towards the tail narrowing the inferior extremity being rounded. The integument is covered with small spines, especially on the ventral surface and in front. The genital pore is situated a little in front of the acetabulum, it often shows the ejaculatory canal evaginated in the form of a penis. The eggs which may easily be obtained by opening the uterus in front of the ventral opening are ovoid and relatively long. The shell is very thin, and one may often observe a small opercule, and at the other a slight, more or less irregular elevation. The size of the eggs seems to vary from 143 to 150 μ . in length and 82 to 87 μ . in breadth. Altogether there is not much difficulty in distinguishing this worm owing to its great length and narrow breadth.

HOW TO PREPARE SEED BEDS.

I wish to say in the beginning that improved methods do not imply more labour, but they do imply more painstaking. It means the taking advantage of favourable conditions and creating conditions that are needed, and more than that, it means the getting of exact results, leaving nothing to chance. It is not necessary to give the many reasons suggested to show that plant beds well burned give the best results, except to say that it destroys the vegetable and insect life, and permits the plant to occupy the entire soil undisturbed. Select for your seed bed fresh land if possible on a hill slope where it will not be shaded, and near water not subject to overflow, as the land will be moist and need no watering. Black soil is to be preferred as it absorbs a greater degree of heat. Clear the ground of undergrowth and stone, and then put on a layer of brush and leaves to the thickness of 2 or 3 feet, and then on the top put wood and logs, covering it well over, so that when it is burned it will leave a heavy bed of coals.

The ground should be burned until it is a red or brick dust colour, in order to destroy all seeds and insect life, and so as to completely pulverize the soil. Do not burn when the ground is wet. When it is cool rake off all unburned wood but allow the ashes to remain on the bed, and then spade it up to the depth of 6 inches, being careful to reverse the soil. It should be then well

chopped with a hoe (or mamoty) and raked until the ground is thoroughly pulverized and the ashes well mixed with the soil, all sticks, roots and stones being removed.

Do not make the beds too narrow or they will get too dry; 6 feet is a very good width, but they may be as long as desired. It is better to have the plants too thin than too thick, as crowded plants grow weak and spindly, having no strength to overcome changed conditions, and when transplanted many of them die. They do not start to grow readily and are more subject to the ravages of cut-worms and other pests, causing many missing plants, making your garden very irregular in growth, and entailing much extra work in the end. But if your seeds are thinly sown the plants grow stocky, with good roots, and are strong and healthy growers, requiring less moisture when transplanted. They grow up readily, soon getting out of the way of pests, and you have a more uniform field.

If you desire to test the vitality of your seed before sowing, take a few in your fingers and sprinkle them on a hot stove; if they are good they will pop and crackle, but if not they will burn and crumble away. When sowing small seeds, mix them with cornmeal or slacked lime, as this will show on the bed, and you can see what you are doing. Lime is preferred, as it is a good fertiliser. After sowing do not rake, but tramp or pat in the seed with the back of a spade.

Do not sow all your seed at once, but at intervals of two weeks, that you may have plants of the proper size for transplanting when wanted; sow more than you are likely to need, that you may be able to select the strongest and best plants. In order to keep your plants free from disease and insects, and to get the very best results, it is necessary to canvas your beds. Take boards and set them on edge all around the bed, driving stakes on either side to keep them in place, and thus form a box around it, closing the joints with earth so as to make them insect-proof. The boards should come 5 or 6 inches above the top of the bed. Drive a row of nails on the outside of the box, 10 or 12 inches apart, all around, leaving 1 inch projecting; have a sheet made of the thinnest cheese cloth, the size of the bed, with holes around the edges to correspond with the nails driven into the box; stretch this sheet over the bed, slipping the holes in the edges over the nails. If the bed is large, lay small poles across the box frame at short distances, to keep the covering from sagging. Be sure to get the very thinnest cloth, that light and air may penetrate.

This covering usually stays on all the time until the bed is abandoned; but watch your plants, and, if they do not appear strong and healthy, you can remove the covering for a time. Make a ditch around the bed to carry off the water during rainy weather. If it is necessary at any time to water the plants, it should be done about sundown, the covering laid off, and, as soon as the watering is finished, replaced.

It is best to draw the water for this purpose in the forenoon, and let it stand in the sun and get warm, as cold water chills both the plants and

the soil. It will be found that a canvas-covered bed retains the moisture better than any other, and also induces a more uniform temperature.

[The above directions are by Mr. R. S. Nevill from the *Queensland Agricultural Journal* of March, 1898, referred to in our issue for December last.—ED. A. M.]

PLANT LIFE.

[A SERIES OF SIMPLE LECTURES INTENDED FOR A CLASS OF JUNIOR STUDENTS.]

LECTURE IV.

As I have already said it is with the soil that we generally connect plants, and indeed it is from the soil that the important part of the food of plants is drawn. This is done through the roots. I must here impress upon you an important fact, namely, that the food of plants which is drawn from the soil is taken up only in a liquid form. Now it is not to be supposed that all the necessary food is already in that form; some of it may be and some not. As you may be aware some substances are soluble in water, but some require the aid of other substances called solvents to dissolve them. Now the water in the soil invariably contains carbonic acid gas dissolved in it, the gas being produced by the decomposition of organic matter in the soil and brought into it in other ways. But the important point for you to remember is that water containing carbonic acid has a greater dissolving power than pure water. We may therefore expect to find a certain proportion of plant food already in a state of solution in the water in the soil and ready to be taken up by the roots. But there is also a good deal of the food of plants that requires to be dissolved out of the solid particles which compose soil, and this dissolving action is carried on by what is known as the acid sap present in the roots. By the aid of this acid sap which contains more powerful solvents than carbonic acid, plants are able to attack and dissolve the solid food particles present in the soil and utilize them for their nutrition. The process by which these liquids enter the roots of plants may be spoken of as absorption.

You must not suppose that everything in the soil is plant food, no more than every form of vegetation is food for animals. The necessary elements of plant food are distributed throughout the bulk of the soil and form by no means a large proportion of it. We speak of soils being fertile or unfertile according to the proportion of these necessary ingredients of plant food present in the soil. The soil we may look upon as the "element" in which the plant exists and flourishes, the greater bulk of it being required for fixing the plant in position so that its roots may travel through it in search of those ingredients which constitute the food of the plant. In addition to the solid matter of the soil, moisture or water must be present so that these necessary food ingredients may be dissolved in it and be absorbed into the plant in the form of solutions. These solutions are weak, that is to say there is comparatively a small quantity of food taken up

with a large proportion of water. It will therefore strike you that there would be an excess of water taken into the plant which will have to be drained off, or removed, after it has performed the function of conveying food from the soil into the plant. And this is so, for the excess of water over and above what is required by the plant passes out of the plant through the stomata as water vapour. This process is called transpiration.

A plant in a healthy state has its cells full of moisture, this condition keeping the plant "turgid," while a plant which lacks moisture, owing to transpiration going on more rapidly than absorption (as is the case in very dry hot weather) is said to become "flaccid." Hence it is that we see the foliage of plants and trees drooping and having a withered appearance during dry seasons but freshening up again after a fall of rain. For the same reason herbaceous garden plants which are shallow rooted and cannot secure the necessary supply of water from the soil require to be watered in dry weather, to prevent them withering off.

OBITUARY.

SIR HENRY GILBERT, F.R.S.—Sir H. Gilbert, the distinguished agricultural chemist and life-long colleague of the late Sir John Bennet Lawes in the Rothamsted agricultural experiments, died on Monday, December 23rd, at his residence at Harpenden, St. Albans. Joseph Henry Gilbert, son of the Rev. Joseph Gilbert, and his wife Ann Taylor, of Ongar, was born at Hull in 1817. He studied in the laboratory of Professor Thomas Thomson at Glasgow University, and then proceeded to University College, London, where he attended the lectures of Professor Thomas Graham, and worked in the laboratory of Dr. Antony Todd Thomson, where J. B. Lawes, three years' Gilbert's senior, was also a pupil. He next went to the University of Giessen to study chemistry under Liebig, and there he took the degree of Ph. D. In 1843, Gilbert, at the age of twenty-six, became associated with Lawes, and assumed control of the chemical laboratory at the Rothamsted experimental station, Harpenden. The collaboration of these two pioneers in the field of scientific agricultural research lasted for fifty-seven years, and was only terminated by the death of Sir John Lawes on August 31st, 1900.

Sir Henry Gilbert was elected a member of the Society of Arts in 1855; and in 1893 the Albert gold medal was awarded to Sir John Lawes, and a like medal to Dr. Gilbert, "for their joint services to scientific agriculture, and notably for the researches which, throughout a period of fifty years, have been carried on by them at the Experimental Farm, Rothamsted." These medals were presented to the two recipients on February 23rd, 1894, by H.R.H. the Prince of Wales (President of the Society) at Marlborough House. In 1893 Dr. Gilbert received the honour of knighthood.

FOOD GRAINS AND FODDERS.

The *Agricultural Ledger*, No. 10 of 1901 consists of a report by Dr. Leather, Assistant Agricultural

Chemist to the Government of India on the chemical composition of Indian Food Grains and Fodders. Among the food grains treated of are some of those cultivated in this Island, and it will therefore be of interest to our readers to know something about the chemical composition and food value of these products. We are a little disappointed to find that though wheat and barley are included in the report, paddy or rice are omitted. We have little doubt, however, that the missing crop will find a place in the second edition which it is intended to publish shortly.

The following introductory remarks by Dr. Leather are important to a correct understanding of the results of analyses that follow:—

An accurate knowledge of the chemical composition of the Food crops of any country is of importance. In the case of India, the information of this nature, which has been available in the past, is very limited. On the other hand the number of crops of different natural orders is larger than in most countries, and that of varieties of the same crop is correspondingly greater. Consequently, the chemical analysis of only a few specimens of each of these varieties would entail a work of very considerable magnitude. Such, for the present, is not being attempted. If, however, the chief characteristics of the composition of the principal crops is determined, a want which is experienced by those who are studying Indian agriculture will be in part supplied.

Regarding the methods of analysis a few words may be usefully added. These are not quite uniformly the same in all countries, and consequently the published analyses of food stuffs are not always comparable in details. The following notes are therefore made.

Moisture.—This has been determined in all cases by drying in an air-oven at about 100° c.

The oil has been extracted from the *air-dry* sample with rectified, but not desiccated, ether.

The ether extract has usually only been determined in the grain, in which case it may be assumed to be almost entirely oil.

In the green fodders and straw or *bhusa* of crops, the matter soluble in ether includes largely other substances than oil, such as wax, chlorophyll or even alkaloids in some cases. It has, therefore, been generally omitted from the analysis of these materials.

Albuminoids.—In some of the older samples, the proportion of albuminoid nitrogen was not separately determined, and for these the amount of total nitrogen has been multiplied by the usual factor 6.25 and the product entered as Albuminoids. All such have been marked with an *. In most of the samples the albuminoid nitrogen was separated by Retthousen's method (precipitation with Capric hydrate). In a few other cases Church's method was employed. As will be seen, nearly the whole of the nitrogen in grain exists as albuminoids; it is only in fodders that any very marked divergence exists between the amount of total and albuminoid nitrogen.

Soluble Carbohydrates.—This term is applied in England to those component parts of food stuffs which are not separately determined.

In cereals and pulses it includes principally starch, but in other cases, such as some of the oil seeds, there is but little starch; its place being taken by such substances as pectin or mucilage.

Woody Fibre.—This includes principally cellulose, but any lignin which is present in the grain or fodder is included.

Soluble Mineral Matter.—Most of the samples were very clean and free from earthy admixture. But since some extraneous earth was usually present and difficult to remove thoroughly, the

soluble part of the "ash" or mineral matter has been stated separately, and the other insoluble portion, which consists principally of the silica natural to the grain or fodder has been entered in the next column. Usually grain contains very little silica, and if any earthy matter was adhering to the sample, its presence is at once indicated. But the straws and grasses contain high proportions of silica as an integral part of their normal composition. Earth or dust also usually adheres to these fodders, which is only partially removed on the threshing floor. Information regarding the composition of the ash will be supplied later.

LECTURE UPON CEYLON TEA.

"FROM THE TEA SEED TO THE TEA CUP."

By ALFRED AMES, LATE PLANTER OF CEYLON.

Written for Switzerland.

Illustrated by Lantern Views.

In the year 1800 the United Kingdom consumed $1\frac{1}{2}$ lb. of tea per head of population. In 1900 $5\frac{1}{2}$ lb. of tea per head of population was consumed.

In 1800 the consumption was20,358,827 lb.
„ 1850.....	51,000,000 lb.
„ 1900.....	303,867,149 lb.

Up to the year 1862 nearly all the tea consumed came from China. The year 1879 registered the high-water mark of China teas, since which time the importation has gradually decreased, the teas from India and Ceylon having almost entirely overthrown the monopoly of that country.

Every day the two islands consume 600,000 lb. of tea which approximately represents 4,000,000 gallons or 120,000,000 cups of tea, or about 3 cups to each person. Indeed the United Kingdom consumes nearly as much tea annually as the whole Continent of Europe, North and South America, Africa and Australia. The British nation has every right, I think you will admit, to consider itself a connoisseur upon the subject of tea. It not only grows the best tea, but drinks the greatest quantity of it. No better guarantee of quality could be given by any manufacturer than the fact that he is the best customer for his own goods.

To commence from the beginning, from the tea seed, arriving eventually at the tea-cup, will necessitate a description of the various processes employed

to produce good tea to drink, and also gives one an opportunity to describe the country in which the best tea is made. I daresay you have all heard how tea became to be the chief product of the sweet-scented Island of Ceylon. Coffee had for many years been the principal export, the others being cinnamon and other spices, coconut oil, etc, the minerals being represented by precious stones such as sapphires, cat's-eyes, moonstones, and last but not least the very useful and humble plumbago of which there are many mines in many parts of the country. In the middle of the seventies a disease was discovered upon the coffee tree of a most virulent description, which gradually attained such ascendancy, as in a few years to completely change the whole aspect of the coffee districts.

Where fields had yielded 10 or even 15 cwt an acre, only a few dried sticks were left to mark the place of former prosperity. This disease was called "Hemeleia vastatrix," and was really a consumption of the lungs of the leaves which after being attacked fell to the ground in decayed heaps, and the fruit without nourishment from the atmosphere failed to mature and ripen. Although as I say the process was gradual, the result to proprietors of Estates was appalling and sudden. It behoved all Ceylon planters and those interested to use their best endeavours to find a substitute that would enable them to maintain the prestige of the island. For this purpose everything was done that human ingenuity could devise. Tropical Agriculturist books were earnestly investigated. Kew Garden's experts were appealed to, and every conceivable plant likely to produce a paying crop was experimented with; but as a satisfactory substitute for coffee, they all more or less failed; representing a good illustration of the well-known fable of the fox who boasted of his nine tricks, whilst the success of the tea industry might be compared with the one trick possessed by the historical cat; the sequel proving that the latter was worth all the other nine put together.

Liberian coffee, cocoa, cinchona, cardamoms, pepper, vanilla, cinnamon, coconut, etc., have by careful cultivation given a good profit to proprietors, although

some of these labor under the disadvantage of supply exceeding demand, the market becoming easily overstocked.

Cocoa, Liberian coffee, and cinchona will only pay to grow under certain conditions of climate and soil, and therefore could not be considered a satisfactory substitute for the defunct coffee tree. The great substitute however was discovered. Difficulties were overcome, dead coffee trees were sawn down or the roots grubbed up to make room for the new seedlings.

Thousands of acres of jungle useless for growing the old product were promptly felled and planted up with the new. No land seemed to be too high or too low to accommodate the tea plant, no soil too rich or too poor to produce a luxuriant crop of tea. From the year 1882 the whole aspect of the island was changed. Huge tracts of land were opened up and factories built.

In the early days of tea planting the manufacture was entirely carried out by hand. In course of time however this was discovered to be inadequate, and machinery of all sorts and sizes was resorted to. The net result has been that Ceylon hand in hand with India has practically rushed China tea out of British consumption.

The three great growing centres of tea are China, India and Ceylon. British subjects should without doubt deal in preference with the two latter rather than with the former, if alone on patriotic grounds; and they have loyally done so, but the principal cause of China's defeat upon British territory has resulted from an economical motive. It was discovered that the British-grown teas go very much further than China. That is to say, two spoonfuls of India or Ceylon tea provide as many cups of teas as three spoonfuls of China.

The London Custom Report says:—

"From the information which has been afforded us on the subject, we believe that we make a moderate estimate in assuming that Indian tea goes half as far again as China tea, so far as depth of colour and fullness (not delicacy of flavour) are concerned. Thus 1 lb. of Chinese tea produces 5 gallons of tea of a certain depth of colour and fullness of flavour. 1 lb. of Indian tea will produce 7½ gallons of a similar beverage."

This report clearly proves that there is a direct saving in the use of British-grown teas. Surely a saving of ½ or 33% should appeal to the economical Swiss housewife.

"Demand controls supply, and it will only be when the small purveyor finds that his customers will no longer drink the China rubbish they have hitherto tolerated, that the great change will take place, exactly in the same way as it did many years ago in England.

In point of fact the reform will take place when the Swiss tea dealer comes to have more faith in English houses than he has in those belonging to Hamburg Jews.

Another great argument in favour of British-grown teas is the extreme cleanliness observed in their manufacture. Any stranger may see the whole process from the beginning to the end, the plucking of the leaf, the weighing of the same at the store, the withering at the factory, the rolling, the fermentation, the roasting and sifting of the manufactured leaf, the packing in lead lined cases, and if he so chooses he can see the cases placed in the bullock carts and despatched, marked and hooped, to the nearest railway station. A visit to a tea factory unmistakably proves that every process through which the tea passes is a *cleanly* one. It is not too much to say that after the green leaf has been once plucked by the coolies *the tea is never allowed to be handled*. Here is a quotation from Mr. Cave's book on Ceylon: "Everything it will be observed is done to avoid handling the tea indeed from the bush to the tea table, such methods of pure clear-

liness are observed as scarcely any other food manufacture can claim, and especially do these methods of Ceylon tea manufacturers stand in contrast to those of China, where the primitive operations employed are such that the stomach would rebel against a detailed description. I am convinced that if the public generally did but realize this difference between Ceylon tea and that of some other countries the demand for the Ceylon article would increase quite beyond the capacity of the country to produce it." What Mr. Cave says is quite true. The most perfectly clean machinery and storage of all descriptions is employed, and it is quite a pleasure and one not easily forgotten to see the whole process in operation. The Chinese on the other hand are very jealous of strangers visiting their gardens. They do not employ machinery but use only their hands and feet for the manufacture of tea. "Ah Sin" has no occasion to pay labour to assist him, his wife and olive branches being sufficient for the very small acreage for which he is responsible. After his tea has passed through an exceedingly unpleasant process, which consists of rolling, breaking, and squeezing the leaves until the juice exudes through the fingers, perhaps not overclean when he commences, but perfectly so by the time he has finished; it is then fermented and we hear it put into a copper pan and afterwards roasted upon primitive trays over a slow charcoal fire. When the process is in all its branches—we do not know or want to know—only a suggestion occurs to one that the *earthy* flavour so very apparent in China teas, is not alone attributable to the constituents of the leaf. The middleman in the tea growing centres of China is a very important person, he buys the leaf manufactured from the peasant grower, and after sorting and sifting it in to large breaks, packs it into the cabalistic cases so familiar to everybody. The tea is then carted to the great centres where it is bought for English or Russian houses and shipped to over-sea ports or despatched by caravan routes to Russia.

In looking at the tea growing centre of Ceylon upon the map, and considering the magnitude of the industry, we are surprised to see what a small area it occupies in relation to the rest of the island, which is about the size of Ireland. Ceylon from both in historical and agricultural point of view is one of the most interesting spots upon the face of the globe. The population is composed of Europeans, Sinhalese, Jaffna Tamils, Moors, Parsees, Portuguese, Afghan and Malays with a sprinkling of people from many other countries. The Sinhalese and Jaffna Tamils are the natives proper of the country. The latter occupy the extreme north of the island where they were driven by the victorious Sinhalese after one of the many dynastic wars between the two races.

The Sinhalese peasants object to work as a coolie, being perfectly able to support himself and family upon his patch of rice and garden, to watch him plunging in with his two buffaloes, who drag a sharp stake through the mud of the paddy-fields; forces the mind back a couple of thousand years, there is little doubt the passage of time has suggested no improvements in field culture to this veritable child of Nature. Lately the wealthy Sinhalese have taken up tea cultivation with the result that the labor class is gradually taking to the work and it is calculated represents about 7% of the wage-earning population. The scenery of the island is magnificent and reminds one very much of Switzerland; there are several mountains, but not nearly of the same altitude as the high ones of this country. "Pidurutalagalla" is a little over 8,000 ft. whilst the celebrated "Adam's Peak" is only about 7,000 feet. This mountain is by 800,000,000 of people considered one of the most scared spots in the World, it is to the Buddhist what Mecca is to the Mahomedan, and thousands of the faithful annually visit it on

pilgrimage. Curiously enough the Mahomedans and Hindus equally hold the mountain in veneration; the former think the well known foot-print upon the summit is that of our common parent from which superstition the Peak derives its name. The Hindus credit their god Siva with the impress, whilst the Buddhists, of course, reverence the foot-print as that of their holy Gautama.

The great working or cooly race is that of the Tamil, from the coast of Malabar; their lot in their own country in the time of famine is so hard that they are glad to emigrate anywhere for a certainty of shelter, a plentitude of rice with regulary paid wages.

The constantly recurring loss of the rice crops, due to the paucity of rain, has caused much distress and loss of life through starvation. By giving regular work and wages, our tea gardens have saved the lives of thousands of our fellow-creatures, surely an additional reason to look kindly upon an industry which has prevented so much suffering. The Tamil cooly is a patient, hard-working representative of humanity, he will work under a tropical sun for 10 hours at a stretch for 5½d. his wife for doing the same being quite content with the equivalent of 4d. in English money, his children find employment as pickers. Although of course he cannot make any considerable amount of savings he will sometimes return to his coast and buy a cow which to him spells affluence, or he will start himself as kangani or small headman, by degrees collecting a labor force to manage which insures him a competency, and what is still more to be desired enables him to superintend the work without working himself, which consists in standing upon a rock and dividing his time between chewing "betel" and shouting at the coolies. Kanganies who are not paid wages are paid each day so much for each cooly in their gang who comes to work. The system adopted by recruiting labor is called "Coast Advances." A sum of money is advanced by the Superintendent to his kangany who straightway returns to his village on the coast of India, and there in his turn advances so much to each cooly who is willing to return with him to the estate and work in his gang, thus a cheap labor force is constantly replenished, and it is no doubt greatly owing to this fact that the success of the tea industry is due. *Cheap labor and cheap transport* are both obtainable in Ceylon, without which, however suitable *climate, rainfall or soil*, no tea garden could by any possibility be made to pay, either in Ceylon, India or elsewhere.

It is generally supposed that Ceylon with its wonderful soil and climate produces a golden harvest of all kinds of fruit without the necessity of cultivation. *This is not so.* Only a few fruits even when cultivated are fit for European digestion: there are of course the well known *Mango, Plantain, Pineapple, Pomegranate, Mangosteen and Orange*, and that is really about all. The pineapple indeed is sometimes grown to an enormous size, weighing as much as 32 lb. and as delicious in flavour as abnormal in size. *The best fruits are carefully cultivated* and it is quite a mistake to suppose that they grow *wild* in the jungles. I mention this fact relative to Ceylon fruits as partly accounting for the downfall of King Coffee.

Coffee being a fruit crop was only kept going by *high cultivation*, the ground was manured hoavily year after year, until the fruit-bearing power reached its climax, and the over-taxed trees became an easy prey to the fell disease which eventually caused their destruction. The grape vine suffers from a very kindred disease to the "Hemileia" of the Coffee, in fact it appears to be an impossibility to force a heavy fruit crop year after year from the same trees, without compelling their destruction, in plain language we take no nourishment from Mother Earth than any system of manuring will enable us to replace.

Tea is not a fruit crop but leaf crop, the natural tendency of all vegetable life in the forcing climate of Ceylon is to run to leaf. *Therefore tea is*

a natural crop. We only ask from the tea tree what it can well afford to part with. The tea tree, it is true, throws out a beautiful blossom like a small single Camelia, to which family it belongs, but should there be too much seed upon the trees it is a sign that the "Jat" or quality of the tea is not good. The best tea throws out the least seed.

The difference between the two crops *coffee and tea*, being understood, it is not difficult to understand why planters have been so successful with the latter. The former exhausted the soil, the cultivation of the tea crop does not do so, it represents a bill of exchange upon the soil, which is always *paid when due and without difficulty.* The tea tree only requires careful pruning and management to bring its leaf crop to perfection. So rapid is the growth of the tea flush that on a properly managed garden the pickers have only time to finish the last field when the first will be ready to recommence upon, the flush takes about 8 or 10 days to grow. The tea planter has little reason to fear the ravages of the numerous pests which have helped to rob the Island of its magnificent coffee crops. No disease has yet appeared to interfere with the ever-growing export of tea from the port of Colombo, there is no apprehension as to that. The real problem to solve is *what is to be done with the surplus of tea which cannot find an outlet in Mincing Lane?* This important question has brought me before you to-day and will be discussed later on. It is one that must sooner or later affect consumer as well as producer. British-grown teas have still to replace those of China on the Continent of Europe and America; this is the special mission of the House I represent, Messrs James Finlay & Co. of Glasgow, with whom are incorporated Finlay, Muir & Co. in the East and Rogivue & Co. Ltd. on the Continent of Europe. This great firm has houses in all parts of the world—Glasgow, London, Calcutta, Colombo, Bombay, New York, Chicago, Toronto, Moscow, Constantinople, Magdebourgh, Lausanne, etc. and has altogether seventy thousand (70,000) acres under tea in Assam, Sylhet, Cachar, Darjeeling, Travancore and Ceylon, besides a considerable area under coffee, cocoa, cinchona, cardamoms, etc. The produce from their tea gardens last year amounted to 22,000,000 lb. of manufactured tea, this converted into cups of tea at the rate of 200 for each pound of tea would make *four thousand four hundred million (4,400,000,000).* Before describing the processes of tea cultivation it would be as well perhaps to study the chemists' analysis of the tea leaf. We have all noticed that there are times when nothing refreshes us so much as a cup of tea. No other beverage possesses this wonderful quality. Nothing in this world can ever replace the afternoon cup of tea, it is the only stimulant which cheers without exacting reaction. To what special property in the leaf is this due?

The constituents of the tea leaf are fifteen in number, but all with the exception of three are of small importance, these three are:

The Essential Oil,
Theine or Caffeine, and
Tannin.

The Essential Oil gives to the tea its flavour and aroma. As regards Theine in India or Ceylon teas there is sometimes as much as 6 per cent whilst in China tea only about 1 per cent is found. The higher the percentage of Theine or Caffeine the greater is the beneficial effect on the human system; this is evidently the invigorating agent. The Tannin in tea is the chief cause of its strength and pungency; it is however probable that the fullness of the tea apart from the pungency is due to the mucilaginous constituents dissolved by the boiling water. With regard to the great Tannin question it is a subject which has been much discussed but little understood. Indian and Ceylon teas are stronger in liquor than China teas, this although distinctly in favour of the former

has been used as an argument for their disparagement, it is simply a case of dealing with the teas according to their strength.

Ceylon teas should only be infused for five or six minutes after which time the made tea should be poured off into another tea-pot heated for its reception. If this were always done we should hear no more about Tannin which in properly made tea only adds as the analyst remarks strength and pungency to the liquor; fresh spring water should be employed, and water that has once been boiled should not be reboiled for tea making. Of course, it is necessary to procure a good sound tea, and for this purpose you have only to apply to any of the numerous agents of Rogivue & Co. Ltd., to obtain what you require.

The most delicate tea is grown at high altitudes whilst magnificent crops are produced from the low country gardens. The curious characteristic of Ceylon tea is that at whatever the altitude it is grown it can always be drunk *unblended*, it is a *self-drinking tea*, and does not require the agency of any other tea to make it enjoyable or drinkable. It is however about time to think of the tea seed if we are ever going to arrive at the tea-cup.

After a block of jungle is *bought, felled and burnt* it must be first well roaded and afterwards holed for the reception of the young tea plants, which are planted from three to four feet apart according to the altitude of the estate. A Nursery must first be prepared for the reception of the tea seed, well screened from the sun by Palm leaves or dried mana grass. This nursery it is needless to say is a most important part of the undertaking. On a large nursery it is quite one man's work to watch and water the seedlings and keep the ground clear of insects, pests, weeds, etc. The tea plant when about nine inches high only requires the rains to commence for planting out. The young plant is then gently extracted from the soft earth of the nursery, tied up into bundles and served out to the most experienced coolies to plant in the holes prepared for their reception. These holes are dug to the depth of about 12 inches and should be filled in with surface soil carefully freed from stones or rough subsoil. Planting is a most important operation and requires great care; should the long tap root get bent the future prospects of the tree will be greatly affected. The rainfall in the low country is about 180 inches per annum, about 6 or 7 times as much as London registers, as much as 6 inches of rain will sometimes fall in a few hours, this humid atmosphere coupled with the forcing properties of a tropical sun produces a wonderful growth in the tea fields, the first picking of the leaf often taking place within two years of planting. In the higher altitudes the rainfall is less and the growth not nearly so rapid, three to four years is generally allowed to elapse before the first crop is plucked. The general management of the tree will much depend upon altitude and climatic differences. The rougher teas from Assam or the Kelani Valley naturally require different treatment to the high-grown and more delicate sorts, it is not altogether unlike the high and low born of the human race, both are necessary but require separate modes of treatment to procure the best results. This is supposed to be a popular lecture on CEYLON TEA so that I shall not weary you with statistics. After I have finished my remarks upon tea cultivation and discussed with you other important points, there will be thrown upon the sheet a number of beautiful photographs taken by Mr. H. W. Cave of Ceylon. If the lecture should have proved a little dry I sincerely trust these pictures will dissipate any weariness acquired during the relation of details a little monotonous perhaps but necessitated by the subject.

