**ACETYLENE.**—Gloser's *Annalen*, in a recent number has a paper by Dr. H. Gerdes, giving an account of a series of experiments by Herr J. Pintsch, of Berlin, undertaken to ascertain the true position of acetylene as regards safety, in view of the common opinion as to its highly dangerous character. He explodes many fallacies, and puts the gas in its true place. The sins laid at its door were that it was very poisonous, that it formed dangerously explosive compounds with copper and copper alloys, and that in its pure state it was as explosive as ordinary coal gas was when mixed with air. The poisonous properties were shown to be non-existent. No acetylides possessing explosive properties were found. It was found possible to prepare an explosive copper acetylide, but only by keeping pure copper exposed for a long time to large quantities of the acetylene. It is now well known that the pure gas does not explode when at ordinary pressure, and that, if heat is applied, the decomposition does not spread catalytically through the mass, but only occurs at the point where heat is applied. When cylinders of gas have exploded upon the application of heat, it has only been when enough heat has been applied to produce an explosive pressure, which, it is needless to state, would be dangerous under any circumstances.—*British Journal of Photography*.

BY ORDER OF THE COMMITTEE.

Colombo, 2nd Feb. 1899.

"SALTBUSH"—the Australian "Atriplex nummularia"—is to be tried in Ceylon, we are glad to hear. It thrives as a fodder in rainless districts and sheep eat it readily. Mr. E B Creasy is sending a small quantity of seed he has, to be tried by Sir Wm. Twynan in Jaffna and by Mr. Byrde at Anuradhapura. We quote from the "Treasury of Botany":—

ATRIPLEX. Orache. A genus of *Chenopodiaceae*, with the foliage covered with a granular mealliness. The Oraches are chiefly distinguished by the two bracts or small leaves, enclosing the fruit, and enlarging after flowering; they are frequently dotted with large-coloured warts, which give them a peculiar appearance. They genera possesses several species, which are very variable in form, according to soil and situation. The inhabit waste places or mud banks by the sea shore, rarely occurring inland, with the exception of the *Atriplex patula*, which accompanies arable cultivation, especially in wet sandy clays. There are five British species:—*A. patula*, of which several more or less distinct forms are described; *A. littoralis* and *A. laciniata*, sea-coast plants, the latter silvery-white all over, as if frosted; *A. portulacoides*, a shrubby much-branched species called Sea Purslane; and *A. pedunculata*, distinguished by its pedicellate fruit.

TEA PRUNING.—The following from a letter in the *Planter* from East Cachar, has a bearing on local discussion:—I notice "South Darjeeling" alludes to the one-inch pruning practised in his district, and although we have not yet descended quite so far in Cachar, much less wood is left on the bushes now than was the case even only a few years ago. One does not require a long experience in tea to call to mind the four and six inches pruning that was almost the universal *duster* a few years back; and as far as the Surma Valley is concerned, South Sylhet leads the way in adopting a more scientific style. The well-known Mr. Thomas McMeekin usually gets the credit of having introduced two-inch pruning in this valley, and such pruning is still sometime alluded to as "McMeekin's system," but whether he was really the first to adopt this plan I cannot say with certainty. I fear that in Cachar we are rather a conservative lot of people, and not partial to innovations; and when a few years since one or two managers started this style of pruning some of our older men were full of gloomy forebodings as to the result. But within the past year or two the system has been very generally adopted, and we shall accordingly see a little less of "cutting down" in future years than has been common in the past.

## UDUGAMA TEA AND TIMBER COMPANY, LIMITED.

The annual meeting of the Udagama Tea and Timber Company was held at the offices of Messrs. Mackwood & Co. on the 31st Jan. when there were present:—Messrs. Hayley (in the chair), H. Figg, Hon. J. N. Campbell, Messrs. H. Creasy and Gillibray, representing the Hon. E. H. Johnson and Mr. F. M. Mackwood.

The report of the directors was unanimously adopted by the meeting and Mr. Hayley, the retiring director, was re-elected, while Mr. H. J. Scott was re-appointed auditor.

The report is as follows:—

Your Directors submit to the Shareholders the accounts for the year ending 30th Sept., 1898.

They regret to report a very serious deficiency in the crop of tea from Saumarez, Ginidomine and Homadola. The estimate was 160,000 lb. but only 119,737 lb. were harvested—a deficiency of 25 per cent, upon the estimate and over 22 per cent upon the previous year's crop. Such a large reduction in the crop has increased the cost of the tea very considerably and has resulted in a heavy loss. All the estates in the district were very short of their estimates.

The estimate for this year from the above estates is 116,000 lb. but it is hoped that the crops will be increased next year to 150,000 lb. by a return to manure. The loss on these estates amounted to Rs. 162-9.

**MAMINADOLA.**—The new clearings have come on fairly well, especially the last 80 acres at Nakiadenia these will give a large crop next year. The first 100 acres were cut down during the year, and yielded 18,781 lb. The crop this year for these 100 acres and a small return from the next 100 acres is estimated at 50,000 lb.

**FACTORY.**—Difficulties with labor, due to the number of Sinhalese employed in plumbago mining, caused the contractor to be very late with this work, and the manufacture of our tea in the new factory was not commenced until the end of September. All the Company's tea is now being manufactured there, and the results so far justify your Directors in taking a more hopeful view for the future. Hitherto the Company's tea has been made in a miserable, inadequately furnished building, with no proper withering room, and it has been absolutely impossible to make good tea. Now we have a new factory with amply water power, plenty of withering accommodation, and good machinery. The prices obtained have already shown a marked improvement. The Company has now, in addition to the 500 acres of tea on Homadola, Saumarez and Ginidomine, 300 acres on Maminadola gradually coming into bearing. This year's crop is estimated at 166,000 lb., next year we should obtain 250,000 lb.

**SAWMILLS.**—The result of the year's working has been very disappointing. There is a loss of Rs. 964-91. This loss occurred at the beginning of the year; during the latter portion we have made a fair profit. On the 30th September 1897 the stock of tea chests was 15,000, but as the demand had been very poor for some time, many of these chests were lost through white ants and dry rot, which caused a serious loss to the Company. It was not until March and April that we were able to find a ready sale at better prices. In barrels we have done better at the end of the year than during the first six months, when we made only 450 against 1,230 for the last six months. We have now a steady demand for our boxes and we shall make more barrels. We hope, therefore, that some profit may be made during the current year.

## PLANTING NOTES.

**INDIAN AND CEYLON TEAS.**—The tea sales for the year are over. The small sale of 17,151 packages Indians on Monday last went off without any noticeable change. Teas "for price" and good liquoring teas were in demand, but there was no increase of price all round. The curtain was rung down on an average for Indian garden teas of 7½d! well nigh a record of cheapness for this particular article. Ceylon still maintains precedence in this respect, her 17,613 packages having realized fully.

**PLANTING AND PROGRESS IN FIJI.**—We are permitted to extract from a letter dated Fiji December 10th:—

"I am hard at it trying to make good my lost time by utilizing my experience in such a way as to get on in the service. With a practical business man and a hard worker like our present Governor, this is made possible for he is prepared, as you always advocated, 'opening up the land and facilitating the employment of the labour at the command of the colony.' Good land must not be idle and what is not necessary to one tribe may be leased by another tribe or failing that and Europeans or Indians requiring it, facilities are given for the leasing of such land. The Government have acquired the lease of many thousand acres of land in the mountains of Vitilern which was unoccupied by the natives and excellent coffee (no disease) is grown at Darivatu which is situated there—facilities of the easiest kind will be given to intending planters when they come. A broad cart road is nearly finished from Javuna Bay up to Darivatu, and it is at last to be the sanatorium in deed as well as in name. I sent you a paper *Fiji Times*, in which the message of His Excellency to the Legislative Council was published. It is without doubt the most statesmanlike paper which we have yet had from any of our governors and is only the thin edge of the wedge. You will see that he proposed appointing ex-Provincial Inspectors to try and save natives from dying out—each to get £350 to £500 per annum. — is pegging along at Mago and Cicia in his usual style and has had a fine season and good price for copra over £10 per ton. I am going to plant a lot of coffee for taxes instead of maize."

**THE SARAPIQUI ESTATES Co.** has for its object the development of valuable plantation property in Costa Rica and is of local interest because old Ceylon planters like Messrs. J. L. Shand and R. P. Macfarlane, who have visited the spot, have reported most favourably of the forest land, of the coffee planted and cropping and of the properties generally. Mr. G. D. Jennings, a city merchant of high repute, is Chairman, and his fellow-Directors include Messrs. J. Huntley Thring, J. L. Shand and O. C. Magniac; and according to our contemporary's correspondent, the shareholders include "millionaires" in Messrs. Whithead, Hope Morley and another. According to the Chairman's address at the recent annual meeting, there are 339 acres planted with coffee up to date and 300 acres more cleared ready for planting; and steps are being taken to develop rubber and tobacco. The labour difficulty has been overcome, and there is a good prospect of early, cheap transport by rail or river, or both. has a competent and influential local manager. Finally the Company in Mr. Lara (brother-in-law of the President of Costa Rica who, by the way, is on a visit to London and has sent for Mr. Shand among others to confer with) and a capital mercantile and shipping agent in Mr. Ford. Altogether, the Sarapiqui Company promises well,

# THE AGRICULTURAL MAGAZINE, COLOMBO.

*Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."*

The following pages include the Contents of the *Agricultural Magazine* for February :—

Vol. X.]

FEBRUARY, 1899.

[No. 8.

## SEASON REPORTS FOR DECEMBER, 1898.

*WESTERN Province.*—Paddy. Maha crop young. Rainfall ample.

*Central Province.*—Paddy. Maha crop in bud and blossom. Rainfall ample, 7.57 in. at Matale.

*Northern Province.*—Paddy in ear in the Jaffna district, where the rainfall was heavy and registered 12.20 in.

*Southern Province.*—Paddy. Maha crops thriving and good yields expected. Rainfall 5.73 in. in Galle.

*Eastern Province.*—Paddy. The Muumari crop harvest is expected to be very good. Rainfall in Batticaloa 51.44 in., in Trincomalee 23.82 in.

*North-Western Province.*—Paddy. Crop prospects good. Rainfall satisfactory, 9.62 in. at Puttalam.

*North-Central Province.*—Paddy. Maha cultivation commenced. Rainfall 10.30 at Anuradhapura.

*Province of Sabasajamuwa.*—Paddy. Maha harvest approaching, and prospects good.

[It is satisfactory to note that the Island is almost free from cattle plague. It is apparently absent in those parts where it always occurs, and is said to be dying out of the Ratnapura district.]

Recorded by Mr. J. RODRIGO.

## THE INTRODUCTION OF NEW VARIETIES OF SEEDS.

We have often drawn attention to the important work that can be done in introducing new varieties of seeds into Ceylon, as well as from one district to another, as the pages of the Magazine will testify. Indeed, the distribution of seed is one of the most important means of agricultural improvement, and the perusal of reports received from the United States, Australia and India issued by the Agricultural Departments of those countries will show how much attention is given to this

branch of work. In Ceylon practically nothing has been done of this nature, though now that there is some prospect of an Agricultural Department, being organised, it is not unlikely the matter will receive attention.

The School of Agriculture has, however, always tried to introduce new varieties of seeds and plants and distribute them among cultivators, but as these efforts were more or less of a personal and private character and unsupported by Government aid (for which, indeed, there is no provision) the work has been of a very limited nature.

An attempt to introduce a variety of American rice was unfortunately unsuccessful through the seed having been damaged in transit, but some Bengal seed paddy imported last year has become fairly established in the island, and Mr. E. Elliott, who is now an extensive rice grower in the Southern Province, could speak to the excellence of the quality and quantity of the crops of this particular variety which he grows.

We are now able to announce the introduction of a new variety of sweet potato brought over from America, and at present growing in the grounds of the School of Agriculture. In this connection we would draw attention to the fact that while the ordinary method of propagation in vogue in the island is by means of cuttings from the vine, the system adopted in the United States is different, viz., by planting tubers in hot beds and thereby raising plants which are separated from the potato and planted out. It is considered that this latter method (which we may assume from its being practised in America—which always leads the way in improved agricultural methods—is to be preferred to any other) secures more healthy and robust plants by conserving the inherent vitality of the parent plant and preserving the good qualities of the potato. It cannot be denied that as a general rule the sweet potatoes raised in the island are of a degenerate stock as evidenced particularly in the lack of flavour and substance in the tuber whose special characteristic is its fibrous nature. It is therefore a matter of some note that a new variety of the sweet potato has now been brought into the island, which, moreover, possesses all the good qualities that can be desired. The potato is that known as the "Nancimum," and was kindly procured for us by Mr. Geo. Warr who has already done much to develop the minor industries of the island, and given particular attention to the oils produced by many of our indigenous trees. We would also desire to draw attention to another detail in connection with the cultivation of the sweet potato, viz., that while in Ceylon the branches of the vines are allowed to root freely and travel far and wide, the practice in America is to prevent the branches from taking root. It may be thought that the latter system would result in a reduction of crop since the rooted branches also produce tubers, but, on the other hand, it is stated that the tubers are more numerous and better developed by being forced to confine themselves to the central hole in which the main roots of the plant stand, as is the case with the English potato.

Another new thing (new in every sense of being unknown in the island) we have received from the same donor is a parcel of sugar-cane seed of the "light amber" variety.

The introduction of sugar-cane seed for the first time into Ceylon is we consider deserving of more than passing notice. We trust our efforts to raise canes from the seeds will be successful, and that it will lead to the establishing of a desirable variety.

Still another donation we are the recipients of is a parcel of four varieties of tobacco seed, described as follows:—

1. Zimmer's Spanish.—Early variety of good size—largely used for cigar fillers.
2. Tennessee Red.—Splendid sort of good quality—used for making plug tobacco.
3. Ohio Seed Leaf.—Favorite variety. Leaf good size—great favorite for cigar wrappers.
4. White Burley.—Noted for its porous and absorbing nature—splendid plug tobacco variety.

In view of the renewed interest in tobacco cultivation in the island, we trust that a good percentage of the seeds will germinate.

Mr. Warr has also been good enough to give us six layered grape vine cutting which have come to us all the way from California in fairly good condition, and have already been put down in a nursery. The following are the varieties:—

Red Cornichan, Muscat, Faberzagos, Zinfandel, Burger and Tokay.

#### OCCASIONAL NOTES.

Referring to recent reports on and accounts of the Plantain, the *Indian Agriculturist* writes:—"The *Spectator* with the happy knack it has of touching nothing without adorning it—to paraphrase the Latin tag—publishes an article on Plantains and Bananas which affords a great deal of up-to-date information on this interesting topic; while in the October number of the *Windsor Magazine* there is an equally charming paper with illustrations of banana-growing in the Canary Islands, which will well pay perusal. We notice, too, in the October number of the *Tropical Agriculturist* a report of the Superintendent of the Ceylon School of Agriculture on plantain fibre and dried plantains which deals specially with these features of the plantain industry."

We welcome back to Ceylon Veterinary Surgeon D. Chinniah after a specially successful career at the Bombay Veterinary College. We understand that Mr. Chinniah is the only Ceylon student who has got a first-class diploma, and he was the only one of his year in the College who gained this honour. We wish all good fortune to the new Veterinary Surgeon, who is an old boy of the School of Agriculture.

H.E. the Governor has been pleased to appoint the following gentlemen members of a Commission to report on the advisability of establishing a Department of Agriculture in Ceylon: The Hon'bles A. C. Lawrie, F. R. Ellis, L. F. Lee, A. de A. Seneviratne, J. N. Campbell, Messrs. A. F. Broun, J. C. Willis, S. D. Bandaranaiake, P. Coomaraswamy, John Fergusson, F. G. A. Lane, and J. H. Starey. Mr. C. Driberg, Superintendent of the School of Agriculture, has been appointed Secretary of the Commission.

The next Show of the Colombo Agri-Horticultural Society has been fixed for the 21st and 22nd of July. A large and representative Agricultural Show will be held at Galle from July 11th to 15th. The comparative frequency of Shows is a healthy sign and should produce good results in the agriculture of the Island.

We have to acknowledge with thanks from the author, Mr. T. B. Pohath Kehelpannala (an old student of the School of Agriculture) receipt of a copy of his interesting brochure on the Kitul Palm. Part of the paper originally appeared in the pages of the *Agricultural Magazine*. The pamphlet were seen through the press by Mr. J. C. Willis, Director Royal Botanic Gardens, Peradeniya, and is published at the cost of the Government.

The article on drought-resisting plants suggests the question whether there are not among our indigenous plants those with similar properties to chicory and sheep's burnet, and which therefore might be grown with the object of minimising the evil effects of drought on perennial crops. The question is one well worthy of the attention of cultivators to whom we commend it for careful consideration, while it shall not escape our notice.

PLANTAINS—DRIED AND MEAL.

The annual report of the Department of Agriculture, Queensland, to hand thus refers to the question of exporting plantains or bananas in a convenient form:—"Some years ago several shipments of dried bananas were made to London and Germany, and though the fruit arrived in good condition and a strong effort to popularise this fruit was made by a free distribution in order to create a demand, the result was anything but satisfactory. Banana meal was also sent to England, but the report received was, however, of such a nature that the manufacturer was reluctantly compelled to refrain from any further experiments. During the past year Messrs. Reis Bros., of Woolloongabba, expressed the desire to again test the London market with a shipment of bananas that had been dried by a new process adopted by that firm. A number of cases each containing 28 lbs. were sent to the Agent-General, and a small quantity was kept in this department to test the keeping quality of the fruit. The report from London was not of a cheering nature, and when the samples left here were inspected, the evidence obtained sufficiently proved the difficulty of exporting this product in such a condition that profitable returns could be secured. From what I have learned from visitors to the United Kingdom, it seems to me to be somewhat futile to attempt to place dried fruit of this kind where the ripe fruit, owing to the rapid means of transit, is brought from countries nearer to England, and sold at prices that place it within the reach of all classes of the community."

What we are interested in just at present is not the preparation and export of dried plantains which we always believed to be an undertaking beset with serious difficulties, but the preparation of the flour or meal, for which, if experiments now in progress give favourable results, there should

be a distinct and large demand apart from the demand for ripe or dried fruit for table use.

Mr. Benson, Fruit Expert, referring to the cultivation of the plantain in Queensland says "that the only chance of extending the industry profitably is that we may be able to utilise or preserve the fruit in some manner, and that there is a demand for the product so obtained. In order to determine this matter it is proposed to carry out a series of experiments to determine the best method of preserving the fruit and utilising same when necessary."

It is just such experiments that we have been engaged in ourselves, and while convinced that there is no hope of plantains being exported as "figs" (witness the failure in the West Indies and India), there is still the want of a ready market for the plantain flour or meal which is the most suitable form for export. Our efforts to find such a market have not yet been abandoned, and as we stated in our last issue we have lately had some encouragement in this connection.

TOBACCO SOILS.

As Havanah cigars and Cuban tobaccos have attained such wide celebrity, the analysis of a good tobacco soil in that country is interesting as giving an idea of the constituents which help to produce the best quality of tobacco. It would appear from the analysis that the large proportion of organic matter gives good texture to the soil, while at the same time supplying the crop with nitrogen. The quantity of phosphorus is comparatively large and shows the need of phosphatic manures in tobacco growing.

The following is the analysis as made by Dr. Earle:—

Moisture at 110°	...	...14.20
Organic Matter	...	...12.30
Sand and Insoluble Matter	...	...30.32
Carbonic Acid	...	... 4.20
Sulphuric Acid	...	... 12
Oxide of Iron	...	...29.40
Oxide of Lime	...	... 7.60
Oxide of Magnesia	...	... 17
Phosphoric Acid	...	... 1.60
Potash	...	... 16
Soda	..	... 0.84
		100.154
Nitrogen to	...	... 32
Ammonia	...	... 39

The sulphuric acid is combined with the lime to form sulphate of lime. The remainder of the lime is combined with the carbonic acid to form carbonate of lime and with the phosphoric acid to form phosphate of lime.

A USEFUL SCHEME FOR AGRICULTURAL EXPERIMENTS.

The Director of State Farms, Queensland, gives the following useful though condensed programme of work, which is useful as a guide for similar work in this colony:—

"In my position as Director of State Farms I drafted a scheme for the working and manage-

ment of the Farms, of which the following is a brief outline:—

The work proposed to be carried out was of two kinds—experimental work and work on a commercial scale. The experimental work embraced every branch of agronomy that the soil and climate of the district in which the farm was situated was suited for.

These experiments were to be conducted:—To determine the most suitable varieties of all kinds of farm crops, economic plants, vegetables, fruit trees, vines, &c.

To determine the best method or methods of growing same.

To determine the best means of utilising the crops when grown.

To carry out experiments in draining, manuring, liming, and general cultivation.

To carry out experiments in the rotation of crops.

To carry out experiments in the feeding of stock.

To carry out experiments in fruit culture and in the drying, canning and preserving of suitable fruits.

To determine the varieties of fruits or vines best suited to each district.

To carry out experiments for dealing with insect or fungus pests of all kinds.

To carry out experiments with a view to improving existing varieties of grain or other farm crops—fruit trees, vines, &c.—with a view of producing varieties adapted to the climate.

To carry out experiments for improving the natural pastures of the colony, and to encourage and propagate valuable drought-resisting grasses and fodder plants.

To keep an accurate and concise record of all experiments.

To compare the results of similar experiments conducted at different farms.

To compare the results of experiments with the results of similar experiments conducted in other colonies or other parts of the world.

To publish the results of experiments, whether successful or not.

To give information in all or any one branch of agronomy.

To distribute seeds, plants, cuttings, or scions of any new varieties of farm or economic plants—fruit trees, vines, &c.—that prove themselves worth cultivating when tested on a commercial scale.

Work on a commercial scale to be confined to the growing of that crop or crops that are found by experiment to be the most suitable to the soil and climate of the district; in brief, the work on a commercial scale should be governed by the results obtained by the experiment work.

In order to carry out the work mentioned, I deemed it absolutely essential that the working and management of the State Farms should be conducted in a thoroughly systematic and business-like manner; as, in my opinion, the value of the work carried out at the State Farms depends entirely on the accuracy with which the records of such work are kept, as without accuracy the results of experiment work are of little if any value.

In order to obtain this accuracy, I therefore defined the duties of everyone connected with the farms, drafted a set of books for keeping record of all experiment and other work, and emphasised

the importance of systematic, business-like, accurate working in everything connected with the farms. I then claimed, and still claim, if the farms are to be a success, that this method of working is absolutely essential, and had I retained the directorship of the State Farms and possessed the necessary authority, I should have endeavoured to work them in this manner.

## MILK.

Milk is rightly considered to be the most perfect food especially for the young, and though the milk of the cow is in general use in civilized countries, that of the camel, ass, goat and other animals affords nutriment to the inhabitants of other parts of the world.

The consumption of—especially purchased—milk is attended with certain risks. Adulteration with water is indeed the least dangerous form of sophistication, provided the water does not come from a contaminated source. It must, however, be admitted that the nutrition of the sick and of infants may be seriously interfered with by dependence on milk which has been thus adulterated, since it does not supply the amount of nutrition expected of it.

In order to guard against the possibility of milk being made unwholesome by its containing foreign substances more objectionable than water, proper supervision should commence with the cow—the source of milk—and be kept up till the fluid reaches the hands of the consumer.

The adage that a bad tree cannot bear good fruit might be adapted with much force to the cow, and the milk from an unhealthy animal is bound to be tainted and unwholesome. A cow whose milk is required for the nourishing of a growing infant must be free from every trace of disease. The diseases of dairy stock may be divided into two classes:—Firstly, diseases of non-communicable nature; and secondly, those communicable to human beings. The milk from animals affected with the first though not capable of communicating similar affection to man, cannot be considered a standard food to repair and nourish tissues. And, so, milk of a bad quality from such sources should not be allowed to pass as first quality milk.

The milk from animals that suffer from communicable diseases, such as tuberculosis, &c., have a tendency to produce similar affections in man, and animals that are to be used for dairy purposes should be free from such diseases.

Bovine tuberculosis has of late received the close attention of scientists, whose researches warn the public of the dangers that threaten those who consume milk and meat of animals suffering from the affection.

So far tuberculin is the only test that may be used with certainty to detect the disease if present; and it will not be long before all dairy animals will have to pass this test before to be selected as milking stock.

Cattle Sheds should be kept as clean as possible and as free as can be from dust, especially during milking hours; for the organisms that lie latent on the floor may be easily carried to the milk where there are favourable conditions for propagation and for gaining admission into the systems

of their hosts. The cow in a state of nature enjoys a free and pure supply of air; but man steps in, for his own benefit and welfare, takes her from her natural abode, and brings her under the influence of artificial conditions rendering her liable to contract certain diseases of which tuberculosis is one. It is very necessary to give a cow at least 800 cubic feet of space.

**Feeding.**—The better the food supplied, the better the milk yielded. The water that is given to the cow should be fresh and good; and the usual way of watering cattle from stagnant ponds and such places should be made prohibitory.

The attendants of animals should be free from disease, and their personal cleanliness should be very much looked into; for, if neglected, they may be the source of contaminating the milk.

**Milking Vessels** should be kept *scrupulously* clean, and glassware should as much as possible be used in place of metal, but, if the latter, regular "tinning" is very necessary.

**Milking** should be carefully supervised. The udder should be washed and the foremilk should be thrown away; for it is found to be prolific in bacteria. If blood, &c, be found in milk, the animal should be treated with suspicion, and the tuberculin test applied.

**Adulteration.**—When water is mixed with milk it puzzles the chemist to properly ascertain the quantity added. Under any circumstances it lowers the nutrient ratio of it. As before stated, if the added water be pure there is no danger to be apprehended. The only possibility of securing unwatered milk is by patronising honest men to carry on dairying and paying them a good price for the genuine article.

**Despatching.**—The usual system of carrying milk in an open vessel is pernicious, and the use of airtight vessels for such purposes is much to be desired; for, the various bacteria that float in the atmosphere not only find a suitable medium for their growth in milk, but secure easy access into the human system.

The last and not the least important precaution to be adopted in dealing with milk is to thoroughly boil it before use, particularly when it is to be used by infants and invalids.

D. A. CHINNIAH,

Veterinary Surgeon

NOTES ON CEYLON PRODUCTS.

(1) The following reports on food stuffs are by Prof. A. H. Church, M.A., F.R.S., Scientific referee of the Imperial Institute:—

CYANOTIS AXILLARIS, ROEM, AND SCHULTES.

**Vernacular.**—*Nirpulli*, Tam.; *Soltraj*, *Baghanulla*, Hind.; *Itsaka*, Bomb.

This annual, which belongs to the N.O. *Commelinaceæ*, is common in many parts of India. Though anything but promising in appearance it has been used as food in times of famine. The seeds are spongy and light; 100 weigh only four grains. The sample received was largely charged with earthy matter which it was impracticable to remove entirely.

These percentages were obtained:—

Water	...	...	11.5
Albuminoids (from total nitrogen)	...	...	13.9
Starch, etc. (by difference)	...	...	64.1
Oil	...	...	0.5
Fibre	...	...	3.1
Ash (includes some sand)	...	...	6.9

The nutrient ratio is here 1 : 4.6, the nutrient value 79. By the phenol method 12.22 per cent. of albuminoids was shown.

After all, these poor-looking seeds possess a good nutrient-ratio and a fair alimentary value.

INDIGOFERA LINIFOLIA, RETZ.

**Vernacular.**—*Torki*, Hind. and Punjab; *Bhangra*, Beng.; *Tandi khode baha*, Santal; *Burburra*, *Pandhari pale*, *Bhangra*, *Torki*, Bomb.; *Pandhi*, *Nasik*; *Jawarich*, *malmandi*, *Kaladgi*, *Bomb.*

The seeds of this common kind of wild indigo are eaten in times of scarcity and famine. They are a little smaller than those of *I. glandulosa*. The percentages obtained were:—

Water	...	...	9.3
Albuminoids (from total nitrogen)	...	...	34.3
Soluble carbohydrates (by difference)	...	...	43.4
Oil	...	...	3.0
Fibre	...	...	6.5
Ash	...	...	3.5

The nutrient-ratio is here 1 : 1.47; the nutrient-value is 84. The phenol method showed 32.2 per cent. of albuminoids.

(2) Notes on ground nuts (*Arachis hypogæa*) known as "Pindars" in Jamaica: from a report by Dr. Watts:—

Although "pindars" are consumed freely in Jamaica, and are imported to a fairly large extent, the cultivation of the seeds in the island itself has not yet reached the proportions that would naturally be expected in a country where the soil, climate, and general conditions are so favourable. At present these nuts are consumed more as a luxury than as a regular article of food, though they form a most wholesome addition to the dietary, and their cultivation might well become an important industry. The oil which they contain is known to be quite suitable for many of the purposes for which *olive* and *cotton-seed* oils are at present imported. The residue left after the expression of the oil is of considerable value, and may be used as a cheap article of food.

The sample nuts, as purchased, yielded about 67 per cent of seeds, which, when pressed in a small hydraulic press, furnished—

31.5 per cent	...	...	Oil of first quality
5.0 per cent	...	...	Oil of second quality
54.8 per cent	...	...	Cake or Meal
8.7 per cent	...	...	Loss in handling, etc.

An analysis of the "pindar" meal gave the following results:—

Water	...	...	9.72 per cent.
Oil	...	...	5.68 "
Starches and digestible carbohydrates	...	...	36.08 "
Protein	...	...	40.05 "
Nitrogenous matter other than protein	...	...	1.07 "
Crude fibre, indigestible carbohydrates	...	...	3.85 "
Mineral matter	...	...	3.51 "

The mineral matter consisted chiefly of potash and phosphoric acid. From this analysis it is evident that "pindar" meal would be eminently suitable as a fertilizer, for which purpose it is valued at about £4 10s. per ton.

The vine itself, when properly dried, is also of considerable value as fodder for stock. "Pindar" hay is very little inferior to clover hay; moreover, it bears on its roots the nodular swellings, characteristic of the *Leguminosæ*, which enable it to assimilate the nitrogen of the air, and so becomes capable of enriching soils which are poor in nitrogen.

There are several varieties of "pindars," and of these the *Spanish* possesses the advantages that the seeds may be planted more closely together, that its crop is comparatively easy to harvest, and that it matures in four or five months, while other varieties require about nine months.

In the United States, it is usual to remove the seeds from the pods before planting; but in the West Indies it is advantageous to sow the seeds in the pods, as they are then protected from the ravages of the ants.

The average yield amounts to about 30 to 50 bushels per acre, the bushel varying from 22 lb. to 28 lb., according to the kind cultivated.

(3) Note on Citronella grass cultivation in Ceylon:—

The production of citronella oil has increased so enormously during the past few years, that Messrs. Schimmel & Co., of Leipzig, have found it necessary to undertake a more complete study of the cultivation of the grass and the preparation of the oil in Ceylon, than has hitherto been made. (*Schimmel & Co.'s Semi-Annual Report, Oct. 1898.*)

The grass is cultivated exclusively in the southern province of Ceylon, mainly between the rivers Ginganga, in the north-west, and Wallaweganga in the east. The present extent of the plantations is from 40,000 to 50,000 acres of land. The grass grows in tufts, to a height of about 40 inches, and only on the declivities of the hills. The plants require but little care; the harvests, however, must be gathered regularly, and in due time, as otherwise the spikes grow too luxuriantly, and partly decay. The crops are generally gathered twice annually, the first during July and August, the second during December and January. The former crop is the more remunerative, as native labour is then more available; it is also more productive, a larger yield of oil per acre of grass being secured. During December and January the rice fields have to be prepared for the south-west monsoon, which occurs during April and May, the result being that the hands are not always available for the citronella crop, and its harvesting has sometimes to be postponed.

The oil is obtained by steam distillation of the grass, without the addition of water, the yield varying from about 22 lb. to 28 lb per acre for the summer crop, and from 7 lb. to 14 lb. per acre for the winter crop. The produce varies, also, with the age of the grass, the weather, and the local conditions of the various plantations. The yield of oil gradually decreases, and after about fifteen years the vitality of the grass seems to become exhausted and the raising of new plants becomes

necessary to maintain the estate in a paying condition.

The distilleries are located at the base of the ridges and hill-sides, where cool water may be obtained in sufficient quantity. The distillate is kept under lock and key, since the natives cannot be entrusted with its care. When a sufficient amount of oil has collected, the proprietor bottles it, and allows the aromatic water to run away. Each distillation occupies about six hours. The exhausted grass, after drying in the sun, is used exclusively for fuel, as wood is almost entirely absent from the southern province of Ceylon. As soon as the rainy season sets in the working of the distilleries ceases, owing to the lack of dry fuel. The working expenses are small, as the water and tear of the distilling apparatus is inconsiderable. The coolies employed receive 37½ cents, the women about 18 cents a day.

Exact figures of the percentage yield of oil are not available, as the weight of grass put into the stills is never ascertained.

The total number of stills in Ceylon is about 600, producing annually about 1,000,000 lb. of oil. The export of oil during 1897 amounted to 1,182,867 lb., while the shipments for the present year, up to August 30, were 1,021,626 lb., as against 781,832 lb. during the same period of last year. Of this quantity, England has imported about 462,000 lb., and the United States 522,000 lb.

The citronella plantations in the Straits Settlements, near Singapore, are insignificant when compared with those of Ceylon. It appears that about 1,000 acres are at present under cultivation there. The oil obtained from that district, however, is of very good quality, and yields as much as 90 per cent. of *geraniol*, the average yield being only from 60 to 80 per cent.

#### PLANTS WHICH RESIST DROUGHT.

The subject of drought is always of importance in the tropics, and indeed the question of resisting it is often a very serious problem in the dryer parts of the island. It is therefore interesting to hear of any experiments calculated to minimise the risks to which cultivated plants are exposed in this connection. Even in England where drought, as we know it, is unheard of, and where the best scientific knowledge has been brought to bear upon all branches of agriculture, the matter of discovering plants capable of resisting a comparatively long period of dry weather is not free from the element of doubt. In the *Edinburgh "Scotsman"* of 26th September last, we find an interesting letter from Mr. Robert H. Elliot, of Clifton Park, Kelso, on this subject. He says:—

"We are now suffering from such a long continued drought that many farmers have begun to use food intended for winter consumption. The sheep on some farms have been described to me as starving. On my Clifton-on-Bowmont farm, on which (as shown in letters you have done me the honour to publish) the most drought-resisting plants and grasses have been used, no difficulty has been experienced. I have this year observed that the late flowering red clover resisted the drought as well as chicory, burnet, and kidney

vetch. The effect of chicory in keeping open peat or clay land, and for so preventing it from solidifying, was particularly called to my attention by Dr. Voelcker when he was lately inspecting the field in which, two years ago, we traced the downward course of chicory and burnet roots right through a very hard grass into the soft subsoil—the field, I may add, which was described in my paper on "The Value of Plant Roots as Tillers of the Soil" ("Royal Agricultural Society of England's Journal," September, 1897). And the result of thus opening, and keeping open, the soil with the agency of deep-rooting plants is, of course, remarkably apparent as regards the grass, the result being that whereas in the case of an adjacent field on the same flat the land is baked as hard as pavement, and the grasses are quite dried up, the field alluded to is quite green, and, comparatively speaking, soft—so much so that my friend cut up with his pocket-knife sections of the soil—sections with a chicory plant in each—to show me how the powerful chicory lateral roots had kept the soil open and pliable. This field, I may observe, is particularly valuable as an illustration, as it had been laid down by me to permanent pasture before I had ascertained the use of these deep-rooting plants, and in consequence of its comparative failure (owing to the hard grass) was ploughed up, and again laid down in April, 1895, and this time with complete success. Those of your readers who are interested in this important subject may read with advantage Mr. Rider Haggard's paper in the September number of "Longman's Magazine." When laying down land to permanent pasture he selected his worst field for an experiment on my system—that is, with the addition of chicory, burnet, &c., and now he finds that his worst field has beaten the best.

"In conclusion, I may note that the advantages of using a mixture of the most drought-resisting and deep-rooting plants and grasses in the case of land to lie for four or more years by no means terminate with the fact that keep for a stock is more plentiful and reliable, for when you plough up a thick sod composed of deeply-rooting plants, which have not only cultivated the land to the utmost depth, but charged it deeply with vegetable matter, you obtain better grain and turnip crops, and enable both to resist drought in really an astonishing degree—facts which have been amply proved this year on my Clifton-on-Bowmont farm."

---

### SOIL MOISTURE.

Under this heading Mr. F. B. Guthrie contributes some thoughtful notes. His object in writing, he states, is to present some information as to what is known about the causes of loss of water in the soil, and the means by which this loss may be prevented or to some extent delayed. For, says he, though we are powerless against drought, we should be able to adopt certain remedial measures in alleviating the effects of a long spell of dry weather, and it often happens that the crop might have been saved if it could have held out a few days longer. Moisture is lost from the soil in two ways, by drainage and by evaporation.

All soils have a certain retentive power, for water which enables them to resist to a greater or less degree these two causes of loss. This power is largely dependent on the texture of the soil and is highest in peaty soils, and soils rich in humus followed in order by marls, clays, loams, and sand.

The loss due to drainage is liable to be exaggerated, indeed there is no room for doubt that properly-drained soils are much less liable to suffer from drought than undrained soils.

The action of drainage does not come into play until the soil has absorbed all the water which it is capable of taking.

Drainage only removes the surplus water. In the case of a fine soil lying on a coarser stratum, a condition under which the natural drainage is most effective, it is a fact that the fine soil does not part with its water to the coarser soil below until it has itself taken up as much as it will hold.

When we further remember that in a well-drained soil the conditions favourable to fertility are at their maximum, that its capillary power is increased, and it is enabled to absorb moisture and dew on its surface, and to draw up water from the lower strata, and that in such a soil the roots of the crop have free development, and can penetrate to a greater depth in search of moisture than on badly-drained soil, it is clear that the soil does not lose much of its essential water by drainage, and that a well-drained soil is in point of fact in a better position to resist drought than an undrained one.

The chief loss due to drainage is the loss of soluble fertilising material, especially nitrates, but this occurs principally during the summer and early autumn, and then only when the rainfall is fairly abundant. In dry seasons loss from this cause may be neglected.

The principal cause of the drying up of soils during dry weather is evaporation.

Water evaporates from the soil in two ways, from the surface of the soil itself, and from the leaves of the crop.

The loss of water by transpiration is enormous, far greater than would be generally believed. Experiments have shown that a crop of barley during its growth evaporates nearly 9 inches more water than is evaporated from an adjoining field under bare fallow.

Transpiration is, of course, beneficial, and a vigorous crop evaporates more water than a sickly one. The water thus exhaled by the leaves is continually replaced by water absorbed by the roots. When the plant is unable to obtain sufficient water through its roots to replace the water lost by evaporation through the leaves the plant begins to wither.

This transpiration may be, however, reduced to a minimum without detriment to the plant, and does not appear to be an absolute essential to its growth. The amount of water evaporated from an acre of wheat during the six months of its growth has been calculated to be  $3\frac{1}{2}$  millions of pounds (this includes the evaporation both from leaves and soil). This quantity represents the total amount of water received per acre during the whole year when the rainfall is about 17 inches.

Assuming, then, that there were no available ground-water to draw upon, an annual rainfall of 17 inches, if it were all retained by the soil within reach of the plant, would be entirely used up and evaporated by a crop of wheat during the period of its growth.

It is further important to remember that the plant begins to wilt long before the moisture in the soil is exhausted.

The actual degree of dryness which causes the plant to wither varies according to the nature of the soil.

It has been proved that plants begin to wilt when the moisture in the soil falls below one-third (about) of the quantity which the soil is capable of absorbing. Thus in an average loam which is capable of absorbing 50 per cent. of its own weight of water, plants will begin to suffer the effects of want of moisture when the amount of water in the soil falls much below 17 per cent.

A sandy soil, on the other hand, may contain as little as 8 per cent. moisture before plants grown in it will begin to wilt.

It is found, further, that plants thrive best when the quantity of water present in the soil is about half that which the soil is capable of absorbing.

It may be interesting to state the capacity for water—that is, the amount of water which the soil is capable of absorbing for different classes of soil:—

Class of Soil.	Capacity for Water.
Sand ... ..	25 per cent.
Loams ... ..	50 " "
Heavy Clay ... ..	60 " "
Pure Clay ... ..	70 " "
Garden mould ... ..	90 to 100 percent.
Pure humus... ..	180 " "

#### FRUIT EVAPORATOR.

Among the many makes of evaporators in the market, it may be said that with the exception of one or two they all come under three heads: the vertical type with the trays placed directly above one another, the horizontal type, and the inclined type. The vertical sorts were first introduced, but it seems as though they were now falling into disuse, owing to better results being uniformly obtained from those which work on the horizontal and inclined system respectively.

In all evaporators of the vertical and horizontal patterns the trays are necessarily placed one above the other, so that the steam from the lower trays ascends, and in so doing passes through and around all the trays above them. The danger from this is cooking or soddening the fruit. These results when they occur are most disastrous, because the vapours expand, and finally burn the cells of the fruit, causing, by exposure of the contents, acidification and oxidation, also dispelling the essential oils, to the retention of which aroma and flavour are due. In other words, the product is deprived of the attributes upon which excellence of quality depends.

In evaporating fruit, one thing that must always be remembered is that the object to be attained is not only to make the fruit keep, but also to retain

the properties for which it is valued. This can only be attained by withdrawing the water contents, and at the same time converting a portion of the starch into sugar in as short a time as possible without boiling the fruit. The quicker the watery portion is removed from the fruit the richer and the more durable its taste will be. Another important point to be remembered is that the more completely the oxygen of the air is excluded during the process, the more perfectly will the fruit retain its colour. Rapidity of the drying process sometimes increases the content of sugar by 25 per cent, and this increase is in exact proportion to a slower or quicker evaporation of the content of water.

This is why evaporated fruit yields better results in weight than can be obtained by sun drying, because in the process of evaporation a portion of the contained water, which otherwise would be lost, is retained by combining with the starch to form glucose, while the carbonic acid, which is always lost in the sun-dried fruit, is retained in its natural combination with the other substances composing the fruit. Hence it is heavier, and those profitable and healthful chemical changes being all in accordance with the laws of Nature will certainly take place if the necessary conditions of heat and air are properly applied. Otherwise the operator will have quite a different product, and no matter how good the fruit may be, or how perfectly bleached, true evaporation will not be obtained, and no matter how deceptive the fruit may be in its colour or fancy packing, it will not stand the test of long keeping in various warm or damp climates. The natural starch, gluten, and albumen of the fruit, instead of having been cured and made indestructible by the chemical changes which constitute the difference between the evaporated and the dried fruit, will absorb moisture and additional oxygen from the air; will increase in bulk, and be attacked by mould; finally ending in sourness and decay.

#### TELEGONY OR ATAVISM.

Telegony may be defined as the science of remote influence in the reproduction of species. The question it involves may be said to be: Does the first impregnation of the ovaries influence several or all the subsequent progeny of the female?

This knotty problem Prof. Cossar Ewart of Edinburgh set himself to solve single-handed. It is needless to state that the experiments conducted by him are of the highest importance to stock-breeders of every class, while as may be imagined they involve considerable difficulty and expense. The influence of the first impregnation so far as colour was concerned has been more or less apparent, but whether similar results followed with regard to other and more important characteristics has never been demonstrated.

It was with horses that Professor Cossar Ewart decided to experiment, and to find a clear issue he secured a Burchell zebra stallion to mate with mares, as the stripes of the zebra would form the best groundwork. The stripping, if it occurred in subsequent progeny, would be the characteristic to first exhibit itself, and the easiest to detect. It

will be readily believed that even to start the experiment was in itself no easy task, but all difficulties were overcome by the acquisition of the Burchell zebra stallion Matopo, 12'2½, from the Antwerp Zoological Gardens. This animal's stripes are clearly defined. There are five upright bars behind the shoulder, and then an equal number of oblique bars behind that. The legs are beautifully marked with alternate stripes, chocolate colour and yellow. The face is also barred. He is still quite wild, considering his long captivity, and careers round the paddock at a great rate with a very light action. Having secured mares the professor mated them with the zebra, and the work of experimenting has now been going on for about five years, and has almost reached that stage when a final pronouncement may be looked for from his pen at an early date. Speaking, however, to a class of agricultural students who visited the scene of his experiments, Prof. Ewart was good enough to give a short account of his method of work. He explained to them the science of atavism, or, as he preferred to call it, regression or reversion. Many years ago a number of people believed in reversion.

Darwin especially pointed out that when two extreme types were crossed reversion undoubtedly occurred. When his first hybrids appeared he had very great difficulty in understanding the peculiar markings on them, and this led him to study reversion. He proposed to show them some results of these reversion experiments. First, he showed an ordinary-looking Angora rabbit with the characteristically fluffy hair. The father of it was perfectly smooth-haired and white, and the doe was the same. He showed a second one with a little dark hair about the snout and ears, showing the presence of Himalayan blood, while the third had practically all the markings of a Himalayan. These three were of the same litter, yet one was an Angora, one practically a Himalayan, and the other about a third Himalayan. This variation he accounted for by the mother of the father of the three being an Angora. Here was a case of reversion straight back to the grandmother. One of the aunts of the litter was a Himalayan, and although these have none of the aunt's blood in them, one was an exact copy of her. They might account for that by saying that they were both descended from a Himalayan ancestor at least three generations removed. He also bred a large number of white doe rabbits with wild rabbits. It was very difficult to tell the progeny from wild rabbits. He did not consider this a case of reversion to the wild rabbit, but of prepotency. He showed a live cockerel alongside a stuffed jungle fowl, and pointed out that it bore a striking resemblance to this common ancestor. It had a red breast at first, but as it got older it got dark like the jungle fowls. It, however, had a double comb, unlike the jungle fowl. It was a cross between an Indian Game Dorking cock and a very dark-coloured bantam. These were two extreme varieties, and they might call the result a reversion towards the jungle fowl. The cross between a Dalmatian dog and a collie was extremely like a pointer or foxhound. It was believed by all fanciers that the Dalmatian had come from a pointer ancestor. Well, if this were true, they had a reversion to the ancestors of the sire, but no

indication of the ancestors of the dam. Referring to pigeons, he pointed out that all the 150 varieties which existed had descended from the Blue Rock, of which there were three kinds—the Shetland, the Indian, and the Madeira Blue Rock pigeons. Darwin had also experimented with pigeons, but he had failed to point out that his reverted bird resembled the pure Rock pigeon in anything but colour. It was necessary to repeat these experiments to see if there was complete reversion. He bred two Blue Fantails (one with some white feathers) from a white and a blue coloured bird, and he got a perfectly white bird. Now, that seemed to be an utterly impossible result, for fanciers told them that when they had got a little blue into the blood they would not be likely to get it out. Now, there was a case of reversion to the grandparents just as in the case of the rabbit. He crossed a White Fantail and a Blue Pouter. According to fanciers he should have had a blue bird like a pouter, but he had an almost white bird shaped very like a pouter. That was no case of reversion, as both of these birds were pure or less in-bred. He also exhibited a Blue Rock pigeon, which was a better bird of the kind than could be bought in Edinburgh or Glasgow. It carried itself well, and behaved like a Blue Rock. It was obtained by a cross between an Archangel and a White Fantail. The professor considered it a most wonderful result. They might say that it was not reversion. He did not see how they would find a simpler explanation. This was all leading up to the telegony experiments.

We reserve Prof. Ewart's account of these experiments for our next issue.

---

#### GENERAL ITEMS.

Mr. A. H. Benson, Fruit Expert, Queensland, referring to the mango, says:—"For really good mangoes I believe there will be a steady and increasing demand once the public of the other Colonies get to know what a first-class mango is. I believe a market could be found for high-class preserved mangoes put up in glass, provided the same were got up in an attractive manner, and if so this should provide a good market for the fruit."

The latest method of destroying mice and flying foxes, both agricultural pests, is by inoculating some of them with the bacillus typhi murium and leaving the rest to be infected by the inoculated.

For warts on cattle a correspondent to the *Cape Agricultural Journal* recommends the following simple but effectual remedy: Dissolve ordinary washing soda in water. Make the mixture strong but do not use caustic soda. Dab this on the warts twice every day and let it dry on, and the warts will soon disappear.

The *Agricultural Journal of N.S. Wales* for November contains a paper on the Ramie Fibre plant and supplies many interesting particulars. The following is a description of the way in which the "ribbons" are got without machinery: "The fresh stems are steeped for a short period in boiling water in a tank 6 ft. x 3 ft. x 5 ft.; about 2 lbs.

of crude soda is added to the water. Green stems are thrown into this and steeped for about 15 minutes; at the end of that time they are hooked out and stripped of the bark. These strips (ribbons) are then passed through wooden rollers to squeeze out the superabundant mixture and are then hung up to dry in the sun. After being very thoroughly dried, the ribbons are packed all the one way, i.e., longitudinally, in bales about 5 cwt. in weight. Great care has to be taken to keep the material clean when in a wet state, and it must never be heaped but hung in strands right away; if heaped, fermentation is set up and the fibre is deteriorated if not destroyed.

F. B. Guthrie, writing on Soil Mixture, in the *N. S. Wales Gazette*, says that the presence of humus is of special importance in reference to the problem we are discussing, namely, the best way to retain the mixture in the soil. He points to the tendency of humus to be deficient in cultivated soil, and remarks that the best way of supplying humus is undoubtedly by green manuring, which, he observes, is of benefit to the soil in other ways, particularly in promoting bacterial activity and increasing the production of nitrates.

The following figures are given by *Poultry Industry* as being taken from an American Census return showing the revenue-producing interests in that country:—

Value of eggs and poultry produced in one year...	dols.
Value of eggs and poultry produced in one year...	290,000,000
„ „ Silver production ...	72,000,000
„ „ Wool clip ...	38,146,459
„ „ All sheep ...	65,167,725
„ „ „ swine ...	186,529,745
„ „ „ horses ...	500,140,186
„ „ Petroleum products ...	62,383,403
„ „ Potato crop...	78,984,901
„ „ Tobacco crop ...	35,574,220
„ „ Cotton crop ...	259,164,640
„ „ Wheat crop...	237,938,998
Imports of Coffee, one year ...	84,793,124
Total of School expenditures ...	178,215,550
Net earnings of railroads ...	322,516,454

Mr. Guthrie, F.C.S., of the Department of Agriculture, Sydney, made the following analysis of Guinea grass examined when rather dry:—

	Per cent.
Water ...	11.26
Ether extract (fats, &c.) ...	0.65
Albuminoids ...	11.37
Carbohydrates ...	40.54
Woody fibre ...	26.08
Ash ...	9.50
	<hr/>
	100.00

Nutrient value = 53½. Nutrient ratio = 1 to 4.

The injury done to hides and the reduction in their value by branding cattle on the rump or sides is well-known. It is suggested that animals should be branded on the neck, close behind the ear, as this does least injury to the hides, which, as a result, fetch much higher prices in the market.

In the *Cape Agricultural Journal* for November is a description of a plunk race and catch-pit for trapping locusts, which in some respects is similar to the method which was found so successful in Cyprus.

The Government Entomologist at the Cape suggests the cultivation of a scale insect for the extermination of the Thorn tree (*Acacia horrida*.)

The botanical name of the plantain is sufficient to show its antiquity, for the word *musa* is the old Sanskrit word *mocha*, while *sapientum* "of or belonging to the wise-men" has reference to the old Hindu sages or Rishis, whose chief food plantains were reported to be.

### VANILLA:

#### THE SPECIES, DISTRIBUTION AND HABITS OF VANILLA PLANTS, AND THE CULTIVATION AND CURING OF VANILLA.

By H. H. RUSHY, M.D.

(From the *Journal of Pharmacology*,  
New York, February, 1898.)

THE genus *Vanilla* was established by Plumier in Miller's *Gardener's Dictionary*, Edition 6, in the year 1752. The genus has been enlarged from time to time, until we find the *Index Kewensis*, in 1896,

recognizing 33 species. Besides these recognized species, the *Index* cites 23 additional names which it regards as synonyms. As in the case of most large genera, there is a wide difference of opinion as to the limitations of the species, their number being thus greater or less according to different authorities. Engler and Prantl, in the "*Pflanzenfamilien*," allow but 20, which is also the number allowed by Bentham and Hooker in the "*Genera Plantarum*." This doubt as to specific boundaries extends even to those of the improved and cultivated species *V. planifolia*, there being a wide difference of opinion regarding half a dozen forms, as to whether they are distinct species or mere varieties of this one.

The genus is peculiar among flowering plants for its exceedingly wide distribution, nearly all parts of the tropical world possessing their representatives,

In the New World we have 18 species; 3 from Mexico, 5 from the West Indies, 2 from Guiana, 3 from Brazil, 1 each from New Granada and Equador and 3 from Peru. This list may have to be extended by the addition of one which I have collected in Bolivia, or this may turn out to be one of those already known in Peru. In the Old World there are 15 species, 4 from Tropical Africa, 3 from the East Indies, 2 from Java, and 1 each from Ceylon, Sumatra, Bourbon, the Seychelles, the Philippines and the Malay Peninsula.

There seems to be no precise record as to whether or not all of these species yield fragrant fruits, capable of use as *Vanillas*, but it is certain that the larger part of them do so. Neither is it certain that there is not among them some other one or more species, which, by cultivation and improvement, might be made to yield a vanilla equal or superior to that now yielded by the *V. planifolia* and its varieties. The fact that the use of vanilla dates back to prehistoric times leaves us in doubt as to whether the quality of this fruit, as known at present, may not have been the result of improvement by methods of cultivation of a product which in a wild state was more or less inferior. Certainly, the field for experiment in the way of cultivation and hybridization of species at present uncultivated is most attractive.

Although vanilla is not obtained for economic purposes, so far as known, from any other orchids than those of the genus *Vanilla*, we are by no means certain that this may not result in the future. I have collected in the Andes representative of a distinct genus, *Sobralia*, very closely related to *Vanilla*, the pod of which develops a strong vanilla-like odor upon maturity.

The flowers of an orchid growing in Switzerland have a strong odor of vanilla, and have been found to yield considerable vanillin.

As regards the production of fruits for commercial purposes from the wild plants, it may be said that it reaches very considerable proportions. Even among the Indians of Bolivia, it has been seen the fruit, of a species unknown to me, collected and traded in, each fruit bringing about 6 reals, equal to some 35 of our money. I have also collected vanilla in a wild state in Venezuela, but there was no one of whom I could inquire as to whether it yielded a useful fruit. Passing out of the reach of such uncivilized districts, we find that considerable quantities are produced without cultivation, and presumably from native species, in various tropical countries.

It is, however, the *V. planifolia* which is chiefly concerned in collection. This species is very widely cultivated, the principal regions being in Mexico and Bourbon, or Reunion Island. The West Indies, Java, Mauritius, Ceylon, the Fijis and the Straits Settlements also yield important supplies. Good scented fruits have been produced in European hothouses, but, of course, not upon a commercial scale.

The methods of cultivation differ widely in the different regions, but are all based upon certain principles deduced from the study of the habits

of the plant in its wild state. Its history in a state of nature is as follows:—It inhabits the richest form of forest land, always completely protected from salt sea breezes, the crevices on a rocky hillside being one of its favorite haunts. It is of terrestrial growth, quickly climbing some adjacent tree trunk. Although it commonly makes a few turns around the trunk, its chief support is derived from the numerous roots which it affixes to the trunk. It ascends to the height of many yards, and then spreads out to a considerable distance over such horizontal supports as it may encounter. The presence of these lixation roots and the fact that it survives for a considerable period after its earth connection has been severed have suggested the idea that it is parasitic or epiphytic, or both. It is not clear just what are the relative degrees of importance of its aerial and terrestrial nutrition, but it is pretty clearly established, especially by the observations of Mr. Charles E. Hires, of Philadelphia, that it cannot long survive after its earth-connection is severed, unless it is able, as is usually the case, to drop down secondary aerial roots, and by this means to establish again a terrestrial support. At the same time we are not entirely without testimony to the continued existence of plants after the decay of their basal portions, and with no other attachment than to the supporting tree. Like most plants of its class, it is fleshy and succulent, and well able to resist accidents of this kind. Its branches readily take root if brought into contact with the soil and this habit is taken advantage of in its artificial propagations by cuttings. Its stem is as thick as the finger, and its leaves are large, oblong, thick and fleshy and very numerous upon the horizontal branches, which are exposed to the light and air. It is these exposed leafy branches, the growth of that year, which constitute the sole flower and fruit-producing portion. There appears to be a very narrowly limited admixture of light and shade which affords the most favorable conditions for flowering, pollination and perfection of the fruit. A lesser proportion of shade will often make the plant thrive better, but will affect adversely its production of fruit. Too much shade, on the other hand, will often result in subjecting the plant itself to destructive fungus disease.

The flowers are born in axillary racemes of some 15 to 20, and they are of a pale greenish white or cream-color and pleasantly fragrant. Nature has taken special care that the flowers shall not be self-pollinated, as she has interposed a well-developed blade of tissue, the labellum, between the pollen and the stigma, preventing all natural contact between them, and causing them to depend for their pollination upon the visits of insects, this mode invariably resulting in cross-pollination. This fact renders it quite certain that the constant introduction of new vital elements from other plants is necessary for the well being of the species and leads to the inference that it is only a question of time when the habit of propagating exclusively by cuttings will result in serious vital deterioration, as has resulted with the sugar-cane, and necessitate the renewal of the stock from carefully produced seedlings. It has been ascertained that, one either to a scarcity of the necessary insects or from the action of some obscure law, only about one on an average, of the 40 flowers ordinarily produced upon a branch of one or two feet in length, will become pollinated, but that, if artificially pollinated, nearly all of these may

be made to yield fruits, although such a prolific yield as this would be very bad for the crop and for the plants. Sometimes a dozen or more fruits will mature upon a single raceme. They will then vary greatly in length—from 5 to 19 inches—and from  $\frac{1}{2}$  to  $\frac{3}{4}$  inch in diameter. Taken as they run, they will weigh from 25 to 35 to the pound in the fresh condition. After curing, their diameter will be reduced by nearly  $\frac{1}{2}$  and their weight by about  $\frac{1}{3}$ .

The bright, green fruit, commonly called a bean, is structurally triquetrous, but two of the sides are so far rounded as to make it appear nearly terete, with one flat side. The top is contracted and then again slightly expanded into a little disk. Its growth ceases many weeks before its maturity. When ripe, it turns first yellowish, then brownish, and if left upon the plant, will split into three parts, and a thick fragrant viscid juice will be exuded. It is just before they begin to turn brown that the fruits should be gathered. If left longer, they will usually split in the drying process, thus seriously affecting the value of the crop. At this time the characteristic odor is not yet developed. It will develop the fruit is left upon the plant, though to a less degree than when artificially cured.

The origin of the use of the vanilla bean, "Bainillo" as it is called throughout tropical America, and, for aught that we know for certainty, its cultivation, is lost in antiquity. It was found in use by the native Mexicans when the country was discovered. They used it for mixing with and flavoring their chocolate, and it was for this that it was introduced abroad. It was only after a long time that it began to be used for flavoring other substances, and only within quite recent times that its present broad field of utility has been developed.

In citing the chief facts in regard to the cultivation of vanilla, reference is made, unless otherwise stated, to the industry as it exists in Mexico, where the conditions are the natural ones of the original home of the plant. The large number of commercial grades depends in part only upon differences in the characteristics of the different beans, as determined by the sorting process. A more important difference is caused by the varieties of the vine which produces them. These are five in number, known respectively as "vanilla oriente," meaning regular or current vanilla; "V. sylvestris," meaning wild vanilla; "V. mestiza," meaning medium vanilla; "V. puera," meaning hog vanilla, and "vanillon,"\* meaning big vanilla. It will be observed that these names bear no botanical significance, being only native names used to characterize the quality or condition of the plant, and thus of its product. All except the last apparently proceed from varieties or states of the V. planifolia. The exception, vanillon, is the product of V. pompona, a distinct native species. This bean is much shorter, twice as thick, looks like a banana and has a pleasant, fruity flavor, on account of which it is eaten. It does not often get to the market. It thus appears that the vanilla fruit is edible by men, and is presumably to be regarded as a food-fruit for animals, a consideration which has an important bearing upon any inquiries which we may institute as to the vegetable physiology of the fragrant principle, which can hardly be regarded

\* The term "vanillon," as it is used commercially in this market, refers to a different article, a product of Bourbon.

as a provision to attract pollinating insects, but which may possibly be an influence in procuring dissemination.

The cultivated plants are trained to native living trees. Much care is necessary in selecting the sort of tree for this purpose, in order to secure just the right degree of shade. Besides this there are many ideas prevalent among the cultivators, most of them probably fallacious, regarding special influences which the supporting tree may have upon the growth of the plant. At Reunion artificial shade is employed,

As has already been stated, the crop is very greatly increased by artificial pollination of the flowers. Most planters believe it best to pollinate but two or three flowers of each raceme, though some believe in pollinating five or six of them. At Reunion, and in some other localities, there is a complete absence of the necessary insects, and all pollination must be artificially performed. In such cases the mode of training the vines is modified by considerations of convenience in reaching the flowers. The pollinating process is very simple, and is rapidly performed. The pollen, which is granular in form, is situated directly above the stigma and scarcely a line distant from it. There is interposed between them, however, a little blade of tissue, which perfectly separates them. Artificial pollination consists in holding the flower with the left hand, running a splinter of wood or bamboo underneath this separating partition, elevating and turning it backward, and at the same time pressing the upper portion of the flower, bearing the pollen, downward upon the stigma with the finger of the left hand.

The plant blooms in March, April and May, and the fruit should be gathered in the following January or February. Unfortunately, the habit prevails in Mexico of stealing the fruit before it is harvested by the proper owner. This leads to a state of rivalry among the different sets of thieves and the owner of the plantation as to who shall be, figuratively and literally speaking, the first in the field. As a result, a large part of the crop is harvested some two or three months before the proper season, and before it is in a condition to develop anything like its possible percentage of active constituent. A well-matured fruit, if also well cured, should become of a beautiful silvery white color, due to a crust of fine crystals which develop upon it. This will not occur in the case of a fruit prematurely gathered (*Fide* Hires.) Very few raisers of vanilla cure their crop, this being a separate industry, requiring great experience, judgment and care, being restricted to the hands of a few persons and yielding a great profit. The curers purchase their beans from the producers. In curing, the fruits are placed between woollen blankets in a sweating-box and left there 36 hours. The exuded moisture has then to be very carefully dried off in the midday sun, or, if the weather is bad, in ovens. This portion of the process is of the most critical character imaginable. It is said that overexposure of the fruits for even a small portion of an hour may result in a loss of weight extending to one pound per thousand beans. On the other hand, an under-exposure is likely to result in the moulding of fruit, this frequently taking place after it is packed, so that the packer is ignorant thereof, and unable to take any measure to prevent it. After this drying, the fruits are again sweated and again dried, this process being repeated as

often as necessary until the fruits are quite black, and until the judgment, born of experience, teaches that they are in a suitable condition for being packed. The complete process of curing requires some three or four months. This curing process varies greatly in different countries, and doubtless great improvements in it still remain to be discovered. In Bourbon they go through a preliminary sweating by exposure in tins to a steaming atmosphere for a day. They are then carefully dried in the air for three or four days, indirectly exposed to the sun; after which they are placed in air-tight boxes with trays of calcium chloride, for nearly a month, thus completing the curing process.

Success has been attained by experiments consisting in immersing them for a time in alcohol, in the manner in which tonka beans are treated. In Guiana they are buried in ashes and left until they begin to shrivel, and then afterward painted with olive oil.

In Peru they are dipped into boiling water, dried for 20 days, and then painted with castor oil.

With the details of the sorting and packing process I have not time to deal. Twenty-one distinct lengths are recognized by the Mexican traders. The United States Consul at Vera Cruz says that a stem will yield about three pounds of dried fruit— $\frac{1}{3}$  of it first class, 1-3 second class, the remainder third class.

Vanilla packers are liable to certain peculiar accidents. Owing to the peculiar strain brought to bear upon the muscles of the hand in holding the bundle which is being made up, muscular cramps are developed, and the bundlers feel obliged to rest for four or five days after having worked for that length of time.

The beans are said by Mr. Hamilton, of the house of David E. Greene, to be poisonous to about 2-3 of those who handle them, the effects extending only to those parts of the body which are exposed to contact with the fruit. Much discussion has taken place in relation to the nature and origin of this poisoning, which takes the form of a fine rash, something like that produced by our poison ivy. It is impossible to discuss this question here, but I may say that it has seemed to me, after all that I have read in relation to it, that this is most likely due to the numerous needle-like crystals of calcium oxalate which exist in the bean, than to any other cause.

## THE MICROSCOPICAL CHARACTERS OF VANILLA.

BY SMITH ELY JELIFFE, M.D.  
STRUCTURE OF THE FRUIT.

In general it may be said that the different varieties of the vanilla fruit have an analogous structure. The form we have here is about 25 cm. long, about 10 mm. wide and 6 mm. thick. The color is a rich dark brown, and it has an oily to resinous feel. It is longitudinally wrinkled and covered with a whitish crystalline deposit of vanillin.

A transverse section shows that the fruit is elliptical, and the moderately thick walls enclose an irregular triangular cavity, into which several rib-like processes extend. These are the placentae, and support the fine black seeds, which are very numerous. Each placenta is two-ranked. The interior of the cavity of the ovary is filled

with minute papillae, to be mentioned later under microscopical considerations.

The external surface of the fruit is the epicarp, which is composed of thick-walled regular cells, disposed in a single row. Beneath this the tissues are very thin walled and lax, containing considerable amounts of an oily substance with the characteristic odor of vanillin, and also containing a large number of fine acicular crystals of calcium oxalate. These are in general larger than the crystals found on the exterior of the fruit. The polygonal cells of the mesocarp are finely pitted in the main, but a number of them, especially near the periphery, are irregularly marked.

In the mesophyll are the fibro-vascular bundles. These are irregularly scattered, the external ones being somewhat radially disposed, while those further in are not infrequently tangentially arranged. The bundles are loose and lax, and are built on the concentric type. In the centre of the bundle the fibres and sieve-tubes are found. These are surrounded by a number of ducts, which are usually spiral in type, and sometimes interspersed with annular ducts. Irregular resinous masses and prisms of vanillin may be found in the tissues of the mesophyll.

The innermost layer of the mesocarp is made of smooth, slightly flattened cells, which bear a single row of unicellular papillose hairs, which project into the central cavity. These hairs have the interesting function of secreting the oily and resinous substances which elaborate vanillin.

A few words upon the microscopical identification of false crystalline structures on the outside of the fruit. Unscrupulous dealers often use benzoic acid to make a false appearance of vanillin. It is to be distinguished from the real article by the fact that its crystals are flattened and rhomboidal, whereas the crystals of vanillin are usually acicular and stand out, as a rule, at right angles to the surface of the fruit.

#### THE MOULDS UPON THE FRUIT.

A beautiful specimen of the fruits was given to me by Mr. Henning which showed a marked development of mould on the inside. Fragments of this mouldy fruit were planted upon gelatin and nutrient agar-agar with the following results: The principal mould found was "*Aspergillus repens*;" another form was the "*Mucor circinelloides*." The first of these moulds is extremely common over the civilized world. The second is a form that has been found by me in the air of this city, but it is extremely rare. In Europe it is reported much more frequently. The characters of these moulds can be seen by consulting the *Journal of Pharmacology* for November, 1897. A number of bacteria were also obtained, but these were in all probability from the air, and not deserving of special mention.

#### THE CHEMISTRY OF VANILLIN.

BY VIRGIL COBLENTZ PH. D.

The odorous properties of the vanilla bean reside in the crystalline principle vanillin and a minute quantity of a balsam-like substance which is found in the seed. As is well known, the odorous principles are not well developed until during the curing process. It is then evident that there pre-exists in this fruit a complex organic body, which undergoes hydrolysis, or oxidation, during the sweating process, the exact nature of which changes has never been studied.

#### METHODS OF PREPARING RUBBER.

BY R. H. BIFFEN.

So much has been written within the last few years on the subject of India-rubber, the sources of our supply, and the possibility of acclimatizing the best-yielding trees in our colonies, that at first sight it may appear that there is little more to be said. A study of the methods in use for preparing rubber from the latex, or milk, may however be of use to many interested in the formation of plantations, especially if some attention is paid at the same time to the inaccurate statements made in some recent publications, which apparently have disregarded the valuable series of papers on the subject contained in our one journal devoted to economic botany, the "*Kew Bulletin*."

The methods in use at present are either the out-come of the limited experience of uncivilised peoples, or the application of experiments made without paying due attention to what is known of the chemical constitution and physical properties of latex. As a good example of the latter we may take the experiments of Morisse,\* who found that coagulation was brought about in the latex of *Hevea* by the addition of alcohol, pheno, hydrochloric acid, nitric acid, sulphuric acid, calcium chloride, ferric chloride, corrosive sublimate, &c.

As the outcome of these experiments, a mixture of phenol in alcoholic solution, and dilute sulphuric acid, was recommended as a coagulating agent.

The latex is, as a general rule, a thick, white fluid, composed of small particles of rubber in suspension in a clear watery solution of various substances. Unfortunately, only the latex of a few trees has, as yet, been chemically examined when fresh.

The analysis of the latex of *Hevea brasiliensis* shows that it contains:—

Rubber .....	32 per cent.
Proteid matter .....	2.3 "
Calcium and sodium salts .....	9.7 "
Resin .....	traces
Water .....	55 to 56,,

It is slightly alkaline to litmus paper.†

The presence of albumin, globulin, and other proteids, has been demonstrated by Green‡ in some other rubber-yielding latices:

As a general rule all these substances are to be found in rubber as it is at present prepared, often with others added to bring about coagulation of the latex, and accidentally or intentionally added impurities such as bark and clay. In all cases the percentage of impurities is large, how large we shall see later, and when it is remembered that some cause a rapid deterioration of the rubber, it is obviously much to the interest of those connected with the industry that a method of preparation should be adopted which would minimize them or ensure their absence.

I propose now to consider a few of the better-known varieties of rubber.

*Para Rubber* is the product of *Hevea brasiliensis*, a tree which thrives in many parts of the Amazon valley, British Guiana, &c. As pointed out by Churchill§ in his consular report, there is no danger of this source of supplying becoming exhausted, though this is the frequent cry of com-

\* Seeligman, Lamy, et Falconnet; "*Le Caoutchouc et la Guttapercha*." Paris, 1896. p. 68.

† "*Le Caoutchouc*," &c., p. 94.

‡ Green, "*Proc. Roy. Soc.*," 1886, p. 23.

§ "*Kew Bulletin*," 1898, p. 241.

panies formed for rubber-planting, usually fated for an ephemeral existence. The tapping is done with considerable care by the natives, and even should a district become exhausted, in a few years a fresh supply of trees springs up. From the planters' point of view Brazil is hardly a suitable country, for the climate is bad, it is difficult to obtain labour, and the exchange is liable to endless variations. The trees have, however, been introduced into Ceylon, where small plantations exist, and into other colonies\*. The method of preparing the rubber has been so frequently described that repetition is needless; but a "translation of a valuable article on rubber of the Orinoco" † has received so much attention of late that it requires some examination. One of its most striking errors is the following:—"As the juice contains a considerable quantity of water, the preparation of rubber consists essentially in separating the former from the latter, which is performed by evaporating the water by means of a heating process or obtaining its coagulation by certain chemical processes. Although the last system is more rapid they prefer the former, as they pretend that the rubber thus obtained is of a superior quality—a supposition devoid of all reason."

As I have already had occasion to show, ‡ this statement is incorrect, for the heating continues for too short a time; ("the rubber" is not "dried in a few minutes") and to evaporate off some 50 per cent. of water, and further there is no loss of all reason," for it is a well-known fact that the smoked rubber is far preferable to that obtained by chemical processes. A comparison of the prices of "Parà fine" and "sernaamby" should be sufficient proof of this. Why it is so may be made clearer from the following experiment. At the end of a day's work I had several litres of latex left, to which an equal volume of water had been added, which would not keep over night without coagulating. To this a small quantity of acetic acid was added, and in a short time the whole of it had formed a stiff curd. On pressing and drying, a portion of the water exuded from this mass of sernaamby, but it still remained full of cavities, and the proteid matter in it quickly decomposed, so that ultimately a stinking, inflated mass was obtained.

If this latex had been coagulated by smoking it would have yielded a wet rubber, but the subsequent decomposition of proteids would not have set in, for the creosote contained in the smoke would have acted as an antiseptic and prevented decomposition, as it does when meat is preserved by smoking.

Then again we find, "the rubber thus prepared (by smoking) acquires a darkish colour, due to the particles of coal which adhere to the outer skin. Some people believe that this tends to improve it, but such is not the case, for it is thus impregnated with impurity." † Now when these "bottles" of rubber are cut across, the fresh, laminated surfaces are a silvery grey colour, and as each layer is exposed to the same extent to the action of the smoke it is difficult to account for the outer layers only being so coloured. The freshly cut surfaces however soon darken and become black in turn, so that the explanation of oxidation seems far more probable, especially when taken in conjunction with the fact that smoke is white ‡

and not black,\* for the nuts are simply dry-distilled and not actually burnt. If the smoke of these heated urucuri nuts is condensed it forms two layers of liquid in the receiver, one a clear limpid solution consisting mainly of acetic acid, the other, darker in colour, of creosote.

The hot vapour of acetic acid brings about the coagulation of the proteids of the latex, as many easily be proved by direct experiment.

A solution of alum is said to be in use for preparing rubber in some parts of the Amazon valley. Morisset † states that alum solution has no effect upon the latex of *Hevea* species however.

The loss in the factories on making up Parà rubber is as follows:—(1) Parà fine, 10 to 15 per cent.; (2) Entre-fine, the carelessly smoked pieces, 15 to 20 per cent.; (3) Sernaamby, rubber pulled from the cuts on the tree and cups, coagulated by being allowed to stand, &c., 20 to 40 per cent. From these data we may safely conclude that the smoking method of preparation is by far the best in use at present, a view which will be further strengthened when we compare the losses on making up other sorts of rubber.

*Ceara Rubber* is the product of *Manihot Glaziovii*, a tree growing chiefly in the highlands of the State of Ceara, Brazil. Cross is responsible for most of the descriptions of the locality in which it grows, but as his experience of it appears to have been limited to Pacatuba, in which place its habitat is far from typical, they are not very accurate. He records it as growing at an elevation of 200 feet above sea level, among granite boulders, in a country whose dryness was indicated by the fact that "ferns, weeds, grasses, and mosses" were absent. True, it does grow among granite boulders, in the scantiest of soil in such localities, but it is more at home in the mountains, up to a height of 3,500 feet, and even more, where there is an abundant rainfall. These facts will serve to show the wide range of conditions the tree will put up with, and were it not for the smallness of its yield (1 to 3 lbs per annum) it would be invaluable for introducing into many of our colonies. Coagulation is brought about either by smoking, as on the Amazons, or by simply allowing the latex to dry on the tree-trunks or soil.

The latter methods are objectionable, as the rubber invariably contains pieces of bark or grit.

It may also be prepared by churning the latex, and pressing the resulting clots. The method is not to be recommended though, for even if the clots are cut into thin slices and exposed to the heavy pressure of a mandioca press, a considerable percentage of water remains in its cavities, and decomposition sets in, but not to the same extent as in "Cearà scrap."

Although so inure it commands a price usually second only to "Parà fine." The loss is from 20 to 25 per cent., which, in inferior qualities, may even amount to 55 per cent.

*Mangabeira rubber* also comes from Cearà. It is the product of *Hancornia speciosa*, a dwarf tree with somewhat the habit of a birch. The rubber is prepared by the addition of an excess of salt to the latex, or by Strauss' method of adding alum. Even after thirty days' drying in the sun it is spongy and full of cavities of liquid. As might be expected, the loss on purification is enormous, amounting to from 40 to 60 per cent.

\* Compare the plate on page 757 of the "Journ. Soc. Arts," 1898.

† "Trinidad Bulletin," 1897, p. 37.

‡ "Le Caoutchouc," &c., p. 67.

By this method of coagulating with chemical reagents it is impossible to get rid of the coagulated proteid matter, to say nothing of the greater part of the water. Morellet's remark that "le procédé Strauss est ingénieux, mais les résultats de son application sont mauvais" may well be applied to all these chemical methods, and the sooner the search for coagulating agents is abandoned the better.

The only other American rubber of importance, at present, is yielded by *Castilloa elastica*. It appears on the market in a number of different forms under the names of Mexican, Nicaragua, &c. As far as we know *C. elastica* is the only species of the genus yielding rubber, for the *C. Markhamia* of Collins turns out to be a *Persea* species.†

The latex is obtained in a rough and ready fashion by hacking a spiral channel from the crown of the tree to the ground, or by making great gashes with a machete.

Collins‡ has recommended a timber scoring knife for tapping, and since then most writers have followed his lead. On experimenting with one, I found it was practically useless, as little latex exuded, possibly owing to the closure of the vessels by the drag of its edge. Stabbing with a broad-bladed knife, or with a chisel, as practised in Ceylon,§ gives good results without much damage to the tree. In the previously-mentioned article in the "Trinidad Bulletin" (1848), there is some slight confusion as to the localities suitable for the growth of *Castilloa*. In one place (p. 122), "it will scarcely thrive in regions that are not equally suited to *Hevea spp.*," which (p. 130) grow "on land which is periodically inundated, even to a depth of five feet." Then (p. 121), "the tree (*Castilloa*) avoids marshy or boggy land, and manifests a preference for warm, deep loam, or sandy soil." The latter statement is the correct one.

The most general method of preparation in Mexico is to add an extract of the leaves and stem of the moon-flower (*Ipomoea bona-nox*), and allowed the mixture to stand over-night. The floating clot which forms is then pressed to remove some of the water.|| As in all these cases of preparation by "wet" methods the rubber contains large quantities of water, it loses from twelve to thirty per cent. on drying. Another method is in use in Nicaragua.¶ The latex is mixed with about three parts of water, and allowed to stand over-night, when the rubber comes to the surface in particles are mixed with a fresh supply of water, and the process is again repeated. The particles are then brought into a solid mass by pressure. The latest account of this method is apparently given by Hart, in an article on the "Coagulation of Rubber,"\*\* who appears to have rediscovered it. I quote it in full as I may be mistaken. "After the addition of water, the mixture is well shaken; the globules of rubber (having a lighter specific gravity than the albumenoids and proteids [sic] contained in the latex) will float quickly to the surface. It is found moreover that on the removal of albumenoid liquors from below the floating rubber, the globules rise much more quickly to the surface."

¶ Belt, "Naturalist in Nicaragua," p. 33. Morris, "Colony of British Honduras," p. 76.

\*\* "Le Caoutchouc," &c., p. 62. "Kew Bulletin," 1887,

The following criticism of this "creaming" process is given in "Le Caoutchouc et la Gutta Percha":—"Ce mode de préparation est bien rudimentaire et ne peut fournir qu'un produit de qualité inférieure, qui perd souvent plus de 50 %, surtout lorsqu'il fraîchement préparé."

Recently there has been some talk of extracting rubber from leaves and twigs by means of solvents, as has been done in the case of gutta-percha. A description of this latter process may therefore be of interest. It originated in the smallness of the yield of the *Isonandra gutta* trees, a tree from 25 to 30 years old, only giving 1-3 lbs. of gutta-percha when felled. The explanation of this fact is to be found in the work of De Bary,† who showed that the laticiferous system of the tree consisted of short, closed sacs. This being the case, a great many would remain unopened, and thus a considerable percentage of the gutta-percha would remain in the bark. As the demand for gutta-percha has been large, and the supply has been obtained by felling the trees, they have become almost extinct.‡

Serullas proposes to utilise the leaves and twigs of the shoots from the old butts to extract the gum from. They are dried, treated with caustic potash to destroy colouring matters, and treated with a solvent for gutta-percha. The solvent is then distilled off and may be used again and again.

Rather more than 1 lb. of gutta-percha is said to be yielded by 30 lbs. of chopped up fresh leaves and twigs.§

For several reasons I do not think this process could profitably be applied to the preparation of rubber. The most important of these are (1) on gathering the leaves and twigs there would be an immense loss of latex, and (2) stripping trees of their foliage (the part which builds up their food supply) invariably kills them.

The direction in which research work should tend, I venture to think, is to prepare rubber free from the other constituents of latex, so that among other things, freight and customs charges on these impurities may be avoided.

Now it has been shown conclusively that the chemical constitution of latex varies with its source, so that it is improbable that any one reagent can be found capable of coagulating any given latex. Thus from the fact that acetic acid coagulates the latex of certain *Hevea* species, it cannot be argued that it will coagulate the latex of a *Kicksia* species.

Then expert opinions, as we have seen, show that the preparation of rubber by these chemical means is not satisfactory, for the product is far from pure.

I have recently succeeded, however, in preparing pure rubber by a physical process, and so demonstrated that chemical methods are not necessary. This is effected by centrifugalizing the latex in a special form of separating machine, when the rubber particles, which have a smaller specific gravity than the medium in which they are suspended, are thrown out of the bowl in an almost dry state. They may then be converted into a solid mass by slight pressure, or by draining off the small quantity of water which remains with a porous tile. So prepared, the rubber forms a translucent mass, free from its usual smell and from all danger of decomposition.

The merits and demerits of this mode of preparation must rest entirely with me, but I cannot be responsible for any statements made in Trinidad, where a copy of my experimental machine was recently exhibited without my consent or knowledge.—*Journal of the Society of Arts.*

**PLANTAIN OR BANANA MEAL OR FLOUR.**

In continuation of my report No. 333 of July 27, 1898. I have the honour to state that I have been in communication with the Superintendent of the Botanical Department, Trinidad, and the Director of Public Gardens and Plantations, Jamaica, on the subject of Plantain Flour Meal. The reports received by me from Trinidad and Jamaica (copies of which I annex) are undoubtedly discouraging.

I have been delaying this report in the hope of being able to add some further information on the subject which I have been expecting from those to whom I have forwarded samples of plantain flour, but up till now I have not received reports on the samples sent.

In the meantime it is reassuring to find that Dr. Tibbles, who is referred to in Mr. Hart's letter, is now advertising "Malted Banana Food." This new departure should improve the prospects of a trade in plantain flour. It would appear that desiccated ripe fruit is difficult to handle as a trade article, owing to its liability to fermentation.

I might here refer to the experiment lately carried out in North-West India by the Director of the Saharanpore Botanic Gardens in drying plantains—among other fruits—by means of Dr. Ryder's American Fruit and Vegetable Evaporator. The following are the particulars regarding plantains in this experiment:—

	Unripe.	Ripe.
Number of fruit used	376	251
Weight of fresh fruit	88 lb.	88 lb.
Cost of fruit per 100	R1'6 5-12 a.	R1'6 5-12 a.
Wood used for drying	2 maunds	3 maunds
Value of wood at R3 per m.	10½ annas	R1
Time occupied in drying	24 hours	74 hours
Weight of dried produce	10 lb. 2 oz.	16 lb.
Cost of dry produce per lb.	9½ annas	4½ annas

Adding to these further items of cost given, viz.:—

Preparation of fruit for evaporation and attendance during drying	½ anna per lb.
Interest on evaporator and premises	1 " "
General supervision	1 " "
	2 annas

we get the cost of producing 1 lb. of dried unripe plantains as 11½ annas, and of dried ripe plantains 6½ annas.

It will thus be seen from the above statement that it takes 87 lb. of fresh fruit to produce 1 lb. of dried unripe fruit at a cost of 11½ annas, or 69 cents, and 5½ lb. fresh fruit to produce 1 lb. of dried ripe fruit at 6½ annas, or 39 cents.

It is interesting to compare with these figures the details of cost, &c., supplied by the Chief Clerk of the Anuradhapura Kachcheri, who makes out that about 6 lb. of peeled unripe fruit yield 1 lb. of flour and 1½ lb. dried chips, while the approximate cost of producing a pound of flour is given as follows:—

6 lb. peeled fruit at 2 cents per lb.	... 12 cents
Cost of labour for drying and pounding, &c.	4 " "
	16 cents

The fruit here used is, as stated, unripe (but not far from becoming mature) and the cost—16 cents per lb. including pounding—by this sun-drying process compares very favourably with the cost of dried unripe fruits desiccated by the American evaporator, viz., 69 cents per lb.

It must be borne in mind, however, that the price of plantains in places like Anuradhapura is infinitely less than in Saharanpore, where they are quoted at Re. 1'6 5-12 annas per 100, equivalent to Re. 1'38 of our money.

The Indian report makes out that about 4 fresh unripe fruits go to make up a pound, which, at the rate of Re. 1'38 per 100 would be 5½ cents; while, according to the figures given by the Chief Clerk of the Anuradhapura Kachcheri, a pound of peeled fruit costs only 2 cents. So that there is an important difference in the cost of fresh fruit at Anuradhapura and Saharanpore. But even calculating the cost of fresh fruit at 2 cents in the Indian Experiment, the cost of producing one pound of dried unripe plantains with the American evaporator would not be much less than 25 cents, as against 16 cent given as the cost of 1 lb. of flour—using the heat of the sun for desiccation. Still, it would not be fair to come to any decision by calculating on paper, and if the American evaporator could be tested for plantains in Anuradhapura under conditions very different from those at Saharanpore—with possibly cheaper fuel and labour—it will probably be found as the Chief Clerk is led to expect, that the use of machinery will tend to reduce the cost of production. But, of course, in that case the manufacture of plantain flour must be on a large enough scale to fully test the capacity of desiccating and grinding apparatus, the initial cost of which is so large.

Details of initial of working cost of a fruit dryer (I saw one of these—an American patent—on trial on an up-country estate some years ago) could be obtained locally.

Mr. Waters of Hawkesbury Agricultural College, recommends a simple and cheap arrangement for drying fruit when sun heat is not available. The following diagram and description will explain the construction:—

The framework consists of hard wood, and the whole covering of either tongued or grooved seasoned boards or galvanized iron, though the boards are better as they do not tend to coil up so quickly.

The circle marked A represents the improvised furnace made out of two oil-drums, by taking the rim off one and forcing it (the drum) about an inch into the other, one of the tops or lids being converted into a door. A hole should be made in the end, and a small flue attached and carried above the machine as shown at B. The bottom of the dryer C can be made of iron, and should be perforated to allow the heat to rise from the air chamber D. Cleats should be nailed on each side as shown in the figure, to slide the trays in and out on. The size of the trays should be 3 ft. by 2 ft., and twenty-four of these could be put into the dryer at one time. The size of the dryer should be 3 ft. by 4 ft. by 4 ft. (inside measurements), and two doors (or, better still, one) provided. Every joint must, of course, be as airtight as possible.

The great advantage of this simple dryer, which could be built by any handy man, is its cheapness: and it can always be used for drying fruits when they become too ripe for eating raw. Mr. Waters admits his preference for sun-dried fruit but of course, in wet seasons a cheap dryer such as I have described would be invaluable, and it is as well that it should be given a trial before investing in more expensive apparatus.

[As regards the two names "bananas" and "plantains," it is advisable that the arbitrary distinction should be rejected, and, as Dr. Watt recommends, the commoner name plantain only used.]

*Annexures.*

MR. HART to MR. DRIEBERG.

Botanical Department, Trinidad,

August 26, 1898.

MY DEAR SIR,—So far as I have seen, there is little hope for a trade in banana meal—dried bananas, &c.—unless a man of Lipton's or Hooley's stamp arises to form the articles and create a demand,

The material is good, and can be supplied in quantity, but buyers are wanting. Advertise dried bananas in the same way as Tibble's Vi-Cocoa, and it would sell and make handsome profits, but to put small samples on the market results in loss and failure.

Yours, &c.,

J. H. HART.

Mr. FAWCETT to Mr. DRIEBERG.

Hope Gardens, Kingston, P. O.,  
Jamaica, August 30, 1898.

DEAR SIR,—I Regret to say that at present there is no established trade in banana meal or banana flour. Efforts are continually being made however, and I hope we may be successful before long.

Yours, &c.,

W. FAWCETT.

Mr. FAWCETT to Mr. DRIEBERG.

September 12, 1898.

SIR,—In answer to your letter of 20th July, I beg to enclose copy of a letter from a resident here, who has done his best to start a trade, but so far has failed.

I shall be pleased to give you any further information in my power.

Yours, &c.,

W. FAWCETT.

With reference to the "banana meal," there is really no market or outlet for it, and I have been working the thing for all its worth, and have spent about £300 over it trying to get a satisfactory market, but all to no purpose.

Quotations have been made by Messrs. John Haddon & Co. Bouverie House, Salisbury Square, London, E.C., as being worth £27 a ton of 2,240 lb. ex-warehouse and docks, London. I have offered to supply at those rates—Haddon & Co. were simply booming it.

I have sent tons of meal to various countries—all to no purpose—as the market seems to want it to compete with wheat or rice.

All I can manage to sell is a barrel now and then. I sell at 3d. per lb. landed in Kingston.

The dried banana as a fig is a failure, as the viscous fermentation sets in so quickly that by the time the fruit has been in England two or three months it is too unsightly to look at the second time, or, as my London Agents wrote to say, "it's too suggestive."

I am sorry I cannot give you a brighter account.

Mr. Geast, if he could have got the meal in free to the States, would have taken all the Island could have produced at £30 per ton ex-warehouse New York. He wanted it for a new kind of beer.

### PLANTING NOTES.

**RHODODENDRON CILICALYX.**—This is the name of a new Rhododendron discovered by the Abbé Delavay, in Yunnan, and figured by M. André, in the *Revue Horticole* of the 16th inst. The leaves resemble those of *R. ciliatum*, and the flowers, which are between 4 and 5 inches across, are widely campanulate and white, flushed with violet. The calyx is less than a quarter-of-an-inch long, with rounded lobes, bordered with long hairs. The plant has flowered in the garden of M. Milne Edwards. *R. cilicalyx*, with no fewer than thirty-five other species from the same region, was described by M. Franchet, in the *Bulletin Soc. Botan. France*, xxxiii., p. 223, and yet there are those who consider that there are no more worlds to conquer in the department of systematic botany!—*Gardeners' Chronicle*.

**EUCALYPTUS CORDATA.**—The Earl of Annesley obligingly forwards from Castlewellan, co. Down, a spray with flower-buds of this species, which so far has proved hardy in East Ireland. The mature leaves are sessile, about 5 cent. long by 4 cent. in breadth, cordate, ovate, obtuse, glaucous on both surfaces. The flowers are in stalked clusters, each cluster consisting of three flowers. It is handsome in appearance, and has an aromatic fragrance.—*Gardeners' Chronicle*.

**EUCALYPTUS GLOBULUS.**—An interest being evinced in the age and dimensions of species of Eucalyptus growing in these islands, I wish to state that I saw a very fine specimen of *E. Globulus* last summer in the gardens at Meadfoot Rock, Torquay; and Mr. Solomon, the gardener at that place, kindly sent me the age and height of this tree, viz., 20 years and 50 feet respectively. Spreading circumference of the trunk at the base is 3½ feet. *C. L. Branson, Coleshill Park.*—*Gardeners' Chronicle*.

**MR. J. G. BAKER.**—On the occasion of the retirements of this Gentleman from the post of Curator of the Herbarium at Kew, his old colleagues, the members of the staff, presented him with an address expressive of their affectionate respect. A representation of the elegant Bromeliad, called *Bakeria tillandsioides*, drawn by Miss Smith, the botanical artist, served to frame the address. The signatures were confined to permanent members of the staff and to one or two regular visitors to the Herbarium. Had it been otherwise many others would have been proud and pleased to have had the opportunity of adding their tribute of respect and gratitude to one who has done so much for botany and gardening.—*Gardeners' Chronicle*.

**THE SAN JOSE SCALE.**—At the last meeting of the Berlin Horticultural Society, Professor Frank read a paper of great interest on the "San José Scale and its allies." Professor Frank said that zoologists have an idea that the *Aspidiotus conchæiformis*, which is widely dispersed in Europe, is but a geographic form of the American *Aspidiotus perniciosus*. To decide this question, Professor Frank made a special journey last summer to those countries which have a similar climate to that of those American regions where the San José scale makes the greatest devastation, viz., to Tirol, especially to the valley of the river Etsch and Eisark, and also to South Baden. The result of these investigations was to establish the fact that there is not the slightest difference between the *Aspidiotus conchæiformis* of Meran, Botzen, &c., and that of Eastern Prussia. So this is a true species, and different from the American one. Besides this, Professor Frank gave particulars respecting the reproduction of the scale insect. He found that *Aspidiotus conchæiformis* and *obstræiformis* have but one generation yearly, and that one female has a progeny of thirty-five to fifty descendants. American writers say that the San José scale has three generations yearly, and that each female breeds about 600 young scales. To examine into this remarkable difference, Professor Frank received at three different times, in the spring, at the end of June and in the autumn, twigs of Peach directly from America, densely beset with the true San José scale. Investigation showed that on the twigs sent in spring there were numerous females and males, as also young chrysalids in different states of development. On the twigs in June the adult males were absolutely lacking, also the adult females, only young scales in great quantity were present. On the twigs in autumn there were again females and males, and young chrysalids. From this Professor Frank concludes that the San José scale has also but one generation yearly. Besides this, he investigated the females, and found, not 600, but about thirty ova and young in them, a number which is in accordance with that found in the European scales. His decision, therefore, is that the American theory is an erroneous one, it is questionable whether the San José scale can live in Europe at all. *Dr. Udo Dammer, Grosse Lichterfelde.*—*Gardeners' Chronicle*.

## PLANTING IN PERAK.

SIR GRAEME ELPHINSTONE, BART., IN  
THE STRAITS SETTLEMENTS :

We are very pleased to have a chatty letter from the worthy and indefatigable Baronet who was so long known as a hardworking planter in Ceylon, a pioneer of Dimbula and, alas! one of the greatest sufferers from the havoc played by the coffee-leaf fungus. We learned some time ago from Mr. Donald Mackay that "Logie"—to quote the familiar old title—was likely to go home this year, to rest after his long spell of work in the Straits; but there is no indication of this in the letter before us nor in its requirements in the shape of planting manuals and current publications. We quote the following interesting notes:—

"PERAK, Jan 21.—Coffee prices has driven the Straits planters to other tropical products, and many of which products find here the necessary conditions for a successful growth, and the information contained in your publications is most valuable. Some day when I have more time I will send you some details of information in connection with our industries. There is no doubt that the Native States have a very fine future before them. I may not live to see it, but undoubtedly there will be a successful development of tropical agriculture. More capital and more labor are required, but those will come in time.

"I have read with sorrow the intelligence of the deaths of so many of our old and valued friends. It seems so sad that men in the (almost) prime of life, and in many instances the bread-winners, should be taken. Such, however, is a common experience, and we who remain behind are warned by these sorrows that we must be always in readiness for the call when it comes. With best wishes, &c."

We are glad to be able to infer that Sir Graeme is in good health and spirits—his motto like that of Edward Thring of Uppingham would seem to be "Life to the end of work and work to the end of life"; but we trust there will be a time of resting all the same, after the appointed work is finished at the Straits.

## PRODUCE AND PLANTING.

TEA IN THE UNITED STATES.—The consumption of tea has not been increasing in the United States. An official statement on the subject gives the following figures for the ten months ending October 31, 1898:—Imports from United Kingdom, 2,118,352 lb; British North America, 1,367,797 lb; China 22,060,653 lb; East Indies, 1,633,377 lb; Japan, 26,384,204 lb; other countries, Asia and Oceania, 283,675 lb; other countries, 8,974 lb. This gives a total of 53,897,082 lb, against a total of 73,310,181 lb. in the corresponding period in 1897, during which the imports were as follows:—United Kingdom, 4,379,634 lb; British North America, 2,405,900 lb; China, 38,423,783 lb; India, 1,775,471 lb; Japan, 31,964,089 lb; other countries, Asia and Oceania, 346,039 lb; other countries, 15,235 lb. Here is a falling off of 25,423,119 lb. in ten months' imports. As to the sources of supply, Indian and Ceylon planters should note that Japan furnishes 48 per cent. of the total supply; China, about 41 per cent. As the New York correspondent of the *Grocer* referring to these figures says: "There is apparently plenty of opportunity for Ceylon and India to displace Japan and China tea. It is certain that the demand for British-grown tea is on the increase; and that the efforts of Messrs. Mackenzie and Blechynden, the Ceylon and India representatives of the planters, have been productive of large results, that will be more and more manifest as time rolls on."

BOGUS TEA.—The art of adulteration flourishes under nearly all conditions. One would think that it would scarcely be worth while to manufacture bogus tea in these days, but when there is the ghost of a chance of turning a dishonest penny the ingenious cheat seldom misses an opportunity. A Belgian chemical paper gives particulars of a bogus green tea which, after examination, was found to contain 68 per cent. of extraneous leaves rolled into a globular shape. On steeping in water these unrolled less readily than the true tea. A bluish-grey powder separated from the leaves under water, and was found to contain manganese in addition to the ordinary ash constituents, but no copper or lead. The microscopic examination of the powder led to the conclusion that earth and indigo had been used to imitate the colour of pure tea. In general form the extraneous leaves resembled *Thea chinensis*, but differed therefrom in microscopic character, as also from *Epilobium Vaccinium arctostaphylos* and other known vegetable adulterants, and, in fact, could not be botanically identified.

THE TRANS-SIBERIAN RAILWAY AND CHINESE TEA.—We know that in China and Russia it is expected that the Trans-Siberian Railway will give an impetus to the China tea trade. Writing on the commercial aspect of the railway a correspondent of the *Globe* says: "Among the many circumstances that will unquestionably conduce to give Russia an exceptionally advantageous position in the Chinese trade of the future is one that is deserving of special consideration. The Chinese tea trade has suffered immensely by the rapid development of the tea plantations in India and Ceylon. This decline has had the most serious consequences both for the Chinese themselves and also for the Government, Chinese tea being subjected to a very productive export duty. A revival of the Chinese tea trade, not only for consumption in the vast Russian markets, but also in those of other European countries, and passing through a purely Russian channel from the producers to the consumers, would, or course, give an immense impetus to the Chinese demand for Russian goods in exchange.—*H. & C. Mail.*

## PLANTING AND PRODUCTS.

(From the *Passara Planters' Association*,  
Report for 1898.)

The SECRETARY then read the Annual Report as follows:—

SIXTH ANNUAL REPORT OF THE PASSARA PLANTERS' ASSOCIATION, 1898.

Chairman: Mr. J. J. ROBINSON. Hon. Secretary: W. STEWART TAYLOR.

COMMITTEE.—Kandy: Messrs. Duncan, Chairman and Hon. Secretary; for Passara: Messrs. Robinson, Tribe, Hope, Cotton, Duncan, Deaker, and W. Stewart Taylor; for Madulima, Messrs. Mason, Gatehouse, Hall, Webster and Kelly; and for Monaragala, Messrs. Betts and Cockburn.

District Hospital Members: Messrs. Duncan and Deaker for Badulla, and Messrs. Gatehouse and Cockburn for Lunugala, "Thirty Committee" Member, Mr. G. K. Deaker.

REGISTER.—The number of estates on the Register is 41.

MEETINGS.—During the year three General and one Committee meetings were held, all being fairly well attended.

FINANCIAL.—The Books of the Association are laid upon the table for the inspection of members and your Committee have much pleasure in bringing to your notice that the amount standing to the credit of the Association with the Bank of Ceylon amounts to the satisfactory sum of Rs99 13.

TEA CROP.—The estimate for 1899 is 3,014,000 lb. with 7,700 acres in bearing and 2,220 not in bearing. This gives an average of just about 400 lb per acre which speaks well for the climate and general suitability of our district as

a tea growing locality. Your Committee are not sanguine that much good will result from the deliberations of the Indian Currency Commission so far as Eastern producers are concerned but venture to hope that the present crisis in the tea industry will shortly come to an end as from all accounts tea extension to any great extent in the meantime has ceased and this is bound to tell on prices in the near future as the consumption of Indian and Ceylon tea is still largely increasing year by year and new markets are being found. Your Committee are of opinion that the Thirty Committee would have better furthered the interests of Ceylon and increased the demand for its black teas had more attention been paid and money voted to the Russian and Continental markets and less to the American. It also seems to them to have been quite unnecessary to subsidize Lipton who was quite able to push his own business. Your Committee are further of opinion that the tea-cess was raised for finding new markets for our black teas and the funds applied to that purpose; they consider that the arrangement with Mr. Kelway-Bamber and the granting of bonuses to makers of green teas were false steps which the "Thirty Committee" were not authorized to make without in the first place consulting the other District Associations and are much to be deplored. Such unauthorized expenditure of the tea-cess is doubtless the reason for the Committee considering the desirability of increasing the fund.

**CACAO.**—The crop for the year has not been so favorable as might have been expected, but the trees are in good heart and there is every prospect of very good crops for the coming year. The young clearings of this valuable product are most promising and the ravages of the disease on the older fields have been very slight; at the same time your Committee would urge that Government be appealed to at once start an Agricultural Scientific Department to protect us against the ravages of disease and pest and not wait for them to have full sway before any attempt be made to grapple with them. Your Committee would further take this opportunity of thanking Mr. Carruthers for his very valuable reports and hints how to combat and guard against the different diseases which cacao seems liable to.

**ROADS AND BRIDGES.**—Your Committee are reasonably justified in thinking that this Association have every right to be proud of the fact that the Namunakula-Passara Road is now completed and opened for traffic since 1st January of the current year. The fight to obtain this road was fierce and the opposition to it strong and in high quarters. Nevertheless the Association persevered and thanks to our present Ruler the road was granted and your Committee have little doubt of its being largely used as a feeder to the Railway at Bandarawela by estates and also by natives. Two of our respected past Chairmen viz:—Mr. W. Waddon Martyn and Mr. R. P. Macfarlane had much to do with the obtaining of this road and the district is under the deepest obligations to these two gentlemen: there is no doubt that they also will be highly gratified to hear that their efforts have been so much appreciated. Your Committee have also to congratulate you on the virtual completion of the Wellawaya-Mupane road as with the exception of the metaling which will be completed in 1899, all the bridges on this important road (some of them very large ones) will be finished during the current year. The thanks of this Association are also due to Government for the sanctioning of the completion of the small piece of connecting road between the Mupane caddies and the main thoroughfare. Your Committee further think the Association should feel gratified at the promised early completion of the Doomoo Extension road to Dnedin Factory. It is hoped this road will be finished during 1899. Your Committee further trust that Government will see their way to shortly complete the Bibile-Meddagama-Obeyagoda road as they feel assured the cutting of this road will benefit to a very large extent a fertile country with a large native cultivation

and population which is at present practically cut off from all cart road communication. At the present rate of construction there is little probability of this generation seeing the completion of this road for which a comparatively small sum of money will be required. As regards road upkeep your Committee have great pleasure in stating that towards the end of the year the roads were in better order than they have been for sometime and a very large increase to the road votes for 1899 has been sanctioned. This increased vote will allow for sharp corners being cut away, parapet walls erected round culverts, and we are assured that a better method of upkeep will be adopted during 1899. Your Committee also view with satisfaction the great improvements made to the Madulsina road which from being previously a comparatively dangerous one has now been made safe. Your Committee feel it is their duty to place on record the warmest thanks of the Association to His Excellency Sir West Ridgeway for the practical interest he has taken in the affairs of this Association by sanctioning all the above-mentioned large public works.

**LABOR AND THE FEDERATION SCHEME.**—Your Committee have pleasure in reporting that the supply of labor is at present sufficient for the needs of the district but at the same time looking to the large acreage of young tea coming into bearing they are of opinion it would be most injudicious to do any thing to discourage the cooly from returning to the country when his services may be required and they will view with interest the working of the Labor Federation scheme. Advances have been reduced considerably during the year where practicable, and your Committee hope will continue to be so.

**FOREST ORDINANCE.**—Your Committee view with concern the present working of this Ordinance. Some years ago shortly after it was passed the Ordinance was worked in a harsh and arbitrary manner. The matter was ventilated in the press, put right and since then it has worked smoothly and no complaints have been made. Lately, however, since the Forester has been removed, cases have again occurred in this district where the forest ranger has used his powers in a most harsh and high-handed manner; and if this be not put a stop to by the Government Agent, there is little doubt but that a state of matter will arise which your Committee will deplore. The Ordinance was passed, they understand, to protect Government property but not to harass and worry unnecessarily honest and well-known parties.

**REDUCTION OF RAILWAY RATES.**—Your Committee have to congratulate you upon a reduction of railway rates which they flatter themselves was obtained to a considerable extent owing to the agitation first started by this Association, and although they are very grateful for the concession allowed, viz., uniform rates on all goods from Nawalapitiya upwards they are at the same time more than disappointed that His Excellency the Governor has not deemed it advisable to also grant what the members of the Railway Rates Reduction Committee urged him to give, viz., a special reduction on all rice above Nannoya. This would have not only placed Passara and Uva generally on an almost equal footing with the other Kandy side districts, but would have been certain to have secured the traffic now passing over the Batticaloa road. Had this concession been granted while considerably helping us it would have materially increased the profits on the railway which are now likely to be lost to it. Whether this policy is a wise one on the part of His Excellency the future alone can prove. Your Committee feel that the heartiest thank of this Association and all Uva should be accorded to the members of the deputation and especially those members comprising it who reside on the Kandy side for the unanimous way in which they so strongly pleaded for this special relief for Uva. Though their efforts were not successful, it was not owing to their having failed in putting the case for Uva most strongly.

The thanks of the Association are also tendered to the Editors of the *Ceylon Observer* and the "Times of Ceylon" for their hearty and strong advocacy

of the claims of Uva for reduction in railway rates, and also for always advancing the interests of Uva in other ways when necessary.

In conclusion your Committee would like to take this opportunity of asking you to express your thanks to our worthy Government Agent, Mr. Baumgartner, for the very great interest he has always shown for advancing the prosperity and development of this province and for cordially giving his attention to any suggestions proposed to him by your Association or by members individually. Your thanks are also due to the Provincial Engineer and his very active and intelligent staff for the manner in which they have carried out all the large and important new public works which are being proceeded with and have been completed during the year.

#### NILGIRI PLANTERS' ASSOCIATION.

The following are from proceedings of a general meeting held at Ootacamund on the 27th ult. :— There were present: Messrs. S Bayly, A H Gerrard, L W Grey, J Harding Pascoe, H D Wilbraham, J W Minchin, W L Edmiston, and E G Windle (Honorary Secretary.)

*United Coffee Producers Co.*—(For selling coffee direct to consumers)—The Honorary Secretary put the scheme of the proposed Company before the meeting, the prospectus had been drawn up the previous day and would be issued very shortly to planters and others interested; considerable support had already been promised.

*Adulteration of Coffee.*—Mr. Windle moved "that this Association request the U.P.A. S.I. to petition the Home Government for more stringent legislation against adulteration of coffee and to endeavour to unite the coffee-producing countries of the world in support of the movement, and in pressing it upon their respective Governments." Seconded by Mr. L W Grey and carried unanimously.—*Madras Mail*, Feb. 4.

#### CENTRAL TRAVANCORE PLANTERS' ASSOCIATION.

The annual general meeting of this Association was held at Peshurst Bungalow, on Saturday, the 21st ultimo, when there were present:— Messrs. F M Parker (Chairman), F Bissett, H J Blandford, H D Deane, R H Goldie, R S Imray, B Laurie, H S Holder, W H J Leahy, J E Pigott, D MacArthur, the Hon. V B Wilbraham, A E Veale, and as visitors Messrs. E Lalter, W MacGrath, N MacGowan and E Williams.

*Election of Officers.*—The ballot resulted as under:—Chairman, Mr. R H Goldie, Honorary Secretary, Mr. A E Veale. Committee, Messrs. B Laurie, F M Parker and R S Imray.

*Shipping facilities.*—Mr. H D Deane in proposing "that H H Government be asked to erect a covered landing stage with a boarded floor at Cottayam," said, that he had frequently seen tea and rice turned out of carts and waggons into the mud and exposed to the rain and which in consequence suffered much damage, so much so that he had received complaints from his Cochinchina agents of the dirty condition in which his tea invariably arrived at that port. Carried *nem con.*—*Madras Mail*, Feb. 4.

#### THE PAST TEA SEASON.

It is sincerely to be trusted that the lessons of the past season will not be thrown away, in spite of the optimistic views expressed by interested parties, anxious to see over-production continued, or to shield

themselves from the results brought about by their own delinquencies. We have before commented upon the supineness and apathy, or at least want of foresight, displayed by the Indian Tea Association (both here and at home) as well as by the Agents in failing to discern indications of the storm that burst upon the tea interest last season. They should have been prepared to meet the operations of the ring with equal energy, but now that the proceedings of the season are before us, a lamentable want of business capacity is exhibited. No doubt these gentlemen have heard a good deal on the subject from justly incensed shareholders, who in future may be trusted to look a little more closely after their own interests, and ere accepting 10 to 20 per cent dividends, enquire more particularly as to whether all reasonable contingencies have been duly provided for \* \* \* \* we are recommended to go in for quality rather than quantity, and herein lies a latent danger. As we have insisted time and again, there is ample area under plant to supply requirements for (now) the next three years, and if the Anglo-American Distributing Company succeed in establishing direct dealing, we shall have reliable prospective statistics to go upon. Fine plucking must perforce result in diminished yield; so that our planters and proprietors must be prepared for a sudden cry that the visible supply of tea is falling behind requirements; and, most probably, alarmist circulars will be published inciting the unwary into lashing out into those sudden extensions.—*Indian Planters' Gazette*, Jan. 28.

#### TEA IN CONSULAR REPORTS.

ANGOLA.—Teas, both black and green, are in demand. I should advise their being introduced in handsome tins, gilded, silver-plated, or ornamented with crystals. The commercial houses (especially in the interior) are only provided very irregularly with this article.—*Belgian Vice-Consul at Mossamedes*.

RUSSIA.—Odessa may be said to have become the centre of the tea trade in this country. Shipments used to be made via London, but latterly tea destined for Moscow and other towns, has been largely stored at Odessa. China teas are imported in ships of the Volunteer Fleet, which has now practically the monopoly of the tea-carrying trade from China. The total imports of tea into Russia for 1897, including those entering the country over the Asiatic frontier, are estimated at about 40,330 tons; the quantity imported at Odessa for local consumption only was 3,550 tons (257,800*l.* in value), showing an increase of 450 tons over 1896, while 7,750 tons passed through Odessa in transit for Moscow, and 1,340 tons for other towns.—*British Acting Consul-General at Odessa*.

TRANSCAUCASIA.—In Tschakwa the preparation of tea upon a large scale is now being seriously thought of. The necessary machines have already been ordered, and the time is probably not far distant when Caucasian tea will make its appearance on the market.—*Handels-Museum: Austro-Hungarian Consulate at Tiflis*.

#### PLANTING AND PRODUCTS.

(From the *Kelani Valley Planters' Association Annual Report for 1898-9.*)

The CHAIRMAN—The next business is for the Secretary to read the Annual Report.

The Hon. SECRETARY then read the following report:—

FOURTEENTH ANNUAL REPORT OF THE KELANI VALLEY PLANTERS' ASSOCIATION 1898-1899.

Your Committee have pleasure in submitting their fourteenth annual report.

#### MEETINGS.

Seven Committee and four general meetings have been held during the year.

#### FINANCE.

The balance in hand is Rs600 7/3 against Rs641 7/0 at credit of last year.

SCHEDULE.

The Schedule of the Association shows 76 estates, one private and one hon. member, as against 75 estates, one private and one hon. member last year. Seven new estates have joined the Association, and six have ceased to subscribe.

CROPS.

The estimate for 1899 is 13,044,000 lb. The acreage of tea in bearing is 24,817; there are 7,747 acres not yet in bearing; the total acreage in tea is 32,564, which gives an average for the tea in bearing of 525 lb. per acre.

It will be observed that the estimated crop for 1899 is 161,000 under the estimated crop of 1898. This is due to the fact that owing to a bad season in 1898 low estimates have been framed for the current year and that the returns, from some of the native gardens have not been obtained.

Including 1899 extensions the returns show the total acreage in tea 32,564 against 32,245 last year or an increase of 319 acres.

MEDICAL.

The health of the coolies has been fair throughout the year.

Large extensions have been made to the Karawalla Hospital and permanent wards built to replace the temporary ones, and Nurses' Quarters, etc. have been erected.

Your Committee are glad to be able to record that Government has sanctioned the extension of the accommodation of the Avissawella hospital and the work is being prosecuted with all possible despatch.

KELANI VALLEY RAILWAY.

This subject has again (as it has for many years past) engaged much of your attention during 1898, and it is now our pleasing duty to report that the construction of the Kelani Valley Railway has at length been sanctioned by the Secretary of State for the Colonies. Your heartiest thanks are due to His Excellency the Governor for the interest he has taken in this matter and the able and statesmanlike way in which he has supported and advocated the construction of this line. Your Committee, however, very much deplore the delay in starting the same since labour is so plentiful in the district. Your Committee earnestly trust that Government will consider the question from this standpoint and realize the necessity of making an immediate commencement.

In this connection it may not be out of place to mention that the Kelani has become practically useless for river transport.

TELEGRAPHS.

The line to Yatiyantota has been opened during the year and Government has given a definite promise to extend the line to Ruwanwella at once.

As regards the opening of a telegraph office at Dehiowita a letter was received from Government dated September 19th, 1898, stating that they could hold out no hopes of an office being opened there in 1899. Your Committee are glad to be able to report that since then a letter has been received from the Postmaster-General dated December 22nd, 1898, in which he states that:—"He is unaware of any decision of Government not to open a Telegraph Office at Dehiowita. That the cost of opening an office there has been included in the Estimates for 1899 and that he will make known to the Association the final decision of Government as to whether the proposed extension has or has not been sanctioned by Government—shortly."

ROADS.

The roads in the district have been a source of much trouble and dissatisfaction and complaints of their general state have been received from all sides. Questions in reference to Kelani Valley roads maintenance were asked in Council and the replies have not been deemed satisfactory. The Hon. the Planting Member has again given notice of questions on the subject. His Excellency the Governor was interviewed by your Chairman and the Hon. J. N. Campbell and their strong representations induced His Excellency to institute enquiries.

Towards the close of the year the Director of Public Works inspected the district roads which now exhibit some signs of improvement.

MINOR ROADS.

The question of improving minor and other roads in the district is now occupying the attention of your Committee.

COACH SERVICE.

The bad condition of the roads during the year has handicapped the coach service considerably and it is therefore unfair to criticize this service too closely.

Your Committee however regret to note that in spite of repeated protests there is much cruelty practised on the horses, and although the services have been slightly improved during the year, there is still great room for a better class of coaches and horses.

The proposed one-horse coach between Yatiyantota and Kitulgala was found impracticable as Government considered the cost prohibitive.

LABOUR.

The supply has been good, coolies have come in very freely from the coast, possibly exceeding requirements; but this excess of labour will correct itself upon the commencement of the Kelani Valley Railway.

During the year your Committee formed a local Labour Federation which may safely claim to be the first really successful combination of planters for dealing with labour difficulties.

The Labour Federation of the Kelani Valley has worked excellently: it is true that now when coolies are plentiful, there has been little or no strain upon its resources, but your Committee hold that the necessity for this Labour Federation was and is very apparent and its existence will be found to be of immense benefit to the Planters of the Kelani Valley.

The Parent Association Labour Federation Scheme has not been unanimously supported in the Kelani Valley. There is however no reason why Superintendents should not join both Federations and thus secure for themselves double benefits and privileges.

OBITUARY.

It was with the deepest regret that your Committee learnt of the decease of Mr. H. L. S. Ingles, of Melfort, Pussellawa, who was many years a leading planter in this district and sometime Secretary of your Association.

SALE OF A TEA ESTATE.

The property of the Central Terai Tea Company, Limited, in liquidation, was offered for sale by public auction by Messrs. Mackenzie, Lyall & Co., at No. 2, Lyon's Range, on Saturday last. The estate is situated in the District of Darjeeling, Pergunnah Pathburghatta, and consists of about 2,300 acres of land held under lease from Government of which about 412 acres are planted with tea and with large nurseries of high *jat* 12 months' old seedlings; and a large area is under forest, with a valuable bazar at Kaprail. The buildings consist of a large pucca-built three-storied Factory; a convenient pucca-built Manager's bungalow; a pucca-built Assistant's bungalow with thatched roof, a pucca-built withering house with iron roof; two cutcha-built withering houses; a pucca-built store godown with iron roof; two cutcha built wood storing godowns; a wood built charcoal godown with iron roof; an open box-making shed, with iron roof. The out-turn for 1898 was 2,014 maunds, and the estimate for 1899 is 2,090 maunds. The first offer for the estate was Rs. 5,000, and the bidding rose rapidly, by bids of Rs. 1,000, to Rs. 1,000, at which figure it was knocked down to Mr. S. K. Das of the National Agency Co., 3 and 4, Hare Street.—*Indian Daily News*.

FIBRES.—Bulletin of Miscellaneous Information. Additional Series, II. Selected Papers from the *Kew Bulletin*. I.—Vegetable Fibres. [This is a very useful summary of information respecting some ninety different fibres.]

NEW INDIAN PATENTS.

No. 461.—Laurence Oliphant Liesching, secretary and accountant of the Colombo Hotels Company, Limited, Colombo, Ceylon. An improved contrivance for weather-proof and thief-resisting covers for live-stock or goods, either while being conveyed by land or water, or while stored on land or water, as well as for all purposes that tents are at present employed for.

No. 464.—James Ernest Hickmott, engineer, of 20, Park lane, Calcutta. Improvements in brick and tile-making machines.

No. 476.—Samuel Cleland Davidson, merchant, of Sirocco Engineering works, Belfast. Improvements in centrifugal fans and pumps.

No. 450.—Arthur William George Silborn, fibre dresser, pulper and tow manufacturer, of Durban, Natal, South Africa, at present residing at Spence's hotel, Calcutta. Improved apparatus for extracting, cleansing and preparing the fibre contained in the aloë and other fibrous plants.—*Indian and Eastern Engineer.*

PIONEERING AND PLANTING IN COIMBATORE, S. INDIA.

(From a Planter.)

Feb. 3.

The weather is very bright and fine over here and jungle is being felled on several blocks and there has been some good buras.

A Mr. Fox, from Knuckles, came over here to take charge of Messrs. Finlay, Muir & Co.'s land, but unfortunately he has fever in his system and the new clearing work seems to have brought it out badly so he had to leave. He also brought some Sinhalese, but they were a discontented lot, evidently expecting little work and lots of pay; and so the beauty and size of our jungle frightened them away. Though my Sinhalese people have had some rough times, yet with a few exceptions they have done splendid work and are quite happy, looking forward to going to "Lanka" in March, with a nice little sun to enjoy their New Year, and I have no doubt that several will come back here again later in the year.

There are a good many iron-wood trees in the jungles here and also some very fine cedar trees, red and white, three or four feet in diameter. My bazaar is all built of cedar; it is built after the fashion of bazaars in Ceylon and is much patronized by Appuhamy and Ramasamy. My head carpenter finds the work to his taste here and has gone to fetch six more of his trade to assist him.

The next estate has a field of coffee planted last year which is coming on splendidly.

PLANTING IN BRAZIL.

COFFEE—RUBBER—TEA—COTTON—

SUGAR & C.

(BY AN EX-CYLON PLANTER.)

(Special for the "Ceylon Observer.")

Rio de Janeiro, 1st Dec., 1898.

Sir,—Since I last wrote you there has been little news to chronicle as regards Brazilian Agriculture. The low price of

COFFEE

during the last few years has led the planters to think of growing other products.

INDIAN CORN,

which grows well all over Brazil—nor at least the coffee-producing parts—has received a good deal of attention. For the supply of food for tramway mules and for horses belonging to private families, as well as for horses and mules for street transport, and for carriages for hiring, had all to be imported in the shape of

Indian corn from the River Plati, and as it had to be paid for in gold, the price in Brazilian currency rose considerably owing to the fall in exchange. The Government Railways and others in the hands of companies reduced the rates for corn, and with these inducements, planters near a railway have taken to grow a great deal of this produce. Others who have large virgin forests near a railway are sending timber to the towns, for which there is a good demand. A great deal of American and Swedish timber was formerly and is still used in construction in the towns.

COTTON

can grow well all over Brazil, and the many local spinning mills—festered by a heavy protective duty on imported cotton manufactures—give a fair price for the raw material, but as yet the coffee planter has not gone in for much cotton planting.

SUGAR CANE

is being grown in the abandoned coffee lands in the State of Rio de Janeiro, but owing to the expense in turning cane juice into sugar, and the continued low price of the latter article, the juice is turned into spirit, for which there is always a fair demand at a paying price.

INDIARUBBER

has not escaped the attention of the coffee planter. A great deal of writing in the newspapers during the last six months has induced the public authorities to encourage the production, by procuring seed, and selling it at cost price, or even below that, to planters; and to small farmers who will promise to plant it, it is given gratis. *Para Rubber* will not grow in the Coffee Districts so far South as Rio and S. Paulo, but there are other two kinds—first: the *Mangabeira* (*Hancornia Speciosa*). It gives a delicate fruit, called in Brazil *Mangaba*, which is said to be harmless to sick people and in the Northern States of Brazil where it grows wild in the forest has the name of "fruit for the sick." The rubber from this tree has been exported from Bahia and Pernambuco for some years, but not in large quantities. It sells at less than the *Para Rubber*. Judging by newspaper reports, this tree is being planted on a large scale in the west of the State of Rio Paulo. Second:

CEARA RUBBER

(*Manihot Glaziovii*) you are already well acquainted with. It is being distributed in the State of Rio. It will grow in any part in Brazil, but hitherto has been exported only from Ceara in the north. Its price has kept low owing to the careless manner of collecting.

TEA.

I must not omit to mention that *Tea*, your principal staple, has also been thought of. A gentleman of my acquaintance, Col. Joao Antonio Alves de Brito, who owns a large Coffee Plantation in the borders of Minas and Rio States—after getting several particulars from me and reading some *Tropical Agriculturists* I lent him, stuck to the idea, and he told me a month ago that he had ordered through his agents, Tea seed enough to plant two hundred acres of virgin forestland. The seed to be the best kind grown in Ceylon. He at the same time told me he had ordered through Messrs. Crashey & Co., English Booksellers and News Agents in Rio de Janeiro, all the back numbers of the *Tropical Agriculturist* as well as ordered current numbers to be sent regularly.

I did not press him or give him encouragement to go in for

TEA CULTIVATION

indeed I told him it would be a losing game attempting to compete with Ceylon and India, where labour was plentiful at from nine-pence to a shilling a day, while here in Brazil it was scarce and cost from two shillings and six pence to three shillings. He replied that Ceylon and Indian Teas had been selling here, and in other parts of Brazil, at never less than twelve milreis a kilo for some

years; at exchange of eight pence per milreis this was equal to three shillings and eight pence per lb. On his tea—which would be all absorbed by local consumption—there would be no duty, and this would pay even with the extra cost of production, better than Tea in Ceylon and India, which sold for nine pence to 10 pence. But I said, "competition in growing, and filling up the local market would bring down the price."

"Future competition!" he cared nothing for that, he would be the first in the field, and would make a large pot of money before others had time to develop Tea plantations.

This gentleman, Col. Joao Antonio Alves de Brito, is a member of the Union Parliament at present sitting in Rio de Janeiro, but he has been absent on leave for over a month. His properties are on very high land on the borders between the State of Rio and Minas. The district is not subject to dry spells, but receives regular rains, and as far as climate goes is very suitable for tea planting. His coffee plantations bear well and he is well supplied with Colonist labour. To make up for the small profit which coffee has given for the last two or three years, he is utilizing the

#### TIMBER FROM HIS VIKING FORESTS.

He has erected by the side of the railway near his properties a large timber-preparing and wood-working establishment, fitted with the finest modern machinery for wood working. He sends timber by rail to Rio in all forms from the rough log of fine cabinet wood to be manipulated in Rio, to doors and windows ready made, cart-wheels, carts and even railway waggons. He has just completed a lot of the latter for the Central Government Railway. The iron work for buggies and wagon frames, as well as for Westing-house brakes come from England and the United States. Coal waggons, good covered waggons, and cattle trucks can be supplied at a cheaper rate by him than those ordered from Europe or the United States, and of course the timber is far superior. My friend is a good example of what an English education and a London office-training can bring to the assistance of an intelligent mind, and an energetic character. When I last wrote to you

#### THE PRICE OF COFFEE

was so low it could scarcely pay for production, and in places where pack-mule or bullock-cart transport made it costly to take to the nearest railway station, it has been produced at a loss—even now although the crop at present being shipped is expected to be much less than the former one, the price has not risen. It has not been much above 6cts. per lb. for No. 7—the middling Brazilian Type—in New York. It was believed that the crop for 1898-99 would be a short one, and that the seasons were unfavourable, but somehow the buyers in consuming countries seemed to wait for a lessening of the number of bags being received by rail in Santos, and Rio de Janeiro. With the exception of the two months July and August, between the old and the new season's shipments, there has been little diminution, and both ports continue to receive equal to last year's quantities, and stock in Rio and Santos as well as in consuming countries are large.

There is a great uncertainty as to the quantity expected for season 1898-99, but some authorities which can be relied on put Santos at 6,500,000 sacks of 132 lb. each, Rio 2,000,000 to 2,500,000 sacks; but such conflicting reports have been received as to the ravages of dry weather from July to November in the districts which have Rio for a shipping port, one cannot form a safe calculation, and to make it too high is to bring a hornet's nest about one's ears, for planters believe that low prices continue because of exaggerated estimates made beforehand, and the newspapers are open to attack any poor unfortunate who ventures on this precarious ground.

As is usual in all coffee-producing countries, a long spell of dry weather immediately before blossoming time, brings out a copious flower after the first rains; the same has occurred here during the flowering time—latter end of September, October and begin-

ning of November,—but since then there has been rain almost every day; nice refreshing evening and night showers say I, but a lot of newspaper reports say embryo fruit is rotting and falling off in many places.

#### EXCHANGE.

The low rate of exchange all during last year, certainly favoured the coffee planter, for although the price was low in consuming countries, it represented gold, and owing to the low rate of exchange, the amount in currency came to a respectable sum. Colonist labour was fairly plentiful at not much above the former rates. Therefore the cost of production was not much above what it used to be when exchange was high. During the latter end of 1897, exchange ranged from 7d to 7½d per milreis—thirty-three to thirty-four milreis to a pound sterling. In the first five months of this year it fell from 7d to 5½d per milreis raising the pound sterling from thirty-four to forty-two-and-a-half milreis—the par value of the milreis is twenty-seven pence—or eight mil eight hundred and eighty-eight reis to a pound sterling.

This state of matters if favouring the coffee planters, was the opposite of cheering to commercial people: to the poor people in the towns—for whom nearly all the necessaries of life had to be imported, and therefore had to be paid for in gold—it meant semi-starvation, and to the Government with its gradually diminishing revenue—owing to protective, one may say prohibitive, duties on all imports—who had to meet annual payments in Europe of over three million pounds sterling: this low exchange was indeed a blue lot.

In July of this year,

#### A FINANCIAL ARRANGEMENT

was made in London, and after that exchange rose in a short time to 8½d; although it has not remained at that figure, it has not fallen much below it, and it is expected—if the Government is able to fulfil its part of the contract which if public men are in earnest it can have no difficulty in doing—the value of the milreis will rise to eighteen pence in three years.

I need not inflict on you and your readers the dry details of this arrangement or "accordo," as it is called here, but in a few words it is this:—

1st. A loan of ten million pounds at five per cent.  
2nd. The amortization of the external debt is suspended for thirteen years.

3rd. A yearly sum of three million pounds is to be taken out of this loan for three years. This sum is to go towards the payment of interest on the external debt, and guaranteed interest on railways, as well as salaries and expenses of representatives of Brazil in Europe and other payments, such as railway materials, &c.

4th. The Government is not relieved from the payment of these sums, but only relieved from remitting to London. The equivalent of these amounts have to be paid in paper money calculated at eighteen pence per milreis, into one or more of the foreign or national banks (nearly all of them get a part of it) as a deposit, and from time to time the paper money forming this deposit has to be destroyed.

Two results are expected from this "accordo":—first, the Government not requiring to enter the market for remittances to Europe, exchange is sure to rise. Second, a large amount of paper taken out of circulation will increase the value of what is left.

This arrangement has been subject to a great deal of criticism both in Europe and in Brazil: in the former it is regarded favourably, but some of the opposers of the Government in Brazil look on it as humiliating owing to their having to give the receipts of the Rio de Janeiro Custom house as a guarantee. The Congress—whose sittings are about to close—have given the Government their full support, and have reduced the expenditure in the various departments much below what the official estimates asked for.

#### A NEW PRESIDENT

entered on his duties on the 15th November, and has by the constitution to remain for four years. Before entering on his new duties he paid a visit to Europe, being there during June, July

and August of this year, and although he had not officially anything to do with the making of the financial "accordo," still at the various dinners and public entertainments in his favour in London and Paris he gave his promise that he would in all his government acts, have steadily in view the faithful fulfilment of the contract.

The President who has just left office—President de Moraes e Barros—was a *Paulista*, as the natives of Sao Paulo are called. The present one, Manoel Ferras de Campos Salles, is also from the same State, both are of the legal profession, but are extensive coffee planters as well.

I intended to have mentioned some facts with regard to narrow-gauge railways, of which there are in successful working many kilometres in Brazil, but I must leave that for another opportunity.

I am glad to see that the colonial governing powers are waking up to the need of further railway communication in Ceylon. I think if you had begun with a narrower-gauge than the five feet six, extensions would have gone on more rapidly.

A. SCOTT BLACKLAW.

#### WYNAAD PLANTERS' ASSOCIATION.

The Annual General Meeting was held at Mep-padi, on January 4th last, at which the Annual Report for 1898 was presented. The following paragraph is of interest :—

**CULTIVATION.**—Coffee crops are very good throughout the district, and we trust we are now entering on a cycle of prosperous years. The competition of S. American countries with a low exchange threatens, however, with lower prices for a time. Experiments with Arabica-Liberian Hybrids are being carried out on a considerable scale, and promise very valuable results. The cultivation is extending, and prices and yields are encouraging. The only cloud on the horizon of this cultivation is the unreliable nature of the labour, of which tea requires a steady supply throughout the year. It is to be hoped that this may be overcome in time, but your Committee beg to draw your attention to the importance of making persevering efforts to solve this problem. Pepper is becoming a cultivation of importance, and is being extended: present prices and crops being very remunerative. Liberian coffee cultivation remains much as it was: it is doing well in parts, but is disappointing in others. On the whole, your Committee consider that the prosperity of the district has improved very much during the past year.

#### PLANTING NOTES.

**TEA SHIPMENTS AND ESTIMATES.**—We are indebted to the Secretary of the Chamber of Commerce for the following figures :—

January shipments	.. 6,750,000 lb.
February estimate :—	7½ to 8,000,000 ,,

**NATIVE TEA GARDENS.**—says a well-informed Nawalapitiya correspondent—have not given up plucking, but since the fall in prices they are not receiving the care and attention hitherto bestowed on them.

**"HANDBOOK OF AGRICULTURAL CHEMISTRY FOR INDIAN STUDENTS."**—By S. H. Collins, F.I.E., etc., Assistant Agricultural Chemist to the Government of India, Calcutta, Office of the Superintendent to Government Printing, India, 1889.

We quote the preface :—

There are many excellent books on agricultural chemistry based on English experience, and this volume aims merely at supplying their deficiencies in subjects peculiar to India. A certain amount of European experience has been interpolated, since without it the book would not have been intelligible to the student. The analyses are, unless otherwise stated, exclusively Indian; and are in most cases, based on the average results of the treatment of several samples—S. H. C.

**CEYLON TEA COMPANIES, LIMITED.**—This mail brings the intelligence from London that in the case of Sterling Ceylon Tea Companies, the Agents have seen their way to make a substantial reduction in their commission and charges, in view of the hard times. We trust this liberal example will be followed by the Agents and Secretaries of Rupee Companies in Colombo, especially of such Companies as are only paying a very modest dividend.

**COFFEE PESTS.**—Much uneasiness is felt in Selangor at the appearance of vast numbers of caterpillars on the Petaling Estate, where they ate the leaves of the coffee trees over fifty acres. Mr. Ridley says they are the caterpillars of the bee hawk moth. Chasseriau estate was badly infested some years ago and the only remedy found was handpicking. He says: "I never heard of the caterpillar doing any permanent injury except to very young trees, but it by no means improves the trees and should be destroyed."—*Singapore Free Press.*

**TEA AND CINCHONA ON THE NILGRIS.**—Mr. T. C. Anderson, who returned recently from a visit to his property in the Nilgris, reports tea there to be in a very flourishing condition, and is confident that by and by it will come to have as good a name as that of Darjeeling. Cinchona cultivation is also being gone in for extensively. Some interesting remarks on quinine are made by *Cosmopolite* in "Odds and Ends," which we publish in another column. He strongly advises planters, especially those in Uva to plant up their road lines and corners with the best cinchona plants they can get.

**A NEW PATENT TEA-DRYER.**—Mr. James Betts, a former well-known tea-planter up-country, who arrived recently from Edinburgh, and is at present residing at the Adam's Peak Hotel, Hatton, has, says our evening contemporary, brought with him the fitting machinery, &c., for the erection of a new patent tea-dryer, constructed on his own designs by Messrs. Cruikshank & Co., Edinburgh. The machinery, which has been sent up to Hatton, will be erected at Messrs. Brown & Co.'s foundry, and experiments carried on as to its suitability, or otherwise, for the purpose for which it was made and designed. Arrangements for its erection have already been made, and Messrs. Brown & Co. are busy attending to the work under the personal supervision of Mr. Betts. The machinery is reported to be unlike that of any other of the dryers used in Ceylon.

**AGRICULTURAL PURSUITS FOR WOMEN** is beginning to be a subject of public interest in New South Wales. Mrs. Armitage (formerly of Colombo) has been writing on the subject and as a prominent member of the New South Wales National Council of Women, she and other leaders have started a proposal for an Agricultural College for women in Sydney. We have received from Mrs. Ingles a copy of an interesting little pamphlet entitled :—

Agriculture and Domestic Economy for Women. Notes and suggestions by Mrs. D. E. Armitage, Hon. Secretary, National Council of Women of N.S.W. A paper read at the half-yearly meeting, November 13th, 1898, and printed by order of Council.

Among branches suggested by women's work are :—butter-making; bacon; poultry and duck-rearing; fruit-growing, jam-making and bee-keeping; vegetable-growing; ramie-fibre; and the growing of flowers for scent-making and of herbs for drugs—all very interesting and useful and most of them feasible, we should say.

"THE JOURNAL OF THE JAMAICA AGRICULTURAL SOCIETY," for December, 1898, has the following contents:—Illustration of Longhorn Cow, "Moss Rose"; Board of Management; Meetings; Durable Whitewash; Cultivation of Potatoes; Bad Dairy Management Cultivation; Adulterated Butter; Notes from the Apiary; The Castor Oil Plant; Skillful Adulteration; Jamaica Preserves; Household Hints; India Sheep for Jamaica; Comments; Poultry Notes; Dairy Notes; Branch Notes; Odds and Ends; Our Imports and Exports; Sale of Indian Cattle; Onion Culture; The Agricultural Outlook; Questions and Answers; Prices of Meat, Vegetables, etc.

**TEA SELLING IN THE SALVATION ARMY.**—It is interesting to learn from "General" Booth that the selling of tea has become a regular business in many branches of his "Army." Throughout France and Germany this is particularly the case and in Paris and Berlin a very considerable business is done. (The "Thirty Committee" ought to make a note of this.) The same is true of the United States, we are told, the selling of tea being added to other work carried on by the "Army" under the direction of "Commissioner" Booth-Tucker.

**PLANTING IN BRAZIL.**—We draw attention to a long communication, given in our daily issue and *Tropical Agriculturist*, from our old correspondent, Mr. A. Scott Blacklaw, dated in December from Rio. He deals not only with coffee, but also with cotton, sugar-cane, rubber and even tea! For, it seems as if the depression in coffee were going to force the Brazil planter into new grooves; but we have no fear of his finding tea profitable at the present cost of labour. Mr. Blacklaw gives us a number of novel particulars respecting rubber; and indeed his friend the pioneer tea planter only meditates supplying the local market. We shall be much interested in hearing of the result of his experiment, more especially as the Colonel takes so much interest in the *Tropical Agriculturist*. For information respecting coffee prospects and Brazil's finances we must refer to the letter on our sixth page.

**VANILLA IN THE SEYCHELLES.**—The Administrator of Seychelles sends the following statement as to the capabilities of the islands in the direction of vanilla production to the *Journal of the Imperial Institute*. A vanilla plantation should not be started in the Seychelles with a capital under £1,000 seeing that it takes three years to produce a crop. Suitable land cannot be secured under R200 an acre, an even at this price it is not easily obtainable. Under the old system (planting on bars, wires, &c.) from 1,200 to 1,300 vines were planted per acre. The vines are now planted on live trees, and the number planted depends on the number of trees existing on the land to be put under cultivation. The vines cost about R4 per 100, and a man can plant 350 cuttings of vines per day, and can keep in good order, throughout the year, 2,500 plants. A man's wages are R12, and a woman's R6 to R8, without rations. The women are employed for "marrying" the flowers, i.e., removing the pollen from the anther of the flower and applying it to the stigma. A woman can "marry" from 600 to 800 flowers per day. Each vine can produce from 25 to 30 pods; 130 of which average 1 lb. of prepared vanilla. The flowering season is from August to December, and the pods are gathered about nine months after, and it takes three or four months to "cure" the pods.

**COFFEE-GROWING** in Serdang continues to be in a hopeful way. Planters there do not complain. There is every encouragement to them from the recent improvement in prices for the berry.—*S. F. Press*.

**NEW GUINEA DEVELOPMENT.**—Messrs. J A Patten and Barrett, we hear from the south are en route for German New Guinea, where they have been offered the same area of land that Sir Somers-Vine tried to acquire in British New Guinea. The offers to Messrs. Patten and Barrett are stated to be even more advantageous to them than the terms on which Somers-Vine proposed to acquire the land. We hear also a rumour is current that it will not be long before British New Guinea will be declared a Crown Colony. The advent of the new Governor may see the change brought about, and if so, rapid changes may occur which will aid settlement and bring along a better and more prosperous state of affairs in New Guinea, the effect of which must sooner or later be felt here.—*Torres Straits Pilot*, December 31.

"THE AGRICULTURAL GAZETTE" of New South Wales, Vol. IX. Part 12. Edited by W. H. Clarke, has the following contents for December, 1898:—Some Exotic Grasses—No. 1 Prairie Grass; New South Wales Weeds—Nut Grass; Botanical Notes; A Successful Duck Farm; The Strawberry; Arrowroot; Rattling Jack Wheat (with coloured plate); Bees, and How to Manage them—Transferring; Ferns; Bacon-curing from the British Point of View; Rust in Wheat during the dry season of 1897; Wheat and Oats in coastal districts; Labour-saving Appliances of the Farm; Insect and Fungus Disease of Fruit Trees and their Remedies; Dairy Breeds and Milk Tests; Bee Calendar for January; Farm Notes for Northern Rivers District; Riverina Notes; Farm Notes for Hawkesbury District; Orchard Notes for January; Practical Vegetable and Flower Growing; Estimates of Wheat Yield; Burning Preventive Breaks; General Notes; Replies to Correspondents.

**TEA COMPANIES' MEETINGS: MODEST DIVIDENDS.**—The shareholders in the three Companies whose reports appear today ought, we suppose, as times go, to be satisfied with dividends ranging from 3 to 4 and 5 per cent. In respect of both the Kalutara and High Forest Companies (but especially the latter) there is so much young tea as to lead one to anticipate a "good time coming" and the promise of this season so far on Upper Maskeliya Estates is so good as to show that 5 per cent ought to be exceeded in 1899—With reference to several Ceylon Tea Companies we have heard the remark made frequently of late, how a good thing to begin with was turned into a less profitable if not doubtful business, through the purchase by Directors—without taking the opinion of shareholders—of estates never thought of in the original prospectuses and the purchase of which would scarcely be sanctioned if it were put to the vote of the shareholders. No doubt the Directors had power to make such purchases under the articles of Association; but we think it a pity that in each case an appeal was not first made to the shareholders and their opinion taken. Of no less than six Companies, we have lately heard the remark in answer to the enquiry,—"How is it that—is paying no dividend (or only a small dividend)?" "Oh, it would have paid well, had there been no after purchase of ——— estate." It is no good being wise after the event; but Directors may later on find it awkward to explain how they came to be so much deceived about some, at least, of their purchases.

WILD AND CULTIVATED TEA IN SOUTH CHINA.

Szemaou, or Esnok, Mr. Jamieson tells us (*N. C. Herald*), in the Report to Lord Salisbury which we noticed two days ago, is the most southerly town of any importance in China, and is situated in a pleasant little mountain plain 4,400 feet above the sea, five days east of the Mekong, in latitude 22° 47' north. To reach either the provincial capital or Mêngtze involves a journey of eighteen stages, and the nearest posts on the French and British frontiers are respectively five and thirteen stages off. The staple industry of Szemaou is the preparation of the celebrated Pu-erh tea in which some twenty-five firms are engaged, of which seven or eight are only brokers. There are five tea "hills," as the Chinese call them, in what is technically the Pu-erh prefecture, south-east and south-west of Szemaou on the left bank of the Mekong. Mr. Jamieson gives a table showing prices and particulars of the different kinds of leaf, which may be of interest if Pu-erh tea ever becomes appreciated in Western markets, and gives some particulars of the duty and likin paid on it. He then discusses the total output which it is not easy to discover, Chinese having no tendency whatever towards the collection of statistics. He says that the merchants value the total trade of Szemaou at 130,000 to 140,000 taels per annum; but after working out the figures given him of the duty and likin collected, he puts the real value of the total trade at about 230,000 Taels. Then he gives an interesting account of the double duty on tea which is collected during three months of every year, although theoretically the collection of duty remains uniform throughout the year. Mr. Jamieson gives a brief account of the tribute tea which is sent annually to Peking, and of the mode in which the tea is made up into cakes, the whole secret, as pointed out by Mr Bourne, consisting "in a judicious arrangement by which the delicate young leaves are made to take up a conspicuous position on the outside of the cake, the coarser leaves being carefully stowed away in the centre." Mr Jamieson adds that "Dr. Augustine Henry, the well-known authority on Chinese botany, has found wild tea on the mountains south of the Red River, and is of opinion that tea occurs wild in the mountainous belt running from the south of the Red River through Yunnan to Assam, where also it has been found in a wild state. He informs me that among the numerous specimens found elsewhere in China, Formosa, and Japan, there is not one which can be considered as undoubtedly from wild trees."

CATERING IN CEYLON.

(SPECIALLY CONTRIBUTED TO THE "HOTEL-KEEPERS' GAZETTE.")

We are indebted to our esteemed subscriber, Mr Ferdinand Gausseلمان, manager of the Grand Oriental Hotel, Colombo, and to Mr. H. Wingfield, the *chef de cuisine* of that fine establishment, for the following interesting notes on hotel management, catering, and food supplies in the beautiful island "where the cinnamon comes from."

Colombo is the veritable marine Clapham Junction of the East. Steamers (cargo and passengers) of all nationalities are calling here daily, to take fresh supplies of coal, and to discharge and re-load goods from and for all parts of the world. The principal lines of steamers are the P. & O., the Orient, the Messageries Maritimes, the North German Lloyd, the Bibby, the Clan, the British India, and numerous other steamers, Russian, Japanese, &c. These steamers run between Europe, Australia, India, China, Japan, and America.

Colombo now possesses three-first class hotels, the Grand Oriental, more widely known as the "G.O.H.," the Galle Face Hotel, and the Bristol Hotel. All are built to suit the exigencies of the climate, having spacious verandahs, and electric punkahs (or fans) in both public rooms and bed rooms. The first two hotels have passenger lifts, and all are lighted by

electricity. They are managed by Europeans, who in their turn are assisted by a European secretary and French chef. The lower staff is recruited from natives of Ceylon, and excellent servants they make. The native element consists of Cingalese, Tamil, Malays, and half-castes or burghers, the last the offspring of European fathers and native mothers.

No females are employed in Ceylon hotels, the "boys" as they are called, attending to the bed room as well as dining room service. On account of existing "caste" it becomes necessary to give the "boy" who is in charge of a set of bed rooms an extra coffee, who does the sweeping and carrying of articles, because the "boy," who claims to be high caste, must not undertake certain manual labour. Of course this is all very silly, but one has to fall in with the native prejudices and customs. Caste originates from the Hindoo religion, and the true natives of Ceylon are Buddhists. Now Buddhism prohibits caste, yet the Cingalese practise it almost as rigorously as do the Hindoos in India.

The hotel clerks are mostly of the burgher or half-caste class, members of which fill all the minor positions in the Government offices, and also in the mercantile establishments. The wages of clerks range from 15 to 50 Rs. per month; bookkeepers are paid as much as 125 Rs.; bed room boys and waiters receive 15 rs. per month, while the coolies as a rule get 10 Rs. per month.

It is a great help to Europeans strange to the island to find most of the natives able to understand a fair amount of English. As already mentioned, they make excellent servants, but the Asiatic native is different to white help, and a manager in Ceylon must exercise a great deal of indulgence and patience. The same order must be repeated day by day, and the manager who can do this without losing his temper scores immensely, because the native is only too willing to do what is required, but he can't think, or doesn't want to think. Tell him what you want and he does it with a smiling face but don't rely upon him to do it again systematically without fresh orders.

Coming now to the question of food stuffs, we labour under a very great disadvantage compared with our more favoured colonial brethren. The quality of the native bullock and sheep (so called) is most inferior. The bullock is small, lean, and tough while the sheep is a long legged animal whose coat and general appearance favours the goat. In fact, nine times out of ten the meat sold under the name of mutton is goat-flesh. It is tasteless, and often so hard as to be positively uneatable. These animals are imported from the southern state of India, and are supposed to be killed in registered abattoirs and under municipal inspection, but there can be no doubt that, owing to the system of bribery which exist and to the natural dishonesty of the native dealers, many carcasses get into the markets that have never had official sanction. The prices run pretty nearly the same all the year round, those obtaining at the time of writing being as follows:—

Beef—

Sirloin, intact with rump, weighing seldom more than 18 to 20lb ..	18c per lb.
Brisket, fresh ..	18c "
Do salted ..	20c "
Round, fresh, with bone ..	18c "
Do salted, without bone ..	21c "
Ribs ..	18c "
Fillet ..	28c "
Shins ..	25c each.
Tongues, fresh ..	35c "
Do salted ..	50c "
Do smoked ..	48c "
Tails ..	15c "
Hump ..	35c "
Tripe, cleaned, but not blanched as at home ..	75c "

Veal, oh! the fallacy of calling it veal. You would simply get a small bullock weighing about 50 lb. when all skin and bone, and what flesh pertaining thereto

of a deep red colour, so different from the well-dressed veal one eats at home. It is sold at 30c per lb.

## Mutton—

Leg .. .. .	.. 35c per lb.
Loin, cut with four rib bones	.. 36c "
Saddle .. .. .	.. 36c "
Brisket, otherwise breasts	.. 31c "
Liver, including heart ..	.. 28c each.
Head, including four feet	.. 50c "
Kidney .. .. .	.. 7c "
Lamb is quoted at .. .. .	.. 36c per lb.

Pork, of which very little is used in first-class hotels, except for farce, is usually sold at 25c per lb.

Poultry, like beef and mutton, is very poor in quality, and the prices at time of writing, to large consumers, are as follows:—

Fowls, weighing, when trussed about 1 to 1½ lb. .. .. .	.. 70c each
Medium size chickens, weighing when trussed, about 1 to 1½ lb. .. .. .	.. 40c "
Ducks .. .. .	.. 87c "
Pigeons .. .. .	.. 37½c "
Cock turkeys, weighing, when trussed, about 8 to 10 lb. .. .. .	.. R8 "
Hen turkeys .. .. .	.. R3.50 "
Geese (very difficult to obtain fit to eat) .. .. .	.. R3.75 "
Guinea fowls, which would give a considerable start to their European confrères in toughness, and then win hands down .. .. .	.. R2.50 "

Game birds, such as partridges and quails, are also imported alive from India, and resemble those at home in shrill notes and plumage only. The partridge is most insipid, and requires cooking in a rich well flavoured sauce to make it passable eating, and it would be stretching imagination to its utmost limits to give to the quail its synonym of "lumps of celestial fatness," as we do to those found in the poulterers' shops at home. The prices of these birds fluctuate according to the market, partridges fetching from 31c to 35c each and the quail 16c to 20c per bird.

The prime joints of elk and deer and wild boar in their seasons can be obtained from 50c to 75c per lb., and hares and rabbits are sold at R1.50 and 50c each respectively. The snipe, which is in season from November until March, has, however, all the characteristics of its European brother, and is the one bright oasis in a desert of sparseness. This delectable morsel can be obtained usually for the *quid pro quo* of 30c. to 35c, sometimes when very abundant even less.

The Colombo Ice and Cold Storage Company import Australian frozen lamb and mutton, and sell at prices slightly above those at home. They also import from the old country at times pheasants, partridges, grouse, Bordeaux pigeons, &c., which enables us to give variety to our menus, although the prices are somewhat prohibitive. Still "nature tells us everywhere we want a little change," and in no one sphere is that more necessary than on the hotel menu, more especially owing to the system of boarding which prevails in the East. This firm also imports salmon, haddocks (fresh and smoked), herrings, kippers, bloaters, soles, and the New Zealand blue fish (smoked). This latter, although a little strong in flavour, makes a welcome addition to our list of breakfast fish.

Of fish caught locally the following, with their sale prices, are the most prominent:—

See rowl gets its firm flesh, lends itself to a variety of ways in serving it; usual price .. .. .	.. 50c per lb.
Pomphret .. .. .	.. 44c to 48c "
Mullet, similar in appearance, flesh, and taste to the sea bass of the southern coasts of England .. .. .	.. 37c to 44c "
Butter fish, a small sweet fish, resembling a John Dory in shape .. .. .	.. 31c to 37c "

We get whitebait from Ceylon waters at 25c per lb., but, ah, Mr. Editor, nothing like that dear little fish for which Greenwich used to be so famous. At the same

price we can also buy sweeting. This little fish, about the size of a sprat, is usually strung on coconut ickles, and then dipped in eggwash, bread-crumbs, and fried, and is then considered very delicate by the upcountry gentlemen specially. Ickles, I might mention, are the wood-like substance of the coconut leaf. Prawns, of which large quantities are caught and which sometimes reach an immense size, fetch from 20c to 25c per lb. Crawfish, called lobsters out here, are sold according to size at prices which range from 12c to 25c each.

As to fruit, we have the green orange, a little sour but not at all unpleasant. Price 6c each.

Banana, the staple food of the native, small, but nice flavour. Price: 37c the 100.

Panpoya, a kind of melon, a splendid fruit, supposed to be especially wholesome, and to yield vegetable pepsin. Price about 15c each, weighing 4 lb. to 6 lb.

Pineapple is in season all the year round, but at its best in May, June and July; of fine flavour, but rather too acid for daily consumption. Price: about 15c to 30c, according to size.

Mango, a splendid fruit of oval form, not unknown in the London market, is in season here in May, June and July, and sells at R3 or R4

Mangosteen, a most delicious monthful, acknowledged to be *facile princeps* among Ceylon fruits, is in season in May, June and July. Price: R4 to R5 per 100.

Speaking generally, however, fruit although plentiful and not over dear, in quality and flavour cannot vie with the produce of English orchards and gardens.

Vegetables, such as carrots, turnips (betroot), marrows, leeks, celery, cauliflowers, we obtain from up-country districts, whose altitudes exceed from 3,000 feet to 6,000 feet above sea-level. The market value is as follows:—

Carrots	R1.25 per 100	Leeks	R0.40 per doz.
Turnips	R1.25 "	Celery	R2.25 "
Betroots	R0.75 per doz.	Cauliflowers	R2.50 "
Marrows	R2.50 "		

Parsley and herbs generally about 16c per lb.

The native vegetables obtainable from the lower lying districts, are pumpkins, ash pumpkins water pumpkins, murrungas, snake gourds spinach, beans, yams, sweet potatoes. Tomatoes are bought for a very few cents each or dozen as required. Ordinary potatoes import from India or Australia fetch as much as 4 rs. 6 to rs. per cwt.

Eggs, as a rule very small, 3 rs. to 5 rs. per 100.

Fresh butter, 1.50 rs. to 2.00 rs. per lb.

A little arithmetical computation will enable your readers to compare prices out here with those at home reckoning the cent as the hundredth part of a rupee and the rupee at the nominal rate of 1s 4d.

It may be interesting to give specimens of table d'hôte bills of fare, which will afford some idea of the catering at the Grand Oriental Hotel:—[Then follow copies of menus.]

## PRODUCE AND PLANTING.

TEA AND THE DUTY QUESTION.—The revenue derived by the Customs from tea during 1898 was £3,923,566, in lieu of £3,856,663 and £3,796,425 in the two former years. Those tea proprietors who think that the reduction or total abolition of these duties would be prejudicial to their interests need not fear that the Chancellor of the Exchequer will be in a hurry to abandon such an easy source of revenue. Considerable political pressure would be necessary before the official mind would be induced to forego this contribution to the national exchequer. The desire to please the consumer, therefore, will have become more intense than it is at present ere any important change is made.

THE DUTY ON COFFEE AND COCOA.—As compared with tea, coffee and cocoa play quite unimportant parts as their contribution to the Government till.

The yield of the former was only £175,565, and on the latter £191,073, showing about the same figures as in former years.

**INDIAN TEA AND THE TIBETAN MARKET.**—The Tibetan market would be a great advantage to Indian tea planters, and if this "splendid outlet," as the *Globe* describes it, were open it would no doubt prove particularly useful just now.

**INDO-CHINA AND PRODUCE PROSPECTS.**—M. Doumer, the Governor-General of Indio China, is now in France, where he is engaged in expatiating upon the glories of the fine domain "three times the size of France," which he governs. It is to be a great market for French manufactures, and as for produce, there are no bounds to the prospect it offers. The first step, M. Doumer pointed out, was to apply intelligence and capital to the cultivation of rice, tea, coffee, pepper, dyestuffs and other tropical products for the French markets, in order to displace those now received from English dependencies. A start had been made in the growth of tea and coffee in Annam, and progress had been accomplished in the production of raw sugar, which was at present refined at Hongkong.—*H. and C. Mail*, Jan. 27.

## GOATS DAMAGE TEA PLANTS.

### CAN TEA SUPERINTENDENT MAINTAIN AN ACTION?

Amongst the cases argued yesterday before Mr. Justice Lawrie at the Appeal Court was one from the Court of Requests, Kurunegala, in which questions of law, of importance to Superintendents of estates, had been raised. In this case

MR. E. SCOTT, OF DYNEOVER ESTATE, KURUNEGALA,

sued two coolies and a kangani of Daisy Valley estate, named Semalla, Sambage, and Sundram Kangani, for the recovery of R90. According to the plaintiff, some goats belonging to the defendant trespassed on Dyneover estate on the 24th May last and destroyed about 1,200 tea plants growing thereon, and caused damage to the plaintiff to the amount of R90, which the defendants had failed to pay. He asked for judgment against them for this amount and costs of suit. The defendants in their answer denied the allegations of the trespass and damage, and pleaded that the plaintiff was bad in substance and in law, in that it did not disclose to whom the property of the estate on which the alleged trespass was committed, and the alleged damage was done, belonged. The plaintiff, as superintendent of the estate, had no status in Court, as no cause of action had accrued to him as such superintendent. The cause of action, if any, had occurred to the owners of the estate which plaintiff was not. The defendants

#### DENIED THEIR LIABILITY

to plaintiff for the amount claimed or any portion thereof, and denied that the plaintiff had suffered any damages by reason of any wrongful act on the part of the defendants or any one of them. The defendants admitted that the first was the owner of four goats, that the second defendant was the owner of three goats, and that the third defendant was the owner of three goats. That the said goats were wrongfully driven on to the said estate by Carnpen Kangani and Poochie, employed on the said estate, on the day alleged, in order that they might be seized and detained for trespass. They were subsequently seized and detained, and were released upon security. That the defendants were not responsible for the damage, if any, caused by the goats so driven. That the plaintiff could not maintain the action jointly against the three defendants, but should have instituted three separate actions. On these answers the Commissioner framed the following issues for trial:—(1) Can plaintiff maintain this action as superintendent, the proprietor being no party? (2) Can plaintiff maintain this action against the defendants jointly? (3) What is the value of damages caused by the ten goats?

At the trial Mr. Scott stated that the whole estate was in his charge, and it was planted with tea, cacao, Liberian coffee, coconuts, &c. He was answerable to the proprietors for the safety of the plants. If any damage was caused, the proprietors looked to him. He was agent of the proprietors regarding this estate, and the entire business of the estate was in his hands as such agent. If he recovered money for or in respect of any damage done to plants, he gave credit of the same to the proprietors. The managing proprietor was Mr. A. Wiggins of Lindula. He then deposed to the trespass and the damage caused. The goats were seized and sent to Gallegedara Police station, whence the defendants removed them. He produced an authority from Mr. Wiggins empowering him to prosecute on behalf of the proprietors for any damage. The authority was dated 20th August, 1898.

The Police Sergeant deposed that the defendants removed the goats on

#### GIVING SECURITY TO PAY

plaintiff any damage which he might be declared entitled to.

The Commissioner then held that the defendants' proctor did not contest the amount of damage, and the trial was on the legal issues. On the first issue he held that the superintendent could maintain this action. He had an undoubted right to detain the goats till the damage was paid, but he prudently sent the animals to the Police Station, from whence they were removed by the defendant, without his consent. On the second issue also he held that the action could be maintained against the defendants jointly. Judgment was therefore entered for the plaintiff as claimed.

On an appeal against this judgment, the case was argued at length on the points raised yesterday, Mr. Bawa appearing for the appellants, and Mr. H. A. Jayawardena appearing for the plaintiff. The counsel on both sides addressed the Court at length on the point of law raised, as to whether Mr. Scott could maintain this action as superintendent of the estate, several authorities being cited on both sides. After argument, judgment was reserved.

**A NEW INDUSTRY: ALOE FIBRE.**—At length, a full and fair trial is to be given to the utilisation of aloe fibre in Ceylon, through a machine, the patent for which has been secured in South Africa and India as well as Ceylon. The patentee has granted certain privileges to a local Syndicate who, with some public spirit, have had a machine constructed at the Colombo Works and an adequate trial is to be made shortly at Matakuliya. But first a due supply of the leaves of *Foucroya gigantea* (formerly known as *Agave fetida*) must be obtained and Mr. Jenkins, of Cargills, Limited, is advertising for any one who will undertake to cut and supply "leaves of the large green prickly aloe." They ought to be found near to a railway station and for their carriage thence to Colombo, we should expect the Government with the cordial approval of the General Manager to give free carriage. This is a very small request to ask for an experiment which is costing money to the promoters, but which may prove of great moment to the Colony. Considering all the expenditure that Mr. Chamberlain has sanctioned in Fibre and other industries in the West Indies, the Ceylon Government may well do all in its power to aid the present trial experiment, and perhaps to the length of supplying the leaves required for the first trial on both sides of their railway line. At a rate, free carriage may well be claimed.—To carry the initial experiment, about 25 tons of the leaves are required, stripped of thorns and cut up in bundles. These will probably be delivered in quantities of one or more tons at different railway stations.

## BRAZIL COFFEE NOTES.

The Governor of the state of Rio de Janeiro has been authorized to reduce the export duty on coffee if he deems it advisable to do so. The respective law fixed no limit to the reduction authorized.

A planter recently shipped from Botucatu to his commission merchant at Santos 21 bags of coffee, which were sold for 381\$200. The expenses on this coffee were as follows:—Freight, 173\$800, cartage, 10\$160; 3 per cent commission, 11\$440; other expenses 184\$800; total, 380\$200. The planter consequently received for his 21 bags of coffee the sum of 1\$.

The *Journal do Commercio* says that several planters offer to bind themselves to pay to Messrs. Holworthy, Ellis & Co., the sum of 100,000\$ if the present coffee crop reaches the estimate of 6,250,000 bags, provided that firm will agree to pay the same sum if the crop proves to be less than that estimate. It is affirmed that this firm has cabled its estimate of the crop at this figure. Messrs. Holworthy Ellis & Co. will be justified in our opinion, in treating this "bluff" with silence. There ought to be no restriction of any description put on these estimates.—*Lio News*.

IMPORTED FRUIT.—We are very pleased to receive and publish the letters from Messrs. W. Thompson & Co. which, we think, so far as Melbourne and Victoria are concerned, shew that Ceylon is safe in respect of all the fruit imported from that Australian Colony. The only question is whether assurance should not be made doubly sure by adding fumigation at this port. But, for ourselves, we feel we are safe with Victorian fruit; for we know how careful the Government there is to conserve the reputation of the Colony and its fruit-growers.

## BRITISH NEW GUINEA.

## TEN YEARS' PROGRESS—LAND FOR COFFEE, &amp;c.

Sir Wm. Macgregor's final Report on his Administration of British New Guinea is a very full and interesting document. He first gives a sketch of the Legislation of 1897-98, and one ordinance passed to regulate the collecting of wild birds ought to be of interest to the local Game Protection Society. A collector of birds has now to take out a license of £5 and one of £1 for each native shooting assistant. Sir William considers, however, that very soon it will be necessary to limit the number of birds of certain species that any one collector may kill, as otherwise the rare birds of the paradise family will become extinct. The final ordinance was one to enable certain persons to acquire and occupy Crown lands up to 250,000 acres. This measure has not yet been sanctioned in view of the protest made against the syndicate by certain Australian colonies.

Sir William next deals with the administration of justice and finds it very satisfactory that no European has been charged with murder, although lamenting that 128 natives have been convicted of this crime during the ten years that the Colony has existed. He regards the manner in which the Papuans are falling into the use of courts of law as very gratifying.

A great part of the Report is taken up with visits of inspection which really mean exploration tours, for much of the country traversed, including elevations of 7,000 to 9,000 feet, has been surveyed and filled in for the first time for geographers. Frequent reference is made to good forestland with rich soil, often on the banks of a river or in hilly districts, suitable for growing tea and coffee. The coast carriers were found useless on account of the cold when an altitude of 9,000 feet was attained. More than once a stubborn fight had to be offered to opposing warriors of inland tribes who refused to be conciliated, and had long been a menace to the peace of the surrounding country. But the native constabulary with their rifles speedily disposed of any enemy. The following refers to one trip thus dealt with:—

They lived on the ordinary forms of native food, but without any coconuts. The place of this latter article was taken by a species of pandanus, cultivated and fenced in on the face of the mountains, at altitudes of 3,000 to 4,000 feet. The seeds are smoke-dried and strung on strings. They seem to contain a large quantity of oil. This district consists of deeply excavated glens, the sides of which are covered by grass to an altitude of 4,000 to 6,000 feet. They are steep and narrow. Villages are generally not far below the edge of the forest that covers the tops of the great mountain ranges. At an altitude of about 3,000 feet the temperature in the early morning was as low as 55 degrees Fah. At midday it rose to 84 degrees. At an altitude of 6,500 feet the early morning temperature was 58, the noon temperature 78, degrees. The lesser temperature at the lower camp was probably caused by the damp fog that rose from the river there, and was not present at the upper camp. It seemed a very healthy country, and might be used by Europeans, were it not so inaccessible. No doubt many of the products of temperate climates could be grown there.

In other cases we are told of gold prospectors being at work and getting a fair show of the precious metal, of good coffee being grown, of coconuts growing well, of imported fruit trees covering 25 acres, "so that rice had not been used at the stations for six months." One gentleman is planting coconuts on the Conflict group of islands, which are without people, and the farms are doing remarkably well, so belying the

old proverb about the coconut and the human voice. The most advanced island is Samarai, which is all planted in coconuts and is the seat of a good deal of business. The Government will soon have a plantation of about 7,000 palms on Gesila island.

The armed constabulary, all Papuans, number 110 men, paid 10 shillings a month the first year and £1 afterwards; a very valuable body of men. In one case where a European official, Mr. Green, was treacherously murdered, a native corporal who had got clear and could have escaped, returned to die with his officer rather than desert him. Besides the constabulary, a large body of village policemen is gradually being created. They already number 202 and are content with £1 a year and suitable uniform. Ten years ago there was not a single native in the employment of the Government; in the next ten years the number is likely to be quadrupled. In fact, the Ceylon village Vidana system is likely to be spread all over New Guinea. Sir William bears full testimony to the splendid work done by the Missionaries, more especially by the London Missionary Society, which began there in 1871, the two great Missionaries being the Rev. Dr. W. G. Lawes, typically a man of thought and a great linguist, and the Rev. Jas. Chalmers, a man of action. Both are still at work and the Mission has 10,000 native adherents, with 3,650 native boys and girls at school. Next came the Roman Catholic Sacred Heart Mission, in 1885, and the Wesleyan and Anglican Missions, followed in 1891. The lady workers of the Missions also come in for great praise. Here is a paragraph of special value from a man of Sir Wm. Macgregor's standing and experience:—

The lapse of time has steadily strengthened the conviction that mission labour is of immense value and importance in the possession. It has been pointed out that the constabulary and the prisons are effective training institutions. This applies, however, almost exclusively to adults. The training and educating of children and of youth is practically entirely in the hands of the missions. The figures given above will give a fair idea of the extent to which this very important task is attended to. The example of the regular and upright life of the missionary is of itself an object lesson of great significance. The humanity they practise in regard to the sick, the castaway, and the abandoned child; the moral force by which they exercise restraint over many bad characters, and their sympathy with the weak and suffering, are all softening and ameliorating influences that could not otherwise be supplied to the natives.

As regard the climate the following paragraph speaks volumes:—

With the exercise of reasonable care there is no doubt that a healthy person may remain in the Possession for an indefinite time in active employment. For example, the oldest missionaries in the country, the Rev. Dr. Lawes and the Rev. James Chalmers, will, as regards physique, compare favourably with men of the same age in any country, and they have each performed a vast amount of work.

The total trade of the Colony has developed from £17,000 in 1888-9 to close on £100,000 in 1897-8. The exports make rather more than half, and the gold value is one half of the export total. Next come pearl shells, over 100 tons value at £8,000; 300 to 400 tons of copra valued at £8 a ton; 15 tons of Indian rubber, £240 a ton; 100 tons sandalwood, £9 per ton; 37 tons be-he-de-mer at less than £100 per ton. The total revenue of the Colony is about £10,000, with an expenditure of £15,000, the difference being made up by Queensland, New South Wales and Victoria.

Finally, as to the prospects, Sir. Wm. Macgregor has following remarks:—

The colony is in the condition of being ready for considerable agricultural development. This is not possible without the intervention of Europeans. With the exception of coconuts, rubber from forest trees, and a few other articles, natives are not likely alone to ever add much to the exports of the colony. The time has come when agricultural development should be pushed in the Possession with as much perseverance as has been employed in forcing peace on the different hostile tribes to prepare for it.

The conditions under which land has been offered for some years for settlement have been very easy, but they have failed to attract settlers. There will be no help for this condition of matters, except to grant such facilities and inducements as may attract settlement of the kind now required. There is already undoubtedly as much land known and available for occupation as, if utilised, would suffice to make the colony self-supporting.

The mining industry is better started than the agricultural, probably because for surface mining it requires much less capital. The fishing industry is capable of fuller development. This will probably proceed gradually by its own efforts. Unless new industries, such as the manufacture of sago, the export of cane, and such like, are established, there does not seem to be room for any considerable addition to the number of small traders already in the Possession. The fishing industry, in some scale or other, will be permanent. The agricultural expansion, so far as directed to coconut-trees and rubber-producing trees, will also be permanent; and the cultivation of such crops as tea, sugar, vanilla, tobacco, &c., would, if once begun, probably continue, as there would always be plenty of virgin land to fall back on. The mining population, on the other hand, is not permanent, and the miner has shown no disposition to settle on the lands of the colony. As soon as a prospector becomes wealthy he leaves for Australia. Quartz-reef mining would, of course, be more abiding, and the surface mining may lead up to this. Agriculture, however, will be, in all likelihood, the largest and surest industry of the colony. It is by far the most difficult to start.

A mass of appendices include some valuable reports. From one of these by the Government Agent for the Rigo district, we copy a picture of the Papuan under peaceful rule.—

The coast tribes need little comment. They are an orderly and law-abiding people, but in many villages they are becoming very lazy. For years past they have enjoyed the benefit of peace, whereas in former years they were always on the alert, expecting an attack from the hill tribes. It is drawing near the time that they should be compelled to assist the Government financially; this would also force them out of the grooves inherited from their forefathers. It is regrettable to see the numbers of fine, young, able men in the coast villages who sleep half the day and employ the other half with a looking-glass and a comb admiring their person and dancing all night. While so employed, their wives are labouring in the heat of the sun in their gardens, and toiling under heavy burdens from the hills. So long as a native has plenty of food, there is no need for him to work for the foreigner for any lengthy period; all he wants is sufficient trade to purchase a wife, then he is quite independent. Clothing is a luxury, and not a necessity. In some of the coast villages it is almost impossible to obtain any labour, although high wages may be offered.

Something like the poll-tax of Ceylon is required to teach the dignity and necessity of labour.

Last of all, we have a series of interesting detailed sketches of exploration and maps:—

Sketch map showing Tracks followed and cut by A. Clunas and Party on trip from Clarke's Fort to the Yodda Valley.

Sketch maps by Mr. W. E. Armit, F.L.S., F.R.G.S., of District lying to Eastward of Port Moresby.

Fishing Kite used by Natives of Dobu.  
Kiriwina Emblazoned Shield.

Map of the Eastern Part of British New Guinea (in four sheets) from the most recent astronomical observations, surveys and explorations.

And then follow no fewer than 47 illustrations, admirably rendered, quite an album of typical Papuan chiefs and men of different tribes, women, girls and children, native dancers, carving, pottery, arms, tools, canoes, ornaments, instruments, implements, constabulary, &c. Mount Victory (a volcano) with Mount Trafalgar, &c.—altogether a most instructive selection giving a wonderfully good idea of what is to be seen in the youngest of British Colonies. We have no doubt that there is a great future before the Colonial "baby"; and the historian cannot fail to do justice to the wise laying of foundations, in exploration, administration, judicial courts, organisation of native corps and the beginning of European settlement in BRITISH NEW GUINEA BY LIEUT. GOVERNOR SIR W. M. MACGREGOR.

### PLANTING NOTES.

**TEA PROSPECTS.**—It is very reassuring to learn that so far as he has gone in his investigations, Mr. Kelway-Bamber is confident of being able to do much for the improvement of Ceylon tea on many plantations, if not over many districts. It is too soon to expect reports; but no doubt very interesting papers may be anticipated from his expert pen a little later on.

**CASTILLOA RUBBER.**—We have an enquiry from Burma for seed of this kind of rubber to try on a coffee plantation (up to 3,000 feet elevation) on the Toungoo range in Burma. For fifteen years coffee was grown profitably without the leaf fungus; but at last the disease reached this out-of-the-way solitary estate. The owners however write:—"In the first instance, we have decided to try and resuscitate coffee, but it will be necessary to introduce a new strain of seed before doing so. Do you know of a good seed which you could recommend? [We have recommended Blue Mountain, Jamaica seed.] I should also like your opinion on the suitability of growing Castilloa rubber. I find Ceara does very well here, but imagine the price is not nearly so remunerative as the former. The highest portion of the estate is barely 3,000 feet above sea-level and most of the land a good friable soil." Castilloa seed may well be tried.

**KELANI VALLEY PLANTERS' ASSOCIATION.**—The annual meeting is reported elsewhere and we see that the Estimate of Tea Crop for 1899 is 161,000 lb. below that for 1898, and is given as follows:—1899's estimate 13,014,000 lb. from 24,817 acres in bearing; not in bearing 7,747 acres—total 32,564 including clearings. Yield equals 525 lb. per acre for bearing tea.—Naturally the Committee are not pleased at the great delay in starting the Kelani Valley Railway with its ample financial guarantee. Roads are beginning to show signs of improvement, we are glad to learn. Here again the Railway will be an unmitigated blessing in preventing cruelty to animals. The testimony borne to the memory of the late Mr. H. L. Ingles was cordial and in good taste.—A discussion over Mr. Harcourt Skrine and his personal charges led to some heated language; and eventually to a vote of confidence in the Planting M. L. C. We heartily congratulate the members on getting Messrs. Forsythe and Gawan Jones for their Chairman and Secretary once more—better men there could not be for the posts.

THE KALUTARA CO., LTD.

The notice calling the meeting having been read and the minutes of the previous meeting having been read and confirmed, the following report was laid on the table:—

ACREAGE :	
Tea in bearing .. ..	426 acres.
Tea in partial bearing ..	117 "
Tea not in bearing ..	115 "
Arecannts, Grass, Ravines, &c.	10 "
	<hr/>
	668
Forest .. ..	416
	<hr/>
Total .. ..	1,084 "

The Directors now submit to the Shareholders the accounts for the year 1898.

The crop amounted to 255,130 lb. Tea including purchased leaf, which realized a nett average of 33.08 cents per lb, against 36.87 cents per lb in 1897, on an expenditure on the estate of Rs55,382.65, equal to 21.71 cents per lb of tea, which included a sum of Rs3,038.38 spent on manuring 100 acres, and Rs1,124.21 for the purchase of 27,857 lb leaf.

The new withering shed, which was urgently required for the efficient manufacture of the teas, should have been completed in April, but owing to delay on the part of the contractor it was not finished till well into October. Since its completion the quality of the teas has improved, and the Directors think they may fairly anticipate better prices during the current year.

About 10,000 rubber plants have been put out in suitable places on the estate and their growth shews promise. The Directors also considered it advisable to prospect for plumbago, and with this object a sum of Rs961.67 was spent on this work, of which Rs206.58 was recovered by sale of the plumbago mined. For the past two months the heavy rainfall has stopped the work, but when the weather settles it is hoped that arrangements can be made with natives to work the pits on the share system.

After making ample provision for depreciation of Buildings and Machinery, writing off the balance of expenditure on plumbago, and a sum of Rs500 to a Coast Advance Reserve account, there remains a balance at credit of profit and loss account on the year's working of Rs15,325.83 after payment of the dividend on the preference shares. To this has to be added the balance of Rs20,448.83 brought forward from last year, making a total of Rs35,774.66. Of the Rs50,000 which the Directors were authorized to issue in Cumulative Preference Shares of Rs500 each, only 35 shares have been subscribed for during the current year, and the Directors therefore recommend that, in order to provide part of the further capital required to balance the expenditure already incurred, the sum of Rs20,000 be transferred from profit and loss account to an Extension Fund account, and that a dividend of 3 per cent on the ordinary shares be declared for the past year. This will absorb Rs32,000, leaving Rs3,774.66 to be carried forward to next year.

The estimate of crop for this year from the Company's estates is 285,000 lb. tea on an expenditure of Rs64,411.86, which includes the cost of manuring 150 acres.

During 1898 Rs23,913.15 was spent on capital account on the erection of a withering shed, additions to Machinery, a cart road between the two estates, the planting of rubber and upkeep of acreage not in bearing, and the estimate for 1899 is Rs8,538.41, chiefly for a new set of lines, balance of withering shed account, planting of rubber, further expenditure on cart road, and upkeep of tea not in bearing.

In terms of the Articles of Association Mr. W. H. Figg retires from the Board, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

HIGH FORESTS ESTATES CO., LTD.

The notice calling the meeting was read by the SECRETARY at the request of the CHAIRMAN, after which the minutes of the previous general meeting were read and confirmed. The following Report was laid on the table and taken as read:—

ACREAGE.	
Tea in bearing ..	432 Acres
" in partial bearing	156 "
" planted in 1896	246 "
" do 1897	174 "
" do 1898	132 "
	<hr/>
	1,140
Forest and Patana	492 "
	<hr/>
Total .. ..	1,632 "

The Directors have now to submit to the Shareholders the accounts of the Company for the past year.

The total crop harvested during 1898 was 221,028 lb Tea, which realized a nett average price of 50.72 cents per pound compared with a nett average price of 44.69 cents in 1897. The improvement in price may be considered very satisfactory, in view of the state of the tea market during the year.

After making the usual provision for depreciation of Buildings and Machinery the result of the year's working shews a profit of Rs37,416.17 to which has to be added the balance of Rs2,739.30 brought forward from 1897. The Directors now recommend a dividend of 4 per cent per annum on the capital Rs75,000 at 31st December, 1898, and at the rate of 4 per cent per annum on the capital of Rs50,000 called up during the year and made payable on 15th March, 1898, which will leave a balance of Rs3,560.47 to be carried forward to the current year's account.

During 1898 a sum of Rs26,969.03 was expended on capital account, viz., Rs24,535.74 on the opening of 132 acres and the upkeep of 420 acres not then in bearing, Rs2,223.10 on Buildings and Rs210.19 on Machinery. During 1899 the expenditure on capital account is estimated at Rs21,226, which includes the cost of 30 maunds of tea seed and nurseries, of opening up 25 acres tea, and of the upkeep of the acreage not yet in bearing. It is not anticipated that it will be necessary to make any call during this year on the holders of part-paid shares, but in 1900 it will be necessary to make a call to cover the cost of increased factory accommodation which will then be required to deal with the increasing quantity of tea coming in from the acreage planted 1896-97.

Referring to the remarks re transport in the last annual report, owing to the abundance of labor in the Island there has been during the past year no difficulty in this work. The Directors have not however lost sight of this question. As Government have again under consideration the construction of a light railway from Nannuoya to Udupascllawa which, by means of a connecting road from Maturata, would be of great service to the estates in that district, the Directors consider it inadvisable at present to commit the Company to the cost of constructing an expensive tramway.

The yield of tea in 1899 is estimated at 230,000 lb on an expenditure of Rs64,132.62 on the estate.

During the year Mr. F. W. Bois resigned his seat on the Board and the Directors appointed in his place Mr. E. J. Young, who now retires in rotation from office in accordance with the Articles of Association, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the Meeting.

GROUND-NUT CROP.—The Madras Government review the question of the alleged deterioration of this crop and authorize the Board of Revenue, as desired by the Chamber of Commerce, Madras, to import from America and Japan a supply of new ground-nut seeds of the best oil-yielding varieties.

—Investors' Guardian.

TEA IN CALCUTTA.—Tea shares are steady, but there is no further advance in prices to record, and transactions during the week have been few and unimportant, says the *Pioneer* correspondent on 4th January. With stocks of tea in London 4,000,000 lb. less at the close of 1898 than in 1897, and the increasing demand from America owing to the growing fashion among all classes to drink tea if they can get it good, there would appear to be justification for the faith in improved results for 1899. The Singell Tea Company's report is among the first of the 1899 reports we have seen, and it discloses a profit enough to pay a dividend of 4 per cent. I understand the Kornafuli Tea Association's position has improved. Two non-paying gardens which hitherto formed a drag upon the company have been sold for a figure sufficient to wipe out all losses in the accounts, so that this year a fair and square start can be made with the remaining gardens which are likely to yield a profit.

## "THE INDIARUBBER WORLD."

[WELL DONE the Editor and Publishers we say.—Ed. T.A.]

NEW YORK, Jan. 9th.

The substance of what follows is this:

On Friday afternoon, December 30th, the Promoters of the Rubber Trust charged the Publishers of *The Indian Rubber World* with an attempt to extort money from them—the charge being based on evidence secured through a hidden stenographer! But they were prudent enough to say that they did not believe we were aware of having committed that crime. No arrests!

On Saturday morning, December 31st, at 9-30, there came to our offices an intermediary whose avowed object was to patch up a peace. He was told that we must insist upon the unqualified withdrawal, in writing, of the infamous charge. No arrests! Sunday and Monday, January 1st and 2nd, were holidays.

On the morning of Tuesday, January 3rd, at 9-15 o'clock, the friendly intermediary again appeared at our offices, to say that the charge would not be withdrawn, but we would certainly never be prosecuted if we would publish articles in *The Indian Rubber World* favourable to the Trust. To encourage us to adopt that policy, he left an order for advertising in *The Indian Rubber World* amounting to \$600. Later in the day he left another order amounting to \$1,200; we received through the mail a third order increasing a half-page advertisement to a full page; he gave us assurance of many more orders of like character and kind; and promised to send us an article which he asked that we publish in the interest of the Trust. No arrests!

On Wednesday, January 4th, the promised article came duly to hand. On Thursday, January 5th, no developments. On Friday, January 6th, the orders for advertising were declined, because they had been given in the hope that our editorial policy would be favorable to the Trust. No arrests!

Saturday, January 7th, *The Indian Rubber World* for January was published, and it contained all the alleged libellous articles upon which the Promoters had based their charge of attempted extortion. No arrests!

It is a waiting game! But the publishers of *The Indian Rubber World* will wait no longer. We give the facts. And we are full ready for the theatrical arrest, the publication of the questionable evidence, and the whole parade of wretched pretense. If it deceives others, it shall neither frighten nor deceive us!

Stand up, Charles R. Flint, and explain yourself! Stand in the open, Mr. Flint, and let us have your story in cold print over your own name. The commercial honor of New York demands it. The moral sense of a great, free people, will have nothing less. No dodging behind a charge of crime devised for the plain purpose of suppressing facts. No dodging behind anonymous publications and authorized "interviews" in their daily press. No dodging behind a pretense that you thought us guilty. For your attorney was instructed to say that you believed us innocent and now we mean to prove it.

And, Gentlemen of the Press, see to it that the fighting is fair. We ask no favours. We court investigation. The methods have been made plain. Now search for the motives. "*Thrice is he armed who hath his quarrel just.*"

ARTIFICIAL RUBBER.—Just now this article is receiving much attention, several persons (says the *Chemist and Druggist*) claiming to be able to produce a substance closely resembling the genuine thing. The P. Carter Bell Company, is making a so-called substitute for rubber. The process is a secret which is not known to any of the employes, the principals keeping it to themselves.—The Rubber Trust is inquiring into the merits of a process for producing mock rubber, invented by a Mr. McCullum.

TO PLANTERS AND OTHERS.

# SEEDS AND PLANTS

OF

## COMMERCIAL PRODUCTS.

**Hevea Brasiliensis** (Para Rubber).—Seeds and Plants supplied, immediate delivery, quantity limited, good arrival guaranteed, packed to stand 4 to 6 months' transit well, five hundred plants in each Wardian case.

Out of a supply of Para Rubber seed collected in July, 1897, and preserved by us, a quantity was forwarded to Hammond Island in December of the same year, and the gentleman who ordered the seeds in ordering a further supply wrote us on the 30th April, 1898 :—“ All the seeds done well, and now some of the plants from them are 18 inches high.” This seed was put in nursery eight months after gathering.

A Mercantile firm who ordered 30,000 Para Rubber plants in 60 Wardian cases, 500 plants in each, wrote 5th April, 1898 :—“ I note that you accept delivery of 60 cases. We shall probably require further supply of seeds and plants.”

*For price, instructions and particulars, see our Circular No. 30, post free on application.*

**Manihot Glaziovii** (Ceara Rubber).—Fresh seeds available all the year round for shipment at any time, guaranteed to stand good 8 to 12 months.

*For price, instructions and particulars, see our Circular No. 31, post free on application.*

**Castilloa Elastica** (Panama or Central American Rubber).—Seeds and Plants supplied  
*See our Circular No. 32 for price, instructions and particulars, post free on application.*

**Urceola Esculenta** (Burma Rubber).—A creeper Seed and Plants.

**Landolphia Kirkii** (African Rubber).—A creeper Seed and Plants.

**Seeds and Plants** of Cinnamon, Nutmeg, Clove, Kolanut and different varieties of Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit trees, Shade and Timber trees, also Palms, Bulbs and Orchids, &c.

Professor MacOwan writes :—

MESSRS. WILLIAM BROS.

DEPARTMENT OF AGRICULTURE,  
CAPE TOWN, 27TH JULY, 1898.

GENTLEMEN,—I have this morning received your letter of 21st June covering parcel of Catalogues. It will give me pleasure to fulfil your wishes in regard to their distribution among likely purchasers.

You will be glad to learn that we have very good reports of the success of the semi-tropical things sent by you to the little Eastern Coast-strip of this Colony, particularly about the mouth of the Buffalo River at East London. Pine Apples are now grown there far superior to the stuff sent half ripe by sea from Natal.

Always yours faithfully,  
(Signed) P. MACOWAN,  
Government Botanist

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for 1899-1900 now in the press, post free on application.

HENARATGODA, CEYLON

## GOOD PROSPECTS FOR QUININE.

The first two cinchona bark auctions of the new year have been held, and quinine stands as it did at the end of 1898. Bark itself dropped scarcely appreciably at the auction in Amsterdam a fortnight ago, almost, but not quite, losing the gain of December over November; whilst in London this week it sold at rather over the Amsterdam average price. There is, therefore, as yet no change in the features of the market in either the crude or refined product, and nevertheless most interested persons feel that present rates are not by any means so permanent as they look. That quinine makers are doing their best to keep prices from fluctuation, and maintain even values for bark and alkaloid, becomes more and more evident. This might almost be called a common base for their tripartite policy. Their aim is to discourage quinine manufacture in Java; encourage bark cultivators in that island to send supplies to Amsterdam (but not at too rapid a rate) and not to work it on the spot; and, thirdly, to demoralise the second-hand quinine market in London. It is hard to carry out all these objects, but they have managed it pretty successfully, and the common means is revealed in their steady buying of supplies and steady selling at a figure only moved with reluctance. But the question is how long they can go on in this way. During 1898 nearly 6,500 tons of bark were offered at the Amsterdam auctions, which is over 700 tons more than what was offered in the highest previous year. In the twelve months of 1898 considerably over 1,000,000 lb. more bark were shipped from Java than in any year previously, and nearly two and half million pounds over what was shipped in 1897. These large shipments and offerings caused some to take a gloomy view of the future prospects of quinine. If it is seen that buyers are taking pretty well all the extra supply that is coming along, and, moreover (and this is important), not accumulating stocks themselves, the increased shipments are a good sign for the future, not a bad one. It is true that only (!) 264 tons of quinine in bark form were sold in Amsterdam in 1898 against 270½ tons in 1897, but the latter year showed an excess of six and a half tons over 1893, which, in turn, exhibited a heavier increase over 1895. Despite the heavy shipments, the number of packages in first-hands on December 31st, was lower than it has been in any of the last seven years, except last year (when the shipments, as seen, were considerably less) and in 1892, which is too long ago to talk about in a question of this kind. The stocks in second-hands are also believed to be small, and in the 12,000 packages in first-hands on December 31st, are included the 8,000 offered at auction on the 13th instant of which 7,310 sold. The signs from Amsterdam, therefore, are satisfactory, and this being so we hardly need notice what is indicated by the London bark market. There were on Dec. 31st fifty tons of quinine in the London public warehouses, an increase of seven tons over last year's stock at the same date. Put this way the excess seems too ridiculously small to make any fuss about, and the entire London stock appears of small account when we remember that at a single Amsterdam auction sixty per cent of such amount is regularly offered. If we take the last ten years we see that Germany has used up or returned in her own territory 44,000 tons of bark, and she has sent out over her borders about 1,900 tons of quinine. Supposing all this bark had a five per cent qui-

nine content, which is too high an estimate, she would have had at the end of last year about 6,000 tons of bark (or its quinine equivalent) in stock if her people had never used an ounce of quinine themselves and had never bought an ounce of bark or bark preparations from an apothecary. Both these suppositions are, of course, merely theoretical. What the German public has consumed during the last ten years in the way of bark and quinine cannot be stated with anything like precision, but it certainly cannot be much short of the 6,000 tons excess over what it has bought and sold outside its borders. This means that the German manufacturers must have been working from hand to mouth recently, and this fact is borne out by the way they have been taking delivery of their bark as soon as they could. Altogether, then, the signs point as distinctly as they can do to an advance in the prices of cinchona bark and quinine. We know the all-powerful "combination" do not want, for the time being, any serious advances of this kind, but it looks as if circumstances were going to be too strong for them.—*British and Colonial Druggist*, Jan. 27.

---

 SALES OF ESTATES AND HOUSE PROPERTY,—AND NEW COMPANIES FORMED,—DURING 1893 IN CEYLON.

We direct attention to the annual tabular lists under the above headings, given on another page. Their publication has been delayed beyond the usual time; but they are none the less useful for reference on that account. The transactions in estate property have shrunk greatly from the imposing array presented for 1897; and were it not for certain Companies which had been practically arranged for some time before, last year's return would have been still poorer. As it is we have transactions affecting some 62 properties or groups and involving the payment of £674,966 and R444,480 or a total of a little over £700,000 against, for 1897, transactions totalling £1,517,702 and R3,382,311 or say £1,750,000. The difference to the Stamps revenue of the Colony and to the local notaries' fees must be very considerable, between the two years. The largest transactions were those effected for the General Ceylon Tea Estates, Limited, involving payments of close on £250,000; while next came the transfer of Lipton's properties for £187,000—an immense advance on what fortunate Sir Thomas had to pay for the same during our time of depression. The Hopewell Tea Company represents some £60,000 of transactions.

Turning to sales of House Property and building sites, we have 21 transactions recorded and the total amount R741,900 does not compare badly with R625,900 and £10,800 for 1897. The most striking purchase was that of a two-acre building lot in Mackenzie Place, Cinnamon Gardens, for which about R11,000 an acre was paid. This is an immense advance on the old orthodox R5,000 an acre for Cinnamon Gardens building sites, and should indicate a still higher value for land and houses in the more accessible and favourite parts of the city.

Finally, we have a list of five Limited Companies incorporated during 1898 with a total capital of R2,425,000 against R3,165,000 in 1897. Three of these only are Estates Companies, the other two being trading Companies—one for Batticaloa, and one of a native firm in Colombo.

**List of Principal Sales of Estates (Tea, Cacao and Coconuts) during 1898.**

### COCONUTS: NOTES FROM THE NORTH-WESTERN PROVINCE.

MARAWILA, 11th Feb.

We have had most extraordinary weather this year. The first three months of the year are generally the months of severe drought. In January, we had 5.72 inches of rain. The latter half of the month was persistently wet and cloudy. Fine drizzles and rain as one experiences in the hill-country during the S.-W. months, prevailed. The opening days of this month were dry, but on the evening of the 6th, ominous thunder was heard and the North-eastern sky became clouded. The next evening we had a slight drizzle. It threatened rain last evening too and for the last three evenings the Southern sky was illumined with perfect flashes of lightning.

Rain cannot be far distant; I read the signs of it in Nature. When I was elsewhere, observation led to my finding a vegetable barometer, the cinnamon bushes. However dry the weather was and however unpromising was the sky, if a cinnamon bud showed

itself, rain was sure to follow. Where I am, I have noticed that the tiny white-ant is Nature's barometer. If they show unwonted activity rain follows.

### ROUNABOUT UVA.

We must answer an enquiry as to the whereabouts of "R.U.F." by saying that he has been "doing" a great part of Uva very thoroughly, penetrating to the remotest corner of Madulsima and Hewa Elliya, the first journalist who was ever on "Uva" estate and many more estates in that 'Ultima Thule' of planting. Cycling wherever practicable has not shut out a great deal of riding and walking and each day has brought so much of one or other as to leave no time for "copy" which is to come now. From Madulsima to Pasara, Namunukula and the Badulla estates on to Haputale and there some of the finest estates in Nayabedde, Craig, Kelburne, Wihare.

glla, Batgoda, &c., have been included in the trip. Finally, a run by rail has been made from Haputale back to Kandy:—

"How magnificent the scenery is on each side summit level—no railway in England can show the like of that piece. Only bits I have seen to compare are on the St. Gotthard and Arlberg Railways—Switzerland and Tyrol."

### TEA-GROWING IN THE CAUCASUS.

The tea plantations in the neighbourhood of Batoum continue to occupy the serious attention of a few Russian tea planters, who appear to be more or less sanguine as to the ultimate results that are likely to be attained. Messrs. Popoff have erected a factory for manipulating tea on one of their estates near Batoum, and have gathered their first crop this year, but I regret to say that, owing to the mystery with which they attempt to surround their industry, and the secrecy which they maintain in respect to all matters concerning their plantations and the cultivation of tea on them, it is quite impossible to procure information of a reliable nature in regard to them. Although the tea crop from these gardens was all forwarded to Moscow and St. Petersburg, it does not, according to the St. Petersburg papers, appear to bear comparison with the imported article in general use in the Russian Empire.

The Imperial Domain authorities expect to obtain a crop next season, and are making preparations for the erection of a factory on their estates, and I am given to understand that the order for the buildings and plant has been placed in the United Kingdom. It seems probable that the results of tea-growing on the last-mentioned estates stand a better chance of success than those obtained on the other estates, thanks to the fact that they have not confined their sowings to one quality only, but have laid out plantations of several kinds, of Indian teas as well as Chinese and Ceylon hybrids. By adopting this rational course they will be able to judge which quality is more especially adapted to the prevailing climate and other local conditions. Their acreage under tea has been largely increased during the present year.

I may here mention that, according to the opinion of persons who have had a wide experience in tea-planting in other parts of the world, the only favourable portion of the Caucasus for tea-planting is the coast land situated between Sonkhoun and the Turkish frontier, the general aspect of the land being southerly, and, therefore, sheltered by the hills from the very cold winds that strike their northern slopes. The rainfall is fairly evenly distributed throughout the year, the driest months of the year being, I should think, as a rule, May and June. The heat is never too excessive for tea-growing. Labour, I believe, is expensive as compared with prices paid in India and Ceylon, and the hands available are of course entirely ignorant of the principles of gardening; but I am of opinion that this difficulty could easily be overcome if tea-planting in this district became general, as labourers, being sure of obtaining permanent work on the plantations, would be sure to flock to this district from the surrounding country, which only grows a poor quality of maize, and is not very remunerative. Up to the present disease among the tea plants have been nil.—*British Consular Report, 1898.*

### FLORIDA BEANS.

Through the kindness of Mr. Lyford we have some more seed to distribute of this useful bean. We are sending some to Mr. E. J. Martin for trial in Coimbatore district, and also some to the Kelani Valley. A few more trials can be given to applicants.