The coolie women and children become very expert in plucking the leaf, it is marvellous to watch their

dexterity, it seems to be an instinct with them to know what part of the flush should be taken and what left for future use. The eye in the axil of the leaf must not be injured as that represents the future flush. The top leaf or bud of the shoot is known in the trade as "tippy" tea, this is a small orange-coloured leaf found in high class teas, easily distinguished amongst the black leaves by its golden appearance, this leaf makes the best tea and would be too strong in liquor to drink by itself unless used sparingly, a single pound specially picked has fetched in Mincing Lane as much as £35 stg. These fine leaves are collected by throwing the tea against a special matting made of jute, the extremely small tips stick to it whilst the heavier leaves fall to the ground. The *Orange Pekoe*, the *Pekoe* and *Pekoe Souchong* are the next in sequence down the stem of the flush. There are two kinds of plucking; fine and coarse, the former turns out teas as follows:—

Broken Orange Pekoe	...	Equal	30 per cent
Orange Pekoe	...	do	40 do
Pekoe	...	do	19 do
Pekoe Souchong	...	do	7 do
Dust	...	do	3 do
Wastage	...	do	1 do

the coarser picking would include a higher percentage of the Pekoe Souchong leaf. After plucking the leaf the coolie carries his or her basket to the central store where it is carefully weighed and placed in the withering rooms. The withering process is very simple, the leaves are spread out thinly upon "Tattu" or shallow trays, and left until they become properly withered, sometimes hot air is passed through the shed, but this is mostly resorted to when the weather is wet and the leaves in consequence refuse to dry, the leaf when ready for rolling should feel to the touch like a dry rag. This is a very important part of tea manufacture, as unless the leaf is properly withered it is quite impossible to roll it. After the withering the leaf is taken by trained coolies to the rolling machine, a marvellous instrument which roll and crushes the withered leaf into the fine spiral form so well known. After rolling comes *Fermentation*, the crushed leaf is placed in flatish heaps and covered with wet cloths until it becomes a *bright coppery colour*. Machinery having done its duty up to this stage, human intelligence must for a short time take its place. It is the *fermentation* of the leaf which is the *most important part of the tea manufacture*. During this process the *chemical properties of the leaf are changed*, the point is to know exactly when this change has taken place, and consequently the right moment to break up the fermentation, and consign the tea to the Dessicator or roasting machine. To gain this experience a long course of close application to the subject is necessary, however careful one may have been in the other parts of the manufacture, carelessness with the fermentation will spoil the whole day's work and not only lose a valuable lot of tea, but should the tea, so spoiled be shipped to London and receive an adverse criticism from the trade, the estate in question may get a bad name which would effect its sales of tea for a considerable time perhaps. In the very early days the proprietors of one garden nearly killed the prospects of Ceylon tea by sending to Mincing Lane samples which were discovered to be quite unfit to drink. There was a good deal of joking about this at the time but fortunately no real harm resulted. In these early days tea was made entirely by hand. Although a tea roaster was invented by a near relation of mine, which if it had been preserved might now have proved of considerable value to a museum set apart for showing the early efforts of the pioneers, who without guidance resorted to their inborn ingenuity and pluck for devising means for tea manufacture all honour to them say I, and I feel sure that you will agree to the sentiment. After the leaf is roasted, it is sifted into the different qualities required and packed into chests, half chests or boxes for the London Market.

A chest contains from ; 80 to 100 lb. of tea.

A half chestabout 50 lb. and
A box 20 lb.

We have had up till now I hope a pleasant canter across the green sward of the subject of my lecture. We will now with your kind permission turn to the question raised a few pages back on the struggle for the mastery between British-grown and China teas, viz., which of them will finally obtain the *tea supply of the world*, is it to be India and Ceylon on the one hand or China on the other?

Last year's Imports into the United Kingdom were as follows:

India	156,968,149
Ceylon	115,322,673.
China, etc	31,576,327.
	149,
	303,867,

One of the most striking episodes in the annals of modern commerce is the struggle between these countries for the tea supply of the world. As regards the consumption in Great Britain the result of that struggle is no longer doubtful. The Indian and Ceylon tea grower has won the battle. During the past twenty years he has displaced China teas in the British Market to the extent of 83,000,000 lb. In 1880 Great Britain consumed nearly 115,000,000 lb. of China teas, last year she consumed only 31,000,000. In 1880 Great Britain consumed only about 44,000,000 lb of Indian and Ceylon teas, last year she consumed 272,000,000 lb. While therefore the total British consumption of tea has increased by nearly 145,000,000, during the past 20 years, her purchases of tea from India and Ceylon have increased by 238,000,000 and her purchases from China have decreased by nearly 83,000,000. *The Times* in a leading article upon the subject says:—"This great Industrial revolution has been accomplished by an international rivalry almost without parallel in the history of the world. British enterprise has been doggedly met by Chinese persistence. British energy and dash against the inertia with which the Celestial clings to an established livelihood, however slender the subsistence which it yields. But Ceylon has taken a rapidly increasing share of the battle till it has now become a struggle between British enterprise in Asia and the Chinese power of endurance. It now stands revealed as a gigantic struggle between the *East and West*, and between the *ancient and modern* organisation of industrial life. Like all such struggles it ultimately resolves itself into a question of quality and price. It only takes a nation about ten years to get rid of its taste for bad teas, and to acquire a preference for good ones. As regards quality China has not a chance against India and Ceylon. Her rule-of-thumb methods produce an article inferior in flavour and in high class strength to that which the scientific appliances, the costly machinery, and the chemistry of arrested fermentation enable the British tea planter to send to the market. It is therefore no longer in the *British Market* but in the *market of the world*, that the struggle must be fought out. The British Planters whether consciously or unconsciously have practically acted on the principle that they had to pretty nearly kill the China tea trade in Great Britain, if they were to secure an adequate expansion for their own industry. They have as shown by the returns already cited *pretty nearly killed it*; and they are doubtless determined to go on with the struggle to the end. It is as we already said ultimately a question of *quality and price* and although the British planter has come off victorious, figures show the loss in price which the struggle has cost him. It is clear that the further displacement of China tea in Great Britain alone will not offer an adequate outlet for the rapidly increasing production of Indian and Ceylon Teas. But even if the British planter succeeded in displacing that quantity of China tea in the British Market he would still require to find new outlets for the

additions which are being yearly made to the tea exports from India and Ceylon. To find these new markets outside the United Kingdom I repeat is the special mission Messrs. James Finlay & Co. have undertaken to pursue and to devote their great influence and large capital to this end. It is for this purpose that Mr. Maurice Rogivue, Director-general of Rogivue & Co., Ltd., was chosen by the Planters' Association of Ceylon to represent the Ceylon Tea Industry in Russia. It is now many years since this redoubtable champion of Ceylon tea was honored by this confidence. He went to Moscow and there started a great number of depots and year by year has enormously increased the sale of Ceylon tea, displacing China Teas to the extent of 17 millions of pounds in 10 years and gradually forcing a path through the strong prejudices of the conservative Russian Tea drinker in favour of British grown teas. The land of the Turk has not been forgotten and a very large trade is being strongly pushed by Mr. Rogivue in Constantinople. It is now many years since I arrived in Switzerland also for the express purpose of introducing the tea grown in British Territory. Twelve years ago in Montreux it was almost impossible to procure Ceylon tea, and I believe the local Banker was almost the only medium for the supply of Indian tea in small packets. We have now about a dozen agents in Montreux who sell our Ceylon teas. Your humble servant was also one of the first Kelani Valley Planters and was also one of the first few to start the sale of tea in England. Myself and Partner represented Ceylon tea at the Healtheries Exhibition in 1884. I daresay some of you will remember our Sinhalese Bungalow in the gardens. We served out to the British Public very often as much as 2,000 cups in one day of the until then unheard of Ceylon Tea. It is needless to say this Bungalow acted as a splendid advertisement. The following year 1885 we shipped it over to the Antwerp Exhibition for the purpose of introducing Ceylon Teas into Belgium. At the Chicago Exhibition the Ceylon Planters provided a fund of £21,000 stg. to push their teas in the United States, the Indian Planters expended £7,000 stg. on the same purpose. The results were most satisfactory. British grown teas for the first time were brought within the knowledge of the American consumer. Next to Great Britain the United States is the largest tea purchaser in the world, but unfortunately the 100,000,000 pounds which they take are almost entirely obtained from China and Japan. Indeed the American taste for tea has been formed upon the coarse leaf of these countries and the fine flavoured Indian and Ceylon teas were a new revelation to most of the visitors at Chicago. 1,500 of the largest American tea firms immediately sent orders for British grown tea and the Ceylon Planters opened a central permanent depot for their teas in Chicago itself.

The amount of British Capital invested in tea gardens is about £30,000,000 stg. It is not to be wondered at that the proprietors of this huge undertaking are anxiously looking about for new customers for their ever increasing yield. In the year 1883 Ceylon bashfully sent to Mincing Lane 1,000,000 pounds of its new tea, in 1900 it plumped down over 115,000,000 at the door of the London Custom House. Such astounding assurance has met with its proper reward, for instead of the goods being returned with thanks as no doubt the aforesaid "Ah Sin" thinks would have been the proper course to pursue, the teas were actively competed for and found a ready market. From the days of its Cadetship Ceylon has grown into a fully equipped fighting soldier who in conjunction with India having fought "a la mort" for the possession of the London market with China, has had many a friendly round with its Indian neighbour, but the contest has always been fought with "gloves," and there is every reason to believe that in future only a friendly alliance supported by identical interests will exist between the two great British tea producing countries. This alliance will

no doubt have for its object the regulation of quality and consequently to a great extent of prices on the London Market by carefully restricting supplies and shipping only a class of tea calculated to increase the demand. It would prove a great misfortune if competition for cheap teas from British gardens, the quality as it has done with cheap China teas, some of which are not fit for human consumption. There is little doubt that magnificent China teas were sold to the general public half a century back, but then the price paid was enormous and the profit on the sale equally so. Now English people have been taught to believe that the best tea the world grows is not worth more than 1s. 7d. per pound at their grocers. This is not true, it is also most unfair on the producer who finds more and more difficulty in getting rid of his really fine Orange Pekoes at a fair price, the public taste for tea is not what it was a generation back, the evil has however to a certain extent cut both ways and it is quite true that one can now a days buy a sound drinkable tea at a much lower price than the last generation would have thought possible.

Before concluding I should like to make a few remarks upon the different names given to tea. In the days when China was the only country that grew tea it was known by such names as Pekoes, Souchongs, Congous and many others which have now almost lost their meaning to the general public such as: Gunpowder, Bohea, Hyson and Twankay, even the more modern names of Kaisow, Lapsaug and Moring are far less common than they were ten years ago. The pioneer planter in India thought it would be more convenient to continue using the names most familiar to the public and to carry out this idea he divided the flush or green shoot into different sections, each section was supposed to resemble one of the well-known China sorts. The China tea plant was discovered 5,000 years ago, it is known to have been used as tea 12 centuries back.

Manufactured tea was introduced into England during the reign of the merry Monarch. China seed was used largely when the first gardens were planted up in India and was employed in Ceylon as far back as the year 1842. The great discovery of the indigenous plant growing wild in the jungles of Assam completely changed the order of things. Some people contend that it was a botanist who first discovered this plant, whilst others say it was a common garden coolie. However that may be the two varieties hybridized very quickly and produced a useful flushing tree which was called "Assam Hybrid" and which has for a number of years been the chief tea of commerce. In some altitudes the indigenous yields much better in its natural condition and it now appears to be a serious question amongst planters whether it was not a mistake in the first instance to blend it with the Chinese variety.

I have now finished my remarks upon tea planting and Ceylon generally. It is a marvellous country with a marvellous history. In the early days of British rule the annual imports amounted to about £250,000, stg. they are now about £5,000,000 stg. In the early days there were no Banks no good roads or bridges. Very few schools, no hospitals, only four post offices and no newspapers. There are now 14 important exchange and deposit Banks, and Banking Agencies doing an annual sum of business amounting to about R60,000,000. 1,500 miles of splendid metalled roads, countless good bridges, more than 2,000 schools. Upwards of 100 hospitals and dispensaries, 250 Post Offices, 36 Newspapers and Periodicals, and nearly 5,000,000 acres of land under cultivation. The shipping entered and cleared in the course of the year amounts to nearly 6,000,000 of tons as against 75,000, in the early part of the century.

The Island is also becoming a net-work of mountain and seaside railways and both commercially and socially was never better off than it is at the present moment.

ALFRED AMES.

Lausanne, August 1901.

A PRELIMINARY NOTE ON THE ENZYME IN TEA.

During the past few months we have heard a great deal as to the occurrence and practical value of the enzyme in Tea. In view of the work which is now being done on this subject in India, Japan and Ceylon, it was thought advisable to lay before the planting community a brief statement as to the nature of the enzyme and the methods of manufacture, which may be suggested in order to allow full activity of the enzyme, if this be desired.

In India, Mr. Mann and Mr. Newton have contributed much to our present knowledge of the subject. Mr. Newton has suggested the application of an external enzyme to improve the flavour of tea, but in the absence of definite knowledge as to the relations between enzyme and flavour, his suggestion may perhaps be regarded as a little premature.

Mr. Mann has made many useful experiments on the substance in question, and bases his deductions entirely on the varying intensities of blue obtained with gum guaiacum on a watery extract of the enzyme. He concludes, that it is doubtful whether it would be possible to add enzyme to leaf of low quality in order to improve the quality, and draws attention to the recognised fact that the enzyme would be no good if the substances on which it had to act were not present. There are, however, several general statements to which we shall take exception, particularly those referring to the distribution of the enzyme, the absence of any knowledge as to what flavour is due to, and the statement that the maximum quality is to be correlated with the maximum amount of oxidase. These will be dealt with at length in a paper to be published later.

Azo of Japan has also noticed the presence of the enzyme in tea, and explains the oxidation and colouring of black tea as a consequence of the oxidising action of the enzyme. This has long been held to be the case in Ceylon and everywhere. In our preliminary note it will be as well to explain what is really understood by the word "enzyme." For our purpose, we may describe a plant enzyme as a substance existing in the sap, and which is capable of inducing chemical changes necessary for the life of the plant. As an instance we may quote the commonest of plant enzymes, known as diastase, which has the power to convert the reserve starch into a soluble sugar, which can be conveyed to the growing parts of the plant. In the leaves of tea, up to the present no starch has been found, so that the action of the tea enzyme *in the leaf* is of a nature different from the above. Nevertheless, its function, that of rendering insoluble bodies into a soluble form, is probably similar to other enzymes.

The presence of an oxidase is usually determined by the reagent known as gum guaiacum. This is a resin, soluble in alcohol, and capable when in contact with certain oxidising and other reagents, of acquiring a brilliant blue colour. It has been used for many years as a test for enzymes and other oxidising bodies, but it does not afford conclusive evidence as to the presence of an enzyme. There are very many other bodies which give the blue reaction with gum guaiacum alone, the most notable being the oxidising reagents:—potassium permanganate, nitric acid, potassium nitrate, potassium chromate, hydrogen peroxide, ozone, iodine and chlorine. What is most surprising, however, is the fact that the blue colouration may be obtained by means of an aqueous solution of old ferrous sulphate. Further, Reynolds Green *page 377*, states that even albumen, peptone and other native proteids as well as gelatine, give the same blue reaction.

It is therefore obvious, that before one can use the test as a means of detecting an enzyme much work must be done. In the first place, all the oxidising substances mentioned above can be neglected, since they do not occur in a free state in the

plant. It was necessary, however, to isolate the enzyme from the tea leaf, and to obtain it free from impurities, or substances with which gum guaiacum gives the blue reaction. This has been done, and the blue colouration obtained when gum guaiacum and the practically pure enzyme are brought into contact. We therefore believe that for our purposes the test can be used for the detection of the enzyme in tea leaf, and all our statements are based on observations of reaction, with this reagent.

OCCURRENCE OF ENZYME IN THE TEA PLANT.

All our experiments show that the enzyme occurs most abundantly in the young leaf, but is also present in old leaves and most other parts of the plant. It does not occur in definite decreasing proportions as one passes from the youngest to the oldest leaf, it being often more abundant in the second than the first leaf, and occasionally exhibiting a very erratic distribution in the active form. In the stem and root of the tea plant, the function of the enzyme is probably different from that in the leaf; or it may be that more than one enzyme exists in the different parts of the plant. Certain it is that the reserve bodies in the different parts are quite unlike one another, and would require different classes of enzymes to render them soluble.

We have determined the general occurrence of the enzyme in teas of all classes from all elevations, and it is important to realise that it is apparently as abundant in low-country teas possessing more flavour as in the highest grown teas in Ceylon. It can also be stated that there is very little difference in the amount present in leaf a few weeks from pruning, and in leaf two or more years from pruning.

It occurs also in the leaf at all times of the day and night, and no great quantitative differences were noticed in leaves plucked at 6 a.m. and 10 p.m. Leaves plucked under conditions varying from severe drought to heavy rains showed abundance of the enzyme at all times.

STRUCTURE OF A LEAF.

Since in the manufacture of tea we are concerned almost totally with the parts of the leaf, a brief description of them will be here convenient. An ordinary flat tea leaf is in reality composed of an accumulation of microscopic pellets, of a substance called protoplasm. Each of these pellets, or cells, has some duties to perform in the life of the plant, and here and there a definite grouping of cells of a particular shape and size is seen. The layer of relatively small cells which forms an entire covering to the leaf is termed the *epidermis*; the layer of long brick-shaped cells disposed in rows only along the upper surface of the leaf constitutes what is known as the *palisade* tissue, whilst the more or less spherical cells composing the lower and middle part of the leaf is known as the *mesophyll*. In the mesophyll are several small hands of conducting cells known as the *vascular bundles* or *nerves*.

THE GUM GUIACUM REACTION.

When a section of a fresh tea leaf is treated with gum guaiacum a blue colour appears mainly in the cells of the epidermis and mesophyll. In many cases the epidermis stains before any of the other parts, and finally assumes the deepest tint. Sometimes the parts around the small vascular bundles in the mesophyll take a deep stain. In every case, yet examined, the contents of the palisade cells have refused to take the blue reaction. This is a very important point to notice, as it would appear that this portion of the leaf, which is known to play the principal part in the manufacture of food materials, is characterised with a minimum quantity, if any of the active enzyme.

There seems some hope of yet being able to associate the maximum occurrence of the active enzyme with

a definite granular texture of the contents of the cells, but the significance of this will be discussed at length in a later paper.

It is worth noting that many of the sections do not give the blue reaction until repeated treatment with gum guaiacum and exposure to air, or only after adding another oxidising reagent. This is probably due to the enzyme existing in the zymogeu or inactive state.

The gum guaiacum must thoroughly mix with the cell contents before the blue reaction occurs, and only very thin sections will to a certainty give successful results. When very thin sections are used, the blue compound is seen to pass away from the section, and in consequence of the transient nature of the reaction, is likely to be overlooked.

We have now seen that an enzyme can be generally demonstrated in all tea leaves, and have briefly indicated the manipulation necessary. It will now be convenient to discuss the relation between

ENZYMES AND FLAVOUR.

In one or two instances the action of an enzyme has been utilised commercially to induce chemical changes, which result in the production of a more or less distinctive flavour. As an instance we may take yeast, a common part, from which no less than five enzymes have been extracted. It has been found that different yeast cells impart to a fluid a different odour and flavour, and this has been used on the continent in the improvement of certain wines. It was shown, that if different portions of the same grape juice were fermented with different species of yeast, wines were obtained which differed much in flavour, because each species of yeast has the power of producing, during fermentation, certain characteristic flavouring bodies. As has been previously pointed out, however, we must remember that all such fermentations require a great deal of time for completion and they are therefore not strictly comparable with the changes occurring in the manufacture of tea. It would be unwise to jump to the conclusion that the enzyme in tea is responsible for what we at the present time know as flavour, although it is possible, that under certain conditions the enzyme will be found to materially affect the quality, and perhaps to some extent the flavour.

It is as well to realise that enzymes of some class or other probably exist in every plant, and their presence is often in no relation to the production of flavouring substances. Even if a flavouring substance is produced by the action of an enzyme on some store material, it is often a question as to whether the change is desirable. These remarks are made on account of the fact that many planters seem to believe, that if an enzyme is found it is always an advantage, and the products of its activity can be utilised in manufacture.

Our experience would point to the conclusion that maturity of the leaf, utilised in manufacture, was an essential factor for the production of a flavoury tea. Every planter knows, that as soon as the absolute rate of growth is diminished an improvement in quality results, even in the low country. This is also borne out in a general sense in the marked differences in the quality and flavour of the tea grown at high and low elevations, the colder climate of the former determining a slower and more stable growth. In India we have also the finest flavoured teas growing at high elevations, where the climate is cold and vegetation grows comparatively slowly. Again, we might note that what is known as an autumn flavour is produced in Assam teas as soon as the weather gets cold and the hushes more mature from pruning. In comparing young leaves from a bush four weeks from pruning with young leaves from a bush two years, three months after pruning, many differences of structure are to be noticed. In the leaves from the latter, the walls of the cells are thicker, they possess a more definite outline, and the chlorophyll is more definitely granular. Everything

*The soluble ferments and fermentation by J. Reynolds Green.

points to a better organization in the more slowly grown leaf, and it seems probable that this will explain the improved flavour of such leaf.

(To be concluded.)

COFFEE AND THE WORLD'S PRODUCTION.

In the latest Consular Report on Rio de Janeiro, it is stated that the calamitous condition into which the coffee industry has drifted is clearly attributable to the unnecessarily large production, a sequel of the very extensive planting which took place six years ago, when prices were high and credits for enterprise of all kinds extremely facile. The world's consumption is now calculated at 14,500,000 bags per annum, and it was the custom to say that, to make up this quantity, 10,000,000 bags were required from Brazil. More recent calculations, however, favour the idea that no more than 8,500,000 to 9,000,000 bags are wanted from that country. But, however that may be, seeing that the world's production is 16,500,000 bags annually, and that the aggregate production of other countries has not expanded during the last 26 years, the excess in production in relation to consumption of 2,000,000 bags annually is attributed entirely to Brazil.

The realisation of this fact led to a project, strongly advocated at first in many quarters, aiming at the compulsory destruction of 20 per cent of the early crops. Fortunately, this anti-economic idea has now been generally condemned and more salutary methods of improving the situation are being earnestly ventilated. The cost of production, of course, varies according to the circumstances of each plantation, its situation, nature of soil, extension, yield per tree, etc. Working expenses in Sao paulo, for example, are considered to be, as a rule, 15 per cent. less than in Rio de Janeiro and Minas Geraes. Perhaps the average figure, including sacking and transit to shipping port, would be about 7 milreis per 32 lb. As the export value for the standard grade 7 is no more than this, and as the planter has still to pay the export duty of 9 to 11 per cent, *ad valorem*, it is evident that a considerable reduction in cost of production must be brought about if coffee cultivation is to continue as a paying industry. To this end incessant claims have been made for reduction of export dues and transport tariffs, and they have not been left entirely unattended to.

The State of Minas Geraes, for example, has reduced its export tax from 11 to 9 per cent. *ad valorem*, and the freight tariffs on the Central, Leopoldina, and other railways have been reduced 25 per cent. for hulled, and 30 per cent. for unhulled coffee, while a maximum rate of 100 milreis per ton is to be charged irrespective of distance. Field machinery and implements and all agricultural accessories also are now exempted from import duties, while favours have been extended to mortgagees to free them from foreclosure during the continuance of the crisis. Moreover, a more encouraging field for consumption in France has been opened by the reduction of the import duties into that country from 150 to 136 fr. per 100 kilos. All these measures will, however, be ineffectual in warding off collapse in many cases, for the simple reason that many of the new estates have been acquired and developed by means of mortgage loans by persons who have not even the floating capital necessary for current working expenses and who, during this period of restricted credit, will be quite unable to obtain the assistance necessary for this branch of expenditure.—*Home paper*

CULTIVATION OF ORANGES.

By F. E. H. W. KRICHAUFF, Chairman Central Agricultural Bureau, S.A.

Although the whole of the citrus tribe prefer a sweet friable soil of good depth and moisture, without being too wet, or planted in holes that prove to be stagnant

puddles unable to drain themselves, the soil is of less importance than irrigation or manuring; only an excess of moisture causes too often disease of the roots—but moderate irrigation, and manuring liberally and regularly, will induce orange trees to become profitable.

Senor Alino, F.R.H.S., of Valencia, Spain, says an acre planted with orange trees may produce 26,500 lb. of fruit, and such a crop probably contains 100 lb. of nitrogen, the same of potash, 105 lb. of phosphoric acid, and 220 lb. of lime, not counting wood and leaves. It is therefore absolutely necessary to give compensatory fertilisers, although somewhat modified in accordance with the soil and its constituents. A clay soil, although poor in phosphoric acid, most likely does not require the whole of the potash returned for some years, as might be necessary for a soil rich in lime and phosphoric acid. Gypsum reduces a soil rich in potash to a fit state for its absorption, and a smaller quantity of this fertiliser may therefore become necessary. Sandy soils are generally poor in plant food, and require all of them—after such a crop, at all events. Senor Alino, however, says that an excess of phosphoric acid results in many but small fruits, well flavoured, with a thin skin; and trees that are shy bearers may therefore require more of a phosphatic manure. Potash makes the fruit even more sweet and juicy, while too much nitrogen produces much wood and foliage, but coarse, thick-skinned, late ripening fruits, containing little sugar or aroma, and they do not keep well.

It is admitted that dung and other organic manures are useful as an aid to commercial fertilisers, which, however, are so much quicker consumed, but it is not advisable to give horse-dung more frequently than once in three years. Orange trees are never quite without a movement of sap at any time of the year, and apparently require plant food to be given more than once a year, especially nitrogen, although once is sufficient for most other fruit trees.

Senor Alino wants a deep annual ploughing, which it seems to me must injure the large number of fibrous roots which, here at least, are generally found to be near the surface. When manuring, a slight stirring of the surface by a four-pronged fork seems to me far better, and does not necessitate trimmed up trees to enable ploughs to run near the stems. Low branches are good protection of the trunk against our frequently too powerful sun. He forms round holes around his trees, and says that neither water nor manure should be allowed to enter. This certainly is a statement which has surprised me and probably most of our orange growers, as our circle formed around a tree was expressly made to water it better. He warns orchardists also to spread fertilisers not within a hand-breadth around the trunks.

Young trees require per acre 325 lb. of nitrate of soda, (or an equivalent of 260 lb. of sulphate of ammonia), 264 lb. of a phosphatic manure and 60 lb. of sulphate of potash in preference to muriate of potash. For old trees in full bearing, 350 lb. of sulphate of ammonia, or 440 lb. of nitrate of soda, 600 lb. of superphosphate of lime and 80 lb. of sulphate of potash may be required. If nitrate of soda is to be used, Thomas phosphate should be applied as phosphatic fertiliser. Lime, although it may be required, should not be given with the above fertiliser; either some time before or later. It is, however, well to apply perhaps both forms of nitrogen—namely, one-half of the doses of sulphate of ammonia in our winter, and one-half of the nitrate of soda three months later, when such division of the nitrogen may prevent the dropping of the young fruit. If the trees are not vigorous give but little potash; if too luxuriant, with few fruits, omit the nitrogen and give more superphosphate. In the United States a fertiliser is used consisting of four cent. ammonia, five to six per cent. phosphoric acid, and thirteen per cent. potash, spread and broadcast twice a year, with great results, *Journal of the Department of Agriculture, Western Australia.*

CAMPHOR.

The recent establishment by the Government of Japan of a monopoly of the production and sale of camphor in Formosa has attracted much attention to this product, and at the same time, by raising the market price, has rendered it by no means unlikely that this may prove to be a profitable cultivation in Ceylon. The present Circular is issued to lay before the planting public, the chief facts connected with this industry, and to describe the methods of cultivation and preparation which have been found best suited to Ceylon in the experiments so far tried with this tree.

The total export of camphor to Europe and America is perhaps about 60,000 piculs annually, or 8,000,000 lb. The market value of crude camphor in Europe is at present about 155 shillings per cwt., or about 1s. 4½d. per lb. Camphor was formerly used chiefly as a drug and for the prevention of insect ravages in clothing, &c., but of late years, in addition to these uses, it has been largely employed in the manufacture of smokeless powders and of celluloid. The tree also produces an oil,—camphor oil,—obtained with the camphor in the preparation of the latter, and which is used in the manufacture of soaps and for other purposes.

BOTANY.

Common, Formosa, Chinese, or Japanese camphor is the product of *Cinnamomum Camphora*, Nees, a tree occurring native along the eastern side of Asia from Cochin-China to Shanghai, and in the islands from Hainan to South Japan; its limits of latitudinal range are from 10° to 34° N., but it is cultivated in Japan to 36° N. In the southern parts of its range it occurs chiefly in the hills.

Two other forms of camphor are frequently met with, though rarely exported to Europe. Barus, Bhumasini, Borneo, or Malay camphor is the product of *Dryobalanops Camphora*, Colebr., a large tree of the family Dipterocarpaceæ, occurring in the islands of Sumatra, Borneo, &c. This camphor is slightly heavier than common camphor, and is highly prized by the natives of India and China, who purchase the entire very small produce at fancy prices, from 100 to 200 shillings per pound. A third form, Ngai, or Blumea camphor, is prepared in S.E. China from *Blumea balsamifera*, one of the family Compositæ. In Ceylon the natives prepare a small quantity of camphor from the roots of cinnamon, *Cinnamomum zeylanicum*, a plant nearly related to the true camphor. In the remainder of this paper only the common camphor, *Cinnamomum Camphora*, will be dealt with.

In its native country the plant grows into a tree about 100 feet high with a trunk 2 to 3 feet in diameter. It is evergreen, with moderate sized laurel-like leaves, which when crushed smell strongly of camphor. It may be well to mention in this connection that the tree is very handsome when young and forms one of the best ornamental trees for roadsides, parks, compounds, &c., in Ceylon.

The native habitat of the species is not widely extended, but it has been successfully cultivated in Ceylon, India, Australia, Florida, California, and elsewhere. It was introduced into Ceylon by the Royal Botanic Gardens in 1852. In 1895 plants were largely distributed from Hakgala to many planters and others. These were the result of seeds obtained in the autumn of 1893 from Japan. Mr. Nock, Superintendent of Hakgala, has collected information about these trees, some 950 in all, and reports as follows:—

"During 1895 plants of camphor were distributed from Hakgala to planters in various parts of the Island at elevations ranging from 250 to 6,450 feet, with annual rainfalls varying from 54 inches on 104 days to 217 inches on 212 days. Replies as to the growth of the plants have been received from thirty localities, and I think it is pretty well proved that

under certain conditions of soil and climate camphor will thrive at all elevations in Ceylon from about sea level to the highest mountains.

"It appears to thrive best in a well-drained deep sandy loam in sheltered situations with a rainfall of 90 inches and over, and dislikes poor or close, stiff, undrained soil. The growth is slow in sterile soil, but, under favourable conditions, in good soil is very rapid, the tree reaching a height of 18 to 20 feet in five years, with a spread of branches of 8 to 12 feet and a stem of 6 to 7 inches in diameter. This compares very favourably with the growth of the trees in their native habitat, where a tree 30 feet high and 6 inches in diameter, a ten years old is considered good. The best five-year old tree (from planting) in Ceylon is at Veyangoda, at an elevation of about 100 feet with a rainfall of about 100 inches on 180 days. It is 25 feet high and growing luxuriantly. The next best are at Hakgala, where the largest is 20 feet high, with a spread of 13 feet, and a stem diameter of 7½ inches at the ground.

"The habit of the trees in Ceylon in good soil is bushy, with a tendency to throw up many stems. This is a point of importance, as it shows that the tree will coppice well and stand frequent cuttings or prunings, and possibly even plucking of the flush as with tea. In close, hard, undrained or stiff clayey soil the growth is poor, and the habit stunted or dwarfed, and this is also the case in exposed wind-blown situations.

"Of course it is only in the experimental stage here yet, but judging from my experience of it for some years, it is my opinion that as a minor product it should be grown in the form of hedges, planted at distances of 6 to 9 feet apart and 2 to 3 feet apart in the row. The rows should run N.W. and S.E., or across the directions of the prevailing winds, and the plants be allowed to grow 6 to 9 feet high. Planted in this way there would be ample room for cultivation, and each row would shelter the other from the N.E. and S.W. winds, besides forming a large surface for clipping. As the young shoots appear to yield the most camphor, the crop could be obtained by clipping the hedge with a pair of light shears, and the expense would be very slight. The trees might also be planted at 6 feet apart, and treated in the same way as tea bushes, or they might be planted 12 feet apart, and trained as pyramids, or again planted 4 feet apart and alternate plants coppiced in alternate years."

PROPAGATION, CULTIVATION, &c.

Mr. Nock states:—

"Camphor plants are best and easily propagated from seeds. The seeds do not keep well, and should be sown as soon as possible after ripening. They ripen in Japan, which at present is the only important source of seed, in October and November, and should be ordered some time in advance, so as to obtain them as soon as they are ripe. I find it a good plan to soak the seed in water for twenty-four to forty-eight hours before sowing, agitating the water occasionally. The best seeds, being heavier, will sink to the bottom, and these should be sown thinly by themselves; the lighter ones should be sown thickly, as only a small percentage will germinate.

"The seeds should be sown in well-prepared beds of sandy loam and leaf mould; they should be sown from ½ to ¾ inch deep, making the bed firm, but not tight. The beds should be kept shaded and just moist. Too much wet will cause the young seedlings to damp off, and if allowed to get too dry the germs will quickly dry up and die.

"We have been most successful when the seed has been sown in boxes (made of ½ inch wood) 18 by 13 by 3½ inches, filled with the kind of soil described above. The boxes are handy to lift about, and can be easily protected from heavy rain and strong sun. Shed

made after the style of the old cinchona seed sheds answer well for standing the boxes in, and if made light and airy would do well to sow the seeds in direct, but care should be taken not to allow the young plants to be 'drawn.'

"We find it a good plan to prick out the seedling into supply baskets as soon as they are large enough to handle comfortably, or transplant them into beds, placing the plants 6 inches apart every way, and keeping them shaded and watered until they begin to grow, when they will bear the full light of the sun, but will require to be freely watered in dry weather.

"When the plants are from 9 to 15 inches high they are at their best for final planting, but if the weather is unsuitable they may be kept in the nursery till they are 2 feet high, or until good planting weather occurs, viz., dull showery weather. In such weather they require very little shading, and soon take hold of the soil.

"Cuttings do not strike root readily, and only under certain conditions will they be successful. If the prevailing weather should be too dry they soon go off, and if too wet and cold they decay before roots are formed. We have had batches of cuttings with 70 per cent. beginning to call us over, and young shoots forming, that have gone off after three or four days of rough weather—cold high winds and heavy rains—and others that have gone the same way after a week of dry sunny weather. The favourable conditions are equable heat, light, and moisture; with these, and wood for cuttings in a proper state, a large percentage will strike root and make good plants.

"The nursery beds for seeds as well as cuttings should be made in a well-drained situation, and as near water as possible. The beds may be any length, and from 3 to 4 feet wide. The soil for cuttings should be composed as follows: one part good sandy loam, one part leaf mould, and one part clean sharp sand (to this it would be beneficial to add a good sprinkling of powdered charcoal), all thoroughly mixed. The soil should be 6 to 9 inches deep. A layer of good sharp sand one inch thick should be laid on the surface. As a protection against hot sun and heavy rains it would be well to put a roof of thatch over the beds in the form of a shed, but it should be constructed with open sides to allow plenty of light and air. A shed 4 feet wide, with a lean-to roof on stout posts, open at the back and front, will be found a useful size. The posts should be 6 feet high in front and 3 ft. 6 in. at the back. The roof may be thatch, shingles, or other light material. If more than one is required, a space 4 feet wide should be left between the sheds to give room for watering, weeding, and general attention.

"The best material for cuttings is that from straight, healthy, and well-matured shoots of the current year's growth, not too soft or too hard. If too hard they will not root readily, and if too soft they will be liable to damp off. The cuttings may be of any size from the thickness of a lead pencil to $\frac{3}{4}$ inch in diameter. They should be cut into lengths of from 6 to 9 inches. A clean cut with a very sharp knife immediately below a joint to form the base of the cutting is of the greatest importance. If the cut portion is torn or jagged, or too far away from the joint, it is almost certain to decay, though it may remain green for a long time.

"The operation for inserting the cuttings is best done by opening a trench with a sharp spade so as to form a straight edge. The prepared cuttings should be laid against this and the soil pressed firmly round them. They should be placed in rows 9 to 12 inches apart, and 3 inches apart in the rows, and at a sufficient depth to leave only two or three buds above the surface.

"The sooner the cuttings are made and put in after being taken from the trees the better. After the cuttings are put in the beds should be watered to settle the soil, and if in the open they must be carefully shaded and sunlight must be only gradually let

in as they become rooted and can bear it. If all goes well they should be rooted in 2 to 3 months, but they will not be ready for planting out for three or four months.

"Camphor may also be propagated by layers. The operation of layering is very simple. The shoots should be sent down to the soil. The branch at the bend should be cut halfway through, then cutting upwards for about $1\frac{1}{2}$ to 2 inches, so as to form a tongue. The cut portion must be kept apart by a slight twist, or by placing a piece of brick or a small stone in the cleft. The shoot should then be pegged down firmly into a groove made in the soil for its reception and covered with soil. The end of the shoot must be kept upright by tying it to a stick.

"Another simple way is to split the branch at the bend where it is to be laid in the ground, making the split about 2 inches long, and keeping the cut parts open by inserting a piece of wood or stone. Peg down well into the soil and stake. The ends of the shoots should be cut back a few inches with a sharp knife."

It is thus evident that the plant will thrive almost anywhere in the Island if the water supply be sufficient and the soil well drained. The best method of treatment is probably to grow it as hedges, which are easily managed and clipped. It may also be planted along roads, jungle edges, &c., but *should never be mixed with the tea*, as the young leaves are very like those of tea, and a twig or two of camphor will spoil a whole brack of tea.

The following analyses of two soils at Hakgala—on one of which (A) camphor does very well, on the other (B) only moderately—will help to guide to the selection of suitable spots:—

CAMPHOR SOILS.

"Six samples of soil were received from Mr. Nock at Hakgala, which represented the character of the soil and sub-soil, where camphor trees grew well and only fairly well.

"No. 1 A represents a section 15 inches deep between trees showing the best growth, viz., 20 to 25 feet high and 12 to 15 feet in diameter at five years and nine months from the time of planting. The surface soil here is about 1 foot deep. It is composed of agglomerated particles of dark brown colour and yellow fragments of decomposing gneiss. It is very rich in nitrogen and the lower oxide of iron, has a fair amount of lime, but is deficient in potash and phosphoric acid.

"No. 2 A, representing the upper 6 inches, is of a dark brownish colour when dry, and is almost entirely composed of the agglomerated particles mentioned in No. 1 A and rootlets, &c. The analysis shows it to contain the bulk of the nitrogen, and an excess of the lower oxide of iron, but it is deficient in potash and phosphoric acid.

"No. 3 A represents the sub-soil at 15 inches deep or 3 inches below the actual surface soil. It is composed of yellow pieces of decomposing light-coloured gneiss, more or less bound together with a clayey matrix. It also contains a fair amount of nitrogen and rather more phosphoric acid and potash than the surface soil, and would be fairly easily penetrated by roots.

"No. 1 B.—This is taken from a section 15 inches deep, where the camphor is only doing fairly well. The plants five years and nine months old are from 9 to 10 ft. high and 6 to 8 ft. in diameter. It is more finely divided than No. 1 A, and is of a lighter-brown colour. Chemically, it is also somewhat poorer, though containing a good amount of nitrogen. Lime and mineral plant food generally may be considered deficient, especially potash, and this no doubt accounts for the poorer growth of the camphor trees in this part.

"No. 2 B, representing the top 6 inches, is a dark coloured loam, somewhat richer in nitrogen and phosphoric acid than No. 1 B, but is very poor in lime, magnesia, and potash.

"No. 3 B, representing the sub soil 15 inches from the surface, is a yellow loam much more finely divided than No. 3 A, but otherwise of somewhat similar composition. When wet it is of a retentive clayey nature requiring drainage.

HAKGALA, NUWARA ELIYA.

"The chief mineral ingredients required by the camphor plant for the growth of leaves are lime and potash, an average yield of prunings removing 196 lb. of lime and 87 lb. of potash, which could be returned to the soil after the distilled wood had been burned for fuel purposes.

"M. KELWAY BAMBER, F.C.S., &c.,

BANANAS UNDER IRRIGATION.

(Continued from page 510.)

VIRGIN LAND.—In virgin land, cultivation is hardly necessary. The great quantity of humus in the soil furnishes a readily available source of plant food, and, with the stumps rotting in the ground, assists drainage and aeration by keeping the soil free and open. It is when the supply of humus is becoming exhausted that the necessity for cultivation arises. The decay of the roots of the weeds cut down by the hoe also assists in keeping the soil in good condition. I am afraid too much is left to nature in this respect. Natural conditions in the tropics are so favourable to agriculture that at times the soil produces good crops in spite of what is done to it.

USE OF CULTIVATORS.—We have seen that the roots of the bananas are fleshy, and that they require a free soil for their proper development. Then, as the soil is exhausted more and more, to absorb the same amount of nourishment the root system has to become more extended. Hence let us consider how the soil and roots should be treated.

PLOUGHING.—My experience has led me to the conclusion that in soil varying from light sandy loam to heavy loam, one thorough ploughing and cross-ploughing per year is sufficient. Just how deep the plough should go depends on the condition of the soil. From four to eight inches should be sufficient. This will cut the root and induce branching from the cut ends, set free a supply of food for the use of the plants, and put the soil in a proper condition for the use of the cultivator. The more thoroughly the soil is broken the more will the elements act on it. Large clods are unfit for plant life; and when the surface is left in this condition soft roots are very liable to dry up. Hence the plough should be followed by the harrow before the lumps of earth bake.

SUBSOIL PLOUGH.—In addition to the yearly ploughing, it will often be found advisable to use a subsoil plough. From the pressing down of the lower stratum of the soil by the turning plough, the passage of air into it is more or less stopped, and water is apt to stagnate. While it may allow of the passage of

roots, it may still be too compact for their proper growth, and for the admission of air, and the roots will remain near the surface, an easy prey to dry weather. Every three or four years should be often enough for the use of the sub-soil plough, except in spots where water settles frequently. The time at which bananas are ploughed is a very important point. I have found it a very good plan to fork young bananas when about two months old, so as to break the hard earth immediately outside the hole; which could hardly be done thoroughly with the plough. Of course, it is better to thoroughly prepare the land with the plough before planting; but where this cannot be done, forking the plants at this stage will be found to give them a good start. This also helps to economise water.

FRUITING OF PLANTS.—The object of every plant is to produce fruit and seed, and so perpetuate itself; and any disturbance of its growth while preparing for this, the object of its life, will seriously impair its condition, and reduce the quality, and quantity or size of its fruit. It is therefore highly necessary that the root system should suffer no shock; but should be so treated as to be strengthened. No plant can successfully make both roots and fruit, nor can it produce good fruit without sufficient roots. Hence we see the importance of ploughing bananas before they begin to make the bunches. Just how late we can do this is hard to say, as there is little precise information to go on the subject. Under present conditions, where the bulk of the fruit is wanted from March to June, I would not consider it desirable to plough bananas after November at latest. As soon as the bulk of the crop is cut, the plough should be started, and all ploughing should be finished before December.

CULTIVATORS.—It is a good plan when ploughing to throw the soil into the centre of the rows, and so produce a convex surface. When the soil is thrown towards the plants, and the rows become hollowed, it is very hard to irrigate thoroughly. If the trench is put at the side of the row, the water is very apt to break away and cause ponding; or if in the middle, the water will wet only a small portion of the land. When the row is "round-ridged," so to speak, and the trench cut in the centre, the water is easy to control, and more thorough work can be done. It also induces the roots to travel towards the water, so increasing the feeding area,—a most important point in dealing with land which has been in cultivation for some time. Ploughing finished and the harrow having been freely used, the planter has then to devote his attention to a most important point, namely, how to make the most of his water supply. Constant surface cultivation is perhaps the best remedy for drought we have. It gives a mulch which does not require to be drawn off and on, drives the feeders down out of the wilting influence of wind and sun, prevents loss of moisture by evaporation—in short it keeps the plants growing. Should heavy rains fall, heating the surface down, causing it to bake into a crust, it will be found quite safe to plough lightly if surface cultivation has been diligently employed. The surface should never be allowed to bake. Various implements are in use for stirring the surface, from the scuffle hoe, worked by hand, to the riding cultivator drawn by a pair of big mules. In practice, I have found the disc harrow the most useful implement, it giving a mulch of thoroughly pulverized soil about four inches deep. The spading harrow will even break up a crust perfectly impervious to any toothed implement—thus obviating the necessity for using the plough. It also chops up weeds, covering them lightly. The best time to use the disc harrow is *always* when the soil is not too wet.

PRUNING.—This is a question on which opinion is very much divided. The term "pruning" as applied to bananas is sometimes taken exception to, for which reason it is hard to say. Pruning is a removal of useless and dead growth, to throw all the strength into

the reproductive part of the plant; and this is precisely what is done with the banana.

TIME OF PRUNING.—The time of pruning should be regulated by the need of it. Slow growing plants require pruning as a rule once a year, and that at a well defined time—usually when the tree is at rest. It may be taken as an axiom that the quicker the growth of a plant, the more constant care it requires; as any influence for good or evil will be felt quickly—this applying to all the operations of the farmer. Hence it would follow that pruning bananas should be done whenever necessary, at any time of the year.

OBJECTIONS.—It is sometimes urged that pruning at any other time than in the winter months is highly injurious to bananas, owing to the excessive bleeding of the trees. This is true to a certain extent, as all vegetation naturally has a most vigorous growth in the spring. But is this bleeding out of proportion to the amount of sap in the tree; and is it more injurious than the demands of a crowd of suckers on the available plant food? When it is remembered that every young sucker occupies a certain space on the bulb that might otherwise be occupied by the roots of the parent tree; and that every young sucker, be it only an inch above ground, has roots of its own, it will be seen that every sucker other than those intended to bear fruit is a distinct check to the growth of the parent tree and its destined successor. It is hardly necessary to define the condition of a field when pruning should be done. It will be of more service to examine the effects of want of pruning. Cutting off the trash and leaves hanging down is the first operation. The trash seems designed to protect the tree from the direct rays of the sun; but in a plantation, where a great deal of light is filtered through the tops of the trees, it is not often required for this purpose—except in the outside rows, and where, from wind or other cause, the sun can enter too freely. Too much sun causes the outer sheath of the tree to dry up. Too much trash hinders the circulation of air, causes the young suckers to run up into spindly whips, and contributes to a weakness of the stems of the trees which is only too apparent in a heavy wind. This latter point will be referred to again.

CUTTING TRASH.—Another point in connection with the trash is that in plant bananas it often rests on the ground at the base of the tree, causing the roots to come to the surface. This, of course, to be avoided.

SELECTION OF SUCKERS.—It is important that the best suckers only be left. Those which are deep rooted are the best, as they have a better grip of the ground and are less liable to blow down when well grown. Due regard to position must also be had, one sucker to each tree, so as to have as much space as possible between them.

CUT SUCKERS.—Objection is sometimes taken to cut suckers being left—that is, suckers which have been cut while the previous pruning was being done; on the ground that the bunches from these suckers will be inferior. My experience has not shewn this to be a fact, unless the sucker was cut when well developed. I measured a cut sucker, and found it was 22 inches high, and eight inches across at the level. This would seem to indicate that cutting a sucker while young tends to increase the size of the bulk.

METHODS OF CUTTING OUT SUCKERS.—The cutlass should not be pointed towards the tree, but sideways so as not to stab the parent tree. The sucker should be cut down to the hard, white part; as if imperfectly cut, it will spring up again very quickly.

GREEN LEAVES.—Green leaves should not be cut off to allow the tree to withdraw the sap from them.

OLD STUMPS.—The tree is usually cut over about six feet from the ground, the bunch cut off, and the upper part of the tree severed completely, leaving an "arm." I am of the opinion that the whole of this should be left until it can be pulled away from the bulk; as observation has shewn that the following sucker thrives better.

NUMBER OF SUCKERS.—The question of how many trees we can allow to the root depends in the first place on the distance apart at which the field was planted. I have seen the following distances tried; 15 x 15, 14 x 14, 12 x 12, 8 x 8, 7' 6" x 7' 6", 15 x 7' 6", 10 x 6, and 12 x 8.

CLOSE PLANTING.—"Close Planting" (8 x 8 and 7' 6") was the result of the demand for fruit being confined to five months in the spring. This method has given good results under proper management. Pruning should be strictly carried out. Attempts have been made, where the crop was coming in too soon, to retard it by leaving young suckers round the single trees. This can only result in stunting of the bunches. In good land, the best plan for ratooning is to take out every row, leaving the field 16 x 8; permitting two or three suckers to grow in each root. It may be necessary for the third ratoons to bring the field to 16 x 16. Ratooning 8 x 8 in rich land can hardly be recommended. In hot land, 8 x 8 gives very good results, covering the ground quickly; and can be ratooned with success. 7" -6" x 7' -6" I consider too close.

CLOSE BY WIDE.—This method, (e. g. 15 x 7' -6") brings in the crop very evenly, but can hardly be recommended for ratooning. Plants may have two suckers in each root; but the ratoons are apt to be crowded. In planting close by wide, it is a good plan to plant the wide rows north and south, so as to allow as much sun as possible to penetrate.

WIDE PLANTING.—This is the old method, and one that has proved successful. It is not possible to regulate the crop so well; but where fruit can be sold all the year round this is hardly a disadvantage. Cultivation with implements can be better carried on, 15 x 15 is the usual distance. Three or four suckers to each root may be left, according to the richness of the soil. The advantages and disadvantages of the different methods of planting may be summarised as follows:

CLOSE PLANTING.—Evenness of crop. Less weeding. Less water. Quick returns.

Extra cost of planting. Extra pruning. Trouble in reducing to wide or close by wide.

CLOSE BY WIDE.—Evenness of crop. Quicker growth. Economy of water. Less weeding.

Can only be cultivated one way. Extra pruning. Crowding of ratoons. Trouble of reducing to wide. Extra cost of planting.

WIDE PLANTING.—Can be cultivated both ways. Less pruning. No trouble in reducing.

Crop more spread. Slower returns. Extra weeding.

GENERAL.—The time in which suckers fruit varies considerably. Plants take from 10 to 16 months, (the latter being the second suckers,) Ratoons take from 14 to 18 months. The causes governing these are the nature of the soils, weather conditions, distance of planting, mode of cultivation. It is impossible to lay down any hard and fast rule on the subject. The penalties for leaving too many suckers are two—small bunches, and blow downs. In one piece of bananas which had in my opinion too many suckers and too much trash, a heavy wind played havoc. It was very noticeable that three out of four suckers were broken over, not uprooted. The land was rich; and the suckers would in the circumstances throw out many roots. They were, too, first ratoons, which are usually strong rooted. In adjacent fields, properly pruned, the loss was comparatively trifling; and, most of the trees were uprooted. It is advisable when pruning to clean the root out thoroughly removing all trash, etc.

Journal of the Jamaica Agricultural Society.

THE IDENTIFICATION OF WOOD.

I have read with much interest Mr. Herbert Stone's paper on the above subject, and would like to be permitted to make a few remarks as an addition to a discussion at which I was unable to be present.

First of all, a small personal matter. My "Manual of Indian Timbers" was several times referred to in very kind language, but both in Mr. Stone's paper, and in the remarks upon it by Dr. Schlich, there is some misapprehension regarding the responsibility of the descriptions of woods given in it. I feel sure that Dr. Schlich was not properly reported, and as, possibly, Mr. Stone had not read my introduction, I propose to give the full extract from page ix., written in November, 1881. The "writer" was, of course, myself.

"It is now necessary to explain how the descriptions of the woods were made. During the progress of the work of preparation of specimens in Calcutta, and afterwards at more leisure in Siula, the examination of the different woods and their description was made by a committee which consisted of—

"1. Dr. D. Brandis, F.R.S., C.I.E., Inspector-General of Forests.

"2. Mr. J. S. Gamble, M.A., Assistant to the Inspector-General of Forests.

"3. Mr. A. Smythies, B.A., Assistant Conservator of Forests, Central Provinces.

"The descriptions were usually dictated by Dr. Brandis, and written down by one of the others, generally Mr. Smythies, but the wood structure was examined by all three officers, and discussed before the description was finally passed. The whole was gone over three or four times, and in the later examinations, when the Committee was more accustomed to the differences of structure, the generic and family characters were discussed and drawn up. Some of the later received specimens, as well as those given in *Addenda*, were described by the writer, but on the same plan and principal as was originally adopted by the Committee."

In referring to the chief works on the subject of the description of wood, and giving keys to enable them to be identified by their more easily-seen characters, Mr. Stone omitted to mention what is, in all probability, the most important, if not the earliest, book on the subject relating to European woods—the "Flore Forestiere" of Mons. A. Mathieu, late Professor of Forestry at the Forest School at Nancy, France. The first edition of Professor Mathieu's work was published in 1858; it was followed by a second and third, the latter in 1877; the fourth edition, issued since Professor Mathieu's death, with complete revision, by his successor, Professor Fliche, appeared in 1897. In the "Flore Forestiere" the wood descriptions are given with the genera, supplemented, where necessary, for the species; and at the end of the book is a detailed analytical key, which in my opinion, is much better than the keys given by Professor Nordlinger and Professor Hartig. I can also recommend to Mr. Stone the excellent key to English (and some Indian) woods given in "Timber, and some of its Diseases," the very useful little work by Professor Marshall Ward, F.R.S., of Cambridge, published in the "Nature Series."

I cannot agree, and I do not think that Indian botanists of any branch will agree, with Mr. Stone's complaint that "botanical explorers" omit from their descriptions, the useful products of the plants. Of course, in large general floras like the "Flora of British India," it would be impossible to insert such things, but, with such exceptions, nearly every Indian botanist has given, perforce briefly, economic information. Roxburgh's "Flora Indica" is an excellent case in point. If, Mr. Stone will study the "Dictionary of the Economic Products of India," by Dr. G. Watts, C.I.E., probably the most complete work of the kind prepared in any country in the world, he will see what Indian botanical explorers have done for the economic products of the country. In the

"Manual of Indian Timbers," the wood specimens collected by Dr. Wallich were all examined and mentioned, as were the more recent collections of Sir D. Brandis, Mr. S. Kurz, Col. Ford, and others. In my new edition about to be issued I have included also the collections of Sir J. D. Hooker, Mr. H. N. Ridley (Malay) and others, deposited at Kew; and one of my chief regrets is that the collection of the Brothers Schlagintweit could not also be included, because the names have been lost. What has been done in India, of course, I know more intimately, but I also know that Colonial British explorers have not deserved to be accused of neglect, and that the work done by the French and the Dutch has been as good as, indeed if anything, better than our own.

I think that in his remarks about Kew Dr. A. Henry was not quite just. I have been recently working in the Kew Museum and have been struck with the care taken to incorporate in it the woods sent by various correspondents. As I was not specially interested in Chinese woods, I can say nothing about Dr. Henry's collections, but they are doubtless there, ready for him or another to work up. The authorities at Kew were most kind in their help to me and were delighted that I should work in the museum; but it is abundantly clear to anybody who inquires into the matter that the present miserably inadequate and ill-paid Kew staff could not be expected to do wood-descriptions for explorers in addition to their own work. The Kew collections are national, and the herbarium and museum are maintained by the State, not only for study by the staff of the establishment, but to be conveniently at the disposal of workers in general. There are, unfortunately, not many specialists in the study of woods, and it is very good news to those interested in the subject that Mr. Stone is going to devote his scientific life to it. His paper was very interesting, and I, for one, shall eagerly look forward to the results of his further work.

December 9th, 1901.

THE EFFECT OF FORESTS ON THE CIRCULATION OF WATER AT THE SURFACE OF CONTINENT.

(Continued from page 513.)

On level spots in the mountains, whether forest grass or bare, there is a decidedly greater amount of moisture in the soil than in the plains under similar circumstances. There is more rainfall and the snow lies longer. The amounts evaporated directly, or utilised by plants, are also less. It is well-known that high plateaux, &c., are often swampy or peaty. But level spots are the exception, mountains consisting principally of more or less steep slopes where surface flow is an important factor. In fact, the surface flow is the great characteristic of unlevel countries and constitutes the great difference between these and the plains. There are numerous examples continually coming to light, showing the excellent effect produced by forests on the volume, the regularity, and the maintenance of springs. This is perhaps the place to mention a certain nala in Lachiwala forest, coming down from Nagsidh hill. Up to 1896 this nala carried running water in November-December. In later years it has always been dry by the end of October. The dryness is perhaps not permanent for the future, but it may be due to fellings that have been made on the slopes of Nagsidh. Nobody now denies the beneficial action of forests from a quadruple point of view, *viz.*, the increase of rainfall, the protection of the soil from erosion, the more regular flow and diminution of floods, and the maintenance and steady flow of springs.

It is possible to explain the apparent contradiction between this last point and the result of the previously mentioned experiments in plains forests, where it was shown that the level of subsoil waters was somewhat lowered? Is it possible that the forest acts in opposite ways in different localities? Before answering this question certain well-known facts may be considered. Suppose a slope at 45° wooded on its left half and bare or grassy on the right half. In winter both halves are covered with snow, more thickly and evenly so in the forests since there are no avalanches and the wind cannot sweep up or evaporate so much. The springs bring a rapid thaw. On the bare slope where nothing hinders the access of warm air the melting will proceed quickly and the greater part of the resulting water will disappear at once by the streams. It is well-known that in bare or grass mountains the melting of the winter snows causes great and sudden floods like the disasters of 1856. The quantity of water soaking into the soil depends, among other things, on the length of time during which the water remains in contact with the soil. This time itself depends partly on the steepness of the slope. A very steep slope removes the water quickly, so that there is little time left for absorption. Hence steep slopes dry up very quickly after rain, more especially if they are not wooded. On the wooded half of the above supposed slope, the melting will be quite slow, taking a fortnight or a month longer. Thus, even without any low vegetation, the surface flow will be much slower and more prolonged, with a corresponding decrease in flooded streams. But the forest soil always possesses a covering of dead leaves and humus acting like a sponge, able to absorb and hold as much as two or three times its own weight of water which it only parts with drop by drop. The soil below is protected from evaporation and sucks it all into the great benefit of subsoil supplies. The effect is still further increased by the then dormant condition of vegetation, which has no need to absorb any water at that time. The same thing happens during the heavy summer rains, except that the trees this time appropriate a certain share for their own use. If there is actually any water flowing along the surface it is much impeded by the network of roots, stalks, and obstacles of all kinds, so that a given flowing drop has every chance of finding a spot able to absorb it, or a small crevice by which it may get underground. The final result is a great diminution or complete stoppage of surface flow. It is true that during excessive rains or melting of snows, the forests cannot always prevent floods, but in such cases the rise is much less sudden and severe than it might have been, and is due more to enlarged springs and less to erosive surface action.

According to M. Imbeaux, State Engineer to the important Municipality of Nancy, the fraction representing the surface flow due to very heavy rains may be calculated from the rise in the streams effected. He found that in the exceptional floods of the drainage on the 27th and 28th October, 1882, the 26th, 27th October 1886, and the 8th, 11th November 1886, the fraction at Mirabeau was .33, .39 and .42, or over a third of the total fall. For less violent rains the fraction were .27, .22 and .18, in accordance with the general law according to which the surface flow follows the intensity of the rain. At the Junction with the Rhone, the figures were very similar but smaller. For the Danube at Vienna, M. Landa found 42.1 per cent, from 28th July to 14th August 1897. It is clear that for a given rainfall the surface flow will be greater as the soil itself becomes steeper and more impermeable or rocky, but the covering of the soil has a powerful influence in all cases.

On this point M. Imbeaux says:—"The re-foresting and returning of bare mountains at high altitudes are, and have in France been long known to be among the most effectual methods possible for checking excessive surface flow and its consequent

disasters. During the first half of the century the United State of America forgot or disregarded all this, and destroyed their primeval forests at a wholesale rate. They have now seen with their own eyes how their former steady (and regular streams have become transformed into torrents, raging down so long as it rains, and dry for the rest of the year. The matter is proved beyond dispute." Thus wherever man has to fear floods, he should plant forests as his best of all protections. They will give him important other advantages into the bargain as already shown.