### PROGRESS IN THE STRAITS SETTLEMENTS:

#### PLANTING AND RAILWAYS.

We make a few extracts from the very interesting report by the Resident-General of the Federated Malay States to his honour the Acting High Commissioner (Sir Alexander Swettenham, K.C.M.G.) and first it is surprising how these States have been able to develop so considerable a Land Revenue collected on a scientific basis. We read:—

In a year which I cannot describe as one of general prosperity it is still satisfactory to report that the land offices show the largest measure of comparative increase, and that the total land revenue collected during 1897 amounted to \$636,054 as against \$511,237 collected in 1896:

The duty on tin is the chief support of the revenue, however, giving \$2,716,763 in 1897; while Railway receipts equalled 1,294,139 and the Post Office and Telegraphs gave \$141,328.

The value of trade is returned at \$56,149,020, Imports gave 25,000,682, Exports 31,148,340.

Revenue and Expenditure rose:—

The total revenue of the Federated Malay States amounted in 1897 to \$8,296,667 against \$8,434,083 received in the previous year. The great fall in the price of coffee seriously depressed agricultural interests, and the railways felt the adverse influence of the depression. Towards the end of the year some of the States were visited by the greatest floods known within living memory and immense damage was caused. The expenditure of the year amounted to \$8,795,313, against \$8,598,147 in 1896. The excess of expenditure over revenue was met from balances belonging to the State of Selangor; but this money was advanced in anticipation of the early issue of the Railway loan, and some inconvenience has been caused by unexpected delays, as it is still necessary for the wealthier States to find funds, not only for useful development but also, in the case of Pahang, for the general purposes of administration.

As regards Agriculture:—

Excluding the planting of rice the principal cultivation has hitherto been that of Liberian coffee; and I reported last year the great progress made throughout the States by this form of industry. I am sorry to say that the price of Liberian coffee fell so low in 1897 that the hitherto bright prospects of the industry were overclouded; and some of the planters who were working on a small capital were unable to contend against the altered condition of the market. Most of the European owners of estates, and some of the natives, are holding on for better times, but in a good many cases, especially among the very small owners, I am told that coffee has been abandoned and that planters are taking to some less expensive and more profitable form of cultivation. Looking at the price which has to be paid for very indifferent coffee in Europe (or at any rate in England) I cannot believe that there is yet serious cause to doubt that the cultivation of Liberian coffee, in the Malay States, can be made a profitable venture. Of the excellence of the berry that can be, and is grown here, there can hardly be two opinions; but before the coffee is consumed it must be very thoroughly and carefully dried, and it ought to be mellowed by keeping for a considerable time. If this is done Malay coffee will compare very favourably with that produced in other countries, and it must be the business of those whose interests are mainly concerned to see that they send their produce to market in the condition to make it most easily saleable. No country should rely on one industry, and, here at least, the enterprising planter should be encouraged to try different forms of agriculture. The various kinds of gutta, both those which are indigenous, and those which have been successfully introduced from South America, seems to offer

a promising field. Again, I am told that the Province of Wellesley and the Krian District of Perak form the one bright spot in the cultivation of cane sugar. There are coconuts, pepper and other spices; but, above all things, I should like to see a vastly increased area, under a well-devised system of irrigation, yielding a rice crop sufficient, not only for the people of the Malay States, but also for the large native population of the neighbouring Colony.

Next we have an important deliverance on Railways and Roads:—

As regards Railways the Secretary of State for the Colonies sanctioned, last year, the extensions necessary to join up all the existing lines in the three western States, and also consented to the raising of a loan of £500,000, an equal sum being furnished from current revenues. This is the most important step, after Federation, that has yet been taken in the Malay Peninsula; and it is doubtful whether anything could confer such benefits on this country and its people as the raising of this loan and the devotion of so large a sum as a million sterling to railway construction. As soon as Mr. Chamberlain's sanction was received work was commenced wherever it was possible to do so, and since then a number of engineers have arrived from England, and survey and construction work has been pushed on in Perak, Selangor and the Colony's territory of Province Wellesley. Steam ferry boats have been ordered for the passenger service between Penang and Kuala Prai, and preparations made for erecting the necessary wharf accommodation at both places. The Kinta Valley Railway has been practically completed as far as the Perak River, where a bridge 1,180 feet in length, is in course of erection. Steps will shortly be taken to bridge the Krian River, and the best means of taking the line through the mountain pass which divides the valleys of the Larut and Perak Rivers will be settled on the advice of Mr. Oliver, the engineer who has recently arrived from England to report on the whole railway system. I hope that the sanctioned extensions might be completed in four years from last July, but owing to delays in raising the loan, and in acquiring the land over which the railway will pass in Province Wellesley, the time that must elapse before we can successfully deal with certain large works (especially bridging and tunnelling) and the one long extent of practically unopened forest between the existing lines in Perak and Selangor, I fear that the work will not be completed for at least another four years from the present date.

Kuala Lipis, which is the terminus of the trunk road connecting Pahang with the Selangor Railway. That road, though not yet completed in its entire length, has been opened as far as Raub; and I trust that the end of the present year will see it completed as far as Kuala Lipis, a distance of 82 miles. Progress has been made with other important roads in the western States; but, though this form of expenditure always repays the outlay, the large sums that it will be necessary to provide for railway construction will leave little for other works and, looking to the amount of road construction already done in Perak and Selangor, I should prefer to see any available balances spent on the irrigation of land for rice cultivation. If we had the funds I should push on the road which was begun ten years ago to get into the high land which divides the States of Perak and Pahang. In that region there is a wide extent of undulating country at a height of 4,000 feet, and this must eventually be planted and will afford a really healthy climate, where some day a great European station may be established. The district is under forty miles from an existing railway, and some thirteen miles of the cart-road have been already constructed, but the rest must wait until more urgent work has been completed.

**COFFEE PROSPECTS.**—Discussing these in Brazil, the *Rio News* of Jan. 3rd says:—The coffee crop will be large and prices will continue low, though some improvement may, perhaps, be expected later on.

## RAMIE CULTIVATION IN THE FAR EAST.

In response to request for information, the United States Government sent instructions to certain Consular officers in China, Japan, the Straits Settlements, &c., asking details in regard to the cultivation, marketing, prices, foreign trade, manufacture, &c., of ramie. The replies to these questions have now been published in an official paper, from which we make the following extracts:—

### AMOY.

The growth and manufacture of ramie in Southern China, Formosa, and the Straits settlements have long constituted a distinct and well defined industry. Grass cloth, which is manufactured from the fibre, is of various grades, ranging from the delicacy and fineness of silk to a coarse cloth used by the coolies class as garments, or in the manufacture of rope, fish nets, and burlap. The finest qualities are grown along the Yangtze, on the Island of Formosa, and in the Straits Settlements. The greater portion of the Chinese exports of the cloth comes from the valley of the Yangtze. The coarse goods come in competition with imported cotton in supplying the masses with clothing. Fine qualities of grass cloth which compares favourably with good linen, retail for about c.30 to 50 silver per yard (c.15 to 25 gold). The greatest obstacle to the production of grass cloth is the tedious process of decortication, which is done by hand.

### CHUNGKING.

There are five classes of ramie—the ch'ing-ma, chu-ma, hwo-ma, t'ing-ma and the chu-ma. The ch'ing-ma is the most productive, and it is exported in bundles wrapped in matting to Hankow and Canton; and the most valuable is the chu-ma, from the fibre of which cloth is woven. Ramie grows in nearly all the provinces in China. The chief hemp-cloth factories in this province are those of Kiang Ching, Lung Ch'ang, and Yung Ch'ang districts. The annual transactions in this city in grass cloth alone amount to over Tls. 100,000.

### FOOCHOW.

In this part of Southern China ramie grows wild, and is not cultivated extensively. It is not a commercial commodity to the extent of being shipped to foreign countries, although the climate, soil, &c., are most favourable for its cultivation. What is raised is collected by the natives, scraped and prepared for use by women and children by hand processes, and manufactured into grass cloth, fishing nets, &c. When degummed in this way it cannot be purchased in sufficient quantities and at a price to warrant its being sent to European or American markets.

### HANKOW.

Two kinds of China grass are extensively grown here white and green, principally in Kiangsi and Szechuan. They make a much finer fabric than that raised in Missouri, Kentucky, and other of the American States, the white variety bleaching nearly the colour of flax. Most of the white hemp is raised in Kiangsi, and always finds ready sale on the ground, clean, at Tls. 9 (about \$6.50) per picul (133½ pounds). It is used mainly for the manufacture of thread, twine, and coarse fabrics. The green sells readily at Tls. 10 (\$7.20) per picul, and is used for the manufacture of ropes, nets, mats, and household articles. There is an increasing demand for this hemp, and if an invention of some kind could be devised to extract the gum, large quantities could be shipped from here to the United States.

### JAPAN.

The Consul-General at Yokohama writes:—"The most important place for the cultivation of the karamushi, as the fibre is called in Japan, is Yamagata Ken; next in importance are Aizu in Fukushima Ken, Niigata Ken, and Nara Ken. In the districts of the North-east and Central Japan, Kyushu and Shikoku, karamushi frequently grows wild at the base of the mountains. The market price is from 3.5 to 4 yen (\$1.75 to \$2) per 8 lb. of the com-

mercial product. The refined product is largely used in the manufacture of Echigo chizimi (a corrugated cloth). The raw material is used for hemp cloth, and when beaten out soft, is used for wadding in clothing and coverlets. Of the so-called Chinese hemp imported into this country, the karamashi seems to form the larger part, but it is not suitable for the manufacture of fine (closely woven) fabrics like the native yamagata product, but rather for the manufacture of ships' cables, and ropes, and the meshes of mosquito netting. The price of the imported article is comparatively cheap, being only from 15 to 17 yen (\$7.50 to \$8.50) per 120 lb., while Japanese hemp is worth six or seven times, and the native karamashi five or six times, that much. Notwithstanding its greatly inferior quality, it is being imported into Japan in large quantities year by year. There is no prospect of export of the native karamashi.

#### KOREA.

The Consul-General at Seoul reports:—There are two kinds of ramie plant raised in Korea. Moshi is the name given to the carefully cultivated one. The fibres of this plant produce the silky threads made up into the high-priced grass cloth. The other plant, called sum, seems capable of growing almost everywhere. It is used for making the coarse fabric worn by the poor classes in the summer, and for the very extensive mourning costumes of all classes—a variable "sack-cloth." Moshi is used for the outer gowns of both sexes. Moshi, once started, becomes a permanent crop, easy to raise and care for, and of much value. There is no export of either fibre or fabric. The import for 1896 amounted to 267,769 in value (equal to \$133,834.50 gold). In 1897 the import was 432,699 yen (\$216,845 gold). The imported grass cloth comes chiefly from China, and is supposed to consist of the finer qualities only. The culture of this plant could be increased in Korea, indefinitely.

#### STRAITS SETTLEMENTS.

In transmitting to the Department of State, a pamphlet ("Facts about Rumie"), Consul-General Pratt, under date of Singapore, March 17th, 1898, reports that the ramie industry in the Straits Settlements is only in embryo, but that planters in the Malay Peninsula, in Borneo, and in the Dutch East Indies are undertaking to grow the plant on an extensive scale, and, with their climatic conditions so favourable, he thinks they will eventually succeed in their experiments.—*L. & C. Express.*

#### INDIAN TEA PROSPECTS 1899.

The season for 1899 for Indian Tea promises to open fairly well, if one can forecast at all. It is at all times dangerous, but we especially wish to point out, that according to all accounts the market may open fairly strong, but may be very easily overdone, if planters rush away and pick anything and any how. An increased outturn of even one or two million pounds early in the season, would be attended by disastrous results, and we cannot too strongly impress upon our readers the necessity for sticking strictly to fine plucking, and careful manufacture, and attention to economy in every way. A slight boom in prices in the beginning must not allow our planters to at all relax their efforts towards excellence of quality, and economy along with it; for the industry is far from being out of the wood, and it will take at least two or three years before it can be positively said that tea investments are on a sound basis, and although it seems rather a gloomy prospect, we are not at all certain that another year or two of bad prices might not be an unmixed blessing in the end. Already we hear some whispers, certainly not loud, but still indicative of what might happen, were even another slight boom to occur, and it is on this, that we are principally writing. Most of those concerns that are now wading in deep waters, have a heavy carry in the large area of unproductive tea, which must be a severe tax, and, doubtless, when this comes into bearing the outlook for these will be brighter, and when it comes, we trust Directors, or Managing Agents, will not allow themselves to be

carried away by a slight rift in the present heavy cloud that hangs over the industry. There seems little chance of cheap silver doing much towards relieving the present high rates, for we believe that Government has quite made up its mind that the ideal is 1s 4d and we believe it will remain there or thereabout; so that it is no use speculating on what arrangements or what exchange will do for tea; far better to set one's house in order, to try and work out a certain revenue at a 1s 4d exchange. That this can be done we do not doubt, for if one could calculate on an all round return of say six mounds per acre, there should be a fair return even at five annas. The local working of a garden should be done for R90 to R100 per acre, and if we allow R35 for Calcutta expenditure it should suffice and more provided there is no block debt to hamper the garden with a big interest bill; 6 mounds of tea, at 5 annas, reads R150 an acre. So, if we add Calcutta and local at R35 and R100 respectively, we find a balance left of R15 per acre. Most gardens are pretty heavily capitalised i.e. the public Companies; and this would not read much to those, but there are a large number of private concerns that are only standing at R300 to R400 per acre, so that R15 per acre, would mean 4 to 5 percent to the proprietors. We do not think this is by any means a handsome return in an agricultural undertaking like tea, which is liable to fluctuations in more ways than one; at the same time we are trying to show that there is no reason why gardens ordinarily capitalised, should not do a little more than cover expenses, which will be the case in but too many instances of last year.

CONSUMPTION OF INDIAN TEA.—It would be interesting to obtain statistics of the local consumption of Indian tea, and information as to the progress it is making. Some of our Calcutta firms may be in a position to enlighten us and, further, supply us with intelligence as to what steps are being taken to make Indian tea better known to the natives. There is a large annual consumption of China tea among the poorer Christian and native population in this city. The reason for this is that it is put up in small packets of two and four ounces and sold for two and four annas per packet, respectively—a price which the poorer classes can only just afford to pay. They are too needy to be able to lay in a stock for a week at a time. It is more convenient for them to resort to the *moodies* (small native grocers), who, as well as the Chinese, realise a handsome profit on the transaction. The so-called tea is stuff of the worst description. Sarely our own low grades of teas (which, at any rate, are unadulterated) would readily be taken instead of the Chinese articles, if we would but supply it in similar small packets. Considering the prices realised at the local sales for our inferior grades, they could be sold retail in small quantities at very low figures, and yet be made to return a profit. Such action would have the effect of relieving the home market of a certain quantity of low qualities, which would prove of decided advantage to all parties concerned. What is wanted is any agency, pure and simple, started with the *bona fide* intention of stimulating the sale of Indian tea, and not for the sake of any big immediate profit. The agency might, for example, be composed of three, four, or more leading tea firms in Calcutta who might be found willing to back up such a scheme with advances of tea, as likewise the necessary funds, and to appoint agents for the sale of small packets of tea. Let Indian tea be found for sale in every huckster's shop where China tea is sold, and where it is not found for sale. Let it be peddled from house to house—start a man with a struck round the streets to sell it. Obtain the services of a really good man to supervise things generally and to travel up-country, when it becomes necessary to work the Mofussil which would, of course, be after the Calcutta business had been firmly established. In three years the results would show what a market we had left unearned for at our very doors, and would in the end be certain to turn out a profitable speculation.—*Indian Planter's Gazette*, Feb. 4.

PLANTING NOTES.

THE "SAN JOSE SCALE" continues to give trouble in the orchards of New South Wales as we learn from the *A. Gazette* last to hand. We might quote much respecting the work of this most pernicious pest; but we prefer to repeat our warning to the Ceylon Government and its Customs Department as to the absolute necessity for the fumigation of imported fruit.

THE CEYLON HILLS TEA ESTATES COMPANY had a short crop from its estates last year: the difference altogether with bought leaf equalling 82,351 lb., while the average selling price was a fraction better than in 1897. But the total result was a dead loss on the year's working of 19,963; and this although Directors, Agents and Secretaries have drawn no fees, and no interest has been paid on debentures since 30th Sept. 1897. This is a truly unfortunate experience and the more so as the estates concerned cannot be said to be old coffee estates or situated in the lowcountry.

TEA IN N. AMERICA.—Jas. and Jno. R. Montgomery of New York—says the *American Grocer*—report the statistical position of China and Japan tea for United States and Canada on January 1, as follows (in pounds):

Total afloat to Jan 1, 1899 . . . . .	7,539,635
Receipts to Jan. 1, 1899 . . . . .	57,328,605
<hr/>	
Total shipment advised by mail . . . . .	64,893,290
Leaving to be shipped . . . . .	16,131,710
Estimated supply, seasons 1898 and 1899 . . . . .	81,000,000
Supply, seasons 1897 and 1898 . . . . .	87,711,780
Afloat, Jan. 1, 1899 . . . . .	3,935,304
Receipts to Jan 1, 1898 . . . . .	71,303,603
<hr/>	
Total shipments advised by mail to Jan. 1, 1898 . . . . .	75,238,904

TEA IN NORTH AMERICA.—The year 1898, says the *American Grocer*—closed with tea showing an advance about equivalent to the duty imposed. On some grades prices are not more than 8 cents a pound higher than when the tax was imposed. It is somewhat singular that the importations for 1898 are very much lighter than for the preceding year, being for the year ending June 30, 1898, 67,696,339 pounds, against 112,907,548 pounds in 1897, a decrease of 45,211,209 pounds. For the ten months ending October 31, they were 25,423,119 pounds lighter than for the corresponding period of 1897. James and John R. Montgomery report that the estimated supply for the season of 1898-99 is 80,000,000 pounds, of which 57,327,605 pounds were received to January 1st, at which date 7,539,685 pounds were afloat, leaving to be shipped 16,131,710 pounds. The effect of the tea exclusion act has been to improve the general character of the supply, to send into distribution considerable quantities of low grade tea, which had been held here for years, and to give the market a much healthier and better tone. The year closed with prices firm. The following table shows the quotations of standard grades of Japan and Formosa Oolong tea:—

		Japan.		Formosa.	
		Good to Medium.		Superior.	
		Cents.		Cent.	
Yearly average,	1898 ..	21.47 at 22.63	..	24.89 at 25.97

DESTRUCTION OF LOCUSTS IN ARGENTINA.—The central commission for the extinction of the *langosta* or locusts in Argentina has made a very interesting report to the Minister of Agriculture in that country. The commission was appointed for the purpose of obtaining all the information possible regarding the locust, its habitat, procreation, migration, &c., and to inaugurate concerted efforts for its extinction. To this end the commission organised many local commissioners, and these again formed a sub-commission, and all investigated and adopted such means of destruction as seemed most effective. The results are that the habits of the locust have been well studied, enormous quantities of eggs and *saltonas* (locusts before they have wings) were destroyed, and the destruction of crops greatly lessened. The means of extinction employed were, a preparation of zinc, various liquid extirpators, the plough and fire. The quantities thus destroyed in 1898 are estimated in thousands of tons weight, and the area of crops saved at hundreds of thousands of acres; and it is believed that if, with what has been learned, those organised efforts be assiduously continued, the locust may be controlled, or its ravages greatly restricted. The arrest of the ravages of the locust, whether through the efforts mentioned or other causes, has greatly encouraged the agriculturists of Argentina, and improved the general condition of the country.—*Journal of the Society of Arts*, Jan. 31.

ELECTRIC: MR. C. C. F. MONCKTON.—The mail last in brought a contemporary letter from the above gentleman—who will be remembered as on the electrical staff of Messrs. Boustead Bros.—in the course of which he says that he is quite fit and well once more. After arriving in England, he was, it seems, lucky to get work, within a week of starting to look out for it, with the Brush Electrical Engineering Company, the firm he was with before he came to Ceylon. He started work in September, and at first came across quite a number of Ceylon men, but, as winter approached he met fewer and fewer, and at the time of writing, he had not seen anybody for some little time. About a month after he joined the Brush Company, he was offered a partnership by an old friend which, after due consideration, he accepted, and he has now joined Mr. Wardrop, in his office at the Army and Navy Mansions, two doors from the Army and Navy Stores. Mr. Wardrop's chief experience has been with railways and waterworks, but he has had electrical experience as well. When Mr. Monckton got to know him he was designing central electric light stations from the Brush Company. There are several places in Ceylon, Mr. Monckton goes on to say, where there is sufficient water-power for light railways, if only the Government allowed private enterprise a look in but, as it is, that power will soon be required for driving the tea machinery within say, a radius of from five to ten miles of the source of power. Mr. Monckton also says:—

I wonder if the planters will wait till all the forests are used up before they think of the power running to waste in one or two localities that I could name. Strangely enough I found that Wardrop is a cousin to Mrs. C. W. Tytler, with whom everybody in Ceylon sympathised in her sad loss lately. Mrs. Tytler started a type-writing office at 54, Whitehall, Westminster, with a friend of her's, last month, and she has now five typists at work. I am enclosing one of her cards, as I know a large number of Ceylon men will be only too glad to put work in her way. I can speak for the work done at the office, as we get all our typewriting done there.

### SUB-TROPICAL CROPS IN NEW SOUTH WALES.

(From latest Official Report to the *Agricultural Department*.)

*Coffee (Coffea arabica).*—The small number of trees planted upwards of two years ago are still thriving, some of them showing promise of an early crop of berries. Some of them during last winter were somewhat injured by frost, but protection will this season be afforded them. It is intended to plant an acre at least to coffee-trees when the land is ready for the purpose.

*Turmeric (Curcuma longa).*—This crop has so far proved successful, the plot harvested since last report having yielded green roots at the rate of 4 tons per acre, valued at £7 per ton. The growing crop now approaching maturity will, in all probability, give an improved return.

*Ginger (Zingiber officinale).*—The last season's crop proved a comparative failure, but owing to better soil being available the plot now growing promises payable results.

*Arrowroot.*—A heavy crop of the purple variety (*Canna edulis*) is almost ready for harvest, while a fair yield should be obtained from a plot of the Bermuda or White Arrowroot (*Maranta arundinacea*). Both of these products will be prepared at a local mill, as the process of preparation with the appliances available at the farm is tedious and expensive. Samples and further reports will be furnished later.

*Cassava.*—The sweet variety (*Manihot Alpi*) only is cultivated, the yield of tubers being over 10 tons per acre. *Manihot utilissima* was applied for from Fiji, but *M. Alpi*, which had previously been in cultivation here, was forwarded in error.

*Rice.*—One variety (Japanese) has been grown this season, but owing to lack of moisture and the attacks of rust it has proved a complete failure.

### THE "VENEER-ACME" TEA CHEST.

Our sub-headings are not at all too strong if the new "Veneer-Acme" tea chest is to maintain among Ceylon planters, the reputation already won elsewhere among Indian planters who have seen and tried it, and among the home tea trade that have had it put before them. When in Glasgow in 1896, learning all about the "Acme" steel chest, we ventured to say that we could not help pinning our faith to the men of the Clyde beating the world when they took up a manufacture in their own line in downright earnest. The Acme Syndicate were at the time extending their Works and were full of faith in their steel boxes and not without warrant; because they are at this moment manufacturing the same not at 10,000 "a month's (as we said last evening); but at 10,000 *a week!* The out-turn last year being not under 400,000 boxes. And their Agent, Mr. H J S Brown, reports that he found very great satisfaction expressed by Indian planters who have been using them. They save so much trouble: no waste of material, no temptation to steal loose lead, nails, &c.; no chips flying about the factory, &c. Why then—it may be asked—should the Acme Company go in for a new chest? Well, undoubtedly, their steel one is heavier than some others in the market: some think it not flexible and handy enough and there is something to be desired on the score of price. So the Clyde machinists set themselves to combine light-

ness, flexibility, strength and elasticity utilising "vener" with specially prepared cement. For the veneer they go to Canadian which are sliced round by a peculiar American machine adapted and improved respects on the Clyde. These "veneers" are cemented together having the grain crossed, and the "cement" is the special invention and the property of the Company and is so admirable that the veneer sides and ends of the chests thus manufactured, have been tested both for heat and wet and have stood both tests admirably. Then the veneer sides are bound together with steel bands firmly fixed, but so flexible that the four sides flatten out in packing as two thin boards might. To stiffen them out into a four-sided chest, slips of hardwood, ingeniously grooved, are used, and nothing can be more satisfactory than the way in which these answer their purpose and are slipped out or in, so far as we can judge by the models. Then the ends—veneers bound with steel—slip into their places and are clasped with steel bands after the fashion with which the Acme chests has made us familiar—nothing more than two screws being required to fix them, over which a thin steel band is drawn and soldered down, so sealing the chest. A lining of lead-foil is duly attached to the veneer.

We are assured that an ordinary coolie can put such chests together in four minutes with the greatest ease; that the tare weight is 16lb against 20lb for the Acme's, while some other chests come between at 18lb or so. Further that each chest can take 110<sup>1</sup>/<sub>2</sub> lb of tea which the tare makes 126lb, or well within the 129lb allowed under London regulations. Lastly it is claimed that the new chest saves up to 15 per cent in freight and altogether in cost as much as 1s 5d per maund (8<sup>1</sup>/<sub>2</sub> lb.) of tea. Then we have been shewn letters from leading representatives of the home tea buying trade, saying they are well pleased with what they have seen of the "Veneer-Acme" boxes, and would give preference to them over any others so far seen. The ease with which they can be opened for samples and shut again, is especially realized.

There is nothing like competition to set invention agoing. Tea planters have certainly no cause to complain of the amount of ingenuity used in their interests and not the least in devising improved and economical tea boxes; and we shall be much surprised if this latest invention the "Veneer-Acme" does not meet with full measure of approval.

**MANGO STARCH.**—As the mango season has now commenced, many will be at a loss what to do with the superabundance of fruit, which, of late, has been difficult of sale, and in many cases not worth the expense of gathering, packing, freight, &c. It is not generally known that the mango contains a quantity of starch which is scarcely distinguishable from arrowroot. When used in the same manner and boiled with water, the jelly is very similar to that of the latter. Mr. Watts, a chemist in Jamaica, reported lately on a sample of mango starch submitted to him by the Jamaica Agricultural Society, and he pronounced it almost pure starch of fairly good colour, though capable of being washed to a whiter condition. As an article of diet or of commerce, it will compare very favourably with arrowroot; this being so, he expresses some doubt whether it can be produced at a price sufficiently low to compete with arrowroot, of which the ordinary brands are selling in the wholesale markets at prices ranging from 2d. to 4d. per lb. We think the matter worth a trial, at all events.—*Queensland Agricultural Journal*, January 1st.

## CEYLON TEA IN AUSTRALIA.

## MR. ROWBOTHAM'S VIEWS.

Among the passengers, who returned by the "Himalaya" from Australia on Wednesday were Mr. and Mrs. Rowbotham, the latter of whom, we are glad to state, has considerably benefited by the change. Mr. Rowbotham has stated to a morning contemporary that, as far as Australia is concerned, we must cry halt, because Ceylon tea does not require any extraneous effort whatsoever; no more puffing or "loz rolling," as it would be termed in Australia. Mr. Rowbotham declares that the mistake has lain in the indiscriminate and injudicious shipments of tea to Australia, a fact which is considerably damaging the Ceylon tea trade in the Southern Colonies. "Do you know," said Mr. Rowbotham, "it was these indiscriminate shipments which wrecked the China trade years ago, and if they are continued much longer I have no doubt that Ceylon is bound to suffer in the same way."

"Arguing then from your point of view the Coolgardie Exhibition will not benefit us as far as tea goes?" Mr. Rowbotham:—"Certainly not. It has been money thrown away, by the planters, which will not do him a bit of good." Ceylon tea, I assure you has the largest proportion of business in Australia, though it will surprise you to know that there has been a decrease in the drinking of tea. We are drinking less tea in 1899 than we did in 1890; any why? you ask. Because, sir, the country is being rapidly opened up and the people are able to drink wine and beer cheaper than they did some years ago, both these commodities being procurable at a very cheap rate in the different Colonies. However, as I say, Ceylon tea is well-known in the Colonies and requires no more advertising." Mr. Rowbotham earnestly advocates the sale of tea in Colombo, the justification for which has been urged in more quarters than one of late. It may not be generally known, but it is nevertheless true, that the attention of Australian tea buyers has been drawn to the fact that it is absolutely cheaper to import tea direct from London than it is to do so from Colombo. And we have a lesson of cause and effect in the fact that at the present moment there is a shipment on the water from London to Australia. Mr. Rowbotham contends that not only can tea be purchased at a cheaper price in London, but that freights are also less, so that, unless a movement is made to sell on the spot, London will command the Australian market, though 6,000 miles further removed from Australia. "It is no use mincing matters," observed Mr. Rowbotham "for I say that, from the facts above stated, there is no doubt that both Ceylon and the Ceylon planter are being imposed upon, and the sooner the remedy is devised the better for all concerned."

**POLISHING SMALL STONES.**—The principal thing in polishing stones is to grade the hardness of the polishing material with the stone to be polished. For cutting a surface level, use various grades of emery on lead laps, with a separate lap for each grade of emery. See that all scratches are removed. For the polishing, on hard wood that will not warp glue a piece of buff leather. On this place a little putty powder, which, like the emery, must be used wet. The following has been given as best for soft stones:—Take, say,  $\frac{1}{2}$  lb of putty powder, put it in a jar, cover it with nitric acid, and place it in the open air, as the fumes are noxious; let it stand for a day, then pour off acid and water repeatedly until the water ceases to be acid. Polish with the residue.—From "Work" for Feb.

\* This is going too far, more especially seeing that Western Australia has been getting no tea direct from Ceylon, although steamers run from Colombo to Fremantle.—Ed. T.A.

## MINOR PRODUCTS REPORT.

**CITRONELLE OIL.**—This article is firm at a spot price of 11 $\frac{1}{2}$ d in drums, whilst the price to arrive is 11 $\frac{1}{2}$ d c.i.f.

**KOLA NUTS.**—Recent arrivals of fresh nuts have been sold at 19 $\frac{1}{2}$ d, and in dried nuts there appears to be practically nothing doing. In auction last week 19 packages were sold, fair Grenada nuts at 4d, boldish but dark nuts at 3d to 3 $\frac{1}{2}$ d, medium quality at 2 $\frac{1}{2}$ d, and dark Ceylon at 2d.—*British and Colonial Druggist*, Jan. 27.

**CINCHONA.**—At the first London auctions of the year, held on Tuesday, nine brokers offered supplies amounting to 1,911 packages, made up as follows:—

	Packages offered.	of which	Packages.
East Indian cinchona	1,015	511	were sold.
Java cinchona	273	do	273 do
African cinchona	267	do	224 do
Ceylon cinchona	235	do	166 do
South American cinchona	121	do	121 do
	1,911		1,325

There was a moderate demand, as instanced by the above table, but some of the bought-in lots were afterwards disposed of by private treaty at sale-rates. The average unit obtained was almost equivalent to that of the last Amsterdam auctions—viz., 15-16d to 1d per lb.

The following figures represent the approximate amount of bark purchased by the principal buyers:—

Agents for the American and Italian works	72,279
Agents for the Brunswick factory	57,518
Agents for the Frankfurt and Stuttgart factories	49,809
Messrs. Howards & Sons	23,244
Agents for the Mannheim and Amsterdam factories	17,818
Agents for the Imperial Quinine factory	3,150
Druggists, &c.	44,949

Bought in or withdrawn .. 141,121

Total quantity offered .. 4,9,688

Prices realised were as under:—

**CEYLON.**—Fair to good *Succubra* stem chips and shavings, 2 $\frac{1}{2}$ d to 3 $\frac{1}{2}$ d per lb. *Ledgeriana* chips 4 $\frac{1}{2}$ d.

**JAVA.**—*Ledgeriana* natural stem chips at 3 $\frac{1}{2}$ d to 4 $\frac{1}{2}$ d; branch at 2 $\frac{1}{2}$ d to 3d; and root bark at 3 $\frac{1}{2}$ d to 4 $\frac{1}{2}$ d per lb.

**EAST INDIAN.**—*Ledgeriana* natural stem chips and shavings, 2 $\frac{1}{2}$ d to 3 $\frac{1}{2}$ d; ditto branch 1 $\frac{1}{2}$ d; root 2 $\frac{1}{2}$ d. Crown original stem 2d to 3 $\frac{1}{2}$ d; renewed 2 $\frac{1}{2}$ d to 4 $\frac{1}{2}$ d; *Succubra* renewed chips 2 $\frac{1}{2}$ d to 3 $\frac{1}{2}$ d; original chips 2 $\frac{1}{2}$ d; broken quill 3 $\frac{1}{2}$ d; and root 2 $\frac{1}{2}$ d. Hybrid natural stem chips 3d per lb.

**QUININE.**—Best German brauds are without alteration, and a dull tone prevails. B. and S. Brunswick is quoted nominally at 10 $\frac{1}{2}$ d per oz.—*Chemist and Druggist*, Jan. 28.

**PLANTING IN THE SOUTHERN PROVINCE.**—Tea cultivation is now at a stand still, and the S.-W. clearings this year will not exceed 200 acres. The natives received a shock through the whole of 1898, owing to the low prices, and are now going back to cinnamon. I see the Udngama Company did badly last year; but can they expect to make a profit out of 500 acres yielding less than 200 lb. per acre? The tea-box-making concern seems to have been also worked at a loss, besides the loss of thousands of trees cut out of the jungle. The Talgaswella Company will shortly hold its annual meeting. I believe they have made a small profit on last year's working. There are our only tea companies, and do not advertise the district, but we have good paying estates all the same.—Co.

CLAREMONT ESTATE COMPANY, LIMITED.

The report is as follows:—

ACREAGE.		
Tea in bearing .. ..	200	acres.
Tea planted, 1895 .. ..	46	"
Forest, Ravines, &c. .. .	90	"
<b>Total .. ..</b>	<b>336</b>	<b>"</b>

The directors submit herewith the balance sheet and profit and loss account, duly audited, for the year ending 31st December, 1898.

The yield for the year was 80,922 lb. against an estimate of 80,000 lb., or just over 400 lb. per acre, costing in Colombo 23.38 cents per lb., after deducting R1,500 on capital account.

The tea was all sold locally, realising 33.10 cents per lb. nett.

The estimate for 1899 is 85,000 lb.

During the year Mr. J F Baker resigned his seat on the board and Mr. J G Russell was elected to fill the vacancy.

Messrs. J G Russell and R Huyshe Eliot retire from the board by rotation, and are eligible for re-election.

The election of an auditor rests with the meeting, and Mr. J Guthrie again offers his services.

MAHA UVA ESTATE COMPANY, LD.

THE REPORT.

The report was as follows:—

ACREAGE.		
Tea in full bearing ...	499	acres
Tea in partial bearing ..	109	"
Tea not in bearing ...	25	"
Cardamoms ..	85	"
Grass ..	15	"
<b>Total Cultivated ..</b>	<b>724</b>	<b>"</b>
Jungle and Wasteland, &c. 234		"
<b>Total of Estates ..</b>	<b>958</b>	<b>"</b>

The Directors now beg to place before the Shareholders the accounts of the Company for the past year.

The crop secured amounted to 198,383 lb tea as against 179,263 lb in 1897, being 32,000 lb below the estimate for the year; this deficiency is accounted for by the short rainfall during the first eight months of the year. The nett average price realized was 42 cents per lb as compared with 43 cents in 1897. Of the cardamom crop 3,751 lb were sold for R6,435.53, or about R1.71 per lb., leaving about 460 lb yet to be realized, which has been estimated at R1.50 per lb. There was also a small quantity of coffee, 235 bushels, which fetched R1,545.20, but very little more of this product may be expected.

After making the usual ample provision for depreciation of Buildings and Machinery the amount at credit of Profit and Loss account for the year's working is R18,806.19, equal to 6.27 per cent on the capital of the Company; this with the balance of R5,789.20 brought forward from the previous year makes a total balance at the credit of Profit and Loss account of R24,595.39. The Directors recommend the payment of a dividend of 6 per cent for the year, and that the balance of R6,595.39 be carried forward to the current year's account.

The estimates for this year are 230,000 lb tea, 100 bushels of cherry coffee and 6,000 lb cardamoms, on an expenditure on the estate of R65,838.89.

The outlay on capital account during the past year amounted to R17,036.01, nearly all of which was expended on additions to Buildings and Machinery. It is anticipated that there will only be a small expenditure of R1,773 on capital account during 1899.

During the year Mr. W. H. Figg resigned his seat on the Board, and Mr. Edward J. Young was appointed in his place. In terms of the Articles of Association Mr. G. H. Alston now retires from the office of Director, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

THE DIVIDEND.

The CHAIRMAN said they would see in the report that the Directors proposed a dividend of six per cent per annum and this he thought they could do quite freely. It disposed of R18,800 and left R24,500 to the credit of the profit and loss account. He proposed that a dividend of six per cent be declared and paid forthwith.

Mr. FORBES seconded,—Carried.

KIRKLEES ESTATE COMPANY, LIMITED.

THE REPORT.

ACREAGE 31ST DECEMBER, 1898.

Tea in full bearing .. ..	327	acres.
Tea in partial bearing ..	50	"
Tea not in bearing ..	23	"
New Clearings ..	45	"
Timber and Cardamoms, about	105	"
Uncultivated Land ..	167	"

Total.. 717 acres.

The Directors now submit to the Shareholders the accounts of the Company for the past year.

The crops secured during the year were 106,852 lb tea and about 1,108 lb. cardamoms, and in addition 4,564 lb. tea were manufactured from bought leaf. The average net prices realized were 39.33 cents per lb. for the tea and R1.62 for the cardamoms. In addition to this 443 bushels cherry coffee were harvested, which sold for R213 and R1,680.60 was received for the manufacture of outside leaf.

After making ample provision for depreciation of Buildings and Machinery and setting aside a sum of R500 to cover possible loss of coast advances, for which the Directors consider it advisable to make provision, the profits for the past year amount to R1,867.37, to which has to be added R3,617.37, the balance brought forward from 1897, making a total of R5,484.74 available for dividend. The Directors now recommend the payment of a dividend of 4 per cent for the year, leaving a balance of R1,484.74 to be carried forward to the current season's account. The crop secured fell very short of the estimate of 130,000 lb. This shortfall was caused by the abnormal dryness of the season, and may also be attributable partly to its having been considered advisable during the year to prune nearly the whole of the older tea.

The crop for the current year is estimated at 125,000 lb. tea and 2,500 lb. cardamoms, on an expenditure on the estate of R38,911.73. During 1898 a net sum of R6,899.53 was expended on capital account in opening up 45 acres tea and planting fuel trees, the upkeep of the acreage not yet in bearing and the erection of a cardamom house for preparing the increasing crops of this product. During 1899 the capital expenditure is estimated to amount to only R2,860.

In terms of the Articles of Association Mr. W H Figg retires from the office of Director, but is eligible for re-election. The appointment of an Auditor for the current year will rest with the meeting.

YATADERIA TEA COMPANY OF CEYLON, LTD.

The Directors have the pleasure to submit the balance sheet and profit and loss account for the year ending 31st December, 1898, duly audited.

After providing R3,277.73 for depreciation of buildings and machinery, the profit for the year is R49,294.77

PLANTING AND PRODUCTS.

(From the Udapussellawa Planters' Association Annual Report for 1898-9)

t) which must be added R6,187 07 balance from 1897. An interim dividend of 10 per cent absorbing R19,000 was paid last August, and the Directors propose that a further dividend at the rate of 15 per cent absorbing R28,500 be declared and made payable on 20th instant, that R2,500 be transferred to the reserve fund to bring this fund up to R47,500, equal to 25 per cent of the share capital, leaving a remainder of R5,481 84 to be carried forward.

It will be seen that the property representing capital stands in the balance sheet at approximately R200 per acre cultivated, as compared with about R204 in the previous year's accounts, and that the profit is R61 per acre in bearing, and 25 94 per cent on the capital.

The total tea crop was 548,306 lb. or 12,306 lb. more than estimated in the last report (though 46,314 lb. less than was estimated when the half-yearly meeting was held—the latter part of the year having been unfavourable.) The plucking area was 805 acres. The total quantity of tea for disposal was 551,829 lb. including 3,523 lb. made from purchased leaf, of which 68,493 lb. were sold locally, averaging 26 78 cents per lb., and 483,336 lb. were shipped to London, of which 83,153 lb. had still to be accounted for; but the average obtained for the 463,676 lb. as yet accounted for is 29 32 cents per lb. The cost of the tea delivered to buyers or put on board ship, including all charges and depreciation of buildings and machinery, was 20 20 cents per lb. (being 1 80 cents less than in 1897.) The net value realised from sales (a portion being estimated) was 29 81 cents per lb. (being 13 of a cent less than for the previous crop.) The sum written off for depreciation represents 59 of a cent per lb. of the cost.

The Company's property consisted on the 31st December 1898, of:—

	Planted in	Yielded in	lb. tea per acre.	
1898 acres tea.	172 acres tea	1885	1898	670
	208 do	1887	do	607
	100 do	1888	do	620
	42 do	1889	do	824
	6 do	1890	do	761
	52 do	1891	do	921
	121 do	1892	do	830
	68 do	1894	do	692
	37 do	1895	do	537
	75 do	1896	do not in bearing	
	31 do	1897	do	do
	27 do	1898	do	do
	22 acres cocoa and Factory site			
293 do Forest, &c.				

Average yield from 805 acres 681 lb.

Total 1,253 acres, as per last report.

During the year 13,000 more para rubber trees and 3,860 more coconut trees have been planted at an expenditure of R1,326 borne upon the year's revenue account.

The directors propose an extension of 10 acres tea in 1899.

The estimated crop for 1899 is 555,000 lb. tea.

Mr. D Fairweather retires from the Board in terms of the articles of Association, and, being eligible, offers himself for re-election.

The shareholders will be requested to elect an Auditor for the current year.

*Planting Opinion* UNDERSTANDS that a Madras firm is about to plant an acre or two of Wynnaid land with roses, with a view to the manufacture of attar.

BARLEY SHOW.—The Madras Government agree with the Board of Revenue in considering that another year may show an improvement in the results of the show to be held in the Nilgiris and that one at least of the judges should have an experience in brewing.

There have been five general meetings held during the year and the number of estates registered 26, the same as last year.

TEA.—This has not been a very favourable season for yield except in some cases near to Kandapola, the drought having been too severe for the middle and lower divisions of the district. The prices also have not been so good, but they still maintain about the former value in excess of the London average. The acreage in bearing is 7,985 acres. Estimated to yield in 1899 3,169,000 lb. which is equal to 396 lb. per acre against 421 lb. per acre in 1898. The area in bearing will be considerably increased during the next two or three years.

COFFEE.—This product is now almost a thing of the past. The existing patches have been all planted with tea, and when the present crop is picked, which is a good one, the most of the bushes will be cut out.

CARDAMOMS.—These are being planted at the lower end of the district under givilleas as a trial.

ROADS.—The district cart road has been lately much improved by widening out some of the sharp corners, but a good deal more has to be done in this direction, and railway is badly wanted in many places. This Association has approached the Colonial Secretary on the subject. The permanent way has been kept in very fair order throughout the year, but an insufficient supply of metal has been laid on the last three miles from Amherst to St. Margarets to last for 12 miles.

MINOR ROADS.—It was suggested to continue the cart road from the P. W. D. Bung low on Delmar to the Hospital, however Government preferred to widen the existing path and they have made a very fair road of it. With the exception of the Kandapola-Brookside portion which is in a disgraceful state, all the minor roads in the district are in fair order considering very little has been spent on them since this time last year.

POSTAL.—The Receiving Office at Ragalla has been so well supported that the district is still of the opinion that a Post and Telegraph Office should be established there and the P.M.G. has been asked to include the cost of this in his estimate for the current year. During the present year the Nawara Eliya Coaching establishment has been running a coach daily each way from Ragalla to Nannuoya which has been a great convenience to the upper end of the district, but it has been of little use to the lower end owing to the fact that it leaves Ragalla at 6 15 a.m. and returns at 7 p.m. The P.M.G. was approached to give a mail subsidy to this coach, but the sum the proprietors asked was more than Government are prepared to give; however it is to be hoped some arrangement will be arrived at to obtain this end.

LIGHT RAILWAY.—This is again under the consideration of Government and a Commission has been appointed to obtain further details as to the up and down traffic.

LABOUR.—Most estates have been working short time for months on account of having too many coolies during the slack season and there will be quite sufficient for the busy months. Coast advances are being reduced considerably wherever large sums are outstanding.

LABOUR FEDERATION.—Out of a total of 26 estates, 23 have joined and it is to be hoped that the others will do so shortly. Influenza was at one time rather bad, but with the exception of this the health of the coolies has been fair.

PLAGUE.—Sites for camps have been chosen by the Medical Officer for the Estates and most Superintendents are prepared to carry out the Government instructions if necessary.

FINANCES.—The funds are sufficient for all requirements.

AGRICULTURAL CHEMIST.—The estate selected for Mr. Kelway Bamber to visit is St. Leonards.

PLANTERS' BENEVOLENT FUND.—This fund has not been so well supported as it might have been; however, it is to be hoped that more subscriptions from the district will be sent in during the next twelve months.

PHOTOGRAPHS OF CEYLON PLANTS  
IN THE HAARLEM COLONIAL  
MUSEUM.

The *Indische Mercuur* of 28 Jan. says:—

In the Colonial Museum at Haarlem are exhibited 151 photographic views from East India, which the Museum has received as a gift from the Society of Amateur Photographers established in Batavia. Beside this very interesting collection, there are also to be seen 24 views from various places in Neth. India, and last not least 51 photos of plants from Ceylon.

These last attract especial attention by the photos being surprisingly fine, and the softness of the plants and flowers being strikingly reproduced.

The deserving Association in Batavia before-mentioned will perhaps find the opportunity, on reading this short notice, to try to equal the professional photographers established in Ceylon, who "take" the flora so excellently in that department.

GROWING POPULARITY OF TEA IN  
FRANCE AND AMONG PARISIANS.

DURING THE LAST TWELVE YEARS THE  
SALE OF THE BEVERAGE "THAT CHEERS  
BUT NOT INEBRIATES" HAS TRIPLED IN  
THE FRENCH CAPITAL.

How far the consumption of tea had entered into Parisian customs was the object of interviews on the part of a *HERALD* correspondent yesterday.

"Our experience," said a representative of the *Compagnie Anglaise*, place Vendôme, is that the consumption of tea in Paris is on the increase.

"With regard to our establishment, the increase in purchases by French customers is very marked, and they have outstripped other nationalities in this respect."

On the other hand, the manager of the English Tea Company, rue Royale, said: "Parisians are becoming fonder of tea than in past years, but certainly not to the extent that is commonly believed. From my experience in Paris, I should say that the manury of the tea trade is to be found in the English, American and Swiss elientes. With these nationalities the taste is fixed, and the demand is steady, for a tea drinking, as everyone knows, is not a fad or a question of fashion. On the contrary, tea is considered as part and parcel of the requirements of a home.

"As a means of making tea popular in Paris I think tea rooms have been very useful. French ladies like to take a cup when shopping, and little by little the advantages of tea drinking have become known."

M. Kastor, of the Royalty House, rue Royale, said: "French people are using much more tea than formerly, and from my experience I am in a position to say that within the last ten years its consumption has at least doubled in Paris.

HOW THE TASTE HAS GROWN.

"The reason for this growing taste in French families no doubt takes its rise in making calls,

Formerly the sale of Spanish wines and 'sirops' was much greater than it is now, and special pains were exercised to support such classes of wines as were particularly suitable to a lady's palate.

"In some way, however, the question was pronounced on by medical men, and the use of these wines and cordials was severely condemned. More than that, it was alleged that the quantity of alcohol contained in what appeared to be harmless beverages was much greater than could be recommended.

"Also, it was said that sweet, syrupy beverages produced disorders of the digestive organs. No one pretended that a glass of Malaga, for instance, would be objectionable. But, suppose in the course of an afternoon several glasses of wine or cordials or 'sirops' were taken, then it is easy to see that the case is different. At all events, the decline in favor of these refreshments was contemporaneous with the increase of tea consumption, and tea-dealers attribute the increase in the sale of tea to this cause.

"I do not think the sympathies for Russia in connection with the alliance had anything to do with the importation into France of the Russian custom of drinking tea. Not that it proves my reasoning to be correct; but it is interesting to note that so far as the sale of Russian samovars is concerned in Paris, our customers seem to regard them rather as ornaments than for practical use.

PARISIANS PREFER OVERLAND TEAS.

"However, the French taste is like the Russian in this respect, viz., that they prefer China tea to any other. When we speak of 'English' tea (in the trade), we refer to tea which comes from English colonies, such as India or Ceylon, or China tea brought by sea.

"Now, French people do not, as a rule, care for these classes of tea, preferring that which is brought overland to Russia. So that in this respect French and Russian tastes are more or less identical.

"I am aware that much tea is imported into Russia by English houses, but I think no one could controvert the general statements that I have made."

"Are these 'caravan' teas superior to China tea brought over by sea?"

"They are commonly supposed to be, but I am not sure that the belief is well founded."

LITTLE GREEN TEA USED.

"Is green tea used in Paris?"

"Yes, but very little of it. Parisians never, so far as I am aware, use it. I have never sold nor heard of its being sold to French people. Russians, however, have a taste for it, and we keep green tea in stock for them."

At Colombin's Tea Rooms, in the rue Cambon, the proprietor said: "Speaking in connection with the Parisian trade alone, I am sure that within the last twelve years the sale of tea has tripled. French ladies stop for a cup on their way home from shopping as a regular thing now. Certainly as a refreshment tea has replaced 'sirops' and liqueurs very largely. We always have the latter on hand, but they are not often asked for.

"In the summer cold tea is used to some extent but Parisians seem to prefer tea with milk and moderately strong. With their tea they ask for 'toast,' in two syllables, for the English word has crept into the French vocabulary, and also waffles and rusks."—*New York Herald*, Jan. 31.

## A MOTH-DESTROYING PLANT.

A plant is cultivated in New Zealand with great care and on a great scale, which has the singular property of destroying the moths that infest vegetation. This valuable plant is the *Auragia alb ns*. It is a native of South Africa, but is easily acclimated wherever there is no frost. It produces a large number of whitish flowers of an agreeable odour, which attracts insects. On a summer evening may be seen bushes of *Auragia* covered with moths, which by the following morning have quite disappeared. The action of the flower is entirely mechanic. The calyx is deep and the nectar is placed at its base. Attracted by the sight and powerful perfume of this nectar, the moth penetrates into the calyx and pushes forward its proboscis to get the precious food, but before it is able to do this, it is seized between two solid jaws that guard the passage, and that keeps the insect a prisoner until it dies.—N. Z. Exchange.—*Sydney Mail*, Jan. 21.

## TEA PROSPECTS.

To the Editor, "*H & C Mail*"

SIR,—In the "*Scotsman*" article the profits of twenty-five representative companies from 1897 are contrasted unfavourably with those of 1896, and I fear those from 1893 must again to some extent contrast unfavourably with 1897; and to enable satisfactory dividends to be paid for 1898, the withdrawals from "Reserves" will have to be on a still more liberal scale than those referred to. The concerns that will come out as well for last season as they did for 1897 will be very few indeed, and confined chiefly to the favoured districts of Assam.

I am entirely in accord as to the advantages for the future. (1) Extensions have had a check, (2) markets are expanding, and (3) it is to be hoped that in all directions unnecessary "expenses are to be strenuously kept down."

The evil of over-production may not prove so serious as is generally dreaded from the area statistics (probably overdrawn generally), because (1) the oldest tea will not yield so well as it should have done under different treatment, and more of it and other poor tea will be forced out of cultivation, and (2) though the yield from recent vast extensions must increase rapidly annually, the increase of crop will not be quite what is no doubt expected, owing to the soil and preparation of it not having been all that could be desired in all instances, and as is natural under all the circumstances, the areas are likely to have been over than under-estimated.

The position of China as at least affecting foreign markets is problematical, but must not be left out of account by any means in regard to the future.

Tea proprietors have always had, and must be prepared for, ups and downs. The great danger is lest they be too much depressed by the latter. Still it can serve no good purpose to ignore the facts. No concern in a strong, sound position financially (that is, in available cash), with good, well-managed gardens has anything to fear, taking an average of years.—I am, sir, yours,

SHAREHOLDER,  
*H & C Mail*, Feb. 3

## PLANTING NOTES.

GOOD NEWS FOR CONSUMERS OF KEROSENE OIL.—Many good things in the way of inventions come from America. We had a call today from the Agent of a New York Oil Purifying Company who is taking a patent out in Ceylon for a preparation that, mixed with kerosene oil, will save 40 per cent in the consumption of the latter. This should be good news for shareholders and still more for planters with oil engines. Full particulars shortly in advertisements.

THE ACME TEA CHEST Co. is at present represented in Ceylon by Mr. H. J. Stuart Brown who, however, states that his Company while turning out 10,000 Acme boxes a month, are also going in for a light veneer box, so as to compete with the lightest and cheapest in the market. Specimens are now in Colombo and are to be sent to some of the estates of Messrs. Lipton & Co., Finlay, Muir & Co. and Colombo Commercial Co., to be filled with tea, shipped to England and tested. Mr. Brown is sanguine this will prove the most economical chest yet supplied to planters. Mr. Brown has just come from Travancore. He was previously through Sylhet, Cachar, and the Dooars.

THE TEA CROP ESTIMATE FOR 1899—is now put by the Planters' Association at 126½ million lb.; but of this, 1½ is put down for local consumption, and only 93 million lb. are counted for the United Kingdom or 3 millions less than was shipped thence in 1898, leaving 32 millions for rest of Europe, North America and Colonies; and if Russia takes 10 million lb., Australasia 16 millions and North America 4 millions, there will only be half-a-million lb. left for all other countries, against about 2½ million lb. taken last year! This, of course, will not do; but it remains to be seen if Russia increases its orders for Ceylon by some fourfold those given in 1898.—We count the tea exported last year for "China" as really intended for the Pacific coast of America.

TEA COMPANIES.—The annual meetings of the Claremont, Kirklees and Maha Uva Companies are reported elsewhere, and the Chairman at the latter (Mr. G. H. Alston) made some interesting remarks in proposing the adoption of Report and accounts. The Maha Uva shareholders get the satisfactory dividend of 6 per cent for the year; while those of Kirklees got 4 per cent.—For other two Companies (Castlereagh and Yatereria) the reports of proceedings are to come to us on Monday; but we give the Directors' Reports today and they show ample dividends. Castlereagh gives 4 in addition to 3 interim, making 7 per cent in all; while Yatereria makes the splendid return of 25 per cent dividend in all for the past year.

CINCHONA BARK AND QUININE IN INDIA.—Ceylon is favoured just now with the present on a very brief visit of Major D. Prain, Indian Medical Service, successor to Sir George King, M.D., as Superintendent of the Calcutta Botanic Gardens and Supervisor of the Government Cinchona Gardens. The policy of the Indian Government in disposing of "pice-packets" of its locally manufactured cinchona alkaloids through the post-offices and kacheheris of Bengal and other Provinces has succeeded so well of late years that there is some risk of the demand overtaking the production of bark! Major Prain in the course of an official visit to Madras—to the Nilgiris and Travancore—has been enquiring if bark could be purchased from the planters and, crossing over from Tuticorin for two or three days in Ceylon, he has been propounding the same question to us here. He strongly advises Ceylon planters to use not Hybrid but pure *Officialis* seed for any nurseries they may form at this time. Major Prain hopes to run up to Peradeniya and we have pressed on him to take a run to Hakgala, as the trip would show him so much of our finest planting districts. We bespeak all due attention to this Anglo-Indian official, accomplished Scientist and worthy Scot, while in Ceylon.

Correspondence

To the Editor.

CACAO PREPARATION AND PRICES.

Jan. 14.

DEAR SIR,—With reference to a letter signed "Miscellaneous Planter" published recently in one of your issues, I wish to offer some remarks. I think that he is mistaken in his statement that the way now adopted by many planters of washing the cacao after 15 or 39 hours' fermentation is to add weight by preserving part of the mucilage, which it would do to only a very small extent. It is then slightly dried and heaped again, so as to give it a secondary fermentation, for two days, and then thoroughly dried. This process has been adopted to obtain as bright a red colour and glossy and unsplit bean as possible which is the desideratum for the London market.

It is my experience, however, that cacao treated in the old way by four to five days' continual fermentation which gives it, if a less prepossessing appearance, what I consider a far better and more decided taste of chocolate, obtains a lesser price in London. Why this is I am at a loss to understand as well as why the bleaching of cardamoms does add to their value, considering that the peel of the cacao as well as the capsules of the cardamom are nearly valueless. Thus even the raw products have to be "faked" and it is not the case that the Ceylon Criollo, which forms still a portion of the production, has fallen to the level of cacao of other countries, formerly less appreciated.

The fermentation of cacao wants a scientific investigation to precise the best method, that is to say to determine the reason why some breaks turnout with a delicate chocolate taste, while others treated apparently in the same way have not that taste.

The continental cacao buyers seem to have another standard to go by for their appreciation of the value of that product: they give high prices for earthen cacao as Caraquez and Puerto Cabellos, the latter generally 50 per cent more than the next best and the earth obtaining represents about 10 per cent of the weight.

With many other cacao growers, I have little faith in the efficiency of the cure proposed by the cryptogamist, Mr. Carruthers. The spores of the fungus are too "millionous"; they not only settle on and develop on cacao trees, but on many others and their growth is too rapid and often undetected. I think that the only efficient way is to paint over the trunk and the crown, some refuse oil mixed with pulverised sulphate of copper, taking care to cut out previously any part of the bark already attacked. In the case of the cacao tree particularly where the heroic cure of excision does such harm to the patient, prevention is better than cure.

Contrary to the experience of Mr. Carruthers who stated that he found no variety of cacao to be immune from the disease, I have a robust and hardy variety of trees which have been planted in 1886 and which never have been attacked, although surrounded by Criollos and Forasteros which have suffered severely. The pods oval and smooth are large and vary in colour from yellow to deep-red and the shell is thin. The beans also are of large size and when fresh, their colour at the section varies from white to purple. These trees have different characteristics of age also from the other varieties.

They have given for the last three years an average of 6½ cwt. per acre, about half in October-December and half in April-June being planted 12 by 12 in stiff soil. When allowed to spread they cover a space of 20 ft. Since 1894 I have planted a good many acres with the seeds of those trees and not one of the new trees which all have the same characteristics has, to my knowledge, been attacked by the fungus, when it is admitted by neighbours that fields of the

same age, planted from seed of robust Forasteros obtained from Matala, have already suffered much. I am thus justified in asserting that there is a variety which is not attacked.

I have heard it stated that the replanting of Criollo fields with hardy varieties was generally successful is to growth. This is not my experience. I find that it is only exceptionally successful, even in good loamy soil which has not been exhausted and has been left fallow for several years. Here again an agricultural chemist might discover the elements missing to render to the soil its lost fertility. I have tried to do this, but without success, with a chemical manure possessing a high percentage of phosphoric acid and potash. This however has given me surprising results being applied to full bearing trees, increasing the size of the pods and the crop by 40 per cent, having been applied four months before the blossoming season.

I hope my letter may elicit the publication of the experience of other planters pro bono Theobroma cacao.—Yours truly,  
A. V. D. P.

GREEN TEA: THE STATE OF THE MARKET.

Kandy, Jan. 27.

SIR,—I enclose extract from a letter of Mr. Larkin to Mr. Mackenzie in reference to Green Tea; also some newspaper cuttings forwarded by Mr. Larkin.—I am, sir, yours faithfully,

A. PHILIP,

DEAR MR. MACKENZIE,—I have your valued favor on the 25th inst. to hand.

I have just been showing those Ceylon Greens to the people in the Japan trade, and they all agree with me that they are exactly on the same lines as Japan tea, only they are finer than even the earliest pickings of Japan, as they are more astringent, drawing the same kind of liquor and having the same kind of smell and taste. We can thank our stars that, although these teas are similar to Japan, so far the Japanese have not been able to make a black tea, for the Japan blacks I have seen in the past have been most wretched.

THE TEA MARKET.

The future of this market seems to be a little more hopeful owing to the great expansion of the demand in countries outside the United Kingdom. In the nine months ended September 30th last these outside markets have consumed over nine million pounds more than in the corresponding period of 1897, and the following figures show that the demand has been steadily increasing for some years past:—

	lb.		lb.
1898	42,918,654	1895	25,002,230
1897	34,859,215	1894	20,905,531
1896	28,250,961		

Fully one-half of the total for 1898 was shipped direct to these foreign markets from Calcutta and Colombo. Ceylon tea is most in favour, the increase being about six million pounds as against less than two millions of Indian varieties.

In addition to the increased foreign demand there has also been a larger home consumption. Last year, it will be remembered, there was a decrease in the latter, owing partly, it was said, to the engineers' strike and partly to the efforts to push cocoa. This year the increase is well above the normal. For various reasons the Indian growers are expected to supply the United Kingdom with only about two million lb. more than last year, while Ceylon only shows an increase of from 3 to 4 million lb. Stocks are, therefore, diminishing instead of increasing, as in past years, and a healthier tone prevails in the market. Some stress is laid upon the altered conditions of training which are expected to lead to an improvement in business later on. The great difficulty in the tea-trade is that four-fifths of the Indian shipments are made in the six months from August to January. In those six months of 1897-8 the shipments exceeded the deliveries by about 34 million

lb. and this surplus stock had, of course, to be held by the market until supplies grew more moderate. The old firms had been accustomed to hold the smaller stocks of earlier days, but their resources had not grown with the expansion of the business, and in the last few years there has been a greater tendency to push the stock on the market when the conditions were unfavourable. Buyers, knowing the weak state of the market, did not come forward and took as little as possible in order to gain every advantage from forced sales. There is a limit to this state of affairs, and the creation of a number of joint-stock sellers of tea is helping to improve matters. These large dealers with their numerous shops find it advantageous to buy in considerable quantities and as direct from the growers as possible. Their resources enable them to carry their stocks for some time, and as their number increases the competition when prices are depressed tends to grow. So far this new order of things has not had much effect, but prices have improved a good deal of late and it is hoped that the development of competition among buyers may strengthen the market for Indian teas. Ceylon teas do not suffer from the same cause, except sympathetically, as the produce from the island comes in fairly regularly each month, and at no time do shipments exceed delivery to any great extent.

#### TEA IN GERMANY.

Stinsford, Veyangoda, Feb. 12.

DEAR SIR,—I append a literal translation of an article appearing in the "Chemnitzer Tageblatt" of the 16th Dec. 1898. Thinking it may prove of interest to your readers.—I am, dear sir, yours truly,  
R. M. ECKERT.

(Copy.)

#### CONSUMPTION OF TEA, COCOA AND COFFEE IN GERMANY.

While in former days the consumption of tea and cocoa in Germany, was limited to a small section of the population, it has with the advance of time, extended to larger circles and today its consumption extends over a large area.

Different is the case with coffee, which was long ago a well-known drink in Germany and could therefore not have increased in the same proportion as tea and cocoa. All these three products are imported from foreign countries and the consumption can thus easily be authenticated by a reference to the Customs returns.

As to Tea.—In 1862, 741 tons were imported into Germany, whilst in 1897, 2,552 tons were imported. We have therefore during the last 35 years increased the imports by nearly three-fold. This continuous rise was only interrupted during the years 1879-80, owing to the increase of duty from 40 to 100 marks per 100 kilograms, importers getting in as much stock as possible before the 7th July, 1879, the date when the new Tariff charges came into force, and which naturally resulted in a considerable decrease of the article during the following twelve months. The export of tea from Germany is naturally very small, in comparison with the quantity imported. In 1897 the total being only six tons! The maximum exported was in 1892 when a total of twelve tons was reached.

Cocoa.—This article shows a very much larger increase than in the case of tea. In 1862 only 948 tons (cured and uncured) were imported, while in 1897 the total reached 15,473. An increase of sixteen-fold! The export was originally small and during the last few years has ceased altogether, the consumption being entirely local. Cocoa has a special interest for Germans, as of late years it has been largely cultivated in our German-African Colonies, whence the export to the mother-country, has been steadily increased. The imports in 1893 being 26.3 tons as against 78.7 in 1897.

Coffee.—With reference to the consumption of this product, our Custom House Returns show that the imports of raw and mixed coffee (excepting chicory)

were 76,979 tons in 1867, whilst during 1897 the total reached 136,395 tons. Coffee originally was largely consumed, whilst tea and cocoa were almost unknown articles. The former has however steadily increased though not in the proportion to the two latter articles.—The figures reading: coffee, under two folds, tea three folds, and cocoa 16 fold. The export of raw coffee has considerably decreased in latter years, the maximum reached being 56 tons in 1883, whilst in 1897 only 14 tons were exported. The following table shows the imports of coffee from our African Colonies:

In 1889	51.0 tons	1892	137.2 tons	1895	9.6 tons
1890	165.0 "	1893	8.7 "	1896	46.0 "
1891	163.2 "	1894	7.5 "	1897	47.8 "

In comparison with the import of the above articles, it will be seen, from the figures quoted below, that the consumption shows a steady increase, viz:

	TEA,	COCOA,	COFFEE,	IN	KILCOGRAMS.
1865	0.02	0.03	1.87	per	head.
1876-80	0.03	0.05	2.33	"	"
1896	0.05	0.23	2.46	"	"
1897	0.05	0.27	2.53	"	"

We therefore see, that during the last 36 years the consumption of tea, shows an increase of 2½ fold, that of cocoa nine fold, whilst coffee with its fluctuations now shows an increase of 35 per cent. Considering that tea and coffee are supposed to be beneficial to the health of the populace, if consumed in limited quantities only, as against cocoa with its nutritive properties its increased consumption must be encouraging.—This article, in the future, will be of special interest, as it is largely cultivated in our own Colonies.

#### FRUIT IMPORTED FROM VICTORIA.

Colombo, Feb. 15.

DEAR SIR,—In pursuance of our letter of December 27, re "The danger of Insect pest being introduced into Ceylon by the importation of fruit from Australia," we have pleasure in enclosing for your perusal (and publication if desirable) a letter received from the Hon. the Minister of Agriculture, Melbourne, in which he assures us that every care will be taken to allow of only good and sound fruit being exported from the Colony of Victoria.

"The Exported Products Act" referred to, is very stringent in the measures adopted for inspection and supervision of exports.

We may add our Melbourne firm are specially careful in selecting only the best fruits for our trade in Ceylon.—We are, dear sir, yours faithfully,  
W. THOMPSON & Co.

Melbourne, Jan. 30.

Messrs. W. Thompson & Co., 6 York St., Colombo.  
Gentlemen,—I beg to acknowledge receipt of your communication of the 2nd inst., and to enclose for your information copies of the Vegetation Diseases Act and the Exported Products Act, which have recently have been passed by the Legislature of this Colony, the former providing for effectively dealing with fruit pests and diseases in the orchard, &c., and the latter for the examination for fruit and other perishable products by Government Inspectors before shipment, with power to reject such as may not be deemed satisfactory.

These measures are being vigorously enforced and should afford guarantee to countries dealing in Victorian products that every effort is made to ensure that products exported from the Colony shall be in all respects sound and in good condition.

I also forward copies of the "Argus" and the "Age," newspapers of the 25th inst., containing references to your letter. I have the honour to be gentlemen.—Your obedient servant,

J. W. TARVERNER, Minister of Agriculture.

## HOW EXETER DEALS WITH SEWAGE.

Colombo, Feb. 20.

SIR,—The enclosed cutting from the *Daily Mail* of 13th January, "A Problem Solved," has been sent to us by a public officer now in England, who still retains his interest in Ceylon affairs, and is, I think, deserving of a prominent place in an early issue of the *Observer*, and the attention of our Municipal Councillors. Will you give it publication and draw attention to it and oblige?—Yours faithfully,

PROGRESS.

[The system has already been described in our columns, but we quote the concluding portion of the extract before us:—

The whole scheme is so simple that the inventor has had some difficulty in persuading some scientific men of its merits. The Local Government Board has however,

## AFTER AN EXHAUSTIVE INQUIRY,

sanctioned a loan for the treatment of the whole of the city's sewage on the new principle, so that the official mind may be said to have been convinced.

Deputations from all parts of the kingdom, as well as from abroad, have visited the works, with a view to the adoption of the system in their towns; indeed, so numerous has this class of visitors been that the path leading to the meadow in which the works are situated has been christened "Deputation Walk."

Having been in constant and successful operation for over two years, the system is to be regarded as having passed the experimental stage, and as being a serious factor in the administrative economy of communities, large or small.

Of course the method has been patented, but authorities are likely to look upon the payment of a royalty as a highly satisfactory method of getting rid of the nightmare of sewage treatment.

No doubt Mr. W. E. Davidson has brought back the very latest reports on the subject.—ED. T.A.]

## WHITE-ANTS V. BIRDS' NESTS SOUP.

DEAR SIR,—No doubt many of your readers are aware that white-ants (*Termites*) in the grub state, especially the large and adipose "queen," are still considered somewhat of a delicacy by Tamil coolies. Apparently, however, they are not in such favour now as they have been in former times, when, land being not so much cultivated as it is now, white-ants were encouraged to multiply, their "nests" being, it seems, often given as marriage dowries, and looked upon as valuable property.

Different tribes of Africa, Asia and Australia have each their own particular insect-delicacy, but the white-ant is invariably held in the highest esteem with all. That these winged creatures, when properly cooked, have a relish which is all their own, is evident from the fact that European Missionaries and bushmen have been known not only to partake of them, but actually to regard them as a delightful treat. Dr. Livingstone, while once taking a meal on the banks of the Zouga, was visited by an intelligent native chief, who was offered some preserved apricots. Asked as to whether there was anything in his country that would equal that, he said, "Ah! did you ever taste white-ants? Well, if you had, you never could have desired to eat anything better."

The best time to collect white ants, according to an Australian paper, is in "the swarming season, when they are about half an inch long, as thick as a crowquill, and very fat." Then they are said to make a pleasant dish when nicely roasted, resembling grains of rice. There seems to me no reason why this apparently dainty and historic dish should not find more favour in Ceylon, especially with globe-trotters who go to China and Japan for a feast of slimy birds' nests in the form of a soup.—Yours faithfully,

E.

## CEYLON CUCKOO AND JUNGLE CROW.

Bentota, Feb. 18.

DEAR SIR,—Can any of your numerous readers give information relating to that most extraordinary bird, the Ceylon Cuckoo (Koha of the Sinhalese). I distinctly heard one this morning quite close to the bungalow and thought it most unusual. Are they not migratory? I was under the impression that they visit us about April and depart again in September; but the natives here tell me they are here all the year round, but are silent during the time of their laying and while other birds are hatching their eggs. Can this be a fact? They also say that the reason why some are speckled is owing to the ash-dove hatching the eggs. This cannot possibly be; for I once shot a pair of which the cock bird was speckled and hen jet black: the two could not have been hatched in two different nests. Another query: do the jungle crows (Atikukula in Sinhalese) build nests? I never came across one or heard of one in all my wanderings in the upcountry as well as the lowcountry.—Yours faithfully,

INQUIRER.

[The Koha or Indian Plaintive Cuckoo (*Cuculus Passerinus*) is, we learn from Captain Vincent Legge's Book on Ceylon Birds, migratory, but it does not make its appearance at the same time all over Ceylon. In Trincomalee it has been known to appear in October, in the Aripu district in January; in the Galle District and Western Province in December. In these latter districts it does not appear in great numbers: it is a lover of a dry climate. The Plaintive Cuckoo does not lay much claim to such a title in Ceylon, as it here is one of the most silent of birds: its notes are supposed to be chiefly uttered in the breeding season. It frequents open scrubby lands or plains dotted with jungle; when disturbed it flies from one low bush to the other; it moves about much in the early morning and evening. It lays its eggs in the nests of Wren-Warblers, the Yellow-eyed Babbler and the Grey-backed Shrike. Miss Cockburn is said to be the only person who has identified its eggs, which are of a pale greenish hue, blotched and spotted boldly but sparsely.

The Carrion or Jungle Crow (*Corvus culminatus*) is described by Legge as building its nest in the fork of a top bough or at the bases of coconut fronds entirely concealed from sight below. It is a large structure of sticks and twigs, lined with fine roots, hair or wool; the nest is often very straggling, but is on the whole very little larger than that of the *Corvus splendens*.—ED. T.A.]

GOVERNMENT QUININE SALES.—The Italian Government made quite a stir recently by proposing to monopolise the sale of quinine the same as it does tobacco, matches, salt, &c. The bill read as follows: For public and hygienic reasons the Minister of Finance is empowered to furnish to the general public sulphate of quinine by means of the vendors of dutiable articles. The sulphate of quinine shall be supplied to the vendors in hermetically sealed glass tubes, each containing one gramme. Upon each tube shall be placed a stamp of the value of 10 centimes (two cents), which shall be the selling price of the tube. Vigorous action by prominent pharmacists in the leading cities have stopped the matter for the time at least.—*Pract. Druggist.*

## THE TEA TRADE IN THE FAR EAST.

We are just nearing the opening of a new Tea Season in China, so that the total exports for 1898-9 as compared with those of the previous year are interesting. Here they are:—

## EXPORT OF TEA FROM CHINA TO UNITED KINGDOM AND CONTINENT:

	1898-99. lb.	1897-98. lb.
Hankow and Shanghai	13,478,766	13,865,361
Poochow	.. 13,200,549	12,622,570
Amoy	.. 688,318	685,651
Canton	.. 4,443,760	5,455,162
	<u>31,811,393</u>	<u>32,631,744</u>

## EXPORT OF TEA FROM CHINA TO UNITED STATES AND CANADA.

	1898-99. lb.	1897-98. lb.
Shanghai	.. 15,661,674	20,223,971
Amoy	.. 12,034,617	14,522,772
Poochow	.. 7,297,412	7,126,264
	<u>34,990,733</u>	<u>41,878,007</u>

## EXPORT OF TEA FROM JAPAN TO UNITED STATES AND CANADA.

	1898-99. lb.	1897-98. lb.
Yokohama	.. 24,964,397	25,670,893
Kobe	.. 12,166,816	24,475,418
	<u>7,131,213</u>	<u>50,146,311</u>

## EXPORT OF TEA FROM CHINA TO ODESSA.

	1898-99. lb.	1897-98. lb.
Shanghai and Hankow	22,691,075	19,462,293

The slight falling-off to Europe is not of much account; but to North America China tea is less by very nearly 7 million lb. Still more notable is the falling-off of 13 million lb. in the export of Japan teas to North America; but we do not see any figures given for tea exports from Formosa now belonging to Japan, and the Oolones of which generally go to America. Finally Russia has taken via Odessa 3½ millions more of China tea this season than in last.

THE ONE REMEDY FOR AGRICULTURE.—Sir Edmond Verney declares—in the *Contemporary Review* that “until agriculture is regarded as a scientific profession, agricultural depression will always be with us.” His contribution is all but entirely made up of a letter from a former farmer who tells how he made his farm to pay by brains, resolution, discipline, quickness, and science. This correspondent’s suggestion is:—

Every county where agriculture predominates ought to have one mixed farm set apart as a training-farm for young fellows about to embark their cash in farming; let the staff for teaching be, say roughly, a general manager and secretary combined, a farm bailiff, and a scientist; these men to be the smartest and most efficient obtainable, and the junior staff the same. Why, with a big old-fashioned farm-house and buildings, the whole thing could be rigged up and started at very moderate cost. Here the pupil would have ocular demonstration of smart and record work, and such a drilling as he would never forget. In every branch he would be prepared to meet the rapid and rushing competition of the age. There would be the library fully stocked and kept replete with all agricultural literature up to date. . . . Such an institution, in my mind, ought to be beacon-light, a “ rallying-point ” for the agriculturists of the county.

## KANAPEDIWATTE TEA COMPANY.

The CHAIRMAN laid the Directors’ annual report for 1898 upon the table, and proposed to take it as read. It reads:—

Directors:—T N Christie, Esq., George Christie, Esq. and W B Kingsbury, Esq.

The Directors have pleasure in laying before the Shareholders their Report and Accounts for the year ended 31st December, 1898.

The amount of Tea secured on Estate account was 142,267 pounds, an increase over the previous year of 20,172 pounds but 2,733 pounds short of the Estimate, which, considering how unfavourable the weather was, may be considered highly satisfactory. The cost laid down in Colombo was cents 20.52 as against cents 23.08 for the previous year.

A further quantity of 20,330 lb. tea was made from bought leaf, being, 7,623 lb. more than was secured the previous season.

The total crop of 172,597 lb. cost in Colombo cents 23.11 per lb. and realised a nett average price of cents 32.71 as against cents 34.38 in 1897.

The nett profits for the year amount to R40,667.99 to which must be added R1,163.25 brought forward from last season. Of this sum R13,367.00 was absorbed by the payment of an Interim dividend of 4 per cent for the 6 months ended 30th June last, and the Directors now recommend that a final dividend of 5 per cent be paid, making 9 per cent for the year that R11,000.00 be placed to the Reserve Fund, thus bringing it up to R15,000.00, and that the balance of R771.24 be carried forward to the next Account. The Nett earnings for the year are equal to over 12 per cent on the paid up Capital of the Company as against nearly 11 per cent in 1897.

In terms of the Articles of Association Mr. W B Kingsbury retires from the Board of Directors, but, being eligible, offers himself for re-election.

The appointment of an Auditor for Season 1899 will also rest with the Meeting.

TRUSTS IN AMERICA.—The industrial monopoly known as a Trust is only some dozen years old in the United States,—says the *Spectator*—yet it already controls about one-half of the industrial capital of the Republic; and as things are now going, it bids fair to control three-fourths before the century has expired. With the present revival of American industry from the great depression which began in 1893, an enormous expansion of Trusts is also taking place. In one day, we read, no fewer than seven of these colossal undertakings were organised, with aggregated capitals reaching into the hundreds of millions of dollars. Among the industries thus closed to outside competition were sewer-pipes, silverware, writing paper, pottery, wire, lead, and tinplate. The capital of the first is put at 30,000,000 dollars, and of the last at 50,000,000. This tinplate monopoly is absolute, 92 per cent. of the manufacturers joining at the start, and the remaining 8 per cent. coming in soon after. At the present time, in addition to the Trusts mentioned, petroleum oil, sugar, cotton-seed oil, whisky, steel rails, and other commodities produced on a great scale are all in the hands of Trusts. Even such a prime necessary of life as meat is controlled by the “big four” of Chicago,—i. e., four huge firms which control the immense stockyards of that city, and which actually fix the retail price of meat in Boston. It is no wonder that the attention of the American people is riveted on this stupendous capitalist development, that manifest anxiety prevails, and that Mr. Bryan is preparing to fight the Presidential election of 1,900 on the Trust question.

NATAL TEA AT AN EXHIBITION.

Mr. Henry Atkins, South African representative of the Nectar Tea Company, writes to the *Cape Times* that a great injustice has been done to the brand of "Nectar" tea, the tea-drinking community of South Africa, and myself. The Judging Committee of the Grahamstown Exhibition appointed to act as expert judge of the teas competing, Mr. Hindson, a Natal tea grower who [Not for competition.—Ed. N.H.] has an exhibit of his teas at the above exhibition. After careful examination of the competing teas he gave "Nectar" the first prize, thereby entitling the brand to the gold medal. This decision, it appears, was not satisfactory to Mr. Douglas, chairman of the Judging Committee. I thoroughly appreciate that gentleman's knowledge of the relative merits of a Kerry or Friesland cow, but cannot conceive that his knowledge of expert tea-tasting entitled him to set aside the most careful judgment and opinion of the very expert he and his colleagues had chosen. In order to further satisfy his own opinion upon the matter, Mr. Douglass, without intimating his intention to his fellow jurors or to Mr. Hindson, invited Mr. Bushby, of the Natal Court, to give his opinion as to the relative qualities of the teas. Mr. Bushby, after careful examination, fully concurred with Mr. Hindson's judgment. A third person was called in, who, I understand, walked into the judging room smoking a cigar, an act that would be considered an outrage on all tea-tasting laws. This gentleman has placed "Nectar" second. I claim the gold medal, and refuse to accept any other. The following is Mr. Hindson's statement to Mr. Atkins:—

January 16th. Judged teas very carefully. Awarded "Nectar" 1st; "Ceylindo," 2nd; "United Kingdom," 3rd. Subsequent action jurors outrageous. I declined to send in report, and withdrew.—*Chemist and Druggist*.

COFFEE MOVEMENT IN 1898.

The year 1898 is one of exceptional interest so far as coffee is concerned, the record showing that the production of coffee, stimulated by years of high prices has far outstripped the consumptive requirements of the world, and that such condition is likely to continue for several years. The world's visible supply began to increase in 1896, and from July of that year in rose from 2,588,193 bags to 7,128,800 bags on November 1, 1898, declining since to 6,690,763 bags on January 1, 1899. This large supply is about one-half the world's average production for the last two years, and is a bulwark against any "bull" movement until there is a partial failure in supply.

Of the 5,825,163 bags delivered in the United States there were 4,643,672 bags of Brazil and 1,181,491 bags of all other sorts, so that Rio and Santos coffee constituted 79 per cent. of the total supply.

The total receipts at Rio and Santos in 1898 were 8,895,000 bags, against 10,039,000 bags in 1897. It is claimed that planters have been holding back coffee and that the crops of Rio and Santos in 1899-1900 will furnish 10,000,000 bags.

The outlook for Java coffee is more favorable for the next than the present crop, the present estimate for next year being 250,000 piculs Government and 350,000 piculs private coffee.

The extension of the industry in Mexico, Central America, and Venezuela has gone forward and supplies from those countries have been increasing, and are likely to for several years to come.

Altogether, it is certain that the world's supply is largely enough in excess of its requirements to keep prices low; and as they are now on a basis of cost commensurate with the relations of supply to demand, it is reasonably safe to carry heavy stocks.—*American Grocer*.

JAVA QUININE.

In the article on Java quinine in our last issue we mentioned that most of the London deliveries have been reshipped to New York. This is a very common rumour, but Messrs Brookes & Green, 21 Mincing Lane, E.C., through whose hands all the Java quinine passes, assure us that it is quite groundless, and, as a matter of fact, not five per cent of the parcels landed in London have been reshipped. It is taken by English buyers for English consumption.—*Chemist and Druggist* for February.

NATAL TEA

Is providing the colony with new outlets for energy and capital. It is about fifteen years since tea-planting was started in Natal, Mr W R Hindson, of the Clifton Tea Estate, being one of the pioneers. The twenty-five acres he commenced with have grown to over 600 acres. Hindoos and their families are the workers employed, the Kaffri having proved to be too dear and too lazy. The picking season in Natal commences generally early in September, and goes on till about the end of the following May. The months of June, July and August are taken up with digging and manuring the land and pruning the plants. The tea is picked by the coolies, mule-carts in different gangs collecting the leaf. Last year's output of tea from the estates was estimated at from 300,000 to 400,000 pounds, for which there is a ready market; and as there are other estates which bring up the total under tea-culture to between 2,500 to 3,000 acres, the year's output of tea may be put down at 1,000,000 lb at least. The industry is a growing one. Incidentally it may be mentioned that although coffee was, as in Ceylon, a failure, it is still grown in Natal, and so is the arrowroot plant to a slight extent.—*Natal Mercury*.

[Our correspondent sends us samples of the Natal tea, which we have tried. The flavour is good, but the teas give a poor liquor with London water, and would only be good herefor blending-purposes. The leaf is made the average in size.—Ed. C. & D.]

THE TEA CROP ESTIMATE.—Very curiously the deductions from the telegraphic news recently made by the local "Times" and ourselves were both wrong; though in different ways. We gathered that the total crop was estimated at 125 millions including (instead of 'apart from') 1½ million lb. for local consumption; while our contemporary put the total estimate correctly at 126½ million lb.; but *wrongly* inferred that all this was available for export. Here is how the Association Committee put the matter:—

Total crop	...	...lb. 126,500,000
Local Consumption	...	... 1,500,000

Probable shipments to U.K.	...	125,000,000
	...	93,000,000

32,000,000

Then we divide this somewhat as follows:—

Australasia	...	16,000,000
Russia	...	(?) 10,000,000
North America direct (including via China)	...	4,000,000
Other countries	...	2,000,000

But "Other Countries" should require 3 (if not 4) million lb.: the only question is, will Russia go in for 10 million lb. of Ceylon tea in 1899 against 2,714,000 lb. in 1898. This increase is, perhaps, too much to expect in one year,

### THE EXPORTS OF DESICCATED COCONUTS.

Our attention has been called to a curious mistake in the able and comprehensive Annual Report of the Planters' Association, which was adopted at the meeting the other day. When reading the paragraph, it struck us that the alleged decrease in the exports of desiccated coconuts last year, did not correspond with our own impression, and with our annual review of our exports. On turning to the official table, we find that so far from the quantity exported being nearly a million lb. less than in 1897, last year shows an increase of 986,082 lb.—the figures being 13,040,534 for 1898, and 12,054,452 for the previous year, according to the Chamber of Commerce.

### OUR JUNGLE "NILLU" PLANTS.

Mr. Thomas Farr, writing from North Cove, Bogawantalawa, on Feb. 18th, says:—"I noticed in your January number of the *Tropical Agriculturist* a repetition of one of the numerous 'popular errors' of Ceylon, viz., a reference to the *septennial* flowering of the 'Nillu.' Now I have seen the Nillu flower in different 'Nillu districts' many times—in 1870, 1882, and 1894 all in the same Nillu district; in 1875, 1887, and 1899 all in the same Nillu district. There are other flowerings, too, in other 'districts' and so far as an experience of 29 years goes, the interval between each flowering in each 'district' is 12 years and not seven. I write of an elevation exceeding 4,000 feet."—From Tennent we quote the following interesting reference, on which no doubt the popular idea is based, as to the "Nillu" flowering in five, seven or nine years:—

"There are said to be fourteen species of the Nilloo (*Strobilanthes*) in Ceylon. They form a complete undergrowth in the forest five or six feet in height, and sometimes extending for miles. When in bloom, their red and blue flowers are a singularly beautiful feature in the landscape, and are eagerly searched by the honey bees. Some species are said to flower only once in five, seven or nine years; and after ripening their seed they die. This is one reason assigned for the sudden appearance of the rats, as invading the coffee estates, when deprived of their ordinary food by the decay of the nilloo. It has been observed that the jungle fowl, after feeding on the nilloo, have their eyes so affected by it, as to be partially blinded, and permit themselves to be taken by the hand. Are the seeds of this plant narcotic like some of the *Solanaceæ*? or do they cause dilation of the pupil, like those of the *Atropa Belladonna*?"

What has the Director of Botanic Gardens or any of his experienced lieutenants to say on the subject? We must refer to Dr. Trimen's latest volume which is not at hand as we write. Never before in our 37 years in Ceylon have we been so struck with the variety of colouring in the 'Nillu' flowers in the jungles around Nuwara Eliya as in the present season; but we have never taken any note of the intervals between the flowering seasons for any particular locality as Mr. Farr has been able to do. We wish there were colonists in every district of the island of Mr. Farr's stamp, ready to make and note observations on matters of scientific and general interest, occurring around them.

Since writing the above we have been able to refer to Dr. Trimen's "Flora," and we quote what he says below: we had no idea when we made the preceding remarks on Mr. Farr's letter, that he was referred to as so good an authority by the late Dr. Trimen himself:—

"One of the largest genera in our flora, and of remarkable interest. All the species but three appear to be endemic, but they cannot be said to have been exhaustively compared with those of the S. Indian Hills, and we may probably have other species here yet undetermined from not having been met with in flower. Many of the species which grow in the upper montane zone are remarkable for their gregarious occurrence in vast abundance and over large areas. The principal ones especially common, and together or separately forming unbroken sheets of undergrowth in the forests, are *S. viscosus*, *asperimus*, *calycinus*, and *sexennis*, to which may be added less commonly *S. Walkeri*, *anceps*, *Arnottianus*, *vestitus*, *Hookeri*, *laxus*, *pulcherrimus*, and a few others. These live for several years without flowering, growing close together with straight erect stems, which in some reach a height of 8-10 ft., are quite woody, and several inches in diameter. A few flowers may here and there be found every year, but it is not until the plants reach a certain age, apparently usually from 10-13 years, that the whole patch or area bursts into simultaneous blossoming. These patches or districts are often of great extent, and the boundaries between those of different ages are very conspicuous, being as distinct as if artificially sown.\* After this general and profuse flowering the whole patch begins to wither and ripen the seed—a process which takes several months or even a year (whence ripe seed is rarely found in herbariums), and then dies down. There is probably a patch to be found flowering somewhere in the mountains every year. The wood is hard but brittle, with a large pith, and makes very good fuel, and the flowers are often beautiful. The name 'Nellu' is applied to the whole genus, and, indeed, is extended to include *Acanthaceæ* generally."

Tennent must stand corrected by the more authentic information thus made available.

### MINOR PRODUCTS REPORT.

**ANNATTO SEEDS.**—Good bright East Indian were bought in at 3d to 41 per lb. and for a bag of first class sea-damaged 2½d was paid.

**COCA LEAVES.**—Broken Huanuco leaves sold without reserve at 5d per lb. and for the best lot of another parcel 7½d was bid and refused.

**CROTON SEED** slightly dearer, good medium Ceylon selling at 71s to 72s, and inferior at 56s, subject; for a parcel of fair Japanese 57s 6d per cwt was bid and refused, the lot being bought in at 75s per cwt.

**OIL CITRONELLA.**—In auction a parcel of 3 drums sold without reserve and with all faults at 4½d per lb. Privately business has been done in drums at 10½d to 11d per lb. c. i. f., for January-April shipment. Tins are quoted at 1s 0½d on the spot.

**LEMONGRASS OIL.**—In auction good quality was bought in at 3d per oz.

**VANILLA.**—Quiet, with no buyers in auction, and for what few tins sold unchanged rates were paid. The following were among the prices paid:—

*Bourbon.*—Common and part mouldy, 4 to 4½ inch, 17s was bid, and for 5½ to 6 inch, 16s 6d per lb.

*Tahiti* were all bought in.

*Seyhelles.*—Good chocolates 7½ to 8½ inch, were limited at 27s per lb. and for 7 to 7½ inch (good bold), 21s was paid; 6 to 6½ in, 19s 6d.

*Ceylon* (poor and mouldy) did not sell.—*Chemist and Druggist.*

\* I am indebted for much information about the Nelus to Mr. T. Farr, of North Cove Estate, Bogawantalawa, who, during a long residence in this high mountain region, has paid much attention to the natural features of the country.

THE CEYLON FOREST DEPARTMENT.

(Extracts from Commission's Report.)

It has been determined that the Forest Administration of the Island shall be divided into two parts: (a) General and (b) Provincial.

The control of the General Administration is vested in the Conservator of Forests, while the management of the Provincial Administration is vested in the Government Agents in their respective Provinces.

All reserved forests are intended to be included in the General Administration, with the exception only of the reserved forests of the Western and Sabaragamuwa Provinces, which will, for the present at all events, remain under the control of the Government Agents of these Provinces.

For the purposes of the General Administration the Island has been divided into six sections denominated: (1) Northern Circle, (2) North-Eastern Circle, (3) North-Western Circle, (4) Eastern Circle, (5) South-Eastern Circle, and (6) Hill Reserves. The extent and boundaries of these divisions are shown in the accompanying map. It will be seen that their boundaries do not coincide in all cases with the boundaries of Provinces.

Each of these divisions has been placed under the management of an Assistant Conservator, who is directly responsible to the Conservator.

The remaining tracts of forests land distributed throughout the Provinces constitute the areas to come within the "Provincial" Administration of the Government Agents. In the Western Province, in the Province of Sabaragamuwa, and in the Galle and Matara Districts of the Southern Province the administration of the Government Agents includes within its scope the forests already reserved and the forests which may have to be reserved. When the detached areas in these three Provinces have been surveyed and proclaimed, it is contemplated that the areas finally determined as "reserved" will be transferred to the General Administration; that is, placed under the control and management of the Conservator and his staff. In the Provinces it is understood that, while the areas as defined by Mr. Fisher are accepted as a basis of administration, the boundaries may be varied hereafter according to circumstances, the Conservator handing over to the Government Agents such portions as may be suited for cultivation and are not required to be reserved for climatic or other purposes, and the Government Agents on their part transferring to the Conservator any portions of the areas now placed in their charge that may subsequently be found to be required as reservations.

The Committee do not view with any particular degree of favour the creation of village forests, but if it be determined to create and to maintain village forests they should be under the control of the Government Agents, should be placed in charge of the village headmen, and all produce taken therefrom should be paid for according to a scale to be fixed by the Government Agent, the proceeds being paid over to Gansabhawa Funds to be employed, if necessary, for the protection of these forests. In the event of any improper use being made of village forests, such as, for instance, as chena cultivation, the forests should be resumed by the Crown. In order that these village forests may be protected from encroachment they should be surveyed.

STAFF.

The Committee have considered carefully the question of the staff requisite to carry out these proposals, and accept with some additions and modifications the staff agreed on between Mr. Fisher and the Government Agents. The staff will be divided into (a) Superior or Controlling, (b) Executive and protective, and (c) Clerical. A re-classification and re-arrangement of salaries on an incremental scale is recommended for the Superior Staff. The scheme submitted is reasonable, and, while calculated to give satisfaction to the officers of the Department, is economical.

SUPERIOR STAFF.

For the Superior or Controlling Staff we recommend—

1	Conservator at	..	..	12,000
1	Assistant Conservator at	..	..	6,000 to 7,000
1	Do.	do.	..	5,000 to 6,000
2	Do.	do.	..	4,500 to 5,000
2	Do.	do.	..	4,000 to 4,000
1	Do.	do.	..	3 500
1	Do.	do.	..	3,000

the maximum cost being R50,500, against R59,000 now provided in the Estimates of Expenditure. The existing staff exceeds in number the staff considered by the Committee to be requisite and we advise that the three Foresters, Messrs. Huddleston, Ferguson, and Hansard, be removed from the Department and, if possible, transferred to other employment. Mr. Ferguson's services, we are disposed to think, could be profitably utilized in the Irrigation Department as a Superintendent of Village Tanks, and Messrs. Huddleston and Hansard might be retired with the gratuity to which their length of service entitles them.

When the senior Assistant Conservator, Captain A M Walker, retires next year, the Committee recommend that the other Assistant Conservators should be advanced a step in the order in which they are shown in the Appendix. If this be done, there will be a vacancy for a junior Assistant Conservator, the officer whom Mr. Fisher calls a supernumerary, and this should be filled, in our opinion, by the appointment of a scientifically trained man, preferably by a man trained in Forestry at Cooper's Hill.

The Committee attach importance to the Assistant Conservators in Circles and Provinces being granted a horse allowance and being required to keep a horse. At present the keeping of a horse is left optional with these officers, such as keep horses being granted the allowance.

The Committee do not think that the appointment of an Office Assistant is at present necessary, and recommend that the post of Superintendent of the Central Timber Depot be maintained on its present footing.

For the Executive Staff Mr. Fisher proposes Rangers and Guards. The Establishment would consist of 34 officers.

SAVING ON ESTIMATES.

The following table shows the estimated total cost of the Establishment advocated by the Committee as compared with the provision considered to be necessary at the present time:—

	New Scheme. Estimates of 1898.	
	Rs.	Rs.
Superior Staff ..	48,500	59,000
Executive Staff ..	22,500	26,120
Protective Staff ..	5,612	6,270
Clerical Staff ..	11,080	11,613
Peons ..	2,100	2,850
	<hr/>	<hr/>
	89,990	105,853
Add for travelling expenses, &c. ..	27,000	34,315
	<hr/>	<hr/>
	116,990	140,168

an eventual saving, as compared with the provision in the Estimates of 1898, of R23,178. In preparing this table the Committee have taken the average rates of salary payable to officers on incremental scales, and have excluded all personal allowances of a temporary character.

RAILWAY SUPPLIES.

We find that the complaint of the Railway Department as to inconvenience and cost of firewood is not exaggerated, but we have obtained no evidence of the Railway being able to obtain better or cheaper supplies elsewhere; on the contrary, we find that the private parties from whom they have hitherto obtained a part of their wood fuel are unable to supply for next year a quantity equal to what they have hitherto, and we are satisfied that, were the Forest Department to cease to supply, the cost of

such firewood as might be procurable from private sources would be largely increased. We find, too, that while the cost and inconvenience of collecting and transporting firewood are great, they are not greater than, if so great as, the cost and inconvenience of transporting coal for a like purpose.

The only other direction in which the Railway Department is interested in the operations of the Forest Department is in connection with the supply of sleepers. The Railway Department takes annually some 20,000 sleepers, which are mostly of imported Norwegian creosoted pine or Australian hardwood. Just now a consignment of some 25,000 Karri sleepers from Western Australia is being landed. Of Ceylon-grown wood only some 2,000 sleepers are supplied annually, the woods preferred being mill and nedun. At present nedun sleepers from Sabaragamuwa forests are being delivered at Hatton station at R4 each, a price that is said by the Assistant Conservator under whose direction the order is being executed to pay. This price compares favourably with the cost of imported sleepers, the creosoted pine sleepers costing R4.23 each and the Karri sleepers R5.73 each delivered at the Colombo Terminal. The General Manager has intimated his willingness to take his entire supply from the Forest Department, if the Department can give him what he wants and at the price now being paid. But the supply is limited, and sleepers of the required quality can be supplied at this price only when the conditions as to felling, &c., are exceptionally favourable. A development of this branch of the Department's operations cannot therefore be looked for.

For the Northern Railway Extension it may be found practicable to supply a certain proportion of the sleepers required of palu, kumbuk, and satinwood, and possibly some even of milla but the question of price will have to be a subject for consideration.

#### INDIAN PATENTS.

No. 19.—John McDonnell, of the Public Works Department of the Government of Ceylon, Jaffna, Ceylon. Improvements in tea-rolling machines whereby the leaf can be treated with electricity during the process of rolling.

No. 20.—John McDonnell, of the Public Works Department of the Government of Ceylon, Jaffna, Ceylon. Improvements in tea-rolling machines whereby light is supplied to the leaf during the process of rolling to promote its oxidation.—*Indian Engineer.*

#### PLANTING NOTES.

VANILLA.—We have received from America a full and interesting paper by Dr. Rusby on the species, distribution and habits of Vanilla plants and the cultivation and curing of Vanilla. This will be reproduced in our March issue of the *Tropical Agriculturist*.

TEA IN FRANCE.—Referring to the interview we published yesterday, the editorial remarks of the *New York Herald* of Paris, in the subject are worth quoting:—

Among the explanations given it is stated that the use of light wines and syrups has diminished, on hygienic grounds, and that tea has gradually taken their place. If this be the correct view then it will be interesting to study the rise and fall of tea drinking in France, for sooner or later one may depend on it, French medical authorities will pronounce upon the custom, if carried to excess, quite as strongly as their English confreres. From another point of view, it is curious to notice how, after all, the English custom of drinking tea has been brought into vogue. In spite of Russian sympathies, French people prefer tea with milk rather than tea with lemon or rum, and even toast is asked for with it. So that not only in the world of sport, but also in social life, Parisians are not loath to borrow much that pleases them from the tight little isle.

OLD FLOURISHING TEA IN CEYLON.—It is very reassuring to learn from Mr. C. Spearman Armstrong, one of the first pioneers of tea in Ceylon and a very early adviser in many districts, that his 23 year old tea fields in Maturatta have continued, without manure, to give as good crops now as fifteen years ago, namely an average of 600 to 700 lb. per acre. Mr. Armstrong has seen nothing of blights in his own high district, though he has heard a good deal of them elsewhere. He agrees, however, that probably Ceylon is approaching its maximum crop of tea,—that future crops may run between 120 and 130 million lb. averaging about 125 millions.

CEYLON HILLS TEA ESTATE CO.—It is brought to our notice that the Company is a good deal better off than we supposed from taking the last sentence of the Report, without observing what immediately preceded it, in reference to the financial condition. It is after allowing for all interest on debentures to the end of 1898, for depreciation, coast advances and all other liabilities, that the loss of R9,962.99 is shewn. We regret very much that we indicated that debenture interest was not paid after 30th Sept. 1897 apart from this loss. The Company, we are glad to see, is much better off than we indicated, and we trust 1899 will shew a balance to the good in every sense.

THE MAZAWATTEE TEA COMPANY had an exceedingly good year (ending December 21st 1898) according to the Report published on January 28th. We make two extracts:—

It is with great pleasure they have to record the most satisfactory year in the history of the business; satisfactory as regards every department, and from every point of view. It will be seen from the Profit and Loss Account that the profit on trading amounts to £60,359 15s 8d, as against £56,695 5s 6d the previous year, showing an increase of £3,664 10s 2d.

More particularly, the volume of trade has surpassed the expectations of Directors, and shows a large percentage of increase over that of any previous year. Some idea of the magnitude of the business which the Shareholders in the Mazawattee Tea Company possess can be gathered from the fact that on April 27th last the Company paid to H. M. Customs for Duty on British grown Tea only, a cheque amounting to £63,000 odd, which is over £12,500 more than any other cheque that has ever been paid for Tea Duty, and which establishes a most telling record.

Here is the handsome disposal of profits:—

Managing Directors' Remuneration	£	s.	d.
and Directors' Fees	1,600	0	0
Office Expenses and other charges,			
Interest on Loans, and amount written off			
for Depreciation of Leases and Plant	5,730	16	5
Placed 'o Reserve, pursuant to Article			
126 of the Articles of Association	15,000	0	0

Further, an Interim Dividend has been paid on the Preference Shares at the rate of £5 per cent per annum, and on the Ordinary Shares at the rate of £8 per cent per annum, amounting 'o

	13,366	10	8
A Dividend at the rate of £5 per cent per annum is due on the Preference Shares for the half year ending December 21st, 1898, and the Directors recommend a further Dividend at the rate of £8 per cent per annum for the half year on the Ordinary Shares, which will, together,			
absorb a further sum of	13,366	10	8

Leaving £3,387 to go in Commissions for Directors if the shareholders so will. Ten per cent paid to preference, and 16 per cent to ordinary, shareholders and all from "tea"; while so many producers cannot make both ends meet! Surely not a few planters should try and sell tea for themselves?

## MR. BETT'S NEW MACHINE.

The new tea drying machine, which is being erected by Messrs. Brown & Co. Ltd., Hatton, for Mr. Jas. Bett, of Beechwood, Strathlay, now verges on completion and is expected to be ready for trial by next week.

The object of the machine, which Mr. Bett has invented, is not so much to do a great deal of work as to improve the quality of tea, but particularly to save fuel. Mr. Bett is quite sanguine of the success in this direction of his new invention. In these days when economy is sought for, Mr. Bett's invention will, by the Planting Community, be looked upon as a great boon. We wish Mr. Bett every success in his new invention.—*Cor.*

## TEA PROSPECTS.

To the Editor of the *H. and C. Mail*.

Sir.—It is, I think, generally admitted that the year 1898 will not pan out as favourably for the majority of tea gardens as even 1897. But, after full allowance is made for this fact, the opinion, which is gaining ground and which was expressed by the *Scotsman* writer, is that the situation, unfavourable as it may be, has been over-discounted in the throwaway valuation which was recently placed by timid holders on their shareholdings both in sound companies and in those of less financial strength.

Your correspondent's allusion to over-capitalisation of many companies is, of course, true enough. Truer still what he says as to anxious buyers of the shares having themselves over-capitalised such issues still further. This feature, of course, intensified the ill effects of reaction in values when the turn of the tide came, as it did, in early 1898.

Your correspondent admits the natural probability of 1899 being generally more favourable than 1897 and 1898 as regards weather and other producing conditions and this seems, I agree, likely, if only on the swing of the pendulum principle.

As regards actual profits of 1898 and the diversion of reserves to dividend equalisation, provided the conditions are admitted to be exceptional, this would seem a very proper course to follow—where adequate reserves exist. Unfortunately, however, the formation of proper reserves, during favourable times, has been more the exception than the rule, and shareholders should insist on this being done more liberally in the future than it has been in the past.

Your correspondent's allusion to:—

1. Check given to extensions,
2. Expanding markets for the produce,
3. Curtailment of expenses,
4. Diminishing output of old or poor tea,
5. Going out of cultivation of same,
6. Only gradual increase of crop from the large new areas planted, and probable over-estimate of what they are capable of giving—

To all these points his references are no doubt correct.

Finally, I can only say very much *ditto ditto* to his strong recommendation to all companies to aim at having solid cash reserves.—Yours faithfully,

G. SETON.

—*H. and C. Mail*, Feb. 20.

THE INDIAN TEA ASSOCIATION  
(LONDON).

## CONDITIONS OF SALE AT PUBLIC AUCTIONS.

I am desired by the Committee to inform you that having had this subject under consideration they are in favour of amending the Conditions of Sale in the following reports:—

1. THE AMOUNT OF DEPOSIT.—Hitherto it has been the custom for the buyer to pay a deposit at the

rate of £1 per chest on the Saturday following the date of sale.

This was fixed when the average value of tea was considerably higher than it is at present.

The Committee favour the reduction of this deposit to an *ad valorem* amount of 20 per cent of the value, with a maximum as at present, of £1 per chest.

The objection of this alteration is to render it easier for the trade to hold larger stocks of tea at the time of the year when auctions are heaviest.

2. THE BIDDING AT PUBLIC AUCTIONS.—The Committee think the bidding should advance by  $\frac{1}{2}$ d instead of  $\frac{1}{4}$ d on teas up to 6 $\frac{1}{2}$ d per lb. after which only bids of  $\frac{1}{4}$ d shall be received.

In Calcutta a similar rule has obtained for some time with satisfaction to all parties. Bids under 6 annas advance by pies, over 6 annas by  $\frac{1}{2}$  annas; 7d in London is, roughly speaking, equivalent to 6 annas in Calcutta.

3. The Committee think it is desirable that the selling broker should have the right of making the first bid with the view to more order in the bidding and to expedite the sales.

The Committee are now in communication with the Ceylon Committee on the subject, and it is proposed subsequently to hold a meeting of members of the Association and others interested to consider the question.

In case you are unable to attend the meeting when called I should be glad to be favoured with an expression of your views by letter. ERNEST TYE, Secretary.

11, St. Mary Axe, London, E.C., Feb. 6, 1899.

—*H. and C. Mail*, Feb. 10.

## MEXICAN COFFEE PRODUCTIONS.

Among those plants having the highest commercial value which flourish on the slopes that extend from the summit of the high plateau of Mexico down to the sea coast are cinchona and coffee. The former has had some attention, but has not been cultivated in anything like the same methodical manner as coffee. The coffee tree is a plant of mild climates. It prospers in localities where the temperature is not commonly inferior to 60 or 64 deg. Fahr., not frequently reaching 86, and generally keeping about 60 or 75 deg. The plant requires also a good amount of moisture in the atmosphere; this seems to constitute its life, and irrigation is therefore unnecessary. The altitudes answering to such temperatures in Mexico are those between 800 and 1,400 metres above the lowest level.

Coffee seems to have been introduced into Mexico in the early years of the present century, and there is some reason to believe that cultivation first began in Cordoba. At any rate, it is on record that in the year 1817 the cultivation had developed in this neighbourhood to an extent which was not paralleled by the progress attained in any other quarter. This position of pre-eminence Cordoba has not been suffered to maintain; but even today the production ranks second only to that of Soconusco, which has the largest output of any coffee district in Mexico. This output has been achieved in face of the general belief that Soconusco is not an ideally suitable place for the cultivation of the berry. Its altitude is from 850 metres to 900 metres, and we believe that it is an undeniable fact that the bearing per tree is larger in the cantons of the same State, Huatusco and Coatepec, lying respectively at 1,300 metres and 1,200 metres altitude. The bulk of each tree is larger in these last cantons, and they are obliged to plant them at a wider distance from each other. Orizaba, at 14 miles from Cordoba and 1,200 metres altitude, enjoys the very climate fit for coffee, and would be more advantageous than its neighbour district if the strong southern winds which blow at the very time of the blooming of the tree, carrying away the flower, had not up to now constituted a very serious check to the development of the industry. The harm, perhaps, might be averted by the planting of trees of thick foliage in a convenient position.

The figures for the output of the fiscal year 1897-98 show a substantial advance on those of 1896-97. The exports were 288,593 cwt. as against 251,826 cwt. Among the States the largest producer was Vera Cruz, with 106,484 cwt., and among the districts, Cordoba with 40,944 cwt. The figures given above are official; but in view of the extensive smuggling which goes on from Soconusco into Guatemala, they cannot be held to be quite accurate. The high price which coffee commands at intervals has, of course, not been without its effect upon the value of coffee lands in Mexico. At Cordoba they are often worth \$48 an acre. Very similar prices rule in Cotepec and little inferior in Huatusco. In Oaxaca, in the good districts, the price is about \$24 an acre. It is not improbable, however, that in view of the low price for the berry which now rules we shall shortly witness a considerable diminution in the number of Mexican plantations and a corresponding fall in the value of land. The present price offers no margin in planters worth talking about. It is plain, therefore, that plantations will be abandoned and the crop reduced until prices rise again. It will be remembered that fifteen years ago, under very similar circumstances, an extensive area went out of cultivation. Although Brazil practically rules the market, it is, we believe, a fact that Mexican coffee is much more appreciated than Brazilian. A Mexican authority is responsible for the statement that the lowest class of the Mexican article commands \$2.50 per cwt. more than the lowest class of Brazilian.—*H. and C. Mail.*

## BALLADS OF THE BROKERS.

### THE COMING OF THE BALE.

[On Wednesday, during the inspection of drugs at Crutched Friars warehouse, a solitary bale of Rio Ipecac., marked K. & F., and of direct import, was delivered. This was the total shipment.]

There was fever heat in Mincing Lane,  
And rage in Crutched Friars,  
The Brokers sulked, and to sell were fain,  
But broadly smiled the buyers;  
For the news had spread that the longed for shi  
From Rio had come back  
With an orange-pip and a farthing dip,  
And one bale of Ipecac.

The Great Man swore, and the Small Man laughed,  
And the Wise Man chirped with glee;  
The Bears they growled, and the Bulls they scowled,  
And jumped at thirteen three;  
And some held firm, with a sidelong squirm,  
And tried another tack,  
But gave in quite at the thrilling sight  
Of that bale of Ipecac.

The fatal day and the baleful bale  
Came soon, and the rafters rang  
With the frenzied shouts of the buyers pale  
With dread of the hammer clang.  
They fell on the man who had bought the lot,  
And stretched him on the rack—  
Then strewed his grave with benzoin tears  
And sprays of Ipecac.  
—*Chemist and Druggist.*

## PLANTING NOTES.

THE TALAGASWELLA TEA COMPANY share holders are to have a dividend of 2½ per cent and we trust this is the beginning of better things from their extensive, but hitherto disappointing property. In Mr. R. H. Ellis as local Superintendent, supervised by Mr. R. Morison as Visiting Agent, the Company have got the right men in the right place, while the Directors and all concerned are evidently well alive to the need of keeping down expenditure.

ROOM FOR IMPROVEMENT.—We hear, says a writer in a contemporary, who would doubtless like to see an improvement in the tea drinking shops here, a great deal about Japanese tea-houses—their cleanliness, their seductive restfulness, their perfect situation. The rooms are without furniture, and the visitor sits and reclines on the floor with a small low table or elevated tray holding the refreshments. A greater difference than that between the Japanese tea house and the London article could scarcely be imagined. No one would call the average institution in London a “restful and seductive haven.” An improvement in the methods of infusing and serving the tea, so as to render it decently palatable, would also tend to an increase in the consumption.

SINHALESE ON SOUTH INDIA PLANTATIONS.—It is very interesting to read the notes from a planter in Coimbatore which appear on page 609; and although Mr. E. S. Fox and his lath of Sinhalese who went over the other day have not been a success, it is very satisfactory to learn how well, those taken over by Mr. E. J. Martin when he left the Kelani Valley, have turned out. To go and fell forest, and erect buildings on plantations, near to a dense population in Southern India is for the Aryan Sinhalese to turn the tables on their Dravidian cousins to some purpose! We hope Mr. Martin's plantation will flourish exceedingly.

THE MAURITIUS SUGAR PLANTERS backed by the local Government and Sir Charles Bruce, the Governor, asked Mr. Chamberlain to obtain consent to a £500,000 loan under the imperial guarantee, to enable £100,000 to be devoted to re-afforestation and £400,000 for loans to be made to planters at low interest. There has been much speaking in the Port Louis Council, Memorizing and Despatches; but finally on 8th December last, Mr. Chamberlain decided to refuse sanction to the proposal, the last clause of his despatch being as follows:—

A sudden catastrophe in the shape of a hurricane overtook Mauritius in 1892. Support was promptly given by the Imperial Government and the fact that it was then given is a reason for not again asking for assistance after so short an interval of time, unless new conditions have arisen of a very urgent nature. But I am not convinced that this is the case, and I am not convinced that the circumstances of Mauritius can be properly compared with those obtaining in the West Indies. The Sugar Industry in the West Indian Colonies has been continuously depressed for a much longer time than in Mauritius. It is only recently that bounty fed beet sugar has seriously competed with Mauritius cane sugar in the Indian Market and the question of imposing a countervailing duty is already receiving the attention of the Indian Government. I am not aware that the area of production has decreased in Mauritius or that the sugar industry is carried on at an actual loss. Moreover, distress in the West Indies has been aggravated, as you are aware, by a hurricane which has devastated Barbados and St. Vincent, caused great damage in St. Lucia, and injured in a smaller degree some of the Leeward Islands. These Colonies were already impoverished, as far as I can judge, to a far greater extent than Mauritius and their case was more exceptional. I do not admit that the Mauritius planters have hitherto suffered in any extraordinary degree, and I am not convinced that if their request for a loan were granted, the relief thus given would be once for all effectual. On the contrary, a precedent would be afforded for turning to the State whenever the pressure of competition was felt and whenever it was desired to improve machinery and introduce new appliances. The outcome would be in my opinion a less energetic race of planters than have hitherto so largely contributed to the prosperity of the Island and a more helpless community.

## ALL ABOUT CEYLON,

There is not much in the statistics and information worth repeating locally; but an exception must be made to the expression of opinion which follows on reading the Governor's Opening Speech, plus:—

It records a programme completed and in progress for the government of the island, and a grasp of the whole situation by the Governor himself, which appears to me to be as near perfection in colonial government as can be; and after passing through other countries where intelligence—as in the United States and Canada—is tempered with various shades of corruption and after experiencing the bar to progress which exists in the want of straight forward dealing in Japan, and the corrupt conservatism of China, it is delightfully refreshing to realise what a capable Governor, a thoroughly representative Council, and a trading population of English gentlemen can do in the way of successful Government. And yet there are some things which take one by surprise. Certain matters are submitted to the home Government by a united Council, on which the Colonial Secretary puts his veto. As an illustration, the address of the Governor contains the statement that the Colonial Secretary has not given his sanction (and this in the face of a unanimous recommendation from a body who ought to know what is best for the country) to a new and important railway. Of course the Government has some troubles, and, as at home, there are plenty of "birds of prey" who look out for the surplus. A reduction of railway rates to help the tea industry, and the removal of the duty on imported rice and on kerosine oil, are asked for by the Chamber of Commerce. This is objected to by the Administration on the ground that the home Government urges that the surplus should be devoted to meet part of the outlay to which the colony is committed in

## EXTENDING THE RAILWAY

to the north of the island. The view I have formed on this question is that the duty on kerosine and rice should be maintained, as the easiest form of enabling each class of the community to take its shares in general taxation; but that so far as railway rates are concerned the Government, in view of the fact that a number of the tea plantations are now not making ends meet, can safely afford to make some concession in rates, especially in districts where, through the inferiority of the land, or because of distance from the point of shipment, the tea-planter is placed at a disadvantage. I had some conversation with Mr. Pearce, the general manager of the railways, with the President of the Chamber of Commerce, and with the editor of the *Ceylon Observer* (whose remarkable Directory of Ceylon is such a valuable compendium of all the information available with respect to the island that it scarcely leaves an opening for any question to be asked). Talks with these gentlemen, and especially with the Governor, who showed us great kindness during our visit, gave me the conviction that the island has a great and lasting future. The success of the railways quite justifies the Government in being bold in extending the system, and there should be no delay in constructing the line to Mannar, to meet the extension which the South Indian Railway Company are making to the point nearest to Ceylon, and the effect of this double extension will be to connect the railways of Ceylon and India, if a bridge is built over the narrow strait. The railway will also be extended to the northern extremity of the island at Jaffna, but Mr. Chamberlain has made a mistake in calling this the main line of the colony. This will only be a branch line, which ought to be built on a narrow gauge; and if branches also on the narrow gauge extend to Trincomalee to the east and to Puttalam to the west, the system will be fairly complete. The home Government has shown some reluctance to sanction the outlay of new capital on railway schemes, on the ground that there is danger of saddling posterity with debt, but when the

railway surplus (after paying interest and redemption) equals an amount sufficient to pay five per cent. on a sum of three millions sterling, it seems to me that it would be sound finance to issue

## PERMANENT DEBENTURES

on the railway of one or two millions, at, say, four per cent., which money could be immediately used for extensions, the profit on which would increase the present surplus and make it available for useful purposes.

Mr. Bainbridge gives a curious reason for keeping on a partial, unjust rice-tax—and so far he failed to profit by our Directory and conversation! We are glad, however, to see that he favours the freeing of salt from duty, for agricultural purposes, and also:—

We have something to learn from the Dutch colony of Java; and we should do well to follow the example of the Dutch Government, who compel the Civil Service candidates who go to the colony to study (as part of their preparation) agriculture for two years, thus turning the mind of the student into a groove which is likely to be of service to the community to which he will be attached. One of the products of the coconut is the arrack spirit, which, unfortunately is likely to be a bane to the natives; and here again we find the Javanese Government enacting laws for the limitation of the sale of the liquor to the natives. Here is something curious:—

So far, the only mineral discovered and worked is plumbago; but the island yields a quantity of beautiful stones of the topaz, amethyst, and sapphire kind as well as some excellent rubies, one of which was purchased by an American firm in my presence for £475. Another precious stone of value is the "Alexandrite," which has the singular characteristic of being green in daylight and red by candlelight.

## TEA BUSHES AND THEIR ENEMIES.

TRAVELLING a few weeks ago with a planter of much and varied experience as proprietary Manager and Visiting Agent, and the conversation turning on how best to cultivate tea and ward off its enemies, he testified to a certain estate in the Agras (with which he had no connection) being, in his opinion, among the best managed in the hill country of Ceylon. Meeting a still more experienced Visiting Agent, we put the question to him with the result of another but much larger estate near the Agras being named; but when he heard of the one just specified, he agreed as to the close attention and great care with which our old friend Mr. W. B. Jackson performed his duties as estate Manager. The special point under remark had reference to the entire freedom of Hauteville tea from fungoid or insect pests of any kind. At this time when there is so much talk of occasional blights appearing in certain districts, generally lower down than Dimbula, it is of importance to know what an experienced manager does as a safeguard against the approach of such enemies and so we wrote to Mr. Jackson who has kindly replied as follows:—

"After pruning I remove all gormandizing stems, and roots with sharp blowngas; (2) I bury all prunings green in holes, one to every four trees in every alternate line, and in certain soils supply unslaked coral lime with the mass of green prunings; (3) I remove all moss on tree and ground and wash the trees with kerosine oil and soap

mixture. The cost of the latter 'mossing and bugging' is from R3 to, eventually (as with us now) R1.50 per acre of pruned tea.

"I don't think there would be much complaint of insect (or fungoid) pests, if everyone did this regularly, and it keeps the trees in a very healthy condition and far more ready to respond to all other treatment. I have followed this plan for years on tea and you know with what success I have used this 'Kerosine Oil Emulsion' to coffee here. As to burying green prunings, &c., after a number of years I find I am able to reduce more expensive manuring very considerably, and yet get as good yields, &c.

"I have had a lot of letters from one or another lately about 'mossing and bugging' and 'burying prunings' and 'lime for tea.' Mr. Kelway-Bamber was here lately and has got samples of soil, as being one of the places he has to visit."

We feel sure that not a few planters will be grateful for the practical hints thus afforded by our correspondent. We know that some Superintendents have been discouraged to find blight returning even after burning all their prunings. Let them now try the kerosine and soap mixture and see if their trees are rendered proof against any returning pest. We shall be glad to hear of results.

#### JAMAICA vs. CEYLON.

##### HOW IT STRIKES A VISITOR.

Mr. Astwood, of Jamaica, to whose visit to Ceylon we have already referred, has just returned from a visit to the coconut districts of Cochin. He has now seen all that is worth seeing in regard to coconut cultivation and copra manufacture in this island and on the adjacent coast of India. And as a proof of Mr. Astwood's interest in our industry and desire to experiment in the West, he is sending 1,000 selected seed nuts to Jamaica, one-half coming from the well-known plantation of Mr. W. H. Wright, namely Mirigama, and the other half from the old established Negombo plantation of Goluapokuna. We have been asking Mr. Astwood how Ceylon compares with the oldest British Colony in the West Indies? First, as regards soil, Ceylon is not in the comparison at all; Jamaica with its volcanic conditions is infinitely richer. As regards natural scenery, Ceylon, though much more extensive, has in Mr. Astwood's opinion, nothing better than the best in Jamaica. In Ceylon, we think a great deal of climbing to our sanitarium in ten hours; but in Jamaica in a buggy and on horseback one can get from the sea-side capital into the midst of the Blue Mountains in about three hours. Indeed, Gordontown that bears the same relation to Kingston, in climate, as Kandy does to Colombo, is attainable within an hour. The view from the Blue Mountains over the hills and out to sea is perhaps finer than anything to be seen from the hills of Ceylon. On the other hand, for historical and archæological interest, Jamaica is not in the reckoning with Lanka, and in this direction presents in no degree so vast a field for research to the tourist. Carib remains are the only ancient objects available for antiquarian students in Jamaica. Mr. Ast-

wood is, moreover, somewhat amused at our efforts to cultivate grass here; in Jamaica the trouble is to keep it down. Mr. Astwood sums up his opinion of the agricultural conditions of Ceylon as compared with his adopted country by the condensed remark: "If we only had your labour supply, you would not be in it for a minute with us in the West Indies, bounties notwithstanding." Still, though hard up for labour, a great advantage that Jamaica possesses is its proximity to the great North American market, although this may in future be neutralised to some extent by the United States' acquisition of Porto Rico and possibly of Cuba. What adds interest to this comparison of the two countries is that when the Panama or Nicaragua Canal is cut, Jamaica will bear to it, in connection with its homeward-bound traffic from the Pacific, pretty much the same relation as Ceylon does now to the Suez Canal with similar traffic from the Antipodes and the Far East. One of the principal objects of Mr. Astwood's mission to the East—the investigation of our coconut planting enterprise—has been satisfactorily met. Mr. Astwood has been studying the preparation of copra, and his investigations appears to confirm our own previous impression that the superiority of the Cochin copra is due not only to their sun-drying as opposed to the local kiln-drying, but also to the drier atmosphere there and the consequent facilities for drying the substance for a longer period of time. Mr. Astwood remains in Ceylon a few days more.

THE RUANWELLA TEA COMPANY REPORT is a satisfactory document although the dividend declared is the modest one of 3 per cent. It will be observed that the unfavourable weather accounts for a short crop and yet that the cost of tea per lb. in Colombo has been no more than 22.41 cents.

FIJI TEA.—A friend writes:—"I am sending you by parcel post three samples of tea from Fiji received yesterday. These are made on Masusu estate, the only tea property in Fiji now carried on. The samples, I am sure, will interest you and probably you will like to get some of your broker friends to examine and report on them for your paper. Masusu has a great pull now that there is an import duty of 6d a lb. on tea and being the only estate to supply the local demand this excessive duty amounts to a monopoly."—The samples have duly come to hand and Messrs. Somerville & Co. kindly report as follows:—

Description.	SAMPLE TEAS.		Remarks.
	London Value.	Colombo Equivalent at Exchange	
		Feb. 27.	
		Colombo:	
		1/4 $\frac{1}{2}$ .	
	d.	cents.

Pekoe ..	6 $\frac{1}{2}$	33	.. Blackish small choppy; liquor coarse common.
Pekoe Souchong..	6 $\frac{1}{4}$	31	.. Greyish choppy; liquor coarse common.
Infused leaf too dull			Leaf is too broken.

SOMERVILLE & Co.

THE RUANWELLA TEA COMPANY,  
LIMITED.

## THE ANNUAL REPORT.

## ACREAGE.

Tea in full bearing	..	358 Acres
Tea not in bearing	..	16 "
Jungle and waste land	..	199 "

Total .. 573 Acres.

The Directors now submit the Accounts of the Company for the past year.

The crop secured amounted to only 183,510 lb. Tea against an estimate of 200,000 lb. The shortfall of 16,490 lb. is due to the abnormally bad season experienced, and this estate has suffered in common with most others in the district.

The average price realized was 30.90 cents per lb., against 32.39 cents last year, and cost delivered in Colombo amounted to 23.41 cents per lb.

The usual provision has been made for depreciation on buildings and machinery this year, after which a sum of R7,922.27 stands at the credit of profit and loss account. To this must be added a balance of R9,408.99 brought forward from last year, less a sum of R8,000 which was passed to the credit of depreciation account in terms of the resolution passed at the last general meeting, making a total of R9,331.26 at credit of profit and loss account. The Directors recommend the payment of a dividend at the rate of 3 per cent on the paid-up capital of the Company and that the balance of R1,331.26 be carried forward to the 1899 account.

The estimate for the current year is 200,000 lb tea against an expenditure on working account of R43,417. No capital expenditure is anticipated this year.

In terms of the Articles of Association Mr. F. G. A. Lane now retires from the Board, but is eligible for re-election.

The appointment of an auditor for the current year will rest with the meeting.

**COFFEE IN NORTHERN BURMAH.**—In order to get rid of the leaf fungus, a Toungoo planter writes:—"We are burning down everything except small fields, lightly attacked which we are spraying with lime sulphur and blue stones with what success we hardly know yet." After this fresh seed is to be tried.

**PROTECTING ORCHARDS FROM LIGHT FROSTS.**—It was, we believe, William Saunders,\* the chief of the Government Experiment Gardens at Washington, who, some fifty years ago, insisted that the text books were wrong in teaching that heated air ascended—that is, ascended in an active sense. It was, rather, pushed up by the heavier cold air pressing against it. It seems a slight distinction, but it has immense practical importance. For instance, those who understand this smile at the Florida Orange grower, who builds fires around his orchard to make smoke when he fears a frost is coming. He lightens the atmosphere at the same time among the trees, and makes it all the easier for the heavy cold air to push in and take its place. The modern thought to spray with water is more philosophical. Water is a good conductor of heat, and would add to the chances of resisting cold by the heat it would abstract from its surroundings. Horticulturists have long known that evergreens are quite hardy in a moist atmosphere, when they would easily succumb under the same temperature in a dry one.—(*Meehan's Monthly*.)

\* Who asked us at Washington in March 1834 if we knew a periodical in the East Indies which he valued much and filed regularly—*The Tropical Agriculturist of Ceylon!*—Ed. T.A.

A SCRAMBLE AFTER "IBEX" IN  
NORTH TRAVANCORE.

(By a couple of Old Ceylon Hands.)

We started off from T's bungalow shortly after 7 a.m., wending our way up through the upper portion of the estate, and amongst last year's planted tea, and eventually got up to the patana land where the ascent was very steep, both of us having to catch hold of tufts of grass and "nilla,"—the patana nilla which is very plentiful all amongst these hills and is short, only being from a foot to 18 inches high. The hills all about this quarter, wore a beautiful bluish purple colour during September and October last, the nilla then being all in bloom and very much resembling heather in the distance. On we went up, but had not gone very far, before we struck an elephant track, and tramped along it for a short distance, when all of a sudden we

## DESCRIED SOME IBEX

away upon some very steep rocky grass land; they did not seem to be much afraid of us. We could make out that they saw us very well, and stood looking down at, I should say, about 200 to 300 yards distance. After a short consultation we proceeded, keeping to their left, and scrambled up a very rough steep bare patana, interspersed with slab rock and boulders, and on to a large ledge about which we proceeded. Shortly afterwards T with his rifle went alone, got up to within about 150 yards, and let drive at the biggest in the herd which numbered about 20; but the rifle being of too small a bore the wounded buck went on, lagging behind the herd, and eventually they all got into a place where it was impossible to follow them. These animals are evidently experts at climbing, and will go with ease where it is doubtful if any other four-footed animal could follow them. Soon another was wounded in the same herd, but we got neither, and somewhat unwillingly came away, for it was no use waiting. We returned to the elephant track and up we went, getting on to more level ground but still steep and rough, along which the elephants had evidently passed a few days before, judging by the droppings which plentifully be strewed the path. We were glad to come across a small mountain stream with which we slaked our thirst. Lighting a pipe, we went on upwards, and at last getting to the saddle of the ridge had a fine view away to the north and west of

## "ANEIMUDI,"

this being the name of the mountain on which we were, some 9,200 feet in elevation and the highest in India south of the Himalayas. But we were not within 1,500 feet of the top, and from the side we were on, it was impossible to get up; so we struck away to the left, and ascended another hill to the westward, amusing ourselves by setting fire to the short patana grass as we went up. The ascent was very gradual, and quite a relief from the stiff path we had just left. The grass being very short, only some five or six inches long, and dry as tinder, it burned away slowly, but left the ground very clean, and in a condition which ought to make it a good feeding ground for the Ibex and Sambar later on when we get a shower or two to make the young grass shoot. But to our tale. We got near the top of this hill, I being ahead, when we descried three fine Ibex lying on a rocky ridge. I took them for bushes at first sight in the distance, but T's "eagle eye" saw at once that they were Ibex; so we bobbed our heads

down (although by this time they had seen us) and went away back to consider what had better be done. We concluded that the best thing we could do was to rest awhile and relieve the inner man. I have hitherto said nothing of a couple of coolies who had followed us with a well-laden box containing a fine pie, &c., which kindly Mrs. T had packed up for us, and to which we now sat down to do justice. After an excellent feed and re-lighting our pipes, T proposed to tuck away round the hill and try to get over, above where the Ibex were resting. I went away up to where we first saw them and lay down watching them through the telescope; fine heads they all had and did not seem to be aware of their danger. I waited for a quarter-of-an-hour or more, and was beginning to think T had mistaken the ground which in fact turned out to be true, but I had nothing for it but to wait. Presently they all jumped up and looked round. I knew then that T had got sight of them. Crack went the rifle, and down the slope they all flew, followed by some half dozen others which had been about somewhere near, but were not seen by us at first.

#### "HEAD THE CROWD!"

was shouted to a cooly who went running down the slope, and managed to turn three of them in my direction, the other cooly being with me. We gave chase and found one had got a broken leg, but he easily outdistanced us running and got over the ridge to the right whither we all pursued them. However by the time we got to the ridge, they had all disappeared, those untouched having evidently gone round the brow of the hill, and the wounded Ibex having headed straight down the steep patana-side. As we could make out his track, we consulted what had better be done, and took a good look round. Presently we heard the baying of wild dogs away down in the steep jungle ravine, and came to the conclusion it was our wounded buck they were at. It was useless trying to get down in time, as we should have had to make a considerable detour, and by the time of our arrival on the scene, little or nothing of our Ibex would have been to the fore. So a second time we had to come away empty-handed. We concluded our rifle was not of a heavy enough calibre to bring the creatures down. What I would recommend would be a good "Henri-Martini," or a Winchester repeater with a magazine holding six or eight cartridges. Nothing less will bring them to the ground; a good double express, would I believe, be an excellent weapon for Ibex shooting, as if they are not shot dead, or so badly wounded that they cannot run, they will do their utmost to get to the edge of a precipice and wriggle themselves over—the fall, whether of 1,000 or 2,000 feet, being apparently no object—and possibly be dashed to pieces at the bottom. Many portions of these hills are almost sheer, bare precipices with no foothold whatever, enough to make one feel very queer to look down; at any rate I felt it so and was always glad to get back from the edge, and on to safer and less precipitous ground. By this time it was about 1 o'clock, and after a short rest we began to descend, picking our way with care, and eventually getting down a very steep portion of our way, and crossing a small stream. On the other side we again espied some of our game, but this time far below us. However we made for them, and after much wriggling and crawling on all fours, T managed to get

shots at two; but they were too near the edge of the precipice, and both wriggled themselves over, and must have fallen some 600 or 800 feet; we never saw them again. In the meantime we spied some little chaps running about on the slab-rock. We all went for them, but they hid amongst the boulders and nearly got the better of us. Eventually we caught one, the others getting away. This we brought home, and in the course of a day or two it grew very tame, taking milk by the spoonful, and was soon not a bit afraid of any one, nor even of dogs. They are curious little creatures, very much like a young goat in shape, and of a greyish colour all over. Well, after our last misfortune we thought it better to wind our way home; we concluded we might be able to scramble down the side of the hill. If not, our only way would have been to go back, and down the way we had come. However we proceeded, and had not gone far when another herd came in view. These rushed away down a long steep hillside, and crossed a flat, up the next ridge, standing looking back now and then; on we went down, down, ever down, starting another lot of them who ran right across in front of us. What a chance we thought for a good gun or two! By this time our ammunition had run out, and we could only stand and gaze

#### AT THE HERD

some (20) or more of them, but they were very soon out of sight. These were the last we saw. Altogether we must have sighted at least 80 or 100 during the ramble. Down we went crawling as best we could, until we got to more easy ground; then turned sharp to our left and crept along under the precipice on which we had been standing an hour or two before. It was very rough walking, but at last we came upon an elephant path which we followed until we reached a slab rock. This they had evidently funk'd,\* and taken a zig-zag back and down through a large flat of jungle. We however managed to get across, where the elephants had failed, and kept on and on, but very slowly. At last we got on to known ground, a large flat of patana grass, where occasionally planters from the surrounding districts come to camp and go out shooting,—an excellent ground, with plenty of game, including Sambar, Tiger, Elephants, and Ibex further up. The last named are never seen low down; the little red deer which used to give such good sport in Ceylon are also here in abundance and an occasional Bear; these however being rarely seen. The Ceylon Leopard, as well as a black species, and the black Wanderoo are plentiful too, in all the jungles; also beautiful squirrels and fine pigeons. Any one fond of sport could get it to his heart's content, in fact a paradise for any one who had the time, and inclination to camp out. We eventually got back at 4 p.m., having spent a most enjoyable day far from the madding crowd, so to speak, of coolies. I must not forget the Bison which are also plentiful in the hilly parts of Travancore: some of these are huge animals, standing 16 hands and over at the shoulder, the head making a grand trophy for the sportsman.

The weather since end of December has been very enjoyable, more especially to those who came through the daily drenching rains of the south-west monsoon; then we had rain almost

\* (Query.—Can an elephant's footprint be traced on a slab-rock?—No doubt the feet left marks of mud or earth on the rock?—Ed. T.A.)

every day for six months. The thermometer is very low some mornings and a white frost to be seen lying in the low hollows, more especially along stream-sides, although cold in the early mornings now (about 50°). It is very hot during the middle of the day, the thermometer rising to quite 100° in the sun, and some 70° or 72° in the verandah shade. KLONDYKE.

#### ANOTHER CAMBRIDGE SCIENTIFIC EXPEDITION TO THE FAR EAST.

Expedition to the Siamese Malay States (i.e., Patani, Kelantan, Tringgame, and Kedah) for scientific purposes. Members of the expedition arrived yesterday per M.M. ss. "Yarra":—

Mr. R. Evans (Jesus, Oxford),  
 ,, N. Annandale (Balliol, Oxford),  
 ,, D. T. Gwynne-Vaughan (Christ's, Cambridge), and  
 ,, W. W. Skeat (Christ's, Cambridge)

Mr. F. P. Bedford of King's, Cambridge, is expected to join at Singapore.

The expedition has been organized in the University of Cambridge, and forms the second important exploring expedition that Cambridge has sent out in the course of the last two years.

In July Messrs. F. F. Laidlaw (of Trinity College, Cambridge) and R. Yapp (St. John's, Cambridge) are also expected to join the Expedition.

#### TEA GROWING IN THE CAUCASUS.

The tea plantations in the neighbourhood of Batoum continue to occupy the serious attention of a few Russian tea planters, who appear to be more or less sanguine as to the ultimate results that are likely to be attained. Messrs. Popoff have erected a factory for manipulating tea on one of their estates near Batoum, and have gathered their first crop this year, but I regret to say that owing to the mystery with which they attempt to surround their industry, and the secrecy which they maintain in respect to all matters concerning their plantations and the cultivation of tea on them, it is quite impossible to procure information of a reliable nature in regard to them. Although the tea crop from these gardens was forwarded to Moscow and St. Petersburg, it does not, according to the St. Petersburg papers, appear to bear comparison with the imported article in general use in the Russian Empire.

The Imperial Domain authorities expect to obtain a crop next season, and are making preparations for the erection of a factory on their estates, and I am given to understand that the order for the buildings and plant has been placed in the United Kingdom. It seems probable that the results of tea-growing on the last mentioned estates stand a better chance of success than those obtained on the other estates, thanks to the fact that they have not confined their sowings to one quality only, but have laid out plantations of several kinds of Indian teas as well as Chinese and Ceylon hybrids. By adopting this rational course they will be able to judge which quality is more especially adapted to the prevailing climate and other local conditions. Their acreage under tea has been largely increased during the present year.

I may here mention that, according to the opinion of persons who have had a wide experience in tea-planting in other parts of the world, the only favourable portion of the Caucasus for tea-planting is the coast land situated between Soukhom and the Turkish frontier, the general aspect of the land being southerly, and, therefore, sheltered by the hills from the very cold winds that strikes their northern slopes. The rainfall is fairly evenly distributed throughout the year, the driest months of the ear-

being, I should think, as a rule, May and June. The heat is never too excessive for tea-growing. Labour, I believe, is expensive as compared with the prices paid in India and Ceylon, and the hands available are, of course, entirely ignorant of the principles of gardening; but I am of opinion that this difficulty could easily be overcome if tea-planting in this district became general. As labourers, being sure of obtaining permanent work on the plantations, would be sure to flock to this district from the surrounding country, which only grows a poor quality of maize, and is not very remunerative. Up to the present diseases in the tea plants have been nil.—*British Consular Report, 1898.*

#### SOLITARY SNIPE.

SM.—H. Inglis, in your paper of the 24th instant is wrong in his identification of the bird he calls the Solitary Snipe (*Gallinago solitaria*). This bird is only found in the Himalayas and does not occur in the plains of India (a straggler was once obtained as far down as Benares). Mr Inglis's bird is the Wood Snipe (*Gallinago nemoricola*) to be found, in winter only, in the hills of Southern India, etc. The Wood Snipe is like a Woodcock, both in flight and appearance, though considerably smaller, while the Solitary species is like the Common Snipe in these respects, but larger. The Indian Woodcock is smaller than the bird of Western Europe. (Blanford *Birds of India* Vol. IV. page 234). Mr Inglis says "the Solitary Snipe is occasionally met with in the Highlands of Scotland." He is wrong again; this is another species—*Gallinago major*. It has a wider distribution in the British Islands than your correspondent imagines. His statement is "another injustice to old Ireland" as the bird frequently visits that island. I would refer Mr. Inglis to any of the many books on British Birds—Yarrell for choice. The so-called Painted Snipe—more of a Water Rail than a snipe—is, of course, never found in Great Britain. As I have never shot down Travancore way, I am not in a position to state whether the Jack Snipe occurs there, but as Legge in his *Birds of Ceylon*, page 828, says this species is met with in that island, I see no reason for its non-existence in Travancore.

Madras, 25th Feb.

DIDUNCULUS.

#### MINOR PRODUCTS REPORT.

OIL CITRONELLA.—Very quiet at the easier tendency noted last week.

CAMPHOR.—In view of the continued stringency of the crude market, English refiners on Monday advanced their prices for refined by 1d per lb. making bells and flowers 1s 7 per lb. in ton lots and 1s 7½ in ½ ton lots. On the following day German refiners advanced their price for bells to 1s 6½d per lb. in ton lots. According to our advices from Germany this week, the upward movement has not yet spent itself, for although large quantities have changed hands in Hamburg at the higher rates, it is asserted that the second-hand holders have not obtained sufficient to cover the usual spring demand, and as soon as this influence is felt prices will again advance. Meanwhile the crude market is also advancing rapidly, and on Friday of last week some 800 piculs of Chinese changed hands at 118s to 120s per cwt., c. i. f. (an advance of 2s on Thursday's prices); and a small business was also done in Japan at 127s 6d, c. i. f. On Monday the market opened with importers quoting Chinese at 125s, and Japanese 135s; but in second-hands there were offers of 122s 6d and 127s 6d, c. i. f. respectively. There were, however, buyers of Chinese at 120s; and on Tuesday about 400 piculs of oil for February-April delivery at this figure, and 300 piculs Japanese at 127s per cwt., c. i. f. On Wednesday a sale of 500 piculs Japanese transpired at 126s 9d to 127s for April delivery, and Chinese at 121s 3d, c. i. f. London. Today 200 piculs Japan sold at 107s 6d c. i. f.

Hongkong advices, dated January 7th, report that the sales for the previous fortnight amounted to about 300 cases for the Straits Settlements and India at well-maintained prices. Stock on the above date was 4,000 cases. The shipments for Hongkong and Canton for the 12 months (January to December) were :—

### TEA CULTIVATION AND THE PREVENTION OF TEA PESTS.

Mr. W. B. Jackson writes from Hauteville on the 2nd instant :—

"You have put too strong a construction on the few lines I wrote you, *re* 'Mossing and Bugging,' when you suppose the trees are rendered proof against any returning pests" by this treatment! What I wrote was :—I had carried on this treatment for years and was still doing so (every time the trees were pruned) and I did not for a moment contend that this was a 'perfect cure'; but that it was used more as a "preventative" to keep these pests from spreading. Of course if they were not merely the few of us who do this, here and there, but if it was generally and thoroughly carried out, it would mean more wholesale destruction and go to make 'life not worth living' to these fungoid pests—under such conditions. It goes without saying that it is true economy to keep up the general health of the tree—not only as regards its life, to-day but its future—and the test of the best success should be profit per acre. 'Slipshod starvation work will never pay."

### MR. BLECHYDEN'S VIEWS ON THE AMERICAN TEA MARKET.

Mr Blechyden writes to the *New York Journal of Commerce and Commercial Bulletin* under date January 13, as follows :—

"I read with interest 'Importer's letter in your issue on Monday last commenting upon the pseudo-official statistics in an article on tea and coffee drinking in America which is going the round of the press. I had hoped that some one more competent than myself might take up the parable, but failing this I venture to offer my feeble support.

"Importer" has very completely shown that the terms 'consumption' and 'importation' have been curiously muddled in the mind of the writer of the article in question, and that when stocks are taken into account the consumption of coffee will be found to be about the same as in previous years, although the importations are larger, so I will leave that aspect of the subject and will confine myself to the supposed falling off in the consumption of tea. Although the contrary is asserted, the official figures show an actual increase in the net imports of tea during the five years ending June 30, 1897. The longer the period taken for comparison the more marked is the increase, not only in actual imports but the imports per capita. The fact that there has been a great reduction in the imports during the current season is due to causes other than a decrease in demand. But apart from that fact the comparison of the figures of any two selected years is apt to be misleading, as is shown when those for 1896 and 1897 are taken. The im-

ports in 1896 were some 93 million, and in 1897 some 112 million pounds. The great increase in imports did not mean a corresponding increase in consumption, but was due to the fact that the tea season was an early one, the Government, or fiscal year, not corresponding with the tea season, and much of surplus should be credited to the following season's account.

"The causes which reduced the importations this season are, first, and most important, the sudden imposition of duty on tea, and, secondly, the passage of the Tea Act in the previous year 'to prevent the importation of impure and unwholesome teas.' To understand the present position of the tea trade these two factors have to be considered together. The 'tea law' has undoubtedly excluded much of the rubbish which used to be imported and which was responsible to a great extent for the comparatively small amount of that article consumed in this country. The latter measure paralysed the trade for many months, as retailers would not meet the enhanced cost of tea by a corresponding price. The two together placed a premium on the surplus stocks of bygone seasons, heretofore unsaleable, some of which had been in the country as long as twenty years. Such stuff acquired a fictitious value, as there was no other cheap tea in the market and no more could come in. The amount of this antiquated trash and the amount of stock actually held in the country has been a surprise to most of the trade and has been the only obstacle to the development of business in new teas. What these stocks must have been can be gathered from the fact that, although some 40 million pounds of tea were imported from June 1st to December 1st, 1898, but 12 million pounds were cleared, or paid duty, during that period. If the consumption of tea per capita is calculated upon this basis, it will be found very low indeed, yet no one in the business would admit that people have ceased to drink tea. The actual facts are now well understood. It is now known that there was from eight to nine months' supply in the country, that these are gradually being absorbed and that until they are absorbed, business will remain dull. What stocks remain in hand is shown by your correspondent, Mr. Martindale, whose letter you published on the 10th inst., and who stated that his broker had been unable to find a single jobber in one of our largest cities who had any tea whatever to sell in a large way out of bond. There can be little doubt that during the last trying half-year a change has been brought about in the trade. Jobbers have ceased to hold or lay in stocks, and have shifted the burden on to the importers, who by the stress of circumstances are being forced to sell as cheaply to the small buyer as to the big man. Events will show whether the jobber has been wise in his generation to play this 'safe game,' and if his clients will for the future feel inclined to pay him more than a brokerage, when he has voluntarily assumed the role of a broker. Pessimistic articles like the one noticed, making sensational claims, are copied widely by the provincial press and must to a certain extent influence the minds of buyers in the country, yet the actual facts point to the tea trade being in a healthier condition now than ever. All the rubbish and accumulations of previous years have been swept away, and thanks to the new tea law only fairly good teas will be admitted. Stocks are lower than ever and when the demand from the country begins to come in it must continue and be a lasting one. The tea in bond is in strong hands.

Stocks in the London market are lower than they have been for years, as the demand for Ceylon and India teas, which constitutes the bulk of the business there, is increasing from other countries; so that everything points to a very healthy condition for the trade.

"With a better class of tea supplied to consumers consumption will increase, and if the trade is only true to its own interests there seems every prospect of an era of prosperity to those who handle this staple article in this country."—*H. & C. Mail*, Feb. 17.

OLD LAMPS AND NEW.

To the Editor of *The Home and Colonial Mail*.

Sir,—As a fairly large shareholder in different tea companies I have been much concerned by the news I have had in so many letters from India lately of the very large number of older planters who have been dismissed this year to make room for younger and cheaper men. To my mind this seems a very mistaken policy on the part of our agents and directors. I wonder what would be thought of London business men who made it a practice to dismiss their employes on reaching, say, the age of forty, filling their places with young and inexperienced men? In tea it is, if possible, worse policy, for when a planter is uncertain of length of his tenure, beyond that it will probably be rather shorter than longer, he is apt to do the best he can for himself, taking little or no thought for the future. Possibly the results for a year or two are brilliant, then comes the reaction. With the well-established man, looking forward to years on the same garden, the results may not be so brilliant, or correct-like, while the dividends will be more steady, and there will always be "a bit in hand." The conspicuous successes on old gardens has been chiefly where the employes were certain of their billets. It may be said the older planters "get stale," and the younger (and cheaper) men are more active, but I doubt if this is the fact. The older planters are "the survivals of the fittest," and I would put my money on the veteran for a tough time or good health. Again, even supposing what is not the case—viz., that the younger men are more active, is activity the only requisite quality on a garden? I think not. The experienced man manages his coolies better, gets more work out of them with less friction, and last, but not least, understands the intricacies of land laws and—others. Lastly (though this, perhaps, is not "business"), is the hardship entailed on those older planters—I do not say *old* planters, as most of the men I have in mind are from forty to forty-five—by having to turn to and find new work for which they have not been trained? It is all very well to say with the members of a large firm notorious for frequently changing their staff. "It is no hardship, even when we turn out our men for younger ones at the end of a five years' agreement. We have taught them a business." They certainly have, but what is the use of the knowledge if there be no vacancies for which to apply. Further, and for this I confess I am more concerned, is it not penny wise and pound foolish to save money by getting rid of your experienced men and putting in youngsters, who, in their turn, are not blind, and, knowing what to expect, make hay while the sun shines?—Yours faithfully, A. H. and C. Mail, Feb. 17.

MANICOPA RUBBER IN BRAZIL.

The official report of Consul Benjamin F. Clark of Pernambuco to the United States government has just reached us:

He says: The manicoba plant is grown in the north of Brazil especially in Ceará and Rio Grande de Norte and Parahyba. In price the rubber from those states is second to the seringueira or Pará rubber, and for certain classes of work is preferred to the latter.

The interest in the growth of the plant is steadily increasing through the three states mentioned above, and is also extending rapidly throughout Pernambuco, Alagoas, and Bahia, giving better results with less labour than almost any other agricultural pursuit.

The seed should be planted at the beginning of winter, red or brown soil giving the best results. At the time of planting the soil should be neither excessively dry or wet; once the tree has reached the age of two years it can resist any weather, but, of course, the amount of milk will always more or less depend on the climatic influence.

At six years the plant will have reached its maturity, which is the time best suited for tapping, though this may be begun at the age of two years. After six years the tree will produce annually, until the age of thirty years from 2 to 5 kilograms (4 to 11 pounds) of rubber, if in good condition. After thirty years the yield will slightly decrease, the life being at least a century, under fair conditions.

The sap is prepared in exactly the same manner as the seringueira of Para, but is of a deeper brown color after smoking.

The way the greater part of the manicoba rubber is produced in the states above mentioned is to simply cut the bark of the tree, letting the sap run in drops to the base, where by the action of the sun's rays it coagulates and forms an irregular solid mass, which is gathered by the natives and sold to the middlemen, by whom it is shipped to America and Europe.

The prices per kilogram range, in the states from 2 to 5 milreis (25 to 70 cents per 2.2046 pounds), according to quality.

Besides the manicoba, these states produce a great quantity of mangabeira rubber, which is of an inferior grade to the manicoba and is used for covering cables, &c.

Below is given a table of the rubber export from Ceara for the years 1893 to 1897, inclusive:—

	Quantity.	Value.	Value.
	* Kilos	† Milreis	\$
1893	135,569	1,129,742	359,840.66
1894	146,627	1,221,892	242,378.80
1895	146,627	1,592,567	302,587.73
1896	324,327	2,702,725	486,490.50
1897	475,663	3,964,108	594,616.20

—*The Rio News*, Jan. 24.

THE MOTHER-OF-PEARL SHELL INDUSTRY.

TO THE EDITOR OF THE LONDON "STANDARD."

SIR,—My attention has been directed to the very interesting Article on "The Mother-of-Pearl Shell Industry," contained in *The Standard* of last Saturday and which is based on the recently-issued Report of Vice Consul Thesiger. Mr. Thesiger's Report deals with Signor Comba's proposition to cultivate the larger tropical mother-of-pearl shell on the Calabrian coast, and suggests that this newly-proposed industry might present a favourable opening for British capital. Queensland is referred to as the only place in which mother-of-pearl shell has, so far, been made the subject of systematic cultivation, and the advantages of establishing a like industry at so much nearer a station as the Mediterranean to the home markets are strongly advocated.

It so happens that the inauguration of this industry in Queensland was the outcome of successful experiments conducted by myself in Torres Straits, when acting as Commissioner of Fisheries to the Queensland Government, and following which, upon my recommendation, an Act was passed by the Queensland Parliament, providing facilities for leasing suitable areas within Queensland waters for pearl-shell cultivation. Full particulars of these earliest successful attempts to cultivate the large tropical mother-of-pearl shell were recorded in my Report to the Queensland Government for the year 1888, and also, with further details, in a paper communicated to the first meeting of the Australasian Association for the Advancement of Science, held at Melbourne in 1889. Since then, acting in a similar official capacity for the Western Australian Government, I have demonstrated that this large mother-of-pearl shell, *Meleagrina margaritifera*, may be successfully cultivated under varying con-

\* 1 kilogram equals 2.2046 pounds.

† The paper milreis is estimated as follows: 1893, 23 cents; 1894 20 cents; 1895, 19 cents; 1896, 15 cents; 1897, 15 cents.

ditions on the Western Australian coasts line, and at the instigation of their present popular Premier, the Hon. Sir John Forrest, made especial experiments in the direction of ascertaining how far outside tropical limits this most valuable species of pearl shell might be successfully acclimatised. As an upshot of these experiments, I succeeded in establishing the species, and proving that it would both grow and propagate, as far south as Shark's Bay, lying between the parallels of 23 deg. and 26½ deg. south latitude, and which had hitherto produced naturally only a small and comparatively valueless variety known in the market as Shark's Bay shell, and to Science as *Melegrina imbricata*. The one important factor in this matter of mother-of-pearl shell cultivation, apart from the mechanical difficulties of transport, is the question of temperature. The large, commercially valuable mother-of-pearl shell, which is alone rightfully named *Melegrina margaritifera*, is an essentially tropical form, which will not live in waters having a lower Winter mean isotherm than that which is coincident with the growth of reef-forming corals, or one varying from 68 deg. to 70 deg. Fahrenheit.

The prospects of cultivating this shell in Mediterranean waters, with a mean Winter isotherm of less than 60 deg. or of British capitalists obtaining a return on funds invested in such an enterprise, is, to say the least of it, absolutely visionary. In the waters of our own Colonies, and more especially those of Australia, there is undoubtedly a wide and exceedingly promising field open to British enterprise in the direction suggested, and to which I have repeatedly drawn attention in reports, books and lectures published relating to Australasian topics.

In the matter of the artificial production of pearls, in which Vice Consul Theisger accredits Signor Comba with having apparently achieved the first successful experiments, I may state that it was accomplished by myself in connection with the pearl-shell cultivation operations in Torres Straits, previously referred to. Such an artificially produced pearl of fine quality is figured and described in my books—"The Great Barrier Reef of Australia" and "The Naturalist in Australia"—and the specimen itself has been on view for the past two years in the Western Australian Court of the Imperial Institute. The production of the finest quality of pearls can be ensured only by dealing with the true tropical pearl-producing mother-of-pearl shell—*Melegrina margaritifera*; it undoubtedly represents a most profitable industrial branch, that could, under expert management, be carried on concurrently with systematic pearl-shell cultivation.—I am, sir, your obedient servant.

W. SAVILLE-KENT, F.L.S.

Late Commissioner of Fisheries to the Governments of Queensland and Western Australia.

The Ehus, Croydon, January 31.

### THE CAMPHOR MARKET.

Reports to hand by this mail show that the sales of camphor on the London market since the last week in January aggregated fully £50,000 in value, the advances in prices amounting to 30 per cent. In an article in the *Chemist and Druggist* in Nov. last it was foreseen that the spring demand for camphor would move the market but generally it was felt that the reports of scarcity of the crude material in China and Japan were exaggerated. Events have proved otherwise and it is now realised that the condition of the industry in Formosa is really bad. It is thought however that the improved prices will stimulate production. In the *Chemist and Druggist* for February 18, it is stated that since the beginning of the year nearly 8,000 piculs of Chinese and Japanese camphor (over 1,000,000 lb.) have been sold in London, and nine-tenths of the quantity during the past three weeks,

The year opened with Chinese at 95s per cwt., c.i.f., nominally, and Japanese 100s. On January 14 the market was slack, but the quotations grew higher during the following week. Buyers of crude still held aloof, and purchases were trifling until the refiners advanced their prices 1d per lb. for the week ending January 28; then a large business was done in Chinese at up to 118s per cwt. and in Japanese up to 128s 6d. Refiners put another penny on last week, and for Chinese crude 121s 3d was paid, and 127s 6d for Japanese. The quotations are higher, this week, and the refiners' prices a halfpenny higher, bringing the price to the highest point for three years. Still further advances are expected, sanguine sellers believing that another 4d per lb. will be added to the present price. A circumstance which gives credence to their prophecy is that although Hamburg received 1,445 chests and 197 tubs of crude camphor from the East last week, German buyers have been in the London market this week as seekers of refined, and they have been unable to get any.

### CEYLON PLANTERS AND THE KAISER.

Reuter today telegraphs the bald fact that the Emperor of Germany has received "the delegates from the Ceylon Planters' Association," no names being mentioned or any information given as to the object of the interview. We know locally of course that a grant of 5,000 lb. of Ceylon tea was forwarded by the "Thirty Committee" to Berlin for distribution to the German regiments as might seem best. A special silver mounted chest (made of various Ceylon woods) containing Ceylon tea, was also despatched for presentation to the Emperor of Germany, the duty of presenting the chest being entrusted to Mr. J. P. Ryan on behalf of the Committee "in co-operation with the proper authorities." No one else was asked by the Committee to act with Mr. Ryan; but he was at full liberty to do what he thought best. It is thought probable therefore that he was able to get some gentlemen connected with Ceylon to join him or perhaps members of the British Embassy in Berlin in the military and commercial attachés. We look forward with much interest to the details of the interview and trust that, as Mr. Lane said at the recent meeting in Kandy, much good to Ceylon will result from the attention of a great military nation like Germany being specially directed to the advantages of tea as evidenced in Kitchener's adventant campaign in the Soudan. Mr. Ryan, we notice, was booked to leave Genoa in the "Prinz Heinrich" yesterday; but no doubt his departure has been deferred or possibly he might have been able to catch the steamer after being received by the Emperor?

TEA IN NORTH AMERICA.—We call special attention to the letter of Messrs. Gow, Wilson & Stanton and to the figures they embody in their Circular. Last year North America took

PLANTING NOTES.

THE "TEA" FIRE in Melbourne will be found fully described on another page: the total loss was put at £35,000; but insurances seem to fully cover the amount.

"THE AGRICULTURAL LEDGER," 1898—No. 18.—The Breeds of Cattle in the Central Provinces. Notes by Veterinary-Lieutenant A. S. Trydell, Superintendent, Civil Veterinary Department, Central Province.—Ditto. No. 19.—Wild Indigo Seed a Famine Food in Bombay and Berar. Report on the Results of the Examination. By Professor A. H. Church, M.A., F.R.S.

COFFEE DIRECT TO CONSUMERS.—We take the following from the *Madras Mail*:—

The United Coffee Growers Company (for supplying coffee direct to the consumer) is the name and style of a new Company that has been started at Coonoor. The capital is to be Rs 2 lakhs, divided into 2,000 shares of Rs 100 each. The Directors are Messrs. A. Allan, A. G. Nicholson, J. Stanes and Rhodes James, all of Coonoor, and Mr. E. P. Oakshot, of Messrs. Spencer and Co. The Agents in India are Messrs. Gordon, Woodroffe and Co., of Madras. The works and offices of the Company will be at Coimbatore or Podanur. It is proposed at first only to erect sufficient machinery to turn out roasted and ground coffee in tins at the rate of about 300 tons per annum, but sufficient motive-power will be established at the commencement to admit of this output being doubled by the simple addition of the requisite roasting and grinding machines. The Directors issue an estimate of annual output and sales showing a return of 13 per cent on the capital. In the course of the prospectus it is stated:—"Practically, all the prepared coffee consumed in India is re-imported into the country, and cannot, therefore, be sold at nearly as low a rate as coffee which only travels from the plantation to the roasting factory. There is also a good demand for coffee which may be put up in tins either as the raw bean or roasted, but not ground. The average annual consumption in India for the last five years, according to the most reliable figures available, has been 1,976 tons. Small as this amount is, considering the population, and doubtless capable of enormous expansion, it yet affords a wide basis for the Company to work on. Arrangements are being made for securing the services of an expert for supervising the roasting, grinding, and tinning." We wish the Company every success, for it is calculated to benefit not only its shareholders but also coffee-planters and coffee-consumers.

A SINGULAR CUSTOM.—Mr. E. E. Fernandez, writes to the *Indian Forester* for January regarding a singular but dangerous custom, which he says, prevails in many parts of the country. It is known as *budna*, and consists in the sacrifice of a large number of animals by setting fire to jungles in order, as it is believed to procure offspring or immunity from disease. The custom was reported as existing first among local tribes in the Jubbulpore Division, and enquiry was instituted, which showed that in Narsinghpur the custom exists, but would appear to be dying out. In Betul also, it is known, but, as the Divisional Officer states, is "gradually losing ground. No one dares to avow it publicly." A case of incendiarism due to this cause was prosecuted many years ago. In Nimar the custom has been heard of more especially in connection with the cure of disease. Baren women have sometimes been known to set fire even to houses, in order, as they believe, to obtain children. In Mandla, it is now rarely practised, though it appears to have been fairly common 20 to 30 years ago. In this district ordinary sacrifices of pigs and fowls are also termed *budna*. The Divisional Officer, Damoh, had ever heard of the custom, although the present Divisional Officer of Betul knew that it was practised when he was in charge of Damoh about three years ago. The Divisional Officer of Hoshangabad is unaware of its existence there the nearest approach to it being the sacrifice of domestic animals by Gonds and Korkus when disease breaks out among them. In Saugor, the custom is apparently unknown, probably because the population is largely of Aryan origin. It would be interesting to learn, our authority says, whether this dangerous and destructive custom is practised in other parts of India. There is the assumption that many forest fires are attributable to it.—*Pioneer*.

To the Editor.

THE GURAMI FISH IN THE SEYCHELLES AND IN CEYLON; AND VANILLA CULTIVATION IN SEYCHELLES, WITH IMPORTS AND EXPORTS.

Mahe, Seychelles, Feb. 12.

Sir,—A day or two ago a new arrival from Ceylon showed me an article on the *gurami* fish, that appeared in the *Tropical Agriculturist* for December last. I note also that an attempt is being made to introduce this fish into your island.

In Seychelles the *gurami* was formerly very common. Owing probably to its excellence, when cooked, nearly all the easily accessible ponds have been netted and the fish captured.

The B.I. ss. "Lawada" goes direct from here to Colombo: so I hoped to have been able to have sent a few specimens of the *gurami* to you by her. A pond, said to contain *gurami*, has just been drawn blank, and there is now hardly time for me to send to other ponds before the steamer's departure. I hope however to be more successful shortly and to send you some good specimens before long.

I doubt very much if the *gurami* will thrive in the hills in Ceylon. Even here in Seychelles, where our highest mountains are under 3,000 ft., the *gurami* do far better near the sea level.

There is a kind of dock-leaf plant, always found growing near *gurami* ponds. The owners occasionally throw in a few leaves which are eagerly devoured by the fish. It is said by some that *gurami* will not thrive without an occasional feed of this leaf. Be that true or not, I take the precaution of now sending you by the "Lawada" a few plants, that they may be ready for the fish when they arrive later on. They ought to be planted out in rather damp soil.

At present things are fairly bright with us here. Our last Vanilla crop was a good one and prices at Mincing Lane still keep at a very satisfactory level. I fear, however, the crop of 1899 will not be nearly so good. The owners of low-lying estates complain that the dry weather was too prolonged. In the hills, on the other hand, we had a splendid show of buttons, and just as flowers were appearing, down came the rain steadily for two or three weeks. In the islands, reports are more satisfactory. From my own island—Felicité—I hear that there is an excellent show of unusually long pods.

I have just leased all the Government islands in the Admirante Archipelago for the next thirty years. These islands only produce turtles, fish, birds-eggs, etc., at present; but I hope to get some of them under coconuts before long.

I hear that several of your Ceylon planters think of trying their luck in Seychelles. I certainly advise caution. They should remember that the area of these islands is small, and that owing to our recent prosperity the present holders of land are not at all disposed to part with their properties except at high rates. Ten years ago any hard-working young fellow possessed of £1,000 could have started here with very fair chances of success; but now I could not advise anyone with less than £3,000 to come here. I send you on a separate sheet the Government trade returns of Exports and Imports since 1891. These will

show you far more eloquently than I can, how things have lately altered for the better with us.

I also send you the detailed Customs returns for 1897 lately issued by the Government. I am informed that last year's figures (not yet published) show a steady improvement.

Should any of your readers wish for information about these islands, I will be happy to tell all I know about this place. I have been here since 1885, so have had some considerable experience. I must, however, again advise caution to intending settlers. Seychelles is "booming" and it is consequently the very worst possible time to enter the lists.—I am, sir, your obedient servant,  
HAROLD BATY.

THE NILLU PLANTS—MORE INFORMATION: "CONJUM NILLU."

Abbotsford, Nanuoya.

DEAR SIR,—Mr. Thomas Farr's remarks in reference to the flowering of the Nillu (*Strobilanthes*) are very interesting, but I question if he has established the fact that this occurs only once every 12 years in the same district. The Nillu flowered in this neighbourhood and all around Nuwara Eliya and the Elk Plains very generally if not universally in 1886. It again flowered in 1894, but whether to the same extent or not I cannot say as I was then absent from the island. During the past few months it has been in blossom quite as extensively as in 1886, which is just 12 years ago, but what about the intermediate flowering? The whole thing depends on the weather and I fancy Mr. Farr has been misled by our regular dry cycles of 11 and 12 years into thinking the Nillu only flowered then.

What happens when a dry year tumbles in between just to prove that everything mundane is more or less uncertain? Why the Nillu blossom, of course—as it can't help itself. The average yearly rainfall here for 16 years is 96.86 inches.

The stand-out dry years are:—

1886	...	...	81.41 inches
1894	...	...	82.00 "
1898	...	...	76.53 "

And those are the three years in which the Nillu blossomed here and tea did badly.

You will find Nillu over 20 ft. high and 8 to 10 inches in diameter in the higher regions.—Yours truly,  
JOHN FRASER.

AMMONIA IN CEYLON RAIN WATER ON ESTATES.

London, E.C., Feb. 14.

GENTLEMEN,—Referring to a letter signed "T. K." page 92 of the *Overland Observer*, January 20th, in which it was mentioned that, in my analysis of rain water collected on Meeribedde estate, between November 16th, 1883, and March 6th, 1884, the ammonia from 90 inches was equal to 87 lb. per acre. I now enclose you my full report.

You will observe that I drew attention to the figures as being unusually high and much above what I had found in rain water collected by Mr. G. Walker at Bogawantalawa.—Yours faithfully,  
JOHN HUGHES.

Analytical Laboratory 79, Mark Lane, London, E.C.,  
No. 1. June 12th, 1884.

Rain Water received in a stone jar case with wicker collected on Mecriabedde, Koslanda, Ceylon, between November 16th, 1883, and March 6th, 1884, and supposed to represent the 20·81 inches of rain registered between the above dates.

An Imperial Gallon was found to yield on evaporation, solid residue dried at 110° C = 5·74 grains consisting of:—

Organic and Volatile Matters	..	1·12
Mineral Matters	..	4·62
Total	..	5·74

Also by direct determination—

	Per Gallon. Grains.	Per Acre for Every Inch of Rain.
Free Ammonia	.. 291	
Albuminoid Ammonia	.. 008	
	299 equal to	966
Nitric Acid	.. 510	1648
Sulphuric Acid	.. 2367	7458
Chlorin	.. 397	1283
{ Equal to Chloride of		
Sodium	.. 654	2,114
Lime	.. 1332	4306
Magnesia	.. 100	323

Assuming that the average annual rainfall on the estate to be 90 inches—the total quantity of Ammonia from the above results would amount to 87 lb. in round numbers, and the Nitric Acid to as much as 148 lb.

The figures are so very high, and so much above what was found in the rain water collected by Mr. Walker, of Bogawantalawa and reported on last November, that it would be desirable to make enquiry respecting the manner in which this particular sample was collected and stored between the 16th November 1883, and 6th March, 1884.

From the accompanying Table of Rainfall,\* it will be noticed that the total of 20·81 inches extends over 42 days and has been made up by numerous showers, most of which are less than half inch; in only six instances did the quantity exceed one inch per day, and in these it varied from 1·35 to 3·62 inches. Doubtless the rain yielded by these showers does contain a much larger proportion of Ammonia and Nitric Acid to that found in water representing a heavy storm of from 3 to 6 or more inches of rain, but it would be desirable to make enquiries as suggested, especially as the relatively large quantity of Mineral matters found on evaporation, leads me to conclude that some impurities had become accidentally introduced.

For sending Samples of Water, clean white glass spirit bottles well corked are always to be preferred to stone jars.—JOHN HUGHES, F.C.S., Fellow of the Institute of Chemistry.

### THE "KOHA."

Galle, March 4.

DEAR SIR,—The bird known in Ceylon as the *Koha* is not a migrant. It has been observed all round the year, although its notes are not heard so frequently like those of other birds. There are two species: the black and the speckled. I have been credibly informed as to this by several gentlemen who have frequently noticed the two. These birds are not gregarious. The cry has a joyous ring about it, the several notes

of the gamut being distinctly heard. When the cry is imitated by the human voice, the bird responds readily to the call as if in defiance and the game is kept up for some time to the great amusement of the listener.

The jungle crow builds its nest on the topmost branches or fronds of the areca palm, concealed from observation.—Yours truly,  
A.

### ALLEGED ADULTERATION OF CITRONELLA OIL.

Galle, March 4.

DEAR SIR,—I notice a complaint in your paper of the 2nd inst. emanating from Mr. Andrew Pears in regard to the adulteration of the bulk of citronella oil shipped from Ceylon. The alleged adulteration is surely not carried on in Ceylon now; for, whatever malpractices may have existed in the past when coconut and kerosine oil were used in distilleries, shippers are too wide-awake at present to purchase any but the genuine article. I believe all the oil now shipped in bulk is tested by Schimmel's or other satisfactory tests before exportation.

My own impression is that the poor quality of the essential oil of citronella now produced in Ceylon, is due to the fact that the original species of grass (*Andropogon nardus*) which was introduced and cultivated by Messrs. George Winter and William Austin at Baddegama and Wakwella is now extinct. The species now in cultivation was obtained from Matara. It grows luxuriantly, but yields a smaller quantity of oil. The late Mr. Simon Perera Abeywardene who owned the largest citronella estates in the South assured me that this was the fact.

The late Mr. Fisher had an extensive plantation of citronella and lemongrass on the Perseverance estate, Singapore, and his oils always commanded the highest prices in London equally with Winter's. He told the writer that the excellent quality of his oil was brought about by careful filtration according to his own method. I am not aware that this estate is still in existence. It would be worth while if a competent authority were to examine specimens of the citronella grasses grown here and in Singapore.

Lemongrass oil is only partially produced in Ceylon owing to the difficulty of keeping up the cultivation.—Yours faithfully,  
MERCATOR.

### LOCUST FUNGUS.

School of Agriculture, Colombo, March 6.

DEAR SIR,—I am in receipt of a letter from Dr. Edrington, the Director of the Bacteriological Laboratory at the Cape, informing me that he has despatched to my address six tubes of the Locust Fungus, with instructions for its use. Dr. Edrington says in his letter: "It has been very successful here, and we are at the present moment destroying immense swarms of the insects." I shall be glad to hear from anyone who would undertake to use the fungus according to directions which I shall supply, and report results.—I am, yours truly,

C. DRIEBERG, Supt.

### THE TIMBER OF GREVILLEAS.

Abbotsford, Nanuoya, March 4.

DEAR SIR,—Timber from immature trees decays rapidly if used out of doors, and suffers from weevils or dry rot quite as rapidly when used for inside work, the sapwood portions of the planks being the first affected.

Ironwood of the same age would probably behave similarly or worse, so do not blame the tree as I have seen timber sawn from 20 years' old grevilleas which left nothing to be desired for ordinary building purposes, as it shrinks exceedingly little and doesn't warp at all even when unseasoned.—Yours faithfully,

JOHN FRASER.

## USEFUL NOTES.

**COCA-LEAVES.**—Ordinary Truxillo are quoted at 7*d.* and light green at 7*d.* per lb. c.i.f., and for Huanoco for dark green quality 10*d.* c.i.f. is wanted. In auction 8*d.* per lb. was refused for good Huanoco.

**ORDER OF ST. MICHAEL AND ST. GEORGE.**—At Osborne, on Monday last, January 30, the Queen conferred the honour of knighthood on William Turner Thyselton Dyer, Esq., Director of the Royal Botanic Gardens, Kew, in recognition of services rendered to Colonial Governments. The new knight was then invested with the Riband and Badge, and the Star of his dignity in the Order was affixed to his left breast by her Majesty.—*Gardeners' Chronicle.*

**OIL, CITRONELLA.**—Privately a small business has been done in drums at 10*d.* per lb., c.i.f. for January-March shipment.

**OIL, EUCALYPTUS.**—A "globulus" oil, so-called "extract," sold without reserve at 1*s.* 7*d.* per lb.

**OIL, LEMON.**—The firm tendency continues, and business has been done privately at last week's quotations. Battaglioni's was limited at 3*s.* 6*d.*

**OIL, LEMONGRASS.**—Privately there are sellers on the spot at 2*d.* per oz., but business is slow. In auction bids of 2*d.* and 3*d.* were refused, 2*d.* being limit for the former.

**VANILLA.**—The small supply offered to-day was firmly held, and the bulk was bought in, holders not appearing anxious to sell. The following prices were paid:—*Seychelles*, of fair colour, 6 to 7 in., 22*s.*; 5½ to 6½ in., 20*s.* 6*d.* to 21*s.*; 5½ to 6 in. 20*s.*; 6, to 7 in. (poor) 15*s.* per lb. No Bourbon were sold, 15*s.* 6*d.* being refused for 4 to 4½ in. Mauritius large bold beans of full flavour, slightly crystallised:—7½ to 8 in., 25*s.*; 6½ to 7 in., 22*s.*; 6½ in., 21*s.* to 21*s.* 6*d.*; 6 in., 21*s.*; 5½ to 6 in., 20*s.*; 5½ in., 19*s.* 6*d.*; 5 to 5½ in., 20*s.* 6*d.*; 5 in., 20*s.*. No Tahiti were disposed of; several parcels catalogued were not up in time.

**CINCIONA.**—At the Amsterdam auction last week there was a good demand, but in consequence of larger shipments from Java prices declined by 0-17*c.* The unit moved between 3½*c.* and 5*c.*, the average being about 4½*c.* (4-70) per half kilo., as against 4½*c.* (4-87) paid at the previous auctions. The total weight of manufactured bark sold was 628 tons, containing about 30 tons of quinine sulphate. The highest prices paid was 90*c.* per half-kilo. (1*s.* 6*d.* per lb.) for 2 cases of fine long Succirabra quill, and the highest quinine-sulphate equivalent was 12-24 per cent. contained in 18 bales of ledgeriana brok-n quill of Government culture, which sold at 53½*c.* per half-kilo. The stock of unsold Java bark at Amsterdam on December 31 was 2,657 packages, Government and 9,478 packages private grown bark. The next auctions in Amsterdam will be on February 15. To-day good Huanoco quill realised 6*d.* to 7*d.*, and Loxa quill, 11½*d.*; good red Guatemala quill sold at 2*d.*, and chips at the same price; for Java trunk bark of fair colour 1*s.* 3*d.* was paid, and fine thin Guayaquil 5*d.* and 6*d.*; mossy crown bark, 4½*d.* and 4*d.*, a bid of 4½*d.* was refused for Java red quills, the buying-in price being 6*d.*; flat Yellow bark, rather musty, sold at 6½*d.* to 7*d.*, the best lots being held for 10*d.* per lb.

**THE WEST INDIES.**—Dr. Morris, who acted for several years as Assistant-Director at Kew, during which period he rendered valuable services to the Royal Horticultural Society, and made many friends among horticulturists, has taken up his work as Imperial Commissioner of Agriculture for the West Indies. An address which he delivered before the Agricultural Society at Trinidad defines the scope of his future work as comprising the furtherance of every possible agency to benefit the general welfare of the people. The sugar-cane in its various aspects will receive much attention, and amongst other things attempts will be made to obtain a variety with a higher percentage of sugar, and drawings are to be made of all the varieties cultivated in various parts of the world, so that uniformity and fixity of nomenclature may be secured. Trinidad has a very efficient botanical department, and an energetic and

experienced superintendent in the person of our valued correspondent, Mr. Hart. A similar establishment exists in Jamaica under the superintendence of Mr. W. Fawcett, so that these two islands do not stand in need of official assistance in the degree that the less prosperous islands do. Agricultural and industrial schools are to be established, horticultural exhibitions started, agricultural instructors appointed, and experiments carried out. Mr. Hart strongly recommends the growth in Trinidad of *Castilleja elastica*, a rubber-yielding tree which promises well in a commercial sense, both in British Honduras and in Trinidad.—*Gardeners' Chronicle.*

## PLANTING NOTES.

**TEA AND COFFEE IN THE WYNAAD.**—From a letter dated, South Wynaad, 28th Feb., we quote as follows:—"We have now settled in Wynaad, the following gentlemen who were formerly, and till recently in Ceylon:—Messrs. J. S. Nicolls, E. de Fonblanque, W. Q. Wright, Stuart Robinson and J. Glennie, all of whom appear to have formed a favourable opinion of the tea already developed here." The difference between the old and new staple is well indicated in the following:—"Within three weeks, the bulk of the season's work on coffee estates will be accomplished, and all superfluous labour paid off, though upon tea gardens no similar cessation of field culture can be looked for."

**FOR SPORTSMEN IN HAMBANTOTA.**—We call attention to the notice appearing in our columns today, announcing that all shooting in the above district between the Yala and Kumbukan rivers is prohibited; this country has been reserved as a game sanctuary, and all licenses will be confined to the Magam Pattu, W. of the Yala river. Sportsmen should note also that they must apply to the A.G.A. at Hambantota for permission to occupy the Salt Department Bungalows at Bundale, Kirunda and Palatupana; otherwise they will be refused admission there, by order.

**THE PLUMBAGO INDUSTRY.**—We are interested in learning that Messrs. Peto, the Chairman and the Managing Director of the Morgan Crucible Co., of London, have been in the island for some little time, and that they have visited all the so-called native mines of plumbago of interest in the island. One day last week they visited Morankanda, and were much pleased with the miner-like manner in which Capt. Tregay has tackled his work and also with the prospect there. Other than at Morankanda, they saw no evidence of real mining as we understand the term. Messrs. Peto will not be leaving the island just yet.

**VANILLA IN THE SEYCHELLES.**—In contrast with the letter of Mr. Baty which we published on Saturday is a letter addressed by a firm of Mahe, Seychelles to Messrs. H. W. Cave & Co. in which they state that "every year brings fresh settlers from England, India and the Colonies and we fully expect some arrivals from Ceylon shortly. We shall be glad to supply all the information we can as to Vanilla planting. Prospects are at present very bright owing to the steady decrease of the Bourbon crop and the comparatively small crops of Mexico."—One estate in the market for which R40,000 are asked, has 100 acres in coconuts and coffee and 80 acres partly in vanilla—184 in all. Over 2,000 lb. of vanilla shipped in 1898 realized 24*s.* all round a lb.! There is a fine bungalow and other out-houses—so that to any one who does not mind comparative banishment, the price does not seem a high one.

**PEARL FISHERIES IN INDIA.**—We recently had some remarks on the Pearl Fishery at Mergui, where the areas are simply let on contract and afford a goodly return for no cost in up-keep or working. On the other hand, the pearl and chank banks in Tinnevely are worked by Government and a service of vessels actually maintained for the purpose. The up-keep of this fish-fleet alone costs on an average something like R24,000 a year, and the total cost of collections, including Superintendents and office salaries, allowances and contingencies comes to the pretty figure of R35,900 more or less—all for what?—*Indian Engineering.*

\* Transaction.

# THE AGRICULTURAL MAGAZINE, COLOMBO.

*Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."*

The following pages include the Contents of the *Agricultural Magazine* for March:—

Vol. X.]

MARCH, 1899.

[No. 9.

**SEASON REPORTS FOR JANUARY, 1899.**

*ESTERN Province.*—Paddy. Maha harvest begun. Crop prospects good. Rainfall fair. A few cases of murrain in Kalutara District.

*Central Province.*—Paddy nearing harvest, prospects fair. Rainfall sufficient. A few cases of murrain in Gampola.

*Northern Province.*—Paddy. Harvest begun in some places, prospects good. Rainfall, 1.65 in. in Jaffna, 2.53 in Mannar. Murrain in Mullaitivu.

*Southern Province.*—Paddy. Maha harvest in progress and yield good. Rainfall, 4.28 in, in Galle. Health of cattle good.

*Eastern Province.*—Paddy. Harvest prospects good in Trincomalee, some damage by rain in Batticaloa. Rainfall, 7 in. in Trincomalee, 15.55 in. in Batticaloa. Cattle healthy.

*North-Western Province.*—Paddy. Prospects of crop good except in a few places where rain has been excessive. Cattle murrain still lingers in the Kurunegalla district, though not prevailing to any great extent.

*North-Central Province.*—Paddy. Maha cultivation commenced in Anuradapura district. Rainfall, 5.05 in. Health of cattle good.

*Province of Uva.*—Paddy. Yala harvest going on, prospects good. Rainfall at Badulla 16.89 in. Health of cattle good.

*Province of Sabaragamuwa.*—Paddy. Crop prospects favourable. Rainfall at Ruwanwella 4.78 in., 5.78 in. at Ambanpitiya. Cattle murrain still lingers in both Ratnapura and Kegalla districts.

**RAINFALL TAKEN AT THE SCHOOL OF  
AGRICULTURE DURING THE MONTH  
OF JANUARY, 1899.**

Greatest amount of rainfall in any 24 hours on the 23rd inst. 2.64 inches.

Mean rainfall for the month .14 in.

Recorded by Mr. J. A. G. RODRIGO.

**IMPORTANT LETTER REFERRING TO  
LOCUSTS.**

We have been favoured with an interesting letter with reference to the destruction of locusts by Mr. Lounsbury, the Government Entomologist at the Cape.

It will be remembered that the visitation of spotted locusts was the subject of a special Circular issued from the Botanic Gardens. Though locust visitations have hitherto not proved so serious in the past, it would seem that there is a tendency for the pests to appear in larger numbers

every year, and it, therefore, behoves us to be well equipped to meet an emergency. With the object of ascertaining the latest methods of attacking locusts and of learning something about the results of using the "locust fungus," we approached Mr. Lounsbury, who has been kind enough to furnish the following reply to the letter we addressed to him:—

I regret that no recent reports on the locust question have been issued by this Government, nor, indeed, have any been issued in the past which could be of service to you. We have no regular system of destruction but leave the farmers to fight the plague the best they can. Scattered through the pages of the *Agricultural Journal* for some years past are "suggestions and recommendations," but with few exceptions these are reprints of the descriptions of ways and means found to be of value elsewhere in the world. We have no legislation on the locust question at all, although "compulsory destruction" has been urged for several years and is now being agitated for by the Horticultural Board of the Eastern Province. The Government keeps a small vote for locust expenses on the estimates, and has paid a few bills for screens and for the collection of eggs, but only under special circumstances. Lately the only aid has been in the direction of spreading a fungus disease among the swarms. The fungus (*Empusa grylli* Fres.?) is cultivated at the Bacteriological Institute at Grahamstown, and one or two officers are employed in travelling about to inoculate; cultures are also sold at a nominal price with directions for use. The Natal Government is also cultivating and distributing the fungus. It is quite impossible to get definite information on the value of the disease-dissemination, and though unquestionably it does some good and probably a great deal it is quite improbable that anything like eradication of the pest is possible by this means. The disease spreads with rapidity and certainty only under certain conditions of moisture. I should have stated before this that we have two migratory locusts; one, the wide-spread *Pachytylus migratorius*, and the other the *Acridium purpuriferum*, a locust closely allied to the *A. peregrinum* of Northern Africa (and India). The former is almost confined to the Karroo—our dry and treeless interior; while the latter keeps pretty well to the eastern coast districts,—doing considerable damage to tree vegetation. Both species reach us from the almost wholly unexplored regions about the Kalahari Desert and other northern territories, and, probably owing to our prolonged state of drought, both have been able to breed in the Colony. The work with the fungus has almost wholly been restricted to *A. purpuriferum*. On the Karroo the more progressive of the farmers have their herdsmen report the presence of young locusts immediately on their appearance. All hands, if necessary, are then taken to the place at night and the swarm destroyed by sprays or by beating with bushes or spades; larger swarms necessitate driving into furrows, but the Karroo swarms now are usually small. Along the coast some use is made of arsenically poisoned bran or sugar cane. In explanation of the seeming indifference of the Government, I need only mention that the ter-

ritorial area of the Colony is immense and the population scant, thus making operations of avail and within the limits of economy in more thickly settled lands entirely out of the question with us. Only a small part of the country ravaged is under cultivation.

As your country is a populous one, I think you would find the reports of the locust work in Cyprus of considerable advantage. These are issued yearly, and I presume you could obtain them from the Colonial Office. I attach the printers' mark. You might also find something of interest in Dr. C. V. Riley's bulletin on American Locusts; I think it is No. 25 of the Division of Entomology, U.S. Department of Agriculture. Regretting that nothing has been published here that would be of use to you.

#### LOCUST FUNGUS FOR CEYLON.

We are glad to announce that we have received the following advice note from Dr. Edington, the Director of the Bacteriological Institute, Grahamstown, Cape Colony: "I beg to inform you that I have sent to your address six tubes of the abovenamed fungus, with instructions for its use. I shall be greatly obliged if you will be so good as to let me know the results you obtain from it. It has been very successful here, and we are at the present moment destroying immense swarms of the insects."

#### OCCASIONAL NOTES.

The first meeting of the Agricultural Commission met on February the 4th, when all the members were present. After some discussion as to the nature and functions of an Agricultural Department, and the prospective advantages to the country of organising such a department, it was decided to ask Mr. J. C. Willis, Director of the Royal Botanic Gardens, to draft a scheme to meet the requirements of the Island. Mr. Willis readily undertook the duty, and the Honorary Secretary was requested to print and circulate Mr. Willis's scheme before calling the next meeting.

Mr. J. B. Cull has resigned his appointment as Director of Public Instruction, and is succeeded by Mr. S. M. Burrows, M.A., of the Ceylon Civil Service. Mr. Burrows, who is on leave, will not assume duties for some months to come, and in the meantime Mr. Harward, the Principal of the Royal College, will continue to perform the duties of Director, which he has done for the past five months with much acceptance.

A small consignment of 10 Sind cows arrived for the Government Dairy on January 14th. One animal unfortunately succumbed to injuries received by a fall on board ship. Another consignment of 20 cows and 2 bulls is expected early in March.

A sale of cattle drafted from the dairy herd was held on the 18th January. The net proceeds of the sale were R533.35 from 19 cows and 1 bull:

Government have decided not to sell any of the young stock belonging to the Dairy but not required by it for its own use, in Colombo, but to send them to the chief provincial towns in rotation. The first batch was to have gone to Kurunegala, but the prevalence of cattle plague in that district interfered with the sale. It is now likely that the first sale will shortly take place in Galle.

Mr. C. Brooke Elliott, Advocate, (an "old boy" of Malvern College) delivered a most interesting lecture on Public School life to the students of the School of Agriculture on the 17th February.

The following are the records of rainfall taken at the Fort and the School of Agriculture during 1898:—

	Fort.	Schoel.	Schoel.
	1898.	1898.	1897.
January	... 2.32	2.01	3.51
February	... 1.98	.68	2.80
March	... 4.21	1.69	2.35
April	... 22.81	25.26	11.82
May	... 5.80	7.14	11.02
June	... 10.94	13.17	11.80
July	... 6.15	6.07	5.37
August	... .97	1.12	11.30
September	... 6.90	8.63	6.32
October	... 20.60	19.92	4.32
November	... 17.38	17.66	10.56
December	... 3.	4.35	8.41
Total...	103.06	107.70	89.58

The wettest month in 1898 is thus seen to have been April; the heaviest rainfall at the School was recorded on Tuesday morning, the 19th April. We also give in the third column the rainfall at the School for 1897, to show how differently the rainfall was distributed in 1897 and 1898.

The *Queensland Agricultural Journal* in taking over our article on Chillies (which appeared in the *Agricultural Magazine* of October last) says:—"The above remarks on chilli-growing should induce some one to make the experiment of growing chillies for export in Queensland. The plant grows to the greatest perfection in all parts of the Colony, and bears heavily for many months. Nearly all the varieties are to be found here. A sample bottle of pickled chillies was sent from London to the Department of Agriculture lately, with an intimation that chillies put up in that form would be readily saleable in London. Those interested could see the sample at the Head Office." We thank the editor of the *Q. A. J.* for the hint regarding pickled chillies, which readers of our Magazine will be glad to have.

The Principal of the Queensland Agricultural College has decided, after feeding the farm dairy cattle with Indian corn fodder, that it is excellent as a milk-producing diet. It does not, he says, tend to put on fat, but undoubtedly tends to increase the milk yield.

CEYLON AND JAMAICA.

A late visitor to Ceylon from the West Indies in deciding as to the comparative merits of Ceylon and Jamaica put the matter pretty tersely when he said: "Ceylon is not in it with Jamaica in the running for the Garden of Eden." We had no idea till we met the visitor referred to above, that the latter Colony was such a paradise from an agricultural point of view. It would appear that the soil is so fertile that cultivation and manuring have as yet demanded little consideration. Of crops, coffee, cacao, coconuts, sugar cane, bananas, fruit trees and fibre plants all have a place and are grown with much success, while the rainfall is so satisfactory that throughout the greater part of the Colony it is said that some rain falls every day. Guinea grass and Mauritius grass grow there without any attention, and the plantain trade is so well established that some two or three hundred thousand bunches of fruit are shipped weekly to supply the American markets. There is a richness and vitality about the general vegetation that the boasted verdure of Ceylon looks pale and artificial after it. Horse and mule breeding is a regular industry, but a satisfactory breed of milch cattle seems to be a desideratum. The experiment of introducing pure bred stock from England has proved a failure owing to the tropical conditions, which, as regards temperature, are very similar to Ceylon. This want may, however, be soon supplied by the plan (already being adopted) of introducing the hardier cross-breds from America, and the contemplated experiment of importing the better types of Indian cattle (Zebus) and establishing a cross breed between them and English stock.

The botanical and agricultural interests appear to be well looked after. A number of excellent Botanical and Experimental Gardens have already been established, and though there is no separate agricultural department, its place is apparently well supplied by an Agricultural Society, the Secretary of which is Mr. George H. Douet.

FLEMINGIA CONGESTA.

No. 16 of 1898 of the *Indian Agricultural Ledger* deals with this leguminous shrub which is indigenous to Ceylon. The surface of the pods of the *Flemingias* possess a number of red-coloured glands, the product of which has been the subject of examination and has proved to be of value. The only other glandular product which bears any resemblance to that found on the pods of these leguminous shrub is the red-coloured powder well-known as *kamala* which is obtained from the capsules of a euphorbiaceous tree, *Mallotus philippensis*, also indigenous to Ceylon and known by the Sinhalese name of *Ilampirila*. *Kalama* is a well-established dye in India (it is referred to in past numbers of the *Agricultural Magazine*), and its botanical origin has been long known, but it is only within the last few years that the ancient Arabian drug known as "waras" or "wars" has been referred to as a species of *Fleminga* growing in the East. The drug engaged the attention of Messrs. Allen and

Hanbury, London, so long ago as 1867, but as already mentioned its botanical name was not traced till quite recently.

The following interesting Notes on the collection of the dye at Harrar were contributed by Major Hunter, and published by Mr. W. T. Thiselton Dyer, C.M.G., C.I.E., F.R.S., Director of the Royal Gardens Kew:—

"In the neighbourhood of the city 'wars' is not now raised from seed sown artificially, and it is left to nature to propagate the shrub in the surrounding terraced gardens. The plant springs up, among jowari (*Andropogon Sorghum*), coffee, etc., in bushes scattered about at intervals of several yards more or less. When sown, as among the Gallas, it is planted before the rains in March. If the soil be fairly good a bush bears in about a year. After the berries (pods) have been plucked the shrub is cut down to within six inches of the ground. It springs up again after rain and bears a second time in about six months, and this process is repeated every second year until the tree dies. Rain destroys the berry (pod) for commercial purposes; it is, therefore, only gathered in the dry season ending about the middle of March. The bush grows to a maximum height of six feet, and it branches close to the ground. The growth is open and the foliage sparse. Each owner has a few acres of land.

"In the middle of February, 1884, the following processes were observed:—

"The leaves [? fruiting shoots] of some plants were plucked and allowed to dry in the sun for three or four days. (The picking is not done carefully and a considerable quantity of the surrounding twigs, etc., is mixed with the berries [pods]). The collected mass was placed on a skin heaped up to about six or eight inches high and was tapped gently with a short stick about half an inch thick. After some time the pods were denuded of their outer covering of red powder which fell through the mass on to the skin. The upper portion of the heap was then cleared away and the residual reddish-green powder was placed in a flat woven grass dish with a sloping rim of about an inch high. This receptacle was agitated gently and occasionally tapped with the fingers, the result being the subsidence of the red powder and the rising to the surface of the chaffy refuse which latter was carefully worked aside to the edge of the dish and then removed by hand. This winnowing was continued until nothing remained but red powder.

"Wars" is sent to Arabia, chiefly to Yemen and Hadramant, where it is used as a dye, a cosmetic and a specific against cold. In order to use it, a small portion of the powder is placed in one palm and moistened with water, the hands are then rubbed smartly together, producing a lather of bright gamboge colour, which is applied as required.

A chemical examination of waras was recently made by Mr. Arthur George Perkin, F.R.S.E., whose invaluable researches in the natural colouring matters of India are well-known. The results of the investigation were communicated in a paper to the Chemical Society of London.

Waras has been found to be an excellent dye for silk, but not suitable for linen and cotton. Its

dyeing properties have been examined by Sir Thomas Wardle and Mr. Perkin. The larger percentage of resinous colouring matter in waras, the richness of its solutions and absorptive power observed in the spectrum are said to indicate its superiority over kamala.

The dye has been long in the Bombay market where it is principally used by the people of Surat for imparting a light brown yellow colour to their silks which are much prized and worn by the native ladies. The Arabs use it as an internal medicine in cases of leprosy and externally in solution as a lotion to remove freckles and pustules. Now that attention has been called to the Arabian trade in waras and to the delicacy of the dye, it is expected that the collection of the powder will become an industry.

#### MORE ABOUT MILK.

Continuing a series of clear and practical papers on bacteria as applied to Farm Problems, Professor H. S. Russel, Professor of Bacteriology at the Wisconsin (U. S. A.) College of Agriculture, discourses as follows:—

Long before he was told the reason, the practical dairyman learned by experience that cleanliness, thoroughly carried out, enabled him to secure his milk in a satisfactory way. The desired result can, however, be much easier accomplished if we know the sources of bacterial infection. Washing the udder to prevent dislodgment of dust particles, steaming the papils and cans to destroy lurking germ life, rejecting the fore milk, keeping the stable free from dust during the milking, are all practical methods that have a rational scientific basis.