The figures given above refer to large basins where the slopes are partly bare, partly cultivated, and partly forests or grass. Figures relating to basins of one kind exclusively would be of value. Since 1860, M.M. Jeandel, Cantegril, and Belland have been making comparisons between neighbouring basins, and they find the tendency to floods to be diminished by one-half in the wooded basins. Their work is not perfect, but it is the best available, the researches of M. Belgrand being worthless on account of defective conditions. The Swiss Forest Research Station is now beginning experiments in this direction in two adjoining basins, one wooded, the other almost without wood. Many rain-gauges will give the true rainfall, and the outflow will be measured in the streams with precision by means of weirs.

The quantity saved from flowing away on the surface can be estimated from the springs, but only approximately. There are many instances of springs drying up or decreasing in quantity and regularity through the clearing of their basins, as also of springs being brought to life again by the growth of forests. There are lists of these in specialist publications, but a few more may here be cited, because they are recent, perhaps little known, and warranted by competent observers. M. Crahay, Inspector of Forests at Brussels, in 1898, quoted instances of the sources of the Sure at Planchimont, &c.:-

"Since the spruce plantation of 35 years back, the flow has become more regular. One which used to be dry all the summer is now never dry, and is now about 220 feet higher up than it used to be. At Bois le Français, in the commune of Villersevant-Orval, after the clearance of an old coppice with standards, two springs dried up. The place where the water came out, and the little bed it ran in, are still to be seen."

At the international Congress of Sylviculture, held at Paris in 1900, M. Servier, a landowner at Lamure sur Azergues (Rhône), made an interesting communication "On the hydrostatic phenomena following the planting of conifers." The soil is sandy. It was, till recently, almost devoid of wood, a fact tending towards floods and torrents. Wherever a small clump of wood remained, the spot was generally marked by a spring. There is a spring on the western edge of one of these clumps. Every time the coppice is felled the spring diminishes, and as the coppice grows, the spring recovers its volume. M. Bargmann quotes two springs in the communal forest of Storkensohn (valley of Saint Amarin, near Urbes) which dried up when the forest above it was felled, but a new spring appeared about 500 feet lower altitude where no fellings had been made. "It is easy to see that the disappearance of forest completely changes the conditions of evaporation and surface flow. Both are increased by disforestation." The only conclusion possible is, that the moisture lost by increased evaporation and quicker surface flow is much greater than the gain by cessation of root-suction.

It was mentioned just now that the portion saved from surface flow could only be roughly estimated from the springs. This is because all the water saved does not reappear in springs. Some of it goes as deep as 1,500 to 3,000 feet to form subterranean reservoirs which are available for artesian wells; for instance, the artesian wells of Paris, the supply for which sinks in along the outcrop of the greensand

in the basin of the Meuse. Elsewhere the water may sink in till it finds an outlet into some ocean. In some cases, the subterranean water losing its outlet in one basin may work across to another valley altogether, and increase the springs there. Finally, and most important, the soil itself must be considered as a great sponge, the degree of saturation of which varies irregularly according to the abundance and persistence of the rains. If a year begins with a low level of saturation and subterranean waters, and ends with a higher level or degree of saturation, it is evident that the surface flow of that year must have been less than normal, much of the normal surface flow having been absorbed to the benefit of the subterranean supply. Hence, the relation between the actual rainfall and the surface flow in that year will be disturbed, being less than would have been the case if the year had begun with full resources. In the one case the relation will be less than the average, in the other case more. In the one case the budget begins with an overdraft which has to be met, in the other there has been something "brought over."

As the subterranean waters are beyond the reach of all measurement, it can only be judged that when the springs run full, the soil is full, and when the springs diminish, the subterranean reserves are low. So long as the springs remain normal, there is equilibrium. The time elapsing between the disappearance of the water underground and its re-appearance in the springs is very variable. In coarse or fissured soils the springs begin visibly to increase almost as soon as the rain begins. In very compact soils, and when the distance of infiltration is long, the process lasts for years. In the first class of cases just mentioned there may be damage. On steep slopes and in soft loose soils the streams dig deep beds and cut away banks whose removal causes landslips. Good earth is continually being carried away and raw mineral soil exposed. Needless to dilate further on this point. Here, again, the forest is the natural remedy. Across all these little streams living weirs are constructed. These are formed of willow cuttings which soon strike root and produce vigorous shoots. A stout fence is thus produced which rises as the river bed itself rises, forming a filter through which all the water indeed passes, but its evil impetuosity is ended. In torrent beds of great width trees are planted, such is the alder forest which is so jealously maintained in the bed of the Veneon, where it joins the Romanche. The forest checks the violence of the flow, and compels the deposit of sediment which would otherwise go further down and raise still more the already too elevated bed of the Romanche; these are the best kinds of dams, they cost little to construct and nothing for maintenance. The method is not always available. But it is not adopted nearly so often as it might be. It is only through the action of forests that the rivers arrive at the sea in a steady and respectable manner, having throughout their courses rendered the highest possible services to man, to animals and to plants, by springs, by percolation, by irrigation, by furnishing power, by providing the means of transport, &c.—*Indian Forester*,

F. GLEADOW.

SISAL HEMP AGAIN.

It is as yet too soon to obtain a report of results from the Sisal hemp-growers who last year obtained parcels of plants from the Department of Agriculture, as it takes at least three years before the plants are old enough to yield the first crop of leaves. We have advocated the growing of this valuable fibre, for the reason that poor land not adapted for cereal or root crops can be utilised profitably at very small expense. Some have hesitated to plant, owing to the fear that expensive machinery would be needed

for preparing the fibre; others because such a large water supply is needed. In view of these objections, we place before our readers the statements of Mr. Quennel, in the Journal of the Jamaica Agricultural Society. That gentleman says:—

I have seen, with a deep regret, some persons rejecting at first the idea of cultivating fibre plants in Trinidad as requiring too much capital and too costly machinery.

This is a great mistake. Yukatan is there as a proof of it, because the Indians of that country export now more than 100,000 tons, prepared with a very rough machine called "raspador," a wheel of 4 feet diameter, working at 160 revolutions a minute. The cost of it cannot be, with horse gear, above 150 dollars. That machine is easy to move from one place to another. It wastes a certain amount of material, and is slow at work; but it is not the first time that the primitive appliance of the peasantry has succeeded better than costly machines and big capital, with their heavy interests and annuities. The raspador gives net 335 lb. in ten hours. A machine for working three-quarters of a ton would cost, with steam-engine and the buildings to correspond, £1,200 at least, when five raspadores would not cost more than £150.

A steam-engine would not be moveable and could not be economically established where the area under cultivation would be less than 1,600 acres.

I take my data from various reports from Dr. Morris, Imperial Commissioner of Agriculture, Barbados, and from Mr. Richard Dodge, of the Washington Fibre Investigation Committee on account of the Government of the United States.

From them I come to the conclusion that the fibre plant gives a hemp of a value of £30 a ton in London which I reduce to £14 a ton after allowing for discount, commission, and freight, and also for cultivation and packing. This is less than the amount given in the reports referred to.

I take for planting five rows in 36 feet—that is to say, four at 6 feet distance and the fifth at 12. I put the plant 6 feet apart in the rows. This gives me more than 1,000 plants to an acre. Each plant at four years gives forty leaves a year of a weight of 50 lb., of which 4 per cent, turns into fibre, dried and white, or 2 lb. of fibre to a plant, or 2,000 lb. an acre. £14 a ton is more than 3 cents a lb. I allow only 2½ cents a lb. to make 50 dollars an acre. Thus an acre producing net 50 dollars yields double the results of 200 cacao trees on an acre, at 10 bags per 1,000 trees at 12 dollars net (when 6s. the London market quotation) or 2 bags, 12 dollars=24 dollars. It is a great deal more than 20 tons of sugar-canes on an acre at 9s. a ton, leaving probably not more than 1s. a ton to the cane farmer, or £1 an acre.

If the acre gives 2,000 lb. a year, and a raspador prepares some 330 lb. a day—100,000 lb. a year of 300 days—it will require 50 acres to produce sufficient fibre for one raspador's work in one year; 5 raspadores for 250 acres; 20 for 1,000 acres.

But what strikes me more is that I noticed that on all the sugar plantations, all the cacao estates, everywhere on Crown lands, there is a large extent of useless land, when not first-class. Well, the fibre plants grow nearly everywhere except on absolutely barren lands; and immediately everyone can foresee what is the future of Trinidad when all lands, unless barren, will be cultivated with plants yielding double what cacao gives. One thousand acres of land for sugar-canes, giving 1,500 tons of sugar, will require (if I do not make a mistake) £37,000 worth of machinery, at least; and 1,000 acres of land for fibre plants will require only twenty raspadores costing £600, and will give yearly at 50 dollars, or £10 per acre, £10,000 sterling to repay cost of land and of contracts.

But no industry can be established with safety without it is not started with economy and perseverance, or if anyone is discouraged because purchasers do not come from abroad to buy the first lb. before it is ready. I believe that this, and five or six years' gambling in the London Exchange, have stopped the first attempt made in Tobago and in Bahamas some ten years ago. But the machines have been greatly improved during the last four years; the prices, after fluctuating during the time of speculation between £13 and £75, have become steady at £30, and the plants, ten years old now, are everywhere giving sprouts from their roots and seeds from their poles.

The Agricultural Society is being called upon to decide regarding the introduction of hard-working immigrants from Teneriffe. Can we find a better basis for settlement by free companies of these free people, in a free country? Profitable contracts could be offered to them on landing at the Quay, at a rate of 25 dollars an acre—5 dollars after brushing, 5 dollars after planting, and 15 dollars on delivery on fourth year. Each contractor would not receive more than 12 acres to be planted in three years—4 acres a year. As there is very little trouble in cultivating the fibre plant when it is a year and a half old, every year each contractor could receive some 4 acres more. In five years he would have planted 20 acres, and from the fourth to the ninth year he would receive 500 dollars, whereas 12 acres in cacao, or 2,400 trees, would give him only 480 dollars in the same time [1 dollar = 4s. 2d. 2 cents = 1d.]—*Queensland Agricultural Journal*.

THE RAISIN INDUSTRY OF CALIFORNIA.

The average annual consumption of raisins in the United States for the past five years, has been about 80,000,000 pounds, or not far from one pound per head of population. Practically the total supply was produced in the United States, a supply which only a short time ago was met wholly by importation. No variety of native American grape has yet been developed suitable for the preparation of raisins. Over twenty-five years ago, choice varieties or vines of the raisin grape were introduced into California from Spain, the country from which almost the entire imports of raisins were derived. The industry did not at once assume commercial proportions, but it is notable that so early as 1855, the effects of increased production in California, began to be shown in a decrease of imports. In the fiscal year 1855-56, imports declined to 40,000,000 pounds from 54,000,000 only two years before. Production in California, on the other hand, began in that year to assume commercial proportions for the first time, and amounted to 9,000,000 pounds, against 2,000,000 in the previous year. The impetus given to the industry at this time was never relaxed; production increased by leaps and bounds until in 1895 the high record mark of 103,000,000 pounds was reached. Since 1895, the raisin production of California has declined, but this it is claimed has been due to adverse climatic conditions, and not to any decrease of interest in the industry. Exports of California raisins first became of sufficient importance to be separately stated in the official reports of United States Treasury Department in the fiscal year ended June 30, 1898. It is estimated by some authorities, that as many as 64,000 acres are devoted to the cultivation of the raisin grape, in the raisin-producing district of California. The city of Fresno, which is known throughout California as the "Raisin City," is a centre of a district which produces about two-thirds of the entire output of the State. Eight months of sunshine and an abundance of water for irrigation make this one of the ideal grape-producing districts of the world.—*Journal of the Society of Arts*.

TOBACCO-GROWING IN CEYLON AND ITS CONDITIONS OF SUCCESS.

We are interested to learn of the visit to Ceylon of a tobacco-curing expert from Borneo and the neighbouring tobacco countries, in the person of Mr. A. Macdonald Gibson who has been spending three months in Jaffna town and district, investigating the industry and samples of the different tobaccos grown on the Peninsula, the Wannai, Trincomalee, Batticaloa and Kandy Districts and testing the "burn," "taste" and "aroma" of each kind. Mr. Gibson was invited to come from Borneo to Ceylon in 1887 to manage a Company then formed to grow tobacco in Ceylon. This Company failed, probably because the Europeans attempted to grow a tobacco to compete with that of Sumatra and Borneo as a cover leaf. Mr. Gibson is of opinion that the aim here should be to improve the tobacco which already grows on the island, and make it into a valuable leaf suitable for European markets, by proper treatment after the tobacco is gathered from the field. This treatment comprises a proper system of "drying" and "curing" of the tobacco, which should be cut only when quite ripe and not—as the native does now—while it is green, so that he may be saved further trouble and expense of watering and other attention to it in the field. The full natural flavour of the Ceylon tobacco ought to be retained, the colour of the leaf improved and the tobacco generally cured so that it will keep for any length of time. The native system tends rather to destroy the leaf, while it renders it as black as possible and liable to rot; hence the anxiety of cigar-makers to sell their cigars as soon as possible. At present native dealers and planters are very loath to take up improved methods of curing their crop, possibly not wishing to incur the initial expense that such improvement would involve; and they would, no doubt, prefer that Government, or some large capitalist, or a Company, should show them the way. In the present semi-primitive practices of dealing with the crop, it appears to be almost overlooked that, in one crop even, there are many different kinds of leaf—requiring different treatment—and it is obvious that to get the full market value of the growth, some changes in working are required. There can be little doubt that cultivated tobacco land will largely increase when the Railway runs through the Wannai, and the limited market for local tobacco, as it is at present produced in Ceylon, will be flooded. Prices will drop till the industry will become unprofitable, unless the Ceylon tobacco is rendered acceptable to other markets than would at present receive it.

We trust that this important fact will be carefully noted in anticipation and, whatever the result of the present visit of Mr. Gibson, that at least local producers will look to their methods of treatment and not let the trade in Ceylon-grown-tobacco run the risk of going

to the wall. This is a fate that is by no means uncertain, if the industry is not handled in a fashion more suited to modern requirements and the rapidly changing conditions of the country in which it is now turned out. In conclusion we may mention that Mr. Gibson has had over twenty years' experience of the tobacco industry in Sumatra, North Borneo and Sarawak, and that he was working a three years' experiment for the Rajah of Sarawak when he visited Ceylon in 1887—so that a better or more experienced adviser could scarcely be found in regard to one of the few important existing industries of the North of the island.

MOSQUITOES AND MALARIA.*

On this subject an important and interesting circular was issued last month from the Royal Botanic Gardens, compiled by Mr. E. Ernest Green, our Government Entomologist. Mr. Green tells us that a careful study of recent investigations on the mosquito-malaria theory affords convincing evidence of a real connection between mosquitoes and malarial fever. The only point in dispute now is: are mosquitoes the sole medium of infection?

Our local medical reports do not specify the number of deaths actually due to malarial fever. Specific, febrile, and zymotic diseases are quoted under one heading. Over 50,000 deaths from these diseases were registered in 1899. It is probable that more than half that number was the result of malarial fever, and a still greater number of persons suffering from this form of fever must have been treated in the Government hospitals of the Island at an immense cost to the country. Besides the actual cost of treatment, there must be reckoned the loss to the Colony of a vast amount of labour, which may seriously delay the progress of important works, such as railway construction, irrigation, &c. In support of this statement, I have been permitted to mention the following facts. At the beginning of December last there were working on the second section of the Northern Railway, some 15 miles from Kurunegala, nearly 600 coolies. Before the end of that same month more than half of them had contracted malarial fever and given up work.

Nor is malarial fever the only disease traceable to the action of mosquitoes. Filariasis, in its various forms, is known to be transmitted through their bites; and in this case both *Anopheles* and *Culex* have been proved to be possible agents. Elephantiasis is one of the forms assumed by filariasis. Excessive anæmia is another. Dr. Manson, in his work on "Tropical Diseases," remarks that "the subjects of filariasis should be regarded as dangers to themselves and to the community, and should be compelled to sleep under mosquito nets." The same remarks apply, with equal force, to subjects of malaria.

In treating of the Life History of the Parasite, Mr. Green gives the main facts as follows:—

When a patient is suffering from malarial fever, his blood is found to contain numerous examples

* Circular.—Royal Botanic Gardens, Ceylon. Series I.—No. 25, December, 1901. Mosquitoes and Malaria.

of the *Hæmameba* parasite. If left in undisturbed possession, they will pass through a sexual cycle in the blood of the man, reproducing themselves by fission, *i. e.*, by the breaking up of the mature parasite into a number of spore-like bodies, which will themselves grow to their full size and break up in like manner. Without further interference the disease will be confined to that one person. But if a certain kind of mosquito (of the genus *Anopheles*) bites the patient and imbibes his infected blood, the contained parasites undergo a new development in the body of the insect,—a true sexual cycle,—the parasites becoming differentiated into male and female organisms reproducing young ones in a normal sexual manner. These young parasites find their way through the tissues of the body of the mosquito and congregate in enormous numbers in the glands at the base of its proboscis. Then, should that mosquito bite another person, the parasites are injected into his blood, and once more go through their sexual cycle, the periods of their maturity and reproduction corresponding with the periods of the induced fever. We thus see that the mosquito acts as an alternate host for the parasite. And so the round continues—man—mosquito—man—mosquito—man, in a continuous series.

The "Structure and Habits of Mosquitoes" are next described. About ten genera of the family culicidæ are known in Ceylon, *Culex* and *Anopheles* are fully described and distinguished and their habits and haunts make a most interesting study. Then comes the question "How to avoid and get rid of mosquitoes." Preventive Measures, he divides into three sections:—

Firstly.—Those aimed at the extermination of the mosquito.

Secondly.—Those designed for the elimination of the malarial element.

Thirdly.—Protection from the bites of the mosquitoes.

Live or sleep under mosquito curtains where feasible. Allow no standing water anywhere, and on water butts or tanks, a thin film of kerosine is very destructive to the larvæ. These are the broad directions, but Mr. Green gives many hints and explanations upon the value of familiar remedies such as the free use of castor oil leaves and sundry essential oils; fumigation with sulphur, the use of white stockings and coverings. Thus, small doses of sulphur, taken internally render one unpalatable to the mosquito. And as to cures for the irritation of the bite it is suggested to moisten and rub soap on the spot. For the treatment of malarial fever when a doctor is not available, Mr. Green quotes Dr. Patrick Manson's advice, and with this we close:—

"During a paroxysm of ordinary intermittent fever it is better, before giving quinine, to wait until the rigor and hot stages are over and the patient is beginning to perspire. A fever fit once begun, cannot be cut short by quinine, and to give quinine during the early stages aggravates the headache and general distress; but so soon as the skin is moist and the temperature begins to fall, the sooner the drug is commenced the better. Ten grains, preferably in solution, should be administered at the commencement of sweating, and thereafter five grains every six or eight hours for the next two or three days. This is almost a certain cure."

The great value of this brief compact circular can only be understood after a careful perusal. Already it is widely appreciated throughout the Northern Province; a recent traveller down the road heard it referred to at several stations in terms of high praise both for its practical usefulness and for the popular treatment of the subject.

TRINIDAD PRODUCTS.

Governor Sir A. Moloney's annual report on Trinidad and Tobago gives some interesting details as to the chief products of that Colony—cacao, sugar and asphalt.

CACAO.—The area under cacao is nearly twice that under sugar, and is extending daily. The crop of 1900 exceed that of the previous year by 1,100,000 pounds, partly due to extended cultivation and partly to a favourable season, but the average prices obtained were about 5s per cwt lower, *viz.*, 63s to 75s. It paid to ship cacao when, in 1896, the prices had fallen to 45s, and the cost of production, apart from rent and interest on capital, is generally estimated at not more than 27s a cwt. Though the world's production of cocoa is being greatly extended, its consumption is increasing rapidly.

SUGAR.—Owing to dry weather the sugar crop of 1900 was a very bad one, and had a shortage of twelve thousand tons. Leaving out of account capital and depreciation charges, it is possible that £1 a ton profit was made on the sale of yellow sugars in the London market. On the other hand, the grey sugars shipped to America were probably sold at an average loss of two shillings a ton on the cost of production. Last year's crop (1901) was above the average, and although the cost of production was reduced considerably below that of the previous year, low prices and heavy imports into the United Kingdom of Continental sugar in anticipation of the new import duty more than neutralized the advantage.

RUBBER.—Rubber is the only new cultivation likely to provide a staple export in the future. It is as yet, however, in an experimental stage. There are some eight plantations in Trinidad and two in Tobago. Several large sales of Crown Land in Trinidad have recently been made on the understanding that they are to be devoted to this cultivation. It is also extending yearly in Tobago, chiefly in combination with cacao. The rubber chiefly planted is the Central American *Castilloa Elastica*, of which there are 100,000 trees planted in Tobago, as well as some thousands of the Brazilian "Mouquet." The former promises to be the most profitable. The West African silk rubber has also been recently introduced, and its importers are hopeful of its success. The greater part of the plantations are still quite young—from one to four years old—and no large return can be anticipated until they have been seven or eight years in existence. The quality appears to be good. A sample of *Castilloa* grown and prepared on this Richmond estate was valued in England by experts at 3s 6d per lb.—*Chamber of Commerce Journal* for January.

PEARL SHELLING IN QUEENSLAND.

There can be little doubt according to the annual report of the British Marine Department, that the pearl shelling industry of Torres Straits has reached a critical stage, and unless some precautions are taken, all the shelling grounds within a distance to be reached from Thursday Island will have been worked down to a payable limit, and the fishery will be practically closed down. Shelling has been carried on in Torres Straits for 31 years.

Appropos of pearls it is to be noted that M. Raphael Dubois, a French naturalist, asserts that all large pearls are nothing but sarcophagi, in the centre of which rest the dead bodies of small marine worms. "If we examine in the month of August molluscs that at certain points along the coast are always full of pearls, we shall be surprised not to find any, or very rare specimens. . . . But if we find no pearls, we discover, on the other hand, if we observe the mollusc attentively, numerous small reddish yellow points in the precise spot where pearls usually form. They are produced by tiny young distomes about one-half millimetre [one-fiftieth of an inch] in diameter, just about to become encysted. Their encystment takes place in an extremely curious manner. In the beginning we see the surface of the distome sprinkled with tiny grains of carbonate of lime; these granulations grow and take the form of crystals, which group and interlace in different patterns, ending by forming a continuous calcareous envelope around the creature's body, which can still be distinguished by its yellow tint. The calcareous shell takes on polish and lustre, and at this moment the nucleus of the young pearl is seen only as a little black point, which soon disappears. The pearl now has a beautiful lustre, and it continues to grow in contact with the membranous pouc that surrounds the calcareous cyst. We may cause the parasite to reappear by decalcifying the young pearls with hydrochloric acid; we shall then see that there is no doubt at all regarding the nature of the nucleus. It appears from our observation that the *Distomum margaritarum* becomes encysted in the *Mytilus edulis* toward the month of August, and that it so remains until the following summer. At the beginning of this season the pearl loses its polish, decays, and falls to pieces. There may remain only a gelatinous mass, corresponding no doubt to the gelatinous pearls noticed by M Dignet in the *Meleagrina margaritifera*. The parasite then resumes its active life, reproduces its kind, and the young distomes become in their turn encysted, forming new pearls. There are pearls that escape their physiological fate, and may grow to larger size because their distomes are dead, killed by another parasite, or because they are sterile. The most beautiful pearl is nothing but the brilliant sarcophagus of a worm."—*Strait Times*, Jan. 24.

THE TEA TRADE AND INDUSTRY.

Mr Joseph Walker, a well-known authority, writes as follows in the *Grocers' Review* :—

In consequence of the South African War, and the greatly increased normal expenditure of the country, the declaration of the Budget has come to have an interest previously unknown to dealers in tea of the present generation. The unsettlement caused by the dislocation of the finances of the country may be a feature in the trade for some year. It may, therefore, not be out of place to refer to the undesirability, even from a commercial standpoint, of buying too far ahead. It is not sufficiently well known that Indian and Ceylon teas, especially of the cheaper and medium classes have not the same keeping properties as the tea that our fathers used. Congo tea still remains good twelve months after arrival, but most Indian and Ceylon teas are flat long before that period is reached, and lack the piquancy so much enjoyed by tea drinkers. No intelligent tea house would run the risk of ruining a trade by sending out a well-known brand which was depreciated by age, and it behoves the grocer to be aware, in these days of Budget speculation, that he does not

go too far, and lose by one policy any advantage he may have gained by another stroke in his business affairs.

The year immediately under review has been noticeable for the variation which has taken place in the price of common tea. The low prices of the spring were brought about by several causes. They were partly the result of the very high prices which the lowest grades reached in 1899, which induced the planters to send over a superabundance of common tea. A great weight of this class of tea was placed upon the market at a time when the finances of the whole trade were stretched to their utmost limits with operations in view of the approaching Budget, and the price fell to a lower point than it had ever reached before. The result of these low prices was the re-introduction in some quarters of a shilling canister, which had been abolished at the time of the increased duty of 1900. This must be regarded as a mistaken policy as the combining circumstances which produced the low prices were exceptional, resulted in heavy losses to the growers and had no solid foundation in the world of commerce. The present season has seen a great change in this respect. Common tea is comparatively scarce, and the prices are much above those ruling in the spring.

The total import this year is estimated at several million pounds under the consumption, and we may, therefore, conclude that the basis of value which has been established will be maintained for the present, if, indeed a further rise does not take place after the holidays. While "tea for price" has advanced, the medium and better grades are cheap and the quality good. Teas with body and richness have been obtainable at moderate prices and there has been a good selection of heavy liquoring broken teas. Darjeelings still maintain their high prices, the scientific blender finding nothing that will exactly take their place. Viewed as a whole, the crop this year may be said to be of a satisfactory character. There is one point in which the trade seems to be undergoing a change, and in my opinion a change for the better. The grocer is willing to sell tea much smaller in leaf than formerly. As long as it is not "dirty," that is, laden with powdery dust, he seldom complains, however small in reason it is made. This is all to his advantage as it enables the blender to use tea which would not otherwise assimilate in leaf, and allows a good proportion of thick, rich broken tea, and manipulation by machinery leaves all the blend a uniform size. It is to be hoped that the day is not far distant when "tip" and "style" may be less valued by the average grocer than at present, as there is not one householder in a thousand who regard these properties if only the tea in the tea cup is pleasing to the palate. In maintaining the trade in a healthy condition it is the cup that will tell.

PLANTING PROGRESS IN PENANG.

Paddy harvest is in full swing in the Province, and the crop as a rule an exceptionally good one. Coconuts are short, but the high price in some measure compensates for that. The Para rubber on Bertam Estate, the planting of which was commenced four years ago, look sturdy, and the first field, planted twelve apart, now cover the ground and require little or no further expense before they come into bearing. Bagan Tuan Keehil is being rapidly transformed into a village of bricks and mortar, which shows that a big fire is not an unmixed evil.—*Penang Gazette*, Jan. 24.

TEA IN AMERICA.

New York, Jan. 8.

Invoice trading light; jobbing demand slow. Prices are well sustained, especially for greens.

REVIEW FOR 1901.

The year 1901 opened with 54,881,219 pounds of tea in warehouse, which quantity steadily declined to 39,521,551 pounds on November 30, 1901.

The following table shows the quantity of tea entered for consumption in the United States including both entries for immediate consumption and withdrawals from warehouse for consumption, value and amount of duties, for the twelve months ending June 30, 1900 and 1901:

	Quantity.	Value.	Duties
	Pounds.	Dollars.	Dollars.
1900 ..	80,086,369	10,835,048	8,008,637
1901 ..	82,693,537	10,005,430	8,259,354
The imports for eleven months of 1901, ending November 30, were as follows:—			
			Pounds.
Chinese Empire	25,692,503
Japan	28,153,849
All other countries	6,793,104
	Total	..	60,650,456
Same time in 1900	89,456,696
Same time in 1899	77,517,386

The above shows that Japan supplied 46 per cent. and China 42.6 per cent. of the total imports.

The light receipts and a slight increase (3 per cent. plus) in consumption accounts for a steadily improving market during the year. The close was firm at the best figures.—*American Grocer*.

A RAILWAY TO NYASSALAND.

After some years of effort, our Nyassaland Protectorate is to have a much-needed railway. Surveys were made more than four years ago with a view to the construction of a narrow-gauge line. The foreign Office however, insisted that a special survey of its own should be made, and for that purpose sent out Sir Charles Metcalfe, who spent a year in the Protectorate making a Government survey for a line of 3 feet 6 inches gauge; and that survey has formed the basis for the concession now granted to the Shire Highlands Railway Company. This result was not achieved without some opposition on the part of the Crown agents, who naturally wished to carry out the undertaking themselves. Their experiences with the Uganda line, and their railway work on the West Coast of Africa seem, however, to have induced them to hand over the Nyassaland enterprise to the Shire Railway Company which will employ its own engineers and provide its own material.

One of the directors of the Shire Highlands Railway Company is Mr. Sharrer, who has taken a leading part in the negotiations which have led to the present concession, and when a representative of the BRITISH TRADE JOURNAL called upon him recently, he courteously furnished us with some particulars of the railway project and with a map, showing the route the line is to take. Its total length will be a little more than 200 miles, and it is to have a 60 lb. rail. The southern terminus will be at Chiromo, whence the line will run in a northerly direction to Blantyre, a distance of about eighty-five miles. From Blantyre it will run to Zomba, the Residency, and thence almost due north to Fort Johnston to connect with the steam-boat traffic on Lake Nyasa.

The primary object of the railway is to do away with the land portage now necessary to carry the coffee and other produce of the Shire Highlands to Chiromo, whence it is conveyed in the river boats of Sharrer's Zambesi Traffic Company down to Chinde, on the East Coast of Africa. This system of land portage is slow, tedious and costly. It has had to be resorted to as the only means of transport, the rapids and falls on the Shire River between Chiromo and McPiube rendering that section of the river impassable for steam boats. The new railway will therefore be the indispensable connecting link in a line of communication for goods and passenger traffic, which will reach a distance of 900 miles from Chinde into the heart of Africa. As three-fourths of this route will be by steam-boat on the Zambesi, the Shire River, and Lake Nyasa, it follows that the least costly system for the conveyance of goods will be at the service of planters of this part of Central Africa. The line may eventually develop the African Lake districts with their abundant native population, which will then be easily brought down to work on the plantations of Nyassaland. Hence Mr. Sharrer anticipates a great development in those districts, especially in the cultivation of coffee and cotton, tobacco and sugar, and other products, whose cost has been increased by the method of transport hitherto available. For cotton, indeed, he anticipates a very important development. Hitherto its cultivation has been almost entirely given up owing to the cost of putting it down at a cheap rate in Europe, yet experiments so far made in cotton cultivation have been highly successful, the quality being equal to that of the Egyptian variety.

In a recent report to the Oldham Chamber of Commerce entitled, "Cotton Growing within the Empire," it is stated by the Secretary to the British Central African Chamber of Agriculture and Commerce, that nearly all the conditions favourable to the growing of cotton on a large scale exist in Central Africa. The plains on the Zambesi and Shire rivers are admirably adapted for the cultivation of the cotton plant, and in the Shire Highlands there are numerous valleys which contain the rich black "cotton" soil so much sought after in India. Every thing is in favour of the growing of cotton as regards land and labour, and the only question would seem to be the one of freight.

So far the main product of the Protectorate has been coffee, though a considerable area is under tobacco and chillies. The future of the Protectorate will be largely due to its rich virgin soil, so well adapted for cotton cultivation, and in which the Protectorate abounds. The new line, it should be pointed out, will affect the economic development not only of the Shire Highlands, but of the vast plains which border the West Coast of Lake Nyasa, and whose produce will soon have the means of being conveyed cheaply from Kambove, Bandawe, Kotakota, Livingstone, and other places on its shores to Chinde, for shipment to Europe. Eventually, doubtless, a connection will be made from the north-westward to the great trunk line from the Cape to Cairo,

The probability of larger quantities of produce arriving at Chinde brought up the question of a direct line of steamships between this country and the East Coast of Africa. Mr. Sharrer states that it is the intention of the Shiré Highlands Railway Co. to charter steamers in this country which will run direct to Chinde to convey rails and other materials for railway construction, and he thinks that this traffic may prove to be the nucleus of a direct line running between that coast and London or Liverpool. In any case, the presence on that part of the coast of large quantities of produce brought down by the aid of the new line should be of assistance in furthering the establishment of a line of direct steamers between this country and East Africa as much of the produce would be shipped for the English market.

The construction of the line is to begin, we understand, early in the present year, and it is hoped that its 202 miles of length will be completed in about two years. The company have the concession for twenty-five years, and also the right to construct any branches of the line which may be necessary with a view to opening up adjoining districts, and especially to connect with the Portuguese railway which is projected to run from Quillimane.

With this enterprise another important step will be taken for the development of East and Central Africa. It can hardly fail to exercise a beneficial influence on our general trade with that district, inasmuch as it will open up one of the richest portions of the Continent, which by the development of its natural resources will be placed in the possession of means of purchasing the numerous classes of manufactured goods produced in England, especially many classes of agricultural implements and tools, machinery, engines, cotton manufactures, and hardware. Ultimately there will be a living artery of commerce from the Nile to the Shiré River district, which, according to the reports of travellers, is rich in coal and alluvial gold. It is reported that in the Mariambe and Central Angoniland districts, in the West Nyasa coast region, and in parts of the Shiré Highlands, a gold-bearing quartz exists, and alluvial gold is reported on the Northern Angoni plateau in the West Nyasa district, and at the head waters of the river Bua, just within the Protectorate. With such resources as these, and with a railway to render the whole accessible, the outlook in Nyasaland, which has been well described as an "enterprising, steady going little Colony," is extremely bright, and indicates a region to which our manufacturers and planters may look for flourishing business.—*British Trade Journal*, Jan. 1.

BRITISH TRADE IN 1901.

The trade of the United Kingdom last year reached the grand total value of 870 millions sterling. Of this amount 522 millions were imports, 280 millions were exports, and 68 millions re-exports. Taking the figures collectively they show a decrease of 11 millions compared with 1900. That year, however, was an exceedingly prosperous one throughout Europe, and a period of abnormally high prices. The year's imports were slightly below those of 1900—522,238,986*l.*, against 523,075,163*l.*—Our imports of

spices declined by 267,527*l.*, due to lessened receipts of ginger, pepper, and unenumerated spices. In raw cocoa there was a decrease of 107,000*l.*, and in the prepared article an increase of 138,500*l.* The coffee import is at the same time higher by just half a million. The exports for the year show a total reduction of 10,693,000*l.*, and it may at once be stated that 8,501,000*l.* of this was due to a falling-off in raw materials, which, in turn, is due to the reduced price of coal. The next largest decrease is that of nearly six millions in metals and metal manufactures. At all times the December report is one of the most interesting documents to the observant and studious Briton—if we may use a word which we find in Mr. J. Arthur Gibson's book on Consumption to designate the English, Scotch, or Irish man. Take, for example, the cotton account. In round figures we imported 42 million pounds' worth of raw cotton last year, and 4½ of cotton manufactures, and sent out of the country cotton piece-goods valued at 66 million pounds, besides 10 millions of other cotton manufactures and 5 millions of the raw stuff; in other words, we supplied our own needs in cotton and returned to the world the original value and as much again, that being payment for the skill and labour put into it. A similar tale might be told about wool; but we seem to use up all the raw jute we get for ourselves, as our exports of manufactured jute goods are just about equal to our imports of the same, while raw jute amounts to over four million pounds' worth. The linen trade is better, for while the imports of flax were valued at 2,606,565*l.*, the exports of linen yarns, piece-goods, threads, &c., were valued at over five millions. The country rarely gets credit for its business in manufactured articles. Yet three-fourths of the exports (or 230,000,000*l.*) are manufactured articles, and between a fourth and a fifth (118,000,000*l.*) only of the imports are manufactures, the rest (404,000,000*l.*) being food, drinks, raw materials, and other natural produce. In short, every man, woman, and child in the United Kingdom spends 5s a week on imported produce, but only 1s of that is on manufactured goods. The bullion and specie account is the smallest for many years. Our imports in 1901 were 32 millions, against 45 millions in 1899, and the exports for the same years 26 and 35 millions. We have to thank the Boer war for this, as in 1899 British South Africa sent us 15 millions' worth of gold, but the value dwindled to 378,626*l.* in 1901, and increased to 1,962,283*l.* last year. It is a pity the Board of Trade does not work out the value of diamonds as well.—*Chemist and Druggist*, Jan. 18.

POISONOUS ENGLISH PLANTS.

In the Year-Book published by that very practical paper, *Farm and Home*, there is, among a mass of useful information, a chapter on the poisonous plants of this country. Some thirty names, among them those of whole families which are more or less noxious, appear in this list, besides the fungi which are known to have toxic properties in a high degree. Has the reader ever felt the physical and mental sensation of plant poisoning? *Experio crede*. It is most unpleasant and disconcerting to the last degree, even though the dose be not severe. The violent, rapid and automatic efforts of the swallowing or receptive parts of the body to get rid of the stuff, the doubt whether this will be accomplished, the utter hopelessness of ordinary countervailing remedies, the feeling of nausea and exhaustion and the mental conviction of stupidity which must accompany accidents of this kind are not to be forgotten.

Fortunately, many poisonous plants have an evil taste or smell; but this is not always the case. Children will eat the seeds of laburnum, for instance, as if they were green peas until the poison begins to take effect; and yew, whether eaten by cattle or in the form of the seeds by human beings appears to be pleasant to the respective tastes of one and the other, though the poison sometimes acts so quickly that horses drop down dead before the stuff is even partly digested. The only cases of plant poisoning now common among grown-up people are those caused by mistaking fungi for mushrooms, or by making rash experiments in cooking the former, of which Gerard quaintly says: 'Beware of licking honey among the thorns, lest the sweetness of the one do not countervail the sharpness and pricking of the other.' But with such a list of toxic plants as our flora can show there is always danger from certain species whose properties are quite unknown to ordinary mortals. Are they equally unknown to the herbalists and that mysterious trade-union of countrywomen and collectors of herbs by the roadside who deal with them? Probably the trade in poisons not used for serious purposes, but for what used in some parts of England to be called 'giving a dose,' a punishment for unfaithful, unkind or drunken husbands, still exists as it did some forty years ago. The collectors of medicinal plants cut from the roadside and rubbish heaps, plants whose 'operations' for good are quite well known and have been handed down by tradition for centuries, cannot be absolutely ignorant of the other side of the picture, the toxic properties which other plants or sometimes even the same plants contain. Foxglove, for instance from which *digitalis* used as a medicine is extracted, is a good example of those kill-or-cure plants. Every portion of the plant is poisonous, leaves, flowers, stalks and berries. It affects the hearts and though useful in cases in which the pulsations are abnormal, its symptoms when taken by persons in ordinary health are those of heart-failure. Thus foxglove is not only a dangerous but a 'subtle' poison.

Among other plants which may cause serious mischief, but are seldom suspected, are such harmless-looking flowers as the meadowsweet, herb-paris, the common fool's-parsley, found growing in quantities in the gardens of unlet houses and neglected ground which has been in cultivation, mezereon, columbine and laburnum. Meadowsweet which is here indicted for the first time so far as the writer knows, among poisonous flowers has the following set against its name:— 'A few years since two young men went from London to one of the Southern counties on a holiday excursion, on the last of which they gathered two very large sheaves of meadowsweet to bring home with them. These they placed in their bedroom in the village inn where they had to put up. In the course of the night they were taken violently ill, and the doctor who was called in stated that they were suffering from the poisonous prussic acid fumes of the meadowsweet flowers which he said almost overpowered him when he came into the room. The flowers were at once removed, and the young men, treated with suitable restoratives were by next morning sufficiently recovered to undertake the journey home.' Without knowing what the young men had had for supper, it seems perhaps rather hasty to blame the meadowsweet. But the other flowers

mentioned above have a bad record. To take them in order. Herb-paris which grows in woods and shady places, with four even-sized leaves in a star at the top of the stem, all growing out opposite each other, bears a large green solitary flower and a bluish-black berry later. All parts of the plant are poisonous, the berries especially. Fool's-parsley is an unpleasantly smelling, very common plant which leaves its odour on the hand if the seeds are squeezed or drawn through it, is said to cause numbers of deaths by being mistaken for parsley and cooked. In the case of poisoning by this plant it is recommended that milk should be given, the body sponged with vinegar and mustard poultices put on the sufferer's legs. It is reckoned that one plant produced six thousand and eighty seeds, an unpleasant degree of fecundity for a poisonous weed. Columbine which is a wild plant with blue or white flowers as well as a domesticated one, has a toxic principle like that of the monkshood more especially in the seeds, and the pretty red berries of the mezereon are responsible for the death or illness of children nearly every autumn. They are like cherries and easily picked from the low bushes on which they grow. A dozen are said to be enough to cause death though this must probably depend on the state of the eater's health. The laburnum with its golden rain, is potentially a kind of upas tree. The writer has only known of two deaths of children caused by eating the beans in the green pods, but it is said to be a frequent cause of death every year on the Continent, where possibly children are less naturally careful about poisonous plants than those in England to whom risks of this kind are usually and properly made part of the 'black list' of the nursery-book of 'Don'ts.' The seeds will even poison poultry if they pick them up after they have dropped from the pod. Laburnum is of comparatively recent introduction into Britain or it would probably earlier have been accorded a place among the severely poisonous plants dreaded by all.

Of these the deadly nightshade and hemlock are the best known in story, while the yew is most dangerous because far more common. Green hellebore and monkshood are also classed in the list of the ranker poisons. Deadly nightshade is rather a rare plant, yet it may be seen often enough on the sides of woods where there are old walls. Several plants were recently recognised growing on a wall by the roadside between Reading and Pangbourne. It is poisonous throughout. The flowers are large single purple bells and the berries black and shiny like a black cherry. The author of the chapter referred to at the beginning of this article says of this dangerous plant that the roots are computed to be five times more poisonous than the berries, that human beings have been found more susceptible to it than animals, and carnivorous animals more so than others. Children suffer more in proportion to the quantity of poison taken than do adults. But cases of nightshade poisoning are very rare though two were reported some three years ago. Possibly the berries often fail to ripen, and so are less attractive in appearance. The poisonous hemlocks are two, one of which (the common hemlock) is said to have been the plant from which the Athenians prepared their poison for executing citizens condemned to death and the other, the water-hemlock or cowbane, is

particularly deadly when eaten by cattle, to which it is fatal in a very few hours. Another plant used for preparing poison in India, which produces a drug used by some tribes of Thugs for procuring the death of their victims, datura or stramonium, has now found a place amongst our wild flowers. It has an English name, thorn-apple, and is said to have been naturalised by the gipsies who used the seeds as a medicine and narcotic and carried them about with them in their wanderings. Like henbane it is often seen on rubbish-heaps and in old brickfields. The leaf is very handsome and the flower white and trumpet-shaped. Both this plant and the henbane retain their poisonous properties even when dried in hay, and stalled cows have been known to be poisoned by fodder containing mixture of the latter plant.

Cattle have a delicate sense of smell which warns them of the danger of most poisonous English herbs, though apparently this warning odour is absent from the plants which kill so many horses when the grass grows on the South African veld, and also from our English yew. Yew was anciently employed as a poison in Europe, much as is the curari today in Central America. Dr. W. T. Fernie, the author of 'Herbal Simples Approved for Modern Use,' says that its juice is a rapidly fatal poison, that it was used for poisoning arrows, and that the symptoms correspond in a very remarkable way with those which follow the bites of venomous snakes. It is believed that in India there is a poison which produces the same effect. An Indian Rajah once desired that a notice should be put in a well-known paper that he did not intend to raise his rents on his accession to the estates. The proprietor of the paper asked him his reasons for wishing for such an advertisement. The Rajah said that his grandfather had raised the rents, and had died of snake; that his father had done the same, and had also died of snake-bite, and that he concluded that there was some connection of cause and effect. The notice was inserted, and this Rajah did not die of snake-bite, or rather of the poison which simulates it.—*Spectator*, Jan. 11.

THE THREATENED INCREASE IN THE TEA DUTY.

The sensitive state of commercial feeling with regard to the intentions of the Chancellor of the Exchequer may find no settled relief until the budget proposals are announced, but we are glad to see that a deputation from the tea industry will wait upon the Chancellor next week. The mystery surrounding everything connected with future taxation is supposed to be profound, but occasionally the Chancellor of the Exchequer unbends and throws a crumb of comfort to those who clamour for it. We trust he may do so in the case of the tea industry. Since the letter of Sir Robert Giffen to the *Times*, and the comments it called forth, there have been no further startling theories put forward on the subject of taxation. One home journal, by the way, has taken exception to the comments cabled here of a Calcutta contemporary which, if its remarks were correctly reproduced, suggested that the Chancellor of the Exchequer, instead of imposing an additional burden on tea, should rather tax cocoa and other produce. These remarks were resented by the home journal, the inference being that it is not the province of an Indian paper to make suggestions affecting British taxpayers, an idea which, if put into practice, would knock the Imperialistic doctrine into a cocked hat.

We do not imagine the Chancellor of the Exchequer needs very many hints even from economists like Sir Robert Giffen. While glad, no doubt, of the opinion of some well-known authority within the charmed circle of officialism, Sir Michael Hicks-Beach is an old Parliamentary hand, and he knows the taxable capacity of most men and things. He may not just now be very particular as to his victims, but he will show a remarkable disregard of circumstances should he, in the face of the representations made to him, burden the tea industry with any further duty. Even a Chancellor of the Exchequer must have some sense of the eternal fitness of things, and to pile up the load on the shoulders of people already tottering under a heavy weight should be repulsive to his notion of justice and true political economy.

Appropos the brilliant suggestions made by Sir Robert Giffen about taxation, the "Speaker" cites the following passage in one of Sir Robert Giffen's "Essays in Finance." The essay in question is a generous appreciation of Mr Gladstone's work in finance and was composed in 1868, the first year of Mr Gladstone's first Ministry. Mr Giffen, as he then was, thought that there was much still to be accomplished for he wrote: "The duty on corn, the taxes on locomotion, not a few of the stamp duties the fire insurance tax, the tea and sugar duties are all burdens whose abolition would benefit the country and for the most part put money directly into the pockets of the poor." And a complacent footnote is added to the edition of 1880: "The taxes here referred to have almost all been abolished since 1869." Since 1880 many things have happened and amongst them it is noticeable that Sir Robert Giffen does not think as did Mr Giffen about the tax on tea, for he now suggests that instead of abolishing the tax altogether it should be largely increased.

The meetings held in India and Ceylon show that tea planters have lost no time in protesting against the danger of the situation. If once the deed be done protestation will be unavailing. The Chancellor of the Exchequer it is argued is not a sentimentalist and he must have money and plenty of it and therefore in case he should take Sir Robert Giffen's hint, it is well to know that the tea planters of India and Ceylon have protested vigorously. It is a remarkable thing that while the British Government is professing the deepest anxiety for the West Indies and sugar producers there and laudable efforts are being made with a view to the relief of the depressed sugar industry, some of our political economists just to show the irony of things seem anxious to bring about disaster to the tea industry of India and Ceylon.—*H. C. Mail*, Jan. 24.

CARDAMOMS IN FRENCH INDO-CHINA.

The *Revue des Cultures Coloniales* of November 5th, in the course of a long article on the cardamoms of French Indo-China, states that the exports to Singapore and Hong-kong may be considered as representing the total production of the country, the quantity consumed locally being insignificant. Nearly the whole of the crop is sent to China via Hong-kong. It is the Chinese, moreover, in Cambodia, Laos, Annam and Tonkin who buy or exchange the cardamoms with the producers, and then send them to the different ports whence they are exported. This trade is said to be entirely in their hands. The port of shipment for Cambodia and a part of Laos is Saigon, with Cholon as entrepot and market. The exports from Annam and the region round Laos go via Vinh, and Tonkin via Haiphong. This latter port also receives many cardamoms from Annam. The following table

shows the quantity and value of the exports of cardamoms from French Indo-China during the last two years:—

	1899.		1900.	
	Quantity. Kilos.	Value. Franes.	Quantity. Kilos.	Value. Franes.
Annam	14,503	67,968	9,857	74,913
Cochin China and Cambo- dia	283,074	1,195,002	196,908	632,679
Tonkin	43,127	97,836	54,019	405,142
Total	{ 346,704 { 763,000 (lb.)	{ 1,380,006 { 54,000L.	{ 260,784 { 574,000 (lb.)	{ 1,12,734 { 45,000L.

—*Chemist and Druggist*, Jan. 18.

PRODUCE AND PLANTING.

The enterprise and energy of the Consuls of the United States have played an important part in the development of the trade of America. Doubtless British Consuls are just as energetic but there is something lacking in our system. In 1880 the "Commercial Relations," or Consular Reports, were first issued by the United States Bureau of Statistics, which in 1893 was superseded by the Bureau of Foreign Commerce. For the last three years a daily bulletin has been issued of the more important and valuable dispatches treating extensively of trade conditions. These advance sheets tell of the enterprises and plans of foreign manufacturers and of the changes in tariff regulations and are eagerly read. They call attention to the tastes, habits and prejudices of the peoples who may become customers. They suggest necessary changes of style or in methods of packing to make American merchandise more saleable, and give much other advice. Contrast this with our own Foreign Office methods, or some of them, or rather note the period covered by some of the Consular Reports issued from the Foreign Office. For instance, a report received on December 23, 1901, from the British Consul at Foochow reviews the trade of that port for 1900, and although doubtless admirable in its way, and compiled with great care, is rather too belated to serve any practical purpose. Referring to tea, the report says: "There seems to have been no change in the general quality of the teas proposed in 1900; the quantity brought to Foochow for sale was somewhat in excess of arrivals in 1899, but much remained unsold whereas all the tea brought here the year before found a market. The sales in London resulted in heavy losses, India and Ceylon having overstocked the market, and the prices obtained were the lowest on record. Some business was done in London in Souchongs and Seewoo Congous, but on the whole Foochow teas fared very badly. In America dealers thought that the Boxer troubles would affect the tea production and so bought heavily, the result being the overstocking of the market and sales at a ruinous loss. In short, while about the same quantity of tea arrived in Foochow as in 1899, less was sent abroad and a large amount remained here unsold, while of that which was exported only a very small percentage sold for remunerative prices." The condition of the tea market might have varied a hundred times since the date written about, and all kinds of things have happened, and been forgotten. Of course the Consul has done his duty in the matter, and the fault of the delay is not his in any way, but surely it is possible to gather official information about the Foochow tea market up to a more recent date than 1900 without causing trouble from overwork.

In its comments on last week's tea sales the "Produce Markets Review" says: "At the public sales on Monday of Indian tea the market was irregular and an easier tendency ruled, particularly for the lower descriptions. Later on the demand was more active and the market closed with a fairly strong tone. The

quantity catalogued for next week is about equal to that of the present week, and with the improving demand and increasing deliveries, which are 3,750,000 lb. larger since the first of the month compared with the same period last year, there is every indication of steady to firm prices. The exports from Calcutta for the past year amounted to 152,810,000 lb. against 159,390,000 lb. in 1900, while from May 1st, which was the beginning of the season, to the end of December the shipments were smaller. The home consumption for the same periods reached 144,389,000 lb. and 134,933,000 lb. respectively, showing an increase of 9,000,000 lb. The market for Ceylon teas has been severely tested this week, as the sales, following on very large Indian auctions, have shown a considerable increase in quantity. No signs of weakness were apparent, however, the demand being fully equal to the supply, and all kinds were well taken at firm rates, while the lowest grades of whole leaf occasionally sold at $\frac{1}{4}$ d more money. The offerings contained a larger proportion of Colombo-bought teas, which consisted principally of leafy broken Pekoes, and, as the quality was very ordinary, many were withdrawn for higher bids."

The latest fad in Paris is the smoking of coffee cigarettes, chiefly by women. The new cigarettes do not contain a compound made of the ground bean, but the leaf of the tree, fine, coarse, or navy cut, or manipulated after the bird's eye method, according to taste. Coffee-leaf smoking is said to be not only perfectly harmless, even if indulged in to the wildest excess, but to possess the property, deemed by the inventors an unquestionable advantage, of imparting to those who practise it an intense and lasting dislike for the flavour of tobacco.

Cocoa and nutmegs continue to maintain the colony of Grenada in easy circumstances, if not in opulence. The annual report for 1900, which has just been issued from the Colonial Office, describes the year as one of much prosperity—a prosperity, happily, that is likely to continue. The cocoa crop was good and the prices in the London market were high throughout the year, whilst the yield of spices was larger than ever before—between two and three times as large as the average annual output for the five years ending with 1897. In 1900 the total value of the colony's exports was £311,000, of which cocoa accounted for £270,000 and spices for £30,000, leaving only £11,000 for cotton, live stock, and everything else. The spice culture is mainly in the hands of large proprietors, who bestow much care and attention upon it and have evidently profited well by the establishment of the botanic station three years ago. Cocoa, on the other hand, is chiefly grown by the peasants on their own small holdings, and they are less respective of new ideas.—*H. and C. Mail*, Jan. 24.

"CEYLON MEN" WANTED FOR NATAL.—At a meeting of the Royal Colonial Institute, held on January 14th, Tuesday night, at the Whitehall rooms, Mr Emile McMaster read a paper on "The High Plateaus of Natal; their Climate and Resources" and the report in the London *Times* winds up as follows:—

He thought there were more small and moderate fortunes to be made in Natal than anywhere he knew of, but no large fortunes, except in coal and iron. He felt well convinced that there were fewer blanks in the lottery of success, and of health and happiness, in high Natal than elsewhere in South Africa; and especially was this the case for those of our race who meant to settle, live, and die, and leave descendants there. The things most lucrative however, called for a few years wait and nursing up; and he thought the class most called for now by the front plateaus was such as had gone planting to Ceylon, young men purposeful and with some capital to bury for a few years.

NEW FIBRE COMPANY.

COFFEE, TEA, OIL SEEDS AND HEMP.

(Registered in Scotland.)

DAURACHERA FIBRE CO., LTD., (4,997).—Registered at Edinburgh January 8th, with capital £25,000 in £10 shares, to acquire the business carried on as "The Dauracherra Fibre Company," in the Maulvi District of Sylhet, Assam, India, and to carry on the business of growing, manufacturing and selling coffee, tea, oil seeds, sisal, Mauritis and other hemp, seeds and snckers, etc. The subscribers are:—

J Hunter, Sarona Valley Sawmills, Sylhet, Assam, India, timber merchant	... 1
R Thomson, Dondonald Road, Kilmarnock, engineer	.. 1
J D Mackintosh, Bank Place, Kilmarnock, solicitor	.. 1
J Barr, 39, Dondonald Road, Kilmarnock, engineer	.. 1
J Boyle, 87, Dondonald Road, Kilmarnock, drysailer	... 1
R Gemmill, 6, Portland Road, Kilmarnock, manufacturer	... 1
G Morrison, Spotland Lodge, Kilmarnock, confectioner	.. 1

The number of directors is not to be less than 3 nor more than 7.—*Investors' Guardian*, Jan. 18.

TO ALL CEYLON TEA GROWERS,

CROP OF 1902.

The following circular has lately been issued by the Ceylon Association in London:—

Dear Sirs,—I am directed by the Tea and Produce Committee to send you a copy of the following Resolution which was passed unanimously at a meeting held this day:—

RESOLUTION.

"That this Committee, viewing with grave concern the disastrous results that would follow an excessive crop of tea in 1902, strongly urge upon producers the necessity of restricting outturn as much as possible by a system of more careful plucking or otherwise and to avoid more especially the production of coarse tea, which did so much harm to the industry in season 1900."

The above resolution having been unanimously accepted by my Committee, I am desired to give you their reasons for the conclusions arrived at, which are shortly as follows:—

In their opinion the experience of the past two seasons has conclusively proved—

- (a) That the coarse plucking resorted to in 1900, resulting in a plethora of common undesirable Tea being forced on an already over-supplied market led to a lower level of prices than has hitherto been known. Pekoe souchongs were sold as low as 3½d, a price which must have been well under the cost of production.
- (b) That on the other hand, the more careful plucking resorted to in 1901, combined with climatic influences, restricted the output to such moderate limits that the market immediately responded.

Messrs. Thomas Cumberlege and Moss, in their circular of the 3rd inst., make the following statement:—

"Of the 187,000,000 lb and 145,000,000 lb respectively produced in India and Ceylon during season 1900-1901, the last 12,000,000 lb from the former country and the last 8,000,000 lb from the latter were at a moderate estimate the actual cause of an aggregate nett loss to producers of over £1,000,000 sterling; this, on the face of it, is an absurd situation, and it is not to be doubted that by individual or collective action some means will be found to prevent its recurrence."

It is, therefore, abundantly clear that it would be a disastrous policy to revert to the system of coarse plucking resorted to in 1900. It would mean that the end of 1902 would see the industry again in a position of great depression equal to or worse than that at the end of 1900.

The position of British grown tea has not, for some years, been so strong as it is now, and this is owing to the certainty of a considerable shortage as compared with the crop of 1900.

Assuming that the home deliveries increase in the same proportion as they have done during the past twelve months, and with the natural increase in demand from abroad, it is obvious that the tea growers have now an opportunity such as they may not have again for years of putting the industry once more on a sound and profitable basis.

An appeal to the same effect as the above is being issued by the Committee of the Indian Tea Association to all Indian Tea Growers,—Yours faithfully, WM. MARTIN LEAKE, Secretary.

BALATA FROM THE LEAVES.

As it is possible to obtain gutta percha from the leaves it was of interest to try also to obtain balata in a similar way. A sample of the leaves was obtained from Venezuela through Mr Englehardt, of Ciudad, Bolivar, on the Orinoco, and on this sample the Colonial Committee, at Berlin, experimented. The results of the tests were, however, disappointing, as the product gained was of no practical use. The leaves were cut into small pieces and macerated in chloroform, which gave an extract containing 10·7 per cent. of the total weight of the leaves when the chlorophyll and the valueless resins were removed by alcohol. The insoluble matter represented 5·1 per cent. of the leaves, and was a substance only slightly elastic, light in colour, brittle, and not at all tough. If this substance represented balata it was apparent that the process had destroyed its most valuable qualities.—*India-Rubber Trades Journal*, January 20.

DISCOVERY OF A NEW TEXTILE FIBRE.

According to the *Bulletin of the Bureau of American Republics*, a new fibre known as *aramina*, has recently been discovered by Dr Silva Telles of the Polytechnic School of Sao Paulo. This fibre is obtained from a variety of plants commonly known in Brazil as *carrapichos*. It is almost white in colour, very fine and flexible, and is from two to three yards in length. It has been called *aramina* owing to its almost metallic lustre and wonderful flexibility. The plant from which the fibre is derived is strong and vigorous, and no special care is required in its cultivation, being perfectly adapted to uncultivated lands. It grows wild throughout the entire western part of the State of Sao Paulo and is being cultivated on a large scale on the plantations in the vicinity of Campinas.

Articles made of this fibre was recently exhibited by Dr Telles at the Polytechnic School, Sao Paulo. These included cords, twines, ropes, and canvas suitable for coffee bags.

It is predicted that this discovery will revolutionize the textile industry.

CULTIVATION OF RUBBER.

The following rather racy account of the difficulties lying in wait for the cultivators of rubber trees, is extracted from the pages of the American "Agricultural Gazette." After speaking of the relatively small proportion of people engaged in this direction, the writer goes on to say:—

The difficulties which confront this handful of farmers are peculiar. In the first place, no one ever tried before to make rubber grow as a crop for the market. There are no data, no facts of even the simplest kind to tell these men whether their ideas are the right ones. The natives of the country take no interest in this outside their own particular business, and a man about to establish a plantation has had to start fresh, with his own ideas to guide him; and these latter cannot be said as yet to have become authoritative, for none of the farms are more than six years old, and the trees must be up that time before the question of growing them can be settled. Rubber planting, then, is not only an absolutely untried undertaking, but there has been nothing of tradition or general knowledge of the subject with which to make a start. If rubber were a delicate tree, or difficult to cultivate, the outlook would be disheartening indeed.