Where these methods are conscientiously carried out, good results are to be obtained with ease. Private dairies that are engaged in supplying the best quality of milk, are following such methods with success. For factory purposes, such scrupulous care as is practised in milk dairies would perhaps be considered impractical, but if our factory milk was handled with equally great care, the hundreds of thousands of dollars that are annually lost in this state alone on inferior dairy products would, for the most part, be saved.

Suppose that the greatest care has been taken to secure the milk in as clean a manner as possible. This will reduce the number of bacteria in the same proportion, and yet, if no pains are taken to chill it, the advantage gained will be largely lost. The temperature of the milk as it comes from the cow approximates blood heat, and, therefore, the conditions are most favourable for bacterial growth. At 80 degrees Fahr. a single organism will form 120 new individuals in four hours, while the development of the same germ would have been so retarded at 50 degrees or 55 degrees Fahr., that but little increase would have taken place.

The secret, then, lies in early cooling. If the milk is allowed to cool naturally it loses its animal heat so slowly, especially in a large volume, like a canful, that the bacteria that are contained in it are able to multiply in a vigorous manner. To check this development, the milk should be cooled as soon as possible. An early diminution of the temperature is much more

efficient in checking growth of germ life than even a longer exposure applied later.

If milk is allowed to stand for several days, it almost invariably undergoes a change that is known as souring. Its physical appearance is much altered, and the once valuable food is converted into a relatively worthless by-product. This change is a fermentative process that goes on in the milk, and is caused by a large group of different bacteria. These kinds are particularly numerous in stables and barns; moreover, they seem to find in milk such good surroundings that they grow with great rapidity.

The sour taste of milk, so fermented, is due to the formation of lactic acid, that is produced by the splitting up of the milk sugar in the milk. As acid is formed in gradually increasing amounts the chemical reaction changes from a neutral to an acid condition. When the amount of acid formed approximates 0.6 per cent, the casein is unable to remain in its normal condition, and is precipitated, forming the solid curd that is characteristic of a sour-milk fermentation. The formation of acid does not go on until the sugar of the milk is all decomposed, for the lactic acid bacteria are unable to grow where the amount of acid exceeds 0.8 per cent. They are retarded, therefore, by the presence of their own by-products.

The souring of milk is so universal a phenomenon that it is considered almost a natural and inevitable change in milk, and yet, if milk could be secured without bacteria, it would undergo no such change.

No exception can be taken to the statement that milk is very apt to sour during a thunderstorm. This universal experience has led to the notion, thoroughly believed by many, that the cause of the souring is due to the action of thunder, or possibly the electric discharge. Experimental researches upon this question, however, fail to establish any such relationship. The passage of the electric spark through milk does not increase the acidity of the same. If bacterial growth is held in check in various ways, no atmospheric disturbance, as thunder or lightning has any effect. All the evidence indicates that the increased tendency toward the formation of lactic acid is due to the more favourable growth conditions that obtain at such a time. The warm, muggy atmosphere favours rapid germ development, and consequently the souring changes occur more quickly.

A well-established rule of dairy practice is not to mix the night and morning's milk, or, to put it on a broader basis, fresh and old milk. Common experiences teaches that this mixture is apt to sour much more rapidly than where the two milks are left separate. The reason for this is a physical one, and is based on the difference in temperature of the two lots and the relation that these temperatures bear to the bacterial life that is contained in each milk. Under normal conditions the older the milk is the richer it is in germ life, but the night's milk is usually cooler than the morning's milk, which is relatively deficient in germ life. The mixture of the two lots raises the temperature of the whole mass, and at the same time increases the germ content of the fresh milk so that fermentative changes occur more rapidly.

If night's milk at a temperature of 55 degrees Fahr. contains 1,000,000 bacteria per c.c., and the morning's milk, at a temperature of 80 degrees Fahr. has only 20,000 organisms per c.c., the mixture of the two in equal volumes would raise the temperature to about 65 degrees.

At this temperature the 510,000 bacteria in the mixed milk would grow more rapidly than the 1,000,000 at a lower temperature, and would, therefore, sour the same sooner.

(To be continued.)

## TOBACCO.

Mr. Nevill, Tobacco Expert, says that it is not at all necessary, nor is it a good thing, to select the richest lands for tobacco-growing. A soil which will produce a splendid crop of maize, potatoes, lucerne, or sugar-cane is not necessarily a soil which will produce a good tobacco. In the United States, tobacco is grown on lands which would not be thought worth cultivating in Queensland. The best soil for tobacco in Florida is a grey sandy loam, underlaid by a stiff red or yellow clay sub-soil. Such land will require manuring.

But what is the proper kind of manure to use? In Florida they say the best fertiliser is cotton-seed crushed and cotton-seed meal—the latter giving the plants a quick start; the former, by its slower action, feeding the plants at a later period and sustaining them during the important crisis of leaf formation. About 80 to 100 bushels of crushed seed and 500 lb. to 800 lb. of the meal should be applied per acre. On land thus fertilised, the Sumatra tobacco yields on an average 800 lb. per acre, but as much as 1,300 lb. have been harvested on small, well-tilled holdings. Cuban tobacco will yield from 500 lb. to 900 lb. on an average; the later yield is, however, exceptional.

At the Queensland Agricultural College, Mr. Nevill is experimenting on two different soils—one a heavy, deep, rich black loam; the other a poor, sandy, shallow soil, overlying a rocky bottom. Unfortunately, the weather since and during the planting-out time was exceptionally dry, and a large proportion of the plants failed, but a good many are growing, and the gardeuers are busy planting up the misses.

The analysis of a perfect tobacco fertiliser should be 10 to 12 per cent. potash, 8 per cent. phosphoric acid, and 4 per cent. nitrogen. A Jamaica paper says that it is quite impossible to get this analysis outside a mineral fertiliser. We are not aware whether Mr. Nevill has used any fertiliser on the poor soil; but if not, probably next year, when the soil has been analysed, and when it is seen what the yield on the unfertilised land is like, he will turn his attention to experiments in this direction, although we know that he does not favour the use of fertilisers in tobacco-growing.

If fertilising can be done cheaply, then there are thousands of acres, close to our largest cities, and on the railway lines and rivers, which may yet be turned to account as tobacco plantations.—*Queensland Agricultural Journal.*

## BILE INOCULATION FOR RINDERPEST.

The GOVERNMENT VETERINARY SURGEON to the  
Hon. the COLONIAL SECRETARY.

No. 286. Colombo, October 10, 1898.

SIR,—With reference to annexed extract from my diary—re inoculation of bulls—I have the honour to state, for the information of His Excellency the Governor, that Mr. Jeffery reports that all the bulls have done well and have had no disease. No cases of rinderpest have occurred for the last month. The yard is now free from the disease.

I am, &c.,  
G. W. STURGESS,  
Government Veterinary Surgeon

*Annexure.*

## EXTRACT FROM THE DIARY OF THE GOVERNMENT VETERINARY SURGEON.

Visit to dairy. All satisfactory.

The four inoculated bulls in Lipton's yard have been tied now for a week by the side of a sick animal—in infected sheds (the sheds where all the cases have been kept)—and will be washed and removed today. None of them have been ill, and none have contracted rinderpest; consequently the bile experiments may be said to be very satisfactory, and I shall go on with the inoculation wherever possible. I am quite prepared to inoculate any herd amongst which rinderpest breaks out, as long as good bile can be obtained from those that die or are destroyed for the purpose, and there should be no difficulty about that. In a good many cases the bile is yellow and unfit for use (it must be quite liquid, dark green in colour, and devoid of smell), but in a good percentage of the fatal cases the bile is quite fit for use.

One thing, I am satisfied that if the inoculation is carried out with proper precautions it does no harm, even if it does no good.

Not one of the animals I inoculated has developed an abscess or sore of any kind at the seat of inoculation, and there has been no appreciable illness. Mr. Jeffery, to whom I am greatly indebted for so kindly allowing me to carry out the experiments with his cattle and for the ready assistance he has given to me, expresses his satisfaction with the results, and should the disease break out again in the yard (it has apparently disappeared now) the remainder of the bulls will be inoculated. I shall write a special report of the procedure, &c., adopted in inoculating with the bile in the course of a few days, as the Government of Madras has asked for information of any experiments and results.

## REPORT ON BILE INOCULATION FOR THE PREVENTION OF RINDERPEST.

During the recent outbreak of rinderpest in the town the disease appeared amongst a herd of 150 cart bullocks belonging to Messrs. Lipton, Limited.

Altogether 80 cases occurred: 50 yielded to treatment and recovered, 30 died. I obtained permission to try the bile inoculation method discovered by Dr. Koeh in South Africa. He found that the contents of the gall-bladder in cattle dead from rinderpest possess the property of protecting healthy cattle against the disease. The method of using it is by subcutaneous injection, and protection is given after ten days have elapsed.

The method is of no use for diseased cattle; it is only effective when the cattle have not had the disease.

I opened several bullocks after death, but the bile was unfit for use for inoculation purposes. However, on 23rd August a large Indian bull died, and on postmortem examination I found the bile in proper condition for use.

*The Bile.*

In a good percentage of fatal cases of rinderpest the bile will be found good for the purpose of inoculation. It should be dark green in colour, perfectly fluid, free from shreds of the lining membrane of the gall-bladder and from any odour of decomposition.

A good number of instances occur where the bile is unfit for use, being yellow or dark brown in colour, ropy in consistency, and containing shreds of the mucous lining of the gall-bladder. Such bile is poisonous and useless. The best bile is that obtained from an animal that has suffered severely from rinderpest for some days, or, better, if it has succumbed to the disease. It must be taken before decomposition of the body commences.

In instances where it has been good I have noticed it was usually very abundant, a half to one pint being easily obtained.

*Method of taking the Bile.*

Great care must be taken in removing the bile in order to avoid contamination by blood, or contents of the intestines, or by fluid of any kind in the abdominal cavity.

The carcass should be placed on the left side and the abdominal cavity opened by cutting along the median line from the extremity of the sternum to the pubis and behind the last rib down to the backbone. An assistant can then raise the flap and the liver and gall-bladder lying underneath the ribs are well exposed.

The gall-bladder should be slightly raised with the hand, and if dirty washed with a weak solution of bichloride of mercury in water (1 in 2,000). An assistant holds a glass jar against the gall-bladder (taking care not to allow any blood or any extraneous matter to enter it), which is then punctured with a sharp knife and the bile allowed to flow into the jar. A glass cover should be placed over the jar as soon as the operation is finished.

My hands, jars, and instruments were well washed and rinsed with a bichloride of mercury solution (1 in 2,000) and dried.

As previously mentioned, I obtained in this manner from an Indian bullock half a pint of bile fit for use. The animal died from the disease after suffering for a week.

At once four healthy bullocks were inoculated.

*Method of Inoculation.*

The animals were cast and the legs tied, and 10 cubic centimetres (about 8 drams) of bile gently injected under the loose skin in front of the chest.

As the needle of the syringe is withdrawn, the skin should be pinched between the finger and thumb at the point of insertion, to prevent any of the bile coming out again and to close the wound. The part should be gently manipulated to insure distribution of the bile in the subcutaneous tissue.

*Particulars of Experiments.*

I.

August 23.—Four bulls received an injection of

10 cubic centimetres of bile into the dewlap. They had not had rinderpest.

August 25.—All eating and looking well. Swelling commencing at the seat of inoculation.

August 26.—All well. All four had a fairly hard swelling, the size of a man's fist, at the seat of inoculation.

August 28.—All well. Swelling decreasing.

August 30.—All well. Hardly any swelling at all.

September 4.—The ten days in which protection is said to be given having elapsed, the four bulls were tied in the infected sheds along with animals suffering from rinderpest, in order to see if they contracted the disease.

September 10.—The four bulls having been exposed to infection for a week were washed with a disinfectant solution and sent back to work the following Monday, 12th. None of them were ill in the slightest degree.

II.

August 28.—Two bulls died, and on post-mortem examination I found the bile good in one case and unfit for use in the other. In the former the bull had suffered badly and died after three days. I inoculated six healthy bulls and a calf.

August 30.—All eating and looking well. A large swelling at the seat of inoculation, the size of a football.

September 6.—All well. The swelling at the chest has been gradually decreasing for some days. All the six were sent back to work again.

October 6.—After a month none have been ill in any way. None of them had sores or abscess at the chest, or suffered in the slightest degree from the inoculation.

Experiments will be continued when the opportunity arises. The method is very simple and quite harmless, if properly carried out.

G. W. STURGESS,

Government Veterinary Surgeon

SOIL MOISTURE.

(Concluded.)

Evaporation, both from the leaves and from the surface of the ground is, under normal conditions, continually going on, as we have just seen, to an enormous extent.

It is at its greatest when the air is dry, the thermometer high, and the wind strong. These are, of course, the conditions that prevail during the greater part of a dry spell; and the evil effects of a drought are due, not only to the actual want of rain, but also to the prevalence of conditions which help to diminish the store of water already in the soil. It is true that we cannot regulate the temperature nor control the wind, but something could be done in the way of cooling and moistening the air and breaking its force by the judicious planting of trees, or the less ruthless destruction of the existing timber.

A belt of trees, even at some distance from the wheat-paddock, exerts quite an appreciable influence upon the crop.

With regard to the surface evaporation, the conditions are somewhat more under control. The same external conditions influence the evaporation from the surface of the soil as from the crop; that is, other things being equal, the loss by evaporation

is greatest during hot, dry, windy days, but in this instance we have an ally in the retentive power for moisture of the soil itself, and there are several ways of checking undue evaporation from the surface.

The minimum of surface evaporation will be found in a well-drained soil, fairly rich in humus, cultivated to the depth of about 6 or 7 inches, and with a light surface mulch about one to two inches deep. This mulch may be obtained in practice by lightly hoeing or harrowing the surface at intervals. The benefit of hoeing in conserving moisture is due to the fact that in its natural condition a soil in good tilth resembles a sponge, the water from below finding its way upwards along the minute channels formed between the particles of soil and evaporating when it reaches the surface. The action of hoeing is to disturb this state of things, and to break up these channels for a time at least, and so to prevent too rapid evaporation until the water has found new channels.

In a true mulch, such as litter, or straw, or leaves, &c., this capillary action is maintained throughout the soil, up to the surface of the soil proper and the further upward movement is checked by the mulch.

In hoeing or harrowing, the surface of the soil itself is converted, temporarily, into a mulch, and the effect is the same. Such a layer of 1 to 2 inches of lightly harrowed surface-soil has all the advantages of a mulch of straw or leaves and none of the disadvantages. This surface mulch of loose soil must be maintained during the growth of the crop by repeated harrowing, the object being to keep a layer of loose soil on the surface and not allowing it to compact.

In order to be able to hoe, the seed must be drilled in rows, a practice which has not yet received the attention it deserves in this Colony.

Humus, or decaying organic matter, as well as being of distinct value as a fertiliser is of still greater value in modifying the texture of the soil. The importance of humus has already been dealt with at greater length in the *Farmers' and Fruitgrowers' Guide*, we are only concerned in this place with its relation to moisture. Probably a description of the following experiment, the details of which were carried out by Mr. Barker in the Departmental laboratory, will best serve to show the extent to which the presence of humus affects the water-holding power of the soil.

The experiment had for its object to ascertain whether or not the capacity for water of a soil and its retentive power for water were diminished when the humus was destroyed.

The experiment was made on a soil containing 18 per cent humus. A portion was taken, and ignited at as low a temperature as possible, until the organic matter was entirely burnt off. It was then allowed to remain exposed to the air for about a week before being weighed, in order that it might be, as far as possible, under exactly the same conditions as to moisture as the original soil. Equal weights were then taken of the ignited and unignited soils, and placed in large funnels, the weights of which were known. The soils were then drenched with the same quantity of water, in the manner in which the capacity for water is usually taken. As soon as the water had ceased

to drip, the funnels and contents were weighed. The result showed that the ignited soil had taken up 54.75 per cent of its weight in water, the unignited soil having in the same time and under the same conditions, absorbed 57 per cent of its weight in water.

To check these results, the volume of water was measured which had drained out of the soils, and from this volume the amount was calculated which had been retained by the soils.

It was found that 27 per cent of the water had been retained by the unignited soil, whereas 29 per cent had been retained by the soil containing humus. This shows that in the case of the particular soil chosen, its capacity for absorbing water is lower when the organic matter is destroyed than when the latter is present.

In order to test the relative power of these two soils for retaining water, the weighings were continued at daily intervals for a few days, with the following results:—

The percentages of water retained by the soils at the different times of weighing are shown below. The figures in brackets show the loss of water since the previous weighing:—

	Soil previously ignited.	Unignited soil.
Saturated	... 54.7	57.0
After 1 day	... 51.4 (3.3)	54.4 (2.6)
" 2 "	... 45.3 (6.1)	48.4 (6.0)
" 3 "	... 40.0 (5.3)	43.6 (4.8)
" 4 "	... 34.9 (5.1)	39.0 (4.6)
" 6 "	... 26.5 (8.4) (2 days)	30.8 (8.2) (2 days)
" 7 "	... 21.7 (4.8)	27.0 (3.8)
" 8 "	... 17.4 (4.3)	23.9 (3.1)
" 9 "	... 13.7 (3.7)	21.1 (2.3)
" 10 "	... 10.9 (2.8)	19.4 (1.7)

In the above case, although the original soil was not exceptionally rich in humus, and possessed only an average capacity for water, yet it was sufficient to show distinctly that this capacity for water was initially higher in the soil containing humus than when the organic matter had been removed, and also that the unignited soil parted with its moisture far less rapidly, retaining at the end of ten days nearly twice as much moisture as did the ignited soil.

The presence of humus in the soil is thus of special importance in reference to the problem we are discussing, namely, the best way to retain moisture in the soil. Other things being equal, the soil, which is rich (within limits) in humus, will be better able to withstand the effects of a dry spell than the one in which this substance is lacking.

For the most part this ingredient is deficient in our soils, more particularly in those that have been under cultivation for any length of time.

The best method of applying humus is undoubtedly by green manuring. What is the best crop for the purpose I am not prepared to say. The crop usually recommended is cow-pea, and it undoubtedly fulfils all the requirements of a green manure, but it is quite possible that experiment will indicate one more suitable to our conditions.

Green manuring is of benefit to the soil in other ways, particularly in promoting bacterial activity and increasing the production of nitrates.

But of even greater importance in preventing surface evaporation and in increasing the area from which the plant can draw its moisture are the mechanical operations of subsoiling and cultivating.

In all cases where the subsoil plough has been used, the benefits to the crop in the increased power of resisting drought have been striking. Subsoiling enables the roots to penetrate more deeply into the soil in search of moisture, and increases the area from which the plant can draw its water. In soils that are not cultivated, or only cultivated to the depth of a few inches, there is frequently a hard compact stratum within a short distance of the surface (often formed by the plough itself), which resists the downward growth of the roots, the plant depending entirely for its moisture on the shallow upper layer of surface soil. By subsoiling, by green manuring, and more particularly by maintaining a surface mulch of loose soil during the period of the active growth of the crop, we shall be able to make the most of the water already present in the soil, and of all that falls in rain.

In addition we have the power of choosing such crops or such varieties as are found to be most drought-resistant. Speaking particularly of wheat, there are one or two varieties that have shown themselves to be less affected by the last two or three dry seasons than any others. These varieties are, unfortunately, not so desirable in other respects, and the problem is still to be solved.

The whole question that I have opened up is one that can only be satisfactorily settled by careful experimenting. I have endeavoured to place the more striking features of the position before us, and to show that the problem of successfully resisting a drought is not so impossible of solution as one may imagine, and that if systematic and intelligent inquiry is directed to the matter there is every reason to hope that in a few years' time we shall not be so entirely at the mercy of droughty seasons as we now are.

## IDENTIFICATION OF CATTLE.

### TELLING THE AGE BY THE TEETH.

It has been stated that no accurate opinion of the age of a calf can be formed until it is six months old; at that time the fourth molars (the back teeth which are used for grinding) are well developed. Between six and twelve months there are no important dental changes; the incisor (front or cutting teeth) become worn, and more space is left between them, but it is not possible to assert from the state of the incisor teeth whether an animal is under or over the age of one year. At one year a bullock has eight incisors, and shortly afterwards the fifth molar appears. At the age of twenty or twenty-one months the two central incisors become loose, and their successors, the first two broad teeth, may begin to show themselves.

At one year and seven months, in very forward animals, the first pair of permanent or broad incisors are cut, but they are never level with the other incisors before one year and ten months, and their perfect development is indicative of the age of two years, at which time the sixth and last

permanent molars are in position, and any error of opinion as to age, which might arise from the permanent (or early) cutting of the central permanent incisors, may be corrected by reference to the state of the molars. When the animal is a month or two over two years, the first and second (counting from the front) permanent molars take the places of the permanent teeth. From two years and three months or two years and six months, the second pair of broad, front, or incisor teeth, the middle permanent incisors, occupy the place of the corresponding temporary teeth in all cultivated breeds. Instances of late dentition present themselves from time to time, in which the middle permanent incisors are not cut till the animal is approaching three years old. There is consequently a possible variation of six months in the time of the appearance of these teeth. It must be understood, in reference to the appearance of the second pair of broad teeth, that an expert, looking at a mouth which has four permanent incisors, will conclude that the animal is two years and a-half old; but if he is required to certify that the age is under or above that period, he must proceed to inspect the molar teeth, and take into account the animal's pedigree, its sex, and its general condition of development. If the animal in question is a bull, and has been forced to early maturity, it may be expected that the second pair of permanent incisors will be cut at two years and four months; and if either of the anterior (foremost) temporary molars remain in their places, the conclusion that the animal is under two years and a-half will be strengthened. Shortly after the first and second molars are cut, the third makes its appearance; occasionally it appears before the others, and the animal at the age of three years will have three anterior molars nearly level with the other teeth, but showing no signs of wear. The eruption of the third pair of permanent incisors may occur at any time between two years and six months and three years of age.

The anterior molars, however, afford more reliable evidence of the age between two and a-half and three years old than is furnished by the incisors. At three years of age the average condition of the teeth in cultivated breeds is—the fourth pair, or the corner permanent incisors, are well up, but they vary considerably. In well-bred cattle they take the place of the temporary teeth soon after the completion of the third year. In well-bred bulls they are often present at two years and ten months, while in some instances they are not cut till the animal is three years and nine months. Very little reliance indeed can be placed on the corner incisors, and the examiner is compelled to refer to the molar teeth to correct his opinion. With the exception of the corner permanent incisors, the fourth pair of broad teeth, the permanent dentition of the ox is completed, and after this period the changes in the form of the teeth from effects of attrition will assist the examiner in forming an opinion of the age.—*Farmer and Stockbreeder.*

#### TELEGONY OR ATAVISM,

(Concluded.)

Of course, as has been already stated, it was the curious markings on the hybrids that first led Professor Ewart to take up reversion. The first

hybrid obtained was the colt Romulus, out of the Rum pony mare Mulatto, 12'3. He bore stripes, it is true, but they did not correspond with the markings on the sire, being much more numerous, and those on the face had a different arch. This opened up the question as to what animal he most closely resembled in his markings, and it was found to be the Somaliland zebra, the reputed common ancestor of the horse, which was another triumph for reversion. But now we must turn to the subject of telegony pure and simple, and when we do so we find that Professor Cossar Ewart carried out his experiments on a large scale. All the mares which bred to the zebra were maidens, except in the case of a dark-brown Shetland mare which in 1896 had a foal to a Shetland stallion. The first hybrid, as already stated, was the colt Romulus, which is now three years old and 12 hands high. He had spots instead of stripes on one part of his body, which clearly taught that the stripes had been derived by the union of spots. In 1897 Mulatto, the dam of Romulus, had a grey colt foal to a grey Arab stallion, which at birth had a great many subtle marks which might have been attributed to a zebraic "infection of the germ." This foal died, and an inspection of the skin showed that what were considered stripes were in reality dispositions of the hair, which gave an impression at a distance of being dark-coloured stripes. If anything had happened, the mare had bred back to her own ancestors. There was some doubt of her having been affected by the zebra. Mulatto had no foal this year. A chestnut pony mare had twins this year to the zebra. One died, but the other is in many ways more a horse than a zebra. A skewbald pony mare, white and brown, had a hybrid which was fairly well marked. She had a second foal to a bay Shetland pony, and this foal in its colouring is almost exactly the same as the dam. There was no indication of infection; it seemed to be a case of prepotency. Another Shetland dark-brown pony mare had a hybrid foal in 1897, and this year she had a foal to a Welsh pony stallion. This foal was exactly like the dam. She was the exception in not being a maiden mare, so that there were thus the two kinds of mares—one which had borne a foal before being put to the zebra, and others which had not done so. Biddie an Irish mare, which had a hybrid foal in 1897, had this year a foal to the Thoroughbred stallion Tupgill. This foal is also like the dam. A small Clydesdale mare had a foal to Matopo in 1897, and by him she had a second one this year. The second one was much liker the sire than the first, but the most interesting thing was that over the hind quarters there was the striping of the zebra, and over that the striping of the horse. This is the first time that the two kinds of stripes had been seen on a hybrid. The one striping was seen to be like those of Mulatto's second foal, and they were the stripes of the horse and not of the zebra. Having got the hybrids, it was not known but that they might be able to resist the attacks of the tse-tse fly which does so much damage to stock in Africa. With the object of finding this out, Professor Ewart secured from Cambridge a rat which had been inoculated with the germ which had been taken over from Africa in relays of animals, and was being kept alive at Cambridge in rats. Three hybrids and a horse were inoculated on

14th July last. There are two kinds of poison the one very virulent and the other not so. From the effects on the animals it appeared that they had been inoculated with the virulent poison. The horse lived for a week, and then dropped down dead, just as if poisoned with strychnine. Two of the hybrids lived nine weeks and one eleven weeks, but one of them died from peritonitis. It was a moot question whether the zebra himself would not have succumbed if he had been inoculated with it. Summing up the results of the experiments, it may be said that telegony has received its death-blow, and the authoritative words of Professor Cossar Ewart will be writed with interest, as an outsider can only skim lightly over the surface of a subject which he has so fully studied in all its bearings.

---

#### GENERAL ITEM.

---

The January number of the *Queensland Agricultural Journal* refers to the Kekum tree of Ceylon (*Aleurites triloba*) as being probably the best known our North Queensland nuts. It is described as growing to 70 feet or more with a diameter sometimes of 3 feet. The wood is said to be soft but saw-millers often use it for cutting into boards for fruit boxes, notwithstanding that is rather heavy when sawn. It dries in a short time and makes up into excellent fruit boxes, having the great advantage of not splitting when nails are driven in near the ends. It is considered, however, a pity to sacrifice so valuable a tree for fruit cases, and the suggestion thrown out that the nuts should be collected for the sake of its valuable oil:

---

The average yield of milk from a good Jersey cow, fed on artificial food, and milked twice a day is about 450 gallons a year. Some cows give as much as 700 gallons a year.

---

As the mango season has now commenced, many will be at a loss what to do with the superabundance of fruit, which, of late, has been difficult of sale, and in many cases not worth the expense of gathering, packing, freight, &c. It is not generally known that the mango contains a quantity of starch which is scarcely distinguishable from arrowroot. When used in the same manner and boiled with water, the jelly is very similar to that of the latter. Mr. Watts, a chemist in Jamaica, reported lately on a sample of mango starch submitted to him by the Jamaica Agricultural Society, and he pronounced it almost pure starch of fairly good colour, though capable of being washed to a whiter condition. As an article of diet or of commerce, it will compare very favourably with Arrowroot; this being so, he expresses some doubt whether it can be produced at a price sufficiently low to compare with arrowroot, of which the ordinary brands are selling in

the wholesale markets at prices ranging from 2d. to 4d. per lb. We think the matter worth a trial at all events.

---

An American orchardist recommends the following method of causing old trees to bear like young ones. He digs up around the tree without injuring the roots, and lays bare all the thick roots. These are split with an iron wedge three or four feet from the trunk, and a stone put in the cleft to keep it open. Fill in with good surface soil. New white feeling roots will grow from the clefts, and the tree will take on a new vigour.

---

Mr. Benson, the Queensland Government Fruit Expert, says, referring to the above practice:—This is a crude method of producing new root growth, which will probably do much more harm to the tree than good, as it is bound to produce more or less decay or gumming, and it encourages the attacks of root-boring insects of all kinds. A judicious root-pruning followed by a severe top pruning and good manuring is the best way of renovating old trees, as this course will give the tree new bearing wood and new roots. Thus it will be seen that he practically condemns the process as injurious instead of beneficial, and we should recommend owners of old trees to try Mr. Benson's plan before possibly running what might become valuable trees if properly treated.

---

The *Farm and Home* quotes an eminent Analyst as follows, with reference to "Artificial Eggs":—Much has been written of the arts of adulteration, says an eminent analyst; but there is very little general knowledge of the extent to which foods are built up chemically, and successfully palmed off on customers as natural products. It will be a shock to many to learn that millions of eggs which have been bought and eaten as products of the hen have no connection with that useful fowl. There are factories on the Continent of Europe where these "oviform frauds" are produced at the rate of many thousands a day, as simply and yet as mysteriously as so many sausages. The yolk is first quickly fashioned by machinery from a mixture of maize, starch, and one or two other ingredients, coloured with ochre. The yellow sphere is then placed in another "box of mystery," when the white part of the egg is added. The resultant ball is frozen and moulded into the requisite oval shape—again by machinery. It is then immersed in a third vat, which contains plaster of paris, and emerges with a shell which quickly assumes all the hardness and appearance of a genuine egg-shell. The process of thawing quickly reduces the contents of the shell to the consistency of a new-laid egg, and the artificial result is ready for the breakfast table or any of the uses to which eggs are put. These "eggs" can be profitably manufactured to sell at prices ranging from 4c. to 12c. (2d. to 6d.) a dozen, and are retailed at prices which yield anything up to 100 per cent profit.

## “PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

(Third Series.)

### JOHN STEPHENS:

CINNAMON, COCONUT, COFFEE AND TEA PLANTER.

HE subject of our biographical notice and portrait in this month's *Tropical Agriculturist* (to be ready in a few days) is the well-known "Patriarch of Dolosbage" where he has resided on his own property for a long series of years. A more venerable or more esteemed pioneer planter there does not exist in or out of Ceylon, at this moment. We have known Mr. John Stephens for a great many years and have always esteemed him as a most careful and upright man of business and a truly industrious planter. Long may he continue to flourish in retirement, enjoying his well-earned *otium cum dignitate*.

Mr. Stephens was born in England on the 26th August 1816; so that he has now attained the truly patriarchal age of well-nigh 83 years; but, it may be said, in the language of Scripture, that "his eye is not dim nor his natural force abated." Mr. Stephens was in his 25th year when he was first engaged in England to proceed to Ceylon in the service of Messrs. Ackland, Boyd & Co., the largest Colombo firm in cinnamon, coffee, &c.,

during the "thirties" and "forties." Mr. Stephens voyaged to Ceylon in the well-known clipper sailing vessel "Symmetry," Capt. Abel Mackwood, brother of the founders of the firm of Messrs. Mackwood & Co. (Caps. Wm. and Francis Mackwood, well-known and esteemed in the Ceylon trade in the early days.) The arrival in Colombo took place on 26th July 1841, so that our friend, if he survives till that date in 1899, will have rounded off no fewer than 58 years' residence in the island. There were four other young men as passengers for Ceylon in the "Symmetry," namely, Messrs. Preston, Hicks (a Surveyor) and W. H. Walters. The first two joined the majority long ago; but Mr. Walters lived to be himself an esteemed patriarch among proprietary Ceylon planters, and regularly once a year were greetings exchanged between Hewaheta (Gonavy) and Dolosbage (The Diggings) as the two fellow-voyagers by the "Symmetry" advanced towards old age. Mr. Walters was, however, the first to go, his death occurring about two years ago. Mr. Stephens' first appointment was to the still well-known cinnamon plantation of Goluapokuna, Kadirana, in the Negombo district. He was at the time almost the only white man—or

certainly planter—in the district. Mr. Stephens learned how to deal with cinnamon and to manage his Sinhalese labourers from a Mudaliyar who could talk a little English. The young and active Englishman, however, soon mastered “the situation”; and in the course of the next two or three years he had several additional plantations placed in his charge with a corresponding increase of salary. In this way Mr. Stephens began to save money—there was not much temptation or opportunity to spend in those early days—and to make judicious investments of the same; so that he soon became recognised as a planter with some capital. In 1849, Mr. Stephens married a daughter of Mr. Rudd, senior, who with his sons, had rapidly developed several coffee estates during the “forties” and built up a prosperous firm in Colombo. Mrs. Stephens still survives in wonderfully good health and the “golden wedding” celebration of her husband and herself is due this year. Their family of six sons and two daughters all survive, most of the sons being well-known Ceylon planters; while the daughters both married to local planters, Mr. H. F. Dunbar (lately deceased) and Mr. Charles Laing of Dolosbage.

But Mr. Stephens was not the first of his family to visit Ceylon: he had a brother who came out in 1839, and who engaged in coffee planting in the Central Province, and was well-known to all by the sobriquet of “Stumps.” Mr. John Stephens frequently visited “Stumps”, and after a time determined to invest in coffee land. In 1854, Mr. John Stephens made his first investment in Crown land, situated five miles from Gampola, and began to open coffee, putting a Superintendent in charge. In that year his brother “Stumps” died. Another brother was Thomas who came out after John, but died whilst on his way to England. To the purchase of Cooroondoo-watta, Mr. John Stephens soon added that of two other blocks of land, which he formed into three coffee plantations, namely, Cooroondoo-watta, Diggings and Somerset. In 1853, Mr. Stephens finally left the Negombo district and took up his residence on his Dolosbage properties and there, with the exception of certain visits home, he has remained ever since. Coffee proved very remunerative in the latter half of the “fifties” and in 1859 Mr. Stephens left with his young family for England; but he himself returned after

eight months' absence. His next trip home was in 1863, when he had a spell of well-earned rest for three years, returning in January 1833, but only to inspect his estates. He left again in March of that year; but returned in 1838 to settle down once more and for 31 years now he has not left the Colony.

Handsome offers for the purchase of his estates were made to Mr. Stephens in the “seventies,” when, although the coffee-leaf fungus prevailed, no one believed it was other than temporary and coffee “boomed.” Among others, Mr. H. S. Saunders and the late Mr. St. George Carey tried to tempt Mr. Stephens to sell; but he declined—unfortunately for himself, perhaps. Instead, Mr. Stephens passed right through the coffee crisis when, although he cultivated well and managed highly, no remunerative return could be got from coffee fields. Mr. Stephens had been noted from the beginning as a liberal cultivator, his stock of cattle being one of the largest maintained in Ceylon by any one individual estate proprietor. So that it could not be said in his case that he took all out of the soil and put nothing back, or that the leaf fungus disease came through impoverished bushes. Still Mr. Stephens found himself in the early “eighties” with clean title-deeds for his properties; but with almost no value attaching to them—and indeed, the Banks could not be got to advance even a temporary loan, so low had the credit of “coffee” and “cinchona” fallen. We well recall a visit paid to the *Observer* Office in which this experience was related. Tea had, however, begun to come to the front in Yakdessa and Dolosbage and in 1834, Mr. Stephens leased 200 acres of one of his properties to three practical men, Messrs. Jas. Allan, J. Aymer and the late Geo. Kyd, who at once planted tea and benefited by the new product. This lease falls in with the end of the present year. In addition Mr. Stephens planted up 200 acres with tea on his own account; so that he will very soon have 400 acres of fine tea, for his very competent Manager (his son Mr. Arthur J. Stephens) to deal with. We ought to have mentioned that some years back Mr. Stephens sold his Somerset property to Mr. W. J. Robson who has developed it into a fine tea plantation now known as Evalgolla.

Mr. John Stephens has thus had during his island career, experience of four staple pro-

ducts of the island in cinnamon, coconuts, coffee and tea, not to mention cinchona, and probably a little of cacao and rubber. During his long tropical residence, Mr. Stephens has enjoyed splendid health, never having been once seriously ill during his 58 years of connection with Ceylon—a fact which he attributes to his temperate habits, love of steady work, and regular hours, always making it a strict rule to have his meals at fixed times, no matter how pressing his occupation with cinnamon or coffee in crop time. Even now, in his 83rd year, our patriarchal friend takes his walks regularly when the weather is fine; and he still reads and writes without the use of glasses; while “R.H.F.,” during his Dolosbage visit, found the patriarch could still play a capital game of chess. Mr. Stephens’ only complaint, so far, is that he cannot hear so well as formerly. What a magnificent advertisement have we in our Dolosbage patriarch for the climate of Ceylon, to send round to Life Insurance Offices! Long may our worthy old friend (and his partner) continue to adorn the long-established Dolosbage home, and to show planters of the present generation how they should live and work in order to earn the privilege of a good and healthy old age. Our hope is that in Mr. Stephens, we or a successor may yet hail the first CENTENARIAN AMONG THE PLANTING PIONEERS OF THIS CROWN COLONY OF CEYLON. So mote it be!

### THE “LANTANA BUG.”

(*Orthezia insignis*, Douglas.)

CIRCULAR FROM ROYAL BOTANIC GARDENS  
CEYLON: JANUARY 1899.

#### HISTORY OF THE PEST IN CEYLON.

It is now more than five years since this insect was first noticed in Ceylon. In January, 1793 specimens were received from the late Dr. Trimen, then Director of the Royal Botanic Gardens, Peradeniya. Dr. Trimen, in forwarding the insects, wrote:—“We are afflicted by an abominable pest now in the gardens, which I do not recollect to have seen before. It bids fair to be the worst thing of the sort I have had here, and attacks especially *Acanthaceae*, which includes our showiest shrubs. I never saw any pest here that increased so rapidly; the garden is quite disfigured by it.” In the following April Dr. Trimen wrote that after cutting down and burning all the affected bushes they had seen nothing of the pest for some time; but that, at the time of writing, it had re-appeared and was rapidly increasing. The next report from the Gardens was not until September, 1891, when the pest was said to be very bad and covering everything. About the same time a very large brood of the male insects suddenly appeared in the Gardens; and in this same year it was observed that the pest had extended its range outside the Gardens and had established itself firmly upon *Lantana* in the neighbourhood.

Thinking that the time had now come to warn the planting community of the danger, an illus-

trated article on the insect was published in the “Tropical Agriculturist” for January, 1895.

Though the pest has been steadily increasing in strength and extending its range, it does not appear to have attracted any general attention or created any alarm until early in the present year, by which time it had spread within a radius of about 20 miles around Kandy. The question then arose as to whether the insect would attack any of our cultivated products. It has since been observed, in one or two localities, upon tea plants growing in the immediate neighbourhood of infested *Lantana* bushes.

#### PRESENT RANGE OF THE PEST IN CEYLON.

Though at first confined to the Kandy District, the pest has now spread to other parts. To the north-east it has been recorded from Rangalla. It extends southwards throughout the Gampola and Nawalapitiya districts. An outbreak has been observed in Pandalu-oya. The Director of the Botanic Gardens reports the occurrence of the insect on the Badulla side of the country. No doubt if careful observations were made all over the Island, the pest would be found to have a still, wider range.

#### DISTRIBUTION IN OTHER COUNTRIES.

The original home of *Orthezia insignis* is still rather doubtful. It has been reported from various countries. The insect was first described from specimens collected in the plant houses at the Royal Botanical Gardens, Kew, where it found a congenial home. It must have been received there from some other country. Dr. Morris, late Assistant Director of the Gardens, considered that they owed its introduction to British Guiana. It occurs in the West Indies (Trinidad, Jamaica, and Antigua being specially mentioned) and in various districts of Mexico. In South America it has been recorded from British Guiana. In the United States it has become a common greenhouse pest. Quite recently Mr. C. P. Lounsbury has drawn attention to its appearance in South Africa (Cape Town, Natal, Port Elizabeth, and East London are mentioned as localities), where it is a troublesome pest both in greenhouses and gardens. It is said to have been known in Natal for the last five years; and specimens—supposed to date back ten years—exist in the South African Museum, labelled “Durban, Natal.”

#### DESCRIPTION OF THE PEST.

As with most scale-insect pests, the resulting injury is more conspicuous than in the insect itself. In the present instance, though most travellers on our railway have observed the unhealthy appearance of the *Lantana* on the side of the track,—with its leaves blackened by the sooty fungus that accompanies the pest,—very few of them have any idea of the actual form and appearance of the bug that is responsible for this effect. A closer examination of the diseased hedges would show that all the younger shoots and branches are thickly covered with what they would probably describe as a “mealy bug.” This species, however, differs from the ordinary “mealy bug,” in the firm—almost shelly—nature of the waxy appendages, and in the fact that a large part of the back of the insect is exposed.

It will be as well to describe first the adult female, as this is the most conspicuous stage and the one in which the *Orthezia* may be most easily recognized. The insect itself is of a dull olive-green or olive-brown colour, with a fringe of short stout opaque-white waxy processes, and a double row of similar projections down the middle of the back. But the most striking feature is the long white cylindrical appendage springing from the extremity of the body. This the ovisac, and contains the numerous eggs. When fully developed this ovisac is four times as long as the body of the insect. It tapers very slightly, is fluted above and smooth below, and has an upward curve to the extremity, where there is an opening for the exit of the young larva. The legs and antennae of the insect are well developed and project beyond the margins of the body. The mouth parts consist of a conical tubercle springing from

between the bases of the first pair of legs, and from its extremity the long hair-like sucking tube can be extended into the tissues of the plant. The length of the insect and ovisac together is very little short of a quarter of an inch.

The half-grown female is in all respects similar in external appearance to the adult insect, except for the absence of the ovisac. It is therefore a much less conspicuous insect, and measures only about one twenty-fourth part of an inch in diameter.

The young larva again does not differ very much from the half-grown insect, except in point of size. It is however of a paler colour, and the marginal fringe is only very slightly developed.

The eggs, which are carried within the ovisac packed in a cottony material, are at first almost white. They soon deepen to yellow, then orange, and just before the emergence of the larva, become of a greenish tint.

The male insect, after the first moult, is readily distinguishable from the other sex. It becomes more elongate and, instead of secreting compact waxy processes, envelops itself in a loose woolly secretion. Rudimentary wings begin to appear towards the end of this stage. The pupal (or nymphal) stage is only distinguished by the presence of rather longer wing pads, and in the greater length of the antennæ, which are then folded back along the sides of the body, extending nearly to its extremity. The pupa has long, well-developed legs which it can use when disturbed, though it usually remains quiescent beneath its woolly covering.

The adult male is a very graceful little insect, of a totally different appearance to the female. It is of a slatey grey colour, with very long slender antennæ, a single pair of grayish wings, and a tuft of long white silky filaments at the end of the body. The eyes are black and divided into numerous facets. It has no mouth, and consequently takes no food in this stage, having laid in a sufficient store during the larval period.

#### LIFE HISTORY AND HABITS.

There appears to be a constant succession of broods. I have examined infected plants at all times of the year, and have always found the insects in all stages, from the newly hatched larva to the adult female. I have kept individual females under observation. After the first commencement of the formation of the ovisac a period of three weeks elapses before the emergence of the first larva, after which the young insects hatch out at the rate of about five a day for a period of six weeks or more; by which time the parent is exhausted and dies, and the earliest hatched larvæ are mature and commence ovipositing on their own account. The length of life of a single insect is therefore about fifteen weeks; but as it commences to produce larvæ at the ninth week, there may be five generations in the course of the year.

This fecundity is more or less independent of the attentions of the male insects, which appear only at irregular intervals. It is doubtful whether a generation of males is produced even once a year. It is remarkable that the true male of *Orthesia insignis* has been recorded only from Ceylon. Supposed males have been described and figured both in England and America; but in both these cases the male of a totally different insect has been erroneously associated with this female. Since the appearance of the pest in Ceylon two male broods only have come under my personal observation—in July, 1894, and May, 1898. On both these occasions the male insects occurred in enormous numbers, hovering in the air like gnats, the silky tufts on their tails glistening in the sunlight. In May of the present year (1899) myriads of these little flies might be seen floating in the air in certain parts of "Lady Horton's Walk" and other roads about Kandy.

It is the female that is responsible for the chief damage, as she continues to pump up sap from the plant during the whole period of her existence. Unlike most scale-bugs, the *Orthesia* is quite an

active insect and able to change its position at will. It prefers the young shoots to the older stems, and moves upward with the growth of the plant.

#### FOOD PLANTS.

Although the *Orthesia* is popularly known in Ceylon as "the Lantana Bug," this is by no means the only plant which it affects. It is more particularly a garden pest, and it was upon the ornamental shrubs and plants in the Peradeniya Gardens that it first attracted attention. Its adoption of the Lantana plant is quite an acquired habit.

It was early noticed that *Orthesia* had a special taste for certain natural orders of plants, *Acanthaceæ*, *Rubiaceæ*, and *Verbenaceæ* being particularly appreciated by the insect. Since its residence with us it has very largely increased its list of food plants. It would be difficult to give a full catalogue, but the following plants have been noted:—

*Acanthaceæ*:—*Crossandra*, *Justicia*, *Thubergia*, *Menya*, *Strobilanthes*.

*Rubiaceæ*:—*Cinchona*, "Coffee" (Arabian and Liberial), *Gardenia*, *Hamelia*, *Ixora*, and many common weeds.

*Verbenaceæ*:—*Verbena citriodora* ("Scented Verbena"), *Lantana*, *Stachytarpheta*, *Duranta*.

*Compositæ*:—*Tithonia* ("Wild Sunflower"), *Chrysanthemum*, *Achillea*, *Vernonia*, *Ageratum* ("Goat-weed"), and many common weeds.

*Solanaceæ*:—*Habrothamnus*, *Capsicum*, "Tomato."

*Labiata*:—*Coleus*, *Salvia*.

*Rutaceæ*:—"Orange" and various kinds of Citrus.

*Leguminosæ*:—*Clitoria*.

*Caprifoliaceæ*:—*Lonicera* ("Honeysuckle").

*Bignoniaceæ*:—*Tecoma*.

*Rosaceæ*:—"Strawberry."

*Amaranthaceæ*:—*Iresine*.

*Terstroniaceæ*:—"Tea."

*Convolvulaceæ*:—*Ipomea*.

*Lythraceæ*:—*Cuphea*.

The above names are chiefly those of ornamental shrubs, garden plants, and common weeds. We have, so far, no very serious reports of injury to any of our more important economic plants. It will be noticed that both the tea and the coffee plant figure on the list. Of the latter I have seen abandoned plants in waste land thickly colonized by the bug. Superintendents of coffee estates should be on their guard against the introduction of this pest.

The Tea plant fortunately does not appear to be a favourite food of the *Orthesia*, though, failing more favoured plants, it can subsist and breed on our staple product, and the subsequent generations might very readily acquire the taste for Ceylon tea. The danger arises from the enormous and rapid reproductive powers of the insect. When it finds a congenial food plant—such as Lantana—it multiplies till every shoot is thickly tenanted, and the later broods are simply crowded off and compelled to seek fresh pastures. The several instances of the establishment of the pest upon tea have manifestly arisen in this manner.

#### REMEDIAL MEASURES.

The *Orthesia* is one of, if not the most resistant of all scale-bugs towards insecticides. It is therefore a useful subject upon which to test various treatments. An insecticide that will kill *Orthesia* can be almost guaranteed against any scale pest. It is remarkable that the half-grown insects will often survive treatment that has successfully destroyed the younger and older individuals.

In the case of isolated trees attacked by this pest, the gas treatment is really the most effective and complete. This consists in covering the tree with a tent or sheet of some closely woven material, beneath which hydrocyanic acid gas is generated. The deadly gas will penetrate to every part of the tree and reach every single insect. I have recently ascertained by experiment that an extra strength of the gas with a shorter exposure (than usually prescribed) is the most certainly fatal to the insects

and the least injurious to the plants. The gas treatment however, though really very simple, requires considerable care in application and is subject to certain dangers. It cannot therefore be recommended for general use without previous demonstration by a trained operator.

Spraying is the next best measure. But however thoroughly this work may be done, a certain proportion of the insects is bound to escape, and the process must be repeated at intervals until the pest has finally disappeared. I have found that mixtures of which soap is the principal component are more efficacious against *Orthezia* than any other form of insecticide. Besides killing the insect, the soapy matter blocks the aperture of the ovisac, and so prevents the emergence of the young larvæ. Kerosine-soap-emulsion is a useful and inexpensive mixture, but requires careful preparation. The formula is:—

Kerosine	...	...	2 gallons
Common Soap	...	...	$\frac{1}{2}$ lb.
Water	...	...	1 gallon

Dissolve the soap in water heated to boiling. Add the kerosine to the hot mixture, and churn till it forms a thick cream on cooling. The churning is the most important part of the process. If this is not done thoroughly, the oil separates out on cooling, and will not then mix with water. A properly compounded emulsion may be subsequently diluted to any extent. The churning may be effected either by stirring vigorously with a bunch of twigs or the liquid may be repeatedly drawn up and expelled through a garden syringe. To test the mixture, put a drop on to a piece of glass. If it adheres without separating into oil globules, the process is complete. For application, dilute with nine or ten times the bulk of water. Kerosine emulsion should not be applied during sunshine, or serious injury to the plants may result.

Strawson's "Red Spider Insecticide" and McDougall's "Insecticide Wash" are very convenient forms of soap mixtures, and are both very effective against *Orthezia* in the proportion of  $1\frac{1}{2}$  lb. of the mixture to 4 gallons of water.

The insects will remain attached to the plant for a long time (sometimes two or three weeks) after they are dead. An examination with a hand lens is necessary to determine whether the application has been successful or not. If the legs remain rigid and do not move when the insect is disturbed, it may be presumed to be dead.

After spraying it will be advisable—where possible—to prune the bush and burn the prunings.

Where the pest has become widely distributed,—as on Lantana in waste land,—any treatment of the above nature will be quite impracticable. In such a case all we can do is to endeavour to keep it in check by periodically cutting back and burning the Lantana and other weeds that lodge the insect. In districts where *Orthezia* is prevalent all boundaries should be kept carefully cleared back. If Lantana is allowed to encroach upon the tea, the latter is bound to become affected sooner or later.

#### NATURAL ENEMIES.

Natural enemies may possibly exist in the native country of *Orthezia insignis*. But, so far, the career of the pest in Ceylon has been unchecked by any such causes. Birds do not feed upon it, and I have not found a single insect parasite—external or internal—preying upon it. I have tried to induce various species of lady-birds to eat this insect, but they have one and all absolutely refused—preferring to die of starvation.

A writer in the "Kew Bulletin" (June-July, 1895) quotes from the "Timehri" (a Demerara Journal) in which Mr. R. Ward gives some account of the habits of the *Orthezia* (in Demerara?). He says: "Although common, it is not nearly so destructive or troublesome as many of its allies. In the young state it is very abundant; after it becomes fully developed it is more easily preyed upon by its natural enemies, which play an im-

portant part in limiting its ravages. In this respect no insects are more assiduous than the grubs of the different species of *Coccinella* (lady-birds), *Syrphus*, the various *Hemeroptide*, of which the different species of *Chrysopa* act a chief part." It would be interesting to know if Mr. Ward is speaking of his personal observation of the natural enemies of the *Orthezia*, or whether he is alluding in general terms to the acknowledged work of such natural enemies.

#### MODE OF DISTRIBUTION.

The young larvæ of all scale-insect are very easily transported from one place to another. They are minute and active, and can exist for several days without food. They may crawl on to the feet of birds, or even on to larger insects that may be resting on the bug-infested plant, and may be conveyed in this manner to a considerable distance before being dislodged. They may be brushed off the plant and carried away on the clothing of passers by.

The rough cumbles used by Tamil coolies are particularly liable to carry the infection. Wandering cattle are also unconscious distributors of the pest. The young insects are so light that they may be transported by wind. The conspicuous way in which the pest is spreading along the sides of the railway track points to the supposition that they are carried along by the draught of passing trains. Running water is another fertile source of distribution. An infested plant growing on the banks of a stream or river is sure to shed some of the insect in the water. Individuals may be floated down for miles before effecting a landing.

The interchange of garden plants is also a great source of danger. It was in this way that the pest obtained a footing in Ceylon.

#### BIBLIOGRAPHY.

## CULTIVATION OF ARECA-NUT IN THE GODAVARI DISTRICT.

[A PAPER READ BEFORE THE AGRICULTURAL STUDENTS ASSOCIATION, MADRAS COLLEGE OF AGRICULTURE, SAIDAPET, BY STUDENT DUVVURI BALAKRISHNA MURTI, OF GODAVARI.]

Gentlemen,—In the whole district of Godavari areca-nut plantation are met with only in one taluq, which forms the delta of the Godavari, namely the Amalapur taluq. A part of this taluq, known as Kona Scema, is exclusively devoted to plantations of various kinds. It is on this account many Europeans call this part, "The Garden of Lombardy." Only a limited portion of this Seema is under areca-nut, and the rest is under coconut, plantations, etc. The total area under areca-nut alone does not exceed six thousand acres. All these plantations are situated around Ambajipeta within a radius of 12 miles. This is the most paying cultivation in the district. A man owing a garden of three acres is considered to be a rich man. Even in settling marriages among Brahmins in Scema, the first question asked by the parents of the bride is whether the bridegrooms' family owns an areca-nut garden.

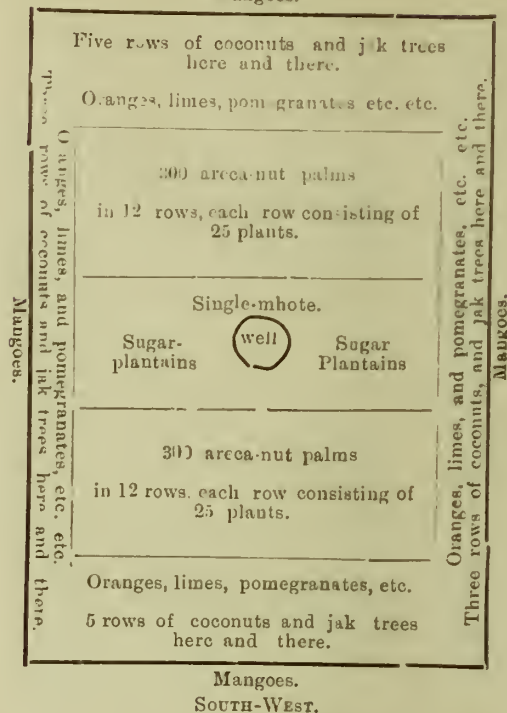

2. The areca-nut palm is a well-known native of tropical climates. There are two varieties of this palm, one producing bigger nuts than the other. It is only the small variety that is found in this taluq, and to it only that the whole of this paper refers. The maximum height of this tree is from fifty to sixty feet. The stem is quite cylindrical and perfectly vertical, having a light greenish white colour. The diameter of a full grown healthy tree is 10 inches at the base, 8 inches in the middle, and 4 inches at the top, and the tree bears about 18 green leaves at the top.

3. The soil best suited to this palm is red loam, rich in organic matter. On this soil the plant is healthy and the yield is heavy. There are also plantations on other soils, as clay loam, sandy loam, and black soils, the last being the most unsuited for the plant. On all soils other than the red loam the yield is comparatively less, and the plant is not so vigorous.

4. *Preparation of Land.*—A plot of land of about three acres is selected. It is generally oblong in shape, facing north-east and south-west. In the middle of these three acres, about one acre is left for the future areca-nut plantation, and the surrounding two acres are placed under coconut. On the exterior border of the coconut plantation a row of good selected mango seedlings is planted on a raised bund, while on the interior border oranges, limes, batters, pomegranate and such like plants are grown. On the north-east and south-west, sides exposed to the monsoonic winds, five rows of coconuts are planted, while three such rows only are planted on each of the other two sides not so exposed. The earth is removed to a depth of 9 inches. The arrangement of these plants is such as to break the force of the wind, the plants in one row alternating with those in the next.

NORTH-EAST.

Mangoes.

The rows of coconut are eight yards from one another, and the plants in the rows are also the same distance apart. At the inter-section of the diagonals between four coconut trees forming a quadrilateral, a jack tree is placed. In addition to these a few grafted mangoes are also found. Thus the coconut plantation all around with all the miscellaneous items forms a protective wall against the strongest monsoonic winds.

Ten or twelve years are allowed to pass before the interior is occupied by areca-nut. During the first eight or ten years pulses, especially gram, are grown in the central part, and in the two years immediately preceding the permanent transplanting of the areca plants, a plantain tope is started for the purpose of affording shelter to the young areca plants during the four years succeeding the permanent transplantation. Sun-hemp is also grown during these years in the interspaces between the plantains, and ploughed in as green Manure. In the centre of the area selected for the plantation there is also a well, generally 12 to 15 feet in diameter, with a water-level from 10 to 12 feet from the surface.

5. *The Raising of Seedlings.*—Under this heading comes the selection of seed nuts. Fruits for seedlings are generally selected from trees over 50 years old, which have ceased to bear well. These trees have generally one or two clusters, each having not more than forty or fifty fruits. These fruits are taken when they are fully ripe and dried for 15 or 20 days in shade when they are ready for sowing. The chief reason for selecting fruits for seedlings from old trees is to ensure timely sprouting and steady growth of the future plant. The scientific explanation for this practice is not known, but it has been decisively proved both by observation and experiment to be a complete success.

As to the raising of seedlings, a plot four feet square is selected on an elevated place under shade, pit thus prepared is filled with sand up to 6 inches; on this the seed-nuts are arranged in rows, the proper time for this operation being November.

And on the top a mixture of finely powdered sand and Godavari silt, in the proportion of two to one, is sprinkled, forming a layer half an inch thick over them. In this plot, four feet square, something like 2,000 seeds are placed. (The cost of 2,000 seeds is at the most Rs. 5.) The bed is watered daily both in the morning and evening, and covered with dried leaves. At the end of a month some seeds begin to germinate, and the sprouting is all over before the expiry of the second month. They are allowed to grow in the bed for four or five months till they attain a height of six to eight inches when they are ready for temporary transplanting.

6. *Temporary Transplanting.*—For this purpose another bed is prepared a month or two prior to the operation, which should be done in June, by thoroughly tilling and heavily manuring. The manure generally applied is a compost of the excrements of sheep and goats. Five or six days before the temporary transplanting, the bed is levelled and pits are dug half-a-yard distant. Each pit is four inches square and six inches deep. Then the seedlings are removed from the nursery and planted in these pits. They are watered well, especially in the first month. The whole bed is shaded by means of a pandal of one yard in height above the ground. The pandal is removed at the expiry of the first summer, when the plants are about half a yard high. Then the bed is well hoed (with hand hoes) and another application of manure is given. In the months of May and June, the bed is watered by lifting water from a well, as in all other months water is available in canals which irrigate the lands by gravitation. Even in these two hottest months a watering once a week will suffice for the plants being very thick and close together, the moisture is retained well throughout the week. Thus proper precautions being taken, the plants will be ready for permanent transplanting at the end of the third and fourth years, by which time the plants leave a stem of nearly one and a-half to two feet.

7. *Permanent Transplanting.*—In the land prepared for permanent transplanting, in the manner described in para. 5, pits are dug nine to ten feet distant. The pits are one foot cube, and are dug in symmetrically parallel rows very close to the plantains already occupying the ground. The plants from the second nursery are then taken, fixed in these pits permanently, and the earth round these plants is well consolidated, and for one week they are watered both in the morning and evening. Generally they are planted in the month of July, so that they may have the advantage of the south west monsoon. If there be no rain they are watered once in two days and the stems are well covered with country date leaves. So far the operation of the first year.

In the succeeding years the operations consist only of ploughing and watering in summer. The covering of the stems is removed in the third year. Practically no manure but green manure is applied. At the end of this year the plantains are all removed excepting those in the central strip marked in the diagram. It is only in the fourth year that the stems are exposed to the sun.

8. *Stages of Growth.*—Four to five years after the permanent transplanting the majority of the plants attain a height of eight or ten feet when they begin to flower. For two or three years after the first flowering a very satisfactory yield cannot be expected. In the majority of cases from the tenth year of permanent transplanting a steady and good yield is given. Thus it takes not less than twelve years from the growing of the seed to get a good yield. Proper care being taken for watering and manuring, the plantation gives a uniform yield for forty years, when the plants are forty to fifty feet high. The maximum life of the palm is said to be 75 years, but I have not been able to see plants over sixty-five years old.

9. *Replanting.*—In the generality of cases, in the fortieth year of the permanent transplanting, another set of areca plants is planted, the new plants being

placed at a distance of a half a yard from the old ones. When this new plantation <sup>is 15 to 20 ft. high</sup> flows the old trees are removed. I have seen a plantation thus renewed for the sixth time.

10. *Manure.*—The practice is invariably to pen sheep and goats in the garden. We have to pay one rupee for every 300 animals folded for one night in the garden. Usually we spend as much as fifty rupees for this item; this is the only manure as far as I know. At a lecture on Agriculture, I learnt that white castor cake might be applied to the areca-nuts, whereupon I tried the cake successively for three years on 20 trees, as my people did not permit me to apply it to the whole garden. The effect of it was that the trees went on growing very luxuriantly, but with no good yield. Even now these are the only trees in my garden which are the tallest and least yielding.

11. *Watering.*—The garden is watered only in the months of May and June by lifting water from a well, but in all other months the anicut water is used, for which an annual tax of ten rupees per acre has to be paid. Those who cannot get anicut water have to irrigate the gardens by lifting water from Sivaratri (March) to Karkatka Sankramanam (July) for about 5 months. In these months they should be watered daily in the morning. In the months of May and June, on such days as are excessively hot, watering twice a day is essential. By one single mhoite, working six hours a day, the whole plantation can be watered.

12. *Miscellaneous Crops.*—A fairly good sum is realised by growing vegetables in the garden. These are generally brinjals, snake gourds, bitter gourds, ribbed gourds, and melons. Once in three years in half of the land under areca-nut, root crops like ginger are put in.

13. *Harvest.*—The harvest season is generally in the months of August, September, and the first half of October. The mode of collecting the mature clusters is very interesting; the clusters of old trees are cut by a man who remains on the stem of a stout tree in the middle, with a long bamboo having an instrument resembling a reaping-hook at the top. In plantations of thirty to forty years old, a boy of fourteen or fifteen goes to the top of a tree, plucks out one or two fruits from a bunch, peels it with his teeth to see if the bunch is ready for being plucked. If it is ready, he removes the bunch and throws it down. (These bunches thus removed are gathered by boys especially employed for the purpose.) Then he bends the tree on which he has climbed and gives it a to-and-fro motion until he gets hold of the next tree, which he first clasps with his hands, and then draws his feet to the same from the other. Thus the tedious business of climbing each and every tree from bottom to top is overcome. The passage from one tree to another in this way is very easy, as the trees bend without difficulty. In this way two boys can go round the whole garden in four hours. After removing the clusters the fruits are separated from the peduncles by beating them against the stem of a tree. The next operation is to remove the outer bark of the fruits. For this purpose there are experts who can do it with the greatest ease. There are certain women who can remove the outer covers of the fruits most skillfully, and can decorticate in one day about sixty Madras measures of fruit, which yield about 25 Madras measures of the decorticated nuts (one Madras measure equals 120 rupees in weight). They are paid at the rate of one pie for every measure of decorticated nuts. These nuts are again cut in the middle into two for which the rate is two annas for every twenty-five measures of the nuts cut. The nuts thus cut are boiled in earthen pots having a capacity of 16 measures with two measures of water and a little chunam (lime) for about two hours over a fire of cowdung cakes. As soon as a red froth appears over the nuts in the pot, it is removed and the nuts are dried in the sun on palmyra mats. But on rainy days they are dried on a raised platform specially constructed with bamboo over a fire pre-

pared out of coconut shells. The manufacture of the nuts is generally done only by merchants, as almost all the owners of the gardens lease out the produce year after year.

14. *Uses.*—The nuts locally produced are not much used in the district, but are exported chiefly to Hyderabad, where they appear to fetch a very high price in the market on account of their greater astringency. The majority of people in the district use less astringent nuts. The uses of the stem of a very old tree are manifold. The stems are used as reapers, cross beams for thatched houses, and in many other ways. The bottom portion of an old stem is used for making instruments for splitting the fibrous covering of coconuts. The expanded portion at the base of the petiole is used for dining plates, cups, fans and for several other purposes, and the leaves are used for brooms.

15. *Diseases.*—This palm is subject to, principally, the attack of white-ants, which eat away the root, and thus cause much damage to the trees. The chief cause of this is the location of a plantation on a sandy soil or sandy loam which is naturally poor. This can be cured by careful watering and manuring.

16. *Yield.*—Under this heading I include the yield of all the different plants in the plantation; as has already been stated, all these plantations are mixed ones. The average yearly yield of the areca-nut alone is about Rs. 250 per acre.

The figures given below refer to my own garden :

RECEIPTS FOR 1898.		Rs.
Areca-nut .. .. .	.. .. .	275
Coconuts, 12,000, at Rs 25 per 1,000 ..	.. .. .	300
Mangoes and jack .. .. .	.. .. .	100
Plantains .. .. .	.. .. .	40
Vegetables .. .. .	.. .. .	25
Limes, oranges, &c. &c. .. .. .	.. .. .	25
Total Rs. ..		765

EXPENDITURE FOR 1898.		Rs.
Cost of feeding one pair of bulls ..	.. .. .	120
Wages for 2 coolies for the whole year at Rs. 30 each ... .. .	.. .. .	60
Manure ... .. .	.. .. .	50
Water cess for 3 acres ... .. .	.. .. .	30
Interest on capital of Rs. 600 for start- } ing the plantation, at 10 per cent }	.. .. .	60
Sundries ... .. .	.. .. .	25
Total Rs. ...		345

Annual net income on three acres, Rs. 420

		Rs.
Average gross receipts for the last eight... years from three acres .. .. .	.. .. .	675
Average expense for the same .. .. .	.. .. .	300
Average net income for the same .. .. .	.. .. .	375
Average net income per acre .. .. .	.. .. .	125

No plantation in the district pays more than Rs. 125 per acre yearly consecutively for forty years.

#### THE COST OF PLANTATION.

		Rs.
150 coconut plants at Rs 80 per 100 ..	.. .. .	120
600 areca-nut seedlings ready for permanent transplanting at Rs. 20 per 100 ..	.. .. .	120
One pair of cattle .. .. .	.. .. .	150
Cost of sinking a well .. .. .	.. .. .	150
Miscellaneous .. .. .	.. .. .	60
Total Rs. ...		600

*Indian Agriculturist.*

COFFEE PROSPECTS.—Messrs. I. A. Rucker & Bencaft writing on Thursday evening, March 16th, say:—As regards values everything looks excessively cheap, and there can be little doubt that as soon as a basis is established we shall have a very large business in mild coffees,

CACAO AND SUGAR IN TRINIDAD.—Sir Cuthbert Quilter and Sir Neville Lubbock, on 27th January last, met a first meeting of the local Chamber of Commerce and Agricultural Society in the Council Chamber. H.E. the Governor—Sir H. E. H. Jerningham—as President of the latter Society presided and spoke. In the course of his address Sir Neville Lubbock said:—

He was very hopeful that as regards cocoa the prosperity would continue for many years to come. He was afraid that the time was bound to come when cocoa would have a hard time, but at the present moment it looked as if that time was somewhat remote.

And again:—

They had a magnificent soil and climate, second to none in the world; they had also the advantage of being very close to that large Continent, and it appeared to him that all they were lacking was a population commensurate with their acreage and their great capabilities. When they looked back for something like a generation they saw that a great advance had been made in that direction already, but when he considered that their population was still only some 280,000 and the country could probably carry with ease two millions, it was obvious to him that there was very great room for population, and he thought an increase of population would be of very great advantage to this island. He hoped the efforts made in the past and which had been so far successful would be continued in the future. He was sure they ought to encourage population to come here in every way they could. With regard to cocoa and sugar, from what he knew and had heard, it appeared that the development of those industries had already outrun the available labour supply.

Mr. Hewatson, President of the Chamber of Commerce, said:—

Everyone must be convinced that central factories would be the only salvation for those colonies where muscovada sugar was still produced, but while he agreed that the abolition of bounties was not likely to bring about any material rise in the price of sugar, it had always been his opinion that the abolition of bounties was necessary to remove the uncertainty of the sugar trade and in some measure restore the credit of the industry, so that nothing could be done, and until the bounties were abolished central factories, in any part of the West Indies would never restore the sugar industry. (Hear, hear). He hoped Sir Thomas Lipton would be advised that the abolition of the bounties must be the first thing before capital was employed for the purpose.

In conclusion, the Governor said:—

They must not be carried away by the idea that this was an official meeting—Not at all, we knew your good works and we are modest enough to recognise your own modesty not to speak of that work though we might do it; but we have come here simply as a body of interested persons in the welfare of Trinidad, to welcome two men who have already understood the necessity of home help—people who are living at home, to help us there in the way that we are trying to help ourselves here, to give utterance to our wishes, in fact, to give life to those inmost desires which we cannot give life to and which Parliament can give, and if you can induce other members of Parliament to come during this season, in yachts, and in numbers, we shall all be here so as to get a majority in favour of the West Indies in what I do not hesitate to say is a just and truthful and an honest demand.—The Governor concluded by asking them to extend their welcome to a very distinguished guest he had the honour to have in his house, viz., the Administrator of St. Lucia. Mr. King-Harm had not been in good health and understanding that Trinidad was the Eden and the Paradise of the West Indies, had come to pay a visit to his old Governor.

## TRIMEN'S "FLORA OF CEYLON."\*

In noticing the fourth part of this valuable work, we cannot help taking over Sir Joseph Hooker's preface in full, so explanatory is it of the plan of the Flora and the contents of the present volume, as well as of the fifth part which is to follow and the complete Index which is to be supplied:—

## PREFACE TO PART IV.

Being instructed by the Government of Ceylon with the completion of Dr. Trimen's Hand-book of the Ceylon Flora (left unfinished through the lamented death of the author), I have to render an account of the materials at my disposal for the above purpose.

Premising that the three Parts already published comprise three-fifths of the contemplated work, I have towards its completion—

1. The Natural Order *Euphorbiaceæ* (by Dr. Trimen), nearly ready for press (about 140 species).

2. A list of the genera and species of all the Orders from after *Euphorbiaceæ* to *Cyperaceæ* inclusive, in the sequence in which Dr. Trimen intended to describe them (*i.e.*, in strict accordance with the Flora of British India), together with such synonyms and references as he thought necessary, habitats, native names (few), and occasional notes. For *Gramineæ*, which are to conclude the work, he left no materials whatever.

3. That portion of the Peradeniya Herbarium which comprises the plants not published in Parts I.-III.; and of the collection of drawings pertaining thereto.

4. The Ceylon collections in the Kew Herbarium, which are much richer than those in that of Peradeniya.

5. The remaining 25 of the 100 quarto lithographed and coloured Plates that accompany this work. These 25 will appear with the present Part.

Thus it appears that my share in the authorship of the Hand-book, as originally contemplated by Dr. Trimen, will be confined to passing his account of the *Euphorbiaceæ* through the press, and to supplying descriptions of all the succeeding Orders, together with a complete account of *Gramineæ*, adding occasional notes on the genera and species where I think it expedient to do so.

In addition to the above, I propose to give in Part V. (1), a key to the Natural Orders of Ceylon Flowering plants, without which the work cannot be of practical use to any but experienced botanists; (2), brief biographical notices, by G. Boniger, Esq., F.L.S., of the botanists who have done most for the advancement of the Sinhalese Flora; (3), two very instructive Maps, of the Rainfall and of the Forest Areas of Ceylon, issued by the Surveyor-General of the Colony, to whom I am greatly indebted for sanctioning this use of them.

Regarding Indexes, it will be observed that a complete Index of the Latin, Sinhalese, and Tamil names of the plants described in Parts I. and II. is appended to Part II. Part III. is not indexed. As I propose to append to Part V. a complete Index to the whole work, I have confined the Index to Parts III. and IV. to generic names.

It remains to add to the above explanations that, in following Dr. Trimen's footsteps, I shall adhere as far as possible to the plan he has adopted, in respect of one point in which I have an observation to make.

\* A Hand-book to the Flora of Ceylon containing descriptions of all the species of Flowering Plants indigenous to the island, and Notes on their History, Distribution and Uses. By Henry Trimen, M.B. (Lond.), F.R.S., Director of the Royal Botanic Gardens, Ceylon. Continued by Sir J. D. Hooker, G.C.S.I., C.B., F.R.S. With an Atlas of Plates illustrating some of the more interesting species. Part IV.: *Euphorbiaceæ*—*Naiadææ*. With Plates LXXVI.—C. Published under the authority of the Government of Ceylon. London: Dulau & Co., 37 Solo Square, W., 1898.

It refers to the following passage in the Introduction to Part I., p. v.: "In the definitions of the Orders and Genera, it must be distinctly understood that the distinguishing characters here given for each group do not include the whole of those which belong to it, but such only as are shown by the species found in Ceylon." Had the Flora of Ceylon been exhaustively explored, this curtailment of the characters of the Orders and Genera would not interfere with the value of the work for its limited purpose, but such, I feel satisfied, is not the case. There are still large areas of the Forest region which await the visits of keen collectors, and there are not a few common (some amongst the very commonest\*) plants of the plains of India that have not as yet been collected in Ceylon.

September, 1898.

J. D. HOOKER.

Sir Joseph's concluding paragraph is particularly noticeable, shewing, that in his opinion, the Flora of Ceylon is by no means exhaustively explored, but that there are wide areas of our Forest region still to be dealt with by careful botanical collectors. It is also surprising to learn that some of the commonest plants in Southern India have not yet been found in Ceylon, notwithstanding the constant intercourse through cooly immigrants, traders, &c. Of course, the plants may be here, though not as yet identified. Most of the names of past botanists and collectors have been given to plants they discovered, and so we are constantly reminded, in the Flora, of Burman, Thunberg, Rottler, Moon, Gardener, Col. and Mrs. Walker, Major Forbes, Champion, James Macrae (Superintendent of Peradeniya Gardens 1827-30—who is described as "an active collector, especially of orchids"), J. G. Watson (Superintendent of Peradeniya Gardens from 1832 to 1838), Dr. Thwaites, Nietner, Kelaart, O. Brodie, Glennie, W. Ferguson, Beckett, Wall, Nevill, Pole, Mackenzie, D. Morris, W. Smith and Dr. Trimen himself. Among collectors still in our midst are Messrs. W. H. Wright, Nock, Alwis, Braine, F. Lewis and E. E. Green; but in view of Sir Joseph's remark there is clearly room for many more apart from Mr. Willis, his Assistant, Mr. Parkin, and Curator, Mr. Macmillan. It would be well if some of the educated permanent residents at outstations and in outlying districts gave their attention to the botany of their neighbourhood and after some study they might be able to add their contributions to future editions of the "Flora of Ceylon."

We now proceed to afford some idea of the volume before us. It opens with the Natural Order "*Euphorbiaceæ*"—herbs, shrubs or trees with often milky juice, and of these 43 generic names with their subsidiary species are described, the same covering 78 pages. Sir Joseph Hooker's explanatory note introductory to this order is of special interest (and we may here mention that while the bulk of the work belongs to Dr. Trimen, the large number of notes signed "J.D.H.," shews the great interest taken, and the varied amount of labour given, by the final editor):—

Chiefly a tropical Order, one of the largest of flowering plants, and one of the six largest of the

\* Of this a conspicuous example is *Folys non plebicum*, B., a weed extending from Africa to Australia; the tropical representative of the European *P. ariculare*, and perhaps the commonest of Indian dicotyledonous plants. Especially abundant in the Madras Peninsula.

Ceylon flora. Of genera not indigenous in the island, but widely cultivated, or more or less naturalised, are the scarlet-bracted *Poinsettia pulcherrima*, of Mexico; the Tallow tree of China, *Excoecaria sebifera*; the American *Manihot utilisima*, yielding Cassava and Tapioca, together with the three recently introduced American India-rubber producing plants, *Hevea brasiliensis*, the Para rubber, *Manihot glaziovii*, the Ceara Rubber, and *Castilloa elastica*, the Mexican Rubber.—J.D.H.

The only plant of the order (Euphorbiaceæ) we feel called on to notice is that named after Mr. Macrae\* "*Macraea myrtifolia*," a species of *Phyllanthus myrtifolius*, thus described as to where found, &c. :—

Moist region by streams, 1,000–2,000 ft.; rare. Near Kandy; Umaoya; Dolosbage. Fl. April, Sept., &c. purplish-red or greenish.

Endemic.—A very ornamental shrub when covered with the multitude of small pendulous flowers.

The next order is Urticaceæ, or the nettle tribe, though some have also milky juice, the explanatory note by Dr. Trimen being :—

A very large, chiefly tropical family, to which belongs the common nettle. The stems of many yield a valuable fibre, especially the Pacific Island *Broussonetia*, from the inner bark of which tappa cloth is made. Ceylon, though containing more than half (27) of the number of genera of *Urticaceæ* occurring in British India (45), is poor comparatively in species. Of these there are nearly 300 in British India, but only about 68 in Ceylon.

The genera and species cover some 40 pages, 14 of these being occupied with the various members of *Ficus*, some 21 genera in all, to which interesting notes are appended in each case; for example, "*Ficus bengalensis* :—

Lowcountry to 2,000 ft., especially in the dry region, but always, I think, planted. Fl. December. Fr. dark red. The well-known 'Banyan' of Europeans, in which the tendency to form aerial roots from the branches which become additional stems is carried to its greatest extent. There are several fine specimens in Ceylon, as at Jaffna, Negombo, &c., and in Hook. Journ. Bot. iii. (1841) at t. 13 is a drawing by Major Forbes of a tree near Matale; but it does not seem to be indigenous. It is said to be native in the sub-Himalayan forests and the lower slopes of the hills of S. India.

"*Ficus tomentosa*" :—

Rocky places and old buildings in the dry region; rather rare. Nilgala; Mihiatale; Polonnaruwa; Bintenne; Trincomalee. Fl. July–September; Fr. grey, *Roxb.* Also in India. Abundant in the ruins of Polonnaruwa, which it has done much to destroy. Specimens in Herb. Perad. have l. ovate to orbicular, quite glabrous above, finely pubescent beneath

"*Ficus altissima*—var. *Fergusonii*" :—

Moist lowcountry to 3,000 ft.; common. Fl. Aug.–November. Fr. orange-red, as large as a cherry. This var. endemic; the type and other vars. in India, Burma, Andaman Is., Malaya. I am not clear as to whether the type occurs wild in Ceylon, though it is given in Fl. B. Ind. There are trees in the Botanic Gardens, and I think I have seen it by the Mahaweli below Kandy. Dr. King erroneously spells W. Ferguson's name with double "s", after whom he names this tree.

"*F. Trimenii*" :—

Lowcountry to 2,000 ft.; rather rare. Peradeniya; Kadugannawa; Ekirankumbura, Uva. Fl. April–May, July–Aug. Fr. orange-yellow or red when ripe, not dotted. Also in Western Peninsular India. A magnificent specimen of this species, with the branches covering a circle of about 200 ft. in diameter, is a

well-known feature of the Peradeniya Gardens. It grew at first epiphytically on a Jack-tree, which it destroyed and supplanted.

"*Ficus nervosa*" :—

Moist region up to 5,000 ft.; rather rare. Heuerat. gods, abundant; Hantane; Hunagiriya; Maturata. Fl. August, December. India, Burma, China, Malaya. The Ceylon tree is var. *minor*, King, and differs from the continental type in its smaller leaves, with fewer lateral veins, and globose recepts.

*F. religiosa*, L., *Bo*, S., *Avachu*, T. (C.P. 3672), is a commonly planted tree, and invariably found by every Buddhist temple, but is nowhere wild. The sacred tree at Anuradhapura, brought from Magadha, in India, in n.c. 288, and carefully tended and guarded ever since, is not improbably the original source of all the trees in Ceylon. It is wild in the sub-Himalayan forests only. There are specimens in Hermann's Herb. (see Mus. Zeyl. 42, and Fl. Zeyl. n. 372).

*F. asperima*" :—

Moist region up to 3,000 ft.; common. Fl. (?) Fr. orange-yellow, or pale yellow with orange spots. Also in Peninsular India. The young leaves are sometimes deeply incised. This is the 'Furniture leaf' of the English, and is generally in use for polishing, as sand-paper in Europe.

"*F. Thwaitesii*" :—

Climbing over rocks and trees in the moist region up to 5,000 ft.; rather common. Colombo; Hantane; Allogula; Matale; Dolosbage; Hunagiriya; Morawak Korale. Fl. March, September. Fr. pale pinkish-yellow or nearly white. Endemic. The slender creeping rooting stems look very unlike the free fruiting branches, and are the *F. diversiformis*, Miq. (C.P. 2217). This is the earliest name for the species, but it was given merely to the barren stems.

Of another species, "*Celtis Cinnamomea*," a very fine coloured figure is given in one of the plates, and we read :—

Moist region, 2–5,000 ft.; rather common. Fl. Feb., March; greenish. E. Bengal, Burma, Malaya Archipelago. The name *cinnamomea* refers to the character of the leaves; Thwaites' name, *dysodorifolion*, to the very disgusting smell of the fresh wood especially, when wet, of which the Sinhalese name is descriptive. Thunberg (*Travels*, iv. 234) says it was called 'Stant-hout' by the Dutch, and employ as an alterative medicine internally and externalised in kin affections. The wood in chips is sold in the bazaar as a medicine under the name 'Pinari,' and is exported to Bombay where it is employed as a fumigatory against evil spirits.

In the same order is included the genus "*Artocarpus*" with its variety "*A. Nobilis*," the Del or Bedi-del of the Sinhalese of which we are told :—

Moist low country up to 2,000 ft.; common. Fl. June. Endemic. The outer shells of the seeds roasted are good eating. The wood is in great request for cabinet-making, and fishing boats are made out of its hollowed trunks.

And also the more famous "*A. integrifolia*," the well-known Jak-tree, "*Kos*" of Sinhalese, "*Pila*" in Tamil :—

*Artocarpus integrifolia*, L. f., is the well-known Jak tree, *Kos*, S., *Pila*, T., universally cultivated in the lowcountry for its fruit, but nowhere wild in Ceylon. It is stated, in Fl. B. Ind. v. 541, to have been found, wild by Beddome in the forests of the western Ghats of India, but it is not included in King's Monograph of the Indian species, who had not this information in time. I have no knowledge as to the time of its introduction to Ceylon, but no doubt it was at a very distant period; curiously, Hermann has not any specimen or drawing. There are good figures in Rheede, Hort. Malab. iii. tt. 26–28, Gaertn. Fruct. i. tt. 71, 72 (*Sitodivium cauliflorum*), and Bot. Mag. t. 2833–4. It is C. P. 2233. The timber is excellent.—*Trimen*.

\* Superintendent of Peradeniya Gardens, 1827–30

The next order—"Ceratophyllaceæ"—is disposed of in a page, and we read:—

An Order of doubtful affinity; peculiar in Natal, with the many-leaved plumule of *Nelumbium*. The numerous described species may prove to be all forms of one or two widely distributed water-plants.

While under the only genus and species "*Ceratophyllum verticillatum*" we read:—

Submerged in water in tanks, lakes, and ponds in the low country; common, especially in the dry region. Throughout the Eastern Tropics.

'Sir J Hooker is probably correct in referring this to the cosmopolitan species *C. demersum*, L. Our Ceylon form is that figured in Wight, Ic. 1948, f. 3, as *C. tuberculatum*, Cham.—Trimen.

We have no species of *Gnetaceæ* nor any *Coniferae* in Ceylon. Of the latter Order a single species, *Podocarpus latifolia*, Wall., occurs in the hills of S. India, but the Peninsula is otherwise devoid of Conifers.

We next have "Cycadææ" with only two species, and of one "*C. Rumphii*" we are told:—

Moist region below 1,000 ft.; very rare and doubtfully native. Near Galle, 1853 (Ferguson); near Hewesse, Pasdum Korale (Thwaites). Fl. (?).

Burma, Andaman and Nicobar Is., Malaya, New Guinea, N. Australia.

This is probably not indigenous; it is much grown in Colombo gardens, but I have never seen a male plant there,\* nor have I been able to obtain one from Peradeniya, where there are many female plants.

Next come "Hydrocharideæ"—fresh or salt-water herbs with undivided, submerged or floating leaves.—occupying seven pages, and to one species "*Halophila ovata*" we have the following interesting note:—

Shallow sea water on the coast in the dry region; rather common. Negombo; Chilaw; Kalpitiya; Jaffna; Aripo; Trincomalie; Batticaloa; Mannar. Fl. July-September.

Shores of Red Sea, Indian Ocean, China, Malay Is., Pacific Is., Australia.

The leaves of this pretty little marine plant vary in form and greatly in size; in the type the blade is oval-oblong, about 1½ inch long, but it is as often almost rotund, or sometimes linear-strap-shaped, and then not more than ¾ inch long. This last very small form, from Jaffna and Trincomalie, may be called var. *minor* (= *Lemnopsis minor*, Zoll.), but there are intermediates. The brackish-water form is thought by Nevill to have narrower leaves than the ordinary marine one (see Taprobanian, ii. 67).—Trimen.

*H. stipulacea*, Aschers., is marked by Ascheron on his map in Peterm. Geog. Mitth. 1871, t. 13, as if in Ceylon. I have seen no specimens.—Trimen.

Amongst the specimens marked *H. ovata* in Herb. Peraden. there are some collected by H. Nevill, in six-fathom water off Chilaw, April 1881, of what appears to me to be a very different species, with very pale green, oblong, petioled leaves, covered on both surfaces with a fine pubescence, and with ciliolate margins. The petioles have no dilatation of the base. The fr. enclosed in its spathe is sessile, about ½ in. long, and resembles that of *H. ovata*.—J. D. H.

"Bum-buniaceæ" are disposed of in three pages, being "annual, erect, saprophytic herbs."

#### CEYLON ORCHIDS.

Then follows the interesting and important order of the Orchids, "Orchideæ," which require some 103 pages, for of it we are told:—

The third largest Order of flowering plants in number of species in Ceylon, ranking between

*Gramineæ* and *Cyperaceæ* and the third largest also in number of genera. In percentage of endemic species it is the fifth of all the larger Orders, nearly half the species being endemic. On the other hand, it is remarkable for the paucity of endemic genera, of which there are only three out of the whole number (61). In the arrangement of the genera, I have adhered as closely as I could to the 'Genera Plantarum' and 'Fl. Brit. Ind.' The principal deviation from these works is the placing of *Phreatia* in *Vandeeæ*, in which I am supported by Dr. King. I have also restored two imperfectly known genera of Thwaites, *Ocarrhena* and *Alvisia*. By far the greater number of species of Orchids have been described for this work from Herbarium specimens solely, or, if aided by published or unpublished figures, these are too often unaccompanied by good analyses. Consequently, not a few of those descriptions will require rectification or amplification from living specimens. An illustrated work on the Orchids of Ceylon, with careful analyses, like Sir G. King's Orchids of the Sikkim Himalaya, would be a great boon to botanists and amateurs. Of the 169 species described in this work, only 97 have been figured, few of them from Ceylon specimens, most in inaccessible works, and not a few very imperfectly.

We much fear that it would be difficult now to find all of the 169 Ceylon species in their native habitat. The law recently passed, prohibiting indiscriminate collecting and exports, was not a day too soon. We have heard of one export-collector who left few or no orchids of any value in his favorite collecting ground. It is difficult to avoid quoting too many references to the many attractive orchids. One of the most delightful, and which has been in full flower in gardens in Nuwara Eliya (on Naseby particularly) this year, is "*Dendrobium aureum*" or "*heterocarpum*"—the '*primrose orchid*' of which we are told:—

Upper montane zone above 6,000 ft.; common. Fl. Jan.-April; pale or dull primrose-yellow, the lip with two orange-purple blotches on the disk; or all orange-coloured but the apex; or (in var. *pallidum*) nearly white, with the blotches pale orange.

Himalaya, Khasia, and Nilgiri Mts., Burma, Java, Philippine Is.

The so-called '*Primrose Orchid*' of Nuwara Eliya, from the sweet faint scent and colour of the flowers. The name, *heterocarpum*, seems to have no application to this species, but has two years' priority over *aureum*.

But the noblest of Ceylon orchids is that discovered by Dr. Thwaites and called after Lady MacCarthy, "*Dendrobium Macarthiæ*"—"Wesak-mal" (May-flower) of the Sinhalese and of which a number of specimens used to grow on trees in Mr. Pate's garden. Flower Road, no doubt brought down by coach from Ratnapura. The description runs:—

Forests in the moist region below 2,000 ft.; rare. Ambaganuwa; Sabaraganuwa Prov. in many places; Hewesse. Fl. May-July, during the heavy south-west rains; clear violet-pink, the lip paler but veined and bordered with deep pink and with a large purple blotch on the disk; rarely all white, with a faint purple stain on lip.

Endemic.

Certainly the handsomest of Ceylon Orchids, and of late years so much collected for export as to have become very scarce in places which formerly produced abundance. The Sinhalese name means '*My-flower*,' from its time of flowering.

\* Ferguson sent male fl. to Thwaites in 1855.

Of three other orchids fine plates accompany this volume, namely, "*Bulbophyllum elegans*":—

Montane zone 3-6,000 ft. : rather rare. Ambagamuwa ; Hantane, abundant ; Maskeliya. Fl. Feb.-May ; dull purple tinged with green, lip orange with purple dots. Endemic. A singular plant, not without beauty. "*Cœlogyne odoratissima*":—

Upper montane zone ; common. Fl. Dec., Jan. ; white, with a yellow stain on the lip. Also on the Nilgiri Mts., S. India.

The name *odoratissima* is scarcely warranted by the very faint scent of the pretty flowers. Neither of the figures quoted, which represent the Nilgiri plant, are characteristic for ours, which has much larger flowers, less acute sep. and pet., and very crowded globose pseudobulbs. And "*Cymbidium ensifolium*":—

Montane zone in open places to 5,500 ft. ; rather common. Hantane ; Kondagula ; Bogawantalawa, abundant. Fl. December, April ; sweet-scented, sep. and pet. dull citron yellow, veined with pink, lip pale yellow, stained and spotted with dark pink.

In Sikkin, Khasia, China, and Japan.

In Fl. Brit. Ind., Lindley's *C. hamatodes* is referred to *C. cypripifolium*, Wall., and it is assumed that its author was mistaken in giving Ceylon (Macrae) as its locality. But, notwithstanding a few discrepancies in the description, I think our common plant is really intended. I have seen no good published figure ; it should ; perhaps, be kept distinct from *C. ensifolium* as a species.—*Trimen*.

There are two drawings of this plant in Herb. Peraden., one (PLATE XC. of this work) with oblong obtuse pale sep. and pet., with fine pink interrupted veins, lip white, spotted with blood red, mid lobe orbicular, and 4 small nearly globose pollinia, one of each pair much smaller than the other. The other drawing has ovate-lanceolate pale straw-coloured sep. and pet., with 5 short red veins at the base of each, a straw-coloured lip, with red spots, and ovate mid lobe ; the pollinia are 4, large, ovoid, and all equal. It is marked, in Thwaites's writing, '*C. hamatodes*, Lindl. C. P. 3694.—J. D. H.

While of another "*Acanthophippium bicolor*" we read :—

Shady woods in moist low country to 2,000 ft. ; rare. Hantane ; Gampola, abundant. Fl. March, April ; bright yellow, the ends of the sepals and petals deep purplish-red. Endemic. Discovered by J. G. Watson, Superintendent of Peradeniya Gardens, 1832-38.

And yet again we have "*Eulophia sanguinea*":—

Moist region to 4,000 ft. ; rare. Hantane ; Moneragala, Uva (Wall) ; Haputale (Wright) ; Mirigama (Wright). Fl. Jan.-April ; sep. and pet. dull purplish-red, as is the whole infl. ; lip paler, pinkish-green, with dark purple wings and a green spur. E. Himalayas and Khasia. The plant is quite leafless at the time of flowering.

A specimen that flowered at Kew, and is figured in the Botanical Magazine, had the sep. and pet. reddish-brown, inclining to purple, the lip nearly white, suffused with pink towards the margin and on the side lobes, and with two purple spots on the disk.—J. D. H.

We must notice that one genus of orchids "*Josephia*" is thus referred to :—

Named in honour of Dr. (now Sir) Joseph Dalton Hooker, Director of Kew Gardens, 1855-55, and author of the 'Fl. Brit. India,' and many other standard books on botany.—*Trimen*. It has two representatives in Ceylon :—

*J. lanceolata*, Lower montane zone, 3-5,000 ft. ; common. Fl. Aug.-Nov. ; white, tinged with purple, column purple. Also in S. India,

Wight (citing Jerdon) says that the fl. are annually reproduced on the same inflorescence. The resemblance of the inflorescence to that of a *Staticia* is striking.

*J. latifolia*, Ramboda (Nock). Fl. Aug. ; apparently deeper coloured than in *J. lanceolata*.

But we must reluctantly leave the orchids and come next to "*Scitamineæ*"—herbs usually perennial to which the plantains, cardamoms and ginger belong—occupying 28 pages in the book, and from which we quote :—

*Elettaria Cardamomum*, Forests in the moist region up to 3,000 ft. ; rather common. Fl. (b) ; lip white, streaked with violet.

There is no specimen or drawing Hermann's Herb. The Ceylon variety is maintained in a species by Horaninow (Prod. Seit. 31).

The type form of *E. Cardamomum* is called 'Rata-ensal' here, and comes originally from Malabar. It is largely cultivated on estates in parts of the montane zone. Figured in Benth. and Trim. Med. Pl. t. 267. Rheede, Hort. Mal. xi. t. 4, 5.

A careful comparison of growing specimens satisfies me that the plants producing respectively the round and the long Cardamoms of commerce are not distinct species. In every essential particular the structure is similar in the two plants, the only difference being that var. *a*, which produces the round Cardamom, is a little taller, with rather narrower and less firm leaves, and that its fr. is more aromatic as well as different in form. The seeds of both varieties are used by the Sinhalese to chew with their betel, and as medicines.—*Thwaites's Enum.* 1. c.

Also about plantains and bananas :—

*Musa paradisiaca*, By rocky steep streams in the moist region, 1-3,000 ft. ; common. Fl. Also in E. Himalaya and Malaya. Fruit eaten in times of famine.

Linnaeus's two species, *M. paradisiaca* and *M. sapientum*, have no distinguishing botanical characters ; both refer to cultivated plants. I use the former, as being the one to which he refers all the Ceylon and Indian synonymy, though *M. sapientum* seems generally preferred by modern botanists. We have but one wild species, and it may well be the origin of the numerous seedless forms in cultivation, distinguished by differences in shape and colour of their fruit. Hermann gives the names of 13 kinds grown in his time, and Moon records no less than 50, of which 5 are considered to be wild by him. The distinction between 'Plantains' and 'Bananas' is not made in Ceylon, and the latter word is not used here. Baker (Ann. Bot. vii. 215), following Moon, refers the wild Ceylon plant to *M. troglodytarum*, L., but I have seen nothing here with an erect inflorescence.—*Trimen*.

In the W. Indies and elsewhere, the name Plantain is used to designate the larger, coarser fruits used for cooking, that of Banana for the sweet sorts. Mr. Morris informs me that the plants of each are always distinguishable by the bracts of the male fls., those of the Banana being deciduous, those of the Plantain being persistent ; as well shown in Ehret, l.c. Pl. Sel. tt. 18-20 and tt. 21-23. See also Kew Bullet. 1894, p. 254.—J. D. H.

Next are "*Hæmodoraceæ*"—perennial herbs with a short rootstock and fibrous roots—of which only two genera are given, one being "*Sansevieria Zeylanica*," the well-known fibre-yielding plant. Then we have "*Amaryllidæ*"—rootstock bulbous or tuberous—with only a few representatives of not much interest.—"*Taccacæ*" has only one repre-

sentative, "*Tacca pinnatifida*, the "Garandikidaran" of the Sinhalese, of which we read:—

Dry region, rather rare, in grassy open places. Bintenne (Gardner); Trincomalie (Glenie); Batticaloa (Thwaites); Jaffna; Nilgala, abundant. Fl. March; green, tinged with purple. Also in India, Malaya, Pacific, Is., Australia. The leaves are remarkably similar to those of an *Amorphophallus*. The rootstock is intensely bitter when raw. It is full of starch, which, when prepared, is of excellent culinary properties. The plant is extensively cultivated in some parts of India and in other tropical countries.

Next come "Dioscoreaceæ," the best-known of which, perhaps, is "*Dioscorea Sativa*" (Pann-kondol of Sinhalese) for which Sir Joseph Hooker gives an interesting note:—

Low country to 2,000 ft.; very common. Fl. Aug., Sept.; yellowish white. Throughout India, wild and cultivated.

Roots, according to Thwaites, employed to attract fish to certain spots where they can be easily caught. For this purpose, pieces are daily, for some time, thrown into the water. I have cited Hermann, Burmann, and Linn. Fl. Zeyl. from *D. sativa*, but the fruit not being figured or described in these works renders their identification doubtful. Thwaites, in a note, mentions *D. sativa*, L., as a cultivated plant in Ceylon, with the name kattoo-kookoolala (katu-kukalala, *Trimen*), supposing it to be a different species from his *D. bulbifera*. As Dr. Trimen, in a note upon his and Thwaites's *bulbifera*, says that the roots are not eaten, it would appear that this may be the wild uneatable state of the cultivated plant. The attention of Ceylon botanists should be given to this subject.—J. D. H.

"Roxburghiaceæ" with one genus is followed by "Liliaceæ" covering 13 pages and then follow "Pretederiaceæ," "Xyrideæ," "Commelinaceæ" (fully represented), "Flagellariaceæ" and "Juncaceæ," when we come to the "Palms," which occupy some 19 pages.

Of the *Arca* we are told that it is nowhere wild in Ceylon, and that though common throughout tropical Asia, it is not now possible to tell where it originated. Of the *Kitul* (*Caryota urens*), on the other hand, *Trimen* reports:—

Though encouraged and protected, I believe this to be a real native here. Yields toddy copiously. The sago-like pith forms a valuable article of food, and a coarse sugar is made from the toddy. The wood, which is silicious, is useful for building purposes. Leaves yield the kitul fibre of commerce.

Of "*Phoenix Zeylanica*," common on our Southern Coast, we are told:—

The stem of *P. zeylanica* sometimes attains 20 ft. in height, and is often characteristic of the scenery after burning off the scrubby surrounding growth for chena-cultivation. Mats and boxes are made of the leaves. The sweet pulp of the fruit is eaten.

A fine plate is given of this palm. Then we have the *Falipof* "*Corypha umbraculifera*," the "*Tala*" of the Sinhalese, with a note as follows:—

Moist region below 2,000 ft.; rather common. Fl. Nov.-Jan. Also in Malabar. This must be a native palm, but I have never seen it in original jungle. Of the vast number of seedlings which come up near the parent tree, very few arrive at maturity, the young leaves being continually cut. Beddome remarks that he has never seen it wild in S. India.

The largest and most imposing of Eastern P. when about 40 years old. The

young fruit, pounded, is used for stupefying fish. The leaves form mats, fans, and umbrellas, and are also used for writing upon. A bread is made of the pounded soft interior of the trunk. The seed have the hardness of ivory, and are known as Bayarbatu nuts; they are used as beads in Ceylon, and in the manufacture of buttons in Europe.

Next we notice the *Palmyra*. "*Borassus flabelliformis*," also called "*Tal*" by the Sinhalese and "*Panai*" by the Tamils. [We recall the puzzled look of a veteran botanist to whom we sat next at a dinner of the Linnæan Society some years ago when we mentioned the "*Palmyra*"; nor could he at all identify it in his mind's eye, until we mentioned "*Borassus*," when he recalled it perfectly—he had been in the West, but not in the East, Indies.] The note is as follows:—

Dry region, especially in the desert sandy tracts near the coast; very common, but always planted. Fl. March, April.

Cultivated in India, Burma, Malaya, apparently wild in Trop. Africa. This is usually known as the *Palmyra*, the Portuguese '*Palmeira*' slightly altered in spelling. It is grown in vast groves, like the coconut, in the north of Ceylon, especially in Jaffna district, as is noticed by Rumph. (l. c. 48).

For a very full account of the uses of this palm in Ceylon, reference may be made to '*The Palmyra Palm*,' by W. Ferguson, printed at Colombo in 1850 (reprinted 1888).

*Cocos nucifera*, universally cultivated throughout the low country, especially near or on the sea-coast, but not wild.

We must also quote the note to the coconut, and express our satisfaction that four times over the name is spelt properly, while, alas! in the above note under *palmyra*, it is given '*cocoa-nut*,' '*cocoa*' being unfortunately spoken of as the product of cacao:—

Cultivated throughout the Tropics, the origin not known. [Indigenous according to Kurz, in the *Cocos* and *Andaman* :s.—J. D. H.]

Several varieties are recognised by growers. '*Tembili*' has the endosperm pink in colour, and is called the '*King Coconut*.' A very small-fruited dwarf sort *C. nana*, (Griff.) goes by the name of the '*Maldivé*' Coconut.†

Next we come to a series of orders with a limited number of representatives, such as "*Pandanaceæ*," "*Typhaceæ*," "*Araceæ*"—one genera of which has four species named after Ceylon botanists:—"*Cryptococcyne Thwaitesii*," "*C. Nevillii*," "*C. Walkerii*" and "*C. Beckettii*."—Then follow in a dozen pages, the orders "*Lemnaceæ*," "*Triurideæ*," "*Alismaceæ*," and "*Naiadeæ*." The Index which follows gives the Natural Orders and Generic Names in Parts III and IV.

Finally, we may mention that the publishers state that the fifth and last volume of this valuable work,—alas that Dr. *Trimen* should not have lived to see it all through the press!—will be ready by Midsummer 1899, and as Sir Joseph Hooker mentioned in the preface quoted above it will contain, besides the

\* From the Portuguese name *Coco* or *Coquo*, given to the fruit from a fancied resemblance to a monkey's face.

† Not to be confounded with the *Cocos maldivica* of the old writers, which was the fruit of *Lodoicea Seychellarum*, the '*Double Coconut*' or '*Coco-de-iaer*' (a palm peculiar to the Seychelles Is.), carried by the ocean currents and often cast on the shores of the Maldives.

conclusion of the Flora, a key to the Natural Orders of Ceylon Flowering Plants, brief biographical notices of Ceylon botanists and two plans of Rainfall and Forests. The Colony—as well as the botanical world—will then owe a debt of gratitude to the memory of the lamented Dr. Trimen and to Sir Joseph Hooker for so kindly continuing and completing the Flora of Ceylon.

#### COFFEE POSSIBILITIES OF PORTO RICO.

Assistant Secretary of War Meiklejohn has made public an abstract of a report made a short time ago by W. Korda to General Brooke. The report refers to a recent visit made by Mr. Korda through some of the cane and coffee districts of Porto Rico, and contains much of commercial interest. Mr. Korda was commissioned to make the trip by the Association of Agriculturists and Manufacturers of Porto Rico, for the purpose of ascertaining the state of affairs in the coffee regions, and, in behalf of the Association, to inform the United States Government, in case it were deemed advisable or necessary, of the general condition of the country. The itinerary made by Mr. Korda was through the vast and rich coffee districts of Ciales, Jayuya.

He says that every foot of this ground gives forth some fruit or profit. The ground which is not covered by coffee or cocoa trees produces plantains, bananas, tobacco, corn, peas, sweet potatoes, etc. Pure running water is met with everywhere. The coffee crop being then gathered was abundant, and promised to reach 15,000,000 pounds.—*American Grocer*, Feb. 1.

#### TEA IN AUSTRALIA.

Melbourne, Feb. 18.

Teas.—Some heavy business has been done in China descriptions, one or two importers clearing available stocks. Sales of 2,700 half-chests from 5½d to 6d for heavy, and from 5½d to 7½d for light weights. Ceylon and Indian in good demand, and prices are firm.—*Lead r.*

From Melbourne *Age* we quote:—

TEAS.—The uncertainty referred to in our Saturday's issue still exists in this market, no notification having as yet been received from the Customs authorities as to what course they intend to follow with the tea salvaged from the late fire, which must have been contaminated by smoke as well as damaged by water. Until this has been settled the trade are not likely to come into the market for any great quantity. Holders, however, are firm, and business today has been done at advances. Sales include 35½ half-chests of both heavy and light weight Panyong at 0½d per lb above last week's opening rates; 250 quarters of Panyong bids also sold at a higher price, and 130 chests of Ceylon up to 1½d.

PLANTS OF COMMERCE CLASSIFIED.—It is an interesting thing to know, says *Science News*, that 4,200 species of plants are gathered and used for commercial purposes in Europe. Of these 420 have a perfume that is pleasing, and enter largely into the manufacture of scents, soaps and sachets. There are more species of white flowers gathered than of any other colour—1,124. Of these 187 have an agreeable scent, an extraordinarily large proportion. Next in order come yellow blossoms, with 95,171 of them being perfumed. Red flowers number 823, of which 84 are scented. The blue flowers are of 594 varieties, 34 of which are perfumed, and the violet blossoms number 398, 13 of which are pleasantly odoriferous.—*Western Druggist*.

#### THE CHIEF FOODS OF THE NATIONS.

Mr. G. R. Waldron, in *McClure's* for November, gives an illustrated and comparative statement of the foods used by the principal peoples. Some of his statistics may be summarised thus:—

##### MAIN CROPS: BUSHELS PER ANNUM.

POTATO: 4,000 millions.  
INDIAN CORN: 2,600 millions.  
WHEAT: 2,500 millions.  
RYE: 1,300 millions.  
BARLEY: 750 millions.

##### MAIN FOODS: QUANTITIES PER HEAD PER ANNUM

Potato (pounds): Ireland, 1,467; Germany, 1,300; Netherlands, 810; Norway and Sweden, 740; France, 700; Austria-Hungary, 663; and Canada, 660.

Wheat (pounds): France, 467; Canada, 360; Italy, 307; Great Britain, 250; United States, 240; Netherlands, 240; Austria-Hungary, 230; Germany, 180; Russia, 93; Japan, 22.

Flesh Meat (pounds): United States, 147; United Kingdom, 100; Norway, 80; France, 77; Spain, 70; Germany, 64; Sweden and Switzerland, 62; Belgium, 61; Austria-Hungary, 60; Russia, Portugal, Netherlands, 50; Italy, 24.

Sugar (pounds): Great Britain, 80; United States, 73; France, 25; Germany, 18; Sweden, 20; Austria-Hungary, 15; Spain, 7.

Tobacco (ounces): Belgium, 110; Switzerland, 80; Netherlands 51; Germany, 48; United States, 43.

Tea (ounces): United Kingdom, 88; Australia, 88; Canada, 70; United States, 24; Russia, 9.

Coffee (ounces): Netherlands, 370; Denmark, 247; Belgium, 176; United States, 155; Switzerland, 112; Germany, 78; France, 53; Austria-Hungary, 32; Italy, 17; Great Britain, 11; Spain, 9; Russia, 3.

Beer (gallons): United Kingdom 30; Germany, 27; Denmark, 24; United States, 15; Switzerland, 14; Netherlands, 8; Sweden and Norway, 7; France, 6; Canada, 4.

Wine (gallons): Spain, 35; France, 20; Italy, 24; Austria-Hungary, 3; Germany and Russia about 1 gal.; United Kingdom and United States, 2 quarts; Canada, less than 1 pint.

#### COCONUT PLANTING, &c., IN SAMOA.

MR. BURCKHARDT.—You made reference to this gentleman a short while ago. He is the Managing Director of a very large Banking, Mercantile and Agricultural concern in Samoa and Tonga Islands. The Company owns 80,000 acres of land and has placed about 10,000 acres chiefly under coconuts. They had a few hundred acres under coffee, which being affected with *Hemileia* was promptly cut down and burnt. The soil is said to be very rich and volcanic and the climate moist and hot. Nuts are not picked off the trees as here, but are allowed to fall and are then gathered. The plantations are divided rectangularly by roads. Donkeys, bred on the plantations, remove the nuts in crates fixed to their sides to the roads, whence they are removed by bullock carts to the stores. The extension of cultivation is limited by want of labor. The labor is "black boys" imported from the Solomon Islands. They are under agreement for three years and are paid the equivalent of R1 a day and grub. At the end of their term of service they return to their homes and are more often than not eaten up by their fellows as a compliment to their sleek condition! Copra is manufactured by means of hot air. In this they are ahead of us. As the climate in Samoa is wet, it was found impossible to make good copra in the open. With praiseworthy enterprise, experiment after experiment was made to dry by means of hot air at an expenditure of thousands of pounds sterling. The present system is con-

sidered as near perfection as possible and has raised the value of copra in all the markets having dealings with the Company.

Cattle and horses too are bred on the plantations. The former are used for draught purposes and the latter for the use of the Superintendents and Overseers to get about the plantations. Surplus stock is sold. With 2,000 head of cattle it is found impossible to keep down the rank growth of grass and weeds.

Samoa is said to be a very gay place. Too gay according to our visitor for honest, hard-work. A dinner once a week and picnics on Sundays are the rule. On special occasions there are other functions. Besides this, the entertainment of guests goes on mainly to the detriment of the interests of the Company. The employees are chiefly German, but other nationalities are not overlooked. Mr. Burekhardt thinks he will fill the next vacancy in his plantations from Ceylon. I feel sure if the importation be of the right sort, he will lead the way in tropical agriculture.—*Cor.*

THE POPULARISING OF INDIAN TEAS.

It is a matter for surprise that, whereas with almost every alimentary product retailed by grocers, and every medicine dealt out by chemists, the greatest attention is paid to presenting it to the public in as attractive a form as possible, no regard whatever, save in a very few exceptional cases, is shown to "appearances" in respect to tea. Take a case for illustration, out of many, that of Crosse and Blackwell. Their name is so old, and their reputation so good, that it might well be thought that it was quite unnecessary for them, as so very old established a firm, to divert from their old usages and system, merely to please the public. Yet, what is found? Whereas, of old, their goods were put on the market in a primitive exterior ugliness, they are now presented in quite an attractive form.

Let some enterprising syndicate, or firm, pack the lower, but good, qualities of teas in small one, two, three, etc., ounce packets with similar labels to attract the attention of the bazar crowd, and great would be the sale of the teas offered in the *modis* shops. The subject of the sale of teas to the natives in this country is too large a one to be entered upon here: suffice it to say, that previous failures do not by any means betoken that there is no outlet. There is a door ajar, and the very force of circumstances will compel all connected with, and interested in, the industry, to open wide the same before many more years are debited to the past. England and America are ensamples of what can be done in the way of popularising goods of all classes. Tea merchants and traders in this country have but to follow suit with their product to ensure a most remunerative trade. The peoples of this country are becoming yearly greater and greater tea drinkers. The enterprise to cater for them, in the way it should be done, at present wanting.—*The Planter*

CULTIVATION OF CHILLIES.—Mr. A. C. Simpson has been impressing on his 'brother' planters in B. C. Africa, the advantage of cultivating chillies. He writes:—

I have exported chillies for several years and I believe I am the only exporter. This year I have sent home 16 bags. I have got up to 47s 6d per cwt. same as Japan chillies fetch. I send you sample of chillies sent home, which fetched the above price, and were considered a first rate chillie, grown in suitable soil and well cured. I have 8 acres in bearing.

In Ceylon we import chillies among "curry stuffs" to a considerable extent; but the figures are not separately given:—

	1897	
Curry stuffs .. ..	121,945 cwt.	R1,569,120
Vegetable dried .. ..	83 pkgs.	R661
"    Raw .. ..	111 ..	R389

There can be no reason why the larger part of the curry stuffs should not be provided locally.

RAILWAYS AND PLANTING IN BRAZIL.

(By an ex-Ceylon Planter.)

(To the Editor, Ceylon Observer.)

Rio de Janeiro, Jan. 14, 1899.

SIR,—I have not time to go into a long description of Brazilian Railways: this I have touched on several times in former correspondence. What the people of Ceylon are interested in at present is the question of gauge and the adaptability of narrow lines to hilly countries.

There are

THREE RAILWAY GAUGES IN BRAZIL.

Like a great many new countries it began with a wide gauge. The first one opened about 40 years ago, on the opposite side of the bay of Rio de Janeiro, to join on to a macadamised road which had been made by a Company, to cross the Serra de Mar, and go into the interior of Minas Geraes, was six feet. This was reduced some years ago to a metre gauge to join on to a Railway on the rachel system, on the same gauge which goes to Petropolis and beyond, in the State of Rio.

Petropolis is the place on the top of the Serra de Mar, where the well-to-do people of Rio go to reside in the hot months. Wealthy businessmen go and come every day; the journey including the time on steamer crossing the bay, occupies two and a quarter hours.

The existing wide gauges are five feet three inches. There is first the Central Government Railway, which starts from the city of Rio de Janeiro and goes across the Serra de Mar, with its 13 tunnels North-West across the Serra de Montequiera into the centre of the State of Minas; *secondly* the Sao Paulo Railway starting from Santos, crossing the Serra de Mar by five inclines with stationary engines and a wire rope, goes North-West through the State of Sao Paulo; *thirdly*, a few Government lines in the Northern states of which I have not the particulars.

The feeder lines to the two first mentioned are on the metre gauge, and were constructed by local Companies. On the metre gauge there are some 800 miles in the Sao Paulo and South of Minas, which go through coffee producing districts. The produce and passengers, which have to find their way to the tea port of Santos, have to be transhipped on to the wide five feet three inches gauge of the S. Paulo Railway Company. The metre gauge branches from the Central Railway in the States of Rio and Minas, are still more extensive. One of them has grown to such importance as to find independent ways of its own to reach the sea port of Rio de Janeiro. The Leopoldina Railway Company, taken over a year ago by a British Company, has nearly a thousand miles on the metre gauge and has a terminus on the opposite side of the bay from the city of Rio.

The one I mean to bring to your notice is on the two feet six inches—or 76 centimetre—gauge the same as is proposed for the Kelani Valley. This is the West of Minas Railway. The Company is a national one; was formed in 1898 on a concession from the State Government of Minas, to construct and work a Railway on the two feet six inches gauge from Sao del Rey, to a point most convenient on the Central Government Railway. The point chosen to connect with the latter was Sitire, a short distance from Barbecena—the famous sanatorium—just after the central has crossed the famous Montequiera mountains. The distance from Rio to Sitiro is 364 kilometres (about 230 miles). This was opened in 1882, the distance being about 120 kilo or nearly 80 miles from Sitire to S. Joao del Rey.

Extensions were afterwards made by the same Company and on the same gauge (2½ feet.)

One of the extensions went South-west to where the head waters of the river Parana are navigable. These waters enter the ocean at the river Plate, but are not navigable all the way from Lavras—the terminus of the narrow gauge line—to the river Plate. Large stretches of it do not admit of even native canoes—dug out—being used, but it in many parts is navigable for long distances which serve for local transport. Another of the extensions goes to the head

waters of the Rio San Francisco which empties into the ocean about 1,500 miles north of Rio de Janeiro. This is the river which Burton called the Misissippi of Brazil, he having sailed down it from the upper waters to its mouth some thirty years ago, and written a very interesting book on his travels called the "Highlands of Brazil." The whole length of this railway in operation on the two feet six gauge including branches, is 684 kilometres, or about 430 miles. Like others of the small lines which commenced as feeders to the main Central line, it has its ambition to reach the coast by an independent line of its own. Four years ago it obtained a concession to construct a line from Lavras, the terminus of one of its extensions mentioned above, to Angra dos Reis, a well sheltered sea-port eighty miles south of Rio de Janeiro, and has some 60 or 70 kilometres working, and the remainder in construction. At the same time it received a concession to construct a line from the terminus of the other extension (to Rio San Francisco) to Catalao, a city in the state of Goaz on the high plateau on which are the head waters of all the south American river systems east of the Andes, and where it is intended in some future day to make the capital of Brazil.

The two last-mentioned concessions are on

#### THE METRE GAUGE

—an example of a trunk line being on the narrow two feet six gauge and its extensions on the wider three feet three-and-half. These concessions were given subject to a law made by the new Republican Government guaranteeing interest up to a certain large amount on Railways on the *metre gauge*, and the cost of construction, or rather the Government guarantee, was not to exceed thirty contos de reis (30,000,000) per kilometre. I travelled over

#### THE TWO-FOOT SIX LINE

about three years ago. Starting from Rio at five in the morning, the train of the Central Railway arrived at Sitire at half past two in the afternoon. From the platform of the Central to that of the West of Minas one had to pass through a large waiting room, along the same level. The train on the narrow gauge seemed diminutive after coming off the one on the five feet three gauge, the wheels being smaller and the platforms of the carriages seemed very low. Entering the first-class saloon carriage (all carriages in Brazil of whatever class are on the saloon system) one was struck with the comfort and neatness presented. The saloon was certainly not so wide as the Central Railway saloons, but the passage down the centre from end to end was ample. The seats had reversible backs, were seated for two on one side of the passage, and one on the other. At the centre of the carriage, the central passage gave a slight bend, thus making half the length on one side double, and half single seats. The lavatory, like on the other lines, was at the end. Second-class was also on a similar plan but with plain wooden seats instead of cane. All were on the bogie system, goods carriages as well, and all were fitted with Westinghouse brake.

The locomotive was of the American type, four wheels coupled with a two-wheeled bogie in front and a tender; weight of engine and boiler looked like 15 tons; rails seemed 35 to 40 lb. per yard, but these technical details I shall give from official figures up to date before I close this. After giving time for lunch at a pleasant refreshment-room between the platforms of the two railways, the train started for Sao Joao del Rey at 3 p.m. The way goes about due West. For the first hour we passed through beautiful natural pasture lands, on which were browsing large herds of cattle, which help to supply the city of Rio de Janeiro with fresh milk, and good beef. The afternoon was beautifully cool and pleasant. It is doubtful if at this altitude—the top of the Montiquira range—there is ever what may be called a hot-day. As the train goes along at forty kilometres an hour—as steady and with as little oscillation as was experienced on the five feet three, we almost forget to notice that a small stream of clear water runs in the same direction on our right. This stream gradually grows larger, gets joined by other streams from the North and from the South.

Now and then the railway line leaves this stream to go along the side of a deep ravine—descending all the time, sometimes the gradient looks like one in fifty—and we see on the other side of the ravine but far below the railroad winding its way towards the central stream. The curves where the line crosses the bottom of the ravines are small, not over two and-a-half chains. As we go on the same sort of thing is repeated, a ridge is rounded and another ravine is entered. As we proceed the scenery goes in grandeur. As the central stream gets larger, on emerging from some of these ravines, we hear a roaring of waters and before we get to the ridge which has to be rounded, our eyes are delighted with the sight of beautiful waterfalls. The same is repeated several times before we reach Sao Joao del Rey. Before darkness set in the stream has grown to a river, the ground gets less undulating and we follow the left bank of the river until close to the town of Sao Joao del Rey, at which place the train arrives at a quarter past seven at night. Although the formation width is small, the line is very solidly built, culverts are all of stone and lime; of the same materials are the railway stations and workmen's houses—easily worked granite and lime-stone are found in the cuttings. Telegraph posts are made of old rails, on which are two wires. Fencing is of barbed wire with posts made of old rails, sleepers are of good native hard wood of which any quantity can be procured alongside the railway line. A few of iron and steel-girder bridges are crossed but of small span. The one near the city is a solid built structure on the British lattice girder style.

An official report was presented to the Government some three months ago, on the

#### WEST OF MINAS RAILWAY.

The Government being much interested in this Railway owing to a loan raised some two years ago on Debentures which the Government guaranteed for the purpose of being used on the extensions on the metre gauge, to which I have alluded above. I shall here use the figures of the official report, so far as they extend only towards the part on the two feet six inch gauge, 684 kilometres, to confirm or correct what I have mentioned above.

*Gradients.*—The maximum gradient is 2 per cent. or 1 in 50.

*Curves.*—The minimum curves are limited to 75 metres radius, or two and three quarter chains, but at same time it is mentioned that some of the curves on the first section over 72 metres radius—or two chains 60 links.

*RAILS.*—Rails now used are steel weighing 25 kilos per metre—or 50 lb per yard—but what was first in use were 18 kilos per metre—or 36 lb per yard. Very few of these remain at present on the line, unless on the level parts, and soon all will be substituted for the heavier material. The rail is of the "Vignol" small type (flat bottom) with fish plates at the junctions, and fastened to the sleepers with dog spikes.

*LOCOMOTIVES.*—These are all American built. The locomotive first used were 13 tons, then 18 tons and now 30 tons weight. These latter are of the "Mogul," and "Consolidation" type. They are said to pull 200 tons of paying freight, but report does not say on what gradient. The report says further on, that these locomotives draw 41 wagons—38 loaded with a paying weight of 230 tons—on a gradient on one and so much more per cent, at a speed of 45 kilometres—say 30 miles per hour, one may say, on a gradient of one in a hundred. You will note that along with the heavy locomotives they have had to substitute heavier rails. This enables them to do all the goods traffic—say a maximum of 200 tons paying load for each train,—with one goods train each way per day; and the fact is that there is one passenger train and one goods train each way per day.

*PASSENGER CARRIAGES.*—Passenger carriages are all of the saloon type with entrance from either end—very long, and supported on four wheeled bogies at each end. The first class carriages, and many of the second-class, as well as the first-made goods wagons, are all of British make. Lately second class carri-

ages and goods and cattle trucks have been made in the company's workshops, the ironwork being imported from Europe, and the Westinghouse brakes—with which all engines carriages and goods wagons are fitted—from U S of America.

There are workshops at San Joao del Rey and at the terminus of the two extensions. Those at the latter are needed to keep in repair, in addition to the railway stock, the flotilla of stern-wheel steamers and barges belonging to the Company, which ply on the Rio Parana (or Rio Grande as it is called there) and the Rio Sao Francisco. In these localities timber of first-class quality is cheap, and labour both skilled and ordinary is abundant and cheap; prepared iron work is imported duty free. It is astonishing what can be turned out by the native workmen when the supervision is European. It is such a long time since I was in Ceylon, I do not remember well how the trains there are made up; but I fancy like all railways worked with British capital and trains, they stuck a long time to the close compartment carriages with doors opening direct on to the platform of the railway station, the same as the British Company's here. In the tropics where one likes the air *even but not* to circulate freely around one, and as a part of pass-time to view all the movements about one, be they of animate or inanimate objects, nothing is like the long open saloon carriage, and here in Brazil one sees nothing else, and a journey on a railway reminds one more of a voyage on a steam boat (without the sea-sickness) than the wearisome rolling in a close stage coach, which the old British system reminds one of. It has been a subject of regret to me as a Britisher, ever since I came to Brazil, that all the railway locomotives one sees here are of North American (U. S.) make. One may see saloon carriages, goods wagons and cattle trucks, together with rails, water-tanks, turntables, travelling cranes, and weighing machines, not to mention iron roofs, lattice bridges, gas works and electric installations of British make; but for the railway locomotive, the American seems to stand supreme. If British locomotive builders are aware of this, why do they not try, by *imitation or improvement*, to supplant the American? Material and skilled labour are cheaper in Great Britain than in the United States, and the name or reputation of all other British made goods stands high above that of any other nationality, and customers on this side prefer to have dealings with the British merchant. I am slow to believe that there is either too much demand for the British pattern locomotive, and that the makers have not time to change their models, or that there is an old conservative obstinacy existing on their part; but I am rather inclined to imagine that the subject has not given them much thought. It is an important matter all the same, for even railways in this country, supported by British capital, continue to order the American locomotive.

Some years ago the

#### GOVERNMENT CENTRAL RAILWAY

had many British-made locomotives and one now and then comes across a "Stephenson" made twenty-five or thirty years ago, and on the Sao Paulo Railway, owned by a British Company, all are of British make, but the heavy work on that railway is done by stationary engines and wire rope. On other Sao Paulo railways there are a few also of British make, but the work there is easy—the wire rope having to do all the serra or mountainous work. In that state in the far interior where the Mogiana railway extends to the mountainous region of Minas, one finds the American locomotive doing all the heavy work.

It is with great reserve, and also with great respect to the opinions of Colonial Consulting Engineers, and Colonial Crown Agents, that I, as an outsider, express the opinion that a great deal of paper and ink, and what is of more importance—valuable time has been lost to the Colony on the question of *gauge*. Personally the metro-gauge is a very convenient one in my opinion. The *great thing* is to get your Railway on any gauge. The data I have given above of the West

of Mina Railway prove that—with a two-foot-six gauge, with *gradients* not more than one in fifty, *curves* under two and three quarter chains radius, *rails* steel of 50 lb. per yard, *locomotives* of thirty tons, *bridges* made to support such weight—a train of two hundred tons paying weight can be run each way per day—that is calculating only one train each way—and more can easily be run if required and that is as much as any of the branch lines in Ceylon will be required to work for some years to come.

With reference to the "Mogul" and "Consolidation" types of locomotives mentioned above—taken from the Government Engineer's Report—I may mention that the "Mogul" is on the old single cylinder, single pressure style, and the "Consolidation" is an improvement on Webb's compound cylinder, double pressure system of locomotive. There are a few of the latter on the Central Railway—five-foot-three gauge—but I doubt if they have many on the West of Mina's two-foot-six gauge.

#### GENERAL NEWS.

From Railway matters to general news the transition is easy. Coffee No. 7—the Brazilian middling type—is 6½ cts. per lb. in New York; and I write it, with the sentiment of one revealing a secret, the arrivals of coffee at the sea port towns are not diminishing in quantity, nor the stocks in consuming countries are not getting smaller. The weather is all that the incoming crop is in need of—occasional hot days with evening thunder showers.

With the New Year comes new taxes to enable the Government to meet its promises made in London in July last. First in importance is an increase on all customs duties to be paid in gold—ten per cent.; this need not be paid in sovereigns but a receipt from a Bank will be sufficient. Opposition by the Mercantile community is given to this, for goods which arrived in the harbour before Dec. 31, had not been despatched at the Customs House. There is also great delay in despatching at the Customs House; goods have to lie in lighters in the C. H. docks for some time, before all the forms can be got through to enable the consignee to get possession.

Articles of common consumption are taxed in the form of stamps, but those of national and those of foreign production, such as boots and shoes, tinned provisions, wines, spirits and liquors, also all prepared medicines either of national or foreign preparation. In fact, everything one buys now has a stamp. Tobacco was taxed before and it is now quadrupled, but: this is only for manufactured tobacco: the poor man's in roll or in leaf is free, and the grower pays nothing. The consumers do not object, for the difference in price is small; but a few agitators try to get up meetings which generally end in failure.

Exchange has not improved, nor will it do so until we hear of the destruction of some of the paper money so long talked of, but slow in coming.

The new President still continues to please everybody. The members of Senate and Camara in Deputados have all left for their homes, and all is quiet. Yellow fever has up till now kept away, although we are never at any time without an occasional case.

A. SCOTT BLACKLAW.

RAILWAYS AND PLANTING IN BRAZIL.—In the above, will be found one of Mr. Scott-Blacklaw's long and interesting letters. This time he deals with Railways on three gauges in Brazil: 5 ft. 3 in., 3 ft. 3 in., and 2 feet 6 inches—and in respect of each we have useful information; while the letter winds up with the latest general news. If Mr. Blacklaw were able to visit the estates in which Ceylon men are interested, he would have much to tell us of a novel character to our readers.

GERMAN STOCKS OF BARK AND  
QUININE.

Let us begin by saying that our figures are obtained from Government sources, and the German Government is generally credited with being as precise in its records as any Government. The statistics do not simply take the purchases of buyers in Amsterdam and agents in London and add the two together; they take cognisance from within Germany of all cinchona bark coming over the borders and of all quinine passing out of the territory, and this is what they say when collated properly:—

	Cinchona Bark.			"Quinine and Quinine Salts."		
	Imports.	Exports.	Net Im-ports.	Exports.	Imports.	Net Ex-ports.
	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.
1889-94	29,882	500	29,382	1,017	46	971
1395	2,024	121	1,903	159	6	153
1896	3,466	131	3,335	196	4	192
1897	4,205	89	4,116	251	5	246
1898*	3,536	94	3,442	201	3½	197½
Total	43,113	985	42,128	1,824	64½	1,759½

We thus arrive at a net import of bark of 42,128 tons, and a net export of quinine, &c. of 1,760 tons. The bulk of the bark imported into England and exported to Germany has been for a number of years East Indian officinalis, Ceylon succirubra, and African succirubra. If we take the total alkaloidal content of the first and the total alkaloidal content of the second and third (which amount together for the last five or six years to nearly as much as the first) we shall see a close approach to the alkaloidal figure of the Java bark. Ledger bark contains a rich percentage of quinine, but it contains precious little of anything else. "Red" bark, on the other hand, contains little quinine, but fetches up considerably with other alkaloid. We have before us some long strings of official analyses (which will be succinctly summarised later) of Java succirubra where, whilst the percentage equivalent of quinine sulphate it contains runs something like this: 2.85 1.61, 1.84, 1.84, 2.85, 2.08, 1.81, 2.25, 2.15, &c., that of the total alkaloid goes 6.40, 6.51, 5.73, 5.73, 6.40, 6.95, 5.58, 6.20 and so on. One does not expect Ceylon bark to come up to this, but in the case of officinalis the East Indian bark of even 20 years was shown (in an examination) of 20 samples by De Vrij to give results which we average at six per cent of total alkaloids. So that in this rough reckoning we are getting towards a more even percentage than some of our commercial readers anticipated. It is a case in which they can be assisted by the records of chemical investigation, but this must be conducted much more carefully than has been done here. However, we have said sufficient to show that the figures for the "quinine" exports of Germany are not impossibly high. It is well to remember in these things that if theories and facts conflict, it must be the lot of the theories to be abandoned.—*B. and C. Druggist.*

\* Of the 3,536 tons imported in 1898, 1,021 tons came from the United Kingdom, 2,170 tons from the Netherlands, 292 tons from the Dutch Indies, and 5 tons from Peru.

TEA PLANTING IN CEYLON.

To begin with, the tea industry is not what it was, owing chiefly to high exchange, low prices at Mincing Lane, over production and lack of new markets. As regards the actual work of Superintendents of tea estates, we may say that manual labour on the part of Europeans is practically unknown, chiefly for climatic reasons, but at the same time the duties are by no means light, and are at times somewhat irksome. Touching on salaries paid to Superintendents we consider that in the majority of cases they are grossly inadequate, especially in the case of beginners. For instance, a fellow coming out here would in all probability have to pay a large premium, say from £100 to £200 a year for the privilege of learning tea planting, after which, having learnt his work he may, or may not, get a billet, carrying with it the enormous salary of from R80 to R100 a month. His initiation would take from six months to a year, and he would probably draw the above salary for another year, after which, provided of course that he is a hard worker, he would probably get a rise of salary, and after some years might in time obtain a fairly comfortable position. The gist of the whole matter is, that owing to the wretched pittance called by courtesy a salary—on which beginners commence, he is unable to make both ends meet for some years, and the result is that a great many fellows are so disheartened with their prospects, that they give it up as a failure. Apart from this, there are already far too many Europeans in the island for the number of billets, and several Companies are retrenching by reducing their European staff, and replacing them by native conductors at half the salary, and who are able to live upon eury and rice. On the other hand, the life out here is very jolly indeed, and one meets the very best of fellows; in fact the Ceylon planter is famed for his hospitality, and if one could only make both ends meet on first commencing, there would be little to complain of. We have not written this letter for the purpose of running down Ceylon, as we like the Colony and the life very much, but rather to warn College fellows that though the life here is comparatively easy it isn't necessarily the "soft snap" some fellows think it to be. The men to do well here are hard working, steady and easy tempered men. Concluding, we urge any College fellows, who are thinking as a livelihood, to consider gravely all the facts of the case before coming here. Wishing all prosperity to your-elves and the old College, where we both spent some of the happiest days of our lives, &c."—From a young Ceylon planter in the *Colonial College Magazine*, for December 1893.

"THE AGRICULTURAL GAZETTE" of New South Wales for January 1899, has the following contents:—Farmyard Manure; Improvement of the New South Wales Live Stock; Insect and Fungus Disease of Fruit Trees and their Remedies; Some Exotic Grasses; Useful Australian Plants; Some Native Australian Fodder Plants; Botanical Notes; Indigenous Drugs; Explanations of Some Scientific Terms met with in Agricultural Literature; Tick Fever; The Common White Butterfly; The Hatching Season of 1898; Lactic Acid Ferment; Bees and How to Manage Them; Bee Calendar for February; Farm Notes for February—North Rivers; Riverina District; Hawkesbury District; Orchard Notes; Practical Vegetable and Flower Growing; General Notes.

## CINCHONA BARK AND QUININE:

MARKET CONDITIONS AND  
PROSPECTS;  
ENCOURAGEMENT TO CEYLON  
PLANTERS.

Messrs. C. M. and C. Woodhouse of Mincing Lane have published an unusually interesting annual report on "bark and quinine"—at one time products of great importance in Ceylon. The Report opens with a table shewing the wonderful contrast in the imports and value of bark between 1878 and 1898. In the first-named year every pound of bark imported into the United Kingdom was worth more than 2s per lb. Last year, the average value was about  $\frac{1}{2}$  per lb. The highest price ever paid for bark in the London market was in 1877 when renewed Officialis from the Nilgiris fetched 15s 8d per lb. We may add that the highest price got for Ceylon bark was for Officialis quill from Looecondra, which realized 10s 2d per lb.; from Bogawaite, over 400 lb. Officialis root bark (eight years old) realized 10s per lb. Howard's quinine at this time was 15s per oz. In 1897, the price fell to 10d an ounce. The cause of the great fall is divided between the discovery of Cuprea bark and the enormous export (15 million lb.) from Ceylon in 1886. India never exported more than four million lb. Of more importance is it to learn about the present condition and prospects and Messrs. Woodhouse shew that the statistical position is exceedingly strong. This is proved by the fact that whereas in 1893-95 there was left eight million lb. of bark in the United Kingdom and Holland for the quinine manufacturers after deducting exports, in 1896-98, there were only 234,000 lb.! In fact the exports from Holland last year greatly exceeded the imports and consumption has more than overtaken production.

On Java alone do quinine manufacturers now depend for the supply of their wants in bark; but there is no evidence that Java can meet an increased demand and India and Ceylon count for very little, and so apparently do South America; while Africa is expected to be a large consumer of quinine rather than a producer of bark.

It is quite clear that the price of bark as well as of quinine must rise during the next few years. There is, therefore, very much encouragement for Ceylon planters to plant cinchona (from fresh seed got from India or Java) on every available part of their properties, likely to be suitable. We would especially recommend planters in the Uva and Northern districts to follow this counsel; but, indeed, we know, as a fact, that it has already been acted on to a considerable extent and that, quietly but surely, Ceylon proprietors have been adding cinchona as far as they could to their products within the past twelve months. May a due reward meet their enterprise is our very sincere wish and hope for them.

## PLANTING NOTES.

MESSRS. FINLAY, MUIR & Co. have tried the experiment on one of their tea gardens, Rungamutti, in the Doora, of having a large electric plant fitted up for electric tea drying. It is purely an experimental departure, and the result of the trial of this new method will be looked for with great interest by all concerned in this industry.—*The Western Star*.

THE CHEMISTRY OF MATE TEA.—Polenske and Busse have examined a number of commercial samples of this tea, and find that the percentage of caffeine varies from .5 to .88 per cent. Of great interest is the discovery that small quantities of vanillin are almost always present. This substance has never, we believe, been found in any of the caffeine containing plants before.—*British and Colonial Druggist*, Feb. 24.

DISCOVERY OF MICA IN ZULULAND.—The *Natal Advertiser* is responsible for the statement that Mr. Dike has discovered some really fine mica in Zululand. The samples, says our contemporary, are almost pure and quite transparent. The discovery was made in the Kkandlila district. Ground to the extent of 1,800 square yards has been secured, and of this large area, mica, about six feet wide, can be traced in about 1,200 yards.

ARTIFICIAL PEARLS.—An artificial pearl doesn't sound very valuable, but when you are base enough to make the oyster himself secrete it the case is rather different. Art stimulates nature in many directions, and the latest example in the proposal of Signor Comba, a distinguished Italian naturalist, to cultivate the pearl oyster on the Calabrian coast. Signor Comba, it appears, has been for nearly forty years experimenting with pearl oysters. He treats them with his process (a process of heating), and they proceed to make pearls. From eleven oysters he has taken thirty-nine pearls. It is proposed to acquire 10,000 pearl oysters, of which 500 will be set aside for breeding purposes. Making all necessary allowances, it is expected these will give annually 5,020 tons of mother-of-pearl, which, even were it all of the third quality, and worth but 1,500 fr. a ton, would yet bring in a sum total of 7,530,000 fr. To this may be added the worth of the pearls, which might be produced artificially from the 9,500 oysters not used for breeding. The Signor is floating a company with a capital of two million lire.—*Pastime*.

CURIOUS TREE-GROWTH.—On the invitation of one of the partners, we, (*Indian Gardening*), paid a visit to Messrs. Monteith and Co.'s Tannery at Ballygunj Calcutta, the other morning to inspect an extraordinary tree of the common "Pipul" (*Ficus religiosa*) growing in the tannery grounds. About 25 years ago a wooden gateway arrangement was put up, that is, two upright posts and a third connecting the two at the top. A bird seems to have dropped a seed of this *Ficus* on one of the upright posts, which germinated, and sent down its roots along the post; and, growing for 25 years, it has amalgamated the posts with its own trunk. While making this growth, the tree threw out a lateral branch along the horizontal beam, and, on reaching the other post, threw out an aerial root, which descended down the other upright, and has now absorbed the post into its second trunk, as it were. The tree is very healthy, and is likely to grow into a great size. In time the dry wood of the uprights will become entirely absorbed into the tree, and there will be nothing left to show how it originated.—*Pioneer*.

## CINCHONA BARK AND QUININE.

## REPORT FOR 1898.

Few articles of commerce have ever been depreciated so much in value in consequence of over-production as have cinchona bark and quinine.

The following statistics, taken from the Board of Trade Returns, give some idea of the extent of the fall in values:—

	Imported into U. K. lb.	Valued at £
1878 ..	6,131,552	653,228
1881 ..	14,024,304	1,812,501
1886 ..	16,231,104	801,353
1891 ..	11,933,712	250,097
1896 ..	3,952,592	61,573
1898 ..	5,143,040	93,132

The above figures are manifestly only approximate, as whilst the supplies in 1879 mainly consisted of Columbian barks with an analysis of rather under 2 per cent of quinine, the Ceylon and East India barks were considerably richer, and contained an average 2 to 3 per cent., whilst the average percentage in Java barks has of late been over 5 per cent.

Mr. Clements Markham, in his book on Peruvian bark, states that the sources of supply of bark to the London market from all parts of the world from June, 1879, to June 1880, were:—

	lb.
From Columbia ..	6,002,000
Do India and Ceylon ..	1,172,000
Do South America (except Columbia) ..	959,000
Do *Java ..	70,000
Do Jamaica ..	about 21,000
	<hr/> 8,224,000

\* To the Amsterdam market.

In addition about 1,000,000 lb. South American were shipped direct to the United States.

The highest price ever paid for Bark in the London market was in 1877, when some renewed Officialis Bark from the Nilgiri Plantations was sold at 15s 8d per lb.; supposing this parcel to have contained 6 per cent of Crystallised Sulphate of Quinine, the value of the unit would have been at that time over 2s 6d per lb. as late, however, as the year 1880 considerable quantities of Bark were sold about 2s per unit per lb. From that time the market has been steadily declining until the lowest point was reached in January, 1897, when the Public Sales in Holland sold at an average unit of 2-12 cents per ½-kilo (equivalent to under ¾d per lb.) In 1877 "Howard's" Quinine (in bottles) was sold at 15s per oz.; on the 31st December, 1878, their quotation was 12s 6d per oz., on 31st December, 1886, 2s 6d per oz., falling by degrees, in sympathy with Bark, till the lowest point was touched in 1897, when business was done at 10d per oz.; at this time sales of German Quinine (best marks) were made at 7½d to 8d per oz.—the lowest price on record.

The cause of this great depreciation in value is not far to seek; in 1880 the discovery of Cuprea Bark from the United States of Columbia, large quantities of which were imported in the years 1880 to 1885, gave the first shock to the market, but it was the enormous supplies shipped from Ceylon (these in the year 1886 reached their maximum of 15,000,000 lb. which, after first destroying the South American trade, brought prices down so low that it was no longer profitable to ship, and in most of the Ceylon Estates the Bark was uprooted and Tea was planted instead. The exports from British India have never reached more than 4,000,000 lb., and here as in Ceylon planters have generally (except on a few estates in the Travancore district) given up its cultivation. Java, however, owing to the superior quality of its Bark, has been able to hold its own, and exports have steadily increased until now it has practically the control of the market.

The present statistical position is we think a strong one, the Imports and Exports of bark in United Kingdom and Holland for the three years 1896-98 compare with the previous three years as follows:—

	1896-98.	1893-95.
IMPORTS		
into U. K. ..	11,853,000	18,723,000
„ Holland ..	21,649,000	28,899,000
Total ..	<hr/> 43,502,000	<hr/> 47,622,000

	1896-98.	1893-95.
EXPORTS		
from U. K. ..	8,777,000	18,020,000
„ Holland ..	31,491,000	21,555,000
	<hr/> 43,268,000	<hr/> 39,575,000

Left for English and Amsterdam quinine Manufacturers and for replenishing Stocks

234,000	8,088,000
---------	-----------

thus showing that, even with the increased supplies received in 1898, consumption has of late practically overtaken production. (It is worthy of note that the Exports from Holland during 1896-98 exceeded the Imports by nearly 3,000,000 lb.) This probability is further confirmed by the statistics of quinine; thus we find the Exports of quinine and quinine salts from Germany during the same periods were:—

	1896-98.	1893-96.
Total ..	22,900,000	15,306,000

As regards the prospects of supplies in the future, we have seen that shipments from Java, if maintained as at present, are barely sufficient for consumption, even when supplemented as they were last year by larger imports from British India and Bolivia. But advices from India state there is very little bark left there, and shipments will show a large falling-off in future.

Quinine is more or less a war article, and is a necessity for troops fighting in the tropics or in marshy districts. With the enterprise shown of late years by most nations in securing colonies in Africa, &c., and whilst the sudden opening up of China by railways, &c., it seems probable that the consumption of quinine is more likely to increase than to diminish, and should any extraordinary demand arise, it is difficult to see where supplies of bark are to come from unless Java planters continued to extend their plantations on a large scale at a time when the market was most depressed, which we think is hardly probable. Of course, any great rise in prices would induce planters all over the world to grow Bark, but it would be some years before any large supplies would be available, and in the meantime prices might be forced up considerably.

The market has been for the last year or so in a sensitive state; in 1897 a slight falling off in shipments from Java caused a rise in the value of the unit from under ¾d per lb. to 1½d per lb., and though prices have since declined to about 1d per unit, the circumstance of a small Dutch sale being advertised for 16th inst., coupled with advice of moderate shipments from Java for January, have brought speculators into the market for Quinine, and prices have advanced about 20 per cent, from 10½d per ounce to 1s 0½d per ounce.

To sum up, it appears that consumption has at last overtaken production, and increased shipments from Java will be required to supply manufacturers and make up for the expected deficiency from British India and Ceylon, and in any case we fancy the days of Quinine selling below 1s per oz. are numbered, and we think it is safe to prophesy that the average value of the unit during the next three years will be above the average of 1896-1898.

C. M. & C. WOODHOUSE.

30, Mincing Lane, 9th Feb., 1899.

## CINCHONA ANALYSIS AND THE GERMAN FACTORIES.

It was, perhaps, somewhat rash on our part to undertake the terrible amount of research that has been necessary to say with anything like confidence what is a fair average per cent of alkaloidal content in the bark which has entered Germany during the last few years. Even after comparing extensive series of analyses that have been made officially in Java and British India, and availing ourselves of the kind assistance of Mr. David Howard, we feel that our figures ought to be placed before readers with explanations of the way they have been arrived at, so that they shall not bear an appearance of absolute precision. Commercial men, however, will be satisfied by a very brief statement of these, and as our object has been mainly to show that although confessedly the 5 per cent quinine average we allowed in the bark imported into Germany was too high, it was not so much too high an alkaloidal figure as to throw doubt on the official Government figures of the imports of bark and exports of quinine.

We threw out a suggestion last week that several correspondents had been misled through ignoring altogether the content of alkaloid in bark other than quinine. On the other hand, the laboratory man might make a mistake in the other direction by looking upon the whole of the alkaloid in the bark as so much merchantable product. To avoid both mistakes, we have employed in our inquiries, and also in what follows, the term "available alkaloid" to express all that can be extracted from the bark and sold. This will, as a practical result, almost resolve itself into calculating the amount of quinine and cinchonidine in the bark, and that, though subjected to checks by us, is very nearly the principle followed in our calculations.

The matter then stands thus: We sent to Germany and Holland in 1893-8 (inclusive) about 7,360 tons out of a total of 21,121 tons that Germany received altogether, most of the rest of her imports being from Java, through Holland, or direct. The bark we sent her had amongst it about 3,706 tons of Indian, 2,465 tons of Ceylon, 602 tons of African, 233 tons of Javanese, and 370 tons of South American, assuming that we sent her supplies of these barks in the same proportion as we received them. Now, if trustworthy analyses of a comprehensive character of all these barks had been published, it would be comparatively easy to calculate how much available alkaloid Germany has obtained through England; and the Java bark content presents little difficulty in this way. But we have to gather our figures for the "English" bark from all sorts of sources. Taking the East Indian as one that has been subjected to independent analyses of a fairly extensive character, and neglecting such of these as are abnormal, we note that Hooper in 1894-95 speaks of bark which had a quinine sulphate yield of 3.94 per cent and a content besides 0.71 per cent cinchonidine, .13 per cent quinidine, and .52 cinchonino as being of the average composition of officialis bark. Again, the average quinine sulphate yield of all crown bark ground up at one of the Government factories in India during 1889-97 was 3.6 per cent. We have spoken of the yield partly because—and this is important to note—the factory results agreed well with the laboratory analyses. These analyses give much higher content than what was obtained, for instance, by Messrs. Boehringer and Söhne from East Indian bark a few years previously (1833-1839 and 1890). But they cover years which we are now noting, and are of a comprehensive character.

Following the same plan with red bark, we note that Hooper, in 56 specimens, found in average of 1.40 per cent quinine (not sulphate), 2.25 per cent cinchonidine, 1.92 per cent cinchonine. A corresponding analysis of crown bark gave 2.93 per cent of quinine (not sulphate), and 1.59 of cinchonidine besides other alkaloids. Red bark, whether from Java, Ceylon, India, or Africa, does not differ much. In the case of the South American

barks, the percentage nowadays is not important as a commercial problem, but Germany has taken large amounts of quinine from cultivated calisaya bark during the last ten years, and she has found it to average pretty well  $4\frac{1}{2}$  per cent of quinine sulphate, containing little else.

These figures and others which we have in our possession lead us to think that if we allow  $4\frac{1}{2}$  per cent as an amount of "available alkaloid" in the bark Germany has obtained from England during the last six years,  $5\frac{1}{2}$  per cent of quinine sulphate in all the bark she has obtained elsewhere, and in addition to the latter  $2\frac{1}{2}$  per cent of cinchonidine from the red bark she has obtained from Java (and not through us), we shall form a fair estimate of the total available alkaloid that Germany has purchased during that period. This would give a purchase of 1,113 tons of alkaloid. The average for the six years was 1,082 tons, leaving about 31 tons (and the residue of former years) for home consumption during these six years, and for stock at the end of 1898.—*British and Colonial Druggist.*

POOR MAURITIUS: A comparison between Mauritius production in 1892 and 1897.—The *Cerecun*, in a recent article, discussing one of the arguments advanced by the Secretary of State in justification of the refusal of Her Majesty's Government to guarantee a Loan of £500,000 to the Colony, observes that Mauritius is at the present time more in need of the Imperial assistance than she was in 1892 when she received generous help from the mother country. In support of this contention, our contemporary proceeds to quote figures to give particulars. In 1892, after the terrible hurricane that swept over the Island and spread ruin and desolation on all sides, the total production of sugar amounted to lb. 180,000,000 which was sold at an average price of R12 per 100 lb. yielding therefore a revenue of R21,600,000. In 1897, although the crop was a larger one, reaching lb 240,000,000, the value received was R19,200,000 only of R 2,400,000 less than in 1892 the explanation for the difference being that while the average price fetched R12 per 100 lb in 1892 the average rate at which we sold our sugar in 1897 was R8 per 100 lb. Furthermore, on account of the famine in India causing a rise in the rice market, the planters and the colony in general had to spend more money on that commodity. It is estimated that on that head alone, the loss to Mauritius could not have been less than R4,000,000. If we add to this amount the R2,000,000 for decline in value, the total loss to the colony would reach the high figure of 6,400,000 on a gross receipt of R19,200,000, leaving a net profit of R15,200,000 as compared with that of R21,600,000 in 1892. So that in 1897, Mauritius was less rich by R6,400,000 than in 1892. Yet in the latter year, Her Majesty's Government thought it imperative to give their guarantee for a loan of £600,000, while in 1897, when the circumstances of the Colony, taken as a whole, have been aggravated, we are told that to obtain the support of the mother country, it is not really essential that we should demonstrate our actual distress, but that we should show that it has come about in a sudden and unexpected manner. Mr. Chamberlain seems to have been held personally responsible in some quarters for the rejection of the request of the Chamber of Agriculture. This is unfair to him. An ordinary loan contracted by a Crown Colony requires, it is true, the approval of the Secretary of State for the Colonies who acts on his own personal authority in the matter, but a loan with the guarantee of Great Britain requires the concurrence of the Cabinet and the assent of the Imperial Parliament.

PRODUCE AND PLANTING.

**CHEERING.**—The Calcutta correspondent of the *Times* cables Messrs. Thomas's annual tea report, in proof of the revival of trade since Christmas. This report shows that the export from Calcutta exceed last season's by over 4,000,000lb. There is an increase of 75 per cent. to America, 101 per cent. to Bombay, and 60 per cent. to Continental, Black Sea, and sundry parts. The only decrease shown in the export to Australia, but the 10 per cent. defect from India is supplied by Ceylon. The future outlook is considered most hopeful, many orders remaining unfulfilled at the close of the season. Foreign consumption is steadily expanding. The present state of the currency conditions has checked extensions which might have caused over-production. The sterling price of tea fell to the lowest recorded level in September, but prices since rose one anna per lb. The trade with America has been greatly facilitated owing to the establishment of a direct monthly steamer service to New York. Whole leaf kinds up to about 8d per lb. were in re particularly in request, and there showed an advance of 1/2d to 3/4d per lb. on previous quotations, while very little was sold under 6 1/2d, and it is not improbable that values of these descriptions will still further improve, the quantity advertised to come forward next week being again very limited. Medium broken pekoes, although in good request, remain unchanged, but the finest sorts were in active demand at somewhat higher rates."

**CHEESY TEA.** There is a letter in the *Grocer* from Messrs. Brooke, Bond and Co., Limited, calling attention to the increasing proportion of "cheesy tea" from India and Ceylon. They say "the most disagreeable, malodorous taint, strongly reminiscent of rancid cheese, is due to sappy, immature timber of unsuitable type being used in the manufacture of tea-chests on the Indian and Ceylon plantations." As showing the prevalence of the evil Messrs. Brooke Bond append a detailed list of 418 packages which have been rejected for "cheesiness" by their own warehouse inspectors during a period of only three weeks. A list of gardens and other particulars are given to reproduce these details in order that those interested may acquaint themselves with the indictment made against their tea. The following are the details given by Messrs. Brooke, Bond, and Co.:

JANUARY, 1899.  
CEYLON.

2nd D-butgama	..	3938/49	..	Very cheesy
3rd Deb-butgama	..	3950/6	..	All cheesy
3rd Katooloya	..	211/15	..	All cheesy
11th K A W	..	181/9	..	All cheesy
11th Eulgama	..	922/30	..	All cheesy
11th K A W	..	197/201	..	Mostly cheesy
19th Eulgama	..	941/6	..	All cheesy
19th Katooloya	..	{ 87/97 }	..	All cheesy
		{ 98/100 }		
20 h Eulgama	..	931/40	..	All cheesy

"To us," says Messrs. Brooke, Bond, and Co., "who have experts ever on the watch for any defective package, and who most carefully examine every one of all the thousands of chests which come into our warehouses every week, there is no possibility of a bad tea being passed into a blend; but in the case of the grocer buyer, who still follows the old fashioned plan of buying un-blended teas, there is grave danger of a more or less tainted package, or part of a package, being unsuspectingly included in a home-made mixture. Such an accident would probably contaminate a whole blend, and, by afterwards disgusting and driving away consuming customers, might cause a grocer grievous loss without, perhaps, his ever realising the reason. There are two principal practicable remedies. The planters must more carefully select and dry all timbers from which they make chests; and all teas, whether previously 'bulked' abroad or not, must be 'bulked' in London, all the containing chests as well as all the contained

teas being systematically and carefully examined by experts.

COFFEE PROSPECTS.

Messrs Crossman and Bro., of New York, estimate the probable yield of Brazil coffee in 1899-1900 at not less than 10,000,000 bags. Other estimates are much lower, and therefore there is not much reliance to be placed on the forecast. Stocks of coffee, however, continue to accumulate, and liberal supplies may be expected from India, Jamaica, Costa Rica and elsewhere. There is not much chance for a rise in prices unless something quite unforeseen occurs.—*H. and C. Mail*, Feb. 4.

CEYLON PROVINCIAL ESTATES CO., LTD.

The Directors beg to present their Report for the year ended 31st December, 1898, together with the annual statement of the Company's accounts.

The tea crop amounted to 430,951 lb. against an estimate of 425,000 lb. for the year, which may be regarded a satisfactory result, seeing that the season was not altogether a favourable one for the growth of leaf.

The total profit for the year was R76,871.16. The cost of producing the tea and bringing it to market works out at 26 10 cents per lb against 29 25 cent. last year, and the expenditure includes a sum equal to 1 1/2 cent a lb. for insuring operations.

The average nett selling price of the teas, on the other hand, shows a falling off from 1897, the rates being 42.73 cents and 45 1/2 cents per lb. respectively.

The clear profit resulting from the season's working, after providing for interest on Mortgages, &c., amounts to R60,661.19, out of which an interim dividend of 3 per cent has been paid to the share holders, and the Directors now recommend the payment of a final dividend of 4 1/2 per cent on the paid-up capital, making 7 1/2 per cent for the year.

The interim and closing dividends together account for a sum of R49,950 and after providing for Directors fees, it is proposed to apply the surplus in part payment of the expenditure which has been incurred during the year on permanent works not chargeable to revenue. This expenditure amounts to R25,168.76, and includes the cost of coupling the factory on Brownlow and nearly all the necessary outlay in connection with the new works on Adneven, together with the upkeep of land not yet in bearing on the two estates.

Both properties are now well provided with all necessary appliances and accommodation for the present crops, and not much further outlay will be required to deal with the increased output of tea which may be expected when the young fields have reached maturity.

The estimates of expenditure for 1899 are again based on a crop of 425,000 lb. of made tea, there being hardly any young land coming in, and the f.o.b. rate works out at 27.33 cents a lb., including the cost of manning 180 acres of tea.

The following is a definition of the Company's properties as at the end of 1898:—

	Glassangh.	Brownlow.	Total.
	acres.	acres.	acres.
Tea in full bearing	.. 426	400	826
Tea in partial bearing	.. 34	—	34
„ planted in 1895	.. 14	—	14
„ planted in 1896	.. 14	50	64
„ planted in 1897	.. 4	30	34
„ planted this season	.. 4	—	4
Total tea	496	480	976
Forest	.. 15	32	47
Waste and Stream	.. 19	64	83
Grass	.. 2	8	10
Total	532	584	1116

Mr. F. L. Clements retires from the Board on this occasion in terms of the Articles of Association, and being eligible offers himself for re-election. The appointment of an Auditor for 1899 will rest with the meeting.

## HÖRREKELLY ESTATE COMPANY.

The report was as follows :—

The Directors have pleasure in submitting the accounts of the Company for the year ending 31st December, 1898, shewing, after writing off R4,405.80 for depreciation on buildings, plant and machinery, a profit of R23,873.11, which, with the balance of R916.88 brought forward from 1897, and the sum of R58.62 unclaimed balances appropriated, gives a total of R24,848.14 available for distribution.

The Directors recommend that a dividend at the rate of 6 per cent on the capital of the Company be declared. This will absorb R24,000, and leave a balance of R848.14 to be carried forward to 1899.

The crop secured has been a fairly satisfactory one. The mortgage balance of R5,000 has been paid, and the property is now free of encumbrances.

The working of the estate for the years 1896, 1897 and 1898 compares as follows (the item of interest being excluded):—

	1896.	1897.	1898.
Expenditure on Estate and in Colombo office	R30,463.23	32,066.69	37,014.85
Number of Coconuts produced	1,548,031	1,400,835	1,437.85
Quantity of Coir Fibre made	Ballots 23,859	20,563	55,474.

Two Directors—Messrs. C. E. H. Symons and F. C. Loss—retire by rotation, and are eligible for re-election.

The shareholders have to appoint an Auditor for 1899.

The Directors consider the current year's prospects favourable,

## NEW CINCHONA BARK.

At a recent meeting of the Zurich Pharmaceutical Association Professor C. Hartwich brought before the meeting three new kinds of cinchona bark. Two of these were from South America, and both were supposed to be of the old Calisaya variety, but one of them only was of that class and the other was the cinchona of Cochamba. The barks were very poor in alkaloids, the first containing  $1\frac{1}{2}$  per cent and the second 1.8 per cent, and neither gave the thalioquin in reaction, so that they were free from quinine. Both differ from the flat Calisaya in structure. Although they seem to belong to the yellow barks, the light colour supporting this theory, they most closely resemble Maracaibo bark.—*Chemist and Druggist*, Feb. 25.

## A SUBSTITUTE FOR CATECHU.

Cay-da, a species of mangrove growing in French Cochinchina, which is used by the inhabitants of Annam as a dye, has been recommended by M. Piequet, of Saigon, as a substitute for catechu. Experiments with cay-da have been successful, and the production of the dye in French China is to be encouraged. Catechu to the value of 1,492,625*l.* was imported into France in the first six months of 1896.—From *Chemist and Druggist* for February.

## VANILLA FOR GERMANY.

Dr. W. Busse states in a German official publication (quoted in *Pharm. Centralh.*, January 5) that the results obtained in the cultivation of vanilla in German East Africa leave no doubt that this colony is well adapted for it. The experiments made in Cameroon district give equally favourable prospects. East African vanilla holds its own with the best Bourbon kind, and at no distant time it is believed that the supply from the German Protectorate will cover the German demand.—*Chemist and Druggist*, Feb. 25.

## THE KANAN DEVAN PLANTERS' ASSOCIATION.

The following are the Minutes of the Quarterly General Meeting held at Manale, on the 16th ultimo :—

Present.—Messrs. H. E. Tollemache, T. W. Schmid, A. J. Fox, A. W. John, R. Hedges, A. Cameron, J. A. Hunter, C. Burn Murdoch, Nicol Thomson; J. S. Sealy (Honorary Member), Baron von Rosenberg (Chairman), H. M. Knight (by proxy, Baron von Rosenberg.)

MR. A. H. SHARP'S RETIREMENT.—Proposed by Baron von Rosenberg, "that this Association expresses its regret at the resignation of Mr. A. H. Sharp, its Honorary Secretary for nearly 10 years, on his leaving the district. That it records its grateful appreciation of his unvarying and successful services to the Association—that it resolves to commemorate this appreciation by presenting him with a Silver Punch Bowl, to bear the following inscription—'Presented by the members of the K. D. P. A. to Mr. A. H. Sharp, Honorary Secretary of the K. D. P. A. during nearly 10 years, February 18th, 1899.'" Seconded by Mr. T. W. Schmid and carried by acclamation.

CHAIRMAN.—Proposed by Mr. Thomson that the question of a Chairman vice Baron von Rosenberg be held over till next meeting in May. Seconded by Mr. R. Hedges and carried.

HONORARY SECRETARY.—Mr. C. Burn Murdoch was elected Honorary Secretary *pro tem*, till May, and accepted conditional to the Association clerk, who knows the work being allowed him. Proposed by Mr. Hunter, that should it not be possible to arrange for the clerk to do Company's work as well as the Association work, the Association will pay his entire salary for the three months. Seconded by Mr. Cameron and carried.

K. D. P. A. AGENCIES.—Proposed by Mr. S. A. Hunter, that from 1st April, 1899, the services of the K. D. P. A. Agents at Ammayanaikanur and Boday be dispensed with by the Association. It is suggested that from 1st April Agents shall be arranged for separately by the K. D. H. Produce Company and by individual planters, but, if possible, that the same Agent at Ammayanaikanur should be retained by all parties, and that their accounts be sent in separately. Seconded by Mr. R. Hedges and carried.

Proposed by Mr. J. A. Hunter, that this meeting do confirm the action of the President in paying the Association R1,000 on behalf of the outside members for the land and buildings belonging to the K. D. P. A. at Boday, and that steps be taken to put the purchasers in possession. Seconded by Mr. Nicol Thomson and carried.

Proposed by Mr. R. Hedges, that an entry in the account of R500 advance to cart contractor by Messrs. Finlay, Muir & Co., be eliminated therefrom. Seconded by Mr. T. W. Schmid and carried.

SURPLUS FUNDS.—Proposed by Baron von Rosenberg, that as the Association accounts show a considerable surplus, and passing members having reported that the sum of R700 voted will be quite insufficient for repairing the Boday Mettoo Ghaut, a further sum of R1,000 be voted for this purpose. Seconded by Mr. J. A. Hunter and carried.

Proposed by Baron von Rosenberg, that any further surplus funds, after the Mettoo Ghaut Road has been put in order, be expended in taking over the three Tanelam houses between Boday and Deviklam at half cost price. Seconded by Mr. J. A. Hunter and carried.

LABOUR ACT.—Proposed by Baron von Rosenberg, that the Association supports Mr. Romilly's letter and the points called attention to therein—extradition into Native States is to be of the first importance to us, it should be made as direct and simple as possible, and the cumbersome roundabout procedure in force in criminal cases avoided—a Labour Act would be of little or no use to us unless extradition is also given. Seconded by Mr. J. A. Hunter and carried.

THE NAHAVILLA ESTATES CO., LTD.

The Directors beg to present their Report together with a statement of accounts for the fifteen months ended 31st December 1898.

The Shareholders were duly advised that for convenience of working it had been decided to extend the season from the 30th September last to the 31st December, and the agricultural year from now onwards will date from the 1st of January.

The Tea crop secured for the fifteen months amounted to 362,856 lb. and the Coffee crop for the same period represented a total of 956 bushels of parchment.

The working for the fifteen months after deducting a sum of R4,747.40 for lost Coast advances, shew a profit of R20,312.56. The nett surplus after providing for interest on mortgages and other charges amounts to R16,741.39, equal to about 1 per cent on the paid up Capital of the Company, but seeing that there will be further expenditure to meet under head of Buildings and Machinery, and that there is also the upkeep of a large acreage of young Tea to provide for, which is as yet giving no returns, the Directors would recommend that this balance be carried forward to the New Year.

It will be seen that better prices have been obtained for the Ury, Mahapahagalla and Galella Teas than last year, and since the completion of the Nahavilla Factory, this Estate Teas have also improved.

The expenditure on Galella, through unavoidable causes was exceptionally high, and prices were very low for the first part of the season. Lately they have shewn considerable improvement, and as the expenditure for 1899, including cost of manufacture at Edamulla Factory is estimated at 34 cents per lb., a fair profit should result this year.

The Shareholders will have been prepared, from what was said in the last report for some loss under head of Advances, and the Directors do not conceal the fact that there are further sums which may have to be written off, but the Superintendents will do their best to recover outstanding.

The estimates for the new year point to a total tea crop of 345,000 lb. and 1,360 bushels of coffee. There will be no cinchona bark, the trees having all been coppiced this year. These estimates of produce are considered to be well within the limits of reasonable expectation, and if prices are maintained prospects point to a fairly good profit on the season's working.

The following is a definition of the Company's Estates as at 31st December, 1898.

	Nahavilla	Ury	Maha-pahagalla	Galella	Total
	A.	A.	A.	A.	A.
Tea in full bearing	251	209	195	*294	949
Tea in partial bearing	47	101	22	—	170
Tea not in bearing and being planted	75	217	35	6	333
Coffee	.. 112	41	—	—	153
Forest	.. 45	66	5	72	188
Grass, Fuel, Trees and Patana	.. 71	132	84	244	531
	601	766	341	616	2324

A detailed plan shews the acreage of tea in bearing on Galella to be 294 instead of 313 acres as per last statement.

Mr. ES Grigson, on his return to the Island resumed his seat on the Board of Directors, and upon Mr. Mason leaving for England, the vacancy thus created was filled by the appointment of Mr. Gordon Pyper. Mr. Orchard now retires by rotation, and being eligible offers himself for re-election.

The appointment of an Auditor will rest with the meeting.—By order, GEORGE STEUART & Co., Agents and Secretaries.

Colombo, Feb. 24th 1899.

THE ROEBERRY TEA COMPANY.

THE REPORT

of the directors was submitted as follows:—

Directors:—Percy Bois, Esq., W. H. Figg, Esq. and George Alston, Esq.

	ACREAGE:	
Tea in bearing	.. 512	acres
.. planted 1896	.. 1274	..
.. .. 1897	.. 50	..

7094  
Cardamoms planted in 1897... 4 ..

7134 acres in cultivation.

The Directors have now to submit their Third Annual Report and Accounts, being those for the year ending 31st December, 1898. The yield of Tea during the period has been 180,500 lb., costing 30.94 cts. per lb., as against 35.31 cts. last year, and realizing 39.94, as against 38.50 cts. for the same period.

On a reference to the accounts, it will be seen that the sum at credit of Profit and Loss Account, including the sum brought forward from last year, is 9,113.65, after allowing for Depreciation on Buildings and Machinery, and out of this sum the Directors recommend that a dividend at the rate of 3 per cent per annum be declared, absorbing R9,000.00, leaving a sum of R13.65, to be carried forward to the current year.

Owing to very unfavourable weather during the latter portion of the year the crop fell considerably short of the estimate which was 200,000 lb., and the result of the year's working is consequently not so satisfactory as was at one time anticipated.

The estimate for the current year is 290,000 lb. of Tea as against an expenditure of R38,390.00.

Mr. W. Sandys-Thomas visited the estates on the 21st December last, and found everything generally in a satisfactory condition.

The retiring Director is Mr. Percy Bois, who is eligible for re-election.

The appointment of an Auditor for the current year rests with the meeting.—By order of the Directors.

BOIS BROTHERS & Co., Agents and Secretaries. Colombo, 2nd March, 1899.

PALMERSTON TEA COMPANY.

THE REPORT.

The report of the directors was then submitted as follows:—

Directors:—Percy Bois, Esq., W Sandys-Thomas, Esq., G C Alston, Esq.

Acreage:—		
Tea in bearing	..	451 acres
do coming into bearing	..	8 do
do not in bearing	..	4 do
Jungle and timber	..	26 do
Grass, &c	..	4 do

Total 493 acres

The Directors have now to submit their third annual report and account, being those for the year ending 31st December last. The yield of the tea during the period has been 198,941 lb costing 29.55 as against 32.18 last year, and realising 46.12 per lb as against 50.69.

As will be seen from the accounts, the net profit for the year amount to R22,237.73 after writing off the sum of R5,768.22 for depreciation on buildings and machinery. An interim dividend of 2 per cent was paid on the 10th Sept. 1898 absorbing R3,200, and the directors recommend that a final dividend of 3 per cent be declared, making a total of 5 per cent for the year and leaving a sum of R1,787.73, to be carried forward.

Mr. W Sandys-Thomas visited the estates in January and found everything generally in a satisfactory condition.

In terms of the Articles of Association, Mr. G C Alston now retires from the Board, but is eligible for re-election.

The appointment of an auditor for the current year rests with the meeting.—By order of the Directors, BOIS BROTHERS & Co., Agents and Secretaries.

## THE INDIAN TEA ASSOCIATION (LONDON).

The following is an abstract of the proceedings of a meeting of the Committee held on Tuesday last:—

Present:—Messrs. D Cruickshank (in the chair), A Bryans, G W Christison, R Lyell, J Riddell, A G Stanton, J N Stuart, W H Verner, and C W Wallace. The minutes of the last meeting, held on Tuesday, Feb 9th 1899, were read by the secretary and confirmed.

Correspondence with Calcutta and New York, which had been previously circulated to the members, was laid upon the table.

The draft interim report of the American and Foreign Tea Committee was submitted, and after discussion was approved, and it was decided to issue the same, together with Mr. Blechynden's report. It was also decided to issue a circular asking for support for the proposed new levy to be made in Calcutta on the same lines as before, but on the understanding that the funds shall be employed to push Indian teas in any part of the world, and not in the United States only.

CONDITIONS OF SALE AT PUBLIC AUCTION.—It was resolved that Messrs. A Bryans, J N Stuart, and W H Verner be appointed a sub-committee to deal with the matter in accordance with the previous resolution and views of the General Committee.

STOCKS OF TEA.—Read letter of 2th inst., from Mr. A G Stanton, enclosing letter from Mr. John McEwan, of McMeekin and Co., on this subject. The secretary was instructed to ask the Tea Brokers' Association to try and obtain information on the point from the warehouses. Telegrams from New York, dated 16th and 21st inst., were read and noted.

A financial statement, showing the position of the Indian Tea Fund at date, was laid on the table.

ERNEST TYE, Secretary.

—H and C Mail, Feb. 4th.

### PLANTING NOTES.

PEARL OYSTERS AND SHELLS.—A seasonable article on "Mother-o'-Pearl trade" will be found in our daily and *Tropical Agriculturist*. The trade in "shells" is evidently reviving. Some years ago, he castaway shells of the pearl oysters at Aripu were collected and shipped to Colombo and thence to Europe at the instance of a local firm. But later on, the trade was stopped as unprofitable. Unfortunately there are no shells to gather on our coast now, until we have another pearl fishery and of the prospects of this Capt. Donnan will shortly tell us.

TEA IN INDIA.—It must be pleasing news to all holders of tea stock—says the Calcutta Correspondent of the *Pioneer*—that there has been a sharp improvement in the value of tea in London. Type tea, which was selling three months ago at 5½d. per lb. is now quoted 7½d. Seeing that the crop of the past year has all gone forward, there is every reason to believe that this price will be maintained, if not advanced upon, for the first two or three months' shipments of the coming crop. I need not to say that the current price would admit of even a backward garden working to a fair profit. The weather so far has been excellent for tea, and the season will be an unusually early one in most districts. Past experience of early seasons warrants us in looking forward to profitable returns, as the bushes are not checked by cold weather as is the case when the season commences late. Like other stocks, tea shares have been influenced by the plague announcement. But as gardens cannot be affected to any extent by the presence of plague in Calcutta, there is no reason for a decline on this ground.

THE CAMPHOR SITUATION is said by the *Drug Reporter* of New York (January 30th) to be getting stronger. We quote the following:— Elsewhere in this issue of the Reporter we enumerate some statistics in regard to camphor. They show that the exports from Japan during the four years 1888-1891 averaged about 45,000 piculs per year, and that there was no increase from 1892 to 1896. In 1897 the amount exported was only 21,400 piculs, and while the figures for the whole of 1898 are not yet to hand, they will probably not exceed 19,000 piculs. The exports from Formosa during the season, July to June are:

1894-95.....	25,300 cases
1895-96.....	30,900 "
1896-97.....	29,500 "
1897-98.....	17,850 "

The stock in Hong Kong, which at one time during 1898 was estimated at 11,000 cases, is now said to be but 2,000 cases. All of which tends to justify a bullish feeling as to values.

THE SEYCHELLES: THE GURAMI FISH; VANILLA AND DEVELOPMENT WITH TRADE.— We call attention to a very interesting letter from Mr. Harold Baty of the Seychelles in another column, giving useful information in regard to the gurami fish which we are so anxious to see introduced around Colombo if not higher up in the island. Mr. Baty is good enough to send us a small box of plants, on the leaf of which gurami is said to feed and we have to thank him for this attention as well as for the promise of some specimens of the fish on a future occasion. We have also to thank the B.I.S.N. Company and the Commander of the ss. "Lawada" for their attention in this matter. As regards Vanilla and progress generally, Mr. Baty gives very timely counsel; for, the latest news we had was to the effect that any young man with £1,000 capital should rush off to the Seychelles. That there has been marked progress in development since 1895, the trade figures clearly show; but when the limited area of available land is considered and the tiny size of the islands altogether, we think any intending settler or investor would do well to profit by Mr. Baty's kind offer and apply to him for further information before making for the Seychelles.

THE CEYLON TEA CROPS IN THE FUTURE.— The Manager of Abbotsford (Mr. John Fraser) in reference to our remark that many people considered 130 million lb. would prove about the maximum attainable, writes:—"Don't you think it quite possible if we ever again get a normally wet season that our tea exports may jump 10 to 20 millions? I do; so don't allow the "Thirty Committee" to go to sleep, as we still want fresh fields and markets new." It would be a novel experience for the *Observer* to be accused of depreciating tea prospects and crops; but we suspect planters in flourishing high districts do not know all that is going on in the lower divisions and in old coffee districts. Still, not only has the Thirty Committee to continue its campaign until a certain footing is got on the Continent of Europe as well as of America; but as we have said before, India tea planters have to be warned not to go extending the planting tea of under the idea that Ceylon is getting played out. There is still a good deal of young tea about in the island to make up for certain deficiencies in some quarters from blight &c.—while it is satisfactory to know that London is not likely to be troubled with a larger supply from Colombo, even if our total crop did exceed 130 million lb. in the future,

MR. R. H. ELLIOT AND THE CURRENCY QUESTION.

We fear Mr. Elliot—for whose letter (see page 711)—will be too late to appear before the Currency Commission, as his intention, when he wrote to us, was to remain in Cairo until about April 24th. However, he had been in correspondence with the Committee, and it is possible that a written statement may be accepted from a gentleman who occupies a peculiarly representative position in reference to the planters of Mysore and of Southern India generally. It is evident that Mr. Elliot is very sound and strong in his views on the side of the producing interests; and we sincerely trust his opinions will be carefully considered by the Committee.

As regards the abandonment of poor, non-paying tea and coffee fields, Mr. Elliot will be interested to learn the reason given by an experienced Ceylon Manager for, in some cases, retaining fields in cultivation which yield little or no profit, namely that they afford work for coolies who must be kept ready for the rush of flush which comes over paying fields in the best months of the year. So long as the poor fields pay expenses, they make it easier to keep and work a large labour force.

THE VOGAN TEA COMPANY.

THE REPORT.

The Directors have pleasure in submitting their Report and Accounts for the year ended 31st December, 1898, which they trust the Shareholders will consider satisfactory.

The total crop secured for the year was as follows:—

Vogan ..	227,848 lb	as against	223,825 lb	in 1897
Iddagodde..	125,989 "	"	105,849 "	"
Bought Leaf	30,929 "	"	8,208 "	"
Stamford Hill & Barkindale	100,712 "	"	95,860 "	"
	485,478 "		433,742 "	

Considering how short the crop has been on the majority of Estates in the island, it is satisfactory to note that there is a total increase (exclusive of bought leaf) over Estimates of 14,549 lb from the Company's properties.

On actual estate account Vogan and Iddagodde have given 23,837 lb over estimate, whilst Barkindale and Stamford Hill shew a short-fall of 9,288 lb.

Iddagodde again shews a most encouraging improvement, and has given 630 lb per acre off the tea in bearing, or nearly double what it was giving when the Company bought it three years ago.

For the purpose of comparison, the following figures shewing the cost and average of the Company's Tea in Colombo (including bought leaf) for the past two years will be found interesting and may be considered very satisfactory:—

Estate.	Cost 1897.	or without Manure	Cost 1898.	or without Manure	Nett Aver- age, 1897.	Nett Aver- age, 1898.
	cts.	cts.	cts.	cts.	ots.	cts.
Vogan and Iddagodde	22.97	20.45	20.22	19.21	37.85	34.0
Stamford Hill & Barkindale	32.26	27.67	25.58	22.60	44.99	43.9

During the year under review, it was found necessary to increase the Factory accommodation of Vogan twelve months earlier than was anticipated, and also to erect a new Roller and Sirocco, and this necessitated, including the cost of upkeep of young tea, and the payment of a balance to complete the buildings on Stamford Hill, an expenditure on Capital Account of R25,571.70.

No further extensions to Factories or Machinery are anticipated for some time to come, but probably when the 1896 and 1897 clearings on Vogan and Iddagodde come into bearing, a small addition to the Vogan Factory will be required.

Extraordinary general meetings of Shareholders were held on the 12th and 26th of November, and 17th December last, when the Directors were authorised to spend a sum of R5,000 in prospecting for Plumbago. Up to the end of December, R3,425 had been spent on this account, which has been carried to a suspense account in the meantime, pending the completion of negotiations which are being carried on for the leasing of the Pit, and which it is hoped may be brought to a satisfactory conclusion ere long.

After paying interest on debentures, namely R6,676.35, the amount at credit of profit and loss is R60,496.96, which is equal to 8 40 per cent on the Capital of the Company.

The Directors recommended that this sum be apportioned as follows:—

	R	c.
By the payment of a dividend of 5 per cent for the year	36,000	00
By the payment of a Bonus to the Vogan Superintendent ..	750	00
By the payment of a Bonus to the Stamford Hill and Barkindale Superintendent ..	500	00
By placing to Depreciation Account	10,353	71
By Placing to Reserve Fund ..	12,500	00
By carrying forward to the next Account ..	393	25

R60,496 96

Mr. Tisdall, Superintendent of Vogan estate, has been allowed three months' leave to proceed to Australia for the benefit of his health, which broke down, on full pay for the first and half pay for the other two months.

The estimate of crop for 1899 is as follows:—

Vogan and Iddagodde ..	375,000
Stamford Hill and Barkindale ..	100,000

The acreages of Company's properties is as follows:—

	Acres	3	23
Vogan and Iddagodde.	590	3	23
Tea in full bearing ..	78	2	30
Do do partial bearing ..	119	0	10
Do not in bearing ..	220	0	00
Stamford Hill and Barkindale.			
Tea in full bearing ..	1,008	2	23
Total in tea, Acres..	1,008	2	23
Vogan and Iddagodde, Jungle, &c. ..	540	2	10

Total Acreage .. 1,549 0 33

In terms of the articles of Association, Mr. G E Woodman retires from the Board of Directors, but being eligible offers himself for re-election.

It will also be necessary to appoint an Auditor for 1899.—By order of the Board of Directors.

FRUIT.—Has anyone ever gone carefully into a calculation of the profits of shipping fruit from Brazil to Europe? Pineapples are now so cheap, that they could not fail to yield a profit. And the production seems to be increasing! Surely the mailsteamers would be only too willing to fit up cold-air chambers for fruit, were responsible parties to undertake shipping the fruit.—*Ris News.*

THE INDIAN TEA CROP.

It will have been seen from figures quoted yesterday that Messrs Baines & Co., of Calcutta, give the actual total of the Indian crop for 1898-9 at 152,900,233 lb., against the estimate of 158,681,312 lb. But we take it there may be some slight further correction of the figures. Still, it is evident that the deficiency is over 5 millions on the estimate or much the same as in the case of the original Ceylon estimate.

Since writing the above, a later report has come to hand from Messrs. Baines & Co., dated 9th March, of so interesting a nature that we give prominence to nearly all its contents:—

TEA.

The close of another season, gives us an opportunity of reviewing its principal features, the general results at Home and in New Markets, and of surveying the prospects for the coming year.

When the crop estimate was published in May last year, the total output was put down at 158½ millions, of which 140½ millions was allotted to the U. K. and 18½ millions for other markets. The estimate was carefully compiled by the Tea Association, from returns furnished by the Growers, and although it was generally pointed out at the time of issue, that, owing to long continued drought in Cachar and Sylhet, the figures were somewhat over sanguine for these districts no one could, at that time, foresee that the actual result would be 4 millions short of estimate from these two districts as well as 1½ millions short from Assam. The Committee of the Tea Association recognizing the difficulty that growers have to face in estimating their crop so far ahead, with the uncertainty of climate to contend against, have wisely decided for the future to issue the actual output at stated periods and so avoid as far as possible, unduly influencing the Home Market with threatened over-supplies.

Last May when the season opened the outlook was indeed a gloomy one, stocks of Indian Tea in London were about 6 millions in excess of previous years, and with an estimated increase of 7 millions for the home market, prices could hardly be expected to show any rise from the already low basis they had reached; owing, however, to increased consumption at home, due, without doubt, to the cheapness of the article, and to the expansion of the American and Foreign Trade, prospects for the coming May are far brighter, and the position more encouraging. At the end of February, stocks in London are 4½ millions below last year, viz.: 59½ millions against 64 millions, while deliveries show an increase of nearly 12 millions, over the corresponding nine months of the previous year. Looking ahead to next July, if deliveries continue on the basis of last season, the stock may be expected to be considerably below that of last year, or barely 2 months' consumption, while it would not be over sanguine to expect a larger quantity to be taken, by the already expanding trade to outside markets.

Calcutta actual figures of crop.	1898.	1897
Export to U.K. (estimated)	135,000,000*	133,782,962*
Australia	6,500,000	6,802,579
America	3,270,000	2,086,369
Asia	7,000,000	3,601,532
Foreign Europe	1,200,000	797,313
Total	152,970,000	147,070,755

\* Re-exported to other countries to and January 1899 .. 5,315,000  
Do do do 1898 .. 3,364,900

AUSTRALIA.—Our trade with this country has been somewhat disappointing, showing as it does no increase on last year, while Ceylon has exported 15,126,891 lb. against 13,253,456 lb. in 1897. No doubt the superior freight facilities which Ceylon enjoys has some thing to do with this, there being 4 or 5 lines calling weekly at Colombo, while we can only boast of one steamer a month! Besides the freight question, many gardens, notably Darjeeling, have preferred to sell in London in spite of the growing enquiry for flavory kinds in this market. During the past season many orders could not be executed for want of supplies, at a time when Darjeeling Pekoe Sonehongs were obtainable in London at 5½d and 6d.

AMERICA.—Has shown a growing appreciation of our Teas, and one of the largest wholesale houses in London is pushing the Trade there with great effect, and the grower should avail himself of the orders which are sent to this market, and not be only dependant upon the export from London.

ASIA.—Has shewn the biggest increase in consumption of any outside market, which has been gratefully welcome to those Cachar and Sylhet growers, who have sold in Calcutta, for the bulk of this export has been Pekoes from these districts, with which, throughout the Season, the London market was fully stocked, and which were plentifully obtainable at 5½d. to 6d. there, against 5-6 to 6-6 annas in Calcutta. The class of Pekoe in favour in the Asian Trade, is a well twisted, black, even leaf, with fair tip, free from broken and small, and all Cachar and Sylhet Gardens should carefully note this. Well made strong chests, not ½ chests, are required, as the Teas have long transport on camel, which none but strongest boxes will bear.

FOREIGN EUROPE.—Orders continue to increase steadily from Germany, Constantinople and other European markets, and there is a growing preference in those centres to obtain their supplies from the country of growth. With regular lines running direct, buyers are saved time and freight by operating in this market, a fact not to be lost sight of by the producer.

THE CROP.

ASSAM.—Early samples were generally equal to average, and some very attractive invoices were sold in July, which gave hopes of a fine quality crop, but unfavourably weather experienced during July and August proved fatal to this and the verdict on this district's teas must be hardly up to average.

DARJEELING.—The first flush was disappointing but some very fine teas were manufactured from the second one, and these were fully appreciated, and their value further enhanced on the home market, when telegraphic advices of the great falling off in quality, reached London about the end of August. It has been most thoroughly admitted by the Trade, that the crop from Darjeeling has been a poor one, a fact further emphasised when we consider that Pekoe Sonehongs from this district were selling in London during the months of November-December down to 5½d. or fully 2d. per pound below their value, if really useful quality.

DOOARS.—In the early part of the season were rather wanting in cup, but improved as the season advanced, when some really useful teas came to market. The quality towards the end of the season was distinctly good, and was somewhat eagerly taken owing to the general absence of flavory kinds from other districts. On the whole, the crop from this district was fully up to average.

CACHAR AND SYLHET.—The season made a very poor start, severe drought completely checking the growth and the bushes never quite recovered its effect, although Sylhet made a wonderful crop, considering the very unfavourable weather up to the middle of July. Under these circumstances the quality of the Teas from these districts was much below average, but improved in the second half of the season. The low range of prices particularly affected these districts, Pekoes being plentiful throughout the year from 6d down 5½d.

**FACTORY BULKING.**—At a time when every saving in expenses is of vital importance to growers, the necessity of most careful bulking cannot be too fully impressed upon them, and it stands to reason that the cheapest and best place for bulking is the Factory, because labour is cheaper, facilities are handy for packing tea quickly while it is fresh, unnecessary delay and exposure are avoided, and a saving 3d. per pound in London charges is made. It cannot be denied that many fine parcels of tea lose flavour through lying all day on a warehouse floor, exposed to the air, while the treatment in re-packing leaves much to be desired. Again, where teas are sold "to arrive," on forward samples, which is a growing custom in the American Trade, it is of the first importance that the whole of the break should be of one dead level quality, which cannot be obtained without careful bulking on the factory.

In Australia and foreign markets, where large warehouses do not exist, and bulking cannot therefore be carried out, the break is represented by 2 or 3 chests, from which buyers draw samples, and upon these samples purchase the teas, and owing to unequal quality, frequent allowances and rejections have now to be made, which would otherwise be avoided.

During the past season a few parcels came before us where the difference in quality in teas, invoiced as one break, was as much as 8d. per lb.!!

**EQUALITY IN TARES, AND WELL MADE PACKAGES,** are matters which should have the attention of every manager.

The consumer attaches great importance to getting his Teas in well made strong boxes, and although there has been great improvement in recent years, there are still many gardens from which Teas are sent down in weak chests, made of bad wood, causing loss in weight, and consequent claims. Where a garden once gets a name for bad packages, buyers will fight shy of the mark in the future. This year badly seasoned wood has resulted in frequent cases of "cheesy" taint upon Cachar and Sylhet Invoices, losing to the grower often 1d. per lb. in value.

The weight of Tea in chest should not exceed 100 to 110 lb. of broken leaf, and 80 to 90 lb. whole leaf, while Dusts should never exceed 100 lb. nett, in order to avoid loss in weight.

**ASSORTMENT.**—There is plenty of room for greater attention to this part of the manufacturing process, and the fewer the qualities made the better, for a garden producing fair medium Teas; four qualities are quite sufficient, this specially applies to small gardens, whose Managers should try to cut down, as much as possible, the number of grades in their assortment; it is better to have two full sized breaks of Pekoe and Pekoe Souchong, than 4 or 5 qualities in small breaks. Where small breaks are unavoidable, it would pay to pack, and keep them until a sufficient amount of Tea of each grade to make a full break, is manufactured, then bulk the whole.

Good appearance in make should be aimed at as America and Asia select Teas of this description,—large, rough, bold leaf should be avoided, if this class of leaf is being taken from the bushes, owing to quick growth, and the flush getting out of hand, it is better to have it equalised in the breaker, thereby saving the wholesale houses and blenders, the trouble of cutting it for themselves, a well equalised leafy Broken Pekoe Souchong, or small Pekoe Souchong, free from dusty broken, sells much better, and is a far more useful Tea, than a bold leaf.

Invoices should comprise breaks of not less than 20 full chests, 30 half chests or 50 boxes, which are the minimum breaks sampled by the Trade, (and it is as well to have a few extra chests, in event of damage reducing the size of the break) for in these days, when the weekly auctions of Indian Tea frequently amount to 50,000 packages, small breaks meet with very little attention, and are sold on a separate day, when large buyers scarcely think it worth while to attend the sale.

Our advice to growers therefore must be to pay the closest attention to improvement of quality, and to avoid sending forward any produce which, from inferiority of quality, or undesirable packing, will damage the reputa-

tion of the article. There is no doubt that careful supervision on these matters will bear fruit in due course.

With the extensions of 1896-98 shortly coming into full bearing, there is no probability of short supplies, nor are prices likely to show any great rise, from the level they have reached in the past 3 years, nevertheless the industry is in a healthy condition and consumption is growing, and there is no reason, with careful attention, to manufacture and export tea, why the Tea Trade in India should not continue on a safe remunerative basis.

In conclusion, we wish our many constituents a prosperous year in 1899. Weather reports from the Districts are generally satisfactory.

#### CEARA RUBBER.

Relative to the extraction of rubber from the ceara rubber (*Manihot Glaziovii*), Mr. Hooper shows by the results of the experiments that the scheme of preparing rubber from the dry bark of this introduced tree is impracticable. He adds:—

"I have since made a microscopical examination of the inner bark with the result that while the laticiferous vessels or caoutchouc ducts are not absent, they are scantily distributed in the bark and are undeveloped and in some cases empty. While the cultivation of the ceara rubber trees has been fully established in Southern India, it is a matter for regret that the climatic conditions or soil are not suitable for encouraging the secretion of rubber in the trees to make their introduction a commercial success."

**PRECIOUS STONES.**—In a review of a new edition of "Streeter", the *Speaker* says:—Perhaps the first thing which most people need to know about precious stones is that if mounted stones are heedlessly jumbled together and allowed to rub against each other, the diamonds in the ornaments will inevitably scratch some of the other stones, and thus disfigure them more or less seriously. Doubtless, in some cases, stones thus marked have been treated by indiscreet executors as valueless imitations, and sold for an old song. The next practical item of information which lovers of jewels should acquire is that while technically "perfect" stones are never met with, nearly a tenth of the stones which are brought into commerce are really of fine quality. No lady is much the worse for not knowing that the true ruby is a corundum, nor will she become much the richer in useful information by learning that it is strictly "a variety of crystallised alumina"; but if she is capable of judging between a spizel ruby and a true ruby, no very arduous task, she may find the little accomplishment profitable as well as rare. Some of the most interesting of the notes which Mr. Streeter has put together are those upon the present condition and prospects of the sources of the supply of precious stones. It is pleasant to the British jeweller to hear that the Chrysoberyl (the true) Cat's Eye, perhaps the most curious, and certainly not the least beautiful, of precious stones, comes principally from Ceylon. Mr. Streeter expresses what is evidently a sincere belief in the possibilities of the ruby mines of Burma, and gives an account of the connection which he formerly had with the enterprise of developing them. An important chapter upon "African Diamonds" contains statistics of produce, as well as geographical information; it seems that some recently-discovered mines in Griqualand West yield well-crystallised stones of remarkable whiteness. It is quite possible that British Guiana is among the "coming" diamond-producing lands; should she prove to be so, the effect upon West-Indian sociology may be startling.

TEA IN JAVA.

We have received a series of statistical tables bearing on the importation and sale of Java and other teas in Holland. In the first place, we are told that last year 5,287,230 half-kilogrammes of Java tea were sold at an average of 32½ cents of a guilder (2s) per half-kilogramme. This is equal to 5,823,114 lb. avoirdupois and an average of 7½d per lb. As regards deliveries in 1898, the figures are 70,572 chests with 8,569 chests in stock at end of year. Of China tea the deliveries were 2,705 chests; stocks 1,979 chests. Of British India and Ceylon tea there were only 43 chests delivered and 15 in stock. It is a great matter, however, that Java tea should be so fully absorbed in the Netherlands and the adjacent division of West Germany. No tea from Java should come to the London market with so good a field to exploit, as that eastward of Amsterdam and Rotterdam.

INDIA-RUBBER:

NOTES ON THE EXPERIMENTAL TAPPING OF RUBBER-TREES IN THE CHARDUAR PLANTATION, ASSAM.

Experiments in tapping 21 selected trees in compartments two and three of the Charduar rubber plantation during the years 1896-97, and 1897-98, the results of which are shown in detail in Appendix VI of the Assam Forest Report for 1897-98, gave a yield of 2½ seers in 1896-97, and of 2½ seers in 1897-98. The trees experimented one have been lightly tapped, and show no signs whatever of having suffered in any way; there appears to me, therefore, to be no reason to suppose that other trees in the plantation of similar age, the oldest experimented on being over 20 years and the youngest 17 years, would be damaged if subjected to similar light tappings.

The compartments that contain trees not less than 17 years of age, that is, in which vacancies were finally filled up over 17 years ago, are Nos. 1, 2, 3, and 4. These compartments cover 318 acres, and contain 5,221 trees, as ascertained by actual counting; of these alternate trees (say, 2,600) were over-tapped for three successive years in 1889, 1890, and 1891, with a view to killing them out, as the trees had been planted too close together to admit of proper development of their crowns, on which the full growth of a tree depends. It was found, however, that no amount of tapping affected the continued growth of the tree, and the opening out of the roots showed that all the trees in these compartments had become fairly anastomosed, or, in other words, that the plantation had become practically one huge tree.

The question now for consideration is whether the systematic light tapping of all the trees in the compartments Nos. 1, 2, 3, and 4 should be carried out every year, under the personal supervision of the Divisional Forest Officer and his Divisional Forest staff as an experiment, and with the view to Government's obtaining some present return for the expenditure incurred in forming the plantation. This expenditure from 1873-74, when work on the plantation commenced, up to 30th June 1898, amounts to R1,67,627, or R75-3 per acre for the 2,218 acres that had been planted up to that date, including 518 acres that were disforested in 1896-97 for tea cultivation.

The present value, taking it to be the cost debitable to the existing plantation, may be accepted as:—

Total cost incurred up to 30th June 1898	R	R
June 1898		1,67,627
Deduct—		
Value to be recovered for rubber-trees on 518 (sic.) acres disforested, fixed by the Government of India at R39 per acre on 482-87 acres actually established	18,832	
Expenditure that may be written off as incurred on the experimental stage <i>i.e.</i> , on learning how to plant rubber successfully, taken to be cost up to 1880-81 and partly up to 1882-83, up to which years almost all previous plants had to be replaced.	34,000	
Sales of rubber, seed, and seedlings, 1897-98	1,050	
		53,882
Balance		1,13,745

which on 1,700 acres of plantation existing on 30th June 1898, equals R67 per acre. With the experience gained, it is estimated that future extensions will cost a maximum of R10 per acre.