Second, the general conditions are against the planter. The nature of the country throws him entirely upon his own resources, and the climate is apt to be enervating, to say the least. Transportation is a great problem. Labour is scarce and not easy to handle, the native peon of Central America being a mixture of childishness and independence, and a hard drinker to boot. Although strong and active as young men, excellent axemen and better with a spade than any other labourers in the world, they become debilitated very early in life. They have no constitution and must be cared for like children. Furthermore, they look to the patron, or owner, for the settlement of every ill spiritual or temporal. You must keep them sober, get them out of debt, make peace between them and their wives, arrange any infelicities that may occur between them and their neighbours' wives, doctor the whole family and educate the children, if you have time. For the peon is essentially a creature formed for the patriarchal system. With a chief or employer whom they know or respect, the better class of peons become in many essentials ideal labourers—steady, careful, hard-working, quick to catch an idea, faithful to follow it out, entirely honest; their employer's interests become their own. But in order to obtain this desirable state of things a farmer should be a first-rate judge of capacity and character, a fair lawyer, physician and man of business.

A third problem before the farmer of rubber is where to plant. *Castilloa elastica*, for practical purposes the only rubber in Central America has an extremely varied habitat. It is found at all elevations up to 2,000 feet and in a great variety of soils and locations, with a consequent variation of rainfall. So here, again, the farmer must make a choice, and one upon which his success will probably depend, with nothing to guide him in the making. As regards location, it is conceded that *Castilloa* needs a tropical climate, a rainfall that can be depended upon, a good drainage, and an elevation of less than 1,500 feet, but these conditions have great latitude of choice.

The most important of the questions relative to the method of planting rubber is the one about which the farmers are most divided, and is probably the most vital connected with its cultivation. It is the question whether to plant in groves in the open or under forest shade. The advocate of the farmer system says that in any other part of the world, if one wants to get a particular crop, it is customary to give the tree or plant all the chance possible. One clears the ground, turns it up, and after the tree is planted keeps all weeds from encroaching upon its light and food space. Why not apply these elementary principles to rubber and plant in ploughed and open land, in groves, as an apple orchard?

The advocate of the forestry system points, however, to the manner in which the tree grows naturally, and says that rubber is found thriving best under shade, in a cool, wet spot, and by "thriving" he says, he means gives the most rubber. The tree will grow, it is quite true, faster in the open than in the forest and you will get your groves of rubber trees more quickly, but the question is, will you get the milk from them? For it does seem to be a fact that rubber found in open pastures will not yield so much milk as those trees growing in the forest where it is cooler and moister. If it could be ascertained exactly what function the milk of the tree performed, one would probably be able to tell how much rain would produce the tree with the largest quantity of rubber. The milk is not a sap, but a latex, which is carried just under the outer bark, and the slightest nick from a pen-knife will be followed by a thick liquid, which if caught on the finger dries at once, leaving a shred or two of pure rubber, like small elastic bands.

There are farms established by exponents of each theory. One can see in Mexico rows of young trees in open cleared land, in every respect like a coffee or orange plantation; and again in Costa Rica the farm consists of rubber trees planted in among the forest trees, only cleared where the growth is very thick, though, of course, the bush is kept down by cutting twice a year. Those who are following these two theories will be relieved when they get their first crop. But at present they are having rather an anxious time of it, for on the one hand it will be expensive business, not to say impossible, to plant shade among those trees in the open, and the rubber may be ruined before the shade comes up; but this course would be imperative should the advocates of the orchard theory find themselves in the wrong. On the other hand, should the forestry people be at fault, it will require considerable skill for the owner of the rubber growing in the forest to cut out the trees and let in the sun without injuring the rubber. Ringing trees at the right phases of the moon, some eminent scientists to the contrary notwithstanding, will go far toward solving the problem for the grower of rubber in the forest and make his position the stronger of the two on the whole, in that he runs the lesser risk, as it is easier to cut out the shade than to put it back.—*The India Rubber and Gutta-Percha Trades' Journal*, Jan. 6.

RUBBER AND COFFEE PLANTING IN COSTA RICA.

We have a letter from Mr. Edwin A. Coles, son of the late Rev. S. Coles, who is a planter in Costa Rica, referring to the death of his lamented father, and his desire to aid the Sinhalese children who wish to place a memorial stone over the grave of their deceased friend. Mr. Coles makes the following reference to planting:—

"I hope shortly to write you an article on the question of Rubber Planting in Costa Rica. It is as is stated in the *T. A.*, in its infancy everywhere, and experience is lacking. I have now been taking stock of other people's experiences and am beginning to form an idea. There is no mistake that Costa Rica is a splendid field for the industry, which though requiring very small capital to begin with, needs, nevertheless, nothing less than personal attention. I have just received from Messrs. Brown & Co. five packages of the "White Ant Compound" delayed somewhere in transmission. To state briefly we are now having terrible hard times in this our 'coffee' country, more especially among the buyers. Competition ran high last season and to make things worse, coffee dropped in the market, resulting in the bankruptcy of about one-

half of the buyers. Apart from this I have pleasure in seeing excellent results from the artificial manuring done last year which has been rather slow in showing itself, but that is the way coffee grows slow and sure."

250 ACRES OF TEA FOR R5,000.

THE SAPAKATI TEA CO., Ltd., was put up for public auction on the first instant by Messrs Mackenzie, Lyall and Co., in the Exchange Commercial salerooms. The estate, which is situated at Sib-sagar in Assam, consists of three blocks of land comprising 578 12/100 acres, 438 39/100 acres and 50 acres, respectively, the first two blocks being held under two freehold grants from Government and the last mentioned block being held under a potta from Government. Out of the above area 250 acres are planted with tea which is in full bearing, and there are the usual buildings and machinery customary for the working of a tea estate. The attendance at the sale was by no means large, and the bidding was anything but brisk. Babu Harish Chundra Baghi started with a bid for R1,600, which rose very slowly to R5,500, for which price the estate was knocked down to Mr W C Aldam, of Messrs Cresswell and Co., tea brokers.—*Indian Planters' Gazette*, Feb. 8.

MAJOR WYLLIE AND THE BURMA RUBBER PLANTATION.

PROPERTY TO BE WORTH £7,000 A YEAR.

Major Wyllie, Cantonment Magistrate, Rangoon, whose services have been placed at the disposal of the Punjab Government, leaves by the Calcutta mail steamer on Monday for Mianmir. Last year on the occasion of the Durbar held by the Lieut.-Governor, Major Wyllie's valuable services in connection with the rubber plantation were referred to by Sir Frederic Fryer. In this connection it may be of interest to know that no less than 14,000 rubber trees have been planted at Cambay of which about 7,000 have already been planted out, the remainder being kept in the nursery. In the ordinary course these trees would also have been planted out, but Government propose to extend the plantation so as to take the whole of the land occupied by the Rifle Range at Kokine and the land behind it known as the "Danger zone." The trees can be planted at about 435 to the acre, and if the value ten years hence of 32 acres of land with the trees thereon were to be calculated it would amount to something like seven thousand pounds per annum. The para rubber trees are said to yield approximately ten shillings' worth of rubber each tree per annum for probably 3) or 4) years after their tenth year of growth. The figures, if correct, no doubt represent a very substantial yearly revenue to Government in the future.—*Rangoon Gazette*, Feb. 8.

BASIC SUPERPHOSPHATE (writes Mr. John Hughes under date, 31st January) is turning out a great success. Notices of it have appeared in numerous papers giving satisfactory accounts of its results as well as its good composition.

PLANTING NOTES.

VALUE OF LIME ON LAND.—H A P, Pennsylvania, writes to the *American Agriculturist*:—The value of lime consists in changing the chemical and physical character of the soil. By so doing it stimulates the development of the latent mineral plant food, promotes decomposition and renders available organic matter, forming compounds which attract ammonia from the atmosphere. Whether it will pay to lime or not depends largely on the nature and composition of the soil. This should be worked out by the individual after consulting the officers of the state experiment station.—*Planting Opinion*, January 25.

CINCHONA BARK SHIPMENTS FROM JAVA.—The New York *Drug Reporter* this month gives the shipments of cinchona bark from Java to Europe during the last three years as follows:—1899, 5,905,150 kilos; 1900, 5,451,500 kilos, and 1901, 6,399,700, kilos. Commenting on these figures the same journal says:—

It will be seen by the above figures that the shipments from Java during 1901 were much heavier than those during either of the other years mentioned, but notwithstanding this large increase, practically all of the bark that has come forward has been taken by makers of quinine, and most of the manufactured article is said to have gone into consumption.

From the *Chemist and Druggist* we learn that Messrs. C F Boehringer and Sohne, of Waldhof, have issued a leaflet of interesting statistics regarding quinine and cinchona. It gives the imports of cinchona into the U.K. for the past four years, exports from Java, stocks of bark at London and Amsterdam, range of unit and average percentage of quinine in manufacturers' bark offered at Amsterdam. Fluctuations in "official" quinine in 1901 are shown, also the estimated contents of quinine in the bark sold at London and Amsterdam, and stocks of quinine in London.

BRITISH GUIANA AND SUGAR BOUNTIES.—The Demerara *Argosy* is very outspoken on this subject:—

If at the next conference Britain makes it clearly understood that she is prepared to enforce her views on the injustice of continental bounties to the extent of adopting duties to counteract their effect, in the same way as the United States and India have done, there will be some chance of the representatives of the Powers coming to an amicable and satisfactory arrangement—but we fear not otherwise. This is a matter that affects not merely the West Indies; it is one of vital importance to the United Kingdom and to the Empire as a whole. "Trade follows the flag," we are told by politicians at home, but this is only true to a certain extent. If the "flag" encourages the trade of the country on which it is placed, reciprocity is the natural result; but our experience in this respect has been that the Home Government's policy of laissez faire has been to encourage trade between the United States and this colony at the expense of our commercial relations with the mother country. In this connection it is interesting to note that ten years ago our imports from the United Kingdom amounted to £927,397, while last year they had dwindled to £762,187. On the other hand, the imports from the United States in 1891 amounted to £374,935, and last year they showed an increase to £381,356. These figures are significant enough, and it is but natural that the inhabitants of one country should encourage trade with the country that provides it with a market for its products.

HAPUTALE PLANTERS' ASSOCIATION.

ANNUAL REPORT.

The twenty-sixth annual report was presented as follows :—

At the close of another year your Committee submits the 26th annual report of the Association, of work undertaken in the furtherance of planting interests generally and matters appertaining to this district especially.

MEETINGS.—Two general and Two Committee meetings have been held, the attendance at which was satisfactory.

TEA.—The past season was an abnormally dry one, and this in addition to the fact that finer plucking has been more general throughout the Island, has resulted in a shortness of crop and a consequent rise in the average price of tea.

Your Committee cannot lay too much stress upon the further adherence to that latter method of shortening output, and are sure that this policy combined with the more thorough exploiting of foreign markets, are the only real remedies for over-production.

OFFICIAL ESTIMATES FOR 1902.—There are 18,608½ acres of tea in Haputale, 14,806 of which are in bearing, yielding an estimated crop of 5,923,565 lb of tea (black tea 5,783,565, green 145,000) or 400 lb per acre. The estimate for native leaf is 487,000 lb.; this is not included in the above estimate.

COFFEE.—Good crops have been harvested on the few estates where this product is still under cultivation; a good blossom, too, has been reported and unless a bad attack of disease is imminent a heavy spring crop should be secured.

THE NEBODA TEA COMPANY OF CEYLON, LIMITED.

REPORT.

DIRECTORS:—Messrs. Joseph Fraser, Robert Morison, J G Napier. Solicitors to the Company: Messrs. F J & G De Saram. Agents and Secretaries: Messrs. Somerville & Co.

ACREAGE :

Tea in full bearing ..	383 acres.
„ in partial bearing ..	112 „
Total Tea ..	495 acres,
Forest Land, &c. ..	171 „
Total	666 acres

The Directors submit their Report and Accounts for the year ending 31st December, 1901

The Crop secured for the year was 209,047 lb., 9,047 lb. in excess of the estimate, or an increase of 14,447 lb., over 1900, and was sold in Colombo at an average rate of cts. 30.341 per lb., as against cts. 23.82 for 1900. The cost of production, including manning, was cts. 25.673, or exclusive of this item cts. 22.148.

The 247 acres of Tea in full bearing gave an average yield of 587 lb., and the 248 acres of Tea in partial bearing an average of 258 lb. per acre, the youngest Tea 112 acres gave 230 lb. per acre, and 136 acres 280 lb. The average for the whole estate was 422 lb. per acre.

The estimate for 1902 is 230,000 lb., and is based upon medium fine plucking being adhered to. After writing off R1,801.13 for irrecoverable Coast Advances, the balance at credit of Profit and Loss was R9,030.35 which sum the Directors recommend should be disposed of in payment of a dividend of 3 per cent, and that the balance be carried forward to next year's accounts.

In terms of the Articles of Association Mr. Robt. Morison retires from the Board, but is eligible for re-election.

The Meeting will appoint an Auditor for the current year.

By order of the Directors.

Total cultivated area ..	1,184 acres
Forest and Grass Land...	227 do
Waste Land and Buildings ..	30 do

Total area of Estate 1,441 acres

The Directors submit their Report and Accounts for 1901.

The tea crop secured amounted to 387,470 lb, being 182,769 lb. less than last year. The net average price realized was 38.40 cents, whilst the cost f.o.b. was 30.391 cents, including manuring and burying prunings, or 23.942 cents exclusive of these items.

The sum of R2,500 received as Premium on 10 new shares issued has been placed to credit of the Reserve Account.

The net profit for the year, including a balance of R3,792.24 from 1900, amounted to R31,932.22. An interim dividend of 4 per cent has been paid, and the Directors recommend a final dividend of 4 per cent making a total of 8 per cent for the year, and that, after transferring R5,000.00 to the Reserve for Extensions, the balance of R2,132.22 be carried forward to next year.

In terms of the Articles of Association Mr Robert Morison retires from the Board of Directors, but, being eligible, offers himself for re-election.

The appointment of an Auditor for the current year rests with the meeting.

AGRA OUVAH ESTATES COMPANY, LIMITED.

Total Estate 193 acres.

Grand Total 524 acres.

The Directors have now to submit to the Shareholders the accounts for the past year.

The crop secured amounted to 326,420 lb., being 17,330 lb. short of the estimate, which is attributable to an unfavourable season for the flushing.

The average nett price obtained for tea was 45.65 cents per lb., against 45.02 cents per lb. in 1900. After deducting the cost of manufacturing outside leaf, the cost of laying down the Company's tea in Colombo was 24.80 cents per lb. The Directors, considering that the interests of the Company would be best served by confining their attention to manufacture of the Company's leaf only, discontinued the

manufacture of outside leaf from the end of July last, up to which date a sum of R6,223-69 was obtained for this work.

In view of the fact that depreciation has been written off so that Machinery and Buildings now stand in the books of the Company at a sum of R26,058-70, the original cost being R90,846-87, and that all repairs and alterations are now charged to Working Account, the Directors consider that it is unnecessary and inadvisable to write off anything further to Depreciation Account.

The amount at credit of Profit and Loss Account for the year's working is R66,785-24, equal to 17-80 per cent on the paid up Capital of the Company, to which must be added a sum of R2,783-92 brought forward from 1900, making the total profit available for distribution R69,569-16. An interim dividend of 7 per cent was paid on 2nd August last, absorbing R26,250, and the Directors now recommend the payment of a final dividend of 11 per cent, making 18 per cent for the year, and that the balance of R2,069-16 be carried forward to the current seasons' working.

During 1901 a bungalow was erected at a cost of R2,451-27, which has been debited to Capital Account; this building has been leased to Government for a Post Office, for a period of 5 years on a monthly rental of R35.

The estimate for this year is 343,750 lb. Tea on an expenditure of R84,852-97, including a sum of R6,989 for manuring.

During the past year Mr Jas. Forbes resigned his seat on the Board, and Mr Jas. Polson was appointed to fill the vacancy. In terms of the Articles of Association Mr Polson retires by rotation from the Office of Director, but is eligible for re-election.

The appointment of an Auditor for the current year rests with the Meeting.—By order of the Directors,

WHITTALL & Co.,
Agents & Secretaries.

Colombo, Jan. 24, 1902.

THE GLASGOW ESTATE COMPANY,
LIMITED.

REPORT OF THE DIRECTORS.

ACREAGE.

Tea in full bearing	..	570	acres.
Do partial bearing	...	68	"
Do not in bearing	..	12	"
Grass	..	2	"
Jungle, &c.	..	62	"

Total Estates ... 714 acres.

The Directors have now to present to the Shareholders their annual report and the accounts of the Company for the past year.

The Tea Crop, which was slightly under the estimate, amounted to 361,189 lb, and realized a nett average price of 43-66 cents per lb, as against 44-63 cents per lb, last year.

As buildings and machinery now stand in the Company's books, after deducting the sum standing to the credit of depreciation account, at only R22,730-77, a sum far below their actual value, the Directors consider it unnecessary to write off any depreciation this year.

The amount at credit of Profit and Loss account for the year's working was R65,548-56, equal to 20-17 per cent on the paid-up Capital of the Company. The sum of R502-53 was brought forward from 1900 account from which falls to be deducted R300, being extra fees to the Directors for 1900 working, in terms of the resolution passed on 18th February, 1893. There is thus an aggregate of R65,751-09 available for distribution, and the Directors now recommend that R5,000 be transferred to Reserve Fund for Equalization of dividends, that a final dividend of 11 per cent be paid for 1901, making with the interim dividend of 7 per cent paid on 2nd August last a

total of 18 per cent for the year, and that the balance of R2,251-09 be carried forward to the current year's account.

To deal with manufacture of the increasing crops from the young Tea, an extension to the factory and machinery was necessary, and this work was completed during the year and charged to Capital account.

The estimate for the current season is 400,000 lb. Tea against a total expenditure of R96,542-50.

During the year the Mr Jas. Forbes resigned his seat on the Board and Mr G C Walker was appointed to the vacancy. In terms of the articles of Association, Mr Walker retire from the office of Director, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

By order of the Directors,
WHITTALL & Co.,

Colombo, Jan. 27th, 1902. Agents & Secretaries.

MAHA UVA ESTATE COMPANY.

THE DIRECTORS' REPORT

as follows was submitted:—

Total Cultivated	..	727	do.
Jungle and Waste land, &c.	..	231	do.
Total of Estate	..	958	acres.

The Directors have now the pleasure to place before, the Shareholders accounts for the past year.

The Tea crop secured, including Tea made from 31,316 lb purchased leaf, amounted to 237,583 lb as against an estimate of 262,000 lb of Tea. Following an abnormally favourable seasons of flush during 1900 it was not to be expected that yield in 1901 would be as large, but the estimate would probably have been secured had it not been for the very unfavourable weather experienced during the last three months of the year. The season being favourable for this product, the Cardamom crop amounted to 7,922lb as against an estimate of 6,000lb. The average net price realised for the tea was 34-78 cents per lb and for the Cardamoms sold to date R. 1-25 per lb as against 36 04 cents and Re. 1-42 respectively for the 1900 crops.

A sum of R5,030-50 was spent on capital account in building new Lines, the purchase of a new Roll Breaker and in fitting the Factory with Sirocco Fans, the results of their working having proved very satisfactory.

After allowing for depreciation on Machinery and Building the amount at credit for the year's working is R18,348-21, equal to 6-11 per cent on the paid up capital of the Company. The balance brought forward from 1900 amounted to R10,663-95, thus making a total of R29,012-17 available for description. An interim dividend of three per cent was paid on 8th August last absorbing R9,000 and the Directors recommend the payment of a final dividend of 4 per cent, making 7 per cent for the year that the sum of R5,000 be transferred to a Reserve Fund for the equalization of dividends, and that the balance of R3,012-17 be carried forward to the current year's account.

The estimates for this year are 262,000lb. Tea and 9,000lb. Cardamoms on an expenditure of R71,609.

During the year the Hon Mr W H Figg resigned his seat on the Board and Mr G H Alston was appointed to fill the vacancy. In accordance with the Articles of Association Mr Alston now retires, but is eligible for re-election.

The appointment of an Auditor for the current year rests with the Meeting.

THE UPPER MASKELIYA ESTATES COMPANY.

Messrs. G H Alston, Jas. Polson and W D Gibbon.—
Directors.

Tea not in bearing..	10 ...	— ...	10
Grass, Timber Trees, &c	62 ...	— ...	62
	518	207	725

The Directors have now the pleasure of laying before the Shareholders the accounts of the Company for the past year.

The crop amounted to 338,466lb. Tea, being 18,467 lb. in excess of the estimate, and sold at an average net price of 44'61 cents per lb as compared with 42'57 cents per lb in 1900; this price included the grant for green teas, for the manufacture of which a contract at very favourable rates was made.

As Buildings Machinery now stand in the company's books at only R13,796'03 an amount far below their real value, the Directors do not consider it necessary or advisable to write off any more for Depreciation.

The amount at credit of the year's working is R56,520'70, equal to 16'14 per cent on the paid up Capital of the Company, to which had to be added R2,441'16 brought forward from 1900, making a total, available for distribution, of R59,064'86. The Directors now recommend that a sum of R5,000 be transferred to the Reserve Fund for the equalization of Dividends, that a final dividend of 60 per cent be paid, making with the interim Dividend of five per cent on 31st July last a total of 15 per cent for the year, and that the balance of R1,564'88 be carried forward to the current year's working.

The Estimate for the present season is 340,000 lb. tea on an expenditure of R95,854'50, which includes a sum of R12,262 to be spent on manuring.

During the past year the Hon Mr W H Figg resigned his seat on the board, and Mr G H Alston was appointed to the vacancy. In accordance with the articles of Association, Mr G H Alston now retires from the Board, but is eligible for re-election.

The appointment of an Auditor for the present year will rest with the meeting.—By order of the Directors,

WHITTALL & Co.,
Agents and Secretaries.

Colombo, Jan. 27, 1902.

BATTICALOA PLANTERS' ASSOCIATION.

THE ANNUAL REPORT.

In submitting the Second Annual Report of the Batticaloa Planters' Association, your Committee is able to congratulate you on the satisfactory position of the Association. The roll of subscribers is a satisfactory one. This Association represents considerably over 14,000 acres and a capital of not less than R4,250,000. The attendance of the members at our meetings has been good, and our proceedings have been followed with keen interest. It is clear that an Association was urgently needed in this district as previously there was no public body who would undertake the thankless task of airing public grievances and support the planting industry of Europeans and natives alike.

DUTCH CANAL.—This Association has addressed Government on the matter time after time. As the Dutch Bar Scheme has been rightly abandoned there is every chance of having the matter settled definitely, as Government has appointed a Commission to enquire into the matter. The re-opening of the

Dutch Canal has been approved of by almost every Governor and by the residents in the district. It is a matter of regret that some Government officials put obstacles in the way of a scheme which will benefit the district to an extent which will amply justify the construction of the Canal. Our best thanks are due to the Press, and particularly so to the Editors of the *Ceylon Observer* and the "Times of Ceylon," for the way in which they have supported this Association in this matter.

HOSPITAL WARDS FOR PAYING PATIENTS.—Our thanks are due to the Government, who have granted the construction of two Wards. It is to be hoped that the building operations will be started without delay.

WATER SUPPLY FOR THE TOWN.—Your Committee regrets to state that nothing has been heard of this matter since H.E. the Governor was last at Batticaloa. Government should be urged to devise a wholesome water supply for the town.

SANITATION OF THE TOWN.—Very little attention seems to have been paid by the Local Board authorities to this important matter. But the thanks of the Public are due to the efforts of the medical officers to bring about a better state of affairs.

DRY DOCK.—It is satisfactory to report that H.E. the Governor has very kindly promised the Batticaloa Steamboat Syndicate every help and assistance. The dock appears to have been finished, and it is likely that the steamers will soon be able to resume their regular service to Kalmunai.

MOTOR CARS.—The arrival of Motor Cars conveying the mails and passengers to and from Lunugalla will add considerably to the advancement of this Province. The regular service will be commenced on the 1st of May.

ROADS.—Complaints about the state of Roads, Bridges and Causeways have been frequent and continual.

SURVEY DEPARTMENT.—This Province, one of the largest in the Island, has not the privilege of a Superintendent of Surveys. Consequently Government surveys have to be done by private surveyors. Your Committee begs to advise that this Association take immediate steps to get a resident Superintendent of Surveys appointed as heretofore.

COCONUTS.—The crops at the beginning of the year have been considerably affected by the drought of the preceding year. However, during the last 6 months considerable improvement has taken place, and copra has risen greatly in price. A large acreage has been brought under cultivation and is sure to attract European capital to this Province.

PADDY.—An average crop has been reaped during the year. A similar crop is expected for 1902. The large irrigation schemes North and South of Batticaloa will add considerably to the acreage already under cultivation.

CHANGES IN THE CIVIL SERVICE.—Your Committee begs to congratulate the Hon. C A Murray, the former Government Agent, on his promotion in the service, and our thanks are due to him for the courtesy, great help and encouragement he has always given to our Association. We are glad to see that his successor, Mr. S Haughton, is likewise giving this Association every help and assistance, for which we are much indebted.

OBITUARY.—Your Committee begs to record with great regret the demise of Mr. W T Wambeek, a valued member of this Association and much respected in the district.

HEWAHETA PLANTERS' ASSOCIATION.

ANNUAL REPORT

There were three Committee meetings and three General meetings held during the year.

FINANCES.—The balance to credit of the Association is R263'33, as compared with R135'87 at end of last year.

MEMBERSHIP.—Includes nine estates in Upper, and eight estates in Lower Hewaheta. Your Committee

regret that there are still a few estates that have not joined. The Galaha Group of estates (5) has seceded from the Association to the Kandy Districts Association.

CROP ESTIMATE—for 1902 is 3,132,000 lb from 7,231 acres, without including 511,000 lb green leaf from native gardens.

SEASON.—This has been an unfavourable one owing to the abnormal duration of the S W Mousoon which checked flush.

MAIN ROADS.—These are in fair order. Your Committee wish to thank Government for carrying out their suggestion of improving and widening the zigzags on the Hanguranketia Road, and would again urge upon Government the desirability of connecting the Upper and Lower Hewaheta district, by joining the two cart-roads now ending on Loolecondera and Rahatungoda, respectively—a distance of some 5 miles.

MINOR ROADS.—The bridle path from Upper Hewaheta, via Rockwood, to Nuwara Eliya, and the connecting branch from Lower Hewaheta; through Loolecondera, via Cammethan, is proving itself a most useful outlet.

RIFLE CORPS.—A section has been formed, and there are now some 24 members on the roll, and it is hoped that more will join.

TELEGRAPH OFFICE (Deltota).—Your Committee desire to thank the P M G for the speedy construction of the line, which is now completed. We trust, when this office is opened Government will see the utility of connecting the Deltota and Maturata offices affording an office at Hewaheta, and an alternative route from Nuwara Eliya to Kandy. We regret that building difficulties have delayed the opening of this office.

DELTOA HOSPITAL.—We regret that the P. C. M. O. has not seen his way to carry out the improvements recommended by our Hospital Visitor.

LABOUR.—Labour is on the whole fairly satisfactory, but the evil of bolting coolies is on the increase, and your Committee is glad to note that the Parent Association is moving in the matter.

TATAPARAI TICKET SCHEME.—Your Committee recognises the usefulness of the scheme, and advise members to give it a full trial.

BENEVOLENT FUND AND HATTON NURSING ASSOCIATION.—Your Committee would be glad to see these meetings with more general support.

P A CHAIRMANSHIP.—Your Committee trust that all members of its Association will vote for Mr. A C Kingsford.

OBITUARY.—It is with deep regret we have to record the death of Mr. T N Orchard, an old and respected resident who was a member of this Association from its inception.

The report was adopted.

THE HIGH FORESTS ESTATES COMPANY, LIMITED.

REPORT OF THE DIRECTORS.

DIRECTORS:—Messrs. J G Wardrop, G B Leechman, G H Alston. Estate Inspector—Jno. Gordon, Estate Superintendent—D Lyall.

ACREAGE.

Tea in bearing	683 acres.
Tea in partial bearing	497 "
	<hr/>
	1,180 "
Forest and Patana	452 "
	<hr/>
Total	1,632 "

The Directors have now to submit to the Shareholders the accounts of the Company for the past year.

Owing to the very unfavourable weather during the months of November and December the yield has not realized expectations: the crop secured being 366,418 lb. Tea, as against an estimate of 402,000 lb, the quantity of Tea made in November and December being practically the same as that made in 1900, though the acreage being plucked was considerably larger.

The nett price realised shows a regrettable decline from that in 1900, being 46-30 cents per lb. against 57-65

cents per lb. It should however be pointed out that the increase in crop is derived solely from the young fields coming into bearing and, as is well known, teas from such leaf, until the bushes have matured, are always thin and lacking in point, while, as is usual when common teas are in demand and fetch comparatively high prices, better classes of tea suffer.

The Directors regret to report, that, since the beginning of this year, one gang of coolies has left the estate owing a sum of R2,161-44, and there is another gang R1,547-74, the recovery of which is considered doubtful; they think it advisable, owing to the legal and other difficulties in recovering such debts, to set aside the sum of R3,750 to provide for the possibility of the advances being lost, and have therefore transferred the amount to the credit of a Coast Advance Reserve Account.

After making this provision and writing off a sum of R12,605-25 for Depreciation of Buildings and Machinery, the amount at credit of Profit and Loss Account for the year's working is R51,439-97, equal to 5-41 per cent on the paid up Capital of the Company, to which has to be added the balance of R17,009-24 brought forward from 1900. The Directors now recommend the payment of a final dividend of 2½ per cent, making with the interim dividend of 2½ per cent paid on 16th August last, a dividend for the year of 5 per cent, and that the balance of R20,949-21 be carried forward to the current year's accounts.

Negotiations are still proceeding as regards an outlet road to join the Uda-Pussellawa Railway, and the provisions of the Ordinance now before the Legislative Council, in connection with estate roads, should considerably facilitate matters. The Directors are at present reserving the Capital uncalled on the part-paid shares for the purpose of paying for such road.

During the past year the total expenditure on Capital Account amounted to R21,589-86, for the upkeep of young tea not yet in bearing and for additions to machinery necessitated by the increase in crop.