Tapping lightly all the trees in compartments Nos. 1 to 4, including the 2,600 that it was attempted to kill out and the 21 that have been experimentally tapped during each of the last two years, may, it is expected at a low estimate, give the following results:—

Two thousand and six hundred un-Mds. Srs. tapped trees may be expected to yield annually an average of 1 seer per tree	65 0
Two thousand six hundred and twenty-one tapped trees at ½ seer per tree	32 30
Total	97 30

say, 8,000lb., the cost of collecting which will be 8 annas per lb., or R4,000.

The value in London of the samples sent from the plantation tappings in 1896-97, through the Reporter on Economic Products to the Government of India, was 2s 8d. per lb. The report on the value of samples (24 seers) sent to that officer, the result of tappings in 1897-98, has not yet been received.

Mr. W. H. B. Lawes, Superintendent, Bashwanta Tea Company, has kindly placed the following information at my disposal regarding the result of tappings of 121 rubber trees that were planted about the cooliclines of Dikorai garden, some 17 to 20 years ago, and have not been looked after, having been out about from time to time by the coolies. These trees were lightly tapped by tappers supplied by the Deputy Conservator of Forests, Darrang Division, and rubber was shipped to London early in 1898.

Rubber obtained by tapping	180 lb.
Rubber sold in London	170 "
Consigned in London to Messrs. George Williamson and Company; realised in London on 170 lb. at 3s. 3d. per lb. £27-12-6 (say)	415 8
Deduct—	R As.
Cost of tapping	90 0
Freight to Calcutta, R1 per maund (say)	2 8
Freight, Calcutta to London, and other charges, £2-2-6 (say) 3 annas per lb. on 180 lb.	32 0
Profit	124 8
or R2-6-0 per tree.	201 0

From the above data and statistics it may be assumed that, taking the sale value of the rubber in London at 2s. 8d. per lb. as reported by the Reporter on Economic Products, the financial

results of the annual experimental tappings proposed may be safely estimated as follows:—

Sale value of 8,000 lb. rubber in London at 2s. 8d. per lb., at 1s. 1d. per rupee	16,000
<i>Deduct</i> :—	R
Cost of tapping 8,000 lb. at 8 annas per lb.	4,000
Freight to Calcutta at R1 per maund, say	98
Freight, Calcutta to London, and other charges at 3 annas per lb.	1,500
	5,598

Profit ... 10,402  
which equals about R2 per tree, or on 318 (sic.) acres, R32-11-4 per acre, and on cost per acre over nearly 50 per cent.

I have been somewhat diffident at putting forward proposals for systematic tappings for fear of eventual evil results on the capital value of the plantation as a property in which a considerable amount of Government money has been expended. I think, however, that, given proper personal supervision by the Divisional Forest Officer and his staff, the time has come when at least the experiment should be tried on the most mature area of 318 acres out of the 1,700 acres that have been planted up, and I therefore advocate, after having visited the plantation again, that action should be taken in this direction during the present tapping season.

A. L. HOME,  
Conservator of Forests, Assam.

Dated Camp Tezpur, the 10th November, 1898.  
—*Indian Forester.*

## GANGAWATTE ESTATES CO.

### REPORT OF THE DIRECTORS.

DIRECTORS.—T G Hayes, Esq., S H Hayes, Esq., W Anderson, Esq.

ACREAGE.—Tea in full bearing 335 acres; Tea planted in 1898 10 acres; Grass and Ravines 10 acres.—Total 355.

The Directors beg to submit their second annual report and accounts being those for the year ended 31st December last.

They have to report with regret a short fall on the estimated crop of tea, though it is no unusual circumstance this year.

The crop from the Gangawatte division was sold in green leaf and that from Bitterne was manufactured partly at Rickarton factory and partly at Gangawatte, which work commenced in July last.

The Bitterne crop analyses were as follows:—

41,348 lb. made at Rickarton and sold in London at the equivalent of 36-06c. net. 23,605 lb. made at Gangawatte and sold in Colombo averaged 33-55c net.

Computing the outturn of Gangawatte leaf at the same rate as that given by Bitterne, the total crop amounted to 140,445 lb. Tea against an estimate of 150,000 lb which realized R55,598-55. or an average of 39-58 per lb.

On reference to the accounts it will be seen that the profit on the season's working amounts to R19,209-65 subject to miscellaneous expenses, interest on mortgage, secretariat and auditor's fees.

Out of the available balance an interim dividend of 5 per cent on the capital has been paid absorbing R8,925, and the directors now recommend the payment of a final dividend of three per cent, leaving a balance of R1,715-91 which after meeting directors' fees, they propose should be carried forward to the New Year.

The estimate of crop for 1899 is 150,000 lb. against an expenditure of R38,992.

Mr. T G Hayes reports that the properties are in good order.

In terms of the articles of association, Mr. T G Hayes retires from the office of director, and being eligible offers himself for re-election.

An auditor for next year will have to be appointed by the meeting.

By order of the directors.

GEO. STEUART & Co., Agents and Secretaries.

## COCONUT PLANTING AND COPRA CURING.

Mr. BURKHARDT has been referred to more than once in your columns. He, as Managing Director of a large agricultural concern, came over to the Island chiefly to compare notes of coconut and cacao cultivation with ours; of coconut estates he visited I believe, Mr. W. H. Wright's, Mr. Scott's at Kurnnegala, and Horrekelle and Siringsapathy estates. It is a pity arrangements could not have been made for his meeting the veterans W. B. Lamont and W. Jardine. He would have gained many a useful wrinkle from these very experienced gentlemen.

### COCONUT PLANTING AND COPRA CURING.

Owing to labour difficulties cultivation is very restricted on the vast plantations owned by the wealthy Company our visitor represents. However experiments have been made with different manures on small plots and the results in crops have been carefully compiled. First place is given to superphosphate and sal ammoniac as yielding the best results. Very disappointing results have followed the application of kainit and it has been tabooed.

IN COPRA CURING we have much to learn. It is a standing reproach to the Europeans and intelligent Natives engaged in Coconut Cultivation that they have not risen above the primitive methods pursued by the natives, may be, since the dawn of coconut cultivation. To my knowledge many attempts at improved methods have been made and could not have been brought to a successful issue owing to funds not having been placed at the command of the experimentors who were merely Superintendents. It is reported that on Siringsapathy Mr. Burkhardt would have had an opportunity of witnessing copra curing by means of hot air, for which a patent is to be obtained. Hot air for copra curing is what is used on the estates our visitor is interested. It is the result of a long series of costly experiments. Air is heated in a chamber by means of a furnace and pipes coiling vertically. From apertures in the wall hot air is directed under a series of trays on which coconuts cut into bits is placed. The moisture expelled from the coconut finds an exit through chimneys in the roof. I myself hit upon what I think is a far simple method, three or four years ago and submitted it for approval. Want of funds has prevented my carrying out my plan. I borrowed the idea from the hot rooms used originally in desiccating coconuts. My idea is simply to place platforms, or by preference trays, over other hot beds. One advantage of drying always by hot air is that the quality of the copra will be uniform all the year through. Besides, the work will be cleaner and there will be no loss from thefts by human beings, crows, dogs and jackals.

## THE CEYLON TEA AND COCONUT ESTATES CO., LTD.

### REPORT OF THE DIRECTORS.

ACREAGE: Tea.—In partial bearing, 293 acres (planted in 1895, 146 acres; and in 1896, 147 acres) not in bearing, 137 acres. Coconuts, 558 acres Rubber, 35 acres; Grass, Forest and Chena, 218 acres; Cinnamon, 21 acres, Total 1,257 acres.

The Directors have pleasure in submitting to the shareholders the accounts for the past year.

TEA DIVISION.—The total crop of tea harvested in 1898 was 32,371 lb., which realised a net average price of 37.34 cts. per pound.

COCONUT DIVISION.—The total crop of coconuts gathered during 1898 was, including 52,640 nuts brought forward from 1897, 641,186 nuts, of which 1,531 nuts were sold on estate, at an average of R30

per 1,000 nts, and the remainder were made into soprah, of which 493 candies were sold at an average of R44.76 per candy, as compared with 246 candies in 1897, which realised a nett average price of R39.40 per candy.

After making the usual provisions for depreciation of Buildings and Machinery, the result of the year's working shows a loss of R3,549.82.

Mr. F. Capper retires from the Board of Directors, but is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.

THE UNION ESTATES COMPANY OF CEYLON, LIMITED.

REPORT OF THE DIRECTORS.

Directors:—Messrs. G H Alston, W D Gibbon, W H Figg; Estate Inspector.—Mr. W D Gibbon; Estate Superintendent.—Hayes Group; Mr. T Maclachlan; Dea Ella; Mr. J Vanderslott.

ACREAGE

	Tea in full bearing.	Tea not in bearing.	Cocoa.	Cardamoms.	Total Cultivated	Grass, Jungle & Waste land.	Total.
Hayes Group	517	11	—	25	553	1,658	2,211
Dea Ella	235	13	91	—	339	147	486
	752	24	91	25	892	1,805	2,697

The Directors have now to submit to the Shareholders the accounts of the Company for the past year.

The Tea crop amounted to 308,025 lb. against an estimate of 360,000 lb., for which the average nett price realised was 34.32 cents per lb. compared with 32.64 cents in 1897, or an increase of over 1/3 cents per lb.; 149 cwt. Cocoa were sold at an average of R41 per cwt., and there were small receipts by sale of Cardamoms. The shortfall in the crops must be attributed to the very dry season.

With reference to last year's report the Directors are glad to be able to announce that the road as far as Anningkande has been opened for some time and that good progress has been made with the extension to Hayes Factory, and it is anticipated that this extension will be opened for traffic in the course of the next two or three months. This will increase the value of the Company's property very greatly, and will reduce the cost of production both by cheaper transport and by enabling the estate to pack in full chests instead of half chests as at present. In spite of the transport difficulty all the new driving machinery has now been erected; a preliminary run carried out last week was satisfactory. The additional power was urgently required, as during the last year manufacture was considerably hampered by a stoppage for repairing the engine.

The Capital Expenditure during the past year amounting to R29,963.28 was incurred on additions to machinery referred to above on Hayes and also on Dea Ella, in clearing and planting 25 acres Cardamoms on Hayes as decided on last year, 30 acres of Cocoa on Dea Ella, and in erection of necessary new lines on both places, and a Rice Store and extension of Factory on Hayes.

A small sum of R93.63, which has been charged to Working Account, was expended in exploring for plumbago on Hayes, and an arrangement is being made to lease the pit to a native in return for one-sixth share of the output.

The estimated crops for the current season are 827,000 lb. Tea, 156 cwt. Cocoa and 300 lb. Cardamoms on an expenditure on Working Account of R97,441.11. In addition a small profit is anticipated from purchase of outside leaf and from manufacturing Teas for other estates. On Capital Account R7,356 is estimated for completion of Machinery on Hayes and the upkeep of the new clearings on both places.

In terms of the Articles of Association Mr. G. H. Alston now retires from the office of Director, but is eligible for re-election.

The appointment of an Auditor for the current year rests with the meeting.

By order of the Directors.

WHITTALL & Co., Agents and Secretaries.  
Colombo, 10th March, 1899.

THE ESTATES COMPANY OF UVA, LIMITED.

REPORT OF THE DIRECTORS.

Directors:—Messrs. W D Gibbon, G H Alston, and W H Figg; Estate Inspector: Mr. W D Gibbon; Estate Superintendents: Dammeria, Mr. J B Cotton; Battawatte, Mr. W M Kelly; and Gampaha, Mr. F J Whittall.

ACREAGE :

	Tea in full bearing.	Tea in partial bearing.	Tea not in bearing.	Total Tea.	Other Pto-ducts.	Timber, Grass, Forest and Waste land.	Total.
Dammeria Group	465	110	27	602	30	558	1190
Battawatte and Forest Hill	418	140	38	591	5	159	755
Gampaha	332	121	119	575	45	246	866
	1,215	374	184	1,768	80	963	2,811

The Directors herewith submit to the shareholders the accounts for the past year.

The tea crop, which was estimated at 505,000 lb. only amounted to 485,712 lb., the shortfall being altogether attributable to the unfavourable weather experienced during the last few months of the year. The coffee crop however amounted to 462 bushels as against estimate of 120 bushels, while there were also crops of 89 cwt. Cocoa, 553 lb. Cardamoms 56,632 lb. Cinchona bark, which latter was harvested from trees cut down to improve growth of the tea planted underneath. During the year 60,658 lb. tea were manufactured for other estates.

The average nett price realized for the tea sold was 39 1/2 cents as against an average of 41 cents last year.

During the past year the acreage under tea has been increased to 1,768 acres by the planting up of 41 acres in Gampaha and 8 acres on Dammeria, while acres 8-1-37 of tea, an encroachment on Government land on Forest Hill, were purchased, and acres 4-2-32 of tea land were taken over by Government for the Madulsima Road, for which the Company received compensation. During the blasting operations on the new road the old coffee store which was not insured, and at the time not being used, caught fire and was burnt down; it has been impossible to definitely ascertain the cause of the fire, though it is attributed by the Superintendent to a piece of burning fuse alighting among temporary withering tats therein. The roofing was saved and the directors estimate the loss to the estate at R2,000, which they have written off the capital cost of the buildings. After writing off this R2,000 and making provision for depreciation of buildings and machinery, and paying the expenses incurred in connection with the mortgage referred to in the last report, the profit for the year amounted to R14,029.45, to which falls to be added the balance brought forward from 1897.

The directors recommend the payment of dividend of 2 per cent for the year, and that the balance of R9,842.10 be carried forward to the current year's accounts.

The directors are glad to be able to announce that the road to Forest Hill is practically completed and is now being made use of for transport.

The crops for the current year are estimated at 540,000 lb. tea, 210 bushels coffee, 600 lb. Cardamoms and 65 cwt. Cocoa, on an expenditure of R174,483 on the estate, while a small profit is anticipated from manufacture of 60,000 lb. Tea for another estate.

The expenditure estimated on capital account is Rs19,911 for the upkeep of acreage not yet in bearing and for addition to the withering accommodation on Battewatte.

In terms of the articles of Association Mr. W. G. Gibbon retires from the Board, and is eligible for re-election.

The appointment of an Auditor for the current year will rest with the meeting.—By order of the Directors,

WHITTALL & Co., Agents and Secretaries.

### BOTANICAL NAMES.

Writes an upcountry correspondent:—“It is not a little amusing, not to say ridiculous, to read in today's local ‘Times’ its bold attempt at correcting botanical names. Or is it an endeavour to coin a new generic name? If the latter, why not indicate the author by affixing ‘Times of Ceylon’? Otherwise surely reference to the Peradeniya authorities would leave no excuse for mistaking the familiar generic name *Agave*, which apparently is what is meant by *Agrava*, the latter never being heard of until its birth today.

[The amusing part is that the botanical names referred to were quite correctly given in the *Ceylon Observer*, and bungled in being taken over.—ED. T.A.]

### REARING INDIA-RUBBER PLANTS IN DEHRA DUN.

I received about 4 lb. of Assam India-rubber seed from the Director, half of which was sown in nursery beds, which were specially prepared with one part pieces of bricks, one part charcoal and one part dried cowdung well ground, on the 23rd April, 1898. This did not germinate till the end of the first week of June, 1898, i.e., it did not germinate till the rains had commenced, although the nursery beds were well-watered and kept moist. Of the remainder of the seed, 1½ lb. were sown in nursery beds on the 7th July, 1898. The first lot of the seeds sown germinated well but the seedlings being very small and not able to catch hold of the soil, were washed away when the heavy monsoon rains came. The second lots of seed began to germinate five days after sowing, but the seed was so light, that much of it was washed away. The remaining ¾ lb. of the seed was sown on the 7th July, 1898, in 16 boxes and flower pots, and the boxes and flower pots were kept in the potting sheds, where they could get little light, in the School compound and fruit garden. The following was the compost in which the seed was sown in boxes and pots; one part, half-inch or smaller pieces of bricks, one part charcoal, half-inch pieces, and one part leaf mould with a little dried cowdung well ground for top dressing. The seed began to germinate five days after sowing and continued to germinate till the 15th August, 1898.

From the nursery beds I got 108 plants of India-rubber; the remainder of the plants and seeds were destroyed or washed away in the monsoon rains, though carefully protected with thatch. From the 16 boxes and pots I got about 1,600 plants, out of which about one thousand plants have been potted and basketed and about 600 plants, being very small are still in the boxes.

From the above experiment I conclude, that India-rubber seed requires for its germination that the atmosphere should be well charged with moisture, so that the dry season is unsuitable. The best time, therefore, to sow India-rubber seed at Dehra is during the early part of July;

it also germinates in August, but it is almost too late, as the whole of the seed will not be able to germinate before the atmosphere begins to cool, and also the young seedlings have not sufficient time to grow before the cold season begins. The sowing of the India-rubber seed in the open is objectionable because the rain either directly or indirectly, when tatties are put over the nursery beds, destroys and washes away the young seedlings and seed. The best way to grow India-rubber seed is to sow the seed in boxes and large flower pots in the compost mentioned above, and place them in potting sheds or verandahs, where they can receive a little light, and never to allow the boxes and pots to get dry. The watering should be carefully managed, so that the seedlings are not rooted out and the seed is not washed away.

BIRBAL.

THE GROWTH OF THE SEEDLING.—At first a pair of cotyledonary leaves appear, which are, about one-tenth inch in diameter, orbicularovate, emarginate, dull green, minutely petioled. Above these come out a pair of opposite leaves. These are stipulate (as are also all succeeding leaves), slightly crenate, distinctly emarginate, membranous, with faint indications of areolate nerves at the sinuses of an intramarginal vein, very shining above until superseded by the next leaf; one of the two leaves is somewhat larger than the other. Above these the leaves are sub-opposite when they appear, but soon become distinctly alternate by the elongation of the stem, each succeeding one larger in size than the one next below, and much brighter especially when fully grown. The fourth leaf above the cotyledons is about 1 by ½ in., ovate, distinctly crenate, emarginate. The next two leaves, the 5th and 6th, are oblong, 2 to 3½ in. long, still emarginate, but the crenations are very shallow in the last leaf; lateral nerves 4 to 6 pairs, slightly arcuate. Then comes out the 7th leaf, all by itself, 3 by 1½ in., oblong, with 6 to 8 pairs of parallel nerves and 2 to 3 intermediate ones between, no longer emarginate, but acute and almost entire, with a row of white glandular dots along the margins. This is the first leaf that reveals the identity of the plant beyond this the leaves become thicker and thicker, the 11th being about as thick as a normal India-rubber leaf. By the time the 5th leaf appears, a swelling is noticed below the root-collum, which goes on increasing in size, as is seen in Fig. 3. Neither *F. bengalensis* nor *F. religiosa* seedling has any swelling of this kind.

UPENDRANATH KANJILAL.

—*Indian Forester* for March.

### INDIAN TEA.

(From *Baines & Co.'s Market Report*.)

CALCUTTA, Feb. 23.

By the courtesy of the Indian Tea Association, we are enabled to give the following figures showing the actual crop for 1898:—

	Actual Crop. lb.	Original Estimated. lb.
Assam ..	62,172,660	63,851,592
Cachar ..	20,363,496	22,181,980
Sylhet ..	24,455,496	26,630,540
Darjeeling ..	7,654,467	8,144,520
Terai ..	3,424,385	3,101,600
Doonars ..	25,717,446	25,795,480
Chittagong ..	887,263	952,000
Chota Nagpore ..	155,020	193,600
Kangra ..	2,070,000	1,800,000
Dehra Dun and Kumaon (Estimate)	2,000,000	2,000,000
Private and Native Gardens (Estimate)	4,000,000	4,000,000
	<u>152,900,233</u>	<u>158,681,312</u>

BRITISH GROWN TEA: BRIGHTER  
OUTLOOK.*(The Statist, Feb. 25.)*

The heavy fall in the sterling value of the rupee which took place some years ago was, for the time being, a source of considerable profit to the tea-producing industry, enabling planters to reduce the cost of cultivation; but after a few exceptionally prosperous years a reaction set in. This was largely owing to great increase in the acreage brought into tea cultivation. The Indian famine and the almost coincident rise in the value of the rupee completely changed the situation, and increased expenses of production to such an extent that the year 1897 proved a bad one for the industry, especially as the price of tea had fallen considerably owing to the largely increased production. The results for the year 1898 have not yet been published, and will not, as a rule, be generally known until next May, or June, but prices of both Indian and Ceylon teas were low, and will probably be below 1897, although the remainder of the crop still unsold will probably realise better figures, and consequently raise the year's average to some extent. The cost of the rupee was greater than the previous year and in consequence production will be more expensive; while the price of rice was also high during the greater portion of the year. Bearing the above facts in mind, it is probable that 1898 will be in some instances as bad as 1897, although for some of the better teas grown in Assam the result will possibly be slightly better. Cachar and Sylhet have suffered severely from abnormal weather, which has not only caused a reduction in the output, but also interfered with the quality of the teas, and many gardens in these districts have therefore been obtaining very low prices. In Ceylon the crop has been short, so that results will also suffer from this cause.

Looking now beyond the 1898 season, there appears very strong reason to believe that the industry has passed through the worst part of the late crisis. Consumption of Indian and Ceylon tea in 1898 was 33 million pounds ahead of 1896, while production had only increased by 18 millions; and, more important still, there was an excess in production during 1896 of 12 millions, which had been turned to a deficit of three millions in 1898. Such a remarkable change has been brought about by a greatly increased use of British-grown teas. Not only is the home market taking more tea, but foreign and colonial markets are rapidly acquiring a taste for the teas of India and Ceylon; and whereas in 1897, 51 million pounds were used outside the United Kingdom, in 1898 the quantity had risen to about 63 millions, and there appears every reason to believe that large increases will take place in the quantity used in these outlets in future. Now that the Americans have started a line of steamers, under the United States flag, going from Calcutta and Colombo direct to New York without coming near the United Kingdom, the sympathy of American shipowners will be enlisted on the side of British-grown tea. The Russian Volunteer Fleet, which calls at Colombo, is already taking large quantities of tea to South Russia, and the fact that Russian tea purchasers have established houses in Ceylon goes far to show the probability of an increased liking for Ceylon teas in Russia. The quantity shipped from Colombo direct to Russia in 1897 was only £39,349 lb., and had risen to 2,714,003 lb. in 1898. The absorption of British-grown tea by Russia is by close observers in the trade regarded as only in its infancy. We may now turn to production. The Ceylon output last year was reduced owing to bad weather, and it is therefore probable that the following crop may be somewhat larger. With respect to Indian, the output in Cachar and Sylhet was also reduced

from the same cause as in Ceylon, and it is possible that this may not occur this year; but, considering the very large area over which tea is now grown in India and Ceylon, the weather is not likely to be suitable everywhere for the growing of large crops. So that we need not, perhaps, look for a very large increase in the 1899 crop, taken as a whole. Even though a large quantity of land was brought into cultivation some few years ago, which should now be coming into bearing, it must be borne in mind that there is reason to believe many estates have allowed some of their unprofitable tea to lapse, and that others have not had the money to carry on the cultivation which they had commenced, or even to fill up some of the vacancies which occur through plants dying out. So that, taking all these things into consideration, it is doubtful whether we shall have a very large increase in production for the present.

Looking, therefore, at the industry as a whole, the position seems to have entirely changed from what it was a year ago, and for the first time in the history of the British grown tea trade consumption appears likely to overtake production. The possibilities opened up by the new markets are very great. For years past it has been a case of educating consumers. The efforts have had little result till quite recently, but in nearly all countries which use tea largely there is reason to believe that a very large development will take place during the next few years. It must not be forgotten that the world's consumption of tea outside countries of production amounts roughly to 500 million pounds, while the total production of British-grown tea in 1898 was only 275 million pounds (3 millions less than the consumption), so that there still remains 222 million pounds of other growths which will, doubtless, eventually be further displaced by the energy of the Indian and Ceylon tea planters. The question of exchange must not altogether be forgotten, and, leaving out the policy of the Government, it would, perhaps, be the best thing for the tea-producing industry if the rupee were to be steadily maintained at its present level. The rapid rise in the rupee cost the tea industry an enormous sum of money, but it has had its effect in causing great efforts to be made to reduce expenditure in all directions, and has resulted in checking the annually increasing cultivation which had previously been taking place. Should the rupee remain stationary, it is possible that production would only slowly expand, and that prices of tea would advance to some extent. The trade has passed through what may be termed a very severe surgical operation. The painful process has saved the industry from a still more serious crisis, bound otherwise to have come upon it in the course of the next year or two; and if the value of the rupee be maintained where it is at present, it will probably produce a continuance of the sounder position into which the industry has now entered.

## INDIARUBBER FROM EUPHORBIA.

The following letter from Major C. Giberne on this subject appeared in the *Standard* on January 5th last, and is re-produced as it may be of interest. Perhaps some of our readers may know about it, and can tell us whether the statements are correct:—  
Sir,—With reference to the leading article in the *Standard* of today on the resources of India, will you allow me to draw attention to the enormous quantity of India Rubber locked up in the jungles of India in the various species of *Euphorbia*, or "milk-bush," with which it is in parts so thickly studded? Many years ago, when in India, I ordered a box of chemicals from England, and in the course of some experiments I made, I added a little nitric acid to the strong alkaline, milk-like juice of the *Euphorbia Tirucalli*, and, to my surprise, not only neutralised

the alkali, but left floating on its surface, a piece of India Rubber. There is a considerable quantity of the *E. Tirucalli* growing in Guzerat, and especially in the neighbourhood of Cambay, but the supply is limited. On the other hand, there are other species of milk-bush, and as the *E. Antiquorum* and *E. Nerufolia*, the supplies of which, should they be found efficacious, are inexhaustible. I should strongly recommend that a trial be made of all these different species as to the quality of the India Rubber they severally produce. Probably, also, a cheaper acid, such as hydrochloric, would prove as efficacious as nitric acid. The milk could easily and expeditiously be extracted from the milk-bush by means of a common native sugar cane press. The only question, then, would be whether the acid should be brought to the milk, or the milk to the acid, and in the latter case, whether it should be sent in the form of a fluid or be previously dried in the sun and exported to England in the form of the gum known in commerce as Euphorbium.—From *Indian Forester* for February 1899.

### CAMBRIDGE EXPEDITIONS IN THE FAR EAST.

An expedition, under the leadership of Mr. W. W. Skeat, left Cambridge a few days ago for Bangkok. The members of the party include Mr. Gwynne-Vaughan, of Christ's College, and Messrs. Evans and Annandale, of Oxford, and it will be reinforced at Singapore by Mr. Bedford, of King's College. The object of the expedition is, says the *Times*, to make a scientific survey of the little-known country lying south of Siam and north of the protected States of the Malay Peninsula. Mr. Skeat, who recently presented a valuable collection of ethnological specimens collected in Perak to the Cambridge Museum of Ethnology, is an official in the Government of the Straits Settlements, and the Colonial Office has granted him leave to organise and command the expedition. The increase of commerce in the Malay Peninsula and the writings of Sir Frank Swettenham, Mr. Joseph Conrad, and Mr. Hugh Clifford have recently stimulated public interest in this quarter of the world, and a thorough zoological, botanical, geological, and ethnological survey of the district is much needed.—Professor Haddon's expedition to the Torres Straits, Borneo, &c., is expected back in Cambridge towards the end of May. Recent letters indicate that it has been completely successful.—*O. Mail*, March 3.

### AFRICAN GAME.

To all lovers of Nature, to all who desire to see some variety and interest, other than humanity provides, left to us in this swiftly narrowing world, it will be welcome news that the British and the German Governments are in consultation over the fate of the wild fauna of Africa. It is quite plain that if something is not done pretty quickly many of the most interesting species of African animals will go the way of the Quagga and the Dodo. Plains which once abounded in game of every sort are now as lifeless as Clapham Common. The elephants are diminishing in number every day, and the giraffe is now found only in the land over which until lately the Khalifa ruled. The great White Rhinoceros is believed to have become altogether extinct, and even the Lion is being speedily swept away from every African country except Somaliland. There will, doubtless, be many who will simply

rejoice over the extinction of dangerous animals, and congratulate themselves that no one is ever likely again to meet with the experience of the Dutch Governor of Cape Town, who, in the old days, was luted out of his carriage by an irritable Rhinoceros in the public street. But most of us would grive to think that all these interesting beasts should disappear. In some form or other they must be preserved by law if they are to be preserved at all, and Mr. Rhodes has already set a good example by enclosing a huge reservation for big game in the territories of the Chartered Company. Some day, we hope that several will be established, but in the meantime the most pressing necessity is to put a check upon the indiscriminate slaughter of wild beasts. This the British and German Governments ought to be able easily arrange, and if they had the assistance of the Congo Free State as well, the big game of Africa would at least be saved from absolute extinction.—*Globe*, March 3.

### BURMA RUBIES.

(The Financial News)

It was on February 27th just ten years ago that the memorable siege of New court took place. The occasion was the opening of the subscription list of the Burma Ruby Mines, and so effective was the blockade in St. Swithin's-lane, so enormous was the crowd of struggling applicants, that it was only by the aid of a ladder that the head of the House of Rothschild was enabled to effect an entry through a window into his own premises. Visions of untold wealth floated before those who were fortunate enough to obtain an allotment; for it was assumed—wrongly, as it has turned out—that a concession from the Indian Government which, in return, required a rent of R400,000 per annum and one-sixth of the net profits must be extremely valuable. Indeed, although the directors were careful not to attempt any definite estimate of profits in the prospectus, they quoted from the report of the Indian Government's engineer that "although it is impossible to fix a money value to the Ruby Mines from the imperfect data at hand, yet I can confidently say that the property is a most valuable one, and capable of yielding a large amount of wealth." With, moreover, Messrs. Rothschild and Sons as the issuing house, and a sum of £245,000 for working capital, there was every reason to anticipate a highly prosperous career for the company. Instead, however, of these rosy anticipations being realised, the shareholders have not only never had a penny of return, but have further been obliged to write down their capital from £300,000 to £180,000. Yet while the Company has been almost in extremis the Government has received no less than £146,000 for rent. It may be asked, of course, why the company has continued to work for the sole benefit of its landlord, and why it did not long ago throw up the sponge and decline to carry on an impossible struggle. The answer is that it is not in the nature of Englishmen to confess themselves beaten until every effort has been exhausted, and that, while larger profits were relied on from an increased output and more economical methods, it was hoped also that the Government would be induced to lower its rent and enable at least moderate dividends to be paid to those whom the Government has to thank for the receipt of £146,000.

The original rent was fixed at R4,00,000 for seven years from November 1st 1889, with, further, one-sixth of the net profits. As there never have been any net profits the latter provision has not affected the company so far, and the Government has not even been able to extort its full rent, because the revenue has never been sufficient. It would be thought, then, that on the expiration of the seven years' lease the Government would have recognised not alone the justice, but the necessity,

of reducing its claim to a reasonable sum. Unfortunately, just when the new lease was being arranged the license fees paid by the independent miners, who are allowed to work in all lands not in use by the company, had reached their highest point, amounting in 1895-96 to £28,277. Since then they have fallen to £9,976 in 1897-98, and it is highly doubtful whether they will ever again rise to the 1895-96 level. It is clear that the more the company extends its own operations—in 1897-98 it washed 823,703 loads, against 366,739 loads in the previous year—the less ground there is for the tributaries, who, moreover, cannot work the deep layers of byon. Anyhow, the Government of India and the Secretary of State fixed a rent under the new lease of R3,50,000, less 10 per cent for the cost of collection—in other words, R3,15,000—plus one-fifth of the net profits. The Government, while reducing its rent slightly, in reality put the shareholders in no better position, because it increased its share of any net profits that might be made. The preposterous character of the new lease appeared from the results of the year ended February 28, 1898, when, after paying £20,815 to the Government, the result to the Burma Ruby Company was a loss of £8,102 on the year's working. It is true that the twelve months were subject to unprecedented calamities, owing to plague, famine, and monetary stringency. But even if the royalties from the tributors had been as large as they were in the previous year (£22,534) there would still have been but a shadowy balance of £4,000 to divide between the Company and the Government. At the meeting held last August Sir Lepel Griffin stated that he and his colleagues had strongly urged on the Government the necessity of a revision of the new lease. His proposal—which seemed an eminently fair one—was that the rent should be reduced to a maximum of R2,00,000, and that if the royalties fell below that amount the company should not pay more than it received from the tributors. The Government's claim for 20 per cent. of the profits to remain as at present.

After long months of delay a reply to the representations of the Board was received a few months ago, stating that, although the Secretary of State for India was not prepared to consider any permanent revision of the terms of the company's lease, he consented, after consulting the Government of India, to remit R1,00,000 from the rent of 1897 and 1898 on the condition that the company otherwise fulfilled its engagements and paid up "all rent due." Even this concession, unhandsome as it seems, is better than nothing; for the remission of R1,00,000—that is £6,666 taking the rupee at 1s 4d—from the 1898 rent reduces the year's loss to about £1,500. But it is really amazing that the Government, which is always ready to talk so sympathetically of its warm desire to foster the interests of British trade all over the world, acts in such an extraordinary manner towards the capitalists whom it practically invited to invest their money in Burma. It is not as if the company were badly managed. As far as we can judge, everything has been and is being done to try and achieve success. The gross cost per load has been reduced from 29s in 1893-94 to 1s 2½d in 1897-98; and yet further economies are being effected by the installation of an electrical plant, which is now in successful operation. It is not possible to say yet what the ultimate saving to the company will be from this installation; but a comparison of cost for winding, pumping, and lighting the central mines shows that, while it was R9,969 in December, 1897, it was reduced in December, 1898, to R3,074, and according to the engineer, will be further reduced to R1,500 almost immediately. The falling off in the royalties is a matter beyond the company's control; but, so far as its own operations are concerned, everything seems to be done that good management can suggest. And what is the response of the Government to the toil and appeals of those who have assisted so much in the opening up of Burma? Exorbitant taxation, which has compelled shareholders to pay out of their

own pockets £146,000, although they have not had the smallest fraction of a dividend. This strikes one as an old method of encouraging trade and enterprise, and it is high time to bring it home to the Indian Government that it was mainly on the faith of the statement of its own engineer (Mr. Barrington Brown) that the public was induced to subscribe to the company.—*H. and C. Mail*, March 3.

#### FROST TEA IN THE AGRAS, DUMBULA.

March 18.—We are having extraordinary weather up here. Rainfall from 1st January to date five inches; very short last year; and now on the top of it all, the most severe frost the Agras has ever had. 1879 was bad enough, but it was not equal to what we have just experienced with the thermometer on the 8th at freezing point, and on 9th at 33° and still threatening. Almost everyone has suffered more or less, and in varying extent, from 10 to—it is reported—300 acres. Some tea has been burnt very badly.

The frost has come much later in the year than previously, and is lasting much longer. Even for the last four nights the thermometer outside stood at from 36° to 37°. How much longer is the drought going to last is an anxious question with most of us. At the same time the wonder is that the rest of the tea, not touched up by frost, looks so well and goes on flushing as it does.

#### THE "STATIST" ON BRITISH-GROWN TEA.

The *Statist* occupies a position second only to that of the *Economist* in the financial and business world of London; and there can be no doubt of the beneficial effect which an article like that which we reproduce on another page, will have on the position of our staple industry in the City of London. Already there are signs of enquiry for Shares in Tea Companies, which had been lost sight of, for many months, and a general rise in quotations may be anticipated. This, of course, is not due merely to the opinion of the *Statist*, but to the encouraging facts to which it has given prominence. For instance, we are reminded once more that India and Ceylon only produce 275 million lb. of tea; while the world outside the producing countries requires 500 million lb. In other words, there is ample room for increased crops if we can go on driving out China and Japan on the Continents of Europe and North America and throughout Australasia. On the other hand, the sixteen-penny rupee is regarded as having given a needful check to overproduction, at a time when the prices for our teas threatened to run down too low in the London market. The great matter now is to get the Americans and Russians to appreciate our Ceylon teas, and this appreciation is steadily advancing.

THE GALLE PLANTERS' ASSOCIATION may have a useful and important career before it, if all planters within the Southern Province render support by membership and attendance at meetings. Light feeding railways or tramways up to the Morawak Korale and in other directions where traffic abounds, may well form part of the Association's programme for the early future.

THE INDIAN TEA ASSOCIATION  
(LONDON.)

MR. BLECHYNDEN'S REPORT FOR THE  
YEAR 1898.\*

New York, January 10th, 1899.

Ernest Tye, Esq., London.

Dear Sir,—I have the honour to submit my report, for the year 1898, and, as requested, make it as brief as possible.

JOINT ACTION WITH CEYLON.

I have great pleasure in recording that our relations with the Ceylon Association continue most close and intimate, as I am satisfied that both Associations are great gainers by the arrangements we are thus both enabled to make. The interests of India and Ceylon tea in this country must remain identical for many years. Each country gains by the increased quantity of tea from either country taken off the London market.

SUBSIDIES.

During the year we have continued to make grants, or subsidies, to firms pushing India and Ceylon tea in packets, and have secured the co-operation of one or two firms to push these teas in bulk. The latter method is, in my opinion, the one which would be to our greatest advantage to foster, but it presents the disadvantage that firms cannot, under present conditions, be certain of retaining the trade they open up, as there are no means of insuring the repeat orders coming to them. It is only when the tea is packed under some copy-righted name that pioneer work can be made to pay. Loose teas of almost, sometimes exactly, the same quality can be supplied by any firm in the business; and competition is so keen that our friends find that trade, that they have been at the trouble and expense to open up, is seized upon by rivals. So far as the Association is concerned, it is of course quite immaterial, so long as the tea is sold, who finally reaps the benefit; but such experiences are very discouraging to our allies. The packet tea business is, so far as firms are concerned, much more lucrative investment. But packet teas have to be advertised to consumers, which is a very expensive matter, and though there are numerous packets in the market, there are but few firms with sufficient capital at command to make this business succeed. We have some staunch allies, and also some who are half-hearted. Others again have gone into business with energy for a short time, but have dropped off, or will do so as the stronger houses gain ground. Our object in aiding packet is not so much for what they actually sell as for the advertising they must do to have any prospect of making a business, all of which day by day familiarized the public more and more with the merits of our teas and makes them better known. The packet teas also act as standards of quality which grocers selling our teas loose must compete with.

LETTERING STORES.

We continue to letter a few stores with the words:—"India and Ceylon Teas;" but as the packet business increases, the demand for a general advertisement of this nature falls off.

DEMONSTRATIONS.

Less of this class of work is being done by us, and it will continue to grow less as we try to turn such work over to packet firms. These are equipped to supervise the details and to follow up work by direct sales. In my half-yearly report I referred to some work of this nature we had inaugurated in the Jewish quarter of the town, where a great deal of black tea is consumed. As there seemed to be good prospects of success, we had no difficulty in transferring the entire care of the matter to a firm which started a special packet to meet the local requirements. They also undertook to spend a reasonable sum, in addition to our grant, in exploiting this field. They have opened

a store for the sale of their packet, and have added the sale of coffee to their business, for, as usual, it is in the greatest demand: the profits on the latter go towards paying part of the expenses. So far the experiment is promising; but whether it succeeds or not is of no great moment, as demand for our tea is being established, and other packet tea firms are also reaping the benefit. Not knowing of our interest in this section of the town, one of our other allies mentioned, as a matter that might be of interest to us, that their sales in the Jewish quarter, which they had done nothing to foster, had suddenly got a start. It is thus indirectly we frequently benefit from the work we cause to have done.

TEA-ROOM.

I stated in my half-yearly report that the tea-room we had started in the previous year, and which we ran for twelve months, has been closed for want of success. While this room was in existence, it was of some use as an advertising medium, but was too expensive, and we closed it with regret. Since it was closed a large dry goods store in that neighbourhood has more than once been on the point of opening a similar room on its own premises, and the scheme may yet take shape. The large number of tea demonstrations given in dry good stores by firms we are in close contact with, is probably one of the main obstacles to the success of independent ventures of this kind.

ADVERTISING.

During the year we have narrowed down the number of magazines we use for advertising purpose, and now use only those where our advertisement appears absolutely next to reading matter. We have for some time discontinued the use of magazines, otherwise excellent in all respects, style, circulation, &c., but which have from forty to sixty pages of advertisement matter in which any single advertisement is buried out of sight.

The newspaper advertising we do is much on the same lines as heretofore; but although it comes under the head of advertising, it might frequently be more appropriately charged under grants. The reason for this is that when firms are pushing their teas vigorously in any given town, they ask us to advertise India and Ceylon tea there. We take our usual space, and advertise the teas generally. They then take a small space immediately under our advertisements, extolling the merits of their special brand of India and Ceylon tea, and thus gain the benefits of our advertisement as well as their own, getting also the advantage of the reduced rates we can secure as large advertisers. In some places we have several firms following our advertisements in this manner. We are not using a single paper in which one or more packet firms are not following us. Our advertisement of course makes the words India and Ceylon prominent; and by this means we not only advertise these teas generally, but those firms wanting to benefit by our advertisement have to use the same words on their packets and in their advertisement, instead of merely pushing the packets under the name of the brand.

We have continued to issue a large quantity of advertising matter in the shape of cards, pamphlets, &c. As has been previously described, this matter has always space reserved whereon the name of a brand or firm can be printed. We distribute all our printed matter through large firms, and they in turn distribute through stores. By this method the expense of distribution is brought down to a nominal figure. Were we to attempt to distribute independently and directly, the cost of stamping, addressing envelopes, &c., would greatly reduce the amount of work we could do, and would exceed the cost of printing. As the space reserved on the printed matter can be filled in with the name of the grocer as well as that of the brand, all parties have equal interest in getting it into circulation, and we can be satisfied that there is no waste. We have been fortunate so far in being able to prepare subjects which have proved popular and are in great demand. We could get them out by millions, instead of thousands, with equal ease and to great advantage if funds permitted.

\* We are indebted to the London correspondent of our evening contemporary for this Report.—ED. T.A.

UNFERMENTED TEAS.

Some samples of unfermented or Oolong teas made in India were sent to me early in the year. They were found so snitable for the market, and firms were so ready to give immediate large orders, that I have had to revise the opinion I formerly had as to the impossibility of Indian gardens preparing suitable teas of this class. I now believe that there are certain districts in India where Oolong teas of a character to command ready sale can be made, and that if such teas are produced, there is practically no limit to the business that could be done. I have dealt with this matter at length in another place, so will confine myself here to adding a warning, so that the same stumbling block which our black teas encounter every day may be avoided. I refer to the

INEQUALITY OF THE TEA TRADE.

It does not appear to matter what tea finds favour here, as soon as one lot of it is sold, and orders are ready for more of exactly the same tea, there seems an impossibility of supplying them. In filling the repeat orders the leaf or liquor, or both, differ from the original, and there is no firm in business on this market which will guarantee to duplicate any given sample of tea exactly. This is one of the most serious obstacles to the expansion of the trade. More than two years ago I urged careful consideration being given to the question of blending teas in Calcutta for this market as the one possible means of supplying a standard article. Now that there is a question of manufacturing a special tea, I feel it my duty to make this point very clear, as the success of the enterprise will depend in a great measure on supplying exactly the tea ordered—not a tea which resembles it, or which may even be thought better. The experience of what was done in the London market cannot be taken as a guide, conditions being different. If a tea (black or green) is found acceptable here, means should be found to supply that identical article. The cost of holding the tea and blending until the standard is reached will not be lost.

GENERAL.

The year 1898 will long be remembered as an exceptional one by the tea trade of America. The period under review was marked by the war with Spain which necessitated the taxation of tea as a war measure. The imposition of duty having been threatened in the previous year, and being withdrawn in the face of the objection of its undue incidence on the poor man, came as a surprise to the trade, and caught it quite unprepared. The only tea it was possible to rush in before the act became law was that in the Canadian market, whence a fair quantity was drawn. There was a sudden boom in prices and a great deal of tea changed hands, but with the imposition of duty the merchants cabled to China and Japan cancelling buying orders and a long period of great depression ensued. During the previous season the new Tea Act had become law under which certain standards of tea were selected and much inferior rubbish heretofore finding a ready market here was kept out. The action of the law had been to reduce the imports of the previous season, and the imposition of a duty of 10 cents per lb. added to the impossibility of importing cheap teas, still the retailers would not pay an enhanced price and business came to a standstill. It was then found that there were quantities of tea left over from previous seasons which had been looked upon as unsaleable, and some of which had been stored in this country over 20 years. The novel conditions placed a premium on the antique rubbish, valued previous to the passing of the duty, at say four cents per lb. It was dragged forth once more into the light of day and sold at prices ranging up to 20 cents per lb. The stocks held all over the country proved a surprise to the trade, and it is only now that they are getting exhausted. What these stocks must have been can be gathered from the fact that, although the importations of all teas into this country since the 1st of June to the 30th November were approximately 40 million lb., the amount of tea which has paid duty, or in other

words has been put upon the market, was only 12 million lb., approximately, in the same period. I am unable to quote the figures for December, inclusive, as they have not so far been published. With the trade in this condition, the sales of India and Ceylon tea have of course suffered, but less I think than those from other countries. The fact that any India and Ceylon tea has been sold speaks highly for the vitality of the demand which has been created for them. It must be borne in mind that China and Japan manufacture a distinct class of tea for sale to America alone, and which has no sale elsewhere. These teas once manufactured must come here, there being no other market for them, and once here have to be sold, even at great loss, to meet bank obligations and so on. India and Ceylon teas have other markets, and are imported only to meet actual or anticipated demand, and can be diverted to other markets. Under the circumstances, it is a matter of some surprise to me that so much business has been done in them during the last disastrous six months. There is an artificial demand for the packet Indian and Ceylon, created purely by advertising; and it is within my knowledge that the past year has been quite up to the average with the packet tea firms; indeed, some of them have done quite well, and even extended their business. Now that stocks are approaching exhaustion, I look very confidently forward to a widespread and lasting demand for tea from all parts of the country. Stocks must be renewed, and though the fear remains that the duty may be removed at any time, and will curtail orders to actual requirements, the market will gain by the steady demand this method of doing business will bring about, and will be saved the unhealthy effects of a sudden boom. Conditions point to our gaining more than our due share of business, as the crop of China and Japan is estimated to be at least six million lb. short of last year, to which has to be added the rejections, which will be at least another million lb. If my estimate of the position is at all accurate, it appears to me that an unusually large quantity will have to be drawn from other markets before new season's China and Japan come in. Before closing this report, I have to record considerable more activity on the part of the advertisers of Japan tea. With the commencement of the new year, they have, I understand, made contracts for quite an extensive scheme of advertising, some of which is already in evidence.—I am, sir, yours faithfully,

(Signed) RICHARD BLECHYNDEN.

TEA IN AMERICA.

New York, Feb. 15.

Note the very light imports for 1898 and we have sufficient reason for the very firm market. The tea duty and the Inspection Act, have combined to relieve importers of low grade tea held here for years. Recent sales cover 3,500 packages, Blacks, at full figures.

The imports of tea for the year 1898, are reported by the U. S. Bureau of Statistics for 1898, compare with those for 1897 as follows:—

From	Quantity lbs.	Value Dollars.
Japan	30,923,813	4,403,121
China	30,591,506	4,065,145
United Kingdom	2,537,671	506,554
East Indies	1,976,968	298,199
British North America	1,437,772	226,406
Other Asia and Oceania	1,327,156	43,156
Other Countries	9,077	2,395
Total imports 1898	68,803,963	9,544,976
" " 1897	99,708,133	13,445,080

The above shows that Japan furnished 45 per cent of the total imports; China, 44.4 per cent.—*American Grocer*

## PLANTING.

**TEA IN COORG.**—The following appears in the Report on the Administration of Coorg for the year 1897-98: "The opening of a tea plantation by a syndicate in the Sampaji Ghat, a district where coffee has completely died out, will, if successful, and it promises well, form the commencement of a fresh era of prosperity in Coorg."

**COFFEE AND COCOA IN MARTINIQUE.**—Both Liberian and the "Mocha" coffee are being cultivated extensively in Martinique, but the product will not be exported for some years to come, when the trees will come into full bearing. Cocoa has already made great progress, but similar remarks apply to it also. A premium is granted to cultivators by the Consul General.

**COORG IN 1897-98.**—In a prefatory note to the Coorg Administration Report, 1897-98, Colonel Donald Robertson, the Chief Commissioner, observes:—"The year was an eventful one in that the coffee crops upon which the prosperity of Coorg mainly depends, was, following the previous year's inferior outturn, a poor one, whilst the money market was remarkably tight; so much so, in fact, that it was difficult to obtain money on any terms."

**MR. H. O. NEWPORT.**—The *Cairns Argus* of 10th ultimo has the following note, under the head of "The New Coffee Expert":—"Mr. Howard Newport, the newly-appointed expert in coffee culture to the Government of Queensland, is at present in Cairns, and will be present at the meeting of the Chamber of Commerce, to be held next Tuesday. Mr. Newport has had considerable experience and will be able to impart a good deal of valuable information to those interested. At present Mr. Newport's plans are that he will spend about a month here, during which time he will visit Kuranda, under the guidance of Mr. Mayers, the Russell, Bloomfield, Daintree, and other districts. So far he has only seen Hambleton, and consequently cannot express any opinions. His desire is to see all the planters in the various districts. He arrived from Cooktown last Saturday, having seen there was to see there."—*Planting Opinion*, March 18.

## COFFEE DIRECT TO CONSUMERS.

Mr. Robert H. Elliot writes from Cairo to the *Madras Mail*:-

All coffee producers must have read with interest that part of your report of the proceedings of the Nilgiri Planters' Association's Meeting of the 27th January which relates to the formation of a Company for selling coffee direct to consumers. My object in writing now is to suggest that this project can only be of the fullest value if the Company undertakes to supply the consumer with roasted coffee, both roasted and ground, and in the shape of unground roasted berries. After having paid much attention to the subject I am convinced that the great obstacle to the spread of the use of coffee as compared with tea is that the former is often available only in the raw state, while the latter is always ready for immediate use. I have been assured on good authority that three-fourths of our British troops in India would prefer coffee to tea if it were supplied to them roasted. The fact that the Army and Navy Co-operative Society at Bombay sells a considerable amount of roasted and ground coffee imported from England in tins, is a sufficient proof of what is required by the public in India. The Company then should supply coffee in three forms—raw, whole roasted berries, and roasted and ground. I have shown that coffee is roasted in England and exported to India, and I would suggest that some experiments should be made as to roasting coffee in India and exporting it for sale in England. As coffee could thus be supplied to the English consumer at much less cost, seeing that so many intermediaries would be cut out, I feel

sure that the numerous Co-operative Societies in Great Britain would be glad to supply their customers with our Indian produce. The best check to adulteration will be found in thus supplying coffee direct from India, as it would obviously be in a form which would make adulteration difficult, or almost impossible. At present the identity of our Indian coffee is lost the moment it is sold, and all sorts of inferior coffees are palmed off on the public as Mysore or other Indian coffees.—*Planting Opinion*, March 18.

## ABBOTSLEIGH TEA COMPANY (1899), LIMITED.

Registered February 24, by Ingram and Co., 67, Lincoln's-inn-fields, with a capital of £50,000 in £10 shares. Object, to adopt and carry into effect an agreement expressed to be made between G Pargiter Fuller and N Rowsell of the one part and this company of the other part, for the purchase of the estates and assets in Ceylon of the Abbotsleigh Tea Estate Company, Limited, to develop and extend the same, and generally, to carry on in the Island of Ceylon or elsewhere the business of tea planters or growers of tea, coffee, cinchona, or other vegetable products, &c.; to acquire, for the purposes of the company, and turn to account any buildings, live stock, easements, rights, privileges, works, machinery, plant, and other property, real or personal. The signatories are:—

	Shares.	Prof. Ord
G P Fuller, Niston Park, Corsham, Wilts	1,000	—
E F Fuller, Abbotsleigh, Ceylon	..	— 500
C Harrison, 67 Lincoln's-inn-fields	..	— 1
N Rowsell, Abbotsleigh, Ceylon	..	— 500
S Hill, 35 Third-avenue, Queen's-park Estate, Harrow-road, W.	..	— 1
W Seal, 43 Cologne-road, St. John's-hill, S.W.	..	— 1
C H Clothier, 6 Worcester-street, Pimlico	—	1

The first directors—of whom there shall be not less than two nor more than five—are G P Fuller, N Rowsell, F Fuller, and C Harrison. Qualification, £100. Remuneration to be fixed by the company.—*Financial News*, March 3.

## THE YATADERIYA TEA COMPANY.

An up-country planter writes to our contemporary:—"Have you heard of the proposal by the Ceylon Tea Plantations Company to purchase Yataderiya for £35,000 sterling in cash? They first offered £30,000, half in cash and the other half in 600 C T P Co.'s ordinary shares. The Yataderiya Directors, however consider that £35,000 is too small. This at 1/4 the rupee works out at R276 per share; and the Directors consider that if the present improved prices for Yataderiya teas continue, 'there is a prospect of this year's dividend exceeding 30 per cent and approaching 40 per cent.' The latest official quotation is R275 buyers and R300 sellers. There won't be anything in the C T P Co.'s offer unless they spring another £5,000, which would make 315 per share."

**LEAF DISEASE IN COFFEE.**—A report by Mr. John Cameron on his visit to Coorg in connection with the prevention of leaf disease in coffee, can be obtained of Messrs Higginbotham & Co., Madras, or of Messrs. E C Duff & Co., the proprietors of "Planting Opinion."

THE AGRICULTURAL MAGAZINE  
FOR MARCH.

The contents we gave previously. We are glad to hear that the locust fungus, which is being used with such success in South Africa, will be shortly tried in Ceylon.

The visitor mentioned in the comparison between Ceylon and Jamaica is no doubt Mr. Astwood who lately come over from the latter Colony and spoke in the highest terms of its excellence from an agricultural point of view.

The striking difference in the distribution of the rainfall in 1897 and 1898 is shown by placing the monthly records for these two years side by side. In 1897 the rainfall was more evenly distributed, while 1898 no less than 25 in. fell in April, which though the wettest month in 1897 also had less than half the amount in that year.

UVAKELLIE TEA COMPANY.

THE REPORT OF THE DIRECTORS.

The directors have now the pleasure to submit their report and accounts for the year ending 31st December, 1898.

The amount of tea secured was 139,000 lb. costing 30.82 cents per lb. against 29.89 cents per lb. for 1897. On the other hand the tea after estimating that still unsold at a low figure has realized 45.10 cents per lb. as against 42½ cents for the previous year.

In view of the low prices ruling for teas during the year just ended the directors think the increase of price reflects a good deal of credit on the Superintendent.

After writing off 7½ per cent for depreciation on buildings and machinery the profit amounts to R17,251.41. Out of this an interim dividend of 3 per cent was paid absorbing R7,200 leaving R10,051.41 to be dealt with.

The directors recommend that this amount be disposed of as follows:—

That a final dividend be paid of 3 per cent (making 6 per cent for the year) absorbing ..	R	c.
That a sum be carried to Reserve of	7,200	00
That a bonus be paid to the Superintendent of ..	350	00
and that the balance of ..	501	41
be carried forward.		
	R10,051	41

The estimate for the current year is 144,000 lbs. tea to cost R46,091.50

In terms of the articles of Association Mr. W Kingsbury retires from the Board, but being eligible offers himself for re-election.

It will also be necessary to appoint an Auditor for 1899.—By order of the Board of Directors.

J. M. ROBERTSON & Co., Agents and Secretaries.

THE KELANI TEA GARDEN COMPANY,  
LIMITED.

THE REPORT OF THE DIRECTORS.

ACREAGE.

282 Acres Tea in full bearing
52 " " planted in 1896
30 " " " 1897
34 " " " 1898
398
179 " Reserve
11 " Ravines, Waste and Grass
158 " New Purchase
746 Acres.

The Directors beg to submit to the Shareholders the accounts of the Company for the year ending 31st December, 1898.

The crop secured amounted to 150,510 lb. made tea, realizing R51,339.44, or an average price of cents 34.11 per lb. as against an expenditure exclusive of item under Capital Account of R37,526.09, or an average cost of cents 24.93 including R2,644.74 spent on manure.

The balance at credit of profit and loss account after allowing for depreciation on buildings and machinery is R6,301.94.

The Directors suggest that a dividend at the rate of 2 per cent per annum be declared absorbing R6,000, and that the balance R301.94 be carried forward to next account.

The estimate for the current season is 185,000 lb. made tea. A small return is expected from the 1896 clearing of 52 acres. The Directors propose during this season to open 10 acres to afford employment to the coolies during the dry months. The application of manure during the last two years has improved the constitution of the bushes, where applied, to an appreciable extent, but the abnormal weather during the last season together with the attack of helopeltis resulted in a short crop. The Directors have every confidence in the ability of the estate to produce the estimated crop under ordinary circumstances.

Mr. E. P. Willisford retires from the Board in terms of the memorandum and articles of Association, but he is eligible for re-election.

The appointment of an auditor rests with the meeting.

CARSON & Co. Agents & Secretaries.

Colombo, March 3rd, 1899.

PRODUCE AND PLANTING.

THE RUBBER FORESTS OF THE CONGO.—King Leopold of Belgium is fully alive to the importance of maintaining the present high output of rubber or caoutchouc in the Congo State. An important order has just been signed by the King whereby a certain number of trees or caoutchouc-bearing lianas are to be planted each year in all the forests of the domain. A new forestry staff of one inspector, six controllers, and six sub-controllers is to be organised for the purpose of seeing that the new order is fully enforced.

TEA GARDENS AS ASSETS.—At an adjourned sitting for the examination of Mr. H M D'Este, China and East India Merchant, of 16, St. Helen's-place, held last week, the statement of affairs showed liabilities £2,343 2s 5d of which £980 2s 5d were unsecured, and assets estimated at £796 17s 4d comprising as to £650 two tea gardens at Assam and Chittagong. On examination by Mr. E L Hough, Official Receiver, the bankrupt said he had also passed under the name of Esteve. He was born in this country, and his proper name was D'Este. He had assumed the name of Esteve for political reasons. In November, 1896, he commenced business at 16, St. Helen's-place, E.C., under the style of Middleton, D'Este, & Company, and had not since then used the name of Esteve. His business was chiefly in tea and mica, and when he started he had about £500 in cash, which he obtained from Mr. Edgar Morris. He had a partner until January, 1897, but he did not bring in £250, his share of the capital, as arranged. Witness was not formerly a tea broker. Since January, 1897, he had traded alone until April or May, 1898, and being then pressed for capital he discontinued the business, and had since acted as agent for others. He had embarked in certain accommodation bill transactions, but only for the purpose of putting his orders through.—H. and C. Mail, March 3.

PLANTING NOTES.

RUBBER HARVESTING.—We direct attention to an extract from the *Indian Forester*, giving details of tapping experiments; but the results so far as we can judge are nothing very wonderful—the return being estimated at not much more than R32½ per acre.

**EUCALYPTUS GLOBULUS IN THE OPEN.**—The readers of the *Gardeners' Chronicle* should be glad of the information respecting this tree afforded by 'J.A.' on page 28. If a tree be killed to the ground by 18° of frost after being planted thirteen years, each must decide for himself whether it is a tree worth planting. Certainly it grows very freely and makes a fine tree in a few seasons, and then comes a hard frost and it is killed to the ground. I have only known *E. globulus* to flower in the open air in our maritime counties.—*A. R. Pearce.*

**THE PROSPECTS OF TEA**, for the coming season, are undoubtedly improving, says the Calcutta correspondent of the *Pioneer*. The stocks in all parts of the world are considerably lower than they have been for some time. The recent fire in Melbourne, in which half-a-million pounds weight of tea was consumed, has resulted in telegrams being received from that quarter to buy all the tea available in Calcutta. The season here being now finished, there will probably be a scarcity of Indian tea in Melbourne. Considerable comment has been made regarding certain Government figures showing that an extra 60,000 acres have been put under tea during the past year. The agents here of tea gardens are unable to discover where these large extensions have been placed. The general opinion being that not more than 20,000 acres have been laid out. Prices of tea yesterday, at the last sale of the season, were fully one anna higher. Present low-priced tea stocks are worth attention.

**TROUT IN CEYLON.**—*Land and Water* for Feb. 4th contains an article on this subject, referring specially to the annual report of the Ceylon Fishing Club by Mr. Burrows, as published in the *Overland C.O.* Regular icing, it is said, is all that is required for preserving trout ova in their transshipment; as yet it has been efficiently seen to only on a vessel of the German line. In reference to the destruction of fry by the larvæ of dragon-flies, each of which, Mr. E. E. Green considered, was enough to swallow them whole, the writer says:—"The hon secretary evidently does not know that the larvæ even of some of our English water insects, if carnivorous, will bite and kill trout fry, even though they are not large enough to swallow them whole." Finally, the orders sent to Messrs. Andrews for mayflies (to rouse the trout) and for a consignment of grayling are approved of, as well as the proposed importation of trout ova from New Zealand.

**RUBBER CULTIVATION IN THE MADRAS PRESIDENCY.**—With a view of extracting rubber from the powdered inner bark of the ceara rubber tree for supply to Government offices, the Madras Government directed the Agricultural Department of the Board of Revenue, last year, to place itself in communication with the Reporter on Economic Products to the Government of India. Mr. Hooper, the Officiating Reporter, is of opinion that the result of his experiments show that the scheme is impracticable. The result of the microscopical examination of the inner bark of the trees shows that while the lactiferous vessels, or caoutchouc ducts are not absent, they are scantily distributed in the bark, and are undeveloped and in some cases empty. While the cultivation of the ceara rubber trees has been fully established in the Madras Presidency, it is a matter for regret that the climatic conditions or soil are not suitable for encouraging the secretion of rubber in the trees, so as to make their introduction a commercial success.—*Madras Mail*, Feb. 27

**MOST EXTENSIVELY USED FOOD.**—Rice, is no doubt, the most extensively used article of food the world over. Hundreds of millions of people chiefly subsist on it, and its consumption is constantly increasing. It is the principal diet of at least one-third of the human race, forming the chief food of the native populations of India, China, Japan, Madagascar, many parts of Africa, and in fact, of almost all Eastern nations. The Burmese and Siamese are the greatest consumers of it. A Malay labourer gets through 56 pounds monthly; a Burmese or Siamese 46 pounds in the same period. Although rice is such a universal article of food, it is not so nourishing as wheat or some other grains. More than nine-tenths of its substance consists of starch and water, forming more fat than muscle.—From the *Journal of the Jamaica Agricultural Society* for February.

**THE LANTANA PEST IN MYSORE.**—To Mr. John Cameron, the Superintendent of the Mysore Government Gardens, is due the establishment of "Lantana, Limited" in Bangalore. It is incorporated under a bye-law of the Bangalore City Municipality, providing that the growth of Lantana within municipal limits shall be kept under control. Mr. Cameron drew attention over a year ago to the extensive growth of Lantana Camara in Mysore, and observed that while the shrub served a useful purpose if kept in its proper place, it should only be admitted with much caution, and to a very limited extent where the soil is already fertile. It is a hardy plant, and its seeds are spread far and wide by birds. Like the Prickly-Pear, too, it takes a good deal to eradicate it. An attractive and protective plant, it makes a good bid for popularity; but the fiat has gone forth, and for the future its growth is to be limited in Bangalore. No doubt similar measures will probably be taken in other parts of Mysore, so that we may expect soon to see "Lantana, Limited," opening numerous branches, and throwing out "suckers and seedlings" as vigorously as the plant itself does.—*Planting Opinion*, cited in "*Indian Gardening*."

**TEA FREIGHTS.**—The question of freights generally has, I learn, been exercising the minds of the Committee of the Indian Tea Association (London). Under an agreement with the London Conference, shortly about to expire, rates have been paid which on comparison with the rates to London, ruling in Colombo during the period, shew an excess of nearly 50 per cent. The days have gone by when tea can stand extra charges of this kind, and it is hoped that the hard hearts of shipowners may be stirred, so that in the near future better terms may be arranged. The position in this matter, however, in Calcutta is so essentially different from that in Colombo that it is vain to hope that Indian tea-growers will ever be put on a footing of equality with their Ceylon brethren. Calcutta is a terminal port, the only vessels trading thence to London being the Conference lines who hold the trade in the hollow of their hands. Colombo, on the other hand, is the port of call of some twenty different lines, running to London from all parts of the earth, from Calcutta itself, from Burma, China, Japan (there is a constant service now of Japanese boats) and Australia. Seldom it happens that there is not ample tonnage offering for all available cargo, and often, if three or four steamers of competing lines chance to call at the same time, cargo becomes an object of extreme desire and freights drop to a minimum.—*London Cor.*, *The Planter*, March 4th.

To the Editor.

INCREASED USE OF INDIAN AND  
CEYLON TEAS IN FOREIGN AND  
COLONIAL MARKETS.

13, Rood Lane, London, E.C., Feb. 24.

DEAR SIRS,—Confirming our letter of the 17th inst., we now have the pleasure to enclose you copy of our this week's Circular from which you will see that there was a considerable increase in the use of Indian and Ceylon tea in Foreign and Colonial markets during 1898, which year showed an excess of 11 million pounds over the previous year; while there has been a rise of nearly 50 per cent over the figures for 1896, the progress of these external outlets having been very remarkable since 1892. This applies especially to Ceylon tea, consumption of which during 1892 was under 10 millions, while in 1898 it rose to over 36 million pounds.

It is certainly owing to a great extent to the progress made in these outside markets that the tea industry is in a more healthy condition than it was last year, and that consumption has at last overtaken production; and if only planters can be induced to restrain their natural desire to rapidly increase cultivation, it looks as though the tea trade would be in a more prosperous position during the coming season.

We know you will thoroughly understand how best to draw attention to these figures in your valuable journal in such a way as to impress the importance of these matters upon tea planters.—We are, dear sirs, yours faithfully,

GOW, WILSON & STANTON.

THE SILVER CURRENCY QUESTION  
AND PLANTERS.

Continental Hotel, Cairo, Feb. 25th, 1899.

SIR,—I have read (in your issue of Feb. 6th) with much interest your careful examination of a Currency policy in relation to the advisability of abandoning poor tea and coffee fields. In the course of your remarks you observe that in Ceylon, "an unusual influx of labour took place during 1898 just as depression had set in, and all further extensions were stopped and orders issued for the strictest economy in all departments." And the policy, you observe, resulted in a decline in the earnings of the labourers. But what caused the depression in 1898? Certainly, it seems to me, not prices, but the fact that whereas at first no one believed that the Government would continue its Currency measure, it became evident by 1898 that the Government was determined to persevere in the suicidal policy of placing India and Ceylon in the worst possible position for competing with other silver-using countries. That prices have probably had little to do with the depression in Ceylon seems evident, if we consider that there has been much depression in Mysore leading to a similar decline in the demand for labour though fine Mysore coffee towards the close of last year was from 105 to 115 shillings a cwt.—a higher price than in the year previous. The fact certainly

seems to be that while capitalists will face great risks which arise naturally out of the circumstances, they will not face those Currency risks which are liable to be created by the notices of partially informed and practically irresponsible Indian officials who have every interest in continuing to force up the rate of exchange.

You ask whether I can give you a case of "deliberate abandonment taking place in any part of India." Certainly, and on my own property. On mentioning this to one of our leading Mysore planters some months ago, he observed "That is just what others are doing too." But this is always the case when any cultivation falls into a state of depression owing either to artificial (as in the Indian Currency case, or the effect of the sugar bounties) or natural causes. A farmer in Scotland once said to me: "How is it that you who have spent so much of your time in India know exactly what ought to be done here to meet those bad times?" Simply because, I replied, I found that you were doing mostly what we had been often doing in India, making money on the good land and throwing it away on the bad—and that the first thing to be done was to throw the latter out of cultivation. It is good policy in any times to diminish risk by cultivating highly the good and abandoning the inferior land. To adopt any other policy in bad times, and especially in the face of a Currency which is liable to be tampered, and re-tampered with, is certainly not the safest course to pursue.—Obediently yours.

ROBERT H. ELLIOT.

THE POSITION OF TEA IN AMERICA,

Kandy, March 6.

SIR,—I enclose extracts received from Mr. Mackenzie from a letter in the "New York Journal of Commerce," which he says gives the position of tea accurately and should be published.—I am, sir, yours faithfully,

A PHILIP,

Secretary, "Thirty Committee."

The causes which reduced the importations this season are, first, and most important, the sudden imposition of duty on tea, and, secondly, the passage of the Tea Act in the previous year "to prevent the importation of impure and unwholesome teas." To understand the present position of the tea trade these two factors have to be considered together. The "tea law" has undoubtedly excluded much of the rubbish which used to be imported and which was responsible to a great extent for the comparatively small amount of that article consumed in this country. The latter measure paralyzed the trade for many months, as retailers would not meet the enhanced cost of tea by a corresponding price. The two together placed a premium on the surplus stocks of bygone seasons, heretofore unsaleable, some of which had been in the country as long as twenty years. Such stuff acquired a fictitious value, as there was no other cheap tea in the market and no more could come in. The amount of this antiquated trash and the amount of stock actually held in the country has been a surprise to most of the trade and has been the only obstacle to the development of business in new teas. What these stocks must have been can be gathered from the fact that, although some 40 million pounds of tea were imported from 1st June to 1st December, 1898, but 12 million pounds were cleared, or paid duty, during that period. If the consumption of tea per capita is calculated upon this basis, it will be found very low indeed; yet no one in the business would admit that people have ceased to

drink tea. The actual facts are now well understood. It is now known that there was from eight to nine months' supply in the country, that these are gradually being absorbed, and that until they are absorbed business will remain dull. What stocks remain in hand is shown by your correspondent, Mr. Martindale, whose letter you published on the 10th inst., and who stated that his broker had been unable to find a single jobber "in one of our largest cities who had any tea whatever to sell in large way."

All the rubbish and accumulations of previous years have been swept away, and thanks to the new "tea law" only fairly good teas will be admitted. Stocks are lower than ever and when the demand from the country begins to come in, it must continue and be a lasting one. The tea in bond is in strong hands, visible supplies are short, the crop in China and Japan of teas available for this market is at least six million pounds short of last season (which in itself was below that of previous years) and rejections have still further decreased the supply. Stocks in the London market are lower than they have been for years, as the demand for Ceylon and India teas, which constitutes the bulk of the business there, is increasing from other countries; so that everything points to a very healthy condition for the trade.

With a better class of tea supplied to consumers, consumption will increase, and if the trade is only true to its own interests there seems every prospect of an era of prosperity to those who handle this staple article in this country. X.

### THE FLOWERING OF THE NILU:

#### INTERESTING INFORMATION.

North Cove, Bogawantalawa, March 17.

SIR,—When I wrote to you on the subject of "Nillu" flowering in Ceylon, I was writing from notes I had made in my "sporting diaries" during the past 29 years.

Mr. J. Fraser of Abbotsford has ventured to doubt the correctness of my statements and has endeavoured to put me right. He has apparently failed to grasp my application of the term "district"—I do not refer to a tea or coffee district, but to a "Nillu district"; and it Mr. Fraser would care to see the boundary of two such districts he can do so the next time he ascends Totapala on his way to fish on the Horton Plains, just above the old Ela. The boundary is straight and perfectly distinct. On the Ambawella side the Nillu—chiefly *Strobilanthes Pulcherrimus*, *S. Sexennis*, *S. Calycinus* and *S. Viscosus*, is now in seed. It flowered (generally) from August to December last year 1898. It last flowered in 1886—on the Horton Plains side, of the boundary I describe, the Nillu is now from four to seven feet high. It flowered in 1893 and seeded and died in 1894. Its previous flowering and seeding was in 1881-82. It will flower again (generally) in A.D. 1905, Mr. J. Fraser and his dry cycles to the contrary notwithstanding!

Some of the Nillus, of which there are over 30 different kinds in the island, I believe, are to be found in flower every year, especially *S. Viscosus*, but not followed by universal death. Again during the year preceding the big and universal flowering many plants throw out a spray or two of flower especially by the sides of roads and notably *S. Pulcherrimus*, but this spasmodic flowering is not followed by death I think.

If Mr. Fraser wants to see another Nillu district boundary, let him walk up from Elgin to the Elk Plains via the Rajabputanas and another between the Horton Plains and North Cove Estate. I know of many more of them.

Mr. Fraser's statement that the "whole thing" depends on the weather is too absurd to be taken seriously. With regard to the height of Nillu he is pretty near the mark—this depends on soil and shelter, but its thickness of stem 8 to 10 inches!

I will give Mr. Fraser a rupee an inch for every inch of diameter over seven inches (for any single stem), I believe, I might safely say 6 inches. I have in my possession notes of the flowerings of Nillu giving dates as follows:—

1851, '57, '62, '63, '73, '81, '82, '86, '88, '93, '94, 98—the first five obtained from the late Dr. Trimen when in correspondence with him upon this subject in 1893. These dates were taken from dried specimens in his possession. By the dates I can trace back a good many of the Nillu districts, I know "duodecennially" if that is the correct term.

Some of these specimens may possibly have been collected in the year preceding the universal flowering. An unusually dry season would probably induce more blossom among the Nillus than a wet one in the year preceding its general flowering.—I am, yours &c., THOS. FARR.

### TEA DISEASE: REPORT BY MR. CARRUTHERS.

Kandy, 18th March 1899.

From the Secretary, Planters' Association of Ceylon.

SIR,—At the request of the Committee I enclose copy of Mr. J. B. Carruthers' report on Tea Disease.—I am, sir, yours faithfully,

A. PHILIP.

### REPORT ON TEA DISEASE.

As requested I visited ——— estate and examined the tea plants which were diseased. The Superintendent has observed the same phenomenon for about three years past. An area of about 40 acres contained affected bushes, but about one plant in five was the most observed on any given square ten yards. In no case had the disease killed any plants and always disappeared after pruning. I took specimens of the leaves and these I have examined microscopically.

There is just a "rust," i.e. a fungus belonging to the Uredineae, a group to which the *Hemileia vastatrix* of coffee and the rust of the wheat belong. This fungus can be recognized on the tea leaf by its fruit which appear to the naked eye as a reddish brown mould covering a space varying from the size of a pin's head to that of a threepenny piece—with an ordinary field lens this shows itself to consist of a number of thread-like stalks swollen at the top and bearing on the swollen portion a series (5 or more) of orange-coloured spores (Basidiospores). These spores in all probability (that is judging by what is known of the life history of allied fungi) will on falling on to another tea leaf or another portion of the same leaf produce another spot of rust.

There is also another fungus which produces a yellow or brown patch and this is covered in some cases by a series of minute black dots which are lighter when older. These small spheres contain as spores—which places this fungus in the large group—characterised by such spores—the *ascomyetes*—to which the cacao canker belongs. That these are the only spores on the tea leaves or that they are alone responsible for every diseased bush I am not willing after so cursory an examination to state; but a careful search revealed no other spores produced on the leaves.

Both these fungi live in the leaf and as they do not re-appear in the plant after pruning, it is evident that they are confined to the leaf and therefore if the leaves are taken off and burnt the spores will be destroyed. From the fact that young leaves plucked for tea making are not rusted even on affected bushes, I should imagine that the time taken for the spores to reproduce themselves is more than ten days. The mycelium of roots of these fungi ramifies among the loose cells of the leaf and gains its nutrition from the juices of the plant—a greater strain therefore is put upon the plant in supplying food both for itself and the fungus.

There was no case in the fields I examined of a bush being so badly attacked as to cause death; a purely leaf disease very rarely produces fatal effects. If measures are taken to prevent the spores of these diseases spreading—by burning diseased leaves, there is no reason to expect that they will spread to any serious extent. A cooly or gang of coolies might be specially employed to collect and burn affected leaves. It has occurred to me that any tea being left to go out of cultivation might easily foster these or other diseases and it would be well that at any rate an inspection of such intended tea should be made to ensure that it is not a "spore farm" for the rest of the island. As the report has been written after a most hasty examination I must ask to be allowed to state that I consider the statements it contains open to correction.

(Signed) J. B. CARRUTHERS.

October 14th, 1898.

THE EFFECTS OF THE RECENT FROST NEAR AND AT NUWARA ELIYA.

Hakgala, Nuwara Eliya, March 17.

DEAR MR. EDITOR,—Being quarantined by the doctor on account of measles in the house I had not been up the road towards Nuwara Eliya until yesterday and was not aware of the extent of the damage done by the frost during the nights of 7th, 8th, and 9th inst. I have not seen anything like it in my 17 years' experience here. Between the 52nd and 53rd mile-stones (elevation being between 5,600 and 5,700 feet) I made a list of over 50 species of plants that had been more or less injured; and as it may be of interest to record these plants, as showing those that are easily affected by frost, I append the list:—

- Rubus—"Blackberries," three species, all badly injured.
- Cynoglossum—"Ceylon Forget-me-not," young shoots only.
- Alsophila } —Tree ferns. These two and } kinds suffered severely.
- Amphicosmia }
- Osbeckia—"Bowitiya" (S.), two species. Quite frizzled up.
- Eurya japonica—"Wild tea." Scorched on the top.
- Strychnos—A creeper of the same genus as Nux Vomica. Scorched on the top.
- Elœagnus—"Wel-embilla" (S.). Scorched on the top.
- "Todallia—"Kudu-miris" (S.) } —Both of the } orange-family: } scorched on } the top.
- "Acronchia—"Ankundu" (S.) }
- Rhodomyrtus—The "Wild Guava." Scorched on the top.
- Pygeum—Of the apple family. Dreadfully cut up.

Photinia—Of the apple family. Slightly cut up.

Litsea—Laurel or cinnamon family. Several species very much injured.

Semecarpus Gardnerii—"Badulla" (S.) This till presents a remarkable appearance. The frosted foliage has turned a yellowish white, and the leaves being very large, the injured trees can be distinctly seen dotted about the forest in the hollows and on the lower side of the hill.

Strobilanthus—The "Nilu" (S.). Several species have dropped all their leaves.

Thunbergia fragrans—The pretty white flowered creepers are all shrivelled up.

Crotalaria semperflorens—The yellow creeper that looks so much like a Laburnum has been badly burnt and there is scarcely a flower of it to be seen.

Hedychium coronarium—"Ela-mal" (S.) or "wild Ginger." Has been quite killed back. This is one of the first plants to feel severe weather.

Symplocas spicata—"Bomba" (S.) and other species, of the same genus, are served in the same way as the Semecarpus, named above.

Apodytes } Of the Order Olacineæ—have and } their tops quite blackened.

Meliosma arnottiana—One of the few deciduous trees of Ceylon, and one that is quite a feature in the upcountry jungle in April, when covered with its cream-coloured blossoms, has had most of its young shoots destroyed.

Among others that were injured I noted several species of Hedyotis, also Rhamnus, Dipsacus, Viburnum, Lobelia, Cassia, Piper, Microglossis, Polygonum, Chrysogonum, Veronica, Blumea, Allophania, Celtis, Mœsa, Emilia, Adenostemma, Gynura and Senecio.

The following ferns were also much blackened:—Gleichenia, Stenoloma, Pteris, Lastrea, Nephrodium, Blechnum, Asplenium, and Pheopteris.

The grass along the road-side is as brown as can be—quite as bad as it is in Nuwara Eliya.

Of introduced species the Mexican sunflower, Tithonia, was killed to the ground. Tree Tomato and Mountain Papaw (from West Indies and Chili,) was killed to the ground. Calla Ethiopica—the introduced arum—suffered in the same way; and the young tips of Eucalyptus robusta were killed—Yours very truly, W. NOCK.

COFFEE IN JAPANESE DEPENDENCIES.—The Governor of Loochoo islands—an intelligent Japanese—is anxious to learn all about coffee growing, as the shrub already grows on one of the islands (of course introduced). A friend is sending him a copy of our "Coffee-planter's Manual" as his best instructor. We should fear the Loochoo's to be too far North for coffee at 28 deg., but if they are favoured with a warm current in the sea around them, it may make the temperature right and free from frost.—Formosa is, however, a more likely coffee country and Mr. Kirkwood on behalf of the Japanese authorities, fully equipped himself for experiments in several of our products, when in Ceylon some months ago.

### TEA SIFTING AND CUTTING.

In our February number we published an account of the improved tea-sifting and cutting machinery made by Messrs. Savage & Co. The sifting and cutting are carried out in one combined apparatus, the process being as follows:—As the tea drops from the hopper it passes over a set of magnets to free it from pieces of wire, nails, and other iron substances, and then falls upon a vibrating sieve, through which the siftings and small teas pass down a shoot, the larger leaves going over another sieve which allows them to pass through, but holds back any pieces of paper or wood which may have got mixed therewith. The leaves fall upon a distributor, which carries them to the cutting rollers, by means of which a uniform, neat, and attractive sample is rapidly produced. Such machines, which are made in various sizes, are generally fitted up on the floor above the mixing or blending machine.—*British Trade Journal*, March 1st.

### MOTHER-OF-PEARL TRADE.

The principal mother-of-pearl fisheries are scattered about in various parts of the world, and all of them lie at a very considerable distance from the home markets; so that the freight for transport adds in no small degree to the price of mother-of-pearl, whether raw or manufactured. The best-known fisheries are those of Ceylon, Tuticorin (on the Coromandel coast), Queensland, the Torres Straits, and the Bay of Panama, and it is from these places that the bulk of the mother-of-pearl is exported.

The true pearl oyster, the "Meleagrina Margaritifera," is a native of the Indian and Pacific Oceans, and is divided into two species, one with a gold-colored border, the other of a uniform silvery colour, for which there is a much greater demand, the pure white shell being much preferred to the variegated mother-of-pearl for commercial purposes. A good shell should weigh from 3 lb. to 4 lb., and in making a contract with the divers it is usually stipulated that the shells should not weigh less than 2 lb. to 3 lb. a pair; that means, of course, the two halves which make up the whole shell. An exceptional pair, weighing 18 lb., and measuring over 1 ft. in diameter, has been gathered in the Torres Straits, but such examples are rare.

Formerly the pearl oysters were found in greater abundance, and in some places could be picked up by hand at low tide. The increasing demand, however, has put an end to this state of things, and the majority of shells are now brought up by divers from a depth of 45 ft. or 50 ft. of water. This is about the average depth for working in, although the pressure at 60 ft. or 70 ft. can be supported by a diver for a quarter of an hour, or even longer. The oysters producing the pearls of greatest value are invariably found in the deeper waters, but nowadays it is the mother-of-pearl, and not the pearls, which are the primary cause of these fisheries.

The prices obtained for mother-of-pearl vary naturally from year to year, but the following, obtained from one of the principal stations in Queensland, are taken by the *New York Commercial* as a guide:—

	Per ton.
Picked quality	£177 10
First quality	125 0
Second quality	90 0
Third quality (inferior)	60 0

The average price realised at the Torres Straits fisheries is £125 per ton for the raw shell, or £100 per ton cleaned.

A company, according to our contemporary, is in process of formation to acquire 10,000 pearl oysters, of which 500 will be set aside for breeding purposes, on the Calabrian coast. It has been computed that the spawn produced by one of these molluscs in the

open sea contains something like 12,000,000 eggs. The majority of these are naturally lost, either because they serve as food to other animals, or because they get covered up by the sand or are carried away by the currents into places unsuited to their development. By breeding in tanks these dangers can for the most part be avoided.

It is estimated that at the end of the seventh year there would be 3,750,000 shells, and, at an average rate of three pounds per shell, this would mean 5,020 tons of mother-of-pearl, which, even were it all of the third quality, and worth but 1,500s. a ton, would yet bring in a sum total of 7,539,000s. It is possible that this enormous quantity of mother-of-pearl, brought suddenly into the market, would considerably lower the price, and therefore only half of this sum has been calculated for each bank fished every seventh year—that is, one annually.—*H. & C. Mail*, March 3.

### COFFEE IN NICARAGUA.

(FROM OUR CORRESPONDENT.)

Kingston, Jamaica, Feb. 27.—Private advices from Granada, Nicaragua, state that the country is completely disorganized. The coffee is spoiling on the trees, as the labourers are drafted into the army. A war contribution of \$200,000 has been levied on the inhabitants of Granada, and the export tax on coffee has been raised to \$4 per quintal.—*London Times*.

### SELANGOR PLANTERS' ASSOCIATION.

#### EXTRACT FROM ANNUAL REPORT FOR 1899.

6th Annual Report of the Planters' Association of Selangor. Owing to various causes, extensions during the past year have not been upon the same scale as in previous seasons, to new members have, however, been enrolled upon the books of the Association and the attached statistics show an increase under cultivation of 1,676 hat of labourers of all nationalities a decrease of 1,166.

PLANTING PRODUCTS.—(a) COFFEE. Whilst estimates have for the most part been realized and in some cases considerably exceeded, the depression in prices has continued throughout the year, except in the months of November and December, when, no doubt owing to short deliveries, the market hardened and as much as \$25 per picul was secured for the best No. 1; as soon, however, as the heavy pickings recommenced, values receded, and the year closed, as in 1897, with quotations in the neighbourhood of \$19 per picul, a price at which, except in very favoured localities, it becomes a difficult matter to do much more than cover expenses. A feature of this year's transactions has been the growing disinclination on the part of planters to sell their coffee in outside markets, the prices ruling in Singapore having compared very favourably with anything obtainable elsewhere. Your Committee think that a distinct improvement in quality has been effected during the year under review, and hope that no efforts will be spared, on the part of those who have stores, to turn out a sample which will hold its own with the best produced anywhere. The maintenance of a high standard of excellence, combined with the greatest economy in production, are questions of vital importance if the coffee industry in this country is to successfully battle with the present crisis, and realizing the necessity for a much closer acquaintance than you now have with the position of affairs in the Brazils, the crops from which country exercise so omnipotent an influence upon the markets of the world, your Committee propose to make immediate arrangements for the supply of regular and reliable information as to the prospects of the coffee enterprise in that country.

(b) **PARA RUBBER.**—Probably no more important evidence, that planters are at last realizing the futility of risking their all on any one product, has been afforded during the past year than the energy with which large areas have been planted up with para rubber. Had it not been for the shipments of seed which were received from Ceylon, operations would have been considerably restricted, as the local supply was nothing like sufficient to meet the demand. The vitality of para seed is so dependent upon immediate planting that it was feared the long journey from Ceylon would prevent a large proportion of the seeds from germinating; happily, however, where proper precautions were taken, from 50 to 60 per cent. of plants resulted on an average from the Ceylon seed, and in consequences this product, which does so well here, and which has to all appearance so prosperous a future before it, has become established in the State with every prospect of large extensions in the coming season. The young plants are reported on all sides to be growing satisfactorily, but on most places heavy losses have been occasioned by rats, lizards, mole crickets and other pests, and the problem now to be solved is, how to best stave off such attacks until the plants are able to take care of themselves. Your Committee, therefore, hope that members will communicate to the Association particulars of any experiments that have been attended with successful results. 389,500 Para Rubber trees have been planted in Selangor during 1898.

(c) **COCONUTS.**—A large number of coconuts also have been planted by Europeans during the past year, mostly through coffee 40 feet apart, and good reports of growth are to hand, especially from the Coast districts. In the Ulu, white ants have done a great deal of damage to the young plants, in one case a clearing of over 80 acres having had to be completely replanted three times, nothing short of a liberal application of tar apparently sufficing to keep the ants at a distance. In Kuala Selangor, a well-equipped oil mill is now working, and is stated to be turning out a fine quality of oil and excellent coconut pounac. 94,800 coconuts have been planted on Selangor Estates during 1898.

(d) **RAMIE.**—On most estates in the Klang district ramie nurseries are to be found, and in Kuala Langat the "Ramie Syndicate" are experimenting and will shortly have machinery at work. In the absence of any statistics of cost of production this cultivation is, however, attracting little local attention, but widespread regret has been expressed at the untimely death of Mr. J. M. MacDonald, which occurred in Singapore in the early part of this year. Mr. MacDonald was one of the patentees of the "MacDonald Boyle" process of extracting ramie fibre from the raw stems; he was a firm believer in the great future before this product in the Malay Peninsula, and in conjunction with the Sultan of Johore was carrying on in that State an experiment of sufficient magnitude to demonstrate clearly whether the industry was one in which the public might profitably invest.

(e) **MINOR PRODUCTS.**—A considerable acreage has been brought under plantations on two estates in Klang, and it appears probable that far more attention will, in future, be paid to catch crops generally in conjunction with permanent products, than has hitherto been the case. This is a matter which your Committee consider well worthy of serious consideration. An object lesson is afforded in the customs of the people of the country, who aided by the produce from the few badly planted and badly tended fruit trees in their small gardens, manage with their wives and families not only so support existence, but in many cases to attain their ideal,—a life of absolute idleness. What is possible on a small scale for thousands of natives, even though the ultimate object be not the same, should be equally feasible on wider lines for a comparatively small community of Europeans. The successful cultivation of catch crops means a proportionate reduction in the capital cost of estates, when the permanent products begin to be remunerative, and a less severe loss to face in times of depression.

**CURRENCY.**—A request having been received from the Secretary to the Government, that your Association would give their views upon a resolution passed by the Singapore Chamber of Commerce to the effect that "Sixty of exchange with gold countries on the basis of 2- per dollar is desirable in the general interests of the Colony" the following resolution which was carried unanimously at a general meeting of your Association on the 18th June, was forwarded in reply. "That in the opinion of this Association any action having for its object fixity of exchange is undesirable in the interest of the planting community.

**CURING ESTABLISHMENT AT KLANG.**—The want of a store to which planters could send their parchment to be peeled having been supplied by Messrs. Barrow & Co's curing establishment in Singapore, and there being apparently no disposition on the part of any of the Ceylon or other firms who were approached, to start in Klang, this project has, for the present, been abandoned. On several properties stores have been erected during the year, and it now appears probable that if estates are to join issue in connection with the curing of their coffee, it will be a matter rather of private arrangement than of any combination under the auspices of the Association.

**COCONUT TREES PRESERVATION ORDINANCE.**—At the instance of your Association the Government have introduced an ordinance which, though somewhat drastic in certain of its provisions, cannot fail, if intelligently carried out, to be of great benefit to the coconut industry. Large numbers of beetle infested trees have been cleared in the various districts, and, when too far gone, have been cut down. The ordinance provides for the prompt burial to a depth of three feet, or destruction by fire; of all such trees, but it is questionable whether sufficient attention is being paid to this important point. The notice of the Government has, however, been drawn to the matter, and your Committee would impress upon all members, whether interested in coconuts themselves or not, the necessity for at once reporting to District Officers any negligence which they may observe on the part of the native headmen, who are supposed to see that the work is properly done. The Government have been prompt in taking steps to eradicate the beetle, and it is the duty of all planters to co-operate and endeavour to get the full benefit of the assistance which has been extended to us.

**DELEGATES TO JAVA.**—With the object of comparing our methods with those in vogue on estates in Java, your Association decided upon recommending the U. P. A. to send two representatives to that country towards the end of the year, the idea was, however, given up so far as the S. P. A. was concerned upon the advice of a gentleman resident there, as savouring too much of an official arrangement.

**RETAIL SALES OF COFFEE.**—The low prices which our coffee has been fetching, without, as far as we have been able to ascertain, any appreciable corresponding advantage to the consumer, has naturally led planters to consider the possibility of supplying the public with the prepared article "direct from the plantations" and appropriating to themselves some of the profits of the middleman.

**LABOUR.**—The Government took steps during last year to stimulate the immigration of Indian labour by subsidizing the B I S S Co. and providing cheap passages: several planters availed themselves of this opportunity of getting coolies over, but the regular recruiting season was past before the system was generally understood, and during the later months of the year it is almost an impossibility to persuade coolies to leave India, as they are all getting their paddy fields ready for planting. The B I Service was only subsidized for a year and therefore the coolies who are coming in on May and June, will not benefit by the reduced rates. It is rumoured that both in Perak and Sangai Ujong the Government have recently imported Tamil coolies, but none have come to Selangor. The price of tin has risen to such a point that little Chinese labour is available for estate work, and it is reported that even Tamils are now

being employed on mines; in all probability, therefore, a scarcity of labour on estates may be expected very shortly and your Committee would recommend employers not to miss the coming recruiting season.

**THE CATERPILLAR PEST.**—Your Committee feel that their report would not be complete if they omitted, whilst it is still fresh in the minds of all, to make some reference to the awful plague of caterpillars which has attacked the Petaling Estate, and to the measures which have been adopted to get the pest under. Coming from no one knows where, myriads of these destructive insects have swept over 250 acres of the estate, entirely denuding the trees of leaves and even attacking the growing berries. Such a terrible visitation has never been experienced in Selangor before (though there is a parallel for it in Ceylon, where hundreds of acres of cinchona were eaten down about the year 1883) and it is devoutly to be hoped that nothing of the kind may ever be heard of again. The sympathy of all will be extended to the proprietors and to the manager, Mr. Rendle, in their trouble, and the thanks of the whole planting community are due to the Government, and to our Resident, Mr. Rodger, in particular, for the splendid way in which they have come to resound; hundreds of coolies have been set down to pick off the caterpillars, numbers of butterfly nets have been provided to catch the moths, and free passages by rail have been granted to all coolies who could be sent down to help; nothing in short that could be done has been neglected, and it is to be hoped that the energetic measures which have been taken will lead to the complete eradication of the pest.

E. V. CAREY, Chairman; TOM GIBSON, Hon. Secy.  
**STATISTICS OF ACREAGE** under Cultivation, estimated crop and labour employed on the European estates in Selangor:—

No. of Estates.	Acreage under cultivation at end of 1898.	Estimated Crop in Pikuls for 1899.	Labour.			Total.
			Tamil.	Chinese.	Malays and Javanese.	
70 Total for 1898	14,344½	18,715	2,937	627	698	4,462
68 Return for 1897	12,639	13,303	3,235	1,219	1,094	5,628
2 Increase and Decrease in 1898

## PLANTING IN WYNAAD:

### NEWS OF CEYLON PLANTERS.

Wynaad, St. Patrick's Day, 1899.

You may be interested to hear news of Ceylon Planters who have settled in the Wynaad. We now have Messrs. E. de Fonblanque, J. S. Nicolls, Stewart Robinson, A. C. Glennie, W. Q. Wright and E. N. F. Day. Mr. DE FONBLANQUE is settled on his "Perindotty" tea garden near Vayitri; he also holds an interest in "Nellanoor," which has been planted with Liberian and Arabica coffee, in addition to which over 20 acres have been opened with Hybrid Liberian-Arabian, one of the best original Hybrids, having been discovered on "Nellanoor" by the late proprietor nearly ten years ago. Apart from these two properties, Mr. de Fonblanque has acquired a block of 250 acres of bamboo land near "Perindotty," 12 acres of which are already planted with the Hybrids referred to above, and the remaining area is to be covered with the tea bush as soon as possible. He is always to the front at athletic gatherings and your champion recently won the Open Singles L. T. Handicap starting with 40.

Mr. NICOLLS resides at Culloor Vayitri, having been nominated as tea-maker and factory-superintendent on the Wynaad Tea Company's "Perrengodda" factory. He is the proprietor of the "Pootha Coollee" estate, Meppady, which is being gradually developed with tea.

Mr. STEWART ROBINSON resides on his own property, "Elton," Kalpatty. This block was purchased from Messrs. Parry & Co., Madras, and consists of some fine forest as well as of what was originally bamboo land; the latter was splendid coffee 30 years ago and yielded phenomenal crops. The forest land is being opened with Arabica and the bamboo with tea; so far both are promising.

Mr. GLENNIE is tea-maker and factory-manager on the "Eiramacullee" estate, Meppady. Teas from this garden have always realised excellent prices in home market.

Mr. W. Q. WRIGHT, who is related to Mr. Parry of Ceylon, is living on "Sentinel Rock" estate, Vellera Mulla, and is opening the fine forest land there with coffee.

Mr. E. H. F. DAY purchased the "Neli Munda" estate, Meppady, from the Wynaad Tea Company last year, and resides on the property, where he is rooting out the fine old coffee and substituting tea. One way or another, Ceylon Planters are already owners of over 2,500 acres of land in South Wynaad.

We had nearly 150 cent rain in South Wynaad last month and several showers have been recorded in the past fortnight, but at present the weather is fine and the coffee which looks better than it has done for many years, is wintering well, the past season's crops of Arabica have been the best known for nearly ten years. Tea is looking very promising; great faith in its future is evinced by the extensions visible on all sides, while the prices realized for South Wynaad teas during the past five or six months have been most encouraging.

**THE SALT BUSH** which is being cultivated in the Botanical Gardens is now bearing seed in abundance. The first seed of this plant was brought from Australia. The plant is known as the *Atriplex semibaccata*, and was introduced here by General Roca two years ago. Its adoption in Argentina will be of immense service, as it grows well in the most barren parts and is splendid for fattening animals.—*Review*, Buenos Aires.

**NILGIRIS CINCHONA PLANTATIONS.**—The Budget estimates for the Government cinchona plantations, Nilgiris, for 1899-1900 have been issued. The estimated receipts amount to 1,20,000. This forecast is based on the anticipation that only 5,000 lb of quinine and 2,500 lb of febrifuge will be sold. If, however, a market can be found for the 10,000 lb of quinine being manufactured this year, there is expected to be a considerable increase in the revenue. The estimated expenditure for the same period is 1,48,400, or 53,500 less than the sanctioned Budget estimate and revised estimate for the current year. This is chiefly due to reductions under factory charges, as only 200,000 lb instead of 400,000 lb of bark will be purchased from private growers at an estimated cost of 43,750, to supplement the yield of the existing plantations.—*Chemist and Druggist*, March 4.

## THE LONDON CINNAMON SALES.

The intelligence received by a recent mail confirms the impression which the telegram, announcing the general results of the first quarterly sale of cinnamon held this year in London, created. The apprehension that Spain has not yet been able to enter the lists, as one of the most active competitors for our spice, especially of the best sorts, is confirmed. The Hispano-American war during its continuance necessarily told on trade; and it has left the effete old European State so crippled, that it must be some time before it can recover from the shock and disorganisation under which it lies prostrate. In the loss of almost all its colonial possessions, it may be thought that it has parted with its chief sources of wealth. On the other hand, these Colonies have been for years centres of rebellion and bloodshed, and a constant drain on the mother country for blood and treasure. There is no reason why the energies which were dissipated in intrigue and internecine struggles should not be devoted to the more profitable arts of peace; and while Spain itself affords a by no means barren field for commerce and agriculture, its adventurous sons might prosper more under alien flags than they did in its priest-ridden and mis-governed Colonies. But recuperation must be slow in the case of a people so enervated and demoralized; and until Spain has buckled up to her new conditions, it is to be feared that her needs in Mining Lane will be moderate. We are not, therefore, surprised to learn that at the Cinnamon Sales on the 27th ult., there was but little bought on Spanish account, with a consequently slack demand and a fall in price.

Though the quantity offered, 1,649 bales, was less than the amount catalogued at the corresponding sale last year, when 1,950 bales were brought to the hammer, it must not be forgotten that that was an unusually heavy quantity for a February sale, and that the offerings, 3,901 bales at the previous auctions in November last were also unprecedentedly large. We have been sending away increasing quantities of cinnamon for some years, rising from 1,969,905 lb. of quilled bark in 1894 to over two million lb. in every succeeding year; while in 1897 and 1898 the quantity was in excess of 2½ million lb. These unprecedentedly heavy exports of quilled cinnamon were accompanied by immense quantities of chips which did not find a place in our Export table till about 30 years ago; and although the 2,534,056 lb. of quills last year show a fall as compared with 2,674,537 lb. in 1897, the excess of chips, aggregating 1,414,165 lb., as against 1,067,051 lb. the previous year, places 1898 *facile princeps*. We have thus sent away nearly four million lb. of our spice, while 20 years ago two million lb. used to be reckoned over-production. It tells not a little for the growing popularity of the spice, and the new uses found for it, that this immense increase in our output has not led to a heavier fall in prices. Indeed, there has been a recovery in prices within the last ten or twelve years, and a rate of 15½d for the Firsts

of the best brands is not to be despised. But it must not be forgotten that the quantity of fine bark offering was exceptionally small, and it is the finest qualities which have suffered most from the paucity of orders from Spain. Even coarse qualities met with a slackened demand, and the acceptance of lower prices did not ensure the clearing of much more than one-third of the catalogue. Our repeated warnings, that prices cannot be maintained with the growing output, have thus been justified; but they have not reached those who have been extending their plantations. These are small native land-owners of the Southern Province, who are said to be attracting the skilled workers of the Western Province by heavy advances, matching those against which tea estates are now banding together. It is to be hoped the fall in prices will induce caution in those whom newspaper warnings fail to reach, as cinnamon differs from tea in not being an article of diet—a necessary of life in fact—and a further drop may mean serious embarrassment to an industry which had just begun to recover its former position.

Here is what one of the leading London firms in the cinnamon trade reports:—

London, 28th Feb. 1899.

CINNAMON.—The first auctions of the year were held yesterday when 1,649 bales Ceylon offered against 1,950 bales catalogued at same period last year. There was but little buying on Spanish account, and the sales went off with a very flat tone, about 650 only being sold at a general decline of ¼d to 1d per lb. Of really fine and good quill the record quantity of 41 bales A. S. C. P. offered, none of the regular brands F. S. W. S., only were F. S. K., J. D. S. R. etc., is being represented. Of the small quantity of fine quill, part sold slowly, mostly at 1d per lb. decline. Firsts ranged from 8½d to 1s 5d; Seconds. 7d to 1s 4d; Thirds, 7d to 1s 2d and Fourths 5d to 8d per lb. 87 bales Tellicherry bought in. Chips were in dull demand. Of 1,121 bags offered, 100 bags only were cleared at 3¾d to 3½d per lb.

Stock of Ceylon 5,239 bales against

1898	1897	1896
4,193	2,790	4,727 Bales,

The next auctions will be held on 29th May

PLANTING IN SELANGOR, STRAITS SETTLEMENTS.—Mr. E. V. Carey, Chairman, and Mr. Tom Gibson, Secretary—both old Ceylon planters—with their Committee, deserve credit for the full and useful annual Report they have just issued. We extract all the practical portions elsewhere and we notice with pleasure the attention given to Para Rubber, Coconuts (rightly spelt). Plantains and other minor products, by way of supplementing their coffee which has fallen on evil days. It is too soon to speculate about the financial success of rubber planting, and we much fear that Mr. MacDonald's lamented death will interfere with a decisive answer to the same question in respect of Ramie fibre. It is refreshing to note the keen interest taken by the officials in exterminating coconut beetles and caterpillar pests: a little of the same zeal displayed by officials of all ranks in Ceylon would do a vast amount of good. How many semi-abandoned native gardens in our low-country are allowed to become nurseries for beetles and other pests?

## THE TEA INDUSTRY AND MANURE.

MR. JOHN HUGHES, of Mark Lane, writes to us under date, London, March 3rd:—

"In common with many others I am looking out for some report from Mr. Bamber in reference to an improved manufacture of tea or a new system of manuring.

"To my mind judicious manuring is specially important, because with poor leaf it must be impossible to make good tea; but good leaf may be spoilt in the manufacture.

"I have been very busy with soil analyses lately and much more manure is being sent out from England than formerly. As the numerous Tea Companies have their offices in London, the shipment can be arranged at once and a complete manure sent out in small bags which can be forwarded direct on to the estate, and afterwards carried out on to the field without the trouble and extra cost of casks and subsequent bagging up for transport upcountry."

We heard lately that Mr. Kelway-Bamber had expressed a favourable opinion of certain of the manures supplied for tea by Mr. A. Baur. We scarcely think that the time has yet come for a full Report: let Mr. Bamber complete his experiments and investigations first. By the way his book "On the Chemistry and Manufacture of Tea" is out of print; and no doubt the next edition will embody the latest results of his observations in Ceylon.

#### CACAO: EXPERIMENTS IN THE FERMENTATION OR SWEATING OF "CACAO" IN GRENADA.

As it is generally believed by the planters of Grenada that the less cocoa is sweated or fermented the greater is the resulting weight of dry cocoa, the Hon. D. S. De Freitas of that island conducted some experiments with a view of ascertaining whether this belief was well-founded or not. His results point to the fact that no appreciable difference is observable, and being desirous of confirming such an important result, he has suggested that some of the planters of Trinidad should be invited to conduct some further experiments with a view of settling the point. The Managing Committee of the Grenada Agricultural Society accordingly invited the Hon. Mr. De Freitas to draw up a plan of the experiments and directed them to be printed and distributed. This he has done, suggesting that owners and managers of drying houses in which artificial heat is used should be especially invited to try the following experiments. Five separate lots of cocoa, each containing 200lb of cocoa freshly removed from the pods, are to be treated in the following way:—

Lot No. 1.—(a) That it be fermented for three days—72 hours; (b) that it be "shifted" and weighed after 34 hours' fermentation; (c) that after 72 hours' fermentation it be put out to dry: when it is perfectly dry it should be carefully weighed; (d) that it will be found convenient to begin this experiment in the morning.

Lot No. 2.—(a) That it be fermented for four days—96 hours; (b) that it be weighed and "shifted" after 48 hours' fermentation; (c) that after 96 hours' fermentation it be put out to dry: when it is perfectly

dry it should be carefully weighed; (d) that it will be found convenient to begin this experiment in the morning.

Lot No. 3.—(a) That it be fermented for five days—120 hours; (b) that it be weighed and "shifted" after 56 hours' fermentation; (c) that after 120 hours' fermentation it be put out to dry: when it is perfectly dry it should be carefully weighed; (d) that it will be found convenient to begin this experiment in the morning.

Lot No. 4.—(a) That it be fermented for six days—144 hours; (b) that it be weighed and "shifted" twice, namely, after 48 hours and again after 96 hours' fermentation; (c) that after 144 hours' fermentation it be put out to dry: when it is perfectly dry it should be carefully weighed; (d) the morning will be found a convenient time to begin this experiment.

Lot No. 5.—(a) That it be fermented for seven days—168 hours; (b) that it be weighed and "shifted" twice, namely, after 48 hours' fermentation and again after 120 hours' fermentation; (c) that after 168 hours' fermentation it be put out to dry: when it is perfectly dry it should be carefully weighed; (d) the morning will be found a convenient time to begin this experiment.

In carrying out these experiments it is essential that each lot should be uniformly treated or no confidence can be placed in the data arrived at. For example, if one lot is trampled, every succeeding lot must also be trampled. With a view of arriving at some verified data bearing upon the important question of heat in fermentation it would be valuable to use a thermometer twice a day (8 a.m. and 4 p.m.) to test the heat of the cocoa in each of the five experimental lots, and that on every occasion the reading of the thermometer and the time when it is taken should be carefully recorded. Lastly, it is also desirable that each experimenter should keep a sample of each lot of dried cocoa.—We shall watch with interest for reports of these experiments, both from Grenada and Trinidad.

◆

#### A WORD TO CEYLON TEA PLANTERS.

(From an ex-Ceylon Resident.)

LONDON, March 3.

I think it would be a wise thing for you to do at the present moment, if you were to try and dissuade Ceylon tea planters from being led to commit suicide, by those who are interested in having cheap teas for blending purposes. The sudden burst of sunshine that has broken through the gloom which has for the last two years hung over a considerable area of the tea districts, may well turn the heads of lowcountry planters and induce them to endeavour to compensate themselves for their past disappointments, by making hay whilst the sun shines.

There are rumours current in Mincing Lane and its neighbourhood, that recommendations and orders from the big tea planting distributors (which is the new name for retailers) have gone out to pluck coarser, with the view of increasing the yield of common tea, whilst prices are high. You know very well that nothing could be more disastrous to the tea industry than for planters to increase the production in this way.

It is the falling-off of supplies to England, owing to the expansion of exports to other countries, that has caused the sudden change in the prospects of bewailing tea planters. The bug-bear of over-production has vanished,

but it may soon be raised again if they carry out the advice given to them by the blenders and increase the exports artificially over the estimate. If they do so, they will lose all the benefits they derive from the sacrifices they have made and are making to increase consumption in other countries.

The recent advance in prices of common tea does not fall on consumers, but it seriously affects the pockets of the distributors who advertise the finest tea the world produces under cost price.

I need scarcely tell you that when the finer qualities advanced some time ago, distributors, who, owing to severe competition, cannot raise their prices, were forced to put less fine tea in their blends and more common. In this way they worked off the surplus stocks of the lower grades to such an extent as to lead them to think they might be cornered in them. They then rushed into the market and bought all that could be obtained at an advance of a penny per pound. Whether this advance is of long or short duration, depends upon the action of planters during the next two or three months, when the big flushes generally take place. If they send home a large increase in the quantity of pekoe souchongs, down will go the price to 5d per pound. If they tell their tempters to get behind them, there is a very fair prospect of the Ceylon tea industry having a good long innings of prosperity.

For the last few months I have been preaching to all who would listen to me, that the slap in the face the Indian and Ceylon tea planters got last year or two, was the best thing that could have happened for their permanent interests. It put a stop to the extensive increases in Indian planting at one time contemplated and compelled planters, especially in Ceylon, to reduce the cost of production to the lowest point. They have been so far successful that at least three-fourths of the tea grown in Ceylon do not cost more than 25 cents per pound f.o.b. or at 16d exchange 4d per lb. With a considerable knowledge of the circumstances of every tea-producing country, I do not hesitate to say that no country in the world can produce tea below that figure. Therefore, in any future struggle for existence, it need not be Ceylon that will go to the wall, if the planters do not lose their heads.

### THE HORREKELLY CO., LTD.

#### THE COCONUT INDUSTRY IN CEYLON.

We had noted for comment the Report of this old Company which declared a dividend of six per cent recently not because there was anything striking or unusual in the Report, but because the Horrekelly is one of the few Joint Stock Companies—as it was, perhaps, the first—which cultivate coconuts alone, and its position is therefore, of some interest. A dividend of six per cent in these hard times is not to be despised; but after all that has been said about the remunerativeness of coconuts, the dividend seems insignificant as compared with those which some Tea Companies declare, and have declared even in years of low

prices and high exchange. The explanation probably is that Horrekelly cannot be reckoned among the crack coconut estates of the Island, though entitled to a place among the good average ones. Then, when the Company was floated, it was generally looked upon as, at least partially, a benevolent scheme to relieve an old colonist, who had fallen on evil times, of the incubus of debt that was weighing on him; and the price paid for the estate to Mr. David Wilson, was considered by many too high. Possibly it was according to the prices ruling 20 to 25 years ago; but the cultivated acreage of 800 works out R500 per acre for a capital of R400,000; and that does not seem to be too high for coconuts in bearing, though the balance-sheet shows the sale of a block of five acres at R300 an acre. We suppose there are substantial buildings on the property, including machinery for the manufacture of coir and fibre.

On looking up the Reports for the last three years—we presume the system has been followed in earlier Reports which we have not at hand to refer to—we find that the land is separately valued at R306,400, or less than R400 per acre—the buildings and permanent works being separately valued among assets, and the plant and machinery separately. As each Report places before the Shareholders, a statistical retrospect of the two previous years, we have before us the output of the estate, consisting of coconuts and coir fibre, for the past five years; and it is interesting to note the variation in crops and the manufacture of fibre. The following is the statement we work out:—

	Coconuts.	Ballots.	Expenditure.
	No.	Coir Fibre.	R.
1894 ..	1,002,237	40,245	33,243
1895 ..	1,332,965	25,703	32,747
1896 ..	1,548,081	23,859	30,463
1897 ..	1,400,835	28,563	32,066
1898 ..	1,437,885	35,474	37,014

It will be observed that there is a difference of as much as 50 per cent between the lowest and highest crops of the past five years—surely a most extraordinary divergence, not to be matched in a product like tea, though possible it may in our old staple coffee. It illustrates the dependence of coconuts on rainfall and the influence of good cultivation. The year when a little over a million nuts was harvested was a very droughty year, and our correspondents are already comparing the present year with that one; and we find that the Report for 1896, in referring to the crop with which it deals as a large one—it is the largest in the table we have prepared—specially claims for manure credit for the result. "It gives ample testimony," are the words, "to the value of manure which is now being applied systematically, and on an increased scale, thus justifying the enhanced expenditure sanctioned under this head by the Directors." And certainly the crops for the two following years, though short of that for 1896, do not show the great variation noticeable in the earlier years. The out-turn of fibre, we presume, depends on the demand. Last year shows the second largest output of fibre, as it does the second largest crop of nuts, of the years under notice.

Turning to income and expenditure for the same period, we find that a small crop does not necessarily mean less expenditure. Not only does the cost of turning out coir tell, but also when all the crop has to be turned into copra, the expenditure naturally rises. Thus, 1896, the year of largest crop, shows the smallest expenditure because, as the Report for that year tells us, the crop "was sold as nuts, and not made into copra as hitherto." That year further yielded the highest income, owing to the satisfactory prices obtained for nuts, and enabled the Directors to declare the highest dividend of the past six years. The List issued by the Shareholders' Association shows the Dividends since 1893 to have been 6, 5, 7, 10, 5 and 6 per cent; so that though there have been no sensational dividends, the Shareholders have had a fair return for their money. We are not aware that a higher dividend than ten per cent has ever been declared; but the regularity of dividends, and the figures we have quoted in estimating the value of the property, explain the value of shares in the market, and point to good management in the office and on the estate.

#### RAINFALL IN PLANTING DISTRICTS.

We continue to get numerous reports from the planting districts. The following authentic figures of Rainfall for four separate divisions, are of interest:—

District.	Jan. 1899.		Jan. av.		Feb. 1899		Feb. av.	
	Inches.	Days.	Inches.	Days.	Inches.	Days.	Inches.	Days.
Central Province and Uva ..	9.05	13	4.08	8	0.27	1	2.43	5
Kelani Valley ..	5.72	8	3.65	6	2.07	2	6.66	8
Ratnapura and Rakwana ..	5.49	12	6.16	9	4.84	6	4.47	9
Maskeliya ..	5.05	6	3.89	7	1.53	4	3.73	6

There has been generally an excess of rainfall in the early part of Jan., and a large deficit in Feb. this year, except perhaps in the Ratnapura District, and even there the distribution of rainfall is not so general as in average years.

#### THE PROLONGED DROUGHT.

It is not alone in the lowcountry that the cry for rain is being raised. Here is what an Inspector of Estates has to say on the subject:—

"We are having a drought with a vengeance. I don't think I ever remember so long a period without *any* rain, and yet there is not much red rust to be seen, nor are other pests and blights very prevalent, though there is a constant and very suspicious *fall of leaf* which may not be altogether due to the dry weather. I understand that on all the higher estates in Uva the flushes are *good*, but on the lower places there is very little doing."

The present drought in Colombo may be said to extend from 10th February as only 8 cents of an inch of rain has fallen since that date. Practically there has been no rain in Colombo for 40 days—an unusual but not unprecedented period; for, from our "Handbook" we see that in Jan.-Feb, 1891,

there was a spell of 55 days in Colombo without rain.—At two thousand feet up we hear from a Manager today, that he had only 14 cents in February and none up to date in March—unprecedented!

#### CINCHONA CULTURE IN CEYLON.

This is how an experienced planter follows up what we have recently written about the advisableness of trying cinchona again in the Ceylon hill districts, importing fresh seed from India or Java for the purpose:—

"Cinchona seems likely to attract attention again, now that quinine is on the rise and letters from home speak confidently of the future. So if cinchona *can* be grown again in Ceylon, there is a chance for some of us. The question is, *can it*? One seldom or ever sees a healthy self-sown seedling now-a-days which looks as if the parent stock were mostly diseased, but perhaps imported seed might give good results. Some time ago I spoke to Mr. Carruthers about the canker in cinchona and asked him if it was due to a fungus. He said he thought very likely it was, and begged me to let him have some bark to examine. I could not come across any suitable specimens just at the moment; but sent him some after his return to England, and am shortly expecting to hear the result of his investigations."

#### TEA IN NORTH AMERICA.

The figures for the importation of tea into the United States from different countries in 1898, are given in our daily and *Tropical Agriculturist*; and it will be observed that the total amounts to less than 69 millions, against nearly 100 millions in 1897. Of course, the latter import was inflated in advance of the war duty; just as the incomings last year were much less than usual from the same cause. Japan and China last year account for 6½ million lb., leaving only 7,300,000 lb. for all other teas.

In this connection we call attention to the interesting Report furnished by the Indian Tea Commissioner on his work for last year, and given in our daily and *Tropical Agriculturist*. Notwithstanding many drawbacks Mr. Blechynden is very hopeful as to the future of British-grown teas in America. At the same time, it will evidently be a severe struggle to drive out our competitors; for, as is pointed out, the China and Japan teas sent across the Pacific or Atlantic as the case may be, have no other market to go to, and such teas if once landed in America, must be sold even at a loss. May it not be, however, that the tea-growers will cultivate less and use their crops at home when they find that there is no remunerative market? On the other hand, Mr. Blechynden has come more and more to believe in judicious advertising in America, and this after all is the best way in which to spend the money of Indian and Ceylon tea planters. Tea rooms and demonstrations and grants are at best temporary: nothing lasts like advertising. As to green teas, here is what

Mr. Blechynden writes, and it is worth repeating:—

Some samples of unfermented or Oolong teas made in India were sent to me early in the year. They were found so suitable for the market, and firms were so ready to give immediate large orders, that I have had to revise the opinion I formerly had as to the impossibility of Indian gardens preparing suitable teas of this class. I now believe that there are certain districts in India where Oolong teas of a character to command ready sale can be made, and that if such teas are produced, there is practically no limit to the business that could be done.

If, as is stated by a contemporary, Mr. Blechynden's own work in America is to cease at the end of April, it will be a question whether our "Thirty Committee" should not ask the Indian planters to contribute to the expenses of Mr. Mackenzie; because, as their own Agent says, anything done to promote the use of Ceylon tea in America benefits the Indian planters as well.

ARRIVAL OF TROUT OVA IN CEYLON.

The third consignment of trout ova for the Nuwara Eliya hatchery received this year arrived last month by the ss. "Prinz Heinrich." It will be remembered that of the first lot, which arrived in January, a good many were found dead and most of those that were alive were prevented from coming to fruition by heavy rain, which occurred at that time. The second lot came about a month ago and half of these was destroyed by some varnish dropping on them, but of the live ones it is satisfactory to know that 6,000 young fish have been reared. Hitherto the ova sent out has been that of the brown trout, but on the last occasion they are those of the rainbow variety and have been sent out from the Surrey Trout Farm, Critchmore, Haslemere, the place which has supplied the other ova sent from England. As the case in which they are placed was closed and would not be opened until Nuwara Eliya was reached, it was impossible to know in what condition the ova were. They were placed in the cool room of the ship and have had ice applied to them at regular intervals during the voyage. Mr. Elhart, who came down for the purpose, had the receptacle, in which the ova is placed, put in an ice case supplied by the New Colombo Ice Co., taken to the Terminus and placed on a cattle truck on which they will travelled up by the night train. During the journey they were to be replenished with ice by Mr. Elhart at the station at which the express stops and the following day were to be placed in the hatchment at Nuwara Eliya. It should be stated that the ova number 10,000 and after they are hatched, which will take about a month, half will be placed in the stew ponds at Nuwara Eliya and sent to Mr. Wilson-Wood, Drayton, Kotagala. This is the last lot to be received during the present season as the hatching time is nearly over, neither the hot weather nor the rainy season which is to follow being favourable for hatching.

ROYAL GARDENS, KEW "BULLETIN" of miscellaneous information. Appendix I.—1899. Contents:—List of Seeds of Hardy Herbaceous Plants and of Trees and Shrubs.

Ceylon Rainfall.

THE P. W. D. METEOROLOGICAL OBSERVATIONS FOR Feby. 1899.—We append this Monthly Return of rain from which it will be seen that the highest fall was at Urubokka in the Southern Province, 7.95 inches, and the lowest at Irrakkamam in the Eastern Province 0.08 inches.

## BUDDING THE MANGO.

The *Journal of the Jamaica Agricultural Society* for October remarks:—"Budding the mango has been generally considered an impossibility, but this is a mistake, because it is done by experts in Florida, and it can be done by others when understood. The secret lies in taking the buds from about the middle of the growing shoot where they are well developed, and yet not too tender—where the colour of the bark is just turing from green to purple—and at a time just prior to a vigorous stage or growth in the tree to be budded. The shield method has been used, but the ring or plate style would be better."

## CURE OF MANGE IN HORSES.

Mr. W. Mewes, farmer at Emu Vale, writes *re* cure of mange in horses:—"I was troubled greatly with mange in my horses the summer before last, I applied the following simple remedy, and got rid of the pest completely in five or six weeks. I waited, before writing to you, to see if the disease was going to reappear this summer. It has not done so, hence I can vouch for the remedy. Recipe: Strain the water in which potatoes has been boiled into a bucket, and allow it to cool. Mop the affected parts at midday and evening copiously with this potato water. Three times each day will hasten the cure. The mange will disappear before six weeks. We gladly welcome any remedy which has proved itself effectual, but would advice those who think they have found a certain cure for this annoying disease to follow the example of Mr. Mewes, and wait for developments before announcing an infallible remedy.—From *Queensland Agricultural Journal* for February 1899.

## LIFE IN JAMAICA.

## A CHAT WITH A COFFEE PLANTER.

"Yes, I have been out now a considerable time," remarked Mr. —, in answer to my question. I was out for a saunter on the hills, and had suddenly dropped into a coffee plantation, and also across the chief. Curiosity in the first place had attracted my attention to the coffee-growers' haunts; and, secondly, being very partial to a good cup of that splendid beverage, I felt a considerable interest in the plant and its production and preparation for the table. I was fortunate in finding so ready and willing an informant as Mr. — proved to be.

On leaving the drying-shed we wound our way by a narrow stony path up a steep hill-side, plentifully sprinkled with low bushes about the size of gooseberry trees, with broad dark green leaves, and well covered with little oblong-shaped berries, in most cases bright green, whilst several were ripe cherry colour.

"Well, you see," said my guide, in answer to my query on the plentifulness of the coffee berry, "the higher one gets the cooler it is, and the cooler it is the later the crop of berries. Now, we have all sorts of land here—lowland plains, and hills, and even mountainous heights, and when the bloom is on the highland plantations the fruit is being gathered in the lowlands."

"I was caught napping once or twice—well. I may say, inattentive, my attention being taken by the beautiful fertile mountain slopes, varied by pretty coves, and playful little waterfalls, whilst hundreds of large stones covered with various hued mosses relieved the monotony of flat places, which constantly met one's eye during our walk.

"Yes, it's a beautiful country," remarked Mr. —, "and most productive, too. Out here east we get mostly oranges, bananas, lemons, and such like; whilst down west yonder, on the lower

ground, sugar cane is vastly produced. It doesn't pay, though, as it perhaps should. The bounties and one thing and another make the foreign sugars come at a lower rate into English markets. Out here even it is landed from German and French refineries."

We had by this time climbed to a prominent height, from where a considerable distance could be seen beyond the bright sparkling waters of the harbour below, and a good bird's-eye view was obtained of Port Royal, at the end of a long strip of sand bank, with fever-stricken Kingston at the other in the near distance, at the immediate foot of the hill. After returning I was glad to sit and make a rough sketch on two to rest.

The branches of the coffee plant have different names. The principal is named the primary, the next—a branch of the first—the secondary, and so on, and when picking the berry it has been noticed that those growing on branches nearest the main stalk are larger and of more value than the fruit of the outlying stems.

The plantation calls for the greatest attention, every tree requiring pruning once a year at least, and the ground has to be hoed and kept clear of deteriorating weeds very often. This, in addition to the labour of picking and cleansing the berry, and afterwards sorting and packing for shipment, means an outlay of a good round sum before roasting and grinding can begin. Therefore, when the coffee is ready for the table, it has caused employment for very many hands, and has been a big expense.

In Jamaica the industry is not at present so great as formerly. Many stations have closed and are closing, on account of the cutting down of market prices. My informer graphically demonstrated this fact by a wave of his hand. Pointing up the mountain side, he said, "Within my memory this hill has been so thickly covered as to cut out a sight of the slope; now we have only these few plants at the base."

The cleansing process of the berry proved very interesting. The berry grows in a thick skin, and the valuable part is again enclosed in a thin brown husk. The two coverings are got rid of by two processes. First, the whole bean is passed through a machine, which crushes the berry slightly, and throws it into a trough of water, where it stays for some two days. A curious thing here happens. For the most part the berries sink to the bottom after being in water a little time, and those that do not sink are put aside as not being of the same value as the heavier ones. This done, the whole heap is spread out to dry in big square yards with concrete flooring. The greatest care must now be exercised, as, should a heavy shower of rain come on whilst drying, the subsequent flavour of the coffee is interfered with; so a weather prophet is almost necessary at this juncture. After carefully drying, the water-wheel is again brought into play. This wheel works two machines. The first we have noticed; the next is a kind of a mortar, into which the beans are put, and a big wooden wheel, copper edged, slightly crushes the berries and causes the thin husk to peel off, when it is blown away by a large fan kept in motion by the same water-wheel. From this machine the beans come in a fit state to be roasted. Previously, however, they are generally classified in different sizes, such as Nos. 1, 2, 3. For this purpose a long cylindrical measure of wire-netting is used. The whole of the beans are passed down the measure, and come out at the other end through the holes which "size" them.

If the berry has been kept for some eighteen months after thus prepared, it adds to its flavour, and hence its value. The Jamaican climate is not suitable to the produce of the finest brands of coffee, but a good aromatic berry is cultivated, —Leeds Mercury.

COFFEE IN COORG.

From the Administration Report on Coorg which has just reached us from the authorities, we quote as follows:—

The total area of coffee land was 1,08,611 acres against 1,09,385 in the previous year. This area includes a great extent of land which, though originally under coffee, is now allowed to remain waste by its owners as not suited for coffee. It also contains a considerable extent of cardamom lands. The area of assessed coffee lands held by European and Native owners respectively is as follows:—

	No.	Acres.
European Estates ..	356	31,752
Native Estates ..	15,223	76,859

Total .. 15,579 1,08,611

The coffee crop during the year was about 2,500 tons against 2,030 tons in 1896-97. A poor crop and for native coffee a very low market told severely on this industry, and not a few of the smaller planters were ruined, while others unable to obtain funds with which to work their estates were obliged to neglect their cultivation; and gardens once neglected even for one year are most difficult to get again into good order.

ANKANDE ESTATE COMPANY.

The general meeting of this Company was held today in the offices of Messrs. Baker & Hall when the following report was submitted and adopted:—

Report of the Directors to 31st December, 1898. Directors:—John Aymer, Esq., Chairman, John F. Baker, Esq., H. Creasy, Esq.

ACREAGE.

Tea ..	175 acres
Cocoa and Liberian Coffee ..	106 "
Cardamoms ..	93 "
Jungle ..	232 "

Total 609 acres.

The total crops harvested during the year were as follows:—

38,450 lb. Tea and 4,814 lb. Green Leaf  
4,113 lb. Cardamoms

136 3/15 cwt. Cocoa

a small quantity of minor products (sold for R6,295)—the whole realising the nett sum of R24,519-85.

Interest on the loan of £1,500 stg. has been paid to 31st December last and depreciation on buildings at 10 per cent absorbing R344-21 has been written off. It will be seen that the additions to capital account amount to R5,069-26, and the balance at credit of Profit and Loss it is proposed to carry forward.

The Glenury & Alwood Estates have fulfilled expectations, but the deficiency of Crop of Ankande which gave lb. 69,987 of made Tea during 1897, against lb. 38,450 for 1898 is much to be deplored. The Visiting Agent reports that the Estates promise well for 1899. Mr. John F. Baker retires from the Board, and being about to leave the Island for a considerable period does not offer himself for re-election. The Shareholders will have to appoint a successor. The appointment of an Auditor for 1899 will rest with the meeting.—By order of the Directors.

BAKER & HALL Agents and Secretaries.

Colombo, 15th March, 1899.

MINOR PRODUCTS REPORT.

CINCHONA.—At the second London auctions of the year, held on Tuesday, nine brokers offered supplies amounting to 2,608 packages, (1,911 in January) made up as follows:—

	Packages offered.	Packages.
Fast Indian cinchona..	296 of which 828 were sold	
Ceylon cinchona ..	442 do	531 do
Java cinchona ..	420 do	420 do
African cinchona ..	235 do	235 do
Cuprea cinchona ..	140 do	51 do
Bolivian-Calisaya cinchona ..	42 do	42 do
Cartagena cinchona ..	26 do	26 do
	2,601	1,939

There was a good competition, and the prices obtained were about ten per cent above the recent Amsterdam sales. The average unit was 1 1/4d to 1 3/4d per lb against 15 1/2d to 1d at the last London sale. Cinchonidine-yielding barks realised in some instances much higher prices than those paid in Amsterdam, and 1 1/2d may be put down at the unit for good Succirubra.

VANILLA.—At auction today 1,262 tins were offered, and practically all sold at about unchanged rates for the finer qualities; medium grades being 1s to 1s 6d dearer. Home buyers again purchased most of the supplies.

The bulk consisted of Seychelles, fair to good black beans, which brought, according to quality: 27s 6d per lb for 8 1/2 to 9 inches; 8 1/2 inches 26s 6d; 8 to 8 1/2 inches 26s; 8 inches 25s 6d; 7 1/2 to 8 inches 24s to 25s; 7 1/2 inches 22s 6d to 24s 6d; 7 to 8 inches 23s to 23s 6d; 7 inches 22s 6d to 23s 6d; 6 1/2 to 7 inches 19s to 23s; 6 1/2 inches 20s 6d to 22s; 6 to 7 inches 21s 6d to 22s 6d; (split), 18s; 6 to 6 1/2 inches 19s to 22s 6d; 6 inches 20s 6d to 22s; 5 1/2 to 6 inches 18s to 22s 6d; 5 1/2 inch 20s to 21s; 4 1/2 to 5 inches 19s; 4 1/2 inches 18s to 20s; 3 1/2 to 4 1/2 inches, 15s to 18s; foxy 12s to 18s per lb.

Mauritius.—7 1/2 to 8 inches, 21s to 24s 6d; 7 to 7 1/2 inches, 21s to 23s 6d; 6 to 6 1/2 inches 19s to 22s 6d; 6 inches 22s; 5 1/2 to 6 inches 21s 6d.

Tahiti.—Eleven tins of bold and full flavoured beans offered, and 1 sold publicly at 10s 6d per lb; the remainder of the parcel being bought in at 11s 6d, but no doubt sold privately afterwards.—Chemist and Druggist, March 4.

TROUT OVA FOR CEYLON.—Mr. W. E. David, son as Secretary for the Ceylon Fishing Club, sends us a very interesting letter reporting the progress made in supplying trout fry to different streams upcountry from the ova received in January. We hope the result may be successful. The February consignment is so far doing well in ponds. What is said about rainbow trout ova is very interesting, and the experiment is sure to be carefully watched.

TEA DISEASE. REPORT BY MR. CARRUTHERS.—We certainly do not attach much importance to the Report which Mr. Carruthers has sent to the Planters' Association on this subject. It is altogether inadequate, and not worthy of himself or his subject. In the first place it would be interesting to know if he has read and studied Dr. George Watt's *magnum opus* on "Tea and its Pests"—be it said, if not, he can have no proper idea of how fungoid troubles prevail in Assam, while there is good evidence for believing that the same pests infest certain districts in Ceylon. They can be fought and beaten in tea, as they never could in coffee; but all the same, as Mr. Carruthers indeed confesses, a more prolonged and careful investigation is needed before an adequate and useful Report can be furnished.

"THE QUEENSLAND AGRICULTURAL JOURNAL."—Vol. IV, Part 2. We give the following from the contents for February:—Agriculture—Wheats at Hennotage State Farm; Wheat and Maize in the Central Districts; Market Gardening, Nos. 3; Jadoo Fibre; Tobacco—Cigar Leaf-curing Barn; Tobacco Under Cover; Bush Work; Dairying; Viticulture—Vineyard Notes; Tropical Industries—Theobroma Cacao; Manufacturing of Tropical Plants—Coffee; Ground Coffee; Coffee in Brazil; Ramie Fibre; Rhea; Foragestry—Tests of Western Australian Timbers; Pisciculture—The Gonrami.

## THE CEYLON RICE IMPORT TRADE.

We can recall the time, thirty to forty years ago, when a local European House maintained a special agent at Chittagong to purchase and ship rice to Colombo. But very recently, the still surviving head of this defunct firm declared that the business was far from being an encouraging one, that the profits, if any, were very limited; and he reiterated a belief which has existed for a generation back in this city, that the rice trade was one to leave to the Chetties. The Chetty monopoly in the rice import trade of Colombo, has, in fact, existed for upwards of thirty years, with the fewest possible interruptions. Last year a great cry was raised over the prospect of Burma rice coming in to redress the balance and to reduce the Chetty's prices for Indian rice; but we have not heard so much for some time now of the economic advantages of rice from Rangoon, and we believe it is acknowledged that it cannot, generally, compete with rice from Bengal or—when there is an abundant crop—from Southern India. But our readers—and our planting readers especially—will be glad to learn that for some time now, Colombo has enjoyed the novelty of an active, substantial and successful rice import business on a considerable scale through the agency of a European House. This is due to the enterprise of the well-known firm of Messrs. Grunberg Bros., Merchants and Agents, of 28 Dalhousie Square, Calcutta, with branches in Paris and at Singapore, and who, with great experience of the rice trade of Bengal, have—fortunately as we think for the planters and public of Ceylon—decided to open a branch house in Colombo under the care of Mr. James Shrager. We had heard, incidentally, for a number of weeks back, of the stir created in Chetty and even steamer circles, by the advent of a mercantile firm with a thorough acquaintance with the rice trade of India, commanding every facility for the purchase and shipment of rice from Bengal and with such a strong financial backing in capital as must ensure the success of a local Agency when once definitively determined on. The interview reported by our representative below, fully bears out these expectations and gives good reason for anticipating that we are entering on a new era in respect of the Rice Import trade. Already, we believe, prices have been favourably affected; and we may well hope that with abundant crops prevailing in India, we are to have a good "rice" year during 1899 for the estate coolies, for our urban population and other consumers in Ceylon. It is well-known that we are determined opponents of the present import duty on rice, and that we believe it is a tax certain to be abolished before the new century has been long with us. When that day arrives,—when there is absolute "free trade" in rice—we may be sure that the fullest benefit resulting from the change will be secured by the public. Hitherto it has been said that the Chetties would appropriate the equivalent of the duty and keep up prices of rice with impunity! With such competition as now exists, it is not likely

we shall hear any more of objections of this kind to the abolition of the Ceylon import duty on rice, the staple food of the people.

## THE CALCUTTA RICE TRADE.

## INTERVIEW WITH A EUROPEAN DEALER.

Calcutta, though not the largest among the sources of the rice-supply sent to Ceylon, holds a position of great importance both from the high quality of the grain and the great extent of the consignments received there. Hitherto, the trade with Calcutta, as with South India, has been entirely controlled by the ubiquitous hard-dealing Chetty. European dealers have tried time and again to run an opposition trade, but invariably the chetty-ring has proved too strong for the would-be benefactors of the European community and they have had to retire from a profitless business. Now, however, the well-known Calcutta firm of Grunberg Bros., which has recently opened a branch in Colombo, seem to be making considerable headway. Hearing that Mr. I. Shrager, the senior partner of the Calcutta firm was over in Ceylon on a brief business visit, a representative of the *Observer* called upon him lately with the object of eliciting information on certain points in connection with the Calcutta rice trade.

We found Mr. Shrager in the upstairs office of Messrs. Grunberg Bros. in Canal Street, towards the end of his last day's work in Colombo before proceeding to the hills. He expressed willingness to answer any questions we might put, as far as circumstances made it fitting.

"Has the plague," we asked, "been largely interfering with the rice trade from Calcutta?"

"Yes, it has," said Mr. Shrager, "in this way. Several steamers whose final destination lay far beyond Colombo, and which called at that port, have been refusing to ship cargo for Colombo, because of the time lost on the voyage. Now that the Indian capital has become a plague-infected port, their homeward journey is delayed by four days if they have cargo to unship at Colombo, for the voyage takes six days, and the boat has to remain in quarantine till 10 days have elapsed from the time of leaving Calcutta. Moreover they are afraid of not being able to fill up with fresh cargo the space emptied here owing to the temporary local disinclination to send cargo to England in Calcutta boats."

"Does the danger of infection by the rice itself have a detrimental effect upon the local markets for Calcutta rice?"

"Not at all. As soon as ever rice arrives at Calcutta from the districts it is immediately bought up for export,—so large is the demand."

"Your exports from Calcutta are not sent by any means solely to the Ceylon market?"

"Oh no! The same qualities that are taken for Ceylon are exported from Calcutta to a great many places and as far off as the West Indies and South African Ports. Of course Ceylon is the largest market. The exports to Colombo from Calcutta alone, during January and February of this year, were about 865,000 bushels."

"If plague subsides in Calcutta is the rice trade likely to be much developed."

"So far there has been no falling-off in the exports of rice from Calcutta owing to plague. The crop in India this year is a very bumper one, and the exports from Calcutta should if anything increase, particularly as the Burmah and Siam crops are considerably below that of last year."

"Do the native dealers compete much?"

"Amongst themselves there is practically no competition. It is to their own interests not to compete with each other, particularly in Ceylon, as they have hitherto had control as a class of the entire rice-trade; they have always taken their price from the head Chetties who set it as high as they dare, varying it nevertheless according to the tone of the market from day to day. Now that we have come, however, they have been forced to realise that their circumstances are at last altered by competition."

"What was the origin of your starting business here?"

"It was at the latter end of last year that my partner, Mr. C. Shrager, had his attention drawn to the Ceylon rice trade; and on looking into it—sending for samples with their prices and comparing these samples and prices with those current at Calcutta and those at which we could supply the same rice—he found that the Chetties were really having a lively time of it, fixing their own exorbitant rates and realising immense profits, without any competition at all. We were at the same time given to understand that, if we came and succeeded, as European dealers we should be supplying a long-felt want in the island, although we were at the same time informed that we would find very formidable rivals in the Chetties."

"How do you find the local competition now? Has your coming here affected the prices charged?"

"Distinctly. The Chetties shewed very strong feeling at first and hinted to the steamer agents that they had retaliatory measures in view and would boycott the boats that our rice was carried in. But that feeling has subsided and already their prices have come down considerably."

"Which do you consider is likely to be the more economical supply—South India or Bengal?"

"Bengal, taking everything into account. The steamer rates from Calcutta are really lower because the competition is greater. Far more steamers go to and from there than ever call at Madras. The resources of Bengal, too, in rice-growing are fully equal, if not superior, to those of Southern India."

Here Mr. Shrager rose to show us some samples of rice from the two regions just referred to. We asked if there was any method of testing the quality of the rice, as in tea-tasting, by some decoction therefrom or by tasting it in a boiled condition.

Mr. Shrager said that such methods were never used, the accustomed eye being able to tell both its quality and its native place from mere inspection. Placing samples of Calcutta and Madras rice side by side, as Mr. Shrager did for us, even the uninitiated could not fail to see that the more northerly grain was the whiter, purer, and richer, the Madras species being, though darker, much more

transparent. Burmah rice was also brought out and its resemblance to that of Bengal, although it was much better cleaned, appeared to be wonderfully close. The sight of it naturally led to the question:

"Can Burmah rice compete with that of Calcutta?"

"With a normal crop, it ought to, most certainly. We have ourselves imported a lot from Rangoon, but the chief buyers say that they have never succeeded in getting the majority of their coolies to like the Rangoon rice. Either the coolies didn't find it so good for them or they were more accustomed to the other kinds. Similar feeling was evidenced in India in the famine before last; starving though the natives were, many of them refused to touch Rangoon rice. In the last famine, however, they were more ready to accept whatever was provided, and a large quantity of Rangoon rice was disposed of in India,—several hundred thousand tons. In Ceylon, I am of opinion that there is not so general and genuine a dislike of Rangoon rice among the coolies as reports would lead one to believe. Complaints as to the kind of rice supplied are brought by the head kangani to the planter and he takes them as such. But many of these complaints are invented. Kanganies get the coolies to say they dislike the rice supplied; it is to the interest of the former to present such objections. They are for the most part either hand-in-hand with the Chetties, or under their thumb. But, considering only the quality of the rice itself, there is absolutely no reason why it should not be largely imported. It would be just as well, too, for Ceylon to develop this source of supply, as far as possible, for if plague increases in Calcutta the difficulties in drawing rice from that port will grow in proportion."

"You have other branches of business than at Calcutta?"

"Yes, beside this one at Colombo, we have branches at Singapore and at Paris."

Here we bade Mr. Shrager good day, but as he came with us to the stairs we recalled one point which had half surprised us.

"You spoke just now of the Chetties proposing to boycott the steamers which carried your rice. If they made this threat, what prevented them from carrying it out?"

"Well, they didn't actually go so far as to propose the measure. They only hinted at the possibility of their taking that step, and we in consequence found some difficulty in engaging tonnage. Since my arrival, however, we have received advice from Calcutta that agents are now willing to book our rice to Colombo, and we do not now anticipate any further trouble on this score."

"You return to India soon?"

"Yes; in a week. I came chiefly in connection with this move of the local dealers." "And you have been here—" "One week; I go upcountry tomorrow, for the last few days of my trip."

We had heard that no business to which the Messrs. Shrager had put their hands had ever yet failed, and our conversation and brief personal contact with the senior, left us with the impression that this record was not to be broken.

## THE AMERICAN TEA TRADE

## MR. R. E. PINEO'S VIEWS.

Mr. R. E. Pineo, who has been in Ceylon tea for the last 3 years, has just arrived by the N. E. S. "Erz Heinrich" a few days ago. Shortly after one of our representatives had a conversation with him at the Galle Face Hotel regarding the progress of Ceylon tea in America. The increase he said had been very slow. In the first place the average of tea consumed in the States was only about a pound and a third per annum per head whereas coffee was taken in much larger quantities than it was in the Eastern people.

## THE EFFECT OF THE WAR

In answer to a question as to the effect the war had on Ceylon tea, Mr. Pineo said that a heavy duty was put on tea instead of nothing as was formerly the case, whereas coffee was exempted. The effect of this was that the large dealers bought up large quantities, previous to the imposition of the duty in July last and did not go to the market again till recently when their accumulated stock had been exhausted. "Did this lessen the amount of tea generally sold" asked our reporter?—Mr. Pineo thought it was about the same as usual and would show no decrease in Ceylon.

## CHINA AND JAPAN.

The bulk of the tea sold was from China and Japan, and the latter country was working very energetically to increase its sale by advertising in the papers with great success. Ceylon tea was however finding its way amongst the people. Ceylon tea was often blended with the China and Japan teas. The traders were very reluctant to let Ceylon become popular amongst the people considering that the profits on China and Japan were greater than on Ceylon. The idea was that one pound of our staple product displaced two and a half pounds of China and Japan tea as it went so much further and so here the trade suffered a loss. The profit on Ceylon was as half as great in the aggregate as China and Japan teas.

## THE PRESS.

A great deal had been said in the American press but the papers had as a whole taken very little interest in the subject and he had tried to work through the press by advertising largely. It was Mr. Mackenzie who had initiated the advertisement about Lady Curzon liking Indian and Ceylon tea and it evidently pleased the Yankees.

The tendency was now to make the American feel very friendly towards England. Everywhere he had been, the feeling had entirely changed. Formerly the American press never allowed an opportunity to escape of talking against England, but now in the same way they always praised her up. The American tariff was a great blot on their Government, but so long as the Government of the country changed every four years there seemed to be uncertainty of its being done away with. The control of politics more or less seemed to be in the grasp of the great monopolists and railway and other corporations.

Our reporter asked Mr. Pineo what he thought was the result of the Tea Campaign in America. He replied they had every reason to wish to keep the American market open which could only be done by wise methods and expending a good deal of money. Of course, Mr. Pineo said: I mean a judicious use of money. You do not want to spend money right and left, for you might as well throw it into the sea. Mr. Pineo said I think the method pursued by Mr. Mackenzie at the time he commenced was the best

that could have been devised, but I think now that he has gained experience of the American market and the American people something better could be done by him. What that better was Mr. Pineo did not suggest. The trade in the United States hated the idea of Ceylon tea getting a firm footing in the market and would do all they can to prevent it. On the other hand in Canada indifference was expressed. In both the States and Canada the trade want a low priced tea to sell at a high one, so that the people did not get the quality they should for the money. The part where tea was most used in Canada was the maritime province, where they drink 6 lb. per head per annum, a favourable contrast to the States. In the latter country Ceylon tea was consumed the most in the Central and Eastern States. In the South coffee reigned supreme and in the Western and Pacific States the trades was in the hands of China and Japan.

## A "KEEPING" TEA WANTED.

In conclusion Mr. Pineo said what was wanted was that Ceylon should improve the quality of the tea especially with regard to its property and keeping powers as Ceylon tea went off very quickly. He had visited the most celebrated of the Japan districts and he must say the methods used for keeping the properties might be learned with advantage in Ceylon.

Mr. Pineo is about to join one of the firms in Colombo with a view to buying tea and shipping direct to Canada.

## CEYLON TEA IN RUSSIA:

Mr. S. J. Tokmakoff, who is in charge of the newly opened local branch of Messrs. Tokmakoff, Molotkoff & Co., Russian tea buyers, who do business in Foochow, Kinkiang, Tientsin, Moscow and Kiachta, has been interviewed by a representative of our contemporary to whom he said that in Russia they did not drink pure Ceylon tea because it was not sufficiently soft in flavour. Ceylon tea, however, was used for blending with China's. Tea which came to Russia over the European frontier and by sea was dutiable to the extent of 21 gold roubles of 2s 6d each on every *pood* of 40 lb., a Russian pound being equal to 1.1 English lb. The duty on caravan teas was only 13 gold roubles upon the same amount of tea. A much higher rate—about 30 to 40 per cent—was charged for railway freight of tea brought to Odessa by all vessels other than Russian, and this affected all tea alike. He was now buying entirely for the Russian market, but would buy for any other country if he got orders. He was also prepared to do business in other products. Darjeeling teas were very much liked because of their soft flavour, but the consumption of Indian tea was not advancing so fast as that of Ceylon.

Black tea made into bricks was always drunk in Siberia. The bricks were made by machinery out of "fannings" and dust. Green tea was also made into blocks, the old green leaves being used.

Mostly cheap and medium teas, from 6d to 8d, were in demand. They did not like a large leaf. They were rather dissatisfied with Ceylon packages. They liked paper between the lead and the tea. Lead was very bad. The lead got broken, and the tare was very heavy. Momi wood was too heavy.

TO PLANTERS AND OTHERS.

# SEEDS AND PLANTS

OF

## COMMERCIAL PRODUCTS.

**Hevea Brasiliensis** (Para Rubber).—Seeds and Plants supplied, immediate delivery, quantity limited, good arrival guaranteed, packed to stand 4 to 6 months' transit well, five hundred plants in each Wardian case.

Out of a supply of Para Rubber seed collected in July, 1897, and preserved by us, a quantity was forwarded to Hammond Island in December of the same year, and the gentleman who ordered the seeds in ordering a further supply wrote us on the 30th April, 1898:—"All the seeds done well, and now some of the plants from them are 18 inches high." This seed was put in nursery eight months after gathering.

A Mercantile firm who ordered 30,000 Para Rubber plants in 60 Wardian cases, 500 plants in each, wrote 5th April, 1898:—"I note that you accept delivery of 60 cases. We shall probably require further supply of seeds and plants."

*For price, instructions and particulars, see our Circular No. 30, post free on application.*

**Manihot Glaziovii** (Ceara Rubber).—Fresh seeds available all the year round for shipment at any time, guaranteed to stand good 8 to 12 months.

*For price, instructions and particulars, see our Circular No. 31, post free on application.*

**Castilloa Elastica** (Panama or Central American Rubber).—Seeds and Plants supplied

*See our Circular No. 32 for price, instructions and particulars, post free on application.*

**Urceola Esculenta** (Burma Rubber).—A creeper Seed and Plants.

**Landolphia Kirkii** (African Rubber).—A creeper Seed and Plants.

**Seeds and Plants of Cinnamon, Nutmeg, Clove, Kolanut and different varieties of Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit trees, Shade and Timber trees, also Palms Bulbs and Orchids, &c.**

Professor MacOwan writes:—

MESSRS. WILLIAM BROS.

DEPARTMENT OF AGRICULTURE,  
CAPE TOWN, 27TH JULY, 1898.

GENTLEMEN,—I have this morning received your letter of 21st June covering parcel of Catalogues. It will give me pleasure to fulfil your wishes in regard to their distribution among likely purchasers.

You will be glad to learn that we have very good reports of the success of the semi-tropical things sent by you to the little Eastern Coast-strip of this Colony, particularly about the mouth of the Buffalo River at East London. Pine Apples are now grown there far superior to the stuff sent half ripe by sea from Natal.

Always yours faithfully,

(Signed) P. MACOWAN,

Government Botanist

**Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for 1899-1900 now in the press, post free on application.**

*Agents in London:—MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.*

*Agent in Colombo, Ceylon:—E. B. CREASY, Esq.*

*Telegraphic Address:*

WILLIAM, VEYANGODA, CEYLON.

A.I. and A.B.C. Codes used.

J. P. WILLIAM & BROTHERS,

*Tropical Seed Merchants,*

HENARATGODA, CEYLON

## CEYLON TEA IN 1898.

This mail brings us the annual Report of Messrs. Wilson, Smithett & Co., entitled "Ceylon Tea Memoranda for 1898." Pending its publication in full, we may call attention to some of its more salient features and we are glad to see that these are so favourable to the prospects of our planting community. For instance, at the outset, this well-known Mincing Lane Firm with their large experience, express the belief "that the bed-rock of value has at length been struck, and that we may look forward in the future to a greater stability of the market and to less nervous apprehension with regard to over-supply. A period seems to have arrived when production is not likely to increase to a greater extent than the expansion in the new markets will be able to provide for." It had been previously shown that the average price for Ceylon tea in 1898 was practically the same as in 1897. On garden account, the teas sold worked out an average of 7-78d last year, against 7-83d in 1897 and 8-21d in 1896. "Home consumption" of Ceylon tea in the United Kingdom fell shortly 3 million lb., due entirely to restricted shipments from Colombo to London. On the other hand the re-exports last year amounted to 11-7 per cent of the total deliveries against 10-1 per cent in 1897; but the great expansion, of course, took place in the direct trade from Ceylon to other countries than Great Britain. As to the *quality* during 1898, the report is that it was fully up to the average; while during last autumn a really high level was reached for a large proportion of the offerings. As to "small breaks" of tea the limits continue to be defined as 18 chests, 24 half-chests and 40 boxes. In the summary of estate sales, the first estate mentioned is Diyagama with 1,119,500 lb. the average being so high as 9½d against 9¼d for 1,115,000 lb. in 1897. This report arrives very appropriately, just as the able and experienced resident Manager of Diyagama, Mr. Dick-Lauder, is about to return home on well-earned furlough. To have shipped the largest record quantity of tea for any estate and to have secured so high an average is no small testimony to the great value of the property and to the admirable management in both field and factory. Next we have Galaha with 1,003,000 lb. at an average of 7d against 934,000 lb. averaging 7½d in 1897. Of estates shipping over 500,000 lb., the lead is taken by Hauteville with 592,000 lb. at 10d.—the same average as 1897. St. Leonards has the highest average 11½d for 522,500 lb. For 350,000 lb. and over we get Bandara-pola first with 366,500 lb. averaging 6½d against 6d for 391,000 lb. in 1897. Talawakelle has the highest average (10½d) for 400,000 lb. Above 200,000 lb. we get Abbotsleigh with

251,000 lb. and an average of 10d; while Ragalla takes the lead with 233,500 lb. averaging 11½d against 229,500 lb. averaging 9½d in 1897. Above 100,000 lb., comes Abbotsford with 188,000 lb., and an average of 9½d; the lead being taken by Concordia with 185,500 lb. averaging 11½d. Above 50,000 lb., Abergeldie comes with 86,500 lb. averaging 7d, the lead being with Silverkandy for 87,500 lb. and an average of 1s 1d. Above 20,000 lb., the lead is taken by Pedro and Holbrook, both with an average of 11d, the former selling 30,000 lb., and the latter 20,000 lb. of tea. The return for Districts is given as follows:—

Estimated relative Yield and Average Price realised for the different Ceylon Tea Districts, compiled from the Public Auctions held in London between January 1st and December 31st, 1898:—

	lb.	Average Price per lb. 1898.	Average Price per lb. 1897.
Nuwara Eliya, Matu-ratta and Udupus-sellawa	about 3,500,000	10½d	10d
Dimbula	18,000,000	9d	9d
Bogawantalwa	3,500,000	8½d	9d
Dikoya	5,000,000	8½d	8½d
Haputale	2,500,000	8½d	—
Uva	5,000,000	8d	8d
Maskeliya	4,000,000	7½d	7½
Hewaheta	1,500,000	7½d	7½
Pusselawa, Kotmale, Pundaloya & Ram-boda	8,500,000	7½d	7½d
Ambegamuwa and Lower Dikoya	3,000,000	7½d	7½d
Nilambe and Hantane	4,000,000	7½d	7½d
Sabaragamuwa	2,500,000	7d	7½d
Knuckles, Kalle-bokka, Rangale, &c.	4,500,000	7d	7d
Matale and Hunasgeria	4,000,000	7d	7d
Kadugannawa and Alagala	1,500,000	6½d	7d
Kalutara	3,000,000	6½d	6½d
Dolosbagie and Yackdessa	5,000,000	6½d	d
Kelani Valley	8,000,000	6½d	6½d

N.B.—Untraceable marks to the extent of about 2,000,000 lb. averaging 7d per lb. are not included in the above estimate

"COFFEE-PLANTING AND SELF-HELP" is the title of a letter from Mr. W. R. Rowland of "Lamquart, Port Dickson" to the *Singapore Free Press*, in which he mentions disadvantages of Malayan planters:—

- 1.—Having to try our coffee more thoroughly before sending it to Singapore than to Port Dickson.
- 2.—Having to pay from Port Dickson to Singapore some 40 per cent more for freight on parchment and water.
- 3.—Having no chance of making a profit on such an establishment and reduce working-cost considerably later on, as would be if we had one on the Estate or if this co-operative mill were started.

And urges the establishment of a coffee-curing store at Port Dickson:—

If we cure our coffee in Port Dickson, there is an end to it, but if we send it to Singapore to be milled, whatever amount of care we may bestow upon it, it will take a long time before establishing there a known mark—if ever—and probably others, who take much less care with their stuff, will earn the fruits of our toils.

## WEST AFRICAN RUBBER.

## THE "KICKXIA AFRICANA."

THE THREATENED DESTRUCTION OF A VALUABLE INDUSTRY.

*(By an Occasional Correspondent.)*

*Kickxia Africana* is the botanical name of a rubber-yielding tree, erroneously known to many, even in West Africa, as the Lagos Rubber Tree, although its commercial utility was first recognised on the Gold Coast, where it was regarded as an important source of trade long before energetic little Lagos rubbed its half-opened, sleepy commercial eyes, and fortunately for itself rediscovered it when the cycling craze set the world a wheel and created a demand for rubber which has always overlapped the supply and will always continue to do so, considering the number of dormant industries involving its use that will leap into activity and outpace any additional supply.

I am almost tempted to digress into describing the marvels of the West African bush, where trees yielding rubber, incredibly long bark fibre valuable timber, gums, and various sorts of oil, &c., flourish side by side with others carrying lurking death in their wood, bark, flowers, leaves, and fruit—all joined together, as it were, in weird comradeship by interlacing creepers, including the world-famed *Strophanthus*, whose seeds are almost worth their weight in gold.

It is, I think, generally admitted that the coagulated milk of the *Kickxia* forms the principal rubber supply of West Africa. The economic value of this supply has progressed by leaps and bounds for a few years in each of our East African Colonies, Protectorates, etc. and declined as rapidly after reaching an unexpected climax that has puzzled colonial officials, particularly those immediately connected with revenue and financial departments. The diminution in the output has been brought about not by the diversion of this particular branch of trade industry to French or German spheres of commercial, competitive activity, but by

## IGNORANT, WASTEFUL, AND DEPLORABLY SUICIDAL METHOD

adopted by the Aborigines in tapping the milk from the lactiferous inner bark in such a destructive way, and at such unreasonable times, that thousands of trees have died from exhaustion, deprivation of the chance of bark healing and recuperation by unseasonable tapping, and unnecessarily deep scorings through the barks into the wood of the tree, rendering it an invitingly easy prey to a destructive grub or maggot with a predilection for the wood of the *Kickxia*, and a prolific fecundity that is simply astounding. Whether the maggot is the progeny of a beetle in an entomologically transitional state like the coffee borer, palm weevil, &c., I have not determined from lack of opportunity for scrupulous observation; but that it attacks the exposed wood of the *Kickxia*, with fatal results is a certainty, preventable by judicious tapping, as I shall subsequently show.

Besides the supply from the *Kickxia*,

## RUBBER IS ALSO OBTAINED FROM THREE SPECIES OF VINE,

principally *Landolphia*, forming, however, only a sixth or seventh of the total rubber output of West Africa. Three kinds of *Ficus* also yield a commercially unimportant supply of what is called paste rubber. This is capable, however, of vast improvement, while in a milky state, by the use of the proper coagulating fluid. The rubber from the vines and *ficus* being comparatively unimportant, I shall confine my descriptive attention to the *Kickxia*, which is, must be, and is easily capable of being, not only the prop but the buttress of the fast declining West African Rubber Trade Industry. It is, moreover, an easily cultivable plantation rubber, and, being indigenous, possesses reproductive advantages it would be fatuously suicidal to overlook. There are certainly excellent species like the four kinds of *Iveea* of Brazil, the *Castilloa Elastica* of South America and Mexico, and the *Ficus Elastica* of Assam and India that imbue hopes of prosperous alternatives, but, alas,

delusive hopes, because the seeds lose their vitality with such disappointing rapidity. Hence what is really urgently needed in West Africa is an indigenous, easily propagable rubber that will give bushmen the minimum of trouble in planting and growing from seed in the bush to continually supply substitutes, growing and mature, to replace trees killed by destructive tapping.

It will thus be seen that the aboriginal bushman, the tapping producer, cannot be depended upon to conserve *Kickxia* from the destructive effects of bad tapping. It will be conclusively seen under the heading *Seed* that the *Kickxia* is easily and inexpensively propagable, although the peculiarity of its comparative isolation seems to militate against the fact.

Dr. Stapf's amplification of Bentham's description under the heading *Apocynaceae* in the "Flora of Tropical of Africa," is in the main, accurate. The lithographed illustration of a pair of follicles forming a supplement to the Kew Bulletin No. 106, for October, 1895, is slightly misleading. The follicles I have plucked from the tree are on an average 8 inches long and planoconvex. They split open when perfectly mature in a straight line, equidistant from the longitudinal ridges, on the plane face.

## SEED.

The *Kickxia* flowers in the dry or Harmattan season, simultaneously shedding its seed from mature follicles developed from the previous year's flowering. Having often donned climbing spurs and a circumferential supporting rope, I have climbed the *Kickxia*, remaining amongst the branches for hours watching the seed fall. This they cannot possibly do till the follicle has entirely split from base to tip; even then they float down singly to the rhythmic movement of the tree's gigantic arms in the breeze, leaving the pod first in the centre. The follicles are tightly packed with seed pointing tipwards, the reversed silky hairs attached with the basalawn pointing in the same direction. On a slightly breezy day I have seen thousands parachute down—none perpendicularly; all point downwards with the basalawn and supporting silky hairs keeping the seed in an upright position for some time, as if nature desired the radicle point to penetrate the soil. Unfortunately this interesting provision of nature to assist germination is counteracted in the dense bush by preventing under-growth and the equally deterring carpet of leaves, on which the seed invariably alights to quickly rot or abortively germinate; out of soil, assisted by the warm, humid, equable temperature of the dense bush. This being so, it is quite evident that hardly one seed in many million has even the soupçon of a chance of germinating to some purpose. For these reasons the *Kickxia* grows in singular isolation like all trees in dense forests with winged, light, delicate seed. Its capacity for reproduction, however, is great, and easily convertible into an accomplished fact if follicles were collected from trees, the seed taken from them and planted in the bush. If the different Colonial and Protectorate Governments of West Africa would only encourage the gathering of the seed, which is simple enough, and persuade the natives to give them the ghost of a chance of germinating in soil in the bush. I am fully persuaded that within seven years from the initiation of this precautionary measure, they will have

## RE-CREATED A RUBBER INDUSTRY

that will not only prove a reliably constant source of reactive revenue, but will soon outrival the everlasting palm oil and palm kernels that have reached and declined from the zenith of remuneration owing to cheaper substitutes and the volition of industry requiring their reduced use to Belgium, Germany, and America.

The Gold Coast colony, with tracks, paths, and roads into the interior, has special facilities for coming in contact with rubber-gathering bushmen, and being handicapped for want of waterways, bulky produce like palm-oil and palm-kernels are with extreme difficulty conveyed to the coast. Rubber, on the contrary, is extremely valuable for bulk, and easily transportable, and short of present or prospec-

tive demand must form the keystone of the industrial arch of this colony—a suggestive arch, pregnant with pathetic meaning; an arch whose stones have been cemented together by the life blood of Englishmen who have sweated in the world's valley of Death pursuing various careers in trade and in Government service. It is to be hoped that this colony in particular will be successful and avail itself of the hopeful prospect of inducing bushmen to sow the seed of the Kickxia, which flourishes in the interior. The process is simplicity itself, as it involves only clearing the bed of leaves, loosening the soil for a foot in circumference to the depth of a couple of inches, and dropping two or three seeds on the loosened bed. The seed will germinate rapidly, the seedling grow quickly, and take care of itself in the bush.

The seeds, if carefully kept, preserve their vitality for a considerable time, thus possessing an incalculable advantage over the short-lived seed of other good rubbers, particularly for plantation purposes. Being only six to seven inches long and delicately spindled, they pack into a conveniently small compass, rendering it possible to send tens of thousands by parcel post ridiculously cheap. I know for a fact that the soil and climatic conditions are eminently favourable in the Straits Settlements and over vast areas in Ceylon, Lower Burmah, Assam, and other places in India, it is possible to utilise the services of splendidly-trained, efficiently-equipped, and thoroughly-organised forest departments.

#### SOIL.

The Kickxia thrives best in a sandy clay, with a subsoil of clay. I have seen it flourishing in stiff clay, but with feeders only partially buried. Of course, under the latter condition the damp, dark shade of the bush is necessary. In quite a number of clearings in West Africa I have seen it growing luxuriantly in a sapling in loose, friable, sandy loam, although I must admit it had a tendency to be rather branched, remediable, however, by judicious pruning. I should say the ideal soil for a plantation would be a loose sandy clay, with more sand than clay, and a subsoil of clay, so that during the warm dry season the latter would act as a reservoir, supplying requisite moisture by capillary attraction.

#### PRUNING.

In the bush, the growing sapling sheds its primaries till it practically overtops the closely surrounding forest growth, 70 and often 80 feet from its base. At this elevation I have seen quite a number of trees throw out their gigantic arms. Nature, more by surroundings than by heredity, if I may say so, seems to prune it in the bush in her own incomparable way to ensure a splendid trunk surface for tapping. When it grows in the open, artificial pruning becomes necessary. As the desideratum is to have a good trunk height or tapable surface, unnecessary primaries should be pruned away close to the stem, leaving a sufficient number with concomitant leafage to form new wood. The Kickxia is also capable of being stumped, even when pretty old. Should the tree be hopelessly irregular, stumping should be resorted to but only in the rainy season, when its roots, with the assistance of moisture, adequately help in the preservation of old and the formation of new wood. All but the best sucker or shoot should be pruned away, care being taken to tar the exposed wood, to prevent the destructive incursion of the grub or maggot.

#### TAPPING.

Assuming that the tree has reached maturity, systematic tapping is necessary or rather essential to get a reliable annual supply of rubber; the best way to do this is to make a longitudinal conducting channel up the trunk from the base. It must be recollected that this is only a conducting channel to capture the milk from oblique, transverse scorings in the bark. The scorings into the bark resemble the letter V, forming angles where they meet the conducting channel of approximately 45°. Rectangular scorings would facilitate the milk flowing down the trunk irregularly instead of all into the conducting channel and straight down the trunk into the receptacle placed at the base of the tree to collect the milk for co-

agulation. It stands to reason that the oblique transverse scorings and conducting channel should be respectively continuous, otherwise there would be a diversion and consequent waste of milk flowing away at the points where they are disjointed. For this reason a *machete*, even in the hands of a skilful European craftsman, would be almost useless, leading to independent cuts and not continuous scorings, considering that the operator must be in an unstable, wobbly position, like Mahomed's mythical coffin. Anyway, he must be above *terra firma* where his *machete* or knife strokes cannot produce continuous and continuous scorings, but must necessarily be disjointed and fluky. The inner bark should never be cut deeper than a quarter of an inch, as this is amply sufficient to drain away enough milk from the tree and facilitate the healing of the bark which may be safely accelerated by the application of what I may call, with every apology to the medical profession, an antiseptic plaster, composed of one part of quicklime, two parts wood-ashes, and five parts clay. This not only excludes the oxygenic, deteriorative action of the atmosphere, but, what is more important, precludes the depredatory entry of the dreaded grub or maggot. If this system be adopted an annual supply is certain, and the conservation of the tree ensured. Moreover, the oblique scorings could be made less than a foot apart, without in any way retarding the complete recovery of the bark or hindering recuperation, which would be so rapid as to enable the tree being tapped again the following year. It is advisable, however, that the scorings should be fully a foot apart, tapping being done a month or so after the commencement of the rainy season. This would leave a good wet period for rapid, healthy convalescence, and complete recovery before the advent of the ensuing dry season.

#### YIELD.

The Kickxia, when treated judiciously, yields between three-quarters and a pound of rubber for every year of its age—that is, a tree twelve years old could be safely depended upon to yield nine pounds of rubber.

#### VALUE.

A pound of Kickxia rubber, properly coagulated, should realise at least 2s 9d. auctioned in open market in London. The milk, when procured clean and allowed to coagulate itself, realises 2s. a pound. Trade rubber, adulterated by the hushmen to mendaciously increase its weight, and soaked in water by traders for the same reason, fluctuates in value from 1s. 6d. to 1s. 9d. a pound. When the proper coagulating fluid is used condensation is more homogeneous, so to say, that the result a compactly welded mass of rubber, with no air chambers and holes full of uncoagulated milk. By soaking the hales or cakes as they are brought to his factory in water the trader generally converts the uncoagulated milk into a putrid smelling liquid.

I am positive it is well worth the while of all West African Governments to interest themselves in the easy bush culture of the Kickxia, as trees are being destroyed very rapidly by unavoidable, deplorable, primitive tapping, which cannot possibly be avoided, as I have shown, but can be remedied as indicated by providing growing substitutes to replace fast dying trees. Moreover, the manner of replacement is simplicity itself. I strongly advise sticking to the Kickxia in West Africa. It must be borne in mind that seven eighths of the rubber exported comes from the Kickxia, the growth of which it is imperative to encourage as a means of reviving a remunerative and, consequently, revenue yielding branch of trade.—*Commercial Intelligence*, Feb. 25.

FOR HEADACHE.—At the last meeting of the Paris Therapeutical Society, M Gallois mentioned that he had obtained good results by treating headache by bicarbonate of soda, taken at meal times in water, the proportion being a tea-spoonful of bicarbonate to a quart of water.—*Chemist and Druggist*, March 11.

## PRODUCE AND PLANTING.

**TEA DRINKING IN RUSSIA.**—While perhaps the greatest tea-drinking nation in the world is still under the spell of the Chinese grower, the planters of India and Ceylon cannot say that there are no more markets for them to conquer. Possibly it is prejudice, or may be it is simple cussedness, but the Russians will have China tea, and a writer in the *Anglo-Russian* tells us that the chances are they will continue in their obstinate course for a long time, although that remains to be seen. This writer, however, tells us something of the habits of the Russian, who, he says, drinks enormous quantities of tea, sufficient to frighten the Englishman. The poor Russian, he says, uses he so-called "brick" tea. This is the cheapest sort, being mixed with the stems, and compressed by some adhesive gum into dry-cakes of varicous sizes, resembling in its appearance "plug" tobacco. This tea, which would probably prove poisonous to anyone else, is consumed by the Russian working man at the average rate of about 20 stakans (or tumblers) a day, the Russian stakan being quite equal to five of the little thimbles of cups used in England at afternoon teas. Indeed, a Russian won't be satisfied until "sedmoi pot proshibyt," or "the seventh perspiration breaks out," according to the popular saying. Taking into consideration that black, sour or bitter, brick-like bread, raw onions, garlic, dried leather-like fish, and strongly salted herrings are usually the chief articles of food of the people at large, one must not wonder at the enormous quantity of hot tea needed to still a Russian's thirst and help on his digestion. The inferior sort of tea is, besides, very cheap, but, of course, it is not the "brick" tea as used by the poor moujik that enjoys a world-wide reputation, but that in use among the middle and upper classes. In such households tea at the price of 5s or 6s per pound (0.90 of the English pound avoirdupois) is quite an ordinary thing, while in wealthier families 10s to 12s per pound is frequently paid. There are choice sorts of teas which are sold even at twenty roubles per pound, but of these only a few leaves are used to add an extra delicious aroma to the ordinary tea. Thus the high quality of the tea itself, brought overland and most carefully packed, is the chief reason of its superiority over the teas in use in Western Europe. But apart from the tea itself, the Russian method of preparing it goes a long way to contribute to the fine taste of the beverage. In this process the famous "samovar" plays the principal part, and a word or two of explanation will not be amiss.

**THE PASSING OF THE CLOUD.**—The following from the *Grocer* about the rice in prices of Indian teas is encouraging: "Periods of abnormal cheapness," says the trade organ, "are not infrequently followed by intervals of exceptional dearth, and such is the experience of those in the Indian tea trade just now. Several seasons of abundant and increasing crops following close upon one another had, up to the end of last year, so flattened the market that prices were forced down to an extremely low point—so low, indeed, as to make it almost impossible to produce tea at a remunerative figure—and many of the companies in India, considerable distances apart, were, as growers or importers of tea, beginning to find the industry an unprofitable one so far as they were concerned. The wholesale dealers were also said to be losing money in the article by holding larger stocks than were supposed to be necessary, and buying brokers had more parcels on hand than they seemed to have any prospect of turning over at a profit. This was the state of affairs up to the close for the Christmas holidays, and nobody had the courage to initiate an upward move in prices, which would have paid them handsomely for their trouble.

**INCREASING CONSUMPTION.**—"Everything was left to chance, and it was the opinion of the majority of the trade that, because Indian tea had been exceedingly cheap, it was going to continue so for an indefinite term. Meanwhile," says the *Grocer*, "there were certain forces in operation which were calcu-

lated to bring about quite opposite results, and chief among these was the expanding use of the article, not only in this country, but in places abroad. British-grown tea is evidently an especial favourite with most classes of consumers, its merits in yielding a good, strong liquor in cup, and likewise in possessing a peculiar pungency of flavour, ensuring for it a ready reception wherever it is introduced; and every year a widening out of the consumption has been seen. Marked as this was last year, when 133,430,350 lb. Indian tea were consumed in the United Kingdom, in opposition to 124,534,194 lb. in 1897, it has been even more so since; and during the past two months the London clearances alone of the same kind of tea for home use and exportation have been augmented by 2,191,200 lb., the total amounting up to 24,847,200 lb., in contrast with 22,556,000 lb. in 1898. Whilst this expansion in the deliveries for general purposes has been going on, all surplus stocks in the hands of holders have been gradually worked off, and the stock of Indian tea here, which at the end of February, 1898 embraced 64,080,300 lb., against only 55,424,700 lb. in 1897, was by the 1st instant shrunk to 59,460,000 lb. It therefore now shows a deficiency of 4,620,300 lb., instead of an excess of 8,655,600 lb. as it did a twelve-month ago.

**AN IMPROVED OUTLOOK.**—The recent advance in prices for common sorts—equalling from the lowest point 1½d to 2d per lb on all Indian teas below 8d—has naturally caused quite a commotion amongst the blenders and purveyors of packet teas, which are a great speciality with the trade; and so increasingly difficult has it become to execute orders since the commencement of the year that purchasers in urgent need of stock have been compelled to enter the market for Ceylon and China descriptions, to pick up there such kinds as might suit them as substitutes for the familiar and useful varieties of Indian growths. Nor is there any alternative to this mode of dealing, which must be more or less cramped while the available supplies in first hands are diminishing, without the least prospect of an increase until the opening of a new season, and that is a long way off at present. The rise in prices, not having been brought about by over-speculation, is a perfectly genuine one, and it is because most parties are convinced of the soundness of its position that they incline to the opinion, says the *Grocer*, that the recent advance in Indian tea is likely to be well maintained.—*H and C Mail*, March 10.

**"THE INDIAN FORESTER."**—In the February number of this little periodical Mr. J. S. Gamble, who is retiring from the editorship, writes:—The editorship of the *Indian Forester* is no sinecure; there have been times when I have had great difficulty in making up a number and, had it not then been for willing help afforded, especially by the Forest Officers in Dehra, it might have been impossible to keep up the regular monthly sequence. To all these Forest Officers, therefore, at the Forest School and in neighbouring Circles, I wish to tender my very best thanks; and there are others at a distance in India and away in Europe to whom acknowledgments are also due. It is a pity that the number of contributors is, after all, so small; if only officers, who can do it, would write for the Magazine, it would be possible to increase the amount of original and decrease the amount of official and extracted matter. I am occasionally told that such and such subjects are too trivial to write about, but this is a mistake; for there is nothing in the daily experience of an officer in one part of India that may not be of interest to his brother officers in other regions. The *Indian Forester* was started at the Comereaco at Al. Haoud in 1864, at which I was myself present, so that I can claim an uninterrupted connection with the Magazine for 24 years, during 10 years of which period I have acted as Editor. In giving up the editorship, I give up a work which has interested me much; but I hope still to maintain some sort of connection with it, though I shall be no longer in India.—*Pioneer*.

E.D. C.O

THE MADRAS AGRI-HORTICULTURAL SOCIETY.  
—We have received a copy of the proceedings of the Agri-Horticultural Society of Madras in the period from October to December last, dealing with sisal hemp, Victoria plants for Peradeniya, economical products for the Imperial Institute, camphor plants, etc. Out of four Victoria plants sent to Peradeniya, it was stated in a letter from Mr. Macmillan, that two were alive, which he considered a pretty good result in view of the perishable nature of the plants especially when out of water. He hoped to save these two from the ravages of tortoises and fishes.

COLOMBO PRICE CURRENT.

(Furnished by the Chamber of Commerce.)

Colombo, March 25th, 1899

APRIL, 1899.

[No. 10.]

## LOCUST DISEASE FUNGUS.

We are glad to announce that the locust disease fungus referred to in our last issue has arrived, and we trust that the use of it will prove as successful as it has done in Cape Colony.

The following notes referring to the fungus and its use have been published by Dr. Edington:—

Highly satisfactory results have hitherto been obtained, and it is particularly requested that all persons using the fungus will report the result of their experiments to this Institute.

During dry weather it is difficult to get the disease to spread, and hence it is advisable to use it in moist or wet weather, and to make the infection of the swarms just before sunset.

### DIRECTIONS FOR PREPARING THE FUNGUS PREVIOUS TO USE.

Open a tube and take out the contents entire, add it to two teaspoonfuls of sugar, and rub the whole together with a spoon or flat knife so as to break up the material and mix it thoroughly. Then dissolve this in three-quarters of a tumblerful of water, which has previously been boiled and allowed to cool. Float in this a few pieces of cork, which have been previously steeped in boiling water and cooled.

Now cover the tumbler with a piece of paper, and let it stand during the day in a warm corner of the house. In the evening the following methods are to be used:—

## METHOD OF DISTRIBUTION.

- (1.) Catch some locusts, and after dipping them into the fungus, let them go into the swarm again.
- (2.) Smear patches of damp ground, where the locusts alight to feed, with the fungus.
- (3.) Confine some locusts in a box which contains some favourite food moistened with the fungus, and, after the food has been eaten, return the locusts to the swarm.

ALEXANDER EDINGTON, M.B.,  
*Director.*

Bacteriological Institute, Graham's Town,  
November 7th, 1898.

Recorded by Mr. J. A. G. RODRIGO.

## OCCASIONAL NOTES.

In reply to a letter asking for information regarding a rubber extractor which was referred to by one of our contemporaries as being shown in Trinidad, we have been favoured with the following reply:—"The Rubber Extractor shown in Trinidad was made by me on the base of a 'Cream Separator' and adopted upon an improved principle to that of Mr. Biffen. I cannot send you a description of the machine, but you will be able probably to see quotations for it or a similar one upon the market shortly by a London firm. I have now a process of preparing Castilleo rubber by another method which will be put upon the market shortly. I will advise you in both cases where you can procure the machines and when."

We make no apology for taking over the instructions on trout breeding from the *Cape Agricultural Journal*, in view of the active interest now being taken in this matter.

We have at the request of Mr. John Ferguson taken charge of the plants (familiar enough in Ceylon) consigned from the Seychelles as the food of young gourami, and they are now established round the pond in the School of Agriculture grounds. We are expecting to have some of the fish to stock the pond, and trust before long to be able to make a favourable report with reference to the experiment.

The report on the Poona Dairy is always interesting to us, from the fact that it served as a model for the Ceylon Government Dairy; and Mr. Mollison never fails to give us useful hints in his report which we publish on another page.

The February number of the *Queensland Agricultural Journal* quotes the letters of Mr. S. M. Fowler and "C. D." contributed to the *Ceylon Observer* with reference to Gourami fish.

We learn that Mr. O'Connor, who called here on his way from Europe, after conveying specimens of the Queensland *Ceratodus* to London and Paris, has introduced gourami from Java. Some seventy specimens were taken over and placed in suitable lagoons and waterholes.

## THE BRAHMANI BULLS OF INDIA.

There is a good deal of confusion existing abroad, to judge from frequent references in the press to the "Sacred trotting oxen of Ceylon," between the sacred bulls of India and the trotting bullocks of this Island, and we are therefore glad to find a clear account of the former given by Dr. Voelcker in his report on Indian Agriculture. The Brahmani bulls, which are dedicated to Siva or some other deity, are let loose when still young, on the occasions of funeral ceremonies, or in fulfilment of a vow. They are picked cattle, and, being sacred, are allowed to roam wherever they please, no one being permitted to kill them. The custom is still maintained, and in some parts there are too many Brahmani bulls. Sometimes

considerable dissension exists regarding the bulls, and frequent trouble between Hindoos and Muhammadans arise on this account. In many parts, however, the Brahmani bull is quite extinct, this being due chiefly to the decrease in free pasturing area, and to the decline of faith in the old religious beliefs.

The Brahmani bull, where he exists, is almost always a fine creature, fed on the best of everything. All that a cultivator may do is to drive the bull off his own field, though it may be only for it to go on to his neighbour's. The old Hindoo system of breeding is carried on by means of these sacred bulls, but so well does the animal fare that it is frequently asserted against him that he gets too fat and lazy to pursue his proper calling, and that the cows get served by the half-starved bulls of their own herds instead. Nevertheless, it is very certain that were it not for the Brahmani bull, many villages would be very badly off.

In some parts, as already mentioned, (Behar for instance) the bulls are too numerous, and cause serious damage to the crops of the indigo planters. Though they do not eat the shrub itself, they tread it down while searching for the grass that grows under its shade but nowhere else. Much expense has accordingly been incurred by planters in putting ditches and hedges round their indigo fields.

When the bulls get too numerous Municipalities often seize them and work them in town carts. This proceeding, so long as the bulls are not killed or sold, is quietly acquiesced in.

In the North-West Provinces considerable trouble has been caused by the depredations of cattle-stealers and Muhammadan butchers. The Muhammadans, being meat-eaters, have not such reverence for the Brahmani bull, and it is said that numbers of these cattle are stolen for the purpose of being slaughtered, and that their flesh is sold.

Dr. Voelcker complains of a decision of Mr. Justice Straight, in which he (the Judge) declared the Brahmani bull to be "no one's property," inasmuch as it could not be said to belong to any particular owner. The bull is thus deprived of the protection of ownership, and becomes more than ever the prey of the cattle stealers and butchers, while the villagers are deprived of the means of getting their cows served. "Surely," says Dr. Voelcker, "such a decision cannot be allowed to stand. That men should be allowed to steal and realize money by the sale of the flesh of stolen animals, and then escape punishment on the ground that the animals are 'no one's property,' seems manifestly unjust, and in the interests of the agricultural communities, the practice should not be permitted to continue."

We doubt not, however, that the Judge's decision is correctly based on the law of property, and there is of course the other side of the story, viz., that there is no possibility of recovering any compensation for the damage wrought by animals that have no rightful owners. Some compromise can surely be arrived at by which the benefits accruing to the agriculturist from Brahmani bulls can be secured, while at the same time the damage which they are capable of causing might be prevented.

## CATTLE NOTES.

In Guzerat (Bombay Presidency) the he-calf is simply starved off by withholding milk from him. In other parts he is driven away to the forests to become the prey of wild beasts. In Bengal he is often tied up in the forest and left, without food, either to starve or to be devoured. And yet the people who do this are those who do not allow an animal to be killed outright even if it were in extreme suffering.

The cow, as being a sacred animal to the Hindoos, is only rarely worked in India, and only by Muhammadans. This is the case at Serajunge (Eastern Bengal), the Muhammadans regularly using cows for ploughing, but the Hindoos not. The same reverence is not always extended to the she-buffalo as to the cow. At Belgaum, when the buffalo cows do not calve, they are sent to the plough or to work the wells.

The udder of the cow is divided into two chambers by a membrane which runs in the same direction as the backbone. So complete is the division resulting from the presence of this membrane that the milk from one chamber cannot pass into the other. For this reason it is advisable that the milker should operate, say on the front and hind teats on the side next to him, and having emptied one chamber of the cow's vessel, should proceed with the other. This is not, however, the general practice. It is customary to operate on the teats of different chambers simultaneously on the ground that the method of procedure preserves the natural state of the udder whereas such a contention is quite contrary to facts.

Here again is one of those absurd paragraphs quoted by the *Farm and Dairy* of February 11th, 1899, relative to the so-called "sacred running oxen of Ceylon," wherein the diminutive breed peculiar to Southern India, the trotting bullocks of Ceylon and the Brahmiani bulls (referred to in another part of this issue) are so hopelessly confused:—The newest breeds of cattle coming to the Dexter Keries, that were landed with the first batch of Government imported dairy cattle, are the Cingalese cattle. They are known to zoologists as the "sacred running oxen." They are the dwarfs of the whole ox family, the largest specimen of the species never exceeding 30 in. in height. One which is living, and is believed to be about 10 years of age, is only 22 in. high and weighs 109½ lb. In Ceylon they are used for quick trips across the country with express matter and other light loads; it is said that four of them can pull a driver of a two-wheeled cart and a 200 lb. load of miscellaneous matter 60 or 70 miles a day. They keep up a constant swinging trot or run, and have been known to travel 100 miles in a day and night without either food or water. No one knows anything concerning the origin of this peculiar breed of miniature cattle. They have been known on the island of Ceylon and in other Buddhist countries for more than 1000 years.

We have before referred the various methods of dehorning cattle, but having received fresh enquiries, we repeat a description of the most

effective process:—Stick caustic potash is the medicine. The earlier the application is made in the life of the calf, the better. The hair should be clipped from the skin, and the little horn moistened with water, to which a few drops of ammonia have been added to dissolve the oily secretion of the skin, so that the potash will adhere to the surface of the horn. Take care not to moisten the skin, except on the horn where the potash is to be applied. One end of the stick of caustic potash is dipped in water until it is slightly softened. It is then rubbed on the horn. This operation is to be repeated from five to eight times, until the surface of the horn becomes a little sensitive. If done carefully, a slight scab forms over the surface of the budding horn. No inflammation or suppuration of any account need follow.

## MORE ABOUT MILK.

(Continued.)

Before one can intelligently search for the cause of the taint in milk, he must have some idea as to the character of the same. A tainted condition arising from any source injures the quality of the product, but the effect of a taint is largely determined by its character.

Taints may be classified into two groups depending upon their origin—

1. Those produced by bacterial fermentations in the milk;
2. Those caused by the absorption of odours directly from the animal, or after milk is drawn.

In the minds of most dairymen, the latter class has been considered the more important, and the effect of the first group has not been adequately recognised. As a matter of fact, a large number of taints, that affect the quality of milk, are induced by bacterial growth than otherwise. The danger that comes from this class is, that it is caused by a living organism, and, therefore, may be widely distributed unawares. A physical taint is unable to reproduce itself, so that a mixture of tainted milk with a larger quantity of normal milk serves to diminish the intensity of the taint:

The manner in which the respective taints are produced enables one to detect the difference. If produced by germ origin, a well-marked taint in any milk can be propagated from one batch of milk to another, by transferring a small quantity and placing it under conditions that favour bacterial growth. Particularly is this true, if the inoculated milk is first heated to destroy pre-existing bacteria. If it has been directly absorbed from some external source, it cannot be transferred in this way.

Then, again, if a taint is produced by biological causes, it will not, ordinarily, appear until some time after the milk is drawn; for, as a rule, bacteria gain access to the milk subsequent to its withdrawal, and a certain period of incubation must elapse before the taint-producing organism can increase in sufficient numbers to produce the obnoxious odour or flavour. If the defective condition of the milk is due to direct absorption from the animal, as is the case where the food contains volatile odour-producing substances, then it will be noted immediately after milking. Aeration of the milk is often recommended in such cases, but

sometimes the odour is so persistent that this fails to eliminate it.

Milk may acquire a taint some time after milking; and still it may be due to direct absorption. If it should happen to be placed in a room with odour-yielding substances, it can easily acquire it in a cold condition. Such belated absorption might be considered as due to germ origin, unless the conditions were carefully determined.

It is a current belief that milk does not take up odours so long as it is warmer than the surrounding air, and on this ground the practice of leaving the milk in the cowshed for a longer or shorter period of time is sometimes defended, more especially if the cans are arranged so as to preclude the possibility of the introduction of dust and dirt. This belief is not infrequently formulated in this way:—Milk evolves odours when warmer, and absorbs them when colder, than the surrounding air.

Recent experiments made by the writer seem to indicate that such a general conclusion cannot be experimentally verified. Exposure of hot and cold milk to an atmosphere charged with various vapours and odours, such as manure, urine, ensilage, and different volatile substances, showed that almost without exception both hot and cold milk absorbed distinctive odours in the course of a few hours to such an extent that they could readily be detected. Moreover, the intensity of the odour was almost invariably more pronounced in the warm than the cold sample, although precautions were taken to have the temperature of both samples alike at time of judging.

This belief, that warm milk does not readily absorb odours, is contrary to the housewife's experience who allows warm milk or warm food to cool before putting it into the refrigerator. Being warmer than the surrounding air, it absorbs more readily the odours arising from fruit, vegetables, or other food substances, than would be the case if it was first cooled down. Such a condition is not due to the retention of the "animal odours," but direct absorption from without.

The practical bearing of this is that milk should not be kept in contact with air that is saturated with undesirable or marked odours. Even an exposure for a half-hour has sometimes been found sufficient to impregnate the milk with the odour of decomposing manure. The straining of the milk in the cowshed, and then its immediate removal, may not give time for the absorption of odours in a marked degree, but it should be borne in mind that the conditions at that time are the most favourable for rapid absorption of any odours, and that in milk that is being produced in the best possible manner even such an exposure is not to be recommended.

The presence of bacteria interferes not only with the keeping quality of the milk, but affects the sanitary conditions of the same. Bacteria are also intimately connected with the production of disease that the mere mention of the word calls up to the minds of many dread visions of epidemics. That all bacteria should thus be considered as enemies of man is entirely erroneous, for, in many cases, they are decidedly beneficial, and particularly is this true with reference to those forms found in the milk. The mere fact that milk invariably con-

tains hundreds of thousands, if not millions, of bacteria per cc. need not in itself cause alarm. Mere numbers of bacteria are no just criterion as to the hygienic value of milk. Of course, just to the extent that bacterial life can be reduced in milk, just to that extent are the decomposition changes retarded, but milk or its by-products, skim milk or buttermilk, may contain scores of millions of germs and still be perfectly wholesome from a hygienic point of view.

The bacteria that exert a deleterious influence on human health are not necessarily those that are distinctively disease-producing,—i.e., pathogenic bacteria; for, in many cases, sickness is caused by the ingestion of milk that is contaminated by putrefactive organisms.

---

#### WILD INDIGO AS FOOD.

---

The *Agricultural Ledger*, No. 197, 1898, deals with the Wild Indigos as a source of food in times of scarcity.

The fact that the grain afforded by certain species of *Indigofera* is eaten in years of scarcity is not new. The grains are known to have been consumed during the Deccan famine of 1877-78, and were described in a paper read by Dr. W. Gray before the Bombay Medical and Physical Society so long ago as 1882. The seeds were ground to flour, and either alone or mixed with cereals they were made into cakes which are very palatable. They were occasionally eaten raw but were found to produce ill-effects; when properly cooked, however, they afforded a nourishing food which had all the characteristics of pulse.

From a letter addressed early this year to the Survey Commissioner and Director Land Records and Agriculture, Bombay, it appears that during 1897, a year of great scarcity in India, a considerable number of people of Malsiras and Pandhapur, in the Bombay Presidency, were subsisting on these grains. The following were the varieties so used: *Indigofera cordifolia*, *I. glandulosa*, and *I. knifolia*.

Analyses of these grains had been made by Prof. Lyon, Chemical Examiner of Bombay, in 1882, but Prof. Church, who is conducting a series of analyses on India Food grains on a special plan of his own—in which he brings out very prominently the nutrient ratio for comparative purposes—has again subjected them to a Chemical examination at the Imperial Institute.

Of the three species of wild Indigo mentioned above and examined by Prof. Church, the only one indigenous to Ceylon is *I. knifolia* which inhabits the dry country. In India the flour of the grain with the husk removed by pounding is made into bread. This bread has a somewhat bitter taste, and is therefore eaten with vegetables or hot condiments. To make the bread palatable the flour of millets is mixed with the Indigo. The bread should not be made of the whole grain without pounding, as it is said to produce a swelling of the mouth or body when thus eaten,

Prof. Church reports on the seeds of *I. linifolia* as follows:—

Water	...	...	...	9.3
Albuminoids (from total nitrogen)				30.3
Soluble carbohydrates (by difference)				43.4
Oil	...	...	...	3.0
Fibre	...	...	...	6.5
Ash	...	...	...	3.5

The nutritive ratio is 1:1.47

The nutritive value is 8.4

The phenol method showed 32.2 per cent of albuminoids.

## TROUT BREEDING AND STOCKING OF STREAMS.

The annexed memorandum drawn up by the officer in charge of the Government Trout Hatchery at Jonker's Hoek, giving instructions for the hatching of trout in a simple and inexpensive manner, and the transport of fry and stocking of streams &c., is published for the information and guidance of persons interested in Trout acclimatization in Colonial waters.

### WATERS SUITABLE FOR TROUT.

The trout being an inhabitant of fresh waters may be placed in perennial rivers, or in lakes and dams of clear waters, and into which a stream of clear water is always running, or which may be fed by bottom springs. Trout will not succeed in waters that become stagnant and muddy at times, or in rivers that dry up in summer. In dams and lakes water plants are of great advantage, both as food producers and also as a benefit to fish; plants absorb carbon\* and give out oxygen, while fish absorb oxygen and give out carbon<sup>ic</sup>, so by placing the two together we are taking advantage of nature's agencies and also materially assisting in keeping the water clearer and wholesome to the fish during the hot summer months. When planting trout in a river or pond a little knowledge of the habits of the fish at the spawning season will be of great benefit. When trout are ready to deposit their spawns they repair up stream as far as they can get, even leaving the river and going up small side streams and rivulets with hardly enough water to cover them. Having chosen a suitable bed of gravel and loose stones; they commence by digging out a bed for their eggs; this is done by scraping out the gravel and small stones with their fins and tail, thus causing an eddy in which they deposit their spawn. The eddy prevents the spawn from being washed away by the stream until they are covered by the parent fish as they work, and also materially assists in the fertilization of the ova. As soon as the trout have completed spawning they return to their old haunts, leaving the eggs to take care of themselves. Here again we have a provision of nature for the protection of the ova; for by placing the eggs in so small a stream they are safe from any larger fish that would otherwise prey on them when hatching out, and they are also safe from being washed away by heavy rains, as might be the case were they left in the

larger river. Therefore it is necessary for us to assist nature by placing eyed ova and the young fish in similar places as would be chosen by the parent fish themselves, and there leave them to their own resources.

### TRANSPORT OF YOUNG FISH.

When transporting fry any distance to a river or lake it is necessary that there should be as little delay on the journey as possible; nothing ought to be left to chance, but all arrangements should be made beforehand. One hour's delay may prove fatal to the fish, when all trouble and expense would count for nothing. When travelling, the fry are safe under ordinary circumstances, as the water in splashing about inside the carriers mixes with the air, thereby supplying the fish with oxygen which is necessary for their existence; but when left standing still for any time the air in the water becomes exhausted and the fish will die not for want of water but for want of air. In cases where they have to stand for an hour or more some person must attend to them, and on any sign of any of the fish turning sick and coming near the top, they may be revived by taking one side of the carboy and lifting it up and down for a short time, this causes the water inside to splash about and take in a fresh supply of air. A few simple rules may be laid down for guidance, such as:—

Keep the water as cool as possible, travel quickly, don't let the sun shine on the carboys and carriers if it can be avoided; don't cover the top closely, but allow as much air to get inside as possible; a wet blanket put around the carboy or carrier on a warm day is a great assistance in keeping the water cool.

When arriving at the stream into which the fry are to be put (a suitable place having been previously selected for them) the first thing to be done is to ascertain if the temperature of the water in the carriers is the same as the water in the stream; if so, then the fish may safely be turned out. But should it happen that the waters vary in temperature, then the water in the carriers must first be brought to the same degree as the stream, for should the fish be turned suddenly into water ten degrees higher or lower the chance is that it may kill most of them. The desired result may be obtained in the following manner: first, fill the carriers up with water from the stream, pouring in steadily, then pour off say half (taking care none of the fry escape) and fill up again; repeat if necessary, or until the water in the carboy is the same degree of temperature as the stream. The fry may then be turned out into a clean bucket, sink the bucket in the stream, and quietly turn it over, when all the fish will come out.

[Here follows a diagram of a "Trout Hatchery" which is not reproduced.]