The estimate for the current year is 429,000 lb. Tea on an estimate of R115,799-33, and on Capital Account R12,246, for the erection of new permanent lines, upkeep of young tea and alteration of water-course to provide increased power.

During the year the Hon. Mr. W H Figg and Mr. F W Bois resigned their seats on the Board, and Messrs. G H Alston and G B Leechman were appointed to fill the vacancies.

In terms of the Articles of Association Mr. J G Wardrop now retires from the Directorate, but is eligible for re-election.

The appointment of an Auditor for the current year rests with the Meeting.

THE KALUTARA COMPANY, LIMITED.

THE DIRECTORS' REPORT

was submitted as follows:—

DIRECTORS—J G Wardrop, Esq., Hon. Mr W H Figg, R S Templar, Esq. Estate Inspector—E D Harrison, Esq. Estate Superintendent—W A Lyford Esq.

ACREAGE.

	31st December, 1901.	
Tea in bearing	658	
New Clearings	24	
Areacants, Grass, Ravines, &c.	10	
	<hr/>	
	692	
Forest	392	
	<hr/>	
Total	1,084	

The Directors herewith present their Report and the Accounts for the year ending 31st December, 1901.

The Crop (including 4,638 lb manufactured from purchased leaf) was 320,569 lb against an Estimate of 324,715 lb which in view of the generally unfavourable season for flushing may be considered satisfactory.

The average net price realized was 30.62 cents per lb against 31.32 cents last year.

The cost of the Tea laid down in Colombo was 23.48 cents per lb of which R8,017.84 was spent on manning.

On Capital account a sum of R3,143.58 was spent on extending Rubber cultivation, building permanent lines and the upkeep of small acreage of young tea not yet in bearing.

A Census of the Rubber trees on the Company's properties has been taken, and exclusive of last year's plants, the total is 11,883. During the current year provision has been made in the Estimates for planting 30 acres of this product.

After making ample provision for Depreciation of Buildings and Machinery, and paying the 7 per cent dividend on the Preference Shares, the balance at credit of Profit and Loss Account for the year's working amounts to R7,924.62. The sum available for distribution is R14,885.38, out of which the Directors recommend the payment of a dividend for the year of 2½ per cent on the ordinary shares, leaving R4,885.38 to be carried forward to the current season's working.

For 1902 the tea crop is estimated at 315,862 lb. on an expenditure of R75,942.34, which includes an amount of R8,605.20 to be spent on manning.

On Capital Account an expenditure of R4,733.56 is estimated, principally for opening the Rubber clearing referred to above and the erection of new permanent lines.

Mr. H Cumberbatch on leaving the Island resigned his seat on the Board and Mr. R S Templer was appointed to the vacancy.

In terms of the Articles of Association, Mr. J G Wardrop now retires from the office of Director, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

GANGAWATTA ESTATES COMPANY OF CEYLON, LIMITED.

REPORT OF THE DIRECTORS.

Messrs. T G Hayes, S H Hayes, W Anderson J Shelton Agar and T S Grigson—Directors.

ACREAGE :

Tea in full bearing	..	335	acres
„ partial bearing	...	2	„
„ not in bearing	...	8	„
Grass and Ravines	...	10	„
Total	..	355	acres

The Directors beg to submit their Fifth Annual Report and Statement of Accounts for the year ended 31st December, 1901.

The total crop of tea secured for the year amounted to 166,182 lb. against an estimate of 170,000 lb. The short fall may largely be attributed to the unfavourable weather which prevailed during the latter months of the season, but a part of the shrinkage may also be put down as the result of the finer system of plucking that has been adhered to throughout the year.

The whole of the crop, with the exception of 12 lb. carried forward to next season, was sold in Colombo, and realised R64,183.19, or an average of 38.62 cents per lb. as compared with 36.07 cents the previous year, while the cost of production, including 1.77 spent on manne, works out at 26.60 cents per lb.

Sixty-four acres, chiefly on the Bitterne division, were manured during the year with good effect on the bushes, and the estates are reported to be looking well.

The working account shows a net revenue of R20,245.54, to which has to be added R1,140.06 brought forward from last season. An interim dividend of 3 per cent has already been paid, and after allowing for interest on Mortgage, Superintendent's commission, Secretariat and other items, there is an available

surplus of R11,848.00, which the Directors propose should be dealt with as follows:—

In payment of a Final dividend of 4 per cent	..	R7,140	00
To credit of a Reserve Account		2,500	00
Balance to be carried forward to next year, subject to Directors' Fees, and provision for depreciation of Machinery		2,208	00
		R11,848	00

The estimate for the current season points to a crop of 170,000 lb. expected to cost R45,224.75, including R4,040.00 for manne.

The accounts have been charged with the balance cost of reconstructing the wire bridge destroyed last season.

In terms of the Articles of Association Mr T G Hayes retires by rotation from the Board of Directors and is eligible for re-election.

The appointment of an Auditor for the current year rests with the meeting.

RUANWELLA TEA COMPANY.

ANNUAL REPORT.

After the usual preliminaries, the annual report was submitted as follows:—

Directors:—Mr H J Scott, Hon Mr W H Figg, Mr J P Anderson; Estate Inspector.—Mr J P Anderson, Estate Superintendent.—Mr D I Mackenzie.

ACREAGE.

Tea in full bearing	374	acres.
Jungle and Wasteland	199	„
Total	573	„

The Directors have now to submit to the shareholders the report and accounts of the Company for the past year.

Most estates in the Kelani Valley are short of their estimates for last year, and the Company's property is no exception to the rule, the crop secured amounting to only 166,300 lb of 33,700 lb short of the estimate. The Directors feel convinced that this unsatisfactory result is attributable primarily to an unfavourable finishing season, and, to a smaller extent, more careful plucking.

The average nett price realized was 27.83 cents per lb., whilst the cost of production was 23.89 cents per lb., of which R3,466.05 was spent on manne, and a sum of R1,055 on purchasing a wire shoot and a new tea sifter.

As Buildings and Machinery only stand in the Company's books at R25,851.57, a sum far below their actual value, the Directors do not consider it necessary to write off any depreciation this year.

After writing off R725.58 for bad coast advances, the sum at credit of Profit and Loss account is R3,573.68, to which falls to be added R6,783.02 brought forward from last year, and R196.81, being underestimated value of Tea appearing as unsold in last year's account. The amount available for distribution is therefore R10,553.51, and the Directors recommend the payment of a dividend for the year of 3 per cent, and that the balance R2,603.51 be carried to the current season's account.

The crop estimated for this year is 200,000 lb. Tea on an expenditure of R46,232.66, which also provides for the planting up of Para Rubber on certain portions of the estate where it is considered that the cultivation of this product is likely to be profitable. The building of a permanent set of lines is also provided for.

In accordance with the Articles of Association, Mr Hercules J Scott now retires from the Board, but is eligible for re-election.

The appointment of an Auditor for the current year rests with the meeting.

INDIA-RUBBER AND GUTTA-PERCHA AND ELECTRICAL TRADES' JOURNAL.

RUBBER PLANT.—A good few people just now are troubling their heads about the plant. We do not refer to that which has leaves and makes a nice ornament, but to the mass of wood and iron, in all sorts of shapes and sizes, that constitutes a rubber factory. Some of it is fixed and immovable, except in the way for which it was made; some of it, and a much larger portion than outsiders would dream of, is loose, and changes its location frequently. It is clear that the latter runs more risk of getting injured or lost than the former; but, on the other hand, breakages in the fixed plant are usually of much greater importance when they do occur. Now that stock-taking is at hand with most concerns, the question crops up: How shall we deal with the plant this year; shall we allow anything for depreciation—and, if so, how much, and what variation shall we make in the different items?

We have laid down here two broad divisions which it is well, we think, always to keep clear of each other—fixed plant and loose plant. Some places do not make the distinction. Suppose it is their hose plant that is in question. They have, say, a hose machine and a hose pan and carriage, but these are no use without mandrills, so they argue that the mandrills should go with the other two, and all be considered as hose plant. The effect is, however, that two things get mixed up that should not be—the loose articles which deteriorate quickly, and the fixed machines which lose their value very slowly.

So far, the rubber industry has been rather favoured with regard to depreciation in fixed machinery. In some trades, notably the cotton trade, so great have been the improvements in machinery that places that have only seen ten or fifteen years have had to be all cleared out—the plant could not be run at a profit. The change has been complete; the new is not simply the new but, in its way, it is the original, the first of its kind. The rubber trade has varied little. A practical man could walk through some rubber works that have been going without a stop for forty years or so and, if he was not told, he might take it for one started only a year or so ago. There have been some improvements, but they have been slight and, indeed, many of them were classed as "fads," with great truth, by a recent writer in this paper. What may be in store for us we know not. In regard to one important branch, the manufacture of rubber shoes, we are promised by the American *India Rubber World* a complete revolution in a very few years. The present method is to be entirely swept away. The statement is backed by the Editor of that paper, a usually clear-headed and well-informed man, but we are still sceptical about it. We do not propose to alter our line in consequence; and that is, that as regards fixed rubber machinery, a heavy depreciation is not called for. The value goes down only slowly and little. There has been a fair quantity of second-hand machinery sold during this year and some of it had worked a long time, yet we doubt if the bulk did not realise two-thirds of its first cost.

One item that is rather outside proper rubber machinery wants looking at carefully, however, and that is the engines and boilers. If these stand in the books at anything near their first cost they are overvalued. From what we have seen ourselves, good articles of these kinds can now be got much below what they were worth three or four years ago.

There remains the very considerable portion that is known as loose plant to deal with, but our space is exhausted. We can only say that this should be treated very liberally for depreciation if the proprietor desires to feel sure that his balance-sheet is on a sound basis.

RECOVERED RUBBERS.—The science of recovered rubber does not simply end when it has been freed from sulphur and extraneous matter. The purest recovered rubber may often be the worst from the manufacturing point of view, owing to the treatment

which it has received in order to bring it to its high state of purity. In these days of competition there is everything to be said for the use of recovered rubber in the manufacture of a large percentage of the principal articles made. There are several conditions, however, which it is essential should be observed in the recovering of rubbers, and these, while not difficult to define, are very difficult to execute in practice.

First, it is essential that the recovered rubbers should not be acidulated, or loaded in any way, for the manufacturer may be using other fillings incompatible with those in the recovered rubber. He should at least be confident that in using recovered rubber, he is making use of a material which will not interfere in any way with the other ingredients of his mixing.

Secondly, the manufacturer should be acquainted with the percentage of mineral matter present in the recovered rubber which he is using, and, through having information of its specific gravity, should be able to work out beforehand the density of the goods which he wishes to produce.

The Rubber Chemical Co., of Mitcham, Surrey, are of our mind in this matter, and they believe that in working on these lines, they can look with every confidence to satisfactory increase of trade with their customers.

As the real test of a recovered rubber is after all, its satisfactory vulcanisation, they are prepared to supply samples (vulcanised) of their recovered rubbers, and, further to guarantee a uniform quality and a uniform percentage of mineral matter and specific gravity on all orders. This can only be accomplished by carefully handling and grading of all the various rubbers received, and certainly no manufacturer can show greater confidence in his efforts in this direction than to guarantee uniformity in every respect. We cordially draw attention to these facts here, because in guaranteeing uniformity in recovered rubber a step is taken in the right direction of utilising a material in the rubber manufacture whose only fault is a very slight tendency to deteriorate quicker than Para. In any case, such a guarantee of uniformity is sufficient inducement for manufacturers to write for circulars, price lists, and samples to the Rubber Chemical Co., Ltd., Mitcham, Surrey. —*India-Rubber and Gutta-Percha Trades' Journal*, Jan. 6.

MALARIAL FEVER AND THE MOSQUITO.

(To the Editor of the *Pioneer*.)

SIR,—The theory that that exasperating insect the mosquito is responsible for the propagation—if not the generation—of malarial fever, is gaining ground so rapidly and widely that one feels backward to impugn it, and still, reading the following unequivocal passage in that delightful book of Du Chaillon's, *The Land of the Long Night*, one cannot help feeling sceptical. He says at page 81: 'Give me the plateaus of the Arctic regions for health. There are plenty of mosquitoes in summer, but no malaria at any time.' So far as I remember, the fundamental experiment upon which the supporters of the mosquito theory base their belief is that of the two gentlemen who lived under a net in a notoriously malarious district in Italy during the worst time of the year for malaria and escaped being attacked. It is argued the mosquitoes did not get at the experimenters, and they did not suffer from the malaria; ergo, the mosquito bite is responsible for the fever. This reasoning is plausible but certainly not conclusive for may not the netting, besides keeping out the mosquitoes have also arrested the germ or atom of malaria from passing through to a degree dependent upon the hygrometric or some other physical condition of the atmosphere? In support of this view, I would quote the following passage from Dr. Moore's *Family Medicine for India* page 628: 'Sir Emerson Tenent writing of the fever district of Ceylon states that curtains round the bed act as preservatives from disease.' Mr. Du Chaillon's observation quoted above is important, coming as it does from one who has

travelled intelligently in remote and unhealthy regions. I may say that my own experience gained from several years spent in Sindh and Burma, two provinces notorious for malarial fever, does not accord with the mosquito theory—for instance, in the Southern Shan hills between Hlandet and the plateau of Phenlah more especially in the neighbourhood of Singu, the country is deadly during the rains from malarial fever, and yet, during this time it is cool enough to keep ones self covered, and so ward off the attacks of mosquitoes, and I found the mosquitoes more numerous in these parts before the rains than during the rains the fever season. Again in Sindh the fever season is coincident with the falling of the river, roughly 15th September, and continues to the middle of December, the weather during this time is cold, and people of course keep themselves covered at night so here the mosquito is not in it. Lastly, Major Waddell, Indian Medical Service, in his excellent work, *In the Himalayas*, makes frequent mention of the deadliness of the valleys in Sikhim from malarial fever, but nowhere is any allusion made to the mosquito in this connection, indeed, it would appear that the doctor did not come across mosquitoes at all!

—*Pioneer*, February 6.

T. D. M.

INDIAN TEA MARKETS EXPANSION.

We take the following extracts from the Report of Messrs Andrew Yule and Co., the Commissioners of the Indian Tea Markets Expansion Commission, for the period ending the 31st December, 1901:—

The offer of Messrs. Andrew Yule and Co., to manage the operations of the Commission, was accepted by the Indian Tea Association at a meeting held on the 16th July, 1901. This report, therefore, deals with the work of the Commission for the first five months of its existence.

GRANT-IN-AID.—Grant-in-aid of Rs40,000 was received from the Indian Tea Association, on the 26th July, 1901, and deposited with the Bank of Calcutta, Ltd. Tea contributions promised to 31st December, 1901, amount to 680,744 lb. Of this quantity 269,395 lb. or about 39 per cent, has been received up to the 31st December, 1901.

PURCHASE OF TEA.—To meet the demand for classes of tea, other than those contributed to the 31st December, 1901, 9,615 lb of tea were purchased at a cost of Rs4,102-14-2.

TEA IN HYDERABAD.—The Hon'ble Lieutenant-Colonel D W K Barr, c s i, resident at Hyderabad, forwarded the Commissioners' copy of a letter which conveyed the consent of His Highness to the announcement of the Nizam's approval of the scheme for developing the consumption of tea in India, and promising the support and countenance of His Highness to the effort of the Commission to increase the use of tea within the Hyderabad Dominions.

THE POST OFFICE.—The Director-General of Post Offices of India, Mr A V Fanshawe, c s i, sanctioned the Commissioners approaching the extra departmental agents of the Post Office, not being regular servants of Government either as Postmasters or Schoolmasters. A start has been made, and pice packets are now to be procured at 46 extra departmental Post Offices.

THE RAILWAYS.—The Sub-Committee of the Indian Tea Association attached the greatest importance to the supplying of tea to native passengers on the various Railways. It was estimated that there are something like 160 million passengers annually, and an average consumption of only 1 oz of tea per head per annum would absorb 10 million pounds. The Commissioners have approached the principal Railway Companies in India for permission to sell tea at such stations as they might deem most suitable.

PRIZE ESSAY COMPETITION.—With a view to elicit the opinion of the native community the Commissioners offered a prize of Rs100 for the best essay on "How to bring Indian tea to Indian homes." Seventy-three essays were submitted, of which ten arrived too late,

and 20 were disqualified for various reasons. The prize was awarded to Babu Sures Chundia Dutt of Sikarpur Post Office, Nadia, Bengal, who has since been taken on the staff of the Commission.

ONE PICE PRIZE PACKETS.—In order to encourage tea drinking it was arranged to issue from the Head Retail Depot of the Commission in Calcutta, as from the 2nd September, 1901, one pice packets containing about three-quarters of an ounce of good tea. Each of these packets bears a separate number, and Rs100 is offered monthly in prizes, viz., one prize of Rs50, five prizes of Rs5 and 25 of Rs1 each, the winning numbers being declared on the 1st of each month. At first the issue was confined to Calcutta, but as the idea caught on, was extended to other places, and daily applications for agencies are now being received from all parts of India.

BREWED TEA IN CALCUTTA.—The supplying of brewed tea entails a small loss to the Commission, but it is a valuable means of introducing the custom of tea drinking among the people, and also of removing the erroneous ideas now largely held by the Hindus as regards the effect of tea on the constitution. The tea is prepared by high caste Brahmins, who have been carefully trained to the work, and the orthodox Hindu can, therefore, drink it with safety. Most of the larger Government and Mercantile offices in Calcutta are now regularly supplied with this tea.

FASHIONABLE NATIVE GATHERINGS.—There are evident signs that tea is being regarded with greater favour by high class Native society in Calcutta. In September last, at a meeting of the leading medical men of this city, brewed tea was, by special request, supplied by the Commissioners, and over 100 cups were taken. Tea has been also supplied to several Indian wedding and social parties.

INDIAN INDUSTRIAL EXHIBITION.—In December last tea was supplied to the Indian National Congress and the Indian Industrial Exhibition, and was much appreciated.

THE STAR THEATRE, CALCUTTA.—Tea is served to the public attending this place of amusement, and a play which is now running there has a tea drinking scene called "The Morning Tea," with verses in praise of tea, which are well received by the audience.

OTHER PLACES OF AMUSEMENT IN CALCUTTA.—Tea was supplied nightly at the Circus tents with satisfactory results, the native patrons of these performances expressing appreciation of this effort to provide for their comfort at a cost within their means. Tea has also been available to the syces and coachmen waiting for their employers at European theatres in town. All round the tea supplied by the Commissioners has been regarded as a boon and a great improvement on that obtainable from the Mahomedan hawkers.

CALCUTTA PORT COMMISSIONERS.—Mr Dumayne, the Vice-Chairman, has kindly issued instructions to officers in charge of the Docks, Jetties and Wharves to afford every facility to the employees of the Commission in the sale of tea to coolies and others frequenting these places.

CALCUTTA STUDENTS.—The Commissioners obtained the sanction of the Principals of the Presidency College and the General Assembly's Institution, Calcutta, to supply tea within the compounds of these institutions, and made a start, the result of which, however, did not come up to expectations.

CALCUTTA MILL HANDS.—To place pure tea at a cheap rate within reach of Mill workers, pice packets are now sold at many of the Jute Mills and other centres of labour.

COLLIERIES.—The pice packets of tea are now being sold in the bazaars of many of the Coal concerns in Raneeungee and Jherriah Districts, and the quantity taken is encouraging.

MICA WORKERS.—The Commissioners record their thanks to Mr. W D Clyburn, of Bhaghitand Koderma, via Giridih, through whose kind assistance they have been able to place the pice packets within reach of the mica workers of his District.

FAIRS AND MELAS.—A start has been made at tea demonstrations at Fairs and Melás, and Mr. Radhanath Dey, late Agent for General Pudma Jung of Nepal and who had travelled extensively in different parts of India, has been engaged for this special work. He attended the Sonopore fair and is now at the Khagra Melá at Kissengunge. Mr. Dey is thoroughly conversant with tea, on which he has written a pamphlet and was awarded a certificate of Honourable Mention for an exhibit of tea in the late Paris Exhibition.

LABOUR DISTRICTS.—Through the courtesy of Mr. Hugh Gordon, the travelling Superintendent of the Tea Districts Labour Supply Association and of Messrs. Begg, Dunlop and Co., the Secretaries, the Commissioners have been allowed to avail of the services of all Agents of the Association, who may care to undertake the sale of tea. A number of these Agents have consented to assist the Commission in this way.

JUTE DISTRICTS.—Messrs. Sinclair, Murray and Co., of Calcutta, have kindly placed their Agencies at the disposal of the Commission, and their Agents are now being communicated with.

AGENCIES.—The teas of the Commission, either in pice packets or other forms, are now available in 78 towns and villages of India, and fresh agencies are in course of arrangement. At Dacca, the Agent reports doing good work, by means of advertisements, handbills, house-visiting, lectures and distribution of tea. The following is taken from his Reports:—"A smart Dacca born Indian assistant, well acquainted with the town, formally visits house by house, distributes samples on his first call, and books orders on his renewed visits. The same assistant holds lectures in popular parts of the town, the chank or market square being the chief one, on the benefits of tea drinking. He emphasises to Hindus that tea is a vegetarian's drink and to Indians in general, and that it is a produce of their mother country. Once weekly the poor assemble, and under circumstances pleasing to themselves, receive brewed tea free. With the beggars come many of the poor but better class, who also receive a cup each free."

SUPPORT.—During the past five months there has been roughly an expenditure of £10,000, and there is a substantial balance in hand. Good work has been put in for the outlay incurred, but the Commission has as yet only touched the fringe of the garment, and as the area of operations extends, the expenditure must be proportionately increased. The Commissioners feel that it would be a very great pity if the extension of such operations be retarded by lack of support, and for this reason they hope that the undertaking will receive greater support from the Tea Industry generally than has so far been accorded it.—*Madras Mail*, Dec. 12.

PLANTING AND PRODUCE.

The tea trade, while doubting that the Chancellor of the Exchequer will increase the tea duty, seem to think that they must be prepared for eventualities. Considerable quantities have lately been clearing from the bonded warehouses. This movement has been going on since the earlier part of December, and its dimensions have been steadily increasing.

It is consoling to find that one of the largest holders of shares in tea-growing companies, and one of the most energetic and enterprising members of the tea distributing trade, not only has faith in the future of British-grown tea companies, where judiciously managed, but is also of opinion that there will be no increase of duty. Mr J Lane Densham, of the Mozawatte, Tea Company, has wisely issued a circular cautioning grocers against any attempts made to scare buyers into a panic about an increase of duty. Mr Densham of course, has been active in furthering the

movement for placing all the facts about the tea duty before the Chancellor of the Exchequer, and as the managing-director of one of the largest tea distributing firms, as well as a shareholder in about thirty tea-growing companies, has, we believe, been in correspondence with Sir Michael Hicks-Beach with reference to the position of the industry. Mr Densham recognises fully the blow the industry would receive were the duty increased, but he, like other leading men in the tea trade, cannot believe that the Chancellor of the Exchequer will, in the face of the representations of the tea planting communities of India and Ceylon, take any steps calculated to bring ruin upon producers. This opinion is shared, as we have stated, by other influential men connected with the tea enterprise, but, all the same, every effort will be made to make it clear to the Chancellor of the Exchequer that the matter is one of life or death to the industry.

A correspondent of the "Grocer" contributes his mite towards the solution of the duty question, by giving the Chancellor of the Exchequer a hint to issue licenses to sell tea. These, he thinks, should be charged at the rate of two guineas a year. The idea, as stated by the correspondent, is that "The tea trade then would go into its proper channels and the extra trade we should do would pay the license. As it is now, anyone and everyone is selling tea. Fruiterers, dairymen, drapers, publicans, &c., are all selling tea, and they would be only too glad to drop it rather than pay a license. It would also stop men hawking from door to door—some of them supposed to represent a London house, but who buy tea done up in quarter-pound plain papers from the first grocer they come to at 1s 2d per lb, and sell it for 2s. These men do the trade a lot of harm." We suppose it is but natural that the grocer should regard the sale of tea as coming within his sole right, and that he should think those who sell it and are not grocers are merely interlopers. But it must be a poor business to the fruiterers, drapers, and the rest engaged in selling tea if a two-guinea license would settle their business.

If the information received from Cape Town be correct, Indian and Ceylon tea growers will have a good opportunity of pushing their tea in South Africa. The Press Association says:—"Information has just come to hand from Cape Town that next year will see a British and Colonial exhibition there on a very large scale. It is felt that this would offer a special opportunity for firms in this country and in our colonies to meet in a measure the tremendous competition which must result from the great efforts which the Germans and Americans are already making in anticipation of the large volumes of trade which may be expected as soon as the war is over. The exhibition will, of course, be confined to British and colonial traders. The movement has the strong sympathy of very high officials in London and prominent commercial men in different parts of the Empire, and at the right time an effort will be made to secure the support of the Colonial Office."—*H and C Mail*, Jan 31.

THE INDIAN CRYPTOGAMIC BOTANIST.

Dr. Butler, cryptogamic botanist, who came out from home last October, is about to be transferred from the control of the Botanical Department, for work under Mr. Mollison, Director General of Agriculture. This step may be taken as an indication of the desire on the part of the Government that Dr. Butler's services shall be utilised exclusively on economic questions.—*Times of India*, Feb. 10.

“THE PEARL OYSTER, NACRE AND PEARLS.”

A FRENCH WORK.

L'Huître Perlière, Nacre et Perles. Par L. G. Seurat. (“Encyclop. Scient. des Aide-Memoire”). Pp. 194. (Paris: Masson et Cie.) Price 2 fr. 50 c.

This is a useful little book of close on 200 pages and a few illustrations in which the author—whose name was already known in connection with pearl oysters—has brought together the leading facts in regard to the molluscs, of both sea and fresh waters producing pearl and mother-of-pearl. The introduction shows that the book has been written mainly in the interest of the French nacre industries, which the author regards as of great national importance. Although London is at present the great market for pearl shell, we are told that “La France possède, en effet, les plus vastes bancs d’huîtres perlières et nacrifères qui soient au Monde, dans ses colonies d’Océanie,” and the author evidently desires to stimulate the exploitation and cultivation of the French pearl industries at Tahiti and other Pacific stations. But still, the descriptions of animals and fisheries have been drawn from all parts of the world, and in fact most attention is given to the oyster (*Meleagrina fucata*) of Ceylon and British India on the well-known banks of the Gulf of Manaar.

M. Seurat points out on more than one page the gaps in our knowledge of the nacre-forming molluscs, and wisely insists upon the necessity of a thorough examination of the structure, life-history and habits of the *Meleagrinas* before it is possible to establish a rational regulation of the fisheries. The scope of the work may be gauged by the following summary of the contents of the chapters: Anatomy and biology of the pearl oyster and of other molluscs that produce pearls or nacre; the pearls, their position, structure, chemical composition and experiments as to their production artificially; the fisheries both in the sea and also in the rivers of Europe and America; commerce and industries; and finally, pearl-oyster cultivation. In his conclusion our author sums up that “l’ostréiculture perlière est une chose possible, qui est susceptible de donner des résultats particuliers,” and draws a rosy picture of the prosperity that would attend the lagoons of Tahiti under a rational exploitation of this new industry. So may it be.—*Nature*, Jan. 23.

THE RUBBER MARKET AND PROSPECTS.

(*Krarich's Annual Review for 1901.*)

During 1901 the rubber market has not been characterised by heavy or exceptional fluctuations; it was again not a particularly satisfactory one for holders and importers of the leading grades, and although trade remained exceedingly active throughout the year, the values of all grades of rubber at the close are less than a year ago, and fine para shows a further recession of 3d per lb, and other grades in proportion. The bulk of the stocks of Mediums have gradually been exhausted, although it must be admitted that the prices realised were exceptionally low, and showed an enormous loss to the importers or holders, and even the more recent imports were disposed of at prices realised show a considerable loss. The imports of important Medium grades have fallen off consider-

ably, and as the enquiry has increased for same, we do not anticipate a further appreciable decline in values, and one ought certainly to advocate the encouragement of a substantial increase in the imports.

As regards the quality of Para rubber, considerable grievance was again caused by the want of care in the proper selection of these grades, especially from the Island districts, and this has led to numerous disputes amongst contracting parties. Trade in Great Britain and with leading Continental rubber works was fairly good and the stocks of raw material at the factories is not large, and in spite of the fact that deliveries have been exceptionally heavy, the reported consumption of fine Para exceeds that of previous years. The American market showed the position there not to be so strong except for the first few months, but, generally speaking, the rubber trade has been busy, and the only important speculative stocks are held by one leading American house, whose position at the close of the year was considered very precarious. Visible supply now of Para and Peruvian is 4,618 tons, against 4,100 tons last year. This includes America, with a stock of 2,005 tons, against 1,200 tons last year.

Should the demand for Para rubber continue good, the statistical position at the end of 1901 is certainly a very healthy one. The total for the year's crop (from July 1st to December 31st) amounts to 13,680 tons; this means an increase of 2,400 tons, while against this total increase of the visible supply gives us only about 480 tons. Thus about 1,920 more tons have gone into consumption; this despite the fact that it is well known that the “invisible” supply is exceptionally small. Although grave financial difficulties were experienced by many holders of rubber, the position of the rubber market is fairly sound, and with constantly increasing consumption, rubber must be considered very reasonable at present quotations.

PARA KINDS.—At the beginning of the year we had to record a brisk enquiry for para grades, and business on a large scale resulted, but, owing to continued “bear” operations, prices quickly exhibited an important recession, and while hard fine Para was quoted at the beginning of January at 3s 10³/₄d, soft at 3s 9d, negroheads, scraggy, at 2s 9¹/₂d, Island at 2s 1³/₄d, Cametas at 2s 4d, Peruvian ball at 2s 7¹/₂d, and slab at 2s 2d, prices declined rapidly during the latter portion of the first month, and sales for forward delivery at a marked decline were done on a large scale, with the result that prices for Para grades receded about 3d per lb by the end of the first three months. In America fine Para was then sold as low as 3s 6d, scraggies 2s 6¹/₂d, Island 1s 11d, ball 2s 4d, and slab 1s 11d per lb. We then began to receive the first advices from Para of probable short receipts, and some important buyers, partly relying upon these reports, bought large quantities, thereby causing considerable briskness; this improvement was actively maintained for a few weeks, and as high as 3s 10d to 3s 11d was paid for fine during the middle of April. Other sorts were 2d to 3d per lb dearer. Soon afterwards, however, the market again showed signs of weakness, the demand being somewhat dragging, and in July hard fine was quoted at 3s 8d, soft 3s 6d, but a temporary reaction in August resulted in quotations again reaching 3s 10d to 3s 9d. We have then had irregular declines of 2d per lb, and in November hard fine was as low as 3s 5¹/₂d, 3s 3¹/₂d the lowest of the year. Additional cable advices

from Para of probable short receipts during the end of the year and the early months of 1902 brought about some recovery on less pressure to sell, and with very large deliveries and moderate receipts, we close the year firmly with quotations of hard fine at 3s 6½d, and soft at 3s 5¼d. Negroheads continue to remain very scarce, scrappy being quoted at 2s 9d, Island (of which the greater portion is being shipped to America) 2s 1½d, Cametas 2s 2d, ball 2s 6d, and slab 2s 0½d. The total amount of rubber imported from Brazil shows a further increase of 3,200 tons, and the total quantity exported from the State of Amazonas, including Peruvian, *via* Iquitos and Manaos, is 4,000 tons, against 3,100 tons. The Peruvian fine imported has, we think, been better as a whole; but, owing to the rubber having arrived in most cases uncut and unselected before shipment, new rules had to be adopted in order to provide for this altered mode of shipping this rubber. The Peruvian ball imported has not been up to the expected quality, and at the end of the year the standard of fair average quality was considered lower, although some nice clean hard balls when received did realise fairly good, and, in some cases, exceptional prices. The slab continues to be of good serviceable quality, and the consumption of it is certainly spreading. Bolivian kinds have been very fair, but the imports were not as large as last year. Mollendo again showed a marked improvement in quality, and consequently sold exceedingly well. From Venezuela, *via* Orinoco, the supply was less than last year, and the quality not very attractive.

Imports of Ceara scrap are smaller, but of these grades only the best qualities could be sold easily; others are dragging. Of Memicoba kinds we received less, but quality was good, and prices realised were satisfactory. Pernambuco and Assaree qualities have somewhat improved, but, owing to the general decline of the rubber market, the values of these classes receded considerably. There were not very important arrivals of good Mangabeira, and although the stocks are considerably going down and available supplies very small, the prices realised for ordinary quality show an enormous falling off in price. The imports of Mattogrosso, in sympathy with Para, showed similar fluctuations, although transactions were only spasmodic. Central America has again been conspicuous by a further considerable decline in its export of rubber, probably owing to the continued political unrest existing in those parts, and the only rubber reaching us comes from the Columbia districts, but the quantities were very insignificant. The Equator and Guayaquil kinds sold readily, and the prices at the end of the year are only 1d lower than they were a year ago. Of course, this refers to good qualities only. Inferiors and mixed kinds are much cheaper. The imports from Honduras, Mexico, and Panama were likewise very small.

AFRICANS.—As expected at the close of the previous year, the increase in imports of these descriptions was not only not maintained, but showed a considerable and serious falling off, and we estimate the difference of imports from Africa to be about 2,000 tons below that of last year.

With the exception of slight spurts in April, and again in August (in sympathy with fine Para) the year 1901 has been characterised by an uninterrupted decline in African rubber, the only exception being first Sierra Leone Niggers, which are actually rather

dearer than a year ago, while all other descriptions show a decline varying from 1d to as much as 6d per lb.

From Angola received 250 tons less, made up in shipments from Benguela of 1,250 tons, as against 1,500 tons in 1900. Loanda 730 tons, against 678 tons (beside 200 thimbles). Quality has been hardly so good. The Congo has slightly increased, but the quality has seriously declined: about 5,300 tons, against 5,000 tons in 1900. The average price shows a very considerable fall, because so much was of poor quality. The supply from Sierra Leone and French Guinea has again fallen off, partly owing to the prohibition by the French authority of the exportation of the dirty wet and inferior rubber from Conakry. The quality being thus reliable, has caused consumers to look on this kind with favour, and their appreciation is reflected in the price, which is unusually high compared with rubbers, both African and Brazilian.

Quite an extraordinary decline in supply of Gold Coast, Accra, Lagos, etc., and only moderate from Cameroons, Sierra Leone, Gaboon, etc., and small of Senegal. Prices of nice hard only about 2d lower, but soft common and Lagos fully 4d decline for the year. We no longer quote strips and biscuits, the pressing of lump rubbers being practically abandoned. Liverpool imports of West African 4,200 tons, against 5,140 tons in 1900, and 5,600 tons in 1899.

The Congo Free State, has again increased its exports to Antwerp, but other kinds of African have gone there in reduced quantities, so that the total Antwerp imports show little change.

During January African rubber met with a disappointing demand at rather easier prices. February and March were very dull, and prices declined for most sorts, closing with lower values all round. In April fairly good trade was done at rather better prices, closing, however, somewhat quieter. A moderately large business was done in May at irregular prices. Good Sierra Leone sorts were then well in demand, showing, however, little, if any, change in price; whilst lump descriptions were ½d to 1d per lb. lower. During June and July African rubbers met with a moderate to poor demand at generally lower rates, and only a comparatively small trade was done at barely steady prices. The demand was better in August, especially for parcels of good quality which arrived from Sierra Leone. This position of the market was not maintained, and we see a constant falling off in the demand, which remained disappointing, with only small business passing at generally lower rates, until the end of November, when quite a steady trade was done at generally unaltered and, in some instances, slightly increased prices. The demand continued to improve during December for all the better grades and rather higher rates were paid all round.

EAST COAST OF AFRICA (ZANZIBAR, ETC.)—The supplies of these descriptions have continued to gradually fall off, and to this must be ascribed the fact that at the close red hard rubber is only 1d per lb. lower, but white and common ball rubber declined about 4d per lb. **LAMU BALL (MOMBASSA).**—The arrivals were not important, although the quantity was fair, and good clean rubber sold fairly well, prices, however, showing a decline of 2d for the year. Nyssaland sent us some very good rubber, but the consignments were small, and when they reached the market, were brought up readily at fair to full prices. Madagascar supplies

were again on the decrease, and have only been about half of what they were last year, and values were consequently well maintained.

Imports from Ceylon were again insignificant; but, whatever small quantity reached this market, it proved very attractive, as the quality and condition continued to be excellent, and many buyers were anxious to secure even the small arrivals owing to the specially clean condition of this rubber. We confidently expect that if larger imports could be arranged a great circle of consumers would come in and pay full prices for these grades, especially if the quality be kept up. It would be advisable to encourage the planters and others interested in this product in giving particular attention to this most valuable rubber. High prices were realised, and 3s 9²d was recently paid for fine, and 2s 4d for the Negroheads. It is, of course, known that this rubber should practically be of the same kind as the one coming from the State of Amazonas, being grown from Para seed.

RANGOON AND PENANG has also been in much reduced supply. Of the latter description we practically received no further shipments this year; but, in spite of this, all the old stocks held were most difficult of sale, and what was disposed of showed an enormous decline, and thus rubber that was quoted at 3s 2d a little more than a year ago sold at about 2s 2d to 2s 5d per lb according to quality. If good quality of those descriptions could be imported to sell at present rates, it is certainly worth encouraging, as with scarceness of good red Mozambique Ball, the demand for these red Penang kinds would again grow gradually.

Small quantities of Assam were shipped, but the quality was very poor and sandy, and consequently did not meet with any requirement or interest.

BORNEO.—Of this rubber the supplies have not been excessive, but in sympathy with the general tendency of the market prices declined. These grades are still held for higher prices, and with a continuance of the lower quotations all round we must also look for much reduced values in these grades before one will be able to effect larger sales.

PONTIANAK.—Supplies were about the same as those of last year and sold readily, prices showing very little change at the close of the year.

Rubber from the French Cochin-China and from Lower China have continued to sell well, the quality and the condition of nearly all arrivals were satisfactory, and the small trade done must have been profitable for the importers.

JAVA rubber and New Guinea have been very scarce but generally speaking these qualities were not in great demand, and quotations were only nominal.—*India Rubber Trades' Journal*, Jan 20.

RUBBER CULTURE IN CRYLON—is spreading steadily. In the Kalutara district the Para plant is nearly universal as a by-product to tea, and now the same is fast becoming true of the Kelani Valley; while a good deal has been done in other districts. This being so, we make no excuse for giving in our daily issue as well as *T. A.* a valuable Annual Review on the Rubber Trade for 1901, from which rubber planters ought to learn a good deal. Ceylon rubber has a full paragraph: "its product being excellent in quality and condition."

REPORT OF THE PLANTERS' ASSOCIATION "AND THIRTY COMMITTEE."

PLANTED AREA AND TEA CROPS.

We give as usual the main portions of these Reports in a Special Supplement; but in the meantime, we may draw attention to certain salient features in both Reports as they reach our hands today. From the former which is for the year ending 17th February, 1902, we learn that the shortage of crop last year—due partly to finer plucking, but chiefly to unfavourable climatic conditions, — would have been much greater were it not for a large amount of young tea that must have come into bearing during the year. The Committee might have verified this belief, as well as the probable maximum, by reference to the "Handbook and Directory" where the approximate area planted each year is given. For instance here are the figures for area planted for 1896 and onwards:—

Year.	Total under tea.	Year.	Total under tea.
Acres.			
1896 ...	330,000	1899 ...	378,000
1897 ...	350,000	1900 ...	384,000
1898 ...	364,009	1901 ...	387,000

The 34,000 acres planted between 1896 and 1898 must have told to some extent on the crop of 1901, just as the 14,000 acres additional put in during 1899, should affect the current year's crop; but after that, the additions are insignificant. We are therefore, in Ceylon, very much in the same position as India, where there has been little or no extension of tea since 1898. Only therefore let this present year be "weathered" and the prospect for tea planters should be a good one. Very important, however, is the advice given in the Report, before us for attention to "careful medium to fine plucking rather than the manufacture of large quantities of common quality teas," during the present season. The comparative freedom of tea from blight during 1901 and at present is noted. Cacao holds a strong position with low stocks and increasing consumption; but the need of a "cacao-stealing ordinance" is emphasized. A warning note is struck with reference to "cardamoms," the extended planting of which threatens overproduction and unremunerative prices. The unprecedented prices ruling for the products of the coconut palm justify the statement that "the industry is on a very firm footing"—a fact which will no doubt lead to an extension of planting wherever suitable land is available in the Batticaloa and Puttalam districts for instance? There is not much else in the P.A. Report calling for notice; but we are glad to see the reference to the Ceylon Contingent which went to South Africa and that a permanent memorial is to be erected in the Victoria Garden, Kandy.

Turning to the Report of the "Thirty Committee," we find some figures that must be of special interest at this time. The total amount raised by the Tea Cess (Jan. 1895 to 31st Dec. 1901) is R1,768,042; and

of this amount, no less than R1,081,862 has gone to the representative to push Ceylon tea in North America. It may be a question whether all this came from the Cess, as the Report speaks of the expenditure from "1894" onwards. The difference, if any, must be very slight. In 1900 and 1901, Mr. Wm. Mackenzie received R262,561 and up to 31st Dec., 1899, as much as R811,862. Verily, America has had its lion's share and after seven years of expenditure, there is some reason for calling "halt" and giving the Continent of Europe, a full measure of attention.

REPORT FOR 1901 OF THE INDIAN TEA ASSOCIATION.

It is a coincidence that the Report of the General Committee of the above body should come to hand the same day as the local Reports from Kandy. The Indian Report is up to the end of last year. Nothing decisive is mentioned about the Cess Memorial—indeed up to date, we suppose it has not yet gone in to the Viceroy. [Our special message, shows that it is to be presented a week hence. Only one Company so far seems to be going in heartily for making green teas in India—the bonus being fixed at 1½ annas per lb., but the total quantity for the present limited to 200,000 lb. as an experiment. The several schemes for promoting local consumption of tea in India are favourably referred to; and so is Mr. Foley's Mission, the Committee meantime carefully studying the questions raised by it. Indian tea prospects in Central Asia, Russia, etc. are fully considered; and once again it is emphasized that the only alternative to the abolition of import duties on tea in Ceylon and India, will be to equalize them. "the question is still engaging the attention of Government." The Labour Question in many aspects, receives a good deal of attention in the Report.

THE PLANTERS' ASSOCIATION AND "THIRTY COMMITTEE."

One of the most important results arrived at by the Committee yesterday morning was the ESTIMATE OF THE CEYLON TEA EXPORTS for the current year, the total being given at 154,000,000 lb. (green tea of course included) against a total of actual shipments of black and green in 1901 of 146,299,018 lb. The distribution compares as follows:—

	Estimated Export for 1902, lb.	Actual Export for 1901, lb.	Increase, lb.
U. K. ...	108,000,000	105,734,570	2,265,430
Anstralia ...	21,500,000	20,641,184	858,816
Russia ...	11,000,000	9,633,896	1,346,104
America ...	6,500,000	4,502,131	1,997,869
China ...	3,500,000	2,694,819	805,181
India ...	2,000,000	1,139,113	860,887
Other Countries..	1,500,000	1,933,305	dec. 433,305
Total ...	154,000,000	146,299,018	inc. 7,700,982

This table enables the reader at a glance to see the out-turn for last year as contrasted with the Committee's anticipations for 1902. Of course "China" is a misnomer, —the teas sent thither (with an insignificant exception) being either intended to be worked up into brick tea for Russia, or for trans-shipment to the Pacific Coast of America. So again with "India" much of the tea sent through Bombay being intended for the Persian Gulf and other parts outside India proper. The fact that "India" is credited for the present year with so considerable an increase will be certain to attract the attention of planters over the way who complain (and most justifiably) of the Ceylon import duty on tea.

THE INDIAN TEA CROP. DECREASE IN 1901-2: OVER 12 MILLIONS.

CALCUTTA, Feb. 19, 8-45 a.m.

The Indian Tea Association has issued the following comparative statement of outturn of crop so far as the returns received for the two seasons 1900 and 1901 respectively:—

	1900-1.	1901-2.
Assam ...	68,708,916	65,203,402 lb.
Cachar ...	27,299,230	23,806,587 lb.
Sylhet ...	34,038,023	29,699,728 lb.
Darjeeling ...	7,738,018	7,323,542 lb.
Terai ...	3,637,688	3,374,985 lb.
Duars ...	30,220,001	30,542,037 lb.
Chittagong ...	1,065,300	831,020 lb.
Chota Nagpur ...	185,089	248,187 lb.
Kangra Valley ...	3,000,000	2,435,405 lb.
Dehra Dun ...	1,785,000	1,798,560 lb.
Total	177,677,257	165,263,453 lb.

The particulars given above are derived from identical sources so far as Assam, Sylhet, Darjeeling, Terai, Duar, Chittagong and Chota Nagpur are concerned, being returns submitted by 23 agency houses, while Kangra Valley and Dehra Dun are furnished by a local Planters' Association.

PLANTING NOTES.

VANILLA FROM THE COLONIES.—A decree has been issued fixing at ten thousand kilos the quantity of vanilla produced in French establishments in Oceania (Tahiti and its dependencies), which, from July 1st 1901, to June 30th, 1902, is to be allowed a deduction of fifty per cent of the ordinary import duty on importation into France.—*Chemist and Druggist*, Feb. 1.

TEN ELEPHANTS were brought for the Forest Department in ss. "Palancotta," and were landed at Brooking Street wharf on Wednesday, says the *Rangoon Gazette*, of 7th February. Probably a larger crowd would have attended the disembarkation had it not been for the counter-attraction of the embarkation of troops for South Africa going on at the same time. Many of the animals who seem no worse for their sea voyage walking ashore, but some who were inclined to be unruly were slung and soon realised their absolutely helpless position when in the air. The cost to the Department of these ten animals landed in Rangoon is close on half a lakh of rupees.

OUR PEARL FISHERIES.—We read in an Indian paper that the Government of India finds that it cannot spare the R.I.M.S. "Investigator," for the use of which the Ceylon Government had applied "to examine the pearl fisheries" here—or banks, rather—till the end of May next.

TEA FOR BOSTON: WAKENING UP.—A Boston correspondent writes on the 15th Jan.:—"In today's *Herald* I saw an advertisement for a good man to demonstrate Ceylon Tea." Benighted Boston is evidently going to be enlightened, though it does seem queer, that so late in the day "the hub of the universe" requires the elementary and "first aid demonstration." It should have been past that long ago.

TEA COMPANY MEETINGS.—Four Tea Company meetings were held in Colombo last month. High Forests declared a final dividend of 2½ per cent making 5 per cent for the year, and the Chairman (Mr. J G Wardrop) in submitting the report dealt with the various points in it showing *inter alia* how the crop had exceeded that of the previous year by 80,000 lb. but that the prices realised were disappointing. It is gratifying to know that satisfactory progress has been made in the matter of securing an outlet road from the estate to the railway. The dividend declared by the Kalutara Company for the year is 2½ per cent and after writing off a large amount for depreciation, a substantial sum is carried forward to the current season's working. Increasing attention is being paid to the cultivation of rubber. The directors of Ruanwella Company have also seriously taken up the question of rubber planting and we trust their experiment will be attended with complete success. The dividend declared today was 3 per cent for the year. Gangawatte Estates Company declared a final dividend of 4 per cent making 7 per cent for the year.

MILK, COFFEE, AND COCOA PREPARATIONS.—"Zoeco" will soon, we calculate, be permanently engraved on the tablets of the public memory, not only because it is a name which "sticks," but because it is associated with three first-class preparations, viz., "Zoeco" coffee and milk, "Zoeco" chocolate and milk, and "Zoeco" milk proteids with cocoa. We do not name these in this order for any particular reason, as the three constitute a trinity of merit, but speaking of the first, we find it is a preparation, two tea-spoons of which yield with hardly any trouble a fine cup of coffee-cum-milk possessing the true flavour of the former. The chocolate and milk combination exhibits nourishing and stimulating materials in a readily assimilable form, and with it, by simple dilution, a refreshing beverage is made. In the milk proteids with cocoa we have the albuminoids of milk declared by scientists to be as nourishing as those of meat, concentrated in natural solution and in a form that affords a quick and nutritive meal. We recognise in the "Zoeco" preparations a superiority in appearance and flavour; we are assured they have a high standard of nutritive value, and that they are permanent even in the hottest climate, and they are put up in neat round tins.—*B. and C. Druggist*, Jan. 24.

COCONUT PRICES.—Our Veyangoda correspondent writes:—"The coconuts of Dr. William Dias' Yakkale estate in Henaratgoda, are reported to have been sold at R56.25 per 1000. Dr. Dias is the retired Colonial Surgeon of the Southern Province who, since his retirement, has been devoting himself zealously to the improvement of his estates with most gratifying results which have astonished his neighbours." Has the price we have named been beaten this season? Or ever?

THE OVER-PRODUCTION OF SUGAR.—It is not tea alone that is suffering from over-production. Another necessary article of diet, sugar, which has been artificially fostered in some quarters by bounties, is feeling the pressure of an inadequate demand. We read that the German Sugar Industry is confronted by a serious crisis, the gravity of which is becoming more and more apparent. According to market experts, the surplus at the end of the sugar year, will be about 2,865,000 tons, against 975,000 tons last year. The same suggestion as was made in regard to tea—the reduction of the acreage by 10 per cent—has been under the consideration of German sugar producers; but it is now felt that the reduction must be by 20 per cent! Meanwhile, as in the case of tea, steps are being taken by the German Sugar Syndicate, to promote consumption, by offering premiums to dealers showing the largest sales, and by allowing special prices to chocolate manufacturers who would bind themselves to use only Syndicate sugar. The similarity in the troubles which tea and sugar have to face, is further disclosed in the enhanced Duty of which both are apprehensive!

PLANTING IN CEYLON.—Mr. C. E. Emerson writes from Deanstone, Rangala, Ceylon, November 11th, 1901 to his old College periodical *Colonia* as follows:—

"Many thanks for the *Colonia*, which I read with great interest, especially the letters from Way, Cartwright and Cettier, and blushed to find that an entire page had been given to my first impressions of Ceylon. No doubt Fairlie has told you that I have secured a billet here in Medemahnewara, rather a lonely district, but a healthy climate and a superb view across the low country to Batticaloa, some 60 miles distant on the east coast. The estate is in tea and cardamoms, 278 acres of the former and about 200 of the latter. Cardamoms, unlike tea, will only grow in certain parts of the island, and in this small valley the majority of the whole crop of the island is cured and bleached. My brother, at the volunteer camp at Urugasmahandiya, met Thorne, who had just returned from his stay at the College; through him I heard of the death of the Director. I must offer you my sincerest condolences on the loss of one whose memory will always remain in the minds of old *Colonials* as a wise, counselling and sympathetic father of the College. The description in *Colonia* of the river Ore brings back vivid memories of sailing and boating days, of Oxford and Butley creek. I shall always retain a keen interest in the College. *Floreat Colonia.*"

TO THE PLANTING WORLD.

Seeds & Plants of Commercial Products.

Hevea Brasiliensis.—Orders being booked for the coming crop August-September delivery 1902, booking necessary before the end of April, quantities of 100,000 and over at special low rates. Plants available all the year round, 100,000 and over at special low rates. A leading Rubber planter in Sumatra, who purchased 50,000 seeds in 1899, and 100,000 in 1900, writes us, under date 15th November, 1900:—"I received your letter of 20th October, from which I learn that you added another case of 5,000 seeds to replace the loss, &c. I am satisfied hereby, and even after this adding I am satisfied by the whole delivery of this year." Special offer, post free on application.

Castilloa Elastica.—True superior variety cultivated in Mexico, seeds from specially reserved old untapped trees. Orders booked for August-September delivery 1902, immediate booking necessary; large quantities on special terms; Plants in Wardian cases.

A foreign firm of Planters writes under date 11th October, 1901:—"We beg to enquire whether you would procure us 100,000 Castilloa seeds, in which month we might expect them, and what would be the average price." Special offer, post free on application.

Manihot Glaziovii.—Seeds and Plants available all the year round, 100,000 and over at special low rates. A Mexican planter in sending an order for this seed wrote on the 22nd August, 1900:—"If they arrive fresh and germinate easily I may send you larger orders, as they are for high ground where the Castilloa does not thrive."

Ficus Elastica.—Seeds available in May-June; booking necessary before the end of March; also plants.

Mimusops Globosa (Balata) wood of the tree is much sought for buildings, fruits sweet like a plum and eaten, oil from seeds, said to yield as much as 45 lbs. of dry rubber per tree per annum, the milk is drunk and when diluted with water used as cow's milk, grow from sea-level up to 2,000 feet, orders being booked for seeds and plants, price on application.

Cinnamomum Zeylanicum (Cinnamon superior variety).—New crop of seed in April to June; booking necessary before the end of February; also plants.

Coffea Arabica, Liberian Hybrid and Maragogopie Hybrid.—New crop March-April; immediate booking necessary.

A foreign Agricultural Department writes dating 9th September, 1901:—"Please accept our order for 175 lbs. of Tea seed and for 2,000 Coffee beans. In regard to Coffee seed I would say that this will be the first importation made by this department, and we will leave the selection of the varieties to be sent to your judgment."

OUR DESCRIPTIVE PRICE LISTS.

The following six Descriptive Price Lists are now being forwarded with Circulars and special offer of Seeds and Plants of Rubber and other Economic Products:—

1. Tropical Seeds and Plants of Commercial Products, enlarged edition for 1902.
2. Seeds and Plants of Shade, Timber, Wind-Belts, Fuel, and Ornamental Trees, Trees for Roadsides, Parks, Open Spaces, Pasture Lands, Avenues, Hedges, and for planting among crops (Tea, Coffee, Cacao, Cardamoms, &c.)
3. Seeds and Plants of Tropical Fruit Trees including Mango grafts.
4. Bulbs, Tubers and Yams.
5. Orchids—Ceylon and Indian.
6. Seeds and Plants of Palms, Calamus, Pandanus, Cycads, Tree and other Ferns, Crotons, Roses, Dracinas, Shrubs and Creepers.

Special Arrangements made with foreign Governments, Botanical and Agricultural Departments, Planters and others for supplying seeds and plants of Commercial Products in large quantities.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says:—"An interesting Catalogue reaches us from the East. It is issued by WILLIAM BROTHERS, Tropical Seed Merchants of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbing. We recommend the great Powers and Concessionaries under them to go to William Brothers."

Agents in London:—MESSRS. P. W. WOOLLEY & Co., 90, Lower Thames Street.

Agent in Colombo, Ceylon:—E. B. CREASY, Esq.

Agent in British Central Africa:—T. H. LLOYD, Esq., Blantyre.

Telegraphic Address:

To the Editor.

THE CULTIVATION AND MANURING OF COCONUTS.

Feb. 11th.

DEAR SIR,—In your issue of the 7th instant your Veyangoda correspondent gives the price of coconuts realised at Yakkala estate, Henaratgoda, the property of Dr. Dias, the retired Colonial Surgeon. Further information regarding this estate will, I think, surprise all interested in coconuts and show to what extent the intelligent cultivation of this palm can increase its yield. The situation of Yakkala estate, I need not say, is by no means the best district for coconuts, and yet its present yield compares most favourably with the best in the land. In 1896 the Doctor took up his residence on the estate and for the first twelve months picked less than 70,000 nuts; previous to this the property was on lease to natives, and within five years he has increased the yield to nigh 300,000 nuts, picked from it in 1901, and this from only four to five thousand trees in bearing or over 60 to 70 nuts per tree. Mr. W B Lamont (who is I am glad to think still amongst us) will, no doubt, be pleased to hear that his words uttered over 30 years ago has been proven, that "no product in Ceylon responds to, or repays so well for manuring as the coconut palm." With this I send you a stalk I took off a coconut tree from this estate, of which the spathe had opened and flowers on the stalks set. You will note the thickness of this stalk and the 11 young nuts on it. This bunch had 36 stalks with two to 11 nuts on each, and there are several such on the tree with nuts similar to this, and I was informed that over 50 trees on the estate are for the first time showing bunches like this, thus promising enormous increase of yield to be gathered during the current year, which the proprietor estimates from four to five hundred thousand. Here then is a nice little sum to work out. What will a 100 acres of coconuts, say with 70 trees to the acre and only 12 spathes per tree per annum (some give sixteen) opening out with 36 stalks and two to 11 nuts on each stalk, of which say only four nuts arrive at maturity (and there are already trees with that number of matured nuts) give per acre? I don't wish to put down the answer on paper for fear the results of its publication may start some blight on the coconut palm. I send you, for the purpose of being better able to follow what I have said, a bunch taken from a native garden on which you will see there are 41 stalks and only 18 of these with one nut on each as you find on ordinary trees. Compare the size of the stalks on this with that on which there are 11 nuts. The proprietor is of opinion that salt especially, mixed with other fertilisers, is the great desideratum and he uses the ordinary culinary salt to the extent of 2 lb. to each tree in spite of its cost, and he is very worth with the Government for not making it more readily available for purposes of agriculture and cultivation of coconuts in particular. The proprietor says that he is not yet in a position to speak with certainty as to what is the best fertilising mixture for coconuts, but hopes to be able to do so two years hence.—Yours faithfully,

COCONUT PLANTER.

SIR,—In the history of the coconut industry have the prices ever reached those ruling at the present time? What is the reason for the present prices? Is it that the demand, by leaps and bounds, outstripped the supply, in spite of the large areas annually coming into bearing in Ceylon and in the Straits, and I suppose in other coconut-producing countries as well? These are a few questions that arise in the minds of coconut planters, and I suppose in the minds of others as well. I have heard it suggested that the war in the Philippines is the chief cause of the rise in the coconut market. I shall feel obliged by your publishing a table showing the areas under coconut cultivation in different parts of the world, with the produce of the trees and the value of the exports. This seems to be a tall order, but for one with an encyclopaedic knowledge such as you possess, it will not be so.

Whatever the cause, the fact remains that prices are in the ascendant, much to the benefit of those interested in coconut cultivation. The ruling price of copra at this time last year was R47. I see it announced in the papers that a parcel of copra fetched R66. That means R19 above the market price at this time last year. Of course there is a corresponding rise in the price of nuts.

With the price now ruling for coconuts, coconut estates in the market ought to command encouraging prices. I see a little correspondence in the papers about the price the well-known Kirimetiana estate ought to fetch. As a rule, those wishing to buy a property at an auction sale do not publish to the world the price they are prepared to pay for it.

With regard to your footnote to the first letter of "H. L. D.," R900 per acre is no record price for coconut land in *full bearing*, which has been confounded with "planted land," the words you used. The average price for good land, in full bearing in this District, is R1,000. I have known of land in this neighbourhood selling at R1,250 an acre. For the purposes of a loan, full-bearing coconuts were once valued at the moderate figure of R750 the acre. A European broker in Colombo, who was to make the loan, was dissatisfied with this, and thought it an inflationist valuation, and sent a well-known Colombo V. A., to value the property. He valued it at a higher figure than the local man!

Ten years' purchase for good, bearing land is a safe average valuation. Exceptionally good land might be valued at 12 to 15 years' purchase. But 30 years' purchase is an unheard of valuation, with the published figures, it is utterly impossible to fairly value Kirimetiana. Much more light is wanted.

The price of lands in this District is a splendid advertisement for a Railway. As can be readily understood, with trees bearing so well, and lands yielding such splendid results, affluence is the rule, want and poverty the exception. Money is available for travelling. The more easy and comfortable travelling is made, the more will the people travel. Those not blessed with much property, have remunerative employment afforded them at the two Desiccating Mills. So I see, money is abundant with all classes here. Nobody need want.

MARAWILA.

CHEAP INDIAN ESTATES AND HOW THE PRICE IS EXPLAINED.

Ambegamuwa, Feb. 15.

DEAR SIR,—I see another Indian estate sold for R5,000. We were treated to the same story not long ago, but it transpired afterwards that the same estate had a mortgage behind it close on R200 per acre. Oh! our solvent Indian brothers, is it not time you bucked up and had a Cess at your end and thus relieved us hampered ones from bearing the burden of giving you a fillip, free, *gratis*?—Yours faithfully,

GO SHARES.

TOBACCO GROWING AT JAFFNA.

Colombo, Feb. 15.