The first and most important consideration for a trout hatchery is to obtain a good supply of suitable water for the purpose. All waters are not suitable; spring water is often too cold, and even allowing that it may answer very well for incubating the ova, is not always good for rearing young trout, as it sometimes contains mineral matter of different sorts.

A very good test of water is to ascertain if it contains a good supply of insect life, for where insect life abounds trout will generally succeed,

\* No, doubt a misprint for carbonic acid—Ed. A. M.

## DIRECTIONS FOR PACKING OVA.

Have at hand a clean basin or bucket about two-thirds full of water from the stream, to place the ova in. Carefully open the box containing the ova, take off the packing on top, lift out the cloth containing the eggs and gently place it in the basin of water, let go two sides of the cloth and pull it gently away; the eggs will then float off and sink to the bottom.

## HATCHING THE EGGS.

Almost any place may be used for the purpose of hatching eyed ova, as long as a suitable supply of good water is obtainable and proper means taken to guard against its being turned off at any time, or the hatching beds flooded by heavy rains. In the latter case it is best to have the hatchery placed some way from the stream and the water led on in pipes, or even through an open furrow, and so arranged by having a properly made sluice to regulate the supply that only a certain amount of water can pass.

When the ova are laid down in the stream itself, a small stream with a low temperature should be selected; the smaller the stream the better as long as it does not run dry in summer. Select a place in this stream having a nice bed of coarse gravel with a run of water three or four inches deep. The gravel must not be too fine—say from the size of a pea upwards—and may be stirred over and levelled with a garden rake before putting the ova down. The eggs should be gently poured out of the basin, adding water until all have passed out. No further attention is needed beyond keeping off birds, crabs, frogs, &c., as much as possible.

When it is not found expedient to hatch the ova in the stream itself very good results can be obtained without the expense of building a hatchery, by leading out the water as stated and simply erecting hatching beds at a suitable spot. The beds may be dug out or wooden hatching boxes may be used; the boxes are the best as they are better under control and easier kept clean. Eyed ova could then be laid down in them and the boxes covered with lids made to fit, to keep out all crabs, birds, &c., and also to keep it dark inside, which is better for the young fry.

The boxes might be made say fourteen or fifteen feet long, two feet broad and nine inches deep, the outlets so made as to allow raising or lowering the depth of the water in the box at will. A box of that size will be quite capable of hatching say 15,000 fry. The sides of the boxes should be made of inch and a half plank, the bottoms of inch and eighth flooring, tongued and grooved. All wood-work inside the boxes would require to be well charred with a red hot iron before using, and the outside painted, or if buried in the ground may be given a coat of tar and pitch.

## TREATMENT OF FRY ON AND AFTER HATCHING.

As soon as the fry hatch out in the boxes all the bad eggs must be picked up, also all the shells from which the little fish have escaped, or they will tend to foul the water. The best method is to take out the plug so as to cause a stronger current through the box, when all the shells, etc., will float against the screen, the plug must be replaced before too much water is run off and also without disturbing the young fry.

The shells, etc., may then be taken out with a syphon into a basin or bucket; should a few fry escape through the tubs into the basin then the shells, etc., must be poured steadily out and care taken that none of the fry escape. Water must be added until all is out, when the fry left in the basin may be put back into the hatching box, putting them in near the head of the box where the water enters, as it is best to keep them away from the screen as much as possible.

As soon as the fry hatch out it will be found that they will pack near the head of the box, there they must not be disturbed other than by an occasional look to see that they are all right, and the lid must be kept close to keep them dark. The top half of the box only requires to be covered (the lid may be removed as soon as they are about to commence to feed.) As long as they keep packed together they do not require to be fed, as they have their food for the time being in the sack attached to their body, but as soon as it is all absorbed they will begin to feed and look out for food. That will be about three weeks after hatching. They will then scatter and head up the stream on the look out for what they can get. They may then be given a little food unless they be turned out into the stream, which may be the most satisfactory as they require a lot of care and attention in feeding.

In turning them out a good plan is to take out the screen and let them escape of their own free will, that is to say, if they are intended for the stream on which they have been hatched and into which the water from the hatching boxes is flowing; but if they are to be divided among a number of places then they may be caught with a fine net made of muslin or some other suitable material, put into carriers, and taken to their destination.

## HATCHERY.

Should it be thought that a hatchery will answer best, then a house for the purpose may be put up. It may be made of wood, iron or stone, but the floor is best made of concrete. In size it may be made to suit circumstances; a place say sixteen feet by twelve broad inside will be capable of hatching at least sixty thousand fry.

The hatching boxes may be made any size to suit the building or the maker's fancy; for a building 16 feet by 12 feet, boxes 12 feet long, 18 inches broad and six or seven inches deep would suit very well, for they could be placed as shown in the drawing attached and leave about three feet space at the end to get round them. The hatching boxes may be raised on trestles about two feet high or to suit the operator, it is then easier to work them. The boxes will require to be fitted with a screen to keep the fish from escaping, also a plug-hole and plug for running the water off when cleaning the boxes out, and must be placed between the screen and the end of the box.

The water may be led into the hatchery through earthenware pipes, or even a charred wooded spout, but iron pipes must not be used as they are liable to rust and thereby harm the fish.

[A plan of filter frame and section of filter box are here given.]

## FILTER.

The water will first require to be filtered before

using in the boxes, not that a little sediment or mud will harm the fish, in fact it does good rather than harm, as it helps to kill any impurities that may arise in the boxes, but to guard against the danger of any enemy to the fry getting among them, such as crabs, frogs, and insect larvae. A box fitted with frames to slide in grooves, and the frames filled with coconut fibre, makes a good filter for the purpose, and requires very little cleaning. The filter may be placed inside the hatchery if space will permit, and the water led from it into the distributing box to supply the hatching boxes. An overflow ought to be made in a suitable place in the distributing box but higher than the outlets to the hatching boxes so as to keep it from overflowing and running into the boxes.

JOHN C. SCOTT.

Jonker's Hoek.

#### MR. MOLLISON'S REPORT ON THE POONA DAIRY.

The financial results shown in the appended balance sheet are disappointing. The net cost works out R831. It will be noticed, however, that the valuation of livestock at the end of the year shows a decrease of R1,840. Under ordinary conditions there ought to have been an increase, because though there should be a liberal deduction for depreciation in the value of the older animals, it should be more than counterbalanced by a corresponding increase in the value of the young stock owing to the natural increase of the herd and improvement during the year in value of growing animals. There were 187 animals in the herd at the end of the year as compared with 192 at the beginning. 35 animals were sold, chiefly old worn-out cows and buffaloes and young bull calves. The older animals had necessarily to be valued at a lower figure than in the previous year, because owing to an outbreak of foot-and-mouth disease many of the milch cattle, and in particular the buffaloes, had gone dry when they became affected with disease. There was then an unduly large proportion of the animals dry at the end of the year, receipts for the year being R1,800 less than in previous year. Among older animals there were no deaths attributable to the disease, but pregnant animals aborted in some instances and many young calves died. Affected animals were segregated as the disease appeared, and their treatment, especially in the case of heavy buffaloes, gave much trouble. They had to be thrown daily, so that their feet could be examined, washed and dressed. The milk of the affected animals was of course not issued. The difficulties connected with segregation were considerable. It was found hard to determine, in the early stage of the disease, whether or not particular animals were affected. Slight salivation without any rise in temperature was the first noticeable sign. But such might occur in a perfectly healthy animal. If, however, an affected salivating animal was not at once removed, the saliva or other excretions apparently proved a ready source of contagion to adjacent animals in the stalls. The contagion was chiefly from animal to adjacent animal in the stalls, and this notwithstanding the fact that the whole of the healthy or apparently healthy were at pasture during the day.

The stalls, feeding boxes, gear, &c. were thoroughly disinfected with phenyle twice daily. Every care was taken regarding segregation of animals and attendants, yet fully one-third of the herd became affected.

The Dairy produce from 77 animals in milk was sold for R15,242. These animals yielded a fair profit. But the upkeep of the young stock had also to be met, and this expense is always heavy. The cost of concentrated food consequent upon scarcity in the year of famine was considerably above the average during the greater portion of the year. The value of concentrated food and fodder bought, the rent of grass land, and haymaking expenses amounted to R12,570. The fodder on hand at the end of the year amounted to R2,876. The difference represents the value of food consumed by the whole herd during the year. The costliness of the upkeep of the young stock has been referred to. This is a contingency that cannot be avoided. The majority of Indian cows, and specially Indian buffaloes will not yield their milk freely unless the calf is allowed to suckle or is tied near the dam at milking time. I am aware that some authorities dispute this conclusion.

The calves of docile tempered Aden cattle might possibly be advantageously weaned at birth, also of cows and buffaloes with feeble maternal instincts, particularly if the practice is started when a particular animal produces a first calf. Taking one animal with another, I think it is best to follow the indigenous method and allow the calves to suckle. If this, however, is allowed, the owner is in the unenviable position of knowing that the calf will consume, before it is weaned, many times its own value in milk. This is especially true of the buffalo calves. Their value, when a year old, rarely exceeds R5. Even in the case of the buffalo calves and the young stock from cows if hand fed with any degree of liberality from birth, the cost of upkeep exceeds their value considerably, particularly if sold as yearlings or two years old. This statement holds good in any purely agricultural district, and the question may be asked how can cattle breeders afford to breed cattle at all. The answer is where the cattle breeding is practised to any extent and followed on systematic lines, extensive grazing lands exist and other suitable facilities and conditions. The extensive tracts of grass land west of Ahamadabad along the Ran of Cutch, the Gir hills of Kathiawar and the Satpuda ranges in Holker's territories are notable examples. In each case well-known pure breeds of cattle are raised at purely nominal cost. The annual grazing charges never exceed a rupee for a full-grown animal, and usually range from 4 annas to 12 according to age.

In our cattle-breeding operations we have taken up a certain line, viz., breeding for milk. In this connection it is necessary that our young stock shall be maintained in continuously thriving condition as they grow, and in consequence their cost of upkeep will be considerable and necessarily much higher in the Poona district or in any other agricultural district than would be the case in cattle-breeding districts proper. When, therefore, the profitable part of our stock—the animals in milk—get out of profit through contagious disease of a serious nature, the balance is likely to appear on

the wrong side of the accounts. There is always a risk of contagion, because cattle disease and its spread is uncontrolled. The danger to private owners is infection of healthy cattle and consequent loss. The danger to the public is perhaps more serious, because the sale of milk from diseased cattle is also uncontrolled. Fortunately, however, in the case of a cow, and especially in the case of a buffalo, milk secretion stops if fever becomes high and illness severe.

We have a full reserve supply of fodder on hand, and at the end of each monsoon a supply sufficient for a full year will always be in stock. In former reports the objects aimed at in our cattle-breeding operations have been fully discussed. The primary object is breeding for milk, and in doing so the indigenous breeds under trial are maintained pure. Inherent characteristics of pure breeds, which have taken probably centuries to stamp, are deformed by cross-breeding, and in consequence I do not believe in the practice. There is good enough pure breed material in the country, if properly selected, and I have pleasure in being able to point now to young animals bred on the farm which give great promise of being specially good milkers. We lost by rinderpest three years ago nearly all the first produce from cows mated at the farm, otherwise our operations would have made better progress. Sind cattle will, I believe, prove our most satisfactory milk breed, although they have shown one failing in the Deccan, which, if inherited by offspring, would be rather disastrous.

The cows at parturition are peculiarly susceptible of inflammation of the udder, and in the case of deep milkers, no remedial precautions that can be taken is quite effective. Imported animals are more susceptible than heifers or cows bred on the farm, and perhaps in stock bred in the Deccan the trouble may disappear. The direct cause, I believe, to be the change from the dry naturally drained alluvial soils and rainless climate of Sind to the chill damp climate and the cold floors of bires in the Deccan, particularly in the monsoon.

The dairy supplies milk and butter to the Commissariat Department for soldiers in hospitals at ordinary rates and to the public at rates fixed purposely higher than in private dairies. Improved method and the manipulation of improved dairy machinery are taught to natives. Those who come to learn have to work. The trade in butter, and other dairy produce made by improved methods, is now in India enormous, and the Bombay Agricultural Department can take credit for initiating this trade.

The services of farm bulls are given gratis for all healthy cows and freely taken advantage of.

Full information regarding the management of dairy cattle in India and regarding milk and milk products will be found in two pamphlets, which I have written for the *Agricultural Ledger* series, and full descriptions of the various breeds of cattle of the Presidency and of the conditions under which these breeds are bred will shortly be published, illustrated by photographs of numerous typical specimens.

## INDIARUBBER FROM EUPHORBIA.

Major C. Giberne writing to the *Standard* says:— "Will you allow me to draw attention to the enormous quantity of Indiarubber locked up in the jungles of India in the various species of *Euphorbia* or "milk-bush," with which it is in parts so thickly studded?"

"Many years ago when in India I ordered a box of chemicals from England, and in the course of some experiments I made, I added a little nitric acid to the strong alkali milk juice of *Euphorbia tirucalli*, and to my surprise not only neutralised the alkali, but left floating on the surface a piece of Indiarubber. There is a considerable quantity of *E. tirucalli* growing in Guzerat and especially in the neighbourhood of Bombay, but the supply is limited. On the other hand there are other species of milk-bush such as *E. antiquum* and *E. nerifolia*, the supplies of which, should they be found efficacious, are inexhaustible.

"I should strongly recommend that a trial be made of all these different species as to the quality of the Indiarubber they generally produce. Probably also a cheaper acid, such as hydrochloric, would prove efficacious as nitric acid. The milk could easily be extracted from the milk-bush by means of a common native sugar-cane press. The only question then would be whether the acid should be brought to the milk or the milk to the acid, and, in the latter case, whether it should be sent in the form of a fluid or be previously dried in the sun and exported to England in the form of the gum known in commerce as Euphorbium."

*E. tirucalli*, *E. antiquum*, and *E. nerifolia* are also well-known in Ceylon, and are familiar as "nawa-handi," "patuk" and "daluk" respectively. It remains to be proved, however, that the latex from these plants is capable of yielding commercial rubber. Dr. Watt mentions the fact that many Euphorbiae yield a gum or gutta-percha-like substance, but does not say anything of its economic value.

## GENERAL ITEMS.

In a recommendation by Dr. W. Schlich, C.I.E., Principal Professor of Forestry at Cooper's Hill, which has just been circulated by the Government of India, that eminent authority on Forestry refers to a visit paid by him with his students to Vieraheim in Hesse-Darmstadt, where they saw the regeneration of oak and Scotch pine in combination with the rearing of field crops, which has been carried on in these forests during the last 80 years with remarkable success. He recommends this as an object lesson to Indian Foresters, particularly to those in Burmah, where teak cultivation under somewhat similar conditions is carried on.

A Freuchman (Mons. Cossius) is said to have invented and patented a new process for sterilising all fermenting liquids. He places the liquid to be operated on in a closed vessel, and subjects it to a stream of oxygen proportionate to the quantity of fluid. Milk can thus be kept for any length of time after the sterilising process. To make champagne milk, which also keeps any length of time, and is a most delicious and refreshing drink, sugar and an aromatic essence are added to the milk, which also receives a quantity of carbonic acid gas in a closed vessel.

Not many people are aware that the onion contains a principle which acts on the nerves in a manner similar to the action of opium. Unfortunately, the persistent odour of the vegetable makes sensitive persons disinclined to use them, at all events in a raw state. Now, an onion taken at night, is one of the best sleep-inducers. The element above mentioned has the effect of calming the nerves, and consequently of putting the brain to rest.

Mr. Cowley, Manager of the Kamerunga State Nursery, Cairns, sees no reason why Cacao should

not be grown in Queensland, which seems to provide the conditions suitable to the cultivation of almost every agricultural product! Cacao has indeed been grown already as an experiment, and Mr. Cowley says that one thing has been ascertained as a result of the trial in his nursery, and that is, that "it should be left unpruned," and that it is as well to let nature have her own way in Queensland. He will be interested to learn that after many years' experience in Ceylon the same decision has been arrived at as regards the cacao tree. Messrs. De Moleyn are said to be planting a considerable area with cacao in the Russell district of North Queensland.

It is tantalising—says *Planting Opinion*—to think of what the consumption of coffee might be but for the adulteration that is practised. Prof. Cochran of the Department of Agriculture at Washington has made examinations of a large number of samples of sound coffee with the following results:—

1. Composed of bran, cracked wheat, and a little caramel; chiefly wheat-bran sweetened and roasted.
2. Sample beans about the same relation to coffee as wheat screenings do to wheat.
3. Roasted sweetened wheat 75 per cent, coffee 25 per cent.
4. Composed of roasted and rather finely broken grains of wheat and barley.
5. Sample is composed chiefly of wheat bran.
6. Coffee about 64 per cent, pea hulls 13 per cent, chicory 23 per cent.
7. Sample is roasted rye.
8. Sample is roasted barley.
9. Sample is composed of wheat, chicory, coffee, and peas coarsely ground.
10. Composed of peas about 69 per cent, grains 29 per cent, and chicory about 2 per cent.
11. Sample is composed of bran, cracked wheat, chaff and caramel.
12. Sample is composed of wheat, chicory, coffee and peas, all coarsely ground.

Of all the samples examined but four were found to be composed of pure coffee, and of these three were pronounced to be of "very inferior quality."

The Jamaica Agricultural Society's Journal remarks that though the budding of the mango is generally considered impossible, it has been done by experts in Florida, and can be done by others when understood. The secret lies in taking the bud from about the middle of the growing shoot where they are well developed, and yet not too tender—where the colour of the bark is just turning from green to purple—and at a time just prior to a vigorous stage of growth in the tree to be budded. The shield method has been used, but the ring plate style is recommended as being better.

The following recipes for preserving and pickling tomatoes given by the *N.S.W. Agricultural Gazette* should prove acceptable to housekeepers:—

*Green Tomato Pickle.*—Wash and cut out the stems of green tomatoes; and place in layers with salt sprinkled between them. Let them remain in the vessel two days, then drain; and put in jars or wide-mouthed bottles with a few chillies, bruised ginger, whole pepper, cloves, and onions, and fill up with the best vinegar. Then place the jar in a cool oven in a saucepan of water, which must boil until the tomatoes are cooked tender, but not done too soft.

*Tomato Pickle.*—Scald the tomatoes, remove the skin; boil spice, whole pepper, a little garlic in the vinegar; pour on tomatoes while hot; put in pickle-bottles, seal securely. This pickle is improved by keeping.

*Tomato Chutney.*—4 lbs. of tomatoes, scalded and peeled; 1 lb. of very sharp apples peeled and cored, 6 oz. of stoned raisins, 6 oz. currants, a little lemon peel, 4 lb. of brown sugar, 2 oz. chillies, 2 oz. bruised ginger, 1 oz. garlic, 3 oz. onions, a large stick of horse-radish grated, and a small bunch of mint. Chop all these ingredients coarsely. Mix all together with one pint of vinegar, put on lime-juice. Put into a saucepan to simmer by the side of the fire until clear. The chutney should be syrupy, but not too liquid, and all the ingredients should be tender but not cooked to a pulp.

*Tomato Sauce.*—6 lb. of tomatoes, 1 lb. onions,  $\frac{1}{2}$  oz. ground ginger,  $\frac{1}{2}$  oz. cloves, 2 oz. salt, cayenne to suit taste. Boil slowly for four hours. Strain through a colander; add sugar to taste; boil to a proper consistency.

*Red Tomato Jam.*—Scald the fruit and remove the skins; put the fruit into a preserving pan (enamel); sprinkle sugar over the fruit, let it stand twelve hours; boil up the fruit, add more sugar, making fruit and sugar equal; boil quickly, stir carefully. Try a little on a plate; if sufficiently boiled it will set and have a glaze. All tomatoes, when made into jam, require some flavouring to take away the vegetable flavour which they have. There are so many excellent fruit essences, such as lemon, strawberry, jargonel, &c., that this matter may be left to the cook's discretion.

*Yellow Tomato Conserve.*—Scald the fruit that the skin may be removed. This is an important item when preparing tomatoes, either for culinary purpose or jam-making. Sprinkle sugar over the fruit; let it stand for a few hours (to set the fruit), then add more sugar, and boil rapidly, keeping it carefully skimmed. Any fruit-flavouring can be added, with a little acid, such as lemon-juice. It is thought by some that three-quarters of a pound of sugar is enough for most fruits; my experience is that equal parts is best.

### REPORT ON COFFEE LEAF DISEASE IN COORG.

[INCLUDING DESCRIPTION OF COORG; CULTIVATION OF COFFEE—SHADE, WEEDING, MANURES,—SEED, VARIETIES, HYBRIDISING.]

BY MR. JOHN CAMERON, F.L.S.\*

ARRIVAL IN COORG.

My arrival in the province on the 15th November was happily timed, as the N. E. monsoon had just subsided, and the country was, therefore, seen to the best advantage.

Coffee was also in its prime, crop beginning to ripen in the drier and more exposed parts of the planting zone.

Mr. Parsous, Honorary Secretary of the Coorg Planters' Association, who had kindly made all arrangements for my tour, met me at the Pollibetta Club, and accompanied me to his fine residence at "Beechlands," which subsequently became the base of operations in South Coorg, or what is locally known as the "Bamboo" district.

During the following fifteen days of inspection and touring, I must have passed through 50 miles of fine coffee in full bearing, most of it in the "Bamboo" being in one continuous stretch.

The crop this season is also considered well above the average. It is needless to say that this was an unique and impressive sight such as one does not forget. A sight such as the former rulers of Coorg had never dreamed of!

It is also my first experience of the kind, as on former occasions when visiting planting districts in Manjarabad, South Wynad and the Nilgiri Hills the coffee was not in crop.

#### PHYSICAL ASPECT OF THE COUNTRY.

Coorg is a hilly plateau girt on the west and south by the western ghats, the highest boundary peaks being Subrahmanya in the North (5,543 feet), Tadiadamol in the west (5,682 feet), and the Brah-

magiris in the south (4,500 feet). It is situated between north latitude 11° 55' and 12° 50', and east longitude 75° 25' and 76° 11', covering an area of 1,585 square miles. Mercara, the capital of the province, occupies a commanding site at an elevation of 3,800 feet. The view from the spot called "Rajah's Seat" is one of the finest I have ever seen. The average elevation of the upper plateau is 3,500, but gently sloping towards the eastern frontier, where the elevation in some places does not exceed 2,700 feet. Minor mountains and hills intersect the whole country beautifully, and are mostly clothed with interesting trees of varying tint. In most parts of the "Bamboo" one feels rather over-shadowed by trees; but commanding situations, as at the Pollibetta Club, Mr. James Gerard's Bungalow, and Elk Hill, afford fine views of this part of the country.

In North Coorg, the finest views observed are at Perembo Coolly, Mr. Salisbury Trelawney's charming place, Mercara, and Hallery, where I was the guest of Mr. and Mrs. Sprott and had the pleasure of meeting Mr. Frank Mangles, one of the most successful pioneers of planting in North Coorg.

The principal rivers and streams have an easterly course and flow right across the peninsula into the Bay of Bengal. These are the Kaveri,—rising on the Brahmagiri Range at a sacred spot called Tala-Kaveri, or head of the river,—Hemavate and Lakshamanatertha. The Barapole is the principal river flowing to the western coast. Mountain streams are abundant and rapid during the monsoon season, but at other times they are not so apparent, and the planters mostly complain of the difficulty they experience in watering flower gardens around their bungalows during the dry season.

But this is of course due to the bungalows being mostly situated on high ground, where there is less malaria to contend with. The little alpine province of Coorg is justly described as one of the prettiest spots in India.

#### GEOLOGICAL FORMATION.

The geological formation is eminently favourable to the creation of good soils. This is due both to the mineral constitution of the indigenous rocks and of their age and mechanism. In nearly every part to the country one sees an abundant outcrop of dis-

\* Reprinted from "Planting Opinion," March 13, 1899.

integrated rock in all stages of decay, and in coffee lands this valuable material is intimately incorporated with the tilth. It is, in my humble opinion, the backbone of both the soil and the planting industry. Would the latter have progressed for 40 years without this wealth of nutrient matter to support it?

The prevailing rocks consist of gneiss, syenite, and limestone; and a reddish-coloured laterite is plentiful in many localities. The minerals from which a fertile soil is usually formed are strongly in evidence, *e.g.*, felspar (in several forms), mica, hornblende, and possibly augite. Such being the case, I conclude that the inorganic portion of the soil is mostly made up of varying proportions of these mineral ingredients. Of organic constituents, humus is the largest natural deposit. But in the planting districts the general use of special manure has tended to greatly alter the nature of the soil. It will thus be seen that the planter possesses all the crude elements for forming fertile soil of an enduring character, and judging from the successful cultivation of one exhaustive crop for periods of 30 to 40 years, the nutrient ingredients of this natural soil must be available in proper proportion, although, in all probability they have not been expended lavishly. In this soil, I therefore think, the Coorg planter possesses a very sound investment. Those crumbling rocks will go on liberating (in some proportion to the pressure put upon them) nutrient material for thousands of years.

#### FLORA AND FAUNA.

Botanically, the whole country is most interesting. But to do justice to this section of natural history required time and equipment for which I was not prepared on this occasion. A list of such known plants as were observed *en route* is appended\* to this paper, as also of specimens collected when there was an opportunity. Most attention was given to the arborecent flora, as bearing more directly on the special work in hand. Except in a few isolated instances, the trees in Coorg do not equal the splendid arborecent growth one sees in Manjarabad and other parts of the Mysore Malnad. But this is partly explained when it is remembered that extensive jungles of bamboo (hence the local designation) have been to a great extent replaced by secondary growth. Colonel Welch refers to the extensive and almost impenetrable growth of bamboo in his "Military Reminiscences," 1790-1829. The virgin forest has also been felled to a great extent to make room for special and exotic trees (secondary planting) now favoured for shading and otherwise promoting the growth of coffee. But except for the arborecent growth, with a few orchids and parasites found upon it, the strictly industrial tract is not of great interest to the botanist. For profitable field work he prefers the primeval forest, the Devarakad riverside and Cadanga, where the indigenous flora is more rampant. The latter position consists of primitive embankments or ancient lines of defence which are found at short intervals all over the country. Weeds of an exclusive kind were observed on several of these mounds, and are possibly due to a difference in the physical or mechanical condition of the soil. A wild or indigenous species of coffee is found in North Coorg. It was first brought to my notice by Mr. Wood, of "Ahtur" estate, who kindly procured me several specimens of the plant in fruit. The only indigenous species hitherto found in the south are *Coffea travancorenensis*, W. & A., and *C. Wightiana*, W. & A., the latter being perhaps only a variety of the former. I consider this the most important find during the tour. But the most attractive plant seen in quantity in North Coorg, is the beautiful *Barleria Gibsoni*. The flora of the Sampagihat is of a ravishing description, and it is difficult to decide whether wealth of vegetation or beauty of scenery is the most attractive in this glorious spot. Of the fauna I practically saw nothing during my tour. Some of the birds of plumage are

exceedingly attractive, and some are very destructive to the coffee. Of the latter class the green barbet, *Thereceryx viridis*, is one of the worst. Bees are plentiful and a giant tree having many tiers of honey-combs suspended from its upper limbs is indeed a novel sight. I am told that it is difficult to induce jungle experts (Kurumbors or Kaders) to collect honey from isolated trees owing to the limited means for beating a hasty retreat if necessity should require it.

#### SOUTH COORG.

Formerly this region was the home of the bamboo, where it was the admiration of every traveller. But it is now the home of coffee, extending over a continuous area of many square miles. In no other part of India does one find so much coffee cultivated within a limited area. With the exception of a few intervening Devarakads (temple lands) the bulk of the cultivation may be described as an unbroken tract.

Wherever one looks, hillside and valley is an unbroken sheet of shining green with thickly clustered berry, the whole being shaded by stately trees. Throughout the tract there is a close similarity in the nature of the shade, or over-growth, as also in the estate roads and boundaries; so that a stranger has difficulty in finding his way about. The "Bamboo" is much the largest planting district in the province, and possesses about 70 estates belonging to Europeans. In extent these gardens vary from 80 to nearly 500 acres, but in some cases they are not fully planted in coffee. The fact of their being joined on to each other as already stated, offers facilities for the easy spread of leaf disease and similar pests. The district differs from North Coorg in being 500 feet lower, with mostly an eastern or southern aspect. It is also warmer, somewhat drier, and more uniformly shaded throughout. The soil is rocky near the surface in some parts, while in others there are deep deposits of clay. As a rule the estates are very neatly kept, some of them being demarcated by thriving hedges of the shoe-flower, *Hibiscusrosa sinensis*. Pretty bungalows crest the lower hills, with flowers and other signs of social life about them.

#### NORTH COORG.

Here the country is of a bolder and wider type, with mostly evergreen forest at intervals. Coffee estates are fewer in number and more isolated; not in one continuous stretch as in the "Bamboo." It is a more exposed region and the rainfall is comparatively heavy. The natural soil appears to be excellent, and old coffee locks well upon it. I was astonished at the steepness of the land in some parts, but withal in good growth and bearing. The scenery in North Coorg is delightful. Owing to the heavier rainfall and colder aspect, estates are not so heavily shaded as in the south. Taking them all round, the crops were heavier here than in the "Bamboo." There were also fewer complaints of the ravages of the borer, an insect which prefers to hark in the southern sun. The mean annual rainfall for the whole province is 123 inches; but the distribution is unequal, being always heaviest on the west side of the country. In some parts of the "Bamboo" it does not exceed 50 inches.

With the foregoing attempt to show how the Coorg planter is situated in regard to climate, soil, and environment, I shall now proceed to discuss more in detail, some of the vital questions bearing on the future prosperity of the planting industry.

#### SHADING.

What constitutes the best shade to coffee is still a keenly contested point among planters, and while one warmly recommends the indigenous "Biti"—*Dalbergia latifolia*, another rejects this tree, and, for example, wholly places his trust in the exotic "Silver-Oak," *Grevillea robusta*. But for reasons which shall be explained farther on, it is preferable, in my opinion, to employ a selection of trees to shade an estate; and most planters have adopted this plan either from necessity or choice. The trees mostly favoured for shading coffee are of two classes

\* [Will be published later.]

*e. g.*, the indigenous and exotic. Their names are as follows:—

INDIGENOUS.		
Ficus Glomerata	...	... <i>Atti.</i>
Dalbergia latifolia	...	... <i>Biti.</i>
Erythrina indica	...	... <i>Palwan.</i>
Pterocarpus marsupium	...	... <i>Honne.</i>
Lagerstromia lanceolata	...	... <i>Nandi.</i>
Terminalia bellerica	...	... <i>Tave.</i>
Acrocarpus fraxinifolius	...	... <i>Horluge.</i>
Cedrela toona	...	... <i>Noge.</i>
Ficus bengalensis	...	... <i>Alada.</i>
" tuberculata	...	...
" Mysorensis	...	... <i>Goni.</i>
" Tjakela	...	... <i>Cup basuri.</i>
" Tsiela	...	... <i>Bili basuri.</i>
" Asperrima (Inferior)	...	... <i>Gargatti.</i>
Alhizzia odoratissima	...	... <i>Bilvara.</i>
Artocarpus integrifolia	...	... <i>Halasu.</i>
" hirsuta	...	... <i>Kad halasu.</i>
Antiaris toxicaria	...	...
Also some undetermined species.		
EXOTIC.		
Erythrina lithosperma		<i>Mostly young.</i>
Alhizzia moluccana		
Grevillea robusta		
Cinchona succirubra		<i>Not classed as shade</i>
Pithecolobium saman.		

The correct amount of shade to be maintained on an estate is another matter for which a fixed rule cannot be laid down, as it must of necessity vary according to circumstances. In situations where the rainfall is heavy or regular, soil good, and aspect cool, the shading should be comparatively light. But in the greater part of the "Bamboo" these conditions are somewhat reversed, and particularly in those parts where the soil is light, stony, and sunburnt, it is essential to have heavier shade. In furnishing this protection, however, care has to be taken not to remove an undue proportion of plant food from the staple cultivation, and in places where young shade trees are thickly planted there is the danger of doing this. During the early years of growth, trees of this class draw nearly their whole nourishment from the surface soil, and at all ages the surface roots of trees will contend for a share of its abundant food.

It is true that most saplings will soon establish their leading roots in the subsoil at depths far beyond the reach of the coffee hush, and as they increase in size, this tendency to draw nourishment from the substratum increases until in many fully developed forest trees surface rooting is reduced to a minimum. All other conditions being favourable, it is deep-rooting trees of this class that should be preferred to shade coffee. The only exceptions would be in the case of fig trees, which (probably from their quasi-parasitic nature) do not appear to exhaust the soil to the same extent as other shadders, and leguminous trees, which assist nitrification in the surface soils. On some of the estates visited, sapling trees ranging in age from five to fifteen years were so closely cultivated that the growth of timber almost appeared to be the primary object. On others, having a more advanced growth, the trees had been considerably thinned, while the remainder had been "lopped up," *e. g.*, pruned from the base upwards, so that the actual shade was far above the coffee. This again conveyed an idea of arboriculture, the trunks being so numerous and bare. Of course, the object aimed at of admitting air and light in this way is perfectly sound, but the fact remains that a plantation of young trees is rapidly consuming food which by right belongs to the coffee.

Where the initial mistake has been made of removing the indigenous deep-rooted shade—and it is pretty universal—replanting has been compulsory, as no one now thinks of growing coffee successfully without shade.

But in addition to losing much valuable time in secondary planting, it will be felt that the land is called upon to do double service. This, however, is not the only disadvantage arising from the sudden exposure of forest soil long nurtured under shade.

Such treatment causes a revulsion in the chemical action of the soil, and under strong sun-light the valuable process of nitrification is arrested. Possibly this may account for the infertility of long-abandoned coffee lands. It is, therefore, clearly to the planter's interest not to bare the land entirely, but rather by careful selection to retain and make use of the forest trees already in possession. The finest shade, with the least exhaustion to the soil, is provided by deep-rooted umbrageous trees growing at 60, 80, and even 100 feet apart. Specimens of this description are sufficiently abundant in the virgin forest, and planters should always utilise them when making new clearings. It is under shade of this sort, with perhaps a little secondary planting here and there to fill up gaps, where one sees the finest coffee. "Devaracadoo" in the south and "Hallery" in the north, may be quoted as good examples of mixed shade. These fine trees not only indicate the fertile nature of the soil but they also protect and manure it, while reserving the upper stratum for the growth of coffee.

They also drain the subsoil, and extract mineral solutions from the latter, which are indirectly conveyed to the surface soil in the fallen leaf and decayed roots. It is in this reciprocation of mineral food constituents that the use of a variety of good shade trees, in preference to a few, is chiefly commendable. But variety is also needed to produce the light and shade which is so necessary to effect the best results in growing coffee. When in the months of June and July the sun is often obscured for weeks together and the trees are dripping with superabundant water, it stands to reason that dense shade would do harm. Then, again, when tender growth is progressing during the hottest months of the year more shade would be necessary. In other words conditions vary, as should also the amount of shade on a coffee estate. Different trees cast their leaves at different times of the year, hence the admission of light in a somewhat varying quantity. The greatest amount of exposure should extend from November, when the berry is ripening, until the flowering period, when the young fruit is set; the object being to insure the thorough ripening of the young wood. Naturally this is what happens, as with the cessation of rain, fall of the leaf is hastened and the coffee bush becomes more exposed to the ripening influence of sun-light. I observed that the "Palwan"—*Erythrina indica*—is a favorite shade-tree with many planters, and is looked upon as a fertiliser of the soil. The evergreen species, *Erythrina lithosperma*, is also under trial, although in some cases it is not true to name, being thorny and a doubtful evergreen. *Dalbergia sissoo*, Roxb., is a new shade tree which I have recommended for planting in stony land.

Seed can be supplied in quantity from Bangalore, where the tree flourishes.

#### CULTIVATION OF COFFEE.

It is not my intention to write a treatise on the cultivation of coffee, as every planter is sufficiently skilled in the routine of his particular work, while many are clever experts in the whole industry. But there are certain details of an important nature, bearing on the results of cultivation, on which the opinion of an outsider might be of some value.

Lands selected for the cultivation of coffee are usually of three classes, *e. g.*, virgin forest, *Kumri* and *kanave*; and they are always the best of their kind, due allowance being made for other necessary conditions, such as rainfall, aspect and shelter from prevailing winds. But forest soil is the best, as also the most enduring under shade. When fully exposed by the entire removal of shade, land of the latter class exhibits extraordinary fertility for a time, but under the influence of full sun-light it gradually becomes less fertile, and coffee eventually dies out. This is due to what might be called adverse circumstances, as for ages, the soil had been accustomed to a wholly different course of treatment for which it was specially adapted. By its absorptive and retentive nature, a deep vegetable mould is peculiarly fitted for the dual support of forest trees and coffee,

rom which products there is an unceasing demand or moisture. But with the removal of this natural drainage (absorption by growth) the soil becomes wet, cold, and unfertile; while the influence of intense light induces denitrification and hence a state of at least partial sterility. It will thus be seen that shaded and exposed lands are differently constituted and that the one cannot be merged into the other without causing intermediate disadvantages to the cultivator. The planter now realises that entire felling is the biggest mistake he has made; but he attributes the cause and, perhaps rightly, more to the absence of shade than to a depreciation of the soil. In planting up abandoned coffee-land the growth is often slow and unsatisfactory, even when supported by liberal tillage and manuring; also in putting in "supplies" the reaction caused by undue exposure is sometimes felt. These difficulties I mostly attribute to a want of tone in the soil, caused by the absence of sufficient shade. Secondary plantings of coffee seldom do much until the shade is well up, when, it will be observed the natural condition of the soil becomes re-established.

When an estate is planted, and during the first few years of its existence, the tillage of the whole land should be deep and thorough. The more the land is opened and aerated at this period the better, as at a later stage of growth when the bushes nearly meet there is both less opportunity and less necessity for deep tillage, should the land be well drained. To recommend draining the side of a steep hill may sound paradoxical, but during my travels I observed such land evidently in need of drainage. Then, where it is not very steep, especially in low-lying ground, a proper system of drainage is a most important factor in the sweetening of the soil.

Humus is not only very absorbent of water, but it also retains it like a sponge.

Wherever there is sufficient foothold for soil of this description, plants will obtain moisture and grow readily, a fact which is strikingly exemplified by the steep cultivation at "Abiall" and other estates in North Coorg. But while the drainage system is intended to remove surplus moisture, care must be taken not to increase "wash" on the upper slopes. On a few estates I observed that open drains, a foot or more in depth and only a few feet apart (sufficient to accommodate one row of coffee bushes), were perpendicularly aligned from top to bottom of the slope. Unless the land is very heavy—a stiff clay—I should consider this practice open to question. Drains eighteen inches deep, following a gently sloping contour across the face of the slope, would be better and would to a great extent intercept wash. The proper distance apart would wholly depend on the nature of the soil.

But as far as can be judged, twelve and eighteen feet are reasonable distances for heavy and intermediate soils. Stagnant water in the soil is a most hurtful thing, and should be removed at any cost.

"Renovation pits," or holes made at intervals for the deposit of weeds, are supposed by some to facilitate drainage. But this is a doubtful function, as the pits have no collateral outlet and soon become clogged with weeds and forest refuse. I should be inclined to call them *brood-beds* for the propagation of fungoid diseases. At any rate they should not be allowed to supersede a proper drainage system when it is required. Many fig trees possess the advantage of being openers of the soil, a fact which would easily account for the luxuriant growth of coffee under them. The woody lateral roots of these trees form vacuities and tunnels which readily admit liberal currents of oxygen for many yards around each trunk. This now brings me to the all-important question of digging in a plantation. Thorough tillage up to a given limit has already been advocated, and it is also admitted unconditionally that a moderately open tilth is beneficial at all times. But there are other conditions to be taken into account, and I hope to show presently that in the matter of digging, the planter has to decide between two evils. These are (1) the destruction of coffee roots and (2) the closing

up of the soil to some extent. The coffee bush is naturally a surface feeder, a position of root-growth which is further strengthened by subdued light and the prevailing practice of manuring on the surface, or very near to it. On productive estates I observed that fine meshes of young roots pervaded the upper soil everywhere, and I contend that the periodical removal of these feeders by injudicious *mamati*-digging would do the estate an incalculable amount of harm. Certainly much more than would be done by leaving the land undisturbed for a season. For routine tillage on an established tote, the *mamati* should be entirely discarded in favour of the fork; which opens the soil lightly without cutting many surface roots. A good argument advanced in support of *mamati*-digging is its efficiency in removing the encroaching roots of trec, which would otherwise take possession of the land. In reply to this, I must refer the reader to what has been written about deep-rooting trees being preferred to all others where coffee is largely grown. When surface-rooting trees are retained for shade (unless they possess special merits, as it has been shewn may be the case) the evil cannot be remedied by surface digging without injuring the coffee, as it is unlikely that in using a *mamati* the ordinary cooly would take the trouble, even if he possessed the skill, to discriminate between the young roots of trees and the roots of coffee. It is rather by the thoroughness of preliminary operations, effectual drainage, and occasional surface forking that the planter can hope to oxygenise his land and thereby maintain its fertility and sweetness. But I can fully sympathise with those who are pestered by the surface roots of voracious trees, and if some implement could be invented to draw these out without doing much damage to the coffee roots, it would be a good thing. Lopping off the principal root-limbs and leaving them with their ramifications to rot in the land is not a bad practice. Care must be taken, however, not to kill the tree or needful shade would be lost.

It may here be asked why so much importance is attached to coffee roots being near the surface. The answer is, that all fruit-bearing plants should have their roots well under the influence of light and heat to insure the best results in the production of fruit. This is all the more necessary in the case of coffee, where the soil is thickly covered by a mantle of vegetation. The food stuffs required for the formation of fruit are not usually procurable in the subsoil, hence the advantage of shallow cultivation. Surface rooting is therefore desirable, although, to support vegetative growth during periods of drought, it is necessary to encourage fairly deep-rooting development also. But in this connection the admission of light, and regulation of growth, is controlled to some extent by careful pruning. I say "careful" advisedly, as the system of pruning which I have seen on some estates (not on the occasion of this tour) leaves much to be desired. It is a truism that bad pruning is worse than none, while hacking and reckless mutilation is often followed by troublesome diseases, such as rotting and canker. The object in pruning coffee is to equalise and encourage the growth of healthy bearing-wood. Anything not capable of giving crop, unless indirectly leading to the formation of crop-bearing shoots, should be removed by clean cutting. If this is done with care, shortly after picking, the soil, bush, and planter will each benefit by the operation. The organic and inorganic substances which combine to form plant food are well known to the intelligent cultivator. What he is more concerned about is whether these substances are present in proportionate quantity and soluble form, as if they are not, the soil will be unproductive. The mere fact that certain constituents are found in a soil is no criterion of its fertility. And when it is remembered that mechanically, chemically, and biologically, soils are subject to ever varying conditions, this is not to be wondered at. Uncertainty as to the natural capabilities of the soil has led to much investigation, and the truths

revealed by agricultural research in recent years are not only very encouraging but of the highest importance to the cultivator. He now understands how the defects in a soil can be remedied at the least cost. Indeed a bad soil can soon be converted into a good one.

It has already been stated that the Coorg soils are naturally good, therefore the planting industry was commenced on favourable terms; and bumper crops, obtained without much cultivation, were the order of the day for many years. But as time went on the shrub became less productive, and coffee pests of sorts commenced to attack the cultivation. It was then realized that the natural soil was becoming deficient in something which only heavy manuring could restore, and henceforward, manuring estates became a necessity. What the planter is chiefly interested in at the present day is how to restore to the land, in the cheapest and most efficient form, what his crops remove from it.

Agricultural chemists tell us that only three principal substances need be applied in the form of artificial manures. These are *nitrogen, phosphoric acid and potash.*

#### WEEDING.

The incursion of weeds on cultivated land has always been looked upon as thriftless husbandry, and generally speaking, we should take that view of it in coffee cultivation also, as the demand made upon the land by tree and coffee roots is already more than it can bear. But the primness of a flower-garden is not required on the estate, and in some exposed soils of a stony nature I instinctively felt that a light covering of weeds would have done good by cooling the over-heated surface. The prevailing weed in the plantations is *Blumea Wightiana*, DC. (Kan "Gabbu Soppu"). It is an annual herb of rapid growth, and abounds everywhere in two varieties, determined by white and purple flowers respectively. Considerable expense is incurred annually in the destruction of weeds, but the outlay is compensated to some extent by the green manure which is thus secured to the soil.

If weeds of annual duration, such as *Blumea*, have their tops cut off before flowering, they will do no harm to the coffee and comparatively little to the soil. I was favourably impressed by the clean cultivation which mostly prevails all over Coorg.

#### MANURES.

##### Valuation of Manures.

The manurial substances at the planter's disposal are of several kinds and may be roughly classed as follows:—

(a) Manures having both a direct and indirect action on the soil:—

- Cattle manure of all sorts.
- Green manure of all sorts.
- Sewage.
- Composts.
- Humus top-dressing.
- Bones, when largely applied.
- Guano do.

(b) Such as act indirectly:—

- Lime.
- Marl.
- Chalk.
- Gypsum.
- Salt.

Lime is of the highest importance to coffee land, as in addition to acting beneficially on humus, it is the salifiable base for the process of nitrification.

(c) Manures having a direct and comparatively quick action:—Bone-meals, dissolved, and in sulphuric acid; Guano, including fish guano, and fish guano such as Mr. Pettie Hay prepares at Hunsur.

- Olecake—Poonac, castor, honge, etc.
- Nitrate of Soda.
- Superphosphates.
- Sulphate of Ammonia.
- Sulphate of Potash.
- Muriate of Potash.
- Mineral Phosphates.
- Kainit.

A most valuable fertiliser of this class, recently discovered in the *debris* of steel factories in Europe, is *basic slag.*

Of the abovenamed manures I shall now attempt briefly, to show which are most valuable in providing *nitrogen, phosphoric acid and potash,* leaving the cultivator to use his own discretion in a final selection. But manure in name and the substance in reality are often quite different things, and in the case of portable manures at least, I would strongly advise careful analysis.

##### Nitrogenous Manures.

Nitrogen in its different forms may be said to be present in everything. But for purposes of cultivation we mostly require it in the forms of *nitric acid and ammonia,* of which there is often a deficiency in impoverished or over-cultivated soils. It is, therefore, in the application of substances rich in nitrates and nitrites that we are likely to maintain this indispensable constituent in a form suitable to the growth of plants. The fixation of free nitrogen from the air through the combined action of leguminous plants and bacteria is a recent discovery of great value to the agriculturist. Nitrogen abounds in humus, and is found in varying quantity in all decaying organic substances.

The artificial manures which contain it in the largest proportion are nitrate of soda, sulphate of ammonia, Peruvian guano, bones, fish and flesh guanos and oilcakes.

All these are now used on coffee estates.

##### Phosphate Manures.

Next in importance to nitrogen, as a soil constituent, comes phosphoric acid. But as the latter enters largely into the composition of the coffee bean it is really of almost first importance to the planter. It is fortunate, therefore, that the crumbling rocks of Coorg are well charged with this useful acid, apatite, carbonate of lime, and the decaying felspars being the usual basis for it. Bare, arid tracts with occasional stunted vegetation indicate its scarcity, as plants are unable to grow without it. Coprolites abound in it. In nature, Phosphoric acid is mostly insoluble, occurring as phosphates of lime, alumina, and iron, etc. For convenient restoration to the land we have numerous artificial manures, such as guano, bones, basic slag and all the mineral phosphates. But for quick effect on growth the soluble superphosphates are the best, especially the double superphosphates manufactured at Wetzlar in Germany.

##### Potash Manures.

Although not so important to growth and reproduction as the preceding constituents, still, potash is an indispensable factor in the raising of crops. It is naturally abundant in old rocks—especially felspar—in decaying vegetable matter and in the salt-water of the ocean. It is the principal ingredient of the ash when a plant is burnt. Mr. Sprott, of Hulery, burns the noxious *Lantana Canara*, to utilize its potash on the estate. In a country situated as Coorg is, one would think that Potash would never be wanting; dense vegetation, sea influence, and crumbling felspar rocks being natural conditions. Still, the application of this mineral by artificial means has proved highly beneficial, and it can only be surmised that the natural product is in some way slow or defective in action. Sulphate and muriate (chloride) of potash are the two artificial forms in which this mineral is quickly restored to the soil. Dried blood is also good for the same purpose.

##### Application of Manures.

Having now classified the important manures under their respective headings, it is necessary to say a few words regarding their application to different kinds of land. Soils poor in organic matter are usually the most benefited by the application of nitrogenous manures. But some of the latter, such as nitrates, ammonia salts, and a few organic forms of nitrogen act so quickly on the soil that they should only be applied as top-dressings at the time the crop most

requires them. Of this class, nitrate of soda is the most volatile. But bones, guanos of sorts, and oilcake are of slow action, and should be applied some months before they are actually required as food to the plant. Powerful fertilisers, as nitrate of soda and sulphate of ammonia, should always be applied in limited quantity, and, if possible, on two occasions during the growing season. Nitrate of soda is of most value in a comparatively dry season, heavy rain having the tendency to wash it down into the sub-soil.

Sandy soils are usually improved by the application of potash. Damp heavy soils, as also such as are rich in organic matter (humus), should have phosphatic manures in preference to all others.

Manures of a quickly soluble nature are best suited to a dry climate, while those of slow decomposition are just the reverse. Mineral phosphates and basic slag require time to ferment in the soil, and should, therefore, be applied several months before they require to be in action.

Superphosphate on the other hand acts speedily, and should be applied as a light top-dressing at two or three intervals during the period of active growth. It will thus be seen that special fertilisers can only benefit crops while active growth is progressing, and when the soil is sufficiently moist to induce chemical action. In the case of nitrate manures the same conditions are necessary to enable the micro-organisms in the soil and roots to work satisfactorily in the production of nitric acid, through the wonderful process called nitrification. It is now known that a fertile soil teems with bacteria, as also the roots of many trees, shrubs, and herbs of the natural order *Leguminosæ*.

#### *Indigenous Manures.*

It was pleasing to hear that a few manurial products of the country are growing in favour. These are, in addition to oil-cake, which is universally and deservedly popular, *lime, fish, guano*, from the Malabar coast, and a substance which I shall call *flesh guano*, prepared by Mr. Petrie Hay at the Hunsur works. It consists of the dried fleshy material which is separated from greenish bones in going through the mill, and as now prepared by Mr. Hay forms a rich compost. If this manure could be prepared on a large scale, and in a somewhat different manner, it would be in great demand as an organic fertiliser. In this connection it may be asked if the millions of carcasses (cattle and horses, etc.), annually put away in obscure places could not be applied to a more useful purpose? Being rich in nitrogen and phosphorus, the fish guano of the western coast should be liberally used on estates.

The lime procurable about Hunsur, and in some parts of Coorg itself, is supposed to be of questionable quality for manurial purposes. But this is a matter which chemical analysis would easily decide. In all probability it is better in some quarries than in others. There are two classes of land in Coorg which could be vastly improved by a liberal use of lime. These are the inert forest tracts and clay deposits. The mechanical and chemical action of lime on these rich soils would, in my opinion, be of the greatest value to the planter. Of course, phosphates in the shape of bone-meal or otherwise, would, to some extent, have the same effect, but they are more expensive and have practically no mechanical action on the soil. Although not a direct food giver, it must be remembered that good lime is a great manufacturer of plant food.

The free admixture of decaying rocky material, containing felspars, etc., is another means of improving the mechanical condition of heavy soils. Indian cattle manure is much poorer in quality than the farmyard dung of western countries, where much pains are taken to make and preserve the latter. But where cattle are folded and littered on the estate, the manure is of better quality. The bracken fern, *Pteris aquilina*, which contains a good percentage of alkaline matter in its constitution, is an excellent material for littering cattle. The location of this herb is said to indicate the presence of a calcareous soil. It is strange that soils of this class are often improved by a light topdressing of chalk and gypsum. In dealing with soils of different sorts, it is necessary to apply such manures as are best adapted to each condition, and the

quantity to be applied has to be regulated on the same principle.

Practical experience is much the safest guide, and it is not difficult to conduct such experiments on a small scale in different classes of land.

#### NURSERIES AND SEED SELECTION.

Preliminary operations on the estate require much care, forethought, and energy; none more so than the selection of sites and formation of nurseries where the young coffee is to be successfully reared. It goes without saying that nursery land should be of the best quality, while specially prepared composts are necessary to provide soluble food for the little seedlings. But this in itself can only maintain and nourish young life. Mere culturable operations cannot prevent or remedy constitutional defects arising from external causes. Thus, although the situation, aspect, and soil of a nursery may be everything that can be desired, it does not follow that the seedlings raised in it are always the best of their kind. For constitutional vigour we have to study race, pedigree, and the quality of individual seeds. This constitutes what is called "selection" of the latter, and when carefully practised is usually the means of improving races or strains of cultivated plants. It is true, purity of strain is sustained by isolation so long as a plant retains its pristine vigour, but it has been observed in the case of many industrial plants that isolation accompanied by much seed bearing has gradually led to degeneracy and loss of constitutional vigour. To prevent this the seed-bearer should not be allowed to produce more than a limited number of seeds, while the nourishment given should be in proportion to the important work such a plant has to perform. In coffee, seed-bearing can easily be regulated by removing 50 to 80 per cent. of the flower buds, leaving such as are favourably situated on the lower half of the primary.

But without taking special measures, a first picking of the finest beans from all over the estate will also be found useful for the propagation of nursery stock. And if such pickings are exchanged with planters situated in different localities, the results are likely to be better still. In nurseries and seed-farms in Europe, the raising and selection of seed form a special department of work to which the greatest attention is paid. Small seeds are carefully examined under the microscope, so that only the very best may be chosen for sowing. Thus by eliminating the inferior and encouraging the cultivation of the best at one's disposal, an improved strain of plants will be gradually formed.

#### VARIETIES OF COFFEE SEEN IN COORG.

The species observed were only three in number, e.g.

1. *Coffea Wightiana*, W. & A., Indigenous.
2. „ *Liberica*, Hiern., West Africa.
3. „ *Arabica*, Linn. Abyssinia.

No. 1 is somewhat sparsely found in North Coorg, and is never admitted into cultivation, I believe. It is whippy-looking shrub 3-5 feet, leaves thinner, smaller, and more pointed than in *C. arabica*. The reddish-purple berry is also small, but contains two miniature beans of perfect form. There were very few berries on the specimens kindly gathered for me by Mr. Wood. The flower was not seen, but I am told it is much smaller than the flower of *C. arabica*. Of No. 2 Mr. Parsons possesses two, if not three, varieties at Beechlands, the most important being the one known as "Johore-Liberian." On this estate the cultivation of Liberians has been pursued for many years, and I had the pleasure of seeing a large number of fine specimens both in flower and fruit. There are also some seedlings in the nurseries with a distinctly hybrid look about them. Indeed it will be a wonder if natural hybrids are not freely produced on this estate before long. Mr. Parsons also deserves credit for the experiments he has made with grafted coffee. Although results in the latter are not great, the persistence in experiments shows the proper spirit of enterprise.

No. 3 affords the staple coffee of the province, as it does of South India generally. There are several

well-marked varieties in cultivation known by the local names of "Coorg," "Chick," "Nalknad" and "Golden drop." Another variety, intermediate between "Chick" and "Coorg," evidently a natural cross, is abundant on the Hellery estate, where it was pointed out to me by Messrs. Mangles and Spratt. Specimens of the "Golden drop" coffee, were seen at Mr. John Logan's place in South Coorg and also at Santagherry in North Coorg, where Mr. H. F. Davy is Superintendent. Instead of being red when ripe, the cherry in this variety is of a bright golden colour. But the most important variation in coffee is that which improves the size, colour, weight, and quality of the bean, conditions which the planter is no doubt on the alert to discover. It is not likely, however, that much improvement in this direction will occur without greatly enhanced vigour in the plant. In other words, the present strain of coffee should be improved by artificial fertilisation.

## CROSSING AND HYBRIDISING.

In my last report on the Lal Bagh, at Bangalore, I have written as follows on the subject of hybrid coffee:—

"The possession of hybrid plants on several estates in Southern India now appears to be an undisputed fact. These new forms are reported to combine, more or less, the characteristics of *Coffea Liberica* and *Coffea arabica*, and are only found in localities where the two species have been cultivated and propagated together. They have not been introduced by the planters as new varieties, and were unknown prior to the introduction of the West African species, *Coffea Liberica*. It is therefore reasonably inferred that these intermediate plants are true hybrids. The most remarkable thing about them is their immunity from coffee-leaf disease, a condition which can only be attributed to enhanced vitality in the constitution of the hybrid. This is a discovery of much importance to the planter, and will encourage him to pursue the operation of crossing on methodical lines, with a view to raising improved strains of seed, as has already been done in most of the chief products of agriculture and horticulture in Europe. What should be aimed at now is the systematic crossing and re-crossing of different species and well marked varieties until a really good hybrid or cross is produced. With this object, a small coffee-plot has been planted in the Lal Bagh. It consists of 135 bushes in two species and one variety as named in the margin. Most of the plants were of a good size

<i>Coffea Liberica</i> (Liberian)	}	when put down, and
<i>Arabica</i> (Arabian)		it is almost certain
<i>Arabica</i> (var. Maragogipe)		that a few of the

Liberian and Maragogipe specimens will flower early next year, when crossing operations will be commenced.

"On the occasion of the Planters' Conference at Bangalore last August, the writer had the honor of being invited to attend the discussion on "Scientific Investigation," when the opportunity was taken before the representative planters of Southern India to advocate the advantages of crossing and hybridising coffee with a view to invigorating growth and increasing productiveness.

"The same advice has been given in official correspondence with planters, and the institution is generally doing what it can to promote the welfare of the planting industry. Hybrids, or supposed hybrids, have been reported from the marginally noted estates."	}	
Ossoor Estate, Manjarabad		
Ubban "		
Koppa " Kadur" Dis.		
Panora Peak S. Wynaad		
Kalpatti do Beechlands S. Coorg		

It is now some years since the operations of crossing and hybridising were first advocated by me and as time advances, I feel more convinced that in those operations, carefully conducted, we possess a potent means of reusitating worn-out estates. Without a rotation of crop it stands to reason that coffee will become less productive, unless some radical change is brought about to modify or alter its condition. Change of constitution in a plant really

means change of action on the soil as well, and where the effete plant must eventually languish, even under the best of treatment, the newly born one will flourish. Coffee planting is a special industry which cannot conveniently or profitably be rotated with other cultures; therefore, to keep the plant going for an indefinite period we must change its nature a little, so as to be in harmony with its environment. Judging from the foregoing remarks, and from what has actually taken place on estates where *Coffea Liberica* is established with the older species, there is no doubt but the shrubs, in both cases, are predisposed to cross fertilisation. That important point being set led it now remains to discuss how a good hybrid or cross is most likely to be produced. This I have already done when lecturing at Mercara and Pollibetta, but it will refresh the planters' memory to reproduce the more salient points here, while the information given under Appendix I affords the *modus operandi* of the work in some detail. A definition of the terms "cross" and "hybrid" will be found in the same place. As far as I am aware (but this is open to correction), no artificial cross or hybrid has yet been produced in the genus *Coffea*. At any rate not in this country, and the new or varying forms referred to above are all nature-crosses.

But artificial crossing, done with a definite object, has been productive of many useful and beautiful plants in Europe. Indeed it may be said that horticulture (and agriculture) is to a great extent revolutionised by this means. It is therefore not a fad, but a potent reality in the improvement of both economic and ornamental plants. In crossing, the object chiefly aimed at is to reproduce the desirable qualities of two distinct individuals, of different kinds, in the body of one individual. It is not always easy to do this, but it can be and has been done extensively; and is well worth trying as a perfectly feasible means of improving an important and growing industry such as coffee-planting. A hybrid produced from two distinct species is called a "primary hybrid," and succeeding generations, if intercrossed, may become secondary and tertiary hybrids, etc.

When the characters of both parents are pretty evenly blended in the hybrid, the latter may be called the "mean" of the former. But it often happens that the prevailing characters are more approximate to one parent than to the other, in which case we have what is known as a "goneoclinic hybrid." Another way of producing the latter is to cross a hybrid with one of the parent stocks. Ternary hybrids are the indirect offspring of three different species.

It is in the production of the two latter forms (goneoclinic and ternary) that the greatest achievements in hybridisation have been made.

The hybrids naturally produced at Ossoor seem to possess the vegetative vigour of the maternal parent, *Coffea Liberica*, but are deficient in the productive quality of the paternal plant, *Coffea arabica*. To remedy this defect, a cross should now be tried between the latter and the hybrid, as the pollen of *C. arabica* would possibly be more potent in the second degree. In nature there are numerous and beautiful inventions to facilitate the crossing of flowers, but in a paper of this scope it is inexpedient to attempt more than a brief reference to what transpires in the short-lived coffee flower. The latter is structurally hermaphrodite, but not functionally so in every case, as I have observed small insects crawling over the mature stigma before the anthers had dehisced, having pollen from other flowers attached to their legs. I cannot say to what extent this provision is made for cross-fertilisation, but as the flowers open progressively for 24 hours and are visited by swarms of insects at the time of opening and during the receptive period, it is probable that a large percentage of the whole are cross fertilised.

The active life of the individual flower is of short duration, and possibly within the first hour of its existence it has been fertilised, cross-fertilised or sterilised. It belongs to the entomophilous class of

flowers which are pollinated through the agency of insects, such as small bees, midges, beetles, small moths, and weevils, etc. Dull cloudy days with a lowering of temperature are unfavourable to fertilisation, hence a bright warm day is desirable when the blossom is out.

#### REVERSION OF HYBRIDS.

This is a matter which troubles the planter a good deal, and possibly causes him to pause before undertaking a series of precarious experiments which involve much time and may lead to nothing in the end. It may, therefore, be said at once that established hybrids of similar strain (slight variations being of little account) do not revert to the parental stock if they are not pollinated by the latter. To maintain purity of strain in a hybrid is simply a matter of protection. Trivial crossing between members of a select group of hybrids—all being very nearly related—is perhaps beneficial on the whole and cannot easily be prevented.

Then, when a really suitable hybrid has been produced, the proper course is isolation from all other varieties of coffee, with a view to inbreeding and seed production. I hope I have made this sufficiently clear, as on these final precautions must rest the success of the whole operations of crossing.

#### INARCHING.

This form of grafting, like the other, retards vegetative growth and promotes the development of fruit.

The coffee-grafts at Bangalore behave in exactly the same way as mango-grafts; *e. g.*, plant stunted and spreading, fruit large, and not so plentiful as in the seedling. *C. arabica* on *C. Liberia* is the only combination of any value at head-quarters. Seedlings from the latter have been distributed for trial, and are being cultivated under my own observation. It is possible that some constitutional vigour may be gained from a mechanical connection of this kind, especially where the grafts are interbred. In other respects I do not think that grafted coffee is of much practical value. Some beans exhibited from the inarched bushes here were admired for their size and colour. The operation is chiefly useful in dwarfing vegetative growth, causing early fruiting, and reproducing the true qualities of particular kinds of plants.

(To be concluded.)

### RUBBER IN INDIA.

That the exploitation of the rubber vines in Africa will lead to serious denudation, once the cupidity of the tribes dwelling in and around the forests in which they are found is excited, seems a foregone conclusion; and unless measures are taken to plant and strictly conserve large areas, this valuable gum promises to become extinct, or procurable only at well-nigh prohibitive prices. We know that efforts are being made to provide supplies for the future, but as erroneous ideas prevail as to the age at which the plant can be tapped, no appreciable quantities are likely to be forthcoming for at least 16 or 20 years, unless in the meantime the received impressions we allude to, are dissipated. On the subject of yearly extraction of rubber, proof of its feasibility has been adduced several times within the last few years; but yet the time is not far distant when the dearth of indispensable material will force attention to this matter. We wish to discuss at present whether our frontier officers, (such as Mr. Needham and others) having influence with hill tribes like the Dufflas, Akas, Abors and Mishmies, in whose countries large reserves of *ficus elastica* are known to exist, could not persuade these people, to adopt a more sensible and less destructive method of collecting the gum than they have hitherto practised. Immense damage has been done by Marwaris and general traders in inciting the tribes to bleed

the vines to death; but savage and unreflecting as the hill men are, the chiefs at least are open to conviction; and were it pointed out to them that they were sacrificing the future to the present, it is possible the forests high up the Boreili, Subansiri, Delling and similar streams might be saved from destruction, while furnishing moderate supplies of the gum, and slips for propagation, until at least our own planting was deemed of mature enough age to be tapped according to sensible methods. We are encouraged to make this proposition by calling to mind a confab we had with an intelligent Lushai who accompanied Messrs. Savage and Loraine on their visit to Calcutta some three years since. The attempt is worth making in the interests of the people themselves, for though, with the sole exception of the Abors, the tribes have been taught the futility of raiding our territory, there is no saying what they may do when all means of peaceful trading in their forest produce is exhausted and themselves reduced to something akin to destitution. For some years previous to 1861 the men of Sookpilall's clan, holding the country round about our outposts at Aijal, were peaceably enough inclined, as they could swap their lac and rubber to Beparis for the requirements the Bengali and Manipuri traders took up, and had these friendly relations been cultivated, as Lieutenant R. Stewart then suggested, we should have secured at least the good-will of this clan any rate.

Unfortunately the Bengal Government decided to leave these people severely alone, and the unscrupulous men of the plains, with their over-reaching tricks and covert threats, roused suspicion, bringing about the raids of 1861-62. But the mischief had been done, and the exhausted vines to the south of the present site of Sookpilall's villages testify to the efforts of hounding on the people to "kill the goose, etc." Not only this, but cupidity once aroused led to the practice of adulterating the true gum with the sap of any tree or creeper from which any milk-like juice could be extracted; a falling-off in the quantity of Lushai rubber took place, leading to disputes, and rejection of much that was brought down by the Beparai traders. This was the real origin of the rows with the clan mentioned. The missionaries and officers of the scattered garrisons in the North Lushai hills have, we may say, civilised these men, and it is time now that every effort should be made to lead them on to make the most of the produce their mountains can yield. There is still a number of vines, though sadly hacked about, in the terai and ravines lying between the Lungai and Tipu, along the south of Sylhet and Cachar, that would furnish saplings enough to plant many hundreds of acres, and the country is opened out sufficiently for our forest officers to exercise the supervision requisite to prevent premature bleeding. The valleys of the Upper Chinwin and Hukong, as also those extending across the basin of the Irrawadi up to the Chinese border, are rich in *ficus*, if it is sought for in the densely-wooded terais; and though any very strict conservation of the plant here presents some difficulty, while facilities for smuggling are abundant, saplings for planting can be had in such quantities that the Burma Government would be well advised to take the matter in hand in view of securing a handsome revenue a few years hence. With the prevalent ideas, tea planters, unless they contemplate handing their estates down to posterity, are not very likely to undertake the cultivation, but companies, who are not supposed to die or retire, should plant, and even young men opening tea or other plantations on their own account would derive a much larger income from two hundred acres of *ficus* laid down at the same time, on their retirement thirty years hence, than from the present staple of Assam according to European lights. Though we cannot now enter minutely into the proper method of rearing rubber from slips, we may mention that a good deal of misconception on the subject exists, and the expense is trivial, being but a tithe of what is supposed.—*The Planter.*

**ALOE FIBRE AND A DECORTICATING MACHINE.**

Our readers are aware that at the instance of a Syndicate of local gentlemen who have taken up the matter, a "Silburn's Patent Decorticating Machine," to deal with Aloe Fibre, has been constructed at the Colombo Iron Works. It has given much trouble to the machinists and the gentlemen more immediately concerned; but it is hoped that all is now smooth, and lately an exhibition of the machine at work was conducted by the patentee at Mr. Alex. Stevenson's Fibre Mills, Mattakkuliya. The reason for going to Mattakkuliya was the need of a good water supply. The Government has very readily met the wishes of the pioneers in a new industry—which may be of importance to the Colony,—by granting free carriage of aloe leaves by rail from Hatton, Kotagala, &c., and altogether as much as 87 tons, we believe, have been received. This quantity should certainly afford a fair trial and give a sample of fibre that can be practically tested in the London market. The machine is an insignificant one to look at, the whole being enclosed in a small case; but if it does what the patentee claims, appearance does not matter. The advantages claimed are:—

"That the Machine will extract the whole of the fibre contained by the leaf. That the Fibre is extracted without any breakage whatever. That the Machine will decorticate one ton of Aloe leaves per hour, which can be increased proportionately with the width of the Machine. That the Machine will supply a long felt want in the island, and will make the cultivation of Aloe a sure commercial success."

Mauritius has a considerable export trade in aloe fibre, but we do not think it is very profitable to the producers. It remains to be seen if Silburn's machine will make a wider margin of profit to be secured in Ceylon and elsewhere.

**NOTES FROM THE CENTRAL PROVINCE.**

March 25.

I suppose the little monsoon will be on us more early than usual this year after the drought and frost. So far the showers are very partial. Kandy requires a lot more rain.

Oh! bother Tewson's case. We are all sick of it and the same of Talwatte. The "Standard"'s idea of a statue for the Kandyan murdered martyr is too funny. Where does murder come in the case? At the worst the Tommies were hastening home to barracks, and Mr. Talwatte blocked the way. One of them gave him a clout on the head with a hockey stick, and it happened to alight on a most wonderfully thin-skulled native gentleman. He died from its effects; but there was no premeditation in the matter, and all the wonderful letters from eye-witnesses that are sent in now, are only pabulum to get more damages and sympathy from Government and the gullible native community.

The proper step for the P.A. to do in the matter of Henniker Heaton is to pray Her Majesty to bestow on him a baronetcy. He is more worthy of that title than the general dealer and blender of tea, Lipton, who scored a knighthood.

British North Borneo is to the front. They could not issue fresh shares when the old shares were at a discount. Now that they have touched par and even a premium, this issue of shares can be effectively placed. British North Borneo only wants developing to be one of the finest jewels of the Empire.

Why were you down on Carruthers for his report on gray fungus, in the Kelani Valley? He tells you that the time at his disposal was too short to give more than a very general Report.

[Which we think, had better be reserved and not given at all, for the reason that the matter required more careful study and attention than Mr. Carruthers could have given to it. We were jealous for the Cryptogamist's own reputation in the matter, knowing the good work he had done for cacao. —ED. T.A.]

**COLOMBO COMMERCIAL COMPANY, LIMITED.**

London, 7th March, 1899.

Directors:—Alfred Brown, Chairman, Leon Famin, J G Wardrop, P C Oswald. Secretary:—J Alec Roberts 5, Dowgate Hill, Offices London, E.C.

Report.—To be presented to the Fourth Ordinary General Meeting of the Company, on Thursday, 16th day of March, 1899, at 12 o'clock noon.

The Directors have pleasure in placing before shareholders statements shewing favourable results for the past year, viz:—

Profit and loss account for the year ending 30th Sept. 1898.

Balance Sheet made up to 30th Sept. 1898.  
It will be seen from the profit and loss account that after debiting all charges, interest on debentures, &c., the profit for the year amounted to .. £9,716 1 1  
A balance was brought forward from last year of .. 510 14 6

Making the total at credit of profit and loss .. £10,226 15 7

From this there has been transferred to exchange reserve against capital expenditure .. 2,232 5 5

Leaving available for dividend, &c., a sum of .. £7,994 10 2

Interim dividends of three per cent on the preference capital and 2½ per cent on the ordinary capital were paid on the 15th Sept, 1898, and the directors recommend that the following dividends be now declared, viz.: three per cent on the preference capital, making six per cent for the year, and 5½ per cent on the ordinary capital, making eight per cent for the year, the latter free of income tax.

After payment of the above dividends there will remain a balance of £1,303 8s 2d, which the directors propose should be carried forward to next year.

The liquid assets in Ceylon appear in the Company's accounts at the same exchange as in last year's balance-sheet, viz.:—1s 1d per rupee, the present value of the rupee being about 1s 4d.

Exchange reserve against capital expenditure now stands at £26,000, inclusive of the sum of £2,232 5s 5d transferred in the present accounts.

The directors regret to report the death of their esteemed Colleague, Mr. Norman Stewart, and they have filled up this vacancy on the Board by the appointment of Mr. J G Wardrop.

Mr. L Famin, a member of the Board, retires from office on this occasion, and, being eligible, offers himself for re-election.

Messrs. Deloitte, Dever, Griffiths & Co., the auditors, also offer themselves for re-election.

## NORTH CENTRAL CEYLON:

## THE SCOPE FOR NEW OR EXTENDED INDUSTRIES.

The approach of the "railway era" gives a new interest, if not importance, to the North-Central division of this island. The province itself contains 4,002 square miles or almost the same extent as our largest or Eastern Province which includes 4,037 miles—both divisions comprising well-nigh one-third of the whole area of Ceylon. In the four thousand odd square miles in our North-Central division, last census gave but 75,333 of a population—in the proportions of 41,545 males and 33,988 females—or at the rate of 19 to the square mile. Anuradhapura, the capital and terminus of the section of railway already sanctioned, had in 1891 a population of 2,508. To enable a comparison to be made with territory nearer Colombo, we may mention that the district of Kegalla, which is also to be favoured with Railway extension, had in 1891, on the 624 square miles within its bounds, 150,627 persons or double the total scattered over the North-Central Province. There is therefore, immense room for occupation and settlement in the territory entrusted to the administrative care of Mr. Evan Byrde whose Report for last year has just been published. Let us see what encouragement can be gathered from its contents for capitalists and settlers to go up and possess the land, now in advance of the railway, when the terms per acre are exceedingly low and favourable; or later on—five or six years hence—when doubtless rates will have increased more in proportion to those prevailing nearer Colombo. Let us premise by stating that we have never doubted the fertility and advantages of a great deal of the country in the immediate neighbourhood of Anuradhapura. We expected ten miles south of that town as well as ten miles north of Kurunegala from the criticism we have uniformly advanced and still support, against the sixty miles of intermediate territory, a great deal of it in the Wannī Hatpattu or wilderness division. To get to the richer land beyond, our route would have been along the populous coast division from Colombo Northwards, and then turning inland from Puttalam to Anuradhapura, so following the natural course with which the great coconut planting industry has hitherto extended in Ceylon—from the coast gradually inland. But let that pass. The point has yet to be practically settled whether much of the North Central Province will do to grow coconut palms profitably, on account of the scarcity of rainfall. We are quite clear that very little, if anything can be done along the railway route, until the neighbourhood of Anuradhapura is reached. There the coco-palm has been planted to a limited extent within recent years and Mr. Ievers had favourable reports to give of the condition and prospects of the industry. Mr. Byrde gives a table of rainfall for five years showing a maximum of 67½ inches last year and a minimum of 46 in 1894, the average being close on 55 inches and wonderfully well distributed, no month (save February in one year) showing an absence of rain; while the

heaviest falls up to 11½, 10 and 10½ inches are in October, November, December. For most of the Province, as indeed for all the arid region of the North and East of Ceylon, the palmyra palm should prove far more suitable than the coconut, and we have often regretted that the system of toll or "rajakariya" suggested by the late Mr. Kilmer wellnigh 40 years ago, was never established, namely that every traveller along the North road between Daumbula and Elephant Passes should, *pro bono publico*, carry with him and plant at least one palmyra palm nut. By this time, no doubt, an avenue of such palms would be in process of growth. We hear a good deal said at present of the field for growing aloes and other fibre plants, that will be presented along the Northern railway. But we much fear that for so succulent, fleshy a plant as aloes, the rainfall generally will be found deficient. There is more likelihood of cotton succeeding; but is the price now offered for cotton grown on the strong black soil of Tinnevely sufficiently remunerative to justify extension? Wherever irrigation is available, there is no doubt of the encouragement to grow rice and it is something to learn from Mr. Byrde that a sufficient supply was last year produced at least for the people in the rural parts of his province, though not enough for the town. On small plots of good soil with the means of watering, we shall see tobacco gardens multiply, and there will be an extension of cultivation in vegetables and fruit for local requirements if not for export. So far as we can judge, however, the only agricultural industries on a large scale that would seem to suit the province are paddy where irrigation can be made available; and palmyra palms which do well with a limited rainfall; and, in some favoured parts, a certain area of coconut palms. No doubt in time other industries may be developed. We are now writing of the early future in the light of Mr. Byrde's Report. One of the first questions for a capitalist will be, of course, as to labour supply; and labour, we fear, is not available locally to any extent. In one part, Mr. Byrde tells us how his attempt to get "villagers to make village gardens below their tanks has proved a failure. I offered the land free, also seeds, which I am constantly distributing, but all to no purpose." Such villagers are not likely to be tempted to work for strangers; nor do we anticipate that the capitalist will be able to tempt many Jaffnese to the neighbourhood of Anuradhapura. The patient, industrious, money-making, immigrant cooly must be looked to, for any hard work in the region referred to, which may be set a-going through the influence of capital; and no doubt the proximity to his own country should be an attraction. At the same time the work of pioneering and turning over new land is often an unhealthy one, and special care would have to be taken against an outbreak of fever in the case of a large gang. But, in this respect, a good deal of experience will be gained—let us trust at not too heavy a cost—during railway construction between Kurunegala and Anuradhapura. Meantime, we should be

glad to learn for what purpose—besides paddy, palmyras and possibly in more favoured parts coconuts—land can be expected to be taken up in lots exceeding a hundred acres, within the bounds of the North-Central Province, or to begin with, alongside the Railway line between Kurunegala and Anuradhapura?

PEPPER-CULTIVATION IN ASSAM.

The Assam Government has recently issued a note on the cultivation of black pepper in that province, with the idea of inducing the people to cultivate it extensively as a commercial product. At the present time it is only produced in sufficient quantities to supply local requirements. The pepper-vine in Assam, it appears, is generally reared on betelnut trees, and the average yield of a single vine is said to be about three seers (40 seers=2½ lb.) of cured pepper. An acre of betel-nut plantation holds about 500 trees.—*Chemist and Druggist*, March 11.

RUBBER AND THE CONGO.

A telegram from our Brussels Correspondent today indicates that fresh effort is being made to develop the natural resources of the Congo State. The suitability of its soil and climate for the growth of trees producing caoutchouc, or india-rubber, has often been insisted upon by travellers during the last few years, and systematic efforts are to be made to foster the industry. The King of the Belgians has just signed a Decree prescribing that a certain number of the trees yielding rubber are to be planted every year in the forests in all parts of his Domain. It goes on to establish a staff of inspectors and other officers to look after the culture. In a climate favourable to the rapid growth of rank vegetation, and among a "happy-go-lucky" folk like the native races, the young trees would have a poor chance, and those which reached maturity would be destroyed by the reckless collection of their produce. To cut them down causes least trouble and gives the largest immediate supply of rubber, but it is killing the goose which lays the golden eggs; a proceeding which seems to commend itself to the savage mind, and is not always without attraction even to the partially civilised intelligence. The crop of rubber, if we may use that phrase, is obtained by tapping the tree, and there are right and wrong ways or seasons for this process; so that the officials are not likely to find their posts a sinecure. Forty pounds of the juice, it is said, can be taken from a tree during the period of its yield, so that in a few years the output from the Congo State ought to be largely augmented. India-rubber is not obtained from a single tree. In Central Africa alone it is to be found in more than one species; in India it comes from the *Ficus elastica*, a tree allied to the banyan, and known in our greenhouses as the india-rubber plant; while the most noted variety, from Brazil, is got from a tree called siphonia, which is related to the spurge. Probably the last-named kind will be selected for systematic cultivation, for of late years several experiments have been made to acclimatise the Brazil or Para india-rubber tree in other countries.—*London Standard*, Feb. 28.

EIGHTY YEARS AGO AND NOW.

The following table gives a comparison of approximate prices in England in 1819 and 1899 :—

	s.	d.	s.	d.
Tobacco, per lb.	6	—	5	—
Tea, in canister per lb.	7	4	1	8
Sugar, moist do	—	19	—	1½
Do lump do	1	1	—	2
Cheese do	—	10	—	8
Salt do	—	5½	—	1½
Candles do	—	11	—	4
Soap, yellow, per cwt.	11	6	2	6

The figures point their own moral.—*Planting Opinion*, March 25.

THE TORTOISESHELL TRADE.

Last week's *Nature* contains an article on the trade in tortoiseshell. It is largely based upon trade-circulars of Messrs. Lewis & Peat. The article deals with the origin of the shells, the quantities annually consumed, the different varieties, and the price obtained for them. Great Britain, France, Japan, China, and the United States are the principal consumers of this commodity, of which enormous quantities are consumed annually, but it is believed by this authority that there is no real danger of the reptile being exterminated. The uses of tortoiseshell are also referred to. It is worked practically in the same manner as horn, and is exceedingly amenable to steam, heat, and pressure; indeed, it seems to be more easily moulded than horn, because the dust and scrapings are collected, steamed, and remoulded into solid pieces, from which articles may afterwards be turned or carved.—*Chemist and Druggist*, March 11.

THE CHINA TEA SEASON FOR 1898-9 may be considered to be closed and here is the result :—

TEA.

CANTON, 2nd March.—The market is closed, and there is nothing further to be shipped.

EXPORT OF TEA FROM CHINA TO UNITED KINGDOM AND CONTINENT.

	1898—99.	1897—98.

## NORTH-CENTRAL PROVINCE OF CEYLON.

(FROM ADMINISTRATION REPORT FOR 1898.)

## FOOD SUPPLY.

Rice, the main food supply of the inhabitants, was grown in sufficient quantity to meet the requirements of the people. Imported rice is not much used except by Tamil coolies and in the town of Aunradhapura. Its price varies according to the distance from Matale. The price of locally-grown rice varies slightly in the different palatas of the Province. . . . Curry stuffs, onions, coconuts and kitul and coconut jaggery are imported from Matale, palmirah jaggery from Jaffna, salt from Puttalam, and some dried fish. The greater part of the dried fish comes from Mannar and Trincomalee. Kurungala supplies the larger number of coconuts. Fruit and vegetables were not so scarce as during the previous year. The town market was generally well supplied. The cultivation of plantains is on the increase throughout the Province. The annual show of garden products was held in the "Pilgrim's Rest," which was kindly placed at my disposal by Mr. N. S. Fernando of Colombo. I feel satisfied that these shows are doing good, and stimulating the people to more activity in the growth of vegetables and fruit. At the close of the show vegetable seeds from the Tissa gardens were distributed free to all who cared to have them. During the year supplies of seed were issued to the chiefs for distribution among villagers; this besides the distributions I made when on circuit. Nearly every village school has its garden now and I have full hopes that the early training of the young will have good results. The cultivation of coconuts is not increasing as I should like to see it, though there is ample land fit and available in different parts of the Province. The advent of the railway will no doubt be the means of bringing outsiders into the Province, who will I feel sure purchase land for this cultivation.

## IRRIGATION.

The only large work in course of construction is the restoration of Maha Iluppallama tank in the Eppawala korale of Nuwaragam palata, one mile to the south of the Talawa-Ihalagama minor road and between Ipologama and Eppawala. This work has not progressed satisfactorily, owing to the difficulty experienced by the Public Works Department in procuring labour. The people are quite prepared to purchase all the irrigable land below the tank, and I feel sure that its restoration will prove to be a remunerative work. Nuwarawewa Yoda-ela.—The restoration of this ela is progressing, Minneriya Tank.—The Irrigation Engineer, Mr. Eves, is on the spot working under the Director of Public Works and Mr. Parker. This work is taken out of the hands of the Provincial Irrigation Board. The sluices were fully opened, after a deal of trouble, to enable the work to progress, but in December the tank filled considerably, and the work is delayed. The Kalawewa Yoda-ela has again given a lot of trouble in consequence of large quantities of silt. A special Irrigation Engineer, Mr. Nunn, was busy on this work for about six months taking sections and levels. For over two months the ela was allowed to run dry for the purpose of clearing, as it was found that the water would not flow into the Anradhapura tanks. After the clearing the water reached Anuradhapura in nine days, travelling at the rate of six miles per day. For want of water at the Tissawewa high-level sluice and in Basawakkulam tank part of the paddy crop failed. Village Tanks.—In the northern division there are 723 village tanks under supervision. Of this number, 325 are completed tanks and 396 are half and one-fourth completed, and two are new tanks. Three tanks were added to the completed list during 1898. Exclusive of old Crown tanks given for restoration, the quantity of earthwork done in village tanks during the year amounted to 221,255 cubic yards. This includes work for 1898 and arrears of previous years. Compared

with 1897 there was an increase of earthwork to the extent of 41,774 cubic yards; this is very satisfactory. Sixty village tanks were sluiced during the year with cement pipe sluices (Murray's): 44 of these were four-inch, 16 six-inch, and 1 a nine-inch sluice. Many more have still to be sluiced, and these will receive attention next year. Fifty-three Crown tanks are being restored under permit, and I am glad to be able to record that the earthwork done on these tanks exceeds that done in 1897 by 3,112 cubic yards. Very few tanks were breached during the wet weather, and this I attribute in a great measure to the more even distribution of rainfall during the year. There were no heavy floods in November and December, as is usually the case in this Province. The votes allowed for upkeep of tanks were expended in repairs to (iron and cement) sluices and in repairs to spills. There can be no doubt that the restoration of the village tanks is helping immensely to improve the condition of the people. The water supply is better and purer, more paddy is grown, and the people are better off than they were even a few years ago. Parangi is not so common. As I stated in my report last year, I consider the restoration of village tanks to be far more important than the undertaking of large new works in a Province so sparsely populated as the North-Central Province. When the population increases and outsiders apply for land, it will be time enough to consider the restoration of some of the fine old tanks that are now in jungle all over this vast Province. For the present I prefer to improve the condition of the existing population.

## NEW AREAS OF CULTIVATION.

During the year 211 lots of Crown land were sold, comprising an extent of 1,278 acres. Much of this land has been cultivated with paddy. It is seldom that any high land is applied for and purchased, but towards the latter end of the year there were several inquiries for land suitable for cocout cultivation from capitalists outside the Province, and I was informed that with the advent of the railway many applications would come in for cocout as well as for paddy land. I hope so, for there is abundance of good land available. The people of the Province are too poor to purchase more than a few acres at a time below their village tanks. I have received an application from some Jaffnese to purchase 1,000 acres of irrigable land below Sangilikanadarawa, a breached and abandoned old tank, on condition that the Government restore the tank. The restoration of this tank is under the consideration of the Provincial Irrigation Board. My attempt to get villagers to make village gardens below their tanks has proved a failure. I offered the land free, also seeds, which I am constantly distributing, but all to no purpose.

## BOTANICAL AND EXPERIMENTAL GARDENS.

The gardens were well kept, and were visited by Mr. Willis from Peradeniya. Nearly 1,000 fruit and shade trees were distributed for planting round Government buildings, dispensaries, gansabawas, as well as amongst villagers. A large number of plants were given for the general cemetery. A plant of the *Victoria regia* was sent from Peradeniya Gardens, and within six months it had eight blossoms. Tissa vegetable garden has done well in the way of producing a large quantity of seed, which I have had distributed all over the Province. The fig trees continue to do well.

## GAME.

Thirty-six game licenses were issued, as against fifty-four during the preceding year. Twenty-five licenses to capture buffaloes were issued. In most of these cases the animals are village cattle, unbranded and unregistered, and quite wild. No licenses to shoot buffaloes were issued. No licenses were issued to capture elephants; there were two licenses to shoot issued. In four cases rogue elephants were proclaimed and rewards offered. Skins are not brought to the Kachcheri, as traders

offer a larger price for them than the amount of the reward offered by Government. Any illicit shooting of game that takes place is merely for the sake of the meat as food, and I have not heard of any gang-shooting whatever. There were prosecutions in three cases, two for illicit capturing of buffaloes and one for game, and all resulted in convictions.

#### ARCHÆOLOGY.

Excavations were continued at Thuparama and Elala's tomb, just outside the town, and at Puliyankulam on the Jaffna road. Under an extra vote the Archæological Commissioner was entrusted with the clearing of jungle round the ruins outside the town, and good work was done.

#### TEA IN RUSSIA.

Tea "Farmer" is no doubt well justified in writing as he does, in criticism of the statements we quoted the other day from the "*Home and Colonial Mail*." If the Russian people throughout the Empire were the greatest tea drinkers in the world, not 92 million lb. (according to Mr. T. N. Christie's official figures) or 140 million lb. (according to the Shanghai Committee's return); but well over 900 million lb. of tea would be required to meet their requirements! This is taking the population of the Russian Empire at 130,000,000 and the Australian rate of consumption at 7lb. a head; whereas it is evident that the Russians do not average at the highest estimate, much above 1lb. a head. How then explain the statements of visitors to Russia that their friends there seem to be drinking tea all day long and that tea is the chief drink of Russian families. We think the explanation is (as "Farmer" surmises) found in the fact that tea is far too dear to be afforded by the poorer classes—by the bulk of the people away from the large towns, or even by the ordinary workmen and labourers in the towns. The higher and middle classes may be drinking tea all day long to an average of 7lb. a head; but then that would mean only some 20 millions of people out of the total of 130 millions. However, in accordance with our correspondent's suggestion, we hope to give the opinions of the Russian tea buyers in Colombo, on the points raised.

#### COLOMBO AND TEA BLENDING.

"COLOMBO AS A GREAT TEA-BLENDING PORT AND THE CONSEQUENT ADVANTAGE TO LOCAL PRODUCERS"—forms the theme of the paper by our old friend "W.F.L." to which we give prominence below today. In a private letter our correspondent emphasizes his little sermon as follows:—"There is a lot of Ceylon and Indian tea which goes home and is practically taken over by the buyers without any competition whatever. A few months ago it was common teas; now it is medium. The danger in the London market is that what with big dealers like Lipton, Mazawatte and Peak Winch Bros. and a few other, competition may cease altogether. Ceylon would find a better abiding market for teas of these descriptions if it went in for blending, besides be able to compete with London in the rest of Europe." Now, in nearly all that he says on this subject, "W.F.L." must know that he was long ago forestalled in the editorial columns

of the *Observer*. We urged the abolition of the existing iniquitous local import duty on tea many years ago, and pointed out how it practically shut out Travancore—an outlying district of Ceylon—from the Colombo market and port. We urged the great advantage of making Colombo the principal tea depôt in Asiatic waters, so that teas could be blended on the spot to suit all markets and shipped direct whether to Australia, North America or the Continent of Europe. Leading planters took an opposite view, dreading an influx of cheap China and Java teas which would be afterwards shipped hence under marks, claiming to be Ceylon's. In rejoinder, we showed first that Ceylon, as it was, is even now responsible for some of the poorest and cheapest (as well as for some of the best and dearest) teas that go into the London market; that nothing prevents local tea dealers shipping the veriest trash as Ceylon-grown teas and that in the present day no teas were bought on their name or mark, without expert testing, so that there was not the least chance of the value of good Ceylon teas being affected. "W. F. L." now shows how, on the contrary, it is to the direct interest of our tea planters to encourage blending operations at this port of Colombo,—how one result would be to create greater competition for local teas, and to fit our teas for direct export to the various European markets. We leave his admonitions to the careful consideration of those most concerned. We think the time has come to appoint Sub-Committees (or a joint Sub-Committee) of the Chamber of Commerce and Planters' Association, to enquire and report on the subject, namely, as to whether it is, or is not, to the advantage of the Ceylon tea producer to maintain the present import duty on other teas at this port, and prevent Colombo becoming a great tea blending depôt, as well as market, and port of direct shipment to all tea-consuming countries:—

#### CEYLON BLENDED TEAS.

(Communicated.)

With relation to teas, if there is one accepted fact more than another, it is that the British consumer has a preference for blended teas. The custom of the blender is to buy a certain quantity of various qualities and out of them to make a drinkable tea, for price, at the smallest cost to himself. This has resulted in the smaller country blender and dealer being almost thrown out of the market and the consequent larger London man acquiring an undue influence on the London market, and this looks as though it might go on until he has a monopoly altogether. Then, what will be the use of a Public Sales Auction mart? It will become simply "a knock out."

Surely it is time that the question of bonded warehouses and blending teas in Ceylon should be considered. There are buyers and there would be more, for they know what would re-sell best. Excepting perhaps some Chinas and some Darjilings, most Ceylon teas, more than others, can be drunk alone; yet few will be prepared to admit that any, even including the above, are so attractive as when judiciously blended; and thus think

the blender and consumer: so it is nouse bringing abstract ideas against practical conclusions.

Some years ago I proposed a scheme for introducing Ceylon teas into America and impressed my opinions fully on the necessity of the American dealer supplying blended teas to consumers. There is not the slightest doubt but that this is the line to be adopted. Americans have not hitherto proved themselves willing to drink either Ceylon or Indian tea, pure and simple; and this has been expressed by many writers, including our Commissioner, over and over again. I fear, however, Ceylon has lost the chance now of selling blended tea; to America, if it ever possessed it, although other new countries are still assailable.

There are strong pungent flavoury teas grown in India, which if blended in considerable proportions with many Ceylon light teas, would raise their values in the Colombo market, and besides make them more acceptable in other countries. In other words a judicious use of Indians would help the extension of four-fifths of the Ceylon-grown article. I do not say that Indians are superior to Ceylons: such would be treason, even if I thought it, which I do not; but I will, however, say that not using the geographical position of Colombo for this purpose, is neglecting one of the great advantages that the island possesses.

At present there are regular buyers in the Ceylon market and a fresh incentive would be established by those who, by blending a small proportion of foreign teas with Ceylons, would raise the value of those special kinds for which everyone would be pleased to meet with a better demand and price, resulting in obtaining help where most needed and producing qualities practically suited to the wants of the whole universe. At present Ceylon in adhering to sell not exactly what the buyers require, is injuring herself.

I doubt if requirements would be shipped from Calcutta or China to Colombo, cheaper than to London; so that the object in introducing would not be for the benefit of those countries, but to make the most of Ceylon teas. Neither is the importation likely to be overdone, as it would cost too much.

The consumption of tea is doubtless spreading over Europe; so if the merchants of Colombo could only adapt their samples to the wants of Southern Europe, saying nothing of the Persian Gulf and Egypt, a grand future is before them for the blended article. No country in the long-run could compete with them in the East. It does not much matter how the Ceylon planter is willing to view the question:—blending, if not done in Ceylon, will be done elsewhere; and if in Colombo the extra cost of extra shipment, carriage and landing will handicap the imported tea to such a degree that the object will be to use as little foreign, and as much locally-grown, as the blend will stand, and this always in a growing degree; so that in the long-run Ceylon teas will be most benefitted. Besides, from what I have seen, I believe it could be much better done in Ceylon than in London and as I have said its position seems to have been naturally

chosen expressly for the purpose. Indeed it is a great pity, that from the first, when Ceylon emerged into the world as a tea-growing country, it did not also start a universal market.

As I see blended teas winning their way everywhere, I write in no interest otherwise than that of a tea-grower, in whose basket most of my eggs are lying. As time goes on, Ceylon will be brought in closer competition with Assam, and perhaps Java: so I consider it is now acting unwisely in not using its best means of making the most of every chest of tea shipped from its shores. That is, no effort should be lost in making the tea attractive, and not have it cast aside as wanting, and so knocked down to the buyer almost at his own price. Nothing, I believe, would benefit the Ceylon grower more than shipping blended teas into London: as it might bring back the smaller buyers into competition with the larger who are gradually and effectually dominating the market. Again, probably four-fifths of the Ceylon tea shipped would be placed more attractive, if wisely blended with suitable teas of other growths, and which in time would find their own markets and help to prevent the heavy drops in prices experienced during the last two years.

Prices are now looking up again; yet, after my past experience, I am inclined to think that, if growers are most careful when times are good, they will have less to rue, when they go down again. W. F. L.

#### COFFEE AND SHADE-TREES; AND TEA AND SHADE-TREES.

We have been seeking the opinion of our "Honorary Entomologist," Mr. E. E. Green, on the very full Report just furnished by Mr. Cameron, F.L.S., to the planters of Coorg on their coffee and its enemies, particularly *hemileia vastatrix*. The practical point was whether we should reproduce the whole of the Report in our monthly periodical. Mr. Green is good enough to write:—

"It is a most interesting Report and is certainly worth a place in the *T.A.* The remarks on the use of shade trees are of particular interest to Ceylon planters. I believe that we should have more coffee remaining in Ceylon if partial shade of the *right sort* had been more systematically employed. And I think that most planters are beginning to realize that a light shade will be equally a necessity for tea, if it is to go on indefinitely. Mr. Cameron points out that one of the most important properties of partial shade is the conservation of fertility in the soil. Speaking of forest soil, Mr. Cameron writes:—When fully exposed by the entire removal of shade, land of the latter class exhibits extraordinary fertility for a time; but under the influence of full sun-light it gradually becomes less fertile. . . . . The influence of intense light induces denitrification and hence a state of at least partial sterility.

"My own idea of the right kind of shelter for tea is a light shade—such as given by a judicious admixture of *Erythrina* (Dadap), *Albizzia moluccana* and *Grevillea*—high up; the stems bare up to at least 30 feet—pre-

ferably 40; and the branches first meeting at that height, leaving plenty of air space below, with an evenly diffused chequered shade.

"Mr. Cameron's suggestions on the hybridization of coffee are of great importance to coffee planters. Some of the natural hybrids seem to show a marked immunity from leaf-disease. The pity is, that systematic work in this direction was not commenced on the first appearance of leaf-disease."

We shall take Mr. Green's advice and re-print the Report in full; and in regard to the value of light shade for tea we have been getting a great deal of evidence lately from different quarters and especially from some of the lower and medium districts. Mr. Maitland-Kirwan is as strong as to the value of grevillea trees in Elkaduwa as Mr. Cantlay is in respect of the same in his fields in Dimbula.

### JAVA QUININE.

A meeting of the shareholders of the Java Bandoeng Quinine-works was held there on January 23rd, Baron van Heeckeren (director of the company) occupying the chair. The first point of the agenda, the election of a director, was quickly disposed of, after which the terms of dismissal of Mr. H J van Prehn were considered. Until Dec. 14th last the management of the company had been vested in Mr. Van Prehn as technical director, jointly with the commercial director, Barron van Heeckeren, but on that date, at a general meeting, Mr. van Prehn was removed and the office of technical director abolished. A committee of shareholders was appointed to report on the subject, and it was now proposed:—

1. That the dismissal of Mr. van Prehn should take effect from December 14th last.

2. That the conditions of his dismissal should be definitely settled only after the balance-sheet had been dealt with.

The articles of association required alteration in accordance with the committee's report, and after an amendment increasing the maximum number of directors on the board from four to five had been adopted the whole proposal was carried unanimously. As, however, pending the approval of the alteration of the articles of association by the Government, the office of technical director, vacated by Mr. van Prehn, had to be filled temporarily, the meeting appointed to this post Mr. Smith Sybinga, who had acted since Mr. van Prehn's removal.—*Chemist and Druggist*, March 11.

### THE COTTON INDUSTRY IN INDIA.

The Annual Report of the Bombay Mill-owners' Association contains some interesting figures, exhibiting the continued development of cotton mills and their outturn, notwithstanding all that is written of bad times and diminishing profits, and notwithstanding the terrible ravages of Plague. The figures further justify Lord Curzon's lecture to Bengal, in replying to one of the many addresses which he used as occasions for enforcing much-needed lessons, when he drew attention to the little that was being done for trade, and industries and agriculture by the Bengalis, as compared with other races, and notably as compared with the people of Bombay. It will be seen from the

following that Bombay can claim fully one-half of what is credited to all India under every head:—

	No. of Mills.	Spindles.	Looms.	Consumption of Cotton, bales.	Hands employed.
<i>For Bombay :</i>					
1897 ..	75	2,187,425	21,237	702,756	69,530
1898 ..	82	2,226,982	21,379	817,328	70,728
<i>For all India :</i>					
1897 ..	173	4,065,618	37,584	1,800,936	1,44,335
1898 ...	185	4,259,720	33,913	1,481,328	1,46,964

The outlook cannot, however, be said to be very hopeful, seeing how greatly restricted is the demand for exports. In yarns there was an increase of 76,254 bales, or about 21 per cent; but there was a material decrease in piece-goods—the shipments in 1898 to China alone having fallen-off by about 1½ million yards or over 56 per cent; while Japan (which is starting mills of her own) took no goods from Bombay! But, curiously enough, the imports from the United Kingdom to China and Japan of piece goods and yarn combined, show an increase of 9.68 per cent as compared with 1897. Competition must therefore be very keen. No doubt the influence of such conditions has told on our own Spinning and Weaving Company apart from restricted capital to start with. We would fain hope, however, that the local Mills may not cease work, but that they may prosper in the hands of a richer Company (or enterprising wealthy individual) not only because of the numbers to whom they give employment, but because their presence should ensure some attention to cotton-growing, in one or other division of the Northern districts to be traversed by the Railway.

### TEA IN RUSSIA.

In accordance with our correspondent's suggestion yesterday we interviewed the Russian tea-buyers, Messrs. Tokmakoff and Stcherbatchoff, of the firms of Tokmakoff, Molotkoff & Co. and Stcherbatchoff, Tchokoff & Co. with the following result:—

The price of the very cheapest brick tea in Russia is, we learnt, about 2s a brick, which consists of from 2½ to 3 lb., so that the average price per lb. of the cheapest tea drunk in Russia would be little more than 8d. But, Mr. Tokmakoff informed us, brick tea is very little drunk in European

There were, also, two kinds of brick tea known in the Russian dominions, the black and the green. The green brick tea, unlike the black, was never employed to make an afternoon beverage. When a decoction was made from it, it was always mixed up with a quantity of (to us unheard of) ingredients and transformed into a thick soup; milk, fat, tallow, and mutton chips were, said Mr. Stcherbatchoff, often thrown in and the resulting fluid was only used at meals—like ordinary soup.

On enquiry as to what classes in Russia drank tea we heard that the working men in the towns drank it whenever procurable, the drink being very popular, but no leaf teas

were obtainable under 2s a pound. The peasants in the country very seldom tasted it, the beverage being beyond their means. Several millions of the poorer people in Russia had never heard of tea to this day and would not understand its use if it were distributed to them gratis. Amongst the middle and well-to-do classes, however, the consumption was very large.

"What would be the average per head amongst those who can afford tea?"

"Ah! Russia is a large place," was the reply, "and it would be difficult to ask every man if he had drunk any tea during the year. But, yes, it is a sad thing that the Russian Government do not publish such full statistics as you have here and in London. All the figures, nearly that we get about the imports of tea into Russia come from London."

Was tea-drinking likely to spread, we asked, in view of M. de Witte's (Finance Minister) policy of repressing the drinking shops. Most certainly it would, was the answer we received. The "policy" in question was the buying up of all liquor shops by the Government, and this immense piece of work had now been very nearly completed, only a few liquor shops remaining in private hands. Liquor had consequently become far dearer than previously, and, amongst the beverages to which the people would have recourse, tea held a prominent place. But it was not this so much as the decrease of duty that would increase the sale of tea in Russia, for so few could now afford to buy it.

The duty at Odessa and the other ports was 86 kopeks per pound, *i.e.*, about 1s 10d—100 kopeks going to the silver rouble, which is about 2s.; on the frontier the duty was just under 1s. 1d. The smaller duty here being to encourage the transport of tea from China overland, and the consequent opening up of Siberia. When the Siberian railway is complete, however, the duty will be raised, in all probability considerably above 1s. 1d. as the railway rates will be cheaper than the present overland means of transport.

On asking how other tea than that from China reached Russia we were told that none, or very little indeed, came overland from Italy or across via Germany from London. Direct shipments of Ceylon and Indian tea were made to Odessa, but the quantity bought in the London market and taken round by the Baltic was about twice as much as that shipped direct from the East. The total consumption of Ceylon and Indian teas in Russia was now about 10 million lb. per annum.

Another item, interesting to learn, was that originally there was no duty in the Northern ports of the Russian Empire and that tea was actually sent from Hankow to London and thence round the North Cape to the Gulf of Obi, whence it was quietly brought into North Russia and sold cheaper than what was brought over the frontier. The tea was sent to London first and transhipped there in the months of June and July, these being the only months in which the most northerly sea on the route would be navigable. But in due time the Government found out this little game and stepped in and stopped it. Amongst the last con-

signments which might have got into Russia without duty was one of 14,000 lb. on board the ill-fated P. & O. steamer "Aden," but the wreck of that vessel prevented its ever reaching its destination.

In conclusion we learnt that the Russian Volunteer Fleet which conveys tea to Odessa, while also acting as troop-transports, is to be increased by several new large vessels, one of the biggest being a sister-ship to the big three-funnelled "Moscow" which was in the harbour the other day at the time of the Regatta, as seen in Messrs. Plate's photographs. With native vessels like these the Russians will more freely convey teas to Russia; and from all we could learn, though the Russian nation as a whole are yet far from being reckoned as the greatest tea-drinkers in the world; yet amongst the better classes the beverage is highly appreciated and wherever Russians can afford to indulge it the taste grows upon them with no small rapidity. The outlook, therefore, for tea, as far as the Russian market is concerned, may even now be considered bright and full of promise.

#### COLOMBO TEA TRADERS' ASSOCIATION.

In another column we give the report of the Committee of this Association for the past year, showing a credit balance of R1019 71. Gratifying reference is made to the increased quantity of tea sold locally, and the growing demand from American and Russian markets. We sincerely join in the hope expressed by the Committee that sellers on the local market will endeavour to obviate the complaints received from Australia and other places as to the bad condition of packages owing to excessive quantities of tea having been put in them. We are also glad to know that the three pounds' sampling allowance has worked satisfactorily. There has been an increase in the membership of the Association which we trust will continue to grow in usefulness.

TEA IN THE NORTHERN DISTRICTS.—After all we have heard about tea going back in some quarters, it is extremely satisfactory to have such good reports of the splendid appearance and yield of tea on such good old plantations as are comprised in the Elkadua group and in the Kelebokka valley. Galheria, Oonoonegalla and Madullekele are said to be a picture of the vigorous tea.

TASMANIAN FRUIT.—Messrs. Anderson & Co., of the Orient Steamship Co., inform us that they have received a telegram to the effect that the quantity of Apples shipped in the "Cuzco" is 11,000 cases, and in the "Britannia" 10,000 cases. This quantity includes Apples from Australian ports as well as from Hobart. Vendors here will appreciate the value of this communication. The "Cuzco" is due to arrive on April 1.—*Gardener's Chronicle*.

AGRICULTURAL EDUCATION.—It may be mentioned that missionaries and persons going out to the German tropical colonies are instructed in botany and plant-raising at the Central Experimental Station in Berlin. Though this idea was made in Germany it is an excellent one. Such enlightenment and instruction is what the natives in all colonial centres stand greatly in need of, and it might be taken over by Britishers with advantage.—*Journal of the J. A. Society*.

## CAMPHOR.

The position of this article remains strong, but it is felt that we are approaching the end of the advance. At this time of the year purchases for domestic purposes are generally made, but since camphor became of technical importance, much of it being used in the manufacture of celluloid, a new basis is supplied for calculations. The utility of celluloid is increasing day by day, and nothing so far has been found to take the place of the ten per cent or so of camphor which it contains. There has been little speculation in the heavy purchases made recently; camphor-refiners bought well, and the advance is commensurate with supply and demand. The subjoined figures show the statistical position in London for January-February and stocks on February 23th in the respective years:—

	1899.	1898.	1897.	1896	1895.
Imports ...	775	134	1,934	447	530
Deliveries...	1,701	368	1,991	3,045	451
Stocks ...	4,968	11,204	11,874	13,674	4,379

The stock is, therefore, much lower now than it has been for five years.—*Chemist and Druggist*, March, 11.

## A RUBBER PECULIAR TO COLUMBIA.

In a recent official report, the British Consul at Tolima, Columbia, makes the following reference to a tree which is little known as a producer of rubber. If the rubber is really of good quality, it may in time prove of importance, owing to its adaptability to high elevations, which, as a rule, is not true of rubber trees. The report says: "A very important species of rubber is indigenous, and I am inclined to think peculiar, to Tolima. Unlike other important kinds of rubber, it grows at high elevations, namely, at from 6,000 to 8,000 feet above sea level. Several thousand bales of it were exported a dozen years ago. But as the tree was only locally distributed, the source of supply was soon exhausted. The authorities at Kew have named this plant *Sapium bi glandulosum*, a species which is also said to be found in British Guiana, where, however, it seems to be of no value as a rubber producer. In connection with the cinchona plantations \* \* \* a plantation of this rubber was made about ten years ago. The trees grew with remarkable rapidity, with trunks a foot in diameter in six years; but this plantation shared the same fate as the cinchonas—that is, it was abandoned years ago because the cinchona was abandoned. With renewed attention, however, this plantation may still be made important.—*Indian Planters' Gazette*.

THE FUTURE OF CEYLON TEA.  
THE RISK OF HEAVY CHINA EXPORTS.

(By an ex-Ceylon Merchant.)

London, March 16.

As long as the lower grades of common Indian or Ceylon tea could be bought in London at five-pence per pound, there was not much chance of the market being inundated with increased import of common China congo, because this price would not pay exporters from China, even with the protection afforded to them, by the effect of the closing of the Indian mints. But with pekoe soucheongs at 7d per pound, the matter assumes a very different aspect, and it is to be feared that larger shipments may be made from China next June, July and August. The only thing that will prevent them, is the fear of the certain loss that would occur, if such shipments were made.

Pieces in China will doubtless open high in May next, and when they arrive here they will

bring down prices to their old level. Unfortunately the British speculator seldom benefits by past experience; old ones die off, or have retired from the trade, but a new set always springs up to take their place. A friend in the China trade, told me yesterday, he was going to send out an order for common congo by the next mail. I asked him if he had lost his senses, or had more money than he knew what to do with, for in the latter case I could comfortably help him to get rid of it. When I pointed out to him that present prices of common tea could only be maintained by being scarce, and any large increase from China would lead to disaster, he made up his mind not to send the order.

Indian and Ceylon planters will this year have to watch the China exports closely. As I told you in my last letter, the advance has not affected Home consumption; the retail prices cannot be raised; but there is no doubt, it is interfering with the continental and American demand, and may extend to the Australian colonies. It has been somewhat too rapid. Common teas will I think more than hold their own until July, when the market will have before it the unknown Indian and China supplies. Every endeavour will be made to push forward shipments to catch the high prices now current whilst they last; it will be a case of "devil take the hindmost."

If no great increase takes place in next season's China exports to England, then I think the Indian and Ceylon Tea Industry has a good future before it, because though Foreign and Colonial consumption may not expand, at the same rate as during last year, it will not be diminished by an advance of only a penny per pound on the average,

CALABRIAN MOTHER-OF-PEARL  
INDUSTRY:

An interesting report was received at the Foreign Office on 14th January last from H. M. Vice-Consul at Taranto, giving an account of the new mother-of-pearl industry on the Calabrian coast.

The prices obtained for mother-of-pearl vary from year to year, but the average price realised at the Torres Straits fisheries is £125 per ton for the raw shell. The only place, so far, where the pearl oysters are cultivated, is Queensland; at all the other fisheries the shells are collected from the banks formed by the natural oyster. Queensland, however, is far distant from the chief markets for mother-of-pearl, London, Hamburg, and Trieste, and it was this fact that gave rise to the idea of cultivating the pearl oyster in European waters.

A series of interesting experiments was commenced by Signor Comba, in 1860, and continued by him from time to time till 1884, when he was director of the aquarium of the National Exhibition at Turin. These experiments proved definitely that pearls can be produced by a certain process of treatment, and also that the cultivation might be conducted on a large scale on the Calabrian coast.

In a pamphlet on the subject, Signor Comba says that "Having proved that they are reproductive in a domesticated state, that is in small aquariums, we can be certain that in large basins they will reproduce with better results. The facility with which these oysters throw out their byssus allows them to be transferred from the breeding tanks to the coast, where the natural banks would be made, without any danger of their dying. As the spawn is not exposed in the tanks to currents or to the danger of destruction by fishes, it would be easy to form large

banks in a very short space of time, the value of which would always be increasing."

It has been decided that the south coast of Calabria is the fittest locality for the laying down of the beds, and the Italian Government has conceded the necessary waters, and done much to encourage this new industry. It is proposed to acquire 10,000 pearl oysters (*Melagrina margaritifera*), of which 500 will be set aside for breeding purposes. It has been computed that the spawn produced by one of these molluscs in the open sea contains about 12,000,000 eggs. The majority of these are lost, either because they serve as food to other animals, or because they get covered up by the sand, or are carried away by the currents into places unsuited to their development. By breeding in tanks these dangers can, for the most part, be avoided, and certainly a twentieth part can be saved, which would give an average of 600,000 eggs for every shell, and a sum total of 3,000,000,000 eggs for the 500 oysters set apart for breeding. But, allowing that of these only a twentieth part develop, in the second year the total would be 15,000,000. Again, if only half of these survive all the natural and chance risks to which they may be exposed, still 7,500,000 would be laid down on the banks in the open sea. At the end of the seventh year, say 50 per cent. are fished up; this would give 3,750,000 shells, and, at an average of 3 lb. per shell, would realise 5,020 tons of mother-of-pearl, which, even of third-rate quality, and worth but 1,500 fr. (£60) a ton, would yet bring in a sum of 7,530,000 fr. (£305,200).

It is possible that this enormous quantity of mother-of-pearl brought suddenly into the market would considerably lower the price, and in the estimates only half this amount, 3,765,000 fr. (£152,600) has been calculated for each bank fished every seventh year, that is one annually, seven being laid down. To this may be added the worth of the pearls which might be found naturally, or produced artificially.

It would not, however, be necessary to wait seven years before any return could be obtained for money invested, the reproduction being so great that at the end of the third year it would be possible, without damaging the banks, to take up shells of 8 to 10 centimetres in diameter, which are well suited for the manufacture of buttons, and could be sold at 1,500 fr. (£60) per ton. It would also be easy to prepare a sufficient quantity of the 9,500 oysters not used for breeding, so that they would produce pearls by the end of the third year.

As the productiveness of the banks would increase yearly, there is no doubt that by the seventh year, when it would reach its height, the receipts from the sale would have sufficed to leave a very fair margin of profit, in addition to redeeming the capital and paying off the interest.

The Vice-Consul concludes his report by observing that, as at present the chief market for mother-of-pearl is London, and as the larger part of this trade is in British hands, this scheme for bringing the sources of a valuable commodity nearer to the home market is not without interest. "It seems, too, that this might, upon inquiry, turn out possibly to be a very favourable opening of the British capital.—*Imperial Institute.*

**MOTHS.**—An Indian newspaper says that clothing seen ed with a mixture of oils of clove, cinnamon and cedar will not be attacked by larvæ of any kind.—*B. and C. Drug list.*

**THE COFFEE ESTATES IN SELANGOR** that have suffered most from caterpillars are those in which the plants are raised from Pengerang seed. Mr. Bailey is reported to have a theory that there is something peculiarly sweet or attractive in trees raised from that seed.—*S. F. Press.*

## PRODUCE AND PLANTING.

**TELLING US ALL ABOUT IT.**—Just as planters and importers were congratulating themselves that things were looking up in the tea market their hopes are suddenly dashed by the revelation of one who, with a fine gift for seeing round the corner, tells us all about the workings of the market, and reveals the future in a flash of inspiration. Describing himself with sweet simplicity as "Merchant," a correspondent of the *Grocer* lets himself go as follows. He says: "In regard to the advance in Indian tea, I believe that the market is getting excited in regard to the shortness of supply in Indian tea, under a somewhat mistaken notion. I notice in your last Saturday's issue you give the quantity of teas sent direct to America, Australia, &c. for the last two months, and for the same two months in previous years, and whereas last year there was practically no increase over the previous year, this year there is a tremendous increase, amounting to millions of pounds of tea, which I am informed is entirely due to a direct line of ships having commenced this year, for the first time to those countries, whereas in previous years those countries were supplied chiefly from the London market. The result is, therefore, that there will not be so much tea required from our London stock as was required in former years. My opinion, therefore, is that if the blenders and other buyers will buy from hand to mouth, the prices will not go up—indeed, I believe they will come down. I hear, also, on conclusive information, that a number of brokers bought largely on their own account, and that they are trying their best to drum into the blenders the alleged fact of shortness of stock, whereas, as I have shown above, it is chiefly caused by tea being sent direct to countries, instead of their being supplied, as in former years, through London." How the wicked brokers here referred to must squirm as they read "Merchant's" terrible indictment.

**IN ADVANCE.**—We notice that certain London tea-brokers have been asked to give their opinion as to the probable effect of a reduction in or the total abolition of the tea duty, as though the Chancellor of the Exchequer were eagerly awaiting this expression of opinion before taking action. It is, of course, very interesting to learn the view of experienced brokers on this subject, but it seems just now rather a waste of force. While Sir Michael Hicks Beach is engaged with plans for raising the wind rather than removing or reducing duties he is less likely to give attention to the views of members of the tea trade about the duty question than he would if the matter were under serious consideration. All the same, it is useful to know that Messrs. Thompson think that if "the tax were removed, probably the number of distributors might be increased, with the result that for the time at least demand would be brisk and clearances large, which would deplete stocks to the benefit of importers; but it is by no means certain that a large permanent increase in consumption would follow, and that looking at the question broadly, they incline to the opinion (not generally held) that abolition of duty would turn the scale in favour of the best as against the cheapest tea—thus directly encouraging the production of the finer kinds in Ceylon—but importers would not expect to obtain more than a part of the total remission, and that only for a time." Messrs. Wilson Smithett & Co. express the view that "the home consumption of Ceylon tea would, in all probability, receive some stimulus, in common with that of other growths, from a reduction or total abolition of the duty; any alteration would, we think, affect every growth alike, with this exception, that inasmuch as the present fixed duty imposes a relatively heavier tax on low-priced tea, any reduction or total abolition of duty would give considerable impetus to the exportation of common tea from China, which would, in that case, become once more an important factor in the trade, and interfere considerably with Ceylon and Indian tea in the market for low-grade tea for 'price.' The

total abolition of the duty and the consequent absence of proper Customs supervision would also greatly facilitate the importation of worthless or adulterated leaf, which has hitherto not been allowed to be entered for home consumption." This may savour of discussing the nature of the jelly to be eaten with the hare before the latter is caught, but these opinions may have some weight one of these days when the tea duty becomes a burning question.—*H. & C. Mail*, Mrrch 17.

### THE AGRA TEA COMPANY OF CEYLON, LIMITED.

The following is the report of the directors:—  
DIRECTORS:—Major E. F. Tranchell, Joseph Fraser, Esq., John K. Symonds, Esq.

The Directors have the pleasure of submitting their Report on the transactions of the Company for the year ending 31st December, 1898.

The acreage of the Company's property was given in the last report.

The estimated crop for 1898 was 155,000; but owing to the unfavourable weather that prevailed all over the planting districts, the outturn was only 151,887 lb., showing a shortage of 3,113 lb. This crop realized R68,244, or 45 cents per lb. The total expenditure on Sackarawatte, as shown in the accompanying accounts, was R42,060.17, or 27½ cents per lb.

The net profits on the working of Sackarawatte Estate amounted to R27,348.83, which represents over 6½ per cent on the value of that property, as shown in the balance sheet.

The balance, after writing off the balance of preliminary expenses, interest on mortgage, etc. is R14,111.03; but as the expenditure on Kalkudah Estate has not been provided for the Directors propose to carry this forward to next year's accounts.

The profits of the Company being much hampered by the expenditure on Kalkudah Estate, the Directors recommend that the vendors be requested to take back the property for the price paid by the Company plus the amount expended on it with interest at 4 per cent on the latter.

The Directors propose to borrow the equivalent of £1,000 sterling at 8 per cent interest to pay the Standard Life Assurance Company for the release of the mortgage held by that Company over Kalkudah Estate. The interest on the loan to be paid half-yearly.

The Visiting Agent reports that the tea property has been kept in very good order, and the new cart-road and bungalow and the improvements to the Factory have been completed.

In terms of the Articles of Association, Mr Joseph Fraser retires from the Board of Directors but is eligible for re-election.

The appointment of an Auditor rests with the meeting. By order of the Board of Directors,

J. P. GREEN & Co.,  
Agents & Secretaries.

### NAHALMA TEA ESTATE.

The report of the directors of the Nahalma Tea Estate Company, Limited, for the year ending December 31st states that they regret it results in a debit to profit and loss account, at December 31st, 1898, after providing for general expenses, directors' and auditors' fees' interest on Debentures, etc., of £143, leaving a deficit of that amount to be carried forward against next year. The directors, in handing their report for 1898, regret that it is so unfavourable. The crop obtained was 234,917 lb, as against an estimate of 260,000 lb. This disastrous result is mainly attributable to a blight of *helopeltis* (*helopeltis antonia*) ("mosquito blight," "tea bug" of India), which prevailed during the closing months of the year. The average cost per lb. was 5.49d, and realised 5.91d per lb, as against the cost in 1897 of 5.27d per lb, and an average

sale price of 6.04d per lb. The increased rate of cost is due to shortness of crop and to the higher rate of exchange, which averaged 1s 4½d in 1898, as against 1s 3½d in 1897, 1s 27.16d in 1896, and 1s 129.64d in 1895. The prevalence of the blight has also tended to lower quality. The directors are assured by Mr. William Forsythe, the director resident in Ceylon, that the superintendent is taking energetic steps to overcome the *helopeltis* acting upon the advice of Mr. E. Ernest Green the Ceylon Honorary Government Entomologist who visited the estate in December last, and pointed out the best method of dealing with the insects in their embryonic stages. For the information of the shareholders, the directors asked Mr. J. P. Anderson (an independent shareholder resident in the Kelani Valley, Ceylon) to visit and report upon the estate. This he did on January 20th last, and remarks generally as follows:—Nahalma Estate is not well situated as regards transport facilities, being six miles from the nearest cartroad. For three miles out of six the transport has to be done on coolies' heads, the remaining three miles being done by boat. The estate, when I visited, was much troubled with *helopeltis*, 175 acres being very bad indeed, and the pest appearing rather badly on 119 acres, which were coming into flush after pruning. The rest of the estate was fairly free, but Mr. Duncan informs me that the only field which this insect has never touched is the 30 acre field, the remaining fields all having suffered more or less. To this pest I attribute the loss in crop and the high expenditure incurred last year. When the pest is at all bad, the flush, as it appears, is attacked, and instead of plucking a healthy shoot, one has to be content with a wretched shrivelled thing, more like a cinder than a tea shoot. In this way the crop is lost, the expenditure is increased, and the tea made cannot possibly be as good as that made from healthy leaf. To put the damage done in figures, Nahalma Estate should I consider, give 650 lb. tea per acre. The tea should, easily be put f.o.b. for 24 cents, and should certainly fetch the Kelani Valley average, which will be about 32 cents net for 1898. This on 446 acres tea would mean a profit of R23,000, or say, £1,540, a sum sufficient to pay both Debenture and Ordinary shareholders well. Mr. Green (Hon. Consulting Entomologist to the Ceylon Government) visited Nahalma Estate in December, and his report is daily expected by Mr. Duncan. In the meantime his suggestions are being carefully carried out, and I have not the slightest doubt that Mr. Duncan (now that he knows the habits of the insect) will very materially reduce, if not entirely eradicate the pest. The latest advices from the estate are more hopeful, and had it not been for the blight the results for the year would have been more favourable. The acreage of the company's properties on December 31st last remained unaltered, at: Tea in full bearing, 446; jungle, 246; 692 acres. The crop for 1899 is estimated at 260,000 lb, to cost 24 cents per lb. f.o.b. Colombo. During the year the improvement of the coolie lines has been continued at an outlay of R3,145, which has been charged to current expenses. The estate is now, with the exception of one set, equipped with permanent coolie lines. Two of the company's Debentures have been redeemed during the financial year ending December 31st. The chairman, Mr. Arthur Marshall, the director retiring by rotation, being eligible, offers himself for re-election. Messrs. Fox, Sissons and Co., auditors to the company, offer themselves for re-election.—*Bullionist*, March 16,

## BLENDED TEAS.

*(Communicated.)*

A few months ago one of the chief subjects before the British public was the volume of the exports of their manufactures; and which statistics, in spite of all the promises of Cobden and his party, are proved without doubt to be rapidly decreasing. Instead of becoming the manufacturers of the world, the world is gradually becoming the manufacturers of Great Britain. This may be somewhat strongly put, but as a matter of fact, if Britain loses as much of its foreign trade in the next fifteen years, as it has in the past, the accomplishment will be proved beyond doubt. The investigations this has occasioned, have resulted in a somewhat unanimous opinion that the British producer is too prone to supply what *he chooses*; while the chief aim of the German and foreigner is to supply what the *customer wants*. Time was when such discrimination of goods and produce did not exist—when sound and strong calico and drinkable tea and coffee would be taken without comment. Whether through the art movement or from what cause—everybody has become a man of taste; for now differentiation is extreme. Everything is required to the closest degree of individual fancy; consequently, the wholesale British deliveries are complained of, and the more painstaking and patient foreigner is gradually but certainly making himself felt.

I have always maintained that America should be Ceylon and India's chief objective, and that black and not green teas should be poured in, although we are told America only asks for the latter.

My reason for this one exception to my main contention, is that America is practically a coffee and not a tea drinking country; and that we can never expect its people to become tea drinkers—in *green* teas alone. These are all very well in their way, but they will never induce people to leave off drinking coffee and take to tea. Judicious blends with their own teas, will in time overcome the partiality for green; and as black predominates the coffee drinkers will come in. Such has been the experience elsewhere, and what happens elsewhere will most likely happen again in America. The blending art is a wonderful means of persuasion as to what is best; and it also produces drinkable tea, to the public taste, at the lowest price, even though we grumble there at to our hearts' content; yet the consumer is the man we have to please; and as I have before stated, *he will have what he likes and not what we want*. He has distinctly evinced a preference for blended teas, so there is an end of the matter as far as we are concerned.

It is practically impossible to send any continuous standard of tea from any one estate in Ceylon or India, without the aid of blending. The character of tea made would be different in the South-west, to what it would be in the North-east, monsoon; pruning, tipping, exceedingly wet or exceedingly dry weather would prevent equal standards being maintained. These causes are accountable for many of the shipwrecked hopes and aspirations of many tea planters who have imagined they have discovered a special, direct and permanent market for their own

particular gardens' produce in the Mauritius, the Cape, Australia, New Zealand or elsewhere. The demand doubtless continued until it came into competition with the blended article, when it had to give way to something more stable in character and so more acceptable.

It must not be considered that I, individually, am advocating blended against pure teas. The little "I" has little to do with the matter; for poor "I" drink perhaps six lb. of tea a year; while those who will have the *blend* drink perhaps nearly 400 millions. Personally, I am prepared to say I prefer a judicious blend myself, although I am prepared to admit that I have seen some awful mixtures; yet as a rule the consumer prefers the blend, the British isles first and now Russia and America without doubt are of the same opinion. The question now resolves itself into whether in the face of all the evidence, the growers in Ceylon are determined to stand by their resolve and not allow Ceylon to take its chance of becoming the centre of the world's tea industry? If it desires to become this, the sooner it removes the restrictions upon blending teas, the better. It should give every inducement for Colombo to become in the East, what London is in the West, a centre of the tea-trade. It could blend better, pack better and do all far cheaper than could be accomplished in London; but all obstacles should be removed, even to the abolition of Customs duties on the importation of foreign teas. This would enable many estates near Colombo where teas are grown, not of the highest price, to do a little judicious flavouring on their own account.

## A SEASON FOR MANURING.

We hear on all sides of the wonderful effects of judicious manuring, more especially in respect of tea grown on old coffee fields as well as in regard to coconut palms in the lowcountry. The old veteran palm planter, "W.B.L.," long ago declared that no plant was more greedy of manure, or responded more readily to its application, than the coco-palm. For every rupee judiciously spent in fertilizers, he calculated that under ordinary circumstances, the return ought to be tenfold. So, in respect of tea. The way in which fields yielding under 300 lb. of made tea per acre have been worked up to a substantial yield, and the bushes invigorated, in some of our older districts, forms a striking testimony to the value of experimental if not scientific manuring. We are promised, for publication, some "facts and figures" giving actual results in this connection, which cannot fail to be of interest. Meantime, it is evident that the present season is going to be a busy one in the market for manures.

THE YATADERIYA COMPANY.—We are interested to learn in connection with the recent paragraph in the *Observer* re an offer made to the Directors for the purchase of Yataderiya, that a considerable spring has been made on the original price offered; but that the Company's Directors do not see their way to consider anything under £50,000 sterling—or over R400 per share.

## PRUNING DOWN OF TEA CHARGES.

The following circular has been issued by the Tea and Produce Committee:—

The profit on tea cultivation having reached such a narrow margin, it has become imperative on the grower to curtail every item of expenditure on the garden to the very lowest limit; and many forms of allowances, which were common in better times, have of necessity been abolished.

It has now become necessary that the grower should extend this pruning down of charges to those on his teas after reaching the London Market.

The allowance of 1-lb draft per chest or half-chest to the buyer is considered by the grower an unwarrantable charge on his teas and one that should be abolished.

The reason for this allowance is founded on the assumption that the dealer and grocer loses weight in sampling and in the turn of the scale when retailing the teas. Importers, however, are convinced that sufficient allowance is given in the Customs weights to cover any such loss.

By the system of weighing by H. M. Customs, the weight is always in the buyer's favour, and this advantage varies from as much as 1-13th oz. to 5 oz. per package, and may safely be taken to average  $\frac{1}{2}$  lb. per package.

When in September, 1890, H. M. Customs issued an order that, in future, teas were to be weighed to the  $\frac{1}{2}$  lb., the order was withdrawn on the strong representation made by the dealers and grocers that the turn in the scale of the Customs weighing was essential; otherwise they would sustain considerable loss.

The late Sir Francis Peck (Chairman of the meeting held in London to protest against the order of Government) in referring to the system of weighing by the Customs said:—"If it were not for the turn of the scale given in favour of the buyer, it would result in a loss to him."

The growers have no wish to do away with this system of weighing or to deprive the buyer of his present advantage, although, at  $\frac{1}{2}$  lb. per package, it means the grower has to provide 1,390,000 lb. of tea for which he receives no payment.

The 1-lb. draft, however, is a distinct bonus to the dealer or grocer which the grower can no longer afford, owing to the difficulty of producing tea at a profit.

Last year there were imported into London:—

	Chests.	$\frac{1}{2}$ chests.
From India ...	1,286,998	285,664
„ Ceylon ...	831,406	316,090
	2,118,404	601,754

and the allowance from draft alone amounted to 2,720,000 lb. of tea which, at a cost of 8d and 2d profit, equals a bonus of £113,000 per annum to the trade. Inclusive of the turn in the scale, given by the Customs, the growers, therefore, have to provide 4,080,000 lb. per annum which are not paid for.

India and Ceylon supplied last year 560,000 chests of Tea to Countries other than Great Britain, on which no rebate in weight was allowed, and it seems, therefore, preposterous that this allowance should continue to be given in England.

In 1890, all draft allowance on cured provisions and cheese was abolished, and the same has been the case with bark and other articles.

It may further be pointed out that, even if it could be shown that there was any sufficient reason why an importer in selling 100 lb. of tea should be paid for only 99 lb.=1 per cent. reduction, there can be none in penalizing him 2 per cent. when his teas are put into a 50-lb. chest.

CINNAMON OIL.—For the week ending February 14th 2,600 oz. only of both bark and leaf oil was shipped from Ceylon, and all to Hamburg. —*Chemist and Druggist*, March 11.

## TEA IN JAVA.

One of the principal Java products—namely, tea—enjoys a continual progress, which is shown by the figures of the recently issued statistics of the past year. The consumption of Java tea in this country increases considerably and in connection with it the cultivation on Java is extended. This fact is the more satisfactory, as the prospects a few years ago were far from being favourable. In 1833 Mr. N. P. van den Berg wrote: the tea cultivation is gradually decreasing and even the best estates will not be able to stand the fearful competition of British India, where the working occurs under the most favourable circumstances. After some elapse of time, Java tea will have to give up competition and the Dutch market is lost for the article. Its existence remained questionable for a few years more, so that even the export duty was abolished; but after 1893 better times arrived. The production increased and the Dutch market received a larger share of it. From 1895 to 1898 the imports on this market increased from 48,000 to 68,000 chests (nearly 42 per cent), the home consumption from 27,500 to 33,500 chests (nearly 33 per cent), the export from 24,000 to 35,000 chests (nearly 46 per cent)—a very satisfactory progress. However, more should have been obtained if the cultivation had been effected on a larger scale. At present new estates are worked in the Preanger districts, the produce of which may be expected shortly, but all is done in a too moderate manner. A ten times larger extension of ground should be brought into cultivation. The Preanger district seems specially fit for the tea plant, and doubt is expressed whether the soil, climate, &c., are suitable as well, but a survey is desirable. A great fortune would be obtained if a larger surface could be obtained. Tea is less dependent upon weather and wind than coffee, and yields a better profit for the native population. The native tea plantations in the district of Soekaboemi are constantly extended, and in the last colonial report the desire is expressed that further steps may be made in this direction.—*L. and C. Express*, March 17.

## THEOBROMA CACAO.

BY E. COWLEY.

Manager, Kamerunga, State Nursery, Cairns.

Not a great deal is known about cocoa in Queensland, for little has been grown in the colony. That it can be grown was evinced at the last Cairns Show, when some pods of the fruit were displayed, the same being grown at the State Nursery, Kamerunga. What indeed, could not Queensland grow? Perhaps the mangosteen and the durian\* would puzzle them, but cocoa has been exhibited before now in a Cairns Show. A few years ago the Messrs. Swallow Bros., of Hambleton, showed a pod which puzzled many persons. However, the Messrs. De Molcyn are planting a considerable area in the Russell district, where probably the plant has the chance of thriving better than in any other part of the colony. It would seem that a humid climate is essential to this plant, and this Russell River climate, accord-

\* Three varieties of mangosteen have been discovered in Queensland—the latest from Cairns. The durian will also flourish where the Jak fruit thrives as it does in Queensland.—*Ed. Q. A. J.*

ing to our Hydrographic Engineer, is the premier of Queensland. Up to the present time it has not been proved that cocoa beans grown in Northern Queensland are fertile, but trials will be made by seeds grown at the State Nursery (Kamerunga) during next year. The rainfall there is on the average about one hundred inches a year, but at times, drought extends to thirty days. This, of course, is most unsuitable for cocoa plant. It would seem that there are at least nine varieties of this plant, from Mexico, New Granada, Guiana, &c.

But Mexico, as far as can be gathered, is the cocoa country. Many varieties of things are made from the cocoa bean, including spirituous liquors, &c., which have been shown at various international exhibitions. Simmonds tells us: "When Cortez and the Spaniards entered the vast kingdom of Moctezuma they found the use of cocoa and chocolate as a beverage very common. The Emperor, however, alone drank it flavoured with vanilla from a golden cup. Simmonds also says:—"Cocoa or chocolate is without exception, of all domestic drinks, the most alimentary; and the Spaniards esteem it so necessary to the health and support of the body, that it is considered the severest punishment to withhold it even from criminals—nay, to be unable to procure chocolate is deemed the greatest misfortune in life."

It would seem that coffee-drinkers such as the Americans overtake the Spanish cocoa-drinkers, notwithstanding what Simmonds says. We all esteem cocoa as a beverage, and the various cocoa manufacturer in Europe vie with each other in making it up into almost innumerable shapes and forms.

That the pods can be grown in Queensland has been proved, but will their production be of economical value? Certainly there is no reason why every planter or farmer in North Queensland should not have a few trees in his garden or orchard. It is probable that some seed will be available at Kamerunga next year. One thing has been ascertained at that nursery about *Theobroma Cacao*. It should be left unpruned. Trees that have been pruned have not, up to the present, borne fruit, whatever they may do hereafter. The overseer thought some of his plants looked unsightly, and cut away a quantity of branches. The result was that an extraordinary number of branches sprang out from the primary branches and stem, and have yielded no fruit, nor do they seem likely to do so; so, perhaps, it would as well to allow Nature to have her own way in Queensland and probably experience will teach.

It would be, of course, little short of folly for persons to go in expressly for cocoa-growing at the present stage. The Messrs De Moleyn will demonstrate, probably, which is the best part for the cultivation of this plant in North Queensland. Individuals may well await the result of their trial. It is probable that the area of land between the Jobnstone and Mulgrave Rivers, which has the largest rainfall in the colony, will be most suitable for the trial. It is understood that the Sandeman Syndicate Company, as the Messrs. Do Moleyn, are doing their best in this strip.—From *Q. A. Journal* for February.

### BARK AND QUININE.

During the past five weeks, fully one-and-a-half million ounces of quinine have been bought and sold in London. Five or six buyers have been concerned in the speculation, and they have bought and sold "spot" and "forward" stuff. May-June delivery has been the favourite, but even November-December has been bought at 1s 4½d per ounce. These half-dozen speculators set themselves against the wisdom of all the sellers when they estimate that quinine is bound to be dearer at the end of the year than it is now. It is admitted all round that they are well advised, and the advice in some cases has been so excellent that some after making their bit have quietly retired. Something like £250 profit a day

has been made during the past month by sellers; what buyers will make remains to be seen. We have endeavoured to make it quite clear in our market reports that the quinine boom is fictitious in its scope. Two German brands of quinine alone have been greatly involved in the boom. Speculators have a fancy for these—why they cannot tell; but since so much of the "quinine" exists on paper only, one is as good as another for speculative purposes, provided the speculators agree to recognize specific articles. It is interesting to note the immediate effects of the speculation upon production. In the first place, there is no doubt whatever that the German makers have been buying every scrap of bark they can lay their hands on, and they want it urgently, which means that they have orders for quinine to fill. Professedly they do not supply speculators, and actually speculation stimulates production. That seems undeniable. But how much stimulus? The quinine landed in London last month amounted to 112,176 oz, against speculative sales of over a million, some of which were "forward." The January-February importations and stocks at the end of February) of quinine sulphate for the last five years are as follows in lb. :—

	1899	1898	1897	1896	1895
Imports	15,402	10,811	4,556	5,293	2,750
Stocks	105,766	87,502	123,648	163,063	209,483

These figures show that there is enough stock in London to meet the transactions of speculators, which, though totalling a million and a half ounces, do not leave much in excess of half a million to be provided. A good deal of old quinine has changed hands. Various suggestions are put forward to strengthen the position, such as the statement that America will be buying soon; America is always buying, and could not afford to do otherwise seeing that she is the largest and steadiest consumer. The substantial justification of a rise in quinine is the fall in bark imports, which are very low, the Board of Trade figures for the past three years being :—

	1899	1898	1897
Imported	4,186	10,493	2,984 cwt.
Exported	4,754	2,503	799 ,,

These export figures substantiate our statement regarding exceptional German purchases this year, which have been as four to one by our other foreign buyers.—*Chemist and Druggist*, March 11.

**FORESTRY, RAINFALL AND CULTIVATION.**—One of the most sensible Reports on this subject we have read for a long time is by Mr. Horner and addressed to Mr. Giffard, Chairman of the Hawaiian Planters' Association Forestry Committee, contained in the local monthly periodical. We must reproduce it in full in the *Tropical Agriculturist*; but meantime we may mention that Mr. Horner is sound in saying that rains produce forests rather than forests the rains or even the increasing of rainfall. Forests conserve moisture and springs are the result, and forests are an undoubted blessing to man. Worms, we are told, are the great enemies of forest trees in Hawaii: and hundreds of acres of koa forest have been killed out by them in 10 or 12 years. Fire is very destructive. In selling land for coffee culture in Hawaii, the Government reserve a strip of forest 150 to 200 feet wide to the windward of every 50 or 100 acres lot of land for cultivation. Land for new forests is proposed to be taken up to the extent of 50,000 acres.

## CEYLON TEA IN AMERICA.

WE give prominence to the following circular letter from Mr. Pineo to the tea planters of the island interested in the disposal of their Cess Fund:—

## IN RE MR. MACKENZIE'S MISSION.

TO THE TEA PLANTERS OF CEYLON.  
Gentlemen,—

In some quarters it is rumoured that this gentleman's efforts are deemed unsatisfactory, and that, in consequence, the campaign in the United States should be discontinued!

In prosecuting your claims for recognition in the markets of the United States, you have already made two fatal blunders; and it is your bounden duty to avoid making another. Who among you is in a position to measure, or to accurately forecast, the results of his efforts? Do you fully realise the stupendous opposition, difficulties, and prejudices that he has encountered and contended with? Are you thoroughly familiar with American methods and the difficulties attendant upon introducing a product that is not wanted by the trade? Have you ever considered the position of the wholesale dealer in tea, in his relation to your staple? Has he not got an established business that gives him fair returns; and, would it not be suicidal to relinquish or change it, in order to handle and create a demand for an article that there is no sale for?

Have you succeeded in educating the Russians up to that point where they like and will have your tea? Whose business is it to impart this education?

Look at these questions in a spirit of fairness and equity, and then say—on whose shoulders the burden of making your staple known and creating a demand for it must rest? Has your experience of advertising, as it is conducted in the United States, been of a character that will enable you to determine its success or failure, or when to discontinue it; or the best methods to adopt in pursuing it? Do you know what the experience of the American successful advertiser has taught him, and what he now completely, wholly, and thoroughly believes in? Are you able to determine the result of a discontinuance of the campaign in the United States?

The foregoing may, in your estimation, possibly, be worthy of consideration?

My reason for coming before you—once more—is to have you pause in order to weigh the matter in all its bearings, and, before coming to a determination to discontinue Mr. Mackenzie's mission, to consider what effect such a measure would have on the *future* prospects of Ceylon tea in the United States of America.—I remain now, as I ever have been, your humble, faithful servant,  
R. E. PINEO.

We should have liked Mr. Pineo to have indulged rather less in general statement and to have afforded a little more practical information on a subject with which he must be familiar. As it stands we do not know that his letter will be of much help to the tea planters or to the "Thirty Committee." What we should like to know is whether Mr. Pineo thinks that private subsidies to certain American tea firms should be continued beyond the present year, even in return for advertising vouchers, while other large tea firms—such as Tetley's—do their advertising both of Ceylon and Indian teas without troubling the Cess Fund? Secondly, has the time not come for entering into direct advertising contracts in favour of Ceylon teas only and framing such notices so as to benefit all who may choose to hold such teas? It is on

points such as these that we should like to have information at this time. If the policy of private and partial subsidies is to be continued, we can quite see that the "Thirty Committee" must continue to have its Agent or Commissioner on the spot, to transact the necessary business and to watch over its interests; but if the expenditure were now confined to advertising contracts in the best available media, we think it possible that, after a series of these were concluded, stamped and delivered, the "Thirty Committee" could thereafter do its own business with America. We have, however, for ourselves, arrived at no positive conclusion on the subject. We want "more light"; but we confess that Mr. Pineo does not do much to enlighten us in his letter today. Perhaps the first practical step should be to ask Mr. Mackenzie himself for a special Report on "the situation" as he regards it, now that his colleague Mr. Blechynden seems to be retiring. In this Report the Commissioner would no doubt give a sketch of the policy he would propose for the immediate future and his reasons for its adoption or continuance. No one in Ceylon, we believe, has meditated a change in present arrangements before the end of 1899.

## MR A. E. WRIGHT BACK FROM THE STRAITS.

MR. A. E. WRIGHT returned by the ss. "Caledonien" recently, after a month's absence, during which he visited Singapore, and thence passed to Kwala Lumpur and Kwala Selangor, in which latter district he left his son (Mr. Alfred C. Wright) in charge of his Tilok Pei estate, a coconut and rubber plantation. There are half-a-dozen planters (including Messrs. Tanner and Tollemache) there engaged in coffee, coconuts and rubber, the district being about a mile from the sea (always cool) on flat land, with rich soil. Coffee prospects are not brilliant and a good deal has been abandoned even by Ceylon men; but coconuts are very promising. A Coconut Oil Factory has been started; but, so far, enough of palms are not in bearing to keep it in full work. The growth of the coco-palm in some of the native gardens is very fine, as might be expected from the exceptionally rich soil and abundance of moisture.

## TEA CONSUMPTION IN RUSSIA.

ABOUT the middle of last year we showed, on the authority of a Shanghai Trade Committee's Report, that Russia (in Europe and Asia) must altogether be importing (and consuming) 140 million lb. of tea in place of the 92 million lb. (of consumption) given officially to Mr. T. N. Christie when he visited Russia. In a local paper "Times" we have the following paragraph:—

## RUSSIA'S ANNUAL TEA IMPORT.

SAID TO AMOUNT TO 140,000,000 POUNDS.

By the courtesy of Messrs. Stecherbatchoff Tchokoff & Co., we are now in a position to give the amount of the Russian tea imports for the past three years, as set forth in the *Chiny Verstuch*, a weekly market paper published in St. Petersburg. Excluding brick tea, the amounts were given us as follows:—1898, 54,000,000 lbs.; 1897, 50,000,000

lbs. ; and 1896, 52,000,000 lbs. The amount of brick tea, our representative was told, was at the very lowest computation an equivalent quantity to the amounts given above, and it has been freely stated among Russian merchants that the aggregate amount of tea coming into Russia for the last two or three years was as much as 140,000,000 lbs. per annum. The whole of the tea entering the country had to pay duty, the brick tea going into Siberia being charged at Irkutsk at the rate of 7/6 for 36 lbs. ; upon black tea through the Marine Customs a duty of 1/10 per lb. was imposed ; and upon overland teas 1/ or 1/1 per lb., according to exchange ; while for green teas the amount charged was something similar to that for overland teas, but the exact figure our informants could not at the time to call to mind.

This induces us to publish the following letter which we addressed to the Chairman of a Shanghai Tea Committee in September last ; but to which we have never had a reply, possibly through his absence in Europe. The letter carries its own explanation :—

Colombo, Sept. 12, 1898.

DEAR SIR,—I venture to address you as Chairman of the Sub-Committee that reported on "Tea" in January 1897, to ask for information, or your opinion,—if you will be so kind as to give it—on a question that has arisen out of your Report and Statistics. A Ceylon planter, Mr. T. N. Christie, visited Russia and from official information gave the total consumption of tea in the Empire as "52 million lb. leaf teas and 40 million of brick and slab teas"—a total of 92 million lb. teas

In your Shanghai Report, I find that the Exports of China Tea to Russia in 1896 aggregate 132,567,866 lb. (55,618,666 lb. green and leaf tea and 76,949,200 lb. brick tea.) I ventured to infer that in place of 92 million lbs., Russia—between the Pacific and Germany and Thibet and the Arctic Ocean,—consumed nearer 140 million lb. of all kinds of tea, including re-exports from London and some Ceylon and Indian. But Mr. Christie thinks not—that his figures cover all the consumption and that the excess of the China Exports in 1896 must represent re-exports. The difference really concerns the 37 million lb. excess of brick tea and since you could not mean that quantity of tea to go from one part of China to another, while Russia covers or protects nearly all the other territory served through Kiachta, using "brick tea," I am puzzled to think to what countries, re-exports can take place? Thibet must be served, I infer, by a south-west route from China, and not through Kiachta? Does Corea use brick tea and get it through Kiachta? Or what light can you kindly throw on the question? The Russian Consul here (Capt. de Frisch\*) was of opinion that a good deal of the brick tea was allowed to enter Russia by certain routes paying little or no duty, which the Government were anxious to develop, and that that fact might account for much of the excess. I send with this letter two copies of *Ceylon Observer* marked, and copy of Mr. Christie's Report on Tea in Russia ; and I need scarcely say the favour of any information you can give will be much appreciated by,—Yours truly,

EDITOR, *Ceylon Observer*,

M. C. DAVIES KAURI AND JARAH CO.,  
LD., OF KARRIDALE, WESTERN  
AUSTRALIA.

This important and wealthy Company, which is now represented here by Messrs. Buchanan & Co., will in a short time, we expect, hold a very prominent position in our midst through the introduction of large quantities of timber. We understand that several ships are now due and on arrival the timber will be stored at "Lake View", Messrs. Buchanan & Co.'s recent purchase at Kew Point. The Government is taking up a large quantity of the consignment and we are certain that, when once the durability of the wood is known, the demand for it will be considerable. We passed through the Jarrah Forests of Western Australia in 1875.

#### PLANTING NOTES.

**MADRAS CEMENT.**—Why should not Ceylon be able to manufacture her own cement? An Indian contemporary reports that some time ago the Madras Government determined to try Madras cement against English cements of the highest quality sent out by the Secretary of State. After prolonged tests and trials, a circular has been issued to the D.P.W., to the effect that "the tests of cement made by the Consulting Architect show that Madras cement has attained a sufficiently high standard to be commonly used in the Department. Its use in the Department is, therefore, sanctioned and recommended."

**IN SAMOA COCOA** grows very freely, and yields abundant results with but little attention. There seems very good prospects for small capitalists going to this part of the world, who have about £500 to £2,000 making a fair income by the cultivation of cocoa. Of course it is necessary to have a knowledge of tropical planting at the start, so that those ignorant in this respect should obtain knowledge from those in Samoa who are experienced before planting on their own account. The cocoa tree does not begin to pay until the third or fourth year, and is in full bearing after the fifth year, and continues to yield, for there is practically no age limit to the bearing of the cocoa tree. —*Produce World*.

**INDIAN MUSEUM NOTFS.**—Volume IV.—No. 3. —We have to acknowledge receipt of the latest of these useful issues. The contents are as follows :—

1. Original Communications—(i) Description of two new species of *Tineina* from Bengal by the Right Honorable Lord Walsingham, M.A., F.R.S., etc. ; (ii) On the possible utilization of the Calcutta Green Bug as food for Birds, etc. : by F. Finns, B.A., F.Z.S. ; (iii) Description of three new species of Indian Coleoptera of the family Curculionidae : by Mons. J. Desbrochers des Loges ; (iv) Some comparative trials of Insecticide pumps in relation to the treatments of Tea blights, and experiment in the treatment of red-spider : by W. J. Fleet.

2. Notes on insect pests from the Entomological Section, Indian Museum : by E. Barlow—(i) Tea Pests ; (ii) Insects destructive to cereals and crops ; (iii) Insects destructive to fruit-trees ; (iv) Forest Pests ; (v) Determination of miscellaneous insect pests ; (vi) Reports of results of remedies, etc., tried during the years 1895-96.

3. Reprints and Miscellaneous Notes—(i) Description of three species of Indian Aleurodidae : by W. M. Meskell, reprint ; (ii) The Bot-fly of the Indian Elephant, reprint ; (iii) Food of Wood-peckers of the United States.

MANURING TEA :  
PRACTICAL EXPERIMENTS AND  
RESULTS.

We mentioned the other day that a planter had promised us some figures in reference to practical experiments in manuring, which he had sent in to Messrs. Freudenberg & Co. Our application to the latter has been courteously attended to, as may be seen from the letter and return appended. These carry to a great extent their own explanation, more especially as Mr. Joseph Fraser has himself summed up the main results. We see that all the experiments, save one, shewed a profitable return even on the first year's crop; but a second year's crop must be realized before a fair conclusion can be arrived at as to the most economical and most durable as well as profitable application. At present we suppose plot No. 8 stands at the head of the list so far as profit per acre is concerned, but then we are told the tea bushes shew a falling-off in vigour. The tea bushes on numbers 5 and 7 are very vigorous; but the returns in profit per acre are considerably less. Still, we have to wait and learn which will do best during the current year without any further fertilizer. As regards the essential ingredients applied, there seems to be an utter absence of consistency, not simply as regards "Potash" as pointed out by Messrs. Freudenberg & Co.; but also in regard to Nitrogen and Phosphoric Acid which are most unequally supplied to the several plots without the higher quantities at all corresponding to the higher returns. But here again, safe deductions can only be made when Mr. Joseph Fraser furnishes his next Report, twelve months hence. The inclusion of such returns in our *Tropical Agriculturist* are of immense importance to the whole "planting" world for instruction as well as for future ready reference. Meantime here is the letter of Messrs. Freudenberg & Co. embodying the Report and figures remarked on above:—

To the Editor "*Ceylon Observer*."

Colombo, April 5.

DEAR SIR,—Replying to your memo. of yesterday, we take pleasure in handing you enclosed, the statistics asked for, to which Mr. Fraser made at the time the following additional remarks:—

"With the exception of field No. 2, they have all paid for the manure and most show an excellent profit besides. The results in yield next year will show more accurately which will give the best paying results per acre for a two yearly application—what is the best now may not by any means show the best results at the end of the two years.

"The suppression of one essential ingredient in 2, 3 and 4 shows clearly their relative importance. Nitrogen being the dominant element, Potash the next and Phosphoric acid the last, which agrees with my previous experiments.

"The Basic Slag through its free lime helped in several instances, apparently to bring the nitrifying organisms into play and helped to render the inert nitrogen available for plants. Next year's results will further test this point. So far, as appearance of the bushes is concerned, they look best in the following order 5, 7, 10 and 6.

9 shows most fungoid-affected leaves and a falling-off in the vigor and succulence of the flushes and 8 shows a falling-off to a more limited extent. This may be owing to the lack of available nitrogen during the dry weather."

These experiments are exceedingly instructive. Some of the results are difficult to reconcile as for instance plots 6 and 8 with a maximum and a minimum supply of potash, but the following year may throw more light on the subject.—We are, dear sir, yours faithfully,

FREUDENBERG & Co.

## COCONUT OIL FOR THE AMERICAN MARKET:

### A NEW RIVAL TO CEYLON AND COCHIN OIL—IN CUBAN OIL?

The latest New York "Oil Market Review" has an article on the probability of Cuba supplying the United States, among other things, with a sufficiency of coconut oil to render the country independent of shipments from the East Indies. It is acknowledged that some time must elapse before the shipments from Cuba are regular or important. This is how the New York paper looks at the matter:—

During the early part of 1898 the shipments from various Cuban ports to New York were small, but with the close of war operations with Spain, or since November last, they have been on the increase. While it is true the shipments all told look insignificant, they being only about 350 tons, still they are sufficient to cause the trade to ask themselves what is to be the future of this new enterprise, and how it will affect the conditions of a trade which has heretofore been supplied from Ceylon and Cochin. While it is true the lots of Cuban oil which have come to hand have been of poor quality and by some in the trade considered only as a "poor specimen of axle grease," still large Western soapmakers considered it good enough and of sufficient importance to recently clean up the market of the stock on hand at a price equal to about 5 cents per pound.

One reason why the Cuban shipments have been curtailed has been not only the cost of producing the oil, but the poor shipping facilities existing there. But with the islands under our control new lines of transportation, both by water and land, will be established, and it will not be long before the Western soapmaker will be able to purchase his supplies delivered on a through bill of lading at his works. Just as his neighbor, a corn oil manufacturer is enabled to sell his product delivered in Germany or England, cheaper than he can deliver a carload to a consumer on the seaboard. This is also true today of coconut oil, either brought by steamers direct from the coast or via England. The future development of this new enterprise will be watched with interest not only by the consumers of coconut oils, but by those in other lines of trade, who have been contemplating a similar step in their various interests with the recently acquired possessions in both the East and Cuba, and its adjacent islands. Since writing the above there have been sales of 600 tons Cuban oil for March—May delivery at 5½ cents. With the adjustment of affairs in the Philippines that country will also become an important factor, as the quality of the oil produced there is much superior to the Cuban. Already negotiations are pending with San Francisco parties for round lots for forward delivery at that port for distribution in this country.

Then, again, Florida is likely to come to the front as a producer of coconuts rather than oranges; for, we read:—

While on a recent trip down the east coast of Florida we were impressed by the large quantities of coconut trees, loaded with fruit, and the question naturally arose why have not these nuts been utilized. When one who was familiar with the situation was asked the question, he at once wanted to know "our occupation." When however, we gave him an "Irishman's answer," and at once began to display such an amount of ignorance about the uses of coconut oil as to really surprise ourselves, we soon found out that steps had already been taken to ascertain the cost of a plant for the production of coconut oil, and the prospective demand for this grade of oil. At the same time a large delegation of Ohio merchants stopped off at this point in Florida on their way to Cuba to spy out the land and see what the prospects were for locating factories and

other business enterprises in our newly acquired possessions. Among them were two gentlemen who were going to look into the matter of making coconut oil, it having been of sufficient importance to attract the attention of Western consumers. While we admit the manufacture of this article is in its infancy and it may be several years yet before it will be satisfactorily produced, yet with the large available capital seeking investment by either Western or Eastern capitalists, and the improvements which are being made in machinery and the opening up of these islands to travel and commerce it is only a question of time when this article will be an important factor in the soaptrade of this country.

The great comfort to the coconut planter is that he has so many markets to look to—and so many different products available in his nuts.

## THE PITAKANDE TEA CO. OF CEYLON, LIMITED.

### THE REPORT.

Directors:—Messrs. Joseph Fraser, (Chairman), Edward C. Mitchell and Robert Morison.

Solicitors to the Company:—Messrs. F. J. & R. F. De Saram.

### ACREAGE:

Tea in full bearing ..	500 acres
Tea in partial bearing ..	260 "
Tea not in bearing ..	240 "
	1,000 acres
Cardamoms in bearing..	44 "
Cocoa in bearing ..	100 "
Fuel Trees ..	40 "
Forest ..	20 "
Grass Land ..	207 "
Waste Land, Buildings, &c.	80 "

Total area .. 1,441 "

The Directors beg to submit their Report for the year ended 31st December, 1898.

The total crop of tea secured was 409,953 lb at a cost of cts 26.4149 per lb or cts 24.20 per lb f.o.b. when allowance is made for manure in stock charged against 1898.

An interim dividend of nine per cent on the capital of the Company, viz., R280,000 as it stood in September, 1898, has already been paid, and taking the unsold 53,270 lb tea at the estimated value of 34 cts. per lb there remains a further balance of R7,440.05, of which it is now proposed to carry R7,090 to the Reserve Fund, making this account R27,000 at the end of December, 1898, and to carry forward to next year's accounts the balance R440.05.

It will be seen from the accounts that the expenditure of 1898 includes an invoice of manure amounting to R1,897.87, which manure will be applied in 1899. It has further to be mentioned that, in the year under review, the expenditure on 260 acres of young tea, and the manuring of 110 acres of similar tea which has as yet given little return, have been included in the current expenditure. During the year, 9,953 lb. Tea over the estimated quantity were secured, and cocoa and cardamoms came fully up to expectations. The 500 acres of tea in full bearing gave 676 lb made tea per acre in spite of very adverse circumstances during the latter half of the year.

In October, 1898, the capital of the Company was increased by 50 shares of R500 each to rank for dividend on the working of the properties from 1st January, 1899, the whole of which were taken up by the present shareholders. In February, 1898, the Directors appointed Messrs. Buchanan & Co. a Agents and Secretaries of the Company. In terms of the Articles of Association, Mr. Edward C. Mitchell retires from the Board of Directors, but being eligible offers himself for re-election. The appointment of an Auditor for the current year rests with the Meeting. By order of the Directors.

BUCHANAN & Co., agents & secretaries.

## PEARLS: NATURAL AND ARTIFICIAL.

M. Dastre contributes to the first February number of the *Revue des Deux Mondes* a very interesting paper on the production of fine pearls both by natural and artificial means.

We have lately been interested in the announcement that a syndicate in London were placing upon the market considerable quantities of pigeon-blood rubies which were products of the laboratory and not of the mine, and now it seems that as far back as last November the French Academy of Sciences received a report on the experiments of a M. Boutan in making artificial pearls. The curious part of it is that in spite of the advances made in biology we are still ignorant of the precise manner in which the natural pearl is produced inside the oyster, and our imitations of nature must therefore be empirical and consequently not always trustworthy. There is no need to follow M. Dastre in his investigations into the ancient repute of the pearl as a gem. It is enough to say that the principal fisheries of pearls are those of Ceylon, the Coromandel Coast, those which have existed from time immemorial in the Persian Gulf, and those of the Red Sea, the Antilles, and Australia. M. Dastre contrasts the intelligence of the Indian Government, which carefully regulates the fisheries within its control and draws from them an important revenue, with the entire neglect by France of her fisheries in the Gambier and the Tuamotu Islands.

It is interesting to note that M. Dastre does not expect much danger to the market value of the natural pearl from the competition of the artificial one. The artificial cultivation of the pearl oyster appears to be a matter of considerable difficulty, which is always likely to handicap the artificial pearl in competition with the spoils of the pearl divers. By artificial pearl is meant, of course, some foreign body introduced into the oyster and clothed by it in the course of years with the mother-of-pearl covering with which the creature also covers its shell. The objection to introducing this foreign body into the oyster is that the result is not so fine as the pearls which are produced by natural means by the oyster itself. Curiously enough, in the last century a Swedish naturalist attempted to produce the real article by irritating the oyster, but though a merchant of Gothenburg bought his scheme for a large sum, he seems never to have carried it out. The Chinese, who are not celebrated as a nation for humanity, introduce into the unfortunate oyster all kinds of irregularly shaped foreign bodies, such as little dragons and idols, which must irritate the creature much more than a perfectly rounded object. As for the experiments of M. Boutan, their object was apparently not commercial but scientific. In conclusion, M. Dastre gives some interesting figures as to the value of famous pearls. It seems that the modern collections of pearls do not really rival the magnificence of those possessed by the wives of famous Romans, and nothing, M. Dastre thinks, could compare with the magnificence of one necklace possessed by Lollia Paulina.

## CACAO PODS' DISEASE.

The following Report from scientific men in Trinidad will be of interest to cacao planters in Ceylon. It should be carefully compared by them with the Report of Mr. Carruthers on the same subject as they will find it reproduced in their file of the *Tropical Agriculturist*. It will be observed that the Trinidad investigators make light of cacao disease and generally blame Mr. Carruthers for giving it undue importance! This is simply absurd; for, the fungus in Ceylon had done most serious damage in certain districts and among the weaker cacao; but probably

Messrs. Marryat, Carmody and Hart merely mean that undue importance has been given to the cacao pod disease?

REPORT OF THE CACAO COMMITTEE ON  
"CACAO POD DISEASE."

(Laid before the Agricultural Society, Trinidad, 14th March, 1899.)

At the meeting of the 14th February after discussion on the so-called "Cacao pod disease," the Committee appointed a Sub-Committee to make a Report, dealing with the various facts brought out in the discussion, and to invite further information from members of the Society.

The opinion of the Sub-Committee is as follows:—

1. That the malady is due to a fungus, the precise species of which is being investigated at Kew, but that pending a longer term of observation and of a series of experiments, it would be premature to make too positive assertions, as to its origin and growth. 2. Experienced planters state that they have in certain seasons, known the pods to be similarly affected any time during the past 25 years. Much depends on the nature of the soil. November and December are the worst months, especially if cold, wet, and a northerly wind follow a hot Indian summer. With the dry weather the fungus disappears. 3. There is no evidence to show that the Cacao tree itself is in any way affected by the malady of the pods and to all appearance a perfectly healthy tree may be laden with diseased pods. The fungus has not been observed to penetrate to damage the bark, even when a diseased pod is lying against the trunk. 4. The experiments which the Government Botanist has found time to make, unfortunately only on a limited scale, prove conclusively:—a. That a sound pod inoculated from a diseased pod, readily takes the malady and becomes rotten in a week to ten days. 5. That pods in the immediate neighbourhood of the inoculated pods, though purposely wounded with a knife, were not affected. It has yet to be proved that the malady is infectious. 5. It having been shown that a wounded pod readily accepts inoculation, it is obvious that the fungus may be carried and spread by rats, bats, squirrels, wood-peckers, insects, etc., which attack the pod.

6. Assuming this to be possible, the origin and the home of the malady may not be far to seek. The Government Botanist in visiting an estate by request, noticed within a narrow radius of the "breaking" grounds, a greater number of black pods, than in other parts of the cultivation.

7. In some cacao countries (Surinam and Central America), the practice of breaking the pods in the field itself, and of allowing the shells and refuse to remain and rot on the ground as in Trinidad, is unheard of. The pods are picked and carted to the "works," then broken, and the refuse placed on the manure heap and properly treated. To ask the planter in the billy districts to adopt this system, would be too great a tax on the labour and stock at his disposal, but pending further investigation, and as a matter of precaution, it is recommended that the following procedure be adopted:—(1) Where burning is not practicable, to cover all refuse with soil and bury it, or otherwise completely destroy it. (2.) Or the "broken" pods may be chopped up small and covered with quick or temper lime. This in time would form a safe and valuable manure. (3.) All pods showing signs of attack should be carefully collected and destroyed. The probable home and nursing ground of the fungus would thus be destroyed.

8. In conclusion the Sub-Committee is inclined to think that an undue importance has been attached in certain quarters to the question of disease amongst Cacao, which would never have arisen but for the publication of Mr. Carruthers' Report on Ceylon cacao disease.

Complaints of the same character have arisen in Trinidad from time to time for many years past, but so far as can be ascertained no serious loss has occurred; but the question having

been raised, the committee is of opinion that it should not be allowed to drop until thoroughly investigated.

It is highly probable that conditions of season have a great influence on diseases of the nature above discussed, and that given more favourable conditions, no more will be heard next year of "Cacao disease"; but bearing in mind that prevention is better than cure, the Cacao planter will do well to put himself in the position of the prudent householder, who when rumours of fever are in the air, looks to his sanitary arrangements and sees that his surroundings are kept sweet and clean.

A. P. MARRYAT, Chairman.

F. CARMODY, F.I.C., F.C.S., Govt.

Analyst.

J. H. HART.

P.S.—It will materially assist the committee if members whose crops during the past three months have suffered from "black pods," will put in writing their experience, coupled with suggestions, and forward them to the Secretary Mr. E. Tripp.

## THE CULTIVATION OF COCONUT TREES AT ZANZIBAR.

### REMARKABLE YIELD OF NUTS AT MANGAPWANI.

Mr. J. T. Last, F.R.C.S., of Mangapwani, Commissioner of Slavery, reports, that from 350 coconut trees he is getting 7,250 nuts at one gathering; an average of 29 nuts, which at 4 gatherings a year gives an annual yield of over 80 nuts per tree. Twelve months ago these trees gave about 2,300 at a gathering, which is less than 30 nuts per tree per year. What is more remarkable is that from one tree he got 106 nuts (at one picking); from another 100 nuts; from two others 91 each, and that from 7 trees he obtained 644 nuts at one gathering, an average of 92 nuts per tree in 3 months. This has occurred during an exceptionally dry season. Mr. Last attributes these yields to the fact of his having dug the ground round each tree to a radius of 6 feet from the stem, increasing the distance a little each time over, leaving a shallow trench at the circumference to catch the water. We cannot offer the planters of Zanzibar better advice than to go and do likewise. Let us figure out the money value of this increase. The increase, represented by the difference between 2,300 and 7,250 is (roughly) 5,000 nuts which at R22 per 1,000 is worth R110, equal to R410 per annum. Some allowance should perhaps be made for the fact that the September crop is usually a much smaller one, though on the other hand the coming March or April gathering is as a rule large, when the Mangapwani trees may be expected to yield 9,000 nuts. The cost of cultivating the trees (digging, not merely weeding) is insignificant. Two men working together will do 20 trees per diem, which at 20 pice each man comes to 2 pice per tree. Give them 2 pice per tree and they would probably do more than 20 trees. At less than 1 pice each the trees can be mulched with grass to keep the sun off the newly upturned soil and check the evaporation of moisture:—Say 3 pice a tree altogether. If the trees are gone over twice a year the annual cost comes to 6 pice; that is about R33 for 350 trees, leaving a net profit of about R407, or nearly R1½ per tree.

Digging round the trees aerates the soil, increases its capillary attraction, and promotes nitrification. It is the same thing as stoking the fire which burns brighter as fresh particles are exposed to the air. The manufacture or "burning" of plant food in the soil cannot proceed without air any more than the fire can burn without a draught.

A correspondent of the *Tropical Agriculturist* wrote as follows in April of last year:—

This short paragraph contains much that is worth reflecting upon. The pendant branches, as they clasp the trunk, are another of nature's provisions for protecting the tree

from the baneful effects of the sun. In one respect we have the advantage of the writer in that we have plenty of weeds available for litter. The Zanzibar planters cannot be said to be victims of æsthetic prejudices in the matter of weeds. But of cattle manure there is little or none though many cart-loads of horse manure from the town stables are daily emptied into the sea. Goat manure is more plentiful and equally good, while at Latham island there are large deposits of guano that could be utilized. Lime, again, is a valuable manurial ingredient. Dr. J. Augustus Voelker, consulting chemist to the Royal Agricultural Society of England, to whom samples of Zanzibar soils were submitted for analysis, wrote of Lime (see the annual Report of the Agricultural Department, 1897):—"I am quite certain that value of Lime on the laud has been underrated, and that in many cases it will be found to give valuable results." Lime and guano must however be used cautiously, as they would injure the trees if too liberally applied.—*Shamba*, Jan. and Feb.

## MR. E. E. GREEN, HONORARY ENTOMOLOGIST.

This gentleman will be much missed even during the five or six months' absence from the island, which is to limit his holiday. Mr. Green has so completely identified himself with the interests of his brother planters and he so well combines scientific knowledge with practical experience that he is the *beau idéal* of a scientist-planter; while in his own special department of Entomology, Mr. Green's attainments are acknowledged all over the world. There never, in our opinion, was a more fortunate appointment for the Colony—for the agricultural interests of the natives as well as of the European planters—than that of Mr. E. E. Green as "Honorary Entomologist."

It is very interesting to learn that after all, the consignment of lady-bird beetles which the Entomologist at Cape Colony sent by letter-post (in a higgish case!) was not altogether useless. Mr. Green found in the moss three or four beetles and a couple of *larvæ* alive and two beetles and one larva continued to flourish under his care—the chief food being the "green bug," though aphes generally will do—until now there are 16 lady birds and several larvæ which Mr. Green is leaving in the well-qualified and interested care of Mr. Jowitt of Haputale until his return. We trust that before the end of the year a regular campaign against the enemies (green bug chiefly) of the little coffee left to us, may be opened.

Mr. Green has tried in vain so far to find a remedy for,—or efficient enemy to,—"Lantana bug" which has developed so much of late and which ought to be checked, lest unknown evils arise. He thinks that probably the latest introduction by Mr. Kœble, which has proved so effective against "fluted scale" in oranges, might do. This has now been introduced into Portugal; and we would urge that, on his way back, Mr. Green should be commissioned by Government to visit Portugal and secure a consignment for Ceylon. Of even more practical importance with reference to the future of Mr. Green's work in Ceylon would be a brief visit to the United States—the country, before all others, in which the application of science to agriculture in all departments, is studied and utilised. We

trust Governor Ridgeway may empower Mr. Green to visit Washington and consult with Dr. Howard, the leading Entomologist, with whom he has already been in correspondence. Much benefit to future work in Ceylon might well be anticipated. In any case we hope Mr. Green may have a pleasant and profitable holiday and return invigorated to enter on his special duties out here.

### DRYING CLOVES IN PEMBA.

[TO THE EDITOR OF THE SHAMBA.]

FRIEND'S INDUSTRIAL MISSION, PEMBA ZANZIBAR

Oct. 27, 1898.

DEAR SIR,—I am just in receipt of yours of the 15th inst. After various experiments in drying cloves under glass and otherwise, I am of opinion that, for the present we shall do best to try and improve the present system without introducing any radical changes which the average planter would not be able to carry out. The old method of drying our cloves in the open sunshine is not far wrong; but some improvements are needed all through the process. Greater care must be taken in the gathering of the buds to get them as near the pink of perfection as possible, and not to damage the trees. In the 'stalking' constant watching is needed to see that all stalks, leaves and sticks are removed. This work is usually done in the evening, and the buds are then left in baskets or heaps until morning by which time they have become heated and brown. I believe this is a great mistake; those which get heated are apt to become dark coloured in drying, they should be spread out thinly on mats during the night. To issue good cloves planters need better stores which should be roomy, clean, light and airy; the present dark hovels are fatal to the production of good samples. Large open sheds adjoining the stores are also much needed, so that when a shower comes on the cloves can quickly be put under cover when they will have air and be spread out to prevent heating and discolouring. Wherever possible a large concrete floor should be provided instead of the bare ground to spread the mats on; as the damp ground in showery weather injures both the mats and the cloves. Even if all these things are done, and a good sample produced it is liable to be ruined before it reaches Zanzibar. So long as cloves have to be exported in dhows they will get wet and damaged. Exporters are compelled to use dhows and run the risk of damaging the cloves. It is scarcely likely that the bulk of the year's crop can be got as good as small experimental samples which have been dried entirely under European supervision. Much of the crop has of necessity to be dried under native management. This year there will be many small cloves and some over ripe ones amongst the bulk, as, owing to the drought the bunches contain cloves in all three stages of development. Some simple machine needs constructing to screen out sand and small fragments of stalks, and to blow out dust and bits of leaves before the cloves are finally bagged for exportation.—Yours, etc.,

THEODORE BURTT.

We agree with Mr. Burt in thinking that the Arab method of heaping up green cloves is injurious. In rainy weather, when drying cannot proceed, these heaps remain in the go-downs for several days, growing daily larger, till a high state of fermentation is set up. These cloves will subsequently turn black. The desirable rich brown colour can be secured only if the clove buds are spread out as they are brought in, and never allowed to be heaped. Colour however depends as much, if not more, upon the picking than upon the drying, and unless the buds are picked in the proper pink condition no amount of subsequent management will produce a good sample.—*Shamba*, February,

### PLANTING IN NORTH TRAVANCORE.

(From our Correspondent.)

April 1899.

Grand rains after the long spell of drought we have had, the little dribblets during the month of January, February and March, only amounting to 0.28 of an inch: How is this for a drought? On 31st March we had a nice shower; on 1st April a grand down-pour; and today, Sunday, another nice wetting rain, commencing at dark and still going on as I now write at 9 p.m. I note by the *Observer* that Ceylon has also passed through a severe spell of dry weather; but I do not think so severe as the above, and still our tea does not seem to have suffered very much. In not one instance, have I seen a dead bush. Our soils are deeper perhaps, and the tea roots get away down further into the damp sub-soil. On some of the lower-lying estates, the bushes had pretty well closed up; but away higher up on the hills, the shoots continued to come until the last, and I have no doubt would have gone on sometime longer. But these rains were very welcome nevertheless, and have cooled the air, and made it much more bearable for man and beast.

A noteworthy feature of the dry season was the number and variety of

#### WILD ANIMALS

which were evidently driven down from the higher hills in quest of water.—elephants and quantities of sambur foot-prints being found all over the estates, along roads, through tea, upsetting nursery pandals and passing, in some instances, within 150 yards of bungalows; but all evidently making for the much-prized water. The hills all about I need hardly say are all of the colour of dirty dusty roads, except those which had been set fire to, and they are still black as the old boy himself. The rains, however, will be the means of making these to be clothed with a coat of emerald hue, and so provide good grazing for the numerous animals about. The streams had gone down to a very low ebb, and in fact, a great many of the smaller ones had gone dry altogether; dust driven by the wind, and ashes from numerous clearings which had been lately burnt off have been rampant for weeks past:—

Away before, and give a whirlwind room,  
Or I will blow you up like dust! Avault;  
Madness but meanly represents my toil  
Eternal Discord!  
Fury! Revenge! Disdain and indignation  
Tear my swol'n breast, make way for fire and  
tempest.

My brain is burst, debate and reason quenched;  
The storm is up, and my hot bleeding heart  
Splits with the rack, while passions like the wind,  
Rise up to Heav'n, and put out all the stars.

Clearing work being the order of the day, we are all busy in this quarter. Coolies are fairly plentiful, and quite sufficient for all requirements at present; glad to see tea has taken a turn for the better again. Long may it remain and bring more grist to the mill, although a good many companies have done no that bad considering the hard times.

K. D.

TEA BLIGHT.—It is reassuring to learn from Mr. E. E. Green that, so far as he has seen, only one of the "blights," described by Dr. George Watts as affecting tea in Assam, is to be found in Ceylon.

## QUININE EXCITED.

SOLD AND RESOLD AT FEVERISH RATES.

Quinine has had a rollicking week of business, "forging a head like Pattison's whisky" said a "Change frequenter the other day, but "forging" suggests too much effort for the progress of the alkaloid, and the connecting of Pattison's with quinine has an unfortunate inappropriateness. Quinine has sold and re-sold at feverish rates in the second-hand market, and is now on the border of 1s 6d an ounce. More noteworthy even is the fact that the German combination of makers have put up their price to pretty nearly the same figure, and, of course, the chief English manufacturers have advanced, maintaining a dignified reserve as to how much they sell and whom they sell to.

This is the result of eight weeks' influence on the situation that existed when quinine was 10s., and we were anticipating the advance that is now a fact. No wonder timid spectators of the rush are shaking their heads and prophesying a slump. Still, there is plenty of confidence in others, and these—we must say, generally the best-informed in the subject—that we shall have quinine worth 2s. before the year is out. Even the more cautious ones, who, nevertheless, are not afraid to look facts in the face, ask one another whether we are not rapidly approaching a very serious scarcity in the supply of bark.

Of course, these thoughtful observers do not say this because of the speculation. That is really a result, not a cause of such reflections. Speculation, like it is always doing, is anticipating future events. All this buying and selling of quinine that has been going on during the last two months is merely the constant turning over of the same parcels of the article. The consumptive demand is stagnant compared with this speculative activity. All the same, the latter rests for its justification ultimately on the principle that second-hand quinine could always go into consumption at, say, 2d. per oz. below the makers' price, and a second-hand price of 1s. 6d. on this basis is really only warrantable on the supposition that makers will, shortly, either not be able to sell at all or will have to sell at 2d. above that. Hence all this selling and re-selling in view of future upward movement. No one would buy quinine to-day in the second-hand market for immediate consumption, for a better bargain could be made with makers.

But there is the usual danger in this speculation that it may go too far; that the second-hand price may anticipate too much; or that it may go so fast that a reaction will set in and the weakness of nervous holders will cause the market to collapse at a time when it has got too far ahead of natural effects, which, if they could be awaited, would support it. And it is to answer the question whether the speculation has gone too far now that some are eagerly watching the reports as to shipments of bark, and asking, as we have said, whether all these signs of great future shortage are to be trusted.

We ask ourselves the same question, and we can only say that unless some extraordinary artificial arrangement is at work in Java there is only an affirmative answer to be given. If we turn round to all the possible places from which bark can be got we see none that is so situated as to be able to supply the market if Java falls short. That ought to be too obvious to need stating. But people talk in an absurd way about this, that, and the other country being able to bring forward bark if the price goes much higher. Can India put forth more than she did last year, when she came up to her highest year's production, and effected—nothing? She did not put bark down a fraction. Can Africa do anything, seeing that she has made the mistake of others and given all her attention to a comparatively little-needed bark, because it is easy to cultivate?

Of Bolivian cultivation there was hope once; but even here there has been disappointment, and of South America generally it may be said that bark must very considerably advance before it will be induced to collect again. We have little trustworthy information as to its stores, and so will leave alone the question how far it is exhausted. In the matter of remuneration for collection, it must be remembered that men often, once having started a business, continue it long after it reaches that point at which it is barely profitable to begin it, and the price that made bark collectors and exporters in America desist will have to be materially increased before they begin again. Those who know at what figure South American bark did not pay to collect will also know that we can go on putting up bark a great deal more before collectors will organise those arduous journeys that are required to obtain South American bark.

Ceylon is not worth thinking of, but so desperate are some in their desire to take a pessimistic view of bark, and so singular are others, that the most easily negligible factor in the situation is one on which we must spend most words. We have given our contemporaries the lead in the proper direction on this subject, but to get them to go in the right way seems futile judging by the hopeless tangle into which one of them gets itself. To talk seriously about Ceylon in the situation was, we thought, only possible in such a case as that of an acquaintance on 'Change who gravely asked us the other day if we had noticed that Ceylon had exported in the first week of February as much bark as in the whole of January. When he was gently taken in hand he explained that he did not get the Java figures—only the Ceylon! However, good was done in his case, and even something has been effected in the case of the contemporary, for we have at last managed to make it see that the German purchases and sales are the key of the situation; but this lesson has taken so long to penetrate that the learner has forgotten whence he received it.

There is left Java herself. Here it is most difficult to get at anything like an accurate figure for the possible output at present. We do know, though, that after a year of large shipments at prices lower than the present, Java is only sending small supplies to the European market, and what it is sending is better bark. The natural conclusion is that it has not got more bark to send, and this is true, unless, to come back to our earlier statement, the Java planters have been induced to do what they have never been induced to do before—*i.e.* keep bark back when they are getting good pay for it. We do not say such a thing is impossible, and after the recent visit of the planters' emissary, an arrangement of this kind might seem likely, but we doubt very much its having been made, and, in the absence of other information, look upon the present circumstances as leading fast to a scarcity that has never been known in the bark market.—*British and Colonial Druggist.*

MANURING TEA.—We are interested in learning that the experience of Mr. Melville White fully confirms that of Mr. Joseph Fraser as reported yesterday. Mr. Geo. Greig, in Maskeliya and Dimbula, has also confirmatory evidence. Mr. W. D. Bosanquet again reports that experiments made by him during the past three years bear out the conclusions arrived at, especially as to Potash being an important element. Potash and Phosphoric acid he has found quite inert without Nitrogen, and Nitrogen most effective when combined with a considerable proportion of Potash and Phosphoric Acid—more especially the former.—*C. O.*, April 7.

## NATAL TEA INDUSTRY A GRATIFYING REPORT.

It will be remembered that the tea taken to the Grahamstown Exhibition by Mr. Hindson of the firm of W. R. Hindson & Co., Clifton Tea Estates, Nonoti, met with remarkable success, there being a very heavy demand for it at the various kiosks and other places frequented by visitors to the exhibition, while large orders for supplies for the Cape have since been received.

It is gratifying to learn that, as the result of samples of exhibition teas sent to London for valuation and report, Messrs. R. M. Holborn & Sons, one of the oldest-established and largest firms of tea merchants in Mincing Lane, have forwarded most satisfactory reports. One of the members of the Mincing Lane firm reports as follows:—"I have now carefully tasted the samples of Natal teas. They are certainly a long way the best specimens we have yet seen." The firm's detailed report is as follows:—

"We have pleasure in sending our present market valuations, also our descriptions of samples of Natal tea received from you, and now return your canisters by post.

No. 7.—Tippy, leafy broken Pekoe, very brisk and good quality; value 8d. to 8½d.

No. 19.—Well made, grey leaf Pekoe, excellent quality, with bright infusion, and very pungent; value, 10d.

No. 10.—Orange Pekoe, golden tipped and well twisted leaf, bright infusion, fine quality, pungent liquor; value, 1s. to 1s. 1d.

No. 9.—Broken Orange Pekoe, bright, golden-tip, fine pungent liquor, with bright infusion; value, 1s. 1d.

When it is stated that at the date of these reports Indian teas were only averaging 9d. per lb. and Ceylons 8d. in public sales, and that Messrs. Hindson's teas were valued against all going, it will be recognised that the valuations are eminently encouraging. It has been asked from time to time whether in Natal we cannot obtain high-class teas approximately to some of the fancy kinds that were exhibited at the last Durban July Show. It will be seen by the foregoing that teas of as good a quality as can be desired are to be obtained in the Colony, and particularly if people will pay for these better qualities prices analogous to those they pay for the best imported article. The fact is that Natalians have been favoured in having tea grown at their own doors and supplied at a very cheap rate, and have perhaps grown accustomed to using lower grade teas because of their cheapness; whereas if they paid, say, 2s. 6d. per lb., which is not so much as is asked for some of the best imported blends, they would get a superior tea, and one grown within the Colony. It is, at any rate, satisfactory to find our tea-growers not only paying attention to the quality of their teas, but offering them to the public in an attractive style. Such a canister as the sample we have before us can scarcely fail to commend itself to purchasers. It may be mentioned that the tea can also be obtained in lead packets and in boxes.—*Natal Mercury*, March 10.

## MINOR PRODUCTS REPORT.

**CROTON SEED.**—Offered 48 packages. Sold 0. The buying-in price was 60s to 70s.

**COCA LEAVES.**—Offered 11 packages. Sold 6. No South American leaves were sold. Ceylon leaves sold at 11d for good bold green of Truxillo character, and 8½d for bold brown.

**CINCHONA BARK.**—Offered 93 packages. Sold 74. South American Calisaya bark sold at from 6d to 9d for small strips and chips. Guayaquit Succirubra sold at 2d to 4d. Bold Maracaibo chips fetched 1½d to 3½d.

**CINNAMON.**—Ceylon chips sold in auction this week at 3½d.—*B. & C. Druggist*, March 17.

**ANNATTO SEED.**—No business was done publicly, although abundant supplies were offered; 3½d per lb. was the limit placed on good bright Madras.

**KOLA NUTS.**—Small African quarters sold at 1½d per lb for poor West Indian 2½d was refused; and 5d was the limit for washed.

**CITRONELLA OIL.**—Business has been done privately at 11½d per lb (in drums) c.i.f. The exports from Ceylon, from January 1st to February 21st were 114,141 lb.

**LEMONGRASS OIL.**—Unchanged at 2½d per oz.

**VANILLA.**—Only oddments were offered, and the business done was unimportant. Tahiti, good chocolate, realised 10s 6d per lb for 4 to 6 inch, and 4½d to 6½ inch. Seychelles, good 7½ inch 22s; and mixed lengths 16s 6d per lb.—*Chemist and Druggist*, March 13.

## KEELING AND CHRISTMAS ISLANDS.

Acting-Governor Sir J. A. Swettenham has just sent to Mr. Chamberlain an interesting report on the Cocos-Keeling and Christmas Islands, whose "King," Mr. Ross, was recently in London. The population of Cocos is now 595. The copra exported in 1897-8 amounted to 826½ tons, valued at nearly £13 per ton. The general neglect of theoretical education is counterbalanced to some extent by the anxiety of the boys to go through the practical training of the workshops. Religion is regarded with almost as much indifference as education, the people being satisfied with one annual attendance at the mosque. A really calm day is almost unknown. The valuable beds of phosphate on Christmas Island remain practically undeveloped, but Sir J. A. Swettenham expresses the hope that Mr. Ross's visit to England will settle the policy of the company concerned, and enable the phosphate industry to be developed within a reasonable time.—*Daily Chronicle*, March 17.

## PLANTING NOTES.

**EIGHT CAMPHOR SEEDLINGS** were planted on experimentally in the Mysore Government gardens a couple of years ago, and the superintendent, in his recent reports, notes with satisfaction, that the growth, under full exposure to the sun, has been vigorous. The largest specimen is 3 1-2 feet, with a branching diameter of about 3 feet. Such rapid growth, he remarks, would soon establish a young plantation of this useful tree.—*Bombay Gazette*.

**INDIGO.**—Messrs. J. Thomas and Co.'s Price Current, dated Calcutta, 6th April, says:—"The crop in Lower Bengal is well reported on. Rain is rather wanted in Purneah. In Behar sowings have been completed. Caterpillars have shown themselves in most places but no material damage has been done by them. Some of the latest sowings have suffered from the west winds, but the crop on the whole is a good one so far. In Benares sowings are progressing under favourable circumstances."—*Pioneer*.

"STRAY LEAVES FROM INDIAN FORESTS" is the opening part of what it is hoped will quickly become a volume of important dimensions and interesting contents. It contains notes on the deodar, the sal, the shisham and the khair by well-known forest officers. All forest officers are requested to contribute articles dealing with the life-history of any particular species of tree, results of methods of treatment of forests, and any subject relating to forestry in India. It is intended that the work shall consist of records of actual knowledge rather than theoretical discussions. The work is published under the authority of the Inspector-General of Forests to whom contributions should be sent.—*Pioneer*.

MR. T. N. CHRISTIE.  
A FAREWELL INTERVIEW.

Before this well-known Ceylon planter and estate proprietor left by the ss. "Staffordshire" recently we had a brief interview with him, asking several questions of general interest to the planting community of which he has for many years been a distinguished and valuable member. The answers to our enquiries we here briefly summarise.

Mr. Christie's general impression of  
THE TEA IN THE DISTRICTS

he saw was that it was eminently satisfactory, and far more so than somewhat-recent reports and prices would have led people to anticipate. He did not, beside this, notice anything special, and certainly he had seen nothing in any way likely to affect for the worse the prospect of the tea crop for the current year. As to

MANURING,

of course, Mr. Christie said, no general rule can be laid down. In some cases it is worthwhile, in others decidedly not. If you are going to get only 6d to 6½d for your teas, you will be running the minimum cost of production very close and by the extra outlay on manure you will injure or destroy the very slight margin of profit that might have been yours. But if your prices are bound to run higher than that you can afford to manure plentifully and be pretty certain that some result will be seen in enhanced prices. He had noticed the "blister and grey blights" upon the tea in several places, but neither was likely to do any serious harm or to spread with the fatal power or even the rapidity of a disease, like *Hemiteia* for instance.

The

LABOUR SUPPLY

in Ceylon he considered would never be found superabundant to a degree that would in time check the immigration of coolies from the neighbouring peninsula. Of

FUEL

too, he thought there would always be a good supply. Nothing had struck him more in this last visit than the marvellous celerity of growth (since he was last in Ceylon) in the trees that had been planted with a view to fuel supply. The timber in the country was likely to last, well,—as long as it was wanted. The

ROADS

in the planting districts, too, he found to be everywhere in very good order.

As to

THE SALE OF TEA IN RUSSIA

and on the Continent generally, Mr. Christie was highly pleased, and here and there astonished, with the immense progress made. He had read our recent interview with the local tea-buyers (appearing in our issue of March 30th), and found nothing therein to contradict or even supplement. On the subject of tea in America Mr. Christie was not very communicative, but could scarcely assert that Ceylon ought just yet to give up its campaign, costly though it was.

AS TO OTHER PRODUCTS

he found CACAO doing well, and the cacao disease he considered far from serious; it could not be compared to that of coffee for

danger and destructiveness. CARDAMOMS, too, were making good progress, but numbers of acres he saw had been planted in soil entirely unsuitable for it. Cardamoms needed the richest soil, virgin forest soil, at a fair elevation, under good continuous shade, and *not* in a very damp situation—at any rate as regarded the lie of the ground they grew in.

For the proposed

AGRICULTURAL DEPARTMENT

Mr. Christie had no great praise or encouragement to offer; such departments were seldom worth their cost and the trouble expended. And he would certainly not have all revenue cadets pass through Cirencester Collège. They would come out here knowing far too much for their position, and with an utterly insufficient quantity of practical experience to balance it.\*

As to the abolition of the

RICE DUTY

he thought it very desirable, were it possible to substitute an equitable and easily collected tax in its place.† At present he had seen no suitable substitute suggested. The Land Tax he could not by any means approve.

HIGH PRICES FOR COMMON TEAS,

which of late have become likely to continue, Mr. Christie thought would undoubtedly encourage larger imports of China tea into the United Kingdom this year; but he did not consider the effect would be so marked in the home as in the continental markets. In conclusion Mr. Christie expressed strong condemnation of the abolition of the

IMPORT DUTY ON TEA.

As we stated two days ago, it would, he felt sure, encourage the importation of Indian and China teas by unscrupulous dealers in Colombo, who after keeping it awhile in their godowns, would ship it off without compunction, and without unpacking it even, as Ceylon tea. Even if Ceylon does sell some of the commonest teas now, the inrush of other common teas in the manner described would go far to blind the public to the good name our Colony has also possessed hitherto for exporting some of the finest tea to be tasted anywhere. As to macking Colombo a general blending depôt, he did not know of any marked advantages contained in the proposal, if the tea-duty were not abolished. But against that abolition, Mr. Christie remains, like most of his planting brethren, immovably firm.

Apropos of the

PLANTING COMMISSION

at the Paris Exhibition, we learnt in reply to a question we put to him, that our departed visitor had no intention of serving on it if he were asked. Mr. Christie hopes to return to Ceylon in twelve months' time, probably visiting the Paris Exhibition *en route*. We look forward to his next trip hither and to whatever he may have to tell us, either by way of change or confirmation of his views, with anticipation of a pleasurable kind.

\* In Java, the result of the system is, we believe, that a more sympathetic interest is taken in all the native and other branches of agriculture.—*Ed. T.A.*

† Or to keep down expenditure to R22,000,000, the rate of two years ago?—*Ed. T.A.*

TO PLANTERS AND OTHERS.

# SEEDS AND PLANTS

OF  
COMMERCIAL PRODUCTS.

**Hevea Brasiliensis** (Para Rubber).—Seeds and Plants supplied, immediate delivery, quantity limited, good arrival guaranteed, packed to stand 4 to 6 months' transit well, five hundred plants in each Wardian case.

Out of a supply of Para Rubber seed collected in July, 1897, and preserved by us, a quantity was forwarded to Hammond Island in December of the same year, and the gentleman who ordered the seeds in ordering a further supply wrote us on the 30th April, 1898:—"All the seeds done well, and now some of the plants from them are 18 inches high." This seed was put in nursery eight months after gathering.

A Mercantile firm who ordered 30,000 Para Rubber plants in 60 Wardian cases, 500 plants in each, wrote 5th April, 1898:—"I note that you accept delivery of 60 cases. We shall probably require further supply of seeds and plants."

*For price, instructions and particulars, see our Circular No. 30, post free on application.*

**Manihot Glaziovii** (Ceara Rubber).—Fresh seeds available all the year round for shipment at any time, guaranteed to stand good 8 to 12 months.

*For price, instructions and particulars, see our Circular No. 31, post free on application.*

**Castilloa Elastica** (Panama or Central American Rubber).—Seeds and Plants supplied  
*See our Circular No. 32 for price, instructions and particulars, post free on application.*

**Urceola Esculenta** (Burma Rubber).—A creeper Seed and Plants.

**Landolphia Kirkii** (African Rubber).—A creeper Seed and Plants.

**Seeds and Plants** of Cinnamon, Nutmeg, Clove, Kolanut and different varieties of Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit trees, Shade and Timber trees, also Palms, Bulbs and Orchids, &c.

Professor MacOwan writes:—

MESSRS. WILLIAM BROS.

DEPARTMENT OF AGRICULTURE,  
CAPE TOWN, 27TH JULY, 1898.

GENTLEMEN,—I have this morning received your letter of 21st June covering parcel of Catalogues. It will give me pleasure to fulfil your wishes in regard to their distribution among likely purchasers.

You will be glad to learn that we have very good reports of the success of the semi-tropical things sent by you to the little Eastern Coast-strip of this Colony, particularly about the month of the Buffalo Rum at East London. Pine Apples are now grown there far superior to the stuff sent half ripe by sea from Natal.

Always yours faithfully,  
(Signed) P. MACOWAN,  
Government Botanist.

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for 1899-1900 now in the press, post free on application.

*Agents in London:—*MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.  
*Agent in Colombo, Ceylon:—*E. B. CREASY, Esq.

*Telegraphic Address:*  
WILLIAM, VRYANGODA, CEYLON.  
A.I. and A.B.C. Codes used.

J. P. WILLIAM & BROTHERS,  
*Tropical Seed Merchants,*  
HENARATGODA, CEYLON.

MALABAR-WYNAAD NOTES.

WYNAAD, April 1.—Liberian coffee will be in blossom on the 3rd or 4th instant, Arabica following three days later, and the hybrids in between. The good rains we have had should give a great start to old and young coffee, force old tea into a flush, and prove the salvation of young tea clearings, where such down pours were wanted, especially as there is every indication of the showery weather continuing. Upon most coffee estates pruning has been completed, and surplus labour discharged, but upon tea gardens all available hands have been retained.—*M. Mail*, April 7.

DRAYTON ESTATES CO.  
THE DIRECTORS' REPORT

was as follows:—

Directors:—Messrs. V. A. Julius, A. R. Wilson Wood and H. Whitham.

The Directors beg to submit the Annual Balance Sheet and Profit and Loss Account for the year ending 31st December 1898.

After providing for depreciation of buildings and machinery the balance of profit available is Rs2,667-57. The Directors propose that a dividend of seven per cent be declared, making, with the interim dividend of four per cent, eleven per cent for the year, and that the balance Rs2,617-57 be carried forward to next year's account.

The crop of Tea secured from the Company's Estates was:—

	lb.	Increase...	lb.
Drayton ..	402,770	68,432	
Yuillefield ..	77,024	1,296	
Cwm ..	31,792	680	
Total ..	511,586	as against	460,000

estimated. The following comparative statement may be of interest to the Shareholders.

	Acreage.	Yield per Acre.	Acreage Pruned.	Acreage Mannured.
Drayton ..	722	565	305	306
Yuillefield..	207	384	117	37
Cwm ..	90	342	42	—

	Cost F.O.B. Exclusive of Manure.	Cost F.O.B. Inclusive of Manure.	Price per lb.	Profit per lb.
Drayton ..	22-23	27-07	46-43	19-36
Yuillefield..	28-29	30-13	46-06	15-93
Cwm ..	24-98	24-98	46-43	21-45

Expenditure for 1898 includes the sum of Rs20,886-70, cost of manuring 343 acres at Rs62-25 per acre as follows:—

	Acres.
With Artificial ..	268
With Bulk ..	35
Burying and Lining Prunings ..	40
Total ..	343

The estimate provided for 200 acres to cost Rs64-87 per acre.

The total cost of 511,586 lb. Tea, including above and Cwm rent, but exclusive of depreciation, was cts. 28-30 per lb., as against estimated 460,000 to cost cts. 27. Excess is explained by cts. 4-06 being spent on manuring as against cts. 2-41, estimated, so there is an actual saving of cts. 1-65 per lb. on other items.

Estimating that the tea unsold will fetch 48 cts. per lb., the nett value of the whole crop will be cts. 46-37 as against cts. 45-05 last season, shewing a profit of cts. 18-07 per lb. as against a profit of cts. 16-85 in 1897.

On Drayton the sum of Rs10,002-83 was spent on capital account, this includes putting wooden tats in one floor of factory, new sorting room and packer, new set 14 rooms lines, and iron roofing for 20 rooms,

a large new cattle shed, and opening up 8 acres of forest land in grass.

In view of largely increased yield on Drayton and the fact that neither the Turbine nor Engine are capable of driving more machinery, it has been decided to erect a small factory on Drayton division, capable of turning out from 12,000 to 15,000 lb tea per month.

The estimated cost of above is Rs20,000, and it is hoped that with more room a better class tea may be turned out, as present accommodation was insufficient to manufacture all the leaf in November and December. Some 20,000 lb. was sold at cts. 4 per lb. purchaser plucking the leaf.

The Company's properties consist of:—  
DRAYTON—

Tea in bearing ..	769	Acres.
Grass Land ..	26	"
Timber ..	10	"
Forest ..	9	"
Waste Roads, &c. ..	69	"

YUILLEFIELD—

Tea in bearing ..	218	"
Forest and Timber ..	7	"
Waste ..	8	"

Total...1,116 Acres.

THE ESTIMATED CROP FOR 1899

Drayton ..	440,000	lbs.
Yuillefield ..	90,000	"
Cwm ..	30,000	"

Total . 560,000 lbs. at an estimated cost of cents 27-50 per lb.

Estimate includes Rs17,800 = cts. 8 per lb. for manuring 330 acres with Artificial, 40 acres with Bulk, and Prunings being buried and lined on 70 acres, making a total to be manured of 440 acres.

In terms of the Articles of Association Mr. A. R. Wilson-Wood retires from the Board by rotation, and being eligible, offers himself for re-election as a Director.

The Shareholders will be requested to appoint an Auditor for the current year.

By order of the Board of Directors,  
HARRY WHITHAM, Secretary.

Colombo, March 18th, 1899.

TALAWAKELLE ESTATES COMPANY, LTD.

The following report was presented at the first ordinary annual general meeting of the Company held at the office of the Company on Tuesday, 28th March noon:—

The Directors have the pleasure to submit the balance sheet and accounts of the Company for the year ending 31st December 1898, duly audited.

The mortgage of Rs21,500, which was being arranged when the Prospectus was issued, was executed on 21st February. It bears interest at the rate of 5 per cent. per annum, and the principal is repayable in 14 annual instalments, the first of which Rs1,500 was paid on the 31st December last, and charged against the profit of the year.

The high rate of exchange averaging Rs 43-16d per rupee increased the cost of production. Owing however to the satisfactory prices obtained for the tea, the profit for the year compares favourably with that of the three years preceding, and is equal to over 12 per cent. on the cost price of the estates, after charging some Rs500 spent on factory extension and new machinery against revenue.

The total yield was 421,284 lb. Tea plucked off 802 acres, being at the rate of 525 lb. per acre, costing about 27½ cents or say 4½d per lb., free on

board Colombo. The gross average price of the 418,565 lb. sold in London was 10/57d per lb.

The Profit for the year inclusive of Interest, and after providing for General Expenses, &c., amounts to ... £7,691 9 5

Interest due Vendors and on the mortgage, less Income Tax, has been paid, amounting to ... 1,047 9 2

The first instalment of the mortgage of £21,500 has been paid, viz. ... 1,500 0 0

Dividend on the 6 per cent. Preference Shares for the year, less Income Tax ... 319 0 0

In Interim Dividend of 4 per cent., free of Income Tax, on the Ordinary Shares was paid on the 30th September... 1,482 16 0

*It is Proposed—*

To write off the whole of the Preliminary Expenses ... 193 0 6

To pay a Final Dividend of 6 per cent. on the Ordinary Shares, free of Income Tax, making 10 per cent. for the year, which will require... 2,224 4 0

And to carry forward (out of which Income Tax has to be paid) the balance of ... 924 19 9

£7,691 9 5

The Directors desire to place on record their appreciation of the efficient management of the Estates by their Superintendent and his Staff.

The Director who retires on this occasion is Mr. Charles Murray Robertson, who, being eligible, offers himself for re-election. Mr. John Smith, the Auditor, also retires, and offers himself for re-election.

PUNDALUOYA TEA COMPANY OF CEYLON, LIMITED.

REPORT.—To be presented at the Second Ordinary Annual General Meeting of the Company to be held at the Office of the Company Thursday, 30th March.

1. The Directors now submit their Report for the year ending 31st December, 1898, together with the Balance Sheet and Accounts of the Company made up to that date and duly audited.

2. The tea crop amounted to 627,986 lb., of which 627,740 lb. shipped to London realised a gross average of 9/27d. per lb. This crop, although exceeding that of the previous year by some 4,000 lb., is considerably less than was expected at the commencement of the year, a result due to unfavourable weather in the first six months.

The cost of the production in rupee currency is less than in 1897, but in consequence of a higher average rate of exchange the sterling cost of production is slightly greater.

3. During the year 106 acres of land have been planted with Tea, and a further 30 to 35 acres have been opened and partly prepared for planting in the rainy season of 1899, while Tea Nurseries have been laid down for future extensions. The cost of this has been charged to Capital Account, as well as the cost of new machinery.

4. The following statement gives details which may be of interest:—

Season.	Acres Plucked.	Total Tea Crop.	Yield per Acre.	Cost of Crop per lb. f.o.b. Colombo.	Gross Average Price obtained per lb. Tea.	Average rate of Exchange per Rupee.	Dividend on Ordinary Shares.
	acres	lb.	lb.	d.	s. d.	s. d.	
1898	1,640	627,886	383	5/29	9/27	1 4 3/16	6%
1897	1,640	623,699	380	5/23	9/52	1 3/4	6%

5. The profit for the year inclusive of Interest and after providing for General Expenses, &c., amounted to £7,419 12 4 To which has to be added the Balance from last year of making Total of... 340 16 7 ... £7,760 8 11

The Directors have already paid out this, Interest for the year upon the Mortgage, less Income Tax ... £441 17 4

Dividend for the year upon the 6 per cent. Preference Shares, less Income Tax ... 1,914 0 0

Income Tax ... 317 10 8

And they propose to deal with the Balance as follows:— To pay a Dividend of 6 per cent., free of income Tax, on the Ordinary Shares, requiring ... 3,960 0 0

To Transfer to Reserve for Depreciation and General Purposes (increasing this Account to £2,500) ... 1,000 0 0

And to carry forward the Balance of ... 127 0 11 £7,760 8 11

6. The Director who retires on this occasion is Mr. Charles Murray Robertson, who, being eligible, offers himself for re-election.

7. Mr. John Smith, the Auditor, also retires and offers himself for re-election. By order of the Board,

ROBERTSON BOIS & Co., Agents and Secretaries.

STRAITS SUGAR INDUSTRY.

To "The Straits Sugar Company, Limited," which has recently been formed, already one of the company's new estates (Gedong) has begun to assume a definite shape. A large area of jungle has been cleared; canals and drains have been dug; and cane planting has commenced. Mr. Stothard is opening up a large block of land in Lower Perak, lately conceded to the new company by the Perak government. In addition to cultivating canes on the company's behalf, Mr. Stothard is prepared to give out land, free of rent, to any cultivators who are able to show that the land handed over to them will be planted up in canes within a reasonable time. Advances will be made by the company as work progresses, the company buying the canes, when ripe, at a fixed price, and deducting the advances from the proceeds.

THE TRAVANCORE TEA ESTATES  
COMPANY, LIMITED.

The annual ordinary general meeting of the shareholders of the Travancore Tea Estates Company, Limited, was held at the offices of the company, 20, Eastcheap, yesterday (Thursday).

In the absence of the Chairman of the Company the chair was occupied by Mr. H. K. Rutherford.

The Secretary read the notice convening the meeting.

The Chairman, in moving the adoption of the report and accounts, said:—I happen to be in the chair today by the unavoidable absence of Mr. McKenzie, the chairman of the company, who is at present in America in connection with the joint enterprise of India and Ceylon in pushing British-grown teas in that country. Another of our colleagues, Mr. Talbot, is absent in Ceylon where he had an opportunity of meeting our Estates manager, Mr. Knight, and going into various matters connected with the management. Mr. David Reid's absence, I regret to say, is due to the fashionable complaint of influenza. My duty today does not demand of me any lengthened statement of the position of the company, as the reports and accounts explain that position very clearly. Perhaps it would be well to take the accounts first. You

\* 30 to 35 acres cleared and partly prepared for Tea Planting.

will note in the balance-sheet the capital issued is £70,000, or £14,500 more than it stood at a year ago. That difference arises from the 10s per share called up on the 21,000 ordinary shares amounting to £10,500, and an issue of £2,000 in ordinary shares and 2,000 in preference shares amounting to £4,000, as payment for part of Pambanar Estate. There is next a sum of £1,150 15s 1d placed to reserve which, as you will doubtless remember, represents the profits earned between the date from which we took over the properties and the date of registration of the company, and which sum was not legally available for dividend. Bills payable and sundry creditors amount to £28,443 3s 9d. The proportion of this sum which is chargeable to capital account as the bills fall due is provided for by issuing debentures against the same, and up to the present time we have issued £25,000 of debentures. On the other side of the account you will note the cost of estates amount to £91,016, and this is £31,635 more than last year—a very large sum, but necessary for the land we have opened up. This sum is made up of £11,400 for payments for land, £15,553 for new clearings and upkeep of land not in bearing, and £4,682 for buildings and machinery. In the profit and loss account you will observe the profit on sales was £2,031 or £814 less than the previous account, but which you will remember was for a period of fifteen months, so the profit is practically about the same. You will note the directors again give their services free, and that the London expenditure is remarkable for its moderation. The balance of profit is £2,358 2s 8d, which admits of the full preference dividend being paid, and leaves a balance of £241 2s 8d to be brought forward to next year. Now we cannot pretend to say this is a very satisfactory result, but when you take into consideration that the fall in the price of our tea of 3d per lb. and the higher rate of exchange has curtailed our profits some £1,500, you will perhaps agree we have been fortunate in coming out as well as we do in probably one of the worst years the British-grown tea industry has had. The crop was unsatisfactory in quality and yield, but we see hopeful signs of better results in the current year in both of these particulars. You will note we have planted up nearly 1,300 acres with tea, which is a great deal to accomplish in one season and great credit is due to our manager Mr. Knight and his staff for the work they have been able to get through, and which we are led to believe is good work and that the clearings promise to be successful. Now with regard to our debentures, we told you at last meeting we were contemplating such an issue and I am happy to state we have been able to carry this matter through. The debentures are for a total issue of £50,000 of which we hope only £44,000 will be required. They are repayable at par on January 1st 1904, and are only being issued as we require the money. When this issue is completed the estates with factories, will have cost us about £32 per acre which is a reasonable price. As to the future we are of course, mainly dependent on the selling price of tea, and if this continues to keep about its present level which is considerably higher than last year—1d or 1½d per lb.—I have no fear whatever but that the other important factors of yield and cheap production will not be found wanting. We can only ask the ordinary shareholders to exercise patience until the estates come into bearing, when we trust the hopes of your directors may be realised. I shall be very pleased to give any further information

that any shareholder may desire to ask and now beg to move the following resolution:—

“That the report and accounts be adopted.”

The proposal was seconded by Mr. H. Tod and carried unanimously.

Mr. White then moved the re-election of the auditors Messrs. Harper Brothers, which was seconded by Mr. Dangerfield and carried unanimously. The meeting concluded with a vote of thanks to the chairman, directors and managers.—*H. and C. Mail*, March 22.

## TEA IN GREAT BRITAIN.

### IS THE DUTY TO BE INCREASED?

This will be definitely known on April 13, when Sir Michael Hicks-Beach places the Budget before the House of Commons, but the following remarks taken from the columns of the *Yorkshire Post*, a leading provincial conservative paper, seem to point to the possibility:—

We are now within a fortnight of the end of the financial year. The *Statist* thinks that the revenue will much exceed the estimate which Sir Michael Hicks-Beach placed upon it last April, and that the Chancellor of the Exchequer will be justified in anticipating a still larger yield in the coming year. Trade no doubt continues good, the foreign and colonial outlook is better politically and commercially. If only our expenditure could be held in check the path of the Minister of Finance would be rosy. But that will not be possible. We are already committed to an expenditure which cannot be met by the existing standard of taxation, however buoyant may be the sources of revenue. Assuming that we may reckon on an income of £109,000,000—which would probably be something like a million more than that of the present year—there must be a deficit in prospect of at least three millions, for the estimated expenditure is not less than £112,000,000. We are still in the dark as to how this margin is to be met. The grocery trade is, we observe, somewhat agitated over the possibility of some of its staple commodities being affected by fresh taxation. Most of the controversy seems to circle round the item of sugar, but an Edinburgh firm of tea merchants has had its eye upon the warping we offered ten days ago that the charms of tea might well attract the attention of Sir Michael Hicks-Beach, and has embodied it in a circular which it is issuing to its customers on the subject. The *Grocer* also takes note of the contingency, and counsels the trade to be on the alert and make provision against the evil day. It is unnecessary to say that we pretend to no specific knowledge of what is likely to happen. What we said on the subject was said in the way of argument that if fresh taxation is necessary it should come in the form of an indirect charge such as would fall equitably on all classes, and that there is no reason why the reduction made in the tea duty a few years ago should be regarded as permanent under all circumstances. No doubt there is a larger party in favour of a restoration of the sugar duties, and of course there is behind this feeling a desire to hit the bounty-fed sugar and to assist the West Indian planters. But if the Government selected sugar for revenue raising they would scarcely place the tax on the basis of a countervailing duty on bounty-fed sugar. They would be raising two thorny questions at once instead of one. The objection to reviving the duty on sugar at all is that sugar has become the raw material for a very important industry in this country, one that is vastly greater and more widespread as a source of employment than that of the refineries, which were injured by the influx of cheap sugar from the bounty-giving countries.

#### NO SUCH OBJECTION

applies to the duty on tea. It is a mere article of domestic consumption, and if we could afford to pay a sixpenny duty on tea a few years ago we can

better afford to pay it now, when the cost of producing it is lower and the wages of every class are higher than they were then.

It is whispered (says another London Correspondent) in well informed City circles that the Government, instead of announcing increased taxation in the forthcoming Budget, will propose a loan, to be called the “Warship Loan,” with the object of paying for the necessary naval increase. Particulars, it is understood, have not yet been definitely concluded; but the amount will, of course, be for some millions, and the interest probably  $2\frac{1}{2}$  per cent.

**SOUTH AFRICAN FRUIT.**—Says the *Spectator*: Cape growers are not handicapped, as are those in the West Indies, by want of adequate steam service or easily reached markets. The huge increment of wealth in the gold-fields has caused passenger lines to increase their steamers in number, size, and accommodation. These steamers, meant to carry those enriched by the goldfields, or those who in hope of being rich are careless of expenditure, are the ideal vessels for fruit transport,—speedy, roomy, and furnished with ample cold storage. Yet Cape fruit, except the little black grapes, is very dear. It is still a costly luxury, not a popular delicacy. The Japanese plums grown in South Africa were this week selling at a shilling a piece in Covent Garden, Cape peaches were eightpence each, and pears eightpence. The quality of all three kinds was perfect, but they could only be regarded as specimen fruit. While the crop remains dear and uncertain it is not strange that little Cape fruit is yet imported, compared with the demand. The blame lies entirely at the doors of the growers themselves. Their Government is endeavouring to awaken Afrikaner opinion on the subject. They need teaching that only the best fruit is wanted here, that this must be carefully sorted, beautifully packed, so that in the package the fruit looks like a piece of decoration, or, at least, as fresh as when plucked, and that *then* the English public will pay a good price for it. At present the farmers are mostly too ignorant and indolent to do this. The fruit, as the Government botanist complains, is thrown into kerosene tins, or any chance receptacle, and sent off to be hawked about the local towns instead of being properly graded and sold in Europe and America. They should be taught the methods of California. Unlike the Cape, California has no near markets, as at Cape Town and Johannesburg. The shortest journey is to Chicago, two thousand five hundred miles by rail, which costs £10 for every ton of fruit. New York is three thousand five hundred miles distant, yet tens of thousands of tons are sent by rail to each city. They also ship their fruit another three thousand miles by sea from New York to England, making six thousand five hundred miles in all; and they make this pay, though their season is the same as our own. If California had the season of the Cape, and could get its peach and grape crops into our market in the winter and spring, it would double its industry. But the organisation of the Californian growers is perfect. The Fruit Growers' Union, in “acre shares” so that the smallest and the largest owners are members, collects the fruit, despatches it, and finds a market. The Cape growers have only to study the Californian system of business and modern modes of culture, and Nature will complete an industry as valuable as the goldfields and more lasting.

## TEA IN AMERICA.

NEW YORK, March 8.

The following United States Treasury circular refers to Foochow and Amoy teas:—

TREASURY DEPARTMENT, Feb. 27, 1899.

*To Collectors and other officers of the Customs:—* In accordance with the recommendation of the board of tea experts, Department's regulations under the tea Act of March 2, 1897 (Synopsis 17895 and 18933), are supplemented as follows:

All Foochow and Amoy teas will hereafter be compared with both the Foochow and Amoy standards, and, if found equal in drawing quality and infused leaf to either, the tea may be admitted. It should be understood, however, that the tea need not be of the same character as to drawing qualities as either standard, so long as it is equal in general sweetness.

This rule will be followed until the adoption of new standards to be prepared by the present board of tea experts.—Respectfully yours,

W. B. HOWELL, Assistant Secy.

The latest London Circular, February 24, reports a strong demand for tea under about 83, which advanced  $\frac{1}{4}$  to  $\frac{3}{4}$  per pound. The average price of Ceylon for the week was 8 66d, against 7 23d, same week in 1898. Indian tea sold, averaged 9 42d, against 8 15d in 1898.

PHILADELPHIA, March 4, 1899.

Editor, American Grocer:

Sir,—Since the effects of the blizzard have passed away it is gratifying to note the very large number of inquiries that are being received from all over the country for 'teas for price,' but particularly so from the West and South. From the tenor of the letters we note that interior supplies of teas must be very low indeed, as the requests for a prompt mailing of samples suggest that fact very plainly. Country greens and Foochows, with here and there an inquiry for Japans, are mostly in demand. Dealers here expect a very lively trade from now until the middle of April, when it is believed that no teas of any kind, green or black, will be obtainable under 25 cents.

THOMAS MARTINDALE.

Some of the worst rubbish that ever bore the name of tea is being sold in a jobbing way at 22 cents per pound; one dealer says it's poison. The Tea Act has made a fine market for all the trash and accumulations of years. Good low-priced tea is in light supply and very firm. The character of the market will be developed at the regular monthly auction sale, at noon today, held by the Montgomery Auction Company and comprising 9,801 packages, viz: 503 half-chests Moyune; 50 boxes Pingsuey; 97 half-chests Japan, basket-fired and Sundried; 493 packages Congou, a varied assortment, including small boxes; 193 packages India and Ceylon Pekoe; 1,099 half-chests and boxes Amoy; 529 half-chests Foochow.

## INDIAN TEA.

Although we are not one of those who advocate "whistling ere we are out of the wood," it must be conceded that both the tea and indigo seasons are commencing under more than usually favourable auspices. Not only are stocks of both being depleted in the home markets, but purchasers here are diverting no inconsiderable quantity direct to foreign centres of consumption, or, at any rate, of distribution. Direct shipments of tea from Ceylon to America and Russia, coupled with the expansion of the Gulf trade *via* Bombay, ought to have a hardening tendency on London prices that should more than compensate for the possibility of exchange coming up another halfpenny. Still the markets need careful watching, and we hope our remarks as to the undesirability of sending forward coarse teas, at all events in the early part of the season will not be unheeded.

As yet we regret being unable to record that any unanimous decision has been arrived at on this point and would urge upon the heads of the agency houses the advisability of coming to some mutual understanding with as little delay as possible for already there are opinions expressed in the districts of beating last year's outturn *in quantity*, this intention being also apparent in the estimates placed before the shareholders at several recent meetings. Almost all anticipate an excess over the past year, and the early storms seem to justify the realization of such. With reference to Ceylon's crop, there would appear little difficulty in disposing of it to advantage, as for some unexplained reason our competitor's teas have acquired a greater popularity in the Colonies and Canada than our own, and much the same may be said as to the Russian demand.—*Indian Planters' Gazette*.

## COOLIES AND TEA PLANTING IN ASSAM.

The number of adult coolies per 100 acres of tea in Assam is now nearly double what it was sixteen years ago, the actual number now employed per 100 acres being 129. Planters as a rule are now well aware that a strong labour force ensures the health and contentment of their coolies, as well as thoroughness of cultivation, and they have profited by the facility of recruitment during the last two or three years to secure this. There is also a considerable increase in the land cultivated by time-expired coolies. Sixteen years ago only 4,584 acres were held by ex tea garden coolies, and there is now nearly 70,000 acres under such cultivation; even this figure does not adequately represent the land held by emigrants, as in the Assam Valley many coolies rent land from the gardens on which they are employed, or from Assamese ryots, while the land rented from the zemindars of Sylhet and the mirasdars of Cachar amounts to many thousands of acres.—*Indian Planters' Gazette*.

CARDAMOMS.—The long list of sales in London of Ceylon cardamoms, published by us lately shews the growing importance of this industry. We notice that the exports up to 28th March last compare as follows:—

1st January-28th March 1899 158,361 lb.

" " " 1898 134,116 "

Mr. T. N. Christie has something to say about cardamoms in an interview which will be found fully reported on page 776.

MESSRS. I. A. RUCKER & BENCRAFT report on coffee March 23rd:—"Since the commencement of December last little progress has been made in the relative position of receipts. Then we were 1,500,000 bags behind, and were talking of an 8,000,000 crop, today we are 1,650,000 bags behind, and are looking for a crop of 8,750,000 bags. Last year at this time values of Rio and Santos were about what they are today. Exchange was however 6 $\frac{1}{4}$ d and went decidedly lower, today it is 7d, and expected to go higher. The sentiment of the market is languid, because in the notable absence of estimates the worst is anticipated. Two factors however, continue, which some day will alter things, viz, the steadily increasing consumption, and the steadily decreasing inclination to produce. Term absolutely unchanged on the week, cost and freight steady, but more inclination to sell forward shipments."

## PRODUCE AND PLANTING.

**KEEPING UP THEIR SPIRITS.**—A few months ago most of the newspapers were very pessimistic on the subject of tea. The industry was in a bad way, and tea planting had been altogether overdone. There is a different tone observable now, and the "Leeds Mercury," a journal which claims credit for being cheerful on the subject of the outlook when other papers were very gloomy, congratulate investors on the brighter outlook. It says: "A few months ago, when the outlook in the Indian and Ceylon tea trade was popularly regarded as extremely black, we sought to infuse a more hopeful spirit amongst investors in tea shares. Up to that time it was the fashion to refer to the high rate of exchange as an influence that was likely to work havoc with this particular industry, but we pointed out that it had its advantage, inasmuch as it was calculated to restrict over-production, which was, from our point of view one of the main causes of the trouble that had overtaken the trade. Since then the situation has greatly improved. The consumption of Indian tea has once more reached a record level, having for 1898 exceeded the production exported from India and Ceylon by no less than 2,594,000lb. The excess of the exports over the world's consumption ranged during the three years 1895-6-7 from about 6,000,000lb. up to 7,000,000lb. The last occasion on which consumption was ahead of the export from countries of production was in 1894, when the excess amounted to 4,945,000 lb. In regard to prices of Indian tea, the average obtained on garden account for the past week was 9.27d., in comparison with 8.20d for the corresponding week last year. The average since June 1 to date was 8.70d. as compared with 8.77d, while as regards Ceylon tea, the average was 8.30d, as compared with 7.63d. Looking broadly at the position, it is obvious that the maintenance of a high rate of exchange is not inconsistent with a marked improvement in the trade, and we should say that the future has about it many elements of an encouraging nature. We look for an improved state of the share market, and think that investors on the look-out for shares likely to undergo enhancement in price could do worse than give their attention to these specialities, confining their purchases for the most part to preference shares. Prices are well above the level at which they stood when we last dealt with this question, and there is little reason to doubt that they are destined to advance still further."

**THE TEA TRADE OF THE UNITED STATES.**—The effect of the tea duty imposed last year in the United States to meet war expenses, a duty by the way which is not expected to be removed until 1900, has been to reduce importations to the lowest point. Importations for warehousing have not fallen off, but the withdrawals for consumption upon which duty is actually paid have been much less. An American paper gives the following figures, giving the comparison in the importation of tea in 1897 and 1898, and showing the countries from which tea is shipped to the United States: France in 1897 sent 209 lb. and in 1898, 333 lb.; Germany in 1897, 39,093 lb., and in 1898, 586 lb.; Italy in 1897, 367 lb., in 1898 640 lb; Netherlands in 1897, 20,143 lb., in 1898 280 lb.; Russia, on Baltic and White Seas, in 1897, 600 lb. in 1898, 270 lb., the United Kingdom in 1897 sent 6,217,726 lb., and in 1898, 2,971,116 lb.; Nova Scotia in 1897, 90,531 lb., in 1898, 27,128 lb.; Ontario, Quebec, &c., in 1897 sent 2,156,758 lb., and in 1898, 1,305,817 lb.; British Columbia in 1897, 1,005 lb., in 1898, 168,336 lb.; China in 1897 sent 53,524,546 lb., and in 1898, 39,754,736 lb.; India (and including, presumably, Ceylon) sent 2,117,433 in 1897, and 2,237,897 lb. in 1898; Japan in 1897 sent 45,465,161 lb., in 1897, and 22,798,308 lb in 1898. About 4000,000 lb. of tea were sent from Hong Kong in 1897, but only 189,972 lb. in 1898.

**WONDERFUL.**—Excessive tea drinking, some medical authorities have stated drives people mad, especially in Ireland, but in New York it is coffee that works

the mischief. The noted specialist, Doctor Elton, tells us that American women of the middle classes remain too much indoors, drink extravagantly of coffee, and brood too much over their inability to compete with the wealthy women whose doings are advertised in the daily Press. This is the great cause of insanity. It is but fair that coffee should have a turn just by way of a change. It will be time that sugar had an innings soon.

**RUBBISH MASQUERADING AS TEA.**—Five hundred and, eighty two half-chests of stuff called tea (about 30,000 lb), which recently arrived at the Albert Docks, and were seized by the sanitary authorities of the Port of London, were brought to the West Ham Police Station on Tuesday and submitted to Mr Gillespie, one of the magistrates. The tea which was said to have been submerged in Marseilles Harbour, looked like a mixture of mouldy manure and black and green mud, and Mr. Spadaccini, one of the food inspectors, asked that it might be destroyed. Dr. Collingridge, the medical officer of health, in supporting the application, said he had made experiments and found that though the tea was so bad it could be "faked" and put on the market in such a condition as to deceive the purchaser. Mr Gillespie ordered the whole consignment to be destroyed under the supervision of Customs officers.

**A BIG CHEQUE FOR DUTY.**—Lipton, Limited, have paid Her Majesty's Customs a sum of £76,847 9s 1d, representing a clearance of over 2,000 tons of tea, a quantity equal to the average weekly consumption throughout the whole of the United Kingdom.

**CINNAMON AS A CURE FOR INFLUENZA.**—Cinnamon should be in increasing demand. Dr. Carne Ross, in the current number of "The British Medical Journal," claims to have discovered a cure for influenza. His remedy is simple. All that one has to do, according to Dr. Carne Ross, is to dose oneself with cinnamon as soon as one feels the grip of the microbe. The doses have to be repeated at intervals, first of half an hour and then of an hour, until the temperature becomes normal, and the patient must stay indoors for twenty-four hours afterwards. By that time, Dr. Carne Ross believes, the disease will have disappeared. This is not the first time that cinnamon has been suggested as a specific for influenza. But its properties seem now to have been tested with unusual thoroughness, during a period of five years, and the result has made the investigator an enthusiastic believer in its value.—*H. and C. Mail*, March 24.

**WOOD PRESERVATION.**—A process of seasoning wood which, it is stated, will in about a fortnight render timber as well seasoned as is accomplished in five years by storage in the usual way has recently been attracting attention. According to "Nature," an effort is being made to introduce the method, which is known as the Nodon-Bretonneau method, into this country. The system consists in placing the timber to be seasoned in a large tank and immersing all but an inch or two in a solution containing ten per cent. of borax, five of resin, and three-quarter per cent. of carbonate of soda. The lead plate upon which it rests is connected with the positive pole of a dynamo, the negative pole being attached to a similar plate, arranged on its upper surface so as to give good electrical contact, and the circuit is completed through the wood. It is stated that under the influence of the current the sap appears to rise to the surface of the bath, while the aseptic borax and resin solution takes its place in the pores of the wood. This part of the process requires from five to eight hours for its completion, and then the wood is removed and dried either by artificial or natural means. In the latter case about a fortnight's exposure in summer weather will complete the process.—*Daily Chronicle*, March 17.

PORTMORE TEA COMPANY OF CEYLON,  
LIMITED.

Offices.—24, Rood Lane, London, E.C.; Directors.—R. C. Bowie, L. M. Torin, W. Herbert Anderson; Secretaries—Shand Haldane & Co.; Manager in Ceylon.—R. C. Grant.

The Directors have the pleasure to submit the General balance Sheet and Profit and Loss Account for the year ending 31st December 1898, duly audited.

	£ s. d.	£ s. d.
The net amount at Credit of Profit and Loss Account after providing for General Expenses, Income Tax, &c., and writing off New Clearing Account £238 19s. 1d.		5,167 8 5
An Interim Dividend of 5 per cent. was paid 19th August, 1898, amounting to ...	2,000 0 0	
It is proposed to pay a final Dividend of 7 per cent. (making 12 per cent. in all, free of Income Tax) which will absorb ...	2,800 0 0	
And to carry forward to next year a Balance of ...	367 5 8	
		£5,167 5 8

In presenting their second Annual Report, the Directors have pleasure in recommending a dividend of twelve per cent.

The yield of tea has been 241,686 lb. being at the rate of 509 lb. per acre, the cost of production has been £4,349 8s. 8d. being at the rate of 4d. 319 per pound and the crop has netted £9,878 8s. 5d., being 9d. 80 per pound equal to a profit of 13.82 per cent. on the capital of the Company.

The average rate of exchange for year has been 1s. 4 5-6d. against 1s. 3 29-6d. during 1897.

The latest reports from the Manager in Ceylon describe the estates, buildings, and machinery as all being in good order and the estimates of crop and expenditure for the current year give promise of continued satisfactory results.

The Directors desire to express their unqualified satisfaction with the manner in which the Manager and the Superintendent of the estates in Ceylon have discharged their duties during the year.

By Order of the Board,

SHAND HALDANE & Co., Secretaries.

PLANTING NOTES.

QUININE SPECULATION has gone ahead strong this week, and cinchona is also in a similar position.—*Chemist and Druggist*.

PEARLS and MOTHER-OF-PEARL.—Everything connected with this subject is of interest in Ceylon; for who does not anticipate the day when lucrative Pearl Fisheries will be resumed off our North-West Coast, and when not only the pearls but the shells will become an object of merchandise and trade?

THE "NILU:" ITS DISTRICTS, HABITS, FLOWERING, &c.—We direct attention to another interesting letter from Mr. Thomas Farr who did so much to help Dr. Trimen in describing the "Nilus" in his "Ceylon Flora." Mr. Farr mentions there are perhaps 30 different kinds in the island. Dr. Trimen gives the names of 28 species and considers all but three to be endemic; but he thinks there may be other local species undetermined from not having been met with in flower.

COCONUT PLANTING IN THE STRAITS.—Here is news of progress in Lower Perak in the local *Gazette* of March 10th:—Two Chinese planters from Province Wellesley applied on behalf of themselves and their brothers for 1,920 acres of land, at Bagan Datoh in this district, for coconut planting, on similar terms to those given to a recent European applicant in the same locality. One hundred and forty-six Tamil immigrants arrived here on the 30th in the steamer "Perse"

CEYLON TEA IN FOREIGN AND COLONIAL MARKETS.—It is certainly a little self-denying on the part of the well-known Rood Lane firm of Tea Brokers to express their great satisfaction—see their letter elsewhere—at the process which has taken away so much tea from the London Market during 1898—a process which is bound to go on during 1899, making Colombo a more and more important tea market for the supply of Australasia, America, Africa, the rest of Asia, Russia and the rest of the Continent of Europe direct, to the great advantage of our tea industry.

SEASON REPORT.—The following is an abstract of Season Report for the month of February for the Galle District:—Paddy; maha harvest has been reaped, and preparations are being made for the sowings of yala. Miscellaneous: the supply of vegetables is poor. Coconut crop fair; price varies from R3 to R4. Prices of staple food: rice, R3 to R4 per bushel; paddy, R1.50 to R2 per bushel; kurakkan, R2 per bushel; and anna, R1.50 per bushel. Health satisfactory; a few cases of chicken-pox and dysentery prevailed during the month. Rainfall: 2.21 in.

CEYLON TEA COMPANY DIVIDENDS.—Our Special telegram from London affords information as to the dividends declared by a number of Sterling Tea Companies in their annual Reports just published. No one mentioned can be considered to make a brilliant appearance, the 6 per cent given by the Pandaloya Company being the highest. The Yatiyantota Company has, however, doubled its dividend of 1898 which was only 2 per cent; but some others of the Companies have done much worse. On the other hand the 5 per cent interim dividend of the flourishing New Dimbula Company is 1 per cent more than it was a year ago.

EUCALYPTUS GLOBULUS IN SCOTLAND.—Having read several letters in the *Gardeners' Chronicle* about these trees, my experience in the open here may be of interest. Some fifteen years ago a plant of Eucalyptus Globulus was put out against a south wall of this house. The plant has thriven since, and now covers the entire wall, the top of the tree having been cut off many years ago to encourage the branches to spread. In 1894 this plant flowered freely. I gathered the seed in 1896, and sowed it in February, 1897. Almost every seed came up, and these are now splendid young plants, all of which I intend planting out when two years old. In the autumn of 1897 I planted in the woods two young E. Globulus, about 7 feet high, both these have grown rapidly, one making a growth of 9 feet 4 inches during the past summer. This plant is growing in a very wet peaty soil; the measurement was taken on September 30, and is accurate. Seventeen degrees of frost was registered here in November last, but neither plant was in the least affected, Logan, Mull of Galloway, N.B.

TEA IN AMERICA.

New York, February 22nd.

The new tea law goes further than the exclusion of impure or adulterated tea, and makes a quality standard. The result has been a general improvement of quality, but the question has been raised, and not without reason, that it is beyond the province of the United States Government to establish standards of quality. Naturally, some will ask, if the United States Government fixes a quality standard for tea, why not for sardines, spices, or coffee, of which some very inferior and trashy lots are imported? The chairman of the Board of Tea Experts, Mr. Phelan, in a letter to the Assistant Secretary of the Treasury, makes answer to this and says:—

The reason for the incorporation of "quality" in the present law is because of the failure of the original tea law on account of not having "quality" established as a test. Under the old law "quality" was not mentioned, but the tea examiners were instructed to exclude teas which had "an adulterated, spurious or exhausted leaf, or such an admixture of chemicals or deleterious substances as to render them unfit for use."

After ten years' trial it was proved conclusively that no two tea men could agree on what was adulterated, spurious or exhausted leaf, or what constituted what was unfit for use. This law resulted in two evils—first, wild inconsistency and constant injustice; and second, the gradual admission of anything that had the appearance of tea, until the country became deluged with the trash of the world to such an extent that the very existence of tea as an article of consumption became jeopardized.

To remedy all this and establish the most certain guide known to tea men the term "quality" was, with great care, incorporated in the new law as the only test which could be used with a minimum amount of uncertainty and inconsistency.

Mr. Phelan attributes the reduced imports to former importations of trash. This is true in part, but another cause is the narrowing of the difference between the relative cost of tea and coffee. One pound of tea at 50c, would make six gallons of infusion, costing 8½c per gallon; while one pound of coffee at 15c, would make two gallons of infusion, costing 8½c, and if the coffee cost only 9 or 10c per pound, the infusion would cost only 4½ @ 5c per gallon, while a 35c tea would make the beverage cost about 6c per gallon. If, however, a Ceylon or India tea is used, one gallon of infusion will cost from 5 @ 8c per gallon, making it a cheaper beverage than if Japan or China sorts are used, as one pound makes 10 to 16 gallons of infusion. The decline in the cost of coffee makes it relatively the cheaper beverage and that, in part, accounts for the increased imports of coffee since 1896, and the decreased imports of tea. The net imports of the two articles compare as follows:

	1896.	1898.
Tea.....	\$3,549,331	66,290,691
Coffee.....	621,429,664	781,028,817

Trashy coffee is freely imported, but it does not seem to reduce consumption. Regarding the workings of the tea law, Mr. Phelan says:

After only one season and a half we have had almost all the evils of fifty years abolished from the trade and the country. The millions of pounds of decayed and spurious leaves with which we were inundated have been at last eliminated, as well as all the trashy and worthless flavors which have been so unfit for use as almost to drive tea out of consumption. This has been accomplished without any advance of price, excepting on the very trash which it was desirable to exclude. Until a recent advance, on account of the imposition of a duty which deterred importation, all the teas which had any substantial merit were sold at a lower price than ever before in the history of the tea trade. Good flavored Oolongs are procurable in large quantities for 14c. per pound

in bond, and good sweet young Hysons at 13½c per pound, the same quality of Congous (English breakfast) at 14c. per pound, and Japans from 15 to 16c. per pound. There is hardly an impure leaf in the entire importations of teas to America during the present season, and we go on record as receiving the finest crop of teas, not only in our own history, but in the history of any other nation.

The consumer has been thoroughly and absolutely protected without increase in price for fair quality, excepting by the recent duty imposed by Congress. The representation, therefore, made in the brief that great injustice has been done to the poor man is entirely at variance with the universally acknowledged facts.

In this connection we republish the statement from last week's market report, showing the importations of tea in 1898, and the sources of supply, as follows:—(Already given.)

The above shows that Japan furnished 45 per cent of the total imports; China, 44½ per cent.

Before the 10c per pound duty, a very good tea was retailed at 20 @ 25c per pound furnishing a wholesome and palatable beverage at 3½c @ 4½c per gallon, but now coffee is the cheaper drink, for which and beer the American people seem to have a decided preference. The value of the 1898 imports of tea was \$9,608,252, against imports of coffee valued at \$62,674,241.

Demand quiet, but the market is strongly held on all medium and low-grade teas.—*American Grocer*, Feb. 22.

THE INDIAN TEA ASSOCIATION (LONDON.)

The following is the interim report of the American and Foreign Tea Committee:—

The committee now have the pleasure to lay before the members, as is usual at this time of the year, a review of the work undertaken during the period that has elapsed since the annual meeting, which was held in July last.

The subscriptions to the fund raised for exploiting new markets during the year amounted to R1,02,031 collected in Calcutta as compared with 1,02,029 in 1897 and 1,03,674 in 1896. The planters in Southern India have, as before, contributed liberally to the fund, and a subscription of £200 from a London subscriber was again received last year.

A war tax of ten cents per lb of tea imported was imposed last year by the United States Government towards meeting the cost of hostilities with Spain. This has had the effect for the time of seriously curtailing the importation of all tea, and has been a great hindrance to business. On the other hand, it has served as a useful advertisement, enabling attention to be called to the economy effected by using British-grown teas in performance to those of other countries.

It is gratifying to learn that the prospects of India and Ceylon tea are much brighter in consequence of the strictness with which the law excluding poor tea is enforced in America. This falls heavily on the low class tea of other countries, although the recent sharp rise in the value of common tea must have a tendency for a time to check the expansion of the trade.

The committee refer members to the accompanying report received from Mr. Blechynden, under date New York, January 10th, in which he reviews the work for the year 1898. The Commissioners for India and Ceylon have been continued to co operate to the mutual advantage of both association.

Fewer demonstrations have been organised during the year, as this work is been done by packet firms and others engaged in selling tea, but more money has been spent in subsidies and grants to those doing the work of educating the public and pushing our teas

Advertisements have continued to be inserted in principal papers, and are followed by those of houses dealing in British-grown tea.

The committee call attention to Mr. Blechynden's remarks in his report on unfermented or Oolong tea, for which a demand exists, although it must be borne in mind that this is a distant class of tea for consumption in America alone, and failing a sale there, cannot be diverted to other markets.

The committee have to thank Messrs. Gow, Wilson and Stanton for the following figures, which show concisely the progress made in the use of India and Ceylon tea in North America:—

		India and Ceylon tea taken by the United States and Canada each of the last seven years:—			
		1898.	1897	1896.	
		lb.	lb.	lb.	
Indian	..	5,972,000	.. 5,663,000	.. 5,259,000	
Ceylon	..	7,637,000	.. 5,699,000	.. 4,365,000	
<b>Total</b>	<b>..</b>	<b>13,609,000</b>	<b>.. 11,362,000</b>	<b>.. 9,624,000</b>	
		1895.	1894.	1893.	1892.
		lb.	lb.	lb.	lb.
Indian	4,072,000	.. 2,428,000	.. 2,111,000	.. 1,586,000	
Ceylon	3,745,000	.. 2,295,000	.. 1,871,000	.. 1,490,000	
<b>Totals</b>	<b>7,817,000</b>	<b>.. 4,723,000</b>	<b>.. 3,982,000</b>	<b>.. 3,076,000</b>	

The above figures show that a trade has now been established which may be expected to continue to increase. Your committee are of opinion that the work Mr. Blechynden has been engaged in during the last five years, since his return to America in May, 1894, has been productive of much benefit to the industry and has been well performed, but there are now so many well-established and powerful agencies at work in the United States and Canada, whose interest it is to push British-grown tea, both by means of travellers and by the distribution of samples through the post and otherwise, that the committee consider the further expansion of the trade may safely be left in their hands, and that it is not necessary for the Association to continue a special agency for the purpose. Any further assistance that may be required should, your committee think, take the form of subsidies.

Your committee hope to give more attention in future to the other new markets for our teas that are opening out on the Continent, particularly in Russia and France, and especially in connection with the forthcoming Paris Exhibition in 1900, where it is hoped that a good impression may be made by the arrangements that are in contemplation for serving Indian tea in connection with the building for Indian Imperial exhibits. It is expected that 38 millions of persons will visit Paris next year.

Funds will be needed for these purposes and for assisting in the work of pushing the sale of our teas in France, Russia, Germany, Turkey, South Africa, or elsewhere.

Your committee therefore recommend that a levy be raised in Calcutta on the same lines as before, but on the understanding that the funds shall be employed to push Indian teas in any part of the world and not in the United States only.

A Bryans, G W Christison, D Cruickshank, R Lyell, J Riddell, A J Stanton, J N Stuart, W H Verner, C W Wallace, Members of the Committee.—*H. and C. Mail*, March 10.

### ANOTHER TEA CIRCULAR.

#### DISTRICT INQUIRY AS TO FACILITIES FOR MAKING GOOD TEA.

In continuation of the Circulars we had previously issued, and which had resulted in the collection of a mass of most useful information from a variety of sources, which we published for the benefit specially of our planting readers, we sent out a series of questions of more general import bearing on tea toward the end of last year. The results we are able only now to make public,

owing to the pressure of subjects demanding attention during the few months, in connection with the Legislative Sessions, Planters' Meetings, Railway controversy, and other matters of interest which have arisen from day to day. Nor do we regret the delay that has occurred in dealing with the information supplied by our obliging correspondents; for although it may at first sight seem as if the improvement in tea prices renders some of the cautions and hints embodied in the answers rather out of date, it is really not so. We may hope that the advance in prices has come to stay; but there is no guarantee that such will be the case; and political and economic developments entirely outside the island may upset our calculations. Indeed, what has been the chief factor which has contributed to the crisis through which tea recently passed, and from which it cannot be said to have yet wholly emerged? It has been the rise in exchange, brought about by Indian legislation which we were helpless to control, or even to delay. So it may prove in the future. Outside circumstances, entirely beyond our knowledge or guidance, might once again induce a crisis, more or less sudden, and more or less prolonged.

Quite apart, however, from such considerations and from unpleasant surprises, we have a continual war to wage with our rivals. Our efforts must not be relaxed to oust China and Japan from the best markets; and we can accomplish that only by establishing and maintaining the superiority of our teas. That, of course, can be done only by conscientious attention to details; while there are few estates, and certainly no districts, which can declare perfect contentment with prices, yield, quality, and profits. In this view, even in our present good humour, and in our present satisfaction with the outlook, the following questions cannot be considered wholly out-of-place:—

What are any drawbacks to making better tea than the average now turned out, in your neighbourhood? Is the jāt generally good? or inferior? Is the soil generally poor on estates in your division? Are any estates worn out? Would manuring improve the tea and be profitable, in your opinion? Are factories on the whole deficient in withering room? Are factories on the whole deficient in machinery? or in motive power? Is the labour force sufficient to secure regular cultivation and careful plucking? Has the pruning been too severe, or too frequent? Or has the pruning been too long neglected? Any general remarks on your neighbourhood and its suitability for tea?

We must content ourselves today with the answers which have come from the two rather out-of-the-way districts of Rakwana and Morawaka, whose possibilities in respect of tea are far different from what they were with coffee which practically depended on one blossoming season—a prolonged drought scorching all the blossom, and too much rain resulting in its running into leaf. And often the memory of past failures hangs over a place, as it sticks to a man; for Rakwana, in holding the London Market (the combination of big buyers, we presume) to be the chief drawback to the manufacture of better tea, declares its average out-turn "good stuff," and that, at the price it fetches, it is simply given away, not sold! The jāt is

generally fair, excluding small patches of China, and although the soil is not of the best, some of the old estates being worn out, it responds to cultivation, while the shuck fields are little by little struck off. It is cheering to learn, in view of recent experiments and our consistent advocacy of manures, that manuring both improves the tea and is profitable. There is no complaint about factories, the labour supply is ample, medium pruning is the rule; and only the Kclani Valley Railway with its branch to Ratnapura, is wanted to give the old, and rather inaccessible district a spurt, and attract settlers by its climate, and its capabilities, not alone for tea, but also for cocoa, coconuts, and even coffee, if transport difficulties are overcome.

The tale from Morawaka is not so cheery; for although its factories are deficient neither in machinery, nor in motive power, they are not generally provided with sufficient withering space. The pruning, while not severe has to be pretty frequent to force paying flushes, and that must tell on the bush. Though the district has a sufficient labour force, and is well suited for tea, it is handicapped by land badly opened with insufficient drainage, and planted with poor jats to the extent of quite one-half. In these circumstances, the tea turned out is naturally poor, and although confidence is expressed in manure, as a means of improving both the quality and the yield, the plea is put forward that the cost would swallow up the profits "at present prices." But prices have improved since October; and we trust that the outcome of experiments *now* undertaken, will demonstrate the remunerativeness of manuring even when prices are lower; for though there is splendid soil in parts of Morawaka, it cannot be said to be generally rich.

#### IN BRITISH EAST AFRICA.

##### NEWS OF MR. A. WHYTE.

We have intelligence of Mr. Alex. Whyte, so well remembered in Ceylon and who is Naturalist and Botanist to the British Central African State, but who has this time been on a special mission to British East Africa, travelling from the Coast up to Uganda. Mr. Whyte's letter to a friend in Ceylon is from "Kampala or Menyö, capital of Uganda," but without date. He was well and hearty when he wrote and full of interest in the natural resources of the country. He had had a very tedious journey up, occupying over four months, owing to the great scarcity of porters. This, however, enabled Mr. Whyte to look round all the Government stations, and to form some idea of their capabilities, as he has to report on the same to the Foreign Office. He has been freely collecting seeds and dried plants on his journey—many of the seeds being from magnificent timber trees. Some may come to Ceylon. He is anxious to introduce economic plants into Uganda, always barring coffee (at least from Ceylon), though he remarks that Uganda is a good coffee country and that he is trying to get the natives to cultivate rice on a large scale to save the importing of Indian rice. Coffee so far is

only cultivated in small patches by the natives who raise it not from seed, but from twigs, both ends of which are stuck in the ground! This must mean a rich soil and forcing climate; and, indeed, Uganda is not far off the original habitat of coffee, which is supposed to be Abyssinia or in the region south of it. Mr. Whyte concludes by saying how much he prizes the *Tropical Agriculturist* which he receives regularly.

#### MANURING TEA AND RECENT EXPERIMENTS.

Mr. Joseph Fraser writes, in correction of an error which we noticed and corrected immediately after our daily issue; but it is well to put Mr. Fraser's remarks with his additional observations on record:—"In your remarks on the Pitakande manuring experiments, I find an error has crept in, which might be corrected, before the inclusion of the returns in the *Tropical Agriculturist*. You say 'so with No. 6 which comes next in profit, but has most fungoid affected leaves.' The paragraph in my letter from which you evidently drew this inference, should be 'so far as appearance of the bushes is concerned, they look best in the following order 5, 7, 10 and 6, while 9 shows most fungoid affected leaves and a falling off in the vigor, and succulence of the flushes, and 8 shows a falling off to a more limited extent." Six therefore comes 4th in order, as regards appearance and vigour of the bushes, and was little affected by fungoid or insect pests. Nine and 8 were the two plots that suffered most in this respect. The healthy condition of the bushes judging by the foregoing is largely the outcome of a liberal supply of available nitrogen and potash, and this is confirmed by the fields I have systematically manured on similar lines for the past 6 to 10 years.

"I have for the past 4 years had clear indications that by indirect means, the organic matter in the soil may be so acted on, and aid the nitrifying organisms in their work of rendering inert nitrogen active, that the cost of manuring so far as the direct application of nitrogenous manures is concerned, is greatly reduced, but in this case the supply of organic matter will have to be kept up, while a liberal supply of potash and a more limited quantity of phosphoric acid will in most cases, have to be added to the soil."

BOOKS ON TEA AND TEA PESTS.—A leading colonist, after reading both books, writes:—

"Dr. Watt's book and Kelway-Bamber's are very interesting reading, and ought to be in the possession of such bodies as the Planter's Association and the Chamber of Commerce, as well as of all those who largely control the cultivation of tea in the island."

THE EXPERIMENT WITH ALOES.—A correspondent writes that "it would be of interest to know what the result of the recent experiment in extracting fibre from Aloes was—what the cost was, the proportion of fibre to the weight of leaves operated on, and local valuation of the fibre. Of course, the final valuation and decision depend on London." We hope shortly to give some information on this subject.

### THE FOOCHOW TEA IMPROVEMENT COMPANY.

The *foochow Echo* says:—The news of the winding up of the Foochow Tea Improvement Company comes as a great disappointment to us all. Any hope that remained of a possible revival of the trade rested on the chance of our being able to meet the demand in London and other markets for machine-made teas, and now that has to be abandoned we are left with the gloomiest of prospects. The wish being father to the thought there are those who argue that the end is not yet, that there is nothing more certain to happen than the unexpected, that we need not despair. Who knows, they ask, that Indian and Ceylon will be able to meet the rapidly-increasing consumption of tea all over the world? Are there not such things as drought and blight, without referring to the arbitrary Indian exchange? Will not the Chinese see soon how greatly it would be to their advantage as an economic measure, to do away with, or at any rate lessen, the heavy duty, likin and squeezes which have been killing the trade? These thoughts will be read by most of us as the dreams of despair. Nothing remains but to make the best of what is still left us and await the course of events; but in the meantime our thanks are due to the Tea Improvement Company for the time and money they have expended in their endeavour to revive our languishing trade.

### ELECTRICITY AND AGRICULTURE.

Science as applied to the operations of Agriculture has for many years engaged the attention of enthusiastic experimentalists, and in many cases the results of applied sciences have been little short of marvellous. The idea of the application of electricity to growing crops is not by any means new. We have ourselves achieved good results by using it in connection with a crop of potatoes. The *California Fruit Grower*, writing on the subject, says:—

Perhaps the most extensive and conclusive experiments on the relation of electricity to plants growing were those of Dr. Selim Lemstrom, a physicist in the University of Helsingfors, Finland. He became convinced that the rapid growth of plants in the short summers of Finland and Spitzbergen was due to the highly electrified atmosphere. Laboratory experiments were so successful that in the summer of 1885 a field trial was made with barley. Part of the field was covered with parallel wires, about a yard apart, which were secured to insulators on low posts at the margin of the field. At distances of eighteen or twenty inches each wire was supplied with metal points, through which a current could discharge into the air. The whole was connected with a Holtz electric machine, and the current was supplied from six to ten o'clock in the morning and from five to nine o'clock in the evening, from the middle of June until the first of September. The barley was well up when the experiment began, and at harvest time it was found that the yield of this portion of the field was thirty-five per cent greater than the other; also that the quality was correspondingly improved. The following year the experiment was repeated upon a more extensive scale. In this case garden vegetables were the plants tested, and white beets, red beets, potatoes, radishes, parsnips, leeks, celeriac, turnips and rutabagas gave increased yields in the order named varying from 107 per cent. to one per cent. On the other hand, carrots and kohlrabi showed losses of five per cent and cabbages, cereals and potatoes gave per cent. Further experiments with of forty-three results that were considered very favourable.

At least one instance may be cited in which electricity has been used commercially. Near Boston a large grower has put the electric light to work in forcing lettuce so that a gain of at least two weeks on three crops is secured. Two lamps are hung above the house, and their effect is apparent for at least 100 feet.

### COOPER, COOPER, AND JOHNSON, LTD.

#### A PROMISING INDUSTRIAL INVESTMENT: THEIR CEYLON ESTATES.

The sharp rise which has recently taken place in the price of common teas, and the improvement in the general outlook of the trade, have caused considerable attention to be paid by investors to the shares in companies owning estates in Ceylon and India. The ordinary and preference shares in the above-named company seem to us to be unduly depressed and well deserving the attention of investors, combining, as the company does, two essential factors, viz. producing and distributing businesses. The company was formed to take over the old-established and well-known businesses of Messrs. Cooper, Cooper, and Company, Limited, and the Manchester and London businesses of Messrs. Johnson, Dodds, and Company, the profits of the latter being guaranteed by the vendors at a minimum rate of £5,000 per annum for three years. In addition to these businesses, the company took over as going concerns the well-known estates of the Ceylon and Oriental Estates Company, Limited, and the Pallikellie Ceylon Estates Company, Limited, and numerous tea and cocoa estates owned by private owners. The board is composed of sound business men, and we are officially informed that Mr. E. H. Hancock, one of the directors, is now in Ceylon inspecting and supervising the management of the company's estates. The important rise that has occurred in the price of common teas, and which is now affecting teas of a higher range of value, must necessarily have an important bearing on the earning capacity of the company, having regard to their valuable tea and cocoa estates in Ceylon. The special settlement in the company's shares and debentures has been fixed for April 6, and an official quotation will be applied for in due course. We look for a considerable increase in the price of the shares from the present unreasonably depressed level, which is 15s to 16s for the £1 fully-paid ordinary, and 18s to 19s for the £1 fully-paid six per cent preference, the five per cent first mortgage debenture stock being at the same time quoted about 35. The company have paid the interim interest to December 31 last on the preference and debenture capitals. The estates of this company in Ceylon are both important and extensive. They comprise 13,670 acres, of which 6,860 acres are already in cultivation in tea, 3,543 in cocoa, and 177 in coffee.—*Sunday Times*, March 26.

### TEA GOSSIP.

The most important feature of late in the tea world is the issue of Mr. Blechynden's report on the Indian Tea Propaganda in America. On the whole it cannot be doubted that the movement is in first-class hands there, and the only point to be deplored is the want of push behind the American explorers.

We have waited until the conclusion of Mr. Apjohn's experiments in tea bulking locally to note our opinion. We call them "experiments" advisedly, for it was patent from the first that the machine would not completely or nearly effect the desired object. The machine as it stands does not effect the object proposed because of the absence of any arrangement for thoroughly incorporating the teas during their passage through the funnel. How to do this without cutting the leaf is the problem and a pretty stiff one; and when this is overcome the question remains how the tea is to be exposed to the humid air of Calcutta without taking injury. Special dry chambers will certainly have to be devised to get over the latter difficulty.

With regard to the question of uniformity of tea supply we attribute the great success of packet teas everywhere to this feature. Undoubtedly the great advertising firms deserve their success to their care in ensuring uniformity.

Most districts are reporting prospects of a prosperous year to come. We fear that in most instances the prospects have only in regard the actual quantity

to be manufactured irrespective of quality or price to be obtained.

*Capital* has been going for the *Rhoni Tea Co.*, now in liquidation, in its own lovable style. We do not know if any good is to be done by the "screamer" style of writing against a company which is admittedly down and is now trying only to pull a few rupees out of the wreck for its shareholders by the sale of its property; but at the same time we do not commit ourselves to saying that the object of the paragraph was to do good to any one. The garden will be sold to the highest bidder by Messrs. Mackenzie Lyall & Co., on the 16th instant. The total grant is 4,830 acres of which 1,470 is under tea. Estimate for ensuing season 6,000 maunds.

We may here note an attempt that is to be made by Mr. Russell Pym, brother of the well-known book-maker, to push Darjeeling teas as such in London.—*Indian Sportsman*, April 8.

### PRODUCE AND PLANTING.

TEA AND COFFEE IN AMERICA.—Although the people of the United States are not large consumers of tea, the representatives of the Indian and Ceylon tea-planters have yet considerable scope for activity, for China last year supplied 44.4 per cent. of the total imports of tea into the United States. Perhaps when the art of judicious blending with China is thoroughly understood, and the advantages from the point of view of purity which Indian and Ceylon tea possess, as compared with China, make a deeper impress upon public opinion, business will develop more rapidly. The Americans are, on the whole, coffee drinkers, and the consumption of coffee was never larger than at present, although less than 4.4 per cent. comes from India and Ceylon. The United States Government's official record of Imports for the calendar year 1898 show gross imports of 804,250,988 lb.; exports, 23,231,141 lb.; leaving net imports of 781,019,847 lb., against 787,561,585 lb. in 1897, 621,429,664 lb. in 1896. This shows an average annual net import for three years, which practically represents consumption, of 790,003,632 lb., or over ten pounds per capita. Of the total imports of coffee 75.6 per cent came from Brazil, 20 per cent. from the West Indies and other South American countries (except Brazil).

THE "MAGNIFICENT TEA INDUSTRY."—This pamphlet while attacking the policy of the Indian Government, pats the Indian tea planter on the back. It says: It would be far better for the Indian Government to spend part of its present surplus in teaching its subjects how to grow an improved stock of sugar cane and how to extract and manufacture the sugar by scientific methods. It is by means of scientific cultivation and scientific manufacture that the magnificent tea industry of India has been built up, and by the same means India could quickly create a sugar industry that no other country could rival. Instead of helping in the development of such an industry Lord George Hamilton proposes to throw India back upon methods of sugar production that were already ancient when the Honourable East India Company first received its charter from Queen Elizabeth."

PLANTING PROSPECTS IN NEW GUINEA.—At a meeting of the Royal Colonial Institute, held on Tuesday night at the Hotel Metropole, Sir H. W. Norman presiding, a paper was read by Sir W. Macgregor (late Lieut.-Governor of British New Guinea) on the prospects of the Colony. Sir William said that peace and tranquillity had been established over large areas of the country, and that some of these extensive stretches of land could be utilised for industrial purposes. As regarded cultivation, perhaps the most promising undertaking would be the development of rubber-producing trees and vines. There are several trees and plants indigenous to the country that produced a high-class article in this line. The area of land that could be utilised for this purpose was extensive. The land suitable for growing sugar cane was not likely to be turned to account in the present condition of the sugar market

though the sugar cane in a great many varieties was indigenous to the country. There were numerous hills and mountain slopes suitable for the production of tea, coffee, and articles of that kind. With a rainfall of about 37 in. in the central district to 120 in. in some others; and with altitudes from sea level to 13,000 ft.; and with almost all sorts of soil, it was manifest that in a colony lying between five and eleven degrees south of the equator a very great variety of articles could be grown. Land had been offered at cheap rates, but with small results.—*H. and C. Mail*, March 30.

CEYLON TEA ON THE CONTINENT: MR. ROGIVUE'S WORK.—A letter of the highest interest to the planting community written by Mr. Bremer, and forwarded to us by Mr. Philip, has reached us and will be found on another page. It describes the widely spreading work of Mr. Rogivue in Switzerland in making known the excellencies of Ceylon tea to the intelligent Swiss. Glasgow companies are not wont to do things by halves, and the account given of how Mr. Rogivue distributes circulars and sample packets and is enabled to advertise without stint, and of the numerous fresh orders that reach him every day (e.g. through someone having tasted his teas at a friend's house), carry their own lesson with them. Some time ago we recommended that an illustrated pamphlet, with a sample packet of tea, if freely distributed, would greatly further the increase of tea sales in Germany. Circulars, (no doubt illustrated) and sample packets are the method pursued with marked success by Mr. Rogivue, and the letter from Mr. Bremer, from the shores of Lake Geneva, tells us that Messrs. Jas. Finlay & Co., the Glasgow agents of his Company, are anxious he should similarly establish agencies in Germany. The greater portion of the strongly commercial race of Switzers are of German origin and speak the German tongue, and if the methods of Mr. Rogivue have proved so vastly successful amongst these citizens of the Swiss republic there is every reason why the same success should be won for our teas throughout the German Empire. The "Thirty Committee," in the fuller light that has been thrown upon the harvest-bearing work accomplished by Mr. Rogivue, should henceforth deal out with no lavish hand the monetary aid necessary for pushing our island teas in the land of the Teuton with all skill, thoroughness, and despatch. Mr. Rogivue has even gone so far as to supply neat little tea-pots to the Russian consumers, and we have no doubt that the same course would prove a great "draw" in Germany where crockery of a tasteful, if curious, sort meets with high appreciation. The main point to be pressed upon the Thirty Committee is that small doles, poured out trickle by trickle, will accomplish *less than half* what the same sums dealt out in a lump, liberally and without delay, would perform in a rapid and immediate campaign. There is, in our opinion, no country in Europe so ready for our teas, or where their popularisation could proceed with such rapidity, as hitherto half-neglected Germany. If a reduction in other markets is necessary for the development of this most promising one, it ought, it is pretty generally agreed, to be made in the American States, though not in Canada. But whether such curtailment is desired or not, in all respects the Teutonic people should have more money spent upon them in the generous promulgation of one most beneficent gospel from this Island:—"Drink Ceylon tea!"

## THE VOGAN CO. AND PLUMBAGO MINING.

## DRAFT AGREEMENT

referred to :—

Colombo, 24th March, 1899.

Heads of Agreement provisionally arranged between Mr. W. Kingsbury for the Vogan Tea Company of Ceylon, Ltd., and Messrs. Peto for the Morgan Crucible Company, Ltd.

1. The Vogan Tea Company of Ceylon, Ltd., to grant to the Morgan Crucible Company, Ltd., the sole right to seek for and mine Plumbago for a period coterminous with their own leases or for 21 years if they own the freehold on all lands held or owned by them in Ceylon containing or believed to contain Plumbago or necessary for access thereto.

2. The Morgan Crucible Company, Ltd. to pay the Vogan Tea Company of Ceylon, Ltd., for land required for spoil heaps, dressing floors, cooly lines or other purposes connected with the raising of, or rendering marketable any Plumbago from their estates at the following rates per acre or part of an acre—at a rate per acre :—

For land under cultivation .. R900 per acre.  
For land suitable for cultivation .. R200 per acre,

such land to revert to the Vogan Tea Company of Ceylon, Ltd., at the termination of the Mining Lease or renewed lease, and to pay an annual rent for land not suitable for cultivation at the rate of Re.1 per acre.

3.—a. The Morgan Crucible Company, Limited, to refund to the Vogan Tea Company, Limited, the net amount they are out of pocket at this date in respect of their plumbago mining.

b.—The Morgan Crucible Company, Limited, to pay to the Vogan Tea Company of Ceylon, Limited, a Royalty per ton half yearly on the actual out-turn of cleaned plumbago, lump, chip, and dust, on the values of same determined by Messrs. Aitken Speuce & Co., at the following rates :—

2½ per cent on the value below R200 per ton.  
5 per cent on the value from R200 and below R300 per ton.  
7½ per cent on the value from R300 and below R500 per ton.  
10 per cent on the value from R500 and above.

4.—The Morgan Crucible Company, Limited, to have the right of determining this agreement and any leases under it, and of removing all plant and machinery and buildings and all mine timbering, on giving three months notice in writing.

5.—The Morgan Crucible Company, Limited, to have the right of renewing this agreement for a further period of 21 years from its expiration on the same terms, on giving three months notice.

6. The Morgan Crucible Company, Ltd. to have the right to assign this Agreement and all leases under it at will—but in the event of the Vogan Tea Company of Ceylon, Ltd., not approving of the Assignee, the Morgan Crucible Company, Ltd., to be responsible for the performance of the covenants of the Agreement.

7. The Morgan Crucible Company, Ltd., are not bound to continue working continuously, but in the event of their ceasing to mine for any period they to leave all pit-shafts, etc. securely fenced in.

8. The Morgan Crucible Company, Ltd., are to keep accounts showing, and furnish the Vogan Tea Company of Ceylon, Ltd., with particulars of the tonnage raised.

9. If the Royalty remains unpaid and is in arrear for six months, then the lessors have the right of re-entry and re-possession of the Mine.

10. At the expiration of the lease or renewed lease the Morgan Crucible Company, Ltd., are to leave all pits, shafts, etc., securely fenced.

11. The Morgan Crucible Company, Ltd., are not at liberty to sink any shaft within 300 feet of the Vogan Tea Company of Ceylon, Ltd. as Factory or Bungalows,

12. The Morgan Crucible Co., Ltd., are to contribute towards the upkeep of estate roads in proportion to the damage done by their traffic.

13.—The Morgan Crucible Company, Limited, to have the right to purchase from the Vogan Tea Company of Ceylon, Limited, and the Vogan Tea Company of Ceylon, Limited, to agree to sell to the Morgan Crucible Company, Limited, any timber they may require for mining, or purposes connected therewith, at the same price as the Vogan Tea Company of Ceylon, Limited, can obtain for sale of similar timber to other people in the neighbourhood.

14.—The Morgan Crucible Company, Limited, to have the right to divert any surface water with the object of preventing its damaging their works.

To appropriate and use for any purpose any water not now required by the Vogan Tea Company of Ceylon, Limited, subject to usual Ceylon riparian rights.

To construct any culvert required for the discharge of waste water, or to use any culvert constructed by the Vogan Tea Company of Ceylon, Limited, for this purpose.

But the Morgan Crucible Company, Limited, are liable for any damage done to any culvert or otherwise by the discharge of waste water or for any damage proved to be done to other parties by the diversion or consumption of water by them.

15.—If any other minerals are found, Royalty to be paid by the Morgan Crucible Company, Limited, who are to have the sole right to work them, in accordance with the scale provided in the Mining Rules of the Madras Presidency.

16.—Usual arbitration clause.

## CHAIRMAN'S SPEECH.

The chairman said that when the directors asked the permission of the shareholders to spend Rs.5,000 in prospecting for plumbago they did so because they had private information that the mining of this mineral in Ceylon was attracting the attention of European Capitalists. Rs.5,000 was not a very large sum for a company like theirs to run the risk of losing, and as they had proved that plumbago did exist on Idagoda, he thought they had enhanced the value of their property at a very low cost. He mentioned this because some of the shareholders seemed to think that the proposal of the directors to spend this money was a speculative. He thought, however, the directors had very good grounds for hoping to be able to lease their mining rights, and they had much more chance of doing so if they went in for a certain amount of prospecting on their own account, so advertising themselves rather than let others approach them. On the 12th February they had an interview with Messrs. Peto of the Morgan Crucible Co., who made the following offer subject to certain contingencies which he need not refer to there :—

The Tea Co. to grant us the right to seek for and mine plumbago for a period coterminous with their own lease or for 21 years if they own the freehold of all lands held or owned by them in Ceylon containing or believed to contain plumbago or necessary for access thereto.

(2) We to pay an annual rent for land required for dressing floors or other purposes connected with the raising of, or rendering marketable, any plumbago from their estates at the following rates per acre or part of an acre. For land under cultivation R— for land suitable for cultivation R1— and for land unsuitable for cultivation R1 plus actual damage to growing crops. Timber at valuation. We to purchase any land required for spoil at the following rates—under cultivation R—and not suitable for cultivation R—.

(3) On signing the agreement we will either (a) refund the Tea Company the net amount they are out of pocket to date in respect of expenditure on plumbago mining and pay them a royalty of Rs per

ton on all plumbago we raise when cleaned, or (b) we pay a royalty of R20 per ton on the plumbago we raise when cleaned. We to have the right to determine this agreement and any leases under it, and to remove all plant and machinery whether fixed or not on giving three months' notice in writing. In the event of their electing (a) we also to have the right to remove any shaft timbering.

(4). The usual arbitration clause.

This letter was left in abeyance till the 22nd March when Mr. Peto wrote a letter to him saying that they would make their conditional offer absolute. On receipt of that letter he went and interviewed Mr. Peto and told him that they did not think the amount of the royalty offered was high enough and afterwards the firm wrote making another offer which was embodied in clause 3 of the draft agreement (which had been sent to the shareholders) which was more favourable to the Company. The other terms would be on the basis of the original draft proposal of 12th February. Now although the directors did not approve of all the conditions of this draft agreement they agreed to bring them before the shareholders who could decide for themselves whether to accept them or not. The clauses that he more particularly objected to included clause 5. The original proposal was that the lease should be one of 21 years but there was no mention then that the Crucible Company should have the option of renewal. He certainly thought that a lease of practically 42 years was much too long. Then as regarded No. 7 he was of opinion that if the lessees did not mine, say for six or twelve months they should be bound to cancel the lease because the Company would not be getting any royalty and the fact of their having leased their mining rights might prejudice any chance they might have of selling these estates if they wished to do so. He also suggested that the proposed concession should be limited to the Kalutara property. If they were to mine on the Dikoya estates the Company would have a good deal of difficulty in working economically because the properties were so small, being only about 80 and 140 acres respectively. This they would not agree at all; they said they preferred to have the whole thing. Well the matter really resolved itself into this—were they willing to write off the amount spent which came to R4,748-27 and reject the offer made on the chance of getting better terms elsewhere, or would they lease their mining rights, getting the money they were out of pocket and any royalty that might accrue. Personally he as a shareholder was against leasing their rights on these terms. As a director he should like to see every shareholder satisfied. There was a great many shareholders who at the beginning were against spending this money and if there was any way they could get back the money it would be satisfactory.

Mr. ALDERSON asked what was the value per ton up to date.

The CHAIRMAN said it had gone up as they sank the pit. The first two tons realised R209.31, which was about R104 a ton, the second two tons realised R322, which was about R160 a ton, and then they sold just over five tons for R1,282, which was about R260 a ton.

Mr. ALDERSON asked what was the average.

The CHAIRMAN replied that it was about R213 and explained that the value had gone up the further down they got the pit, which was now about 91ft., The last must have been very good stuff.

Mr. ALDERSON thought the offer that had been made extremely low.

The CHAIRMAN said that was what they wanted to get the opinion of the shareholders about. He got the best terms he could and he felt bound to bring the matter before the shareholders, for those who made the offer said—Are you going to work this mine or are you going to entertain on proposal? If you are not going to entertain our proposal tell us at once.

Mr. WATHEW:—You have proved you have got a plumbago-bearing property and improved the value of it.

Mr. ALDERSON:—I think an offer has been made by some native or other.

The CHAIRMAN:—That was a long time ago.

Mr. ALDERSON:—Any native would give one-eighth and R10 royalty.

The CHAIRMAN:—Personally I am against leasing to natives, because I do not believe that we would get what they would promise.

Mr. ALDERSON:—A check could be put upon them.

The CHAIRMAN said they went burrowing all over the place and of course they would not pay the money back.

Mr. ALDERSON said that if they granted a lease for 21 years at the rates offered they would be simply throwing away the property. The terms suggested tied them down fearfully.

Mr. F. W. BOIS thought it would be a vast mistake if they leased the property on the terms offered. If they analysed them the terms were not very much after all. Plumbago was either there or it was not there. If it was there he thought they should feel very foolish if on such low terms, they gave up all the rights of mining plumbago that they now held. If it was not there they only recovered the R5,000, which he thought had been well spent, but in return for that R5,000 they gave a lease for 42 years and the right of going all over their property sinking shafts and doing other damage for what he did not consider adequate payment. The condition about supplying timber might also hamper them very much and altogether he thought this was a purely one-sided bargain. He was not here when the resolution was passed to allow the Directors to spend this R5,000, but had he been he should have entirely approved of it. He thought the money had been very well spent. They now knew that plumbago was there and probably to a large extent. He would not advocate that the Company should spend more money but there was no reason to believe that they would lose anything by holding off. In all probability experiments with a proper system of mining would be made in Ceylon, and they could very reasonably write off this R5,000 which was very little seeing that they had ascertained that they had plumbago on their property, and wait to see what was accomplished, and they could take advantage of anything that might accrue.

Mr. ALDERSON approved of all that Mr. Bois had said and he should like to see the meeting follow his advice and allow the matter to stand over. He knew the district well and they had a valuable property there and it would be a great mistake to give the concession on the terms proposed.

Mr. BOIS said he would propose that the proposed agreement be not accepted.

Mr. JULIUS said, before they got to the actual vote, he thought there was a misapprehension with regard to that matter. A great many proxies had come down with no instruc-

tions as to how they were to be used. The impression seemed to be among the outside public that the draft was approved and had only to be brought forward by the Directors to be passed. That was not so at all. That meeting was simply to take the sense of the shareholders on the matter. If they came to voting then the Directors would be in a rather awkward position in holding proxies without knowing how they were to be used. As a Director he would say that he did not approve of that agreement as it stood, and besides the points that their attention had been called to there were various other matters, as the limiting of amount of land and the number of shafts to be put in. Then there was nothing there as to the damage done to the surface by mining. They said the shaft should not be within a certain distance of their buildings, but there was nothing to prevent the purchasing Company from tunneling under their buildings if they wished to, and that would have to be dealt with. A shareholder spoke to him about some other small matters with regard to that, and if the question was then to be whether the agreement was to be or not to be signed, he thought that it would be well to postpone the meeting, and get direct instructions from the shareholders as to what they wished to do. There were only a few shareholders present, but a large number of proxies, which if used could swamp the meeting in either direction. As for himself he was quite prepared to agree with the shareholders that the agreement should not be accepted.

Mr. BOIS thought if there was any feeling that the matter should not be decided at once, it might be better to adjourn the meeting and reconsider the question.

The CHAIRMAN explained that he would not know what to do with a number of the proxies if it came to a vote. As far as he was concerned he would vote against accepting the offer, but preferred not to have the onus of the proxies on his shareholders.

Mr. W. E. MITCHELL enquired if the agreement was subject to revision or would it have to stand if they accepted it as it was. He thought there were a lot of clauses that required to be looked into, one being how the value of the plumbago should be determined.

The CHAIRMAN said the question was whether the shareholders were in favour of leasing their rights upon certain terms or whether they were not. He would not think of accepting the offer as it was. Those, however, were the best terms they could get, and they as Directors were bound to bring them before the meeting. Various things were discussed that the Directors did not approve of, but the Company making the offer insisted upon them. They might refuse the whole thing, but if they wished to lease it, they could authorise the Directors if they liked to enter into communication with the lessees and lease their mining rights on that basis with any modifications they might think necessary, or else they could reject the whole thing.

Mr. ALDERSON:—I think we ought to defer the whole thing, and put this offer aside and wait. There are sure to be some better offers in future.

The CHAIRMAN remarked that he had in quite a private way been asked by a friend in London upon what terms the Vogan Company would lease their mining rights, but he did not wish to raise people's hopes by stating that.

Mr. ALDERSON said they ought to be able to raise their own hopes and get much better terms for their rights.

Mr. BOIS mentioned, although he did not wish to compare gold mines in any way with plumbago mines, that in South Africa gold mines and land were sold for a mere song, and afterwards turned out most valuable mines, and he believed that might be the case with plumbago. Mrs. Obeyesekere was working a mine which her husband worked from 20 to 25 years ago.

Mr. ALDERSON pointed out that the Kalutara district was full of plumbago, and mines were being opened up all over the place, and getting good returns from them.

Mr. BOIS:—We should be very foolish if we give up our rights for the sake of recovering a few thousand rupees.

Mr. ALDERSON fully endorsed these remarks.

Mr. BOIS then proposed the following resolution:—"That this meeting be adjourned for a period of six months, and that the Directors then lay before the shareholders any offer they may have received in the meantime for the leasing or working of plumbago." Mr. BOIS added that that resolution was a practical rejection of the agreement, and was simply to bring the matter again before a general meeting for them to decide.

Mr. ALDERSON: remarked that it was a very slow matter to get tenders for a lease of that description.

Mr. BOIS: It only means that if we get anything at the end of six months we can bring it up again.

Mr. ALDERSON: Why not have an indefinite period?

Mr. BOIS: Said the shareholders would like a certain time. He would rather postpone it for an indefinite time unless they received a good offer.

Mr. ALDERSON: There is no doubt there is valuable property there.

Mr. W. E. MITCHELL: thought they were rejecting that offer too hurriedly. It was not such a bad offer after all. R25 per ton of the plumbago taken out he did not think was so bad.

The CHAIRMAN: Upon what basis are you taking plumbago?

Mr. W. E. MITCHELL: R250 per ton.

Mr. WOODMAN: thought they ought to reckon on getting R300 per ton average as they were now well below the surface. He thought that a very good offer and a very fair return. No native would take over the mine because it was flooded, and if they refused the offer they might be passing over what would not be repeated. He admitted there were one or two weak points in the agreement, but at the same time it was not at all bad, and they secured themselves for the money that had been expended.

Mr. ALDERSON: This the first offer made?

Mr. WOODMAN:—Yes.

Mr. ALDERSON:—Then there is no hurry.

Mr. WOODMAN:—They are trying to hurry us.

Mr. W. E. MITCHELL:—It is very good if we can get a modification of some of the terms; if not, we ought to refuse the offer.

Mr. ALDERSON:—I entirely disagree to the whole thing.

Mr. BOIS expressed the opinion that too much importance was attached to the offer. The people to whom they gave the concession would probably do nothing at all. He thought they would get the concession and then put it up for sale in the London Market, and get a good price for what they obtained for a mere song. Then a company

would probably be floated and which would go all over the estates they had concessions over, and cut them up in all directions to ascertain if there was plumbago in paying quantities. That was what would happen to their estates for the simple return of R5,000. If they found no plumbago they would have their estates cut about and get no royalty at all; if it did pay it meant that plumbago existed in such paying quantity that the returns to the Vogan Company would be totally inadequate.

Mr. ALDERSON agreed.

Mr. W. E. MITCHELL :—Do the Directors think there is any chance of having the agreement modified?

The CHAIRMAN said he tried to alter the conditions, but they absolutely refused to do so. They certainly refused to bind themselves to work the thing at all, and would not agree to a 21 years' lease, as they said they would have to stop working after 16 years. Their reply to his (the Chairman's) arguments was that it was usual in mining concessions, and therefore they preferred to have it. The conditions might be modified. (To Mr. Mitchell) Do you propose an amendment?

Mr. W. E. MITCHELL :—No, I do not propose any amendment.

Mr. JULIUS suggested that the Crucible Company would be written to pointing out one or two reasons why their offer could not be accepted as it stood, and that they could renew their offer after being modified.

Mr. W. E. MITCHELL :—I don't think I should drop all negotiations.

Mr. JULIUS said unless certain modifications were made he thought the offer should be declined. The damage done to the surface by mining should be provided for, and also that there should be no renewal of the lease after twenty-one years, and in the event of their not using the mine for a period—say for six or twelve months—to forfeit their rights, and also to send to them prices realised and details of the tonnage raised. Then in clause 14, in the second paragraph, it is said "To appropriate and use for any purpose any water not now required by Vogan Company," and the word "now" must come out.

Mr. ALDERSON also suggested some alterations in the 13th and 5th clauses with regard to the sale and purchase of timber and the rights of the lessees to renew the agreement after 21 years.

Mr. JULIUS considered that there should be no renewal after 21 years, as that was much too long even if they took the agreement into consideration.

Mr. ALDERSON observed that plumbago was a very fluctuating product, and there was a chance of its becoming more valuable in future than it was at present.

The CHAIRMAN said if no one had any amendment, he would put Mr. Bois' proposition to the meeting. After reading the motion again.

Mr. ALDERSON asked :—That does not bind us to anything, does it?

Mr. JULIUS :—No.

Mr. ALDERSON :—Then I shall be glad to second it.

The resolution was carried *nem con.* Considerable further discussion, however, ensued on the subject, those present conversing in little groups.

Mr. ALDERSON enquired if they thought it would pay for the Vogan Company to work

the plumbago in charge of a European with a knowledge of mining. The cost of water and timber would be absolutely nothing.

The CHAIRMAN :—Without pumping machinery?

Mr. ALDERSON :—Natives would take the water out in no time. How many veins tapped or cut through have you already?

The CHAIRMAN :—Five or six.

Mr. ALDERSON :—What size were they?

The CHAIRMAN :—The last had been started at two-and-a-half inches and then the springs came in.

Mr. ALDERSON :—Does it really promise well?

The CHAIRMAN :—The native miners seem very keen.

Mr. ALDERSON :—What about the quality?

The CHAIRMAN :—It is not of the very best, but I have a lump of plumbago in my office weighing 42 lb.—pure plumbago.

Mr. ALDERSON :—That ought to be good enough.

The lump of plumbago referred to by the Chairman was then brought into the room and came under the interested inspection of those present, and after some further discussion of an informal character the meeting concluded after lasting nearly an hour.

CACAO DISEASE IN TRINIDAD.—Mr. Hart has kindly given us a full answer, it will be found elsewhere, to the questions we asked him in view of the criticisms of Mr. Carruthers' report, by a well-known planter, in our issue of January 21st. From all he says, and his words deserve close attention, we gather that the attack of the disease is periodic, during the moist season chiefly, and not of so serious a character as to cause general alarm, if only judicious measures are taken. Chief among these is the burning, burying; or otherwise completely destroying all infected pods and pods opened for abstracting beans; for it is in these that the spores which are responsible for the disease most readily germinate.

COFFEE PLANTING IN SUMATRA.—Upon this subject some interesting (periodical) notes by W.T.M.K. appear on page 802. It is amusing to read the German coffee planter's comment on the recent present of Ceylon tea to the German Emperor. "German soldiers" he says "will never drink tea." Probably this planter refers to the tea with which he has perhaps been acquainted in Germany, the ordinary decoction brought to one at the hotels under the name of tea. This we have tasted, and found it not only weak, but offensively weak, and offensive as well; we can well believe that German soldiers would refuse to touch it. But once the finer article makes its way in German homes, we are sure this Tenton colonist will one day need to retract his words. But, as to coffee; Serdang seems to be a veritable paradise for the Liberian coffee grower as Mr. M.K.'s report will testify. Yet no colony likes to consider itself really prosperous, as our correspondent's half-recriminative remarks on the Ceylon planters' outeries will show. It is also found difficult to obtain cacao seed; Ceylon seed is mistrusted, and from elsewhere it spoils in transport. It is gratifying to find that the Northern Railway Agitation has been followed with relish beyond the seas, for here in Ceylon we were thoroughly sick of it, and feel relieved at its cessation.

NUTS AS FOOD IN FRANCE.

Through the centre of France, from the Bay of Biscay to Switzerland, there are large plantations, almost forests, of chestnut trees. The poor people through the autumn and winter, often make two meals daily from chestnuts. The ordinary way of cooking them is to remove outside shell and blanch them. The blanching is done by throwing the nuts into boiling water, and with a *brquette* rubbing them around the kettle until the inside skin peels off. The *brquette* is composed of two square pieces of wood, 24 to 36 inches long, the angles of which are notched about one foot up; they are joined like shears with a rivet. After the blanching process, a wet cloth is placed in an earthen pot, which is almost filled with raw chestnuts; they are covered with a second wet cloth, and put on the fire to steam. They are eaten with salt and milk. Hot steamed chestnuts are carried round the city streets in baskets or pails; the majority of the working people, who usually have no fire early in the morning, eat them for their breakfast, with or without milk. These nuts are often used as a vegetable, and are exceedingly popular, being found on the tables of the well-to-do and wealthy. They are served not only boiled, but roasted, steamed, pureed, and as dressings for poultry or meats. Chestnuts are made into bread by the mountain peasantry. After the nuts have been blanched they are dried and ground. From this flour a sweet, heavy flat cake is made. It resembles the oaten cakes so popular among Scotch peasants. The United States commercial agent at Limoges says that when these nuts are stored they are very apt to heat and ferment, and great care must be taken to prevent this: they are placed in cool, airy bins, so that the air can readily pass through the pile and perfect ventilation be obtained. The walnut tree is very generally grown all over France, but more especially in the central and eastern departments. Walnuts, as an article of food, are losing ground in France because of their scarcity. The trees have been in great demand for timber and furniture-making: nevertheless there are certain sections of the country in which these nuts form a regular article of diet. The peasants eat them with bread that has oftentimes been rubbed with garlic. The hygienic effects are considered good, replacing meat to a large extent. These nuts are also used to make oil. It is much cheaper, and similar in taste to that pressed in olives, and is employed to adulterate the latter. The prisoners in certain prisons are, says the commercial agent, engaged in cracking walnuts and picking out the kernels, which are pressed into oil. Almonds are largely exported from France. The climate of the middle and southern departments of the country are most favourably adapted to the growth of this fruit. In the summer, the almond, while the shell and husk are soft, green and tender, is sold by the dozen or hundred in the markets, at from one farthing to two pence half-penny per dozen, according to the condition of the crop. The meat is white and creamy. As an article of food they are not used as extensively as chestnuts and walnuts. Almond oil is employed for various purposes. Apricot stones are often ground with almonds to adulterate the oil. Confectioners and bakers consume large quantities of these nuts in making different kinds of cakes and sweetmeats. Hazelnut trees are only grown for their fruit, and although they will flourish in nearly all the departments, the nuts are considered a luxury, and are always high-priced. Hazelnuts are eaten green, like almonds, in the summer, when they are sold at more reasonable rates. The exportation from France is unimportant. The peanut so common in the United States, is very rarely eaten roasted in France, and nearly all that enter the ports are imported from Spain, Italy and Africa. The variety is small and uninviting, and very high in price. The taste for these nuts, as a food, is said to be growing. Many tons of pea-nuts are imported from the west coast of Africa, India and the Malayan Archipelago, and are sold in Marseilles and other centres. These are principally bought for the oil which is extracted from them. Peanut oil is used for cooking

purposes, and as an adulterant and substitute for olive oil. Many physicians in different parts of Europe have been making experiments as to the nutritive and medicinal qualities of all kinds of nuts, and have advanced views favouring their use as food, under certain conditions, for special diseases. Nuts contain a special kind of salt, especially adapted for lubricating and softening the muscles. Some practitioners claim that elderly people would be benefited by a more extensive nut diet. The only evil to be overcome is that the nuts should be thoroughly masticated.—*Journal of the Society of Arts*, Mar. 24.

To the Editor

## TEA-DRINKING IN RUSSIA.

March 28.

SIR,—See that article in the *H. & C. Mail* of March 10 about tea-drinking in Russia? When are you—as the first authority on Tropical Agriculture as well as Trade Statistics—going to prick this bladder about the greatest tea-drinking nation in the world being Russia? You must know better than most people that, if Russia consumed three pounds a head against seven pounds per head in Australia, and nearly six in the United Kingdom, there would not be enough tea grown to go round. And yet there is not the slightest protest on the part of the local or any other press when we are periodically treated (generally in the pages of the singularly ill-informed *H. & C. Mail*) to this sort of thing:—“The Russian drinks enormous quantities of tea sufficient to frighten any Englishman,” or “The Russian working man takes 20 tumblers of tea a day.” I suppose these mis-statements are too gigantic to be tackled, and therefore they are let pass. And the “Samovar” is responsible for a good deal of misinformation one gets about Russian tea drinking. As a matter of fact the “Samovar” is about as common in the house of the ordinary Russian peasant or Monjik, as a claret jug is in the cottage of a Suffolk farm labourer.

Surely the actual figures can be got and published as regards consumption per head in Russia. We all want the Russians to take our tea, but with the present duty on it, it is absurd to suppose that the Russian working man (about the poorest in the world) can treat himself to much of it, if any. Very strange it is with a lot of slack writing there is about tea. Anything seems good enough or wrong enough to set down. For example the London Correspondent of the local “Times” can describe a race—a cricket match—a garden party, or a play, or anything that he has not seen and knows nothing about quite as well as the average London Reporter. But when he gets on to Tea, about which he is supposed to really know a bit, this is the sort of thing he treats us to (quoting from his letter of March 10, 1899):—“It would have been well if some of the optimistic writers and others, who are so ready to hit an article when it is down, to see the scramble for the lots.”

With the number of Russian buyers now in Colombo, it would surely not be difficult to get some correct information as to what classes in Russia drink tea, and how much they consume. Put your clever “Cyclist” on to them.—Yours obediently

FARMER.

## THE BLENDING OF TEA IN COLOMBO.

DEAR SIR,—I have always been under the impression that “the blending of tea” was a speciality indulged in only by experts; but now it would appear from “W.F.L.’s” laboured remarks that even I may settle down in Colombo, connect with Labugama and blend teas for the million.

It sounds so sweetly simple and remunerative, I have the greatest difficulty in restraining myself from embarking in it forthwith.

Reason, however, comes to the rescue and asks is it true, or is it not, that all big blenders get samples of water from the particular district they purpose exploiting and blend accordingly? Is Labugama, the lake and those delightfully green canals in Colombo equal to such varying requirements? I trow not, as any novice knows some teas taste ever so much nicer when made with certain water than they do elsewhere and therein lies the secret of blending.

Is Colombo a suitable place to keep and expose tea in for any length of time.

Most certainly not, and here is my reason for saying so. A few months ago a small portion of a break of tea got slightly wet on the way to Colombo, and I consequently had the whole lot examined and partly re-fired there and the result was 3d per lb. less for that lot than for anything for some time before or afterwards. London report: “These teas have a rather dull smell which we fear may detract from their value, &c.”

A recent lot which lay in Colombo for about a fortnight owing to lack of freight, was reported on thus:—“The firing is fairly satisfactory though they do not smell quite as fresh as many teas we have received from this estate and the result is just 1d per lb. less than for the following lot sold in the same sale.”

In neither case was the Broker aware of anything unusual having happened to the tea; so evidently some folks know the rudiments of their business which is more than I can give “W. F. L.” credit for.

If Colombo is to become the hub of the universe in tea, special warehouses will have to be constructed for its manipulation as at present I would sooner see my teas bulked in London than blended in Colombo and that is saying a good deal.—Yours faithfully,  
OLD FOGIE.

[We have no doubt that if Colombo were made a free port for teas, the construction of special warehouses or the alteration of existing stores would follow. Our correspondent forgets that there are tea experts already among Colombo buyers and that a good deal of blending is already done, no doubt to the satisfaction of Australian buyers and consumers and to the profit of the blenders.—ED. T.A.]

## CEYLON TEA IN AMERICA.

## THE PACIFIC ROUTE ADVOCATED.

Kandy, April 7.

SIR,—Under separate cover I send to your address an American Newspaper with some columns in regard to a Mr. Tissera, who, I think, proceeded to Chicago as one of Sir John Grinton's staff, which may not have been seen by you.—I am, sir, yours faithfully,  
A. PHILIP

The article referred to begins by referring to the arrival in Seattle (Washington) of “a quiet business-like foreigner,” who “it is not improbable may prove a potent factor in the unfolding of that great volume of Transpacific Commerce of which the world is now beginning concede that Seattle to

is one of the accredited heirs. This gentleman is Vincent L Tissera, head of the firm of V L Tissera & Co., one of the largest tea importing houses of America. The object of his visit here is, in brief, to see whether the growing tea trade between Ceylon and India as exporters and the United States as importers cannot be diverted to the Pacific instead of the Atlantic Coast. At present most of the tea sent to America from those countries goes by way of Liverpool and thence across the Atlantic to New York or Montreal. There are other East Indian products which Mr. Tissera thinks should also reach this country by way of the Pacific Coast, and he is profoundly impressed with the conviction that return trade could easily be built up in American products, especially in the line of machinery and mechanical products of all kinds. He is also positive in his conviction that this interchange of trade, if it can be effected will seek Puget Sound as its natural entrepot, and the Seattle will inevitably become the centre of it." This practically sets forth the news of Mr. Tissera which occupy about three columns in the contemporary from which we are quoting, accompanied by a portrait of this Ceylonese abroad.

### THE SANDALWOOD PLANT.

SEA VIEW ESTATE.

Veyangoda, April 14.

DEAR SIR,—The Sandalwood (*Santalum Album*) plants, planted out at this and Kola Estates 2½ years ago in the open, in red gravel and sand (mixed) soils are now five to six feet high. The plants will not thrive at damp situations; green or dried leaves of jungle trees answer well as manure. Cowdung or any other manure is injurious to the tree. When weeding care should be taken not to disturb the roots. If the roots were injured the tree perishes. Plants may be raised in ordinary nurseries without using any manure or seed and may be planted at stake in favourable weather. I enclose a few seeds for your inspection.—Yours faithfully,

J. P. WILLIAM.

[We are obliged to our correspondent for the seeds sent. "The tree," says Dr. Trimen, in his Handbook to the Flora of Ceylon, "is a native of Central Peninsular India, and known in Ceylon as a cultivated tree only; it was introduced here in 1850."—Ed. T.A.]

### CEYLON TEA ON THE CONTINENT.

MR. ROGIVUE'S WORK.

Kandy, April 14th 1899.

SIR,—I herein enclose extract of a letter from Mr. Bremer, to Mr. J. P. Ryan in reference to Mr. Rogivue's work on the Continent as likely to be interesting.—Yours faithfully,

A. PHILIP,

Secretary, "Thirty Committee."

Extract.

Hotel Beau-Rivage, Ouchy, Lauanne.

March 25th, 1899.

You asked me the other day at Milan to let you know how Rogivue was getting on. He is now in Switzerland establishing agencies for Jas. Finlay & Co. and they want him to do the same in Germany. He sells and advertises Ceylon Tea chiefly and there can be no doubt that the conversion of his business into a Company, with a man like Sir John Muir as Chairman, has enabled him to push our teas far more successfully than he was able to do when working on his account. He now has capital at his command and money is not stinted for advertising. His whole time is taken up in travelling between Moscow, Constantinople, Switzerland, and London, in all of which places M. Rogivue's & Co. have established themselves. I enclose some circulars, &c., to show you what is being done. Thousands of sample packets,

circulars, &c., are sent out. I had no idea that he had done so much for Ceylon until we went into details, and there is no doubt he is deserving of every support which the Thirty Committee can give him. Of course he is making a good thing for himself, but his opportunities for making our teas known are now so many that the more we can help him, the more we shall help on ourselves. I have been travelling about the country with him, and have seen how he is able to push business. His teas are A1, and are so superior to what the people have been accustomed to get that every day brings in fresh orders, from people who have tasted the tea at some friend's house. In Russia he has spent a lot of money in sending out thousands of elegant little teapots, marked Ceylon Tea and with directions for making, also thousands of photographic cards, and this year thousands of very attractive-looking and useful tea caddies are going out. He is quite enthusiastic over it. It is most gratifying to find such enthusiasm. Rogivue told me that the money he had received from the Tea Fund was a mere nothing compared with what he had spent in advertising. If he applies for assistance in Switzerland I hope his application will be granted, as I am sure the money will be well spent. There are all sorts of people pushing Tea here, but they are mostly if not all agents for London blending houses and do not make such a speciality of Ceylon as Rogivue does.

### CACAO DISEASE.

SIR,—I note the questions asked in your issue of January 21st, 1899. Recent reports from Kew on specimens sent home by this Department, show that a species of *Peronospora* (so named provisionally) is the origin of a "pod disease" which appears to be of similar character to that recently studied by Mr. Carruthers in Ceylon. This fungus was found by me some three days previous to the receipt of Mr. Carruthers' report on pods sent up to the Gardens for examination. Further specimens are to be examined later with the view of obtaining full particulars of the life history of the organism.

The disease is readily reproduced by inoculation on healthy pods.

Planters state that they have observed this disease for many years past, and that it only becomes prominently present during moist seasons.

I have observed that the disease is much more prevalent in localities where the broken pods are allowed to rot upon the ground without being either covered or buried. I have recommended burying, burning, or otherwise completely destroying all infected pods, and all fresh pods opened for the abstraction of the beans.

So far I have only observed the disease upon material which contains living tissue. It however germinates upon the freshly opened pods which soon rot and are then taken possession of by *saprophytic* fungi, which soon destroy all trace of the parasitic forms.

It appears, so far as can be ascertained at present, to affect all varieties of *Theobroma* alike; but I think that it is likely to affect the weaker growing varieties far more seriously than the robust and stronger kinds.

Mr. Massie suggests that the fungus can hardly exist on the pods alone, but must find for itself a congenial habitat elsewhere, and a search for any likely host is strongly recommended so that the power of the enemy may be well understood.

So far the attack in Trinidad is not considered by planters to be of a serious character, except perhaps in places where the trees and general cultivation have been much neglected.

J. H. HART, F.L.S.

THE VOGAN COMPANY AND PLUMBAGO MINING.

Colombo, April 19.

SIR,—Referring to the following remark made by one of the Vogan shareholders at the meeting of that Company held on 15th April, viz. :—

“Too much importance was attached to the offer. The people to whom they gave the concession would probably do nothing at all. He thought they would get the concession and then put it up for sale in the London market and get a good price for what they obtained for a mere song.”

We, as representatives of the Morgan Crucible Co., Ltd., in Ceylon (since the Chairman of the Vogan Co. did not at the time see fit to contradict it) beg to state that the remark was absolutely and entirely without fact or foundation.—Yours faithfully,

p.p. AITKEN, SPENCE & CO.,  
A. S. BERWICK.

MANURING COCONUTS.

Colombo, April 19.

DEAR SIR,—As promised we now beg to enclose copy of Mr. Beven's interim report on manuring coconuts, carried on Franklands Estate, Veyangoda.—We are, dear sir, yours faithfully,

FREUDENBERG & CO.

REPORT ON THE APPLICATION OF ARTIFICIAL MANURES ON FRANKLANDS ESTATE, VEYANGODA.

The manures applied for a series of years are cattle manure and bone meal; sulphate of ammonia, Thomas' phosphate powder (Bassic Slag) and Kainit were used side by side with them, so that the fields might be compared both in appearance and in results.

The two first plots experimented on contain trees which have been in bearing for several years and have been regularly manured every other year. The third and fourth plots contain only a few trees just coming into bearing, the rest being too young to bear, and most of them have had cattle tied under them for the first time; the droppings of two cattle tied under each tree for ten days being dug in 2 or 3 lb. bone meal. The trees in plots 1 and 2 have cattle manure brought from the roadside applied to them:—

Plot No. 1.—This plot I divided into four blocks, viz., A containing 32 trees, B 33 trees, C 22 trees, and D 35 trees. Of these A was manured with 8 basket cattle manure and 3 lb. bone dust per tree; B with 2 lb. Thomas' Phosphate and 6 lb. kainit per tree, C with cattle manure and bones and D with 4 lb. kainit and ½ lb. sulphate of ammonia per tree. The soil in A and B is somewhat clayey and in C and D gravelly. The general appearance of the trees is much the same. The manures were applied in November and December 1897, since when I have kept a record of the number of nuts plucked in each block.

	Dec. 1897.	Feb. 1898.	April 1898.	June 1898.	Aug. 1898.	Oct. 1898.	Dec. 1898.	Feb. 1899.	per acre.
A	75	92	168	240	3 8	189	75	62	1159 36.9
B	132	177	190	386	416	191	1 3	108	1773 52.2
C	91	107	204	310	386	172	135	97	1502 47.0
D	122	96	274	412	572	216	171	80	1373 56.4

The trees are plucked six times a year, the first plucking being in April, the beginning of the financial year. The disappointing crop in February is, I believe

wholly unconnected with the manure, and is due partly to the season, but chiefly to the unusually heavy crops of June and August.

I give below the total amount plucked for the year ending April, and the crops plucked for the two previous years, when cattle manure and bone was applied.

April 1896-97.	April 1897-98.	April 1898-99.
5,340	5,466	5 525

Considering that it is just over a year since the manures were applied, four or six months must yet elapse before I can determine whether the trees have responded, with regard to their bearing capacity.

No. 2.—Is a block cut up into two (a) gravelly soil containing 72 trees, manured with 7½ lb. castor cake, 1½ lb. Thomas' Phosphate and 4 lb. Kainit per tree in November '97 (b) light blackish soil containing 75 trees manured with 2 lb. Thomas' Phosphate, 1 lb. sulphate of ammonia and 1 lb. sulphate of potash also in November 1897. The nuts plucked in each is.

Dec. '97.	Feb. '98.	April.	June.	Aug.	Oct.	Dec. '98.	Feb. '99.	
a 136	175	280	623	750	315	187	99	2,565 35.6 per tree.
b 356	342	525	900	10 20	483	434	236	4,296 57.2 „

Below I give a similar comparison as the above, in lot No. 1.

April 1896-97	April 1897-98	April 1898-99
4394	5944	5352

The trees in both the above fields are about 20 years old.

No. 3.—Consists of 43 trees, coming into bearing, on the slope of a hill of fairly stiff soil. The trees were manured in Dec. '97 with 1 lb. Thomas' Phosphate, ½ lb. Sulphate of ammonia, and 1 lb. sulphate of potash. No separate record was kept of the nuts plucked, owing to no separate record having been kept before, only a few of the trees are in bearing. With regard to the general appearance of the trees, of which I made a note at the time of manuring there seems to be no difference compared with those immediately surrounding which were manured with cattle droppings and bones.

No. 4.—Is another block of 56 trees, which I marked out and to which was applied 2 lb. kainit, 1 lb. Thomas phosphate and ½ lb. sulphate of ammonia in December '97. The soil is a fairly stiff brown. The same remarks as I made at No. 3, apply to this.

No. 5.—I have also applied 2 lb. kainit with cattle manure and bones to other fields but can trace no improvement so far.

THE RICE TRADE.—European competition seems to be steadily increasing in the rice trade, and that is in favour of lower prices. An Indian contemporary reports that European merchants have been the largest buyers of paddy this year in Akyab; and literally nothing is being exported to India. The *Arakan News* states that this time last year there were 25 native crafts in the port loading with paddy, whereas now there are only 6 European steamers. Paddy has risen very considerably in consequence. Probably, the time is not so far distant when the market rate of paddy in most places in Burmah will not differ vastly from the ruling rate in Rangoon. Prices of paddy ruling lower in Rangoon than in the districts, the cultivators are holding back their supplies hoping for a rise in the market rate. There is an unusual absence of shipping from the port, showing how well calculated and carefully considered has been the fixing of the present rates and the manœuvres generally of the merchants and shippers, who, however, cannot put back the Europe demand much longer.

## PANAWAL TEA COMPANY, LTD.

Report of the Directors of the Panawal Tea Company, Limited, to be presented to the shareholders at the seventh annual general meeting to be held on Tuesday, 11th April 1899, at the office of the Company, 39, Victoria Street, Westminster, S.W., at 3 o'clock in the afternoon.

The Directors beg to submit the general balance sheet and profit and loss account for the year ending 31st December 1898, duly audited—

	£	s	d	£	s	d
The net amount at credit of profit and loss account, including balance brought forward at 31st December 1897, after providing for general expenses, Directors' and auditors' fees				1,803	2	10
It is proposed to pay a dividend of 4 per cent on the ordinary shares for the year ending 31st December 1898, absorbing	680	0	0			
Dividends on the 7 per cent cumulative preference shares were paid for 1898 in full, amounting to	371	0	0			
It is proposed to add to a special reserve fund against loss on coolie advances a sum of	250	0	0			
To set aside in reduction of capital expenditure on estates	500	0	0			
Leaving a balance to be carried forward to next season of	2	2	10			
	£1,803	2	10	£1,803	2	10

The Directors are of opinion that the result of the year's working may be considered satisfactory, having in view the further rise in exchange, and the very low prices appertaining to the earlier months of the season.

No alteration in the acreage of the Company's properties has taken place during the last twelve months. It may be given as—

	On
	31st December last.
Tea in full bearing	.. 577
Do. under two years old	.. 13
Total under cultivation	.. 590
Jungle	.. 341½
	931½ Acres

The Visiting Agent inspected these properties on 25th and 26th January last, and reports that he found them in capital order.

During the year the whole of the coolie lines have been re-roofed with iron, and additional withering accommodation, etc., has been provided at a cost of £548 2s 4d. It is proposed to write off £500 of this out of the year's profits, thus reducing the cost of the estates on the Company's books to £20,228 14s 6d.

Having in view the unsatisfactory state of labour in the past, the Directors recommend that the sum of £250 be placed to a special reserve fund against loss on coolie advances. The present state of labour is more satisfactory, there

being a large enough force on the estate for present requirements.

The average rate of exchange for the year was 1s 4 1-16d against 1s 3 11-32d in the previous year.

The crop obtained for 1898 was 293,933 lb., as against an estimate of 300,000 (and a yield of 258,309 lb. in 1897), and realized an average of 6'31d per lb. against 5'761 per lb. in 1897.

The cost of tea f.o.b. in Colombo was about 23.63 cents per lb. and laid down in London 4'82d, after payment of London charges, expenses, income tax, &c., as against 27 cents and 5'17d respectively in the previous year.

Mr. John Holgate Batten, the Director retiring by rotation, being eligible, offers himself for re-election.

Messrs. Fox, Sissons & Co., Auditors to the Company, offer themselves for re-election.—By order of the Board,

J. HOLGATE BATTEN, Secretary.

London, 28th March, 1899.

## BATTALGALLA ESTATE COMPANY, LTD.

## NINTH ANNUAL REPORT TO THE SHAREHOLDERS.

The directors in presenting their report on the Company's business for the past year, are glad to be able to advise an improvement in the average price obtained for tea during the year, but the higher working expenses, due to the high rate of exchange ruling, continue to be a serious tax upon the industry.

The quantity manufactured has not differed much from the previous year, being 222,414 lb., against 226,191 lb. in 1897. The average selling price in London has been 9'13d, against 8'30d in the previous year, the average selling price in Colombo was 32 cent, against 31 cent in 1897.

London sales amounted to 184,055 lb., realizing net £6,153 15s 1d, and Colombo sales 37,430 lb., realizing R12,016'10. The compares with 163,670 lb., realizing £4,934 13s 10d, and 60,120 lb., realizing R18,729'85, sold in 1897 in London and Colombo respectively.

Exchange has again ruled higher, the average drawing rate for the year having been 1/4 9-22nds, against 1/3 15 32nds in 1897.

A further amount of about £1,200 has been expended on the new Withering House, which is now completed, and is proving a most satisfactory addition for conducting the Company's business. No further outlay on capital account is now expected.

The securities of the Tea Corporation, Limited, owned by the Company, have been sold, and a small excess on previous valuation has been credited to profit and loss account.

An interim dividend of 5 per cent on the shares, free of income tax was paid in October last, and after writing off £233 11s 6d from machinery account the Directors have £956 17s 4d at credit of profit and loss account left to deal with. They propose to pay a further dividend of 5 per cent, free of income tax, absorbing £750, and to carry forward £206 17s 4d.

In accordance with the articles of Association, Mr. Adolf Zimmern retires from the Board by rotation, and, being eligible, offers himself for re-election.

The Directors have again been most ably seconded by their Superintendent on the estate, Mr. G. C. R. Norman, and by their Colombo agents, Messrs. E. Benham & Co., to whom the best thanks of the shareholders are due.

**AUGUSTA TEA ESTATES COMPANY, LTD.**  
SECOND ANNUAL REPORT.

The Directors beg to submit the audited accounts for the year closing 31st December, 1898 :—

The accounts show a profit of £173 2s 6d after paying fixed charges and writing £58 13s off preliminary expenses account; out of this amount the preference dividend for the year has been paid, amounting to £162 13s, and leaves a small balance to carry forward of £10 4s 6d.

The quantity of tea manufactured during the year has been 101,211 lb., of which 91,780 lb. have been sold in London at an average price of 6·71d per lb., and 9,431 lb. in Colombo, chiefly dust, at an average of 17 cent per lb.

The average rate of exchange has been 1/4 5-16ths, and the average cost of production 26·90 cent, or 4½d per lb. f.o.b. in Colombo.

The outturn from the garden has been less than estimated by about 9,000 lb., owing to the partial failure of both monsoons. With favourable weather this year the Directors expect 110,600 lb. from the estate, which should give a more satisfactory return to the Company. Since the commencement of the new year there has been a substantial rise in the price of common and medium tea, which, if continued, will considerably increase the profits.

By the articles of Association Mr. H. A. Hancock retires by rotation from the Board, and, being eligible, offers himself for re-election.

The Auditors again offer themselves for re-election.

C. A. REISS, T. J. LAWRENCE, Directors.

**BURNSIDE TEA CO. OF CEYLON.**

REPORT OF THE BOARD OF DIRECTORS

To be presented to the shareholders at their third annual ordinary meeting, to be held at the office of the Company, 15, Philpot Lane, London, E.C., on Monday, 10th April 1899, at 2 o'clock p.m.

The Directors beg to submit to the shareholders the report and accounts of the Company for the year ending 31st December 1898.

The past year in Ceylon has not been a good one for planters, drought having been experienced in the first half, and too much rain in the latter, and although as regards the estates in the Kaugala District the rainfall for the year was about the average, it was not well distributed.

The total crop secured from the four estates during the year was 356,455 lb made tea against an estimate of 330,000 lb, and 116½ maunds of tea seed and 202 lb of cardamoms, against respective estimates of 150 maunds of the former and 300 lb of the latter product.

The estate comprising the Burnside group (Burnside, Wattagalla, and Heeloya) are 8,308 lb short estimate, and Midlothian is responsible for the balance of short fall, viz., 15,237 lb, a result due, in the Superintendent's opinion, to the very unfavourable season experienced.

The average price realized for all the Company's tea was 6¾d per lb, and the directors have been disappointed with the comparatively low prices realised for Midlothian tea.

The average rate of exchange was 1s 4 15-16d per rupee as against 1s 3 21-32d last year.

Owing to the poor prices realized during the first half of 1898, coupled with the short fall in crop, the profit earned on the year's working after paying debenture interest, etc., amounts to only £395 4s 1d which, with £27 9s 7d brought forward from last account leaves £422 13s 8d to be now

dealt with. The directors propose to pay a dividend of 2 per cent for the year (free of income tax) absorbing £352, leaving £70 13s 8d to be carried forward to next account.

In accordance with the Articles of Association, Sir George A Pilkington retires from the Board, and being eligible offers himself for re-election.

Messrs. Cape and Dalgleish, C.A., also offer themselves for re-election as auditors.—By order of the Board,

LYALL, ANDERSON & Co.,  
Agents and Secretaries.

**EDERAPOLLA TEA COMPANY OF CEYLON, LIMITED.**

REPORT OF THE BOARD OF DIRECTORS.

To be presented to the shareholders at their third ordinary general meeting, to be held at the office of the Company, 16, Philpot Lane, London, E.C., on Tuesday, 11th April, 1899, at 2 p.m.

The directors beg to submit to the shareholders the report and accounts of the Company for the year ending 31st December, 1898.

The total crop secured from the three estates was 447,026 lb made tea against an estimate of 478,000 lb being a shortfall of 30,974 lb a result principally due to the unfavourable season experienced.

The average yield for the three estates was 524 lb per acre, the average price realised 6¾d per lb and the average rate of exchange was 1/4 1/4 against 1/3 37/64 per rupee for the previous year.

In his report on the estates, dated 28th December last, the visiting agent speaks very favourably of the young tea planted as follows :—

87½ acres in 1896  
51½ " " 1897  
41½ " " 1898

and anticipates that during the last six months of the present year a good deal of leaf will be secured from the two earlier plantings.

On Ardross, plumbago has been discovered, and under a working arrangement with a native, mining is being carried on successfully; so far about four tons have been secured, a sample of which has been very favourably reported on by a London expert, but at present the output is being sold locally.

Mr. Bett having occasion to visit Ceylon, has gone carefully over the Company's estates, and his report on their condition and prospects has given satisfaction to his co-directors, who are also glad to have from him a strong confirmation of the favourable opinion expressed by Messrs. Porter and Smith, with regard to St. Helen Estate, and which appeared in last year's report.

The nett profit for the year amounts to £2,068 4s 4d. which with £13 13s 3d brought forward from last account, leaves £2,081 17s 7d to be now dealt with, and this it is proposed to appropriate as follows :—

Amount as above ...	£2,081 17 7
Dividend of 5 per cent (free of income tax), absorbing ...	£1,275 0 0
To write off for depreciation on buildings and machinery	450 0 0
To place to reserve account (making it £1,000) ..	300 0 0
	2,025 0 0

Leaving a balance to carry forward of £56 17 7

In accordance with the articles of Association, Mr. J. M. MacMartin retires from the Board, and being eligible, offers himself for re-election. Messrs. Cape and Dalgleish, C.A., also offer themselves for re-election as Auditors.

G. W. PAINE, Chairman.

**KELANI VALLEY TEA ASSOCIATION, LIMITED.**

**REPORT OF THE BOARD OF DIRECTORS.**

To be presented to the shareholders at their thirteenth ordinary general meeting, to be held at the Office of the Company, on Monday, 10th April, 1899, at 12 noon.

The Directors beg to submit to the shareholders the report and accounts of the Company for the year ending 31st December, 1898.

During the year the £2,500 debentures referred to in the last report were issued for five years; £5,400, which matured on the 1st July, were renewed for a further period of three years, and of £5,350, which matured on the 1st January last, £2,000 were renewed for three years and £3,350 for five years, all at five per cent interest per annum.

The total crop secured from the four estates amounted to 578,169 lb. against an estimate of 651,000 lb., and 53,834 lb. less than the 1897 crop, a result due almost entirely to climatic causes. The Company's Visiting Agent reports as follows, under date 28th December last :-

"Shortage of crop on each of the places is very disappointing, but it will be satisfactory to you to know that it is not from the want of care on the part of the Superintendents, or from any shortage of labour, or in fact from any cause that was preventable."

The average price realized for the whole crop was 6½ per lb., being the same as last year, and the average rate of exchange was 1s 4-19 64d against 1s 31-16d for the previous year.

Making the Water course for the New Joint Factory for Weregalla and Parusella estates has proved more expensive than anticipated, but when completed and Water Power applied, the saving effected from its use should compensate for the cost; and with accommodation fully sufficient for every purpose in the New Factory, and ample Water Power, a great improvement is confidently looked for in the quality of the teas from these two estates.

On this occasion the Directors have written 5 per cent off the cost of buildings and machinery as on 1st January, 1898, and the amount, £384 4s, appears in the accounts.

The Company's acreage now stands as follows :-

	Tea in full bearing.	Partial bearing.	Clearings.	Jungle, Scrub, &c.	Total Acres.
Degalessa	55½	54	72	319	1,000
Dover	70¾	—	—	—	70¾
Weregalla	232	—	10	127	369
Parusella	210	32	—	33	275
	1,067¾	86	82	479	1,714¾

The net profit for the year, after deducting the above sum of £384 4s written off for depreciation, amounts to £1,094 14s 10d, which with £184 12s 9d brought forward from last account

leaves £1,279 7s 7d to be now dealt with, and this it is proposed to appropriate as follows :-

	£	s.	d.
Amount as above	1,279	7	7
Dividend of 5 per cent for the year (free of Income Tax) on £18,765	938	5	0

Leaving a balance to carry forward of ... £341 2 7

In accordance with the articles of Association, Mr. L. F. Davies retires from the Board, and, being eligible, offers himself for re-election.

Mr. J. B. Laurie, C.A., offers himself for re-election as Auditor.

G. W. PAINE, Chairman.

**YATIYANTOTA CEYLON TEA COMPANY, LIMITED.**

The report of the directors for the year ended December 31st last states that the weather during 1898 was not generally favourable, and, in common with most estates in Ceylon, the crops secured from the company's properties fell short of expectation formed at the commencement of the year. The plucking area, in full and partial bearing, on all the estates was 2,240 acres, and from this area the crops amounted to 1,135,794 lb. In addition, 8,628 lb. tea were made from purchased leaf, giving a total crop, as shown in the profit and loss account, of 1,144,422 lb. Of this quantity 665,413 lb. were sold in Colombo, and the balance of 479,009 lb. was shipped to London; the net average realised for the whole being 5 35d per pound. Including purchased leaf, the average cost f.o.b. (or delivered to buyers in Colombo) 3-62d per pound, on an average rate of exchange of 1s 4 5-64d per rupee. The fields which came into bearing in 1898—viz., 208 acres—did not yield more than sufficient crop to meet the outlay incurred in working them, and the profit of the year was practically obtained from the 3,032 acres in full bearing, being little more than two-thirds of the cultivated area represented by the subscribed capital. With the younger fields steadily approaching maturity larger crops may confidently be expected. The coast advances outstanding on December 31st last amounted to R49,690, as against R78,024 on same date in the previous year. Of the difference, R24,431 was recovered in cash, and the balance of R3,903, which proved irrecoverable, has been written off to debit of the current year's working expenditure. The directors consider that the Ceylon management are to be commended for the appreciable reduction in the amount of these advances, notwithstanding the loss referred to, which latter, however, has been fully covered by profit on rice issues, amounting during the year to R5,418, which profit has been deducted from working expenditure. The net profit for the year amounts to £7,666 to which has to be added balance from 1897 account, £140, together £7,806. Dividends at 6 per cent. per annum on the preference shares have been paid, leaving now to be dealt with £5,379. The directors propose a dividend of 4 per cent., free of income-tax, on the ordinary capital, writing off cost of properties, including depreciation for two years (1897 and 1898) of machinery and buildings £1,000, and carrying forward £779. During the year a sum of £5,047 was expended on the development of the properties. Since the commencement of the current year an appre-

ciable increase has taken place in the market value of the class of tea produced by this company, and although the advance came too late to have any marked effect on last year's results, it affords good reason for expecting an improved average price for the current season's crops, while the cost of production is unlikely to exceed that of last year. The directors are also glad to say that a modification has been made in the agency charges, to the advantage of the company, and for which thanks are due to the Colombo agents. The further issue of £8,000 in preference shares was fully subscribed and paid for during the past year; dividends there on have been paid from the dates when the shares were allotted.—*H. & C. Mail*, March 31.

**BANDARAPOLA CEYLON COMPANY, LIMITED.**

**REPORT OF THE BOARD OF DIRECTORS.**

To be presented to the shareholders at their sixth annual ordinary meeting, to be held at the Office of the Company, on Tuesday, 11th April, at 11 o'clock a.m.

The Directors have now the pleasure to submit to the shareholders the accounts and balance sheet for the year ending 31st December, 1898.

The net profits for the year after payment of Debenture Interest and all other charges amount to £1,488 3 0d, to which has to be added £66 3s 8d brought forward from 1897, giving a total sum to be now dealt with of ... £1,554 6 8

Out of this it is proposed to pay a Dividend for the year of 5 per cent (free of income Tax), absorbing £1,050 0 0

And to write off for depreciation on Buildings and Machinery 450 0 0

Leaving a balance to carry forward of ... £54 6 8

During the past season the crops secured amounted to 395,270 lb. tea, and 195 cwt. 0 qr. 1 lb. cocoa, against 407,250 lb. tea, and 181 cwt. 0 qr. 14 lb. cocoa in 1897, showing a comparative decrease of 11,980 lb. on the former product, and an increase of 13 cwt 3 qr. 15 lb. on the latter.

The average return from all the tea in full and partial bearing was 540 lb. per acre, the old tea on Bandarapola giving 745 lb. and that first planted on Muendeniya 772 lb. per acre. These figures show a falling off from 1897 returns, but on the other hand, the average price realised for the Company's tea shows a fractional advance being 6'155d per lb. against 6'008d for the previous year.

In view of the unfavourable season through which we have passed, the severe droughts with which the Company's property has had to contend, and the low range of prices which obtained in the Tea Market during the greater part of 1898, the Directors do not look upon the results as altogether unsatisfactory, but given favourable weather, the prospects for current year are considered promising.

The policy of systematically manning the Company's property is being continued, and during 1898 a total of 168 acres were treated, at a cost of about £500 which is included in the year's expenditure.

A few little lots of land, about 20 acres in all, have been acquired during the year on favourable terms, and the acreage according to latest returns is now as follows:—

	Acre.
Tea in full bearing ..	478
Tea in partial bearing...	254
Tea not in bearing ...	50
Cocoa in full and partial bearing...	226
Grass ..	12
-----	
Total cultivated area ..	1,020
Reserve, Jungle, &c. ...	520
-----	
Total Estate ..	1,540
-----	

The Board avail themselves of this opportunity to again express their appreciation of the efficient manner in which the Company's property is managed by Mr. James Anderson.

Since last accounts were issued, debentures at 5 per cent to the extent of £2,500 have been placed at ½ per cent premium, secured on the uncalled capital of the last issued 500 shares, and the small amount of premium received, £12 10s, has been added to Reserve Fund, bringing that account up to £1,525. £9,000 Debentures also matured for payment on 1st January last, and these have been renewed at 5 per cent £2,100 for a period of three years and £6,900 for five years.

In accordance with the articles of Association Mr. Hugh Fraser retires from the Board, and being eligible, offers himself for re-election.

Mr. John Dagleish, C.A., also offers himself for re-election as Auditor.

G. W. PAINE, Chairman.

**NEW DIMBULA COMPANY.**

The following is from the *Investors' Guardian*, of March 25th:—

**NEW DIMBULA COMPANY, LTD.** (61,124).—Registered March 16th, with capital £100,000, in £1 shares to acquire the business of the New Dimbula Company, Ltd., (incorporated in 1895), and to carry on in Ceylon and elsewhere the business of planters, growers and exporters of tea, coffee, cocoa, and cinchona. The subscribers are: Shares.  
 W. S. Bennett, Tower House, Slough, tea planter ... 1  
 Henry Brooks, St. Peter's Chambers, Cornhill, E.C. merchant ... 1  
 Herbert Brooks, St. Peter's Chambers, Cornhill, E.C. merchant ... 1  
 H. T. Brooks, St. Peter's Chambers, Cornhill, E.C. merchant ... 1  
 W. Jordan, The Acacias, Loughboro' Road, Brixton, merchant ... 1  
 A. Crabbe, 52 Gracechurch Street, E.C., merchant ... 1  
 E. T. Wise, Hillgrove, Altyre Road, Croydon, clk ... 1

The numbers of directors is not to be less than three nor more than seven; the first are the directors of the old company; qualification £300; remuneration £500 per annual dividend. Registered office, 52 Gracechurch Street, E.C.

**ALOE FIBRES IN MAURITIUS.**—The market is firm. We have to record the sales of 160 bales first quality at R200 per ton of 1000 kilos. We quote nominally: 1st quality R300 to R305 per ton; 2nd quality R165 to R170 per ton.—*Commercial Gazette*.

**CINCHONA BARK.**—We hear of 400,000 lb. of six per cent cinchona bark being sent off from one property in Southern India. This, at present prices, should bring a very satisfactory return.

### RE-EXPORTS OF INDIAN AND CEYLON TEA.

The table included by Messrs. Gow, Wilson & Stanton in their last circular is of special interest. It shows that the total of Indian teas re-exported from Great Britain has risen from about 3½ million lb. in 1894 to 7,846,500 lb. in 1898; while those of Ceylon's in same period have risen from 5,166,620 lb. to 11,523,186 lb. Germany is our best customer; but it is supposed that the bulk of 3,577,526 lb. of Ceylon tea sent thither, passed through to Russia, a country which also took direct no less than 1,605,701 lb. We suspect, too, that a good deal should be credited to "Austria" for Karlsbad, where 40,000 people for the six months of the season drink a good deal of tea imported through Hamburg. It is noteworthy that Germany and Russia together took nearly double (certainly 75 per cent more than) United States and Canada. France's import (89,207 lb.) is quite insignificant; and Belgium, with no duty, ought to do better than 108,000 lb. The people of Chili and of South Africa seem fond of Ceylon (and Indian) teas to judge by the figures, as also those of Newfoundland, Denmark and the Channel Islands. But certainly Russia and Germany—with Northern Europe generally—would seem now to be the fields most deserving of attention, though, of course, the American campaign has to be persevered with.

### COFFEE PLANTING: NOTES FROM SER- DANG O. K. SUMATRA.

April 6.

I sent the Weekly *Ceylon Observer* with the telegraphic account of Mr. Ryan's reception by His Imperial Majesty to a German coffee planter in this district, who is vice-President of the Serdang Koffie Planters' Vereining (i.e., P.A.), and this is his reply:—"Many thanks for your note and the *Ceylon Observer*. No fear, the German soldiers will never drink Ceylon tea, as they are accustomed to coffee. Nevertheless, the idea of the Ceylon planters was grand, and should be followed by us Serdang planters." Referring to the accounts of frost in Nuwara Eliya and the Agras, he says, "I hope that they will get 28° Fahrenheit in Brazil in their coffee, confound them!"

The long continuance of low prices is hitting hard some few here who rushed into coffee when the prices were most inflated, trusting to be able to borrow later on. Alas! no money is to be found for coffee at present prices. Some of the most careful who went in before the period of inflation, made calculations which were prepared to stand a fall in price to \$20 per picul, though they never really anticipated having to face the music set in such a minor key. These looked upon the affair as an investment, and are consequently rubbing along, though not yet making fortunes! A few, however, with small capital, went in purely and simply on the spree, and that of the wildest; and the corners of their mouths are considerably turned down just now. However, these prices cannot last for ever. One thing here is assured, and

that is crops. Thanks to the soil, these come "whether or no," and the seasons do not affect Liberian to nearly the same extent that they do its more aristocratic brother. The original 20 year old trees have this year borne enormously. Five to six *catties* clean coffee per tree, which is equal to 6½ to eight lb., and one old giant is estimated to have yielded no less than 15 *catties*. Pro-di-gious!

There has recently been a considerable revival of tobacco in Serdang. One Company is planting both products on a very extensive scale, while others who are planting coffee only, are leasing portions of their lands to tobacco planters, and are getting very favourable terms for them, too.

One or two are turning their thoughts to cacao; but so far nothing practical has been done in this direction. One difficulty is where to get seed from? Ceylon is pest-infected, and the risk of seed spoiling in transit is a considerable one. On Tandjong Merawa, a tobacco estate, are some cacao trees, the seed of which was got from Ceylon, 15 or 16 years ago. The cacao was abandoned, and is now, I am told, growing luxuriantly and bearing heavily in the jungle. But nobody knows whether it is the right sort or not!

W. T. M'K.

### SIR T. LIPTON'S SUGAR SCHEME.

It was reported from Barbados the other day that the committee of the Agricultural Society had recommended the rejection of Sir Thomas Lipton's offer to purchase canes at 16s per ton for a central factory, to cost £130,000, and to manufacture only £5,000 worth of sugar, the committee being of opinion that there was nothing in the scheme for them.

Sir Thomas Lipton informs us that there must be some misunderstanding, either in the report or on the part of the committee, because his representative has not made any actual offer to the planters of Barbados. Sir Thomas's experts are still in the West Indies making inquiries, and any offer will, of course, depend on the commercial aspect of the matter as it appears to Sir Thomas when he receives the full reports, which are yet by no means complete.

But his impression is that in the end the matter will come out all right, and he may be able to make an offer to planters on a co-operative basis.

Obviously there is some misunderstanding in the report that Sir Thomas Lipton proposed to manufacture only £5,000 worth of sugar. In the event of his taking up the question of central factories in Barbados, it would be, we are informed, with a view of dealing with a matter of something like three quarters of a million pounds' worth of sugar.—*Daily Mail*, April 14.

TEA-PLUCKING TENDENCIES. A well-known V.A. writes:—"I hear the tendency now is to pluck more coarsely." Is this the result of any fear lest, by plucking too fine, the home market for the better Ceylon teas may be weakened, in consequence of larger purchases of cheap China and Indian teas being made. The late news to hand, on the contrary, describes the bidding for the higher grades as being very vigorous, and, as our London Correspondent tells us, the brokers seem to be looking forward to a season of high prices.

Correspondence.

To the Editor.

CEYLON TEA IN AMERICA.

Toronto, March 21st, 1899.

DEAR SIR,—We are enclosing herewith an article which appeared yesterday morning in one of our daily papers. It will perhaps be of interest to your readers.—Yours truly,

P. C. LARKIN.

TEA AND THE PREFERENTIAL TARIFF.

It is reported that the Government has in view the placing of a tax on tea to meet the deficiency caused by the recent postal reductions. If such is its intention, advantage should be taken of the opportunity to discourage the use of the adulterated and poisonous teas that are dumped on the Canadian market. There is a lot of trash known as tea that should be absolutely prohibited from entering the country. This low grade stuff is the cause of sallow complexion and nervousness in the people who use it. We have no hesitation in saying that it is the exciting cause of many cases of insanity. The farmers seem to use a good deal of it and with bad effects. Whether the Government places a duty on tea or not, it should protect the people from these poisonous teas. They come principally from China and Japan, being prepared by people who are uncleanly, ignorant and devoid of all ideas of sanitation. In order to discourage importations from China and Japan, it would not be a bad idea to extend the preferential tariff, as applied to Great Britain, to such parts of the empire as produce tea, that is if a duty of any kind is to be imposed on tea. The tea plantations of Ceylon and India are under the control of Englishmen, who use machinery to prepare the tea, while in China and Japan the work is done by the bare feet and hands of the natives. A preferential duty would kill two birds with the one stone—encourage trade within the empire and discourage the use of an article that is sending many people to the asylum.

TEA FOR THE QUARTER.

London, E.C., April 6.

DEARSIRS,—We are not issuing a tea circular this week as no public sales have been held in London, but as the month's figures have been published since our last circular was sent out, we enclose copy of the figures with a few remarks upon them which we think may interest you.

The increased deliveries of Indian tea are very encouraging, while the reduction in the stock is very marked. The smaller Ceylon deliveries during the past few months are doubtless accounted for by the somewhat higher prices which ruled for the lower grades of these teas during the greater portion of the season.

We feel sure that you will be interested to receive the enclosed copy of figures, and we are, dear sir, yours faithfully,

GOW, WILSON & STANTON.

Deliveries of Indian tea during March were nearly one million and a half pounds above March last year. This brings up the increase in deliveries of Indian tea for the first ten months of the season to 13½ millions ahead of the corresponding period last season; while the stock is 6½ millions below that at the end of March 1898. Smaller Ceylon deliveries

are doubtless accounted for by the higher relative prices at which the lower grades of this growth were selling during a large portion of the season; but it is satisfactory to notice that the stock is practically the same as a year ago.

Movements (in lbs.) of Indian and Ceylon Tea from:—

	1st June 1898 to 31st March 1899.	1st June 1897 to 31st March 1898.		
	Indian.	Ceylon.	Indian.	Ceylon.
Imports ...	134,212,606	77,266,270	133,359,215	78,782,754
Deliveries ..	119,856,559	76,153,798	106,572,933	80,661,592

MANURING EXPERIMENTS.

Colombo, 21st April, 1899.

DEAR SIR,—Mr. Joseph Fraser sends us today the analysis of a fair sample of the average soil of the experimental plots which, he writes, might be inserted alongside the manuring experiment figures, first published in the *Observer* of the 6th inst., and since in the *Tropical Agriculturist*.

The following is a copy of the analysis mentioned above:—

The results represented the composition of the fine earth of the soil viz., that portion which passes through a sieve having 40 meshes to the linear inch.

	Per cent.
Water lost at 212° Fahr. ..	5.550
*Organic and volatile matters ..	11.900
Soluble in standard hydrochloric acid oxides of iron ..	11.720
Alumina and Manganese oxide ..	16.127
Lime ..	.461
Magnesia ..	.690
Potash ..	.245
Phosphoric Acid ..	.153
Insoluble silicates and undetermined matters ..	53.154
Total ..	100.000

\*Containing Nitrogen .. .135

The soil is well supplied with lime, potash, phosphoric acid and magnesia. There is a fair amount of nitrogen, but this is relatively the most deficient element of plant food present; and from the analysis we would expect this soil to be more responsive to the nitrogenous elements in manures than to the potash and phosphoric acid. The air-dried soil contains a high percentage of water, viz., 5.55 per cent. or in a drier condition of the atmosphere 4.20 per cent. The high percentage of alumina accounts for the soil being thus retentive of moisture.

(Signed) M. COCHRAN, F.C.S.  
City Analyst

—We are, dear sir, yours faithfully,

FREUDENBERG & CO.

CEYLON TEA IN AMERICA.

Kandy, April 21st, 1899.

SIR,—I enclose copy of a letter received by Mr. Lane from Mr. Wm. Mackenzie, dated New York, March 20th, reporting generally on the state of the tea trade in America.—I am, sir, yours faithfully,

A. PHILIP.

Secretary "Thirty Committee."

New York, March 20.

DEAR LANE,—I wrote to you three days ago, to catch Saturday's mail. This may possibly catch the same mail from London to Ceylon.

I have just heard the surplus Revenue in Canada is likely to be so large that no new duties will be imposed. But until the Revenue Bill comes up, nothing definite will be known.

Discriminative against China-Japan meets with no approval from the Home Government, who have to take a wide and general view of the Empire's affairs.

See the enclosed cutting. (Given below.—Ed. C.O.)

It is astonishing how the dealers here are sticking out against the rise in the London tea market for lower grades.

The importers had Calcutta and Colombo teas on hand—bought before the rise which began two months ago. These teas have been arriving during the last three weeks basing their prices on the recent rise, the Importers have been loudly boasting that they would not sell under present London values. But one after another has been selling his teas one-half per cent. under London value to please the trade, and steal his neighbour's customers.

The trade has for years been getting China blacks (Congons) at 6d. and under, and last year got our P. Souchong at 3½d to 5½d. With another year of low prices, we would, I think, have entirely killed the China blacks. But the rise has driven importers to enquire for these again.

During my trip to the West, I had chiefly in view, an enquiry into the success or otherwise of the demonstrators scheme I started last November-December re Pittsburg, Detroit, Buffalo and Boston. I had been getting weekly returns of those sales since we began demonstrating. I sent you some of those before leaving, England. I was shown those of past four weeks all exhibiting a steady increase.

	Feb. 18th	Feb. 25th	March 4th	March 11th
Detroit	702 lb.	673 lb.	584 lb.	711 lb.
Buffalo	617	737	719	804
Pittsburg	649	773	617	934
Boston*	460	1,210	1,440	1,685
	2,428	3,393	3,390	4,334

\* A snow-storm stopped deliveries.

Those demonstrations were in connection with—tea. He had previous to last October been pushing his tea in those cities some for 12 months, some for two years. He at first met with great encouragement, as the grocers took small quantities 5 to 20 lb. on the strength of his promise to advertise the tea. This he did splendidly, and at a great expense, spending in Boston alone £20 to £30 a week in the best papers. His sales however gradually fell off—but perhaps because his advertising roused U.S. firms to make a push with similar teas. Grocers returned his teas instead of paying for them—he became disheartened, and was gradually reducing his advertising. I was afraid he would retire from the States, in which case his U.S. rivals would revert to their first loves. Chinas and Japans. I proposed substituting demonstrations for advertising and offered to contribute: so far the success has exceeded expectations and when I put it to his Managers in all four cities, "whether they would have advertising or continue the demonstrations," they with one accord answered "Let us have both, but if one must go, let it be the 'advertising.'"

One of the travellers selling the tea in Boston said, what I have often urged:—"I have been selling these teas since—started in Boston. I failed miserably with the advertising. I have succeeded splendidly since the demonstrations were started. Every packet bought from advertisements, makes enemies, because of the way the tea is made.

The demonstrators show the people how to make it—and make friends for us."

I have been interrupted by several callers. Mr. Blechynden has returned. It is not quite certain yet what the Indian Committee are to do. I shall not know till I see them in London, which I hope to do within a fortnight.

The last week for which I gave you the sales here (we are having demonstrations) ended March 11th. For week ending 18th, I have, so far, had the return from Boston only—it is the largest on our record, 1,740 lb.

About Chicago, and the West, I have much to say; but must postpone it. All goes well, however, so far as the packet business is concerned, but bulk teas are too dear in London for the market, as it is, low grades may take.

*Greens.*—In Mr. Blechynden's report to his committee he says about *unfermented teas*:—"Some samples of these Oolong teas made in India, were sent me early this year. They were found so suitable for the market, and firms were so ready to give immediate large orders, that I have had to revise my opinion. I now believe that there are certain districts in India, where Oolong teas of a character to command a ready sale can be made, and if such teas are produced there is practically no limit to the business that could be done" &c.

Those Indian greens I mentioned in my letter of 14th were packed up at once. Unfortunately there were only a few hundred cases, whereas thousands could be sold. These could be sold easily, whereas our blacks for price are unsaleable being too dear.

An Importer bought some Ceylon greens lately. He has twice told me the people to whom he sold them, could not get rid of them—as they were good and pretty, but different from the kinds used here. These people have now wired to him to reserve for them any other similar Ceylon greens he could get. —Yours truly,  
(Signed) WM. MACKENZIE.

### PLANTING NOTES.

*BRAZIL COFFEE NOTES.*—The committee of coffee factors of Rio de Janeiro, in its report presented on last Friday, maintains its previous estimate of 3,000,000 bags for the crop of 1899-1900. The committee says that the crop, as well as the trees, has been injured by drought, but that it is not yet possible to estimate the amount of damage thus caused. It is expected that the early maturing of the coffee will cause an increase of 20 per cent. in the receipts at Rio de Janeiro before the 30th of June.—*Rio News*, March 28.

*HOOKE'S "ICONES PLANTARUM."* Part IV. of the sixth volume (March 1899), of Hooker's *Icones*, edited for the Bentham Trustees by Sir W. T. Thiselton-Dyer, contains illustrations of several plants of botanical interest. Among them various species of the Euphorbiaceous genus *Hevea* are given. The floral details of some of these are singularly like some of the Malvales or Sterculiads. *Odontospermum pygmaeum*, t. 2583, is a desert Composite, shrivelling in dry weather, but expanding when the rain comes, hence it has been (with others) called the Rose of Jericho. Mr. Hemsley contributes further details relating to the extraordinary Pandanad named by him *Sararanga sinuosa*.—*Gardeners' Chronicle*, April 1.

*CEYLON TEA AT MANILA.*—At the close of some interesting notes on affairs at the Philippines forwarded to us by a resident, at Manila, we learn that there is likely to be a considerable opening for the sale of Ceylon tea at the Philippine capital. At present it is quite unknown there. The price at present paid there for China tea is 2½ dollars, or rather over 4s a pound. With the increasing traffic which passes through Colombo on its way to Manila there should be no difficulty for the transport of the article, and the sooner an experiment is made at Manila, the more likely is the Ceylon product to get a footing too firm to suffer appreciably by any continuing importations of China teas. Although the troops are reported to be discontented and eager to return home, there is little doubt that once the islands are subdued a considerable number of colonists will pass over from America to settle in these fertile colonies. In this connection we may mention we have received some daily notes from a private on board the U.S. transport "Sheridan" from which we hope shortly to publish extracts.

## THE VELLIKELLIE TEA COMPANY OF CEYLON, LIMITED.

REPORT:—

To be presented at the second ordinary general meeting of the Vellikellie Tea Company of Ceylon, Limited, held at the Offices of the Company, 12, Fenchurch Street, London, E.C. :—

Your Directors have the pleasure of submitting their Report and Balance Sheet for the six months ending 31st December, 1898, in accordance with the announcement made in their last Report, that such special closure of Accounts would be effected, in order that the Season's working may henceforth run from January to December of each year.

The result of the working is not very favourable but as much so as could be anticipated from the weather conditions.

The yield of the Estates has been 90,539 lb. of which 85,145 lb. have been shipped to London, and sold at a gross average of 10.03 per lb.

The crop for 1899 is estimated at 210,000 lb.

Exchange has averaged  $1/4$  13 64 per rupee.

The Working Account discloses a surplus of receipts (£919 17s 11d.) which, after the addition of the balance brought forward (£47 8s 6d) and the deduction of dividend on Preference Shares (£142 10s 0d), leaves sufficient for the payment of a Dividend of 2 per cent free of income tax, on Ordinary Shares (£705), and a balance to be carried forward of £119 16s 5d in respect of preliminary expenses, income tax, etc.

Mr. G. A. Dick, at present in Ceylon, expresses himself as thoroughly pleased with the local management of the Company's property and affairs, and considers that the present season opens with better prospects of financial success.

Mr. Edgar Bois retires from the Board on this occasion, and, being eligible, offers himself for re-election.

Mr. J. Hamilton Alston, the Auditor, also offers himself for re-election.

## THE TEA INDUSTRY IN INDIA.

A FAVOURABLE FORECAST.

Messrs. Carritt & Co.'s Indian Tea Market Review, for the season 1898-99, says:—

Prospects for the ensuing season are brighter, and there are indications of a more prosperous year before the trade. The present strong position will doubtless become accentuated by the end of May, and statistically the outlook is exceptionally encouraging.

The low scale of prices has enabled distributors to handle tea freely and force consumption, and the extraordinary increase in home deliveries is the most satisfactory feature in the year's work. That so large a portion of the crop should, under such abnormal conditions as existed during the past year, have been dealt with before any recovery in prices took place in London, is instructive, and it is to be hoped that the measure of strength now acquired by producers will not be disturbed.

The statistical position would seem to invite a freer supply, which in many cases would mean a coarser system of plucking and a consequent lowering of quality; under such conditions the outlook is not favourable. The past year's crop was by no means a full one and with the increased yield during the current season from considerable extensions coming into bearing, there should, under normal conditions of weather, be quite sufficient tea to meet home requirements, and also the increasing demands for outside markets. With a large and inferior quality crop, lower prices must be looked for and any recovery in value (signs of which are now seen) cannot be maintained.—*Pioneer*.

## THE AMERICAN TEA MARKET FUND.

THE PROPOSED WITHDRAWAL OF INDIA OPPOSED.

The Chairman of the Assam Branch, Indian Tea Association, has issued a Memorandum on the above subject as follows:—

"I am of the opinion that the Assam Branch of the Indian Tea Association should strengthen the hands of the Calcutta Tea Association by taking this matter up, and should protest in the strongest terms possible against discontinuing the American Market Fund at present, or taking any of its funds towards introducing tea into other countries. In Messrs. Thomas & Co.'s report, dated 17th February, the following is stated: "America, increase 75 per cent. Exports from 1st April 1898 to 6th February 1899.—America, 2,459,964 lb.; Exports from 1st April 1897 to 6th February 1898, 1,397,005 lb."

"While agreeing with Messrs. Thomas & Co.'s remarks in the all importance of every one interested in the tea industry losing no opportunity of supporting the efforts that are being made to stimulate the demand for Indian tea in every habitable portion of the globe, still I think it would be premature to take any of the funds now given towards pushing tea in America and to apply them to other countries until a plan of campaign is clearly made out.

"Mr. Blechynden has done (contrary to the expectations of many) exceedingly good work for us in America, and to act on the supposition that his work is over, or even nearly so, would I feel convinced, be hazardous in the extreme, not only weakening our hold in America, but risking the support we now obtain.

"Let Mr. Blechynden's opinion be asked how far we can relax our hold in America, and should he support the London Association; then let a well-thought-out plan be arranged for the introduction of tea into other countries and, if necessary, further subscriptions asked for.

"Those who have already come forward in a liberal way to support the introduction of tea into new markets have, without doubt, succeeded in a way the most sanguine could hardly have anticipated; and it can scarcely be imagined that concerns which have so far withheld their support can any longer waver or fail to come forward (though late) to the assistance of those who have borne the brunt of the fight."

J. BUCKINGHAM.

## PLANTING NOTES.

**CINNAMON AND CINCHONA.**—At the London cinchona monthly sales there were 1,200 lb. The general tone is easier, and the price  $1\frac{3}{4}$  per unit. In regard to cinnamon the tone is firm; quill buyers offer 8 $\frac{3}{4}$  per lb.; sellers ask 9d per lb. and chip buyers are giving 31 per pound.

**COCONUT PLANTING BY EUROPEANS IN THE EASTERN PROVINCE.**—The 390 odd acres, at Urany, in Pottuvil, bought last year by Messrs. J E Carey and H M Alley, of Maskeliya, have been planted with coconuts, and the land at Pottuvil, bought by Mr. A J Browne, is under plantation. A portion of 1,000 odd acres, at Tirukkivil and Komar, purchased by Mr. Browne, will be cleared and planted this year. Messrs. S C Northcote and A Jemmet Browne went in for about 250 acres at Tirukkivil some time ago. It is calculated that about 2,500 acres have been purchased during the last few years by Europeans, the principal purchasers being Messrs. R H S Scott and W R Tatham, of Dikoya, A J Browne, now of Batticaloa; J E Carey, and H M Alley.—*Batticaloa Cor.*, Local "Times."

RUBBER MACHINES.—With regard to machines for the preparation of rubber from the raw state, of which few if any are, we believe, at present in use in Ceylon, it is of interest to learn that the local School of Agriculture are to receive a supply in the course of a few weeks from Messrs Thomas Christy and Co. the well known experts of Lime Street, E. C. A large quantity are being made, the machine having been carefully tested in several rubber countries. The price will be somewhere about £7, the exact figure not having been fixed yet.

## ROYAL BOTANIC GARDENS CEYLON. REPORT FOR 1898:\*

### TEA AND ITS ENEMIES; COFFEE VARIETIES AT PERADENIYA; CACAO; RUBBER PROSPECTS WITH PATENT PREPARING MACHINERY.

The Administration Report of the Director for last year is swelled to an unusual size, mainly through the appearance for the first time of long and valuable extracts from the Report of the Honorary Entomologist indicating. As Mr. Willis puts it, "an immense amount of work during the year" got through by Mr. E. E. Green for the benefit of his brother tea planters as well as of the "paddy" and other native cultivators, and of the cacao, cardamom and coconut planters. What is said about the enemies of tea, in caterpillar, borer, helopeltis, tea mite, &c., will be carefully considered by those concerned as also the section on "the introduction of beneficial insects." On the whole, however, the enemies noticed by Mr. Green are eminently conquerable if we may say so, and are chiefly confined to limited spaces or districts. More seriously important is the "gray blight" of Assam, a fungus which has been giving some cause for anxiety in a few of the lower and older districts. Every planter concerned should possess a copy of Dr. George Watt's monumental work on the subject of these tea blights and study the chapters specially devoted to them; and we think it would be advisable for the Planters' Associations in the districts at all troubled, to arrange some sort of concerted action for dealing with the pest when it appears. The lower and older districts are specially supposed to be liable; but we heard of the appearance last year of the blight on a plantation at 4,000 feet elevation and we have been puzzled as to the exact force of the following expression of opinion by an experienced planter in a letter written early in April:—"The low-country and medium-elevation estates are now scoring and the high-elevation estates have now to take a back-seat with frost and leaf-disease: I wonder if the bushes that are not pruned for two or three years and the leaf constantly nipped off are not more liable to fungoid disease than tea bushes pruned every eighteen months with the rest such treatment gives them." Now this seems to imply that high estates are more troubled than those lower down and of this fact—if fact it be—we ourselves (and evidently Mr. Willis and Mr. Green) have had no proof. Indeed a short time ago we forwarded to Mr. Green, from the neighbourhood of Nuwara Eliya, a specimen of what was supposed to be *Helopeltis*; but he assured us it was nothing of the kind and that he did not think the insect would be found troubling tea so high. We are aware of tea being a good deal troubled around the sanatorium this season through the effects of frost, and it is possible this result has been confounded with 'fungoid disease'? Mr. Willis adduces a good reason why 'abandoned' tea should be destroyed—at any rate we should say, burnt to the ground, though, judging from Assam, the

vitality of the shrub is by no means then extinguished, a few months seeing a new stem and crown of vegetation—so hardy is tea. In that fact lies the great difference between it and coffee, and therein we have a reason for reassuring planters in the midst of insect or fungoid enemies or rumours of enemies. We may experience a tendency to magnify the importance of such matters in Ceylon after our great trial during the coffee era, and there is certainly good reason why the planter should be on the watch and why he should fortify himself with all that science and careful investigation and experiment can make available to him.

Mr. Willis is hopeful that, as the result of Mr. Kelway-Bamber's exhaustive study, the methods of tea manufacture will be improved and become less haphazard than is at present the case. We get some interesting information in respect to varieties of coffee now growing at the Peradeniya Gardens; but nothing is said as to whether the plants are even, so far, free of *hemileia vastatrix*? Hitherto—that is since 1870—any new varieties of coffee tried in any part of Ceylon, manifested the yellow fungus almost as soon as the first branches with their leaves were formed. If such is not now the case, would it not indicate that the dreaded coffee fungus is dying out in the island?—Mr. Willis does justice to the work done by Mr. Carruthers for cacao, and shows that henceforth the treatment of the pest and the substitution, where possible, of the hardy kind rest with the planters themselves. The next matter of importance treated is India-rubber and we are told that not more than 10,000 acres of land really favourable to the cultivation of Para rubber are to be found in Ceylon. This, we should hope, is not only a moderate, but an unduly low estimate, if we take what should be available in the Western, Southern and Sabaragamuwa Provinces. But as Mr. Willis shows, all speculations as to the best rubber-yielding tree to plant and the best situation to occupy, must now be held in suspense until the full effect of the new patent method of separating caoutchouc from the latex or milk, is realized. Rubber-yielding trees, which have hitherto been despised as yielding a poor quality, may, under the new treatment, prove profitable and young trees and stems may possibly give returns without waiting for well-developed trees. If this prove to be the case, we may expect a rush into rubber planting after the fashion of that into cinchona in the early "eighties." Meantime there will be enquiry for seed of the "Castilloa elastica"—the rubber-tree of Central America *par excellence*—even more perhaps than for those of Para or Hevea; and what may we ask of the almost forgotten "Ceara" rubber tree which grew like a weed when the industry was first tried in Ceylon—may it not under the revolution which patent machinery is to create, come to the front again? Mr. Parkins' experiments are not yet closed; but the results will be looked for with interest.—Here we must pause for to-day in our reference to the Report, from which we shall quote fully in an early issue, so as to give Mr. Willis's concise, and often suggestive, as well as practically useful, remarks in regard to Minor Products, &c.

NEW DEVELOPMENTS IN THE  
COCONUT INDUSTRY.

We have had the privilege of being consulted by a party who has been going very fully and energetically into the methods of extracting oil from the coconut, and has brought to bear much practical experience of a technical nature on the question, with a view to discovering a means of producing a finer article on a commercial scale. It is well known that special methods can be, and are, used for preparing special samples of fine oil for exhibition purposes, but such methods, or rather devices, are quite outside commercial possibilities.

Not very long ago the *Ceylon Observer* opened its columns to the discussion of the question of the superiority of Cochin over Ceylon coconut oil, and the reasons for this fact. As a result a good deal of interesting correspondence was forthcoming, in the course of which much useful information regarding the preparation of coconut oil was brought to light. The conclusion of the whole matter, however, pointed to the fact that there was no secret in the preparation of the best oil in the market, and that the sun-drying of the copra, coupled with careful manipulation in the orthodox fashion, accounted for the difference in the quality of the rival oils.

Now, a dry heat and a meagre rainfall are not within the command of the coconut planter who

would turn his nuts into copra, while, some how, (we will not stay to enquire why) drying the kernels by means of dessicators has not come to be fancied in copra making as in the manufacture of "dessicated coconut."

It has remained, however, for the party above referred to, after an expenditure of much time—not to say capital—to solve the problem of producing, on a commercial scale, the finest possible quality of oil by an altogether new process. Naturally, a prolonged and careful study of this question has brought other new facts to light as side issues, for instance the purification of oils generally, and the preparation of what for the present are called "Extracts" from oil seeds, and particularly the coconut. Again, we would state that the tedious device of straining and filtering adopted in the clarification of exhibition oils, forms no part of the purification method referred to, while the new "Extracts" are as promising as they are startling in their novelty. And the great point about all these processes is that they can be carried on rapidly and on the widest commercial bases, with the production of the purest articles—perfectly free, be it said, from chemical taint.

These statements as to the quality of the products are not merely founded on the *ipse dixit* of the inventor, nor are they the views of an interested or favourably prejudiced critic, but are based on reports of chemical experts and dealers in London. The keenest interest has been evinced in this new development of the cocount industry, and business negotiations are just now in active progress. We have been permitted to say this much and no

more, till definite arrangements have been made to launch the new industry, which is already engaging the attention of more than one capitalist outside the island, and we will only add that we heartily congratulate the promoter of this business which should help to further strengthen the position of the coconut planters of the Colony.

Greatest amount of rainfall in any 24 hours on the 29th inst. .74 inches.

Mean rainfall for the month .05 in.

Recorded by Mr. J. A. G. RODRIGO.

OCCASIONAL NOTES.

Catalogues of the Colombo Agri-Horticultural Show to be held in July next can be had on application to the Honorary Secretary, School of Agriculture, Colombo.

The following are the Agricultural Exhibits required for the Ceylon Agriculture in the Paris Exhibition 1900.—Group VII. Agriculture (classes 35-42) in the Paris Exhibition official catalogue. Class 39. Vegetable Food Products: Rice, Tea, Coffee, Cacao, Cardamoms, Vanilla, Pepper, Cinchona, Sugar, Cinnamon. Class 41. Non-edible Agricultural Products: Rubber, Ramie, Aloe and Fibre, Coir, Palmyrah, Kital, Coconut Oil, Citronella Oil, Cinnamon Oil, Lemon Grass Oil, non-cultivated oils (such as Kekuna, Mi, Domba, &c.) and Tobacco. Of these the Planters' Association of Ceylon has undertaken to collect the whole of class 39, except Rice, Sugar and Cinnamon, and also Rubber, while the Chamber of Commerce has undertaken to supply Sugar and Cinnamon as well as the whole of class 41, excepting Rubber, non-cultivated Oils, and Tobacco. Rice has been assigned to the Government Agents, Western, Eastern and Southern Provinces; Tobacco to the Government Agents, Northern, Eastern and North-Western Provinces; Sugar also to the Government Agent, Southern Province; Non-cultivated oils to the Conservator of Forests and the Government Agent, North-Central Province.

Mr. Thomas Christy of Lime Street reports that he will shortly place a large stock of approved Rubber machines on the market, the approximate price of a machine being £7. Some of these will no doubt very shortly reach Ceylon, and help to settle the vexed question of what form of rubber would be most easily grown and remuneratively cultivated in the Colony.

Mr. E. Elliott, of Walawe Estate, Amblanteta, reports having received from Queensland three descriptions of paddy seed—one of which is put down to yield 1½ to 3 tons per acre (75 to 100 bushels).

Mr. S. D. Mahawallatenne, Ratemahatmeya, of Balangoda, is establishing an extensive garden, both for flowers and fruits, in which he is trying different imported varieties of fruit with a view to finding out those which will thrive in his district. Naturally, the experiment is costing a good deal, but Mr. Mahawallatenne will have the satisfaction of feeling that he is engaged in a most laudable work, which should go a great way towards making his district conspicuously progressive, as well as to confer a permanent benefit on the inhabitants. Balangoda possess good soil and a climate that should suit many temperate plants.

AGRICULTURAL EDUCATION.

Just at this stage when the question of an Agricultural Department and the reorganising of Agricultural Education in the Island is occupying the attention of a Commission, the following extract from Dr. Voelcker's report on the improvement of Indian Agriculture is much to the point:—

"The question next arises: granted that there is a need of men more agriculturally trained, what inducements are there to be given to them to pursue the study of agriculture? If young men go to other employments because there are no openings for them in agriculture, how are these openings to be made? Only by giving as good "prizes" for agriculture as for the Bar or for Government employ. The Land Revenue Administration needs a regular supply of men to fill posts in it. Land Revenue Inspectors are required whose business is with the people in their agricultural relations, and who have to do with the soil and the crops. Surely those best fitted are the ones who have had an agricultural training, and the administration of matters connected with the land will be best carried out by the men who understand agriculture best. In England a land steward is not a man who is taken out of a bank, or who has done no more than take a high university degree in classics or mathematics. So should it be with Land Revenue Inspectors; they should be men who have passed through the agricultural classes, or through institutions that give a training in agriculture. In the course of my tour I met many Inspectors whose mind seemed to be quite a blank on the subject of agriculture; in other parts, as in some districts of the Central Provinces, I found them to take a decided interest in agriculture. These latter were men who had passed through Mr. Fuller's Agricultural Class.

In Bombay it is now provided that all candidates for the staff of Inspectors of Village Records must qualify by passing a course in agriculture. I cannot put these views into better general terms than those adopted in the following two Resolutions adopted at the Simla Agricultural Conference:—

Resolution VI.—It is highly desirable that the claims of men trained in Scientific Agriculture to appointments in the Revenue and Cognate Departments should be as freely recognised as those of men trained in Law, Arts and Engineering.

Resolution VII.—That where appointments in the Revenue and Cognate Departments are made on the results of competitive examinations, Scientific Agriculture should be included as an optional or necessary subject in the examination course."

These remarks of Dr. Voelcker have, to our mind, a most important bearing on the question at issue in Ceylon.

It is common enough to hear the remark that the School of Agriculture is a failure. And why? The answer, we think, is because the Government do not recognise the factors which are necessary for the success of the school. One important factor has been indicated in the passage extracted from Dr. Voelcker's report, namely, that Government should utilize the agents which have been provided by them for the spread of agricultural knowledge among the masses, and to help the cultivators in the rural districts.

In this connection we might quote from a letter received from a Tamil gentleman, referring to the circumstances of the Tamil districts. "Headmen, such as Irrigation Vannias, Pattu Vannias in the Eastern Province, and Maniagars and Adigars in the Northern Province should be drawn from among those who have had a training in agriculture. I say this with good reason, since everything connected with paddy cultivation is under the control of these officers. How well a trained man could serve in such appointments will be seen when I refer to the duties of such headmen.

The headman, as a responsible officer, has to convene meetings of cultivators and discuss with them such questions as the extent of land which could be irrigated, the kind of paddy to be sown, the method of sowing to be adopted, and other agricultural details of a practical nature. In short, he is the authorised guardian of paddy cultivation. Where else could a man with an agricultural training better prove his utility than in such a situation, invested with authority sufficient to influence and control the cultivators in their practical operations. Why, the power for good he will be able to exert will be immense."

These remarks are on all fours with those of Dr. Voelcker, though written with reference to Ceylon.

There are some who would say, the idea is sound enough, but the School of Agriculture does not turn out men suitable for such appointments. And the reason is because the students at present at the school are drawn from a class that have no hopes of attaining such positions. Given the prospects, and the proper class of men will be attracted.

There is one other point we would wish to refer to before abandoning this subject for the present, and that is the importance of widening

the scope of the practical side of an agricultural training (now totally lost sight of) by, among other methods, taking the students about to see in actual practice the work which they have been taught theoretically or by small object lessons, and to appreciate the defects and excellences of agriculture in practice. This is a detail which is acknowledged to be of the first importance in a technical training, and forms part of the course in all agricultural schools and colleges, whether in the West or the East—with Ceylon alas! as a solitary exception.

But we have written enough for the present, and we conclude with the hope that such important points as we have touched upon in this article will not be lost sight of by the Commission at present sitting.

THE JAK TREE.

We are indebted to the Hon'ble W. T. A. Edwards, M.P., of Mauritius, for a copy of the annual report on the work carried on at the Station Agronomique in that Colony during the year 1897. The report is very full and interesting, and we would acknowledge its receipt with many thanks. Most interesting to us, however, are the chemical analyses of many vegetable products familiar enough in this Colony, and for the present we shall refer to the notes on the Jak Tree (*Artocarpus integrifolia*). The tree is referred to as an excellent shelter against wind, a vigorous grower and supplying valuable timber for carpenter's work. The leaves are spoken of as good food for cattle, while the fruit is used both as food for human beings and for cattle. The seed and fleshy, sweetish "pods" are edible, but the remainder of the fruit—that is almost half the total weight—consisting of the envelope properly so called, and the core, is excellent food for cattle and swine. Each fruit weighs from 10 to 20 kilos: the tree is therefore highly productive.

The entire fruit yields a proportion of

Rind and core	...	...	54.5
Pods	...	...	13.0
Seeds	...	...	32.5

Fruit complete 100.0

The composition in 100 parts is given as follows.—

	Envelope.	Seed.	Pods

### BORACIC ACID AS A PRESERVATIVE.

Boracic acid is the chief ingredient in most of the patent preparations which are sold under various trade names for preserving milk and butter. A little boracic acid added to milk goes a great way to keep the milk sweet, an important consideration in tropical countries where milk turns so quickly. The souring of milk is due to the generation of lactic acid brought about by the action of a ferment which converts the milk sugar or lactose in milk into lactic acid. When the acid reaches a certain proportion the milk begins to curdle. The same change could of course be brought about artificially by adding other acids such as citric acid in the form of lemon juice. In cheese-making the curdling of milk is a necessary process, and is induced by the addition of rennet, an extract generally got from the fourth stomach of the calf or the stomach of the pig, and containing hydrochloric acid, an ingredient of the gastric juice. Boracic acid, or boric acid as it is more commonly called, is an antiseptic which prevents the action of ferments in a medium such as milk when added to it. The chief merit of boracic acid is that it is a comparatively harmless substance as compared for instance with salicylic acid, which possesses the same antiseptic properties. Still, it is not to be supposed that it can be used in unlimited quantities, and for that reason it is reasonable that some check should be placed on its use as a preservative. In this connection we might quote from the *Adelaide Observer* a reference to the excessive use of boracic acid in the preservation of butter, while the maximum quantity permitted is also indicated: "The Minister of Agriculture, the Hon'ble R. Butler, has received from the Agent-General, Mr. E. Benny Young, Manager of the London depot, an account of the prosecution of a grocer in Birmingham for selling butter from Adelaide containing too large a percentage of boracic acid. The report states that the two boxes purchased were part of a consignment of 25,143 packages from Adelaide in the steamship "India." The butter as tested was found to contain 1 per cent. of boracic acid, equal to 70 grains to the pound. A fine of 40s. was imposed. The Minister wishes attention drawn to this case, as it is of the greatest importance to the Australian butter trade, and he also points out that the total quantity shipped from Adelaide by the "India" was 76 cases, or less than 2 tons, and that there is no

proof that the two cases tested were of South Australian manufacture. On the other hand, it is extremely improbable that out of the 25,143 cases on board, the two cases tested would belong to the 76 cases from South Australia. The Minister sent on the information to the Dairy Expert, Mr. Thomson, for report, and he replied as follows:—"Concerning the use of preservatives for butter and dairy produce, this I have emphatically condemned in my lectures throughout the dairying districts of the colony, and also in articles written on dairy subjects. Many eminent authorities recognise their use as beneficial to health, but the maximum quantity advised for butter preservation rarely exceeds 0.6 per cent. The butter-testing lately conducted at the Government Depot gave satisfactory evidence that preservatives are not essential to the keeping qualities of well-washed and carefully-manufactured butter. When butter is thoroughly freed from buttermilk, preservatives can be entirely dispensed with. If the system of pasteurization were adopted, the general quality of butter would be increased considerably, and little cause would remain to encourage makers to add boracic acid or any other preservative."

Taking 1 per cent. of boracic acid as equivalent to 70 grains to the pound, 0.6 per cent. (the amount which, it is recommended, should not be exceeded) would be equivalent to 42 grains to the pound.

Taking the same proportionate weights and milk equal to 2½ lbs. per quart, the maximum amount for milk would be as nearly as possible 52 grains per pint (20 oz.). Those who are in the habit of using boracic acid for preventing milk from turning sour quickly would do well to note this fact which is based on expert opinion.

### PREPARATION OF ANATTO IN THE WEST INDIES.

The preparation of anatto is very simple. The freshly-gathered seeds are put in a tub and boiling water is poured over them, the mass being frequently stirred so as to wash off the waxy testa from the seeds. After some days the mass is passed through a sieve to separate the seeds which should come away free from the dye. The liquid is then left for a week to ferment and to allow the dye to settle at the bottom of the vessel and the clear water is drawn off. The deposited dye is next put into shallow pans in order that the excess of moisture may be evaporated in the shade. When the substance is of the consistency of putty, it may be made into rolls of two or three pounds weight and wrapped in banana leaves, and it then becomes the flag or roll anatto which is exported in great quantity from Brazil. It may, however, be allowed to become drier by a longer exposure in the shallow pans, and then it can be moulded into square cakes weighing eight or ten pounds each and also wrapped in banana leaves. The cakes are usually packed for export in casks containing five hundredweights. Cake anatto is brown externally, but the inside is of a reddish or yellow colour; and in this form it fetches the highest price in the market. The cakes should be thoroughly dry before they are packed to prevent deterioration by their becoming mouldy after they are shipped.

In the French Colony of Guadeloupe where anatto (called by the French "roucou") is extensively cultivated, a different mode of preparation is adopted. The seeds are thoroughly crushed between rollers so that they come out as fine powder intimately mixed with the dye. The product is then put into water, and when it has subsided to the bottom, the surface water is run off, and the paste is boiled for four or five hours. It is afterwards put into boxes pierced at the bottom with holes that are covered with a cloth so as to prevent the paste running through. A board is placed on the top of the paste, and weighted down so as to press out the excess of moisture through the bottom holes. The paste is then packed in cakes in layers separated by banana leaves, and this is done so as to retain moisture and to prevent fermentation. If the paste be too dry water is sometimes poured into the cask, for unless the anatto be kept moist it will deteriorate in value. The product, of course, contains only a proportion of the dye mixed with the powdered seeds, and it is, therefore, not nearly so valuable as the pure cake anatto. The finer the dye is sent to the markets the higher will be the prices obtained for it; and, unless a fine article be prepared, it is better to ship the dried seeds from which the dye is extracted in England and the United States.

[For the above interesting description we are indebted to Dr. Nicholls.

We would point out an apparent contradiction in the above account, for while we read in one place that anatto cakes should be thoroughly dry to prevent them losing their value by becoming mouldy, in another place we are told that unless the anatto be kept moist it will deteriorate in value.

In Ceylon anatto cultivation has been practically abandoned, but the name which is always associated with the product is that of Mr. A. Van Starrex of Crystal Hill, Matale. Mr. Van Starrex is no doubt quite familiar with the different processes of preparation referred to above, and we believe he has worked out a new one for himself, which to judge from his persistency in anatto manufacture and his excellent exhibits at the last Fruit and Flower Show in Colombo, doubtless as remunerative as it is successful. We understand that his *modus operandi* is not so simple as either of the methods above described, and involves many mechanical and chemical details, with the result that a highly finished article is produced. We have seen no account of Mr. Van Starrex's system of anatto extraction and preparation for the market, and if it is no secret we shall be most pleased to have a description of it—in continuation of the above notes—for publication in these pages.

According to Dr. Nicholls ten pounds of seed will give at least a pound of the cake.

The dye is used for colouring butter and cheese, and also for dyeing calico, silk, wool, skin, feathers, ivory, bone and the like. It produces a fast colour of a fine tint, and it is sometimes used to give a deeper shade to simple yellow dyes. A red as well as a yellow dye can be obtained from it. We read in the January number of the Queensland Journal that Aniline is being used in butter-colouring—a practice which is of course most objectionable and has been strongly condemned by Chemists.

The following method of detecting the presence of aniline has been published as a warning against the practice:—

"Pour a few drops of the butter-colour upon a white china plate and over-pour these with a few drops of pure concentrated sulphuric acid. If the butter colour is vegetable colour (orlean or orlean seed) there appears a dark bluish-green colour, which gradually goes over the greenish yellow. If it contains aniline eller tar colour there will appear a red margin or red spots which gradually spread themselves over the whole.—  
Ed. A.M.]

#### THE FORTHCOMING AGRICULTURAL SOCIETY'S EXHIBITION.

The Catalogue of this Exhibition, fixed to take place in Colombo on the 21st and 22nd July next, is now out. A glance shows that the Exhibition is to be on a much more ambitious scale than the successful Fruit and Flower Show held in June last year, but that is no reason why it should not be quite as successful. The Chairman (the Hon. Mr. F. R. Ellis, Government Agent, Western Province) is taking the greatest interest in the movement, and this is sufficient guarantee that no pains will be spared to make the Exhibition a success.

The following are the sections and classes as given in the Catalogue: Section I. Class A. Flowering Plants in pots. Class B. Cut Flowers in boxes, stands or glasses. Class C. Foliage Plants in pots. Class D. Ferns in pots. Section II. Class A. Fruits. Class B. Vegetables. Class C. Vegetable Products. Section III. Food Products. Section IV. Class A. Cattle. Class B. Poultry &c. Class V. Dairy Produce. Section VI. Arts and Manufactures. We give below the items of Agricultural interest for which prizes are offered:—

Best Jaffna Mangoes (twelve)	... Silver Medal
Best collection of Mangoes (six of each variety) ...	... do.
Best Oranges (twelve) ...	... do.
Best Mandarin Oranges (twelve)	... do.
Best Lemons (twelve) ...	... do.
Best Citrons (six) ...	... do.
Best Limes (twelve) ...	... do.
Best Pinnelos (six) ...	... do.
Best Mauritius Pineapples (three)	... do.
Best West Indian Pineapples (three) ..	... do.
Best Custard Apples (six) ..	... do.
Best Mangosteens (twelve)	... do.
Best Papaws (three) ...	... do.
Best bunch eating Plantains	... do.
Best bunch cooking Plantains	... do.
Best bunch of Grapes ...	... do.
Best Cherimoyas (six) ...	... do.
Best English Fruits grown in Ceylon	... do.
Best Sapodillas (six) ...	... do.
Best collection of Jambu (twelve of each variety) ...	... do.
Best Nani-Nams (twelve) ...	... do.
Best collection of the following:— Gauva, Uguressa, Lovi-Lovi, Masan, Nelli (twenty five of each)	... do.
Best Rambutans (hundred)	... do.
Best collection of imported Fruit	... do.
Special Prize for the best collection of Ceylon grown Fruit not more or less than twelve kinds...	... Gold Medal

Best collection of Native Vegetables (12 distinct kinds)	1st Prize ... Silver Medal	Nutmegs with Aril (2 doz.)	... do.
	2nd ,, ... Certificate	Vanilla (1 lb.)	... do.
Best collection of Exotic Vegetables (12 distinct kinds)	1st Prize ... Silver Medal	Pepper (5 lb.)	... do.
	2nd ,, ... Certificate	Arrowroot (5 lb.)	... do.
Beans (Exotic, 4 varieties, 25 of each)	... Silver Medal	Cardamoms (5 lb.)	... do.
Beans (Native, 4 varieties, 25 of each)	... do.	Cinnamon (25 lb.)	... Gold Medal
Yams (6 edible varieties, 2 of each)	... do.	Cacao (10 lb.)	... do.
Gourds and Pumpkins (6 kinds, 2 of each)	... do.	Arabian Coffee (5 lb.)	... Silver Medal
Tomatoes (12 best)	... do.	Liberian Coffee (5 lb.)	... do.
Lettuces (3 cabbage, 3 cos)	... do.	Tea grown above 1,500 ft. (10 lb.)	... do.
Potatoes (dish of 9 tubers)	1st Prize ... do.	Tea grown below 1,500 ft. (10 lb.)	... Gold Medal
	2nd ,, ... Certificate	Best Bull of Indian breed	... do.
Sweet Potatoes (12 tubers)	... Silver Medal	Best cross-bred Native Bull	... Gold Medal
Chillies (6 varieties, 12 of each)	... do.	Best Cow of Indian breed	... Silver Medal
Cucumbers (best pair)	... do.	Best Cow (cross-bred English)	... do.
Ceylon-grown Onions (5 lb.)	... do.	Best Buffalo (Bull)	... do.
Breadfruits (6)	... do.	Best Bull of Native breed	... Gold Medal
Jak (largest single fruit)	... do.	Cage of Native or Indian Fowls reared in Ceylon (2 pairs)	... Silver Medal
Jak (single fruit of best quality)	... do.	Cage of Fowls of Foreign breed reared in Ceylon (2 pairs)	... do.
Brijnals (12)	... do.	Best cage of Turkeys reared in Ceylon (1 pair)	... do.
Collection of Leaves of Native Plants used as Food	... do.	Best cage of Geese reared in Ceylon (1 pair)	... do.
Turnips (12)	... do.	Best cage of Ducks reared in Ceylon (1 pair)	... do.
Carrots (12)	... do.	Best cage of six Fowls reared in villages by Sinhalese, Tamils, or Moormen	... do.
Beetroots (12)	... do.	Best cage of Pigeons reared in Ceylon (2 pairs)	... do.
Celery (3 sticks)	... do.	Best collection of Ceylon Birds	... do.
Cauliflowers (3 heads)	... do.	Best pen of Poultry in the Show	... Gold Medal
Cabbages (3 heads)	... do.	Sample of Milk (½ gallon)	... Silver Medal
Cabbage (heaviest head)	... do.	Sample of Cream (1 pint)	... do.
Peas (best dish)	... do.	Sample of Butter (1 lb.)	... do.
Rhubarb (6 sticks)	... do.	Basket of Fowls' Eggs (1 doz.)	... do.
Cho-cho (3)	... do.	Basket of Ducks' Eggs (1 doz.)	... do.
Collection of Exotic Seasoning Herbs	... do.	Basket of Turkeys' Eggs (1 doz.)	... do.
Collection of English Vegetables grown below 1,500 ft. elevation	... do.		
Coconut Oil (2 gallons)	1st Prize ... Gold Medal		
	2nd ,, ... Silver Medal		
Kekuna Oil (½ gallon)	... do.		
Lemon and Citronella Grass Oils (1 bottle of each)	... do.		
Cinnamon Leaf and Bark Oils (1 bottle of each)	... do.		
Best general collection of Oils (2 oz. of each)	... do.		
Best general collection of Gums and Resins	... do.		
Coir Fibre (1 lb.)	... do.		
Kitul Fibre (1 lb.)	... do.		
Palmyrah Fibre (1 lb.)	... do.		
Collection of Native Fibres (¼ lb. of each)	... do.		
Ceylon-made Cigars from Country Tobacco (25)	... do.		
Best sample Ceylon Anatto	... do.		
Best commercial sample of Rubber (½ lb.)	... do.		
Best collection of products of the Coconut Palm	... do.		
Commercial sample of Coconuts (12) (space 100 square ft.)	... do.		
Areanuts, commercial sample (25)	... do.		
Best sample of Paddy (¼ bushel)	... do.		
Best collection of different varieties of Paddy	... Gold Medal		
Best collection of the following Grains:—Kurakkan, Mineri, Amu, Tanahal, Muneta (1 measure of each)	... Silver Medal		
Indian Corn (2 measures)	... do.		
Sugarcane (6 sticks)	... do.		
Ginger (5 lb.)	... do.		
Betel (100 leaves)	... do.		

With reference to the cattle class it is notified that only animals born and bred in Ceylon can compete. This is as it should be.

Another element which should go a great way to make the Exhibition a success is the fact that the Paris Exhibition Committee are likely to offer special prizes for competition in class in which exhibits wanted for the Paris Exhibition 1900, occur. While writing on this subject we will quote the following from the Agricultural Journal of the Cape referring to the educational aspect of Shows:—

It is usually understood that Agricultural Shows are held for a twofold purpose, each of which is of equal importance: the first object being the encouragement and stimulus given to the improvement of farm stock and produce, and the second to form an object lesson for supplying suggestive information to practical farmers. The collection of exhibits affords an opportunity for seeing the best specimens of the stock and produce of the country, for making comparisons between different breeds of stock or kinds of farm produce, and also between exhibits in the same classes; and this in numbers and variety in a way not otherwise obtainable by the large majority of farmers. In addition to their own observation and conclusions, visitors have the advantage of seeing the verdicts and awards of judges. Believing in the great importance of this, the educational side of the Show, we feel every facility should be given, and all the necessary arrangement made that visitors should be fully informed what every exhibit is, what it is there for, as to its classification and the prize it competes for, and to whom it belongs,

Exhibits should be labelled and a card be either attached to each, or so placed as to indicate which animal or article is referred to. This card or ticket should contain the information above suggested as to description and competition, and if the awards are made, the name of the owner too. Cards could have a top line in small print telling the name and date of the Show, and all the rest of its space left for the name, class, &c., to be written in good fair round hand, so that he who runs may read.

#### INDIAN CORN.

Maize or Indian Corn, the characteristic cereal of North America, is, next to cotton, the most valuable crop grown in the United States. It is admitted free of duty into Canada, and is also largely grown in the Dominion for consumption, in its green state, as a vegetable; indeed, with the possible exception of tomatoes and, of course, potatoes, "canned corn" is the most extensively used vegetable in both countries. The Canadian Government is, at the present moment, making efforts to create a trade for it in the United Kingdom, where many people are quite unaware of its dietetic value. Should maize once come into favour as a food, a considerable home industry might arise, as the climate is considered to be quite suitable for its growth. As will be noted later, great quantities of maize are utilised for the production of glucose, employed very largely in the brewing and confectionery industry. At present the trade is almost entirely in the hands of an American Trust, which, during the recent war with Spain, shipped large consignments of glucose to the United Kingdom *via* Canada. The attention of the High Commissioner having been called to this fact, he authorised the Cutator of the Canadian Section of the Imperial Institute, and others, to inquire into the extent of the trade, with the result that a comprehensive report was sent to Ottawa on the subject, and during his recent visit to that city, Lord Strathcona himself brought the whole question before the Department of Trade and Commerce, in the interests of Canadian industry. A bulletin recently issued by the United States Department of Agriculture, dealing at length with the composition and economic applications of maize, is of value in this connection. The following is a brief abstract: "In the United States, Maize or Indian corn not only serves as one of the chief articles of food, but is also the source of a large alcohol industry. The stalks which, a few years ago, were considered waste product, have been found to possess valuable properties as a cattle food. The pith is very suitable as a lining for cattleships, and as its peculiar structure allows of ready nitration, and the resulting compounds are said to be more stable than the corresponding cotton-derivatives, maize-pith has special advantages for preparation of pyroxylin-varnishes, gun-cotton, and high explosives.

#### COMPOSITION.

Typical American maize has, approximately, the following composition:

Weight of 100 kernels	...	38 grammes.
Moisture	...	10-75 per cent.
Proteids	...	10-00 "
Oil	...	4-25 "
Crude fibre	...	1-75 "
Ash	...	1-50 "
Carbohydrates (other than fibre)	...	71-75 "

Although certain varieties of "early maturing" maize or "sweet" maize intended for table use, when partially ripe, contain considerably larger quantities of both sugar and oil than do the ordinary ones, it appears from the many analyses which have been made in the Departmental laboratories, that maize is one of the most invariable of the cereals, maintaining, under very different climatic conditions, a remarkable uniform composition, and varying chiefly in the size, colour and physical characteristics of the individual kernels.

#### THE MILLING OF MAIZE.

The flour made from Indian corn is known as "corn meal." The simplest and one of the most prevalent methods of preparing it was to grind the kernels between stones, and use the whole meal coarsely sifted. In the Southern States this process is still largely employed. A finer grade of the corn meal is prepared by first grinding in the above manner, and then bolting to remove the greater part of the bran. Unfortunately, the meal thus prepared is very hygroscopic, and, as the germ contains a large proportion of the oil, the product is apt to be become rancid and mouldy. Improved processes have hence been introduced during the last few years, and the following description is fairly applicable to the majority of them.

The grain is first broken, and the germ loosened in a "degerminator." The germ and the hull are then separated by means of bolting cloths and currents of air, and the remaining corn is ground between corrugated iron rollers. The resulting meal is again submitted to bolting and purification by currents of air, and the refined product is known as 'granular' meal. The waste matter (hull, germ, flinty portions of the corn, etc.) amounts to about 30 to 35 per cent. The use of artificial heat during the process ensures better results, and the meal keeps longer. Notwithstanding the improved methods of preparation, this 'granular' meal has not found favour in the Southern States.

Apart from the methods of manufacture, there are two distinct kinds of corn-meal distinguished by their colour, namely, the white and the yellow. These colours are due to the original tint of the corn, and there is probably but little difference in nutritive value and palatableness of the two varieties.

#### RELATIVE NUTRITIVE PROPERTIES OF WHEAT AND MAIZE.

Although so extensively used in America, there is a widespread opinion in Europe that the products of Indian corn are less digestible and less nutritious than those of wheat. This opinion, it appears, has no justification, either from the chemical composition of the two classes of bodies, or recorded digestive and nutritive experiments. A study of the analytical data of the whole grain shows that, in so far as actual nutrients are concerned, maize is fully equal to wheat. The ash content of maize being small, there is no doubt that there is a slight deficiency in the mineral food, employed for the nourishment of the body, but as the cereals contain an excess of mineral matter above the requirements of the body, this slight deficiency may be disregarded. In its percentage of fat, Indian corn easily takes precedence over all other cereals with the single exception of

hulled oats, while of digestible carbohydrates (such as starch, sugar, dextrin, etc.), it possesses a higher proportion than hulled oats, almost the same as wheat, and slightly less than rye or barley. With the exception of oats, Indian corn contains nearly the same quantity of proteid matters as the other leading cereals.

In this connection it is interesting to note that manual labour in the southern part of the United States is performed almost exclusively on a diet of Indian corn bread and fat pork.

It is suggested by the Department of Agriculture that the systematic cultivation of especially selected seeds should be commenced at once with a view to increasing the percentage of proteid as the ratio of nitrogenous to other digestible constituents is, at present, rather low.

#### MAIZE OIL.

In the manufacture of starch and glucose, and of some varieties of maize meal, the germ of the grain, which contains the larger proportion of oil, is extracted. From this germ an oil of considerable economic value is expressed, while the residue forms a nutritious food material, fully equal to that obtained by the expression of the oil from ordinary oil seeds. Maize oil is easily purified, and forms a light amber-coloured transparent liquid, without rancidity and of a pleasant taste. It has been used to some extent as a salad oil, and also as a lubricant, and having good burning properties as an illuminant. The coarser varieties of the oil are used in soap manufacture. The commercial value is stated to be fully equal to that of cotton seed oil.

#### COMPOSITION AND PROPERTIES OF THE STALKS.

Until a few years ago the stalks of maize were considered of little value for feeding or other purposes, although the blades of the stalks have been used as a cattle-food from the earliest times. The proportions of the different parts of maize stover are:

Leaves and husks	...	...	65.2 per cent.
Stalk without pith	...	...	24.5 "
Pith	...	...	10.3 "

The average chemical composition of the air-dried stover is as follows:

Moisture	...	...	9.80 per cent.
Proteids	...	...	4.31 "
Ether extract (oil etc.)	...	...	2.37 "
Crude fibre	...	...	28.29 "
Ash	...	...	4.50 "
Carbohydrates (other than crude fibre)	...	...	40.33 "

Maize stover, in one form and another, is now being largely used as fodder, and in some districts its use excludes even that of clover and timothy hay. The stover is usually finely shredded, as this not only increases the quantity which becomes available for food, but also leaves the manure in a better condition for spreading on the field. The pith is also removed from the stalks, as it is much less digestible.

#### MANUFACTURE OF STARCH AND GLUCOSE.

The bulk of the starch used in the United States is made from Indian corn, there being only small quantities made from potatoes and cassava. The yield of starch is good, about 60 to 65 per cent. being available. In its preparation the grains are first softened in hot water, and then crushed to a

fine pulp between stones or rollers. The pulp is now transferred to slakers, lined with fine cloth, and the starch washed through the meshes by means of a current of water; it is allowed to settle, and the supernatant liquid having been poured off, the moist blocks are removed and allowed to dry. When the product is required for cooking purposes it undergoes further purification.

The manufacture of grape sugar or glucose from maize starch is now an extensive industry in the United States, about 40,000,000 bushels of corn being used annually. The product known commercially as grape sugar is solid, and is employed as a substitute for malt in the brewing of beer and ale. Another product known as glucose, is a thick colourless syrup, which is used in the preparation of table syrups as well as for confectionery, and for adulterating molasses and honey.

#### MANUFACTURE OF WHISKY AND ALCOHOL.

It is estimated that more whisky is now made in the United States, from Indian corn, than from all other grains combined. The product is generally known as "Bourbon," to distinguish it from rye whisky. The process of manufacture is analogous to that used in the preparation of whisky from other cereals. The starch is converted into fermentable sugars by diastatic action, and the resulting mash fermented and distilled. A considerable quantity of alcohols belonging to the "fusel oil" series is produced, but these may be removed by allowing the whisky to mature a sufficiently long time. The distillation of alcohol consumes about 15,000,000 bushels of Indian corn annually.

The glutinous and other residues from the manufacture of starch glucose and alcohol were formerly regarded as waste material, but it has been found that, after careful drying, they furnish a cattle food, the nutritive value of which is fully equal to that of "Brewers' grain."

#### THE TRINIDAD GOVERNMENT FARMS.

The Annual Report on this institution for 1898 has reached us, as we go to press, and we give below a short extract from it referring to the working of the Dairy, reserving further notes for another issue:—

The quantity of milk produced was somewhat less than the previous year: this was due to the young polled cattle being allowed more to keep up their growth. Though the quantity of milk dispatched to the medical institutions was less, the yield from the same number of cows as milked last year (55) has increased from a daily quantity of 360 quarts to 386 quarts this year, and from a yield per cow of about 5 quarts to exactly 7 quarts at the present time. This increase is due to good feeding and better milking. As the Farm lands have been very much reduced and therefore cannot carry an increased herd, it is satisfactory to know that with good management our cows can be induced to respond to such treatment, and that a comparatively small herd well handled will give as good and perhaps better results than a large herd which is apt to get beyond profitable control with the class of labour at command.

The cost of production of the milk was 3½ cents per quart, ½ cent lower than last year and 1½ cent

lower than the previous year. As the Farm is now well equipped with dead stock and the land in good order, the cost of production will, it is anticipated, show a further decline this year. As it is the cost is below that of condensed milk, and what is vitally important is, that the Hospitals have at command a full supply of pure milk, a material aid in the treatment of tropical diseases.

21,864 quarts of milk was sent to San Fernando Hospital, an increase of 4,160 quarts over the previous year. At the contract rate 6½d. the milk supplied would have cost the Government £592; charged at the cost of production this institution saved £410.

The milch herd number 91 cows, all in profitable condition, and 26 heifers, these will come in later on the year to augment the herd, or for sale in calf as suggested in the Report for 1897. The health of the herd has been as usual excellent, anything like disease is unknown. In calthood there must be losses from various causes known and unknown. During the year 82 calves were born and 8 died, a rate of 10 per cent.

The losses to record have occurred from the following causes:—

- 8 Calves from Scour, Dysentery, Strongylus, &c.
- 1 Ox from injury.
- 1 Cow do.
- 1 " from Hæmorrhage after calving.

Three calves were born dead. One cow had to be forcibly delivered. This and another case occurred within 24 hours. I noted at the time that the weather was most unseasonable, it was on the 21st March, our driest period. On that day which was hot and oppressive there was showers, with thunder and a slight shock of earthquake. This abnormal weather had no doubt an influence on the cows, which were pure bred zebus and always highly sensitive when near calving.

The average quality of the Farm milk has maintained its high standard and kept pace with the extra amount produced. Below is shown the average composition of milk from eight leading Continental countries, the minimum quality permitted by the Society of Public Analysts, and the analysis of the average milk of the Farm taken morning and evening:—

CONTINENTAL MILK.—

Govt. Analyst.

Feeding has continued much the same as in previous years, viz., 8 lbs. per head: generally costing 6s. per day. This year it has been slightly higher due to war freights on consignments from America. But taking the output of milk at 7 quarts per diem, worth at the current rate 3s. would leave a wide margin of profit and from the food value of the milk it is clearly shown that it pays to feed. The artificial food is varied occasionally

to prevent satiety, but coconut meal is the basis of the ration, and as it is obtained fresh from the milk and containing a somewhat large percentage of oil, it has a beneficial effect upon the milk. If the coconut is suddenly withdrawn from the feed the cows will not look at it, and on trials with individual animals it has taken days for them to become accustomed to the change, with very evident detriment to their milk yield.

The experiments in feeding have been confined to ascertaining how the milk yield is affected by feeding the ration dry or in a thick drink. On the first change from wet to dry there was a decided loss of milk, but as the cows became accustomed to the change they returned to their average yield. The result of the experiment is in favour of the mash over dry feeding—it is convenient and less wasteful and from observation it has a decidedly favourable influence on the milk yield.

GENERAL ITEMS.

The following is taken from Dr. Voelcker's annual report for 1898 to the Royal Agricultural Society of England, under the head of Analyses of Feeding Stuffs:—The husk or "parchment" skin of the coffee berry which envelopes the berry after the fleshy pericarp has been removed by the washing and macerating process to which the fruit is subjected on the estates where the coffee is grown, and which in turn is removed by hand before the coffee is roasted, has hitherto been rightly looked upon as useless for feeding purposes. Lately, however, it appears to have been introduced as a convenient component of certain of those frequently very "doubtful" articles known as "compound" or "feeding" cakes. I have also had before me an instance of the direct sale of the material by itself as a feeding substance. The composition is represented by the following analysis:—

Moisture	...	...	...	10.78
Oil	...	...	...	90
* Nitrogenous constituents	...	...	...	3.88
Digestible fibre, &c.	...	...	...	25.71
Woody fibre	...	...	...	57.63
Mineral matter (ash)	...	...	...	1.10
				100.00
* Containing Nitrogen				62

It is sold at 20s. per ton, but is quite worthless and unsuitable for feeding purposes. The microscopical appearance, presented by coffee-husks are distinctive, and somewhat resemble those of earth-nut.

In an article on Duck Farming in an Australian exchange, we read with reference to muscovies that they are a comparatively distinct species, and the progeny of a cross between them and the more common kinds has been found decidedly infertile. They are also said not to mate with other ducks if left to their own choice, keeping to their own kind in all respects. Their native country is South America, and are found in great numbers in the Amazon Valley. The drakes are said to

reach 10, 11 and 12 lbs. in weight, while the ducks turn the scale at 6, 7 and 7½ lbs. Growing quickly and maturing early they are fit to kill as early as eight weeks old. The females are described as good sitters producing large broods, nevertheless they are great scavengers and require plenty of food—being particularly partial to meat. They will go the length of eating up each others' young to satisfy their appetite. The drakes are much given to fighting, and as a result become very rugged after a time. Muscovies are not great layers, but will keep it up off and on all the year though if allowed to hatch their own young. Five eggs often go to weigh a pound. It is thought that they cannot be improved upon for table use by crossing with other breeds, and are better kept to themselves and bred as naturally as possible. If not killed young for the table the flesh has an unpleasant musky flavour.

A correspondent writing to *The Dairy* makes out that there are certain unknown virtues in Castor-oil, which go to make it a most useful agent in the improvement of the milking capacity of the herd. He describes how he brought a Jersey cow milking in only three teats, and these were covered with warts. The fourth teat was quite dry, and about half the size of the others, and that quarter of the udder shrunk to less than half its proper size. He goes on to say: "In two months I had milk coming from the blind teat, and every wart gone; in twelve months I had her udder as perfectly shaped as was ever seen. Breed had not been able to resist bad treatment in this case, but responded to good feeding and good handling in a most surprising manner. The practical lesson from this is, don't cast a well-made milker because she has gone wrong through bad treatment. Try good feeding, and rub castor oil into the udder after every milking. No one can imagine the effect of castor oil on the mammary glands unless they have tried it. Once having made your good milker, remember she is a machine that requires constant and most careful looking after, just like any other machine that has to be kept running at high pressure. Having got your machine in the best of order, turning out a good reliable article, don't sell it to anyone that is not willing to pay according to quality."

At the Cape they have a bill for checking the spread of insect pests and plant diseases, and for preventing the introduction of the same from abroad by means of imported fruit, plants, &c. Some time ago we heard of a proposal to enforce quarantine measures in the case of plants imported into the Island and for fumigating all such before allowing them to pass into the interior, but there has been no practical issue so far. The report of the Government Entomologist of the Cape of Good Hope for 1897 contains the terms of the bill referred to above and the regulations based thereon, as well as an illustrated description of the treatment of infected and imported vegetable produce.

It was stated some time ago that Australian leather was rejected by the military authorities of Great Britain as not being sufficiently tanned to

meet the requirements of the home Government, and that the English-made leather throughout showed a marked superiority over the colonial article. There is no doubt that some inferior Australian leather is from time to time placed on the English markets, but it is hardly fair to judge all the colonial leather with this as the standard. It is evident that the superiority in quality is in a great measure due to the process of tanning, the oak-tanned hides and skins, for instance, being considered far better adapted for purposes of trade than that cured and preserved by means of wattle bark. Within a fairly recent date it has been the privilege of a Queensland firm of leather manufacturers to open up a new departure in the art of tanning, which for effectiveness and durability is said to be one of the most valuable patents in the trade. The patent is the property of Messrs. Dyball & Co., Limited, Toowong, near Brisbane, and is known as the gum process, the eucalyptus gum having proved an excellent tanning medium, and completes the work of tanning in about half the time ordinarily required. The leather samples are of excellent quality, and work up well, while the sole leather, for hardness and solidity, is considered by many expert boot and shoe manufacturers throughout the colonies as equal to anything that could be possibly procured from the old country. The process seems particularly adapted to the tanning of fur skins, the texture of the leather being very close, and the fur showing no tendency to fall out. Mr. Dyball is preparing an exhibit for the Greater Britain Exhibition, and is also getting up samples of buff and piano leather, which, we are informed, is a new departure for the colonies. Operations at present are not on an extensive scale, but development in this direction is only a question of time. This process has been patented in all the colonies, the registered office of the company is at Adelaide-street, Brisbane, and the Secretary, Mr. J. Stevenson, will be pleased to answer any inquiries.

In referring to the different methods of preserving eggs we made mention of water-glass as among the best preservative media. What this substance is is not generally known. Water-glass is silicate of soda. It is easily dissolved in water and is used for a great many purposes. For egg preservation, boil 10 gallons of water to kill all germs. When the water is cold, add to it a gallon of soda silicate or water-glass and pour over the eggs until they are immersed in the fluid. The cost of the silicate of soda is 10s. per cwt. in Europe, and 9d. per lb. for small quantities here.

Quite lately we were referred to by a gentleman who was full of the idea of starting trawling operations, on the most modern lines, in Ceylon. We find from a most interesting publication we have received—the annual report of the Marine Biologist at the Cape, which covers 148 pages—that the fishing industry has there been placed on an organized basis, and that the trawling experiments which have been initiated by the Government have given most encouraging results. Now that attention is being directed to inland fisheries, it is opportune that the subject of Marine fisheries should be also taken in hand.

## “PIONEERS OF THE PLANTING ENTERPRISE IN CEYLON.”

(Third Series.)

### JOHN CAPPER:

MERCHANT, PLANTER, JOURNALIST, 1837-1886\*.

THE name of Mr. John Capper as an old and notable Colonist, was placed in one of the early lists of “pioneers” to be enrolled in our annals of the Planting and Commercial as well as Journalistic Enterprise of Ceylon. But it was not till our visit to England in 1896 that we could command the needful information to make our biographical notice an adequate one. Mr. Capper himself had shortly before taken a special interest in our proposal, and at our request, readily wrote out some dozen pages of “Recollections” of his early days in Ceylon; but these had to be closed abruptly for the reason given in a pathetic little note which accompanied the manuscript, and which we venture to reproduce as follows:—

“MEMO: to J. FERGUSON, Esq.  
London, December 25th, 1895.

“When I promised to send for publication some of my Ceylon experiences I was in good health: since that date I have been afflicted with paralysis affecting my muscular and cerebral powers. Please therefore kindly edit these remarks and omit or modify any which appear to need revision—this for my sake. With best wishes for your future health and prosperity.—J. CAPPER.”

Mr. Capper was then in his 82nd year. Later in February and June 1896 we had friendly notes from him (besides an interview) with reference to securing a sufficiently good photograph, from which to prepare an illustration for our *Tropical Agriculturist*. The one eventually used was a copy of that placed in the Ceylon (London) Association album and had been taken by Walery of Regent Street some years previously.

To turn now to the subject of what has become our Memoir: Mr. John Capper was born in 1814 of an East Anglian, and we believe Nonconformist, family, though he himself became an Anglican Low Churchman. After a good plain education, he took to journalism early in life, and when only 20 years of age was engaged in the office of a weekly paper called the “Mining and Steam Navigation Gazette” of which he became Sub-Editor, and he continued his connection with the press, until he started for Ceylon in 1837. This same year witnessed the arrival here, of his future rival in Ceylon Journalism, A. M. Ferguson, who was two years Mr. Capper’s junior in age. Mr. Capper came out as Assistant to the firm of Ackland and Boyd, then fast developing into the leading Planting and Mercantile House in Colombo. Mr. Ackland was an able, all-round man who took a keen interest

\* Although 1886 was the year in which Mr. Capper finally quitted Ceylon; yet he continued to act as London Correspondent for his firm’s paper, the “Times of Ceylon,” until 1894.

in public as well as in commercial and planting affairs. Mr. Boyd (or a relative, Capt. Boyd ?) is credited with having made the first shipment, of coconut oil from Ceylon. We may mention in passing, that Robert Boyd Tytler also came out in this same year 1837, in the service of Messrs. Aekland & Boyd, in order to introduce the West Indian system of coffee cultivation into Dumbura and other districts, he (Mr. Tytler) having served an apprenticeship in Jamaica.

To return to the subject of our Memoir, we may now let Mr. Capper speak for himself in the following very interesting autobiographical narrative :—

“When I landed in the Island in 1837, the coffee industry was just coming to the front; whilst sugar was scarcely an article of daily concern. I had little or nothing to do with either one or the other; and my first business on behalf of the then well-known firm of Aekland and Boyd was the care of the firm's books. Two years later, however, my services were brought into requisition for the supervision of some extensive Cinnamon properties at Kadirana, near Negombo, totalling in the aggregate some 3,000 acres. If I knew nothing of the cultivation of this spice, I was but in a similar plight to others, and I managed to expend largely in coolies' wages.\*

“At Kadirana I resided about five years, and eventually took charge of the firm's Oil Mills in Colombo, and besides took the supervision of their general Export business into the intricacies of which somehow I managed to obtain an insight. Later on I was on trial as a junior partner taking charge of the entire Export business of the firm. In 1848 a crisis in the affairs of nearly all Ceylon business houses gave a check to my career; the firm had to suspend payment, and after two years spent in the service of the then Shipping Company of the place, I took my departure for England on the “*Alice Maud*.” In 1851 I was appointed to represent the Island at the Great Exhibition in Hyde Park, but with a sorry show of Ceylon Industries.

“My means were now recruited by writing for Dickens in his new venture *Household Words*, in the pages of which I continued to furnish chapters of Eastern life more or less successfully. I, about the same time, also undertook the Sub-Editorship of the *Globe*, to which I was appointed by Colonel Torrens, the then proprietor; this how-

ever was not my first venture at London Journalism, as I had in 1834 assisted in launching the first paper devoted to Mining and Railway matters, the *Mining and Steam Navigation Gazette*, which proved a success. I, at the same time, had worked on the staff of the *Spectator* under Rintoul, the founder of that journal.

“In 1852 whilst on the *Globe*, I wrote and brought out an octavo volume profusely illustrated—“*The Three Presidencies of India*”—which was a marked success, the East India Company's Charter being just then under discussion. At this time, too, I began writing for the stage and successfully, but my work in that direction was so opposed to the wishes of my family, the stage being regarded as a rather discredited connection, and soon afterwards my labors were devoted to quite another channel by my departure for India, where, having succeeded in greatly improving the then little known jute fibre, I proceeded to Calcutta and started Steam Spinning and Weaving Mills at Serampore. I set in motion the first jute-weaving machinery, which promised a fortune in the near future, for whilst thousands of tons of jute cuttings lay about the yards of jute shippers, who were glad to get rid of the incumbrance at the rate of six-pence per maund of 80 lb., it was worked into yarn worth ten times that amount. An enormous trade soon sprang up; but, alas! our dreams of fortune were scattered to the winds by the Indian Mutiny, which just then broke out and cut off our supplies of the raw material. Of course, those who, having capital in abundance and could afford to bide their time, were content to wait for the collapse of the Mutiny; but this was not my case, and making over the concern to my partner Aekland, I bade adieu to Calcutta and once more sought the familiar shores of Ceylon, where another phase of my chequered career met me. This was in 1853; and as it happened I found the *Ceylon Times* on its last legs, and at once set to work to negotiate for its purchase from the nominal proprietors, Messrs. Wilson, Ritchie & Co. It signified nothing that I was without capital; but I had, what was in those days, nearly as good, any amount of *credit*; for the competition amongst the banks, for business of almost any kind, was extreme.

“Those were *golden days* for the needy speculator, and of this latter class there was no lack; as one Kandy Manager said:—“*Plenty of stiff pleases the head Johnnies, and it looks well on paper.*” But, alas! they had rather too much ‘stiff’ in the end. It was an unhealthy state of banking business when your appui's name on a pro-note was as good as that of any European and sometimes better!—when estates could be bought on credit for the utmost amount which friendly Estate Agents chose to place against them and no questions asked; and when they were paid for by the convenient medium of ‘stiff.’ It is true that half of the Central Province would have remained under forest had these conditions been otherwise, and well do I remember the saying of one go-ahead young planter declaring that he was so deeply in debt to his Agents that he had no alternative but to buy another estate which he found no difficulty in having appraised for sale at something like thirty per cent. above its actual value. In those days estate valuers were frequently very obliging!

“There were at that time many royal roads to fortunes; amongst them were the charges levied by Colombo Agents on the preparation and shipment of Coffee. The consolidated amount was

\* “In order to illustrate the fallacy of the old-fashioned belief that the indigenous industries of a tropical country can be most successfully worked by natives, I may state that when I took over charge of the Kadirana Cinnamon Gardens I was warned that Europeans were ignorant of the mysteries of spice cultivation, and when I selected an experimental block of ten acres of cinnamon land by no means the best on the estate for high cultivation, and began putting the pruning knife into the bushes, ruin to their production was predicted. The actual result was that in four years I brought up the yearly produce from three-fourths of a bale to nine bales an acre, with the result that the London Agents forbade any further work on that system on the place, as it would flood the market and tend to lower the price of the spice.”—J.C.

usually 8s. per cwt., out of which there was a royal slice for the shippers. It may not be amiss to mention in this place the reply of a well-known Colombo retail trader who, when he was told that the officers' mess of a certain regiment was about to embark for England, coolly replied that they owed him just a thousand pounds sterling, but that he should not trouble them for the amount as they had always treated him in a most gentlemanly manner and he would behave towards them in a similar fashion, a declaration which evoked from a well-known joker of that period, 'What a world it is, Mr. Veum!'—a saying which since passed into a proverb.

"The following years were memorable ones, long remembered from the sad and eventful changes which overturned many a hitherto prosperous planter, leaf-disease and financial disaster each worked their share of havoc in nearly every district. In the course of ten years the face of the country was changed from smiling prosperity to a deepening gloom which gradually spread from one district to another until all wore similar features. These were not times one cares to recall to memory: one would fain try to forget them. Happily there were bright spots in that gloomy picture which modified the saddening recollection of what one would fain pass over. In cheery contrast to the misery to be found on every side were the redeeming features of calm self-denial and courageous endeavour of scores of young planters who had to look upon actual poverty and semi-starvation, the results of the insolvency of their proprietors. Many an instance occurred of assistant managers of estates being indebted to native dealers in rice and fish in the bazaars for their daily rations and occasionally for clothing. I have not forgotten how liberally some of the Chetties of Uva and Dimbula joined in raising funds towards enabling destitute planters to leave the island for more favoured lands in the south.

"As one of the incidents illustrating the changeful tenor of Ceylon planting life I can call to mind how at a festive gathering in the Dimbula Hall one of the guests posted up a fictitious Reuter's Telegram from London advising Plantation Coffee as up to 100s, which he caused to be exhibited by way of a joke. This elicited roars of laughter, but the figure was actually realised early in the following year. I have in mind also words of warning uttered by one of the speakers at the same meeting cautioning his fellow-planters against extravagant expenditure, for that a time *might come* when times would be so sadly changed that estates would probably be so sadly depreciated in value as to be sold for the value of the iron roofing on their stores, a prediction which I lived to see realised.

"But I pause in my notes of recollections which might be extended over many sides of a newspaper sheet. Having jotted down such notes as occur to me at a time when my powers of memory are no longer what they were, I close my jottings asking readers to bear in mind the fact that, thankful for the share of health and strength left me, I rejoice to know that a large measure of prosperity is vouchsafed to those I leave in the island which has witnessed so many vicissitudes of fortune in the past."

It must be confessed that there is not much that is autobiographical in the above paper, after 1858; but the sketch afforded of the vicissitudes in coffee and afterwards cinchona planting, carries

with it the history of the Colony and of nearly every European, whether planter, merchant or journalist. Our own arrival in the island dates from 1861 in the midst of what were still the "good old times" when we had to content ourselves with a fortnightly mail from Europe; when a foreign telegram—Reuter not having then appeared—was a rarity; when the island was well supplied with a daily newspaper through the *Observer* publishing on Monday and Thursday, the *Times* on Tuesday and Friday, and the *Examiner* on Wednesday and Saturday. Easy-going days these were in the Fort of Colombo, when Mr. E. J. Darley and other "old hands" did their banking as well as office business all in "white" with short white jackets—now relegated to the dinner table; when a black hat or boots, (or a pair of gloves) under any circumstances (save a funeral), were the occasion of derisive comment; when everybody knew everybody else, and the gathering on Galle Face of an evening approached a good deal to that of one big family, and the illness of any one member disturbed the entire, but very limited community of ladies, and provoked offers of nursing and aid from all sides; when, moreover, the spirit of competition (outside the newspapers) was still very much in abeyance, so that it was thought unfair to compete at a land sale with the man who had taken the trouble to prospect for any particular lot and to cause it to be put up for sale; and when, for instance, we have personally known a Baillie Street merchant rush in to stop the press and get an advertisement altered, because he did not want to announce his quarter casks of Madeira as for sale until his neighbours, Mackwoods & Co., had disposed of all their stock, and he had just learned from "Frank Smith" that some still remained on hand! Those were the days of sailing ships, when a steamer, save Captain Donnan's little "Pearl", was scarcely ever seen in Colombo roadstead, and when the commanders of barques took many weeks at their ease in our port, to discharge and take in cargo. The first interruption to these quiet, old times,—certainly the first public excitement we can recall—arose out of the American civil war, when Tinnevelly cotton (largely dealt in by Colombo merchants) rapidly rose in 1862-3, from 2½d to 1s 6d and more per lb., and Messrs. Darley, C. Shand, A. Gibson and J. C. Fowlie made rapid "fortunes" and retired. Those were the years too of one of the most somnolent governments that ever administered affairs in British Ceylon: Sir Charles MacCarthy was a polished scholar and speaker, but averse to travel or hard work; his Colonial Secretary, Mr. Wm. Charles Gibson, was bent on hoarding revenue; and so Mr. Cardwell as Secretary

of State swept down and took large appropriations of surplus balances for the military chest. The merchants in 1863-4 had found it impossible to get one of their number to accept a seat in the Legislative Council, and so finally recommended the Editor of the local "Times" as an ex-merchant; and thus Mr. Capper was one of the unofficial phalanx which under the leadership of Mr. George Wall (then Planting M.L.C.) resigned during the temporary administration of Major-General O'Brien who had succeeded Sir Charles MacCarthy. Afterwards, under Sir Hercules Robinson, Mr. Capper served as paid Secretary of a Cattle Commission, he having got out a nephew, Mr. Keppel Jones, to help with the paper. After this Mr. Capper aided another nephew in starting and carrying on the "Kandy Herald," an abortive effort which speedily died down. He also contributed to the short-lived comic journal "Muniandi," if indeed he did not edit it at one time. To this same period of unsettlement and of many "irons in the fire," belongs Mr. Capper's origination of a Cart Transport Scheme for Uva, in which he was specially supported by the late Mr. Thomas Hudson (of J. I. Strachan & Co.) This was managed by his son, Mr. Charles Capper, and was afterwards taken over by Mr. Lucius C. Glennly when he commenced his Haldummulla and Ratnapura stores. In 1870 the Duke of Edinburgh visited Ceylon, and Mr. Capper acted as Correspondent for the *London Times* and afterwards published an illustrated volume on His Royal Highness's visit. In 1874 Mr. Capper parted with the local "Times" to a Limited Company formed by Mr. Dunlop, Manager of the Oriental Bank, and from this year dates the "Times of Ceylon" which had for its first Editor Mr. Ailardye from Bombay, afterwards Reader to the publishing house of Blackwoods. In 1882, the Company having collapsed, the newspaper and printing property reverted to Mr. Capper (who had returned from home) and his two sons who made the Firm "Capper & Sons." Mr. John Capper (after a brief engagement as representative of Ceylon at the Calcutta Exhibition in 1884) finally retired to London in that year; but, although then in his 71st year, he could not be idle, and so he took up the rôle of London Correspondent, continuing in that post for fully ten years more. Indeed after he gave over this special work to younger hands, we found him early in 1896 still interested as Editor of a small monthly periodical published in London for the benefit of West Indian planters. Even after 63 years of continuous work with his pen, the veteran journalist could not refrain from doing something in his old capacity, and we believe his interest in public news continued unabated

until the end came on March 31st, 1898, when Mr. JOHN CAPPER had attained the good old age of 85 years. Mr. Capper was twice married: first, to a sister of Mr. Aekland of the firm he first joined in Ceylon, by whom he had two sons and two daughters—all of whom, save one daughter, predeceased their father. By his second wife (Miss Baylis, aunt of Dr. Baylis long in Kellebokka) there were three sons.

We are conscious of affording but a meagre sketch of the career of one who served his day and generation well, and whose connection with Ceylon during about forty years of continuous residence, was marked by much useful work. Our foregoing record is by no means complete; for as "Honorary Secretary to the Ceylon Branch of the Royal Asiatic Society," Mr. Capper (as we publicly testified at a meeting some years ago) rendered for many years very valuable service, keeping the Branch alive in fact, when it would otherwise have possibly become defunct. Then, too, there is a phase of his literary career we have omitted to notice above, namely, in his contributions to Dickens' "Household Words" and this we may best do by quoting from a notice of Mr. Capper in the local "Examiner" at the time of his death:—

He will best be remembered as the writer of those breezy sketches, which found a permanent lodgement eventually in *Old Ceylon*. Who that has read his sketch of "Our Old Clerk"—a figure taken from life when the writer was an assistant at Ackland Boyd's, and the object of the sketch was the Chief Clerk of the firm with his strict business habits, unswerving integrity, unassuming ways, and yet shrewd dealings—but will acknowledge that the writer possessed powers of observation beyond the ordinary—the ordinary standard that is generally concentrated in the one word keen? Then, "Philip of Brassfounder Street"—a faithful sketch of the Kanakpillais of the olden days: and the Chetty with his elastic ideas, first as to the free use by him of the Firm's postage stamps, and his indignant and dignified planking down of his purse when he was reminded that stamps could not be supplied for nothing—all these sketches and more of mercantile life in the metropolis in days gone by may be read in the little volume we have referred to. Nor in it are scenes of a graphic and even touching interest wanting of up-country life. Of the particular sketches of planting life in the work we are referring to, we cannot speak with certainty—we have all along been depending upon memory. But there is one bit—"The Kandyan's Captive," we think is its title—which for the simple narration of an incident—real or fancied—in connection with the Kandyan dynasty, may fairly lay claim to a place among not the least of our prose idylls.

Our portrait gallery of the Pioneer Colonists of Ceylon would certainly have been incomplete if it had not included one whose career we have thus imperfectly indicated and to whose work and memory we have endeavoured to do justice, in the varied capacities of planter, merchant, but especially of littérateur and journalist, all of which appertained to MR. JOHN CAPPER.—*Requiescat in pace.*

## REPORT ON COFFEE LEAF DISEASE IN COORG.

[INCLUDING DESCRIPTION OF COORG; CULTIVATION OF COFFEE—SHADE, WEEDING, MANURES,—SEED, VARIETIES, HYBRIDISING.]  
BY MR. JOHN CAMERON F.L.S.

(Concluded from page 752).

### COFFEE PESTS.

"We should be happy that it is an industry that involves a certain amount of trouble. Otherwise it would be taken out of our hands altogether." Such is the pithy and hopeful remark made by an able and experienced planter on the occasion of the last Conference of the United Planters' Association at Bangalore. A statement of this sort indicates the true energy which underlies all the actions of British enterprise.

In the latter case obstacles are of little moment, and may be of real advantage in keeping out the faint-hearted. The same spirit prevails in Coorg, although borer, leaf-rot, leaf-disease, bug and other pests have each done their best to diminish the planters, profits—uncertain crops and foreign competition being a further tax on his patience. Leaf-disease, which is most dreaded, was not very prevalent or any of the estates visited. *Hemileia vastatrix*, the fungoid parasite which causes leaf disease, by partially or wholly disorganising the functions of the leaf, made its appearances in Coorg in the early seventies after committing great havoc in the planting districts of Ceylon. The peculiarity of the fungus is that it persistently follows the coffee bush all over the country and is more or less prevalent wherever coffee is grown. A violent attack on the experimental plot in the Gardens (Lal Bagh), has just been temporarily checked by burning every infected leaf and coating the ground with a thick layer of quicklime.

Combustion, whether active or passive, is the natural enemy of fungoid organisms; and when Mr. Marshall Ward recommended burning everything that could be burnt with safety on the estate, he gave good advice. During the pruning and wood-ripening season, tons of leaves and twigs could be disposed of in this way, although it is admitted that a coffee zone such as the "Bamboo" provides but little space for kindling fires. It is the annual recurrence of the scourge which makes it so disastrous, and anything that would harass it or deprive it of nourishment at critical periods would have the effect of saving the host to a large extent.

Spraying operations were observed at Hallery, where Mr. Sprott thinks he has gained some advantage over the fungus. The mixture in use is 3 lbs. sulphate of copper and the same quantity of lime dissolved in 25 gallons of water.

The Californian remedies for fungoid and other pests are given at the close of this paragraph.

### The Life-history of

*Hemileia vastatrix* was thoroughly worked out by Mr. Marshall Ward in 1881, and readers cannot do better than refer to his scientific reports, written for the Ceylon Government on the subject about that time.

The Director of Kew Gardens gave it as his opinion, in 1892, that *Hemileia vastatrix* is a species endemic to the island of Ceylon. This great authority further adds,—"Like thousands of other microscopic leaf fungi, it probably maintained its existence in an unobtrusive manner in some native Rubiaceaceous plant (i. e., belonging to the same family as the coffee). It was probably only by a kind of accident that about 1869 it found a suitable host in cultivated coffee, and thus was enabled to develop itself on a scale which speedily made it a scourge." Since the latter date, when first observed, the parasite has followed its host unremittingly to every coffee region of the old world. Change of food would possibly arrest its progress sooner than anything. Slight constitutional change in the host might bring this about, and the process of hybridising would be of much value if it secured even

partial immunity to the coffee plant from the attack of *Hemileia*. That such a thing is possible has already been proved by the rising of certain varieties of potato which are wholly immune from *Phytophthora infestans*, the most hurtful fungoid parasite of that esculent.

### THE BORER.

The next pest to be briefly considered is the borer (*Xylotrechus quadripes*), which is indigenous to the country. In fact, there are several borers, and the remedies here recommended will apply to them all. It is only in the more exposed parts of South Coorg that the ravages of these insects are much felt, and even there the conditions are far more hopeful than they were thirty years ago. At that time the wholesale destruction of forest trees, accompanied by undue exposure and indifferent cultivation, aggravated the attack and was the indirect cause of enormous loss to the planter. But it is now understood that sufficient shade and moisture, supplemented by good tillage, are conditions inimical to the spread of borer. The rush for extension which prevailed a few years ago, when prices went up, must be held responsible to a large extent for the maintenance, if not increase, of coffee pests. A large area (in fragments here and there) of unsuitable land was placed under cultivation, and by a process of forcing in some cases and comparative neglect in others it was hoped to increase the average output of bean. But a cycle of dry seasons shortly followed, and the new openings were mostly found to be infested with leaf disease and borer, which rapidly spread to healthy tracts that had not suffered before to the same extent. The occupation of such lands by coffee is therefore a standing danger to the whole local industry. I can imagine nothing more disheartening to a really good planter than to have neighbours who will act recklessly in the selection and treatment of land, to the jeopardy of the whole community. In addition to depth of soil, moisture, and shade, the presence of numbers of insectivorous birds is recommended for the extinction of borer. Of these, woodpeckers, jays, thrushes, mynas, hoopoes, sparrows, larks, jungle fowl, the crow pheasant and many others are insect eaters. When the larvæ can be got at, which is not very frequently, the direct application of neem oil is the surest remedy. If poured into the holes and tunnels caused by the insect, it will either bring out the latter quickly or cause its death inside. In this connection I may mention that neem oilcake, which is manufactured at Hunsur, might have a remedial effect if applied to land affected by borer. Rubbing the coffee stem at intervals with the oil would be a good practice.

### LEAF ROT.

*Pellicularia Koleroga*, or "leaf-rot," is an epiphytal fungus which envelopes the coffee leaf during the monsoon and subsequently kills it. Continuous or heavy rainfall, density of shade, drip, and stagnation of drainage, are the causes of this fungoid growth. A modification of the above conditions with the use of fire to destroy all affected leaves, and the application of flowers of sulphur in the early stages of attack are the best known remedies. Bordeaux mixture and other fungicides should also be tried. For the eradication of bug and scale insects, the importation of a useful species of lady-bird is under trial. The brown scale-insect, *Dactylopius adonidum*, is prevalent on many of the jungle trees, where it is farmed by ants for the secretion known as "honey dew." It is usually accompanied by the black fungus *Trisporium Gardneri*, Berk. Kerosine emulsion is a good remedy for these pests.

### REMEDIES FOR PLANT DISEASES.

Extract from Spraying Calendar, Central Experiment Farm, Ottawa.

\* The 'Brown scale insect' is *Lucanium coffea* *Dactylopius adonidum* is the so-called 'Mealy bug'—Ed. T.A.

prevailing variety on the estate. This is all right where the prevailing strain is good. But where the product for which a plant is cultivated shows signs of exhaustion, or has become deficient in quality or quantity, the strain is said to have "run-down," and in all such cases too much individualism in reproduction is undesirable. It is in all probability to prevent this running down of strain or breed that nature insists on cross-fertilization.

*Coffea arabica*, or Arabian coffee, of which there are several well-defined local varieties known by such names as "Cbick," Coorg and "Nalknad," has been almost exclusively cultivated in this country from the time the industry was started, and it is only within recent years that one or two new varieties and species have been introduced and cultivated on the estates. This fact will explain the absence of hybrids over such an extensive area, there being no material to make hybrids from. Yet, within the past few years, some hybrids have made their appearance, shortly following the introduction of Liberian coffee, a distinctly new species. And, barring the fact that two distinct species have been placed in juxtaposition to each other, the hybrids are the work of nature. But in the instances referred to, man must get the credit of having materially helped nature by providing a new species for the latter to work upon.

If he would, therefore, do more in this direction, the chances are that worn-out strains of coffee would soon be replaced by better kinds.

This leads me on to the suggestion that approved varieties and new species of coffee should be freely introduced from other countries. The field for experiment would then be much widened, as planters would have sufficient material to work upon.

The cultivated forms of coffee in different parts of the world are already so far advanced of the indigenous or wild bush that it would probably be mere waste of effort to bring the latter into experiments, the object of which is to secure further improvement in productiveness and quality. Collections of species and varieties should, therefore, be confined, in the first instance at least, to well-known jats already in cultivation. These I shall leave the planter, being the best judge, to select for himself. Now supposing that some enterprising planter has already secured such a collection of coffee-bearing plants, how is he to dispose of them to the best advantage?

This is a question that I shall endeavour to answer in my next.

With one or two new species of coffee at one's disposal, and a like number of distinctly marked varieties, such as the "Maragogipe," which is an introduced variety (from Brazil) of *Coffea arabica*, an experimental plot could be started on the following lines:—

(a) Situation, as regards aspect, soil, water and shade, to be the best the estate can afford. Occasional irrigation will possibly be required to induce the different bushes to blossom together, so that the possession of a perennial water-supply would be a convenience.

(b) The crossing-plot need not exceed one-eighth or at greatest one-fourth of an acre in extent, while it is possible that equal results may be obtained by working systematically on a few bushes.

(c) In planting up the crossing-plot, an equal number of healthy seedlings of the estate coffee should be thoroughly mixed with the new kinds, so that winged insects may have full play on the whole. But in addition to the general and haphazard operations performed by the insects, a few bushes should be carefully isolated for hand-fertilization. For the latter purpose a few skeleton frames covered with fine muslin would be a sufficient protection, if placed over the bushes before the flowers opened. Plant in a square plot at 6 x 6 feet, so that air may circulate around the bushes freely. The preliminary details which I have emphasised under the sub-headings a, b and c will keep the planter employed for at least two years, or to be strictly accurate, until a maiden crop of flowers is produced in the crossing-plot.

Then, at this latter stage, the work of fertilization will actually begin, should several distinct kinds of coffee flower simultaneously. Unprotected bushes will be pollinated through the agency of insects chiefly, while the protected ones will be self-pollinated, should no precautions be taken to prevent it. Where bushes are intended for hand-fertilization, it will be necessary in the early stages of reproductive growth to rub off a great many of the young flower buds, so that the inflorescence of an individual may be reduced to a manageable number of flowers. For that matter, the flowers could be reduced to what is borne on a single primary, or to a few clusters of the same. The necessity for this apparently ruthless treatment is contained in the fact that, during the short time the stigma is receptive of foreign pollen, the fertilizer could only pollinate a limited number of flowers with any degree of certainty. It is, therefore, wiser to make sure of getting a few goods crosses than to attempt a larger number indiscriminately. Let us now suppose that the operation is about to take place. Having provided himself

with the marginally noted requisites, and selected a protected bush sharp pair of scissors; pocket to become the seed-lens; flowering branch from bearer, the fertiliser male parent, with pollen.

places himself under the protective frame and eagerly watches for the opening of the first flower. Directly the flower opens (usually early in the morning), there will be seen, slightly projecting from its delicate-white throat (tube of the corolla) a bifid or two-horned stigma supported by 5-7 arrow-headed another on shorts on short stalks. At time of opening, the stigma, which is seen well in advance of the anthers, glistens with a sticky substance which holds fast any powdery matter, such as pollen, that may fall on to it. What the fertilizer has to do at this stage is to dust a little foreign pollen on to it by means of his camel's-hair brush. This done, he instantly, and deftly as possible, cuts away the 5-7 anthers behind the stigma. But as the anthers are usually closed at this early period, they could perhaps do no harm if they were left. Everything would depend on the behaviour, so to speak, of the stigma towards the new pollen by which it has been fertilized.

The process as described above has to be done with every flower until the primary or clusters of flowers reserved for crossing have been exhausted. A register is then made of the parentage on both sides, and after a day or two the bush is liberated from its protecting covering.

I have examined many coffee flowers at the moment of opening, in most cases the stigma projects in advance of the anthers and the style lengthens rapidly. By this means the spreading horns of the stigma afford a good platform for small bees and other insects to rest upon when searching for honey. Then flitting from one stigma to another they deposit quantities of pollen, which readily adheres to their hairy limbs. Crossing operations being completed, the next step would be to select a suitable piece of land for the cultivation and trial of seedlings raised from the crossing-plot. It is in this final stage of the experiment that the exact result of cross-fertilization would become apparent, and not before.

But the operator needs to possess patience, for among 10,000 seedlings cultivated there may not be one showing real improvement in every respect.

With our limited experience in crossing, it is uncertain what would happen, although there is reason to believe that cross-fertilization would induce beneficial variation in the growth and production of coffee.

The land required for testing seedlings of mixed parentage should be of the best quality, and the cultivation should be on a liberal scale also. Area is a matter for the planter himself to decide, as it depends wholly on the extent of his operations. I do not, however, advocate large areas for mere experimental work. When the seedlings give their

maiden crop, it will be seen approximately what merits they possess from a productive point of view. But other merits, which may be roughly termed constitutional, will only become apparent after a lapse of time and under different modes of treatment.

I can readily imagine that a judicious selection of the fittest would prove a most difficult task, even to an expert.

The operations discussed from the beginning until now, when the second generation has borne its first crop of fruit, covers a period of about six years. This is a long time, and some men would doubtless say "is the trouble worth the candle? especially as there is nothing to prove that much good would come out of it." In answer to such a remark, I am pretty firmly convinced that good would come out of it and have already planted up a small crossing-plot with the view of raising hybrids. The plot consists "of 130 bushes, and includes *C. arabica*, *C. liberica* and the variety—Maragopipe." A few of the bushes are already well advanced in growth, so that the first batch of crossed seedlings may fruit within five years from date. But when matured bushes can be cross-fertilized this season, the results might be known within four years, which is not very long for a planter to wait. My object, so far, has been to explain the *modus operandi* of fertilization rather than to discuss side-issues bearing on its application to the genus *Coffea*. But now, I may refer briefly to argumentative views on the latter question. As the coffee bush possesses a hermaphrodite flower, it may be held by some that crossing is neither possible nor desirable. But it does not follow that a flower is self-pollinated because it contains both sexes. In numerous hermaphrodite flowers the sexes attain maturity at different periods, and in all such cases self-pollination is effectually prevented. That dichogamy prevails to some extent in the coffee-flower is certain, as I have often observed stigmas in the receptive stage when the anthers had not dehisced. I am unable to say, however, if this is a general condition, or if it only happens in occasional flowers. A flower may thus be structurally hermaphrodite and functionally unisexual. Then, the sweet-scented coffee-flower offers great attraction to insects, which is a pretty sure sign that the dispersion of pollen is favoured by Nature. Indeed, the condition of the pollen is such as would adhere readily to the hairy limbs of insects. It is not of the fine powdery kind (so-called dust of flowers) that would be suspended in the air or lightly carried by the wind.

Considered, therefore, from a morphological standpoint there is little doubt but the genus *Coffea* is subject to cross-fertilization, and that its flowers are entomophilous. Lastly, I wish to dispel the idea that established coffee can be infertile; one way or the other by operations of crossing, the results of which are only discovered in a subsequent generation.

But it is highly necessary that the planter should strictly conserve his testing-ground, and not allow any unknown seed to be utilised for estate purposes. The golden rule in the testing or experimental ground is to destroy all inferior forms as quickly as possible.

New strains of seeds reserved for trial could be treated separately until such time as their merits are fully established. This is all I have to say on the fertilization of the coffee flower at present.

#### MR. CAMERON'S REPORT ON COFFEE IN "COORG."

WE have been requested to give publicity to the following correspondence between Mr. Alex. M. Neilson, F.C.S., of Coimbatore, and Mr. John Cameron, F.L.S., of the Government Gardens, Bangalore:—

1.—From Mr. Neilson to Mr. Cameron.

COIMBATORE, 25th March 1899.

DEAR SIR,—I have read your Report on Coffee Cultivation in Coorg with much interest. There are some statements, however, under the heading "Manures," which, I think, require explanation. You do not mention Saltpetre at all though it is one of the chief sources of Nitrogen and the principal artificial sources of Potash to most South Indian Coffee. In European

Works on Agriculture it is scarcely mentioned as its price precludes its use where Nitrate of Soda and Sulphate and Muriate of Potash are cheaper. In this country, where it occurs naturally, it is a much cheaper and more important manure than either of these three. Then you do not include Dried Blood in your list of Nitrogenous Manures, but mention it as a source of Potash. This is no doubt a slip, as Dried Blood contains only about one per cent. of Potash and 12-14 per cent. of Nitrogen, which is the ingredient which gives it its value. I should like to know, also, on what experimental fact the statement is based that "for quick effect on growth the soluble superphosphates are the best, especially the double superphosphate manufactured at Wetzlar in Germany." Are double supers better than an equivalent quantity of the ordinary kind, and in what way are those manufactured at Wetzlar superior to the numerous other makes? I can understand that in cases when the cost of transport is very heavy the double supers might prove more economical, but only in very exceptional cases as the unit price of the phosphate is very much higher than in the ordinary kind. I have thought it better that these things should be pointed out to yourself personally, rather than through the newspapers; and this is my apology for addressing you.

II.—From Mr. Cameron to Mr. Neilson.

BANGALORE, 7th April 1899.

DEAR SIR,—Owing to my absence at Mysore, I regret that your letter of the 25th ultimo has not been answered promptly. I have to thank you for drawing attention to the weak points in my statements about manure. Saltpetre was inadvertently overlooked, although I was under the impression that nitrate of potash had been recommended and entered in the list. Dried Blood is of course wrongly placed, being a nitrogenous fertilizer. I have not heard that German superphosphates are in use in this country, but they are highly spoken of by continental cultivators, and I am going to try them here on coffee and other plants. Being specially prepared for export to distant countries, they are worthy of trial. But I can understand that their use on a large scale might seriously affect local interests—a phase of the question which did not occur to me until I had read your letter. I may tell you, in conclusion, that my report to the planters of Coorg has no pretension to be exhaustive, and that sound criticism may be of more value, if made known to the planters, than the report itself.

Yours faithfully, (Sd.) J. CAMERON,

#### SEEDING OF THE GREAT BAMBOO (BAMBUSA ARUNDINACEA).

SOME account of the seeding of this plant in its native country may not be out of place at the present time, when the cultivation of the hardier kinds of Bamboo in Great Britain is receiving such general attention, creating, as it were, another link of sympathy between the nations of the East and West, bringing to the minds of former travellers familiar and graceful objects in the landscapes of foreign climes, and to the untravelled some idea of the graceful beauty of one of the most interesting and wonderful genera of plants. It would almost appear that there is nothing in this life unaccompanied with some disappointing drawback, and the more exquisite "a thing of beauty" it first appears, the more crushing the subsequent disappointment.

In the case of the genus under notice, the drawback undoubtedly is the death of the plant after producing seed, this effort of reproduction being, I believe, in most if not all the species, fatal to the existence of the parent plant.

The seeding and subsequent death of at least some of the hardier kinds of Bamboo in Britain may, perhaps, be familiar enough to some people, but it may be doubted if it has fallen to the lot of many English men to have witnessed the phenomena on a large scale in the native country of the Bamboo. It was my lot early in life to see this mysterious act of Nature in relation to the huge forests of *Bambusa arundinacea* covering hundreds of square miles of country in Malabar and Coorg, in Southern India, and reaching far into the adjoining province of Mysore. It was at the close of the year 1862

that I took up my residence in an upland district of Malabar, where the slopes of the Western Ghats were clothed with gigantic evergreen forests and from their base stretching for several miles into the Mysore territory, grew a veritable forest of Bamboo, intermixed with Teak and other deciduous and hard-wooded trees, the Bamboo predominating.

My primary object is to give some account of the seeding of the Bamboo, I yet cannot help writing a few words on the beauty and grandeur of this forest as I first beheld it, and before "decay's defacing fingers" had wrought desolation. Viewed as a whole from an eminence, nothing could well surpass the splendour of this vast area of waving plumes rising to a height of 60 to 70 feet; and individually the clumps as seen more or less isolated on the grassy laterite knolls, were of surpassing beauty. From March until nearly Christmas, the Bamboo is clothed with leaves of a pale delicate green, after which they begin to fall, and the jungle for a month or two is shorn to a great extent of its attractiveness. But there is extra beauty in the young leaves as they begin to appear in response to the first showers of spring. I shall never forget a ride I took on my first arrival in the country along a road leading from Malabar into Mysore, and cut right through the heart of the Bamboo-jungle, and when the trees had on their best attire. The huge clumps stood almost at regular intervals close by the road on either side, the culms bending over and forming a complete archway of greenery for miles. This was the grandest triumphal archway I ever beheld, and when the subsequent seeding and destruction came, one could hardly help lamenting the inexorable laws of Nature.

Very soon after my arrival in Malabar, I heard rumours that the Bamboo forests of Travancore to the south were in seed, and in the following season our turn came, and then that of Coorg to the north. So that this strange frutescence would appear to have taken place in sections, beginning at the most southern point of India, and travelling northwards year by year.

When the seed became fully ripe, the culms were quite divested of leaves, and bent down with the heavy load of oat-like seeds—a magnificent harvest, it is true, but one which only occurs twice in a century, and which is then accompanied with the annihilation of the parent plants.

When the seed became quite ripe, it fell to the ground, which was quickly covered with what had a wonderfully close resemblance to Oats. This fall was the signal to the jungle tribes to lay up a store of the grain to serve them during the ensuing monsoon, and groups of men and women were to be seen all over the forests gathering and deftly winnowing the seeds, whilst pea-fowl, jungle fowl, partridge, and others of the feathered tribe, were not slow in taking advantage of the bountiful supply of food, and waxed fat and lazy, and so became an easy prey to the fowler's gun. Long, however, before a tithe of the rich store could be consumed the season of jungle-fires began, and added by the thick coating of leaves on the ground, completely licked the Bamboo forests from end to end, to all appearance converting into charcoal every seed that had dropped from the trees, extinguishing every hope that the land would ever again resume its former appearance. Nature, however, had her own secret way of preservation, and as time went on, tiny little Bamboo seedlings began to appear, which year by year increased in strength till, in 1877, or fifteen years from the time of seeding of the forests, the country had all but resumed its former grandeur.

No description of mine could possibly convey an adequate idea of the scene of desolation the country presented after the death of the Bamboos over the whole extent of this magnificent forest, which was transferred suddenly from a scene of surpassing splendour into one of dust and ashes. The monsoon, which had brought revivifying power to the leafless Bamboos for the bygone fifty years, and bid them again and again burst into leaf and beauty, at last failed in its appeal to the "dull cold ear of death."

The succeeding hot season began its drying process on the dead culms, preparing them for the fires which were destined eventually to clear the country of every vestige of the old forest. It was several years, however,

before this process was completed, and here again rested a marvel, viz., how the young seedlings escaped with life and increased in stature through the years of heat and smoke.

For several seasons in succession the country was filled with smoke from the combustion of the dead and dry culms from about January to April which made it very unpleasant to the lives of the Coffee-planters and others. There was kept up night and day also a succession of loud reports from the ignitions of the put-up gases between the joints of the huge culms.

I do not know, but I sometimes doubt if there is any example in the vegetable kingdom which can boast of a more rapid growth in a given space of time than the culms of a fully-developed plant of *Bambusa arundinacea* in its native clime. The clumps send up a yearly supply of culms, which begin to appear in February, and by the end of July they have reached a height of from 60 to 70 feet, and are well furnished with lateral branches from top to bottom, with a diameter, close to the ground, of some 8 or 9 inches. The culms, as they issue from the ground, are furnished with a curious protecting capping of brown-coloured sheaths, which they retain till they reach a considerable height, and the points are out of danger—an admirable protective process of nature.

With reference to the longevity of the Bamboo, I took considerable pains to arrive at the approximate truth. I questioned and cross-questioned on many occasions the jungle tribes, who had their homes in the seclusion of these Bamboo wilds, and who, previous to the advent of the Coffee-planting industry, hardly ever left but lived on the produce from their small clearings, edible roots dug with pointed stakes from the woods, honey, and the fruits of the chase. One tribe was called Jain Coombers, or, in plain English, honey men, or honey collectors. They are a lively race of people, with a wonderful amount of intelligence, and with a rare appreciation, among natives, of fun and humour. I singled out several of the elder and most intelligent of this interesting tribe for my inquiries, and arrived at the conclusion that fifty years, or thereabouts, was the limit to the life of *Bambusa arundinacea*. There were several other species of Bamboo in the district, which, curiously enough seeded simultaneously with *B. arundinacea*.

The uses to which the larger Bamboo is put in Malabar and other provinces of Southern India are too numerous to mention, and it would be difficult to imagine what the natives would do without it.

The Bamboo in Malabar is found almost from the sea level up to an elevation of something over 3,000 feet so that its range is considerable, and although it is generally described as a stove-plant in England, it might, I think, flourish in a house with less heat than that usually assigned to a stove, and might possibly, without hurt from an interesting object in the sub-tropical garden during a warm summer. To make the canes more lasting, and, in some measure prevent the ravages of the white ant, the natives of Malabar adopt the practice of soaking them in water for some months before putting them to use.

The belief, or rather superstition, obtaining in some parts of England with regard to the influence of the moon on vegetation is also found amongst the natives of Malabar, and no native will cut a tree or a Bamboo for his own use during the wane of the moon.

For some reason unexplained these Bamboo forests of Malabar are very unhealthy, alike to European and native. Ague and fever prevail, more especially during the showery weather of spring, and immediately after the end of the south-west monsoon, when the ground begins to dry, or, as the natives put it "during the making of mud and the making of dust." The natives sometimes attribute the prevalence of malarial fever in these jungles to the quality of the water, and I have frequently known a gang of coolies fresh from the Mysore stop at a Coffee plantation and taste the water, and then pass on to the next plantation.

If I am correct in thinking that the life of *Bambusa arundinacea* is limited to fifty years, those forests in Malabar which I saw in seed and then perish, will again come to maturity about the year 1913, when will be witnessed a very curious phenomenon in the vegetable kingdom.—J. LOWRIE.—*Gardeners' Chronicle*.

## FACILITIES FOR MAKING GOOD TEA.

In continuation of the notes and comments dealing with the above subject, on we shall next take up two sets of replies to our circular, received from the Kelani Valley, which regard the situation from different stand points. And that is one of the advantages of eliciting information, by means of circulars, from men who are engaged in the same vocation, but who work necessarily under conditions more or less different. One of our planting friends congratulates himself that the old fancied draw backs to making good tea are being overcome, and that better tea is now being made on a majority of estates: another deals with the drawbacks as still potent factors. The two he gives prominence to are the scramble for quantity, and the attempt to cut down expenditure as much as possible. The inflated rupee compels the strictest economy, and the planter must show a saving on the cost per lb. of tea laid down. By sacrificing quality he attains this end; and if quantity yields a very slight profit, he excepts the inevitable, but at the cost of the estate's name in the market. If the craze for quantity has not altogether subsided, we doubt if ever before in the history of the enterprise there has been a greater trust in quality than during the past few months: and perhaps the wave has spread into the Kelani Valley too, since the answers to our circular were penned.

As regards jät, both writers hold it to be poor on most old estates, while land more recently opened up had the benefit of the best jät. Neither is prepared to class the prevailing jät as inferior: but merely medium; but even so, we fancy, both quality and yield must be affected by the failure to secure the best types of indigenous and hybrid. On the other hand, these were scarce and difficult to get at the out set of the enterprise; and in tea, as in other things, it is experience that teaches. In soil, too, the lower parts of the district are wanting, with alaterite and white quartz stratum. Though the higher parts are much better, there is no rich deep loam to speak of, most of the good soil being shallow, and many estates have a sub-stratum of slab rock. In these circumstances, we should say careful drainage for the conservation of soil and manuring for its improvement, are of prime importance, even though no estates can yet be spoken of as worn out. It is with a field here and a field there that abandonment begins, and with timely attention, a venture which might otherwise prove unremunerative may be made to yield what may be called a living return. One of the papers before us is most emphatic that manuring is profitable and improves the tea, and it records the heavy application of manures during the past two years on some estates with the best results: while the other is more cautious. It admits the improvement of tea by manuring, but doubts whether, the results are generally remunerative—the few being expressed that, if a continued downward tendency in prices render expenditure on manures impossible, the last state of the estate would be worse than

the first! We trust such apprehension is out of place now—at any rate average estates—and that the ruling prices will justify and repay the liberal treatment of bushes. Except in small privately-owned places, there is, according to one report, sufficiency of withering room and well-equipped machinery, but the other refuses to regard accommodation which cannot cope with a week of rainy weather as adequate. As leaf must be plucked when it is fit, and manufacturing cannot wait, it is always better to err on the safe side, and a factory which cannot provide for a rush must be deemed deficient. The second report puts it in this way:—

“I consider a factory should have a roller to take 350 lb. withered leaf for every 100,000 lb. of made tea, so a factory making 500,000 lb. tea should have five of these, and diers in proportion. Very few factories in the island have, at least I do not know many, and in this district I do not know one factory.”

In motive power, however, both reports agree there is no deficiency to mention, and such as there is being yearly lessened.

Both reports speak of a more than sufficiency of labour—and that is not an unmixed blessing. Superabundant labour means short time, and that, however comforting to the worker temporarily, means less pay, with all the trouble incidental to it. There is, happily, a consensus of opinion that the day of too severe pruning is past. The lessons of experience have not been lost; and light pruning, at intervals of 14 to 18 months, now commands confidence as suited to the Kelani Valley at any rate, and is practised on most estates. It is cheering to learn that, though the Valley does not profess to turn out Darjilings, or to match Udapussellawa and Nuwara Eliya, it heats them in yield, in pungency, and in transport facilities: while it is happy in its labour, and only wants a 14d. rupee to be content all round, even while looking to Lipton as its best customer! With more supervision, too, said to be directed to manufacture than aforesaid, and with the Railway in view, there is no reason why old planters and young should not hold up their heads proudly in the great young district.

## AMBALANGODA DISTRICTS NOTES.

April 23,

## WEATHER.

Fine weather set in again on the 25th inst., after most useful showers which came on every day for over a fortnight. The rains freshened up everything and have not only made the tea bushes flush vigorously, but put renewed life into all the various products cultivated in these districts—coconuts, cinnamon, sugar-cane, arcanuts, &c., &c.

Sinhalese pluckers have at last put in an appearance after their somewhat prolonged new year's junketings, much to the relief of mind of many an estate manager about here, visions of the garden covered with bushes yards high, having been prominent as the flush sprung up so rapidly. As usual the venches all demanded a new year's gift each in cash on coming to work again. Is this custom peculiar to the low country Sinhalese, or does it prevail too among the Kandyans?

Artizans have also returned to work, but are a more than a trifle listless and needless to say stony-broke.

#### ACREAGE.

There will not be much added to the acreage under tea in this portion of the province this monsoon, small clearings at Elpitiya and Baddegama being the only ones mentioned; while a few acres of moist and will go into Para Rubber. Of course one must not forget the whole half acre the enterprising directors of the Talgaswella Company have decided to put into Vanilla, as mentioned recently in the *Observer*.

#### THE TEA CROP.

So far the tea crop on most places is larger than for the same four months of last year, except on some of the estates near Mapalagama where it is said to be short; but the drought there was more severe than at Baddegama and Elpitiya and the celebrated "lake" on Talgaswella is reported, though probably an exaggeration, to have evaporated down to a chunk of mud before the rains restored it.

#### SUGAR.

It is a current idea upon country that the only place that sugar-cane is grown and sugar manufactured at in Ceylon, is Baddegama estate. A trip by boat up the Ginganga river from Galle would dissipate this notion; for miles up one sees flourishing cane fields on both banks. The fields are not continuous, but show up constantly behind the fringe of coconut trees, with every mile, or two mile where sugar and treacle are made. What becomes of all this sugar?

#### SNIPE.

Two good bags of snipe were made during the past week in the Karandeniya fields by a local planter, but these will be about the last of the season, and it is a little surprising it should wind up so well, as birds have not been particularly plentiful in the Karandeniya-Elpitiya fields this year.

### KELANI VALLEY.

NEW FACTORY FOR THE KELANI VALLEY TEA ASSOCIATION, LTD. (WEREAGOLLA ESTATE).

This has been erected on land specially acquired for the site and to provide for the development of the water power, on the opposite side of the Weoya river to the original factory and estate.

It will now serve for the manufacture of tea from Parusella estate also, and which is about two miles distant by cart-road direct. A substantial suspension bridge is being erected over the river in place of the ordinary ferry-boat, so that all communication and leaf transport will be independent of floods. The factory is of iron, 45 feet by 120 feet, with teak windows and weather boarding. There are two upper floors for withering purposes, with a special entrance for green leaf from the outside. The ground floor is lofty, well-lighted and ventilated.

Power is transmitted to the various machines by a line-shaft extending the full length of the building and passing into the power-house which adjoins the main building at its end and in which is stationed the engine and boiler and also the counter-shaft connected with the turbine.

The turbine is of the vortex type (30 h.p.) and stands just below the level of the power-house and near the river. Water is obtained

at a point about one-third of a mile above the Factory by building masonry across the river, the supply being regulated by means of a sluice, and conveyed through pipes and open-spouting to a settling tank, which connects by pipe with the turbine direct.

The construction of the dam has been a very difficult work, and in the upper portions of the watercourse many tons of rock have been removed by blasting.

Work was commenced at the middle of March last year and the factory was running under steam power by December, the water power being completed and started on the 20th inst. All the machinery available from the two factories has been thoroughly put in order and they with the new ones added provide ample manufacturing capacity. The Superintendent, Mr. A. H. Wyness, has had a very arduous task in connection with the dam and watercourse and it is satisfactory to know that a heavy flood immediately following its completion has not damaged it in any way. The ironwork of the Factory was supplied by Messrs. Main, the woodwork and complete erection by Messrs. Walker Sons & Co., Colombo, the water power being devised and generally carried out under the supervision of Mr. Holland Porter of the latter firm. The Directors have now a commodious factory, well-situated for transport, and supplied with duplicate power, water-power being available throughout the year, and it is hoped they may reap the benefits arising therefrom to the full.

### CENTRAL TRAVANCORE PLANTERS' ASSOCIATION

From the report of the Secretary of this Association for the past year we extract the following:—

**FINANCE.**—Our expenditure for the year amounted to Rs 2880-1-1 inclusive of our donation of Rs 1000 to the American Market Fund, as well as Rs 200 for the expenses of our delegate to Travandrum, an item which does not often occur. The year closed with a credit of balance of Rs 77-9-0.

**MEDICAL FUND.**—Owing to the depression from which our industry is suffering, we found ourselves unable to maintain so costly a Fund; the Fund was accordingly wound up, the Travancore Tea Estates Co. taking over the dispensaries and who make a charge for medicines, etc., to outsiders making use of the dispensaries. H.H. Government was approached on the subject of appointing a fully qualified medical man to the District and acceded to our request by appointing Dr. Joseph, to whom we guarantee a sum of not less than Rs 100 per month, in addition to his grade pay as remuneration for the extra work entailed on him in visiting members of this Association.

**ROADS AND BRIDGES.**—This is a subject which engages no small amount of our attention every year. I think we must all agree, however, that roads have of late improved, but much still remains to be done. At the same time I fail to understand why large quantities of metal have been broken if it is not to be spread. For months past it has been almost impossible, I may even say dangerous, for a horse to pass a cart or for two carts to pass one another on certain roads, more especially on the Carady Goody Hill, a road none too wide in itself to admit of any portion of its width being blocked by heaps of broken metal. With regard to the bridges in the District, I do not think that I have ever seen them in a more dilapidated and unsafe condition than they are at present, and I trust the Chief Engineer will lose no time in putting them in thorough order before the approach of the mousoon.

RAILWAYS.—A light tramway line is shortly to be constructed from Ammavanayakanur to Uttamapoliyam and will eventually be extended to Kuravanoth. If rates for goods over this line are sufficiently low, and when taken into consideration with the cheaper steamer freights always to be obtained at Tuticorin, no doubt some estates, more especially those on the eastern side of the District, will send their tea to Tuticorin for shipment rather than as at present to Cochin. The promoters of the line expect considerable progress will have been made in its construction by the end of the current year.

OBITUARY.—We have to deplore the death of one of the oldest members of this Association, Mr. J. Burrows, who passed away early in the year. Deceased was on the point of leaving for England when death overtook him.

GAME LAWS.—Mr. Holder at the meeting of the association drew the attention of the meeting to the way in which big game of both sexes was being exterminated and numbers of persons now to be seen prowling around the confines of the estates with guns intent on butchery. Only recently a cooly had been shot by some person unknown who had been trespassing on the Woodlands Estate. In fact, it was becoming positively dangerous on some estates to walk along the roads even in broad day-light. He therefore proposed and Mr. Laurie seconded the following Resolutions which were carried unanimously:—

1. "That members of this Association do view with alarm the manner in which game is being exterminated in the District, and do agree to do their utmost to prevent the possession of guns by coolies and kanganyes on their respective estates and in every way to try and protect the game surrounding them."

2. "That the Dewan be requested to confer the powers, as laid down in Section 4 of the Travancore Game Preservation Regulation, on all members of the Committee of this Association."

"It was further resolved 'that members' attention be drawn to Section 3 of the Travancore Game Preservation Regulation."

### THE EXPERIENCE OF CEYLON AND SOUTH INDIAN PLANTERS.

A correspondent writes:—Looking through the columns of *Planting Opinion* (issue of the 1st inst.) the heading "Tea from Seed to Cup," attracted my attention. Your contemporary has arranged with a *South Indian Planter* (the italics are mine), to write a special series of papers on tea cultivation and manufacture, giving practical hints that will serve the beginner and enable him to start tea planting with the teachings of experience before him. What struck me was the announcement that the papers were to be written by a *South Indian Planter*. Considering that North-Eastern Indian and Ceylon planters are far more experienced men than their confreres in the South of India, specially as regards *manufacture*, would it not have been more to the point if we had been informed that that some expert from our part of India, or from Ceylon, had engaged to write a series of practical articles for the benefit of his less experienced brethren in the South of India. Although tea was started in Southern India at the same time as it was in Assam and North-Western India, the industry may, in comparison to the latter, be said, to be still in its infancy in the former. I look forward with interest to see how my Southern brother will teach "the young idea how to shoot," especially regarding *manufacture*.—*Planter*, April 15.

### CINGALESE CATTLE AND GOVERNMENT FARM IN TRINIDAD.

WE direct attention to the interesting letter sent to us by Mr. Meaden, the Manager of the Trinidad Government Farm, in reference to the cattle selected by Dr. Sturgess and sent from Ceylon, via Calcutta, to Trinidad. It is too soon yet, it will be observed, to say that the experiment is a success; but so far all has gone well and we trust Mr. Meaden will have a good account to give by-and-bye. The Government Farm on which he reports is entirely devoted to "stock," and the title of the "Council Paper No. 10 of 1899," now before us, is "Annual Report of the Superintendent of Pastures for 1898." Both the Farm and the Pastures seem to be worked at a profit: the former shown in the sale of £572 worth of stock and of the supply to hospitals of about 130,000 quarts of milk produced at so low a cost as 3½ cents per quart. In the case of "Pastures," the fees leave a balance to the good of £230. A balance-sheet for the whole establishment tells us that the value of stock is £3,775; the cost of Farm £3,160. The total revenue for 1898 equalled £3,114 (counting the milk at 4d a quart, less than is paid for inferior milk to Colombo milk-sellers) and the total expenditure in salaries, wages, feeding stock, &c., expense of stallions, purchase of pure-bred poultry, &c., £2,001—showing a net profit of £1,113. Clearly Mr. C. W. Meaden deserves great credit for so good a result. The stock under his care on 1st January, 1899, included dairy stock 224; zebus 21—total 245. Stud:—one stallion, 14 brood mares, 16 young stock—total 33. Poultry:—Wyandottes 14; white Minorcas 9; Crève Cours 3; Creole 12—total 38. Here are extracts of interest and of practical value with reference to local "Dairy" experiments. Mr. Meaden states:—

The milch herd numbers 91 cows, all in profitable condition, and 26 heifers; these will come in later on in the year to augment the herd, or for sale in calf as suggested in the Report for 1897. The health of the herd has been, as usual, excellent, anything like disease is unknown. In calfhood there must be losses from various causes known and unknown. During the year 82 calves were born and 8 died, a rate of 10 per cent.

The average quality of the Farm milk has maintained its high standard and kept pace with the extra amount produced. Below is shown the average composition of milk from 8 leading Continental countries, the minimum quality permitted by the Society of Public Analysts, and the analysis of the average milk of the Farm taken morning and evening:—

	Fat	Solids not fat	Total solids	Moisture
Continental Milk.	3.73.	9.19.	12.92.	87.48.
Society public Analysts.	3.	8.50.	11.50.	88.50.
Farm Milk.—Morning	6.00.	9.38.	15.38.	84.62.
Evening	5.20.	9.36.	14.56.	85.44.
Average per cent. Cream 10.				
„ Sp. Gr.	10.28.			

P. CARMODY, Govt. Analyst.

During the year experiments in butter-making have been carried on. The chief obstacle to success is the difficulty in bringing the moisture contained in the butter down to the legal limit, viz., 12 per cent. When it is considered that the melting point of butter is 87 degrees and that our temperature nearly always approaches this during

the day it is quite clear that there is a difficulty in effectual working. The milk yields as much butter as the English average, the colour, flavour, grain and consistency is good and an excellent article has been produced with the exception of the amount of moisture. However, Professor Carmody, the Government Analyst, has kindly given me his assistance and no doubt success will follow. A Dairy has been fitted up with Separator, Churn, Delaitouse, Thermometers, &c., all that is necessary to carry out experiments in a complete manner.

The benefit conferred not only on Trinidad, but on the West Indies generally, by this Farm experiment, is clearly seen in our next extract:—

At the annual December sale 58 head of stock were offered. The prices obtained were in advance of the last sale and generally were satisfactory. The animals were all in excellent order and well shown. The pen and boxes were littered down and the place on the sale day looked in business-like order. The attendance was good and the bidding fairly brisk. Jamaica were buyers of the pure bred bulls. I am informed that the stock bred from these bulls in that Colony are 100 per cent in advance in price upon the ordinary Creole stock. Two new features of the sale were the cross bred red Poll stock, and pure bred poultry. The bulls of the above cross realized £12 per head, a reasonably good price for a first attempt and for little more than yearlings. The two heifers went for £3 5s. each. The poultry—White Minorcas and silver Wyandottes sold for 9s. per head and the regret was that there was not more of them. Demerara for the first time were purchasers of stock and as they got some excellent cross bred bulls, it is to be hoped that they will prove satisfactory and induce the purchasers and others to visit us again. The following were offered and the prices realized were:—

	Per Head.
6 Milch Cows and 2 in-calf Heifers	\$179 00 = 22 37
19 $\frac{1}{2}$ bred Zebu Heifers 1-2 years old	273 50 = 14 40
2 Cross bred red Poll heifers	30 00 = 15 00
1 Pure bred Zebu Heifer	36 00 = 33 00
4 " " Bulls	569 00 = 142 25
7 $\frac{1}{2}$ and $\frac{3}{4}$ bred Zebu	217 00 = 30 10
3 Cross bred red Poll Bulls	174 00 = 58 00
14 $\frac{1}{2}$ bred Zebu Oxen 3-4 years old	964 00 = 69 00
	\$2,412 50 42 11
	Average.
1 Trio white Minorca Fowls	5 75 5 75
6 Silver Wyandotte	12 35 2 06

As regards "breeding," we have information which ought to be of value not only to local officials concerned, but to many of our planters who go in freely for stock, both in the hill and lowcountry. Mr. Meaden reports:—

It may safely be asserted that the animal most suited to the climate of Trinidad is the Zebu (E. I. Cattle). They have great size and are very healthy, produce fine stock and without detriment to the milking qualities unless bred too close. They are irritable and difficult to handle and move from the place they are accustomed to: this is the chief objection to them. The red Poll was introduced to breed a more docile class and one that would in a greater measure than the Zebu become beef beasts. The result of crossing the red Poll with our mixed breed of cows has given satisfactory results so far. Altogether 32 calves were born to him, 13 bull and 19 heifer calves, with only the loss of one. Four bull calves were sold as unthrifty to the butcher. Five head were sold at the annual sale leaving six bulls and 16 heifers for augmenting the herd or future sale. Those reserved have shown ex-

cellent growth under ordinary treatment. They are hardy and healthy and have given no trouble. In the event of the heifers being brought into the herd they will be sent to a pure Zebu bull; this cross it is anticipated will give stock suitable for work or the butcher, and will be superior milkers, docile and with reduced horns. The red Poll bull cost £65, of his stock £46 worth was sold during the year, and stock to the value of £113 based on the prices realized remains on hand. This within two years may be considered satisfactory. Outside of the immediate profit, the result of importing this bull will be the foundation of a type new to the Colony which will have many advantages, one of which is that they will be practically hornless, a great point where a number of animals are herded together.

The Guernsey bull imported as a calf has grown well and given no trouble and is now quite acclimated, and his case proves that it is good policy to import from temperate climates all animals as young as possible, though the delay may be tedious. This bull will be put to  $\frac{1}{2}$  and  $\frac{3}{4}$  bred Zebu heifers from the best milch cows. This cross though smaller perhaps than the above will, it is anticipated, result in deep rich milkers. It is early to speak of this because another year must elapse before service can commence. However, the above is the line it is proposed to go upon in improvement.

We next come to "Poultry" a department of almost universal interest to Ceylon residents both Native and European, if they would only take the trouble to learn how to improve their "poultry-keeping." Mr. Meaden tells us that,—

Three varieties of poultry were imported from England in June. The breeds were: No. 1—White Minorcas, No. 2—Silver Wyandottes, No. 3—Creve Cours. They came to hand in bad order infested with vermin, and four hens of No. 3 were in the last stage of disease and these succumbed in a very short time. A good deal of this mischief was due to faulty in packing. They were placed upon peat litter which speedily became filthy; it would have been better to have left this out and turned the hose upon them each day if the decks were washed. The different breeds are enclosed in separate runs, well shaded. They each in turn have a run about the stables and guinea grass plots during the day, and in this way gain most of their living. Nos. 1 and 2 have kept in excellent health, but have lost some of the leading characteristics of their breeds. The Minorcas, six hens, laid nine dozen eggs from June to November, then moulted. They have now recommenced laying. The Wyandottes, six hens, laid 14 dozen eggs, but did not become broody, and only lightly moulted. Speaking from a fairly extensive knowledge of different breeds of poultry here, I think that the Wyandottes are one of the best and most useful breeds ever introduced, and no better fowl could be desired. The two Creve Cour hens laid two dozen eggs, all unfertile. Now these fowls have become accustomed to the climate, better result will be recorded. A few pullets have been added to Nos. 1 and 2, and will be further increased so as to reduce the price of the eggs and distribute them cheaply amongst the peasantry. Minorca cockrells bred here, at six months old, weigh 4  $\frac{1}{2}$  lbs., pullets 3 lbs., their eggs six to the pound, Wyandotte cockrells at the same age weigh 5 lbs., pullets 4 lbs., and their eggs nine to the pound.

As regards "pastures," it is evident that special attention is given and there ought to be valuable lessons to stock-owners in a land with so poor a natural pasture as Ceylon has. For instance, we are told:—

To make up for the loss of pasture handed over to the Botanic Department, the land between the

rifle range and the river was outlashed, burnt and roots grabbed out, and about 4,000 feet of open drains was dug. It will take some time and expense to bring this land into sound grazing. A piece of land at the rear of the range, about five acres, was also cleared of bush, fenced and had live hedging placed to the wires. Guinea grass and other grasses were planted, but the land is poor and will only afford rough accommodation for oxen and perhaps occasionally for horses. The calves' pasture received a dressing of bone ash two cwt. per acre. The Euphorbia hedges were trimmed and looked exceedingly well. The only expenditure for the Farm fences will be the annual trimming of them. A lot of old standing grass was mown and had a little artificial feed added, this was fed to the oxen during the driest period, they did not seem to relish it much, and beyond the good done by mowing the pasture it would not pay as a feed. Some of the old grass was burnt standing, but no good result appeared from this (a few ticks may have been destroyed) and if more expensive it is better to mow than burn. An additional acre of Guinea grass was planted to provide fodder for stabled horses. The Guinea corn was also extended. I still find this a most useful fodder for young cattle. Guinea grass, the finest fodder in the West Indies, grows most luxuriantly in a wild uncultivated state. The analysis of a sample collected in the scrub is as follows:—

Moisture	...	...	16.88
Albuminous Compounds	...	...	8.448
Carbonaceous principles, woody fibre	...	...	58.752
Mineral matter	...	...	15.72
			100.00

A note accompanying the above from the acting Government Analyst remarked that: "From the analytical data guinea grass is infinitely superior to ordinary pasture or Bahama grass, but had about the same value of manured pasture grass or English clover."

Trinidad, like Ceylon, depends largely on a foreign supply of meat; and we read:—

Our meat supply comes from Venezuela and the market is worth £50,000 per annum. A recent advance in price and the stoppage of exporting heifers indicates that their stock is running low. This fact ought to be another inducement to invest in stock-raising in Tobago. A paper was submitted to the Agricultural Society, entitled "Breeding for Beef." This gave an account of the commencement of an experiment to test whether beasts suitable for the butcher can be reared on our natural pasture grasses within a reasonable length of time and of sufficient good size. Without repeating too much, three young bulls were selected, cross red Polls, No. 1 at 12 months weighed 570 lbs., No. 2 at 7 months weighed 435 lbs., and No. 3 at 14 months weighed 465 lbs. Up to this age their daily gain equalled weights recorded by the Smithfield Club. Until the time they were weaned they had the greater part of the cow's milk, with Guinea grass and Guinea corn fodder at night and were stabled. After weighing, Nos. 1 and 3 were turned out with the oxen to take their chance with them. No. 1 speedily ran down and became infested with ticks and had to be brought in for a couple of weeks, he is now out again and doing well. No. 3 has given no trouble. No. 2 gets 21 artificial feed per day. These bulls will be weighed when another year expires, and go to the butcher. Their carcasses will be examined to ascertain the quality of the meat, &c. Something definite will then be ascertained as to the prospect and value of raising cattle for the butcher, and whether under ordinary conditions we can compete with imported cattle,

Finally, we come to "the stud" and here is a check to prosperity; for Mr. Meaden tells us:—

The history of the stud for the year is not a pleasant one to relate, on the two principal points, viz., the demand for the stallion's services and the foaling; failure and disappointment has to be recorded. A new departure was made in disposing of the horses, as indicated in last year's report, by offering at auction such as were for disposal. This being the first attempt in this direction some anxiety was felt as to the result, but what were good realized satisfactory prices, and further the sale indicated the right class of horse to breed and what would most likely find a demand. The three young mares realized £28 per head, about the current value for this class of horse. The price obtained for the seven young horses averaged £30 per head. The cost to rear them to 3 6-12th months old amounted to £17 each, leaving a profit of £13, an excellent average as times go. From the time they were weaned until commencement of breaking they had a feed each morning consisting of two parts crushed oats, two parts middlings, one part Indian corn, in all about 4 lb. costing 3d. per day. On this feed and always at pasture they have shown good growth, and the fact of their being disposed of at so early an age is sufficient proof of this. An exercising and driving ground was laid out levelled and gravelled. A dog cart and harness was purchased. These are home made and show excellent work. The horse stock stood as follows on the 31st December:—One thorough bred Stallion, nine in-foal mares, one Gelding, five years old, eight rising three year old colts and fillies, 10 rising two year old colts and fillies, two yearling colts, and was valued at £1,100.

We make no apology to our readers for the many extracts we make from Mr. Meaden's useful Report; for what intelligent family in Ceylon is not interested, more or less, in the improvement of cattle and poultry—in the supply of better milk and beef; of less skinny fowls and better eggs?

### PRODUCE AND PLANTING.

THE "FREE BREAKFAST TABLE."—This pretty expression of political sentiment is lost sight of for the present, the increased national outlay relegating it to the back ground. Indeed, speculative opinion is engaged just now in discussing the prospect of a re-imposition of duty in some cases, and an increase rather than a reduction on those articles of produce on which the duty is comparatively slight. Tobacco importers are preparing for a possible rise in duty, and the clearances of tobacco from bond have been enormous. The possibility of a tax on sugar is discussed in some quarters, while the idea that tea so far from being relieved of any of its present burden should be made to contribute a still higher sum to the Exchequer is not regarded as an altogether remote contingency. Chancellors have receptive minds, and if the consumer bears his burden patiently, it is very unlikely even in a fat year that the Chancellor of the Exchequer will do anything to lessen, say, the duty on tea, so long as he can with confidence affirm that members of the tea trade are not in favour of any change. The question is, do those who express this view represent the real interest of the trade? and upon this doubtless, there will be a considerable difference of opinion also.

A MECHANICAL TEA BULKER.—We notice that Mr. H J Apjohn, chief engineer to the Port Commissioners at Calcutta, recently gave a demonstration of his plan for the mechanical bulking of tea and repacking. From the comments in the "Indian Planters' Gazette" we gather that the representatives of the tea industry who were present were not very favourably impressed.

**BOGUS TEA.**—We referred in a recent issue to the destruction by the Customs authorities of some bogus tea. According to the "Grocer," one of the "latest discoveries of the public analysts is that the Customs authorities are growing careless in the matter of the tea imported into our ports. There have been two prosecutions within the past few months for an alleged excess of foreign matter in samples of tea, but both of these were dismissed, and now there is another prosecution proceeding in which a small country grocer is being made to bear the expense of a scientific discussion as to how far the Customs authorities are doing their duty in examining tea." As the "Grocer" points out, it is a great hardship that retail grocers should have to bear the brunt of this battle.

**ENTERPRISE.**—Ceylon tea proprietors and their representatives do not weary in the task of advertising the merits of Ceylon tea. The idea of sending samples appropriately packed to the Austrian and German Emperors is one capable of further development. All the remaining crowned heads of Europe might be treated in the same generous way, and doubtless the industry would ultimately benefit. The plan adopted in Ceylon of bringing the produce of the island to the front on every possible occasion must tell in the long run. It has been successful hitherto, and will, if persisted in, work wonders.—*H. and C. Mail*, April 7.

#### CARRITT & CO.'S INDIAN TEA MARKET REVIEW SEASON, 1898-99.

April, 1899.

The season closed on the 31st ultimo, with an export to the U. K. of 133½ millions compared with 133¼ millions the previous year.

The quality of the crop taken as a whole has been of average standard. It has been largely composed of ordinary medium grades, and the proportion of high class tea has been small.

Early in the season Cachar and Sylhet suffered severely from prolonged drought; outturns at one time were seriously behind last year, and the indifferent quality of the early teas resulted from the same cause. A favorable spell of weather, however, set in with the rainy season, and prospects were improved both in respect of quality and yield, but generally speaking outturns had fallen so far behind that Managers found it impossible to overcome the deficiency; much of the lost ground was eventually recovered, but the crop fell far short of estimates.

Assam has experienced fairly favorable weather throughout the season; the character of the crop has been of a useful description with a very limited proportion above the ordinary average standard of quality.

Similar conditions have prevailed in the Doors; at one period of the season the outturn was appreciably ahead of last year, but an early setting in of the cold weather curtailed yield, and manufacture concluded somewhat sooner than usual. Some good teas were seen at the beginning and close of the season, but during the intermediate period, with some few exceptions, arrivals somewhat largely consisted of thin liquoring kinds.

Weather has not been altogether favorable in Darjeeling. The second flush produced some excellent teas, but continued and heavy downpours during the rainy season made it impossible to turn out anything but different quality from the leaf available. With improved weather, better quality followed, and some attractive flavory teas were made towards the close.

Other districts call for no special remark, their quality being of the usual description. The Terai, with the exception of a few of the best gardens, has practically passed into the hands of natives.

The markets have remained fairly steady throughout the year; beyond the usual irregularities consistent with a large trade, no violent fluctuation in prices has occurred, but the establishment of a lower

of value for all but finest descriptions, and the difficulty in moving tea outside this sphere in spite of an exceptionally strong statistical position, have been the disappointing features of the season.

The result of the last year's working has again been unsatisfactory to growers. The chief causes are to be found in the sameness of quality of a very large proportion of the crop, the unequal distribution of supply, the concentration of buying power in the London market and high exchange.

Climatic conditions have not been altogether favorable, and existing circumstances have made it difficult to raise the standard of quality, which, as a rule, can only be done at the expense of outturn. The consistently low level of value, increased deliveries at home, together with the certainty of a crop practically the same weight as last year, and the uncertainty of a proportionately better price being obtainable, opposed the idea of curtailing outturn with a view to improving quality. The character of the crop, which has largely consisted of ordinary medium quality, has not tended to bring about any appreciable advance in sterling values, though, apart from other features of the trade, it should have been sufficiently good to maintain last year's level.

Owing to improved facilities of transport, and also to accelerated services, the crop has reached the market quicker than usual; no adverse influences have temporarily impeded transit or have tended to check the rapid forwarding of supplies. Climatic causes, however, have had some bearing on the adjustment of supplies; and although regarded at the time in the most serious light, have really proved to be of some help to the industry—whilst favorable to yield in some districts they have at the same time occasioned a severe check to outturn in others, and excess on the one hand has been counterbalanced by deficiency on the other—no relief however has been afforded the London market, which for several months during the season receives a supply altogether out of proportion to demand.

The effect of a congested supply, and the want of a more equable distribution of the crop on the home market, has been more than ever emphasized this year. Improved means of carriage have been largely availed of (mainly on account of economy in finance), and tea has been rushed forward at headlong rate regardless of the inevitable fate awaiting it in London. A more convincing proof of the need of a better regulation of supply cannot be wanted than this year's working affords; even the law of supply and demand has been suspended by the persistent pouring in of shipments, and any tendency to improved prices has been immediately stifled.

The altered condition of the trade, and the concentration of buying power in the hands of the comparatively few large London houses, make it all the more necessary to feed the markets judiciously, and the absence of this precaution has never been brought home to the seller so acutely as in the past year. The continually depressed market at home, and the difficulty in moving up sterling value, in spite of an exceptional position, are in a great measure directly attributable to this drawback, and so long as the annual flooding process supervenes no healthy recovery in values appears probable; they may slightly improve during the months of diminished supply, but only to be forced down again when the weight of tea comes forward.

That some effective scheme for ensuring a more uniform supply throughout the year than now exists would prove of enormous benefit to the industry is undoubted, but the difficulties to be overcome appear insurmountable; it would necessitate a strong combination of producing interests, and restricted dealings would probably be unacceptable to many. But prices have been forced down to such a low level, and the margin of profit to the grower, where it has not disappeared altogether, is so small and uncertain, that any active measures with this object in view should receive every consideration. Reference to the appended "Movements of Tea" will be interesting in this connection.

Fine teas have maintained their value throughout the season, and have realised full prices whenever brought forward, indicating that there has been no falling-off in the appreciation of really good tea.

The distinction made by the home trade between good to fine tea and tea barely reaching that standard has been severely reflected in prices; the difference in value has become more accentuated, and Darjeeling gardens have been the chief sufferers. When teas from this district fall short of good to fine quality (which is as a rule unavoidable in respect of "first flush" and "rains" manufacture) they drop into the plane of ordinary classes, and become difficult to move; they fare badly in London in competition with Ceylons, and unlike Calcutta, with its various outlets, there are, comparatively, no special demands for Darjeelings of intermediate quality to look to for support.

The distribution of the crop from Calcutta, as compared with last year, has been as follows:—

	1898-99.	1897-98.
To United Kingdom ..	135½ millions.	133¾ millions.
„ Colonies ...	6½ „	6½ „
„ America ...	3¼ „	2 „
„ Bombay, Persian Gulf, Black Sea ports, Con- tinent & other markets 8½ „	8½ „	4½ „

The above figures may be considered eminently satisfactory, showing as they do, healthy competition and a substantially extended business between Calcutta and new outlets for Indian tea. The quantity drawn from Calcutta sales to meet these demands has amounted to 17¾ millions, or about 36¾ per cent. of the total offerings, and contrasted with last year's work in this direction the details are as follows:—

	1898-99.	1897-98.
Total quantity sold in Calcutta	49 millions	46 millions
Percentage of the above ex- ported to the Colonies ..	13 %	14¾ %
„ „ „ America ...	6¾ %	4½ %
„ „ „ Bombay, &c. ...	17 %	9¾ %

The satisfactory increase in trade with America and Bombay can in a great measure be attributed to the fact that a somewhat more liberal supply of teas suitable to their particular requirements have been offered in the Calcutta market.

As foreshadowed in our review last year, these markets have readily responded to the opportunities given them, and it is encouraging to know that the endeavours made to stimulate these demands have been so successful. It is a clear indication of probabilities, and should offer producers a strong inducement to feel these valuable outlets more freely, as they are capable of rapid extension and can generally pay a better price than obtainable in London for similar descriptions.

The benefits of such a policy are manifold: London would be relieved to some extent of a class of tea which is yearly becoming more unsuited to the home trade, and which has consequently shrunk in value considerably; the demands for new markets which are, in a great measure, the salvation of the industry and are gradually but surely extending in Calcutta, would be nurtured, and the grower, in doing this, would derive advantage in price. Our trade with America, Canada and Russia is surprisingly small when contrasted with an annual consumption of 150 to 200 millions, but Indian tea has secured a footing, and considerable progress may be confidently expected in these directions, provided the proper channels are used to encourage it.

The strength of these demands, and the imperative-ness of drawing supplies from Calcutta, were clearly demonstrated during the early months of the season. Hitherto operations had been almost exclusively confined to Cachars and Sylhets, but owing to severe drought, supplies were much curtailed; the volume of business however was not affected, buyers freely substituting the produce of other districts. Nellocherry and Travancore teas, of which none appear on this market, would be taken

freely, and it is a matter well worth the consideration of growers in those centres if it would not benefit them, suitable as their teas are for the various foreign markets, to sell in Calcutta.

The market has felt the want of a better selection of high class tea; no fine, and very few really good Assams have been seen during the season, the bulk of the offerings having been of the ordinary description. The same may be said of Darjeelings, though a few attractive second flush teas were shown.

The growing scarcity of the higher grades in the market acts as a serious check to the progress of our trade with Australia and New Zealand particularly, and to this is partially attributable the disappointing export figures to these ports. In the case of Darjeelings, paucity of supplies has been specially observable, and importers in those centres do not disguise the fact, that owing to the difficulty and delay experienced in finding their requirements in Calcutta, they have often been compelled to substitute Ceylon growths.

A feature of considerable importance as affecting the price of tea in Calcutta is the appreciable quantity now being purchased for direct shipment to the large distributing houses in Great Britain. From the commencement of the season up to the middle of January last Calcutta sales have totalled about 43 millions, of which 15 millions have been absorbed by outside markets, leaving 28 millions for London. Allowing for transit, the corresponding period in which this tea would be placed on the London market extends from the beginning or July until the end of February. During this interval sales in Mincing Lane of Calcutta bought teas have totalled 25 millions against 23 millions actually shipped. The appreciable balance may be regarded as going to the distributor direct and to America. Such teas are therefore never seen on the London market; heavy warehouse and other charges are consequently avoided, and the buyer is therefore in a position to pay the producer a better price proportionate to the charges he saves.

The question of exchange has attracted considerable attention during the year. Producers have viewed the prospect of a fixed rate of 1s 4d with dismay, and it would seem that they have good reason for regarding the future with no little concern.

The immediate effect of an appreciated rupee has been to severely handicap the industry, so much so that many concerns that could have existed on a natural exchange, or even at a compromised rate, have been obliged to give up the struggle, as no compensating advantage has been secured in sterling values, the movement being in the opposite direction. Difficulties in arranging finance, which may in some measure be attributed to the same cause, have also hampered the industry, and the work of opening out new markets, although it has made considerable progress, has nevertheless been cramped. Advanced exchange has been reflected in a higher cost of production, and as it is a matter of price alone that can enable us to compete in new countries of consumption, the natural progress of our trade in this direction is in danger of being materially checked.

It has been argued that the state of over-production has been reached, and that a fixed exchange of 1s 4d would be the means of checking supply and restoring a healthy position. So far figures show that we are some distance off this deadlock; excess supply has appeared temporarily during the rush of shipments, but home deliveries for the past twelve months have outstripped receipts to the extent of 7 millions, and stocks on this date are over 6½ millions less than last year.

Prospects for the ensuing season are brighter, and there are indications of a more prosperous year before the trade. The present strong position will doubtless become accentuated by the end of May, and statistically the outlook is exceptionally encouraging.

The low scale of prices has enabled distributors to handle tea freely and force consumption, and the extraordinary increase in home deliveries is the most satisfactory feature in the year's work. That so large

a portion of the crop should, under such abnormal conditions as existed during the past year, have been dealt with before any recovery in prices took place in London, is instructive, and it is to be hoped that the measure of strength now acquired by producers will not be disturbed.

The statistical position would seem to invite a freer supply, which in many cases would mean a coarser system of plucking and a consequent lowering of quality; under such conditions the outlook is not favorable. The past year's crop was by no means a full one, and with the increased yield during the current season from considerable extensions coming into bearing, there should, under normal conditions of weather, be quite sufficient tea to meet home requirements and also the increasing demands for outside markets. With a large and inferior quality crop, lower prices must be looked for, and any recovery in value (signs of which are now seen) cannot be maintained.

As regards manufacture, the foregoing remarks may be some guide in deciding upon the best course to pursue. In the districts Planters have been fully alive to the situation, and every effort on their part will doubtless be continued to attain the best results.

### SELANGOR PLANTERS' ASSOCIATION. LABOUR SUPPLY

From the official minutes of the annual general meeting held in the Victoria Hotel, Kuala Lumpur, on Saturday, 25th February, we take the following:—

Mr. Carey, (Chairman) proposed the following, resolution viz:—"That in view of the increasing demand for Tamil labour in this State, it is desirable than an understanding should be arrived at amongst employers with respect to the employment of labourers from other estates, and this Association is of opinion that members should individually guarantee to knowingly employ no cooly or gang of coolies from another estate without the express consent and good will of their previous employers. In order that fair play may be assured in every case and that the liberty of the coolies may not be unreasonably curtailed all employers shall have the right of appeal to the Committee of this Association, whose decision shall be final and failure on the part of any member to comply with the Committee's ruling should be at once attended by the prompt expulsion of such offending member from the roll of the Association. In case, where coolies who have been a cause of trouble to their previous employer, have been engaged in good faith and in ignorance of the facts on another estate, the Committee shall deal with each such case upon its merits and their decisions as to the course to be followed shall be final, and neglect on the part of members concerned to comply with their ruling shall be attended by expulsion from the Association; special emergency meetings of the Committee to deal with these questions will be held upon members advising the Honorary Secretary of their desire to have a settlement of such disputes arrived at." Mr. Carey said it was of vital importance that there should be combination amongst the planters so as to be masters of the coolies or the coolies would be masters of the planters. In Ceylon great trouble had arisen through coolies moving about without reasonable restrictions and in consequence advances had gone up by leaps and bounds until it had become a serious matter indeed for proprietors. In Ceylon kangaries left estates unless they got anything they wanted and if Selangore Planters were not careful they would find themselves in the same position. Under the present system a cooly can legally give a month's notice and leave the estate and another planter would take him on, but planting etiquette was stronger than law and this resolution would prevent coolies from acting in a manner which was unfair to their employers. The coolies' interests however must also be safeguarded and in the case of a very unhealthy estate, they should be

allowed to leave if such was their wish. Boycotting and unreasonable restrictions were obviated by the second part of the resolution, for it gave the right of appeal to the Committee, men in whom presumably the Association had confidence and who would see that no injustice was done. The labour question was a most serious one, but treated on the lines of the resolution, there would be no friction. There was no earthly reason why a planter should say he was dependent upon his neighbour for labour, yet anyone who opposed that resolution practically did say so. There was every reason for believing that Government would meet the planters fairly in this matter and if coolies left a planter without sufficient cause no Government Department would employ them.

Mr. C Meikle in seconding the resolution said that similar a proposition had been discussed some years ago and that the effect of that discussion had been wonderful. The coolies understood from it that Europeans would stand by each other and the passing of this resolution would have the effect of making the coolies contented and would be a guarantee that a planter would get a return for his outlay in bringing our labour from the coast. He hoped the resolution would be passed unanimously. Mr. W W Bailey said he agreed with all that had been said and approved of the resolution, but he would go further and would like to see every planter present guarantee to import a certain number of coolies from the coast. Now that many estates were coming into crop it was found a great difficulty to keep coolies where heavy pickings were in force as they preferred such works as weeding, &c., which was easier. He was prepared to guarantee to take four times as many coolies as he now had on Lowlands and if the other planters would do the same Government would be impressed with the importance of granting reduced fares.

Mr. Gibson said that certain representations had been made through the U P A to the R G with a view to having the present cheap-ticket system extended, for another year, and he believed that such would be done. The passing of this resolution would necessitate the importation of coolies from the coast as local supply would virtually cease.

Mr. Carey sympathised with what had been said but pointed out that it was impossible for planters to say off-hand how many coolies they wanted. Competition with each other would cause a rise in the price of labour, but the resolution did not mean competition. A definite statement as to the number of coolies each planter would import was very necessary, but it was impossible to make such a statement then.

The resolution on being put to the meeting was carried unanimously.

Mr. Carey proposed the following resolution viz:—"That the Government be accorded a hearty vote of thanks for their prompt action in rendering assistance to the Superintendent of Petaling Estate by sending down large gangs of coolies to help him in clearing his coffee of caterpillars, and also for temporarily remitting the export duty on coffee," and said he could only characterise the action of Government as magnificent.

Mr. Bailey in seconding the resolution said that, but for the grand assistance of Government, and that from other Estates, not only Petaling but many other Estates would have been absolutely exterminated, and he took that opportunity of publicly thanking Messrs. Mitchell and Poulett for their assistance.

The resolution was unanimously carried with acclamation.

The meeting then proceeded to ballot for a Chairman and Secretary for the new year with the result that Mr. Carey was elected Chairman and Mr. Gibson, Hon. Sec. practically unanimously.

WILLIAM S. ARMSTRONG, who owns a rubber plantation in Nicaragua, writing from Natalbany, La, invites correspondence from persons wishing to purchase rubber tree seeds.—*India Rubber World*.

DELGOLLA ESTATE COMPANY.

The Directors have now to present to the Shareholders their report for the season ending 28th February, 1899, together with the annual statement of the Company's accounts for the same period.

THE ISABEL ESTATE.—The decision of the shareholders to part with this property was carried out as directed, with the results shewn in the balance sheet.

The effect of the diminished cocoa crop has been to make the balance of the working account somewhat less satisfactory than was anticipated at the time the estimates were framed, but the expectations of crop so early in the year have always to be founded more or less upon mere conjecture so many months prior even to the blossoming season and the apparent capabilities of the trees are entirely modified by any vicissitude of the season later on, and although only 250 cwts. of cocoa were estimated as against 403½ cwts. gathered the previous year on Delgolla, only 211½ cwts. were secured, and the quality of much of it exceeding poor, the weather being unpropitious and the tree suffering therefrom considerably.

COCONUTS.—There were 240,500 nuts gathered on Delgolla against an estimate of 250,000. The previous year's crop was 200,265 against an estimated 150,000, and although this season's crop falls short of its estimate by 9,500 nuts, it nevertheless shows an increase of about 20 per cent above last year's yield and steady progress.

INCREASED AREA OF COCONUTS.—Of additional land brought into cultivation there is 133·3·4 and the old lands have been thoroughly supplied .. .. . 409·1·29

making a total area now under coconuts .. 543·0·33 and the Visiting Agent reports the supplying a success.

COCOA SUPPLIES.—A larger area than estimated has been fully supplied, viz., 158a. 3r. 14p. and is not altogether the complete success that the coconut supplies have been as the season has not been so favourable, but the work has to be done over every season until the land is fully occupied as intended.

DIRECTORS.—Mr. Frank M. Laurie retires from the Board by rotation.

AUDITOR.—The election of Auditor rests with the meeting.

Dividends on the 7 per cent. Preference Shares were paid for 1898 (less Income Tax), amounting to	...	5,486 16 0
It is proposed to add to Reserve Fund	...	5,000 0 0
It is proposed to write off for Depreciation	...	5,000 0 0
And to carry forward to next year a balance of	...	3,908 19 1
		£44,502 15 1

Owing to climatic influences the Ceylon tea crop of 1898 fell considerably short of estimates, and the yield from the Company's Estates was 7½ per cent. under that of the previous year. This, coupled with a further rise in the rate of Exchange, somewhat diminished the profits for the year.

The Directors, however, are in a position to recommend the usual dividend of 15 per cent. on the Ordinary Shares, this being the twelfth consecutive year of a like distribution.

It is proposed to write off for depreciation the sum of £5,000, and to add £5,000 to the Reserve Fund, which will then amount to £95,000, and to carry forward £3,908 19s 1d.

The yield of Tea was 460 lb. per acre as against 495 lb. the previous year.

The crop for 1898 was as under:—  
Estate Tea, 3,714,316 lb.; Bought Leaf Tea, 355,571 lb.; Tea manufactured for others, 1,005,294 lb.; Total, 5,075,181 lb.

The gross price realized for the Company's Teas sold in London was 8·24d as against 7·85d per lb. in 1897, and the average rate of exchange is 4 3·16d compared with 1s 3 13·32d the previous year.

The crop of Coconuts fell somewhat short of anticipation, due to a partial failure of the blossom, and the working of the Hunupitiya Mills resulted in a loss, owing principally to unfortunate delays with the installation of the oil machinery, and the low price obtained for desiccated coconuts.

The following is a statement of the crops for the last three years.

Years 1896	...	875,570 Coconuts.
" 1897	...	1,200,980 "
" 1898	...	1,180,520 "

The Board have again great pleasure in acknowledging their appreciation of the services of the staff both in Ceylon and London.

Under the Articles of Association Mr. H. K. Rutherford vacates his seat on the Board, but, being eligible, offers himself for re-election. The Auditors, Messrs. Harper Brothers, Chartered Accountants, also retire from office, and offer themselves for re-election.—By order of the Board,  
WM. JOHNSTON, Secretary.

CEYLON TEA PLANTATIONS COMPANY, LIMITED.

Directors.—H. K. Rutherford, (Chairman and Managing Director); Henry Tod, David Reid, G. A. Talbot; Secretary, Sir Wm. Johnston, Bart.; Manager in Ceylon, H. V. Masefield; Office, 20, Eastcheap, London, E.C.

Report of the Directors to be submitted at the Twelfth Annual Ordinary General Meeting of Shareholders, fixed to be held at the Office of the Company, on Wednesday, 26th April.

The Directors have the pleasure to submit the General Balance Sheet and Profit and Loss Account for the year ending 31st December, 1898, duly audited.

The net amount at credit of Profit and Loss Account, including Balance brought forward at 31st December, 1897, and after providing for General Expenses, Directors' Fees, Income Tax, &c. is ... .. £ s. d. 44,502 15 1

An Interim Dividend of 7 per cent. on the Ordinary Shares was paid 28th October, 1898, amounting to ... .. 11,716 12

It is proposed to pay a final Dividend of 8 per cent. on the Ordinary Shares (making 15 per cent. in all, free of Income Tax) which will absorb 13,390 8 0

PEANUT BUTTER.—It is reported in an American journal that a new factory has just been put in operation in the City of Kokomo, Indiana, for the manufacture of butter from peanuts. At the present price of the nuts the butter can be sold at 15 cents per pound. The process of manufacture is no secret. The nuts, after the hulls are removed, are carefully handpicked and faulty kernels removed. They are then roasted in a large rotary oven. Again, they are gone over by hand for the removal of scorched grains. The nuts are then put through a mill and ground as fine as the finest flour the natural oil in the grains giving it the appearance and consistency of putty as it leaves the mill, except that it is more of an orange colour. By the addition of water the butter is complete, no other ingredient—not even salt—being used. It never grows rancid, and keeps in any climate. If this butter is all that it is said to be, it would seem that sooner or later the ordinary dairies will have to cease business, but much must be allowed for American enthusiasm in heralding this new butter substitute.  
—Chem. Trade Journal.

## CEYLON TEA IN AMERICA.

By latest accounts from London, our Tea Commissioner had just returned from America. He thinks our Ceylon teas are too dear now for America, the rise of 2d following on 5d duty, being more than a people who care so little for black tea, want to digest. Coffee—their national drink—they can have almost for nothing. On the other hand, men have been scouring the American cities for tea to be shipped to London! Some teas rejected by the United States Inspectors lately, were bought for 2d in New York, shipped to London, and sold for 6d. They were rubbishy “China blacks.”—We append an article on the proposed differential duty in Canada. Several papers are agitating for it; but we learn that the agitation is a “worked-up” one, not the natural outburst which would betoken a strongly felt grievance. Still let us hope it may succeed. But the Canadian blenders and packet-people who have made our trade with the “Dominion,” will feel this rise very bitterly. Unless they organize, they cannot raise the price of their packets. The article from the *Toronto World* is as follows:—

## TEA AND THE PREFERENTIAL TARIFF.

It is reported that the Government has in view the placing of a tax on tea to meet the deficiency caused by the recent postal reductions. If such is its intention, advantage should be taken of the opportunity to discourage the use of the adulterated and poisonous teas that are dumped on the Canadian market. There is a lot of trash known as tea that should be absolutely prohibited from entering the country. This low grade stuff is the cause of sallow complexion and nervousness in the people who use it. We have no hesitation in saying that it is the exciting cause of many cases of insanity. The farmers seem to use a good deal of it and with bad effects. Whether the Government places a duty on tea or not, it should protect the people from these poisonous teas. They come principally from China and Japan, being prepared by people who are uncleanly, ignorant and devoid of all ideas of sanitation. In order to discourage importations from China and Japan, it would not be a bad idea to extend the preferential tariff, as applied to Great Britain, to such parts of the empire as produce tea, that is if a duty of any kind is to be imposed on tea. The tea plantations of Ceylon and India are under the control of Englishmen, who use machinery to prepare the tea, while in China and Japan the work is done by the bare feet and hands of the natives. A preferential duty would kill two birds with the one stone—encourage trade within the empire and discourage the use of an article that is sending many people to the sylum.

## NORTH MYSORE PLANTERS' ASSOCIATION.

At the last annual general meeting of this Association a report was submitted showing that the accounts were in a satisfactory condition. The income derived from subscriptions amounted to Rs. 593-11-0. The expenditure was Rs. 483-8-6 and there was now a total credit balance of Rs. 2,013 of which Rs. 1,000 was allotted to the Reserve fund. Crops had been good, but any satisfaction felt on that account, was fully counterbalanced by the poor prices their coffee was now realising. The plague had been very severe in several districts of the Province and had interfered with the completion of various public works, particularly in connection with means of communication. The Imperial Government had sanctioned the ap-

pointment of Dr. Adolf Lehmann as Agricultural Chemist to the Mysore Government for a period of five years. No cases of coffee stealing had this year been brought to the notice of the Association, in spite of the fact, that placards offering a reward of Rs. 100 for information leading to the conviction of receivers of stolen coffee were posted in the principal villages of the district; the absence of claims for the rewards did not, it was feared, mean that coffee stealing had in any way abated.

Mr. O. SCOT-KIRVING was elected President for the year. A letter was read from Mr. G. R. OLIVER re the buying and selling of coffee advocating the use of English weights as a standard, stating that at present the Mangalore maund is 28½ lb. English, and a candy 576 lb. instead of a maund of 28 lb. and a candy of 560 lb. It is true that the native lb. is 40 rupees weight and the English 39 rupees in weight, but even then the difference is not calculated correctly, and as it is presumed that English weighing machines are used by all planters and firms it is an anomaly that native weights should be used. Resolved that the Honorary Secretary address the South Mysore Planters' Association, and in the event of their agreeing to co-operate, that all Curing Agents be addressed on the subject.

## ADDRESS BY THE AGRICULTURAL CHEMIST.

Dr. Lehmann then said:—I thank you for the honour you have done me, in inviting me to be present at this Meeting, and I wish to take this opportunity of expressing to you, and to all the other planters, it has been my privilege to meet, my gratitude for the hearty welcome which you and they have given me. It would be useless to mention to you the objects of my visit to this State, but I ought to say that my present tour is only a preliminary one, and simply for the purpose of becoming acquainted with some of your difficulties. As I have been barely two months in India I am in a large measure unacquainted with your climate, and have examined your soil, with a mamotie only. I know practically nothing of the peculiarities of the coffee tree, and have not had the opportunity of making a single experiment, it would be presumptuous on my part to speak to you, on any of the subjects which lie nearest to your hearts. I should however like to ask for your support and co-operation in the work which the Mysore Government has asked me to undertake. The Laboratory work will suggest methods or in other cases, test results, but a part of the work will have to be carried out on experimental plots, or on your plantations, I hope that some experimental plots will be established, yet the great difference in climatic and other conditions in the State, make the experiments conducted on your own estates, other things being equal, of greatest value to you. I should be glad therefore if you would undertake some experiments for yourselves, and I shall of course give you all the assistance that lies in my power. The subject of fertilisers is one that has been much spoken of: as you know, plants are composed of compounds of various elements, some of which are essential, or necessary for the growth of the plant; others are simply accidental or taken up because they happened to be present in the soil. The plant is not dependent on the latter. It could grow, if they were not present, but if any of the former were missing the plant could not grow. I doubt if there being any soil in the Mysore in which one of these essential elements is absolutely absent, still there are probably Districts in which plants suffer, because their roots are not able to obtain as large a supply of one or other of these constituents as is necessary for the perfect growth of the plant. It suffers from partial starvation. As you are aware, this starvation is generally due to the absence of available compounds of either potash, phosphoric acid, or nitrogen, one or more of these compounds, or possibly some other compound like lime may be lacking, or in other words, the particular plant, to be grown may be unable to assimilate a sufficient quantity, for there is a difference in plants as well as a difference in soils—some plants for example, can readily assimilate from a particular soil all the potash they require, while

another crop, on the same soil, would readily respond to a potash fertiliser. For a crop, the peculiarities of which are well-known, an analysis of a soil may suggest the particular fertiliser which would give best results: but a chemical analysis is by no means absolutely necessary for finding out the requirements of the soil you can easily do this on your estates. "The proof of the pudding is in the eating." If a crop is benefited by a certain simple fertiliser it is evident that the soil was lacking in that particular plant food in so far as this particular crop was concerned; but in order to ascertain whether a fertiliser has had a beneficial effect or otherwise we must leave a part of a uniform piece of land, treated in every other respect in the same manner, unfertilised. To my mind an advisable way of conducting these fertilising experiments would be to select as uniform a piece of coffee (uniform shade-soil-coffee, etc.), as possible, to apply to a narrow strip, say 20 or 40 feet running straight down the hill, a certain fertiliser leaving a similar strip next to this unfertilized, follow this by a strip to which another fertiliser has been applied. Every strip to which a fertiliser has been applied will thus be separated, by a similar strip, of unmanured soil, which will serve as a standard for comparison. I shall not take up your time with any further remarks on this subject but hope you will do me the honour of writing to me when you have time. The extent and the object of the experiment will have to determine the particular fertilisers used, and the rotation in which they are applied. I should esteem it an honour if you would permit me to consult with you whenever you contemplate making an experiment, however small it may be. While speaking of fertilisers, permit me to say that the more evenly and the more intimately it is mixed with the soil (other things being equal), the better the results are likely to be. Of course you know that certain fertilisers, such as sulphate of ammonia and lime ought not to be mixed together as it would result in the loss of ammonia; and that saltpetre ought never to be applied either just before or during the monsoons, as a heavy shower of rain would cause it to be washed away. But I am not yet in a position to say what would be the best time of the year to apply it, this might vary for different seasons and localities, and would depend to some extent on whether the coffee requires a period of rest during the hot weather or not. On the subject of digging, mulching, and green manuring, I hope to have something further to say later on. If my first impressions are true it would be well to try and allow the leaves to remain on the surface as long as possible. But I must not occupy your time any further as I hope to have the privilege of attending some of your future meetings.

After a vote of thanks to Dr. Lehmann for his most interesting address, and the usual vote of thanks to the Chairman and Honorary Secretary, the meeting broke up.

### CEYLON TEA IN AMERICA AND RUSSIA.

We have received a number of specimens of the advertising of Ceylon and Indian Teas in the American press. Most, if not all, of these are very admirably conceived and in design and letterpress reflect credit on Mr. Mackenzie and Mr. Blechynden. Our correspondent, in forwarding the specimens, writes from New York, March 17th, as follows:—

"Some of the enclosed might interest you. The advertisements are more to the Grocery trade, on the position of the market. Teas are now being shipped from here to London. Any rubbish, provided it is cheap enough, is the tenor of the orders from London!

"What has become of shipments to Russia? Up to the middle of Feb. the *Observer* shows none! If the

rise in lower grade has already stopped the Russian trade, it can be of use to Ceylon, only when teas are below the cost of profitable production. Perhaps Russian buyers are holding back for a vessel of their Volunteer Fleet."

Our correspondent will see that Russia did much better in March and that the comparison of shipments to Russia at the latest date the Chamber's return is as follows:—

January to April 18, 1899	..	599,796lb.
January to April 18, 1898	..	315,381lb.
	Increase	.. 284,415lb.
To America, the increase is	..	very satisfactory:—
January to April 18, 1899	..	613,399lb.
January to April 18, 1898	..	559,187lb.
	Increase	.. 54,262lb.

### INDIAN TEA AND COFFEE AT THE PARIS EXHIBITION.

The following communication from the Government of India to the Madras Government has been passed on to the United Planters' Association of Southern India for remark:— "Copy of letter from the Secretary to the Government of India, Department of Revenue and Agriculture Commercial Exhibitions), Circular No. 15-1-11, dated 25th March, 1899. "In accordance with the terms of the Resolution of the Government of India, dated 2nd March, 1899, the Rules and Regulations relating to the British Indian and Ceylon Section of the Paris Exhibition, 1900, have been published in the *Gazette of India* and the *Gazette of Local Governments and Administrations*. In the meantime the question of how the space provided in the Indian Imperial Court which is shown in the plan attached to the Rules and Regulations can be best utilised in the interests of India has been under consideration. The Government of India have decided to contribute to the Exhibition representative collections of forest produce and minerals. But after providing for these collections a certain amount of space will remain, and the Government of India consider that this cannot be better utilised than as a means of assisting the tea and coffee industries to an adequate and effective exhibition of their produce. It is proposed therefore to grant, free of charge, to the Indian Tea Association, and also to Coffee Planters' Associations in case the latter should desire it, such space as is available in the Imperial Court and to assist in the decoration of the Court in a suitable manner. I am further to request that intimation of the Government of India's intention may be given to the Planters' Associations of Madras, and that it may be suggested to those bodies that should they desire to avail themselves of the offer of exhibition space, the arrangement of details might most conveniently be entrusted to a Central Committee working in London, and representing and financed by the several Associations. If this suggestion be adopted, the Central Committee might organise a coffee-room in co-operation with the tea-room of the Indian Tea Association. As the time for completing arrangements is short, I am to request that no time may be lost in ascertaining the views of the Associations concerned."

## NOTES FROM NORTH TRAVANCORE.

April 24,

## WEATHER.

The weather still continues wet although not unduly so. As a rule, we have fine mornings, clouding up about the middle of the day with mist, and sometimes rain in the early afternoons, but more generally, late at night. The cold weather we had in the early months of the year, with frosty mornings, have entirely gone and instead we are having fine, mild, growing weather, suiting everything to perfection. The months of April and May, I should say, are the two best and pleasantest months of the whole year so far as my experience goes, and the lull before the storm of the S.W. monsoon, which generally reaches this quarter early in June: then is the season of the year for rain coats, overalls, and water-tight boots, some not even despising the far-famed "Sairey Camp" when it is possible to hold it up. The strong S.W. winds, however, often prevent this, but still the S.G. is not a thing to be despised, although some people, I know, think it effeminate to be seen in tow with the so-called old lady; lang may she wag aboon the grun! The rains remind me of a story of a Ceylon S.D., a true son of the North of Scotland, who came out to tea-planting in the N.E. monsoon in an estate where it happened he was fixed, and having to send in his Weekly Report of how things were progressing in the estate, he was greatly troubled with what he called the "Weet." The coolies couldn't work very weel on account of the "weet," the weeding was behind hand on account of the "weet," he couldn't get a drink on account of the "weet"! and so on, and so on to the end of the report, and ending up by his getting nicknamed "the weet."

## WORK ON ESTATES.

Every one seems busy in this quarter just now with new clearing work, pushing on to get things ready for the planting season, which will shortly be at hand. So far things seem to be pretty well forward, but there is still a lot to do in the way of roading, draining, &c., &c., before the planting actually commences. I hear that Factories are also in full-swing, lots of leaf coming in, and the bushes looking very fit. The coffee crops, so far as I hear, seem to have been good, heavy crops in fact on most places, and no doubt these showers, which we have had during the month, will have done the trees an immense deal of good; prospects in coffee for coming season, I am not in a position to report on as yet, only having seen certain coffee-estates in the distance. The appearance, however, seems to portend to be good, if the dark green colour of the trees is any indication to go by, no leaf disease or green bug seemingly about, or at least I have heard of none, of either disease. Long may these pests stay away.

## POSTAL COMPLAINTS.

I often notice complaints made about the delay at Post Offices in Ceylon, delay in getting letters, &c., &c., but how is the following for a record? A Post Office money order for only a small sum, was despatched from Munnar on 22nd of March, and did not reach the party for which it was intended until 13th April, both these dates being on the receipt received the other day. Thus it takes 23 days as you will see to send money from the above-mentioned Post Office to a Post Office in Ceylon. I think this will be hard to beat; no one could be surprised to hear of people

sending small sums through some other channel and not much wonder? Let others grumble; you good folks in Ceylon, I don't think are so badly off after all. Labour seems plentiful enough everywhere about, and coolies healthy as a rule, "pneumonia" being about the only disease amongst the labourers at present and this only amongst newly arrived batches coming up from the low country to the upper regions. This, however, is always the case, but it is never bad, only a death here and there being reported. When once they get settled down and acclimatised, they seem to like the climate well enough, and certainly no one can say it is unhealthy. The death rate amongst coolies, I should say, is very low, compared with many districts in Ceylon, and less even than the Ceylon average. I may be wrong, but that is my impression from what I have seen, and also what I have heard about these districts. I am not speaking of South Travancore.

## ELEPHANTS.

The elephants still keep up their playful gambling amongst the tea estates around about; they seem to be very inquisitive at times, and any new land mark about, in the shape of a newly made road, or drain, or weeds hole, where fresh earth has been brought to the surface, is duly examined and reported on. These reports, however, are not sent in as a rule, so it is difficult for anyone to say what their judgments are, but I have no doubt they are very satisfactory to themselves, for they seem to go their regular rounds at stated intervals; but on the whole, they do not do much damage, and show that there are always some of those denizens of the forest to the fore; long may they be say I.

## CYCLING.

It would be worth while for some true son of the cycle to take a tour through these districts. The scenery he would find grand, almost beyond description. The roads, however, are a trifle out of order and might be against the trip; but these are always improving, and in time, we hope to have as good roads as the hill districts of Ceylon; in time, I say,—a few years more or less,—but "Rome was not built in a day," so neither are catroads, tramways, nor railways, but some day we expect to have them all and then, oh! well I won't say what will happen; but any Ceylon man curious enough to come over and see for himself, can give a true and faithful report and see that that report is duly printed and published (not like the elephant's reports) and held up to the light of day for every good and true planter, (and others for that matter) to see—so mote it B.

CARDAMOMS.—Another large arrival has come in since our last. In Ceylon *Mysore* kind the usual jobbing business has been done. For *Malabar* there is more inquiry, qualities worth between 2s. 2d. and 2s. 4d. being especially wanted.—*B. and C. Druggist.*

CINCHONA BARK.—The London warehouse stock is now about 1,100 packages below that at the end of the last year. It is smaller than it has ever been before in the last seven years at the corresponding date. The arrivals up to March 31st were 4,108 packages, which is only reduced on by 1897 of the last seven years. The deliveries are 5,220 packages, which is about the average of the same years. The Java shipments are given elsewhere.—*B and C. Druggist.*

CEYLON TEAS IN HIGH DISTRICTS.  
ARE THEY FALLING OFF IN QUALITY?  
THE TEA PROSPECT.

The following extracts from the letter of a practical and experienced tea planter in a comparatively high district, are well worth careful consideration at the hands of all interested. Writing on April 26th, our friend says:—

We are getting plenty of rain now, and the tea is flushing heavily, so much so that I am afraid the quality will be much poorer, and prices will drop. Crops for the first quarter of the year have, in this quarter, been very disappointing, I am afraid. We had the long and severe drought, and very bad attacks of red rust on some fields, and then on the nights of the 7th and 8th March, the frost destroyed the flush on hundreds of acres in the District affected. The worst portions are only now beginning to recover from the effects, and I should be afraid to say how much tea has been lost from this cause alone. I only hope prices will continue good to make up for short yields. Some time ago I had a letter from Mr. ———, in which he says:—"In London I had a talk with the manager of a tea-dealing firm who have confined themselves all along to pure Ceylon tea, and he told me that Ceylon tea had fallen off so much from its strength of past years, that he thought, if they were to keep their customers, they must resort, as he said many firms have done, to fortifying the Ceylon with the stronger teas from India. This is very serious news, coming from a man of long experience in dealing with Ceylon teas, and who has no object to serve except to keep up the quality of his teas and so retain his customers. I was assured that all the large dealers in Ceylon teas had taken to mixing them with Indian, that there are hardly any now that deal out pure Ceylon teas. I should like to hear what you have got to say as to the quality of the tea of 1898, as compared with the teas of some years back. Have they in your experience fallen off as much as what I heard would lead one to suppose?"

Now, what do you think? I don't think teas, well and carefully made, have fallen off in strength, though I have often thought the liquors are not so rich and thick as they used to be in the earlier days of Ceylon tea. Until the last year or two, it was the fashion to ferment lightly or not at all, and probably teas made in that way "went off" very quickly, and had little good left in them by the time they got to the teapot, but I think there is not much of the light fermentation now. I know that I improved my teas considerably, with satisfactory results in London prices, by taking the advice of Colombo Brokers to ferment much longer than I was doing.

There can be no doubt of the superior teas which virgin soil gave (and gives) for a few years in Ceylon: the question now is, can planters by manuring or cultivation, or improvement in manufacture, make up for a certain falling-off in strength and flavour as estates get older? This is part of the problem now being tackled by Mr. Kelway-Bamber. It is also being partially investigated (at least so far as manuring is concerned) by many practical managers who are using the manures of Messrs. Freudenberg & Co., the Colombo Commercial Company, Limited, Mr. A. Baur and others. But, as our correspondent shows, more has to be studied than renovating or renewing the soil.

There can be no doubt of the widespread injury done by frost in certain parts of the higher districts during the present unusual season; and we believe some Visiting Agents have been misled into attributing to "blight" what is solely due to an excep-

tional snap of frost—an attack, however, which does no harm to the bush, save to give it a rest and to send it to work with fresh vigour in flushing. The consolation for Ceylon planters affected in this or other ways and behind with crop as compared with last year, or with their estimates, is that short supplies must mean a continuance of good or better prices; for we cannot believe in a revival of the China tea trade with the United Kingdom.

SALE OF THE LATE MR. TOM GRAYS'  
ESTATES IN LONDON.

BUNYAN AND OVOCA SOLD TO  
SIR T. J. LIPTON (LIPTON  
LIMITED) FOR £25,000.

We heartily congratulate Sir T. J. Lipton, or as we suppose, "Lipton Limited" on the bargain now made. From the advertisement of the estates which appeared in our issue of the 20th March we quote as follows:—

"The estates contain about 563 acres of excellent tea soil of which 533 acres are under cultivation, the remainder being planted with fuel trees or waste land. There are two charming bungalows with flower and fruit gardens, stabling and all accessories. The buildings are in good repair, ample for present and future purposes and comprise: Two large factories, tea-makers' houses and other premises with valuable plant and machinery, having capital water power for driving purposes. There are also live and dead stock and a very efficient labour force. The plantations are in excellent order, well worked in every aspect. The bushes being in good condition, of a very useful working Hybrid and the tea finds a ready market, both in London and Colombo, at rates considerably above the average. The estates could be most advantageously worked as one property which would considerably reduce the cost in every respect, thus tending to greatly increase the profits and they will be sold together as a going concern with possession upon completion of the purchase."

We are aware that the late Mr. Tom Gray derived as much as £2,500 a year profit for many years from the estates, and occasionally as in 1895-6, as much as £3,500; and both Bunyan and Ovoca are still flourishing estates, and the price paid—under £45 per acre—is very moderate.

DR. JOHNSON AND TEA-DRINKING.

Mr. Thomas Auld, a recognised writer in "Notes and Queries," recently contributed the following note to that paper:—

The theory regarding the size of the teacups which Dr. Johnson so frequently evinced is to me new and very interesting; but I incline to think that the doctor's twenty-four (or twenty-five cups, according to Mr. Marchall's interesting reference) would have amounted to much more than a pint and a half of liquid, of which any one might dispose in the course of an evening without much effort. It is, I believe, evident that Dr. Johnson rather prided himself on his feasts as a tea-drinker. We all remember the famous passage in which (in answer to Jonas Hanway's attack on tea) he describes himself as a "hardened and shameless tea-drinker." Then we have the evidence regarding the capacious teapot which held two quarts (was it?). Then, again, we have the verses which he playfully addressed to Miss Reynolds when

that lady was supplying him with the "cup which cheers," in which he tells her:—

Thou can'st not make the tea so fast  
As I can gulp it down.

Dr. Johnson's record as a tea drinker must stand. I should suppose each cup contained about one-third of a pint. Twenty-four cups would thus represent four quarts. This was the quantum for an entire evening, and Dr. Johnson's evening often lasted (*more Hibernico*) till four next morning. Say he began to talk and drink tea at ten, and continued for six hours, there is nothing so remarkable in the quantity. Many beer-drinkers in any of our large towns could dispose of as much liquor in an even shorter time. It is also worthy of note that Dr. Johnson was a very large man, that he talked much and perspired freely

### ELECTRICAL TRANSMISSION OF WATER POWER.

Having in view the increasing scarcity of firewood in the island of Ceylon, and the fact that, away from the railway, oil is too expensive, it is pretty evident that, sooner or later, some other means of obtaining the necessary power for the driving of machinery will have to be devised. A decided step in this direction has been made by Messrs. Whittall & Co., who, at the commencement of this month, laid down at Hayes estate, in the Morovak Korale, the property of the Union Estate Company, an installation for the electrical transmission of water power for the factory, and have met, we are glad to learn, with unqualified success. It is the first instance of successful electrical transmission on any estate in Ceylon, though it has been attempted elsewhere, and is a good example in a small way of what can be done in this direction.

The difficulty on Hayes estate has been that, though there is water power, it is below any spot on which a factory could have been built and so the cheapest of all powers could not be utilised direct. An idea was mooted, therefore, some years ago on the same estate, to utilize a wire rope transmission; but as the result of a visit by Mr. Garratt (engineer to Messrs. Whittall & Co.), it was clearly seen that electrical transmission would be far cheaper, and certainly more simple, than any other system. The factory at Hayes is rather a large one for the district, and the power is transmitted from a point one-third of a mile distant from the estate. The total fall of water utilized is 250 feet, and, without going into too technical details, it will interest planters to learn that with only 18½ brake or actual horse-power at the Pelton wheel, the following machinery was driven, all doing work and the rollers hard rolling:—One Brown's Roller; 1 thirty-two inch Rapid Roller; 1 Economic Roller; 1 Downdraft Sirocco; 1 No. 3 Desiccator; 1 Venetian Dryer, a Roll-breaker and a made-tea sifter.

The conducting line is overhead, and consists of two bare copper wire, supported on porcelain insulators, similar to those used by the telegraphs. In the factory, of course, rubber insulated cables are used. The running of the plant is entirely in the hands of the ordinary cooly, and the working appears exceedingly simple; in fact, all the attendant at the Pelton wheel and generator-house has to do is to keep the wheel running at one constant speed, which is indicated by a tachometer or revolution indicator. As long as this is done, the motor in the factory also runs at practically a constant speed.

Throughout the island there are numbers of steamers, small and large, which are fairly constant all the year round, and could very easily be turned to good account. The Hayes installation is wonderfully simple; in fact, no transmission could possibly be more simple than that from one generator to one motor. When transmitting to several points and subdividing the power, however, a different system has to be used, and becomes, perhaps, a little more complicated, although, as a matter of fact, there is absolutely no difficulty in transmitting from one large stream to any number of factories within a reasonable distance—say, a radius of five miles.

It is admitted that the use of coal is practically out of the question. Oil engines are satisfactory and economical in districts near the railway. But, on the other hand, nothing can compete with free water power. With this new system there is no smoke, noise or heat and Messrs. Whittall & Co., who are responsible for the laying of the plant, as well as Mr. Garratt, under whose personal supervision it was erected, are extremely satisfied with their venture. We are assured that in the system as designed there are absolutely no electrical dangers. We shall be glad to hear of the further success of the undertaking.

### THE EASTERN PRODUCE AND ESTATES COMPANY, LIMITED.

DIRECTORS.—Ralph A Cameron, Managing Director, Norman W Grieve, C J Lindsay, Nicholson, David Reid, Christopher B Smith, Edward Wabab, Douglas R Smith, Secretary.

Report to be presented at the twelfth ordinary general meeting, to be held at Winchester House, Old Broad Street, at 12 o'clock noon, on the 27th April, 1899.

The Directors submit Report and balance sheet for the year ending 31st December, 1898.

The profit for the year is £32,526 7s 1d, which added to £10,878 18s 3d, balance from last account amounts to .. .. . £43,405 5 4

From this has to be deducted:—	
Interest on Debentures ..	£4,612 10 0
Debentures for £7,500 drawn and paid off, with bonus of 5 per cent, on 31st Dec., 1898 ..	7,875 0 0
Interim dividend of 2½ per cent on preferred and ordinary share capital, paid 4th Nov., 1898	7,497 4 0
	19,984 14 0

leaving a balance of ... .. 23,420 11 4  
which it is proposed to appropriate as follows:—

Final Dividend on the Preferred Shares of 2½ per cent., making 5 per cent. for the year, and on the Ordinary Shares of 4½ per cent., making 7 per cent. for the year .. .. .	13,440 1 6
Balance to be carried forward as provision for retirement of Debentures in the current year .. .. .	9,980 9 10
	£23,420 11 4

As shown in the Schedule below, the Company, on 31st December last, had 10,867 acres under Tea cultivation, of which 9,771 were over four years old.

The yield of tea in 1898 was 3,643,000 lb., being about 6 per cent short of the estimate, owing to deficiency in the rainfall. The average gross sale price was 7-32d.

The cost of production was enhanced by a further rise of nearly 1d in the value of the rupee, the average rate of exchange for the year being 1s 4-13/64.

In accordance with the Articles of Association, two of the Directors, Mr. Ralph A. Cameron and Mr. C J Lindsay Nicholson, retire from office, and, being eligible, offer themselves for re-election.

The retiring Auditors, Messrs. Welton, Jones & Co. offer themselves for re-election.

C J L NICHOLSON, Chairman.

41, Eastcheap, E.C., 12th April, 1899.

SCHEDULE OF THE COMPANY'S ESTATES AT 31st DEC., 1898.

Arapolakande, Asgeria and Bulatwatte, Colonna, Condegalla, Doombagastalawa, Dromoland, Hope, Ingrugalla and Berrewella, Kirrimettia, Kumaradola, Kumbukkan, Labookellie, Meddecoombra, Norwood, Rothschild, Sogama, Vellai Oya and Danukelawa, Wevekellie.

	acres.
Under Tea .. .. .	10,857
" Cocoa .. .. .	634
" Coffee, Cardamoms & Sundries	367
" Forest grass and uncultivated land	4,631
Total	16,499

### TWO IMPORTANT CEYLON TEA COMPANIES.

The annual Report of the Ceylon Tea Plantations Company, Limited, is always an instructive document. Not that there is much variety in the prosperous account, the Directors regularly render. For twelve years this premier Ceylon Tea Company has declared a dividend of 15 per cent on its ordinary shares—an almost unprecedented record—while building up a Reserve Fund which now amounts to £95,000 or considerably more than one-third of the capital issued. Last year was a poor one for crops in tea as also in coconuts, and yet there is no diminution in dividend, in the addition to reserve fund, or in the writing off for depreciation, while nearly £4,000 are carried forward. All this speaks well for the good management of the Company. The tea in bearing aggregates 8,067 acres; not in bearing 496 acres; while of coconuts the bearing trees cover 723 acres and those not in bearing 1,424 acres. This Company has, therefore, by no means reached the limits of its planting crops. The number of coconuts gathered in 1898 was 1,180,520; before many years this number should be increased to four millions, if not more, from the land already planted.

Another Company, whose Report is before us today, is that of the Nuwara Eliya Tea Estates Co., Ltd.—a Report which, as the local Agents Messrs. Leechman & Co. have learned by wire, was duly adopted by the general meeting of shareholders on 24th April. Notwithstanding several drawbacks, this Company has had a fairly prosperous year, the dividend being 6 per cent, which is satisfactory considering the difference in exchange. The Company is distinguished for its superior tea, the average price realized being so high as 9-21d. per lb., although the yield from tea in bearing was as heavy as 545 lb. per acre. The most profitable return was from Concordia estate and equalled £11 6s. 8d. per acre, a yield of 546 lb. per acre and of 10-30d. per lb. being realized. On the other hand, Naseby, which used to give the highest profit has fallen off to £3 5s. 1d. per acre! This, however, is greatly owing to the Factory being under reconstruction during

the greater part of 1898, so interfering with manufacture; while the tea bushes in many parts suffered severely from frost. No doubt further drainage and tree-planting will be undertaken to endeavour to mitigate the effects, or prevent the attacks, of frost in the future.

### FACILITIES FOR MAKING GOOD TEA IN CEYLON:—III.

THE two replies to our Tea Circular from the Northern Districts are very brief, though they are to the point. From Matale East, the sole drawback to the manufacture of better tea than at present is said to be that "it is not in the leaf." That is a tale we have heard from more than one old district; and if soil constituents have anything to do with the character of the crop produced, the complaint is but reasonable. What better remedy than judiciously selected manure for giving strength and flavour to tea? And our friend would seem to agree in this verdict; for, although he pronounces the jāt of the tea generally good, and the soil also good in his locality yet; he thinks that manuring would improve the tea and be profitable as well. It is here that the aid of the scientist should come in, to determine what the deficiencies of the soil are, and what special manures are required to give flavour and character to the tea. From the Panwila and Wattegama side, the drought of last year is mentioned as one of the (temporary) drawbacks to the turning out of better tea; while previous chenaing of the land—not an uncommon experience, we fancy, in the older districts round which villages cluster—and full exposure to the South West monsoon, are among the permanent obstacles. Another possible reason, is said to be the lack of appliances for cool fermentation. There, too, there is no complaint about the jāt, though in the older places, it is a little mixed. The soil cannot claim to be virgin, except in rare instances, and it varies a good deal from ironstone and red loamy clays to clays, quartzes, gravels, gritty cabooks, micaceous talc and plumbago lands. The variety of the soil points to the need of differently constituted manures to meet deficiencies; and we are glad to find our correspondent express him self emphatically in favour of manuring, as justified by all analogy, seeing how, a short while ago, persistent attempts were made in some quarters, if not to under-rate manuring, at any rate to regard it as a practice whose advantages had yet to be proved.

In regard to Factories, the latter report speaks of them as not generally deficient in withering room, in machinery, or motive power; while the former report notes deficiency in withering room, whenever there is a rush after a spell of dry weather. Without adequate withering room, good tea can thus be turned out only when average pluckings are in progress; and that means a variable standard which must be prejudicial to the estate marks. The labour force is said to be adequate in both districts; but that has been the experience almost throughout the planting districts for some time past. While Matale East has naught

to say against pruning as practised, the sister District records distinctly severe pruning in some cases, with an evident belief in its efficacy under certain circumstances. We are told that "heroic pruning requires as great skill as heroic surgery, and very careful tipping after"; but, we fancy, that it is only under very exceptional conditions that severe pruning is now practised?

Both districts claim to be admirably suited for tea; and the claim is proved by the crops, which average 500 to 650 lb. an acre; but quality is not on a par with quantity. In regard to that no surprise need be felt, as elevation and climate are important factors in flavour; and it is satisfactory to learn, not only that buyers get better value than they ever did before in the history of tea—the remarks were penned six months ago—but also that greater care is generally exercised in manufacture than ever previously. If the prices of medium teas do not show an advance, it is because there is less competition for them in the market.

### THE TEA TRADE.

The Indian and Ceylon tea industries have for several years past suffered from gradually increasing production, cultivation having gone ahead more rapidly than consumption. Although both

#### INDIAN AND CEYLON PLANTERS

have done their best to open up new outlets for their produce, it was found impossible to develop these sufficiently rapidly to keep pace with production. The natural result was accumulating stocks and lower markets. The last two seasons therefore proved very bad for producers, as a consequence both of higher costs and lower prices. The check thus caused has now borne its natural consequence. Since the beginning of this year, by which time the heaviest quantities of Indian teas had been sold, a very sharp recovery has taken place in the market for commoner grades of both Indian and Ceylon teas. These have advanced between 40 and 50 per cent. from the lowest prices at which they were selling in November and December last. This has been brought about by the increase in demand, and by a shorter supply than was expected from both India and Ceylon. For months past the trade in England had been suffering from the extremely heavy stocks, especially of Indian tea; but the deliveries of Indian tea in London for the present season, of which nine months have already passed, have been 12 millions ahead of the same period last season, resulting in a dearth of the lower grades, and contributing to the improvement in prices. The conditions under which the tea trade is carried on at home have been changing materially during the last few years, through the importation into the trade of large "blending" houses, who have made it their business to blend the teas for the retailer and supply him with mixtures suitable for his special trade, thus saving the grocer the necessity of purchasing a stock of different kinds of tea in order to keep up his own blends. The natural sequel has been to obviate the need for a large stock of tea in the grocer's own warehouse, such stock being now held by a few blenders instead of by a large number of small grocers. In other words, it has enabled the country retailer to do an equally large business upon a less amount of stock, so that the buyers are more dependent upon arrivals to supply their wants. Consequently the pulse of the country responds much more quickly to any shortage in supplies, and it is doubtless partially owing to consumption increasing that the sharp advance in quotations has taken place.

**CROPS RECEIVED.**—As far as can be ascertained, not only is the stock of British-grown tea in London decidedly short, especially that of Indian teas, but

the duty-paid total held by retailers in their own shops appears to be distinctly less than was the case some time previously, so that retailers are compelled to buy, whatever may be the condition of the market, as they have apparently very little of their own stores to fall back upon. Almost all the season's crop has arrived from India, and there will be very little to receive from this quarter until August next. The quantity to

#### COME IN FROM CEYLON

is likely to be less than last year, as so much is being taken away for new markets; while the new season's tea from China will not arrive until about July. Consequently there is not much to draw upon besides the existing stocks—mainly held in London—and the 8 or 9 millions a month which may come from Ceylon; so that everything points to a continuance during the next few months of the strong demand at present existing, and there does not appear to be any reason to suppose there will be a set-back in prices. It must also be remembered that many of the wholesale houses sold large portions of their stocks at a profit as soon as the rise set in, and their only opportunity of replacing these has been by purchasing at higher prices; so that the usual practice on the part of holders of tea, of reducing their stock about this time of year, will not take place, they having already parted with a large portion of their surplus. This still further militates against the probability of any fall in prices, and appears likely to strengthen competition amongst buyers rather than otherwise.

**MARKET OUTLOOK.**—The immediate prospects of the trade, therefore, appear to be that prices will be sustained at the present level, at any rate until the arrival of the new Indian crop, which cannot reach here in quantity until late in August next. Of course, the question of prices for the coming season will mainly depend upon such increases in production as may take place in India and Ceylon. There is little doubt that the enhanced prices of the last few months will induce cultivators to send home all the tea they can produce; but (although it is early to form any estimate of the coming crop) there does not appear to be any reason to suppose that the increase over last year will be excessive. Indeed, many properties have suffered so severely from the depression of the last two years that it is doubtful whether they can find the means to increase their production at present; hence it seems probable that prices will remain during the next few years upon a higher level than has been the case; that the downward course, which has been going on for many years past, is at last arrested; and that a somewhat higher average will be obtained for the next few years' crops, with more profitable results to cultivators. Indeed, had prices continued to recede, large areas of tea plantations would doubtless have gone out of cultivation, many estates being quite unable to make ends meet at the disastrous prices of 1898. The general condition of the industry, therefore, appears to have at last become much more healthy, and if only production is kept within reasonable bounds there is little fear but that results of tea growing will continue to be profitable, particularly if the efforts of Indian and Ceylon planters to open up new markets are continued with the same spirit as has been the case during the last few years. There is strong reason for believing that many foreign and colonial markets will largely increase their consumption of British-grown tea, and if due advantage be taken of these fields for enterprise, the industry appears likely soon to revert to the prosperous condition experienced some four or five years ago.—*Statist April*

**INDIA RUBBER IN GOA.**—The Goa papers announce that Captain Moraes has discovered in the wilds of the Portuguese territory of Goa a tree which yields India rubber in considerable quantities. The tree is described as *Randallia*, and it is stated that the Portuguese authorities are about to encourage its cultivation on a large scale.—*Indian Engineering*.

THE MAZAWATTE TEA COMPANY.

An issue of 14,000 five per cent. emulative £5 preference shares is announced by the directors of this company. These shares form part of 20,000 in all, by the creation of which the capital of the company is raised to £650,000, viz., £300,000 in preference and £350,000 in ordinary shares. The former of £5, and the latter of £1. It is stated in the prospectus that the money now to be raised will be devoted to new factories and warehouses, by the help of which the company's business will be concentrated and economies effected. The plea is good, but in any case the profits are so large and the business expands so remarkably that ample security exists for the dividends on the whole preference capital. Were it all issued it would require only £15,000 per annum, and the average profits for the past three years have exceeded £51,600. A. J. W.—*Daily Chronicle*, April 13.

THE EDERAPOLLA TEA COMPANY OF CEYLON, LIMITED.

At the third annual ordinary meeting of the Ederapolla Tea Company of Ceylon, Limited, it was:—

Proposed by Mr. Paine, seconded by Mr. MacMartin, "That a dividend of 5 per cent. (free of income-tax) for the year 1898 be declared and paid forthwith."

Proposed by Mr. Paine, seconded by Mr. Bett, "That Mr. J. M. MacMartin be re-elected a director."

Proposed by Mr. Campbell, seconded by Mr. James F. Anderson, "That Messrs. Cape and Dalgleish be re-elected as auditors for the current year."

Proposed by Mr. Paine, seconded by Mr. Bett, "That a vote of thanks be given to the Ceylon and London staffs for their efficient working of the company's estates and business."

A vote of thanks was given to the Chairman and Director.—*H. & C. Mail*, April 14.

HAWAIIAN COFFEE PLANTERS are very much disturbed at the prospect of the disease affecting coffee in Venezuela and certain parts of Central America, getting into their estates. *The Planters' Monthly* says:—"In several of the districts of Central America, where it is now, many of the estates have been rendered almost worthless. This seems to be a different disease from that which destroyed the coffee industry in Ceylon." The disease is caused from two small parasitic fungi, namely, *Stilbum flavidum* and *Sphaerella coffeicola*.

THE ORANGE CROP OF FLORIDA, which was destroyed a few years ago by the frost, will this year be nearly one-half what it formerly was. The orange trees were, as it were, swept out of sight in one night, and the labour of years was demolished. The young orange trees, since planted, are now fairly developing, and from this time on will increase in bearing capacity until the average will be reached again. The disaster to the orange trees, however, has proved to be a boon to that State. The cultivation of other fruits, as well as of early vegetables, has now become established, so that hereafter the failure of one crop will not mean the failure of all.—*Planters' Monthly*.

**A BATCH OF CEYLON TEA COMPANIES' RESULTS.**

The reports of the smaller Ceylon tea companies so far published emphasise the fluctuating character of the enterprise. Yield, quality, and price appear to vary in the most bewildering fashion, and it is evident that holders of shares in companies of this class must demand a high return upon their money, in order to face the vicissitudes that befall the industry. The following table gives their experience in regard to crop and price obtained:—

	Manure Acreage.		Crop.		Price per lb.	
	1897.	1898.	1897.	1898.	1897.	1898.
Bandarapola	416	478	407,250	395,270	6	0 1/2
Burnside	1,034	*	327,145	356,455	*	0 1/2
Edarapolla	821	853	401,105	447,066	5	6 1/2
Kelani Valley	1,200	1,200	632,033	578,109	6	0 1/2
Nahalma	446	446	245,336	234,917	6	9 1/2
Panawal	577	577	258,303	293,933	14	6 1/2
Portmore	472	474	228,001	241,656	10	9 1/2
Yatiantota	2,032	2,249	1,014,291	1,135,794	5	6 1/2

In these results there appears no sort of uniformity, for one company has a larger crop, and another a smaller. This company has to sell its out-turn at a great diminution in price, while for that other the average is decidedly higher. No doubt the marked variations arise partly from the smallness of the concerns, as there are so few acres over which to spread the result. The larger companies, with a cultivated area ten times as great as some of those enumerated below, are able to bring out more regular results, as no doubt the change of yield and quality in one group of fields is often counterbalanced by opposite variations on the part of another group. Profits have fluctuated even more widely than other results, but on the whole the year must be considered a poor one for the companies. Dividends have tended to decline rather than improve, and the declines, where they have occurred, are usually more important than the additions to the dividends. The record in this respect is set forth in the subjoined table:—

	Net Profits.		Sums put to Dividend		Depreciation, per cent.	
	1897.	1898.	1897.	1898.	1897.	1898.
Bandarapola	1,956	1,488	68a	432	10	5
Burnside	2,447c	355	599	41	7	2
Edarapolla	1,123	2,063	18	733	5	5
Kelani Valley	3,178	1,478	721	511	10	5
Nahalma	207	147b	8a	—	2	1
Panawal	669	1,814	101a	750	2	4
Portmore	4,916	5,405	116	489	12	12
Yatiantota	3,799	7,666	211	1,639	2	4

The poor showing of the Nahalma Company is altogether exceptional, being the result of a bad out-break of disease amongst the plants. Efforts are being put forth to exterminate the troublesome insect that causes the mischief, but apparently the immediate future is not very hopeful. The result for Burnside is an experience of a new company, that earned a fair profit for the first eighteen months of its career, and then returns only a minute dividend to its shareholders. The Kelani Valley claims that the diminution in profit was entirely the result of the season, which led to a small crop. It is gratifying to find that this company put a fair sum to reserve in spite of the considerable reduction in its distribution. The companies that fared better than in 1897 have likewise been careful to add to their accumula-

\* Not stated.  
a Balance forward reduced to this extent.  
b Debit balance.  
c For eighteen months.

tions, which seems to point to the conclusion that they have taken warning from the experience of the past, and are no longer content to go skating upon thin ice. If only the same care had been exercised in the past, the last two years might have been faced with comparative ease. As it is, if dividends are increased in the future, some time will be required to efface the remembrance of what has recently occurred.—*Investors' Review*, April 7.

**THE NUWARA ELIYA TEA ESTATES COMPANY, LIMITED.**

Directors.—C. A. W. Cameron, H. St. J. Oscar Thompson, Alexander Thomson, Wharram Meg, ginson; Managing Agents and Secretaries, Frith-Sands & Co., Winchester House, E.C.; Ceylon Agents, Leechman & Co., Colombo.

Report of the Directors to be presented to the third annual general meeting of Shareholders to be held on Monday, the 24th day of April:—

The Directors beg to submit to the Shareholders the Balance Sheet and Profit and Loss Account for the year ending 31st December, 1898.

The Surplus shown is £17,709 17s 10d. from which falls to be deducted Debenture Interest amounting to £1,800, leaving a balance of £15,909 17s 10d. An Interim Dividend, free of Income Tax was paid in October, 1898, of £6,000, being at the rate of 6 per cent. per annum. It is now proposed to pay a final dividend free of Income Tax, at the same rate, making 6 per cent. for the year, which will absorb a further sum of £6,000.

Of the Balance £3,909 17s 10d, it is proposed to add £300 the Sinking Fund, against the premium of £2,162 15s 2d. paid for Leases, bringing the total up to £900. To place the sum of £2,000 to the credit of Estates Purchase Account, including depreciation to 31st December, 1898, and to carry forward the balance of £1,600 of £17s 10d.

The Crop of Tea from the Company's Estates amounted to 1,153,480 lbs. which realised an average nett price of 9 2 1/2d. per lb.

The average Exchange for the year was 1s 4 3/16th d.—against 1s 3 1/2d. in 1897. The cost of production of the Tea crop and placing on Steamer at Colombo was 5 3/4d. per lb. which includes the rent of the Leased lands.

During the year, for the purpose of more economical working, Kenmare Estate has been amalgamated partly with Park and partly with Portwood; Lovers' Leap has been incorporated with Pedro; and Hillside with Concordia. The following Table shows results of the working of the Estates for last year.

Estates.	Acreage in bearing 1898.	Tea Crop.	Average yield per bearing acre.	Nett price realized per lb. Tea.	Profit per bearing acre.	
					£	s d
	Full.	Par-tial.	lbs.	lb.	d.	£ s d
Park	242	22	144,764	548	9 70	11 2 11
Portwood	360	—	175,854	586	8 90	9 7 4
Naseby	125	66	80,096	419	8 27	3 5 1
Pedro	345	104	213,791	479	8 94	7 6 7
Concordia	217	121	184,689	546	10 30	11 6 8
Court Lodge	302	66	155,072	421	9 52	6 19 3
Hetherset	367	25	199,214	508	8 63	7 4 6

1,893 404 1,153,480 501lb 9 2 1/2d £8 7 6

The yield from tea in full bearing was 545 lb. per acre, and from that in partial bearing 292 lb. which the Directors consider highly satisfactory, the weather having been unfavourable for a great part of the season. The disappointing results from Naseby are due to the Estate having suffered more severely from frost than the other properties, thus reducing the crop very consider-

ably, while the re-construction of the Factory seriously interfered, during 9 months of the year, with the manufacture of good tea.

The expenditure on Capital account of £3,790 17s 2d includes the reconstruction of Naseby Factory; building an extension to the Withering House on Pedro; and erecting on different estates 103 new line rooms of a permanent character, besides the necessary cost of Nurseries and supplying new tea.

The present acreage of the Company's Estates is constituted as follows:—

	Acres.	Aeres.
Tea in full bearing ...	1,861	
"    "    leased lands ...	90	
"    partial bearing ...	384	
"    "    leased lands ...	8	
"    not yet in bearing ...	264	

Total land under cultivation with Tea	2,607
Jungle, Patna and Scrub, and Fuel Trees, &c.	440
	<hr/> 3,047

The total acreage under Tea differs by 35 acres from that given in the last Report which is accounted for by the inclusion of acres projected clearings which have not been opened, and by 20 acres of inferior tea land having been planted up with Fuel trees this year.

The thanks of the Company are due to the Colombo Agents for a modification in their scale of charges to the advantage of the Company, which has been accepted by the Directors.

The Directors retiring are Mr. Alexander Thomson and Mr. W. McGginson, who being eligible, offer themselves for re-election.

C. A. W. CAMERON, Chairman.

London, 12th April.

### AGRICULTURE AND THE CONGESTED "EAST INDIANS" OF BURMA.

(By a practical man.)

SIR,—There is in Rangoon, Burma, a large congested population of East Indians (officially termed "Eurasians" although natives and the class themselves invariably use the term "East Indian.") Many are born in Burma, but large numbers come to it from India, mostly from Madras presidency, in search of employment, Burma, to these latter, being a kind of El Dorado until they get to it. They are as a class not physically robust, but in a warm climate are capable of considerable endurance and when judiciously handled are willing enough workers. All of them have at least the usual smattering of education, are intelligent and of more or less European ambitions. The most active and capable I have found to be those from the Madras presidency—mixed European and Tamil or of old Portuguese descent.

These East Indians, from their peculiar position and the force of circumstances, are, nine-tenths of them, in a state bordering a chronic starvation; only the bountifulness of the nature and the cheapness with which body and soul may be held together, keep them from hopeless starvation. They have no trade or profession as a rule, and the majority of them live by odd jobs as clerks, petition-writers and hangers-on at the Customs and wharves where they may find casual work at tallying, &c.

Even among those few who learn a trade, as for instance Engineering, many drift into the mass of hangers-on either because they are outclassed by Europeans (it is not plain why this should be in a tropical country) or because natives can be found to work for less and have no social ambitions.

I have had an almost unique experience of 10 years of these East Indians, having in Burma employed many hundreds of them, watched their characteristics and can therefore estimate their capabilities. They are nobody's children—the Government exercises its paternal solicitude only for the pure native—and in a country where the social conditions are so peculiar these people are allowed to drift outside the pale

of both European and native. Yet from my knowledge of them, I have confidence that given considerate and judicious treatment, were they put to agricultural work, they would do well, and though there might be difficulty at first in getting them to move from their familiar haunts that could be overcome, more easily with the Rangoon East Indians since they, for the most part, have already travelled long distances from their native places. It may seem strange that in Burma, the one province in India where population is wanted, suitable lands of which there are vast unoccupied acres—for such product as coffee, tea, ginger and even cacao—are not taken up. But it is the fact that the Government places all restrictions it can in the way of these lands being taken up by Europeans under the plea and policy of preserving Burma for the Burmans; although the Burman entirely confines himself to growing the rice of the deltas and has not the necessary energy (the Burmese are the most easy-going of races) or intelligence to grow coffee, tea, or any product requiring forethought, skill and patience. Thus the door is practically closed in Burma to other than rice which, from the nature of its growth, will always be in the hands of the native agriculturist. Were the policy of the Government not so, there would indeed be a splendid field in Burma wherein to make the experiment with the congested East Indians. For with European initiative, money and management, I have not personally a doubt but that he would succeed as a worker in a coffee, tea, cacao or ginger plantation and be content with no more remuneration than would be given to imported native labour from India. I have mentioned the two latter (cacao and ginger) because the conditions for their successful cultivation exist in Burma also, although, with the exception of ginger, cacao is quite untried.

It is the custom to generalise the East Indian as a casual and unstable worker and that his innate conceit would stand in the way of his becoming an "agricultural labourer" for long. As to his instability that is more or less forced upon him by his untoward circumstances. He has no feeling of security in his position (he does not know the moment he may be supplanted by a native) and is therefore restless and continually on the look out for something else to do. His conceit is a weakness which would disappear by contact with more manly occupation and in the tropics where nature is dominant, the wooing of her is far less a labor than in austerer climates. It is really in the tropics a passionate instinct which must be latent also in the East Indian were he given the chance to develop it.

A step in this direction has already been taken in Burma by the American Methodist Mission who, owning some land at Thandaung, near Toungoo, some 2,500 feet up in the Pogu Yomahs, have transferred their school for orphan Burman and Eurasian lads there and have planted some 30 acres or so with coffee, the work being entirely done by the lads under the supervision of one of the Mission who has himself a knowledge of agriculture. When the coffee plants are in bearing, the Mission is to be self-supporting. This is excellent and practical work and the Americans are to be congratulated on either hoodwinking or ignoring the Government of Burma in so far that the latter have not yet contested their right to use the land, which they owned before, for this purpose or imposed impossible stipulations as it has hitherto done on planting ventures, so smothering them at their birth.

I have seen with regret and shame this enforced idleness—literally transforming them into vagrants—of many hundreds of intelligent, willing and sober East Indians in a country thinly populated and with rich lands, lying unused and waste, that I cannot but feel there is somehow a serious wrong committed in allowing this to be. It is all very well to say that the Government help those who help themselves and that this class of people are helpless. The artificial social conditions which obtain are the result of our presence and rule and it is under these unnatural conditions that the East Indian has been produced

and made helpless. He is our creation. Yet we have provided no place on the scale for him that is tolerable. We have in fact ignored his self-respect thinking he should be content with the crumbs that fall from his master's table and yet even of these crumbs very few are allowed to come his way. Then we speak of his lack of will and "grit" as if these qualities could survive where there is no room for self-respect. Our English icinces and lack of sympathetic imagination are not only a barrier between the natives and ourselves, they also chill and paralyze the East Indian so that we never get the best out of him. That he is capable of sustained hard work, I have reason to know and that under happier circumstances his little weaknesses would give way to more manly qualities I have little doubt. The cultivation of the soil would bring him back to those natural conditions from which his soul is estranged by a generation of town-lounging and rouse in him the instinct of possession in the land which after all is as much, or should be as much his as, the natives.

The nucleus of a healthy population of East Indians might therefore be formed in Burma, the one province in India so greatly in need of intelligent labor and the only one also where no native population need be ousted as it has vast unoccupied lands where tea and coffee would certainly grow well and such by-products as cacao, ginger, vanilla and almost all kinds of tropical fruits could also be successfully cultivated judging by conditions of soil and climate.

But first of all the inert and self-satisfied Government of Burma must be educated beyond the Civil Service ideas of Government in which it is swathed and the planting class are the men to do that.

R. B.

#### RUBBER: NOTES FROM PARA.

It is estimated that in Amazonas state this year the budget will show a surplus of 10,000,000 milreis (= \$5,460,000 at par of exchange), due chiefly to the extensive trade in rubber which centers at Manaus. An "Export duty of 20 odd per cent. on rubber," says the *Rio News*, "is a mine of wealth for the Amazon states in these times, and is better than coffee or any other product."

Dr. Vicente Miranda, a civil engineer, is writing for *A Provincia do Par * an interesting series of articles on the little known islands of Mexiana and Caviana, which lie beyond the island of Marajo. The length of Mexiana, the smaller, is estimated at 32 miles and the width at 14 miles. The forests along the coasts of these islands, as well as on the margins of innumerable small streams, are declared to be particularly rich in rubber. Navigation around these islands has been discovered only recently to be entirely safe.

The cost of living in Para is very high. Imagine paying 3\$000 (about 50 cents at present exchange) for a pint of milk or 24\$000 (or \$4) for the laundrying of a gentleman's white suit! GRAO PARA, Para, Brazil, March 3, 1899.

#### STILL ANOTHER SOURCE OF RUBBER.

The secretary and managing director of the Musa River Plantation Co., Limited, who are operating at Samarai, New Guinea, writes to the *India Rubber World* that the *Ficus elastica* (the rubber tree of Assam) is indigenous to that part of the island, and that until they see reason to plant a better species—if there is a better one for that region—they will devote their attention to this tree and its product. This enterprise is the result of explorations made by Dr. Cecil Vaughan, an Englishman, who visited New Guinea as early as 1884.

In his "Cantor" lectures of India-rubber, Dr. Morris says of rubber from New Guinea, which lies east of Borneo and is separated by a distance of only 120 miles from the northern-most

point of North Australia. He quotes from various authorities evidence of the existence of rubber on that island. The exports of New Guinea rubber in 1896-97 were estimated at 60,000 pounds, of the value of £7,000. The price quoted in London, July 1, 1898, was 21. 8d. to 2s. 10½d. per pound.

Not long ago Australian newspapers printed news from Cooktown, New Guinea, mentioning that two parties were working for India-rubber near Mambare, also on the coast, pending the arrival of supplies and carriers for use inland.

#### OUR MINERAL WEALTH.

It is quite evident that the great attention now directed to the one mineral of commercial importance hitherto developed in Ceylon, namely plumbago, is likely to lead to investigations in respect of a good many other minerals. At the same time, it is a great shame that the island is still without a Geological and Mineralogical survey to guide enquirers. There are extant a number of many papers referring to isolated districts and explorations, but a systematic reliable enquiry and survey have yet to be realized; and it would be well if Governor Ridgeway saw to the appointment of a competent Geologist, before returning from England.

There are now several Mining Engineers in the island and they are naturally curious about our Mineralogy. Plumbago is, no doubt, the immediate cause of their presence; but it is impossible they should confine their attention or interest to that mineral alone. One gentleman has already been making enquiries as to the means available for fitting up an Assay Office and whether there was any such to be found in Colombo. Our correspondent has been a professional Assayer and Metallurgist for a number of years; and last year he made a trip to Ceylon. He has been chiefly engaged since, in the south of the island, and has discovered, *inter alia*, that many of our conglomerates carry gold, and he has also—while reporting on plumbago—sampled a number of rocks containing gold, as well as some others of the rarer metals. Of course, it is true that gold is about the most widely disseminated of all metals and traces of it in Ceylon have been found again and again, both in the hill and low country; while the native names of several villages and districts indicate where the Sinhalese have, from time immemorial, found the precious metal. Ruanwella, Rangala, Ramboda, to name only three, are points widely apart—west, north and south of Kandy; but a good deal of "washing," "blasting" and mining in the early "eighties"—when coffee was expiring—gave no payable or satisfactory results. It is quite possible, however, that we had not the needful scientific or practical knowledge to direct these experiments; and that the time is approaching when we may see other mineral industries, besides that in plumbago and the native digging for gems (recently supplemented by a European experiment with a patent gem-separating machine), established in our midst. The Mining Engineer and Assayer, whom we have already quoted, thinks he has discovered a mineral-bearing zone crossing the island, and he has already secured evidences of thirty metals existing

within that zone. He mentions "Wolfram"—Tungstun metal—as one which is valuable and ought to be developed. All this is very interesting, although merely indicative of how much we have yet to learn of the Mineralogy as well as Geology of Ceylon.

Has any one of our Mining Engineers exploring from the Kalutara district into the Province of Sabaragamuwa come across large deposits of iron ore? We ask, because Dr. Gyfax's "fifteen miles" of iron ore of a very pure quality in Sabaragamuwa or its neighbourhood,—reported over fifty years ago—has to be rediscovered; and we were assured a few years ago in London that if it existed anywhere near the Kaluganga, it would at once command the attention of English capitalists in the iron ore trade. In connection with the required Geological Survey of Ceylon, the following paragraph from a London daily is both interesting and significant:—

"For more than a year now the Egyptian Government has been carrying on an important geological survey in the mountains along by the Red Sea and in the Sinai Peninsula. English geologists are engaged in the work, and their duty is to investigate the mineral possibilities of the country, report on matters of archaeological interests, draw new maps, &c. The places they explore have not, in some cases, been visited for perhaps 2,000 years, and they are finding many evidences of mineral wealth, including old emerald mines."

Now, if "English geologists" can be got to do the work of the Egyptian Government, surely Sir West. Ridgeway need have no difficulty in securing a competent man to begin the Geological Survey of Ceylon?

### STOCK BREEDING AT DELFT.

#### HISTORY AND PROGRESS OF THE EXPERIMENT.

##### INTERVIEW WITH DR. G. W. STURGESS.

In view of the approaching departure on leave of Dr. G. W. Sturgess, the well-known Government Veterinary Surgeon, and the interest that is naturally excited by the Government scheme of

##### STOCK-BREEDING IN THE NORTH,

we were kindly afforded an interview with the gentleman mentioned, who shares with Mr. Ievers, of the Northern Province, the responsibility for the success of the work at Delft as at present carried on.

After we had asked a few preliminary questions, Dr. Sturgess expressed his readiness to tell in its sequence the story of the experiment. His narrative included the answers to our interrogatory remarks and dealt with the subject with such fulness that little further questioning was wanted. Hence we shall quote the Doctor's words without material alteration.

"At the beginning of the century there was at Delft a breed of ponies which supplied the native cavalry in some degree. This breed has since been

##### CONTINUALLY DETERIORATING,

and, not receiving proper attention and care, the ponies dwindled down until at length they reached their present small size. There used originally to be a very large establishment, —a resident's bungalow, compound and court-house, and a regular breeding system was

carried on. But for some reason or other these were allowed to run down, until the ponies were gradually crushed out of the grazing grounds by cattle and at last had very great difficulty in getting nourishment. Since then it has been the custom to run across to Delft once or twice a year, catch a few ponies and sell them at Jaffna.

"When Mr. Ievers was appointed Government Agent for the Northern Province, he took note of the then existing state of things, and said that the best things to do—the only humane alternatives—in fact—would be either to

##### AMELIORATE THEIR LOT

or to do away with the thing altogether. That was how the interest came to be taken in the matter. Mr. Ievers decided to try and improve them, seeing that they were very useful ponies. Mrs. Ievers took as much interest as her husband—possibly, indeed, even more—in the proposed step.

"There were 60 or 70 mares on the island. From these we weeded out the least suitable and sold them, and the others we branded with a regular series of a numbers and entered in a stock-book. The Delft stallions were removed, and

##### AN ARAB WAS PURCHASED

and placed on the island so that now the stud comprises 60 mares, and one stallion "Ræburn."

"During the first year or two there were considerable losses amongst the young stock, especially among the foals. And very great difficulty was experienced in finding out the cause to which these losses were due. The discovery of that was important because it depended upon the kind of stock one reared whether the experiment was to be a success or not. It has been found that the principal

##### CAUSE OF DEATH

amongst the young foals is the great general debility and blood disease due to the ravages of ticks. If this can be prevented of course it will materially add to the success of the breed. There is every reason to hope that it will.

"At the close of the year the young yearlings are removed to another island,

##### IRENETIVU

where there is better pasture—about 30 miles away. About ten or twelve are taken at the end of every year. On Irenetivu there are now 33 young horses, colts and fillies, all fit and well and very nice ponies indeed.

"When I was there this year we took about 12 fresh ones and put them on the island. Thirteen of the big colts now on Irenetivu have been operated upon and will be ready for sale in about two years. These will be the first, but there are several other colts by "Ræburn" which look like making very good little horses.

In connection with "Ræburn" it may be mentioned that two foals by this sire have been racing at home this year. QUEEN OF THE ISLES, a filly, ran last month in the Ashley Plate at Newmarket, and RAMELTON LASSIE, a colt, in the Newmarket Biennial Stakes a day or two later,—though both went without success.

"It is a mistaken idea to suppose that the Delft ponies are really the little animal that is seen about the country.

## THE REAL DELFT PONY

is more like a little Arab, the improved ones being especially so. That there has been a considerable improvement in the breed is shown by the fact that the average price at the sales in Jaffna has gone up from R60 to R150. None, however, of the Delft colts by Raeburn have been sold yet.

## THE PASTURE

on Irenetivu is excellent, the grass (*doub*) being up to the ankles. Irenetivu is a much smaller island than Delft, being only two or three miles across. The land on Irenetivu moreover, is entirely open. The ponies are quite quiet, and if any of them have to undergo treatment they are driven into a kraal and dealt with. They are by no means hard to manage.

"All the foals are branded, and the dates of this, and of their birth are entered in the stud-book kept for the purpose—so that the ages of all are known. It is to be hoped there will be a few for sale in a year, or a year and a half. If anyone wishes to obtain a Delft pony they should apply in good time to Mr. Levers who will send one, or give them the offer of one, as soon as he has them for sale. They are very useful little animals for travelling and for driving."

"Not for racing?" we enquired. "Oh no! they were never intended to be used as race-horses."

"It is a pity," Dr. Sturgess went on, "that these ponies should have been neglected, and left to keep themselves alive under such hard conditions as they have hitherto endured. The present Government Agent's idea was either to ameliorate their lot or to do away with them altogether. Seeing that they have responded so readily to a little care, it was found worthwhile to go on with the experiment. The island of Delft and its cattle and horses have always been Government property, but the latter were formerly left to live as best they could. The Delft horses were running about promiscuously without any attempt at selection, or anything else to improve the breed; and liberty was given them to roam over the whole island. Nothing was ever done except to catch a few occasionally and take them to Jaffna, where they were sold and the proceeds added to the Government revenue."

Asked as to

## THE SIZE OF DELFT

Dr. Sturgess said it was about 12 miles long, by about two broad. The island, too, was traversed along the middle by one dividing wall, which in turn was crossed by parallel walls across the breadth of the island, thus forming a number of enclosures of which 60 or 70 acres are devoted to the horse-rearing. Delft is about 30 miles from the mainland at the nearest point, and the passage across in a dhoney, said Dr. Sturgess, "takes five or six hours when the weather is favourable, but on rougher occasions it has taken me as much as twenty-fours and more." There are very few trees on the island, which is mostly covered with the thick *doub* grass, its growth being especially rich towards the centre of the isle.

In conclusion we asked if any Delft stallions would be introduced into studs in the pro-

vinces as in the case of cattle. To this Dr. Sturgess replied that at present there was no intention of doing so, and he thought it unlikely that Government would ever take that step.

## CATTLE BREEDING AT DELFT.

Before leaving and thereby bringing to a close a very pleasant interview, we were favoured with further information respecting similar measures that were being taken to improve the Delft breed of cattle.

"There have been" said the Government Surgeon, "several ideas mooted with reference to the improvement of Delft cattle. One suggestion I made was the establishment of stud bulls at each Kachcheri in the island."

Here Dr. Sturgess looked up the Administration Report for 1897 in which his suggestion had appeared. There it was stated that "good bulls, suitable for native cows, which might be obtained from the Government dairy, should be kept, one at each Kachcheri, in charge of some person appointed by the Government Agent; probably the Kachcheri Mudaliyar would take charge and interest himself in the matter. The cows served should be subject to his approval, as being cows that were likely to breed strong healthy stock. Some encouragement might also be given to breeders to rear the offspring properly, and this might well take the form of a small money prize once a year—for the best-reared one-year-old animal of each sex."

"This was in 1897, and I drew up a number of rules to be observed in keeping the bull, and having reference also to the cows that he was to be allowed to serve. A small fee for each cow would cover the cost of keeping a cow. These rules are now under consideration. Another suggestion was that instead of holding a sale of the calves bred at the Government Dairy in Colombo, they should be sent to outstations for sale. Kurunegala was the first place selected, as it was easy of access. But owing to the outbreak of the pest, it was not thought advisable to send them. Next, they were sent to Galle.

"That was in March, and there (at Galle) they were a success. They averaged R58 at each sale, six being sent. They will hereafter be sent to other Kachcheris—some, indeed, are going to the Northern Province this year. There will, however, be

## A SALE IN COLOMBO

on the 15th of this month—at the Government Dairy. By one or other of the means above suggested, it is hoped to provide some really good cattle for the island."

In every way the Government Agent for the Northern Province and the Government Veterinary Surgeon deserve the greatest credit for the care and attention with which the stock breeding experiments are being carried on under their auspices. Dr. Sturgess leaves Ceylon this day week by the P. & O. ss. "Australia," by which steamer he will be making his first trip home for a holiday since his arrival in Ceylon five years ago. The period of his present leave is three months.

"About your 4th or 5th (Delft) visit from now, I suppose you will be journeying

## TO JAFFNA BY RAIL?"

we remarked in rising to depart.

"I'm sure I hope so," said the Doctor. "But it will be an awfully monotonous journey, will it not?" "No doubt, but being no sailor anything is better than that trip by steamer; beside it the dhoney crossing is comparatively pleasant. However, both these must be repeated a few times before the Northern Railway is ready. I shall be returning here in time for my annual second visit to Delft before the end of the year."

---

FACILITIES FOR MAKING GOOD  
TEA:—IV.

We purpose dealing today with three replies to our circular, which reached us some time ago, from Nawalapitiya and Dolosbage. On the subject of drawbacks to making better tea than the average now turned out in the district, one correspondent knows of no drawback, as finer plucking than ever before now obtains, and has resulted in the outturn of better teas. A second, whose experience has evidently not been so progressive demands finer plucking, and more withering accommodation, especially where leaf is bought for manufacture; and in this he is supported by the third, who holds bad plucking, and bad withering (especially between 15th March and 30th June approximately) when leaf comes in with a rush, as responsible for much; while he also mentions scanty supervision. As regards jât, one report considers it good, as a whole—a good hybrid with some indigenous—saving perhaps, about 500 acres in little patches which are inferior China. "Generally good," says the second, while the third declares jât very poor on some estates, and on many no more than fair; only portions of a few estates being planted with good indigenous. The verdict on soil, too, similarly varies—from poor generally, to about an equal division of land suitable for tea, and poor chena and patna which, perhaps, had better have been left alone. Another classes one-half as poor worn-out soil which once grew coffee, and the other half very fair soil. On virgin land tea continues to flourish, and promises to be a permanency; while worn-out places must have been worked at a loss, or scarcely gave any profit, when low prices ruled. On the effect of Manuring in improving the tea, all three correspondents are agreed; but while one holds that, to be profitable, it must be carried on regularly in alternate years to prevent a falling-off of the bushes; the other two question the remunerativeness of manuring except on good land, which would respond readily to treatment. We can quite understand that there must be a certain extent of land past mending, except at a prohibitive cost; but is there not a tendency to help on the really good fields—perhaps to force them on unduly—and to plead the smallness of profits against expenditure on backward fields which nevertheless, might respond to regular cultivation? If it is not so, perhaps it is the way some writers put it which causes misapprehension—as when they say, manuring would be desirable, but prices are against its profitable adoption.

Most factories are considered fully equipped; but with the important reservation that more withering room is needed during wet weather and when there is a rush of leaf. How can tea be even in quality if the withering is imperfect at certain seasons? But then there is "a good time coming" (according to engineers now experimenting with a patent machine) when the process of withering may be dispensed with! The 'patent' has, however, yet to be practically proved. In machinery, there seems to be no deficiency, except in a few places which adhere to primitive methods. The consensus of opinion as regards a sufficiency, and even a superabundance, of labour, is most striking, after years of grumbling, and heavy advances, and fear of scarcity. Already there would appear to be a turn in the tide; for what with the reaction after the drought, and the South India cooly crippling scare, Planters in some districts have begun to be uneasy. Severe pruning is still an evil, and its practice on worn-out estates to induce flush, is justly condemned; but its day is rapidly passing away. Generally, both rainfall and soil are suitable for tea, and the District should be able to hold its own if only the patches which should never have been planted up, be abandoned; but it cannot be expected that the tea produced should be of the flavour and class of the higher growths. Such is the general verdict and we see no reason why Ambagamuwa and Dolosbage should not maintain a fair reputation for good medium tea and yield satisfactory returns to the prudent, observant planter.

---

NOTES OF A TRIP TO PUTTALAM.

(By a planter.)

What an unbroken stretch of

SPLENDID COCONUT PLANTATIONS

one passes through between Toppu and Madampe. It is such as delights the heart and pleases the eye of the coconut planter. The soil is a red, friable, sandy loam, which seems peculiar to this part of the country. The trees are all bearing splendidly and the branches are borne down with the heavily-bearing bunches. Drooping branches are a peculiarity of the trees here and have been a subject of adverse comment. But drooping branches are one thing and bunches which are almost broken and limp against the trunk are another. The one is a peculiarity; the other a sign of inherent, constitutional weakness. I have a theory as to this peculiarity in the growth of the coconut tree and to the yellowish color of the fronds. I have an idea that although the color of the soil betokens the presence of iron in it, it is either poor in iron or has iron in a not readily available or injurious form. Iron plays as important a part in vegetable as in animal physiology. The green coloring matter of leaves is regulated by the available supply of iron or of iron in a non-injurious form. I had an opportunity not very long ago of observing coconut trees grow on a cabook soil with plenty of available iron in it and was struck by the dark green color of the leaves and of the vigorous growth of the trees.

It may surprise some people unacquainted with this splendid coconut district to be told that the average price of an acre of bearing coconuts is R1,000, and that an acre of good coconuts with a favorable situation and in heavy bearing fetches R1,250 and even more. After this to be told that what is a stranger here will not be surprising. One sees signs of comfort and even affluence along the whole route. Large, substantial houses that would do credit to a township are met with, upstairs houses are not uncommon, and the houses that are being now built are being roofed with Mangalore tiles. In what other district in the island can this be exceeded or even equalled. Add to this that the land-holders move about in gaily painted travelling carts of a kind peculiar to this part of the district and with splendid trotting bulls and the picture of affluence is complete. A word of description of the carts. They have very light frames for the bodies and are covered over with cadjans. The standards of the sides are painted with blue and red alternately. The wheels and the pole are of bright red, and the inside is lined two or three feet high with oil-cloth cushions.

#### RUBBER FROM YEAR-OLD TREES.

The most interesting point under discussion in relation to rubber planting in the British West Indies is a series of experiments now being carried on in London and Trinidad, by which it is proposed to secure rubber from year-old trees of the *Castilloa elastica*. It has been found that seed sown broadcast over a prepared field will yield an abundant crop of young trees, which at about a year old can be cut and sent to a factory where, with ordinary machinery operating a simple process, eight per cent of fine rubber can be extracted from the young shoots. This can be done in the laboratory. It is claimed that the process is a simple one, that but little machinery is necessary, and that in future the world's rubber supply will be secured from an annual crop of young trees sown on cultivated estates, and not from remote forests as at present. A series of experiments has shown that the young tree contains about eight per cent of rubber, which would at present prices return an estimated profit of 200 dollars to 400 dollars per acre. The extraction of rubber from young shoots has been accomplished chemically in the laboratory, but whether it can be applied to the economic production of rubber on a large scale remains to be seen.—From *Q. A. Journal* for April.

#### PLANTING NOTES.

**LIQUID AIR AS AN EXPLOSIVE.**—The Technical Committee of the Austrian War Office have made experiments in a quarry with liquid air as an explosive. The results are stated to be extraordinary.—*British and Colonial Druggist*, April 21.

**STOCK-BREEDING AT DELFT.**—The interview reported elsewhere shows how greatly indebted the Colony is to the Government Agent of the Northern Province for the special interest taken in what Dr. Sturgess now regards as a successful enterprise. There is no doubt great room for the improvement of "stock"—cattle especially—in every province of the island, and we trust the day is not far distant when systematic attention will be generally given to the matter.

**VENESTA TEA CHESTS.**—Mr. Penny, of Venesta fame, has returned from a trip to Assam and after a visit to the Kelani Valley, he purposed leaving for Europe about the 17th ultimo. He has shown us an improved "Venesta," the obnoxious clamps being superseded in a way that enables the chest to be easily opened and closed again. There are also improvements in respect of the rivetting along the sides. Certainly the "Venesta" we inspected looked a very neat, desirable tea chest.

"THE AGRICULTURAL GAZETTE" of New South Wales. Volume X. Part 4. Contents for April 1899:—An Ostrich Farm in Embryo; Bees and How to Manage Them; Cultivation of Onions and Rape in the United States; The Grain Drill and Horse Hoe; Some Edible Trees and Shrubs of the West Bogan; Insect Pests; The Mutton Export Trade; The Effects of Sorghum; Native Food Plants, Part II; Dairy Bacteriology; Pigs at the Hawkesbury Agricultural College; Bee Calendar; Farm Notes; Orchard Notes; Practical Vegetable and Flower Growing; General Notes; Replies to Correspondents; Lists of Shows; Label for Specimens.

**THE FUTURE PLANTER.**—Should the European tropical agriculturist receive any preliminary grounding in the first principles of agriculture previous to his setting sail for the scene of his future operations? This is a question which, by keeping continually cropping up, points to its significance. The question: what class of men produce the best planter? may be entirely set aside. Given a good constitution and a fair education, and sufficiently civilized to possess an average conscience, with will power strong enough in the majority of emergencies to pay due heed to its promptings, is the sort of average man most likely to make a successful planter.—*Indian Planters' Gazette*, April 22.

**PLUMBAGO MINING AND THE VOGAN TEA CO.**—In connection with the letter on this subject appearing on page 797 we may further add that we learn the Morgan Crucible Co. have absolutely and unconditionally withdrawn the offer they made for the mining rights of the Vogan Tea Co. The latter might indeed consider themselves fortunate if such an offer were renewed. It was apparently made to them to help the Directors out of a hole, the object of the Morgan Crucible Co. being to encourage plumbago mining in every way possible. As they are the largest consumers of plumbago in the world, it is but natural they should wish to go in for *bona fide* mining themselves, not "Company-mongering" as we understand a Vogan shareholder politely suggested.

**FRUIT FROM THE CAPE.**—The officials of the Union Steamship Company inform us of the arrival of the ships "Hawarden Castle" and "German." The former brought 725 boxes of Grapes, 7 of Plums, and 36 of Quinces; total, 768 boxes. The Grapes were all rather wet, and realized low prices; some were altogether poor and bad, and sold for a nominal figure. The Quinces arrived in good condition, but no market could be found for them, so they were sold to private individuals. The Plums were small, and in good condition, realising fair prices. The "German" brought 420 boxes of Grapes and 107 of these were placed on the market, 40 boxes realising fair prices, being in good condition; 67 boxes were very bad, and sold for a mere nothing; 303 boxes were consigned to private individuals.—*Ibid.*

UNITED PLANTERS' ASSOCIATION OF THE FEDERATED MALAY STATES.

From the report of this Association for 1898-99 we take the following:—

**EXPERIMENTAL GARDENS.**—This matter has had attention, but only lately has sufficient information become available to enable your Committee to pursue this subject. They are now advocating the formation of an Agricultural Department for the benefit of the Federated Malay States.

**THE RATES OF PAY IN P W D SELANGOR AND COST OF IMPORTING IMMIGRANTS BY THE PERAK STATE RAILWAY** have been the subject of correspondence during the 14 months under review. It cannot fail to be a matter of congratulation to the members of this Association, that the State Railway Department, Perak, and the State of Negri Sembilan have imported labour for their requirements, and the results have in both instances been reported as satisfactory. Your outgoing Committee call your attention to the desirability of this Association continuing to press upon the various Governments and Sanitary Boards the urgency and equity of their importing labour in proportion to their public works requirements.

**SCHEMES FOR RAISING THE STANDARD OF MALAY PLANTATION COFFEE.**—This matter has received close attention during the year. No authentic data of large quantities of coffee produced elsewhere, of the Liberian variety, having fetched higher prices have become available to your Committee. There appears to be little doubt that the flavour of well matured Malay Peninsula Coffee entitles it to a front rank, and that the development of a demand for it will have to be a matter for individual enterprise, much having already been done and is being done to this end.

**THE CHEAP TICKET SYSTEM.**—It is a matter for congratulation, that this system has been extended for another 12 months, and it is to be hoped that it will be availed of by the planters and the Government to increase the labour supply. The system has proved simple, efficient, and satisfactory, more particularly towards the end of 1898, since when it was better understood, and the thanks of many members of this Association are due to Dr. Hardaker, the Emigration agent at Negapatam, for the trouble he has taken to explain to many immigrants and emigrants how they can comply with all regulations and yet be entirely free in their coming and going.

The thanks of the Planting Community are due to the High Commissioner, the Resident-General, and the Residents for the system of free immigration now prevailing in the Federated Malay States, alike to the advantage of employers and employed, and which may be said now to be working satisfactorily.

MINOR PRODUCTS REPORT.

**CINCHONA.**—In auction good Huanoco crown bark, sound, sold at 7d to 11d per lb; good Loxa 10d; damages 7d and 8d; Huanoco and Loxa, part mixed 6d to 7d; and thin Guayaquil 4d to 6d for hold. The stock in first hand on April 12th in Amsterdam, consisted of 2,433 packages Government and 3,741 packages private bark, including the quantity which will be offered in the next auctions, viz., 1,272 packages druggist's bark, 3,364 manufacturing and 3 East Indian.

The arrivals in Amsterdam from Java last week amounted to 992 packages. As indicating the spirit with which Java March shipments are regarded in Amsterdam, we note that a leading broker there remarks:—"The Java planters should profit by their recent experience, and remember that, while with a little management the value of their product will increase considerably, injudicious shipments of bark are bound to cause a slump in the market."

**COCA LEAVES.**—Broken Truxillo sold without reserve at 9d, another lot at 10d and Ceylon at 6d per lb. Privately Huanocos are scarce, and 1s 4d per lb. is wanted.

**CROTON SEED.**—Fair bright Ceylon sold at 55s to 56s, subject.

**VANILLA.**—Only a small supply was offered, consisting of Seychelles, Mauritius, and Tahiti beans, and the rates paid for fine beans were 1s to 2s dearer. The following prices were paid:—Seychelles: fine bold beans, 8 to 8½ inch 25s to 27s 6d; 7 to 7½ inch 23s to 24s; 6 to 6½ inch 21s to 22s 6d; 5 to 5½ inch 17s to 21s 6d and various sizes, slightly mouldy, 8s to 8s 3d. Mauritius: 8 to 8½ inch 23s; 7½ to 8 inch, 25s to 26s; 7 to 7½ inch, 24s to 24s 6d; 6 to 6½ inch, 23s to 24s; 5 to 5½ inch, 23s; and 3½ to 5 inch, 23s. Tahiti were practically all bought in.—*Chemist and Druggist*, April 15.

INDUSTRIES IN THE EASTERN PROVINCE.

(1) The manufacture of cloth is an old industry in this district, but the cotton from which it is made is all imported now, instead of being locally grown as before. The usual kind made for trade is the ordinary "comboy" in all sizes and colours, and is much sought after for its strength and lasting qualities. A ready market is found for it at Colombo, Galle, and some upcountry towns. I find there are in the villages of Koddaimunai, Kodaikkallar, Kattankudi, and Palamunai, over 500 compounds or gardens, each containing from four to twelve looms. The industry is deserving of some encouragement by the reduction of duty on imported cotton thread, as the staple article is very little grown in Ceylon now.

(2) Fish-curing.—Some encouragement has been given to this industry by the sale of salt for curing purposes at the reduced rate of a rupee a hundred-weight. Annexed is a return of the quantity of fish caught and cured along the five miles of coast in the neighbourhood of Kalkuda, where the experiment is tried. It is yet too early to judge of results, but the concession is already attracting more fishermen to that locality; and there is some difficulty in settling conflicting claims to fishing rights.

I have not yet succeeded in inducing some one to try the tinning process. Perhaps the want of experience and knowledge is the chief difficulty, but this could easily be overcome by engaging the services of a trained curer for a short time until local men picked up the work.

Statement of fish cured in Kalkuda, Punnaikkuda, and Pasikkuda, for shipment to outstations, during the year 1898, out of salt issued at R1 per cwt.

Name of Company	Quantity cured.

(3) The paddy-husking industry carried on at the new factory gives every promise of success. All the rice is sent upcountry, and so great is the demand that it is contemplated to enlarge the premises and add new machinery with a view of increasing the supply. The original intention was to husk local paddy only but the sharp rise in prices in unfavourable seasons has induced the manager to turn to other countries for his supplies. When local crops are good and prices low, he will buy up all that is available, but when the reverse is the case foreign paddy is to be imported. With easy and cheap sea transport, the Batticaloa Mill should receive support from all the paddy-growing districts along the sea-coast. Hambantota has set the example by sending 800 bushels of paddy, which was pronounced excellent, being large in grain and easily husked. It was grown in fields under the Walawe Irrigation Works.

(4) PADDY CULTIVATION IN BINTENNA.—As already stated endeavours are being made to induce the scattered Sinhalese population of this district to take up paddy cultivation more than they have hitherto

done. With this object in view, three village tanks were constructed some years ago by Government, and a fourth—the old abandoned one of Tampichchiya—is now being surveyed with the object of having it restored. Mr. West's attempt to centralise the Veddah population in a part of Bintenna will also be of much service towards this object, for as soon as they show any inclination to settle down to fixed occupation a tank and lands will be given to them to work upon, and no doubt the example will be followed by others.

(Signed) C. A. MURRAY, Acting Govt. Agent.  
Batticaloa, February 27, 1899.

### THE SOUTH WANARAJAH TEA ESTATES, LIMITED.

The annual general meeting of the shareholders of the South Wanarajah Tea Estates, Limited, was held at the offices of the company, 30, Mining Lane, E.C., on Thursday, the 13th inst.

The chair was occupied by Mr. M. P. Evans. The Secretary having read the notice convening the meeting, the CHAIRMAN said: The report and balance sheet have been duly circulated, and I trust you have found them not only satisfactory, but clear in all respects. I presume you will take them as read, but before moving their adoption I will endeavour to give you some information as to the business of the company during the past twelve months, which, I am able to say, has been fairly prosperous, notwithstanding an adverse commencement. At our meeting last year I mentioned that we were suffering from a depressed tea market, and that the price of Ceylon tea had fallen to the lowest point ever recorded; this state of things continued until August, when a recovery took place in the market value of all kinds of tea, which still, I am glad to say, continues; the common and medium kinds being at present about 2d to 3d per pound above the lowest prices previously ruling. The finer kinds have also participated in the advance, but not to the same extent. When prices began to rise a large portion of our crop was fortunately unsold, and we were thus enabled to take advantage of the more healthy condition of the market. The crops, as estimated for the year, were 445,000 lb of tea, and the actual amount sold was 444,384 lb, including about 60,000 lb of bought leaf. The gross selling price has averaged 6 81d per lb, as against 6 51d per lb last year. As regards future crops, it must be borne in mind that we have 64 acres of young tea yet to come to maturity, and also that much of the older tea has been plucked sparingly, in order to get it well established; and it is very satisfactory to notice that our managing director advises that the estates are in good order, and the bushes in good heart, so we may, in the natural course, expect an increase of crop during the next two years, with a corresponding decrease in the cost of production. Contrary to expectation, the rate of exchange has been nearly 3d higher than last year—the average rate for our bills being 1s 4 17d per rupee. A small loss in our rice accounts last year has been changed into a small profit for this year, and to date this account continues to show a profit, but the fresh outbreak of plague in Calcutta having placed that port in quarantine, it is possible that prices of rice may rule higher for a time. The sum outstanding for advances to coolies has been reduced by £200 this year, and the amounts now out under this heading are small, and all the ad-

vances are recoverable and considered safe. You will have seen by the report that the Blackburn Factory has been completed, the total cost being £1910, as against the managing director's estimate of £2,000. The most recent type of machinery has been supplied, and by latest reports everything was working satisfactorily. You will also notice the special expenditure of £650 for the purchase of the field of tea adjoining the above factory, which was fully referred to in our last year's report. The rest of our outlay on capital account does not exceed £350, which money has been spent on the up-keep of non-bearing land, and erection of new coolie lines, &c. By looking at the report you will find that we are enabled to write off £2.0 for depreciation, and a further £200 from the preliminary expenses, carrying the small balance to reserve after providing for the dividend, bringing the reserve up to £220, which we see every prospect of adding to considerably by the present season's trading. Our teas are selling at satisfactory rates, and in connection with the future of the Ceylon tea industry it is encouraging to notice the greatly increased demand for the tea from the colonies and specially from Russia, to which country have been shipped from Ceylon direct during the past twelve months 2,714,000 lb., against 439,350 lb., the corresponding period of the previous year, and the shipments from London to Russia during last year were 6,675,087 lb., against 6,272,596 lb. in 1897. I now beg to move that the report and statement of accounts for the year ending December 31st, 1898, now presented, be received and adopted, and that the dividend of 5 per cent. per annum be paid on the ordinary shares of the Company registered on the 4th inst, the same to be paid on and after the 15th inst.

The motion was then seconded by Mr. H. A. Hancock.

Mr. Chapman called attention to the balance of the amount for preliminary expenses, and in reply the Chairman stated this would be charged in the current year's account.

The Chairman then put the motion for the adoption of the report and the payment of the dividend of 5 per cent on the ordinary shares, which was carried unanimously.

On the motion of Mr. Evans, seconded by Mr. Dunn, Mr. Hancock was re-elected to a seat on the board.

On the proposal of Mr. Chapman, seconded by Mr. Alexander, Messrs. Fuller, Wise, and Fisher were reappointed auditors.

The Chairman moved a vote of thanks to Mr. Tatham, the managing director, and the staff abroad, for their services during the past year, which was seconded by Mr. Lawrence, who spoke in complimentary terms of work performed abroad, and adopted unanimously.

The proceedings closed with a vote of thanks to the Chairman.—*H. & C. Mail*, April 21,

THE QUININE SPECULATION has been going the wrong way for speculators this past week, says *Chemist and Druggist* of April 22, as the Java bark shipments are good.

GEMSBOK AND OSTRICHES are so numerous in Bushmanland at present that farmers and others are complaining of the damage done by them to veld and water, where it has rained. That they have multiplied and increased at a marvellous rate within the last few years is a fact generally recognised.

COCONUT PLANTING.

Mr. J. J. O'Dowd, of Batticaloa, speaks very favourably of the coconut planting enterprise in Tirukovil, in which several capitalists have recently invested. Mr. Carey will, it is said, shortly go in for some more acres of the reserves of the well-known Ouchterlony group of estates. Mr. Troller, who arrived at Batticaloa last week by steamer, will be stationed at Tirukovil, as the superintendent of Mr. R. H. S. Scott's plantations.—*Cor.*

POONAGALLA VALLEY CEYLON COMPANY, LIMITED.

REPORT OF THE BOARD OF DIRECTORS.—Presented to the Shareholders at their Third Annual Ordinary Meeting, to be held at the Office of the Company, 16, Philpot Lane, London, E.C., on Tuesday, the 2nd May.

The Directors have the pleasure to submit to the Shareholders the Report and Accounts of the Company for the year ending 31st December, 1898.

The net profit for the year after providing for Debenture Interest and other charges, amounts to £820 2s 1d, which, with £44 3s 2d brought forward from last account, gives £864 11s 3d to be dealt with, and this it is proposed to appropriate as follows:—

Amount as above...	£	s.	d.
	864	11	3
Dividend of 4 per cent. (free of Income Tax) for the year, absorbing	700	0	0

Leaving a balance to carry forward of £164 11 3

The total Tea Crop secured amounted to 261,164 lb. male Tea, against an estimate of 270,000 lb., showing a shortfall of 8,836 lb. but compared with 1897 there is an excess of 2,962 lb.

The following figures afford further comparison between the season now closed and the preceding year.

	1898.	1897.
Total Tea Crop secured	261,164 lb	258,262 lb.
Total Coffee Crop secured (parchment)	724 bushels	153½ bushels
Average Price realised for Tea	8-182d per lb.	7-579d per lb.
Average rate of Exchange	1s 4 9-32d	1s 3 37-64d

The Directors have to record with much regret the death of Mr. James Bisset, who has been the Manager of the Estates since the Company was inaugurated. The vacancy thus caused has been filled, on the strong recommendation of their adviser in Ceylon, by the appointment of Mr. R. G. Coombe, lately of Chrystlers Farm Estate, and the Board feel confident, from what they know, and have heard, of that gentleman, that the appointment will prove to be a satisfactory one in every way.

For the more advantageous working of the Estates your Directors decided to make the Factory at Poonagalla a Central one for dealing with the total crop, and extensive additions have been, and are being, carried out, which will make the Factory there practically a new one capable of dealing with 400,000 lb. of Tea.

The position of the Factory close to the new Kitulkelle Road and Bridge, which are being constructed by the Government, with the assistance of assessments from the seven adjoining Estates, will effect an appreciable saving in Transport Charges, and this saving will be further increased by the reduction now accorded in Railway Rates.

In accordance with the Articles of Association Mr. R. Porter retires from the Board, and, being ligible, offers himself for re-election.

Messrs. Cape and Dagleish, C.A., also offer themselves for re-election as Auditors for the current year.

By Order of the Board, LYALL, ANDERSON & Co., Agents and Secretaries.  
16, Philpot Lane, London, E.C.  
20th April, 1899.

IMPERIAL CEYLON TEA ESTATES, LTD.

REPORT OF THE DIRECTORS.

To be submitted at the annual ordinary general meeting of Shareholders, to be held at the Company's offices, 9, Fenchurch Avenue, London, E.C., on Wednesday, the 26th April, 1899, at 11-30 a.m.

The Directors now beg to submit the balance sheet and profit and loss account for the year ending 31st December, 1898.

The nett profit, after payment of Debenture and other interest for the year, amounts to ... ..	£3,955 2 5
To which has to be added the balance brought forward from 1897 ...	123 2 1
	<hr/>
	£4,078 4 6

This the Directors propose to deal with as follows:—

- (1) In writing off balance of preliminary expenses... .. £136 0 0
- (2) In writing off from cost of properties as depreciation of Machinery &c. ... .. 300 0 0
- (3) In payment of a dividend of 4 per cent (free of income tax) on the paid-up share capital of the Company...3,600 0 0
- (4) In carrying forward to next year the balance of .. .. 42 4 6

The following Table gives the Acreage and Results of the Tea Estates for the year:—

Estate.	Acreage in bearing		Tea Crop. lb.	Cost per lb. in cents (including manuring)	Nett Price realised per lb. in pence.	Profit.	
	Full.	Partial.				£	s. d.
Binoya	441	—	169,151	31.80	6.74	1,081	2 4
Edinburgh	306	39	168,439	27.55	7.47	2,602	9 2
Friedland	158	3	60,685	28.59	7.18	629	0 7
Mottingham	212	—	102,368	29.98	6.27	531	18 0
St. Vigeans	185	—	68,713	29.42	7.54	814	10 5
	1,302	42	569,356	29.59	7.01	5,659	0 6

Although the weather during the year was unfavourable, the total crops secured exceeded those of the previous year. The only estate showing a falling off in yield was Binoya, but the very satisfactory prices secured for these teas, having regard to the Tea Market and to the situation of the property, in a measure compensate for the short yield, and consequent higher cost of production. The Edinburgh teas were made at a disadvantage in the old factory throughout the year, the new factory only being completed in time to deal with the 1899 crop.

The capital expenditure on tea clearings was incurred in respect to 260 acres not yielding crop and in planting 85 acres new land on Edinburgh and Binoya Estates. The outlay on new buildings and machinery principally represents the cost of providing Edinburgh with a new factory and water-power installation capable of dealing with the steadily increasing crops from this property.

The proceeds of the Nonpareil crop of 1,000 bushels Coffee, 8,141 lb. Estate Tea, and 3,056 lb. Tea from Purchased Leaf were insufficient to meet the expenditure on general cultivation, but the advices from Ceylon indicate there is every reason to expect that this year the Estate will be at least self-supporting. At the time this property was acquired there were 400 acres in cultivation in coffee and tea. On the advice of the Company's Ceylon Management, and after due consideration, the Directors have decided for the present only to retain the best of the land already planted in tea, the extent of these fields being 245 acres.

The following is a Statement of the Acreage of the Company's Properties as on 1st January, 1899:—

	Tea in full bearing.	Tea in partial bearing.	Tea in bearing.	Forest, Cof. etc.	Total Acreage.
Blnoya ..	441	—	85	—	403 920
St. Vigeans ..	185	—	—	—	185
Mottingham ..	212	—	9	—	87 258
Edinburgh ..	306	56	25	—	50 437
Friedland ..	161	—	—	—	2 163
Nonpareil ..	—	36	209	77	227 549
	1,305	92	328	77	719 2,521

In their last report the Directors referred to an intended issue of £10,000 of six per cent. Debentures, but only £5,000 have so far been issued.

The Directors are pleased to report that the Colombo Agents have voluntarily made a modification in their scale of charges, as from the commencement of the 1898 season, to the advantage of the Shareholders.

In accordance with the Articles of Association, Mr. Alex. Thomson retires from the Board at this Meeting, and, being eligible, offers himself for re-election.

During the past year the Directors have had the advantage of Mr. W. Megginson's advice and assistance in connection with the general working of the Company's Estates, and the Directors now propose that he shall join the Board as an additional Director, it not being intended, for the present, that this appointment shall increase the fees paid to the Director.—By Order of the Board, W. H. BARTLET, Secretary.

London, 17th April, 1899.

THE STANDARD TEA COMPANY OF CEYLON, LIMITED.

Eighth report of the Directors to the shareholders, to be submitted at the general meeting, to be held on Wednesday, 26th April, 1899, at noon, at the offices of the Company.

The Directors submit statement of accounts to 31st December, 1898.

The profit and loss account shows a profit on the working of the estates in Ceylon of £11,343 19s 2d, which with amount brought forward from last year, less interest and home charges, shows a sum of £10,569 11s 10d. available for division.

In August, 1898, the Directors, under the powers entrusted to them, distributed an interim dividend for the six months ending 30th June, 1898, of 5 per cent (10 per cent per annum), absorbing £2,975.

They now recommend a dividend at the rate of 10 per cent (making 15 per cent for the year) absorbing £5,950; the placing £1,000 against depreciation; and the carrying forward to the next year £644 11s 10d.

Coffee has contributed to the results some £1,000 less than last year. The crop was 115 cwt.; it realised about £500.

The average Exchange for the Company as drawers in Colombo was 1/4 5-32, against 1/3 15-32 in 1896 and 1/2 19-32 in 1896. The difference in 1898, compared with 1897, unfavourably affected the accounts to the extent of about £900.

Finest tea were lower in price this last season, our Uda Pussellawa Teas were 1/4 per lb. nett lower. The Maskeliya Teas realised the same price per lb. as in 1897.

Coneygar is now worked with and as part of St. Leonards.

The St. Leonards factory has been enlarged several times. The yield, however, from the Uda Pussellawa places has nearly overtaken its capabilities; and there is further increase to be feared. The Directors, therefore, have sanctioned the erection of a factory on Gordon, to deal with the produce of that estate and Tulloes. With this relief St. Leonards factory should be sufficient for some time for all that at present seems likely to be demanded of it.

To pay for the new factory and pay off some of the floating debt, the Directors seek authority to issue some of the unissued shares as preference shares. As shown in the notice on the face of this report a formal resolution will be submitted to the meeting.

The Company's properties at the close of 1898 were 3,465 acres, with 1,714 acres of tea considered in full bearing, viz:—

	Acres tea bearing.	
In Uda Pussellawa—St. Leonards and Coneygar...	901	399
Liddesdale ...	814	140
Eskdale ...	240	208
Gordon ...	386	154
Tulloes ...	419	199
In Upper Maskeliya—Gonravilla and Upper Cruden ..	705	614

There are also 536 acres tea in partial bearing, and some 237 acres in addition planted with tea.

On St. Leonards, Liddesdale and Gordon estates there is still some coffee interspersed through the tea.

Mr. William Rollo, the Director who retires by rotation, being eligible, offers himself for re-election.—By order,

A. TRAFFORD BROOKE, Secretary.

SOUTH MYSORE PLANTERS ASSOCIATION.

The annual general meeting of the above Association was held at Saklaspur, on the 30th ultimo, present:—Messrs. F. Lonsdale Allen, R. A. Anderson, Graham Anderson, c.i.e., J. E. Butcher, W. L. Crawford, J. G. Crawford, Thomas Hunt, W. Lawder, C. Lake, A. R. Park (President), E. M. Playfair, S. Sladden, and R. Taylor. Visitors.—Messrs. Barclay and Roffey. The Vice-President (Mr. Playfair) read

THE ANNUAL REPORT,

of which following are extracts:— It is my pleasant duty to report that the somewhat gloomy forebodings expressed early in the year have not been realised, and that the season, on the whole, has been a moderately good one. The advices of sales of East India that have reached us indicate a depressed state of the market, which, owing to the increasing production in different parts of the world, seems likely to continue for some time. The cardamom crop was above aver-

age; but prices were lower, ruling from R50 to R60 per maund. Leaf disease has been less prevalent than for some years past. Crop prospects for the coming year are favourable, and the rain which fell in February has not on the whole been prejudicial.

AGRICULTURAL CHEMIST.—The outcome of the various discussions that have taken place, as far as Mysore is concerned, is the appointment of Dr. Lehmann, the Dewan exhibiting in the matter his accustomed liberal-mindedness. All those who are interested in agriculture cannot fail to be gratified at the appointment of so highly qualified a Chemist, U. P. A. S. I.—I refer you to the "Proceedings" for full particulars of the business of the year. Since their publication two matters of interest have been the subject of correspondence:—(1) *The Classification of Coffee*. As Reuters now quote Mysore, as well as other qualities, our wishes in this respect have been met, and as regards uniform sizing, it appears that the meshes in use are as nearly similarly as the variations in size and shape of beans will admit. (2) *Co-operation*. This idea is a natural result of bad seasons, low prices, and high exchange. Whether practical or not, is worthy of consideration, but if any scheme should take shape, it seems to me it would be wise at first to limit its operations to distribution, or say to promoting the sale of our produce in India, England or elsewhere.

SPEECHES, &c.

Mr. Graham Anderson, C.I.E., said:—I feel sure that every planter in Southern India is rejoiced to find that after nearly 30 years of negotiations the Government of India has been fully impressed with the justice of all that has been represented after studying the elaborate report of the Southern India Planters' Enquiry Commission. In due course the various Planting Associations of Mysore will doubtless have opportunities afforded of studying drafts of the improved legislative arrangements which are to be substituted for the unsatisfactory and unintelligible laws which have hitherto existed and which have frustrated the objects for which their provisions were specially extended to the Planting Districts, by encouraging unscrupulous individuals to become dexterously dishonest. We in Mysore are specially gratified to learn that the beneficial influences calculated to result from the peculiarly favourable position of the Mysore Province, which is entirely surrounded by the territories of the Paramount Power, will in the future cease to be neutralised by the absence of equitable and reciprocal facilities for the execution of warrants and extradition. We feel sure that sympathetic consideration will be bestowed on all arrangements which will be made for this Province in which the conditions under which industries are conducted differ considerably from those existing in Ceylon, Assam and other Planting Districts. We may feel perfectly confident that, in consultation with the Durbar, the Government of Madras will not experience any insurmountable difficulty in arranging for the maintenance of cheap, prompt and efficient justice as between man and man, be he employer or employee, and that with the clearly defined object of restraining unscrupulous individuals nothing will be permitted which he distasteful to those who have constant congenial employment always to offer, or which will in any way unduly sacrifice the freedom and best interests of hundreds of thousands of the labouring peasantry upon whose welfare and work the developments of industrial success entirely depends.

A vote of thanks to the retiring Honorary Secretary was proposed by Mr. R. A. Anderson and unanimously carried. He said:—"We are about to say good-bye for a time to Mr. Harris, our Honorary Secretary, who leaves shortly to enjoy a well-merited holiday in England. Mr. Harris has performed the duties of Honorary Secretary of our Association for several years

past, and has won the esteem, regard and gratitude of our community for his devotion to his work, his proverbial courtesy and the untiring energy with which he has maintained the usefulness of this Association. During his term of office he has had to deal with many most difficult subjects, and whether we remember his speeches or peruse his written communications, we cannot fail to admire him as a most tactful and painstaking man of business in every way worthy of the unqualified confidence which he has always enjoyed.

NEW OFFICERS.

Mr. Park was elected President and Mr. Playfair Honorary Secretary.—*M. Mail*.

HIGHLAND TEA COMPANY OF CEYLON.

The report of the directors for the year ended December 31 last states that the net profits for the year amount to £1,879, to which has to be added £75 brought forward from last accounts, giving a total to be dealt with of £1,955. An interim dividend of 2½ per cent. was paid in September, and it is now proposed to pay a final dividend of 3 per cent. (free of income-tax), making 5½ per cent. for the year, and to write off new clearings £125, leaving a balance to carry forward of £70. The directors regret that, owing to various factors, climatic and otherwise, the profits for the year show a falling-off from those earned for the previous season. The total tea secured from the company's properties, including a small quantity of brought leaf on Chrystler's Farm, amounted to 212,415 lb., against 220,205 lb. in 1897, showing a shortfall of 7,790 lb. Glenorchy Estate, owing to abnormal weather, has given a very disappointing return, the decrease on that property alone amounting to 14,155 lb. Chrystler's Farm crop, on the other hand, shows an excess over that of last year. The average yield per bearing acre was 352 lb., against 385 lb. for the previous twelve months. The tea sold in London realised an average price of 9d per lb., against 8-669d, for the previous year, and the rate of exchange was ls. 4 5-161., against ls. 3 21 32d.—*H. & C. Mail*, April 21.

ALLIANCE TEA COMPANY, LIMITED.

REPORT OF THE DIRECTORS.

The following report was submitted at the annual ordinary general meeting of the shareholders, held at the Company's Offices, 9, Fenchurch Avenue, London, E.C., on Thursday, 27th April:—

The Directors have pleasure in submitting the balance sheet and profit and loss account for the year ending 31st December, 1898.

The Nett Profit, after payment of Debenture and other Interest for the year, amounts .. £5,207 11 2  
To which has been added the Balance brought forward from 1897 .. 161 2 3

£5,368 13 5

An Interim Dividend of 3 per cent. was paid on the 29th September, 1898, absorbing .. 1,957 16 0

And the Directors now propose to deal with the balance as follows:—

- (1) In writing off from cost of Proprietors of Depreciation of Machinery, &c. 300 0 0
- (2) In payment of a final Dividend (free of income tax) of 4 per cent. (making 7 per cent. for the year) .. 2,610 8 0
- (3) In carrying forward to next year the balance of ... .. 500 9 5

£5,368 13 5

The result of the year's working is a distinct improvement upon the previous season, notwithstanding the unfavourable weather and the comparatively low level of prices prevailing during the year.

The item of £659 2s 6d for manuring brought forward from 1897 and the whole expenditure under this heading incurred in 1898 have been debited in last year's profit and loss account.

The following table gives the acreage and results of the year:—

Estate.	Average in bearing.		Tea Crop lb.	Cost per lb. in cts. (including manuring)	Nett Price realised per lb. in pence.	Working Profit.
	Foli.	Partial.				
Aberdeen	387	—	128,749	32.33	5.13	—
Calsaya	312	—	153,505	29.60	7.51	1,638 12 10
Dunkeld	322	50	144,326	31.32	6.59	812 10 3
Lucombe	717	—	265,397	32.81	5.83	423 9 2
Thornfield and Gleneagles	455	15	230,884	29.00	8.82	3,877 17 7
Uda Radella	340	40	180,716	27.76	7.52	2,428 5 1
	2,563	105	1,101,168	30.40	7.00	9,230 14 11

There was a loss on the Aberdeen working amounting to £168 16s 11d making the actual working profit £9,061 18s 0d. It has been decided to abandon 40 acres of the poorest tea land at Aberdeen, and by this means it is expected that the acreage retained under cultivation will give better results in the future.

The following is a Statement of the Acreage of the Company's properties as on 1st January, 1899.

	Tea in full bearing.	Tea in partial bearing.	Tea not in bearing.	Cleanings.	Forest, Waste, &c.	Total Acreage.
Aberdeen	317	—	14	—	119	480
Calsaya	342	—	—	23	22	387
Dunkeld	492	36	—	—	75	603
Lucombe	550	—	—	—	200	750
Thornfield and Gleneagles	457	—	7	—	48	512
Uda Radella	380	40	—	52	83	555
Kehelgama	—	—	—	—	322	322
	2,568	76	21	75	869	3,609

The Elstree leaf, which had previously been treated at Lucombe, is now dealt with at Dunkeld, and in the above Statement the acreage of Elstree has been deducted from Lucombe and included in Dunkeld.

The capital expenditure shown in the accounts has been chiefly in respect to the rebuilding and extension of the Uda Radella Factory.

In their last report the Directors referred to an issue of £10,000 of 6 per cent Debentures, but of these only £8,900 have been issued.

The Directors are pleased to report that the Colombo Agents have voluntarily made a modification in their scale of charges, as from the commencement of the 1898 season, to the advantage of the shareholders.

In regard to the prospects of the current season the teas so far produced are deriving the benefit of the appreciable advance in market values both here and in Colombo, whilst there are reasonable expectations of the yield of the Company's Estates being maintained at about the quantity produced last year.

## THE TEA MARKET.

In the tea market prices have ruled very strong, often at an advance of ½d per lb. In the Budget speech of the Chancellor of the Exchequer he is made to say there are short supplies of British grown tea! China tea prospects improve while the run is maintained on the lower grades. The blending firms who make low-priced tea their chief outlet have been caught with running contracts on low terms. — *L. & C. Express*, April 14.

## TEA BLIGHTS AND PEST.

### TO THE EDITOR OF THE "ENGLISHMAN."

SIR,—Incidentally to the valuable report by Dr. George Watt, and partly published in your issue of the 16th instant, there are under the heading of the paragraph "Prevention better than cure," statements, which, however correct they may have been in 1835, are now at variance with the actual facts. Dr. Watt states "that a much famed insecticide has been tried, has proved a failure, and therefore nothing further need be thought of."

Last year exhaustive experiments were carried out in Cachar by the representatives of the Chiswick Soap Company, of Chiswick London, W., with great success; and this has resulted in an extensive use of the Chiswick Soap Company's compound by fifty-two concerns in that and other districts. It has been a generally expressed belief that the prevention of mosquito blight is an utter impossibility, but practical demonstrations show that the destruction wrought on tea bushes by this pest can be successfully prevented, if careful spraying of the bushes in Jan. or Feb.,—and at any time thereafter that the blight may appear,—is carried out.

Patches of tea suffering from red spider, white thread, green fly, blight and all other similar pests may be cleared by one or two applications, and at a small cost.

It was not until 1895-96 that the compound was tried, and the experiments since carried out privately in various gardens, by many who at the outset thoroughly disbelieved in its efficacy, have proved without a shadow of doubt, that many maunds of valuable tea may be saved at a reasonable outlay. The results of the experiments made by planters prove quite the contrary to Dr. Watt's statement, that "remarkably little value can be placed in insecticides," and it is open to anyone who is dubious on this point to thoroughly prove for himself that the ravages of tea pests may be prevented, and that the greatest benefits may accrue from the judicious and thorough use of the compound. Confident that the spraying of large areas of pest-ridden bushes, with properly prepared insecticides, was possible, and that positive relief could be given, the makers of this compound spent £1,000 last year in successfully demonstrating this fact, and they are now prepared to consider the question of providing material for any large tract of tea requiring treatment, for an equitable share in the value of manufactured tea saved.

Dr. Watt's hints and suggestions, as to combination and methodical research as to the habits and developments of tea pests are excellent, and to the point. In the meantime, mosquito blight and other pests flourish, and any relief that can be given at a moderate cost should be welcomed by planters.

THOS. R. PARTT.

"A SLUMP IN QUININE" is the expressive heading in trade journals by a recent mail, and it is evident that bark and quinine owners are in luck's way. We hear of one Nilgherry estate owner who, early in March, sold his bark to the Madras Government Factory at the rate to rule on 1st April. On 29th March the price went up 100 per cent, and so the lucky proprietor has scored, more particularly as there has been a fall since.

## TEA IN AUSTRALIA.

Melbourne, April 15.

Market very firm and advancing. An active demand for all descriptions of China teas; sales of common Congous and Panyongs totalling 1,500 half-chests at 5½d to 6¼d, and 400 half-chests of finer grades; 300 quarters of buds taken at 7¼d to 7½d. Ceylons very scarce; sales of 900 chests at 7½d to 8d for medium, and from 10d to 1s 1d for fine. Indians are meeting with a good inquiry; sales of 400 chests at 8d to 10d.—*Leader*.

## PRODUCE AND PLANTING.

PRODUCE AND THE BUDGET.—So far as produce is concerned there are no surprises in the Budget. The reference to tea, coffee, and cocoa was brief, and was as follows. The Chancellor of the Exchequer said: With regard to the minor items of Customs, coffee for once shows an increase. I am told that this is due to the increasing number of excellent temperance refreshment rooms in London, where coffee is a favourite beverage. The use of cocoa also, I am happy to say, has increased by 14 per cent, and it may comfort my hon. and gallant friend the member for Central Sheffield, who I know is a patron of cocoa, to be informed that a much larger proportion of the cocoa used in this country was of British manufacture than in the previous year. Tea shows an increase of £62,000, but I shall have to be cautious in my estimate of tea for the coming year, for I am sorry to say that tea has lately risen in price; I am told, 2d in the pound, due to the fact that Indian and Ceylon tea is becoming very popular in Russia, the United States, and our great colonies; and consequently there is a shorter supply in this country. No one seems to have noticed the increase in the price of tea, but a good deal would have been said about it if it had been due to an increase of taxation. It may interest the committee to be informed of a curious circumstance in regard to the receipts from tea. There is a singular rivalry now going on between certain great houses in the tea trade as to the amount of the cheques which each of them shall give for individual clearances of tea, and the result is sometimes greatly to discompose the receipts from tea in one quarter of the year, or even in different years when compared with one another. The Customs were actually asked the other day to allow the inclusion in one of these cheques of the duty on tea aboat and not yet arrived in this country. I need hardly say that we promptly put a stop to the suggestion, which if allowed, would have entirely disorganised the proper keeping of our accounts from year to year."

MISSING AN OPPORTUNITY.—We notice that "Merchant," in the columns of a contemporary, calls attention to a neglected opportunity. He says: "In consequence of the advance in duty on tea by the United States Government to pay for war taxes, there is an enormous quantity of tea lying in bond in New York—probably six times the usual amount. How is it that some of our blenders or other speculators have not secured some of this?" We hope importers will not tumble over one another in their haste to take advantage of this chance.—*H. & C. Mail*, April 11.

THE POSITION OF INDIAN TEA.—It is satisfactory to find trade opinion optimistic on the subject of the present position of Indian tea. Commenting on the particulars of outturn of the crops of Indian tea for 1898-99, which shows a total production of 153,000,000 lb. the largest ever known, the *Grover* says: "The increase over the entire crops in 1897-98 and 1896-97 was, in round numbers, between 1,613,000 lb. and 4,683,000 lb. whilst as compared with 135,479,000 lb. in 1835-96, and 127,127,000 lb. in 1891-95, the aggregate quantity of Indian tea raised this season was many millions of pounds heavier than in those years. From the very outset, when the crop was origi-

nally estimated at fully 153,000,000 lb. the yield of tea in British India for 1898-99 has been regarded as of unexampled extent and at one time a lower range of prices than ever was expected to rule in consequence. In this hope, however, the trade have been greatly disappointed, for besides increasing demands for consumption at home, there have been developments and wider outlets for shippers in other quarters, which have been large enough to absorb the whole of the surplus supply above shown; and since the end of December last the market has, without interruption, maintained a strong rising tendency."

TEA PLANTING IN NATAL.—The United States Consul-General at Cape Town is so interested in the tea cultivation of Natal, he describes for the benefit of his countrymen the process of cultivation and manufacture in that colony. We give it in his own words and we leave Indian and Ceylon planters to solve the question whether their brethren in South Africa are up to date in their methods. The picking season in Natal generally commences early in September and goes on till about the end of the following May. The months of June, July and August are taken up with digging and manufacturing the land, and pruning the plants. The tea is picked by the coolies, mule carts in different gangs collecting the leaf. Men and women are employed in the picking process. The tea leaf is taken down to the factory, where it is "weighed in." When that is done, it is spread out thinly on frames covered withessian, for the purpose of "withering," in a temperature of 80 to 90 degrees. In the course of twelve hours, the leaf has become perfectly soft. The leaf is then passed through shoots into the machine room, where it is "rolled." When the rolling is finished, the sappy, juicy mass is sent down into the cooling chamber where it is spread out and submitted to the action of the air at a temperature of from 60 deg. to 70 deg. The rolled leaf is then passed to drying trays, on which it is spread out thinly and submitted to a temperature of about 250 deg. the excessive heat staying fermentation, and taking all moisture out of the leaf. The now manufactured article is sent on to the sorting department, where the different grades of Golden Pekoe, Flowery Pekoe, Pekoe Souchong, Souchong, and dust are separated by machinery, which consists of a huge, revolving screen cylinder, the meshes gradually getting larger towards the outer end, so that the dust falls from the separating machine first, and the Souchong last. The smallest leaves on the twig, says the Vice Consul, when picked, make the finest tea. The tea is then put into airtight bins where it is allowed to remain from two or three months to mature. After this it goes to the packing department, where it is put into packets or boxes for the trade.

ARTIFICIAL RUBBER.—Many attempts to make artificial rubber by oxidizing linseed oil and other vegetable matters with strong acids have not proved quite successful. A Chicago glucose company are now trying to make it from the refuse material of their factory. This rubber made from the oil of Indian corn is of a brown colour, but its fault, thus far, is that it does not resist heat so well as genuine rubber.—*H. and C. Mail*, April 21.

"RAINFALL AND FERTILITY" is the subject of a very interesting letter from Mr. John Hughes given elsewhere. It has been long recognised here that the desirable rain for tea comes in gentle, light-falling showers which are richer in nitrogen and do not create wash. At the same time tropical rains are altogether richer in nitrogen than is the rainfall in temperate regions. It would be extremely interesting to compile returns for an average Ceylon estate, similar to those framed for Rothamsted; but twenty years is a long period to cover.

**A BOTANICAL EXPERIMENT.**—The following experiment may be of interest to lovers of botany, and will partially explain the two colours (mauve and white) found in the cuckoo flower (*Cardamine pretensis*). Two strong plants were carefully removed from the ground and potted. One was allowed to grow in the open and the other placed under cover, the only light allowed being that which passed through an amber coloured glass. In less than three days the bloom under the amber glass had assumed a distinct mauve colour, whilst that left in the open was white, or nearly so.—*Quarterly Therapeutic Review*.

**INDIA AND CEYLON TEA.**—We lately published a letter from Messrs. Gow, Wilson & Stanton in which figures were given regarding the movement of Indian and Ceylon tea from 1st June 1898 to 31st March 1899, compared with the corresponding period of the previous year, and a general statement made in reference to the deliveries during last month. A similar letter had been sent to the Secretary of the Planters' Association, who has today placed it at our disposal. The only details in addition to those we have already published are the following:—

	March 1899		March 1898	
	Indian	Ceylon	Indian	Ceylon
Imports	6,039,152	8,190,084	6,688,567	7,874,642
Deliveries	13,149,228	7,310,692	11,717,357	8,095,842
Stock	52,399,835	18,105,766	59,051,489	18,074,314

**CEYLON TEA DIRECT FROM THE GARDENS, GUARANTEED ABSOLUTELY PURE.**—Mr. Charles Knight, of Kingston, near Taunton, who has been a Planter in Ceylon for 30 years, wishes to start a business in the Tea Trade and to give the community the benefit of it by selling tea direct from the grower and at a lower figure than it is now sold, for by the experience he has had, he knows the best months when the best teas are made. Since his return home he has had over several lots and is pleased to find they have been appreciated by his customers, and, acting upon their recommendations, he has pleasure in announcing that he is open to receive orders from anyone in the neighbourhood. Any order, either large or small, he will be glad to receive, and will get it packed in the Factory in Ceylon as customers may require, each grade packed separately in chests or small boxes, for he is confident that the mixing of teas should only be done in the teapot. Note the address—Kingston, near Taunton.—[Copy of advertisement in English paper.]

**WEATHER FORECASTS IN AMERICA**—have become of great practical value. Prince Kropotkin tells us in the *Nineteenth Century* that last winter, when a cold wave and a blizzard were expected in the West, 650 points in twelve ranching States, as also all the railway and steamboat stations, and thousands of private persons were warned from the Chicago weather bureau. Immediately most ranchers took their flocks of sheep under shelter (200,000 head of sheep and cattle in one single small spot), and masses of both sheep and cattle were saved from an almost certain destruction by an awful blizzard. In April last most valuable crops of strawberries were saved in the same way. The strawberries were covered with straw, or artificial clouds were made. The meteorological service has so much won the confidence of the population that last year it was very seriously urged by the Press to issue forecasts of 'increase of crime,' it being known that such an increase really takes place during some sorts of hot weather.

**"THE INDIAN FORESTER."**—Edited by H. C. Hill, Conservator of Forests and Director of the Forest School, Dehra Dun. Contents No. 4—April, 1899:—Brandis' Prize Fund; Photographs of Cutch-boilers' Camp; Remarks on Forest concessions in Oudh and in general; Tannin Extracts; Correspondence; More information about Bamboos, T. F. Bourdillon; Forestry in New South Wales, Colonial; Tassar Silk culture, T. F. Catania; Gestation of the Elephant, C. B. S.; Longicorn Beetle on Mulberry trees P. H. C.; Official Papers and Intelligence; Appendix Series and "Stray Leaves from Indian Forests"; Forest Revenues—1898-99; Paris Exhibition; Retirement of Mr. J. S. Gamble, M.A., F.L.S., from the Forest Service; Reviews. Shikar, travel, etc.; Extracts, Notes and Queries.

**"THE QUEENSLAND AGRICULTURAL JOURNAL."**—Vol. IV. Part 4. Contents for April 1899:—Agriculture; Market Gardening—The Vegetable Garden; Imported Agricultural Produce; The Expansion of Agriculture; Ensilage; Agricultural Education in the United States; Profit in Wheat Farming; Dairying; The Orchard; Fruit Culture in Queensland; Fruit Fly Experiment; The Export of Fruit; The Problem of Fruit Preservation; Botany; Contributions to the Flora of Queensland; Plants Reputed Poisonous to Stock; Popular Botany; Our Botanic Gardens, No. 9; Tropical Industries: Queensland Coffee; Coffee Notes; Coffee-leaf Disease; Coffee in 1898; Manure for Coffee; Manuring of Tropical Plants—Corn; Ramic Cultivation; Sugar in the West Indies; Animal Pathology; Forestry; General Notes.

**SEEDS AND "THE DEVELOPMENT OF CURRENCY IN THE FAR EAST."**—Col. Temple has a currency paper in the *Asiatic Quarterly Review* in which we read:—

I must begin by stating that all the existing Troy weights and currencies in India and the Far East are based on one, and sometimes on both, of two seeds, which are known to Europeans as the seeds of the *Abrus precatorius* and the *Adenanthera pavonina*. I must ask that these two names be borne in mind, and I will call them in my arguments the *abrus* and the *adenanthera*. The *abrus* is a lovely little creeper yielding a small bright red seed with a black spot on it. The *adenanthera* is a great deciduous pod-bearing tree, having a bright red seed. Conventionally the *adenanthera* seed is double of the *abrus* seed. Now as will be presently seen, our subject literally bristles with every kind of difficulty, and here, at the very beginning, is the first. The weights represented by the two seeds have everywhere and an all times been mixed up. The terms for the *abrus* and its conventional representatives have been applied to the *adenanthera*, and *vice versa*, both by native writers and European translators and reporters. As a result of the same kind of confusion of mind, whole systems of currency have been borrowed from outside by half-civilized and ill-informed rulers and Governments, and brought arbitrarily into existence, starting on the wrong foot, as it were. The unlimited muddle thus arising may be easily imagined, and so, too, may the amount of investigation necessary to unravel the resultant tangle. Based on the conventional *abrus* seed, there were in ancient, or at any rate in old, *i.e.*, in undiluted Hindu, India, two concurrent Troy scales, which, for the present purpose, I will call the literary and the popular scales. For the present purpose also, and for the sake of clearness, I will call the *abrus* seed of convention in the literary scale by one of its many ancient names, *raktikā*, and in the popular scale by one of its many modern names, *ratī*. In the Indian Troy scales, then, the lower denominations represented in each case the *abrus* seed, but the upper denominations differed greatly, *i.e.*, in the literary scale there were 320 *raktikās* to the *pala*, and in the popular scale there were 96 *ratīs* to the *tola*.

TO ALL PARTS OF ASIA, AFRICA, AMERICA AND OCEANIA.

# Seeds & Plants of Commercial Products.

**Hevea Brasiliensis** (Para Rubber).—Orders being booked for the coming crop available in August and September. This is the only crop of seeds in the year. All orders should reach us before the end of July to avoid disappointment, as we have to make arrangements in time; guaranteed to arrive in good order at destination. We have already booked a large number of orders. A Sumatra Planter writes, dating 9th March, 1899:—"I consent to the price of £——per thousand. I herewith order 50,000 upon condition that you guarantee at least 33 % seeds germinating." Plants can be forwarded all the year round in Wardian cases. Price and particulars as per our Circular No. 30.

**Ficus Elastica** (Assam and Java Rubber).—Seeds supplied by the pound with instructions; price according to quantity. This tree grows equally well in high and low land, in forest and grass land, its cultivation being extended largely by the Indian Government.

**Manihot Glaziovii** (Ceara or Manicoba Rubber).—Fresh seeds available all the year round; price as per our Circular No. 31. It is superior to Mangiberia rubber and second to Para rubber.

**Castilloa Elastica** (Panama or Central American Rubber).—Seeds and Plants supplied; price and particulars as per our Circular No. 32.

**Urceola Esculenta** (Burma Rubber) and **Landolphia Kirkii** (Mozambique Rubber).—Seeds and plants, both are creepers.

**Cinchona Seeds.**—Different varieties.

**Hybridised Maragogipe Coffee.**—A large-beaned superior variety of Coffee in demand; seeds.

**Santalum Album** (Sandlewood).—The cultivation and felling of the tree is entirely under Government monopoly in India, Sandlewoods to the value of over £100,000 being annually exported to various countries from India. The cultivation of this useful tree is now receiving increased attention in other countries; seeds and plants.

**Eucalyptus Marginata** (Jarra).—Large quantities of this most valuable timber are being annually exported from Australia to London and various parts of the world for street paving and other purposes. Price of seeds on application. 7,846 pieces of Jarra timber has already arrived for Ceylon use.

**Seeds and Plants of Cinnamon, Nutmeg, Clove, Kolanut, Pepper, Cardamom, Vanilla, Arabian, Liberian and Maragogipe Coffee, Cacao, Tea, Coca, Fibre, Medicinal and Fruit Trees, Shade and Timber Trees, also Palms, Bulbs, Orchids, &c.**

Our enlarged Descriptive Price List of Tropical Seeds and Plants of Commercial Products for Foreign Countries for 1899-1900 are now being forwarded to applicants in different parts of the world.

"SOUTH AFRICA."—The great authority on South African affairs of 25th March, 1899, says;—"An interesting Catalogue reaches us from the East. It is issued by William Brothers, Tropical Seed Merchants, of Henaratgoda, Ceylon, and schedules all the useful and beautiful plants which will thrive in tropical and semi-tropical regions. We fancy Messrs. Williams should do good business, for now that the great Powers have grabbed all the waste places of the earth, they must turn to and prove that they were worth the grabbing. We recommend the great Powers and Concessionaries under them to go to William Brothers."

A leading Planter writes from *New Hebrides* under date 17th January, 1899:—"I shall like a few more of your Catalogues to distribute through these Islands, as I feel sure many would place themselves in communication with you, did they know where to write for Seeds and Plants."

**Our New Descriptive Price List of Seeds and Plants of Fruit Trees now being prepared and will be ready shortly.**

*Agents in London:*—MESSRS. P. W. WOOLLEY & Co., 33, Basinghall Street.

## Correspondence.

To the Editor.

## CINGALESE CATTLE IN TRINIDAD.

Government Farm, Trinidad, B.W.I.,  
16th March, 1899.

DEAR SIR,—I beg to offer you the annual report on the working of this farm for the past year. The year proved a fairly good one.

With regard to our importation of Cingalese cattle from your colony, the animals arrived in good condition after their long journey. The little cows are curiosities, but the bull is a sturdy fellow and if we can rear oxen up to his standard, they will find a ready demand here. Sir H. Jermyham's object in bringing out this breed was to have a class of animal that would be the *poor man's beast*. We have any number of donkeys and small mules, yet there should be a place for these cattle as beasts of burden and fulfil the requirements of the peasant proprietors.

Cow-farming is progressing by leaps and bounds and these small oxen should be especially useful for such work, also for cacao estate work where they could pass freely under the trees without injuring them; there are many openings for them in various employments and those who have seen them and are competent to judge think that they have come to stay. Any way the experiment is worthy of a trial.—Yours truly,  
C. W. MEADEN, Manager.

## THE "NILU" PLANT AND "JUNGLE CROW."

Vavuniya, April 26, 1899.

DEAR SIR,—As regards the flowering seasons of the "Nilu" family, in the Northern Province, the species found is *Stenosiphonium Russellianum*. When I came here in 1895, there were no signs of it; in 1896 there were young plants; in February 1897 it flowered and died down; in 1898 there were young plants and it has flowered again this year, in Feb.-March, and is practically dead now. This shews that this species flowers every other year. It had evidently flowered and died down in 1895, before I came here.

As regards your note in *T.A.* for March about jungle crows, you have mixed up the true crow of the forest, *corvus culminatus*, with the jungle crow, a cuckoo. I have seen them building a nest, but never seen the eggs. There are two species in Ceylon, one found all over the island up to a moderate height and the other one peculiar to the Adam's Peak wilderness and similar forests. The latter is figured in Legge. I regret I am unable to give you the scientific name, but this information may be of use.—Yours truly,  
H. P. C. ARMITAGE.

P.S.—The "nilu" above referred to attains a height of from 5 to 7 feet, and is chiefly found in poor forest growing over a sub-soil of conglomerate iron (pan).

H. P. C. A.

[A large number of *Acanthaceæ* are called "nilu" by the natives, but *Strobilanthus* is the genus usually understood by the name. The *Stenosiphonium Russellianum*, Mr. Armitage mentions, is the Bu-nilu, according to Dr. Trimen's flora. It is the next genus to *Strobilanthus* and from Dr. Trimen's remarks we should have thought it flowered every December; but Mr. Armitage indicates that it flowers once in two years. The specimens Mr. Armitage sends us are very poor with no leaves nor flowers, but we have no doubt it is the "Bu-nilu." This reminds us to quote a hill correspondent that "Mr. Farr was quite right about the "nilu" districts in the higher regions and their flowering in masses periodically. I saw, last year, almost a straight line dividing one district from another. This was dividing the Horton Plains side of Totapolla from this side."—As regards the crows, does Mr. Armitage mean that Legge whom we quoted is wrong? Legge gives the varieties of the "black crow" as follows as far as his knowledge extended:—

## CORONE MACRORHYNCHA.

(The Black Crow.)

*Corvus macrorhynchus*, Wagler, Syst. Av. *Corvus*, 3 (1827); Hume, Stray Feath. 1877, p. 461; id. *ibid.* (B. of Tenasserim) 1878, p. 660.

*Corvus leucillanti*, Less Traité, p. 328 (1831); Holdsw. P.Z.S. 1872, p. 469; Hume, Nests and Eggs, ii. p. 411; id. Str. Feath. 1874, p. 243; Ball, *ibid.* p. 418; Hume, *ibid.* 1875, p. 143.

*Corvus culminatus*, Gray, Cat. Mamm. &c. Nepal Coll. Hodgs. p. 102 (*æc* Sykes) (1844); Blyth, Cat. B. Mus. A. S. B. p. 89 (1849); Kelaart, Prodromus, Cat. p. 124 (1852); Lavard, Ann. & Mag. Nat. Hist. xiii. p. 213 (1851); Horsf. & Moore, Cat. B. Mus. E. I. C. ii. p. 533, in pt. (1856); Jerdon, B. of Ind. ii. p. 295 (1863); Legge, *Ibis*, 1874, p. 23, et 1875, p. 393.

*Corvus sinensis*, Moore, Cat. B. Mus. E. I. Co. ii. p. 556 (1856).

*Corone leucillanti* (in pt.), Sharpe, Cat. Birds, iii. p. 39 (1877).

*The Indian Corby, The Bow-billed Corby, The Indian Raven* (of some) in India.

*The Carrion or Jungle-Crow* in Ceylon.

Dhar, Hind. in the north; *Dhuri-kova*, Hind. in the south; *Dad-kag*, Beng.; *Kaki*, Telugu; *Ulak*, Bhoctias.

*Kaka* or *Goyegamma kaka*, lit. "High-caste Crow," Sinhalese; *Kaka*, Ceylonese Tamils. [We learned from Mr. Nock the other day that he has several "jungle crows" pretty nearly always in the Hakgala Gardens and he thinks they must nest there, though he has never seen one to be certain. He is now to keep a watch and will report result. No doubt a great deal remains to be verified and corrected in respect of Ornithology since Legge's time.—ED. T.A.]

## RAINFALL AND FERTILITY.

SIR,—That fertility is largely associated with the rainfall is fully recognised; but that excessive rainfall causes a loss of fertility is perhaps not so fully recognised.

At Bothamsted for upwards of 20 years a most complete system of collecting and recording the rainfall, as well as the drainage water passing through 20 inches of arable land, has been established, and the results afford valuable practical information,

The amount of nitrogen found in this drainage water has been carefully determined and calculated into the equivalent of nitrate of soda and the results have been tabulated as follows:—

AVERAGE RESULTS OF THE RAINFALL AND DRAINAGE AT ROTHAMSTED FOR 20 YEARS, 1877-78 to 1896-97.

	Rainfall, 1-1000th Acres Gauge.	Drainage.	Retained in Soil or Evaporated.	Nitrogen lost per Acres reckoned as Nitrate of Soda.
	Inches.	Inches.	Inches.	lb.
September ...	2.63	1.04	1.59	25.0
October ..	3.38	2.07	1.31	40.7
November ..	3.14	2.41	0.73	4.3
December ..	2.42	1.95	0.47	23.5
January ..	2.04	1.67	0.37	16.4
February ..	1.95	1.55	0.40	15.7
March ...	1.88	1.00	0.88	9.4
April ..	4.89	.52	1.37	6.3
May ..	2.17	.58	1.59	7.2
June ...	2.33	.61	1.72	7.9
July ..	2.80	.73	2.07	13.3
August ..	2.91	.87	2.07	18.4
Harvest year ...	29.57	15.00	14.57	224.1

It will be noticed that the losses of nitrogen during the winter months from September to February, average 161.6 lb. nitrate of soda, or 72.1 per cent of the entire average losses of the year.

From these figures it will be understood that after continuous rainfall the soil becomes temporarily impoverished, and consequently in need of readily available plant food.

These remarks will have special application to a climate like that of Ceylon where there is a heavy annual rainfall, and to plantations like those of tea, coffee, and cacao, which are kept constantly under cultivation and free from weeds.

JOHN HUGHES, F.I.C.

Analytical Laboratory,

70, Mark Lane, London, E.C., April 21, 1899.

SUNSPOTS, CYCLES AND THE MONSOON.

In his paper on "recent science" in the *Nineteenth Century*, Prince Kropotkin writes:—

It is now certain that the number and the size of the dark spots which we see on the surface of the sun are in some way connected with the weather which we have on the earth. Charles Meldrum, Sir Norman Lockyer, the Indian meteorologists, and especially Dr. W. Köppen in his great work, have proved that there is a certain periodicity in the temperature, the rainfall, the number of cyclones, &c., which corresponds to the eleven years' periodicity (11.1 years) in the number of sunspots. However, the amount of variation which may be due to this cause is so small in comparison with the non-periodical irregularities of weather that it is often masked and obliterated by them. Moreover—to say nothing of the connection which exists between the sun-spots' period and the magnetical forces in our atmosphere—the whole matter, as has been shown by Polis, is more complicated than it seemed to be at first sight. It appears that when the sunspots are at a minimum, mild winters and hot summers prevail, while cold winters and cool summers seem

to characterise the maximum periods of the sunspots; while Mr. A. McDowall points out that not only the seasons and fractions of the year, but different days as well, must be treated separately in all discussions upon the influence of the sunspots' periods. Years of sunspots' maximum, in his opinion, years when the monthly and daily extremes of temperature are greater as a rule. In short, our weather is undoubtedly influenced by the eleven years' periodical variation of the Sun's radiation which is indicated by the sunspots. But this influence is only now studied in such details as to be taken into consideration in weather predictions. Another weather period, which perhaps has not yet been taken sufficient notice of, is the thirty-five years' period discovered by the Swiss professor, Ed. Brückner. A number of other periodicities of weather is also under consideration. Such are the 19 years' period so forcibly advocated by H. O. Russell for Australia, and corresponding to the well-known period of 235 lunar months; the seven years' period discovered in America by Murphy, and three shorter periods of 424, 412, and 11.9 indicated by Lamprecht; the 267 days' periodicity in pressure and temperature noticed by Professor Bigelow, which would correspond to the period of rotation of the sun; the 5½ days' period detected at the Blue Hill Observatory; and so on. And finally there are the cold waves spreading every year in May, and the no less than six cold and three warm periods recurring every year in Europe, and indicated years ago by the veteran Scotch meteorologist, Mr. Buchan. The first long period forecasts were made in India, on the basis of a few empirical squonces suggested by Henry F. Blanford. The whole life of India depends upon the timely beginning of the rainy season, its perseverance and its timely end. Consequently, it was a vital question to be able to foretell the coming and the general character of the monsoon which brings rains with it. This was begun by H. F. Blanford, and in the hands of his successor, Mr. Eliot, the seasonal forecasts, which are now issued semi-annually, become every year more rational and trustworthy. In India, owing to its tropical position, the seasonal changes of weather, which depend upon the general circulation of the atmosphere, are far more important than the irregular non-periodical changes upon which weather depends in Europe; and this circumstance facilitates the task of the forecaster. Still it took years of study before the various causes influencing the monsoons became known; but now the Indian meteorologists can foretell, as a rule, in the first week of June when the rainy south-west monsoon is expected to come, what will be its probable strength and general character, and what is the probability of that break in the rains in July and August which is so important for the crops. They also foretell the general character of the winter monsoon, but they find it difficult to prophesy when the rainy season will come to an end, although its early termination, being fatal to some crops, may result in a famine.

WATERFALLS FOR SALE,

To the Editor of the *Spectator*.

Sir,—Members of the Bergens Polytekniske Forening would be very thankful for advice from you whom to address or where to write in London for sale of waterfalls for industrial use. We can offer powers of 100—500—1,000 up to circa 8,000 horse-power. Awaiting your good news, I am, sir, &c.

Bergen, April 10th.

R. FALKENBERG.

[The above letter is so curious an example of the coming importance of waterfalls producers of industrial power that we place it before our readers. We fear, however, that there are as yet no regular waterfall brokers to be found in London.—Ed. *Spectator*.]

## "ROBERT FORTUNE, PLANT COLLECTOR."

Is the title given to a short notice of a very remarkable man in one of the home magazines by this mail. Robert Fortune, born in Berwickshire, began life as a gardener's apprentice, but he rose to a responsible post in the service of the Horticultural Society of London and by its Directors he was sent out in 1842 to China as a botanical collector. Subsequently he made two further voyages to the Far East in the service of the East India Company. He travelled all along the coast of China and at some points penetrated into the interior at the risk of his life. Still narrower were his several escapes from pirates in visiting Chusan, the Philippines and Japan 40 to 50 years ago. But Fortune never spared himself in the cause of science and commercial enterprise. He was the first to introduce the China tea plant into India (hence the Assam-Hybrid) and to arrange for the manufacture of the leaf. He brought altogether as many as 200 species and varieties of new plants to Europe from the Far East, most of which are now such established favourites in English and Indian gardens that their origin is overlooked. Under the dripping rocks of the ravines in the rocky islet of Hongkong, Fortune found *Chiretta sinensis* with its elegant foxglove lilac flowers; on the hills he came across the yellow orchid *Spathoglottis fortunei*. From Chusan he got the beautiful *Wistaria sinensis*; and from Shanghai for the first time he sent home *Cryptomeria Japonica* or Japan cedar, so well-known now in some of our higher districts in Ceylon. Another great find at Shanghai was *Anemone Japonica* which he discovered in full flower. From Soehow he took away a fine new double yellow rose and *Gardenia florida fortunei* with large white blossoms like a camellia. In January 1845, Mr. Fortune visited the Philippines and got a large supply of the beautiful orchid *Phalaenopsis amabilis*. In 1848, while after tea (as described in his "Tea Districts of China and India") Mr. Fortune discovered the beautiful weeping cypress tree (*Cupressus funebris*), and the charming *Berberis japonica*. His visit to Japan in 1860 was productive of a great gathering of new plants:—the glorious *Thujaopsis dolabrata*, the handsome evergreen *Asmanthus aquifolius*, the queen of primroses, *Primula japonica*, the fine oak *Quercus sinensis*, the lovely *Lilium auratum*, etc., etc. One specimen of *Wistaria* seen in Japan measured 7 feet in circumference at 3 feet from the ground, and covered a space of trellis-work 60 by 102 feet. One of the racemes of blooms was 42 inches in length with thousands of long drooping lilac racemes! But we must stop. There is no man who has left a broader mark on English gardening than Robert Fortune. He lived in the neighbourhood of London till 1880, so that he saw the Indian tea industry well established, though that of Ceylon had only entered on a very elementary stage. Nevertheless, here as in India, the name of Robert Fortune, "the plant collector," should always be regarded with respect and admiration.

GAME AND ITS PRESERVATION IN  
CEYLON.

## THE WORKING OF THE ORDINANCE.

The question of game and the working of the Game Ordinance is one which has lately been much before the public, and numerous remedies, more or less wild, have been suggested. I do not for a moment admit that game is any scarcer now than it was ten or twenty years ago. Of course with the advance of cultivation game is driven further and further into the forests, and sportsmen have to go further afield in search of game: but the natural reproduction keeps pace with the slaughter, and I entertain no fear of the "extermination" that is so much talked of. In my opinion, the remedy for "indiscriminate slaughter" is a simple one; and the existing law gives sufficient protection. I do not consider that the Game Ordinance requires any amendment, nor do I suggest such drastic remedies as an annual tax on guns or special taxes on foreigners. I think the principle of the new Forest Department arrangements may be followed, and the remedy should be found in the Forest Ordinance No. 10 of 1885. Following the principle of the new forest arrangements, I would divide the Island into reserves (which in the case of game would become preserves) and non-reserves, and the divisions might be made coterminous with the forest circles. Thus, the great yala division of the Hambantota District would be one preserve corresponding with the South-east Circle of the Forest Department. The reserved forests of the Batticaloa District would form a second preserve, and the west and south of the Trincomalee District with a large slice out of the North-Central Province, corresponding with the North-east Circle of the Forest Department, would be another preserve, and so on. Another would be formed in the hill districts to include the forests and patanas of the Horton Plains, the Elk Plains, and the Pedro range. The first step to be taken would be to get these areas proclaimed as "reserved forests" under the Ordinance No. 10 of 1885, and as soon as they have been proclaimed special rules can be framed by the Government Agent under clause 26 (d). All lands outside these reserves would be treated as comparatively valueless and would be worked under the existing Game Law, while the reserves would be worked under the special rules. As regards the special rules, I divide them into two classes, one for the hill reserves and the other for low-country. In the former I would prohibit all shooting, in the latter all hunting with dogs; and the following rough draft might be adopted as a basis for the rules:—

*Hill Reserves.*—(1) No person shall within the reserved forests named in the schedule annexed carry a gun under any pretext whatever. Any person found carrying a gun shall be liable to a fine of Rs50, and the gun shall be confiscated.

(2) No person shall take any dog, or allow any dog to be taken or to stray, within the reserved forests named in the schedule annexed, and it shall be lawful for any Forest Officer or ranger forthwith to destroy any dog which he may find straying in such reserved forest, and the owner, if he can be found, shall be liable to a fine of Rs50.

Provided that it shall be lawful for the Government Agent or Assistant Government Agent to issue licenses for any registered pack of hounds to hunt within the said reserved forests on payment of a sum of Rs250 for a pack not exceeding ten couples, and a further sum of Rs20 for each additional couple.

(3) The owner of any pack of hounds shall register the same at the commencement of each season, giving a full description of every hound comprising the pack, and shall from time to time register any changes in, or addition to, the pack.

*Low-country Reserves.*—(1) No person shall carry a gun within the reserved forests described in the schedule annexed unless he shall have taken out a license under clause (3).

Any person found carrying a gun without such license shall be liable to a fine of R50 and the gun shall be confiscated.

(2) No person shall, under any pretext whatever take or allow to be taken or to stray, any dog within the reserved forests described in the schedule annexed.

Any dog found within a reserved forest, whether accompanied or not by its owner, may be forthwith destroyed by any Forest Officer or ranger, and the owner shall be liable to a fine not exceeding R50.

(3) The Government Agent or Assistant Government Agent of the district within which any such reserve is situated, in whole or in part, may issue licenses to shoot game within such reserve on payment of the following fees;—

(a) To any resident of the district, a license for the whole season, R100.

(b) To non-residents—A license for one week, R100; for one month, R200; for the season, R500.

These regulations would not provide a "sanctuary" but a "preserve," which would in my opinion be just as good as a sanctuary. They would practically keep out the ordinary villager, who would be content with shooting outside the preserves, and they would effectually keep out the wandering game-butcher. Most of the game of the district would soon flock into the preserves, and no sportsman would object to pay the higher scale of fees for the improved shooting that would result. The fees should be devoted to increasing the staff of forest rangers, who would be engaged equally in protecting the timber and preserving the game. In this connection I may mention that during the season November 1, 1897, to May 31, 1898, I issued 70 game licenses, of which 21 were to Europeans and 49 to natives, and for the period November 1 to December 31, 1898, I issued 44 licenses, of which 16 were to Europeans and 28 to natives.—*Mr. Lushington's Administration Report for 1898.*

## TEA IN AMERICA IN EUROPE.

### MR. AYDEN'S EXPERIENCE.

Mr. Ayden who, we reported, had returned to Ceylon lately, has been away for a year, six months of which he spent travelling about advocating the interests of Ceylon Tea. He spent about three months in doing the principal cities of the United States and Canada, and took the same time to travel across Europe to Russia, going as far as St. Petersburg. "Yes," he replied to a question about the condition of the Ceylon product in the American tea market, "our teas are

#### CERTAINLY GAINING GROUND

as against Japan and China teas." He agreed that the "Thirty Committee" were doing well in advertising as was done at present, and could not suggest any better method, and he was not in favour of subsidising certain firms to push the article as was recommended in certain quarters.

"Are you in favour of introducing green teas into the country as advocated by Mr. Mackenzie?" asked our reporter. "Yes, I think there is a fine opening for Ceylon green teas. Of course they will have to compete with China and Japan

greens, but I think that is only a matter of time, especially if the planter makes the tea."

#### THE AMERICANS WANT.

A certain amount of black tea would always be used, but it was only a small percentage of the total consumption, the principal teas being the greens and oolongs.

They had been greatly handicapped by the duty imposed at the time of the war of 10 cents (5d) per lb while coffee went free. It made tea so much more expensive than coffee, which had a tendency to become cheaper. That the latter was

#### THE NATIONAL BEVERAGE

was seen in the fact that coffee was consumed last year at the rate of 11 lb. per head of the population as against under 1 lb. of tea. Tea was drunk very much more in Canada than in the States, even amongst the French-speaking people, who, however, live in the same way and have much the same habits as their English-speaking neighbours. He thought in America the trade were favourably inclined towards Ceylon tea, though they used it in blending with China and Japan teas. Our tea can be obtained by itself in the principal cities, but it was difficult to get pure Ceylon tea in the smaller towns, though they had some

#### VERY EXCELLENT BLENDS.

Apart from the pushing of tea Mr. Ayden had time to look round and was struck with the go-aheadness of the people. Even this was to the advantage of Ceylon, for if once they could be got to take up our teas they would go for it for all it was worth as they do with every other things they go in for.

Mr. Ayden's next journey was from London through Holland, Germany, Austria and Central Russia as far as St. Petersburg. Asked which country was the greatest tea-consuming one, he replied without hesitation Russia, adding that there was a great future for our teas there. Ceylon tea was used there to blend with China teas in order to

#### INCREASE THE STRENGTH.

With regard to the tea duty in that country he did not think there was much chance of getting it reduced. It was very heavy, being about 1/8 per lb. and he mentioned that he had to pay three roubles for a lb. of pure Ceylon tea or 6/ in English money.

With respect to the other countries visited, tea was

#### NOT A BIG ARTICLE

and was not much consumed, though here again Ceylon tea was becoming more liked than China and Japan and the prospects were favourable. The trader had no difficulty in selling tea, as it is shipped, direct to Hamburg, Bremen, and other Continental Ports.

## THE COTTON TRADE:

### A NEW ERA IN EGYPT—COTTON MILLS AND FREE TRADE.

PERHAPS in no branch of trade do conditions change so fast and so materially as in the cotton trade. Fortunes have been made in it in times of war, and have also been lost again before the said wars have closed. In the piping times of peace, too, wealth has been amassed by some, and losses made by others. A day or a week may make all the difference between profit and loss, as not a few Colombo merchants

and residents found during the American war. We have known a shipload of Timnevelly cotton sold six times over between Tuticorin and London, and a telegraphic code providing for the price—at the time 2½d per lb.—running up to a shilling, rendered useless, because the American blockade had raised the value to eighteen pence a pound! Then, see, how profits from cotton goods have dwindled in Lancashire and in Bombay in recent years; while even here, the experience of our solitary Cotton Mills, started under the brightest auspices, proves how swiftly new conditions may arise and upset the calculations of the shrewdest heads in the community. To commence with, the capital subscribed was insufficient; but so confident were the promoters of a large and quick turnover with local sales and a steady demand for yarn from the Far East, that work was started with the assurance that no inconvenience would result from insufficient capital which, it was further felt would be only a temporary trouble as the shares would be taken up as soon as the Mills began to work. The slack and diminishing demand for yarn from China and Japan, which countries ere long began starting their own Mills; the uncertainty and variation of local wants; the depression in the tea industry; the tightness of the money market, jointly and severally brought about conditions with which our first and only Spinning and Weaving Company found itself unable to contend, and it had to transfer its interests to others whose business connections with India hold out a promise of success which, we trust, will be abundantly realized.

We refer to the subject just now, through having come across information lately which points to a further impending revolution in the cotton trade. Egyptian cotton has had a high reputation in the markets of the world for a number of years, both for staple and for strength; and the fertility of the Nile Valley and the cheapness of labour gave Egypt an immense advantage over all other competitors. But, hitherto, it is only for the production of the raw material that the land of the Pharaoh's has been famed. Now, a new order of things is imminent; and Egypt will soon enter the lists as a manufacturer. Already we learn from an Indian exchange, that Bombay piece goods have found their way to Khartoum, and, as the Soudan gets more and more settled, naturally the demand for cotton goods will grow, especially under the free trade principles just announced by the Sirdar. Indeed, it is the expectation of commercial advantages of this nature which has been one of the inspiring forces for the reconquest of the Soudan and the proclamation of British sovereignty together with Egyptian. But Egypt is not content that distant industrial centres should have the monopoly of manufacture for her wants and for those of the newly acquired or reconquered territory. A strong tendency is shown by Egyptian capitalists to find other investments for their money besides,—that is, in addition to,—land. Industrial and commercial concerns are attracting more attention than they used to, and the Government has been approached with a view to

the establishment of Cotton Mills. Certain economic considerations have, however, to be dealt with before any decided steps can be taken. Egyptian cotton pays an export duty of 1 per cent, and when it returns in the shape of yarn and piece goods an import duty of 8 per cent is levied. Is this source of revenue to be abandoned in furtherance of Cobdenite principles? If so, what taxes should be levied to compensate for the loss? And is the Soudan to have a different fiscal policy? The effect of maintaining the import duty in Egypt would be practically to exclude foreign, that is British competition. That is not a form of protection which will suit the British taxpayer; nor is it for the ruin of his own industries that he has been clamorous for the extension of British influence in Africa, from Egypt to the Cape. There is the alternative of an excise on Egyptian goods equivalent to the import duty. It will thus be seen that revnual, economic and commercial considerations come into play; and until they have been weighed and decided on, the investor will hesitate and the astute British representative in Egypt will determine nothing. But the progress of commercial and industrial undertakings cannot be altogether stayed even by such considerations as have been stated. They may only be delayed, and that only for a short time. The Egyptian Government will have to declare its policy; and once investors begin establishing Mills, a fresh impetus will be given to cotton cultivation. The contemplation of the possibilities which open to view need cause no anxiety; for, concurrently with the entry of new competitors in the field of manufacture, will develop new demands from races and peoples growing in numbers and civilization under just and humane laws. These are among the greatest and most pleasing triumphs of peace; and the day of wars and contention has prevailed long enough to serve the arts of peace.

#### THE CLOSE OF THE CHINA TEA SEASON.

We may hope shortly to hear how the new China Tea Season has opened during the early days of May; but meantime we are free to take the following as the complete figures for Export season 1898-99, as compared with the previous year, for China and Japan teas:—

#### EXPORT OF TEA FROM CHINA TO UNITED KINGDOM AND CONTINENT.

	1898-99.	1897-98.
	lb.	lb.
Hankow and Shanghai..	12,233,930	15,292,448
Foochow ..	12,682,534	12,160,708
Amoy ..	688,318	685,651
Canton ..	5,105,660	5,993,839
	30,760,442	34,132,646

#### EXPORT OF TEA FROM CHINA TO UNITED STATES AND CANADA.

	1898-99.	1897-98.
	lb.	lb.
Shanghai ..	16,621,547	20,836,000
Amoy ..	15,036,413	15,861,506
Foochow ..	9,178,280	7,740,345
	40,836,240	44,437,851

EXPORT OF TEA FROM CHINA TO ODESSA.

	1898-99.	1897-98.
	lb.	lb.
Shanghai and Hankow...	22,783,272	19,492,594

EXPORT OF TEA FROM JAPAN TO UNITED STATES AND CANADA.

	1898-99.	1897-98.
	lb.	lb.
Yokohama ..	25,944,170	26,826,182
Kobe ..	13,948,634	16,732,118
	39,890,804	43,558,300

It will be observed there is a comparative decrease all round, save in the case of shipments from China for Odessa which are 3,300,000 lb. in excess of those in 1897-8.

SOME TRADE CURIOSITIES.

(Sir F Mowatt.) In the yearly prices which you gave us of the teas, I observe some curious variations. In 1892-93 I think you said that India was selling at 11d., Ceylon at 9d., and China at 8½d?—Yes.

The next year it fell to 9½d in India, 8½d in Ceylon, and 8d in China?—Yes.

The next year it rose again to 10½d, 8½d, and there was a little fall in the case of China to 7½d?—Yes.

Is there any explanation of that beyond the ordinary rates of supply and demand?—Probably not. We had one very fine year from Assam—a sort of climatic influence came over Assam and gave us a very large quantity of high priced teas. I think that was the year when the price rose to 10½d.

AN INCREASE OF BRITISH-GROWN TEAS POSSIBLE.

On the whole, from your experience of the trade, do you anticipate that the supply of Indian and Ceylon teas will tend to increase?—Yes, I am certainly of that opinion.

(Sir D. Barbour) In the figures you gave of the prices, I noticed that, in the earlier years, Ceylon tea fetched a much higher price than Indian and now it is lower. What is the explanation of that?—In the earlier years there was only a small quantity and it was of finer quality than now—at first, too, it was a novelty.

I think you said that there had been some over-production in recent years?—Well, there has been quite enough.

You suggested that if there had been 5 per cent. less tea, the price would have been ten per cent. higher?—Yes.

So that the tea planters would have gained?—in that way; but it is impossible to stop protection.

But suggest those figure—5 per cent. less tea would mean 10 per cent more in price? Yes, our stock is so small, that a reduction of 12 millions in it would cause an advance in price. That is what amount to.

You also said that the rise of exchange would diminish the profits?—That is a *sequitur*, I think.

And that would diminish, to some extent, the rate of production?—I think it would eventually have that effect. It has with some people I know.

According to your figures, it a rise in the rate of exchange caused a 5 per cent. reduction of production, there ought to be some gain to the planter from a rise in the London price?—That is so, taking these figures, but tea, as you know, takes five or six years before it is in full bearing. That is why you cannot stop production.

But the arrangement would be this; that a fall of exchange might so increase production as to lead to over production, and be followed afterwards by a reaction?—Quite possibly.

Where if there was a exchange, you would, at any rate, get rid of one cause of fluctuation and uncertainty?—Yes.

You said that the tea plant in India and Ceylon is altogether different from the tea plant in China?—Yes.

And gave a letter tea?—Yes.

That also gives an advantage to the Indian and Ceylon planters?—Yes, but the first gardens in India were laid out with the China plant, and now nobody would dream of sowing the China plant.

THE INDIAN CURRENCY COMMITTEE.

EXTRACTS FROM THE EVIDENCE.

MR. W. J. THOMPSON, JUNIOR:—

THE LOSSES OF TEA COMPANIES.

You are aware that the dividends paid by the tea companies this season have been materially less than they were last year and in previous years?—Yes.

Arising mainly from what cause?—Increased cost of production.

One of the leading elements in that is the difference in exchange; that is to say, suppose your agents in Calcutta sell a 90 days' sight bill upon a London bank to lay down funds to pay the coolies' wages, if they sell the bill at 1s 4d in the one case, whereas if the Government of India had not in this arbitrary way fixed the rate at 1s 4d, they could have sold the bill at 1s 2d, that would have made a considerable difference?—Yes.

And probably have turned the loss on the last season into a profit? It would have made a considerable difference, of course.

What difference do you estimate there would be between a 1s 4d rate and a 1s 2d rate, on the wages of the coolies per lb of tea? I believe it would amount to about five-eighths of a penny per pound.

That effect is felt very much more severely, is it not, in Ceylon than in India, because the entire industry of the island of Ceylon now, since the coffee failed, is tea?—Yes, that is the great industry of the island.

The great industry of the island hangs now upon tea?—Yes.

THE FUTURE OF CEYLON.

Suppose the tea industry should fail, as coffee has failed, what becomes of the island?—I will leave you to deal with that question, I do not like to think of it.

How is the Government to carry on the administration of the Colony?—I am not the Governor.

These are questions, I think, that it behoves us a little to look at. I hear the Ceylon tea planters putting questions of that nature, and I dresay you have heard the same?—Yes, but is it not a little hard to put the question to a poor tea-broker?

You are a tea planter to a small extent, but you are not in the same position as some of the poor tea planters are?—No, and I never was in that position from the other point of view either.

We know that the China is an old country, and tea has grown on the same land there for a large number of years, so that it is possible that the soil may become exhausted; whereas in Assam and the Doars, you have virgin soil. That would make a difference, would it not?—I do not think so, because the original garden where the China seed was planted were also on virgin soil.

I do not say what the difference would amount to, but there would be that additional difference?—Of course, it is a newer soil undoubtedly.

And, therefore, a better soil?—There is no doubt.

## PLANTING IN B. C. AFRICA:

### COFFEE IN MLANGI.

(By an ex-Ceylon Planter.)

In the middle of our cold season the thermometer during the night goes as low as 43 and 50 deg. and during the day seldom above 65 deg. The cold commences with the middle of our crop season, July; but unfortunately the drought during the blossoming months left us little to trouble about. So no one was very busy, for the study is to keep down expenditure.

#### COFFEE

here is not the success I anticipated. This country is subject to periodical droughts during the blossoming months, September, October and November, accompanied with hot winds from the plains between the sea and here, which do a tremendous amount of damage to coffee; besides burning up the blossoms and set crop. It scorches the trees to such a degree that it takes about two years for them to recover: not only is the wood killed, but the very trees, especially young ones (one or two years old) are so much damaged that they never recover, being burned right into the ground. The result of those scorplings is that canker sets in, the trees are bark bound, and the sap cells become diseased and black and empty beans become in course of years so numerous that the only visible remedy is the cutting down to the ground. This no doubt accounts for the stamping of old coffee, which has been done in this country by planters from time to time. After stamping a good sound crop is obtained again, the same as the maiden crops usually are.

The necessity for

#### SHADE

is now recognised and most planters in the country are going in for it by either planting local trees or imported ones. I must say I prefer the latter, at least those that have been proved good coffee shade trees such as the dadap, albizzia noluccana, &c.; but the difficulty is in getting seed imported as it is only procurable from the East where leaf-disease is so prevalent. We have some excellent shade trees in the country, but they don't grow so fast as the dadap and others familiar to me in Ceylon.

I never saw coffee on the Uva-side or anywhere else in Ceylon

#### BLOSSOM

the same as it does here: 10 to 15 spike in a cluster is the usual number. So you need not wonder at 8 cwt. an acre being secured from the primaries as a maiden crop, which is quite common, if a favourable season is got; but older coffee gets weakened by repeated droughts, and supposing it gets favourable weather during the blossoming season, the berries drop off even when the

size of peas, the same as they used to do in Ceylon through the effects of leaf-disease. This does not occur, however, where there is any shade, even that of an individual tree or two suffices to save the crop. Our climate is, I suppose, as suitable as any in the world (and our soil in most districts is exceptionally good) for the successful cultivation of coffee, were it not for those occasional dry seasons, so disastrous to the health and vigour of the coffee tree.

I am strongly of opinion that the best and most successful way to treat coffee here and ensure the best results is to allow it to run up into

#### NATIVE COFFEE

or at least till it reaches six feet the same as is done in Java, so that the crop would be matured higher off the ground and the cover effected by the lofty trees would keep the ground cool. At present cultivating, as we do, our trees, well handled and pruned leaving little wood, are forced too much, beyond their strength, blossoming to the tune of a ton per acre, which they are unable to stand, when the thermometer registers 96 deg. and 98 deg. in the shade and the ground does not, during the night, lose the heat of the day before, being quite warm in the morning. No dew falls as a rule during this time (October and November our best blossoming months). Owing to the country bush-grass burning night and day at this time of the year, the air is fearfully dry. The objection might be raised to allowing coffee to run up to 10 or 15 feet, viz. wind (the trees' greatest enemy). I know most districts in Ceylon, some where I've seen the coffee pulled up by the roots by wind and others where you had to get off your horse and hold on to the grass by your teeth, and others where bullock bangles were blown off the road, with 1½ ton loads in them; and yet coffee with staking when young stood it all and paid well. We have no such wind here, coffee is never staked, and does not need it, in any of the districts I have seen. I am quite convinced that low topping, especially in green wood, does a fair amount of harm to our coffee and this is usually done to try and secure a big maiden crop. I myself tried it and nearly killed some beautiful young coffee: in fact it has never recovered the shock it got, with a dry season to boot.

We are now in

#### TELEGRAPHIC COMMUNICATION

with the old country and it is expected that we shall have a railway from the coast before long. The Portuguese Government is to build a line from Quilimane to Chiromo: the line has been surveyed and the funds voted for the construction of this line which is very necessary to connect with our mountain line into the Shire Highlands as the river from Chinde (our coast port) to Chiromo and Katungas is a very unsatisfactory means of transport, as the water is very low for half of the year, rendering it almost un-navigable for the smallest draft steamers constructed. It is just as bad as your Kelani and Kaluganga are in the dry season.

Our projected

#### RAILWAY

from Chiromo into the Highlands and from thence to lake Nyassa has been twice surveyed over by Mr. McCrombe on account of the African Lakes Company and a party of Engineers are now at work between Blantyre and the lake on account of Government. So this line which is an absolute necessity for the future development of the

country is bound to be constructed soon, and when (as it is well-known) Mr. Rhodes and his Beira-Mashonaland Railway Company are interested in the line to tap the B.S.A. Company territory North of the Zambezi, and beyond this protectorate, is a sure guarantee of a railway being built from Chiromo through the planting districts, which show no engineering difficulties, at no very distant date.

Our present means of transport are very unsatisfactory and traffic gets congested every dry season and thousands of labourers are employed for transport when they might be utilized for agricultural purposes.

Missionaries and trading Companies are determined to have the railway carried right to their very door in Blantyre, irrespective of the future requirements or the development of other parts of the country.

#### TEA

is a success here: it grows fast and flushes well all the year round, with the exception of about two months, and the quality, flavour and strength compare fairly well with Ceylon's medium elevation tea. Not to trust to my own opinion, I sent a flush to an experienced Ceylon planter to make and taste and he pronounced it as excellent tea and a good marketable article. I have planted up a few acres and intend to extend, although there is a fear of over-production and lower prices. Our cheap labour (2d per diem) will enable us to compete with Ceylon and India, if not China.

The tea introduced into the country by the Blantyre Mission (which most old planters have got a few bushes of) is not of a superior jät; but I have seen many worse in Ceylon, and it seems to suit our climate well, which is the great thing.

This country seems to be the home of the

#### TOBACCO

plant and should become a great competitor of Cuba, Manila, and other countries if acreage and soil is to be considered.

Ceylon seems to be in a bad way, what with low prices for tea, and exchange unfavourable. I am sure a lot of old worn-out coffee lands, which would hardly grow weeds in my day, and I see are now (by recognised names) flourishing tea properties, cannot yield many hundred pounds per acre, 300 or 400, which I presume is required to make them pay expenditure alone, leaving out of the question profit or even interest on capital invested. You must go in for quality and keep up your good name for purity. A friend of mine, latley, wrote to a friend in Ceylon for some tea and the stuff sent was so beastly bad that he could not drink it, and had to buy J. T. Morton's Darjeeling tea from a local shop-keeper.

This stuff makes me think that the old appn dodge, which I often saw in my kitchen, of drying master's tea leaves out of the tea pot over the kitchen fire, is still going on: for sale to whom I don't know for I never took the trouble to enquire; but it might be worth while the "Thirty Committee" of finding out what becomes of the Ceylon's cook's dried tea leaves.

P. S. — Durraven, Mlangi, 15th March, 1899. We have had a very good year, and a decent crop is maturing on the trees nearly everywhere and people and prospects are looking much brighter than they were when I wrote the above letter.

#### THE VANILLA BEAN IN MEXICO.

The State of Vera Cruz has been considered the home of the vanilla, but recent developments show that vanilla can be cultivated in the State of Tobacco and on the Isthmus of Tehuantepec. The true home of the vanilla, where it flourishes the best in its wild state, is a narrow strip about 30 miles wide, 5 miles from the coast, and 90 miles long. The upper end of this strip is about 50 miles south of Tampico, and extends along the coast 90 miles towards the city of Vera Cruz, the bottoms along the Tuxpan, Casonez, and Nautla rivers, and the creeks contiguous, constitute the richer parts. Here the cultivated varieties yield most without artificial fecundation, either on account of the number of wild bees in the locality or by self-pollination, which some claim as impossible. The United States Consul at Tuxpan says that

#### ARTIFICIAL FECUNDATION

must be practised in order to produce the beans in commercial quantities. The vanilla plant is a vine of a bright green colour, with a smooth, waxy, transparent bark. It has a thick, waxy-looking leaf, light green in colour, 6 to 9 inches long,  $1\frac{1}{2}$  to 2 inches wide, and sharply pointed. The vine reaches out tendrils which cling tightly to its tree support, but do not, as some believe, draw nourishment from the tree. The best time to set out the vines, or rather cuttings, is in April or May. The cuttings are the vines divided into lengths, usually  $2\frac{1}{2}$  to 3 feet long. Some of these can be cut in two according to the number of joints. Two to three joints are sufficient to put under the ground, with the same number of joints above ground. The joints are easy to propagate, in fact they are hard to kill if kept from being bruised. A cutting can be kept in the house on a dry shelf, and will live for months with scarcely any apparent change. In making a vanilla plantation much depends upon the selection of location. The first thing is to have the plantation where the pilfering of the beans while ripening can be prevented. A vanilla plantation need not be large; a few acres, with care and proper fecundation, will soon produce excellent results from a monetary point of view. Patient care and attention at the proper time is the chief secret of success.

#### THE VINE REQUIRES RICH SOIL.

heat, ventilation, shade, and moisture. Rich pockets of land along the creeks and river bottoms are best. A profusion of wild vines of all kinds growing into a jungle, with abundant loose soil affording ventilation at the roots, is the best proof of the adaptability of the land. The land should be free from sand on account of the drought, and free from clay, which would cause the vines to rot during the rainy season. There should be plenty of small trees, at the feet of which the vines can be planted. Trees which have smooth bark, and which never shed their bark or leaves, and grow to be no longer than 2 to 4 inches in diameter and from 7 to 10 feet high, are best for this purpose. Usually a variety of such grow on all wild lands, and any of them are good if the trunk of the tree be smooth, with plenty of sap. A small orange tree affords a good trunk for vanilla to grow to. If, while clearing the land, there be not enough of such trees found already growing, to plant the desired number of vines (there should be from 1,500 to 2,000 vines to the acre) enough should be planted, selecting the kinds that make the most rapid growth, which exist in abundance, and are destroyed by the thousands in nearly every new clearing of land. The ground should be kept clean from weeds. All undergrowth should be thrown around the vines to decay, and serve as manure for the roots. The ground around the roots should not be disturbed. One or two vines should be planted to each tree, and tied at first to the trunk with some flat, flexible band, such as strips of coconut leaves or plantain fibre. Round cord should not be used, as it is liable to cut and injure the green, succulent stem of the vine. Livestock are never permitted on a vanilla plantation. The stems and roots of the vine are disturbed as little as possible.

## THE VINE NEEDS NO CUTTING OR PRUNING,

and all other wild vines are cut out and kept from choking the vanilla vines. The trees should be topped to prevent too high a growth, so that the flowers can be reached from the ground. Light and ventilation beneath, shade from the sun above, rest and plenty of moisture—but free from standing surface water—are the prime requisites for the growth of vanilla vines. One peculiarity of the vine is that after three or four years planting, the stem will rot off at the roots, and continue to rot three to four feet up the vine, while the top looks green and flourishing. In the meantime, from above where it is going to rot, it shoots out fine little rootlets like threads, and continues them to the ground. So delicate are these threads running along the trunk of the tree, and so prominent the rotted off end of the stem, that it gives the vine the appearance of living independent of the earth, thus giving rise to the theory that it is an air plant. It will sustain itself in a severed state, but to make material growth and fruitage it must connect itself with mother earth. The new vine will commence bearing the third year from planting, and full crops may be expected the fifth year. A vine will bear from 15 to 45 beans a year. Some vines have been known to produce as much as 65 beans at one time. Twenty beans to a vine is a good average. Rarely do those who grow the beans cure and market their crops. Some buy the green beans and make a business of curing and exporting them. Consul Jones says that judging from the way they all get rich at the business, and the difference between the price at which they buy the green bean and the price at which they sell the cured, there must be more profit in the curing than in the growing. Still, in view of the price of vanilla, and the demand for it all over the world, there are large profits for both parties. Wild lands suitable for vanilla can be bought for £1 to £2 per acre. There are vanilla-producing plantations in the vicinity of Papantla that could not be bought

FOR £100 PER ACRE.

Various estimates have been furnished as to the cost per acre of converting wild lands into vanilla-producing plantations. Approximately, £17 an acre is correct, which is very moderate for so profitable a plant. The greater part of the vanilla in the district of Tuxpan is grown about Papantla, much of which is exported from Vera Cruz, it being easier to reach Vera Cruz by water than Tuxpan by land. The two busy seasons of the year are during the pollination months—March, April and May, and the gathering months—November, December, and part of January. During the balance of the year the plantation should have absolute rest, other than keeping down the weeds and undergrowth. Many of the beans are gathered in October, sometimes before they reach their growth, by those who see an opportunity of gathering them unknown to the owner, or by the owner, for fear of losing them, because he has not his vines where he can watch them. Beans gathered too soon are woody and inferior in quality, lacking the oil that furnishes the flavour. Good ripe beans lose but little of their weight while curing; 5 lb. of green beans will weigh 4½ lb. when cured. The quality and flavour are increased by allowing them to mature and by the proper curing. The curing is principally done by Spaniards who have followed this business. The process adopted is slow and laborious. The secret is to evaporate the water while retaining the oil, and to take care not to injure the flower. Vanilla is principally exported from Mexico to the United States—about \$400,000 worth annually.—*Journal of the Society of Arts*, April 21.

## CINCHONA: A RETROSPECT AND A PROSPECT.

There is no need to tell regular readers of the *B. & C.D.* that cinchona bark and quinine are now at one of the most interesting periods of their history since the introduction of the former to Europe in 1640 and the discovery of the latter about 1820. For the

benefit of those, however, who have missed the opportunity of following recent developments in these drugs a few succinct notes on these will be worth giving, and we may at the same time add something new in the shape of information as to the course of events in the future.

The situation of the moment is this. Quinine has seen a period of active speculation, during which its price in the "second-hand" market (that is in the buying and selling of German quinine in London that mainly takes place in Mincing Lane and between parties none of which are makers) has gone up to 1s 9½d per ounce, and since receded to 1s 4d. This advance was anticipated in the *B. & C.D.* of January 27th, at which time quinine was exciting no attention, and was only worth 10½d per ounce. The natural cause of such an advance was, according to our articles of that and subsequent dates, the short supplies of bark that continental makers of quinine possessed, in spite of the huge shipments from the producing countries in 1898.

The course of events that has led up to this state of affairs is remarkable. South America, the home of the cinchonas, has for some years been almost a negligible source of supply for cinchona bark. Since the cultivation of the cinchona trees was taken up in Java, India, and Ceylon, prices have declined so much as to discourage the exporters and collectors in South America from pursuing their labours. India and Ceylon, once started on the cultivation, rapidly grew, the latter especially extending its output so quickly as to cause most venturesome prophecies of its future. But prices became too low even for it, and Java, which was longer in getting on its feet, when it did stand took a firmer footing, and so has been able to endure the cutting down of prices. The Dutch in this island laid hold of the best kind of tree, and then made tremendous strides in securing the bark market, which was thus transferred from London to Amsterdam. Ceylon planters at last found prices so unremunerative that they began uprooting trees, and turning their attention to other things. India reached her height in 1889, and has since then been going down fast, her planters also being disgusted with the reward of their outlay. And all this time Java has not only managed to hold on but to grow.

While all this has been going on the consumption of quinine has been enlarging. The reduction of the price of bark was to a large extent the result of a combination of the quinine manufacturers. At length the worm turned; the bark importers in Amsterdam made a stand, and supported by the strength of the market that had now been attained (through the fact that Java exports had not grown enough to make up for the loss from India and Ceylon and the increased consumption) they secured a slight advance in the price of bark. This encouraged India and Ceylon to ferret out all their stores, and ship as much as they could. Hence it came about that in 1898 there was more quinine in bark form shipped from the growing countries than ever there has been before. Yet, today, stocks of bark in the public warehouses of Amsterdam and London are lower than they have been for years. So that the observant ask, What is to become of the price of quinine? Where is the bark to come from? And that is a subject for another paragraph.

\* \* \*

If it be true that India and Ceylon last year put forth as big an effort as they are capable of, then we cannot look to them for increased supplies unless they begin again to extend plantations, and the crop from these would not be ready for five years at least. Java appears (though the statement here is more doubtful) to be in the same condition. It looks then as if we must turn our attention to the original source of bark once more. And here we are dealing with a mysterious factor. No one can speak except hazily about the supplies America holds. Judging by the history of past years, it would seem that we must depend on Columbia for most of the natural South American bark. And it will not pay Columbia to start collecting again until bark is much dearer than

it is at present. A planter we have seen, who has a very lengthy acquaintance with the chief producing districts, considers that a unit of 4d would have to be reached before it would pay to collect even the richer barks. This means that, whereas now the unit is 2½d, i.e., that 1-100th lb. of quinine costs whilst in the bark 2½d., the same amount would have to be worth 4d. If this were so, quinine (in bark) would be worth, to manufacturers, 2s 1d per ounce, and worth, to the wholesale dealers, about 2s 6d per ounce. If Java, India, Ceylon and Africa cannot produce enough to meet the demand until five or six years have elapsed and the expert's view given above is correct, then there is nothing for it but to pay the price we have named.

And that is a prospect worth studying. Perhaps it will tempt some of our readers to sigh for the planters' existence, in which longing they may be strengthened by the photographs reproduced in connection with this article. These all represent views in Java, either of plantations or of the planters' bungalows. But they have had their bad times—these planters—and it is to be hoped their opportunity is coming at last.

The next question is, Will they make use of their chance? They can scarcely help doing so if they do not behave with the utmost folly. In that unlikely possibility, however, that we had in mind when we spoke just now of Java's apparent condition—the possibility that is, that it has not been sending over as much bark as it can by normal collection, there may arise a forced collection under the impression that present prices are worth this; and if the quinine makers, aided by this, do manage to press the price down a little the importers may give way further. But this would be extraordinary folly on the part of the bark growers and importers, and not in accordance with their recent conduct. If they show only the smallest amount of firmness they can let makers see that the recent manœuvre which the latter made is transparent and refuse to be drawn into working the game of the latter.—*British and Colonial Druggist*.

### TO DESTROY ANTS.

To cleanse a cupboard infested with ants, all the shelves should be washed with carbolic acid and water, or carbolic soap. If the scent of the carbolic is offensive, as it is offensive to some persons, use the following:—A large lump of ammonia dissolved in hot water, and cold added. The proportion is ammonia the size of a hen's egg to a quart of water. Brush the shelves well over with it. The ants will soon leave, as they greatly dislike the scent of ammonia.—*Queensland Agricultural Journal*.

### MINOR PRODUCTS REPORT.

**CINCHONA.**—As announced last week, the Amsterdam auctions on May 4th will be very small, and, supplementing the particulars there given, we may state that the total weight of the 4,639 packages (consisting of 253 bales and 82 cases Government culture and 3,748 bales and 556 cases private bark) is 396,541 kilos, divided as follows:—Ledgeriana, 28,924 kilos., succirubra, 5,681 kilos. Of the private bark (weighing 361,936 kilos.) 268,179 kilos. are Ledgeriana, 76,988 succirubra, 16,252 hybrid, 300 Calisaya, and 217 kilos. officinalis.

**COCOA BUTTER.**—The auctions to be held in Amsterdam on May 2nd will consist of 70 tons Van Houten's, 3 tons Hamer, and 2½ tons Helm brand, while at London on the same day 85 tons Cadbury will be offered.

**QUININE** has passed through a dull week, and prices in second-hand have declined fully 2d per oz. At the close of last week business was done to the extent of some 70,000 oz., including spot or May delivery at 1s 4½d to 1s 4½d, and June 1s 4½d to 1s 5d, but mostly August at 1s 4d to 1s 6d. On Saturday the

market was further depressed, in consequence of the good report from Java regarding the bark shipment, half of April being returned at 585,000 Dutch lb. This week opened dull at easier prices, the small business done on Monday comprising spot at 1s 4d and May delivery at 1s 3½d to 1s 4d. On Tuesday there was a further decline to 1s 3s spot or May delivery, but little business was done. There was a "bear" rumour on Change on Tuesday that makers had reduced their price to 1s 3d, but it proved to be without foundation. Yesterday the speculative market improved somewhat, and 1s 4d was paid for August, and there were no willing sellers of spot stuff at 1s 3½d until the close, when 1s 3d was the price for prompt or May. Today the market is flat and unchanged. The week's turnover is about 200,000 oz. There is considerable doubt as to what the makers' next move will be. Much depends upon how the bark sales go in London next week and in Amsterdam in May. It is not expected that the present unit will be maintained, but the holders of cinchona now hold the key of the situation.

In their periodical report Messrs. Gehe & Co. have something to say regarding the speculative movement and appreciation in the value of quinine. We quote from their remarks, not so much owing to their originality, but as showing that the opinions are similar to those that obtain in England and America:—"The upward tendency has arisen from a justifiable view, but it must be borne in mind that we may have strayed all too far away from really firm ground. Present circumstances are not new, but have, on the contrary, very often arisen. In every crisis a time arrives, when an outside attack causes a psychological change, but it has always happened that when it was hoped the price-position had reached its height, fate caused another downfall. This is to a certain extent due to natural circumstances, as a higher rate of production leads to more of the material being introduced into the markets, which again lowers its worth. Last year the prices of quinine were raised from the low position into which they had fallen in 1897, and it would be a great pity if, through want of due care were allowed to be dragged down again.—*Chemist & Druggist*, April 22.

### CEYLON TEA COMPANIES.

We have been favoured with a special report of the proceedings at the meeting of the Standard Tea Estates Co. under the presidency of Mr. Alex. Brooke. No Company has been more carefully guided from its inception than this one; while no other reflects more credit on its Directors, Agents and Managers. The anxiety not to imperil the high reputation of the Company is well shown in the discussion on the issue of Preference Shares and by the narrow division that followed. We can only say that the interests of the shareholders are in safe hands.

Mr. Rutherford, as Chairman of the Ceylon Tea Plantations Co., made a very full and instructive statement at the annual meeting. The question of manuring is being considered in all its bearings. But of most value is what we are told about the coconut investments: how that the only plantation in bearing is paying 6½ per cent, and that a return of £2 profit per acre will equal fully 7 per cent on the capital outlay. This is very satisfactory. Mr. Talbot had not much that was new to say; but his report is eminently reassuring after all the talk of blight up and down country at this end.

Mr. A. F. Souter made the proceedings a little lively at the Imperial Co.'s meeting,

and succeeded in obtaining a good deal of additional information, which, however, in our opinion, went to show that Directors, Agents and Managers are working with the utmost economy. Mr. Souther was also the sole critic at the Nuwara Eliya meeting; but the full information afforded, evidently satisfied the shareholders, and a resolution towards further economy found no seconder.

COPRA MARKET.

Colombo, May 15.—Arrivals of copra are still poor; consequently prices are keeping up.

There is a great demand for nuts.

Prices of copra today are as follows:—Catt copra, R41 to R43 per candy; Marawila copra, R44.50 to R45.50; estate copra, R45.50 to R46; Calpentyn copra, R46.50.

CEYLON PROPRIETARY TEA ESTATES COMPANY, LIMITED.

Report of the Directors submitted at the second annual ordinary general meeting of shareholders held at the Office of the Company, on Tuesday, 9th May.

The Directors herewith submit the General Balance Sheet and Profit and Loss Account for the year ending 31st December, 1898, duly audited.

	£	s	d
The net amount at Credit of Profit and Loss Account after writing off balance of the Preliminary Expenses, providing for General Expenses, Income Tax, &c., is ..	5,244	10	4
Debenture Interest paid to 30th Sept., 1898 ( <i>less</i> Income Tax) amounts to ..	£725	0	0
<i>Less</i> from last account ..	181	5	0
Three months' Debenture Interest to 31st December, 1898 ( <i>less</i> Income Tax) amounts to ..	181	5	0
Preference Dividends paid for 1898 ( <i>less</i> Income tax) amounts to ..	1,262	16	0
Interim Dividend of 2 per cent. on the Ordinary Shares paid 31st October, 1898, amounts to ..	1,567	12	0
It is proposed to pay a final Dividend of 2 per cent. on the Ordinary Shares (making 4 per cent. in all, free of Income Tax), which will absorb ..	1,567	12	0
And to carry forward to next year a balance of ..	121	10	4
	£5,244	10	4

The past year has been an exceptionally bad one for the Ceylon Tea industry generally, and the Directors regret to say this Company suffered in common with others.

A further rise in the rate of Exchange, together with a diminished crop, owing to unseasonable weather, curtailed the profits for the year.

The crop of tea from the Company's Estates was 857,351 lb., 94,370 lb. were manufactured for others, and 38,530 lb. from bought leaf; the total output amounting to 990,251 lb.

The yield of tea was 407 lb. per acre, the gross price realised in London was 7.15d per lb., and including that sold in Ceylon 6.94d per lb. against 6.90d last year, and the average rate of Exchange 1/4 15-64ths against 1/3 15-32nds.

The following is a statement of the acreages of the Company's Estates:—

Estates.	District.	Tea in bearing.	Tea not in bearing.	Jungle Scrub, &c.	Total.
		Acres.	Acres.	Acres.	Acres.
Beaumont	Pussellawa	823	81	353	1,257
Forres	Makeliya	356	...	82	388
Troy	Kelani Valley	326	40	105	471
Summerville	Dikoya	190	...	52	242
Radella	Dimbula	410	130	130	670
Total acreages ..		2,105	251	702	3,058

Additions have been made to the Tea Machinery in the Forres, Troy and Beaumont Factories and 120 acres have been planted with tea during the year.

The Chairman paid a visit to all the properties of the Company in February last, and is able to report that they are in a good and improving state of cultivation.

SCOTTISH CEYLON TEA COMPANY, LIMITED.

INCORPORATED UNDER THE COMPANIES ACTS, 1862 TO 1886.

REPORT OF THE BOARD OF DIRECTORS.

Presented to the Shareholders at their tenth annual ordinary meeting, held at the office of the Company, on Wednesday, 10th May, at noon.

The Directors have pleasure in submitting to the Shareholders the Accounts and Balance-sheet for the year ending 31st December, 1898.

The net profits for the year amount to £4,234 11s 8d., which, with £951 12s 11ds., brought forward from last Accounts, gives a total sum to be dealt with of .. .. £ 5,186 4 7

An Interim Dividend on the Ordinary Shares of 3½ per cent (free of Income Tax) paid in September, 1898, amounted to .. .. 1,435 0 0

Dividends on the 7 per cent Preference Shares have also been paid, absorbing .. .. 630 0 0

It is now proposed to pay a Final Dividend on the Ordinary Shares of 6½ per cent (free of Income Tax), making 10 per cent for the year .. .. 2,665 0 0

Leaving a balance to carry forward to next accounts of £456 4 7

The Directors regret that the results shew a further slight falling off as compared with previous years, due to a continued high level of Exchange and a lower range of prices in the tea market during the past year.

The average rate of exchange was 1s. 4¼d. per Rupee, against 1s. 3 13-32nd d. for 1897, and the average prices realized in the London and Colombo markets respectively were 7.869d. and 32 cents against 7.956d. and 35½ cents for the previous year.

The total crops secured from the Company's properties amounted to 758,999 lb., which, though 17,001 lb., short of estimates, shew an increase of 50,466 lb. as compared with 1897 figures, and but for the deficiency in the rainfall, the crops should have been well over estimates.

In addition to the above, 208,716 lb., of tea have been manufactured for others, making a total output from the Company's Factories during the year of 967,715 lb.

The Directors have not thought it necessary on this occasion to write off anything for depreciation on buildings and machinery, as the Ceylon Manager's valuations of these as on the 31st December last are considerably in excess of the costs at which they now stand in the Company's books.

The Company's acreage remains unaltered at 1,963 acres, including 1,720 acres planted in tea. The periodical reports from Ceylon continue to be of a satisfactory nature, and, given favourable weather, it is hoped that the results of the current season's working will shew an improvement on those for the past year.

The Directors have again to express their appreciation of the services of the Company's staff, both in Ceylon and London.

**RANGALLA TEA COMPANY OF CEYLON LIMITED.**

Report of the Directors for the year ending 31st December submitted at the annual general meeting of shareholders held at the offices of the Company on Monday, 8th May, at 11-30 a.m.

The Directors beg to submit the balance sheet and profit and loss account to 31st December 1898, duly audited.

The balance brought forward from last year, after payment of final dividend for 1897, amounted to ..	£106	0	1
To which has to be added the profit for 1898 ..	412	1	2
	<u>£518</u>	<u>1</u>	<u>3</u>

Which it is proposed to deal with as follows:—			
By writing off from cost of properties, as depreciation of machinery, &c. ..	£300	0	0
And carrying forward the balance of ..	218	1	3
	<u>£518</u>	<u>1</u>	<u>3</u>

The unfavourable result is due to a falling-off in the yield of both tea and cardamoms, caused by unseasonable weather, and to the lower level of prices ruling on the tea market during 1898.

The tea crop amounted to 206,620 lb. and the cardamoms to 240,000 lb. and 5,000 lb. respectively.

The sales of tea show a net average price per lb. of 6'31 pence, being equal to, say, 39 cents per lb. Exchange for the Company's drafts during the year has averaged 1s 4-16d, as against the exchange for 1897 of 1s 3-35-64d.

The following table gives the acreage of the estates for the last five years:—

	1894.	1895.	1896.	1897.	1898.
Tea in bearing ..	558	591½	591½	591½	591½
„ „ partial bearing ..	—	—	63	63	90
„ not in bearing ..	135	112½	61½	61½	34½
Cardamoms ..	63	65½	56	56	56
„ not in bearing ..	—	—	—	—	10
Grass and Fuel Timber	15	25	25	25	25
Forest and Waste Land	470	446½	444	444	434
	<u>1,241</u>	<u>1,241</u>	<u>1,241</u>	<u>1,241</u>	<u>1,241</u>

The following is a statement of the tea and cardamom crops, with the yield of tea per acre for the same period:—

	TEA AND CARDAMOM CROPS.	
Tea.	Cardamoms.	Yield of Tea per Acre.
1894 ..	160,963 lb.	3,786 lb. 300 lb.
1895 ..	201,631 „	2,172 „ 340 „
1896 ..	228,360 „	4,842 „ 380 „
1897 ..	212,555 „	8,291 „ 360 „
1898 ..	206,620 „	4,026 „ 349 „

During the year an additional expenditure of £1,081 has been incurred on capital account, but from this must be deducted £66 8s 9d realized by the sale of tea plants.

The prospects for the current year are more encouraging, the estimated yield being 210,000 lb. of made tea, and 5,000 lb. dry cardamoms, and according to recent advices received from Ceylon the yield for the first three months of the present year was 10,000 lb. made tea in excess of the corresponding period last season. The prices being realized at present for the Company's teas are also much above the average of last year, owing to the improvement in the market.

**RAGALLA TEA ESTATES, LIMITED.**

REGISTERED OFFICES.—30, Mincing Lane, London.  
DIRECTORS.—Charles Edward Strachan, Colombo, and 6, Balfour Place, Mayfair, W. (chairman); Charles Hannen, 25, Maida Hill West, W.; and Matthew Pennefather Evans, 30, Mincing Lane, E.C.

SECRETARIES.—M. P. Evans & Co.

Report of the Directors to be submitted to the Shareholders at the Ordinary General Meeting, to be held at 30, Mincing Lane, E.C., on Friday, 5th May, 1899, at 12 o'clock noon.

The Directors beg to submit their Report, and also Statement of Accounts duly audited, for the year ending 30th June last:—

Showing a net Profit for the	£	s.	d.
Season of ..	2,153	19	8
Add the balance of last Account ..	10	15	1
	<u>2,164</u>	<u>14</u>	<u>9</u>

The Total is ..			
Out of which the following Dividends have been paid:—			
1898, 1st January—Preference Shares ..	£1,050	0	0
1898, 1st July—Preference Shares ..	1,050	0	0
	<u>2,100</u>	<u>0</u>	<u>0</u>

Leaving a Balance to carry forward of 64 14 9

The issue of this Report has been delayed by the desire of the Directors to place before the Shareholders the enclosed Report on the Company's properties, recently received from Mr. W. Lumsden Strachan—a large Ordinary Shareholder in the Company—who has just returned from Ceylon, and who, at the request of the Board, made an exhaustive inspection of the Company's properties. [Will be given tomorrow.]

The Report shows that the Estates have been maintained in the highest state of cultivation, and that the future prospects of the Company are most favourable.

During the year the crops realized in London were:—

Tea, 367,715 lb., at a gross average of 9-96d per lb.
Coffee, 95 cwt. 2 qrs. 23 lb., at a gross average of 91s 8d per cwt.

The following are the acreages of the Company's Estates:—

	Forest				
	Tea.	Coffee.	Timber.	Patna	Total.
	Acres.	Acres.	Acres.	Acres.	Acres.
Ragalla ..	712	—	157	120	989
Halgran Oya..	195	—	23	183	401
Kelburne ..	772	10	135	64	981
	<u>1,679</u>	<u>10</u>	<u>315</u>	<u>367</u>	<u>2,371</u>

In common with many others, these Estates suffered severely from the excessive drought, and the Directors much regret that, owing to the short crops and the higher cost of cultivation, brought about by the advance in exchange, the average for the season being 1s 3-9d per rupee, the profits of the Company have seriously fallen below the estimates, and that no Dividend has been earned on the Ordinary Shares.

PLANTING IN BRITISH CENTRAL AFRICA.—We direct attention to a chatty and instructive letter from an ex-Ceylon planter now busy over coffee and tea in Nyassaland. He is very candid in his report as regards our old staple; and we should suppose there was more in tea if a local market could be found, including that of Mashonaland and indeed all the way to the Cape. Of course, if proper factories are built and preparation carefully attended to, there will no doubt be shipments to Europe; but it will take some years before these can be appreciable.

## COCONUT PLANTING IN CEYLON.

(From Mr. Rutherford's speech at the Ceylon Tea Plantations Company, Limited.)

Our issued capital of £248,460 is equivalent to a capital value of £23 per acre for all the planted land in tea and coconuts, allowing £1 per acre for the value of cultivated lands. The advances to coolies last year stood at £13,003, and are now at £11,201, which is a step in the right direction, and had the crop been a larger one there would have been more work for our labour force, and consequently with more wages they would have been in a better position to repay their advances. The investments at cost are £29,045, an increase of £215 over the previous year, and if these securities were realised they would yield a considerable profit on the cost price. The coconut estates and mills now stand at £51,491, or £4,270 above what they were the previous year. The sales of tea amounted to £122,385, or £8,236 less than the year before, but the expenditure in Ceylon was less by almost exactly a like amount commissions and interest this year amount to the considerable sum of £5,357, and I may point out that a good share of the profits so earned comes from our having a reserve fund, enabling us to earn interest and also commissions from sources other than the commission charged on the company's own sales of produce. I do not think I need say anything more with regard to the figures in the accounts, than merely to state that the net profit of £41,381 is only £813 under that of last year. Reverting back to that portion of our reserve invested in coconut estates and mills, as we show very little profit under this head, some of you may be of the opinion the investment is not a particularly good one. To make our position perfectly clear to you. I must explain that of the £51,494 so invested, £28,000 is in young coconut estates, which cannot be expected to give any return until the trees begin to bear in four or five years' time. £19,400 is the price of Sirangapathe Estate, the only place we have in bearing, and which has given us a return of 6½ per cent. per annum from the day we bought it. It is not yet in full bearing, and we look for better results with age. The balance of £3,800 represents the cost of our Hunupitiya Mills, which during this, the first full year of their working has unfortunately resulted in a loss of £848. The chief reason our manager gives for this is that the engineers who had the erection of the oil machinery were unable to get it to work and no oil was produced in 1898. Added to that, the price of desiccated coconuts fell so low that we lost on our manufacture of this article. We have every confidence, however, that the mills will pay a good return on their cost, and that the loss for the first year's working is more or less incidental to fresh ventures of this nature. We have had estimates made which show that our capital outlay to bring our planted lands into bearing coconut lands (inclusive of cost of mills) will amount to £57,000, and a profit of £2 per acre would yield fully 7 per cent. on that capital sum. The acreage we have in bearing has yielded an average profit of £2 16s per acre (and that is not in full bearing), so that we would like you to understand our belief in the future of that portion of our reserve investment is in no way weakened by the unfavourable result of last year. To return to our larger interests in tea.

## TEA PLANTING IN CEYLON.

It would seem that at length the continued and combined efforts of Ceylon and India in finding new markets for their teas have had the desired effect of increasing the demand in various countries of the world, and to turn the scale in favour of the producer. There is every reason to hope that as extensive clearings of land for tea have practically ceased, at any rate in Ceylon, supplies for the future will be well within reasonable limits of the demand, and that prices will be maintained at a fair level of profit to the producer. This company has practically exhausted its reserve land for opening out in tea, and we have been asked by some shareholders in that case why we do not purchase forest lands, and add to our acreage in cultivation. Our reply is that the Ceylon Government have closed the door to the acquisition by planters of any remaining forest land at high elevations, and that the production of low-grade teas in the poorer jungle lands still remaining in the low country of Ceylon is not sufficiently attractive for a company like this to venture into. As you are aware, we have been carefully noting the effects of manuring, and I think had we not cultivated our bushes as well as we have done, we would not be now enjoying the good results we are. We began manuring in a tentative fashion in 1893, and have during the last three years spent an average annual sum of £4,400 on this item. It is our endeavour to bring the estates, if not up to a higher yielding capacity, at any rate to do all we can to keep them from going back in productiveness, and this, naturally, can only be done by a more liberal system of cultivation. Where we have carried out manuring persistently and systematically it has undoubtedly resulted in a greater profit per acre, and sustained the bushes in a more vigorous condition than they otherwise would have been. Manuring a fourth of our acreage yearly would entail an outlay of nearly £7,000 per annum, and should we come to the conclusion this extended policy of manuring is necessary to increase, or even maintain, our profits, we shall not hesitate to incur the extra expenditure under this heading.

*Mr. Talbot's view.*

We may reasonably hope that we can equalise our crops if we can cultivate sufficiently. As regards the results of our manuring, the treatment we have adopted for the last two years in some of our estates has been entirely successful. It has repaid outlay. Having come to that decision with regard to our cultivation, I can speak with confidence as to the future of this Company, for in my visits to Ceylon I saw a good deal of tea planted in exhausted lands which were not so treated and which in unfavourable weather was of necessity unremunerative. You gentlemen in the tea market know the advance being made in Ceylon tea. In Colombo, I know that some influential Russian buyers had started to take up large quantities of tea, and now that we know our output from the reasons I have given is likely to increase, I think the company is in a much better position than it was before. With regard to the working of the estates, I dare say you will remember in the early part of last year there was a great demand for economy. We made good provision for the plucking and manufacture of tea with the result

that during the past year we have got a better range of prices. Those in charge of the estates deserve our congratulations, for they have kept up their quality and prices at a critical time. Next, as regards the labour supply. This has become almost a standing dish with us. The labour supply in Ceylon is now in a position that I have never known it before. At the beginning of this year it was unnecessary to send any money to India for the recruiting of coolies. The labour supply being more than sufficient, we have every reason to think that our liability for advances will go down. I may say that during the past year there was a certain amount of hardship among the coolies, the supply of labour being greater than was required for the work. The coolies said they would rather stay on if they might be allowed to work half-time. That means a good deal of trouble to the superintendents, and I think we may congratulate ourselves they kept the labour force in good order without our making any further advances.

### NILGIRI GAME AND FISH PRESERVATION ASSOCIATION.

#### CLOSE SEASON—TROUT FISHING.

OOTACAMUND, MAY 10.—At a meeting of this Association, on Wednesday, the following elections were announced to have taken place:—Lieut.-General Sir George Wolseley, Major Fanshawe, Major Bagnall, Mr. S G Roberts, and Mr. A S Crum. Of these, Lieut.-General Sir George Wolseley, Major Bagnall, Mr. S G Roberts, and Major Fanshawe were asked to serve on the Committee.

Captain Swan has been obliged to resign charge of the trout cultural operations, and Major Bagnall has kindly consented to relieve him. A batch of rainbow trout is now on its way from England.

With regard to the extension of the close season to the reserved forests in South-East Wynaad, the following notice has been issued by the Collector and recorded with satisfaction by the Association:—“Under the authority vested in him by Rule 7 of the Rules framed under Sections 21 and (f) of the Madras Forest Act, and published in the *Fort St. George Gazette* by notification No. 40, dated January 10th, 1894 (*vide* also *District Gazette Supplement* for March, 1894), the Collector hereby notifies that the close season for large and small game in the reserved and rented forests of South-East Wynaad shall begin on the 31st October for large game, and on the 19th September, 1899, for small game, and that thereafter the close season for both large and small game in the forests aforesaid shall be the same as in other parts of the district.

The cases referred to in Resolutions IV and V of the last Committee meeting, viz., the accidental shooting of small stags by two license-holders have been settled.

A meeting of the Sub-Committee had already been held for deciding whether and when the fishing for trout should be opened in the Pykara river, Kundah river, and Emerald Valley river. There were present:—Captain N G Beadnell, Mr. M. Clementson, Captain C T Swan, Mr. W L Edmiston, and Mr. F J Hill.

It was resolved that fishing for trout under the following restrictions be thrown open to all game license-holders for the months of March, April, and May, 1899:—(1) The only lure to be used to be artificial fly; (2) No gaff to be used, but a landing net; (3) All fish under 12 inches to be returned to the water; (4) All fish found to be in spawn to be also returned to the water, and it was earnestly requested that a record of all fish caught be sent to the Honorary Secretary, Nilgiri Game Association.

In this connection the following note has been received by the Honorary Secretary from Major Bagnall:—“If there is any probability of a meeting of the Game Association soon, I would like to bring the following questions before them:—(1) Whether trout fishing should not be opened everywhere, except-

ing in Burnfoot Lake. If the trout are fairly fished for with fly and local limits to size laid down, there is no fear of too many being caught; in fact, my chief object in raising this question is the preservation of the fish, as the watchers will work much more keenly if they know sahibs are about. (2) Whether there should not be a license for fishing *only* at a reduced price (say R15). (3) If we really are to preserve trout, the fly only should be allowed in those streams which are known to have a fair stock of trout.”

On Wednesday it was resolved “That fishing for trout be thrown open to all game license-holders of the season 1898-99 up to the end of August, 1899, with the exception of the following water:—(1) Burnfoot Lake; (2) the tributary of the Avalanche stream that flows past the Avalanche bungalow; (3) the headwaters of the Bozau River; (4) that the fishing be free to the above-named license-holders up to the time specified in the foregoing Resolution, subject to the conditions proposed by the Sub-Committee.

The Committee hopes that with the record of fish caught the name of the flies with which they have been taken will be sent to the Honorary Secretary. —*M. Mail*, May 12.

### TEA CORPORATION, LIMITED.

The following circular has been issued to the Shareholders of this Company:—

It will be within the recollection of those of you who were present at the adjourned general meeting, that a strong view was expressed by some Shareholders, in which your Directors acquiesced, that a short *résumé* of the working of the Company's Estates should be circulated, as soon as the Directors considered themselves in a position to make a statement. They have pleasure in forwarding you this Report, which shows the working of the Company's Estates, as far as possible, up to date.

They wish, however, emphatically to point out that the following figures must not be taken as an indication of the result of the Company's working for the whole year, as the expenditure for the first half-year (which includes the cost of the greater part of the manuring for the year) is much heavier than for the succeeding six months, while the larger portion of the crop is produced and sold during the latter portion of the year.

The amount of tea produced from 1st July to 31st December last was about 530,000 lb., at an average cost of 31½ cents per lb. Over 530,000 lb., have been sold in London and Ceylon up to the end of March, at an average of rather over 6d per lb. nett. Since the beginning of the year, the price of common tea has advanced considerably, and the sales of the Company's tea during February and March averaged 6½d per lb. nett.

It is, however, important for the Shareholders to bear in mind, that the Manager's estimate of the tea output is liable to fluctuation owing to climatic conditions; this will be appreciated by those Shareholders who may possibly be investors in similar Companies, where market and climatic conditions sometimes unavoidably upset the most carefully drawn conclusions. At the same time your Directors are pleased to say that the Manager advises them that the recent drought is now at an end, and that rain having fallen in every district, heavy flushes can be expected during April and May.

The rise in the price of tea above referred to is a matter for congratulation; it is naturally impossible to form a definite opinion as to whether it will be maintained, but the statistical position of the Tea Market generally, and the largely increased demand for Ceylon teas, undoubtedly point to a higher range of values being maintained than that which has ruled during the past two years.

The estimated output of tea from your estates (which estimate has been carefully compiled by Mr. Tatham, the Company's Manager in Ceylon) is 1,300,000 lb., which should show, from tea alone, a very satisfactory income, without taking into account any profits arising from Plumbago, Cocoa, Tea Seed, etc.

As regard the question of Plumbago, which was referred to at the meeting, this matter is having the careful consideration of your Directors; they are now awaiting more definite statements from the Manager, who has already been approached by certain persons with a view of leasing or purchasing the mining rights. Nothing, however, will be done without the approval of the London Board, who have in mind that, if necessary, expert evidence should be obtained as to the value of this Plumbago Deposit.

By Order of the Board,

E. T. BARTLETT,

Secretary.

15, Bishopsgate Street Within,  
London, E.C., 22nd April, 1899.

### COFFEE AND COCOA IN SAN DOMINGO.

The mountain regions of San Domingo, says Robert S. Hill, in his admirable work, "Cuba and Porto Rico," like those of Haiti, Cuba, and Jamaica, are especially suited to the culture of coffee. The annual yield is about a million and a half pounds. The area of uncultivated lands suitable for coffee in this island probably exceeds that of all of the rest of the Antilles.

Cocoa is extensively cultivated, much foreign capital having been invested in it within recent years, and the production having multiplied five-fold within the past decade.—*American Grocer*, April 12.

### PLANTING NOTES.

**GREEN TEAS.**—It will be seen from an interview reported elsewhere, that Mr. Ayden favours the preparation of Ceylon green teas for the American market.

**A NEW VENTILATING FAN** is in working order at the Sirocco Factory (Davidson & Co., Ltd.), and its results are certainly extraordinary. A little 30' diameter Fan puts through over 10,500 cub. feet of air per minute when driving at only 380 revolutions per minute, and the power required to drive it was only  $\frac{1}{2}$  H.P.—its work is therefore 2-3rds of 1,000,000 cub. feet per hour.

**"CROSSMAN ON COFFEE."**—It is evident from the April circular of W H Crossman and Brother (says the *American Grocer*) that they are firm believers in a continuation of cheap coffee, and that prices must go considerably lower before overproduction will be checked. The present Brazil crop is placed at 5,500,000 bags of Santos and 3,500,000 bags Rio, making a total of 9,000,000 bags. The next crop, it is believed, will exceed that of 1898-99, but this is regarded immaterial, as "the fourth consecutive large crop in excess of the requirements of consumption will mean a continuation of very low prices. With three large crops in Rio and Santos aggregating 28,000,000 bags, and a fourth (claimed to be a "record breaker" to follow, it is no longer a question how much coffee is on the trees; it is a question how much coffee is in the warehouses, the surplus production of the last three seasons."

**DARJEELING TEA.**—Recent advices from Darjeeling—says the *Indian Planter's Gazette*, April 29th—state that tea prospects are looking up in the surrounding district, the late heavy rain being good for the bushes. Most gardens are going in for very fine quality in the manufacture of tea. Planters consider that the season is opening favourably.

**"THE VANILLA BEAN IN MEXICO"**—is the subject of an interesting paper from the Society of Arts Journal, which we reproduce in our daily and *Tropical Agriculturist*. All interested in this spice, the cultivation of which in Ceylon has lately been on the increase, should carefully study the brief article referred to. Vanilla plantations in Mexico, we see, are valued up to £100 per acre.

**A FAVORITE FODDER.**—We have heard "Alfalfa" or "Lucerne" (*Medicago sativa*) much praised by Mr. Noek of Hakgala, who has had a good deal of experience of foders. The following is from a recent number of the *Rural Californian*:—

Alfalfa is better than a bank account, for it never fails or goes into the hands of a receiver. It is weather proof, for the cold does not injure and heat makes it grow all the better. A winter flood will not drown it, and a fire will not kill it. As a borer it is equal to an artesian well; it loves water and bores to reach it. When growing there is no stopping it. Begin cutting a 20-acre field, and when your last load of hay is handled at one end of the field it is ready to cut again at the other end. For filling a milk can, an alfalfa-fed cow is equal to a hand pump. Cattle love it, hogs fatten upon it, and a hungry horse wants nothing else. If your land will grow alfalfa, you have the drop on dry weather. Once started on your land, alfalfa will stay by you like Canada thistles or a first-class mortgage, but only to make you wealthier and happy. Evidences of the profitableness of alfalfa on irrigated land in the semi-arid regions multiply from year to year.

**OIL MOTORS.**—Our London Correspondent ("B.P.") sends us the following:—"Everybody in Ceylon knows Mr. Jackson, of Tea Machinery fame, by name at least. I was interested to hear of a recent tour he took with Mrs. Jackson and two friends from Aberdeen to London in a motor car, driven by oil. The party travelled the distance of over six hundred miles in seven days, and their itinerary was as follows: left Aberdeen on the 17th April, reached Edinburgh the same evening, left Edinburgh at 10 a.m. 18th, reached Newcastle in the evening. Left Newcastle at 10 a.m. on the 19th and reached York in the evening; left York at 11 a.m. on the 20th and reached Gainsborough in the evening. Spent the following day there, and started once more on 22nd, reaching Huntingdon the same evening. Left Huntingdon at 11-30 a.m. next day, and arrived in London at 3 p.m. Forty gallons of oil, costing 1s a gallon, were used in the journey which for four passengers reckons up to 10s a passenger for over 600 miles. Mr. Jackson's conclusions as to the different kinds of power to be used comes to something like this. In towns where it can be easily obtained electricity would work best for private carriages and vehicles, and steam for busses, but in long country journeys "oil will be found to answer best being capable of storage to last some distances;" enough oil can be carried to do for 200 miles in such a motor car as he used, which held four people."

## FACILITIES FOR MAKING GOOD TEA—V.

We would group the replies received from Pussellawa, Kotagala (Lower Dimbula) and Watawala (Lower Dikoya) together for the sake of convenience, though the districts are neither adjacent nor characterised by the same conditions. Pussellawa seems pessimistic in its enumeration of the drawbacks to making better tea than at present—"jât, soil, climate, want of sufficient withering space, excessive pruning, bought leaf from native gardens, carelessness and indifference." A heavy catalogue truly! And yet we are told that, although the jât on the older plantations is inferior and mixed, on recently planted estates the jât is excellent; and that the soil is not generally poor, though, of course, not so good as in some of the younger districts. In the matter of jât and soil, Pussellawa is thus no worse off than other old districts which grew coffee and cinchona before the era of tea; but yet our friend declares that manuring would not be profitable, and would be only helpful in bringing up the poor portions to average yield. Does that mean that no financial benefit follows from placing the poor fields on a level with the good ones? And if the poor can thus be benefited, may not the better fields respond to manuring with larger crops? In withering room, factories are said, on the whole, to be deficient, but not in machinery, though there are exceptions, nor in motive power. Labour is abundant, or at least was when the report was made. Pruning has been far too severe in many cases, though not, perhaps, too frequent; it has, however, seldom been too long neglected. In dry seasons the tea in the higher fields does best; but when the rains set in, the lower elevations have the advantage.

From Kotagala, as from most other places from which we have heard, the chief drawback to making better tea is regarded as a deficiency in the soil; but we are very hopeful that agricultural chemistry will both indicate the character of the deficiency and suggest the remedy. We shall soon see what Mr. Kelway Bamber has to say on the subject. Of jât, we learn that there is good, indifferent, bad and very bad—a splendid range in sooth!—and the same description is applied to the soil. On wind-blown and steep ridges, estates are approaching the worn-out stage; and although faith is expressed in manure, as calculated to improve the bushes and possibly help the tea, its profitableness is regarded as contingent on cost of transport, &c. As regards factories, there is no great deficiency in withering room; nor are they wanting in machinery or motive power. Labour has been not only abundant, but even over-abundant for some time past; but, of late, we suspect, the supply has scarcely been in excess of the demand. Pruning has not been too severe except in a few cases, nor has it been too long neglected, at any rate, recently. And, it is comforting to learn, notwithstanding the growls about jât and soil that the district is, on the whole, very suitable for tea!

The only drawback experienced in Watawala in improving the character of the tea manufactured there, is connected with "cli-

matic disadvantages," by which we understand the inability to equal the flavour of the highest districts, rather than excess of sun or rain for proper manufacture. In jât, though some of the bushes are very poor, others are good, making the district as a whole a very fair medium. The soil is generally "lightish"; and if the tea districts be divisible into three classes, Watawala prefers a claim to be reckoned in the second for soil—few, if any, of the estates being worn out. It is consistent with this verdict that faith is expressed in manures, as both improving and profitable, save on the very poorest fields. The average estate should, therefore, derive benefit from manures and find their application remunerative. There is no deficiency, whether in withering room, motive power, or machinery, in the factories, and the labour supply is adequate. Severe pruning is not practised, but average bushes will not run long without pruning—22 months being a fair limit. In some cases the bushes have been allowed to grow too high and beyond the sustaining power of the soil; but the yield is fair, the climate being wet, although soil and climate are against the attainment of the best flavour.

## CEYLON TEA COMPANIES' REPORTS.

Several Reports, published by us, remain to be noticed. There is not much noteworthy in respect of the "Proprietary Tea Estates Company;" but why do some reports give the cost of the tea harvested, and others not? Several Companies tell us the gross price realized; but nothing is said as to cost f.o.b. or otherwise. The "Proprietary" has 2,105 acres of tea in bearing and 251 young, distributed over five districts so representative as Pussellawa, Kelani Valley, Dimbula, Dikoya and Maskeliya. The dividend for last year was 4 per cent. The Scottish Tea Company, as already mentioned, gives 10 per cent altogether for 1898: it owns close on 2,000 acres of tea, all in Dikoya, Lower Dikoya and Maskeliya districts. The Rangalla Company is in the unfortunate position of giving no dividend whatever, owing to a falling-off in the yield of both tea and cardamoms last year, the latter especially giving less than half the crop of 1897. Prospects for 1899 here, as in most Reports, are given as encouraging. We now come to the Ragalla Tea Estates, Ltd., which is also unable to show any dividend to its ordinary shareholders—a very remarkable fact, considering the high reputation of Udapussellawa estates (Ragalla and Halgranoya) as well as of Kelburne in Haputale. Possibly, too much was paid for the latter as one reason for the disappointment about dividends. However—a special Report has been furnished on these properties (which we give on page 870 by Mr. W. L. Strachan and he is very hopeful (as a large shareholder himself) that there are better times and crops to come. We are much surprised that Ragalla should be cropping at not much over 300 lb. an acre, and this is the more striking as one flat gives over 1,000 lb. an acre. But Mr. Strachan anticipates a steady increase until 600 lb. an acre

all over is reached. For Kelburne a crop of well under 300 lb. an acre was only got for 1898; but for the current year the estimate is about 400 lb. an acre at a cost f.o.b. of 33·07 cents per lb. Finally, the Tea Corporation, Limited, issues a special circular as to prospects which is of a decidedly satisfactory character, even if the plumbago anticipations come to nothing.

#### CEYLON TEA AT PARIS EXHIBITION; AND ON THE CONTINENT OF EUROPE.

MR. RENTON is a fortunate Colonist: for, not only is he to have the Planting Commissionership to the Exhibition, but a fee of £500 for the duties to be performed. After the Exhibition closes, his three years' engagement as Commissioner for the Continent on £1,000 a year will commence. All this we gather from the proceedings of the "Thirty Committee" given elsewhere in full. Apparently the Commissioner is to treat with Messrs. Lipton, Limited, about some proposal for advertising Ceylon teas or produce? Meantime, it will be seen that the independent efforts to promote Ceylon tea in Russia, Germany, &c., are by no means slackening, but that due encouragement continues to be given. All this should bear fruit.

#### THE MINERAL WEALTH OF CEYLON.

##### THE VIEWS OF AN EXPERT.

Mr. C L Boyd, a gold expert, is now on a visit to his brother, Mr. Bolton Boyd, of Agars Land, and he has taken the opportunity to inquire into the mineral wealth of Ceylon. What was wanted, he said, to one of our representatives, was to find gold in the low grade condition, on the same principle as the Mysore mines are, which are among the best paying concerns in the world. In those mines they had a homogeneous rock in which was found the precious metal and the value per ton would figure the same throughout the vein. The ore in this low grade condition is valued at 10s per ton and upwards, and was much better security than those flash mines where nuggets were found. These would run to thousands of pounds per ton intermittently, but one could never be sure that he would continue to find them. Mr. Boyd has just returned from Matara and in answer to a query whether he had found gold there he answered:—Yes, sir, I have most decidedly."

##### TEA AND METALS.

Mr. Boyd said that what helped the growth of tea were the metallic constituents in the ground and in other tea countries such as China and Japan they found iron. Ferric oxide was a very important factor in the growth of tea. "You have it there," said Mr. Boyd, pointing to the red road outside the hotel "and it is in the tea districts in larger quantities."

In Ceylon they had limonite (iron) which ran up to 52 to 60 per cent of metallic iron and he had found 71·62 per cent of oxide of iron deposited in the ground. Mr. Boyd reported satisfactorily of the plumbago in the Matara district. That place was on the centre of the

##### MINERAL BELT OF CEYLON,

a great belt which ran north 20 degrees east.

Mr. Boyd visits Nuwara Eliya for the purpose of reporting on plumbago, mica and iron, and hopes, when he returns, to have something favourable to tell. He mentioned that he had opened negotiations with people in Liverpool with a view to getting out the necessary machinery for a stamping mill on the reef he has discovered. He would suggest that Government should start a Geological Department with experts at the head to make a survey of the country, seeing the value minerals would be through the royalty they would bring in. He prophesied that in a short time people would flock into the country after gold.

##### TIMBER SEASONING BY ELECTRICITY.

We extract the following from the *Engineer*:—During the last few years considerable attention has been given to the invention of new processes for treating timber. The latest aspirant to fame is a process and apparatus which claims to give to timber properties which time alone has so far been able to produce. It is a French idea, and has, we are informed, met with considerable success in Paris, where works have been established to treat timber on a large scale. The Nodon-Bretonneau process involves the expulsion of the sap and its replacement by a solid matter, insoluble and aseptic. This is effected by placing the material to be treated in a vat containing a lukewarm solution made of borax, ten per cent; resin five per cent; and 75 per cent of carbonate of soda. While in this bath, an electric current of about 100 volts pressure is caused to pass through the timber. The current set up what is termed electro-capillary attraction, and drives out the sap by the introduction of the solution. This treatment lasts from six to eight hours generally, after which the wood is subjected to a further treatment of a few hours' duration in a warm bath to allow of thorough permeation of the entire section. It is then removed and dried under cover by air currents, a process which is said to take from fourteen days to a couple of months, according to the density and thickness of the material. The inventors claim that not only is a considerable saving in time and expense in the drying of timber effected by this process, but that certain classes of wood, such as maritime pine, which have not hitherto been readily saleable owing to the large amount of moisture they contain, can by its use be readily deprived of the sap. The expenditure of electric current is said to be 600 watts per cubic metre per hour for five hours. The Electric Timber Seasoning Company, Victoria Street, Westminster, is introducing the system into this country, and a model apparatus has been fitted up at the works of Messrs. Johnson and Philips, Charlton Junction.

THE GALAHA TEA ESTATES COMPANY is to be congratulated on the very satisfactory nature of the report made on its estates. The Vedehettes, Kitoolamoola and Galaha have been familiar to us since the early "sixties" and we had no idea they were going to do so well in tea; while the news of a cart road all the way from Oodawella to Kitoolamoola—superseding the bridle path which at one point was the scene of one of the most atrocious murders ever committed in Ceylon—recalls "days of old" and of more than one ride across the Hantane range and patanas. But it is of tea, we have to speak. Crops of over 400 lb. and rising to 600 and even 700 lbs. per acre, must be considered very good. What is told of the Factory is of interest and specially so what we learn about wire-shoots and economic working.

**GALAHA CEYLON TEA ESTATES AND AGENCY COMPANY.**

**ANNUAL REPORT AND BALANCE SHEET.**

Although the balance at credit of profit and loss would have provided for further dividend of two per cent on the ordinary shares, the Directors decided to retain that amount, carrying part to reserve, and the rest to the next account.

The tea crops, including bough leaf, amounted to 1,422,297 lb., which sold at a net average of 6.11d per lb., and the cardamom crops to 35,724 lb., which realised 2s 5½d per lb., net. The Directors had expected better results, but, owing to the failure of the south-west monsoon, the crops obtained were slightly under the estimates, and the average price of the tea was affected by the unusually low rates ruling in the market during part of the time. The rate of exchange for the Company's drafts on London averaged 1s 3½d per rupee. It will be noticed that the amount at debit for advances to coolies has been reduced by £1,500 since the date of the last account.

It has been necessary during the period covered by the report to spend a considerable sum on capital outlay for the extension of the Factory, the purchase of further machinery, the erection of additional cooly lines and other buildings, and the upkeep of non-bearing land, but the requirements for capital this year will not, it is believed, exceed £1,000, which will be chiefly used for the development of land recently brought into cultivation.

The Directors desire to call attention to the enclosed report on the properties by their colleague, Mr. W Lumsden Strachan, who has just returned from Ceylon, and it will be satisfactory to the shareholders to learn that the estates are in the highest state of cultivation, and capable of yielding very large returns in the future. The crops for this year are estimated by the Colombo Manager as follows:—

	..	..	lb.
Tea	..	..	1,684,950
Cardamoms	..	..	24,400

And in a recent letter he writes that generally speaking, the Company's estates have not suffered from the late drought, consequently large yields may be expected, and looking to the higher range of prices now ruling for Ceylon teas on the London market, it is confidently believed that the next report will show a large increase in the profits, and thus enable the Directors to add considerably to the Reserve Fund, it being their policy to strengthen the Company's position by building up a substantial Reserve.

The Directors are pleased to report that up to date the sales of this season's teas amounting to 94,320 lb. have averaged 7½d net per lb. against the estimate of 6d net per lb.

**MR. W. LUMSDEN STRACHAN'S REPORT.**

February, 1899.

**NORTH VEDEHETTE.**—The fields both above and below the cart road have filled out, and cover the ground much better than they ever did before. These fields make up 56 acres, and last year gave a crop of 354 lb. an acre. For the six months ending 30th December last 216 lb. were secured. A clearing of 18 acres has been opened above the cart road, and as this land is steep, and much wind blown, I think that though the soil is good, the greater part should be thickly planted with fuel trees, and regarded as timber land. The fuel can very easily be carted to the factory door. Another clearing of seven acres close by is more sheltered.

**WEST VEDEHETTE.**—This division now consists of 68 acres of old tea, and 59 of clearings, or 127 acres in all. All the old tea is now being pruned, and the crop will therefore come in during the latter part of the season. The old tea gave 450 lb. an acre last year, and 380 for the half term ending December, both of which crops were quite satisfactory. For this season 450 lb. are estimated. The new clearing has

good soil, and the lay of land is very suitable for the cultivation of tea, and when in bearing the field will give 500 to 600 lb. an acre. Owing to a bad planting season a large number of the plants died; these have since been thoroughly supplied, and the lines are now regular; but for estimating purposes, the clearing should be regarded as being only one year old. There are still some 50 acres of fine land on this estate, which can some day, if desired, be planted with tea.

**EAST VEDEHETTE.**—Here also the tea is looking well. Last year the property gave 421 lb. an acre, and for the present season 405 are expected. I mention, and will continue to mention, the crops, as this will give the best idea of what the places are capable of doing in the future. A clearing of 35 acres below the estate cart-road was opened three years ago. The forest was of good size, but when the land was cleared the soil was found to be light and quartz, and I think that it would be good policy to plant the whole field with fuel trees. The timber can easily be sent across the valley to the Government cart-road, as was done with the forest trees when the land was first cleared. The new bungalow is a substantial one, and the lines are all in good order. Labour force is sufficient, and the estate is clean. The cardamoms of which there is 54 acres, are all looking very well. Last year the crop fell short of the estimate owing to the dry season. This year 80,000 lb. green, or 16,000 lb. dry, are estimated and as there is already a good show of racemes the estimate should be secured, if the south-west rains do not again fail, which is hardly probable. The caddies yield R60 a month, and if more were built a larger revenue would be derived from this source. The Government thinks of moving the Deltota post office to this spot, and if this be done it would at once increase its importance and raise the rents.

**KIToola-Moola.**—Owing to the rocky nature of the ground the tea has been longer than usual in coming on and forming a good spread. Even at the time of my last visit the hushes did not cover the ground fully, but now the estate presents an even appearance, and the yield is satisfactory. I find that from the total acreage of 342 acres a crop of 438 lb was secured in the twelve months ending 30th June last. The estimate for the current season is 118,750 lb or 347 lb all over. The smaller crop is due to the fact that some 200 acres are this year to be pruned down. Roads and drains are all in order. The old bridle-path from Uduwella has been enlarged and made into a cart road, and this is of great advantage to the group of estates, in so far as it makes them so much more accessible from Kandy. The cost of the work was R2,400, of which the District Road Committee contributed R1,500 and the estates up the valley and private people the rest. The cost to our estates was only some R100, and I think Mr. Carcy is to be praised both for the way in which he raised the money and for the way the work has been done. The cardamoms, though now some sixteen years old, still continue to crop well, and this year a yield of about 160 lb. an acre is expected. Where the shoots have got thin a replanting might with advantage be done. The timber clearing above the Kandy Road continues to make steady progress.

**GALAHA AND DUNALLY.**—There is a marked improvement in the 175 acres of tea, which for so long a time was disappointing. All the young tea—13, 5, 47 acres, &c.—still continues to give large crops, but the 17 acres is showing a slight falling off. The fields on the Kitoola Moola side also continue to look and yield well, and the 22 acres at the top are a picture of luxuriance. This tea yielded last season 739 lb. an acre. The 125 acres (three-year-old tea) on Dunally has not grown quite as quickly as I should have expected from the nature of the soil, which is rich and deep, but the fields are an even cover, and will yield in the current season 200 lb. an acre. Altogether there are 353 acres of clearings on Dunally and Galaha, all coming on well except about 20 acres on the top of the former estate, which I

think better adapted for fuel trees. These clearings will next year add considerably to the crop of the estates. The grevillias are too thick on parts of Galaha, and with advantage to the tea, and without any risk of letting in wind, some of the belts might be thinned, and many of the roadside trees cut down. By so doing, perhaps a thousand yards of timber will be obtained for factory use. Labour is more than sufficient, and buildings are in good order. The 38 acres of cardamoms are looking well, and this season 6,000 lb. dry are estimated. It has been arranged to plant up 164 acres of timber land with this product. This is certainly a wise move, for the land is now being weeded, and after the bulbs are once put into the ground there will be no further expenditure, except a nominal sum for supplying the vacancies. Mr. H Carey tells me that on a neighbouring estate, about two miles away on the same range of hills, the cardamoms so planted under shade of the fuel trees are growing most satisfactorily. Since water was spouted to Galaha from Kitoola-Moola, and from the top of Amblamana there has been a marked improvement in the health of the labour force, and the head kangany tells me the Estate is now much more popular with the coolies.

**MAUSA KELLE -MADDEGAMA.**—These estates have 260 acres under tea of which Maddegama has 60 acres. This tea gives a poor yield, as the land is very steep and rocky. All the fields on Mausa Kelle, on the Ulawatte side, are looking very well, and it is from them that the bulk of the crop is obtained. Labour is plentiful, and advances stand at R619 only.

**GOOROOKELLE AND KIRRIWANE.**—This fine block of property has 878 acres under tea, of which 690 are in full bearing, 31 three years old, 38 two years, and 113 acres one year. All the recently-planted tea, that is, tea planted in new soil, has grown very well, and forms a fine cover, and tea on old coffee land is also giving good crops. With ordinary seasons, the estate will give 600 lb. all over, including the old coffee land, or say a crop of 525,000 lb. Weeding is done for 90 cents an acre. All the buildings are permanent, except one set of liues, and will only require ordinary repairs in the future. No capital outlay will be required therefore, except for upkeep of the young land till it comes into bearing. Crops is put on board at 2½ cents, including 8 cents for manufacture, and 1 cent for transport of leaf over the tramway. Advances stand at R15,187 for 842 coolies, and will be reduced later on when full time is being worked. The rainfall last year was only 80.26 inches on 186 days, which accounts for the crop being so short of the estimate, Mr. White lightly forked the pruned branches into the ground over a considerable area, and the system has answered so well that I think it should in future be made a rule. In this somewhat dry climate the soil thus treated retains its moisture for a longer period, and the bushes have responded to the cultivation. There is some good land still available for tea, and when and if desired, another 60—80 acres could be opened.

**FACTORY.**—This is in excellent order throughout, and machinery is working well. At no great cost the weir and watercourse could be raised about 20 feet, and this would give 15 H.P. additional power. The tramway continues to run smoothly, and Mr. Hall is now able to repair the wheels in the factory. The whole group of estates is generally in the highest state of cultivation, and in thoroughly good order. A considerable acreage has been manured yearly, and each season this while be continued. A complete system of wire shoots is now established to transport the leaf to the factory, and I think the estates are being worked in a thoroughly economical way. So long as the properties are kept up in their present condition it is difficult to see where a saving can be made. The crop estimates for the present season have been framed on a moderate basis, and, given the usual rains at the ordinary times, they will be secured. In the coming and succeeding seasons, as the 672 acres of young tea come into bearing, we shall get larger crops.

## CEYLON TEA IN AUSTRALIA AND NEW ZEALAND.

### VIEWS OF A NEW ZEALAND BUYER.

In the course of an interview with a representative of the local "Times" Mr. Graham Cripps of Messrs. Scouler and Company, Dunedin, who was on a visit to Ceylon, was asked if he could give any reason for the falling off in the exports of tea direct from Colombo to New Zealand, the figures for 1897 being 2,228,137 lb. as against 2,133,564 lb. in 1898.

"A large amount of tea," said Mr. Cripps, "is at present purchased in the Melbourne and Sydney markets, and shipped direct to New Zealand; the advantage to the buyer being that he can see before hand what he is going to buy and avoids running the risk of receiving badly matched tea from the Colombo dealer, who is sometimes more anxious to carry out an order than to properly match the tea."

"But are not the prices in Melbourne and Sydney a little dearer?"

"That depends on the market. Of course, when the market is weak, we take advantage of it."

"With regard to China teas, they are clean out of our markets, or next door to it. Whilst formerly we used to bring down full shipments of Chinas, now 50 half chests last us two years."

Mr. Cripps pointed out that it was extremely unfortunate that Ceylon teas keep so badly as compared with Indian.

"We are anxious to push Ceylon teas; he remarked, "but our experience is that Indian teas keep so very much better. We might have stuff in our stores for some time, and then we send it out to the country storekeeper, who keeps it in his stores for another two or three months, with the result that the tea is flat before it reaches the consumer. We have to correct this by using much more Indian teas than we should otherwise. It is generally found, however, that the consumer prefers Ceylon to Indian teas. So you will see that the dealer runs a considerable amount of risk in stocking Ceylon teas very largely, owing to the fact that they go off, whereas Indians do not, and thus the business is far more hard to mouth in character than it would be.

"How do the retail prices of Australia and New Zealand compare?"

"The retail prices in New Zealand are much better than those in Australia. In the latter it is 1s, 1s 3d, and occasionally 1s 6d, but with us the prices are 1s 9d, 2s and 2s 4d, though the bulk is sold at 2s, the duty being 4d."

"Do you think the consumption of Ceylon tea is likely to increase?"

"Yes, I believe the consumption of Ceylon tea will increase. There is not a big population to work upon, but the consumption is something over 5 lb. per head."

"Are New Zealanders as big tea drinkers as the Australians?"

"Not quite. You see Australia has a hotter climate, and they drink much more tea there."

"What do you think, roughly, is the relative difference in consumption between Ceylon and Indian teas?"

"The proportion, I think, is Ceylon 3 lb. and Indian 2 lb."

"What kind of tea is in most demand?"

"I think the people prefer a full-flavoured and heavy tea, especially in the South."

In concluding the interview, Mr. Cripps expressed the opinion that Colombo tea firms were a bit behind in regard to the attractiveness of the labels placed upon the tea packages sent down to Australia and New Zealand. Very often, he said, smartly packed tea with attractive labels, something indicative of the place from whence it comes, induces the public to purchase.

Mr. Cripps had taken a trip to Kandy and Nuwara Eliya, and was delighted with the lovely scenery of the hill country.

## PLANTING NOTES.

**THE BRITISH TEA DUTY.**—It will be interesting to see what the General Committee of the Indian Tea Association say to the opinion of the Mincing Lane Brokers, that the total abolition of the tea duty would probably lead to an increased import of cheap China teas. Of course, the discussion is academic at present; for, there is no chance of abolition for several years, although a reduction from 4d to 2½d to which no one would take exception—may be granted in an early Budget, especially if Mr. Stead's "Truce of God" is carried as the result of the sitting of the Peace Congress.

"COCONUT TREES in quantity do not help a landscape much," writes Henry Drummond about the South Pacific islands, as quoted in his life by Dr. Geo. A. Smith. "It is *one* against the sky that stirs your soul with the wonder of its grace and beauty. But any kind of tree will beat them as foliage. The form is not fine; shadows are wanting. There is a stiff, metallic look, and the green is dingy and tarnished with decaying fronds, the shreds of fibrous cloth, and even the bunches of brown which hold the coconuts." It is curious how exactly this view corresponds with that of the poet, Miss Jewsbury, when, after a visit to Ceylon, she wrote:—

"Those coco palms not fair in woods,  
But singly seen and seen afar,  
When sunset pours its yellow floods,  
A column and its crown a star!"

**CENTRAL AFRICAN TEA** may in the near future become a feature in the Mincing Lane. The following from the *British Central African Times* is significant:—"Mr. Moir has favoured us with a sample of his tea, grown and cured on the Lauderdale estate. Not being professional tea-tasters we can't give an authoritative opinion on its merits, but the sample appeared to us to be of very good quality and made an excellent cup of tea. Judging from the rainfall of Mlanje, and the samples which both Mr. Moir and Mr. Brown have succeeded in producing, we should say that tea could be grown very successfully in the Mlanje district. It is, however, a risky culture at the present time, overproduction in Ceylon and India having brought down the price considerably. As an article of local consumption, however, there is an opening for one or two estates just as there is for sugar. We believe, Mr. Moir has disposed of all the crop he had to the local residents at Mlanje."

**INDIGO.**—*The Oil Paint and Drug Reporter* of New York, discussing the question of artificial indigo, remarks:—"Whether the natural article will eventually be superseded by its synthetical competitor is a question that only the future will answer. The artificial product has already established itself, and it cannot be denied that its consumption is increasing. The acreage in India planted with indigo last year was 235,519 acres. In 1897, 376,899 acres were sown, and in 1896 as much as 436,601 acres. The crops were of corresponding amounts. This shows that the output of natural indigo has declined during the last three years. What 1899 will bring forth in regard to this question remains to be seen. Those interested in the industry in India are alive to the situation, and, knowing the powerful competitor they now have in the synthetical indigo, are bending every effort to hold their own; but, as in every other article which the soil produces, the crops of indigo are irregular in quantity and uncertain in quality, and this fact will greatly handicap the champions of the natural article in their fight against artificial indigo, the supply of which is uniform in quality and inexhaustible in quantity, and can be regulated to suit prevailing conditions.

**PLANTING IN REUNION.**—The readers of our monthly periodical in this French Dependency are very eager to deal with a number of tropical products after the latest approved and scientific fashion. Among other enquiries, one lately reached us as to why in our "Coconut Planter's Manual" and "Cochran's Manual of Chemical Analyses" no fuller analysis of Copra was given. The answer is afforded in the letter from Mr. Cochran, which we publish elsewhere, and which practically supplies all that is needed.

**DRY ROT**—The May Part of *Building World* contains an article on "Dry Rot in Timber and its Prevention." Amongst other recipes the writer says:—Substances, such as paint or tar, that imprison moisture within wood or prevent its free evaporation, should never be used on damp or badly seasoned timber. Painting the ends of beams, joists, and all timbers touching the walls, with creosote has been found to be very effective in keeping out damp. It coagulates the cell contents, thus giving solidity to young cells; it absorbs oxygen from the cells; it resinifies within the cells, and so excludes air and moisture; and it acts as a poison to fungus. Several other preservatives against damp and dry rot have been suggested, the best being, perhaps, jodelite and carbolineum avenarius. These preparations are applied hot, with a brush in the same manner as ordinary paint, and it is claimed for them that owing to their powerful penetrating properties they drive out all moisture, and make the wood impervious to damp. Timber of large scantling is sometimes, while appearing perfectly sound, quite rotten internally, where strings of mycelium permeate the core. It is wise, therefore, to have all large timber sawn in two parts, which can then be reversed and bolted together, care being taken to insert strips of wood between the pieces so as to form an air space. As a further precaution, the inside face of each piece might be painted with creosote, jodelite, carbolineum, or corrosive sublimate dissolved in alcohol.

**A CORNER IN TEA.**—We (*Indian Planters' Gazette*) doubt very much, notwithstanding all that has been said on the subject, whether such a thing as a "corner" in tea could be carried out. Interests are too many and conflicting, and too well divided to allow of this. It is true, Lipton, Limited, holds a pretty commanding position on the market, yet we doubt if his opposition or support could alter the market a halfpenny either way. We may take it, judging from exports, that Messrs. Finlay, Muir & Co. hold even a stronger position, in relation to other agency houses in India, than Lipton, Limited, does in London and yet we would be very sorry to see them trying on a "corner," for they would soon find their level. We note in Messrs. Carritt & Co.'s annual review of the tea market a reference to this combination of buying interests; but we believe more attention is being paid to this than it is worth. The natural law of supply and demand continues to rule the roast, and was never better exemplified than in 1898 and 1899. Overproduction in 1898 drove prices down to starvation point; in 1899 scarcity is driving them up. If the strong combination of buying interests exists, as is supposed, why has it not stepped in just now and said: "No; we won't buy at these prices!" Some other cause, we are of opinion, must be found to account for the abnormal depression of 1898. Whatever it was (and we do not presume to say what it was), it had a very depressing effect, and will be long remembered.

THE  
AGRICULTURAL MAGAZINE,  
COLOMBO.

Added as a Supplement Monthly to the "TROPICAL AGRICULTURIST."

The following pages include the Contents of the *Agricultural Magazine* for June:—

Vol. X.]

JUNE, 1899.

[No. 12.]

SEASON REPORTS FOR APRIL, 1899.

*Eastern Province.*—Paddy. Yala cultivation, delayed by the drought, is now going on. There are prospects of a good harvest. Rainfall light. No reports of cattle disease.

*Central Province.*—Paddy. Maha harvest over cultivation for Yala going on. Crop prospects good. Rainfall ample. Health of cattle good.

*Northern Province.*—Paddy. The rains have been taken advantage of to prepare fields for ensuing harvest. Rainfall in Jaffna 5.65 in. Health of cattle good, except in Vattappulai, where murrain is reported to have broken out.

*Southern Province.*—Paddy. Yala sowing over; cultivation of a considerable area prevented by drought. Rainfall in Galle 8.59 in. No reports of cattle disease.

*Eastern Province.*—Paddy. Some crops in Batticaloa district damaged by caterpillars. Rainfall 2.32 in. in Batticaloa, 5.29 in Trincomalee.

*Province of Uva.*—Paddy. Maha crops in blossom. Floods of April caused sore damage to paddy. Rain during the early part of the month only. Health of cattle good.

*Province of Sabaragamuwa.*—Yala fields being ploughed or sown; prospects good. Rainfall at Ruanwella 17.61 in. Cattle disease prevails in Pohorubawa in Kuruwiti Korale.

*North-Western Province.*—Paddy. Yala cultivation in progress; prospects good except in places where drought prevails. Cattle murrain still prevails in parts of the Province.

USEFUL FIBRE PLANTS OF THE WORLD.

We have been favoured by the United States Department of Agriculture with a copy of an exhaustive work on the above subject. It is entitled "A Descriptive Catalogue of Useful Fibre Plants of the World, including Structural and Economic Classification" by Charles Richard Dodge. The name of the author is a sufficient guarantee of the accuracy of the information contained in the 361 pages of which the work consists, for Mr. Dodge's reputation as a specialist in fibres is world-wide. The Report is illustrated by means of 13 plates and 103 figures.

For the present we will only quote Mr. Dodge's "Letter of Transmittal" as an introduction to the work, from which we shall quote from time to time such useful information as should prove of value to our readers:—

To the Secretary for Agriculture.

Sir,—I have the honour to submit herewith the manuscript of a descriptive catalogue of 1,018 species of useful fibres of the world. No similar work has appeared in any country with so full descriptive lists of the commercial and native fibres of the people of the globe, the compilation embodying notes, observations, and re-

search by the author during a period of over twenty-five years. During the preparation of the work for publication the author has had the assistance of fibre experts, botanists, and others in many lands, and it is thought the volume will prove a valuable contribution not only to the literature of economic industries but to ethno-botany as well.

The demand made upon the department for information regarding every phase of the fibre industry shows the extent of the industrial interest in fibres and their manufacture, while the popular interest in this subject is evinced by the constant applications received by the department from teachers in our colleges and schools for fibre specimens and literature. To these two classes especially the work will prove most useful, and at the same time it is hoped that it may be of assistance to those writers upon industrial topics who from lack of authoritative information regarding new fibres have sometimes been led into error and mis-statement. The alphabetical arrangement of the titles, which include both the common and botanical names of the fibre plants described, afford a ready means of referring to any described species.

In the portions relating to the study and uses of fibres and on fibre identification the technology of fibre work is presented in the hope that more attention may be given to this work by American students, as it opens up a broad field of practical research.

CHAS. RICHARD DODGE,

*Special Agent in charge of Fibre Investigation.*

Hon. J. STERLING MORTON, *Secretary.*

#### OCCASIONAL NOTES.

On another page we give a resumé of an instructive article on Ostrich Farming. It would be interesting to have further particulars regarding the breeding of these profitable birds (which we shall endeavour to procure), such as the nature of the climate &c. suitable to them, as there may be a possibility of their thriving in the dry arid areas towards the north of the Island, where natural drawbacks and remote situation make successful agriculture an impossibility.

There is some difference of opinion about the form in which food should be to dairy cows given *i.e.*, whether dry or in a semi-liquid state. In the last report on the Trinidad Government Farm we read: "The result of experiment is in favour of the mash over dry feeding—it is convenient and less wasteful, and from observation it has a decidedly favourable influence on the milk yield."

The following analysis of Guinea grass by the Government analyst of Trinidad appears in the last report on the Trinidad Government Farm, with a note by the chemist, who says: "From the analytical data Guinea grass is infinitely superior to ordinary pasture or Bahama grass, but

has about the same value as manured pasture grass or English clover."

Moisture ..	16.88
Albuminous compounds ..	8.448
Carbonaceous principles, woody fibre ..	58.752
Mineral matter ..	15.72

We are glad to learn that Veterinary Surgeon Chinniah (an old student of the School of Agriculture) has made a successful start in practice, and that his inoculation treatment for rinderpest has been attended with good results. We feel certain that with the energy and love for his profession which Mr. Chinniah possesses, he will soon gain eminence in his profession.

Mr Sturgess, Government Veterinary Surgeon has left for England on short leave, and Mr. E. T. Hoole is acting for him.

We heartily congratulate Mr. H. D. Lewis, late Headmaster of the School of Agriculture, at present Inspector of Schools, Central Province, on the honour that has been conferred on him by H.E. the Lieut.-Governor, who has been pleased to appoint him a Muhandiram. Mr. Lewis is an enthusiastic agriculturist who has not forgotten the instruction of the native cultivation in agriculture in his journeyings to and fro as an Inspector of Schools. If for no other reason he deserves the honour for the good work he has done in this direction.

A sale of stock drafted from the Government Dairy Herd took place on the 15th May when excellent prices were realised. These sales are becoming very popular, and we are glad to find the Government revenue officers among the purchasers. Before long the influence of the Government Dairy will be markedly seen in the improvement of cattle in various parts of the Island.

The first plants of the Nancimum sweet potato (previously referred to as having been introduced from America) were lifted after about four months' growth, and the results were very promising. One vine which was placed in a more favourable situation than the others gave  $\frac{1}{2}$  lbs. of tubers of good average size. A large number of plants will now be secured, some of which will be available for distribution. Our thanks are due to Mr. George Warr who presented the original plants to the School.

The Agri-Horticultural Show fixed to take place in Colombo on July 21st and 22nd promises to be a most successful function. The Government Agent of the Western Province (the Hon. Mr. F.R. Ellis) has taken much trouble to enlist the sympathies of the Headmen of the Province, through whose influence alone the rural population—who should greatly benefit by these Shows—can be expected to take an interest in the exhibition.

Mean rainfall for the month 23 in.

Recorded by Mr. J. A. G. RODRIGO.

VETERINARY NOTES FROM THE VILLAGES.

The *vedarala* who heats cattle is, like the *vedarala*, who heats human beings a prominent figure in rural society. Sometimes the same person who treats men practises the healing of the lower animals, as is the custom in certain parts of Central Europe; but very often we meet with distinct cattle *vedaralas*.

2. The classification and nomenclature of diseases, according to the native method, are rather peculiar. They are based chiefly according to their symptoms, and the same disease may go by different names when different symptoms are prominent. The village method of treating cattle is also more empirical than rational.

3. Nevertheless, some of the remedies prescribed by the *vedaralas* are very efficacious, and they are mostly vegetable drugs which may be procured fresh from the neighbouring jungles, or bought in the bazaar for a trifling sum of money. Mineral substances sold in the bazaars, such as the various crude salts, are also prescribed.

4. The *vedaralas* have for their guidance and information certain old *ola* books which may have been handed down to them by some ancestor who was famous in the healing art. Reference is also made to Sinhalese and Tamil printed books, such as the "Gawaratunaya," by the present generation of *harak vedaralas*.

5. It was not without some surprise that I saw this well-known work on cattle diseases in the hands of a young cattle *vedarala* in one of the remote villages of the North-Central Province. He evinced an anxiety to know some of the more modern and scientific phases of the Veterinary art, and asked me for information on a good many points, on which I was only too glad to impart instruction to him, seeing his anxiety to obtain it.

6. The "Gawaratunaya" is a Sinhalese book on cattle diseases by one Mr. Perera, and may be looked upon as a sort of connecting link between

the ancient and modern systems of treating the diseases of cattle. It is divided into several parts, some of which are in prose and some in poetry. While on the one hand it contains many *manthrams* or incantations and appeals addressed to demons, on the other it also contains several useful vegetable remedies for some of the commonest diseases of cattle. One part of it treats of certain brand-marks to be placed on different parts of the body for different cattle diseases. Most of these marks are phantastic in form, and it is difficult to trace the connection between them and the diseases they are calculated to cure. The closing part of the book treats of the use of some of the well-known disinfectants, such as carbolic acid and phenyle, in connection with rinderpest and other contagious diseases.

7. Odd though such a book would be as to the nature of its contents, it is still useful to a certain extent, and, as already stated, contains several valuable prescriptions. It also represents the ideas prevalent among half-educated natives about the diseases of cattle and their treatment.

8. As in most other matters connected with the native villager, superstition has found its way into this subject of cattle diseases. Just a few days ago I was surprised to find that a virulent form of rinderpest, which had been prevailing on an estate in the neighbourhood of Horana, was seriously spoken of as the work of a demon called *Palhora*, and firing a gun occasionally was prescribed as a method of preventing the disease. Even the native conductor on the estate professes to believe this, and the suddenness with which several animals succumbed to the disease was given as the foundation for this belief.

It is, however, known to science that rinderpest not unfrequently assumes a very virulent form at the commencement of an outbreak causing death without even leaving sufficient time for the infected animals to develop the symptoms of the disease fully. Latterly, however, the disease assumes a comparatively milder form, and the symptoms of the disease are more fully evident, as was the case with the cattle on the estate referred to.

9. A scientific knowledge of the various diseases which are more commonly prevalent among village cattle, imported in a simple manner, would go a great way towards dispelling the delusive and superstitious popular ideas about them, and will tend to save the lives of a great many cattle.

10. The little pamphlet called "Notes for Cattle-Owners," recently published by Government is very welcome when looked upon from this point of view. Vernacular copies of this work are now found in possession of most of the headmen of the villages, and are bound to do a great deal of good. Two of the most common diseases, viz., rinderpest and foot-and-mouth disease have been dealt with in this pamphlet. It is highly desirable that the good work thus begun should be continued, and that information about other common diseases, both contagious and non-contagious, such as *kandamalai*, or malignant sore throat, hoven, &c., should be placed within reach of cattle owners in the villages of the backward provinces.

E. T. H.

(To be continued.)

VETERINARY NOTE.

On March 17th last, I received a call from Dikoya, where it was reported that four animals out of a herd of draught cattle had succumbed to some unknown disease. On proceeding to the spot I found among the sick one animal that was said to be recovering and also the carcass of another that had lately died. In addition to the general symptoms of ill-health, I noticed a copious flow of tears and partial blindness. The affected animals were suffering from acute inflammation of the eye-membrane (conjunctivis), and this I immediately traced to the presence of free ammonia. The cattle were kept in a place without proper ventilation, and where there were catch-pits to hold the urine which was undergoing fermentation. In attempting to manipulate a dislocated shoulder of a bull in the same herd, I found the irritation of the ammonia so objectionable, that I had to hurry over the operation. I may mention that the high temperature and the heat of the sun greatly aid the evolution of free ammonia from the fermenting urine.

The owners of the stock were pretty confident that they had some contagious form of disease to deal with, but I answered them that this was not the case, and ordered that the cattle-shed should be thoroughly cleaned out, the floor well washed and spread over with dry earth. After this the "plague" was stayed. I attributed the ultimate cause of death to exhaustion due to starvation. Not merely were the eye membranes affected, but also the nasal and pharyngeal membranes, and hence the total refusal of food. The non-recurrence of the disease I attributed to the cleansing of the sheds, the use of dry earth to absorb any standing urine, and also to the fact that the rainy weather which followed helped to cool the atmosphere, improve the surroundings, and make the condition of the cattle altogether more comfortable.

D. CHINNAH, *Veterinary Surgeon.*

THE MANURING OF RICE.

The following plant food ingredients have been found to be removed from one acre of paddy:—

By an average crop of		Phosphoric		
2,676 lb. grains	} Potash. acid. Nitrogen.	23 1 lb.	16.3 lb.	26.2 lb.
446 " chaff				
By a good crop of				
4,014 lb. grains	} 45.7 lb. 24.9 lb. 39.2 lb.			
4,460 " straw				
624 " chaff				

Very thorough investigations have been conducted by Prof. Kellner and others in Japan, as to the fertiliser requirements of water rice. In order to determine the exhaustion of nitrogen, phosphoric acid, and potash in the soil, a fertiliser trial was inaugurated, in which each plot received the following quantities of fertilisers to the acre:—

	Phosphoric acid.	Potash,	Nitrogen.
" 2	89 lb. ...	89 lb.	—
" 3	— " ...	89 " "	68
" 4	89 " ...	— " "	89
" 5	89 " ...	89 " "	89

Nitrogen was applied in the form of sulphate of ammonia, phosphoric acid in the form of double

superphosphate, and potash in the form of carbonate. The development of the plants corresponded to that of the previous years; the plants which had received a complete fertiliser grew best of all, showing a normal green colour: next came the plants to which no potash had been applied. The plants to which no nitrogen had been given were of a light-green colour. Phosphoric acid seems to have a very beneficial effect upon the growth of the plant, for the plants which had not received phosphoric acid differed but little from the unfertilised plants; they were of a dark-green colour, but very small. The average yields from three check plots (the size of the plots is unfortunately not given) were as follows:—

(Yields given in ounces.)

		Full Empty		
	Straw.	grains.	grains.	Total.
No fertiliser	... 10.2	7.5	0.1	17.8
Without nitrogen	... 16.8	12.0	0.2	29.0
Without phosphoric acid	... 13.1	9.5	0.2	22.8
Without potash	... 22.2	14.6	0.4	37.2
Complete fertiliser	... 27.5	20.3	0.3	48.1

FERTILISING EXPERIMENT WITH RICE.  
By Professor Tito Poggi on the Vendramin Farm (Po Valley.)

No. of Plot.	Fertilisers applied per Acre.				Yields per Acre in the 1st year.			Yields per Acre in the 2nd year.			Profit or Loss from both years after deducting cost of fertiliser.	
	Plaster.	Acid Phosphate.	Sulphate of Ammonia.	Nitrate of Soda.	Muriate of Potash.	Cost of Fertiliser.	Rice Grains.	Chaff and Straw.	Value of Increase of Yield.	Rice Grains.		Chaff and Straw.
1	..	..	..	..	..	..	1338.0	945.5	25.02	1338.0	945.5	25.02
2	..	..	..	..	..	..	1641.3	999.0	24.61	1641.3	999.0	24.61
3	..	..	..	..	..	..	1677.0	1186.4	25.25	1677.0	1186.4	25.25
4	..	..	..	..	..	..	1892.0	1213.1	25.95	1892.0	1213.1	25.95
5	..	..	..	..	..	..	1717.8	892.0	9.71	1717.8	892.0	9.71
6	..	..	..	..	..	..	1692.4	1141.8	21.37	1692.4	1141.8	21.37
7	..	..	..	..	..	..	1694.8	1141.8	25.60	1694.8	1141.8	25.60
8	..	..	..	..	..	..	1726.0	1445.7	28.17	1726.0	1445.7	28.17
9	..	..	..	..	..	..	1605.6	1110.5	19.43	1605.6	1110.5	19.43

The highest yield was obtained where all three of the plant-food ingredients had been applied, and on these plots a very good after-effect was produced in the second year. Phosphoric acid proved very beneficial, especially upon the yield of grain.

Professor Poggi, Rovigo, makes the following recommendations for the quantities of fertilising materials to be applied per acre:—

	For New Fields.	For Exhausted Fields.
Sulphate of ammonia ...	89.0 lb.	178 lb.
Acid phosphate (16 per cent.) ...	222.5 ,,	353 ,,
Muriate of potash ...	44.5 ,,	89 ,,

267 to 356 lb. plaster or slaked lime should be applied to soils deficient in lime. In case of light soils, the quantity of muriate of potash applied per annum should not be less than 89 lb.

However, too much potash should not be applied to water rice, as this ingredient produces a luxurious formation of straw at the expense of the yield of grain. American rice-planters always recommend large quantities of potash for upland rice, holding that this is necessary to obtain a heavy yield of grain.

Mr. C. K. McQuarrie, of De Funiak Springs, Florida, holds that the presence of empty husks of upland rice is due to a deficiency of potash.

### OSTRICH FARMING.

The April number of the *N. S. W. Gazette* contains an interesting account of an ostrich farm in embryo in that Colony, which is owned by a Mr. Barracluff, a feather manufacturer (plumiere) by profession. The writer (Mr. W. S. Campbell) mentions that when he first saw the birds (nine in number), they were comfortably sprawling and squatting about, basking in the sun, on the sand, which seemed hot enough to waste their great bare thighs. The enclosure in which they are confined is about quarter of an acre in extent, fenced in with a high fence, and contained but few trees. In a smaller enclosure is a large shed for use in time of heavy gales.

The ostriches are fed on bran, carrots, green stuff, &c., and behind the shed is what is known as a bonyard, where broken bits of bone, of which the birds are said to consume an incredible quantity, are provided.

Mr. Barracluff owns eleven acres of land, and thinks by properly managing his birds that he can increase his stock considerably and breed young birds for stocking another farm. He has great faith in ostrich-farming becoming a profitable industry in the Colony, provided the necessary attention be given to the birds, for they should not be allowed to roam about on large areas, but be kept in small paddocks and changed about frequently from one paddock to another. He considers that want of care in this respect has caused ostrich farming at the Cape to become far less profitable than it should be there, and that the ostrich feathers have deteriorated in quality owing to continuous in breeding.

In New Zealand and South Australia ostriches are kept in considerable numbers, and succeed as well as they do in their native countries.

The birds imported by Mr. Barracluff are just two years old and may be considered almost chickens, but it is found that already their feathers are of excellent quality, and what is of considerable importance, they have no "spandora" feathers, or feathers with imperfect tips described as "airy tips," and already feathers from these birds have been made use of to adorn hats. The feathers now on the birds are really equal in quality to three-year-old feathers. The feathers are in reality not pulled from the wings, but are cut, and in course of time the butts fall out, so that the birds suffer no pain whatever.

Mr. Barracluff is of opinion that feathers could be produced in New South Wales far cheaper than they could be imported, and the quality would be much better than half those imported. He is very much pleased with the beautiful appearance and texture of the feathers now growing on the birds. He has been engaged "manufacturing" feathers in New South Wales for about fifteen years. The term "manufacturing" really means the making up of feathers into commercial articles, and this involves various processes and much delicate labour. When one is informed that some of the hats worn by ladies cost as much as £8 each in ostrich feathers, and that some fans cost as much, it can be understood how ostrich farming pays; and it is stated that there is an increasing demand for feathers in the fashionable world, with the probability that in the near future the huge gardens of gaily-coloured flowers that are carried about our ladies' hats will give place to the more graceful plumes of the ostrich.

Ostrich feathers, in the trade, are known as first white, second white, and third white, prime; first, second, and third feminas; best long black, medium black, and short black; long and short drabs; long and medium byock; white bows or tail feathers; femina bows; speckled and grey black butts; and moss and floss of all the above ranges.

An ostrich produces annually twenty white feathers on each wing, as well as four grey feathers, thirty-six white and twenty-four black on the tail, and many feathers on the body which are made use of. The annual produce from each bird that has been well and properly cared for, and not knocked about, should be worth £10 to £15. Mr. Barracluff thinks that if the ostrich industry is taken up in New South Wales, the prospects of a trade to London are promising, provided the feathers are good and properly classed, for the differences in quality and weight are enormous; and it frequently occurs in the feather trade (as in other trades) that the very best ones always seem to shake up to the top, the inferior ones hiding themselves in the middle of the packages. This has a depressing effect on buyers, who become suspicious, and the consequence is low prices.

There is a good deal of misapprehension about the dangers of ostrich farming. The birds are quiet enough except during the nesting season when a good deal of caution has to be observed in handling the birds.

## PTEROCARPUS MARSUPIUM.

This tree known as the Indian Kino Tree and in Ceylon as Gammalu has of late come into some prominence owing to its peculiar and much-admired wood. It is closely related to the Indian tree which yields the well-known Paduk wood (*P. Indicus*).

Dr. Watt thus describes the wood: "Sapwood small; heartwood brown with darker streaks, very hard, durable, seasons well, and takes a fine polish, it is full of red gum resin and stains yellow when damp; weight 47 lbs. to 52 lbs. per cubic foot. It is much used for door and window frames, posts and beams, furniture, agricultural implements, cart and boat building; and has also been employed for sleepers. Twenty-five sleepers which had been laid down seven to eight years on the Mysore State Railway were found to comprise nine good, eleven still serviceable, and five bad; sleepers of this timber have also been used on the Holkar and Neemuch and other lines (Gamble).

Dr. Trimen in his Flora refers to the tree thus: "Lowcountry, chiefly in the dry and intermediate regions up to 3,000 ft., rather common; in the moist region on open grassy land, rarer; common about Nawalapitiya. Flowers July to September, bright yellow. A dark red gum-resin exudes from the bark, and is used as a medicine and for outward application. Affords a fine timber, very hard, heavy, dark reddish brown, durable, containing a red resin."

The leaves are pronounced an excellent fodder, and are in great request among cattle-keepers in India.

The gum yielded by this species is the Kino of European Materia Medica.

Dr. Morris referring to Gammalu in his list of Ceylon Plants says: A large and beautiful tree when in flower. It is widely diffused and yields one of the most abundant and useful timbers, also a valuable gum kino.

The *Indian Forester* in a reference to a list of timber trees of the Central Province of Ceylon says: "Our old friend 'Bijasal' reappears under the Ceylon name of 'Gammalu,' with the curious remark that Mr. E. M. Hay of Nawalapitiya is the only planter in the Central Province that knows its value."

Since then the wood of Gammalu has been much sought after, and we learn that Sir J. J. Grinlinton took some blocks of it to Chicago where it was much admired.

## COCONUT OIL AND COPRA.

The section devoted to Coconuts in the Kelani Valley Commissioner's report contains without doubt some valuable information on the subject, but our attention has been drawn to certain averages which are apparently contradictory, e.g., that 1,000 nuts is a safe average of the number required to produce one candy (560 lbs. or 5 cwt.) of copra, and copra contains  $\frac{3}{4}$  oil and  $\frac{1}{4}$  poonac; while 36 nuts is a safe average to calculate for a gallon of oil. And further that according to the usual calculation 2 nuts=1 lb. copra. Now adopting these figures, as our correspondents point out, we arrive at curious results. On the basis that 1,000 nuts

will give a candy of copra, we find that 3,000 nuts should give 15 cwt. copra, and that this ought to produce 10 cwt. oil and 5 cwt. poonac. But then 15 cwt. copra = 1,680 lbs., which, at two nuts to the lb. would require 3,360 nuts for its production. Again, if 36 nuts are required for one gallon oil, the number required for 10 cwts. (125 gallons) would be 4,500 nuts: So that we thus have as a result of the calculation based on the above averages the unsatisfactory result that 10 cwt. of oil would require 3,000, or 3,360, or 4,500 nuts oil.

Another calculation gives an acre yielding 3,000 nuts as producing only 6 cwt. oil and 3 cwt. poonac, which is put down as equivalent to (not 9 cwt. but)  $14\frac{1}{2}$  to 15 cwt. copra. But how is the difference accounted for? Putting aside these figures for the present, we should like to know what test is adopted in the trade for ascertaining the percentage of oil in purchased copra, or is it merely judged "by the eye?"

Turning to Mr. Cochran's Manual of Chemical Analysis, we find that the percentage of oil in copra may vary from 63 to 70 per cent, and the moisture from 2 to 7 per cent. If there is no means of judging of these variations in a practical way, and if copra is bought by weight, there is surely ample opportunity for finessing on the part of sellers.

## VILLEBRUNIA INTEGRIFOLIA: A RIVAL TO RHEA.

This tree, which has apparently no vernacular name, is described by Dr. Trimen as occurring in the moist region, 2-5,000 ft., as being rather common in Hantane, Alagalla, Nitre-Cave District and Haputale. It flowers in January and September. In India the tree is known as Ban Rhea or wild Rhea, and has of late come under notice as producing an excellent fibre. It has previously been treated of in the *Agricultural Ledger*, No. 15 of 1898, but is the subject of a special bulletin just issued by the Indian Government.

The bulletin contains a valuable report on the fibre by Prof. Wyndham Dunstane, F.R.S., which confirms the exceedingly favourable views already expressed regarding Villebrunia as a commercial fibre. "Its superiority over Rhea," says Dr. Watt, "both in regard to strength and texture, as well as composition, cannot but be considered as a most important result, and one which should commend it to the favourable attention of all persons interested in Rhea cultivation. As a catch crop to the tea industry it has perhaps no rival, certainly no equal. The fact that this fibre can be cleaned simply by retting the ribbons of bark (after the fashion of jute) is perhaps of even more interest than its exceptionally high merit as a textile. Expensive decorticating and gumming machinery are thereby rendered unnecessary. It is thus possible that the fibre could be turned out at a price that would not only undersell Rhea, but, for certain purposes, compete with flax, if not with jute itself. At all events the cultivation and separation of a crudely cleaned fibre of great merit might easily enough be accomplished by even the poorest agriculturist. While Rhea must of necessity command capital and enterprise, Ban Rhea can be developed by the peasant."

In a letter to Sir Frederick Abel, Director of the Imperial Institute, Dr. Watt wrote last year: "Vilibrunia can be grown on all waste lands; it is a very fine fibre, and perhaps as strong, if not stronger than China grass. . . . All that has to be done is to strip the ribbons off the stems. The plant produces shoots 20 feet long; the bark strips off easily, but no doubt machinery could be readily designed to produce a cleaner and partly bleached raw fibre. The most important thing about this fibre is that it could be produced at one-third the price of Rhea. I trust, with all these facts before you, that you may see your way to co-operate with me in the effort to give to India a perfectly new commercial fibre."

We give below the report by Prof. Danstane, Director of the Scientific Department of the Imperial Institute on *Vilibrunia integrifolia*:—"An examination of Ban Rhea fibre was particularly asked by Dr. Watt in his letter dated 28th April, 1898. Unfortunately the untreated bark was sent for examination, consisting of the bark peeled from the plant—containing the bark fibres in strips from 3 to 5 feet in length. The only course to adopt was to imitate as closely as possible the retting process adopted on an industrial scale, which the almost complete absence of gum rendered possible. Two samples of fibre were received. A small quantity of each was placed in dishes covered with water, and allowed to stand for about three weeks, after which time one of the samples was sufficiently soft for the fibre to be removed. This was carefully combed and picked, and by this means almost 10 grains of a nearly clean brown fibre in long silky threads were procured. The fibre thus treated was then submitted to the usual examination with the following results:—

	Ban Rhea.	<i>Bœhmeria nivea</i> .
Moisture, per cent - - -	10.93	9.0
Ash, per cent - - -	3.52	2.9
Hydrolysis (a), loss per cent	8.22	13.0
Hydrolysis (b), loss per cent	15.82	24.0
Mercerising, loss per cent	8.05	11.0
Acid, purification, loss per cent	5.09	6.5
Nitration, gain per cent - -	56.88	25.0
Cellulose, per cent - - -	80.04	80.3
Length of ultimate fibre -	40mm.	40—200mms and upwards.

"It is interesting to compare these numbers with those obtained in the examination of the fibre of *Bœhmeria nivea* (commonly known as 'Rhea' or 'China-grass') made by Messrs. Cross and Beven. Dr. Watt has pointed out that these two fibres are certainly distinct; the Ban Rhea may be the more important of the two owing to its growing wild on waste land, to its containing little or no gum, and also because it furnishes a silky fibre at least as strong as China-grass, with which, indeed, it, and not *Bœhmeria nivea*, may prove to be identical. A comparison of the results of the examination of these two fibres clearly brings out the superiority of the Ban Rhea, especially in regard to its smaller loss by hydrolysis and its higher nitration number. At the same time it must be remembered that the process adopted in treating this fibre in the Laboratory only very roughly approximates to that which would be used on a large scale.

"Portions of the original samples have been submitted to a fibre expert, who reports that they can be readily treated by a special and simple process which has recently been devised. Further information as to this process can be supplied if this aspect of the matter is thought to be of importance.

"In any case a sample of the properly retted and prepared fibre should be sent for chemical examination."

### AN ENTERPRISING INDIAN AGRICULTURIST

The idea of dairies proper is generally associated in the European mind with Europe, at least—in the English mind with the brightest and prettiest portions of the pasture lands of the home-country. Few would have expected to find in such a place as Grant Road Bridge, Bombay, a dairy which might rival in cleanliness, nicety of arrangement, and completeness of appliance any establishment of the kind, no matter where it be situated. Yet such there is, and its progress under the direction of Mr. N. H. Patuck appears to have been wonderful. That gentleman showed a number of visitors interested in dairy work the process of milk sterilisation, and pasteurisation and it is not too much to say that it could not have been more perfectly accomplished. Every detail from the cleaning and sterilising of the tins to the final corking—or, more properly speaking, air-tight closing—of the bottles was carefully and scientifically carried out. Then by means of a De Laval separator (one of the cleverest appliances of its kind), the heavy cream particles were divided from the milk, passed on to the churn, and made into excellent butter. In these days when nearly every young lady at home is a more or less accomplished butter-maker, and the knowledge of farming is spread through the length and breadth of the land by means of technical education, everyone knows about dairies, and what science has done for their perfection. It is unnecessary, therefore, to describe in detail that most modern one, over which Mr. Patuck presides. Suffice it to say that it is shortly to be transported upcountry, where the milk is better and cheaper, and from whence people in the city will be provided with absolutely safe milk—what until very recently has been a non-existent in the East. Under the circumstances Mr. Patuck himself is of the greatest interest, especially in view of the knowledge of Indian agriculture of which he is possessed.

Born in Bombay, this gentleman, after going through university course and passing his B.A., went up to the School of Agriculture at Madras—the only available one at the time. He came through all his examinations, and ended first in the first class. Several Native Princes at once offered him appointments, and among these the late Maharaja Holker, who was an enthusiastic agriculturist, in Central India. Mr. Patuck engaged himself to the latter, and for ten years continued in the Prince's service, the arrangement being that a salary of Rs200 a month should be given with a half share in profits.

"That must have been a very good thing," was remarked by one who overheard Mr. Patuck, in answer to inquiries narrating his history."

"Well no," was the answer. "So far as the profits were concerned, there never were any. His Highness supplied European implements, and all manner of improvements were made, but these, in addition to the cost of labour, ate up all surplus results, and the conclusion I came to was that the system of labour employment was wrong. The people might have been worked in the way they work to pay Government rent."

"And that is"?—"Well, the ryots are very poor. They know nothing of leaving land to lie fallow or the rotation of crops. They live as far as possible on what the ground brings forth, and during the time they can grow no crop in particular, they bring up opium to pay the rent. They count their labour as nothing, and the labour of their oxen, which during the monsoon would otherwise be idle, as a necessary exercise. So the crop in the market is sold very low, and none can compete. It was after making all manner of calculations that I realized the possibility of making agriculture pay in this way. Provide the people with good implements, good seed and manure, help them with information, and work the business on rent lines."

"How did you drift into dairy work?"

"That was a considerable time afterwards. When in Central India, the Central India Agency took great interest in my experiments, the results of which were entered in the blue-books. So I came to be known in England, where they had started a big company for the cultivation of opium in Africa. Their secretary was sent to me, and my services were engaged for the new undertaking. I took seventy-five opium manipulators and cultivators with me and started off on the course which Livingstone took by the River Quaqua to Mopia, where the work lay. I was there for some time, and desired to work the crops in the same way that experience told me the Indian crops ought to have been worked. But the secretary disagreed, and after six months I came away. We should have made the natives the cultivators, giving them tools, helping them to sink wells and then buying the crops from them."

"How did the company get on afterwards?"

"It turned its attention from opium to sugar, but what finally became of it I do not know."

"And you, yourself?" "I being of a roving turn of mind went off to see how European agriculture compared with agriculture in India, and since that time I have been on several occasions to the West. The first time I went I got out at Suez to study Egyptian methods. I found Nature most favourable to luxurious crops, the land being so enriched by the Nile inundations. They used rude implements similar to those to be found in this country, but got better results with the exception perhaps of the districts watered immediately by the Gauges and other such rivers. On to Russia I went, thence through Serbia and Roumania to Italy, France, Norway, Sweden and England. As I went on I found greater and greater improvements. Italy I found somewhat primitive, and the cultivators in method seemed to resemble the Indians."

"And what inference did you draw as regards India from your observations?"

"This. The people being very very poor here, they cannot afford to purchase implements as are used successfully in more advanced countries, and they would need to be educated up to such implements if they had them. It would be dangerous to give ryots improved implements without teaching them properly."

"And why?" "Why? Well in the first place you use, say, in England a plough that turns a good deep furrow. Here in India they only scratch the ground, and bit by bit the subsoil comes up. It would be disastrous to bring it up from any depth, because while there is plenty of nourishment in the earth, it is only effective after being sun-locked and that process takes time. To plough in India to good purpose would mean giving three inches deep the first year, four the next, and five the next, so the process is gradual." "But European implements could surely be adopted to the work?"

"Yes, I have adopted them so that they can be regulated. In very small sums I have lent these implements with excellent results—the native could never buy. I look forward to seeing a time when the system of lending will be increased, and, generally speaking, the ryots are freed from the hands of the Vannias. That could be a good day for India, and the sooner it is recognized the better. Yes, most certainly I would advocate Government if possible being the lenders of implements as they are the providers of wells; Government, too, might provide manure. Indian soil is never manured, and in due time the crops grow less, because the land is always being impoverished."

"Manure is one of the most expensive of four items?"

"Yes, manure is wasted, absurdly wasted. Rain comes from the clouds to the earth, through the earth to the rivers, through the rivers to the sea, and from the sea to the clouds once more. So should be returned the food grown on the land. When I was in Central India there was great trouble about what was to be done with the night soil. I took it, deodorized it, mixed it with lime and spread it on the land with excellent results. This is what should be done all over. It is a natural sequence, and necessary—second only to irrigation. You cannot take away from the land and give nothing in return."

Then Mr. Patuck went on to explain how he, in his various trips to Europe brought back useful agriculture machines. Six years ago butter was imported to Bombay from Denmark, now Bombay exports butter to China, Africa and Japan. Hermetically sealed in cases, he thinks the day may come when India butter may compete with Danish and English and European markets. Meanwhile, he applies himself to the study of Indian dairy work and agriculture, and trusts his country may benefit.

We are indebted for the above interview to *Tea Indian Agricultural*. Mr. Patrick's career offers an admirable example—and one worthy of emulation—of what Entapure can do for the *Agriculturist*—Ed. A. & J.

VICHKA SEED—A FAMINE FOOD.

This is the product of a plant botanically known as *Cyanotis axillaris* and commonly called the Spider wort. It was found during the month of January, 1898, that a considerable number of people in the Bombay Presidency were subsisting on this and other wild food grains, and this suggested the examination of the seeds of *Cyanotis axillaris*.

The seeds are prepared for food by being ground and cooked into a large quantity of water. When sufficiently boiled it is allowed to cool, and suet and jaggery are added to taste.

Attention was first called to the grain in a paper read by Dr. W. Grey before the Medical and Physical Society of Bombay in 1882. Last year a sample was sent to Prof. Church, F.R.S., who is conducting an examination of Indian food stuffs at the Imperial Institute on a special plan of his own in which for comparative purposes he brings out very prominently the nutrient ratio.

We give below the Report made by Prof. Church:—

This annual, which belongs to the N.O. Commelinaceæ, is common in many parts of India. Though anything but promising in appearance it has been used as food in times of famine. The seeds are spongy and light; 100 weigh only 4 grains. The sample received was largely charged with earthy matter which it was impracticable to remove entirely.

These percentages were obtained:—

Water	-	-	-	11.5
Albuminoids (from total nitrogen)	-	-	-	13.9
Starch, etc. (by difference)	-	-	-	64.1
Oil	-	-	-	0.5
Fibre	-	-	-	3.1
Ash (includes some sand)	-	-	-	6.9

The nutrient-ratio is here 1:4.6, the nutrient value 79. By the phenol method 12.22 per cent. of albuminoids was shewn.

After all these poor-looking seeds possess a good nutrient-ratio and a fair alimentary value.

NEW TREATMENT FOR MILK FEVER IN COWS.

The disease which is known as milk fever parturient paralysis, or dropping, after calving, has a very obscure pathology, although the circumstances in which it occurs are very well known. It must also be confessed that it is a very fatal disease, and although in this country several different methods of treatment have been warmly recommended, the mortality has always remained high when calculated on the results obtained in a large number of cases treated by different veterinary surgeons. In consequence of this comparative failure of remedial measures, a good many owners have adopted the practice of simply having every cow attacked with milk fever slaughtered for butchers' purposes as soon as the animal loses consciousness. It therefore appears to be desirable to call attention here to a new method of treatment, which, it seems impossible to doubt, leaves every other far behind in point of success.

The new method of treatment was first practised by Schmidt, a Danish veterinary surgeon, who was led to employ it tentatively because of his conception of the nature of the disease. He believed that the symptoms of milk fever are the result of the absorption into the general circulation of a poisonous substance which is formed within the udder itself during the first few days of lactation, the source of this poison being the cells which, prior to calving, occupy the ultimate recesses of the mammary gland, and which are normally cast off and passed out with the milk first secreted. The primary seat of the disease being, according to this conception, the udder itself, it occurred to Schmidt to try the effect of treatment which would immediately influence the secreting epithelium of the gland. With this object he injected a warm solution of iodide of potassium in water into each of the quarters (previously milked) and then kneaded and rubbed the udder in order to force the liquid into the ultimate glandular recesses. At the date of publication of his original paper on the subject, Schmidt had applied this treatment to fifty cases of milk fever, and had obtained 46 recoveries. Since then the treatment has had an extensive trial in Denmark, with results almost as gratifying as those obtained by Schmidt himself. Moreover, the method has already been employed in a good many cases in Germany and this country, with results that appear to be much more satisfactory than those previously obtained by other methods.

As in the case of most other therapeutic efforts, it is very important that the treatment should be begun early, but it is admitted that death has resulted in cases of milk fever treated by Schmidt's method even within 12 hours after the onset of the attack. It may perhaps be reckoned a defect in the method that it is hardly one which the layman can take in hand, since it demands special instruments and great care that these and the liquid injected into the udder are free from bacteria, the introduction of which would be very apt to set up inflammation of the gland. When proper care is taken there are no serious after-effects, the milk secretion soon becoming normal in quantity and quality. Should further experience of Schmidt's treatment justify the high opinion of it generally entertained by those who have already tried it, a rather serious source of loss to those engaged in milk production will have been in great measure removed.

GENERAL ITEMS.

Sugar, as is well known to most people, is not obtained solely from the sugarcane and beetroot, but from sources which would appear the most unlikely to yield any edible product. Take coal tar, for instance, from which so many beautiful dyes are obtained, and we believe also an exquisite scent. From the foul-smelling tar a very sweet sugar is obtained. In fact, so excessive are the sweetening properties of coal-tar sugar, that a quantity sufficient only to thinly cover a threepenny piece will suffice to sweeten a large cup of tea. Maple sugar is largely produced in North America from

the maple-tree. In that country, *Chicago Produce* says that at Marengo, Ill., sugar is made from the whey from the cheese vats. This whey is forced into large boilers, and after boiling for some time it is run into evaporating pans, where the boiling is continued until a thick syrup is left. After standing a certain length of time it is again boiled, when the sugar forms. The sugar is worked over till thoroughly drained, and is then packed in barrels for the refinery. It now resembles the ordinary brown sugar of commerce. The secret of refining is known only to two persons. When the product emerges from the refinery it is snow white. A new factory has just been completed at Marengo. It requires 5,000 lb. of milk to produce one barrel of sugar, which sells at 40 cents (1s. 8d.) per lb. There are thus at least four commercial products resulting from the manipulation of milk—viz., butter, cheese, cream, and sugar, besides which there are waste products which are utilised by farmers in feeding stock.

The following is a recipé for Banana or Plantain Jelly, which we have tried and found excellent: Peel the fruit, cut into slices, add three cups of water to each pound, and boil for one hour or till quite soft enough to admit of being strained through a net. After stirring add the sugar (which should be the same weight as the fruit when peeled and cut up) and some acid to taste. Boil all for at least an hour, when the jelly will assume a nice colour and consistency.

The extension of the coffee-growing industry in Queensland, especially in the Northern portion of the colony, having drawn the attention of the Department of Agriculture to the necessity for instructing planters, present and prospective, in the best methods of conducting planting and curing operations, the services of Mr. Howard Newport have been engaged. Mr. Newport is a coffee-planter of eleven years' experience in India, where he successfully managed a plantation at Melrose, Yercand, in the Madras Presidency. He also visited Ceylon, where he applied himself to the study of coffee culture in that island. He is at present visiting all the districts where coffee is being grown, and will advise planters on the best methods to be adopted in all branches of the industry in order to ensure success.

Dr. F. E. Brown, in a late issue of the *Leesbury Commercial* (U.S.A.) gives a cure for the bite of rattlesnakes, which he says he has used successfully in his practice. We reproduce in full his letter, which may at some time prove of value to some of our readers:—Seeing in your paper a notice of the death of a lady from the effect of the bite of a rattlesnake, it occurred to me that it would be the proper thing to do to give you my experience with the tincture of iodine in these cases. I have treated thirteen cases of snake-bites in my practice with simply marvellous results—even restoring to life and health when the patient was supposed to be dying. My first case occurred many years ago. A little child, say three or four years old, was brought to me with two ugly gashes on the instep by a fair-sized rattler. I suppose I saw the child about an hour after the bite, with limbs badly swollen and in great pain. I applied iodine to the wound, and gave the child drop doses every ten minutes for an hour, then every half-hour until decided improvement. The child took 10 to 15 drops in all. Next morning the father reported child perfectly recovered and playing around as usual. My last case was about one year ago. A lad about fifteen years old, whilst reaching under some boards for hen-eggs, was bitten on his right hand by a large rattler. He was brought to me with hand and arm enormously swollen, and scarcely able to stand on his feet. I pursued precisely the same treatment as in my first case, except that I doubled the dose. He took in all perhaps 25 drops of the iodine. He recovered rapidly with no outward results. Some of my cases were much more remarkable than these; each one recovering quickly with no suppuration of the wounds or other outward results. It is equally efficacious in the treatment of dumb beasts. A neighbour of mine had a cow bitten, which when found was unable to stand. I supplied the owner with iodine, and advised him to go back and drop 10 drops upon her tongue every ten minutes for an hour, then every hour for a time. He did so, but came back in an hour or so and reported that it was too late, as the cow was nearly dead. In the morning he went back to see what had become of his cow, and to his surprise found her up and feeding. Her recovery was rapid.

# LITERARY REGISTER SUPPLEMENT.

[Under this heading, in future, we mean to give a four page "Supplement" with our *Tropical Agriculturist*, from time to time as there is matter of sufficient value, so to be preserved.]

---

OCTOBER, 1893.

## Prof. W. Geiger on the Etymology of Ceylon.

PROF. Wilhelm Geiger, of Erlangen, has issued another of his essays on the dialects of Ceylon, namely "Etymologie des Singhalesischen." In this Prof. Geiger shows the connection of some 1,700 Sinhalese vocables with Sanskrit, Pali, Prakrit, and other Indian dialects. Scholars will doubtless dispute some of the etymologies here given; but the largest number are indisputably correct, and prove beyond doubt that Sinhalese must be regarded as an Aryan dialect. Dr. Geiger's further essays on Sinhalese, &c., will be looked for eagerly by scholars in Ceylon especially. D. F.

## Javanese Exiles to Ceylon in the 18th Century.

SIR,—In the lives of the Governors-General of the Dutch Indies, we find a reference to one Pangoran Depati Anom, Prince of Java, who was captured by the Dutch in 1708. The reference is as follows:

"After the Prince had remained about a month at Batavia, the Government resolved to send him to Ceylon. Punto Gale (Galle) was selected as his residence and he had a body guard of one Ensign, one Sergeant and 24 soldiers together with a monthly allowance of 250 rixdollars, besides rice and other necessaries for the support of himself, three sons, 19 wives and 52 people forming his suite. At this place this unlucky Prince ended his days"

About the year 1748 according to the same work, a Prince of Bantam by name Pangerang Gusty was banished to Ceylon.

Is there no record or tradition among the Mohamedans of Ceylon about these Princes.—Yours truly,  
GALLICUS

[And what about their descendants?—ED.]

## Palk's Bay and Straits.

DEAR SIR,—In a review of Vol. 25 of the Archaeological Survey of India which recently appeared in your columns, reference is made to

a statement contained in it that Palk's Strait "commemorates the name of a Dutch Governor," and it is suggested that Governor Valck may perhaps be meant.

This volume has for its compiler Mr. Alexander Rea, Superintendent of the Archaeological Survey, Madras.

A prophet, verily, has no honour in his own country; but it is rather curious to find an official of the Madras Government whose special business is antiquarian and historical investigations, apparently unaware that there was a Governor of Madras named Robert Palk, whose administration lasted from 1763 to 1767, and that the Strait and Bay are called after him (see "Names and their Histories" by Isaac Taylor).

X.

---

No. II.

Bangalore, June 9.

SIR,—In an issue of your journal, published after the middle of last month, there appears a letter by "X," commenting on a statement in Mr. Rea's "Monumental Remains of the Dutch E.I. Company in Madras," that Palk's Bay or Strait commemorates the name of a Dutch Governor. On referring to Mr. Rea's authority for the quotation (Madras Manual of the administration, Vol. 1, p. 2, 1885), I clearly read, that "the name of the Palk's Strait commemorates a Dutch Governor." Now, as this work—by Dr. Maclean, a late member of the Madras Civil Service—was described by another former and learned Governor,—not necessarily Dutch—Sir M. E. Grant Duff, as a monumental one, highly creditable to its author, besides being an official publication; and, as moreover, the quoted statement has not hitherto—so far as I know—been contradicted, even by "X," during the seventeen years that have elapsed since it has been published, there seems some reasons for its repetition. Who is this authority, that he and his statements should be eclipsed by that quoted by "X?" and why has "X" delayed to take action all these years? It may be, that as stated in p. 648, vol. III, of the same Manual, published in 1893—Palk's Bay was "named by the Dutch after Governor Palk," but the error, a clerical one, no doubt, apparently rests with the quoted authority. Let, not, however, those feeble attempts to detract from the fame of the immortal

and hitherto unnoticed Palk, disturb his peaceful slumbers or those of his champions. Peace be to his ashes, and otherwise R. I. P.

["R. I. P." we think is rather unreasonable in criticising, in place of thanking "X" for coming forward when he did to give the public correct information.—ED.]

### No. III.

SIR,—Regarding the correspondence in your columns as to the origin of the above name, permit me to say, in reply to "X," that there are many instances of the transformation of names much less similar than "Palk" and "Valck." In the vernacular, the former would be the pronunciation of the latter name, just as "office" becomes "oppice." Even in connection with Madras, to which your correspondent has referred, as a place where local great names may have a chance of survival, a curious example may be quoted. A bridge was once called after a local high official of the name of Hamilton. The native pronunciation of this good old Scotch name is "Amattan." Now there is a Tamil word "Ambattan," meaning a Barber. In time the bridge became, and is at present known as the Ambattau or Barber's bridge. Therefore, the Barber's bridge commemorates a former official of the name of Hamilton. The connection is scarcely obvious without an explanation: and yet this startlingly Barberous transformation has been effected within a century! I may also perhaps be permitted to say, that it is possible for one to have heard and known of the previous existence of Governor Palk, of his having been a President of the Council of Fort St. George, and of his name being and having been for a time used as a designation for a certain Strait, and yet at the same time suggest a doubt as to the correctness of the latter. Had the Dutch remained masters of the country, we should doubtless have heard much more of Valck than of Palk. At the time when these worthies reigned, the Dutch were the ruling European power on both sides of the Strait. The western bounding Indian districts, and Ceylon itself, only came finally into the power of the British, long after the departure of the English Governor Palk. It seems curious therefore, that at a time of bitter competition between the two Powers, when the British had but a precarious footing in the locality, the Dutch should have thus favoured one of their English rivals; or, that the latter should have been able to appropriate to themselves by name, a piece of sea dominated by the opposing power. It appears more probable, that the English, afterwards taking advantage of the similarity in name—or perhaps unaware of the previous existence of Valck—appropriated the honour in favour of their countryman. It may be of interest to state that the Tamil name of the strait is Pakkukuda kadal. R. I. P.

### No. IV.

SIR,—To what a strait has Governor Palk been reduced when a member of the Service to which he once belonged passes him over without remark, and makes a present of what was apparently his only chance of immortality (on this earth at least, to his Dutch neighbour and contemporary!

It is clear from the letter of "R. I. P." in your issue of the 17th inst. that it is Dr. Maclean and not Mr. Rea, who is responsible for the error. This however, merely adds force to my illustration of the saying about the prophet and his own country; for now it appears that not one, but two, Madras officials were ignorant of the fact that there was a Governor of Madras last century, named Palk. This circumstance also shows how soon even a Governor may be forgotten,

and that he may not escape oblivion even though he has given his name to a strait and a bay. Had it been a street or a square in Madras, his chances of remembrance would perhaps have been better, though in Colombo one or two former rulers of the Colony have recently been deprived even of that chance.

I still venture to call Dr. Maclean's derivation of the name an error. I am not aware whether he gives any reasons for it; but some strong reasons would seem to be necessary to get over the awkward facts, first that the Dutch Governor's name was not Palk, but Falck or Valck and that it is hardly likely that within a century the name of the Strait would have altered from the one to the other, and secondly, that there was a Governor of Madras last century whose name does not require any alteration to make it suit the derivation. Why go in search of a Dutch Governor whose name requires such alteration when there was an English Governor on the spot, so to speak, whose name requires none.

These seem to me strong enough reasons for preferring the latter, and sufficient even without any authority until stronger reasons are shown to the contrary. "R. I. P." however wants to know who my authority is, and why Dr. Maclean's statement should be "eclipsed" by his. Dr. Isaac Taylor, whom I quoted as my authority but whom apparently "R. I. P." has never heard of, is the author of "Words and Places" and is, I believe, looked upon as something of an authority on this subject. He is possibly as well known in the literary and philological world as Dr. Maclean "late member of the Madras Civil Service."

"R. I. P.'s other argument is irresistible. He asks triumphantly "why has "X." delayed to take action all these (seventeen) years"? It has not occurred to him that although Dr. Maclean's *Mannal* has been praised by such a learned Governor as Sir M. E. Grant-Duff, even that has not been sufficient to make it a text-book among the English residents of Ceylon. Their study is but little upon "District Manuals of Administration." Our libraries do not keep this one, apparently because there is no more demand for it than there is for our local productions of the same sort. It was only upon the appearance of Mr. Rea's monumental work, which gave some promise of permanency, (*acre perennius*) to the 17-year old error, that it was possible for 'X.' to "take action," for the simple reason that he had never heard of the error before.

It is curious that the two rival candidates for the honour were for a year or two contemporaries in office, Governor Palk of Madras ruling from 1763 to 1767 and Governor Falck of Ceylon from 1765 to 1785. X.

### No. V.

WE are pleased to have the following decisive note from Sir. M. E. Grant-Duff. Writing from Lexden Park, Colchester, on the 2nd September, he says:—

"I find from the best possible authority that there is no doubt whatever that Governor Palk gave his name to Palk's Straits. There seems reason to believe that the name was suggested by Rennell who seems to have surveyed the Straits and their neighbourhood as a very young man when he first came to India after leaving the Navy in which he began life."

## "Monumental Remains of the Dutch East India Company in the Presidency of Madras:"

BY ALEXANDER REA,

Archæological Survey of India: (New Imperial Series, vol. 25.)

THE following is a very interesting work to us in Ceylon. In chapters i. and ii. the writer gives a history of the origin and decline of the trade of the Company in the East. It is stated that in 1672, Philip Baldores, a Dutch Missionary from Ceylon visited Masulipatnam. The reference is clearly to Philip Baldaeus. The year referred to is the date of the publication, at Amsterdam, of his work on Ceylon and the Malabar coast, and the correct date would therefore have been earlier. The references from this work are loosely translated, the writer evidently not having the original work in Dutch before him, but a translation. Chapter iii. treats of the 18th century. The origin of the numerous Portuguese names found among the Sinhalese is incidentally discussed and it is stated that Palk's Strait "commemorates the name of a Dutch Governor." The reference is perhaps to Governor Valck.

Chapter iv. treats of the most interesting part of the work, the monumental remains, especially the tombstones, of which many sketches, with coats of arms, appear. The translations of some are faulty. Plate ii. contains the epitaph of Johannes Kruyf *Predikant* who died 23rd April, 1664, at Negapatnam. This is not translated. Baldaeus, whose friend he was, refers to him in his work at pages 118 and 155 giving a letter, dated 13th October, 1662, written by Kruyf about the massacre of the Rev. Hambroeck at Formosa. At p. 155 Baldaeus states that Kruyf died in the island of *Tajovan* but the fact remains that his tomb is in Negapatnam.

Elizabeth de Pape is said, on her tomb, to have been the first Dutch lady buried in Negapatnam, evidently the daughter of Rev. Nathaniel de Pape referred to by Baldaeus at page 155. Some of the tombstones are interesting to the Dutch descendants in Ceylon. Abraham Dormieux, whose descendants made alliances with many of the leading families during the Dutch period was married according to plate VI to Margareta Maartensz, the eldest daughter of Jan Maartensz van Suchtelen and his wife Gertruida Pietersz. The van Suchtelen family seems, at this period, to have adopted the surname Maartensz. Capt. Pieter Huybertsz of Rotterdam (plate XXI) lies buried at Pulicat. Plate XXV refers to one Sara Lindeborn, daughter of Hercules Lindeborn "Captain of the Burghers in Colombo." The epitaph in plate XXIX is that of Abraham Mendis "free merchant" born in the city Oeteootta. Plate XXXVII refers to Petronella Jacoba Leembruggen of Colombo the wife of Nicolaas Tadama, chief of Pulicat. She was the daughter of Henricus Leembruggen, the chief of the cinnamon department in Ceylon. At Sadras there lie buried (plate XLIII) Barent Clebont "Chief Captain and Major of the Ceylon military forces" and Reynier Jacobsz de Vos, his wife, Catherina Maria Davidsz, and children. Reynier Jacobsz, was the son of Reynier de Vos Dissave of Matara, who afterwards in 1694 was Admiral of the Return Fleet under whose flag the Rev. Francois Valentin (the great historian of the Dutch East Indies)

performed his first voyage "home." There is also the epitaph of Esther Classina (plate LIV) wife of Mr. Jacob Pieter de Neys chief of Sadras, At Tuticoreen there lie buried Francina Lydia Giffening, the wife of F. C. van Spall (plate LIX.) and Pieter Hollebeck, who was born in Pulicat (Plate LV). The above are a few of the tombstones which I have selected as being of the greatest interest to those in Ceylon. Plate XII contains the following:—

"In the year 1777 and on the orders of the honourable and ruling governor Reynier van Vlissingen this pagoda was rebuilt."

It is a pity that all the epitaphs are not translated and that the references, in such a work, should be to translations and not to the original Dutch sources. The coats of arms are not discussed from a genealogical and heraldic point of view although there is much scope for such a treatment of them. The writer says by way of quotation that at Masulipatnam even "the grave stone of an obscure *schipper* or sea captain, probably not of degree to bear coat armour has an effigy of the deceased, with a three cornered hat and long coat familiar in old illustrations." There is no sketch of this tombstone given. It is probably because the *schipper* was not of degree to bear coat armour that he had to rest satisfied with his effigy, three cornered hat and long coat, unless the writer considers that these constituted his coat of arms.

Part III treats of Indo-Dutch Coinage and plate LXIII contains sketches of 45 coins.

V.

### Mr. Horatio John Suckling:

AUTHOR OF "CEYLON: BY AN OFFICER, LATE OF THE CEYLON RIFLES."

Croydon, June 29.

WHEN, in 1876, there was published in London, in two volumes, a work entitled "Ceylon: A General Description of the Island, Historical, Physical, Statistical. Containing the most recent information. By an Officer, late of the Ceylon Rifles," there was much speculation regarding the identity of the author, which was concealed under the initials "H.S." at the end of the preface. Many were the guesses; but none, I believe, was right. In 1893, however, I sent a note to the *Monthly Literary Register*, stating that in a list of works on Ceylon appended to "Palms and Pearls," by Alan Walters (London, 1892), there was the following: "Suckling, Capt. H. 'Ceylon Ancient and Modern,' Lond., 1876." I pointed out that this evidently referred to the work by "an officer" &c.; and asked if the identification were correct. No reply to my query appeared; but a little later I sent another note to the M.L.R. regarding a little book by "H.S." entitled "Anti-Darwin," issued in 1886 and again in 1887. Since then I have often desired an opportunity of meeting the writer; and this opportunity I have had today, when I called on Mr. Suckling at his residence. I had expected to find him rather advanced in years; but was surprised to find him still in the prime of life, though it is over forty years since he left Ceylon. [He is not a "Captain," by the way: his brother Horace was Captain in the 90th Perthshire in Ceylon in 1837; and he himself was an ensign in that regiment in Ceylon in 1844, though
